In the Kentucky bluegrass region pasture will finally consist almost entirely of bluegrass, redtop, and white clover, with a sprinkling of orchard grass. The timothy, Italian and perennial rye-grasses are added solely to provide abundant pasturage the first year. The same gradual transformation will take place where Canada bluegrass is seeded, and on the sandy soils the fescues are likely to predominate. In the South, Bermuda grass often excludes all other grasses and legumes on the heavy soils as does carpet grass on moist, sandy soils. Lespedeza persists here more than either white clover or yellow trefoil. Pastures of these grasses and lespedeza only are unproductive in winter and spring. Therefore winter growing legumes like white clover and yellow trefoil must be encouraged. Bur clover should be added, or grown in a supplementary pasture.

Temporary pastures are more often of annual grasses and legumes than of perennials. Sometimes the aftermath of a meadow (hayfield) is grazed for one or two months and the winter grains, wheat, rye and oats, are pastured a short time in late fall and winter. Vetch and oat mixtures make excellent early spring pasture, and peanuts, cowpeas and soy beans are useful in summer wherever they will grow. Among annual and biennial plants which make good temporary pasture are melilot (sweet clover), Sudan grass, and bur clover. Sweet clover and Sudan grass are much grown in the Central West and are very productive. Bur clover in the Gulf States is extremely useful because it is productive and nutritious in late winter and early spring.

Fertilizers. — Feeding cotton-seed cake or grain in the pasture improves the grass, but it is well to scatter the manure yearly with a spike-tooth or drag harrow. This method is inadequate and commercial fertilizers benefit pastures greatly and in most cases increase yields. The element phosphorus is most often beneficial, and superphosphate (acid phosphate), rock phosphate or basic slag may be used. Superphosphate at 100–300 lb. per acre as a top-dressing gives the best results. Nitrogen (nitrate of soda or sulphate of ammonia) at 100–150 lb. per acre is effective. Except on sandy soils muriate or sulphate of potash is rarely profitable; used with phosphate and nitrogen, however, it

seems often to increase yields. Phosphate fertilizers, especially with lime, markedly encourage legumes; while nitrogen stimulates grasses chiefly and usually decreases legumes in the herbage. Nitrate of soda, or sulphate of ammonia without phosphate, or both phosphate and potash at the same time or during the growing season are rarely to be recommended. (See FERTILIZERS and FEEDING STUFFS.)

Systems of Grazing.—If enough animals are not available to prevent the grass from sending up culms or seed stalks the pasture should be mowed to encourage a new growth of fresh leaves. Mowing also helps to control weeds and brush. Top-dressing with phosphates or nitrogen after mowing will hasten recovery. Pastures of turf-forming grasses like Kentucky bluegrass and carpet grass are injured more by light grazing than by heavy. In the latter case the weedy grasses and other undesirable plants are kept down and the better grasses occupy all the soil. Rotation grazing combined with frequent fertilizing, so effective in Germany and England, has not been tested in America. A comparison of alternate and continuous grazing on bluegrass pastures in Virginia showed very little advantage in the alternate grazing of two pastures. In the West deferred and rotation grazing improves the natural bunch-grass pastures.

Pasture Soils.—Like cultivated crops the grasses thrive best on the better soils. Certain soils in Kentucky with an unusually high percentage of available phosphoric acid and calcium make fine pastures. It is said that this bluegrass produces better horses and cattle than elsewhere. Light sandy soils are perhaps the poorest for pasture, although good pastures are possible there with the development of such grasses as Southern carpet grass. The ordinary pasture plants usually suffer from summer drought on sandy soils, and chemical fertilizers leach out quickly.

GRASSE, FRANÇOIS JOSEPH PAUL, MARQUIS DE GRASSETILLY, COMTE DE (1722–1788), French sailor, was born at Bar (Alpes Maritimes). In 1734 he took service on the galleys of the order of Malta, and in 1740 entered the French service. He took part in the American War of Independence, and fought at Dominica and Saint Lucia (1780), and Tobago (1781). He was defeated by Admiral Hood at St. Kitts, and in April 1782, defeated and taken prisoner by Admiral Rodney. On his return to France, he published a *Mémoire justificatif,* and was acquitted by a court-martial (1784).

See Alexandre de Grasse, *Notice bibliographique sur l'amiral comte de Grasse d'après les documents inédits* (1840); G. Lacour-Gayet, *La Marine militaire de la France sous le règne de Louis XV.* (1902).

GRASSE, capital of an arrondissement, department of Alpes Maritimes (till 1860 in that of Var), France, 12½ m. by rail N.N.W. of Cannes. Pop. (1936) 13.878. From 1244 (when the see was transferred hither from Antibes) to 1790 it was an episcopal see, but was then included in the diocese of Fréjus till 1860, when the region was annexed to the newly formed department of the Alpes Maritimes. It has a 12th century cathedral, now a simple parish church; and an ancient tower, of uncertain date, near the town hall, formerly the bishop's palace (13th century). The library contains the muniments of the abbey of Lérins, on the island of St. Honorat opposite Cannes. In the chapel of the old hospital are three pictures by Rubens. Grasse is built in an amphitheatre at a height of 1,066 ft., on a south slope facing the Mediterranean. It possesses a mild and salubrious climate, and is well supplied with water. That used for the purpose of the factories comes from the fine spring of Foux. But the drinking water used in the higher portions of the town flows, by a conduit, from the Foulon stream. Grasse is particularly celebrated for its perfumery. Oranges and roses are cultivated abundantly in the neighbourhood. It is stated that the preparation of attar of roses (which costs nearly £100 per 2 lb.) requires alone nearly 7,000,000 roses a year. It manufactures wax, soap and the finest quality olive oil. There are a sub-prefecture and a tribunal of commerce.

