Lecturer on Dutch Language and Literature, University of Hamburg. Corresponding Member, Academy of Sciences, Amsterdam. DUTCH LANGUAGE AND LITERATURE *(in part).*

G. G. S. George Gregory Smith, M.A., **LL.D.**
Former Professor of English Literature at Queen's University, Belfast. DOUGLAS, GAVIN.

G. H. Br. George **Hartley** Bryan, M.A., **D.Sc.,** F.R.S.
Formerly Professor of Mathematics, University College of North Wales. DIFFUSION *(in part).*

G. H. R. George H. Ryden, M.A., **Ph.D.**
Professor of History and Political Science, University of Delaware. State Archivist of Delaware. Author of *Foreign Policy of the United States in Relation to Samoa.* DELAWARE.

G. J. N. George Jean Nathan, B.A.
Founder and Editor (with H. L. Mencken) of the *American Mercury.* Author of *Land of the Pilgrim's Pride;* etc.
DRAMA *(in part).*

G. K. A. B. Right Rev. George Kennedy Allen Bell
Bishop of Chichester. Dean of Canterbury, 1924–29. Formerly resident Chaplain to the Archbishop of Canterbury. Author of *The Meaning of the Creed;* etc. DAVIDSON, RANDALL THOMAS.

G. K. C. Gilbert Keith Chesterton, F.R.S.L., **LL.D.,** D. Litt.
Author and Journalist. Author of *Dickens; The Napoleon of Notting Hill; The Return of Don Quixote;* etc. DICKENS, CHARLES.

G. **McL.** Wo. George **McLane** Wood
Former Editor, United States Geological Survey, Washington. Former Secretary, Chesapeake and Potomac Telephone Company. ECUADOR *(in part).*

G. M. D. George M. Darrow, A.M., **Ph.D.**
U.S. Bureau Plant Industry (1918–). Senior Pomologist in charge Small Fruit Investigations. Originator of many varieties of strawberries, raspberries and blackberries. Editorial board of *Journal of Heredity.* DEWBERRY OR TRAILING BLACKBERRY.

G. T. M. Sir Gilbert T. Morgan, O.B.E., **D.Sc.**
Formerly Mason Professor of Chemistry, University of Birmingham; Professor in the Faculty of Applied Chemistry, Royal College of Science for Ireland; Professor of Applied Chemistry, Technical College, Finsbury. Author of *Organic Compounds of Arsenic and Antimony.* Contributor to *Thorpe's Dictionary of Applied Chemistry.* DIAZO COMPOUNDS.

G. W. Major-General Geoffrey White, C.B., C.M.G., D.S.O., R.A.
Commandant, Royal Military Academy, Woolwich, 1918–20. Commandant, Woolwich Sub-area, 1920–3. Director of Remounts, War Office, 1925–9. DRIVING *(in part).*

G. W. P. George W. Pickels, B.C.E., C.E.
Professor of Civil Engineering, University of Illinois, Urbana, Ill. Author of *Drainage and Flood-Control Engineering; Engineering Aspects of Land Drainage in Illinois;* etc.
DRAINAGE OF LAND *(in part).*

H. *A. M.* Sir Henry Alexander Miers, **D.Sc.,** M.A., F.G.S., F.R.S.
Trustee of the British Museum since 1926. Fellow of Magdalen College, Oxford. DIAMOND.

H. A. Si. Harvey Alexander Simmons, M.S., **Ph.D.**
Assistant Professor of Mathematics, Northwestern University, Evanston, Ill. DIOPHANTINE EQUATIONS.

H. B. Ba. Herbert Brereton Baker, C.B.E., M.A., **D.Sc.,** F.R.S.
Former Professor of Chemistry, Imperial College of Science and Technology, London. DRYNESS, CHEMICAL *(in part).*

H. Cam. Harvey Campbell
Executive Vice-President, Detroit Board of Commerce.
DETROIT.

H. C. U. Harold C. Urey, **Ph.D.**
Professor of Chemistry, Columbia University. Nobel Prize Winner for the discovery of Deuterium (Heavy Hydrogen), 1934. DEUTERIUM (Heavy Hydrogen).

H. Da. H. Das
Graduate Member of New College, Oxford. Fellow of the Royal Society of Literature and Contributor to the *Calcutta Review* and *The Journal of Indian History.* Editor of *The Life and Letters of Toru Dutt.* DUTT, TORU.

DAMASCUS TO EDUCATION IN **ANIMALS**

DAMASCUS, the name of a Sanjak and town of Syria, 57 m. from Beirut and situated in 33° 30′ N. and 36° 18′ E. Its origin is unknown, and the belief that it is the oldest city in the world still inhabited has much to recommend it. It is mentioned in the account of the battle of the four kings against five, in the book of Genesis (ch. xiv.), where Abram (Abraham) is reported to have pursued the routed kings to Hobah north of *Damascus (v.* 15).

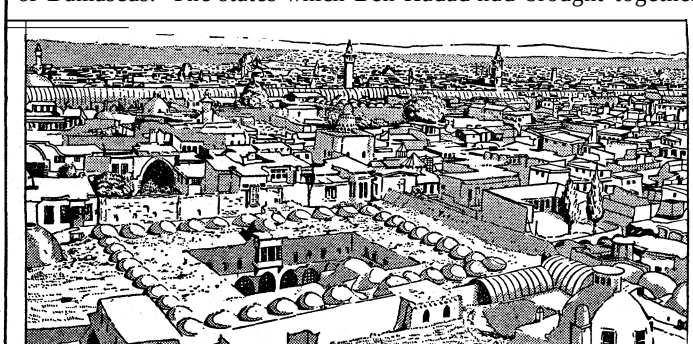
In the period of the Egyptian suzerainty over Palestine in the 18th dynasty Damascus (whose name frequently appears in the Tell el-Amarna tablets) was capital of the province of Ubi. The name of the city in the Tell el-Amarna correspondence is Dimashka. Towards the end of that period the overrunning of Palestine and Syria by the Khabiru and Sutu evidently changed the conditions, language and government of the country, and the Aramaean form, Darmesek, appears in an inscription of Rameses III.

Damascus soon reached such strength that though Tiglath-Pileser I. reduced the whole of northern Syria, and by the fame of his victories induced the king of Egypt to send him presents, yet he did not venture to attack Kadesh and Damascus, so that this kingdom acted as a "buffer" between Assyria and the rising kingdom of Israel.

David made an expedition (2 Sam. viii) against Damascus as a reprisal for the assistance the city had given his enemy Hadadezer, king of Zoba. The Israelite possession of Syria did not last long. A subordinate of Hadadezer named Rezon (Raṣun) succeeded in founding a dynasty there, and throughout Solomon's reign he was a constant enemy to Israel (1 Ki. xi. 23 *seq.).*

It is inferred from 1 Ki. xv. 19 that Abijah, son of Rehoboam, king of Judah, made a league with Tab-Rimmon of Damascus to assist him in his wars against Israel, and that afterwards Tab-Rimmon's son Ben-Hadad came to terms with the second successor of Jeroboam, Baasha. Asa, son of Abijah, followed his father's policy, and bought the aid of Syria, whereby he was enabled to destroy the border fort that Baasha had erected (1 Ki. xv. 22). Hostilities continued between Israel and Syria. Syria established a quarter for Syrian merchants in Samaria (1 Ki. xx. 34.). A Syrian defeat at Aphek, when the king of Israel acted too leniently, was the cause of a prophetic denunciation (1 Ki. xx. 42). According to the Assyrian records Ahab fought as Ben-Hadad's ally at the battle of Karkar against Shalmaneser in 853 B.C. This seems to indicate the vassalage of Ahab, of which no direct record remains; and it was perhaps in the attempt to throw this off that he met his death in battle (1 Ki. xxii. 34–40). In the reign of Jehoram, Naaman, the Syrian general, came and was cleansed by the prophet Elisha of leprosy (2 Ki. v.).

In 842 Hazael assassinated Ben-Hadad and made himself king of Damascus. The states which Ben-Hadad had brought together



GENERAL VIEW OF THE CITY OF DAMASCUS, SHOWING, IN THE DISTANCE, THE COVERED "STREET WHICH IS CALLED STRAIGHT"

into a coalition against the advancing power of Assyria all revolted; and Shalmaneser, king of Assyria, took advantage of this and attacked Syria (841). He wasted the country, but could not take the capital. Jehu, king of Israel, paid tribute to Assyria, for which Hazael afterwards revenged himself, during the time when Shalmaneser was distracted by his Armenian wars, by attacking the borders of Israel (2 Ki. x. 32).

Adad-nirari III. invaded Syria and besieged Damascus, *c.* 805–802; and Jehoash, king of Israel, seizing the opportunity, recovered the cities that his father had lost to Hazael. In 735 Ahaz of Judah was attacked by Rezon (Raṣun, Rezin), king of Damascus; at the same time the Edomites and the Philistines revolted. The king of Assyria, Tiglath-Pileser III., was besought to help; and, invading Syria, reduced Damascus in 733.

Except for the abortive rising under Sargon in 720, we hear nothing more of Damascus for a long period. In 333 B.C., after the battle of Issus, it was delivered over by treachery to Parmenio, the general of Alexander the Great. It had a chequered history in the wars of the successors of Alexander, being occasionally in

Egyptian hands. In 112 B.C., the empire of Syria was divided by Antiochus Grypus and Antiochus Cyzicenus; the city of Damascus fell to the share of the latter. Hyrcanus took advantage of the disputes of these rulers to advance his own kingdom. Demetrius Eucaerus, successor of Cyzicenus, invaded Palestine in 88 B.C., and defeated Alexander Jannaeus at Shechem. On his dethronement and captivity by the Parthians, Antiochus Dionysus, his brother, succeeded him, but was slain in battle by Ḥāritha (Aretas) the Arab. Ḥāritha yielded to Tigranes, king of Armenia, who in his turn was driven out by Q. Caecilius Metellus. In 63 B.C. Syria was made a Roman province.

In the New Testament Damascus appears only in connection with Acts ix., xxii., xxvi., 2 Cor. xi. and Gal. i. In A.D. 106 under Trajan, Damascus became a Roman provincial city. On the establishment of Christianity Damascus became the seat of a bishop who ranked next to the patriarch of Antioch, and the great temple of Damascus was turned into a Christian church.

In 635 Damascus was captured for Islam by Khalid Ibn Welīd. After the murder of Ali, the fourth caliph, his successor Moawiya transferred the seat of the Caliphate (*q.v.*) from Mecca to Damascus and thus commenced the great dynasty of the Omayyads, whose rule extended from the Atlantic to India. Ninety years later it was supplanted by that of the Abbasids, who removed the seat of empire to Mesopotamia; and Damascus passed through a period of unrest in which it was captured and ravaged by Egyptians, Carmathians and Seljuks in turn. The crusaders attacked Damascus in 1126, but never succeeded in keeping a firm hold of it. It was the headquarters of Saladin in the wars with the Franks. The chief later events are the Mongolian capture in 1260, its Egyptian recapture by the Mameluke Kotuz; the ferocious raid of Timur (Tamerlane) in 1399; and the conquest by the Turkish sultan Selim, whereby it became a city of the Ottoman empire (1516). Of its more recent history, one may mention the massacre of July 1860, when the Muslim population rose against the Christians, burnt their quarter, and slaughtered about 3,000 adult males. (See SYRIA.)

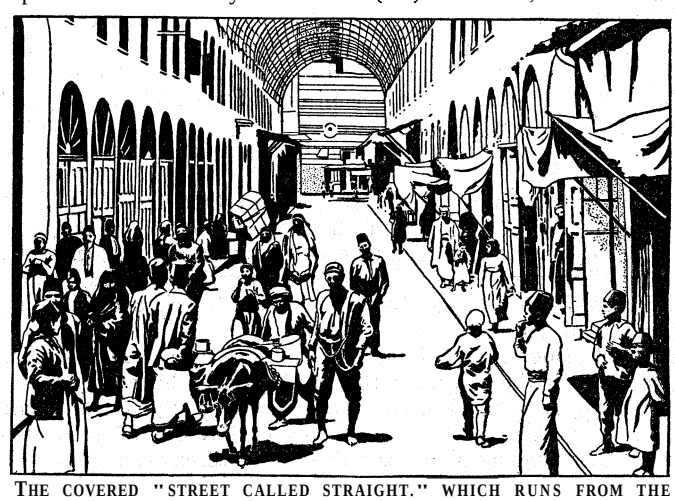
Modern City.—Damascus is the chief town of the new state of Syria; 2,200 ft. above sea-level; pop. 188,000 (21,000 Christians, 16,000 Jews). It stands on both banks of the main channel of the Baradā about 2 m. from the point where it emerges from a gorge of the Antilibanas to branch off eventually fanwise and irrigate a wide area. Damascus stands on the north-west edge of this extensive tract of amazingly fertile ground (the *Ghūtah*), where, intermingled with fields of wheat, barley and maize, are orchards of apricot, fig, pomegranate, pistachio and almond, and groves of poplar and walnut, whilst vine boughs trail everywhere. Viewed from a point of vantage (as at the suburb Sālihīyah), the white minarets of the city bathed in sunlight rising above the mass of verdure leave an ineffaceable impression on the mind of the beholder. The ancient city, rudely rectangular in shape, was huddled within a wall on the southern bank of the Baradā. The modern city is spoon-shaped, the handle to the south whither the city has been drawn a long way on the Meccan road forming the quarter known as the *Meidān.* A suburb, *El-Amāra,* has been built on the northern bank, and farther off towards the north-west is another suburb, *Sālihīyah.* Damascus is supplied with water from the Baradā by an extensive system of canals and conduits. Its streets, for the most part narrow and protected overhead, are by no means clean, and the high walls which conceal private dwellings belie the magnificence to be found within. Its public buildings, mosques, schools and Khans reveal many fine examples of Arabian art. To a partial extent sheltered by hills to the north, west and south, the city lies open to the east and its trying and prevalent winds. It suffers a great variation in temperature in the course of the year. In winter frost and snow are not unknown, and summer temperatures are high but the nights are always cool. Fever, dysentery and ophthalmia due to the climatic conditions are prevalent.

In recent, as in earlier times, the development of the city has been affected by great outbreaks of fire. The Great Mosque was gutted in 1893, and in 1912 a conflagration destroyed a considerable tract of bazaars. Great damage was done by the French bombardments of Oct. 1925 and May 1926. It is said that Damascus has 240 mosques, mostly dilapidated, of which 70 are still in use. Catholic and Protestant missions support a large number of educational institutions and hospitals. The municipality has erected a public hospital and a hospital for lepers. There is a resident British consul.

Antiquities.—The ground plan of the city may be said to have remained unaltered since the Mohammedan occupation at least, and a conflagration such as reduced the city to ashes in 1401 merely cleared the site for fresh building. Material and facilities for archaeological study are consequently less than might have been expected. The hand of the Roman workman is visible in what is left of the city walls and gates, in the area of the Great Mosque, in the *Darb-el-Mustakīm,* which was probably colonnaded, and in an aqueduct in the western quarter. The Great Mosque (or Umayyad mosque) was originally the Church of St. John Baptist, whose building was begun by the emperor Theodosius (375) and completed by his son Arcadius (395–408). It occupied the site of an earlier temple, probably that of Rimmon (cf. 2 Ki. v. 18). The Caliph El-Watid deprived the Christians of their building (A.D. 705), and destroyed it in great part before re-erecting it as a mosque. It was burned down in 1069, pillaged by Tamerlane (1401) and badly damaged by fire (1893). In this mosque in 1905 some valuable Syriac and Kufic manuscripts were discovered. The citadel in the north-west of the city was built in 1219 by Mālik el-Ashraf, refortified by Beibars (1262) and by the Turks (16th century). The French have established an Institute of Mohammedan Archaeology and Art (its archaeological collection suffered heavily from fire and pillage in Oct. 1925), and a School of Arabic Decorative Art to revive the work in glass and wood and the colouring of stuffs. They aim at reproducing the best Arabic work of the best period. A new Syrian National Museum has also been instituted.

Commerce.—From its happy situation Damascus has ever had much to offer to the nomad and from the earliest times it has been the market of the desert. Ezekiel (xxvii. 18) mentions its "wine of Helbon" and its wool. In classical times it had a reputation for its Chalybonian wine (*i.e.,* of Helbon, mod. *Halbūn,*



THE COVERED "STREET CALLED STRAIGHT," WHICH RUNS FROM THE EASTERN TO THE WESTERN GATE OF DAMASCUS

13 m. N.N.W. of Damascus). Its dried fruits (*pruna et* cottana: Juvenal iii. 83) were a valued present, and its linens, cloths and cushions were famous. For centuries the "Damascene blade" carried far afield the reputation of the city's armourers. Diocletian promoted this industry but it perished when Tamerlane carried off the smiths in 1401. The silk looms are not so important now as of old, but modern industries such as leather work, the filigree work of gold and silversmiths (who are all Christians), inlaid work in wood and metal (brass, copper), have survived. Damascus was hard hit by the World War and in-

dustry has revived but slowly. Egypt since World War I has manufactured goods previously made in Syria and many artisans from Damascus have migrated thither. The textile industry suffers from foreign competition, and dyeing has declined in sympathy. Railway connection with the Hauran (1894), Beirut (1895) and Haifa (1905) has diminished its caravan trade. Damascus is tending more and more to become a centre for foreign imported goods as well as local produce, and with the development of motor transport an increase in transit trade may be expected. The shops of Damascus are famous for the wealth and variety of their goods and its streets for the mixture of races that throng them.

THE TWENTIETH CENTURY

During World War I, Damascus served as the headquarters of the Turkish and German forces which tried under General Liman von Sanders to attack the Suez canal and later to stop the British counteroffensive into Palestine. The Egyptian expeditionary force under Lord Allenby and the Arab army, commanded by Emir Feisal (*q.v.*), ad anced into Syria and entered Damascus on October 1, 1918. Emir Feisal made his formal entry into the capital of Syria on Oct. 3, and was rapturously greeted by the Arab population. Backed by the arrdngements made during the war, he proceeded to establish the government for an independent Arab state which was to include the districts of Damascus, Homs, Hama, and Aleppo with Damascus as the capital.

Supported by the enthusiasm of the population, the formation of the new state was in good progress, when with the arrival of General Henri Gouraud as French High Commissioner in Beirut on Nov. 22, 1919, the French tried to gain control of Syria. A Syrian national congress had been elected and met at Damascus, offering, on March 11, 1920, the royal crown of Syria to Feisal and unanimously adopting on July 3 a democratic constitution for a united Syria, including the Lebanon, Palestine and Trans-Jordan.

But the progress was checked by General Gouraud's ultimatum on July 19 which demanded Syria's submission to French administration. An Arab army under Yussuf el Azmi, the minister of war, met the French at Khan Meizalun on July 24 and was defeated, Damascus was occupied by the French, Feisal forced to flee and the short-lived existence of the kingdom in Damascus came to an end.

French policy in the mandated territory of Syria inclined toward the partition of the country into different administrative areas, so as to weaken the national sentiment and to destroy the unity of the country. For some time Damascus was the capital of one relatively small administrative area, but all these partitions and divisions proved purely temporary and futile. In the summer of 1924 the then French High Commissioner, General Weygand, again created a larger administrative unit, called Syria, and made Damascus the capital.

The French High Commissioner, however, continued to reside in Beirut, the capital of the newly created state of the Great Lebanon, thus relegating Damascus to a secondary rank Yet the population of Damascus never ceased to express its national aspirations and its violent opposition to the policy pursued by the French administration.

On April 1, 1922, Charles Crane visited Damascus. The great mass demonstrations during his presence led to severe government repression. Similar demonstrations on a vast scale occurred in April 1925, when Lord Balfour visited Damascus. These demonstrations were intended as a protest against Zionism and

KHAN SULEIMAN PASHA, AN OLD ROOFLESS BUILDING NAMED AFTER THE GREAT SULTAN OF TURKEY WHICH WAS FORMERLY AN INN, BUT IS NOW A THRIVING BAZAAR

the separation of Palestine from Syria. A constitution granted on Dec. 5, 1924, provided for a Syrian state with an elected president, a ministry appointed by him, and an elected legislative council, but no real power was given to the newly created native authorities, the partition of the country was maintained and thus Syrian discontent continued, until it flared up in the violent and long-lasting nationalist revolution of 1925.

This revolution began in the mountains of the Druse state in July 1925. After the first successes, achieved under the leadership of Sultan Pasha el Atrashi, Damascus joined in the revolution. A provisional government was constituted, and for months the fertile and thickly populated oasis of Damascus formed a battleground. Nor did Damascus itself escape. From Oct. 18 to Oct. 20 violent encounters were fought in the streets of the ancient city, while the French army withdrew from the town and bombarded it from the neighbouring hills, reducing much of it to ruins and destroying partly the Palais Azm, the most beautiful building in the city. In spite of the strong measures taken by the French, the revolution continued and only subsided in 1927. Damascus was bombarded a second time by French artillery and aircraft on May 7, 1926, when the greater part of the Meidān quarter was destroyed and probably about 1,000 persons killed. Only in 1927 did Damascus and its environment regain a more or less normal character and communications become re-established with the outside world on a peacetime basis.

The French administration now tried a more conciliatory policy. In February, 1928, Taj-ed-Dine-el-Hassani was appointed prime minister and elections were held for a national constituent assembly, which was opened in Damascus on June 9. After long negotiations, full of conflict and suspense, a new Syrian constitution was promulgated on May 14, 1930. Yet the time of trouble for Damascus was in no way ended. A treaty between Syria and France, suggested by the French government, was rejected in

Nov. 1933 by the Syrians as completely unsatisfactory. A new vehement agitation, starting in January 1936, finally brought a more satisfactory treaty in 1936, but, though accepted by the Syrians it was never ratified by the French. Finally, World War II brought a change in the situation at Damascus.

The fall of France in June 1940, and the nomination of General Henri Dentz, a leading adherent of full French collaboration with Germany, brought the danger of a German use of Damascus as a center of axis propaganda and strategy in the middle east. Under these conditions allied forces, British, Australian, Free French and Indian, moved in June, 1941, into Syria and entered Damascus on June 21.

On September 16 the Free French authority proclaimed the independence of Syria with Damascus as its capital and Taj-ed-Dine became first president of the new republic. Damascus which in 1919 had for a short time been the capital of an independent Arab state, regarding itself as the nucleus of a unification of all the Arab lands, became so again the capital of an independent Arab state and the center for the hopes of achieving the longed-for Arab unity.

Throughout the 20th century Damascus aspired to this leading position in the Arab world to which its past, its size, its trade and the intensity of its national spirit entitle the ancient city.

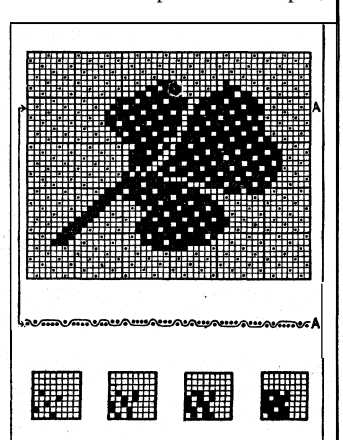
(H. Ko.)

DAMASK, the technical term applied to certain distinct types of fabric. The term owes its origin to the ornamental silk fabrics of Damascus, fabrics which were elaborately woven in colours, sometimes with the addition of gold and other metallic threads. At the present day it denotes a linen texture richly figured in the weaving with flowers, fruit, forms of animal life, and other types of ornament. "China, no doubt," says Dr. Rock (*Catalogue* of Textile Fabrics, Victoria and Albert Museum), "was the first country to ornament its silken webs with a pattern. India, Persia and Syria, then Byzantine Greece followed, but at long intervals between, in China's footsteps. Stuffs so figured brought with them to the West the name 'diaspron' or diaper, bestowed upon them at Constantinople. But about the 12th century the city of Damascus, even then long celebrated for its looms, so far outstripped all other places for beauty of design, that her silken textiles were in demand everywhere; and thus, as often happens, traders fastened the name of damascen or damask upon every silken fabric richly wrought and curiously designed, no matter whether it came or not from Damascus."



DETAILS OF A DAMASK DESIGN
The name "damask," originally given to the woven silks of Damascus, today signifies a linen texture elaborately designed in the weaving

The term is perhaps now best known in reference to damask table-cloths, a species of figured cloth usually of flax or tow yarns, but sometimes made partly of cotton. The finer qualities are made of the best linen yarn, and, although the latter is of a brownish colour during the weaving processes, the ultimate fabric is pure white. The high lights in these cloths are obtained by long floats of warp and weft, and, as these are set at right angles, they reflect the light differently according to the angle of the rays of light; the effect changes also with the position of the observer. Subdued effects are produced by shorter floats of yarn, and sometimes by special weaves. Any subject, however intricate, can be copied by this method of weaving, provided that expense is no object. The finest results are obtained when the so-called double damask weaves are used. These weaves are shown under DIE, and it will be seen that each weave gives a maximum float of seven threads. (In some special cases a weave is used which gives a float of nine.)

The small figure here shown to illustrate a small section of a damask design is composed of the two single damask weaves; these give a maximum float of four threads or picks. No shading is shown in the design, and this for two reasons—(1) the single damask weaves do not permit of elaborate. shading, although some very good effects are obtainable; (2) the available space is not sufficiently large to show the method to advantage. The different single damask weaves used in the shading of these cloths appear, however, at the bottom of the figure, while between these and the design proper there is an illustration of the thirty-first pick interweaving with all the 48 threads.

The principal British centres for fine damasks are Belfast and Dunfermline, while the medium qualities are made in several places in Ireland, in a few places in England, and in the counties of Fife, Forfar and Perth in Scotland. Cotton damasks, which are made in Paisley, Glasgow, and several places in Lancashire, are used for toilet covers, table-cloths, and similar purposes. They are often ornamented with cdlours and sent to the Indian and West Indian markets. Silk damasks for curtains and upholstery decorations are made in the silk-weaving centres.

DAMASK STEEL or **DAMASCUS STEEL,** a steel with a peculiar watered or streaked appearance, as seen in the blades of fine swords and other weapons of Oriental manufacture. One way of producing this appearance is to twist together strips of iron and steel of different quality and then weld them into a solid mass. A similar but inferior result may be obtained by etching with acid the surface of a metal, parts of which are protected by some greasy substance in such a way as to give the watered pattern desired. The art of producing damask steel has been generally practised in Oriental countries from a remote period, the most famous blades having come from Isfahan, Khorasan, and Shiraz in Persia.

DAMASUS, the name of two popes.

DAMASUS I., Saint, was pope from 366 to 384. As a deacon he protested against the banishment of Pope Liberius (355), but when the emperor Constantius sent to Rome the anti-pope Felix II., Damasus, with the other clergy, rallied to his cause. When Liberius returned from exile and Felix was expelled, Damasus again supported Liberius. On the death of Liberius (366) he was nominated successor; but the irreconcilables of the party of Liberius set up against him another deacon, Ursinus. A serious conflict ensued which quickly led to rioting. The prefect of Rome recognized the claims of Damasus, and Ursinus and his supporters were expelled. The new pope also secured the sympathy of the people by his zeal in discovering the tombs of martyrs, and in adorning them with precious marbles and monumental inscriptions. The inscriptions he composed himself, in mediocre verse, full of Virgilian reminiscences. In Rome he erected or embellished the church which still bears his name (S. Lorenzo in Damaso).

The West was recovering gradually from the effects of the Arian crisis, and Damasus endeavoured to eliminate from Italy and Illyria the last champions of the council of Rimini. The bishops of the East, however, under the direction of St. Basil, were involved in a struggle with the emperor Valens, whose policy was favourable to the council of Rimini. Damasus, to whom they appealed for help, was unable to be of much service because that episcopal group, viewed askance by St. Athanasius and his successor Peter, was incessantly combated at the papal court by the hatred of Alexandria. The Eastern bishops triumphed in the end under Theodosius, at the council of Constantinople (381), in which the Western church took no part. They were invited to a council at Rome in 382, but few attended.

This council had brought to Rome the learned monk Jerome, for whom Damasus showed great esteem. To him Damasus entrusted the revision of the Latin text of the Bible. A short time before the pope had received a visit from the Priscillianists after their condemnation in Spain and had dismissed them. Damasus died on Dec. 11, 384.

His writings are printed in Migne, *Patrol. Lat.* XIII. ***See*** **also**

Duchesne, *Liber Pontificalis* I. 212; J. Wittig, *Papst Damasus* I. (Rome, 1902) and *Die Friedenspolitik des Papstes Damasus I.* (Breslau, 1912).

DAMASUS II., pope from July 17 to Aug. 9, 1048, was the ephemeral successor of Clement II. His original name was Poppo, and he was bishop of Brixen when the emperor Henry III. raised him to the papacy.

DAME, properly a name of respect or a title equivalent to "lady," now surviving in English as the legal designation of the wife or widow of a baronet or knight, or of a dame of the Order of the British Empire; it is prefixed to the Christian name and surname. It has also been used in modern times by certain societies or orders, *e.g.,* the Primrose League, as the name of a certain rank among the lady members, answering to the male rank of knight. The ordinary use of the word by itself is for an old woman. As meaning "mistress," *i.e.,* teacher, "dame" was used of the female keepers of schools for young children, which have become obsolete since the advance of public elementary education. At Eton college boarding-houses kept by persons other than members of the teaching staff of the school were known as "Dames' Houses," though the head might not necessarily be a lady. As a term of address to ladies of all ranks, from the sovereign down, "Madam," shortened to "ma'am," represents the French *madame,* my lady.

"Damsel," a young girl or maiden, now only used as a literary word, is taken from the O.Fr. *dameisele,* formed from *dame,* and parallel with the popular *dansele* or *doncele* from the M. Lat. *domicella* or *dominicella,* diminutive of *domina.* The French *damoiselle* and *demoiselle* are later formations which developed merely to the title of a young unmarried lady, the *mademoiselle* of modern usage, the English "miss." At the court of France, after the 17th century, *Mademoiselle,* without the name of the lady, was a courtesy title given to the eldest daughter of the eldest brother of the king, known as *Monsieur.* Anne Marie Louise is known to history as *La Grande Mademoiselle.* The English literary form "damosel" was another importation from France in the 15th century. In the early middle ages *damoiseau,* M. Lat. *domicellus, dameicele, damoiselle, domicella,* were used as titles of honour for the unmarried sons and daughters of royal persons and lords *(seigneurs).* Later the *damoiseau* (in the south *donzel,* in Béarn *domengar)* was specifically a young man of gentle birth who aspired to knighthood, equivalent to écuyer, esquire or *valet* (*q.v.*).

DAME'S VIOLET, the name for *Hesperis matronalis,* a biennial herb belonging to the family Cruciferae, and closely allied to the wallflower and stock; called also dame's rocket. It has an erect, stout, leafy stem, 2 to 3 ft. high, with irregularly toothed, short-stalked leaves and white or lilac flowers, $\frac{3}{4}$ in. across, which give off a scent in the evening. The slender pods are constricted between the seeds. The plant is a native of Europe and temperate Asia, and is found in Great Britain and in the eastern United States and Canada as an escape from gardens.

DAMGHAN, town, Iran, in 36° 10′ N., 54° 20′ E., 216 mi. from Tehran, on the high road to Khurasan; elevation 3,737 feet. Pop. 16,500. Damghan was an important city in the middle ages, but there are few remains of that period. Near the city are the remains of Hecatompylos, extending from Frat, 16 mi. S. of Damghan, to near Gúsheh, 20 mi. W. Damghan was destroyed by the Afghans in 1723. Fath Ali Shah was born here in 1772. There is considerable trade in pistachios and almonds, the latter with very thin shells, for which Damghan is famous.

DAMIANI, PIETRO, SAINT (*c.* 1007–1072), celebrated ecclesiastic, was born at Ravenna, and after some years of teaching about 1035 entered the hermitage of Fonte Avellana, near Gubbio, where he became superior some eight years later. He entered into communication with the emperor Henry III., addressed to Pope Leo IX. in 1049 his *Liber Gomorrhianus* denouncing the vices of the clergy, and soon became associated with Hildebrand in the work of reform. As a trusted counsellor of successive popes he was made cardinal bishop of Ostia in 1057, and presided over a council at Milan in 1059. He assisted Alexander II. in his struggle with the anti-pope, Honorius II.; and having served the papacy as legate to France and to Florence, was allowed to resign his bishopric in 1067. After a period of retirement at Fonte Avellana, he proceeded in 1069 as papal legate to Germany, and persuaded the emperor Henry IV. to give up his intention of divorcing his wife Bertha. He died at Faenza on Feb. 22, 1072. Damiani was a determined foe of simony and clerical marriage, and a vigorous controversialist.

His works published by Cardinal Cajetan, 4 vols. (Rome, 1606–15) are reprinted in Migne, *Patrol Lat.* v. 144 and 145. *See* F. Neukirch, *Das Leben des Peter Damiani* (Gottingen, 1875); Kleinermanns, *Der heilige Petrus Damiani* (Steyl, 1882); R. Biron, St. *Pierre Damien* (1908); J. A. Endres, *Petrus Damiani und die weltliche Wissenschaft* (Miinster, 1910).

DAMIEN, FATHER, the name in religion of JOSEPH DE VEUSTER (1840–1889), Belgian missionary, born at Tremeloo, near Louvain, on Jan. 3, 1840. In 1858, he joined the Society of the Sacred Heart of Jesus and Mary (also known as the Picpus Congregation), and while still in minor orders, in 1863 went as a missionary to the Pacific islands, taking the place of his brother, who had been prevented by illness. On reaching Honolulu he was ordained priest in 1864. Struck with the sad condition of the lepers, whom the Hawaiian Government deported to Molokai island, in 1873 he volunteered to take spiritual charge of the settlement. Besides attending to the spiritual needs of the lepers, he managed, by the labour of his own hands and by appeals to the Hawaiian Government, to improve the water-supply, the dwellings, and the victualling of the settlement, and after five years received assistance from other resident priests. He succumbed to leprosy on April 15, 1889. Some ill-considered imputations upon Father Damien by a Presbyterian minister produced a memorable tract by Robert Louis Stevenson *(An Open Letter to the Rev. Dr. Hyde,* 1890).

See *Life and Letters of Fr. Damien,* ed. by his brother, Fr. Pamphile (London, 1889) and M. Quinlan, *Damien of Molokai* (London, 1909), which reproduces Stevenson's letter.

DAMIENS, ROBERT FRANÇOIS (1715–1757), a Frenchman who made an attempt on the life of Louis XV. on Jan. 5, 1757. As the king was entering his carriage, he rushed forward and stabbed him with a knife, inflicting only a slight wound. His mind seems to have been unhinged by the ecclesiastical controversies of the moment. He was condemned as a regicide, and sentenced to be torn in pieces by horses in the Place de Grève. Before being put to death he was barbarously tortured.

See *Pièces originales et procédures du procès fait à Robert François Damiens* (Paris, 1757).

DAMIETTA, a town of Lower Egypt, on the eastern (Damietta or Phatnitic) branch of the Nile, a few miles above its mouth and 125 mi. N.N.E. of Cairo by rail. Pop. (1937) 40,332. The town is built on the east bank of the river between it and Lake Menzala. Though ill-built and partly ruinous, the town possesses some fine mosques, with lofty minarets, public baths and busy bazaars. Along the river-front are many substantial houses with terraces and steps leading to the water. Their wooden lattices of saw-work are very graceful. Once the third town in Egypt, it enjoys now little more than a coasting trade, and ships of over 6ft. draught must anchor in the offing.

Damietta is a Levantine corruption of the Coptic name *Tamiati,* Arabic *Dumyat.* The original town was 4mi. nearer the sea than the modern city. Under the Saracens it had great wealth and commerce, and, as the eastern bulwark of Egypt, was frequently attacked by the crusaders. In June 1249, Louis IX. of France occupied Damietta without opposition, but being defeated near Mansura in the February following, and compelled (April 6) to surrender himself prisoner, Damietta was restored to the Muslims as part of the ransom exacted. To prevent further attacks from the sea the Mameluke sultan Bibars blocked up the Phatnitic mouth of the Nile (about 1260), razed old Damietta to the ground, and transferred the inhabitants to the site of the modern town. Damietta gives its name to dimity, a kind of striped cloth, for which the place was at one time famous. Cotton and silk goods are still manufactured here and there is some trade in rice and salted fish.

DAMĪRĪ, the common name of KAMĀL UD-DĪN MUHAMMAD IBN MŪSĀ UD-DAMĪRĪ (1344–1405), Arabian writer on canon law and natural history; he belonged to one of two towns called Damira near Damietta and spent his life in Egypt. Of the Shafi'ite school of law, he became professor of tradition in the *Rukniyya* at Cairo, and also at the mosque el-Azhar; in connection with this work he wrote a commentary on the *Minhāj ut-Tālibin* of Nawāwi. He is, however, better known in the history of literature for his Life of Animals (*Hayāt ul-Hayawān*), which treats in alphabetical order of 931 animals mentioned in the Koran, the traditions and the poetical and proverbial literature of the Arabs.

The use of the animals in medicine, their lawfulness or unlawfulness as food, their position in folk-lore are the main subjects treated, while occasionally long irrelevant sections on political history are introduced.

Several editions have been made at various times of extracts, among them the poetical one by Suyiiti (*q.v.*), which was translated into Latin by A. Ecchelensis (1667). Bochartus in his *Hierozoicon* (1663) used Damiri's work. There is a translation of the whole into English by Lieutenant-Colonel Jayakar (Bombay, 1906–1908).

DAMJANICH, JÁNOS (1804–1849), Hungarian soldier, was born at Stása in the Banat. On the outbreak of the Hungarian war of independence he was promoted to be a major of the third Honvéd regiment at Szeged, for although he was an orthodox Serb, he was from the first a devoted adherent of the Magyar Liberals. At the beginning of 1849 he was appointed commander of the 3rd army corps in the middle Theiss on account of his reputation for ability and valour. He fought battle after battle, so that after the battle of Isaszeg, Kossuth, at the ensuing review at Gödöllö, expressed the sentiments of the whole nation when he doffed his hat as Damianich's battalions passed bv. Alwavs a fiery democrat, Damjanich uncompromisingly supported the extremist views of Kossuth. and was appointed commander of one of the three divisions which, under Görgei, entered Vácz in April 1849. After the catastrophe of Vilagós, Damjanich surrendered to the Russians, by whom he was handed over to the Austrians, who shot him in the market place of Arad a few days later.

See Ödön Hamvay, *Life* of Jdnos Damjanich (Budapest, 1904).

DAMMAR or **DAMMER,** a resin, or rather series of resins, obtained from various coniferous trees of the genus *Agathis* (*Dammara*). East Indian dammar or cat's eye resin is the produce of Agathis *Dammara,* which grows in Java, Sumatra, Borneo and other eastern islands and sometimes attains a height of 80–100ft. The resin oozes in large quantities from the tree in a soft viscous state, with a highly aromatic odour, which, however, it loses as it hardens by exposure. The resin is much esteemed in oriental communities for incense-burning. Dammar is imported into England by way of Singapore; and as found in British markets it is a hard, transparent, brittle, straw-coloured resin, destitute of odour. It is readily soluble in ether, benzol and chloroform, and with oil of turpentine it forms a fine transparent varnish which dries clear, smooth and hard. The allied kauri gum, or dammar of New Zealand (Australian dammar), is produced by Agathis australis, or kauri-pine, the wood of which is used for wood paving. Much of the New Zealand resin is found fossil in circumstances analogous to the conditions under which the fossil copal of Zanzibar is obtained. Dammar is besides a generic Indian name for various other resins, which, however, are little known in western commerce. Of these the principal are black dammar, yielded by *Canarium strictum* (family Burseraceae) and white dammar, Indian copal, or piney varnish, the produce of Vateria *indica* (family Dipterocarpaceae). Sal dammar is obtained from *Shorea* robusta; *Symplocos* micrantha is the source of rock dammar and other species yield resins which are similarly named and differ little in physical properties.

DAMMARTIN, a small town of France, in the department of Seine et Marne, 22 mi. N.E. of Paris. Pop. (1936) 1,479. Situated on the plateau of la Goele, it is known as Dammartin-en-Goële to distinguish it from Dammartin-sous-Tigeaux, a small commune in the same department. Hugh, the earliest recorded count of Dammartin, made himself master of the town in tne 10th century. His dynasty was replaced by another family in the 11th century. Reynald I. (Renaud), count of Dammartin (d. 1227), who was one of the coalition crushed by Philip Augustus at the battle of Bouvines (1214), left two co-heiresses, of whom the elder, Maud (Matilda or Mahaut), married Philip Hurepel, son of Philip Augustus, and the second, Alix, married Jean de Trie, in whose line the countship was reunited after the death of Philip Hurepel's son Alberic. In the 15th century the countship was acquired by Antoine de Chabannes (d. 1488) by his marriage with Marguerite, heiress of Reynald V. of Nanteuil-Aci and Marie of Dammartin. Antoine de Chabannes fought under the standard of Joan of Arc, became a leader of the *Écorcheurs,* took part in the war of the public weal against Louis XI., and then fought for him against the Burgundians. The collegiate church at Dammartin was founded by him in 1480, and his tomb and effigy are in the chancel. His son, Jean de Chabannes, left three heiresses, of whom the second left a daughter who brought the countship to Philippe de Boulainvilliers, by whose heirs it was sold in 1554 to the dukes of Montmorency. In 1632 the countship was confiscated by Louis XIII and bestowed on the princes of Condé. It was the extreme point of the German drive on Paris in 1914.

DAMME, a decayed city of Belgium (pop. 1,100), 4½ m. N.E. of Bruges, once so important as a commercial port that it had its own maritime law, known as Zeerecht *van Damme.* It is on the canal from Bruges to Sluys (Ecluse), but in the middle ages a navigable channel called the Zwyn connected it with the North sea; the battle of Sluys, in which Edward III. destroyed the French fleet, was fought in 1340 at its mouth. In 1490 a treaty was signed at Damme between the people of Bruges and the archduke Maximilian, and very soon after the channel became completely silted up, and the foreign merchant gilds or "nations" removed to Antwerp. The marriage of Charles the Bold and Margaret of York, sister of Edward IV., was celebrated at Damme on July 2, 1468. The town, although long neglected, preserves some remains of its former prosperity. The tower of Our Lady, dating from 1180, is a landmark across the dunes, and the church, although a shell, merits inspection; out of a portion of the ancient markets a town hall has been constructed; and in the hospital of St. Jan are a few pictures; and in the Place is a statue (1860) to Jacob Van Maerlant, the Flemish poet, who was clerk to the magistrates of Damme in the late 13th century.

DAMOCLES, one of the courtiers of the elder Dionysius of Syracuse. When he spoke in extravagant terms of the happiness of his sovereign, Dionysius is said to have invited him to a sumptuous banquet, at which he found himself seated under a naked sword suspended by a single hair (Cicero *Tusc.* v. 21; Horace Odes, iii. 1, 17; Persius iii. 40).

DAMOH, a town and district of British India, in the Jubbulpore division of the Central Provinces. The town of Damoh is situated on the railway from Katni to Bina, a branch of the G.I.P. railway, 48 m. E. of Saugor. It has small local industries and a large cattle market, and is a distributing and collecting centre for the district. Being situated below rocky hills it is decidedly hot. In pre-railway days its population was about 8,000, which had increased to 17,000 in 1911. In 1921, owing to an epidemic, population fell to 15,296 but was 20,728 in 1931. Damoh was looted by mutineers from Jubbulpore in 1857 and the district office was burnt.

The DISTRICT OF DAMOH is one of the smallest in the Central Provinces, having an area of 2,818 sq.m. and a population of 305,568. It is one of the Vindhyan districts and on the north and north-east borders Bundelkhand. It is drained by the Sonar and Bearma rivers which flow northwards into the Ken, and thus eventually reach the Jumna. The district is mainly wheat producing, but its agriculture is liable to severe vicissitudes of drought and excessive rain, and its population and prosperity have fluctuated greatly. The central plain is rich and fertile but the areas to both the north and south are hilly and jungly. Its people, among whom Lodhis predominate, are turbulent in character. Agricultural losses have been responsible for a condition of indebtedness, for which special measures have at various times

been taken. Dyeing, weaving, pottery and the manufacture of bell-metal utensils are the chief industries. Cattle slaughtering for the export of dried meat, bones, hides, horns and hoofs has been established near Damoh, the old and infirm cattle from long distances being brought in for slaughtering. Except for a little iron ore and sandstone for building, there is no mineral wealth in the district. There are notable temples at Bandakpur and Kundalpur and there are old Hindu and Jain remains at Nohta.

DAMON AND PHINTIAS (not Pythias), Syracusan Pythagoreans, devoted friends. Condemned to death by Dionysius of Syracuse, Phintias begged a short respite that he might arrange his affairs. Damon pledged his life for the return of his friend; and Phintias returned in time. The tyrant released both and begged to be admitted to their friendship (Diod. Sic. x. 4; Cicero, De *Off.* iii. 4j; cp. Hyginus, fab. 257).

DAMOPHON, a Greek sculptor of Messene, who executed many statues for the people of Messene, Megalopolis, Aegium, and other cities of Peloponnesus. Considerable fragments, including three colossal heads from a group by him representing Demeter, Persephone, Artemis, and the giant Anytus, have been found on the site of Lycosura in Arcadia, where there was a temple of the goddess called "The Mistress." They are preserved in part in the museum at Athens and partly on the spot. Hence there arose controversy as to the date of the artist, who was assigned to various periods, from the 4th century B.C. to the 2nd A.D. G. Dickins, however, by the help of inscriptions proved the date to be the 2nd century B.C.

See G. Dickins, *Annual of the British School at Athens* (xii. and xiii.).

DAMP, vapour or mist, and hence moisture. In the vocabulary of coal-miners "firedamp" is marsh gas, which, when mixed with air and exploded, produces "choke damp," "after damp" or "suffocating damp" (carbon dioxide). "Black damp" consists of accumulations of irrespirable gases, mostly nitrogen, which cause the lights to burn dimly, and the term "white damp" is sometimes applied to carbon monoxide. As a verb, the word means to stifle or check, hence damped vibrations or oscillations are those which have been reduced or stopped, instead of being allowed to die out naturally; the "dampers" of the piano are small pieces of felt-covered wood which fall upon the strings and stop their vibrations as the keys rise; and the "damper" of a chimney or flue, by restricting the draught, lessens the rate of combustion.

DAMPIER, WILLIAM (1652–1715), English buccaneer, navigator and hydrographer, was born at East Coker, Somersetshire, in 1652. Raving early become an orphan, he was placed with the master of a ship at Weymouth, in which he made a voyage to Newfoundland. On his return he sailed to Bantam in the East Indies. He served in 1673 in the Dutch War under Sir Edward Sprague, and was present at two engagements (May 28, June 4); but then fell sick and was put ashore. In 1674 he became an under-manager of a Jamaica estate, but continued only a short time in this situation. He afterwards engaged in the coasting trade, and thus acquired an accurate knowledge of all the ports and bays of the island. He made two voyages to the Bay of Campeachy (1675–76), and remained for some time with the logwood-cutters, varying this occupation with buccaneering. In 1678 he returned to England, again visiting Jamaica in 1679 and joining a party of buccaneers, with whom he crossed the Isthmus of Darien, spent the year 1680 on the Peruvian coast, and sacking, plundering and burning, made his way down to Juan Fernandez island. After serving with another privateering expedition in the Spanish Main, he went to Virginia and engaged with a captain named Cook for a privateering voyage against the Spaniards in the South Seas. They sailed in Aug. 1683, touched at the Guinea coast, and then proceeded round Cape Horn into the Pacific. Having touched at Juan Fernandez, they made the coast of South America, cruising along Chile and Peru. They took some prizes, and with these they proceeded to the Galapagos islands and to Mexico, falling in with the latter near Cape Blanco. While they lay here Captain Cook died, and the command devolved on Captain Davis, who, with several other pirate vessels, English and French, raided the west American shores for the next year, attacking Guayaquil, Puebla Nova, etc. At last Dampier, leaving Davis, went on board Swan's ship, and proceeded with him along the northern parts of Mexico as far as southern California. Swan then proposed, as the expedition met with "bad success" on the Mexican coast, to run across the Pacific and return by the East Indies. They started from Cape Corrientes on March 31, 1686, and reached Guam in the Ladrones on May 20; the men, having come almost to an end of their rations, had decided to kill and eat their leaders next, beginning with the "lusty and fleshy" Swan. After six months' drunkenness and debauchery in the Philippines, the majority of the crew, including Dampier, left Swan and thirty-six others behind in Mindanao, cruised (1687–1688) from Manila to Pulo Condore, from the latter to China and from China to the Spice Islands and New Holland (the Australian mainland). In March 1688 they were off Sumatra, and in May off the Nicobars, where Dampier was marooned (at his own request, as he declares, for the purpose of establishing a trade in ambergris) with two other Englishmen, a Portuguese and some Malays. He and his companions contrived to navigate a canoe to Achin in Sumatra; but the fatigues and distress of the voyage proved fatal to several and nearly carried off Dampier himself. After making several voyages to different places of the East Indies (Tongking, Madras, etc.), he acted for some time, and apparently somewhat unwillingly, as gunner to the English fort of Benkulen. Thence he ultimately contrived to return to England in 1691.

In 1699 he was sent out by the English Admiralty in command of the "Roebuck," especially designed for discovery in and around Australia. He sailed from the Downs on Jan. 14, with twenty months' provisions, touched at the Canaries, Cape Verdes and Bahia, and ran from Brazil round the Cape of Good Hope direct to Australia, whose west coast he reached on July 26, in about 26° S. Anchoring in Shark's Bay, he began a careful exploration of the neighbouring shore-lands, but found no good harbour or estuary, no fresh water or provisions. In September, accordingly, he left Australia, recruited and refitted at Timor, and thence made for New Guinea, where he arrived on Dec. 3. By sailing along to its easternmost extremity, he discovered that it was terminated by an island, which he named New Britain (now Neu Pommern), whose north, south and east coasts he surveyed. That St. George's bay was really St. George's channel, dividing the island into two, was not perceived by Dampier; it was the discovery of his successor, Philip Carteret. Nor did Dampier visit the west coast of New Britain or realize its small extent on that side. He was prevented from prosecuting his discoveries by the discontent of his men and the state of his ship. In May 1700 he was again at Timor, and thence he proceeded homeward by Batavia (July 4–Oct. 17) and the Cape of Good Hope. In February 1701 he arrived off Ascension island, when the vessel foundered (Feb. 21–24), the crew reaching land and staying in the island till April 3, when they were conveyed to England by some East Indiamen and warships bound for home. In 1703–1707 Dampier commanded two Government privateers on an expedition to the South Seas with grievous unsuccess; better fortune attended him on his last voyage, as pilot to Woodes Rogers in the circumnavigation of 1708–1711. On the former venture Alexander Selkirk, the master of one of the vessels, was marooned at Juan Fernandez; on the latter Selkirk was rescued and a profit of nearly £200,000 was made. But four years before the prize-money was paid Dampier died (March 1715) in St. Stephen's parish, Coleman street, London. Dampier's accounts of his voyages are famous. He had a genius for observation, especially of the scientific phenomena affecting a seaman's life; his style is usually admirable—easy, clear and manly. His knowledge of natural history, though not scientific, appears surprisingly accurate and trustworthy. (C. R. B.)

See Dampier's *New Voyage Round the World* (1697); his *Voyages and Descriptions* (1699), a work supplementary to the *New Voyage;* his *Voyage to New Holland in . . . 1699* (1703, 1709); *Dumpier's Voyages* (ed. J. Masefield, 1906); W. C. Russell, *William Dumpier* ("English Men of Action," 1889); also Funnell's Narrative of the Voyage of 1703–1707; Dampier's *Vindication of his Voyage* (1707); Welhe's *Answer to Captain Dumpier's Vindication;* Woodes Rogers, *Cruising Voyage Round the World* (1712).

DAMROSCH, LEOPOLD (1832–1885), German-American musician and conductor, born in Posen, Prussia, Oct. 22, 1832. In early life a physician, he became konzertmeister at Weimar, then conductor of the Philharmonic Society at Breslau; he went to America as conductor at the Metropolitan Opera House and founded the Oratorio Society, New York, 1874, the New York Symphony Society, 1878, etc.

His son, WALTER JOHANNES DAMROSCH (1862–), American musician and conductor, was born at Breslau, Germany, Jan. 30, 1862. He went to America in 1871, and ten years later began his career as conductor in Newark, New Jersey. On the death of his father in 1885, he was appointed conductor of the Metropolitan Opera House, the New York Symphony Society and the Oratorio Society. In 1894 he founded the Damrosch Opera Company for producing Wagner and in 1896 produced Wagner's Parsifal in concert form for the first time in the United States. In 1903 he was appointed director of the New York Symphony Orchestra, remaining conductor up to Feb. 1927. He was then appointed musical adviser to the National Broadcasting Company, informal lectures on Wagner with music having developed into lecture recitals over the radio. His compositions include The Scarlet Letter (1894); Cyrano (1913); and music for Euripides' Media, *Iphigenia in Aulis* (Berkeley, 1911) and Sophocles' Electra (1917). He wrote an autobiography, *My Musical Life* (1923).

Another son, FRANK HEINO DAMROSCH (1859–1937), was born at Breslau. He became in 1905 director of the Institute of Musical Art, New York city, and wrote a Popular Method of *Sight Singing* and *Some Essentials in* the Teaching of *Music*.

DAMS. From immemorial times dams have been constructed of earth and masonry for the purpose of forming reservoirs for the storage of water to ensure regular supplies to communities for domestic purposes and for irrigation. There are records of a huge earthen dam on the Tigris and a large masonry darn on the river Nile, built almost in prehistoric times, which remained in service for incredibly long periods, and the Romans built numerous massive masonry dams in Italy and northern Africa. All the early masonry dams were characterized by excessive width of base usually three to four times the height.

The production of hydro-electric energy and the application of irrigation on a large scale are two forms of development which have expanded very rapidly in the 20th century in countries having the requisite conditions and resources and in many cases have involved enormously greater storage of water than that required for even the largest towns. The progress in scientific design and in magnitude of dam structures has been correspondingly extensive, and new types of structure have been introduced to meet the call for greater economy in a class of work which is seldom cheap.

Types of Dams.—The principal types are (a) earth dams, (b) solid masonry or concrete gravity dams, (c) rock-fill dams, (d) single horizontal arch, (e) multiple buttress dams, (f) timber dams, (g) steel dams.

While types (a), (b), and (f) have been used from antiquity, the others are products of the 19th and 20th centuries.

Earth Dams.—Earth dams are largely used on account of their permanence and cheapness and convenience of construction where suitable material is available in the vicinity. Security depends on the construction being adequately watertight to prevent scouring away of any of the earth by water passing through the dam, and on the installation of a spillway and spillway channel formed in masonry concrete or rock sufficient to pass the maximum flood without allowing any water to pass over the top of the earth bank. Water passing over the top would form ruts on the outer slope which would rapidly develop into a breach. Passage of water through the dam is usually prevented by the provision of a watertight core in the centre of the embankment extending from end to end of the dam and carried down in a trench below the ground surface until an impermeable stratum is reached. Although the best arrangement of materials consists of a core of fine impermeable silt or clay flanked on each side by coarse free draining sand or gravel, dams have been built entirely of fine material when coarse material was unavailable. When built of coarse materials, a central corewall of concrete or steel or an impervious apron on the up-stream face of the dam is required. Corewalls are not now in general use on large dams.

The slopes of the embankment vary according to the height of the dam and the nature of the material. Generally the slope next the water is made rather flat, frequently from 1:23 to 1:3½ while the outer slope is somewhat steeper, 1:2 to 1:3. In high dams the slopes in the lower part are flattened out still more as compared with the upper part and in all cases the water slope must be protected by stone or concrete paving or beaching sufficiently massive to withstand wave action and prevent the earth of the embankment from being disturbed.

FIG. 1.—CROSS-SECTION OF THE DAVIS BRIDGE DAM, VERMONT

Earth dams are constracted either by the rolled fill or the hydraulic fill methods For the former. the material is placed in the dam in layers, each layer being well compacted by special rollers. For the latter, ihe material is hauled or sluiced to the dam and washed into place, the fines depositing in the centre.

Fig. 1 shows a cross-section of the Davis Bridge hydraulic fill dam in Vermont, 200ft. high, with an earthworks volume of 1,900,000 cu yd., which was constructed in less than two years by this method

Rock-fill Dams.—A rock-fill dam depends for its stability on an embankment of tipped rock material and for its watertightness on a skin of reinforced concrete laid on a derrick-placed or hand-built water face and carried down in the form of a vertical cut-off wall to an impervious stratum. Lack of suitable earth material and excessive cost of concrete lead to consideration of the rock-fill type of dam. The embankment is usually formed with rock of all sizes as blasted from the quarry, the outer face being roughly built to a plain surface with large blocks and the inner face more carefully and solidly built to a uniform surface and formed with grooves or keyways to furnish a grip for the concrete. Care in constructing the hand-built face reduces somewhat the effect of the considerable settlement which is typical of rock-fill dams following construction The skin concrete must be well built to withstand this settlement as well as any possible wave action. The water face is steep (sometimes 1:1 or steeper) to minimize the quantity of materials, the outer face being generally somewhat flatter, about 1·25:1 or slightly flatter.

The largest dam of this type yet constructed is the Salt Springs darn in California, built 1929–31. This has a height of 328ft. and a volume of rock-fill of 3,000,000 cubic yards. The upstream slope averages 1·3:1 and is slightly concave to avoid any tendency toward buckling. Downstream, the slope averages 1·4:1. A thick layer on the upstream face was of derrick-placed large stones, while the rest of the material was side-tipped from trains. The watertight skin of reinforced concrete varies in thickness from 1ft at the top to 3ft. at the bottom.

Gravity Dams.—Though dams of massive masonry have been used for thousands of years it was not till the 19th century that a proper scientific basis for design was developed by Prof. Rankine and others so that the width could be reduced from three to four times the height to something less than the height. The tendency in gravity dams is to use the simple triangular form for even the highest dam and to use concrete to the exclusion of masonry. The triangular form gives a uniform stability condition at any horizontal section, and the maximum stresses in the material are directly proportional to the depth below H.W.L. Assuming a usual inclination of the waterface, say 1:20, and concrete of normal density, the necessary inclination of the outer face will depend on the amount of upward water pressure on the base. If by means of effective drainage arrangements upward pressure is

WATER SUPPLY DAMS FOR IRRIGATION PROJECTS

1. Roosevelt dam, Salt River irrigation project, Arizona. Curved gravity type of storage dam showing spillways at either side and discharge pipes at base of dam. Built in a narrow gorge, each end of dam is supported by natural rock abutments. Masonry is curved to natural radius ot a circle

2. Elephant Butte dam, Rio Grande irrigation project, New Mexico. Concrete gravity type of storage dam, built in triangular form with outlet at base. Construction is thickest at base, where water pressure is heaviest, tapering to width of roadway at the top of dam. Dimensions are determined by amount of water and rate of discharge

eliminated, an outer slope of about 0·65:1 will suffice. If the conditions require an allowance of upward water pressure on the base varying from the full head at the inner face to zero at the outer face, the outer slope will require to be about 0·80:1. If, in addition, it is necessary to allow for heavy ice pressure at the top of the wall, still greater slope, up to 0·85:1, will be required. These dimensions ensure that the resultant will pass within the

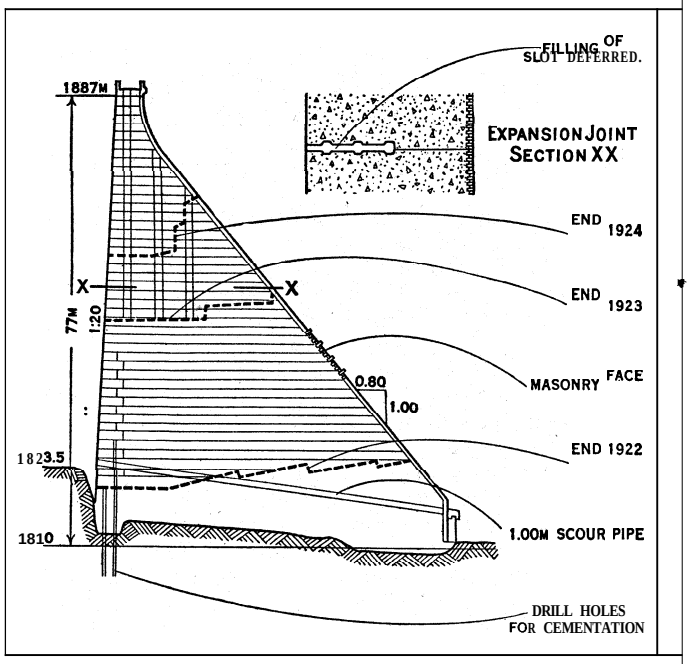

FIG. 2.— CROSS-SECTION OF BARBERINE DAM. SWITZERLAND

middle third, so that there will be no tension on the concrete. A dam having a height in excess of about 300ft. requires a flatter face in the lower part in order to spread the footing and keep the intensity of pressures within permissible limits. For some foundation conditions further precaution must be taken to avoid the possibility of the dam sliding on the foundation. For this purpose keys are constructed on the base of the dam, the depth of the key depending on the condition of the rock in the foundation.

To reduce tendency of the concrete to crack due to temperature changes and shrinkage, modem practice requires as lean a mix of concrete as is practical. However, some specifications require

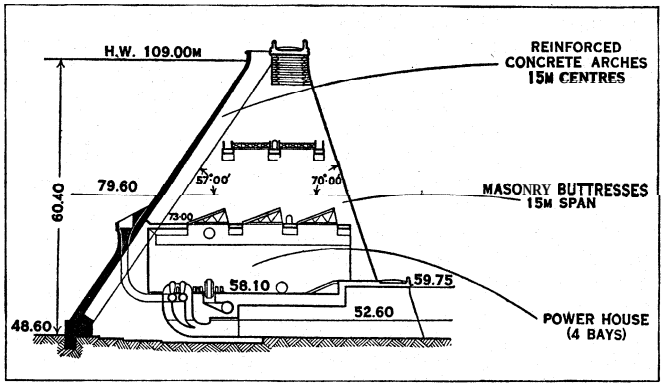

FIG. 3.— CROSS-SECTION OF THE TIRSO DAM. SARDINIA

a rich concrete mixture on the outer faces to ensure durability against weathering. The proportion of cement to mixed aggregate may vary from 4 cwt. or less per cu.yd. for the body of the dam to about 5 cwt. on the faces.

The Barberine dam in Switzerland, completed 1925, and shown in cross section in fig. 2 illustrates the application of the triangular form, together with excellent arrangements for sealing the base by cement grouting in drill holes, and for providing for expansion and shrinkage in the upper part. The dam is of concrete with mixtures varying from 250 to 300 kg. of cement per cu.m., is without drainage arrangements and is designed for water uplift on the base varying from full-head at the inside to zero at the outside. The slope of the waterface is 1:20 and of the outer face 0·80:1. The section indicates an infrequent masonry facing of gneiss applied on the outer slope, which has a southern exposure and is subject to severe temperature variations.

The highest dam of this type yet projected is the Shasta dam of the Central Valley reclamation project which is to have a maximum height of 560ft., a downstream slope of 0·80:1 and will contain over 5,500,000 cu.yd. of concrete. The reservoir with a capacity of 4,500,000 ac.ft. will be one of the largest.

Horizontal Arch Dams.—The horizontal arch dam is suitable only for narrow gorges with sound rock at the sides to resist the great thrust from the abutments. Each horizontal section of the dam tends to act as an arch spanning the gorge. The fact that the dam is in contact with the bottom of the gorge-alters this tendency and part of the water load is resisted by a vertical cantilever action. This combined action produces stresses which are exceedingly complicated, and requires for accurate determination of stress the use of the trial load method of analysis which necessitates more calculations than any other type of dam. Considerable information was obtained in 1926 by construction of an experimental arch dam on Stevenson creek, California. A plan, profile, and cross-section of the dam is shown in fig. 5. The thickness of this experimental dam is much less than used for practical cases because of the very low safety factor used in its design.

The first arch dams were constructed generally with a constant radius throughout, with a resulting variation in the central angle. Increased economy in concrete can be obtained by Jorgensen's

FIG. 4.— PLAN OF LAKE PLEASANT (ARIZ.) MULTIPLE-ARCH DAM. SHOWING: ABOVE. SIDE ELEVATION OF HIGHEST BUTTRESS AND. BELOW. A SECTION THROUGH THE ARCHES AND HOLLOW BUTTRESSES

constant angle system of construction whereby the radius of the arch increases from the bottom of the dam to the top in accordance with the varying width of the gorge. The largest dam of this type, constructed in 1934, is the Sautet dam on the Drac river, a tributary of the Rhone river, with a maximum height of 414ft., thickness varying irregularly from 8ft. at the top to 56ft. at the bottom and radius of the water face varying from 230ft. at the top to about 85ft. at the bottom.

Multiple Buttress Dams.—In multiple buttress dams the water load may be supported and transferred to the buttresses either by reinforced flat slabs or by arches. With flat-slab construction a spillway section can readily be formed by providing flat slabs also on the outer face, formed to a suitable spillway

curve. The Junction Brook main dam of the Newfoundland Power and Paper company is of this type and about 1,000 ft. long and 75 ft. high and carries a single-line railway. The buttresses, spaced at 18 ft. centres, are of plain concrete from 16 in. to 44 in. thick. The slabs vary from 16 in. to 47 in. in thickness and are heavily reinforced as simple beams to support the water pressure. Flat slabs form an uneconomical type of construction for support of heavy water pressures as compared with arches and entail a multiplicity of buttresses with close spacing, the practicable maximum being about 20 feet.

In multiple arch dams the buttress spacing may be from 15 to 60 ft. depending on the general height of the dam. The highest multiple arch dam constructed in Europe to 1940 is the Tirso dam in Sardinia. The buttresses, spaced at 50 ft. centres, are of masonry with courses sloped at the outer face to suit the direction of maximum pressure and are designed to be independently stable and safe under the maximum loadings transmitted to them by the arches. The arches are of concrete, nearly semi-circular, lightly reinforced for temperature and shortening stresses, and have a thickness varying from 20 in. at top to $5\frac{1}{2}$ ft. at bottom.

The dam provides storage for the triple purposes of power production, irrigation, and river regulation, the power house being worked into the space between the buttresses.

The highest dam of this type constructed in the United States to 1940 is Bartlett dam in Arizona which has a maximum height of 273 feet. Arches and buttresses are of reinforced concrete with a centre to centre spacing of 60 ft. and the buttresses have an overall thickness of 22 ft. but are of cellular construction with double walls. Vertical and horizontal sections of a dam of this type are shown in fig. 4.

Flood Gates.—Special circumstances arise in regard to dams on large rivers, whether installed for purposes of irrigation or for the generation of hydro-electric power. It is generally necessary to control within close limits the flood and backing-up height above the dam, so that provision must be made for passing very large volumes of flood water. The circumstances are accentuated where a large part of the wet season flow of a river carrying much silt has to be stored to give a regulated supply during the dry season. For all such cases movable openings are necessary on a scale commensurate with the flood or maximum flow conditions and where close regulation is essential a series of large steel gates, usually of such weight as must be operated by machinery is most commonly used. The Aswan dam on the Nile (Plate I, fig. 4) has a length across the river of 6,400 ft., with a maximum height of 175 ft. and forms an irrigation storage reservoir with a capacity of over 4,000,000 acre feet. Water is shown being discharged from several of the many large sluice openings.

The Dnieprostroi dam on the Dnieper river, built for the soviet government, is the largest low head dam in the world constructed for hydro-electric power purposes. Gate and spillway arrangements are provided on a scale sufficient to pass a flood of 1,250,000 cusecs. Power can be developed up to 560,000 kw.

For the extreme case of a river transporting great quantities of silt where the barrage must not be allowed to become a trap for the settlement and accumulation of large quantities of material brought down during high floods, a continuous series of gates is used extending from bank to bank and having their sills at the river bed. The gates are separated by piers, usually of concrete. which must be capable of supporting the maximum water load from a panel of the barrage as well as the erections and machinery for operating the gates. The gates are fully opened to pass the first part of the wet season flood and scour the reservoir bed clean, and closed in time to conserve the later and cleaner part of the flow. The Vaal river barrage is an interesting example of this type of dam, on a river whose annual silt burden is estimated at 1,200,000 tons and maximum flood flow 187,000 cusecs.

(J. WI.; W. P. C.)

Boulder Dam.—Harnessing one of the world's great sources of hydro-electric power, the Colorado river, Boulder dam towers 727 ft. above the canyon floor, the highest dam in the world. Originally proposed as a concrete horizontal arch, the dam was finally built as a solid concrete gravity type, curved in plan. Its crest length is 1,282 ft. and it contains 3,241,553 cu.yd. of concrete. The great size of the dam required that it be built in vertical blocks rather than as one solid mass. One of the problems in constructing such large masses of concrete was the dissipation of the heat generated by the hydration of the cement in order to prevent any large amount of expansion and contraction after the concrete had taken its initial set. For this purpose more than 570 mi. of 1 in. tubing was buried in the concrete and refrigerated water pumped through it.

The concrete for the dam was supplied by eight mixers, each with a capacity of four cubic yards. These were located in two plants, one in the canyon for the lower half of the structure, and the other on the canyon rim for the remainder. Construction was facilitated by the erection of a huge cableway suspended over the site for transfer of concrete and other construction materials to all parts of the dam.

An important phase of this great task was the excavation of four large tunnels, 50 ft. in diameter, for diverting the river around the site while the dam was being built. The tunnels, two in each canyon wall, were bored through the solid rock for a combined distance of 15,946 feet.

In spite of its magnitude, completion of the dam was effected March 1, 1936, more than two years ahead of schedule and requiring less than five years for its construction. Built for flood control, irrigation, and power development, Boulder dam stores more than 30,000,000 ac.ft. of water and will produce some 4,330,000,000 kilowatt-hours of firm power annually.

Grand Coulee Dam.—Surpassing even Boulder, the dam on the Columbia river at Grand Coulee is the largest masonry structure ever erected by man. Its 11,250,000 cu.yd. of concrete will be more than two-and-a-half times the size of Boulder dam and about seven times the great Cheops pyramid in Egypt. Unlike the pyramids, however, this structure is conceived as a great social benefit. Some 10,000 families will find new homes on the 1,200,000 acres which will be irrigated by the great dam.

Grand Coulee dam is situated at a point where a glacier once dammed up the river forcing it to find a new course. Later the glacier receded and the river returned to its original bed 600 ft. below, leaving a dry canyon 50 mi. long and 2 to 5 mi. wide, now known as Grand Coulee. Part of the hydro-electric power generated at this dam will be used to pump water from the reservoir behind the dam into another reservoir which will be created in the

U. S. GOVERNMENT PROJECTS

1. The downstream face of Norris Dam, near Knoxville, Tenn., as seen from the west bank of the Clinch river
2. Boulder Dam, Colorado river, on the border of Arizona and Nevada. The dam is 727 ft. high
3. Bonneville Dam, Columbia river, 42 miles east of Portland, Oregon
4. An artist's conception of the Grand Coulee Dam, Columbia river, in the State of Washington. This structure, nearly three-quarters of a mile long, will be approximately 550 feet high. The regulated Columbia river will flow over the central section of the dam, the water surface being raised 355 feet. At the right can be seen the permanent Government city, Coulee Dam, Washington

upper end of the Grand Coulee by constructing two earth and rock-fill dams across it. This will involve lifting the water a maximum of about 370 feet. From this reservoir the water will flow through approximately 250mi. of main canal to irrigate the fertile basin of the Columbia river in the area known as the Big Bend. The Grand Coulee dam is 550ft. high, with a base width of 480ft. at its maximum section. Its total length is 4,500ft. with 1,650ft. of this used as a spillway capable of passing a flood of 1,000,000 cu.ft. per second. Such a flood would create a fall of water 5 times the average flow of Niagara Falls and 3 times as high.

The tremendous size of the dam presented the same construction problems as did Boulder, with the dam built in individual vertical blocks, usually about 50ft. square. Cooling water was circulated through 2,200mi. of 1 in. tubing. A unique construction feature was the use of a system of long conveyor belts to transport materials from the excavation and to deliver concrete aggregates.

Assisting materially in flood control and river regulation, Grand Coulee dam has a storage capacity of 9,610,000 acre feet. Ultimately nine generators will be housed in each of the two power plants at the dam. Their total capacity will be 2,550,000 horsepower. The energy from six of the generators in the plant on the west side of the river is to be used for pumping. The remainder is to be sold to the market that is expected to develop when the irrigated land comes into use. The generators are expected to produce over 8,100,000,000 kilowatt-hours of firm power annually.

Fort Peck Dam.—The largest dam in the world, Fort Peck, begun in 1934 and requiring six years for completion, is on the Missouri river in Montana. Built for purposes of flood control and power development, it has a maximum height of 242ft., a crest length of 9,000ft. and contains 100,000,000 cu.yd. of earth fill placed hydraulically. Four large dredges were built at the dam for purposes of dredging material from the valley bottom and pumping it into place on the dam through steel pipe lines 28in. in diameter and 5mi. long at certain stages of construction.

On Sept. 22, 1938, with over 95% of the fill completed, there occurred a considerable movement of the material in the upstream face of the dam near the east abutment, involving approximately 5,000,000 cu.yd. of fill. The damaged portion was entirely removed and rebuilt causing a delay of over a year in the final completion time of the structure.

Fort Peck will store 19,500,000 ac.ft. of water, exceeded only by Lake Mead, the storage reservoir created by Boulder dam.

Timber and **Steel** Dams.—Mention should be made of the relatively less important dams of steel and timber. The former type is in general similar to the multiple buttress type of concrete dam previously described, in that the water load is supported by steel decks resting on steel frames. Timber dams are sometimes built in the same manner but more frequently are rock filled cribs with timber decks. They are numerous but usually quite small and often only temporary, as for some major logging operation or for a cofferdam. Few steel dams have been built, probably due to lack of confidence in their permanence. Three large steel dams were constructed about 1900, but after one of these failed, although its destruction was attributed to a foundation failure and not in any way connected with the fact that it was built of steel, it was replaced by a concrete dam and since then none of any importance has been erected.

DAN, a tribe of Israel named after a son of Jacob and Bilhah, the maid of Rachel. The earlier home of the tribe was to the west of Judah, where it seems that they occupied the sea coast, covering the caravan routes, where the weakness of the later kings of the Egyptian 18th dynasty made it possible for them freely to plunder travellers (Judges v. 17; Gen. xlix.). The Philistine settlements naturally came into contact first with this tribe, and in the days of Samson their territory was reduced to small compass, embracing only the neighbouring villages of Zorah and Eshtaol. The story of Samson gives us traditions of the struggle which ended in the expulsion of the Danites. In Judges xvii. seq. we have the narrative of their migration to a new site in the far north. This was their home during the whole period of the northern monarchy, and their settlement centred round one of the most famous sanctuaries in Israel. The fact that several of the famous Israelite artists (especially in metal) are connected with the tribe of Dan (cf. *e.g.*, Exod. xxxi. 6; II Chron. ii. 13 seq.) has suggested that early tradition connected Dan with the Calebites and Kenites.

In the monarchic period the importance of Dan is almost entirely religious. It was a home of bull worship, and tradition ascribes the introduction of this cult to Jeroboam I. (I Ki. xii. 28–30), but the shrine is far older, and its priesthood traced its descent from Moses himself (Judges xviii. 30). Dan was subsequently either regarded as the embodiment of wickedness or entirely ignored (the list of the redeemed in Rev. vii. 5–8 omits the tribe of Dan altogether). Late speculation that the Antichrist should spring from it appears to be based upon an interpretation of Gen. xlix. 17.

DAN, a light-skinned patrilineal people (formerly cannibal) sometimes known as the Jula cannibals, on the French Ivory coast and in Liberia in the basin of the upper Kavally. The villages are independent. Family property is joint with individual ownership of personal possessions. They practise husbandry and arboriculture (millet, yam, kola, coco-nut oil and rubber). They are animists and practise ordeal by poison and by boiling oil.

See M. S. Vendeix, "Ethnographie du Cercle de Man, Côte d'Ivoire," *Revue Ethn.* et *Trad.* pop. (1924).

DAN, a town which marked the northern limit of Palestine reckoned "from Dan to Beersheba." It is now identified with Tell-el-Kadhi, a mound 4 m. west of Banias, in a jungle of rank vegetation. From its western base issues a mighty fountain (Leddan), the largest of the sources of the Jordan. Laish, or Leshem (Judges xviii.), was its name prior to its conquest by migrating Danites and it formed, seemingly, a colony or dependence of Sidon. Here the Danites set up Micah's graven image (Judges xviii. 30f.), and Jeroboam erected one of his golden calves (1. Ki. xii. 29). Its name disappears from history with its capture by Ben-Hadad of Damascus (1. Ki. xv. 20). An attempt has been made to locate Dan at Bāniās based on a direct statement of Theodore and a vague allusion of the Jerusalem Talmud; but it has against it the definite testimony of Josephus (*Antiq.* i. 10. i. etc.) and that of Eusebius and Jerome (*Onom.* Sac.) as well as the evidence from the survival of the name (both Dan and Kadhi signify judge). Tell-el-Kadhi is now in British Mandated Territory. A preliminary survey of the mound for excavation purposes has been made since the World War.

DANA, CHARLES ANDERSON (1819–1897), American journalist, was born in Hinsdale, N.H., on Aug. 8, 1819. In 1839 he entered Harvard, but the impairment of his eyesight in 1841 forced him to leave college. From Sept. 1841 until March 1846 he lived at Brook Farm (*q.v.*), where he was made one of the trustees. He had previously written for the Harbinger, the Brook Farm organ, and had written as early as 1844 for the Boston Chronotype. In 1847 he joined the staff of the New York Tribune, and in 1848 he wrote from Europe letters to it on the revolutionary movements of that year. Returning lo the Tribune in 1849, he became its managing-editor, and in this capacity actively promoted the anti-slavery cause. In 1862 his resignation was asked for, apparently because of wide temperamental differences between him and Greeley. Secretary of war Stanton immediately made him a special investigating agent of the war department; in this capacity Dana spent much time at the front, and sent to Stanton frequent reports. He went through the Vicksburg campaign and was at Chickamauga and Chattanooga, and urged the placing of Gen. Grant in supreme command of all the armies in the field. In 1864–65 Dana was second assistant-secretary of war. He became the editor and part-owner of the New York Sun in 1868, and remained in control of it until his death. Under Dana's control the Sun opposed the impeachment of President Johnson; it supported Grant for the presidency in 1868; it was a sharp critic of Grant as president; and in 1872 took part in the Liberal Republican

revolt and urged Greeley's nomination. It favoured Tilden, the Democratic candidate for the presidency, in 1876, opposed the Electoral Commission acd continually referred to Hayes as the "fraud president." In 1884 it supported Benjamin F. Butler, the candidate of Greenback-Labor and Anti-Monopolist parties, for the presidency, and opposed Blaine (Republican) and even more bitterly Cleveland (Democrat); it supported Cleveland and opposed Harrison in 1888, and in 1896, on the free-silver issue, it opposed Bryan, the Democratic candidate for the presidency. Dana's literary style came to be the style of the *Sun*—simple, strong, clear, "boiled down." *The Art of Newspaper Making,* containing lectures which he wrote on journalism, was published in 1900. With George Ripley he edited *The New American Cyclopaedia* (1857–63), reissued as the *American Cyclopaedia* in 1873–76. He edited an anthology, *The Household Book of Poetry* (1857). Dana's *Reminiscences of the Civil War* was published in 1898, as was his *Eastern Journeys, Notes of Travel.* He died at Glen Cove, Long Island, N.Y., on Oct. 17, 1897.

See James Wilson, *The Life of Charles A. Dana* (1907); and Frank M. O'Brien, *The Story of the "Sun," New York, 1833–1918* (1918).

DANA, FRANCIS (1743–1811), American jurist, was born in Charlestown (Mass.), June 13, 1743. He graduated at Harvard in 1762, was admitted to the bar in 1767, became a leader of the Sons of Liberty, and in 1774 was a member of the first provincial congress of Massachusetts. He was a member of the Massachusetts Executive Council (1776–80) and a delegate to the Continental Congress (1776–78). In the autumn of 1779 he was appointed secretary to John Adams, who had been selected as minister plenipotentiary to negotiate treaties of peace and commerce with Great Britain, and in Dec. 1780 he was appointed diplomatic representative to the Russian Government. He remained at St. Petersburg from 1781 to 1783, but was never formally received by the empress Catherine. In 1784 he was again chosen a delegate to Congress, and in 1785 he became a justice of the Massachusetts supreme court, over which he presided (1791–1806) with ability and distinction. He was an earnest advocate of the adoption of the Federal constitution, was a member of the Massachusetts convention which ratified that instrument and was one of the most influential advisers of the leaders of the Federalist party. He died at Cambridge (Mass.), April 25, 1811.

His son, RICHARD HENRY DANA (1787–1879), was born in Cambridge (Mass.), Nov. 15, 1787. After graduation from Harvard in 1808 he was admitted to the bar; but literature was his absorbing interest. From 1815 until 1821 he was associated with Jared Sparks and Edward T. Channing in the editorial control of the *North American Review,* and in 1821–22 he put forth a miscellany, *The Idle Man.* He published his first volume of *Poems* in 1827; and in 1833 appeared his *Poems and Prose Writings,* republished in 1850 in two volumes. An English edition, *The Buccaneer and Other Poems,* was issued in 1844. Dana died in Boston, Feb. 2, 1879.

RICHARD HENRY DANA (1815–1882), son of the last-mentioned, was born in Cambridge (Mass.), Aug. 1, 1815. He entered Harvard in the class of 1835, but an illness affecting his sight necessitated a suspension of his college work, and in Aug. 1834 he shipped before the mast for California, returning in Sept. 1836. This voyage was really a turning point in his career, renewing his health, turning him into a self-reliant, energetic man with broad interests and keen sympathies, and giving him the material for his *Two Years before the Mast* (1840), one of the best American books on the sea. Not only is this still widely read at home and abroad, but it also has historic significance. It created interest in California prior to the gold rush; with Melville's *White Jacket* (1850) it led to reforms in the treatment of sailors; and it vividly preserves a bygone epoch. Before the publication of his book, Dana had completed his legal training at Harvard, and he now began the practice of law, his former experience immediately bringing him a large number of maritime cases. In 1841 he published *The Seaman's Friend,* republished in England as The *Seaman's Manual,* a useful and readable book. In spite of the ostracism and danger it involved, Dana became prominently associated in 1848, with the Free Soil movement and volunteered his services for negroes seized under the Fugitive Slave Act. In 1857 he became a regular attendant at the meetings of the famous Boston Saturday club, to the members of which he dedicated his account of a vacation trip, *To Cuba and Back* (1859). He returned to America from a trip round the world in time to participate in the presidential campaign of 1860, and after Lincoln's inauguration he was appointed United States district attorney for Massachusetts. In this office in 1863 he won before the Supreme Court of the United States the famous prize case of the "Amy Warwick," on the decision in which depended the right of the Government to blockade the Confederate ports without giving the Confederate States an international status as belligerents. He brought out in 1865 an edition of Wheaton's *International Law,* his notes constituting a most learned and valuable authority on this subject and its bearings on American history and diplomacy; but Dana was charged by the editor of two earlier editions, William Beach Lawrence, with infringing his copyright, and was involved in litigation for 13 years. Dana's political aspirations were largely frustrated. He declined the position of United States district judge, but he became a member of the Massachusetts house of representatives (1867–68), and in 1867 was retained, with William M. Evarts, to prosecute Jefferson Davis, whose admission to bail he counselled. Although the Senate refused to ratify Grant's nomination of him for minister to England, he was, in 1877, one of the counsel for the United States before the commission that met at Halifax, N.S., to arbitrate the fisheries question between the United States and Great Britain. In 1878 he gave up his law practice, and he devoted the rest of his life to study and travel. He died in Rome, Italy, Jan. 6, 1882.

For the elder Richard Henry Dana, *see* J. G. Wilson, *Bryant and His Friends* (1885). For the younger, *see* C. F. Adams, *Richard Henry Dana: a Biography* (1890) and *Exercises . . . Celebrating the One Hundredth Anniversary of the Birth of Richard Henry Dana* (Cambridge, 1916).

DANA, JAMES DWIGHT (1813–1895), American geologist, mineralogist and zoologist, born in Utica, New York, on the 12th of February 1813. He early displayed a taste for science, which had been fostered by Fay Edgerton, a teacher in the Utica high school, and in 1830 he entered Yale College, in order to study under Benjamin Silliman the elder. Graduating in 1833, for the next two years he was teacher of mathematics to midshipmen in the navy, and sailed to the Mediterranean while engaged in his duties. In 1836–37 he was assistant to Professor Silliman in the chemical laboratory at Yale, and then, for four years, acted as mineralogist and geologist of a United States exploring expedition, commanded by Captain Charles Wilkes, in the Pacific ocean (*see* WILKES, CHARLES). His labours in preparing the reports of his explorations occupied parts of thirteen years after his return to America in 1842. In 1844 he again became a resident of New Haven, married the daughter of Professor Silliman, and in 1850, on the resignation of the latter, was appointed Silliman Professor of Natural History and Geology in Yale College, a position which he held till 1892. In 1846 he became joint editor and during the later years of his life he was chief editor of the *American Journal of Science and Arts* (founded in 1818 by Benjamin Silliman), to which he was a constant contributor, principally of articles on geology and mineralogy. A bibliographical list of his writings shows 214 titles of books and papers, beginning in 1835 with a paper on the conditions of Vesuvius in 1834, and ending with the fourth revised edition (finished in February 1895) of his *Manual of Geology.* His reports on *Zoophytes,* on the *Geology of the Pacific Area,* and on *Crzcstacea,* summarizing his work on the Wilkes expedition, appeared in 1846, 1849 and 1852–1854, in quarto volumes, with copiously illustrated atlases; but as these were issued in small numbers, his reputation more largely rests upon his *System of Mineralogy* (1837 and many later editions in 1892); *Manual of Geology* (1862; ed. 4, 1895); *Manual of Mineralogy* (1848), afterwards entitled *Manual of Mineralogy and Lithology* (ed. 4, 1887): and *Corals and Coral Islands* (1872; ed. 2, 1890). In 1887 Dana revisited the Hawaiian Islands, and the results of his further investigations were pub-

lished in a quarto volume in 1890, entitled *Characteristics of Volcanoes*. By the Royal Society of London he was awarded the Copley medal in 1877; and by the Geological Society the Wollaston medal in 1874. His powers of work were extraordinary, and in his 82nd year he was occupied in preparing a new edition of his *Manual of Geology*, the 4th edition being issued in 1895. He died on the 14th of April 1895.

His son EDWARD SALISBURY DANA, born at New Haven on the 16th of November 1849, is author of *A Textbook of Mineralogy* (1877; new ed. 1898) and a *Text Book of Elementary Mechanics* (1881). In 1879–80 he was professor of natural philosophy and then was professor of physics at Yale. He died June 17, 1935.

See *Life of J. D. Dana*, by Daniel C. Gilman (1899).

DANAE (Gr. dă-nă-ā, anglicized dăn'ă-ē), in Greek legend, daughter of Acrisius, king of Argos. According to the myth, her father, having been warned by an oracle that she would bear a son by whom he would be slain, confined Danae in a brazen tower. But Zeus descended to her in a shower of gold, and she gave birth to Perseus, whereupon Acrisius placed her and her infant in a wooden box and threw them into the sea. They were finally driven ashore on the island of Seriphus, where they were picked up and brought to Polydectes, king of the island. For her subsequent adventures *see* PERSEUS.

DANAGLA: *see* BARABRA.

DANAO, a municipality (with administrative centre and 30 *barrios* or districts) of the province and island of Cebu, Philippine islands, on the east coast, at the mouth of the Danao river, 17 mi. N.N.E. of Cebu, the provincial capital. Pop. (1939) 28,387, of whom only one was white. It is in the centre of a rich agricultural region producing rice, corn, sugar, copra and cacao. Coal is mined in the vicinity.

According to the census of 1939, there were 3,100 farms in Danao, 1,289 of which were farmed by the owners, 907 by part owners, 903 by share tenants and one cash tenant. The vernacular is Cebuano.

DANAUS, in Greek legend, son of Belus, king of Egypt, and twin-brother of Aegyptus. He was born at Chemmis (Panopolis) in Egypt, but having been driven out by his brother he fled with his 50 daughters to Argos, the home of his ancestress Io. The 50 sons of Aegyptus arrived in Argos, and Danaus was obliged to consent to their marriage with his daughters. But to each of these he gave a knife with injunctions to slay her husband on the marriage night. They all obeyed except Hypermestra, who spared Lynceus. She was brought to trial by her father, acquitted and afterwards married to her lover. Being unable to find suitors for the other daughters, Danaus offered them in marriage to the youths of the district who proved themselves victorious in racing contests (Pindar, *Pythia*, ix. 117).

According to another story Lynceus slew Danaus and his daughters and seized the throne of Argos (schol. on Euripides, *Hecuba*, 886). In the other world the Danaïdes were condemned to the endless task of filling with water a vessel which had no bottom. Crime and punishment alike have been variously explained by mythologists.

See articles in Pauly-Wissowa's *Realencyklopadie* and W. H. Roscher's *Lexikon der Mythologie;* Campbell Bonner, in **Harvard** *Studies*, riii. (1902).

DANBURITE, a rare mineral species consisting of calcium and boron orthosilicate, $CaB_2(SiO_4)_2$, crystallizing in the orthorhombic system and discovered in 1839 at Danbury, Conn., whence its name, and where it occurs embedded in dolomite. The crystals are transparent to translucent, and colourless to pale yellow; they are prismatic in habit, and closely resemble topaz in form and interfacial angles. There is an imperfect cleavage parallel to the basal plane; hardness 7; specific gravity 3.0. Splendid crystals have been found in Japan.

DANBURY, a city of southwestern Connecticut, 65 mi. N.N.E. of New York city, on the Still river; one of the county seats of Fairfield county. It is served by the New York, New Haven and Hartford railroad. The population was 18,943 in 1920 (21% foreign-born white) and was 22,339 in 1940 by the federal census. The city lies in a broad plain, surrounded by the foothills of the Berkshires, and retains much of the delightful aspect of a New England village. It is the seat of a state normal school, opened 1904. The predominant industry is the manufacture of felt hats, begun in 1780, which in 1940 was represented by over 30 factories. More than 4,000,000 hats are produced annually. Other important manufactures are hatmaking machinery, silver-plated ware, surgical instruments, silk braid, thread. ball and roller bearings. The factory output in 1937 was valued at $37,699,460. An agricultural fair is an annual event. Danbury was settled in 1684. The borough was chartered in 1822 and became a city in 1869. In 1776 a depot of military supplies was established here, which in April, 1777, was raided by Governor Tryon of New York. In his retreat he was attacked at Ridgefield (9m. S.) by the Americans under General David Wooster, who was fatally wounded in the conflict. Several books about Danbury were written by James Montgomery Bailey (1841–94), founder and for many years proprietor of the Danbury *News*, whose humorous sketches in the *News* made himself and the paper famous.

The "Danbury Hatters' Case," a suit for damages brought by a manufacturing firm against 186 hatters of Danbury in 1902, on the ground that their boycott was a violation of the Sherman Act, is important in the annals of organized labour in America. Damages were awarded to the plaintiff and his contention was upheld by a decision of the U.S. Supreme Court in 1915.

DANBY, THOMAS OSBORNE, EARL OF: *see* LEEDS, THOMAS OSBORNE, 1ST DUKE OF.

DANBY, FRANCIS (1793–1861), English painter, was born in the south of Ireland on Nov. 16, 1793, and died at Exmouth on Feb. 9, 1861. He led a wandering life, but spent his last 20 years in England. A good example of his work is "Fisherman's Home—Sunset" in the National Gallery, and the "Departure of Ulysses from Ithaca" (1854). His sons, James Francis (1816–75) and Thomas (1817?–86), were also well-known artists.

DANCE, the name of an English family distinguished in architecture, art and the drama. GEORGE DANCE, the elder (1700–1768), obtained the appointment of architect to the City of London, and designed the Mansion House (1739); the churches of St. Botolph, Aldgate (1741), St. Luke's, Old street; St. Leonard, Shoreditch; the old excise office, Broad street; and other public works of importance. His eldest son, JAMES DANCE (1722–1774), was educated at the Merchant Taylors' school and St. John's college, Oxford. He took the name of Love, and became an actor and playwright, connected for 12 years with Drury Lane theatre. He wrote a number of comedies—the earliest *Pamela* (1742).

George Dance's third son, SIR NATHANIEL DANCE-HOLLAND, BART. (1735–1811), studied art under Francis Hayman in Italy, where he formed a hopeless attachment for Angelica Kauffmann. From Rome he sent home "Dido and Aeneas" (1763). On his return to England he took up portrait-painting with great success, and contributed to the first exhibition of the Royal Academy, of which he was a foundation member, full-length portraits of George III. and his queen. These, and his portraits of Captain Cook and of Garrick as Richard III., engraved by Dixon, are his best-known works. In 1790 he became M P. for East Grinstead, taking the additional name of Holland. He was made a baronet in 1800.

George Dance's fifth and youngest son, GEORGE DANCE, the younger (1741–1825), succeeded his father as City surveyor and architect in 1768. He had spent several years abroad, chiefly in Italy, and had already distinguished himself by designs for Blackfriars bridge. His first important public work was the rebuilding of Newgate prison in 1770. The front of the Guildhall was also his. He, too, was a foundation member of the Royal Academy. His son, CHARLES DANCE (1794–1863), was for 30 years registrar, taxing officer and chief clerk of the insolvent debtors' court. In collaboration with J. R. Planché and others, or alone, he wrote a great number of extravaganzas, farces and comediettas. He was one of the first of the burlesque writers, and was the author of those produced so successfully by Madame Vestris for years at the Olympic.

DANCE. Dancing consists in the rhythmical movement of any or all parts of the body in accordance with some scheme of

individual or concerted action which is expressive of emotions or ideas. Amongst primitive peoples it always has some accompaniment by means of which the rhythm is emphasized. In its simplest form this consists in clapping the hands, or beating a drum to mark the time; more elaborate is the accompaniment composed of several drums each with its own rhythm, or of an orchestra of different instruments. Frequently every dance has its own song which is sung by the performers themselves or by the onlookers.

Among primitive peoples the range of movements employed in dancing is very wide. All parts of the body are used, head, back, hips, arms, fingers and even the facial muscles are brought into play as well as the feet. Some performances demand great physical exertion, with leaping and many bodily contortions, as in the war *haka* of the Maori.[1] In others the dancers confine themselves to a monotonous movement of the hands and feet. Many observers have commented on the sameness and lack of beauty in savage dances, but such a condemnation is based upon the misconception that they are performed primarily for the pleasure of the spectator. Spectacular dances are not unknown, but generally the satisfaction of the dancers is of first importance.

Much has been written of the obscenity of primitive dancing and it has even been said that it is primarily sexual in intent. Evidence from many parts of the world does not bear this out. To a certain extent all dancing is sexually stimulating, but, except in courtship dances, this stimulus may be regarded as a by-product. Nor is it true that all primitive dance movements are mimetic. Some are undoubtedly so, as the totemic dances in Australia *(see* TOTEMISM), but in the Andaman islands there is no trace of any such significance. Often the movements seem to be artistic renderings of spontaneous actions resulting from some emotional state.

As a rule a dance is performed by a group or groups of people all of whom move in the same way. Solo dances are rare, though not infrequently there is a dance leader who has a special part to play. All the able-bodied adults of the community are expected to take part. Usually the sexes are segregated, though this is by no means universal, but the close embrace, customary in European round dances, is seldom countenanced. Sometimes certain dances are restricted to one sex. Unless the dance forms part of a secret ceremony, that section of the community which is not dancing acts as audience, and often performs the accompaniment. Children are seldom allowed to join their elders, but have dances and singing games among themselves.

Under certain conditions some individuals, such as those who are in mourning or in seclusion at puberty, are not allowed to dance. They are in an abnormal state and temporarily cut off from society, and are therefore excluded from dancing, which is essentially a social occupation. It is for this reason too that a dance is so often a part of the ceremony which terminates a period of isolation; by joining in its performance the individual re-establishes his membership of the group.

ZIBILAE DANCE OF SEMI-BARBAROUS IGOROTS, PHILIPPINE ISLANDS

"The individual shouts and jumps for joy; the society turns the jump into a dance, the shout into a song." Dancing is a general means of enjoyment, often of rejoicing. But, as indicated above, it is more than this. Consciously or unconsciously it is a means of reaffirming social unity and occurs on all occasions which are socially important: at the close of *Passage Rites* (*q.v.*)—especially those of puberty and death; at the initiation and close of group activities such as fighting or the building of a communal house; or during inter-group activities such as the tribal corroboree in Australia, or the peace-making of the Andamans. The food supply is all-important to the community and thus among an agricultural people, for instance, seed and harvest time have social significance, and are therefore times of dancing.

But except on such occasions as the dance-meetings of local groups and the peace-making ceremonies of the Andamans, the sense of social unity is felt as a pleasurable accompaniment to dancing rather than as its conscious purpose. The significance of the dances to the dancers and their emotional accompaniment have been very insufficiently studied, and there has been much theorizing on little data. Many dances seem to be magical ceremonies by means of which human beings or natural phenomena are controlled. Thus the dances of the totemic ceremonies of central Australia are performed to promote the fertility of the animal species concerned, and many hunting and war-dances appear to be intended to influence the hunted game or the enemy, so they may be readily killed. The actions in such dances are mostly mimetic, and it is not uncommon for performers at important ceremonies to be killed if they make any mistake, probably because it is felt that such faults would detract from the efficacy of the dance. Accuracy of movement like accuracy of words is essential to the success of magical rites. From the way in which a dance is performed omens are frequently taken, any mistake or want of spirit being accounted evil.

BY COURTESY OF Y W C A.

CHINESE BOY IN COSTUME FOR DEVIL DANCE

The border-line between magic and religion is notoriously difficult to draw, but among some people dancing seems definitely to be a form of religious exercise akin to prayer.

Dancing as an incident in courtship is found among many species of birds and animals. In all dancing there is an opportunity for pleasurable exercise, but some dances are designed to create sexual excitement in both performers and onlookers. Thus in Torres Straits, the unmarried girls watch the bachelors dancing, and then each taps on the shoulder the one whom she has chosen; and in Australia the occasional periods of organized sexual licence are led up to by dancing.

Auto-intoxication is induced either intentionally or incidentally by dancing, the best known examples of this being the wild excesses of the bacchanals and of the shamans of Siberia, who use dancing as a means of becoming inspired by their tutelary spirit. Similar "possession" is induced by priests among savage peoples, and the power to do this is often a *sine qua non* of priesthood. In a war dance the condition produced is not so extreme, but is akin to this. The warriors work themselves into a frenzy of hatred, and they feel themselves exalted. Though many war dances may have a supposed magical effect on the enemy, this exaltation, this sense of heightened valour, is often one if not the only reason for their performance.

Nothing will survive in any human society unless it has a functional value. Within every individual in a community there is a conflict of desires. On the one hand there is a wish to be outstanding; on the other the longing for a sense of group fellowship. To both these desires dancing at once provides satisfaction. The dancer can display himself to the best advantage and can do so in harmony with others. On certain occasions one or other of these two aspects may be stressed, as, for instance, the individual aspect in dances of courtship, the group aspect in war or peace dances, but, to a greater or less extent, both aspects are always present. Therefore, because dancing is entirely satisfying emotionally, it survives in the savage and civilized world when beliefs in its magical or religious efficacy have passed away.

HISTORY

The term "dancing" in its widest sense includes three things:—(1) the spontaneous activity of the muscles under the influence of some strong emotion, such as social joy or religious exultation; (2) definite combinations of graceful movements performed for the sake of the pleasure which the exercise affords to the dancer or to the spectator; (3) carefully trained movements which are meant by the dancer vividly to represent the actions and passions of other people. In the highest sense it seems to be for prose-gesture what song is for the instinctive exclamations of feeling. At a Mexican feast to the god Huitzilopochtli the noblemen and women danced tied together at the hands, and embracing one another, the arms being thrown over the neck. This resembles the dance variously known as the Greek Bracelet or Brawl, "Ορμος, or Bearsfeet; but all of them probably are to a certain extent symbolical of the relations between the sexes. In a very old Peruvian dance of ceremony before the Inca, several hundreds of men formed a chain, each taking hold of the hand of the man beyond his immediate neighbour, and the whole body moving forwards and backwards three steps at a time as they approached the throne.

The rude imitative dances of early civilization are of extreme interest. In the same way the dances of the Ostyak tribes (Northern Asia) imitate the habitual sports of the chase and the gambols of the wolf and the bear and other wild beasts, the dancing consisting mainly of sudden leaps and violent turns which exhaust the muscular powers of the whole body. The Kamchadales, too, in dancing, imitate bears, dogs and birds. The *Kru* dances of the Coast Negroes represent hunting scenes; and on the Congo, before the hunters start, they go through a dance imitating the habits of the gorilla and its movements when attacked. The Damara dance is a mimic representation of the movements of oxen and sheep, four men stooping with their heads in contact and uttering harsh cries. The canter of the baboon is the humorous part of the ceremony. The Bushmen dance in long irregular jumps, which they compare to the leaping of a herd of calves, and the Hottentots not only go on all-fours to counterfeit the baboon, but they have a dance in which the buzzing of a swarm of bees is represented. The Kennowits in Borneo introduce the mias and the deer for the same purpose. The Australians and Tasmanians in their dances called *corrobories* imitate the frog and the kangaroo (both leaping animals). The hunt of the emu is also performed, a number of men passing slowly round the fire and throwing their arrows about so as to imitate the movements of the animal's head while feeding. The Gonds are fond of dancing the bison hunt, one man with skin and horns taking the part of the animal. Closely allied to these are the mimic fights, almost universal among tribes to which war is one of the great interests of life. The Bravery dance of the Dahomans and the Hoolee of the Bhil tribe in the Vindhya Hills are illustrations. The latter seems to have been reduced to an amusement conducted by professionals who go from village to village,—the battle being engaged in by women with long poles on the one side, and men with short cudgels on the other. There is here an element of comedy, which also appears in the Fiji club-dance. This, although no doubt originally suggesttd by war, is enlivened by the presence of a clown covered with leaves and wearing a mask. The monotonous song accompanying the club-dance is by way of commentary or explanation. So, also, in Guatemala there is a public *baile* or dance, in which all the performers, wearing the skins and heads of beasts, go through a mock battle, which always ends in the victory of those wearing the deer's head. At the end the victors trace in the sand with a pole the figure of some animal; and this exhibition is supposed to have some historical reference. But nearly all savage tribes have a regular war-dance, in which they appear in fighting costume, handle their weapons, and go through the movements of challenge, conflict, pursuit or defeat. The women generally supply the stimulus of music. There is one very picturesque dance of the Natal Kafirs, which probably refers to the departure of the warriors for the battle. The women appeal plaintively to the men, who slowly withdraw, stamping on the ground and darting their short spears or *assegais* towards the sky. In Madagascar, when the men are absent on war, the women dance for a great part of the day, believing that this inspires their husbands with courage. In this, however, there may be some religious significance. These war-dances are totally distinct from the institution of military drill, which belongs to a later period, when social life has become less impulsive and more reflective. (The Greek καρπαία represented the surprise by robbers of a warrior ploughing a field. The gymnopaedic dances imitated the sterner sports of the palaestra) There can be little doubt that some of the characteristic movements of these primitive hunting and war-dances survive in the smooth and ceremonious dances of the present day. But the early mimetic dance was not confined to these two subjects; it embraced the other great events of savage life—the drama of courtship and marriage, the funeral dance, the consecration of labour, the celebration of harvest or vintage; sometimes, too, purely fictitious scenes of dramatic interest, while other dances degenerated into games. (The Greek Lenaea and Dionysia had a distinct reference to the seasons.) For instance, in Yucatán one man danced in a cowering attitude round a circle, while another followed, hurling at him *bohordos* or canes, which were adroitly caught on a small stick Again, in Tasmania, the dances of the women describe their "clamber for the opossum, diving for shell-fish, digging for roots, nursing children and quarrelling with husbands." Another dance, in which a woman by gesture taunts a chieftain with cowardice, gives him an opportunity of coming forward and recounting his courageous deeds in dance. The funeral dance of the Todas (another Indian hill-tribe) consists in walking backwards and forwards, without variation, to a howling tune of "ha! hoo!" The meaning of this is obscure, but it can scarcely be solely an outburst of grief. In Dahomey the blacksmiths, carpenters, hunters, braves and bards, with their various tools and instruments, join in a dramatic dance. We may add here a form of dance which is almost precisely equivalent to the spoken incantation. It is used by the professional devil-dancer of the wild Veddahs for the cure of diseases. An offering of eatables is put on a tripod of sticks, and the dancer, decorated with green leaves, goes into a paroxysm of dancing, in the midst of which he receives the required information. This, however, rather belongs to the subject of religious dances.

It is impossible here to enumerate either the names or the forms of the sacred dances which formed so prominent a part of the worship of antiquity. After the middle of the 18th century there were still traces of religious dancing in the cathedrals of Spain, Portugal and Roussillon—especially in the Mozarabic Mass of Toledo.

HISTORIC DANCES, 15TH–19TH CENTURY

France and Italy.—Italy, in the 15th century, saw the renaissance of dancing, and France may be said to have been the nursery of the modern art, though comparatively few modern dances are really French in origin. The national dances of other countries were brought to France. studied systematically, and made perfect there. An English or a Bohemian dance, practised only amongst peasants, would be taken to France, polished and perfected, and would at last find its way back to its own country, no more recognizable than a piece of elegant cloth when it returns from the printer to the place from which as "grey" material it was sent. The fact that the terminology of dancing is almost entirely French is a sufficient indication of the origin of the rules that govern it.

The earliest dances that bear any relation to the modern art are probably the *danses basses* and *danses hautes* of the 16th century. The *danse basse* was the dance of the court of Charles IX. and of good society, the steps being very grave and dignified, not to say solemn, and the accompaniment a psalm tune. The *danses hautes* or *baladines* had a skipping step, and were practised only by clowns and country people. More lively dances, such as the *Gaillarde* and *Volta,* were introduced into France from Italy by Catherine de' Medici, but even in these the interest was chiefly spectacular. Other dances of the same period were the *Branle* (afterwards corrupted to *Braule,* and known in England

as the Brawle)—a kind of generic dance which was capable of an almost infinite amount of variety. Thus there were imitative dances—*Branles mimés,* such as the *Branles des Ermites, Branles des flambeaux* and the *Branles des lavandières.* The *Branle* in its original form had steps like the *Allemande.*

Perhaps the most famous and stately dance of this period was the *Pavane* (of Spanish origin), which is very fully described in Tabouret's *Orchésographie,* the earliest work in which a dance is found minutely described. The *Pavane,* which was really more a procession than a dance, must have been a very gorgeous and noble sight, and it was perfectly suited to the dress of the period, the stiff brocades of the ladies and the swords and heavily-plumed .hats of the gentlemen being displayed in' its simple and dignified measures to great advantage.

In the *Pavane* and *Branle,* and in nearly all the dances of the 17th and 18th centuries, the practice of kissing formed a not unimportant part, and seems to have added greatly to the popularity of the pastime. Another extremely popular dance was the *Saraband,* which, however, died out after the 17th century. It was originally a Spanish dance, but enjoyed an enormous success for a time in France. Every dance at that time had its own tune or tunes, which were called by its own name, and of the *Saraband* the chevalier de Grammont wrote that "it either charmed or annoyed everyone, for all the guitarists of the court began to learn it, and God only knows the universal twanging that followed." Vauquelin des Yveteaux, in his 80th year, desired to die to the tune of the *Saraband,* "so that his soul might pass away sweetly."

The *Courante* was a court dance performed on tiptoe with slightly jumping steps and many bows and curtseys. The minuet and the waltz were both in some degree derived from it, and it had much in common with the famous *Seguidilla* of Spain. It was a favourite dance of Louis XIV., who was an adept in the art, and it was regarded in his time as of such importance that a nobleman's education could hardly have been said to be begun until he had mastered the *Courante.*

The dance which the French brought to the greatest perfection —which many, indeed, regard as the fine flower of art—was the *Minuet.* Its origin, as a rustic dance, is not less antique than that of the other dances from which the modern art has been evolved. It was originally a *branle* of Poitou, derived from the *Courante.* It came to Paris in 1650 and was first set to music by Lully. It was at first a gay and lively dance, but on being brought to court it soon lost its sportive character and became grave and dignified. It is mentioned by Beauchamps, the father of dancing-masters, who flourished in Louis XIV.'s reign, and also by Blondy, his pupil; but it was Pécour who really gave the minuet its popularity, and although it was improved and made perfect by Dauberval, Gardel, Marcel and Vestris, it was in Louis XV.'s reign that it saw its golden age. It was then a dance for two in moderate triple time, and was generally followed by the gavotte. Afterwards the minuet was considerably developed, and with the gavotte became chiefly a stage dance and a means of display; but it should be remembered that the minuets which are now danced on the stage are generally highly elaborated with a view to their spectacular effect, and have imported into them steps and figures which do not belong to the minuet at all, but are borrowed from all kinds of other dances. The original court minuet was a grave and simple dance, although it did not retain its simplicity for long. But when it became elaborated it was glorified and moulded into a perfect expression of an age in which deportment was most sedulously cultivated and most brilliantly polished. The "languishing eye and smiling mouth" had their due effect in the minuet; it was a school for chivalry, courtesy and ceremony; the hundred slow graceful movements and curtseys, the pauses which had to be filled by neatly-turned compliments, the beauty and bravery of attire—all were eloquent of graces and outward refinements which we cannot boast now. The fact that the measure of the minuet has become incorporated in the structure of the symphony shows how important was its place in the polite world.

The *Gavotte,* which was often danced as a pendant to the minuet, was also originally a peasant's dance, a *danse des Gavots,* and consisted chiefly of kissing and capering. It also became stiff and artificial, and in the later and more prudish half of the 18th century the ladies received bouquets instead of kisses in dancing the gavotte. It rapidly became a stage dance, and it has never been restored to the ballroom. Grétry attempted to revive it, but his arrangement never became popular.

Other dances which were naturalized in France were the *Écossaise,* popular in 1760; the *Cotillon,* fashionable under Charles X., derived from the peasant *branles* and danced by ladies in short skirts; the *Galop,* imported from Germany; the *Lancers,* invented by Laborde in 1836; the *Polka,* brought by a dancing-master from Prague in 1840; the *Schottische,* also Bohemian, first introduced in 1844; the *Bourre'e,* or French clog-dance; the *Quadrille,* known in the 18th century as the *Contre-danse;* and the Waltz, which was danced as a *volte* by Henry III. of France, but only became popular in the beginning of the 19th century. We shall return to the history of some of these later dances in discussing the dances at present in use.

Spain.—If France has been the nursery and school of the art of dancing, Spain is its true home. There it is part of the national life, the inevitable expression of the gay, contented, irresponsible, sunburnt nature of the people. The form of Spanish dances has hardly changed; some of them are of great antiquity, and may be traced back with hardly a break to the performances in ancient Rome of the famous dancing-girls of Cadiz. The connection is lost during the period of the Arab invasion, but the art was not neglected, and Jovellanos suggests that it took refuge in Asturias. At any rate, dances of the 10th and 12th centuries have been preserved uncorrupted. The earliest dances known were the *Turdion,* the *Gibidana,* the *Pié-de-gibao,* and (later) the *Madanta Orleans,* the *Alemana* and the *Pavana.* Under Philip IV. theatrical dancing was in high popularity, and ballets were organized with extraordinary magnificence of decoration and costume. They supplanted the national dances, and the *Zarabanda* and *Chacona* were practically extinct in the 18th century. It is at this period that the famous modern Spanish dances, the *Bolero, Seguidilla* and the *Fandango,* first appear.

Of these the *Fandango* is the most important. It is danced by two people in 6–8 time, beginning slowly and tenderly, the rhythm marked by the click of castanets, the snapping of the fingers and the stamping of feet, and the speed gradually increasing until a whirl of exaltation is reached. A feature of the *Fandango* and also of the *Seguidilla* is a sudden pause of the music towards the end of each measure, upon which the dancers stand rigid in the attitudes in which the stopping of the music found them, and only move again when the music is resumed. M. Vuillier, in his *History of Dancing,* gives the following description of the *Fandango:*—"*Like* an electric shock, the notes of the Fandango animate all hearts. Men and women, young and old, acknowledge the power of this air over the ears and soul of every Spaniard The young men spring to their places, rattling castanets or imitating their sound by snapping their fingers. The girls are remarkable for the willowy languor and lightness of their movements, the voluptuousness of their attitudes—beating the exactest time with tapping heels. Partners tease and entreat and pursue each other by turns. Suddenly the music stops, and each dancer shows his skill by remaining absolutely motionless, bounding again into the full life of the Fandango as the orchestra strikes up. The sound of the guitar, the violin, the rapid tic-tac of heels *(taconeos),* the crack of fingers and castanets, the supple swaying of the dancers, fill the spectator with ecstacy. The measure whirls along in a rapid triple time. Spangles glitter; the sharp clank of ivory and ebony castanets beats out the cadence of strange, throbbing, deepening notes—assonances unknown to music, but curiously characteristic, effective and intoxicating. Amidst the rustle of silks, smiles gleam over white teeth, dark eyes sparkle and droop and flash up again in flame. All is flutter and glitter, grace and animation—quivering, sonorous, passionate, seductive."

The *Bolero* is a comparatively modern dance, having been invented by Sebastian Cerezo, a celebrated dancer of the time of King Charles III. It is remarkable for the free use made in it of the arms, and is said to be derived from the ancient *Zarabanda,* a violent and licentious dance, which has entirely disappeared.

CHARACTERISTIC DANCES OF JAPAN

1. Ghost of umbrella in "Hyaku Monogatarl," danced by an actor. 2. Dance called Manzai in "Noriai-bune," danced by actors. 3. "Kagami-jishi," danced by an actor. 4. "Fuji-musume" (wistaria-maid), danced by a girl dancer. 5. "Dojoji," a favourite dance, named after the monastery where it originated. 6. Fox in "Tadanobu," danced by a geisha of Nagoya. 7. "Dojoji," danced by a geisha of Nagoya. 8. Dancing with a ***tenugui*** (scarf) in "Kisen." 9 "Dojoji," by a girl dancer. 10. "Sagi-musume" (heron-maid) danced by a geisha of Nagoya

and with which the later Saraband has practically nothing in common. The step of the *Bolero* is low and gliding but well marked. It is danced by one or more couples. The *Seguidilla* is hardly less ancient than the *Fandango*, which it resembles. Every province in Spain has its own *Seguidilla*, and the dance is accompanied by *coplas*, or verses, which are sung either to traditional melodies or to the tunes of local composers; indeed, the national music of Spain consists largely of these coplas.

The *Jota* is the national dance of Aragon, a lively and splendid, but withal dignified and reticent, dance derived from the 16th-century *Passacaille*. It is still used as a religious dance. The *Cachuca* is a light and graceful dance in triple time. It is performed by a single dancer of either sex. The head and shoulders play an important part in the movements of this dance. Other provincial dances now in existence are the *Jaleo de Jerez*, a whirling measure performed by gipsies, the *Palotéa*, the *Polo*, the *Gallegada*, the *Muyneria*, the *Habas Verdes*, the *Zapateado*, the *Zorongo*, the *Vito*, the *Tirano* and the *Tripola Trapola*. Most of these dances are named either after the places where they are danced or after the composers who have invented tunes for them. Many of them are but slight variations from the *Fandango* and *Seguidilla*.

Great Britain. — The history of court dancing in Great Britain is practically the same as that of France, and need not occupy much of our attention here. But there are strictly national dances still in existence which are quite peculiar to the country, and may be traced back to the dances and games of the Saxon gleemen. The Egg dance and the *Carole* were both Saxon dances, the *Carole* being a Yule-tide festivity, of which the present-day Christmas carol is a remnant.

The oldest dances which remain unchanged in England are the *Morris* dances, which were introduced in the time of Edward III. (*See* MORRIS DANCE.)

Dancing practically disappeared during the Puritan *régime*, but with the Restoration it again became popular. It underwent no considerable developments, however, until the reign of Queen Anne, when the glories of Bath were revived in the beginning of the 18th century, and Beau Nash drew up his famous codes of rules for the regulation of dress and manners, and founded the balls in which the polite French dances completely eclipsed the simpler English ones.

The only true national dances of Scotland are reels, strathspeys and flings, while in Ireland there is but one dance — the jig, which is there, however, found in many varieties and expressive of many shades of emotion, from the maddest gaiety to the wildest lament. Curiously enough, although the Welsh dance often, they have no strictly national dances.

Popular Dances of Universal Importance. — The *Waltz* is no doubt the most popular of the 19th century dances. Its origin is a much-debated subject, the French, Italians and Bavarians each claiming for their respective countries the honour of having given birth to it. As a matter of fact the waltz, as it is now danced, comes from Germany; but it is equally true that its real origin is French, since it is a development of the *Volte*, which in its turn came from the *Lavolta* of Provence, one of the most ancient of French dances. The *Lavolta* was fashionable in the 16th century and was the delight of the Valois court. The *Volte* danced by Henry III. was really a *Valse à deux pas;* and Castil-Blaze says that "the waltz which we took again from the Germans in 1795 had been a French dance for four hundred years." The change, it is true, came upon it during its visit to Germany, hence the theory of its German origin. The first German waltz tune is dated 1770 — "Ach! du lieber Augustin." It was first danced at the Paris opera in 1793, in Gardel's ballet *La Dansomanie*. It was introduced to English ballrooms in 1812, when it roused a storm of ridicule and opposition, but it became popular when danced at Almack's by the emperor Alexander in 1816. The waltz *à trois temps* has a sliding step in which the movements of the knees play an important part. The *tempo* is moderate, so as to allow three distinct movements on the three beats of each bar; and the waltz is written in 3–4 time and in eight-bar sentences. Walking up and down the room and occasionally breaking into the step of the dance is not true waltzing, and the habit of pushing one's partner backwards along the room is an entirely English one. But the dancer must be able to waltz equally well in all directions, pivoting and crossing the feet when necessary in the reverse turn. It need hardly be said that the feet should never leave the floor in the true waltz. Gungl, Waldteufel and the Strauss family may be said to have moulded the modern waltz to its present form by their rhythmical and agreeable compositions. There are variations which include hopping and lurching steps; these are degradations, and foreign to the spirit of the true waltz.

The *Quadrille* is of some antiquity, and a dance of this kind was first brought to England from Normandy by William the Conqueror, and was common all over Europe in the 16th and 17th centuries. The term quadrille means a kind of card game, and the dance is supposed to be in some way connected with the game. A species of quadrille appeared in a French ballet in 1745, and since that time the dance has gone by that name. It then consisted of very elaborate steps, which in England have been simplified until the degenerate practice has become common of walking through the dance. The quadrille, properly danced, has many of the graces of the minuet. It is often stated that the square dance is of modern French origin. This is incorrect, and probably arises from a mistaken identification of the terms quadrille and square dance. "Dull Sir John" and "Faine I would," were square dances popular in England 300 years ago.

An account of the country-dance, with the names of some of the old dance-tunes, has been given above. The word is not, as has been supposed, an adaptation of the French *contre-danse*, neither is the dance itself French in origin. According to the *New English Dictionary*, *contre-danse* is a corruption of "country-dance," possibly due to a peculiar feature of many of such dances, like Sir Roger de Coverley, where the partners are drawn up in lines opposite to each other. The English "country-dances" were introduced into France in the early part of the 18th century and became popular; later French modifications were brought back to England under the French form of the name, and this, no doubt, caused the long-accepted but confused derivation.

The *Lancers* were invented by Laborde in Paris in 1836. They were brought over to England in 1850, and were made fashionable by Madame Sacré at her classes in Hanover Square Rooms.

The *Polka*, the chief of the Bohemian national dances, was adopted by society in 1835 at Prague. Josef Neruda had seen a peasant girl dancing and singing the polka, and had noted down the tune and the steps. From Prague it readily spread to Vienna, and was introduced to Paris by Cellarius, a dancing-master, who gave it at the Odéon in 1840. It took the public by storm, and spread like an infection through England and America. Everything was named after the polka, from public-houses to articles of dress. Mr. Punch exerted his wit on the subject weekly, and even *The Times* complained that its French correspondence was interrupted, since the polka had taken the place of politics in Paris. The true polka has three slightly jumping steps, danced on the first three beats of a four-quaver bar, the last beat of which is employed as a rest while the toe of the unemployed foot is drawn up against the heel of the other.

The *Galop* is strictly speaking a Hungarian dance, which became popular in Paris in 1830. But some kind of a dance corresponding to the galop was always indulged in after *Voltes* and *Contre-danses*, as a relief from their constrained measures.

The *Barn-dance* is no doubt of American origin, its height of popularity being toward the end of the 19th century. It was customary for the farmer who wished to build a new barn to call in his neighbours for a "working" and finish the job within a short time, after which a dance was "thrown." The dance is still very popular in certain rural sections, and does not necessarily confine itself to new or empty barns. The square dance, or some form of group dancing, is executed to the accompaniment of a two- or three-piece string band or the neighbouring fiddle.

The *Paul Jones* is one of the many "sets" that comprise an evening of barn-dancing. A number of couples are required for the performance as well as a "caller" who gives direction as to the action of each couple.

The *Washington Post* belongs to America.

The *Polka-Mazurka* is extremely popular in Vienna and Budapest, and is a favourite theme with Hungarian composers. The six movements of this dance occupy two bars of 3–4 time, and consist of a mazurka step joined to the polka. It is of Polish origin.

The *Polonaise* and *Mazurka* are both Polish dances, and are still fashionable in Russia and Poland. Every State ball in Russia is opened with the ceremonious Polonaise.

The *Schottische,* a kind of modified polka, was "created" by Markowski, who was the proprietor of a famous dancing academy in 1850. The *Highland Schottische* is a fling. The Fling and Reel are Celtic dances, and form the national dances of Scotland and Denmark. They are complicated measures of a studied and classical order, in which free use is made of the arms and of cries and stampings. The *Strathspey* is a slow and grandiose modification of the Reel.

Sir Roger de Coverley is the only one of the old English social dances which has survived to the present day, and it is frequently danced at the conclusion of the less formal sort of balls. It is a merry and lively game in which all the company take part, men and women facing each other in two long rows. The dancers are constantly changing places in such a way that if the dance is carried to its conclusion everyone will have danced with everyone else. The music was first printed in 1681, and is sometimes written in 2–4 time, sometimes in 6–8 time, and sometimes in 3–9 time.

The *Cotillon* is a modern development of the French dance of the same name referred to above. It is an extremely elaborate dance, in which a great many toys and accessories are employed; hundreds of figures may be contrived for it, in which presents, toys, lighted tapers, biscuits, air-balloons and hurdles are used.

Ballet. — *The* modern ballet (*q.v.*) would seem to have been first produced on a considerable scale in 1489 at Tortona, before Duke Galeazzo of Milan. It soon became a common amusement on great occasions at the European courts. The ordinary length was five acts, each containing several *entrées,* and each *entrée* containing several quadrilles.

BIBLIOGRAPHY.—For the old division of the *Ars Gymnastica* into *palaestrica* and *saltatoria,* and of the latter into *cubistzca, sphaeristica* and *orchestzca, see* the learned work of Hieronymus Mercurialis, *De arte Gymnastica* (Amsterdam, 1572). Cubistic was the art of throwing somersaults, and is described minutely by Tuccaro in his *Trois Dialogues* (Paris, 1599). Sphaeristic included several complex games at ball and tilting—the Greek κώρυκος, and the Roman *trigonalis* and *paganzca.* Orchestic, divided by Plutarch into *latio, figura* and *indicatio,* was really imitative dancing, the "silent poetry" of Simonides. The importance of the χειρονομία or hand-movement is indicated by Ovid:—"Si vox est, canta; si mollia brachia, salta." For further information as to modern dancing, *see* Rameaus *Le maître à danser* (1726); Querlon's *Le triomphe des grâces* (1774); Cahousac, La *danse ancienne et moderne* (1754); Vuillier, *Htstory* of *Dancing* (Eng. trans., 1897); Giraudet, *Traité de la danse* (1900).

JAPAN

The dance in Japan has its origin in her mythical age. According to the 8th century *Kojiki,* when Amaterasu, the sun-goddess, retired in high dudgeon to a cavern, Ama-no-Uzumeno-mikoto danced at the cavern's mouth to lure her out. *Kagura,* the sacred dance of today, is traced back to this incident by the native literati. Records speak of the emperor Inkyō playing on a *wa-gon* (Japanese native *koto)* and the empress dancing at the imperial banquet given in 419 on the completion of their new palace building. In the Orient the dance is as old as history, and when some 7,000 Chinese families emigrated to Japan in 540 it is not to be doubted that they brought with them their cherished national custom. In 552 a Korean monarch sent a Buddhist mission to Japan and the dance formed a part of their religious ceremony. The old picturesque dance of China and Korea is still executed semi-annually, to the sound of flutes and waving of feathers in worship by the followers of Confucius. The dance became definitely established as a Japanese institution by Ashikaga Shogun Yoshimitsu's (1363–94) school for dancing, and the Shogun himself incorporated many historical themes of China into dramatic dances. With the invention of the *Nō* play by Kwanami Kiotsugu (1406) and its development by his equally famous son, Seami Motokiyo, the dance became closely associated with the national theatre. In the 16th century the fame of the beautiful Okuni popularized the dance among all classes of society. But the tradition begun by her was interrupted in 1643 when, for reasons of public morality, women were forbidden to appear upon the stage; male actors and the priests of Buddha continued the ancient custom of Korea and China. Western ballroom dances, such as waltzes and two-steps, were introduced to Japan in the last quarter of the 19th century and became a fashion for a time, but were soon dropped, and then revived again. (Y. K.)

Visitors to Japan generally return deeply impressed with the beauty of cherry blossoms and the charming grace of the *geisha* girl dance. The dance is performed not only by the *geisha* and other dancing professionals, but is given in connection with the classical *Nō* drama, and it plays an important part in the old style of acting known as *kabuki* for, as an eminent actor of the old school has said, "an actor without ability to dance is like a wrestler without strength." Sacred dances called *kagura,* very simple in character, are given by maidens at some shrines, while Buddhist dances, such as *Nembutsu-odori,* may be seen in connection with some religious observances.

Speaking of the native dance of Japan, three terms are used: *mai, odori* and *furi* or *shosa,* all meaning dance, though technically differentiated. The first has been used to designate the older style of dancing which has been in vogue among the upper class and come to be performed by professionals. It is likened to the graceful movements of the crane at sunrise. The second, which does not appear in literature before the 15th century, has been applied to the dance that was born and has become a fashion among the common people. It means the spontaneous expression of joy with gesture of hands and feet common to all people. The third designates the dance woven into the acting on the stage. *Mai* may be said to designate a classical, *odori* a popular and *furi* a dramatic dance. However, the first may also be classified into two: classical and popular. The classical *mai* is preserved in the imperial court in connection with traditional observances, or in Shinto shrines as *kagura,* or in *Nō* drama, while the popular *mai* is practically the same as *odori* but called *mai* according to the custom peculiar to certain localities. It is generally maintained that in *ntai* the attitude is characterized by solemnity, the gesture by elegance and refinement, and the movement by an easy and natural flow, while in *odori* the dance is more natural and free in attitude and movement, and the gesture more active and subtle, with a greater freedom for variation, allowing even a comical or a rustic element to creep in. *Furi* is enlivened with dramatic quality. However, in many instances the distinction is hard, or even impossible, to draw. Moreover, the three terms may be said to represent different essential elements in the dance, rather than its kinds.

The dance of Japan may generally be divided into two classes: the popular and the special or professional. The former is for the pleasure of the mass of people who may acquire the art in several days or weeks, and it includes such dances as *Ise-odori* (time-honoured dance in the province of Ise), *Tanabata-odori* (for the festival of the star Vega) and others connected with popular festivals, as well as such religious dances as *Bon-odori* (held in summer in memory of the dead), *Nenzbutsu odori* (with Buddhist prayers), etc. The professional dances are acquired only by patient and laborious practice, requiring at least several years to master them. Some of these dances consist purely of graceful movements, while others are enlivened with dramatic elements. Those with dramatic elements try to narrate a story in rhythmic movements or to reveal feelings of joy, anger, sorrow, love, hatred, etc., either expressed or suggested in the songs or music played in accompaniment. The songs so used are of different styles, such as *naga-uta, tokiwazu* and *kiyomoto,* all rendered to the accompaniment of *samisen,* the three-stringed musical instrument, and some with drums and flutes in addition. The songs are descriptive of scenery; narrative of historical or traditional events; accounts of heroes; of love or madness; sometimes they deal with ghosts of men and women, or with the spirit of a lion or of a spider, etc., an effort being often made to transport the observer to the realm of dreams.

RELIGIOUS AND COURT DANCES

1. One of a pair of dancers below a *dhamma-cakka* (wheel of the law), in a detail from an Amarāvatī relief, *c.* 200. Madras museum. The pose and lotus support are familiar in later Cambodian art
2. Dancer and part of chorus, in a *nātya-śāla*, a balcony relief in the verandah of the Rānī Gumphā (excavated monastery), at Udayagiri, Orissa, Eastern India, 150–100 B.C.
3. Pastoral dance, Krsna (Krishna) and herdsmen dancing before Rādhā. Miniature of mixed Mughal (Mogul) and Rajput style, illustrating the Priyā līlā, from a ms. of the Rasikpriyā of Keśava Dās, *c.* 1600, one of the oldest and most important Hindī works on love poetry. Metropolitan Museum of Art, New York
4. Dancing scene in a palace, relief from Amarāvatī, *c.* 200. British museum
5. Dancer before a prince, with chorus, an 18th century Pahārī Rajput painting

The dramatic dance was originally taught by actors themselves until about the beginning of the 18th century, when it became an independent profession. The pioneers of that profession in Tokyo were Denjiro Shigayama, who was originally an actor, Kwambei Fujima and Senzo Nishikawa, each the founder of his own school or style, followed by other masters who formulated styles of their own, each with a number of followers. The most influential styles of dancing in Tokyo are *Fujima-ryu, Hanayagi-ryu,* and *Wakayagi-ryu* (*ryu* meaning style or school). Those of Kyoto are *Inouye-ryu* and *Shinozaki-ryu;* those of Osaka are *Nishikawa-ryu, Yamamura-ryu* and *Umemoto-ryu,* while Nagoya is dominated by *Nishikawa-ryu.* Broadly speaking, the dances in vogue in Tokyo are those with a dramatic element, being bold and active, cheerful and witty in style, more fitting to be performed by men on the stage than in a room, while those of Nagoya, Kyoto and Osaka, which lay great stress upon the grace and charm of movement, are more appropriate to be seen in a room than on the stage, and performed by female rather than male dancers.

According to a rule, the dancer begins at a point one step behind the centre of the stage, and brings the dance to a close at the centre with a stamp of the foot. The first step is to be taken with an "active" effect and the last with a "passive" feeling. Generally the dancer, in the course of the performance, describes a shape of a folding fan, which symbolizes prosperity as it spreads out toward the end. In pose. the face or the head of the dancer is considered to stand for heaven, the shoulders for the earth, and the waist for the man, indicating the three most important points to be considered in the dancing, and suggesting the relation of the one towards the others in the order of the universe. However, all parts of the body are used to make the dance well balanced, graceful and effective. While limbs, chiefly arms and hands in an endless variety of graceful sweeps and powerful flourishes, are mainly relied upon for the rhythmic movement, the waist keeps the equilibrium. A fan or a *tenugui* (scarf) is often used in dancing, being manipulated to suggest all sorts of things as the occasion may require. To give a few examples in common practice: an open fan raised gradually in front signifies the rising sun; used in a drinking attitude it may represent a wine cup; a closed fan may be used to suggest a stick, a bow, an arrow, or a gun, etc.; a scarf may be doubled and thrust into the sash to indicate long and short swords worn by a *samurai;* when redoubled and held on the palm in a smoking attitude it may serve as a pipe; or it may be made to describe running water by holding one end of it and giving it a quick succession of jerks from one side to the other.

It has been the ideal of some great master dancers of Japan to give the dance dignity, refinement and charm by investing it with idealistic, rather than realistic, quality; to make it suggestive, rather than merely explanatory; to create an interesting design, rather than a conglomeration of decorations. The dance of Japan is unique in many respects, and rich in beauty and tradition as the cherry blossoms that adorn the country in spring. (See THEATRE, NŌ DRAMA; JAPANESE ARCHITECTURE; PANTOMIME; FAN.) (J. HAR.; Y. K.)

INDIA

The Dramatic Dance.—Dancing and the drama in India are inseparable. The same words *naṭa, naṭī,* actor, actress, also designate dancer, danseuse; and a theatre (*nāṭya-śālā,* ves'ma) is equally a dancing stage. The classic Indian theatre is a thing of the past, with perhaps some exceptions in the south, but its technique survives in the modern "nautch" (nhc). Dancing is of three sorts, according to the content, and two according to style. *Nāṭya* is dancing used in a drama (*nāṭaka*) as part of the plot (the word *nāṭayati,* "gesturing," or "acting as if," is a regular stage direction whenever a particular action or mood is to be portrayed); *nṛtya* is dancing that expounds a theme by means of explicit gestures; *nṛtta* is dancing to music, but without a definite theme, and includes folk (*deśī*) dancing. The first two are of the same character Beyond this, *tāṇḍava* is a masculine and vigorous style of dancing; *lāsya* a feminine and graceful style.

The dance in its higher forms (*nṛtya*), as distinguished from merely decorative, and from the folk-dance, is a sort of pantomime in which a story is told, or events or persons alluded to, by means of formal gestures (*aṅgikâbhinaya*) presented in a rhythmic sequence and accompanied by singing and instrumental music; it is a kind of visible poetry with a definite meaning. Treatises on dancing are essentially dictionaries of gesture defining certain positions and movements of the head, neck, eyes and, above all, the hands; the latter are particularly used to convey explicit meanings, the head and eyes to express emotions. A single "hand," for example, the "flag" (*patāka*) hand, in which the fingers are extended in contact as when giving a slap, may have twenty or more meanings, depending on the way in which it is moved or the position in which it is held, and on the context of preceding and following "hands." In this kind of dancing the movement of the lower limbs is restricted to a quite subordinate rhythmic accompaniment; the dancer may indeed be seated.

The dance is accompanied by singing (by the dancer or by a chorus) and by instruments (usually in the north a *sāraṅgī* and drums, in the south a tambura and drums). The whole course of the dance may be summarized as follows: "The song should be sustained in the throat; its meaning must be shown by the hands; the mood must be shown by the glances; rhythm is marked by the feet. For wherever the hand moves, there the glances follow; where the glances go, the mind follows; where the mind goes, the mood follows; where the mood goes, there is the flavour." (Coomaraswamy and Duggirala, Mirror of Gesture.)

Dance Songs.—The songs of bayaderes are the lauds and songs of devotion of classical poets; the theme of their dances, the deeds of Kṛṣṇa, and the interplay of hero and heroine with their esoteric meaning. All conditions in India are penetrated and illuminated by a devotional culture. Three examples of songs, sung by the dancer while dancing and forming the theme of the dance, may be quoted: the first from northern India (Mathura), the second from the south (*Tanjore*), the third with an antiquity of a millennium and a half:

THE LONELY WIPE

Left all alone, my darling gone to another land, how
can I pass the days and nights?
Left all alone, wringing both her hands, left all alone
The rainy season has begun, the lightning flashes, the
night is dark, left all alone,
Senseless is my darling, my bed lies empty, left all
alone!

It should be explained that it is usual to abandon warlike operations during the rainy season; hence, if a man has not at that time returned, the suffering of the woman left at home is intensified by every reminder of the time when he should have been expected. In the actual dance, which is one of those that can suitably be performed seated, not only is the emotional experience clearly expressed, but the rain, the lightning and the dark night can all be represented.

The words of a Tanjore song are descriptive of Viṣṇu:

Is he the great being who rides on Garuda?
Is he the great being who sleeps on a snake?
Is he the great being who lifted Mt. Govardhana
upon his little finger?
Is he the great being who assumed the form of
the Fish Avatār?

The avatars of Viṣṇu are then given successively.

The words of Mālavikā's dance in Kālidāsa's classical Sanskrit play, the *Mālavikāgnimitra* (Act ii.) are as follow:

My beloved is hard to obtain, be thou without hope with respect
to him, O my heart!
But lo, I feel a throbbing in the outer corner of my left eye[1];
How then is this man, seen only after a long time, to he won?
My Lord, reflect that I am devoted to thee with ardent longing!

The stage direction, *Iti yathārasam abhinayati,* is "She gestures in accordance with the flavour (or sentiment)."

Like Indian music, the dance form begins and ends, from a Western point of view, unexpectedly: there is no emotional crisis, no excitement. Above all, it is not an exposition of the dancer's

[1]A good omen.

personality. Aesthetic experience, from the Indian point of view, is the work of the spectator; all that the artist can do is to provide the conditions. The dance is in no way strange or exotic to the Indian audience; its continuous rhythm, which can be more nearly paralleled in Western art by the music of Bach than by that of Beethoven, leads the spectator not away from himself, but far into himself. It is just because the visible spectacle is not insistent, not something to be curiously observed, but something that penetrates beyond the threshold of consciousness to the inner world of each beholder, that it can be watched for many hours without fatigue. Circumstantially, of course, the dance is more varied than at first it seems to be; for example, not only do the themes of successive dances change, but with every hour of the night the modes of the accompanying music must change, in accordance with a well-understood convention. It is not this variation, however, that explains the lack of monotony; that is due to a quality inherent in the art itself, whereby the spectator loses consciousness of the passage of time. It will be understood that this is not an art which can be transported to a foreign land; and perhaps the only opportunity that Europeans in Europe have ever had to witness oriental dancing was when King Sisowath brought his Cambodian dancers to Marseille and Paris.

Aesthetic Experience. — Mention has been made above of flavour in Indian aesthetics. Flavour (rasa) is that emotional quality which distinguishes a work of art from a mere statement, and aesthetic emotion from the emotions experienced in daily life. To the Indian, the dance, like any other art, has a spiritual significance independent of its theme or charm, for "by clearly expressing the flavour, and enabling men to taste thereof, it gives them the wisdom of Brahma, whereby they may understand how every business is unstable; from which indifference to such business, and therefrom, arise the highest virtues of peace and patience, and thence again may be won the bliss of Brahma."

The so-called oriental dancing of the European stage is in almost all respects unlike the dancing of the East where, for example, the dancer is always more, and not less, fully clothed than are other women in daily life, and where, if there be in the dance some erotic allusion, this not only has a definite significance, but is made in such a way as entirely to escape the notice of a western audience. The movements of the so-called oriental dancers of the West are indeed sinuous; but the fluidity of eastern movement is something far more than this. It is not even serpentine, but more like the wreathing of smoke. Nothing in India corresponds to the ball-room dancing of Europe and America; the mixed dancing of this kind is shocking to Indian ideas of propriety.

Education. — Dancers (female) are to a certain extent trained (Plate I., figs. 3, 4) by performers of their own caste and sex, but more especially by male dancing-masters, Brahmans, who are familiar with the literature as well as the practice of the art. Gaṇadasa speaks of the art as "a pleasing sacrificial feast to the eyes of the gods . . . and the one chief amusement of human beings." He exhibits his pupil Mālavikā before the king, queen and certain courtiers. Her performance is adjudged perfect in the following terms: "All was blameless, and in accordance with the rules of art; for the meaning was completely expressed by her [upper] limbs, which were full of language, while the movement of her feet was in perfect time, and she represented the moods to perfection. . . . In the successive developments of the acting, emotion kept banishing emotion from its place; it was a vivid picture of a series of passions" (*Mālavikāgnimitra,* Act. ii.).

An account of the education of a dancer is found in the Tamil *Silappadigāram,* ch. iii. She is initiated in her fifth year by means of the *taṇḍiyampiḍipittu* ceremony. Here a horizontal rod, wound about with flowers and a new cloth, is held by two dancers. The new pupil, bringing offerings of coconut, betel leaves, etc., and standing on grains of rice, symbolizing plenty, touches the rod with folded hands, repeating verses chanted by the instructor in honour of Ganapati and Jayanta. At the same time the instructor holds the pupil's feet and moves them according to the steps of the dances, and anklets with bells are placed on the ankles. This is a life dedication to the calling of a dancer. Instruction is begun in her seventh year, and must last at least five years. The theoretical part is usually given by a Brahman teacher, the practical exercises by an elderly and retired danseuse. In her twelfth year the pupil may appear in public and the teacher receives a reward.

Domingo Paes, writing about 1520, describes a room in the Vijayanagar palace in which the royal dancers practised and performances were given. On one side was "a painted recess where the women cling on with their hands in order better to stretch and loosen their bodies and legs." Presumably there was a horizontal rod against the wall, like that used by modern ballet-dancers for practice. At the other end of the room was the place occupied by the king during a performance, and in the middle of the wall was a golden image of a woman, or rather girl of 12 years, with her arms in the position taken at the end of a dance.

Generally speaking, the costume of a dancer does not differ markedly from that of local fashion, except by its greater richness. One part of it, the bells, however, is special and essential: a string of these, a hundred or two hundred in number, is bound round the ankles at the time of dancing, and the sound of these bells, as the dancer moves her feet in time, forms part of the music. When the dancer ties them on before dancing, she will invariably touch them to her eyes and forehead and murmur a brief prayer, and those who are learned in the lore of dancing say that "that dancing is vulgar and inauspicious which the actress does not begin with prayer."

Like other vocations in India, that of music, dancing and acting is in the main an hereditary profession. There have always been and still are some Brahmans and others of high caste who are expert both in the theory and practice of music, but the profession as practised by members of special castes has always had a low social status. At the present day the "Anti-Nautch movement" represents an endeavour to boycott the professional dances on puritanical grounds (with reference to the morals of the dancers, not to the character of the dance). It is desired to banish the danseuse alike from private and public entertainments and from all connection with temple service.

HISTORY OF THE DANCE IN INDIA

Vedic Dances. — Ritualistic dances are mentioned in the Vedas. Thus, in the Mahāvrata ceremony, women celebrate to the sound of the lute the patrons of the ceremony; maidens dance round the fire with water-pitchers while the Stotra is being performed. They pour water on the fire, an act of sympathetic magic intended to produce rain, and the song shows that they desire richness in milk, as well as water for the cows. At the close of the Horse Sacrifice also girls dance round the Mārjālīya fire with water-pots on their heads, beating the ground with their feet and singing "This is honey." They are said to endow the sacrificers with might. Again, four or eight women dance at the house of the bride, at a wedding.

The word iyati in the Black *Yajur* Veda refers to the accompaniment of recitation by pantomimic gesture: the Nata *Sūtras* mentioned by Pāṇini must have been handbooks of gesture, analogous to the later works on *abhinaya.*

Dancing as a Court Function. — In the Buddhist and Epic periods, dancing is well known as a normal court function and as a means of paying honour to a king or distinguished guest. Thus the festival of the gods takes place in Indra's city; he is host, and the other gods come and take their seats in due order as spectators of the dance of the Gandharvas and Apsarases. The gods themselves may sing and dance in honour of a human saint, but the dancers and musicians proper are the Gandharvas and Apsarases. The latter are beautiful girls, often employed by the gods to seduce the great saints from their meditations, for which there is a parallel in the Buddha legend in the attempted seduction of Gautama by the three daughters of Māra, who dance before him. More often the Apsarases are simply the dancers in heaven, by whom the gods are entertained and honoured. Equally characteristic was the keeping of troupes of dancers at royal courts on earth. Whatever the social status of professional dancers may always have been, and despite the fact that the art, like others, is an

almost purely professional vocation, it is certain that dancing in the Gupta and mediaeval periods was also an aristocratic accomplishment, affording in this respect a parallel to the state of painting at the same time.

Dancing as an Accomplishment.—Dancing and music as a royal accomplishment may be illustrated by the following examples: In the *Divyāvadāna* (Cowell and Neill, p. 544 et seq.) King Rudrāyaṇa plays the lute (*viṇā*) while his wife Candrāvatī dances; the Gupta emperor, Samudragupta, had coins struck in which he is represented as seated and playing on the lyre or lute, while an inscription of the same great monarch at Allahabad records his skill in music. Kālidāsa represents King Agnivarman as competing with actors in their art. In Devendra's *Uttarādhyayana-ṭikā* (Meyer, *Hindu* Tales, p. 105) King Udāyana plays on the lute while his wife dances, but drops the plectrum of the lute, at which the queen is angered and asks "Why have you spoilt the dance?" In the *Mahāvaṁsa,* ch. lxiii. v. 82, 83, Parākrama Bāhu I. (of Ceylon) is said to have built a theatre beside his palace "that so he might listen to the . . . singers, and witness the delightful dance," while his queen Rūpavatī, who was young and beautiful, and an embodiment of all the traditional virtues of a Hindu wife "was skilled in dancing and was richly endowed with a mind as keen as the point of a blade of grass." These instances will suffice to show that the modern prejudice against dancing as an art to be studied by persons of honourable social status has no foundation in classic tradition.

Dancing as a Religious Office.—Still more interesting is the ritual service of dancing in temples. The proper occasions of dancing are festivals, celebrations, processions of men or gods, marriages, reunion of friends, first occupation of towns or houses, the birth of children and similar auspicious events. The dance is essentially an honour paid to the chief guest, and particularly to kings. Now the daily ritual or service performed at the shrine of a deity is essentially the same as the daily service of a king, and it is therefore only natural that dancing before the shrine should form a part of the regular morning and evening offices. At wealthy shrines a considerable number of Devadisis ("women servants of the deity") are permanently attached to the temple, both to perform this office and to take part in the dramas which are presented in the temple on certain holidays. This practice has survived in southern India to the present day, but we have earlier records of it on a more lavish scale (N. M. Penzer, The Ocean of Story). Inscriptions of Rājarāja and other of the Coḷa kings (in the Tanjore district, at the beginning of the 11th century) refer to theatres and the establishment of large numbers of dancers in connection with temples, and for this purpose we find that private as well as royal endowments were made. Thus the assembly or town council of Sāttanūr gave lands for the maintenance of Sanskrit plays; Rājarāja brought from other temples and settled at Tanjore as many as 400 dancing girls; Kulōttunga III. appointed an additional dancing-master in the temple who had to dance with gestures. The entertainment of the god enshrined is modelled upon that of a god in his heaven, and that of a king on earth.

DANCES OF THE GODS

The Veda knows of gods who dance; thus, in Rigveda x., 72, we have a creation hymn in which the gods, dancing apparently in a ring, set up a rhythmic flux in the primeval waters, and this magic dance sets all nature in motion:

> When there, O gods, ye stood in the primeval sea, holding each the other by the hand, then rose from you as dancers (*nṛṭyatām* iva) clouds of dust.

Indra is also said to appear as an aged dancer, as a presage of victory in battle; Uṣas, the Dawn, is called a dancer adorning herself. But none of these conceptions of a dancing god or gods seems to have had the importance later attained in the case of Siva, who as the divine dancer par excellence is known as Naṭarāja.

Dance of Śiva.—We find an invocation (commencement of the Mirror of Gesture) addressed to Śiva, the great patron of the drama and an actor whose gesture is the world process, whose speech is the sum of all languages and whose ornaments are the moon and stars. His dances are *tāṇḍava* dances, energetic and virile. The most significant is the *nadānta,* represented in the well-known south Indian metal images of Naṭarāja (Plate I., fig. 7). The significance of this dance is often alluded to in the mediaeval Śaiva literature: "Our Lord is the dancer, who, like the heat latent in firewood, diffuses his power in mind and matter, and makes them dance in their turn." More specifically, the dance represents the deity's five activities (*Pañcakṛtya*), viz., the world process of creation or evolution, maintenance, and destruction or involution; the embodiment of souls and their release from the cycle. The drum in the upper right hand stands for creative sound, the flame in the upper left for the fire of destruction or change. It should be understood that in Indian mythology the cosmic process is conceived as a succession of vast cycles of manifestation and non-manifestation, or creation and destruction; and also that the phenomenal world at all times is one of perpetual change, involving perpetual creation and destruction. The dance is the entire process in all its complexity; and it is only rightly apprehended when it is realized as taking place within the worshipper's own consciousness. Śiva is also called Sudalaiyiidi, Dancer of the Burning Ground (cemetery), and the heart of the lover of god, made bare of all else, is this bare field prepared for him. The same idea is met with in connection with the goddess in the form of Kali:

> I have made a burning-ground of my heart,
> That Thou, Dark One, haunter of the burning-ground
> Mayest dance the eternal dance therein.

Siva also performs an evening dance on Mt. Kailāsa, before the assembled gods and the goddess, and paintings of the subject are known. The elephant-headed deity, Gaṇeśa, son of Siva, is also spoken of as taking part in this evening dance, and is represented in sculpture as dancing. It is probable that most of the dances referred to above belong to the non-Aryan and ancient Dravidian elements in the personality of Śiva-Rudra. The *tāṇḍava* in particular, and the dance of Kālī, must have been originally orgiastic dances, later interpreted in a philosophical and mystical sense. The principal "primitive deity" in Ceylon, Gale Yakā, the God of the Rock, is worshipped by an annual dance on the summit of the rocks sacred to him, with which may be compared the ritual dances of south Indian hill-men in honour of Murugan.

While every Śaiva temple in southern India has a copy of the metal image of Śiva as Naṭarāja kept in a special Hall of Audience (*sabhā-maṇḍapa*) at Cidambaram, he is worshipped in this form as the principal deity; here in the Golden Hall (*kanaka-sabhā*) is the premier Naṭarāja image of the south. The western and eastern gopurams of this temple, dating from the 13th century, contain sculptured panels with accompanying text, illustrating no less than 93 of the 108 dancing poses described in the Bharatiya *Nāṭya-śāstra.*

Dances of Other Deities.—The elephant-headed deity, Gaṇapati, son of Siva, is a patron of the stage, and himself often dances. In Buddhist art numerous feminine divinities, corresponding in a general way to Kālī of the Hindu pantheon, are represented as dancing. Dances of victory are attributed in the Silappadigāram to Subrahmaṇya, the god of war. According to the commentator, Adiyārkunallār, Subrahmanya, having slain the demon Sūrapadmāsura, danced his war-dance of triumph on the heaving wave-platform of the ocean-stage, to the accompaniment of the rattle of his drum, and subsequently danced in derision of the flying demons the *kuḍaikūttu,* or umbrella dance. This dance is still sometimes performed during temple processions, when the god's umbrella-bearer cuts some capers with his unwieldy parasol borne before the deity. Other familiar dances of a deity are those of Kṛṣṇa, the cowherd incarnation of Viṣṇu. One of these is the pot-dance (*kuḍakūttu*), originally a pastoral folk-dance, but used by Kṛṣṇa as a dance of victory after the defeat of Bāṇāsura. Another dance of victory took place after the poisonous dragon Kāliya finally had been overcome. Kṛṣṇa is again often represented dancing a childish dance with a pat of butter, of which he was very fond. But the most significant of his dances is the

rāsa-maṇḍala, the circle of passion, a round dance in which the milkmaids took part on moonlit nights beside the Jamna.

FOLK DANCES

Folk dances (*deśī, i.e.,* "countrified") still are and no doubt have always been found all over India; among agriculturists and in primitive tribes everything is celebrated and solemnized with the dance. It should be observed that, as Col. Hodson has remarked, primitive culture is the matrix of the higher; thus the folk dances have not only an interest of their own, but also they provide the material from which the dances of the aristocracy and of the higher ritual are derived. Indeed, there are many folk dances which make their appearance in the most artistically sophisticated spheres as *dances de divertissement.* Before referring to these, however, we shall discuss the dances of the people in their original environment.

'There are, for example, courtship dances among the Santals. On full moon nights the drum is sounded and the girls assemble under a big banyan tree, their dresses decorated with flowers in spring. with feathers in winter. Meanwhile the young men with a banner and musical instruments gather in the rice-fields beyond. The girls do not seem to see them, but are chattering together and completing their toilet. Then the banner and drum come forward; the young men approach the girls, who stand in a row, linked in pairs, arm in arm. The girls sway to and fro with the music, bending and rising; they advance and retire, but never actually mix with the young men. It is only after the dancing that young men and women have any opportunity to meet and court. The Santals have also their decorative *dances de divertissement;* for example, "the gathering of indigo," and "the quarrelling of co-wives."

In Bengal there is a women's ritual dance, never seen by men, the drummer remaining behind a curtain. This takes place during the Indra-pūjā festival on full moon nights. The women dance and sing erotic songs and in the morning they go down to the river and bathe.

A kind of dancing especially characteristic of southern India and Ceylon is the so-called devil dance (*Yakkun neṭuma*). This is a violent male dance, thus of *tāṇḍava* character. Used primarily as a means of exorcism, it is performed in cases of sickness. The possessing yakkas, regarded as demons causing disease, are first invited by beat of drum to attend the performance; afterwards, having been thus entertained, they are asked to take their departure.

The Nongkrem dance, one of the greatest festivals in the Khasi hills, is an essential part of the goat sacrifice performed by the Siem of Nongkrem: "the sacrifice is followed by twenty-two men armed with swords and cowries (fly-flaps). Having danced before the altar, the party returns to the house of the Siem priestess and executes another dance in the great courtyard. . . . Then follows a great dance of girls and men in front of her house . . . then there is the dance of the men. . . . After gyrating for some time two men at a time rapidly approach one another and clash their swords together in mock combat. . . . Dancing forms part of the ceremony of placing the ashes in the sepulchre of the clan." With the last feature may be compared the honouring of the body of the Buddha before the cremation, with song, dance and music, as mentioned in the *Mahāparinibbāṇa Sutta.*

Primitive dances are often symbolical enactments of events which the people desire to be successfully accomplished. "The Bhils danced at their festivals and before battles . . . The object was to obtain success in battle by going through an imitation of a successful battle beforehand. . . The Sola dance of Gonds and Baigas in which they perform the figure of the grand chain of the lancers, only that they strike their sticks together instead of clasping hands as they pass, was probably once an imitation of a combat. It is still sometimes ddnced before their communal and hunting parties" Among the Angami Nagas, "Dancing. singing . . . go hand in hand with ceremonial dress . . . the songs sung include both particular songs traditionally associated with the occasion, and sometimes in archaic language not fully understood except by those skilled in them" or a highly developed sign language (Col. Hodson, *Primitive Culture of India*).

It is by no means unusual to meet with the folk dances in the environment of the higher culture. The Sangita Ratnākara, an authoritative work on music and dramatics, enumerates 10 varieties. The Tamil Silappadigāram enumerates 14 dances of which the majority are for use at the Indra Pūjā festival, and of these several, such as Koṭṭavai's dance with a rice measure, are of folk character. We also meet with these folk dances on the classical stage; as in the *Karpūramañjarī* of *Rājaśekhara* we have a circular dance performed by girls, another in which the dancers face each other in two rows, and also the stave dance (*daṇḍa rāsa*) referred to above. This *danda rdsa,* in which the dancers hold short staves in each hand, striking them against those of the neighbouring dancer alternately to right and left, is also frequently depicted in decorative temple sculpture (fig. 6). The *rāsa-maṇḍala* and other dances of Kṛṣṇa with the milkmaids of Bṛndāban are of folk character, being constantly represented in paintings of the Rājput school, and are typically circular dances in which the figure of Kṛṣṇa is multiplied. Not infrequently Kṛṣṇa and Rādhā occupy the centre of the field, whirling round with feet together and leaning .apart with hands clasped at full arm's length.

MODERN DANCING

Until 1912, modern dancing was a decadent phase of 18th and early 19th century forms. In that year began a new era of popular dancing, in which 20th century industrialized society finally broke away from the courtly steps which had expressed the emotions and social attitudes of another civilization and found new steps to fit a new cultural situation. America led the way in this renaissance. Until the turn of the century, dancing in the United States was a slavish imitation of standardized and well-worn European steps. The polka, schottische, Viennese waltz and cotillon were all favoured by Yankee dancing masters of the 19th century. Sectional groups in the country developed indigenous group dances, such as the Paul Jones and the square dance. But these failed to affect the prevailing trend.

In 1912, coincident with the rise of ragtime and jazz in popular music, the United States gave birth to a new form of dancing whose nervous and gyrating motions were well suited to express the emotions of a mechanical, urbanized civilization. The first jazz dances of this century, the Turkey Trot, Bunny Hug. and Grizzly Bear, were often crude, vulgar and ugly. But the sense of exhilaration and release experienced by the dancer of these steps caused them to sweep the country. Elderly people, as well as boys and girls, were caught up in a dance-enthusiasm that writers of that period called the "dance-craze." From then on, dancing was taken over by the common people, and became an authentic expression of their moods and feelings.

Before the World War of 1914 to 1918, Mr and Mrs. Vernon Castle were the principal exponents of popular dancing. They took the crudeness out of the early jazz steps, and introduced the first refinements into ballroom dancing. The most important of their original dances was the Castle Walk, a long-legged walking step in which the lady was backed around the room continuously The Castles also pioneered when they imported a Spanish-American dance to this country. They introduced the Tango, a sinuous and extremely graceful dance whose point of origin was Argentina. The Tango remained popular until very recent years.

Between 1912 and 1915 new dances sprung up and disappeared in very rapid succession Of more than one hundred new dances introduced during that time, the Hesitation, to Waltz music, and the Maxixe, imported from Brazil, were the most popular. Between 1915 and 1935, with the exception of the Charleston, which had a slight vogue in 1925, no new dance ever achieved any noticeable degree of popularity. The Charleston was most popular as an exhibition dance

BALLROOM AND EXHIBITION DANCES

1. The Castle Walk, originated by Vernon and Irene Castle. This dance is a variation of the one-step and was popular from **1913** to **1915.** It consisted of long walking steps on one's toes, moving up and down after striking the beat
2. The Argentine Tango was popular between **1914** and **1916,** but was later replaced by the French Tango. Photograph shows Ricardo Cortez and Dolores Del Rio
3. The Maxixe had a brief popularity as a ballroom dance in **1914.** For a year afterwards it was used only as an exhibition dance, danced by Ramon and Renita
4. The Lula-Fado. Tato Polka, Braziliane had a brief vogue between **1914** and **1916.** Photograph shows Arthur Murray and partner in the Chinese Tato
5. There was a lull in dancing after the hectic craze which died down in **1917,** until **1926** when the Charleston became popular. Photograph shows Fred Astaire and Ginger Rogers, in a characteristic step of the Charleston
6. Tap Dancing. Eleanor Powell in a characteristic pose

by amateurs and was extensively used in tnusical comedy choruses. The Black Bottom followed on the heels of the Charleston, hut it was an ugly dance and short lived.

In 1925, Arthur Murray, a protege of Vernon Castle, standardized ballroom dancing. He simplified all modern dancing by introducing five fundamental steps. In 1930 Mr. Murray introduced the Westchester style of dancing popular with college students. This new youthful step called for a sixth basic movement—the Running Step.

The staple dance-steps of the present generation are the Waltz and the Fox Trot. After a lengthy popularity, the Tango died out: The Cuban Rhumba, an intricate dance, and the Conga are growing in public favour. Especially among the more sophisticated circles in larger cities, the Rhumba is close in popularity to the Fox Trot (1940).

Among the younger people of the more moderate economic classes the Shag and the Lindy Hop are popular. These two "jitterbug" dances followed on the heels of the craze for swing-music, which developed after 1935 and saw the inception of a second "dance-craze." The Shag is a fast, nervous, hopping dance, performed in time to strongly accentuated rhythm.

The growing popularity of swing-dancing led in 1937 to the first of a series of group-dances. The Big Apple, which swept the United States during 1937, was a combination of several "jitterbug" steps, including the Shag and the Lindy Hop, as well as the addition of such vivacious movements as the Suzy-Q and Truckin'. In the Big Apple, the "caller," an appendage of the 18th century group-dancing, came into being again. The Big Apple was generally performed by a group of eight or ten couples, formed into a ring. After a march by the group as a whole, the "caller" would shout for one or another of the swing steps and at each call one of the couples would enter the centre of the ring and perform a figure.

In the summer of 1938, Mr. Murray imported the Lambeth Walk from London. The simplicity of the Lambeth Walk quickly gained it nationwide popularity. Originally, the Lambeth Walk was an old English folk-step, performed in the Limehouse district of London. It was dressed up, polished, refined and brought to America. Essentially, it was a walking-dance, done in a jaunty, strutting fashion.

After the Lambeth Walk, three other group dances were imported from England in succession: The Palais Glide, Chestnut Tree and Boomps-a-Daisy. None of them matched the Lambeth Walk in public popularity.

The Fox Trot is still the most widely performed step, probably because its rhythm is simple enough to be easily and quickly learned by beginners, and because its possible combinations of steps are sufficiently varied to hold the interest of the most accomplished.

The Waltz, too, has become a standardized step for modern dancers. People who have learned the Waltz correctly are admittedly the most graceful dancers, and they are able to adopt other steps more readily.

All the modern dances are composed of combinations of the six Basic Steps. Without a thorough knowledge of these Basic Steps, one cannot hope to do any of the modern dances really well. With a knowledge of them, there are practically no combinations, done ordinarily in the Fox Trot and the Waltz, at least, which one should not be able to pick up readily. The six Basic Steps are: The Walking Steps, the Chassé, the Waltz, the Balance and the Pivot and the Running Steps.

Walking Steps: Each of the Walking Steps takes up two beats of the music. On the first beat, place the whole foot forward on the floor, toe first, the heel barely touching—if you are doing the man's part. If you are doing the woman's part, reach backward with the toe as far as possible. On the second beat, rise slightly on the toes to give spring and pep to your step, and finish.

Step smartly and lightly, shifting your weight from one ioot to the other. When you take a step with one foot, always lift the other off the floor. Never drag or slide the feet along.

Practice taking long, slow steps about the room. Women, in their practice, should give especial attention to walking backward. Keep the knees straight and firm and always make the toes lead. Dance as if you did not have a foot but only a great toe. Practice stretching your toes forward, or backward, as far as you can reach, and always keep them turned out to avoid a pigeon-toed appearance. Always step in a straight line, directly forward, directly back, or directly to the side. This is fundamental to a good balance, good appearance, and a sense of unity with your partner.

The Chassé: The Chasse is a short, quick step directly to the side—either to the right or to the left. For the left Chassé, step directly sidewise to the left and draw the right foot up to the left. For the right Chassé, step directly to the right with the right foot and draw the left foot up to the right. Complete the movement with smartness and precision by bringing the feet together so that they actually touch each time.

The Waltz: The Waltz is a combination of a Walking Step and a Chassé (in 3–4 time). In the modern Waltz, the accent falls upon the Walking Step, and ali the steps are of the same length and value. Practice the Waltz Steps to modern Waltz music, counting one-two-three with a definite accent each time on the "one." Or, better still, keep time with the words, "step, side, together," the accent falling upon "step."

The Waltz may be done forward, backward, or used as a turn to left or right. The Waltz may also be danced to Fox Trot music by holding the first step for two beats; the second and third steps of the Waltz each receive one beat.

The Balance: The Balance is a Hesitation. Step forward, back or to the side with the whole weight upon one foot, and rise, pointing the free foot forward, back or to the side with the toe just touching the floor. The Balance is used in many combinations in both the Fox Trot and the Waltz. When danced to Fox Trot music, it is given two counts. When danced to Waltz music, it is given three. It is a very graceful step, interesting to do, and, moreover, a sure means of developing a good sense of balance.

The Pivot is simply a particularly graceful and effective way of making a quick turn. Always see that one foot is directly in front of the other. Rock forward, on right foot, bringing the entire weight upon the ball of the forward foot, and spin round, making a quarter turn. Rock back on the left foot, and repeat the motion.

The Running Steps are known as syncopated steps because three steps are taken to four beats of the music; you take three quick running steps, then pause on the fourth beat. The syncopated steps are helpful to the lady in following because they teach her to step quickly. This is a decided asset to one who must change her step rapidly in order to follow various partners. Although the running steps are faster than walking steps, they are just as long. It is always best to take long steps, whether they be fast or slow. A short step betrays a lack of confidence.

A man must train his ieet by constant practice to do the various steps and combinations automatically in order to inspire confidence in his partner and to lead with that easy nonchalance that is the mark of an accomplished dancer. It is a mistaken idea that to be a strong leader a man must take a death grip upon his partner and push and pull her with force about the floor. Hold your partner firmly, yes—especially with your right hand—and then go through your steps with certainty and precision. If she knows the steps she will be able to follow. If she does not no amount of forceful guiding upon your part will be of any help to her.

The Rhumba, a graceful and exciting dance-step, is based on the Rhumba rhythm: one, two, three, pause; one, two, three, pause. Because the knees are actively employed in this step, the dancers stand about 8 inches apart. Stand erect, heels together, and relax your weight on the heel of the left foot and at the same time cross your right knee in front of the left. Then shiit your weight to the heel of the right foot and cross the left knee in front of the right. Once again shift your weight to the heel of the left foot and cross the right knee in front of the left. Pause after the third count. This is the basic Rhumba motion, unique for this dance, and employed in all Rhumba steps, whether forward or backward.

The Shag has one main step: step on left foot and hop with left, landing on left. Step on right foot and hop with right, landing on right. Shift weight quickly to left foot, lifting the right ioot about two inches off the floor. Shift weight quickly to right foot, lifting the left foot about two inches off the floor.

The Correct Position: The best position is the easiest and most natural. Stand erect on the balls of your feet, making yourself as tall as possible. Rest the weight upon the foot that you are not going to use first, leaving the other one free for your initial step. Keep the back straight, the shoulders relaxed, the chest out, head up, chin in, eyes directed over your partner's right shoulder, arms high, at about shoulder height. It is very important to keep the arms well up in dancing. Women who unconsciously allow their arms to sag always seem heavy, even though they may be very light on their feet.

The man holds the woman straight in front of him—never to one side—and firmly, just close enough to enable him to guide her easily. His right hand rests in the middle of her back, just below the shoulder blades. His left arm is extended to the side and bent slightly at the elbow, the left hand holding her hand lightly.

The woman rests her left hand lightly upon the back of the man's shoulder. She should never curl her hand under his arm. Trick holds are out of date. Her right arm is extended to the side in an easy, graceful curve with the right hand resting lightly in the man's. Be careful to avoid a spasmodic clutch. It betrays a tension and a lack of confidence that are destructive to your partner's pleasure in dancing with you.

In starting, the man steps forward directly toward his partner, leading with his left foot. The woman steps directly backward, leading with her right foot. Don't be afraid of stepping on your partner's feet. If you start on the proper foot and step in a straight line. directly forward or directly back, you never will get in your partner's way.

There is no fixed sequence for the six Basic Steps or any of their variations. In modern dancing, the leader may swing into any step at any time, as his fancy may dictate or the music seems to suggest. This is why it is so extremely important that the woman should be thoroughly familiar with the steps her partner may decide to do. The only way to gain confidence and to overcome self-consciousncss, awkwardness, and stiffness in dancing is to learn the steps and by constant practice to master them so perfectly that you could almost do them in your sleep.

Self-assurance, ease, grace, and relaxation come as a natural consequence of knowing how. Self-consciousness, stiffness, awkwardness will vanish, and you will find yourself dancing with ease and spontaneous

enjoyment. *See also* BALLET. (A. Mu.)

DANCOURT, FLORENT CARTON (1661–1725), French dramatist and actor, was born at Fontainebleau on Nov. 1, 1661. In 1685, in spite of the strong opposition of his family, he appeared at the Théâtre Français. One of his most famous impersonations was Alceste in the *Misanthrope* of Molière. His first play, *Le Notaire obligeant,* produced in 1685, was well received. *La Désolation des joueuses* (1687) was still more successful. *Le Chevalier à la mode* (1687) is generally regarded as his best work, though his claim to original authorship in this and some other cases has been disputed. In *Le Chevalier à la mode* appears the *bourgeoise* infatuated with the desire to be an aristocrat. The type is developed in *Les Bourgeoises à la mode* (1692) and *Les Bourgeoises de qualité* (1700). Dancourt was a prolific author, and produced some 60 plays in all. He died on Dec. 7, 1725. The plays of Dancourt are faithful descriptions of the manners of the time, and as such have real historical value. Most of them incline to the type of farce rather than of pure comedy. Voltaire defined his talent in the words: "Ce que Regnard était à l'égard de Molière dans la haute comédie, le comédien Dancourt l'était dans la farce."

His two daughters, Manon and Marie Anne (Mimi), both obtained success on the stage of the Théâtre Français.

DANDELION (*Taraxacum officinale*), a perennial herb belonging to the family Compositae (*q.v.*). The plant has a wide range, being found in Europe, Central Asia, North America, and the Arctic regions, and also in the south temperate zone. The leaves form a spreading rosette on the very short stem; they are smooth, of a bright shining green, sessile and tapering downwards. The name dandelion is derived from the French *dent-de-lion,* an appellation given on account of the tooth-like lobes of the leaves. The long tap-root has a simple or many-headed rhizome; it is black externally, and is very difficult of extirpation. The flower-stalks are smooth, brittle, leafless, hollow and very numerous. The flowers bloom from April till August, and remain open from five or six in the morning to eight or nine at night. The flower-heads are golden yellow, and reach 1½ to 2 in. in width; the florets are all strap-shaped. The fruits are olive or dull yellow in colour, and are each surmounted by a long beak, on which rests a pappus of delicate white hairs, which occasions the ready dispersal of the fruit by the wind; each fruit contains one seed. The globes formed by the plumed fruits are nearly two inches in diameter. The involucre consists of an outer spreading (or reflexed) and an inner and erect row of bracts. In all parts of the plant a milky juice is present. The root externally is brown and wrinkled, internally white, with a yellow centre and concentric paler rings. It is two inches to a foot long, and about a quarter to half an inch in diameter. The leaves are bitter, but are sometimes eaten as a salad; they serve as food for silkworms when mulberry leaves are not to be had. The root is roasted as a substitute for coffee. Several varieties of the dandelion are recognized by botanists; they differ in the degree and mode of cutting of the leaf-margin and the erect or spreading character of the outer series of bracts. *T. paludosum,* the marsh dandelion, aifects boggy situations, and flowers in late summer and autumn; it has nearly entire leaves, and the outer bracts of its involucre are erect.

The red-seeded dandelion (T. *laevigatum*), a native of Europe, very similar to the common species but smaller with red, shorter beaked fruits and more deeply and finely cut leaves, is now widely naturalized in the United States and Canada.

DANDIN (*fl.* 6th century A.D.), Sanskrit author and court poet of Siidraka. He wrote the *Kāvyādarśa,* a manual of poetics (Sanskrit text and Eng. trans. by S. K. Belvalkar, 1924), and *Daśakumāracharita* or "adventures of the ten princes" portraying low-class city life (latest Sanskrit and English edition published at Bombay, 1919).

DANDOLO, the name of one of the most illustrious patrician families of Venice, of which the earliest recorded member was one of the electors of the first doge (A.D. 697). The Dandolo gave to Venice four doges; of these the first and most famous was Enrico Dandolo (*c.* 1120–1205), elected on Jan. 1, 1193 (*more Veneto,* 1912). Although over 70 years old and of weak sight (the story that he had been made blind by the emperor Manuel Comnenus while he was at Constantinople is a legend), he proved a most energetic and capable ruler. He re-established Venetian authority over the Dalmatians who had rebelled with the king of Hungary's protection, but he failed to capture Zara, owing to the arrival of the Pisan fleet, and although the latter was defeated by the Venetians, the undertaking was suspended. In the meanwhile the Eastern emperor Isaac II. Angelus had been deposed, and the new emperor Alexius was unfriendly to the Venetians. Dandolo therefore listened to the proposals of the crusaders who asked Venice for free passage and the means of transport. Dandolo subsidized the crusaders heavily, and, with a promise that payment would be deferred, persuaded them to turn aside and assist him in the reduction of Zara. Dandolo himself commanded the expedition, and Zara was taken and sacked. He then induced the crusaders to listen to the proposals of Isaac's son, Alexius, for the dethronement of the emperor Alexius. The fleet wintered at Zara, and then, under Dandolo's command, sailed for the Bosporus. For the capture and sack of Constantinople and the erection of the Latin empire, *see* CRCSADES.

Immense booty was secured, the Venetians obtaining among other treasures the four bronze horses which adorn the façade of St. Mark's. Dandolo was one of the candidates for the imperial throne of the new Latin empire, but Count Baldwin of Flanders was elected and crowned on May 23. The Venetians were given Crete and several other islands and ports in the Levant, which formed an uninterrupted chain from Venice to the Black Sea, a large part of Constantinople (whence the doge assumed the title of "lord of a quarter and a half of Romania"), and many valuable privileges. But hardly had the new state been established when various provinces rose in rebellion and the Bulgarians invaded Thrace. A Latin army was defeated by them at Adrianople (April 1205), and the emperor himself was captured and killed, the fragments of the force being saved only by Dandolo's prowess. But he was now old and ill, and on June 23, 1205 he died.

Enrico Dandolo's sons distinguished themselves in the public service, and his grandson Giovanni was doge from 1280 to 1289. The latter's son Andrea commanded the Venetian fleet in the war against Genoa in 1294, and, having been defeated and taken prisoner, he was so overwhelmed with shame that he committed suicide by beating his head against the mast (according to Andrea

Navagero). Francesco Dandolo, also known as Dandolo Cane, was doge from 1329 to 1339. During his reign the Venetians went to war with Martino della Scala, lord of Verona, with the result that they occupied Treviso and otherwise extended their possessions on the *terra firma.* Andrea Dandolo *(c.* 1307–1354), the last doge of the family, reigned from 1343 to 1354. He had been the first Venetian noble to take a degree at the university of Padua, where he had also been professor of jurisprudence. The terrible plague of 1348, wars with Genoa, against whom the great naval victory of Lojera was won in 1353, many treaties, and the subjugation of the seventh revolt of Zara, are the chief events of his reign. The poet Petrarch, who was the doge's intimate friend, was sent to Venice on a peace mission by Giovanni Visconti, lord of Milan. "Just, incorruptible, full of zeal and of love for his country, and at the same time learned, of rare eloquence, wise, affable, and humane," is the poet's verdict on Andrea Dandolo *(Varior. epist.* xix.). Dandolo died on Sept. 7, 1354. He is chiefly famous as a historian, and his *Annals* to the year 1280 are one of the chief sources of Venetian history for that period; they have been published by Muratori *(Rer. Ital. Script.* tom. xxi.). He also had a new code of laws compiled (issued in 1346) in addition to the statute of Jacopo Tiepolo. Another well-known member of this family was Silvestro Dandolo (1796–1866), son of Girolamo Dandolo, who was the last admiral of the Venetian republic and died an Austrian admiral in 1847. Silvestro was an Italian patriot and took part in the revolution of 1848.

BIBLIOGRAPHY.—S. Romanin, *Storia documzentata di Venezia* (Venice, 1853); among other books H. Kretschmayr's excellent *Geschichte von Venedig* (Gotha, 1905) should be consulted: it contains a bibliography of the authorities and later researches and discoveries; C. Cipolla and *G.* Monticolo published many essays and editions of chronicles in the *Archivio Veneto,* and the "Fonti per la Storia d'Italia," in the *Istituto storico italiano; H.* Simonsfeld wrote a life of *Andrea Dandolo* in German (Munich 1876).

DANDOLO, VINCENZO, COUNT (1758–1819), Italian agricultural chemist, a native of Venice, welcomed the advent of Napoleon in Italy (1796), and was a member of the grand council of the Cisalpine Republic at Milan. From 1805–09 he was governor of Dalmatia, where he sought to improve agriculture. He died at Venice on Dec. 13, 1819. Dandolo wrote several treatises on agriculture, vine-cultivation, and the rearing of cattle and sheep, and a work on silk-worms, which was translated into French by Fontanelle.

DANDURAND, RAQUL (1861–1942), Canadian lawyer and statesman, was born on Nov. 4, 1861, at Montreal. Educated at Montreal college and Laval university, he was admitted to the bar in 1883. He applied himself to the local organization of the Liberal Party, was called to the Senate in 1898, being Speaker 1905–9, and was minister without portfolio in the cabinet of 1926–30. His chief work is *Traité théorique et pratique de droit criminel* (Montreal, 1890). He was president of the 6th Assembly of the League of Nations. Dandurand died March 11, 1942.

DANDY, a word which about 1813–16 became a London colloquialism for the exquisite of the period. It is probably derived from the French *dandin,* "a ninny or booby," but in *The Northampton Mercury* (April 17, 1819), occurs the following: "Origin of the word 'dandy.' This term, which has been recently applied to a species of reptile very common in the metropolis, appears to have arisen from a small silver coin struck by King Henry VII., of little value, called a *dandiprat;* and hence Bishop Fleetwood observes the term is applied to worthless and contemptible persons."

It was Beau Brummell, the high-pricst of fashion, who gave dandyism its great vogue, though it existed before his day. About the middle of the 18th century was founded the Macaroni club. This was a band of young men of rank who had visited Italy and sought to introduce the southern elegances of manner and dress into England. Their costume is described as "white silk breeches, very tight coat and vest, with enormous white neckcloths, white silk stockings and diamond-buckled, red-heeled shoes." For some time the moving spirit of the club was Charles James Fox. It was with the advent of Brummell, however, that the cult of dandyism became a social force. Beau Brummell was supreme dictator in matters of dress, and the Prince Regent is said to have wept when he disapproved of the cut of the royal coat. Around the Beau collected a band of young men whose insolent and affected manners made them universally unpopular. Their chief glory was their clothes. They wore coats of blue or brown cloth with brass buttons, the coat-tails almost touching the heels. Their breeches were buckskin, so tight that it is said they "could only be taken off as an eel would be divested of his skin." A pair of highly-polished Hessian boots, a waistcoat buttoned incredibly tight so as to produce a small waist, and opening at the breast to exhibit the frilled shirt and cravat, completed the costume of the true dandy.

See Barbey D'Aurevilly, *Du dandysme et de G. Brummell* (1887); Sir A. Conan Doyle, *Rodney Stone* (1896).

DANEGELD, an English national tax originally levied by Aethelred II. as a means of raising the tribute which was the price of the temporary cessation of the Danish ravages. This expedient was first adopted in 991 and was repeated in 994, 1002, 1007 and 1012. With the accession of the Danish king Canute. the original *raison d'être* of the tax ceased to exist, but it continued to be levied, though for a different purpose, assuming now the character of an occasional war-tax. It was, apparently, not levied by Edward the Confessor in the latter part of his reign, but William the Conqueror revived it immediately after his accession, and it was with the object of facilitating its collection that he ordered the compilation of Domesday Book. It continued to be levied until 1163, in which year the name Danegeld appears for the last time in the Rolls. Its place was taken by other imposts of similar character but different name.

DANELAGH, the name given to those districts in the north and north-east of England which were settled by Scandinavian invaders in the 9th and 10th centuries and in which Danish customary law subsequently prevailed. The real settlement of England by Danes began in the year 876, when a division of the great army, which had been ravaging widely over England, divided out Northumbria among its members. Next year, another portion of the same army divided out Eastern Mercia and in 880 so much of the army as remained in England divided out East Anglia. A similar division of Wessex had been prevented by the victories of King Alfred (*q.v.*), and between 880 and 890 definite boundaries were drawn between Alfred's kingdom and that of Guthrum, king of East Anglian Danes. The boundary thus drawn ran along the Thames estuary to the mouth of the Lea (a few miles east of London), then up the Lea to its source, then due north to Bedford, then up the Ouse to Watling street at Stony Stratford. From this point the boundary is left undefined, perhaps because the kingdoms of Alfred and Guthrum ceased to be conterminous here. Thus Eastern Mercia, Northumbria from Tees to Humber, East Anglia, and the shires to the immediate west and south were handed over to the Danes and henceforth constitute the district known as the Danelagh.

The three chief divisions of the Danelagh were: (1) the kingdom of Northumbria, corresponding, roughly, to the modern Yorkshire, (2) the kingdom of East Anglia, (3) the district of the five (Danish) boroughs—lands grouped round Leicester, Nottingham, Derby, Stamford and Lincoln. Of the history of the two Danish kingdoms we know very little. Guthrum of East Anglia died in 890, and later we hear of a King Eric or Eohric, who died in 902. The history of the Northumbrian kingdom is yet more obscure. The original Danish kingdom seems to have come to an end in 909, but within a decade this region was overrun by fresh invaders of Norwegian rather than Danish extraction, and Northumbria was not brought definitely under English rule before the middle of the 10th century.

More is known of the history of the five boroughs. From 907 onwards Edward the Elder, working together with Aethelred of Mercia and his wife, worked for the recovery of the Danelagh. In that year Chester was fortified. In 911–912 an advance on Essex and Hertfordshire was begun. In 914 Buckingham was fortified and the Danes of Bedfordshire submitted. In 917 Derby was the first of the five boroughs to fall, followed by Leicester a few months later. In the same year after a keen struggle all

the Danes belonging to the "borough" of Northampton, as far north as the Welland (*i.e.,* the border of modern Northamptonshire), submitted to Edward and at the same time Colchester was fortified; a large portion of Essex submitted and the whole of the East Anglian Danes came in. Stamford was the next to yield, soon followed by Nottingham, and in 920 there was a general submission on the part of the Danes.

Although the independent existence of the Danelagh did not last for half a century, it profoundly affected the later history of this region. It was subsequently distinguished by a large population of free peasant landowners, who undoubtedly represent the descendants of the Danish settlers of the Viking age. The signs of Scandinavian occupation are particularly evident in Yorkshire and the territory of the five boroughs, where land was divided into ploughlands and oxgangs instead of hides (*q.v.*) and yardlands, where the Scandinavian *wapentake* replaces the English *hundred* (*q.v.*), and where many traces of Scandinavian methods of monetary and fiscal computation survived into the middle ages. For at least two centuries the language of this region must have been a Scandinavian dialect, gradually modified by English influences from the south. In the early 12th century the legal custom of the Danelagh was sharply distinguished from the customs of Wessex and English Mercia, and to the present day a Scandinavian institution, the *riding,* survives, in the three ridings of Yorkshire. A number of Danish place-names still exist in the original Danelagh.

See J. C. H. R. Steenstrup, *Normannerne* (4 vols., 1876–82); P. Vinogradoff, *English Society* in *the Eleventh Century* (1908); *F.* M. Stenton, *Danelaw Charters* (1920) and *The Danes in England* (1928). The place-names of this region are discussed by E. Ekwall in the *Introduction to the Survey of English Place-Names,* pt. *I.,* ch. iv. (1924). (A. M.; F. M. S.)

DANGERFIELD, THOMAS (*c.* 1650–1685), English conspirator, was born at Waltham, Essex, the son of a farmer. He began his career by robbing his father, and, after a wandering life on the continent, took to coining false money, for which offence and others he was many times imprisoned. Faithless to everyone, he first tried to involve the duke of Monmouth and others by concocting information about a Presbyterian plot against the throne, and, this having been proved a lie, he pretended to have discovered a Catholic plot against Charles II. This was known as the "Mealtub Plot," from the place where the incriminating documents were hidden at his suggestion, and found by the king's officers by his information. Mrs. Elizabeth Cellier—in whose house the tub was—almoner to the countess of Powis, who had befriended Dangerfield when he posed as a Catholic, was, with her patroness, actually tried for high treason and acquitted (1680). Dangerfield, when examined (Oct. 26, 1680) at the bar of the House of Commons, made other charges against the duke of York, the countess of Powis and the earl of Peterborough. He continued to defame the Roman Catholics in a long series of pamphlets, among others being *Dangerfield's Narrative.* This led to his trial for libel, and on June 29, 1685 he received sentence to stand in the pillory on two consecutive days, be whipped from Aldgate to Newgate, and two days later from Newgate to Tyburn. On his way back he was struck in the eye with a cane by a barrister, Robert Francis, and died shortly afterwards from the blow. The barrister was tried and executed for the murder.

DANGEROUS TRADES. By the British Factory and Workshop Act 1901, cases of industrial lead, phosphorus, arsenical and mercurial poisoning, also of anthrax, must be reported to the Chief Inspector of Factories, Home Office. Subsequently, carbon bisulphide, aniline and chronic benzene poisoning, also cases of toxic jaundice and of epitheliomatous and chronic ulceration, were included. Accidents in mines and factories had previously been notifiable. The inclusion of industrial poisoning at first presented difficulties from the point of view of workmen's compensation; for, could lead poisoning, for example, be regarded as an accident, since it is usually not of sudden onset? As in the case of anthrax, however, a workman might develop and die from pneumonia within 24 hours after infection, it was clear that certain industrial diseases must be scheduled. This circumstance marks a distinct and humane advance in factory legislation.

Lead Poisoning was among the first of the industrial diseases thus made notifiable; it is therefore compensable. Lead miners do not suffer from the malady but from disease of the lungs due to inhalation of rock dust. Smelters of the ore and refiners develop plumbism (Lat. *plumbum,* lead) through inhalation of the fumes. Workers in white lead factories are peculiarly prone to plumbism owing to white lead dust (carbonate) being soluble in the respiratory and digestive passages. A similar liability applies to house painters—especially during the "burning-off" and "dry-rubbing down" of old lead painted surfaces. The substitution of "wet" for "dry" rubbing down will diminish plumbism among painters. Opinions are divided as to whether the occupational illness of painters may not be as much due to the turpentine in the paint as to the pigments. Persons working in lead become anaemic. There is a personal and family idiosyncrasy to plumbism, and young females are if anything more predisposed to it than males. The symptoms are colic, the presence of a blue line on the gums close to the teeth, paralysis of the muscles of wrists and fingers, albuminuria, and in the acute and serious form blindness and convulsions. Lead is found in the internal organs after death.

As a result of periodical examination of workers in lead factories, also in potteries which use lead glazes, cases of plumbism have considerably decreased during the last 2j years, as well as in consequence of better ventilation of the workrooms, means for the removal of dust, personal hygiene, and attention to the bowels. Lucifer match making is no longer a dangerous trade owing to the substitution of sesquisulphide of phosphorus for the harmful white phosphorus. *Mercurial poisoning* occurs among men employed in the preparation of rabbits' skins by nitrate of mercury for hat making, in makers of scientific instruments of precision such as thermometers and barometers, and in men repairing electric meters. *Carbon bisulphide* used as *a* solvent in rubber industries causes a peculiar form of intoxication not unlike alcoholic, accompanied by staggering gait and mental excitement, also paralysis of the limbs in the more chronic cases. Carbon bisulphide is used extensively in the manufacture of artificial silk from cellulose. *Benzene* or *Benzol* used in "dry-cleaning" causes headache and drowsiness, while its nitric acid products, nitrobenzene and amido-benzene, destroy the red blood corpuscles inducing pallor of face with marked blueness of the lips, tongue and finger nails, irregularity of the heart's action and collapse. The blueness mentioned is due to the formation of aniline in the body. *Toxic jaundice* was occasionally met with during the war in persons in munition works handling the material of or inhaling vapours of dust from high explosives. *Anthrax, Wool-Sorters' Disease* or *Splenic fever* attacks workers employed in opening bales of infected wools. In the form of a local pustule the disease occurs in butchers and in men handling infected hides. It is due to an organism, the *bacillus anthracis,* which may gain entrance into the lungs by inhalation of dust to which spores are adherent; it may also enter through the broken skin or by the alimentary canal through persons eating infected flesh. The pulmonary form is extremely dangerous; it may cause death within 24 hours. If seen early the local pustule can be excised satisfactorily. A preventive serum has been used with encouraging results, but the essential thing is to have all bales of imported wool carefully opened and thoroughly disinfected before distributing it to the workers. During 1926 in Great Britain there occurred 38 cases of anthrax with three deaths.

Cancerous Ulceration.—Epitheliomatous or cancerous ulceration occurs in tar and mineral oil workers, makers of arsenical dip for sheep, and in mule spinners in cotton mills. Chimney sweeps have long been known to be subject to scrotal cancer. Workmen exposed to splashings of hot pitch and mineral oil develop brown patches and warts on their forearms. The warts may disappear or break down and are followed by ulceration which becomes malignant. Mule spinners in cotton mills have recently exhibited a high morbidity rate of epitheliomatous ulceration. In view of the increase of cancer generally, the large number of cases of scrotal cancer in mule spinners is not only a cause of anxiety but a matter calling for research.

Cases Notified Since Epitheliomatous Ulceration Was Added to the List in 1920

Industry	1920	1921	1922	1923	1924	1925	1926	Total
Manufacture of patent fuel (pitch)	30	17	19^{1}	14^{1}	11	25^{2}	27	143^{4}
Tar distillers	4	9^{2}	6	14^{1}	15^{2}	23^{4}	18^{3}	89^{12}
Gas works	4^{1}	4	2^{1}	6^{1}	1^{2}	9^{2}	15^{9}	41^{16}
Shale oil works (paraffin)	3	..	5^{1}	6	2^{1}	4	2	22^{2}
Mule spinning (mineral oil)	..	..	..	15^{1}	79^{17}	78^{35}	88^{20}	260^{73}

The raised figures refer to deaths.

Coal Mining.—The winning of coal is a hazardous occupation; the risks are: explosions followed by fire; gassing; also accidents mainly due to falls of stone from the roof. Apart from these, coal mining is not an unhealthy occupation.

It is generally known that in the United States more men are killed by accidents in proportion to the number of men working than in any of the leading European countries; on the other hand if fatalities are estimated by the number of tons of coal raised, fewer men are killed in U.S.A. than in any other country. Many mine accidents might be prevented by employing more supervisors to look after haulage equipment and falls of roof. Comparing the lie of coal and underground conditions these are more favourable to a larger output per man in U.S.A. than in European countries; the coal is near the surface, the seams are thicker, they are generally flat and uninterrupted. During the five years ending 1920 the average number of fatalities per one million tons of coal mined was, in U.S.A. 3.8 lives; in Great Britain 4·52 lives; France 6·9; Belgium 8·01, and in Prussia 11·85 lives. The following figures give the ratio of fatalities to numbers employed:

Number of Men Killed per 1000 Full Year (loo-day) Workers

	U.S.A.	Great Britain	France	Belgium	Prussia
1916	3'93	1·34	..	..	3·15
1917	4·25	1·41	..	..	3·73
1918	3'94	1'43	..	..	3·40
1919	4·27	1·13	1·43	1·30	2·47
1920	3·78	1·11	1·13	1·12	2·16
1921	4·19	1·08	..	·91	..
1922	4·89	1·09	..	·91	..

Machinery and electricity are also becoming increasingly employed in winning coal, and there is always the possibility of an electric spark firing inflammable gas or igniting coal dust.

The lesser maladies to which miners are liable are displacement of the cartilage of the knee joint, also "beat hand," an inflammation of the cellular tissue of the palm of the hand which may become septic. That coal miners arc a comparatively healthy class is shown by the following table:

Mean Annual Death Rate per rooo

	Coal miners		All males	
	1900–2	1910–12	1900–2	1910–12
All causes	885	727	1004	790
Phthisis	89	75	187	141
Cancer	53	61	69	78

Cotton **Industry.**—As indicating improvement in general occupational mortality the cotton industry may be cited with reference to diseases of the nervous, respiratory and circulatory systems, and also to tuberculosis. As regards bronchitis and circulatory diseases, the morbidity incidence is higher among certain operatives in cotton mills than among other textile workers. The phthisis rate, which in occupied and retired males was during 1900–02 187, and in 1910–12 141, was in cotton operatives for the same periods 197 and 120, while bronchitis, which was 58 and 38 in males generally, reached in cotton operatives 92 and 57 respectively. The unhealthy influences are dust and high temperatures with humidity. Males suffer more from chest diseases than females. the latter more from digestive troubles and anaemia. Dust rich in silica is present in all the dry processes. The high temperatures and humidity predispose to colds, and the dust to asthma. Female operatives standing at work all day in high temperatures develop varicose veins and ulcers on the limbs, and suffer from debility and anaemia. Weavers suffer from "twister's cramp," an infection of the muscles of the forearm, thumb and index finger, attended by a considerable amount of pain and followed by muscular weakness. Of accidents in cotton mills the largest numbers occur on Tuesday and on Friday, and in relation to the hours of the day the maximum appears to be reached between the hours of 10 to 11 A.M. with a progressive decrease thereafter to the end of the working day.

Compressed Air.—Divers and men working in caissons in compressed air are liable to illness of a special kind. Inside the caisson men work practically speaking without discomfort; in order to enter this iron chamber they must pass through an attached "compression" lock and be gradually subjected to a rise of air pressure equal to that inside the caisson into which they will descend. Inside the caisson, beyond possibly experiencing unpleasant sensations due to the drums of the ears being forcibly driven inwards, the men are capable of doing even more work than on the surface; but all the while, owing to air being passed into the chamber under high pressure, their blood and tissues are becoming supersaturated with the nitrogen in the atmospheric air. In the body the gas becomes liquefied. It is not until the end of the shift when men are about to leave work and undergo "decompression" that symptoms arise. The men return to the lock wherein they had been "compressed" to undergo "decompression," and if this is done too rapidly bubbles of nitrogen gas gradually appear in the minute blood vessels, which arrest the circulation, or blebs of gas develop in the liver and central nervous system. So that a man who has been too rapidly decompressed may emerge from the chamber apparently well, yet on his way home be overtaken with severe pains in the limbs (bends) and be seen to stagger and fall, paralysed in his legs. Should such an event happen close to his work and the individual be carried back and placed in a warmed "recompression" chamber, upon being subjected to increasing increments of pressure and kept therein for two or three hours and then slowly decompressed, his pains will usually disappear and the power of walking be regained. By this mode paralysed caisson workers have been relieved and their muscular function and equilibration restored three hours after having left work. Some men are more liable to the malady than others, stout men particularly, for fat dissolves by bulk more nitrogen than the blood and tissues. Men above 40 years of age should not be employed in caissons. Supersaturation of the body liquids and tissues with atmospheric nitrogen is determined by the amount of pressure in the caisson, duration of exposure, and the absorbability of the tissues. Symptoms hardly ever occur in men who have worked under 28lb. pressure. Danger arises when the pressure mounts to 40–50lb. above that of the outside atmosphere. The essential thing is slow decompression, not less than 2mins. for every 3lb. of pressure worked in, and should this have exceeded 30lb. then at a rate of 1min. per lb. Professor John Haldane introduced as a means of treatment "stage" decompression, *i.e.*, decompression is suddenly made, for example from 30lb. to 15, and thereafter at a uniform slow rate.

DANIEL, the name given to the central figure of the biblical book of Daniel (see below). Two other personages mentioned in the Old Testament bear this name; see I Chron. iii. 1, Ezra viii. 2, Neh. x. 6. Daniel the prophet is known to us only as a character in Jewish fiction. He is mentioned in Ezek. xiv. 14, 20, between Noah and Job, as one of three foremost saints of Israel, and in xxviii. 3 as the type of wisdom. This may mean either that such stories as those in our book of Daniel were in circulation as early as the 6th century B.C., or (in the present writer's opinion)

much more probably that the book of Ezekiel was written in the 3rd century B.C. (see below).

According to Dan. i. 3, the Babylonian chief eunuch was commanded to bring to the court certain youths of the Judaean captivity, "of the children of Israel, and of the king's seed, and of the nobles," to serve in the king's palace. It is apparent that Daniel is thought of as one of the nobles, or even of the royal line. Thus Josephus, Ant. x. 10, 1, and the Lives of *the Prophets* (various Greek recensions), the latter adding that his birthplace was Upper Beth-Horon, and that he was buried in the royal vault in Babylonia. In the biblical account, the earlier narrator says that his life extended "to the first year of king Cyrus" (1. 21, cf. vi. 29), while the later author represents him as still living "in the third year of Cyrus" (x. 1). In the late rabbinical tradition (*Midr.* Šir *ha-širim* vii. 8) he is said to have returned to Jerusalem among the exiles freed by the royal edict. The Jewish traveller Benjamin of Tudela (12th cent. A.D.) was shown his tomb in Susa, and notices of this tomb are found as early as the 6th century.

Daniel, Book of.—The Book of Daniel stands between Esther and Ezra in the third great division of the Hebrew Bible known as the *Hagiographa,* in which are classed all works which were not regarded as forming part of the Law or the Prophets.

The book consists of two widely different portions: a didactic and popular narrative in successive episodes, chaps. i.–vi.; and a series of prophetic visions, chaps. vii.–xii. Chaps. ii.–vii. are in Aramaic, the remainder is Hebrew. The unity of the whole has been maintained by the great majority of scholars (Bevan, Comm., pp. 6, 23 note). Recently, however, theories of composite authorship have gained ground; see Dalman, *Worte* Jesu (1898), p. 11, and the works named below. The differences between the two parts are indeed many and striking, notably in the following particulars. (1) Style, irrespective of the changes in language and subject matter. In the first half, including the Hebre chapter i., it is generally simple and without any unusual features; in the second half it is obscure and difficult to a remarkable degree. (2) In the mental attitude of the author, and his portrayal of the character of Daniel, there is a profound difference to be seen. (3) The Persian words, so numerous in i.–vi., are entirely absent in vii.–xii. (4) There is nothing in the first half of the book to suggest the presence of the arch-enemy, Antiochus Epiphanes, always in the background of the second half; contrast ii. 39–43 with vii. 23–25. (5) There is a manifest contradiction between i. 21 (*cf.* vi. 29), the statement that Daniel "continued *until* the *first* year of Cyrus," and x. 1, the account of the vision in that king's *third* year. It is natural to suppose that a later author had in mind the words of vi. 29, but forgot, or chose to disregard, those of i. 21. (6) The use of the two languages finds its only convincing explanation in the theory of dual authorship (see following).

The great majority of scholars at the present day agree that neither the whole book nor the first half, containing the narratives, can have been written in the time of the Babylonian monarchy, or even in the earlier part of the Persian period. The chief reasons for this conclusion are the following:

1. The position of the book among the Hagiographa seems to show that it was introduced after the final collection of the "Later Prophets" had been made. The collectors of the prophetical writings, who in their care did not neglect even the parable of Jonah, would hardly have ignored the record of so great a prophet and foreteller of future events as Daniel is represented to have been.

2. Jesus ben Sirach (Ecclesiasticus), who wrote about 180 B.C., in his otherwise complete list of Israel's leading spirits, makes no mention of Daniel.

3. The internal evidence is even stronger than the external, as will appear in the particulars which here follow. The historical inaccuracies in the narrative chapters are such as could be credited only to a writer who lived long after the events described. The statement at the very beginning of the book, that "in the third year of the reign of Jehoiakim" Nebuchadrezzar berieged and captured Jerusalem, and carried the Jewish king and the vessels of the temple to Babylonia, finds no support in the history known to us, but seems to be the work of a writer who combined II Chron. xxxvi. 6 f. with II Rings xxiv. i. The use of *Kasdim,* "Chaldaeans," as the name of a class of magicians is a striking anachronism (see CHALDAEA); and the position of Daniel, a devout Israelite, as "the master of the magicians" at the Babylonian court (iv. 6) is more easily comprehensible in edifying romance than in actual history.

The four kingdoms of chap. ii. introduce a still greater difficulty. The first kingdom is the Babylonian (vs. 38), the fourth is the Greek empire (cf. chap. viii.); the third, immediately preceding the Greek (viii. 20 f., x. 20), is the Persian. The identity of the second kingdom is then made certain by numerous passages; it is the kingdom of the Medes, whose reigning king, called "Darius the Mede," took possession of Babylonia upon the death of Belshazzar, and at the close of his reign was succeeded by Cyrus (v. 30, vi. 1, 29; cf. ix. 1, x. 1, xi. 1). There was, however, in fact no Median power which came "after" the Babylonian (ii. 39) and in turn yielded the throne of Babylonia to the Persians (xi. 1). The name Darius is not Median, and we have certain knowledge that the immediate successor of Nabonidus and Belshazzar as ruler of Babylonia was Cyrus. Comparison with the list of Persian kings in the book of Ezra seems to show that in the last centuries B.C. the Jewish learned tradition transposed the reign of Cyrus with that of Darius I. Hystaspis, the latter being regarded as king of the Medes. The reign of Cyrus was believed to have been immediately followed by those of Xerxes and Artaxerxes, Ezra iv. 5 (where the reference is to Darius II. Nothus), 6; cf. Montgomery, Comm., p. 423. (See EZRA and NEHEMIAH, Books.)

The highly interesting narratives of Nebuchadrezzar and Darius can hardly be regarded as true pictures of these monarchs. The former erects a golden image and commands all the people in his realm to fall down and worship it at a given signal; afterwards he confesses the God of Israel, and decrees that any subject of his who shall say anything against this God shall be cut in pieces. Darius commands by royal statute that "whosoever shall ask a petition of any god or man for 30 days," save of the king himself, shall be cast into the den of lions. After Daniel's rescue, the king confesses the God of Israel, and writes to all the peoples, nations, and languages, commanding them to fear this living God, whose dominion is everlasting. All this is plainly popular narration rather than historical record, even though one and another of the items have an undoubted basis of fact. The picture of Belshazzar in chap, v. has quite generally been pronounced unhistorical by modern scholars, but recent discoveries have tended to show that the historical background of the chapter is substantially correct. Documents in cuneiform prove that Belshazzar, the son of Nabonidus, exercised at Babylon such administrative powers as belonged to no mere crown prince; indeed, it is expressly stated that in the third year of Nabonidus the king entrusted *the* kingship to his eldest son, Belshazzar (Sidney Smith, Babylonian Historical Texts, 1924, *pp.* 84 sqq.). This would seem to explain the dignity of "the third ruler in the kingdom," conferred upon Daniel. Whether, and in what way, Belshazzar could be correctly described as the lineal descendant ("son") of Nebuchadrezzar is a question which future discoveries may settle.

4. The late date of the second half of the book, chaps. vii.–xii., is evidenced in many ways, not merely by the fact that its author presents a detailed sketch of contemporary history, especially in chap. xi., extending down to the time subsequent to the desecration of the temple at Jerusalem by Antiochus Epiphanes. In both literary and religious character it is a product of the later Greek period. The "apocalypse" as a distinct branch of Jewish literature makes its first appearance at this time, in the books of Daniel and Enoch, and continues henceforth in many similar compositions; its most characteristic features clearly represent a late stage in the history of Jewish thought. See the article "Apocalypse" in the *Jewish* Encyclopaedia; Montgomery, Comm., 78–81. The way in which Daniel in ix. 2 refers to the authoritative scriptures naturally suggests a time subsequent to the final redaction of the Law and the Prophets. A like impression is given by the

angelology of the visions, including the names of the archangels Gabriel and Michael (cf. the book of Tobit). The doctrine of the resurrection, xii. 2, appears now for the first time in clear and definite form (it had already received expression in Is. xxvi. 19). Not only the resurrection of the righteous but also that of at least a part of the wicked among the Jews is predicted; and the fact well illustrates the growing prominence of the individual, as contrasted with the nation, in the type of theology here represented. Some scholars have seen in this doctrine, as well as in other features of the theology of the book, evidence of the influence of Zoroastrianism (thus Kohut, Bousset, and especially Eduard Meyer, *Ursprung und Anfänge* des Christentums), but the arguments in support of this theory are unconvincing.

5. Finally, the linguistic evidence points unequivocally to a date more than two centuries later than the supposed time of the prophet Daniel. Comparison of the language of the sufficiently abundant inscriptions and papyri shows beyond question that the Aramaic of Dan. ii.–vii. represents a type which cannot possibly be carried back of 300 B.C. (Torrey, Ezra Studies, 161–166; G. R. Driver, *Journal* of Bibl. Lit. xlv. 110 sqq., 323; and especially Baumgartner, "Das Aramaische im Buche Daniel," *Z. A. T. W.*, xlv. [1927], 122 *sqq.*). The Hebrew of the book is also of a very late type; see Bevan, Comm., 28–35. The presence of Greek words, especially the names of the musical instruments in iii. 7, 10, 15, adds its significant contribution to the many-sided argument.

The book, then, is not a record of historical fact, but in its first half an edifying romance, and in its second half a typical apocalypse. The narrative portion is excellently suited to its purpose, and in the handling of the successive episodes the author's ability as a story-teller is as evident as his religious fervour. Chapter v., in particular, is powerfully dramatic, a gem of the world's literature. The popularity of the stories is early attested by the existence of varying recensions. The old Greek version (as old as the middle of the 2nd century B.C.), now extant in a single ms., supported by the Syriac Hexaplaric version, differs very considerably from the standard text in chaps. iv.–vi., and is here probably the rendering of a text which was reproduced frqm memory. (Our standard Greek is the rendering of Theodotion, 2nd century A.D.) The influence of the second half of the book, the visions, was even more powerful and pervasive than that of the stories, determining to a considerable extent the course of the Jewish apocalyptic tradition, and affecting profoundly the early Christian scriptures. The visions are strongly patriotic in their immediate purpose, and there is abundant evidence that they gave in full measure the encouragement and the new religious impulse that they were designed to give. Very little attention is paid in them to the unseen world; their author does not concern himself with the secrets of the universe (contrast the book of Enoch). The eschatology of the book—immensely important as it is, and strongly emphasized by the author himself—is given the briefest possible space, vii. 13 seq., 27, xii. 1–3. That to which everything else is subordinated is the prediction of the immediate future. The Jews are soon to be delivered from their oppressors, and the faithful will triumph forever. In making his final and most vivid prophecy, the writer at length passes over from the known to the unknown in a very striking manner. In chap. xi., verses 3–39 present in the form of a prediction the detailed history of the Greek empire in the East, from the conquest of Alexander down to the latter part of the reign of Antiochus Epiphanes. Verses 40–45 continue this with an almost equally vivid description of events which *had* not yet taken place, but were only expected by the writer, namely, the wars which should result in the death of Antiochus and the fall of his kingdom. The mysterious symbolism employed in the computation of various intervals of time is another highly characteristic and significant feature of the Daniel visions. Thus, the "time, times, and a half" (xii. 7) which must elapse before the end which has been foretold; the "weeks" (seven-year periods) of ix. 24–27; and the enigmatic numbers of days in viii. 14 and xii. 11 sqq. For the interpretation of these ever-fascinating riddles the reader is referred to the standard commentaries. The influence of the book of Daniel on the Messianic hope of the Jews is still another fact of great importance. The "*man*" ("son of man") of vii. 13 becomes henceforth a definitely Messianic title, as in the Book of Enoch and the Christian scriptures; on the other hand, the "anointed one" of ix. 26 doubtless refers to the high priest Onias III., who was assassinated at Antioch c. 171 B.C. (II Macc. iv. 33–38), referred to in xi. 22 as "the prince of the covenant."

The strange manner of occurrence of the two languages, first Hebrew, then Aramaic, then Hebrew again, the alternation not corresponding to any changes in subject matter or literary character, furnishes a riddle which many scholars have been content to abandon as insoluble. The view that the book, as we have it, is in its original linguistic form and the work of a single author (Behr, Kamphausen) certainly leaves the principal difficulties unexplained. It has been a favourite theory that the book was originally written in Hebrew, and that a portion of it was lost or destroyed in the Maccabaean wars and afterward supplied from an Aramaic version (so Lenormant, Bevan, Prince). "This hypothesis stumbles on the fact that the Aramaic begins neatly at the appropriate point" (Montgomery, *Comm.*, p. 92). There are other significant features, mentioned above, for which it fails to account. A theory first proposed by the present writer and adopted by Montgomery, Comm., recognizes two distinct halves of the book, an earlier and a later, and explains the alternation of languages as the work of the later writer, who himself devised this way of joining his own work to that of his predecessor. The original work, consisting of popular narratives written in Aramaic, comprised the first six chapters, vi. 29 forming the natural conclusion. The author of the apocalyptic chapters, vii.–xii., writing in the name of Daniel and with the purpose of supplementing the book already existing, composed his first vision, chap. vii., in Aramaic; wrote the remaining chapters, viii.–xii., in Hebrew (the natural, almost essential, language of the older Jewish apocalypses); and replaced the original Aramaic of i. 1–ii. 4*a* with his own rendering of it into Hebrew. An excellent place for making the transition was offered by ii. 4, the verse in which the Chaldaean soothsayers first address the king. This ingenious proceeding made of the whole an indissoluble unit. Chap. i. is indispensable to ii. seq , while on the other hand viii. seq. (Hebrew) could not possibly be separated from vii. (Aramaic), for the successive revelations are manifestly all of one piece, and viii. 1*b* significantly alludes to the preceding vision.

The date of the latter half of the book (and thus of the complete work) is given approximately by allusions to contemporary events. It was written in the time of Antiochus IV. Epiphanes, after the desecration of the temple (viii. 11–14), which took place in Dec. 167 B.C. (for this date, and the others here given, see Kolbe's epoch-making *Beiträge zur* syrischen und jiidischen Geschichte, Berlin, 1926). If, as some think, viii. 14 implies that the writer had seen the rededication of the sanctuary (Dec. 164), while on the other hand the passage xi. 40–45 shows, as all agree, that the death of Epiphanes (April 163) was still in the future, the visions are dated almost to the month.

The date of the first half of the book, the stories, is indicated with great probability by the allusions and the symbolism in chap. ii. The historical sketch terminates with the attempted alliance, through marriage, of the Ptolemaic and Seleucid kingdoms (so most comms) at a time when the contrast between the two was like that between iron and clay. This would perfectly apply to the political conditions at the time when the crushing blow was inflicted on the northern kingdom by Ptolemy III. Euergetes in 246 B.C., immediately after the murder of Antiochus II., the Seleucid king, and his newly espoused wife, Berenice, the daughter of Ptolemy II. At no other time in the history of the two kingdoms was the contrast so strongly marked; the northern kingdom was not only impotent, it was actually crumbling. The provinces of the Euphrates and Tigris were now lost; Asia Minor was soon to follow; the two sons of Antiochus II. were arrayed against each other. The most probable date for Daniel i.–vi. would seem to be between 246 and 240, the year of the peace concluded between Ptolemy III. and Seleucus II. This dating satisfies all the conditions known to us; nor is there any evident objection to it, if

the fact of composition is accepted. Those few who postulate for Ezekiel a date *c.* 230 obtain an interval sufficient to account for the allusions to Daniel *(see* above) and for the mention of Ezekiel by the Siracide.

BIBLIOGRAPHY.—The commentaries of A. A. Bevan (1892), Behrmann (1894), J. D. Prince (1899), Marti (1901), and especially Montgomerv *(International Critical Commentary,* 1927), with full bibliography; Torrey, *Notes on the Aramaic Part of Daniel* (Trans. Conn. Acad. of Arts and Sciences, xv., 1909, 241–282), supplemented in *Journ. Am. Or. Soc.,* xliii. (1923), 229–234. In the above article use has been made of the article by J. D. Prince in the 11th edition of this encyclopaedia. (C. C. T.)

The "additions to Daniel" are three in number: *Susannah and the Elders, Bel and the Dragon,* and *The Song of the Three Children.* The two former have no organic connection with the book of Daniel; the last is inserted between verses 23 and 24 of chap. iii.

Susannah.—This addition was placed by Theodotion before chap. i., and *Bel and the Dragon* at the close, whereas by the Septuagint and the Vulgate it was reckoned as chap. xiii. after the twelve canonical chapters, *Bel and the Dragon* as xiv. Theodotion's version is the source of the Peshitto and the Vulgate, for all three additions, and the Septuagint is the source of the Syro-Hexaplaric, which was published by Ceriani *(Mon. Sacr.* vii.). The legend recounts how that in the early days of the Captivity Susannah, the beautiful and pious wife of the rich Joakim, was walking in her garden and was there seen by two elders who were also judges. Inflamed with lust, they made infamous proposals to her, and when repulsed they brought against her a false charge of adultery. When brought before the tribunal she was condemned to death and was on the way to execution, when Daniel interposed and, by cross-questioning the accusers apart, convinced the people of the falsity of the charge.

The most interesting part of the story is the latter half, which deals with the trial. It has been plausibly conjectured that the characteristic features of this section point to its composition about 100–90 B.C., when Simon ben Shetah was president of the Sanhedrin, and when the Pharisees were attempting to bring about a reform in the administration of the law courts. *See* Ball in the *Speaker's Apocrypha,* ii. 329 f.

The language was Semitic. The original of Theodotion's Greek seems to have been Hebrew; notice especially the idiom (not Aramaic) in vs. 15. In the "Septuagint" version the evidence is not so clear; certain features seem rather to point to Aramaic. *See* further Ball in the *Speaker's Apocrypha;* Rothstein in *Kautzsch's Apokryphen;* D. M. Kay in Charles' *Apocrypha.*

Bel and the Dragon.—We have here two independent narratives, in both of which Daniel appears as the destroyer of heathenism. It is possible, as the comms. have remarked, that some details of the story of the dragon were suggested by the Babylonian mythology. The legend of Habakkuk, who brings food to Daniel in the lions' den, is an interesting feature. The Greek exists in two recensions, those of the "Septuagint" and Theodotion. The original language, which was certainly Semitic, seems to have been Hebrew, though this has not been demonstrated conclusively. *See* Ball and Rothstein (as above); Witton Davies in Charles' *Apocrypha.*

Song of the Three Children. — This section is composed of the Prayer of Azariah and the Song of Hananiah, Azariah and Mishael, and was inserted after iii. 23 of the canonical text of Daniel. The original language of both prayer and hymn was certainly Hebrew, and the insertion was made in the Aramaic text. Careful comparison with the Greek versions shows that our canonical text has the original form of verses 21–25. *See* Ball and Rothstein (as above); Bennett in Charles' *Apocrypha.*

(R. H. CH.; C. C. T.)

DANIEL (DANIL), of Kiev, the earliest Russian travel-writer, and one of the leading Russian travellers in the middle ages. He journeyed to Syria and other parts of the Levant about 1106–07. He was the *igumen,* or abbot, of a monastery probably near Chernigov in Little Russia. He visited Palestine in the reign of Baldwin I., Latin king of Jerusalem (1100–18), and apparently soon after the crusading capture of Acre (1104); he claims to have accompanied Baldwin, who treated him with marked friendliness, on an expedition against Damascus *(c.* 1107). Though Daniel's narrative beginning at Constantinople, omits some of the most interesting sections of his journey, his work has considerable value. His picture of the Holy Land preserves a record of conditions (such as the Saracen raiding almost up to the walls of Christian Jerusalem, and the friendly relations subsisting between Roman and Eastern Churches in Syria) peculiarly characteristic of the time; his three excursions—to the Dead sea and Lower Jordan, to Bethlehem and Hebron, and towards Damascus —gave him an exceptional knowledge of certain regions. In spite of blunders in topography and history, his observant and detailed record is among the most valuable of mediaeval documents relating to Palestine: it is also important in the history of Russian language, and in the study of ritual and liturgy. Several Russian friends and companions, from Kiev and an old Novgorod, are recorded by Daniel as present with him at the Easter Eve "Miracle" in the church of the Holy Sepulchre.

There are 76 mss. of Daniel's Narrative, of which only five are anterior to A.D. 1500; the oldest is of 1475 (Leningrad, Library of Ecclesiastical History, 9/1086). Three editions exist, of which I. P. Sakharov's (1849) is perhaps the best known (in *Narratives of the Russian People,* vcl. ii. bk. viii. pp. 1–45). *See* also the French version in *Itinéraires russes en orient,* ed. Mᵉ B. de Khitrovo (Geneva, 1889) (*Société de l'orient latin*); and the account of Daniel in C. R. Beazley, *Dawn of Modern Geography* (1897) etc. ii. 155–174.

DANIEL, ARNAULT (*fl.* late 12th century), French troubadour, was born at Ribeyrac in Périgord and became a member of the court of Richard, the lion-hearted. He has become famous through the praise of Dante who ranks him with the Lustful in the seventh circle of purgatory. Arnault's amatory poems, though often obscure, are technical masterpieces of versification.

See E. Canello, *La Vita e le opere del trovatore Arnaldo Daniel* (Halle, 1883) and *Les Poésies d'Arnaut Daniel, Réédition critique d'après Canello* (Toulouse, 1910).

DANIEL, GABRIEL (1649–1728), French Jesuit historian, was born at Rouen on Feb. 8, 1649. He entered the Jesuit order at the age of 18, and became superior at Paris. He is best known by his *Histoire de France depuis l'établissement de la monarchie française* (first complete edition, 1713). Daniel published an abridgment in 1724 (Eng. trans., 1726), and another abridgment was published by Dorival in 1751. Daniel also wrote a *Histoire de la milice française,* etc. (1721) and a reply to Pascal's *Provincial Letters,* entitled *Entretiens de Cléanthe et d'Eudoxe sur les lettres provinciales* (1694); two treatises on the Cartesian theory as to the intelligence of lower animals, and other works.

See Sommervogel, *Bibliothdque de la Compagnie de Jésus,* t. ii.

DANIEL, SAMUEL (1562–1619), English poet and historian, was born near Taunton in 1562, and died at Beckington, near Devizes, on Oct. 14, 1619. His brother, John Daniel, was a musician and the author of *Songs for the Lute, Viol and Voice* (1606). In 1579 Samuel was admitted a commoner of Magdalen hall, Oxford, where he remained for about three years. He was first encouraged and, he says, taught in verse, by Sir Philip Sidney's sister, Mary, countess of Pembroke, whose household he had entered as tutor to her son, William Herbert. His first known volume of verse is dated 1592; it contains the cycle of sonnets to *Delia* and the romance called *The Complaint* of *Rosamond.* Twenty-seven of the sonnets had already been printed at the end of Sir Philip Sidney's *Astrophel and Stella* without the author's consent. Several editions of *Delia* appeared in 1592, and they were very frequently reprinted during Daniel's lifetime. The *First Pour Books of the Civil Wars,* an historical poem in *ottava rima,* appeared in 1595. *Poetical Essays,* apparently first printed in 1599, contained, besides the "Civil Wars," "Musophilus," and "A letter from Octavia to Marcus Antonius," poems in Daniel's finest and most mature manner. About this time he became tutor to Anne Clifford, daughter of the countess of Cumberland. On the death of Spenser, in the same year, Daniel received the title of poet-laureate, which he seems, however, to have shortly resigned in favour of Ben Jonson. About this time, and at the recommendation of his brother-in-law, Giovanni Florio, he was taken into

favour at court, and wrote a *Panegyric Congratulatorie offered to the King at Burleigh Harrington in Rutlandshire,* in *ottava rima.* In 1603 this poem was published, and in many cases copies contained in addition his *Poetical Epistles* to his patrons and a prose essay called *A Defence of Rime* (originally printed in 1602) in answer to Thomas Campion's *Observations on the Art of English Poesie,* in which it was contended that rhyme was unsuited to the genius of the English language. Daniel's essay and Campion's were published together, *Bodley Head Quartos,* No. 14 (New York, 1925). In 1603 Daniel was appointed master of the queen's revels. In this capacity he brought out a series of masques and pastoral tragi-comedies, of which were printed *A Vision of the Twelve Goddesses,* in 1604; *The Queen's Arcadia,* an adaptation of Guarini's *Pastor Fido,* in 1606; *Tethys Festival or the Queene's Wake,* written on the occasion of Prince Henry's becoming a knight of the bath, in 1610; and *Hymen's Triumph,* in honour of Lord Roxburgh's marriage in 1615. Meanwhile had appeared, in 1605, *Certain Small Poems,* with the tragedy of Philotas, which brought its author into difficulties, as Philotas, with whom he expressed some sympathy, was taken to represent Essex. In 1607, under the title of *Certaine small Workes heretofore divulged by Samuel Daniel,* the poet issued a revised version of all his works except *Delia* and the *Civil Wars.* In 1609 the *Civil Wars* had been completed in eight books. In 1612 Daniel published a prose *History of England,* from the earliest times down to the end of the reign of Edward III.

Daniel was made a gentleman-extraordinary and groom of the chamber to Queen Anne, and was now acknowledged as one of the first writers of the time. Later in life he threw up his titular posts at court and retired to a farm called "The Ridge," which he rented at Beckington, near Devizes, in Wiltshire, where he died.

Of Daniel's works, the sonnets are now, perhaps, most read. They depart from the Italian sonnet form in closing with a couplet, as is the case with most of the sonnets of Surrey and Wyat, but they have a grace and tenderness all their own. Of a higher order is *The Complaint of Rosamond,* a soliloquy in which the ghost of the murdered woman appears and bewails her fate in stanzas of exquisite pathos. Among the *Epistles to Distinguished Persons* will be found some of Daniel's best work. The epistle to Lucy, countess of Bedford, is remarkable among those as being composed in genuine *terza rima,* till then not used in English. *Hymen's Triumph* is perhaps the best of all his dramatic writing. An extract from this masque is given in *Lamb's Dramatic Poets,* and it was highly praised by Coleridge. In elegiac verse he always excelled, but most of all in his touching address *To the Angel Spirit of the Most Excellent Sir Philip Sidney. Musophilus* is one of the most characteristic writings of Daniel. It is a dialogue between a courtier and a man of letters, and is a general defence of learning, and in particular of poetic learning as an instrument in the education of the perfect courtier or man of action. It is addressed to Fulke Greville, and written in a sort of *terza rima,* or, more properly, *ottava rima* with the couplet omitted. Daniel is wanting in fire and passion, but he is pre-eminent in scholarly grace and tender, mournful reverie.

Daniel's works were edited by A. B. Grosart in 1885–96; ***Selected Verse*** (Pembroke Booklets, No. 6, 1905).

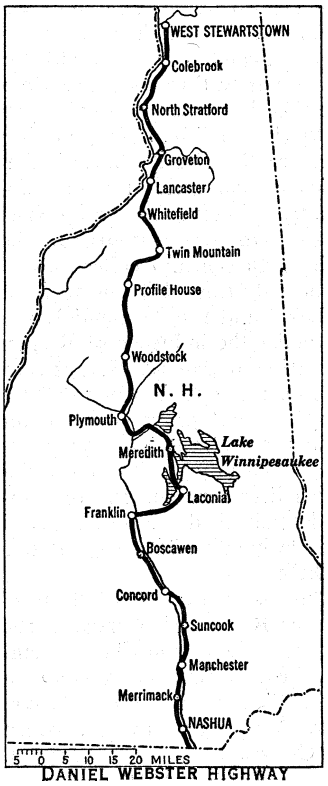
DANIELL, JOHN FREDERIC (1790–1845), English chemist and physicist, was born in London on March 12, 1790, and in 1831 became the first professor of chemistry at the newly founded King's College, London. His name is best known for his invention of the Daniell cell *(Phil. Trans.,* 1836; *see* BATTERY), still extensively used for telegraphic and other purposes. He also invented the dew-point hygrometer known by his name (*Quar. Journ. Sci.,* 1820), and a register pyrometer *(Phil. Trans.,* 1830); and in 1830 he erected in the hall of the Royal Society a water-barometer, with which he carried out a large number of observations *(Phil. Trans.,* 1832). A process devised by him for the manufacture of illuminating gas from turpentine and resin was in use in New York for a time. His publications include *Meteorological Essays* (1823), an *Essay on Artificial Climate considered in its Applications to Horticulture* (1824), which showed the necessity of a humid atmosphere in hothouses devoted to tropical plants, and an *Introduction to the Study of Chemical Philosophy* (1839). He died suddenly on March 13, 1845, in London, while attending a meeting of the council of the Royal Society, of which he became a fellow in 1813 and foreign secretary in 1839.

DANIELL, THOMAS (1749–1840), British painter, born at the Chertsey inn, Surrey, in 1749, and died at Kensington. London, March 19, 1840. Up to 1784 he painted topographical subjects and flower pieces. By this time his two nephews *(see* below) had come under his influence, the younger, Samuel, being apprenticed to Medland, the landscape engraver, and the elder, William, being under his own care. In this year (1784) he embarked for India accompanied by William, and remained there ten years; on returning to London he published his largest work, *Oriental Scenery,* completed in 1808.

WILLIAM DANIELL (1769–1837), his nephew, was 14 when he accompanied his uncle to India. He executed engravings in aquatint, and was elected R A. in 1822.

SAMUEL DANIELL (1775–1811), was brought up as an engraver, and first appeared as an exhibitor in 1792. He travelled into the interior of Africa, with his sketching materials in his haversack, and published *African Scenery.* He left for Ceylon in 1806, where he spent the remaining years of his life, publishing *The Scenery, Animals and Natives of Ceylon.*

DANIELS, JOSEPHUS (1862–), American editor and politician, was born at Washington, N.C., on May 18, 1862. He studied at the Wilson (N.C.) institute and also the University of North Carolina, and at 18 became editor of *The Wilson Advance.* He was admitted to the bar in 1885, but preferred newspaper work, becoming in that year editor of the Raleigh *State Chronicle.* He was printer for the State of North Carolina from 1887 to 1893; and then, for two years, was chief clerk of the Department of the Interior. From 1904 he was editor of the Raleigh *News and Observer,* with which his former paper was consolidated. He was on two occasions a delegate to the national Democratic convention, and from 1896 to 1916 was a member of the Democratic national executive committee. In 1913 he was appointed secretary of the Navy by President Wilson. His personal interest in the enlisted men was shown by his provision of opportunities for training in various trades. On retiring from this office in 1921 he resumed the editorship of his newspaper. He was the author of *The Navy and the Nation* (1919); *Our Navy at War* (1922); *Life of Worth Bagley* (1924) and *Life of Woodrow Wilson* (1924).



DANIEL WEBSTER HIGHWAY

DANIEL WEBSTER HIGHWAY, American thoroughfare extending from the Massachusetts-New Hampshire State boundary line to the Connecticut river at Canaan, Vermont. This highway was established by the New Hampshire legislature in 1921 to commemorate the great statesman whose name it bears; at Franklin it passes near his birthplace. It traverses the White Mountains and the heart of the State, and is hard surfaced or paved throughout its length of 200 miles. Lake Winnepesaukee, Mt. Washington, Old Man of the Mountains, the Indian Head and Franconia Notch are among the scenic attractions along its route.

DANISH LANGUAGE AND LITERATURE. The territory of Old Danish included the present Denmark, the southern Swedish provinces Halland, Skåne and Blekinge, the whole of Schleswig, and for a short period also a great part of

Britain, and parts of Normandy. The oldest monuments of the language are runic inscriptions, altogether about 225 in number. The oldest of them go as far back as to the beginning of the 9th century. No Danish literature arose before the 13th century. The oldest manuscript dates from the end of that-century, written in runes and containing the law of Skåne. From about the year 1300 we possess a manuscript written in Latin characters and containing the so-called Valdemar's and Erik's laws of Zealand, the Flensborg manuscript of the law of Jutland, and a manuscript of the municipal laws of Flensborg. These three manuscripts represent three different dialects—that, namely, of Skåne, Halland and Blekinge, that of Zealand and the other islands, and that of Jutland and Schleswig. There existed no uniform literary language in the Old Danish period.

The form of the language hardly differs at all during the period between A.D. 800 and 1200 from Old Swedish. In the oldest literature the differences are not important, and are generally attributable to the fact that Danish underwent a little earlier the same changes that afterwards took place in Swedish. Internally, they show considerable differences; the law of Skåne most nearly corresponds with the Swedish laws, those of Zealand keep the middle place, while the law of Jutland exhibits the most distinctive individuality. The vocabulary, which in earlier times only borrowed a few, and those mostly ecclesiastical, words, became chiefly owing to the predominant influence of the Hanse towns—inundated by German words.

The earliest traces of literary production in Denmark may be found as far back as the Germanic migration. The mythical events of that period provided inspiration for a Danish epic, which has been lost. Its outline and its ideas can be found in the free version in Latin made by Saxo about 1200 (see Axel Olrik, *Danmark's Heltedigtning*). During the first centuries after the arrival of Christianity in the country, the Danish mind was almost exclusively engaged in a slow process of assimilation. This was completed by the year 1200, when Denmark came into touch with the Latin civilization common to Europe, partly through translations and partly through adaptations. To this time belong many legends (the earliest about Knud the saint, by the English monk Aelnoth); the Hexaemeron, a poem about the creation, by Archbishop Andreas Sunesøn; annals of monasteries and chronicles, the most important being the *Compendiosa Historia Regum Daniae* by Sven Aggesen, and the Gesta Danorum of Saxo Grammaticus. In the Danish language we find, during the 13th century, collections of legal customs which before that time only existed in the form of oral tradition; *e.g.*, the "Scanian Law" and the "Seeland Law." The "Jutland Law" was somewhat under the influence of Roman and canonical law. The medical treatises of Henrik Harpestreng were written at the same time. From the 14th century dates a version of *Lucidarius*, the collection of old proverbs by Peter Laale, and a history of Denmark in verse (*Rimkrøniken*). This was the first book in Danish to be printed (1495). The most significant section of mediaeval Danish literature consists of folk-songs. In 1591 Anders Sørensen Vedel published 100 songs. Svend Grundtvig began a complete and scholarly edition in 1883. It was continued after his death by Axel Olrik.

Effect of the Reformation.— The 16th century was influenced by Humanism, but the struggle of the Reformation engaged the energies of all that was most significant in the nation. The humanist, Poul Helgesen, who had been trained by Erasmus, was a passionate Catholic polemist, while Hans Tausen (d. 1561 as bishop of Ribe) was a Protestant agitator. A useful mediator between the old and the new tendencies was Christiern Pedersen (d. 1554). In 1534 he adapted the French poems about Holger Danske—a book which remained popular for three centuries. Finally he was the principal author of the first complete Danish translation of the Bible (1550). Peder Palladius (d. as bishop of Seeland in 1560) transports us into the very midst of the fight for the Lutheranization of the national life in his *Visitatsbog*, consisting of notes made for his visits of inspection as a bishop.

The Danish hymn originated during this period. The earlier hymn-books have been lost, but their contents can be found in the first larger collection published by Hans Thomisen in 1569. A little later Hans Christensen Sthen wrote hymns in the style and in the tender tone of folk-songs.

The main part of the non-religious literature of the 16th century has been lost. The most important is the translation from the low German of Reynard the Fox by Herman Weigere (1555). The earliest trace of dramatic poetry in Denmark can also be found in that century—miracle- and morality-plays and farces in naïve style, enacted by the pupils of the schools. The oldest-known work is a miracle-play, *Ludus* de Sancto *Canuto* (c. 1530). The most talented dramatic author of the period was Hieronymus Justesen Ranch (d. 1607), rector in Viborg.

Apart from belles-lettres we have to mention the *Skiby-chronicle* by Poul Helgesen, the excellent translation of Saxo in 1575 by Anders Sørensen Vedel, the translation of Snorre's *Heimskringla* by the Norwegian, Peder Clausøn Friis, as well as the *Danmarks Riges Krønike* (Chronicle of the Danish State) by the chancellor Arild Huitfeld. Fantastical historiography is represented by Claus Lyschander, who carries the origin of the Danish royal house back to Adam.

Coming of the Renaissance.— During the Thirty Years' War Denmark was drawn into the European literary renaissance. The first representative of the new tendency was Anders Arrebo (1587–1637) for some time bishop in Trondhjem. He translated the Psalms into verse, and wrote an adaptation of the Hexaemeron by Du Bartas. Anders Bording (d. 1677) wrote lively topical poems and poems in the sentimental and gallant pastoral manner. He also wrote Den *Danske Mercurius*, a court-journal written in Alexandrine verse (1666), which was the first Danish weekly newspaper. By far the greatest poet is the writer of hymns, Thomas Kingo (1634–1703), the son of an emigrated Scottish weaver. After some smaller collections of hymns (including admirable morning- and evening-hymns) he published at the invitation of the king his sketch of a new hymn-book. A large part of this work was incorporated in the authorized hymn-book, the so-called hymn-book of Kingo of 1699.

The prose of this period contained a large amount of creative work. Ole Worm (1588–1654) is the originator of research into national antiquities, with the Monumenta Danica (1643), which described and interpreted all runic inscriptions known in his time. The Teutonic renaissance, which a century later was to come over from England as a reaction against the one-sided worship of French classicism, was already making itself felt in works such as the edition and translation of some of the older songs of the Edda by Peder Resen (1665), and in the essay De *Causis contemptae* Mortis a *Danis* (1689) by Thomas Bartholin the Younger. For the first time the living language was the object of serious study, in Latin by Bishop Erik Pontoppidan (1668) and in Danish in the Danske Sprogkunst, and in the Considerations about the *Cymbric Language* by the priest Peder Syv (1631–1702). At the end of the century two scholarly ladies appear, Brigitte Thott, who translated Seneca in 1658, and the daughter of Christian IV., Leonora Christina Ulfeldt, who in the unique human document *Jammersmindet*, first discovered and published in 1869, has described in a moving manner the history of her 20 years' imprisonment. Famous anatomists were Thomas Bartholin (d. 1680), Nicolaus Steno (d. 1686), who also founded geognosy, and Ole Rømer (d. 1710), who discovered the velocity of light.

The 18th Century.— In the first half of the 18th century Ludvig Holberg (*q.v.*, 1684–1754), puts all other names in the shade. He is called the father of Danish literature and contributed to nearly every branch of it. He wrote satires, 34 comedies, novels and epigrams. Unprejudiced and humorous, a raisonneur in the English and particularly in the French manner, he poured forth popular philosophical letters and moral considerations, and for the first time in Denmark, catered for the general cultured public.

Frederik Eilschow, popular philosopher, who died at the age of 25 in 1750, was a pupil of Holberg, as was Jens Schelderup Sneedorff (d. 1764), editor of a review in the manner of Addison, called *The* Patriotic Spectator. Historians of the period include Hans Gram (1685–1748), a critical student of sources and a scholarly annotator, founder of the "Videnskabernes Selskab" (Scientific Association, 1742), and Jakob Langebek (1710–78) who was

first and foremost an editor. He began the great edition of *Scriptores Rerum Danicarum*. Erik Pontoppidan the Younger (*q.v.*, d. 1764) wrote Danzsche Kirchengesclziclzte and the topographical work Danske Atlas. Apart from Holberg, poetry in the first half of the 18th century has little importance.

After Holberg's death English and French influences became increasingly marked. Pope's didactic poetry and the nature poems of Thomson found an imitator in Christian Braunman Tullin (1729–65). An association for improving the people's taste had been founded in accordance with the rules established by French aesthetics. These rules were strictly applied in the first original Danish tragedy Zarine (1772) by the Norwegian, Nordahl Brun. After 1770, other tendencies appeared. It was through Klopstock, who spent a great part of his life in Denmark, that the German Renaissance, which had its starting point in Young, Macpherson and Percy, was imported into Denmark. Its most talented representative is Johannes Ewald (*q.v.*, 1743–81), perhaps the most important lyrical poet in the pathetic manner of the 18th century. Ewald began as an adherent of French classicism, but was afterwards influenced by Shakespeare and Ossian. He wrote the first national tragedies, choosing his subjects from Saxo and the Edda (Rolf Krage and Balder's Death). In the musical play The Fishermen we find expressed for the first time the love of the sea and admiration for the common seaman. In his autobiography *Levned* og Meninger his delicate mind found its best medium of expression. Here we find humour and sensitiveness like Sterne's and the self-analysis of Rousseau.

The Norwegian, Johan Herman Wessel (1742–85), was a lover of clearness, wit and elegance. He caricatured insincere pathos and servile imitation in his tragic parody Kaerlighed *uden Strømper* (Love without Stockings, 1772). He was the wittiest of the clever literary people who gathered in the "Norske Selskab" (Norwegian Association). Jens Baggesen (*q.v.*, 1764–1826) was a man of restless nature but charming mind and real facility. His best work was done in his rhymed epistles and in Labyrinten, a description of travel in the manner of Sterne (1792).

The poets of the last decade of the 18th century are not of great importance, but, in a tentative way, they tried new tunes. Thomas Thaarup described the peasants in dramatic idylls with a patriotic tendency, e.g., *Høstgildet* (Harvest Festival, 1791). Ole Samsøe (d. 1796) chose a subject from the national past for his tragedy Dyveke (the mistress of Christian II.). O. C. Olafsen (1764–1827) wrote the best comedy since Holberg, Gulddaasen. Political and social satire predominate in the work of Peter Andreas Heiberg (1758–1841), who wrote plays (De Vonner og de Vanner), articles for periodicals and club-songs. Having been punished several times for his audacious criticism, he was banished in 1800 and settled in Paris. The same fate befell Malte Conrad Bruun (1775–1826) because of the *Aristokraternes Katekismus*.

The growing interest taken in political and public affairs manifested itself in the formation of clubs where social life was inspired by the punch-bowl and by songs. The most fertile and amiable song-writer of the period was Knud Lyhne Rabbek (1760–1830). He also contributed to the periodicals *Minerva* and The Danish Spectator. As an editor and a historian of literature he collaborated with the scholarly philologist Rasmus Nyerup (1759–1829) and with Werner Abrahamson (1744–1812), aesthete and critic. During this period Danish prose acquired increasing flexibility, clearness and irony. The doctor Johan Clemens Tode (d. 1806) wrote witty essays, Ove Malling aimed at arousing the patriotic sense of the Danes with anecdotes from the national history, Store og gode *Handlinger* (Great and Good Deeds, 1777), and Peter Frederik Suhm (1728–98) wrote a book about Odin and a history of Denmark, rich in material. Niels Treschow (1751–1833) was a philosopher with a style of Gallic delicacy.

The Golden Age.—The period between the battle of the roadstead of Copenhagen (1801) and the battle of Diippel (1864) was the golden age of Danish poetry. The Danish romantic movement shows an unusually harmonious blend of nationalism, of Christianity and of humanity. The first representative of the movement was Adolph Wilhelm Schack von Staffeldt (1769–1826), who was born in Germany and whose lyricism is profound and thoughtful, though rather heavy and lacking in polish. In the appreciation of the public he was entirely put in the shade by Adam Oehlenschlaeger (1779–1850), the most richly endowed poetical genius of Denmark. It was the Norwegian Henrik Steffens, whose conversations and lectures (1802) introduced Oehlenschlaeger to the world of romantic thought. The following years were the creative period, when Oehlenschlaeger wrote his romances, tragedies, poetic stories of adventure and sagas, works which are still the culminating point of Danish poetry. The power and beauty of his style and its picturesqueness influenced the poetry of the whole century that followed; the world of the Northern gods and heroes became as visible and tangible in Oehlenschlaeger's poetry, as that of the Greek Olympus in Homer. In *Aladdin* and in the figures of his tragedies the nation found an idealized picture of its own character, open, naïve, innocent, pious and true. Nicolaj Frederik Severin Grundtvig (*q.v.*, 1783–1872) was a clergyman, poet and historian. He developed through hard inner conflicts into a mighty advocate of religious and national awakening which, particularly through the Grundtvigian folk high schools, has been of enormous importance to the Danish people. He wrote historical and popular poems and a great number of hymns, some of which by their mixture of prophetic inspiration, simplicity and depth rank among the foremost in the world's literature. He was also a learned mythological and historical writer and gave, during three visits to England about 1830, an impetus to Anglo-Saxon studies. The importance of Bernhard Severin Ingemann (*q.v.*, 1789–1862) also lay in his awakening and strengthening the national self-confidence. This he effected by his historical novels of the middle ages, written somewhat in the manner of Scott, and by his cycle of romances *Holger Danske*. Carsten Hauch (*q.v.*, 1790–1872) was a pupil of Oehlenschlaeger and was romantic in the manner of Tieck and Novalis. His profound and noble personality expressed itself in historical dramas and novels, and especially in his lyrical poems.

The New Realism.—It is in the 'nos of the 19th century that the first traces of an interest in reality can be detected in the choice of poetical subjects. Poul Martin Møller (1794–1838), a strong and vital personality, portrayed, particularly in his novel En dansk Students Euentyr (The Adventures of a Danish Student, 1824), the types of his own time. Jute Steen Steensen Blicher (1782–1848) also wrote of contemporary life. His starting point was the 18th century. He began in 1807 with a prose translation of Ossian. Later he translated Pope's Abelard and The Rape of the Lock, Goldsmith's Vicar of *Wakefield* and several of the Percy folk-songs. Sterne also strongly influenced him. He was the first to describe in his poems Jutland, its heaths and its inhabitants. After 1824 he also did this in his short stories. Particularly original is E. *Bindstouw*, a collection of poems and stories written in Jutish dialect. Blicher was a clergyman and, completely in the tradition of the 18th century, he aimed at the enlightenment and practical reform of his flock. The divorced wife of P. A. Heiberg, Thomasine Gyllembourg-Ehrensvard (*q.v.*, 1773–1856), was much admired in her own time on account of her short stories, Hverdags-historier (Stories of Everyday Existence). She described the troubles of the heart, drawing upon her own experience, with an unprejudiced and delicate human understanding. Her nephew Carl Bernhard (pseudonym, Andreas Saint-Aubain) revealed similar qualities in his novels, while Carl Baggers's (d. 1846) short story (The Life of *My* Brother), which is full of audacious realism and Byronic pride, shocked the few readers it found.

About 1830 the other naïve romanticism gave way to a poetical realism, more contemplative and conscious, more artistic than national, more interested in form than in matter. The leader of this movement is Johan Ludvig Heiberg (*q.v.*, 1791–1860). His vaudevilles heralded the newer Danish comedy and his romantic dramas *Elverhøj* (The Hill of the Fairies) and *Syvsoverdag* ousted the serious tragedies of Oehlenschlaeger from public favour. Heiberg was the first Danish critic who founded himself upon clearly defined principles. The upper classes allowed him to dictate their taste, until they accepted the doctrines of Georg Brandes. Henrik Hertz (q *v.*, 1797–1870) was another author of

comedies, also a champion of good taste. He was a creature of delicate moods and style, of an artistic mind rather than forceful personality. Christian Winther (*q.v.*, 1796–1876) was the fertile singer of the natural beauties of Seeland and the first great lyrical love poet in Danish. Ludvig Adolf Bødtcher (1793–1874) and Emil Aarestrup (1800–56) are excellent lyrical writers in the small manner.

Hans Andemen.—Unique, and one of the greatest figures was Hans Christian Andersen (*q.v.*, 1805–75). He experimented in several genres without much success until in his *Eventyr* (Fairy-tales), which came out in small instalments from 1835 onwards, he succeeded at last in expressing his real self, his sublime simplicity, his all-inspiring fancy, his deep sentiment and his quaint humour, which always plays between smiles and tears. The fairy tales were told for a childish audience in a very lively and impressionistic style, but their ideas are for adults—a mixture of simple idealism and bitterness caused by personal experiences.

In the '40s political liberalism was acquiring an increasingly powerful hold, and a growing sense of actuality and of realism began to undermine the old aesthetic humanism. Heiberg, with his superior sarcasm, condemned what he called the spiritless outlook of this time in his satirical work En *Sjael* efter *Døden* (A Soul after Death, 1841). Paludan Müller's (1809–76) point of view however was ethical. His chief work was the epic poem Adam Homo (1841–48), in Byronic stanzas, full of reminiscences of Don Juan. He was one of the masters of Ibsen. So was Søren Aaby Rierkegaard (*q.v.*, 1813–55), the most original genius of the '40s. He was a fascinating and at the same time a profound writer, a captivating stylist, a subtle philosophic and religious author. He set forth his conception of life, his views on aesthetic, ethical and religious problems, in *Enten-Eller* (Either-Or) and Stadier *paa Livets* Vej (Stages on the Road of Life).

The Jew Meir Aaron Goldschmidt (1819–87) was a figure of transition, a Danish Disraeli. He edited the first satirical weekly, Corsaren (The Corsair). He was the first writer who gave a sympathetic description of Jews. In his novel *En Jøde,* a Jew (1845), and in his delicate short stories, he displayed a psychological penetration and depth of mood, which pointed towards a newer poetry. In the '40s a certain liveliness was displayed by the students who carried the banner of aesthetic liberalism and of the pan-Scandinavian idea. Carl Ploug (1813–94) and Jens Christian Hostrup (1818–92) were their leaders. They wrote songs and students' comedies. Many of the lyrical poets of the middle of the century are delicate in expression even if they are somewhat colourless and vague—Christian Richardt (d. 1892); Hans Vilhelm Kaalund (d. 1887); Christian Molbech (d. 1888), who also translated Dante; Edvard Lembcke (d. 1897), the translator of Byron and Shakespeare. Eric Bøgh (1822–99) was a skilled writer of songs and of vaudevilles in the popular humorous taste.

Prose-writers also followed in the traces of the older generation. Herman Frederik Evald (1821–1908) and J. C. C. Brosbøll (pseudonym, Carit Etlar, d. 1900) wrote entertaining historical novels in the manner of Blicher and Ingemann. A series of schoolmasters took the same line (Thyregod, Anton Nielsen, Zacharias Nielsen). They widened the circle of readers and in their works probed deeper into popular life than any writer before them. Vilhelm Bergsøe was a capable maker of novels which suited the easily satisfied taste of the upper-classes (Piazza del Popolo, 1866). The most original was Hans Egede Schack. His novel *Phantas*terne (The Phantasts, 1857) reveals considerable psychological gifts.

The period which ends about 1870 is rich in important names in the sphere of scholarship. C. J. Thomsen (d. 1865) and J. J. Asmussen Worsaae (1821–85) were the first to place on a firm foundation the study of Nordish archaeology. Niels Matthias Petersen (1791–1862) wrote a pioneer work on the History of Danish Literature, and translated, about 1840, the Seelandish sagas. Christian Molbech (1783–1857), a learned historian and acute critic, published the first good Danish dictionary. Other historians were Engelstoft (1774–1850) and K. F. Allen (1811–71). In philosophy specially notable personalities were Frederik Christian Sibbern, the Hegelian Rasmus Nielsen (d. 1884) and Hans Brøchner (d. 1875), the master of Georg Brandes.

The Work of **Brandes.**—Georg Brandes (*q.v.*, 1842–1927) is undoubtedly the leading Danish representative of the new outlook on life which manifested itself during the second half of the 19th century. The brilliance and ingenuity of his manner are shown as much in his lectures about The *Principal* Tendencies of *19th* Century Literature as in his literary essays and critical portraits (Holberg, Kierkegaard, Shakespeare, Goethe, Voltaire). He shattered the national self-confidence and linked the general thought of Denmark with the mind of Europe, especially in the direction of positivism and individualism. His historical and psychological criticism, formed in the school of Taine and Sainte-Beuve, indicated the direction in which all subsequent Danish literary history was to move. Finally he pointed the way to the poets of his time in the direction of a truer psychology, a more characteristic style, and in particular towards a more daring and more modern choice of subject matter. His critical attitude towards tradition shocked many people. But most of the talented among the younger generation were delighted and enthusiastic. Until 1900 literature had essentially been a debate between old and new, national and foreign, a choice between tradition and freedom. For deeper natures it had meant a debate between the rights of dreams and those of the outer world, between the romanticism of the heart and the realism of the intellect. That is how Holger Drachmann (*q.v.*, 1846–1908) the greatest lyrical poet of the period, saw the conflict. He was a great writer of love poems and of vivid poems about the sea and seamen, but his inner life oscillated restlessly between the old and the new.

Jens Peter Jacobsen (*q.v.*, 1847–85), in his stories and novels, went much deeper into the same problems of dream and reality, especially in Niels Lyhne. In Marie *Grubbe* he introduced the naturalism of Flaubert. In this genre he showed himself capable of closer observation and of deeper psychological interpretation than any of his predecessors.

Sophus Schandorff (1838–1901) painted racy and robust pictures of peasant and lower middle-class life. (Little *Folk,* 1880). He caricatured priests and noblemen in the true manner of an agitator. His successor was Gustav Wied (1858–1914) whose pictures of provincial towns were witty distortions of reality, and exposed the hypocrisies of social life (*Slaegten, Satyrspil*). Erik Skram (1847–1923) became, with Gertrude *Colbjørnsen* (1879), a member of the corporation of iconoclasts. Marl Gjellerup (1857–1919) began with a contentious and anti-theological novel, The Disciple of *Teutons,* in homage to Georg Brandes. But soon his religious and humanitarian sentiments made him turn his back on naturalism. In drama (*Brynhild, Wuthorn*) and novels *Minna, Møllen* (The Mill), he dealt with eternal problems in the ethical manner of Schiller.

Representatives of the modernist doctrines of Brandes were Edvard Brandes (1847–1931) in his modem tendentious drama, the mocking Peter Nansen (1861–1918) in his stories in the style of Maupassant, and Carl Evald (1856–1908) in his natural-history tales with a Darwinian tendency. In his comedies (e.g., En *Skandale*), Otto Benzon (1856–1927) battles against the hypocrisy of society, and Gustav Esmann (1860–1904) pokes fun at the older generation, *e.g.,* in Den kaere *Familie* (The Dear Family). Less of an agitator and more bound by tradition is Einar Christiansen (1861–). Sven Lange (1868–1930) was a poet and an individualist unburdened with doctrines, as he showed in his drama Samson and *Delila,* in his novel *Hjertets* Gerninger which describes the early '90s, and in The First Conflicts, in which the young Georg Brandes is the principal figure. A typical Copenhagen poet was Karl Larsen (1860–1931), with an acute perception and a perfect capacity for expression. He described the types of the big town, from the lowest classes upward: *Udenfor Rang*klasserne (Outside the Upper Classes). In Den gamle Historie (The Old Story), which is really an autobiography, he has given us a picture of the exaltation of the '70s.

Outside the Brandes movement were the subtle exponent of feminine psychology Wilhelm Topsøe (1840–80) and the more modern Herman Bang (1857–1912). Bang's outlook on life was decadent and pessimistic. He is fascinating because of the

virtuosity of his impressionistic technique His special subjects are the uneventful existences, those poor nonentities. old or lonely women with a hidden tragedy in their lives that are made up out of nothing at all *(Ved Vejen:* Away from the Trodden Path; *Ludvigsbakke:* Ludvigshill; *Irene Holm).* Henrik Pontoppidan (1857–1943) is another important author, although in a somewhat older style. In 1917 he shared the Nobel prize with Karl Gjellerup. In a series of great novels *(Det forjaettede Land:* The Promised Land; *Lykkeper; De Dødes Rige:* The Kingdom of the Dead) he has exposed in a forceful and mordantly ironical way the weaknesses of his time.

The '90s in Denmark. — About 1890, a reaction against uninspired naturalism set in, with a deeper impulse towards beauty, a consciousness of duty towards the universe. This applies especially to a number of lyrical poets in the '90s. The most important was Johannes Jørgensen *(1866–*). He was first attracted by Modernism but became converted to Catholicism. In his youth he was a refined stylist; afterwards in his collections of Poems: *Fra det Dybe* (From the Depths), *Blomster og Frugter* (Flowers and Fruit); and in his prose works: *St. Francis of Assisi, The Goethe Book,* he revealed the depth of his feeling and his gentle simplicity. His friend Viggo Stuckenberg (1863–1906) was a poet who sang of every-day existence and fidelity. Sophus Claussen (1864–1931) was a capricious, but always an elegant, poet (*Dansk Sommer:* Danish Summer; *Djaevlerier:* Devilries; *Heroica*) and translator, *e.g.,* of Shelley.

Ludvig Holstein (1864–) was a successor of Christian Winther, as Valdemar Rørdam (1872–) was the successor of Holger Drachmann. Rørdam is also the translator of Kipling. Thor Lange (1851–1915), Ernst v. d. Recke (1848–1933), and Niels Møller (1859–) have also to be mentioned, as well as Sophus Michaëlis another refined prose writer.

A special group is formed by the Jutland authors who are inspired by love of their land, its natural beauty and its inhabitants, and its daily life in field, farmyard and home. Jeppe Aakjaer (1866–1930) was a great lyrical poet of popular inspiration, a pupil of Blicher and of Burns. Johan Skjoldborg *(1861–*) is the poet of the Jutland smallholders (*En Stridsmand; Kragehuset*). Marie Bregendahl (1867–) is important for her descriptions of local life which are astonishingly true to life and full of faith in the deeper forces of the world. Jakob Knudsen (1858–1917) stands entirely by himself. He was a writer of strong personality, who broke away from modernism, individualism and intellectualism (*Gaering-Afklaring:* The Fermentation Subsides. *Angst og Mod:* Fear and Courage, a book about Luther; *Den Gamle Praest:* The Old Priest: *Sind).* Johannes V. Jensen (1873–), the most genuine of the Jutland authors, expanded the Jutish movement into an Anglo-Saxon movement. In *The Gothic Renaissance* (1900) he attacked the sickness and tiredness of the end of the 19th century. At the same time he is the greatest language reformer since Oehlenschlaeger. His chief works are: *Stories from Himmerland, Myths and Hunts, Exotic Stories,* which are based on his travels, and a series of novels; e g., *The Long Journey.* He also wrote a *History of the Northern Races from the Ice-age to the Vikings* (translated into English in *1924).*

Other modern Danish prose writers of merit are Martin Andersen Nexø (1869–), author of the monumental epic of proletarian life *Pelle the Conqueror* and *Ditte Girl Alive;* Harald Kidde (1878–1918) who lacks Nexø's social interests but deals in a subtle manner with complex psychological difficulties (*Aage and Elsa; The Hero);* Thorkild Gravlund (1879–) who specializes in Danish national psychology; Knud Hjortø (1869–1931) who painted pictures of provincial town-life. Johannes Buchholtz *(1882–*) describes provincial life in a baroque and fanciful manner (*Egholm's Gud; The Miracles of Clara v. Hang).* Hans Poulsen (*Julie Pandum,* 1927) is subtle and penetrating, and studies the same *milieu.* Otto Rung (1874–) depicts in his novels (*The Bird of Paradise*) and in his dramas *(The Bridge)* the dregs of the urban population as well as the "high-brows." Poul Levin (1869–1929) takes his amiable and pleasant subjects from the life of the upper middle-class. Harry Søiberg (1880–), in his *Country of the Living* (1920), has given a description of great value of the religious struggles among the population of West-Jutland. Lighter food is provided in the witty literary portraits and pastiches by Svend Leopold *(1874–*), and in Svend Fleuron's *(1874–*) widely-read animal stories.

After the **World War.**—The ferment of the period after the War has been noticeable in Denmark. Anker Larsen *(1874–*) deals with general conceptions of life in his novels, especially in *The Philosopher's Stone,* which obtained the Gyldendal prize for literature in 1923. Among the younger writers the most original are Tom Kristensen *(1893–*) *(The Arabesque of Life)* and Jakob Paludan (1896–) *(Birds round the Fire* and *The Field is Ripening).* In lyrical poetry we find again Tom Kristensen, Emil Bgnnelycke, the poet of town life, the epicurean Hans Hartvig Seedorff Pedersen *(1892–*) *(Vine and Ivy)* and the pithy satirical painter of the provinces, Harald Bergstedt *(1877–*). The lyrical and dramatic works of Helge Rode *(1870–*) and the work of Jute Thøger Larsen (d. *1928)* deal more and more with religious and national questions. Finally we may mention Olaf Hansen, L. C. Nielsen and Kai Hoffmann, lyrical poets.

There are a few dramatists besides those already mentioned: Svend Lange, Helge Rode and the fertile Carl Gandrup (1880–). The Jew Henri Nathansen (1868–) deals with the troubles of his race. He has written the dramas *Daniel Hertz* and *Within the Walls,* and a novel, *The Life of Hugo David.*

There are many women writers, some important: Ingeborg M. Sick (1869–) and Karin Michaëlis *(1872–*), whose novel *The Dangerous Age* (1910) has been translated into most European languages. The novelist and dramatist Agnes Hennigsen (1868–) depicts the love-life of modern women. Thit Jensen has discussed problems of feminine life. Gyrithe Lemcke (1866–) has given a good description of the life of several generations of a merchant family during the course of a century (*Edwardsgave*). The novels of Astrid Ehrencrone Kidde about Värmland are delicate and full of atmosphere. Inga Nalbandian (1879–) has described the terrpr in Armenia with fiery hatred. (For the contribution of Icelandic authors to Danish literature *see* ICELANDIC LITERATURE)

Amongst historical writers since 1870 are Troels Lund (1840–1921) who wrote *Daily Life in Northern Europe during the 16th Century;* the South Jute A. D. Jørgensen (1840–1897); the historian of the Normans and Vikings Johannes Steenstrup (1848–1935); the critic of sources of mediaeval history Kristian Erslev (1852–1930); and Eric Arup (1876–), who collaborated in a Danish history written from a social-economic viewpoint. Folklorists were Svend Grundtvig, H. F. Feilberg (author of a Jutish dictionary) and Axel Olrik. In 1879 Trap finished the first edition of his great statistical and topographical work *Denmark,* and in 1905 appeared Bricka's biographical dictionary. Julius Lange (1838–96) is the author of the monumental work *The Human Figure in the History of Art.* Karl Madsen (1855–) dealt with national art and with the Netherlands; Frederik Poulsen (1876–) with the art of the ancients; Wilhelm Wanscher (1875–) especially with the Renaissance. A fascinating writer on the history of national literature is Vilhelm Andersen (1864–) whose chief work is *Times and Types in the History of the Danish Mind.* Valdemar Vedel (1865–) has given scholarly pictures of historical types from the middle-ages to the 17th century (*Lives of Heroes, Town and Burgher, Monastic Life, Baroque*). Amongst younger writers, Paul V. Rubow (1896–) is notable for outlook, method and critical sagacity. Harald Nielsen (1879–) was the most independent judge of the literature of his day, but he became increasingly interested in the observation of the social and moral aspects of his own time, and a modern mediaevalist like Chesterton. In philosophy Harald Høffding (1843–1931) is the greatest name.

Finally we may mention the annual publications and the scholarly editions of the Danish Association for National Language and Literature (*Sprog og Litteraturselskab)* founded in 1911, which also edits the great Danish dictionary.

An extensive bibliography may be found in Krarup and Erichsen, *Danish Historical* **Bibliography** (1917), part *iii.* and in the Danish biographical ***Hand Lexicon*** (ended *in* 1926). (G. CH.)

DANRL, VIKTOR, FREIHERR VON (1854–), Austro-Hungarian general, was born in Udine on Sept. 18, 1854. In the World War he commanded at the outset the I. Army and defeated the Russians in the battle of Krasnik (Aug. 23–25, 1914). After the Italian declaration of war he became in May 1915 commander of the defence forces in Tirol. As an army commander in the following years he took a successful part in the offensive against Asiago-Asiero, but shortly afterwards retired from his post on account of ill-health.

DANNAT, WILLIAM T. (1853–1929), American artist, was born in New York city in 1853. He was a pupil of the Royal Academy of Munich and of Munkacsy, and became an accomplished draughtsman and a distinguished figure and portrait painter. He early attracted attention with sketches and pictures made in Spain, and a large composition, "The Quartette," now in the Metropolitan Museum of Art, New York, was one of the successes of the Paris Salon of 1884. Dannat settled in Paris; he is represented in the Luxembourg, was president of the Paris Society of American Painters, and a member of the National Institute of Arts and Letters. He died in France on March 12, 1929.

DANNECKER, JOHANN HEINRICH VON (1758–1841), German sculptor, was born at Stuttgart, on Oct. 1j, 1758, and died there on Dec. 8, 1841. His father was employed in the stables of the duke of U'urttemberg. The boy was entered in the military school at the age of 13, but after two years he was allowed to follow his taste for art. The duke made him sculptor to the palace (1780), and employed him on child angels and caryatids for the decoration of the reception rooms. In 1783 he left for Paris with Scheffauer, and placed himself under Pajou; in 1785 he went to Rome, where he worked for five years. Goethe and Herder were then in Rome, and became his friends, as well as Canova, who was the hero of the day, and who had undoubtedly a great and powerful influence on his style. The marble statues of Ceres and Bacchus (in the Schloss at Stuttgart) were done at this time. On his return to Stuttgart, which he never afterwards quitted, except for short trips to Paris, Vienna and Zürich, the double influence of his admiration for Canova and his study of the antique is apparent in his works. The Ariadne (1806), in the Bethmann museum, Frankfurt, is the most popular of his works. Many of the illustrious persons of the time were modelled by him, among others, Lavater, Metternich, Countess Stephanie of Baden and General Benckendorif. Of the three portrait busts of Schiller the first in date (1 797) is life-size, and is at Weimar; the second, modelled in colossal size, is in the Stuttgart museum; the third was made for the then Crown Prince Louis of Bavaria. Dannecker was director of the Gallery of Stuttgart, and received many academic and other distinctions.

DANNEWERK or **DANEWERK** (Dan., *Dannevirke* or Danevirke, "Danes' rampart"), the ancient frontier rampart of the Danes against the Germans, extending 10½m. from just south of the town of Schleswig to the marshes of the river Trene near the village of Hollingstedt. The rampart was begun by Guðoðr (Godefridus), king of Vestfold, early in the 9th century. In 934 it was passed by the German king Henry I., after which it was extended by King Harold Bluetooth (940–986), but was again stormed by the emperor Otto II. in 974. The chronicler Saxo Grammaticus mentions in his Gesta *Danorum* the "rampart of Jutland" (Jutiae moenia) as having been once more extended by Valdemar the Great (1157–82), which has been cited among the proofs that Schleswig (*Sønderjylland*) forms an integral part of Jutland (*Manuel hist.* de la question de *Slesvig,* 1906). After the union of Schleswig and Holstein under the Danish crown, the Danevirke fell into decay, but in 1848 it was hastily strengthened by the Danes, who were, however, unable to hold it in face of the superiority of the Prussian artillery, and on April 23 it was stormed. From 1850 onwards it was again repaired and strengthened at great cost, and was considered impregnable; but in the war of 1864 the Prussians turned it by crossing the Schlei, and it was abandoned by the Danes on Feb. 6 without a blow. It was thereupon destroyed by the Prussians; in spite of which, however, a long line of imposing ruins still remains. The systematic excavation of these, begun in 1900, has yielded some notable finds, especially of valuable runic inscriptions (F. de Jessen, La Question *de Slesvig,* pp. 25, 44–50, etc.).

See Lorenzen, *Dannevirke og Omegn* (2nd ed., Copenhagen, 1864); H. Handelmann, *Das Dannewrrk* (Kiel, 1885); Philippsen and Sünksen, *Führer* durch *das Danewerk* (Hamburg, 1903).

DANNREUTHER, EDWARD (1844–190j), German pianist, teacher and writer on music, was born at Strasbourg on Nov. 4, 1844, and was brought up in the United States. He studied music (1859–63) at Leipzig under Moscheles, Hauptmann and Richter, and settled in London in 1863. There he rendered great service to the English musical world in a variety of ways—by his own interpretations of the great German classics, by his musical writings in general, and by his propagandist labours on behalf of Richard Wagner in particular. He was professor of the pianoforte at the Royal College of Music from 1895. Dannreuther's principal works are: *Musical* Ornamentation (1893–95), the standard English work on the subject, and vol. vi. ("The Romantic Period") of the Oxford History of *Music.*

DANSVILLE, a village of Livingston county, New York, U.S.A., 49 mi. S. of Rochester, adjoining Stony Brook state park. It has an airport, and is served by the Dansville and Mount Morris and the Lackawanna railways. Pop. (1940) 4,976. Large nurseries for growing fruit and ornamental trees and several manufacturing plants are there. The Instructor, a magazine for teachers, with a national circulation, is published there. There is a sanatorium in the village. Clara Barton established the first chapter of American Red Cross in Dansville, Aug. 1881. Dansville was settled about 1800 and incorporated in 1845.

DANTAN, JEAN PIERRE (1800–1869), French sculptor, born in Paris on Dec. 28, 1800. His father was a carver in wood, and Jean in company with his brother Antoine Laurent were trained in his studio. The two brothers then studied under Bosio and in 1828 went to Rome. On his return to Paris Jean Pierre became known for his caricature statuettes. He portrayed many famous men (Talleyrand, Wellington, Rothschild, William IV, Brougham, Liszt, Victor Hugo and many others). He died in Baden-Baden on Sept. 6, 1869.

ANTOINE LAURENT DANTAN (1798–1878), brother of Jean Pierre, made many monuments for churches, public buildings and squares (St. Raphael in the Madeleine, Paris; St. Duquesne in Dieppe; La Place in Caen).

JOSEPH EDUARD DANTAN (1848–1897), French historic painter, son of Jean Pierre, studied under Pils. He exhibited regularly in the Salon des Artistes Français; and he also illustrated Zola and Victor Hugo.

DANTE (or **DURANTE) ALIGHIERI** (1265–1321), the greatest of Italian poets, was born at Florence about the middle of May 1265. He was descended from an ancient family, but from one which at any rate for several generations had belonged to the burgher and not to the knightly class. Dante himself does not, with the exception of a few obscure and scattered allusions, carry his ancestry beyond the warrior Cacciaguida, whom he met in the sphere of Mars (Par. xv. 87 seq.). Of Cacciaguida's family nothing is known. The name, as he told Dante (Par. xv. 130, 135), was given him at his baptism. He further tells his descendant that he was born in the year 1091, and that he married a lady from the valley of the Po, from whom the name Aldighieri or Alighieri passed to his descendants. He also mentions two brothers, Moronte and Eliseo, and that he accompanied the emperor Conrad III. upon his crusade into the Holy Land, where he died (1147) among the infidels. From Aldighiero, son of Cacciaguida, were descended the Alighieri. Bellincione, son of Aldighiero, was the grandfather of Dante. His father was a second Alighiero of whom little is known. Dante appears to have been the son of Alighiero's first wife, Bella, whose family name is doubtful. By his second wife, Lapa di Chiarissimo Cialuffi, Alighiero had a son Francesco and a daughter Tana (Gaetana); another daughter, who married Leone Poggi and whose name is not known, was perhaps the poet's sister. Thus the family of Dante held a most respectable position among the citizens of his beloved city; but had it been reckoned in the very first rank they could not have remained in Florence

after the defeat of the Guelphs at Montaperti in 1260. It is clear, however, that Dante's mother at least did so remain, for Dante was born in Florence in 1265. The heads of the Guelph party did not return till 1267.

Apart from his love for Beatrice, we know very little of Dante's boyhood and early life. His early biographers, Boccaccio and Leonardo Bruni, represent him as an assiduous student. From the age of 18 he, like most cultivated young men of that age, wrote poetry assiduously, in the philosophical amatory style of which his friend, older by some years than himself, Guido Cavalcanti, was a great exponent, and of which Dante regarded Guido Guinicelli of Bologna as the master (*Purg.* xxvi. 97, 8). He doubtless owed much to the paternal influence of Brunetto Latini (d. 1294), the philosopher and rhetorician, who figured largely in the councils of the Florentine commune. Of Brunetto Latini Dante himself speaks with the most loving gratitude and affection, though he does not hesitate to brand his vice with infamy. He had some knowledge of drawing; at any rate he tells us that on the anniversary of the death of Beatrice he drew an angel on a tablet; he is said to have been an intimate friend of Giotto, who has immortalized his youthful lineaments in the chapel of the Bargello. Nor was he less sensible to the delights of music. Milton had not a keener ear for the loud uplifted angel trumpets and the immortal harps of golden wires of the cherubim and seraphim; and the English poet was proud to compare his own friendship with Henry Lawes with that between Dante and Casella, "met in the milder shades of purgatory." There is some evidence that Dante was at Bologna not later than 1287, but it is doubtful whether, as Boccaccio states, he studied at the university. It is clear that, from his youth onwards, he began to make himself master of all the sciences of his time, while playing his part in society and in touch with every aspect of Florentine life.

PORTRAIT OF DANTE. FROM A WOOD-CUT OF 1521

Political Life.—We must now consider the political circumstances in which lay the activity of Dante's manhood. From 1115, the year of the death of Matilda, countess of Tuscany, Florence developed as a self-governing commune attached to the cause of the Church. According to tradition, the Guelph and Ghibelline factions were introduced into the city in 1215. Buondelmonte de' Buondelmonti, a noble youth of Florence, being engaged to marry a lady of the house of Amidei, allied himself instead to a Donati, and was attacked and killed by the Amidei and Uberti at the foot of the Ponte Vecchio, close by the pilaster which bore the image of Mars (Par. xvi. 136–147). Although a number of noble families, headed by the Uberti, now ranged themselves with the Ghibellines, the commune remained Guelph; but, in 1248, with the aid of German horsemen sent by Frederick II., the Uberti and the Ghibellines gained the upper hand and expelled the Guelph nobles. In 1250, when the emperor was dying, there was a revolution by which the Primo Popolo, the first democratic constitution of the republic, was established, with a captain of the people to counterbalance the podestà, and the Guelphs were recalled. The Uberti and other Ghibellines—in understanding with Manfred who had succeeded his father Frederick as king of Sicily—attempted to rebel in 1258, were expelled from the city and their houses and towers destroyed. The reception of the exiles in Siena brought on the war which resulted in the great battle of Montaperti, Sept. 4, 1260, "which dyed the Arbia red," in which the Florentine Guelphs and their allies were completely defeated by the Sienese and the German troops of Manfred. At a congress at Empoli, in which the Ghibelline cities of Tuscany were represented, it was proposed to destroy Florence—a proposal defeated by the bold patriotism of Farinata degli Uberti (*Inf.* x. 91–93).

The Ghibellines now held sway in Florence as elsewhere in Tuscany, until Charles of Anjou—to whom the pope had offered the crown of Apulia and Sicily—came to Italy, and on Feb. 26, 1266, defeated and killed Manfred at Benevento. In 1267 the Guelphs were recalled, and the Ghibellines were driven out. Florence was for a while under the suzerainty of Charles of Anjou; but in 1282, after the "Sicilian Vespers," the Secondo *Popolo*—the second democratic constitution of Florence—was established. By this the government was placed in the hands of the Priors of the Arts, who, associated with the Captain of the People, became the chief magistrates of the republic. The Arts or Gilds—seven maggiori and 14 minori—were organized, to be the backbone of the State. The Priors, elected from the Arts, were six in number and held office for two months. Siena had become Guelph, but Pisa and Arezzo remained Ghibelline, and Florence led a Guelph Tuscan league against them in a war which culminated on June 11, 1289, at Campaldino near Poppi, in the Casentino, where the Ghibellines were utterly defeated. They never again recovered any hold in Tuscany but the violence of faction survived under other forms. Several allusions in the *Commedia* (Inf. xxii. 1, xxi. 95; Purg. v. 92) indicate that Dante saw military service in this war, and a passage in a letter of his, no longer extant but quoted by Leonardo Bruni, states that he fought in the front rank at Campaldino.

Meeting with Beatrice.—As he tells us in the Vita *Nuova,* Dante had first met the girl whom he calls Beatrice, the love for whom was to be the guiding-star and inspiration of his life, in 1274, when she was at about the beginning of her ninth year, and he at about the end of his ninth year. If she has been rightly identified with Bice Portinari, she married Simone de' Bardi. Beatrice died on June 8, 1290 (the date June 9 is due to a mystification in the Vita *Nuova*). The last chapter of the Vita *Nuova* relates how, after the lapse of some undefined time, "it was given me to behold a wonderful vision, wherein I saw things which determined me to say nothing further of this blessed one until such time as I could discourse more worthily concerning her. And to this end I labour all I can, as she in truth knoweth. Therefore if it be His pleasure through Whom is the life of all things that my life continue with me a few years, it is my hope that I shall yet write concerning her what hath not before been written of any woman. After the which may it seem good unto Him who is the lord of courtesy that my spirit should go hence to behold the glory of its lady, to wit, of that blessed Beatrice who now gloriously gazes on the countenance of Him *qui* est per *omnia saecula benedictus.*" In the *Convivio* he resumes the story of his life. "When I had lost the first delight of my soul (that is, Beatrice) I remained so pierced with sadness that no comforts availed me anything, yet after some time my mind, desirous of health, sought to return to the method by which other disconsolate ones had found consolation, and I set myself to read that little-known book of Boetius in which he consoled himself when a prisoner and an exile. And hearing that Tully had written another work, in which, treating of friendship, he had given words of consolation to Laelius, I set myself to read that also." At some unascertained date, perhaps about 1292, he married Gemma, daughter of Manetto Donati, a connection of the celebrated Corso Donati, afterwards the leader of the party opposed to Dante's own. By this wife he had two sons, Jacopo and Pietro, and either one or two daughters (Antonia being perhaps the same as the daughter who became a nun, Suora Beatrice, at Ravenna). Although he never mentions his wife in the *Divina* Commedia, and although she did not accompany him into exile, there is no clear evidence for the belief that the union was otherwise than happy. Certain it is that he spares the memory of Corso in his great poem, and speaks with affection of his kinsmen Piccarda and Forese, the latter of whom was one of his own intimate friends.

In 1293 Giano della Bella, a man of old family who had thrown in his lot with the people, induced the commonwealth to adopt the so-called "Ordinances of Justice," a severely democratic addition to the constitution, by which among other things it was enacted that no man of noble family, even though engaged in trade, could

hold offices as prior, or be a member of the popular councils of the State, and a new magistrate, the *Gonfaloniere di Giustizia,* was added to the Signoria. Two years later Giano was banished, but the ordinances remained in force, though their severity was modified.

Banishment.—Dante now began to take an active part in politics. He was inscribed in the *arte* of the *Medici* and *Speziali,* which made him eligible for the priorate. Documents still existing in the archives of Florence show that he took part in the deliberations of the several councils of the city from the latter part of 1295 onwards, and there is record of an important speech of his in the Council of the Hundred on June 5, 1296. In May 1300 he served on a special embassy, to the commune of San Geimignano. From June 15 to Aug. 14, 1300, he sat in the Signoria as one of the six Priors, which, he says, was the cause and origin of all his misfortunes. The spirit of faction had again broken out in Florence. The two rival families were the Cerchi and the Donati—the first of great wealth but recent origin, the last of ancient ancestry but poor. A quarrel had arisen in Pistoia between the two branches of the Cancellieri—the Bianchi and Neri, the Whites and the Blacks. The quarrel spread to Florence, the Donati took the side of the Blacks, the Cerchi of the Whites. Pope Boniface was asked to mediate, and sent Cardinal Matteo d'Acquasparta to maintain peace. He arrived just as Dante entered upon his office as prior. The cardinal effected nothing, but Dante and his colleagues banished the heads of the rival parties in different directions to a distance from the capital. The Blacks, including Corso Donati, were sent to Città della Pieve in the Tuscan mountains; the Whites, arnong whom was Dante's dearest friend Guido Cavalcanti, to Sarzana in the unhealthy Maremma. After the expiration of Dante's office the banished Whites were allowed to return, Guido Cavalcanti so ill with fever that he shortly afterwards died. In the following year, 1301, in consequence of a treasonable meeting in the church of S. Trinità, a number of the Blacks were banished, and a fresh sentence passed against Corso Donati. The Whites now controlled the politics of Florence, and expelled the Blacks from Pistoia.

In this-same year, 1301, we have several records of Dante's political activity. One of these is noteworthy. The pope had demanded the service of 100 Florentine horsemen, and on June 19, in the council of the Hundred, Dante urged *"Quod de servitio faciendo domino Papae nihil fiat,"* thus showing himself a firm opponent to papal interferences in Florentine politics. Pope Boniface had already sent for Charles of Valois, brother of the French king, Philip the Fair, to act as "peacemaker." The priors sent at the beginning of October, three ambassadors to the pope, one of whom, according to the chronicler Dino Compagni, was Dante. Charles entered Florence on All Saints' day, 1301, and was followed by Corso Donati and his allies. The Blacks, restored to power, appointed Cante de' Gabrielli of Gubbio as podestà, a man devoted to their interest. More than 600 Whites were condemned to exile and cast as beggars upon the world. On Jan. 27, 1302, Dante, with four others of the White party, was charged before the podesti with *baratteria,* or corrupt practices in and out of office and with offences against the Guelph party, and, not appearing, was condemned to pay a fine of 5,000 lire of small florins. If the money was not paid within three days their property was to be destroyed; if they did pay the fine they were to be exiled for two years from Tuscany and never again to hold office in the republic. Dante's innocence of "barratry" is unquestionable; his real offence was his opposition to the policy of Boniface and his Florentine supporters. On March 10, Dante and 14 others were condemned to be burned alive if they should come into the power of the republic.

Dante's Wanderings in Exile.—It is probable that Dante had not returned from his embassy to the pope. Leonardo Bruni states that he received the news of his banishment at Siena. He probably joined his fellow-exiles who met at Gargonza, a castle between Siena and Arezzo, and made Arezzo their headquarters preparing to make their way back to Florence by arms. On June 8, 1302, a meeting was held at San Godenzo, a place in the Florentine territory, Dante's presence at which is proved by documentary evidence, and an alliance was there made with the powerful Ghibelline clan of the Ubaldini. In Sept. 1303 the fleur-de-lis had entered Anagni, and Christ had a second time been made prisoner in the person of his vicar *(Purg.* xx. 86–90). Boniface did not survive the insult long, but died in the following month. He was succeeded by Eenedict XI., and in March, 1304, the cardinal Niccolb da Prato came to Florence, sent by the new pope to make peace. The people received him with enthusiasm; ambassadors came to him from the Whites; and he did his best to reconcile the two parties. But the Blacks resisted all his efforts. He shook the dust from off his feet, and departed, leaving the city under an interdict. In July, with aid from the Ghibellines of Tuscany and other regions, the exiles made an unsuccessful attempt to enter Florence from Lastra, the failure of which further disorganized the party.

Dante had, however, already separated from the "ill-conditioned and foolish company" *(Par.* xvii. 61–69) of his fellow-exiles who rejected his counsels of wisdom, and had learnt that he must henceforth form a party by himself. He appears to have been for a while at Forli in Romagna, of which city Scarpetta degli Ordelaffi was lord, and, probably towards the end of 1303, he went to Bartolommeo della Scala, lord of Verona, where the courtesy of the great Lombard gave him his first refuge and his first hcspitable reception. Cangrande, to whom he afterwards dedicated the *Paradiso,* was then a boy. Bartolommeo died in 1304, and it is possible that Dante may have remained in Verona till his death. It is very difficult to determine with exactness the order and the place of Dante's wanderings. He was probably at Bologna in 1304 and 1305. A rather questionable document attests his presence at Padua in Aug. 1306, the time when Giotto was working upon the frescoes of the Madonna dell'Arena. In Oct. 1306 he was unquestionably the guest of the Marquesses of the house of Malaspina in Lunigiana, where he acted as their ambassador in making peace with the bishop of Luni. From this time till the arrival of the emperor Henry VII. in Italy, Oct. 1310, all is uncertain. His old enemy Corso Donati had at last allied himself with Uguccione della Faggiuola, the leader of the Ghibellines, and in 1308 was declared a traitor, attacked in his house, put to flight and killed.

It is not impossible that Dante about this time visited Paris, but that he ever crossed the Channel or went to Oxford may safely be disbelieved. The election in 1308 of Henry of Luxemburg as emperor stirred again his hopes of a deliverer. At the end of 1310, in a letter to the princes and people of Italy, he proclaimed the coming of the saviour; at Milan he did personal homage to his sovereign. The Florentines, in alliance with King Robert of Naples, made every preparation to resist the emperor. Dante wrote from the Casentino a letter dated March 31, 1311, in which he rebuked them for their stubbornness and obstinacy, and another on April 17, to the emperor himself, upbraiding his delay and urging him on against Florence. A new sentence against the poet was pronounced on Sept. 2. Henry passed from Genoa to Pisa, and on June 29, 1312, was crowned by the pope's legates in the church of St. John Lateran at Rome; the Vatican being in the hands of his adversary King Robert of Naples. Then at length he moved towards Tuscany and reached Florence on Sept. 19. He did not dare to attack it, but returned in November to Pisa. In the summer of the following year he prepared to invade the kingdom of Naples; but in the neighbourhood of Siena he caught a fever and died at the monastery of Buonconvento, on Aug. 24, 1313. He lies in the Campo Santo of Pisa; and the hopes of Dante and his party were buried in his grave.

After the death of the emperor Henry (Bruni tells us) Dante passed the rest of his life as an exile, sojourning in various places throughout Lombardy, Tuscany and the Romagna, under the protection of various lords, until at length he retired to Ravenna, where he ended his life. After the death of the French pope, Clement V, he addressed a letter, in the spring or summer of 1314, to the cardinals in conclave, urging them to restore the papacy to Rome. About this time he probably came to Lucca, then lately conquered by Uguccione della Faggiuola. In May

1315 a general recall of exiles offered Dante an opportunity of returning to Florence. The conditions given to the exiles were that they should pay a fine and be subjected to the ceremony of "oblation" as penitents in the Baptistery. Dante refused to tolerate this shame; and the letter is still extant in which he declines to enter Florence except with honour, secure that the means of life will not fail him, and that in any corner of the world he will be able to gaze at the sun and the stars, and meditate on the sweetest truths of philosophy. In Aug. 1315, Uguccione won the great battle of Montecatini over the united armies of Florence and Naples, but lost Pisa and Lucca at the beginning of the following year. A fresh sentence of death had been pronounced by Florence upon Dante in Nov. 1315, and he seems now to have taken refuge with his most illustrious protector Cangrande della Scala of Verona, then a young man of 25, rich, liberal and the favoured head of the Ghibelline party, whose name has been immortalized by an eloquent panegyric in the 17th canto of the *Paradiso.*

The last few years of the poet's life were spent at Ravenna, under the protection of Guido da Polenta. In his service Dante undertook an embassy to the Venetians, on his return from which he caught a fever and died in Ravenna on Sept. 14, 1321. His bones still repose there. His doom of exile has been reversed by the union of Italy, which has made the city of his birth and the various cities of his wanderings component members of a common country. His son Piero, who wrote a commentary on the *Divina Cornmedia,* settled as a lawyer in Verona, and died in 1364 His daughter Beatrice lived as a nun in Ravenna, dying at some time between 1350 (when Boccaccio was commissioned to bring her a present of ten gold crowns from a Florentine gild) and 1371. His direct line became extinct in 1509.

The **Divina** Cornmedia.--Of Dante's works, that by which he is known to all the educated world, and in virtue of which he holds his place as one of the half-dozen greatest writers of all time, is of course the *Commedia.* (The epithet *divina,* it may be noted, was not given to the poem by its author, nor does it appear on a title-page until the 16th century.) The poem is absolutely unique in literature; it may safely be said that at no other epoch of the world's history could such a work have been produced. Dante was steeped in all the learning, which in its way was considerable, of his time; he had read the *Summa Theologica* of Aquinas, the *Trésor* of his master Brunetto, and other encyclopaedic works available in that age; he was familiar with most of what was then known of the Latin classical and post-classical authors. Further, he was a deep and original political thinker, who had himself borne a prominent part in practical politics. The age was essentially one of great men; of free thought and free speech, of brilliant and daring action, whether for good or evil. It is easy to understand how Dante's bitterest scorn is reserved for those "sorry souls who lived without infamy and without renown, displeasing to God and to His enemies."

The time was thus propitious for the production of a great imaginative work, and the man was ready who should produce it. It called for a prophet, and the prophet said, "Here am I" "Dante," says an acute writer, "is not, as Homer is, the father of poetry springing in the freshness and simplicity of childhood out of the arms of mother earth; he is rather. like Noah, the father of a second poetical world, to whom he pours forth his prophetic song fraught with the wisdom 'and the experience of the old world." Thus the *Commedia,* though often classed for want of a better description among epic poems, is totally different in method and construction from all other poems of that kind. Its "hero" is the narrator himself; the incidents do not modify the course of the story; the place of episodes is taken by theological or metaphysical disquisitions; the world through which the poet takes his readers is peopled, not with characters of heroic story, but with men and women known personally or by repute to him and those for whom he wrote. Its aim is not to delight, but to reprove, to rebuke, to exhort; to form men's characters by teaching them what courses of life will meet with reward, what with penalty, hereafter; "to put into verse," as the poet says, "things difficult to think." For such new matter a new vehicle was needed. We have Bembo's authority for believing that the *terza rima,* surpassed, if at all, only by the ancient hexameter, as a measure equally adaptable to sustained narrative, to debate, to fierce invective, to clear-cut picture and to trenchant epigram, was first employed by Dante.

The action of the *Commedia* opens in the early morning of the Friday before Easter, in the year 1300. The poet finds himself lost in a forest, escaping from which to ascend the mountain of felicity, he has his way barred by a wolf, a lion and a leopard. This seems to indicate that at this period of his life, about the age of 35, Dante went through some experience akin to what is now called "conversion." The strong vein of mysticism, found in so many of the deepest thinkers of that age, and conspicuous in Dante's mind, no doubt played its part. His efforts to free himself from the "forest" of worldly cares were impeded by the temptations of the world—cupidity (including ambition), the pride of life and the lusts of the flesh, symbolized by the three beasts. But a helper is at hand. Virgil appears and explains that he has a commission from three ladies on high to guide him. The ladies are the Blessed Virgin (representing the Divine Mercy), St. Lucy (symbol of illuminating grace) and Beatrice. In Virgil we are apparently intended to see the symbol of what Dante calls philosophy, what we should rather call natural religion; Beatrice standing for theology, or rather revealed religion. Under Virgil's escort Dante is led through the two lower realms of the next world, Hell and Purgatory, meeting on the way with many persons illustrious or notorious in recent or remoter times. as well as many well enough known then, but who, without the immortality, often unenviable, that the poet has conferred on them, would long ago have been forgotten. Popes, kings, emperors, poets and warriors, Florentine citizens of all degrees, are there found; some doomed to hopeless punishment, others expiating their offences in milder torments, and looking forward to deliverance in due time. It is remarkable to notice how rarely, if ever, Dante allows political sympathy or antagonism to influence him in his distribution of judgment. Hell is conceived as a vast conical hollow, reaching to the centre of the earth. It has three great divisions, corresponding to Aristotle's three classes of vices, incontinence, brutishness (which Dante identifies with violence) and malice. The first is outside the walls of the city of Dis; the second is within. The sinners by malice, which includes all forms of fraud or treachery, lie at the bottom of a gigantic pit, called Malebolge, with vertical sides, and accessible only by supernatural means; a monster named Geryon bearing the poets down on his back. The torments here are of a more terrible, often of a loathsome character. Ignominy is added to pain, and the nature of Dante's demeanour towards the sinners changes from pity to hatred.

At the very bottom of the pit is Lucifer, immovably fixed in ice; climbing down his limbs they reach the centre of the earth, whence a cranny conducts them back to the surface, at the foot of the purgatorial mountain, which they reach as Easter Day is dawning. Before the actual Purgatory is attained they have to climb for the latter half of the day and rest at night. The occupants of this outer region are those who have delayed repentance till death was upon them. They include many of the most famous men of the last 30 years. In the morning the gate is opened, and Purgatory proper is entered This is divided into seven terraces, corresponding to the seven deadly sins, which encircle the mountain and have to be reached by a series of steep climbs, compared by Dante in one instance to the path from Florence to Samminiato. The purifying penalties are not degrading, but rather tests of patience or endurance, and borne voluntarily by the souls; in several cases, Dante has to bear a share in them as he passes. On the summit is the Earthly Paradise. Here Beatrice appears in a mystical pageant; Virgil departs, leaving Dante in her charge. By her he is led through the various spheres of which, according to both the astronomy and the theology of the time, Heaven is composed, to the supreme Heaven, or Empyrean, the seat of the Godhead. For one moment there is granted him the intuitive vision of the Deity, and the comprehension of all mysteries, which is the ultimate goal of

mystical theology; his will is wholly blended with that of God, and the poem ends. The date of composition of the *Commedia* is still uncertain; but the *Paradiso* was unquestionably written in the last years of Dante's life.

Other Works.—The *Vita Nuova* (*Young Life* or *New Life*, for both significations seem to be intended) contains the history of Dante's love for Beatrice. He describes how he met Beatrice as a child, himself a child, how he feigned a false love to hide his true love, how he fell ill and saw in a dream the death and transfiguration of his beloved, how she died, and how the tender compassion of another lady nearly won his heart from its first affection, how Beatrice appeared in his imagination and reclaimed his heart, and how at last he saw a vision which induced him to devote himself to study that he might be more fit to glorify her who gazes on the face of God for ever. It is in the form of lyrics—canzoni, one ballata, and sonnets—set in a prose narrative with scholastic divisions and explanations, and was probably completed about 1293, though the reference to the vision may be later.

The *Convivio* or *Banquet* (less accurately *Convito*) is the work of Dante's manhood, as the *Vita Nuova* is the work of his youth. It consists, in the form in which it has come down to us, of an introduction and three treatises, each forming an elaborate commentary on a long canzone. It was intended, if completed, to have comprised commentaries on 11 more canzoni, making 14 in all, and in this shape would have formed a *tesoro* or handbook of universal knowledge, such as Brunetto Latini and others have left to us. It is perhaps the least well known of Dante's Italian works, but contains many passages of great beauty and elevation, the magnificent apotheosis of Rome and her empire in the fourth treatise being the first expression of his ideal imperialism. Indeed a knowledge of it is quite indispensable to the full understanding of the *Divina Commedia* and the *Monarchia*. It was probably written between 1304 and 1308.

Besides the poems contained in the *Vita Nuova* and *Convivio*, Dante composed a considerable number of canzoni, ballate and sonnets which are collected under the general title of *Rime* or *Canzoniere*, and which secure him a place among lyrical poets scarcely if at all inferior to that of Petrarch. Some scholars—very questionably—would attribute to Dante a rendering of the *Roman de la Rose* in 232 sonnets entitled *Il Fiore (The Flower)*.

The treatise *De vulgari eloquentia*, in Latin, is mentioned in the *Convivio*. It was probably written between 1304 and 1306. Its object was first to establish the Italian language as a literary tongue, and to distinguish the noble or "courtly" speech which might become the property of the whole nation, at once a bond of internal unity and a line of demarcation against external nations, from the local dialects peculiar to different districts; and secondly, to lay down rules for poetical composition in the language so established. The work was intended to be in four books, but only two are extant. The first of these deals with the language, the second with the style and with the composition of the canzone. It contains much acute criticism of poetry and poetic diction, and its treatment of the Italian dialects is of singular interest.

The Latin treatise *Monarchia*, in three books, contains the mature statement of Dante's political ideas. In it he propounds the theory that the universal temporal monarchy or empire is necessary for the well-being of the world, that the Roman people acquired this dignity by right, and that the authority of the emperor depends immediately upon God though he must reverence the pope as the first-born of the Father. Pope and emperor are the guides divinely appointed to lead the human race to eternal life and temporal felicity. Dante's ideal of the empire is a power above national conflicts to preserve universal peace and liberty, in order that the goal of civilization, the realization of all man's potentialities may be achieved. The work was probably composed at the time of the descent of Henry VII. into Italy, between 1310 and 1313. The book was first printed by Oporinus at Basle in 1559, and placed on the Index of forbidden books.

In the last years of his life Dante wrote two eclogues in Latin in ansaer to Giovanni dei Virgilio, who invited him to compose a Latin poem on some contemporary event and come from Ravenna to Bologna to receive the laurel crown. The most interesting passage is that in the first poem (1319) where he expressed his hope that when he has finished the third part of the *Commedia* his grey hairs may be crowned with laurel on the banks of the Arno.

The *Quaestio de aqua et terra* purports to be a discourse which Dante delivered at Verona in Jan. 1320 as a solution of the question which was being at that time much discussed—whether in any place on the earth's surface water is higher than the earth. It was first published at Venice in 1508, by an ecclesiastic named Moncetti. Since Dr. Moore, from internal evidence, made out a very strong case for it, its authenticity has been generally accepted.

There are 13 Latin *Letters* ascribed to Dante. Those to the princes and peoples of Italy announcing the coming of Henry of Luxemburg, to the Florentines, to the emperor himself, to the Italian cardinals and to a Florentine friend refusing the base conditions of return from exile, have been already mentioned. These are certainly authentic, as probably is also a long letter to Can Grande della Scala, containing directions for interpreting the *Divina Commedia*, with especial reference to the *Paradiso*. Of less importance are the letters to cardinal Niccolb da Prato, to the nephews of Count Alessandro da Romena, to the marquis Moroello Malaspina, to Cino da Pistoia, and three written in the name of the Countess of Battifolle.

Dante's reputation has passed through many vicissitudes, and much trouble has been spent by critics in comparing him with other poets of established fame. Read and commented upon with more admiration than intelligence in the Italian universities in the generation immediately succeeding his death, his name became obscured as the sun of the Renaissance rose higher towards its meridian. His fame is now fully vindicated as one of the world's universal poets and the national poet of Italy.

(**A. J.** Bu.; E. G. G.)

BIBLIOGRAPHY.—We have now two authoritative editions of the text of the complete *Opere di Dante:* the *testo critico* of the Società Dantesca Italiana, edited by M. Barbi and others on the occasion of the sixth centenary (Florence, 1921), reproducing the forms and orthography of the poet's own time; the *Oxford Dante* of Edward Moore revised and re-edited by Paget Toynbee (1923). Dr. Toynbee's *Concise Dictionary of Proper Names und Notable Matters in the Works of Dante* (1914) is invaluable. Concordances—based upon editions previous to the *testo critico*, but still highly useful—to the *Commedia* by E. A. Fay (Boston, 1888), to the minor Italian works by E. S. Sheldon and A. C. White (1905) and to the Latin works by E. K. Rand and E. H. Wilkins (1912), are due to American scholars.

Editions of the Divina Conzmedia and Commentaries: The first three editions of the *Commedia* were printed in 1472 at Foligno, Mantua and Jesi. They were reprinted, together with the Neapolitan edition of 1477, by Lord Vernon and A. Panizzi in *Le Prime Quattro Edieioni della D. C. letteralmente ristampate* (1858). The first Venetian edition is of 1477, the first Milanese (Nidobeatina) of 1478, the first Florentine of 1481. In 1502 Aldus produced the first "pocket" edition in his new "italic" type. The *Conzrnedia* began to be the subject of commentaries as soon as the author was in his grave; beginning, before 1330, with those of Dante's son, Jacopo Alighieri, and Graziolo de' Bambaglioli of Bologna on the *Inferno*, and of another Bolognese, Jacopo della Lana, on the whole poem. Somewhat later, but still before 1350, come the *Ottimo Commento* attributed to the Florentine notary Andrea Lancia, and those of Dante's other son, Pietro, and the Carmelite Guido da Pisa. Boccaccio's commentary, the substance of lectures delivered at Florence in 1373, stops short at *Inf.* xvii.; it is accessible, together with the two versions of his famous life of Dante; edited by D. Guerri, in the *Scrittori d'Italia series* (Bari, 1918). The great Latin commentary of Boccaccio's disciple, Benvenutc da Imola (1375–80), who lectured at Bologna, was published by William Warren Vernon with the aid of James Lacaita in 1887. Another noteworthy early commentator is Francesco da Buti who lectured at Pisa towards the close of the same century. Extracts from the early commentators are given by G. Biagi in *La D. C. nella figurazione artistica e nel secolare commento* (Turin, 1921, etc.). The foundations for the establishment of an accurate text were laid by Carl Witte in his edition of 1862. The fullest 19th century commentary, that of G. A. Scartazzini, is now somewhat out of date. Among the best of more recent editions. with notes or commentaries, are those of F. Torraca, of T. Casini, revised and amplified by S. A. Barbi, and of Isidoro del Lungo. An excellent pocket edition of the text alone with a critical introduction, is that of Mario Casella (Bologna, 1923). For English readers, the three small volumes in the Temple Classics, with text, translation and commentaries by H. Oelsner, T. Okey and P. H. Wicksteed, are very useful, as also the *Readings in the Inferno, Purgatorio* and *Paradiso* of William Warren Vernon.

Editions of the Minor Works: The *Vita Nuova* was first printed at Florence in 1576, the *Convivio* at Florence in 1490. The *De Vulgari Eloquentia* was first published in Trissino's Italian translation at Vicenza in 1529, and in the original Latin, from a ms. now preserved at Grenoble, at Paris in 1577; the *Monarchia* at Basle in 1599. There are critical editions of the *Vita Nuova* by M. Barbi (Florence, 1907), of the *De Vulgari Eloquentia* by Pio Rajna (1896), of the *Eclogues* by P. *H.* Wicksteed (*Dante and Giovanni del Virgilio,* 1902), and G. Albini (Florence, 1903), of the *Letters* with translation and commentary by Paget Toynbee (1920). The *Canzoniere,* or *Rime,* were first adequately edited, the genuine pieces separated from the doubtful and spurious, by Michele Barbi in the *testo critico* of the Societa Dantesca Italiana (1921).

English Translations: The entire *Divina Commedia* appeared first in English in the version of Henry Boyd (1802), and was followed by the admirable blank verse rendering of H. F. Cary (1814, 2nd ed., 1819), which has remained the standard translation. Of the numerous later translations may be mentioned those of Longfellow; of J. A. Carlyle *(Inferno* only), C. E. Norton and H. F. Tozer in prose; G. Musgrave of the *Inferno* in Spenserian stanzas; C. L. Shadwell, of the *Purgatorio* and *Paradiso* in the metre of Marvell's "Ode to Cromwell"; Haselfoot and M. B. Anderson in *terza rima.* D. *G.* Rossetti's translation of the *Vita h7uova* will always hold its place as a thing of beauty. Translations of the *Vita Nuova* by T. Okey, of the *Rime, Convivio, Monarchia, Letters, Eclogues, Quaestio de Aqua et Term,* by P. *H.* Wicksteed, and of the *De Vulgari Eloquentia* by *A.* G. F. Howell, are published in the Temple Classics, with full explanatory notes. *See,* in general, P. Toynbee, *Dante in English Literature from Chaucer to Cary* (1909), and *Britain's Tribute to Dante in Literature and Art 1380–1920* (1921).

Aids and Studies: It is only possible here to mention a few works useful to English readers. As general introduction, P. Toynbee, *Dante Alighieri, his Life and Works* (4th ed., 1910); E. G. Gardner, *Dante* (1923); N. Zingarelli, *Vita di Dante in compendio* (Milan, 1905), and his larger *Dante* (1903). Among critical studies, or elucidations of particular aspects of Dante's work, E. Moore, *Studies in Dante* (four series, 1896–1917); P. Toynbee, *Dante Studies and Researches* (1902), *Dante Studies* (1921); P. H. Wicksteed, *Dante and Aquinas* (1913), *From Vita Nuova to Paradiso* (1922); the volumes of Dante studies by F. D'Ovidio, now reprinting in the collected edition of his works; F. Torraca, *Studi danteschi* (1912) and *Nuovi Studi danteschi* (1921); *E.* G. Parodi, *Poesia e storia nella Divina Commedia* (1921); B. Croce, *La Poesia di Dante* (1921, Eng. trans. by D. Ainslie); C. Ricci, *L'ultimo rifugio di Dante* (new ed., 1921); F. Ercole, *Il pensiero politico di Dante* (Milan, 1928). Copious bibliographical indications on disputed points are given in the latest edition of the D. C. with the commentary of Casini and S. A. Barbi (Florence, 1926). The *Giornale Dantesco* and the *Studi Danteschi* directed by M. Barbi are important periodical publications dealing with every aspect of the subject.

Portraits of Dante: It is now generally agreed that the repainted figure of Dante in a fresco of the podestà's chapel in the Bargello in Florence is authentic and by Giotto,, probably painted (c. 1334) from a sketch taken in the poet's early life. The Torrigiani mask, now in the same chapel, long supposed to have been made from a death-mask, is probably a work of the 15th or 16th century. It is possible that the later representations of Dante may have been influenced by the portrait by Taddeo Gaddi in Santa Croce (destroyed in 1566). Noticeable among these are the miniature in codex 1040 of the Biblioteca Riccardiana *(c.* 1436); the fresco transferred to canvas of Andrea del Castagno in Sta. Apollonia *(c.* 1450); the symbolical picture by Domenico di Michelino (1465) in the duomo at Florence; the bronze bust at Naples (late 15th century); the recently discovered panel attributed to "Amico di Sandra." In the 16th century, we have the figure of Dante in Luca Signorelli's fresco at Orvieto, and in Raphael's "Parnassus" and "Disputa" in the Vatican. A famous signed sketch of Dante by Raphael is in the Albertina at Vienna. *See* R. T. Holbrook, *Portraits of Dante from Giotto to Raphael* (1911). Attempts have frequently been made to discover the portrait of Dante in various 14th century frescoes, and there have been recent "discoveries" of this kind at Assisi and elsewhere; the only one that is in the least plausible is that in Orcagna's "Paradise" in Santa Maria Novella at Florence.

(E. G. G.)

DANTON, GEORGES JACQUES (1759–1794), French revolutionary leader, was born at Arcis-sur-Aube on Oct. 26, 1759. He belonged to a respectable family of Champagne; his father, who died in 1762, was an attorney at the local tribunal, his maternal grandfather the roads and bridges contractor of the province. His mother neglected his upbringing, and the boy was allowed to run wild beside the Seine, finding vent for his animal spirits in rustic games, in wood and field, in wrestling with the beasts on the farm and in defying his schoolmistress, who tried to tame him with the whip. At the age of 14, after a short term at the small seminary at Troyes, this wild young ruffian, with pock-marked face, was entered at the *Oratoriens* to finish his studies. He won the prize for mythology, *accessits* for rhetoric and Latin verse, and for French essay. His imagination was fired by republican Rome, and this appeal to the essential part of his nature, was strengthened from day to day by his assiduous study of the ancient historians and moralists.

Deciding to study law he went to Paris in 1780, where, thanks to his confidence in himself, he was admitted to the chambers of Maître Jean Nicolas Vinot. The manifold sources of interest provided by the courts could not, however, entirely absorb him, and his passion for physical exercise found outlet in swimming, fencing and tennis. Once, in an interval between two cases, we find this high-spirited clerk plunging into the Seine and hurling angry imprecations against the towers of the Bastille as the symbol of oppression. Back at his lodgings he greedily read the *Encyclopédie,* the writings of Montesquieu and Voltaire, of Rousseau and Buffon, and Beccaria's *Traité des délits et des peines,* which, as early as 1764, heralded a revolution in European criminal law. As a probationer advocate in the *parlement,* Danton was engaged in pleading; in a case in which a shepherd was in dispute with his overlord, he asserted his love of equality, and obtained the approval of Linguet.

His marriage with Angélique Charpentier forced him to settle down—or to appear to do so. In 1787, therefore, he became advocate in the *conseils* du *roi.* This required him to take an oath "to observe and keep strictly the laws and ordinances of the kingdom" and also to deliver a speech in Latin on his admittance. He paid a high price for this post, but it gave him a thorough insight into public law and administration, civil and ecclesiastical affairs, commerce and finance, the whole machinery of monarchy, the intricacies of customary law, and the law of corporations and property. He was elected to the Masonic lodge of the *Neuf Soeurs,* to which Franklin and Voltaire had belonged, and there met Bailly, Desmoulins, Condorcet, Chamfort and Sieyès. He continued his studies, and it should be noted that he read and spoke fluently Italian and English; he had read, in the original, Pope, Shakespeare and Adam Smith's *Wealth* of *Nations.*

We may picture him at this time—a broad face with strong features, sharply curved mouth and brilliant eyes, blazing with inward fire and passion.

At the outbreak of the Revolution (1789) Danton belonged to Cordeliers district; his house was exactly where his statue stands to-day. He was as impetuous as he always had been from childhood in Champagne. As captain of the civic guard he attempted, on the night of July 15, to force the gates of the Bastille that he had before defied. He was already taking sides against both the supporters of the old régime and the moderates. He opposed Lafayette, elected to the States General by the nobility of Auvergne, who, after July 14, became chief of the National Guard, but who, on Oct. 5 and 6, defended the royal family. He went further than Bailly, the learned mayor of Paris. Danton's position is clear from the time of the events of October, when the king and the assembly, the only two lawful authorities, became prisoners of the people, when Louis XVI. had to leave Versailles and return to the Tuileries, escorted by a hunger-maddened mob. It was Danton who had the tocsin rung; and Danton who was charged by the general assembly of the Cordeliers to thank the king for having graciously taken up his residence in *sa bonne ville.* Although on Aug. 13, 1793, he was to affirm before the Convention that "the republic had existed in all men's minds 20 years before its proclamation," he, at this time, professed himself a good Royalist. His record at the *Palais Royal,* and even more at the Cordeliers, shows him quick in conciliating and incapable of refusing popular favour. At each re-election to the presidency of the district, the assembly "accompanies its unanimous vote with an outburst of enthusiasm." Persuasion and force of character made him, the popular tribune, dominant. "Danton, the president of the Cordeliers," writes Taine, "could secure in his district the arrest of any one he pleased. His violence in speech and counsel made him, in the absence of wider opportunities, the ruler of his quarter."

After the fall of the Bastille, the commune of Paris displaced the former council and took up its quarters at the hôtel de ville. This municipal organization was to play an important part in the Revolution. By the decree of May 21, 1790, it was divided into

48 sections with a mayor, 16 administrators, a municipal council of 32 members, and a general council of 96 notables, a *procureur syndic* and two deputies. Originally, with Bailly as mayor, the commune maintained a monarchist and moderate tone. Danton was elected to represent his district in Jan. 1790. After May 21, when the districts were suppressed, he founded the Cordeliers club, the Society of the Rights of Man and the Citizen, which met in the convent of that name, which stood on the site of the present school of medicine. He also joined in the debates of the Jacobin club, which met in the former library of the convent in the *rue St. Honork.* His violent and extreme views led to his defeat in the communal elections, but on Jan. 31, 1791, he was appointed administrator of the department. In this year he found a wider scope for his powers. He took a prominent part in events before and after the king's flight. On July 16, mounted on the altar dedicated to *la patrie,* in the *Champ de Mars,* he read in his powerful voice, the celebrated petition to the assembly to convoke new constituent and executive bodies, and to bring the king to trial. After the Varennes affair, the Cordeliers were induced, by the smooth running of the government during Louis XVI.'s absence, to declare for the republic. The attitude of Lafayette and Bailly at the massacres of the *Champ de Mars,* the shooting down of the petitioners, and the fears of the moderates, caused the first grave split amongst the revolutionaries. Danton, whose arrest had been decreed, took refuge first with his father-in-law at Fontenay, then at Arcis and Troyes. Thinking it more prudent to quit France, he fled to London, accompanied by his brothers-in-law, who went there to purchase weaving machines. During this period, the Cordeliers, long regarded askance by the Constituent assembly, for the decree of May 21, 1790, was directed against them, became more extreme than the Jacobins. They were accused of demagogy, and Danton was known to be the moving spirit. A split had at least begun to occur between the moderates and democrats. Danton, without hesitation, joined the latter.

His influence was in no way impaired by his exile; in his absence the *Théâtre Français* section appointed him their representative. At the electoral assembly on Dec. 6, 1791, he became assistant deputy to the *procureur* of the commune. Already, it may be noted, he had to meet murmurs against his wealth and accusations of taking tainted money. In his inaugural speech he laid down his principles, the reasons for his vehemence "how he risked being thought too violent so as never to be weak"; nor was he above self-praise: "I always act in accordance with the eternal laws of Justice." He declared himseli in favour of constitutional monarchy, but in the most threatening terms, and with assurances of devotion to the king that rang like a summons. Aug. 10, 1792, was destined to bring him into power at one bound, making him indispensable in the provisional executive committee which the assembly appointed after decreeing the suspension of the king.

The summer of 1792 was also the summer of Danton's career. The war declared by the assembly against the king of Hungary and Bohemia had started disastrously. Louis XVI.'s dismissal of the Girondin ministry led to an insurrection on June 20 and an attack on the Tuileries. Danton opened his campaign; he worked up the feelings of the deputies sent to the festival of the federation, persuaded his section to proclaim universal suffrage, excited the mob against the duke of Brunswick's manifesto, served out ball cartridges to the federalist Marseillais and brought them to the Cordeliers. His hurried journey to Arcis "to embrace his mother and settle his affairs" on Aug. 5 shows that he was determined to play the supreme part. It was he who on the night of Aug. 9 rang the tocsin and launched the attack; had Santerre appointed chief of the armed forces of Paris, and arrested Mandat, the commander of the king's troops. The revolutionary victory of Aug. 10 was his victory—the formation of the Convention was his work. As minister of justice, he took upon himself the full responsibility of his office. His circular of Aug. 19, published by André Fribourg, in his collection of *Speeches,* summarizes the tragic situation in terse phrases, each of which strikes home like a sword-thrust. The revolution of July 14 was now completed. Danton asserts the discovery in the archives of the *château,* of a "mass of proof of the most infamous perfidy and the blackest conspiracies," glorifies "holy insurrection," rejoices in the murder of Mandat and the king's suspension. He defines his programme. "The tribunals will find me unchanged. My whole efforts are concentrated on political and individual freedom, the maintenance of the laws, public tranquillity, the unity of the 83 departments, the glory of the State, the prosperity of the French people and on the equality of rights and happiness, though not on the chimerical equality of worldly goods."

This vigorous and clear conception of political liberty and of the unity of the country was the keystone of Danton's policy, based on an often expressed confidence in the people. During the disasters of August, the Prussian invasion of Lorraine, the fall of Longwy, the investment of Verdun, he kept his head against the stream of general panic. Michelet says that "at that sublime and sinister crisis, he was the voice of the Revolution and of France." On the evening of Tuesday, Aug. 28, he made his strenuous appeal in the legislative assembly, for resistance, for the mass levy and a general requisition. "Everything belongs to the country when the country is in danger." It is true that a school of historians to-day denies this reading of the part he played. Albert Mathiez, in his *Danton et la paix,* will not be moved even by his famous declaration of Sept. 2: *Il nous faut de l'audace, encore de l'audace et toujours de l'audace, et la France est sauvée!*—"we must dare, and dare, and dare again—and France is saved!" He will not believe the sincerity of his opposition—spirited as it was—to the removal of the government from Paris. Mathiez would have us believe that while openly prophesying a certain victory, secretly he was negotiating with Great Britain and saved the Prussian army by ill-timed conferences. But surely there is no contradiction in the fervour of a popular leader keeping up the *moral* of the nation, and the prudence of a statesman desirous of ending the war as soon as possible. To proceed, on Sept. 21, 1792, Danton resigned the Ministry of Justice to devote himself to his work in the Convention. On Dec. 1 he was sent on a mission to Belgium, and for several months, by his counsels and example, instilled courage into the army. He advocated the annexation of the Belgian provinces which were clamouring for union. In his view, the Republic should be extended as far as possible; "its frontiers are marked out by nature and we shall attain them on all four corners of the horizon—the Rhine, the Atlantic, the Pyrenees, the Alps. These are the natural frontiers of France." Thus Danton showed himself a disciple of Richelieu, and it cannot be denied that his politics were already tinged with imperialism. In a speech to the Convention he had revealed that, with Dumouriez, he even favoured the invasion of Holland and the declaration of war on England.

Meanwhile, Danton was continually attacked by his adversaries. They accused him of offering to save Louis XVI. in exchange for some millions of francs; of having secretly protected the *émigrés.* The statement of Théodore Lameth, the conversations with the duke of Chartres, the letters of the agent Miles, the assertions of Lord Acton carry no convincing proof. One may be shocked by his needlessly brutal words in casting his vote for death; one may consider that he stifled his real opinions in bidding for popular favour, without believing that Danton offered his influence for money. Many have accused him of prevarication; it seems certain that his financial affairs were in great disorder, and it cannot be denied that he increased his fortune during the Revolution. But venality has not been proved.

In April 1793, he was again called to a post of the gravest responsibility. The king's execution provoked the insurrection in the Vendée and the formidable coalition against France. Dumouriez was preparing his *coup d'e'tat.* The Convention, thus defied, created the Committee of General Security, the Revolutionary Tribunal, and the Committee of Public Safety, of which Danton was the real head. Once again his rôle had increased thanks to that secret logic which, since the days of 1789, had constantly increased his influence and, so to speak, his force of expansion. There is no cause for surprise that Danton should,

even to this day, be subject to suspicion—the very fervour of his opinions made enemies on every side. Far from hiding or exonerating himself, he summoned his adversaries to come out into the open. In the convention on March 30, 1793, he declared: "To-day I invite all sorts of doubts and suspicions, all manner of accusations, for I am resolved to state everything. . . . If any one of you entertains the slightest suspicion about my conduct as minister, if any one wishes for detailed accounts . . . let him rise and say so." On April 1 he again attacked his slanderers. If he really was corrupt, it must be admitted that his enemies were singularly wanting in clearness of vision or courage. He tried in vain to reconcile the two hostile sections of the assembly. The tribune, in his words, had become "an arena of gladiators." When he rose to speak he was greeted with murmurs, altercations and threats, and at times, *e.g.*, April 10, 1793, there was tumultuous disorder. The Montagnards and the Girondins attacked one another incessantly; the *commune* attempted to impose its wishes by force.

Amid these storms, Danton's sole concern was to organize the new régime which was to transform France. Never was his reasoning more lucid. He wanted complete religious liberty, subject only to the ordinary law. He championed a programme of public education for the children "whose fathers have leapt to arms for the defence of the frontiers," for "our chief need is enlightenment in the country and sounder patriotism in the towns." He asked that the nation "should be endowed as soon as possible with a republican constitution with settled laws." He determined to exploit all the benefits of the Revolution; his lucid reasoning led him straight to the kernel of the problem, and he appealed for rapidity of execution and, above all, for national unity for the sake of which he urged all Frenchmen to sink their differences. He never lost the revolutionary sense; his aim was to discipline the spirit of liberty—in no way to weaken or restrict it. When the Girondin, Isnard, president of the convention, seemed to threaten Paris because the *commune* sent a deputation to plead for the liberation of Hébert, Danton, in a heated extempore speech, defended and exalted the capital against the accusations brought by the counter-revolutionaries. "Paris," he cried, "will always be a worthy setting for the national representative body." In these impassioned struggles an event occurred, clearly illustrating the clash of ideas. On the night of May 30–31, the tocsin roused Paris yet again, and the alarm cannon was heard. The *Gironde* had demanded the appointment of a "Committee of Twelve" to enquire into the acts of the *commune*. Danton demanded the suppression of this committee to which arbitrary powers had been given, arguing that the ordinary tribunals were competent and that Paris, the advance guard of the Revolution, should be exempt from accusation.

The insurrection of May 31, the appointment of Hanriot by the *commune*, to command the army of Paris, the rising of June 2, when the Convention was forced to expel 27 Girondins, constitute a definite set-back to Danton's policy. Robespierre's star was rising. On July 10, he superseded Danton on the Committee of Public Safety, who, only the previous day, had seemed to be its master. Yet Danton eulogized "the holy insurrection of May 31" which, he maintained, had saved the republic. His sang-froid, and his confidence in the Revolution were unimpaired. On Thursday evening, Aug. 1, though it was no longer to his personal advancement, he pressed for the strengthening of government authority, and the constitution of a powerful central body. The course of events was rousing all Danton's passion. The adoption of a constitution granting universal suffrage increased his fervour; he was anxious, it would seem, at seeing the legislative gain power at the expense of the executive, and apprehensive of the dangers threatening the country since, at several points, the frontiers had been violated. Danton reverted to his policy of the past year. He became more and more vehement, clamoured for a "war of lions," enunciated the necessary measures for the war in which the whole forces of the nations were now engaged, and urged the mobilization, as we should say to-day, of men, grain and money. He maintained that in such times of crisis, the government had need of secret funds—proof of his corruption. it will be said; proof of his patriotic courage, it might be urged. At the most tragic moment of this crisis he was able to look ahead, and to resume his persistent advocacy of the cause of public education.

On July 25 the convention elected him president. Although he refused to serve again on the Committee of Public Safety, his influence, which dominated all the debates, remained formidable. When he spoke, it was to the applause of the assembly and the tribunes. His demands for vigorous action were carried out, and even exceeded. The convention decreed that the provisional government of France should continue to be revolutionary until the peace; in spite of gaps in the constitution, an executive power was formed, more powerful than it had ever been. But the stage was already set for Danton's fall.

On Oct. 12 he went for a holiday to Arcis-sur-Aube to restore his health This was an excellent opportunity for his enemies—for Billaud Varenne and Robespierre—to prepare his downfall. When he returned to Paris in November, it was soon obvious that quitting his post had cost him his position. Henceforward the Committee of Public Safety was the dictator, and Robespierre dictator to the Committee. The Terror was established. In truth Danton's withdrawal seems hard to account for, and it has been said that he opened negotiations with insurgents in Normandy; be that as it may, he was accused once more of taking money.

Having decided to put an end to the Terror, could Danton lay the monster low? No. The movement he had helped to unchain was to pursue its course with pitiless logic. Robespierre and Danton hated each other. Danton was superseded. In Nivôse 23, his friend, Fabre d'Eglantine, was arrested. In Ventôse the Hébertists were imprisoned. Robespierre, who was marching toward the dictatorship, attacked both the *Indulgents* and the *Enrage's*. Danton maintained his courage. He again denounced "the false patriots in red bonnets," but his very successes only compromised him the more. Hébert's execution brought him but an apparent triumph. Robespierre meant to deal quickly with the formidable adversary who, at one moment, seemed beaten, only to leap up again, and who in the midst of all his perils seemed calm, even to the point of light-heartedness.

Danton neglected to attack in self-defence. On Germinal 10, Robespierre had him arrested, impeached him before the intimidated Convention and cowed the Assembly. The decree for his trial was voted without one dissentient voice. Danton succumbed less to the ferocity of his enemies than to the pusillanimity of his friends. We do not possess his defence before the Revolutionary Tribunal; there seem to have been only a few indignant outbursts, haughty remonstrances against the accusation of having betrayed the people. Danton did not plead, he defied. He well knew that the crimes of which he was accused before the judges were not those that were really driving him to his death. "I have lived," he declared, "entirely for my country." "I am Danton till my death; to-morrow I shall sleep in glory." On April 6 (Germinal 16) Danton was guillotined. His age was 34 years and six months. (E. HE.)

DANUBE (Ger. *Donau*, Hungarian *Duna*, Rumanian *Dunarea*, Lat. *Danubius* or *Danuvius*, and in the lower part of its course *Ister*), the most important river of southern Europe. Rising in the Black Forest mountains and emptying into the Black sea, it receives tributaries on the right bank from the eastern Alps, the Dinaric Alps and the Balkan mountains, and on the left bank from the Frankischer Jura, Bohmer Wald, Böhmisch-Mährisch Hohe, the Carpathians and the Transylvanian Alps. It is 1,750 m. long, drains an area of 320,200 sq.m. and is the most important river of Europe as regards the volume of its outflow, but inferior to the Volga in length and drainage area. The river is first called the Danube at Donaueschingen in the Black Forest, where three streams, the Brigach, the Brege and a smaller stream meet at an altitude of 2,185. feet. It is navigable for special river craft below Ulm (height 1,505 ft. above sea level), and it is fed by at least 300 tributaries many of which are themselves mighty streams.

The river can be divided into three sections; the upper course, above Bratislava, the middle course, between Bratislava and the Iron Gates and the lower course, below the Iron Gates.

The direction of the river in its upper course is determined by the structure of the Alpine foreland. Rising in the crystalline rocks of the Black Forest it flows eastward across a narrow belt of Jurassic rocks to Sigmaringen and from thence to Regensburg along the northern edge of the Swiss plateau (see ALPS), its bed being in the soft Molasse (Upper Oligocene and Miocene rocks) and its direction following the so-called Danube Fault, which passes from Schaffhausen to Regensburg. Below the latter town the river is deflected south-eastward by the Bohemian massif and flows in part upon the crystalline rocks of the latter and in part upon the Molasse, but at Krems it turns eastward across the Molasse and after passing Vienna it flows through the gap which separates the eastern Alps from the Carpathians. The valley of the Danube above Sigmaringen is narrow, the scenery being wild and beautiful, especially above Tuttlingen, where castles crown every possible summit on the neighbouring hills. Below Immendingen much water escapes by subterranean fissures into the river Ach, a tributary of the Rhine. After it is joined on the right bank by the Iller, which tributary rises in the Algauer Alps, the Danube attains a width of 78 yd. and an average depth of 3 ft. 6 in. and becomes navigable downstream for specially constructed craft of 100 tons. At Donàuwörth (height 1,330 ft.) it receives the Lech, which tributary rises near the Iller and flows in a direction parallel to it, whilst at Regensburg (height 949 ft.) the Danube receives on the left bank the river Naab which rises in the Fichtel Gebirge. Below Regensburg, at Deggendorf, it is joined by the Isar, on the banks of which stands Munich. The upper course of the Danube lies in German territory, rising in Baden and flowing through Wiirttemberg and Bavaria. At Passau (height 800 ft.) it enters Austria and approximately 100 m. of the north-western boundary of that country is formed by the Danube, its right bank tributary the Inn, and the Salzach which flows into the Inn on its right bank. The rivers Isar, Inn and Salzach drain a large portion of the eastern Alps and have many important towns on their banks. The Inn joins the Danube at Passau.

GREIN WHIRLPOOL

From Passau to Linz the Danube is hemmed in by mountains, but its valley becomes wider below the latter town where the river subdivides into several arms which unite again at the once famous whirlpool near Grein. Below Grein, the river flows through another narrow defile as far as Krems but once more subdivides as its passes toward Vienna. The district between Linz and Vienna is renowned for its beauty and for the numerous places of historical and archaeological interest along the river's banks. At Vienna the river is 316 yd. wide, and 429 ft. above sea level and below the town is the district of Marchfeld which is a low-lying country across which the Danube frequently subdivides forming numerous islands. An important left bank tributary, the March, which drains Moravia, joins the main stream here. Before reaching Bratislava (Pozsony, Pressburg), the Danube passes through the narrow gap between the lower spurs of the Alps and the Carpathians and enters upon the middle section of the river. At this gap the river also passes out of Austria and for a few miles is entirely in Czechoslovakia but it very soon becomes the boundary between that country and Hungary, until it reaches Esztergom (Gran), below which town it enters Hungary.

The Danube flows for the first 100 m. of its middle course upon alluvial and Quarternary deposits of the Little Hungarian Plain. This latter is separated from the Great Hungarian Plain by the Bakony Wald ridge, the innermost arc of the Carpathian mountain system, and the Danube breaks through this ridge at Esztergom. After leaving Bratislava, the river divides into three channels forming several islands, but these join together again at Kombrom where the river is also joined on its left bank by the river Waag which rises in the Carpathians. Higher up the stream at Györ (Raab), the southern branch of the divided Danube is joined by the river Raab which rises in the Styrian Alps. Between Esztergom and Waitzen (Vbcz) the valley becomes narrow until at the latter town the river turns southward to flow in that direction for 230 m. across the great Hungarian plain. In this long stretch, the Danube meanders about in a wide alluvium-filled valley, frequently dividing into two or more streams and passing Budapest, Baja (where it leaves Hungary and enters Yugoslavia) and Mohbcs. At Almas, 14 m. east of Osijek, the Danube is joined by the important right bank tributary, the Drave (height 81 ft.), which rises in Tirol and drains a large portion of the Eastern Alps. The Danube is again diverted eastward at Borovo by the Fruška Gora, and it flows along the northern edge of this range, passing Novi Sad (Újvidék), until it reaches Belgrade. Between these two towns, the Danube receives the important left bank affluent, the Tisa (Theiss), which, rising in the Carpathians, drains the greater part of the western slopes of those mountains, as well as the great Hungarian plain. At Belgrade, the Danube is joined by the important right bank affluent, the Save, which, rising in the Julian Alps, flows eastward and drains the greater part of western Yugoslavia, whilst the eastern part of that country is drained by the Morava, which joins the Danube between Belgrade and Bazias, also on its right bank.

The whole character of the Danube valley changes suddenly at Bazias, and between that town and Turnu Severin, the river has worn out for itself a channel through the mountain ridge which joins the Carpathian arc with the Balkan mountains. A large part of the great Hungarian plain, which covers an area of about 30,000 sq.m., is remarkably flat and low-lying, and the altitude rarely exceeds 300 ft. In consequence, natural drainage by the Tisa and the Danube is very poor, and where artificial drainage has not been carried out, the banks of the rivers are in many places lined by wide swamps and marshes, which in winter form large ice-fields. Until comparatively recent geological times, this plain formed an extensive inland sea, whose final effluent followed the present course of the Danube through the Kazan defile and the Iron Gates. By the lowering of its channel through the gap (the level of the Danube at Orsova is now 42 ft. above sea level), this epicontinental sea was drained, leaving the great Hungarian plain covered with a thick deposit of alluvial sands and gravels. Hemmed in by precipitous rocks, the river passes through the stupendous Kazan defile (162 yd. wide), then widens out to nearly a mile at Orsova, but becomes narrower again at the Iron Gates. The river has been cleared of numerous obstructions to make possible navigation along this stretch.

THE LOWER COURSE

The lower course of the Danube stretches from the Iron Gates to the Black Sea. From Bazias to the junction with the small right bank tributary, the Timok, the Danube forms the boundary between Yugoslavia and Rumania. From the Timok to a point 27 m. east of Ruschuk, it forms the boundary between Rumania and Bulgaria, after which it flows entirely through Rumanian territory. Along its lower course, the Danube flows over Quaternary deposits covered by river sands and gravels. Its north bank is low, flat and marshy with numerous small lakes, but its south bank is crowned by low heights which make excellent town sites, *e.g.,* Vidin, Lom-Palanka, Svishtov, Ruschuk and Silistra. At Ruschuk, the railway from Bucharest to Varna, crosses the Danube. The river receives many tributaries along this stretch, those on its left bank, of which the Oltul and Dambovita, on which stands Bucharest, are the most important, draining the Transylvanian Alps, and those on its right bank, draining the northern ridges of the Balkan mountains. At Cernavoda, where the river is crossed by the railway from Bucharest to Constantça, the Black sea port, the Danube is diverted northward by the hills of Dobruja, which form an isolated remnant of the Hercynian foreland of Europe. Along this stretch as far as Braila, the river subdivides into several channels, and spreads out over the surrounding country forming numerous lakes. The river changes its direction again at Galatz, the chief port on the delta of the Danube, and flows eastward toward its mouths. Sea-going vessels having a register up to 4,000 tons can ascend the river as far as Braila, but those up to 600 tons can sail as far as Turnu Severin. Two left bank affluents, the Seret and the Prut, which drain the eastern side of the Carpathian

mountains, enter the river near Galatz. For 30 m. in an easterly direction from Galatz, the Danube flows as a single channel until it breaks up into the several branches of its delta. Along the northern shore of the river from Galatz to-the sea there is a large number of shallow lakes, which indicates the poor drainage of the region. The most important mouths of the river are, reading from north to south, the Kilia, Sulina and St. George, and in 1905 the ratio of the discharge of these three branches was Sulina 9%, St. George 24%, and Kilia 67%. The mean annual outflow of all the mouths is estimated at 315,200 cu.ft. per sec., and the amount of silt brought down at 108 million tons per year. As the currents of the Black sea along this coast flow from north to south, the silt brought down by the Kilia branch tends to block up the mouths of the other channels.

The delta of the Danube, which is about 1,000 sq.m. in area, is a mere wilderness of swamps and marshes covered by tall reeds and through which the silt laden distributaries of the river slowly meander. The monotony of this waste of country is relieved here and there by isolated elevations covered by oak, beech and willows, many of them marking ancient coast lines. The most important towns in the delta region are Ismail, Chilia and Vilkof on the Kilia branch, Sulina at the mouth of the Sulina branch and Tulcea and St. George on the St. George's branch. The Kilia branch itself breaks up into a wide delta which is continually advancing seaward, and it is estimated that its various mouths pour into the sea 3,000 cu.ft. of sediment per minute. The Sulina branch breaks off from the Tulcea (St. George's) branch, 7 m. below the town of Tulcea, and the St. George's branch again subdivides before entering the sea.

Before engineeripg works were commenced to make the channels navigable, ships drawing only 8 ft. of water experienced great difficulty in entering, for the depth of water in few portions of the channels rarely exceeded this figure and the frequent occurrence of numerous sand banks and bars further added to the difficulty of shipping. To-day, ships drawing 22 ft. of water can reach Brăila.

Traffic.—The Danube may be divided for traffic purposes into the maritime Danube from the sea to above Brăila, and the fluvial Danube from this point up to Regensburg, where the river at present ceases to be navigable for large craft. Brăila and Galatz, situated respectively 171 and 150 kilometres from Sulina (at the mouth of the river), are the usual points for transhipment between seagoing vessels and barges. Besides transhipping goods on to barges, seagoing vessels also tranship on to railways at Brăila and Galatz. Traffic has never equalled that on the Rhine, where the countries are much more highly developed industrially.

The European Commission.—The administration of the Danube was formerly controlled by the single European commission of the Danube, an institution set up with a provisional character by the Treaty of Paris in 1856. Its headquarters were at Galatz, and it administered the Danubian delta only, eight interested nations being represented on it. The conservancy of the other Danubian reach of international importance—the Iron Gates—was entrusted to Austria-Hungary, and assigned by her to Hungary.

In the Treaty of Bucharest (May 1918) the Central Powers reduced the membership of the European commission to "states situated on the Danube or the European coasts of the Black sea." The Treaty of Versailles (June 1919) reinstated the commission in "the powers it possessed before the war." It went on that "as a provisional measure, only representatives of Great Britain, France, Italy and Rumania shall constitute this commission." The commission acquired definite character when the Danube statute was signed in Paris on July 23, 1921. In future, subject to the unanimous consent of the states represented on the commission, any European state which is able to prove its possession of sufficient maritime commercial and European interests at the mouths of the Danube may be represented on it. Up to 1926, however, the representation had not been increased.

The International Commission.—The Treaty of Versailles, Art. 347, provided that "from the point where the competence of the European commission ceases," *i.e.*, from above Brăila, "the Danube system referred to in Art. 331," *i.e.*, as far as the highest navigable point at Ulm, "shall be placed under the administration of an international commission composed as follows:—

Two representatives of German riparian States.

One representative of each other riparian State.

One representative of each non-riparian State represented in the future as the European commission of the Danube."

This commission was to carry on the administration provisionally until the conclusion of a definite statute concerning the Danube.

On July 23, 1921, this statute was signed. Many of its provisos simply followed the lines of the "convention on the régime of navigable waterways of international concern" concluded at Barcelona on April 20, 1921. Article 1 declared navigation on the Danube system to be unrestricted and open to all flags, on a footing of complete equality, from Ulm to the Black sea, and the internationalised portions of the Danube tributaries were defined. The provisional composition of the international commission was confirmed. It had to see that the declaration in Art. 1 was not infringed by any riparian State or States, to draw up a programme of public works for the improvement of the waterway on the basis of proposals submitted by the riparians, controlling and if necessary modifying the annual programmes of the riparian states for current works of maintenance. The cost of such works was borne by the riparian State concerned, assisted, if the commission so decided, by other States interested.

The cost of works of improvement (not maintenance) might be covered by navigation dues, to be imposed (with the commission's authorisation) by the riparian State which had executed the works, or by the commission itself, if it had executed them at its own charges. Dues were to be assessed on the ship's tonnage and not based on the goods transported, revenue from them was to be applied exclusively to the works for which they were imposed, there was to be no differential treatment of flags. Customs duties levied by a riparian on goods loaded or discharged at the Danubian ports in its territory were also to be levied without distinction of flag or hindrance to navigation, and were not to be higher than duties levied at other frontiers of the same state. The transport of goods and passengers, even between ports of the same riparian State, was to be unrestricted and open to all flags on a footing of perfect equality, with the exception of regular local services which may only be carried out by foreign craft subject to the observance of the national law of the local sovereign, and in agreement with the authorities of the riparian state concerned (Art. 22). Passage of goods and passengers in transit was to be free. Uniform police regulations were to be drawn up and applied by each riparian on its own territory. A special joint service of Rumania and Yugoslavia, organised with the approval of the commission, will have to take over the maintenance and improvement of the Iron Gates section, with headquarters at Orsova. The commission was to decide on special works to be undertaken (and dues to be levied for the purpose) and to have power to abolish the service when its work was done; it could inaugurate like services elsewhere if necessary.

The commission was to determine its own procedure and administer its own budget, the presidency being held for six months by each delegation in turn. Its seat was to be at Bratislava the first five years, and thereafter it might be established at other towns on the Danube, selected at its discretion, for five-year periods in rotation. Its property and members were to enjoy diplomatic privileges and it was to fly its own flag. It was to deal in the first instance with questions regarding the interpretation and application of the convention; but the special jurisdiction set up by the League of Nations would ultimately have to deal with complaints from a state that the commission was acting ultra *vires*, or from the commission against a state for neglecting to carry out its decisions. Every effort was made to insure uniformity between the workings of the International and the European commissions, and between different signatory states

The convention came into force on June 30, 1922. One of the

most important questions that has been raised since that date was connected with the interpretation of art. 22 (above), as certain states in eastern Europe were anxious to reserve to their own flag the passenger and goods traffic between ports in their own territory. In the discussion on art. 22, the Rumanian delegate stated that the carriage of goods on river craft between two ports in the same country did not constitute sabotage if the goods were subsequently transhipped to a seagoing vessel to export, and that art. 22 imposed no restriction on the traffic carried on up to that time by Greece. It would seem to be established by the decisions of the Powers' conference that casual transport by foreign vessels between two ports in the same state is to be unrestricted even if it takes place repeatedly. *(See* INLAND WATER TRANSPORT.)

The old Ludwigskanal connecting the Danube and the river Main has been enlarged and will form the Rhine-Main-Danube canal, thus making navigation between the Atlantic ocean and the Black sea through the European continent possible.

Many legends are woven around the course of the Danube. A district in former Austria near Grein is still called the Nibelungengau in memory of one of the most famous sagas.

DANVERS, a town of Essex county, Massachusetts, 19 mi. N.E. of Boston, on the coast. It is served by the Boston and Maine railroad. The population was 14,179 in 1940. It is a residential suburb; has various manufacturing industries, with an output in 1937 valued at $4,147,150; and is the seat of a state hospital for the insane. Danvers was separated from Salem as a district in 1752 and incorporated as a town in 1757, but the act of incorporation was disallowed by the privy council. In 1775 it was again incorporated. Within its present limits was Salem village, the centre of the witchcraft delusion of 1692. Danvers was the birthplace of Israel Putnam (q v.).

See J. W. Hanson, *History* of *the Town* of *Danvers* (1848); and A. P. White, "History of Danvers" in *History of Essex County* (1888).

DANVILLE, a city of eastern Illinois, U.S.A., 124 mi. S. of Chicago, on the bluffs of the Vermilion river; the county seat of Vermilion county. It is served by the Chicago and Eastern Illinois, the Illinois Traction (electric), the New York Central and the Wabash railways. The population was 33,776 in 1920 (87% native white) and was 36,919 in 1940 by the federal census of that year.

Danville is the commercial centre of a rich farming and coal-mining region, and has substantial manufacturing industries, including railroad locomotive and repair shops, flour and lumber mills, large brick plants, glass works and a zinc smelter.

The bank clearings in 1940 were $25,703,207 The assessed valuation of property in 1940 was $20,385,459. There are large dairy and stock farms round about. At the western boundary of the city is Lake Vermilion, a reservoir 8 mi. long, with a capacity of 2,500,000,000 gal, completed in 1925. A branch of the National Home for Disabled Volunteer Soldiers was established there in 1898. The National Soldiers' Home for veterans of American wars has been converted into a neuropsychiatric unit of the veterans' administration. About 1,800 patients are cared for. Danville was the site of an Indian village, Piankeshaw, the centre of many trails. In 1824 Dan Beckwith, for whom the city was named, built his trading cabin there, and in 1826 the settlement became the county seat.

It was incorporated as a city in 1869. A commission form of government was adopted in 1927, a city plan (prepared in 1920) was in process of development.

DANVILLE, a city in the "blue grass" region of Kentucky, U.S.A., 70 mi. S.E. of Louisville; the county seat of Boyle county. It is served by the Southern railway system. The population was 5,099 in 1920 (27% Negroes) and was 6,734 in 1940 by the federal census. The city of Danville is an important market for horses, cattle, hogs and sheep, hemp, tobacco; is the trading centre for a large area; and has a clothing factory and railroad shops. It is the seat of the Kentucky school for the deaf (founded 1823), the first state institution of the kind in the U.S.A.; Centre college for men (Presbyterian; chartered 1819); and Kentucky (formerly Caldwell) college for women (Presbyterian; 1860). There are many fine old mansions in and near the city, and beautiful landscapes and river scenery in every direction. Herrington lake, created by the hydroelectric development on the Dix river, has 75 mi. of shore line. The battlefield of Perryville is 11 mi. west. At Pleasant Hill, 13 mi. north, are the massive stone buildings of an abandoned Shaker community. Danville was on the Wilderness road, and was one of the first settlements (1781) in Kentucky. It was the home of Dr. Ephraim McDowell (1771–1830), who in 1809 performed the first entirely successful operation for ovarian tumour; and was the birthplace of Justice John M. Harlan. From 1786 to 1790 an influential "political club" held long winter evening debates in the Gill tavern, and there met the nine conventions which discussed the terms of separation from Virginia and framed the first state constitution.

DANVILLE, a borough of Montour county, Pa., U.S.A., on the high northern bank of the Susquehanna river, at the base of Montour ridge, 110 mi. N.W. of Philadelphia; the county seat and an active manufacturing centre. It is on federal highway 11, and is served by the Lackawanna, the Pennsylvania and the Reading railways. The population was 7,185 in 1930, and was 7,122 in 1940 by the federal census. It is in the centre of a rich agricultural region and has varied industries. An outstanding mental hospital, the Danville state hospital (established 1868), is located there, as well as the Geisinger Memorial hospital, a noted general hospital, and the first Catholic Slovak Girls' academy in the U.S. Settlement was made there about 1776, and in 1792 a town was laid out, called Dan's Town, after Gen. Daniel Montgomery, the founder. Ore was discovered on Montour ridge and the town as an iron centre grew rapidly. It was incorporated in 1849. The first "T" rail in America was rolled there in 1845.

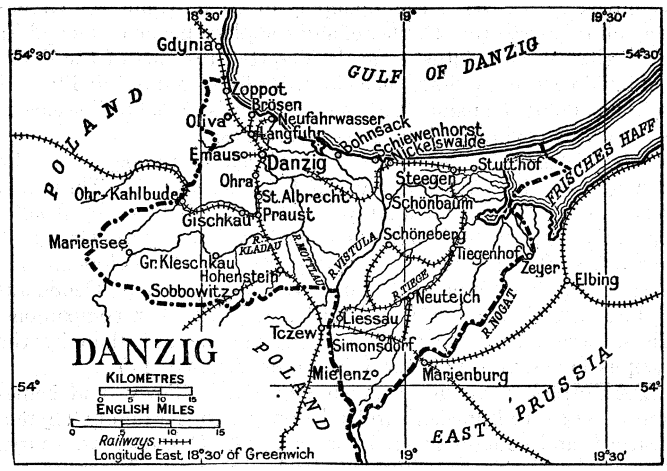
DANVILLE, a city of Virginia, U.S.A., on the high banks of the picturesque Dan river, near the southern boundary of the state; in Pittsylvania county but politically independent of it. It is on federal highways 29, 58 and 360, and is served by the Southern and Danville and Western railways. The population was 21,539 in 1920 (15·5% Negroes). The population for 1940, not including immediate suburbs, was 32,749. It is one of the largest markets in the country for bright-leaf tobacco, handling 50,000,000 lb. annually, and has one of the largest and oldest cotton mills in the south, valued at $34,000,000 and producing 2,000,000 sq.yd. of cloth per year. There are hosiery and silk mills, and other manufacturing industries. The output of 42 factories in the city in 1940 was valued at $25,000,000. Danville was settled about 1770, incorporated as a town in 1793, and as a city in 1833. After the evacuation of Richmond on April 2, 1865, the archives of the Confederacy were brought to Danville, and for a few days Jefferson Davis made it his capital. The building in which he met his cabinet is now a Confederate memorial and the city library.

DANZIG, Baltic port, town and territory close to the mouth of the river Vistula. Until Sept. 1, 1939, the town of Danzig was the administrative seat of the autonomous territory of the Free City of Danzig (*Freie Stadt Danzig*), whose absorption into the third reich has not been (1943) recognized by the United Nations.

The territory of the free city as established by art. 100 of the treaty of Versailles has an area of about 790 sq.mi. To the north it is bordered by the Gulf of Danzig and protected against heavy seas by the Polish peninsula of Hela. East of Danzig territory is the German province of East Prussia, west is situated the Polish province of Pomorze—also known as the Polish Corridor. At the

southerd tip of the'free city, Germany, Poland and Danzig meet. The river Vistula splits the territory into two nearly equal parts, the eastern Grosses Werder and the western Niederung and Hoehe. In the fertile alluvial lands of the river valley beet sugar and wheat are grown.

Apart from the municipality of Danzig the territory contains only smaller communities. An exception is the internationally-



MAP SHOWING BOUNDARIES OF THE FREE CITY OF DANZIG AS ESTABLISHED BY THE TREATY OF VERSAILLES, 1919. THE STATE, WHICH HAD A BOUNDARY LINE OF 147 MI., WAS UNDER THE PROTECTION OF THE LEAGUE OF NATIONS UNTIL 1939

known seaside resort of Zoppot (31,000 inhabitants), where a gambling casino is maintained. Noted for its surroundings, Zoppot organizes annual sport weeks and invites leading singers to the *Waldoper,* a natural theatre in the woods with 6,000 seats.

Danzig city is connected with the sea by two dead arms of the river Vistula, the Mottlau and the Tote Weichsel. These waters have been dredged to the depth of 15 ft. to allow larger ships approach of the inner wharves. For a distance of four miles the harbour canal is navigable for ships with a draught of 30 ft. During a flood in the '90s the flowing Vistula left its former bed and broke through to the gulf at the fisher village of Schiewenhorst, seven English miles east of Danzig city. Large parts of the old fortifications were removed in 1896 and turned into public parks.

To a remarkable degree Danzig has preserved its picturesque mediaeval scenery. Small streets with gabled houses and carved stone balconies (Beischlaege) are still called after the various professional guilds such as goldsmith alley and trousers-sewer alley. The old part of the city is overshadowed by the *Marien*-kirche, now one of the largest Protestant churches, built between 1343 and 1505. Hans Memlinc's painting ('The Last Judgment" is in the church. The *Uphagenhaus* on the main street, Langgasse, conveys the living conditions of the old patricians. Noteworthy for architecture are also the Gothic town hall, the stock exchange, the armoury (*Zeughaus*) and some of the old towers, like the Hohes Tor and Krantor. Danzig has a state theatre and a technical university of repute. It is connected by rail and air routes with Berlin, Warsaw and Moscow. Regular shipping lines exist with Scandinavia, England, the United States and other countries. In 1939 the free city had a population of about 410,000 and the Danzig municipality of 291,000. Of these, 95% were German speaking. Family names, however, are frequently Polish sounding and testify to a Germanizing influence. These German-speaking Danzigers of Polish descent—mostly Catholics—consider themselves Germans.

Two thirds of the populace is Protestant, one third Catholic. In 1933 Danzig counted about 10,000 Jews. Many emigrated before the outbreak of World War II. The remainder were forcibly removed during the war to the ghetto of Warsaw.

History.—Originally a Slavonic settlement, Danzig underwent in the 12th and 13th centuries Germanizing influence by tradesmen attracted by the famous amber of the region. From 1308 to 1454 under the Order of the Teutonic Knights, Danzig changed allegiance when the order decreased in power. As a member of the influential Hanseatic League, it entered into a personal union with the Polish crown which lasted from 1455 to 1793. During the 16th and 17th centuries Danzig (Polish *Gdansk*) rose to great wealth and fame as a trading-post between east and west. The Polish kings granted it extensive rights of autonomy and it was represented abroad by its own envoys. As a result of numerous Swedish-Polish wars fought at the gates of Danzig it became indebted. Its cultural life, however, continued to flourish. Schopenhauer, the philosopher, was born in Danzig. Also Fahrenheit, the inventor of the thermometer, and Chodowiecki, the engraver of the German classics.

At the third partition of Poland Danzig came for the first time to Prussia. After the latter's defeat by Napoleon Danzig was made in 1807 a free city under French-Saxon control. Marshal Lefebvre was appointed duke of Danzig. During the Napoleonic era it underwent several sieges, both parties rivalling for its possession. Not consulted, Danzig was assigned to Prussia by the Vienna Conference in 1815 and was made capital of the province of West Prussia. The merchant aristocracy of the ancient city remained irreconciled.

After its separation from Poland Danzig never regained its predominant shipping position in the Baltic. In the second half of the 19th century there occurred a moderate industrialization, mainly shipbuilding, sugar and arms manufactory. Danzig became provincial, with a large garrison and many officials and *rentiers.* The crown prince of Germany resided in the suburb of Langf uhr.

International Status.—According to arts. 100-108 of the treaty of Versailles, Germany ceded its rights concerning Danzig to the Allied and Associated Powers. The latter made Danzig a free city in an attempt to reconcile the principle of self-determination with the necessity of giving Poland a port for access to the sea.

The Danzig constitution, approved with minor alterations by the League of Nations, placed sovereignty in the people. The volkstag, a democratically-elected parliament, selects the government, or senate, headed by a *Senatspraesident.* The president of the senate and seven senators are elected for a term of four years while a vice-president and 13 senators are elected for an indefinite period, depending on parliamentary support. German is the official language, and legislature, administration and judicature were run on the German republican pattern.

Poland enjoyed commercial privileges and Poles were granted an extensive minority protection. Poland owned the major railways, and Danzig was included in the Polish customs except for a small free-port zone. The port of Danzig was administered by a mixed board consisting of an equal number of Poles and Danzigers with a Swiss subject at the head. Poland was entrusted with the conduct of Danzig's foreign affairs. Further details may he found in the Paris Convention of 1920 and the Warsaw Convention of 1921.

The League of Nations was set up as an arbiter for Danzig-Polish controversies and as a protector for the territorial integrity. Danzig's constitution was placed under the guarantee of the league. There resided in the city a league high commissioner who decided Danzig-Polish controversies in the first instance and who acted as an observer for the other league functions.

On Nov. 15, 1920, Danzig was formally proclaimed a free city and the allied troops were withdrawn. General Haking (English) acted as first league commissioner until 1923. Successive commissioners were M. S. MacDonnell (English); Professor van Hamel (Dutch), 1926; Count Manfredi Gravina (Italian), 1929; Helmer Rosting (Danish), 1932; Sean Lester (Irish), 1933–36; and Professor Karl Burckhardt (Swiss), 1937–39.

Politics.—Between 1920 and 1933 numerous Danzig-Polish frictions arose as a result of the conflicting policies of Germany and Poland. The council of the League of Nations was occupied repeatedly with Danzig-Polish controversies, Danzig often being referred to as the powder barrel of Europe. Danzig protested against installation of Polish mailboxes in the city, denied Poland the right to use its port as anchorage for warships, claimed the right of jurisdiction over the Polish railways in its territory. Danzig was dissatisfied with the distribution of customs receipts and protested against the use of the Westerplatte (place at the entrance of the port) as a munition depot. Poland was opposed to exchanges between Danzig and German officials and maintained that there was discrimination against Poles. The most important dispute centred around the problems created through the building of the Polish port of Gdpnia, 10 mi. north of Danzig territory. Danzig maintained Poland had the duty to direct all its overseas shipping via Danzig whereas Poland denied such obli-

gation and considered the building of Gdynia a matter of its territorial sovereignty. The league council took an intermediary position.

In internal politics Danzig had coalition governments similar to those of the reich. The first one was headed by Heinrich Sahm, later burgomaster of Berlin; the last one of the pre-Hitler era by Dr. Ernst Ziehm, a former president of the supreme court of administration. As a result of general elections to the volkstag held in May 1933, the nazi party acquired a majority of 50.03%. The new government u-as headed by Dr. Hermann Rauschning, who concluded economic agreements with Poland leading to an alleviation of tension.

Under the leadership of the nazi *gauleiter* Albert Forster, a Bavarian, Danzig's nazification was pushed forward with unconstitutional measures. Against these the opposition parties, in particular the Social Democrats, Centrists and Conservatives, appealed to the league council, the Danzig Poles holding themselves aloof. Rauschning resigned in Nov. 1934, in protest against the unconstitutional attitude of his party. He was replaced by Arthur Greiser. In May 1935, terrorized elections were held in which the nazis tried to achieve a two-thirds majority, which, if attained, would have entitled them to amend the constitution. In these elections the nazis drew only 57.3%. The German opposition parties appealed to the league council and demanded annulment of the elections on constitutional grounds. As guarantor of the Danzig constitution the league should have intervened. But the league council, with Anthony Eden as *rapporteur,* postponed all oppositional requests for a restoration of the constitution. In the fall of 1936 Sean Lester resigned as league high commissioner. He was replaced by Professor Burckhardt, who ceased to report on the constitutional position. As a result of the inactivity of the league the opposition parties were dissolved, press freedom finally abolished and many parliamentarians imprisoned. By the end of 1937 the gestapo ruled supreme in the free city.

Shortly after the conclusion of the Munich Pact, Germany demanded from Poland the return of Danzig to the reich and a corridor through the Corridor. Poland refused to acquiesce, and in April 1939 Hitler renounced the German-Polish Non-Aggression Pact of Jan. 1934. During the summer of 1939 followed Danzig's accelerated rearmament. In Aug. 1939 Forster proclaimed himself president of the free state, a measure involving a coup d'état. The first shot of World War II was fired by the German warship "Schleswig Holstein" while paying a courtesy visit to Danzig. Professor Burckhardt was requested by the military authorities of the occupation force to leave Danzig within two hours. After concurring declarations of Hitler and Forster, Danzig was reincorporated in the reich and was made again capital of the province of West Prussia.

Economics.— In 1923 Danzig adopted a new gulden currency to be issued by the Bank of Danzig, 25 gulden equalling one British pound sterling. The Danzig gulden did not follow the devaluation of the pound, but in May 1935 the gulden was depreciated 41% by senatorial decree. After the German occupation the gulden was replaced by the mark. During Danzig's independence German and Polish banks maintained branches in the city. Prominent were the Deutsche bank, Dresdner bank, Bank Zwiansku and the British-Polish Trade bank, a branch of the Bank Gostpodárstwo.

The chief import goods were foodstuffs, fertilizers, chemicals, ore, machines, hardware, building materials, raw cotton and textiles; the principal exports were coal, timber, sugar, grain, cement, naphtha, iron and steel. The Danzig port possesses ample facilities for storage, and timber ponds extend for several miles along the banks of the Tote Weichsel. Modern cranes in the coal basin turn a whole railway car upside down and the cargo is dumped in the hold.

Danzig's shipping increased rapidly during the 'nos. As compared with an average total turnover of about 2,500,000 metric tons prior to 1914 the Danzig harbour attained a turnover of 6,000,000, 1926, and of nearly 8,000,000 in 1927. The peak was reached in 1928 with a turnover of over 8,500,000 tons. Then a gradual decrease set in and in 1932 Danzig lost about 3,000,000 tons, mostly at the expense of Gdynia. In 1938 Danzig had a turnover of nearly 6,000,000 tons, Gdynia one of about 8,750,000 tons. National socialist political measures probably also affected Danzig's trade position. Its overseas trade was to a considerable extent managed by foreign residents of Danzig, in particular by Poles, British and Scandinavians. Most of the cargoes were delivered by way of tramp-shipping. The Norwegian, German, English and Polish flags predominated in the port.

Only sugar, railway cars and machines were produced on a larger scale. The leading industry was shipbuilding. Prominent in this branch were the firms of F. Schichau and the International Shipbuilding and Engineering Co. Ltd. The latter firm had leased the establishments of the former German Imperial Wharft from the governments of Poland and Danzig to which they had been assigned by the conference of ambassadors after World War I. The original capital of the international company amounting to £10,000 had been distributed in Britain, France, Poland and Danzig. British and French citizens each held 30% of the capital, Polish and Danzig citizens each 20%. After Danzig's occupation in 1939, the premises of the international company were taken over by the occupation force.

DAPHNAE (Tahpanhes, mod. *Defenneh*), an ancient fortress near the Syrian frontier of Egypt, on the Pelusian arm of the Nile. Here King Psammetichus established a garrison of foreign mercenaries, mostly Carians and Ionian Greeks. After the destruction of Jerusalem by Nebuchadrezzar in 588 B.C., the Jewish fugitives, of whom Jeremiah was one, came to Tahpanhes. When Naucratis was given by Amasis II the monopoly of Greek traffic the Greeks were all removed from Daphnae, and the place never recovered its prosperity; in Herodotus' time the deserted remains of the docks and buildings were visible. The site was discovered by Sir Flinders Petrie in 1886; the name "Castle of the Jew's Daughter" seems to preserve the tradition of the Jewish refugees.

DAPHNE (Gr. laurel tree), in Greek mythology, was the daughter of the Arcadian river-god Ladon, or the Thessalian Peneus, or of the Laconian Amyclas. She was beloved by Apollo, and when pursued by him was changed by her mother Ge into a laurel tree (Ovid, *Metam.,* i, 452–567). In the Peloponnesian legends, another suitor of Daphne, Leucippus, son of Oenomaus of Pisa, disguised himself as a girl and joined her companions. His sex was discovered while bathing, and he was slain by the nymphs (Pausanias, viii, 20; Parthenius, *Erotica,* 15).

DAPHNE, a genus of much cultivated, showy, and sometimes evergreen, Eurasian shrubs, belonging to the family Thymelaeaceae, and containing about 40 species. D. *Laureola,* spurge laurel, a small, widely cultivated shrub with green flowers in the leaf axils towards the ends of the branches and ovoid black, very poisonous berries, is found in England. D. *Mezereum,* mezereon, a rather larger shrub, 2 to 4 ft. high, has deciduous leaves, and bears fragrant pink flowers in clusters in the axils of last season's leaves, in early spring before the foliage. The bright red ovoid berries are cathartic, the whole plant is acrid and poisonous. It is a native of Europe and north Asia, and found apparently wild in copses and woods in Britain. It is a well-known garden plant, and several other species of the genus are cultivated in the open air and as greenhouse plants. *D. Cneorum* (garland-flower) is a hardy evergreen trailing shrub, with pink sweet-scented flowers. D. *odora* (China and Japan) is a hardy evergreen with showy, rosy-purple, fragrant flowers.

D. indica (China) and *D. japonica* (Japan) are greenhouse evergreens with respectively red or white and pinkish-purple flowers.

DAPHNEPHORIA, a festival held every ninth year at Thebes in Boeotia in honour of Apollo Ismenius or Galaxius. It consisted of a procession in which the chief figure was a boy, of good family and noble appearance, whose father and mother must be alive. Immediately in front of the boy, who was called *Daphnephoros* ("laurel bearer"), walked one of his nearest relatives, carrying an olive branch hung with laurel and flowers and having on the upper end a bronze ball from which hung several smaller balls. Another smaller ball was placed on the middle of the branch or pole, which was then twined round with ribbons.

These balls were said to indicate the sun, stars and moon, while the ribbons referred to the days of the year, being 365 in number. Then followed a chorus of maidens carrying suppliant branches and singing a hymn to the god. The *Daphnephoros* dedicated a bronze tripod in the temple of Apollo. The festival is described by Proclus (in Photius, *Cod.,* 239).

DAPHNIS, the legendary hero of the shepherds of Sicily, and reputed inventor of bucolic poetry. According to his countryman Diodorus (iv, 84), and Aelian (Var. *Hist.,* x, 18), Daphnis was the son of Hermes and a Sicilian nymph, and was found by shepherds in a grove of laurels (whence his name). He won the affection of a nymph, who made him promise to love none but her, threatening that if he proved unfaithful he would lose his eyesight. He failed to keep his promise and was smitten with blindness. Daphnis, who endeavoured to console himself by playing the flute and singing shepherds' songs, soon afterwards died, or was taken up to heaven by his father Hermes, who caused a spring of water to gush out from the spot where his

son had been carried off. Ever afterwards, the Sicilians offered sacrifices at this spring. In Theocritus, Id. I., Daphnis[1] apparently has offended Eros and Aphrodite, and in return has been smitten with unrequited love; he dies, although Aphrodite, moved by compassion, endeavours, but too late, to save him.

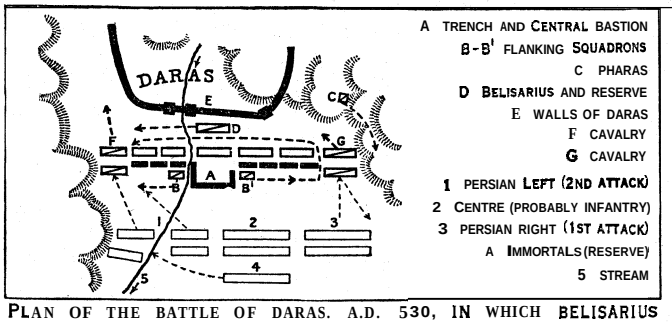
DARAB, a town of Fars, in Persia, and headquarters of a district of the same name, situated in 28° 45' N., 54° 37' E., at an elevation of 4,000 ft., on the Shiraz, Fasa, Furg, Bandar Abbas caravan route, about 140 m. from the first-named and 208 m. from the last. It is a straggling place with an estimated population of 12,000. The district around produces oranges and lemons in abundance, and tobacco of good quality is cultivated extensively. In Iranian legend, the foundation of the town, known also as Darab-gird, is attributed to Darab, father of Dara (Darius III.). About 4 m. to the south-west, is a large circular earthwork known as Kalah-i-Darab, described in Sir W. Ouseley's Travels (1819), the history of which is unknown. Another monument in the vicinity is a gigantic bas-relief, carved on the vertical face of a rock, representing the victory of the Sasanian Shapur I. over the Roman emperor Valerian, A.D. 260.

D'ARANYI, JELLY (1895–), Hungarian violinist, grand-niece of Dr. Joachim and one of the most brilliant players of her day, was born at Budapest on May 3, 1895. She studied under Hubay and quickly attracted notice by her exceptional powers, eventually winning world-wide recognition. She resides in London. Her sister, Madame Adila Fachiri, also a violinist, is likewise a player of the first rank.

DARAS, a fortified Roman city on the Mesopotamian frontier about 12 miles N.W. of Nisibis, founded A.D. 504 by Anastasius to replace Nisibis, ceded to the Persians A.D. 363. It was built near the head of, and almost completely blocking, a narrow valley running north-north-east and south-south-west. It flanked the road to Mardin.

Belisarius, aged 24, appointed General of the East by Justinian in 529, was stationed here in June, 530, when Pezozes arrived at Nisibis with a Persian army of 40.000 horse and foot, to invade the Roman empire. Reinforcements from Lebanon raised Belisarius' army to 25,000 undisciplined troops, discouraged by recent defeats. Daras was dominated on three sides by high ground. This, and the low spirits of the troops, made it unwise to stand a siege. Belisarius caused a ditch to be dug across the valley, the flanks protected by the high ground unsuited to cavalry. Openings allowed the Romans to counter-attack. In the centre a rectangular projection, like an entrenched camp, gave flanking fire across the front and protected the front and exposed flanks of



PLAN OF THE BATTLE OF DARAS. A.D. 530, IN WHICH BELISARIUS DEFEATED THE PERSIANS

two bodies of 600 Hunnish light cavalry, placed on either side of this bastion. Infantry manned the centre, and cavalry was posted on the flanks. In concealment, on the high ground beyond the Roman left (east) flank, was posted a squadron of 300 light horse, under Pharas. Belisarius kept a reserve under his own hand. The city walls gave the protection of overhead fire from the bows of the inhabitants of Daras and, probably, artillery engines.

Pezozes arrayed his host in two lines. He kept the "Immortals" in reserve. The first day the Persians looked over the situation and skirmished, but did not attack. Only a short time before, a Persian force had ridden to disaster into a similar ditch dug for them by the Ephthalite Huns. Pezozes did not like the unusual steadiness in the Roman ranks any more than he liked the ditch. Also a stream, whose bed was four feet deep, probably interfered with his power to manoeuvre. The next day reinforcements brought the Persian strength to a total said to be 50,000 men. The Persians advanced about noon. Pezozes relieved the front line with the second to keep up a continuous fire of archery; but the wind favoured the Roman bowmen. Both sides suffered heavy losses in this missile fight. The Persian horse charged the Roman left. The Roman cavalry gave way. Then the squadron of Pharas, moving along the high ground, fell on the Persian rear, and the 600 Hunnish cavalry from the left (east) angle of the central bastion, took the enemy in flank. The Persian horse was routed with heavy loss.

Belisarius noted a movement of the Persians, including the "Immortals," toward his right. He ordered the victorious Huns from the left flank to reinforce the similar detachment on the right, and added troops from his reserve. The Persian attack drove in the Roman cavalry on their front, but the Huns, charging from the west angle of the trench, penetrated between the two Persian lines and created disorder. The reinforcements sent by Belisarius charged also, and the defeated Roman cavalry rallied and counter-attacked. Surprised and almost surrounded, the Persians broke. The Roman lines now advanced across the ditch, and the victorious cavalry rolled up the Persian flank. Belisarius called an early halt to the pursuit lest his undisciplined troops might get out of hand and fall into an ambush.

This victory restored the prestige of Roman arms, raised morale and discipline, and established the reputation of Belisarius. The use of the ditch afforded security to the weakest part of the line. By its location, it protected the front, flanks and rear. It economized force by making use of the walls of Daras and the citizens to cover a possible retirement. It left the cavalry the greatest freedom of manoeuvre. Finally, it permitted a counter-attack.

DARBHANGA, a town and district of British India, in the Tirhut division of Behar and Orissa. The town is on the left bank of the Little Baghmati river, and has a railway station. Pop. (1931) 60,676. The town is really a collection of villages round the residence of the Maharaja, a large modern building in extensive grounds. There are a hospital, with a medical college and a Lady Dufferin hospital attached, and a town hall and large tanks extending for over a mile. The district of Darbhanga extends from the Nepal frontier to the Ganges. Area 3,348 sq.m. Pop. (1931) 3,166,094. The district consists entirely of an alluvial plain, in which the principal rivers are the Ganges, Burh Gandak, Baghmati and Little Baghmati, Balan and Little Balan, and Tiljuga. Rice is the staple crop, and the cultivator is especially dependent on the winter harvest. In 1897 a famine affected the whole district except the Samastipur subdivision, and another affected half the district in 1906–07. Indigo manufacture was formerly an important industry but has declined. Sugar cultivation and manufacture have to some extent taken its place. Tobacco is also a valuable crop. The district is traversed by the main line of the Bengal and North-Western railway. Pusa (*q.v.*) in the west of the district is the headquarters of the Imperial Agricultural Department.

The Darbhanga raj, which was founded in the 16th century, is a name applied to a large estate which includes parts of the districts of Darbhanga, Muzaffarpur, Monghyr, Purnea and Bhagal-

[1] It is erroneous to suppose that every shepherd called Daphnis in pastoral poetry and romance is this Daphnis.

pur. It is held by one of the chief noblemen of the province, Sir Rameshwar Singh Bahadur, Maharajadhiraj of Darbhanga, G.C.I.E., K.C.I.E., K.B.E., who was born in 1860, and on attaining his majority in 1878 was appointed to the Indian Statutory Civil Service, which he resigned in 1885 in order to manage his estates. He was created raja bahadur in 1886, maharaja bahadur on his succession to the raj in 1898, and hereditary Maharajadhiraj in 1920: he was a member of the Executive Council of Behar and Orissa from 1912 to 1917. He is the head of the Maithil Brahmans.

D'ARBLAY. FRANCES (1752–1840), English novelist and diarist, better known as FANNY BURNEY, daughter of Dr. Charles Burney (*q.v.*), was born at King's Lynn, Norfolk, on June 13, 1752. Her mother was Esther Sleepe, granddaughter of a French refugee named Dubois. Fanny was the fourth child in a family of six. Of her brothers, James (1750–1821) became an admiral and sailed with Captain Cook on his second and third voyages, and Charles Burney (1757–1817) was a well-known classical scholar. In 1760 the family removed to London, and Dr. Burney, who was now a fashionable music-master, took a house in Poland street. Mrs. Burney died in 1761, when Fanny was only nine years old. Her sisters, Esther (Hetty), afterwards Mrs. Charles Rousseau Burney, and Susanna, afterwards Mrs. Phillips, were sent to school in Paris, but Fanny was left to educate herself. Early in 1766 she paid her first visit to Dr. Burney's friend Samuel Crisp at Chessington Hall, near Epsom. Dr. Burney had first made Samuel Crisp's acquaintance about 1745 at the house of Fulke Greville, grandfather of the diarist, and the two studied music while the rest of the guests hunted. Crisp wrote a play, *Virginia,* which was staged by David Garrick in 1754 at the request of the beautiful countess of Coventry (*née* Maria Gunning). The play had no great success, and in 1764 Crisp established himself in retirement at Chessington Hall, where he frequently entertained his sister, Mrs. Sophia Gast, of Burford, Oxfordshire, and Dr. Burney and his family, to whom he was familiarly known as "daddy" Crisp.[1] It was to her "daddy" Crisp and her sister Susan that Fanny Burney addressed large portions of her diary and many of her letters. After his wife's death in 1767, Dr. Burney married Elizabeth Allen, widow of a King's Lynn wine-merchant.

From her 15th year Fanny lived in the midst of a brilliant social circle, gathered round her father in Poland street, and later in his new home in St. Martin's street, Leicester Fields, London. Garrick was a frequent visitor, and would arrive before eight o'clock in the morning. Of the various "lyons" they entertained she leaves a graphic account, notably of Omai, the Otaheitan native, and of Alexis Orlov, the favourite of Catherine II. of Russia. Dr. Johnson she first met at her father's home in March 1777. Her father's drawing-room, where she met many of the chief musicians, actors and authors of the day, was in fact Fanny's only school. Her reading, however, was by no means limited. Macaulay stated that in the whole of Dr. Burney's library there was but one novel, Fielding's *Amelia;* but Austin Dobson points out that she was acquainted with the abbé Prévost's *Doyen de Killérine,* and with Marivaux's *Vie de Marianne,* besides *Clarissa Harlowe* and the books of Mrs. Elizabeth Griffith and Mrs. Frances Brooke. Her diary also contains the record of much more strenuous reading. Her stepmother, a woman of some cultivation, did not encourage habits of scribbling. Fanny, therefore, made a bonfire of her mss., among them a *History of Caroline Evelyn,* a story containing an account of Evelina's mother. Luckily her journal did not meet with the same fate. The first entry in it was made on May 30, 1768, and it extended over 72 years. The earlier portions of it underwent wholesale editing in later days, and much of it was entirely obliterated. She planned out *Evelina, or A Young Lady's Entrance into the World,* long before it was written down. *Evelina* was published by Thomas Lowndes in the end of Jan. 1778, but it was not until June that Dr. Burney learned its authorship, when the book had been reviewed and praised everywhere. Fanny proudly told Mrs. Thrale the secret. Mrs. Thrale wrote to Dr. Burney on July 22: "Mr. Johnson returned home full of the Prayes of the *Book* I had lent him, and protesting that there were passages in it which might do *honour* to Richardson: we talk of it for ever, and he feels ardent after the denouement; he could not get *rid* of the Rogue, he said." Miss Burney soon visited the Thrales at Streatham, "the most consequential day I have spent since my birth" she calls the occasion. It was the prelude to much longer visits there. Dr. Johnson's best compliments were made for her benefit, and eagerly transcribed in her diary. His affectionate friendship for "little Burney" only ceased with his death.

Evelina was a continued success. Sir Joshua Reynolds sat up all night to read it, as did Edmund Burke, who came next to Johnson in Miss Burney's esteem. She was introduced to Elizabeth Montagu and the other bluestocking ladies, to Richard Brinsley Sheridan, and to the gay Mrs. Mary Cholmondeley, the sister of Peg Woffington, whose manners, as described in the diary, explain much of *Evelina.* At the suggestion of Mrs. Thrale, and with offers of help from Arthur Murphy, and encouragement from Sheridan, Fanny began to write a comedy. Crisp, realizing the limitations of her powers, tried to dissuade her, and the piece, *The Witlings,* was suppressed in deference to what she called a "hissing, groaning, catcalling epistle" from her two "daddies." Meanwhile her intercourse with Mrs. Thrale proved very exacting, and left her little time for writing. She went with her to Bath in 1780, and was at Streatham again in 1781. Her next book was written partly at Chessington and after much discussion with Mr. Crisp. *Cecilia; or Memoirs of an Heiress,* by the author of *Evelina,* was published in 5 vols. in 1782 by Messrs. Payne and Cadell (who paid the author £2,000 as stated by Macaulay).

On April 24, 1783, Fanny Burney's "most judicious adviser and stimulating critic," "daddy" Crisp, died. He was her devoted friend, as she was to him, "the dearest thing on earth." The next year she was to lose two more friends. Mrs. Thrale married Piozzi, and Johnson died. Fanny had met the celebrated Mrs Delany in 1783, and she now attached herself to her. Mrs. Delany, who was living (1785) in a house near Windsor castle, presented to her by George III., was on the friendliest terms with both the king and queen, and Queen Charlotte soon after offered Miss Burney the post of second keeper of the robes, with a salary of £200 a year, which after some hesitation was accepted. Fanny's own misgivings as to her unfitness for court life were quite justified. From Queen Charlotte she received unvarying kindness, though she was not very clever with her waiting-maid's duties. She had to attend the queen's toilet, to take care of her lap-dog and her snuff-box, and to help her senior, Mrs. Schwellenberg, in entertaining the king's equerries and visitors at tea. The constant association with Mrs. Schwellenberg, who has been described as "a peevish old person of uncertain temper and impaired health, swaddled in the buckram of backstairs etiquette," proved to be the worst part of Fanny's duties. The strain told on her health, and after pressure both from Fanny and her numerous friends, Dr. Burney prepared with her a joint memorial asking the queen's leave to resign. She left the royal service in July 1791 with a retiring pension of £100 a year, granted from the queen's private purse, and returned to her father's house at Chelsea.

In 1792 she became acquainted with a group of French exiles, who had taken a house, Juniper Hall, near Mickleham, where Fanny's sister, Mrs. Phillips, lived. On July 31, 1793, she married one of the exiles, Alexandre D'Arblay, an artillery officer, who had been adjutant-general to La Fayette. They took a cottage at Bookham on the strength, it appears, of Miss Burney's pension. In 1793 she produced her *Brief Reflections relative to the Emigrant French Clergy.* Her son Alexandre was born on Dec. 18, 1794. In the following spring Sheridan produced at Drury Lane her *Edwy and Elgiva,* a tragedy which was not saved even by the acting of the Kembles and Mrs. Siddons. The play was never printed. Madame D'Arblay issued her next novel, *Camilla: or A Picture* of *Youth* (5 vols., 1796), by subscription, by which she made over £2,000; Jane Austen was among the subscribers. Unfortunately its literary success was not great. **A**

[1] His letters to Mrs. Gast and another sister, Anne, were edited with the title of *Burford Papers* (1906), *by* W. H. Hutton.

second play, *Love and Fashion*, was actually put in rehearsal in 1799, but was withdrawn in the next year. In 1801 Madame D'Arblay accompanied her husband to Paris, where he eventually obtained a place in the civil service. In 1812 she returned to England, bringing with her her son Alexandre to escape the conscription. In 1814 she published *The Wanderer; or Female Difficulties*. Possibly because readers expected to find a description of her impressions of revolutionary France, it had a large sale, from which the author realized £7,000. Nobody, it has been said, ever read *The Wanderer*. At the end of that year she returned to France. During the Hundred Days of 1815 she was in Belgium, and the vivid account in her *Diary* of Brussels during Waterloo may have been used by Thackeray in *Vanity Fair*. General D'Arblay now received permission to settle in England. After his death at Bath on May 3, 1818, his wife lived in Bolton street, Piccadilly. There she was visited in 1826 by Sir Walter Scott, who describes her (*Journal*, Nov. 18, 1826) as an elderly lady with no remains of personal beauty, but with a gentle manner and a pleasing countenance. The later years of her life were occupied with the editing of the *Mentoirs of Dr. Burney, arranged from his own Manuscripts, from family papers and jrom personal recollections* (3 vols., 1832). Her style had, as time went on, altered for the worse, and this book is full of extraordinary affectations. Madame D'Arblay died in London on Jan. 6, 1840 and was buried at Walcot, Bath, near her son and husband.

Madame D'Arblay's best title to the affections of modern readers is the *Diary and Letters*. Dr. Johnson lives in its pages almost as vividly as in those of Boswell, and King George and his wife in a friendlier light than in most of their contemporary portraits. Croker, in *The Qzrarterly Review*, April 1833 and June 1842, made two attacks on Madame D'Arblay. The first is an unfriendly but largely justifiable criticism on the *Memoirs of Dr. Burney*. In the second, a review of the first three volumes of the *Diary and Letters*, Croker abused the writer's innocent vanity, and declared that, considering their bulk and pretensions, the *Diary and Letters* were "nearly the most worthless we have ever waded through." These pronouncements drew forth the eloquent defence by Lord Macaulay, first printed in *The Edinburgh Review*, Jan. 1843, which perhaps did more than anything else to maintain Madame D'Arblay's constant popularity.

BIBLIOGRAPHY.—The *Diary and Letters of Madame D'Arblay* was edited by her niece, Charlotte Frances Barrett, in 7 vols. (1842–46). The text, covering the years 1778–1840, was edited with preface, notes and reproductions of contemporary portraits and other illustrations, by Mr. Austin Dobson in 6 vols. (1904–05). This *Diary*, which begins with the publication of *Evelina*, was supplemented in 1889 by *The Early Diary of Frances Burney* (1768–78), which in the first instance had been suppressed as being of purely private interest, edited by Mrs. Annie Raine Ellis, with an introduction giving many particulars of the Burney family. Mrs. Ellis also edited *Evelina* for "Bohn's Novelist's Library" in 1881, and *Cecilia* in 1882. *See* also Austin Dobson, *Fanny Burney (Madame D'Arblay)* (1903), in the "English Men of Letters Series"; S. E. Burney, *The Early Diary of Frances Burney*, with a selection from the journals of her sisters Susan and Charlotte Burney (1907); F. F. Moore, *The Keeper of the Robes*, (1911); *C*. B. Tinker, *Dr. Johnson and Fanny Burney* (1912); *T*. B. Macaulay, *Essay on Frances Burney* (1919); *R*. B. Johnson, *Fanny Burney and the Burneys* (1926).

DARBOUX, JEAN GASTON (1842–1917), French mathematician, was born at Nîmes on Aug. 13, 1842. His father died in 1849, and under the guidance of his mother, and with her encouragement, he was educated at the Ecole Normale, Paris. Pasteur became interested in Darboux, and created a teaching post for him at the Ecole Normale. After acting as assistant to Bertrand in the chair of mathematical physics at the Collège de France (1866–67) he became successively professor of mathematics at the lycée Louis le Grand (1867–72), Maître de conférences at the Ecole Normale (1872–73), assistant to the professor of rational mechanics at the Sorbonne (1873–80), professor of higher geometry at the Sorbonne (1880–89), dean of the faculty of science (1889–90) and perpetual secretary of the Academy of Science. Darboux, besides being an excellent teacher and a notable mathematician, was also a very capable organizer and the last two posts he held gave him ample scope in this direction. He died in Paris on Feb. 25, 1917.

Practically all his mathematical work was on geometry, his early papers (1864 and 1866) were on orthogonal surfaces; these were followed by a memoir on partial differential equations of the second order (1870), which embodied a new method of integration. In his treatise *Sur une Classe remarquable des courbes* (1873) Darboux developed the theory of the class of surfaces called cyclides. *Leçons sur la Théorie générale des surfaces et les applications géométriques du calcul infinitésimal* (4 vols., 1887–96) is one of Darboux's most important works; dealing with infinitesimal geometry, it embodies most of his previous research work. In 1898 the publication of *Leçons sur les systèmes orthogonaux et les coordonne'es curvilignes* was commenced. Darboux was the author of a number of papers and memoirs on the approximation to functions of very large numbers, on discontinuous functions and on other subjects.

Darboux held honorary degrees of many foreign universities; he was a foreign member of the Royal Society and in 1916 was awarded the Sylvester Medal.

DARBOY, GEORGES (1813–1871), archbishop of Paris, was born at Fayl-Billot in Haute Marne on Jan. 16, 1813. He was appointed bishop of Nancy in 1859, and in January 1863 was raised to the archbishopric of Paris. The archbishop was a strenuous upholder of episcopal independence in the Gallican sense, and sought to suppress the jurisdiction of the Jesuits and other religious orders within his diocese. At the Vatican council (*q.v.*) he strongly opposed the dogma of papal infallibility, against which he voted as inopportune. When the dogma had been finally adopted, however, he submitted. During the Franco-Prussian War he organized relief for the wounded and remained at his post during the siege of Paris and the brief triumph of the Commune. On April 4, 1871, he was arrested by the Cornmunards as a hostage and confined in the prison at Mazas, from which he was transferred to La Roquette on the advance of the army of Versailles. On May 27 he was shot within the prison along with other hostages. He died in the attitude of blessing and uttering words of forgiveness. His body was recovered with difficulty and received a public funeral (June 7). Darboy was the third archbishop of Paris who perished by violence between 1848 and 1871. He wrote a *Vie de St. Thomas Becket* (1859) and translated the works of St. Denis the Areopagite and the *Imitation of Christ*.

See J. A. Foulon, *Histoire de la vie et des oeuvres de Mgr. Darboy* (1889), and *J*. Guillermin, *Vie de Mgr. Darboy* (1888), biographies written from the clerical standpoint.

DARBY, a borough of Delaware county, Pa., U.S.A., on the south-west border of Philadelphia, near the Delaware river; served by the Baltimore and Ohio, and the Pennsylvania railways. It is largely a residential suburb, with few businesses operating in the town. Its population was 9,899 in 1930 and 10,334 in 1940 by the federal census

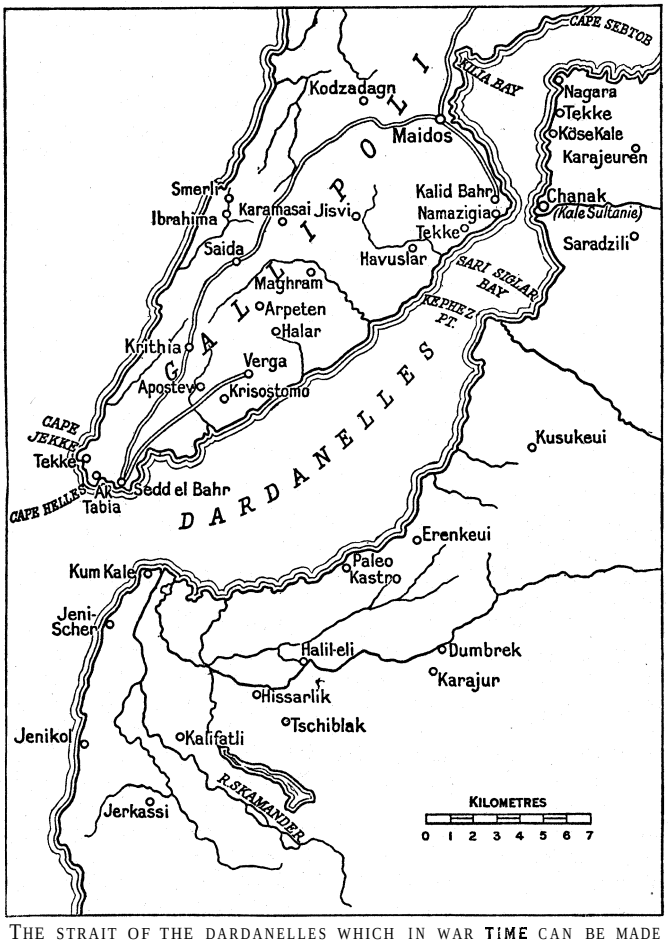
Darby was settled by eight Friends, in 1682. and has one of the oldest libraries in the country. It was incorporated in 1853, but most of its development has taken place since 1900.

DARCY, THOMAS DARCY, BARON (1467–1537), English soldier, was a son of Sir William Darcy (d. 1488). In 1505, having been created Baron Darcy, he was made warden of the east marches towards Scotland. In 1511 Darcy led some troops to Spain to help Ferdinand and Isabella against the Moors, but he returned almost at once to England, and was with Henry VIII. on his French campaign two years later. Darcy, who was one of the most powerful nobles on the border, was also a member of the royal council, dividing his time between state duties in London and a more active life in the north. He brought forward accusations against his former friend, Cardinal Wolsey; however, after the cardinal's fall his words and actions caused him to be suspected by Henry VIII. Disliking the separation from Rome, Darcy asserted that matrimonial cases were matters for the decision of the spiritual power, and he communicated with Eustace Chapuys, the ambassador of the emperor Charles V., about an invasion of England in the interests of the Roman Catholics. Detained in London by the king, he was not allowed to return to Yorkshire until late in 1535, and about a year after his arrival in the north the rising known as the Pilgrimage of Grace broke out. For a short time Darcy defended Pontefract Castle against

the rebels, but soon he surrendered to them this stronghold, which he could certainly have held a little longer, and was with them at Doncaster, being regarded as one of their leaders. Darcy may have assisted to suppress the rising which was renewed under Sir Francis Bigod early in 1537, but the king believed, probably with good reason, that he was guilty of fresh treasons, and he was seized and hurried to London. Tried by his peers, Darcy was found guilty of treason, and was beheaded on June 20, 1537.

DARDANELLES (Turk. *Chanak Kali* or *Çanakkale*), the chief town of a Turkish vilayet which includes the peninsula of Gallipoli, the ancient Troad, and the adjoining islands. Population, 54,476. It is at the mouth of the Rhodius, and at the narrowest part of the strait of the Dardanelles, where its span is but a mile across. The pottery trade, from which the town derived its Turkish name (Chanak means "pot" in Osmanli) has declined in importance; valonia and cereals are the chief products of this section.

DARDANELLES (Turk. *Bahr-Sefed Boghazi*), the strait (anciently called the Hellespont) that unites the Sea of Marmora with the Aegean. The city of Dardanus in the Troad, where Mithridates and Sulla signed a treaty in 84 B.C., gave the strait its name. The shores are formed by the peninsula of Gallipoli on the north-west and by Asia Minor on the south-east; it extends for a distance of about 47m. with an average breadth of 3 or 4 miles. At the Aegean extremity stand the castles of Sedil Bahr and Kum Kaleh respectively in Europe and Asia; and near the Marmora extremity is the town of Gallipoli (Callipolis) on the northern shore, and that of Lamsaki or Lapsaki (Lampsacus) on the southern. The two most famous castles of the Dardanelles



THE STRAIT OF THE DARDANELLES WHICH IN WAR TIME CAN BE MADE ALMOST IMPREGNABLE

are Chanak-Kalehsi, Sultanieh-Kalehsi, or the Old Castle of Anatolia, and Kilid-Bahr, or the Old Castle of Rumelia. The strait has long been famous in history since the passage of Xerxes' army by a bridge of boats. It is the scene of the story of Hero and Leander, and of Byron's successful attempt to rival Leander. The strategic importance of the strait has always been very great, since it is the gateway to Constantinople and the Black Sea from the Mediterranean. Although easily capable of defence, the strait was forced by the English admiral, Sir J. T. Duckworth, in 1807; and during World War I a British submarine under the command of Lieutenant-commander Stoker penetrated through the Turkish minefields and sank a Turkish battleship off the Golden Horn. Its strategic importance has given to it an international political importance that has found expression in what is known as the Straits (Dardanelles and Bosphorus) Question (*q.v.*). (I. F. D. M.)

DARDANELLES CAMPAIGN. This campaign, brought about by a desire on the part of the Allies that communications should be opened up from the Mediterranean into the Black sea with a view to assisting Russia, was begun in Feb. 1915 as a purely naval undertaking. (See WORLD WAR I, Naval.)

But it had been realized from the outset that, even should the warships succeed in attaining their object, land forces would sooner or later be required to aid in the campaign, if only to secure the communications of the fleet after it had passed into the Sea of Marmora. Before the failure of the naval attack of March 18, Allied troops had been set in motion for the Aegean. Some were already in Lemnos, and Sir Ian Hamilton, chosen as commander-in-chief of the military contingents, had arrived in time to witness the fight of the 18th. In view of its result, the Allied Governments decided that from this time onwards the gathering army must assume the principal rôle in the effort to secure possession of the straits. Hamilton was unable to initiate land operations at once. The Turks were making preparations to repel landings on both sides of the straits, while the troops at his disposal were partly in Egypt, partly at Lemnos, and partly on the high seas, en route from their respective bases in England and France.

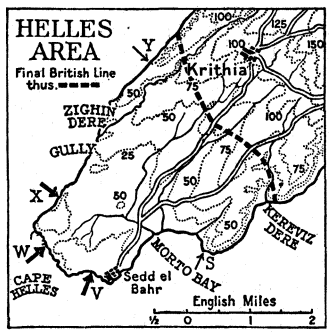
Organization in Egypt.—He decided therefore that his army must in the first place be concentrated in Egypt, to be organized for the hazardous undertaking to which it was about to be committed, and that it must then be disposed in transports in accordance with tactical requirements in anticipation of a landing in face of the enemy. A month was lost in consequence. During that month the Turkish army was formed (March 24) to guard the straits. Marshal Liman von Sanders, head of the German military mission in Turkey, was appointed its commander-in-chief, and under his instructions the defence system, organized in consequence of the warning offered by the naval operations, was overhauled and developed.

The Allied force was composed of five divisions—two (the 29th and the Royal Naval) furnished by the United Kingdom, two formed of Australian and New Zealand troops, and one composed of French colonial troops. Against this force Liman von Sanders could pit six divisions, but these were perforce dispersed; two (3rd and 11th) were watching the coast on the Asiatic side, two (5th and 7th) were near Bulair to guard against a landing at the neck of the Gallipoli peninsula, while the remainder (9th and 19th) were disposed towards its southern end.

I. THE FIRST LANDINGS

The expeditionary force concentrated in Mudros bay, Lemnos, in the third week of April. Hamilton contemplated two distinct major operations to secure a footing on the Gallipoli peninsula. The 29th Div., supported by the Royal Naval Div., was to be put ashore at its extremity, an area which it is convenient to designate as Helles; the Australian and New Zealand Divs. under Sir W. Birdwood (*q.v.*) were to land north of Gaba Tepe, where there are extensive beaches. But part of the one available French division was furthermore to effect a descent at Kum Kale, opposite Helles, as a subsidiary operation, subsequently being transferred to Helles. After a short delay, enforced by bad weather, the armada put to sea during the nights of April 23–24 and 24–25, so that the transports and the covering warships should arrive at their various rendezvous at or before dawn on the 25th, and the day broke calm after a placid night.

Landing at Cape **Helles.**—Five points had been selected in the Helles area for attack. Enumerating from right to left the beaches were "S" in Morto bay, "V" and "W" on either side of Cape Helles, and "X" and "Y" on the outer shore. The attacks at "S" and "Y" were intended to be subsidiary; but great importance was attached to "W" and "V," as those two beaches offered the most suitable landing places from the point of view of subsequent operations. Owing to its vicinity to "W," "X" was calculated to play a very prominent part in the affair as a whole. Covered by the fire of battleships and cruisers, the troops started in flotillas of boats soon after dawn for all points, and, as it turned out, the actual disembarkations at "S," "X" and "Y" were carried out without any great difficulty. But at "W" the troops gained a footing only after incurring heavy loss, while at "V," where a large part of the landing force was carried in the steamer "River Clyde" which was run ashore, the effort nearly failed altogether. After hard fighting all day the position at nightfall was that the troops landed at "W" and "X" beaches had joined hands and that a battalion was established at "S," while the situation at "V" was critical, as also at "Y"; but during the night more troops were got ashore at "V," and those at "Y" were safely withdrawn and re-embarked next morning. Losses had been severe.



MAP SHOWING THE LANDING BEACHES S, V, W, X, Y, AT GALLIPOLI

Landing **at** Kum Kale.—In the meantime a French brigade had, after a tough struggle, effected a lodgement at Kum Kale (Qum Qal'e). The Turks were in strong force here, so that any advance by the French was out of the question, but their presence on the Asiatic side was being indirectly helpful to secure a footing on the further shore. Some little progress was made on the morrow in spite of determined resistance by the enemy, additional troops were landed, and during the night the French were withdrawn from Kum Kale and they were landed at "V" beach on the 27th. On that day the Allies' line was again advanced by a few hundreds of yards; but the Turks had received substantial reinforcements in this quarter, and but little ground was gained when Hamilton ordered a fresh attack on the 28th. The invaders had suffered very heavy losses during the initial landing and the subsequent strenuous encounters, and there were no reserves on the spot to fill the gaps that had been created in the ranks.

Landing **at Anzac.**—Birdwood's divisions had in the meantime effected a lodgement to the north of Gaba Tepe. The actual disembarkation had in this case been started before dawn on the 25th at a point about a mile and a half north of the Gaba Tepe promontory, and at a spot where the hills rose abruptly from the actual beach which came to be known as Anzac. A haphazard line on the heights immediately above the beach had been secured at once, the Turks being in weak force at the moment when the advanced parties of invaders reached the shore; but the defenders were able to hurry reinforcements to the point of danger and the actual area secured was of limited extent. Won practically at the first blow, it provided but a scanty water supply, it presented great inconveniences and its beach was much exposed in the event of bad weather setting in; it was but slightly extended during the following three months, for Liman von Sanders realized that owing to its proximity to the narrows of the Dardanelles, it represented a very serious danger to the Turks, and he took steps accordingly. Although the Ottoman troops delivered vigorous counter-attacks on the 26th, these were beaten off with loss to the assailants, and by the night of April 27–28 the position of which Birdwood had contrived to gain possession had come to be, tactically, fairly secure.

Hamilton thus gained a somewhat precarious footing at two points of the peninsula. But his two forces were some 15m. apart, and what amounted to little more than a patch of ground had been won in either case. His intentions were now completely exposed to the enemy, and the great advantage of surprise had passed away without his force having established itself in a dominating position capable of being turned to satisfactory account in subsequent operations. In both areas the Turks enjoyed the tactical command, they were at least equal in force to the Allies, their guns were able to bear with effect upon the beaches used as landing places and advanced bases, and, although at this time of the year the weather was generally calm, these beaches provided but inadequate facilities for the landing of ammunition, armament or stores.

Reinforcements.— Early in May the Allies' contingents planted in the Helles area were strengthened by the arrival of the British 42nd Div., an Indian brigade, and the French 2nd Division. Some ground was gained on May 6, and during the next day or two determined counter-attacks on the part of the enemy were effectually repulsed. The two French divisions were occupying the right of the line, next to the straits; and that arrangement held good up to the time when the Gallipoli peninsula was finally evacuated early in January in the following year. Both here and facing the Australasian troops at Anzac the Turks had dug themselves in, establishing elaborate defences, and trench warfare was becoming the order of the day.

During the month a state of stalemate set in, and although ground was gained by the Allies in attacks delivered in the Helles area on June 4, 21 and 28 and during the month of July the line was gradually pushed forward near Krithia, the situation was so unpromising that the British Government, decided to send five more divisions (10th, 11th, 13th, 53rd and 54th) to the Aegean. These arrived at the islands of Mytilene and Imbros during the closing days of July and the first days of August. Hamilton's artillery was at the same time strengthened, and his very inadequate ammunition supply somewhat improved. But Liman von Sanders was likewise receiving reinforcements, and, although the Ottoman maritime communications with the Gallipoli peninsula were from time to time imperilled by the submarines of the Allies, the relative strength of the two opposing armies facing each other in the theatre of war was not, as it turned out, greatly affected by the appearance of the fresh troops sent out from England to these waters. The Allies, in view of the coming of reinforcements, treated July as a month of preparation, although a general attack was delivered by them in the Helles area by which a little ground was gained. A few days later the first of the reinforcing divisions, the 13th, arrived and was landed at Helles as a temporary measure.

II. SARI BAIR AND SUVLA BAY

How to employ the fresh divisions coming out from home had to be decided by Hamilton. The French had from the outset favoured operations on the further side of the straits, and there was something to be said for such a plan of campaign. But a descent in that quarter must involve a disembarkation in face of opposition, the perils of which had been made apparent on April 25; moreover, granting the landing to be successful, the forces would start work much farther from the narrows of the Dardanelles, the objective, than were either Helles or Anzac. There were also not wanting inducements for the Allies to attempt a landing at Bulair, seeing that their presence at that point would carry with it the severance of the Turkish land communications with the peninsula. But this would likewise mean a landing in face of opposition; and the distance of Bulair from the Island of Imbros, the nearest base of operations for the peninsula, provided a strong argument, from the point of view of ship transport, against such an undertaking. Moreover, a landing either on the Asiatic side or at Bulair meant a dispersion of the Allies' forces as a whole, unless Helles or Anzac, or both of them, were to be abandoned; and the fact that the Ottoman commander-in-chief had to be prepared for his opponent adopting one of these two plans, offered a strong argument against selecting either of them, apart from any other considerations as to their tactical advantages or disadvantages.

British Plans.—Hamilton decided that his great effort should be made at, and immediately north of, Anzac. The rugged bluffs on which Birdwood's men had taken root since April were spurs of a tangled mountain mass known as Sari Bair, from the topmost ridges of which the narrows were visible four or five miles off; Anzac was, moreover, situated almost at the narrowest point of the peninsula. The plan was to reinforce Birdwood secretly by a division and a half (the 13th and part of the 10th) and that, thus strengthened, he should secure possession of Sari Bair by a night attack. A further force (the 11th Div. and the rest of the 10th) was on that same night to effect a landing at an entirely new point—Suvla bay—a few miles north of Anzac, where the Turks were known to be few. This force was to assist the troops attacking Sari Bair in due course; and the possession of Suvla bay would furnish troops ashore in and about this area with a much more sheltered landing place than the beaches about Anzac offered. The last divisions to arrive, the 53rd and 54th, were to be employed wherever should seem best after the offensive had begun; to land the whole of the reinforcements simultaneously would not have been practicable with the amount of water transport available.

The utmost secrecy was observed by the Allies' staff. Steps were taken to mislead the Ottoman authorities by means of feints and of reconnaissances executed at localities other than those selected for operations. False reports were circulated assiduously by the intelligence department. Liman von Sanders was well aware of the arrival of large bodies of British troops in the islands; but he remained in complete ignorance of his rival's real design until this was actually in course of execution. He had organized his forces as a southern group watching Anzac, while two divisions were retained near Bulair, where he was disposed to anticipate that the blow would fall. There were also large bodies of Turkish troops in reserve about Chanaq, and others about Kum Kale and Besika bay. Numerically the contending armies at this critical juncture were about equal, but the Turks were necessarily much dispersed, so that the result of the impending clash of arms really hinged upon the speed with which the attacking side should gain ground before the defenders had time to concentrate.

The Allies' offensive started on Aug. 6 with two preliminary enterprises. An onset was made upon part of the Turkish lines in the Helles area. Portions of Birdwood's force broke out of the southern end of the Anzac position and gained ground. But the real purpose of the two operations was to occupy the enemy's attention and to conceal a design of much greater moment.

Attack on Sari Bair.—So dexterously had the assembling of the reinforcements in the Anzac area been effected that the Turks were entirely unaware that Birdwood's army had been nearly doubled. The plan for gaining possession of the Sari Bair mountain was that several columns were to move out from the northern end of the Anzac position at nightfall on Aug. 6 and, on reaching their appointed stations, were to wheel to the right and to work their way in the dark up certain steep but well-defined gullies that led up to the summit. But although the Turks were to some extent surprised, and although the outlets of the gullies were in consequence in the assailants' hands by midnight, so stubborn a resistance was offered by the defenders that by daybreak the columns were not much more than half way up, and all attempts to win the upper ridges failed on the 7th in the face of the Turkish reinforcements.

After a rearrangement of the troops during the night the offensive was resumed on Aug. 8; but except at one point very little progress was made. After a fresh reorganization during the dark hours another effort was made on the gth, and on this occasion a small body of British and Indian troops actually fought their way to a commanding summit from which the narrows were seen, but they were driven off again. Next day the Turks, now in great force, counter-attacked and thrust those opposed to them back down the slopes all along the line, whereupon strenuous fighting ceased. Both sides had lost heavily, but victory for all practical purposes rested with the Osmanlis, even if the Anzac position had been extended considerably in a northerly direction as a result of the operations.

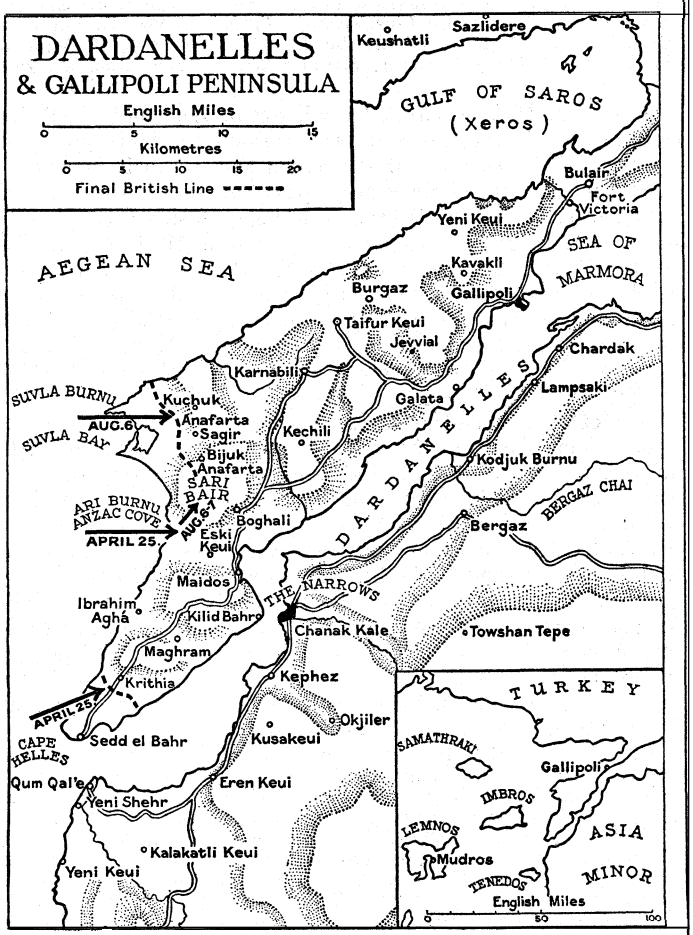
Landing at Suvla Bay.—Stirring events had in the meantime been taking place around Suvla bay. The troops detailed for the landing in this quarter belonged to the British "New Army"; they were not conversant with active service conditions, and they were being highly tried in being called upon to execute a landing in force at night in face of opposition. There was indeed no precedent for an undertaking of this kind under modern tactical conditions, but the Turks were known' not to be in sufficient strength to offer serious resistance. As it was, the whole of the 11th Div. was ashore before dawn; but the urgent need of pressing forward at once was not realized by the local commanders, and some confusion arose when the 10th Div. arrived and began to disembark. No organized advance in force took place until late in the afternoon, and at nightfall the attacking force had only reached the foot of the hills lying to the east of the landing places and captured one advanced spur. The troops had suffered greatly from thirst, the arrangements with regard to water having practically broken down, mainly owing to the inexperience of the troops themselves.

Attack in the Hills.—When Liman von Sanders learned during the night of Aug. 6–7 that the Allies were landing in force at Suvla and were attacking Sari Bair from Anzac, he ordered the two divisions at Bulair to proceed to Suvla with all speed. But this meant a two days' march along indifferent roads. Consequently there was still on Aug. 8 a great opening left for the attacking side to complete the first part of its programme; *i.e.*, to gain possession of the heights to the east of Suvla which dominated the landing places and a considerable area of level ground around Suvla bay. But no organized move took place. The opportunity was allowed to slip by, and that night Turkish reinforcements began to arrive from Bulair and to occupy the all-important high ground. Next morning the 10th and 11th Divs., supported in a measure by the 53rd Div., which had arrived during the night, advanced to the attack. But the effort failed, and when it was renewed on the following day the Turks had been so effectually reinforced. that the offensive enjoyed little chance of achieving success. That day, Aug. 9, was the last on which there remained any hope either of the Sari Bair offensive achieving success or of the Suvla force establishing itself in a satisfactory position. This force, however, made a fresh attempt on the 10th to wrest the heights in front of it out of Osmanli keeping; but this failed completely, and further offensives in this quarter were abandoned for the time being.

Hamilton's carefully devised scheme of offensive operations had in fact come to nought in its most important features. The determined effort to secure possession of Sari Bair had miscarried. A footing had, it is true, been gained at Suvla, giving the Allies control of a fairly well sheltered inlet on the outer coast of the peninsula; but as the high ground within easy artillery range of the landing places, which overlooked the whole occupied area, remained in the hands of the Turks, much of the benefit hoped for from its acquisition was neutralized. Only a restricted patch of Ottoman territory had in fact been occupied, thanks to the new undertaking, and although the position at Anzac had been extended and improved it remained a very bad one. The Allies now occupied many miles of front in the peninsula, but there was scarcely a spot where the enemy did not enjoy the advantage in respect to ground; what the attacking forces needed from the outset was depth rather than breadth, and depth they had failed to secure. They had, moreover, incurred very heavy losses during the succession of combats lasting from Aug. 6 to 10, and, except for a mounted division coming from Egypt to fight on foot, no reinforcements were on the way; the 54th Div. had already been swallowed up at Suvla. The defending side had also, no doubt, suffered heavily in casualties, notably on Sari Bair; but Liman von Sanders could fairly claim that, even if some valuable ground had been lost by the Turks, he had held his own in a contest in which his adversary had enjoyed the initiative and had been in a position to effect a surprise.

An effort was made by the troops on the extreme left of the

Allies' position at Suvla to gain ground along the ridge north of the Suvla plain on Aug. 15, but nothing came of it. Hamilton, however, did not despair of improving the situation in this area, so the mounted division from Egypt and another division from Helles were quietly concentrated there in support of the troops already on the spot, and on the 21st a determined attempt was made to capture some of the high ground which had baffled the



THE THREE THEATRES OF WAR ON THE GALLIPOLI PENINSULA: CAPE HELLES, ANZAC BEACH, AND SUVLA BAY

attempts of the invaders on the 9th and 10th. Large forces were engaged on either side in this battle, and the attack was prepared by a heavy bombardment of the Ottoman trenches, in which warships moored in Suvla bay, where they were secure from submarines, participated. But after a sanguinary encounter the assailants met with a decisive rebuff, and from that date onwards no serious offensive operation was attempted by the Allies in the Dardanelles campaign. The conditions of stalemate which had prevailed before the arrival of the five new divisions from England set in afresh and continued to the end.

As a consequence of the failure at Suvla during the early days of its occupation certain changes in command were carried out, Gen. Byng, especially sent out from home for the purpose, taking over command in this area. Gen. Davies was in command at Helles, and, as the right of the Suvla force was in touch with the left of the Anzac force in the low ground near the shore, Byng and Birdwood now held a continuous front extending from a point on the coast about 3m. N E. of Suvla bay near to Gaba Tepe, overlooked for practically the whole of its length by high ground in occupation of the Turks. Owing to the losses that had been suffered during the August combat and even before the final reverse of Aug. 21, Hamilton had cabled home asking for reinforcements and for the very large drafts needed to bring his depleted units up to their war establishment, amounting to a total of 95,000 men. He had, however, been informed that no large bodies of fresh troops could be spared for the Dardanelles theatre. A temporary change of plan did occur a few days later owing to a French proposal to despatch four divisions to the scene to operate on the Asiatic side of the straits, whereupon the British Government became disposed also to send fresh divisions.

III. EVENTS IN THE BALKANS AND EVACUATION

These projects were dropped early in September, owing very largely to the threatening aspect of affairs in the Balkans. *(See* SALONIKA CAMPAIGNS, SERBIAN CAMPAIGNS.)

The campaign by which the Central Powers and Bulgaria overwhelmed the Serbians for the time being, and by which direct communications were opened through Bulgaria between Austria-Hungary and the Ottoman empire, profoundly influenced the situation in the Gallipoli peninsula to the disadvantage of the Allies. Not only was all idea of reinforcing the Allied army that was planted in this region abandoned, but some of Hamilton's troops had before long been transferred to Salonika. The linking up of Turkey with the Central Powers by railway, moreover, connoted that Liman von Sanders would speedily be furnished with ample munitions of all kinds, which would make the prospect of Anglo-French forces gaining possession of the straits remoter than ever.

Withdrawal Discussed.—By the middle of September the Paris Government had come to the conclusion that there was now no hope of victory in the Dardanelles theatre; but the British cabinet, influenced by anxiety as regards prestige in the East and by disinclination to abandon an enterprise in which great sacrifices had been incurred and from which much had at one time been expected, could not make up its mind to cut losses and to withdraw. On Hamilton being asked to give his views concerning the question of evacuation, he pronounced himself as emphatically opposed to such a step, so Sir C. Monro was sent out from England to take his place. The new commander-in-chief, impressed by the very unsatisfactory positions occupied by the Allied troops, by the impossibility of their making any progress at their existing strength, and by the risks that the army ran by clinging to such a shore without any safe harbour to depend upon for base in stormy weather, declared unhesitatingly in the closing days of October for a complete withdrawal after examining the situation on the spot and consulting with Birdwood, Byng and Davies.

The British cabinet would not accept the recommendation, and sent Lord Kitchener to investigate and report. He had viewed proposals to abandon the campaign with alarm; but after visiting the peninsula he realized that evacuation was the only justifiable course. and reported to that effect. All this time winter was drawing nearer and the need for a prompt decision was becoming more and more urgent, but the authorities in London lost another fortnight before, on Dec. 8, they at last sent instructions to Monro to withdraw from Suvla and Anzac, while retaining Helles.

Evacuation of Suvla Bay and Anzac.—Anticipating orders to this effect, Monro had already made certain preparations for evacuation, and, as he was also responsible for the British forces at Salonika, had placed Birdwood in command, Gen. Godley relieving Birdwood at Anzac. It was recognized that the withdrawal of the vast accumulation of stores about the beaches, and also of the bulk of the actual troops, must be carried out gradually on successive nights, and this process was at once set on foot both at Suvla and at Anzac. The decision come to as to the final stage of the operation was that the front trenches should be held up to the last on the night of definite evacuation, and that the troops manning them should hasten straight to the beaches, everything removable having already been embarked; at a given moment the trenches (which at many points were but a few yards from those occupied by the Turks) would be vacated by detachments which by that hour would have shrunk to mere handfuls of men. The final night was provisionally fixed as that of Dec. 18–19, and, thanks to favourable weather and to the efficiency of the arrangements, the very critical undertaking was carried out with triumphant success just as had been laid down by programme ten days before. Night after night the landing places were scenes of

unceasing activity as war material, food supplies, animals and finally large bodies of troops, were got away. During the daytime reliefs took place as usual, pretences were made of landing stores and animals, and the result was that the Turks remained in complete ignorance of what was passing close to their lines. On Dec. 18 only a meagre force, composed almost entirely of infantry and disposed almost entirely in the front trenches, was holding a front of 10m. face to face with an enemy incomparably stronger in numbers.

At nightfall the very few guns not yet withdrawn were hurried off to the jetties; then the troops along the front were quietly withdrawn by successive detachments; finally the parties still in the trenches slipped away; and when dawn broke the Turks discovered that the invaders were gone. Practically nothing worth mentioning had been left behind at Suvla, and at Anzac, where conditions were more difficult, only a very few worn-out guns had to be abandoned and some valuable war material destroyed. The relaxing by the Allies of their frail hold upon a strip of the outer coast-line of the Gallipoli peninsula had been effected more successfully than the most sanguine amongst them had permitted themselves to hope.

Yet, for a week subsequent to the good news reaching them, the British Government remained irresolute with regard to the policy to be pursued at Helles. Then, however, Monro received the expected sanction for evacuating that area likewise, and Birdwood promptly grappled with this fresh problem, a problem rendered more difficult than the last owing to Liman von Sanders having full warning of what might be expected and, moreover, now enjoying an enormous preponderance ih force. He had 21 divisions available, while there were only four left to oppose him.

Evacuation of Cape Helles.—The same principles as had been adopted by Byng and Godley at Suvla and Anzac were put in practice at Helles, the withdrawal of stores, war material, animals and personnel being carried out on successive nights. While the front trenches were to be held up to the last, the fighting force ashore was to be gradually reduced, and the detachments holding the front trenches were at the given hour on the last night, fixed provisionally for that of Jan. 8–9, to vacate them and hurry straight off to the beaches. But the weather was none too favourable on several of the preliminary nights, and the enemy's guns gave a good deal of trouble on the beaches, causing many casualties. The Turks were aware that a withdrawal was gradually being carried out; but they could not tell which would be the final night, nor could they make sure how far the number of combatants within the British lines had been reduced. So, with the intention of ascertaining the strength of their opponents, on Jan. 7 they delivered a half-hearted attack upon the left of the British position. This was beaten off, and they came to the mistaken conclusion that the final evacuation was not imminent.

Shortly after dark set in on the night of Jan. 8–9 the wind rose ominously. Nevertheless the guns remaining to be embarked were got off, the infantry followed, and the last detachments quitted the front trenches at 11.45 P.M., without the Turks noting their departure. But when they reached the shore it was found, in the case of those detailed for Gully Beach, that embarkation there was impracticable; so these had to march to "W" Beach and they were not afloat till after 4 A.M., only being got off with great difficulty owing to the surf. Several worn-out guns had been intentionally left behind, besides much ordnance material and foodstuff; but practically all of this was rendered unserviceable, for, just as the last boats were lowered off, the masses of stores were set on fire, and only then did the Turks discover that their opponents had evaded them a second time. The withdrawal from Helles had been a masterly military and naval achievement.

IV. CONCLUSIONS

Most authorities on war agree that the failure of the Allies in this memorable campaign was primarily due to the abortive naval effort to force the Dardanelles. This gave the Turk such warning of what was in store that, when Hamilton's army was ready to land, the defenders were in a position to bring it at once to a standstill. The only chance of success after that lay in very substantial reinforcements reaching the scene promptly. But neither the British nor the French would divert the requisite military resources from the main theatre of war at the moment, and when some additional troops were sent later, their numbers were insufficient and it was too late.

(C. E. C.)

DARDANUS, in Greek legend, son of Zeus and the Pleiad Electra, mythical founder of Dardanus on the Hellespont and ancestor of the Dardans of the Troad and, through Aeneas, of the Romans. His original home was supposed to have been Arcadia. Having slain his brother Iasius or Iasion (according to some legends, Iasius was struck by lightning), Dardanus fled across the sea. He first stopped at Samothrace, and, when the island was visited by a flood, crossed over to the Troad. Being hospitably received by Teucer, he married his daughter Batea and became the founder of the royal house of Troy.

See articles in Pauly-Wissowa's *Realencyklopadie* and Roscher's *Lexikon der Mythologie.*

DARDIC LANGUAGES, the name of a family of languages spoken immediately to the south of the Hindu Kush, and north of the frontier of British India, includes the group of Kiifir languages spoken in Kafiristiin, Khowar, spoken in the Chitral country, and the group of Shin5 languages, which includes the Shin5 of Gilgit, Kōhistānī, spoken in the Kohistans of the Indus and Swat rivers, and Kashmiri. Of all these Kashmiri is the only one which has received any literary cultivation. The Dardic languages are Aryan by origin, but are neither Iranian nor Indo-Aryan. They have developed phonetic peculiarities, and possess almost unaltered and in common use words which in India are seldom found except in Vedic Sanskrit. In each there is a small but unimportant element of Burushaski (*q.v.*)

BIBLIOGRAPHY.—For the general question of the Dardic languages, *see* G. A. Grierson's *The Piśāca Languages of North-western India* (1906); *Linguistic Survey of India,* vol. viii. pt. ii. For the different languages of this group *see* G. W. Leitner, *Dardistan* (Lahore, 1877); J. Biddulph, *Tribes of the Hindoo Koosh* (Calcutta, 1880); D. J. O'Brien, *Grammar and Vocabulary of the Khowār Dialect* (Lahore, 1895); J. Davidson, *Notes on the Bashgali (Kāfir) Language* (Calcutta, 1901); G. Morgenstierne, *Report on a Linguistic Mission to Afghanistan* (Oslo, 1926). *(See* also INDO-ARYAN LANGUAGES and KASHMIRI.)

DARDISTAN, a conventional name for a tract of country on the north-west frontier of India. It comprises the whole of Chitral, Yasin, Panyal, the Gilgit valley, Hunza and Nagar, the Astor valley, the Indus valley from Bunji to Batera, the Kohistan-Malazai, *i.e.,* the upper reaches of the Panjkora river, and the Kohistan of Swat. The so-called Dard races are referred to by Pliny and Ptolemy, and are supposed to be a people of Aryan origin who ascended the Indus valley from the plains of the Punjab, reaching as far north as Chitral, where they dispossessed the Khos. They have left their traces in the different dialects, Khoswar, Burishki and Shina, spoken in the Gilgit agency.

DARES PHRYGIUS, according to Homer *(Iliad,* v. 9) a Trojan priest of Hephaestus. He was supposed to have been the author of an account of the destruction of Troy, and to have lived before Homer (Aelian, *Var. Hist.* xi. 2). A work in Latin, purporting to be a translation of this and entitled *Daretis Phrygii de excidio Troiae historia,* was much read in the middle ages and was then ascribed to Cornelius Nepos; but the language is corrupt, and the work belongs to a period much later than the time of Nepos (probably the 5th century A.D.). It is doubtful whether the work as we have it is an abridgment of a Latin work or an adaptation of a Greek original. Together with the similar work of Dictys Cretensis (with which it is generally printed) the *De excidio* forms the chief source for the numerous middle age accounts of the Trojan legend. *(See* DICTYS CRETENSIS; and O. S. von Fleschenberg, *Daresstudien,* 1908.)

DAR-ES-SALAAM, a seaport of East Africa, in 6° 50′ S., 39° 20′ E., capital of Tanganyika Territory. Pop. (1927) about

25,000, including some 600 Europeans and 4,500 Asiatics. The harbour is small but perfectly sheltered (hence its name); the entrance to it is through a narrow opening in the palm-covered shore. The depth of water at the entrance is from 20 to 34 ft. according to the tides. Since 1927 a wharf 300 ft. long has been made where ships can berth. A railway (built 1905–1914), starting from the harbour, goes via Tabora to Kigoma-Ujiji on Lake Tanganyika, a distance of 772 miles.

In 1862 Sayyed Majid, sultan of Zanzibar, decided to build a town on the shores of the bay, and began the erection of a palace, which was never finished. In 1871 Majid died, and his scheme was abandoned. In 1876, the construction of a road from the harbour to Victoria Nyanza was begun. The project failed, but in 1928 the port came into railway connection with Victoria Nyanza by the completion of the Tabora-Mwanza line. In 1887 Carl Peters occupied the bay for the German East Africa Company and in 1891 Dar-es-Salaam was made the administrative centre for German East Africa. A town was laid out on an ambitious scale, and it has fine buildings and a good botanical garden; the native quarter is distinct from that of the Europeans. Dar-es-Salaam was occupied by the British forces in 1916; the wireless station was destroyed in 1914.

DARESTE DE LA CHAVANNE, CLEOPHAS (1820–1882), French historian, was born in Paris. Educated at the École des Chartes, he became professor in the faculty of letters at Grenoble in 1844, and in 1849 at Lyons, where he remained nearly 30 years. His works comprise: *Histoire* de *l'administration en* France *depuis Philippe-Auguste* (2 vols., 1848), and a *Histoire* de France (8 vols., 1865–73), completed by a *Histoire* de la Resfauration (2 vols., 1880), and by a *Histoire* du Gouvernement de *Juillet,* a dry enumeration of dates and facts. Before the publication of Lavisse's great work, Dareste's general history of France was the best of its kind.

DARFUR, a semi-independent kingdom of east central Africa. the westernmost province of the Anglo-Egyptian Sudan. It extends from about 10° N. to 16° N. and from 21° E. to 27° 30′ E., has an area of some 150,000 sq.m., and an estimated population of 750,000. It is bounded north by the Libyan desert, west by Wadai (French Congo), south by the Bahr-el-Ghazal and east by Kordofan. The two last-named districts are *mudirias* (provinces) of the Anglo-Egyptian Sudan. The greater part of the country is a plateau from 2,000 to 3,000 ft. above sea-level. A range of mountains of volcanic origin, the Jebel Marra, runs north and south about the line of the 24" E., and forms the watershed between the basins of the Nile and Lake Chad. About 100 m. long and 80 m. thick, its highest points attain from 5,000 to 6,000 ft. Eastward the mountains fall gradually into sandy, bush-covered steppes. North-east of Jebel Marra lies the Jebel Medob (3.500 ft. high), a range much distorted by volcanic action. and Bir-el-Melh, an extinct volcano with a crater 150 ft. deep. South of Jebel Marra are the plains of Dar Dima and Dar Uma; south-west of the Marra the plain is 4,000 ft. above the sea. The mountains are scored by numerous *khors,* whose lower courses across the tableland represent the beds of former rivers, now dry except when scoured by torrents in the rainy season. In the west and south water can always be obtained in the dry season by digging 5 or 6 ft. below the surface of the khors.

The climate, except in the south, where the rains are heavy and the soil is a damp clay, is healthy except after the rains. The rainy season lasts for three months, from the middle of June to the middle of September. In the neighbourhood of the khors the vegetation is fairly rich. The chief trees are the acacias whence gum is obtained, and baobab (Adansonia digitata); while the sycamore and, in the Marra mountains, the *Euphorbia* candelabrum are also found. In the southwest are densely forested regions. Cotton and tobacco are indigenous. The most fertile land is found on the slopes of the mountains, where wheat, durra, *dukhn* (a kind of millet and the staple food of the people) and other grains are grown. Other products are sesame, cotton, cucumbers, water-melons and onions.

Copper is obtained from I-Iofrat-el-Nahas in the south-east, iron is wrought in the south-west; and there are deposits of rock-salt in various places. Camels and cattle are both numerous and of excellent breeds. Horses are comparatively rare; they are a small but sturdy breed. Sheep and goats are numerous. The ostrich, common in the eastern steppes, is bred by various Arab tribes, its feathers forming a valuable article of trade.

Inhabitants. — The population of Darfur consists of negroes and Arabs. The negro For, forming quite half the inhabitants, occupy the central highlands and part of the Dar Dima and Dar Uma districts; they speak a special language, and are subdivided into numerous tribes, of which the most influential are the Masabat, the Kunjara and the Kera. The *Massalit* are a negro tribe which, breaking off from the For some centuries back, have now much Arab blood, and speak Arabic; while the *Tunjur* are an Arab tribe which have incorporated a large For element, and no longer profess Mohammedanism. The Dago (Tago) formerly inhabited Jebel Marra, but they have been driven to the south and west, where they maintain a certain independence in Dar Sula. Genuine Arab tribes, *e.g.,* the Baggara and Homr, are numerous, and they are partly nomadic and partly settled. The Arabs have not, generally speaking, mixed with the negro tribes. They are great hunters, making expeditions into the desert for five or six days at a time in search of ostriches.

Slaves, ostrich feathers, gum and ivory used to be the chief articles of trade, a caravan going annually by the Arbain ("Forty Days") road to Assiut in Egypt and taking back cloth, fire-arms and other articles. The slave trade has ceased, but feathers, gum and ivory still constitute the chief exports of the country. The principal imports are cotton goods, sugar and tea. There is also an active trade in camels and cattle.

The internal administration of the country is in the hands of the sultan, who is officially recognized as the agent of the Sudan government.

The capital and residence of the sultan is El-Fasher (pop. about 10,000), on the western bank of the Wadi Tendelty. There are a few fine buildings, but the town consists mainly of tukls and box-shaped straw sheds. It is 500 m. W.S.W. of Khartum. Dara, a small market town, is 110 m. S. of El-Fasher. Shakka is in the S.E. of the country near the Bahr-el-Homr, and was formerly the headquarters of the slave dealers.

History. — The Dago or Tago negroes, inhabitants of Jebel Marra, appear to have been the dominant race in Darfur in the earliest period to which the history of the country goes back. How long they ruled is uncertain, little being known of them save a list of kings. According to tradition the Tago dynasty was displaced and Mohammedanism introduced, about the 14th century, by Tunjur Arabs, who reached Darfur by way of Bornu and Wadai. The first Tunjur king was Ahmed-el-Makur, who married the daughter cf the last Tago monarch. His great-grandson, the sultan Dali, a celebrated figure in Darfur histories, was on his mother's side a For, and thus was effected a union between the negro and Arab races. Dali divided the country into provinces, and established a penal code, which, under the title of Kitab *Dali* or Dali's Book, is still preserved, and shows principles essentially different from those of the Koran. His grandson Soleiman (usually distinguished by the Forian epithet Solon, the Arab or the Red) reigned from 1596 to 1637, and was a great warrior and a devoted Mohammedan. Soleiman's grandson, Ahmed Bahr (1682–1722), made Islam the religion of the State, and increased the prosperity of the country by encouraging immigration from Bornu and Bagirmi. His rule extended east of the Nile as far as the banks of the Atbara. Under succeeding monarchs the country, involved in wars with Sennar and Wadai, declined in importance.

In 1799 Abd-er-Rahman, the then reigning sultan, wrote to congratulate General Bonaparte on his defeat of the Mamelukes in Egypt. To this Bonaparte replied by asking the sultan to send him by the next caravan 2,000 black slaves upwards of 16 years old, strong and vigorous. To Abd-er-Rahman likewise is due the present situation of the *Fasher,* or royal township. The capital had formerly been at a place called Kobbé. Mohammed-el-Fadhl, his son, whose reign lasted till 1839, devoted himself largely to the subjection of the semi-independent Arab tribes who lived in the country. In 1821 he lost the province of Kordofan to the

Egyptians. Of his 40 sons, the third, Mohammed Hassin, was appointed his successor. In the later part of his reign Hassin became involved in trouble with the Arab slave raiders who had seized the Bahr-el-Ghazal, looked upon by the Darfurians as their especial "slave preserve." The negroes of Bahr-el-Ghazal paid tribute of ivory and slaves to Darfur, and these were the chief objects of merchandise sold by the Darfurians to the Egyptian traders along the Arbain road to Assiut. Hassin died in 1873, blind and advanced in years, and the succession passed to his youngest son Ibrahim, who soon found himself engaged in a conflict with Zobeir (*q.v.*), the chief of the Bahr-el-Ghazal slave traders, and with an Egyptian force from Khartoum. The war resulted in the destruction of the kingdom. Ibrahim was slain in battle in the autumn of 1874, and his uncle Hassab Alla, who sought to maintain the independence of his country, was captured in 1875 by the troops of the khedive, and removed to Cairo with his family. The Darfurians were restive under Egyptian rule. Various revolts were suppressed, and in 1881 Slatin Bey (Sir Rudolf von Slatin) was made governor of the province. Slatin defended the province against the forces of the Mahdi, but was obliged to surrender (Dec. 1883), and Darfur was incorporated in the Mahdi's dominions. Following the overthrow of the khalifa at Omdurman in 1898 the new (Anglo-Egyptian) Sudan government recognized (1899) Ali Dinar, a grandson of Mohammed-el-Fadhl, as sultan of Darfur. A rising attempted by Ali Dinar in 1915 necessitated a punitive expedition in which he was killed (Nov. 1916), and Darfur then became in effect a Sudan province.

The first European traveller known to have visited Darfur was William George Browne (*q.v.*), who spent two years (1793–95) at Kobbé. Gustav Nachtigal in 1873 spent some months in Darfur, and since that time the country has become well known through the journeys of Gordon, Slatin and others.

BIBLIOGRAPHY.—Browne's account of Darfur will be found in his *Travels in Africa, Egypt and Syria* (1799); Nachtigal's *Sahara und Sudan* gives the results of that traveller's observations. The first ten chapters of Slatin Pasha's book *Fire and Sword in the Sudan* (English edition, 1896) should be consulted. *See* also *The Anglo-Egyptian Sudan* (1905), edited by Lord Edward Gleichen, and the bibl. under SUDAN.

DARGAI. (1) Mountain ridge of the Samana range, on the Kohat border, famous for the stand made there by the Afridis and Orakzais in the Tirah Campaign, 1897. (*See* TIRAH CAMPAIGN.) (2) The terminus, on the Peshawar border, of the frontier railway running from Nowshera to the foot of the Malakand pass.

Attack on Dargai (1897).—During the British advance through Tirah in 1897 two attacks were made on the Dargai ridge, the first on Oct. 18, and the second on the 20th. The first failed; the second succeeded through British pluck, in spite of its tactics being of the meanest order.

Dargai is a spur of the Samana range of hills which flanks the Kuram valley, north of Thal, Shinawari and Hangu. It is clearly visible from near Fort Gulistan, whence on the 20th, it was seen that the tribesmen were holding the ridge in strength, and were throwing up sangars (stone breastworks). Major-General Yeatman-Biggs decided to take the position by a frontal attack, and though he had 24 guns at his disposal no attempt was made to concentrate their fire on the tribesmen. The result was that the attack was brought to a standstill by a hail of bullets, and a second one had to be mounted. More wisdom was then displayed, the guns being ordered to bombard the position for three minutes prior to the assault. This bombardment demoralized the tribesmen, and the position was carried. The British losses were 37 officers and other ranks killed, and 156 wounded. The bulk of these losses could have been avoided had it at first been realised that frontal attacks must be prepared by gun-fire.

See C. E. Callwell, *Tirah,* (1897); H. D. Hutchinson, *The Campaign in Tirah 1897–98,* (1898); L. J. Shadwell, *Lockhart's Advance Through Tirah,* (1898).

DARGOMIJSKY, ALEXANDER SERGEIVICH (1813–1869), Russian composer, was born at Tula on Feb. 14, 1813, and educated in St. Petersburg (Leningrad). He was already known as a talented musical amateur when in 1833 he met Glinka and was encouraged to devote himself to composition. His light opera *Esmeralda* was written in 1839, and his *Roussalka* was performed in 1856; but he had small success or recognition either at home or abroad, except in Belgium, till the '60s, when he became one of Balakirev's circle. His opera *The Stone Guest* then became famous among the progressive Russian school, though it was not performed till 1872. Dargomijsky died at St. Petersburg (Leningrad) on Jan. 17, 1869. His compositions include a number of songs and some orchestral pieces.

DARGU: *see* NUBA.

DARIAL, a gorge in the Caucasus, on the east of Mt. Kasbek, pierced by the river Terek for 8 m. between vertical walls of rock (5,900 ft.). It is mentioned in the Georgian annals, by Strabo and by Ptolemy. Being the only available passage across the Caucasus, it has been fortified at least since 150 B.C. In Russian poetry it has been immortalized by Lermontov. The present Russian fort, Darial, which guards this section of the Georgian military road, is at the northern issue of the gorge, at an altitude of 4,746 feet.

DARIEN, a district covering the eastern part of the isthmus joining Central and South America. It is mainly within the republic of Panamá, and gives its name to a gulf of the Caribbean sea. Darién is of great interest in the history of geographical discovery. It was reconnoitred in the first year of the 16th century by Rodrigo Bastidas of Seville; and the first settlement was Santa Maria la Antigua, situated on the small Darién river, northwest of the mouth of the Atrato. In 1513 Vasco Nuñez de Balboa stood "silent upon a peak in Darién," and saw the Pacific at his feet stretching inland in the Gulf of San Miguel; and for long this narrow neck of land seemed alternately to proffer and refuse a means of transit between the two oceans. The first serious attempt to turn the isthmus to permanent account as a trade route dates from the beginning of the 18th century, and forms an interesting chapter in Scottish history. In 1695 an act was passed by the Scottish parliament giving extensive powers to a company trading to Africa and the Indies; and this company, under the advice of one of the most remarkable economists of the period, William Paterson (*q.v.*), determined to establish a colony on the isthmus of Darién midway between Porto Bello and Cartagena, two of Spain's strongholds, and to gain a free trade route to the Pacific "whereby to Britain would be secured the key to the universe, enabling their possessors to give laws to both oceans and to become the arbiters of a commercial world." On July 26, 1698 the pioneers set sail from Leith amid the cheers of an almost envious multitude; and on Nov. 4, with the loss of only 15 out of 1,200 men, they arrived at Darién, and took up their quarters in a well-defended spot, with a good harbour and excellent outlook. The country they named New Caledonia, and two sites selected for future cities were designated respectively New Edinburgh and New St. Andrews. At first all seemed to go well; but by and by lack of provisions, sickness and anarchy reduced the settlers to the most miserable plight; and in June 1699 they re-embarked in three vessels, a weak and hopeless company. Meanwhile, a supplementary expedition had been prepared in Scotland; two vessels were despatched in May, and four others followed in August. But this venture proved even more unfortunate than the former. The last addition to the settlement was the company of Capt. Alexander Campbell of Fonab, who arrived only to learn that a Spanish force of 1,500 or 1,600 men lay encamped at Tubacanti, on the river Santa Maria, waiting for the appearance of a Spanish squadron in order to make a combined attack on the fort. Campbell was at first successful in a surprise attack but after the arrival of the Spanish fleet the garrison was forced to capitulate, and Darién colony was no more. Of those who had taken part in the enterprise only a miserable handful ever reached their native land.

See J. S. Barbour, *A History of William Paterson and the Darien Company* (1907); A. H. Varrill, *Panama, Past and Present* (1921); E. Cullen, *Isthmus of Darien Ship Canal* etc. (2d. ed, 1853); J. H. Burton, *The Darien Papers* (1849); and G. P. Insh, *Papers Relating to the Ships and Voyages of the Company of Scotland Trading to Africa and the Indies* (1924).

DARÍO, RUBEN (1867–1916), South American poet, was born at Metapa (Nicaragua), and came to Madrid in 1892. In

his *Prosas profanas* (1899) he revealed himself a symbolist; then, throwing off every trammel, ardent in the pursuit of all that was rare and new and beautiful, he astonished the Spanish-speaking world by his *Canto a la Argentina y otros Poemas* (1900), *Cantos de Vida y Esperanza* (1905), and *Canto errante* (1907). Heedless of rules and schools, Dario followed his own path, trying the boldest innovations, especially in metre. His experiments were not always successful, nor did he succeed in founding a school, but he has left his mark on Castilian verse, infusing into it new life and enlarging its traditional forms. He writes a nervous prose in such works as *Los Raros* (1893), *Tierras solares* (1904) and *Todo al Vuelo* (1912).

DARIUS, the name of three Persian kings (Pers. *Darayavaush;* Old Test. *Daryavesh).*

1. DARIUS *THE* GREAT, the son of Hystaspes (*q.v.*). The principal source for his history is his own inscriptions, especially the great inscription of Behistun (*q.v.*), in which he relates how he gained the crown and put down the rebellions. In modern times his veracity has often been doubted, but without any sufficient reason; the whole tenor of his words shows that we can rely upon his account. The accounts given by Herodotus and Ctesias of his accession are in many points evidently dependent on this official version with many legendary stories interwoven, *e.g.,* that Darius and his allies left the question as to which of them should become king to the decision of their horses, and that Darius won the crown by a trick of his groom.

Darius belonged to a younger branch of the royal family of the Achaemenidae. When, after the suicide of Cambyses (March 521), the usurper Gaumata ruled undisturbed over the whole empire under the name of Bardiya (Smerdis), son of Cyrus, and no one dared to gainsay him, Darius, "with the help of Ahuramazda," attempted to regain the kingdom for the royal race. His father Hystaspes was then alive but evidently had not the courage to urge his claims. Assisted by six noble Persians, whose names he proclaims at the end of the Behistun inscription, he surprised and killed the usurper in a Median fortress (Oct. 521; for the chronology of these times *cf.* E. Meyer, *Forschungen zur aiten Geschichte,* ii. 472 ff.), and gained the crown. But this sudden change was the signal for an attempt on the part of all the eastern provinces to regain their independence. In Susiana, Babylon, Media, Sagartia, Margiana, usurpers arose, pretending to be of the old royal race, and gathered large armies around them; in Persia itself Vahyazdata imitated the example of Gaumata and was acknowledged by the majority of the people as the true Bardiya. Darius, with only a small army of Persians and Medes and some trustworthy generals, overcame all difficulties, and in 520 and 519 all the rebellions were put down (Babylon rebelled twice, Susiana even three times), and the authority of Darius was established throughout the empire.

Darius in his inscriptions appears as a fervent believer in the true religion of Zoroaster. But he was also a great statesman and organizer. The time of conquests had come to an end; the wars which Darius undertook, like those of Augustus, only served the purpose of gaining strong natural frontiers for the empire and keeping down the barbarous tribes on its borders. Thus Darius subjugated the wild nations of the Pontic and Armenian mountains and extended the Persian dominion to the Caucasus; for the same reasons he fought against the Sacae and other Turanian tribes. But by the organization which he gave to the empire he became the true successor of the great Cyrus. His organization of the provinces and the fixing of the tributes are described by Herodotus iii. 90 ff., evidently from good official sources. He fixed the coinage and introduced the gold coinage of the Daric (which is not named after him, as the Greeks believed, but derived from a Persian word meaning "gold"; in Middle Persian it is called *zarig*). He tried to develop the commerce of the empire and sent an expedition down the Kabul and the Indus, led by the Carian captain Scylax of Caryanda, who explored the Indian Ocean from the mouth of the Indus to Suez. He dug a canal from the Nile to Suez, and, as the fragments of a hieroglyphic inscription found there show, his ships sailed from the Nile through the Red Sea by Saba to Persia. He had connections with Carthage (*i.e.,* the *Karka* of the Nakshi Rustam inscr.), and explored the shores of Sicily and Italy. At the same time he attempted to gain the good will of the subject nations, and for this purpose promoted the aims of their priests. He allowed the Jews to build the Temple of Jerusalem. In Egypt his name appears on the temples which he built in Memphis, Edfu, and the Great Oasis. He called the high-priest of Saïs, Uzahor, to Susa (as we learn from his inscription in the Vatican), and gave him full powers to reorganize the "house of life," the great medical school of the temple of Sais. In the Egyptian traditions he is considered as one of the great benefactors and lawgivers of the country (Herod. ii. 110, Diod. i. 95). He stood in similar relations to the Greek sanctuaries (*cf.* his rescript to "his slave" Godatas, the inspector of a royal park near Magnesia, on the Maeander, in which he grants freedom of taxes and forced labour to the sacred territory of Apollo. *See* Cousin and Deschamps, *Bulletin de corresp. hellén.,* xiii. (1889), 529, and Dittenberger, *Sylloge inscr. graec.,* 2); all the Greek oracles in Asia Minor therefore stood on the side of Persia in the Persian wars and admonished the Greeks to attempt no resistance. Even Delphi was not entirely free from the taint of Medism.

About 512 Darius undertook a war against the Scythians. A great army crossed the Bosporus, subjugated eastern Thrace, and crossed the Danube. The purpose of this war can only have been to attack the nomadic Turanian tribes in the rear and thus to secure peace on the northern frontier of the empire. It was based upon a wrong geographical conception; even Alexander and his Macedonians believed that on the Hindu Kush (which they called Caucasus) and on the shores of the Jaxartes (which they called Tanais, *i.e.,* Don) they were quite near to the Black Sea. Of course the expedition undertaken on these grounds could not but prove a failure; having advanced for some weeks into the Russian steppes, Darius was forced to return. The details given by Herodotus (according to him Darius had reached the Volga!) are quite fantastical; and the account which Darius himself had given on a tablet, which was added to his great inscription in Behistun, is destroyed with the exception of a few words. (*See* R. W. Macan, *Herodotus,* vol. ii. appendix 3; G. B. Grundy, *Great Persian War,* pp. 48–64; J. B. Bury in *Classical Review,* July 1897.)

Although European Greece was intimately connected with the coasts of Asia Minor, and the opposing parties in the Greek towns were continually soliciting his intervention, Darius did not meddle with their affairs. The Persian wars were begun by the Greeks themselves. The support which Athens and Eretria gave to the rebellious Ionians and Carians made an attempt to punish them inevitable as soon as the rebellion had been put down. But the first expedition, that of Mardonius, failed on the cliffs of Mt. Athos (492), and the army which was led into Attica by Datis in 490 was beaten at Marathon. Before Darius had finished his preparations for a third expedition an insurrection broke out in Egypt (486). In the next year Darius died, probably in Oct. 485, after a reign of 36 years. He was one of the greatest rulers the East has produced.

2. DARIUS II., OCHUS. Artaxerxes I., who died in the beginning of 424, was followed by his son Xerxes II. But before two months had elapsed he was murdered by his brother Secydianus, or Sogdianus (the form of the name is uncertain). Against him rose a bastard brother, Ochus, satrap of Hyrcania, who after a short fight killed him and suppressed by treachery the attempt of his own brother Arsites to imitate his example (Ctesias *ap. Phot.* 44; Diod. xii. 71, 108; Pausan. vi. 5, 7). Ochus adopted the name Darius (in the chronicles called *Nothos,* the bastard). Neither Xerxes II. nor Secydianus occurs in the dates of the numerous Babylonian tablets from Nippur; here the dates of Darius II. follow immediately on those of Artaxerxes I. Of Darius II.'s reign we know very little (a rebellion of the Medes in 409 is mentioned in Xenophon, *Hellen* i. 2. 19), except that he was quite dependent on his wife Parysatis. In the excerpts from Ctesias some harem intrigues are recorded, in which he played a disreputable part. As long as the power of Athens remained intact he did not meddle in Greek affairs; even the support which the Athenians in 413 gave to the rebel Amorges in Caria would not have roused him (Andoc. iii. 29; Thuc. viii. 28, 54; Ctesias wrongly names his father Pissuthnes in his stead; an account of these wars is contained in

the great Lycian stele from Xanthus in the British Museum), had not the Athenian power broken down in the same year before Syracuse. He gave orders to his satraps in Asia Minor, Tissaphernes and Pharnabazus, to send in the overdue tribute of the Greek towns and to begin war with Athens; for this purpose they entered into an alliance with Sparta. In 408 he sent his son Cyrus to Asia Minor to carry on the war with greater energy. In 404 he died after a reign of 19 years, and was followed by Artaxerxes II.

3. DARIUS III., CODOMANNUS. The eunuch Bagoas (*q.v.*), having murdered Artaxerxes III. in 338 and his son Arses in 336, raised to the throne a distant relation of the royal house, whose name, according to Justin x. 3, was Codomannus, and who had excelled in a war against the Cadusians (*cf.* Diod. xvii. 5 ff., where his father is called Arsames, son of Ostanes, a brother of Artaxerxes). The new king, who adopted the name of Darius, noted the fate of his predecessors and saved himself from it by forcing Bagoas to drink the contents of the cup himself. In 336 Philip II. of Macedon had sent an army into Asia hfinor and in the spring of 334 the campaign of Alexander began. In the following year Darius himself took the field against the Macedonian king, but was beaten at Issus and in 331 at Arbela. In his flight to the east he was deposed and killed by Bessus (July 330).

The name Darius was also borne by many later dynasts of Persian origin, among them kings of Persis (*q.v.*), Darius of Media Atropatene who was defeated by Pompeius, and Darius, king of Pontus in the time of Antony. (ED. M.)

DARJEELING, a town and district of British India, in the Rajshahi division of Bengal. The town is a hill station and the hot weather headquarters of the Bengal Government. In 1931 it had a population of 19,903. It occupies a long ridge with two projecting spurs, on which are the town proper and the cantonments of Katapahar, Jalapahar and Lebong. The total area is nearly 5 sq.m., and the difference between its highest and lowest points is about 2,000 feet., Katapahar being 7,886 ft. and Lebong 5,970 ft. above sea level. It enjoys a temperate climate, the average maximum and minimum temperatures being only slightly above those of London; but it has a heavy rainfall, over 100 in. falling from June to October; in these months it is often hidden in mist. On the other hand, snow rarely falls in the winter. Darjeeling commands one of the most beautiful views in the world, for the eye goes up from the valleys to a succession of ranges culminating in Kinchinjunga (28,146 ft.), with snow-clad peaks on either side, a glittering white wall of perpetual snow, which fills a great part of the horizon. There are several schools, botanic gardens and sanatoriums for both Europeans and Indians. The buildings and the roads suffered severely from landslips in 1899; protective works have been built to prevent the recurrence of such a disaster.

BY COURTESY OF THE CANADIAN PACIFIC STEAMSHIP CO.

DARJEELING DEVIL DANCER

The district of Darjeeling has an area of 1,164 sq.m., and a population of 319,635. It consists of two well-defined tracts, viz., the lower Himalayas, and the *tarai,* or plains, at their base. The plains from which the hills take their rise are only 300 ft. above sea-level; the mountains ascend abruptly in spurs of 6,000 to 12,000 ft. in height. The scenery is picturesque, and in many parts magnificent. Two of the highest mountains in the world, Kinchinjunga in Sikkirn (28,146 ft.), and Mt. Everest (29,140 ft.), are visible from Mt. Sandakphu (11,929 ft.) on the Singalila ridge. Other high points in the district are Phalut (11,811 ft.), Rishi-la (10,500), Tanglu (10,084) and (6 m. from Darjeeling) Senchal (8,163) and Tiger hill (8,515 ft.). The chief rivers are the Tista, Great Ranjit, Mahananda and Balasan. Bears, leopards and deers are found on the higher hills, and elephants and tigers in the *tarai* and lower hills.

The majority of the inhabitants of the hills are Nepalese by origin, with Bhotias (10,710) of Tibetan extraction and the Lepchas (9,669). In the *tarai* the Bengali Rajbansis (originally Koch) predominate. Over a third of the district is occupied by forests, which cover the hills above 6,000 ft., and below 3,000 ft., these being roughly the limits of cultivation of food crops and of tea. The cultivation of tea is the main industry. There were 168 tea gardens, with an output of 14 million lb. in 1921. Cinchona cultivation was introduced by the Government in 1862; the factory at Mungpo is capable of manufacturing over 50,000 lb. of quinine annually. The Darjeeling Himalayan railway of 2 ft. gauge, connects the town of Darjeeling with the Eastern Bengal State railway at Siliguri, from which a branch line runs up the Tista valley to Kalimpong road.

The British connection with Darjeeling dates from 1816, when, at the close of the war with Nepal, the British made over to the Sikkim rajah the *tarai* tract, which had been wrested from him and annexed by Nepal. In 1835 the nucleus of the present district was created by a cession of a portion of the hills by the rajah of Sikkim to the British as a sanatorium. A military expedition against Sikkim, rendered necessary in 18jo by the imprisonment of Dr. A. Campbell, the superintendent of Darjeeling, and Sir Joseph Hooker, resulted in the annexation of the Sikkim *tarai* at the foot of the hills and of a portion of the hills beyond. The hill territory east of the Tista was acquired as the result of the Bhutan war of 1864, and now forms the Kalimpong sub-division.

DARK AGES, a term formerly used to cover the whole period between the end of classical civilization and the revival of learning in the 15th century. The use of the term implied an exclusive respect for classical standards in literature and art and a corresponding disparagement of all that was achieved between the decline of ancient culture and the work of Renaissance scholars, writers and artists. With the progress of mediaeval studies in the 19th century it became impossible for historians to dismiss one of the great constructive periods in human activity with an epithet implying contempt for its achievements, and the phrase has now become obsolete. It remains, nevertheless, the fact that the six centuries following the collapse of the Roman empire are in an especial sense dark through the insufficiency of historical evidence. Even so, it is necessary to remember that intellectual work of the highest quality was done by exceptional individuals in ages when life was insecure and its environment very discouraging to thought. The ages which form the prelude to mediaeval history are dark when compared with the time which followed them, but the foundations of mediaeval civilization were laid in these obscure and troubled centuries.

(F. M. S.)

DARLEY, GEORGE (1795–1846), Irish poet, was born in Dublin and educated at Trinity college. He settled in London in 1822, where he contributed to *The London Magazine,* and became dramatic and art critic to the *Athenaeum.* His best known works are a fairy opera, *Sylvia* (1827), and a poem "Nepenthe" (1839).

See the *Selections from the Poems of George Darley,* with an introduction by R. A. Streatfeild (1904); Claude Abbott, *Life and Letters of George Darley* (1928).

DARLING, CHARLES JOHN, 1ST BARON (1849–1936), English judge, was born on Dec. 6, 1849. At the age of 24 he was called to the bar; in 1885 he became a Q.C., and soon afterwards entered Parliament as Conservative member for Deptford. He sat in the House of Commons from 1888 until 1897 when he was knighted. His appointment in 1897 to a judgeship was not received with universal approval; but he later justified the choice by proving himself to be a man of acute understanding, with an unusual insight into human nature. In 1923 he retired, and in 1924 was granted a peerage. Among his published works are *Scintillae Juris* (1877); *Meditations in the Tea Room* (1879); *Seria Ludo* (1903); *On the Oxford Circuit* (1909); *Musings on Murder, etc.* (1925). *A Pensioner's Garden and other verses* (1926).

See Evelyn Graham, *Lord Darling and his Famous Trials* (1929).

DARLING, GRACE HORSLEY (1815–1842), British heroine, was born at Bamborough, Northumberland, on Nov. 24, 1815. Her father, William Darling, was the keeper of the Longstone (Farne Islands) lighthouse. On the morning of Sept. 7, 1838, the "Forfarshire," bound from Hull to Dundee, with 63

persons on board, struck on the Farne Islands, 43 being drowned. The wreck was observed from the lighthouse, and Darling and his daughter determined to try to reach the survivors. By a combination of daring, strength and skill, the father and daughter reached the wreck in their coble and brought back four men and a woman to the lighthouse. Darling and two of the rescued men then returned to the wreck and brought off the four remaining survivors Grace Darling and her father received the gold medal of the Humane society, the treasury made a grant, and a public subscription was organized. Grace Darling died of consumption on Oct. 20, 1842.

See *Grace Darling, her true story* (1880); *Grace Darling, The Maid of the Isles* (1839); *E.* Hope, *Grace Darling* (1875); *T.* Arthur, *Grace Darling* (1885).

DARLING, a river of Australia (*q.v.*).

DARLINGTON, market town. county and parliamentary borough, Durham, England, 232 mi. N.W. of London, on the L.N.E. Ry. Pop. (1938) 75,930. Area 10.1 sq.mi. It lies on the river Skerne, a tributary of the Tees, not far from the main river. Its appearance is almost wholly modern, but there is a fine old parish church on the site of an earlier church, dedicated to St. Cuthbert. It is cruciform, and in style mainly transitional Norman, and has a central tower surmounted by a spire of the 14th century. Educational establishments include an Elizabethan grammar school, a training college and a technical school. There is a park of 44 ac. The industries include worsted-spinning, coal and ironstone mining, quarrying and brickmaking, the manufacture of iron and steel into bridge castings, ships' engines, munitions, etc. The large locomotive works of the L.N.E. Ry. were removed there from Gateshead. The town was incorporated in 1867.

Before the 19th century Darlington was noted for the manufacture of linen, worsted and flax, but it owes its modern importance to the opening of the railway between Darlington and Stockton on September 27, 1825. "Locomotive No. 1," the first that ever ran on a public railway, stands in Bank Top station. Darlington sent no members to parliament until 1862, after which year it returned one member. The fairs and markets in Darlington were formerly held by the bishop and were in existence as early as the 11th century. The markets and fairs were finally in 1854 purchased by the local authority, and now belong to the corporation.

DARLINGTON, a town of northeastern South Carolina, U.S.A., served by the Atlantic Coast Line and the Seaboard Air Line railways; county seat of Darlington county. It is on federal highway 52. Pop. (1940) 6,236. It has a cotton mill of 37,800 spindles, a drinking cup factory, a chair factory, a flour and corn products mill, veneer mills, shingle mills, a cottonseed oil mill. ice and lumber manufacturing plants, tobacco warehouses and a tobacco-stemming plant. It was founded about 1785.

DARLINGTONIA (named after Dr. William Darlington, an American botanist, 1782–1863), the Californian pitcher plant, belonging to the family Sarraceniaceae. There is only one species. D. *californica.* According to Greene, the generic name should be *Chrysamphora.* It grows in sphagnum swamps and springy hillsides in southwestern Oregon and northwestern California from near sea level to an altitude of 6000 ft. in the Sierra Nevada Mts. The tall tubular leaves grow in a cluster arising from a stout horizontal stolon and have two forms. The juvenile leaf has the open top overhung by a tapering lid-like appendage, seen on the left of the illustration. Such leaves are found in seedlings and variously on small shoots. The leaf of maturity may reach a height of 3 ft., gradually expanding its diameter till at the top it expands suddenly into a bent-over hood ending in a downward hanging appendage of the shape of a fishtail. Beneath the hood is a rounded opening, the entrance, guarded on the inside by a low, inturned flange having many nectar glands, which are common also to the fishtail appendage, and to the interior surface of the hood. The roof of the hood is tesselated by white translucent patches, windows mullioned by green, eventually red bands of chlorophyll bearing tissues. To an insect approaching the entrance, attracted by the nectar on the fishtail or elsewhere beneath the hood, the fenestrations doubtless suggest a way of exit. When once inside, the insect feeds on the abundant nectar and gradually, impelled by downward pointing hairs, falls into the hollow tubular leaf. Since digestive glands are absent, the decay of the captured insects takes place through the agency of bacteria, the products of this sort of digestion being absorbed by the walls of the tube, from which cuticle is absent.

An interesting matter in this connection is the invariable presence of living insect larvae in the wet mass of decaying insects which are usually very plentiful. A few of these are obligate commensals, not occurring elsewhere. Among these are two minute gnats, *Metriocnemus Knabi* and *M. Edwardsii.* So abundant is the dead prey that the odour of decay has often been remarked.

(F. E. L.)

DARLY, MATTHIAS or **MATTHEW,** (? –1781?) English caricaturist, designer and engraver. This extremely versatile artist produced social and political caricatures, designed architectural and mobiliary accessories, made many engravings for Thomas Chippendale, and sold his own productions at his print shop in the Strand (and elsewhere) which was one of the first to stock prepared colours and materials for artists. His first known publication is a coloured caricature, "The Cricket Players of Europe" (1741). Darly was in partnership with one Edwards, with whom he published many political prints which were collected annually into volumes under the title of *Political and Satirical History.* He published in 1754 *A New Book of Chinese Designs* and engraved many of the plates for the *Director* of Thomas Chippendale. in 1770–71 appeared Darly's most important work—The *Ornamental Architect or Young Artists' Instructor,* the title of which became in the 1773 edition *A Compleat Body of Architecture, embellished with a great Variety of Ornament.* His last caricature was published in October 1780, and as his shop, No. 39 Strand, was let to a new tenant in 1781, it is presumed that he had by then died or become incapable of further work.

See George Paston, *Social Caricature in the 18th Century* (1905).

DARMESTETER, ARSÈNE (1846–1888), elder brother of James Darmesteter *(see* below), was a distinguished philologist and man of letters. He studied under Gaston Paris at the École des Hautes Études, and became professor of old French language and literature at the Sorbonne. He collaborated with Adolphe Hatzfeld in a *Dictionnaire général de la langue française* (2 vols., 1895–1900). Among his most important work was the elucidation of old French by means of the many glosses in the mediaeval writings of Rashi and other French Jews. His scattered papers on romance and Jewish philology were collected by James Darmesteter as *Arskne Darmesteter, reliques scientifiques* (2 vols., 1890). His *Cours de grammaire historique de la langue française* was edited after his death by E. Muret and L. Sudre (1891–95; English edition, 1902).

DARMESTETER, JAMES (1849–1894), French author and antiquarian, was born of Jewish parents at Château Salins, Alsace. The family name had originated in their earlier home of Darmstadt. He studied in Paris under Michel Bréal and Abel Bergaigne. In 1875 he published a thesis on the mythology of the *Zend Avesta,* and in 1877 became teacher of Zend at the École des Hautes Études. He followed up his researches with his *Études iraniennes* (1883), and ten years later published a complete translation of the *Zend Avesfa,* with historical and philological commentary (3 vols., 1892–93), in the *Annales du musée Guimet.* He

also edited the *Zend Avesta* for Max Muller's *Sacred Books of the East*. Darmesteter regarded the extant texts as far more recent than was commonly believed, placing the earliest in the 1st century B.C., and the bulk in the 3rd century A.D. In 1885 he was appointed professor in the Collège de France, and was sent to India in 1886 on a mission to collect the popular songs of the Afghans, a translation of which, with a valuable essay on the Afghan language and literature, he published on his return. His impressions of English dominion in India were conveyed in *Lettres sur l'Inde* (1888). He married A. Mary F. Robinson (*see* DUCLAUX, AGNES MARY FRANCES). He died on Oct. 19,1894.

There is an *éloge* of James Darmesteter in the *Journal asiatique* (1894, vol. iv. pp. 519–534), and a notice by Henri Cordier, with a list of his writings, in *The Royal Asiatic Society's Journal* (Jail. 1895); *see* also Gaston Paris, "James Darmesteter," in *Penseurs et poètes* (1896, pp. 1-61).

DARMSTADT, a city of Germany, capital of the *Land* of Hesse-Darmstadt, on a plain gently sloping from the Odenwald to the Rhine, 21 mi. by rail S.E. from Mainz and 17 mi. S. from Frankfort-on-Main. Pop. (1939) 115,526.

Darmstadt is mentioned in the 11th century, but in the 14th century it was still a village, held by the counts of Katzenelnbogen. It came by marriage into the possession of the house of Hesse in 1479, the male line of the house of Katzenelnbogen having in that year become extinct. The imperial army took it in the Schmalkaldic War, and destroyed the old castle. In 1567, after the death of Philip the Magnanimous, his youngest son George received Darmstadt and chose it as his residence. He was the founder of the line of Hesse-Darmstadt. Its most brilliant days were those of the reign of Louis X. (1790–1830), the first grand-duke, under whom the new town was built.

Darmstadt consists of an old and a new town, the streets of the former being narrow. In the new town is the stately Luisenplatz, on which are the old house of parliament, the palace and the post office, and, in the centre, a statue of the grand-duke Louis I., the founder of the new town. The ducal palace is a complex of buildings of various centuries. Adjoining the palace gardens, are the theatre and armoury, and a little farther west the museum, a library of 600,000 volumes and 4,000 mss., a museum of Egyptian and German antiquities, a picture gallery with masterpieces of old German and Dutch schools, a natural history collection and the State archives. To the south of the castle lies the old town, with market square, town hall and town church. The town possesses a technical high school, having (after 1900) power to confer the degree of doctor of engineering, and attended by about 2,000 students, two gymnasia, a school of agriculture, an artisans' school and a botanical garden. The chemist, Justus von Liebig, was born in Darmstadt in 1803. The industries are very varied. The city was bombed by the British in World War II.

To the east of the town lies the Mathildenhohe, formerly a park and now converted into villa residences. Here are the Alice hospital and the Russian church, built (1898–99) by the emperor Nicholas II of Russia in memory of his Hessian wife.

See Walther, *Darmstadt wie es war und wie es geworden* (Darms. 1865); and Zernin and Worner, *Darmstadt und seine Umgebung* (Ziirich, 1890).

DARMSTÄDTER UND NATIONALBANK. The Bank is a merger of the Bank fur Handel und Industrie (generally known as the Darmstadter Bank) with the Nationalbank fur Deutschland. The amalgamation took place in 1922.

The Bank fur Handel und Industrie was founded in 1853 in Darmstadt. It was in intimate relationship with the most important firms and possessed a large number of branches.

The Nationalbank fur Deutschland was founded in 1881. In 1920, after having absorbed the Deutsche Nationalbank in Bremen and later the Holsten Bank in Neumünster, it turned its attention to branch banking. The Nationalbank fur Deutschland saw in its relationships with industrial enterprises the main support of its business, and by founding, or collaborating in the founding, of many important German enterprises it established a basis for financial and syndicate investment business.

The capital of the Darmstadter und Nationalbank in 1928 was 60,000,000 Reichsmarks, and the open reserves (which were 40,000,000 Reichsmarks when the gold balance sheet was drawn up in 1924) were increased by 10,000,000 in 1927 and by an additional 5,000,000 in 1928; the reserves amounting to 55,000,000 Reichsmarks.

The Darmstädter und Nationalbank is represented in the management of the most important industrial enterprises in Germany and is on the board of approximately 1,000 companies. The Bank also has a number of foreign investments in other banks abroad. It founded, together with an international group, the "Internationale Bank te Amsterdam" with the object of carrying out international financial transactions.

In 1928 the Darmstadter und Nationalbank owned 143 bank buildings, had branches in approximately 120 towns. (A. SN.)

DARNLEY, HENRY STEWART or **STUART,** LORD (1545–1j67), earl of Ross and duke of Albany, second husband of Mary, queen of Scots, was the eldest son of Matthew Stewart, earl of Lennox (1516–1571), and through his mother Lady Margaret Douglas (1515–1578) was a great-grandson of the English king Henry VII. Born at Temple Newsam in Yorkshire on Dec. 7, 1545, he was educated in England. After the death of Francis II. in 1j60 Darnley was sent to France by his mother, who hoped that he would become king of England on Elizabeth's death, and entertained the idea of his marriage with Mary, queen of Scots, the widow of Francis, as a means to this end. In 1561 both Lady Margaret and her son, who were English subjects, were imprisoned for a short time by Elizabeth; and Darnley spent some time at the English court before going to Scotland in Feb. 1565. The marriage of Mary and Darnley was now definitely proposed, and the queen, having nursed her new suitor through an attack of measles, decided to marry him. Elizabeth had permitted Darnley's journey to Scotland, but she and her council declared their dislike of the proposed marriage, and ordered Darnley and his father to repair to London, a command which was disobeyed. In March 1565 there were rumours that the marriage had already taken place, but the public marriage, at all events, was celebrated at Holyrood on July 29, 1565.

Although Mary had doubtless a short infatuation for Darnley, the union was mainly due to political motives, and trouble soon arose between them. Contrary to his expectations Darnley dia not receive the crown matrimonial. He was on bad terms with the regent Murray and other powerful nobles, who disliked the marriage and were intriguing with Elizabeth. He was in addition soon estranged from his wife. He became jealous of David Rizzio, and was easily persuaded to assent to the murder of the Italian, a crime in which he took part. Immediately afterwards, however, flattered and cajoled by the queen, he betrayed his associates to her, and helped her to escape from Holyrood to Dunbar. Deserted and distrusted by his companions in the murder, he decided to leave Scotland, but a variety of causes prevented his departure; and meanwhile at Craigmillar a band of nobles undertook to free Mary from her husband, who refused to be present at the baptism of his son, James, at Stirling in Dec. 1566. The details of the conspiracy at Craigmillar are not clear, nor is it certain what part, if any, Mary took in these proceedings. The first intention may have been to obtain a divorce for the queen, but it was soon decided that Darnley must be killed. Rumours of the plot came to his ears, and he fled from Stirling to Glasgow, where he fell ill, possibly by poisoning, and where Mary came to visit him. Another reconciliation took place, and Darnley was persuaded to journey with Mary by easy stages to Edinburgh. They stayed for a few days at Kirk o' Field, a house just inside the city walls. On the evening of Feb. 9, 1567 Mary bade her husband farewell, and went to attend some gaieties in Edinburgh. A few hours later, on the morning of the 10th, Kirk o' Field was blown up with gunpowder. Darnley's body was found at some distance from the house, and it is supposed that he was strangled whilst making his escape. The remains were afterwards buried in the chapel at Holyrood.

As the father of King James I., Darnley is the direct ancestor of all the sovereigns of England since 1603.

For further information, and also for a list of the works bearing on his life, *see* the article *MARY,* QUEEN OF SCOTS.

DARRANG, a district of British India, in the province of Assam. It lies between the Bhutan and Dafla hills and the Brahmaputra, including many islands in the river. The administrative headquarters are at Tezpur (pop. 5,047) on the right Sank of the Brahmaputra. Its area is 3,197 sq.mi. Pop. (1931) 584,817. This area was reduced in 1914 by the transfer of 500 sq.m. of almost uninhabited country to the Balipara Frontier Tract formed in that year. It is for the most part a level plain watered by many tributaries of the Brahmaputra. The district contains the two subdivisions of Tezpur and Mangaldai, tea being the principal cultivation in the valley of Tezpur, and rice in Mangaldai. In Tezpur the density has risen to 157 per sqm. from 42 in 1890 owing to large areas of waste land being brought under cultivation. In Mangaldai 800 sq.m. are available. for settlement. There were 58,000 acres under tea with an output of 27½ million lb. in 1921, when the tea-garden population numbered 122,749. There are 568 sq m. of reserved forests, mostly at the foot of the hills along the northern boundary.

DARROW, CLARENCE SEWARD (1857–1938), American lawyer, was born at Kinsman, O., April 15, 1857. He received a public school education and was called to the bar in 1875, afterwards practising in Chicago. He appeared as counsel in a large number of important cases, many of which attracted wide attention, and he became recognized as one of the leading criminal lawyers in the United States. He was retained by the labour organizations in much of their litigation of recent years. Among the celebrated cases in which he appeared were the Debs strike case (1895), anthracite coal strike arbitration (1902), Steunenburg murder (1907), The Los Angeles Times dynamite case (1911) and the Loeb-Leopold case (1924). In July 1925 he defended J. T. Scopes at the Tennessee evolution trial. He wrote Crime, *Its* Cause *and* Treatment (1922); Farmington, *A* Persian Pearl and Other Essays, *An* Eye for an Eye, The *Prohibition Mania,* and many other books and pamphlets on social, literary and economic questions.

For many years he was a well-known platform speaker and debater.

DARTER: see SNAKE-BIRD.

DARTFORD, a market town and municipal borough in the Dartford parliamentary division of Kent, England, 17 mi. E.S.E. of London by the Southern railway. Pop. (1938) 35,680. Area 6.6 sq.mi. Its most noteworthy building is the parish church, restored in 1863, which contains an old fresco and several interesting brasses, and has a Norman tower, restored in 1910. The grammar school dates from 1576.

Dartford was the scene, in 1235, of the marriage, celebrated by proxy, between Isabella, sister of Henry III, and the Emperor Frederick II; and in 1331 a famous tournament was held in the place by Edward III. The same monarch established a Dominican nunnery on West Hill in 1356, of which, however, little remains. After the Dissolution it was used as a private residence by Henry VIII, Anne of Cleves and Elizabeth. The chantry of St. Edmund the Martyr on the opposite side of the town was a part of Edward III's endowment to the priory, and became famous as a place of pilgrimage on the way to Canterbury. The part of Watling street which crossed there towards London was sometimes called "St. Edmund's Way." On Dartford heath is the mental home maintained by the London County council. Greenhithe, on the banks of the Thames, has large chalk quarries in its neighbourhood, from which lime and cement are manufactured. One of the first attempts at the manufacture of paper in England was made here by Sir John Spielman (d. 1607), jeweller to Queen Elizabeth. Papermaking is still important here as well as chemical, metal and leatherworking. From 1894 until 1933, when it was incorporated, Dartford was governed by an urban district council.

DARTMOOR, high plateau, in south-west Devonshire, England. It is 23 mi. from north to south, 20 mi. from east to west, 215 sq.mi. in area with a mean altitude of 1,500 feet. It is the highest and easternmost in a broken chain of granitic elevations which extends to the Scilly isles. The higher parts are open, bleak and wild. Sloping heights rise from the main tableland, crested with broken masses of granite, locally named tors. The highest of these are Yes Tor and High Willhays (2,028 and 2,039 feet). Large parts of the moor are covered with morasses; and head-waters of all the principal streams of Devonshire (*q.v.*) are found here. Only two good roads cross the moor, one between Exeter and Plymouth, and the other between Ashburton and Tavistock, intersecting at Two Bridges. The central part of Dartmoor was a royal forest from a date unknown, probably before the Conquest. Its woods were formerly more extensive than now, but a few small tracts of dwarf oaks remain in the lower parts. Previous to 1337 the forest had been granted to Richard, earl of Cornwall, by Henry III., and from then has belonged to the Duchy of Cornwall. The districts immediately surrounding the moor are called the Venville or Fenfield districts. The holders of land by Venville tenure have rights of pasture, fishing, etc., in the forest. (For antiquarian remains see DEVON.)

Princetown prison was built in 1806 to house French prisoners, and was adapted for use as a convict station in 1850. A tract of moorland adjacent to the prison was brought under cultivation by the inmates.

DARTMOUTH, EARL OF, an English title borne by the family of Legge from 1710 to the present day.

WILLIAM LEGGE (c. 1609–1670), the eldest son of Edward Legge (d. 1616), vice-president of Munster, assisted Charles I. in his war against the Scots in 1638. He was also very useful to the king during the months which preceded the outbreak of the Civil War, although his attempt to seize Hull in Jan. 1642 failed. During the war Legge distinguished himself at Chalgrove and at the first battle of Newbury, and in 1645 he became governor of Oxford. Legge helped Charles to escape from Hampton Court in 1647, and was arrested in May 1648. He was released, but was again captured in 1649, and remained in prison until 1653. He then spent some years abroad, but in 1659 was in England inciting the royalists to rise. The old royalist died on Oct. 13, 1670.

Legge's eldest son, GEORGE, BARON DARTMOUTH (1647–1691), served as a volunteer in the navy during the Dutch war of 1665–1667. He was a member of the household of the duke of York, afterwards James II., was governor of Portsmouth and master-general of the army. In 1678 he commanded as colonel the troop at Nieuport, and in 1682 he was created Baron Dartmouth. In 1683 as "admiral of a fleet" be sailed to Tangiers, dismantled the fortifications and brought back the English troops. Under James II. Dartmouth was master of the horse and governor of the Tower of London; and in 1688 when William of Orange was expected, James II. made him commander-in-chief of his fleet. Although himself loyal to James, the same cannot be said of many of his officers, and an engagement with the Dutch fleet was purposely avoided. Dartmouth, however, refused to assist in getting James Edward, prince of Wales, out of the country, and even reproved the king for attempting this proceeding. He then left the fleet and took the oath of allegiance to William and Mary, but in July 1691 he was arrested for treason, and was charged with offering to hand over Portsmouth to France and to command a French fleet. Dartmouth protested his innocence. He died in the Tower of London on Oct. 25, 1691 before the question was investigated. (See *Dartmouth* Papers [Hist. Mss. Comm. 2nd Report ix. and spp. pp. 9–12, 1870–72].)

Lord Dartmouth's only son. WILLIAM, 1ST EARL OF DARTMOUTH (1672–1750), succeeded to his father's barony in 1691. He became secretary of state for the southern department and joint keeper of the signet for Scotland in 1710. In 1711 he was created viscount Lewisham and earl of Dartmouth; in 1713 he exchanged his offices for that of keeper of the privy seal, which he held until the end of 1714. After a long period of retirement from public life he died on Dec. 15, 1750.

WILLIAM, 2ND EARL OF DARTMOUTH (1731–1801), grandson of the 1st earl, was lord privy seal at the beginning of the dispute with the American colonies. He advised them in 1777 to accept the conciliatory proposals put forward by Lord North, but in 1776 he opposed similar proposals and advocated the employment of force. In March 1782 lie resigned his office, and in 1783 became lord steward of the household; he died on July 15, 1801. Dartmouth's piety and his intimacy with the early Methodists won for

him the epithet of the *Psalnt-singer*. Dartmouth College was named after him, and among his papers preserved at Patshull House, Wolverhampton, are many letters from America relating to the struggle for independence, printed in *Dartmouth Papers* (Hist. Mss. Comm. 11th Rep. pp. 19–23 and spp. v. 1–500, 1887).

DARTMOUTH, a seaport and municipal borough in the Torquary parliamentary division of Devonshire, England, 27 mi. E. of Plymouth. Pop. (1938) 5,966. Area, 3 sq.mi. It is near the mouth of the river Dart, which here forms an almost landlocked estuary, and is connected by ferry steamer with Kingswear on the opposite shore. The houses rise in tiers from the shore, beneath a range of hills. The parish church of St. Saviour is of the 14th and 15th centuries, and retains an oak rood-screen and an ancient stone pulpit. The churches of St. Petrox and St. Clement, both Early English, represent respectively the ancient manors of Clifton and Hardness, which with Dartmouth give the borough its official name of Clifton-Dartmouth-Hardness.

Dartmouth castle, partly Tudor, commands the river; the wooded castle estate was purchased by the corporation in 1904. Portions of the cottage of Thomas Newcomen, one of the inventors of the steam-engine, are preserved. The Royal Naval Cadet college was opened in 1905 to take the place of the Britannia training ship; it occupies the site of a former seat called Mount Boone. Dartmouth is a yachting centre, and shipping and yacht and boat building are the chief industries. Coal is imported, and resold. River steamers ply to Totnes, 10 mi. up the Dart.

Probably owing its origin to Saxon invaders, Dartmouth was a seaport of importance when Earl Beorn was buried in its church in 1049. From its sheltered harbour William II. embarked in 1099 for the relief of Mans and Richard I.'s squadron set sail for the crusades in 1190, while John landed here in 1214. The borough, first claimed as such in the reign of Henry I., was in existence by the middle of the 13th century. In the 13th century Dartmouth was required to furnish ships for the king's service, an obligation maintained throughout the following century. In 1342 the town was incorporated by a charter frequently confirmed by later sovereigns. A French attack on the town was repulsed in 1404, and in 1485 the burgesses received a royal grant of £40 for walling the town and stretching a chain across the river mouth. Dartmouth fitted out two ships against the Armada, and was captured by both the Royalists and Parliamentarians in the Civil War. Manorial markets were granted for Dartmouth in 1231 and 1301. These were important, since as early as 1225 the fleet provisioned there. During the 14th and 15th centuries there was a regular trade with Bordeaux and Brittany, and complaints of piracies by Dartmouth men were frequent.

DARTMOUTH, a town in Halifax county, Nova Scotia, Canada, on the north-eastern side of Halifax-harbour, connected by a steam ferry with Halifax. Pop. (1941) 10,847. It contains a large sugar refinery, foundries, machine shops, saw mills, skate, rope, nail, soap and sash factories and also the Imperial Oil works. Though now practically a suburb of Halifax, Dartmouth was separately founded in 1750; was the first town incorporated in Nova Scotia.

DARTMOUTH COLLEGE, an American institution of higher education for men, in Hanover, New Hampshire. It is Congregational by origin but actually non-sectarian. Dartmouth embraces the original college, incorporated in 1769, a medical school, dating from 1798; the Thayer School of Civil Engineering, established in 1867 by the bequest of General Sylvanus Thayer; and the Amos Tuck School of Administration and Finance, established in 1900 by Edward Tuck—the first, and until the establishment at Harvard of a similar graduate school, the only commercial school in the country whose work is largely postgraduate. The Chandler School of Sciences and the Arts was founded by Abiel Chandler in 1851 in connection with Dartinouth and incorporated in the collegiate department in 1893 as the Chandler scientific course in the college. From 1866 to 1893 the New Hampshire College of Agriculture and the Mechanic Arts, now at Durham, was connected with Dartmouth. The medical school granted the degree of M. D. until 1914, when the last two clinical years were discontinued. The Thayer school and the Tuck school maintain each a two years' course, the first year of which may, under certain conditions, be counted as the senior year of the undergraduate college.

The college has a beautiful campus; 15 instruction halls; 22 residence halls, with accommodation for 1,650 students; a large gymnasium, built in 1911 by alumni, with the Spaulding swimming pool (1919), the Davis field house (1927) and the Davis Hockey Rink (1929) attached, and large athletic fields; an auditorium, Webster hall (1901); College hall (1901), a social headquarters; Rollins chapel (1885); an astronomical and meteorological observatory (Shattuck observatory, 1854). The Fisher Ames Baker Memorial Library (completed 1928) replaces Wilson hall (1885) and contains 420,000 volumes. This library, the gift of George F. Baker, cost $1,000,000. With it are associated the Carpenter Fine Arts Building (1929) and the Sanborn English House (1929). The physical laboratory is housed in Wilder hall (1899). Instruction in chemistry is given in the Steele Chemistry Laboratory (1921), the natural sciences in Silsby hall (1928) where geological and ethnological collections are also maintained, while botany is taught in the Clement greenhouse (1928). Parkhurst hall (1911) contains the administrative offices, and Robinson hall (1914) is the home of all college organizations other than athletic. The Mary Hitchcock Memorial Hospital (1893) is associated with the Medical School, and Dick Hall's house (1927), adjoining the hospital, is a completely equipped infirmary for 50 students. The college owns the Hanover Inn with accommodation for 150 guests and maintains single or apartment houses for 50 faculty families. A new upper-class dining hall, seating some 500 students, was completed in 1937.

Dartmouth is the outgrowth of Moor's Indian Charity School, founded by Eleazar Wheelock (1711–79) about 1750 at Lebanon, Connecticut. This school was named in 1755 in honour of Joshua Moor, who in this year gave to it lands and buildings. In 1765 Samson Occum (c. 1723–92), an Indian preacher and former student of the school, visited England and Scotland in its behalf and raised £10,000, whereupon plans were made for enlargement and for a change of site to Hanover. In 1769 the school was incorporated by a charter granted by George III. as Dartmouth College, being named after the earl of Dartmouth, president of the trustees of the funds raised in Great Britain. The first college building, Dartmouth hall, was built between 1784 and 1791. This building was twice destroyed by fire, in 1904 and 1935, and reproduced in its original external form, the second time with fireproof materials. During the War of Independence the support from Great Britain was mostly withdrawn. In 1815 President John Wheelock (1754–1817), who succeeded his father in 1779, and was a Presbyterian and a Republican, was removed by the majority of the board of trustees, who were Congregationalists and Federalists, and Francis Brown was chosen in his place. Wheelock, upon his appeal to the legislature, was reinstated at the head of a new corporation, called Dartmouth University. The State courts upheld the legislature and the "university," but in 1819 after a famous argument of Daniel Webster (*q.v.*) in behalf of the "college" board of trustees as against the "university" board before the U. S. Supreme Court, that body decided that the private trust created by the charter of 1769 was inviolable, and Dr. Francis Brown and the old "college" board took possession of the institution's property. At the Webster centennial, celebrated in 1901, it was stated that the Dartinouth College Case had at that time been cited in judicial opinions more frequently than any other in the American reports—about 970 times.

The annals of the college have been tranquil with the exception of the disturbed years of the "university" controversy. During the Civil War Dartmouth College contributed 652 alumni and undergraduates to the Union armies. In World War I 3,319 graduates, undergraduates and faculty served in the military forces of the United States. Those dying in active service numbered 112. During most of the 19th century there was little variation in the numbers attending the college. With the administration of President William Jewett Tucker (1893–1909), however, a great expansion of equipment, endowment and enrolment took place which has continued during the present administration

of Ernest Martin Hopkins, the 11th president. The enrolment increased from 256 students and 19 members of the faculty in 1890 to 2,400 students and more than 250 members of the faculty in 1936. In 1890 91% of the students came from New England. Tne constituency of the college gradually changed, until in 1936 less than 40% of the men came from homes within those States. The productive investment assets of the college also increased from approximately $1,000,000 in 1890 to $17,000,000 in 1936. The tuition cost in 1937 will be $450 a year; provision is made through scholarships for assisting deserving students unable to pay this sum. The government is entrusted to a hoard of 12 trustees, five of whom are elected upon the nomination of the alumni. Applicants for the entering class are selected on a basis of character, scholarship and general promise of profiting by a college course. Out of more than 2,000 applicants who apply each year, an entering class of approximately 650 is selected.

During President Hopkins' administration several important features were introduced. A personnel department for advice on the curriculum and later occupation was organized. Outdoor recreation was made coinpulsory in the two lower classes. Experts in psychiatry and in nutrition were added to the college staff. In June 1925 certain major changes were made in the liberal arts curriculum providing inter alia for special treatment for students of higher grade and for the granting of but one degree, Bachelor of Arts. In 1929 senior fellowships were introduced, and more recently complete medical and surgical care without charge was adopted, and the curriculum was revised so as to insure greater study of modern social problems. One of the interesting influences of the college is promoted by the Dartmouth Outing Club, which maintains a chain of 23 cabins and shelters between Hanover and the White mountains and promotes winter sports.

Woodward* (Portsmouth, 1819); Shirley, *The Dartmouth College Causes (St.* Louis, Mo., 1879); Kent, *Commentaries on American Law* (vol. i., Boston, 1884). (E. F. C.)

DARU, PIERRE ANTOINE, COUNT (1767–1829), French soldier, was born at Montpellier on Jan. 12, 1767. He was a great army administrator, and served as commissary to the army of defence of the Breton coast (1793), in Masséna's army in Switzerland (1799), in Berthier's army in Italy (1799), and again on the Breton coast (1803). He enjoyed the complete confidence of Napoleon, who employed him as chief commissary of the Grand Army in 1805, and made him intendant of his military household. In the campaigns of 1806–07 he served, in his usual capacity, in the army which overthrew the forces of Russia and Prussia; and he had a share in drawing up the treaty of Tilsit (July 7, 1807). After this he supervised the administrative and financial duties in connection with the French army which occupied the principal fortresses of Prussia. At the congress of Erfurt, Daru was present at the interview between Goethe and Napoleon, and interposed tactful references to the works of the great poet. Daru served again as commissary in the campaign of 1809 against Austria, and late in the year 1813 he took up the portfolio of military affairs. After the first abdication of Napoleon in 1814, Daru retired into private life, but aided Napoleon during the Hundred Days. After the second Restoration he became a member of the Chamber of Peers, in which he defended the cause of popular liberty against the ultra-royalists. He died at Meulan on Sept. 5, 1829.

Few men of the Napoleonic empire have been more generally admired and respected than Daru. On one occasion when he expressed a fear that he lacked all the gifts of a courtier, Napoleon replied, "Courtiers! They are common enough about me; I shall never be in want of them. What I want is an enlightened. firm and vigilant administrator; and that is why I have chosen you" At another time Napoleon said, "Daru is good on all sides; he has good judgment, a good intellect, a great power for work, and a body and mind of iron."

Among Daru's literary works are his *Histoire* de *Venise* (7 vols., 1819); *Histoire* de Bretagne (3 vols., 1826); a poetical translation of Horace; *Discours* en *vers* sur les *facultés* de *l'homme* (1825), and *Astronomie,* a didactic poem in six cantos (1820).

See the "Notice" by, Viennet prefixed to the fourth edition of Daru's *Histoire de la republique* de *Venise* (9 vols., 1853) and three articles by Sainte-Beuve in *Causeries du lundi,* vol. ix. For the many letters of Napoleon to Daru *see* the *Correspondance de Napoléon Ier* (32 vols., 1858–70).

His son, NAPOLÉON DARU (1807–1890), created count in 1832, was a liberal member of the National Assembly in 1848, and of the Legislative Assembly (1869) and foreign minister in 18 jo. He sat as a conservative in the National Assembly (1871–76), and in the senate from 1876 to 1879.

DARWEN, municipal borough, Darwen parliamentary division, Lancashire, England, 20 mi. N.W. from Manchester by the L.M.S.R. Pop. (1938) 31,850. Area 9.2 sq.mi. It lies on the river Darwen, which traverses a densely populated manufacturing district. In the neighbourhood are collieries and stone quarries. Darwen manufactures cotton goods, paper, and has blast furnaces and fire-clay works. It has a market hall, technical schools, a free library, and two public parks. A grammar school was opened in 1938. Darwen was incorporated in 1788.

DARWIN, CHARLES ROBERT (1809–1882), English naturalist, author of the Origin of Species, was born at Shrewsbury on Feb. 12, 1809, the grandson of Dr. Erasmus Darwin (*q.v.*). His mother, a daughter of Josiah Wedgwood (1730–1795), died in 1817. Charles's elder brother, Erasmus Alvey (1804–81), was interested in literature and art rather than science: on the subject of the wide difference between the brothers Charles wrote that he was "inclined to agree with Francis Galton in believing that education and environment produce only a small effect on the mind of anyone, and that most of our qualities are innate" (Life and Letters, London, 1887). Darwin considered that his own success was chiefly due to "the love of science, unbounded patience in long reflecting over any subject, industry in observing and collecting facts, and a fair share of invention as well as of common sense" (ibid.). He also says: "I have steadily endeavoured to keep my mind free so as to give up any hypothesis, however much beloved (and I cannot resist forming one on every subject), as soon as facts are shown to be opposed to it" (ibid.). The essential causes of his success are to be found in this latter sentence, the creative genius ever inspired by existing knowledge to build hypotheses by whose aid further knowledge could be won, the calm unbiassed mind, the love of truth which enabled him to abandon or to modify his own creations when they ceased to be supported by observation. The great naturalist appeared in the ripeness of time, when the world was ready for his splendid generalizations. In the preparation for Darwin Sir Charles Lyell's *Principles* of Geology played an important part, accustoming men's minds to the vast changes brought about by natural processes, and leading them, by its lucid and temperate discussion of Lamarck's and other views, to reflect upon evolution.

Darwin studied at Shrewsbury School under Dr. Samuel Butler (1774–1839), and in 1825 went to Edinburgh to prepare for the medical profession, for which he was unfitted by nature. In 1828 his father sent him to Christ's College, Cambridge with the idea that he should become a clergyman. He took his degree in 1831, tenth in the list of those who do not seek honours. Both at Edinburgh and at Cambridge he gained the friendship of older scientific men — Robert Edmond Grant and William Macgillivray at the former, John Stevens Henslow and Adam Sedgwick at the latter. From Dec. 1831 to Oct. 1836, Darwin was on the "Beagle" as naturalist for the surveying expedition. After visiting the Cape de Verde and other Atlantic islands, the expedition surveyed on the South American coasts and adjacent islands (including the Galapagos), afterwards visiting Tahiti, New Zealand, Australia, Tasmania, Keeling Island, Maldives, Mauritius, St. Helena, Ascension, and Brazil, de Verdes and

Azores on the way home. His work on the geology of these countries and that on coral islands became the subject of volumes which he published after his return, as well as his *Journal of a Naturalist*, and his other contributions to the official narrative. The voyage was the real preparation for his life-work. His observations on the relation between animals in islands and those of the nearest continent and between living animals and those most recently extinct and found fossil in the same country, related but not the same, led him to reflect upon the modification of species. He had also been much impressed by "the manner in which closely allied animals replace one another in proceeding southwards" in South America. His pocket-book for 1837 contains the words: "In July opened first note-book on Transmutation of Species. Had been greatly struck from about the month of previous March [while still on the voyage and just over twenty-eight years old] on character of South American fossils, and species on Galapagos Archipelago. These facts (especially latter) origin of all my views" From 1838 to 1841 he was secretary of the Geological society, and saw a great deal of Sir Charles Lyell, to whom he dedicated the second edition of his *Journal.* In Jan. 1839 he married his cousin, Emma Wedgwood. They lived in London until 1842, when they moved to Down, which was Darwin's home for the rest of his life. From 1846 to 1854 he was chiefly engaged upon four monographs on the recent and fossil cirripede Crustacea *(Ray Soc.,* 1851 and 1854; *Palaeontograph. Soc.,* 1851 and 1854).

Soon after opening his note-book in 1837 be began to collect facts bearing upon the formation of the breeds of domestic animals and plants, and quickly saw "that selection was the keystone of man's success. But how selection could be applied to organisms living in a state of nature remained for some time a mystery to me." Various ideas as to the causes of evolution had to be successively abandoned. He had the idea of "laws of change" which affected species and finally led to their extinction, to some extent analogous to the causes which bring about the development, maturity and finally death of an individual. He also had the conception that species must give rise to other species or else die out, just as an individual dies unrepresented if it bears no offspring. In Oct. 1838 he read *Malthus on Population,* and his observations having long since convinced him of the struggle for existence, it at once struck him "that under these circumstances favourable variations would tend to be preserved, and unfavourable ones to be destroyed. The result of this would be the formation of new species. Here, then, I had *a* theory by which to work." In June 1842 he wrote out a sketch, which in 1844 he expanded to an essay of 231 pages folio. The idea of progressive divergence as an advantage in itself, because the competition is most severe between organisms most closely related, did not occur to him until long after. In Jan. 1844 he wrote to his friend, Sir Joseph Hooker: "At last gleams of light have come, and I am almost convinced (quite contrary to the opinion I started with) that species are not (it is like confessing a murder) immutable" *(ibid.,* ii. 13). In 1857 he explained his views to the great American botanist Asa Gray in a letter which afterwards became classical. He had completed about half of a third and far more expanded treatise, when, in June 1858, he received a manuscript from A. R. Wallace, who was then at Ternate in the Moluccas. Wallace wanted Darwin's opinion on the manuscript, which he asked should be forwarded to Lyell. Darwin was much startled to find in the essay a complete abstract of his own theory of natural selection. He wrote to Lyell, "your words have come true with a vengeance—that I should be forestalled." He placed himself in the hands of Lyell and Hooker, who decided to send Wallace's essay to the Linnean society, together with an abstract of Darwin's work, which they asked him to prepare, the joint essay being accompanied by an explanatory letter to the secretary. The title of the joint communication was "On the Tendency of Species to form Varieties; and on the Perpetuation of Varieties and Species by Natural Means of Selection." It was read on July 1, 1858, and appears in the *Linn. Soc. Journal* (Zoology) for that year. In this statement of the theory of natural selection, Darwin's part consisted of two sections, the first being extracts from his 1844 essay, including a brief account of sexual selection, and the second an abstract of his letter to Asa Gray dated Sept. 5, 1857. Canon H. B. Tristram was the first to apply the new theory, explaining by its aid the colours of desert birds, etc. *(Ibis,* Oct. 1859).

Acting under the advice of Lyell and Hooker, Darwin published on Nov. 24, 1859, his great work, *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life.* The whole edition of 1,250 copies was exhausted on the day of issue. The first four chapters explain the operation of artificial selection by man and of natural selection in consequence of the struggle for existence. The fifth chapter deals with the laws of variation and causes of modification other than natural selection. The five succeeding chapters consider difficulties in the way of a belief in evolution generally as well as in natural selection. The three remaining chapters (omitting the final recapitulation), deal with the evidence for evolution. The theory which suggested a cause of evolution is thus given the foremost place and the evidence for the existence of evolution considered last. This evidence had never been thought out and marshalled in a manner which bears any comparison with that of Darwin, and the work would have been epoch-making had it consisted of the later chapters alone. A storm of controversy arose over the book, reaching its height at the British Association at Oxford in 1860, when the celebrated duel between T. H. Huxley and Bishop Wilberforce of Oxford took place. Throughout these struggles Huxley was the foremost champion for evolution and for fair play to natural selection, although he never entirely accepted the latter theory, holding that until man by his selection had made his domestic breeds sterile *inter se,* there was no sufficient evidence that selection accounts for natural species which are thus separated by the barrier of sterility.

The Variation of Animals and Plants under Domestication.—Probably the second in importance of Darwin's works was published in 1868, and may be looked upon as a complete account of the material condensed in the first chapter of the *Origin.* He finally brought together an immense number of apparently disconnected sets of observations under his "provisional hypothesis of pangenesis," which assumes that every cell in the body, at every stage of growth and in maturity, is represented in each germ-cell by *a* gcmmule. The germ-cell is only the meeting-place of gemmules, and the true reproductive power lies in the whole of the body-cells which despatch their representatives, hence "pangenesis." There are reasons for believing that this infinitely complex conception, in which, as his letters show, he had great confidence, was forced upon Darwin in order to explain the hereditary transmission of acquired characters involved in the small proportion of Lamarckian doctrine which he incorporated. If such transmission does not occur, a simpler hypothesis based on the lines of Weismann's "continuity of the germ-plasm" is sufficient to account for the facts *(see* HEREDITY; LAMARCKISM).

The *Descent of Man and Selection in Relation to Sex* (1871), both fulfilled his statement in the *Origin* that "light would be thrown on the origin of man and his history," and collected the evidence in support of his hypothesis of sexual selection which he had briefly described in the 1858 essay. The *Expression of the Emotions* (1872) offered a natural explanation of phenomena which appeared to be a difficulty in the way of the acceptance of evolution. In 1876 Darwin brought out his two previously published geological works on *Volcanic Islands* and *South America* as a single volume. The widely read *Formation of Vegetable Mould through the Action of Worms* appeared in 1881; and the *Fertilization of Orchids* in 1862. *The Effects of Cross- and Self-Fertilization in the Vegetable Kingdom* (1876) proved that the offspring of cross-fertilized individuals are more vigorous, as well as more numerous, than those produced by *a* self-fertilized parent. *Different Forms of Flowers on Plants of the Same Species* (1877) demonstrates that each different form, although possessing both kinds of sexual organs, is specially adapted to be fertilized by the pollen of another form, and that when artificially fertilized by pollen from a plant of its own form, less vigorous offspring are produced. *Climbing Plants* and *Insectivorous Plants* were pub-

lished in 1875, and *The Power of Movement in Plants* in 1880.

Darwin died on April 19, 1882, and was buried in Westminster Abbey on the 26th.

Two daughters and five sons survived him, four of the latter becoming prominent in the scientific world,—Sir George Howard (1845–1912), who became professor of astronomy and experimental philosophy at Csmbridge; Sir Francis (1848–1925), distinguished botanist; Leonard (1850–1943), a major in the royal engineers, and afterwards well known as an economist and eugenist; and Sir Horace (1851–1928), civil engineer.

Ward, C. *Darwin* (1927). *See* also HUXLCY, *T.* H., WALLACE, A. R. and HOOKER, SIR JOSEPH. (E. B. PO.)

DARWIN, ERASMUS (1731–1802), English man of science and poet, was born at Elton, Nottinghamshire. Educated at Cambridge and Edinburgh, he settled in 1756 as a physician at Nottingham, but moved in 1757 to Lichfield, and in 1781 to Derby, where he died suddenly on April 18, 1802. His fame as a poet rests upon his *Botanic Garden,* though he also wrote *The Temple of Nature, or the Origin of Society* (1803), and *The Shrine of Nature* (posthumously published). The *Botanic Garden* (1792, the part entitled *The Loves of the Plants* was published anonymously in 1789) shows a genuine scientific enthusiasm and interest in nature, but has little other poetic quality. The artificial character of the diction renders it in emotional passages stilted, and the personification is carried to excess. Botanical notes are added to the poem, and its eulogies of scientific men are frequent. Darwin's most important scientific work is his *Zoonomia* (1794–96), which contains a system of pathology, and a treatise on generation, in which he, in the words of his famous grandson, Charles Darwin, "anticipated the views and erroneous grounds of opinions of Lamarck." The essence of his views is contained in the hypothesis that through millions of ages all warm-blooded animals may have arisen from one living filament which the First Cause endowed with animality, with the power of acquiring new parts, attended with new propensities, directed by irritations, sensations, volitions and associations.

His *Phytologia, or the Philosophy of Agriculture and Gardening* (1799) claims that plants have sensation and volition. A paper on *Female Education in Boarding Schools* (1797) completes the list of his works.

ROBERT WARING DARWIN (1766–1848), his third son by his first marriage, a doctor at Shrewsbury, was the father of the famous Charles Darwin; and VIOLETTA, his eldest daughter by his second marriage, was the mother of Francis Galton.

See A. Seward, *Memoirs of the Life of Dr. Darwin* (1804); Charles Darwin, *Life of Erasmus Darwin, an introduction to an essay on his works by Ernst Krause* (1879); *L.* Brandl, "E. Darwin's Botanic Garden" in *Wiener Beiiriige zur englischen Philologie* (1909).

DARWIN, SIR GEORGE HOWARD (1845–1912), British astronomer, was born at Down, Kent, on July 9, 1845, and was the second son of Charles Darwin (q v). He was educated at Trinity college, Cambridge (second wrangler and Smith's prizeman), of which he was elected a fellow in 1868, and where he became Plumian professor of astronomy and experimental philosophy in 1883. His work on the application of harmonic analysis and prediction to oceanic tides is monumental, as is his discussion of the influence of tidal friction in determining the evolution of binary systems, with special reference to the earth and moon. In an early paper he discussed the possibility of geological changes having altered considerably the inclination of the earth's axis to the plane of its orbit, and came to a negative conclusion. These works constituted the first attempt to apply thorough dynamical analysis to cosmogony and the major problems of geological evolution. He also carried out important work on periodic orbits in the problem of three bodies, figures of equilibrium of rotating masses of fluid and the stresses in the earth's crust produced by continents and mountains. He was awarded the gold medal of the Royal Astronomical Society in 1892 and the Copley Medal of the Royal Society in 1911. In 1899 Darwin was made president of the Royal Astronomical Society, and of the British Association in 1905. He was made K.C.B. in 1905, and he died in Cambridge on Dec. 7, 1912.

Among his works are *The Tides and Kindred Phenomena in the Solar System* (1898; 3rd ed., 1911) and *Scientific Papers* (5 vols., Cambridge University Press, 1907–16), which has a supplementary volume edited by F. J. M. Stratton and J. Jackson, containing biographical memoirs.

DARWIN GLASS: *see* TEKTITE.

DAS, CHITTA RANJAN (1870–1925), Indian politician and leader of the Swaraj party in Bengal, was born at Calcutta on Nov. 5, 1870 His father, Bhuban Mohan Das, an attorney of the Calcutta High Court, joined the Brahmo Samaj, and edited the *Brahmo* (afterwards the *Bengal) Public Opinion.* Chitta Ranjan was educated at the London Missionary college, Bhowanipore, and at the Presidency college, Calcutta. He was called to the bar at the Middle Temple on June 26, 1894. Joining the Calcutta bar, he won his reputation by his successful defence of Arabinda Ghosh in the Manicktollah bomb conspiracy case. He defended relays of young political offenders, and assisted in keeping extremist papers, such as *Bande Mataram,* going, until they were checked by the Press Act, 1910.

In 1895 Das had published a volume of Bengali lyrics, *Malancha,* and two volumes of verse were issued during the World War. In 1915 Das started the Bengali monthly *Narayana,* but his chief journalistic work was the founding and conduct of the aggressive Swarajist daily, *Forward.* "His dominating note was hatred—and dread—of everything that savoured of the West. . . . It was the pursuit of these false gods that had converted Bengal from a smiling land of happiness and plenty into a salt waste over which brooded stagnation and death" (Lord Ronaldshay's *Heart of Âryâvarta* [1925]). Yet he was sufficiently interested in the shaping of political reforms on western lines to participate in discussions leading to a joint address of Europeans and Indians to the Secretary of State and the Viceroy in Nov. 1917 *(see* Lionel Curtis, *Diarchy,* 1920).

Das became an influential though not always tractable supporter of M. K. Gandhi in the non-cooperation movement launched in the autumn of 1918. He abandoned general practice, though he continued to defend political offenders, took to the wearing of *khadar* (homespun cloth) and lived in the utmost simplicity. Late in 1921 the "volunteer" movement was proscribed in Bengal, as in other provinces. On Dec. 10. some days before Das was due to preside at the Indian National Congress at Ahmadābād he was arrested for issuing a public appeal for the proscribed organization, and was sentenced to six months' imprisonment. Mrs. Das, who was in thorough sympathy with her husband's views, was arrested, but by order of the governor, Lord Ronaldshay, was speedily released. Das presided at the National Congress at Gaya in Dec. 1922, and endeavoured to secure revocation of previous resolutions against entering the Legislatures, suggesting obstructive tactics in place of boycott. The controversy sharply divided the non-cooperationists, but with the decline of Gandhi's influence the Das policy gained ground, and influenced the second general election (1923) under the Reforms; Das was elected to the Bengal Council by more than one constituency. In the following April Das was elected the first mayor of Calcutta.

In the Bengal Legislature Das did not command a clear majority, but he was able to bring pressure both on the Independents and the Mohammedans, to whom he suggested a pact by which a substantial proportion of elective seats and public appointments would be reserved for them in the event of Swarajist success. He secured a bare majority on March 24, 1924, for refusal of the salaries of Ministers appointed provisionally by Lord Lytton. Lord Lytton's offer of a ministership to Das was refused after some hesitation. Das offered vehement opposition to the Bengal Criminal Law Amendment Ordinance (Oct. 25,1924) subsequently embodied in a certified Act under which 110 persons, some of them associates of Das, were kept in imprisonment for terrorist conspiracy. His refusal of office and command of votes in the Legis-

lature led to the suspension of the diarchical system in Bengal, all transferred subjects being taken over by the executive government.

At the Bengal Provincial conference at Faridpur, early in May 1925, Das modified his position, and a resolution was passed condemning revolutionary tactics. There can be no doubt that the connection between the Terrorists and the Swarajists under Das was more than mere sympathy of the latter for the former. While each party had its own separate aims, each was working to use and assist the other in so far as it was useful for the attainment of its own ends.

The secretary for India in the first Labour government, Lord Olivier, stated in debate (July 21, 1924) that he was informed by a high authority in Indian politics that Das had "the reputation of being a particularly upright and scrupulous politician second only to Gandhi himself in saintliness of character." Undoubtedly, the Indian mind was impressed by the great personal sacrifices of Das for the Swaraj cause, and by his courage in act and utterance. In resource and driving power he stood high above his associates. He was skilful in swaying Bengali audiences and individuals, being capable both of playing upon their weaknesses and appealing to what was best in them. But his vision of India under Sm-araj as a conglomeration of semi-autonomous villages had no relation to the hard facts that make centralization inevitable.

There is reason to believe that Das was gaining a fresh outlook, more tolerant of western ideas, in the closing months of his life. He was at Darjeeling in search of health when he died from heart failure followuing diabetes, on June 16, 1925.

Das' book, India for *Indians* (1918), gives extracts from speeches. A substantial volume of Speeches (some translated from Bengali) was published in Calcutta, 1918. The Way to *Swaraj* (1923) gives the speeches made during a tour in southern India, and expounding, according to the prefatory note, "the whole of Desabandhu's philosophy of Indian Nationalism." This philosophy is discussed with penetrating insight in Lord Ronaldshay's hooks: India: *A* Bird's-eye View (1924) and *The Heart* of *Âryâvarta* (1925). See also Life and *Times* of C. R. Das by P. C. Ray, 1928.

DASEWRA (DUSSERA), the "ten days" (or nine nights) festival of the modern Hindus; also called in Bengal the Durga-puja. It celebrated the close of the rainy season and the opening of the season for warlike activities; but is now observed merely as a festival.

DASWKOV, CATHERINA ROMANOVNA VORONTSOV, PRINCESS (1744–1810), Russian *littérateur,* was the third daughter of Count Roman Vorontsov. (For the family see VORONTSOV.) She studied mathematics at the University of Moscow, and became one of the leaders of the party that attached itself to the grand duchess (afterwards empress) Catherine. Before she was 16 she married Prince Mikhail Dashkov and went to reside with him at Moscow. In 1j62 she was at St. Petersburg (Leningrad) and took a leading part, according to her own account the leading part, in the coup d'e'tat by which Catherine was raised to the throne. (See CATHERINE II.) Another course of events would probably have resulted in the elevation of the Princess Dashkov's elder sister, Elizabeth, who was the emperor's mistress, and in whose favour he made no secret of his intention to depose Catherine. Her relations with the new empress were not cordial and she set out in 1j68 on an extended tour through Europe. In Paris she secured the warm friendship and admiration of Diderot and Voltaire. She corresponded with Garrick, Dr. Blair and Principal Robertson In 1782 she returned to the Russian capital, where she was appointed *directeur* of the Academy of Arts and Sciences, and in 1784 the first president of the Russian academy founded at her suggestion She projected the Russian dictionary of the academy, arranged its plan, and executed a part of the work herself. She edited a monthly magazine; and wrote at least two dramatic works, The *Marriage* of Fabian, and a comedy entitled Toissiokoff. Shortly before Catherine's death she retired from court.

On the accession of the emperor Paul in 1796 she was deprived of all her offices. and ordered to retire to a village in the government of Novgorod, "to meditate on the events of 1762." But she pnssed the closing years of her life on her estate near Moscow, where she died on Jan. 4, 1810.

The *Memoirs* of the Princess *Dashkoff* Written by Herself were composed in English and published in London (2 vols., 1840). They were edited by Mrs. W. Bradford, who, as Miss Wilmot, had resided with the princess between 1803 and 1808, and had suggested their preparation.

DASS, PETTER (1647–1708), the "father" of modern Norwegian poetry, was the son of a Scottish merchant, Peter Dundas, settled in Bergen. He was born on the island of Nord Hero, on the north coast of Norway, studied at Copenhagen, and was ordained priest in 1672. In 1689 be received the important living of Alstahoug in the north of Norway, with jurisdiction over the neighbouring districts. His writings passed in ms. from hand to hand, and few of them were printed in his lifetime. *Nordlands* Trompet (The Trumpet of Nordland), his greatest and most famous poem, was not published till 1739; Den norska Dale-Vise (The Norwegian Song of the Valley) appeared in 1696; the *Aandelig* Tidsfordriv (Spiritual Pastime), a volume of sacred poetry, was published in 1711.

The *Trumpet* of Nordland remains as fresh as ever in the memories of the inhabitants of the north of Norway; boatmen, peasants, priests will alike repeat long extracts from it at the slightest notice, and its popularity is unbounded. It is a rhyming description of the province of Nordland, its natural features, its trades, its advantages and its drawbacks, given in dancing verse of the most breathless kind, and full of humour, fancy, wit and quaint learning.

The collected writings of Dass were edited (3 vols., Christiania, 1873–77) by Dr. A. E. Eriksen.

DASYURE, a name for any member of the family *Dasyuridae* (see MARSCPIALIA). The name is better restricted to animals of the typical genus Dasyurus. These are mostly inhabitants of the Australian continent and Tasmania. They hide themselves in the daytime in holes among rocks or in hollow trees, but prowl about at night in search of the small mammals and birds which constitute their prey. In arboreal species there are transversely striated pads on the feet; these are absent in terrestrial forms such as the common dasyure (D. *viverrinus*). The ursine dasyure (*Sarcophilus* ursinus), often called the "Tasmanian Devil," constitutes a distinct genus. In size it may be compared to an English badger. The general colour of the fur is black tinged with brown, with white patches on the neck, shoulders, rump and chest.

It is a burrowing animal, nocturnal and carnivorous, and commits great depredations on the sheepyards and poultry-lofts of the inhabitants.

DATE LINE: see INTERNATIONAL DATE LINE.

DATE PALM. The dates of commerce are the fruit of a species of palm, Phoenix *dactylifera,* a tree which ranges from the Canary Islands through northern Africa and the southeast of Asia to India. For an illustration of this tree see PALM. It has been cultivated and much prized as the staple food and chief source of wealth in the irrigable desert portions of most of these regions from the remotest antiquity. Iraq (Mesopotamia) is the leading date growing country in the world and supplies most of the fruit exported to Europe and America. Although high summer temperatures and low humidity during the ripening season are required for successful fruit production, the palm itself wiil grow in any tropical or subtropical region where prolonged temperatures below 20° F. are not of frequent occurrence. Along the Mediterranean shores of Europe the date palm is grown as an ornamental and used to supply leaves for the festival of Palm Sunday among Christians, and for the celebration of the Feast of Tabernacles by Jews. It was carried to the new world by Spanish missionaries in the 18th and early 19th centuries and a few seedling plantings of date palms in the dry districts of Mexico date back to that period. Early in the 20th century some of the better varieties of the old world were introduced into the southwestern United States and are being cultivated on a commercial scale. In 1941 there were approximately 500 ac. of dates in Arizona and 3300 ac. in southern California, of which 3000 were in Coachella valley, 140 mi. S.E. of Los Angeles. The leading varieties grown in the United States are Deglet Noor from

Algeria, Saidy from Egypt, and Khadrawy, Zahidi and Halawy from Iraq.

The date palm is a beautiful tree, growing to a height of from 60 ft. to 80 ft. and its stem, which is strongly marked with the pruned stubs of old leaf bases, terminates in a crown of graceful, shining, pinnate leaves, 10 ft. to 20 ft. long. The flowers are of separate sexes borne on different palms in branching spadices from the axils of leaves which emerged the previous year. Under cultivation it is necessary to pollinate the female flowers by artificial means. The fruit is a one-seeded berry, usually more or less oblong, but varying much in shape, size, colour, quality and consistency of flesh according to variety and cultural conditions. A single large bunch may carry over 1000 fruits weighing 20 lbs. or more. The dried fruit so widely exported contains more than half its weight of sugar and about 2% each of protein, fat and mineral matter.

Propagation is either from seeds or from suckers or offshoots which arise chiefly near the base of the stem in the early years of the palm's life.

Palms grown from seed are a source of new varieties but extremely variable and about equally divided as to number of males and females.

Offshoots reproduce the sex and character of the parent palm and are used for commercial plantings. When offshoots are 3–6 yrs. old and have formed roots of their own they are removed and planted. Palms are spaced about 30 x 30 ft.; they begin to bear in 5 or 6 yrs. and reach full bearing at 10 to 15 yrs., yielding 100 to 200 lbs. or more each. Although palms are known to live as long as 150 yrs., fruit production declines, and in commercial culture palms are replaced at a much earlier age.

All parts of the date palm yield products of economic value to the old world areas where it is grown. Its trunk furnishes timber for house-building; the midribs of the leaves supply material for crates and furniture; the leaflets for basketry; the leaf bases for fuel; the fruit stalks for rope and fuel; the fibre for cordage and packing material; the seeds are sometimes ground and used for stock feed; vinegar and a strong liquor are made from the fermented fruit.

Date sugar is a valuable commercial product of India, obtained from the sap or toddy of *Phoenix sylvestris,* another species very closely related to the date palm. The juice, when not boiled down to form sugar, is either drunk fresh, or fermented and distilled to form an alcoholic drink. *Date palm meal* is obtained from the stem of a small species, *Phoenix farinifera,* growing in the hill country of southern India.

For further details *see* Sir *G.* Watt, *Dictionary of the Economic Products of India* (1892); *The Date Palm,* U.S. Department of Agriculture, Bureau of Plant Industry, Bulletin No. 53 (W. T. Swingle), 1904; and Reports of the Annual Date Growers' Institutes, Indio, Calif., yearly since 1924. (R. W. N.)

DATIA, an Indian state in the Bundelkhand agency. It lies in the extreme northwest of Bundelkhand, near Gwalior, and is surrounded on all sides by other states of central India, except on the east where it meets the United Provinces. The state came under the British government after the treaty of Bassein in 1802, and was settled with the present family by treaties in 1804, and 1818. Area, 911 sq.mi.; pop. (1931) 158,834. The chief, whose title is maharaja, is a rajput of the Bundela clan, being descended from a younger son of a former chief of Orchha; his salute is 11 guns. The town of Datia (pop. 18,292 in 1931) is surrounded by a stone wall, enclosing handsome palaces, with gardens; the palace of Bir Singh Deo, of the 17th century, is "one of the finest examples of Hindu domestic architecture in India" and is now untenanted.

DATIVE, the name, in grammar, of the case of the "indirect object," the person or thing to or for whom or which anything is given or done (Lat. *dativus,* giving or given, from *dare,* to give). In law, the word signifies something, such as an office, which may be disposed of at will. In Scots law the term signifies "appointed or granted by a court." In Roman law, a *tutor* was either *dativus,* if expressly nominated in a testament, or *optivus,* if a power of selection was given.

DATO, EDUARDO (1856–1921), Spanish politician, was born at Corunna on Aug. 12, 1856. He graduated in law at Madrid university and was elected deputy in 1884. Under-secretary for the home department in 1892, he became minister for the department in 1899, and promoted bills regarding accidents, insurance and women's labour. In Dec. 1902 he became minister of justice, in 1907 mayor of Madrid and then president of the chamber. He belonged to the "liberal-conservative" variety of the conservative party, which his friend and political chief Silvela had represented, and after Silvela's death continued to maintain this attitude. When in 1913 Señor Maura refused to take power, Señor Dato dissented from his chief, carrying with him the majority of his party, which elected him as its leader. When World War I broke out, he was responsible for Spain's declaration of neutrality. Becoming prime minister again in June 1917, he faced with determination the revolutionary outbreaks and disturbances of that summer. He resigned in October, but in 1920 resumed office, and while prime minister was murdered in Madrid on March 8, 1921.

DATOLITE, a mineral species consisting of basic calcium and boron orthosilicate, $Ca(BOH)SiO_4$. It is white or colourless. often with a greenish tinge, and may be either transparent or opaque; it usually occurs as well-developed monoclinic crystals bounded by numerous bright faces, many of which often have a more or less pentagonal outline, but also as masses with a granular to compact texture, the fractured surfaces having the appearance of porcelain when the mineral is compact. Hardness $5–5\frac{1}{2}$; specific gravity 3.0.

Datolite is a mineral of secondary origin, and in its mode of occurrence it resembles the zeolites, being found with them in the amygdaloidal cavities of basic igneous rocks such as basalt; it is also found in gneiss and serpentine, and in metalliferous veins and in beds of iron ore. At Arendal in Norway, the original locality for both the crystallized and botryoidal, or fibrous variety (known also as botryolite), it is found in a bed of magnetite. In amygdaloidal basaltic rocks it is found at Bishopton in Renfrewshire and near Edinburgh; and as excellent crystallized specimens at several localities in the United States.

DATURA: *see* STRAMONIUM.

DAUB, KARL (1765–1836), German Protestant theologian. was born at Cassel on March 20, 1765. He studied at Marburg, and in 1795 became professor ordinarius of theology at Heidelberg, where he died on Nov. 22, 1836. Daub sought to bring about a speculative reconstruction of orthodox dogma, but he unfortunately ignored historical criticism. His *Lehrbuch der Katechetik* (1801) was written under the spell of Kant, his *Theologumena* (1806), his *Einleitung* in *das Studium der christl. Dogmatik* (1810), and his *Judas Iscarioth* (2 vols., 1816), in the spirit of Schelling, while *Die dogmatische Theologie jetziger Zeit* (1833), and *Vorlesungen über die Prolegomena zur Dogmatik* (1839) are Hegelian in principle.

See Rosenkranz, *Erinnerungen an Karl Daub* (1837); F. Lichtenberger, *History of German Theology* (1889); *O.* Pfleiderer, *Development of Theology* (1890).

DAUBENTON, LOUIS-JEAN-MARIE (1716–1800), French naturalist, was born at Montbar (Côte d'Or). In 1741 he graduated in medicine at Reims, and returned to his native town with the intention of practising, but Buffon invited him to provide the anatomical descriptions for his treatise on natural history. His details of the dissection of 182 species of quadrupeds in Buffon's work brought him great reputation; but a feeling of jealousy induced Buffon to dispense with his services in the remainder of the treatise. Daubenton now occupied himself with zoological descriptions and dissections, the comparative anatomy of recent and fossil animals, vegetable physiology, mineralogy, experiments in agriculture, and the introduction of the merino sheep into France. In 1744 he was appointed keeper and demonstrator of the cabinet of natural history in Paris, and from 1775 lectured on natural history in the college of medicine, and in 1783 on rural economy at the Alfort school. He was also professor of mineralogy at the Jardin du Roi. In Dec. 1799 he was appointed a member of the senate.

Daubenton died in Paris on Jan. 1, 1800.

DAUBENY, CHARLES GILES (1795–1867), English scientist born at Stratton, Gloucestershire, on Feb. 11, 1795, studied medicine. He was professor of chemistry (1823–j's), and of botany (1834–67) at Oxford, and carried out numerous experiments on the effect of changes in soil, light, etc., on plants. He also made an extensive survey of the volcanoes of Europe, the results of which are embodied in his Description of Active and *Extinct Volcanoes* (1826; 2nd ed., 1848). He died at Oxford on Dec. 12, 1867.

DAUBIGNY, CHARLES FRANÇOIS (1817–1878), French landscape painter, allied in several ways with the Barbizon school, was born in Paris, on Feb. 15, 1817, but spent much time as a child at Valmondois, a village on the Oise to the north-west of Paris. Daubigny was the son of an artist, and most of his family were painters. He studied in Italy and painted for nearly two years; he then returned to Paris, not to leave it again until, in 1860, he took a house at Auvers on the Oise. By 1837 Daubigny had become famous as a river and landscape painter, althcugh he had been devoting himself as well to drawing in black-and-white, to etching, wood engraving and lithography. In 1855 his picture, "Lock at Optevoz," in the Louvre, was purchased by the State. He visited London more than once, and spent some time in Holland. He died in Paris on Feb. 19, 1878. Daubigny is chiefly preferred in his riverside pictures, of which he painted a great number, but although there are two landscapes by Daubigny in the Louvre, neither is a river view. They are for that reason not so typical as many of his smaller Oise and Seine pictures. Among his most ambitious canvases are: "Springtime" (1857), in the Louvre; "Borde de la Cure, Morvan" (1864); "Villerville sur Mer" (1864); "Moonlight" (1865); "Andrésy sur Oise" (1868); and "Return of the Flock—Moonlight" (1878).

His followers and pupils included his son Karl (who painted so well that his works are occasionally mistaken for those of his father, though in few cases do they equal his father's mastery), Oudinot, Delpy and Damoye. The works of Daubigny are, like Corot's, to be found in many modern collections.

See Fred Henriet, C. Daubigny et son oeuvre (1878); Albert Wolff, La *Capitale* de *l'art*: Ch. *François Daubigny* (1881); J. Claretie, Peintres et *sculpteurs* contemporains: Daubigny (1882); D. Croal Thomson, The *Barbizon* School of Painters (1890); J. W. Mollett, Daubigny (1890).

DAUBLER, THEODORE (1876–1934), German writer, was born in Trieste on Aug. 17, 1876, son of a merchant family. With the appearance of Das Nordlicht (1910) Daubler took his place at the head of the German expressionist movement. Das Nordlicht is a massive religious allegory showing the author's own path from agnosticism to mystic religion, under an epic-heroic disguise. Other characteristic poetical works are Der *Sternhelle* Weg (1913), Das Sternenkind (1916) and Die *Treppe zum* Nordlicht (1920), Attische Sonette (1924); prose works, *Mit silberner* Sichel (1921); *Wir wollen* nicht verweilen (autobiographical fragment, 1916); Der neue *Standpunkt* (artistic criticism, 1916); *Lucidarium* in arte *musica* (musical criticism, 1917); Ein *Kampf um* die *moderne Kunst.* Daubler was remarkably successful in giving his thought clear and often melodious expression, but his original work, possibly owing to its Latin forms, was slow in achieving wide popularity in Germany. His influence as a critic of expressionist music and poetry was, however, very great. In 1928 he was elected a member of the German Academy of Letters.

DAUDET, ALPHONSE (1840–1897), French novelist, was born at Nimes on May 13, 1840, the son of a silk manufacturer. The lad, amid much truancy, had but a depressing boyhood. In 1856 he left Lyons, where his schooldays had been mainly spent, and began life as an usher at Alais, in the south. The position proved to be intolerable. On Nov. 1, 1857, he abandoned teaching, and took refuge with his brother Ernest in Paris. Alphonse wrote poems, shortly collected into a small volume Les *Amoureuses* (1858), which met with a fair reception, obtained employment on the Figaro, and wrote two or three plays. The duc de Morny appointed him to be one of his secretaries—a post which he held till Morny's death in 1865.

In 1866 appeared Lettres de mon *moulin.* The first of his longer books, Le petit chose (1868), the pathetic story of his own earlier years, is told with much grace and pathos. The year 1872 produced the famous *Aventures prodigieuses* de *Tartarin* de *Tarascon,* and the three-act piece *L'Arlésienne. Fromont jeune et Risler aîné* (1874) struck a note, not new certainly in English literature, but comparatively new in French. Here was a writer who possessed the gift of laughter and tears, a writer not only sensible to pathos and sorrow, but also to moral beauty. Jack, the story of an illegitimate child, a martyr to his mother's selfishness, followed in 1876. Other novels followed: Le Nabab (1877), Les *Rois en exil* (1879), *Numa* Roumestan (1881), Sapho (1884) and *L'Immortel* (1888). Daudet then wrote his own reminiscences in Trente *ans* de Paris (1887) and Souvenirs d'un *homme* de leftres (1888). These, with the three Tartarins—Tartarin the mighty hunter, Tartarin the mountaineer, Tartarin the colonist—and the admirable short stories, written for the most part before he had acquired fame and fortune, constitute his life work.

Though Daudet defended himself from the charge of imitating Dickens, it is difficult altogether to believe that so many similarities of spirit and manner were quite unsought. What, however, was purely his own was his style. It is a style that may rightly be called "impressionist," full of light and colour, not descriptive after the old fashion, but flashing its intended effect by a masterly juxtaposition of words that are like pigments. Nor does it convey, like the style of the Goncourts, to whose work it owed something, a constant feeling of effort. It is full of felicity and charm—*un charmeur* Zola has called him. An intimate friend of Edmond de Goncourt (who died in his house), of Flaubert, of Zola, Daudet belonged essentially to the naturalist school of fiction. His own experiences, his surroundings, the men with whom he had been brought into contact, various persons who had played a part, more or less public, in Paris life—all passed into his art. But he vivified the material supplied by his memory. His world has the great gift of life. *L'Immortel* is a bitter attack on the French Academy, to which august body Daudet never belonged.

Daudet wrote some charming stories for children, among which may be mentioned La Belle Nivernaise, the story of an old boat and her crew. His married life—he married in 1867 Julia Allard—seems to have been singularly happy. There was perfect intellectual harmony, and Madame Daudet herself is known by her Impressions de *nature* et *d'art* (1879), *L'Enfance d'une* Parisienne (1883), and by some literary studies written under the pseudonym of Karl Steen. In his later years Daudet suffered from insomnia, failure of health and consequent use of chloral. He died in Paris on Dec. 17, 1897.

The story of Daudet's earlier years is told in his brother Ernest Daudet's *Mon frère* et moi. There is a good deal of autobiographical detail in Daudet's *Trente ans* de Paris and Souvenirs d'un *homme* de *lettres,* and also scattered in his other books. The references to him in the Journal des *Goncourt* are numerous. See also L. A. Daudet, Alphonse Daudet (1898), and biographical and critical essays by R. H. Sherard (1894); by A. Gerstmann (1883); by B. Diederich (1900); by A. Hermant (1903), and a bibliography by J. Brivois (1895); also The Works of *Alphonse* Daudet, translated by L. Ensor, H. Frith, E. Bartow (1902, etc.). Criticism of Daudet is also to be found in F. Brunetière, Le Roman naturaliste (new ed., 1897); J. Lemaitre, Les *Contemporains* (vols. ii. and iv.); G. Pellissier, Le Mouvement *littéraire* au *XIXe siècle* (1890); A. Symons, Studies in Prose and Verse (1904).

DAUDET, LÉON (1867–1942), French man of letters and politician, born in Paris Nov. 16, 1867, son of Alphonse Daudet (*q.v.*) He married a granddaughter of Victor Hugo, whom he subsequently divorced. His violent opposition to the Government permitted him to display his talents as a controversialist. He wrote for Le *Gaulois* and Le Figaro, and also for La *Libre* Parole, a violently anti-semitic paper, in the columns of which he was able to give full vent to his fiery temperament. Influenced by the writer, Charles Maurras, he adopted the doctrines of neo-royalism. At the time of the Dreyfus case, through the generosity of Madame de Loynes, the royalist paper, Action *Française,* was founded in 1899, afterwards appearing as a daily newspaper in 1908. The lucidity and force of his literary style, the wealth of his invective, often highly-coloured, combined to make him read and

feared for 20 years. He was elected to the Chamber as a deputy for Paris in 1919, but was defeated in 1924. With the establishment of peace his influence declined. In the summer of 1925 the death of his young son, Philippe, caused a great sensation. The finding of the judicial enquiry was that he had committed suicide, but Leon Daudet conducted a long and violent campaign to prove that he had, in fact, been murdered. He accused the chauffeur, in whose taxi his son had been found dead from a bullet wound, of complicity. The chauffeur prosecuted him, and Daudet was condemned to prison and ordered to pay heavy compensation. He was imprisoned in the *Santé* at Paris, from which he was rescued in 1927 by a ruse of royalists, who made the governor of the prison believe he had been pardoned; Daudet fled to Belgium.

The best of Daudet's novels are: *L'astre noir* (1893); *Les Morticoles* (1894); *Le voyage de Shakespeare* and *Sylla et son destin* (1922). Among his philosophical and controversial works may be mentioned *L'Hérédo* (1916); *Le monde des images* (1919); *L'avant-guerre* (1913); *Le stupide XIXe siècle* (1922); and *Souvenirs* (1914). Daudet died July 1, 1942.

DAUGAVPILS (Dvinsk), a town of Latvia in 55° 53' N., 26° 32' E. on the Daugava (Western Dvina). Pop. (1939) 41,160. Formerly a Russian fortress, it was later the training centre for the Lettish army. The Livonian Knights of the Sword founded a fort 12 mi. farther up the river, which was removed to its present site by Stephen Bathori, King of Poland, in 1582. Poland, Sweden and Russia alternately occupied this strategic border fort until the partition of Poland gave it to Russia in 1772. The French occupied it in 1812 and it was a centre of strife in both World Wars I and II. The population and industry (particularly timber) were diminished as a result of war and political shifts. (*See* LATVIA.)

DAULATABAD, hill-fortress, Hyderabad State, India, about 10 m. N.W. of the city of Aurangabad. The former city of Daulatabad (Deogiri) has shrunk to a village though its magnificent fortress and remains of public buildings survive. The fortress, on a conical rock, crowns a hill rising steeply from the plain to a height of some 600 ft. The outer wall, $2\frac{3}{4}$ m. in circumference, once ecclosed the ancient city of Deogiri (Devagiri), and between this and the base of the upper fort are three lines of defences. The only access to the summit is by a narrow bridge, with passage for two men abreast, and a long gallery, excavated in the rock, with a steep stair midway, the top of which is covered by a grating destined in time of war to form the hearth of a huge fire kept burning by the garrison above. The remarkable Chand Minar in Daulatabad, a tower 210 ft. high and originally covered with Persian glazed tiles, was erected in 1445 by Ala-ud-din Bahmani to commemorate his capture of the fort. The Chini Mahal, or China Palace, is the ruin of a building in which Abul Hasan, the last of the Kutb Shahi kings of Golconda, was imprisoned by Aurangzeb in 1687.

Deogiri is said to have been founded *c.* A.D. 1187 by Bhillama I. who renounced his allegiance to the Chalukyas and established the power of the Yadava dynasty in the west. In 1294 the fort was captured by Ala-ud-din Khilji, and the rajas were reduced to pay tribute. The tribute fslling into arrear, Deogiri was again occupied by the Mohammedans, and in 1318 the last raja, Harpal, was flayed alive. Deogiri now became an important base for Muslim expeditions southwards, and in 1339 Mohammed ben Tughlak Shah made it his capital as Daulatabad ("Abode of Prosperity"), and made arrangements for transferring to it the population of Delhi, but troubles summoned him north; during his absence the Muslim governors of the Deccan revolted, and Daulatabad itself was taken by Zafar Khan, governor of Gulbarga. Later it fell into the hands successively of the Nizam Shahis, the emperor Akbar, the Shah of Ahmednagar, the Nizam Shahi usurper, Malik Amber, Shah Jehan, the Mogul emperor and the Nizam of Hyderabad, who took it after the death of Aurangzeb. Its glory, however, had already decayed owing to the removal of the seat of government by the emperors to Aurangabad.

DAUMER, GEORG FRIEDRICH (1800–1875), German writer on religion, was born on March 5, 1800, at Nuremberg arid died on Dec. 13, 1875, at Wurzburg. He was educated at Erlangen and Leipzig, and, forsaking his early pietism, violently opposed Christianity, especially in his *Die Geheimnisse des christlichen Altertums* (1847). After the publication of *Religion des neuen Weltalters,* 3 vols. (1850), Daumer approached Mohammedanism in his poems, *Mahomet* (1848) and *Liederblüten der Hafis* (1846–51). He became a Catholic in 1859, and wrote Das *Wunder* (1874) and *Kaspar Hauser, sein Wesen, seine Unschuld* (1873).

DAUMET, PIERRE JEROME HONORÉ (1826–1911), French architect, member of the Académie des Beaux-Arts, was born on Oct. 23, 1826, in Paris. He entered the École des Beaux-Arts in 1846, and in 1855 was awarded the Prix de Rome. In 1861 he was sent on an archaeological expedition to Macedonia, and published, in collaboration with Léon Henzey, an important work on the researches in Thessaly, Thrace and Illyria. He was entrusted with the restoration of many monuments of French architecture, in particular the castle of Chantilly, the Palais de Justice, Paris, and the theatre at Orange. In Nov. 1884 Daumet undertook the construction of the Église du Sacré-Coeur on Montmartre, which had already been begun by the architect Abbadie; but the following year he abandoned the task, after a dispute with the ecclesiastical authorities. He died in Paris on Dec. 15, 1911.

DAUMIER, HONORÉ (1808–1879), French caricaturist and painter, was born at hfarseilles on Feb. 20, 1808, and died at Valmondois on Feb. 11, 1879. Daumier started his artistic career by producing plates for music publishers and illustrations for advertisements; these were followed by anonymous work for publishers, in which he followed the style of Charlet and displayed considerable enthusiasm for the Napoleonic legend. When, in the reign of Louis Philippe, Philipon launched the comic journal, La *Caricature,* Daumier joined its staff, which included Devéria, Raffetand Grandville, and started upon his pictorial campaign of scathing satire upon the foibles of the bourgeoisie, the corruption of the law and the incompetence of a blundering Government. His caricature of the king as "Gargantua" led to imprisonment for six months at Ste. Pélagie in 1832. The publication of *La Caricature* was discontinued soon after, but Philipon provided a new field for Daumier's activity when he founded the *Charivari.* For this journal Daumier produced his famous social caricatures in which bourgeois society is held up to ridicule in the figure of Robert Macaire, the hero of a then popular melodrama. Another series, "L'histoire ancienne," was directed against the pseudo-classicism which held the art of the period in fetters. In 1848 Daumier embarked again on his political campaign still in the service of *Charivari,* which he left in 1860 and rejoined in 1864. In spite of his prodigious activity in the field of caricature — the list of Daumier's lithographed plates compiled in 1904 numbers no fewer than 3,958 — he found time for flight in the higher sphere of painting. Except for the searching truthfulness of his vision and the powerful directness of his brushwork, it would be difficult to recognize the creator of "Robert Macaire," of "Les Bas bleus," "Les Bohémiens de Paris," and the "Masques," in the paintings of "Christ and His Apostles" at the Ryks Museum in Amsterdam, or in his "Good Samaritan," "Don Quixote and Sancho Panza," "Christ Mocked," or even in the sketches in the Ionides Collection at South Kensington. But as a painter, Daumier, one of the pioneers of naturalism, was before his time, and had little success until in 1878, a year before his death, when M. Durand-Ruel collected his works for exhibition at his galleries and demonstrated the full range of the genius of the man who has been well called the Michelangelo of caricature. At the time of this exhibition Daumier, totally blind, was living in a cottage at Valmondois which was placed at his disposal by Corot, and where he breathed his last in 1879. An important exhibition of his works was held at the École des Beaux-Arts in 1900.

DAUN (DHAUN), LEOPOLD JOSEF, COUNT VON (1705–1766), prince of Thiano, Austrian field marshal, was born at Vienna on Sept. 24, 1705. He served in Sicily (1718), in Italy and on the Rhine in the War of the Polish Succession (1734–35), against the Turks (1737–39), and in the War of the Austrian Succession (1740–42). He was present at Chotusitz and Prague, and led the advanced guard of Khevenhuller's army in the victorious Danube campaign of 1743. Field Marshal Traun, who succeeded Khevenhiiller in 1744, thought equally highly of Daun, and entrusted him with the rearguard of the Austrian army when it escaped from the French to attack Frederick the Great. He held important commands in the battles of Hohenfriedberg and Soor, and in the same year (1745) was promoted to the rank of *Feldzeugmeister*. After this he served in the Low Countries, and was present at the battle of Val. Maria Theresa made him commandant of Vienna and a knight of the Golden Fleece, and in 1754 he was elevated to the rank of field marshal.

During the interval of peace that preceded the Seven Years' War he began the reorganization of the Austrian army. He was not actively employed in the first campaigns of the war, but in 1757 he commanded the army raised to relieve Prague. On June 18, 1757, Daun defeated Frederick for the first time in his career in the desperately fought battle of Kolin (*q.v.*). The union of the relieving army with the forces of Prince Charles at Prague reduced Daun to the position of second in command, and as such he took part in the pursuit of the Prussians and the victory of Breslau. Frederick now reappeared and won the most brilliant victory of the age at Leuthen. Daun was not held accountable for the disaster, and when Prince Charles resigned his command, Daun was appointed in his place. With the campaign of 1758 began the war of manoeuvre in which Daun, if he missed, through over-caution, many opportunities of crushing the Prussians, at least maintained a steady and cool resistance to the fiery strategy of Frederick. In 1758 Major-General Loudon, acting under Daun's instructions, forced the king to raise the siege of Olmutz, and later in the same year Daun himself surprised Frederick at Hochkirch and inflicted a severe defeat upon him (Oct. 14). On Nov. 20–21, 1759, he surrounded the entire corps of General Finck at Maxen, forcing the Prussians to surrender. These successes were counterbalanced in the following year by the defeat of Loudon at Liegnitz, which was attributed to the dilatoriness of Daun, and Daun's own defeat in the great battle of Torgau (*q.v.*). In this engagement Daun was severely wounded.

He continued to command until the end of the war, and afterwards worked with the greatest energy at the reorganization of the imperial forces. In 1762 he had been appointed president of the *Hofkriegsrat*. He died on Feb. 5, 1766.

See *Der deutsche Fabius Cunctator, oder Leben u. Thaten S. E. des H. Leopold Reichsgrafen v. Dhaun K.K.F.M.* (Frankfort and Leipzig, 1759–60), and works dealing with the wars of the period.

DAUNOU, PIERRE CLAUDE FRANÇOIS (1761–1840), French statesman and historian, born at Boulogne-sur-Mer on Aug. 18, 1761, was educated in the school of the Oratorians there and joined the order in Paris in 1777. He was professor in various seminaries from 1780 till 1787, when he was ordained priest. Elected to the Convention by Pas-de-Calais, he associated himself with the Girondists, but strongly opposed the death sentence on the king. He took little part in the struggle against the Mountain, but was involved in the overthrow of his friends, and was imprisoned for a year. In December 1794 he returned to the Convention, and was the principal author of the Constitution of the year III. It seems to have been due to his Girondist ideas that the Ancients were given the right of convoking the *corps législatif* outside Paris, an expedient which made possible Napoleon's *coup d'état* of the 18th and 19th Brumaire. The creation of the Institute was also due to Daunou, who drew up the plan for its organization. His energy was largely responsible for the suppression of the royalist insurrection of the 13th Vendémiaire, and the important place he occupied at the beginning of the Directory is indicated by the fact that he was elected by twenty-seven departments as member of the Council of Five Hundred, and became its first president. He had himself set the age qualification of the directors at forty, and thus debarred himself as candidate, as he was only thirty-four. The direction of affairs having passed into the hands of Talleyrand and his associates, Daunou turned once more to literature, but in 1798 he was sent to Rome to organize the republic there, and again, almost against his will, he lent his aid to Napoleon in the preparation of the Constitution of the year VIII. He supported Napoleon's policy in the controversy with the Vatican in his *Sur la puissance temporelle du Pape* (1809). Still, he took little part in the new régime, with which at heart he had no sympathy, and turned more and more to literature. At the Restoration he was deprived of the post of archivist of the Empire, which he had held from 1807, but from 1819 to 1830 (when he again became archivist of the kingdom) he held the chair of history and ethics at the Collkge de France. In 1839 he was made a peer. He died in 1840.

Daunou's lectures at the Collkge de France, collected and published after his death, fill twenty volumes *(Cours d'études historiques,* 1842–1846). They treat principally of the criticism of sources and the proper method of writing history, and occupy an important place in the evolution of the scientific study of history in France. Personally Daunou was reserved and somewhat austere, preserving in his habits a strange mixture of bourgeois and monk. His indefatigable work as archivist in the time when Napoleon was transferring so many treasures to Paris is not his least claim to the gratitude of scholars.

See Mignet, *Notice historique sur la vie et les travaux de Daunou (1843)*; Taillandier, *Docztments biographiques sur Daunou* (1847), including a full list of his works; Sainte-Beuve, *Daunou* in his *Portraits Contemporains,* t. iii. (unfavourable and somewhat unfair).

DAUPHIN, an ancient feudal title in France, borne only by the counts and dauphins of Vienne, the dauphins of Auvergne, and from 1364 by the eldest son of the king of France. The origin of this curious title is obscure; but it now seems clear that it was in the first instance a proper name. It was borne by Guigo, or Guigue IV. (d. 1142), count of Albon and Grenoble, as an additional name, during the lifetime of his father, and was also adopted by his son Guigue V. Beatrice, daughter and heiress of Guigue V., whose second husband was Hugh III., duke of Burgundy, bestowed the name on their son André, to recall his descent from the ancient counts of Albon. His successors Guigue VI. (d. 1270) and John I. (d. 1282) call themselves sometimes Delphinus, sometimes Delphini, the name being obviously treated as a patronymic, and in the latter form it was borne by the sons of the reigning "dauphin." But even under Guigue VI. foreigners had begun to confuse the name with a title of dignity, an imperial diploma of 1248 describing Guigue as "Guigo Dalphinus Viennensis."

It was not until the marriage of Anne, heiress of John I., with Humbert, Lord of La Tour du Pin, that "dauphin" became definitely established as a title. Humbert not only assumed the name of Delphinus, but styled himself regularly Dauphin of the Viennois (Dalphinus Viennensis), and in a treaty concluded in 1285 between Humbert and Robert, duke of Burgundy, the word *delphinatus* (Dauphiné) appears for the first time as a synonym for *comitatus* (county). In 1349 Humbert II., the last of his race, sold Dauphiné to Charles of Valois, who, when he became king of France in 1364, transferred it to his eldest son. From that time the eldest sons of the kings of France were always either actual or titular dauphins of the Viennois.

The eldest son of the French king was sometimes called "the king dauphin" (*le roy daulphin*), to distinguish him from the dauphin of Auvergne, who was known, since Auvergne became an appanage of the royal house, as "the prince dauphin." The dauphinate of Auvergne, which is to be distinguished from the county, dates from 1155, when William VII., count of Auvergne, was deposed by his uncle William VIII. William VII. had married *a* daughter of Guigue IV. Dauphin, after whom their son was named Dauphin (Delphinus). The name continued, as in Viennois, as a patronymic, and was not used as a title until 1281, when Robert II., count of Clermont, in his will, styles himself for the first time Dauphin of Auvergne for the portion of the county of Auvergne left to his house. In 1428 Jeanne, heiress of the dauphin Béraud

III., married Louis de Bourbon, count of Montpensier (d. 1486), thus bringing the dauphinate into the royal house of France. It was annexed to the Crown in 1693.

See A. Prudhomme, "De l'origine et du sens des mots dauphin et dauphine" in *Bibliothdque de l'École des Chartes,* liv. *an.* 1893.

DAUPHINE, one of the old provinces (the name being still in current use in the country) of pre-Revolutionary France, in the south-east portion of France, between Provence and Savoy; since 1790 it forms the departments of the Isère, the Drôme and the Hautes Alpes.

After the death of the last king of Burgundy, Rudolf III., in 1032, the territories known later as Dauphin6 (as part of his realm) reverted to the far-distant emperor. Much confusion followed, out of which the counts of Albon (between Valence and Vienne) gradually came to the front. The first dynasty ended in 1162 with Guigue V., whose daughter and heiress, Beatrice, carried the possessions of her house to her husband, Hugh III., duke of Burgundy. Their son, André, continued the race, this second dynasty making many territorial acquisitions, among them (by marriage) the Embrunais and the Gapençais in 1232. In 1282 the second dynasty ended in another heiress, Anna, who carried all to her husband, Humbert, lord of La Tour du Pin (between Lyons and Grenoble). The title of the chief of the house was Count (later Dauphin) of the Viennois, *not* of Dauphiné. (For the origin of the terms Dauphin and Dauphin6 *see* DAUPHIN.) Humbert II. (1333–49), grandson of the heiress Anna, was the last independent Dauphin, selling his dominions in 1349 to Charles of Valois, who on his accession to the throne of France as Charles V. bestowed Dauphin6 on his eldest son, and the title was borne by all succeeding eldest sons of the kings of France. In 1422 the Diois and the Valentinois, by the will of the last count, passed to the eldest son of Charles VI., and in 1424 were annexed to the Dauphiné. Louis (1440–61), later Louis XI. of France, was the last Dauphin who occupied a semi-independent position, Dauphin6 being annexed to the crown in 1456. The suzerainty of the emperor (who in 1378 had named the Dauphin "Imperial Vicar" within Dauphin6 and Provence) gradually died out. In the 16th century the names of the reformer Guillaume Farel (1489–1565) and of the duke of Lesdiguières (1543–1626) are prominent in Dauphin6 history. The "States" of Dauphin6 (dating from about the middle of the 14th century) were suspended by Louis XIII. in 1628, but their unauthorized meeting (on July 21, 1788) in the tennis court *(Salle du Jeu de Paume)* of the castle of Vizille, near Grenoble, was one of the earliest premonitory signs of the great French Revolution of 1789. It was at Laffrey, near Grenoble, that Napoleon (March 7, 1815) was first acclaimed by his old soldiers sent to arrest him.

DAURAT or **DORAT, JEAN** (in Lat. AURATUS) (1508–1588), French poet and scholar, and member of the Pléiade, was born at Limoges. His name was originally Dinemand. He belonged to a noble family, and, after studying at the college of Limoges, came up to Paris to be presented to Francis I., who made him tutor to his pages. As a private tutor in the house of Lazare de Baïf, he had J. A. de Baïf for his pupil. His son, Louis, showed great precocity, and at the age of ten translated into French verse one of his father's Latin pieces; his poems were published with his father's. After the death of Lazare de Baïf in 1547 Jean Daurat became the director of the Collège de Coqueret, where he had among his pupils, besides Baïf, Ronsard, Remy Belleau and Pontus de Tyard. Joachim du Bellay was added by Ronsard to this group; and these five young poets, under the direction of Daurat, formed a society for the reformation of the French language and literature. They increased their number to seven by the initiation of the dramatist Etienne Jodelle, and thereupon they named themselves La Pléiade, in emulation of the seven Greek poets of Alexandria. The election of Daurat as their president proved the weight of his personal influence, and the value his pupils set on the learning to which he introduced them, but as a writer of French verse he is the least important of the seven. Meanwhile he collected around him a sort of academy, and stimulated the students on all sides to a passionate study of Greek and Latin poetry. He himself wrote incessantly in both those languages, and was styled the Modern Pindar. His influence extended beyond the bounds of his own country, and he was famous as a scholar in England, Italy and Germany. In 1556 he was appointed professor of Greek at the Collkge Royale, a post which he continued to hold until, in 1567, he resigned it in favour of his nephew, Nicolas Goulu. Charles IX. gave him the title of *poeta regius.* His flow of language was the wonder of his time; he is said to have composed more than 15,000 Greek and Latin verses. The best of these he published at Paris in 1586 as *J. Aurati Lemovicis poëtae et interpretis regii poëmata.* He died in Paris on Nov. 1, 1588, having survived all his illustrious pupils of the Pléiade, except Pontus de Tyard. He was a little, restless man, of untiring energy, rustic in manner and appearance. His unequalled personal influence over the poets of his age gives him an importance for which his own writings do not fully account.

The *Oeuvres poétiques* in the vernacular of Jean Daurat were edited (1875) with biographical notice and bibliography by Ch. Marty-Laveaux in his *Ple'iade française.*

DAVAO, a well laid out chartered city (with administrative centre and 7 *barrios* or districts), and capital of the Province of Dávao, Mindanao, Philippine Islands, located on the Gulf of Dávao, at the mouth of the Dávao river, about 800 mi. from Manila. Pop. (1939), 95.546, of whom 170 were whites, 14,181 Japanese and 2,234 Chinese. An unusually high grade of abacá (Manila hemp) is produced and exported from the surrounding country, as well as copra; but it was the former which attracted the Japanese when its price rose to new levels during World War I. Concentrating there and then, they were by 1939 dominating the city, the hemp market, pearl fishing and other industries. It was quite natural, therefore, for the Japanese to make Dávao one of their landing places in their invasion of December 1941. The native population consists of Bisayans, Mandayas, Bagobos and Moros. Of those aged 6 to 19. 32·1% in 1939 attended school and of those ten years old and over 55·8% were literate.

DAVENANT, CHARLES (1656–1714), English economist, eldest son of Sir William Davenant, the poet, was born in London, and educated at Cheam grammar school and Balliol college, Oxford. He was member of parliament successively for St. Ives, Cornwall, and for Great Bedwyn. He held the post of commissioner of excise from 1683 to 1689, and that of inspector-general of exports and imports from 1705 till his death in 1714. He was also secretary to the commission appointed to treat for the union with Scotland. His most important works were: *Ways and Means of supplying the War* (169j); *An Essay on the East India Trade* (1697); *Two Discourses on the Public Revenues and Trade of England* (1698); *An Essay on the probable means of making the people gainers in the balance of Trade* (1699); *A Discourse on Grants and Resumptions* and *Essays on the Balance of Power* (1701).

See his *Works* edit. by C. Whitworth (1771).

DAVENANT or D'AVENANT, **SIR WILLIAM** (1606–1668), English poet and dramatist, was baptized on March 3, 1606; he was born at the Crown Inn, Oxford, of which his father, a wealthy vintner, was proprietor. It was stated that Shakespeare always stopped at this house in passing through the city of Oxford, and out of his known or rumoured admiration of the hostess, a

very fine woman, there sprang a story which attributed Davenant's paternity to Shakespeare, a legend which there is reason to believe Davenant himself encouraged. After a brief stay at Lincoln college, Oxford, Davenant became a page to the duchess of Richmond, and then entered the household of Fulke Greville, Lord Brooke. After Brooke's death he turned to the stage, his first play, *Albovine, King of the Lombards*, being produced in 1629. Other plays and masques followed, the most important of which was *The Wits*, licensed in 1633 and published in 1636. Davenant was high in favour at court, and succeeded Ben Jonson as poet laureate. Throughout the civil war Davenant supported the king. He joined Henrietta Maria in France, and was sent by her on more than one mission to England. He fought at the siege of Gloucester (1643), after which he was knighted, and returned to Paris after the battle of Naseby. He was captured by the Parliamentarians more than once. In 1650 he was at the head of a colonizing expedition to Virginia which was intercepted in the Channel. He was interned at Cowes until 1651 and was sent to the Tower to await trial for high treason. He solaced his imprisonment by the composition of his epic poem, *Gondibert*, and was released, it is said, on the personal intercession of Milton, for whom he interceded in his turn after the Restoration.

Davenant had been manager of the Drury Lane theatre when the Puritan régime put an end to dramatic performances. In 1656 he contrived to evade the law by giving semi-private representations in private houses. The first of these productions was *The First Day's Entertainment at Rutland House* (May 21, 1656), speeches for and against the drama with declamation and music. The famous *Siege of Rhodes* (Xug. 1656) followed. This was not, as sometimes stated, the first occasion in which changes of scenery were employed and women appeared on the stage, but it does mark the beginning of the change from the ancient simplicity of the English stage. To this performance was given the name "opera." In 1658 Davenant was permitted to open the Cockpit theatre in Drury Lane for historical drama, though not without some protest from Puritan sources. In 1659 he was imprisoned for complicity in the rising of Sir George Booth. At the Restoration Davenant and Killigrew received a patent to set up two companies of players, and Davenant's company became known as the duke of York's players, housed at first in Lincoln's Inn Fields. There were performed many "musical plays," and the theatre became known as the "opera."

The duke of York's players produced some of Davenant's pre-Commonwealth plays in a revised form, notably *Love and Honour* (1649), *The Wits* and *The Platonic Lovers* (1636), but many plays of Shakespeare, Jonson and Fletcher were "adapted," with considerable freedom, by Davenant for the Restoration stage. He also produced versions of various French plays.

Davenant died on April 7, 1668, and was buried in Westminster Abbey.

His works were collected in folio in 1672. *See* the edition of his *Dramatic Works*, with prefatory memoir and notes, by J. Maidment and Logan (1872–74).

DAVENBORT, CHARLES BENEDICT (1866–), American zoologist, was born at Stamford, Conn., on June 1, 1866. He graduated in 1886 at Brooklyn Polytechnic institute and, in 1889, at Harvard, from which in 1892 he received the degree of doctor of philosophy. After serving as assistant and instructor in zoology at Harvard in 1888–99, he was assistant and associate professor of zoology and embryology in the University of Chicago from 1899 to 1904 when he was made director of the station (at Cold Spring Harbor, L.I., N.Y.) for experimental evolution of the Carnegie Institution of Washington, in which he became the director of the eugenics record office and of the department of genetics (1904–34). He made valuable investigations in the breeding of animals, and in the heredity of eye. hair, and skin color, and of temperament, stature, and build in man. Among his published works are *Experimental Morphology* (1897–99), *Statistical Methods in Biological Variations* (2nd cd. 1904), *Inheritance in Poultry* (1906), *Eugenics* (1910), *Heredity in Relation to Eugenics* (1911), *Heredity of Skin Color in Negro-White Crosses* (1913), *The Feebly-Inhibited—Nomadism and Temperament* (1915), *Defects Found in Drafted Men* (1920), *Body Build and Its Inheritance* (1923), and *How We Came by Our Bodies* (1936).

DAVENPORT, EDWARD LOOMIS (1816–1877), American actor, born in Boston, made his first appearance on the stage in Providence in support of Junius Brutus Booth. Afterwards he went to England, where he supported Mrs. Anna Cora Mowatt (Ritchie) (1819–70), Macready and others. In 1854 he was again in the United States, appearing in Shakespearian plays and in dramatizations of Dickens's novels. As Bill Sikes he was especially successful and his Sir Giles Overreach and Brutus were also greatly admired. He died at Canton, Pa., on Sept. 1, 1877. In 1849 he had married Fanny Vining (Mrs. Charles Gill) (d. 1891), an English actress also in Mrs. Mowatt's company.

Their daughter FANNY (LILY GIPSY) DAVENPORT (1850–1898) appeared in America at the age of 12 as the king of Spain in *Faint Heart Never Won Fair Lady*. Later (1869) she was a member of Daly's company; and afterwards, with a company of her own, acted with especial success in Sardou's *Fédora* (1883), *Cleopatra* (1890) and similar plays. Her last appearance was on March 25, 1898, shortly before her death.

DAVENPORT, ROBERT (fl. 1623–1639), English dramatist, of whose life nothing is known. Three plays of his have survived, *King John and Matilda* (printed 1655); and two comedies, *The City-Nightcap*, (licensed in 1624, but not printed until 1661), and *A New Tricke to Cheat the Divell* (printed 1639). Other plays entered in the Stationers' Register as Davenport's are lost, including one called *Henry I. and Henry II.* (1653), the second part of which was said to be the work of Davenport and Shakespeare.

Davenport's plays were reprinted by A. H. Bullen in *Old English Plays* (new series, 1890). The volume includes two didactic poems, which first saw the light in 1623.

DAVENPORT, the third largest city of Iowa, U S A , on the Mississippi river, opposite Rock Island and Moline, Ill ; the county seat of Scott county. It is on federal highways 6, 61 and 67, and is served by the Chicago, Burlington and Quincy; the Chicago, Milwaukee, St. Paul and Pacific; the Chicago, Rock Island and Pacific, and the Davenport. Rock Island and Northwestern railways; and by bus lines and barges. Land area 18.1 sq.mi. Pop. (1940) 66.039. Davenport has a beautiful location on the slope of a bluff, rising to an altitude of 561 ft. above sea level, and commanding extensive views of landscape and river scenery. There are 12 parks (one along the river front), covering 710 ac., and including two municipal golf courses, a bathing beach, tennis courts, baseball diamonds and a zoological garden. The assessed valuation of property in 1940 was $58,233,071. Davenport has ten public grade schools, three junior high, one senior high and 11 parochial schools; St. Ambrose college for young men, Marycrest college for young women, the American Institute of Commerce and the Palmer School of Chiropractic. Davenport is an Episcopal see of the Roman Catholic and the Protestant Episcopal churches. It has a large commerce, by rail and by water, shipping especially great quantities of grain and oil; and has important manufactures, including freight cars, gondolas, ready-cut houses, flour, cereal products, candy, bakery goods, cement, washing machines and agricultural implements. The output of its factories in 1940 was more than $38,000,000. Bank clearings in 1940 amounted to $315,041,297. On an island in the Mississippi opposite the city, Rock Island arsenal is the largest government arsenal in the world, with 1,000 ac Davenport was founded in 1835, under the leadership of Col. George Davenport. It was incorporated as a town in 1839 and as a city in 1851 The first bridge across the Mississippi was built at this point in 1853.

DAVENTRY (pronounced dān'trĭ or dăv'ĕn-trĭ), a market town and municipal borough in the Daventry parliamentary division of Northamptonshire, England, 73¾ mi. N.W. from London on a branch of the L.M S.R. from Weedon. Population (1938) 3,703. Area 5 sq mi. Daventry is situated on a sloping site in a rich undulating country. The parish church of Holy Cross was rebuilt in 1752 Borough hill, adjoining Daventry, is the site of a vast ancient earthwork, more than two miles in circumference and en-

closing a superficial area of 150 ac. Other remains have been found at Burnt Walls in the vicinity; Watling street passes close by. Daventry grammar school (1576), enlarged and modernized, is a mixed secondary school under the county council. The chief industry of the town is the manufacture of boots and shoes. The making of whips is an extinct craft. Daventry became an important wireless centre after 1925, when the British Broadcasting corporation established on Borough hill a high-power station (5 XX) which assumed the functions formerly performed through Chelmsford. In 1927 a second station (5 GB), largely for experimental purposes, was installed, but it also took the place of an earlier Birmingham station (IT) for the broadcasting of alternative programs. These two stations were superseded by others, including a high-power short-wave station for overseas broadcasts. The outbreak of World War II, with a consequent increase in the amount of overseas broadcasts, accelerated the steady development of this wireless centre. Power is derived from Northampton through an electricity substation built in 1925 to supply Daventry.

The large commercial post office station at Hillmorton, near Rugby, is visible from Borough hill. The borough of Daventry is under a mayor, 4 aldermen, 12 councillors, and has a court of summary jurisdiction.

Nothing is known of Daventry itself until the time of the Domesday Survey, when the manor consisting of eight hides was held by the countess Judith, the Conqueror's niece, as the widow of Waltheof, the last native earl of Northumbria, who at the Conquest held the great midland earldom of Huntingdonshire and Northamptonshire. Before the end of the century it had passed to Simon de St. Liz, whose grandson, Walter Fitz-Robert, held "of the fee of the king of Scotland," who had become possessed of the earldom of Huntingdon (*see* HUNTINGDONSHIRE and NORTHAMPTONSHIRE). Daventry was created a borough by King John, who granted to Simon, son of Walter, a market on Wednesday and a fair on St. Augustine's day. But there is no extant charter before that of Elizabeth in 1576, by which the town was incorporated under the name of the bailiff, burgesses and commonalty of the borough of Daventry. James I confirmed this charter in 1605–06, and Charles II in 1674–75 granted a new charter. The corporation was reconstituted in 1835. During the civil wars Daventry was the headquarters of Charles I immediately before the battle of Naseby. He is supposed to have slept at the Wheat Sheaf inn. The last remains of the Cluniac priory endowed by Simon de St. Liz were removed during the 19th century.

The pronunciation of Daventry as "Dane-tree," which is sanctioned by ancient local usage (*cf.* Shakespeare's "Daintry," Henry *VI.*, pt. iii., act V.), is referred by tradition to the building of the town by the Danes. Though the written element affords no definite proof of early pronunciation, the spelling "Daventrei" in Domesday is explicit, and in the legend of a seal of the Prior Nicholas (1231–64) reads "Davintre" (*Victoria County History, Northampton,* vol. ii.).

DAVEY OF **FERNHURST, HORACE DAVEY,** BARON (1833–1907), English judge, son of Peter Davey, of Horton, Bucks, was born on Aug. 30, 1833, and educated at Rugby and University college, Oxford. In 1861 he was called to the bar, and in 1875 became a Q.C. In 1880 he was returned to parliament as a Liberal, but lost his seat in 1885. On Gladstone's return to power in 1886 he was appointed solicitor general and was knighted, but had no seat in the House, being defeated at both Ipswich and Stockport in 1886; in 1888 he found a seat at Stockton-on-Tees, but lost it in 1892. As an equity lawyer Sir Horace Davey ranked among the finest intellects and the most subtle pleaders ever known at the English bar. He was standing counsel to the University of Oxford, and senior counsel to the Charity Commissioners. Among the cases in which he was engaged were the Mogul Steamship Case (1892), the trial of the bishop of Lincoln, and the Berkeley Peerage case. In 1862 he married Miss Louisa Donkin, who, with two sons and four daughters, survived him. In 1893 he was raised to the bench as a lord justice of appeal, and in the next year was made a lord of appeal in ordinary and a life peer. He died in London on Feb. 20, 1907.

DAVID, ST., the patron saint of Wales, whose feast falls on March 1. Few historical facts are known regarding the saint, although there is reason to suppose he was born c. 500 and died *c.* 600. According to his various biographers he was the son of Sandde, a prince of the line of Cunedda, his mother being Non, who ranks as a Cymric saint. He seems to have taken a prominent part in the celebrated synod of Llanddewi-Brefi (see CARDIGANSHIRE); and to have presided at the so-called "Synod of Victory" held later at Caerleon-on-Usk. At some date unknown, St. David, as *pen-escoli,* or primate of South Wales, moved the seat of ecclesiastical government from Caerleon to the remote headland of Mynyw or Menevia, which is still under the name of St. David's (*Ty-Dewi*) the cathedral city of the western see. St. David founded numerous churches throughout South Wales (53 still recall his name) but apparently he never penetrated farther north than the region of Powys, although he seems to have visited Cornwall. His shrine at St. David's became a notable place of pilgrimage, and at Henry I.'s request he was formally canonized by Calixtus II. about 1120.

The earliest known biography is that of Rhygyvarch (d. 1099), one of the last British bishops of St. David's, from whose work Giraldus Cambrensis (*q.v.*) chiefly compiled an extravagant life. Rhygyvarch's Life has been edited with a translation by A. W. Wade-Evans (1914). *See* also *Catalogue of mss., books,* etc., *relating to St. David, the cathedral Church* of *St. David's,* etc. (Cardiff, 1927).

DAVID, king of Judah and Israel, was the founder of the Judaean dynasty at Jerusalem. The exact date of his reign is uncertain. It used to be reckoned from 1055–1015 B.C., but is now generally fixed at about 1010–970 B.C. Our principal source for his history is 1 Sam. xvi.–1 Kings ii. Its very extent shows how deep was the impression he made upon the mind of his people; indeed, his popularity as a national hero is one cause of the difficulty we find in reconstructing his history. Stories of exploits and incidents in his career were repeated with delight from generation to generation. Groups of these stories were collected together, and from several such sources the history of his doings was compiled. The editors have pieced their material so well together, however, that it is impossible for us to separate it with accuracy into its constituent sources. But the harmonizing has not been perfectly carried out, and the inconsistencies and duplications have enabled the critics to separate more or less clearly at least two main sources. The Greek text, again, varies very considerably from the Hebrew, offering a different collection of the narratives. For detailed discussion of these problems the commentaries on Samuel, and SAMUEL (BOOKS OF) should be consulted. Another history of David is to be found in 1 Chron. xi.–xxix., which is to some extent parallel to that in Samuel but omits many of the narratives. On the other hand it contains much additional material, which is, however, of inferior historical value. It is much fuller on subjects which were the special concern of the editor of Chronicles, such as details of temple arrangements and lists of officers. It is particularly interesting because of its obvious tendency to idealize the character of David, and in this respect was the late stage of a process which must have begun soon after the death of the national hero, and of which we find traces even in Samuel.

The history in Samuel opens with an account of the anointing of David by Samuel as successor to Saul, whom Yahweh had rejected from the throne of Israel (1 Sam. xvi. 1–13). Samuel is instructed that the new king is to be found among the sons of Jesse, who dwells at Bethlehem, 5m. south of Jerusalem. A sacrifice is celebrated there, to which, beside Jesse and his sons, the elders of the town are invited. David, busy in tending the sheep, is apparently too young to be summoned with his older brothers. But when the oracle rejects each of the seven elder brothers Samuel asks whether there is no other son, and David is summoned. It is made clear that he is the chosen one, and Samuel anoints him. This narrative, which is seemingly rather the conclusion of Samuel's history than the beginning of David's, raises suspicions. It will be noted that in 1 Sam. xvii. 13 seq. the brothers of David are three in number (v. 12 is harmonistic), not seven, and in I Chron. ii. 13–15, six. It is highly improbable that the ceremony could have been performed without some news of it getting to the ears of Saul, and the later narratives seem to ignore it.

Introduction to Saul.—I Sam. xvi. 14–23 gives an account of David's introduction to the court of Saul. One of the king's attendants, when a man is sought who can play the harp to charm the moods of melancholy which have fallen upon Saul, recommends David, whom he describes not merely as a good harpist, but as "a mighty man of valour, and a man of war"—a description difficult to reconcile with the preceding narrative unless a considerable number of years be supposed to intervene. David is summoned, and his manly beauty appeals to Saul, who makes him not only court harpist but also his own armour-bearer.

The next section of the history in Samuel (xvii. 1–xviii. 5) records the most famous exploit of David, his victory in single combat over the Philistine giant Goliath, and its consequences. This account, however, raises several serious difficulties. First of all there is the fact that in 2 Sam. xxi. 19 the slaying of Goliath is attributed to Elhanan, one of David's heroes. An attempt to reconcile these contradictory statements is found in 1 Chron. xx. 5, where the victim of Elhanan's valour is described as "Lahmi, the brother of Goliath." David's exploit is not referred to in 1 Sam. xxi. 10–15, or in xxix., where some reference to it would have been expected, and on these and other grounds the simpler tradition of 2 Samuel is usually preferred. On the other hand, it may well have been some such valiant deed that first attracted Saul's attention to David (cf. xiv. 52), and accounted for the popularity of the latter which made him an object of jealousy to Saul. Hence the narrative of 1 Sam. xvii., though legendary, may be the expanded version of some historic combat in which David's opponent was not Goliath. Much more serious is the impossibility of reconciling the narrative with what precedes. Although according to xvi. Saul has already appointed David to be his musician and armour-bearer, now David appears as an untried shepherd lad, sent by his father with provisions for his brothers in the Israelite camp. His brothers treat him with a petulance hardly conceivable if he already stood well at court, and vv. 55–58 show that neither Saul nor his captain Abner had ever heard of David before. Some light is thrown upon this difficult problem by a study of the Greek versions, in one group of which, represented by the Vatican text, xvii. 12–31, 41, 50, and xvii. 55–xviii. 5 are missing. This shorter form of the tradition is much more intelligible, and more easy to reconcile with xvi. It will be seen at once that xvii. 32 follows xvii. 11 much more naturally than does v. 12. Whether the Greek or the Hebrew text is original is a much-debated problem, but on the whole it is more likely that the additional verses in the latter are expansions, taken from another biography of David, than that the Greek is an abbreviated form of the Hebrew. In xviii. 1–4 we have the first notice of the friendship that grew up between Jonathan, Saul's son, and David. The investment of David in the apparel of Jonathan may be an alternative to the exchange of blood as a symbol of brotherhood, for the clothes of a man were regarded as in a sense part of his personality. Otto Eissfeldt, however, has argued plausibly (*Theologische Blätter,* Oct. 1927) that this is part of a parallel tradition according to which David was armour-bearer and favourite, not of Saul, but of Jonathan, a theory which would explain some difficulties in the later narratives.

Conflicts with Saul.—But now Saul becomes jealous of David, because he is the popular idol and his exploits are extolled beyond those of the king. The development of this jealousy is described naturally in the shorter Greek version of xviii., according to which Saul removes David from personal attendance at the court and makes him captain of a thousand soldiers. In his new position David is very successful and his popularity increases, so that Saul becomes more alarmed than ever. Michal, Saul's daughter, falls in love with David, and Saul promises him her hand if he will attempt an almost impossible task of valour, hoping that he may be killed in the endeavour. David succeeds brilliantly and claims the king's daughter. Saul's anger now becomes a fierce hatred, and he proposes to Jonathan and the court the assassination of David (xix. 1). The additional matter in the Hebrew, which includes the incident—a double of xix. 9 *seq.*—of Saul's attempt to murder David, and his unfulfilled promise to give his daughter Merab to him, destroys the psychological truth of the narrative. The breach between Saul and David was made up, for a time, by Jonathan (xix. 2–7); but further successes of David in war reawaken the dormant hatred of Saul, who hurls a spear at David, which the latter evades. The story of Saul's attempt to have David assassinated in the house where he dwelt with Michal (xix. 11–17), which bears all the marks of truth, is out of place here, when David has already fled (v. 10), and may possibly be connected with xviii. 27 (see H. P. Smith in the *International* Critical *Commentary*).

Chapter xx., which records the covenant made by Jonathan with David and prepares the way for the story of David's kindness to Jonathan's son Meribaal, seems to be independent of the traditions in which it is embedded, and has been expanded by the additional interview between the two friends, vv. 40–42. It certainly cannot follow on xix. 18–24, the story of David's attempt to find sanctuary with Samuel at Ramah, for it supposes David to be still at court and Jonathan to be unaware that David stands in peril. This flight of David's may possibly be fitted in after xxi. 9; xx. 1 is an ineffective attempt to remove the difficulty. Next David goes to the sanctuary at Nob, where he had been wont to consult the priestly oracle (xxv. 15), and, pretending that he is engaged on a secret expedition in Saul's behalf, obtains of Ahimelech the priest bread from the sacred table and the sword of Goliath. This narrative may well follow xix. 10, the incident of David's escape from the spear hurled at him by Saul. The story goes on to relate the flight of David to the court of the Philistine king of Gath, Achish, where he escapes from the revenge which might otherwise have been taken upon him by feigning madness (xxi. 10–15). This anticipates xxvii., and is out of place at this point of the history; surely David would not go to the very city of Goliath flaunting the sword of the giant!

Outlaw Life.—For years after his escape David lived the life of an outlaw. He made his headquarters first at the stronghold—the traditional "cave" is a mistake—of Adullam, a Canaanite town said to have been captured by Joshua (Josh. xii. 15), probably on the western border of Judah, and about 12 miles from Bethlehem. Here he was joined by his clansmen and by others who were in a desperate position, such as those who feared to be sold into slavery for failure to pay their debts, until his band numbered 400 men. A probably secondary tradition xxii. 3 seq., relates that he placed his father and mother under the protection of the king of Moab. The following verse, which speaks of the seer Gad as in the company of David, is also probably a later tradition. Saul was disconcerted at this new development. His hated rival had escaped his clutches, largely through the connivance of his son. An Edomite, Doeg, who had been a concealed witness of the interview at Nob between Ahimelech and David, reported what had happened there, and Saul sent for Ahimelech. In spite of Ahimelech's protest that he had acted in all good faith with Saul, the king commanded that he and all the other priests of the sanctuary should be slaughtered. His bodyguard refusing to carry out this command, he ordered the informer to act as executioner, and Doeg slew 85 priests of Nob—a suspiciously large number. All living creatures in that town were also put to death, save Abiathar, one of Ahimelech's sons, who escaped and took refuge with David.

Presently word was brought to David that the Philistines were raiding Keilah, south of Adullam; and, despite the reluctance of his followers to undertake so desperate an enterprise, the outlaw chief, encouraged by a priestly oracle. defeated the Philistines and delivered Keilah. Probably he maintained his band by acting, at aprice, as protector of the district against such marauding attempts on the part of the Philistines and Bedouins. Saul saw an opportunity of capturing David while he was away from the protection of his stronghold and prepared to besiege him in Keilah; but David, warned by the oracle that the inhabitants of Keilah would deliver him up to Saul if he remained within their walls, dispersed his band, which had now grown to 600 men. David lived now the life of the hunted outlaw, wandering from stronghold to stronghold in the border country. Popular tradition tells in xxiii., xxiv., xxvi., of a visit of consolation from Jonathan, the attempt of the men of Ziph to betray David to Saul, and of David's magnanimity in sparing Saul's life when it was in his power to kill him, the two latter incidents appearing in duplicate. The incident of David's marriage to Abigail, the wife of a rich farmer who died a few days after he

had churlishly refused to pay David the levy for protection afforded him (xxv.), is important as showing how David maintained his band, and how he strengthened his position by matrimonial alliances (cf. xxv. 43).

Wearying at last of his precarious life he decided to place himself under the protection of Achish, the Philistine ruler of Gath, from whom he obtained permission to establish himself and his band at Ziklag, which probably lay to the south of Judah. Here for more than a year he maintained his troop by raids upon the Amalekites and other marauding Bedouins. According to the rather improbable story of xxvii. 10–12 he represented these to Achish as raids upon Judah, as though to give proof of his permanent alienation from his own people. In any case Achish was convinced of David's loyalty and took him and his band as part of the army which he led in an important campaign against Saul. But on the eve of battle the Philistine captains, more distrustful than their leader, persuaded Achish to order David's return to Ziklag. David reached Ziklag to find that in his absence the Amalekites had raided and burned the town, carrying off with other booty David's wives. Pursuing the marauders he inflicted upon them a signal defeat, recovering all that had been carried off and much spoil in addition. By distributing a part of his spoil among the rulers of the various towns in the south country and of the old haunts of his freebooting days he strengthened his hold upon the affections of that countryside. In the meantime the Philistine campaign against Israel had been successful, and Saul and his sons, including Jonathan, lay dead upon the slopes of Mt. Gilboa. The fertile lowlands of Jezreel and the Jordan fell into the possession of the victors, and Saul's son Ishbaal, who had escaped the fate of his brothers, maintained a shadowy sovereignty in the remote city of Mahanaim, the force behind his throne being Abner, Saul's commander-in-chief. The news of Israel's defeat and Saul's death is brought (2 Sam. i.) to Ziklag by an Amalekite, who claims—in contradiction to the account in 1 Sam. xxxi. 4—to have slain the wounded king, and offers to David the crown and bracelet which he had taken from the corpse. Instead of receiving the reward which he doubtless looked for the messenger is slain at the command of David, who utters the noble dirge on Saul and Jonathan, 2 Sam. i. 19–27. The compiler avowedly takes the poem from the "Book of Jashar," but there appears to be no cogent reason for denying that David is its author.

King at **Hebron.**—David now takes a further step in his advance towards the throne, for, in response to a Divine oracle, he establishes his household and his band in Hebron, where, at the age of 30 (if 2 Sam. v. 4 may be trusted), he is anointed king by the Judaean clans: there he reigned, according to the statement of ii. 11, seven and a half years. His position as established ruler of an important town, on friendly terms with the neighbouring sheikhs, and allied by marriage with the families of Caleb and Jezreel (in Judah), was well secured. Further such marriages are recorded in iii. 3–5. It is quite in keeping with the constant tradition of David's chivalrous treatment of Saul that he should have sent a message of appreciation to the men of Jabesh-Gilead for their pious act in burying the bodies of Saul and his sons, ii. 46 seq.; and with his skilful diplomacy that the messengers should hint that Jabesh-Gilead might do well to transfer its allegiance to himself—a hint which was for the time being ignored.

A conflict between the forces of Ishbaal, under Abner, and those of David, under Joab, which developed out of a contest between 12 picked men on either side, ended greatly to the advantage of David's men. In the course of the struggle Abner slew Asahel, Joab's brother, thus creating a blood-feud which had serious consequences in the subsequent history. Abner, recognizing that the cause of Ishbaal was hopeless, took to himself one of Saul's concubines, an infringement of Ishbaal's prerogative as Saul's successor, with deliberate intent to raise a quarrel with his lord which might provide him with a pretext for transferring his allegiance to David. When Ishbaal protested Abner sent an embassy to David offering to bring the northern clans over to him. According to one story (iii. 12–16), David demanded the return of Michal to him, as an evidence of good faith, but this story is consistent neither with itself nor with its context. In any case Abner, returning from Hebron after arranging terms with David, was summoned back by Joab and treacherously slain in pursuance of the blood-feud. David was indignant, and showed his indignation by according burial to Abner and proclaiming a fast. Apparently Joab was both too strong and too useful for the king to punish him, so David handed over that task to his God. The position of Ishbaal, deprived of Abner's help, went from bad to worse, and he was eventually assassinated by two of his own followers. They brought his head to David, but received the same reward as the Amalekite who thought to have found favour with David by his claim to have killed Saul. Following this the northern tribes swore allegiance to David at Hebron, and he became king of the united peoples. Here we may place the two successes over the Philistines narrated in v. 17–25.

Capture of Jerusalem.—Another important stage in David's career was marked by the capture of Jerusalem, an ancient Jebusite stronghold which had never been in Hebrew hands. Regarded as impregnable by its inhabitants, who treated David's threat with derision, it was captured by the ascent of a shaft which had been pierced through the rock to aiford the city a water supply. The stronghold was further fortified by David, who built himself a cedarwood palace, the materials and artificers for which were furnished by Hiram, king of Tyre—another indication of David's growing importance. David also enlarged his harem.

The king now turned his attention to the ark of Yahweh, which had remained in obscurity since its return from the Philistines in the early youth of Samuel. It was brought up from Baal of Judah, and, after having been temporarily housed with Obed-Edom owing to an untoward incident during its progress, was placed in a specially prepared pavilion in the citadel, amid great rejoicings. That the king should have proposed to build a temple worthy to stand beside his palace is quite natural, and ch. vii., which relates how Nathan the prophet, after first sanctioning the project, forbade it in the name of Yahweh, may, though comparatively late, be based on a historical foundation. There follows in viii. a summary of military successes achieved by David and Joab, his commander-in-chief. The concluding verses show that the court had been properly organized and a bodyguard of mercenaries provided for the king. The lame Mephibosheth (-Meribaal), Jonathan's son, was admitted to the royal table as the king's pensioner, and his family estates were restored to his use.

A friendly embassy from David to the newly crowned king of Ammon was treated with insult, and a war ensued, in which the Ammonites, who succeeded in gaining considerable Aramean support, were completely defeated, and their chief city was captured by David after a siege. It was during this campaign that David, in order to obtain for himself the beautiful Bathsheba, caused Joab deliberately to abandon her husband, Uriah the Hittite mercenary, to an Ammonite assault. Not only were the Syrian allies of Ammon reduced to submission, but Edom was completely subjugated by Joab.

Internal Troubles.—From this time on David's reign was undisturbed by foreign attack, but, in the absence of necessity for standing together against a common foe, internal troubles developed. In part these proceeded from the king's own household. Absalom, his third son, having contrived the murder of Amnon, the eldest, in revenge for an assault upon Absalom's sister Tamar, fled the country and took refuge with his mother's father, Talmai, king of Geshur. After three years Joab satisfied the unexpressed longing of David for his son's return, for which he secured permission by a stratagem. Absalom was excluded from the court for two years, and when David was fully reconciled to receive him began to plot against his father. He succeeded in creating a party for himself, and after some four (so read in xiv. 7) years raised the standard of revolt in Hebron. David was compelled to flee in haste to Gilead, abandoning Jerusalem to Absalom. The first battle between the forces resulted in the total defeat of Absalom, who was slain. against the express command of David, by Joab. David was welcomed back by the people, but the northern tribes resented the precedence which was claimed by Judah on the ground of kinship to the king. This discontent manifested itself in a rebellion headed by Sheba, a Benjamite, who eventually threw him-

self into the walled city of Abel of Beth-Maacah. There he was besieged by David's army under Joab. To avoid the disastrous consequences of a prolonged siege the inhabitants slew Sheba and threw out his head to Joab, who had agreed to draw off his forces on that condition. It should be said that some scholars, *e.g.*, Winckler and S. A. Cook *(Notes on* Old Testament History, pp. 3–17), have argued forcibly that the revolts of Absalom and Sheba should be dated in a much earlier period of David's reign. The remaining chapters of 2 Samuel interrupt the history of David, which is resumed in 1 Kings i. They contain fragments relative to David which have been inserted here by different editors. The two poetical pieces, 2 Sam. xxii. 1–xxiii. 7, are not Davidic: it will be recognized at once that they interrupt the catalogue of David's heroes and their exploits, which xxiii. 8 resumes from xxi. 22. The story of xxi. 1–14, relating how David delivered over to the men of Gibeon seven of Saul's descendants to be impaled, and how, moved by the pathetic fidelity of Rizpah, he gathered the bones of these men and of Saul and Jonathan to be decently interred, is probably historic, though not in its proper chronological order. The story of the census and its disastrous results, xxiv., may possibly come from the same source, though some parts of it may be later insertions.

The closing scenes of David's life, 1 Kings i.–ii. 11, show the old warrior enfeebled by age, and the succession to his throne the subject of intrigue. His eldest surviving son, Adonijah, regarded himself as the heir. Like Absalom, he was of great personal charm and a favourite with numbers of the people, his outstanding supporters being Joab and Abiathar. Like Absalom, too, he sought to make his position secure by assuming the state suitable to the heir-apparent. He made a great feast for the men of Judah, inviting the king's sons but deliberately ignoring Solomon, Bathsheba's son, the prophet Nathan, and David's "mighty men," who evidently constituted a party in favour of Solomon's succession. Bathsheba and Nathan contrived to secure from David the ratification of an old promise that Solomon should succeed to the throne, and the aged king roused himself to make arrangements for the formal proclamation of Bathsheba's son. Adonijah's followers were seized with panic, and he himself sought sanctuary by taking hold of the horns of the altar, whence he suffered himself to be removed upon a rather equivocal promise by Solomon that his life should be spared. The remainder of the story records, with some later expansion by a Deuteronomic editor, how David left instructions to Solomon that Joab and Shimei should be put to death, but kindness shown to the family of Barzillai. This ungenerous treatment of Joab, to whom more than to any man he owed the success of his career, and the virtual recantation of his promise to spare Shimei strike an unpleasant note in our ears. Nor does the consideration of the king's failing powers and of his possible fear that Solomon's position might be endangered by adversaries whom he himself had felt free to spare completely mellow its harshness. And so, after a reign of 40 years, David slept with his fathers.

David's Character and Work.—Rightly to estimate the character and work of David we must judge him by the standards of his own day. His military capacity is proved by the uniform success he achieved as commander. Even though the story of his conflict with Goliath may be legendary it undoubtedly gives us the measure of his reputation for personal bravery. To these qualities he added astute diplomacy and far-seeing statesmanship. That at times he resorted to deceit—as, for example, in the employment of Hushai to spy upon the movements of Absalom—is true, but this would be commended by his own age and is reputable even to-day. He knew well how to wait his opportunity, and instead of snatching at the kingship in haste allowed the fruit to ripen until it fell into his hands, all the while strengthening his hold upon his fellow countrymen. His choice of Jerusalem as capital is an excellent example of his wisdom. In seizing it he furnished himself not only with a secure citadel, whose natural strength was shown later by its desperate resistance to Babylonians and Romans, but also with a centre of government not so closely associated with his own tribe of Judah as was Hebron, and one therefore less likely to cause jealousy on the part of northern Israel. His real monument was the united kingdom which he established, its influence stretching right up into Syria; it was the most powerful empire that ever Palestine produced. True, his opportunity was exceptional, because neither Egypt, Assyria, nor Babylon was at the time in a position to challenge his progress; but to have achieved it at all was wonderful. We can readily understand that the Jews of later days looked back to David as the ideal king and pictured the ruler of the happy day for which they hoped as a second David.

David may be charged with harshness in the treatment of conquered peoples—though the true meaning of 2 Sam. xii. 31 is that he set the people of Rabbah to menial labour, not that he tortured them; but in this respect he compares favourably with his contemporaries. His delivery of Saul's descendants to be impaled was but obedience to the will of Yahweh as he understood it. And on the other hand his record is marked by chivalrous treatment of his foes on several occasions. Even his outstanding faults, the murder of Uriah that he might obtain Bathsheba, and his weakness in dealing with his sons, though we need not palliate them, were less heinous a thousand years before Christ than they would be to-day. He was a sincerely religious man, a devout worshipper of Yahweh, as may be seen from his care for the Ark. Though his relationships with the prophets Gad and Nathan may have been idealized by later editors he certainly was more amenable to prophetic guidance than was Saul. He was assuredly not the soldier-saint of Chronicles, or the Psalmist of profound religious experience. But while it is improbable that he was the author of any of the Hebrew hymns he was undoubtedly a musician and a poet. The dancer of 2 Sam. vi. would naturally be the singer, too, and there is good reason for believing the elegy on Saul and Jonathan and the little dirge on Abner, 2 Sam. iii, *seq.* 33, are of David's composition. Moreover, the attribution of Psalms to David, though mistaken, is most easily understood if he was really a minstrel (cf. also Amos vi. 5).

Greatly loved in his day, deeply revered by those who came after him, David was perhaps the most winsome character in Hebrew story, lovable, because so human, even in his faults. A great warrior and a great statesman, his importance as the real constructor of the Hebrew kingdom can hardly be overestimated.

Cook, *Critical Notes on Old Testament History;* R. Kittel, *Geschichte des Volkes Israels,* ii. pp. 108–187; *Gestalten und Gedanken in Israel,* pp. 120–157. (W. R. S.; W. L. W.)

DAVID I. (1084–1153), king of Scotland, the youngest son of Malcolm Canmore and (Saint) Margaret, sister of Edgar Aetheling, married in 1113 Matilda, daughter and heiress of Waltheof, earl of Northumbria, and thus became possessed of the earldom of Huntingdon. On the death of Edgar, king of Scotland, in 1107, the territories of the Scottish crown were divided in accordance with the terms of his will between his two brothers, Alexander and David. Alexander, together with the crown, received Scotland north of the Forth of Clyde, David the southern district with the title of earl of Cumbria. The death of Alexander I, in 1124 gave David possession of the whole. In 1127, in the character of an English baron, he swore fealty to Matilda as heiress to her father Henry I., and when the usurper Stephen ousted her in 1135 David vindicated her cause in arms and invaded England. But Stephen marched north with a great army, whereupon David made peace. The peace, however, was not kept. After threatening an invasion in 1137, David marched into England in 1138, but sustained a crushing defeat on Cutton Moor in the engagement known as the battle of the Standard. He returned to Carlisle, and soon afterwards concluded peace. In 1141 he joined Matilda in London and accompanied her to Winchester, but after a narrow escape from capture he returned to Scotland. Henceforth he remained in his own kingdom and devoted himself to its political and ecclesiastical reorganization. A devoted son of the church, he founded five bishoprics and many monasteries. In secular politics he energetically forwarded the process of feudalization which had been initiated by his immediate predecessors. He died at Carlisle on May 24, 1153.

DAVID II. (1324–1371), king of Scotland, son of King Robert the Bruce by his second wife, Elizabeth de Burgh (d. 1327), was born at Dunfermline on March 5, 1324. In accordance with

the terms of the treaty of Northampton he was married in July 1328 to Joanna (d. 1362), daughter of the English king, Edward II., and became king of Scotland on his father's death in June 1329, being crowned at Scone in November 1331. Owing to the victory of Edward III. of England and his protégé, Edward Baliol, at Halidon Hill in July 1333, David and his queen were sent for safety into France, reaching Boulogne in May 1334, and being received very graciously by the French king, Philip VI. Little is known about the life of the Scottish king in France, except that Chbteau Gaillard was given to him for a residence, and that he was present at the bloodless meeting of the English and French armies at Vironfosse in October 1339. Meanwhile his representatives had obtained the upper hand in Scotland, and David was thus enabled to return to his kingdom in June 1341, when he took the reins of government into his own hands. In 1346 he invaded England in the interests of France, but was defeated and taken prisoner at the battle of Neville's Cross in October of this year, and remained in England for eleven years, living principally in London and at Odiham in Hampshire. His imprisonment was not a rigorous one, and negotiations for his release were soon begun. Eventually, in October 1357, after several interruptions, a treaty was signed at Berwick by which the Scottish estates undertook to pay 100,000 marks as a ransom for their king. David, who had probably recognized Edward III. as his feudal superior, returned at once to Scotland; but owing to the poverty of the kingdom it was found impossible to raise the ransom. A few instalments were paid, but the king sought to get rid of the liability by offering to make Edward III., or one of his sons, his successor in Scotland. In 1364 the Scottish parliament indignantly rejected a proposal to make Lionel, duke of Clarence, the next king; but David treated secretly with Edward III. over this matter, after he had suppressed a rising of some of his unruly nobles. The king died in Edinburgh Castle on Feb. 22, 1371. His second wife was Margaret, widow of Sir John Logie, whom he divorced in 1369; but he left no children, and was succeeded by his nephew, Robert II. David was a weak and incapable ruler without his father's patriotic spirit. (See SCOTLAND, History.)

DAVID, the name of three Welsh princes.

DAVID I. (d. 1203), a son of Prince Owen Gwynedd (d. 1169), came into prominence as a leader of the Welsh during the expedition of Henry II. in 1157. In 1170 he became lord of Gwynedd (*i.e.*, the district around Snowdon), but some regarded him as a bastard, and Gwynedd was also claimed by other members of his family. After fighting with varying fortunes he sought an ally in the English king, whom he supported during the baronial rising in 1173; after this event he married Henry's half-sister Emma. But his enemies increased in power, and about 1194 he was driven from Wales by the partisans of his half-brother Llewelyn ap Iorwerth. The chronicler Benedictus Abbas calls David rex, and Rhuddlan castle was probably the centre of his vague authority.

DAVID II. (c. 1208–1246) was a son of the great Welsh prince, Llewelyn ap Iorwerth, and through his mother Joanna was a grandson of King John. He married an English lady, Isabella de Braose, and, having been recognized as his father's heir both by Henry III. and by the Welsh lords, he had to face the hostility of his half-brother Gruffydd, whom he seized and imprisoned in 1239. When Llewelyn died in April 1240, David, who had already taken some part in the duties of government, was acknowledged as a prince of North Wales, doing homage to Henry III. at Gloucester. He was soon at variance with the English king, who appears to have espoused the cause of the captive Gruffydd. Henry's Welsh campaign in 1241 was bloodless but decisive. Gruffydd was surrendered to him; David went to London and made a full submission, but two or three years later he was warring against some English barons on the borders. To check the English king he opened negotiations with Innocent IV., doubtless hoping that the pope would recognize Wales as an independent state, but here, as on the field of battle, Henry III. was too strong for him. Just after Henry's second campaign in Wales the prince died in March 1246.

DAVID III. (d. 1283) was a son of Gruffyddand thus a nephew of David II. His life was mainly spent in fighting against his brother, the reigning prince, Llewelyn ap Gruffydd. His first revolt took place in 1254 or 1255, and after a second about eight years later he took refuge in England, returning to Wales when Henry III. made peace with Llewelyn in 1267. Then about 1274 the same process was repeated. David attended Edward I. during the Welsh expedition of 1277, receiving from the English Iring lands in North Wales; but in 1282 he made peace with Llewelyn and suddenly attacked the English garrisons, a proceeding which led to Edward's final conquest of Wales. After Llewelyn's death in December 1282 David maintained the last struggle of the Welsh for independence. All his efforts, however, were vain; in June 1283 he was betrayed to Edward, was tried by a special court and sentenced to death, and was executed with great barbarity at Shrewsbury in October 1283. As the last native prince of Wales, David's praises have been sung by the Welsh bards, but his character was not attractive, and a Welsh historian says "his life was the bane of Wales." (See WALES, History.)

DAVID, FÉLICIEN (1810–1876), French composer, was born on April 13, 1810, at Cadenet (Vaucluse). He was a precocious child, and composed a string quartet at the age of 12. He was educated at the Jesuit college at Aix, and became choirmaster at St. Sauveur at Aix for a year. He then studied for a while at the Paris Conservatoire. In 1831 he joined the sect of Saint Simonians, and in 1833 travelled in the Near East in order to preach the new doctrine. After three years' absence he returned to France and published a collection of Oriental Melodies for the pianoforte. For several years he worked in retirement, and wrote two symphonies, some chamber music and songs. On Dec. 8, 1844, he suddenly leapt into fame with his symphonic ode *Le* De'sert, produced at the Conservatoire. In this work David attempted in simple strains to evoke the majestic stillness of the desert. Notwithstanding its title of "symphonic ode," Le De'sert, has little in common with the symphonic style. What distinguishes it is a certain naïveté of expression and an effective oriental colouring. His succeeding works, *Moïse* au *Sinai* (1846), *Christophe* Colomb (1847), *L'Éden* (1848), scarcely bore out the promise shown in Le De'sert. David produced several operas: La Perle *du Brésil* (1851), *Herculanum* (1859), Lalla-Roukh (1862), Le *Saphir* (1865). He died at Saint-Germain-en-Laye on Aug. 29, 1876. At a time when the works of Berlioz were still unappreciated by the majority of people, David succeeded in making the public take interest in music of a picturesque and descriptive kind. Thus he may be considered as one of the pioneers of modern French musical art.

See R. Brancour, *Félicien* David (1911), with full bibliography.

DAVID, GERARD [GHEERAERT DAVIT] (?–1523), Netherlands painter, born at Oudewater, in Holland, was the last great master of the Bruges school. He was only rescued from complete oblivion in 1860–63 by W. J. H. Weale, whose researches in the archives of Bruges brought to light the main facts of the master's life. David came to Bruges in 1483, presumably from Haarlem, where he had formed his early style under the tuition of Ouwater; he joined the gild of St. Luke at Bruges in 1484, and became dean of the gild in 1501; he married, in 1496, Cornelia Cnoop, daughter of the dean of the Goldsmiths' gild; became one of the leading citizens of the town; died on Aug. 13, 1523, and was buried in the Church of Our Lady at Bruges.

In his early work he had followed the Haarlem tradition as represented by Dirck Bouts, Ouwater and Geertgen of Haarlem, but already gave evidence of his superior power as colourist. To this early period belong the "St. John" of the Kaufmann collection in Berlin, and "St. Jerome" in the Salting collection (National Gallery, London). In Bruges he studied and copied masterpieces by the Van Eycks, Van der Weyden, and Van der Goes, and came under the direct influence of Hans Memlinc. From him he acquired the intensity of expression, the increased realism in the rendering of the human form and the orderly architectonic arrangement of the figures. In 1515 he visited Antwerp, and became impressed with the life and movement in the work of Quentin Matsys, who had introduced a more intimate and more human conception of sacred themes. David's "Pietà" in the National Gallery, and the "Descent from the Cross," in the

Cavallo collection, Paris, were painted under this influence and are remarkable for their dramatic movement. But the works on which David's fame rests most securely are the great altar-pieces executed by him before his visit to Antwerp—the "Marriage of St. Catherine," at the National Gallery; the triptych of the "Madonna Enthroned, and Saints" of the Brignole-Sale collection in Genoa; the "Annunciation" of the Sigmaringen collection; and, above all, the "Madonna with Angels and Saints" at Rouen. Of David's pupils in Bruges, only Isenbrandt, A. Cornelis and Ambrosius Benson achieved importance. Among other Flemish painters, Joachim Patinir and Mabuse were to some degree influenced by him.

Eberhard Freiherr von Bodenhausen published in 1905 a very comprehensive monograph on *Gerard David and his School* (Munich, F. Bruckmann), together with *a catalogue raisonné* of his works, which, after careful sifting, are reduced to 43.

DAVID, JACQUES LOUIS (1748–1825), French painter, was born in Paris on April 30, 1748. His father was killed in a duel, when the boy was but nine years old. His education was begun at the Collège des Quatre Nations, but he was soon placed by his guardian in the studio of François Boucher. Boucher recommended him to J. M. Vien, the pioneer of the classical reaction in painting. Under him David studied for some years; and, after several attempts to win the *prix de Rome*, at last succeeded. in 1775, with his "Loves of Antiochus and Stratonice." He then accompanied Vien, who had just been appointed director of the French academy at Rome. The classical reaction was now in full tide; Winckelmann was writing, Raphael Mengs painting; and the treasures of the Vatican galleries helped to confirm David in a taste already moulded by so many kindred influences. This severely classical spirit inspired his first important painting, *"Date obolum Belisario,"* exhibited at Paris in 1780. The picture exactly suited the temper of the times, and was an immense success. It was followed by "The Grief of Andromache" (1783), "The Oath of the Horatii" (Salon, 1785), "The Death of Socrates," "Love of Paris and Helen" (1788), "Brutus" (1789). In the first years of the revolutionary movement the fashion of imitating the ancients even in dress and manners went to the most extravagant length and it was at this time that David returned to Paris.

The success of his sketch for the picture of the "Oath of the Tennis Court," and his pronounced republicanism, secured David's election to the Convention in Sept. 1792, by the *Section du Muséum*, and in the January following his election into the Convention his vote was given for the king's death. David's revolutionary ideas, which led to his election to the presidency of the Convention and to the committee of general security, inspired his pictures "Last Moments of Lepelletier de Saint-Fargeau" and "Marat Assassinated." He also arranged the programme of the principal republican festivals. When Napoleon rose to power David became his enthusiastic admirer. His picture of Napoleon on horseback pointing the way to Italy is now in Berlin. During this period he also painted the "Rape of the Sabines," and "Leonidas at Thermopylae." Appointed painter to the emperor, David produced the two notable pictures "The Coronation" (of Josephine), and the "Distribution of the Eagles."

On the return of the Bourbons the painter was exiled with other regicides, and retired to Brussels, where he again returned to classical subjects: "Amor quitting Psyche," "Mars disarmed by Venus," etc. He rejected the offer, made through Baron Humboldt, of the office of minister of fine arts at Berlin, and remained at Brussels till his death on Dec. 29, 1825.

It is difficult for a generation which has witnessed another complete revolution in the standards of artistic taste to realize the secret of David's immense popularity in his own day. Yet he exercised in his time and generation a great influence. His pictures are magnificent in their composition and draughtsmanship; and his keen observation and insight into character are evident, especially in his portraits, notably of Madame Récamier, of the Conventional Gérard and of Boissy d'Anglas.

See E. J. Delécluze, *Louis David, son école et son temps* (1855), and *Le Peintre Louis David. Souvenirs et documents inédits, by* J. L. Jules David, the painter's grandson **(1880)**; L. Rosenthal, *David* (1904).

DAVID, PIERRE JEAN (1789–1856), usually called David d'Angers, French sculptor, was born at Angers on March 12, 1789, and died in Paris on Jan. 4, 1856. The son of a carver, he went to Paris at 17 with 11 francs in his pocket to study under Roland. After a year and a half's struggle he received a small annuity from the municipality of Angers, and in 1811 won the *prix de Rome*, and was sent to Italy, where he worked for some time in Canova's studio. Returning to Paris in 1816, after a short visit to London, he received many important commissions. He was in revolt against the prevailing classical style, and one of his first works in Paris, the "Condé" at Versailles, shows the new tendency towards a more realistic method. In 1827 he visited England, and m 1828 and 1834, Germany. Always a Radical in politics, he had to leave France for a short period after the *Coup d'état* of Dec. 1851. Many of the most famous men and women of his time sat to David for busts or medallions. A nearly complete collection, originals or copies, is to be seen in the Musée David at Angers. Among David's most important works are: the sculptures on the pediment of the Panthéon, showing the principal personages in France since the Revolution grouped round a figure of "La Patrie"; the Gutenberg monument at Strasbourg; the monument to General Gobert in Père Lachaise, the "Philopoemen" in the Louvre, and the bust of Goethe, presented by him to the poet in 1831, in the public library at Weimar.

See H. Jouin, *David d'Angers et ses relations littéraires* (1890); *Lettres de P. J. David d'Angers à Louis Dupré* **(1891)**; *Collection de portraits des contemporains d'après les médaillons de P. J. David* (1838).

DAVIDISTS, a fancy name rather than a recognized designation for three religious sects. It has been applied (1) to the followers (if he had any) of David of Dinant, in Belgium, the teacher or pupil of Amalric (Amaury) of Bena, both of whom taught apparently a species of pantheism. David's *Quaterni*, or *Quaternuli*, condemned and burnt at Paris (1209), is a lost hook, known only by references in Albertus Magnus and Thomas Aquinas; its author would have been burnt had he not fled. (2) To the followers of David George or Joris (*q.v.*). (3) To the followers of Francis David (1510–79), the apostle of Transylvanian unitarianism *(see* SOCINUS; UNITARIANISM).

DAVIDQVIC, LJUBOMIR (1863–1940), Yugoslav politician, was born at Vlaška in Serbia. In 1901 he entered parliament and, the next year, with Ljubomir Stojanović, founded the Independent Radical party. In 1904 he became Minister of Education, in 1905 President of the Skupština and in 1909 mayor of Belgrade. In that year he was one of the Serbian witnesses at the Friedjung trial in Vienna, and soon afterwards Prof. Masaryk laid before the Austrian delegation the papers on which the forgers had practised Davidovic's signature. In the Serbian Coalition cabinet, formed during the Austrian invasion in Nov. 1914, Davidovic again became Minister of Education, but in 1917 he resigned office and remained in active opposition to Pašić throughout the remainder of the World War. In 1919 he was elected chief of the newly formed Democratic party and was Yugoslav premier from August of that year until Feb. 1920. In July 1924 he again became Prime Minister at the head of a coalition of Democrats, Slovene Clericals and Bosnian Moslems, supported by the Croat peasants. He was, however, replaced, in 1924, by a purely Radical Government under Pašić. Not active in the succeeding governments, Davidovic, however, led the democratic party against the Government party in the elections of 1935 and 1938.

DAVIDSON, ANDREW BRUCE (1831–1902), Scottish divine, was born in 1831 at Kirkhill, Aberdeenshire, where his father, Andrew Davidson, had a farm. During his four years at Aberdeen university his mother supplied him fortnightly with provisions from the farm and sometimes walked the whole 20 miles from Kirkhill, handing the coach fee to her son. He graduated in 1849. In 1852, after three years as a schoolmaster, he entered New college, Edinburgh, and was licensed to preach in 1856. For two years he preached occasionally and took vacancies. In 1858 he became assistant professor of Hebrew at New college. He taught during the winter, and in the long vacation continued his

preparation for his life work. One year he worked in Germany under Ewald, another year he went to Syria to study Arabic. In 1862 he published the first part of a commentary on Job. It was never finished and deals only with one-third of the book, but it is recognized as the first really scientific commentary on the Old Testament in the English language. In 1863 he was appointed by the General Assembly professor of oriental languages at New college. He was junior colleague of Dr. John Duncan (Rabbi Duncan) till 1870, and then for 30 years sole professor. He was a member of the Old Testament revision committee. He died on Jan. 26, 1902.

Besides the commentary on Job he published a book on the *Hebrew Accents,* the only Scottish performance of the kind since the days of Thomas Boston. His *Introductory Hebrew Grammar* has been widely adopted as a class-book in theological colleges. His *Hebrew Syntax* has the same admirable clearness, precision and teaching quality. His *Commentary on the Epistle to the Hebrews* is one of a series of handbooks for Bible classes. These were followed by commentaries on Job, Ezekiel, Nahum, Habakkuk and Zephaniah, in the Cambridge series; and a Bible-class primer on *The Exile and Restoration.* His lectures on *Old Testament Prophecy* were published after his death by Prof. J. *A.* Paterson, The *Theology of the Old Testament* in the "International Theological Library" is a posthumous volume edited by Prof. Salmond. "Isaiah" in the *Temple Bible* was finished, but not revised, when he died; and he also had in hand the volume on Isaiah for the *International Critical Commentary;* to which must be added a mass of articles contributed to the *Imperial Bible Dictionary,* the *Encyclopædia Britannica,* and the chief religious reviews. Various articles in Dr. Hastings' *Bible Dictionary* were by Davidson, including the article "God." Two volumes of sermons, *The Called of God* (with biographical introduction), and *Waiting upon God,* were published after his death.

DAVIDSON, JOHN (1857–1909), British poet, playwright and novelist, son of the Rev. Alexander Davidson, a minister of the Evangelical Union, was born at Barrhead, Renfrewshire, Scotland, on April 11, 1857. In 1876 he studied for a session at Edinburgh university, and then went as a master to various Scottish schools till 1890, varying his experiences in 1884 by being a clerk in a Glasgow thread firm. He had married in 1885, and meanwhile he had published his poetical and fantastic plays, *Bruce* (1886), *Smith; a tragic farce* (1888) and *Scaramouch in Naxos* (1889). Determining at all costs to follow his literary vocation, he went to London in 1890. *Fleet Street Eclogues* (1893) at, once established Davidson's position among the younger generation of British poets. He produced other books in prose, but his most important work is found in his *Ballads and Songs* (1894), *Second Series of Fleet Street Eclogues* (1895), *New Ballads* (1896), *The Last Ballad, etc.* (1898), all full of remarkably fresh and unconventional beauty. Meanwhile, in 1896, he produced an English verse adaptation in *For the Crown* (acted by Forbes Robertson and Mrs. Patrick Campbell), of François Coppée's drama *Pour* la *couronne,* and he wrote several other literary plays. In later years he lived at Penzance, provided with a small Civil List pension, but otherwise badly off, for his writings brought in very little money. On March 23, 1909, he disappeared, in circumstances pointing to suicide, and six months later his body was found in the sea.

DAVIDSON OF LAMBETH, RANDALL THOMAS DAVIDSON, 1ST BARON (1848–1930), English divine, archbishop of Canterbury, 1903–28, was with King Edward VII. at his death in 1910, and he crowned King George V. in 1911 He was one of the four counsellors of State who acted as His Majesty's Commission when the King went to India in 1911, and again in 1925 when the King went to the Mediterranean after illness. During the whole of this period he took a leading part as spokesman of the national Church in the House of Lords. Lord Morley bore public witness to the effectiveness of his intervention in the critical debate on the Parliament Act in 1914. He made important contributions in debates on temperance, divorce and various social and moral questions. His influence was also constantly and successfully exerted in matters affecting the welfare of native races; *e.g.,* in Kenya, and he made notable appeals on behalf of Christian minorities in the East. In his educational policy he has steadily supported definite religious instruction in all schools, by teachers willing to give it.

Trusted by Englishmen of all classes for his wisdom and goodness, the archbishop commanded the confidence of Free Churchmen to a greater degree than any of his predecessors. He had a peculiarly anxious task during the World War. On more than one occasion he lifted up his voice against reprisals which had "as a deliberate object the killing and wounding of non-combatants." Twice he visited the troops in France. In 1916 he placed himself at the head of a national mission, which aimed at the deepening of religious life at home. At an early date he gave public support to the proposals for a League of Nations, and it was recognized as specially fitting that he should preach the sermon at the opening of the third Assembly in Geneva, 1922. In 1922 Dr. Davidson took the lead in issuing a vigorous protest, signed by the leaders of the Anglican, Roman, Free Church and Jewish Communions, against religious persecution in Russia. In 1923 he made a successful public appeal for the retention of the Oecumenical patriarchate at Constantinople.

The archbishop also took a deep interest in the work of the Church overseas. He presided over the sixth Lambeth Conference in 1920, attended by 252 out of the 368 bishops of the Anglican Communion, and throughout the deliberations adopted a strong forward-looking attitude. After the issue of the appeal to all Christian people by that conference he took a prominent part in securing widespread consideration of the proposals for the reunion of Christendom which it contained. He actively forwarded conferences with the Free Church representatives in England, a series of important meetings being held at Lambeth Palace. He further expounded the appeal to the General Assemblies of the Church of Scotland, and the United Free Church of Scotland in 1921. In addition, the archbishop markedly developed friendly relations between the Anglican and Orthodox Churches, and it was to him that the Patriarch (Meletios IV.) of Constantinople communicated his Synod's acceptance of the validity of Anglican ordinations in 1922. He also took "cognizance" of the conversations between Anglican and Roman Catholic theologians held at Malines (1921–25), under the presidency of Cardinal Mercier; Pope Pius XI. taking a similar "cognizance."

He was mainly instrumental in securing the passage into law of the Church Assembly (Powers) Act, 1919, and from 1920–28 presided over the Church Assembly with wisdom and courage. During this period a large number of measures were passed. But the principal measure, dealing with Prayer Book revision, was rejected by the House of Commons on Dec. 15, 1927. This situation, however, afforded an opportunity for an extraordinary outburst of admiration for the archbishop personally in all sections of the community. In Feb. 1928 he completed the 25th year of his primacy—a primacy longer than any since Archbishop Warham. He displayed a remarkable combination of sincere piety, common sense, loyalty to truth and sympathy with modern movements. He resigned Nov. 1928, was succeeded by Dr. Lang, and was created a baron. He died May 25, 1930. (G. K. A. B.)

DAVIDSON, SAMUEL (1807–1898), Irish biblical scholar, was born near Ballymena. He became in 1842 professor of biblical criticism, literature and oriental languages at the Lancashire Independent college, Manchester, but was obliged to resign in 1857, on account of *The Text of the Old Testament, and the Interpretation of the Bible,* written for a new edition of Horne's *Introduction to the Sacred Scripture.* In 1862 he removed to London to become scripture examiner in London university, and he spent the rest of his life in literary work. He died on April 1, 1898. Davidson was a member of the Old Testament Revision Committee.

Among Davidson's principal works *are:—The Hebrew Text of the Old Testament Revised* (1855), *Introduction to the Old Testament* (1862), *On, a Fresh Revision of the Old Testament* (1873), *The Doctrine of Last Things in the New Testament* (1883), besides translations of the New Testament from Tischendorf's text, Gieseler's *Ecclesiastical History* (1846) and Fiirst's *Hebrew and Chaldee Lexicon.*

DAVIDSON, THOMAS (1817–1885), British palaeontologist, born in Edinburgh on May 17, 1817, was educated partly in the University of Edinburgh and partly in France, Italy and Switzerland. His *Monograph of British Fossil Brachiopoda* was published by the Palaeontographical Society (1850–86, 6 vols. with zoo plates). He also prepared an exhaustive memoir on "Recent

Brachiopoda," published by the Linnean Society. He was elected F.R.S. in 1857. He died at Brighton on Oct. 14, 1885.

See biography with portrait and list of papers in *Geol. Mag.* for 1871, p. 145.

DAVIES, ARTHUR B. (1862–1928), American painter, was born at Utica, N.Y., on Sept. 26, 1862. He was a pupil of Dwight Williams at Utica, afterwards studying in New York and Chicago. He became an adherent of the Romantic school of painting and made notable contributions in the fields of etching and colour-lithography. Among his more important works are "Dream" and "The Girdle of Ares," in the Metropolitan Museum, New York city; "Maya, Mirror of Illusions," in the Art Institute, Chicago; "Spring in a Valley" and "Night Overture," in the Minneapolis Institute of Art; and "The Place of the Mother" and "Children of Yesterday," in the Brooklyn museum. In 1923 his picture, "After-Thoughts of Earth," procured for him from the Carnegie Trust a medal of the first class and $1,500. He died in Italy on Oct. 24, 1928.

DAVIES, SIR HENRY WALFORD (1869–1941), knighted 1922, English organist and composer, was born at Oswestry, Salop, on Sept. 6, 1869, and educated privately. In 1882 he became a chorister at St. George's chapel, Windsor, and in 1885 assistant organist to Sir Walter Parratt there. From 1890–94 he was pupil and scholar at the Royal College of Music, where, in 1895, he became a teacher of counterpoint. In 1898 he was appointed organist to the Temple church, a post which he held until 1923. From 1903–07 he was conductor of the London Bach choir in succession to Stanford; and from 1919–26 professor of music in the University college of Wales, at Aberystwith. During the World War, with the rank of major, he worked for the organization of music among the troops, and in 1918 was made director of music to the R.A.F. In 1919 he was appointed director of music and chairman of the National Council of Music, University of Wales; in 1924, Gresham professor of music. He was organist of St. George's chapel, Windsor, 1927–32.

His compositions include two symphonies; and in the way of choral works, *Everyman,* a felicitous setting for chorus and orchestra of the old morality play, which enjoyed nide favour; "Ode on Time" (1908); *The Sayings of Jesus* (1911); "Dante Fantasy" (1914); and *Heaven's Gate;* in addition to a quantity of church music, chamber music, part songs, etc. Over and above his creative work, Walford Davies mas for many years one of the most potent and stimulating forces (not least by means of his immensely popular radio talks) in musical education in England. He wrote *Music and Worship* (1935), with Harvey Grace, and *The Pursuit of Music* (1936), and edited several song books. In 1937 he was created K.C.V.O.

DAVIES, HUBERT HENRY (1869–1917), English playwright, was born in Cheshire on March 17, 1876. After some years of journalism in San Francisco, where he also produced a few vaudevilles, he returned to England and made a success in London with *Cousin Kate* and *Mrs. Gorringe's Necklace.* Among his other comedies were *The Mollusc* (1907) and *Doormats* (1912). He produced *The Outcast* (1914). His health broke down as the result of overwork in France as a hospital orderly during the World War, and he was found dead at Robin Hood's bay, Yorks, on Aug. 17, 1917.

DAVIES, SIR JOHN (1569–1626), English poet, was baptized on April 16, 1569, at Tisbury, Wiltshire. He was educated at Winchester college, and became a commoner of Queen's college, Oxford, in 1585. In 1588 he entered the Middle Temple, and was called to the bar in 1595. In his general onslaught on literature in 1599 the archbishop of Canterbury ordered to be burnt his volume, *All Ovid's Elegies, 3 Bookes, by C. M. Epigrams, by J. D.* (Middleburgh, 1598?), which contained posthumous work by Marlowe. The epigrams were probably earlier in date of composition than the charming fragment entitled *Orchestra* (1596), written in praise of dancing, and dedicated to the author's "very friend, Master Richard Martin," but in the next year the friends quarrelled, and Davies was expelled from the society for having struck Martin with a cudgel in the hall of the Middle Temple. He spent the year after his expulsion at Oxford in the composition of his philosophical poem on the nature of the soul and its immortality—Nosce *teipsum* (1599). Its force, eloquence and ingenuity, the orderly and lucid arrangement of its matter, place it among the finest of English philosophical poems. In 1599 Davies published a volume of 26 acrostics on the words *Elisabetha Regina,* entitled *Hymns to Astraea.* He produced no more poetry except two dialogues contributed to Francis Davison's *Poetical Rhapsody* (1608). In 1601 Davies was restored to his position at the bar, after making his apologies to Martin, and in the same year he sat for Corfe Castle in parliament. James I. received the author of *Nosce teipsum* with great favour, and sent him (1603) to Ireland as solicitor-general; he was knighted in the same year. In 1606 he was promoted to be attorney-general for Ireland, and created serjeant-at-arms. One of his chief aims was to establish the Protestant religion firmly in Ireland, and he took an active part in the "plantation" of Ulster. In 1612 he published his prose *Discoverie of the true causes why Ireland was never entirely subdued untill the beginning of his Majestie's happie raigne* (ed. H. Morley in his *Ireland under Elizabeth and James I.* [1890]). In the same year he entered the Irish parliament as member for Fermanagh, and was elected speaker after a scene of disorder in which the Catholic nominee, Sir John Everard, who had been installed, was forcibly ejected. In the capacity of speaker he delivered an excellent address reviewing previous Irish parliaments. He resigned his Irish officesin 1619, and sat in the English parliament of 1621 for Newcastle-under-Lyme. With Sir Robert Cotton he was one of the founders of the Society of Antiquaries He was appointed lord chief justice in 1626, but died suddenly before he could enter on the office. He had married (1609) Eleanor Touchet, daughter of George, Baron Audley. She developed eccentricity verging on madness, and wrote several fanatical books on prophecy.

BIBLIOGRAPHY.—In 1615 Davies published at Dublin *Le Primer Discours des Cases et Matters in Ley resolues et adjudges en les Courts del Roy en cest Realme* (reprinted 1628). He issued an edition of his poems in 1622. His prose publications were mainly posthumous. The *Question concerning Impositions, Tonnage, Poundage . . .* was printed in 1656, and four of the tracts relating to Ireland, with an account of Davies and his services to that country, were edited by G. Chalmers in 1786. His works were edited by Dr. A. B. Grosart (1869–76), with a full biography, for the Fuller Worthies Library; also by H. Morley for the "Carisbrooke Library" (vol. x. 1889). *Nosce teipsum* is printed in Arber's *English Garner* (vol. v. 1882).

DAVIES, JOHN, of Hereford (1565?–1618), English poet, was born at Hereford, and settled in Oxford as a writing master. His principal work is the *Microcosmus* (1603), modelled largely on Joshua Sylvester's translation of the *Semaines* of Du Bartas.

Among other works *are:—Mirum in modum* (1602), *The Holy Roode* (1609), *Wittes Pilgrimage* (*c.* 1610), *The Scourge of Folly* (*c.* 1611), *The Muses Sacrifice* (1612), and *Wittes Bedlam* (1607). His *Scourge of Folly* contains verses addressed to many of his contemporaries, to Shakespeare among others. He also wrote 4 *Select Second Husband for Sir Thomas Overbury's Wife* (1616), and *The Writing Schoolmaster* (earliest known edition, 1633). His works were collected by Dr. A. B. Grosart (1873) for the Chertsey Worthies Library.

DAVIES (DAVISIUS), **JOHN** (1679–1732), English classical scholar and critic, was born in London. He was president of Queen's college, Cambridge, and was considered one of the best commentators on Cicero. He edited the *Tusculanae disputationes* (1709), *De natura deorum* (1718), *De divinatione* and *De fato* (1725), *Academica* (1725), *De legibus* (1727), *De finibus* (1728) and other works. Davies's editions, which were intended to supplement those of Graevius, show a great knowledge of history and philosophy, but are too free in emendation.

DAVIES, JOHN LLEWELLYN (1826–1916), English divine and educationalist, was born at Chichester on Feb. 26, 1826. He was educated at Repton and Trinity College, Cambridge, where he was made a fellow in 1851. He was ordained in the same year, and held successively several London livings. He was given the crown living of Christ church, Marylebone in 1856, and in 1889 became vicar of Kirkby Lonsdale, Westmorland, where he remained until 1908. Davies was closely associated with John Frederick Denison Maurice in the foundation of the Working Men's College (1854), where he taught for many years. He was elected to the first London school board in succession to Huxley,

and from 1873–74 and 1878–86 was principal of Queen's College, Harley street, founded by Maurice in 1848 for the advancement of women's education. Davies was an advocate of the higher education of women, a cause in which his sister, Sarah Emily Davies (*q.v.*), was also prominent, and favoured the granting to women of university degrees and the Parliamentary franchise. He died at Hampstead on May 17, 1916. With Vaughan he produced the well-known translation of Plato's *Republic*.

DAVIES, SIR LOUIS HENRY (1845–1924), Canadian politician and jurist, was born in Prince Edward Island in 1845, of Huguenot descent. In 1882 he entered the Canadian parliament as a Liberal, and from 1896 to 1901 was minister of marine and fisheries. In the latter year he became one of the judges of the supreme court of Canada. In 1877 he was counsel for Great Britain before the Anglo-American fisheries arbitration at Halifax; in 1897 he was a joint delegate to Washington with Sir Wilfred Laurier on the Bering sea seal question; and in 1898–99 a member of the Anglo-American joint high commission at Quebec. In 1918 he became chief justice and a member of the privy council. He died at Ottawa on May 1, 1924.

DAVIES, RICHARD (*c.* 1501–1581), Welsh bishop and scholar, was born in north Wales and educated at New Inn Hall, Oxford, becoming vicar of Burnham, Bucks., in 1550. He took refuge at Geneva during the reign of Mary. In Jan. 1560 he was consecrated bishop of St. Asaph, whence he was translated, early in 1561, to the bishopric of St. Davids. Davies was a member of the council of Wales, was very friendly with Matthew Parker, archbishop of Canterbury, and was consulted both by him and by Burghley, on Welsh concerns. He took part in translating the New Testament into Welsh, and assisted with the Welsh translation of the Book of Common Prayer. He helped to revise the "Bishops' Bible" of 1568, being responsible for Deuteronomy and 2 Samuel. He died on Nov. 7, 1581.

DAVIES, SARAH EMILY (1830–1921), British educationalist, sister of John Llewellyn Davies (*q.v.*), was born at Southampton on April 22, 1830. She was educated at home, and later identified herself with the movement for the higher education of women, being also one of a group of women who, about 1858, were discussing the question of women's suffrage at the Kensington Society. In 1862 she became secretary to the committee which was formed to procure the admission of women to university examinations. In 1867, Miss Davies, with the help of Mme. Bodichon (Barbara Leigh Smith) and others, organized a women's college at Hitchin, which was subsequently transferred to Cambridge as Girton college in 1873. From 1870 to 1873 she was a member of the London School Board, and withdrew to become mistress of Girton college, Cambridge, a post which she held for two years. In 1873 she was elected a life governor of University college, London, and in 1882 became honorary secretary of Girton college, retiring in 1904. She died in London on July 13, 1921. She published *The Higher Education of Women* (1886), and *Thoughts on Some Questions Relating to Women 1860–1908* (1910).

See B. Stephen, *Emily Davies and Girton College* (1927).

DAVIES, WILLIAM HENRY (1871–1940), British poet, born at Newport, Monmouth, April 20, 1871. After serving as apprentice to a picture-frame maker he tramped through America, crossed the Atlantic many times on cattle boats, became a pedlar and street singer in England, and after eight years of this life published his first volume of poems, *The Soul's Destroyer*, from the Marshalsea prison. Next year appeared in prose *The Autobiography of a Super-Tramp* (1908) with a preface by G. Bernard Shaw, and also *Nature Poems and Others*. Collected editions of his poems appeared in 1916, 1924, 1928. His poetry includes: *Forty New Poems* (1918); *The Hour of Magic, and Other Poems* (1922); *A Poet's Alphabet* (1925); *The Song of Love* (1926); *Poems* (1930–31, 1932); *The Loneliest Mountain* (1939). He published a novel, *A Weak Woman* (1911), and volumes of nature studies, including *A Poet's Pilgrimage* (1918), *Later Days* (1925), *The Adventures of Johnny Walker Tramp* (1926).

DAVILA, ENRICO CATERINO (1576–1631), Italian historian, was descended from a Spanish noble family His immediate ancestors had been constables of the kingdom of Cyprus for the Venetian republic since 1464. But in 1570 the island was taken by the Turks; and Antonio Davila, the father of the historian, had to leave it, despoiled of all he possessed. He travelled into Spain and France, and finally returned to Padua, and at Sacco on Oct. 30, 1576, his youngest son, Enrico Caterino, was born. About 1583 Antonio took this son to France, where he became a page in the service of Catherine de' Medici, wife of King Henry II. In due time he entered the military service, and fought through the civil wars until the peace in 1598. He then returned to Padua, where, and subsequently at Parma, he led a studious life until, when war broke out, he entered the service of the republic of Venice. During the whole of this active life he never lost sight of his early design of writing the history of those civil wars in France in which he had borne a part. The success of the *Istoria delle guerre civili di Francia* was immediate and enormous. Over 200 editions followed, of which perhaps the best is the one published in Paris in 1644 Davila was murdered, while on his way to take over Cremona for Venice in July 1631.

The *Istoria* mas translated into French by G. Baudouin (1642); into Spanish by Varen de Soto (Madrid, 1651, and Antwerp, 1686); into English by W. Aylesbury (1647), and by Charles Cotterel (1666), and into Latin by Pietro Francesco Cornazzano (1745). The best account of the life of Davila is that by Apostolo Zeno, prefixed to an edition of the history printed at Venice in 2 vols. in 1733.

DAVIS, CHARLES HAROLD (1857–1933), American landscape painter, was born at East Cambridge (Mass.), Feb. 2, 1857. A pupil of the schools of the Boston Museum of Fine Arts, he was sent to Paris in 1880. Having studied at the Academy Julian under Lefebvre and Boulanger, he went to Barbizon and painted much in the forest of Fontainebleau under the traditions of the "men of thirty." He became a full member of the National Academy of Design in 1906, and received many awards, including a silver medal at the Paris Exhibition of 1889. He is represented by important works in the Bletropolitan Museum of Art, New York; the Corcoran Art Gallery, Washington; the Pennsylvania Academy, Philadelphia, and the Boston Museum of Fine Arts. The Union League club in New York had an exhibition of his works in Feb. 1927.

DAVIS, CUSHMAN KELLOGG (1838–1900), American political leader and lawyer, was born in Henderson, N.Y., on June 16, 1838. He was taken by his parents to Wisconsin Territory in the year of his birth, and was educated at Carroll college, Waukesha, Wis., and at the University of Michigan, where he graduated in 1857. After studying law he was admitted to the bar in 1860. During the Civil War he served as a first lieutenant in 1862–63 and in 1864 was an aide to Gen. Willis A. Gorman (1814–76). Resigning his commission in 1864, he settled in St. Paul, Minn., where he soon became prominent both at the bar and, as a Republican, in politics. He served in the State house of representatives in 1867, and was U.S. district attorney for Minnesota (1868–73). In 1874–76 he was governor of the State, and from 1887 until his death at St. Paul, Nov. 27, 1900, was a member of the U.S. Senate, where he was one of the acknowledged leaders of his party, an able and frequent speaker, and a committee worker of great industry. He was one of the peace commissioners who negotiated and signed the treaty of Paris by which the Spanish-American War was terminated. In addition to various speeches and public addresses, he published an essay entitled *The Law of Shakespeare* (1899).

See sketch by W. B. Chamberlain in *Michigan Alumnus*, vol. vii., pp. 133–139 (1901).

DAVIS, HENRY WILLIAM CARLESS, C.B.E. (1874–1928), British historian, a son of H. F. A. Davis of Stroud, Gloucestershire, was born on Jan. 13, 1874 and educated at Weymouth college and Balliol college, Oxford. He was a fellow of All Souls (1895–1902), and of Balliol (1902–21). During the World War he served in the War Trade Intelligence Department, and after attending the Peace Conference, directed the Overseas Trade Department. In 1921 Davis was appointed professor of modern history at Manchester and in 1925 he returned to Oxford as regius professor of modern history. He became, in addition, curator of the Bodleian Library in 1926. He was made

director of the *Dictionary of National Biography*, when, in 1902, the copyright of that work passed to the Clarendon Press. Davis's historical work was chiefly done in the mediaeval field and found expression in his *England under the Normans and Angevins* (1905), *Mediaeval Europe* (1911), a revised edition of the *Select Charters* of William Stubbs (1913) and *Mediaeval England* (1924). The calendar of Anglo-Norman Royal Charters, 1066–1154, was not completed, owing to the difficulty of obtaining literary assistance during the World War. Davis was able to finish only the first volume (1913).

The considered judgment, exact scholarship and constructive imagination shown in his *England under the Normans and Angevins* brought him into prominence as an authority on mediaeval history. This work was remarkable for its appreciation of the true position held by England in the period dealt with, and marks a definite advance in historical scholarship. His *Mediaeval Europe*, though showing a masterly knowledge of the period, was written rather for the general public than for the serious student. After the outbreak of war, Davis's writings on subjects connected with modern political thought *(The Political Thought of Treitschke* [1914], and various articles) demonstrated his skill in the delineation of character and the exposition of policy, and he brought to this work in a very different field the same characteristic ability and thoroughness which had made his mediaeval studies famous. He was exceptionally gifted as a tutor, particularly for those who, themselves, intended to become teachers. Davis died of pneumonia on June 28, 1928, in Edinburgh, where he had gone to conduct an examination.

He contributed several articles to this *Encyclopædia.*

DAVIS, HENRY WINTER (1817–1865), American political leader, was born at Annapolis (Md.), U.S.A., on Aug. 16, 1817. He graduated from the law department of the University of Virginia in 1841, and began to practice law in Alexandria (Va.), but in 1850 removed to Baltimore (Md.). Early imbued with strong anti-slavery views, he began political life as a Whig, but when the Whig party disintegrated, became an "American" or "Know-Nothing," and as such served in the national House of Representatives from 1855 to 1861. In 1860, not ready to ally himself wholly with the Republican party, he declined to be a candidate for the Republican nomination for the vice-presidency. After Lincoln's election, he became a Republican, and was re-elected in 1862 to the National House of Representatives, in which his radical views commanded especial attention owing to his being one of the few representatives from a slave state. From Dec. 1863 to March 1865 he was chairman of the committee on foreign affairs. With other radical Republicans Davis was a bitter opponent of Lincoln's reconstruction plan of the Southern States. On Feb. 15, 1864, he reported a bill placing reconstruction under the control of Congress. The bill finally passed both houses but failed to receive the approval of the president, who on July 8 issued a proclamation defining his position. On Aug. 5, 1864, Davis joined Benjamin F. Wade of Ohio, in issuing the so-called "Wade-Davis Manifesto," which violently denounced President Lincoln for encroaching on the domain of Congress. He was one of the radical leaders who preferred Frémont to Lincoln in 1864, but subsequently supported the President. In July 1865, he publicly advocated the extension of the suffrage to negroes. He died in Baltimore (Md.), on Dec. 30, 1865.

See *The Speeches* of *Henry Winter* **Davis** (1867), *to* which is prefixed an oration on his life and character delivered in the House of Representatives by Senator J. A. J. Creswell of Maryland.

DAVIS, JEFFERSON (1808–1889), American statesman, president of the Confederate States of America, was born on June 3, 1808 on a farm on the present site of Fairview, Todd county, Ky. He was the tenth and youngest child of Samuel Davis (1755–1824), a descendant of a Welsh family that had settled originally in New Jersey, and he probably was a cousin of Samuel Davies (1724–1761), president of Princeton. Samuel Davis was born in Georgia, was a captain of infantry in the American revolution and subsequently was a planter. He married Jane Cook (1759–1844) of Scotch-Irish stock. They moved to south-western Kentucky in 1796, thence to Louisiana about 1810 and still again to Wilkinson county, Miss.

Schooled in Kentucky and in Mississippi, Davis attended Transylvania college, Ky., in 1821–24, entered the U.S. Military Academy in Sept. 1824, and graduated no. 23 in a class of 33, in July 1828. Albert Sidney Johnston was in a higher class during Davis' cadetship, and Robert E. Lee and Joseph E. Johnston belonged to the next junior class. Davis remained in the army seven years, and served chiefly in Wisconsin, where a severe attack of pneumonia left him with a facial neuralgia that often incapacitated and sometimes blinded him. After 1831 he was never a man of robust health or of a normal nervous system.

Finding in 1835 that army life had become a routine, Davis resigned his commission as lieutenant and after marrying Sarah Knox Taylor, daughter of Col. Zachary Taylor, started as a cotton-planter in Mississippi. His young bride died within three months of their marriage, and he spent the next ten years of his life on his plantation with his leisure devoted to hard reading. He soon developed a system that was almost a model in the relations of master and slaves. He gave the servant community a large measure of self-government and left in its hands, through an interesting jury system, the trial of all petty offenders. His own experience shaped his views: knowing that his negroes were well-fed, happy and advancing, he could not believe the evil alleged against slavery.

An unsuccessful candidate of the legislature in 1843 and a Democratic presidential elector in 1844, Davis was elected to the U.S. House of Representatives in 1845. He was married that same year to Varina Howell (1828–1907), granddaughter of Gov. Richard Howell of New Jersey. His service in Washington had hardly begun when the war with Mexico broke out and he was named colonel of the First Mississippi Infantry. He resigned from Congress in June 1846, and speedily had his troops well drilled and ready to join in the advance of the army under Gen. Zachary Taylor. Davis and his regiment acquitted themselves well in the battle of Monterey, Sept. 21–23, 1846, and when Taylor's reduced force was attacked at Buena Vista on Feb. 22, 1847, a stand by the Mississippians saved the day for the American forces and made Davis something of a national figure. He was wounded in this battle and was forced to return to Mississippi, in the company of his troops, whose term of enlistment had expired. He declined President Polk's complimentary commission as brigadier-general of volunteers, on the ground that officers of volunteers should be named by the States, but in Aug. 1847 he accepted appointment to the United States Senate and soon was named chairman of its committee on military affairs. In 1851 the Democrats of Mississippi prevailed upon him, in the party's interest, to become a candidate for governor. He was defeated by a narrow vote, and was again in retirement for 18 months, but upon the inauguration of Franklin Pierce in 1853, he became secretary of war and served for four years. During this time he strengthened the coast-defences, enlarged the army, directed valuable surveys for a railroad to the Pacific, introduced various betterments at West Point, and experimented with the use of camels as draft animals in the West. Expansionist plots in Cuba and in Nicaragua were supposed to have his support President Pierce's endorsement of the repeal of the Missouri compromise was probably the result of Davis' influence with him.

Davis re-entered the United States Senate on March 4, 1857, but an affection of the eyes limited his activities for nearly two years. In 1859–60 he was one of the foremost leaders of Southern Democrats in opposition to Stephen A. Douglas. During his first term in the senate (1847–51) he had argued that all the territories should be opened to slavery, but he had been willing to accept an extension of the line of the Missouri compromise to the Pacific. After the verdict of the Supreme Court in the Dred Scott case, he became more aggressive in his views of Southern rights and repudiated Stephen A. Douglas' doctrine of squatter sovereignty. He asserted that Congress had no right to deny admission to the Union to any territory because of the existence or non-existence of slavery, which he now frankly defended. His opinions were fully set forth in a series of resolutions offered on Feb. 2, 1860, and subsequently adopted. He did his utmost to

prevent the nomination of Douglas for the presidency, and after the split in the Democratic convention at Charleston, he supported Breckinridge and Lane, though he did not canvass for them.

Always a believer in the right of secession, Davis had favoured a convention of the Southern States in 1851, to consider what action they should take on the compromise of 1850, but until after the election of Lincoln in Nov. 1860 he never felt that circumstances justified a withdrawal from the Union. The victory of the party opposed to slavery, the uncompromising attitude of the Republican senators, and the unwillingness of President Buchanan to concede the right of a State peaceably to leave the Union, combined in the early winter of 1860–61 to convince Davis that the South in self-protection should exercise its right of secession and should form a separate confederation. He united with six other senators from the cotton States in an historic declaration to this effect. At the instance of his colleagues he consented to serve on the "committee of thirteen" that sought a last-minute settlement of slavery, but when he found that the Republican members would accept no compromise, he voted against the committee's report. Although he believed further efforts at accommodation were futile, he intervened in South Carolina's behalf in an attempt to have the Federal garrison withdrawn from Charleston harbour. Then, following the secession of his own State, he bade farewell to the senate on Jan. 21, 1861, in a moving address.

CIVIL WAR CAREER

Designated commander of his own State's troops, Davis hoped for a military career in case of war. Instead, to his surprise and regret, he was unanimously chosen by Congress provisional president of the Confederate States Feb. 9, 1861. He was inaugurated at Montgomery, Ala., on Feb. 18, 1861, mas formally elected by the people on Oct. 16, 1861, was again inaugurated, this time at Richmond, Va., under the "permanent constitution" on Feb. 22, 1862, and was holding the office of president when the Confederacy collapsed.

Selecting a cabinet of moderate views and of no more than moderate ability, Davis sought to negotiate for a withdrawal of the Union troops from military posts in the South, and he did not order military operations to be opened at Charleston, S.C., in April 1861, until he was convinced that the Lincoln administration had sent an armed expedition to revictual and reinforce the garrison of Ft. Sumter.

The easy victory of the Confederates at Bull Run, on July 21, 1861, misled the South into believing that its independence would be won without great effort. Even Davis himself, who had warned the Confederacy of the magnitude of its task, seems to have been so deluded in the summer of 1861 by the hope of speedy foreign intervention that he did not capitalize the war ardour of the first months of the struggle. Events of the winter of 1861–62, however, spurred him to a vigorous policy. He procured the passage of a conscription law, and although the South had only one rolling-mill of any consequence, he contrived to manufacture cannon in sufficient numbers. Side-arms, powder, uniforms and quarter-masters stores were obtained in a country that had few facilities for making them. A navy was constructed in improvised yards and by secret, adroit purchase abroad. The war was financed on fiat money. The feeble, disjointed transport system of the South was welded together and was made to serve.

The results of hard effort, coupled with the fortunate choice of good commanders, showed during 1862 in a series of brilliant victories in Virginia. It was otherwise on the Mississippi. Friction among rival generals and a lack of co-ordination led from disappointment to disaster. A visit of Davis to the threatened front in Dec. 1862 failed to change the situation. The next year he decided on an offensive in the East in preference to reinforcement of the army on the Mississippi. It was his most momentous decision and perhaps his greatest blunder, because the Eastern offensive failed at Gettysburg and the very next day, by the fall of Vicksburg, the Confederacy was cut in half.

In 1864, Lee maintained a successful defensive in Virginia, but in Tennessee and Georgia conditions went from bad to worse. Davis had delayed too long in removing the unsuccessful Braxton Bragg and after he at last relieved Bragg of command of the Army of Tennessee, he offended public opinion by making him his chief military adviser. On July 17, 1864, when Sherman was close to Atlanta, Davis supplanted Joseph E. Johnston by John B. Hood. This most ruinous change led to the speedy break-up of the only army that stood in the way of Sherman's march to join Grant, who by this time had pinned Lee to the Richmond defences. The reaction against Davis, who was blamed for all this, was immediate and severe. Congress no longer sustained him, the governors of North Carolina and of Georgia were openly antagonistic, the press denounced him, and Robert E. Lee would probably have been named dictator in Davis' place if Lee had been willing to countenance a revolution within the Confederacy. The failure of the Hampton Roads conference, on Feb. 3, 1865, to find any basis of peace, filled out the measure of Davis' unpopularity.

Davis was perhaps too harshly judged by his contemporaries. He never had a general military policy. He was too prone to 'take the course of immediate safety. After the removal of the Confederate capital to Richmond, in May 1861, he laid too much emphasis on the defence of Virginia to the neglect of other parts of the Confederacy. He acted on occasion as his own chief of staff, and then, with no apparent reason for change, he left his field commanders entirely to their own discretion. He became so absorbed in operations that he neglected the commissary and transport. Above all, he was not a good judge of men when his affection, his pride or his prejudice were involved, though it must be remembered to his credit that he kept his faith in Robert E. Lee at a time when the press and the country decreed Lee a failure because of his unsuccessful campaign in Western Virginia. Criticism sometimes aroused in Davis a dangerous obstinacy. He could not brook open opposition and he was singularly sensitive. This last-named bad quality, his coldness and his personal dignity kept him from making an effective appeal to the emotions of his people. He was unhappy in his dealings with a short-sighted, contentious congress, and he was maladroit in his foreign relations, particularly with France. His loyalty to his friends was so extreme as to be a positive vice. But against all his failings is to be set the fact that the agricultural South, with resources vastly inferior to those of the North, kept up the struggle for four years. Perhaps the strongest single force in that defence, when all is said, was Jefferson Davis.

On the evacuation of Richmond, April 2–3, 1865, Davis removed the executive offices to Danville, Va., and thence to Greensboro, N.C. Journeying southward in the hope of reaching the Trans-Mississippi department, he was captured near Irwinville, Ga., on May 10, 1865, and was transported to Ft. Monroe, Va. He was confined there, under threat of a trial for treason, until May 4, 1867, when he was admitted to bail and was allowed to go to Canada. During the early part of his imprisonment he was manacled and subjected to severities that impaired his health. This maltreatment, and the effort of the North to make him a scapegoat, won for him the sympathy of the South and restored him to his former place in its affection. Although he was twice indicted for treason, the proceedings were dropped after the general amnesty proclamation of Dec. 25, 1868. He subsequently visited Europe, served for a time as president of an insurance company and then retired to Beauvoir, the home of an admiring friend in Mississippi, where he wrote his *Rise and Fall of the Confederate Government* in two volumes (1881). This is an excellent review of the constitutional questions underlying secession but is in many respects a singularly reticent account of his administration. He later composed *A Short History of the Confederate States of America,* issued posthumously in 1890. He declined to take any part in politics on his return to the United States, and he was cheerfully engaged in his correspondence and in interviews with frequent visitors when a brief illness from a bronchial complaint terminated fatally on Dec. 6, 1889, in New Orleans, La. He was buried there, but in 1893 his body was taken to Richmond and on May 31 was reinterred in Hollywood cemetery.

In person, Jefferson Davis was imposing, over 6 ft. in height, erect, thin and graceful in his movements. His jaw was strong, his eyes were grey-blue, his nose was slightly aquiline and his features were sharply cut. He had much dignity of manner and a fine voice, combined with unfailing personal courtesy.

All four of Davis' sons predeceased him. Besides his widow by his second marriage, he left two daughters, Margaret Davis (1857–1909), who married J. Addison Hayes, and Varina ("Winnie") Davis (1864–1898), known as the "daughter of the Confederacy," born in the confederate executive mansion. She wrote several books that enjoyed some popularity. Mrs. Jefferson Davis lived until 1907, chiefly in New York. Her biography of her husband in two volumes, *Jefferson Davis . . . A Memoir* (1890) is a detailed and persuasive picture of Davis.

BIBLIOGRAPHY.—F. H. Alfriend and E. A. Pollard soon after the war wrote partizan lives that are now supplanted by Mrs. Davis' *Memoir (see* above), by *W*. E. Dodd's *Jefferson Davis* (1907), by A. C. Gordon's biography of the same title (1918) and by H. J. Eckenrode's *Jefferson Davis, President of the South* (1923), an exacting critique of Davis' military policy. Dunbar Row-land in 1923 issued in ten volumes *Jefferson Davis, Constitutionalzst, His Letters, Papers and Speeches.* Mrs. Dunbar Rowland (Eron Rowland) publisned (1928) a biography *Varina Howell, Wife of Jefferson Davis. W. H.* Whitsitt published a tentative *Genealogy* in 1910. *See* also Allen Tate, *Jefferson Davis, His Rise and Fall* (1929). (D. S. F.)

DAVIS or **DAVYS, JOHN** (1550?–160j), one of the chief English navigators and explorers under Elizabeth, was born at Sandridge near Dartmouth about 1550. He early made several voyages with Adrian Gilbert. In Jan. 1583 he appears to have broached his design of a north-west passage to Walsingham and John Dee, and in 1585 he started on his first north-western expedition. He began by striking the ice-bound east shore of Greenland, which he followed south to Cape Farewell; thence he turned north, and coasted the west Greenland littoral, and shaped a "course for China" by the north-west. In 66° N., however, he fell in with Baffin Land, and though he pushed some way up Cumberland sound, he turned back (end of August). He tried again in 1 j86 and 1587; in the last voyage he pushed through the straits still named after him into Baffin's bay, coasting west Greenland to 73° N., almost to Upernavik. Many points in Arctic latitudes (Cumberland sound, Cape Walsingham, Exeter sound, etc.) retain names given them by Davis, who ranks with Baffin and Hudson as the greatest of early Arctic explorers and, like Frobisher, narrowly missed the discovery of Hudson's bay via Hudson's straits.

In 1588 he seems to have commanded the "Black Dog" against the Spanish Armada, and in 1591 he accompanied Thomas Cavendish on his last voyage, with the object of searching "that northwest discovery upon the back parts of America." After the rest of Cavendish's expedition returned unsuccessful, he continued to attempt on his own account the passage of the Strait of Magellan, and discovered the Falkland islands. After his return in 1593 he published a valuable treatise on practical navigation in *The Seaman's Secrets* (1594), and a more theoretical work in *The World's Hydrographical Description* (159j). His invention of back-staff and double quadrant (called a "Davis Quadrant") held the field long after Hadley's reflecting quadrant had been introduced. In 1596–97 Davis sailed with Raleigh (as master of Sir Walter's own ship) to Cadiz and the Azores; and in 1598–1600 he accompanied a Dutch expedition to the East Indies as pilot. In 1601–03 he accompanied Sir James Lancaster as first pilot on his voyage in the service of the East India Company; and in Dec. 1604 he sailed again for the same destination as pilot to Sir Edward Michelborne (or Michelbourn). On this journey he was killed by Japanese pirates off Bintang near Sumatra.

A Traverse Book made by John Davis in 1587, an *Account of his Second Voyage in 1586* and *a Report of Master John Davis of his three voyages made for the Discovery of the North West Passage* were printed in Hakluyt's collection. Davis himself published *The Seaman's Secrets, divided into two Parts* (1594), *The World's Hydrographical Description . . . whereby appears that there is a short and speedy Passage into the South Seas, to China, Molucca, Philippina, and India, by Northerly Navigation* (1595). Various references to Davis are in the *Calendars of State Papers, Domestic* (1591–94), and *East Indies* (1513–1616). *See* also *Voyages and Works of John Davis,* ed. *A. H.* Markham (Hakluyt Society, 1880), and the article "John Davys" by Sir J. Laughton in the *Dict. Nat. Biog.* (C. R. B.)

DAVIS, JOHN WILLIAM (1873–), American lawyer, was born at Clarksburg (W. Va.), April 13, 1873, where he received his early education. He graduated at Washington and Lee university in 1892, and from the law school there in 1895, being admitted to the bar in the same year. After a year as assistant professor of law at his alma mater, he returned in 1897 to Clarksburg, where he entered into an informal partnership with his father, also a lawyer, which continued until 1913. In 1899 he was elected a member of the West Virginia house of delegates, and in 1904 was a delegate to the Democratic national convention at St. Louis. He was elected to the 62nd (1911) and 63rd (1913) congresses for the first West Virginia district. During his period of service he was one of the managers on the part of the House in the successful impeachment of Judge Archbald.

In Aug. 1913, he was appointed solicitor-general of the United States, an office which he held until 1918. In this position he conducted many important cases, among them the Midwest Oil case, involving the right of the President to withdraw from entry public lands thought to contain mineral deposits. From 1913 to 1918 he was counsel for the American Red Cross. In 1918 he was appointed American delegate to a conference with Germany at Bern on the treatment and exchange of prisoners of war, and in the same year succeeded Walter Hines Page as American ambassador to Great Britain, retaining this post until 1921. Among the honours conferred upon him was that of election as a bencher of the Middle Temple.

During the Peace Conference John W. Davis was one of President Wilson's advisers, and was the American representative on the joint committee which drafted the form of Allied control and government in the occupied Rhineland territory. In 1921 he returned from England and accepted a partnership in the New York law firm of Stetson, Jennings and Russell, which had many distinguished clients, among them J. P. Morgan and Co., and the Guaranty Trust Company. Davis was nominated on the 103rd ballot as Democratic candidate for the presidency at the Democratic national convention held in New York city, July 1924. The ensuing election resulted in an overwhelming victory for Calvin Coolidge, the Republican candidate, the electoral vote being 382 for the latter, 136 for Davis and 13 for La Follette, the Progressive candidate, while the popular vote was 15,748,356 for Coolidge, 8,617,454 for Davis and 4,686,681 for La Follette.

DAVIS, RICHARD HARDING (1864–1916), American writer, was born in Philadelphia, April 1S, 1864. He studied at Lehigh and Johns Hopkins universities, and in 1886 became a reporter on the Philadelphia *Record.* After working on several newspapers, at the same time writing short stories, he was managing editor of *Harper's Weekly.* In Dec. 1890 he arranged to travel and write for *Harper's Monthly,* the first book thus resulting being *The West from a Car-Window* (1892). He became widely known as a war correspondent, reporting every war from the Greco-Turkish War (1897) to the World War. Of his numerous works of fiction, the earliest are the best, especially *Gallegher and Other Stories* (1891), and *Van Bibber and Others* (1892). His other books include *Soldiers of Fortune* (1897), *A Year from a Reporter's Note-Book* (1898), *Real Soldiers of Fortune* (1906), *Farces* (1906), *The White Mice* (1909), *Notes of a War Correspondent* (1910), and *Somewhere in France* (191j) He died near Mt. Kisco, N.Y., April 11 1916.

There have been several collective editions, the principal one being *The Novels and Stories of Richard Harding Davis* (1916). A collection of the best of his short stories, *From Gallegher to the Deserter,* was edited by Roger Burlingame in 1927. *See* also *Adventures and Letters of Richard Harding Davis* (1917), edited by his brother Charles B. Davis and *Richard Harding Davis; a Bibliography* (1924), by *H.* C. Quinby.

DAVIS, THOMAS OSBORNE (1814–1845), Irish poet and politician, was born at Mallow, co. Cork. He graduated at Trinity college, Dublin, in 1836, and was called to the bar in 1838. Adopting nationalist views he joined John Blake Dillon in editing the *Dublin Morning Register* (1841), and worked, as a follower of Daniel O'Connell, on the committee of the repeal association He helped Dillon and Charles Gavan Duffy to found the weekly newspaper, *The Nation,* in 1842, to which he contributed a series

of lyrics, "The Lament of Owen Roe O'Neill," "The Battle of Fontenoy," "The Geraldines," "Máire Bhan a Stoir," and many others. Differences arose between O'Connell and the young writers of *The Nation,* and Davis was one of the leaders of the extremist party, "Young Ireland," till his premature death.

See his *Poems* and his *Literary and Historical Essays* collected in 1846 (new ed. 1915). There is an edition of his prose writings (1889) in the *Camelot Classics. See* the monograph on *Thomas Davis* by Sir Charles Gavan Duffy (1890, abridged ed. 1896), and the same writer's *Young Ireland* (revised ed. 1896).

DAVIS, WILLIAM MORRIS (1850–1934), American geographer and geologist, was born in Philadelphia, Pa, on Feb. 12, 1850. After graduating from the Lawrence scientific school, Harvard university in 1870, he was assistant astronomer at the Argentine Kational observatory, Cordoba, Argentina, in 1870–73. In **1877** he made a tour of the world. He was instructor and professor of physical geography and geology at Harvard from **1877** until **1912** when he was made professor emeritus. In 1903 he went to Turkistan as a physiographer of Pumpelly's Carnegie institution expedition. He visited South Africa in 1905 and Australia in 1914 as guest of the British Association for the Advancement of Science. He was visiting professor at the University of Berlin in 1908–09, and at the University of Paris in 1911–12. In **1914** he crossecl the Pacific on a Shaler memorial study of coral reefs. He was founder and for three terms president of the Association of American Geographers; founder and president (1902–11) of the Harvard Travellers' club, and president **(1911)** of the Geological Society of America. By his lectures and writings on the development of the physical features of the earth he won high rank among modern physiographers.

Among his published works are *Elementary Meteorology* **(1894)** ; *The Triassic Formation of Connecticut* (U.S. Geological Survey, **1896);** *Physical Geography* **(1898)**; *Practical Exercises in Physical Geography* (1908); *Geographical Essays* (1909); *Physiogeographie* (with G. Braun, 1911); *Erkl. Beschreibung der Landformen* (lectures in Berlin, 1912); *The Coral Reef Problem* **(1928);** and numerous scientific essays. In **1895** he was made a member of the editorial committee of *Science* and in 1909 he became associate editor of the *American Journal* of *Science.*

DAVISON, WILLIAM (*c.* 1541–1608), secretary to Queen Elizabeth, was of Scottish descent. In 1566 he acted as secretary to Henry Killegrew (d. 1603), when he was sent into Scotland by Elizabeth on a mission to Mary, queen of Scots. Remaining in that country for about 10 years, Davison then went twice to the Netherlands on diplomatic business, returning to England in **1586** to defend the hasty conduct of his friend, Robert Dudley, earl of Leicester, who had assumed the office of Governor of the Low Countries without Elizabeth's instructions. In the same year he became member of parliament for Knaresborough, a privy councillor, and assistant to Elizabeth's secretary, Thomas Walsingham; but he soon appears to have acted rather as the colleague than the subordinate of Walsingham. He was a member of the commission appointed to try Mary, queen of Scots, although he took no part in its proceedings, was never at Fotheringay, and was not present at Westminster when the sentence of death was passed. The warrant for Mary's execution was entrusted to Davison. On this occasion, and also in subsequent interviews with her secretary, Elizabeth suggested that she would be glad to avoid the responsibility of the execution, but Mary's gaolers, Paulet and Drury, refused to take the hints thrown out to them. Meanwhile, the privy council having been summoned by Lord Burghley, it was decided to carry out the sentence at once, and Mary mas beheaded on Feb. **8,** 1587. When the news of the execution reached Elizabeth she was extremely indignant, and her wrath was chiefly directed against Davison, who, she asserted, had disobeyed her instructions not to part with the warrant. The secretary was arrested and thrown into prison, but, although he defended himself when interrogated in the Tower, he did not say anything about the queen's wish to get rid of Mary by assassination. Charged before the Star Chamber (March **28,** 1587) with misprision and contempt, he was acquitted by many of the commissioners of evil intention, but was sentenced to pay a fine of 10,000 marks, and to imprisonment during the queen's pleasure; but he was released in 1589. He retired to Stepney, where he died. He was buried on Dec. 4, **1608.** Davison was undoubtedly made the scapegoat for the queen's pusillanimous conduct.

His eldest son FRANCIS DAVISON (*c.* **157j-c** 1619), and his fourth son WALTER (1581–1608?) both contributed poems to the *Poetical Rhapsody* **(1602)** ; notices of them are given in Sir N. H. Nicolas's edition **(1826)** of that miscellany. Francis Davison also wrote a metrical translation of the Psalms, which remained in ms. until they were edited by Sir E. Brydges and by Nicolas in the 19th century.

Many state papers written by him, and many of his letters, are extant in various collections of manuscripts. *See* Sir N. *H.* Nicolas, *Life of* W. *Davison* (1823); *J.* A. Froude, *History of England* (1881 fol.); *Calendar of State Papers 1580–1609;* and *Correspondence of Leicester during his Government of the Low Countries,* edited by *J.* Bruce (1844).

DAVIS STRAIT, the broad strait which separates Greenland from North America, and connects Baffin bay with the open Atlantic. At its narrowest point, which occurs just where the Arctic Circle crosses it, it is nearly 200 m. wide. This part is also the shallowest, a sounding of 112 fathoms being found in the centre, whereas the depth increases rapidly both to north and to south. Along the western shore (Baffin Land) a cold current passes southward; but along the east there is a warm northward stream. There are a few Danish settlements on the Greenland coast. The strait takes its name from the explorer John Davis.

DAVITT, MICHAEL (1846–1906), Irish Nationalist politician, son of a peasant farmer, was born at Straide, Co. Mayo, on March **25, 1846.** His father was evicted for non-payment of rent in 1852, and migrated to Lancashire, where at the age of ten the boy began work in a cotton mill at Haslingden. In **1857** he lost his right arm by a machinery accident; he was sent to school, and at 15 became a newsboy and printer's "devil." He drifted into the ranks of the Fenian brotherhood in **1865,** and on May 14, 1870, he was arrested at Paddington for treason-felony in arranging to send firearms into Ireland, and was sentenced to **15** years penal servitude. After seven years, spent chiefly at Dartmoor, he was released on ticket-of-leave. He at once rejoined the "Irish Republican Brotherhood," and went to the United States, where his mother, herself of American birth, had settled with the rest of the family, with the idea of grafting constitutional methods on the revolutionary movement on lines which he had thought out in prison. He proposed to link up the campaign for independence with the agrarian question. Returning to Ireland he seems to have persuaded Parnell of the importance of the agrarian element, and helped him to start the Land League in 1879, and his violent speeches resulted in his re-arrest and consignment to Portland by Sir William Harcourt, then home secretary. He was released in **1882,** but was again prosecuted for seditious speeches, and imprisoned for three months in **1883.** Before this his support of Parnell had led to his expulsion from the supreme council of the I.R B., though he remained a member of the organization until **1882.** Between **1882** and **188j** he conducted a campaign on land nationalization. which Parnell repudiated. He had been elected to parliament for Meath as a Nationalist in **1882,** but, being a convict, was disqualified to sit. He was included as one of the respondents before the Parnell Commission (1888–1889), and spoke for fire days in his own defence. That he had brought the Irish Party into contact with the Fenians in America was undoubted. *(See* PARNELL **)** He took the anti-Parnellite side in 1890, and in **1892** was elected to parliament for North Meath, but was unseated on petition. He was then returned for North-East Cork, but had to vacate his seat through bankruptcy, caused by the costs in the North Meath petition. In **189j** he was elected for West Mayo. In **1898** he helped William O'Brien to found the United Irish League to reconcile the Parnellite and anti-Parnellite factions. He retired from the House of Commons to express his disapproval of the Boer War. He fiercely opposed the Wyndham Land Purchase Act and William O'Brien's conciliatory policy. He died on May 31, 1906, in Dublin. A sincere but embittered Nationalist, anti-English, anti-clerical and sceptical as to the value of the purely parliamentary agitation

for Home Rule, Davitt was often in conflict with his fellow Home Rulers. In later years his socialistic radicalism connected him closely with the Labour Party. His force of character earned him the respect of many, even of those who thought his doctrine pernicious. The chief original authority is to be found in his own works, notably in his speech before the Parnell Commission, separately published as The *Defence* of tlze Land *League* (1891).

See also F. Sheehy Skeffington, *Michael* Davitt, etc. (1908).

DAVOS, a mountain valley in the Swiss canton of the Grisons (Romansch Tavau), lying east of Coire (40 m. distant by rail), and north-west of the Lower Engadine (18 m. by road from Süs). It contains two main villages, 2 m. from each other, Dorfli and Platz (the chief hamlet), which are 5,015 ft. above sea-level, and had a population in 1930 of 11,164, a figure exceeded in the Grisons only by Coire. Of the population in 1920 5,885 were Protestants, 3,309 Romanists and 163 Jews; while 7,776 were German-speaking and 430 Romansch-speaking. Tavaus or Tavauns is mentioned in 1160 and 1213, as a mountain pasture or "alp." It was then in the hands of a Romansch-speaking population, as is shown by many surviving field names. But between 1260 and 1282, German-speaking colonists from the Upper Valais were planted there, so that it has long been a Teutonic island in the midst of a Romansch-speaking population. Historically it is associated with the Prattigau or Landquart valley to the north, and in 1436 became the capital of the League of the Ten Jurisdictions. (See GRISONS.) It formerly contained many iron mines, and belonged from 1477 to 1649 to the Austrian Habsburgs.

In 1860 the population was only 1,705; the increase being due to the fact that the region is much frequented as a winter resort and has many sanatoria, etc. At the north end of the valley is lake Davos, while from Platz the Landwasserstrasse leads (20 m) down to the Alvaneubad station.

DAVOUT, LOUIS NICOLAS, duke of Auerstadt and prince of Eckmühl (1770–1823), marshal of France, was born at Annoux (Yonne) on May 10, 1770. His name is also, less correctly, spelt Davoût and Davoust. He entered the French army as a sub-lieutenant in 1788, and was *chef* de bataillon in a volunteer corps in the campaign of 1792, and distinguished himself at Neerwinden in the following spring. He had just been promoted general of brigade when he was removed from the active list as being of noble birth. He served, however, in the campaigns of 1794–97 on the Rhine, and accompanied Desaix in the Egyptian expedition of Bonaparte. On his return he fought in the campaign of Marengo under Napoleon, who made him a general of division, and in 1801 gave him a command in the consular guard. Davout was created a marshal of France when Napoleon became emperor. As commander of the III. corps of the *Grande Armée* Davout rendered the greatest services. At Austerlitz, after a forced march of 48 hours, the III. corps bore the brunt of the allies' attack. In the Jena campaign Davout with a single corps fought and won the brilliant victory of Auerstadt against the main Prussian army. (See NAPOLEONIC CAMPAIGNS.) He took part in the campaign of Eylau and Friedland. Napoleon left him as governor general in the grand-duchy of Warsaw when the treaty of Tilsit put an end to the war (1807), and in 1808 created him duke of Auerstadt. In the war of 1809 Davout took a brilliant part in the actions which culminated in the victory of Eckmuhl, and had an important share in the battle of Wagram (*q.v.*). He was created prince of Eckmiihl about this time. It was Davout who was entrusted by Napoleon with the task of organizing the "corps of observation of the Elbe," which was in reality the army with which the emperor invaded Russia in 1812. In this Davout commanded the I. corps, over 70,000 strong, and defeated the Russians at Mohilev before he joined the main army, with which he continued throughout the campaign and the retreat from Moscow. In 1813 he defended Hamburg, a city ill fortified and provisioned, and full of disaffection, through a long siege, only surrendering the place on the direct order of Louis XVIII. after the fall of Napoleon in 1814.

Davout was a stern disciplinarian, almost the only one of the marshals who exacted rigid and precise obedience from his troops. Thus, in the earlier days of the Grande *Armée,* it was always the III. corps which was entrusted with the most difficult part of the work in hand. His rapacity in the conduct of civil affairs was in reality Napoleon's, for he gave the same undeviating obedience to superior orders which he enforced on his own subordinates. He was admitted by his contemporaries and by later judgment to be one of the ablest, perhaps the ablest, of all Napoleon's marshals. On the first restoration he retired into private life, and at once joined Napoleon on his return from Elba. Appointed minister of war, he was so far indispensable to the war department that Napoleon kept him at Paris during the Waterloo campaign. Napoleon has been criticised for not availing himself in the field of the services of the best general he then possessed. Davout directed the defence of Paris after Waterloo, and was deprived of his marshalate and his titles at the second restoration. When some of his subordinate generals were proscribed, he demanded to be held responsible for their acts, as executed under his orders, and he endeavoured to prevent the condemnation of Ney. After a time the hostility of the Bourbons towards Davout died away, and he was reconciled to the monarchy. In 1817 his rank and titles were restored, and in 1819 he became a member of the chamber of peers. He died in Paris June 1, 1823.

See Ch. de Mazade, Corr. du mar. Davout (1885); the marquise de Blockqueville, Le *Maréchal* Davout *raconté* par *les siens* et *lui-même* (Paris, 1870–80, 1887); Chenier, Davout, *duc d'Auerstädt* (Paris, 1866).

DAVY, SIR HUMPHRY, BART. (1778–1829), English chemist, was born on Dec. 17, 1778, at Penzance, Cornwall. In his school days at the grammar schools of Penzance and Truro he showed few signs of a taste for scientific pursuits. During his apprenticeship to a surgeon-apothecary at Penzance he studied metaphysics, ethics and mathematics. He turned to chemistry at the end of 1797, and, after reading Nicholson's and Lavoisier's treatises he began a series of chemical experiments with any apparatus and materials he could obtain. About this time he made the acquaintance of Davies Giddy, afterwards Gilbert (1767–1839), who was president of the Royal Society (1827–31). Giddy recommended him to Dr. Thomas Beddoes, who was in 1798 establishing his Medical Pneumatic Institution at Bristol for investigating the medicinal properties of various gases. Here Davy, released from his indentures, was installed as superintendent towards the end of 1798. Early next year two papers by him were published by Beddoes; these contained the results of Davy's crude experiments and theories hastily formed on insufficient evidence.

One of his first discoveries at the Pneumatic Institution on April g, 1799, was that pure nitrous oxide is perfectly respirable, and he narrates that on the next day he became "absolutely intoxicated" through breathing 16 quarts of it for "near seven minutes." This discovery brought both him and the Pneumatic Institution into prominence, and Count Rumford, requiring a lecturer on chemistry for the recently established Royal Institution in London, engaged him in 1801 as assistant lecturer in chemistry and director of the laboratory. He was almost at once appointed lecturer, and his promotion to be professor followed on May 31, 1803. One of his first tasks was the delivery of a course of lectures on the chemical principles of tanning. The main facts he discovered from his experiments in this connection were described before the Royal Society in 1802–3. In 1802 the board of agriculture requested him to direct his attention to agricultural subjects; and in 1803, with the acquiescence of the Royal Institution, he gave his first course of lectures on agricultural chemistry and continued them for ten successive years, ultimately publishing their substance as Elements of Agricultural Chemistry in 1813. Although Davy had taken up the subject by order, this book remained for nearly 50 years the standard work on the subject.

But his chief interest at the Royal Institution was with electrochemistry. His early work on this subject is summed up in his first Bakerian lecture "On some Chemical Agencies of Electricity." This paper gained him from the French Institute the medal offered by Napoleon for the best experiment made each year on "galvanism." The discovery of potassium and sodium, and their preparation by an electrolytic method effected in Oct. 1807 was of great

importance. According to his cousin, Edmund Davy, then his laboratory assistant, he was so delighted with this achievement that he danced about the room in ecstasy.

Four days after reading his second Bakerian lecture his health broke down, and he was unable to resume work until March 1808. He continued to research on the alkalis and earths and his results were communicated in successive Bakerian lectures (1807–10). Another important discovery due to Davy was that oxymuriatic acid was a simple substance; he proposed the name "chlorine" for it. He succeeded in preparing boron, for which at first he proposed the name boracium, under the impression that it was a metal. Davy also discovered hydrogen telluride, hydrogen phosphide and a number of other compounds. On April 9, 1812, he gave his farewell lecture as professor of chemistry at the Royal Institution, though he continued his connection as an honorary professor. In that month he was knighted, and married to Mrs. Apreece, daughter and heiress of Charles Kerr of Kelso. A few months after his marriage he published the first and only volume of his *Elements of Chemical Philosophy*.

In Oct. 1813 he started with his wife for a continental tour, and with them, as "assistant in experiments and writing," went Michael Faraday, his assistant in the Royal Institution laboratory. In spite of the fact that England and France were at war Davy was welcomed in Paris, where he was made a corresponding member of the first class of the Institute. From Paris he went to Genoa where he investigated the electricity of the torpedo-fish, and at Florence, by the aid of the great burning-glass in the Accademia del Cimento, he effected the combustion of the diamond in oxygen and decided that, beyond containing a little hydrogen, it consisted of pure carbon.

A few months after his return, through Germany, to London in 1815, he considered the construction of a miner's safety lamp. His lamps were brought into use in the mines in 1816. A large collection of the different models made by Davy in the course of his inquiries is in the possession of the Royal Institution. He took out no patent for his invention, and in recognition of his disinterestedness the Newcastle coal-owners in Sept. 1817 presented him with a dinner-service of silver plate. Davy's will directed that this service should pass to his brother, Dr. John Davy, on whose decease, if he had no heirs who could make use of it, it was to be melted and sold, the proceeds going to the Royal Society "to found a medal to be given annually for the most important discovery in chemistry anywhere made in Europe or Anglo-America." The silver produced £736, and the interest on that sum is expended on the Davy medal, which was awarded for the first time in 1877, to Bunsen and Kirchhoff for their discovery of spectrum analysis.

In 1818 he received a baronetcy for this signal service to industry. In that year also he was commissioned by the British government to examine the papyri of Herculaneum in the Neapolitan museum. He had been secretary of the Royal Society from 1807 to 1812, and on his return from Italy in 1820 became president, but his personal qualities did not make for success in that office, especially in comparison with the tact and firmness of his predecessor, Sir Joseph Banks. He directed his attention to various subjects, chiefly electromagnetism, but his researches were less successful than his earlier experiments. In 1823 the admiralty consulted the Royal Society as to a means of preserving the copper sheathing of ships from corrosion and keeping it smooth, and he suggested that the copper would be preserved if it were rendered negatively electrical, as would be done by fixing "protectors" of zinc to the sheeting. This method was tried on several ships, but it was found that the bottoms became extremely foul from accumulations of seaweed and shellfish. For this reason the admiralty decided against the plan. In 1826 Davy's health, which showed signs of failure in 1823, made rest necessary. The following years were spent chiefly abroad. and he died at Geneva on May 29, 1829. On this journey he wrote his *Consolations* in *Travel* (1830).

Of a sanguine, somewhat irritable temperament, Davy displayed characteristic enthusiasm and energy in all his pursuits. As is shown by his verses (all his life he found solace in writing verse) and sometimes by his prose, his mind was highly imaginative; the poet Coleridge declared that if he "had not been the first chemist, he would have been the first poet of his age," and Southey said that "he had all the elements of a poet; he only wanted the art." In spite of his ungainly exterior and peculiar manner, his happy gifts of exposition and illustration won him extraordinary popularity as a lecturer, his experiments were ingenious and rapidly performed, and Coleridge went to hear him "to increase his stock of metaphors." Though his ambition sometimes betrayed him into petty jealousy, it did not leave him insensible to the claims on his knowledge of the "cause of humanity," to use a phrase often employed by him in connection with his invention of the miners' lamp.

See J. A. Paris, *The Life of Sir Humphry Davy* (1831); John Davy, *Memoirs of Sir Humphry Davy* (1836); *Collected Works* (with shorter memoir, 1839); *Fragmentary Remains, Literary and Scientific* (1858); T. E. Thorpe, *Humphry Davy, Poet and Philosopher* (1896).

DAVY LAMP. If a piece of metal gauze is interposed between a flame and an explosive gaseous mixture, the heat of the flame is absorbed and conducted away by the metal gauze so that the gaseous mixture does not explode. That is the principle of the Davy lamp, which was invented by Sir Humphry Davy in 1816. The Davy lamp consisted of a small cylindrical oil lamp, covered with a cylinder of wire gauze about 6in. long and 1½in. in diameter, with a flat gauze top. The upper part of the gauze was doubled to prevent it from being worn into holes by the products of combustion. The gauze was mounted in a frame of upright wires screwed into a brass ring at each end. The upper ring carried the handle, and the lower one was screwed to a collar on the oil vessel at the bottom of the lamp. Thus encircled with a case of metal gauze, the flame or gases could not pass out at a temperature high enough to fire an explosive mixture in the mine. For the subsequent developments of this invention, *see* SAFETY LAMP.

DAWARI or **DAURI,** a Pathan tribe on the Waziri border of the North-West Frontier Province of India. The Dawaris inhabit the Tochi Valley (q *v.*), otherwise known as Dawar or Daur, and are a homogeneous tribe of considerable size.

DAWES, CHARLES GATES (1865–), American statesman and financier, was born in Marietta, O., on Aug. 27, 1865, the son of Gen. Rufus R. Dawes. He was educated in his home town, graduating at Marietta college in 1884 at the early age of 19. He then attended the Cincinnati law school and in order to defray his expenses obtained employment during his vacation on the Marietta, Columbus, and Northern Ohio railway. Before finishing his two-years law course he was made chief engineer in charge of construction on this railway—a fact eloquent of the energy and versatility which were to distinguish his whole career. He graduated in 1886, before he was old enough to practise. Admitted to the bar several months later, he commenced practice at Lincoln, Neb., in 1887.

Dawes' reputation as a lawyer was established by his part in the Nebraska rate case, in which he appeared successfully as counsel for the Lincoln board of trade in an effort to obtain a reduction in railway rates in Nebraska. In 1894 he became extensively interested in the gas business at Evanston, Ill., and at other western points, and removed to Evanston in that year. In 1896 he organized the movement in Illinois to nominate William McKinley as Republican candidate for the presidency. He was active in securing McKinley's nomination and election and was chosen a member of the executive committee of the Republican national committee. He was appointed comptroller of the currency by President McKinley on Jan. 1, 1898. His tenure of office was conspicuous for efficiency of administration and disregard of "red-tape" methods, especially in the conduct of the many receiverships and trusts created by the financial disorders following 1893. Retiring from this office in 1902, he organized the Central Trust Co. of Illinois, which, under his presidency, became one of the strongest financial institutions in Chicago.

On the declaration of war against Germany by the United States (April 6, 1917) Dawes volunteered for service and was given a commission as major and later as lieut.-col. of the 17th

Engineers (Railway), his well-known ability and early experience in railway construction outweighing the fact that he was over age. He landed in France July 17, and was placed on the head-quarters staff of the A.E.F. by General Pershing as chairman of the general purchasing board and chief of supply procurement, charged with the duty of collecting supplies in Europe and of co-ordinating their purchase in such a way as to guard against inflated prices and duplication of orders. His conspicuous success in directing these transactions, which secured for the American army 10,000,000 ship tons of supplies in Europe as against 7,000,000 shipped to it from the United States, led to his promotion to the rank of brigadier-general in 1918. On the unification of command of the Allied forces under Foch, General Dawes was appointed as U.S. member of the Military Board of Allied Supply, the organization of which had been largely due to his efforts. This board for the last four months of the War co-ordinated the movement of supplies for the Allied Armies in the zone of the advance.

After the conclusion of the Armistice, Dawes became a member of the liquidation committee of the A.E.F., charged with the task of disposing of the huge accumulations of American property in France and of settling outstanding claims against the army. This engaged his efforts until Aug. 1919, when he resigned his commission and returned to the United States. Upon the creation of a budget bureau by Congress, April 1921, the directorship of it was offered to General Dawes by President Harding and was accepted on condition that the bureau should be non-political, that in gathering information the director should be assumed to be acting for the President and his calls for consultation or information should take precedence of all others. His work in organizing this bureau and creating under executive order the existing system of co-ordinating boards now operating in Government business was carried through with characteristic vigour and directness and resulted in savings estimated officially at $250,000,000 in the first year. Having completed the task of placing the budget on a satisfactory and permanent basis, he resigned his position on June 30, 1922.

In the meantime the collapse of the German financial structure and international reactions resulting therefrom had precipitated a crisis in European affairs, the outcome of which appeared ominous. At this juncture, the Allied Reparations Commission, in 1923, appointed General Dawes and Owen D. Young as U.S. members of the committee of experts to report upon means of balancing Germany's budget and stabilizing its currency. Dawes was selected as chairman, and the committee's report, known as the "Dawes Plan," was accepted by all the Powers concerned. By making the actual transfer of reparation payments conditional on the stability of the German exchange, this plan provided a non-political and automatic means for determining Germany's ability to pay and so withdrew this vexed question from international controversy and paved the way for the later agreements entered into at Locarno. (*See* REPARATIONS AND THE DAWES PLAN.)

At the Republican National Convention held at Cleveland, O., June 10–12, 1924, following the nomination of President Coolidge for re-election, General Dawes was nominated for vice-president on the third ballot by a vote of 682½ against 334½ for Herbert Hoover and 75 for Judge Kenyon. Following the overwhelming triumph of the Republican ticket at the ensuing election, General Dawes assumed office on March 4, 1925. In his inaugural speech he called for a revision of the rules of procedure in the Senate so that a majority vote could apply the closure to debate. He later carried his proposals for senatorial reform before the people in a series of public meetings in various parts of the country.

Another aspect of General Dawes's character is revealed by two acts of philanthropy. In memory of his son, Rufus Fearing, who was accidentally drowned (Sept. 5, 1912) he established the Rufus F. Dawes hotels in Chicago and Boston, at which impoverished men could obtain food and accommodation at nominal rates. As a memorial to his mother he established the Mary Gates Dawes memorial hotel, where women might live cheaply and retain the physical comforts and social opportunities compatible with self-respect. In the course of his varied and successful career as engineer, lawyer, politician, comptroller of the currency, public utility operator, banker, philanthropist, soldier, organizer of the Government budget, leading spirit in the settlement of German reparations, and vice-president of the United States, General Dawes found time also to become an accomplished musician on the piano and flute. In March and April, 1929, he headed a financial commission to the Dominican Republic. In April he was appointed ambassador to Great Britain.

Dawes wrote *The Banking System of the United States and its Relation to the Money and Business of the Country* (1894); *Essays and Speeches* (1915); *A Journal of the Great War* (1921); and *The First Year of the Budget of the United States of America* (1923).

(O. D. Y.)

DAWES, RICHARD (1708–1766), English classical scholar, was born in or near Market Bosworth. He was elected fellow of Emmanuel college, Cambridge, in 1731. From 1738 to 1749 he was master of the Newcastle grammar school. The book on which his fame rests is his *Miscellanea critica* (1745), which gained the commendation of such distinguished Continental scholars as L. C. Valckenaer and J. J. Reiske. The *Miscellanea*, which was re-edited by T. Burgess (1781), G. C. Harles (1800) and T. Kidd (1817), will remain an enduring monument of English scholarship, although some of the "canons" have been proved untenable.

See J. Hodgson, *An Account of the Life and Writings of Richard Dawes* (1828); H. R. Luard in *Dict. of Nat. Biog.*; J. E. Sandys, *Hist. of Classical Scholarship*, ii. 415.

DAWES PLAN: *see* REPARATIONS AND THE DAWES PLAN.

DAWISON, BOGUMIL (1818–1872), German actor, was born at Warsaw, of Jewish parents, and at the age of 19 went on the stage. In 1839 he received an appointment to the theatre at Lemberg in Galicia. In 1847 he played at Hamburg with marked success, was from 1849 to 1854 a member of the Burg theatre in Vienna, and then of the Dresden court theatre. He died in Dresden on Feb. 1, 1872. Dawison was considered in Germany an actor of a new type; a leading critic wrote that he and Marie Seebach "swept like fresh gales over dusty tradition." His chief parts were Mephistopheles, Franz Moor, Mark Anthony, Hamlet, Charles V., Richard III. and King Lear.

DAWKINS, SIR WILLIAM BOYD (1837–1929), English geologist and archaeologist, was born at Buttington vicarage near Welshpool. Educated at Rossall school and Oxford, he joined the Geological Survey in 1862, and in 1870 became curator of the Manchester museum, a post which he retained till 1890. He was appointed professor of geology and palaeontology in Owens college, Manchester, in 1872. He paid special attention to the question of the existence of coal in Kent, and in 1882 was selected by the Channel tunnel committee to make a survey of the French and English coasts. He was also employed in the scheme of a tunnel beneath the Humber. His chief distinctions, however, were won by his researches into the lives of the prehistoric cave-dwellers described in *Cave-hunting* (1874); *Early Man in Britain* (1880); *British Pleistocene Mammalia* (1866–87). He was knighted in 1919, and died on Jan. 15, 1929.

DAWLISH, urban district and seaside resort, Tiverton parliamentary division. Devon, England, on the English channel at the mouth of Dawlish brook, 12 mi. S. from Exeter by G.W. railway. Population (1938) 5,455. Area, 9·5 sq.mi. It lies on a cove sheltered by two headlands, and both sides of the Dawlish brook are lined by pleasure grounds. The warm climate and excellent bathing attract many visitors in spring and early summer. It holds an annual fair on Easter Monday and a regatta in August or September. Until its sale, in the 19th century, the site of Dawlish belonged to Exeter cathedral from 1050.

DAWN, the time when light appears (*daws*) in the sky. The dawn colours appear in the reverse order from those of the sunset. When the sun is lowest in both cases the colour is deep red; this gradually changes through orange to gold and yellow as the sun nears the horizon. This is their order of refrangibility, in the spectrum; the blue rays usually are scattered in the sky. The colours of the dawn are purer and colder than the sunset colours as the reduced dust content of the atmosphere causes less sifting of the light rays.

DAWSON OF PENN, BERTRAND EDWARD DAWSON, 1st VISCOUNT, British physician, studied medicine at Univer-

sity college and the London hospital, where in 1896 he became an assistant physician and in 1906 physician. By his extensive researches on gastric affections he became one of the authorities on this subject. He was appointed physician extraordinary to Edward VII in 1907, and later physician in ordinary to George V and in 1923 to the prince of Wales. During World War I he worked on war diseases, publishing various papers on paratyphoid and infective jaundice. He was made G.C.V.O. in 1917, K.C.M.G. in 1919 and in 1920 was raised to the peerage. Dawson has published *The Diagnosis and Operative Treatment of Diseases of the Stomach* (1908) and other similar works. He was made a privy councillor in June 1929 and a viscount in 1936.

DAWSON, GEORGE GEOFFREY (1874–), editor of the *Times*, 1912–19, and from 1923 until his retirement in 1941. He was educated at Eton and Magdalen college, Oxford, and was elected a fellow of All Souls college in 1900. Passing into the civil service, he was appointed to the colonial office, and in 1901 he went to South Africa as private secretary to Lord Milner, then high commissioner. On Lord Milner's retirement from the high commissionership in 1905 he accepted the editorship of the Johannesburg *Star*, which he held for the next four years. Returning to London in 1910, he was appointed a director of the *Times*, which was then in the early days of Lord Northcliffe's direction, and in 1912 succeeded G. E. Buckle as editor. The conspicuous success which the *Times* attained during the difficult years of World War I was largely due to Dawson's sound judgment and knowledge of affairs, which formed an admirable and often very necessary complement to Lord Northcliffe's imagination and genius. In 1919, however, Dawson found himself unable to carry out Lord Northclifie's policy for the *Times* and resigned. He was succeeded by Henry Wickham Steed (*q.v.*). When in consequence of Lord Northcliffe's death in 1923 the *Times* was reconstructed, Steed retired and Dawson was recalled to the editorship. He had been estates bursar of All Souls college (1919–23) and secretary to the Rhodes Trust (1921–22). In 1917 he changed his name by royal licence from Robinson to Dawson.

DAWSON, SIR JOHN WILLIAM (1820–1899), Canadian geologist, was born at Pictou, Nova Scotia, on Oct. 30, 1820. He was educated at Edinburgh, Scotland, and on his return to Nova Scotia in 1842 he accompanied Sir Charles Lyell on his first visit to that territory. He was superintendent of education (1850–53); at the same time he studied the geology of the country, making a special investigation of the fossil forests of the coal-measures. From these strata, in company with Lyell (during his second visit) in 1852, he obtained the first remains of an "air-breathing reptile" named *Dendrerpeton*. He also described the fossil plants of the Silurian, Devonian and Carboniferous rocks of Canada for the geological survey of that country (1871–73). From 1855 to 1893 he was professor of geology and principal of McGill university, Montreal. He was elected F R.S. in 1862 and knighted in 1884. Dawson published, besides other works, *Acadian Geology: The Geological Structure, Organic Remains and Mineral Resources of Nova Scotia, New Brunswick and Prince Edward Island* (1855; ed. 3, 1878); *Air-Breathers of the Coal Period* (1863). He died on Nov. 20, 1899.

His son, GEORGE MERCER DAWSON (1849–1901), was born at Pictou on Aug. 1, 1849, and received his education at McGill university and the Royal School of Mines, London. In 1873 he was appointed geologist and naturalist to the North American boundary commission, and two years later he joined the staff of the geological survey of Canada, of which he became assistant director in 1883 and director in 1895. He was in charge of the Canadian government's Yukon expedition in 1887, and his name is commemorated in Dawson City, of gold-bearing fame. He was one of the Bering Sea commissioners in 1891. He was elected F.R S. in 1891, and was president of the Royal Society of Canada in 1893. He died on March 2, 1901. He was the author of many scientific papers and reports on the surface geology and glacial phenomena of the northern and western parts of Canada.

DAWSON or DAWSON CITY, capital of the Yukon territory, Canada, on the bank of the Yukon river, and in the middle of the Klondike gold region, of which it is the distributing centre. It is in beautiful mountainous country, 1,049 ft. above the sea and 1.500 mi. from the mouth of the Yukon river, and is reached by river steamer from White Horse (460 mi.) in summer, and by tractors and aeroplanes in winter. There are metal-works and sawmills.

Order is kept by the Northwest mounted police. Founded in 1896, its population soon reached over 30,000 at the height of the gold rush; in 1901 it was 9,142; in 1931, 819; and in 1941, 1,043 The record of temperature varies from 83° F. in summer to −60° in winter. (*See* YUKON AND NORTHWEST TERRITORIES.)

Dawson was named for George M. Dawson, director of the Canadian geological survey. In 1898 the town became the administrative centre of Yukon territory. Jack London, Robert Service and Rex Beach were among the inhabitants of the town in its "boom" days and later wrote of the robustious period of the gold rush. The town was severely damaged by fire in 1898 and 1899.

See Merle Colby, *A* ***Guide*** to *Alaska, Last American Frontier* (Federal Writers' Project, 1939).

DAWSON-WATSON, DAWSON (1864–1939), U.S. artist, was born at London, England, July 21, 1864. He studied art under Mark Fisher and others in England and moved in 1893 to the United States to become art director of the Hartford (Conn.) Art society. Later he taught at the Byrdcliffe colony, Woodstock, N.Y., and from 1904 to 1915 at the St. Louis (Mo.) School of Fine Arts; he also was art director of the St. Louis Industrial exhibition in 1914 and the St. Louis centennial exhibition in 1918.

Aside from his paintings in oil and water colour, he designed textiles and costumes and was a wood carver and mezzotint engraver. He died at San Antonio, Tex., Sept. 3, 1939.

DAX, a town of southwestern France, capital of an arrondissement in the department of Landes, 92 mi. S.S.W. of Bordeaux, on the Southern railway between that city and Bayonne. Pop. (1936) 10,168. It lies on the left bank of the Adour, and its suburb, Le Sablar, on the right. Its ancient Gallo-Roman fortifications are now a promenade. Dax (*Aquae Tarbellicae, Aquae Augustae,* later *D'Acqs*) was the capital of the Tarbelli in Roman times, when its waters were already famous. In the 11th century its viscounty passed to the viscounts of Béarn and in 1177 was annexed by Richard Coeur de Lion to Gascony. The bishopric, founded in the 3rd century, was in 1801 attached to that of Aire. The church of Notre Dame, once a cathedral, was rebuilt from 1656 to 1719, but still preserves a sacristy, a porch and a fine sculptured doorway of the 13th century. The church of St. Paul-lès-Dax, mainly 15th century, has a Romanesque apse with curious bas-reliefs. Dax, well known as a winter resort, has thermal waters and mud baths (the deposit of the Adour). The principal of numerous bathing establishments are the Grands Thermes, the Bains Salés, adjoining a casino, and the Baignots, which fringe the Adour and are surrounded by gardens. Dax has a subprefecture and tribunals of first instance and of commerce Commerce is chiefly in the pine wood, resin and cork of the Landes, in mules, cattle and horses, hosiery and ceramics. Dax was occupied by Germany in June 1940.

DAY, JOHN (1574–1640?), English dramatist, was born at Cawston, Norfolk. in 1574, and educated at Ely. He became a sizar of Caius College, Cambridge, in 1592 but was expelled in the next year for stealing a book. As early as 1598 he became one of Henslowe's playwrights, collaborating with Henry Chettle, William Haughton, Thomas Dekker, Richard Hathway, and Wentworth Smith, but his almost incessant activity seems to have left him poor enough, to judge by the small loans, of five shillings and even two shillings, that he obtained from Henslowe. The first play in which Day appears as part author is *The Conquest of Brute, with the Finding of the Bath* (1598), which, with most of his journeyman's work, is lost. *The Ile* of *Guls* (printed 1606), a prose comedy founded upon Sir Philip Sidney's *Arcadia,* contains in its light dialogue much satire to which the key is now lost. In 1607 Day produced, with William Rowley and George Wilkins. *The Travailes of the Three English Brothers,* which detailed the adventures of Sir Thomas, Sir Anthony and Robert Shirley. The work on which Day's reputation chiefly

rests is the *Parliament of Bees*. This exquisite masque, or rather series of pastoral eclogues, is entirely occupied with "the doings, the births, the wars, the wooings" of bees. The bees hold a parliament under Prorex, the Master Bee, and various complaints are preferred against the humble-bee, the wasp, the drone, and other offenders. This satirical allegory of affairs ends with a royal progress of Oberon, who distributes justice to all. There is no earlier edition of *The Parliament of Bees* than that in 1641, but a persistent tradition has assigned the piece to 1607. In 1608 Day published two comedies, *Law Trickes;* or, *Who Would have Thought it?* and *Humour out of Breatlz.* The date of his death is unknown, but an elegy on him by John Tatham, the city poet, was published in 1640. The six dramas by John Day which we possess show a delicate fancy and dainty inventiveness all his own. The beauty and ingenuity of *The Parliament of Bees* were noted and warmly extolled by Charles Lamb; and Day's work has since found many admirers.

His works, edited by A. H. Bullen, were printed at the Chiswick Press in 1881. The same editor included *The Maydes Metamorphosis* in vol. i. of his *Collection of Old Plays. The Parliament of Bees* and *Humour out of Breath* were printed in *Nero and other Plays* (Mermaid Series, 1888), with an introduction by Arthur Symons. An appreciation by Mr. A. C. Swinburne appeared in *The Nineteenth Century* (Oct. 1897).

DAY, THOMAS (1748–1789), British author, was born in London, and is famous as the writer of *Sandford and Merton* (1783–89), a book for the young. Day mas educated at the Charterhouse and at Corpus Christi college, Oxford, and became a great admirer of J. J. Rousseau and his doctrine of the ideal state of nature. Having independent means he devoted himself to a life of study and philanthropy. He brought up two foundlings, one of whom he hoped eventually to marry, on the severest principles, but neither acquired the high quality of stoicism which he had looked for, and ultimately he married an heiress who agreed with his ascetic programme of life. He settled in 1781 at Ottershaw, in Surrey, and took to farming on philanthropic principles. His poem "The Dying Negro" (1773) struck the keynote of the anti-slavery movement.

DAY, in astronomy, the interval of time in which a revolution of the earth on its axis is performed. Days are distinguished as solar, sidereal or lunar, according as the revolution is taken relatively to the sun, the stars or the moon. The solar day is the fundamental unit of time in daily life and in astronomical practice. In the latter case, being determined by observations of the sun, it is taken to begin with the passage of the mean sun over the meridian of the place, or at mean noon, while the civil day begins at midnight.

The question of a possible variability in the length of the day is one of fundamental importance. One necessary effect of the tidal retardation of the earth's rotation is gradually to increase this length. It is remarkable that the discussion of ancient eclipses of the moon, and their comparison with modern observations, show only a small and rather doubtful change, amounting perhaps to less than one-hundredth of a second per century. As this amount seems to be less than that which would be expected from the cause in question, it is probable that some other cause tends to accelerate the earth's rotation and so to shorten the day. (*See* MOON and TIDES.)

Legal Aspects.—In law, a day may be either a *dies naturalis* or natural day, or a *dies artificialis* or civil day. A natural day includes all the 24 hours from midnight to midnight. Fractions of the day are disregarded to avoid dispute, though sometimes the law will consider fractions, as where it is necessary to show the first of two acts or events. In cases where action must be taken for preserving or asserting a right, a day means the whole natural day of 24 hours.

When a statute directs any act to be done within so many days, these words mean *clear days, i.e.,* a number of perfect intervening days, not counting the terminal days: if the statute says nothing about Sunday, the days mentioned mean consecutive days and include Sundays. Under some statutes Sundays and holidays are excluded in reckoning days, and consequently all the Sundays, etc., of a prescribed sequence of days would be eliminated. By custom, the word "day" may be understood in some special sense.

Lay Days, which are days given to the charterer in a charter party, either to load or unload without paying for the use of the ship, are days of the week, not periods of 24 hours. As to lay days, running days, working days and weather working days, *see* AFFREIGHTMENT. For days of grace *see* BILL OF EXCHANGE.

Civil Days.—An artificial or civil day is difficult to define; it is a convenient term to signify the various kinds of "day" known in legal proceedings other than the natural day. In England, the United States and most of the countries of Europe the Roman civil day still prevails, the day commencing at 12 P.M.

In England the period of the civil day may and does vary under different statutes. Daytime, within which distress for rent must be made, is from sunrise to sunset. An obligation to pay money on a certain day is discharged if the money is paid before midnight of the day on which it falls due, but the law requires reasonable hours to be observed. If, for instance, payment has to be made at a bank or place of business, it must be within business hours.

When an act of parliament is expressed to come into operation on a certain day, it is to be construed as coming into operation on the expiration of the previous day. (Interpretation Act 1889, § 36; Statutes [Definition of Time] Act 1880.)

Under the orders of the supreme court the word "day" has two meanings. For purposes of personal service of writs, it means any time of the day or night on week-days, but excludes the time from 12 midnight on Saturday till 12 midnight on Sunday. For purposes of service not required to be personal, it means before six o'clock on any week-day except Saturday, and before 2 P.M. on Saturday.

Closed Days, *i.e.,* Sunday, Christmas day and Good Friday, are excluded from all fixtures of time less than six days: otherwise they are included, unless the last day of the time fixed falls on one of those days (R.S.C., O. lxiv.).

See ENGLISH LAW.

DAY-BED, a small type of French couch bed, intended to serve as a bed at night and as a sofa during the day. The standard day-bed is narrow, with foot and head pieces identical in size and appearance. Because of the convenience of its size the day-bed has come into wide use in small apartments where every effort must be made to conserve space. It is especially popular in the large cities of the United States. The low and symmetrical head and foot pieces give it the appearance of a divan, thus serving to conceal to some degree the fact that the living-room in which it appears is converted at night into a bedroom.

DAY BOOK: *see* BOOKKEEPING.

DAYE, STEPHEN (c. 1594–1668), first printer in the Anglo-American colonies, was born in London. Although it has been stated that he served an apprenticeship as a printer there, the records extant indicate that he was a locksmith. In the summer of 1638, however, he came to America with the Rev. José Glover, a dissenting minister of some means, with whom he made a contract to set up the first printing press in the English colonies. This he did in the autumn of 1638 at Cambridge, Mass. The first issue from his press was the *Freeman's Oath,* Jan. 1639; the second, an *Alnzanack* by William Pierce, mariner, 1639; the third, the *Psalms,* now known as the *Bay Psalm Book,* 1640. According to the records of the general court of Cambridge, Dec. 10, 1641, he was granted 300 ac. of land for "being the first that sett upon printing." His name is not found in connection with the imprint of any of his publications, but that of his son, Matthew, who seems to have been next in charge of the press, appears on the title-page of the *Almanack,* 1647. The extant issues from his press are: *The Whole Booke of Psalms, faithfully translated into English Metre* (1640); *A list of Theses at the Harvard Commencement in 1643* (1643); *A Declaration of Fornzer Passages and Proceedings betwixt the English and the Narrowgansetts, with their confederates, Wherein the grounds and justice of the ensuing warre are opened and cleared* (1645). He died at Cambridge, Mass., on Dec. 22, 1668.

DAY-FLOWER, rather weedy, quick-wilting, plants of the genus *Commelina* of the spiderwort family (Commelinaceae).

There are about 11j species, chiefly natives of tropical and subtropical regions, 8 of which are found in the southern United States. They are usually ascending or reclining, somewhat fleshy, branching herbs, with short-stalked leaves, and irregular, usually blue ephemeral flowers, in small clusters more or less enfolded in two spathelike bracts. The Virginia day-flower (C. *virginica*), found in moist places from southern New York to Illinois southward to Florida and Texas and thence to Paraguay, has diffusely branching stems, 1½ ft. to 3 ft. high, lance-shaped leaves, and showy blue flowers an inch broad. The creeping day-flower (C. *nudiflora*), with reclining stems 1 ft. to 23 ft. long, rooting at the joints, and small blue flowers, about ½ in. broad, found from New Jersey to Missouri and southward, is extensively distributed also in South America, Asia and Africa. The Asiatic day-flower (*C. communis*), with small, very deep blue flowers, has become widely naturalized in the eastern and southern States.

DAYLESFORD, a town of Talbot county, Victoria, Australia. Pop. *c.* 5,000. It lies on the flank of the Great Dividing range, at an elevation of 2,030 ft. Much wheat is grown in the district; gold-mining, both quartz and alluvial, is carried on, and there is a mining school. Near the town are the Hepburn mineral springs.

DAYLIGHT, ARTIFICIAL. The wide use of artificial light in civilization has created a demand for lamps which show coloured objects truthfully; *i.e.,* which do not change colours from their hues as seen by daylight. The problem is thus one of producing an artificial light whose spectrum *(see* LIGHT) closely resembles that of sunlight. Artificial light always contains too high a proportion of red, orange and yellow rays.

A gas-filled electric lamp is employed, as its filament temperature is high and its form the most economical. The spectrum obtained from a black body, heated to 5,000° C., is found to be approximately that of average diffused daylight. According to the temperature at which the filament of an incandescent electric lamp burns the amount of red and orange contained in the spectrum of its light varies, becoming greater as the temperature is lowered; a metal filament bulb burns at 2,200° and has more red and orange in it than the gas-filled bulb, which burns at approximately 3,000°. Therefore, the gas-filled bulb is used in artificial daylight devices, but its light has to be subjected to special treatment to correct its undue yellowness and redness.

Various means are employed for this purpose, such as filtering the light through a coloured transparent medium; *i.e.,* glass, talc or varnish, or by the use of a coloured reflector, or by a series of coloured mirrors fixed in a reflector. Coloured reflectors with certain pigmentations have proved successful, and by this means it is possible to match practically any type of daylight, but this method absorbs a very large quantity of the initial illumination. By the use of tinted or coloured glasses, one or more different colours being placed one behind the other, the same effect can be obtained; the loss of light by this method, however, is not so high as in the former.

Artificial daylight was at first mainly used for the purpose of matching colours. It has come into use for general illumination, however, as the value of artificial daylight in resting the eyes has become appreciated. Hospital staffs, dentists, physicians and surgeons find artificial daylight of great value. The method is also employed in dye and colour works. *See* LIGHTING.

DAYLIGHT SAVING. In the second year of the World War nearly every country in Europe adopted the device of putting the clock forward an hour during the spring, summer and autumn months. The motive was to get people to bed an hour earlier and out of bed an hour earlier, to save fuel for lighting and heating.

Great Britain.— In Great Britain, the idea itself did not arise out of the war. About 1907 it occurred to William Willett, a Chelsea builder, that civilization got up an hour or two too late in the summer months, and had a short evening for outdoor recreation, when it might have a long one. He devoted himself to a campaign for putting the clock on by 80 min. in the spring and summer months. He ran the campaign at his own expense, and succeeded so far that in 1908 Mr. (afterwards Sir Robert) Pearce introduced a bill in the House of Commons to put the clock on by law. The bill was sent to a select committee the following year. In 1916, the expert committee set up by the British Government to study the question of fuel economy advised that the measure should be adopted. The scheme was simplified. Willett had proposed that the clock should be put on 80 minutes in four moves of 20 minutes each. The first select committee in 1908 had advocated one movement of the clock of one hour in the spring. This was the method adopted by the act which was passed on May 17, 1916, and put into operation the following Sunday, May 21. There was a good deal of opposition. Farmers objected to it because milkers would have to get up an hour earlier to do their work, which meant getting up in the dark during the greater part of the year. Hay and corn harvests could not be carried until the dew was dried off, which meant an hour during which labourers could do nothing. When put to the test of practice these difficulties proved to have been much exaggerated.

Summer time was introduced on Sunday, May 21, 1916. The president of the Royal Meteorological Society sent out a letter stating that Greenwich mean time would continue to be used for all meteorological observations and publications, but asked that regular observers for this society should state in their reports whether they were recording Greenwich or summer time. The Port of London Authority announced that the tide tables in the almanacs would remain Greenwich time. The Royal and L.C.C. parks decided to close at dusk by the sun, but Kew Gardens decided to follow the clock and closed an hour earlier by the sun. At Edinburgh the Castle gun continued to be fired at 1 P.M. summer time, but the ball on the top of the Nelson monument on Calton hill was dropped at 1 o'clock, Greenwich mean time, for the benefit of mariners who watched it from the Firth of Forth. The legal change of the clock was fixed for 2 A.M.

In Great Britain summer time was renewed after the World War by a series of acts of Parliament. The final and permanent Act of 1925 provided that summer time should begin on the day next following the third Saturday in April, or if that day is Easter day the day next following the second Saturday in April. Summer time closes on the first Saturday in October. The official time for altering the clock is 2 A.M., Sunday.

United States.—No public interest was developed in the project in the United States till after the outbreak of the World War, and it was not until 1916 that a nation-wide campaign was initiated in its support. Opinion was divided, but in 1917 Congress passed an act, to take effect in 1918, whereby the standard time of the United States would be advanced one hour on the last Sunday in March and set back one hour on the last Sunday in October. The act was effective from March 31 till Oct. 27, 1918, and again on March 30, 1919. Strenuous opposition developed, however, from the farmers and the law was repealed on Aug. 20, 1919, over the President's veto. Since then daylight legislation has been sporadic and intermittent. Daylight saving is observed (1928) in the States of Massachusetts and Rhode Island by virtue of State laws, and by municipal ordinance in the New York Metropolitan district, Philadelphia, Chicago and a number of other cities and towns, but the movement as a whole has lost ground. Chicago is the most westerly city using the summer system. In Seattle the banks alone have adopted it. But west of the Mississippi and in the South daylight saving is practically unknown. While the system is widely used only in the North-east, it has, even there, found opposition, as in Connecticut, where it is a State offence to show any but Eastern standard time publicly. However, a number of the principal towns in this State observe daylight saving. An analogous State law is in force in Maine; yet in the city of Portland daylight saving is observed by general consent.

Other Countries.— The daylight saving bills adopted during the World War in Germany, Austria, Italy and Scandinavia have not been revived. A permanent "summer time" bill was adopted in France, in 1923, and in 1928 summer time was being observed, April 14–15 to Oct. 6–7. Summer time bills were approved in Canada in 1924, in Holland and Belgium in 1925, in Spain and Portugal in 1926 and in New Zealand in 1927. Mexico observes "summer time" all the year round.

DAY NURSERIES. These institutions, of a semi-philanthropic nature, formerly known as "crêches" (from the Fr. *crêche* —crib) but now as "day nurseries," form an integral part of the public health work of Great Britain, the United States, and other industrial countries.

Their original intention was to assist widows, and other women whose circumstances obliged them to go out to work, by caring for their young children, under school age, during the day. During the 19th century France and Belgium had many "crêches," but they were on a very simple scale: a "motherly" woman was put in charge of two or three rooms and for very small fees the working mothers couldleave their children to be fed and cared for during the day. This system proved unsatisfactory; want of technical knowledge and insufficient sanitary precautions led to the spread of infection and the "crêche" soon got a bad name. But with the increase in the knowledge and study of "mothercraft" and infant welfare, which coincided roughly with the early years of the 20th century, day-nurseries were brought to England, and to the United States, and organized on modern and hygienic methods, very different from those of the old "crêches." The value of fresh air and "moving" air was increasingly appreciated and open-air nurseries were built in London, Manchester and elsewhere.

In Great Britain the movement is largely associated with the names of Mrs. Arthur Percival and Muriel, Viscountess Helmsley, who founded the National Society of Day-Nurseries with the objects of starting nurseries, raising the standard of existing "crêches," putting them in close touch with the Government departments, and "standardizing" the training of staffs.

The movement, like many other branches of the infant welfare movement, originated in private enterprise and the day-nursery was generally started by a voluntary committee. From the year 1915 a grant in aid was given by the Board of Education. When, in 1918, the Local Government Board was merged in the Ministry of Health, day-nurseries were placed under their maternity and child welfare department.

The ministry inspect the nurseries at regular intervals and give a grant proportionate to the expenses incurred; in certain cases grants are also made towards capital expenditure, such as the purchase of premises, etc. The cost of upkeep is met by the parents' payments (1s. a day is a common charge), the Government grant, private subscriptions and, in some cases, a municipal grant. Local authorities have the power to provide day-nurseries

Children are received from the age of one month, until they attain school-age. The mother brings the child in the early morning on her way to work and calls for it on her return in the evening. The child is inspected on arrival by the "crêche-trained" matron, and, if found to be free from any signs of infection, is bathed, dressed in the nursery clothes, and cared for during the day in accordance with the requirements of its age. The infants have cots, and the necessary food and sleep; the older children or "toddlers" have three good meals and plenty of opportunity for fresh air, rest and exercise. The mental development of the toddlers is assisted by "nursery school classes," under the supervision of a specially trained member of the staff. The furnishing of the nursery is of great importance, small tables and chairs are provided for meals, etc., and stretchers for rest. The staff generally consists of a matron and sister, with "nursery" training and some hospital experience, a toddlers' nurse, young probationers and a cook.

The health of the children is under the daily care of the matron, who weighs the children weekly or fortnightly; accurate records are kept and are seen by the visiting doctor at the fortnightly medical inspection. The previous medical history of the child, if it has attended the infant welfare centre, is used for reference and the nursery record is available for the school doctor when the child leaves the nursery. In this way a complete record can, in some cases, be obtained of the child's medical history. A great point is made of the clothing and feeding of the children in the nursery; it is held that the nurseries are in this way of great educational value to the mothers.

Probationers in day-nurseries are trained on a syllabus prepared by the National Society of Day-Nurseries in conjunction with the National League for Health, Maternity and Child Welfare. They attend certain lectures and then sit for a series of examinations. The successful candidates who can show evidence of satisfactory practical work then obtain a certificate of proficiency in the care of children. These girls are then fitted to become "nursery nurses" in private posts or public institutions, and the scheme of training is approved by the Ministry of Health.

Since 1919 the headquarters of the National Society of Day-Nurseries have been under the same roof as many other organizations for infant and child welfare at Carnegie house, 117, Piccadilly, London. The Society publishes a monthly magazine, *Crêche News*. (N. *L.* H.)

United States.—The day-nursery movement in America has followed rather different lines, but there, even more than in England, its value is recognized as an essential part of child welfare. Inspection varies and may be under the control of State, county, or city departments of health or welfare, but no Government grant is given and the nurseries are supported by voluntary subscription, supplemented by parents' fees. Some States license the day nurseries, inspect periodically, and require minimum standards. Progressive nurseries include programs of family case work, health, and education The first day nursery in America opened in New York in 1854, but the actual movement dates from conferences held 1892–1898. The National Federation of Day Nurseries, organized in 1898, was superseded in 1938 by the National Association of Day Nurseries, a consolidation of the Federation and the New York Association of Day Nurseries. The National Association serves as a co-ordinating body for day nurseries, raises standards, provides field service and information, and issues publications including a bulletin *The* Day *Nursery*. Headquarters: 122 East 22nd street, New York.

As regards other countries the tendency of the present day is to establish day-nurseries in connection with infant welfare work and nursery schools. In France the "Crêches d'Arrondissements" of 19th century Paris have been largely superseded by nurseries connected with large factories and shops, or department stores. These are frequently used for infants, and give special facilities to nursing mothers for the breast-feeding of their own babies.

Belgium, Holland, Switzerland, Germany, India and Japan encourage the provision of day-nurseries, and Poland, Serbia and Spain have followed their example.

See the publications of National Society of Day-Nurseries, 117, Piccadilly, London, and of the National Association of Day-Nurseries, New York. *Maternity and Child Welfare Act* (1918). (A. E. BE.)

DAYS OF GRACE. The extra time allowed to meet the payment of a bill of exchange after its due date. In English law, three days grace are thus allowed. No extra time is allowed, however, for a bill payable at sight. In the case of insurance premiums, also, days of grace are allowed before the policy actually expires. In the United States days of grace in all bills of exchange have been abolished by the Negotiable Instruments Law, except in a very few States, as to sight drafts. *(See* BILL OF EXCHANGE; INSURANCE.)

DAYTON, a city of Campbell county, Kentucky, U S.A., on the Ohio river, opposite Cincinnati; served by the Chesapeake and Ohio railway. The population was 7,646 in 1920 (95% native white) and was 8,379 in 1940 by the federal census. There is a watchcase factory, but the city is primarily a residential suburb of Cincinnati. It was settled and incorporated in 1849.

DAYTON, a city of southwestern Ohio, U.S.A., on the Great Miami river, 55 mi. N.N.E. of Cincinnati; a port of entry, the county seat of Montgomery county, and a leading centre of aviation research. It is served by the Baltimore and Ohio, the Big Four, the Erie and the Pennsylvania railways, by a number of air lines and by 10 motorbus and 52 motor truck lines operating over the hard-surfaced roads which radiate in every direction. There are three commercial and two government airports and numerous emergency landing fields. The population was 152,559 in 1920, of whom 9,025 were Negroes (an increase of 86% in ten years), and 13,111 were foreign-born white (nearly a third from Germany); and was 210,718 in 1940 by the federal census. About 70% are natives of Ohio

The city covers 24·24 sq.mi. of level ground 740 ft. above sea level, in a wide river trough, where three rapid streams (Wolf creek, Stillwater river and Mad river) flow into the Miami. It is completely protected (since 1921) from all danger from floods. Boulevards and streets are wide and in the residential districts are lined with trees. The dwellings (56% of which were owned by the occupants in 1940) are for the most part small private houses, each with its own garden. Many of the factories are surrounded by attractive grounds. The public parks and playgrounds comprise 1,100 ac. (including a 23-ac. island in the Miami), and just south of the city there is a municipal country club (294 ac. of natural forest), with golf courses and tennis courts. The elimination of grade crossings ivithin the city and the construction of a boulevard on the bed of the abandoned Miami and Erie canal were begun in 1927. A comprehensive city plan (adopted in 1925) was in 1941 in process of development.

Dayton has had a commission-manager form of government since 1914. The water supply comes from driven wells 50–100 ft. deep. Natural gas is used, and it is estimated that the supply will last until 1970 or 1980. Electric current, steam-generated, is provided by a super power system, and the local power and light company furnishes steam heat to a considerable area in the central part of the city. The city has one of the few financially successful municipal garbage-reduction plants. Both the death rate and the cost of living are relatively low.

The manufactures are many and varied, with an aggregate output in 1939 valued at $400,000,000. Dayton has long been known as the home of the National Cash Register company. In recent years it has become the leading producer, also, of electric motors, water plants for home use, electric refrigeration equipment, fare registers, computing scales, water softeners, fan belts, automobile parts, aeroplane parts, golf clubs and ice-cream cones; and it makes all the government stamped envelopes "Precision industries" predominate, in which labour is more important than material, and skilled labour more important than unskilled. The percentage of women in industry is relatively low, and there is little child labour. Except in the building trades the "open shop" prevails. The making of aeroplanes at Dayton began with the experiments of Orville and Wilbur Wright (*qq.v.*) who in 1903 flew successfully the first heavier-than-air machine. During the World War of 1914–18 the U.S. government located its aviation experiment laboratories at McCook field, on the northern boundary of the city. When this became too small, the people of Dayton raised $400,000 in four days to buy a tract of 5.000 ac. northeast of the city (including the Wrights' original flying field), which they presented to the war department, to be a permanent home for the experimental and research division of the army air corps.

The annual volume of Dayton's wholesale business is estimated at $115,000,000; its retail trade at $106,000,000. In 1940 bank debits amounted to $890,152,056; post-office receipts were $2,-871,098; and the assessed valuation of property was $308,556,000.

The city has 82 public schools. including a normal college, and 20 parochial schools; 152 churches; and 4 daily newspapers, one of which is in German. It is the seat of the University of Dayton, a Roman Catholic institution (formerly St. Mary's college, founded in 1850); Bonebrake Theological seminary (United Brethren); and the Central Theological seminary of the German Reformed Church; also of an art institute (established 1919). The Engineers' club and the Foremen's club are distinctive organizations. The National Association of Foremen was founded in Dayton and its official organ is published there. The first house built in Dayton, a log cabin on the bank of the Miami, is preserved as a historic museum. There is a state hospital for the insane; and a branch of the National Home for Disabled Volunteer Soldiers.

History. — The site of Dayton was bought in 1795 from John Cleves Symmes by a party of Revolutionary soldiers. It was laid out as a town in 1796 by Israel Ludlow, one of the owners. and named after Jonathan Dayton (1760–1824), who had fought in the Revolution and was at the time a representative of New Jersey in congress In 1803 it was made the county seat and in 1805 the town was incorporated. Growth was rapid after the opening of the Miami and Erie canal in 1828, and in 1841 it was chartered as a city. By 1860 the population had reached 20,081, increasing to 38,678 in 1880, 85.333 in 1900 and 116,577 in 1910. In March 1913, the Miami valley was swept for five days by a steady downfall of rain, resulting in a great flood. Over 400 lives were lost in the valley, and damage to property was estimated at $100,000,000. When the waters receded, Dayton was left covered with mud and debris. A pestilence was averted only by prompt and energetic measures. Martial law was declared; food was distributed, and tents were put up for the homeless. A relief fund of $750,000 was disbursed by the American Red Cross and the Citizens' Relief committee. Steps were taken to prevent the recurrence of such a disaster. On June 28, 1913, the Miami conservancy district, a political subdivision of the state, was established under a new law, for the purpose of building and maintaining flood-control works in the Miami valley. The plan finally adopted combined channel improvement with the construction of five great retarding basins. Five dams (from 1,200 to 6,400 ft. long; from 75 to 125 ft. high; and from 380 to 785 ft. thick at the base) were built across the upper valleys of the Miami and four of its tributaries. Construction work began in 1918 and was completed in 1922. The cost was $32,000,000. Protection has been provided against a flood 40% greater than that of 1913, and 20% greater than the maximum estimated to be possible. Following the flood Dayton adopted a commission-manager form of government, which came into effect on Jan. 1, 1914. It was the first large city to install a manager and there has been no disposition to return to the mayoralty system.

For an account of the flood of 1913 and the construction of the flood-control works see **Technical** Reports (10 vols) by various authors, published by the Miami conservancy district, Dayton, O.

DAYTON, a city of southeastern Tennessee, U.S.A., 38 mi. N.N.E. of Chattanooga, at the foot of the Cumberland escarpment; the county seat of Rhea county. It is served by the Southern railway. The population in 1940 was 1,870. In July 1925 the little country town was the scene of the famous "anti-evolution" trial, in which John T. Scopes, a teacher of science in the high school, was found guilty of having violated a state law prohibiting the teaching. in the schools supported by the state, of any theories to the effect "that man is descended from the lower animals." Counsel for the defence included Clarence Darrow and Dudley Field Malone. The prosecution had the support of William Jennings Bryan, who died in Dayton a few days after the close of the trial. Mr. Scopes was fined $100, but the penalty was set aside by the state supreme court on a technicality, without any expression of opinion as to the constitutionality of the law. A Fundamentalist university on a hill at the back of the town is projected by Bryan's admirers as a memorial.

DAYTONA BEACH, a city of Volusia county, Fla., U.S.A., on the Halifax river, 50 mi. below St. Augustine; on federal highways 1 and 92 and state highway 140, and is served by the Florida East Coast railway, air lines and buses. It was formed in 192; by the consolidation of the city of Daytona (pop., 1925, 9,592) and the towns of Daytona Beach (pop., 1925, 2.129) and Seabreeze (1,792), and its population in 1940 was 22.584 by the federal census. Daytona Beach is a popular all-year resort, with many hotels and private winter homes. The Spanish style of architecture prevails, and the assessed valuation of property in 1940 was $32 000,000. Along the hard, white beach, which adjoins that of Ormond, is a fine automobile racing course, where many speed records have been made.

DEACON, a minister or officer of the Christian Church. The status and functions of the office have varied in different ages and churches, and the name is the Gr. διάκονος, minister, servant.

(*a*) The Ancient Church. — The office of deacon is almost as old as Christianity itself. Tradition connects its origin with the appointment of "the Seven" recorded in Acts 6:1–6. This connection, however, is questioned on the ground that "the Seven" are not called deacons in the New Testament and do not seem to have been identified with them till the time of Irenaeus (c. 180). The officers of the church are described in Philipp. 1:1 as "bishops and deacons"; and in 1 Tim. 3:8–13 the office of

deacon has evidently become a permanent institution of the Church. By the time of Ignatius (c. 110) the "three orders" of the ministry were definitely established, the deacon being the lowest and subordinate to the bishop and the presbyters. In the apostolic age the duties of deacons were naturally vague and undefined; with the growth of the episcopate, however, they became the immediate ministers of the bishop. Their duties included the management of Church property and finances, distribution of alms and care of the sick and of widows and orphans. They were also required to seek out and reprove offenders (*Apostolical Constitutions,* 4th cent.). With the growth of hospitals and other charitable institutions, however, the social work of the Church was transferred to others, and the diaconate came by degrees to be regarded (as in the Roman Catholic and Anglican Churches to-day) merely as a step towards the priesthood, and the deacon's duties were practically restricted to ritual acts, such as reading the Gospel, censing the priest, etc., at High Mass.

(h) The Church of England.—The diaconate is recognized as one of the "three orders," and is conferred by episcopal ordination. Candidates must be 23 years old and must satisfy the bishop as to their intellectual, moral and spiritual fitness. Deacons may perform any sacred office except that of consecrating the elements and pronouncing absolution.

(*c*) Churches of the Congregational Order.—In these (which include Baptists) the deacons are laymen appointed by the members of the Church to superintend the financial affairs of the Church, co-operate with the minister in the various branches of his work, assist in the visitation of the sick, attend to the Church property and generally supervise its activities.

See Thomassinus, *Vetus ac nova disciplina,* pars i. lib. i. c. 51 f. and lib. ii. c. 29 f. (Lugdunurn, 1706); J. N. Seidl, *Der Diakonat in der katholischen Kirche* (Regensburg, 1884); R. Sohm, *Kirchenrecht,* i. 121–137 (Leipzig, 1892); F. J. A. Hort, *The Christian Ecclesia* (London, 1897).

DEACONESS, a woman set apart for special service in the Christian Church. The origin and early history of the office are obscure. The arguments for its existence in apostolic times, based on Rom. xvi. 1 (where Phoebe is called διάκονος) and 1 Tim. iii. 11, and on Pliny's mention of two ancillae *quae ministrae dicebantur,* are hardly conclusive. But it is certain that before the middle of the 4th century there existed in the Eastern Church an order of deaconesses, of higher rank than the somewhat similar orders of "virgins" and "widows." The order is recognized in the canons of the councils of Nicaea (325) and Chalcedon (451), and many of Chrysostom's letters are addressed to deaconesses at Constantinople. The ordination of deaconesses resembled that of deacons, but conveyed no sacerdotal powers or authority (for specimens of the ordination service see Cecilia Robinson, *The Ministry* of Deaconesses, 2nd ed., 1914, pp. 219–229). Their mission was to perform certain offices in connection with the care of women. The functions of the deaconess, according to the apostolical Constitutions, were as follows: (1) To assist at the baptism of women; (2) to visit and minister to the needs of sick and afflicted women; (3) to act as door-keepers in the church, and conduct the women to their seats. In the Western church an attempt seems to have been made in the 4th century to introduce the order into Gaul. The movement, however, was strongly opposed, and was condemned by the councils of Orange (441) and Epaone (517). Despite the prohibition the institution made some headway, and traces of it are found later in Italy, but it never became popular in the West. In the middle ages the order fell into abeyance in both East and West.

In modern times several attempts have been made to revive the order. In 1833 Pastor Fliedner founded "an order of deaconesses for the Rhenish provinces of Westphalia" at Kaiserswerth. The original aim of the institution was to train nurses for hospital work, but afterwards it trained its members for teaching and parish work as well. Kaiserswerth became the parent of many similar institutions. The revival of the order in the Church of England dates from 1862, when Miss Elizabeth Ferard was set apart by the Bishop of London. Other dioceses gradually adopted the innovation. It has been sanctioned by Convocation, and the Lambeth Conference in 1897 "recognized with thankfulness the revival of the office of deaconess," but insisted that the name must be restricted to women set apart by the bishop and working under the control of the parochial clergy.

In addition to Miss Robinson's book cited above, see *Church Quarterly Review,* xlvii. 302 ff., art. "On the Early History and Modern Revival of Deaconesses" (London, 1899), and the works there referred to; D. Latas, Χριστιανική Ἀρχαιολογία i. 163–171 (Athens, 1883); *Testamentum Domini,* ed. Rahmani (Mainz, 1899); L. Zscharnack, *Der Dienst der Frau in den ersten Jahrhunderten der chr. Kirche* (1902).

DEAD, DISPOSAL OF THE. Monuments and buildings set up by man for the use of the living were seldom preserved by him beyond their period of usefulness and seldom remain intact; but his arrangements for the dead were usually made with permanency in view and are frequently discovered undisturbed. From these records of the past knowledge is yielded of man's physical characteristics, circumstances, material achievements, customs and beliefs. Inscriptions are rarely present to give a date to graves; but the method of disposal, the type of grave, the objects deposited with the dead, their relative positions, the posture and orientation of the body, and, in the older periods, the geological stratification and contemporary fauna, provide knowledge of the period and race to which the remains may be assigned.

PALAEOLITHIC PERIOD

The earliest human remains as yet discovered—at Trinil (*pithecanthropus*), Heidelberg and Piltdown—were river-borne fragments; whether originally buried is unknown, but the earlier part of the last ice age supplies in several instances evidence of the disposal of its dead by the Neanderthal race in Europe. Thus the bodies of the La Ferrassie man and child were protected by stones; a pillow of flint-chippings was gathered together for the Le Moustier youth, and graves were dug for the La Chapelle man and La Ferrassie infant. Belief that the dead lived on and had the same needs as the living is shown in the stone implements placed with the Le Moustier, Spy I, and La Chapelle burials, and in the ochre and food supplied for La Chapelle; and in each case the home of the dead is, as in life, the rock-shelter or cave.

Finds from the Upper Palaeolithic period are more numerous, and here again almost all burials are in caves or by rock-shelters, including probably the remarkable oval grave fenced round with mammoth shoulder-blades at Pfedmost (Moravia): this enclosed 20 burials in squatting position, and was dug in loess close to a limestone outcrop which once probably formed a rock-shelter. The chief exception is the richly furnished single burial in level ground at Briinn. The same kind of provision continues to be made for the dead during this epoch, but its developed culture provides finer implements and a wealth of personal ornament: necklaces, armlets, anklets, aprons, caps, of threaded shells and animals' teeth; carved bone amulets, ivory figurines. Instead of the small lumps of red ochre at La Chapelle, many of these later graves are liberally bestrewn with the substance. The cave-hearth is now frequently chosen as burial-site (Solutré, Grimaldi), and here occasional charred bones are more probably due to incompletely extinguished fires than to deliberate cremation.

Though no invariable position characterizes palaeolithic burials, an attitude of sleep—knees bent, arm under head—is the most frequent in Europe; while in Africa contracted posture obtained in the palaeolithic cave-burials discovered in 1927 near Lake Nakuru (Kenya), and with the skeleton of the same type and period from Oldoway (1913) further north. In Lower Palaeolithic burials at La Ferrassie and an Upper Palaeolithic at Grimaldi, however, were skeletons whose sharply-bent knees and arms were pressed close against the chest. So lie the dead of many primitive peoples: bound tightly lest they walk, or use their hands for mischief on the living

Already in Upper Palaeolithic Spain and France there are some indications of a cult of the skull in calvaria prepared as "bowls," and in occasional burial of the head alone. But with its closing phase (Azilian) comes the remarkable cave-burial at Ofnet (Bavaria) where the severed heads of the dead were deposited one by one into two scooped-out "nests," six into one, 27 into the other. They wore rich ornaments of shells and stags' teeth, were ceremonially besprinkled with red ochre; and all faced west. Charcoal

and charred remains near by suggested that the bodies were cremated. From the same period date the human bones in Mas d'Azil (France), scraped clean of flesh and painted red before interment.

POST-PALAEOLITHIC

As mankind passes through stages marked by his discoveries of the crafts of stone-polishing, copper-, bronze- and iron-working, we find an immense variety of funerary custom, conditioned partly by natural and cultural resources, largely by belief as to the kind of life after death, and the relationship between dead and living.

Cremation and Inhumation.— In Europe total cremation is found associated with the Late Neolithic banded-pottery and painted-pottery cultures, from Belgium to southern Russia. Inhumation was general over Europe in the earlier part of the bronze age, but gradually in the later part it was largely replaced by cremation, and from then on the two methods competed and alternated in different countries until the spread of Christianity banished cremation from European civilization down to its modern revival. This practice has a long and varied history in other continents also. A mid-4th-millennium cemetery rich in gold and copper objects was discovered at Ur (Mesopotamia) in 1927, and contained partial cremations which argued total cremations at an earlier epoch; by the end of that millennium inhumation prevailed alone at Ur. Cremation has been the usual Hindu method; frequent also among Buddhists; rare in China. It was general among the Aztecs of Mexico, reserved only for people of rank in the Maya civilization of Yucatan, and for occasional criminals among the Jews. In Egypt it is unknown.

Other Methods.—These include (1) the preservation of the body by smoke-drying, embalming, etc. (see MUMMY); (2) exposure to birds of prey (as by the ancient Scythians, the Zoroastrians, the poorer Siamese), river-committal, or other methods little likely to help in identifying the remains; (3) disposal in two stages—first, of the corpse by burial, exposure, etc., until the soft tissues disappear; second, of the bones: either individually as in eastern South America (in jars), or collectively, as in neolithic British barrows, in the great neolithic hypogeum at Hal Saflieni (Malta), or in vaults of mediaeval English churches such as Hythe.

Posture and Orientation.— In many cultures and religions a definite position is given to the dead. The posture usually ranges from tightly contracted to fully extended, the former tending to be associated with more primitive, the latter with higher civilizations; the body usually lies on side or back, or is seated, and it is frequently orientated in a given direction. Thus in Egypt the tightly contracted pre-dynastic posture gradually loosens as the dynasties pass until full extension is reached in the Middle Kingdom. From the Old Kingdom onwards the body usually lies with head north, face to the sunrise. In England bodies lay contracted till shortly before our era; but orientation varied until Christianity taught that the feet of the dead should be towards the east, whither they must hasten at the last trump. The custom mainly holds in England still, but Norway and Holland have long abandoned it, except in country districts. Buddhist tradition—where Buddhists bury—dictates head north, face upward, as Buddha died. The Mohammedan must lie on his right side, facing Mecca; but the Japanese in his tub-shaped coffin sits upright, like some among our ancestors in chambered barrows.

Tomb-furniture.— Burials bare of all else but (originally) a garment or shroud are not infrequent, and betoken sometimes poverty, sometimes high beliefs: strict Jews must bury thus. But further protection is usually afforded. The pre-dynastic Egyptian and early Sumerian were often wrapped in matting, though pan-shaped and bucket-shaped pottery coffins were already in use. Slipper-shaped pottery coffins were common among the Chorotegans (Nicaragua) and Parthians; large jars, in Greece at the end of the 2nd millennium, in prehistoric southern India, in the Americas. Wicker-work, wood, stone, marble—all have played their part in coffining the dead. As to possessions: sometimes the latter have none; sometimes a sophisticated civilization cheats them with useless imitations; but mostly the objects are real, valued in life and retained in death.

Type of Tomb.—The use of caves as sepulchres continued in the Neolithic period—usually as sepulchres alone; and in the Late Neolithic were excavated the first artificial burial-caves. In Mediterranean lands the single "cave" entered direct from cliff-face then added an entrance-passage, as the trench in level ground gained a side-chamber; then both gradually developed extra chambers and niches. These elaborations culminated in catacombs such as those of Panticapoeum (Crimea) and—most elaborate of all—of Rome. Megalithic tomb-architecture sprang up in Neolithic, flowered and died in Bronze (see MEGALITHS). In Neolithic times the first barrows also were piled up as burial-places and memorials. But as mankind elaborates—plays out—these various ideas conceived in his imaginative adolescence, he reverts ever and again to the simple grave as standard; while, throughout, we find the simple grave persists for simple folk.

BIBLIOGRAPHY.—Hastings, E.R.E. *s.v.* "Death and Disposal of the Dead" (1911); M. Ebert, *Reallexikon der Vorgeschichte* (1924–); C. E. Vulliamy, *Immortal Man* (1926). (M. L. T.)

In the early times of Neanderthal man the bodies of the dead were buried with some ceremony, and, with the apparent exception of one or two very primitive tribes, there is no known people to-day which does not dispose of its dead in some well-defined, traditional manner. The treatment of the corpse, however, is not as a rite complete in itself; it is but an incident in a series of rites. When a community loses one of its members, especially anyone of importance, it suffers a shock, and the rites connected with the dead are to be regarded as the stereotyped behaviour of society by which it readjusts itself during such a period of strain and emotional disintegration. For this reason their correct performance is important to society. The more serious the loss, that is, the greater the value of the deceased to the community, the more elaborate will these rites be and the greater the number of people which they concern. The very aged, on the other hand, and those who have long been ill and who, therefore, have for some time taken little part in the life of the community, often receive scant attention at death and may even be buried alive, since, socially, they are in a sense already dead.

There are many variations in the ceremonies connected with death, and in the treatment of the corpse, but each has its recognized procedure from which deviations are rare, and in all there seem to be three distinct phases. The first lasts from the time of death, or when all hope of the sick person's recovery is abandoned, until the beginning of the rites directly connected with the disposal of the body; the second is during the performance of these rites; the third is covered by the period from the disposal of the body till the cessation of mourning.

When the individual is dead, or regarded as dead, the corpse is usually washed and decorated and a ceremony of leave-taking may be gone through, often accompanied by the presentation of gifts. The duration of this period varies considerably according to the importance of the deceased or to the affection felt for him. For a commoner a day or two may suffice but for a chief it may occupy many weeks and the body is sometimes partially embalmed to prevent decomposition from setting in during this time. If it is suspected that death was due to foul play, especially sorcery, omens are now carefully observed or the body is asked to indicate in some recognized manner the guilty person or village. Friends and relatives having now said farewell, the body is laid to rest.

The number of ways in which a body can be disposed, are six: inhumation or burial, cremation, preservation, exposure, water-burial and hastening decomposition by artificial means. Occasionally the bodies are exposed for destruction by wild animals. Many or all of these methods are sometimes found in use among a single people. Where this is so, the mode of disposal of the body is usually determined by his social status, by membership of some social group, his achievements in life or the cause of his death. In general, such methods as preservation and the artificial hastening of decomposition are reserved mainly for those who have been important in life. Those who are unimportant to society are usually given a form of disposal which entails little trouble or expense. The cause of a person's death often affects profoundly the fate both of the body and soul. A person who has died by

falling from a tree, or by violence in peace or war, is usually treated differently from his fellows, and special treatment is almost always allotted to suicides and women who have died in childbed. The reasons for such distinctions are not always clear but, in general, these unfortunates are considered to be undesirable. Those who are earth-bound are usually feared and measures are taken to prevent their souls from troubling the living, such as putting thorns into the feet of the corpse so that the spirit may not walk, placing stones or briars over the grave that it may not escape thence, or burning the body and so destroying the soul.

Inhumation. — Where inhumation is practised there is often a cemetery, usually situated at a little distance from the village, where all of that community are buried; or there may be separate ones for the different kindreds which compose it; occasionally one is reserved for men, and another for women. These are often carefully tended and are sometimes used for the meetings of the village council. Frequently, however, cemeteries are absent and the site of a man's grave is either fixed by tradition, as, for instance, in his garden or before the threshold of his house, or selected by himself or his heirs. The most usual form of grave is a trench, sometimes shallow, occasionally of considerable depth, but some are more elaborate. A common form is a pit at the bottom of which a horizontal recess is excavated and in this the corpse is laid, the pit being usually but not always filled in afterwards. In some areas the grave is an underground chamber approached by a subterranean passage. To prevent the soil touching the corpse the sides of the grave are sometimes lined with wood, stone, leaves or mats, or the body itself is carefully wrapped up. Wooden coffins are used by some tribes, or, among sea-faring peoples, the deceased is buried in his canoe. The superstructure of the grave may be only a low hummock of earth, but, over the remains of important people, large mounds are often erected. A small hut is often set up over or beside the grave, to protect the soul (which usually lingers near the body until decomposition is complete) from the inclemencies of the weather. Grave-stones are also erected as memorials and as temporary abodes for the spirits when they desire to visit the living.

Cremation. — The destruction of the corpse by fire has a world-wide distribution. Often it is restricted to a certain class of people, notably chiefs, but sometimes, where other methods are normal, it is used for lunatics, workers of black magic and other dangerous members of society. When such people are burnt the remains are generally thrown away. In other cases they are buried, cast ceremonially into water or placed in ossuaries belonging to a kindred or village group. Sometimes some member of the deceased's family keeps them, or certain of them, and treasures them as a link with the soul of the departed. The construction of the pyre and the kind of timber used are generally decreed by custom, since any deviation brings misfortune on the soul of the deceased.

Preservation. — The practice of preserving the bodies of the dead is not restricted to ancient Egypt. It is found to-day among tribes scattered throughout the world and even among such primitive ones as those of Torres straits. Generally it is reserved for chiefs or priests. The methods used vary considerably. Preservatives, such as alcohol, honey, salt, butter or the shavings of certain woods are common; sometimes the body is dried by smoking, usually preceded by evisceration or massage to extract the juices; and sometimes it is placed in a sealed wooden effigy or coffin. In one tribe in East Africa, a fire is lit on the top of the grave with the intention of baking the body.

Exposure. — More common than preservation is the custom of exposing the dead on trees, rocks or on platforms erected in the gardens or the bush. Where the atmosphere is hot and dry this may result in desiccation which possibly is intended. Elsewhere the corpse is left to decompose and the bones are collected and kept as relics or placed in an ossuary. During the period of decomposition the living often visit the body and sometimes rub themselves with its juices probably in order to link themselves more closely to the deceased or to absorb his virtues. Exposure may, in some places, be closely allied to burial, for where there is not sufficient depth of soil to dig a grave (as in islands of coralline and volcanic formation), the obvious alternative is to lay the body on the ground.

Artificial Decomposition. — Artificial means to hasten decomposition are often reserved for important men. It is sometimes effected by warming the body over a slow fire or by washing it regularly and scraping away the putrifying flesh. If only a portion of the body is to be cleaned, such as the head, which is treasured by many who have an ancestor cult, this may be wrenched off and placed in a termites' nest to be eaten clean, while the rest of the body is disposed elsewhere.

Water Burial. — To fling a corpse into the water is an easy mode of disposal and is, therefore, often the fate of slaves, foreigners or people of no account. But there are tribes among whom it is not considered an undistinguished end, and some individuals may even request to be buried at sea, because they "like wash all time 'long salt water." Certain parts of the coast are in some islands set aside as water cemeteries where, after being wrapped up to protect them from the fish, and weighted to prevent them from being washed on shore, the bodies are sunk. In the Solomon islands, however, where sharks are regarded with veneration, the dead are laid on the reef for these creatures to complete the burial. A method (not strictly "water-burial") is that of placing the deceased in a canoe and pushing it out to sea. This was formerly practised in many parts of Polynesia, and is recorded from the Cameroons, where the coastal inhabitants set the figure of a bird on the prow of a funeral canoe to guide it on its way because those for whom it is done are descendants of an immigrant people who, at death, must return across the sea to the land of their origin. This may also explain the other forms of sea-burial and likewise the use of a canoe as a coffin; certainly the latter is sometimes definitely connected with an after world which must be reached by boat.

Orientation. — Wherever inhumation, cremation or exposure are the custom, the position in which the body is placed and the orientation in the grave or on pyre or platform, are important. Even so insignificant a point as whether the body is laid on its right or left side may affect the fate of the soul in the land of the dead. The corpse may lie extended on its back or front; or be seated upright or recline with flexed knees. Sometimes if buried on land or in the sea it may be fixed as though standing, the erect position in the water being obtained by weighting the feet. A very common position for burial is lying on one side with knees drawn up and the hands raised to the face as in sleep, though it has also been suggested that this is in imitation of an infant before birth.

Often there is no definite orientation. Even in one cemetery the bodies may be facing in many different directions. But it is frequently the custom for the head to point or the face to look towards that point of the compass where lies the other world or the land whence the people have migrated.

Secondary Disposal. — The disposal of the remains after cremation and exposure is a necessary part of the funeral rites. But even where inhumation is practised the bones are sometimes exhumed and laid in a special spot, often as a regular part of the ritual which may take place at a definite time after the burial or on a great annual ceremony when the bones of all who have died within the year are finally laid to rest. Among people who have a cult of the dead the skull is often kept by the living to be an abode for the soul if it wishes to visit this world. Other bones are also sometimes kept, not as shrines, but for use in magical ceremonies or for the making of weapons. This secondary disposal often marks the close of the period of mourning and may be for the deceased the last act in the *passage* rite *(see* PASSAGE RITES), as a ceremony whereby the soul is finally despatched to the other world of which community it is henceforth a full member. Sometimes, however, exhumation and secondary disposal are only performed under exceptional circumstances. If a soul troubles the living, the body may be dug up and either removed elsewhere or destroyed by fire or water. Often the soul itself indicates that it desires such a removal, and it may demand several changes of abode before it finds one to its liking. It expresses its wishes

either to a relative in dreams, or by causing sickness and misfortune.

Grave-goods.—To the savage the dead closely resemble the living in both psychological and physical make-up. It often seems that at death the soul is conceived as being weak, just as its body was. To give it increased vitality the mourners cut themselves and allow the blood to drip on to the corpse, for blood is the elixir of life. The laying of food on the grave and the lighting of fires are plainly the result of this material conception of the soul, but the reasons given for the practice vary. Sometimes the journey to the other world is long and the food is for the support of the traveller on his way. In other places it is intended for the comfort of the disembodied creature during the time that it hangs about its home, before departing to join its ancestors. The grave-goods destroyed or buried with the body are definitely for use in the land of the dead, which in physical and social formation is very like that of the living. In it a man will need those things which were valuable in life—weapons, tools, wealth. They are therefore buried or burnt with him; if buried they are often broken in order that their non-material essence may be released. Pots have been found specially made as grave-goods, with holes in the bottom or with uncompleted designs, through which this spiritual part can escape. The killing of a man's favourite wife or slaves is a further logical result of this conception of life after death, for he will continue to need them to minister to his wants. To avoid the actual destruction of the property cheap imitations may be buried or burnt as in China to-day, or the objects may be laid on the corpse while it lies in state and removed before disposal: in this way the dead man retains the use of them in the other world and his heirs have the use of them in this.

DEAD RECKONING, the computation of a ship's position derived from the latitude and longitude last determined, from the direction of the compass and rate and time of sailing according to the log, reference also being made to astronomical observation for correction and comparison of this method. See NAVIGATION, and AERIAL NAVIGATION.

DEAD RENT. The fixed rent payable under the leases of mines or quarries and paid in addition to the stipulated royalties. This payment secures to the owner of the mineral a certain income, and ensures that the mine or quarry is worked in his interest, since if the property lies idle the dead rent must be paid. *(See* RENT.)

DEAD SEA, the lake in southern Palestine in which the river Jordan terminates. It is bounded on the north by the Jordan valley—at that point broad, arid and forbidding, on the east by the escarpment of the Moabite plateau, on the south by the desert of the Arabah, and on the west by the mountains of Judaea. It has a length of 47 m. and a breadth of 10 m., a superficial area of 360 sqm. and a mean depth of 1,080 feet. Its surface level, which has a seasonal variation of 10 to 1j ft., lies about 1,300 ft. below that of the Mediterranean, and is the lowest sheet of water on the earth's crust. The Jordan alone pours into the Dead sea on a daily average a volume of water estimated at 6 million tons, and in the winter season torrents—very few of which are perennial—from the hills to the east and west add their contribution. The rainfall in the Dead sea valley seldom exceeds j in. in the year. There is, of course, no effluent. The heavy inflow is carried off by evaporation (estimated at 13½ mm. per day), visible in strange looking blue-white clouds which float half-formed and ethereal above the waters. An interesting feature is the peninsula, called from its shape the *Lisān* (tongue) which projects from the east shore. The sea to the south of this peninsula is shallow, showing a depth of from 3 to 30 ft., whilst north of it, towards the eastern shore, is the point of greatest depth (1,310 feet).

Geology.—The Dead sea occupies the lowest point of the Jordan rift-valley or trough-fault, caused by the slipping down of the strip of earth's crust confined by the two parallel fractures visible in the rock walls on either side of the valley. In the Jurassic and Cretaceous periods an extended Mediterranean covered Syria and Palestine, but during the Tertiary period an extensive upheaval of the sea-bed produced land. The earth movement was uneven, creating wrinkles (the Lebanons and the hills of western Palestine) and causing the fractures which resulted in the Jordan-Dead sea depression. There seems reason to suppose that prior to the Pluvial period, which later followed, the climate of this region was similar to that now prevailing, and that the Dead sea was approximately the same size as at present. During the Pluvial period the surface of the Dead sea gradually rose until it reached a height of 1,400 ft. above present level, and consequently higher than the Mediterranean. At this stage it was a vast inland sea stretching 200 m. from Huleh in the north to a point 40 m. beyond its present southern limit. Its waters were capable of supporting life, and remains of its fauna have been found in its marginal deposits.

A dry period supervened during which evaporation prevailed over precipitation causing a gradual shrinkage, until after a long interval only a remnant of the great sea remained, leaving in its wake deposits of marl, gypsum and salt, and clearly-defined beaches to bear silent witness to the uneven course of desiccation. The formation of the Lisān and of Jebel Usdum, a hill on the south-west shore, must have occurred subsequent to this period of contraction, since both are composed entirely of these lacustrine deposits. The strata of the Lisān dip to the east showing that there has been an upheaval of the floor of the Ghōr. It is permissible to conjecture that the crustal movements, due probably to continued faulting, which forced up the Lisān and Jebel Usdum, forming a southern escarpment of varying elevation and irregular base line, depressed at the same time the sea-bed to the north of the Lisān, where its deepest part is known to be. With the sea confined to the north of this barrier, what is now the shallow end of the Dead sea would be dry land. At no very distant date the sea broke this barrier at its western side, aided, it may be, by another tremor, or by merely overflowing, as its level rose, at a point where the barrier was low. That the level of the Dead sea is now rising, and has seemingly been rising for centuries, is well established. Since Kitchener's survey in 1883–84 it has risen nearly 20 feet. Since 1900 it has not risen more than 6 to 8 ft., however. The chief contributing factors to this rise of level are the encroachment on the sea of the Jordan delta, the gradual raising of the sea-bed through fresh layers of precipitate and climate that seems to be growing more moist.

Salinity.—The water of the Dead sea is intensely saline. Whilst ocean water has a salinity of 4–6%, Dead sea water contains 23–25% of salts. Exhaustive analyses of water taken from different parts and at different depths have been made The following selection from the analyses made by Terreil will suffice. A is surface water at the north end, B 120 metres deep 5 m. E. of Kās el-Feshkha, C 300 metres deep at the same point. T = Trace.

Magnesium, sodium, calcium and potassium are present as chlorides, The chloride of magnesium, largely held in solution,

gives the water its nauseous taste, and chloride of calcium its smooth, oily feeling. The brine, as can be seen, is a commodity of great economic and commercial value, and applications have recently (1926) been invited by the Government of Palestine for the monopoly right for developing the mineral resources of the Dead sea. The density of the water is roughly 1.160, increasing from north to south and with the depth. At the southern end the density is 1·253. In consequence the wader in the Dead sea finds that when the water reaches his armpits he is swept off his feet, and in swimming the shoulders are all the time out of the water. When the water is permitted to dry on hands or clothing the resulting stickiness is distinctly disagreeable. No animal life can exist in its waters. Fish brought down by the Jordan die and furnish food for the sea-birds. From the salt pools on the north shore and from the Jebel Usdum the Badouin have been in the habit of retrieving salt to smuggle. Salt was a Government monopoly under the Turks and continues to be so under the new Palestine régime.

Recent investigation has shown that the river Jordan carries an unusually high percentage of salts, especially sodium chloride and magnesium chloride. In the Dead sea the sodium chloride crystallizes out, but the magnesium chloride remains in solution. With magnesium as a permanent and increasing element in Dead sea water, its rate of entry and the cubical content of the sea calculable, the age of the Dead sea becomes a matter of simple arithmetic. From the data available to him Irwin puts the figure at 50,000 years—obviously much too low.

Bitumen, or more exactly, asphalt, floats ashore on occasion. It is collected and used as a protection against worms and grubs in vineyards. According to Arab writers, it had many medicinal virtues. Search is now being made for petroleum in the Dead sea area.

History.—No other sea has had such a variety of names. The term "dead sea" was first introduced by late Greek writers, and is used by Pausanias, Galen, Justin and Eusebius. To the Hebrews it was "the sea," "the salt sea," "the sea of the Arabah," "the eastern sea." To Josephus it was "the asphalt sea," "the Sodomitish sea," whilst to Arab writers it was "the sea of Za'rah (Zoar)," "the stinking sea," "the sea of overwhelming," "the dead sea" and "the sea of Lot." This last is its modern designation. Historically, interest in the Dead sea centres in the biblical narratives of Abraham and Lot, and the destruction of Sodom and Gomorrah. At En-Gedi, on its western shore, David took refuge. To the south of En Gedi lies the fortress of Masada *(Sebbah)*, built by Jonathan Maccabeus, the refuge of Herod and Mariamne when the Parthians took Jerusalem (42 B.C.), and the scene of the last stand and self-destruction of Eleazor and his devoted band of zealots after the fall of Jerusalem (A.D. 70)—this last a grim tale of Roman determination and Jewish heroism.

In early times the sea was navigated, as Tacitus and Josephus bear witness, and under the crusaders the new navigation dues formed part of the revenues of the lords of Kerak. The Turkish sultans of more recent times regarded the sea as their private possession, and sold to individuals the exclusive right of putting boats on it. The Turks, with German assistance, put a flotilla of motor boats on the sea during the World War, and in 1922 one steamer, three motor boats and 14 sailing vessels were plying on its waters.

The tradition that the Dead sea covers Sodom and Gomorrah dates from Josephus. The site of the overwhelmed cities, whether under the waters of the sea at its north end, or its south end, or on its eastern or western shores, continues to occupy the minds and excite the ingenuity of investigators. Although the question is not fully resolved—if, indeed, it ever can be—the evidence seems to favour the south end, where, as we have seen, there was almost certainly dry land within historic times. That in this bituminous region a violent earth tremor—to which, indeed, the Ghor and its borders are peculiarly liable—should have brought into play eruptive forces whose catastrophic effects are indicated in the Bible narrative, is more than probable. The recent (1924) joint expedition of the Xenia seminary and the American School of Oriental Research sent out to locate the Cities of the Plain are convinced that three of them, Sodom, Gomorrah and Zoar, stood in the south-east corner of the Dead sea, on the lower courses of the only perennial streams in that region, the Numeirah, the 'Esāl and the Kurāhī respectively, but now of course beneath the sea. Kyle and Albright would assign but one town to each watercourse, and think that Admah and Zeboim must be sought elsewhere. Yet if they would but think of these perennial streams meandering over the plain to meet the sea west of the Lisān, the vision pictured is of an oasis like Damascus, a veritable "garden of the Lord," where there would be room for Admah and Zeboim and, indeed, many others.

The dismal associations of its name are not borne out by the sea itself. The wild tales of mediaeval travellers that in its poisonous air no plant could live, that over its dread waters no bird could fly and that no waves ever disturbed its gloomy ,surface, are figments of the imagination. The doom of Sodom and Gomorrah must needs be writ large on the waters that hid them. "To think of this lake as sombre is quite an illusion; its intense colouring, its varied effects of light, its scarped overhanging slopes, broken by deep gorges, produce a picture of wild and sublime beauty." Its winter climate, with a temperature of 75° F by day and 60 to 65° by night, is probably the finest in the world. The possibility of the development of some oases on its south-east shore as winter resorts has been suggested. Here is the testimony of the Xenia seminary expedition, which spent part of the winter there in 1924: "With proper irrigation three large oases, totalling perhaps 10,000 ac., could be made into a veritable tropical garden. The atmosphere was pure and refreshing and there was as little swamp smell as may be found anywhere along the shores of salt water. The scenery is beautiful, sublime and romantic far beyond that of many of the winter resorts of the world. Under proper irrigation, with the establishment of a motor boat and automobile line to Jericho and Jerusalem, this plain may soon vie with Luxor as a winter health resort."

The future of this, the most interesting of all seas, will be watched with interest whilst modern enterprise takes a hesitating step towards the fulfilment of Ezekiel's prophetic vision.

DEADWOOD, a city in the Black hills of western South Dakota, U.S.A., 2m. N.E. of Lead, the county seat of Lawrence county. It lies in a narrow canyon 4,530ft. above the sea, on federal highways 14 and 85, and is served by the Burlington and the Chicago and North Western railways, air and bus lines. Pop. (1940) was 4,100. Deadwood is a headquarters for tourists, and the commercial centre of a cattle-raising and gold-mining region. It has stamp mills, smelters and cyanide mills. In 1875 the discovery of gold in this region was made public. The United States bought the land from the Sioux, and in 1877 opened it to settlement. Deadwood Gulch was the centre of the rush that followed, and its colourful history is commemorated by an annual pageant held in a natural amphitheatre rimmed by steep hills. At the celebration of 1927, President Coolidge was inducted into full tribal membership by the Oglala Sioux, and Deadwood Dick, a national hero among the boys of his generation (one of the shot-gun guard that protected the early shipments of gold by stage-coach), rode in the parade. Ft. Meade, headquarters of the Black Horse cavalry, is 10m. N.E. of Deadwood.

DEAF AND DUMB, EDUCATION AND WELFARE OF THE. The term "deaf" is frequently applied to those who are deficient in hearing power in any degree, however slight, as well as to people who are unable to detect the loudest sounds. The reference here is to those who are so far handicapped as to be incapable of instruction by means of the ear. Deafness, then, is the incapacity to be instructed by means of the ear, and dumbness is ignorance of how to speak as an effect of deafness.

Of such deaf people many can hear sounds to some extent. D. Kerr Love quotes several authorities (Deaf Mutism, p. 58) to show that 50% or 60% are absolutely deaf, while 25% can detect loud sounds, and the rest can distinguish vowels or even words. He thinks that the ability to hear speech exists in about one in four, while ten or fifteen in each hundred are only semi-deaf. He warns against the use of tuning forks or other instruments held on the bones of the head, when the vibration may be only felt not heard, as tests of hearing.

EDUCATION

In the early ages the deaf were regarded as idiots and were killed out of hand. They had no place in the social order of things and were regarded as mere encumbrances. Later on, isolated cases are on record of the deaf being taught. The Venerable Bede relates that in 700 St. John of Beverley taught a deaf mute to speak. But it was not until the 16th century that any serious attempt was made to instruct the deaf. At this time, Jerome Cardan, who was born in Pavia in 1501, stated that the deaf could be instructed by writing. This method was put into practice by a Spanish Benedictine monk, Pedro Ponce (b. 1520). Another Spanish monk, Juan Paulo Bonet, taught the deaf to speak. He published a book on the subject in 1620.

Great Britain.— In England, Dr. John Bulwer in 1648, and Dr. William Holder in 1669, both wrote on the subject of teaching the deaf and dumb. In 1680, George Dalgarno, a Scotsman, wrote his *Deaf and Dumb Man's* Tutor. In 1760, a school for the deaf was opened in Edinburgh by Thomas Braidwood, and one in Paris at the same time by the Abbé de l'Epée. In 1783 Braidwood moved to London and in 1792 the London Asylum for the Deaf and Dumb was founded. This was the first British Institution for the deaf.

Up to nearly the end of the 19th century the education of the deaf was provided for mostly by charity. In 1893, the report of the Royal Commission which had been appointed to consider the condition of the blind and deaf, was published. As a result, the Elementary Education (Blind and Deaf Children) Act was passed. This provided for the compulsory attendance at school of deaf children between 7 and 16 years of age, and made it the duty of Local Education Authorities to make suitable provision for the education of the deaf. In this way State action was established.

Although the compulsory age for attendance at school is 7 years, children are admitted much earlier. Deaf children receive their education in day schools and residential schools. The day schools are maintained by Local Education Authorities and, with the exception of eight which are maintained by local education authorities, the residential schools are provided by voluntary committees. For the year ended March 1927 there were 50 schools, day and residential, with an accommodation for 4,826 pupils in England and Wales. Children are mostly taught by the oral method, that is by means of speech and speech-reading, although a proportion do not benefit by this method. These are taught by means of writing and a manual alphabet. The curriculum in schools for the deaf includes besides speech and speech-reading, the ordinary elementary school subjects. Vocational training is given in boot-making, cabinet-making, dress-making, laundry-work, etc. The London County Council provides the following schools for its deaf children: (1) Six day schools for deaf children up to 13 years of age. (2) Five day schools for partially-deaf children. (3) One residential school for deaf boys from 13 to 16 years of age, with provision for vocational training. (4) One residential school for deaf girls from 13 to 16 years of age, with provision for vocational training. (5) One residential school for deaf boys and girls up to 16 years of age who have a defect other than deafness.

The National College of Teachers of the Deaf has for many years past advocated the scientific classification of deaf children for the purposes of instruction according to the history and degree of their deafness and their mental condition. Clearly, the partially deaf and those who lose their hearing after the habit of speech has been naturally acquired, stand in a different relation to education from the deaf born, whose minds have never been stimulated by heard speech. Up to comparatively recent times, both types were grouped together for instructional purposes. The movement to give these children the advantages of a hearing environment and to train them by methods adapted to children who hear is steadily growing, and schools for partially deaf children are increasing in number. This is only part of the classification necessary to ensure that such type and condition of deafness shall receive the special educational care it needs. The London County Council Institution for the defective deaf at Penn is another step in this direction.

The Board of Education is the official department which issues statistics relating to the deaf and these necessarily apply to children, The incidence of deafness in children as shown in the

returns of the local education authorities for 1924 was ·81 per 1,000 children. The incidence of deafness in school children varies very widely in different districts and is shown in the chief medical officer's report to be 5·18 per 1,000 children in the Isles of Scilly and ·33 in Southport.

The central authority controlling schools for the deaf in this country is the medical branch of the Board of Education and all schools are open to inspection by the chief medical inspector and his staff. The British Deaf and Dumb Association is a national body consisting of deaf adults together with the leaders, hearing and deaf, of the local welfare societies.

The great advance in the education of the deaf during the 20th century established their fitness for higher educational and technical training. With this conviction the leaders of the schools and welfare societies for the deaf initiated in 1923 a movement for the reconstitution of the then national bureau for promoting the general welfare of the deaf, established in 1911, which was reorganized as the National Institute for the Deaf and came into being in April, 1925. The main attention of the Institute has been devoted to the industrial conditions of the deaf, the conditions of the deaf in poor-law institutions and mental hospitals, fuller citizenship of the deaf.

The general objects of the Institute are:— The prevention of deafness; the education of the deaf including the proper administration of the law effecting the attendance of deaf children at suitable schools, and the furtherance of their early training; the re-education of the partially deaf through speech-reading; the provision of efficient training in trades for children leaving school, and of opportunities for continued academic study; the adjustment of official and trade regulations where they operate harshly against the deaf worker; the provision of opportunities for the higher education of the deaf; the adequate care of the blind-deaf and the mentally defective deaf; the social elevation and fuller citizenship of the deaf; supplying information to, and advising public departments, private bodies, and individuals needing assistance, and generally, by propaganda, whether in the way of local or national action, to influence the public in favour of the deaf, with a view to bringing about necessary reforms.

International Action.—At the International Conference of Teachers of the Deaf held in London in 1925, which was attended by leading experts from some 15 nations, recommendations were adopted urging the need for opportunities for the higher education and technical training of the deaf after school age; the establishment of classes for the partially deaf in connection with schools for hearing children, such classes to be taught by specialist teachers of the deaf; the enforcement of a compulsory hearing test in elementary schools in order to ensure the detection and treatment of deafness in its early stages; the appointment of national committees to enquire into, and report upon, all matters affecting the education, training, industrial and social conditions of the deaf in the various countries represented; and the establishment in every country of a national organization to promote the general interests of the deaf throughout life. The Conference also decided to establish an international organization of teachers,

Denmark.— This was the first country in the world to introduce by royal decree in 1817 compulsory instruction for deaf children. The first school was opened at Copenhagen in 1807. The State provides for the education of all deaf children. The compulsory period of education is 8 years, children being admitted to school between the ages of 7 and 8. Classification is good and most of the children are taught orally. A proportion are taught by means of writing and spelling.

Norway.—As in Denmark the education of the deaf in Norway is undertaken by the State. For this purpose the country is divided into two districts, north and south, each having a school where pupils are admitted annually. There is a private agricultural and trade school in South Norway.

Sweden.—Up to 1926, unlike other Scandinavian countries the education of the deaf in Sweden was undertaken by local authorities, the State only allowing a grant per head for this purpose. In 1927 there was a measure before Parliament providing for State control.

Holland.— Instruction for the deaf goes as far back as 1790, when an Institute for the Deaf and Dumb was founded at Groningen. Dutch schools for the deaf are all private and are subsidized by the state and municipal authorities. Children are taught on the oral method, and nearly all pupils learn a trade.

France.— The Act of 1882 made instruction for deaf children compulsory. Besides several state schools there are many schools which are controlled by religious and private bodies. The National Institution in Paris was founded in 1785. The one in Bordeaux in 1795, and the one in Chambery in 1860. The age of admission of children is 6 years although children may be admitted earlier.

Japan.— The education of the deaf in Japan is of comparatively recent growth. The first special school was established in Kyoto in 1878. In 1923 a bill was passed by Parliament granting state aid to schools for the deaf. (C. SH.)

UNITED STATES

The increasing emphasis on oralism in the United States is breaking down the barriers that separated the totally or partially deaf from normal people when only signs were used. The teaching of speech and lip-reading is now generally prevalent so that the word "dumb" is stripped of its one-time significance in America. As the deaf are educated, they cease to be dumb. The latter word has been eliminated by law from titles of institutions. According to the 1920 census the deaf numbered 44,885 but an unofficial estimate of totally and partially deaf runs into millions.

Education.— The first attempt to teach a deaf-mute recorded in the United States was Philip Nelson's in Rowley, Mass., 1679. From 1773 to 1776 there was a deaf boy in John Harrower's school, Fredericksburg, Va., but not until the early 19th century was concerted action taken to educate deaf children. Francis Green, of Boston, whose deaf son was sent to Edinburgh to be educated at Thomas Braidwood's institution, became much interested in the problem. With some ministers, he attempted a census of Massachusetts, 1803, when 75 deaf were found. They then estimated 500 deaf in the United States and urged the creation of a special school. In 1810 in New York, the Rev. Dr. John Stanford found several deaf children in the city almshouses and tried to instruct them, efforts which later resulted in the founding of the New York institution. A grandson of Thomas Braidwood, John Braidwood, began to teach a family of deaf children in Virginia in 1812, later establishing a school. After six precarious years alternately in that State and New York, he died, and the first American oral school for the deaf ended. Meantime, the case of Alice Cogswell, the deaf daughter of a Hartford physician, interested a group of men. Their investigations, 1812, disclosed 84 deaf in the vicinity. They estimated 400 in New England and 2,000 in America. In 1815 they organized a society to instruct the deaf, raised $2,278 and sent a young minister, the Rev. Thomas Hopkins Gallaudet, to Europe to learn methods of teaching the deaf. Gallaudet studied the sign language method at the Abbé Sicard's school in Paris, which influenced the whole course of the education of the deaf in America. When Gallaudet returned in 1816, he was accompanied by the celebrated Laurent Clerc, himself deaf, one of the Paris institution's teachers. On April 15, 1817, the Hartford school was opened with subscriptions from New York, Philadelphia, Albany, New Haven and other cities amounting to $12,000 and an appropriation of $5,000 from Connecticut, probably the first made in the United States for other than regular schools. It used the sign language of de l'Epée and Sicard, the manual alphabet and writing as the basis of instruction. In 1819 the Federal Government granted 23,000 ac. of public land, the proceeds from which formed a fund of $339,000. The New England States, Georgia and South Carolina (beginning 1834) sent deaf children to the school, renamed American asylum.

In May 1818 the New York Institution for the Deaf was

opened. Of the 62 attending, 32 were "charity pupils" provided for by the city. Thirty-eight belonged to distant parts of New York State, 19 to the city, four to New Jersey and one to Connecticut. After an exhibition by the students in 1819 the State legislature appropriated $10,000, and granted "a moiety of the tax on lotteries in the city of New York" which for 14 years formed a good income.

In Philadelphia, David Seixas began teaching deaf children in his home in 1819 or early in 1820. His work was noted by a group of citizens who, after an exhibition of results accomplished in 1821, helped to secure a charter and a *per caput* appropriation from the State of $160. The Hartford school lent him Laurent Clerc. New Jersey began at once to send pupils to the Pennsylvania institution, Maryland followed in 1827 and Delaware, 1835. Kentucky in 1823 was the fourth State to establish a school for the deaf, the Kentucky asylum at Danville, which was the first school established distinctly as a State enterprise. Other States followed, interest in many cases in the South being aroused by tours of the educated deaf who exhibited what could be done for these hitherto neglected members of society. In 1863, there were 22 schools for the deaf with 2,012 pupils. Within 60 years of the first foundation, they were established in 31 States, great areas of public land being granted in several instances, as in Connecticut and Kentucky, for such purpose. In all the institutions, up to 1867, the manual system of instruction held sway, though the oral method had been tried at the New York institution.

In 1867 the Clarke school, Northampton, Mass., the first permanent oral school in the United States, was established. Gardiner Hubbard, a Massachusetts senator, whose daughter lost her hearing when four and one-half years old, tried to establish an oral school and unsuccessfully applied for a charter in 1864. Then the work of Harriet B. Rogers with Fannie Cushing, a deaf-mute, came to his notice. He and his friends financed a small, private oral school in 1865. An exhibition by these pupils of Miss Rogers in 1867 convinced the legislature that so-called deaf-mutes could be taught to converse A great step forward in the education of the deaf was thus made. Massachusetts voted for the incorporation of "an Institution of Deaf-Mutes at Northampton"; for "primary instruction of younger pupils than were then received"; and for "a longer term of instruction of pupils aided by the State." The Institution for the Improved Instruction of the Deaf, New York, also came into being in 1867 instituting oral instruction. Both schools exerted an influence on the early education of the deaf.

Educators of the deaf divided themselves into those who favoured the manual system supplemented by articulation and those who taught speech and lip-reading, vetoing the manual method. Manual teachers maintained that certain deaf-mutes would never learn to speak and to read lips; oral teachers considered it unjust to separate the deaf from the hearing because of lack of instruction in the use of vocal organs. Dr. Edward Miner Gallaudet's stand for the teaching of speech to deaf children after his extended European tour of 1867 influenced many instructors. In 1886 tension had sufficiently modified to permit the convention of Instructors of the Deaf to pass noteworthy resolutions urging endeavours in the schools to teach every pupil to speak and read from the lips. The resulting "combined system" is defined in the *American Annals* of *the Deaf*, the instructor's official organ, as: —

> Speech and speech-reading are regarded as very important, but mental development and the acquisition of language are regarded as still more important. It is believed that in some cases mental development and the acquisition of language can be best promoted by the Manual or the Manual Alphabet method, and, so far as circumstances permit, such method is chosen for each pupil as seems best adapted for his individual case. Speech and speech-reading are taught where the measure of success seems likely to justify the labor expended, and in some of the classrooms of most of the Combined-System schools the Oral or the Auricular method is strictly followed.

The combined and the oral systems came into increasing use. Yet even in 1904 the World's Congress of the Deaf at St. Louis ruled that champions of the oral method were not friends of the deaf and that every teacher of the deaf ought to have a working command of the sign language. Oralism was helped forward by the establishment of day schools. The Horace Mann school, Boston, was the first, starting Nov. 10, 1869, under Sarah Fuller, principal for 41 years, who gave Helen Keller her first lessons in speech. The number of day schools increased slowly up to 1894 when there were 15, and more rapidly thereafter. In 1901, for instance, they numbered 49. with 835 pupils; in 1913, 64 with 2,109 pupils; and in 1926, 101 with 2,972 pupils. Pupils from oral schools have passed on to high schools and colleges, holding their own with those who hear, and graduating successfully. New York State, to promote such higher education, provides a *per caput* sum of $300 that a hearing note-taker may attend college lectures with the deaf student and take full notes for the latter's use.

The situation may be summed up in the conclusions of the 1924–25 survey made by a committee of the National Research Council financed by the Laura Spelman Rockefeller Memorial: The typical school does not prohibit the use of manual spelling. Pupils who after ample trial do not make satisfactory progress orally are transferred and taught in the manual classes. Of the three methods of education in practice, the oral, manual and combined, no one method is superior to the others, taking into account the educational achievement of the pupils and their basic intelligence. The beginning of the 20th century saw a further development in educational methods. It was realized that the percentage of the totally deaf is small. The 1924–25 survey disclosed that but 3% of the children tested were without any hearing and the average had 25%. As early as 1886 attention had been drawn to auricular training by the commissioner of education commenting on the work of the Nebraska Institution for the Deaf to educate the brain to use the hearing so that speech might be gained. Increasingly, greater stress is being laid on the development of the remnant of hearing, known as residual hearing, really an integral part of the oral method, so that sounds and language ideas are associated. Audiometer tests have shown pupils to have from 5% to 85% of available hearing acuity. Auricular training by means of exercises teaches the child to perceive the sound of the human voice and to interpret it, giving a vocabulary, improving speech and increasing activity in the psychic acoustic centres.

Provision for the education of the deaf in local institutions is made by the diiferent States as a general rule. Only in Delaware, New Hampshire, Nevada and Wyoming are deaf children sent at public expense to a school outside the State. Several of the southern States have at least two institutions, one for white children and the other for coloured. Only nine States have compulsory attendance laws for deaf children: Indiana, where the age is 7–18; Iowa, 12–19; Maryland, 6–18; Minnesota, 8–20; North Carolina; North Dakota, 7–21; Rhode Island, 7–18; West Virginia, 8–25; and Vermont.

Higher Education. — The United States is the only country with a college of accepted standard for the deaf, awarding the usual masters' and bachelors' degrees in art and science. It was established in Washington, D.C., in 1864 as the highest department of the institution of the deaf and dumb founded by Congress in 1857. First known as the National Deaf-Mute college, it was renamed Gallaudet college in 1893, and with the Kendall school (secondary) forms the Columbia Institution of the Deaf. In 1886–87 women were admitted to the college. Its graduates have successfully pursued special courses at Johns Hopkins, George Washington, McGill and the Universities of California and Pennsylvania. Of 353 graduates, 111 are teachers, 66 home managers, 36 printers and publishers, 24 farmers, 31 in business, 20 in chemistry, 17 in the ministry or training for it, and 11 acting as supervisors or in charge of athletics in the schools.

Teachers of the deaf are educated in the oral method at Clarke school; in the combined system at Gallaudet college; at the Central institute, St. Louis, Mo.; and at the Institution for the Improved Instruction of Deaf-Mutes, New York. Several schools in Illinois, Indiana, Ohio, North Carolina, Pennsylvania, Oklahoma, New York, Connecticut, Virginia and other States have at different times and for varying periods held normal classes.

The Volta Bureau for the increase and diffusion of knowledge relating to the deaf was founded in 1887 by Alexander Graham Bell (*q.v.*), who had taught his father's "visible speech" system

at the Clarke school in 1872 and whose life was largely devoted to helping the deaf. In 1909, at its founder's suggestion, it was presented to the American Association to promote the teaching of speech to the deaf, the largest organization of teachers and friends of the deaf in the world.

DEAF-MUTISM, MEDICAL ASPECTS OF. Mutism. or dumbness, is almost always due to malformation or disease of the ear. Children learn to speak by imitating those about them who speak. Cases have occurred in which a child with normal hearing, brought up by deaf and dumb guardians in an isolated cottage in the mountains, did not learn to speak until it came into contact with speaking people in a town.

The air vibrations constituting sound are conducted through the outer ear passage to the tympanic membrane, and from this through a chain of three small bones in the middle-ear to the inner ear or labyrinth—the essential part of the organ of hearing. The inner ear itself consists of (1) the cochlea, which is concerned in hearing, and (2) the vestibule and three semicircular canals, which together are concerned with body equilibrium. (See EAR; HEARING.) From the inner ear the cochlear and vestibular nerves pass to the corresponding centres in the brain.

Lesions of the ear producing deafness so great as to cause a child to become mute are almost always situated in the inner ear. Deaf-mutes are usually classified into (A) congenital cases due to error in development of the ears, and (B) acquired cases in which the ears, normal at birth, become diseased in childhood. Less than half the cases of deaf-mutism are congenital.

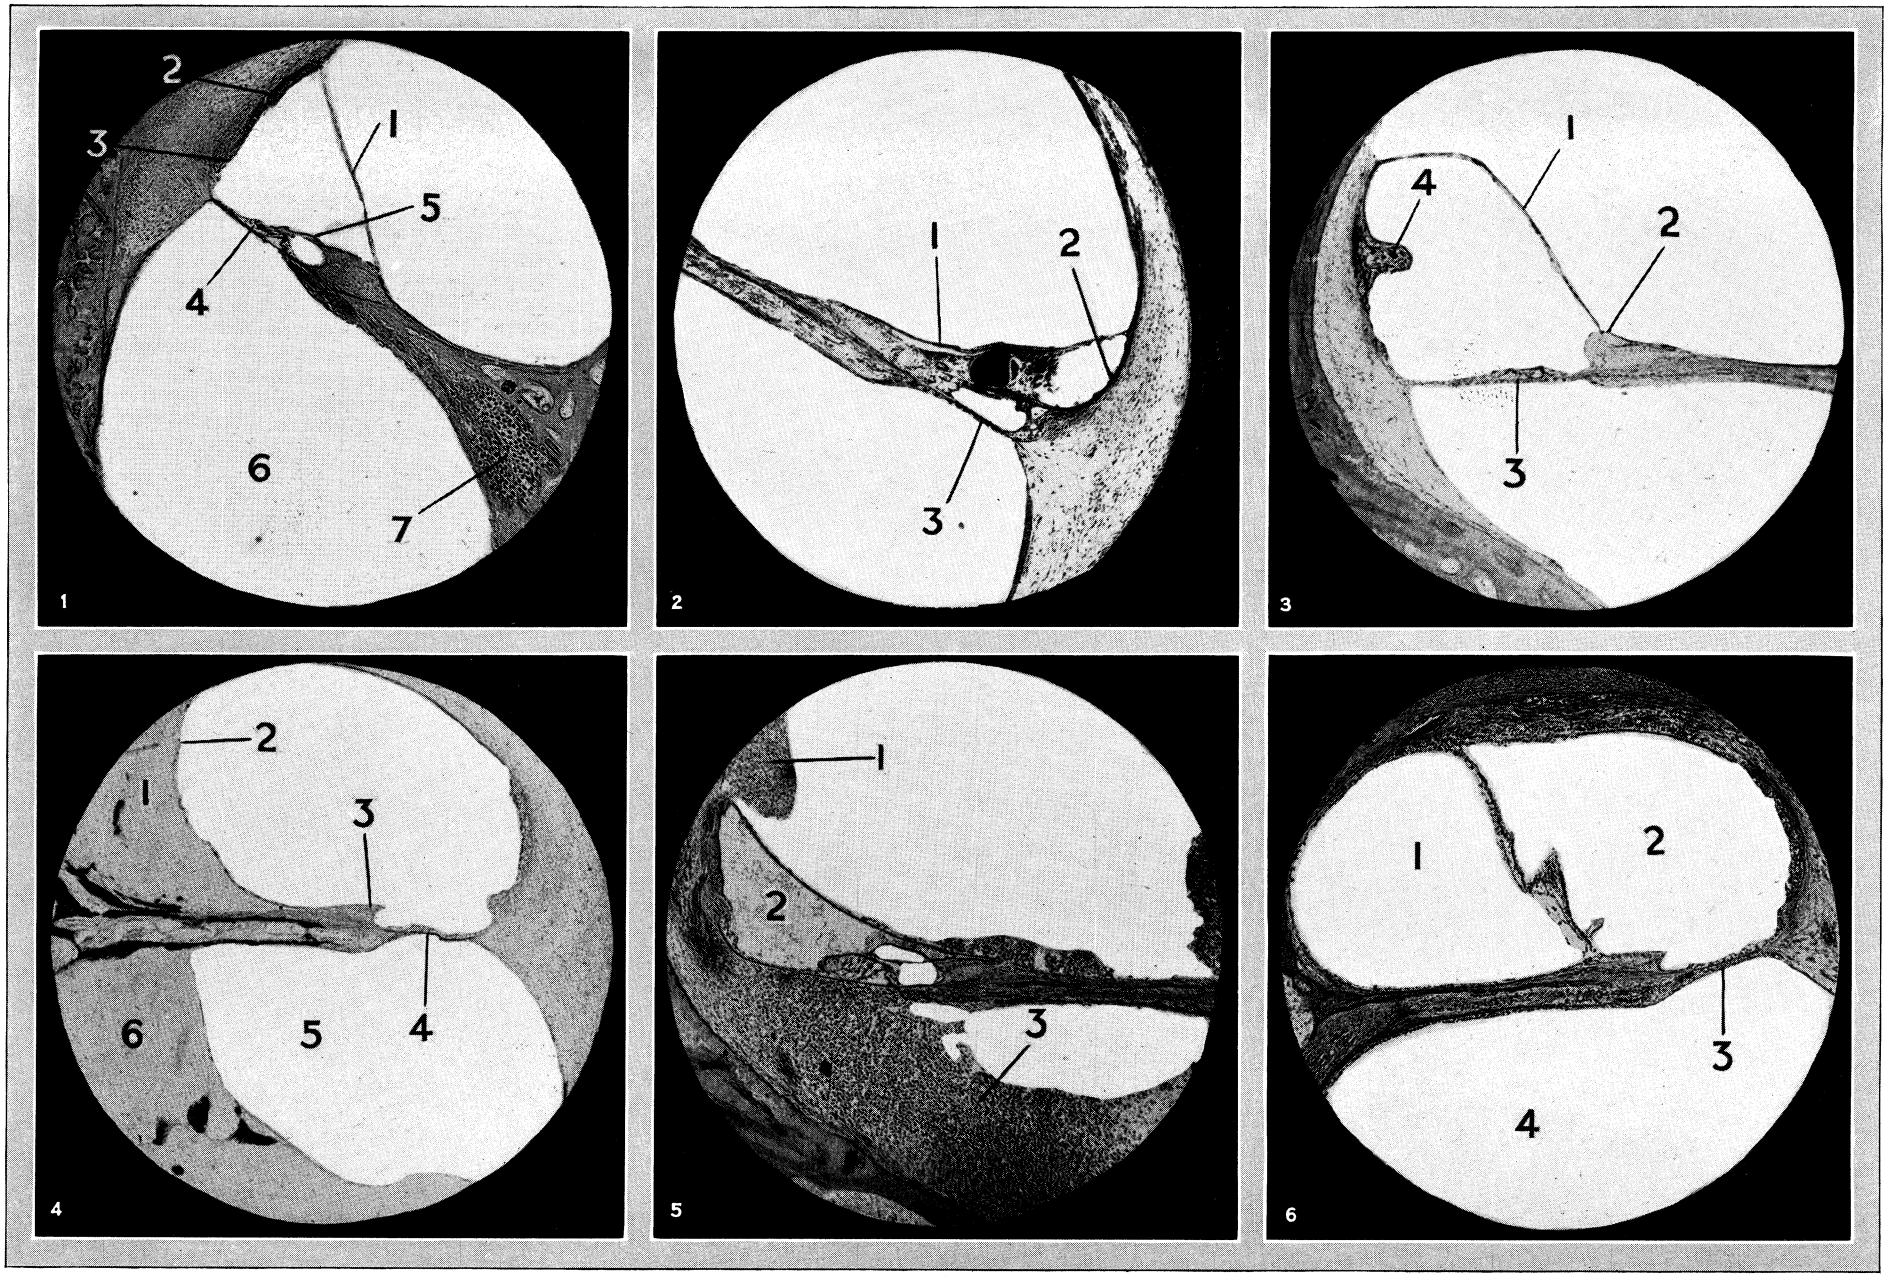
(A) Congenital cases are of two kinds: (1) "endemic" deaf-mutism, peculiar to certain districts or countries, *e.g.,* Switzerland, and associated with cretinism and goitre (see CRETINISM). Here, the lesion is in the middle ear; the drum cavity, which should contain air, being more or less filled up by connective tissue or bone. Deafness may not be very marked and the mutism is due mainly to the poor mental development of the patient. (2) The great majority of cases of congenital deafness are due to faulty development of the inner ear. This condition is known as "sporadic" deaf-mutism and is not uncommon in Britain. In the most marked instances the bony and membranous labyrinths are absent, while in the least severe cases only the membranous cochlea is involved. Between these two extremes there are several degrees of maldevelopment. Many of these patients have considerable remains of hearing. The vestibular or balancing apparatus in these cases is usually free from any developmental defect.

(B) Acquired deaf-mutism is due to injury to, or disease of, the inner ear. The deafness may only occur after the child has learnt to speak, but a child which has already acquired fluent speech may quickly become dumb if it loses its hearing, unless special training is begun at the earliest possible moment. The deafness may be produced by such conditions as (1) fracture of the base of the skull, which sometimes results in destruction of the organ of hearing on both sides; these cases are rare. (2) Suppurative disease in the middle and inner ears caused by severe attacks of scarlet fever, measles, or influenza. In these diseases the infection may pass from the nose and throat up the Eustachian tube to the drum cavity, and to the mastoid process which lies behind. (As long as the infection remains localized to the middle-ear spaces the deafness is seldom or never so severe as to give rise to deaf-mutism, though the children are often so "hard of hearing" that they cannot be educated efficiently in an ordinary school.) When the infection spreads from the middle to the inner ears, it gives rise to such severe changes that deaf-mutism results. Both the middle and inner ears on each side are filled with pus and, if the patient recovers, the inner ears are more or less obliterated by the formation of connective tissue and new bone, with consequent destruction of the nerve endings of the hearing and balancing apparatus. (3) Meningitis, the infective material finding its way outwards from the brain to the inner ear on each side along the sheath of the nerve of hearing. These children, if and when they recover from meningitis, are not only deaf but have lost their power of balancing for a time and have to learn to walk again. (4) Inherited syphilis which, in Great Britain, is responsible for about 5% of cases of acquired deaf-mutism. In these patients deafness does not occur until the child has, as a rule, reached the age of nine or ten years—a period at which it has of course already learnt to speak. (5) Otosclerosis, in which there is a formation of spongy bone in the normally dense bony capsule of the inner ear that impedes or prevents movement of the stapes. This disease is a common cause of deafness in early adult life, especially in young women, but rarely occurs so early as to render the patient a deaf-mute.

The clinical examination of a case of suspected deaf-mutism is not easy. The observer has little or no means of communicating with the child. If the parents are both congenital deaf-mutes and the child is one of a family of deaf-mutes, there can of course be no difficulty in making a diagnosis; but the case is not often so clear as that. We have to seek the aid of knowledge derived from Mendelism before we can explain many of the sporadic cases of deaf-mutism. (See MENDELISM.) The history as obtained from the child's parents is often far from accurate, as they are unwilling to acknowledge, in congenital cases, that the child has never heard, and adduce such facts as that "the child notices a door slamming or a band passing in the street" as proof of hearing. The deaf-mute of course feels the vibrations caused by such disturbances. Further, the mother often states that the child can say "Mamma" and considers that this shows that it can hear, whereas an intelligent congenital deaf-mute may pick up such a word by watching its mother's lips. Even with regard to cases of acquired deaf-mutism the history of the case is often at fault, the deaf-mutism being attributed to "vaccination," or "fright," when subsequent enquiry and examination show that it has really been due to meningitis, or to the results of middle-ear disease. If the tympanic membranes show the effects of middle-ear suppuration and if the deafness has only come on after the child has learnt to speak, one may be certain that the mutism has been acquired. In other cases where the deafness has only come on at the age of eight or nine years, examination may show that the upper central incisor teeth are peg-shaped and notched and that the cornea has become cloudy as the result of congenital syphilitic infection. Cases of acquired deaf-mutism due to meningitis in infancy are hard to diagnose, but as a rule a clear history is obtained if the meningitis occurred in later childhood. These children are totally deaf. The rare cases which are caused by fracture of the base of the skull are also not difficult to diagnose.

Considerable help in the clinical diagnosis of deaf-mutism may be obtained from examining the semicircular canal apparatus or balancing portion of the ear. A normal child, if turned round rapidly in a rotating chair, becomes very giddy and shows twitching movements of the eyes (nystagmus). Cases of congenital deaf-mutism, in which the maldevelopment is confined to the hearing portion of the ear, react like normal children, but cases of acquired deaf-mutism due to destruction of the labyrinth from any of the causes described above almost invariably fail to become giddy on rotation. Another method of testing the balancing portion of the inner ear is to syringe the ear with cold water. In a normal person such syringing produces giddiness and twitching movements of the eye and, if too prolonged, induces vomiting Here again congenital cases react like normal children, while the acquired cases are not disturbed even by the most prolonged cold syringing. Nevertheless, it is not possible in every case to classify the child as a congenital or as an acquired deaf-mute.

The hearing power of children who are suspected of being deaf-mutes may be tested in various ways, but it is impossible to be quite certain that a child has been born deaf before it reaches the age of one year. It is best to have the child seated on the knee of its mother or nurse and to attract its attention by showing it some small object. (In some cases the question arises whether the absence of response to sound is due to deafness or to idiocy. The true deaf-mute child is generally mentally alert and



PATHOLOGICAL ASPECTS OF DEAF-MUTISM

1. Normal cochlea of dog. (1) Reissner's membrane. (2) Normal stria vascularis. (3) Spiral prominence. (4) Basilar membrane. (5) Normal membrana tectoria. (6) Scala vestibuli. (7) Spiral ganglion. 2. Cochlea in congenital deaf-mutism. (1) Depressed Reissner's membrane. (2) Atrophied stria vascularis. (3) Basilar membrane; cochlear canal largely filled with a mass of cells and colloid material. 3. Congenital deaf-mutism, with dilated cochlear canal. (1) Reissner's membrane displaced upwards. (2) Membrana tectoria. (3) Maldeveloped Corti's organ. (4) Stria vascularis, with tumour formation. 4. Acquired deaf-mutism. (1) Scala vestibuli filled with new connective tissue. (2) Retracted Reissner's membrane. (3) Hushke's tooth; tectorial membrane should be attached. (4) Basilar membrane with degenerated Corti's organ. (5) Patent part of scala tympani. (6) Connective tissue and bone in scala vestibuli; nerve fibres absent in lamina. 5. Inflammation of labyrinth due to meningitis. (1) Pus in scala vestibuli. (2) Cochlear canal containing sero-purulent exudate: Corti's organ lying on basilar membrane. (3) Scala tympani filled with pus. 6. Congenital syphilitic deafness. (1) Scala vestibuli. (2) Dilated cochlear canal. (3) Basilar membrane with degenerated Corti's organ: membrane tectoria absent. (4) Scala tympani

at once takes notice of a coin or a watch shown to it.) An assistant stands well behind the child and blows a whistle, sounds a rattle, or claps his hands, and the observer notes whether the child pays attention to the loud noise suddenly created behind it. The assistant must not stand too near, otherwise the child may feel the vibrations caused, for instance, by the clapping of hands. Kerr Love recommends a dinner bell to test the hearing of deaf children. The child is instructed to count the strokes. At a later age tuning-forks of varying pitch may be used to ascertain whether the child can hear them when vibrating close to but not touching the ear. Vowel sounds may also be spoken in a loud voice into the child's ear, but he must not be allowed to see the face of the examiner, as a good "lip-reader" may detect from the face or lips the particular vowel which is being used. Some deaf-mutes have a fair amount of hearing which may be used for educational purposes; indeed there are at the present time in deaf-mute schools many children who should really be educated in special schools for the hard-of-hearing. Such schools, however, exist in but few centres in Great Britain. For education and training of deaf-mutes, *see* DEAF AND DUMB.

DEAK, FRANCIS (FERENCZ) (1803–1876), Hungarian statesman, was born at Sojtor in the county of Zala on October 17, 1803. Of an ancient and distinguished family, he was educated for the law and practised first as an advocate and ultimately as a notary. His reputation in his own county was quickly established and when in 1833 his elder brother, Antal, was obliged by ill-health to relinquish his seat in the Hungarian parliament, the electors chose Ferencz in his stead. No man 'owed less to external advantages. He was to all intents and purposes a simple country squire. His true greatness was never exhibited in debate. It was in friendly talk, generally with a pipe in his mouth and an anecdote on the tip of his tongue, that he exercised his extraordinary influence over his fellows. He convinced them from the first of his disinterestedness and sincerity, and impressed them by his instinctive faculty of always seizing the main point and sticking to it. Perhaps he is unique in history, for though neither soldier, nor diplomatist, nor writer he became the leader of a great party by sheer force of intellect and moral superiority. This is all the more remarkable because he appealed to no passion but patriotism, and avoided power instead of seeking it.

During the struggle between Austria and Hungary for the preservation of the Hungarian constitution, Déak and Count Stephen Szechényi were the leaders of that party who wished all proceedings to be conducted in a strictly legal manner, and who therefore were opposed to the extreme revolutionary methods of Kossuth and his followers. In the diet of 1839–40 it was Déak who brought about an understanding between a reactionary government in need of money and recruits for the army and a Liberal opposition determined to vindicate Hungary's political rights. He did not sit in the diet of 1843–44 because his election was the occasion of bloodshed in the struggle between the Clericals who would have ousted him and the Liberals who brought him in. After the constitutional victory of 1848 he became minister of justice in the Batthyány ministry. All through the stormy days that followed, culminating in the War of Hungarian Independence, he never ceased to urge moderation and the adoption of a strictly legal position, but Kossuth and the extremists got the upper hand. "YOU cannot argue with a drunken man," he is reported to have said, "and at the moment the diet is drunk." When it became obvious that the Vienna Government did not intend to keep its promises to Hungary, Déak resigned with Batthyány, but without ceasing to be a member of the diet. He was one of the parliamentary deputation which waited in vain upon Prince Windischgratz in his camp. *(See* HUNGARY: *History.)* He then retired to his estate at Kehida. After the War of Independence he was tried by court-martial but acquitted.

After 1854 he spent the greater part of his time in Pest, where his room at the "Queen of England" inn became the centre for those patriots who in the dark days of the Bach administration looked to his wisdom for guidance. He did all in his power to stimulate the moral strength of the nation and to keep its hopes alive. He considered armed resistance dangerous, but he was the immutable defender of the continuity of the Hungarian constitution on the basis of the reforms of 1848. The Kossuth faction looked for salvation to a second war with Austria engineered from abroad, while the followers of Szechényi adopted an attitude of resignation, equally repugnant to Déak.

The Italian war of 1859 convinced the Austrian Government of the necessity of a reconciliation with Hungary. Bach was replaced by Schmerling and an imperial patent of April 19, 1860 removed some of the chief grievances of the Magyars. The October diploma of the same year was intended to provide the empire with a federal system of government on constitutional lines. Déak rejected it, but at the request of the government he went to Vienna to set forth the national demands. He insisted on the re-establishment of the constitution in its integrity as a *sine qua* non. On February 16, 1861 the government withdrew the diploma and issued a patent which was a return to the former centralist and bureaucratic system. On April 6 the diet met at Pest. Déak rose to defend the national right and traditions, and on June 5 moved an address to the crown refusing to recognize the February patent, insisting on the laws of 1848 as the sole basis of accord, and reminding the Emperor that an uncrowned king was no true sovereign of Hungary. The speech of Déak on this occasion was his finest effort and he was acknowledged the leader of the nation by all parties. He next proposed to the emperor that he should break away from counsellors who had sought to oppress Hungary, and restore the constitution as a personal act. The emperor thereupon dismissed Schmerling, suspended the February constitution and summoned the coronation diet. Of that diet Déak was the indispensable leader, and all parties left him to conduct the delicate negotiations with the emperor. The committee of which he was president had completed its work when the Austro-Prussian War broke out. The extreme party would have used the defeat of Koniggratz to extort still more favourable terms, but Déak made it easy for the emperor in the hour of his humiliation. To his question, "What does Hungary demand?" Déak answered, "Nothing more after Sadowa than before it." On Feb. 18, 1867 the restoration of the Hungarian constitution was publicly announced in the diet, and a responsible ministry was formed under the premiership of Count Julius Andrbssy. Déak himself refused to take office. There was still one fierce parliamentary struggle, in which Déak defended the compromise (Ausgleich) of 1867, both against the Kossuthites and against the Left-centre, which had detached itself from his own party under the leadership of Kálmán Tisza (*q.v.*). It was the wish of the diet that Déak should exercise the functions of a palatine at the coronation, but he refused the honour, just as he had refused every other reward and distinction. "It was beyond the king's power to give him anything but a clasp of the hand." His reward was the assurance of the prosperity and tranquillity of his country and the reconciliation of the nation and its sovereign. This service reconciled him to the loss of much of his popularity; for a large part of the Hungarian people looked upon the compromise of 1867 as a surrender and blamed Déak for it. He died at midnight of July 28–29, 1876; his funeral was celebrated with royal pomp on Feb. 3. A mausoleum was erected by national subscription and in 1887 a statue overlooking the Danube was erected to his memory.

DEAKIN, ALFRED (1856–1919), Australian statesman, was born at Melbourne on Aug. 3, 1856. Educated at Melbourne university, he was called to the Victorian bar in 1877. He entered the Victorian legislature in 1880, and from 1883 onwards held

several important ministerial posts. After the fall of the coalition ministry in 1895 he remained a private member of the legislature, though office was repeatedly offered to him, until 1900. In that year he came to London to discuss with Chamberlain more particularly the legal points in the Australian Commonwealth Constitution Bill. In Victoria his public speeches helped on the Federation movement and in 1901, as attorney-general, he was included in the first Federal cabinet of Sir Edmund Barton, whom he succeeded as prime minister in 1903. During his legislative career in Victoria he was active in promoting social legislation and an ardent advocate of preference in favour of Great Britain. This fiscal policy he pursued during his three Federal premierships (1903–04, 1905–08, 1909–10), and supported Australia's co-operation in imperial defence, being responsible for the inception of the measure authorizing Australian naval constructioh in 1909, and for the invitation to Lord Kitchener to visit Australia and report on the question of defence. After 1910 he led the Opposition in the Australian parliament until compelled to retire, owing to ill-health, in 1912. He died at Melbourne on Oct. 7, 1919. Deakin had made a special study of the irrigation problem, and wrote three books on irrigation in Western America (1885), in Egypt and Italy (1887), and in India (1892). The Irrigation Act of 1886 was largely his work.

DEAL, a seaport and municipal borough in the Dover parliamentary division of Kent, England, $9\frac{1}{4}$ mi. N.N.E. of Dover on the Southern railway. Pop. (1938) 23,420. Area 4.5 sq.mi. It consists of Loner Deal, on the coast; Middle Deal; and about a mile inland, though formerly on the coast, Upper Deal, which is the oldest part. The borough was extended in 1931 to include the urban district of Walmer and other areas. Frequented as a seaside resort, the town derives further importance from its vicinity to the Downs, a fine natural roadtrack between the shore and the Goodwin Sands, about 9 mi. long and 6 mi. wide, in which large fleets of windbound vessels may lie protected against the north, west and easterly gales. The trade consists in the supply of provisions and naval stores, which are conveyed to the ships in need of them by "hovellers," as the boatmen are called along the Kentish coast. The Deal hovellers, pilots and lifeboatmen are famous for their skill. Fish curing and a few other industries are carried on St Leonard's church in Upper Deal dates from the Norman period The site of the old navy yard is occupied by villas. The esplanade, nearly 4 mi long, extends through Walmer to the south, and north to the ruins of Sandown castle, and has a promenade pier, owned by the corporation. The golf-links are well known. At the south end of the town is Deal castle, erected by Henry VIII in 1539, together with the castles of Sandown, Walmer and Sandgate. They were built alike and consisted of a central keep surrounded by four lunettes. Sandown castle was the prison in which Col. Hutchinson, the Puritan soldier, was confined and is said to have died, September 1664. It was removed on becoming endangered by encroachments of the sea. The "captain" of Deal castle is appointed by the lord warden of the Cinque Ports.

Deal is one of the possible sites of the landing-place of Julius Caesar in Britain. Later in the period of Roman occupation the site was inhabited but was not a port. In the Domesday Survey, Deal (*Dola,* Dale, Dele) is mentioned among the possessions of the canons of St. Martin, Dover, as part of the hundreds of Buesborough and Cornilo; it seems from early times to have been within the liberty of the Cinque Ports as a member of Sandwich, but was not continuously reckoned as a member before the reign of Henry VI. In the time of Henry VIII Deal was a fishing village half a mile from the sea, but the growth of the navy and the increase of trade brought ships in increased numbers to the Downs. Lower or New Deal was then built along the shore. William III incorporated the town in 1698–99 and granted a market and fairs, with a court of Pie Powder The Cinque Ports were first represented in the parliament of 1265; the two members returned by Sandwich represented Sandwich, Deal and Walmer, until they were disfranchized in 1885. In World War II 2,000 houses had been damaged by German air raids by the end of 1941.

DEAL. A British term commonly used to designate the soft woods derived from the Scotch pine (*Pinus* sylvestris) which is called yellow or red deal, and the spruce fir (Abies excelsa) which is called white deal. The former is by far the better timber. Deal is freely imported into the British Isles from Scandinavia and Russia, and so widely used for building and other purposes that the world is threatened with a soft-wood famine.

The term deal (derived from Dan. deel, plank) is also used as the name of a soft-wood measurement. A deal in England is a piece of pine wood sawn gin. wide and 2 to 4in. thick, not less than 8ft. long. (See TIMBER.)

DEALER, one who sells at retail to the public. This term is used to cover nearly all retailers except department and chain stores, and in the loose parlance of trade it is sometimes applied to the individual units of chain-store systems. The term "dealer" formerly meant one who bought and sold primarily without a place to stock a quantity of merchandise; he was sometimes also referred to as a "curb dealer"; *i.e.,* one who transacted his business from the sidewalk.

DEAL-FISH, the name applied to marine fishes of the genus *Trachypterus,* which, together-kith the oar-fish (*q.v.*), comprises the family *Trachypteridae,* or ribbon-fish. Deal-fish inhabit the middle waters, probably not below 200 fathoms, and are characterized by their long, laterally compressed bodies, short head, narrow mouth and feeble dentition. The dorsal fin extends the length of the back, the anal is absent, and the caudal, when present, is reduced. The pectoral fins are small. In young deal-fish some of the fin-rays are prolonged in an extraordinary way. Deal-fish may reach a length of eight feet. They have a world-wide distribution. All the specimens found at the surface of the sea have been more or less mutilated by the release from the enormous pressure under which they are accustomed to live. The commonest species is T. arcticus.

DEAN, primarily one having authority over ten; the title of an ecclesiastical dignitary, or of a university or civil official (Lat. decanus, from Gr. δέκα, ten).

The original use of the word decanus was evidently to denote a military grade: it occurs in this sense in the De Re *Militari* of Vegetius (c. 386). Slightly later (c. 400), St. Jerome uses it in the Vulgate, instead of the *decurio* of the Old Latin version, for the "rulers of tens" in Exod. xviii. 21, 25. It was also applied, from the late 4th century onwards, to the members of a gild, whose occupation was the burial of the dead, as well as to certain minor officials of the imperial household, and in later times of the empire to various civil functionaries. In the Visigothic and Lombardic codes it occurs as the title of a subordinate judge, having jurisdiction within a district called a deanery (decania) or tithing; in the Anglo-Saxon system the corresponding official was entitled dean, tithing-man or head-borough.

In monastic life the term was used at an early period to denote a monk having charge of ten monks (St. Augustine, De Mor. *Eccl.* Cath., i. 31, etc.); and it occurs in this sense in the Rule of St. Benedict (ch. 21). As monachism developed the title came to be applied to various special functionaries, e.g., *foris* decanus, the monk responsible for the external business of a monastery.

In its now most familiar use, as denoting the head of a cathedral or collegiate chapter, the title probably owes its origin to this monastic usage, since many of the cathedrals were in the charge of monks. In the 8th century the decanus as a cathedral official was subordinate to the *praepositus* or provost, who presided over the chapter as the bishop's vicegerent; but during the next few centuries deans were almost everywhere substituted for provosts.

The office of rural dean, representing one type of the earlier archpriest (*q.v.*), is of great antiquity in the Western Church, going back to the time (at least as early as the 6th century) when the bishops of the large dioceses found it necessary to subdivide the diocese into districts called archipresbyterates or deaneries (*decanatus*), each with an archpriest (later entitled rural dean) at its head. This functionary supervised the local clergy, and to some extent represented the bishop within his district, but was

always subordinate to the archdeacon. At the present day, in the Roman Catholic Church, the powers and duties of rural deans vary considerably from country to country, and even from diocese to diocese; being restricted in some cases to presiding at the monthly conference of the clergy. In the Church of England the office fell into practical abeyance at the Reformation, but was revived about the middle of the 19th century; rural deans may act as deputies to the bishop and archdeacon, and are supposed in particular to see that the churches and parsonages within their district are in proper repair.

The title "dean of the sacred college" is borne by the oldest (in standing, not in age) of the cardinal-bishops, who takes the title of bishop of Ostia and Vellelri. Perhaps the use of the word "dean," as signifying the oldest member of any corporation or body of men, may be derived from its application to dignitary. The dean of the sacred college is in the ecclesiastical hierarchy second to the pope alone. A compendious account of his privileges and special functions may be found in the work of G. Moroni, vol. xix., p. 168.

There are four sorts of deans of whom the law of England takes notice: (1) The dean and chapter are a council subordinate to the bishop, assistant to him in matters spiritual relating to religion and in matters temporal relating to the temporalities of the bishopric. The dean and chapter are a corporation, and the dean himself is a corporation sole. Deans are said to be either of the old or of the new foundation—the latter being those created and regulated after the dissolution of the monasteries by Henry VIII. The deans of the old foundations before the Ecclesiastical Commissioners Act, 1541, were elected by the chapter on the king's *congé d'élire*; those of the new foundation (and, since the act, of the old foundation also) are appointed by the king's letters patent. It was at one time held that a layman might be dean; but since 1662 priest's orders are a necessary qualification. By the act of 1841 the dean is required to be in residence eight months, and the canons three months, in every year. The bishop is visitor of the dean and chapter. (2) A dean of peculiars is the chief of certain peculiar churches or chapels. He "hath no chapter, yet is presentative, and hath cure of souls; he hath a *peculiar*, and is not subject to the visitation of the bishop of the diocese." The only instances of such deaneries are Battle (Sussex), Bocking (Essex) and Stamford (Rutland). The deans of Jersey and Guernsey have similar status. (3) The third dean "hath no cure of souls, but hath a court and a *peculiar,* in which he holdeth plea and jurisdiction of all such ecclesiastical matters as come within his peculiar. Such is the dean of the arches, who is the judge of the court of the arches, the chief court and consistory of the archbishop of Canterbury, so called of Bow Church, where this court was ever wont to be held." *(See* ARCHES, COURT OF.) The parish of Bow and twelve others were within the peculiar jurisdiction of the archbishop in spiritual causes and exempted out of the bishop of London's jurisdiction. They were in 1845 made part of the diocese of London. (4) Rural deans *(see* above) are clergymen whose duty is described as being "to execute the bishop's processes and to inspect the lives and manners of the clergy and people within their jurisdiction." *(See* Phillimore's *Ecclesiastical* Law.)

The bishop of London is *ex officio* dean of the province of Canterbury, and in that capacity summons the bishops of the province to Convocation. In the colleges of the English universities one of the fellows usually holds the office of "dean," and is specially charged with the discipline, as distinguished from the teaching functions of the tutors. In some universities the head of a faculty is called "dean"; and the president of the Scottish Faculty of Advocates is called the Dean of Faculty. In each of these cases the word is used in a non-ecclesiastical and purely titular sense.

DEAN, FOREST OF, a district in the west of Gloucestershire, England, between the Severn and the Wye. It is oval in form, 20 m. long and 10 m. wide, and still retains its true forest character. The surface is undulating, its elevation ranging from 120 to nearly 1,000 ft., and its sandy peat soil renders it most suitable for the growth of timber. It has been a royal forest from time immemorial. In the reign of Charles I. the forest contained 105,537 trees, and the king granted it to Sir John Wyntour for £10,000, and a fee farm rent of £2,000. The grant was cancelled by Cromwell; but at the Restoration only 30,000 trees were left, and Wyntour, having got another grant, destroyed most of these. In 1680 an Act was pasaed to enclose 11,000 acres and plant with oak and beech for supply of the dockyards. Near Coleford and Westbury pit workings of the Roman period have beer, discovered.

DEANE, RICHARD (1610–1653), British general-at-sea, major-general and regicide, was a younger son of Edward Deane of Temple Guiting or Guyting in Gloucestershire, where he was baptized July 8, 1610. In 1644 he held a command in the artillery under Essex in Cornwall and took part in the surrender after Lostwithiel. Appointed comptroller of the ordnance, he commanded the artillery at Naseby and during Fairfax's campaign in the west of England in 1645. In May of that year Deane was appointed lieutenant of artillery to Cromwell in Ireland. Cromwell refused thus to be put out of the way, and Deane followed his example. He commanded Cromwell's right wing at Preston (Aug. 17–19, 1648). He was one of the commissioners for the trial of Charles I. and a member of the committee which examined the witnesses. He signed the death warrant.

In 1649 the office of lord high admiral was put into commission The first commissioners were Edward Popham, Robert Blake and Deane, with the title of generals-at-sea. At the outset of the battle off the North Foreland (June 1–3, 1653) Deane was killed. He was buried in Henry VII.'s chapel at Westminster Abbey, to be disinterred at the Restoration.

See J. Bathurst Deane, *The Life of Richard Deane (1870).*

DEANE, SILAS (1737–1789), American diplomat, was born in Groton, Conn., on Dec. 24, 1737. He graduated at Yale in 1758 and in 1761 was admitted to the bar. From 1774 to 1776 he was a delegate from Connecticut to the continental congress. Early in 1776 he was sent to France by Congress, as a secret agent to induce the French Government to lend its financial aid to the colonies. Subsequently he became, with Benjamin Franklin and Arthur Lee, one of the regularly accredited commissioners to France from Congress. On arriving in Paris, Deane secured the shipment of many vessel loads of arms and munitions of war to America. He also enlisted the services of a number of Continental soldiers of fortune, among whom were Lafayette, Baron Johann De Kalb and Thomas Conway. His carelessness in keeping account of his receipts and expenditures led, in 1777, to his recall to face charges. Before returning to America, however, he signed on Feb. 6, 1778, the treaties of amity and commerce and of alliance which he and the other commissioners had successfully negotiated. In America he was defended by John Jay and John Adams, and after stating his case to Congress was allowed to return to Paris (1781) to settle his affairs. The publication of some "intercepted" letters in Rivington's *Royal Gazette* in New York (1781), in which Deane declared his belief that the struggle for independence was hopeless and counselled a return to British allegiance, aroused such animosity against him in America that for some years he remained in England. He died on shipboard in Deal harbour, England, on Sept. 23. 1789 after having embarked for America on a Boston packet. No evidence of his dishonesty was ever discovered, and Congress recognized the validity of his claims by voting $37,000 to his heirs in 1842. He published his defence in *An Address to the Free and Independent Citizens of the United States of North America* (Hartford, Conn., and London, 1784).

See *The Correspondence of Silas Deane* published in the Connecticut Historical Society's *Collections,* vol. ii.; and *The Deane Papers,* in the New York Historical Society's *Collections* (1887–90). *See* also Winsor's *Narrative and Critzcal History,* vol. vii. chap. i.; Wharton's *Revolutionary Diplomatic Correspondence* of *the United States* (1889); and G L. Clark, *Silas Deane: A Connecticut Leader in tlze American Revolution* (1913).

DEARBORN, HENRY (1751–1829). American soldier and secretary of War, was born at Hnmpton in south-eastern New Hampshire. Upon hearing of the battle of Lexington, he left the practice of medicine to join the provincial forces and served as an officerat the battle of Bunker Hill, Arnold's expedition to Quebec

(where he was taken prisoner and exchanged), battle of Saratoga, Valley Forge, battle of Monmouth, Sullivan's expedition against the Indians, and the siege of Yorktown. He kept a detailed journal throughout the war, which gives a valuable first-hand account of the principal campaigns of the Revolution. Upon the organization of the Government, President Washington designated him United States marshal for the District of Maine, and in 1792 he was elected to Congress, where he served as a Republican for two terms. He was secretary of War through the administration of President Jefferson, 1801–1809. In *1803* he issued an order for "erecting barracks and a strong stockade" at "Chikago," "with a view to the establishment of a Post." The important part which this post, Fort Dearborn, played in the early history of Chicago. has given his name a lasting association with that city. In Jan. *1812*, President Madison appointed him senior major general of the United States Army. Upon the outbreak of hostilities with England, he undertook to carry out an extensive plan of campaign, including an invasion of Canada at several points. After a long succession of delays and reverses, he was relieved of his command in July *1813*. In *1822*, President Monroe appointed him minister to Portugal. He died in Roxbury, Mass. (H. D. SM.)

DEARBORN, a city of Wayne county, Michigan, U.S.A., 10 mi. W. of Detroit, on the Michigan Central railroad. The population was 2,470 in *1920* but grew rapidly to *50,358* in 1930, and was *63,584* in 1940 by the federal census. It is a residential suburb and is known as the home of Henry Ford (*q.v.*), who was born on a farm near the city. Ford restored the farm to its early appearance, and built at Dearborn a "museum village" of old buildings collected from all parts of the United States and from England.

DEATH, the permanent cessation of the vital functions in the bodies of animals and plants, the end of life or act of dying. The word is the English representative of the substantive common to Teutonic languages, as "dead" is of the adjective, and "die" of the verb; the ultimate origin is the pre-Teutonic verbal stem dau-; cf. Ger. Tod, Dutch dood, Swed. and Dan. dod.

For the scientific aspects of the processes involved in life and its cessation *see* BIOLOGY, PHYSIOLOGY, PATHOLOGY, and allied articles; and for the consideration of the prolongation of life *see* LONGEVITY. Here it is only necessary to deal with the more primitive views of death and with certain legal aspects.

FROM A WOODCUT BY HANS HOLBEIN THE YOUNGER

SIXTEENTH CENTURY PORTRAYAL OF DEATH

Ethnology.— To the savage, death from natural causes is inexplicable. At all times and in all lands, if he reflects upon death at all, he fails to understand it as a natural phenomenon. If a man dies without being wounded he is considered to be the victim of the sorcerers and the evil spirits with which they consort. Throughout Africa the death of anyone is ascribed to the magicians of some hostile tribe or to the malicious act of a neighbour. A culprit is easily discovered either by an appeal to a local diviner or by torturing some one into confession. In Australia whenever a native dies, no matter how evident it may be that death has been the result of natural causes, it is at once set down that the defunct was bewitched. Even to-day the peasantry of many European countries believe that all disease is the work of demons. Sleep and trance are regarded as the temporary, death as the permanent, absence of the soul regarded as the vital principle, as the moral principle and as the intellectual principle. It may be diffused all through the body but can be concentrated in one organ (*see* HEAD-HUNTING). It inheres in each and every part in excreta and hair clippings and for safety may be hidden in some external object.

The body's shadow or reflection is the soul, and subject to a malice of enemies. The soul is pictured as a man's breath (*anima*), and the word "breath" has become a synonym for life itself. The phrase "last breath" expresses the savage belief that there departs from the dying in the final expiration a something tangible, capable of separate existence—the soul. Myths account for its origin. Sometimes it is a "tabu" which has been broken and gives Death power over man. In India Yama, the god of Death, the first man, married his sister and thereby violated the fundamental law of exogamy, breach of which to this day in many cases still entails actual as well as civil death. In other myths, men were destined by Divine Mercy to be immortal but the messenger of the glad tidings failed or erred.

See Sir *J. G.* Frazer, *The Belief in Immortality*, vol. i. (1913), *The Golden Bough* (**Perils** *of the Soul*).

REGISTRATION

Legal Requirements.— The registration of burials in England goes back to the time of Thomas Cromwell, who in *1538* instituted the keeping of parish registers. Statutory measures were taken from time to time to ensure the preservation of registers of burials, but it was not until *1836* (the Births and Deaths Registration Act) that the registration of deaths became a national concern. The law for England was consolidated by the Births and Deaths Registration Acts *1874* and *1926*. Under the former act, the registration of every death and the cause of the death is compulsory. When a person dies in a house information of the death and the particulars required to be registered must be given within five days of the death to the registrar to the best of the person's knowledge and belief by one of the following persons:— (I) The nearest relative of the deceased present at the death, or in attendance during the last illness of the deceased. If they fail, then *(2)* some other relative of the deceased in the same sub-district (registrar's) as the deceased. In default of relatives, (3) some person present at the death, or the occupier of the house in which, to his knowledge, the death took place. If all the above fail, (4) some inmate of the house, or the person causing the body of the deceased to be buried. The person giving the information must sign the register. Similarly, also, information must be given concerning death where the deceased dies not in a house.

Where written notice of the death, accompanied by a medical certificate of the cause of death, is sent to the registrar, information must nevertheless be given and the register signed within 14 days after the death by the person giving the notice or some other person as required by the act. Failure to give information of death, or to comply with the registrar's requisitions, entails a penalty not exceeding *40* shillings, and making false answers to any question put by the registrar relating to the particulars required to be registered, or making false statements with intent to have the same inserted in the register, is punishable either summarily with a penalty of £10, or, on indictment, with penal servitude for seven years, or with imprisonment for two years with or without hard labour.

The registrar, upon registering the death, must' forthwith give to the person giving the information a certificate under his hand that he has registered the death; hut where he has received written notice of the death, accompanied by a medical certificate of the cause of death, he may, before registering the death and subject to such conditions as may be prescribed, give to the person sending the notice, if required to do so, a certificate under his hand that he has received notice of the death.

The body of the deceased cannot be disposed of before the certificate of the registrar, or order of the coroner, has been delivered to the person effecting the disposal, *i.e.*, the person by whom the register of burials in which the disposal is to be registered is kept. or, in the case of a burial in a churchyard or graveyard of a parish or ecclesiastical district under the Burial Laws Amendment Act *1880*, the relative, friend, or legal representative who is responsible for the burial of the deceased. Where, however, the disposal is by burial, the person effecting the disposal may proceed with the burial if satisfied by a written declaration in prescribed form by the person procuring the disposal that a certificate or order has been issued. The person effecting the dis-

posal must, within 96 hours of the disposal, notify the registrar in the prescribed manner as to the date, place and means of disposal. The registrar, on the expiration of the prescribed period after the issue of a certificate by him or of a coroner's order, if no notification as aforesaid has been previously received by him, must make inquiry of the person to whom the certificate or order was given; and such person must give information to the best of his knowledge and belief as to the person having the custody of the certificate or order, the place where the body is lying, or, if disposed of, the person effecting the disposal.

It is the duty of the father or mother of a still-born child to give information to the registrar of the particulars required to be registered concerning the still-birth. Upon doing so, he or she must either (1) deliver to the registrar a written certificate that the child was not born alive, signed by a registered medical practitioner or certified midwife who was in attendance at the birth or who has examined the body; or (2) make a declaration in prescribed form to the effect that no such practitioner or midwife was present at the birth, or has examined the body, or that his or her certificate cannot be obtained and that the child was not born alive.

The registration of deaths at sea is regulated by the Births and Deaths Registration Act 1874 together with the Merchant Shipping Act 1894.

Death can be proved by the production of a certified copy of the entry in the register of birth and deaths, which is evidence not only of the fact of death, but also of the date of death, the sex, rank, or profession of the dead person, and the cause of death.

Presumption of Death. — The fact of death may, in English law, be proved not only by direct but by presumptive evidence. When a person disappears and is not heard of for seven years, the presumption of law arises that he is dead (Nepean v. Doe, 1837, 2 M. and W. 894). In Scotland, by the Presumption of Life (Scotland) Act 1891, the presumption is statutory. In those cases where people disappear under circumstances which create a strong probability of death, the court may, for the purpose of probate or administration, presume the death before the lapse of seven years (see *In the* Goods of *Matthews,* 1898, p. 17). The question of survivorship, where several persons are shown to have perished by the same calamity, has been much discussed. It was at one time thought that there might be a presumption of survivorship in favour of the stronger party. But it is now clear that there is no such presumption; the question is one of fact depending wholly on evidence, and, if the evidence does not establish the survivorship of any one, all must be taken to have died at the same moment (Wing v. *Angrave,* 1860, 8. H. L. Cas. 183). This rule has been applied by the court of probate where husband and wife were both killed in a railway accident, and the bodies were found two hours afterwards, and administration was granted to their respective next of kin (*In* the Goods of Wheeler, 1861, 31 L. J. P. M. & A., 40); so also where husband and wife were proved to have been on board a ship which was supposed to have been lost at sea (In *the* Goods of Alston, 1892, p. 142).

Civil Death is an expression used in law in contradistinction to natural death. Formerly, a man was said to be dead in law (1) when he entered a monastery and became professed in religion; (2) when he abjured the realm; (3) when he was attainted of treason or felony. Since the suppression of the monasteries there has been no legal establishment for professed persons in England, and the first distinction has therefore disappeared, though for long after the original reason had ceased to make it necessary grants of life estates were usually made for the terms of a man's natural life. The act abolishing sanctuaries (1623) did away with civil death by abjuration; and the Forfeiture Act 1870, that on attainder for treason or felony.

For the statistics of the death-rate of Great Britain as compared with that of the various European countries see GREAT BRITAIN. See also ANNUITY; CAPITAL PUNISHMENT; CREMATION; INSURANCE, ARTICLES ON; MEDICAL JURISPRUDENCE, etc.

THE UNITED STATES

Legal **Registration.**—It is generally provided that the State department of health shall have charge of the registration of deaths, shall provide the necessary forms and blanks for obtaining and preserving such records, and shall procure the faithful registration of each death. For this purpose the States are, as a general rule, divided into registration districts, sometimes called vital statistics registration districts, in each of which there is a registrar charged with the registration of births and deaths. In Massachusetts and in some other States this duty is imposed upon each town clerk.

It is provided by statute in most States that the body of any person whose death occurs in the State shall not be buried, cremated, deposited in a vault or otherwise disposed of or removed from or into any registration district, or be temporarily held pending further disposition, more than 72 hours after death unless a permit for burial removal or other disposition shall have been properly issued by the registrar of the district. Whenever it is practicable, no such burial or removal permit shall be issued by any registrar until a complete and satisfactory certificate of death has been filed with him. If, however, a dead body is transported from one State into a district in another State, the transit or removal permit issued in accordance with the law of the place of death has the force of a burial permit. It is frequently required that the certificate of death shall be of the standard form recommended by the United States Bureau of the Census and adopted by the American Public Health Association and shall contain: — (I) the place of death, including the State, county, township, village or city; (2) the full name of the decedent. If an unnamed child, the surname preceded by "unnamed"; (3) sex and colour or race—as white, black, mulatto, Indian, Chinese, Japanese, etc.; (4) conjugal condition, whether single, married, widowed or divorced; (5) place and date of birth, including year, month and day; (6) age in years, months and days; (7) name of father and maiden name of mother; (8) birth-place of mother; (9) occupation; (10) signature and address of informant; (11) date of death, year, month and day; (12) statement of medical attendance on decedent, fact and time of death, including time last seen alive; (13) cause of death; (14) signature and address of physician or official making medical certificate; (15) place and date of burial or removal; (16) signature and address of undertaker; (17) official signature of registration with date when certificate was filed and registered number.

The personal statistical particulars should be authenticated by the signature of the informant, who should be the nearest of kin or other competent person acquainted with the facts. The statement of the facts relating to the disposition of the body shall be signed by the undertaker. The medical certificate shall be made and signed by the legally qualified physician, if any, last in attendance on the deceased. The cause of the death must generally be stated so as to show the disease or sequence of causes resulting in the death.

In regard to the registration of still-born children, in some jurisdictions the law provides that the child shall be registered as a birth and also as a death, and separate certificates of birth and death shall be filed with the registrar; in others, the still-born child is merely registered as a death. A certificate is not required for a child that has not advanced to the fifth month of inter-gestation.

If a death occur without medical attendance, it is the duty either of the undertaker or other person who learns of the death to notify the local health officer. The latter immediately investigates and certifies the cause of death. If, however, he has reason to believe that the death may have been due to unlawful act or neglect, he refers the case to the coroner for his investigation and certification. The undertaker must file the certificate of death with the local registrar, and obtain a burial or removal permit prior to any disposition of the body, which he delivers to the person in charge of the place of burial.

Presumption of Death. — The fact of death may, as a general rule, be proved by presumptive evidence. An unexplained absence of seven years at common law raised a presumption of death. This is still the period in most jurisdictions in this country, though a few have by statute adopted a shorter period, *e.g.,* five years in Arkansas, and five years in Indiana for the sole purpose of

authorizing the administration of an estate. Death may in some cases be presumed from the facts surrounding the disappearance indicating death within a shorter time than seven years. The English rule prevails in the United States that the presumption is of the fact of death only and not of the time of death. There are some cases, however, in which death has been presumed to have occurred at the expiration of the seven-year period.

Survivorship. — In the absence of circumstantial evidence, in the case of a common disaster, there is as a general rule, no presumption as to survivorship. In some States, however, there are codes embodying certain presumptions as to survivorship. Otherwise, the law will treat the case as one to be established by evidence, and the burden is placed on him who claims survivorship.

DEATH, BIOLOGICAL ASPECTS OF. The life cycle of individual multicellular organisms, standing relatively high in the scale of organic specialization, as for example, a fly, a bird or a man, is typically divisible into five biologically differentiated,and usually distinct, phases as follows: (a) The formation of the zygote, which is the individual, by the union of ovum and spermatozoon in the process called fertilization. The life-history of the individual, as a distinct and biological entity, begins with this event. (b) The period of development and growth, which has two sub-phases, commonly designated respectively as embryonic or foetal, and post-embryonic or post-natal. The duration of this growth phase of the life-cycle varies widely in different organisms, as from 8 to 10 days in the fruit fly, *Drosophila,* to more than 20 years in man. This phase comes normally to an end in most forms of higher animal life, and is succeeded by (c) the phase of adult stability, in which no marked changes are observable either in the direction of growth or degeneration. This phase is the "prime of life" in common parlance. Its duration in time is again widely variable. Sooner or later the individual can

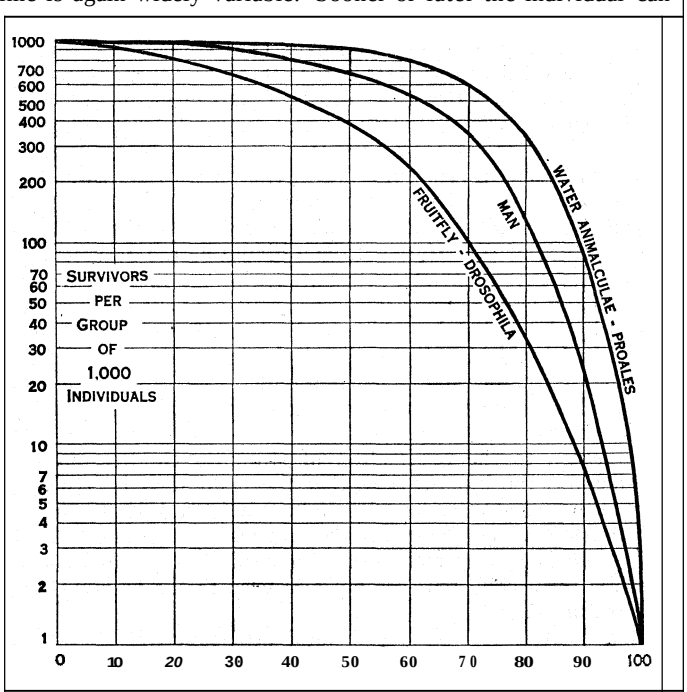

FIG. 1. — SURVIVAL RATES FOR MAN. A FRUIT FLY (DROSOPHILA) AND WATER ANIMALCULA (PROALES) AT CORRESPONDING AGES
The lower figures are the biologically equivalent life spans represented as equal and divided into 100 units

be observed to have passed definitely into the next phase of the life-cycle, which may be designated (d) the period of senescence. This phase is characterized by a progressive waning in the intensity of the vital processes generally, accompanied by regressive and degenerative changes in the structures of the body. The duration in time of this portion of the life-cycle again varies greatly, but ultimately, in all the more highly specialized organisms, the life of the individual, as such, comes to an end with the terminal event of the cycle (*e*) death. By this term is designated the cessation of all vital capacity.

The Cycle of Life. — In the cycle of individual life as outlined, the most significant phases biologically are obviously (b) growth and (d) senescence. Phases (a) and (e) (fertilization and death) are the terminal events of the important periods (b) and (d). Phase (c) is transitional between (b) and (d), and may be wholly absent, as when obvious senescent changes follow immediately upon the cessation of obvious growth. Indeed it is doubtful if phase (c) has theoretically any place in the life-cycle at all. Perhaps in cases where a stable adult plateau in the middle of the cycle seems to exist, it merely means that the changes of growth or of senescence are proceeding at too slow a rate to be observable by the relatively crude methods available.

In the case of the human species phases (b), (cj, and (*d*) are rather definitely and precisely limited by the biological phenomena of birth; puberty (precisely established in the female by the onset of menstruation, or *menarche*); the ending of the capacity to reproduce (marked in the female by the cessation of menstruation, or menopause) and its diminution to statistically insignificant proportions in the male at about the same age; and death. Pearl has shown (*The Natural* History of Population, 1939) that the average age at menarche, for large samples covering many different countries and peoples, is very close to 15 years, and that the average age of menopause for similarly representative samples is between 47 and 48 years. So, in round figures, human life after birth can be divided into three periods: (1) The *pre-reproductive* period of infancy and childhood, extending from birth to about 15 years of age. In this period the individual is incapable of self-maintenance or support on its own unaided resources, as well as of reproduction. (2) The *reproductive* period, extending from about 1j to about 50 years. In this period of life the work that supports the human socio-biological structure is mainly done, as well as the reproducing that continues the species. (3) The post-reproductive period, extending from about 50 years to the end of life. In this period the old, besides being incapable of reproduction to any statistically significant degree, are in large part dependent for their support upon the work done in the middle (reproductive) period of life; either by themselves with a concomitant saving for old age of the products of their efforts, or by others.

When statistics of population are arranged according to this threefold age classification a striking regularity or rule may be observed all over the world. This regularity may be stated as follows: Always and everywhere about one-half of the whole living population falls in the middle age group (15–49 years inclusive); while the other half is made up of the young (0–14 years inclusive) and the old (50 years and over) together, these two latter groups standing statistically in a compensatory relation to each other. In populations where there is a high proportion in the 0–14 year group there is a correspondingly small proportion in the 50 year and over group. Examples of this relationship are shown in the following table of the populations of 20 countries:

Country	Year	Percentage of living population aged:		
		0–14 yrs.	15–49 yrs.	50+ yrs.
Brazil	1920	42·7	48.3	8·9
Cuba	1919	42·3	47·5	10·1
Turkey	1935	41·3	45·5	13·2
India (excluding some provinces)	1931	39·9	50·4	9·7
Mexico	1930	39·2	50·2	10·6
Chile	1930	37·2	51·2	11·5
U. S. S. R. (including Asiatic territory)	1926	37·2	49·9	13·1
Japan	1930	36·7	48·1	15·2
Greece	1928	32·1	50·9	17·0
Canada	1931	31·7	51·6	16·6
Union of South Africa (whites only)	1936	31·2	52·5	16·3
Italy	1931	29·7	50·9	19·4
United States of America	1930	29·4	53.4	17·3
Eire	1926	29·2	48·4	22·4
Norway	1930	28·4	51·2	20'3
Australia	1931	27·5	53·3	19·1
Germany (excluding Saar Territory)	1933	24·2	54·0	21·8
England and Wales	1931	23·8	53·4	22.8
France	1931	22·0	51·4	25·7
Sweden	1935	22·2	54·4	23·4
Averages	1929·7	32·4		16·7

(This table ~ ~computed f r o official census data given in the *Statistical Yearbook of the League of Nations,* 1938.)

From this table it is seen that countries with high rates of reproduction, and consequently relatively high proportions of their people in the 0–14 year or pre-reproductive phase (such as Brazil, Cuba, and Turkey) have but a small proportion of persons over 50 years of age in their populations. On the other hand countries reproducing only sparely (such as England, France, and Sweden) have a relatively high proportion of old people in the population, but only a low proportion aged 0–14 years.

It has been alleged that man is unique among living things in having a disproportionately long, and from one point of view biologically useless, post-reproductive phase in the life cycle. This is not so. Other species are similar to man in this respect. Thus Pearl and Miner (Mem. *Musée* Roy. *d'Hist. Nat.* de Belgique, 2 ser., fasc. 3, 1936) showed that the females of a moth (Acrobasis *caryae,* the pecan nut case bearer) spend an average of about 25% of their total imaginal life-span—which in chronological times lasts only 6 to 8 days on the average—in the post-reproductive phase, as compared with 26% as an average for human females.

Senescence and Death.— The special problem of the biology of death is the analysis and elucidation of phases (d) and (e) of the life-cycle, senescence and death. As a result of investigations in this special field of general biology certain broad generalizations are now possible. The more important of these will now be discussed.

Time Duration.— The time duration of the entire individual life-cycle varies enormously, both between different forms of life, species, genera, families, etc., and also between different individuals belonging to the same species. Thus the maximum duration of life of the rotifer, *Proales decipiens,* is eight days (Noyes). At the other extreme there are other authentic records of individual reptiles living to as much as 175 years. Among mammals man is, on the average, the longest lived, with the elephant as his nearest competitor for this position.

Zoological Groups.—The differences between distinct groups of animals (species, genera, families, etc.) in respect to the length of the life-span stand in no generally valid, orderly relationship to any other broad fact now known in their structure or life-history. In spite of many attempts to establish such relationships every one so far suggested has been upset by well-known facts of natural history. Thus it has been contended that the duration of an animal's life is correlated with its size, in the sense that the larger the animal the longer its life. But plainly this has no general validity. Men and parrots are smaller than horses, but have life-spans of much greater length.

Individual Differences.— The differences between individuals of the same species in the duration of their lives are distributed in a lawful and orderly manner, in marked contrast to the apparently haphazard character of the inter-group variation in length of life-span just discussed. The individual variation in the duration of life is capable of exact mathematical description, and, indeed, its treatment constitutes a special branch of mathematics, known as actuarial science. It has been shown by R. Pearl and his students that if the life of different animals, such as the rotifer, Proales, the fly, *Drosophila,* various other insects and man, be measured not in absolute time-units of years or days, but in terms of a relative unit, namely a hundredth part of the biologically equivalent portions of the life-span in the several cases, then the distribution of individual variation in duration of life, or the distribution of mortality in respect to age, or, in short, the life-curve, is quantitatively similar in these widely different forms of life almost to the point of identity. This is illustrated in fig. 1.

These facts suggest that the observed difference between individuals in duration of life are primarily the result of inborn differences in their biological constitutions (their structural and functional organizations) and only secondarily to a much smaller degree, the result of the environmental circumstances in which their lives are passed.

Inheritance.— This inference is supported by the further fact that the differences between individuals which find expression in varying degrees of longevity, or duration of life, are definitely inherited. It has been proved experimentally by cross-breeding long-lived and short-lived strains of the fruit fly *Drosophila*

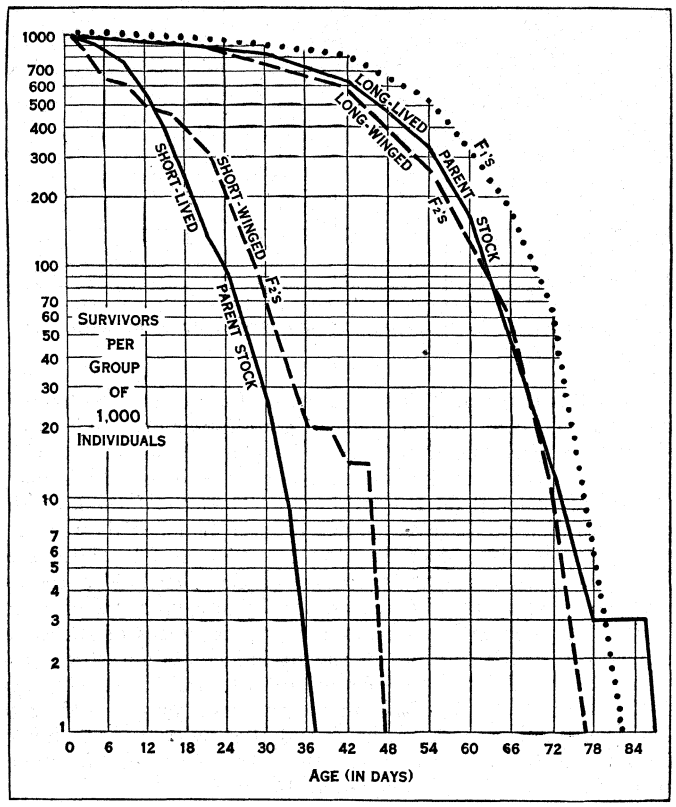

FIG. 2.—SHOWING HOW LONGEVITY IS INHERITED AMONG FRUIT FLIES WHEN A LONG-LIVED IS CROSSED WITH A SHORT-LIVED STOCK

The first generation of progeny (dotted line, F_1's) is longer lived than either parent stock and, when inbred, produces progeny of two kinds (F_2's), a short-winged, which is short-lived, and a long-winged, which is long-lived. The Mendelian laws of heredity are thus seen to hold, in the case of these fruit flies, for longevity, which is shown to behave like a definitely inheritable quality

melanogaster (Hyde, Pearl and his students, Parker and González). The results of such an experiment are shown in fig. 2.

In the first generation (F_1) from such a cross the progeny exhibit a life-curve essentially like that of the long-lived parent stock, but with a slightly greater average duration. If now these F_1 individuals are bred together *inter* se there are produced in the second cross-bred generation (F_2) two kinds of individuals, one of which (long-winged) has a life-curve like the original long-lived parent stock, while the other (short-winged) resembles in duration of life the original short-lived parent stock. In addition to these experiments along Mendelian lines, it has been shown that there can be isolated from a general population of wild *Drosophila* inbred strains showing definite and permanent innate difference in average longevity. The conclusion that individual differences in life duration are fundamentally an expression of hereditary differences between individuals is firmly established.

The importance of inheritance in determining human longevity has been demonstrated from various different lines of approach. In this field Karl Pearson and Alexander Graham Bell were pioneers. Pearl and Pearl studied intensively the ancestry of 36j persons living at ages of 90 and above about whose six immediate ancestors (2 parents and 4 grandparents) there was complete information. They compared with this group 136 persons chosen at random from the general population, all of whose 6 immediate ancestors were dead, and at known and recorded ages. This comparison group had an average living age of 48.75 years, and contained 29 persons over 60 at the time of observation, 6 over 70, and 1 over 80. The average age of the group was almost 16 years higher than that of the living white population of the United States in 1930.

Fig. 3 shows how the ancestry of the nonagenarian and centenarian group compared with the group of ordinary persons in respect of average longevity.

FIG. 3.— INFLUENCE OF IMMEDIATE ANCESTORS UPON AVERAGE LONGEVITY

From this diagram it is seen that, on the average, each single immediate ancestor, father, mother, grandfather or grandmother, of the extremely longevous persons of panel A on the left side, was longer lived than the corresponding ancestor of the ordinary persons of panel B on the right side. Thus the fathers of the longevous died at the average age of 72·4 years. This was 12·3 years, or over 20%, older than the average age of the fathers of the panel B folk at the right end of the chart. The central panel, A-B, gives the differences, in absolute numbers of years (upper figures in each sex sign) and as percentages of the panel B means, for each category of the six immediate ancestors. The "computed total longevity" figures for the individuals observed in the rectangles at the bottom are the resultants of adding to the mean number of years the A and B individuals had already lived at the time of observation the expectations of life proper to those ages, as given in a standard life table.

From this chart two important results emerge regarding the influence of heredity upon longevity, namely:

(a) People who achieved extreme longevity had immediate ancestors (parents and grandparents) who were, on the average, definitely longer lived than the corresponding ancestors of the general run of the population. This was true without exception for each particular category of immediate ancestors.

(b) This hereditary influence promoting longevity was between two and three times as great relatively for parents as it was for grandparents.

A specific study was made as to how each of the parents of the extremely longevous persons was bred relative to longevity, as compared with the parents of the general run of folk. This led to the results shown in fig. 4. In this study an individual who died under 50 years of age was regarded as short lived; one who died between 50 and 69 as average or mediocre in life duration, and one who died at 70 or over as long lived. Fig. 4 shows the percentages of the fathers and mothers respectively that had (a) both of their parents long lived (shown by the solid black portion of each bar); (b) one parent long lived and the other mediocre or short lived (shown by the cross-hatched portion of each bar); and (c) neither of their parents long lived (shown by the white portion of each bar).

The picture presented by fig. 4 is precise and striking. The nonagenarians and centenarians were produced by parents who were themselves bred out of wholly longevous parentage in more than half of all the cases observed—a markedly higher proportion than that shown by the parents of the general population sample. At the other end of the genetic scale the opposite is true. Fewer than half as many proportionally of the nonagenarians and centenarians as of persons generally were produced by parents who themselves had no longevous parentage whatever. There can be no question or doubt that breeding was of great importance in the production of these nonagenarians and centenarians.

Actuarial studies have also demonstrated the importance of heredity in the achievement of long life. This fact has been equally established by life tables for parents of children who died at specified ages, and by life tables of children of parents having specified degrees of longevity. For example such studies have shown that the mean-after-lifetime of fathers of children dying (or living) at ages of 80 and over is about 26% greater at age 20; 43% greater at age 40; 75% greater at age 60; and 58% greater at age 80, than the mean-after-lifetime at the same ages of fathers of children dying under 5. The corresponding excesses in expectation of life of mothers mere 27% at age 20; 27% at age 40; 36% at age 60; and 23% at age 80. Throughout the whole life-span the parents of the very long-lived children appear to be persons of superior biological constitution, as evidenced by their ability to keep on living.

Similar studies have shown that the sons of fathers dying (or living) at ages of 80 years and over have a mean-after-lifetime about 13% greater at birth than that of the sons of fathers dying between 50 and 79 years of age, and 22% greater than that of sons of fathers dying under 50 years of age.

Further evidence for the innate constitutional superiority of the longevous was afforded by Pearl's and Raenkham's (Human *Biology*, vol. 4, 1932) analysis of the causes of death of nonagenarians on the basis of the official records of the Census Bureau. That analysis led to the conclusion that nonagenarians are a selected lot of people. They are the ultimate survivors after all the rest of mankind has gone, unable to meet the vicissitudes of life and keep on living. Nonagenarians and centenarians come to be such because they have organically superior constitutions, resistant to infections, soundly organized to function efficiently as a whole organism and keep on doing it for a very long time. Observations on mortality at ages have indicated that throughout life infections and other harmful environmental forces were, on the whole, tending to take off the weaker and leave the stronger. Medical knowledge and skill, improved sanitation and better conditions of life generally have been able to prevent an increasingly larger amount of premature mortality before age 50. Especially have these agencies been able to reduce the lethal effects of infections, or at least to postpone to a later part of the life-span their fatal action. But ultimately there is left a group of extremely old people, for whom on the whole infections have no particular terrors. In all the early part of their lives they have been able successfully to resist infections, and to a remarkable degree still are in extreme old age. These people eventually die. But a great many of them die, not because the noxious forces of the environment kill them, but because their vital machinery literally breaks down, and particularly that important part of it—the circulatory system.

Natural Death a Novelty.— Neither senescence nor natural death is a necessary, inevitable consequence or attribute of life. Natural death is biologically a relatively new thing, which made its appearance only after living organisms had advanced a long way on the path of evolution. The evidence supporting this conclusion is manifold, and may be considered under several heads. (a) Various single-celled organisms (Protozoa, *q.v.*) prove, under critical experimental observation, to be, in a certain sense, immortal. They reproduce by simple fission of the body, one individual becoming two, and leaving behind in the process nothing corresponding to a corpse. The brilliant work of Woodruff and his students, in particular, has demonstrated that this process may

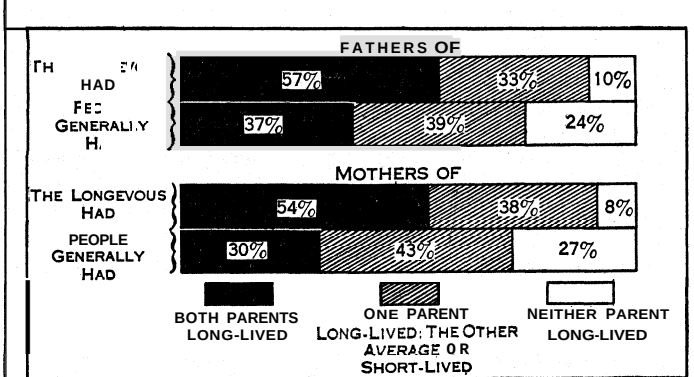

FIG. 4.—THE PERCENTAGE DISTRIBUTION, RELATIVE TO THE NATURE OF THE PARENTAL MATINGS PRODUCING THEM. OF THE FATHERS AND OF THE MOTHERS OF (A) AN EXTREMELY LONGEVOUS GROUP (NONAGENARIANS AND CENTENARIANS). AND (B) A SAMPLE OF PEOPLE GENERALLY

go on indefinitely, without any permanent slacking of the rate of cell-division corresponding to senescence, and without the intervention of a rejuvenating process such as conjugation or endomixis, providing the environment of the cells is kept favourable. (b) The germ cells of all sexually differentiated organisms are, in a similar sense, immortal. Reduced to a formula we may say that the fertilized ovum (united germ cells) produces a soma and more germ cells. The soma eventually dies. Some of the germ cells prior to that event produce somata and germ cells, and so on in a continuous cycle which has never yet ended since the appearance of multicellular organisms on the earth. (c) In some of the most lowly-organized groups of many-celled animals or Metazoa, the power of multiplication by simple fission, or budding off of a portion of the body which reproduces the whole, is retained. This asexual, or agamic, mode of reproduction occurs as the usual, but not exclusive, method in the three lowest groups of multicellular animals, the sponges, flatworms and coelenterates. More rarely it may occur in other of the lower invertebrates.

So long as reproduction goes on in this way in these multicellular forms there is no place for death. In the passage from one generation to the next no residue is left behind. Agamic reproduction and its associated absence of death also occur commonly in plants. Budding and propagation by cuttings are the usual forms in which it is seen. The somatic cells have the capacity of continuing multiplication and life for an indefinite duration of time, so long as they are not accidentally caught in the breakdown and death of the whole individual in which they are at the moment located.

(*d*) There is some evidence that in certain fish there is no occurrence of senility or natural death, but that instead the animal keeps on growing indefinitely, and would be immortal except for accidental death. The animal soma in such cases behaves like the root stock of a perennial plant. (For further discussion of this line of evidence see interesting correspondence by Geo. P. Bidder, in Nature, vol. cxv., 1925, passim and M. A. C. Hinton's monograph of the Voles and *Lemmings* [British Museum, 1926], in which it is concluded that voles of the genus *Arvicola* "are animals that never stop growing and never grow old.") (e) The successful cultivation in vitro of the tissues of higher vertebrates, even including man himself, over an indefinitely long period-of time, demonstrates that senescence and natural death are in no sense necessary concomitants of cellular life. Carrel and Ebeling, by transferring the culture at frequent intervals into fresh nutrient medium, have kept alive and in perfectly normal and healthy condition, a culture of tissue (see TISSUE CULTURE) from the heart of a chick embryo for more than 25 years; *i.e.*, for much longer than the normal life-span of the fowl. There is every reason to suppose that, by the continuation of the same technique, the culture can be kept alive indefinitely. The experimental culture of cells and tissues in vitro has now covered practically all of the essential tissue elements of the metazoan body, even including some of the most highly differentiated of those tissues. Nerve cells, muscle cells, heart muscle cells, spleen cells, connective tissue cells, epithelial cells from various locations in the body, kidney cells and others have all been successfully cultivated in vitro.

Potential Immortality.— Itmay fairly be said that the potential immortality of all essential cellular elements of the body either has been fully demonstrated, or has been carried far enough to make the probability very great, that properly conducted experiments would demonstrate the continuance of the life of these cells in culture to any indefinite extent. It is not to be expected, of course, that such tissues as hair or nails would be capable of independent life, but these are essentially unimportant tissues in the animal economy, as compared with those of the heart, the nervous system, the kidneys, etc. Generalizing from results of tissue culture work of the last three decades, it is highly probable that all the essential tissues of the metazoan body are potentially immortal, when placed separately under such conditions as to supply appropriate food in the right amount, and to remove promptly the deleterious products of metabolism.

Death Among Multicellular Animals.— A fundamental reason why the higher multicellular animals do not live forever appears to be that in the differentiation and specialization of function of cells and tissues in the body as a whole, any individual part does not find the conditions necessary for its continued existence. In the body any part is dependent for the necessities of its existence, as for example nutritive material, upon other parts, or put in another way, upon the organization of the body as a whole. It is the differentiation and specialization of function of the mutually dependent aggregate of cells and tissues which constitute the metazoan body that brings about death, and not any inherent or inevitable mortal process in the individual cells themselves.

When cells show characteristic senescent changes it is perhaps because they are reflecting, in their morphology and physiology, a consequence of their mutually dependent association in the body as a whole,

Deaths due primarily to organic breakdown or failure of	Mean age at death (years)		Median age at death (years)	
	Male	Female	Male	Female
1. Alimentary tract and associated organs of digestion	25·54±·06	28·24±·07	4·98±·08	14·93±·09
2. Respiratory system	32·24±·05	32·57±·06	31·86±·07	28·24±·08
3. Skeletal and muscular system	35·09±·29	37·96±·32	33·02±·36	35·96±·41
4. Endocrinal system	44·17±·82	44·15±·36	45·45±1·03	43·42±·46
5. Skin	46·73±·34	42·45±·46	53·47±·43	48·96±·58
6. Sexual system	47·37±·32	42·47±·08	57·96±·40	40·88±·11
7. Nervous system	49·11±·08	51·56±·09	54·64±·10	60·29±·12
8. Circulatory system and blood	54·50±·07	54·25±·08	62·04±·09	62·14±·09
9. Excretory system (kidneys and associated organs)	57·94±·07	54·24±·09	61·37±·09	57·50±·11

and not any necessary progressive process inherent in themselves. In other words, in the light of present knowledge, it seems necessary to regard senescence, in part at least, as a phenomenon of the multicellular body as a whole resulting from the fact that it is a differentiated and integrated morphologic and dynamic organization. This phenomenon is reflected morphologically in the component cells. But it apparently does not primarily originate in any particular cell because of the fact that the cell is old in time, or because that cell in and of itself has been alive; nor does it occur in the cells when they are removed from the mutually dependent relationship of the organized body as a whole and given appropriate physico-chemical conditions. In short, senescence appears not to be a primary or necessary attribute to the physiological economy of individual cells as such, but rather of the body as a whole.

Times of Death.— The different organ-systems of the body have characteristic times of breaking down and leading to death. These differences probably represent in considerable part different innate degrees of organic fitness of the different tissues and organs, and also in part the degree of exposure of the different organ-systems to environmental stresses and strains. The table above, based upon mortality returns of the U.S. Registration Area in 1910, illustrates these differences. The figures tabulated are (a) the mean or average age at death, and (*b*) the median age at death (that is, the age so chosen that the same number of deaths occur below this age as the number occurring above it).

There are thus wide differences in the time of breakdown of the dif-

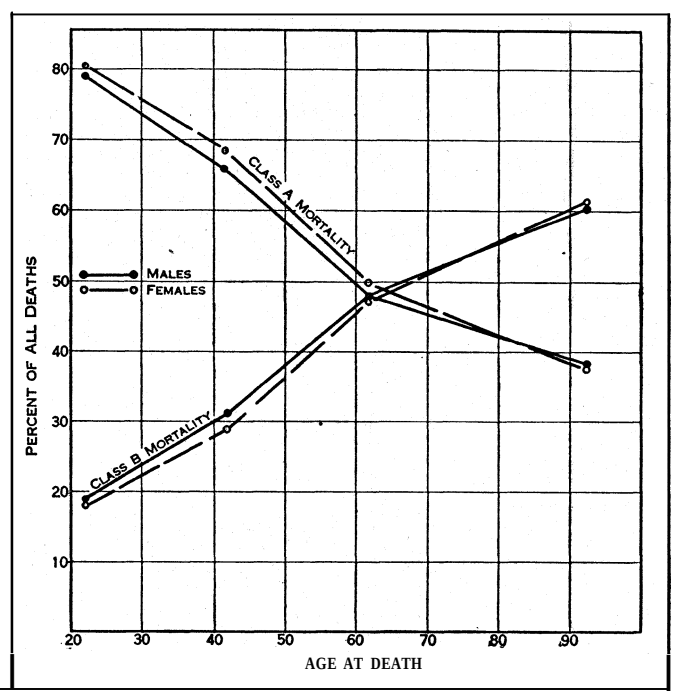

FIG. 5.— THE TRENDS. AT FOUR ADULT AGE PERIODS FROM AGE 20-24 ON TO THE END OF THE LIFE SPAN. OF MORTALITY HAVING ITS PATHOLOGICAL LESIONS AND/OR CLINICAL MANIFESTATIONS ASSOCIATED WITH (A) ORGAN SYSTEMS NORMALLY IN DIRECT CONTACT WITH THE EXTERNAL ENVIRONMENT (PLUS EXTERNAL CAUSES EXCEPT SUICIDE): AND (B) ORGAN SYSTEMS NORMALLY NOT IN DIRECT CONTACT WITH THE EXTERNAL ENVIRONMENT (PLUS "SENILITY")

ferent organ-systems, as reflected in mortality. The alimentary tract, on the average, "wears" rather less than half as long as the cxcrctory system.

The structural and functional organization of the vertebrate body is Such that certain organ-systems come normally and regularly into direct and immediate contact with the external environment, while other organ-systems do not, but are, on the contrary, protected from such contact. On this basis the organ-systems may be classified as follows.

A	B
Orgall-systems coming into direct contact with the etternal environmeni	*Organ-systems not coming into direct contact with the external environment*
Respiratory system	Circulatory system
Sex organs	Skeletal and muscular system
Kidneys and associated excretory organs	Nervous system
Alimentary tract	Endocrine system
Skin	

The mortality of white persons in the U.S. Registration Area, during the five-›ear period 1923–27 inclusive has been subsumed under this A (unprotected) and B (protected) classification of organ-systems by Pearl and Raenkham, with the results shown in fig. 5.

It is seen from this diagram that, with advancing adult age the proportion of deaths due to causes having their pathological lesions or clinical manifestations associated with the organ-systems of the body which are normally and regularly in direct contact with the external environment (Class A mortality) *decreased,* while the proportion having their pathological lesions or clinical manifestations associated with the organ-systems normally protected from direct contact with the external environment (Class B mortality) *increased.*

Death and the Environment. — It is a plain fact of experience that the environmental circumstances surrounding an organism may, in varying degrees, condition its duration of life. Thus complete starvation can induce death in a much shorter time than would have occurred in the absence of starvation. Similarly, there are many poisons that are lethal in appropriate doses. But, quite apart from such extremc and violent agents, the effect upon longevity of the never-ceasing changes in the normal environment is a matter of the first importance in reaching an understanding of the biology of death. The vast literature embodying the results of modern studies on nutrition and diet has shown, directly and indirectly, the role played by this factor in influencing life duration. Research in the field of nutrition has shown that qualitatively the diet of each particular kind of living organism must contain certain chemical elements and compounds in adequate amounts and proportions if life is to continue. Only within very narrow limits can there be any substitutions for these essentials. In some cases the requirements are absolutely rigid and obligatory. Clinical experience and investigation has shown that quantitatively there are limitations to the amount of food intake if the maximum potential longevity is to be realized. Too much food can shorten life as well as too little. The studies of Curt P. Richter have indicated that the normal appetite of animals lower in the evolutionary scale than man is a highly effective regulatory governor of food intake, as regards both quality and quantity. Rats given a free choice of chemically pure food elements tend to make for themselves a diet that is physiologically optimal.

In man critical studies by appropriate statistical and actuarial methods have thrown light upon the relation between longevity and certain widespread environmental circumstances. Evidence has been accumulated to show, for example, that the moderate consumption of alcoholic beverages is not significantly associated statistically with differences between individuals in life duration; that, on the other hand, the smoking of tobacco is significantly so associated, in the sense that as the average amount of smoking shown by a group increased the expectation of life decreased; and that the amount or degree of expenditure of energy in physical labour after age 40 is significantly associated statistically with differences in longevity — as the amount of such expenditure increased the expectation of life decreased.

Rejuvenation. — In recent years numerous attempts have been made to achieve "rejuvenation" (*q.v.*) of the aging body and to lengthen the span of life by various surgical alterations of certain endocrinal organs, particularly the essential organs of sex. Nevertheless, whatever may he the immediate physical and psychological effects of such procedures, there is as yet no convincing evidence that they alter the expectation of life of the individual. On the other hand certain experimental studies on lower organisms have shown that under defined and reproducible conditions the span of life may be greatly increased beyond that normal to the species under usual conditions. Such results are of great biological interest even though, in the present state of knowledge, they have no evident application to the prolongation of human life. Gould and her associates (*Annals of Bot*, vol. xlviii, 1934) experimented with seedlings of the cantaloup (*Cucumis melo*) grown under sterile conditions in the dark, so that all their food came from the supply stored in their own cotyledons. It was found that if measured portions of this stored food were removed by aseptic surgical operations on the cotyledons the total duration of life of the seedlings, as well as the duration of each of the component phases of the life-cycle, could be prolonged up to as much as 6 to 7 times the normal expectation for the amount of food available. Furthermore the amount of growth, however measured, was increased as compared with the normal for the same amount of available food. Other experimental studies on various lower animals have shown that partial starvation materially increased the duration of life.

Senescence. — Many theories of senescence have been advanced. No one of them can be regarded as entirely satisfactory, or as generally established by the evidence. Most of them suffer from the logical defect of setting up some particular observed attribute or element of the phenomenon of senescence itself, such as protoplasmic hysteresis, slowing rate of metabolism (meaning essentially only reduced activity), etc., as the cause of the whole. More experimental work on the problem is essential; in particular in the direction of producing at will, and under control, the objective phenomenon of senility irrespective of the age of the organism, and conversely preventing the appearance of these phenomena in old animals.

BIBLIOGRAPHY. — The literature on the subjects treated in this article is widely scattered in biological, medical and statistical journals and separate treatises. The following books summarize the field, and will serve to introduce the reader to the detailed literature: C. M. Child. *Senescence and Rejuvenescence* (1915); *E.* Korschelt, *Lebensdauer, Alter und Tod* (1922); R. Pearl, *The Biology of Death* (1922); *T.* Brailsford Robertson, *The Chemical Basis of Growth and Senescence* (1923); R. Pearl, *Studies in Human Biology* (1924); *The Rate of Living* (1928); R. Pearl and Ruth D. Pearl, *The Ancestry of the Long-lived* (1934); *L.* I. Dublin and A. J. Lotka, *Length of Life. A Study of the Life Table* (1936); E. V. Cowdry (Editor), *Problems of Ageing. Biological and Medical Aspects* (1939). (R. PL.)

DEATH-RATE. Since communities vary in numbers of population, it is the practice to compare their death statistics in the form of death-rates per 1,000 of population. Thus, there were 1,380,986 deaths reported in the United States during 1938; since the population for that year was estimated to have been 130,215,-000, the death-rate was 10·6 per 1,000 of population. In England and Wales, the death-rate in 1938 was 11·6 per 1,000 of population. The death-rate computed simply as the ratio of the total deaths in a community within a calendar year to its total population living during the same period is known as the crude annual death-rate.

Age, Sex, and Race Incidence. — Death-rates may be computed specifically for each sex and age, and also for each race living in the community. Thus, among white persons in the United States, the death-rate during 1937 was 10·8 per 1,000, while among Negroes it was appreciably higher, namely 14·7 per 1,000. The death-rate among males is higher than that among females in most countries of the western world. For example, in the United States during 1937 there were 12·0 white male deaths per 1,000 white males living while the figure for white females was 9·6 per 1,000. The corresponding death rates in England and Wales for 1937 were 13·2 per 1,000 males and 11·7 per 1,000 females.

When the number of deaths occurring at a specific age within a calendar year is divided by the number living at that age, the result obtained is an annual age-specific death-rate. There is a striking variation in the age-specific death-rate with advancing age It is very high in the first year of life, but diminishes rapidly as the child grows older, and reaches a minimum at about age 10 or 11 years. From this point, the death-rate increases, at first slowly, until the fifth decade of life, and then more and more rapidly to the end of the natural span of life. The experience of the total population of the United States during 1937 may be cited as an example. Starting with a death-rate of a little more than 50 per 1,000 babies in the first year of life, the figures fell to a minimum of practically one per 1,000 children at age 10. The death-rate per 1.000 then rose to 2.73 at age 20, to 3.85 at age 30, to 12·04 at age 50, and to 53·29 at age 70.

Standardized Death-Rate. — In view of the marked variation of the age-specific death-rate with regard to age, it is evident that the crude death-rate of a community is strongly influenced by the age distribution of its total population. Even if two communities have identical age-specific death-rates, the crude death-rate of one may be higher than that of the other simply because it has a larger proportion of its population in the higher ages of life. According to one method adopted to obviate this difficulty in making a valid comparison of the situation in two communities, the death-rates are "standardized." The "standardized" death-rate of a community is the death-rate which would prevail in the community if

its population had the age distribution of some suitably selected standard population. The actual operation of computing a "standardized" death-rate consists in (1) multiplying the age-specific death-rates of the community by the number of persons at corresponding ages in the standard population; (2) summing the resulting products for all ages; (3) dividing the sum so obtained by the total population of the standard The result is the "standardized" death-rate. The process may be extended to standardize death-rates for variations in the sex and colour constitution of communities. Standardized death-rates are not always available and it accordingly becomes necessary to make mental allowance for the extraneous effects of age, sex and racial composition of communities whose crude death-rates are being compared. (See *Average Length* of *Life* below.)

International Comparisons. — The death-rates of the United States and of England and Wales compare very favourably with those for most countries of the world. Among the few countries with lower death-rates during the period 1936–38 are: Canada, with a death-rate of 9.8 per 1,000; Denmark. 10·7; The Netherlands, 8.7; Norway, 10·3; Australia, 9.5; and New Zealand, 9.2. The following countries, among others, experienced death-rates of 20 per 1,000, or more: Mexico, 23·0; Chile. 24.6; British India, 22.9; and Egypt, 27·5. In addition to these countries. there are many others with poor health conditions which do not compile their death statistics. The foregoing death-rates, and those for several other countries, are shown in Table I.

Trend. — There has been a steady decrease in the death-rate in most western countries since about the middle of the 19th century; the improvement has been particularly marked since 1900 (see Table 11). Thus, in England and Wales, the crude death-rate from 1851 to 1870 was, on the average, somewhat over 22 per 1,000, while during the decade 1901–1910 it averaged 16·9 per 1,000. The downward movement continued to a low of 12·0 per 1,000 during 1931–35; following a slight rise to 12·4 in 1937, it dropped to 11·6 in 1938. In the United States, the death-rates per 1,000 fell from an average of 15·7 during 1901–10 to a record low of 10·6 in 1938. France experienced a decline in the death-rate from a level of about 24 per 1,000 during 1851–80 to a level somewhat over 15 per 1,000 since 1930. In Germany, the drop was from about 27 per 1,000 during 1851–80 to a little less than 12 per 1,000 since 1926. A more accurate picture of changes in mortality conditions with lapse of time may be obtained from a comparison of age-specific death-rates. A comparison of this kind inevitably shows that the greatest improvements have been at the youngest ages, while practically no change in death-rate has taken place at the older ages. Thus, in the United States, the death-rate in the first year of life in 1901 was 124 per 1,000, while in 1937, it was only a little over 50 per 1,000. At age 20, the death-rates per 1,000 were 5.89 in 1901 and 2·73 in 1937, while at age 50 they were 14·59 and 12·04 respectively; at age 70, the corresponding figures were 56·41 and 53·29.

TABLE II. Average Annual Deaths per 1,000 Total Population in Selected Countries for Specified Periods and Years from 1851 to 1938

Period or Year	United Stales	England and Wales	France	Germany	Italy	Sweden
1851–60	*	22·3	24·0	26·4	*	21
1861–70	*	22·5	23·7	26·9	*	20

1937	11·2	12·4	15·0	11·7	14 2	12 0
1938	10·6	11·6	15·4	11·7	13 9	11 5

Marital Status. — When marital status is taken into consideration, it is usual to find, in western countries, that the death-rates are lowest among the married and highest for the widowed and divorced, while those for the single fall in-between. An exception to this general situation is found at the early child-bearing ages, where the risks of maternity among married women are sufficient to bring their death-rate to a level higher than that for the single, widowed, or divorced women of the same ages. The lower death-rates of the married as compared to those of the single at the same ages may be ascribed in part to the stabilizing influence of marriage, which is inducive to longevity; but also in part to the fact that persons in indifferent health may thereby be deterred from marrying. Death-rates per 1,000 for New York State, 1929–31, typify the differentials according to marital status: at age 20, the rate for married women was 3.78 and that for the single women was 2·50; at age 40, the rates were 5.34 for the married. 6·07 for the single, and 6·70 for the widowed. Among men, the death-rates per 1,000 at age 25 were 2·81 for the married and 4·71 for the single; at age 40, they were 6·08 for the married. 12.84 for the single, and 13.16 for the widowed.

Occupation. — There is a distinct gradation in the death-rates in passing from the lowest to the highest social-economic classes of a community. In a study based upon the United States census of 1930 and death statistics for 10 States during that year, it was found that the death-rates per 1,000 males between the ages 15 to 64 years in the several social-economic classes were as follows: unskilled workers, 13·1; semi-skilled workers. 9.9; skilled workers, 8·1; clerks, proprietors, managers and officials, 7.4; professional men, 7·0; and agricultural workers, 6.2 per 1.000 There is evidence that variation in death-rates of men according to social-economic class arises primarily from the environment associated with their occupation and that the occupational risks involved have only a relatively small influence.

Causes of **Death.**—Death-rates may also be computed according to the cause of death. Thus, the death-rates for the 10 leading causes of death per 100,000 total persons in the United States during 1937 were, in order of rank: heart disease, 268; influenza and pneumonia, 115; cancer, 112; cerebral haemorrhage, 87; accidents, 82; nephritis, 80; tuberculosis, 54; diseases of early infancy and congenital malformations, 49; diabetes mellitus, 24; and arteriosclerosis, 17. These 10 causes accounted for 79% of the deaths from all causes

There have been striking changes in the death-rates for certain causes of death in the United States since 1900. For example, the death-rate for typhoid fever was 36 per 100,000 in 1900, but only 2 per 100 000 in 1937 For tuberculosis, the decline was from 202 to 54 for the corresponding period; in the case of diarrhoea and enteritis the death-rate dropped from 133 to 15 Preventive measures have practically eliminated diphtheria as a cause of death; its death-rate fell from 43 in 1900 to 2 in 1937. On the

other hand, many important causes of death have shown increases in their rates. Mortality from heart disease practically doubled in the period from 1900 to 1937. The death-rate for cancer rose from 63 per 100,000 in 1900 to 112 in 1937. A large part of the increase in the death-rates for heart disease and cancer may be attributed to the increase in proportion of older persons in the population and to improvement in diagnosis. The death-rate per 100,000 from diabetes mellitus rose gradually from 10 in 1900 to 24 in 1937. Deaths from automobile accidents, which were very rare in 1900, claimed 30 out of every 100,000 persons in 1937.

Average Length of Life.- he average length of life, which is also known as the expectation of life at birth, is the number of years the average newly born baby may expect to live if the age-specific death-rates remain constant as of the calendar year or period for which the figure is computed. The average length of life thus provides a composite measure of the age-specific death-rates of a community independent of its age distribution. The superiority of this figure, over the "standardized" death-rate, as a composite measure lies in the fact that it is independent of any arbitrarily chosen age distribution used as a standard.

The average length of life for white persons in the United States is much the same as that for England and Wales. In 1937, white males in the United States had an average length of life of 60.75 years and white females of 65.08 years, while the corresponding figures for England and Wales in 1937 were 60.18 years for males and 64.40 years for females. Sweden has the longest series of figures for the average length of life. Whereas males in that country had an average length of life of only 33.20 years in 1755–76, the figure increased steadily to 63.22 years in 1931–35. For the average length of life for other countries see Table III.

Lotka, *Twenty-Five Years* of Health Progress (Metropolitan Life Insurance Co., 1937); Walter F. Wilcox, Introduction to the Vital Statistics of the United States (Bureau of the Census, 1933). (A. J. Lo.)

DEATH VALLEY, a depressed basin in Inyo county, Calif. The name commemorates the fate of a party of "forty-niners" who perished here, by thirst or by starvation and exposure. The exceedingly arid Death Valley region lies immediately north of the Mojave desert and then stretches east from the Sierra Nevada mountains, covering a large part of Inyo county and extending into Nevada. The valley proper, which is some 50 m. long and on an average 20 to 25 m. broad from the crests of the enclosing mountain ranges, is below sea-level (276 ft.). This is the lowest point on the continent and in a direct line it is less than 80 m. E. of Mt. Whitney, 14,495 ft. high, the highest peak in the United States. The mountains about it are high and bare, and brilliant with varied colours. The Amargosa river, entering the valley through a deep canyon at the south, disappears in the basin, leaving the surface crusted with white salts. The fact that this limited region is the final area of concentration for a very extensive drainage system is thought to explain the extent and supposed depth of the deposits of salt, borax and nitrate of soda found in the basin. Death Valley is one of the hottest regions in the world. The minimum daily temperature in summer is rarely below 70° F (in the shade); the maximum may, for days in succession, be as high as 120°, and the U.S. Weather Bureau has recorded an extreme of 134°.

See W. C. Mendenhall, "Some Desert Watering Places in South-eastern California and South-western Nevada," U.S. Geological Survey, Water Supply Paper No. 224.

DEATH-WARNING, a term used in psychical research for an intimation of the death of another person received by other than the ordinary sensory channels, *i.e.,* by (1) a sensory hallucination or (2) a massive sensation, both being of telepathic origin. (See TELEPATHY.) Both among civilized and uncivilized peoples there is a widespread belief that the apparition of a living person is an omen of death; but until the Society of Psychical Research undertook the statistical examination of the question, there were no data for estimating the value of the belief. (See HALLUCINATION.)

DEATH-WATCH, a popular name given to insects of two distinct families which burrow and live in old furniture, and produce a mysterious "ticking" sound vulgarly supposed to foretell the death of an inmate of the house. The name is often applied to two small beetles *Xestobium rufovillosum* and *Anobium punctatum* (fam. Anobiidae) but belongs more properly to the former insect. The sound is a sexual call, and is produced by the beetle striking the front of the head upon the surface upon which it is standing. Certain book-lice (order Psocoptera) are sometimes known as lesser "death-watches," but the ability of such minute soft insects to produce audible sound is doubtful. The names *Atropos pulsatoria* and *Troctes divinatorius,* given to two of the common species, bear witness to the superstition regarding the fateful significance of the sound.

DE BARY, HEINRICH ANTON (1831–1888), German botanist, was born on Jan. 26, 1831, at Frankfurt-on-Main. He studied medicine at Heidelberg, Marburg and Berlin, and in 1853 settled at Frankfurt as a surgeon. In 1854 he became privatdocent for botany in Tiibingen, and professor at Freiburg in 1855, migrating to Halle in 1867, and in 1872 to Strasbourg, where he was the first rector of the University, and where he died on Jan. 19, 1888.

De Bary will be remembered as the founder of modern mycology, a science which he revolutionized by his celebrated *Morphologie und Physiologie d. Pilze,* etc., of 1866. His appreciation of the real significance of symbiosis and the dual nature of lichens is one of his most striking achievements. It is as an investigator of the then mysterious Fungi, however, that de Bary stands out. He not only laid bare the complex facts of the life-history of many forms; *e.g.,* the Ustilagineae, Peronosporeae, Uredineae and many Ascomycetes, but insisted on the necessity of tracing the evolution of each organism from spore to spore. One of his most fruitful discoveries was the true meaning of infection as a morphological and physiological process, which he traced in *Phytophthora, Cystopus, Puccinia* and other Fungi, and thereby demonstrated the significance of parasitism. He showed wherein lay the essential differences between a parasite and a saprophyte.

These researches led to the explanation of epidemic diseases, de Bary's contributions to which are well seen in his classical work on the potato disease in 1861. They also led to his discovery of *heteroecism* (or metoecism) in the Uredineae, the truth of which he demonstrated in wheat rust experimentally (1863). He described the phenomena of sexuality in Peronosporeae and Ascomycetes—*Eurotieum,* Erysiphe, *Peziza,* etc., and established the existence of parthenogenesis and apogamy on a firm basis. He did much work on the Chytridieae, Ustilagineae, Exoasceae and Phalloideae, as well as on the Myxomycetes; he contributed to algology in his monograph on the Conjugatae (1858), and investigated Nostocaceae (1863), Chara (1871), Acetabularia (1869), etc. In 1877 appeared his *Comparative* Anatonty of Ferns *and* Phanerogams, and in 1885 his Lectures on Bacteria (Eng. trans. 1887).

Memoirs of de Bary's life will be found in *Bot. Centralbl.* (1888), xxxiv. 93, by Wilhelm; *Ber. d. d. bot. Ges.* vol vi (1888) p. viii., by Reess, each with a list of his works; *Bot. Zeitung* (1889), vol. xlvii. No. 3, by Graf zu Soems-Laubach.

DEBENTURES AND DEBENTURE STOCK: *see* COMPANY LAW.

DEBORAH, the name of two women mentioned in the Old Testament (Heb. for "bee"). (1) Foster-mother of Rebecca, buried under the "Oak of Weeping" below Bethel (Gen. xxxv. 8). It has been suggested that this tree is connected with the "palm-tree of Deborah," between Bethel and Ramah (Judges iv. 5), the home of Deborah. (2) This latter is the famous prophetess and "judge," who, in company with Barak, son of Abinoam, delivered Israel from a Canaanite oppression.

Two narratives of this exploit have been preserved, an account in prose in Judges iv., and a descriptive poem in Judges v. They differ in one or two important detsils. The most obvious contrast is in the identity of the enemy overthrown. The prose narrative makes the enemy Jabin, king of Hazor, though a prominent part is played by his commander-in-chief, Sisera, who lived at Haro-sheth-haggoyim. In the poem Jabin does not appear, and Sisera is an independent king. It is possible that the introduction of Jabin is due to the conflation of two traditions, one of which referred to Sisera, while the other was parallel to the story of the defeat of Jabin, king of Hazor, by Joshua (Josh. xi. 1–9) at the Waters of Merom. Another contradiction is to be found in the manner of Sisera's death. In Judges ch. iv. he is murdered in his sleep, in ch. v. he is struck down from behind whilst drinking a bowl of milk.

Assuming that the tradition preserved in ch. v. is the older, we can do something to reconstruct the actual history of the events. Israel holds the wilder parts of the country, the hills and the forests, but their settlements in the central range are cut off from those in the northern hills by a chain of Canaanite (Egyptian?) fortresses down the plain of Esdraelon. For the time the plain dominates the hills; the Israelites are disarmed and their communications are cut. At the instigation of the prophetess Deborah, and possibly aided by her spells, Barak raises the clans of Ephraim, Benjamin, Machir (Manasseh), Zebulun, Issachar and Naphtali. Asher, Dan, Gilead (Gad) and Reuben hold aloof. Judah and Simeon are not mentioned. The Israelite clans fall on the enemy at Taanach; a thunderstorm, in which Israel sees the coming of Yahweh, strikes terror into the Canaanites, their chariots are useless on the sodden ground, and the Kishon swollen by torrential rains, sweeps away the fugitives. Sisera escapes on foot, pursued by Barak, but, taking refuge in the tent of Heber the Kenite, is treacherously slaughtered as he drinks.

The poem is one of the most important documents of ancient times. It is contemporary with the events to which it refers, and is therefore invaluable as a picture of the life of Israel in the early days of the settlement. Further, it is in itself a magnificent lyric outburst, and proves a very high standard of poetic skill in ancient Israel.

DE BOSIS, ADOLFO (1863–1924), Italian poet and man of letters, was born at Ancona. He studied at the University of Rome, where he graduated in law and practised for a few years, but was always more interested in literature. In 1895 he became editor of *Il Convito.* Although he became manager of the Italian Carbide Company, he continued his literary activities. He translated Shelley's "Prometheus Unbound" (1922) and Homer into Italian verse. He collected his own poems in a volume entitled *Amori ac silentio sacrum* (1900, rep. 1914, 1923). De Bosis exercised considerable influence on the younger authors of his time, many of whom were inspired by his deep love of the classics and keen sense of beauty. He died near Ancona on Aug. 29. 1924.

DEBRECEN, one of the largest towns in Hungary (pop. 1939, 128,442), is at the junction of three contrasted regions, viz.:—the extensive Hortobagy pastures or *puszta,* the Nyirseg sandy plateau and the marshes of the Berettyo. In early times it commanded two important routes, the salt way from Szatmar to western Europe and the road from Bohemia to Transylvania, both traversed by important trade movements in the mediaeval period; it is still an important railway junction. It developed as a market centre with special interests in cattle and grain and as a walled town attracted numerous refugees from surrounding plundered villages during the Turkish advance in the 15th century. Partly as a result of this the municipality acquired large areas of territory until it covered an area of nearly 400 sq.mi. Much of this was cultivated by farmers who maintained houses and often worked in the town during the winter season but of recent years villages known as *tanyas* have grown up in the surrounding district. The town tends more and more to function as the centre of economic and intellectual inspiration for its region through its fairs, its agricultural academy, its well-equipped university and its long tradition of spiritual independence which has made it the focus of Protestant ideals in Hungary and gained for it the name of "Calvinistic Rome." This outlook first determined in the 16th century has caused a stormy history but strengthened its position in the national structure.

Apart from its agricultural activities many varied industries have developed upon a small and local scale, notably the manufacture of soap, prepared foodstuffs and tobacco.

DEBS, EUGENE VICTOR (1855–1926), American Socialist leader, was born at Terre Haute, Ind., on Nov. 5, 1855. On leaving the public schools he became in 1871 a locomotive fireman. In 1879 he was elected city clerk of Terre Haute and in 1881 was re-elected. During 1885 he was a member of the Indiana legislature. Previous to this, in 1880, he was elected secretary and treasurer of the Brotherhood of Locomotive Firemen and was appointed editor of *The Locomotive Firemen's Magazine.* In 1893 he organized the American Railway Union and was elected president of the union, serving four years. In 1894 he led the strike which, beginning in the Pullman-car plants, soon involved the railways leading into Chicago.

Debs was arrested on a charge of conspiracy to kill, and acquitted, but was later convicted of contempt of court for violating an injunction, and sent to gaol for six months (May–Nov. 1895). In 1897 he joined the Socialist movement. He was Socialist candidate for the Presidency of the United States in 1900, 1904, 1908, 1912 but declined the nomination in 1916. In 1907 he was on the editorial staff of the *Appeal to Reason,* and in 1914 became editor-in-chief of the National Rip-Saw, a Socialist paper published at St. Louis. He was an advocate of industrial unionism, though he eventually dissociated himself from the I.W.W. (*q.v.*), and was one of the chief opponents of Samuel Gompers (*q.v.*).

He was a pacifist and in Sept. 1918 was convicted of violating the Espionage Act and sentenced to ten years in the penitentiary. In 1920, while in prison, he was again nominated presidential candidate by the Socialists and received 915,302 votes. His sentence was commuted by President Harding in Dec. 1921. He died at Elmhurst, Ill., Oct. 19, 1926. He was one of the foremost figures in American Socialism.

He was the author of *Liberty* (1895); *Unionism and Socialism, a Plea for Both* (1904); *The American Movement* (1904); *Industrial Unionism* (1905); *The Growth of Socialism* (1910); *The Children of the Poor* (1911); and *Walls and Bars* (1927). Also *see* Stephen Marion Reynolds, *Life of Eugene V. Debs* (1910); Max Eastman, *The Trial* of *Eugene V. Debs* (1919); Walter Hurt, *Eugene V. Debs: an Introduction* (1919); David Karsner, *Debs: His Authorized Life and Letters* (1919); and Scott Nearing, *The Debs' Decision* (1919). Consult also *Debs' Magazine.*

DEBT, a definite sum due by one person to another. Putting aside those created by statute, recoverable by civil process, debts may be divided into three classes: (1) judgment debts *(see* JUDGMENT DEBTOR), (2) specialty debts, (3) simple contract debts. As to judgment debts, it is sufficient to say that, when by the judgment of a court of competent jurisdiction an order is made

that a sum of money be paid by one of two parties to another, such a debt is not only enforceable by process of court, but it can be sued upon as if it were an ordinary debt. A specialty debt is created by deed or instrument under seal. Until 1869 specialty debts had preference under English law over simple contract debts in the event of the bankruptcy or death of the debtor, but this was abolished by the Administration of Estates Act of that year. The main difference now is that a specialty debt may, in general, be created without consideration, as, for example, by a bond under seal, and that a right of action arising out of a specialty debt is not barred if exercised any time within 20 years, whereas a right of action arising out of a simple contract debt is barred unless exercised within six years. (See LIMITATION, STATUTES OF.) Any other debt than a judgment or specialty debt, whether evidenced by writing or not, is a simple contract debt. There are also certain liabilities or debts which arise from tacit or implied contracts to pay.

At English common law debts and other choses in action were not assignable (see CHOSE), but by the Judicature Act, 1873, any absolute assignment of any debt or other legal chose in action, of which express notice in writing is given to the debtor, trustee or other person from whom the assignor would have been entitled to receive or claim such debt, is effectual in law The discharge of a debt may take place either by payment of the amount due, by accord and satisfaction, *i.e.*, acceptance of something else in discharge of the liability, by set-off (*q.v.*), by release, or under the law of bankruptcy (*q.v.*). It is the duty of a debtor to pay a debt without waiting for any demand, and, unless there is a place appointed either by custom or agreement, he must seek out his creditor for the purpose of paying him unless he is "beyond the seas." Payment by a third person to the creditor is no discharge of a debt, as a general rule, unless the debtor subsequently ratifies the payment.

Imprisonment for debt, the evils of which have been so graphically described by Dickens, was abolished in England by the Debtors Act, 1869, except in cases of default of payment of penalties, default by trustees or solicitors and certain other cases. But in cases where a debt or instalment is in arrear and it is proved to the satisfaction of the court that the person making default either has or has had since the date of the order or judgment the means to pay the sum in respect of which he has made default and has refused or neglected to pay, he may be committed to prison at the discretion of the judge for a period of not more than 42 days. In practice, a period of 21 days is usually the maximum period ordered. Such an imprisonment does not operate as a satisfaction or extinguishment of the debt, and no second order of commitment can be made against him for the same debt, although where the court has made an order or judgment for the payment of the debt by instalments a power of committal arises on default of payment of each instalment. In Ireland imprisonment for debt was abolished by the Debtors Act (Ireland) 1872, and in Scotland by the Debtors (Scotland) Act, 1880. In France it was abolished in 1867, in Belgium in 1871, in Switzerland and Norway in 1874 and in Italy in 1877. In the United States imprisonment for debt was universal under the common law, but it has been abolished in every State, except in certain cases, as where there is any suspicion of fraud or where the debtor has an intention of removing out of the State to avoid his debts. (See also CONTRACT; BANKRUPTCY; PAYMENT; NATIONAL DEBT.)

In the United States the law is in general as stated above. But the effect of a seal to make consideration unnecessary to the creation of a debt has been very generally abolished by statute; even where not abolished, the effect has commonly been reduced to raising a prima facie presumption of consideration. Yet the seal commonly retains its effect of lengthening the period of limitation. The notice of an assignment need not, in the United States, be given to the debtor in writing. And the English rule that payment by a third person will not discharge has either been abolished or rendered substantially null by liberality in construing the slenderest of evidence into "ratification" by the debtor.

Debt, it should be noted, is the legal counterpart of the economic concept "credit" (*q.v.*); and where liquidity of credit is important, debts are commonly put in the form of negotiable instruments, to facilitate transfer. (See BILL OF EXCHANGE.) There is, however, some financing done by merchants transferring their book accounts — though at a heavy discount. (See ASSIGNMENT.)

DEBT CONVERSION. Conversion is the term applied to the exchange of any form of security for another form of security. Though the exchange is usually connected with a decrease in cost to the borrower of the security in question, this is not always the case. It is sometimes necessary, more particularly in time of war when a series of loan operations is probable, to assure subscribers to an earlier issue that they will be entitled to "convert" it to any later issue made on more favourable terms. Such a provision was a common feature of British war loans, for instance, holders of $3\frac{1}{2}\%$ War Loan were entitled to convert into 5% War Loan, and holders of National War Bonds of the first three series retained a right to convert at any time on favourable terms into 5% War Loan. Similarly in the United States holders of the $3\frac{1}{2}\%$ First Liberty Loan were entitled to convert into the 4% Second Liberty Loan and holders of the Second Liberty Loan into the $4\frac{1}{4}\%$ Third Liberty Loan.

But the more frequent and more interesting cases of conversion arise in connection with debt reduction. Public debt, other than the relatively limited amount created for revenue producing purposes, usually results from a period of financial emergency in which revenue has not covered expenditure and the State has accordingly had to pledge its credit in circumstances least favourable to itself. It has, therefore, always been the natural object of financial statesmanship, as soon as normal financial conditions return, to reduce the burden of debts created under duress — after an earthquake, a famine or a war. This course is dictated by the consideration that ex *hypothesi,* the debt is raised at a price higher than the credit of the State in normal circumstances would justify. It is also desirable because as a rule the great public debts such as war debts, justified and even inevitable as they may have been, do not leave behind them any concrete object from which posterity can see that it draws tangible benefit.

Methods of Debt Reduction. — The burden of debt may be reduced in various technically distinguishable ways. In the first place, debt may be redeemed either out of budget surpluses (in Great Britain called "old sinking fund") or out of a sinking fund provided within the normal budget (in Great Britain called "new sinking fund"), these resources being applied either to paying off debt as it falls due or to the purchase of public stock or bonds on the Stock Exchange at current market prices or, where the loan contract so permits, to drawings of individual bonds by lot for payment at a fixed price, usually not necessarily at par. These latter redemptions can be effected irrespective of the date on which the debt holder is entitled to claim repayment from the State as a right. In the second place, maturing debt, that is to say, debt for which the repayment date as fixed by the loan contract has arrived, may be repaid out of money raised by new borrowing on more favourable terms. This operation, which is properly a form of redemption, is frequently, though inaccurately, described as conversion. In the third place holders of the debt which has not yet reached its maturity date may be persuaded to exchange their holdings into some other form of debt. This is debt conversion proper, its essential feature being the exchange of one obligation for another. Conversion is normally a voluntary process. Forced conversion, such as for instance the Italian "Lictor" Loan of 1926, is a practical operation in certain cases. Whether it is a wise operation depends on such factors as the financial position and traditions of the country concerned; the nature of the crisis with which it is faced; and its probable needs for further credit. Obviously, when a particular class of persons have lent money to the community on agreed contractual terms, it requires very exceptional circumstances to justify subsequent compulsion to accept other terms presumably less advantageous to themselves.

These three methods of debt reduction are frequently practised in combination. Indeed, with a large volume of debt no one

of them can be successful in isolation; each contributes to, and is a condition of, the success of the others. Large revenue surpluses applied to debt redemption in Great Britain and the United States of America in the years immediately following 1918 were the essential preliminary to that appreciation of the national credit of the two countries which caused their public securities to rise in price and consequently enabled the two Treasuries to replace old debt by new debt on cheaper interest terms. Where the total debt is large, the maintenance of a substantial sinking fund provided out of revenue is primarily required for this purpose. A reduction in the supply of any commodity tends to intensify the demand for that commodity and thus to increase the price which the seller can obtain. **A** reduction in the volume of debt has precisely the same effect. The borrowing Government can sell its wares at a better price by reducing the amount in supply. A sinking fund which removes stock or bonds from the market and cancels them enhances the price of what remains and enables maturing debt in excess of what can actually be paid off to be replaced at a lower interest rate. Similarly, the reduction in the volume and the increase in the value of Government securities enables conversion schemes to be launched with success.

It is futile to single out any one method of debt reduction as a success or a failure. The general result usually flows from the combined use of all methods; and the attribution of specific portions of that result to any single method tends to be misleading. Redemption and conversion go together. Thus, in Great Britain the interest charge for the debt was reduced by £19,000,000 per annum in the period between 1920–21 and 1925–26. If, to compare like with like, allowance is made for the fact that in the former year only £289,000 was paid on the debt due to the United States Government while in 1925–26 the full interest charge of over £28,000,000 was paid, the real reduction in interest charge is seen to be more than £47,000,000 per annum. Of this reduction it may be said that £29,500,000 was due to the repayment of debt from revenue; £16,000,000 to the replacement of short-term floating debt by cheaper floating debt; and £1,500,000 to strictly identifiable long-term conversions. It is, however, impossible to say what would have been the result of any one of these three methods without the concomitant of the other two.

Conditions of Conversion. — It is usually held that for successful conversion certain preliminary conditions must be fulfilled. The problem is to persuade the holder of a given security that it is in his interest to accept instead another security subject to different terms as regards interest, redemption date and possibly other privileges. The holder will probably be affected in the first place by his belief in the political stability of the borrowing Government. He will not wish to extend in time his commitment to a State which is politically insecure or which for any reason is likely in the visible feature to depreciate its credit. He will require to be convinced that his new commitment if he accepts conversion, is not likely to fall in value. The first condition is therefore the prospect of general stability as regards both external and internal politics. In the next place the investor will need to be persuaded that general financial conditions are such that the new security which he is offered is likely to represent as much as he can expect to receive if he waits until his existing security is paid off and he has to seek a new investment. The normal type of conversion would be somewhat as follows: A security is due for repayment or can be called by the borrower for repayment, say five years hence. The borrower wishes to replace that security now by a conversion issue carrying a lower rate of interest and repayable, say 30 years hence. His chance of persuading the holder to accept such a proposal will therefore depend on the holder's estimation of the relative advantages of making certain of a lower rate of interest for the longer period of 30 years, and of retaining for another five years his original (higher) rate of interest subject to the risk that when paid off in five years time he will not be able to reinvest his money so profitably as if he had accepted the conversion offer. The second condition of successful conversion is therefore a general belief that financial tendencies are such that future interest rates are likely to decline. The outward sign of such a belief is usually that the security to be converted is quoted in the market at or over its redemption value, for that means that the market thinks that the interest payable on that security is above the normal current rate. Thus for the 14 months previous to the Goschen conversion in 1888 Consolidated 3% Stock had averaged £101 9s. 9d. in spite of the fact that the Government could call the stock for repayment at £100. Finally much depends on the amount of the issue to be converted. A very large issue is physically difficult to handle; the number of holders who from ignorance or inertia will not respond to a conversion offer, even if advantageous to them, may in the aggregate be great; and for both reasons the amount of the issue not converted may remain considerable. It may almost be said that in normal circumstances a third condition of successful conversion is that not too much is attempted at any one time. In many cases there is a special feature which emphasizes the importance of this condition. It is frequently necessary in order to bring holders into a conversion scheme to announce that such holders as do not convert will be paid off by the borrowing Government. The unwillingness of the holder to be paid off is a motive to induce him to convert. But a Government can only make such an announcement if it can feel sure that it can readily raise the amount of cash it will require to pay off those who do not convert. This will depend partly on the size of the issue and therefore of the probable unconverted remanet to be paid off; and partly on the position of the Government's short-term debt. The Government will probably have to have recourse to short-term borrowing to meet the remanet, and the cost and possibility of such borrowing will depend entirely on the amount of short Government paper already in existence. At the time of the Goschen conversion the unfunded debt (treasury bills, exchequer bills and exchequer bonds) was only £17,385,100; and the Government had consequently no difficulty in raising at reasonable rates the £19,817,952 it temporarily required to redeem non-converted stock.

British Conversions. — The more important conversions of British Government debt have been as follows: —

(a) Before *the* World *War:*

1749. Pelham offered holders of £57,703,475 4% stocks then standing above par a new stock bearing 4% interest till 1750, 3½% interest till 1757 and thereafter 3% interest. £54,413,433 stock was converted at an annual saving of £272,067 for five years and then of £350,101; and the balance was paid off at par.

1822. Vansittart offered holders of Navy 5% and Irish 5%, then standing at 108⅞ to an amount of £152,422,143, a 4% stock at 105; £149,627,867 was converted at an annual interest saving of £1,197,025; and the balance of £2,794,276 paid off in cash. This conversion owing to the issue at 105 added £7,481,350 to the nominal total of the National Debt.

1824. Robinson offered holders of £76,248,180 4% annuities then standing at 101¾ and new 3½% stock at par. £68,000,000 was converted at an interest saving of £381,242 per annum.

1830. Goulburn offered holders of the £153,561,091 4% stock (remaining from Vansittart's operation in 1822) now standing at 1024, either 34% stock at par or 5% stock at 70. £150,790,179 was converted, all but £670,567 into 3½% stock, with an annual interest saving of £753,952.

1844. Goulburn ofiered holders of the £248,860,663 34% stock resulting from the 1824 and 1830 conversions now standing at 101⅝ conversion at par into a stock carrying 3¼% for ten years and then 3%. £248,757,311 was converted at an annual saving of £621,893 per annum for the first ten years, and £1,243,786 per annum thereafter.

1884. Childers endeavoured to convert £612,761,061 3% stock standing at 101¾ into either 24% stock at 102 or 2½% stock at 108. But only £22,362,595 was converted, at a saving in interest of £62,303 per annum, and an increase of £1,515,604 on the nominal total of the debt.

1888. Goschen offered the holders of £557,992,508 new 3% (Goulburn) Reduced Three per cents (Pelham) and 3% Consols, then standing at 103¾, a new stock at par ("Consols") bearing 2¾% interest, to be reduced after 25 years to 2½%. £514,314,702 was converted (over 92%) at an annual saving of £1,411,943 for 25 years and of £2,823,886 thereafter. (It is interesting to

observe that in every case the stock converted was standing at a high price; that the largest operation attempted, that of Childers in 1884, was a failure; and that chancellors of the Exchequer were not deterred by increase in nominal debt from effecting interest savings. It will also be observed that stocks originally 5% or 4% were brought down to 34% or 2½% by a series of operations. In the conversions of Vansittart, 1822, Goulburn, 1830 and 1844, and Goschen, 1888 [except as regards Reduced Threes and Consols], the assent of holders to conversion was assumed unless they signified dissent within a prescribed period.)

(b) Since the World War:

Between March 31, 1914, and March 31, 1920, British Deadweight Debt rose from £649,770,000 to £7,831,744,000, and of the later enormous figure only some £315,000,000 was permanently funded. The scope for debt conversion, provided that satisfactory financial and political conditions could be secured, was thus large. In addition to cash amounting in the six years 1920–26 to £708,308,000 applied out of revenue to debt redemption, and to very large reborrowings to meet maturities as they fell due, the British Treasury launched a number of pure conversion operations. These operations, still in 1928 in progress, should be regarded as a single whole rather than a series of separate transactions each by itself comparable, say, to the Goschen conversion. The difficulties arising from (a) the slow recovery to sound financial conditions, (b) the large amounts to be handled, and (c) the large outstanding floating debt are very clearly reflected in the relatively slow progress. The Treasury have had to conduct their operations under far from ideal conditions.

The main conversion operations have been as follows:

April 1921. Holders of 5% National War bonds repayable at a premium on various dates from Oct. 1922 to Sept. 1925, were offered 3½% Conversion Loan at £160 to £163 for each £100 bond. £164,000,000 5% bonds were converted into £266,000,000 3½% loan at an increased interest charge of £1,110,000 per annum against which must be set (a) the advantage of postponing the maturity for many years and avoiding an increase in short-term debt, (b) a saving of £3,381,000 in premiums.

February 1922. Holders of 5% Exchequer bonds were offered 3½% Conversion Loan at £136. £14,500,000 were converted into £19,500,000 Conversion Loan, with an interest saving of £35,000 per annum.

April 1922. £70,000,000 5% War bonds due in October 1922 and April 1923 converted into £94,000,000 3½% Conversion Loan at £134, with an interest saving of £218,000 per annum.

1923. £11,000,000 5% National War bonds converted at par (with cash payment of £2 15s %) into 4½% Treasury bonds 1932. Interest saving, £57,000 per annum.

1924. Holders of 5¾% Exchequer bonds offered the choice of (a) 4½% Conversion Loan 1940/44 at par (with cash payment of £2 15s %) or (b) 44% Treasury bonds 1934 at par. £82,000,000 of bonds were converted at par, with an annual interest saving of £1,026,800.

April 1924. Holders of 5% War Loan 1929–47 (to a total of £200,000,000) were offered 4½% conversion Loan 1940/44 at 103. £148,000,000 was converted into £153,000,000 Conversion Loan at an interest saving of £541,000 per annum.

1925. Three issues of 34% Conversion Loan: Jan. for £59,660,000; April £30,000,000; Sept. £40,000,000; thus reducing the floating debt from £845,825,000 in 1924 to £816,641,000.

Oct. 1926. Holders of 5% Treasury Bonds invited to convert and £82,700,000 converted; Dec. new issue of Consolidated Loan, conversions to which amounted to £128,060,313.

Feb. 1927. Holders of £135,247,000 5% Treasury bonds 1927, £135,258,000 5% National War bonds were offered conversion into 4½% Treasury bonds 1934 at par or 4% Consols at varying prices. £94,989,000 Treasury bonds and £65,341,000 War bonds were converted at an interest saving of £466,000 per annum. At the same time £35,420,000 tax free 4% War bonds were converted into £41,796,000 4% Consols at an increased gross interest of £165,000 per annum but subject to tax.

Dec. 1928. Holders of £153,987,000 5% War bonds payable at 105 were offered 5% Treasury bonds 1933–35 at £105 10s. £110,857,000 were converted into £116,984,000 Treasury bonds at an increase in interest of £305,000.

Down to 1928 the net result of conversions on the annual interest charge was not great. Their importance lay in providing by postponement for the heavy maturities of debt and in clearing the way for future conversions. In 1932, as a measure to promote national recovery after the narrowly averted financial crisis of 1931, the large 5% War Loan was converted to 3½%.

United States Conversions.—After the Civil War the Federal debt amounted to about $3,000,000,000 of which $500,000,000 was short-term debt. Secretary Hugh McCulloch commenced in 1865 by turning this short debt into go-year 6% Notes. By 1868 he had repaid out of surplus $519,000,000; and he then, while maintaining a high annual debt redemption, converted these 30-year Notes into 20-year Notes (with a right to pay them off in five years). His successor, Secretary Boutwell, having further reduced the debt outstanding, was able in 1870 to convert the 6% Notes into $200,000,000 5%, $300,000,000 44% and $1,000,000,000 4% Notes.

After the World War the United States had the advantage of a debt two-thirds the size of that of Great Britain, very much larger resources on which to draw, and a revenue for many years consistently in excess of its normal appropriations, so that by December 31, 1930 it had reduced its total indebtedness from $26,596,701,648.01 (Aug. 31, 1919) to $16,026,087,087.07. By a series of conversions in 1924, 1927, and 1928 it also cut its interest charges nearly $21,000,000. per annum.

But much more extensive refunding operations were carried out during the years 1933–35 when a favorable money market enabled the Government to bring its average interest rates down drastically. Most conspicuous in this program was the redemption of all outstanding Liberty bonds, successive calls were announced for April 15, 1934, October 15, 1934, April 15, 1935, June 15, 1935, and October 15, 1935; and before each date new bonds or notes at substantially lower rates were offered in exchange for the called issue. These offers were all well subscribed with the result, according to a public announcement by Secretary of the Treasury Morgenthau, that the nation stood to save approximately $100,000,000. yearly in interest.

DEBTS, INTER-ALLIED: see INTER-ALLIED DEBTS.

DEBUSSY. CLAUDE ACHILLE (1862–1918), French composer, was born at St. Germain-en-Laye on Aug. 22, 1862, and died in Paris on March 26, 1918. His musical training he received at the Paris Conservatoire under Marmontel, Lavignac, Massenet and Guiraud. There, between 1874 and 1884, he gained many prizes for solfège, pianoforte playing, accompanying, counterpoint and fugue, and, in the last-named year, the coveted Grand Prix de Rome by means of his cantata *L'Enfant* prodigue. In this composition germs of unusual and "new" talent were already latent, though, in the light of later developments, it is not very easy to discern them, for then Debussy had not come under the influence which ultimately turned his mind to the system which he afterwards used in so remarkable a manner.

Early Tendencies.—It was not long, however, before these highly-individual tendencies revealed themselves. For, in order to fulfil that condition of the Prix de Rome which entails the submitting periodically of compositions to the judges, Debussy sent to them his symphonic suite, Printemps, to which exception was immediately taken by the judges on the ground of its formlessness and other unacademic qualities. Following in the wake of Printemps came La *damoiselle* klue for female voices (solo and chorus) and orchestra—a setting of a French version of Rossetti's "The Blessed Damosel"—which, in the eyes of the judges, was even more unorthodox than its predecessor, though, be it said, fault was found almost as much with the libretto as with the music. So poor was the impression produced by these works, indeed, that

both were denied the customary public performance.

The Rome period over, Debussy returned to Paris, whence shortly he went to Russia, where he came directly under the influence already referred to. That is to say, he absorbed here the native music, especially that of Moussorgsky who, recently deceased, had left behind him the reputation of a musical nihilist, and on his return to Paris the results became speedily apparent. At the same time the effect of this Russian visit should not be overrated, and there is no reason to suppose that it did more than confirm and strengthen tendencies which were already deeply implanted, and would have quite certainly revealed themselves in due course in any event.

Recognition Tardy. — Public recognition was rather slow in coming to Debussy, but in 1893 the Société Nationale de Musique performed his *La damoiselle élue,* in 1894 the Ysaye quartet introduced the string quartet (one of his greatest achievements), while in the same year was heard another of his most remarkable and individual creations, the now world-famous prelude *L'Après-midi d'un faune,* which could no longer leave room for doubt as to the originality of its composer. Concurrently also, his pianoforte pieces were being performed more and more. The works named were followed in due course by his only opera, *Pelléas et Mklisande,* first heard at the Opéra Comique on April 30, 1902. Then it was little understood, but understanding came in due course, and it was recognized as one of the most notable contributions to the repertory of the lyric stage since Wagner.

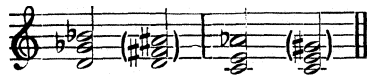
In an Apologia which he subsequently published, Debussy declared that in composing *Pelléas* he had wanted to dispense with "parasitic musical phrases." "Melody," he observed, "is, if I may say so, almost anti-lyric and powerless to express the constant change of emotion and life. Melody is suitable only for the chanson, which confirms a fixed sentiment. I have never been willing that my music should hinder, through technical exigencies, the change of sentiment and passion felt by my characters. It is effaced as soon as it is necessary that these should have perfect liberty in their gestures or in their cries, in their joy and in their sorrow." And these principles found exquisite expression in the work as carried out, of which Dr. Ernest Walker has happily observed — "It is one of the great landmarks in the history of opera; it is the summit of musical impressionism, catching every faint nuance of the words, always suggesting rather than saying, but always tense and direct and full of throbbing beauty."

Works for Piano and Orchestra. — But, outstanding as is *Pelléas* et *Me'lisande,* it is surpassed even in importance by Debussy's contributions to piano literature, in which by the novelty of his methods he was responsible. for the greatest development which had been efiected in the technique since Chopin. In such things as *La Soirée dans Grenade, Jardins sous la pluie, L'isle joyeuse, Reflets dans l'eau, Bruykres* and *La Cathédrale engloutie,* he revealed possibilities which had previously been entirely unsuspected in the best known and most exhaustively studied of all instruments. Such music might not be of the highest order, indeed it made no pretensions to bigness or grandeur, but in its delicacy, subtlety and refinement, in its exquisite adaptation of the most novel means to the purposes of the most sensitive musical impressionism, it possessed a fascination all its own, and may be said to have opened a new chapter in the history of the art.

Debussy's work for the orchestra was, as a whole, of less significance in the technical sense; he did many fine things also, besides the consummate *L'Après-Midi,* in this field. Such are the exquisite nocturnes *Nuages, Fêtes* and *Sirènes,* one and all the last word in delicate impressionism. Neither should mention be omitted of his songs, all characterized by the same individuality of style and perfection of workmanship distinguishing his music as a whole, and including such examples as "Mandoline," "Recuillement," "Fantoches," "La Flûte de Pan" and "La Chevelure," things which have long since won universal favour.

Musical System. — AS to the theories, so much debated, of this remarkable musician, probably in the whole range of musical history there has not appeared a more difficult theorist to "place." Unquestionably Debussy introduced a new system of colour into music, which has begun already to exert widespread influence. Roughly, Debussy's system may be summarized thus:

First, a scale basis is of six whole tones (enharmonic), as middle C, D, E, G♭, A♭, B♭, which are of excellent sound when super-imposed in the form of two augmented unrelated triads,



used frequently incomplete (*i.e.,* by the omission of one note) by Debussy.

Now, upon the basis of an augmented triad a tune may be played above it provided that it be based upon the six-tone scale, and a fugue may be written, the re-entry of the subject of which may be made upon any note of the scale, and the harmony will be complete.

Secondly, a free use of the chord of the 7th, 9th, 11th and 13th upon *every* degree of the scale instead of (as in the conventional theory) only upon the tonic, super-tonic and dominant, in conjunction with melodies constructed upon the ordinary diatonic scale. These two methods have an interesting connection which can be shown, *i.e.,* let a major 9th be taken:

one may conventionally flatten or sharpen the fifth of this (A becoming ♯ or ♭ as desired): if *both* the flattened and sharpened fifths be taken in the one chord this chord is arrived at,

which is composed of the notes of the aforesaid scale whole-tone. It will be noticed that chords of the 9th in sequence and in all forms occur in Debussy's music as well as the augmented triad harmonics, where the melodic line is based on the tonal scale. This, in all likelihood, is the outcome of Debussy's instinctive feeling for the association of his so-called discovery with the ordinary scale.

But the appearance of a whole-tone scale as a by-product of two ordinary chords a tritone apart (as in a Neapolitan cadence) decorated by passing notes:

$$\begin{Bmatrix} \text{CDE} & \text{F♯} & \text{G♯} & \text{A♯} \\ \text{C} & \text{F♯} & & \end{Bmatrix}$$

must not be confused with the conscientious avoidance of classical key-relation which Debussy intends. As is shown in the article HARMONY, even Debussy's whole-tone scale really falls into the classical scheme, with much more various results. Debussy himself becomes eclectic in his later works; though he would never have allowed the whole-tone chord to resolve in a classical polyphony. (R. H. L.; X.)

DÉCAEN, CHARLES MATHIEU ISIDORE, COUNT (1769–1832), French soldier, was born at Caen on April 13, 1769. He made his name during the wars of the French Revolution under Kléber, Marceau and Jourdan, in the Rhenish campaigns. In 1799 he became general of division, and fought at Hohenlinden (Dec. 1800). Selected by Napoleon early in the year 1802 for the command of the French possessions in the East Indies, he set sail with Admiral Linois early in March 1803 with a small expeditionary force, touched at the Cape of Good Hope (then in Dutch hands), and noted the condition of the fortifications there. On arriving at Pondicherry he found matters in a very critical condition. Though the renewal of war in Europe had not yet been heard of, the hostile preparations adopted by the Marquis Wellesley caused Decaen to withdraw promptly to the Isle of France (Mauritius), where, for eight years, he sought to harass British trade and prepare for plans of alliance with the Mahratta princes of India. They all came to naught. Linois was captured by a British squadron, and ultimately, in 1811, Mauritius itself fell to the British. Decaen then received the command of the French troops in Catalonia. He died of the cholera in 1832

See M. L. E. Gautier, Biographie du *général Decaen* (Caen, 1850); J. Tessier, "Le général Decaen aux Indes," in Rev. Hist. vol. xv.

DECALIN, a chemical substance obtained by reduction of naphthalene (*q.v.*); it is decahydronaphthalene, $C_{10}H_{18}$.

DECALOGUE, another name for the biblical Ten *Commandments*, in Hebrew the Ten *Words* (Deut. iv. 13, x. 4; Exod. xxxiv. 28), written by God on the two tables of stone (Exod. xxiv. 12, xxxii. 16), the so-called Tables of the Revelation (E.V. "tables of testimony," Exod. xxxiv. 29), or Tables of the Covenant (Deut. ix. 9, 11, 15) (in patristic Gr. ἡ δεκάλογος *sc.* βίβλος Or νομοθεσία). These tables were broken by Moses (Exod. xxxii. 19), and two new ones were hewn (xxxiv. 1), and upon them were written the words of the covenant by Moses (xxxiv. 27, sqq.) or, according to another view, by God himself (Deut. iv. 13, ix. 10). They were deposited in the Ark (Exod. xxv. 21; 1 Ki. viii. 9). In Deuteronomy the inscription on these tables, which is briefly called the covenant (iv. 13), is expressly identified with the words spoken by Jehovah (Yahweh) out of the midst of the fire at Mt. Sinai or Horeb (according to the Deuteronomic tradition), in the ears of the whole people on the "day of the assembly," and rehearsed in vi. 6–21. The order of the commandments varies in some ancient texts (Vatican ms. of the LXX., Nash Papyrus), and there are differences in detail between the form in which the Decalogue appears in Exodus and in Deuteronomy. Further, the term "Ten Words" does not occur in Exod. xx., but is found in Exod. xxxiv. 28, in a context which seems to imply that the words mentioned had immediately preceded this passage. Accordingly some scholars would find another Decalogue embedded in Exod. xxxiv. 10–26.

The Decalogue of **Exod. xx.,** Deut. **v.**—Comparison between the two texts, especially in the law of the Sabbath, strongly suggests that neither form is original, both having been expanded from a rather shorter common source. It seems that in the earlier commandments even this common source has been extended from a much more concise primitive form, and that the commands first took the form of simple injunctions and prohibitions of the same type as "Thou shalt not steal."

Different views have been held as to the actual divisions of the Decalogue. Thus Philo regarded Exod. xx. 2–3 as the first commandment, while the Talmud made v. 2 the first and vv. 3–6 the second, thus identifying the sins of apostasy and idolatry. In Christian circles the Roman and Lutheran Churches make the first commandment extend from v. 2 to v. 6, and distinguish the coveting of a wife from the coveting of property. (This last is only possible on the basis of the text in Deuteronomy.) The arrangement of the Orthodox Eastern, Calvinistic and Anglican Churches takes Exod. xx. 2 as an introduction, separates the prohibition of apostasy from that of the making of images, and unites the clauses prohibiting covetousness into a single commandment. Different opinions obtain as to the date of the Decalogue. The general tendency is to place it late rather than early, though the view that the whole is Mosaic has been revived by some modern scholars (*e.g.*, McFadyen and Volz).

The Decalogue of Exod. xxxiv. 12–26.—This passage contains a number of precepts, and if we are to see here the original "Ten Words" referred to in v. 28, it is clear that we have them in a greatly expanded form. It is, moreover, far from certain as to how we are to apportion the "Ten Words" among the precepts contained in these verses. We may, perhaps, find the best arrangement as follows (1) prohibition of worship paid to other gods, (2) prohibition of molten images, (3) observance of the feast of unleavened bread, (4) the feast of weeks, (5) the feast of the ingathering at the beginning of the year, (6) the seventh day rest, (7) firstlings and firstfruits (separated in the text as it stands), (8) prohibition of leaven with sacrificial blood, (9) sacrificial fat must not be left over till the morning, (10) a kid must not be seethed in its mother's milk.

It goes without saying that other arrangements are possible, and none is wholly satisfactory. But on any identification of the individual precepts, two features stand out clearly. In the first place the provisions are all ritual rather than ethical, and in the second place, while some of them are equally adapted to a nomad people in the wilderness and to a settled agricultural community, others could only have applied to the conditions of the latter. It is worth noting that most of the precepts are found also in the "Book of the Covenant" (Exod. xx.–xxiii. E.), where they occur unconnected with one another. This fact, together with the very simple type of ritual enjoined, has suggested a Judaean rather than an Ephraimite origin for Exod. xxxiv. 12–26.

The Decalogue in Christian Theology.—Following the New Testament, in which the '(commandments" summed up in the law of love are identified with the precepts of the Decalogue (Mark x. 19; Rom. xiii. 9; cf. Mark xii. 28 ff.), the ancient Church emphasized the permanent obligation of the ten commandments as a summary of *natural* in contradistinction to ceremonial precepts, though the observance of the Sabbath was to be taken in a spiritual sense (Augustine, *De spiritu* et *litera,* xiv.; Jerome, De celebratione *Paschae*). The mediaeval theologians followed in the same line, recognizing all the precepts of the Decalogue as moral precepts de *lege* naturae, though the law of the Sabbath is not of the law of nature, in so far as it prescribes a determinate day of rest (Thomas, summa, $I^{ma}II^{dae}$ qu. c. art. 3; Duns, *Super* sententias, lib. iii. dist. 37). The most important mediaeval exposition of the Decalogue is that of Nicolaus de Lyra; and the 15th century, in which the Decalogue acquired special importance in the confessional, was prolific in treatises on the subject (Antoninus of Florence, Gerson, etc.).

Important theological controversies on the Decalogue begin with the Reformation. The question between the Lutheran (Augustinian) and Reformed (Philonic) division of the ten commandments was mixed up with controversy as to the legitimacy of sacred images not designed to be worshipped. The Reformed theologians took the stricter view. The identity of the Decalogue with the eternal law of nature was maintained in both churches, but it was an open question whether the Decalogue. as such (that is, as a law given by Moses to the Israelites), is of perpetual obligation. The Socinians, on the other hand, regarded the Decalogue as abrogated by the more perfect law of Christ; and this view, especially in the shape that the Decalogue is a civil and not a moral law (J. D. Michaelis), was the current one in the period of the 18th century rationalism. The distinction of a permanent and a transitory element in the law of the Sabbath is found, not only in Luther and Melanchthon, but in Calvin and other theologians of the Reformed church. The main controversy which arose on the basis of this distinction was whether the prescription of one day in seven is of permanent obligation. It was admitted that such obligation must be not natural but positive; but it was argued by the stricter Calvinistic divines that the proportion of one in seven is agreeable to nature, based on the order of creation in six days, and in no way specially connected with anything Jewish. Hence it was regarded as a *universal* positive law of God. But those who maintained the opposite view were not excluded from the number of the orthodox. The laxer conception found a place in the Cocceian school.

DECAMPS, ALEXANDRE GABRIEL (1803–1860), French painter, was born in Paris on March 3, 1803, and died at Barbizon on Aug. 22, 1860. In his youth he travelled in the East, and reproduced oriental life and scenery with a bold fidelity to nature that made his works the puzzle of conventional critics. He died in consequence of being thrown from a vicious horse while hunting at Fontainebleau. He was probably the first of European painters to represent scenes from Scripture history with their true and natural local background. Of this class were his "Joseph sold by his Brethren," "Moses taken from the Nile," and his scenes from the life of Samson, nine vigorous sketches in charcoal and white. Decamps produced a number of genre pic.

tures, chiefly of scenes from French and Algerine domestic life. Probably the best known of all his works is "The Monkey Connoisseurs." a clever satire of the jury of the French Academy of Painting, which had rejected several of his earlier works on account of their divergence from any known standard.

See Moreau's *Decamps et son oeuvre (1869).*

DE CANDOLLE, ALPHONSE: see (*s.v.*) CANDOLLE, AUGUSTIN PYRAME DE.

DECAPOLIS, a league of ten cities situated with one exception on the eastern side of the upper Jordan and the sea of Tiberias. The names of the ten cities are Damascus, Philadelphia, Raphana, Scythopolis (=Beth-Shan, now *Beisan,* W. of Jordan), Gadara, Hippos, Dion, Pella, Gerasa and Kanatha. Of these Damascus alone retains its importance. Scythopolis (as represented by the village of Beisan) is still inhabited; the ruins of Pella, Gerasa and Kanatha survive. Scythopolis, in command of the communications with the sea and the Greek cities on the coast, was a very important member of the league. The purpose of the league was mutual defence against the marauding Bedouin tribes that surrounded them.

It was soon after Pompey's campaign in 64–63 B.C. that the Decapolis league took shape. The cities comprising it were united by the main roads on which they lay, their respective spheres of influence touching one another. A constant communication was maintained with the Mediterranean ports and with Greece. The cities were subject to the governor of Syria and taxed for imperial purposes

The best account is in *G.* A. Smith's *Historical Geography* of *the Holy Land,* chap. xxviii.

DECASTYLE, the architectural term given to a portico that has ten columns, as in the temple of Apollo Didymaeus at Miletus; also applied to a building with such a portico (see TEMPLE).

DECATUR, STEPHEN (1779–1820), American naval commander, was born at Sinnepuxent (Md.) on Jan. 5, 1779, and entered the U.S.Navy as a midshipman in 1798. He was promoted lieutenant and saw service in the short naval war with France (1798-1800). In 1803 he commanded the "Enterprise," a part of Commodore Preble's squadron in the Mediterranean, and in Feb. 1804 led an expedition into the harbour of Tripoli to burn the U.S. frigate "Philadelphia," which had fallen into Tripolitan hands. He succeeded and made his escape under battery fire with only one man wounded. This exploit earned him his captain's commission and a sword of honour from Congress. He was engaged in all the attacks on Tripoli during 1804 and 1805.

In the War of 1812 his ship the "United States" captured H.M.S. "Macedonian." In 1813 he was appointed commodore to command a squadron in New York harbour, soon blockaded by the British. In an attempt to break out in Jan. 1815 his flagship the "President" was forced to surrender to a superior force. Subsequently he commanded in the Mediterranean against the corsairs of Algiers, Tunis and Tripoli with great success. He was made a Navy commissioner (Nov. 1811), an office which he held until killed in a duel with Commodore James Barron at Bladensburg (Md.) on March 22, 1820. A toast of his has become famous—"Our country! In her intercourse with foreign nations may she always be in the right; but our country, right or wrong."

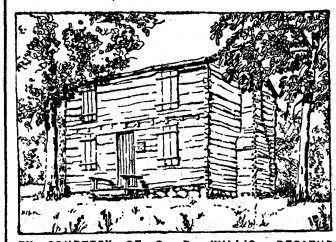
See A. S. Mackenzie, ***Life*** of *Decatur* (Boston, *1846).*

DECATUR, a city of northern Alabama, U.S.A., on the Tennessee river, 75m. N. of Birmingham, served by the Louisville and Nashville and the Southern railways; the county seat of Morgan county. It was formed in 1927 by the consolidation of Albany, formerly called New Decatur (pop. 7,652 in 1920) and Decatur (pop. 4,752 in 1920), and its population was 16,604 in 1940 by the federal census. The city has many important manufacturing industries, including a large cotton mill, steel works, lumber mills and woodworking plants, cotton gins and compresses, cottonseed oil mills, silk and hosiery factories, tanneries, iron foundries, flour mills and shipbuilding.

DECATUR, a town of Georgia, on the Georgia railroad, adjoining the city limits of Atlanta, at an altitude of 1,000 ft.; the county seat of Dekalb county. The population was 6,150 in 1920 (21% Negroes) and was 16,561 in 1940 by the federal census. It is a residential suburb, the seat of Columbia Theological seminary (Presbyterian), and of Agnes Scott college for women (Presbyterian), founded in 1889 as a "female seminary" and named after the mother of a generous benefactor, Col. George W. Scott. Decatur was incorporated in 1823.

DECATUR, a city in central Illinois, U.S.A., on Lake Decatur; the county seat of Macon county. It is on federal highways 36 and 51, and state highways 47, 48 and 121, and is served by the Baltimore and Ohio, the Illinois Central, the Illinois Terminal (electric), the Pennsylvania and the Wabash railways. The land area is 9.5 sq.mi. The population was 57,510 in 1930, and 59,305 in 1940 by the federal census. Decatur is a pleasant city, of diversified manufacturing industries, in a rich agricultural region underlain with coal. It has a commission form of government. The assessed valuation in 1940 was $32,875,770. Bank debits in 1940 amounted to $239,330,000.

There are parks in and near the city covering 960 ac., in one of which the original county courthouse (of logs) is preserved. Lake Decatur (12 mi. long), constructed in 1922–23 to assure an ample and dependable supply of water, provides fishing, boating and bathing. There is one coal mine within the city. The factory output in 1935 was valued at $32,035,000. Corn products (starch, syrup, hominy, meal, flour, oil, feed, sugar) and soybean products (oil meal, oil, sauce, lecithin, flour) are among the most important manufactures, and the corn-milling plants have a grinding capacity of over 60,000 bushels a day. Others of importance are brass plumbing goods, soda-fountain and office fixtures; malleable and gray iron, structural and sheet steel. The Wabash has its principal repair shops there, also its hospital for employees. The James Millikin university (opened 1903) has an endowment of over $1,250,000. Decatur was founded in 1829 and was named after Stephen Decatur. It was the first Illinois home of Abraham Lincoln, and the Grand Army of the Republic was organized there on April 6, 1866.



BY COURTESY OF C. R. WILLIS, DECATUR, ILL.

COURTHOUSE IN MACON COUNTY, ILLINOIS, ERECTED 1829, WHERE ABRAHAM LINCOLN PRACTISED LAW WHILE ON THE EIGHTH JUDICIAL CIRCUIT

DECATUR, a city of eastern Indiana, U.S.A., on St. Mary's river, 100 mi. N.E. of Indianapolis; the county seat of Adams county. It is on federal highway 27, and is served by the Erie, the Nickel Plate and the Pennsylvania railways. The population was 4.762 in 1920 (97% native white) and was 5,861 in 1940 by the federal census. It is surrounded by a farming and lumbering region, and has various factories. Decatur was settled about 1836 and incorporated in 1882.

DECAZES, ÉLIE, DUC (1780–1860), French statesman, was born at Saint Martin de Laye (Gironde) on Sept. 28, 1780. He studied law, became a judge in the tribunal of the Seine in 1806, was attached to the cabinet of Louis Bonaparte in 1807, and was counsel to the court of appeal at Paris in 1811. Immediately upon the fall of the empire he declared himself a royalist, and remained faithful to the Bourbons through the Hundred Days. He made the personal acquaintance of Louis XVIII., who appointed him prefect of police at Paris in July 1815. His marked success in that difficult position won for him the ministry of police, in succession to Fouché, on Sept. 24. In the interval he had been elected deputy for the Seine (Aug. 1815) and both as deputy and as minister he led the moderate royalists. His formula was "to royalize France and to nationalize the monarchy." The Moderates were in a minority in the chamber of 1815, but Decazes persuaded Louis XVIII. to dissolve the house, and the elections of Oct. 1816 gave them a majority. As minister of police he had to suppress the insurrections provoked by the ultra-royalists (the White Terror); then, after the resignation of the duc de Richelieu, he took the actual direction of the ministry, although the nominal president was General J. J. P. A. Dessolle (1767–1828). We held at the same time the portfolio of the interior. The cabinet, in

which Baron Louis was minister of finance, and Marshal Gouvion Saint Cyr remained minister of war, was entirely Liberal; and its first act was to suppress the ministry of police, as Decazes held that it was incompatible with the régime of liberty. His reforms met with the strong hostility of the chamber of peers, where the ultra-royalists were in a majority, and to overcome it he got the king to create 60 new Liberal peers. He then passed the laws on the press, suppressing the censorship. By reorganization of the finances, the protection of industry and the carrying out of great public works, France regained its economic prosperity, and the ministry became popular. But the powers of the Grand Alliance had been watching the growth of Liberalism in France with an anxiety that was increased by the election of the celebrated Abbé Grégoire. A threat of foreign intervention, rather than the clamour of the "Ultras," forced Louis XVIII. to urge a change in the electoral law that should render such a "scandal" as Grégoire's election impossible for the future. Dessolle and Louis, refusing to embark on this policy, now resigned; and Decazes became head of the new ministry, as president of the council (Nov. 1819). But the exclusion of Grégoire from the chamber and the changes in the franchise embittered the Radicals without conciliating the "Ultras." The news of the revolution in Spain in Jan. 1820 added fuel to their fury, and when, on Feb. 13 the duke of Berry was murdered, clamorous tongues loudly accused Decazes of being an accomplice in the crime. Decazes, indeed, foreseeing the storm, at once placed his resignation in the king's hands. Louis at first refused. But in the end he was forced to yield to the importunity of his family (Feb. 17th); and Decazes, raised to the rank of duke, passed into honourable exile as ambassador to Great Britain.

In Dec. 1821 he returned to sit in the house of peers, when he continued to maintain his Liberal opinions. After 1830 he adhered to the monarchy of July, but after 1848 he remained in retirement. He had organized in 1826 a society to develop the coal and iron of the Aveyron, and the name of Decazeville was given in 1829 to the principal centre of the industry. He died on Oct. 24, 1860.

His son, LOUIS CHARLES ÉLIE DECAZES, duc de Gliicksberg (1819–1886), was born at Paris, and became minister plenipotentiary at Madrid and at Lisbon. In 1871 he was elected deputy to the National Assembly by the Gironde, and was chosen by the duc de Broglie as minister of foreign affairs in Nov. 1873. He voted with the Orleanists the "constitutional laws" of 1875, and approved of MacMahon's parliamentary *coup d'état* on May 16, 1877. He died on Sept. 16, 1886.

On the Duc Decazes *see* E. Daudet, *Louis* XVIII. *et le duc Decazes* (1899), and his "L'ambassade du duc Decazes" in the ***Revue*** *des deux mondes* for *1899.*

DECAZEVILLE, a town of south-central France, in the department of Aveyron, 34 mi. N.W. of Rodez by the Orléans railway. Pop. (1936) 11,154. It possesses iron mines and is the industrial centre of the coal- and iron-fields of the Aveyron, which supply the iron-works established by the Duc Decazes, minister of Louis XVIII. A statue commemorates the founder.

DECCAN (Sans. *Dakshina,* "the South"), *a* name applied, according to Hindu geographers, to the whole of India situated south of the river Nerbudda. It is sometimes understood as the country between that river and the Kistna, the latter having long formed the southern boundary of the Mohammedan empire of Delhi. In the more extended meaning it comprehends the whole Indian peninsula, and in this view the Eastern and Western Ghats constitute the most striking feature. These two ranges unite in the north with the Vindhya mountains, and thus form a vast triangle enclosing the high table-land from Cape Comorin to the valley of the Nerbudda. The surface of this table-land slopes from west to east—the great rivers, the Cauvery, Godavari, Kistna and Pennar, though deriving their sources from the base of the Western Ghats, all finding their way into the Bay of Bengal through fissures in the Eastern Ghats.

History.—The authentic history of the Deccan only begins with the 13th century A.D. (For the early history *see* the article INDIA: *History;* and also BOMBAY PRESIDENCY; *History.)* In 1294 Ala-ud-Din Khilji, emperor of Delhi, invaded the Deccan, stormed Devagiri, and reduced the Yadava rajas of Maharashtra to the position of tributary princes *(see* DAULATABAD), then proceeding southward overran Telingana and Carnata (1294–1300). In 1307, owing to non-payment of tribute, a fresh series of Muslim incursions began, under Malik Kafur, ending in the final ruin of the Yadava power; and in 1338 the reduction of the Deccan was completed by Mohammed ben Tughlak. The imperial sway was, however, of brief duration. Telingana and Carnata speedily reverted to their former masters; and this defection on the part of the Hindu states was followed by a general revolt of the Muslim governors, resulting in the establishment in 1347 of the independent Mohammedan dynasty of Bahmani, and the consequent withdrawal of the power of Delhi from the territory south of the Nerbudda. On the dissolution of the Bahmani empire (1482), its dominions were distributed into the five Mohammedan states of Golconda, Bijapur, Ahmadnagar, Bidar and Berar. To the south of these the great Hindu state of Carnata or Vijayanagar (*q.v.*) still survived; but this, too, was destroyed, at the battle of Talikota (156j), by a league of the Mohammedan powers, who also in their turn soon disappeared before the victories of the Delhi emperors. Their rule was of short duration. In 1706 the Mahrattas acquired the right of levying tribute in southern India, and their principal chief, the Peshwa of Poona, became a practically independent sovereign. A few years later the emperor's viceroy in Ahmadnagar, the nizam-al-mulk, threw off his allegiance and established the seat of an independent government at Hyderabad (1724). The remainder of the imperial possessions in the peninsula were held by chieftains acknowledging the supremacy of one or other of these two potentates. In the sequel, Mysore became the prize of the Mohammedan usurper Hyder Ali. Mysore formed one of the earliest British conquests in the Deccan. Tanjore and the Carnatic were shortly after annexed. In 1818 the forfeited possessions of the Peshwa added to their extent, and these acquisitions, with others which have more recently fallen to the paramount power by cession, conquest or failure of heirs, form a continuous territory stretching from the Nerbudda to Cape Comorin.

See J. D. B. Gribble, *History of the Deccan (1896);* Prof. Bhandarkar, "Early History of the Dekkan" *(Bombay Gazetteer);* Vincent *A.* Smith, *Early History of India* revised by S. M. Edwardes (1924).

DECELEIA (Gr. Δεκελεία), an Attic deme, on the pass which led over the east end of Mt. Parnes towards Oropus and Chalcis, commanding the Athenian plain. Its eponymous hero, Decelus, was said to have indicated to the Tyndaridae, Castor and Pollux, the place where Theseus had hidden their sister Helen at Aphidnae; and hence there was a traditional friendship between the Deceleians and the Spartans (Herodotus ix. 73). This tradition, together with the advice of Alcibiades, led the Spartans to fortify Deceleia as a basis for permanent occupation in Attica during the later years of the Peloponnesian War, from 413–404 B.C. Its position enabled them to harass the Athenians frequently and to form a centre for fugitive slaves and other deserters. The royal palace of Tatoi has been built on the site.

See PELOPONNESIAN WAR; also Judeich in Pauly-Wissowa, *Realencyklopädie.*

DE CELLES, ALFRED DUCLOS (1843–1925), Canadian writer, was born at St. Laurent, and educated at Quebec seminary and Laval university. He edited successively the newspapers *Le Journal de Quebec, La Minerve* and *L'Opinion Publique* before becoming librarian of the Dominion parliament in 1880. Thenceforth he devoted himself to history, producing *La crise du régime parlementaire* (1888); *A la conquête de la liberté en France et au Canada* (1890); *Les constitutions du Canada* (1890); *Les États-Unis* (1896); *Papineau, Cartier* (1905); *Cartier et son temps* (1907); papers in vol. xv. of *Canada and its Provinces* on "The Province of Quebec" (1914); and *The "Patriotes" of 1837* (1920).

DECEMBER (Lat. *decem,* ten), the last month of the year. In the earliest Roman calendar, the year was divided into ten months, the last of which was called December, or the *tenth* month, and this name was retained for the last or 12th month

of the year as now divided. Julius Caesar gave the month its present length. The Saturnalia occurred in December, which explains the phrase of Horace "libertate Decembri utere." Martial applies to the month the epithet *canus* (hoary), and Ovid styles it *gelidus* (frosty) and *fumosus* (smoky). The Saxons called it *winter-monath,* winter month, and *heligh-monath,* holy month, from the fact that Christmas fell within it. Thus the modern Germans call it Christmonat. In December is the date of the winter solstice, when the sun reaches the tropic of Capricorn.

DECEMVIRI, "the ten men," the name applied by the Romans to any official commission of ten, followed by a statement of the purpose for which the commission was appointed, *e.g., Xviri* stlitibus iudicandis, sacris *faciundis,* etc.

I. Usually, it signified the temporary commission which superseded all the ordinary magistrates from 451 to 449 B.C., for the purpose of drawing up a code of laws. In 462 B.C. a tribune proposed the appointment of a commission to draw up a code to secure for the plebs a defence against magisterial caprice. In 452 B.C. decemvirs were appointed to draw up a code; during their tenure of office all other magistracies were in abeyance, but they were bound to maintain the rights of the plebs. The first board of decemvirs (wholly patrician) held office during 451 B.C.; the chief man among them was Appius Claudius (see CLAUDIUS). The decemvirs ruled with singular moderation, and submitted to the *Comitia* Centuriata a code of laws in ten headings. So popular were the decemvirs that another board of ten was appointed for the following year, some of whom, if the extant list of names is correct, were plebeians. These added two more to the ten laws of their predecessors, thus completing the Laws of the Twelve Tables (see ROMAN LAW). But their rule then became violent and tyrannical. They were forced to abdicate (449 B.C.).

II. The judicial board of decemvirs (stlitibus *judicandis*) formed a civil court concerned mainly with the status of individuals. They were originally a body of jurors under the presidency of the praetor (*q.v.*), but eventually became minor magistrates of the republic, elected by the Comitia *Tributa.*

III. The priestly board of decemvirs (sacris *faciundis*) was half patrician and half plebeian. They were first appointed in 367 B.C., instead of the patrician *duumviri* who had hitherto performed religious duties. Their chief function was the care of the Sibylline books, and the celebration of the games of Apollo and the Secular Games.

IV. Decemvirs were also appointed from time to time to control the distribution of the public land (*agris* dandis adsignandis; see AGRARIAN LAWS).

BIBLIOGRAPHY.—J. Muirhead, Private Law of Rome (1899); A. H. J. Greenidge, Legal Procedure of Cicero's Time (1901); J. E. Sandys, Companion to Latin Studies (1921), with useful bibliography; W. E. Heitland, The Roman Republic (1923).

DECEPTION TEST, a name given to the measurement of certain bodily changes caused by the effort of lying, or by fear due to a sense of guilt. Working at Graz, Austria, in 1914, Vittorio Benussi devised a test based on the idea that the rate of breathing is affected by the effort of telling a lie, and that this change could be accurately measured. Three years later Harold Burtt further developed this method in the Harvard Psychological Laboratory. In 1917 W. M. Marston, working in the same laboratory, had tested the relation of blood pressure to the effort of lying, but found that all persons examined showed blood pressure higher than normal whether they lied or told the truth.

A psychological deception test, based on association of words, was devised in Austria by Wertheimer and Klein in 1904, and developed by Carl Jung in Switzerland in 1905. Jung read a list of words to three nurses suspected of stealing a purse. Some of these words referred to objects which would have been seen when the theft was committed, and the suspects were asked to give associated words. In Jung's view the guilty nurse gave words which would not have been in the mind of an innocent person and further revealed guilt by delay in answering.

The vegetable alkaloid scopolamin was used by a Texas physician, R. E. House, with the idea that it produced a garrulous semi-intoxication in which the truth was likely to be blurted out. Another test depends on the variation in electrical conductivity of the skin caused by the secretion of sweat under pressure of emotion. The objection to these forms of trial by ordeal is that they are considered too uncertain to be used with assurance in criminal trials.

See C. T. McCormick, "Deception Test and the Law of Evidence," California Law Review (Sept. 1927).

DECEREBRATE RIGIDITY: see EQUILIBRIUM, ANIMAL.

DE CESARE, CARLO (1824–1882), Italian political economist and legislator, was born at Spinazzola. He studied at Naples and was successively inspector-general of the banks of issue, secretary-general of agriculture, industry and commerce in 1868, and counsellor of the "cour des comptes." In his chief work, *Manuale di* Economia *pubblica* (2 vols., 1862), he advocated the doctrines of Ricardo. Of his numerous other works the most important are *Il* mondo civile e industriale nel secolo xix (1857); Del *potere temporale* del Papa (2nd ed., 1861); *Il primo unitario* italiano (2nd ed., 1861); La *Politica, L'Economia* e la Morale die moderni *Italiani* (1869); and La *Germania* Moderna (2nd ed., 1874). De Cesare died at Rome in 1882.

DECHAMPS, ADOLPHE (1807–1875), Belgian statesman, born on June 17, 1807, at Melle; in 1842 became governor of Luxembourg, in 1843 minister of public works, during his office working for the opening up of railways, and in 1845 minister of foreign affairs. His intimate knowledge of contemporary politics is exhibited in his La Second Empire (1859); *L'Empire* et *L'Angleterre* (1860); La France et *L'Allemagne* (1865) and Le Prince de Bismarck et *l'entrevue* des *trois empereurs* (1873). He died on July 19, 1875.

See E. de Moreau, *A. Dechamps* (Brussels, 1911).

DECHEN, HEINRICH VON (1800–1889), German geologist, was born in Berlin on March 25, 1800, and was educated in the university in that city. He was in the service of the mining department of the Prussian State for 44 years in all, being its director from 1841 to 1864. He paid special attention to the coal-formation of Westphalia and northern Europe generally and wrote some important works on the mineralogy of the Rhineland, but his main work was a geological map of Rhenish Prussia and Westphalia in 35 sheets on the scale of 1:80,000, issued with two volumes of explanatory text (1855–82). He published also a small geological map of Germany (1869). He died at Bonn on Feb. 15, 1889.

DECIDUOUS, a botanical and zoological term for "falling in season," as of petals after flowering, leaves in autumn, the teeth or horns of animals, or the wings of insects.

DECIMAL: see ARITHMETIC; FRACTION; NUMERALS.

DECIMAL COINAGE, any currency in which the various denominations of coin are arranged in multiples or submultiples of ten (Lat. decem) with reference to a standard unit. Thus if the standard unit be 1 the higher coins will be 10, 100, 1,000, etc., the lower ·1, ·01, ·001, etc. In a perfect system there would be no breaks or interpolations, but the actual currencies described as "decimal" do not show this rigid symmetry. In France the standard unit—the franc—has the 10 franc and the 100 franc pieces above it; the 10 centime below it; there are also, however, 50 franc, 20 franc, 5 franc, 2 franc pieces as well as 50 and 20 centime and other denominations. Similar irregularities occur in the German and United States coinages.

Subject to these practical modifications the leading countries of the world (Great Britain and India are the chief exceptions) have adopted decimal coinage. The United States led the way (1786 and 1792; see MORRIS, GOUVERNEUR), and France soon followed (1799 and 1803), her system being extended to the countries of the Latin Union (1865). Germany (1873), the Scandinavian States (1875), Austria-Hungary (1870, developed in 1892) and Russia (1839 and 1897) are further adherents to the decimal system. The Latin-American countries and Japan (1871) have also adopted it.

In Great Britain proposals for decimalizing the coinage have often been discussed. Besides the inconvenience of altering the

established currency, the difficulty of choosing between the different schemes propounded has been a considerable obstacle. One plan took the farthing as a base: then 10 farthings = 1 doit ($2\frac{1}{2}d.$), 10 doits = 1 florin (2*s.* 1*d.*), 10 florins = 1 pound (20*s.* 10*d.*). The advantages claimed for this scheme were the preservation of the smaller coins and the avoidance of interference with the smaller retail prices. Its great disadvantage was the destruction of the existing unit of value. Another proposal would retain the pound as unit and the florin, but would subdivide the latter into 100 "units" (or farthings reduced 4%) and introduce a new coin = 10 units (2.4*d.*). By it the unit of account would remain as at present, and the shilling (as 50 units) would continue in use. The alteration of the bronze and several silver coins, and the need of readjusting all values and prices expressed in pence, formed the principal difficulties.

A third scheme, which was connected with the assimilation of English to French and American money, proposed the establishment of an 8s. gold coin as unit, with the tenpenny or franc and the penny (reduced by 4%) as subdivisions. The new coin would be equivalent to 10 francs or (by an anticipated reduction of the dollar) 2 dollars.

A fourth scheme was put forward by the Decimal association to meet the objections raised by the royal commission on coinage of 1918–20 to the proposed £-mill system (=£ divided into 1,000 parts). This scheme left all the silver coins unchanged but proposed to increase the value of the copper coins by 20%, so that the shilling would consist of ten instead of 12 pence.

For the general question of monetary scales *see* MONEY. and for the decimal system in reference to weights and measures *see* METRIC SYSTEM and MEASURES AND WEIGHTS. (C. F. B.)

DĚČIN or TETSCHEN, a town on the right bank of the Elbe in Bohemia, Czechoslovakia; it owes its chief importance to the fact that it shares with the sister town of Podmokly (q *v.*) the guardianship of the entrance to Bohemia from Saxony It has a varied development of industry, its products comprising chemicals, confectionery, dyes, plaster of Paris, cotton goods, cellulose, flour and beer. The town is dominated by a rocky height crowned by an old 17th century chateau and the frontier position is evident in the fact that its control alternated between Saxony and Bohemia and in the composition of the population, 13,034, of whom about 10,000 are German. The town has road and rail connection with Bodenbach. With the Sudetenland the town was occupied in 1938 by the Germans.

DECIUS, GAIUS MESSIUS QUINTUS TRAIANUS (AD 201–251), Roman emperor, was born at Budalia near Sirmium in lower Pannonia in 201. About 245 the emperor Philip the Arabian entrusted him with a command on the Danube, and in 249 (or end of 248), having been sent to put down a military rising in Moesia and Pannonia, he was proclaimed emperor, against his will. Philip advanced against him and was slain near Verona. Decius had to take the field at once against the Goths, who crossed the Danube and overran Moesia and Thrace. The details of the campaign are obscure. The Goths were surprised by the emperor while besieging Nicopolis on the Danube; at his approach they crossed the Balkans and attacked Philippopolis Decius followed but was defeated near Beroë. Philippopolis fell and its commander, Priscus, declared himself emperor under Gothic protection. The siege had so exhausted the Goths that they offered to surrender their booty and prisoners on condition of being allowed to retire unmolested. But Decius, who had succeeded in surrounding them, refused their offer. The final engagement took place on swampy ground in the Dobruja near Abritum (Abrittus) or Forum Trebonii and ended in the defeat and death of Decius and his son. Decius was a capable soldier and administrator. The chief blot on his reign was the systematic and authorized persecution of the Christians, which had for its object the restoration of the religion and institutions of ancient Rome. Decius tried to revive the separate office and authority of the censor. The choice was left to the senate, who unanimously selected Valerian (afterwards emperor) who declined the responsibility. The invasion of the Goths and the death of Decius put an end to the abortive attempt.

See Aurelius Victor, *De Caesaribus,* 29, *Epit.* 29; Jordanes, *De rebus Geticis, 18;* fragments of Dexippus, in C. W. Muller, ***Frag. Hist. Graec.*** iii (1849); Edward Gibbon, *Decline and* Fall, chap 10; H. Schiller, *Geschichte der römischen, Kaiserzeit,* i (pt. 2), 1883.

DECIUS MUS, PUBLIUS: *see* MUS.

DECIZE, a town of central France, in the department of Nièvre, on an island in the Loire, 24 mi. S.E. of Nevers by the Paris-Lyon railway. Pop. (1936) 3,357. Julius Caesar mentions it as Dhcetia, stronghold of the Aedui, and in 52 B C held there a meeting of the senate to settle the leadership of the tribe and to reply to his demand for aid against Vercingetorix. Later the counts of Nevers owned it, and granted it a charter of franchise in 1226 The church of Saint Aré dates in part from the 11th and 12th centuries; there are also ruins of a castle of the counts of Nevers. Decize is the starting point of the Nivernais canal. The coal mine of La Machine, which belongs to the Schneider company of Le Creusot, lies 4 mi. to the north. The industries of Decize and its suburbs on both banks of the Loire include the working of gypsum and lime, and the manufacture of ceramic products and glass. Trade is in horses from the Morvan, cattle, coal. iron. wood and stone.

DECKEN, KARL KLAUS VON DER (1833–1865), German explorer, was born on Aug. 8, 1833, at Kotzen. He left the military service of Hanover in 1860 to explore East Africa. He reached the volcanic mountain, Kilimanjaro, which he ascended to the height of 15,000 ft., and then explored the East African coast. In 1865 he attempted to navigate the Juba river, but with three others was murdered in Bardera by the Somali, the rest of the party escaping to Zanzibar.

See O. Kersten, *K.K.* v. *der Deckens Reisen in Ostafrika (4* vols., 1869–79).

DECKER, SIR MATTHEW, BART. (1679–1749), British merchant and writer on trade, born in Amsterdam in 1679, went to London in 1702 and established himself there as a merchant. He was a director of the East India company, sat in parliament for four years as member for Bishop's Castle, and was high sheriff of Surrey in 1729. He was created a baronet by George I in 1716 Decker's fame as a writer on trade rests on two tracts. The first, *Serious considerations on the several high duties which the Nation in general, as well as Trade in particular, labours under, with a proposal for preventing the removal of goods, disclzarging the trader from any search, and raising all the Publick Supplies by one single Tax* (1743; name affixed to 7th ed., 1756), proposed to do away with customs duties and substitute a tax upon houses He also suggested taking the duty off tea and putting instead a licence duty on households wishing to consume it. The second, an *Essay on the Causes of the Decline of the Foreign Trade, consequently of the value of tlze lands in Britain, and on the means to restore both* (1744), has been attributed to W. Richardson, but internal evidence is strongly in favour of Decker's authorship. He advocates the licence plan in an extended form; urges the repeal of import duties and the abolition of bounties, and, in general, shows himself such a strong supporter of the doctrine of free trade as to rank as one of the most important forerunners of Adam Smith. Decker died on March 18. 1749.

DECLARATION, formerly, in an action at English law, a precise statement of the cause of action. Under the system of pleading established by the Judicature act 1875, the declaration has been superseded by a statement of claim setting forth the facts on which the plaintiff relies. Declarations are now in use only in certain local courts of record, and in those of the United States and some British colonies in which the common law system of pleading survives. In the United States a declaration is termed a '(complaint," which is the first pleading in an action. It is divided into parts—the *title* of the court and term; the *venue* or county in which the facts are alleged to have occurred; the *commencement,* which contains a statement of the names of the parties and the character in which they appear; the *statement* of the cause of action; and the *conclusion* or claim for relief. *(See* PRACTICE AND PROCEDURE.)

The term is also used in other English legal connections; *e.g.,*

IN CONGRESS, JULY 4, 1776.

The unanimous Declaration of the thirteen united States of America.

When in the Course of human events it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation. We hold these truths to be self-evident, that all men are created equal; that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness. That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed, That whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness. Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes; and accordingly all experience hath shewn, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same Object, evinces a design to reduce them under absolute Despotism, it is their right, it is their duty, to throw off such Government, and to provide new Guards for their future security. — Such has been the patient sufferance of these Colonies; and such is now the necessity which constrains them to alter their former Systems of Government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute Tyranny over these States. To prove this, let Facts be submitted to a candid world. — He has refused his Assent to Laws, the most wholesome and necessary for the public good. — He has forbidden his Governors to pass Laws of immediate and pressing importance, unless suspended in their operation till his Assent should be obtained; and when so suspended, he has utterly neglected to attend to them. — He has refused to pass other Laws for the accommodation of large districts of people, unless those people would relinquish the right of Representation in the Legislature, a right inestimable to them and formidable to tyrants only. — He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public Records, for the sole purpose of fatiguing them into compliance with his measures. — He has dissolved Representative Houses repeatedly, for opposing with manly firmness his invasions on the rights of the people. — He has refused for a long time, after such dissolutions, to cause others to be elected; whereby the Legislative powers, incapable of Annihilation, have returned to the People at large for their exercise; the State remaining in the mean time exposed to all the dangers of invasion from without, and convulsions within. — He has endeavoured to prevent the population of these States; for that purpose obstructing the Laws for Naturalization of Foreigners; refusing to pass others to encourage their migrations hither, and raising the conditions of new Appropriations of Lands. — He has obstructed the Administration of Justice, by refusing his Assent to Laws for establishing Judiciary powers. — He has made Judges dependent on his Will alone, for the tenure of their offices, and the amount and payment of their salaries. — He has erected a multitude of New Offices, and sent hither swarms of Officers to harass our people and eat out their substance. — He has kept among us, in times of peace, Standing Armies, without the Consent of our legislatures. — He has affected to render the Military independent of and superior to the Civil power. — He has combined with others to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his Assent to their Acts of pretended Legislation: — For Quartering large bodies of armed troops among us: — For protecting them by a mock Trial, from punishment for any Murders which they should commit on the Inhabitants of these States: — For cutting off our Trade with all parts of the world: — For imposing Taxes on us without our Consent: — For depriving us in many cases of the benefits of Trial by Jury: — For transporting us beyond Seas to be tried for pretended offences — For abolishing the free System of English Laws in a neighbouring Province, establishing therein an Arbitrary government, and enlarging its Boundaries so as to render it at once an example and fit instrument for introducing the same absolute rule into these Colonies: — For taking away our Charters, abolishing our most valuable Laws and altering fundamentally the Forms of our Governments: — For suspending our own Legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever. — He has abdicated Government here, by declaring us out of his Protection and waging War against us. — He has plundered our seas, ravaged our Coasts, burnt our towns, and destroyed the lives of our people. — He is at this time transporting large Armies of foreign Mercenaries to compleat the works of death, desolation and tyranny, already begun with circumstances of Cruelty & perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the Head of a civilized nation. — He has constrained our fellow Citizens taken Captive on the high Seas to bear Arms against their Country, to become the executioners of their friends and Brethren, or to fall themselves by their Hands. — He has excited domestic insurrections amongst us, and has endeavoured to bring on the inhabitants of our frontiers, the merciless Indian Savages, whose known rule of warfare is an undistinguished destruction of all ages sexes and conditions. In every stage of these Oppressions We have Petitioned for Redress in the most humble terms: Our repeated Petitions have been answered only by repeated injury. A Prince whose character is thus marked by every act which may define a Tyrant, is unfit to be the ruler of a free people. Nor have We been wanting in attentions to our British brethren. We have warned them from time to time of attempts by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They too have been deaf to the voice of justice and of consanguinity. We must, therefore, acquiesce in the necessity, which denounces our Separation, and hold them, as we hold the rest of mankind, Enemies in War, in Peace Friends.

We, therefore the Representatives of the united States of America, in General Congress, Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do in the Name and by authority of the good People of these Colonies solemnly publish and declare, That these United Colonies are, and of Right ought to be Free and Independent States; that they are Absolved from all Allegiance to the British Crown, and that all political connection between them and the State of Great Britain, is and ought to be totally dissolved; and that as Free and Independent States, they have full Power to levy War, conclude Peace, contract Alliances, establish Commerce, and to do all other Acts and Things which Independent States may of right do. — And for the support of this Declaration, with a firm reliance on the protection of divine Providence, we mutually pledge to each other our Lives, our Fortunes and our sacred Honor.

THE DECLARATION OF INDEPENDENCE OF THE UNITED STATES

A facsimile reproduction of the DECLARATION OF INDEPENDENCE, given to the world on July 4, 1776, although the resolution of independence was adopted by the colonial Congress on July 2. It was written by Thomas Jefferson and slightly amended by John Adams and Benjamin Franklin. The original document is enshrined in the Library of Congress, Washington, D. C. The printed text is to be found on the other side of this plate.

DECLARATION OF INDEPENDENCE

IN CONGRESS, JULY 4, 1776

THE UNANIMOUS DECLARATION of the thirteen united STATES OF AMERICA.

WHEN in the Course of human events it becomes necessary for one people to dissolve the political bands which have connected them with another. and to assume among the powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.—We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness.—That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed,—That whenever any Form of Government becomes destructive of these ends, it is the Right oi the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness. Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes; and accordingly all experience hath shewn that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same Object evinces a design to reduce them under absolute Despotism, it is their right. it is their duty, to throw off such Government, and to provide new Guards for their future security.—Such has been the patient sufferance of these Colonies; and such is now the necessity which constrains them to alter their former Systems of Government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute Tyranny over these States. To prove this, let Facts be submitted to a candid world.—He has refused his Assent to Laws, the most wholesome and necessary for the public good.—He has forbidden his Governors to pass Laws of immediate and pressing importance, unless suspended in their operation till his Assent should be obtained; and when so suspended, he has utterly neglected to attend to them.—He has refused to pass other Laws for the accommodation of large districts of people, unless those people would relinquish the right of Representation in the Legislature, a right inestimable to them and formidable to tyrants only.—He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their Public Records, for the sole purpose of fatiguing them into compliance with his measures.—He has dissolved Representative Houses repeatedly, for opposing with manly firmness his invasions on the rights of the people.—He has refused for a long time, aiter such dissolutions, to cause others to be elected; whereby the Legislative Powers, incapable of Annihilation, have returned to the People at large for their exercise; the State remaining in the mean time exposed to all the dangers of invasion from without, and convulsions within.—He has endeavoured to prevent the population of these States; for that purpose obstructing the Laws for Naturalization of Foreigners; refusing to pass others to encourage their migrations hither, and raising the conditions of new Appropriations of Lands.—He has obstructed the Administration of Justice, by refusing his Assent to Laws for establishing Judiciary Powers.—He has made Judges dependent on his Will alone, for the tenure of their offices, and the amount and payment of their salaries.—He has erected a multitude of New Offices, and sent hither swarms of Officers to harass our people, and eat out their substance. He has kept among us, in times of peace, Standing Armies without the Consent of our legislatures.—He has affected to render the Military independent of and superior to the Civil Power.—He has combined with others to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his Assent to their Acts of pretended Legislation:—For quartering large bodies of armed troops among us:—For protecting them, by a mock Trial, from punishment for any Murders which they should commit on the Inhabitants of these States:—For cutting off our Trade with all parts of the world:—For imposing Taxes on us without our Consent:—For depriving us in many cases, of the benefits of Trial by Jury:—For transporting us beyond Seas to be tried for pretended offences:—For abolishing the free System of English Lau-s in a neighbouring Province, establishing therein an Arbitrary government, and enlarging its Boundaries so as to render it at once an example and fit instrument for introducing the same absolute rule into these Colonies:—For taking away our Charters, abolishing our most valuable Laws and altering fundamentally the Forms of our Governments:—For suspending our own Legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.—He has abdicated Government here, by declaring us out of his Protection and waging War against us.—He has plundered our seas, ravaged our Coasts, burnt our towns, and destroyed the lives of our people.—He is at this time transporting large Armies of foreign Mercenaries to compleat the works of death, desolation and tyranny, already begun with circumstances of Cruelty & Perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the Head of a civilized nation.—He has constrained our fellow Citizens taken Captive on the high Seas to bear Arms against their Country, to become the executioners of their friends and Brethren, or to fall themselves by their Hands.—He has excited domestic insurrections amongst us, and has endeavoured to bring on the inhabitants of our frontiers, the merciless Indian Savages, whose known rule of warfare, is an undistinguished destruction of all ages, sexes and conditions. In every stage of these Oppressions We have Petitioned for Redress in the most humble terms: Our repeated Petitions have been answered only by repeated injury. A Prince, whose character is thus marked by every act which may define a Tyrant, is unfit to be the ruler of a free people. Nor have We been wanting in attentions to our Brittish brethren. We have warned them from time to time of attempts by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They too have been deaf to the voice of justice and of consanguinity. We must, therefore, acquiesce in the necessity, which denounces our Separation, and hold them, as we hold the rest of mankind, Enemies in War, in Peace Friends.—

WE, THEREFORE, the Representatives of the UNITED STATES OF AMERICA, in General Congress, Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the Name, and by Authority of the good People of these Colonies, solemnly publish and declare. That these United Colonies are, and of Right ought to be FREE AND INDEPENDENT STATES; that they are Absolved from all Allegiance to the British Crown, and that all political connection between them and the State of Great Britain, is and ought to be totally dissolved; and that as Free and Independent States, they have full Power to levy War, conclude Peace, contract Alliances, establish Commerce, and to do all other Acts and Things which Independent States may of right do.—And for the support of this Declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other our Lives, our Fortunes and our sacred Honor.

THE DECLARATION OF INDEPENDENCE OF THE UNITED STATES

The Text of the Declaration of Independence. The original document is shown in facsimile on the other side of this plate

the Declaration of Insolvency *(see* BANKRUPTCY); the Declaration of Title, for which, when a person apprehends an invasion of his title to land, he may, by the Declaration of Title act 1862, petition the Court of Chancery *(see* LAND REGISTRATION); or the Declaration of Trust *(see* TRUSTS). By the Statutory Declarations act 1835 a solemn declaration may be substituted for an affidavit. In nearly all civilized countries an affirmation is now permitted to those who object to take an oath or upon whose conscience an oath is not binding. *(See* AFFIDAVIT; OATH.)

An exceptional position in law is accorded to a Dying or Deathbed Declaration. Where the charge is one of homicide it is the practice to admit dying declarations of the deceased with respect to the cause of his death. Unsworn declarations as to family matters, *e.g.,* as to pedigree, may also be admitted as evidence, as well as declarations made by deceased persons in the course of their duty. *(See* EVIDENCE.)

In the United States the declaration survives in such States as still follow common law pleading. It is a statement of all material facts constituting the plaintiff's cause of action in a methodical and legal form filed appropriately. Where code pleading has been adopted, the complaint supersedes the old declaration.

In the United States, the declaration of intention is that statement of an alien that he intends to renounce his or her citizenship and acquire that of the United States. Popularly it is known as "first papers." It may be filed at any time in a court competent in naturalization matters, even though the alien may not be naturalized until he has been a resident for five years. A declaration expires if the alien fails to file his application for naturalization or "second papers" within a period of seven years thereafter. If subsequently he desires to take out naturalization papers, he must file a new declaration of intention. Two years must elapse between the filing of the declaration of intention and the application for naturalization.

DECLARATION OF INDEPENDENCE in United States history, the act (or document) by which the 13 original States of the Union broke their colonial allegiance to Great Britain in 1776. The controversy preceding the war *(see* AMERICAN REVOLUTION) gradually shifted from one primarily upon economic policy to one upon issues of pure politics and sovereignty, and the acts of Congress, as viewed to-day, seem to have been carrying it, from the beginning, inevitably into revolution; but there was apparently no general and conscious drift toward independence until near the close of 1775. The first colony to give official countenance to separation as a solution of colonial grievances was North Carolina, which, on April 12, 1776, authorized its delegates in Congress to join with others in a declaration to that end. The first Colony to instruct its delegates to take the actual initiative was Virginia, in accordance with whose instructions—voted on May 15—Richard Henry Lee, on June 7, moved a resolution "that these United Colonies are, and of right ought to be, free and independent States." John Adams of Massachusetts seconded the motion. The conservatives could only plead the unpreparedness of public opinion, and the radicals conceded delay on condition that a committee be meanwhile at work on a declaration "to the effect of the said . . . resolution," to serve as a preamble thereto when adopted. This committee consisted of Thomas Jefferson, John Adams, Benjamin Franklin, Roger Sherman and Robert R. Livingston. To Jefferson the committee entrusted the actual preparation of the paper. On July 2, by a vote of 12 States—10 voting unanimously, New York not voting, and Pennsylvania and Delaware casting divided ballots (3 votes in the negative)—Congress adopted the resolution of independence; and on the 4th, Jefferson's "Declaration." The 4th has always been the day celebrated, the decisive act of the 2nd being quite forgotten in the memory of the day on which that act was published to the world. "Independence Day" is a holiday in all the States and Territories of the United States. It should also be noted that as Congress had already, on Dec. 6, 1775, formally disavowed allegiance to parliament, the Declaration recites its array of grievances against the crown, and breaks allegiance to the crown. Moreover, on May 10, 1776, Congress had recommended to the people of the Colonies that they form such new governments as their representatives should deem desirable; and in the accompanying statement of causes, formulated on May 15, had declared it to be "absolutely irreconcilable to reason and good conscience for the people of these colonies now to take the oaths and affirmations necessary for the support of any government under the crown of Great Britain," whose authority ought to be "totally suppressed" and taken over by the people—a determination which, as John Adams said, inevitably involved a struggle for absolute independence, involving as it did the extinguishment of all authority, whether of crown, parliament or nation.

Though the Declaration reads as "In Congress, July 4, 1776. The unanimous Declaration of the thirteen united States of America," New York's adhesion was in fact not voted until the 9th, nor announced to Congress until the 15th—the Declaration being unanimous, however, when it was ordered, on the 19th, to be engrossed and signed under the above title. As read before the army meanwhile, it was headed "In Congress, July 4, 1776. A Declaration by the representatives of the United States of America in General Congress assembled." Contrary to the inference naturally to be drawn from the form of the document no signatures were attached on the 4th. As adopted by Congress, the Declaration differs only in details from the draft prepared by Jefferson; censures of the British *people* and a noble denunciation of slavery were omitted, appeals to Providence were inserted, and verbal improvements made for the sake of terseness and measured statement. The document is full of Jefferson's fervent spirit and personality, and its ideals were those to which his life was consecrated. It is the best known and the noblest of American State papers. Though open to controversy on some issues of historical fact, not flawless in logic, necessarily partisan in tone and purpose, it is a justificatory preamble, a party manifesto and appeal, reasoned enough to carry conviction, fervent enough to inspire enthusiasm. It mingles—as in all the controversy of the time, but with a literary skill and political address elsewhere unrivalled—stale disputation with philosophy. The rights of man lend dignity to the rights of Englishmen, and the broad outlook of a world-wide appeal, and the elevation of noble principles, relieve minute criticisms of an administrative system.

Jefferson's political theory was that of Locke, whose words the Declaration echoes. Both Locke and Jefferson wrote simply of political equality, political freedom. Even within this limitation, the idealistic formulae of both were at variance with the actual conditions of their time. The variance would have been greater had their phrases been applied as humanitarian formulae to industrial and social conditions. The Lockian theory fitted beautifully the question of colonial dependence, and was applied to that by America with inexorable logic; it fitted the question of individual political rights, and was applied to them in 1776, but not in 1690; it did not apply to non-political conditions of individual liberty, a fact realized by many at the time—and it is true that such an application would have been more inconsistent in America in 1776 as regards the negroes, than in England in 1690 as regarded freemen. The Declaration's influence upon American legal and constitutional development has been profound. Locke, says Leslie Stephen, popularized "a convenient formula for enforcing the responsibility of governors"—but his theories were those of an individual philosopher—while by the Declaration a State, for the first time in history, founded its life on democratic idealism, pronouncing governments to exist for securing the happiness of the people, and to derive their just powers from the consent of the governed. It was a democratic instrument, and the revolution a democratic movement; in South Carolina and the Middle Colonies particularly, the cause of independence was bound up with popular movements against aristocratic elements. Congress was fond of appealing to "the purest maxims of representation"; it sedulously measured public opinion; took no great step without an explanatory address to the country; cast its influence with the people in local struggles as far as it could; appealed to them directly over the heads of conservative assemblies; and in general stirred up democracy. The Declaration gave the people recognition equivalent to promises, which, as fast as new governments were instituted, were converted by written constitutions into

rights, which have since then steadily extended.

For 101 years after the Declaration was proclaimed it had no permanent home. During its wanderings, it found shelter in 10 cities and 5 states, twice narrowly escaped destruction by fire, and in both the Revolutionary War and the War of 1812 was nearly captured by the British. In 1894, when the text of the manuscript had been dimmed by more than 50 years' exposure to light and its signatures damaged by too frequent rolling of the parchment, the document was placed in a safe in the State Department library. Finally, in 1921, it was removed to the Library of Congress, where it is on permanent exhibition in a shrine specially constructed for its preservation and safekeeping.

The signers were: John Hancock (1737–92), of Massachusetts, president; Button Gwinnett (c. 1732–77), Lyman Hall (1725–90), George Walton (1740–1804), of Georgia; William Hooper (1742–90), Joseph Hewes (173—79), John Penn (1741–88), of North Carolina; Edward Rutledge (1749–1800), Thomas Heyward, Jr. (1746–1809), Thomas Lynch, Jr. (1749–79), Arthur Middleton (1742–87), of South Carolina; Samuel Chase (1741–1811), William Paca (1740–99), Thomas Stone (1743–87), Charles Carroll (1737–1832) of Carrollton, Md.; George Wythe (1726–1806), Richard Henry Lee (1732–94), Thomas Jefferson (1743–1826), Benjamin Harrison (1740–91), Thomas Nelson, Jr. (1738–89), Francis Lightfoot Lee (1734–97), Carter Braxton (1736–97), of Virginia; Robert Morris (1734–1806), Benjamin Rush (1745–1813), Benjamin Franklin (1706–go), John Morton (1724–77), George Clymer (1739–1813), James Smith (c. 1719–1806), George Taylor (1716–81), James Wilson (1742–98), George Ross (173—79), of Pennsylvania; Caesar Rodney (1728–84), George Read (1733–98), Thomas McKean (1734–1817), of Delaware; William Floyd (1734–1821), Philip Livingston (1716–78), Francis Lewis (1713–1803), Lewis Morris (1726–98), of New York; Richard Stockton (1730–81), John Witherspoon (1722–94), Francis Hopkinson (1737–91), John Hart (1708–So), Abraham Clark (1726–94), of New Jersey; Josiah Bartlett (1729–95), William Whipple (1730–85), Matthew Thornton (1714–1803), of New Hampshire; Samuel Adams (1722–1803), John Adams (1735–1826), Robert Treat Paine (1731–1814), Elbridge Gerry (1744–1814), of Massachusetts; Stephen Hopkins (1707–8j), William Ellery (1727–1820), of Rhode Island; Roger Sherman (1721–93), Samuel Huntington (1732–96), William Williams (1731–1811), Oliver Wolcott (1726–97), of Connecticut. Not all the men who rendered the greatest services to independence were in Congress in July 1776; not all who voted for the Declaration ever signed it; not all who signed it were members when it was adopted. The greater part of the signatures were certainly attached on Aug. 2; but at least six were attached later. With one exception—that of Thomas McKean, present on July 4, but not on Aug. 2, and permitted to sign in 1781—all were added before printed copies with names attached were first authorized by Congress for public circulation in Jan. 1777.

DECLARATION OF LONDON: see BLOCKADE, CONTRABAND, PRIZE, NEUTRALITY, VISIT and SEARCH.

DECLARATION OF PARIS (1856) owes its origin to the diametrically opposing views of Great Britain and France on the carriage of property at sea at the time of the Crimean War. In 1854 France allowed enemy goods in neutral vessels to go free, but confiscated neutral goods in enemy vessels, whilst Great Britain confiscated enemy goods in neutral vessels, but respected neutral goods in enemy vessels. The situation was an impossible one for neutrals. Accordingly each Power abandoned part of its doctrines and acceded to part of its ally's doctrines. This compromise finds expression in Articles 2 and 3 of the Declaration, which stated four principles of international law:—

1. Privateering is and remains abolished; 2. The neutral flag covers enemy's goods, with the exception of contraband of war; 3. Neutral goods, with the exception of contraband of war, are not liable to capture under the enemy's flag; 4. Blockades in order to be binding must be effective, that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy. (See Hertslet, Treaties, x. p. 547.)

The Declaration was signed by Austria, France, Great Britain, Prussia, Russia, Sardinia and Turkey, and acceded to by all the Powers except Bolivia, Spain, United States, Uruguay and Venezuela. Spain acceded in 1908. The United States withheld formal adherence on the ground that, not possessing a large navy, she was obliged to rely upon privateers, and she would not agree to their abolition unless the principle of the immunity of private property at sea were generally accepted. At the commencement, however, of the Civil War and again in the Spanish American War, 1898, she declared her adherence to the Declaration for the duration of hostilities only. Spain in the latter war, whilst repudiating any obligation to the Declaration, announced that she would take a similar course.

During the World War it was declared in the British Prize Court that the court would regard the Declaration not only in the light of rules binding in the conduct of war, but as a recognized and acknowledged part of the law of nations; see *The* Marie Glaeser, 1 B. and C. P. C. 38 (414). But with the disappearance of the "Free List"; by the extension of the term "contraband" to all commodities of use, directly or indirectly, to the enemy in the operations of war; by the presumption of hostile destination; by the application of the doctrine of continuous voyage, Article 2 became almost wholly nullified. Article 3 was also rendered almost wholly nugatory by the German submarine method of indiscriminate destruction. Whilst the neutral owner of goods on board an enemy vessel was entitled to their restitution or value when brought in for adjudication, he took the risk of all necessary acts of war. It was held by the French and German Prize Courts that in the case of lawful destruction of an enemy merchant vessel compensation for loss of neutral goods on board could not be claimed. Sinking at sight, without visit and search, was, however, illegal, and it has now been prohibited by the Treaty of Washington, 1922, Parl. Pap. 1922 [Cmd. 1627], ratified by the United States, the British Empire, Italy and Japan. Article 4 was reproduced in the Declaration of London and it was objected that the so-called blockade of the German coast on the Baltic was not effective, since neutral Baltic States still had access to German Baltic ports. The answer is that the British measures were taken under the law of contraband and not under those of blockade. (H. H. L. B.)

DECLARATOR, in Scots law, a form of action by which some right of property, or of servitude, or of status, or some inferior right or interest, is sought to be judicially declared.

DE CLIFFORD, BARON: see CLIFFORD.

DECLINATION, in magnetism is the angle between true north and magnetic north, *i.e.*, the variation between the true (geographic) meridian and the magnetic meridian. It is derived from Lat. declinare, to decline. In 1596 at London the angle of declination was 11° E. of N., in 1652 magnetic north was true north, in 1815 the magnetic needle pointed 24½° W. of N., in 1891 18° W., in 1896 17° 56′ W. and in 1906 17° 45′. The angle is gradually diminishing and the declination will in time again be 0°, when it will slowly increase in an easterly direction, the north magnetic pole oscillating slowly around the North Pole. Regular daily changes of declination also occur. Magnetic storms cause irregular variations sometimes of one or two degrees. (See

TERRESTRIAL MAGNETISM.)

In astronomy the declination is the angular distance, as seen from the earth, of a heavenly body from the celestial equator, thus corresponding with terrestrial latitude. (See ASTRONOMY.)

DECOLORIZING, in practical chemistry and chemical technology, the removal of coloured impurities from a substance. Charcoal, preferably prepared from blood, is frequently used; when shaken with a coloured solution it often retains the coloured substances, leaving the solution clear. Thus the red colour of wines may be removed by filtering the wine through charcoal; the removal of the dark-coloured impurities of crude sugar may be similarly effected. Other "decolorisers" acting through purely chemical reactions are sulphurous acid, permanganates and manganates, all of which have received application in the sugar industry. (See CHARCOAL and ADSORPTION.)

DECORAH, a city of north-eastern Iowa, U.S.A., on the Upper Iowa river; the county seat of Winneshiek county. It is on federal highway 52, and is served by the Chicago, Milwaukee, St. Paul and Pacific and the Rock Island railways. The population in 1940 federal census was 5,303. It is the seat of Luther college (1861). Decorah is supported by farming, and the main product is corn which is fed to hogs, and the hogs in turn are marketed. No corn is sold. A famous ice cave is near by. Decorah was founded about 1849; incorporated as a city in 1871.

DECORATED PERIOD, in architecture, the name of the second of the three periods into which the English Gothic was usually divided, generally embracing the first three quarters of the 14th century. It may itself be divided into two, the earlier half being known as the Geometric period, and the later as the Curvilinear, although no definite date separates these two parts. The Geometric Decorated style is characterized by window tracery based on the arch, the circle and the quatrefoil and trefoil, frequently much cusped. (See CUSP.) Windows of great width and height were thus treated, with two, four, six or even eight lights, or main subdivisions. In the later, or curvilinear style, the ogee curve, or curve of double curvature, controls tracery design. Two main types thus developed; one, in which the tracery bars form a net, the other in which flame-like, or flowing forms predominate (*See* TRACERY.) In the entire decorated period moulding profiles are heavy and complex; carved ornament is intricate and of great naturalism. The most famous examples are the east end of Lincoln cathedral and the crossing and western part of the choir of Ely. During the decorated period, church vaulting became much complicated and subdivided by the addition, first of tiercerons, which are additional vaulting ribs springing from the capital, and rising to the ridge; toward the end of the period there also appeared liernes, which are smaller ribs of little structural value, connecting the more important ribs, and so forming star or network patterns. (T. F. H.)

DECORATION DAY, a holiday, known also as Memorial Day, observed in the northern States of the United States on May 30, originally in honour of soldiers killed in the American Civil War, but subsequently also in honour of those who fell in later wars. Before the close of the Civil War May 30 was thus celebrated in several of the Southern States; in the North there was no fixed celebration until 1868, when (on May 5) Commander-in-Chief John A. Logan, of the Grand Army of the Republic, issued a general order designating May 30, 1868, "for the purpose of strewing with flowers or otherwise decorating the graves of comrades who died in defense of their country during the late rebellion"; Logan did this "with the hope that it will be kept up from year to year." In 1882 the Grand Army urged that the "proper designation of May 30 is Memorial Day"—not Decoration Day. Rhode Island made it a legal holiday in 1874, Vermont in 1876 and New Hampshire in 1877; and by 1910 it was a legal holiday in all the States and Territories save Alabama, Alaska, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina and Texas In Virginia May 30 is observed as a Confederate Memorial Day. June 3 (the birthday of Jefferson Davis) is observed as Confederate hfemorial Day in Louisiana and Tennessee; April 26, in Alabama, Florida, Georgia and Mississippi; and May 10, in North Carolina and South Carolina.

DECORATIVE ART, that art which is concerned with the decoration of objects which in themselves are not necessarily beautiful, hence practically the same meaning as applied art or the arts and crafts. Decorative art may concern itself with the treatment of architectural units, furniture, textiles or any other object which the human being feels should not only be useful but beautiful. If the object has no use other than that of its aesthetic appeal the art is no longer decorative but falls into what is known as fine art.

Good decorative art is appropriate in its adaptation and seems to be a part of the object upon which it is executed, as though it had sprung from within, rather than as though it had been applied on the surface. In days past the craftsman who made an object decorated it so that this principle was more closely adhered to, but the modern method sometimes leads to the execution of a decoration which has little or nothing to do with the structure, material or feeling of the object. (See PAINTING; DRAWING; SCULPTURE; ARTS AND CRAFTS, etc.) (W. E. Cx.)

DE CORT, FRANS (1834–1878), Flemish poet, was born on June 21, 1834, at Antwerp, and died on Jan. 18, 1878, at Elsene. He edited the *Schelde* from 1858, and from 1861 to his death was secretary to the general auditor of the Brussels military court. His Leideren (2 vols., 1857), his *Zingzang* (1866) and his *Leideren* of 1868 show great tenderness and feeling. His translation of poems from Burns appeared in 1862. He also made many fine translations from Jasmin, the Provençal poet, and from the German.

DECOY, a contrivance for the capture or enticing of duck and other wild fowl within range of a gun, hence any trap or enticement into a place or situation of danger. Decoys are usually made on the following plan: long tunnels leading from the sea, channel or estuary into a pool or pond are covered with an arched net, which gradually narrows in width; the ducks are enticed into this by a tame trained bird, also known as a "decoy" or "decoy-duck." In America the "decoy" is an artificial bird, placed in the water as if it were feeding, which attracts the wild fowl within range of the concealed sportsman. The word "decoy" has etymologically a complicated history. It appears in English first in the 17th century in these senses as "coy" and "coy-duck," from the Dutch *kooi,* a word which is ultimately connected with Latin *cavea,* hollow place, "cage."

BY COURTESY OF VON LENGERKE AND DETMOLD, INC.

ARTIFICIAL DUCK DECOYS USED TO LURE LIVE FOWL

DECREE, in earlier form Decreet, an authoritative decision having in some places the force of law; also the judgment of a court of justice. In Roman law, a decree (*decretum*) was the decision of the emperor, as the supreme judicial officer, settling a case which had been referred to him. In ecclesiastical law the term was given to a decision of an ecclesiastical council settling a doubtful point of doctrine or discipline (*cf.* also DECRETALS). In English law decree was more particularly the judgment of a court of equity, but since the Judicature acts the expression "judgment" (*q.v.*) is employed in reference to the decisions of all the divisions of the supreme court. A "decree *nisi,*" now "order nisi," is the conditional order for a dissolution of marriage made by the divorce court (*see* DIVORCE). *Decreet arbitral* is a Scottish phrase for the award of an arbitrator. In some foreign countries, *e.g.* in Spain, royal decrees may amount to legislation, while in some the subsequent ratification by the legislature is required. In the United States, a decree is the judgment given in courts of admiralty and equity. In addition to the decree *nisi,* courts of equity sometimes issue decrees of nullity, for annulment of marriages.

DECRESCENDO (It.), abbr. *decresc.,* lit. "decreasing," *i.e.,* as used in the familiar musical direction, diminishing in loudness. The sign ⟩ conveys the same meaning.

DECRETALS (*Epistolae* decrefoles), the name (see DECREE above), which is given in Canon Law to those letters of the pope which formulate decisions in ecclesiastical law; they are generally

given in answer to consultations, but are sometimes due to the initiative of the popes. These furnish, with the canons of the councils, the chief source of the legislation of the church, and form the greater part of the *Corpus Iuris*. In this connection they are dealt with in the article on Canon Law.

The False **Decretals.**—A special interest, however, attaches to the celebrated collection known as the False Decretals. This collection, indeed, comprises at least as many canons of councils as decretals, and the decretals contained in it are not all forgeries. It is an amplification and interpolation, by means of spurious decretals, of the canonical collection in use in the church in Spain in the 8th century, all the documents in which are perfectly authentic. With these amplifications, the collection dates from the middle of the 9th century.

The author assumes the name of Isidore, evidently the archbishop of Seville, who was credited with a preponderating part in the compilation of the *Hispana (see* CANON LAW); he takes in addition the surname of Mercator, perhaps because he has made use of two passages of Marius Mercator. Hence the custom of alluding to the author of the collection under the name of the "pseudo-Isidore."

The collection is divided into three parts. The first, which is entirely spurious, contains, after the preface and various introductory sections, 70 letters attributed to the popes of the first three centuries, up to the council of Nicaea, *i.e.,* up to but not including St. Silvester; all these are a fabrication of the pseudo-Isidore, except two spurious letters of Clement, which were already known. The second part is the collection of councils, classified according to their regions, as it figures in the *Hispana;* the few spurious pieces which are added, and notably the famous Donation of Constantine (*q.v.*), were already in existence. In the third part the author continues the series of decretals which he had interrupted at the council of Nicaea. But as the collection of authentic decretals does not begin till Siricius (385), the pseudo-Isidore first forges 30 letters, which he attributes to the popes from Silvester to Damasus; after this he includes the authentic decretals, with 35 apocryphal ones, generally given under the name of those popes not represented in the authentic collection, but sometimes also under the names of the others, for example, Damascus, St. Leo, Vigilius and St. Gregory; with one or two exceptions he does not interpolate genuine decretals. The series stops at St. Gregory the Great (d. 604), except for one letter of Gregory II. (715–731). The forged letters are not, for the most part, entirely composed of fresh material; the author draws his inspiration from the notices on each of the popes given in the *Liber Pontificalis;* he inserts whole passages from ecclesiastical writers; and he antedates the evidences of a discipline which actually existed; so it is by no means all invented.

Thus the authentic elements were calculated to serve as a passport for the forgeries, which were, moreover, skilfully composed; and the collection thus blended was passed from hand to hand without meeting with any opposition. At most all that was asked was whether those decretals which did not appear in the *Liber canonum* (the collection of Dionysius Exiguus, accepted in France) had the force of law, but Pope Nicholas having answered that all the pontifical letters had the same authority, they were henceforward accepted, and passed in turn into the later canonical collections. No doubts found expression until the 11th century, when Cardinal Nicholas of Cusa (d. 1464) and Juan Torquemada (d. 1468) freely expressed their suspicions. More than one scholar of the 16th century, George Cassander, Erasmus, and the two editors of the *Decretum* of Gratian, Dumoulin (d. 1568) and Le Conte (d. 1577), decisively rejected the False Decretals. This contention was again upheld, in the form of a violent polemic against the papacy, by the Centuriators of Magdeburg *(Ecclesiastics historia,* Basle, 1559–74); the attempt at refutation by the Jesuit Torres *(Adversus Centur. Magdeburg. libri quinque,* Florence, 1572) provoked a violent rejoinder from the Protestant minister David Blondel *(Pseudo-Isidorus et Turrianus rapulantes,* Geneva, 1620). Since then, the conclusion has been accepted, and all researches have been of an almost exclusively historical character.

Date.—The author shows himself acquainted with the False Capitularies, three books of capitularies of the Frankish kings (mostly spurious) purporting to have been written by a certain Benedict, a deacon of Mainz. These are for civil legislation what the False Decretals are for ecclesiastical, and their date, 847, gives the earliest possible date for the latter; on the other hand, in a letter of Lupus, abbot of Ferrières, written in 858, and in the synodical letter of the council of Quierzy in 857 are to be found quotations which are certainly from these false decretals; and further, an undoubted allusion occurs in the statutes of Hincmar to his diocese on Nov. 1, 852. The composition of the collection may then be dated approximately at 850.

Aim of the Forger.— This is clearly stated in his preface; the reform of the canon law, or rather its better application. But in what particular respects he wishes it to be reformed can be best deduced from certain preponderant ideas which make themselves felt in the apocryphal documents. He constantly harps upon accusations brought against bishops and the way they were judged; his wish is to prevent them from being unjustly accused, deposed or deprived of their sees; to this end he multiplies the safeguards of procedure, and secures the right of appeal to the pope and the possibility of restoring bishops to their sees. His object, too, was to protect the property, as well as the persons, of the clergy against the encroachments of the temporal power. In the second place, Isidore wishes to increase the strength and cohesion of the churches; he tries to give absolute stability to the diocese and the ecclesiastical province; he reinforces the rights of the bishop and his comprovincials; while he initiates a determined campaign against the *chorepiscopi;* finally, as the keystone of the arch he places the papacy. These aims are most laudable and in no way subversive.

Canonical Influence.—It is certain that in 864 Rothad of Soissons took with him to Rome, if not the collection, at least important extracts from the pseudo-Isidore; M. Fournier has pointed out in the letters of the pope of that time, "a literary influence, which is shown in the choice of expressions and metaphors," notably in those passages relating to the *restitutio spolii;* but he concludes by affirming that the ideas and acts of Nicholas I. were not modified by the new collection: even before 864 he acted in affairs concerning bishops, *e.g.,* in the case of the Breton bishops or the adversaries of Photius, patriarch of Constantinople, exactly as he acted later; all that can be said is that the False Decretals, though not expressly cited by the pope, "led him to accentuate still further the arguments which he drew from the decrees of his predecessors," notably with regard to the *exceptio spolii.* In the papal letters of the end of the 9th and the whole of the 10th century, only two or three insignificant citations of the pseudo-Isidore have been pointed out; the use of the pseudo-Isidorian forged documents did not become prevalent at Rome till about the middle of the 11th century, in consequence of the circulation of the canonical collections in which they figured; but nobody then thought of casting any doubts on their authenticity. One thing only is established, and this may be said to have been the real effect of the False Decretals, namely, they gave a powerful impulse in the Frankish territories to the movement towards centralization round the see of Rome, and opposed legal obstacles to unjust proceedings against the bishops.

BIBLIOGRAPHY.—The best edition is that of P. Hinschius, *Decretales pseudo-Isidorianae et capitula Angilramni* (Leipzig, **1863**). In it the authentic texts are printed in two columns, the forgeries across the whole width of the page; an important preface of ccxxviii. pages contains, besides the classification of the mss., a profound study of the sources and other questions bearing on the collection. The nationality and place of composition has been the subject of much discussion. The view that they originated at Rome has long been abandoned. Hinschius and others argue that they were composed in the province of Reims: *see* for instance Hinschius, Preface, p. ccviii.; Tardif, *Histoire des sources du droit canonique* **(1887)**; Schneider, *Die Lehre der Kirchenrechtsquellen (1892).* The latter afterwards inclined to place them in the Province of Tours and at Le Mans, a conclusion defended by Simson, *Die Entstehung der pseudoisidorianischen Fälschungen* **(1886)** and by Fournier, "La Question des fausses décrétales" in the *Nouvelle Revue historique de droit français et étranger* **(1887,** 1888), and in the *Revue d'histoire ecclésiastique de Louvain V.* (1906, 1907).

DECURIO, a Roman official title, used in three connections. (1) A member of the senatorial order in the Italian towns, and in provincial towns organized on the Italian model. The number of *decuriones* was usually 100. The qualifications for the office were fixed in each town by a special law (*lex municipalis*). Cicero alludes to an age limit, to a property qualification, and to certain conditions of rank. The method of appointment varied. Cicero speaks of the senate in the Sicilian towns as appointed by a vote of the township. But in most towns the chief magistrate drew up a list (album) of the senators every five years. The decuriones held office for life. They were convened by the magistrate, who presided as in the Roman Senate. Their powers were extensive. In all matters the magistrates were obliged to act according to their direction, and in some towns they heard cases of appeal against judicial sentences passed by the magistrate. By the time of Julius Caesar (45 B.C) special privileges were conferred on the decuriones, including the right to appeal to Rome for trial in criminal cases. Under the principate their status underwent a marked decline. The office was no longer coveted, and means were devised to compel members of the towns to undertake it. By the time of the jurists it had become hereditary and compulsory. This change was largely due to the heavy financial burdens which the Roman Government laid on the municipal senates.

(2) The president of a *decuria,* a subdivision of the curia, (*q.v.*).

(3) An officer in the Roman cavalry, commanding a troop of ten men (*decuria*).

DEDEAGATCH, officially known as Alexandroupolis, a seaport of Western Thrace in the Hebros province, 10 m. N.W. of the Maritsa estuary, on the Gulf of Enos, an inlet of the Aegean sea. Pop. about 12,000, Greeks and Armenians. A monastic community of Dervishes, of the Dédé sect, which was established here in the 15th century, shortly after the Turkish conquest, gave to the place its name. Until 1871 Dédéagatch was a mere cluster of fishermen's huts. Then settlers attracted by the possibilities of trade in the products of the valonia oak forest nearby gathered here. In 1884 it was made a sanjak. In 1889 the Greek archbishopric of Enos was transferred to Dédéagatch. On the opening, in 1896, of the Constantinople-Salonica railway, a large proportion of the transit trade which Enos, situated at the mouth of the Maritza, had acquired, was diverted to Dédéagatch, and an era of unprecedented prosperity began; but when the railway connecting Burgas on the Black sea with the interior was opened, in 1898, Dédéagatch lost all it had won from Enos. Owing to the lack of shelter in its open roadstead, the port has not become the great commercial centre which its position otherwise qualifies it to be. It is, however, one of the chief outlets for the grain trade of the Adrianople, Demotica and Xanthi districts. In the Balkan War of 1913 the town was occupied for a time by Greeks but later handed to Bulgaria. In 1915 when Bulgaria annexed the coastal plains from the Maritsa to the Struma, Dédéagatch became permanently Bulgarian until 1918. After the collapse of Bulgarian opposition in 1918 the town was used for the concentration of British troops against the Turkish frontier. When the Peace Treaty drew the Bulgarian frontier along the mountains north of the coastal plains Dédéagatch fell to Greece. After the treaty of Lausanne the Greek frontier was withdrawn to the Maritsa river. Dédéagatch became a frontier town and Enos fell to Turkey. In 1941 Dédéagatch was occupied by Bulgaria.

See Admiralty Handbook of Macedonia, pp. **463-464 (1920)**; *Survey* of International *Affairs,* 1920–23, pp. 338–340 (1925).

DEDEKIND, JULIUS WILHELM RICHARD (1831–1916), German mathematician, was born at Brunswick on Oct. 6, 1831. He studied at Gottingen, where he obtained his doctorate in 1852. After holding various minor posts he became professor of mathematics at the Technische Hochschule at Brunswick in 1894. He died at Brunswick on Feb. 12, 1916. Dedekind's most important work, *Stetigkeit und irrationale Zahlen* (1872), deals with the theory of ideal numbers. He wrote a preface to the collected works of Riemann (1876), and edited Dirichlet's researches on the theory of numbers. The later editions of this work have an appendix containing Dedekind's own work on ideal primes. He was also the author of a memoir on the vibrations of a liquid ellipsoid.

DEDHAM, a town of Massachusetts, U.S.A., on the Charles river, 10mi. S.W. of Boston; the county seat of Norfolk county. It is served by the New York, New Haven and Hartford railroad. The population was 10,792 in 1920 (26% foreign-born white) and 15,508 in 1940. The principal manufactures are envelopes, paper drinking cups and pottery (a variety of true crackleware). Dedham was one of the first two inland settlements of the colony, "planted" in 1635 and incorporated in 1636. A free public school, supported by direct taxation, was established in 1645.

DEDICATION, the setting apart of anything for a special object; especially the consecration of altars, temples and churches; also the inscription prefixed to a book, etc., and addressed to some particular person, formerly designed to gain the patronage of the person addressed. In law, the setting apart by a private owner of a road to public use. (See HIGHWAY.)

The Jewish Feast of Dedication was observed for eight days from the 25th of Kislev (*i.e.,* about Dec. 12), to commemorate the purging (164 B.C.) of the temple after its desecration by Antiochus Epiphanes: See 1 Macc. i. 20–64, iv. 36–59; 2 Macc. i. 9, 18, ii. 16, v. 15–16, vi. 1–11; John x. 22; also Josephus, Antiq., vii. 6–7, xii. v. 4 (where it is called the Feast of Lights).

Dedication of Churches.—The custom of solemnly dedicating buildings set apart for Christian worship must be almost as old as Christianity itself. Before the reign of* Constantine Christian churches were few, and any public dedication of them would have been dangerous in those days of persecution. But from the early 4th century allusions to and descriptions of the consecration of churches become plentiful.

Like so much else in the worship and ritual of the Christian Church, this service is probably of Jewish origin. The hallowing of the tabernacle and its ornaments (Exod. xl), the dedication of the temples of Solomon and Zerubbabel (1 Ki. viii., Ezra vi.), the rededication of the latter by Judas Maccabaeus (see above), the dedication of Herod's temple (Josephus, Antiq. xv. xi 6), and our Lord's recognition of the Feast of Dedication (John x. 22, 23)—all support this hypothesis.

Eusebius (*Hist.* Eccles., x. 3–4) speaks of the dedication of churches rebuilt after the Diocletian persecution, including that of the church at Tyre in A.D. 314–315. The consecrations of the church of the Holy Sepulchre, built by Constantine at Jerusalem (A.D. 335), and of other churches after his time are described by Eusebius and other ecclesiastical historians. From them we gather that every consecration was accompanied by a celebration of the Holy Eucharist, a sermon, and special dedicatory prayers St. Ambrose and other writers mention also the deposition of relics, and a vigil overnight, and there are occasional references to the tracing of the Greek and Latin alphabets on the pavement of the church.

The separate consecration of altars, by sacerdotal blessing and unction with chrism, is prescribed in canons of the councils of Agde (506) and Epaone (517). St. Columbanus (d. 615) is said to have also used holy water (Walafrid Strabo, Vita S. *Galli,* cap. 6). At an early date the right to consecrate churches was reserved to bishops, as by the council of Braga in 563 and in the 8th century Irish collection of canons known as "Synodus Patritii." Accordingly, it is in the pontifical that we find the fully developed consecration service. This occurs in a form closely resembling that now used in ms. pontificals of the 10th century, one of which, believed to be a copy of that of Egbert, archbishop of York (732–766), was printed in 1853 by the Surtees Society. Some idea of the general character of the service may be obtained from the following outline of it as performed in England before the Reformation, according to the use of Sarum (printed by W. Maskell, *Monumenta ritualia ecclesiae Anglicanae,* 2nd ed., vol i. pp. 195–239, from an early 15th century pontifical).

There is a preliminary office for laying a foundation-stone (Maskell, pp. 191–94). On the day of consecration the bishop vests in a tent outside the church, proceeds thence to the church door, a single deacon being inside the church, and there blesses holy water, twelve lighted candles being placed outside and twelve inside the church. He sprinkles the walls all round outside, and knocks at the door; these two actions are repeated twice and after the third knocking he enters the church with his attendant clerics, all laity being excluded. He then fixes a cross in the centre of the church and the litany is said, including a special petition for the consecration of church and altar. He next inscribes the Greek and Latin alphabets, in form of a St. Andrew's cross, on the pavement cindered for the purpose; blesses water, mingled with salt, ashes and wine, and sprinkles thrice the walls inside the church, then the centre of the church longwise and crosswise on the pavement, and then goes round the outside of the church sprinkling it thrice. Returning to the centre of the church he sprinkles holy water to the four points of the compass and toward the roof. Next he anoints with chrism the twelve internal and twelve external wall-crosses, afterwards perambulating the church thrice inside and outside, censing it.

Consecration of Altar. — Then follows the consecration of the altar. Holy water is mixed with chrism, and with the mixture the bishop makes seven crosses on the altar. The altar is sprinkled seven times or thrice with water not mixed with chrism, and the altar-table is washed, censed and wiped. A cross is made with oil of catechumens in the centre of the altar; the altar-stone is anointed with chrism; and the whole altar is rubbed with oil of catechumens and with chrism. Incense is blessed and the altar censed, five grains of incense being placed crosswise in the centre and corners, and on the grains five slender candle-crosses, which are lit. Afterwards the altar is scraped and cleansed; the altar-cloths and ornaments are sprinkled with holy water and placed on the altar, which is then censed. The service ends with the celebration of mass. The various collects, psalms, anthems, benedictions, etc., have been omitted for the sake of brevity.

The Sarum rite described above is substantially identical with that of Rome; but the latter contains in addition one important feature, viz., the translation of relics, found also in the Gallican and other uses. After the sprinkling of the church, the bishop prepares cement at the altar. He then goes to the place (outside the church) where the relics have been placed overnight and carries them in solemn procession to the church door, where he addresses the people and the founder, and two decrees of the council of Trent are read, together with the deed of foundation. Then the bishop, anointing the door with chrism, enters the church with the relics and deposits them in the cavity on the altar, censes and covers them, and anoints the cover. The altar is then censed and wiped, as in the Sarum order.

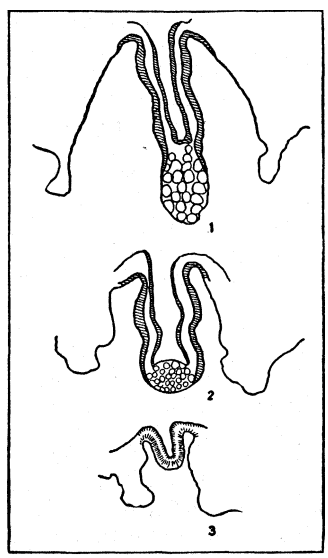
This use of relics goes back to the time of St. Ambrose (see above), but was not universal. The council of Cealchythe (Chelsea) in 816 ordered that part of the consecrated Host should be enclosed if relics were not obtainable. The tracing of the Greek and Latin alphabets on the church floor can be traced back certainly to the beginning of the 10th century, and is doubtless earlier. Its origin and precise meaning are unknown, but various explanations have been suggested by Rossi and others. The annual commemoration of the dedication of a church is probably as old a custom as that of dedication itself. In the Roman Catholic Church it is observed as a double feast of the first class, with octave.

The dedication service of the Eastern Church is long and elaborate (see J. M. Neale, *Hist.* of the Holy Eastern Church, part ii., 1850, pp. 1042–45). Relics are prepared and guarded overnight in a neighbouring sacred church. On the day, the bishop goes to the latter, vests and returns in procession with the relics to the new church, and goes round it. When he comes to the door the relics are laid on a table called the tetrapodion and the epistle and gospel are read. A second and third procession follow, after which the bishop is admitted into the church, the relics are placed in the reliquary and set on the altar, and the bishop is wrapped in a roll of linen over his vestments. He then washes the altar with warm water and with wine and makes crosses on it with chrism. The altar is vested and the service ends with the liturgy, which is repeated daily for seven days.

There is no authorized form for the dedication of a church in the reformed Church of England. A form was approved by the convocation of Canterbury in 1712, and an almost identical form was submitted in 1715, but neither form ever received royal sanction. Anglican bishops have, however, drawn up forms for use in their various dioceses. In the diocese of London, for instance, the bishop, attended by clergy and churchwardens, receives outside the west door a petition for consecration; the procession then moves round the whole church outside, while certain psalms are chanted. On again reaching the west door the bishop is admitted after knocking thrice and advances to the east end of the church. He there lays the keys on the table "which is to be hallowed." The Veni Creator is sung, followed by the litany with special suffrages. The bishop then blesses the font, chancel, lectern, pulpit, stalls and holy table. The deed of consecration is read and signed and Holy Communion is celebrated. The Church of Ireland and the episcopal Church of Scotland have no fully authorized form of dedication, but various forms have been issued on episcopal authority.

DEDIFFERENTIATION, a biological term meaning the reverse of differentiation, *i.e.*, for processes which lead to organisms or their parts reverting to greater simplicity; the term reduction has also been employed, but is unsatisfactory as it is in demand for chromosome-reduction. (See CYTOLOGY.) Dedifferentiation in its strict sense should not be applied to simple cases of degeneration, but in practice it is often impossible to draw the line.

Dedifferentiation in many Protozoa (*q.v.*) may be a regular and physiological phenomenon. When Protozoa with complicated structure, such as many Ciliates, reproduce by simple fission, many of the old structures dedifferentiate, the daughter-cells acquiring new organs of the same kind by new differentiation. In Bursaria, Lund has shown that, in addition, damage or unfavourable conditions will cause the whole animal to revert to a sphere without any trace of normal differentiation. Redifferentiation to the normal form may occur from this state or from any stage in the process. Similar total dedifferentiation occurs in the encystment of *Bursaria* and many other unicellular forms.



FROM DE BEER, 'AN INTRODUCTION TO EXPERIMENTAL EMBRYOLOGY (CLARENDON PRESS)

FIG. I. — STAGES IN THE DEDIFFERENTIATION OF THE TENTACULOCYST OF AURELIA. BY STARVATION (1) Normal tentaculocyst. (2) Slightly dedifferentiated. (3) Dedifferentiated to a small knob without the characteristic structure

Starvation is a frequent cause of dedifferentiation. The common Hydra, by this and other means, may be made to lose all its tentacles, and eventually revert to a mere spheroid with no mouth, and similar phenomena have been described in sea-anemones. The common jelly-fish *Aurelia*, kept without food, shrinks enormously in bulk, some parts, *e.g.*, the gelatinous bell, being much more reduced than others like the mouth-tentacles; specialized tissues lose their histological differentiation, *e.g.*, the genital organs and the special sense-organs, the tentaculocysts. In the worm *Ophryotrocha*, remarkable dedifferentiation occurs if it is damaged or mutilated.

In starvation, there will clearly be a "struggle of the parts," the less resistant breaking down and serving as food for the rest. Starvation itself is apparently favourable to dedifferentiation, but when this has once begun, the tissue can be more readily made to degenerate into mere food-materials. This differential resistance of tissues has sometimes been turned to physiological ac-

Many steps are reversible

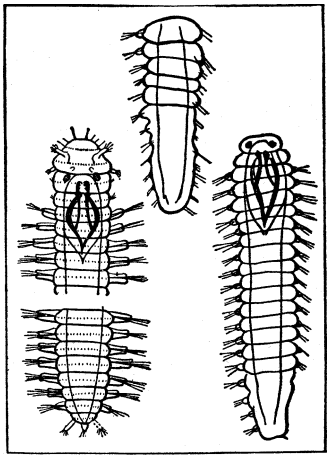
count in higher forms, *e.g.,* the salmon's sexual organs grow enormously while the fish is in fresh water, though it takes no or negligible food during this time. The necessary material is supplied by the dedifferentiation and later degeneration of the muscles. Similarly the wing-muscles of the queen ant are so constructed that when she breaks off her wings after the nuptial flight, they dedifferentiate, eventually becoming converted into food-material.



FROM KORSCHELT, "REGENERATION AND TRANSPLANTATION" (GUSTAV FISCHER)

FIG. 3.—DEDIFFERENTIATION OF OPHRYOTROCHA PUERILIS

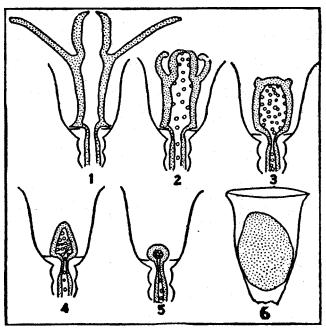
On left, anterior and posterior ends of body, normal. Right and centre, partial and almost complete dedifferentiation after injury

Dedifferentiation is often complicated by resorption. When the process has reached a certain stage, many kinds of cell migrate out of the tissues. In higher forms with massive tissues this is not possible, and resorption is usually effected by phagocytes devouring the dedifferentiating cells. This is so in the tail-resorption of metamorphosing tadpoles; the tissues begin to dedifferentiate, but are subsequently attacked by phagocytes.

In lower types, the fate of dedifferentiating organs is largely determined by the space available to the emigrating cells, *e.g.,* in colonial Hydroids, such as *Obelia,* when exposed to unfavourable conditions, the polyps start to dedifferentiate as does *Hydra;* but the large spaces of the less susceptible stalk are available for the cells migrating out of the tissues, and accordingly the polyps become entirely resorbed into the stem. The same is true in the social Ascidian *Perophora.* In both cases the amount of stalk or stolon left attached to an individual (zooid) determines the final result. If the amount of stalk is relatively large, total resorption occurs. If small, the result is a dedifferentiated zooid.

One particularly interesting point has been elicited by Child. By applying depressant agents such as weak alcohol to pieces of Hydroid stems *(Corymorpha)* he obtained dedifferentiation which led to complete obliteration of the original polarity. On being replaced in sea water, regeneration took place, but at right angles to the direction it would have taken if no dedifferentiation had occurred.

The Ascidians are the most highly organized animals in which total dedifferentiation is possible. This has been best worked out in *Clavelina.* Halved animals may, in the midst of normal regeneration, dedifferentiate to a small opaque spheroid, from which later a whole organism may arise. Intact whole animals, if small, may also dedifferentiate thus. Dedifferentiation may be induced by leaving in unchanged water, redifferentiation by change of water. Two successive dedifferentiations, each followed by redifferentiation, have been obtained in a single animal, though deprived of food throughout. The internal organs become greatly simplified, and different parts are affected at a very different rate; the cells revert to an embryonic type. Recovery is not possible from the most extreme stages, but at all earlier stages the process is reversible.



FROM HUXLEY AND DE BEER IN "THE QUARTERLY JOURNAL OF MICROSCOPICAL SCIENCE"

FIG. 4.—DEDIFFERENTIATION AND RESORPTION IN OBELIA

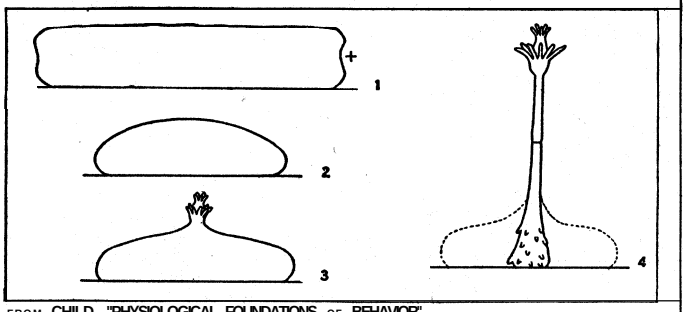
(1) to (5) When a section of stem is left attached to the polyp. (1) Normal polyp. (2) Dedifferentiation begins, and cells start migrating into the digestive cavity. (3) Mouth closed, tentacles resorbed to knob. (4) and (5) Total resorption of tentacles and shrinkage of the polyp. (6) No stem is left attached to the polyp. Dedifferentiation alone occurs

Schultz has attemptad to show that dedifferentiation is a true reversal of normal development; but later work shows that this view is untenable. The structural changes seen are mainly due to the cells reverting to the "embryonic" type, roughly cubical when in epithelia, spherical when isolated. This, however, is not due to any mysterious force compelling return to the embryonic type because it is embryonic, but because this type has the least amount of surface relative to volume; to maintain any other form demands a continual performance of work against the forces of surface-tension, which is beyond the powers of cells exposed to other unfavourable conditions. The picture is complicated by two other factors—first, the facility with which different kinds of cells migrate out of their tissues; secondly, the different resistance of cells, leading to the least resistant breaking down and becoming food-material for the others.

Behaviour which may perhaps be included under dedifferentiation is that of (*e.g.*) certain Planarian flatworms when starved.

These do not revert to a morphologically simpler state, but become smaller, living upon their own capital. As Child showed, these reduced specimens not only acquire the proportions of normal young animals, but are in most respects physiologically young; they have undergone rejuvenation (*q.v.*). Here the destruction of reserves and the altered surface-volume relations probably effect the change automatically.

Sea-urchin larvae dedifferentiate readily in unfavourable conditions, resorbing arms and skeleton, and eventually becoming mouthless lumps. This tendency has been taken advantage of in nature, and dedifferentiation of larval tissues, followed by their resorption into the adult rudiment, is the method of normal metamorphosis (*q.v.*).

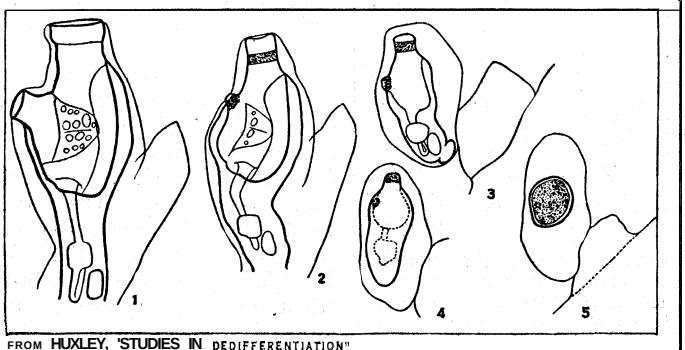


FROM CHILD, "PHYSIOLOGICAL FOUNDATIONS OF BEHAVIOR"

FIG. 5.—DEDIFFERENTIATION IN CORYMORPHA. FOLLOWED BY REDIFFERENTIATION. WITH NEW POLARITY

(1) A piece of cut stem; + is the end nearest to the polyp. (2) The same, after dedifferentiation in dilute alcohol in sea-water. (3) and (4) When replaced in pure sea-water, redifferentiation occurs, but the new stem axis is at right-angles to the old, the polyp being formed where oxygen is most abundant

A striking type of dedifferentiation is that of tumour tissue, malignant and otherwise. When a tumour is formed, the cells of the tissue from which it arises lose some of their differentiation. Roughly speaking, the greater the malignancy, the more complete the dedifferentiation. (*See* CANCER.) This type of dedifferentiation apparently differs importantly from that hitherto discussed, for tumour-cells are characterized by undue activity and multiplicative power, whereas in the other type activity is reduced, and multiplication, if present, stopped. Possibly the existence of histological differentiation is only possible at a not too high level of metabolic activity, and relatively such stable scaffoldings as connective tissue fibrils, muscle-fibres, nerve-fibrils, etc., are only constructed and maintained when the cell's activities are keyed at a certain pitch, and are broken down when they are higher; just as, to use a rough analogy, sandbanks are only laid down in a river when its rate of flow is suitable, and are destroyed if its speed increases. On the principle of the struggle of the parts, it would be expected further that if cell-metabolism were altered so as to encourage cell reproduction. less food-material would be available for maintaining structural differentiation or for activities such as secretion. However, these views, though interesting, are admittedly speculative. They do not in any case cover all the facts, since differentiation can he shown to be sometimes caused by presumably chemical stimuli from another kind of tissue, *e.g.,* when kidney-tubule tissue is cultivated alone in artificial media (*see* TISSUE-CULTURE) its cells dedifferentiate entirely; but when connective tissue is added, the tubule-cells differentiate to form regular tubules.



FROM HUXLEY, "STUDIES IN DEDIFFERENTIATION"

FIG. 6.— REDUCTION PHENOMENA IN THE ASCIDIAN CLAVELINA

(1) Upper part of normal specimen, showing heart (below to right), gullet, stomach, and rectum (below to left), with above, large pharynx opening by upper aperture of atrium (opening by aperture to left). The small circles are gill-slits leading from pharynx to atrium. (2) to (5) stages in dedifferentiation of the same specimen, to scale

In any event, it is a well-established fact that active cell-multiplication is incompatible with the maintenance of differentiation; we may accordingly correlate the dedifferentiation of cancer cells with this fact, and conclude that its origin is different from the dedifferentiation correlated with lowered activity.

Dedifferentiation associated with increased cell-multiplication is also seen in regeneration. In many cases, the first process observed at the cut surface after wound-healing is rapid multiplication of cells to form a so-called regeneration blastema, consisting of cells dedifferentiated as far as visible characteristics go. That they are also dedifferentiated in other respects is shown by the interesting results obtained in newts, where grafting of a young regeneration blastema, *e.g.,* of a limb, to some other region, *e.g.,* the newly-cut stump of the tail, will cause the blastema to complete the organ on to which it is grafted, instead of that by which it was first regenerated. (*See* REGENERATION; GRAFTING IN ANIMALS.) It will be seen that several diverse processes are at present lumped together under the head of dedifferentiation. Not only is the dedifferentiation correlated with increased multiplicative activity to be sharply distinguished from that correlated with depression of activity, but among depressant agencies starvation, at least in moderate degree, probably has a different, less pathological effect than exposure to chemically unfavourable conditions. Distinction should also be made between reversible dedifferentiation and that which is irreversible and therefore leads to degeneration (though reversible dedifferentiation, if long continued, often passes over into irreversible). In reversible cases, investigation is needed as to whether the dedifferentiated cells themselves redifferentiate (as in Protozoa, and undoubtedly in some Metazoan cases, *e* g , in early stages of *Clavelina's dedifferentiation*), or whether they degenerate, and redifferentiation occurs from undifferentiated "reserve" cells. Investigation is also needed with reference to "metaplasia"—the capacity for tissues to transform from one differentiated type into another. While this undoubtedly occurs, it is probably confined to the power of a tissue to pass from lower to higher grade of differentiation, as when non-cornified epidermis becomes converted into cornified under abnormal stimuli; and to redifferentiation in a new direction after passing through a dedifferentiated phase in which cell-multiplication has taken place, as in the above-cited example from regeneration. The study of tissue-culture may solve several of these problems.

DE DONIS CONDITIONALIBUS: *see* ENTAIL.

DEDUCTION, a term used in common parlance for the process of taking away from, or subtracting (as in mathematics),

and specially for the argumentative process of arriving at a conclusion from evidence, *i.e.*, for any kind of inference (from Lat. *deducere*, to take or lead from or out of, derive). Two forms of the verb are used, "deduce" and "deduct"; originally synonymous, they are now distinguished, "deduce" being confined to arguments, "deduct" to quantities. In this sense it includes both arguments from particular facts and those from general laws to particular cases. In logic it is generally used in contradiction to "induction" for a kind of mediate inference in which a conclusion (often itself called the deduction) is regarded as following necessarily under certain fixed laws from premises. This, the most common form of deduction, is the syllogism (*q.v.*; see also LOGIC), which consists in taking a general principle and deriving from it facts which are necessarily involved in it. This use of deduction is of comparatively modern origin; it was originally used as the equivalent of Aristotle's ἀπαγωγή (see *Prior Analytic*~B xxv.). The modern use of deduction is practically identical with the Aristotelian συλλογισμός. Logical usage is somewhat inconsistent. On the one hand, Deduction is said to be from a universal premise; on the other hand, even syllogisms consisting of singular propositions only are described as deductive. To secure consistent usage it is best to apply the term *deduction* to *all* inferences from a universal proposition (even to immediate inferences of a singular or particular proposition from a universal) and to no other inference (such as singular syllogisms). Another source of confusion lies in the fact that in Mathematics the term deduction is sometimes used as synonymous with *Analysis*. Descartes' "deductive method" is often misunderstood for this reason as it covers both deduction proper and this analytic method.

DEE, JOHN (1527–1608), English mathematician and astrologer, was born in London, and educated at St. John's college, Cambridge, becoming a fellow of Trinity. He spent two years at Louvain and at Rheims in study and lecturing, returning to England in 1551, when he received a pension from Edward VI., which he exchanged for the living of Upton-on-Severn. Soon after Mary's accession he was imprisoned on a charge of using enchantments against the queen's life, but was released in 1555. Dee enjoyed the favour of Queen Elizabeth. He was asked to name a propitious day for the coronation, gave lessons to the queen in the mystical interpretation of his writings, was sent abroad in 1578 to consult with German physicians and astrologers on the nature of her illness, and was employed by her in establishing the claim of the Crown to the overseas countries discovered by British subjects. In 1581 began his collaboration with Edward Kelly, who professed to have discovered the philosopher's stone and to be able to raise spirits. The two spent the years 1583–89 in Poland and Bohemia under the patronage of Albert Laski, palatine of Siradez. Dee returned to England in 1589. He was helped over his financial difficulties by the queen and his friends. In May 1595 he became warden of Manchester college. In Nov. 1604 he returned to Mortlake, where he died in Dec. 1608, at the age of 81, in the greatest poverty. Dee's *Speculum* or mirror, a piece of solid pink-tinted glass about the size of an orange, is preserved in the British Museum.

His principal works are: *Pvopaedeunzata aphoristica* (1558); *Monas hieroglyphica* (Antwerp, 1564); *Epistola ad Fredericum Commandinum* (Pesaro, 1570); *Preface Mathematical to the English Euclid* (1570); *Divers Annotations and Inventions added after the tenth book of English Euclid* (1570); *Epistola praefixa Ephemeridibus Joannis Feldi, a 1557; Parallaticae commentationis praxeosque nucleus quidam* (1573).

The catalogue of Dee's printed and published works is to be found in his *Compendious Rehearsal*, as well as in his letter to Archbishop Whitgift. *The Private Diary of Dr. John Dee, and the Catalogue of his Library of Manuscripts*, edited by J. O. Halliwell, was published by the Camden Society in 1842. There is a life of Dee in Thomas Smith's *Vitae illustrium virorum* (1707); Eng. trans. by W. A. Ayton, the *Life of John Dee* (1909); M. R. James, "Lists of Manuscripts Formerly owned by Dr. John Dee," *Bibliog. Soc. Trans.* Sup. no. 1. (1921).

DEE, river, south Aberdeenshire, Scotland, flowing generally eastwards from its source in the west of the county till it reaches the North Sea at the city of Aberdeen. It rises in the Wells of Dee, a spring on Ben Braeriach, one of the Cairngorms, at a height of 4,061 ft. With its tributaries the river drains an area of 1,000 sq.m. Rapid and turbulent during the first half of its course of 90 m., it broadens below Aboyne and the rate of flow is diminished. The channel towards its mouth was artificially altered in order to provide increased dock accommodation at Aberdeen, but, above, the stream is navigable only for barges and small craft for a few miles It runs through beautiful scenery especially in Braemar. About two miles above Inverey it enters a narrow rocky gorge, 300 yd. long and only a few feet wide at one part, and forms the rapids and cascades of the famous Linn of Dee. One of the finest of Scottish salmon streams, it retains its purity almost throughout. The principal places on the Dee are Castleton of Braemar, Ballater, Aboyne, Kincardine O'Neil, Banchory, Culter and Cults.

DEE, a river of Wales and England. It rises in Bala Lake, Merionethshire. Leaving the lake near Bala, it flows north-east to Corwen and turns east past Llangollen to near Overton, and then bends nearly north to Chester, and thereafter north-west through a great estuary into the Irish Sea. In the Llangollen district the Dee crosses Denbighshire, and thereafter forms the boundary of that county with Shropshire, a detached part of Flint, and Cheshire. From Bala to Overton (35 m.), the river falls about 330 ft., and its course lies through a narrow, beautiful valley, enclosed on the south by the steep slopes of the Berwyn Mountains and on the north by a succession of lesser ranges. The Vale of Llangollen is especially famous. Here an aqueduct of the Shropshire Union canal bestrides the valley; it is a remarkable engineering work completed by Thomas Telford in 1805. The Dee has a total length of about 70 m. and a fall of 530 ft. Below Overton it debouches upon its plain track. Below Chester it follows a straight artificial channel to the estuary, and this is the only navigable portion. The estuary, which is 14 m. long, and 5¼ m. wide at its mouth, between I-lilbre Point and Point of Air, is not a commercial highway like the Mersey, for at low tide it becomes a vast expanse of sand, through which the river meanders in a narrow channel. The tide rushes in with great speed over the sands, and their danger is illustrated in the well-known ballad "The Sands of Dee" by Charles Kingsley. The Dee drains an area of 813 sq.m.

DEED, in law, **a** contract in writing, sealed and delivered by the party bound to the party intended to benefit. Contracts or obligations under seal are called in English law *specialties*, and down to 1869 they took precedence in payment over *simple* contracts, whether written or not. Writing, sealing and delivery are all essential to a deed The signature of the party charged is not material, and the deed is not void for want of a date. Delivery, it is held, may be complete without the actual handing over of the deed; it is sufficient if the act of sealing were accompanied by words or acts signifying that the deed was intended to be presently binding; and delivery to a third person for the use of the party benefited will be sufficient. On the other hand, the deed may be handed over conditionally as an *escrow*, in which case it will not take effect as a deed until the conditions are performed. A deed indented, or indenture (so called because written in counterparts on the same sheet of parchment, separated by cutting a wavy line between them so as to be identified by fitting the parts together), is between two or more parties who contract mutually. The actual indentation is not now necessary to an indenture. The *deed-poll* (with a polled or smooth-cut edge, not indented) is a deed in which one party binds himself without expression of any obligations undertaken by another party. *(See* CONTRACT.)

Statutes have been enacted in many of the United States, as in Great Britain and her colonies, setting forth certain short and convenient forms for deeds, thus giving effect to statutory provisions and forms. In the United States a deed has the effect of feoffment with livery of seisin or as a deed under the statute of uses or of any species of conveyance necessary to effect the intent of the parties and not repugnant to the legal requirements.

DEED REGISTRATION: *see* LAND TITLES.

DEEMS, CHARLES (ALEXANDER) FORCE (1820–1893), American clergyman, was born in Baltimore (Md.) on Dec. 4, 1820. He graduated at Dickinson college in 1839, and

in 1841 became agent for the American Bible Society in North Carolina. He taught at the University of North Carolina and at Randolph-Macon college, was for four years (1850–54) president of the Greensboro (N.C.) Female college, and preached in a number of Southern churches. In 1868 he founded in New York city the undenominational Church of the Strangers, where he remained till his death on Nov. 18, 1893. With Phoebe Cary, one of his parishioners, he compiled *Hymns for All Christians* (1869); he also was the author of many books. For ten years he edited *Christian Thought*, organ of the American Institute of Christian Philosophy, of which he was one of the founders and president and through which the Charles F. Deems lectureship in philosophy was established at New York university.

See the memoir (1897), in part autobiography, in part the work of his sons; and the memorial number of *Christian Thought* (Feb. 1894).

DEEMSTER or **DOOMSTER,** the former title of an officer attached to the High Court of Justice in Scotland who pronounced the doom or sentence on condemned persons. Mention of this officeis made in the Doomsday Book. Deemster is the title proper to each of the two justices of the Isle of Man.

DEER, originally the name of one of two British species, the red-deer or the fallow deer, but now extended to all the family Cervidae *(see* PECORA, *ARTIODACTYLA*, *UNGULATA)*. Briefly, deer may be defined as Pecora, in which antlers are usually present in the male; when no antlers are developed, the upper canine teeth are elongated and sabre-like. The antlers arise from pedicles or bony projections of the frontal bone; when a new antler is to be formed the summits of these pedicles become highly vascular and from the blood thus supplied a bony secretion is deposited. During its growth the antler is covered with soft, hairy skin, through which run a number of blood-vessels; this skin is known as the velvet. Towards the completion of the antler's growth a more or less prominent ring of bone, the burr or coronet, is deposited at its base just above the junction with the pedicle; this tends to constrict the blood-vessels, and thus cut off the supply of blood from the antlers. When the antlers are freed from the velvet—a process usually assisted by the animal rubbing them against trees—they have a more or less rugose surface, owing to the grooves formed in them by the nutrient blood-vessels. In the antlers of the red-deer group, which form the type of the whole series, the following names have been applied to their different component parts and branches. The main shaft is termed the beam; the first or lowest tine the brow-tine; the second the bez-tine; the third the trez-tine, or royal; and the branched summit the crown, or surroyals.

The Cervidae are distributed all over Europe, Asia, northern Africa and America, but are unknown in Africa south of the Sahara. They are essentially woodland animals and where forced to dwell in open country, as in the highlands of Scotland, become stunted. Thus the prehistoric remains found in the Scottish peat-bogs indicate that a moderate sized, old time red deer (*Cervus elaphus*), which was a forest dweller, was a third as large again as well-grown modern forms. That this is not due to deterioration of the stock, but primarily to the conditions of the environment, is shown by the fact that the descendants of Scottish deer introduced into New Zealand are amongst the largest specimens known.

The existing members of the family are arranged in two subfamilies, the Moschinae containing only a single species, the musk deer, and the Cervinae, including not only the true deer but the muntjaks, roe deer, mule deer, etc.

The subfamily Moschinae is distinguished by the presence of a gall-bladder and, in the males, a large caudal gland, and by the absence of antlers, face-glands and foot-glands. The hemispheres of the brain are comparatively smooth, with few convolutions. The subspecies are distributed over a large part of central and north-eastern Asia, from Gilgit southwards to Cochin China, and eastwards to Korea. The musk deer or kastura (*Moschus moschiferus)* stands about 20 in. at the shoulder, with the hind-quarters elevated, but the Korean subspecies is smaller and more slenderly built. The hair is thick and brittle, resembling pith; the general colour is brownish speckled with grey. The ears are large and the upper canine teeth of the males greatly enlarged, projecting well beyond the lip margin. The tail is very short, and the naked area of the muzzle is extensive. Musk deer are forest dwelling animals, usually found at considerable elevations; the males secrete the "musk," from which the animal derives its name, in an abdominal gland. The record specimen carries canine teeth which project out beyond the jaw-bone for a distance of $3\frac{9}{16}$ in.; these weapons appear to be chiefly used for fighting, the bucks engaging in severe combats during the pairing-season.

The Cervinae have no gall bladder or caudal gland, but there are foot-glands at least in the hind-limbs (absent in *Pudu*); antlers are, as a rule, developed and are characteristic of all true deer. The cerebral hemispheres present numerous convolutions. It is an interesting point that the ratio between body-weight and antler-weight increases with the absolute size of the animal. Thus in the red deer (*Cervus elaphus*), it was found that in stags of mean weight 74.4 kg. the antler-weight was 2.2% of the total, in stags of mean weight 130.6 kg., it was 3.03%, and in those of 211.8 kg., 4.21%, a point of great evolutionary significance. The growth of the antlers depends also upon a number of other circumstances, which are favourable or unfavourable to the production of large, heavy antlers. Lime in the soil is very important and the amount of food available, depending on the weather, is also influential. The successive antlers of a stag increase rapidly in weight during the first few years, but after the 11th year, and sometimes before, decrease again ("go back"). The percentage increments for the red deer from Warnham Park are: — and year, 230.6%; 3rd, 72.2%; 4th, 38.6%; 5th, 18.1%; 6th, 8.5%; 7th, 5.2% *(see* J. S. Huxley, *Proc. Zool. Soc.,* London, 1926). The antlers are used in fighting other stags and only exceptionally, or as a last resort, for defence, deer trusting rather to their fleetness to escape from an enemy. It is a remarkable fact, however, that antler-less stags, which fight with their fore-hooves, seem often to be able to vanquish their antlered rivals. Most deer (but not the roe) are polygamous, the males fighting fiercely for possession of the females.

The subfamily contains 19 genera which vary in size from the pudu, standing only about $13\frac{1}{2}$ in. in height, to the gigantic moose and elk.

I. **Muntiacus.**—The members of this genus agree with all the other Cervinae, excepting the reindeer and caribou (*Rangifer*), in the absence of antlers in the females and the presence of a small, bare muzzle. They are known popularly as muntjaks or barking deer and are characterized by the tusk-like development of the upper canine teeth in the males, a feature in which these animals approach the condition found in the musk deer and resembling in this respect the tufted deer (*Elaphodus*) and the Chinese water deer *(Hydropotes)*. Six species and numerous subspecies have been described; all are small animals, with small and simple antlers consisting of a small brow-tine and a beam, arising from long, bony pedicles which are continued downwards to form prominent ridges on the frontal region of the skull. In the females these pedicles are represented by small, bony prominences surmounted by tufts of hair. The ears are small and the tail long and thin. The various species are distributed over the Indo-Malayan region eastwards as far as Sumatra and Borneo, a number of forms occur in China and one in Formosa; muntjaks do not extend into Japan. The record length of the antlers taken from the burr to the tip, is $10\frac{3}{8}$ in. The males stand about 20 to 22 in. in height at the shoulder and weigh about 38lb.

II. **Elaphodus** contains but a single species, E. *cephalophus*, or Chinese tufted deer, distinguished from the muntjaks by the small size of the antlers and by the supporting pedicles diverging inferiorly. Further, the pedicular ridges on the frontal region are absent. Four races are known, all confined to China. In size these deer about equal the larger species of muntjak.

III. llama. — Two species of *Dama* are now recogniscd, *D. dama* and *D. mesopotamica* from Persia; they are popularly known as fallow deer. In this genus, as in all the remaining gegera except *Hydropotes*, the male canine teeth when present, are not tusk-like. The antlers are large and are supported on short pedicles which do not form frontal ridges as in the muntjaks; the bez-

tine is normally absent, and the beam is palmated and bears numerous snags on the hinder edge. The coat is usually spotted with white in summer, and the height at the shoulder is about 3 ft. Originally the species were restricted to the Mediterranean countries and Persia; the typical species has, however, been introduced into many parts of Europe. The extinct Irish elk (Megaceros) is an allied genus.

IV. Axis.—Some authors regard the genera Axis, *Hyelaphus,* Rusa, Rucervus and Sika as subgenera of Cervus, but it seems more convenient to regard them as distinct. The chital or spotted deer (Axis axis) resembles *Dama* in the coat being spotted with white; the antlers are, however, very different, being long, slender and not palmated. They are three-tined, the brow-tine forming a right angle with the beam. These Indian deer are of medium size, standing about 36 in. at the shoulder; fine antlers measure as much as 39 in. along the outer curve.

V. **Hyelaphus.**—Closely allied to the chital, the hog-deer of the genus *Hyelaphus* are more stocky in build and the horn pedicles longer. The auditory bullae are very large and the coat is either spotted in summer or uniformly coloured throughout the year. The two species are confined to the Oriental region: H. *porcinus* is the best known.

VI. **Rusa.**—This genus includes large, medium-sized and small deer, normally carrying three-tined antlers in which the brow tine forms an acute angle with the beam. The coat is long and shaggy and uniformly coloured in the adults. The species are widely distributed over most of the Oriental region, extending northwards as far as Sze-chuan. Five species are recognized, of which the sambar (R. *unicolor*) is the best-known. This species is typically a very massive animal, standing as much as 54 in. at the shoulder; some stags carry exceptionally large antlers (45 to 50 in. in length).

VII. **Rucervus.**—In this genus, the species of which are all large, both the second (bez) and third tine are wanting and the beam divides into four or more branches; the brow tine forms either a right angle or continuous curve with the beam. The range includes a large part of south-eastern Asia, extending to the island of Hainan. R. duvaucelli, the barasingha or swamp-deer (confined to peninsular India), R. schomburgki, Schomburgk's deer, (remarkable for its many-tined antlers) and R. *thamin,* the thamin (with cylindrical and rugose antlers), which have a long brow-tine forming a continuation of the curve of the beam), are the best known.

VIII. **Sika.**—The sika or Japanese deer of Japan and Manchuria are medium-sized deer related to the true deer but with smaller and simpler antlers; the latter are flattened and usually four-tined. The coat is spotted with yellowish-white in summer; there is a white area bordered with black in the caudal region.

IX. **Cervus.**—In this genus, which includes the true deer, the antlers are more complex, usually having at least five tines. The tail is considerably shorter than in Sika, and the coat-colour uniform in the adult. The following species are here regarded as belonging to the typical genus:—the red deer (C. *elaphus*), wapiti (C. canadensis), Yarkand stag (C. *yarkandensis*), shou (C. *wallichi*), Macneill's deer (C. *macneilli*), hangul (C. *cashmiriensis*) and Thorold's deer (C. albirostris). The typical species (C. *elaphus*) is widely distributed, ranging over the greater part of Europe (excluding the Italian peninsula) and extending eastwards to the Caucasus and Caspian provinces of Persia. The largest of these red deer is the maral (C. e. maral) from Persia, the height at the shoulder reaching as much as $4\frac{1}{2}$ ft. The wapiti (miscalled elk in America) is typically from eastern Canada; but in addition to the New World forms, several local races have been described from central and north-eastern Asia. The wapiti may stand as much as 5 ft. 4 in. at the shoulder and carries very massive antlers. Both red deer and wapiti have been successfully introduced into New Zealand. The shou and the hangul occur in the Himalayan region.

X. **Elaphurus** is apparently most nearly related to the true deer. The antlers divide a short distance above the burr, the front branch curving forwards and again dividing, and the single hind branch projecting backwards. Only one species is known, E. *davidianus,* the mi-lu, or Père David's deer; the distributional range is uncertain, as this deer is known only from a herd formerly kept in the gardens of the Summer palace, Pekin, and their descendants, notably at Woburn abbey, England.

XI. Odocoileus inctudes the white-tailed deer (0. *virginianus*), mule deer (0. hemionus) and black-tailed deer (0. *columbianus*). In this genus and those following unlike *Dama,* Cervus, etc., the lateral metacarpals are represented by their lower, and not their upper, extremities. The antlers are large and the beam dichotomously forked; a subbasal snag is developed. The deer included in this group are exclusively American, the range extending from Alaska to Peru, Bolivia and northern Brazil. A large number of local races of the white-tailed deer have been described, from both North and South America. The mule deer and black-tailed deer are found only in North America.

XII. **Blastocerus.**—Closely allied to the foregoing, but without metatarsal gland. The antlers are large, complex and lack the sub-basal snag of *Odocoileus.* Two species are known:—B. *dichotomus,* the marsh deer; and the smaller B. bezoarticus, the Pampas deer, both South American. The former species is the largest South American deer, nearly equalling the red deer. B. bezoarticus is a little larger than a roe deer.

XIII. Hippocamelus is distinguished by the small, simple, dichotomously forked antlers, of which the front prong is the shorter, and absence of metatarsal glands. Two species occur, both in South America.

XIV. **Mazama.**—The deer of this genus are all small species allied to Hippocamelus, but distinguished by their antlers being unbranched spikes. A large number of species and subspecies have been named, distributed throughout central and tropical South America, but the distinguishing characters are, in many instances only very slight. The typical brocket (M. americana) is about 27 in. in height at the shoulder and the coat is bright rufous in colour. Some species are considerably smaller, notably M. *nana* from the Matto Grosso.

XV. **Pudu.**—This group contains two very small species, standing only $13\frac{1}{2}$ to 15 in. at the shoulder, with very small spike-like horns, both from South America.

XVI. **Capreolus.**—This genus, comprising the roe deer, is distinguished by the antlers arising almost vertically from the head; the beam divides into two upright branches, the hinder one of which again divides. It includes three species, varying in height from 26 (typical roe) to 34 in. (C. pygargus); they range over central southern Europe across Asia north of the Himalayas to the Pacific coast. The roe is monogamous. During the rutting period, the stags pursue the does in circles and often several pairs may be seen thus engaged. Although the rut takes place in autumn, the female roe shows no signs of pregnancy until the following spring, and it is suggested that development of the embryo is suspended during the winter.

XVII. **Alces.**—The members of this genus are at once distinguishable by their massive palmated horns, bordered with snags, large size (height at shoulder $5\frac{3}{4}$ to $6\frac{3}{4}$ ft.) and broad, overhanging muzzles. The European elk (*A.* alces alces) at one time extended throughout the greater part of northern Europe and part of northern Asia, but is now extinct in most parts of Europe; the American moose (*A. alces americanus*) from eastern North America is the typical moose. During the winter, a herd of moose will often trample down a space in the soft snow ("moose yard") to give them firm footing. The gait of these animals is a curiously stiff-legged run, but they nevertheless possess a considerable turn of speed notwithstanding their ungainly appearance.

XVIII. **Rangifer.**—The reindeer and caribou differ from all the preceding genera in that the female bears antlers and the muzzle is completely hairy. In size medium or large; in some subspecies the antlers are massive and broadly palmated (R. *tarandus* terraenovae), in others long and slender (R. *t. arcticus*). The various races range over the northern parts of Europe and North America as far south as northern Columbia and New Brunswick. In many parts of its range, *Rangifer* is migratory and is indispensable as a domestic animal to the Lapps of northern Europe.

XIX. **Hydropotes.**—In this genus antlers are entirely wanting, and the upper canines form long, curved tusks. The Chinese water deer (H. *inermis*) is the sole species; it stands only 20 in. at the shoulder. The general colour is rufous, much as in the brockets and the range is confined to China and Korea.

Dollman, *Game Animals of India* (1924). For special points, *see* J. G. Dollman, *Rowland Ward's Records of Big Game* (1924) and J. S. Huxley, *Proc. Zool. Soc. Lond.* (1926). (J. G. D.)

DEERE, JOHN (1804–1886), American manufacturer and inventor of the steel plow, was born at Rutland, Vt., on Feb. 7, 1804 He attended Middlebury college for a short time, but left at the age of 17 to become an apprentice to a blacksmith in Middlebury. He established his own smithy in 1825. Eleven years later he moved to Grand Detour, Ill., where he opened a shop in partnership with Maj. Leonard Andrus. Here he began experimenting with the use of steel, instead of wood, for plowshares, and in 1837 he manufactured the first steel plow, moulded over a log. By 1846 the output of his small establishment was about 1,000 plous annually. The next year he went to Moline, Ill., where he founded his own firm, incorporated in 1868 as Deere & Company. He continued as president of the company until his death at Moline.

DEERFIELD, a town of Franklin county, Massachusetts, U.S.A., on the Connecticut and the Deerfield rivers, 33 mi. N. of Springfield; served by the Boston and Maine and the New York, New Haven and Hartford railways. The population in 1940 was 2,684. The greater part of the population is centred about the village of South Deerfield, a supply and shipping point for a large onion and tobacco-growing area. The oldest of the several villages, Old Deerfield, sometimes called "The Street," extends along one broad thoroughfare lined with elms, through a beautiful valley, bordered by hills on the east and the west. Many of the houses date from the 18th century, and the ground is dotted with tablets marking the home lots of early settlers and places where historic incidents occurred. In Memorial hall, built in 1798 for the Deerfield academy, the Pocumtuck Valley Memorial Association has assembled a collection of colonial and Indian relics. In 1896 many of the old household arts and crafts were revived and placed on a business basis by the formation of a society for the marketing of the products. For many years Deerfield (settled in 1669 and incorporated in 1673) was the frontier post of New England on the north-west. It suffered severely from the Indians in 1675 and 1677; and again. on Feb. 29, 1704, the village was surprised in the early morning by a force of French and Indians, who killed 49, captured 111 (including the Rev. John Williams, who lived to publish an account of his experiences), burned the town and on the way back to Canada killed 20 of the captives.

DEER PARK, an enclosure of pastureland for deer. The largest existing deer park in England is at Savernake (4,000 ac.).

DE FALLA, MANUEL (1876–), Spanish composer, was born at Cadiz on Nov. 23, 1876. He studied piano with José Tragó and composition with Felipe Pedrell in Madrid. In 1905 he won the prize offered by the Academia de Bellas Artes with his opera *La Vida breve.* Two years later he went to live in Paris, where he met with much help and encouragement from Debussy, Ravel, Dukas and others, who recognized the sincerity of his aims. *La Vida breve* was produced at Nice in 1913 and in Paris the year following. When at last it reached Spain it was received with great enthusiasm; but in view of the tardy recognition of the composer in his own country overtures were made to him to become a naturalized Frenchman and so improve his chances of being heard in Paris. This he declined to do, and on the outbreak of the World War in 1914 he went back to Spain, where he made an exhaustive study of Spanish folk-music—in particular of the *cante* of Andalusia—before settling in his new home in Granada in the precincts of the Alhambra. The traditional music of Spain provides an unusually rich source of inspiration, containing as it does melodic elements from the church modes introduced by early Christians and Eastern rhythms brought by the Moors. De Falla's researches in this field have made him a national composer in the profoundest sense of the word. He makes comparatively little use of traditional melodies as they stand; for although he believes that the modality of folk-tunes should, and does, form the basis of all great music, his belief implies not only a complete absorption of the spirit of that modality, but a thorough testing of the material in the light of the composer's aesthetic and ethical principles. Acting upon this, he submits his own work to the most searching revision before it is given to the public, though fortunately without destroying its effect of spontaneity. He is a firm believer in tonality and in consonant chords, having no love of dissonance for its own sake. His best-known work is the brilliant second ballet, *The Three-cornered Hat,* which was first played by the Russian Ballet at the Alhambra, London, in 1919. His first ballet, *Love the Magician,* was performed in Madrid in 1915. Another dramatic work is *Master Peter's Puppet-Show,* a scenic version of a chapter from *Don Quixote.* He also wrote: *Nights in the Gardens of Spain* for piano and orchestra; Concerto for harpsichord (or pf.), fl., ob., clar., vlin. and 'cello; *Pieces espagnoles* for piano; and *Seven Spanish Folk-Songs.*

See Manuel de Falla, *Miniature Essays* (J. & W. Chester, Ltd., London); *Dictionary of Mod. Music & Musicians* (London).

DEFAMATION, the publication concerning a person of matter which is untrue and tends to lower him in the estimation of right-thinking men, or causes him to be shunned or avoided, or exposes him to hatred, contempt or ridicule. (*See* LIBEL AND SLANDER.)

DEFAULT, in common law, a failure to do some act required by law either as a regular step in procedure or as being a duty imposed. Default in compliance with a statute renders the defaulter liable to action by the person aggrieved or to indictment if the matter of command is of public concern, subject in either case to the qualification that the statute may limit the remedy for the default to some particular proceeding specifically indicated; and in some instances, *e.g.,* in the case of local authorities, default in the execution of their public duties is dealt with administratively by a department of the Government, and only in the last resort. if at all, by recourse to judicial tribunals.

DEFEASANCE, in law, an instrument which defeats the force or operation of some other deed or estate.

DEFENCE: *see* PRACTICE AND PROCEDURE.

DEFENCE MECHANISMS, a psychological term, referring to various devices unconsciously adopted by the human mind to escape attack or to avoid unpleasant experience. The same mental mechanisms of defence which are employed by normal minds, appear in extreme form in the mental processes of the insane.

Defence Mechanisms of Normal People.—Whenever a normal person anticipates attack from an antagonist so much stronger than himself that he thinks he will be defeated if the contest ever comes to a decisive issue, he immediately tends to act in a way calculated to prevent the conflict from occurring. Such responses are termed defensive reactions. They are of two general types: anticipatory attack upon the supposed opponent, and precautionary withdrawal from the anticipated danger. Lies told by children to avoid incurring punishment and the displeasure of loved parents exemplify both types of defence mechanisms. Concealment of the child's true actions represents withdrawal from threatened conflict with an antagonist (the parent) who is sure to win if the child tries to contest the case on its merits. The falsely imagined story constitutes an inducement response, wherein the child takes the initiative in an attempt to gain the approval and favour of the parent, thus preventing anticipated attack. Emotional irritability, active dislike of superiors, and blustering, pompous manners frequently represent aggressive defence mechanisms of normal people. Shyness. seclusiveness, timidity, and sometimes day-dreaming and forgetting the names of real people and things represent the passive type of defensive mechanism.

'Defence Mechanisms of Abnormal People.—Whenever a person tries ultimately to *comply* with some unpleasant emotional situation instead of *dominating* it, the result is an abnormal state of mind. By permitting the conflicting emotions to remain in consciousness without getting rid of some, or harmonizing all, a number of abnormal states may result. The weaker emotion may

be suppressed into a "repressed complex," causing the person to perform acts over which he has no control because he does not understand what emotion is causing the acts. Or each conflicting emotion may organize about itself a separate personality, resulting in "dissociation of personality," the afflicted individual uncontrollably changing from one personality to another at different times. Many psychiatrists (Hart) attribute somnambulism, obsessions, hallucinations, and delusions to abnormal defence mechanisms similar to dissociation. Symbolization, stereotyped actions, rationalization, projection, where the patient believes other people are expressing toward him the very emotions from which he is suffering, and insane phantasy are attributed to repression.

(W. M. M.)

See Hart, *The Psychology of Insanity,* 1925; Marston, *The Emotions of Normal People,* 1928.

DEFENDANT, in law, a person against whom proceedings are instituted or directed; one who is called upon to answer in legal proceeding. (See PRACTICE and PROCEDURE.)

DEFENDER OF THE FAITH (Lat. *Fidei* Defensor), a title belonging to the sovereign of England in the same way as *Christianissimus* (Most Christian) belonged to the king of France, and Catholicus (Catholic) belongs to the ruler of Spain. It seems to have been suggested in 1516, and although certain charters have been appealed to in proof of an earlier use of the title, it was first conferred by Pope Leo X. on Henry VIII. The Bull granting the title is dated Oct. 11, 1521, and was a reward for the king's treatise against Luther. When Henry broke with the papacy, Pope Paul III. deprived him of his designation, but in 1544 the title of "Defender of the Faith" was confirmed to Henry by Parliament, and has since been used by all his successors on the English throne.

DEFERENT, in ancient astronomy, the mean orbit of a planet, which carried the epicycle in which the planet revolved. (Lat. *deferens,* bearing down.)

DEFERRED ANNUITY, a periodic fixed money payment, generally arranged on an annual, semi-annual or quarterly basis, but upon which payments do not begin until the expiration of a certain time or the occurrence of some certain event. It is quite customary for insurance companies to sell deferred annuities whose payments begin when the beneficiary reaches a certain age, often 65 years or more. The deferred annuity may continue for a stipulated number of years, or for a specified number of payments (a deferred certain annuity); it may be continued for an uncertain period (a deferred contingent annuity); or may be continued during a person's lifetime (a deferred life annuity). (See ANNUITY.)

DEFERRED ASSETS, also known as deferred charges to expense, and prepaid expenses, are items of expense which have been paid or for which liability has been assumed, but which are not properly chargeable to the current accounting period. The charging of such items to current operating costs is deferred until the period arrives to which they are applicable. The premium, for example, on an insurance policy may be paid one year in advance. Obviously, the entire premium is not applicable to the month in which payment is made or obligation assumed but to the 12 months. Thus at the end of an accounting period, only that part of the cost applicable thereto would be charged to expense; the remainder is a deferred asset.

In addition to unexpired insurance, the other common deferred assets are advertising paid in advance, development expense, moving expense and organization expense. With such items as insurance and advertising, the problem of pro-rating costs is relatively simple; with such items as development, moving and organization expenses. the problem becomes more involved. Organization expense, theoretically, extends over the entire life of the enterprise to which it applies. Since there is no way of knowing in advance how long a concern will remain in business, some arbitrary basis must be selected for writing off the organization expense. Some organizations spread the cost over a five year period, others over a ten year. period or even longer. Conservative accounting practice suggests the desirability of writing off such expense as rapidly as the profits of a business will permit.

DEFFAND, MARIE ANNE DE VICHY-CHAMROND, MARQUISE DU (1697–1780), a celebrated Frenchwoman, was born at the chbteau of Chamrond near Charolles (department of Saône-et-Loire) of a noble family on Dec. 25, 1697. Educated at a convent in Paris, she showed a sceptical and cynical turn of mind, which led the abbess to arrange that Massillon should reason with her, but he accomplished nothing. She was married at 21 to her kinsman, Jean Baptiste de la Lande, marquis du Deffand but they were separated as early as 1722. Mme. du Deffand, young and beautiful, is said by Horace Walpole to have been for a short time the mistress of the regent, the duke of Orleans (Walpole to Gray, Jan. 25, 1766). In 1721 began her friendship with Voltaire, but their regular correspondence dates only from 1736. She spent much time at Sceaux at the court of the duchesse du Maine, where she formed a close friendship with the president Hénault. In Paris she was in a sense the rival of Mme. Geoffrin, but the members of her salon were drawn from aristocratic society more than from literary cliques, though Voltaire, Montesquieu, Fontenelle and Mme. de Staal-Delaunay were among the habitués. When Hénault introduced D'Alembert, Mme. du Deffand was at once captivated by him. With the encyclopaedists she was never in sympathy, and appears to have tolerated them only for his sake. When she lost her sight in 1754 she engaged Mlle. de Lespinasse to help her in entertaining. This lady's wit and charm made some of the guests, D'Alembert among others, prefer her society to that of Mme. du Deffand, and she arranged to receive her friends for an hour before the appearance of her patron. When this state of things was discovered Mlle. de Lespinasse was dismissed (1764), but the salon was broken up, for she took with her D'Alembert, Turgot and the literary clique generally. From this time Mme. du Deffand rarely received any literary men. The principal friendships of her later years were with the duchesse de Choiseul and with Horace Walpole. Her affection for the latter, which dated from 1765, was the most durable of all her attachments. Under the stress of this tardy passion she developed qualities of style and eloquence of which her earlier writings had given little promise. In the opinion of Sainte-Beuve the prose of her letters ranks with that of Voltaire as the best of that classical epoch. Walpole refused at first to acknowledge the closeness of their intimacy from fear of the ridicule attaching to her age, but he paid several visits to Paris expressly for the purpose of enjoying her society, and maintained a close and most interesting correspondence with her for 15 years. She died on Sept. 23, 1780, leaving her dog Tonton to the care of Walpole, who was also entrusted with her papers. Of her innumerable witty sayings the best known is her remark on the cardinal de Polignac's account of St. Denis's miraculous walk of two miles with his head in his hands,—*Il* n'y a *que* le premier pas *qui coûte.*

The *Correspondance inédite* of Mme. du Deffand with D'Alembert, Hénault, Montesquieu, and others was published in 2 vols. (1809). In 1810 Mary Berry edited *Letters of the Marquise du Deffand to the Hon. Horace Walpole, afterwards earl of Orford, from 1766 to 1780* (4 vols.), and gave numerous extracts from Walpole's letters to Mme. du Deffand, since destroyed. In 1912 Mrs. Paget Toynbee published in 3 vols. *Lettres de Mme. du Deffand à Horace Walpole,* with *18* of the supposedly lost letters from Walpole. Her letters were also edited by M. de Lescure in *Correspondance complète de la marquise du Deffand* (1865), and by the marquis de Stc. Aulaire in *Correspondance ine'dite, etc.* (1859 and 1866). *See* also Sainte-Beuve, *Causeries du Lundi,* vols. i. and xiv. (1852–62); L. Percy, *Le président Hénault et Mme. du Deffand* (4th ed., 1893); P. de Ségur, *Esquisses et recits: Mme. du Deffand et sa famille* (1908).

DEFIANCE, a city of northwestern Ohio, U.S.A. at confluence of Auglaize and Tiffin rivers with the Maumee; county seat of Defiance county; on federal highway 24 and five state highways, and is served by Baltimore and Ohio and Wabash railways, bus and truck freight lines. Pop. (1940) 9,744 (federal census). It is the central market of the Maumee valley, a rich dairying and farming region. Manufactures include machine tools, radio condensers, metal stampings, screw machine products, commercial refrigeration, dairy products, luncheon meats, beer, packaging machines, service station equipment, mechanics' tools, pole line hardware It is the seat of Defiance college (Christian), estab-

lished as a normal school in 1884. The confluence of the rivers was a favourite meeting-place of the Indians. In 1794 Gen. Anthony Wayne built a fort (which he named Defiance) on a spot now included in a public park. It was rebuilt and enlarged as Fort Winchester by Gen. Harrison during the War of 1812. The town was incorporated as a village in 1836. It developed commercially after the opening of the Miami and Erie canal (1845), was made the county seat in that year, and became a city in 1881.

DEFILE, a military expression for a passage, to march through which troops are compelled to "defile," or narrow their front (from the Fr. *défiler,* to march in a line, or by "files"). The word is usually applied to a ravine or gorge in a range of hills, but a causeway over a river, a bridge and even a village may equally be called a defile. The term is also used to express, with out any special reference to military operations, a gorge among mountains. The verb "to defile" is used of troops marching on a narrow front, or narrowing their front, under all circumstances, and in this sense is the contrary of "deploy."

"Defile," in the sense of "pollute," is another form of "defoul."

DE FILIPPI, FILIPBO (1869–1938), Italian scientist and explorer, was born in Turin April 6, 1869. After graduating in medicine at the Turin University, he became assistant in the surgical clinic and lecturer in operative surgery in the University of Bologna. He published a number of important papers on physiological and biological chemistry. In 1897 he went with the Duke of the Abruzzi to Alaska as scientific observer and ascended Mount St. Elias. Although he did not accompany the Duke to the Ruwenzori in Central Africa in 1906, De Filippi wrote the report of the expedition. In 1909 De Filippi joined the Duke's expedition to the Western Himalaya and Karakoram Mts., where a point 24,600ft. high was reached on a ridge of the Bride Peak close to K2, which established a record of altitude unsurpassed until the exploits on Mount Everest (1922 and 1924). He later (1913–14) organized and led an important scientific expedition to the Karakoram range in Central Asia, under the auspices of the Indian and Italian Governments. He died Sept. 23, 1938.

He published *The Ascent of Mount St. Elias* (1900), *Ruwenzori* (1909), *Karakorant and Western Himalaya* (2 vol. 1912), *Storia della spedizione scientifica italiana nel Himàlaia, Caracorùm e Turchestàn Cinese, 1913–1914* (1924), and *Ippolito Desideri of Pistoia, S.J.: His Travels and Account of Ttbet, 1712–27* (1932 and 1937).

DEFINITION, a logical term used popularly for the process of explaining, or giving the meaning of, a word, and also in the concrete for the proposition or statement in which that explanation is expressed (Lat. *definitio,* from *de-finire,* to set limits to, describe). In logic, definition consists in determining the qualities which belong to given concepts or universals; it is not concerned with individuals, which are marked by an infinity of peculiarities, any one or all of which might be predicated of another individual. Individuals can be defined only in so far as they belong to a single kind. According to Aristotle, definition is the statement of the essence of a concept, that is, it consists of the genus and the differentia. In other words, "man" is defined as "animal" and "rational," or "rational animal," *i.e.,* the concept is (1) referred to the next higher genus, and (2) distinguished from other modes in which that genus exists, *i.e.,* from other species. "Rational animal" is thus the predicate of the statement constituting the definition. Sometimes the word "definition" is used to signify merely the predicate. It is sometimes argued that, there being no definition of individuals as such, definition is of names *(see* J. S. Mill, *Logic,* I. viii. 5), not of things; it is generally, however, maintained that definition is *of things, regarded as, or in so far as they are, of a kind.* Definition of words can be nothing more than the explanation of terms such as is given in a dictionary.

The following rules are generally given as governing accurate definition. (1) *The definition must be equivalent or commensurate with that which is defined;* it must be applicable to all the individuals included in the concept and to nothing else. Every man, and nothing else, is a rational animal. "Man is mortal" is not a definition, for mortality is predicable of irrational animals. (2) *The definition must state the essential attributes;* a concept cannot be defined by its accidental attributes; those attributes must be given which are essential and primary. (3) *The definition must be per genus et differentiam,* as we have already seen. These are the important rules. Three minor rules are: (4) *The definition must not contain the name of the concept to be defined;* if it does, no information is given. Such a proposition as "an archdeacon is one who performs archidiaconal functions" is not a definition. Concepts cannot be defined by their correlatives. Such a definition is known as a *circulus in definiendo. (5) Obscure and figurative language must be avoided,* and (6) *Definitions must not be in the negative when they can be in the affirmative.*

Definition *per genus et differentiam* is a concise description of what a certain kind of thing *is.* There is another kind of definition, known as *genetic definition,* which describes how the kind of thing in question can be *produced.* Some terms can be defined in both ways, *e.g.,* the term *circle* may be defined as "a plane curve every point of which is equidistant from a certain point called the centre," or as "a plane curve produced by moving a point at a constant distance from another point." Many chemical formulae are really genetic definitions.

DEFLATION. A diminution of the volume of currency, causing a rise in the value of money per unit and a fall in prices. Its effect varies with the degree of inflation which preceded it and which it is concerned to reduce. For a full discussion *see* INFLATION AND DEFLATION; CURRENCY; MONEY.

DEFOE, DANIEL *(c.* 1659–1731), English author, was born in the parish of St. Giles, Cripplegate, London, in the latter part of 1659 or early in 1660, of a Nonconformist family. His father James Foe, was a butcher and a citizen of London. Until late in life Daniel signed Defoe or Foe indifferently.

Daniel was educated at a famous dissenting academy, Mr. Charles Morton's of Stoke Newington, where many of the best-known Noncomformists of the time were his schoolfellows. He joined Monmouth's rebellion in 1685, and is supposed to have owed his lucky escape from the law to his being a Londoner, and therefore a stranger in the west country. Before his western escapade he had taken up the business of hosiery factor, and had married Mary Tuffley, by whom he had seven children. At the entry of William and Mary into London he is said to have served as a volunteer trooper "gallantly mounted and richly accoutred." At this period he seems to have been a sort of commission merchant, especially in Spanish and Portuguese goods, and at some time to have visited Spain on business. In 1692 he failed for £17,000. Although his creditors accepted a composition, he afterwards honourably paid them almost in full, a fact attested by not very friendly witnesses. He then became secretary and afterwards manager and chief owner of some tile works at Tilbury, but here also he was unfortunate, and his imprisonment in 1703 brought the works to a standstill, and he lost £3,000. About the middle of the reign of William III. he was introduced to the King, and in 1695 he was appointed accountant to the commissioners of the glass duty, an office which he held for four years. At this time he produced his *Essay on Projects* (1698), containing remarkable suggestions, much in advance of his time, on banks, road-management, friendly and insurance societies of various kinds, idiot asylums, bankruptcy, academies, military colleges, high schools for women, etc. In the same year he wrote the first of a long series of ingenious pamphlets on the then burning question of occasional conformity. He argued that the conscience of the Dissenters should not permit them to conform; yet he denounced the impropriety of requiring tests at all. In support of the government he published, in 1698, *An Argument for a Standing Army,* followed in 1700 by a defence of William's war policy called *The Two Great Questions considered,* and a set of pamphlets on the partition treaty. *The True-Born Englishman* (1701) is a satire in rough but extremely vigorous verse on the national objection to William as a foreigner, and on the claim of purity of blood for a nation of mixed origin. He also took part in the proceedings which followed the Kentish petition, and was the author, some say the presenter, of the *Legion Memorial,* which asserted the supremacy of the electors over the elected. The theory of the indefeasible supremacy of the freeholders of England was one of Defoe's favourite political tenets, and he returned to it in a powerfully written tract entitled *The Original Power of the Collective*

Body of the People of England examined and asserted (1701).

In an evil hour for himself Defoe wrote the anonymous *Shortest Way with the Dissenters* (1702), a statement in the most forcible terms of the extreme "high-flying" position, which some high churchmen were unwary enough to endorse, without any suspicion of the writer's ironical intention. The author was soon discovered; and the advertisement offering a reward for his apprehension gives the only personal description we possess of him, as "a middle-sized spare man about forty years old, of a brown complexion and dark brown-coloured hair, but wears a wig; a hooked nose, a sharp chin, grey eyes, and a large mole near his mouth." In this conjuncture Defoe had really no friends, for the Dissenters had already been annoyed by his rather casuistical tracts on the question of occasional conformity, and were as much alarmed at his book as the high-flyers were irritated. He was fined (Feb. 24, 1703) 200 marks, and condemned to be pilloried three times, to be imprisoned indefinitely, and to find sureties for his good behaviour during seven years. It was in reference to this incident that Pope, whose Catholic rearing made him detest the abettor of the Revolution and the champion of William of Orange, wrote in the *Dunciad*—

Earless on high stands unabash'd Defoe

—though he knew that the sentence to the pillory had long ceased to entail the loss of ears. Defoe's exposure in the pillory (July 29, 30, 31) was, however, rather a triumph than a punishment, for the populace took his side; and his *Hymn to the Pillory* is one of of the best of his writings in verse. Unluckily for him his condemnation had the indirect effect of destroying his business at Tilbury.

He remained in prison until Nov. 1, 1704, and then owed his release to the intercession of Robert Harley, who represented his case to the queen, and obtained for him not only liberty but pecuniary relief and employment, which, of one kind or another, lasted until the termination of Anne's reign. There is no doubt that Harley, who understood the influence wielded by Defoe, made some conditions. Defoe says he received no pension, but his services were certainly rewarded, and he was a secret agent of the government in 1706 and 1707 in Scotland, working in favour of the Union. In this case he was employed by Godolphin, to whom Harley had recommended him. He wrote in prison many short pamphlets, chiefly controversial, published a curious work on the famous storm of the 26th November, 1703, and started in February 1704 *The Review*. This was a paper which was issued during the greater part of its life three times a week. It was entirely written by Defoe, and extends to eight complete volumes and some few score numbers of a second issue. He did not confine himself to news, but wrote something very like finished essays on questions of policy, trade and domestic concerns; he also introduced a "Scandal Club," in which minor questions of manners and morals were treated in a way which undoubtedly suggested the *Tatlers* and *Spectators* which followed. Only one complete copy of the work is known to exist, and that is in the British Museum. After his release Defoe went to Bury St. Edmunds, though he did not interrupt either his *Review* or his occasional pamphlets. One of these, *Giving Alms no Charity, and Employing the Poor a Grievance to the Nation* (1704), is extraordinarily far-sighted. It denounces both indiscriminate alms-giving and the national workshops proposed by Sir Humphrey Mackworth.

In 1705 appeared *The Consolidator, or Memoirs of Sundry Transactions from the World in Moon,* a political satire which is supposed to have given some hints for Swift's *Gulliver's Travels;* and at the end of the year Defoe performed a secret mission, the first of several of the kind, for Harley. In 1706 appeared the *True Relation of the Apparition of one Mrs. Veal,* an excellent example of Defoe's skill as a special reporter. In the course of his service in Scotland he wrote his *History of the Union,* which appeared in 1709. In this year Henry Sacheverell delivered his famous sermons, and Defoe wrote several tracts about them and attacked the preacher in his *Review*.

In 1710 Harley returned to power, and Defoe was placed in a somewhat awkward position. He seems, in fact, to have agreed with the foreign policy of the Tories and with the home policy of the Whigs, and naturally incurred the reproach of time-serving and the hearty abuse of both parties. At the end of 1710 he again visited Scotland. In the negotiations concerning the Peace of Utrecht, Defoe strongly supported the ministerial side, to the intense wrath of the Whigs, displayed in an attempted prosecution against some pamphlets of his on the all-important question of the succession. Again the influence of Harley saved him. He continued, however, to take the side of the Dissenters in the question affecting religious liberty. He naturally shared Harley's downfall; and, though the loss of his salary might seem a poor reward for his constant support of the Hanoverian claim, it was little more than his ambiguous, not to say trimming, position must have led him to expect.

Defoe declared that Lord Annesley was preparing the army in Ireland to join a Jacobite rebellion, and was indicted for libel; and prior to his trial (1715) he published an apologia entitled *An Appeal to Honour and Justice* which is one of the chief sources for the facts of his life. He was convicted, but was liberated later in the year under circumstances that only became clear in 1864, when six letters were discovered in the Record Office from Defoe to a government official, Charles Delafaye, which, according to William Lee, established the fact that in 1718 at least Defoe was doing political work of an equivocal kind—that he was sub-editing the Jacobite *Mist's Journal* under a secret agreement with the government that he should tone down the sentiments and omit objectionable items. He had, in fact, been released on condition of becoming a government agent. He seems to have fulfilled similar functions in *Dormer's Letter* and the *Mercurius Politicus.*

The first volume of Defoe's most famous work, the immortal story—partly adventure, partly moralizing—of *The Life and Strange Surprizing Adventures of Robinson Crusoe,* was published on April 25, 1719. It ran through four editions in as many months, and then in August appeared the second volume. Twelve months afterwards the sequel *Serious Reflections*, now hardly ever reprinted, appeared. The first two parts were reprinted as a *feuilleton* in *Heathcote's Intelligencer,* perhaps the earliest instance of the appearance of such a work in such a form. The story was founded on Dampier's *Voyage round the World* (1697), and still more on Alexander Selkirk's adventures, as communicated by Selkirk himself at a meeting with Defoe at the house of Mrs. Damaris Daniel at Bristol. Selkirk afterwards told Mrs. Daniel that he had handed over his papers to Defoe. *Robinson Crusoe* is one of the world's classics in fiction. Crusoe's shipwreck and adventures, his finding the footprint in the sand, his man "Friday," are all inimitably told, but it is the conception of civilized man alone face to face with nature which has made Defoe's great work an imperishable part of world literature. In the same year appeared *The Dumb Philosopher,* or *Dickory Cronke,* who gains the power of speech at the end of his life and uses it to predict the course of European affairs.

In 1720 came *The Life and Adventures of Mr. Duncan Campbell.* This was not entirely a work of imagination, its hero, the fortune-teller, being a real person. There are amusing passages in the story, but it is too desultory to rank with Defoe's best. In the same year appeared two wholly or partially fictitious histories, each of which might have made a reputation for any man. The first was the *Memoirs of a Cavalier,* which Lord Chatham believed to be true history. *Captain Singleton,* the last work of the year, has been unjustly depreciated by most of the commentators. The record of the journey across Africa, with its surprising anticipations of subsequent discoveries, yields in interest to no work of the kind.

In 1721 nothing of importance was produced, but in the next year three works of capital importance appeared. These were *The Fortunes and Misfortunes of Moll Flanders, The Journal of the Plague Year,* and *The History of Colonel Jack. Moll Flanders* still ranks among the great English novels, and deserves far more notice than it has usually received.

The *Journal of the Plague Year,* more usually called, from the title of the second edition, *A History of the Plague,* reads like *a*

contemporary record. No one had the imaginative power necessary to create circumstantial detail in a greater measure than Defoe, and there is no more reason to presuppose a documentary basis than in the case of *Moll Flanders*. Defoe was able to make all his narratives appear true stories, and he was gifted in a high degree with historical imagination. *The History of Colonel Jack* is an unequal book, and the end of the story is less good than the beginning.

To this period belong his stories of famous criminals, of Jack Sheppard (1724), of Jonathan Wild (1725), of the Highland Rogue, *i.e.*, Rob Roy (1723). The pamphlet on the first of these Defoe maintained to be a transcript of a paper which he persuaded Sheppard to give to a friend at his execution.

In 1724 appeared also the first volume of that admirable guide, *A Tour through the whole Island of Great Britain*, which was completed in the two following years. In 1725 appeared *A New Voyage round the World*, apparently entirely due to the author's own fertile imagination and extensive reading. It has all the interest of Anson's or Dampier's voyages.

Towards the end of 1726 appeared *The Complete English Tradesman*, which called forth the scorn of Charles Lamb. To 1726 also belongs *The Political History of the Devil*. This belongs to a series of demonological works, of which the chief others are *A System of Magic* (1726), and *An Essay on the History of Apparitions* (1728), issued the year before under another title. *A Plan of English Commerce*, containing very enlightened views on export trade, appeared in 1728.

During the years 1715-28 Defoe had issued a formidable array of pamphlets and minor works which cannot be enumerated here. No man can ever have written more continuously. He must in some way or other have obtained a considerable income. In 1724 he had built himself a large house at Stoke Newington, and he had obtained on lease in 1722 a considerable estate from the corporation of Colchester, which was settled on his unmarried daughter at his death. He died in Ropemaker's Alley, Moorfields, on April 26, 1731, and was buried in Bunhill Fields. He left no will, all his property having been previously assigned, and letters of administration were taken out by a creditor. How his affairs fell into this condition, why he did not die in his own house, and why in the previous summer he had been in hiding, as we know he was from a letter still extant, are points not clearly explained. In 1724 he was, however, attacked by Mist, who was disarmed and wounded and (May 18) imprisoned. It is more likely that Mist had found out that Defoe was a government agent and quite probable that he thus informed other editors, for Defoe's journalistic employment almost ceased about this time, and he began to write anonymously, or as "Andrew Moreton." Mist had escaped to France, and may have designed revenge on Defoe. It is possible that he had to go into hiding to avoid the danger of being accused as a real Jacobite, when those with whom he had contracted to assume the character were dead.

The earliest regular life and estimate of Defoe is that of Dr. Towers in the *Biographia Britannica*. George Chalmers's *Life*, however (1786), added very considerable information. In 1830 Walter Wilson wrote the standard *Life* (3 vols.). In 1864 the discovery of the six letters stirred up William Lee to a new investigation, and the results of this were published (1869), in three large volumes. The first of these (well illustrated) contains a new life and particulars of the author's discoveries. The second and third contain fugitive writings assigned by Lee to Defoe for the first time. There is also a *Life* by Thomas Wright (1894). The best modern version is the Novels and Selected Writings of Daniel Defoe (Oxford, 14 vols. 1927–28). Charles Lamb's criticisms were made in three short pieces, two of which were written for Wilson's book, and the third for *The Reflector*. The volume on *Defoe* (1879) in the "English Men of Letters" series is by W. Minto.

There is considerable uncertainty about many of Defoe's writings; and even if all contested works be excluded, the number is still enormous. Besides the list in Bohn's *Lowndes*, which is somewhat of an *omnium gatherum*, three lists drawn with more or less care were compiled in the 19th century. Wilson's contains 210 distinct works, three or four only of which are marked as doubtful; Hazlitt's enumerates 183 "genuine" and 52 "attributed" pieces, with notes on most of them; Lee's extends to 254, of which 64 claim to be new additions. There have been various editions of Defoe, none of them complete. In 1870 Nimmo of Edinburgh published in one volume an admirable selection from Defoe. It contains Chalmers's *Life*, annotated and completed from Wilson and Lee, *Robinson Crusoe*, pts. i. and ii., *Colonel Jack*, *The Cavalier*, *Duncan Campbell*, *The Plague*, *Everybody's Business*, *Mrs. Veal*, *The Shortest Way with Dissenters*, *Giving Alms no Charity*, *The True-Born Englishman*, *Hymn to the Pillory*, and very copious extracts from *The Complete English Tradesman*. An edition of Defoe's *Romances and Narratives* in sixteen volumes by G. A. Aitken came out in 1895. The *Selected Writings of Daniel Defoe* (14 vols.), were published by Blackwell, 1927.

The reprints and editions of *Crusoe* have been innumerable; it has been often translated; and the eulogy pronounced on it by Rousseau gave it special currency in France, where imitations (or rather adaptations) have also been common.

See also John Forster, *Historical and Biographical Essays* (1858); G. Saintsbury, "Introduction" to Defoe's *Minor Novels;* and valuable notes by G. A. Aitken in *The Contemporary Review* (February 1890) and *The Athenaeum* (April 30, 1889; August 31, 1890). Dr. Karl T. Biilbring edited two unpublished works of Defoe, *The Compleat English Gentleman* (1890) and *Of Royall Educacion* (1905), from British Museum Add. MS. 32,555. Further light was thrown on Defoe's work as a political agent by the discovery (1906) of an unpublished paper of his in the British Museum by G. F. Warner. This was printed in the *English Historical Review*, and afterwards separately.

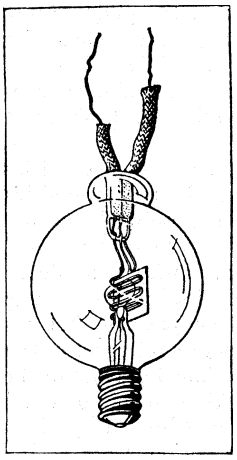
DE FOREST, LEE (1873-), American inventor, was born at Council Bluffs, Ia., Aug. 26, 1873. He was educated at the Sheffield Scientific School, Yale, receiving his B.S. in 1896 and Ph. D. in 1899, and continued his studies at the Armour Institute of Technology, Chicago. His earliest employment was with the Western' Electric Co., Chicago, in their experimental telephone laboratory. He was the first to use the alternating current generator and transmitter, which were later universally employed in wireless transmitting sets. He designed and installed the first five high-power radio stations for the U.S. Navy. The most important of his inventions was the audion amplifier, which made possible long-distance telephony. His other inventions include the oscillating audion, or three-electrode tube, and the four-electrode tube. After 1921 he devoted himself to the development of the so-called phonofilm, a talking motion picture, involving the synchronizing of sound and motion by the photographic representation of sound waves.



THE ORIGINAL AUDION, INVENTED BY DE FOREST
The audion, by regulating the amount of current that passes and magnifying feeble currents, is of vital importance to long-distance telephony and radio

He was the recipient of the Elliott Cresson medal of the Franklin Institute for his discovery of the audion in 1921. He also received the medal of the Institute of Radio Engineers and a prize from the Institute of France in 1923. He was awarded a gold medal for his work in wireless telegraphy at the St. Louis exposition in 1904 and a gold medal from the Panama Pacific exposition in San Francisco in 1915.

DEFREGGER, FRANZ VON (1835–1921), Austrian genre painter, was born in Dolsach, in Tirol, on April 30, 1835, in the old farm house Ederhof zu Stronach. He spent his youth amid the mountains as a farm labourer, and on the death of his father took over the farm, at the age of 23. Two years later he sold his farm, meaning to go to America, but eventually went to Innsbruck to study drawing and carving, to which he was devoted from his boyhood. His teacher, Franz Stolz, took him to Munich in 1861. In 1863 he went to Paris, and returning to Munich, studied under Piloty for five years. His pictures, representing the rustic life of the Tirolese, and the struggle of Tirol, under Andreas Hofer, for freedom from foreign yoke, met with success from the first. They made their appeal by the subject-matter. Among his best known works are the "Speckbacher" (1869) at the Ferdinandeum, Innsbruck; the "Wrestlers" (1870); the "Dancers" (1871); the "Return of the Victors" (1876). He is represented in most German museums and also in the Metropolitan Museum of Art, New York

DEGAS, HILAIRE GERMAIN EDGARD (1834–1917), French painter, was born in Paris on July 19, 1834 and died there

on Sept, 27, 1917. He studied under Lamothe and Ingrès at the École des Beaux Arts, and first exhibited in the Salon of 1865, contributing a "War in the middle ages," a work executed in pastel. To this medium he was ever faithful, using it for some of his best work. But he soon turned to subjects from contemporary life. He exhibited "Steeplechase" (1866), "Family Portraits" (1867) and a portrait of a dancer in the "Ballet of *La Source*" (1868). In 1869 and 1870 he restricted himself to portraits; but thenceforward he abandoned the salons and attached himself to the Impressionists. With Manet and Monet he took the lead of the new school at its first exhibition in 1874, and repeatedly contributed to these exhibitions (in 1876, 1878, 1879 and 1880). In 1868 he had shown his first study of a dancer, and in numerous pastels he proclaimed himself the painter of the ballet. He painted innumerable studies of dancers, showing an amazing mastery of drawing and of light. Several of his works may be seen at the Luxembourg Gallery, to which they were bequeathed among a collection of impressionist pictures by M. Caillehotte. In 1880 Degas showed his powers of observation in a set of "Portraits of Criminals," and he attempted modelling in a "Dancer," in wax. He afterwards returned to his studies of the sporting world, exhibiting in Dec. 1884 at the Petit Gallery two views of "Races" which had a great success, proving the increasing vogue of the artist among collectors. At the eighth Impressionist Exhibition, in 1886, Degas continued his realistic studies of modern life, showing drawings of the nude, of workwomen, and of jockeys. Besides his pastels and his paintings of genre and portraits — among these, several likenesses of Manet — Degas also handled his favourite subjects in etching and in aquatint; and executed several lithographs of "Singers at Cafés-concerts," of "Ballet-girls," and indeed of every possible subject of night-life and incidents behind the scenes. His work is to be seen not only at the Luxembourg but in many of the great private collections in Paris, in England and America. In the Centenary Exhibition of 1900 he exhibited "The Interior of a Cotton-Broker's Office at New Orleans" and "The Rehearsal."

DE GEER, JONKHEER DIEK JAN (1870–), Dutch statesman, mas born on Dec. 14, 1870, and graduated doctor at Groningen. He was a barrister and a journalist by profession. Entering the second chamber in 1907, he became one of the leaders of the Christian Historical Union. He was burgomaster of Arnheim (1920–22), finance minister (1921–23), and in March 1926 became prime minister, retaining for himself the portfolio of finance. The new Government put forward a moderate program of retrenchment, disarmament, and the promotion of native participation in the government of the East Indies. In August 1939 de Geer again became premier.

DE GEER, LOUIS GERHARD, BARON (1818–1896), Swedish statesman and writer, was born on July 18, 1818, at Finspång castle. In 1855 he became president of the Gota Hofret, or lord justice of one of the Swedish supreme courts. From 1858–70 he was minister of justice. His greatest achievement was the reform of the Swedish representative system, whereby he substituted a hi-camera1 elective parliament, on modern lines, for the existing cumbersoine representation by estates, a survival from the later middle ages. This great measure was accepted by the *Riksdag* in Dec. 1865, and received the royal sanction on June 22, 1866. He retired from the ministry in 1870, but took office again, as minister of justice, in 1875. From 1876–80 he was minister of State, and from 1881–88 chancellor of the universities of Uppsala and Lund.

Besides several novels and aesthetic essays, De Geer wrote political memoirs of supreme merit both as to style and matter, the most notable of which are: *Minnesteckning ofver A. J. v. Höpken* (1881); *Minnesteckning ofver Hans Järta* (1874); *Minnesteckning ofver B. B. von Platen* (1886); and his own *Minnen* (1892), an autobiography, invaluable as a historical document.

See *Sveriges historia* (1881, etc.), vi.; Carl Gustaf Malmstrom, *Historiska Studier* (1897); C. Arcadius, *Louis de Geer* (1906).

DEGENERATION. This term is used in several ways in biology. It is applied by Sir E. Ray Lankester (1890) to a racial change in the direction of simplification, as contrasted with elaboration or with persistent balance. An ascidian is in some respects degenerate, *e.g.*, in its nervous system, as compared with its presumed free-swimming ancestor, or its actual free-swimming larva. Lankester defined degeneration as "a gradual change of structure in which the organism becomes adapted to less varied and less complex conditions of life; whilst elaboration is a gradual change of structure, in which the organism becomes adapted to more and more varied and complex conditions of existence. In elaboration there is a new expression of form, corresponding to new perfection of work in the animal machine. In degeneration there is suppression of form, corresponding to the cessation of work." He referred to the vestiges of limbs in certain lizards, such as *Seps* and *Bipes,* to parasitic crustaceans such as *Sacculina* and *Lernaeocera,* sedentary types like rock-barnacles and ascidians, endoparasitic animals such as some mites and Linguatulids. Lankester was careful to point out that "simplicative evolution" may be illustrated in some of the structures of an organism, while "elaborative evolution" is seen in others. Thus the ascidian is not degenerate as regards its pharynx. Lankester excluded cases where there is simplification in the number of parts, yet specialization of what remains, as in the horse limb, where only the third digit is well developed. Anton Dohrn (1875) may be mentioned as another naturalist of distinction who has emphasized degeneration as one of the alternatives of evolutionary change.

In the second place the term is often applied to retrogressive changes in the normal development, which appear to be conditions of subsequent re-differentiation of a new, and. it may be, more complicated plan. This is well illustrated in the metamorphosis of Diptera, Hymenoptera, Coleoptera, and Lepidoptera, where in varying degrees there is a destruction of the larval organization, sometimes by means of phugocytes, and a reconstruction on a new plan, that of the imago, the change being mainly due to very active complexes of small cells, called imaginal discs or folds. This was well described by Kowalevsky and by Weismann for the body-wall and alimentary tract of Dipterous larva. Analogous processes occur in other kinds of metamorphosis, as in the pilidium larva of Nemertines and the pluteus larva of sea-urchins. The dissolution of the complex tail of the tadpole is familiar and obviously much more localized than the thorough-going retrogressive changes in the pupating maggot of a blue-bottle. In these degenerative processes many cells are actually destroyed, but when the development is continued on new lines it must be supposed that certain cells return to an undifferentiated embryonic condition, and that new hereditary factors, previously inhibited, find liberating stimuli and developmental expression.

Here the term de-differentiation is useful and has been defined as the process by which specialized cells or tissues lose their characteristics and become simple or undifferentiated. Apart from its occurrence in metamorphosis, de-differentiation is seen when an organism breaks down in adverse conditions, such as cold and scarcity. If the hydroid *Obelia* is kept in unpropitious environment, the polyp may collapse into an undifferentiated bag of cells, without mouth or tentacles. The cells lose their coherence and migrate to the base of the hydrotheca, being finally absorbed into the common stem. A similar de-differentiation is well illustrated by some Ascidians, and may be an adaptive method of surviving adverse conditions. It is also well known in the case of tissues that are cultivated *in vitro,* and the interesting fact has been demonstrated by Champy and others that if the de-differentiated isolated tissue be re-planted in an appropriate living organism, re-differentiation may occur. *(See* DEDIFFERENTIATION.)

A third use of the term degeneration is for the retrogressive changes that occur during senescence, or when an organ like the thymus gland undergoes reduction of function, or when a nerve-ganglion is over-fatigued, as in the brain-cells of the short-lived summer bee.

DEGGENDORF or **DECKENDORF,** town of Bavaria, Germany, 25 mi N.W of Passau, on the left bank of the Danube, which is there crossed by two iron bridges Pop. (1939) 11,767. It is at the lower end of the beautiful valley of the Perlbach. The old town hall dates from 1566. The church of the Holy Sepulchre, built in 1337, attracts thousands of pilgrims to its *Porta Caeli* or *Gnadenpforte* (Gate of Mercy) opened annually on Michaelmas eve and closed again on Oct. 4. The town is a depôt for the timber trade of the Bavarian forest, a station for Danube steamboats and the seat of several mills, breweries, etc. On the bank of the Danube outside the town are the remains of the castle of Findelstein; and on the Geiersberg (1243 ft.), in the immediate vicinity, stands another old pilgrimage church. About 6 m. N. is the village of Metten, with a Benedictine monastery founded by Charlemagne in 801, restored as an abbey in 1840 by Louis I. of Bavaria, and well known as an educational institution. The first mention of Deggendorf occurs in 868, and it appears as a town in 1212. Henry (d. 1290) of the Landshut branch of the ruling family of Bavaria made it the seat of a custom-house; and in 1331 it became the residence of Henry III. of Natternberg (d. 1333). In 1337 a wholesale massacre of the Jews, who were accused of having thrown the sacred host of the church of the Holy Sepulchre into a well, took place in the town; and it is probably from about this date that the pilgrimage above mentioned came into vogue. The town was captured by the Swedish forces in 1633, and in the war of the Austrian Succession it was more than once laid in ashes.

DE GOEJE, MICHAEL JAN: *see* GOEJE, MICHAEL JAN DE.

DEGOUTTE, JOSEPH (1866–1938), French soldier, was born on April 18, 1866, at Charnay (Rhône). He entered Saint-Cyr in 1888 and joined the 4th Zouaves in 1890. After service in Madagascar, he distinguished himself in the Chinese expedition of 1900, was made a lieutenant-colonel in 1911 and sent to Morocco to take charge of the depôt at Casablanca. During the World War he became general of brigade in 1916 and led the Moroccan Division during the Somme, Champagne and Verdun campaigns. In the summer of 1918, at the head of the IV. Army, he helped Mangin to carry through the counter-offensive against the German flank. He was made major-general on the staff of the King of the Belgians in the same year. Thereafter from Oct. 1919 to Oct. 1924 he was commander-in-chief of the French armies on the Rhine, and in 1920 became a member of the Supreme Army Council. He died at Charnay, Oct. 31, 1938.

DEGREE, a step or stage. In academic usage, a degree is a title conferred by a university as a mark of proficiency in scholarship. The word was first applied to the preliminary steps to the mastership or doctorate; viz., the baccalaureate and bicentiate. "The use of academic degrees, as old as the 13th century, is visibly borrowed from the mechanic corporations, in which an apprentice, after serving his time, obtains a testimonial of his skill and a license to practise his trade and mystery" (Gibbon, *Autobiography*, 29). Originally, as the words "master" and "doctor" imply, the degree was a certificate of fitness to teach at a university. Degrees in law, medicine and theology still carry with them a license to practise the corresponding professions, but degrees in arts are no more than certificates of a certain measure of acquaintance with the subject. In modern times the practice has arisen of conferring honorary degrees as a recognition of distinction without regard to academic qualifications. (X.)

In general two practices are followed in the award of degrees. The European and South American countries have as a rule retained the degrees of the five traditional faculties: law, medicine, theology, arts and philosophy, and in granting academic recognition for work in newer fields of study have granted the degree of the faculty to which they most nearly approximate. Except in France and Spain all intermediate degrees, such as those of bachelor and master, have been abolished. In Germany the doctorate of the various faculties is the only one granted, but there is a tendency to add new signatures such as *Dr. Phil. Nat.* or *Dr. Rer. Nat.* in mathematics and sciences and *Dr. Ing.* or *Dr. Rer. Techn.* in engineering. Except in the faculty of law, where the *baccalauréat* is granted, the usual French degrees are the *licence* and *doctorat* according to the faculties; these are State degrees, to which a *doctorat d'université* has been added recently, carrying with it the recognition of a university but none from the State.

In the British universities Oxford and Cambridge have remained conservative and grant the B.A. as the first degree in most faculties; the B.Sc. and B.Litt. at Oxford are awarded for special research and examination. In 1926 Dublin introduced the B.Sc. for students who do not present a classical language in their examinations. The local universities have been more liberal in adding to the list of degrees although the B.A. and B.Sc., the latter in a great variety of special branches of science and technology, are the first degrees (M.A. in Scotland). The B.Com. in commerce, B.Arch. in architecture and B.Ed. in education are the more recent additions. The second degree is the M.A. or M.Sc., obtained everywhere by examinations except at Oxford and Cambridge where it is granted after a period of residence and payment of the prescribed dues. The doctorate (D.Sc., D. Litt., LL.D., etc.) is available in most branches, but in arts and science is usually awarded on the basis of contributions to knowledge and distinction in some special field. Since World War I an attempt has been made, but without much success, to establish the Ph D. by examination. The usual degrees are available in medicine, law and theology. In all the universities the first degrees in arts or science may be obtained as an ordinary degree or with honours.

The greatest multiplication of degrees has taken place in the United States. Not only has there been a rapid expansion of specialization in the universities and colleges, but graduation in each specialty is recognized by a distinctive degree. The commonest degrees are still the B.A. and B.S. to which the signature of the special field is added, as B.A. in Ed., or B.S. in Arch. No attempt seems to be made at standardization; thus in business are A.B. in B. and B. (business administration and banking) and B.B.A. (business administration). As soon as a new grouping of subjects takes place, it is designated by its own degree, as B.J. (journalism) or B.S. in Ae.E. (aeronautical engineering). These special fields have their corresponding designations at the more advanced levels, especially the master's degree, and although there is a tendency to retain the Ph.D. as the most advanced degree in arts and science special signatures are found; as Ed.D. (education). An attempt has been made for several years to grant certain degrees, such as L.H.D., D.D., LL.D., Litt.D., and D.C.L., *honoris causa* only. (I. L. K.)

In the science of measurement, degrees are small equal subdivisions of an interval; *e.g.*, the interval between the freezing and boiling points of water are divided into equal increments of temperature, the size of these depending on the arbitrary temperature scale chosen (*see* THERMOMETRY). The angle (*q.v.*) through which the radius of a circle turns in completing one revolution is divided into 360 degrees. The subdivisions of density scales are also termed degrees (*see* HYDROMETERS). The universal symbol for degree is a small circle at the top right-hand side of the figure denoting the number of degrees; *e.g.*, fifteen degrees centigrade is written thus: 15° C. The degree as an angular measure is further divided into 60 *minutes* of arc (1° = 60′).

In mathematics (*q.v.*), the degree of an expression is determined by the highest dimensions of its terms; thus $2x^2y+xy$ is an expression of the third degree, the first term, being the product of three variables, x, x and y, has three dimensions, and is of higher dimensions than the second which is the product of only two variables. (*See* EQUATIONS, THEORY OF.) In dynamics (*q.v.*) the expression "degrees of freedom" refers to the number of unique possible directions or modes of motion of a body (*see* also QUANTUM THEORY and GYROSCOPE).

DEHMEL, RICHARD (1863–1920), German poet, was born in Wendisch-Hermsdorf, Brandenburg, on Nov. 18, 1863. He was educated in Kremmen, Berlin and Danzig, and in 1882 began

to study philosophy. natural sciences and social economy, and also became editor of a provincial newspaper. From 1887–95 he was secretary of the Union of German Fire Insurance Companies. In 1891 he published his first volume of poetry, *Erlösungen.* This was followed by Aber die *Liebe* (1893), and *Weib und* Welt (1896). From 1899 until 1902 he travelled in Italy, Greece, Switzerland, Holland and England, and afterwards lived in Biankenese, near Hamburg. In collaboration with his first wife, Paula Dehmel, he published some books for children including *Fitzebutze* (1907). He wrote a novel in lyrical form, Zwei *Menschen* in 1903, the epic composition Die *Verwandlungen* der *Venus* in 1904 and also dramas and pantomimes. He took part as a volunteer in the World War, and in 1919 published his diary, *Zwischen* Krieg *und Menschheit.* Amongst his dramas, Die *Menschenfreunde* (1917) was successful. His Collected *Works,* 10 vols., began publication in 1906. Dehmel's work is characterized by most unusual emotional power. His theme, whether it be erotic or social, awakens in him an intensity of feeling which seeks expression with almost explosive force. Sometimes taste and even sense are swept away in this torrent; on the other hand, Dehmel had a very strong feeling for form and music, and his best pieces, where form and thought have been most successfully welded together, are among the masterpieces of the German lyric. He died at Blankanese, Feb. 8, 1920.

See *Selected Letters,* 2 vols. (1922–23); E. Ludwig, *Richard Dehmel* (1913).

DEHRA, a town of British India, headquarters of the Dehra Dun (*q.v.*) district in the United Provinces. It lies at an elevation of 2,300 ft., at the terminus of the Hardwar-Dehra railway. Dehra is the headquarters of the Trigonometrical Survey and of the Forest Department, besides being a cantonment for a Gurkha force. The Indian Forest college, which trains forest officials for all parts of India, is a fine building. Attached to it is a Research Institute for the scientific study of sylviculture and the exploitation and administration of forests. The school for training cadets of good family for the Imperial Service troops was located here; but in 1922 it was virtually replaced by the Prince of Wales' Military college, where Indian boys are trained for Sandhurst and ultimately for the king's commission in the Indian army.

The town of Dehra grew up round the temple built in 1699 by the heretical Sikh Guru, Ram Rai, the founder of the Udasi sect of Ascetics. This temple is a remarkable building in Mohammedan style. The central block, in imitation of the emperor Jahangir's tomb, contains the bed on which the Guru, after dying at will and coming back to life several times, ultimately died outright; it is an object of great veneration. At the corners of the central block are smaller monuments commemorating the Guru's wives. Pop. of town (1931) 40,409; of cantonment, 9,721.

DEHRA DUN, a district of British India, in the Meerut division of the United Provinces, with an area of about 1,189 sq.m. The Dun proper is a beautiful valley lying between the Siwalik range and the foot-hills of the Himalayas. The administrative district runs up into the latter and embraces the sanatorium of Mussoorie. The mountains in its northern section attain a height between 7,000 and 8,000 ft., one peak reaching an elevation of 8,565 ft.; the highest point of the Siwalik range is 3,041 ft. above sea-level. The principal passes through the Siwalik hills are the Timli pass, leading to the military station of Chakrata, and the Mohand pass leading to the sanatoriums of Mussoorie and Landaur. The Ganges bounds the Dehra valley on the east; the Jumna bounds it on the west. It is well wooded, undulating, and relatively temperate in climate. To the east the valley is characterized by swamps and forests, but to the west the natural depressions freely carry off the surface drainage. In 1931 the population was 230,247. A railway to Dehra from Hardwar, on the Oudh and Rohilkhand line (32 m.), was completed in 1900. The district is served by the Dun canals. Tea gardens cover a considerable area, and the valley contains a colony of European tea planters.

Dehra Dun only emerges from the mists of legend into authentic history in the 17th century A.D., when it formed part of the Garhwal kingdom. Towards the end of the century the heretical Sikh Guru, Ram Rai, expelled from the Punjab, sought refuge in the Dun and gathered a crowd of devotees. Fateh Sah, raja of Garhwal, endowed the temple which he built, round which grew up the town of Gurudwara or Dehra (*q.v.*). In the 18th century the fertility of the valley attracted the attention of Najib-ud-daula, governor of Saharanpur, who invaded it with an army of Rohillas in 1757 and annexed it to his dominion. His rule, which lasted till 1770, brought great prosperity to the Dun; but on his death it became a prey to the surrounding tribes, its desolation being completed after its conquest by the Gurkhas in 1803. In 1814 it was taken possession of by the British.

DEHYDROGENATION, the removal of hydrogen from the molecule of a chemical compound, which may be effected in the case of an organic compound by heating it in the presence of a metal, which acts as a catalyst (see CATALYSIS); *e.g.,* the alcohols (*q.v.*) lose hydrogen and yield aldehydes (*q.v.*; see also HYDROGENATION).

DEHYDRATION, in chemistry, the removal of molecules of water from a chemical compound. The water may be present in the form of water of crystallization (see HYDRATE) in which case it is removed by heating the crystals, or by placing them in an evacuated desiccator in the presence of a drying agent such as phosphorus pentoxide. Alternatively, water may form part of a molecule of an organic compound, in which case it is removed by heating the compound in the presence of a metallic oxide, which acts as catalyst (see CATALYSIS); *e.g.,* the alcohols (excepting methyl alcohol) are converted into the corresponding olefines. (See ALCOHOLS and OLEFINES.)

DEINARCHUS, last of the "ten" Attic orators, son of Sostratus (or, according to Suidas, Socrates), born at Corinth about 361 B.C. He settled at Athens early in life, and when not more than twenty-five was already active as a writer of speeches for the law courts. In 324 the Areopagus, after inquiry, reported that nine men had taken bribes from Harpalus, the fugitive treasurer of Alexander. Deinarchus wrote, for the prosecution, the three speeches which are still extant—*Against Demosthenes,* Against *Aristogeiton,* Against Philocles. The sympathies of Deinarchus were in favour of an Athenian oligarchy under Macedonian control; but it should be remembered that he was not an Athenian citizen. In the Harpalus affair, Demosthenes was doubtless innocent, and so, probably, were others of the accused. Yet Hypereides, the most fiery of the patriots, was on the same side as Deinarchus.

Under the regency of his old master, Demetrius Phalereus, Deinarchus exercised much political influence. On the restoration of the democracy by Demetrius Poliorcetes, Deinarchus was condemned to death and withdrew into exile at Chalcis in Euboea. About 292, thanks to his friend Theophrastus, he was able to return to Attica. Deinarchus died at Athens about 291.

According to Suidas, Deinarchus wrote 160 speeches; and Dionysius held that, out of 85 extant speeches bearing his name, 58 were genuine—28 relating to public, 30 to private causes. Although the authenticity of the three speeches mentioned above is generally admitted. Demetrius of Magnesia doubted that of the speech Against *Demosthenes,* while A. Westermann rejected all three. Deinarchus had little individual style and imitated by turns Lysias, Hypereides and Demosthenes. He is called by Hermogenes ὁ κριθινὸς Δημοσθένης, a Demosthenes whose strength is rougher, without flavour or sparkle.

Editions: (text and exhaustive commentary) E. Mätzner (1842); (text) T. Thalheim (1887), F. Blass (1888); *see* L. *L.* Forman, *Index Andocideus, Lycurgeus, Dinarcheus* (1897); and, in general, F. Blass, *Attirche Beredsamkeit,* iii. There is a valuable treatise on the life and speeches of Deinarchus by Dionpsius of Halicarnassus.

DEINOCRATES, a famous and original Greek architect, of the time of Alexander the Great. He tried to captivate the ambitious fancy of that king with a design for carving Mount Athos into a gigantic seated statue. This plan was not carried out, but Deinocrates designed for Alexander the plan of the new city of Alexandria, and constructed the vast funeral pyre of Hephaestion. Alexandria was, like Peiraeeus and Rhodes (see HIPPODAMUS), built on a regular plan, the streets of most earlier towns being narrow and contused.

DEIOCES (Δηιόκης) according to Herodotus (i. 96 ff.) the first king of the Medes. He narrates that, when the Medes had rebelled against the Assyrians about 710 B.C., according to his chronology (*cf.* Diodor, ii. 32), they lived in villages without any political organization. Then Deioces, son of Phraortes, was chosen judge in his village, and the justness of his decisions induced the inhabitants of the other villages to throng to him. At last the Medes resolved to set up a kingdom, and chose Deioces king. He now caused them to build a great capital, Ecbatana, with a royal palace, and introduced the ceremonial of oriental courts. He united all the Median tribes, and ruled 53 years (c. 699–647 B.C.), though perhaps, as G. Rawlinson supposed, the 53 years of his reign are exchanged by mistake with the 22 years of his son Phraortes.

The narration of Herodotus is only a popular tradition. We know from the Assyrian inscriptions that just at the time which Herodotus assigns to Deioces the Medes were divided into numerous small principalities and subjected to the great Assyrian conquerors. Among these petty chieftains, Sargon in 715 mentions Dāyukku, "lieutenant of Man" (he probably was, therefore, a vassal of the neighbouring king of Man in the mountains of south-eastern Armenia), who joined the Urarteans and other enemies of Assyria, but was by Sargon transported to Hamath in Syria "with his clan." His district is called "bit-Dāyaukki," "house of Deioces," also in 713, when Sargon invaded these regions again. So it seems that the dynasty, which more than half a century later founded the Median empire, was derived from this Dāyukku, and that his name was thus introduced into the Median traditions, which contrary to history considered him as founder of the kingdom.

DEÏOTARUS, a tetrarch of Galatia in Asia Minor, and a faithful ally of the Romans. At the beginning of the third Mithridatic war, he drove out the troops of Mithridates from Phrygia. Pompey, when settling the affairs of Asia (63 or 62 B.C.) rewarded him with the title of king and an increase of territory (Lesser Armenia). Dei'otarus naturally sided with Pompey in the civil war and after Pharsalus escaped with him to Asia. In 47 Caesar arrived in Asia from Egypt and pardoned Deiotarus for having sided with Pompey. In consequence of the complaints of certain Galatian princes, Dei'otarus was deprived of part of his dominions, but allowed to retain the title of king. On the death of Mithridates of Pergamum, tetrarch of the Trocmi, Dei'otarus was a candidate for the vacancy. Other tetrarchs also pressed their claims; Dei'otarus was accused by his grandson Castor of having attempted to assassinate Caesar when the latter was his guest in Galatia. Cicero undertook his defence, but the assassination of Caesar prevented any final decision. In his speech Cicero deals mainly with the distribution of the provinces, the real cause of the quarrels between Dei'otarus and his relatives. After Caesar's death, Mark Antony, for a large sum of money announced that, in accordance with instructions left by Caesar, Dei'otarus was to resume possession of all the territory of which he had been deprived. When civil war again broke out, Dei'otarus was persuaded to support Brutus and Cassius, but after Philippi went over to the triumvirs. He remained in possession of his kingdom till his death at a great age (see GALATIA).

DEIR or **DEIR EZ-ZOR,** a town in Syria (French mandated territory until 1941), on the right bank of the Euphrates. 27½ mi. above its junction with the Khābūr: population 6,659. The chief town of a considerable area it boasts a hotel, bazaar and many shops. It has a French garrison and an aerodrome, macadamized streets and a public garden, and is a centre of commerce. In Ptolemaeus' list of towns on the right bank of the Euphrates (Geog. v. 18) the following have been identified with Deir ez-Zor: Gadirtha (Fischer, Herzfeld), *Birtha* (Kiepert), *Auzara* (=*Azaura*) (Dussaud). The ancient roads from Aleppo and Damascus to Baghdad met here. One of the modern motor routes from Damascus to Baghdad passes through the town.

DEIRA, the southern of the two English kingdoms afterwards united as Northumbria. According to Simeon of Durham it extended from the Humber to the Tyne, but the land was waste north of the Tees. York was the capital of its kings. The date of its first settlement is quite unknown, but the first king of whom we have any record is Ella or Aelle, the father of Edwin, who is said to have been reigning about 585. After his death Deira was subject to Aethelfrith, king of Northumbria, until the accession of Edwin, in 616 or 617, who ruled both kingdoms (see EDWIN) till 633. Osric the nephew of Edwin ruled Deira (633–634), but his son Oswine was put to death by Oswio in 651. For a few years subsequently Deira was governed by Aethelwald, son of Oswald.

See Bede, *Historia ecclesiastica,* ii. 14, iii. 1, 6, 14 (ed. C. Plummer, 1896); Nennius, *Historia Brittonum,* s. 64 (ed. Th. Mommsen, Berlin, 1898); Simeon of Durham, ***Opera, i, 339*** (ed. T. Arnold, 1882–85). (F. G. M. B.)

DEIRDRE, in older Irish Derdriu, the heroine of the tale of the Fate *of* the Sons *of* Uisnech, one of the "three sorrowful tales" of Ireland. According to the story, she was the daughter of Feidlimid, son of Dall, the king's story-teller. When the Ultonian braves were a-drinking in the house of Feidlimid, and his wife, then pregnant, was serving them, the child screamed from the womb of her mother. The druid Cathub prophesied that a girl-child would be born, by name Derdriu, and great evil would come with her. The Ultonians said she should be slain, but King Conchobar interfered, and ordered her to be brought up in seclusion, and kept to be his own wife. Derdriu grew up thus; but having accidentally come in contact with Nóisi, son of Uisnech, she fell in love with him, and persuaded him and his two brethren, Ainle and Ardan, to carry her off to Alba. Here the four lived together for some time, but they were enticed back by guile by Conchobar's emissaries. The three brethren were slain, and Derdriu taken to Conchobar; but she committed suicide to avoid falling into the king's hands. The *dénouement* of the tale varies, however, in different versions.

The tale is edited (without translation) in Windisch's ***Irische Texte,*** vol i. (Leipzig, 1880). A convenient edition of a modern version bas been published, with translation and vocabulary, by the Society for Preservation of the Irish Language (1898). For a modern Scottish Gaelic version *see* Alex. Carmichael, ***Deirdire*** (Paisley, 1914). (R. A. S. M.)

DEISM is a theological term bearing two accepted meanings.

1. It is the technical name for a particular philosophical doctrine concerning the relation of God to the world. Deism is then contrasted with theism (*q.v.*), though etymologically the two words are equivalent. Whereas theism asserts God to be continuously active in the world and in touch with human souls, *i.e.,* to be immanent in, or operative upon, nature and man in respect of providential guidance, revelation and grace, deism limits the divine activity to creation of the world and fixation of its primary collocations. It conceives the world-process to be determined by these alone: the world originally received from its Maker a capacity for self-development, or a delegated autonomy describable in terms of proximate causes without invocation of further divine intervention. Thus deism is what is popularly called the doctrine of an absentee-God, who, once and for all having wound up the world-machine, has left it to run its course and to work out its self-evolution. In this extreme form, deism has seldom been embraced by theological thinkers; it has rather seemed to be an exaggerated conception of the relative independence of the world and its causal nexus, But unless theism asserts somewhat of relatively fixed order and continuity of causal determination in created things, from which the Deity stands "a hand-breadth off" to give free play, so that God is not the sole operative cause in the spheres of physical process and human conduct, it lapses from the doctrine of an immanent God into pantheism. In other words, if theism is to be in earnest with the distinction involved in speaking of God and the world. and is not to adopt Spinoza's identification, expressed in his phrase God or Nature, it must accept so much of deistic tincture as to enable it to assert that there is a world-order which, however dependent on God, is in some degree independent of Him in that, when once "planted out," it evolves according to the laws of its being, and so provides a sphere for His continuous energizing. Thus pantheism

and deism are two extremes between which theism is a middle way.

2. Deism is also the received name for a trend of theological thought, not explicitly concerned with the philosophical problem above indicated. The term then has an historical, rather than a technically philosophical, signification; and this is its earlier and commoner meaning. The movement which the word indicates was connected primarily with the relation of revealed religion to natural religion, or the relation of Christian doctrine to theology mediated by reason alone, as exercised on the world and man. It manifested itself chiefly, but not exclusively, in England, and most conspicuously in the 18th century. In fact "deism" is very commonly an abridgment of the phrase "English deism of the 18th century." Deistic thought had, indeed, already appeared in the 17th century; but it was then premature and consequently still-born; whereas the movement in the first half of the succeeding century evoked widespread excitement and controversy, and profoundly influenced theological science.

Deism, as it first emerged, was the natural issue, in theology, of historical causes that operated similarly in other fields of thought. The Reformation had brought individual liberty in religion, and toleration had become a politically expedient practice. Consequently, variety of opinion found expression, from allegiance to the orthodox theology such as might be called protestant scholasticism, to the vagaries and "enthusiasms" of individuals and sects. The new physical science, progressing rapidly after the Copernican revolution, was presenting an exemplar of certain knowledge, a sound method and criterion of truth. This was the primary quest of deism. It was first prosecuted by Lord Herbert of Cherbury (1583–1648), the father of English deism, and a contemporary of Descartes. Without denying or repudiating historically "revealed" religion, such as Christianity, Lord Herbert commended a "natural" religion, not transmitted by tradition admitting of corruption, nor accepted on external authority, but demanded and established by reason common to all men, and capable of finding universal acceptance. Adopting as certain, because unquestioned in his age, the belief that in all men there is divinely implanted a faculty, such as was commonly called "natural light," comparable to instinct save that it is of the nature of rntellection rather than of sensibility, he taught that this rational light is the mediator of innate ideas or "common notions" in which the essential elements of all true religion are to be found. These are that God exists, that man's duty is to worship Him, that virtue and piety are the essentials of worship, that repentance and retribution are divinely called for from us, and that there is a future life in which reward and punishment will be meted out. Such, he further held, was the primitive form of religion, from which mankind has been diverted.

As Herbert laid the foundations of deism, in the 17th century, in so far as its positive and its philosophical aspects are concerned, so also, during the same century, did Charles Blount (1654–93) initiate the negative procedure which became the more conspicuous characteristic of deism in the later stages of its development. This procedure consisted in criticism of the Scriptures, of received views as to authorship of the sacred books, of miracles, of specific Christian doctrines, and of ecclesiastical history. It has been called negative, because its aim was not so much to commend the certainty and sufficiency of natural theology, of which deism at first asserted revealed theology to be a more or less superfluous republication, as to suggest the doubtfulness of the data, evidences and arguments, on which revealed religion had hitherto been based. The chief writers who, between 1700 and 1750, conducted this attack upon orthodoxy, were Thomas Woolston, Anthony Collins, Thomas Morgan and Thomas Chubb. They were not scholars of the highest order, nor thinkers of more than mediocre ability. Indeed they were silenced by writers better equipped with learning. Nevertheless deism of this negative or sceptical kind was not merely the exhibition of temporary unrest or discontent. It was an expression of vague suspicions which developed into critical sciences that, in the succeeding century, effected a revolution in Christian apologetic. In its championship of freedom of inquiry; in search for certainty instead of groundless or disputable opinion; in its insistence on reason as the sole instrument for acquiring and judging of truth, and in its use of the method of doubt, deism may be said to offer a parallel to the Cartesian renaissance in philosophy, and to represent the beginning of modernity in English theology. Hence, even on its negative side, deism is an important movement in the history of theological thought.

This phase of 18th century deism finds its best expression in two works. The first is *Christianity not mysterious,* by John Toland, in which it is argued that there is nothing in the Gospels that is mysterious, either in the sense of being contrary to reason or in the sense of being above or beyond reason. Toland, from one point of view, upheld the certainty of the natural theology which reason could read, and of the revelation that had been divinely vouchsafed to it. Provided they are allowed to put their own interpretation on the vague and ambiguous word "reason," most persons of common sense, as well as most philosophers, will perhaps nowadays accept Toland's conclusion. If reason include the discovery of actual premises, such as science deals with, it does not provide the infallible natural theology that deism prided itself on having found, and in comparison with which it afterwards proceeded to disparage revealed religion. Rather did Bishop Butler, the most considerable critic of the deists, hit the mark in his pregnant dictum, "probability is the guide of life." The other of the two works just now referred to, is Matthew Tindal's *Christianity as* old *as the Creation; or the Gospel a Republication of the Religion of Nature.* This book states the case in favour of natural religion more comprehensively than any other of its period: it came to be called "the deist's Bible," and it evoked in especial degree the notice of Bishop Butler and other defenders of revealed religion. The deistic creed, here set forth, is essentially similar to that of Lord Herbert; and natural religion is regarded as consisting in rational knowledge, as contrasted with subjectively caused belief, together with morality. Revelation is restricted to communication of ready-made truth; and the "natural" revelation, old as creation, is described as "internal," *i.e.,* as involved or implicated in the constitution of the world and the natures of God and man. Being thus essential or intrinsic, it is an eternal truth of reason, not contingent on historical facts.

If any one of the deists' tenets was more fundamental than another, it was their assertion that revealed religion presupposes natural religion, And this, though it was for the most part overlooked or evaded during the 19th century, may be regarded as their lasting contribution to theological thought. Unfortunately their conception of the content of natural theology, and of the rational grounds on which they supposed it to be infallibly based, involved *a priori* assumptions which, shortly after deism found its completed expression in Tindal, were demolished by Hume, and later by Kant. Genetic sciences as yet scarcely existed; evolution or development was as wanting from the stock of 18th century ideas as it was paramount in the succeeding century. So the deists worked with static ideas; and some of the assumptions, which to them seemed self-evidept truths, came to be found inconsistent with facts. Human nature and reason are evolved products; and reason as innate *lumen naturale,* to which, the deist thought, a just God *must* reveal Himself perfectly and clearly from the first, never existed. It may be observed, however, that none of those free-thinkers held the kind of deism that was here first described, but rather repudiated it as "atheism."

See Leslie Stephen, *History of English Thought in the 18th century,* Vol. I. (1876 and 1902) and the bibliography therein. (F. R. T.)

DEISTER, a chain of hills in Germany, in the Prussian province of Hanover, about 15 m. S.W. of the city of Hanover. It runs from Springe in the south of Rodenberg in the north. It has a total length of 14 m. and rises in the Hofeler to a height of 1,250 feet. The chain is well-wooded and abounds in game. There are some coal mines and sandstone quarries.

DEJAZET, PAULINE VIRGINIE (1798–1875), French actress, born in Paris on Aug. 30, 1798, first appeared on the stage at the age of five. In 1820 she started to play soubrette and "breeches" parts at the Gymnase, with such success that such parts became known as "Déjazets." After playing at the Nouveautés and the Variétés she became manager of the Folies,

renamed the Théatre Déjazet. Here, even at the age of 6j, she had marvellous success in youthful parts, especially in some previously unacted early plays of Sardou. She retired in 1868, and died on Dec. 1, 1875.

Duval, *Virginie Déjazet* (1876), *L. H.* Lecomte, *Un amour de Déjazet* (1907), and *Virginie Dtjazet* (1904).

DE KALB, a city of DeKalb county, Ill., U.S.A., on the Rishwaukee river, 60 mi. W. of Chicago It is on the Lincoln highway, is served by the Chicago and North Western, Chicago Great Western and Chicago, Milwaukee, St. Paul and Pacific railaays. Land area 2 sq mi. Population was 8,545 in 1930 and 9,146 in 1940 by federal census. Barbed wire was invented and first manufactured there. Other products manufactured are truck bodies, insulated copper mire and cable, warm air furnaces, pianos, piano accordions, player piano rolls, canned vegetables, commercial refrigerating machinery, screen cloth, day beds, bed springs, ladies' sports apparel, two-piece upholstered furniture. The total annual value of manufactured products is estimated at $18,000,000; retail sales at $8,000,000. DeKalb is in the centre of the rich agricultural lands; corn, small grain and cattle raising predominate. The Northern Illinois State Teachers' college occupies a campus of 67 ac. DeKalb was settled in 1832, incorporated a city in 1877; until 1840 it was called Buena Vista.

DE KEYSER, THOMAS (1596 or 1597–1667), Dutch painter, was born at Amsterdam, the son of the architect and sculptor Hendrik de Keyser. Aert Pietersz, Cornelis vanider Voort, Werner van Valckert and Nicolas Elias are accredited by different authorities with having developed his talent. De Keyser chiefly excelled as a portrait painter, though he also executed some historical and mythological pictures, such as the "Theseus" and "Ariadne" in the Amsterdam town hall. His portraiture is full of character and masterly in handling, and often, as in the "Old Woman" of the Budapest gallery, is distinguished by a rich golden glow of colour and Rembrandtesque chiaroscuro. Some of his portraits are life-size, but the artist generally preferred to keep them on a considerably smaller scale, like the famous "Group of Amsterdam Burgomasters" assembled to receive Marie de' Medici in 1638, now at The Hague museum. His pictures are in the Dresden and Frankfurt museums, in the Heyl collection at Worms, and the Liechtenstein gallery in Vienna. The National Gallery, London, owns a characteristic portrait group of a "Merchant with his Clerk"; The Hague museum, besides the group already referred to, a magnificent "Portrait of a Savant," and the Haarlem museum a fine portrait of "Claes Fabricius." At the Ryks museum in Amsterdam there are 12 of his works.

DEKKER, EDWARD DOUWES (1820–1887), Dutch writer, commonly known as MULTATULI, was born at Amsterdam on March 2, 1820. In 1838 he went out to Java, and obtained a post in the Inland Revenue. He rose from one position to another, until, in 1851, he found himself assistant-resident at Amboyna, in the Moluccas. In 1857 he was transferred to Lebak, in the Bantam residency of Java. By this time, however, he had begun to protest against the abuses of the colonial system. He was threatened with dismissal from his office for his openness of speech, and, throwing up his appointment, he returned to Holland in a state of fierce indignation. He determined to expose in detail the scandals he had witnessed, and he began to do so in newspaper articles and pamphlets. In 1860 he published, under the pseudonym of "Multatuli," his romance, *Max Havelaar* (Eng. trans. by W. Siebenhaar, with introd. by D. H. Lawrence, 1927). This book made a complete exposure of the abuse of free labour in the Dutch Indies. His *Miiznebrieven* (1861), in spite of their mild title of "love letters," proved to be mordant satires of the most rancorous and unsparing kind. He collected his miscellanies in uniform volumes called *Ideën* (7 vols., 1862–77), and shaking the dust of Holland from his feet, went to live at Wiesbaden. Dekker died at Nieder Ingelheim, on the Rhine, on Feb. 19, 1887. His *Brieven* (6 vols., 1890–92), and his *Verzamelde Werken* (10 vols., 1892) were edited by his widow.

See F. van Eeden, "Multatuli" in *Studien* (vol. i., 1890), and G. Jonckbloet, *Multatuli* (1894).

DEKKER (or DECKER), **THOMAS** (c. 1572–*c.* 1632), English dramatist, was born in London, and a Thomas Decker, who may probably be identified with the poet, was buried at St. James's, Clerkenwell, on Aug. 25, 1632. Ben Jonson drew him as Demetrius Fannius, the "dresser of plays," in the *Poetaster*. His name as a playwright first appears in Henslowe's *Diary* on Jan. 8, 1598, and he was busily engaged in the preparation of plays in the next few years. In all he is said to have had a hand in 44 plays. His special interest is as a depicter of London life, of the manners and tastes of the citizens and their wives, of the London apprentice, and of the young aristocrats who frequented the playhouse. About six of the plays attributed to Dekker survive. *Old Fortunatus,* drawn from a German tale already dramatized by Hans Sachs, was played on Dec. 27, 1599, and printed in 1600. *The Shoemaker's Holiday,* based on T. Deloney's prose tract, *The Gentle Craft,* was probably also played in 1599, and was printed in 1600. *Patient Grissill* (played 1600, pr. 1603) was the joint work of Dekker, Chettle and Haughton. In *Satiromastix* (played 1601, pr. 1602), which was a counterblast to Jonson's *Poetaster,* Dekker seems to have had the help of Marston. Dekker also had a hand in *Sir Thomas Wyatt* (1602), *The Honest Whore* (1604), *Westward Ho* (1604) and many others. *If it be not Good the Devil is in It* (c. 1610) and *Match Mee in London* (of unknown date) are ascribed wholly to Dekker, and many plays for which his name is given in the theatrical records are lost. The last play in which he had a share appears to be *The Noble Soldier* (c. 1631), in which Day and S. Rowley were perhaps his associates.

Dekker was also a popular pamphleteer, and one of his pamphlets, *The Gull's Hornbook* (1609) gives an unmatched picture of the London of Dekker's day by describing in detail a day in a young fop's life in the city. In *The Wonderful Year* (1603) he describes the state of London during the plague of that year with a realism that matches Defoe. Other pamphlets are *The Seven Deadly Sins of London* (1606), *Newes from Hell; Brought by the Divells Carrier* (1606), etc.

In 1613 Dekker's fortune, never too radiant, underwent eclipse. In 1598 and 1599 Henslowe had lent him money for his discharge when he had been arrested, but in 1613 he was put in the King's Bench prison for debt, and lay there certainly until 1616 and perhaps until 1619. In *Dekker his Dreame* (1620) he speaks of the "Bed in which seven years I lay dreaming," possibly referring to his prison bed.

Dekker is not one of the greatest dramatists of his time, but his loveable personality, his irrepressible humour and his Londoner's lightheartedness, whimsicality and happy-go-lucky temperament have endeared him to all students of Jacobean London. He was, too, a lyric poet of genius, and to him we owe some most charming lyrics. One of them "Art thou poor, yet hast thou golden slumbers?" is to be found in every anthology of the period.

Dekker's *Dramatic Works* were edited by R. H. Shepherd (1873); and four plays were published by E. Rhys in the *Mermaid Series* (1887). His *Non-Dramatic Works* were edited by A. B. Grosart (1884–86) for the Huth Library; and *The Gull's Hornbook* by R. B. McKerrow (1904). *See* E. K. Chambers, *The Elizabethan Stage* (vol. iii. 1923).

DE KOVEN, REGINALD (1861–1920), composer, was born at Middletown, Conn., April 3, 1861. At the age of 20 he graduated from Oxford with a doctor's degree in music. He also studied music in Stuttgart, Florence, Paris and Vienna. After his return to the United States, he wrote music criticism for many publications, including *Harper's Weekly* and the New York *World.* In 1902 he founded the Washington Symphony Orchestra, which he conducted until 1905. He was a fertile composer of comic operas, 300 songs and works for piano and orchestra. The first included *Don Quixote, The Algerian, The Fencing Master, Rob Roy, The Knickerbockers, The Mandarin, From Broadway to Tokio, The Golden Butterfly* and *Robin Hood,* the most successful of all, first given in Chicago in 1900 and since repeated often throughout the English-speaking world. Two grand operas, *Trilby* and *The Canterbury Pilgrim* (1917), were also composed by him. He died at Chicago, Jan. 16, 1920.

DE LA BECHE, SIR HENRY THOMAS (1796–1855), English geologist, was born in 1796, the son of an army officer

settled in Jamaica. The boy spent his youth in England with his mother at Lyme Regis and was educated for the army at the college at Great Marlow, but the peace of 1815 changed his career. He joined the Geological Society of London, of which he was president in 1848–49. After a period of travel in Europe he began the detailed investigation of the rocks of Cornwall and Devon. Thrown much into contact with the mining community, he conceived the idea that the nation ought to compile a geological map of the United Kingdom, to aid the scientific development of its mineral industries, and persuaded the government to give him an appointment in connection with the Ordnance Survey. This formed the starting point of the Geological Survey of Great Britain, which was officially recognized in 1835, when De la Beche was appointed director. Eventually Parliament sanctioned the erection of a museum of geology and the organization of a staff of professors. The establishment, in which were combined the offices of the Geological Survey, the Museum of Practical Geology, The Royal School of Mines and the Mining Record Office was opened in Jermyn street, London, in 1851.

De la Beche published numerous memoirs on English geology in the *Transactions of the Geological Society of London,* as well as in the *Memoirs of the Geological Survey,* notably the *Report on the Geology of Cornwall, Devon and West Somerset* (1839). In his *Researches in Theoretical Geology* (1834) he enunciated a philosophical treatment of geological questions much in advance of his time. His *Geological Observer* (1851; 2nd ed., 1853), enlarged from an earlier work, displays his talent for artistic delineation of geological phenomena. He was elected F.R.S. in 1819, was knighted in 1848, and near the close of his life was awarded the Wollaston medal. He died on April 13, 1855.

See Sir *A.* Geikie's *Memoir of Sir A. C. Ramsay* (1895), which contains a sketch of the history of the Geological Survey, and of the life of De la Beche (with portraits); also *Summary of Progress of the Geological Survey for 1897* (1898).

DELABORDE, HENRI FRANÇOIS, COUNT (1764–1833), French soldier, the son of a Dijon baker, served in the revolutionary war from the beginning. He was created count in 1808 when he was serving under Junot in Portugal. He fought the skilful action of Roliça. In 1812 he was a divisional commander under Mortier in the Russian campaign. He joined Napoleon during the Hundred Days, was court-martialled at the Restoration, but acquitted on technical grounds.

DELACROIX, FERDINAND VICTOR EUGENE (1798–1863), French historical painter, leader of the romantic movement, was born at Charenton-St. Maurice, near Paris, on April 26, 1798. His father, Charles Delacroix (1741–1805), was foreign minister under the Directory. Eugène was educated at the Lycée Napoléon, and then entered the *atelier* of Baron Guérin. He studied the works of Rubens and Paolo Veronese at the Louvre; and he was attracted by the work of Jéricault, whose influence can be traced in Delacroix's first important picture, "Dante and Virgil," exhibited in 1822 and now in the Louvre. At a time when the classic school was predominant and artists were intent on the representation of scenes of antiquity and mythology the appearance of Delacroix's "Massacre of Chios" in the Salon of 1824 marked a victory for the romantic movement. It represented in a tragic manner the atrocities enacted in Greece, and, like Byron's poetry, enlisted sympathy for the Greek War of Independence. The picture was painted in glowing colours, and contrasted with the dark canvases of the Classicists, whose opposition was roused. The aged Gros is said to have called the "Massacre of Chios" *le massacre de la peinture.* Delacroix spent some months in England in 1825, and drew fresh inspiration from the works of Byron. He was attracted by the fresh and direct painting of Constable's landscapes. His next two pictures, "Marino Faliero Decapitated on the Giant's Staircase of the Ducal Palace" and "Greece Lamenting on the Ruins of Missolonghi," with many smaller works, were exhibited for the benefit of Greek patriots in 1826. Next year he produced "Sardanapalus," from Byron's drama. After this, he says, "I became the abomination of painting, I was refused water and salt"—but, he adds with singularly happy naivete, *J'étais enchanté de moi-même!* The patrimony he inherited, or what remained of it, was 10,000 *livres de rente,* and with economy he lived on this, and continued to paint large historical pictures. In 1831 he re-appeared in the Salon with six works, among which was "Liberty leading the People," now in the Louvre, and immediately after left for Morocco, where he found the colour and light which flood his later work. "The Entry of the Crusaders" into Constantinople is a powerful colour harmony (Louvre). A visit to Madrid acquainted him with the methods of Velasquez and Goya. The "Noce Juive" (1839) in the Louvre shows the influence of Spain. In 1835, through the influence of Thiers, he received a commission to decorate the interior of the chamber of deputies, and between that date and 1861 he completed that and other great decorative works: "The Triumph of Apollo," the panel in the centre of the ceiling of the Galerie d'Apollon in the Louvre; subjects from the Divine Comedy in the library of the Luxembourg; and the mural paintings in the church of St. Sulpice, and in the Salon de la Paix in the Hôtel de Ville. Delacroix died on Aug. 13, 1863, at Champrosay, considered the greatest of the romanticist subject painters. Although he was hailed during his life time as a great revolutionary, it is not him, but Ingres, his classicist opponent and rival, whom modern painters claim as their ancestor. His large pictures representing romantic epics have not created a following. It is by his magic colour harmonies that he contributed to the development of painting; and his subtle decomposition of colour taught one of their principal secrets to the impressionists.

Moreau, *Delacroix et son oeuvre* (1893); Dorothy Bussy, *Eugène Delacroix* (1907); Phil. Burty, *Lettres d'Eugène Delacroix 1815–1863* (1879); Raymond Escholier, *Delacroix* (1927).

DE LA GARDIE, JAKOB, COUNT (1583–1652), Swedish field-marshal, son of Count Pontus de la Gardie, was born at Reval on June 30, 1583. In 1610 he led an army of mercenaries to Moscow in support of Basil Shuisky; after his abdication La Gardie seized Ingria and Novgorod, which acknowledged the sovereignty of the Swedes, but the Swedish army was held up before Pskov. But with the accession of the Romanovs the Russian situation changed. La Gardie defeated the Russians at Bronitski in July 1614, but Gustavus Adolphus now took charge of the operations, and with him La Gardie returned to Sweden. By the peace of Stolbova (1617) the Swedish possessions on the eastern Baltic were secured. La Gardie was promoted field-marshal, and devoted himself to the organization of the army. In 1625 he was again fighting in the Baltic provinces. On the death of Gustavus Adolphus he was appointed one of the guardians of the child queen Christina. He married in 1618 Countess Ebba Brahe, the early love of Gustavus Adolphus. He died on Aug. 22, 1652.

See A. Hamilton, *Minne af riksmarsken grefve Jakob Pontusson de la Gardie* (1880).

DE LA GARDIE, MAGNUS GABRIEL, COUNT (1622–1686), Swedish statesman, was born on Oct. 15, 1622, in Reval, son of the preceding. In 1646 Queen Christina sent him on an extraordinary mission to France, and on his return he married the queen's cousin, Marie Euphrosyne of Zweibriicken. He stood well in Christina's favour and continuously held high office until 1653 when he fell into disgrace and had to leave the court. But in the reign of Charles X. (1654–60), his brother-in-law, he held high command in the army fighting in the Ealtic provinces against Russia and Poland, and conducted the peace negotiations at Oliva (1660). Charles appointed him grand chancellor and a member of the Council of Regency of Charles XI. during his minority. He succeeded in dominating the council, and pursued a policy of reckless extravagance, and in 1672 engineered the alliance with France, which entangled Sweden two years later in the disastrous war with the elector of Brandenburg. *(See* SWEDEN: *History.)* In 1675 a special commission was appointed to enquire into the conduct of De la Gardie and his associates, and on May 27, 1682, it decided that the regents and the senate were solely responsible ior dilapidation of the realm, the compensation due by them to the Crown being assessed at 4,000,000 *daler* or £500,000. De la Gardie was treated with relative leniency, but he "received permission to re-

tire to his estates for the rest of his life" and died there in comparative poverty, a mere shadow of his former magnificent self. He was a man of brilliant social gifts and a great patron of literature and art. He presented to the library at Uppsala the famous late 5th-century *Codex Argenteus* of Ulfilas' Gothic version of the Gospels.

DELAGE, YVES (1854–1920), French zoologist, was born on May 13, 1854, at Avignon. He became zoology professor at the Sorbonne in 1886. In 1901 he was made director of the laboratory of marine biology at Roscoff, Finistère. Delage was one of the first authorities on animal reproduction, hybridism and hereditary *(see* REPRODUCTION; HYBRIDISM; PROTOPLASM). He died in Paris on Oct. 8, 1920.

Goldsmith, *Le Rêve, itude psychologique, philosophique et lzttiraire* (1919).

DELAGOA BAY (Portuguese for the bay "of the lagoon"), officially known as Bahia de Lourenço Marques (*q.v.*), an inlet of the Indian ocean on the east coast of South Africa, between 25° 40' and 26° 20' S, with a length of 26 m. and a breadth of 22 m. It is the northern termination of the series of lagoons which line the coast from St. Lucia bay. The opening is towards the north-east. The southern part of the bay is formed by the Inyak (native *Nyaka)* or Mahlungulu peninsula.

North of the peninsula is Inyak island, with the fishing village of Pt. Melville at its north-west point, and beyond Elephant's island. Delagoa Bay forms a valuable harbour, accessible to large vessels at all seasons of the year. The surrounding country is low and very unhealthy, but the island of Inyak has a height of 240 ft., and could be used as a sanatorium. The Manhisa or Komati river enters the sea just north of the bay; the Matolla, the Umbeluzi and the Tembe, from the Lebombo, meet in the estuary called by the Portuguese the Espirito Santo, but generally known as the English river; and the Maputa, or Lisuthu, which has its head-waters in the Drakenberg. enters in the south, as also does the Funti river. These rivers are the haunts of the hippopotamus and the crocodile.

The bay was discovered by the Portuguese navigator Antonio de Campo, one of Vasco da Gama's companions, in 1502. Antonio Caldeira explored the lower courses of the rivers entering Delagoa Bay. especially the Espirito Santo. The Portuguese visited the district from time to time. In 1721 the Dutch East India company built a fort and "factory" on the spot where Lourenço Marques now stands; but in 1730 the settlement was abandoned. Thereafter the Portuguese had—intermittently—trading stations on the Espirito Santo. In 1771, the Austrian Asiatic company of Trieste attempted to establish a station there, but were expelled. Intermittent native wars followed the building of a fortress on the site of the present town, in 1781. In 1823 W. F. W. Owen concluded treaties of cession with native chiefs, and appropriated for Britain the country from the English river southwards; in 1824 the Portuguese, disregarding the British treaties, concluded others with the natives, and endeavoured (unsuccessfully) to take military possession of the country. The sovereignty of either power was left undecided till the claims of the Transvaal Republic rendered a solution of the question urgent Great Britain had taken no steps to exercise authority on the spot, while the ravages of Zulu hordes confined Portuguese authority to the limits of their fort. In 1835 Boers had attempted to form a settlement on the bay, which is the natural outlet for the Transvaal; and in 1868 the Transvaal President, Marthinus Pretorius, claimed the country on each side of the Maputa down to the sea. In the following year, however, the Transvaal acknowledged Portugal's sovereignty over the bay. In 1861 Bickford had declared Inyak and Elephant's island British territory. In 1872 the dispute between Great Britain and Portugal was submitted to the arbitration of M. Thiers, the French President; and on July 24, 1875, his successor, Marshal MacMahon, declared in favour of the Portuguese. It had been previously agreed by Great Britain and Portugal that the right of pre-emption in case of sale or cession should be given to the unsuccessful claimant to the bay. Portuguese authority over the interior was not established until some time after the MacMahon award; nominally the country south of the Manhisa river was ceded to them by the Matshangana chief Umzila in 1861. In 1889 another dispute arose between Portugal and Great Britain in consequence of the seizure by the Portuguese of the railway running from the bay to the Transvaal. This dispute was referred to arbitration, and in 1900 Portugal was condemned to pay nearly £1,000,000 in compensation to the shareholders in the railway company. *(See* LOURENÇO MARQUES and GAZALAND.)

For an account of the Delagoa Bay arbitration proceedings *see* Sir E. Hertslet, *The Map Of Africa by Treaty* (1909). Consult also the British blue-book; *Delagoa Bay, Correspondence respecting the clatms of Her Majesty's Government* (1875); *L.* van Deventer, *La Hollande et la Baie Delagoa* (The Hague, 1883); G. McC. Theal, *The Portuguese in South Africa* (1896); Tesset, *The Key to South Afrtca, Delagoa Bay* (1899), and *History of South Africa since September 1795* (1908). *The Narrative of Voyages to explore the shores of Africa . . . performed . . . under direction of Captain W. F. W. Owen, R.N.* (1833) contains much interesting information concerning the district in the early part of the 19th century.

DELAINE. A term which applies strictly to an all-woollen fabric of light and fine texture and constructed with the plain calico weave. The fabric may be all white or piece-dyed, *i.e.,* dyeing the cloth in the "piece," after weaving, as distinct from coloured cloth woven from warp and weft yarn dyed previous to weaving. Delaine fabrics are also sometimes figured with patterns in various colours. The pattern may be printed on the warp, before weaving, after the manner adopted in chintzes and cretonnes (*q.v.*) and in Chiné silk fabrics, while others are printed with patterns after weaving, as in calico printing. One quality of delaine is made with 54 warp ends per inch, of 46's, and 64 picks per inch of 64's Botany wool.

Delaine union fabrics are also produced from a cotton warp and Botany weft, with 30's counts of yarn for both warp and weft, and with 64 warp threads and picks per inch. Some fabrics described as "delainettes" are produced from all-cotton both for warp and weft of soft spun yarn, and finished with a soft finish similar to that of the lighter and finer textures of flannelette (*q.v.*). (H. N.)

DE LA MARE, WALTER JOHN (1873–), British poet and novelist, of Huguenot descent, was born on April 25, 1873, at Charlton, Kent, and educated in London at St. Paul's Cathedral Choir school. From 1889 to 1908 he was engaged in business in London, but he had already printed poems and prose, writing as "Walter Ramal" in *The Cornhill* and other magazines, and in 1901 his *Songs of Childhood* appeared, his novel *Henry Brocken* following in 1904. A grant from the Privy Purse enabled him to devote himself fully to literary work, and he gradually found a growing audience for his delicate and highly individual work. *The Return* (1910) won the Polignac prize. *The* Listeners *and other Poems* (1912), *Peacock Pie* (1913), *Motley and Other Poems* (1918) brought him to the front rank of his contemporaries, and his *Collected Poems, 1901–1918,* appeared in 1920. A fairy play, *Crossings,* was published in 1921, and also further poems, *The Veil.* The long novel, *Memoirs* of *a Midget* (1921), showed his prose gifts at their highest; it also showed him to be a master of fantasy (he gives substance and verisimilitude to the fantastic) and of symbolism, and the critics have seen in him the heir of Maeterlinck tradition. Later books were volumes of stories: *The Riddle* (1924), *Broomsticks* (1925), *The Connoisseur and other Stories* (1926). De la Mare was a close friend of Rupert Brooke, and wrote an interesting essay on him in 1919.

See R. L. Megroz, *Walter de la Mare* (1924).

DELAMBRE, JEAN BAPTPSTE JOSEPH (1749–1822), French astronomer, was born at Amiens on Sept. 19, 1749. In 1771 he became tutor to the son of M. d'Assy, receiver-general of finances. He attended the lectures of J. J. Lalande, who induced d'Assy in 1788 to install an observatory for his benefit at his own

residence Here Delambre observed and computed almost uninterruptedly, and in 1790 obtained for his Tables of Uranus the prize offered by the academy of sciences. He was admitted to the Institute on its organization in 1795, and became, in 1803, perpetual secretary to its mathematical section. He served from 1795 on the bureau of longitudes. From 1792 to 1799 he was occupied with the measurement of the arc of the meridian extending from Dunkirk to Barcelona, and published a detailed account of the operations in *Base du systbme métrique* (3 vols., 1806, 1807, 1810). He succeeded Lalande in 1807 as professor of astronomy at the Collège de France, and was treasurer to the imperial university from 1808 until its suppression in 1815. Delambre died in Paris on Aug. 19, 1822. He wrote: *Histoire de l'astronomie ancienne* (2 vols., 1817); *Histoire de l'astronomie au moyen âge* (1819); *Histoire de l'astronomie moderne* (2 vols., 1821); *Histoire de l'astronomie au XVIII^e siècle* (edit. C. L. Mathieu, 1827); *Tables écliptiques des satellites de Jupiter*, inserted in the third edition of J. J. Lalande's *Astronomie* (1792), and republished in an improved form by the bureau of longitudes in 1817, and other works.

DELAMERE or **DE LA MER, GEORGE BOOTH, 1ST** BARON (1622–1684), son of William Booth, of Dunham Massey in Cheshire, was born in Aug. 1622. He was returned for Cheshire to the Long Parliament in 1645 and to Cromwell's parliaments of 1654 and 1656. In 1655 he was appointed military commissioner for Cheshire and treasurer at war. He was one of the excluded members who tried and failed to regain their seats after the fall of Richard Cromwell in 1659. He had for some time been regarded by the Royalists as a well-wisher to their cause, and now became one of the chief leaders of the new "Royalists" who at this time united with the cavaliers to effect the Restoration. A rising was arranged for Aug. 5 in several districts, and Booth took charge of operations in Cheshire, Lancashire and North Wales. He seized Chester on the 19th and marched towards York. The plot, however, had failed in other parts of the country, and Lambert defeated Booth's men at Nantwich Bridge. Booth himself was captured at Newport Pagnell on the 23rd and was imprisoned in the Tower. He was soon liberated, sat in the parliament of 1659–60, and was one of the 12 members deputed to carry the message of the Commons to Charles II. at The Hague. In July 1660 he received a grant of £10,000, and on April 20, 1661, he was created Baron Delamere, with a licence to create six new knights. The same year he was appointed *custos rotulorum* of Cheshire. He died on Aug. 8, 1684, and was buried at Bowdon.

His second son, HENRY (1652–1694) who succeeded him in the barony, was created earl of Warrington in 1690. He was implicated in the Rye House Plot (1683), joined William of Orange in 1688, and received many honours from the new king.

DELAND, MARGARETTA WADE (CAMPBELL) (1857–), American writer, was born at Allegheny, Pa., Feb. 23, 1857. She studied in private schools and at Cooper Union in New York, and for a time taught drawing. In 1880 she married L. F. Deland, of Boston. She attracted attention with her first novel, *John Ward, Preacher* (1881), which dealt with religious and social questions after the manner of Mrs. Humphry Ward. Her books include *The Story of a Child* (1892); *The Awakening of Helena Richie* (1906); *The Iron Woman* (1911); *The Rising Tide* (1916); and *The Vehement Flame* (1922). She is most popularly known for her sympathetic studies of village life and character, *Old Chester Tales* (1899) and *Dr. Lavendar's People* (1904).

DE LAND, a city of Florida, U.S.A., 10om. S.S.E. of Jacksonville, on the St. John's river, 18m. from the Atlantic ocean; the county seat of Volusia county. It is served by the Atlantic Coast Line railroad, and by river steamers to Jacksonville. The population was 5,246 in 1930 and 7,041 in 1940 by the federal census. It is in a region of beautiful hills, pine groves and lakes. where winter truck-farming and the growing of citrus fruits are important. Ponce de Leon springs are 8 mi. north. De Land is the seat of the John B. Stetson university, established as an academy in 1884 by the founder of the town, and re-named in 1889 after John Batterson Stetson, a Philadelphia hat-manufacturer, who gave it nearly $500,000. The town was founded in 1876, by Henry A. De Land, a manufacturer of Fairport, N. Y., who built a public school in 1877, a high-school in 1883 and the academy mentioned above in 1884.

DELANE, JOHN THADDEUS (1817–1879), editor of *The Times*, born in London and educated at King's college, London, and Magdalen college, Oxford. He was called to the bar at the Middle Temple in 1847. Delane was editor of *The Times* for 36 years (1841–77), and under his rule the paper acquired very great influence at home and abroad. It had become a power in British politics under Delane's predecessor, Barnes; and under Delane it attained a larger cosmopolitan standing. He superintended in detail the work of the leader writers and foreign correspondents of the paper. Among the latter in Delane's day were Thomas Chenery in Constantinople, and Blowitz in Paris. An example of the caution exercised by Delane in foreign affairs may be cited. When in 1875 Blowitz sent word that Bismarck contemplated a fresh attack on France, Delane held back the news for a fortnight until he had been able to send Chenery to Paris to substantiate the report. Delane had an impartial mind, and built up a tradition of independence of the Government of the day, even when it was a Conservative one.

See the biographies by Arthur Irwin Dasent (1908) and Sir Edward Cook (1915).

DELANO, JANE ARMINDA (1862–1919), American nurse, was born at Townsend, N.Y., on March 12, 1862. She graduated from the Bellevue hospital school of nursing in 1886. In 1888 she was asked to take charge of a temporary hospital during the yellow fever epidemic in Jacksonville, Florida. After an experience as visiting nurse in Arizona, in the days of the still war-like Apache Indians, she was appointed superintendent of nurses at the University of Pennsylvania hospital, Philadelphia. Pa., 1891; and director of nursing at her alma mater in 1902. From 1909–12, she served as superintendent of the U.S. Army Nurse Corps. During the latter part of this period she accepted the chairmanship of the National Committee on Red Cross Nursing Service and began the development of a nursing reserve. In 1909 there were but 950 nurses on the Red Cross records. A month after the outbreak of the World War, ten picked units from the 5,000, then on the rolls, sailed for Europe. Before the end of the war 20,000 Red Cross nurses served at home and abroad with the army, navy and the American Red Cross in its work among the civilian population. When in France on a tour of inspection she died at Savenay, on April 15, 1919, worn out by war work. After a military funeral overseas her body was brought home on a U.S. transport for interment at Arlington National cemetery, on Sept. 18, 1920. Her decorations included Japanese, Austrian and Pan-American medals, and her country's D.S.M. awarded posthumously for "extraordinary devotion to duty."

DELANY, MARY GRANVILLE (1700–1788), an Englishwoman of literary tastes, was born at Coulston, Wilts, on May 14, 1700, and died on April 15, 1788. She was a niece of the 1st Lord Lansdowne. In 1718 she was unhappily married to Alexander Pendarves, a rich old Cornish landowner, who died in 1724. During a visit to Ireland she met Dean Swift and his intimate friend, the Irish divine, Patrick Delany, whose second wife she became in 1743. After his death in 1768 she passed all her summers with her bosom friend the dowager duchess of Portland—Prior's "Peggy"—and when the latter died George III. and Queen Charlotte, whose affection for their "dearest Mrs. Delany" seems to have been most genuine, gave her a small house at Windsor and a pension of £300 a year. At this time Mrs. Delany was a charming and sweet old lady, with a reputation for cutting out and making the ingenious "paper mosaiks" now in the British Museum; she had known everyone worth knowing in her day, had corresponded with Swift and Young, and left an interesting picture of polite society in her *Autobiography and Letters*, 1700–88, an abridged version of which was compiled by G. Paston, 1900. Burke calls her "a real fine lady"—"the model of an accomplished woman of former times."

See *Mrs. Delany at Court and among the Wits*. Arranged from the "Autobiography and Correspondence. . . ." With an introduction by R. Brimley Johnson (1925).

DE LA REY, JACOBUS HERCULES (1847–1914), Boer general, was born in the Lichtenburg district in what is now the Orange Free State, and in his youth and early manhood fought in the Rafir wars. In 1893 he entered the Volksraad of the South African Republic, where he supported the policy of Gen. Joubert. At the outbreak of the war with Great Britain in 1899 De La Rey was made a general, and fought in the western campaign against Lord Methuen and Lord Roberts. He won his first great success at Nitral's Nek on July 11, 1900, where he compelled the surrender of a strong British detachment. In the second or guerrilla stage of the war De La Rey was conspicuously successful. He was assistant to Gen. Louis Botha and a member of the government with charge of operations in the western Transvaal. The principal actions in which he was successful (see also TRANSVAAL: History) were Nooitgedacht, Vlakfontein and the defeat and capture of Lord Methuen at Klerksdorp (March 7, 1902). The British general was severely wounded in the action, and De La Rey released him at once, being unable to afford him proper medical assistance. This humanity and courtesy marked De La Rey's conduct throughout the war. After the conclusion of peace De La Rey, who had shared in the negotiations, visited Europe with other Boer generals to raise funds for resettlement. In Dec. 1903 he went on a mission to India, and induced the Boer prisoners of war detained at Ahmednagar to accept the new order of things and to take the oath of allegiance. In Feb. 1907 Gen. De La Rey was returned unopposed as member for Ventersdorp in the legislative assembly of the first Transvaal parliament under self-government. At the outbreak of the World War he was implicated in Maritz's rebellion, and was shot dead by a police patrol at Johannesburg on Sept. 16, 1914.

DE LA RIVE, AUGUSTE ARTHUR (1801–1873), Swiss physicist, was born at Geneva on Oct. 9, 1801. He was the son of Charles Gaspard de la Rive (1770–1834), who became professor of pharmaceutical chemistry at the Academy of Geneva in 1802 and rector in 1823. In 1823 de la Rive was appointed to the chair of natural philosophy in the Academy of Geneva. He devoted himself specially with François Marcet (1803–83), to the investigation of the specific heat of gases, and to observations for determining the temperature of the earth's crust. Electrical studies, however, engaged most of his attention. His experiments on the voltaic cell were of importance in the development of electrical theory; the results were published in 1836. In common with Faraday, de la Rive held the theory that voltaic electricity was due to chemical action. In 1840 he described a process for the electro-gilding of silver and brass, for which in the following year he received a prize of 3,000 francs from the French Academy of Sciences. Between 1854 and 1858 he published a *Traité de l'électricité théorique et appliquée*, which was translated into several languages. De la Rive's birth and fortune gave him considerable social and political influence. He was distinguished for his hospitality to literary and scientific men, and for his interest in the welfare and independence of his native country. In 1860, when the annexation of Savoy and Nice had led the Genevese to fear French aggression, de la Rive was sent by his fellow-citizens on a special embassy to England, and succeeded in securing a declaration from the English Government, which was communicated privately to that of France. Later (1867) he carried out a series of researches on the discharge of electricity through gases, with observations on the critical pressure and the conductivity of the cathode dark space. He died suddenly at Marseille on Nov. 27, 1873.

DELAROCHE, HIPPOLYTE, commonly known as PAUL, (1797–1856), French painter, was born in Paris on July 17, 1797. He studied under Gros and exhibited for the first time in the Salon of 1822. He visited Italy in 1838 and 1843, when his father-in-law, Horace Vernet, was director of the French Academy. His studio in Paris was in the rue Mazarin, where he never spent a day without some good result, his hand being sure and his knowledge great. His subjects, definitely expressed and popular in their manner of treatment, illustrating certain views of history dear to partisans, yet romantic in their general interest, were painted with a firm, solid, smooth surface, which gave an appearance of the highest finish. Delaroche held a course midway between the classicists and the romanticists. His long series of historical pictures had a great popular success and were made familiar in thousands of homes by engravings of them. Three of them are in the Louvre: "The Death of Queen Elizabeth" (1827), "The Children of Edward IV." (1830), and "The Young Martyr." But his easel pictures no longer have much importance.

In 1837 Delaroche received the commission for the great picture, 27 mitres long, in the hemicycle of the lecture theatre of the École des Beaux-Arts. This represents the great artists of the modern ages assembled in groups on either hand of a central elevation of white marble steps, on the topmost of which are three thrones filled by the architects and sculptors of the Parthenon. To supply the female element in this vast composition he introduced the genii or muses, who symbolize or reign over the arts, leaning against the balustrade of the steps. The portrait figures are nearly all unexceptionable and admirable. This great and successful work is on the wall itself, an inner wall, however, and is executed in oil. It was finished in 1841 and considerably injured by a fire which occurred in 1855, which injury he immediately set himself to remedy (finished by Robert-Fleury); but he died before he had well begun, on Nov. 4, 1856.

See L. Runtz, ***Oeuvre de Paul Delaroche,*** photographic reproductions, with a notice by H. Delaborde and Jules Goddé (1858). Rees, ***Delaroche*** (1880).

DELARUE, GERVAIS (1751–1835), French historical investigator, formerly regarded as one of the chief authorities on Norman and Anglo-Norman literature, was a native of Caen who took refuge in England during the French Revolution. His principal works are *Essais historiques* sur *les* Bardes, les Jongleurs, et les Trouvkres normands et *anglo-normands* (3 vols., 1834), and books on the history of his native town.

DE LA RUE, WARREN (1815–1889), British astronomer and inventor of the photo-heliograph, son of Thomas De la Rue, was born in Guernsey on Jan. 18, 1815. He constructed in 1850 a 13-in. reflecting telescope, mounted first at Canonbury, later at Cranford, Middlesex, and with its aid executed many drawings of the celestial bodies. In 1851 he saw a daguerrotype of the moon by G. P. Bond, shown at the great exhibition of that year. Employing the more rapid wet-collodion process, he succeeded before long in obtaining exquisitely defined lunar pictures, which remained unsurpassed until the appearance of the Rutherford photographs in 1865. In 1854 he turned his attention to solar physics, and in order to obtain a daily photographic representation of the state of the solar surface he devised the photo-heliograph, described in his report to the British Association, "On Celestial Photography in England" (1859), and in his Bakerian Lecture (*Phil. Trans.* vol. clii.). Regular work with this instrument, begun at Kew by De la Rue in 1858, was carried on there for 14 years; and was continued at Greenwich from 1873 to 1882. The results obtained in the years 1862–66 were discussed in two memoirs, entitled "Researches on Solar Physics," published by De la Rue, in conjunction with Professor Balfour Stewart and Mr. B. Loewy, in the Phil. Trans. (vol. clix. and vol. clx.). The photographs which he took in Spain of the solar eclipse of July 18, 1860, proved beyond doubt the solar character of the prominences or red flames, seen around the limb of the moon during a solar eclipse. In 1873 De la Rue presented most of his astronomical instruments to the university observatory, Oxford; in 1887 he provided it with a 13-in. refractor to enable it to take part in the International Photographic Survey of the Heavens. With Dr. Hugo Miiller as his collaborator he published many chemical papers between 1856 and 1862, and investigated, 1868–1883, the discharge of electricity through gases by means of a battery of 14,600 chloride of silver cells. He was twice president of the Chemical Society, and also of the Royal Astronomical Society (1864–66). He died in London on April 19, 1889.

DELATOR, in Rome, one who gave notice (deferre) to the treasury officials of moneys due to the imperial *fiscus* (see AERARIUM). This meaning was extended to those who lodged information as to punishable offences, and further, to those who brought a public accusation against any person. Although the word delator ("common informer") is confined to imperial times,

the right of public accusation had long been in existence. When exercised from patriotic motives its effects were beneficial, but when rewards were introduced this was no longer the case. Cicero expresses his opinion that such accusations should be undertaken only in the interests of the State or for other urgent reasons. Under the empire the system degenerated into an abuse, which reached its height during the reign of Tiberius.

Delatores were drawn from all classes of society. The objects of their attacks were the wealthy, all possible rivals of the emperor, and those whose conduct implied a reproach against the imperial mode of life. Special opportunities were afforded by the law of *maiestas* (treason) which (originally directed against attacks on the ruler by word or deed) was made to cover all kinds of irrelevant accusations. The chief motive for these accusations was no doubt the desire of amassing wealth, since by the law of *maiestas* one-fourth of the goods of the accused was assured to the accuser (who was hence called *quadruplator*). Pliny and Martial mention instances of enormous fortunes amassed by those who carried on this hateful calling. But it was not without its dangers. If the *delator* lost his case he was liable to the same penalties as the accused; he was exposed to the risk of vengeance at the hands of the proscribed, or of their relatives; while emperors like Tiberius had no scruples about putting out of the way those creatures for whom they had no further use. Under the better emperors severe penalties were inflicted upon the *delatores*. Titus drove into exile or reduced to slavery those who had served Nero, after they had been flogged in the amphitheatre. The abuse reappeared under Domitian; they were again banished by Trajan, and threatened with capital punishment in an edict of Constantine.

See J. *E. B.* Mayor's note on Juvenal iv. 48 for ancient authorities; also J. E. Sandys, *Companion to Latin Studies* (1921), with useful bibliography.

DELAUNAY, ELIE (1828–1891), French painter, was born at Kantes on June 12, 1828, and died in Paris on Sept. 5, 1891. He studied under Flandrin and at the École des Beaux-Arts. He worked in the classicist manner of Ingres until, after winning the Prix de Rome, he went to Italy in 1856, and abandoned the ideal of Raphaelesque perfection for the sincerity and severity of the quattrocentists. As a pure and firm draughtsman he stands second only to Ingres. After his return from Rome he was entrusted with many important cominissions for decorative paintings, including the frescoes in the church of St. Nicholas at Nantes; the three panels of "Apollo," "Orpheus," and "Amphion" at the Paris opera-house; and 12 paintings for the great hall of the council of state in the Palais Royal. His "Scenes from the Life of Ste Geneviève," which he designed for the Pantheon, remained unfinished at his death. The Luxembourg museum has his famous "Plague in Rome" and a nude figure of "Diana"; and the Kantes museum, the "Lesson on the Flute." In the last decade of his life he achieved great popularity as a portrait painter.

DELAUNAY, LOUIS ARSÈNE (1826–1903), French actor, was born in Paris, the son of a wine-seller. He studied at the Conservatoire, and made his first formal appearance on the stage in 1845, in *Tartufe* at the Odéon. Three years later he made his début at the Comédie Française as Dorante in Corneille's *Le Menteur,* and began a long and brilliant career in young lover parts, which he continued to act until he was 60, his grace, marvellous diction and passion enchanting his audiences. He was especially happy in the plays of De Musset. He was made a Chevalier of the Legion of Honour in 1883, and retired in 1887.

See *Souvenir de M. Delaunay de la Comédie-Française* (1901).

DELAUNAY-BELLEVILLE, LOUIS (1843–1912), French engineer, was born at Corbeil on Nov. 20, 1843. Educated at St. Barbe and the École Polytechnique, he entered the Naval Engineering school in 1864 and in 1867 left to join the Bellerille works at St. Denis, near Paris. He became a partner and finally head of the firm which produced the well-known Belleville boilers, and also the motor car callrd by his name. From 1890 he was president of the Paris Chamber of Commerce. He died at Cannes on Feb. 10, 1912

DELAVIGNE, JEAN FRANÇOIS CASIMIR (1793–1843), French poet and dramatist, was born on April 4, 1793, at Havre, and was educated in Paris at the Lycée Napoléon. His *Dithyrambe sur* la *naissance du roi de Rome* (1811) secured for him a sinecure in the revenue office. Inspired by the catastrophe of 1815, Delavigne wrote the stirring patriotic poems entitled *Messéniennes.* In 1819 his play *Les vêpres Siciliennes,* refused for the Théâtre Français, was performed at the Odéon. In *Paria* (1821) he expressed political opinions which led to his deprivation of a comfortable sinecure, but Louis Philippe compensated him by making him librarian at the Palais Royal. Here he wrote the *École des vieillards* (1823), his best comedy, which gained his election to the Academy in 1825. To this period also belong La *Princesse Aurélie* (1828) and *Marino Faliero* (1829), a drama in the romantic style.

At the revolution of 1830 his song "La Parisienne," set to music by Auber, was on the lips of every Frenchman, and rivalled in popularity the "Marseillaise." Of the many historical dramas written by Delavigne under the July monarchy the most famous is *Louis* XI. (1837). His last work was *Charles VI.* (1843), an opera libretto partly written by his brother Germain (1790–1868). In 1843 he started for Italy in search of health, but died at Lyons on Dec. 11, 1843.

Delavigne's *Poésies* and his *Théâtre* were published in 1863. His *Oeuvres complètes* (new ed., 1855) contains a biographical notice by his brother, Germain Delavigne, who is best known as a librettist in opera. *See* also Sainte-Beuve, *Portraits littéraires,* vol. v.; *A.* Favrot, *Étude sur Casimir Delavigne* (1894), and *F.* Vuacheux, *Casimir Delavigne* (1893).

DELAWARE, popularly called the "Diamond State," is one of the 13 original states of the United States of America. It is situated in the eastern part of the peninsula formed by Chesapeake bay and the estuary of the Delaware river, between 38° 27′ and 39° 50′ N. lat. and between 75° 2′ and 75° 4j′ W. long. The state has a length of about 100 mi. and an average width of a little more than 20 mi.; its total area being 2,057 sq mi., of which 79 sq mi. are inland water surface. Excepting Rhode Island, it is the smallest state in the union. Delaware is bounded north and northwest by Pennsylvania, east by the Delaware river and Delaware bay, which separate it from New Jersey, and by the Atlantic ocean; south and west by Maryland.

Physical Features. — Delaware lies on the Atlantic coastal plain and is for the most part level and low, its average elevation above the sea being about 60 feet. Topographically, the state is two unequal areas, divided by a line following the general course of White Clay and Christina creeks. Northward of this line the country is rolling, with bold hills, moderately deep valleys and rapid streams. Southward, the country is level or gently undulating West of Wilmington there rises a ridge which crosses the state in a northwesterly direction and forms a watershed between Christina and Brandywine creeks, its highest elevation above sea level being 440 ft. at Centerville. South of the Christina there begins another elevation, sandy and marshy, which extends almost the entire length of the state from northwest to southeast and forms a second water parting. The streams that drain the state are small and insignificant. Those of the north flow into Brandywine and Christina rivers, whose estuary into Delaware river forms Wilmington harbour; those of the southwest have a common outlet in the Nanticoke river of Maryland; those of the east empty into Delaware bay and the Atlantic ocean. The principal harbours are those of Wilmington, New Castle and Lewes. The shore of the bay is marshy, that of the Atlantic is sandy. In Kent county there are more than 60,000 ac. of tidal marshland, some of which has been reclaimed by means of dikes; Cypress swamp, in the extreme south, has an area of 50,000 acres. Hornblende, felspar, granite of the Brandywine region and kaolin are found in the north. The prevailing soils of the region are clays, sometimes mixed with loam. Next, to the southward, come the Cretaceous formations and clays suitable for terra-cotta manufacture. The soils of this region are mainly loams. The remainder of the state has a sandy soil resting on Tertiary white and blue clays.

Minerals of economic value are found only in the north part of the state. Kaolin, mined chiefly in the vicinity of Hockessin,

New Castle county; granite, used for road-making and rough construction work, found near Wilmington; and brick and tile clays are the products of greatest importance.

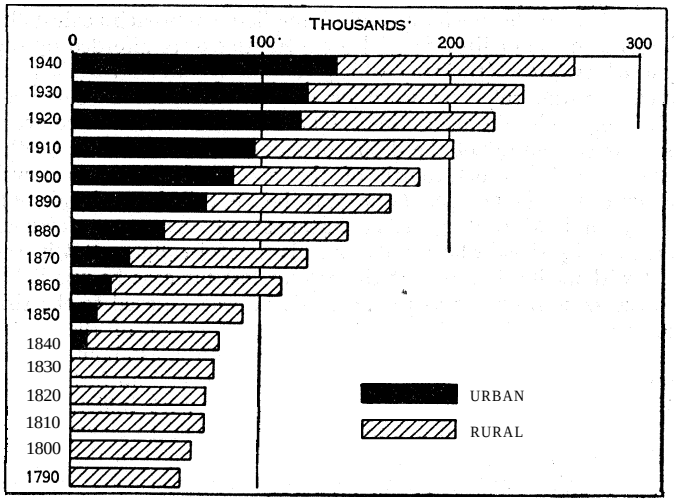
The proximity of the Delaware and Chesapeake bays helps to give Delaware a mild climate. The mean annual temperature is approximately 53° F, ranging from 52" in the S. to 56° in the N., and the extremes of heat and cold reported by the U.S. weather bureau are 107° in the summer and −12° in the winter. The annual rainfall, greater on the coast than inland, ranges from 40 to 45 inches.

Government. — The Constitution by which Delaware is governed was adopted in 1897. Like the Constitutions of 1776, 1792 and 1831, it was promulgated by a Constitutional Convention without submission to the people for ratification, and amendments may be adopted by a two-thirds vote of each house in two consecutive legislatures. Its character is distinctly democratic. The property qualification of State senators and the restriction of suffrage to those who had paid county or poll taxes are abolished; but suffrage is limited to adults who can read the State Constitution in English and, unless physically disqualified, can write their names, and who have registered. In 1907 an amendment to the Constitution was adopted which struck out from the instrument the clause requiring the payment of a registration fee of $1 by each elector. Important innovations in the Constitution of 1897 were the office of lieutenant-governor and the veto power of the governor, which extends to parts and clauses of appropriation bills; a bill may be passed over his veto by a three-fifths vote of each house of the legislature, and a bill becomes a law if not returned to the legislature within ten days after its reception by the governor, unless the session of the legislature shall have expired in the meantime. The governor's regular term in office is four years, and he is ineligible for a third term. All his appointments to offices where the salary is more than $500 must be confirmed by the senate; all pardons must be approved by a board of pardons.

Representation in the legislature is according to districts, there being ten districts in each county for the election of members in the lower house for two years; and five senatorial districts in each county for the election of members in the upper house for four years; in addition, the city of Wilmington, which is in New Castle county, has five representative districts and two senatorial districts. In Nov. 1906, the people of the State voted (17,248 for; 2,162 against) in favour of the provision of a system of advisory initiative and advisory referendum; and in March, 1907, the general assembly passed an act providing initiative and referendum in the municipal affairs in the city of Wilmington. The organization of the judiciary is similar to that under the old English system. Six judges (a chancellor, a chief justice and four associate justices) of whom there shall be at least one resident in each of the three counties, and not more than three shall belong to the same political party, are appointed by the governor, with the consent of the senate, for a term of 12 years. Certain of the judges hold courts of chancery, general sessions, oyer and terminer, and orphans' courts; the six together constitute the supreme court, but the judge from whose decision appeal is made may not hear the appealed case unless the appeal is made at his own instance.

Corporations cannot be created by a special act of the legislature, and no corporation may issue stock except for an equivalent value of money, labour or property. In order to attract capital to the State, the legislature in 1899 passed a general corporation act which reduced the taxes on corporations, forbade the repeal of charters and gave permission for the organization of corporations with both the power and the name of trust companies. A liberal policy is still pursued in respect to mergers and consolidations of corporations organized under the laws of the State, but all corporations using the word "trust" in their titles are under the supervision of the insurance commissioner and are compelled by law to make at least two reports each year to the commissioner.

Legislative divorces are forbidden by the Constitution, and a statute of 1901 subjects wife-beaters to corporal punishment. Although punishment by whipping and by standing in the pillory was prohibited by an act of Congress in 1839, in so far as the Federal Government had jurisdiction, both these forms of punishment were retained in Delaware, and standing in the pillory was prescribed by statute as a punishment for a number of offences, including highway robbery, various kinds of larceny and forgery, and even pretending "to exercise the art of witchcraft, fortune-telling or dealing with spirits." In 1905, by a law approved on March 20, the pillory was abolished. The whipping post is still



BY COURTESY OF THE U.S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF DELAWARE: 1790 TO 1940

maintained in Delaware, and whipping continues to be prescribed as a punishment for a variety of offences, although in 1889 a law was passed which prescribed that "hereafter no female convicted of any crime in this State shall be whipped or made to stand in the pillory," and a law passed in 1883 prescribed that "in case of conviction of larceny, when the prisoner is of tender years, or is charged for the first time (being shown to have before had a good character), the court may in its discretion omit from the sentence the infliction of lashes." An old law still on the statute books prescribes that "the punishment of whipping shall be inflicted publicly by strokes on the bare back, well laid on." In 1929 the death penalty for first-degree arson was abolished.

The unit of local government is practically the county, the old "hundred," which formerly corresponded to the township of Pennsylvania, having become almost obsolete.

The marriages of whites with Negroes and of insane persons are null; but the children of the married insane are legitimate.

There was settled by decision of the United States supreme court in 1934 the boundary dispute between Delaware and New Jersey which had almost led to another "oyster war." The court upheld Delaware's claim to territory as far as the low-water mark on the New Jersey shore within a twelve-mile radius of Mew Castle. Farther down the Delaware river, however, it decreed that the boundary should follow the centre of the ship channel and not, as Delaware had contended, the geographic middle of the river. New Jersey thus succeeded in establishing its right to certain oyster beds.

Population. — The population of Delaware in 1790 was 59,096; in 1820 it was 72,749; in 1850, 91,532; in 1880, 146,608; in 1910, 202,322; and in 1940, 266,505. This last figure represents an increase of 11.8% over the population in 1930. The population per square mile was 134.7, as compared with 44.2 for the United States as a whole. Of the 1940 population, 139,432, or 52.3%, lived in urban places, that is, in cities and towns of 2,500 or more. The number of occupied dwelling units returned in the housing census of 1940 was 70,572, which is approximately the same as the number of families. The average population per family (occupied dwelling unit) declined from 4.0 in 1930 to 3.8 in 1940.

The white population of Delaware formed 86.6% of the total

in 1940, as compared with 86.3% in 1930, practically all the nonwhite population being Negro. The number of males per 100 females in the entire population of the state was 104.0, the sex ratio being 103.6 for the white and 106.7 for the nonwhite population.

The population of the state and of its principal cities is summarized for recent censuses in the following table:

Area	Population			Percent of increase	
	1940	1930	1920	1930–40	1920–30
The State	**266,505**	**238,380**	223,003	11.8	**6.9**
Urban	139,432	**123,146**	120,767	13.2	2.0
Rural	127,073	115,234	**102,236**	10.3	12.7
Percent urban	52.3	51.7	54.2		
Principal cities:					
Wilmington	112,504	106,597	**110,168**	5.5	−3.2
Dover	5,517	**4,800**	**4,042**	14.9	18.8

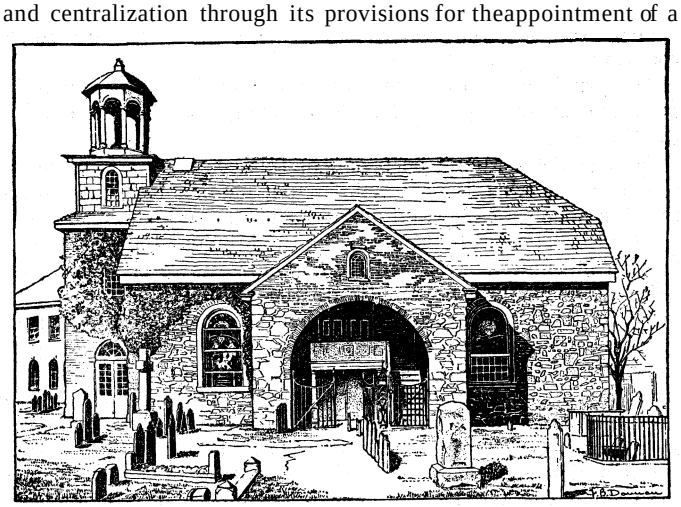
Finance and Taxation. — The state income from all sources, during the fiscal year ending June 30, 1940, amounted to $17,148,023. Important sources of revenue were general property, licences, permits, motor vehicle licences, income tax, motor vehicle fuel taxes, filing fees and subventions and grants from the federal government.

The total amount of state expenditures for the fiscal year ending June 30, 1940, was $18,433,019. Of this amount $4,355,372 was expended upon the state highways and $6,420,683 was appropriated for education. For charities, hospitals and corrections $2,052,622 was expended and for health and sanitation, $393,668. For the protection of persons and property $1,246,132 was expended.

A state banking department was created (1919), with a banking commissioner and a deputy, whose duty it is to examine every bank at least once a year. In 1921 a budget plan, which became effective in 1923, was adopted for the state.

Education. — The educational system of the state has been considerably improved within recent years. The maintenance of a public-school system is rendered compulsory by the state constitution, and a new compulsory school law came into effect in 1907. The first public-school law, passed in 1829, was based largely on the principle of "local option," each school district being left free to determine the character of its own school or even to decide, if it wished, against having any school at all.

The system thus established proved unsatisfactory, and a new school law in 1875 brought about a greater degree of uniformity and centralization through its provisions for theappointment of a



OLD SWEDISH CHURCH AT WILMINGTON, DELAWARE. BUILT IN 1698 BY SWEDISH COLONISTS AND STILL USED AS A PLACE OF WORSHIP

state superintendent of free schools and a state board of education.

In 1888, however, the state superintendency was abolished and county superintendencies were created instead, the legislature thus returning, in a measure, to the system of local control. Centralization was again secured, in 1898, by the passage of a law increasing the powers of the state board of education.

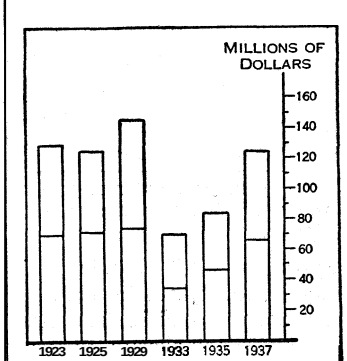
After 1910 a distinct advance was made in the field of education. Better facilities for the training of teachers were developed, and new school buildings erected in many parts of the state. In 1940 the enrolment in public elementary and secondary schools was 44,372, the number of boys being 22,604 and the number of girls 21,768. The average number of days the schools were open was 183. Teachers employed totalled 1,717, and the number of school buildings in use was 203. The enrolment in elementary and secondary schools was: whites 37,400, Negroes, 6,972. White pupils enrolled numbered 26,111, Negro pupils numbered 18,261. Separate schools are maintained for Negro pupils throughout the whole educational system. The total expenditure for education in 1940 was $6,420,683, including $1,498,805 for higher education for whites and Negroes. It had increased $3,217,683 over that expended in 1924. The schools are supported in part from the state school fund and in part from local taxation.

Prior to 1913 the state's participation in higher education was confined to Delaware college, at Newark, founded in 1833 as Newark college, but rechartered, after suspension from 1859 to 1870, as a state institution. The college receives financial support from the United States land grant of 1862 and the supplementary appropriation of 1890.

In 1913 the Women's college was founded and affiliated with Delaware college, with the same faculty, but entirely separate in buildings, classes and student organizations. In 1921 the two colleges were incorporated as the University of Delaware. The relations between the colleges have grown steadily closer since then. The faculty in 1940–41 numbered 159. The total value of university property in 1940 was $4,932,007; the income for the fiscal year 1939–40 was $856,548. The total undergraduate attendance in 1940-41 was 599 men and 304 women. The agricultural experiment station, also affiliated with the university, was established in 1888 under the Hatch act of 1887. Under the Purnell act, increased federal appropriations to the agricultural experiment station made possible greater expansion of education in improved agricultural methods.

An outstanding phase of educational development was the erection of school buildings in various parts of the state, made possible by gifts approximating $4,000,000 by Mr. Pierre S. du Pont to an organization of citizens known as the Service Citizens of Delaware. The legislature appropriated some $3,000,000 for public-school construction in 1931 so as to furnish work for the state's unemployed.

Charities and Correction. — The charitable and penal administration of Delaware was very poor until Sept. 1919, when the state board of charities began to function. Before the creation of this board the tax-supported institutions of penal and corrective character had never been subject to supervision by any central state agency, except as the general assembly or some temporary commission may have inspected them occasionally. The institutions supported in whole or in part by the state in 1924 were: the Delaware State Hospital for the Insane, at Farmhurst; the Home for the Feeble Minded, at Stockley; the Blind Shop, at Wilmington; the Ferris Industrial School of Delaware, at Marshallton; Delaware Industrial School for Girls, at Claymont; Wilmington House of Detention, at Wilmington; Industrial School for Coloured Girls of Delaware, at Marshallton; Palmer House, at Dover; Layton Home for Aged Coloured People, at U'ilmington; Soldiers' Rest Room, at Delaware City; and the St. Michael's Day Nursery and Hospital for Babies, at Wilmington. Each of the three counties of Delaware maintains an almshouse and a jail, and the three jointly maintain, with aid from the United States district court, the New Castle county



GRAPH SHOWING VALUE OF PRODUCTS IN DELAWARE FOR SELECTED YEARS, AND (LOWER PART OF COLUMN) THE COST OF MATERIALS USED

workhouse. In 1923 the state health and welfare commission was created and vested with the duties of the then existing child's welfare commission, the tuberculosis commission and the state board of health.

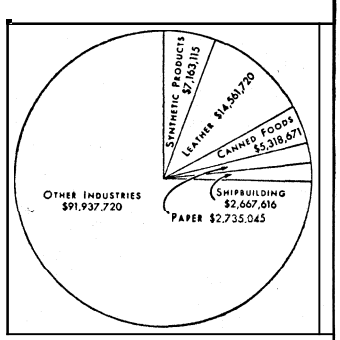
The state has regular appropriations for charitable, correctional and medical-charitable purposes.

Industry, Trade and Transportation. — Delaware's population was chiefly rural and agricultural until 1920, when the urban population exceeded the rural for the first time. This change in population ratio was in a great measure due to rapid industrial development during the World War of 1914–18. After the passage of the Agricultural Extension act (1911), co-operative associations developed, and especially after 1918 the farm bureau movement made swift progress. In 1940 the number of farms was 8,994, as compared with 9,707 in 1930, a decrease of 713. All land in farms in 1930 amounted to 900.815 ac.; in 1940, 895,507 ac., being 70·7% of the total land area of the state. The value of all farm property in 1940 was $54,898,828, a decrease of $12,042,919 from the figures for 1930.

The cash income from all crops in 1940 was $8,083,000. The total production of wheat was 1,406,000 bu.; of hay, 101,000 tons; of Irish potatoes, 443,000 bu.; of sweet potatoes and yams, 725,000 bu.; of soybeans for beans, 364,000 bu. Delaware is a great producer of tomatoes and fruits, especially apples and strawberries whose 1940 productions were 1,909,000 bu. and 400,000 crates, respectively. The farm population in 1940 by federal census was 45,724.

The development of manufacturing in Delaware has not been so extensive as the situation of the state, its facilities for water and railway transportation and the proximity of the coal and iron fields of Pennsylvania would seem to warrant; the intense industrial activity during the war of 1914–18, however, influenced Delaware greatly, especially Wilmington and its environs. New Castle county, in which Wilmington is situated, in 1920 reported 88.7% of the total wage earners and 92.2% of the total value of products.

The peak year for manufacturing in Delaware was 1919, when 32,972 wage earners were engaged, and gross production amounted to $165,073,009 In 1937 Delaware had 21,052 wage earners engaged in manufacturing (under the factory system); the total paid in wages was $22,991,808; the gross value of products was $124,383 887. Important industries were: synthetic products, leather, cars and general shop construction and repairs by steam railway companies, shipbuilding, iron and steel, canning and preserving of fruits and vegetables, paper and wood pulp, bread and bakery products, slaughtering and meat packing, and foundry and machine shop products.



LEADING INDUSTRIES OF DELAWARE AND THE VALUE OF THEIR PRODUCTION, 1937

The U.S. bureau of mines estimated the total mineral products in 1924 to be worth $512,105, but by 1933 their value had dwindled to $135,000; in 1938 it was $320,621. Of these, sand and gravel, kaolin and clay products were most important. The forests, which once afforded excellent timber, including white oak for shipbuilding, have been greatly reduced by constant cutting; in 1919 it was estimated that 222,659 ac. were in woodland, of which 46,187 ac. were merchantable timber. The lumber production in that year was 27,000,000 bd.ft., but in 1924 the production had decreased to 14,000,000 bd.ft., in 1929 to 10,000,000 bd.ft., and in 1937 to only 6,000,000 bd.ft. The fisheries are chiefly oyster, crab, clam, menhaden and alewife. In 1937 the catch totalled 50,941,000 lbs. valued at $319,400. Delaware has good facilities for transport. Its railway mileage in 1937 was 300; the Pennsylvania, the Baltimore and Ohio and the Reading systems cross the northern part of the state, while the Pennsylvania system runs the length of the state below Wilmington.

In 1936 Delaware had 1,702 mi. of improved roads in the state highway system, and during 1938 $4,140,000 was expended on rural highways. In 1938 the registration of motor vehicles was 64,078.

The Delaware and Chesapeake canal (about 13½ mi. long), which crosses the northern part of the Delaware-Maryland peninsula from the Delaware river to Chesapeake bay, has in recent years been widened and deepened by the war department, thus affording a shorter passageway for larger ships from Philadelphia to Baltimore and improving an important link of the proposed inland waterway for commerce. Wilmington is the centre of a customs district in which New Castle and Lewcs are included, and although much of the trade is coastwise, it is expected that the recently constructed marine terminal at Wilmington, near the mouth of the Christina river, will afford adequate facilities to attract increasing ocean-going trade. Imports at Wilmington amounted to 632,974 cargo tons in 1937; exports in the same year totalled 1,643 cargo tons.

History. — Before the coming of the white men, the present state of Delaware was inhabited by tribes of aborigines of the Leni-Lenape stock, later called Delaware Indians. Of an ancient and proud lineage, they were known as the "original people" and bore the familiar name of "grandfathers of the red men." The Nanticokes, occupying the lower part of Delaware and the eastern shore of Maryland, were a fishing and trapping people, less warlike than the tribes of the interior. Henry Hudson in 1609 first explored Delaware bay for the Dutch.

In the next year Lord De la Warr (from whom the name Delaware was derived) according to tradition is said to have entered the bay in the interest of England.

The territory was more thoroughly explored in 1615–16 by Cornelis Hendricksen. whose repcrts did much to cause the incorporation of the Dutch West India company (*q.v.*) in 1621. About the time the Puritans were establishing themselves in New England, the first settlement on Delaware soil was made by members of the Dutch company in 1631 near the site of the present Lewes. The leaders, one of whom was Capt. David P. de Vries, wished "to plant a colony for the cultivation of grain and tobacco as well as to carry on the whale fishery in that region." The settlement, however, was soon completely destroyed by the Indians (see LEWES).

A more successful effort was made under a charter or manifesto from Gustavus Adolphus by the South company of Sweden, a corporation organized in 1624 as the "Australian Company," by William Usselinx, the chief organizer of the Dutch West India company.

The privileges of the company were extended to Germans in 1633, and about 1640 the Dutch members were bought out by the Swedes.

In 1638 Peter Minuit on behalf of this company established a settlement at what is now Wilmington, naming it "Fort Christina," in honour of the child queen Christina, and naming the entire territory, bought by Minuit from the Minquas Indians and extending indefinitely westward from the Delaware river between Bombay hook and the mouth of the Schuylkill river, "New Sweden." This territory was subsequently considerably enlarged. In 1642 mature plans for colonization were adopted. A new company, officially known as the West India, American or New Sweden company, but also popularly known as the South company, was chartered, and a governor, Johan Printz (*c.* 1600–63) was sent out by the crown. He arrived early in 1643 and subsequently established settlements, including one on the island of Tinicum, near the present Chester, Pa.; another at the mouth of Salem creek, N.J.; and another near the mouth of the Schuylkill river. Printz remained governor of New Sweden for a period of ten years, his mansion, fort and church were on Tinicum island. Friction soon arose with New Netherland, although the Swedes and the Dutch, owing to their common dislike of the English, and the common interests of Sweden and Holland in the Thirty Years' War, had maintained a formal friendship. In 1651, Peter Stuyvesant, governor of New Netherland, and more aggressive than his predecessors, built Ft. Casimir, near what is now New Castle, In 1654

Printz's successor, Johan Claudius Rising, who had arrived from Sweden with a large number of colonists, expelled the Dutch from Ft. Casimir. In retaliation, Stuyvesant, in 1655, with seven vessels and as many hundred men, recaptured the fort and also captured Ft. Christina (Wilmington). New Sweden thus passed into Dutch control and became a dependency of New Netherland. In 1656, however, the Dutch West India company sold part of what had been New Sweden to the city of Amsterdam, which in the following year established a settlement called "New Amstel" at Ft. Casimir (New Castle). This settlement, badly administered, made little progress.

In 1663 the whole of the Delaware country came under the jurisdiction of the city of Amsterdam, but in the following year, with New Netherland, was seized by the English. For a brief interval, in 1673–74, the Dutch were again in control, but in the latter year, by the Treaty of Westminster, the "three counties on the Delaware" again became part of the English possessions in America held by the duke of York, later James II. His formal grant from Charles II was not received until March 1683. In order that no other settlements should encroach upon his centre of government, New Castle, the northern boundary was determined by drawing an arc of a circle 12 mi. in radius with New Castle as the centre. This accounts for the curved boundary line between Delaware and Pennsylvania. However, in Aug. 1682, the duke of York conveyed by a deed of feoffment to William Penn the entire territory, leasing it for 10,000 years, a transfer later challenged by Maryland. But differences in race and religion, economic rivalry between New Castle and Pennsylvania towns, and petty political quarrels over representation and office-holding, similar to those in the other American colonies, were so intense that Penn in 1691 appointed a special deputy governor for the "lower counties." Although reunited with the "province" of Pennsylvania in 1693, the so-called "territories" or "lower counties" secured a separate legislature in 1704 and a separate executive council in 1710; the governor of Pennsylvania, however, was the chief executive until 1776. A protracted boundary dispute with Maryland, which colony at first claimed the whole of Delaware under Lord Baltimore's charter, was not settled until 1767, when the present line separating Delaware and Maryland was adopted. In the American Revolution Delaware furnished only two regiments to the American Continental army, but they were among the best in the service. One of the companies of the first regiment carried a number of game-cocks said to have been the brood of a blue hen; hence the soldiers, and later the people of the State, have been popularly known as the "Blue Hen's Chickens," though the State itself, as already mentioned, is popularly called the "Diamond State."

Although Washington's whole army entered the State of Delaware and was encamped near Newport with a view to blocking Gen. Howe's march to Philadelphia after the landing of the latter's army at the head of the Elk in August, 1777, only a brisk skirmish at Cooch's Bridge (contemporaries called it Cooch's Mill) was fought on Sept. 3 between the American light infantry under Gen. Maxwell and some British detachments. Having encamped near Newark, Del., for five days, Howe marched through that town toward Kennett Square, Pa., in an effort to flank Washington's army, causing the American commander to march his men behind the Brandywine river in order to confront Howe at Chadd's Ford. (See BRANDYWINE.)

In 1776 a State Government was organized, and the term "Delaware State" was first adopted. In the constitution of 1792 the title was changed to "State of Delaware." One of the peculiarities of the Government under the first Constitution was that, in addition to the regular executive, legislative and judicial departments, there was a privy council without whose approval the governor's power was little more than nominal. In 1786 Delaware was one of the five States whose delegates attended the Annapolis Convention (see ANNAPOLIS; MARYLAND), and it was the first (Dec. 7, 1787) to ratify the Federal Constitution. The State was strongly Federalist for 30 years after the adoption of the Federal Constitution, and in several presidential elections stood almost alone in choosing Federalist electors. This strong Federalist influence caused the State to oppose the War of 1812, but after war was declared it loyally supported the Union. The slavery sentiment of the State was never strong, as was shown by the assembly's passing a resolution favouring the restrictions placed on further slave expansion by the Missouri Compromise and in 1845 passing a resolution against the annexation of Texas. In 1860 the State cast its electoral votes for John C. Breckinridge, as it was thought he represented the most neutral stand on the question of slavery. A further effort was made to prevent the rupture on the slave question when the general assembly, in 1861, went on record as favouring the Crittenden Compromise (see CRITTENDEN, JOHN JORDAN). In 1850 the Democrats, who had before then elected a few governors and United States Senators, secured control of the entire administration — a control unarrested, except in 1863, until the last decade of the 19th century. Although it was a slave State, the majority of the people of Delaware opposed secession in 1861, and the legislature promptly answered President Lincoln's call to arms.

In 1865, 1867 and 1869, respectively, the legislature refused to ratify the 13th, 14th and 15th amendments to the Federal Constitution. The provision of the State Constitution that restricted suffrage to those who had paid county or poll taxes and made the tax lists the basis for the lists of qualified voters, opened the way for the disfranchisement of many Negroes by fraudulent means. Consequently the levy court of New Castle county was indicted in the United States circuit court in 1872, and one of its members was convicted. Again in 1880 the circuit court, by virtue of the federal statute of 1872 on elections, appointed supervisors of elections in Delaware. The Negro vote increased in importance until 1900, when it was approximately one-fifth of the total vote of the state; since then it has declined, because of decrease in the percentage of Negro population. In 1901 the legislature ratified the three federal amendments concerning the status of the Negro rejected in former years. Another political problem has been that of representation. According to the Constitution of 1831 the unit of representation in the legislature was the county; inasmuch as the population of New Castle county has exceeded since 1870 that of both Kent and Sussex, the inequality became a cause of discontent. This was partly eradicated by the new Constitution of 1897, which reapportioned representation according to electoral districts, so that New Castle has 7 senators and 15 representatives, while each of the other counties has 5 senators and 10 representatives.

In 1889 the Republicans for the first time since the Civil War secured a majority in the legislature; Anthony J. Higgins (Republican) was elected to the United States Senate. Internal dissensions in the Republican Party, arising out of a struggle between the so-called Regular Republicans and a personal "machine" built up by J. Edward Addicks, a Wilmington capitalist, prevented the legislature from electing a Senator in 1895. The next election brought the Democrats into power, and the vacancy was filled by Richard R. Kenney. The struggle between the Republican factions continued, and with the expiration of Senator Gray's term in 1899 an election was again prevented. The State was wholly without representation in the United States Senate from the expiration of Senator Kenney's term in 1901 until 1903, when a compromise was effected whereby two Republicans, one of each faction, were chosen. Again in 1905 the legislature adjourned without being able to fill a vacancy in the Senate. The deadlock, however, was broken at a special session of the legislature called in 1906 when in June of that year Henry A. du Pont was elected Senator.

Since 1901 the Republicans have maintained their control of the State executive offices. Much of the time, however, the Democrats controlled the House of Representatives; and after the biennial elections of 1922 and 1924 they controlled the Senate also. In 1922 the Democrats elected Thomas F. Bayard to the United States Senate, the fifth successive member of that family to serve the State with credit in that body. In 1924 Gen. T. Coleman du Pont, also of a distinguished family long prominent in the State, was elected to the Senate by the Republicans to succeed Dr. L. Heisler Ball. In 1928 Coleman du Pont resigned because of ill health, being followed by Daniel O Hastings, who

continued United States senator until 1937, his successor being J. H. Hughes, a Democrat. In the presidential election of 1912 the Democrats carried the state; in 1916, 1920, 1924, 1928 and 1932 the Republicans won by a considerable margin, but in 1936 and 1940 the Democrats succeeded in overpowering them. Since 1910 the state's history has been mainly characterized by progressive legislation. In this period there were two progressive governors, Charles R. Miller and John G. Townsend. In the administration of the latter a number of important statutes were enacted, including a child labour law (1917), a workmen's compensation act (1917), laws for the regulation of labour for women, an income tax law (1917), a direct inheritance law (1917) and a thorough revision of the school laws, known as the New School code (1919). The state also passed in 1923 statutes providing for the sterilization of the feeble-minded, epileptic and insane and of those who had thrice been convicted of felonies resulting from mental abnormality. In 1938 was celebrated the 300th anniversary of the landing of the Swedes and Finns on the site of Wilmington and the founding of the first permanent settlement (Ft. Christina) in the state of Delaware.

Messersmith, *The Government of Delaware* (1908); *Revised Code of 1935; Delaware School Code* (1920); *Sixteenth Census of the United States; Annual Reports* of the state treasurer, the state auditor, the department of public instruction, the state highway department and the board of health. In vol. iv. of J. Winsor's *Narrative and Critical History of America* (Boston, 1884) there is an excellent chapter by Gregory B. Keen on "New Sweden, or the Swedes on the Delaware," to which a bibliographical chapter is appended. The *Papers* of the Historical Society of Delaware (1879 *seqq.)* contain valuable material. *Letters to and from Caesar Rodney, 1756–1784,* edited by George H. Ryden (1933), contains important material on Delaware's part in the American Revolution. For articles on political conditions since the Civil War *see* vol. cxli of the *North American Review,* vol. xxxii. of the *Forum,* and vol. lxxiii. of the *Outlook—all* published in New York. In part ii. of the *Report of the Superintendent of the U.S. Coast and Geodetic Survey* for 1893 (Washington, 1905) there is "A Historical Account of the Boundary Line between the States of Pennsylvania and Delaware," by W. C. Hodgkins. *See* also *Delaware, A Guide to the First State* by the Federal Writers' Project of WPA (1938). Some colonial records are preserved with those of New York and Pennsylvania. Others, together with state records, are in the Delaware Public Archives in Dover, Del. (G. H. R.)

DELAWARE, a city of central Ohio, U.S.A., 24 mi. N. of Columbus, on the Olentangy river; the county seat of Delaware county.

The city is on federal highways 23 and 42, and is served by the Big Four, Chesapeake and Ohio and the Pennsylvania railways. The population was 8.675 in 1930; in 1940 it was 8,944. The city is built on rolling ground, 900 ft. above sea level. It is the seat of the Ohio Wesleyan university, founded in 1841 by the Ohio Conference of the Methodist Episcopal church. Delaware was laid out in 1808 and incorporated in 1815. It was the birthplace of President Hayes.

DELAWARE AND HUDSON COMPANY, THE, a holding company, formerly the oldest operating railway company in America, and a large anthracite carrier, founded by William and Maurice Wurts, Philadelphia merchants, who discovered and acquired anthracite lands in the Lackawanna valley, Pennsylvania, for replacing English coal cut off by the War of 1812. It was chartered in New York, on April 23, 1823, as "The President, Managers and Company of the Delaware and Hudson Canal Company," which built a canal, Rondout, New York, to Honesdale, Pennsylvania, in 1828, aided by a loan of credit of the State of New York in the amount of $800,000, and a railroad, Honesdale to the coal beds at Carbondale, Pennsylvania, on which the "Stourbridge Lion," the first locomotive to run on an American railroad, made its famous trial trip on August 8, 1829. The name was changed by act of the New York legislature, passed on April 28, 1899 The canal was abandoned and its cost charged off in 1898. Coal ownership was greatly enhanced by acquisition and lease, after the Civil War, of additional coal properties, at a later time transferred to a wholly-owned subsidiary.

By obtaining control of numerous railroads and some construction, the company built up a railway system extending from Plymouth, Pennsylvania, by way of Albany and Schenectady to Rouses Point, New York, at the Canadian border, with branches to Binghamton, Troy, Lake George, Lake Placid, New York, and Rutland, Vermont, and other points, a total of 857.85 miles, consisting of 324.53 owned, 440.51 leased and controlled, and 92.81 trackage rights. On April 1, 1930, the railroad operations were transferred to "The Delaware and Hudson Railroad Corporation," a wholly-owned subsidiary, chartered December 1, 1928, in New York.

The company also owns a railroad in Canada, operating 27.11 miles.

(J. H. Nu.)

DELAWARE INDIANS, tribes that occupied the drainage of the river Delaware and the shores of Delaware bay, eastern United States. They called themselves Lenape or Leni-Lenape, and were an association or confederacy of three Algonkin tribes, the Munsee, Unami and Unalachtigo. Their speech seems to have been more similar to the Algonkin dialects of Ohio valley than to the adjacent ones of the Atlantic coast, and their own tradition, in the Walam Olum, brings them out of the west. They were friendly to the whites; but, conquered in 1720 by the Iroquois and their lands more and more encroached on by the English settlers, they began to move westward, successively to central and western Pennsylvania, Ohio, Indiana, Missouri, Texas, Kansas and Oklahoma, with branches in Wisconsin and Ontario. They mixed with other Indian remnants in these migrations and the survivors contain much tribally alien blood. Though not particularly powerful or aggressive at the time of discovery, the Delaware were accorded an honorific pre-eminence by the other eastern Algonkins and were called "Grandfathers." *See* D. G. Brinton, *The Lenâpé and their Legends* (1885).

DELAWARE, LACKAWANNA AND WESTERN RAILROAD COMPANY, THE, operates 2,615 m. of track through New Jersey, Pennsylvania and New York. The main line extends from New York (Hoboken, N.J.) to Buffalo, N.Y.; branches from Scranton to Bloomsburg and Northumberland, Pa.; Binghamton to Syracuse, Oswego and Utica and Owego to Ithaca, New York. This system had its genesis in the incorporation of the Ligett's Gap railroad and in the construction of its railroad from Providence (now Scranton), Pa., to the Susquehanna river at Great Bend, Pa., to provide an outlet for the anthracite coal and the iron of the Lackawannb valley.

During its early history the road was mainly an anthracite coal carrier, but the inauguration of a comprehensive scheme of improvements subsequent to 1899 enabled the company to handle a larger volume and greater diversity of freight and passenger traffic. In 1899 anthracite coal comprised 53% of all freight traffic; in 1939 it represented but 31%. Revenue in 1899 from transportation of passengers was $3,951,051; in 1939 $6,649,041. The gross transportation revenue in 1939 was $50,454,438; the capital stock, $87,407,500. Over 60.000 passengers are transported daily over the Lackawanna's New Jersey suburban lines in and out of New York City. Electrification between Hoboken and Dover, N.J. was completed in 1931. Through service is operated to Cleveland and Chicago via the Nickel Plate road, and to Detroit and Chicago via the Michigan Central railroad.

(J. M. D.)

DELAWARE RIVER, a stream of the Atlantic slope of the United States, meeting tide-water at Trenton (N.J.), 130m. above its mouth. Its total length, from the head of the longest branch to the capes, is 410m., and above the head of the bay its length is 360m. It constitutes in part the boundary between Pennsylvania and New York, the boundary between New Jersey and Pennsylvania, and, for a few miles, the boundary between Delaware and New Jersey. The main or west branch rises in Schoharie county (N.Y.), about 1,886ft. above the sea, and flows tortuously through the plateau in a deep trough until it emerges from the Catskills. Other branches rise in Greene and Delaware counties, New York In the upper portion of its course the varied scenery of its hilly and wooded banks is exquisitely beautiful. After leaving the mountains and plateau, the river flows down broad Appalachian valleys, skirts the Kittatinny range, which it crosses at Delaware water-gap, between nearly vertical walls of sandstone, and passes through a quiet and charming country of farm and forest, diversified with plateaus and escarpments, until it crosses the Appalachian plain and enters the hills again at Easton (Pa.). From this point it is flanked at intervals by fine hills, and in places by cliffs, of which the finest are the Hockamixon rocks, three miles long and more than 200ft. high At Trenton there is a fall of eight feet.

Below Trenton the river becomes a broad, sluggish inlet of the sea, with many marshes along its side, widening steadily into its great estuary, Delaware bay. Its main tributaries in New York are Mongaup and Neversink rivers and Callicoon creek; from Pennsylvania, Lackawaxen, Lehigh and Schuylkill rivers; and from New Jersey, Rancocas creek and Musconetcong and Maurice rivers. Commerce was once important on the upper river, but only before the beginning of railway competition (1857). Of the various early canals only two are of any importance now; the canal from Trenton to New Brunswick which unites the waters of the Delaware and Raritan rivers and the Delaware and Chesapeake canal which joins the waters of the Delaware with those of Chesapeake bay. The magnitude of the commerce of Philadelphia has made the improvements of the river below that port of great importance. At a cost of many millions of dollars to the U.S. Government a 32ft. channel 600ft. wide has been opened from the deep water in Delaware bay to Philadelphia and a 12ft. channel from there to Trenton.

DELAWARE WATER GAP, a borough and summer resort of Monroe county (Pa.), U.S A., on the Delaware river, about 108m. N. of Philadelphia and about 88m. W. by N. of New York. Population (1930) 443; (1940) 410. It is served directly by the Delaware, Lackawanna and Western, and by the Belvidere division of the Pennsylvania railways. The borough is connected with the county seat, Stroudsburg, three miles distant, by a three-lane highway. The borough was named from the neighbouring gorge. On the New Jersey side of the river is Mt. Tammany (about 1,600 ft.), a cliff of which has been weather-carved into the profile of an Indian, once so common to this section. On the Pennsylvania side Mt. Minsi rises approximately 1,500 ft. The river elevation is about 300 ft. The gap, some two miles long, is the result of erosion by a river which once flowed northwards acting along a line of faulting at right angles to the strike of the tilted rock formations. The river's present course is thought to be young geologically, and the gap exposes Ordovician, Silurian and Devonian strata. One of the fine remnants of the Wisconsin terminal moraine is to be found in near-by Cherry valley along Cherry creek, extending to a height of 300 ft. at some points. The Water Gap is a popular summer resort. The borough was incorporated in 1889.

See L. W. Brodhead, ***The Delaware*** Water-Gap (Philadelphia, 2nd ed., 1870).

DE LA WARR or **DELAWARE,** an English barony, the holders of which are descended from Roger de la Warr of Isfield, Sussex, who was summoned to parliament as a baron in 1299 and the following years. He died about 1320; his great-grandson Roger, to whom the French king, John, surrendered at the battle of Poitiers, died in 1370; and the male line of the family became extinct on the death of Thomas, 5th baron, in 1426.

The 5th baron's half-sister, Joan, married Thomas West, 1st Lord West (d. 1405), and in 1415 her second son, Reginald (1394–1451) succeeded his brother Thomas as 3rd Lord West. After the death of his uncle Thomas, 5th Baron De La Warr, whose estates he inherited, Reginald was summoned to parliament as Baron La Warr, and he is thus the second founder of the family. His grandson was Thomas, 3rd (or 8th) baron (d. 1525), a courtier during the reigns of Henry VII. and Henry VIII.; and the latter's son was Thomas, 4th (or 9th) baron (c. 1472–1554). The younger Thomas was a very prominent person during the reigns of Henry VIII. and Edward VI. He died without children in Sept. 1554, when his baronies of De La Warr and West fell into abeyance. His monument may still be seen in the church at Broadwater, Sussex. He had settled his estates on his nephew William West (c. 1519–95), who was disabled by act of parliament (1549) from succeeding to his honours for having sought to poison his uncle. However, in 1570 he was created by patent Baron De La Warr. In 1596 his son Thomas (c. 1556–1602) claimed precedency in the baronage as the holder of the ancient barony of De La Warr, and his claim was admitted.

THOMAS WEST, 3rd or 12th Baron De La Warr (1577–1618), British soldier and colonial governor in America, was born on July 9, 1577, and succeeded to the title in 1602. He fought in Holland and in Ireland under the earl of Essex. He was imprisoned for complicity in Essex's revolt (1600–01), but was exonerated. He became a member of the council of the Virginia company and was appointed (1609) governor and captain-general of Virginia for life. Sailing in March 1610 with three ships, 150 settlers and supplies, he arrived at Jamestown on June 10, in time to intercept the colonists who had embarked for England and were abandoning the enterprise. Lord De La Warr's rule was strict but just; he constructed two forts near the mouth of the James river, rebuilt Jamestown, and in general brought order out of chaos. In March 1611 he returned to London, where he published, at the request of the company's council, his Relation of the condition of affairs in Virginia (reprinted 1859 and 1868). He remained in England until 1618, when the news of the tyrannical rule of the deputy, Samuel Argall, led him to start again for Virginia. He embarked in April, but died *en* route on June 7, 1618, and was buried at sea. The Delaware river and the State of Delaware were named in his honour. A younger brother, Francis (1586–*c.* 1634), was prominent in the affairs of Virginia, and in 1627–28 was president of the council, and acting-governor of the colony.

In 1761 the 3rd or 12th baron's descendant, John, 7th or 16th Baron De La Warr (1693–1766), was created Viscount Cantelupe and 1st Earl De La Warr. He was a prominent figure in the House of Lords, at first as a supporter of Sir Robert Walpole. He also served in the British army and fought at Dettingen, and was made governor of Guernsey in 1752.

George John West, 5th earl (1791–1869), married Elizabeth Sackville, and in 1843 he and his sons took the name of Sackville-West. The earl was twice lord chamberlain to Queen Victoria, and he is celebrated as "Fair Euryalus" in the *Childish* Recollections of his schoolfellow, Lord Byron. His son, Charles Richard (1815–73), 6th earl, served in the first Sikh war and in the Crimea, and being unmarried was succeeded by his brother Reginald (1817–96) as 7th Earl De La Warr. In 1896 the 7th earl's son, Gilbert George (1869–1915) became 8th Earl De La Warr. He was succeeded as 9th earl by his son, Herbrand Edward (b. 1900).

See G. E. C(okayne), *Complete Peerage* (1887–98).

DELBRÜCK, HANS (1848–1929), German historian, was born at Bergen on the island of Riigen on Nov. 11, 1848. and studied at the universities of Heidelberg and Bonn. He saw active service in the Franco-German War, and was afterward tutor to Prince Waldemar of Prussia (1874–79). In 1885 he became professor of modern history in the university of Berlin. Frorn 1884–90 he sat as a conservative in the German reichstag. Delbriick's writings are chiefly concerned with the history of the art of war, his most ambitious work being his Geschichte *der Kriegskunst im Rahmen* der *politischen Geschichte* (first section,

Das Altertum, 1900; second *Römer und Germanen,* 1902; third, *Das Mittelalter,* 1907; fourth vol., 1921). Among his other works are: *Die Perserkriege und die Burgunderkriege* (Berlin, 1887); *Historische und politische Aufsätze* (1886); *Erinnerungen, Aufsätze und Reden* (1902); *Die Strategie des Perikles erlautert durch die Strategie Friedrichs des Grossen* (1890); *Die Polenfrage* (1894); *Das Leben des Feldmarschalls Grafen Neithardt von Gneisenau* (1882 and 1894); *Krieg und Politik* (3 vols., 1919), *Ludendorff, Tirpitz, Falkenhayn* (1920), *Weltgesclzichte* (1923–26, 3 vols.) and *Vor und Nach dem Weltkrieg* (1926). Delbriick began in 1883 to edit the *Preussische Jahrbücher,* in which he has written many articles, including one on "General Wolseley iiber Napoleon, Wellington und Gneisenau," and he has contributed to the *Europäischer Geschichtskalender* of *H.* Schulthess. After the World War he was appointed member of the commission to publish German archives. He died July 14, 1929.

DELBRUCK, RUDOLF VON, Prussian statesman (1817–1903), was born at Berlin on April 16, 1817. On completing his legal studies he entered the government service in 1837; in 1848 he was transferred to the ministry of commerce. Both Germany and Austria had realized the influence of commercial upon political union. Delbruck in 1851 induced Hanover, Oldenburg and Schaumburg-Lippe to join the Zollverein; and the southern states, which had agreed to admit Austria to the union, found themselves forced in 1853 to renew the old union, from which Austria was excluded. Delbriick now began, with the support of Bismarck, to apply the principles of free trade to Prussian fiscal policy. In 1862 he concluded an important commercial treaty with France. In 1867 he became the first president of the chancery of the North German Confederation, and represented Bismarck on the federal tariff council (*Zollbundesrat*). In 1868 he became a Prussian minister without portfolio. In Oct. 1870, when the union of Germany under Prussian headship became a practical question, Delbriick was chosen to go on a mission to the South German states, and contributed greatly to the agreements concluded at Versailles in November. In 1871 he became president of the newly constituted *Reichskanzleramt.* Delbruck, however, began to feel himself uneasy under Bismarck's leanings towards protection and state control. On the introduction of Bismarck's plan for the acquisition of the railways by the state, Delbriick resigned office, nominally on the ground of ill-health (June 1, 1876). In 1879 he opposed in the *Reichstag* the new protectionist tariff, and then retired definitely from public life. In 1896 he received from the emperor the order of the Black Eagle. He died at Berlin on Feb. 1, 1903.

See his *Lebenserinnerungen 1817–1867* (2nd ed., 1905), with an additional section on the events of 1870.

DELCASSE, THEOPHILE (1852–1923), was born at Pamiers (Arikge) on March 1, 1852, his father being an *huissier* or bailiff. He was educated locally, took his degree of *licence ès lettres,* and served as tutor to the children of an official in the ministry of foreign affairs. The taste for politics was ingrained in young Delcassé. He contributed to the *République Française* under Gambetta, made friends, if not with the Tribune himself, at least with Camille Barrkre who acted as foreign editor of the paper, besides fulfilling the function of French representative on the Danube commission, and became secretary to Massip, a wealthy man who had been elected to the chamber in the Arikge department. Eventually, he married Massip's widow and, in 1889, succeeded him in the Chamber. Freed once for all from all material cares, he was able to devote himself to his new duties, and his personal integrity was never questioned by anyone. In the political struggles of the period, he ranked as a follower of Gambetta but, at the same time, was clever enough to keep a close connection with the very radical *Dépêche de Toulouse,* the most powerful electoral factor in the south of France, which supported him to the end on patriotic grounds. At that time, Delcasst. was considered, on the whole, as a man of the Left. In Jan 1898, he criticised the cabinet of Méline on account of its excessive tolerance towards clericalism. He climbed the ministerial ladder very rapidly: under-secretary for the colonies (Jan–Dec. 1893), and minister of the colonies from May 1894 to Jan. 1895, after the Colonial Office had been transformed for his sake into a separate and independent ministerial department.

But the real career of DelcassC began in June 1898, after the general election of that year and the overthrow of the Méline cabinet, with his appointment as minister of foreign affairs in the Radical cabinet headed by Brisson. He retained this office under the subsequent premierships of Dupuy, Waldeck-Rousseau, Combes and Rouvier, until June 6, 1905. In 1898, French diplomacy was roughly divided into two schools. Hanotaux, his predecessor at the Foreign Office, had been striving in an uncertain way to bring about some sort of co-operation between France, Russia and Germany, and he had rather allowed the Franco-Russian alliance to evolve in an anti-British direction. On the other hand, the French ambassadors in Rome and Constantinople, Barrkre and Paul Cambon, always insisted that the Franco-Russian alliance should be made compatible with a Franco-British rapprochement, it being absurd for a colonial power like France deliberately to cross the purposes of the supreme maritime power. The foreign office officials were amazed when they saw that the new-comer, apparently without any previous experience of practical diplomacy, resolutely cast in his lot with Barrkre and Cambon (the latter was appointed to the London Embassy in Dec. 1898) and unhesitatingly acted from the outset on the principle that the only nation France need be afraid of and guard against was Germany, snd that, therefore, alliance must be sought with Britain as well as with Russia and that the way must be paved (incredibly paradoxical as it seemed then) for a Russo-British understanding.

As a matter of fact Delcassé had inherited these views from the Gambetta school of thought through Camille Barrkre. As early as the autumn of 1898—the grand duke Vladimir happening to be in Paris—Delcassé is reported to have expounded the above policy to his advisers, protesting to them that the grand duke, who was still thinking and speaking in the terms of the Hanotaux period, had misunderstood him. In 1903, when Delcassé came back from London, where he had prepared the Franco-British treaty of April 8, 1904, he told his officials the conversation he had had with Lord Lansdowne and Joseph Chamberlain, and told them that Chamberlain had incited him to bring about a rapprochement between England and Russia. "When I heard this," he said, "I felt my brain turning I replied to Mr. Chamberlain: 'I shall refrain from making any direct approach to Russia because I should be denounced in Petersburg as having sold her in London. But I promise you I shall take every opportunity of praising the new Entente Cordiale and of inspiring our Russian ally with a desire for some sort of treaty with Great Britain.' " These details are worth stating because they may enable the historian to apply to Delcassé what Cardinal de Retz said about Richelieu: *"Il eut l'intention des choses qu'il fit."*

At the back of Delcassé's political conceptions was a very deep feeling of France's greatness and an unshakable confidence in her destiny. Not that he ever planned war. But he was of opinion (he stated it clearly at the time of the Russo-German intrigue of 1904–1905, which aimed at compelling France, under the threat of an invasion through Belgium, to enter a coalition of Germany and Russia) that if the friendship of England was not secured by French diplomacy, Berlin and London would sooner or later get together, the Triple Alliance be rendered still more formidable, and France pay the cost of that combination on the Continent and in her oversea territories. Only second in importance in Delcassé's mind, to this persistent idea of the Anglo-French-Russian Triple Entente, was the belief that his country's fate was bound up with the consolidation and extension of its North African empire. In his judgment no great nation could exist without a minimum of material power and territorial weight. France could only find that minimum by making use of her North African opportunities.

Delcassé's scheme was carried out in the seven years extending to 1905, under difficulties which seemed well-nigh insuperable. In succession, he was confronted by the incident of Fashoda; the South African war, which rekindled anti-British feeling in France; the Dreyfus affair, bringing in its train the distinct weakening of

the French army; and the Russo-Japanese war of 1904. The Minister bravely stood his ground. The recall of Captain Marchand from the Nile was announced on Nov. 4, 1898, and the Franco-British Convention of June 14, 1898, which Hanotaux had concluded before his resignation, for the delimitation of French and British interests in the region of the Niger, was completed by the fuller settlement of March 21, 1899. As regards the Far East, M. Delcassé unceasingly sought to support in Petersburg the peaceful policy of Count Lamsdorf as against the faction Alexeiev-Bezobrazov and, in Oct. 1904, when the Dogger Bank incident occurred, he was fortunate enough to mediate between London and Petersburg. As to the Dreyfus affair, he consistently observed an attitude of reserve and detachment. As a member of the Waldeck-Rousseau and Combes cabinets, he formally approved the whole anti-clerical policy, and did nothing openly to check the action of the War Minister, General André. He shut himself up in his study at the Quai d'Orsay, enjoying the hearty support of the president of the republic, Loubet, and turning a blind eye to home politics in his passionate attachment to his work. But the time was approaching when he would have to come forward and fight for what he had done. Things changed for him with the advent to power of Rouvier in Jan. 1905.

On April 8, 1904, had been signed the Convention about Morocco and Egypt, the starting point of the Entente Cordiale, the great achievement of Delcassé, Paul Cambon and Lord Lansdowne, not to speak of Edward VII. who consistently favoured it. In Berlin, the Franco-British rapprochement had to the last moment been deemed unthinkable. After some hesitation it was challenged by the Kaiser himself in his famous speech at Karlsruhe on April 27, 1904, and, on March 31, 1905 William II. paid a visit to the representative of the Sultan of Morocco in Tangier, proclaiming that he would stand by the independence of the Sherifian empire. German diplomacy acted throughout on the theory that French parliamentary opinion would not stick to the Entente Cordiale as soon as it understood that it might mean instant war with Germany. To a certain point the calculation proved true enough. Rouvier, a practical financier, who was inclined to believe that the German danger could be disposed of by means of economic co-operation between France and Germany, and that the French army was not fit to withstand the onslaught of the German Army, led the battle against his own foreign minister with the assistance of nearly the whole cabinet. In the sitting of the Chamber of April 18, Delcassé was criticized from nearly every side, and though formally supported by the premier, tendered his resignation, which, however, the president of the republic persuaded him to withdraw. But the position of Delcassé quickly became untenable. Germany was pressing for the summoning of an international conference on Morocco, and Rouvier was exchanging views with von Biilow behind the back of his colleague. Towards the end of May, the German Government was in that way acquainted with the British proposal for a military alliance in case war should ensue from the 1904 treaty, a step that immediately led von Biilow to let it be known in Paris, through Tittoni, that any advance of France towards Fez would bring about a declaration of war. Rouvier openly pressed Paul Cambon to discontinue the negotiation for the treaty of alliance with England. Vehement explanations were exchanged in the ministerial council held on June 6, 1905, which culminated in the final resignation of Delcassé.

There is no doubt that technical faults could be put to the debit side of Delcassé's account. He did not take sufficient care to communicate officially to Germany in advance the bargain he was going to make with the British Foreign Office: the information he had given to Prince Radolin on March 13, 1904, can perhaps hardly be regarded retrospectively as fully supplying the missing link in the chain of necessary diplomatic preparation. In April 1905, he evinced some vacillation, and tried to initiate a belated conversation with the German ambassador. At times, his character was not perhaps as resolute as his policy. During his whole career he was prone to make mistakes, which it is even to-day all the more difficult to explain as he usually surrounded himself with complete secrecy, confided in no one, and took care that his steps should not be easily traced. In 1902, he had been about to sign with Spain, to the amazement of his own officials, a treaty which included Fez in the Spanish zone and did not even provide for the passage of troops between Algeria and the French zone in Morocco, an accident which accounts for the hostility shown to him by Etienne, deputy for Oran and war secretary under Rouvier. However, when he left the Quai d'Orsay, the position of France in Europe had changed beyond recognition. The Triple Entente was virtually in existence, and even the foundation of the Anglo-Russian treaty of January 31, 1907, had been laid. The clauses of the Triple Alliance treaties specially directed against France since 1887 had been suppressed as a result of the Franco-Italian convention of 1902 on Tunis and Tripoli, secured by Barrère. Spain had rallied to the Franco-British treaty of April 1904 in October of the same year. On the whole, the system had withstood the test of the most trying developments. As Paul Cambon remarked in a letter of May 1905, the British alliance was perhaps in advance of what French public opinion was ready to stand at the time, and it was not well that it should be possible to denounce it as the work of one man. But what was done in 1898–1905 might perhaps not have been done later.

Having fallen from office, Delcassé remained completely silent for nearly three years but, meanwhile, he was very active in the lobbies. On Jan. 24, 1908, taking the opportunity offered by a debate on Morocco, he suddenly launched a carefully prepared speech which amounted to a vindication of his policy. He was acclaimed by the assembly. On July 20, 1909, as chairman of the marine commission, he engaged in an oratorical duel with Clemenceau, who was clumsy enough to allude to the events of 1905; the Clemenceau cabinet had to resign on the same night. The vacant premiership was not, however, offered to Delcassé, lest the Central Powers should interpret the move as a provocation. He was given the Ministry of Marine in the spring of 1911, and kept it for two years under Monis, Caillaux and Poincaré. He certainlv thought of contesting the presidency of the republic in January 1913, but his calculation that his name would be put forward at the second ballot once the other candidates, Poincaré and Pams, had spent their strength, came to nothing. He voted openly for the Radical Socialist, Pams. Notwithstanding the distant and unfriendly relations obtaining between the two men, Poincaré, as president of the republic, endeavoured to induce Delcassé to accept either the premiership or the ministry of foreign affairs. He refused, but, a few days afterwards, was persuaded by Briand and Jonnart (respectively president of the council and foreign secretary) to take charge for several years of the St. Petersburg embassy, which had fared very badly under Georges Louis, to the detriment of the Franco-Russian Alliance.

Germany was quickly increasing her armaments, and the whole machinery of the Franco-Russian alliance sadly needed mending and overhauling; it was felt that Delcassé alone would enjoy the moral authority requisite to perform the task. The hope reposed in him was fully fulfilled. With the emperor Nicolas and with Sazonov his credit was unbounded. Yet, he did not make the least attempt to live as an ambassador. His way of living was parsimonious. He stuck to the habits of a little French bourgeois, taking a stroll on the quay at 8 o'clock in the morning. As far as current affairs were concerned, he always favoured a concert of Europe, and urged moderation on Russia in the controversies over Silistria and Scutari. In December 1913, he expressed himself very pessimistically about the consequences of the Liman von Sanders mission in Constantinople. Two months before, he had asked for his recall. No satisfactory explanation of that sudden decision is available. He had not seen eye to eye with the Paris Government over the French claims to Syria and the pourparlers with Germany for the building of French railways in Armenia, as he was steadily opposed to the extension of French commitments in the Near East, which he believed dangerous and likely to resuscitate former Franco-British dissensions. But, in 1913, such matters did not loom very large on the horizon.

The word "failure" must unfortunately be written across Delcassé's last tenure of office. In June 1914, after the general election had resulted in the constitution of a radical majority, the

premiership was again pressed upon him in vain by Poincaré. He only agreed to take the War Office in the short-lived Ribot cabinet. The temper of the country was very far removed then from the impending European developments. In the midst of the invasion of France by the German army, when Viviani had to transform his ministry into a ministry of national defence, Delcassé, who was hailed by the country as the embodiment of the Russian and British alliances came back, on Aug. 27, to the Quai d'Orsay and remained there until Oct. 13, 1915, when he resigned in order to protest against the Salonika expedition. As far as the winning of Italy to the side of the Allies was concerned, he did all that could be expected of him, and, in April 1915, approved the Treaty of London with the Government of Rome. But, in the Balkans, from beginning to end, he persistently followed the wrong track, and his closest advisers are at loss to understand his conduct, which bore such a striking contrast with his former clearness of judgment and power of vision. He allowed himself to be deceived by Bulgaria, held in check the Serbian army which, left to itself, would have interfered with the mobilization of King Ferdinand's army, allowed Venizelos to be dismissed by King Constantine and, having approved of the Gallipoli campaign some nine months before, set his face against any assistance being lent to Serbia. Moreover, for unknown reasons, he delayed for fully six months the assent of the French Government to the annexation of Constantinople by Russia as a feature of the eventual peace treaties. On Sept. 16, 1916, in the secret sitting of the Chamber, he harped, for his defence, on the theme that he only wished 500,000 Germans were already encamped in Salonika, since the strength of the Kaiser's army on the western front, where the issue would be settled, could not fail to be all the more impaired. A passionate reply from Briand, then president of the council, crushed him, and he retired into private life and complete solitude. He entirely disapproved of the policy followed by the French and British cabinets in 1918 and 1919. The British Alliance and the building up of the Rhineland as a bulwark against Germany remained his motto to the end. Hardly any one ever saw him till his sudden death from arterio-sclerosis, on Feb. 21, 1923. He had been very much affected by the death of his son, Jacques, who had been seriously wounded and transferred to Switzerland. His daughter, Suzanne, married General Noguès.

He is reported to have destroyed most of his personal papers. In spite of his limitations, he remains, by general consent, the outstanding figure of the Third republic in the field of foreign affairs. (A. GÉ.)

DEL CREDERE. A "del credere agent," in common law, is one who, in consideration of additional remuneration called a del credere commission, undertakes that persons with whom he contracts on his principal's behalf shall duly pay any sums due from them to the principal under the contracts. His position is thus that of a surety who is liable to his principal should the other contracting party make default. The agreement between him and his principal need not be reduced to or evidenced by writing, for his undertaking is not a guarantee within the Statute of Frauds. (*See* also BROKER; FACTOR; GUARANTEE.)

DELESCLUZE, LOUIS CHARLES (1809–1871), member of the Paris commune, was born at Dreux (Eure-et-Loir) on Oct. 2, 1809. Under Louis Philippe he adopted extreme republican views, fought in the insurrection of June 1832 and in 1836 was forced to leave France. In 1840 he returned, settled at Valenciennes, and took up republican journalism. On the success of the revolution of 1848 he was appointed prefect of the Nord and Pas-de-Calais departments. He was afterwards the only communard leader with administrative experience. He resigned his post on the meeting of the National Assembly, went to Paris and combated the growing conservatism of the Government by means of his journal *La Révolution Democratique et Sociale,* and by *a* society called *Republican Solidarity* intended to defend the republic in the provinces. On the failure of the radical *emeute* in June 1849 he was forced to fly to England. He returned in 1853, was betrayed by a spy and taken to a convict plantation in French Guiana. In 1859 he returned to France, broken in health, and resumed journalism. He was personally hostile to Blanqui (*q.v.*), but in reality his policy was impregnated with Blanqui's ideas; he was commonly classified neither as a socialist nor as an internationalist, but as a "jacobin." After a further imprisonment he fled to Belgium in 1870, returning on the fall of the empire. He was elected a member of the National Assembly and also of the Paris commune in 1871; he chose to sit in the latter, and his seniority, ability and high character gave him the most authoritative position. His energies were not, indeed, equal to producing order in the chaotic administration of the commune (*see* COMMUNE) in two months, but he was its most capable and disinterested leader. On May 9 he took over the department of war, but it was too late for reorganization. The Government troops broke in on May 22, and the communard forces separated into their local sections. Delescluze for the next three days attempted to combine and organize the defence, himself fighting with reckless courage; but on May 25, perceiving that defeat was certain, he dressed himself in civilian clothes, with the broad red sash of a member of the commune, and climbed, unarmed, a barricade at the Chateau d'Eau which was under heavy fire. When he reached the crest and his insignia could be seen by the Government troops, he was immediately, as he had hoped, killed by a bullet.

See his *De Paris à Cayenne, journal d'un transporté* (Eng. trans. 1872); P. Larousse, *Dicfionnaire du XIXe siècle* (1870) *s.v.* "Delescluze"; and the books cited under COMMUNE. (R. W. P.)

DELESSE, ACHILLE ERNEST (1817–1881), French geologist and mineralogist, was born at Metz Feb. 3, 1817, and educated at the École Polytechnique and the École des Mines. He was successively professor of mineralogy at Besançon, of geology in Paris, and of agriculture in Paris. In 1878 he became inspector-general of mines. In early years as *ingénieur des mines* he investigated and described various new minerals; he proceeded afterwards to the study of rocks, devising new methods for their determination, and giving particular descriptions of melaphyre, arkose, porphyry, syenite, etc. He prepared in 1858 geological and hydrological maps of Paris, with reference to the underground water, similar maps of the departments of the Seine and Seine-et-Marne and an agronomic map of the Seine-et-Marne (1880), in which he showed the relation which exists between the physical and chemical characters of the soil and the geological structure. His annual *Revue des progrès de géologie,* undertaken with the assistance (1860–65) of Auguste Laugel and afterwards (1865–78) of Albert de Lapparent, was carried on from 1860 to 1880. His observations on the lithology of the deposits accumulated beneath the sea were of special interest and importance. His separate publications were: *Recherches sur l'origine des roches* (1865); *Etude sur le métamorphisme des roches* (1869); *Lithologie des mers de France et des mers principales du globe* (2 vols. and atlas, 1871). He died in Paris on March 24, 1881.

DELESSERT, JULES PAUL BENJAMIN (1773–1847), French banker, was born at Lyons on Feb. 14, 1773, the son of Etienne Delessert (1735–1816), the founder of the first fire insurance company and the first discount hank in France. Young Delessert was travelling in England when the Revolution broke out in France, but he hastened back to join the Paris National Guard in 1790, becoming an officer of artillery in 1793. His father bought him out of the army, however, in 1795 in order to entrust him with the management of his bank He started many commercial enterprises, founding the first cotton factory at Passy in 1801, and a sugar factory in 1802, for which he was created a baron of the empire. He sat in the chamber of deputies for many years, and was a strong advocate for many humane measures, notably the suppression of the "Tours" or revolving box at the

foundling hospital, the suppression of the death penalty, and the improvement of the penitentiary system. He was made regent of the Bank of France in 1802, and founded many learned and philanthropic societies. He founded the first savings bank in France.

DELFT, town, province of South Holland, on the Schie, 5 mi. S.E. by S. of The Hague, Holland. Pop. (1940) 54,108. Delft was founded in 1075 by Godfrey III., duke of Lower Lorraine, after his conquest of Holland, passing then to the counts of Holland. In 1246 it received a charter from Count William II. In 1536 it was almost totally destroyed by fire, and in 1654 largely ruined by explosion of a powder magazine.

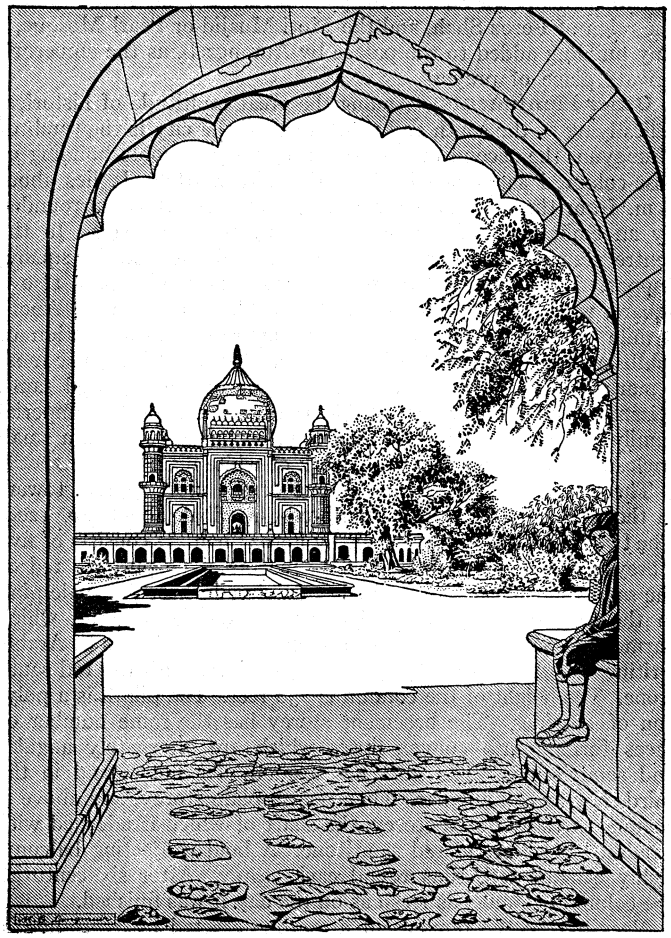
The Prinsenhof, previously a monastery, was converted into a residence for the counts of Orange in 1575; here William the Silent was assassinated. It is now the William of Orange Museum. The former church of St. Ursula (14th century) is now the New Church, where the members of the royal house of Orange-Nassau are buried. It has a fine tower and chime of bells, and contains a monument to William the Silent, executed by Hendrik de Keyser and his son about 1621, and the tomb of Hugo Grotius, whose statue stands in the market-place. The Old Church, founded in the 11th century, but in its present form dating from 1476, contains monuments erected to admirals Martin Tromp and Piet Hein, as well as the tomb of Leeuwenhoek. In the town hall (1618) are some corporation pictures, portraits of the counts of Orange and Nassau, including several by Michiel van Mierevelt (1567–1641). The Indian institute was abolished about 1900, and the civil service training for the colonies was transferred to Leyden and Utrecht. The Institute of Technology, formed in 1905 from the former Polytechnic school, became the sole qualifying university for engineers in Holland.

Delft is most intimately associated with the manufacture of the beautiful faïence pottery for which it was once famous. *(See* CERAMICS.) This industry was imported from Haarlem towards the end of the 16th century, and achieved an unrivalled position in the second half of the following century; but it did not survive the French occupation at the end of the 18th century. It has, however, been revived in modern times under the name of "New Delft." The chemical industry is very important, as is also the manufacture of tobacco. Germany occupied Delft in May 1940.

DELHI (dĕl'ĭ), old capital of the Mogul empire in India, and the new capital of British India, lies on the right bank of the Jumna, practically in the same latitude as the more ancient cities of Cairo and Canton. Since the headquarters of the government of India was transferred from Calcutta to Delhi in 1912, the district around Delhi, formerly a part of the Punjab, has for administrative reasons been constituted a minor province under a chief commissioner who is directly subordinate to the central government. The ruins of several of the older fortresses (for they were all heavily walled) strew the surrounding country.

Two of them are of special interest:—Old Delhi (about 10 m. from the present city), where stand the stately Kutb Minar with the enigmatic Iron Pillar, and Tughlakabad with its titanic walls; but there is hardly an acre in all the intervening country that does not carry some relic of the historic past. The present city, the seventh of the series, was re-constructed by the emperor Shahjahan on an older site, and is still known locally as Shahjahanabad. The greater part of it is still confined within his walls. Of its river frontage, about $2\frac{1}{4}$ m. long, one third is occupied by the battlements of his palace; and the complete circuit of the walls is $5\frac{1}{2}$ miles. Shahjahan's original fortifications were strengthened by the British by the addition of a ditch and glacis, after Delhi was captured by Lord Lake in 1803; and its strength was turned against the British at the time of the Mutiny.

The Imperial Palace (1638–48), now known as the "Fort," is disfigured by bare and ugly British barracks, among which are scattered exquisite gems of oriental architecture. The two most famous among its buildings are the Diwan-i-Am or Hall of Public Audience, and the Diwan-i-Khas or Hall of Private Audience. The Diwan-i-Am is a splendid building in the Hindu style, with 60 pillars of red sandstone supporting a flat roof. It was in the recess in the back wall of this hall that the famous Peacock Throne used to stand. "so called from its having the figures of two peacocks standing behind it, their tails being expanded and the whole so inlaid with sapphires, rubies, emeralds, pearls and other precious stones of appropriate colours as to represent life." Tavernier, the French jeweller, who saw Delhi in 1665, describes the throne as of the shape of a bed, supported by four golden feet, 20 to 25 in. high, from the bars above which rose 12 columns to support the canopy; the bars were decorated



TOMB OF NAWAB SAFFAR JANG, RULER OF OUDH, BUILT IN 1753. THE WORSHIPPERS LEAVE THEIR SLIPPERS AT THE DOOR OF THE MOSQUE

with crosses of rubies and emeralds, and also with diamonds and pearls, while the columns had rows of splendid pearls. The whole was valued at £6,000,000. This throne was carried off by the Persian invader Nadir Shah in 1739, and has been rumoured to exist still in the Treasure House of the Shah of Persia; but Lord Curzon, who examined the thrones there, found nothing except perhaps some portions worked up in a modern Persian throne.

The Diwan-i-Khas is smaller than the Diwan-i-Am, and consists of a pavilion of white marble, in the interior of which the art of the Moguls reached the perfection of its jewel-like decoration. On a marble platform rises a marble pavilion, the flat-coned roof of which is supported on a double row of marble pillars. The inner face of the arches, with the spandrils and the pilasters which support them, are covered with flowers and foliage of delicate design and dainty execution, crusted in green serpentine, blue *lapis* lazuli and red and purple porphyry; the ravages of time were repaired as far as possible by Lord Curzon.

The Chandni Chauk ("silver street"), which was once supposed to be the richest street in the world, has fallen from its high estate, though it is still a broad and imposing avenue with a double row of trees running down the centre. During the course of its history it was four times sacked, by Nadir Shah, Timur, Ahmad Shah and the Mahrattas, and its roadway has many times run with blood. The jewellers and ivory-workers now dwell there

A short distance south of the Chandni Chauk the Jamma Musjid, or Great Mosque, rises boldly from a small rocky emi-

nence It was erected in 1648–50, two years after the royal palace, by Shah Jahan. Its front court, 450 ft. square, and surrounded by a cloister open on both sides, is paved with granite inlaid with marble, and is approached by a magnificent flight of stone steps. The mosque itself is paved with marble, and three domes of white marble rise from its roof, with two tall minarets at the front corners. Two other mosques in Delhi deserve passing notice, the Kala Musjid or Black Mosque, which was built about 1380 in the reign of Feroz Shah, and the Moti Musjid or Pearl Mosque, a tiny building added to the palace by Aurangzeb, as the emperor's private place of prayer.

Other Monuments. — Among the great multitude of historical relics lying to the south and south-west of the city is the tomb of Humayun, the second of the Mogul dynasty, a noble building of rose-coloured sandstone inlaid with white marble. It lies about 3 m. from the city, in a terraced garden, the whole surrounded by an embattled wall, with towers and four gateways. In the centre stands a platform about 20 ft. high by 200 ft. square, supported by arches; and above it rises the mausoleum, also a square, with a great dome of white marble in the centre. About a mile to the west is another burying-ground, or collection of tombs and small mosques, some of them very beautiful. The most remarkable is the little chapel in honour of a celebrated saint, Nizam-ud-din, near whose shrine the members of the imperial family, up to the time of the Mutiny, lie buried, each in a small enclosure surrounded by lattice-work of white marble.

The Kutb Minar, regarded as one of the most perfect towers in the world, was begun by Kutb-ud-din Aibak about A.D. 1200. The two top storeys were rebuilt by Feroz Shah. It consists of five storeys of red sandstone and white marble. The purplish red of the sandstone at the base is finely modulated, through a pale pink in the second storey, to a dark orange at the summit, which harmonizes with the blue of an Indian sky. Dark bands of Arabic writing round the three lower storeys contrast with the red sandstone. The height of the column is 238 feet. The plinth is a polygon of 20 sides. The basement storey has the same number of faces formed into convex flutes which are alternately angular and semicircular. The next has semicircular flutes, and in the third they are all angular. Then rises a plain storey, and above it soars a partially fluted storey, the shaft of which is adorned with bands of marble and red sandstone. A bold projecting balcony, richly ornamented, runs round each storey. After six centuries the column is almost as fresh as on the day it was finished.

Near by are the remains of a mosque erected by Kutb-ud-din immediately after his capture of Delhi in 1193. The design of this mosque is Mohammedan, but the wonderfully delicate ornamentation of its western façade and other remaining parts is Hindu. In the inner courtyard stands the Iron Pillar, dating from about A.D. 400. It consists of a solid shaft of wrought iron some 16 in. in diameter and 23 ft. 8 in. in height, with an inscription eulogizing Chandragupta Vikramaditya. It was brought here, possibly from Behar, by Anang Pal, a Rajput chief, who erected it in 1052.

Modern Buildings include the temporary Vice-regal Lodge; the old Residency, now occupied by a government high school; the Protestant church of St. James, built at a cost of £10,000 by Colonel Skinner, an officer well known in the history of the East India Company; and the college and hospital of the Cambridge Mission. Behind the Chandni Chauk, to the north, lie the Queen's Gardens; beyond them the "civil lines" stretch away out to and along the well-known rocky ridge, about a mile outside the town. The old Delhi college, once famous as an oriental school, was attacked during the Mutiny, plundered of a very valuable oriental library, and the building completely destroyed.

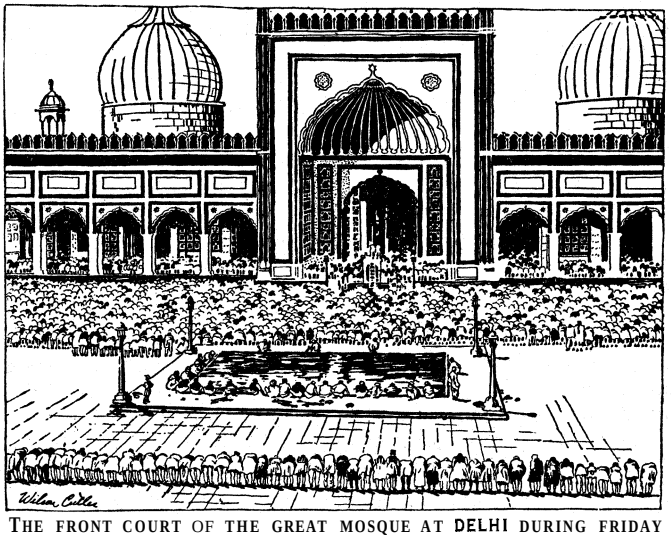
The Ridge, famous as the British base during the siege of Delhi during the Mutiny, in 1857, is a last outcrop of the Aravalli hills which rises in a steep escarpment some 60 ft. above the city. At its nearest point on the right of the British position, where the Mutiny memorial now stands, the Ridge is only 1,200 yd from the walls of Delhi; at the Flagstaff tower in the centre of the position it is a mile and a half away; and at the left near the river nearly two miles and a half. It was behind the Ridge at this point that the main portion of the British camp was pitched. The gallant Nicholson was buried just outside the Kashmir gate, near to where his statue now stands. The Kashmir gate itself bears a slab recording the gallant deed of the party under Lieutenants D. C. Home and P. Salkeld, who blew in the gate in broad daylight on the day that Delhi was taken by assault.

The Population of Delhi according to the census of 1931 was 447,442, of whom 180,018 were Mahammedans. The city is the converging point of a number of railways and occupies a central position, being 940 m. from Karachi, 950 from Calcutta, and 960 from Bombay. Owing to the advantages it enjoys as a trade centre, Delhi is recovering much of the prominence which it lost at the time of the Mutiny. It has a number of busy factories, and famous hand industries in gold and silver filigree work and embroidery, jewellery, muslins, shawls, glazed pottery and wood-carving.

The Province **of Delhi** has an area of 573 sq.m. and a population of 636,246. It consists of a strip of territory on the Jumna river which formed part of the old Delhi district, and of 65 villages on the opposite bank which were formerly in the Meerut district of the United Provinces. It is an enclosure created for administrative convenience, as a consequence of the new capital.

When Lord Lake broke the Mahratta power in 1803, and the emperor was taken under the protection of the East India Company, the districts of Delhi and Hissar were assigned for the maintenance of the royal family, and were administered by a British resident. In 1832 the office of resident was abolished, and the tract was annexed to the North-Western Provinces. After the Mutiny in 1858 it was separated from the North-Western Provinces and annexed to the Punjab. The old Division of Delhi has its headquarters now at Ambala. (ME.; X.)

History. — According to legend Delhi has from time immemorial been the site of a capital city. The actual history of Delhi, however, dates no further back than the 11th century A.D., when Anangapala (Anang Pal), a chief of the Tomara clan, built the Red Fort, in which the Kutb Minar now stands; in 1052 the same chief removed the famous Iron Pillar from its original



THE FRONT COURT OF THE GREAT MOSQUE AT DELHI DURING FRIDAY PRAYER

Although said to be one of the largest Mohammedan buildings in the world, this mosque is too small to accommodate its 15,000 congregation, with the result that worshippers overflow into the front court. The domes are of white marble, and the court is paved with marble and granite

position, probably at Muttra, and set it up among a group of temples of which the materials were afterwards used by the Muslims for the construction of the great Kutb Mosque. About the middle of the 12th century the Tomara dynasty was overthrown by Vigraha-raja, the Chauhan king of Ajmere. His nephew and successor was Prithwi-raja, the last Hindu ruler of Delhi. In 1191 came the invasion of Mohammed of Ghor. Defeated on this occasion, Mohammed returned two years later, overthrew the Hindus, and captured and put to death Prithwi-raja, Delhi became henceforth the capital of the Mohammedan

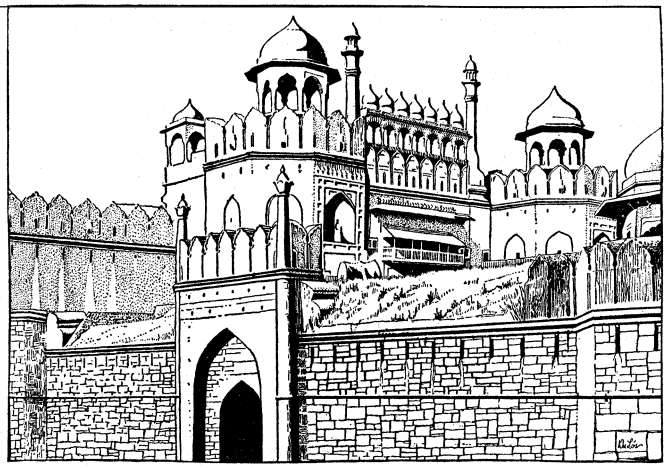
Indian empire, Kutb-ud-din (the general and slave of Mohammed of Ghor) being left in command The dynasty retained the throne till 1290, when it was subverted by Jalal-ud-din Khilji. The house of Khilji came to an end in 1321, and was followed by that of Tughlak; Ghias-ud-din Tughlak erected a new capital about 4 m. farther to the east, which he called Tughlakabad. The ruins of his fort remain. Ghias-ud-din was succeeded by his son Mohammed b. Tughlak, who reigned from 1325 to 1351. Under this monarch the Delhi of the Tughlak dynasty attained its utmost growth. His successor Feroz Shah Tughlak transferred the capital to a new town, Ferozabad, which he founded some miles away. In 1398, during the reign of Mahmud Tughlak, occurred the Tatar invasion of Timurlane. The king fled to Gujarat, his army was defeated under the walls of Delhi, and the city surrendered. At length Mahmud Tughlak regained a fragment of his former kingdom, but on his death in 1412 the family became extinct. He was succeeded by the Sayyid dynasty, which held Delhi and a few miles of surrounding territory till 1444, when the house of Lodi supervened and Agra became the capital. In 1526 Baber, sixth in descent from Timurlane, invaded India, defeated and killed Ibrahim Lodi at the battle of Panipat, entered Delhi, was proclaimed emperor, and finally put an end to the Afghan empire. Baber's capital was at Agra, but his son and successor, Humayun, removed it to Delhi. In 1540 Humayun was defeated and expelled by Sher Shah, who entirely rebuilt the city, enclosing and fortifying it with a new wall. In 1555 Humayun, with the assistance of Persia, regained the throne; but he died within six months, and was succeeded by his son, the illustrious Akbar.

During Akbar's reign and that of his son Jahangir, the capital was either at Agra or at Lahore, and Delhi once more fell into decay. Between 1638 and 1658, however, Shah Jahan rebuilt it. In 1707 came the decline. Insurrections and civil wars on the part of the Hindu tributary chiefs, Sikhs and Mahrattas broke out. Aurungzeb's grandson, Jahandar Shah, was, in 1713, deposed and strangled after a reign of one year; and Farrakhsiyyar, the next in succession, met with the same fate in 1719. He was succeeded by Mohammed Shah, in whose reign the Mahratta forces first made their appearance before the gates of Delhi, in 1736. Three years later the Persian monarch, Nadir Shah, after defeating the Mogul army at Karnal, entered Delhi in triumph. For fifty-eight days Nadir Shah remained in Delhi, and when he left he carried with him great treasure.

In 1771 Shah Alam, the son of Alamgir II., was nominally raised to the throne by the Mahrattas, the real sovereignty resting with the Mahratta chief, Sindhia. An attempt of the puppet emperor to shake himself clear of the Mahrattas, in which he was defeated in 1788, led to a permanent Mahratta garrison being stationed at Delhi. From this date, the king remained a cipher in the hands of Sindhia, until the 8th of September 1803, when Lord Lake overthrew the Mahrattas under the walls of Delhi, entered the city, and took the king under the protection of the British. Delhi, once more attacked by a Mahratta army under the Mahratta chief Holkar in 1804, was gallantly defended by Colonel Ochterlony, the British resident, who held out against overwhelming odds for eight days, until relieved by Lord Lake, and the city, together with the Delhi territory, passed under British administration.

Fifty-three years of quiet prosperity for Delhi were brought to a close by the Mutiny of 1857 (see INDIA, History). It was not till the 20th of September that the entire city and palace were occupied, and the reconquest of Delhi was complete. During the siege, the British force sustained a loss of 1,012 officers and men killed, and 3,837 wounded. On receiving a promise that his life would be spared, the last of the house of Timur surrendered to Major Hodson; he was afterwards banished to Rangoon. Delhi, thus reconquered, remained for some months under military authority. Delhi was made over to the civil authorities in January 1858, but it was not till 1861 that the civil courts were regularly reopened Since that date Delhi has settled down into a prosperous commercial town, and a great railway centre. Delhi was selected for the scene of the Imperial Proclamation on the 1st of January 1877, and for the great Durbar held in January 1903 for the proclamation of King Edward VII. as emperor of India.

New Delhi.—New Delhi, the establishment of which was first announced by His Majesty King George V. at the Imperial Durbar of 1911 in the second year of the Viceroyalty of Lord Hardinge, has been designed and built as a capital for all India. Its site, occupying at present about 5 sq.m., is on the great alluvial plain of the Jumna sloping slightly from west to east. Its centre in the Great Place at the foot of the rock on which stand the main Government buildings is about 5m. to the south of Shah Jahan's fort in Old Delhi. The site was chosen in 1912 by a commission consisting of Capt. Swinton (Chairman), Mr. Brodie, engineer to the City of Liverpool and Mr. Edwin (now Sir Edwin) Lutyens, architect. To the last of the three was given the planning of the city, after an agreement had been come to with Lord Hardinge that the main Government buildings should be placed on the rock to which reference has already been made. This rock is a spur of the main Delhi ridge of Mutiny fame and like it consists of very hard quartzite. It stood some soft. above the plain but the top 20ft. have been blasted off to make a level plateau for the great buildings and to fill in depressions.



LAHORE GATE IN DELHI FORT. FACING CHANDNI CHAUK, "THE STREET OF SILVER" BY COURTESY OF THE INDIAN STATE RAILWAYS
During the siege of Delhi in the Mutiny of 1857, General John Nicholson, leader of the British storming party, was mortally wounded when advancing upon the Lahore Gate

With this low acropolis as the focus of his city Sir Edwin Lutyens laid out a very original city plan as large in scale and covering a larger area of organized planning than Washington (D.C.). His central mall and his diagonal avenues may owe something to L'Enfant's plan for that city as well as something to Sir Christopher Wren's plan for London after the Great Fire, but the total result is quite different.

It is a plan based on a series of large hexagons closed by a semicircular road to the west where the site is bounded by the ridge. This plan, with its wide central processional road and its diagonals at 30° and 60°, brings into vista all the chief landmarks of the flat landscape. The main axis leads to the old walled city of Indrapat, while one avenue is focussed on the great mosque or Jumma Musjid in Old Delhi, forming an absolutely direct route to that town, and another on the lofty tomb of the emperor Humayun. Subsidiary avenues lead to other monuments. In this way the new city is not only related to the Delhis of the past which surround it but emphasizes its peaceful and all-embracing character in distinction to their encircling walls and fortifications. In detailed planning the roads are in three classes, 150ft., 120ft. and 76ft. wide, lined with one, two or even three avenues of trees. The central mall has continuous canals of water as well. Where main roads intersect there are great round turning points showing an appreciation in the plan of the needs of motor traffic several years before that traffic had anywhere developed.

The filling in of the plan has provided sites of varying importance for every class of residence. The princes of India are to build their palaces in the great circular roads round the

triumphal arch to the Indian armies which closes the main processional way. H.H. the nizam of Hyderabad has already completed a large palace with the advice of Sir Edwin. Along the main axis are sites for Government buildings—the Record Office by Sir Edwin Lutyens is partially built—and for the residences of members of council. Along the lesser avenues are residences for officials of various grades and nationality, hostels for members of the assembly divided in like manner. In other districts are chummeries and bungalows for European and Indian clerks, circles of shops and other necessary commercial buildings. Altogether 35,000 persons are already permanently housed on the site, which has been planned so far for 65,000. All this building is in brick covered in stucco whitewashed every year after the rains. The general form of expression, which has been suggested by the few bungalows Sir Edwin has himself built, is a simplified form of Palladian classic. This has meant nearly everywhere long horizontal lines of classical porticoes having their deep shadows contrasted with the plain white wall surfaces, the whole set in lawns and surrounded with trees and flowering shrubs. The result is a garden city and in a more just sense than the term is generally used. Seen from the ridge the city is already a sea of trees (all of which have had to be planted and have water-pipes laid to them), through which long, low, white classical buildings glint.

KUTB-MINAR

Built to commemorate the victories of the Mohammedan general Kutb-ud-din. This tower is 238 feet high and composed of sandstone ranging in colour from red, at the bottom, to orange, at the top

It remains to mention the main buildings on the acropolis of rock which form the climax of the town and overlook the plain of bungalows, trees and magnificent roads, very much as the Palace of the Popes does the plain of Avignon. These are three, the two great secretariat buildings designed by Sir Herbert Baker which line the processional way, and Government House, the palace of the viceroy, designed by Sir Edwin Lutyens, to which this great avenue leads. As an afterthought, there is also the big legislative building. It is situated on the plain at the foot of the rock on the axis of the road from Old Delhi and is a great circular structure by Sir Herbert Baker with a continuous open colonnade, half a mile in circumference. It contains the three chambers, one for the assembly, one for the council and one for the ruling princes grouped round a central library large enough to hold a durbar of the members of all three. Its circular form was dictated partly by political reasons and partly by the triangular space on which it is situated between three roads. It is hoped that some day a circular structure on a similar triangular site on the opposite side of the main axis may house supreme courts of justice for all India.

The two secretariat buildings are in the main Italian structures and present to the processional way four projecting blocks in pairs each carrying a portico of columns with recessed courts between. The idea of these projections is apparently to stand out like sentinels on the great approach. Crowning the recessed building in the centre on either side is a tall Italian dome on a drum. All these features, if not too tall and important in themselves, together with the towers which rise from the end blocks and face down the canal, being in pairs about the main axis should make a fine approach to the great palace set back behind its forecourt and itself crowned with a great dome. This latter building is (early 1928), two years from completion and though enough has been built to show that it is a true palace of great majesty and refinement with many noble courts, stairways and apartments, as well as a great durbar hall under its dome, it yet remains to be seen whether the secretariat buildings are not too lofty for full justice to be done to it. All these four great buildings, together with their steps, terraces and surrounding walls, are in red sandstone to the base of the columns and in white above, brought by a specially constructed railway from the States of Bharatpur and Dholpur, 80m. away. Two to three thousand masons have been employed continually on the work. The form of architectural expression used throughout is Palladian classic but both architects have introduced Indian features such as the Chajja or projecting stone slab to keep walls cool, the Chattri or umbrella shaped roof—Indian symbol of royalty—the Jaalis or pierced stone grilles. Sir Edwin Lutyens, however, in Government House, has deliberately gone farther than Sir Herbert Baker in the secretariat buildings in trying to marry the spirit of Indian Architecture, both Hindu and Mohammedan, to that of English and Italian classic. Because the spirit of Indian detail as far as compatible with classical motives has been absorbed by him rather than its forms copied, new and interesting character, which nevertheless seems harmonious and inevitable, has resulted.

(C. H. R.)

DELIA. An ancient quadrennial festival of the Ionians, held on Delos (hence the name; the local title was Apollonia, which seems to have been always used for the corresponding yearly festival). It was in honour of Apollo; after great brilliancy in early times, it declined as the political importance of Ionia did so, but was revived in 426 by the Athenians as part of their imperial policy.

See "Homer" *Hymn,* iii., 146 ff.; Thucydides, iii. 104; and M. P. Nilsson, *Griechische Feste* (1906), p. 144 ff.

DELIAN LEAGUE or CONFEDERACY OF DELOS, a confederation of Greek states under the leadership of Athens, with its headquarters at Delos, founded in 478 B.C. after the repulse of the expedition of the Persians under Xerxes I. This confederacy, broken up by the capture of Athens by Sparta in 404, was revived in 378–377 B.C. as a protection against Spartan aggression, and lasted, until the victory of Philip II. of Macedon at Chaeroneia (338 B.C.). These two confederations are the first examples of a serious attempt at united action on the part of a number of self-governing states at a high level of political development. The first league in its later period affords the earliest example in history of imperialism in which the subordinate units enjoyed local autonomy with an organized system, financial, military and judicial

History.—During the 6th century B.C. Sparta was regarded as the chief power in Greece, including the islands of the Aegean. The Persian invasions of Darius and Xerxes, with the consequent increase in the importance of maritime strength as compared with military power, caused a loss of prestige which Sparta was unwilling to recognize. Moreover, at that time the Spartan leaders were not men of strong character. Pausanias, the victor of Plataea, soon showed himself destitute of the high qualities which the situation demanded. The Ionian allies realized that, had it not been for the Athenians, the battle of Salamis would never have been fought, and Greece would have become a Persian satrapy. The Athenian contingent sent to aid Pausanias in driving the Persians out of the Thraceward towns was under the command of Aristeides and Cimon, men of tact and probity. When Pausanias was recalled to Sparta on the charge of treasonable overtures to the Persians, the Ionian allies appealed to the Athenians, and when Sparta sent out Dorcis to supersede Pausanias he found Aristeides in unquestioned command of the allied fleet. The Spartans were relieved, in that it no longer fell to them to organize distant expeditions to Asia Minor. The Spartan system was unable to adapt itself to the spirit of the age. To Aristeides was due the organization of the new league and the adjustment of the contributions of the various allies in ships or in money. His assessment remained popular after the league of autonomous allies had become an Athenian empire. The affairs of the league were managed by a synod which met in the temple of Apollo and Artemis at Delos, sanctified by the common worship of the Ion-

SCENES IN OLD AND NEW DELHI

1. Moti Musjid (Pearl Mosque), built 1659 by Aurangzeb. It is of gray and white marble, the walls being decorated with low reliefs. 2. Jamma Musjid (Great Mosque) said to be the largest in world. Built 1638–1648 by Shah Jahan. It is of red sandstone and white marble, the three marble domes relieved by thin vertical strips of black marble. The mosque is 201 ft. high, to top of dome. 3. Mausoleum of Humayun (d. 1555) and shrine of Nizam-ud-din, a large central octagon surmounted by a dome, with octagonal towers of unequal sides at the angles. It stands upon a platform of red sandstone. 4. Street scene in Delhi showing Great Mosque in distance. 5. Courtyard of the Great Mosque. 6. Diwan-i-'Am, council hall in the Mughal fort and palace, built by Shah Jahan, middle of 17th century. The emperor used to take his seat in the raised recess, above the marble seat of the wazir, seen in foreground. Inlaid panels by Austin of Bordeaux have been restored. 7. Great Council House, opened at the inauguration of Delhi as the new capital of India. Procession of the viceroy, Lord Irwin, and native princes leaving after the ceremony. 8. The Scale of Justice in the Mughal fort. 9. Diwan-i-Khas (hall of private audience) in the Mughal palace, considered one of the most graceful buildings in the world; built wholly of white marble inlaid with precious stones. In background, base on which stood the famous peacock throne

ians (see AMPHICTYONY). In this synod the allies met under the presidency of Athens. Thucydides (i. 97) lays emphasis on the fact that in these meetings Athens, as head of the league, had no more than presidential authority, and the other members were called *σύμμαχοι* (allies). Athens appointed a board called the *Hellenotamiai* (*ταμίας*, steward) to administer the treasury of the league, which was kept at Delos, and to receive the contributions (*φόρος*) of the allies who paid in money.

The league was therefore a free confederation of autonomous Ionian cities founded with the object of protecting themselves by means of a "counter-offensive" (Thuc. i. 96) against the common danger from Persia, and led by Athens in virtue of her predominant naval power. It is a mistake to regard the league during the first 20 years of its existence as an Athenian empire. Thucydides (*loc. cit.*) expressly describes the predominance of Athens as *ἡγεμονία* (leadership, headship), not as *ἀρχή* (empire), and the attempts made by Athenian orators during the second period of the Peloponnesian war to prove that the attitude of Athens had not altered since the time of Aristeides are manifestly unsuccessful.

The first ten years of the league's history was a period of steady, successful activity against the few remaining Persian strongholds (see ATHENS; CIMON). In these years the Athenian sailors reached a high pitch of training, while certain of the allies became weary of incessant warfare. Athens supported by the synod (*ξύνοδος*) of the Hellenotamiai, enforced the contributions of ships and money according to the assessment. Gradually the allies began to weary of personal service, and persuaded the synod to accept a money commutation. The Ionians were averse to prolonged warfare, and in the prosperity which followed the rout of the Persians a money contribution was held a trifling burden. The result was, however, bad for the allies, whose status in the league became lower in relation to that of Athens, while at the same time their naval resources diminished. Athens became more powerful, and could afford to disregard the authority of the synod. Another new feature appeared in the coercion of cities which desired to secede. The protection of the Aegean would become impossible if some of the islands were liable to be used as piratical strongholds, and it was only right that all should contribute in some way to the security which all enjoyed. In the cases of Naxos and Thasos, the league's resources were employed, not against the Persians, but against recalcitrant Greek islands. Shortly after the capture of Naxos (*c.* 467 B.C.) Cimon proceeded with a fleet of 300 ships (only 100 from the allies), to the south-western and southern coasts of Asia Minor, and routed the Persians on land and sea at the mouth of the Eurymedon, in Pamphylia. This engagement was the final episode of the struggle between the Greeks and Persia. The very completeness of the victory raised the question of the continuance of the league now that the danger which had given rise to it was effectively removed. It remained to be seen whether Athens would permit secession, which she was theoretically unable to prevent. If she did not, her "leadership" would definitely be converted into an empire. The event proved that Athens had no intention of allowing the dissolution of a body which had brought her such an advance in power. The capture of Thasos (463 B.C.), due to trade rivalry on the Strymon, was a first indication of what the "allies" might expect. About the same time Cimon (*q.v.*), whose philo-Spartan policy was displeasing to the leaders of the new democracy, was successfully overthrown by Ephialtes and Pericles. After his fall the resources of the league were increasingly used in the prosecution of Athens' imperial designs. Between this time and the peace of Callias (449 B.C.) which put an end to the war with Persia (see CIMON) all the allies had commuted their naval service for a money payment, with the exception of Chios, Lesbos and Samos. In 454 B.C. the domination of Athens was crystallized by the transference of the federal treasury from Delos to Athens. In the meantime Athens was busy transforming her sea empire into a land and sea empire. By 448 B.C. she dominated not only her former "allies," but also Megara, Boeotia, Phocis, Locris, Achaea and Troezen. The conception of a league of independent allies was still further violated in 451 B.C. by Pericles' law under which citizenship, with all its advantages, such as the right to sit on paid juries, was restricted to those who could prove themselves the children of an Athenian father and mother. Thus the "allies" saw themselves still further excluded from recognition (see PERICLES). The resulting antipathy to Athens, and the centrifugal spirit natural to the Greek in politics, combined for the disruption of a tyranny which had become odious to all alike. The first to secede were the land powers, where the democracies established by Athens as a guarantee of her predominance were overthrown by oligarchies. The reverse of Coroneia (446 B.C.) was followed by the loss of Boeotia, and shortly afterwards by that of Phocis, Locris and Megara. By the "Thirty Years Peace" (445 B.C.) Athens abandoned Nisaea, Pegae, Troezen and Achaea. Her newly acquired land empire was irretrievably lost.

The maritime allies were not slow in attempting to follow the example of Boeotia and the land powers. The next important event is the revolt of Samos (440 B.C.), which had quarrelled with Miletus and refused the arbitration of Athens. The island was conquered with great difficulty by the whole force of the league. It is noticeable that the main body of the allies was not affected, and that the Peloponnesian league, on the advice of Corinth, recognized the right of Athens to deal with her rebellious subject allies, and refused to help the Samians.

The events which led to the Peloponnesian war are discussed in other articles. (See ATHENS: History; and PELOPONNESIAN WAR.) Two alone call for special notice. The first is the raising of the allies' tribute in 42j B.C. by a certain Thudippus. The second event belongs to 411, after the failure of the Sicilian expedition. In that year the tribute of the allies was commuted for a 5% tax on all imports and exports by sea.

The Tribute.— Thucydides is almost certainly wrong in saying (i. 96) that the amount of the original tribute was 460 talents (about £106,000); this figure cannot have been reached for at least 12 years, when new members had been enrolled (Lycia, Caria, Eion, Lampsacus). He is probably wrong, when he says that it amounted to 600 talents at the beginning of the Peloponnesian war. The moderation of the assessment is shown not only by the fact that it was paid so long without objection, but also by the individual items. Even in 42j Naxos and Andros paid only 1j talents, while Athens had just raised an *eisphora* (income tax) from her own citizens of 200 talents.

The number of tributaries some authorities give as 200; others put it as high as 290: in some cases several towns were grouped together in one payment (*συντελεῖς*). These were grouped into geographical divisions, each division represented by two elective commissioners (*τακταί*), who assisted the Boulē at Athens in the quadrennial division of the tribute. Each city sent in its own assessment before the commissioners who presented it to the Boulē. If there was any difference of opinion the matter was referred to the ecclesia for settlement. In the ecclesia a private citizen might propose another assessment, or the case might be referred to the law courts.

Government and Jurisdiction.— There is much difference of opinion regarding the attitude of imperial Athens towards her allies. Grote maintained that on the whole the allies had little ground for complaint; but he seems to leave out of account the Greeks' dislike of external discipline. The fact that the hegemony had become an empire was enough to make the new system offensive to the allies. No strong argument can be based on the paucity of revolts. The indolent Ionians had seen the result of secession; the Athenian fleet was perpetually on guard in the Aegean. Among the mainland cities revolt was frequent; Athenian domination may have been salutary in its effects, but the allies did not regard it with affection.

In the later period of the first league's history the Athenians interfered with the local autonomy of the allies. Though it appears that Athens made individual agreements with various states, and therefore that we cannot regard as general rules the terms laid down in those which we possess, it is undeniable that the Athenians planted garrisons under Athenian officers (*φρούραρχοι*) in some cities, All important cases between Athenians and citizens of allied cities were tried before the Athenian courts. Athens im-

posed democratic constitutions on her allies; indeed Isocrates takes credit for Athens on this ground. Though Chios, Lesbos and Samos retained their oligarchic governments, and Selymbria was permitted to choose its own constitution, it is clear that Athens did exercise over many of her allies an authority which extended to local administration. Thus the leadership of Athens in a harmonious league of free Greek states became an empire which proved intolerable to the autonomous states. Her failure was due partly to the commercial jealousy of Corinth working on the dull antipathy of Sparta, partly to the hatred of compromise and discipline characteristic of Greece, and partly also to the lack of tact and restraint shown by Athens and her representatives.

The Second League.—The conditions which led to the second Delian Confederacy were fundamentally different, because the enemy was no longer an oriental power, but Sparta, whose ambitious projects since the fall of Athens had shown that there could be no safety for the smaller states save in combination.

As soon as the Athenians began to recover from the victory of Lysander and the government of the Thirty, their thoughts turned to the possibility of recovering their lost empire. The first step in this direction was the recovery of their sea power, which was effected by the victory of Conon at Cnidus (Aug. 394 B.C.). Cities which had formed part of the Athenian empire returned to their alliance with Athens, until Sparta had only Sestos and Abydos of all that she had won by the battle of Aegospotami. No systematic constructive attempt at a renewal of empire was made. Athenian relations were with individual states only, and the terms of alliance were various. The whole position was changed by the successes of Thrasybulus, who set up a democracy in Byzantium and reimposed the old 10% duty on goods from the Black Sea. Many of the island towns subsequently came over, and from inscriptions at Clazomenae and Thasos we learn that Thrasybulus was deliberately aiming at a renewal of the empire, though he had no general backing in Athens.

The peace of Antalcidas (see ANTALCIDAS) in 387 B.C. was a blow to Athens. Antalcidas compelled the Athenians to give their assent to it by making himself master of the Hellespont by stratagem. By this peace all the Greek cities on the mainland of Asia with the islands of Cyprus and Clazomenae were recognized as Persian, all other cities except Imbros, Lemnos and Scyros as autonomous. Directly, this arrangement prevented an Athenian empire; indirectly, it caused the sacrificed cities and their kinsmen on the islands to look upon Athens as their protector. The selfishness of the Spartans was emphasized by their capture of the Theban citadel, and by the raid upon Attica in time of peace by Sphodrias, and his immunity from punishment at Sparta. The Athenians at once invited their allies to a conference, and the Second Athenian Confederacy was formed. Those represented at it were Athens, Chios, Mytilene, Methymna, Rhodes, Byzantium and Thebes, which joined Athens soon after the Sphodrias raid. In the spring of 377 invitations were sent out to the maritime cities. Some time in that year Tenedos, Chios, Chalcis in Euboea, and Eretria, Carystus and Arethusa gave in their adherence, followed by Perinthus, Peparethus, Sciathus and other maritime cities.

Sparta was roused to a sense of the significance of the new confederacy, and the Athenian corn supply was threatened by a Spartan fleet of 60 triremes. The Athenians fitted out a fleet under Chabrias, who gained a victory over the Spartans between Naxos and Paros (battle of Naxos 376 B.C.), both of which were added to the league. Proceeding northwards in 375 Chabrias brought over a large number of the Thraceward towns, including Abdera, Thasos and Samothrace. The successes of Timotheus in the west resulted in the addition to the league of Corcyra and the cities of Cephallenia. Sparta sent out a fleet, but Timotheus, in spite of financial embarrassment, held his ground. By this time, however, the alliance between Thebes and Athens was growing weaker, and Athens, being short of money, concluded a peace with Sparta Trouble, however, soon arose over Zacynthus, and the Spartans not only sent help to the Zacynthian oligarchs but even besieged Corcyra (373). Timotheus was sent to relieve the island, but shortness of money compelled him to search for new allies. This delay in sending help to Corcyra was condemned by the Athenians, who dismissed Timotheus in favour of Iphicrates. An expedition followed, but the absence of any positive success, the pressure of financial difficulty, and the high-handed action of Thebes in destroying Plataea (373), induced Athens to renew the peace with Sparta. An agreement was made by a congress at Sparta on the basis of the autonomy of the cities. The Thebans at first accepted the terms, but, realizing that they were baulked of their pan-Boeotian ambition, severed themselves from the league.

The peace of 371 B.C. may be regarded as the conclusion of the first period in the league's existence. The original purpose of the league—the protection of the allies from the ambitions of Sparta—was achieved. Athens was recognized as mistress of the sea; Sparta as the chief land power. The weakness of the coalition had, however, become apparent. The enthusiasm of the allies waned rapidly before the financial exigencies of successive campaigns, and it is clear that Thebes had no interest save the extension of her power in Boeotia. There were not wanting signs that the league was not destined to remain a power in the land.

The remaining history may be broken up into two periods, the first from 371 to 357, the second from 357 to 338 B.C. Throughout these two periods, which saw the decline and dissolution of the alliance, examples of corporate action are few.

Period **371–357 B.C.**—The first event in this period was the battle of Leuctra (July 371), in which, no doubt to the surprise of Athens, Thebes temporarily asserted itself as the chief land power in Greece. To counterbalance the new power Athens tried to induce the states which recognized the hegemony of Sparta to transfer their allegiance to the Delian league. It seems that the states adopted this policy with the exception of Elis. The policy of Athens was mistaken for two reasons: (1) Sparta was not entirely humiliated, and (2) alliance with the land powers of Peloponnese involved Athens in enterprises which could not awaken the enthusiasm of her maritime allies. This new coalition alarmed Sparta, which at once made overtures to Athens on the ground of their common danger from Thebes. The alliance was concluded in 369 B.C. About the same time Iphicrates was sent to take possession of Amphipolis according to the treaty of 371. Some success in Macedonia roused the hostility of Thebes, and the subsequent attempts on Amphipolis caused the Chalcidians to declare against the league. The old suspicion of the allies was now awakened, and we find Athens making great efforts to conciliate Mytilene by honorific decrees. This suspicion, due primarily, no doubt, to the agreement with Sparta, was strengthened by the exchange of compliments with Dionysius I. of Syracuse, who received the Athenian citizenship, and by the Athenian alliance with Alexander of Pherae (368–367). The maritime allies had no desire to be involved in the quarrels of Sicily, Thessaly and the Peloponnese.

In 366 Athens lost Oropus, a blow which she endeavoured to repair by forming an alliance with Arcadia and by an attack on Corinth. Timotheus was sent in 366–365 to make a demonstration against Persia. Finding Samos in the hands of Cyprothemis, a servant of the satrap Tigranes, he captured it after a ten months' siege, and established a cleruchy.

The next important event was the attempt on the part of Epameinondas to challenge Athenian naval supremacy. Though Timotheus held his ground the confederacy was undoubtedly weakened. In 362 B.C. Athens joined in the opposition to the Theban expedition which ended in the battle of Mantineia. In the next year the Athenian generals failed in the north in their attempt to control the Hellespont. In Thessaly Alexander of Pherae became hostile, and after several successes even attacked the Peiraeus. Chares was ordered to make reprisals, but instead sailed to Corcyra, where he made the mistake of siding with the oligarchs. The last event of the period was a success, the recovery of Euboea (357), which was once more added to the league.

During these 14 years the policy of Athens towards her maritime allies was shortsighted and inconsistent. Alliances with land powers, and an inability to understand the true relations

which alone could unite the league, combined to alienate the allies, who could discover no reason for the expenditure of their contributions on protecting Sparta or Corinth against Thebes. There was ground for suspecting disloyalty in many quarters. On the other hand, though the Athenian fleet became stronger and several cities were captured, the league itself did not gain any important adherents.

Period 357–338 B.C.—Chios, Rhodes, Cos, Byzantium, Erythrae and other cities were in revolt by the spring of 356 B.C., and their attacks on loyal members of the confederacy compelled Athens to take the offensive. Chabrias had been killed in an attack on Chios, and the fleet was under the command of Timotheus, Iphicrates and Chares, who sailed against Byzantium. The enemy sailed north from Samos, and in a battle off Embata (between Erythrae and Chios) defeated Chares, who, without the consent of his colleagues, had ventured to engage them in a storm. Chares sought to replenish his resources by aiding the Phrygian satrap Artabazus against Artaxerxes Ochus, but a threat from the Persian court caused the Athenians to recall him, and peace was made by which Athens recognized the independence of the revolted towns. The league was further weakened by the secession of Corcyra, and by 355 B.C. was reduced to Athens, Euboea and a few islands. By this time, moreover, Philip II. of Macedon (*q.v.*) had begun his career of conquest. In 355 his advance temporarily ceased, but the financial exhaustion of the league was such that its destruction was only a matter of time. Resuming operations in 354, Philip, in spite of temporary checks at the hands of Chares, took from the league all its Thracian and Macedonian cities. In 352–351 Philip actually received help from former members of the confederacy. In 351 Charidemus, Chares and Phocion were sent to oppose him, but no successes were gained. In 346 the peace of Philocrates was made between the league and Philip on terms which were accepted by the Athenian Boulē. It is very remarkable that, in spite of the powerlessness of the confederacy, the last recorded event in its history is the steady loyalty of Tenedos, which gave money to Athens about 340 B.C. The victory of Philip at Chaeroneia in 338 finally destroyed the league.

In spite of the precautions taken by the allies, the policy of the league was, almost throughout, directed in the interests of Athens. Founded with the object of thwarting the ambitious designs of Sparta, it was plunged by Athens into enterprises which exhausted the resources of the allies without benefiting them in any respect. There is no doubt that the cities were held to their allegiance solely by the superior force of the Athenian navy.

BIBLIOGRAPHY.—The First League.—The histories of Greece, of G. Busolt (1893), J. Beloch (1893), A. Holm (Eng. trans., 1894), and G. Grote (the ed. of 1907 has some further notes on later evidence). E. Meyer's Gesch. des Altertums (Stuttgart, 1892 foll.) and *Forschungen* (1892) are of the greatest value as also Cambridge Modern History, V. (ch. ii., etc.) (1927), and W. S. Ferguson, Greek Imperialism (1913).

See also E. A. Freeman, Federal Government and articles ARISTEIDES; THEMISTOCLES; PERICLES; CIMON, etc.; and GREECE; History, with works quoted. For the last years of the league see also PELOPONNESIAN WAR. For inscriptions, see E. L. Hicks and G. F. Hill, Greek Historical Inscriptions (Oxford, 1901); G. F. Hill, Sources of Greek History, *478–431* (2nd ed. 1907).

-- *The Second League.*—The chief modern works are G. Busolt, "Der zweite athenische Bund" in Neue *Jahrbücher für classische Philologie* (supp. vol. vii., 1873–75, pp. 641–866), and F. H. Marshall, The Second Athenian Confederacy (1905), one of the Cambridge Historical Essays (No. xiii.). The latter is based on Busolt's monograph and includes subsequent epigraphic evidence, with a full list of authorities. The meagre data given by ancient writers are collected by Busolt and Marshall.

DELIBES, CLEMENT PHILIBERT LEO (1836–1891), French composer, was born at Saint Germain du Val on Feb. 21, 1836. He studied at the Paris Conservatoire, and became accompanist at the Théâtre Lyrique. His first essay in dramatic composition was his Deux *sous* de *charbon* (1853), and during several years he produced a number of operettas. His cantata Alger was heard at the Paris opera in 1865. Having become second chorus master of the Grand Opéra, he wrote the music of a ballet entitled La *Source* (1866) for this theatre, in collaboration with Minkous, a Polish composer. The composer returned to the operetta style with Malbrouk s'en va-t-en *guerre*,—written in collaboration with Georges Bizet, Émile Jonas and Legouix, and given at the Théâtre de l'Athénée in 1867. Two years later came *L'Écossais* de *Chatou*, a one-act piece, and La Cour *du* roi *Pétaud*, a three-act opera-bouffe. The ballet *Coppélia* was produced at the Grand Opéra on May 25, 1870, with enormous success.

Delibes gave up his post as second chorus master at the Grand Opéra in 1872 when he married the daughter of Mademoiselle Denain, formerly an actress at the Comédie Française. His first important dramatic work was Le Roi *l'a* dit, a charming comic opera, produced on May 24, 1873, at the Opéra Comique. Three years later, on June 14, 1876, Sylvia, a ballet in three acts, one of the composer's most delightful works, was produced at the Grand Opéra. This was followed by La *Mort D'Orphée*, a grand scena (Trocadéro concerts in 1878); *Jean* de *Nivelle* (Opéra Comique, Mar. 8, 1880), and by *Lakmé* (Opéra Comique, April 14, 1883). Lakmk has remained his most popular opera. The composer died in Paris on Jan. 16, 1891, leaving Kassya, a four-act opera, in an unfinished state. In 1881 Delibes became a professor of advanced composition at the Conservatoire; and in 1884 he took the place of Victor Massé at the Institut de France.

See E. Guiraud Delibes (1892).

DELILAH, in the Bible, the heroine of Samson's last love-story (Judges xvi.). She was a Philistine of Sorek (mod. Sūrīk), west of Zorah, who, bribed by the "lords of the Philistines" to entrap him, coaxed him (after several failures) into telling her the secret of his strength, whereupon she took advantage of his confidence to incapacitate him and betray him to his enemies. (See SAMSON.)

DELILLE, JACQUES (1738–1813), French poet, was born at Aigue-Perse in Auvergne. He was an illegitimate child, and was descended by his mother from the chancellor De l'Hôpital. He was educated at the college of Lisieux in Paris and became an elementary teacher. He gradually acquired a reputation as a poet by his epistles, in which things are not called by their ordinary names but are hinted at by elaborate periphrases. Sugar becomes "le miel américain que du suc des roseaux exprima l'Africain." The publication (1769) of his translation of the Georgics of Virgil made him famous. Voltaire recommended the poet for the next vacant place in the Academy, but his admission was deferred until 1774 on the ground of his youth. He showed a real love of nature, of an 18th century cultivated landscape, in his other poems, *Jardins* (1782), *L'Homme* des champs (1800), Les *trois règnes* de la *nature* (2 vols., 1808).

Delille had become professor of Latin poetry at the Collège de France, and abbot of Saint-Sévérin, when the outbreak of the Revolution reduced him to poverty. He retired to St. Dié, where he completed his translation of the *Aeneid*. He emigrated first to Basle and then to Glairesse in Switzerland, and he passed some time in London, chiefly employed in translating Paradise Lost. In 1802 he was able to return to Paris, where, although nearly blind, he resumed his professorship and his chair at the Academy, but lived in retirement.

His Oeuvres (16 vols.) were published in 1824. See Sainte-Beuve, Portraits *littéraires*, vol. ii.

DELIQUESCENCE, the absorption of water from the air by a crystalline hydrate (*q.v.*) to give, finally, a solution. This formation of a liquid phase occurs when the presence of water vapour in the air is above the vapour pressure of the hydrate.

DELIRIUM, a temporary form of brain disorder apt to occur in acute fevers, diseases and injuries of brain, exhaustion and some poisons; *e.g.*, opium, Indian hemp, belladonna, chloroform and alcohol. It may vary from slight and occasional wanderings of the mind and incoherence of expression, to fixed delusions and maniacal excitement, or may be associated with insensibility. (See INSANITY and NEUROPATHOLOGY.)

Delirium tremens is an acute symptom supervening on chronic alcoholism. Nevertheless, many habitual drunkards never suffer from delirium tremens.

It was long supposed that delirium tremens only comes on when the supply of alcohol has been suddenly cut off; but there

is abundant evidence that it occurs while the patient is still continuing to drink. Even when several days have elapsed between the cessation from drinking and the seizure, premonitory symptoms, consisting in aversion to drink and food, have shown themselves. An attack is often precipitated by disease (pneumonia), accidents (burns), severe mental strain or starvation, even where the supply of alcohol is less than would have been likely to produce it otherwise.

The earliest indications of an approaching attack are sleeplessness, terrifying dreams, restlessness and irritability of manner, with trembling of the hands and a thick or tremulous articulation. The skin is perspiring, the countenance oppressed-looking and flushed, the pulse rapid and feeble. During the attack the patient is mentally confused, talks incessantly and incoherently, has a distressed and agitated or perplexed appearance, and a vague notion that he is pursued by some one seeking to injure him. His delusions are usually transient, but he is constantly troubled with visual hallucinations of disagreeable animals or insects. The trembling of the muscles from which the name of the disease is derived is a prominent but not invariable symptom. It is most marked in the muscles of the hands and arms and in the tongue. The character of the delirium is seldom wild or noisy, but is much more commonly a combination of busy restlessness and indefinite fear. When spoken to, the patient can answer correctly enough, but immediately thereafter relapses into his former condition of incoherence.

In uncomplicated cases the symptoms abate in three to six days, cessation of the attack being marked by the occurrence of sound sleep, from which the patient awakes in his right mind, although exhausted and partly or wholly oblivious of his condition during his illness. Serious and permanent impairment of intellect is common in confirmed drunkards who have suffered from frequent attacks of this disease.

Treatment.— In mild attacks entire withdrawal of stimulants, liberal supply of light food, quietude and gentle but firm control may be all that is required. In severer attacks sedatives may be necessary, but must be given only under medical supervision

DELISLE, JOSEPH NICOLAS (1688–1768), French astronomer, was born in Paris on April 4, 1688. He proposed in 1715 the "Diffraction-theory" of the sun's corona, visited England and was received into the Royal Society in 1724, and left Paris for St. Petersburg on a summons from the empress Catherine towards the end of 1725. Having founded an observatory there, he returned to Paris in 1747, was appointed geographical astronomer to the naval department, and installed an observatory in the Hôtel Cluny. Charles Messier and J. J. Lalande were among his pupils. He died of apoplexy at Paris on Sept. 12, 1768.

Delisle is chiefly remembered as the author of a method for observing the transits of Venus and Mercury by instants of contacts which was first proposed by him in a letter to J. Cassini in 1743. In his *Mémoires pour servir à l'histoire et au progrès de l'astronomie* (St. Petersburg, 1738), he gave the first method for determining the heliocentric co-ordinates of sun-spots.

See S. Newcomb, *Washington Observations* for 1875, app. ii. pp. 176–189.

DELISLE, LEOPOLD VICTOR (1826–1910), French bibliophile and historian, was born at Valognes (Manche). At the École des Chartes, where his career was remarkably brilliant, his valedictory thesis was an *Essai sur les revenus publics en Normandie au XII^e siècle* (1849), and it was to the history of his native province that he devoted his early works. Of these the *Études sur la condition de la classe agricole et l'état de l'agriculture en Normandie au moyen âge* (1851), condensing an enormous mass of facts drawn from the local archives, was reprinted in 1905, without change, and remains authoritative. In Nov. 1852 he entered the manuscript department of the Bibliothèque Impériale (Sationale), of which in 1874 he became the official head in succession to Jules Taschereau. Delisle was responsible for the catalogue of printed books in the library, and under his administration the library was enriched with numerous acquisitions, notably by the purchase of a part of the Ashburnham mss. He was elected member of the Académie des Inscriptions et Belles Lettres in 1859, and became a member of the staff of the *Recueil des historietzs de la France,* collaborating in vols. xxii. (1865) and xxiii. (1876) and editing vol. xxiv. (1904), which is valuable for the social history of France in the 13th century. After his retirement (Feb. 21, 1905) he prepared a catalogue and description of the printed books and mss. in the Musée Condé at Chantilly, left by the duc d'Aumale to the French Institute. Of his other works may be mentioned his *Mélanges de paléographie et bibliographie* (1880) with atlas; *Mémoire sur les actes d'Innocent III.* (1857), and *Mémoire sur les opérations financieres des Templiers* (1889), a collection of documents of the highest value for economic history. The 32nd volume of the *Histoire littéraire de la France,* which was partly his work, is of great importance for the study of 13th and 14th century Latin chronicles. Delisle was undoubtedly the most learned man in Europe with regard to the middle ages; and his knowledge of diplomatics, palaeography and printing was profound. His output of work, in catalogues, etc., was enormous, and his services to the Bibliothbque Nationale in this respect cannot be overestimated. His wife, a daughter of Eugbne Burnouf, was for many years his collaborator.

The *Bibliographie* des *travaux* de *L. Delisle* (1902, supplement 1911), by Paul Lacombe, may be consulted for a full list of his numerous works.

DELITZSCH, FRANZ (1813–1890), German Lutheran theologian, Hebrew scholar and orientalist, was born at Leipzig on Feb. 23, 1813. He studied in the university of his native town, becoming in 1850 professor of theology at Erlangen, and in 1867 at Leipzig, where he died on March 4, 1890. Delitzsch was a strict Lutheran. With a view to the conversion of the Jews he edited the periodical *Saat auf Hofnung* from 1863, revived the "Institutum Judaicum" in 1880, founded a Jewish missionary college, and translated the *New Testament* into Hebrew. He acquired such a mastery of post-biblical, rabbinic and talmudic literature that he has been called the "Christian Talmudist." Though never an advanced critic, his article on Daniel in Herzog's *Realencyklopädie* (2nd ed.), his *New Commentary on Genesis* and the fourth edition of his *Isaiah* show that his sympathy with higher criticism increased — much so that Prof. Cheyne has included him among its founders.

He wrote valuable commentaries on *Habakkuk* (1843), *Genesis* (1852), *Neuer Kommentar über die Genesis* (1887, Eng. trans. 1888), *Psalms* (1869, Eng. trans. 1886), *Job* (1864), *Isaiah* (4th ed., 1889, Eng. trans. 1890), *Proverbs* (1873), *Epistle to the Hebrews* (1857, Eng. trans. 1865), *Song of Songs and Ecclesiastes* (4th ed. 1875). Other works are *Lutherthum u. Lugenthunz* (1839); *Geschichte der jüd. Poesie* (1836); *Jesus und Hillel* (1867); *Handwerkerleben zur Zeit Jesu* (1868, Eng. trans. 1902); *Poesieen aus vormuhammedanischer Zeit* (1874); Iris, *Farbenstudien und Blumenstücke* (1888, Eng. trans. 1889); *Messianische Weissagungen in geschichtlicher Folge* (1890); and a popular devotional work *Das Sakrament des wahren Leibes und Blutes Jesu Christi* (1844).

DELITZSCH, FRIEDRICH, German orientalist, son of the preceding, born at Erlangen on Sept. 3, 1850, and educated at Leipzig, became professor of Semitic languages and Assyriology successively at Leipzig, Breslau and Berlin. His chief works are: *Assyrische Lesestiicke* (1876); *Wo lag das Paradies* (1881); *Assyrisches Worterbuch zur gesampten bisher veröffentlichen Keilschriftliteratur* 3 pts. (1887–90); *Assyrische Grammatik* (1889, Eng. trans. 1889); *Geschichte Babyloniens* u. *Assyriens* (1891); *Babel u. Bibel* (1902, Eng. trans. 1903); *Grundziige der Sumerischen Grammatik* (1914); *Die Welt des Islam* (1915) and *Die grosse Tauschung . . . Israels Eindringen in Kanaan* (1920). *Babel und Bibel,* two lectures delivered before the German emperor, caused a great controversy because it denied the verbal inspiration of the Old Testament and contended that it was largely inspired by Babylonian stories and that Semitic monotheism had gradually developed. While this attitude was not in itself new, the public letter of the emperor proclaiming the need of orthodoxy and of a realization of the distinction between reason and revelation brought the position of scholars before the public, and thereby aroused violent discussions.

DELITZSCH, town, in the Prussian province of Saxony, Germany, on the Lober, an affluent of the Mulde, 12 m. N. of Leipzig at the junction of the railways, Bitterfeld-Leipzig and Halle-Cottbus. Pop. (1939) 17,913. It has an old castle of the 14th century now a female penitentiary. Besides *Kuhschwanz,* a peculiar kind of beer, it manufactures tobacco, cigars, chemicals, shoes and hosiery; and coal-mining is carried on in the neighbourhood. Originally a settlement of the Sorbian Wends, and in the 12th century part of the possessions of the bishops of Merseburg, Delitzsch ultimately passed to the Saxe-Merseburg family, and, on their extinction in 1738, was incorporated with Electoral Saxony but was finally transferred to Prussia in 1815.

DELIUM, BATTLE OF, 424 B.C. This battle, in the Peloponnesian War (*q.v.*) was the outcome of the Athenians' attempt to get control of Boeotia by a converging attack at three points, helped by expected uprisings of the democratic faction. But the Boeotians were forewarned and the risings forestalled. Nevertheless the main Athenian force was duly disembarked at Delium, on the coast, whither the Boeotians advanced to dislodge it. The significance of the subsequent battle is as a foreshadowing of the great era of Theban generalship under Epameinondas (*q.v.*), and of his method at Leuctra (*q.v.*). Room for deployment being restricted, the Theban commander, Pagondas, formed his right wing in exceptional depth—25 ranks, whereas the Athenians were the customary eight deep. When the two sides clashed, Pagondas's Boeotian left wing was driven in but the concentrated punch of his massive Theban phalanx on the right crushed their opponents. At this juncture Pagondas despatched his cavalry from the right wing, where it was unnecessary, to move round behind the hill from which he had advanced and to fall upon the Athenian right wing. This, disordered by its victorious encounter, was broken by the charge of Pagondas's cavalry, all the more effective because of the rarity of mounted shock tactics at that period. The defeated Athenian army was hotly pursued back to its landing place, and there embarked for home.

DELIUS, FREDERICK (1863–1934), British musical composer, was born at Bradford, Yorks, Jan. 29, 1863, the son of Julius Delius, a German, who, in 1860, became a naturalised British subject. He was educated at Bradford Grammar School and the International College, Isleworth, London. Declining the business career offered him in Bradford he went to Florida as an orange planter, but devoted his spare time to such musical study as he could obtain from the books in his possession. In 1886 he left Florida for Leipzig and there underwent a more or less regular training from Jadassohn and came under the influence of Grieg, then living in that town. His first published work, a *Légende* for violin solo with orchestral accompaniment, was issued in 1892, since when he has gained in ever-increasing measure, though very slowly, the recognition which is his due as one of the most considerable masters of his time. His music is as a whole however too delicate and restrained in character to be likely ever to secure wide general favour. Delius might be defined indeed as a musician's musician and although general recognition has come to him so slowly, and even still in such limited measure, among the discerning few he has never lacked warm .and whole-hearted appreciation. His not very extensive output comprises examples in most of the leading forms, including no fewer than six operas, *Irmelin, The Magic Fountain, Koanga, Margot la Rouge, Fennimore and Gerda* and *A Village Romeo and Juliet,* most of these have been produced in Germany but only the last named has been heard in England. Among his other compositions may be named, in the way of choral works, *A Mass of Life, Sea Drift, A Song of the High Hills,* and a *Requiem;* for orchestra, *Over the Hills and Far Away, Paris: the Song of a Great City, Life's Dance, Brigg Fair,* the two exquisite idylles *Summer Night on the River* and *On hearing the first Cuckoo in Spring,* and four concertos (pianoforte, violin, violoncello and violin and violoncello); for the chamber, two string quartets and three sonatas for violin and piano; and a number of songs. He was created a Companion'of Honour in 1929.

DELIUS, NIKOLAUS (1813–1888), German philologist and Shakespearean scholar, was born at Bremen Sept. 19, 1813. He was educated at Bonn and Berlin, and in 1855 was appointed professor of Sanskrit, Provenqal and English literature at Bonn, a post he held until his death. His greatest literary achievement was his scholarly edition of Shakespeare (1854–61). He also edited Wace's *St. Nicholas* (1850), a volume of Provenqal songs (1853), and published a *Slzakespere-Lexikon* (1852). As a critic of Shakespeare's text he stands in the first rank.

See the biographical notice by J. Schipper in *Englische Studien,* vol. 14 (1890).

DELLA BELLA, STEFANO (1610–1664), known in France as ÉTIENNE DE LA BELLE, Italian engraver, was born at Florence. He was apprenticed to a goldsmith; but turned his attention to engraving, and studied the art under Canta Gallina. By the liberality of Lorenzo de' Medici he was enabled to spend three years in study at Rome. In 1642 he went to Paris, where Cardinal Richelicu engaged him to make drawings at Arras of the siege and taking of that town by the royal army. About 1650 he returned to Florence. His productions numbered over 1,400 separate pieces. His masterpiece is the view of the Pont Neuf in Paris.

DELLA CASA, GIOVANNI (1503–1556), Italian poet, was born at Mugello, in Tuscany. He studied at Bologna, Florence and Rome, and Pope Paul III. made him nuncio to Florence, where he was elected a member of the celebrated academy, and then to Naples. He was appointed to the archbishopric of Benevento, and it was believed that it was only his openly licentious poem, *Capitoli del forno,* and the fact that the French court seemed to desire his elevation, which prevented him from being raised to a still higher dignity. He died in Rome on Nov. 14, 1556. Casa was the leader of a reaction in lyric poetry against the universal imitation of Petrarch, and originated a style, which, if less soft and elegant, was more nervous and majestic than that which it replaced. His principal prose work is *Il Galateo* (1558), a treatise of manners, which has been translated into several languages. A reproduction of the English translation by R. Peterson (1576) was edited by H. J. Reid in 1892.

A complete edition of his works, which include translations from Thucydides, Plato and Aristotle, was published at Florence in 1707, to which is prefixed a life by Casotti. The best edition is that of Venice, 1752.

DELLA COLLE, RAFFAELLMO, Italian painter, was born at Colle, near Borgo San Sepolcro, in Tuscany, about 1490. A pupil of Raphael, whom he is held to have assisted in the Farnesina and the Vatican, Della Colle, after his master's death, was the assistant of his chief pupil, Giulio Romano, at Rome and afterwards at Mantua. In his later years Della Colle resided at Borgo San Sepolcro, where he kept a school of design; among his many pupils of note may be mentioned Gherardi and Vecchi. His works, which are to be found at Urbino, at Perugia, at Pesaro and at Gubbio, are fine examples of the Roman school of Raphael.

DELLA CRUSCANS, THE, a group of insignificant versifiers, the leaders of which were R. Merry (actually a member of the Florentine academy *della Crusca—see* ACADEMIES) and Hannah Cowley. Their first production was a *Florentine Miscellany* (1785) to which Mrs. Piozzi contributed. Returning to England in 1787 Merry began to publish verses in *The World,* and the collected poems of the group appeared in *The British Album* (1789, four editions). In 1791 William Gifford fell upon them in *The Bauiad,* giving in his footnotes quotations which amply justify the severity of his satire. He renewed the attack in *The Maeviad* (1795) and there are references to the Della Cruscans in T. J. Mathias's *Pursuits of Literature* (1794–97). The Della Cruscan manner, beyond furnishing a name for a particular kind of fantastic and insipid verse had no consequences for literature.

DELLA PORTA, GIOVANNI BATTISTA (*c.* 1538–1615), Italian natural philosopher, was born of a noble and ancient family at Naples about the year 1538. He travelled extensively in Italy, France and Spain, and was still a youth when he published *Magia naturalis, sive de miraculis rerum naturalium lib. IV.* (1558), the first draft of his *Magia naturalis,* in 20 books, published in 1589. He founded in Naples the Academia Secretorum Naturae, otherwise known as the Accademia dei Oziosi; and in 1610 he became a member of the Accademia dei Lincei at Rome.

He died at Naples on Feb. 4, 1615.

Porta is the author of a number of books on cryptography, physiology of plants, farming, gardening, optics, etc. He also wrote several Italian comedies. His most important work, the *Magia naturalis,* deals with a strange medley of subjects, including the reproduction of animals. the transmutation of metals, pyrotechny, domestic economy, statics, hunting, the preparation of perfumes. Most of his work contains descriptions of experiments which were never performed and is much exaggerated. The only portions of any great interest are the experiments on magnetism and the optical experiments which include a description of the camera obscura (*q.v.*).

DELLA QUERCIA, or DELLA FONTE, **JACOPO** (1374–1438), Italian sculptor, was born at Siena. He was the son of a goldsmith of repute, Pietro d'Agnolo. In 1394 he made an equestrian statue of Gian Tedesco. In 1402 he was one of six artists who submitted designs for the great gates of the baptistery in Florence, in which competition Ghiberti was the victor. In 1406 he executed one of his finest works, the monument of Ilaria del Caretto, wife of Paolo Guinigi, at Lucca, and received a commission for the famous Fonte Gaia, at Siena, early in 1409. This work was not seriously begun by him until 1414, and was only finished in 1419. In 1858 the remains of the fountain were removed to the Opera del Duomo, where they are now preserved; a copy of the original by Sarrocchi being erected on the site. After another visit to Lucca in 1422, he returned to Siena, and in March 1425 undertook the contract for the doors of S. Petronio, Bologna. He was known, in following years, to have gone to Milan, Verona, Ferrara, and Venice; but the rest of his life was chiefly divided between his native city and Bologna. In 1430 he finished the great font of S. Giovanni at Siena, which he had begun in 1417, contributing himself only one of the bas-reliefs, "Zacharias in the Temple," the others being by Ghiberti, Donatello, and other sculptors. Among the work known to have been done by Jacopo may be mentioned also the reliefs of the *predella* of the altar of S. Frediano at Lucca (1422); and the Bentivoglio monument which was unfinished at the time of his death on Oct. 20, 1438. Jacopo della Quercia's work exercised a powerful influence on that of the artists of the later Italian Renaissance. He himself reflects not a little of the Gothic spirit, admirably intermixed with some of the best qualities of neo-classicism. His powers have hardly yet received the recognition they deserve.

See C. Cornelius, *Jacopo della Quercia: eine Kunsthistorische Studie* (1896), and works relating generally to the arts in Siena.

(E. F. S.)

DELLA ROBBIA, the name of a family of great distinction in the annals of Florentine art. Its members are shown in the following table:

LUCA DELLA ROBBIA (1399 or 1400–1482) was the son of a Florentine named Simone di Marco della Robbia. According to Vasari he was apprenticed to the silversmith Leonardo di Ser Giovanni; this, however, appears doubtful from the great age which it would give to Leonardo, and it is more probable that Luca was the pupil of Ghiberti. During the early part of his life Luca executed many important and exceedingly beautiful pieces of sculpture in marble and bronze. No sculptured work of the 15th century ever surpassed the singing gallery which he made for the cathedral at Florence between 1431 and 1438, with its ten magnificent panels of singing angels and dancing boys. This splendid work is now in the Museo del Duomo, and there is a cast in the Victorian and Albert museum, London, which also possesses a study in *gesso duro,* apparently Luca's original sketch, for one of the panels.

In 1437 Luca received a commission from the signorina of Florence for five reliefs for the campanile, to complete the series begun by Giotto and Andrea Pisano. These panels, with representative figures typifying grammar, logic, philosophy, music and science, are much in the earlier style of Giotto. In 1439 Luca in association with Donatello received an order for two marble altars for chapels in the cathedral. The reliefs from one of them—St. Peter's Deliverance from Prison and his Crucifixion—are now in the Bargello. A tabernacle made by Luca in 1442 is now at Peretola, near Florence, in the church of S. Maria. In 1437 Donatello received a commission to cast a bronze door for one of the sacristies of the cathedral; but, as he delayed to execute this order, the work was handed over to Luca in 1446, with Michelozzo and Maso di Bartolomeo as his assistants. Part of this wonderful door was cast in 1448, and the last two panels were finished by Luca in 1467. It is divided into ten square panels, with small heads in the style of Ghiberti projecting from the framing. The subjects are the Madonna and Child, the Baptist, the four Evangelists, and the four Latin Doctors, each with attendant angels. The heads are full of life, and the treatment of the drapery in broad simple folds is worthy of a Greek sculptor of the best period of Hellenic art.

The most important existing work in marble by Luca (executed in 1455–56) is the tomb of Benozzo Federighi, bishop of Fiesole, originally in the church of S. Pancrazio at Florence, but removed to S. Francesco di Paola in 1783 and in 1898 to the church of SS. Trinita in Florence. A very beautiful effigy of the bishop lies on a sarcophagus sculptured with graceful reliefs of angels holding a wreath which contains the inscription. Above are three-quarter length figures of Christ between St. John and the Virgin. The whole is surrounded by a rectangular frame of tiles of exquisite beauty, each painted in enamel pigments, with a bunch of flowers and fruit in brilliant realistic colours.

In the latter part of his life Luca was mainly occupied with the production of enamelled terra-cotta reliefs. The *rationale* of this process was to cover the clay relief with an enamel formed of the ingredients of glass *(marzacotto),* made white and opaque by oxide of tin. *(See* POTTERY AND PORCELAIN: *Italian Majolica.)* Though Luca was not the inventor of the process he extended its application to fine sculptured work in terra-cotta, so that it is known now as Della Robbia ware. The great majority of these reliefs which in Italy and elsewhere are ascribed to Luca are really the work of some of the younger members of the family or of the *atelier* which they founded. Among the earliest of the comparatively few which can with certainty be ascribed to Luca himself are medallions of the four Evangelists in the vault of Brunelleschi's Pazzi chapel in S. Croce. These fine reliefs are coloured with various metallic oxides in different shades of blue, green, purple, yellow, and black. It has often been wrongly asserted that the polychromatic reliefs belong to Andrea or his sons, and that Luca's were all in pure white, or in white and blue. A relief in the Victoria and Albert museum furnishes a striking example that colours were used freely by Luca and is of especial value from its great size, and because its date is known. This is an enormous medallion containing the arms of René of Anjou and other heraldic devices; it is surrounded by a splendidly modelled and brilliantly coloured wreath of fruit and flowers, especially apples, lemons, oranges and fir cones. This medallion was set up on the façade of the Pazzi Palace to commemorate René's visit to Florence in 1442. Other reliefs by Luca, also in glazed terra-cotta, are those of the Ascension and Resurrection in the tympani of the doors of the sacristies in the cathedral, executed in 1442 and 1446 and the tympanum reliefs of the Madonna between two Angels in the Via dell' Agnolo, a work of exquisite beauty, and another formerly over the door of S. Pierino del Mercato Vecchio, but now removed to the Bargello. Among the few existing statues by Luca are two lovely enamelled figures of kneeling angels holding candlesticks, now in the canons' sacristy. A very fine work executed between 1449 and 1452 is the tympanum relief of the Madonna and four Monastic Saints over

the door of S. Domenico at Urbino. He also made the four coloured medallions of the Virtues set in the vault over the tomb of the young cardinal-prince of Portugal in a side chapel of S. Miniato in Florence and various polychromatic medallions outside Or San Michele. The Victoria and Albert museum possesses 12 circular plaques of majolica ware painted in blue and white with the Occupations of the Months; these have been attributed to Luca but their origin is doubtful.

In 1471 Luca refused to serve as president of the Florentine Gild of Sculptors, on account of his age and infirmity. He died on Feb. 20, 1482. His chief pupil was his nephew Andrea, and Agostino di Duccio, who executed many pieces of sculpture at Rimini, and the marble reliefs of angels on the façade of S. Bernardino at Perugia, may have been the work of one of his assistants.

ANDREA DELLA ROBBIA (1435–1525), the nephew and pupil of Luca was born Oct. 20, 1435, and died Aug. 4, 1525. He carried on the production of the enamelled reliefs on a larger scale and also extended its application to various architectural uses, such as friezes and to the making of lavabos, fountains and large retables. Though the finest reliefs from the workshop of Andrea were but little if at all inferior to those from the hand of Luca, some of those by pupils and assistants reached only a lower standard of merit. Only one work in marble by Andrea is known, an altar in S. Maria delle Grazie near Arezzo.

Andrea sometimes omitted the enamel on the face and hands (nude parts) of his figures, especially when he had treated the heads in a realistic manner; as in the noble tympanum relief of the meeting of St. Dominic and St. Francis in the loggia of the Florentine hospital of S. Paolo—a design suggested by a fresco of Fra Angelico's in the cloister of St. Mark's. One of the most remarkable works by Andrea is the series of medallions with reliefs of Infants in white on a blue ground set on the front of the foundling hospital at Florence. He produced a large number of reliefs of the Madonna and Child, varied with much invention and all of extreme beauty of pose and sweetness of expression. These are frequently framed with realistic yet decorative garlands of fruit and flowers painted with coloured enamels, while the main relief is left white. The hospital of S. Paolo, near S. Maria Novella, has also fine medallions with reliefs of saints, two of Christ Healing the Sick, and two fine portraits, under which are white plaques inscribed "DALL ANNO 1451 ALL ANNO 1495." Arezzo possesses a number of fine enamelled works by Andrea and his sons, a retable in the cathedral and in the chapel of the Campo Santo a fine relief of the Madonna and Child with four saints at the sides. In S. Maria in Grado is a very noble retable with angels holding a crown over a standing figure of the Madonna Perhaps the finest collection of works of this class is at La Verna, not far from Arezzo. The three large retables with representations of the Annunciation, the Crucifixion, and the Madonna giving her Girdle to St. Thomas are probably the work of Andrea himself, the others being by his sons. In 1489 Andrea made a beautiful relief of the Virgin and two Angels, now over the archive-room door in the Florentine Opera del Duomo. In the same year he modelled the fine tympanum relief over a door of Prato cathedral, with a half-length figure of the Madonna between St. Stephen and St. Lawrence, surrounded by a frame of angels' heads.

In 1491 he was still working at Prato, where many of his best reliefs still exist. A fine bust of S. Lino exists over the side door of the cathedral at Volterra, which is attributed to Andrea. Other late works of known date are a magnificent bust of the Protontary Almadiano, made in 1510 for the church of S. Giovanni de' Fiorentini at Viterbo, now preserved in the Palazzo Comunale there, and a medallion of the Virgin in Glory, surrounded by angels, made in 1505 for Pistoia cathedral. One of the latest works attributed to Andrea, though apparently only a workshop production of 1515, is a relief representing the Adoration of the Magi, made for a little church, St. Maria, in Pian di Mugnone, near Florence. Portions of this work are still in the church, but some fragments of it are at Oxford.

Five of Andrea's seven sons worked with their father and after his death carried on the Robbia studio (see table).

LUCA II. The chief existing work known to be by the second Luca is the very rich and beautiful tile pavement in the uppermost story of Raphael's loggie at the Vatican, made at Raphael's request and under his supervision in 1518.

GIOVANNI DELLA ROBBIA (1469–1529?) was born May 19, 1469. He worked as assistant to his father, Andrea, and in many cases the enamelled sculpture of the two cannot be distinguished. Some of Giovanni's independent works are of great merit, especially the earlier ones; during the latter part of his career his reliefs deteriorated in style, owing to the universal decadence of the time. One of his finest works is a retable representing the Last Judgment at Volterra in the church of S. Girolamo, dated 1501. Quite equal in beauty to anything of his father's is the lavabo in the sacristy of S. Maria Novella at Florence, made in 1497. In the tympanum of the arch is a very lovely white relief of the Madonna between two Adoring Angels. This part is of enamelled clay, but the basin of the fountain is of white marble. Neither Luca nor Andrea was in the habit of signing his work, but Giovanni often did so, usually adding the date, probably because otherpotters had begun to imitate the Robbia ware. Among the very numerous other works of Giovanni are a relief in the wall of a former convent in the Via Nazionale at Florence, and two reliefs in the Bargello dated 1521 and 1522. At Pisa in the Campo Santo is a relief in Giovanni's later and poorer manner dated 1520; it is a Madonna surrounded by angels, with saints below. Giovanni's largest and perhaps finest work is the polychromatic frieze on the outside of the Del Ceppo hospital at Pistoia, for which he received various sums of money between 1525 and 1529; the subjects of this frieze are the Seven Works of Mercy. Six of these reliefs are by Giovanni, the sever-th, Giving drink to the Thirsty, was made by Filippo Paladini of Pistoia in 1585. Giovanni's chief pupil was Benedetto Buglioni (1461–1521), and a pupil of his, one Santi Buglioni (b. 1494), entered the Robbia workshops in 1521, and assisted in the later works of Giovanni.

GIROLAMO DELLA ROBBIA (1488–1566), another of Andrea's sons, was an architect and a sculptor in marble and bronze as well as in enamelled clay. During the first part of his life he worked with his father, but in 1528 he went to France and spent nearly 40 years in the service of the French Royal family. Francis I. employed him to build a palace in the Bois de Boulogne called the Château de Madrid, decorated richly with terra-cotta medallions, friezes and other architectural features. For this purpose he set up kilns at Suresnes. Though the palace has been destroyed, drawings of it exist.

The best collections of Robbia ware are in the Florentine Bargello, Accademia, and Museo del Duomo; the Victoria and Albert museum (the finest out of Italy); the Louvre, the Cluny and the Berlin museums; while fine examples are to be found in New York, Boston, Leningrad and Vienna. Many fine specimens exist in private collections in England, France, Germany and the United States. The greater part of the Robbia work still remains in the churches and other buildings of Italy, especially in Florence, Fiesole, Arezzo, La Verna, Volterra, Barga, Montepulciano, Lucca, Pistoia, Prato, and Siena.

Florence, 1868).

DELMEDIGO, a Cretan Jewish family, of whom the following are the most important:

ELIJAH DELMEDIGO (1460–1497), philosopher, taught in several Italian centres of learning. He translated some of Averroes' commentaries into Latin at the instigation of Pico di Mirandola. In the sphere of religion, Delmedigo represents the tendency to depart from the scholastic attitude in which religion and philosophy were identified. His principal work, *Behinath ha-Dath* (Investigation of Religion), was devoted to this end.

JOSEPH SOLOMON DELMEDIGO (1591–1655), pupil of Galileo, wrote many books on science and philosophy, and bore a considerable part in initiating the critical movement in Judaism. He belonged to the sceptical school, and though his positive contributions to literature were not of lasting worth, Graetz includes him among the Important formative influences within the synagogue of the 17th century.

DELMENHORST, a town, *Land* of Oldenburg, Germany, on the Delme, 8 m. by rail W. from Bremen, at the junction of a line to Vechta. Pop. (1939) 38,147. It is engaged in woolcombing, weaving, jute-spinning and the manufacture of linoleum. Delmenhorst was founded in 1230, and from 1247 to 1679, when it was destroyed by the French, was protected by a strong castle.

DELOLME, JEAN LOUIS (1740–1806), Swiss jurist and constitutional writer, was born in Geneva in 1740, and died at Sewen, July 16, 1806. Having given offense to the authorities by a pamphlet entitled *Examen de trois parts de droit,* he was forced to take refuge in England, where he stayed. until 1775. During his exile Delolme made a careful study of the English constitution, the results of which he published in his *Constitution de l'Angleterre* (Amsterdam, 1771), of which an enlarged and improved edition in English appeared in 1772. Along with a translation of Hume's *History of England* it supplied the *philosophes* with most of their ideas about the English constitution. It thus was used somewhat as a political pamphlet. Several editions were published after the author's death. Delolrne also wrote in English, *Parallel between tlze English Government and the former Government of Sweden* (1772); *A History of the Flagellants* (1782), based upon a work of Boileau's; *An Essay on the Union of Scotland with England* (1787), and one or two smaller works. Notice by C. Coote prefixed to the 1807 edition of the English translation of the *Constitution.*

DELONEY (or DELONE), **THOMAS** (1543?–1607?), English ballad-writer and pamphleteer. In 1588 the coming of the Armada inspired him to write three broadsides, which were reprinted (1860) by J. O. Halliwell-Phillipps. *A* collection of *Strange Histories* (1607), known in later and enlarged editions as *The Royal Garland of Love and Delight* and *The Garland of Delight,* consists of historical ballads by Deloney, with some poems from other hands.

See the works of Thomas Deloney, ed. F. O. Mann, Oxford (1912).

DE LONG, GEORGE WASHINGTON (1844–1881), American explorer, was born in New York city on Aug. 22, 1844. He graduated at the U.S. Naval academy in 1865, entered the U.S. navy, attaining the rank of lieutenant in 1869, and lieutenant-commander in 1879. In 1873 he took part in the voyage of the "Juniata," sent to search for and relieve the American Arctic expedition in the "Polaris," which was sent out from Upernavik, Greenland. In 1879 he again set out for the Arctic in the "Jeannette." The "Jeannette" was caught in the polar ice-pack Sept. 5, 1879, and drifted helplessly until June 13, 1881, when she was finally crushed and sunk About 14 members of the expedition survived. De Long succeeded in reaching the mouth of the Lena river in one of the boats, only to die of starvation. His journal, in which he made regular entries until the day of his death, was edited by his wife and published in 1883 under the title of *Voyage of the "Jeannette."* Three years after the ship was sunk several articles belonging to the crew of the "Jeannette" were found on an ice-floe on the south-west coast of Greenland, a fact that added fresh evidence to the theory of a continuous ocean current passing along the unknown Polar regions.

DELORME, MARION (1613–1650), French courtesan, was the daughter of Jean de Lou, sieur de l'Orme, president of the treasurers of France in Champagne, and of Marie Chastelain. She was born at her father's château near Champaubert on Oct. 3, 1613. Initiated into the philosophy of pleasure by the epicurean and atheist, Jacques Vallée, sieur Desbarreaux, she soon left him for Cinq-Mars, whom she is said to have married secretly. Her salon became one of the most brilliant centres of elegant Parisian society. After the execution of Cinq-Mars she is said to have numbered among her lovers Charles de St. Evremond (1610–1703) the wit and litterateur, Buckingham (Villiers), the great Condé, and even Cardinal Richelieu. Under the Fronde her salon became a meeting place for the disaffected, and her arrest is said to have been pending when she died on July 2, 1650. Legendary accounts declared that she lived until 1706 or even 1741, after having had the most fantastic adventures, including marriage with an English lord and an old age spent in poverty in Paris. She figures in Alfred de Vigny's *Cinq-Mars,* and in Victor Hugo's *Marion Delorme.*

See P. L. Jacob, *Marion Delorme et Ninon Lenclos* (1859); J. Peladan, *Histoire et légende de Marion de Lorme* (1882).

DE L'ORME, PHILIBERT (c. 1510–1570), French architect, one of the great masters of the Renaissance, was born at Lyons, the son and pupil of the architect Jehan de L'Orme. At an early age Philibert was sent to Italy to study (1533–36) and was employed there by Pope Paul III. Returning to France he was patronized by Cardinal du Bellay at Lyons, and was sent by him about 1540 to Paris, where he began the Château de St. Maur; in 1545 he was made architect to Francis I. and given the charge of works in Brittany. In 1548 Henry II. gave him the supervision of Fontainebleau, Saint-Germain and the other royal buildings; but on his death (1559) Philibert fell into disgrace. Under Charles IX., however, he returned to favour, and was employed to construct the Tuileries, in collaboration with Jean Brillant. He died in Paris on Jan. 8, 1570. An ardent humanist and student of the antique, he yet vindicated resolutely the French tradition in opposition to Italian tendencies; he was a man of independent mind and a vigorous originality. His masterpiece was the Château d'Anet (1552–59), built for Diane de Poitiers, the plans of which are preserved in Du Cerceau's *Plus excellens bastimens de France,* and his designs for the Tuileries (also given by Du Cerceau), begun by Catherine de' Medici in 1565, were magnificent. His work is also seen at Chenonceaux and other famous châteaux; and his tomb of Francis I. at St. Denis remains a perfect specimen of his art. He wrote two books on architecture (1561 and 1567).

See Chevalier, *Lettres et devis relatifs à la construction de Chenonceaux* (1864); Pfror, *Monographie du château d'Anet* (1867); Marius Vachon, *Philibert de L'Orme* (1887); Herbet, *Travaux de P. de L'Orme à Fontainebleau* (1890).

DELOS (mod. *Mikra Dili,* or Little Delos, to distinguish it from Megali Dili, or Great Delos), an island in the Aegean, the smallest but most famous of the Cyclades, and, according to the ancient belief, the spot round which the group arranged itself in a nearly circular form. It is a rugged mass of granite, about 3 m. long and 1 m. to ½ m. broad, about ½ m. E. of Megali Dili or Rheneia, and 2 m. W. of Myconus. Towards the centre it rises to its greatest height of 350 ft. in the steep and rocky peak of Mount Cynthus, which, though overtopped by several eminences in the neighbouring islands, is very conspicuous from the surrounding sea.

Archaeology.—Excavations have been made by the French school at Athens slowly but systematically since 1877. The sacred precinct of Apollo has been recovered, as well as the commercial quarter of Hellenistic and Roman times, the theatre, the temples of the foreign gods, the temples on the top of Mount Cynthus, and interesting private houses. Sculpture of all periods has been found, and extensive series of inscriptions throwing light upon temple administration.

The ancient mole faces the channel between Delos and Rheneia. The precinct is approached by an avenue flanked by porticoes, that upon the seaside bearing the name of Philip V. of Macedon, who dedicated it about 200 B.C. This was the usual approach for sacred embassies and processions; but Nicias, on the occasion of his embassy, built a bridge from the island of Hecate to Delos, that the Athenian procession might not miss its full effect. Facing

the avenue were the propylaea, the chief entrance, with a projecting portico of four columns. The sacred road continued across an open space, with the precinct of Artemis on its west side, and, on its east side, a terrace on which stood three temples. The southernmost of these was the temple of Apollo, but only its back was visible from this side. The other two faced west and were either dedicated to heroes or minor deities or were treasuries. Beyond them the road sweeps round to the front of the temple of Apollo. The outer side of this curve is bounded by a row of treasuries, similar to those at Delphi and Olympia, to house the offerings of various islands or cities. The temple of Apollo could also be approached directly from the entrance, through a passage with a porch at either end. Just to the north of this is the basis of the colossal Apollo dedicated by the Naxians, with its well-known archaic inscription and two large fragments of the statue itself.

The temple of Apollo, the centre of the whole precinct, was of Doric style, built early in the 4th century B.C. Its sculptural decoration was but scanty; the metopes were plain: the acroteria are now in the national museum at Athens; at the one end was Boreas carrying off Oreithyia, at the other Eos and Cephalus, the centre in each case being occupied by the winged figure. To the east of the temple was an oblong Prytaneum or other official building with colonnade on each side. Beyond it is the most interesting and characteristic of all the monuments of Delos, a long narrow hall, entered by a portico at its south end. At the north end was the famous altar, built out of the horns of the victims, which was sometimes reckoned among the seven wonders of the world. The rest of the room is taken up by a paved space, surrounded by a narrow gangway; and on this it is supposed that the γέρανος or stork-dance took place. The most remarkable architectural feature of the building is the partition that separated the altar from this long gallery; it consists of two columns between *antae,* with capitals of a very peculiar form, consisting of the fore parts of bulls set back to back; from these the whole building is sometimes called the sanctuary of the bulls. Beyond it, on the east, was a sacred wood filling the space up to the mall of the precinct; and at the south end of this was a small open space with the altar of Zeus Polieus.

At the north of the precinct was a broad road, flanked with votive offerings and exedrae, and along the boundary were porticoes, reception chambers and two entrances through extensive propylaea. At the north-west corner is a building of limestone, often mentioned in the inventories of treasures. South of it is the precinct of Artemis, containing within it the old temple of the goddess; her more recent temple was to the south, opening into the precinct of Apollo. The older temple is mentioned in some of the inventories as "the temple in which were the seven statues"; and close beside it was found a series of archaic draped female statues, which was the most important of its kind until the discovery of the finer and better preserved set from the Athenian Acropolis. Outside the precinct of Apollo, on the south, was an open place; between this and the precinct was a house for the priests, and within it, in a kind of court, a set of small structures identified as the tombs of the Hyperborean maidens. To the east was the temple of Dionysus, of peculiar plan; on the other side of it was a large court, forming a commercial exchange; with a temple to Aphrodite and Hermes.

To the north between the precinct and the sacred lake, are extensive ruins of the commercial town including a sort of club or exchange and the new and the old palaestra. The shore of the channel facing Rheneia is lined with docks and warehouses, and behind them are private houses of the 2nd or 3rd century B.C. Each consists of a single court surrounded by columns and often paved with mosaic; various chambers open out of the court, including usually one of large proportions, the ἀνδρών or dining-room for guests. The theatre, set in the lower slope of Mount Gynthus, has the wings of the auditorium supported by massive substructures. The *scena* consisted of an oblong building of two storeys, surrounded by a low portico reaching to the level of the first floor. This was supported by pillars, set closer together along the front than at the sides and back. An inscription showed that this portico, or at least the front portion of it, was called the *proscenium* or *logeum,* two terms of which the identity was previously disputed. On the summit of Mount Cynthus, above the primitive cave-temple which has always been visible, is a small precinct dedicated to Zeus Cynthius and Athena Cynthia. Some way down the slope of the hill, between the cave-temple and the ravine of the Inopus, is a terrace with the temples of the foreign gods, Isis and Serapis, and a small odeum.

History. — Many alternative names for Delos are given by tradition; one of these, Ortygia, is elsewhere also assigned to an island sacred to Artemis. Of the various traditions that were current among the ancient Greeks regarding the origin of Delos, the most popular describes it as drifting through the Aegean till moored by Zeus for the wandering Leto, as a birthplace for Apollo and Artemis. The island first appears in history as the seat of a great Ionic festival to which the various Ionic States, including Athens, were accustomed annually to despatch a sacred embassy, at the anniversary of the birth of the god on the 7th of Thargelion (about May). In the 6th century B.C. the influence of the Delian Apollo was at its height; Polycrates of Samos dedicated the neighbouring island of Rheneia to his service and Peisistratus of Athens caused all the area within sight of the temple to be cleared of the tombs by which its sanctity was impaired. After the Persian wars, the predominance of Athens led to the transformation of the Delian amphictyony into the Athenian empire. *(See* DELIAN LEAGUE.) In 426 B.C., in connection with a reorganization of the festival, which henceforth was celebrated in the third year of every Olympiad, the Athenians instituted a more elaborate lustration, caused every tomb to be removed from the island, and established a law that ever after any one who was about to die or to give birth to a child should be at once conveyed from its shores. And even this was not accounted sufficient, for in 422 they expelled all its secular inhabitants, who were, however, permitted to return in the following year.

At the close of the Peloponnesian War the Spartans gave to the people of Delos the management of their own affairs; but the Athenian predominance was soon after restored, and survived an appeal to the amphictyony of Delphi in 345 B.C. During Macedonian times, from 322 to 166 B.C., Delos again became independent; and the temple and its possessions were administered by officials called ἱεροποιοί. After 166 B.C. the Romans restored the control of Delian worship to Athens, but granted to the island various commercial privileges which brought it great prosperity. In 87 B.C. Menophanes, the general of Mithradates VI. of Pontus, sacked the island, which had remained faithful to Rome. From this blow it never recovered; the Athenian control was resumed in 42 B.C., but Pausanias (viii. 33. 2) mentions Delos as deserted but for a few Athenian officials; and several epigrams of the first or second century A.D. attest the same fact, though the temple and worship were probably kept up until the official extinction of the ancient religion. A museum has now been built to contain the antiquities found in the excavations; otherwise Delos is now uninhabited, though during the summer months a few shepherds cross over with their flocks from Myconus or Rheneia. As a religious centre it is replaced by Tenos and as a commercial centre by the flourishing port of Syra.

BIBLIOGRAPHY.—The French excavations are fully published in *Fouilles de Delos* (in progress); *see* also Th. Homolle, *Les Archives de l'intendance sacrée à Délos* (with plan). For history, *see* Sir R. *C.* Jebb, *Journal of Hellenic Studies,* i. (1889), pp. 7–62, and Pauly-Wissowa. For works of art found at Delos *see* GREEK ART.

DE LOUTHERBOURG, PHILIP JAMES (1740–1812), English artist, was born at Strasbourg on Oct. 31, 1740, where his father, of Polish descent, practised miniature painting; but he spent the greater part of his life in London, where he was naturalized, and exerted a considerable influence on the scenery of the English stage. De Loutherbourg studied under Vanloo in Paris, and painted landscapes, sea storms, battles, all of which had some celebrity. He travelled in Switzerland, Germany and Italy, distinguishing himself as much by mechanical inventions as by painting. One of these, showing quite new effects produced in a model theatre, was the wonder of the day. The exhibition of lights behind canvas representing the moon and stars, the illusory

appearance oi running water produced by clear blue sheets of metal and gauze, with loose threads of silver, and so on, were his devices. In 1771 he came to London, and was employed by Garrick, who offered him £500 a year to apply his inventions to Drury Lane, and to superintend the scene painting, which he did with complete success. Garrick's own piece, the *Christmas* Tale, and the pantomime, 1781–82, introduced the novelties to the public, and the delight not only of the masses, but of Reynolds and the artists, was unbounded.

"Lord Howe's Victory off Ushant" (1794), and other large naval pictures were commissioned for Greenwich Hospital gallery; his finest work was the "Destruction of the Armada." A pamphlet published in 1789, entitled *A* List *of* a few Cures *performed* by *Mr.* and Mrs. De *Loutherbourg without Medicine,* shows that he had taken up faith-healing, and he seems to have associated at one time with Cagliostro. He died on March 11, 1812.

DELPHI (the Pytho of Homer and Herodotus; in Boeotian inscriptions Βελφοί, on coins Δαλφοί), a place in ancient Greece in the territory of Phocis, famous as the seat of the most important temple and oracle of Apollo. It was situated about 6 m. from the north shore of the Corinthian gulf, in a rugged glen, closed on the N. by the wall-like under-cliffs of Mount Parnassus known as the Phaedriades or shining rocks, and on the S. by Mount Cirphis. Between the two mountains the Pleistus stream flowing from east to west, receives the brooklet which rises as the Castalian fountain in a deep gorge in the Parnassian cliff. About 7 m. to the north, on the side of Mount Parnassus, was the famous Corycian cave, which afforded the people of Delphi a refuge during the Persian invasion. It is now called in the district the Sarant' Aulai or Forty Courts, and is said to be capable of holding 3,000 people.

I. Site.—The site of Delphi was occupied by the modern village of Castri until it was bought by the French government in 1891. Systematic excavation began in 1892. The plan of the precinct is now easily traced, and with the help of Pausanias many of the buildings have been identified.

The ancient "Hellenico" wall running east and west and the two boundary walls running up the hill at each end of it, are clear. In the eastern part was the main entrance by which Pausanias entered along the Sacred Way. This road zigzags up the hill, with treasuries and bases of offerings on both sides. First westwards to an open space, then eastwards till it reaches the eastern end of the terrace wall that supports the temple. Here it curves up north and then west towards the temple. Above this, are the Lesche and the theatre, and on a higher level still, to the west, is the stadium. In describing the monuments, the simplest plan is to follow Pausanias. Outside the entrance is a paved court flanked by a Roman colonnade. On the north side of the Sacred Way, close to the main entrance, stood the offering dedicated by the Lacedaemonians after the battle of Aegospotami, a quadrangular building with a back wall but stood open to the road. On a stepped pedestal stood statues of the gods and the admirals.

The statues of the Epigoni stood on a semicircular basis on the south side of the way; opposite them another semicircular basis carried the statues of the Argive kings. Farther west was the Sicyonian treasury south of the way, a small Doric temple in antis, with its entrance on the east. The sculptures from this treasury (in the museum) are in rough limestone, and most likely belong to an earlier building.

The Cnidian treasury (originally surmised by the excavators to be the treasury of Siphnos) stands south of the way farther west. It is a small Ionic temple of marble with two caryatids between antae on a substructure. The sculpture from its frieze and pediment is of great interest and the fragments of architectural mouldings are of great delicacy and beauty; perhaps the most perfect example of the transitional style of the early 5th century. Standing back from the path as it bends is the Theban treasury; then where the path turns again, the Athenian. This structure, a small Doric temple in *antis*, has been rebuilt with the original blocks. There can be no doubt about the identity of the building, for the basis bears the remains of the dedicatory inscription, stating that it was erected from the spoils of Marathon. The sculptured metopes are of the highest interest. The famous inscriptions with hymns to Apollo accompanied by musical notation were found on stones belonging to this treasury.

Above the Athenian treasury is the "Sybil's rock." Here, too, was placed the curious column, on which stood the colossal sphinx, dedicated by the Naxians, now in the museum.

A little farther on, but below the Sacred Way, another open space, of circular form, is perhaps the sacred threshing-floor on which the drama of the slaying of the Python by Apollo was periodically performed. Opposite, and backed against the beautifully jointed polygonal wall which supports the terrace on which the temple stands, is the colonnade of the Athenians, now assigned to the end of the 6th century. The polygonal wall at the back is covered with inscriptions concerning the manumission of slaves.

After passing the Great Altar, dedicated by the Chians, on the left the way enters the space in front of the temple, with remains of offerings by the Cyrenians and by the Corinthians. The site of the temple shows successive structures. Of that built by the Alcmaeonids in the 6th century B.C. considerable remains have been found. Sculptures assigned to this building are archaic and resemble those from the early temple of Athena at Athens. The existing foundations are of the 4th century. They give no certain information as to the sacred cleft and other matters relating to the oracle. Up in the north-eastern corner of the precinct, at the foot of the cliffs, is the interesting Cnidian clubhouse, a long narrow building; the famous paintings were probably disposed so as to meet in the middle of the north side. Scanty fragments of the frescoed walls are not enough to give information as to the work of Polygnotus.

At the north-western corner of the precinct is the theatre. The stadium lies to the north-west on a narrow plateau supported by a terrace wall. The seats are well preserved; some are hewn in the rock. An immense number of inscriptions have been found in the excavations, and many works of art, including a bronze charioteer (see GREEK ART).

II. History.---Our information as to the oracle at Delphi and how it was consulted is confused; probably ritual varied. The tale of intoxicating "mephitic" vapour has no early authority, nor is it scientifically probable. The questions had to be given in writing, and the responses were uttered by the Pythian priestess, in early times a maiden, later a woman over 50 attired as a maiden. After chewing the sacred bay and drinking of the spring Cassotis, which was conducted into the temple by artificial channels, she took her seat on the sacred tripod in the inner shrine. Her utterances were reduced to verse and edited by the prophets and the "holy men" (ὅσιοι). (See also ORACLE.)

Delphi also contained the "Omphalos," a sacred stone bound with fillets, supposed to mark the centre of the earth. It was said Zeus had started two eagles from the opposite extremities and they met there. Other tales said the stone was the one given by Rhea to Cronus as a substitute for Zeus.

For the history of the Delphic Amphictyony see under AMPHICTYONY. The oracle at Delphi was asserted by tradition to have existed before the introduction of Apollo-worship and to have belonged to the goddess Earth (Ge or Gaia). The Homeric Hymn to Apollo evidently combines two different versions, the approach of Apollo from the north by land, and the introduction of his votaries from Crete. The earliest stone temple built by Trophonius and Agamedes, was destroyed by fire in 548 B.C., and the contract for rebuilding was undertaken by the exiled Alcmaeonidae from Athens, who generously substituted marble on the eastern front for the specified limestone. Portions of the pediments of this temple have been found in the excavations; but no sign of the pediments mentioned by Pausanias, representing on the east Apollo and the Muses, and on the west Dionysus and the Thyiades (Bacchantes), and designed by Praxias, the pupil of Calanias. The temple seen by Pausanias (of which the foundations were found by the excavators) was that of which the building is recorded in inscriptions of the 4th century.

A raid on Delphi attempted by the Persians in 480 B.C. was said to have been frustrated by the god himself, by means of a storm or earthquake which hurled rocks down on the invaders; a similar tale is told of the raid of the Gauls in 279 B.C. But the

sacrilege thus escaped was inflicted by the Phocian defenders of Delphi during the Sacred War, 356–346 B.C., when many precious offerings were melted down. The Phocians were condemned to replace their value to the amount of 10,000 talents, which they paid in instalments. In 86 B.C. the sanctuary and its treasures were put under contribution by L. Cornelius Sulla for the payment of his soldiers; Nero removed no fewer than 500 bronze statues from the sacred precincts; Constantine the Great enriched his new city by the sacred tripod and its support of intertwined snakes dedicated by the Greek cities after the battle of Plataea. This still exists; with its inscription, in the Hippodrome at Constantinople. Julian afterwards sent Oribasius to restore the temple; but the oracle responded to the emperor's enthusiasm with nothing but a wail over the glory that had departed.

Provisional accounts of the excavations appeared during the excavations in the *Bulletin de correspondance hellénique*. A summary is given in J. G. Frazer, *Pausanias*, vol. v The official account is entitled *Fouilles de Delphes*. For history *see* Hiller von Gartringen in Pauly-Wissowa, *Realencyclopädie, s.v.* "Delphi." For cult *see* L. R. Farnell, *Cults of the Greek States*, iv. 179–218.

DELPHINIA, a festival of Apollo Delphinius held annually on the 6th (or 7th) of the month Munychion (April) at Athens. All that is known of the ceremonies is that a number of girls proceeded to his temple (Delphinium) carrying suppliants' branches and seeking to propitiate Apollo, probably as a god having influence on the sea. It was at this time of the year that navigation began again after the storms of winter. According to the story in Plutarch (Theseus, 18), the festival was instituted by Theseus (q.v.) to commemorate his voyage to Crete.

See A. Mommsen, *Festeder Stadt Athen* (1898); Preller-Robert, I., 260; P. Stengel, *Die griechische Kultus-altertümer* (1898); Daremberg and Saglio, *Dictionnaire des antiquitis; G.* F. Schoemann, *Griechische Altertümer* (4th ed., 1897–1902).

DELPHINIUM, a genus of herbaceous plants of the crowfoot family (Ranunculaceae), comprising 150 or more species, native to north temperate regions, several of which are widely cultivated for their irregular but very showy flowers. The rocket larkspur (D. *Ajacis*) occurs in Great Britain and is somewhat naturalized in the eastern United States and Canada. Upwards of 40 species are natives of North America, most numerous in the Rocky Mountain region and on the Pacific coast, some of which are poisonous to grazing animals. Among the best known are the dwarf larkspur (D. tricorne), the tall larkspur (D. exaltatum), and the prairie larkspur (D. *carolinianum*) of the eastern and central states; the mountain larkspur (D. *occidentale*), of the central Rockies; and the cardinal larkspur (*D. cardinale*), and the red larkspur (D. *nudicaule*), of the Pacific coast. Among the most extensively cultivated forms are the rocket larkspur, native to Europe; the field larkspur (D. *Consolida*), native to Asia; the bouquet larkspurs derived from D. *grandiflorum*, of eastern Asia; and the candle larkspurs, probably derived chiefly from D. *elatum*, of Eurasia.

DELPHINUS, a small constellation (*q.v.*) appearing in the northern hemisphere not far from Altair, the brightest star of the constellation Aquila (*q.v.*). As its name signifies, it was supposed by the ancients to represent a dolphin. γ Delphini is a double star, the yellowish component being of magnitude 4, and the bluish component of the 5th magnitude (see STAR).

DELPHOS, a city of western Ohio, U.S.A., in Allen and Van Wert counties, 70 mi. S.W. of Toledo. It is on federal highway 30, and is served by the Nickel Plate, the Northern Ohio and the Pennsylvania railways. The population was 5,745 in 1920; 1930 it was 5,672; 1940, 5,746 by federal census. The city has railroad shops, a galvanizing plant and other manufacturing industries.

DEL RIO, a city of southwestern Texas, U.S.A., on the Rio Grande, 150 mi. W. of San Antonio; county seat of Val Verde county. Del Rio is on federal highways 90 and 277 and the Southern Pacific railway.

Across the Rio Grande is the Mexican city of Villa Acuna. Population of Del Rio, 1940 census, was 13,343. Val Verde county (Del Rio) is the largest wool, sheep and lamb producing county in the United States

Shipped annually from Del Rio are 8,000,000 lb. of wool, 400,000 lambs and 3,000,000 lb. of mohair.

The city was founded in 1872 and has a commission form of government.

DELTA, the tract of coastal land bounded by the most divergent branches of a river's mouth, and traversed by other tributaries of the stream. The name comes from the shape of the delta resembling the Greek (A) letter of that name. This triangular area is formed from the fine silt brought down in suspension by a muddy river and is deposited when the river's current becomes ineffective on reaching the sea. When tidal currents are insignificant, the delta advances seawards, forming a local addition to the coastal land. The term, by analogy, is now applied to lake deltas and also to tributary river deltas. In the latter case the feature is usually small and occurs where a swift muddy tributary enters a slowly-flowing main stream. Lake deltas formed by an entering stream at the side of a lake occasionally grow outwards as far as the opposite shore and result in the lake being divided into two separate water areas, *e.g.*, Thun and Brienz in Switzerland.

DELTA RAYS, a stream of slowly moving electrons emitted when α particles impinge on matter (*see* RADIOACTIVITY).

DELUC, JEAN ANDRE (1727–1817), Swiss geologist and meteorologist, was born at Geneva on Feb. 8, 1727, and spent his early manhood in business and politics in his native city. He settled in England in 1773, and became reader to Queen Charlotte, a position which gave him a competency and leisure to travel in pursuit of his scientific studies. Deluc, who was a fellow of the Royal Society, died at Windsor on Nov. 7, 1817.

His principal geological work, *Lettres* physiques et morales *sur les* montagnes et *sur l'histoire* de la terre et de *l'homme* (1778; enl. ed. 1779), explained the six days of the Mosaic creation as so many epochs preceding the actual state of the globe. Deluc discovered many important facts relating to heat and moisture He noticed the disappearance of heat in the thawing of ice about the same time that J. Black founded on it his ingenious hypothesis of latent heat. He ascertained that water was more dense about 40° F (4° C) than at the temperature of freezing, expanding equally on each side of the maximum; and he was the originator of the theory, readvanced later by Dalton, that the quantity of aqueous vapour contained in any space is independent of the presence or density of the air, or of any other elastic fluid.

In the *Phil.* Trans., 1773, appeared his account of a new hygrometer, which resembled a mercurial thermometer, with an ivory bulb, which expanded by moisture, and caused the mercury to descend. The first correct rules ever published for measuring heights by the barometer were those he gave in the Phil. Trans., 1771, p. 158. He sent to the Royal Society, in 1809, a long paper on separating the chemical from the electrical effect of the pile, with a description of the electric column and aerial electroscope, in which he advanced opinions so little in unison with the latest discoveries of the day, that the council deemed it inexpedient to admit them to the *Transactions*. The paper was afterwards published in Nicholson's Journal (xxvi.), and the dry column described in it was constructed by various experimental philosophers. This dry pile or electric column has been regarded as his chief discovery.

His other works include: *Recherches sur les modifications de l'atmosphère* (Geneva, 2 vols., 1772), which contains accounts of many physical experiments; and *Traitt élémentaire de géologie* (1809, Eng. trans., 1809), in refutation of the Vulcanian theory of Hutton and Playfair. Many of his papers on subjects kindred to those mentioned are to be found in the *Transactions* and in the *Philosophical Magazine*. See *Philosophical Magazine* (Nov. 1817).

DELUGE is the name given to a great flood of water submerging the whole or a large part of the earth's surface. Legends of such floods occur in the traditions of many peoples. Collections of these legends have been made by several scholars, notably R. Andree (Die Flutsagen, 1891), M. Winternitz (Die *Flutsagen* des *Alterthums* und der *Naturvölker*, 1901), and J. G. Frazer (Folklore in the Old Testament, vol. i. pp. 104–361).

Hebrew Traditions. — The most familiar of these stories is that related in Genesis vi.–ix. It has long been recognized that the Biblical record consists of two distinct traditions which have been dovetailed by an editor to make a consecutive story. One of

these comes from the Yahwist document J, the other from the "priestly" source P. The matter common to the two traditions tells of God's anger at the iniquity of mankind, whom He therefore proposes to destroy by a flood. Noah, whose piety finds favour in God's eyes, is instructed to take into an "ark" his family and specimens of all beasts and birds. (In J the animals fit for sacrifice are taken by sevens, the others by twos, but in P all alike by twos.) A great flood is caused by rain—P adds also an uprush of the subterranean waters—in which all men other than those in the ark perish, but God promises that no similar flood shall ever occur again. Peculiar to the J story are the details that Noah sends out birds from the ark to test the subsidence of the waters and that Noah, after he comes out of the ark, offers a sacrifice, which God smells. Peculiar to the P story are the warning given to Noah, the elaborate instructions as to the making of the ark, and in particular the mention of bitumen, the resting of the ark upon a mountain in Ararat, and the rainbow sign. No doubt there were parallels to some features in one or other documents which have disappeared in the dovetailing process. The time notes show considerable variation. In J the flood culminates in 40 days; in P it reaches its climax in 150 days. In J the animals take seven days to enter the ark, but seemingly only one in P.

Babylonian Traditions.—Numerous traditions resembling the Genesis story have been found in Babylonia. Most of them are, unfortunately, but fragments. The best-known forming the 11th tablet of the Gilgamesh Epic, is elaborate, and the experiences of Utnapishtim, bear striking resemblances to those of Noah. The Gilgamesh story, for example, relates the sending forth from the ark of three birds in succession—dove, swallow, raven, instead of a dove three times as in Genesis (where the raven probably does not belong to the original text). It mentions the bitumen, using the same word as Genesis, and speaks of the ark grounding on a mountain. The offering of the sacrifice is mentioned, with the detail, in almost identical words, that the gods smell the savour. The Babylonian traditions reflect a higher level of civilization. Utnapishtim takes into his ark not only animals but treasure and craftsmen of all kinds, so that not only all kinds of animals but all different crafts may be preserved. One of the craftsmen was a sailor, to whom, very prudently, Utnapishtim entrusted the navigation of his vessel during the flood. The version of Berossus, a Babylonian priest who wrote at Babylon c. 300 B.C., which is doubtless much older than its recorder, shows also a care for literature in the detail that its hero buries before the flood a written account of "the beginning, middle and end of all things," disinterring it when the flood had gone. But the Biblical story reaches the higher religious and ethical levels Its majestic conception of God is in striking contrast with the many gods of the Babylonian story, who suffer from human weaknesses such as cowardice, intrigue and deceit. It is hardly fair to say that the Babylonian record is without ethical qualities. In at least one version the piety of the hero is emphasized. In the Gilgamesh version the god Ea protests that only the guilty should have been punished, from which it may be inferred that the flood was intended as a punishment for sinful men. But in any case the sense of sin is much more definitely expressed in Genesis.

Relation Between Hebrew and Babylonian Traditions.—However clear may be the moral and religious superiority of the Biblical versions it remains true that the many striking points of resemblance make it absolutely certain that they are not independent of the Babylonian traditions. Since the latter are the older—even some of the written forms in which they come to us are several centuries older than the Mosaic period—they must, if the dependence be direct, be regarded as the cruder material which the Genesis tradition has refined. It would have been possible for the early Hebrews to learn the story either from Babylon itself or, more probably, from the Canaanites, for Canaan was very much under the influence of Babylonia. This, is, indeed, the view most generally held by scholars. It is urged that the story is much more likely to have arisen in a country liable to inundations, like Babylon, than in Canaan. The elaborate description of the ark, too, seems much more plausibly to have originated in Babylonia than among a people so little accustomed to the sea and its ways as were the Hebrews. A. T. Clay, however, has effectively criticized the proposition that the descriptions of the deluge exactly fit the alluvial plain of Babylonia. In the cuneiform records the cause of the flood is invariably heavy rain, and not inundation from river or sea. Statistics seem to show that the average rainfall in Babylonia is by no means heavy, and therefore one of the main arguments for thinking the story indigenous to Babylonia is weakened. The theory of Süss, that the real cause of the flood was water driven in by a typhoon from the Persian gulf, though accepted by many scholars, has no foundation in the tradition itself. On the whole it is safer to conclude that, while there is undoubtedly a close kinship between the Biblical and the Babylonian traditions, the evidence hardly warrants a dogmatic assertion that the former are derived directly from the latter. In view of the widespread prevalence of similar traditions, and of the fact that, like the account in Genesis, the one in the Gilgamesh Epic is probably composite, it would be safer to say that both derive material from some common source.

Greek Traditions.—The most familiar of the Greek flood stories—later elaborated by Ovid—is that told by Apollodorus. It recounts how Deucalion, king of the country round Phthia, and his wife, Pyrrha, escaped from a flood caused by Zeus pouring water on the earth. The escape was made in a chest, which Deucalion had previously constructed on the advice of his father Prometheus. In this they floated for nine days over the sea, until the chest grounded on Mt. Parnassus. After the rain had ceased Deucalion emerged from the chest and offered sacrifice to Zeus. Being granted a boon by the god he chose men; Zeus bade him throw stones over his head, and these became men, while stones similarly thrown by Pyrrha became women. It is true that the story in this form is not older than the and century B.C., but Hellanicus, a historian of the 5th century B.C., has a version of it in which the chest grounds on Mt. Othrys in Thessaly, and slightly older is the version of Pindar, in which the mountain is Parnassus. A Megarian account specifies Mt. Gerania.

But the tradition varies in features more important than this: in some versions Deucalion is replaced by Ogyges, founder of Thebes in Boeotia, or by Dardanus, who was a king in Arcadia. Frazer hazards the guess that the Ogyges story may be founded on an extraordinary inundation of the Copaic lake, which formerly occupied a large part of central Boeotia, and thinks this theory may find some support from the Dardanus legend, for in one tradition the birthplace of Dardanus was Pheneus in northern Arcadia, and "no valley in Greece is known to have been from antiquity subject to inundations on so vast a scale and for such long periods as the valley of Pheneus." On the whole, however, he is more inclined to the theory that the story may have been suggested by a desire to explain the origin of the gorge of Tempe, which was thought to be the opening burst by a vast lake once dammed by the circle of the Thessalian mountains. It is not easy to trace connection between the Greek and Babylonian traditions. The most likely link would be Hittite tradition. But though it is asserted that the Hittite deluge hero Ul (l)ush is the same as Ulysses (=Odysseus) this does not help very much.

Other Traditions.—Apart from Greece flood legends are comparatively rare in Europe. Examples are found in Wales, Lithuania and Iceland; the last-named has a striking note of difference in that its deluge is caused by blood flowing from a wounded giant. India furnishes much material in the later Sanskrit literature. The earliest record goes back to the 6th century B.C. It tells how the hero, Manu, was warned by a fish of the coming flood, and advised to prepare a ship as a means of escape. When the flood came Manu's fish towed the ship to a mountain in the far north. After the waters had receded Manu offered a sacrifice, from the materials of which a woman was evolved. This story is repeated, with variations, in still later Sanskrit books, and similar stories are found in the folk-lore of existing Indian tribes. In Frazer's opinion the main theme of the legend may be aboriginal and form the source of the Sanskrit versions, He is also inclined to agree with Sir Marc Aurel

Stein that one at least of the stories may be explained as the product of imagination working on the existence of a gorge, which, like the gorge of Tempe mentioned earlier, drains an area enclosed by mountains.

Deluge stories are found in China, Burma, Cochin China, Malay, the Indian archipelago, among the aborigines of Australia, in New Guinea, and abundantly in the islands of Melanesia, Polynesia and Micronesia. They are plentiful also in South, Central and North America.

A survey of the whole field shows that deluge stories are common in Southern Asia, but not found in the rest of that continent, the examples quoted from China and Japan generally not answering to the description of universal inundations. Europe furnishes a few, Africa hardly any. It is especially noteworthy that we have none from the valley of the Nile. On the other hand, America and the islands of the Southern Seas are prolific in these stories.

Origin of **Traditions.**—Are these widespread legends connected? The Sumerian story seems to be the oldest, but it is difficult to derive the others from it. Frazer is certain that the Hebrew story descends from the Babylonian, but sees no decisive grounds for believing that the others do. He emphatically, and rightly, rejects the view that the various deluge traditions were originally myths relating to the voyages of the sun and moon in the heavens. His own view is that many of the stories may arise from the inundations caused by the far-reaching tidal waves that accompany earthquakes, and some from inundations caused by rain. Frazer's final verdict is "while many diluvial traditions are based on reminiscences of catastrophes which actually occurred, there is no good ground for holding that any such traditions are older than a few thousand years at most; wherever they appear to describe vast changes in the physical configuration of the globe they probably embody, not the record of contemporary witnesses, but the speculation of much later thinkers."

Wardle, *Israel and Babylon,* pp. 203–235, (1925); articles "Deluge" in *Encyc. of Religion and Ethics* and *Encyclopaedia Biblica;* "Flood" in Hastings' *Dictionary of the Bible.* (W. L. W.)

DELUSION is an erroneous belief, usually rather persistent and more elaborate in character than hallucinations or illusions, inasmuch as it is commonly based on more or less elaborate, if fallacious, reasoning. Delusions may result from ignorance or prejudice, or they may be due to mental abnormality, known as "delusional insanity." In the most serious cases they are confined to a few subjects such as persecution or personal eminence, etc. See ABNORMAL PSYCHOLOGY; HALLUCINATION; ILLUSION.

DELYANNI, THEODOROS (1826–1905), Greek statesman, was born at Kalavryta, Peloponnesus, in 1826. He studied law at Athens, and entered the civil service. In 1862, he became minister for foreign affairs. In 1867 he was minister at Paris. In the so-called "Oecumenical Ministry" of 1877 he voted for war with Turkey, and on its fall he entered the cabinet of Koumoundoros as minister for foreign affairs. He was a representative of Greece at the Berlin congress in 1878. From this time forward, and particularly after 1882, when Tricoupi again came into power at the head of a strong party, the duel between these two statesmen was the leading feature of Greek politics. (See GREECE: History.) Delyanni first formed a cabinet in 188; ; but his warlike policy ended in failure. He returned to power in 1890, with a radical programme, but his failure to deal with the financial crisis produced a conflict between him and the king, and his disrespectful attitude resulted in his summary dismissal in 1892. In 1895, however, he again became prime minister, and was at the head of affairs during the Cretan crisis and the opening of the war with Turkey in 1897. The humiliating defeat which ensued—though Delyanni himself had been led into the disastrous war policy to some extent against his will—caused his fall in April 1897, the king again dismissing him from office when he declined to resign. Delyanni kept his own seat at the election of 1899, but his following dwindled to small dimensions. He was again president of the council and minister of the interior when, on June 13, 1905, he was murdered in revenge for the rigorous measures taken by him against gambling houses

DEMADES (c. 380-318 B.C.), Athenian orator. At one time a common sailor, he rose by his eloquence and unscrupulous character to a prominent position. He espoused the cause of Philip in the war against Olynthus, and thus became the enemy of Demosthenes, whom he at first supported. He fought against the Macedonians at Chaeroneia, and was taken prisoner. On his release he helped to negotiate peace between Macedonia and Athens. He continued to be a favourite of Alexander, and, prompted by a bribe, saved Demosthenes and the other obnoxious Athenian orators from his vengeance. It was also chiefly owing to him that Alexander, after the destruction of Thebes, treated Athens so leniently. His conduct in supporting the Macedonian cause, yet taking bribes from the opposite party, caused him to be heavily fined more than once; and he was finally deprived of his civil rights. He was reinstated (322) on the approach of Antipater, to whom he was sent as ambassador. Before setting out he persuaded the citizens to pass sentence of death upon Demosthenes and his followers, who had fled from Athens. The result of his embassy was the conclusion of a peace greatly to the disadvantage of the Athenians. In 318 (or earlier) he was again sent to Antipater, who, learning that he had intrigued with Perdiccas, put him to death.

A fragment of a speech (Περὶ δωδεκαετίας), bearing his name, in which he defends his conduct, is to be found in C. Müller's *Oratores Attici,* ii. 438, but its genuineness is exceedingly doubtful.

DEMAGOGUE, a leader of the popular as opposed to any other party (Gr. δημαγωγός, from ἄγειν, to lead, and δῆμος, the people). Used in an invidious sense, a mob leader or orator, one who for his own political ends panders to the passions and prejudices of the people.

DEMAND. In economics, as in trade, demand denotes the extent of the outlet or market which the wants and preferences of buyers, joined to their purchasing power, establish for particular goods or services. Demand is always relative to price, and the character of the relation is commonly exhibited in treatises on economics either arithmetically (in "demand schedules") or diagrammatically (in "demand curves") by showing in sequence the amount of a commodity which supposedly would be purchased at each price in an ordered series of prices. The inaccurate statement that "an increase of prices will diminish demand" really means that an increase in price will diminish the volume of potential sales. The statement "an increase of demand will raise the price" means that a shift to the right in the position of the demand curve tends to raise the price. The relationship between price and the amounts which buyers will purchase is generally inverse; that is, sales volume is commonly larger at lower than at higher prices. This elementary theorem rests in the first instance upon common observation of the facts of the market, but it can be explained by or related to the way in which households and individual consumers apportion their expenditures. Most goods serve a variety of purposes, and these purposes differ greatly in importance. If the price of a commodity increases, consumers generally cannot continue to buy it in undiminished quantities without cutting into their expenditures for other goods so deeply as to sacrifice some of their relatively important uses. They will prefer to give up some relatively unimportant uses of the commodity which has increased in price, and will therefore reduce their purchases of it.

The extent to which a change of price affects the quantity of a commodity which can be sold is called the elasticity of demand. The greater the ratio of the proportionate change in potential sales volume to the proportionate change in price, the greater is said to be the elasticity of demand. This ratio is called the co-efficient of elasticity. Thus if a large wheat or cotton crop will sell for less in the aggregate than a smaller crop would have sold for, within certain limits, the demand for wheat and cotton is comparatively inelastic, and the co-efficient of elasticity is less than unity. In general, the demand for necessaries, for goods for which there are no substitutes, and for goods the use of which creates a habit is relatively inelastic. The elasticity of the demand for any commodity is rarely the same over any considerable range of prices. The demand for salt

for example, would be much less elastic at high than at low prices. H. L. Moore and other scholars, by making skilful use of statistics of the production and prices of certain commodities and of the general movements of prices, have been able to find formulae which express approximately the relations (for the time being) between the prices of those commodities and the demand for them. These empirical laws of demand add materially to our economic knowledge, and promise to be useful in forecasting the probable effects of increased or decreased production upon prices.

The demand for any one commodity is dependent not only upon its own price but upon the prices of other goods as well. There are many instances of joint demand, as where a falling off of the price of fresh fruit leads to increased purchasing of sugar, and of competing demand, as where a reduction of the cost of electric lighting leads to a smaller use of illuminating gas. So far, indeed, as a change of the price of any commodity whatsoever affects the amount of money expended for it, the demand for other goods must be affected. The demands for labour, land, and productive instruments are derived from the demands for their products. In some instances the relation between the demand for consumer's goods and the derived demand for productive goods and services is fairly direct and simple. More often, however, this relation is exceedingly intricate, because productive agents can be combined in various ways and in various proportions. What the most economical combination of productive agents for any one purpose is will depend upon the demand not for one but all of their possible products.

See also ECONOMICS; SUPPLY AND DEMAND; PRICE. (W. I. K.)

DEMAND AND SUPPLY: see SUPPLY AND DEMAND.

DEMAND LOAN: see CALL MONEY.

DEMANTOID: see GARNET.

DEMARATUS, king of Sparta of the Eurypontid line, successor of his father Ariston (Doric Δαμάρατος, Ionic Δημάρητος). He is known chiefly for his opposition to his colleague Cleomenes I. (*q.v.*) in his attempts to make Isagoras tyrant in Athens and afterwards to punish Aegina for medizing. He did his utmost to bring Cleomenes into disfavour at home. Thereupon Cleomenes urged Leotychides, a relative and personal enemy of Demaratus, to claim the throne on the ground that the latter was not really the son of Ariston. The Delphic oracle, bribed by Cleomenes, pronounced in favour of Leotychides, who became king (491 B.C.). Soon afterwards Demaratus fled to Darius, who gave him the cities of Pergamum, Teuthrania and Halisarna, where his descendants were still ruling at the beginning of the 4th century (Xen. Anabasis, ii. 1. 3, vii. 8. 17; Hellenica, iii. 1.6); to these Gambreum should perhaps be added (Athenaeus i. 29 f.). He accompanied Xerxes on his expedition to Greece, but the stories told of the warning and advice which on several occasions he addressed to the king are scarcely historical.

See Herodotus v. 75, vi. 50–70, vii.; later writers either reproduce or embellish his narrative (Pausanias iii. 4, 3–5, 7, 7–8; Diodorus xi. 6; Polyaenus ii. 20; Seneca, De *beneficiis,* vi. 31, 4–12). The story that he took part in the attack on Argos which was repulsed by Telesilla, the poetess, and the Argive women, can hardly be true (Plutarch, *Mul. virt.* 4; Polyaenus, *Strat.* viii. 33; G. Busolt, *Griechische Geschichte,* ii. 563, note 4). (M. N. **T.**)

DEMAVEND, MOUNT. An extinct volcano in the Elburz mountains, Persia, with an altitude of 17,930 feet. It has supplies of sulphur and pumice.

DEMENTIA PRAECOX: see INSANITY.

DEMERARA, one of the three counties of British Guiana, taking its name from the river Demerara. (See GUIANA.)

DEMESNE, that portion of the lands of a manor not granted out in freehold tenancy, but (a) retained by the lord of the manor for his own use and occupation or (6) let out as tenemental land to his retainers or "villani." This demesne land, originally held at the will of the lord, in course of time came to acquire fixity of tenure, and developed into the modern copyhold (see MANOR). It is from demesne as used in sense (a) that the modern restricted use of the word comes, *i.e.,* land immediately surrounding the mansion or dwelling-house, the park or chase. *Demesne* of the Crown, or royal demesne, was that part of the crown lands not granted out to feudal tenants, but which remained under the management of stewards appointed by the crown. These crown lands, since the accession of George III., have been appropriated by parliament, the sovereign receiving in return a fixed annual sum (see CROWN LANDS; CIVIL LIST). Ancient demesne signified lands or manors vested in the king at the Norman Conquest. There were special privileges surrounding tenancies of these lands, such as freedom from tolls and duties, exemption from danegeld and amercement, from sitting on juries, etc. Hence, the phrase "ancient demesne" came to be applied to the tenure by which the lands were held. Land held in ancient demesne is sometimes also called customary freehold (see COPYHOLD).

DEMETER, in Greek mythology, daughter of Cronus and Rhea and sister of Zeus, goddess of agriculture. Her name has been explained as (1) "grain-mother," from δηαί, the Cretan form of ζειαί, "barley," or (2) "earth-mother," or rather "mother earth," δᾶ being regarded as the Doric form of γῆ. She is rarely mentioned in Homer, nor is she included among the Olympian gods.

The central fact of her legend was the story of her daughter Persephone. After her carrying off by Hades (see PERSEPHONE), Demeter revealed to the people of Eleusis, where she had been hospitably received, her secret rites (see TRIPTOLEMUS). This is the legendary origin of the famous Eleusinian mysteries (see MYSTERY). The Eleusinia, sometimes confused with them, were a distinct festival.

Demeter is a mother-goddess. Besides Zeus, she has a consort Iasion, who "lay with her in a thrice ploughed field" (Homer, Od. v. 125 et seq.), and to whom she bore Plutus (*q.v.*)—"Wealth," (*i.e.,* abundant produce of the soil). The story is compared by Frazer (Golden Bough, 3rd ed. vii. 207) with the West Prussian custom of the mock birth of a child on the harvest field, the object being to ensure a plentiful crop for the coming year. In Homer the scene is laid in Crete, and may well represent part of the ritual or mythology of the Cretan goddess. Erysichthon ("tearer up of the earth"), son of Triopas or Myrmidon, having cut down the trees in a grove sacred to the goddess, was punished by her with terrible hunger (Callimachus, Hymn to Demeter; Ovid, *Metam.,* viii. 738-878). Of this story no very convincing explanation has yet been put forward; perhaps Erysichthon may be explained as the personification of the labourer, who, by the systematic cultivation and tilling of the soil, endeavours to force the crops instead of allowing them to mature unmolested as in the good old times.

It is as a corn-goddess that Demeter appears most commonly. The name Ἰουλώ (? at Delos), from ἴουλος, "corn-sheaf," has been regarded as identifying the goddess with the sheaf, and as proving that the cult of Demeter originated in the worship of the corn-mother or corn-spirit, the last sheaf having a more or less divine character for the primitive husbandman. According to this view, the prototypes of Demeter and Persephone are the corn-mother and harvest maiden of northern Europe, the corn-fetishes of the field (Frazer, Golden Bough, 3rd ed. vii., p. 35 et seq.; but see Farnell, Cults of the Greek States, iii. 35). The influence of Demeter, however, was not limited to corn, but extended to vegetation generally and all the fruits of the earth, with the curious exception of the bean, the use of which was forbidden at Eleusis, and for the protection of which a special patron was invented. In this wider sense Demeter is akin to GE, with whom she has several epithets in common, and is sometimes identified with Rhea-Cybele; thus Pindar speaks of Demeter χαλκόκροτος ("bronze-rustling"), an epithet obviously more suitable to Rhea-Cybele than Demeter (see CORYBANTES).

Another important aspect of Demeter was that of a divinity of the under-world; as such she is χθονία (earth-goddess) at Sparta and especially at Hermione in Argolis where, at the festival Chthonia, a cow (representing, according to Mannhardt, the spirit of vegetation), which voluntarily presented itself, was sacrificed by three old women. Those joining in the procession wore garlands of the flower called *huakinthos.* The remarkable epithets, Ἐρινύς ("avenger") and Μέλαινα ("the black one"), as applied to Demeter, were both localized in Arcadia, the first at Thelpusa (or

rather Onkeion close by), the second at Phigaleia (see W. Immerwahr, Die Kulte *und Mythen* Arkadiens, i. 1891). According to the Thelpusan story, Demeter, during her wanderings in search of Persephone, changed herself into a mare to avoid the persecution of Poseidon. The god, however, assumed the form of a stallion, and the fruit of the union was a daughter of mystic name and the horse Areion or Arion (*q.v.*). Demeter, at first enraged, afterwards calmed down, and washed herself in the river Ladon by way of purification. An almost identical story was current in the neighbourhood of Tilphossa, a Boeotian spring, and a similar one at Phigaleia, where, in a cave still called Mavrospēlya ("black cave"), there was an image of the goddess, a female form seated on a rock, but with a horse's head and mane, to which were attached snakes and other wild animals. It was clothed in a black garment reaching to the feet, and held in one hand a dolphin, in the other a dove.

Both μέλαινα and ἐρινύς, according to Farnell, are epithets of Demeter as an earth-goddess of the under-world. The first has been explained as referring to the gloom of her abode, or the blackness of the withered corn. According to Farnell, the meaning of the epithet is to be looked for in the original conception of Erinys, which was that of an earth-goddess akin to GE, thus naturally associated with Demeter, rather than that of a wrathful avenging deity.

Various interpretations have been given of the horse-headed form of the Black Demeter: (1) that the horse was one of the forms of the corn-spirit in ancient Greece; (2) that it was an animal "devoted" to the chthonian goddess; (3) that it is totemistic; (4) that the form was adopted from *Poseidon Hippios,* who is frequently associated with the earth-goddess and is said to have received the name *Hippios* first at Thelpusa, in order that Demeter might figure as the mother of Areion (for a discussion of the whole subject see Farnell, Cults, iii. p. 50-62). In any case the association of Poseidon, representing the fertilizing element of moisture, with Demeter, who causes the plants and seeds to grow, is quite natural.

Demeter also appears as a goddess of health, of birth and of marriage; and a certain number of political and ethnic titles is assigned to her, the most important being Ἀμφικτυονίς, at Anthela near Thermopylae, as patron-goddess of the Amphictyonic league, subsequently so well known in connection with the temple at Delphi.

Brief mention may here be made of certain agrarian festivals held in honour of Demeter.

1. *Halōa,* obviously connected with ἅλως ("threshing-floor"). begun at Athens and finished at Eleusis, where there was a threshing-floor of Triptolemus, in the month Poseideon (December). This date, which is confirmed by historical and epigraphical evidence, seems inappropriate, and it is suggested (A. Mommsen, Feste der Stadt *Athen,* p. 365 et seq.) that the festival, originally held in autumn, was subsequently placed later, so as to synchronize with the winter Dionysia. Dionysus, as the god of vines, and (in a special procession) Poseidon φυτάλμιος ("god of vegetation") were associated with Demeter. In addition to being a harvest festival, marked by the ordinary popular rejoicings, the *Halōa* had a religious character. The ἀπαρχαί ("first-fruits") were conveyed to Eleusis, where sacrifice was offered by a priestess, men being prohibited from undertaking the duty. A τελετή ("initiatory ceremony") of women by a woman also took place at Eleusis, characterized by obscene jests and the use of phallic emblems. The sacramental meal on this occasion consisted of the produce of land and sea, certain things (pomegranates, honey, eggs) being forbidden for mystical reasons. Although the offerings at the festival were bloodless, the ceremony of the presentation of the ἀπαρχαί was probably accompanied by animal sacrifice; Mommsen, however, considers the offerings to have been pastry imitations. Certain games (πάτριος ἀγών), of which nothing is known, terminated the proceedings. In Roman imperial times the ephebi (*q.v.*) had to deliver a speech at the *Halōa.*

2. *Chloeia* or *Chloia,* the festival of the corn beginning to sprout, held at Eleusis in the early spring (Anthesterion) in honour of Demeter Chloë, "the green," the goddess of growing vegetation. This is to be distinguished from the later sacrifice of a ram to the same goddess on the 6th of the month Thargelion, probably intended as an act of propitiation. It has been identified with the *Procharistēria* (sometimes called *Proschairetēria*), another spring festival, but this is doubtful. The scholiast on Pindar (*Ol.,* ix. 150) mentions an Athenian harvest festival *Eucharistēria.*

3. *Proërosia,* at which prayers were offered for an abundant harvest, before the land was ploughed for sowing. It was also called Proarktouria, an indication that it was held before the rising of Arcturus. According to the traditional account, when Greece was threatened with famine, the Delphic oracle ordered first-fruits to be brought to Athens from all parts of the country, which were to be offered by the Athenians to the goddess Deo on behalf of all the contributors. The most important part of the festival was the three sacred ploughings—the Athenian ὑπὸ πόλιν, the Eleusinian on the Rharian plain, and the Soirian (a compromise between Athens and Eleusis). The festival itself took place, probably some time in September, at Eleusis. In later times the ephebi also took part in the Proërosia.

4. *Thalusia,* a thanksgiving festival, held in autumn after the harvest in the island of Cos (see Theocritus vii.)

5. The name of Demeter is also associated with the *Skirophoria* (see ATHENA). It is considered probable that the festival was originally held in honour of Athena, but that the growing importance of the Eleusinia caused it to be attached to Demeter and Korē.

The attributes of Demeter are chiefly connected with her character as goddess of agriculture and vegetation—ears of corn, the poppy, the mystic basket (kalathos) filled with flowers, corn and fruit of all kinds, the pomegranate being especially common. Of animals, the pig is her favourite, owing to its productivity and the cathartic properties of its blood. As a chthonian divinity she is accompanied by a snake; the myrtle, asphodel and narcissus (which Persephone was gathering when carried off by Hades) also are sacred to her.

In Greek art, Demeter resembles Hera, but she is more matronly and of milder expression; her form is broader and fuller. She is sometimes riding in a chariot drawn by horses or dragons, sometimes walking, sometimes seated upon a throne, alone or with her daughter. The Demeter of Cnidus in the British Museum, of the school of Praxiteles, apparently shows her mourning the loss of her daughter.

The Italians identified Demeter with their own Ceres (*q.v.*).

Harrison, Prolegomena to the *Study* of *Greek* Religion (1903); Preller-Robert, *Griechische Mythologie,* 4th ed. i., p. 747 *et seq.;* O. Gruppe, Griechische Mythologie und Religionsgeschichte, ii. (1907), and the classical dictionaries.

DEMETRIA, an obscure festival or rite of Demeter, probably Athenian, in which the participants beat each other with whips of twisted bark, a well-known fertility charm (Pollux. i. 37, Hesych. *s.v.* μόροττον). Also a name given to the Attic Dionysia in compliment to Demetrius Poliorcetes (Plut., *Demetrius,* 12).

See Stengel in Pauly-Wissowa, Realencyk., iv. 2,764.

DEMETRIUS, king of Bactria, was the son of the Graeco-Bactrian king Euthydemus, for whom he negotiated a peace with Antiochus the Great in 206 (Polyb. xi. 34). Soon afterwards he crossed the Hindu Kush and began the invasion of India (Strabo xi. 516); he conquered the Punjab and the valley of the Indus down to the sea and to Gujerat. The city of Sangala, a town of the Kathaeans in the Punjab (Arrian v. 22, 2 et seq.) he named after his father Euthydemia (Ptol. vii. i. 46). That his power extended into Arachosia (Afghanistan) is proved by the name of a town Demetrias near Kandahar (Isidor, Charac. 19, cf. Strabo xi. 516). On his coins he wears an elephant's skin with trunk and teeth on his head; on bronze coins, which have also an Indian legend in Kharoshti letters (see BACTRIA), he calls himself the unvanquished king (Βασιλέως ἀνικήτου Δημητρίου). One of his coins had already the square form used in India instead of the circular. Eventually he was defeated by the usurper Eucratides (*q.v.*), who meanwhile had risen to great power in Bactria. About

his death we know nothing; his young son Euthydemus II. (known only from coins) can have ruled only a short time. (ED. M.)

DEMETRIUS I. (337–283 B.C.), King of Macedonia, surnamed *Poliorcetes* ("Besieger"), son of Antigonus Cyclops and Stratonice. In 321 he married Phila, daughter of Antipater. At the age of twenty-two he was left by his father to defend Syria against Ptolemy the son of Lagus; he was totally defeated near Gaza (312), but soon partially repaired his loss by a victory in the neighbourhood of Myus. After an unsuccessful expedition against Babylon, and several campaigns against Ptolemy on the coasts of Cilicia and Cyprus, Demetrius sailed with a fleet of 250 ships to Athens. He freed the city from the power of Cassander and Ptolemy, expelled the garrison which had been stationed there under Demetrius of Phalerum, and besieged and took Munychia (307). After these victories he was worshipped by the Athenians as a tutelary deity under the title of *Soter* ("Preserver"). In the campaign of 306 against Ptolemy he defeated Menelaus (the brother of Ptolemy) in Cyprus, and completely destroyed the naval power of Egypt.

Demetrius and his father then adopted the royal title, thereby (and by their coinage) claiming the whole of Alexander's empire. A joint expedition into Egypt, Demetrius in command of the fleet, was a failure. In 305 he endeavoured to punish the Rhodians for having deserted his cause; and his ingenuity in devising new instruments of siege, in his unsuccessful attempt to reduce the capital, gained him the appellation of Poliorcetes. He returned to Greece to deal with Cassander again. After a riotous winter in which he even shocked Athens, he drove the Cassandrian party out of the Peloponnese, called a conference at the Isthmus, and re-organized Philip's League of Corinth, much on the same lines, except that it rested on democracies in the constituent states. It was to meet at the Great Games (6 times in 4 years), and to include tribes (ἔθνη), *i.e.*, peoples not organized into city-states. Eventually Seleucus, Cassander and Lysimachus united to destroy Antigonus and his son. The hostile armies met at Ipsus in Phrygia (301). Antigonus was killed in the battle and Demetrius retired to Ephesus, defeated. Many enemies rose up against him; even the Athenians refused to admit him to their city. Demetrius ravaged the territory of Lysimachus, and effected a reconciliation with Seleucus who married his daughter. Demetrius gained possession of Athens then oppressed by the tyranny of Lachares. In the same year (294) he established himself on the throne of Macedonia by the murder of Alexander, son of Cassander, but, expelled by the combined forces of Pyrrhus, Ptolemy and Lysimachus, he passed into Asia where he was forsaken by his troops and surrendered to Seleucus. His son Antigonus offered all his possessions and even his own liberty to have his father set free but without avail. Demetrius died in 283 after a confinement of three years.

See Life *by* Plutarch; Diod. Sic. xix., xx.; Wilamowitz-Moellendorff, *Antigonos von Karystos;* De Sanctis, *Contributi alla storia Ateniese* in Beloch's *Studi di storia antica (1893)*; Fergusson *in* Lehmann's *Beitrage z. alt. Gesch. (Klio)*, vol. v. (1905); also authorities under MACEDONIAN EMPIRE.

DEMETRIUS II., son of Antigonus Gonatas, reigned from 239 to 229 B.C. He had already during his father's lifetime distinguished himself by defeating Alexander of Epirus at Derdia and so saving Macedonia (about 260). On his accession he had to face a coalition which the two great leagues, usually rivals, the Aetolian and Achaean, formed against the Macedonian power. He succeeded in dealing this coalition severe blows, wresting Boeotia from their alliance. The revolution in Epirus, which substituted a republican league for the monarchy, gravely weakened his position. Demetrius had also to defend Macedonia against the wild peoples of the north. A battle with the Dardanians turned out disastrously, and he died shortly afterwards, leaving Philip, his son by Chryseis, still a child. Former wives of Demetrius were Stratonice, the daughter of the Seleucid king Antiochus I., Phthia, the daughter of Alexander of Epirus, and Nicaea, the widow of his cousin Alexander.

See Thirlwall, *History of Greece,* vol viii. (1847); *Ad.* Holm, *Griech, Gesch.* vol. iv. *(1894)*; B. Niese, *Gesch. d. griech. u. mnked. Staaten,* vol. ii. *(1899)*; *J.* Beloch, *Griech. Gesck.,* vol. iii. (1904).

DEMETRIUS, the name of three kings of Syria.

DEMETRIUS I. (d. 150 B.C.), surnamed *Soter,* was sent to Rome as a hostage during the reign of his father, Seleucus IV. Philopator, but after his father's death in 175 B.C. he escaped and seized the Syrian throne (162 B.C.) after murdering King Antiochus V. Eupator. He was called *Soter,* or Saviour, by the Babylonians, whom he delivered from the tyranny of the Median satrap, Timarchus, and is famous in Jewish history for his contests with the Maccabees. Demetrius fell in battle against the usurper, Alexander Balas, in 150 B.C.

DEMETRIUS II. (d. 125 B.C.), surnamed *Nicator,* son of Demetrius I., fled to Crete after the death of his father, but about 147 B.C., with the help of Ptolemy VII., Philometor, king of Egypt, regained his father's throne. In 140 B.C. he marched against Mithridates, king of Parthia, but was held captive for ten years, regaining his throne about 129 B.C. on the death of his brother, Antiochus VII., who had usurped it. But he was hated for his cruelty, and during another civil war was defeated at Damascus, and killed near Tyre. His successor was his son, Antiochus VIII. Grypus.

DEMETRIUS III. (d. 88 B.C.), called *Euergetes* and *Philometor,* was the son of Antiochus VIII. Grypus. By the assistance of Ptolemy VIII Lathyrus, king of Egypt, he recovered part of his Syrian dominions from Antiochus X. Eusebes, and held his court at Damascus. In attempting to dethrone his brother, Philip Epiphanes, he was defeated by the Arabs and Parthians, and kept prisoner in Parthia by King Mithridates until his death.

DEMETRIUS, a Cynic philosopher, born at Sunium, who lived at Corinth and in Rome during the reigns of Caligula, Nero and Vespasian. He was an intimate friend of Thrasea Paetus and Seneca. He was equally impervious to the bribes of Caligula and the anger of Vespasian who banished him. He reached the logical conclusion of Cynicism in attaching no real importance to scientific data.

DEMETRIUS, a Greek sculptor of the early part of the 4th century B.C., who is said by ancient critics to have been notable for the life-like realism of his statues. His portrait of Pellichus, a Corinthian general, was admired by Lucian. He was contrasted with Cresilas (*q.v.*), an idealizing sculptor of the generation before. Since, however, the peculiarities mentioned by Lucian do not appear in Greek portraits before the 3rd century B.C., and since the Greek art of the 4th century consistently idealizes, there would seem to be a difficulty to explain. The date of Demetrius is confirmed by inscriptions found on the Athenian Acropolis.

(P. ***G.***)

DEMETRIUS DONSKOI ("OF THE DON") (1350–1389), grand duke of Vladimir and Moscow, son of the grand duke Ivan Ivanovich by his second consort Alexandra, was placed on the grand-ducal throne of Vladimir by the Tatar khan in 1362, and married the princess Eudoxia of Nizhny Novgorod in 1364. He built the Kremlin of Moscow and waged war with Michael, prince of Tver, for supremacy. Demetrius was generally successful. In 1371 he won over the khan by a personal visit to the Horde, and in 1372 he defeated the Lithuanian supporters of Tver at Lyubutsk. Demetrius then formed a league of all the Russian princes against the Tatars, and in 1380 encountered them on the plain of Kulikovo, between the rivers Nepryadvaya and Don, where he completely routed them, the grand khan Mamai perishing in his flight from the field. But now Toktamish, the deputy of Tamerlane, organized a punitive expedition against Demetrius Moscow was taken by treachery, and the Russian lands were again subdued by the Tatars (1381). Nevertheless, while compelled to submit to the Horde, Demetrius maintained his hegemony over Tver, Novgorod and the other recalcitrant Russian principalities, and even held his own against the Lithuanian grand dukes. Demetrius was one of the greatest of the north Russian grand dukes. He was not merely a cautious and tactful statesman, but also a valiant and capable captain, in striking contrast to most of the princes of his house.

See Sergyei Solovev, *History of Russia* (Rus.), vols. i.–ii. (St. Petersburg, 1857), etc.; Nikolai Savelev, *Demetrius Ivanovich Donskoi* (Rus.) (Moscow. *1837).*

DEMETRIUS PHALEREUS (*c.* 345–283 B.C), Attic orator, statesman and philosopher, born at Phalerum, was a pupil of Theophrastus and an adherent of the Peripatetic school. He governed the city of Athens as representative of Cassander (*q.v.*) for ten years from 317. On the restoration of the old democracy by Demetrius Poliorcetes, he was condemned to death and obliged to leave the city. He escaped to Egypt, where he was protected by Ptolemy Lagus, to whom he is said to have suggested the foundation of the Alexandrian library. Having incurred the displeasure of Lagus's successor Philadelphus, Demetrius was banished to Upper Egypt, where he died (according to some, voluntarily) from the bite of an asp. Demetrius composed a large number of works on poetry, history, politics, rhetoric and accounts of embassies, all of which are lost.

The treatise Περὶ Ἑρμηνείας (on rhetorical expression), which is often ascribed to him, is probably the work of a later Alexandrian (1st century A.D.) of the same name; it has been edited by L. Radermacher (1901) and W. Rhys Roberts (1902), the last-named providing English translation, introduction, notes, glossary and complete bibliography. Fragments in C. Muller, *Frag. Hist. Graec.* ii. p. 362. *See* A. Holm, *History* of *Greece* (Eng. trans.), iv. 60.

DEMETRIUS, PSEUDO- (or **FALSE**), the name by which three Muscovite princes and pretenders, who claimed to be Demetrius, son of Ivan the Terrible, are known in history. The real Demetrius had been murdered, while still a child, in 1591, at Uglich, his widowed mother's appanage.

1. In the reign of Tsar Boris Godunov (1598–1605), the first of these pretenders, whose real name seems to have been Yury or Gregory, first appears in history *circa* 1600, when his learning and assurance impressed the Muscovite patriarch Job. Tsar Boris, however, ordered him to be seized and examined, whereupon he fled to Prince Constantine Ostrogsky at Ostrog, and subsequently entered the service of another Lithuanian, Prince Wisniwiecki, who tried to enlist the sympathy of the Polish king, Sigismund III., in his favour. The king refused to support him officially, but his cause was taken up by the Polish magnate Yury Mniszek, whose daughter Marina he afterwards married. The Jesuits also seem to have believed in the man, who was evidently an unconscious impostor brought up from his youth to believe that he was the real Demetrius: finally he set out, at the head of an army of Polish and Lithuanian volunteers, Cossacks and Muscovite fugitives, to drive out the Godunovs, after being received into the Church of Rome. At the beginning of 1604 Sigismund presented him at Cracow to the papal nuncio Rangoni. His public conversion took place on April 17. In October the false Demetrius crossed the Russian frontier, and shortly afterwards routed a large Muscovite army beneath the walls of Novgorod-Syeversk. After the sudden death of Tsar Boris (April 13, 1605) the principal Russian army, under P. E. Basmanov, at once went over to him (May 7); on June 20 he made his triumphal entry into Moscow, and on July 21 he was crowned tsar by a new patriarch, the Greek Isidore. He at once proceeded to introduce a whole series of political and economic reforms. He did his best to relieve the burdens of the peasantry; he formed the project of a grand alliance between the emperor, the pope, Venice, Poland and Muscovy against the Turk; and he displayed an amazing toleration in religious matters which made people suspect that he was a crypto-Arian. But his assumption of the title of emperor, and his predilection for Western civilization, alarmed the ultra-conservative boyars (the people were always on his side), and a conspiracy was formed against him, headed by Basil Shuisky, whose life he had saved a few months previously. On May S, 1606, when Demetrius was married to Marina Mniszek, the boyars urged the citizens to rise against the Poles who had accompanied Marina to Moscow, while they themselves attacked and slew Demetrius in the Kremlin on the night of May 17.

See Sergyei Solovev, *History of Russia* (Rus.), vol. viii. (St. Petersburg, 1857, etc.); Nikolai Kostomarov, *Historical Monographs* (Rus.) vols. iv.–vi. (St. Petersburg, 1863, etc.); Orest Levitsky, *The First False Demetrius as the Propagandist of Catholicism in Russia* (Rus.) (St. Petersburg, 1886); Paul Pierling, *Rome et Demetrius* (Paris, 1878): R. N. Bain, "Poland and Russia," *Camb.* Nod, *Hist.*, chap. 10 (Cambridge, 1907).

2. The second pretender, called "the thief of Tushino," first appeared on the scene *circa* 1607 at Starodub. He is supposed to have been either a priest's son or a converted Jew, and was well educated. He pretended at first to be the Muscovite boyarin Nagi; but confessed, under torture, that he was Demetrius Ivanovich, whereupon he was taken at his word and joined by thousands of Cossacks, Poles and Muscovites. He captured Karachev, Briansk and other towns; was reinforced by the Poles; and in the spring of 1608 advanced upon Moscow, routing the army of Tsar Basil Shuisky, at Bolkov, on his way. He entrenched himself at the village of Tushino, 12 versts from the capital, which he converted into an armed camp. In the course of the year he captured Marina Mniszek, who acknowledged him to be her husband (subsequently quieting her conscience by privately marrying this impostor who in no way resembled her first husband), and brought him the support of the Lithuanian magnates Mniszek and Sapieha so that his forces soon exceeded 100,000 men. He raised to the rank of patriarch another captive, Philaret Romanov, and won over the towns of Yaroslavl, Kostroma, Vologda, Kashin and other places to his allegiance. But subsequent disasters, and the arrival of King Sigismund III. induced him to fly his camp disguised as a peasant and go to Kostroma, where Marina joined him and he lived once more in regal state. He also made another but unsuccessful attack on Moscow, and, supported by the Don Cossacks. recovered a hold over all south-eastern Russia. He was killed, while half drunk, on Dec. 11, 1610, by a Tatar whom he had had flogged.

See Sergei Soloviev, *History of Russia* (Rus.), vol. viii. (St. Petersburg, 1857, etc.).

3. The third, a more enigmatical person than his predecessors, supposed to have been a deacon called Siderka, appeared suddenly, "from behind the river Yanza," in the Ingrian town of Ivangorod (Narva), proclaiming himself the tsarevich Demetrius Ivanovich, on March 28, 1611. The Cossacks, ravaging the environs of Moscow, acknowledged him as tsar on March 2, 1612, and under threat of vengeance in case of non-compliance, the gentry of Pskov also kissed the cross to "the thief of Pskov," as he was usually nicknamed. On May 18, 1612, he fled from Pskov, was seized and delivered up to the authorities at Moscow, and there executed.

See Sergei Soloviev, *History of Russia* (Rus.), vol. viii. (St. Petersburg, 1857, etc.).

DEMIDOV, the name of a famous Russian family, founded by Nikita Demidov (b. *c.* 1665), who was originally a blacksmith serf. He made his fortune by his skill in the manufacture of weapons, and established an iron foundry for the Government. Peter the Great, with whom he was a favourite, ennobled him in 1720. His son, Akinfiy Demidov (d. *c.* 1740), increased his inherited wealth by the discovery and working of gold, silver and copper mines. The latter's nephew, Paul Grigoryevich Demidov (1738–1821), was a great traveller who was a benefactor of Russian scientific education; he founded an annual prize for Russian literature, awarded by the Academy of Sciences. Paul's nephew, Count Nikolay Nikitich Demidov (1774–1828), raised and commanded a regiment to oppose Napoleon's invasion, and carried on the accumulation of the family wealth from mining; he contributed liberally to the erection of four bridges in St. Petersburg, and to scientific education in Moscow. Paul's son, Prince Anatoli Demidov (1813–1870), was a well-known traveller and patron of art; he married Princess Mathilde, daughter of Jerome Bonaparte.

DEMIJOHN, a glass bottle or jar with a large round body and narrow neck, encased in wicker-work and provided with handles. The word is also used of an earthenware jar, similarly covered with wicker. The capacity of a demijohn varies from two to twelve gallons, but the common size contains five gallons. According to the ***New*** English *Dictionary* the word is an adaptation of a French *Dame Jeanne*, or Dame Jane, an application of a personal name to an object which is not uncommon.

DEMING, an incorporated town of south-western New Mexico, U.S.A., in the Mimbres valley, 35m. from the Mexican border, at an altitude of 4,332ft.; the county seat of Luna county,

It is on federal highways 70, 80 and 260; is served by the Santa Fe and Southern Pacific railways and ha.; a municipal airport. Pop. was 3,377 in 1930 and 3,608 in 1940. Farming by irrigation, cattle grazing and mining of copper, manganese, fluorspar and zinc constitute the chief industries of the region. Near by are medicinal springs, and 40 mi. N. of the city is the Gila national forest, in which is the Gila Cliff Dxellings national monument.

DEMISE, an Anglo-French legal term for a transfer of an estate, especially by lease (see LAKDLORD AND TENANT). The phrase "demise of the Crown" is used in English law to signify the immediate transfer of the sovereignty, with all its attributes and prerogatives, to the successor without any interregnum in accordance with the maxim "the king never dies." At common law the death of the sovereign eo facto dissolved parliament, but this was abolished by the Representation of the People Act, 1867, s. 51. Similarly the common law doctrine that all offices held under the Crown determined at its demise has been negatived by the Demise of the Crown Act, 1901.

DEMISEMIQUAVER, in music, a note of the duration of half a semiquaver, a quarter of a quaver, and so on, represented as follows:  . In the German nomenclature, which, in English equivalents, is also that employed in the United States, it is known as a Zweiunddreissigstel, or two-and-thirtieth note, being, as it is, a thirty-second part of a semibreve.

DEMIURGE (dē'mi-urj) (Gr. *dēmiourgos,* artisan or handicraftsman). In Homer it includes hand-workers and heralds and physicians. In Attica the *demiourgoi* formed one of the three classes, with the Eupatridae (q.v.) and the *geōmoroi,* into which the early population was divided. (See EUPATRIDAE.) The word was used in the Peloponnese, with the exception of Sparta, for a higher magistrate. The *demiourgoi* represented Elis and Mantinea at the treaty of peace between Athens, Argos, Elis, and Mantinae in 420 B.C. (Thuc. v. 47). In the Achaean League (q v.) the name is given to ten officers who presided over the assembly, and Corinth sent *Epidemiourgoi* to Potidaea.

In Plato *demiourgos* is the name given to the "creator of the world" (*Timaeus,* 40) and the word was so adopted by the Gnostics. (*See* GNOSTICISM.)

DEMMIN, town in the Land of Prussia, Germany, on the navigable river Peene, 72 mi. W.N.W. of Stettin, on the Berlin-Stralsund railway. Pop. (1939) 15,745. It has manufactures of textiles, and an active trade in corn and live stock.

An ancient Slav town, it was important under Charlemagne. It was besieged by a German army in 1148, and captured by Henry the Lion in 1164. In the Thirty Years' War Demmin was the object of frequent conflicts, and even after the Peace of Westphalia was taken and retaken in the contest between the electoral prince and the Swedes. It passed to Prussia in 1720, and its fortifications were dismantled in 1759.

DEMOCHARES (c. 355–275 B.C.), nephew of Demosthenes, Athenian orator and statesman, was one of the few distinguished Athenians in the period of decline. He is first heard of in 322, when he spoke in vain against the surrender of Demosthenes and the other anti-Macedonian orators demanded by Antipater. During the next fifteen years he probably lived in exile. On the restoration of the democracy by Demetrius Poliorcetes in 307 he occupied a prominent position, but was banished in 303 for having ridiculed the decree of Stratocles, which contained a fulsome eulogy of Demctrius. He was recalled in 298, and during the next four years fortified and equipped the city with provisions and ammunition. In 296 (or 295) he was againrbanished for having concluded an alliance with the Boeotians, and did not return until 287 (or 286). According to Cicero (Brufus, 83) Democharcs was the author of a history of his own times, written in an oratorical rather than a historical style. As a speaker he was noted for his freedom of language (*Parrhesiastes,* Seneca, De *ira,* iii. 23). He was violently attacked by Timaeus, but found a strenuous defender in Polybius (xii.13).

See also Plutarch, ***Demosthenes,*** 30, *Demetrius, 24, Vitae* ***decem oratorum,*** p. 847; J. G. Droysen's essay on Democharcs in ***Zeitschrijt für die*** *Altertumswissenschaft* (1836), Nos. 20, 21.

DEMOCRACY. Historical Development.— Democracy is a form of government based upon self-rule of the people and in modern times upon freely elected representative institutions and an executive responsible to the people; and a way of life based upon the fundamental assumption of the equality of all individuals and of their equal right to life, liberty (including the liberty of thought and expression), and the pursuit of happiness. Democracy has a long and ancient history, and may be regarded as the modern fruit of western civilization and of its two component elements, the Athenian and Roman legacy and the Judaeo-Christian tradition. The word is derived from the Greek *δημοκρατία* from *δῆμος,* the people, and *κράτος,* rule. In his Politics Aristotle, critical of the decaying Athenian democracy, regarded it in one passage (Bk. III, chap. 7, 1279b) as a perverted form of that state where the citizens at large govern, because democracy considers only the poor and not the common good. In Bk. IV, chap. 4 (1290b, 1291b), he expressed his opinion differently: "We should rather say, that a democracy is when the supreme power is in the hands of the freemen; . . . a democracy is a state where the freemen and the poor, being the majority, are invested with the power of the state." And: "The most pure democracy is that which is so called principally from that equality which prevails in it: for this is what the law in that state directs; that the poor shall be in no greater subjection than the rich; nor that the supreme power shall be lodged with either of these, but that both shall share it. For if liberty and equality, as some persons suppose, are chiefly to be found in a democracy, it must be so by every department of government being alike open to all; but as the people are the majority, and what they vote is law, it follows that such a state must be a democracy."

Democracy was widespread in ancient Greece. Greek history in its most developed period may be regarded as a struggle between democratic and oligarchic states, of which Athens and Sparta were the most representative examples. The Athenians were the first people to try, in their empire, to form a democratic empire, not merely one possessed by a sovereign people but one bound together by common democratic constitutions and institutions. This experiment failed because, as a result of the nature of the ancient city-state, the franchise of Athenian citizens was not extended, as later in Rome, to men of non-Athenian descent. But ancient democracy was in several ways fundamentally different from that of modern times. It was direct democracy in which the whole people formed the legislator and in which the representative system was unknown. That was made possible by the limited size of the ancient state which was generally confined to a city and its rural surroundings, and counted almost never more than 10,000 citizens. In the ancient democracies every citizen was entitled to attend the legislative meetings and to vote. A very large number of the citizens held one of the many elective offices in the course of the years. No division between the legislative and the executive branch existed; both were in the hands of the whole active citizenry, there was no modem party organization. The inability of the ancients to develop a representative system made it impossible for them to create large democratic states. On the other hand, the political life in the ancient democracies was most intense and all citizens were actively interested in and highly conversant with all details of administration. Direct democracy of this kind was the ideal form envisaged by Jean Jacques Rousseau in his Contrat social, and it may be found, to a certain extent, in the New England town meetings and in some of the smaller Swiss cantons. The referendum and the popular initiative preserved in several modern democratic constitutions, as in that of Switzerland, can be regarded as elements of direct democracy surviving in the indirect or representative democracy, which is the generally accepted form of modern times.

Another and very important difference between ancient Greek democracy and modern democracy does not concern the form of government but the fundamental assumption of the equality of all individuals. Ancient democracy was not only compatible with slavery, it presupposed slavery, which alone permitted the necessary leisure for the citizens to devote themselves to questions

of public interest. Modern democracy has tended more and more to abolish all differences and privileges of birth, class, race and sex, and to broaden its basis so as to become all-inclusive. The ancients had a very low estimate of labour, even of highly skilled labour, which also was performed by slaves. This attitude prevailed for a long time and characterized many feudal and post-feudal societies. Only modern industrial civilization. which arose in countries where simultaneously modern democracy developed, produced the new concept of the dignity of labour which helped to break down the barriers of privilege. It should be noted, however, that in Athens slaves were very well treated, and that the main difference between their ways of life and those of other citizens of the poorer classes was the lack of political rights. The Stoic philosophy which dominated the Roman empire and pervaded Roman law, and the emphasis put by prophetic Judaism and early Christianity on the poor and the disinherited and on the equality of all men before God, created the fundamental assumptions on which democracy could develop its faith in the essential equality of all human beings.

The middle ages were not a favourable soil for the functioning of democracy, but toward the end of that period the growing power and wealth of the cities, especially in northern Italy, provided the opportunity for a more intense cultural and social life and with it the reappearance of the spirit of liberty. It is noteworthy that Niccolb Machiavelli in his *Discorsi sopra la prima deca di Tito Livio* praised the value of liberty and the superiority of republics over monarchies or tyrannies. He emphasized the fact that the common weal is observed and promoted nowhere except in republics with a free citizenry. (Bk. II, chap. 2; see also Bk. I, chap. 10.) These discourses, replete with the realistic wisdom of a statesman and a political thinker, contain a remarkable plea for democracy, assert that the people are wiser and more constant than a prince, and reject the contrary opinion, adding that this contrary opinion has its origin in the fact that everyone can speak ill of the people, freely and without fear, even while the people rule, while everyone speaks of the princes only with a thousand fears and a thousand considerations. (Bk. I, chap. 58.) Renaissance and Reformation helped to prepare the soil for the growth of democracy through their emphasis on the individual and individual conscience, and through their return to the sources of classical and Biblical antiquity. A new spirit of inquiry grew up; spurred on by the new discoveries and inventions, it raised man's stature in his own eyes and opened before him vast and unknown possibilities. This new spirit found its expression in Francis Bacon's experimental philosophy as well as in René Descartes's rationalism which proclaimed in his "I think, therefore I am," the sovereignty and maturity of the thinking individual.

It was a long and hard struggle which from 1640 to 1918 carried democracy to world-wide victory. Through a number of great revolutions, but even more through the unceasing toil, the unsparing efforts and the spiritual devotion of countless individuals in many countries during these three centuries, the ideas of liberty and equality gained more and more concrete form. Seventeenth-century England may be regarded as the birthplace of modern democracy. Christian and classical traditions could grow there into something new on a soil well prepared by the development of the Magna Carta and of common law, and fertilized by the Renaissance and Reformation. With a deeply religious enthusiasm the English revolution broke the path for liberty in the modern world. Largely under the inspiration of the Bible, a number of sects proclaimed and propagated all, and sometimes even the most radical, implications of the democratic faith. The great voice of the age was raised again and again in a passionate plea for liberty: all of John Milton's writings were imbued with the newly awakened sense of freedom, freedom of thought, freedom of the printed word, freedom of education, freedom of personal life and conduct, in addition to freedom of church and state. His outcry against censorship: "Give me the liberty to know, to utter and to argue freely according to conscience, above all liberties," *(Areopagitica)*, was matched by his declaration that "no man who knows aught can be so stupid to deny that all men naturally were born free, being the image and resemblance of God himself . . . it being thus manifest that the power of kings and magistrates is nothing else, but what is only derivative, transferred and committed to them in trust from the people, to the common good of them all" *(Defense of the People of England)*. Milton identified the English people and their cause with that of individual liberty, freedom of conscience, and the dignity of reason; but this new dispensation was to be universal, the English only preceding other nations, who were soon to follow. Macaulay in his *Essay on Milton* characterized the man and his epoch:

"He lived at one of the most memorable eras in the history of mankind, at the very crisis of the great conflict between liberty and despotism, reason and prejudice. That great battle was fought for no single generation, for no single land. The destinies of the human race were staked on the same case with the freedom of the English people. Then were first proclaimed those mighty principles which have since worked their way into the depths of the American forests, which have aroused Greece from the slavery and degradation of two thousand years, and which have kindled an unquenchable fire in the hearts of the oppressed and loosed the knees of the oppressors with an unwonted fear."

The spirit of liberalism, rationalism and optimism pervading 17th century England found its lasting expression in John Locke's *Letters on Toleration* and *Two Treatises of Government*. They were dominated by the spirit of compromise, the "live and let live" attitude of mutual respect and toleration within the common frame, which characterized liberalism and democracy. Locke formulated and expounded two basic principles: that the individual, his liberty, dignity and happiness form the foundation of all social life, and that government is a moral trust dependent upon the free consent of the governed. As a result of the two revolutions of the 17th century, England was the only country in which the power of absolutism was definitely broken, and though democracy's growth was slow, its basis had been so firmly established that England never knew any retrogression. The control of national affairs had passed into the hands of a parliament with a steadily growing preponderance of the house of commons and a steadily enlarging electorate; the liberties of the community and of the individuals were protected by a Bill of Rights; judges had become independent from the executive power; the abolition of censorship and the recognition of tolerance became acknowledged principles.

From these roots the tree of democracy grew faster in the virgin soil of the American colonies than in the mother country Locke became "America's philosopher par excellence." The colonists struggled with the mother country as Englishmen and on the basis of their freedom as Englishmen. What was a constitutional conflict within a common heritage of 17th-century liberty became the starting point for a new surge of democracy, not only as a result of the peculiar social conditions of the colonies and the absence of the classes and institutions surviving from a feudal past, but also from the influence of the new ideas of natural rights, the rule of reason, and the freedom of man, which were expressed in the pamphlets *"Common Sense"* and *"The Crisis"* of an Englishman, Thomas Paine, and which were propagated in France by the Encyclopaedists and especially by Jean Jacques Rousseau. Their spokesman in America was Thomas Jefferson nho had drafted the Declaration of Independence and whose life work in the later years was to convert the United States into a democracy under the influence of the 18th-century ideas. This ideological foundation, started in the American Revolution, was carried on and expanded in the two following great conflicts through which the United States passed—in the Civil War under Abraham Lincoln. and in World War I under Woodrow Wilson.

Meanwhile the American Revolution, deeply influenced by the "French ideas," in turn acted upon developments in France. French society idealized the events across the Atlantic. It saw in them the first example of a people which in its eagerness for liberty and justice had thrown off the yoke of an unjust monarchy, and had established a government based upon the enlightened principles of reason. Soon the French people were to find themselves involved in a similar effort. Years of unprecedented turmoil shook not only the foundations of French society, but also those of all Europe. The French Revolution introduced the symbols of a new cult of liberty and human rights and coined the

three words which expressed the essence of the new faith of democracy: the liberty of every individual, the equality of all men, and the brotherhood of all human beings. In the immense enthusiasm of its beginnings, age-old privileges were abandoned; the new feeling of the dignity of man, of his right to self-expression and self-determination, not only created new political forms but manifested itself in all fields of public and private life. The armies of the French Revolution and of Napoleon carried the new spirit all over Europe, everywhere awakening the masses from their age-old lethargy and arousing in them the will to creative participation in the political, social and cultural fields.

Though the new ideas of liberalism and democracy seemed defeated in 1814, and Europe was apparently returning to the old order of authoritarian regime, of inequality and privilege, democracy was soon to resume its growth. In the century from 1820 to 1920 it gained both in depth and in breadth. The revolution of 1830, which started in Paris in July and ended in 1832 with the English Reform bill, re-established the trend toward constitutional government with guarantees for the rights and liberties of every citizen. Its invigorating influence made itself felt in 1848, the "spring of the peoples." The new ideas penetrated into central Europe and Russia, and finally, at the beginning of the 20th century started to transform traditional life even in the Ottoman empire and in Persia, in China and in Japan. World War I was really a democratic world revolution, in which the conservative monarchies of central and eastern Europe crumbled and gave way to democratic republics, suffrage became general everywhere, and the working class began for the first time to assume the responsibilities of government. So great was the impetus which World War I gave to the development of democracy that in most nations even women received the right to vote. This democratic wave did not stop at the confines of Europe: World War I had stirred the masses of the oriental and backward countries into previously unknown demands for national self-determination and for individual rights. The victory of the democratic states of western Europe and of the United States of America over the military and conservative monarchies of central Europe, and the Russian revolution of March 1917 marked, up to that date, the highest points of development for democracy. At that time democracy for the first time seemed to fulfil its world-wide mission of a liberating message to all classes and to all peoples.

For democracy is not only a form of government, but also carries definite implications in the economic field. In their rise, liberalism and democracy were connected with the ascendancy of the middle classes and with the growth of industrial civilization. As social phenomena, the English revolutions of the 17th century, the American and the French revolutions of the 18th century, and the revolutions of 1830 and 1848 were largely middle class movements. Economically they served the fight against a feudal and rural economy to provide the necessary liberty of development for the rising urban economy of traders and industrialists. This new economy was based on essential liberties removing all the restrictions of the past which had hindered the free development of the individual and had kept him in stations of life to which he had been assigned by birth or tradition. All these movements had also their more radical wings which insisted, beyond individual liberty and equality before the law, upon equality of opportunity and sometimes even equality of income. Though little was accomplished in the field of "economic democracy" in these revolutions, and in most cases the problem was neither seen nor understood, the rise of democracy with its emphasis upon equality and upon each individual's right to the pursuit of happiness awakened the masses to the realization of their situation. and brought many members of the upper and middle classes to the conviction that the benefits and blessings of democracy must be extended to the economic field to become real and effective for the masses. Complaints about the shortcomings of purely political democracy were frequent at the beginning of the 19th century. Thus the *Mechanics Free Press* in Philadelphia declared in 1829: "There appear to exist two distinct classes, the rich and the poor; the oppressor and the oppressed; those that live by their own labors and they that live by the labor of others; the aristocratic and the democratic." The aspirations for a broadening of democracy to the economic field received a growing impetus throughout the 19th century with the progress of industrialization and of urbanization. The socialist movements in the 1830s and 1840s in France culminated in the formulation of socialist demands in the *Communist Manifesto* of Karl Marx and Friedrich Engels in 1848. It maintained that the "bourgeois" society could not develop a true democracy because it remained based on the exploitation of the wage earners by the capitalists. Some years before, the Chartists in England had tried to formulate a program of complete democracy without putting any emphasis, however, upon economic demands, confident that general and equal suffrage, annual elections to parliament, indemnities to parliamentarians and other means of making the elected representation correspond as closely as possible to the popular will, would result in economic democracy. Modern socialist movements, however, believed that political means alone were not sufficient and that economic measures were necessary. As such a measure, Henry George urged in his *Progress and Poverty* the introduction of the single tax to absorb the unearned increment in land values. Though important measures have been taken in most countries since the latter part of the 19th century to democratize the economic setup and to make the economically weaker classes participate more fully in social security and in the amenities of life, nevertheless economic democracy is still far from realization.

Ultimately, democracy in its political and economic expressions will always be determined by its strength as a moral and spiritual factor dominating the public mind. Great democratic statesmen like William Ewart Gladstone in England, or great democratic popular leaders like Giuseppe Mazzini in Italy have always understood how to instil some of their own democratic fervour and moral conviction in their people and thus to keep democracy as a live issue. For democracy does not exhaust itself in political techniques or in economic reforms. It is above all a fundamental attitude, a scale of values, a definite conception of man and his place in society. Though the institutions and forms of democracy may differ widely, and in fact do so in the various countries, there are central values which underlie all forms of democracy and determine what may be called the "democratic way of life." These values have been discussed above in the historical development. Here it is only necessary to point out what may be called the method of democracy. It is the method of discussion, of open-minded critical inquiry, and finally and frequently of compromise. Democracy presupposes the existence of opposition as a legitimate partner in the democratic process; it accepts a pluralistic view of values and associations, and it rejects any totalitarian or monolithic identification of the state with one party or with one dogma. But discussion and tolerance must always be held within the framework of the democratic faith, and that means the recognition of the fundamental values of individual liberty and of the equality of all men. Tolerance toward elements which deny the fundamental assumptions of democracy and even its right to existence, would not only be theoretically inadmissible, but also practically most dangerous to the existence of democracy. Democracy has many shortcomings, some of which are inherent in its nature; they can and must be improved and modified by constant criticism and vigilant opposition; they should not be allowed to foster a spirit of unproductive criticism which in its wish to put something "better" in the place of its "inefficiency" or "corruption" or "mediocrity" generally is not clear about the alternative which turns out to be some form of old authoritarianism or master-serf relation. however streamlined it may seem. By its own essence, democracy can never be perfect, because that would presuppose a perfect citizenry, highly educated and never swayed by blind emotion or by inertia. But with all its imperfections, democracy is so far the most human and humane form devised by the growth of western civilization which increases the dignity and the creative faculties of every individual. Its intrinsic imperfections make it the most difficult, most daring and most promising form of human organization.

With the awakening of the masses from apathy to activity, from

immaturity to full stature, democracy creates a number of complex problems which have sometimes been summed up in slogans like "the revolt of the masses" or, applied to former colonial peoples, "the revolt of the east." With the broadening of education, which only a comparatively short time ago was confined to a tiny minority and today practically everywhere tends to include everyone, the level of education necessarily had to be lowered, though the gain on the whole has been immense, not only in the breadth of education imparted but also in its quality. Since their awakening from traditional inertia, the masses have been more easily swayed by emotions; the democratic process of the formation of a collective will is cumbersome and allows the full play of demagoguery and may, in times of emergency, weaken or confuse the national resolve. All these difficulties offered to some an excuse for discarding democracy and for returning to the domination of a selected group, a self-appointed elite, convinced of its divine-grace mission over the '[eternally immature" people. Faced by the complexities of modern life, some wished to take refuge in an apparent "security" by scrapping 300 years of social and intellectual development. Since World War I a number of movements of this kind have arisen, motivated partly by a conscious return to what Oswald Spengler has called "age-old barbarism," an attitude long believed obsolete, partly by a sense of defeatism, of frustration, of discouraged cynicism. Democracy had lost its vigour to a certain extent, had become softened by a preoccupation with material progress and economic considerations. The attacks to which it found itself exposed revitalized democracy and brought about a rethinking of its fundamental values and implications. The difficulties inherent in democracy were realized, but they were understood as a challenge to which. the right response was a deepening and broadening of a regenerating democracy.

The conditions of the 20th century, with its new means of communication and the fast-growing interdependence of all people on a shrinking earth, faced democracy with the problem which is inherent in its conception of human brotherhood: that of establishing a democratic world order which would assure universal peace and the security of democracy in the different countries. The task had been foreseen by Immanuel Kant in his essay on *Perpetual Peace,* published in 1795 under the influence of the first great democratic revolutionary wave. "A state of peace among men who live side by side is not the natural state, which is rather to be described as a state of war: that is to say, although there is not perhaps always actual open hostility, yet there is a constant threatening that an outbreak may occur. Thus a state of peace must be *established."* Kant said that this peace was possible only if each state were what he called "republican," possessing representative institutions, and if the law of nations were founded on a federation of free states. "The intercourse, more or less close, which has been everywhere steadily increasing between the nations of the earth, has now extended so enormously that a violation of rights in one part of the world is felt all over it. Hence the idea of a cosmopolitan right is no fantastical, high-flown notion, but a complement of the unwritten code of law — constitutional as well as international law — necessary for the public rights of mankind in general and thus for the realization of perpetual peace." What Kant foresaw about 150 years ago, what was postulated by the democrats of 1848, became in the 20th century a matter for thoughtful consideration as a precondition for the survival of democracy anywhere. Woodrow Wilson, and with him many democrats in all democratic countries, felt the need and endeavoured to meet it by the creation of a League of Nations. Its close and fundamental connection with democracy was understood by Wilson. In his appeal for it he warned, "I think we all realize that the day has come when democracy is being put upon its final test." In the last address which he broadcast on Armistice Day, 1923, he repeated, "The faith of the world can be set straight only by the firmest and most determined exhibition of the will to lead and make the right prevail." The refusal of the democratic peoples to establish a firm international order, when the victory of 1918 gave them an opportunity, their unwillingness to shoulder responsibility for the common destiny of all nations, made possible World War II which began in 1939, in which democracy was faced with an unprecedented danger fraught with almost unimaginable consequences. Should democracy weather this danger, it will emerge from it profoundly revitalized. It will hold the hope and promise which animated Milton and Jefferson, Kant and Mill, Condorcet and Mazzini, of a peaceful world based upon the liberty of the individual and the equality of all men.

Theory and Institutions. — Considered as a form of government, democracy usually confronts modern thinkers under two separate aspects: as democratic theory and as democratic institutions, and this division will be followed here. Even as a theory, however, it has undergone a series of developments from the earliest times. Philosophically, it has always suffered from the apparent paradox that under it the people are at the same time both the rulers and the ruled, and this, to many of the ancients, was rather a form of anarchy than of government. Hence Aristotle placed it in the lowest degree of legitimate governments, and the most likely to degenerate into tyranny. The modern concept of democracy, on the other hand, finally emerged as a result of the perennial search for the best and most equitable form of government. Largely as a result of the rediscovery of Aristotle himself, the Middle Ages summed up the qualities of good government under three headings: it must be 'rule for the common good, it must be representative of the community, and it must, in its authority, be immediately derived from the community. Still under the influence of Aristotle, however, the Middle Ages, preoccupied with the idea of unity, considered the monarchy — the rule of one — to be the best form, the one most suited to secure this unity. It is clear to us now, however, that this concept was valid only so long as the monarch was himself ruled by an interior criterion of goodness, and then only in theory. For while the absolute monarchies did not always change into tyrannies, nevertheless, in practice, and in the 15th century, in theory, as a result of the re-introduction of the Roman law, the monarch became absolute in the sense that he, and not the community, was considered as the ultimate source of law, which in turn ceased to be the expression of reason, and became the instrument of the monarch's will, or, more accurately, his arbitrary decision. It was because of this fact, that, as Harold Laski has well said, it was at last discovered that the "only way to respond to the wants of the community was to associate him with the process of authority." In other words, since it had always been agreed that government exists only because of the common good — that is, ultimately because of the perfection of the human personality in its separate individuals congregated into a definite community — it came to be seen that the essentials of good government, as listed above, could not be realized unless those who were governed themselves had a say in the government. Man, therefore, in the 18th century, looked to the community as the means by which that community's good would be achieved.

Once, however, this point of reasoning had been reached, another, and graver, question had to be settled before a sound theory of democracy could be established. If the community was to govern itself, instead of being governed by some ruler or senate, then some justification would have to be found by which the community, or an agency set up by it, would possess the moral right to impose obligations upon the citizens as a whole. The writers of the Old and New Testaments, and the fathers of the church, assumed that the authority of the ruler was in fact the authority of God Himself. Those philosophers who followed Aristotle saw the origin of authority in the natural law,

which amounted to the same thing, since the natural law was deemed to be merely the law of God as discovered in man's nature by human reason. On the other hand, the lawyers, following Ulpian, held that all authority is derived immediately from the people, while admitting that ultimately it came from God the Creator. In the early Middle Ages, following Charlemagne, the authority of the ruler arose as a result of a contract between the ruler and the people, signified by a mutual exchange of oaths. In the 13th century, a synthesis was made of these various opinions, and the community was said to possess the authority from God through the natural law and to have transferred it by a contract to the ruler. There was still no question of the community normally exercising its own authority, though democracy was always considered in theory to be a legitimate form of government. Soon, however, a distinction made between a political regime and a regal regime, one in which either the people or the king was the source of law, opened the way to the rise of the absolute monarchies. Sir John Fortescue tells us in the 15th century that in his time the political regime survived only in England, while on the continent generally it was the regal regime that held sway. The influence of Machiavelli, with his rigid concept of the absolute ruler, quite universally entered into political theory. In spite of the opposition of Richard Hooker, who looked to the older European tradition for his inspiration, England at last under the Tudors and then the Stuarts succumbed to the idea of the regal regime in an exaggerated form. It was Thomas Hobbes who made himself the philosophical protagonist of this theory. Meanwhile on the continent, a reaction against absolute rule had set in in Italy and Spain under Roberto Bellarmine and Francisco Suarez, and an attempt was made by these Jesuits to restore the mediaeval doctrine of a justification of political authority by seeking its immediate origin in the community itself. In England, in turn, the old Whigs, and the writers Algernon Sidney and John Locke (q *v.*), both frankly basing their contentions on the older European tradition, sought the justification of authority in the compact by which a number of human wills concurrently seek the common good. The Scottish school of common sense, under Buchanan and Reid revived in Great Britain the older concept of the natural law, by which man, being a social animal, derives his rights from God and sets up a society to safeguard these rights. Still later, however, we find Jean Jacques Rousseau in France resurrecting the old patristic idea that it is unworthy of man to obey another man. He gave it the subtle twist, however, that whereas the fathers of the church held that we obey only God when we obey the state's laws, Rousseau, rejecting the source of authority in God, was driven to see it in each man's own will, and so, by his concept of the general will, he held that when a man obeys the political authority he is really only obeying himself, inasmuch as his own will is contained in the general will by virtue of the social contract. On the other hand, the theorists of the American Revolution, Whigs like James Madison, James Wilson and Alexander Hamilton, trained under the Scottish school. took the stand of an objective obligation to obey arising from man's own nature as a social and political animal, and the consequent placing of sovereignty in the people itself. In this they were abetted in England by Edmund Burke. It remained for George Washington, in his farewell address, to express this idea in a lapidary sentence: "The very idea of the right and power of the people to establish government presupposes the duty of every individual to obey the established government." This is the ancient doctrine of the essential correlation between rights and duties. It implies a mutual responsibility between state and individual, in which man, by his nature as a social animal, seeks from the state his perfection as a person, and the state in its turn seeks from the individual that co-operation by which it may contribute to the perfection of every other individual. It was this concept, as expressed by George Washington and others of his time, which gave to the American system its distinctive character, for it solved once for all the problem of the moral right of the people as a sovereign to command the people as subject.

Equally important in the development of democratic theory is the evolving notion of the necessary limitations on political authority which are required if government is to realize its essential function of caring for the common good. In the early days of western civilization this limitation was purely internal and spiritual. The ruler was the representative of God and should do nothing in his regime that was contrary to the will of God; that is, nothing that God would not do if He were the direct ruler. This internal sanction was a powerful incentive as long as rulers voluntarily accepted the moral teaching of the church. It persisted, as a matter of history, only as long as did the influence of churchmen on rulers. It was a mediaeval tradition that lasted even into the American colonies, particularly Massachusetts and Virginia. In the course of time, it gradually became clear that some external sanction was necessary as well. Yet, while the need for limitation was clear, the visible means to this end were not so clearly discernible. The mediaeval contract between people and ruler was fairly efficient. In the hands of a man like Manegold of Lautenbach it became in fact a powerful instrument for holding the ruler to his duties as a servant of the people; for by his defying of the contract, the ruler became, in this theory, no longer a king, but a tyrant, and hence the people were by that very fact absolved from their allegiance to him and to his government. Outside of the imperial faction, political writers quite generally held, with Isidore of Seville, that the ruler is bound by his own laws; and the *lex regia* of the old Roman law was interpreted in the Middle Ages to be the law by which the people set up a ruler and established the precise limits within which he could rule. We have here, moreover, the first germs of constitutional rule, which was later to become so important in democratic theory. This development, however, was temporarily retarded by the rise of the absolute monarchies, but as Laski has observed, if it had been allowed to continue, it would have introduced democratic institutions much sooner in the history of western Europe. It remained for the American theorists to see the precise application of constitutionalism to self-government as the only external means to ensure that the ruler or government will be wholly devoted to the common good. According to these, it is the people who give the constitution. and the appointed ruling agency is held in its administration within the rigid limits of its letter. subject to the right of the people at any time, by appropriate means, to enlarge or constrict the powers which it has granted. In this theory, again, three things are done by a constitution: the requisite consent is granted by which a people constitutes a state; a form of government is chosen and set up; and to this government, the incumbents of which are later to be elected, certain rights are granted, and at the same time, definitely limited. Thus the ancient theory of the necessity of limitation of government within the consent of the people was made actually feasible by the democratic theory of a popular constitution. The example of the American colonists in adopting a constitution was followed in the French Revolution. On the other hand, in Great Britain, the claim is also made for a constitution, on the grounds that the commons, the ruling agency, is at any time restricted by the powers which, for the occasion, the people, through its representatives, are willing to grant. Thus, in that system, while the constitution is not written, it is nevertheless considered to exist as a definite limitation of power on the ruling agency.

Other limitations, however, had to be placed upon authority before a constitutional democracy could become possible. These, like the mediaeval one of justice in the ruler, are in the internal order; but, unlike the earlier limitations, they regard the community rather than the ruler. The principles of these are two: liberty and equality. Liberty, as a political idea, has always had to struggle between two opposing concepts of its meaning. The ancient idea, as expressed, for instance, by Aristotle, Augustine and Aquinas was that liberty is the right of the members of the community to be ruled in their own interest. This remained the controlling theoretical idea of liberty for many centuries, whatever the practice may have been at various times. Later, however, and especially after the Renaissance and Reformation, another idea came in to dispute this earlier concept. According to this idea, the autonomy of the individual in the political society is stressed, and liberty implies the right of the individual to settle his own destiny, in complete freedom from any outside influence. Liberty, therefore, is in eternal antithesis to authority, and the subsequent political problem has been how the two can be reconciled. It has been seen how Rousseau ingeniously evaded the difficulty by his concept of the general will, through and in which the individual merely obeys his own will under political authority; but his solution was not generally adopted. The American revolutionary theorists reverted to the earlier theory, by which government was accepted as a normal and necessary natural institution, but was subjected to the needs of the community. Under this theory, liberty is the complement, not the antithesis, of authority, and liberty under the law became an American slogan and legal axiom. Authority existed for the very purpose of safeguarding liberty. The citizen is free under this interpretation, when he sets up his own government and when this government operates for his own interests, not the interests of the ruler or any privileged group. Here again, the development of a traditional idea resulted in a theory that was reducible to practice, as we shall see.

Closely allied to the idea of liberty in democratic theory, is the idea of equality. The early Christian idea, inherited from the Jewish tradition, and enunciated by Jesus and elaborated by St. Paul, was that all men are equal before God, being descended from the same first parents, who were created by God, and being redeemed by the death of Christ, and hence are all brothers and can boast no inherent distinction one over the other because of race, fortune or other accidental inequalities. On the other hand, the ancient pagan tradition, both Greek and Roman, with its civilizations economically based on human slavery, maintained the existence of essential inequality between different classes of men. As the Judaeo-Christian doctrine gradually took possession, equality became a fundamental tenet in theory, and the much-quoted dictum of Pope Gregory the Great (590–604), that "all men are by nature equal," was maintained as the universal teaching for many centuries. This equality, however, remained what may be called passive equality; it meant that originally all men without exception enjoyed liberty, the right to be ruled in their own interests. It was, therefore, essentially a conscientious limitation on the power of the ruler, and was achieved only when he accepted the obligations which it laid upon him. It did not formally include the right of the individual to participation in government itself. The axiom laid down by Aquinas in the 13th century that "all should have some share in the government" was new for his time and did not bear fruit for many centuries. It took long thought before western man actually saw the implications of his own teaching, and it was a teaching, of

course, that was absolutely nonexistent in the east. For this reason, political equality, even under the enlightened English theory, remained only a partial right until the 19th century; it was an equal right shared by only a portion of the population. Once again, it remained for the republican theory originating on the American continent during the colonial period to perfect a system which would make it ultimately possible for an active equality of universal participation in government to become a reality. The equality practised by the French Revolution, while more extreme, was in reality a historical development posterior to the American experiment, and undoubtedly influenced by it. Even then, however, as we shall see, in practice it took a generation before universal suffrage became the ultimate conclusion from the postulate of equality.

Intimately connected with the notion of political equality in a democracy is that of social equality. In a negative sense, this latter is usually taken to mean that hereditary or financial distinctions do not entitle individuals to special privileges in public life or before the law; and particularly that social inequalities do not constitute a title to political power. Such an equality in the social sense was an achievement of both the American and French Revolutions, though inequalities did not disappear in Britain until the liberal reforms of the early 20th century. Social equality in a positive sense rather pertains to a consideration of democracy as a way of life, and is treated below. On the other hand, in recent times, a more fundamental question has been raised: whether a theory of political and social equality is sufficient to constitute a real democracy. It has been argued that economic equality as well is essential to the establishment of political equality, since a wide distribution of material goods is necessary to the stability of a democratic state. Those who defend this position, however, still show a broad gradation from those who look on economic equality as merely equal economic opportunity to acquire goods, all the way to those who advocate actual equal possession of goods through the medium of membership in the all-inclusive state. Actual economic inequality has persisted, even in theory, up to our day as the controlling doctrine in democratic countries, due to the quite general identification of democracy with the 19th century theory of laissez faire or economic liberalism, by which liberty is interpreted to mean that industrial entrepreneurs, owners and employers are exempt in their purely economic activities from governmental interference. This theory has necessarily resulted in the wide inequalities of possessions and even of opportunities which give one portion of the community a disproportionate share in political power. It is for this reason that many think that democracy ultimately will be preserved only on the one hand by divorcing its concept from that of economic liberalism, and on the other by finding a solution somewhere in the middle between the two extremes mentioned earlier in this paragraph; namely, by creating institutions within the democratic framework in which there would not only be equal economic opportunity for all, but in which it would be guaranteed.

A further question that has been raised on the question of equality concerns the extent to which it should be applied in a democracy. Should it be restricted only to the white populations which form the controlling groups in their respective countries, or should coloured populations, at home and in the colonies, also come under its protection? In the 19th century and the early 20th, there was no question but that the home white population considered that equality applied to it alone, so that democracy appeared as the sole monopoly of the original white democratic countries, while eastern and southern Asia and Africa were implicitly excluded from it, along with indigenous coloured groups within the other parts of the world. The inherent contradiction in this latter position has been perceived only in relatively recent times. If political equality lies at the base of democratic institutions, as most now believe, then no man, whatever his colour, is excluded from its benefits, for equality is a human relation, not an accidental one. This is a question which, as a result of the events of World War II, has become increasingly important in the world at large, but is still more crucial in the United States itself. It became clear that democratic government, like any good government, but even more because of its profession of equality, must be conducted in the interests of the whole people under it.

As the conviction emerged more and more clearly that the original concept of government for the common good was not secure in the hands of even the enlightened absolute ruler, when this ruler abandoned allegiance to an objective moral order, the question arose as to how far individuals should be associated with the process of authority. As a matter of fact, therefore, the history of democracy is largely the history of the inclusion of more and more of the inhabitants of a given country in the exercise of power through the ballot. There are various theories concerning the title of the individual to a right to a place in the electorate. While a logical theory of democracy would seem to place this title in the possession of citizenship, or even in the mere fact of membership in the state, it must be admitted that the hitherto controlling theory of the electorate looks on the right to vote as a privilege extended by those who already have that right to those whom it chooses to include in the right. Thus, while we usually look on the government of Britain as a democracy after the great revolution, and also consider the United States as a democracy after the adoption of the constitution, if not before, nevertheless in both countries for many generations the right of the ballot was restricted to property owners. It was only gradually that voting powers were extended to all citizens as by right, and even then under various restrictions. Also, nonnaturalized members of the state in all democratic countries are considered as not possessing the right to vote, though the United States has gone so far as to include the total number of inhabitants—citizens and noncitizens—in computing the size of a constituency.

Until the early 19th century the word "democracy" was usually restricted to what was properly called "pure democracy"; that is, a government in which the whole people itself exercised the direct power of legislation when gathered together at one place for that purpose. It is the town-meeting idea on a national scale. It was always clear, however, that such a kind of democracy was possible only when the group was sufficiently small to meet all at one place. In a nation of any size, it was necessary to find another means by which the people could rule without taking part in every immediate step of the process of authority. It was thus that the idea was gradually adopted of choosing a certain number of agents, or representatives, who were numerous enough to take the place of the whole people and few enough to meet at one place. The mediaeval Spanish cortes, the French estates general, the English commons, were examples of this kind of representation, but ordinarily for a relatively limited purpose, the voting of moneys to the monarch for his wars or public works. When, with the gradual overthrow of the English monarchy, the commons assumed a political function, the theory of representation took on an entirely different form. In the American constitutional convention, many speakers denounced what they called democracy, a dictatorship of the proletariat which they attributed to the Levellers. It was for this reason that the writers of the *Federalist,* who saw that what they knew as democracy was an impossibility, due to the great extent of the Atlantic coast and to the many special interests prominent in the nascent states, chose rather to give their representative system the name of republic.

The final step in the evolution of the theory of democracy, therefore, involved the settlement of the nature of representation. The mediaeval notion of the ruler as representative of the community was restricted to his internal obligation to look out for its interests, and did not include the continuing power of the people to operate through him. In other words, political equality was passive, not active; it implied the right to receive the benefits of government in an equitable way, but not the right to secure those benefits for themselves by direct action. It is true that Aquinas, in consequence of his axiom that all should have a share in government, held that both the supreme ruler in his ideal state and the subordinate governors should be elective, but his thought was not generally accepted in Europe until the 16th century. Also, while it was generally held that the ruler merely exercised the authority which was the community's, there was, as Carlyle has shown, considerable debate as to whether the community irrevocably handed over its power to the ruler, or could, under certain circumstances, recall it from him. It was not until Bellarmine and Suarez adopted the doctrine of the power of recall that continental thought generally gave hospitality to the notion, in spite of severe opposition in conservative quarters. In England, opinion was equally divided, with James I and his followers holding that power was not even derived from the people and hence could not be recalled by it, while Hooker, Coke, Sidney, Locke and the old Whigs generally held to the ancient tradition. Later, the theorists of the French Revolution, with their inherent hesitation as to whether any political authority was legitimate, except as an artificial and necessary expedient, logically restricted political power to a temporary exercise of physical force. On the other hand, the makers of the American constitution, especially James Wilson and James Madison, the latter writing in the *Federalist* papers, were of an open mind, in theory, as to whether the elected rulers should remain in power "for good behaviour," that is, for life—as long as they satisfied constitutional guarantees—or should be elected for a stated period. It was the latter theory that triumphed. Thus periodical accountability of the representative to his constituency became an essential element of American democratic theory. It was natural that this should happen, for if democracy really means that the people rule themselves, it is not sufficient that government officials simply be elected by the people, even by universal suffrage; they must, at stated intervals far enough apart to be consistent with efficient government, be recalled to account for their actions to the people.

With this point settled, however, it still could not be said that the representative principle had been thoroughly settled. There remained the further question as to the function of that representation. Was it intended to be merely a registering of the majority will of the constituency at a given period, or was the representative elected on the understanding that he be free to use his own best judgment as to the proper means to be adopted for a commonly accepted end? It was the latter theory, as expressed by Edmund Burke in the Bristol speech, which was incorporated into the American system, as it had been adopted by the English. It was the theory of the lawyer, as agent for his principal, who, in his superior knowledge, experience and opportunity, is expected to take the best means to achieve the end which his client desires. Thus, in the political field, it is the constituency which adopts the end to be achieved, while the representative is expected to choose the means which he deems the best suited for that

end. This theory, however, it must be said, is not universally accepted in the United States, especially in the west, where the initiative, referendum and recall have entered into political thinking. Under this opinion, all public officials, even judges, must at any given moment merely register the existing will of the majority of the constituency. The partnership between people and representative, therefore, under this concept, is not one of principal and agent, but of a principal and his messenger, where the principal chooses the end and means.

This question concerning the function of the representative, moreover, involves another: namely, that of the rights of a majority in a democracy. Here the continental and Anglo-American theories are again in conflict. In the third French republic, for instance, under Gambetta and his followers, the majority acquired absolute rights through election, and it was expressly declared to be a derogation of the liberty of the majority to demand that account he taken of electoral minority demands. In the United States particularly this theory has always been considered to be an essential weakness of French republicanism, a weakness that has been reflected through French influence in many Latin-American countries which have adopted democratic institutions. In the American theory, there is an implicit contract in the electorate before each balloting that the eventual minority shall abide by the results of the election, so that each election becomes, post *factum,* a unanimous one, since the whole constituency agrees to the choice of the winning candidate. The important result of this implicit contract is that after the election the representative, once elected, represents, not those who elected him as a majority, but his whole constituency, including the minority. Thus under this theory, in the American system, the whole people, at any given moment, actually governs through its elected representative. It is this theory that has protected the democratic system of the United States from periodical revolutions engineered by discontented minorities which refuse to abide by the results of the balloting and have no other recourse to secure representation except by violence in their own interest.

A final question in democratic theory concerns the right of any people, even under an absolute ruler, to change its form of government. The right of revolution has been in at least a part of the tradition of western civilization since mediaeval times. The theory of contract between people and ruler implicitly involved the right of the community to free itself from a despot who violated his part of the pact by refusing to rule for the common good and turning his government to his own personal advantage instead. The natural-law theory derived by the Schoolmen from Aristotle made justice the fundamental virtue of government and hence voided the title of any ruler whose regime turned into injustice. With the rise of the active equality of all members of the state to participation in deliberations for the common good, the right became explicit. Since both the form of government and the choice of an incumbent in office lay, by hypothesis, within the consent of the people, the community obviously possessed the right to transform itself to another form or to choose other governing officials within the existing form. However, it must be noted that various modifications of this right have been introduced as a result of the modern identification of democracy with a constitutional representative republic. Under this development a republic is intolerant of any fundamental political change which is not carried out according to constitutional provisions, and violence in the course of such a change is particularly forbidden. It is doubtful, however, if any democratic republic would countenance a change, no matter how introduced, which would make it cease to be a democracy. To this extent, any form of government, even a democracy, is totalitarian; namely, that it demands that its members accept its own essence, and will tolerate proposals of change only within the framework of that essence. While the third French republic licensed a political party which demanded a return to the monarchy, such a party would probably not be deemed constitutional in the United States, which guarantees a republican form of government even to the separate states. Here, also, the communist party creates a definite problem; for, while it calls for a revolution which would ultimately essentially transform our type of government (the "withering away" of the state), it necessarily professes to do so by constitutional means, and hence has hitherto been tolerated on this understanding. It remains true, however, that even a democracy cannot, or at least would not, tolerate a form of political agitation for naziism, for instance, which openly professes to intend to do away with democracy altogether.

Democratic Institutions. — The fundamental institution in every modern democracy is the constitution, whether this be a written one, as in the United States and many other countries, or an unwritten ope, as in Great Britain. Such a constitution really performs three functions it expresses the consent by which the people actually establish the state itself; it sets up a definite form of government; and it grants and at the same time limits the powers which that government is to possess. The British constitution, which is an unwritten one, is really at the present time the sum total of the powers which, at any given time, under the doctrine of the omnipotence of the parliament, the commons, as the direct representative of the people, considers itself to possess. It necessarily differs in content from time to time. On the other hand, a constitution of the type of a federal republic like the United States is the sum of enumerated powers of which the several sovereign states have divested themselves and which they have deposited in the central government. The several states themselves have also adopted constitutions, though it is generally held that, unlike the federal government, the state governments have all the powers which accompany sovereignty, whether they are enumerated in the constitutions or not, except those which they have surrendered to the government in Washington. Other more centralized republics possess constitutions which are not lists of enumerated powers, but which profess certain general political principles and leave a wide latitude to the legislature and the executive.

The principal functions of any government are three: legislative, executive and judicial. The concrete political institutions in any given country, therefore, will be those which exercise those functions, and also those which contribute to these three. In ancient tradition, these functions were usually combined in the person of a king or the senate, and theoretically, they could also be combined in a democracy in one institution, provided that that institution were subjected to periodical accountability to the electorate, which, as we saw, is essential to any notion of self-government. In practice, however, such a concentration of power could hardly be called a democracy, though it could be called a representative government. All modern theories of government demand that the judiciary be separated from the executive who is entrusted with the administration of the laws. Democratic theory, moreover, which considers the power of passing laws to be the heart of any government, requires that the community as a whole be, as directly as possible, associated with the process of legislation. Separation of the legislative from the executive is not considered to be an essential of democracy as such. In modern political literature in English, Locke is usually credited with pointing out the distinction between the three powers, though he himself was well aware that he was merely repeating the ancient Roman and mediaeval doctrine, while Montesquieu is probably the first who actually suggested their separation. This suggestion was followed out in the American constitution, principally as a reaction against the confusion between the three powers which had taken place in the English parliament and which was the real cause of the grievances of the colonies. As a result, in the United States, the government, properly so called, is not the president nor the congress nor the court, but all three taken together. The president and his departments in the executive function are properly denominated the administration.

The simplest form of a direct association of the people with the making of laws is that in which the whole community (usually adult male) not only chooses by vote the ends to he pursued, but actually chooses the means to achieve this end and embodies them in laws; in other words, the town meeting, as we know it, while the execution of the laws was entrusted to an elected official (bailiff, sheriff, consul, mayor). Since, however, as has been said, this type of government is feasible only when the population is so small that it can be present at the same time and place, and hence in larger communities the only practical means of giving the people control over legislation is a deliberative body which is elected as representative of the whole community and is small enough to meet at one time and place. The deliberations of such a body could thereupon be presented on each occasion to the community for its approval or rejection, or the representatives could be empowered to enact them into law immediately. It is thus that a parliamentary form of legislative body has by tradition and experience been identified in practice with democracy. Moreover, in a democracy, this parliament could also be entrusted with the execution of the laws, and this is the system which, with the rise of parliamentary supremacy, developed in Great Britain, where the executive, the cabinet, is merely a committee of the commons, and is chosen by the majority party, and also in most other democratic systems. In the United States, as in Britain, a bicameral body constitutes the legislative branch, which, however, unlike Britain's system, is completely separated from the executive branch. Moreover, once again in accord with the mediaeval tradition, the monarchical principle was deliberately preserved in the American system, and the executive of the laws was made one man, the president.

In all the various systems of representative government the obligation of periodical accountability to the electorate has been maintained, hut in varying degrees. Mostly a fixed limit of several years has been set beyond which the parliament must seek a new mandate from the people, with the intervening obligation imposed upon the cabinet, if it loses the confidence of the majority of parliament in a matter of importance, to resign, or go to the country for a new election, or both. Here again the American democratic system departed from precedent. The president is elected for four years, and is recallable only after impeachment and a trial before the senate presided over by the chief justice, with a two-thirds majority necessary to secure his removal. He is not, therefore, as in Britain, subject to a fluctuating congressional majority. In the congress, one-third of the senate is elected every two years, while the house of representatives is elected in totality every two years. It was hoped, with reason, that this overlapping recourse to the people would introduce an element of quasi-automatic stability not present in other systems. In the same way, the conception of representation has also varied in different democratic systems. In Britain, in the third French republic, and in other regimes modelled upon them, the executive is directly responsible to the legislature, since it is really only a part of the latter body, which is directly chosen by the people. In the original form of the American system, the president was chosen by a body of electors, who had

free discretion as to whom they might choose, and hence he was not the immediate choice of the people. The senate also was not immediately chosen by the general electorate of the various states, but by the state legislatures, to whom, therefore, the senators were directly responsible. Only the lower house in the American system was to be elected by popular vote. In the case of the president, and largely as a result of rigid party control, the constitutional provision has been nullified, the electors have lost their discretionary powers, and hence for all practical purposes, he is elected by a direct popular vote. Popular election of the senate was introduced by the 17th amendment (adopted 1913). Only the federal judiciary, in the American system, is theoretically independent of the will of the community, though the popular philosopher, Dooley, has expressed the current opinion, that "the supreme court follows the iliction returns." Due to the fact also that the supreme court justices have been ordinarily appointed at a relatively advanced age, the president who is elected for two terms or more is in a position to appoint incumbents who more or less adhere to the policy of the contemporary majority party. The United States supreme court, however, has been noted for maintaining the civil rights of individual citizens, no matter what general social or economic philosophy its members profess.

Electoral systems in a democracy have also varied in different circumstances and lands, and at different times in the same land, in accord with varying theories of the nature and extent of representation itself. No electoral system, apparently, has included the whole population. At different times, the electorate has been considered either as an attribute of citizenship, a vested privilege, an abstract right, a function of government or a means of expressing human personality, but in general it can be said that the modern tendrncy has been to include as far as possible all the adult population in the number of those who are entitled to express their preference for their representatives. Moreover, with the abandonment of the earlier idea that the family is the essential unit of society, it was quite in accord with this tendency that the head of the family, the husband, should lose his unique prerogative; and so woman suffrage was introduced in the United States by the 19th amendment (adopted 1920) and in its complete form by Great Britain in 1928. All electoral systems in early days, including the British and American, restricted the ballot to property owners, and it was only gradually that universal adult suffrage has been adopted. Meanwhile, also, constant attempts at restriction have been practised. For many years, the "grandfather clause," excluding from the polls those whose grandfathers had been slaves, was a disqualification in southern states in the U.S.A., and at present writing (1942) the poll-tax qualification, by which the very poor (mostly Negroes) are excluded from voting and jury duty in a dozen states, is a matter of intense controversy. Other restrictions have to do with registration, with extended periods of domicile in the respective voting precincts, and other similar forms of exclusion through legal means. Intimidation of rurai or industrial employes has also been widely practised. It has always been assumed that the electoral system should be free of all special influences, and hence that the free ballot necessarily means a secret ballot. In those countries in Europe and elsewhere with democratic regimes in which the political parties themselves supply the ballot outside the polling places, this secrecy has been necessarily absent. The United States system, in which local government itself prints and supplies the ballot or a voting machine, is probably the best way to secure secrecy. Many so-called plebiscites which in totalitarian countries the ruling regimes have designed to give a colour of legitimacy to their revolutionary movements have lacked secrecy, and hence freedom.

In modern times, the party system has been considered a necessary if not an essential element of democracy. The early history of Great Britain and the United States does not bear out this contention; but it can be said that modern practice is all in its favour. In these two countries, in the 19th and early 20th centuries opinion was also in support of the two-party system (liberal and conservative; republican and democratic). In most other democratic countries, however, a multi-party system has prevailed, through each of which not only are social and economic ends promoted, but also different means to the same end. This fractional division has the disadvantage, from the English and American point of view, of establishing "blocs" of minor parties, with a consequently excessively fluid composition of majorities, and a too frequent change of ministries. This tendency to fractional representation has been further accentuated by the movement for proportional representation, by which, in deliberative assemblies, each political group presenting candidates receives a number of representatives in proportion to the number of voters which supported it at the elections. In this way, even relatively small minorities are directly represented, instead of the constituency representation which has been customary in the United States. In some countries, for instance in Great Britain, the party secretariats, in preparing lists of candidates to be presented, take care that in the total number of them are contained specific representatives of the various profession? and branches of industry and commerce. Another type of functional representation has been proposed by some socialist groups in which regional constituencies would be abolished, and only professional and industrial groups would be represented in legislative bodies. In Great Britain for many years, and in the United States in some localities in recent years, labour parties have been created on the theory that such third parties would give the working classes a strong balance of power, since they would draw off to themselves the left wings of both major parties. As has been said, in democratic countries only those parties can in theory be tolerated which accept the democratic regime, or if they wish to change it fundamentally, aim at doing so by constitutional means. There has, however, by tacit consent been no concerted movement to test this theory, probably because such parties (Action Française in France, Communist parties in Britain and America), have never reached such proportions at the polls as to constitute a serious menace to the existing status.

A final institutional characteristic of most democracies is equal educational opportunity. While universal popular education is a relatively new institution, even in democratic countries, including the United States, it is now generally admitted that at least elementary education should keep pace with the extension of the franchise. Since theoretically the ultimate source of political power in a democracy lies in public opinion, the ability to read has always been considered a necessary qualification of the citizens of a democracy. It has usually been held, therefore, that popular education in a democracy, at least of an elementary kind, should be made compulsory by law. The democracies, however, unlike the totalitarian states, have never presumed to dictate the content of the education to be given, and so under them the schools are free.

Democracy as a way of life.—Considered as a way of life, democracy is a subjective attitude by which the members of the community are led to secure to every one his rights, to look upon all fellow citizens without distinction of colour or race as brethren in a common enterprise, and to give spontaneous support to projects which enhance civic excellence and promote the general welfare. In this sense democracy approaches the "virtue" which the old philosophers and the Founding Fathers of America considered the principal characteristic of citizenship, and is akin to the mediaeval "justice" by which all members of the community were to co-operate by joint action to give each one his due. In this sense, therefore, democracy is not necessarily allied either with democratic theory or democratic institutions, but could exist under any form of government. It is, however, one of the more valid claims of democracy that only under it can these civic virtues flourish to their full extent, because only under democracy do there exist those institutions through which those virtues may exercise themselves. These institutions are. a popular constitution, a parliament of some kind, universal suffrage and a disciplined party system. Through these an active equality of persons exists by which the individual citizen is associated with the process of authority. This equality places upon the individual that responsibility which in absolute systems is laid upon the ruler. The individual, therefore, as ruler, must himself possess and exercise all those virtues with which the ideal ruler in all political literature has been endowed. In a sense, therefore, democracy professes a philosophy of life in somewhat the same way that the totalitarian systems of modern days profess one. Implicit, however, in this philosophy is a personal freedom exempt from the dictatorship of intellect by which the total systems maintain themselves. In other words, freedom of conscience and freedom of expression are its necessary components. Along with these freedoms, is also included economic freedom, at least if by that term is understood freedom from dictation to the political process by purely economic forces, and a more nearly equal opportunity to the members of the community to acquire the goods of the earth. (W. PAS.)

DEMOCRATIC PARTY, founded by Thomas Jefferson, the third president, the oldest continuously existing political instrumentality in the United States. Though up to 1929, it had since the Civil War been successful in but four presidential elections, for more than half the 140 years since the first president was chosen it directed the destinies of the nation, and even when out of office has not been altogether out of power. Its original name was the Republican party and the day of its birth has been definitely fixed as May 13, 1792, that being the date of a letter from Jefferson to Washington in which is made the first authoritative claim of a name for the party of which the former had become the recognized head. Actually the seeds were sown in the Constitutional Convention of 1787, when the first battles were fought between those who wanted a strong, centralized, federal government and those who wanted the least possible federal government consistent with national security. In the debates of that convention can be located the Democratic germ plasm, the ultimate growth of which under Jefferson's genius was the establishment of a party whose theory aimed at direct popular control over the government; which championed the rights of the masses and was really democratic in theory and in fact; which was based on the fundamental belief that the people are capable of governing themselves; which aimed at the widest possible extension of the suffrage and the fullest measure of personal liberty consistent with law, order and the national welfare; which was against all sumptuary laws; which favoured the strictest

interpretation of the constitution and the conservation of the rights of the States; which opposed the centralization of power in the Federal Government; which believed in equal rights for all, special privileges for none, and stood militantly for religious liberty, free speech and a free press.

Though this new party was an organized and militant force in Congress in 1792 it was not until 1800 that it secured control of the government with the triumphant election of Jefferson as president and the complete rout of the Federalists under Alexander Hamilton, who typified the other political point of view as completely as Jefferson did the democratic. For 40 years from the first election of Jefferson the Democratic Party was in continuous control of the government, during most of that time almost without opposition. In 1840 it lost to the Whigs but through the death of President William Henry Harrison, Tyler succeeded to the presidency and became more of a Democrat than Whig. It regained control in 1844, lost in 1848, came back into power in 1852 and remained in until its historic split on the slavery rock in 1860, followed so quickly by the Civil War. It may therefore be said that with the exception of four years the Democratic Party was in practically complete control of the government from 1800 to 1860. During the first quarter of a century it was almost completely dominated by Thomas Jefferson, its founder. In his first inaugural address he beautifully enunciated its fundamental concepts and principles, most of which have years ago become embedded into the political institutions of the country, accepted by politicians and public men regardless of party. Jefferson, after serving two terms, selected as his successor, perhaps his closest friend, James Madison, and was chiefly instrumental in making James Monroe, undoubtedly his next closest friend and political disciple, the successor of Madison.

Though Jefferson founded the party on the principle of popular government and his influence and power as party leader lasted longer than that of any other individual in the country before or since, it was not until 1828 that the people really came into power, that the party became democratic in fact as well as in theory. With the election of Andrew Jackson, the second towering figure in Democratic party history, the people really took over the government which had up to that time been practically held in trust for them by leaders such as Jefferson and Madison, who, while democratic in political thought, were as individuals aristocratic in birth, breeding and environment. They believed in popular government but it was Jackson who really put it into effect. It is also true that beginning with Jefferson, each Democratic president of his period found it essential to depart from the strict construction principles of the party, the first instance of which was the acquisition of Louisiana, an undoubtedly wise and popular step, but one for which there was in fact no constitutional warrant. It has since that day been a not infrequent habit of the Democratic Party to repudiate at least one of its basic principles—local self-government or State's rights—and to this fact is traceable no small part of its troubles. Under Jackson, however, it swung back to its original strict construction basis. Under Jackson for the first time the people really participated in politics generally. By this time the restrictions surrounding the suffrage had been largely removed, and it was the mass sentiment favouring Jackson that swept him into power. Under Jackson for the first time the politicians began really to reach the people and to play to public sentiment. Under him the first real political machine was constructed with, for the first time, what has been called "the spoils system," by which the federal offices were distributed as a reward for party service. Though his power did not last as long, Jackson was during his two terms as completely the leader of his party as was Jefferson and long after he went out of office he remained a popular idol. He was not only the champion of the common people but he was one of them. His administrations were tempestuous and the party battles in which he engaged dramatic and bitter. The two great fights of his career as president, both of which he won, were, first, that to abolish the second United States Bank, and second, to crush the defiance of the Federal Government by South Carolina, where, under the leadership of his arch enemy, John C. Calhoun, resentment over the tariff laws led to a seditious effort to make the nullification issue a real national menace. Jackson's Nullification Proclamation, which broke the nullification movement had a ring and a fervour such as no other defence of the Union has contained. It is one of the country's imperishable documents which, like the Monroe Doctrine, the Democratic Party treasures as having been given to the nation by a Democratic President. It should be mentioned here that it was not until after Jackson's election in 1828 that the party name really changed from Republican to Democratic. During the Jackson campaign his followers began to call themselves Democrats and by his second election the name was in general use.

Between 1836 when Jackson, then an old man, retired, and 1860, though there were four Democratic presidents—Van Buren, selected by Jackson, Polk, the first "dark horse," Pierce and Buchanan—the real Party story is the story of its futile struggles to avoid by ignoring it, the slavery issue, and of the inevitability of the great smash which so badly wrecked the party that it was 24 years before it again elected a president. After the Van Buren administration the party more than ever became dominated by the South, which was unshakably convinced that its economic and social as well as political interests were bound up in the preservation of slavery. The fight of the South was for the extension of slavery into new territory as the one way of retaining its political importance and avoiding being overwhelmed by the great industrial States of the North and West. To further this end, the Democratic Party, under compulsion from the South, repudiated its basic principle. It insisted upon the broadest possible construction of the Constitution in order to force slavery on the new States or territories and then applied to them the most rigid possible State's rights doctrine in order to preserve slavery from constitutional interference. By 1850 the slavery issue had advanced too far to permit again any such tacit agreement not to discuss it as had obtained for so many years following the Missouri Compromise. The effort was, however, made in the Compromise of 1850, proposed by Henry Clay and accepted by the Whigs as well as the Democrats, and in both the 1852 and 1856 Democratic national conventions the stand was taken that the issue had been settled. But that idea was absurd. However completely the political parties might ignore it in their platforms, the one absorbing question in the country was the slavery question. The final crash came in 1860. When the delegates to the Democratic convention of that year assembled in Charleston, S.C., on April 23, they were in a highly emotional state. The fight came over the platform. The majority report of the resolutions committee setting forth the point of view of the South was as follows:—

"Resolved.—That the government of a Territory organized by an act of Congress is provisional and temporary; and during its existence, all citizens of the United States have an equal right to settle with their property in the Territory, without their rights, either of person or of property, being destroyed or impaired by congressional legislation.

"2. That it is the duty of the Federal Government, in all its departments, to protect, when necessary, the rights of persons and property in the Territories, and wherever else its constitutional authority extends.

"3. That when the settlers in a Territory, having an adequate population, form a State constitution, the right of sovereignty commences, and, being consummated by admission into the Union, they stand on an equal footing with the people of other States; and the State thus organized ought to be admitted into the Federal Union, whether its Constitution prohibits or recognizes the institution of slavery."

These resolutions were vital to the Southern delegates. When the convention, dominated by Douglas delegates, rejected these resolutions and adopted a minority report ignoring any specific slavery declaration, half the Southern delegates bolted the convention. Eventually, after adjournment and reassembling in Baltimore, Stephen A Douglas of Illinois was nominated for president by the Northern wing, left in complete control. The bolters finally met in Richmond, adopted the rejected majority

report as a platform and nominated John C. Breckinridge of Kentucky and Joseph Lane of Oregon by unanimous vote. Thus stood the party, wrecked, ruined, exhausted by internal struggle over a great moral issue and foredoomed to defeat. The newly formed Republican Party with its clear-cut stand against the extension of slavery, won its first great victory.

Though Lincoln did not get a majority of the popular vote he received a great majority in the electoral college, and the Democrats not only lost the presidency' but control of Congress as well.

From 1860 to 1940 the Democratic Party has been in power only 24 years—in complete control of Congress about half that time. With the Civil War it changed from the majority into the minority party and in the 80 years from 1860 to 1940 it has been defeated 14 times in presidential contests, successful seven. One of these defeats—that of Samuel J. Tilden in 1876—it is true was not really a defeat but a victory. though the party was deprived of its fruits. The enfranchisement of the Negro that followed the war did two things to the Democratic Party—first, it made the South unshakably Democratic; second, it gave to the Republicans an advantage in every pivotal State outside of the South in which there was a negro population. It was not until 1884 that the Democrats regained control of the government with the election of Grover Cleveland. They lost with him in 1888, but renominated and elected him again in 1892. In 1896 the party once more split disastrously—this time on the free silver rock, and its candidate—William Jennings Bryan—was overwhelmingly defeated. Through their addiction to economic heresies under the Bryan leadership the Democrats after 1896 became even more definitely the minority party, and the natural tendency of the large business interests to support the Republican ticket in national elections was strengthened. Democratic success in 1912 was due to three things—the Taft-Roosevelt feud in the Republican party; the final loosing of the Bryan grip; and the strong appeal of the Woodrow Wilson candidacy. Beyond question the two Wilson administrations stand out in Democratic history as most eventful and extraordinary. In the first administration more genuinely constructive legislation, starting with the Federal Reserve Act, was enacted than in any previous four-year period, while in the second, under Democratic leadership, the country successfully participated in the greatest of all wars. What most redounds to the credit of the Democratic Party was that despite the inevitable waste and blunders inseparable from such a conflict, there was a complete absence of any wholesale political plundering or governmental graft such as had characterized previous wars. The most rigid probe of the Republicans following the war failed to reveal any thievery not of a trivial nature. From 1920 to 1932 the party was out of office and for the most part out of power. It lacked unifying issues or leadership and suffered a diminution of support from business and the press. The question of Prohibition split its ranks worse than those of the other side and the bitterness of religious bigotry poisoned its spirit. The backwash of the World War in 1920 and the tide of prosperity in 1924 and 1928 brought it crushing national defeats although in state politics its losses were less severe. The year 1932, however, saw a complete overturn. The Democratic Party under the leadership of Franklin D. Roosevelt, aided by the natural reaction to hard times, carried all but six states. In 1934 the drift was still to the Democrats, and in 1936 the party's triumph was overwhelming—all states but Maine and Vermont casting their votes for Roosevelt and Garner. A new American political precedent was established in 1940 when Roosevelt ran for a third term. He carried all but 10 states and received a popular plurality of some 4,900,000 votes.

2. Electors chosen by legislatures in many states. *Elected.
3. Contest decided in H. of Rep Jefferson elected.
4. Greeley died before electoral vote was cast.

DEMOCRITUS, probably the greatest of the Greek physical philosophers, was a native of Abdera in Thrace, or as some say—probably wrongly—of Miletus (Diog. Laert. ix. 34). Our knowledge of his life is based almost entirely on tradition of an untrustworthy kind. He seems to have been born about 470 or 460 B.C., and was, therefore, an older contemporary of Socrates. He inherited considerable property, which enabled him to travel widely in the East in search of information. In Egypt he settled for seven years, during which he studied the mathematical and physical systems of the ancient schools. The extent to which he was influenced by the Magi and the Eastern astrologists is a matter of pure conjecture. He returned from his travels impoverished; one tradition says that he received 500 talents from his fellow-citizens, and that a public funeral was decreed him. Another tradition states that he was regarded as insane by the Abderitans, and that Hippocrates was summoned to cure him. Diodorus Siculus tells us that he died at the age of 90; others make him as much as twenty years older. His works, according to Diogenes Laërtius, numbered 72, and were characterized by a purity of style which compares favourably with that of Plato. In the variety of his knowledge, and in the importance of his influence on both Greek and modem speculation Democritus was the Aristotle of the 5th century, while the sanity of his metaphysical theory has led many to regard him as the equal, if not the superior, of Plato.

His views may be treated under the following heads:

1. The *Atoms* and *Cosmology* (adopted in part at least from the doctrines of Leucippus). While agreeing with the Eleatics on the eternal sameness of Being (nothing can arise out of nothing; nothing can be reduced to nothing). Democritus followed the physicists in denying its oneness and immobility. Movement and

plurality being necessary to explain the phenomena of the universe and impossible without space (not-Being), he asserted that the latter had an equal right with Being to be considered existent. Being is the Full (πλῆρες, *plenum*); not-Being is the Void (κενόν, vacuum), the infinite space in which moved the infinite number of atoms into which the single Being of the Eleatics was broken up. These atoms are eternal and invisible; absolutely small, so small that their size cannot be diminished (hence the name ἄτομος, "indivisible"); absolutely full and incompressible, they are without pores and entirely fill the space they occupy; homogeneous, differingonly in figure (as A from N), arrangement (as AN from NA), position (as N is Z on its side), magnitude (and consequently in weight, although some authorities dispute this). But while the atoms thus differ in quantity, their differences of quality are only apparent, due to the impressions caused on our senses by different configurations and combinations of atoms. A thing is only hot or cold, sweet or bitter, hard or soft by convention (νόμῳ); the only things that exist in reality (ἐτεῇ) are the atoms and the void. Locke's distinction between primary and secondary qualities is here anticipated. Thus, the atoms of water and iron are the same, but those of the former, being smooth and round, and therefore unable to hook on to one another, roll over and over like small globes, whereas the atoms of iron, being rough, jagged and uneven, cling together and form a solid body. Since all phenomena are composed of the same eternal atoms (just as a tragedy and a comedy contain the same letters) it may be said that nothing comes into being or perishes in the absolute sense of the words (cf. the modern "indestructibility of matter" and "conservation of energy"), although the compounds of the atoms are liable to increase and decrease, appearance and disappearance—in other words, to birth and death. As the atoms are eternal and uncaused, so is motion; it has its origin in a preceding motion, and so on ad *infinitum*. For the love and hate of Empedocles and the *nous* (intelligence) of Anaxagoras, Democritus substituted fixed and necessary laws (not chance; that is a misrepresentation due chiefly to Cicero). Everything can be explained by a purely mechanical (but not fortuitous) system, in which there is no room for the idea of a providence or an intelligent cause working with a view to an end. The origin of the universe was explained as follows. An infinite number of atoms was carried downwards through infinite space. The larger (and heavier), falling with greater velocity, overtook and collided with the smaller (and lighter), which were thereby forced upwards. This caused various lateral and contrary movements, resulting in a whirling movement (δίνη) resembling the rotation of Anaxagoras, whereby similar atoms were brought together (as in the winnowing of grain) and united to form larger bodies and worlds. Atoms and void being infinite in number and extent, and motion having always existed, there must always have been an infinite number of worlds, all consisting of similar atoms, in various stages of growth and decay.

2. The Soul.—Democritus devoted considerable attention to the structure of the human body, the noblest portion of which he considered to be the soul, which everywhere pervades it, a psychic atom being intercalated between two corporeal atoms. Although, in accordance with his principles, Democritus was bound to regard the soul as material (composed of round, smooth, specially mobile atoms, identified with the fire-atoms floating in the air), he admitted a distinction between it and the body, and is even said to have looked upon it as something divine. These all-pervading soul atoms exercise different functions in different organs; the head is the seat of reason, the heart of anger, the liver of desire. Life is maintained by the inhalation of fresh atoms to replace those lost by exhalation, and when respiration, and consequently the supply of atoms, ceases, the result is death. It follows that the soul perishes with, and in the same sense as, the body.

3. Perception.—Sensations are the changes produced in the soul by external impressions, and are the result of contact, since every action of one body (and all representations are corporeal phenomena) upon another is of the nature of a shock. Certain emanations (ἀπόρροαι, ἀπόρροιαι) or images (εἴδωλα), consisting of subtle atoms, thrown off from the surface of an object, penetrate the body through the pores and pass into the soul. At the same time Democritus distinguished between obscure (σκοτίη) cognition, resting on sensation alone, and genuine (γνησίη), which is the result of inquiry by reason, and is concerned with atoms and void, the only real existences. This knowledge, however, he confessed was exceedingly difficult to attain.

It is in Democritus first that we find a real attempt to explain colour. He regards black, red, white and green as primary. White is characteristically smooth, *i.e.*, casting no shadow, even, flat; black is uneven, rough, shadowy and so on. The other colours result from various mixtures of these four, and are infinite in number. Colour itself is not objective; it is found not in the ultimate *plenum* and *vacuum*, but only in derived objects according to their physical qualities and relations.

4. Theology.—Democritus rejected the notion of a deity taking part in the creation or government of the universe, but yielded to popular prejudice so far as to admit the existence of a class of beings, of the same form as men, grander, composed of very subtle atoms, less liable to dissolution, but still mortal, dwelling in the upper regions of air. However, according to Plutarch, Democritus recognized one god under the form of a fiery sphere, the soul of the world, but this idea is probably of later origin. The popular belief in gods was attributed by Democritus to the desire to explain extraordinary phenomena (thunder, lightning, earthquakes) by reference to superhuman agency.

5. Ethics.—Democritus's moral system—the first collection of ethical precepts which deserves the name—strongly resembles the negative side of the system of Epicurus. The *summum bonum* is the maximum of pleasure with the minimum of pain. But true pleasure is not sensual enjoyment; it has its principle in the soul. It consists not in the possession of wealth or flocks and herds, but in good humour, in the just disposition and constant tranquillity of the soul. Hence the necessity of avoiding extrenes; too much and too little are alike evils. (See ETHICS.)

DEMOGRAPHY, the science which deals with the statistics of health and disease, of the physical, intellectual, physiological and economical aspects of births, marriages and mortality (from Gr. δῆμος, people, and γράφειν, to write). The first to employ the word was Achille Guillard in his *Éléments* de *statistique humaine ou démographie comparée* (1855), but the meaning which he attached to it was merely that of the science which treats of the condition, general movement and progress of population in civilized countries; *i.e.*, little more than what is comprised in the ordinary vital statistics, gleaned from census and registration reports. The word has come to have a much wider meaning and may now be defined as that branch of statistics which deals with the life-conditions of peoples.

DE **MOIVRE, ABRAHAM** (1667–1754), English mathematician of French Huguenot extraction, was born at Vitry, Champagne, on May 26, 1667. His eminence as a mathematician secured his admission into the Royal Society in 1697, and also led to his being appointed by the Royal Society to decide the famous contract between Newton and G. W. Leibnitz. He was an intimate personal friend of Newton. De Moivre lived a quiet and uneventful life and died in London on Nov. 27, 1754. Two important theorems in trigonometry bear his name. (See TRIGONOMETRY.) The majority of his papers appeared in Philosophical Transactions. Among his separately published works the most important are: The Doctrine *of* Chances (1716), in which he formulated the theory of recurring series, completed the theory of partial fractions, and laid down the rule for the probability of a

compound event. Miscellanea *Analytica* (1730) contains his trigonometrical theorems.

DEMONETIZATION, a term employed in monetary science in two different senses. (a) The depriving or divesting of a metal of its standard monetary value. From 1663 to 1717 silver was the standard of value in England and gold coins passed at their market value. The debasement and underrating of the silver coinage insensibly brought about the demonetization of silver in England as a standard of value, and the substitution of gold. During the latter half of the 19th century a great depreciation occurred in the value of silver, owing to increasing production, and, consequently, it was impossible to preserve any ratio of stability between it and gold. This led to the abandonment or demonetization of the metal as a standard and to its use merely as token money. (b) The withdrawal of coin from circulation, as, for example, in England that of all pre-Victorian gold coins under the provisions of the Coinage Act 1889, and the royal proclamation of Nov. 22, 1890.

DEMONOLOGY, the branch of the science of religions which relates to superhuman beings which are not gods (Δαίμων, demon, genius, spirit). Demons, when regarded as spirits, may either be human, or non-human, separable souls, or discarnate spirits which have never inhabited a body; a sharp distinction is often drawn between these two classes which are frequently conceived as producing identical results, *e.g.*, diseases.

The term includes (1) human souls regarded as genii or familiars, (2) such as receive a cult (for which see ANCESTOR WORSHIP), and (3) ghosts or other malevolent revenants; excluded are souls conceived as inhabiting another world. Demons may be regarded as corporeal, since primitive peoples do not distinguish clearly between material and immaterial beings.

Prevalence of Demons.—All the affairs of life are supposed to be under the control of spirits, each ruling a certain element or even object, and themselves in subjection to a greater spirit. A rise in culture often results in an increase in the number of spiritual beings with whom man surrounds himself.

Character of Spiritual World.—The ascription of malevolence to the world of spirits is by no means universal. Local spirits are often regarded as inoffensive in the main; true, the passer-by must make some trifling offering as he nears their place of abode; but it is only occasionally that mischievous acts, such as the throwing down of a tree on a passer-by, are, in the view of the natives, perpetrated by the spirits. So, too, many of the

A WITCHES' FROLIC. SHOWING THE DEVIL AND A PARTY OF WITCHES. RIDING IN TUBS OVER A STORMY SEA. ON THEIR WAY TO WRECK A SHIP

spirits especially concerned with the operations of nature are conceived as neutral or even benevolent.

Classification.—Besides the distinctions of human and non-human, hostile and friendly, the demons in which the lower races believe are classified by them according to function, each class with a distinctive name, with extraordinary minuteness.

(*a.*) Natural causes, either of death or of disease, are hardly, if at all, recognized by the uncivilized; everything is attributed to spirits or magical influence of some sort. The spirits which cause disease may be human or non-human; they may enter the body of the victim (see POSSESSION), and either dominate his mind as well as his body, inflict specific diseases, or cause pains of various sorts. The demon theory of disease is still attested by some of our medical terms; epilepsy (Gr. ἐπίληψις, seizure) points to the belief that the patient is possessed As a logical consequence of this view of disease the mode of treatment among peoples in the lower stages of culture is marked by an endeavour to propitiate the evil spirits by sacrifice, to expel them by spells, etc. (see EXORCISM), to drive them away by blowing, etc.; and conversely to keep away smallpox by placing thorns and brushwood in the paths leading to places afflicted by that disease, in the hope of making the disease demon retrace his steps. Another way in which a demon is held to cause disease is by introducing itself into the patient's body and sucking his blood (Rivers, Medicine, Magic and Religion).

FROM SKEAT, "MALAY MAGIC" (MACMILLAN & CO.)

MODELS OF PENANGGALAN AND LANGSUIR, TWO MALAY BIRTH SPIRITS (VAMPIRES)

(b.) One of the primary meanings of δαιμων is that of genius (*q.v.*) or familiar, tutelary spirit. The animal guardian appears in the *nagual* of Central America, the yunbeai of some Australian tribes, the *manitou* of the Red Indian and the bush soul of some West African tribes. All the world over it is held that the familiars of the witch or wizard can assume the form of animals (see WITCHCRAFT).

(c.) The familiar is sometimes an ancestral spirit, and here we touch the fringe of the cult of the dead (see also ANCESTOR WORSHIP). Especially feared among many peoples are the souls of those who have committed suicide or died a violent death; the woman who dies in childbed is held to become a demon of the most dangerous kind; even the unburied, as restless, dissatisfied spirits, are more feared than ordinary ghosts These are they who cannot. be reborn and are permanently severed from their community. They are therefore hostile. Funeral rites (see DEAD, DISPOSAL OF) exhibit marked variations due to this cultural attitude. All spirits have power. Those who are or become permanent spirits have more power and more permanency than those who are due to return. The evocation of spirits, especially in the form of necromancy (*q.v.*) is an important branch of the demonology of many peoples.

(d.) The vampire is a particular form of demon which calls for some notice. In Europe the Slavonic area is the principal seat of vampire beliefs, and as a natural development, means of preventing the dead from injuring the living have been evolved. The corpse of the vampire, which may often be recognized by its unnaturally ruddy and fresh appearance, should be staked down in the grave or its head should be cut off; it is interesting to note that the cutting off of heads of the dead was a neolithic burial rite.

(*e.*) The vampire is frequently blended in popular idea with the *Poltergeist* (*q.v.*) or knocking spirit, and also with the werwolf (see LYCANTHROPY).

(f.) Dream demons are very common; in fact the word "nightmare" (A.S. maer, spirit, elf) preserves this form of belief, which is found right down to the lowest culture. Horses too are said to be subject to the persecutions of demons, which ride them at night. Another class of nocturnal demons, the incubi and succubi, are said to consort with human beings in their sleep.

(g.) Corresponding to the personal tutelary spirit (supra, b) we have the genii of buildings and places, and a snake was a frequent form for this kind of demon. The South African belief that the snakes which are in the neighbourhood of the kraal are the incarnations of the ancestors of the residents, suggests that some similar idea lay at the bottom of the Roman belief. To

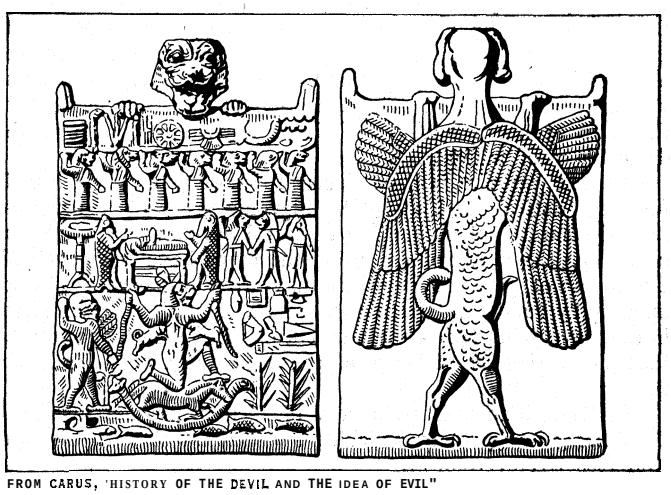
this day in European folklore the house snake or toad, which lives in the cellar, is regarded as the "life index" or other self of the father of the house; the death of one involves the death of the other, according to popular belief. The assignment of genii to buildings and gates is connected with the custom of sacrificing a human being or an animal at the foundation of a building. Sometimes a similar guardian is provided for the frontier of a country or of a tribe.

(h.) The animistic creed postulates the existence of all kinds of local spirits, which are sometimes tied to their habitats, sometimes free to wander. Especially prominent in Europe-classical, mediaeval and modern—and in East Asia is the spirit of the lake, river, spring, or well, often conceived as human, but also in the form of a bull or horse. Less specialized in their functions are many of the figures of modern folklore, some of whom have perhaps replaced some ancient goddess.

(*i.*) Certain aspects of the belief in plant souls demand more detailed treatment. Outside the European area vegetation spirits of all kinds seem to be conceived, as a rule, as anthropomorphic; in classical Europe, and parts of the Slavonic area at the present day, the tree spirit was believed to have the form of a goat, or to have goats' feet.

Of special importance in Europe is the conception of the so-called "corn spirit," by which the life of the corn is supposed to exist apart from the corn itself and to take the form, sometimes of an animal, sometimes of a man or woman, sometimes of a child. The animal identified with the corn demon is sometimes killed in the spring in order to mingle its blood or bones with the seed; at harvest-time it is supposed to sit in the last corn and the animals driven out from it are sometimes killed; in other cases the reaper who cuts the last ear is said to have killed the "wolf" or the "dog," and sometimes receives the name of "wolf" or "dog" and retains it till the next harvest. The corn spirit is also said to be hiding in the barn till the corn is threshed, or it may reappear at midwinter, when the farmer begins to think of his new year of labour and harvest. Side by side with the conception of the corn spirit as an animal is the anthropomorphic view of it; and at the same time the association of gods and goddesses of corn with animal embodiments of the corn spirit is found.

(*j.*) In many parts of the world is found the conception termed the "otiose creator"; that is to say, the belief in a great



FROM CARUS, 'HISTORY OF THE DEVIL AND THE IDEA OF EVIL"

OBVERSE AND REVERSE OF AN ANCIENT ASSYRIAN BRONZE TABLET REPRESENTING THE WORLD IN THE CLUTCHES OF AN EVIL DEMON

deity, who is the author of all that exists but is too remote from the world and too high above terrestrial things to concern himself with the details of the universe. The operations of nature are conducted by a multitude of more or less obedient subordinate deities, who shade off into demons of the usual type from whom they are hardly distinguishable.

Sometimes the gods of an older religion degenerate into the demons of the belief which supersedes it. (See WITCHCRAFT.)

Expulsion of Demons.—Mention must be made of the custom of expelling ghosts, spirits or evils generally. Primitive peoples from the Australians upwards celebrate, usually at fixed intervals, a driving out of hurtful influences. Sometimes it is merely the ghosts of those who have died in the year which are thus driven out; from this custom must be distinguished that of dismissing the souls of the dead at the close of the year and sending them on their journey to the other world; this latter custom seems to have an entirely different origin and is an essential part of the funerary ritual. In other cases it is believed that evil spirits generally or even non-personal evils such as sins are believed to be expelled. In these customs originated perhaps the scapegoat, some forms of sacrifice (*q.v.*) and other cathartic ceremonies.

DEMONSTRATION is commonly used as the equivalent of "proof" or of "exact proof," such as is met with in mathematics or in the "exact sciences." Locke confined the possibility of demonstration to relations among abstract ideas (such as those of mathematics) and denied it to matters of fact (such as the ordinary physical events or human actions). Originally the term demonstration (or rather its Greek equivalent, ἀπόδειξις) was confined to propositions (whether inferential or not), the subject and predicate of which were seen to be intimately interconnected.

See H. W. *B.* Joseph, *Introduction to Logic* (1916).

DE MORGAN, AUGUSTUS (1806–1871), English mathematician and logician, was born at Madura in the Madras presidency. He received his early education in private schools, and before the age of 14 had learned Latin, Greek and some Hebrew, in addition to acquiring much general knowledge. At the age of 16 he entered Trinity college, Cambridge, and studied mathematics, partly under the tuition of Sir G. B. Airy. In 1825 he gained a Trinity scholarship. He was prevented from taking his M.A. degree, or from obtaining a fellowship, by his conscientious objection to signing the theological tests then required from masters of arts and fellows at Cambridge.

A career in his own university being closed against him, he entered Lincoln's Inn; but, almost at the same time, the establishment, in 1828, of the University of London, in Gower street, afterwards known as University college, gave him an opportunity of continuing his mathematical pursuits. At the early age of 22 he gave his first lecture as professor of mathematics in the college which he served with the utmost zeal and success for a third of a century. His connection with the college, indeed, was interrupted in 1831, when a disagreement with the governing body caused De Morgan and some other professors to resign their chairs simultaneously. When, in 1836, his successor was accidentally drowned, De Morgan was requested to resume the professorship. In 1837 he married Sophia Elizabeth, daughter of William Frend. They settled in Chelsea, where in later years Mrs. De Morgan had a large circle of intellectual and artistic friends.

As a teacher of mathematics De Morgan was unrivalled. He gave instruction in the form of continuous lectures delivered *extempore* from brief notes. His writings, however excellent, gave little idea of the perspicuity and elegance of his ***viva voce*** expositions. Many of his pupils distinguished themselves, and, through Isaac Todhunter and E. J. Routh, he had an important influence on the later Cambridge school. For 30 years he took an active part in the business of the Royal Astronomical Society, editing its publications, supplying obituary notices of members and for 18 years acting as one of the honorary secretaries.

De Morgan's mathematical writings contributed powerfully towards the progress of the science. His memoirs on the "Foundation of Algebra," in the 7th and 8th volumes of the *Cambridge Philosophical Transactions,* contain important contributions to the philosophy of mathematical method. The work on *Trigonometry and Double Algebra* (1849) contains in the latter part a most luminous and philosophical view of existing and possible systems of symbolic calculus. De Morgan's long series of publications began in 1828 with a translation of part of Bourdon's *Elements of Algebra.* In 1830 appeared the first edition of his well known *Elements of Arithmetic,* which is distinguished by a simple yet thoroughly philosophical treatment of the ideas of number and magnitude, and by the introduction of new abbreviated processes of computation, to which De Morgan always attributed much practical importance. His other principal mathematical works were *The Elements of Algebra* (183j), a valuable but somewhat dry elementary treatise; the *Essay on Probabilities* (1838), forming the 107th volume of *Lardner's Cyclopaedia,* which forms a useful introduction to the subject; and *The Elements of Trigonometry and Trigonometrical Analysis, preliminary to the Differential Calculus* (1837). Two of his most elaborate treatises are to be found in the *Encyclopaedia metropolitana,* namely, the articles on the "Calculus of Functions" and the "Theory of Probabilities." De Morgan's minor mathematical writings were scattered over various periodicals. A list of these and other papers will be found in the *Royal Society's Catalogue,* which contains 42 entries under the name of De Morgan.

But it is probably as a logical reformer that De Morgan will be best remembered. In this respect he stands alongside of his great contemporaries, Sir. W. R. Hamilton and George Boole, as one of several independent discoverers who enounced the principle of the quantification of the predicate. De Morgan always laid much stress upon the importance of logical training. In his admirable papers upon the modes of teaching arithmetic and geometry, originally published in the *Quarterly Journal of Education* (reprinted in *The Schoolnzaster,* vol. ii.), he remonstrated against the neglect of logical doctrine. In 1839 he produced a small work called *First Notions of Logic,* giving what he had found by experience to be much wanted by students commencing with Euclid. In Oct. 1846 he completed the first of his investigations, in the form of a paper printed in the *Transactions of the Cambridge Philosophical Society* (vol. viii., No. 29), which gave rise to a controversy with Sir W. R. Hamilton regarding the independence of De Morgan's discovery. The eight forms of proposition adopted by De Morgan as the basis of his system partially differ from those which Hamilton derived from the quantified predicate. The general character of De Morgan's development of logical forms was wholly peculiar and original on his part.

Late in 1847 De Morgan published his principal logical treatise, *Formal Logic, or The Calculus of Inference, Necessary and Probable.* This contains a reprint of the *First Notions,* an elaborate development of his doctrine of the syllogism, and of the numerical definite syllogism, together with chapters on probability, induction, old logical terms and fallacies. There followed at intervals, in the years 1850, 1858, 1860 and 1863, a series of four elaborate memoirs on the "Syllogism" printed in volumes ix. and x. of the *Cambridge Philosophical Transactions.* These papers taken together constitute a great treatise on logic, in which he substituted improved systems of notation, and developed a new logic of relations and a new onymatic system of logical expression. In 1860 De Morgan endeavoured to render their contents better known by publishing a *Syllabus of a Proposed System of Logic,* from which may be obtained a good idea of his symbolic system.

De Morgan endeavoured to reconcile the mathematicians with the logicians, and in the attempt showed how many errors an acute mathematician could detect in logical writings, and how large a field there was for discovery. But it may be doubted whether De Morgan's own system, "horrent with mysterious spiculae," as Hamilton aptly described it, is fitted to exhibit the real analogy between quantitative and qualitative reasoning, which is rather to be sought in the logical works of Boole.

In 1866 his life became clouded by the circumstances which led him to leave University college. The refusal of the council to accept the recommendation of the senate, that they should appoint an eminent Unitarian minister to the professorship of logic and mental philosophy, revived all De Morgan's sensitiveness on the subject of sectarian freedom. In 1867 he lost his son George Campbell De Morgan, a young man of the highest scientific promise, whose name, as De Morgan expressly wished, will long be connected with the London Mathematical Society, of which he was one of the founders. From this time De Morgan rapidly fell into ill-health (previously almost unknown to him), dying on March 18, 1871. An interesting and truthful sketch of his life will be found in the *Monthly Notices of the Royal Astronomical Society* for Feb. 9, 1872, vol. xxii. p. 112, written by A. C. Ranyard, who says, "He was the kindliest as well as the most learned of men—benignant to everyone who approached him, never forgetting the claims which weakness has on strength."

It is impossible to omit a reference to his witty sayings, some specimens of which are preserved in the *Diary of Henry Crabb Robinson* (1869), which also contains a humorous account of H. C. R. by De Morgan.

A very large part of De Morgan's work is contained in periodical publications, and in encyclopaedias and works of reference. His correspondence with contemporary scientific men was very extensive and full of interest. It remains unpublished, as does also a large mass of mathematical tracts which he prepared for the use of his students, treating all parts of mathematical science and embodying some of the matter of his lectures. De Morgan's library was purchased by Lord Overstone, and presented to the University of London.

See S. de Morgan, *Memoir of Augustus de Morgan (1882).*

DE MORGAN, WILLIAM FREND (1839–1917), artist and novelist, son of Augustus de Morgan, born in London on Nov. 16, 1839, and educated at Cniversity college and the Academy schools. He became a member of the circle which gathered round Rossetti, William Morris and Burne-Jones, and experimented in various forms of decorative art. After his father's death the family settled at 30 Cheyne row, and there, in the back garden, De Morgan set up a kiln and began to make pottery. He rediscovered the secret of the brilliant blue and green glazes of the old potters, and presently formed a firm to develop the manufacture of tiles and other pottery on a commercial scale. He had an inventive genius. and nearly all the appliances of the factory were designed by him. The De Morgan ware became famous; the tiles were used for the decoration of some of the great liners, and in some cases for exterior decoration of houses. There are many fine examples of his work in the ceramic galleries of the Victoria and Albert museum, London, which also possesses a collection of his sketches. In 1905, when he was over 65, he retired from business, and began his extremely successful career as a novelist. He had written stories for recreation, and *Joseph Vance,* fragments of which had been rescued from destruction by his wife, appeared in 1906. In Charles Heath of *Alice-for-Short* (1907) he put, he said, "a good deal of himself." Other novels, which had a large circulation, followed. He died in London of trench fever on Jan. 15, 1917.

See Mrs. *A. W.* M. Stirling, *William de Morgan and his Wife* (1922).

DEMOSTHENES (d. 413 B.C.), Athenian general, first appears in history in 426 B.C. In this year Demosthenes and Procles were in command of 30 ships on a cruise round the Peloponnese. The attack was first made on Leucas, but this was abandoned for a campaign against the Aetolians, which was the first step in a projected advance through central Greece to Phocis and Boeotia. The Ozolian Locrians, who knew the country, failed him, but he advanced without them. The result was the collapse of his hoplites, on ground completely unsuited to them, and a severe defeat. in which he lost 120 of the 300 Athenians with him. At this point Eurylochus arrived from Sparta to help the Aetolians and attack Naupactus. Demosthenes applied for help to the Acarnanians, and saved Naupactus. Eurylochus then slipped past the Acarnanians, who were opposed to him, and joined the Ambraciots, who had invaded Amphilochian Argos, at Olpae. Demosthenes arrived with 20 ships and defeated the joint forces at Olpae. He

then made a compact with Menedaeus to allow the Spartans to withdraw, and wiped out the remainder of the Ambraciots at Aedomenes. The result of this campaign was the complete destruction of the Corinthian sphere of influence in north-west Greece, and Demosthenes, having redeemed his early failure, could now return to Athens. In 425 he went with Eurymedon and Sophocles on an expedition towards Sicily. He was delayed at Pylos, which was fortified by the soldiers to beguile their idleness, and Demosthenes stayed there with five ships and successfully defended it against attacks from Sparta and Corcyra. The arrival of an Athenian fleet turned the besiegers into the besieged; the Spartans were blockaded in Sphacterium, and their sventual defeat and capture was really the work of Demosthenes, though Cleon had nominally superseded him. The feature of these operations was the successful use of light infantry, a lesson which Demosthenes had learned from his early campaigns, but which no other commander during the war seems to have grasped. The year 424 saw him engaged in the abortive attack on Megara and the equally unsuccessful invasion of Boeotia, which resulted in the battle of Delium. In 413 he was sent with Eurymedon to reinforce Nicias before Syracuse. As soon as he arrived he conducted a night attack on Epipolae. When this failed he advised immediate retreat, but was overruled by Nicias. When at last the retreat began, the division under Demosthenes fell behind, was cornered in an orchard and surrendered. Demosthenes was put to death. We know practically nothing of his political views, but Aristophanes (*Eq.* 242) suggests that he was leader of the party opposed to Cleon.

DEMOSTHENES, the great Attic orator and statesman, was born in 384 (or 383) B.C. His father, who bore the same name, was an Athenian citizen belonging to the deme of Paeania. His mother, Cleobule, was the daughter of Gylon, a citizen who had been active in procuring the protection of the kings of Bosporus for the Athenian colony of Nymphaeum in the Crimea, and whose wife was a native of that region. On these grounds the adversaries of Demosthenes, in after-days, used absurdly to taunt him with a traitorous or barbarian ancestry. The boy had a bitter fore-taste of life. He was seven years old when his father died, leaving property (in a manufactory of swords, and another of upholstery) worth about £3,500, which, invested as it seems to have been (20% was not thought exorbitant), would have yielded rather more than £600 a year—a handsome, though not a great fortune. But his guardians—two nephews of his father, Aphobus and Demophon, and one Therippides—abused their trust, and handed over to Demosthenes, when he came of age, rather less than one-seventh of his patrimony, perhaps between £10 and £60 a year. Demosthenes, after studying with Isaeus (*q.v.*), brought an action against Aphobus, and gained a verdict for about £2,400. But it does not appear that he got the money; and, after some more fruitless proceedings against Onetor, the brother-in-law of Aphobus, the matter was dropped, not, however, before his relatives had managed to throw a public burden (the equipment of a ship of war) on their late ward, whereby his resources were yet further straitened. He now became a professional writer of speeches or pleas (λογογράφος) for the law courts, sometimes speaking himself. Biographers have delighted to relate how painfully Demosthenes made himself a tolerable speaker; how, with pebbles in his mouth, he tried his lungs against the waves, how he declaimed as he ran up hill, how he shut himself up in a cell, having first guarded himself against a longing for the haunts of men by shaving one side of his head, how he wrote out Thucydides eight times, how he was derided by the Assembly and encouraged by a judicious actor who met him moping about the Peiraeeus. He certainly seems to have been the reverse of athletic (the stalwart Aeschines upbraids him with never having been a sportsman), and he probably had some sort of defect or impediment in his speech as a boy. Perhaps the most interesting fact about his work for the law courts is that he seems to have continued it, in some measure, through the most exciting parts of his great political career. The speech for Phormion belongs to the same year as the plea for Megalopolis. The speech against Boeotus "Concerning the Name" comes between the First Philippic and the First Olynthiac.

Political Career and Creed.—The political career of Demosthenes, from his first direct contact with public affairs in 355 B.C. to his death in 322, has an essential unity. It is the assertion, in successive forms adapted to successive moments, of unchanging principles. Externally, it is divided into the chapter which precedes and the chapter which follows Chaeroneia. But its inner meaning, the secret of its indomitable vigour, the law which harmonizes its apparent contrasts, cannot be understood unless it is regarded as a whole. Still less can it be appreciated in all its large wisdom and sustained self-mastery if it is viewed merely as a duel between the ablest champion and the craftiest enemy of Greek freedom. The time indeed came when Demosthenes and Philip stood face to face as representative antagonists in a mortal conflict. But, for Demosthenes, the special peril represented by Philip, the peril of subjugation to Macedon, was merely a disastrous accident. Philip happened to become the most prominent and most formidable type of a danger which was already threatening Greece before his baleful star arose. As Demosthenes said to the Athenians, if the Macedonian had not existed they would have made another Philip for themselves. Until Athens recovered something of its old spirit, there must ever be a great standing danger, not for Athens only, but for Greece—the danger that sooner or later, in some shape, from some quarter, barbarian violence would break up the tradition of separate Hellenic life.

What was the true relation of Athens to Greece? The answer which he gave to this question is the key to the life of Demosthenes. Athens, so Demosthenes held, was the natural head of Greece. Not, however, as an empress holding subject or subordinate cities in a dependence more or less compulsory. Rather as that city which most nobly expressed the noblest attributes of Greek political existence. Wherever the cry of the oppressed goes up from Greek against Greek, it was the voice of Athens which should first remind the oppressor that Hellene differed from barbarian in postponing the use of force to the persuasions of equal law. Wherever a barbarian hand offered wrong to any city of the Hellenic sisterhood, it was the arm of Athens which should first be stretched forth in the holy strength of Apollo the Averter. Athens must never again seek "empire" in the sense which became odious under the influence of Cleon and Hyperbolus Athens must aim at leading a free confederacy, of which the members should be bound to her by their own truest interests.

Such, in the belief of Demosthenes, was the part which Athens must perform if Greece was to be safe. But reforms must be effected before Athens could be capable of such a part. Athens had long been suffering from the profound decay of public spirit. Since the early years of the Peloponnesian War, the separation of Athenian society from the State had been growing more and more marked. Politics were now managed by a small circle of politicians. Wars were conducted by professional soldiers whose troops were chiefly mercenaries. The mass of the citizens took no active interest in public affairs. But, though indifferent to principles, they had quickly sensitive partialities for men, and it was necessary to keep them in good humour. Pericles had introduced the practice of giving a small bounty from the Treasury to the poorer citizens, for the purpose of enabling them to attend the theatre at the great festivals,—in other words, for the purpose of bringing them under the concentrated influence of the best Attic culture. A provision eminently wise for the age of Pericles easily became a mischief when the once honourable name of "demagogue" began to mean a flatterer of the mob. Before the end of the Peloponnesian War the festival-money (theorikon) was abolished. A few years after the restoration of the democracy it was again introduced. But until 354 B.C. it had never been more than a gratuity, of which the payment depended on the Treasury having a surplus. In 354 B.C. Eubulus became steward of the Treasury. His first measure was to make the festival-money a permanent item in the budget. Thenceforth this bounty was in reality very much what Demades afterwards

called it,—the cement (κόλλα) of the democracy.

Forensic Speeches in Public Causes.—Years before the danger from Macedon was urgent, Demosthenes had begun the work of his life—the effort to lift the spirit of Athens, to revive the old civic loyalty, to rouse the city into taking that place and performing that part which her own welfare as well as the safety of Greece prescribed. His formally political speeches must never be considered apart from his forensic speeches in public causes. The Athenian procedure against the proposer of an unconstitutional law—*i.e.*, of a law incompatible with existing laws—had a direct tendency to make the law court, in such cases, a political arena. The same tendency was indirectly exerted by the tolerance of Athenian juries (in the absence of a presiding expert like a judge) for irrelevant matter, since it was usually easy for a speaker to make capital out of the adversary's political antecedents. But the forensic speeches of Demosthenes for public causes are not only political in this general sense. They are documents, as indispensable as the Olynthiacs or Philippics, for his own political career. Only by taking them along with the formally political speeches, and regarding the whole as one unbroken series, can we see clearly the full scope of the task which he set before him,—a task in which his long resistance to Philip was only the most dramatic incident, and in which his real achievement is not to be measured by the event of Chaeroneia.

A forensic speech, composed for a public cause, opens the political career of Demosthenes with a protest against a signal abuse. In 355 B.C., at the age of 29, he wrote the speech "Against Androtion." This combats on legal grounds a proposal that the out-going *Boule* should receive the honour of a golden crown In its larger aspect, it is a denunciation of the corrupt system which that *Boule* represented, and especially of the manner in which the Treasury had been administered by Aristophon. In 354 B.C. Demosthenes composed and spoke the oration "Against Leptines," who had effected a slender saving for the State by the expedient of revoking those hereditary exemptions from taxation which had at various times been conferred in recognition of distinguished merit. He answers the advocates of the retrenchment by pointing out that the public interest will not ultimately be served by a wholesale violation of the public faith. In the same year he delivered his first strictly political speech, "On the Navy Boards" (Symmories). The Athenians, irritated by the support which Artaxerxes had lately given to the revolt of their allies, and excited by rumours of his hostile preparations, were feverishly eager for a war with Persia. Demosthenes urges that such an enterprise would at present be useless; that it would fail to unite Greece; that the energies of the city should be reserved for a real emergency; but that, before the city can successfully cope with any war, there must be a better organization of resources, and, first of all, a reform of the navy.

Two years later (352 B.C.) he is found dealing with a more definite question of foreign policy. Sparta, favoured by the depression of Thebes in the Phocian War, was threatening Megalopolis. Both Sparta and Megalopolis sent embassies to Athens. Demosthenes supported Megalopolis. The ruin of Megalopolis would mean, he argued, the return of Spartan domination in the Peloponnesus. Athenians must not favour the tyranny of any one city. They must respect the rights of all the cities, and thus promote unity based on mutual confidence. In the same year Demosthenes wrote the speech "Against Timocrates" to be spoken by the same Diodorus who had before prosecuted Androtion, and who now combated an attempt to screen Androtion and others from the penalties of embezzlement. The speech "Against Aristocrates," also of 352 B.C., reproves that foreign policy of feeble makeshifts which was now popular at Athens. The Athenian tenure of the Thracian Chersonese partly depended for its security on the goodwill of the Thracian prince Cersobleptes. Charidemus, a soldier of fortune who had already played Athens false, was now the brother-in-law and the favourite of Cersobleptes. Aristocrates proposed that the person of Charidemus should be invested with a special sanctity, by the enactment that whoever attempted his rife should be an outlaw from all dominions of Athens. Demosthenes points out that such adulation is as futile as it is fulsome. Athens can secure the permanence of her foreign possessions only by being strong enough to hold them.

Thus, between 355 and 352, Demosthenes had laid down the main lines of his policy. Domestic administration must be purified. Statesmen must be made to feel that they are responsible to the State. They must not be allowed to anticipate judgment on their deserts by voting each other golden crowns. They must not think to screen misappropriation of public money by getting partisans to pass new laws about State-debtors. Foreign policy must be guided by a larger and more provident conception of Athenian interests. When public excitement demands a foreign war, Athens must not rush into it without asking whether it is necessary, whether it will have Greek support, and whether she herself is ready for' it. When a strong Greek city threatens a weak one, and seeks to purchase Athenian connivance with the bribe of a border-town, Athens must remember that duty and prudence alike command her to respect the independence of all Greeks. When it is proposed, by way of insurance on Athenian possessions abroad, to flatter the favourite of a doubtful ally, Athens must remember that such devices will not avail a Power which has no army except on paper, and no ships fit to leave their moorings.

Athens and Philip.—But the time had gone by when Athenians could have tranquil leisure for domestic reform. A danger, calling for prompt action, had at last come very near. For six years Athens had been at war with Philip on account of his seizure of Amphipolis. Meanwhile he had destroyed Potidaea and founded Philippi. On the Thracian coasts he had become master of Abdera and Maroneia. On the Thessalian coast he had acquired Methone. In a second invasion of Thessaly, he had overthrown the Phocians under Onomarchus, and had advanced to Thermopylae, to find the gates of Greece closed against him by an Athenian force. He had then marched to Heraeum on the Propontis, and had dictated a peace to Cersobleptes. He had formed an alliance with Cardia, Perinthus and Byzantium. Lastly, he had begun to show designs on the great Confederacy of Olynthus, the more warlike Miletus of the North. The First Philippic of Demosthenes was spoken in 351 B.C. The Third Philippic—the latest of the extant political speeches—was spoken in 341 B.C. Between these he delivered eight political orations, of which seven are directly concerned with Philip. The whole series falls into two great divisions. The first division comprises those speeches which were spoken against Philip while he was still a foreign Power threatening Greece from without. Such are the First Philippic and the three orations for Olynthus. The second division comprises the speeches spoken against Philip when, by admission to the Amphictyonic Council, he had now won his way within the circle of the Greek States, and when the issue was no longer between Greece and Macedonia, but between the Greek and Macedonian parties in Greece. Such are the speech "On the Peace," the speech "On the Embassy," the speech "On the Chersonese," the Second and Third Philippics.

The First Philippic, spoken early in 351 B.C., was no sudden note of alarm drawing attention to an unnoticed peril. On the contrary, the assembly was weary of the subject. For six years the war with Philip had been a theme of barren talk. Demosthenes urges that it is time to do something, and to do it with a plan. Athens fighting Philip has fared, he says, like an amateur boxer opposed to a skilled pugilist. The helpless hands have only followed blows which a trained eye should have taught them to parry. An Athenian force must be stationed in the north, at Lemnos or Thasos. Of 2,000 infantry and 200 cavalry at least one quarter must be Athenian citizens capable of directing the mercenaries.

Later in the same year Demosthenes did another service to the cause of national freedom. Rhodes, severed by its own act from the Athenian Confederacy, had since 355 been virtually subject to Mausolus, prince (δυνάστης) of Caria, himself a tributary of Persia. Mausolus died in 351, and was succeeded by his widow Artemisia. The democratic party in Rhodes now appealed to Athens for help in throwing off the Carian yoke. Demosthenes supported their application in his speech "For the Rhodians."

No act of his life was a truer proof of statesmanship. He failed. But at least he had once more warned Athens that the cause of political freedom was everywhere her own, and that, wherever that cause was forsaken, there a new danger was created both for Athens and for Greece.

Next year (350) an Athenian force under Phocion was sent to Euboea, in support of Plutarchus, tyrant of Eretria, against the faction of Cleitarchus. Demosthenes protested against spending strength, needed for greater objects, on the local quarrels of a despot. Phocion won a victory at Tamynae. But the "inglorious and costly war" entailed an outlay of more than £12,000 on the ransom of captives alone, and ended in the total destruction of Athenian influence throughout Euboea. That island was now left an open field for the intrigues of Philip. Worst of all, the party of Eubulus not only defeated a proposal, arising from this campaign, for applying the festival-money to the war-fund, but actually carried a law making it high treason to renew the proposal. The degree to which political enmity was exasperated by the Euboean War may be judged from the incident of Meidias, an adherent of Eubulus, and a type of opulent rowdyism. Demosthenes was choragus of his tribe, and was wearing the robe of that sacred office at the great festival in the theatre of Dionysus, when Meidias struck him on the face. The affair was eventually compromised. The speech "Against Meidias" written by Demosthenes for the trial (in 349) was neither spoken nor completed, and remains, as few will regret, a sketch.

Olynthiacs.—It was now three years since, in 352, the Olynthians had made peace with Athens. In 350 a second Olynthian embassy had obtained Athenian help. In 349 Philip opened war against the Chalcidic towns of the Olynthian League. The First and Second Olynthiacs of Demosthenes were spoken in that year in support of sending one force to defend Olynthus and another to attack Philip. "Better now than later," is the thought of the First Olynthiac. The Second argues that Philip's strength is overrated. The Third—spoken in 348—carries us into the midst of action[1]. It deals with practical details. The festival-fund must be used for the war. The citizens must serve in person. A few months later, Olynthus and the 32 towns of the confederacy were swept from the earth. Men could walk over their sites, Demosthenes said seven years afterwards, without knowing that such cities had existed. It was now certain that Philip could not be stopped outside of Greece. The question was, What point within Greece shall he be allowed to reach?

Demosthenes saw that Athens must have time to collect strength. Nothing could be gained, meanwhile, by going on with the war. Macedonian sympathizers at Athens, of whom Philocrates was the chief, also favoured peace. Eleven envoys, including Philocrates, Aeschines, and Demosthenes, were sent to Philip in February 346 B.C. After a debate at Athens, peace was concluded with Philip in April. Philip on the one hand, Athens and her allies on the other, were to keep what they respectively held at the time when the peace was ratified. But here the Athenians made a fatal error. Philip was now at war with the people of Halus in Thessaly. Thebes had for ten years been at war with Phocis. Here were two distinct chances for Philip's armed intervention in Greece. But if the Halians and the Phocians were included in the peace, Philip could not bear arms against them without violating the peace. Accordingly Philip insisted that they should not be included. Demosthenes insisted they should be included. They were not included. The result followed speedily. The same envoys were sent a second time to Philip at the end of April 346 for the purpose of receiving his oaths in ratification of the peace. It was late in June when he returned from Thrace to Pella—thus gaining, under the terms, all the towns that he had taken meanwhile. He next took the envoys with him through Thessaly to Thermopylae. There—at the invitation of Thessalians and Thebans—he intervened in the Phocian War. Phalaecus surrendered. Phocis was crushed. Philip took its place in the Amphictyonic Council, and was thus established as a Greek power in the very centre, at the sacred hearth, of Greece. The right of precedence in consultation of the oracle (προμαντεία) was transferred from Athens to Philip. While indignant Athenians were clamouring for the revocation of the peace, Demosthenes upheld it in his speech "On the Peace" in September. It ought never to have been made on such terms, he said. But, having been made, it had better be kept. "If we went to war now, where should we find allies? And after losing Oropus, Amphipolis, Cardia, Chios, Cos, Rhodes, Byzantium, shall we fight about the shadow of Delphi?"

Second and Third Philippic.—During the eight years between the peace of Philocrates and the battle of Chaeroneia, the authority of Demosthenes steadily grew, until it became first predominant and then paramount. He had, indeed, a melancholy advantage. Each year his argument was more and more cogently enforced by the logic of facts. In 344 he visited the Peloponnesus for the purpose of counteracting Macedonian intrigue. Mistrust, he told the Peloponnesian cities, is the safeguard of free communities against tyrants. Philip lodged a formal complaint at Athens. Demosthenes replied in the Second Philippic, "If," he said, "Philip is the friend of Greece, we are doing wrong. If he is the enemy of Greece, we are doing right. Which is he? I hold him to be our enemy, because everything that he has hitherto done has benefited himself and hurt us." The prosecution of Aeschines for malversation on the embassy (commonly known as De *falsa legatione*), which was brought to an issue in the following year, marks the moral strength of the position now held by Demosthenes. When the gravity of the charge and the complexity of the evidence are considered, the acquittal of Aeschines by a narrow majority must be deemed his condemnation. The speech "On the Affairs of the Chersonese" and the Third Philippic were the crowning efforts of Demosthenes. Spoken in the same year, 341 B.C., and within a short space of each other, they must be taken together. The speech "On the Affairs of the Chersonese" regards the situation chiefly from an Athenian point of view. "If the peace means," argues Demosthenes, "that Philip can seize with impunity one Athenian possession after another, but that Athenians shall not on their peril touch aught that belongs to Philip, where is the line to be drawn? We shall go to war, I am told, when it is necessary. If the necessity has not come yet, when will it come?" The Third Philippic ascends from the Athenian to the Hellenic view. Philip has annihilated Olynthus and the Chalcidic towns. He has ruined Phocis. He has frightened Thebes. He has divided Thessaly. Euboea and the Peloponnesus are his. His power stretches from the Adriatic to the Hellespont. Where shall be the end? Athens is the last hope of Greece. And, in this final crisis, Demosthenes was the embodied energy of Athens. It was Demosthenes who went to Byzantium, brought the estranged city back to the Athenian Alliance, and snatched it from the hands of Philip. It was Demosthenes who, when Philip had already seized Elateia, hurried to Thebes, and by his passionate appeal gained one last chance, the only possible chance, for Greek freedom, who broke down the barrier of an inveterate jealousy, who brought Thebans to fight beside Athenians, and who thus won at the eleventh hour a victory for the spirit of loyal union which took away at least one bitterness from the unspeakable calamity of Chaeroneia.

After Chaeroneia.—But the work of Demosthenes was not closed by the ruin of his cause. During the last 16 years of his life (338–322) he rendered services to Athens not less important, and perhaps more difficult, than those which he had rendered before. He was now, as a matter of course, foremost in the public affairs of Athens. In Jan. 337, he spoke the funeral oration over those who had fallen at Chaeroneia. He was member of a commission for strengthening the fortifications of the city (τειχοποιός). He administered the festival-fund. During a dearth which visited Athens between 330 and 326 he was charged with the organization of public relief. In 324 he was chief (ἀρχιθέωρος) of the sacred embassy to Olympia. Already, in 336, Ctesiphon had proposed that Demosthenes should receive a golden crown from the

[1] It is generally agreed that the Third Olynthiac is the latest; but the question of the order of the First and Second has been much discussed. *See* Grote *(History of Greece,* chap. *88,* appendix), who prefers the arrangement ii., i., iii., and Blass, ***Die attische Beredsamkeit,*** **iii., p. 319.**

State, and that his extraordinary merits should be proclaimed in the theatre at the Great Dionysia. The proposal was adopted by the senate as a bill (προβούλευγα); but it must be passed by the Assembly before it could become an act (ψήφισμα). To prevent this, Aeschines gave notice, in 336, that he intended to proceed against Ctesiphon for having proposed an unconstitutional measure. For six years Aeschines avoided action on this notice. At last, in 330, the patriotic party felt strong enough to force him to an issue. Aeschines spoke the speech "Against Ctesiphon," an attack on the whole public life of Demosthenes. Demosthenes gained an overwhelming victory for himself and for the honour of Athens in the most finished, the most splendid and the most pathetic work of ancient eloquence "On the Crown."

In the winter of 325–324 Harpalus, the receiver-general of Alexander in Asia, fled to Greece, taking with him 8,000 mercenaries, and treasure equivalent to about a million and a quarter sterling. On the motion of Demosthenes he was warned from the harbours of Attica. Having left his troops and part of his treasure at Taenarum, he again presented himself at the Peiraeeus, and was now admitted. He spoke fervently of the opportunity which offered itself to those who loved the freedom of Greece. All Asia would rise with Athens to throw off the hated yoke. Fiery patriots like Hypereides were in raptures. For zeal which could be bought Harpalus had other persuasions. But Demosthenes stood firm. War with Alexander would, he saw, be madness. It could have but one result—some indefinitely worse doom for Athens. Antipater and Olympias presently demanded the surrender of Harpalus. Demosthenes opposed this. But he reconciled the dignity with the loyalty of Athens by carrying a decree that Harpalus should be arrested, and that his treasure should be deposited in the Parthenon, to be held in trust for Alexander. Harpalus escaped from prison. The amount of the treasure, which Harpalus had stated as 700 talents, proved to be no more than 350. Demosthenes proposed that the Areopagus should inquire what had become of the other 350. Six months, spent in party intrigues, passed before the Areopagus gave in their report (ἀπόφασις). The report inculpated nine persons. Demosthenes headed the list of the accused. Hypereides was among the ten public prosecutors. Demosthenes was condemned, fined fifty talents, and, in default of payment, imprisoned. 'After a few days he escaped from prison to Aegina, and thence to Troezen. Two things in this obscure affair are beyond reasonable doubt. First, that Demosthenes was not bribed by Harpalus. The hatred of the Macedonian party towards Demosthenes, and the fury of those vehement patriots who cried out that he had betrayed their best opportunity, combined to procure his condemnation, with the help, probably, of some appearances which were against him. Secondly, it can scarcely be questioned that, by withstanding the hot-headed patriots at this juncture, Demosthenes did heroic service to Athens.

Next year (323 B.C.) Alexander died. Then the voice of Demosthenes, calling Greece to arms, rang out like a trumpet. Early in Aug. 322 the battle of Crannon decided the Lamian War against Greece. Antipater demanded, as the condition on which he would refrain from besieging Athens, the surrender of the leading patriots. Demades moved the decree of the assembly by which Demosthenes, Hypereides, and some others were condemned to death as traitors. A Macedonian garrison occupied Munychia, on the 20th of Boëdromion (Sept. 16) 322, the day on which, 13 years before, Alexander had punished the rebellion of Thebes with annihilation.

Death.—The condemned men had fled to Aegina. Parting there from Hypereides and the rest, Demosthenes went on to Calauria, a small island off the coast of Argolis. He sought asylum in an ancient sanctuary, the temple of Poseidon. Archias of Thurii, a man who, like Aeschines, had begun life as a tragic actor, and who was now in the pay of Antipater, soon traced the fugitive, landed in Calauria, and appeared before the temple of Poseidon with a body of Thracian spearmen. Archias was not the man to stick at sacrilege. In Aegina, Hypereides and the others had been taken from the shrine of Aeacus. But he hesitated to violate an asylum so peculiarly sacred as the Calaurian temple. Standing before its open door, with his Thracian soldiers around him, he endeavoured to prevail on Demosthenes to quit the holy precinct. Antipater would be certain to pardon him. Demosthenes sat silent, with his eyes fixed on the ground. At last, as the emissary persisted in his bland persuasions, he looked up and said: "Archias, you never moved me by your acting, and you will not move me now by your promises." Archias lost his temper, and began to threaten. "Now," rejoined Demosthenes, "you speak like a real Macedonian oracle; before you were acting. Wait a moment, then, till I write to my friends." With these words, Demosthenes withdrew into the inner part of the temple—still visible, however, from the entrance. He took out a roll of paper, as if he were going to write, put the pen to his mouth, and bit it, as was his habit in composing. Then he threw his head back, and drew his cloak over it. The Thracian spearmen, who were watching him from the door, began to gibe at his cowardice. Archias went in to him, encouraged him to rise, repeated his old arguments, talked to him of reconciliation with Antipater. By this time Demosthenes felt that the poison which he had sucked from the pen was beginning to work. He drew the cloak from his face, and looked steadily at Archias. "Now you can play the part of Creon in the tragedy as soon as you like," he said, "and cast forth my body unburied. But I, O gracious Poseidon, quit thy temple while I yet live; Antipater and his Macedonians have done what they could to pollute it." He moved towards the door, calling to them to support his tottering steps. He had just passed the altar of the god, when he fell, and with a groan gave up the ghost (Oct. 322 B.C.).

Political Character and Oratory.—AS a statesman, Demosthenes needs no epitaph but his own words in the speech "On the Crown,"—I *say that,* if *the event had been manifest to the whole world beforehand, not even then ought Athens to have forsaken this course,* if *Athens had any regard for her glory, or for her past, or for the ages to come.* The Persian soldier in Herodotus, following Xerxes to foreseen ruin, confides to his fellow-guest at the banquet that the bitterest pain which man can know is πολλὰ φρονέοντα μηδενὸς κρατέειν,—complete, but helpless, prescience. In the grasp of a more inexorable necessity, the champion of Greek freedom was borne onward to a more tremendous catastrophe than that which strewed the waters of Salamis with Persian wrecks and the field of Plataea with Persian dead; but to him, at least, it was given to proclaim aloud the clear and sure foreboding that filled his soul, to do all that true heart and free hand could do for his cause, and, though not to save, yet to encourage, to console and to ennoble. As the inspiration of his life was larger and higher than the mere courage of resistance, so his merit must be regarded as standing altogether outside and above the struggle with Macedon. The great purpose which he set before him was to revive the public spirit, to restore the political vigour, and to re-establish the Panhellenic influence of Athens—never for her own advantage merely, but always in the interest of Greece. His glory is, that while he lived he helped Athens to live a higher life. Wherever the noblest expressions of her mind are honoured, wherever the large conceptions of Pericles command the admiration of statesmen, wherever the architect and the sculptor love to dwell on the masterpieces of Ictinus and Pheidias, wherever the spell of ideal beauty or of lofty contemplation is exercised by the creations of Sophocles or of Plato, there it will be remembered that the spirit which wrought in all these would have passed sooner from among men, if it had not been recalled from a trance by the passionate breath of Demosthenes.

The orator in whom artistic genius was united, more perfectly than in any other man, with moral enthusiasm and with intellectual grasp, has held in the modern world the same rank which was accorded to him in the old; but he cannot enjoy the same appreciation. Sincerity and intensity are, to the modern reader, the most obvious characteristics of Demosthenes. His style is, on the whole, singularly free from what we are accustomed to regard as rhetorical embellishment. Where the modern orator would employ a wealth of imagery, or elaborate a picture in exquisite detail, Demosthenes is content with a phrase or a word.

Burke uses, in reference to Hyder Ali, the same image which Demosthenes uses in reference to Philip. "compounding all the materials of fury, havoc, desolation, into one black cloud, he hung for a while on the declivity of the mountains. Whilst the authors of all these evils were idly and stupidly gazing on this menacing meteor, which darkened all their horizon, it suddenly burst, and poured down the whole of its contents upon the plains of the Carnatic." Demosthenes forbears to amplify. "The people gave their voice, and the danger which hung upon our borders went by like a cloud." To our modern feeling, the eloquence of Demosthenes exhibits everywhere a general stamp of earnest and simple strength. But it is well to remember the charge made against the style of Demosthenes by a contemporary Greek orator, and the defence offered by the best Greek critic of oratory. Aeschines reproached the diction of Demosthenes with excess of elaboration and adornment (περιεργία). Dionysius, in reply, admits that Demosthenes does at times depart from simplicity,—that his style is sometimes elaborately ornate and remote from the ordinary usage. But, he adds, Demosthenes adopts this manner where it is justified by the elevation of his theme. The remark may serve to remind us of our modern disadvantage for a full appreciation of Demosthenes. The old world felt, as we do, his moral and mental greatness, his fire, his self-devotion, his insight. But it felt also, as we can never feel, the versatile perfection of his skill. This it was that made Demosthenes unique to the ancients. The ardent patriot, the far-seeing statesman, were united in his person with the consummate and unapproachable artist. Dionysius devoted two special treatises to Demosthenes,—one on his language and style (λεκτικὸς τόπος), the other on his treatment of subject-matter (πραγματικὸς τόπος). The latter is lost. The former is one of the best essays in literary criticism which antiquity has bequeathed to us. The idea which it works out is that Demosthenes has perfected Greek prose by fusing in a glorious harmony the elements which had hitherto belonged to separate types. The austere dignity of Antiphon, the plain elegance of Lysias, the smooth and balanced finish of that middle or normal character which is represented by Isocrates, have come together in Demosthenes. Nor is this all. In each species he excels the specialists. He surpasses the school of Antiphon in perspicuity, the school of Lysias in verve, the school of Isocrates in variety, in felicity, in symmetry, in pathos, in power.

Literary History of **Demosthenes.**—The ancient fame of Demosthenes as an orator can be compared only with the fame of Homer as a poet. Cicero, with generous appreciation, recognizes Demosthenes as the standard of perfection. Dionysius, the closest and most penetrating of his ancient critics, exhausts the language of admiration in showing how Demosthenes united and elevated whatever had been best in earlier masters of the Greek idiom. Hermogenes, in his works on rhetoric, refers to Demosthenes as ὁ ῥήτωρ, *the* orator. The writer of the treatise On Sublimity knows no heights loftier than those to which Demosthenes has risen. From his own younger contemporaries, Aristotle and Theophrastus, who founded their theory of rhetoric in large part on his practice, down to the latest Byzantines, the consent of theorists, orators, antiquarians, anthologists and lexicographers offered the same unvarying homage to Demosthenes. His work busied commentators such as Xenon, Minucian, Basilicus, Aelius, Theon, Zosimus of Gaza. Arguments to his speeches were drawn up by rhetoricians so distinguished as Numenius and Libanius. Accomplished men of letters, such as Julius Vestinus and Aelius Dionysius, selected from his writings choice passages for declamation or perusal, of which fragments are incorporated in the miscellany of Photius and the lexicons of Harpocration, Pollux and Suidas. It might have been anticipated that the purity of a text so widely read and so renowned would, from the earliest times, have been guarded with jealous care. The works of the three great dramatists had been thus protected, about 340 B.C., by a standard Attic recension. But no such good fortune befell the works of Demosthenes. Alexandrian criticism was chiefly occupied with poetry. The titular works of Demosthenes were, indeed, registered with those of the other orators, in the catalogues (ῥητορικοὶ πίνακες) of Alexandria and Pergamum. But no thorough attempt was made to separate the authentic works from those spurious works which had even then become mingled with them. Philosophical schools which, like the Stoic, felt the ethical interest of Demosthenes, cared little for his language. The rhetoricians who imitated or analysed his style cared little for the criticism of his text. Their treatment of it had, indeed, a direct tendency to falsify it. It was customary to indicate by marks those passages which were especially useful for study or imitation. It then became a rhetorical exercise to recast, adapt or interweave such passages. Sopater, the commentator on Hermogenes, wrote on μεταβολαὶ καὶ μεταποιήσεις τῶν Δημοσθένους χωρίων, "adaptations or transcripts of passages in Demosthenes." Such manipulation could not but lead to interpolations or confusions in the original text. Great, too, as was the attention bestowed on the thought, sentiment and style of Demosthenes, comparatively little care was bestowed on his subject-matter. He was studied more on the moral and the formal side than on the real side. An incorrect substitution of one name for another, a reading which gave an impossible date, insertions of spurious laws or decrees, were points which few readers would stop to notice. Hence it resulted that, while Plato, Thucydides and Demosthenes were the most universally popular of the classical prose-writers, the text of Demosthenes, the most widely used perhaps of all, was also the least pure. His more careful students at length made an effort to arrest the process of corruption. Editions of Demosthenes based on a critical recension, and called Ἀττικιανὰ (ἀντίγραφα), came to be distinguished from the vulgates, or δημώδεις ἐκδόσεις.

Among the extant manuscripts of Demosthenes—upwards of 170 in number—one is far superior, as a whole, to the rest. This is *Parisinus* Σ 2934, of the 10th century. A comparison of this ms. with the extracts of Aelius, Aristeides and Harpocration from the Third Philippic favours the view that it is derived from an Ἀττικιανόν, whereas the δημώδεις ἐκδόσεις, used by Hermogenes and by the rhetoricians generally, have been the chief sources of our other manuscripts. The collation of this manuscript by Immanuel Bekker first placed the textual criticism of Demosthenes on a sound footing. Not only is this manuscript nearly free from interpolations, but it is the sole voucher for many excellent readings. Among the other mss., some of the more important *are*—*Marcianus* 416 F, of the 10th (or 11th) century, the basis of the Aldine edition; *Augustanus I.* (N. 85), derived from the last, and containing scholia to the speeches on the Crown and the Embassy, by Ulpian, with some by a younger writer, who was perhaps Moschopulus; *Parisinus; Antverpiensis*—*the* last two comparatively free from additions. The fullest authority on the mss. is J. T. Vömel, *Notitia codicum Demosth.*, and *Prolegomena Critica* to his edition published at Halle (1856–57), pp. 175–178.

The extant scholia on Demosthenes are for the most part poor. Their staple consists of Byzantine erudition; and their value depends chiefly on what they have preserved of older criticism. They are better than usual for the Περὶ στεφάνου, Κατὰ Τιμοκράτους; best for the Περὶ παραπρεσβείας. The Greek commentaries ascribed to Ulpian are especially defective on the historical side, and give little essential aid. Editions:—C. W. Miiller, in *Orat. Att.* ii. (1847–58); *Scholia Graeca in Demosth. ex cod. aucta et emendata* (Oxon., 1851; in W. Dindorf's ed.).

DEMOTICA or **DIDYMOTEIKHON,** a town of eastern Greece on the Maritsa valley branch of the Istanbul-Salonika railway, about 35 mi. south of Adrianople. Population about 10,000. Its mediaeval name of Didymoteichos has been revived and is now in use. Demotica is built at the foot of a conical hill on the left bank of the river Kizildeli, near its junction with the Maritsa. It was formerly the seat of a Greek archbishop, and, besides the ancient citadel and palace on the summit of the hill, contains several Greek churches, mosques and public baths. In the middle ages it was one of the principal marts of Thrace; in modern times it has regained some commerce, and exports pottery, linen, silk and grain. German troops occupied the town, 1941.

DEMOTIC LANGUAGE AND WRITING. The name demotic, "popular," is taken from Herodotus for the ordinary Egyptian handwriting of late times. The script first appears about the 6th century B C. as an improvement on the particularly obscure and unsystematic style of hieratic writing employed in business documents for some centuries before that time. It arose probably in the commercial areas of Lower Egypt at Sais or Memphis, and by the time of Darius, who apparently encouraged the reorganization of the writing schools, a neat script was everywhere in use for the above purposes. Before the Macedonian conquest the cursive ligatures of the early demotic gave birth to new symbols which were carefully and distinctly formed. In the Ptolemaic period an epigraphic variety appears, priestly decrees being engraved on stelae (such as the Rosetta Stone) in triple hieroglyphic, demotic and Greek versions; under the Romans, while religious texts continued to be written in hieratic, literary texts were in demotic, but Greek was almost universal for business documents. The use of demotic went out with or before paganism, but priests of Isis continued to use it in their graffiti at Philae as late as AD. 452.

Demotic is written from right to left in horizontal lines; the signs comprise phonograms, word-signs and determinatives, and a single demotic sign is often in origin a ligature of several hieroglyphic signs. It is difficult to transcribe with precision into hieroglyphic, and the result of such a transcription looks absurd on account of the unetymological spellings and the number of otiose signs included in the ligatures. The language of demotic may represent approximately the speech of the 26th dynasty; it approximates to Coptic (*q.v.*), but employs fewer auxiliaries and periphrastic forms, and even in its latest stages its loans from Greek are confined to a few technical words which do not affect the grammar. In the Ptolemaic age it first distinguished l from *r,* and in very late texts vocalization may be indicated to some extent.

The chief literary compositions in demotic are stories *(The Stories of Setkon Khamois, The Romance of King Petubastis, The Myth of the Eye of Re,* etc.); a prophetic work, the so-called *Demotic Chronicle;* and collections of apophthegms. *The Petition of Peteësi* (temp. Darius I.) on a papyrus in the Rylands collection takes the form of a long narrative of events covering more than a century and a half.

See F. Ll. Griffith, *Catalogue of the Demotic Papyri in the John Rylands Library, Manrhester,* 3 vols. (1909); Spiegelberg. *Demotische Grammatik,* Heidelberg (1925). (F. LL. G)

DEMPSTER, THOMAS (1570–1625), Scottish scholar and historian, was born at Cliftbog, Aberdeenshire, and sent, at ten years old, to Pembroke Hall, Cambridge. He then studied at Louvain, graduated at the English College at Douai, and in canon law in Paris. He was in turn regent of the college of Navarre in Paris, professor of the humanities at Toulouse, of rhetoric at Nîmes, tutor in Spain, and then, after a short visit to Scotland, professor in various colleges in Paris. His quarrelsome temperament led to difficulties in all these places, and in 1615 he came to London at the invitation of James I. His Roman Catholicism stood in the way of preferment in England and he returned to the Continent. He became professor of the Pandects at Pisa, and then professor of the humanities at Bologna, then the most famous of European universities. He died there on Sept. 6, 1625.

Dempster had a great reputation in his day. His principal works are: An edition of Rosinus's *Antiquitatum romanarum corpus absolutissimum* (Paris, 1613); *De Etruria regali,* posthumously published (Florence, 1723–24); *editio princeps* of Corippius (Paris, 1610); an annotated edition of Benedetto Accolti's *De bello a Christianis contra barbaros gesto* (Florence, 1623); and the famous *Historia ecclesiastica gentis Scotorum* (Bologna, 1627), in which Scottish patriotism made him claim as Scots Bernard (Sapiens), Alcuin, Boniface and Johannes Scotus Erigena. Some of his Latin verse was published in vol. i. of *Delitiae poetarum Scotorum* (Amsterdam, 1637).

DEMURRAGE, in merchant shipping the sum payable by the freighter to the shipowner for detention of the vessel in port beyond the number of days allowed for the purpose of loading or unloading. *(See* AFFREIGHTMENT: *Charter-parties.)* In railway law the charge on detention of trucks; and in banking the charge per ounce made by the Bank of England in exchanging coin or notes for bullion. The word is derived from Fr. *demewer,* to delay.

DEMURRER, in common law, an objection taken to the sufficiency, in point of law, of the pleading or written statement of the other side. *(See* PRACTICE AND PROCEDURE.)

DENAIN, a town of northern France in the department of Nord, 8 m. S.W. of Valenciennes. Coal mines and iron-smelting works caused its growth from a mere village in the early 19th century to a town of 24,275 inhabitants in 1936. Besides iron and steel works, it has breweries and manufactories of machinery and glass. Denain has a port on the left bank of the Scheldt canal. Its vicinity was the scene of the victory gained in 1712 by Marshal Villars over Prince Eugène.

DENBIGH, WILLIAM FEILDING, 1ST EARL OF (d. 1643), British naval and military officer, son of Basil Feilding and of Elizabeth Aston, was educated at Emmanuel college, Cambridge, and knighted in 1603. He married Susan Villiers, sister of the future duke of Buckingham, and on the rise of the favourite received various offices and dignities. Created baron and viscount Feilding in 1620, and earl of Denbigh on Sept. 14, 1622, he attended Prince Charles on the Spanish adventure, served as admiral in the unsuccessful expedition to Cadiz in 1625, and commanded the disastrous attempt upon Rochelle in 1628, becoming the same year a member of the council of war, and in 1633 a member of the council of Wales. In the Civil War he served under prince Rupert and was present at Edgehill. On April 3. 1643, during Rupert's attack on Birmingham, he was wounded, and died from the effectson the 8th. The descent of the Feildings from the house of Habsburg, through the counts of Laufenburg and Rheinfelden, long considered authentic, and immortalized by Gibbon, has been proved to have been based on forged documents. *See* J. H. Round, *Peerage and Family History* (1901).

See E. Lodge, *Portraits* iv. 113; (1850), J. Nichols, *Hist. of Leicestershire,* iv. pt. *1,* 273 (1807), *Hist. MSS. Comm. Ser.,* 4th Rep. app. 254; Cal. *of State Papers, Dom;* J. H. Round, *Studies in Peerage and Family History, 216* (1901).

His eldest son, BASIL FEILDING, 2nd earl of Denbigh *(c.* 1608–75), was sent in 1634 by Charles I. as ambassador to Venice, where he remained for five years. During the Civil War Feilding ranged himself among the Parliamentarians, led a regiment of horse at Edgehill, and, having become earl of Denbigh in April

1643, was made commander-in-chief of the Parliamentary Army in the Midlands and lord-lieutenant of Warwickshire. He resigned his command after the passing of the self-denying ordinance in April 1645. At Uxbridge (1645) and at Carisbrooke (1647) Denbigh was one of the commissioners appointed to treat with the king. He supported the army in its dispute with the parliament, but he would take no part in the trial of Charles I. Under the Commonwealth Denbigh was a member of the council of state, but later he came to be regarded as a royalist. He died without issue on Nov. 28, 1675.

His titles devolved on his nephew WILLIAM FEILDING (1640–85), son and heir of his brother George (created Baron Feilding of Lecaghe, Viscount Callan and earl of Desmond), and the earldom of Desmond has been held by his descendants to the present day in conjunction with the earldom of Denbigh.

DENBIGH (Dinbych), municipal borough, market and county town of Denbighshire, Wales, on a branch of the L.M.S.R. Pop. (1931) 7,249. The name suggests an early fortification Din in Dinbych means a fort and the pre-Norman fort was called *Castell* caled fryn yn *Rhôs,* or "the castle of the hard hill in Rhôs." Denbigh castle was built, in Edward I.'s reign, by Henry de Lacy, earl of Lincoln, from whom the town received its first charter. The outer wall is nearly a mile round. The castle was given to the Mortimers and to Leicester under Edward III. and Elizabeth respectively. In 1645, after the defeat of Rowton Moor, Charles I. found shelter here. The castle long resisted the Parliamentarians. There are ruins of a Carmelite priory, dating from the 13th century; a Bluecoat school (1514); a free grammar school (1527); an orphan girl school (funds left by Thomas Howel to the Drapers' Co., in Henry VII.'s reign); the town hall (built in 1572 by Robert Dudley, earl of Leicester, enlarged and restored in 1780); an unfinished church (begun by Leicester), and the old parish church of St. Marcella. The industries are mainly agricultural with a little quarrying. The borough of Denbigh has a separate commission of the peace, but no separate court of quarter sessions. Near Denbigh, at Bodelwyddan, etc., coal is worked.

DENBIGHSHIRE (DINBYCH), a county of the north coast of Wales, made up of two linked regions, north-west and south-east. Area 662 sq. miles. The north-west region is bounded west by the Conwy, along the line of which the Ordovician rocks with volcanic elements to the west (see CARNARVONSHIRE) give place to the sharp edged plateau of Silurian rocks, a part of the general Welsh plateau (see WALES). This region stretches east to the trough of the Vale of Clwyd, the west side of which is in Denbighshire, while the county has extensions up the Bodfari gap in the eastern wall of the vale (the Moel Fammau range, with Moel Fammau 1,820 ft.) and across the Clwyd farther up the valley; Flintshire borders it here on the east. The nucleus of Merionethshire is the fault-valley through Corwen, Bala and Dolgelley, and consequently valleys opening into the main fault-valley are for the most part in the latter county. The north-west region of Denbighshire is thus mainly a dissected plateau draining eastward to the Clwyd, but with small portions draining to the Conwy on the west or to the upper Dee on the south. On the north coast between Old Colwyn and Llandulas is a detached fragment of Carnarvonshire, a fact related to a change in the course of the Conwy stream.

The south-east region of Denbighshire includes the basin of the Ceiriog and its mountain frame of the Berwyn ridge, of Ordovician rock with volcanic elements, Moel Sych (2,713 ft.). Montgomeryshire lies to the south and south-west. The Ceiriog flows into the Dee near its emergence from deep, encased meanders in the Welsh plateau. Ruabon and Wrexham and their coal-measures on the borders of Cheshire are also in this region of Denbighshire, which extends up into the deep meanders of the Dee above Llangollen, until the region focussing on Corwen (see above) is reached. The two regions of Denbighshire are physically linked but humanly divided by the dissected plateau of Silurian rocks north of the Llangollen section of the Dee; to the north-east lies Flintshire. A narrow broken band of the Old Red, or what may be a conglomeratic basement bed of the Carboniferous Limestone series, crops up along the Vale of Clwyd and in Eglwyseg. Resting upon this the Carboniferous limestone extends from Llanymynach, its extreme southern point, to the Cyrnybrain fault, and there forks into two divisions that terminate respectively in the Great Orme's Head and in Talargoch, and are separated from each other by the denuded shales of the Moel Fammau range. In the Vale of Clwyd the limestone underlies the new red sandstone, and in the eastern division it is itself overlaid by the millstone grit of Ruabon and Minera, and by a long reach of the coal measures which, near Wrexham, are 43 m. in breadth. Eastward of these a broad strip of the red marly beds succeeds, and between this and the Dee the ground is occupied—as in the Vale of Clwyd—by the new red rocks. The red sandstone areas form the best agricultural land. The eastern flank of the county is less sharp as it grades down to the coalfield west of the Dee. These coal measures have been extensively worked, with Rhos, Wrexham and Ruabon as centres. From the limestone below, lead, with silver and zinc ores, have been obtained. Valuable fireclays and terra-cotta marls are also taken from the coal measures about Wrexham. As in other northern counties of Wales, the whole of the lower ground is covered more or less thickly with glacial drift. On the western side of the Vale of Clwyd, at Cefn and Plbs Heaton, the caves, a common feature in such limestone districts, have yielded the remains of the rhinoceros, mammoth, hippopotamus and other mammals now extinct in Britain.

Archaeology.— The period of earliest occupation of the region by man is still very doubtful. The high ground is dotted by tumuli, but only one beaker pot has been recorded. Finds of early gold and socketed axes dating from the late Bronze age are more numerous, indicating that the upper Dee valley and the Vale of Clwyd had become important lines of movement by this time. The native hill fortresses and Roman statues of later times show the importance of the North Wales coastal route. A great native hill-fortress was Dinorben (see Willoughby Gardner, "The Native Hill-forts of North Wales and their Defences," Archaeologia Cambrensis, vol. lxxxi. part 2, Dec. 1926). It seems clear that these native fortresses protected routes, and, whatever their original date, they received much attention during the Roman period. Roman roads ran from Chester via Flint through the north of the county to St. Asaph, and thence on to Kanovium and Segontium (Carnarvon). Another line was via Ffrith and the south of the county to the Bala cleft and the Caergai station. Clawdd Coch has traces of the Romans; so also has Penygaer and Penbarras. To their period belong the inscribed Gwytherin and Pentrefoelas (near Bettws-y-coed) stones. The Valle Crucis, "Eliseg's pillar," tells of Brochmael and the Cairlegion (Chester) struggle against Aethelfrith's invading Northumbrians, A.D. 613, while Offa's dike goes back to the Mercian advance. The south-east of the county includes a considerable section of this dike as well as of the smaller and parallel Watt's dike (see Fox, *Archaeologia* Cambrensis, vol. lxxxi., part 1, June, 1926).

History.— After the Edwardian conquest Denbigh castle was built by Henry de Lacy, earl of Lincoln, and Ruthin castle probably by Hugh, earl of Chester. The rolls of the Court of Ruthin are complete from 1294, and are now in the National Library of Wales, Aberystwyth. Owain Glyn Dwr failed to take Ruthin in 1400. In the south-east of the county Chirk castle was founded by Roger de Mortimer in the early 14th century. The county was formed by an act of Henry VIII. out of the lordships of Denbigh, Ruthin (Rhuthyn), Rhos and Rhyfoniog, which are roughly the Perfeddwlad (midland) between Conway and Clwyd and the lordships of Bromfield, Yale (*Iâl,* open land) and Chirkland, the old possessions of Gruffydd ap Madoc, arglwydd (lord) of Dinas Brân. Charles I. took refuge in this county in 1645. and the castle of Denbigh was one of the last strongholds in Wales to surrender to the parliament which "slighted" both Denbigh and Ruthin. Near Ruabon is Wynnstay, the seat of the old Watkin Williams-Wynn family of landowners. The fine church (1470) of Wrexham shows that this part of the county between the Welsh plateau and the English border had developed considerably during the middle ages. Royalist and Jacobite sympathies and continued adherence to the Roman Catholic Church on the part of some of

the great families have been features of the county, which developed considerably under the Nonconformist influences of the 18th century.

Oak wood lofts and screens, a feature of South-west England, the Welsh border and Montgomeryshire, are found at Llanrwst, Gresford and Derwen. Gresford and Llanrhaiadr (Dyffryn Llanrwst Clwyd) have stained glass.

Industries and Occupations.— The great extent of moorland area has confined the agricultural output of the county. A little wheat is grown in the lowlands but ten times as much oats. Turnips and swedes are also important crops. Large flocks of sheep are pastured on the hill-sides, and many black cattle are reared for fattening in the midlands of England and for sale in London. Large numbers of pigs are also kept. Other industries, formerly of greater importance than at present, include slate quarrying, lead-mining and woollen manufacture. Nantglyn prepares paving flags, Rhiwfelen (near Llangollen) slabs and slates, while good slates are also obtained at Glyn Ceiriog. There is plenty of limestone with china stone at Brymbo. Cefn Rhiwabon yields sandstone (for hones) and millstone grit. The great Minera Mine has produced great quantities of lead ore. Woollen manufactures centre around Llangollen and Llansantffraid (St. Bridgit's). The extensive development of coal-mining in the south-east of the county in the latter half of the 19th century has transformed the old world market towns of Chirk, Ruabon and Wrexham into coal-mining and industrial centres. The proximity of the Lancashire and Staffordshire industrial areas ensure a market for the coal, while modern developments on the Wirral and the North Wales coast and the extended interest in by-products may help in the future. The rapid development of the industrial area (south-east) with its new populations and new ideas, provides a social and political contrast over against the other section of Denbighshire (north-west) which has remained rural and agricultural. These distinct geographical and social units illustrate the difficulty of the county as an administrative unit.

Communications.— The Holyhead road to London, a one-time famous coaching route, runs down the Llangollen valley. The L.M.S. railway (Holyhead line), with the Conway and Clwyd valleys branches, together with the lines connecting Denbigh with Ruabon (Rhiwabon), via Ruthin and Corwen, Wrexham with Connah's Quay (L.N.E. railway) and Rhosllanerchrhugog with Glyn Ceiriog (for the Great Western and L.N.E. railways) have opened up the county.

The area of the ancient county is 661 sq.mi. The area of the administrative county is 668 sq.mi., with a population in 1938 of 156,840. The chief towns are: Wrexham, Denbigh, Ruthin, Llangollen, Llanrwst and Holt. The county has two parliamentary divisions. The urban districts are: Abergele and Pensarn, Colwyn Bay and Colwyn, Llangollen and Llanrwst. Denbighshire is in the north Wales circuit, assizes being held at Ruthin. Denbigh and Wrexham boroughs have separate commissions of the peace, but no separate quarter-session courts. The ancient county, which is in the diocese of St. Asaph, contains 75 ecclesiastical parishes and districts and part of a parish.

DENDERA, a village in Upper Egypt, situated in the angle of the great westward bend of the Nile opposite Kena. Here was the ancient city of Tentyra, capital of the Tentyrite nome, the sixth of Upper Egypt, and the principal seat of the worship of Hathor (Aphrodite), the cow-goddess of love and joy. The temple of Hathor was built in the 1st century B.C., being begun under the later Ptolemies and finished by Augustus, but much of the decoration is later. A great rectangular enclosure of crude bricks, measuring about 900x850ft., contains the sacred buildings; it was entered by two stone gateways, in the north and the east sides, built by Domitian. Another smaller enclosure lies to the east with a gateway, also of the Roman period.

The temple building, which is of sandstone, measures about 300ft. from front to back, and consists of two oblong rectangles; the foremost, placed transversely to the other, is the great hypostyle hall or pronaos, the broadest and loftiest part of the temple, measuring 135ft. in width, and comprising about one-third of the whole structure; the façade has six columns with heads of Hathor, and the ceiling is supported by 18 great columns. The second rectangle contains a small hypostyle hall with six columns, and the sanctuary, with their subsidiary chambers. The sanctuary is surrounded by a corridor into which the chambers open; on the west side is an apartment forming a court and kiosk for the celebration of the feast of the New Year, the principal festival of Dendera. On the roof of the temple, reached by two staircases, are a pavilion and several chambers dedicated to the worship of Osiris. Inside and out the whole of the temple is covered with scenes and inscriptions in crowded characters, of ceremonial and religious import; the decoration is even carried into a remarkable series of hidden passages and chambers or crypts made in the solid walls for the reception of its most valuable treasures. North-east of the entrance is a "Birth House" for the cult of the child Harsemteu, and behind the temple a small temple of Isis, dating from the reign of Augustus. Petrie's excavation of the cemetery behind the temple enclosures revealed burials dating from the fourth dynasty onwards, the most important being *mastabas* of the period from the sixth to the 11th dynasties; many of these exhibited a peculiar degradation of the contemporary style of sculpture.

One of the zodiacs of the temple, from a chamber on the roof, was removed in 1820 to the Bibliothèque Nationale in Paris. Figures of the celebrated Cleopatra VI. occur amongst the sculptures on the exterior of the temple, but they are purely conventional, without a trace of portraiture. Horus of Edfu, the enemy of the crocodiles and hippopotami of Set, appears sometimes as the consort of Hathor of Dendera. Juvenal, in his 17th satire, takes as his text a religious riot between the Tentyrites and the neighbouring Ombites, and Sir Flinders Petrie has shown that the Ombos in question was opposite Coptos, only about 15m. from Tentyra, where the hippopotamus sacred to Set was venerated.

DENDERMONDE: see TERMONDE.

DENDRITE. The fibrous process of a nerve-cell or neuron which conducts impulses toward the cell body. The dendrites of a given neuron differin several ways from the axon, which is the fibrous process conducting away from the cell body. There may be several dendrites, whereas ordinarily there is but a single axon fibre; and the dendrites are usually arranged in branching form (hence the derivation of the term from the Greek word, δένδρον, meaning "tree").

See also NERVOUS SYSTEM; C. J. Herrick, *Neurological Foundations of Animal Behavior.*

DENE-HOLES, the name given to certain caves or excavations in England, popularly but incorrectly attributed to the Danes. The word however is probably derived from the Anglo-Saxon den, a hole or valley. There are many underground excavations in the chalk districts of the south of England, but true dene-holes are found chiefly in those parts of Kent and Essex along the lower banks of the Thames.

The general outline is invariably the same. The entrance is a vertical shaft, some 3ft. in diameter, falling sometimes to a depth of 60ft. The depth is regulated by the depth of the chalk from the surface, but although chalk could have been obtained close at hand within a few feet, or even inches, from the surface, a depth of from 45 to 80ft., or more, is a characteristic feature. The shaft, when the chalk is reached, widens out into a domed chamber with a roof of chalk some 3ft. thick. The walls frequently contract somewhat as they approach the floor. As a rule there is only one chamber, from 16 to 18ft. in height, beneath each shaft. From this excessive height it has been inferred that the caves were not primarily intended for habitations or even hiding-places. In some cases the chamber is extended, the roof being supported by pillars of chalk left standing. In a rare specimen of a twin-chamber discovered at Gravesend, the one entrance served for both caves, although a separate aperture connected them on the floor level. Where galleries are found connecting the chambers, forming a bewildering labyrinth, they are usually the work of a people of a much later period than that of the chambers.

Isolated specimens have been discovered in various parts of Kent, Essex, Hants and Berks, but the most important groups are at Grays Thurrock, in the districts of Woolwich, Abbey Wood and

Bexley and Gravesend. Some of the Chislehurst caves may have been begun as dene-holes. but if so, they have been so enlarged and altered that their original character has been obliterated.

The tool work on the roof or ceiling is generally rougher than that on the walls, where an upright position could be maintained. Casts taken of some of the pick-holes near the roof show that, in all probability, they were made by bone or horn picks. And numerous bone picks have been discovered in Essex and Kent. These pick-holes have assisted in fixing the date of their formation to pre-Roman times. Very few relics of archaeological value have been discovered in any of the known dene-holes, to assist in fixing the date or determining their uses. Pliny mentions pits sunk to a depth of a hundred feet, "where they branched out like the veins of mines." This has been used in support of the explanation that dene-holes were wells sunk for the extraction of chalk. Chrétien de Troyes has a passage on underground caves in Britain which may refer to dene-holes, and tradition of the 14th century treated the dene-holes of Grays as the fabled gold mines of Cunobeline (or Cymbeline) of the 1st century. Vortigern's caves at Margate are possibly dene-holes adapted by later peoples to other purposes; and excellent examples of various pick-holes may be seen on different parts of the walls. Local tradition associates these caves with smugglers; and since illicit trade was common both on the coast and in the Thames up to Barking Creek, the theory is tenable.

There are three purposes for which dene-holes may originally have been excavated; (a) as hiding places or dwellings, (b) as draw-wells for the extraction of chalk for agricultural uses, and (c) as store-houses for grain. It is unlikely that they were used as habitations, although they may have been used occasionally as hiding-places. Against the theory that they were primarily designed for the extraction of chalk, it may be urged that chalk could have been obtained on the surface close by, and that known examples of chalk draw-wells do not descend to so great a depth. The discovery of a shallow dene-hole, about 14ft. below the surface, at Stone, negatives this theory still further. The view that these prehistoric excavations were designed as silos is usually accepted as the most probable. Silos, or underground storehouses, are well known in the south of Europe and Morocco. It is supposed that the grain was stored in the ear and carefully protected from damp by straw. A curious smoothness of the roof of one of the chambers of the Gravesend twin-chamber dene-hole supports this theory. The theory that the excavations were made in order to get flints for implements is quite impossible, as a careful examination of a few examples will show.

See F. C. J. Spurrell, "Deneholes and Artificial Caves," in the Archaeological Journal (1882); T. V. Holmes, "Deneholes" (1883) and many other references in the *Essex Naturalist*; Archaeologia Cantiana (vol. xviii., 1896); F. W. Reader, "Deneholes" in Old Essex, ed. A. C. Kelway (1908); W. Johnston, Folk *Memory* (1908) with bibliography.

DENGUE (děng′gĕ), an infectious fever caused by a filter-passing virus (*q.v.*), occurring in warm climates, and transmitted by mosquito agency (see ENTOMOLOGY, MEDICAL). The symptoms are a sudden attack of fever, accompanied by rheumatic pains in the joints and muscles with severe headache and erythema. After a few days a crisis is reached, and an interval of two or three days is followed by a slighter return of fever and pain and an eruption resembling measles, the most marked characteristic of the disease. The disease is rarely fatal. Dengue is nearly always epidemic, and in certain districts almost endemic. The area over which it ranges may be stated generally to be between 32° 47′ N. and 23° 23′ S. The chief epidemics have been those of 1824–26 in India, and in the West Indies and the southern states of North America, in 1870–75, extending practically over the whole of the tropical portions of the East and reaching as far as China. In 1888–89 a great outbreak spread over nearly the whole of Asia Minor, and in 1928 it occurred in Greece.

See Sir Patrick Manson, Tropical Diseases; a Manual of Diseases of *Warm Climates* (1903); J. F. Siler, M. W. Hall and A. P. Hitchens, "Dengue; Its History, Epidemiology, Mechanism of Transmission, Etiology, Clinical Manifestations, Immunity, and Prevention," *The* Philippine Journal *of* Science, vol. 29, No. 1–2, Manila (1926).

DENHAM, DIXON (1786–1828), English traveller in central Africa, was born in London. He served in the campaigns in Portugal, Spain, France and Belgium, and received the Waterloo medal. In 1821 he volunteered to join Dr. Oudney and Hugh Clapperton (*q.v.*), who had been sent by the British government via Tripoli to the central Sudan. He joined the expedition at Murzuk in Fezzan. The pasha of Tripoli did not at first provide the promised escort, but the expedition eventually left Murzuk at the end of 1822. Thence it made its way across the Sahara to Bornu, reached in Feb. 1823. Here Denham, against the wish of Oudney and Clapperton, accompanied a slave-raiding expedition into the Mandara highlands south of Bornu. The raiders were defeated, and Denham barely escaped with his life. When Oudney and Clapperton set out, Dec. 1823, for the Hausa states. Denham remained behind. He explored the western, south and southeastern shores of Lake Chad, and the lower courses of the rivers Waube, Logone and Shari. In Aug. 1824 he returned to England. He had just been appointed governor of Sierra Leone when he died of fever at Freetown on May 8, 1828.

See Narrative of Travels and Discoveries in Northern and Central Africa in the *Years 1822–24* (1826), the greater part of which is written by Denham; Dr. Robert Brown, The Story of Africa, vol. i. chap. xiii. (1892).

DENHAM, SIR JOHN (1615–1669), English poet, only son of Sir John Denham, lord chief baron of the exchequer in Ireland, was born in Dublin, entered at Trinity college, Oxford, in 1631, and at Lincoln's Inn in 1634. His first work was The Destruction of Troy, a verse paraphrase, written in 1636, of the second book of the Aeneid; but he made his reputation with The Sophy, a tragedy acted at Blackfriars in 1641, and printed in 1642. In the latter year appeared the famous descriptive poem of "Cooper's Hill," which Dryden called "the exact standard of good writing," and Pope used as a model for *Windsor* Forest. Denham fought on the king's side in the Civil War, and in 1648 had to leave England when it was suspected that he was concerned in forwarding Charles's correspondence. He remained abroad in the service of the exiled court until 1652, when he returned to England. He was for some time the guest of the earl of Pembroke at Wilton, and then obtained leave to settle at Bury St. Edmunds. At the Restoration he was rewarded with the office of surveyor-general of works. A scandal, caused by the behaviour of his second wife, who became the duke of York's mistress, is said to have driven him mad; but he recovered and survived her for two years. In addition to his poetical works, some satires on the conduct of the Dutch wars, Directions to a Painter, and Fresh Directions are attributed to him. His beautiful elegy on Abraham Cowley dates from 1667.

BIBLIOGRAPHY.—His Poems and Translations, with a dedicatory epistle to Charles 11, appeared in 1668. Other editions followed, and they are reprinted in Chalmers' (1810) and other collections of the English poets His political satires were printed with some of Rochester's and Marvell's in Bibliotheca curiosa, vol. i. (Edinburgh, 1885). See Canabridge History of *English* Literature, vol. vii., ch. iii., by A. Hamilton, Writers of the Couplet.

DENHARDT, KLEMENS (1852–1929) and his brother GUSTAV (1856–1917), German explorers, were born at Zeitz. In 1878 they explored the Tana river, and six years later were able to negotiate a friendly treaty with the sultan of Witu. Part of the territory acquired was sold to the German Witu-Gesellschaft and was later given to England in exchange for Heligoland.

DENIA, a town in east Spain in the province of Alicante; on the Mediterranean sea and on the coast-railway from Carcagente to Alicante. Pop. (1930) 13,063. Denia, built on the seaward slopes of a small hill surmounted by a ruined castle, lies between the limestone ridge of Mongo on the south and a fertile plain on the north. It makes soap, jam, nails, bicycles and woollen, linen and esparto fabrics hut is above all a fruit-port. It exports grapes, raisins. melons and oranges. tomatoes, onions and almonds, usually to Great Britain and north Europe and imports wheat, flour, guano, sulphur, from Italy. Baltic timber, and coal and tin-plates from South Wales. The harbour, sheltered by a breakwater, contains only a small area of deep anchorage and quay accommodation is limited to boats of under 12 ft. draught. Vessels therefore

load and discharge chiefly into lighters, the larger boats anchoring in the open roadstead about 1 mi. from the shore. Throughout the civil war of 1936–39, the port remained in loyalist control.

Denia was colonized by Greek merchants from Emporiae (Ampurias in Catalonia), or Massilia (Marseilles), at a very early date; the Romans named the town *Dianium,* after its temple of Diana, built, in imitation of that at Ephesus, at the foot of the castle hill. Denia was captured by the Moors in 713, and according to an ancient but questionable tradition, under them became so prosperous a trading centre that its population rose to 50,000. Many characteristic Moorish houses survive in the town though it has been largely modernized. After the city was retaken by the Christians in 1253, its prosperity dwindled, and only began to revive in the 19th century. During the War of the Spanish Succession (1701–14), Denia was thrice besieged; and in 1813 the French withstood an allied British and Spanish siege of the citadel for five months before surrendering, on honourable terms.

DENIFLE, HEINRICH SEUSE (1844–1905), Austrian historian and priest, was born on Jan. 16, 1844 at Imst. After becoming a Dominican in 1861, he studied at Graz, Rome and Marseille, and then from 1870 to 1880 taught philosophy and theology at Graz. Ten years after his first important work, *Das geistliche Leben. Eine Blumenlese aus den deutschen Mystikern des 14 Jahr.,* Denifle became in 1883 sub-archivist of the Vatican. Then came a series of erudite works which have revolutionized our knowledge of the middle ages. In 1885 appeared *Die Universitäten des Mittelalters bis 1400;* in 1889–97 the edition (together with Chatelain) of *Chartularium Univ. Pan's;* in 1894–97 *Liber Procuratorum Nationis Anglicanae 1333–46;* in 1888 *Specimina palaeographica Regestorum Pontificum ab Innocentio iii. ab Urbanum* v.; in 1889 *La guerre de cent ans et la de'solation des églises, monastères, et hôpitaux, t. I. jusqu'à la mort de Chas. v.* (1385); in 1897 *La de'solation des églises, monastères, hôpitaux, en France vers le milieu du XVe siècle* (based on some 1,300 documents). The publication in 1904 of *Luther u. Luthertum,* based on original documents, was followed in the same year by *Luther in rationalistischer u. christlicher Beleuchtung,* a reply to the defence of Luther by Harnack and Seeberg, and by a second volume posthumously in 1909. Besides short articles on various mediaeval mystics, in 1885 Denifle together with Ehrle founded the invaluable *Archiv f. Lit. u. Kirchengeschichte des Mittelalters.*

DENIKER, JOSEPH (1852–1918), French naturalist and anthropologist, was born at Astrakhan, Russia. He studied at St. Petersburg (Leningrad) and, as an engineer, travelled extensively in the petroleum districts of the Caucasus, in central Europe, Italy and Dalmatia, In 1888 he was appointed chief librarian of the Natural History museum, Paris. His valuable ethnological works include *Recherches anatomiques et embryologiques sur les singes anthropoides* (1886); *Étude sur les Kalmouks* (1883); *Les Ghiliaks* (1883); and *Rpces et peuples de la terre* (1900; Eng. trans. 1900, 2nd ed. 1926). He was one of the editors of the *Dictionnaire de géographie universelle.* He died in Paris on March 18, 1918.

DENIKIN, ANTON IVANOVICH (1872–), Russian general, was born in humble circumstances on Dec. 4, 1872. During the Russo-Japanese war he rose from captain to colonel, and in the World War became commander-in-chief of the South-Western Front. After the Revolution he followed Kornilov and was arrested and imprisoned with him in Bykov. They escaped together and joined Alexeyev, who was forming in Rostov and Xovocherkassk on the Don a small army of volunteers to fight the Bolsheviks. After Kornilov's death on March 31, 1918, Denikin became military commander of the army, whilst Alexeyev retained the political and financial leadership. They established contact with the Don Cossacks under Krasnov, and were further strengthened by the forces of General Pokrovsky and Colonel Drozdovsky. In June 1918 Denikin initiated a campaign in the Northern Caucasus; by September his army had grown from 9,000 to 40,000; and by February 1919 he had driven a Bolshevik army of 150,000 from the Northern Caucasus. Alexeyev died on Sept. 25. 1918, and early in 1919 Denikin took the name of commander-in-chief of the Armed Forces of South Russia.

In the autumn of 1919 Denikin came within measurable distance of complete victory. His forces had grown to 150,000; Kharkov, Poltava, Odessa, Kiev, and Orel were in his hands; his right wing had, through a force of Ural Cossacks. established connection with Kolchak's left wing; some 400,000 square miles of territory had been wrested from the Bolsheviks; and a South Russian Government was in being, with a "special council" of twenty-four members. But his great military ability was not alone enough to ensure the fulfillment of Denikin's aims. The rapid turn in his fortunes from victory to defeat was due to a complexity of causes, prominent among which were the general political bewilderment and diversity of purpose manifested by his supporters both within and without the boundaries of the former Russian empire, and the consequent difficulty of maintaining the effective morale of his armies. Meanwhile, largely owing to the relentless discipline introduced by Trotsky, the Bolshevik resistance had stiffened. At the beginning of Nov. 1919 Budenny's cavalry broke through the "white" lines at Kupyansk and a general retreat set in. By promising a new Government on federal lines Denikin made a final, but fruitless, attempt to weld the various Cossack units into cohesion. Early in 1920 the Bolshevik army retook Rostov and Ekaterinodar Denikin. in face of great difficulties, transferred his army from Novorossiysk to the Crimea, and shortly afterwards resigned his command to General Wrangel and retired to England.

DENILIQUIN: *see* RIVERINA.

DENIM, the name originally given to a kind of serge. It is now applied to a stout twilled cloth made in various colours, usually of cotton, and used for overalls, etc.

DENINA, CARLO GIOVANNI MARIA (1731–1813), Italian historian, was born at Revello, Piedmont, in 1731, and was educated at Saluzzo and Turin. He was professor of humanity and rhetoric in the college of Turin. His most important work is *Delle revoluzioni d'Italia* (1769–72). In 1782, at Frederick the Great's invitation, he went to Berlin, where he published his *Vie et règne de Frédéric II.* (1788) and *La Prusse littéraire sous Fre'de'ric II.* (3 vols., 1790–91). His *Delle revoluzioni della Germania* was published at Florence in 1804; in the same year he went to Paris as the imperial librarian, on the invitation of Napoleon. He died in Paris on Dec. 5, 1813.

DENIS (DIONYSIUS), **SAINT,** first bishop of Paris, patron saint of France, whose feast is celebrated on Oct. 9. According to Gregory of Tours (*Hist. Franc.* i. 30), he was sent into Gaul at the time of the emperor Decius. He suffered martyrdom at the village of Catulliacus, the modern St. Denis. His tomb was situated by the side of the Roman road, where rose the priory of St.-Denis-de-l'Estrée, which existed until the 18th century. In the 5th century a basilica was built over the tomb. About 625 Dagobert. son of Clotaire II., founded a monastery in honour of St. Denis near by where the greater number of the kings of France have been buried. A false interpretation of Gregory of Tours, apparently dating from 724, represented St. Denis as receiving his mission from Pope Clement, and as having suffered martyrdom under Domitian (81–96). Hilduin, abbot of St-Denis in the first half of the 9th century, wrongly identified Denis of Paris with Denis (Dionysius) the Areopagite. St. Denis is generally represented carrying his head in his hands.

See *Acta Sanctorum,* Octobris, iv. 696–987; Chevalier, *Bio-bibliog ;* J. Havet, Les *Origines* de *Saint-Denis,* in his collected works, i. 191–246 (Paris, 1896).

DENIS, MAURICE (1870–), French painter, born at Granville, France, on Nov. 25, 1870. The guiding influence in his artistic development was the work of Gauguin, and he joined with some fellow-students, all admirers of Gauguin, to form the group known as "Symbolists." Among them were Serusier, Vuillard, Bonnard and X. Roussel. Denis was also attracted to the pointillism of Seurat, as is shown by his use of pure pigments and of the juxtaposition of complementary colours in his pictures. He then devoted himself to decorative painting, following the example of the great Italian fresco painters of the 1 jth century. His most remarkable works are in the sphere of religious art, and mural decorations of this kind are to be seen in the churches of Le

Vésinet and of St. Paul at Geneva, as well as in the priory chapel at Saint Germain-en-Laye. Maurice Denis decorated the ceiling of the Champs Elysées theatre, Paris; he has also illustrated numerous works including a translation of the *Little Flowers of St. Francis.* He is a writer on art and has published *Thkories,* 1890–1910; *Du Symbolisme et de Gauguin, vers un nouvel ordre classique* (1912); *Nouvelles thkories sur l'art moderne, sur l'art sacrk* (1914–21); and *Aristide Maillol* (192j).

DENIS, MICHAEL (1729–1800), Austrian poet, was born at Scharding on the Inn, on Sept. 27, 1729. He was brought up by the Jesuits, entered their order, and in 1759 was appointed professor in the Theresianum in Vienna. In 1784, after the suppression of the college, he was made second custodian of the court library, and seven years later became chief librarian. He died on Sept. 29, 1800. Michael Denis is best remembered as the translator of *Ossian* (1768–69; also published together with his own poems in 5 vols. as *Ossians und Sineds Lieder,* 1784). His *Sammlung kürzerer Gedichte aus den neuern Dichtern Deutschlands,* 3 vols. (1762–66), introduced current North German literature to Austrian readers.

A selection of his poetry edited by R. Hamel will be found in vol. 48 (1884) of Kurschner's *Deutscke h'ationalliteratur.* His *Literarischer Nachlass* was published by J. F. von Retzer in 1802 (2 vols.). *See* P. von Hofmann-Wellenhof, *Michael Denis* (1881).

DENISON, GEORGE TAYLOR (1839–1925), Canadian soldier, and publicist, was born in Toronto on Aug. 31, 1839, and died there on June 6, 1925. In 1861 he was called to the bar. He saw active service during the Fenian raid of 1866, and during the rebellion of 1885. In 1877 he was appointed police magistrate of Toronto. Col. Denison was one of the founders of the "Canada First" party. He was a member of the Royal Society of Canada, and was president of the section dealing with English history and literature. His best-known military work is the *History of Modern Cavalry* (1877) which was awarded first prize by the Russian Government in an open competition and has been translated into German, Russian and Japanese. In 1900 he published his reminiscences under the title of *Soldiering in Canada.*

DENISON, a city of Grayson county, Texas, U.S.A. 75 mi. N. by E. of Dallas, and 4m. from the Red river, the boundary between Texas and Oklahoma. It is on federal highways 75 and 69 and is served by the Frisco, the Kansas. Oklahoma and Gulf, the Missouri-Kansas-Texas, the Southern Pacific and the Texas and Pacific railways. Pop. (1940) 15,581. It is an important railway centre, and the collecting and distributing point for large shipments of fruit, peanuts, wheat and cotton. The manufacturing industries include freight-car construction shops, bridge works, planing mills, cotton textile mills, a cheese factory, a large peanut plant, and a wood preserving plant. The $50,000,000 Denison dam on the Red river for hydroelectric and flood control is to be completed in 1943. Denison was settled by northerners in 1872, when the Missouri, Kansas and Texas railway reached this point, and was named after George Denison, a director of the railway. It was incorporated as a city in 1891.

DENIZEN, a dweller; a stranger admitted to certain rights in a foreign country; in England, an alien who obtains by letters patent *(ex donatione regis)* privileges of a British subject. By 12 and 13 Will. 3. Ch. 2 a denizen, unless born of English parents, cannot be a member of the privy council or of parliament, or hold any civil or military office of trust, or take a grant of land from the Croun. The British Nationality Act. 1914, provides that nothing therein contained shall affect the grant of any letters of denization by the sovereign.

DENIZLI, chief town of a vilayet of the same name of Turkey (anc. *Laodicea* [*q.v.*] *ad Lycum*), altitude 1,167 ft. Population 43,345. It is beautifully situated at the foot of Baba Dagh (Mt. Salbacus), on a tributary of the Churuk Su (Lycus), and is connected by a branch line with the station of Gonjeli on the Smyrna-Dineir railway. It took the place of Laodicea when that town was deserted during the wars between the Byzantines and Seljuk Turks, probably between 1158 and 1174. It had become a fine Muslim city in the 14th century, and was then called Ladik, being famous for the woven and embroidered products of its Greek inhabitants. The delightful gardens of Denizli have obtained for it the name of the "Damascus of Anatolia."

DENMAN, THOMAS, 1ST BARON (1779–1854), English judge, was born in London, the son of a well-known physician, on July 23, 1779. He was educated at Eton and St. John's college, Cambridge, where he graduated in 1800. He then married, and in 1806 he was called to the bar at Lincoln's Inn. In a few years he attained a position at the bar second only to that of Brougham and Scarlett (Lord Abinger). He distinguished himself by his eloquent defence of the Luddites; but his most brilliant appearance was as one of the counsel for Queen Caroline, for whom he made a great speech before the Lords which gained him the enmity of the king and retarded his career. At the general election of 1818 he was returned M.P. for Wareham in the Whig interest. In the following year he was returned for Nottingham, for which place he continued to sit till his elevation to the bench in 1832. In 1822 he was appointed common serjeant by the corporation of London. In 1830 he was made attorney-general under Lord Grey's administration. Two years later he was made lord chief justice, and in 1834 he was raised to the peerage. As a judge he is most celebrated for his decision in the important privilege case of *Stockdale v. Hansard* (9 Ad. and El. i.; 11 Ad. and El. 253), but he was never ranked as a profound lawyer. In 1850 he resigned his chief justiceship and retired into private life.

The HON. GEORGE DENMAN (1819–96), his fourth son, was also a distinguished lawyer, and a judge of the Queen's Bench from 1872 till his death in 1896.

See Memoir of *Thomas, first Lord Denman,* by Sir Joseph Arnould (1873); E. Manson, *Builders of our Law* (1904).

DENMARK *(Danmark),* a small kingdom of Europe, occupying part of the peninsula of Jutland (Jylland) and a group of islands dividing the Baltic and North seas, lying between 54° 33' and 57° 45' N. and between 8° 5′ and 12° 47' E., exclusive of the island of Bornholm. The southern part of the peninsula (Schleswig-Holstein) belongs to Germany. The northern extremity of the Danish part is actually insular, being separated from the mainland by the narrow and shallow Limfjord, which connects the North sea with the Cattegat. Though broadest in the west, its connection with the North sea dates from 1825 only. The Skagerrak bounds Jutland on the north and north-west. Between the Cattegat and the Baltic, and between the base of the peninsula and south-western Sweden, lie the Danish islands. Of the total area of the kingdom (16,575 sq.m.), Jutland covers 11,411 and the islands in the Baltic 5.136 sq. miles. These consist of the two large islands, Fünen and Zealand, with smaller islands, chiefly on their south sides, and Bornholm far to the east in the Baltic.

The solid geology is almost everywhere obscured by deposits of boulder clay lying generally on Cretaceous rocks, which outcrop for example in Moen and Aalborg, giving rise to important lime and cement industries. Much of the Danish chalk, including the well-known limestone of Faxe, belongs to the highest or "Danian" sub-division of the Cretaceous period. In the south-west a succession of strata, including lignite formations, intervenes between the chalk and the boulder clay. It is on the island of Bornholm only that older formations come to light. This island compares rather with south Sweden, and forms, in fact, the southernmost portion of the Scandinavian system; boulder clay is absent in the south-west of the island, where Cambrian, Silurian, Jurassic and Cretaceous formations appear. Some parts of Denmark are supposed to have been raised out of the sea towards the end of the Cretaceous period, and may have been above water in various subsequent periods, but the final emergence was during the formation of the Ancylus lake towards the close of the Ice age. Recent research has greatly enlarged our knowledge of the Pleistocene glaciation in its relation to early man; and its phases in the Baltic area have been correlated with the stages observed in the Alps. Successive layers of trees preserved among peat in certain small depressions found in many of the forests of Denmark show that the flora has undergone remarkable variations to be connected with changes of climate during and since the glacial epoch. The first pine forests replaced a

tundra flora during the period of the Ancylus lake, a fresh water inland sea caused by a phase of elevation in the area now occupied by the Baltic. Before the disappearance of the lake there followed a still milder climate with oak forests; while a later cooler and moister phase is represented by the beech forests which are so widely distributed in modern Denmark, and which apparently spread in the late Bronze and early Iron age. It is to the Gothiglacial and to the preceding Daniglacial retreats (equated by many respectively with the Achen and Laufer oscillations in the Alps), that the country owes its covering of morainic deposits.

PHYSIOGRAPHY

The surface of the country is uniformly low, the highest ground culminating in Ejer Bavnehoj in south-eastern Jutland, which is but 172 metres above the sea. There are, however, numerous hills between 100 and 150 metres in height. Undulating morainic formations of fertile clay, the legacy of the Pleistocene glaciation, are commonest in Zealand, Fünen and east Jutland, where they form the basis of Denmark's most characteristic landscapes of rich corn-fields, meadows and beech woods. Extensive plains are in the west, consisting of poor sandy soils washed from the western edge of an ice-sheet which lay from north to south down the peninsula. These wide expanses of heather-covered sands are broken here and there by morainic formations of an earlier glacial phase. They have been reclaimed for forest or arable land in the last 50 years, to the extent of nearly 5,000 sq kms. The dune-islands and dunes form an almost continuous line along the west coast of Jutland from Blaavahdshuk to the Skaw, and the dunes did great damage up to the end of last century by drifting in over the cultivated areas and even destroying settlements, but they are now largely planted and secured by means of groynes.

Jutland. — Bordered by this sparsely-peopled zone, with a coast dangerous to shipping, the peninsula may be said to turn its back on the North sea: and its life has tended to orient itself towards the islands, where Copenhagen provides a metropolitan centre which contains, with Frederiksberg and Gentofte, 21% of the total population of the country. Esbjerg, the home of a large fleet of fishing vessels, and the origin of daily steamship services to England and France, is the only harbour on the west coast. The need for ports has become urgent of recent years, and new harbours have been constructed at Hirtshals and Hanstholm. The drainage of the peninsula is typical of a low glaciated region. The Varde, Omme, Skjerne, Stor and Karur, sluggish and tortuous streams, flow through marshy tracts into the lagoons of the west coast, while the eastern Limfjord is flanked by the swamps known as Vildmose. The country's largest river, the Gudenaa, 80 m. in length, rises near the east coast and drains the Silkebore series of lakes, following a winding course into Randers Fjord (Cattegat). Off Slesvig (S. Jylland) is the island of Alsen in the Little Belt. Fiinen (Fyen), the main western island, is separated from the peninsula by the Little Belt, varying in width from 10 m. to the ½ m. strait which lies between the resort of Middlefart and the port of Fredericia, in Jutland. In form roughly oval, with a length from north-west to south-east of 53 m., and an area of 2,986 sq.km., Fiinen is closely allied to the mainland; and its fertile meadows among patches of woodland and boulder-strewn hills are typically Danish. An archipelago, which includes Taasinge, Avernako and Dreio, lies to the south, enclosed by the narrow islands of Aero (16 m. in length) and Langeland (32 m.). On Langeland is the 13th century castle of Tranekjaer.

Zealand (Sjaelland), the largest island in the kingdom, lies east of Fünen, from which it is separated by the Great Belt, 11 m. wide in its narrowest part. It is 82 m. N. to S. and 68 m. from E. to W., but the outline is very irregular. The area is 2,636 sq. miles. On the north lies the Cattegat; on the east the Sound, narrowing to 3 m. off Elsinore; and on the south the straits beyond which come the island of Moen, Falster and Laaland. The undulating surface is little above sea-level, save that the Cretaceous hills of the south-east, especially in Moen, reach heights of over 100 metres. Of numerous coastal indentations the most important is the Ise Fjord on the north, with its east and west branches the Roskilde and the Lamme Fjords, penetrating some 25 m. inland. Small lakes among the glacial débris are common here as elsewhere in Denmark, those of Arre and Esrom in the north-east attaining notable dimensions.

Climate. — The climate is milder than that of most countries in the same latitude, for it is profoundly modified by maritime influences. No part of the land is more than 40 m. from the open sea, while numerous indentations carry equable conditions, and their effect is noticeable on the monthly weather maps. The mean annual temperature is 45·2°; the average for July is about 61°, and for January about 32°. Frost occurs on an average on 20 days in each of the months from December to March. The eastern coasts are ice-fringed for some time, and both the Sound and the Great Belt are very occasionally impassable on account of ice. Variable winds (mainly west and south-west) of cyclonic origin lead to considerable variations from day to day, especially in the winter months. The average annual rainfall is about 24 in. showing a tendency towards a maximum from July to November. The wettest month is September (2.95 in.), and April (1·14 in.) the driest. Thunderstorms are frequent in summer. At that season rainfall is greatest in central Jutland, where the higher ground produces an increase throughout the year; more rain falls in the east of the kingdom than in the west. The reverse is true of the distribution of winter rain. The most equable climate occurs on the North sea coast, wider temperature ranges marking the higher ground of central Jutland and the interior of Zealand. On the west coast a salt mist, hindering vegetative growth, exerts its influence inland for some 15–30 miles. For the most part, climate combines with location and soil conditions in rendering Denmark an essentially agricultural and pastoral land.

The flora presents greater variety than might be anticipated. The ordinary forms of northern Europe grow freely in the islands and on the eastern coast; while the heaths and sandhills of the Atlantic side have a number of distinctive species. The native Danish forest is almost exclusively made up of beech, but it comprises only one-third of the whole timbered area, extensive coniferous plantations having been made in recent years. These are, however, confined for the most part to Jutland, so that the beech remains characteristic of the landscape in the islands. The oak and ash are now rare; in the first half of the 17th century the oak was still the characteristic Danish tree. Large oak-woods have recently been planted. As we have seen, abundant traces of ancient extensive forests of fir and pine are found. Numerous peat bogs with remains of trees supply a large proportion of the fuel locally used. In Bornholm, the flora is more like that of Sweden; not the beech, but the pine, birch and ash are the most abundant trees.

The wild animals and birds of Denmark are those of the rest of Central Europe. The larger quadrupeds are all extinct; even the red deer, formerly so abundant that in a single hunt in Jutland in 1 j93 no fewer than 1,600 head of deer were killed, is now only to be met with in preserves. The sea fisheries are important. Oysters are found, but have disappeared from many localities, where their abundance in ancient times is proved by their shell mounds on the coast. The Gudenaa is the only salmon river.

Early Man.—A fine series of prehistoric remains of various dates are preserved either in the present-day landscape or in the famous museum at Copenhagen. This it owes in no small measure to its position on the fringe of the continental mass of Eurasia, a natural peninsula termination, just as Brittany is farther west, of long lines of movement from central Europe along the loess belt and up the German rivers. If this peripheral location sometimes meant poverty it must be remembered that Denmark also lies open to maritime influences from western Europe; and the meeting of these two contrasted culture streams resulted in the notable enrichment of Denmark's long tradition of settled life. The first certain evidence of human occupation is found in the Nörre-Lyngby culture of the early Ancylus period, the distribution area of which comprises Denmark, Scania, Rügen and Northern Prussia. Its coarsely flaked flints and reindeer-horn axes give way, towards the end of the Ancylus period, to the civilization called after the famous Danish site at Maglemose, near

Mullerup, representing, in part, a northward extension of the Tardenoisian culture, but characterized by its greater use of bone implements.

But the best-known palaeolithic or epipalaeolithic survival in Denmark falls in the Littorina period, when the climatic optimum of the 4th millennium B.C., marked by the spread of the oak tree, is the time of the "kitchen-middens" or shell-mounds. The people sf the Baltic lived chiefly on the sea-shore, then some 25 ft. above its present level, feeding for the most part on fish and molluscs, the shells of which accumulated in huge mounds. This mesolithic industry represents a deterioration from a virile hunting life to a mere collecting of food, but it is marked by the introduction of the domesticated dog and, towards the close of the second (Entebolle) phase, by the use of coarse pottery, our first evidence of the potter's art in northern Europe. With these exceptions, Denmark, isolated by forest and as yet uninfluenced by western sea-borne cultures, remained in a primitive unprogressive condition until the 3rd millennium B.C.

Considerable diversity of opinion exists as to the position of Denmark in the transition period from stone technique to metal workings. The megalithic monuments seem to indicate maritime influence from the south-west and to suggest that Denmark shared in early coastal trade. Other important influences were also at work. In the single graves are found cord-ornamented beakers and perforated stone battle-axes. Some regard these as evidences of the rise of a strong native culture which later spread towards the south-east, but more emphasize the resemblances between them and similar finds in central Europe. They suggest that nomad warriors may have penetrated north-westwards along the loess, bringing with them a memory at least of metal using and possibly, in due course, some metal tools and weapons. Thus Denmark and other parts of western Europe would appear to have been on the periphery of metal-using civilizations and to have been stimulated by interactions between coastal traders, nomad warriors and the native peoples.

In the full Bronze age Denmark shared with the rest of Scandinavia a highly developed civilization. Thanks to the preserving properties of the peat bog, we have detailed information on questions for the most part unsolved elsewhere; and the famous tumuli of Treenhoi, Ribe and of Borum-Eshoi, Aarhus, have yielded woollen articles of dress from both male and female burials. The bronze sword-hafts and shields with spiral decorations are perhaps the most delicate examples of prehistoric craftsmanship found anywhere. Objects of Italian and Swiss origin are frequent, and demonstrate the wide commercial relations maintained by Scandinavia. The bronze-using civilization persisted long after iron had come into use in central Europe, but after 800 B.C. there came a decline consequent upon climatic deterioration and the formation of peat bogs. There is evidence for a southward movement of Scandinavian peoples of Wadic type through Jutland, for the proportion of long heads to broad in the graves of the Iron age (after 500 B.C.) rises remarkably. Denmark remained unaffected by the Romans; and the consequent revival, or rather survival, of pre-Roman elements in its outburst of energy in the dark ages is probably connected with this fact.

Population and Occupations. — While the farming population is thickest on the most fertile soils, *i.e.*, in the islands and in eastern Jutland, its density shows a close correlation within those regions with the forest areas and with the size of the estates and farms. Forest-free districts exploited by small holdings support the densest populations. There are indications that concentrated settlement was the rule until about 1800, but since then the villages have been greatly reduced or become industrialized, and the isolated farm is to-day a very characteristic Danish feature. The total population in 1935 was 3,706,349, with an average of 224 per sq. mile. The density in the islands is nearly twice that in the peninsula. Against greater Copenhagen's 843,168 inhabitants, the next largest town, Aarhus, has 90,898 inhabitants (1935). The only other town with over 50,000 is Odense. The provincial towns range up to 20,000. While the urban population (1935) amounted to almost half the total, in 1875 it constituted only one quarter; but the great conurbation of the capital accounts for much of this increase. Since the war of 1914–18 the rural and urban populations have grown at approximately the same rates; the respective figures for 1935 being 2,061,946 and 1,644,403.

Compared with agriculture, the natural resources of the country are of subordinate importance. Though coal is found in Bornholm, neither coal nor metals can be profitably mined anywhere. Extensive strata of bog-iron ore in Jutland are used for purifying purposes in gas works. The newer chalk is utilized in lime-burning while the limestone at Stevns is used as a building material. Chalk also forms the basis of an important cement industry. Tertiary and glacial clays are used in the tile industry, while calcareous deposits of clay have been widely utilized, particularly in Jutland, for soil-improvement. Bornholm supplies granite for building and paving, and kaolin for the china and paper manufactures. From the time of the kitchen-middens the fish of the shallow seas, belts and fiords have been exploited; and fishing contributed largely to Copenhagen's supremacy. Improved marketing facilities and the use of motor boats have greatly increased its economic importance in recent years. The value of the yield increased from 8 million kroner in 1890 to about 40 million in 1936. Coast fishing supplies mostly cod, plaice, eels, herring and mackerel, while deep-sea fishing yields cod, plaice and haddock. The fleet consists of about 16,000 boats. Numerous co-operative marketing associations and an up-to-date railway system facilitate rapid distribution and a large export.

Communications. — Regular connections with foreign countries are mainly westward by sea, via Esbjerg, with England, the Netherlands, Belgium and France. There is a German ferry passage for passengers and trains from Gedser to Warnemiinde and the Swedish services from Copenhagen to Malmö and from Elsinore to Helsingborg. The latter is also one of the main lines of communication with Norway. The main land route is the railway via Padborg and Slesvig to Hamburg. Denmark possesses some 5,000km. of railways, of which nearly one-half belong to the State, while the State and the larger towns hold nearly all the shares in the "private" lines. There are highly organized train-ferry schemes for communication among the islands and between these and Jutland. Motor transport, similarly facilitated by low land relief, is highly developed, and air traffic is progressing with Copenhagen as a centre of international lines.

Government and Constitution. — The constitution of Denmark is laid down in the Act of June 5, 1915, amended in 1920 on the restoration of North Slesvig in accordance with the treaty of Versailles. It marks, for the most part, a return to the constitution of 1849. Legislative authority rests jointly with the crown and parliament; the executive power is vested in the cro n, while the administration of justice is exercised by the courts Parliament consists of two chambers, the Landsting (senate) and the Folketing (lower house). The franchise is held by all persons over 25 years of age with a fixed place of abode. The members of the Folketing, at present 149, are elected for four years. Of the members of the Landsting, 56 (including one from the Faeroe Is.) are elected by the votes of the Folketing's electors who are over 35 years of age; while 19 members are elected by the former Landsting. The Rigsdag (parliament) must meet every year on the first Tuesday in October. The privy council is the highest executive power in the State; it deals with all new bills and all important Government measures. For administrative purposes there are 22 Amter (counties), each of which is under the superintendence of a governor. Local government is largely in the hands of the municipal councils.

Religion and Education. — The church of Denmark is Lutheran, which was introduced as early as 1536. The king must belong to it. There is complete religious toleration, but though most of the important Christian communities are represented their numbers are very small. There are nine dioceses; the primate is the bishop of Zealand, and resides at Copenhagen, but his cathedral is at Roskilde. According to the latest census there were 3,221,843 Protestants, 22,137 Roman Catholics, 535 Greek Catholics, 5,947 Jews and 17,349 of other or no confession.

Since 1814 education has been compulsory for those aged 7 to 14 years. The last school laws (1903) have made this instruction gratuitous for the greater part. However, in 1937, but 34 of these schools were government institutions; 3,899 were maintained locally, and 565 were private. Their teachers are trained in about 20 normal schools. After five years of elementary instruction, pupils may receive four years of secondary education and may then proceed to a high school, of which there are some 300. Here there is a choice between classical. modern language and scientific courses terminated by a State examination. There are some 60 popular high schools for adults, all private, but all assisted by the State. For specialized study there are 21 agricultural schools (one including veterinary courses), over 300 technical schools, and institutions for dentistry, pharmacy and art. The Royal university, in Copenhagen, was founded in 1479 and has about 5,000 students. Women are received on a parity with men in all departments. (E. E. E.; X.)

ECONOMICS AND TRADE

Two of the most significant facts of Danish economics are the high ratio of productivity of the land and the dependence of the country on foreign trade. Ninety per cent of the land is productive, and 77% is actually farmed (3,213,000 hectares). Approximately 1,200,000 of the population are directly engaged in or dependent on agriculture or fishing, and an almost equal number (1,100,000) in handicrafts and industry. Commerce, finance and transportation concern about 650,000; administrative and intellectual occupations another 210,000; domestic service about 220,000; and classed as "economically inactive" are about 350,000 (figures include children and all dependents).

Agricultural Holdings. — Denmark possesses an exceptionally high rate of freehold farms — about 94%, with only 6% leased or tenanted. During the period since 1900, while a trend toward tenantry was prominent in many countries, Denmark proceeded in the opposite direction. The conscious governmental attempt to subdivide large farms and establish agricultural workers on independent holdings began with legislation of 1899, was reinforced by the Three Land Laws of 1919 and by the Acts of 1933 and 1934. Co-operatives have aided in making small-farm operation profitable, and the adult education program has helped farmers to be good managers. Animal husbandry, a prominent feature of their activity. also lends itself to small individual enterprise.

The Small Holdings Acts and the agricultural expansion of the country have brought the subdivision of large estates, the parcelling out of glebe lands, and the abolition of leasehold for anything except small holdings (1919). The acquisition of North Schleswig (Slesvig), after a plebiscite held under the terms of the Treaty of Versailles, also added 14,364 farms. The steady growth of independent small farms under the law of 1899 and its successors is shown in Table I.

TABLE I. — *Increase of Small Farms under Act of 1899 and its Amendments*

	Number	State Loan and State Grant Mill. kr.
1900–20	9,263	58·0
1920–30	5,390	88·0
1930–31	401	6·3
1931–32	435	7·0
1932–33	64	0·9
1933–34	54	1·4
1934–35	286	4·0
1935–36	261	4·1
1936–37	274	4'4
1937–38	309	4·8
Total 1900–38	16,737	178·9

Purchasers under the Acts of 1919, of glebe lands, fiefs or estates, paid no purchase sum, but only an annual interest to the Government. This was at first a fixed sum based on the capital invested by the State, but in 1933 holders were given the option of paying this fixed charge or a variable annual charge based on average prices of butter, bacon and barley. In 1938 this was amended, the annually adjusted charge to be based on the rate of net profit of all small farms. Exactly 6,022 farms have been established under these laws, and some 2,000 tiny parcels have been added to other small holdings. In effect these holders become owners.

TABLE II. — *Distribution of Farms According to Size*

Hectares	Number		Agricultural Area	
	Total	Per cent	1,000 hectares	Per cent
0·55 to 3	27,893	13.7	52	1.6
3 " 10	77,784	38.1	472	14.9
10 " 30	72,352	35.4	1,308	41.2
30 " 60	21,406	10.5	845	26.6
60 " 120	3,769	1·8	290	9·1
120 " 240	740	0·4	119	3·8
240 and over	287	0·1	90	2·8
Total	204,231	100·0	3,176	100·0

The total farm holdings as of July 1938 numbered 205,909, and represent a notable increase over the 171,000 holdings of 1903.

Production and Marketing. — During the 30 years prior to the World War of 1914–18 Danish agricultural production was increasing rapidly. In 1913 Denmark exported agricultural produce worth about 550,000,000kr., about 97% of which was animal products. This specialization in animal husbandry necessitated importation of 181,000,000kr. worth of grain and feeding stuff. The war, especially after intensive submarine activity began in Feb. 1917, seriously injured this industrialized agricultural economy, as is indicated in the following table. (It must be remarked that the figures even before 1920 include Schleswig, so as to make comparisons more just.)

TABLE III. — *Number of Farm Animals 1909–38 (in 1,000's)*

	Horses	Cattle Total	Cows	Pigs	Sheep	Poultry
1903.	519	2,056	1,177	1,539	922	11,836
1914.	605	2,717	1,416	2,715	533	15,495
1918.	578	2,303	1,106	669	495	..
1920.	602	2,504	1,196	1,116	540	14,395
1926.	548	2,838	1,480	3,122	233	18,524
1935.	521	3,072	1,647	3,036	..	28,568
1938.	565	3,186	1,599	2,842	..	27,863

In addition to the decrease in number of cows during the latter years of the World War of 1914–18 the yield of milk per cow was drastically reduced, from 2,750kilog. in 1914 to 1,810kilog. in 1919, producing a total decrease in butter of from 143,000,000 kilog. in 1914 to 76,000,000kilog. in 1919. This decline was mainly due to the complete cessation of imports of feeding stuffs and fertilizers. It was aggravated by the poor harvests of 1917–18, due in turn partly to lack of imported fertilizer and partly to decrease of manure on account of decrease of fodder. By 1922 the milk yield had come up to the 1914 level, and by 1926 it was increased by 250kilog. per cow, the average yield passing 3,000 kilog. Production and export of other animals and animal products suffered similarly, as shown in Table IV.

Exports of fresh milk and cream have decreased, but remarkable increases have developed in condensed milk, butter, cheese, live pigs, eggs. The value of animal products exported rose to over 1,000,000,000kr. by 1926, more than double the pre-war export; by 1937 it rose further to 1,200,000,000kr.

Both change and increase in the agricultural and animal products and their export was due largely to the demand of the foreign market, especially that in Great Britain, to which Denmark shipped by far the greater portion of her produce. (See TABLE VIII.)

Crop yield has increased by expansion of area and scientific farming about 200% in the last 60 years.

Barley and oats in 1940 accounted for about two-thirds of the total grain crop, which was 35,000,000hectogr. in 1937. Fodder beets make up most of the root crops, which total over 250,000,-

TABLE IV.—*Export of Animals and Animal Products in* Certain Years*

1934	72·4
1935	82·2
1936	76·5
1937	83·6

oohectogr., including potatoes, sugar beets and a small amount of chicory root. Some 70,000,000hectogr. of hay is produced.

Of course not all of the animal products are exported and total production can only be estimated. Fair approximations indicate that Denmark produced annually in the late 1930s over 5,000,000 tons of milk, 180,000,000kilog. of butter, 315,000,000kilog. of bacon, pork fillets, etc., and about 125,000,000kilog. of eggs.

Co-operatives.—Agricultural production and marketing in Denmark undoubtedly owe much to the growth of farm organizations. Associational promotion began as far back as the founding of the Royal Agricultural Society (1769), and both it and numerous special societies stimulate breeding and other improvements. Local farmers' associations have 109,000 members and small holders' societies have 90,000; each of these groups is organized in a national federation. These two federations have established a joint organization with the Federation of Danish Co-operative Societies, known as the Agricultural Council (Landbrugsraadet). This council represents agriculture in dealings with government, industry and foreign trade. Numerous co-operative societies flourish, and in the important dairy and bacon businesses they dominate the scene. About 86% of all cows belong to the 90% of Danish dairy farms which are members of the co-operative organization; 75% of the pigs belong to the 70% of farm members of the bacon factory co-operative. Only about 25% of the egg production is co-operatively organized, but even this is of great importance in the maintenance of standards for the export trade. The extraordinary success of the Danish farmers in managing their co-operative societies, since the establishment of the first dairy co-operative society in 1882, is due largely to the spread of adult education and especially the folk high schools. Here the people have learned to know each other and to become intelligently aware of common self-interest.

Financial Returns of Agriculture. — After the long period of depression at the close of the 19th century prices improved, and the relatively few financial accounts which are available for the years 1910–13 show an average yield of interest on capital invested in well managed farms of about 4 to 5%. During the first years of the World War of 1914–18 the prices of corn and seed, as well as of live animals and meat, rose considerably, increasing the capital yield for large and middle size farms. In the later years of the war prices of eggs, bacon and dairy produce rose, increasing returns on small farm investment. Later the low rate of exchange somewhat artificially influenced prices, resulting, together with other factors, in fluctuations of interest return from under 1% to above 8% in different years.

Fisheries. — Although the backbone of Danish economy is agriculture, her fisheries are important also, and played a great part in the life of the country in mediaeval times. In the last 40 years fishing has been rejuvenated as an export industry, due to the improved means of transportation. In 1937 Denmark used in the shallow waters along her coasts many small boats: 7,700 row boats, 3,500 motor boats and 1,200 sail boats, and the picturesque fish market of Copenhagen is an olfactory memory of any visitor to the city. Over 3,000 sail and motor boats seined for plaice, haddock and cod in the deeper waters of the Baltic, the Skagerrak and the North Sea. About 19,000 persons are directly engaged in fishing, and numerous others are dependent on it: merchants, netmakers, boat builders and motor makers, for most of the motors and gear are manufactured in Denmark. Both quantity and value of total haul has increased since the opening of the 20th century.

TABLE VI.—*Total* Yield of *Fisheries in* Million *Kroner*

	1908	1918	1928	1937
North Sea.	2·3	12·	15·2	19·4
Limfjord. . . .	1 7		2·4	1·8
Inner waters (east and south of the Scaw) . . .	9.2	26·7	19·1	18·6
	13·2	41·7	36·7	39·8

This represents for 1937 a quantitative yield of 89,000,000kilog., consisting largely of plaice (flatfish), with cod, herring, mackerel, eel and haddock following in order of importance. Of this total 55,000,000kilog. were exported, usually fresh, ice-packed or live.

The fishermen are largely organized in some 200 associations, federated into two national groups. They also have marketing and purchasing co-operatives, though not on the same scale as the farmers' societies.

Industry and Employment. — Danish industry produces primarily for home consumption, though certain products, such as the Diesel motor, enjoy a large export. This is the most widely used marine motor, and is used extensively in railway service. Iron mines are non-existent, but the country does a large casting and machine building business and assembles automobiles for a large part of the Scandinavian and Baltic trade. Margarine industries and textile manufacturing are important for the home market, and the breweries not only supply the local market, but export also. Bicycles are another important manufacture to provide the most popular transportation for Copenhageners.

The metal industries employ the most workmen (95,000); food processing employs 75,000; earthworks and building 79,000; textile industries and clothing 70,000; woodworking 31,000 and chemicals 27,000. About one-fourth of all industrial workers are women. The internal wholesale trade employed about 65,000 in 1935; retail establishments 155,000; cafes and restaurants 41,700. In these three groups 89,000 of the employees were women.

Unemployment had sunk to 7·3% in 1913, but the World War of 1914–18 completely upset Danish economy. Well planned social insurance only alleviated the difficulties which were largely out of Denmark's power to control. This is illustrated by the course of later unemployment statistics. Choosing the month of May one finds 25% unemployment in 1932; reduced to 13% by 1936; up to 17% in 1938; down again to 11·5% in 1939, but up to 21% in 1940 on account of the war situation.

The development of handicraft and industry, especially the utilization of power, is indicated in the table below.

TABLE VII.—*Handicrafts and Industries*

	1897	1906	1914	1925	1935
Number of establishments	77,256	85,118	82,494	89,189	102,032
Total employees	272,456	315,219	350,194	392,475	462,361
Of mhich workmen	178,443	206,592	227,458	269,830	317,395

Horse-power of machinery	48,060	113,270	229,843	437,616	651,138

Commerce and Shipping.— The per capita rate of Denmark's foreign commerce is exceptionally high, indicating her dependence on world conditions. Actually this dependence is especially on Great Britain. to whom the country normally sends about 60% of her exports. In the years just prior to 1940 the proportion of trade with Britain declined slightly, due to the policy begun in the United Kingdom in the early '30s and never completely overcome by the trade agreements. German trade increased somewhat during this period of military and economic preparation.

TABLE VIII.—*Imports and Exports*

	Imports, million kr.	Exports, million kr.

Finance, Exchange and Banking.— After war ended in 1918 Denmark experienced a great credit expansion, due to loans abroad and to the state internally, to the demands of a refreshed trade and the development of Slesvig. The krone fell below par and it required steady and heroic state policy to bring it up to its gold parity by Jan. 1, 1927. Agriculture suffered, but was able to weather the difficulties caused by this deflation. Then the British pound sterling collapsed in Sept. 1931, and the Danish boat found itself drawn in the wake of her great customer. From that time Denmark, along with several other states of northern and western Europe, adjusted her currency as well as possible to the British pound, as one of the so-called sterling bloc.

The old joint-stock private National Bank, successor to the Rigsbank founded in 1813, was reorganized in 1936 as Nationalbanken. It is the only bank of issue and is controlled by a board of governors (25) who are chosen by the Government, Rigsdag, the Ministry of Trade and by the board itself. Nationalbanken has five inland branches, and a foreign branch at Flensburg. There are three large pdvate banks, and 161 smaller ones, the three large ones doing about one-half the total business. There are 526 savings banks, with deposits, in 1937, of 2,200,000,000 kroner. The Bourse is in Copenhagen. Insurance companies, several dating from the 18th century, do a large business abroad as well as at home.

Shipping.— The country's favourable position for shipping encourages her to hold her No. 4 rank on the per capita basis, with 300 tons per 1,000 inhabitants. (In 1938 Norway had 1,594, Great Britain 443, Holland 334.) The number of steamships iell from 6j1 in 1915 to 509 in 1938, but motor ships more than made up the difference, increasing from 27 to 227, and combination sail-motor ships from 370 to 1,119. Sailing vessels of above 20 tons practically disappeared, dropping from 870 to 10. Denmark is one of the leaders in the modern transition to motor ships and builds them both for herself and others in her Diesel works. Danish vessels carry about two-fifths of the country's sea-borne trade, and do a large foreign business.

Defense.— The principle of national conscription has been maintained since 1849 and the most recent Army Act is of 1937. Recruits are enrolled at 17 and receive instruction of at least five months between the ages of 19 and 25. Liability to call extends over 16 years, in two classes. There are 600 permanent officers and about 700 non-commissioned officers, and the total strength of the army under war conditions is 100,000 men. The navy consists of two coast defense ships, with a number of torpedo boats, submarines, etc. There are 300 officers and 1,200 men, with a potential war-time strength of 4,000. There are 65 aeroplanes. Both navy and army are under the Ministry of War, and the king is the supreme head of the army.

Much more important than statistics of men and material is the fact that the Danes decided many years ago that military defense of the land was futile--only one country was a practical threat, and she could bring to bear at will such overwhelming forces that the most strenuous efforts would be of no avail. Hence Denmark rejected tentative proposals from her Scandinavian neighbours, especially Sweden, to fortify her boundary, and made up her mind to rely on the League of Nations, and when that bulwark crumbled, to trust to fate. Hence, except for a few "token" shots, no resistance was offered when the Germans marched in on April 9, 1940. (*See* WORLD WAR II.)

HISTORY

Earliest Times.— Apart from the ancient traditions preserved in the Old English poem *Beowulf* (*q.v.*), little is known about Danish history before the beginning of the Viking age. The Danes were seated far beyond the sphere of interest of Roman writers, and their own traditions are coloured by a mythological element which makes their history uncertain. In the first centuries of the Christian era they were probably settled in the south of the Scandinavian peninsula, where the province of Skaane was long the centre of their power. In these early times they must have counted among the Baltic peoples rather than among those who looked towards the North sea. It is further probable that their occupation of Jutland and the adjacent islands belongs to the 5th and 6th centuries, and was made possible by the migration of the Anglian peoples to Britain in that age. Even after their establishment in these regions, it was long before they came into permanent contact with the peoples of western Europe. The Frisians (q v.) were the greatest naval power in the North sea in the 6th and 7th centuries, and the destruction of this power by the Franks probably gave to the Danes the opportunity of raids on a great scale towards the west. In the 8th century the Danes were ruled by kings claiming mythological ancestry of the kind asserted by most royal families of the age. They were in occupation of Skaane, Zealand, and the lesser islands in its neighbourhood, and the north of the Jutish peninsula. They possessed at Leire, in Zealand, a very ancient religious sanctuary, near which stood the chief residence of their kings. They were as yet hardly touched by the wave of missionary enterprise which had brought the neighbouring Frisians within the influence of the Western Church. The conversion of Denmark belongs to the 10th century.

The northward extension of Charlemagne's dominion brought him and his successors into temporary relations with individual Danish kings. In the frequent quarrels between different members of the Danish royal family it was natural for one or other of the opponents to seek the support of the emperor. But the historic facts brought to light by such negotiations are meagre. It is, in particular, doubtful whether the individuals who to Frankish writers were kings of the Danes were in reality more than local

rulers, of royal descent, but limited authority. In any case, the interest of Danish history in this age lies outside Denmark itself, in the expeditions led by Danish chiefs and in the new political communities which they founded in the west of Europe. (*See* VIKINGS.)

Mediaeval. — The consecutive history of Denmark begins early in the 10th century with the reign of Gorm, "the Old." He, like his predecessors, is a shadowy figure. But he certainly founded a permanent dynasty, and the name of his wife, Thyra, is associated with one of the greatest public works of the dark ages, the *Dannewirk,* which bounded Denmark against the German territory to the south. His son, Harald "Bluetooth," played a wider part in history. He himself claimed to have conquered Denmark and all Norway and made the Danes Christian. To him, in fact, is probably due the permanent unification of Denmark and the introduction of organized Christianity under royal authority. He also, it would seem, began the attempt at the acquisition of Norway in which much of the energy of his successors was destined to be expended, and he founded a highly organized community of Vikings at Jomsborg at the mouth of the Oder, which gave him by far the strongest military force in all the north. But it was his son, Sweyn "Forkbeard," who brought Denmark once more into the forefront of European affairs. The wide dominion of his son, Canute the Great, and his importance in English history have tended to obscure Sweyn's achievements. Nevertheless, Sweyn was the real founder of the power which Canute enjoyed, and it was he who first made the Danish kingdom a rival to the more ancient States of western Europe and laid the foundations of the power of Denmark in the early middle ages.

The careers of Canute and his sons are described elsewhere. (See ENGLISH HISTORY: Canute the Great.) In the next generation Denmark becomes once more a purely Scandinavian power, occupied in rivalry with formidable Norwegian kings and in the extension of its influence over the peoples of the southern Baltic coast line. The last king of Denmark who consistently attempted to achieve an Anglo-Danish kingdom was Sweyn Estrithson, who died in 1074. With the collapse of the great expedition planned against England by his son, Canute "the Holy," in 1085 Danish history enters upon a new phase. The kings of Denmark henceforward abandon their English ambitions and Danish history once more centres upon the Baltic. (A. M.)

Consolidation of the Kingdom Under the Valdemars.— To the early part of this period belongs the growth and consolidation of a national church, which culminated in the erection of the archbishopric of Lund (*c.* 1104) and the consequent ecclesiastical independence of Denmark. The third archbishop of Lund was Absalon (1128–1201), Denmark's first great statesman, who materially assisted Valdemar I. (1157–82) and Canute VI. (1182–1202) to establish the dominion of Denmark over the Baltic, The policy of Absalon was continued on a still vaster scale by Valdemar II. (1202–41), at a time when the German kingdom was too weak and distracted to intervene to save its seaboard; but the treachery of a vassal and the loss of one great battle sufficed to plunge this unwieldy, unsubstantial empire in the dust. (See VALDEMAR I., II., and ABSALON.)

Yet the age of the Valdemars was one of the most glorious in Danish history, and it is of political importance as marking a turning-point. Favourable circumstances had, from the first, given the Danes the lead in Scandinavia. They held the richest and therefore the most populous lands, and geographically they were nearer than their neighbours to western civilization. Under the Valdemars, however, the ancient Danish monarchy was merging into a more complicated development of separate estates. The monarchy, now dominant, and far wealthier than before, rested upon the support of the great nobles, many of whom held their lands by feudal tenure, and constituted the royal Raad, or council. The clergy, fortified by royal privileges, had also risen to influence; but celibacy and independence of the civil courts tended to make them more and more of a separate caste. Education was spreading. Numerous Danes, lay as well as clerical, regularly frequented the University of Paris. There were signs, too, of the rise of a vigorous middle class, due to the extraordinary development of the national resources (chiefly the herring fisheries, horse-breeding and cattle-rearing) and the foundation of gilds, the oldest of which, the Edslag of Schleswig, dates from the early 12th century. The bonder, or yeomen, were prosperous and independent, with well-defined rights. Danish territory extended over 60,000 sq.km., or nearly double its present area; the population was about 700,000; and 160,000 men and 1,400 ships were available for national defence.

On the death of Valdemar II. a period of disintegration ensued. Valdemar's son, Eric Plovpenning, succeeded him as king; but his near kinsfolk also received huge appanages, and family discords led to civil wars. Throughout the 13th and part of the 14th century, the struggle raged between the Danish kings and the Schleswig dukes; and of six monarchs no fewer than three died violent deaths. Superadded to these troubles was a prolonged struggle for supremacy between the popes and the Crown, and, still more serious, the beginning of a breach between the kings and nobles, which had important constitutional consequences. The prevalent disorder had led to general lawlessness, in consequence of which the royal authority had been widely extended; and a strong opposition gradually arose which protested against the abuses of this authority. In 1282 the nobles extorted from King Eric Glipping the first *Haandfaestning,* or charter, which recognized the Danehof, or national assembly, as a regular branch of the Administration and gave guarantees against further usurpations. Christopher II. (1319–31) was constrained to grant another charter considerably reducing the prerogative, increasing the privileges of the upper classes, and at the same time reducing the burden of taxation. But aristocratic licence proved as mischievous as royal incompetence; and on the death of Christopher II. the whole kingdom was on the verge of dissolution. Eastern Denmark was in the hands of one magnate; another magnate held Jutland and Fünen in pawn; the dukes of Schleswig were practically independent of the Danish Crown; the Scandian provinces had (1332) surrendered themselves to Sweden.

It was reserved for another Valdemar (Valdemar IV., *q.v.*) to reunite and weld together the scattered members of his heritage. His long reign (1340–75) resulted in the re-establishment of Denmark as the great Baltic power. To re-establish public order he had to re-establish the royal authority by providing the Crown with a regular and certain income. This he did by recovering the alienated royal demesnes in every direction, and from henceforth the annual *landgilde,* or rent, paid by the royal tenants, became the monarch's principal source of revenue. Throughout his reign Valdemar laboured incessantly to acquire as much land as possible. Moreover, the old distinction between the king's private estate and Crown property henceforth ceases; all such property was henceforth regarded as the hereditary possession of the Danish Crown. Valdemar took a remarkable personal interest in the organization of his kingdom and the smallest detail was not beneath his notice.

The national army was also re-organized on its ancient footing. Not only were the magnates sharply reminded that they held their lands on military tenure, but the towns were also made to contribute both men and ships, and peasant levies, especially archers, were recruited from every parish. It resulted that under such a ruler law and order were speedily re-established. The popular tribunals regained their authority, and a supreme court of justice, Det Kongelige Retterting, presided over by Valdemar himself, punished the unruly and guarded the prerogatives of the Crown. He voluntarily resorted to the old practice of summoning national assemblies, the so-called *Danehof.* At the first of these assemblies held at Nyborg, Midsummer Day 1314, the bishops and councillors solemnly promised that the commonalty should enjoy all the ancient rights and privileges conceded to them by Valdemar II., and the wise provision that the Danehof should meet annually considerably strengthened its authority. The keystone to the whole constitutional system was "King Valdemar's Charter" issued in May 1360 at the Rigsmode, or parliament, held at Kalundborg. This charter was practically an act of national pacification, the provisions of which king and people together undertook to enforce for the benefit of the commonweal. (X.)

1397–1625

The Union of **Kalmar.**—In 1397 all the most important magnates of the three Scandinavian kingdoms assembled at Kalmar to attend the coronation of Queen Margaret's nephew, the young Duke Erik of Pomerania, whom she had succeeded in having chosen as her successor as joint king of three kingdoms. At this meeting a committee was formed which projected an act of union; but Margaret took care that this project should not become law, for in it both the right of the inhabitants to self-government was insisted upon and great political influence Was accorded to the privy council of each kingdom. It was Margaret's intention, however, that union should be maintained under Denmark's suzerainty and a strong monarchy. To this end she set up men on whom she could rely in the Swedish and Norwegian castles and episcopal sees, and after 1412 Erik VII. pursued the union policy which she had outlined. Erik did not appreciate, however, that the strengthening of the union was the chief task which Margaret had bequeathed to him. Although he was the first Danish king who was German by birth, he held that in order that the Danish people should maintain their national individuality he had to combat Germanism in Denmark. Schleswig, which since 1386 had been ceded as a fief to the counts of Holstein, had to be regained. He proceeded against the counts first by suits laid before the German emperor, then by declaring war—a war, however, which ended by his being forced to leave the counts in possession of Schleswig except for Haderslev and the most northerly regions. He sought also to drive the German merchants out of Denmark by means of a decree of 1422 in which he gave the Danish merchants a monopoly in trade; in 1425 he began to levy what was called the Sound Dues at Helsingør on all ships sailing through the Sound. The natural consequence was that the Hanseatic League supported the Holstein counts against him. Copenhagen, which the king had taken in 1416 from the bishop of Roskild, and from this day onwards was to remain the permanent seat of the Danish Government, was attacked in 1428 by the fleet of the Hansa towns, but under the leadership of the heroic Queen Philippa, sister to England's great warrior-king, Henry V., the city defended itself successfully. When in 1435 Erik abandoned the strife with the League and the Holstein counts it was because the Swedes, who were being plagued by the Danish sheriffs and the taxation resulting from continual war, had risen in revolt. In the years that followed he repeatedly made serious efforts towards devising a different form of union from that which Margaret had established; but becoming weary of this, and discouraged by opposition even from the Danish Rigsraad (privy council), he retired to Gottland, where in 1439 he received tidings that the privy councils of the three Scandinavian kingdoms had dethroned him and set up his nephew, Duke Christopher of Bavaria as his successor. In 1449 Erik handed over Gottland to Denmark. He died in Pomerania in 1459.

With the death of Christopher, known as Christopher III., in 1448 the Kalmar Union had really come to an end. Denmark and Norway had elected Christian of Oldenburg king and in 1450 concluded a permanent union. Sweden on the other hand elected a native nobleman, Karl Knutsson, as king and this called forth strife between the different parties of the Swedish nobles; now and again one or other would seek to resume the union with a view to overcoming its opponents with the aid of the Danish king, and thus Christian I. (1448–81) was acknowledged the nominal ruler of Sweden from 1457 to 1464 and Hans (1481–1513) from 1497 to 1501. The party strife in Sweden intensified into a bitter feud between the two most powerful of the noble families, the Stures and the Trolles. The Swedish archbishop, Gustav Trolle, called in the help of Christian II. (1513–23) against the Swedish regent (Riksforestandare) Sten Sture; and when the Danish sovereign at the head of a great force had conquered Sweden, it seemed for a moment as though Queen Margaret's idea of union might be taken up again. Christian II. received allegiance as heir to the Swedish throne in 1520. But Gustav Trolle, availing himself of his triumph, instigated a wholesale massacre of his opponents, in what came to be called the "blood-bath of Stockholm," When two years later Christian II.'s enemies joined together to effect his overthrow, the peasant population of Sweden also rose against the foreign invader, and in 1523 Gustav Vasa succeeded at last in founding the national Swedish kingdom (see GUSTAVUS I. and SWEDEN).

Schleswig and Holstein.—In the meantime the Danish king had won back Schleswig and secured the alliance of Holstein, In 1459 Duke Adolf VIII., the last representative of the Holstein counts, had died, and in 1460 Christian I. of Denmark, his sister's son, had been made a member of the nobility of the country as duke of Schleswig and count of Holstein on his promising that the two lands should remain "for ever together undivided." The nobles thought that in this way they had abolished the rights of inheritance of the family of dukes from that time forward. In 1474 the emperor made Holstein also a dukedom. Ditmarsh was still at that date independent of Holstein, and when in 1500 King Hans tried to conquer it his army of nobles experienced a bloody defeat; it was not till 1559 that Frederick II. succeeded in conquering this free country of peasants.

The election of Christian I. entailed the making of heavy payments to various would-be claimants to the succession and this was one of the reasons why the king, on the marriage of his daughter Margaret to the Scottish king, James III., in 1469, was obliged, in lieu of dowry, to mortgage the Norwegian Orkneys and Shetland to Scotland, which has possessed them ever since. The question of the inheritance to the dukedoms arose afresh after the death of Christian I., and in 1490 the nobles were forced to submit to the division of the lands into a Segeberg and a Gottorp region between King Hans and his younger brother, Frederick, the unity of the country being formally maintained by the arrangement that the two dukes should reign together. United afresh through the fact that Duke Frederick in 1523 became king of Denmark, in 1544 they were once again shared in the same way, between King Christian III. and his brother Adolf who became duke of the Holstein-Gottorp.

Administration.—In the 15th century there had come into full development the differences which from this time forth were to characterize the Danish political situation down to the 19th century. The constitutional problem was, to whom should belong the chief power in the country, the king or the landowners represented in the Rigsraad, which at this time was made up of the country's seven bishops and about 20 noble landowners, whom the king indeed chose but whom he had to take from the leading families, and who thus corresponded in some degree to a privy council. This Rigsraad possessed in theory the highest constitutional powers, for it elected the king, who ever since 1481, before being elected, had to sign a charter drawn up by the Rigsraad, embodying the constitution of the country and asserting that the king should conduct no important State affairs without the sanction of the Rigsraad. But except by open revolt the Rigsraad possessed in reality no means of compelling the king, once elected, to observe the rules laid down in this charter; and further, this large assembly of men from all parts of the land, who were themselves fully preoccupied with their own concerns, had naturally to leave to the king and his chancery the actual daily management of the political affairs of the country. One landowner of noble birth as high steward, acted in some sort as a political leader, while another as chief constable was at the head of the nobles in their capacity as Denmark's armed cavalry, but their influence on the Government's conduct could always be set on one side by the king and his chancellor, the head of his chancery. Only in matters of local government was the king virtually compelled to make use of the nobles, who, insisting on their right to be appointed lord lieutenants, were in charge of the local administration in the 200 herreder (hundreds) of the provinces which were governed from the king's castles.

The Estates of **the** Realm.—In the 15th century also the Danish people became divided more sharply into distinctive estates. Denmark's principal industry, then, as at all times, was agriculture and the cultivated soil, apart from about 700 manorial estates, consisted of about 80,000 farms, from 10 to 20 of which would be clustered together in country villages. Each of these villages was administered by the peasant farmers in common.

whether these owned their farms themselves or were tenants paying a yearly rent—landgilde—to the actual owners. In the year 1500 there were about 12,000 Danish peasants who owned their farms; 18,000 were cultivators of land which belonged to the Crown, the so-called *Faestebønder* or leasehold tenants; while quite 30,000 were leasehold tenants of the church estates or of the estates belonging to the nobles, this large number being due to the freedom enjoyed by these properties from the old land taxes due to the State. In one or two respects, however, this tax exemption had other results. Thus the leasehold tenant on a manorial estate was liable to certain terms of forced labour and feudal duties, and when, as a result of the Black Death of 1348–49, many leasehold farms became vacant, there being no one willing to undertake their cultivation, a law was introduced by the lords of the manor in Zealand that the next heir to any leasehold tenant must take over his farm. This form of serfdom, therefore, which enacted that the farmers' sons who had become artisans or tradesmen in a town could be forced to abandon their occupations in order to continue the cultivation of their father's farms, had the result that an estate-owner in return for a payment would place his rights at the disposal of a neighbour; so that it is no exaggeration to speak of the actual sale of farmers' sons.

The Danish Church.—With its seven bishoprics and more than 70 monasteries the church in Denmark was immensely rich. It derived a huge income from its estates and leasehold farms, which were both exempt from the old land taxes and on which extraordinary taxes could be levied only with its consent. It drew still greater revenues from the tithes on the entire corn production of the country, one-third of such tithes going to the bishops, one-third to the parish-churches, and one-third to the parish priests. The pope, since the Council of Basle, had assumed the right to make all ecclesiastical appointments in Denmark, although he allowed the king certain nominations when he sought in 1458 to render the Vienna Concordat of 1448 applicable also to Denmark. The Danish nobles, however, considered that the ecclesiastical appointments ought to come to their younger sons, who were too poor to buy estates, so they demanded and in 1523 obtained from King Frederick a decree that to become a bishop a man must be of the Danish nobility and to obtain an important prelacy he must be either of the Danish nobility or else a doctor of theology. The result was a series of endless and costly proceedings in Rome. The enterprising place-hunters often secured for themselves these posts, including the position of parish priests. The service of religion, however, was neglected and it is not surprising therefore that the churches like the monasteries fell into decay and the people turned away from a church most of whose leaders were concerned, like Leo X. himself, in spending the riches provided for them by their high offices. The setting up of a university and school of theology in Copenhagen in 1479 had the effect of bringing about a more serious study of the principles of Christianity. Paul Helgesen, who became Lektor in 1519, vigorously attacked the malpractices in the Church, especially—as Luther did—in the matter of the sale of indulgences, but Luther's break with Rome in 1521 changed Helgesen into one of the last great champions of the Catholic Church in Denmark.

The Nobility.—The 15th century was to mark a turning-point in the history of the Danish nobility. Until then any Dane might become a noble by fulfilling the duties entailed in time of war, namely, by presenting himself well equipped for military service at his own expense. In return for this he was exempted from all taxes on his entire estate. Naturally there were estate owners and farmers on a large scale who in the course of the centuries had thus attained noble rank, but the dividing line was hard to indicate, since there were opportunities for the coming in of new families to take the place of those which had died out. But henceforward the nobility marked itself off as an estate apart: to belong to it a man had to show that his forefathers also for at least three generations had been exempted from taxation. The nobles thus put a stop to the incursion of new families into their ranks. The king sought to effect an addition on a small scale by assuming to himself the right to issue titles of nobility, but in contrast with England, where this practice secured for the nobility a continuous addition in each successive generation, the Danish nobility in the 15th century was made into something like a caste. After increasing from 242 families to 264 during the years 1400–50, the number sank from 230 families in 1500 to 140 (including at most 3,000 persons) in 1650. These figures offer the best explanation of the revolution of 1660. Of the Danish noble families in the 15th century the Gyldenstjerne and the Rosenkrans (whose names are commemorated in Shakespeare's Hamlet) were among the most important.

Trade Policy and the Burgher Struggle.—The Danish landowner of noble birth in the 15th century acquired estates in great numbers and were capable agriculturists. Their efficiency was demonstrated especially in Denmark's increased export of produce. The country had long had a market for its horses; now stall-fed bullocks were added and the landowners had to find sales not only for their own output of corn, butter, bacon, hides and meat, but also for the supplies of these goods levied by them in the form of rent from their leasehold tenants. In this way the estate-owners, lay and clerical, also became merchants; many of them owned ships on which they transported their wares to foreign merchants who were their customers. An estate-owner or a peasant-farmer who sailed over to Liibeck and Rostock with corn, butter or pork, needed to maintain his right to sell his own produce and to make purchases abroad to supply his own needs. But in this he found himself fettered by the commercial policy which had been proclaimed by King Erik VII. in 1422, and for a century had been maintained by the Danish Government, namely, the enactment that Danish merchants in the Danish mercantile towns had a monopoly in the transaction of business with other countries. Accordingly all Danish agricultural produce had to be brought to these towns and there sold to citizens who in their turn exported them, making a profit thereon; and in the same way only citizen-merchants might import the foreign goods required by Denmark, which had to be bought in the same towns. This was the theory, but in practice it was not possible to carry it out because the Danish merchants were not wealthy enough to finance the trade in question. The German merchants who had immigrated and become Danish citizens were the keenest of all to see this arrangement carried out and took up this position against the Danish estate-owners arid the Hanseatic merchants who were still doing good business in Denmark.

In 1466 a cleavage had come about between King Christian I. and the then leading Danish-Swedish family of Thott. In 1468 Christian called together at Kallundborg the first Danish assembly of the estates of the realm, consisting of representatives of the Church, the nobility, the burghers and the peasants, so that they might vote him means for waging war against Sweden. From that time on the Government was on the side of the burghers against the landowners. It sought to create competition with the Hanseatic League by concluding treaties of commerce with England and the Netherlands. Christian II. at this time was guided by the Dutch woman, Sigbrit Willemszoon, whose standing was more or less that of a controller of customs and finance, and by Hans Mikkelsen, burgomaster of Malmo, who was a kind of minister of the interior. This Government made the king, especially after the great victory in Sweden, an absolute monarch. Under the leadership of Hans Mikkelsen were formulated two great laws, the law for the land and the law for the towns, which came into force at the end of 1521. They contained many provisions which seem of a very modern nature; their tendency may best be gathered from the fact that they forbade "the evil and unchristian custom of selling the poor peasants" and strongly maintained the monopoly of the Danish towns and burghers in regard to Danish trade. Thus the landowners of noble birth and their rights were entirely set aside.

It is not surprising therefore that the Danish landowners, when Sweden was in a state of insurrection in 1522, should resolve to sweep aside this burgher Government. The nobles from Jutland co-operated with Duke Frederick and the Hanseatic League, renounced allegiance to King Christian and on March 26, 1523, acclaimed the duke as Danish king. On April 13 King Christian sailed from Copenhagen on his way to the court of his brother.

in-law, the Emperor Charles V. Some years later in 1531 he made an effort to win back his kingdom, but was taken prisoner in Norway and remained in captivity until his death in 1559.

Reformation and Reorganization. — It was not until 1524 that Frederick I. (1523–33) assured his position; when Copenhagen and Malmo, which had heroically supported King Christian, were forced to surrender by the great Holstein general, Johan Rantzau. The victory was that of the Danish landowners and the *Rigsraad;* King Christian's two great laws were abrogated and the actual documents publicly burnt; the landowners were now once more free to sell their peasants and to trade with any foreign merchants they wished. It was the *Rigsraad* that governed; Frederick I. was king only in name. He came however to exercise a considerable influence in Denmark, for he, and even to a greater extent his son, Duke Christian, gave their protection to the zealous reformers of the church, whose leader was Hans Tausen and who were striving to bring about Denmark's accession to Lutheranism. This movement secured strong support among the burghers and the peasants; nor were all the landowners blind to the fact that they might benefit by demanding back the properties which their forefathers had bestowed upon the church and the monasteries, although the majority sided with the Catholic Church. When the struggle was at its height, in 1533, King Frederick died and the *Rigsraad* decided under the leadership of the Catholic bishops, who would not have Duke Christian king at any price, that Denmark should do without a king altogether, and that the *Rigsraad* would be Government enough. The Danish burghers, however, would not agree to this. Their leader, Ambrosius Bogbinder, the burgomaster of Copenhagen, and the burgomaster of Malmo Jøzgen Kock, concluded a treaty with Lubeck — where Jurgen Wullenweber had really overthrown the old aristocratic ruling council — and they joined together to restore the burgher King Christian II. on the throne and to incorporate Copenhagen and Malmo in the Hanseatic League. The lay members of the *Rigsraad* then, in 1534, recognized the necessity of choosing Duke Christian, and a bitter civil war followed, known to history as the "Count's War" — the count in question being Christopher of Oldenburg, great nephew of King Christian I., whom Liibeck and her allies raised up to oppose Duke Christian. He acted throughout as the nominee of the captive Christian II. Everywhere the burghers and the peasants took up arms and in North Jutland they won victories over the Danish nobles. But Johan Rantzau returned with his Holstein and German troops, and the peasants suffered severely alike in Jutland and on the islands. With Swedish and Prussian assistance a fleet was formed which, under Peder Skram as admiral, defeated the citizens of Liibeck. The holstein army was conveyed over to Zealand and in July 1535 the siege of Copenhagen and Malmo began. Malmö surrendered in April, Copenhagen not until it had been besieged for a year, in July 1536. On Aug. 6 Christian III. (1534–59) made his entry into Copenhagen and soon afterwards Ambrosius Bogbinder committed suicide.

It was the king who had won the victory with the help of his Holstein troops; the effects of this decisive triumph of the monarchy became very perceptible in the future political development of the country. The most direct outcome of the conflict was the remodelling of the church. In accordance with a decision come to by the king's council of war on Aug. 22, the bishops resident in Copenhagen were imprisoned, then the others all over the country; they were released only after they had submitted to the new organization of the church. At an assembly of the estates in Copenhagen in Oct. 1536, at which representatives of the peasants were present for the last time, assent was given to the king's charter and to a statute which established the new church. The social life of the country was revolutionized. The Church became a Lutheran State Church with the king as its supreme head, while seven bishops were to exercise supervision over the parish clergy. The property of the bishops and eventually also all the property of the monasteries fell to the king, and as at the same time a half of the farms of the peasant-proprietors were confiscated, as a punishment for having sided against the king, the possessions of the Crown were trebled, so that it now owned a little over one-half the soil of the country. The bishops' tithes henceforward went into the king's coffers, the revenues of whicn were increased through the better administration of the Crown estates.

The lord lieutenants more often than not held their fiefs on a fixed rent or else only in return for feudal military service: in future they were obliged to account for the expenses and revenues of the fiefs so that the king should receive the balance. In 1533, of the country's 162 *herreder* (Schleswig not included) 43 were on the register, in 1559 there were 123; in the succeeding years efforts were made to combine the *herreder* into larger fiefs, the number of which in 1642 was 54. Centralization of Government was carried out on a firmer basis; financial matters were dealt with under an exchequer, while the chancellors took over the administrations of the interior and the exterior. The defeated estates, the burghers and the peasants, lost in 1536 their political influence, the burghers for a century, the peasants for more than three centuries. The burghers had to abandon entirely their great trade policy and to be content with sharing with the landowners the right to export bullocks, which gave the latter almost a monopoly, and generally to put up with the commercial operations of the landowners. For the peasants, of whom in the middle of the 17th century, 94% were leasehold farmers, what was of most importance was that the king and the landowners, during the second half of the 16th century had started farming on a large scale. A great many leasehold tenants were thereby turned out of their fathers' farms, and since the larger new estates called for increased labour the leasehold tenants in the parishes of the large estates were called upon to give their services three days a week. In order to compel the unwilling, both the Crown and the landowners began to make use of legal punishments, and many of the latter set up law-courts on their own estates where they themselves or their bailiff sat in judgment on the peasants. Moreover the landowners retained in 1536 all their rights as nobles and even extended them. To exemption from taxes was added exemption from tithes, to a monopoly in posts like the lord lieutenancies was added what was practically a monopoly of the Government offices and the Exchequer, together with a right to a seat in the *Rigsraad* (which now consisted often of 23 members) and the exclusive right to promotion to the chief posts, such as high steward, chancellor, chief constable, lord high admiral or lord chancellor of the kingdom.

From 1560, with the new discoveries of silver in America, agriculture became increasingly a remunerative occupation, and, further, since 1590, the Dutch had been steadily buying corn in Denmark and the Baltic provinces for shipment via Amsterdam to southern Europe. Apart from two quite fruitless wars against Sweden (1563–70, 1611–13), Denmark had enjoyed peace and was able to make full use of it. The landowners especially acquired much matter, which many of them used for the creation of beautiful dwellings, and the names of Tycho Brahe, the astronomer, Holger Rosenkrans, the theologian, and Arild Hvitfeldt, the historian, show that in the intellectual world also Denmark played its part. The burghers too were acquiring capital and were thus enabled to compete with the Hanseatic towns — for instance in the trade with Iceland. The commercial navy grew, and Christian IV. was able to found new cities like Gluckstadt and Christianshavn, nhile enlarging and beautifying Copenhagen with new edifices, notably the Bourse, and new harbour-works and fortifications. Frederik II. (1559–88) built Kronborg as a support for the collection of the Sound dues, which continued to bring in larger and larger revenues. Christian IV. (1588–1648) built in the Dutch renaissance style the heautiful castles of Frederiks. borg and Rosenborg.

The Swedish Wars. — Christian IV. was encouraged by success to think that it must be the Danish king's policy to make Denmark the leading country in northern Europe, and that it must be his duty in particular to prevent the increase of Swedish influence. This aim was unattainable, for the power of Sweden at this period was superior to that of Denmark's. Sweden had become famous both for her copper and for the finest iron in Europe, also for the firm administration and an army and navy

always ready for war which her highly-gifted kings of the Vasa line had created. Denmark could hold her own against Sweden only with her navy, to the strengthening of which Christian IV. had given special care with a view to maintaining Danish mastery over the Baltic no less than over the North Sea; and it was this which repeatedly saved Denmark from destruction.

A period of misfortune began for Denmark when Christian IV., at the behest of England, intervened in the Thirty Years' War, first as Protestant leader against the emperor (1625–29), later, when he had had to cede this position to Gustavus Adolphus, as a mediator, until prevented by a Swedish attack in the years 1643–45. Both wars resulted in bitter defeats for Denmark. While the Danish islands were defended by the navy, Jutland was pillaged and laid waste by hostile armies, first by the imperial forces under Wallenstein, then by the Swedes under Thorstenson. Denmark had to purchase peace in 1645 by surrendering the islands of Gottland and Oesel and the provinces of Norway, Herjedalen and Jemteland. In order to find the money to defray the wars, Christian had to increase greatly the Sound dues, but this evoked much ill-will on the part of the Western Powers, and although the Dutch in 1645 obtained considerable reductions they came to feel strongly that it would be a good thing if Denmark did not possess both banks of the Sound. Over and above all this, the Thorstenson conflict brought the friendship of the duke of Holstein-Gottorp to the side of Sweden, and this developed into a definite alliance when Frederick III. (1648–70) rashly declared war on Sweden in 1657. This war, famous for the advance of the Swedish king, Charles X., over the ice from Jutland to the islands, ended in 1658 with the Peace of Roskilde by which Denmark gave up Bornholm and Trondhjem and the southern provinces of the Scandinavian peninsula, while the duke of Gottorp was acknowledged as a reigning prince in part of Schleswig.