GRASSES, a group of plants possessing certain characters in common and constituting a family (Gramineae) of the class Monocotyledons. It is one of the largest and most widespread and, from an economic point of view, the most important family of flowering plants. No plant is correctly termed a grass which is not a member of this family, but the word is in common language also used, generally in combination, for many plants of widely different affinities which possess some resemblance (often slight) in foliage to true grasses; *e.g.,* knot-grass (*Polygonum aviculare*), cotton-grass (*Eriophorum*), rib-grass (Plantago), scorpion-grass (*Myosotis*), blue-eyed grass (*Sisyrinchium*), sea-grass (Zostera). The grass-tree of Australia (*Xanthorrhoea*) is a remarkable plant, allied to the rushes in the form of its flower, but with a tall, unbranched, soft-woody, palm-like trunk, bearing a crown of long, narrow, grass-like leaves and stalked heads of small, densely-crowded flowers. In agriculture the word has an extended signification to include the various fodder-plants, chiefly leguminous, often called "artificial grasses."

The first attempts at a classification of plants recognized and separated a group of *Gramina,* and this, though bounded by nothing more definite than habit and general appearance, contained the Gramineae of modern botanists. The older group, however, even with such systematists as Ray (1703), Scheuchzer (1719), and Micheli (1729), embraced in addition the Cyperaceae (Sedge family), Juncaceae (Rush family), and some other monocotyledons with inconspicuous flowers. Singularly enough, the sexual system of Linnaeus (1735) served to mark off more distinctly the true grasses from these allies, since very nearly all of the former then known fell under his Triandria Digynia, whilst the latter found themselves under his other classes and orders.

Structure.—The general type of true grasses is familiar in the cultivated cereals of temperate climates—wheat, barley, rye, oats, and in the smaller plants which make up pastures and meadows and form a principal factor of the turf of natural downs. Less familiar are the grains of warmer climates—rice, maize, millet and sorgho, or the sugar-cane. Farther removed are the bamboos of the tropics, the columnar stems of which reach to the height of forest trees. All are, however, formed on a common plan.

Root.—Most cereals and many other grasses are annual, and possess a tuft of very numerous slender root-fibres, much branched and of great length. The majority of the members of the family are of longer duration, and have the roots also fibrous, but fewer, thicker and less branched. In such cases they are very generally given off from just above each node (often in a circle) of the lower part of the stem or rhizome, perforating the leaf-sheaths. In some bamboos they are very numerous from the lower nodes of the erect culms, and pass downwards to the soil, whilst those from the upper nodes shrivel up and form circles of spiny fibres.

Stem.—The underground stem or rootstock (rhizome) of perennial grasses is usually well developed, and often forms very long creeping or subterranean rhizomes, with elongated internodes and sheathing scales; the widely-creeping, slender rhizomes in Marram-grass (Ammophila), *Agropyrum junceum,* Elymus arenarius, and other sand-loving plants render them useful as sand-binders. The turf-formation, which is characteristic of open situations in cool temperate climates, results from an extensive production of short stolons, the branches and the fibrous roots developed from their nodes forming the dense "sod." The rhizome is always solid, and has the usual internal structure of the monocotyledonous stem. In the cases of branching the branches break directly through the sheath of the leaf in connection with which they arise. In other cases the branches grow upwards through the sheaths which they ultimately split from above, and emerging as aerial shoots give a tufted habit to the plant. Good examples are the oat, cocksfoot (Dactylis) and other British grasses. This mode of growth is the cause of the "tillering" of cereals, or the production of a large number of erect growing branches from the lower nodes of the young stem. Isolated tufts or tussocks are also characteristic of steppe—and savannah—vegetation and open places generally in the warmer parts of the earth.

The aerial leaf-bearing branches (culms) are a characteristic feature of grasses. They are generally numerous, erect, cylindrical (rarely flattened) and conspicuously jointed, with evident nodes. The nodes are solid, a strong plate of tissue passing across the stem, but the internodes are commonly hollow, although examples of completely solid stems are not uncommon (*e.g.*, maize, many species of Andropogon, sugar-cane). The swollen nodes are a characteristic feature. In wheat, barley and most of the British native grasses they are a development, not of the culm, but of the base of the leaf-sheath. The function of the nodes is to raise again stems which have become bent down; they are composed of highly turgescent tissue, the cells of which, under the influence of gravity, elongate on the side next the earth when the culm is placed in a horizontal or oblique position, and thus raise the culm again to an erect position. The internodes continue to grow in length, especially the upper ones, for some time; the increase takes place in a zone at the extreme base, just above the node. The exterior of the culms is more or less concealed by the leaf-sheaths; it is usually smooth and often highly polished, the epidermal cells containing an amount of silica sufficient to leave after burning a distinct skeleton of their structure. *Tabasheer* is a white substance mainly composed of silica, found in the joints of several bamboos. **A** few of the lower internodes may become enlarged and subglobular, forming nutriment-stores, and grasses so characterized are termed "bulbous" (Arrhenatherum, Poa bulbosa, etc.). In internal structure grass-culms, save in being hollow, conform to that usual in monocotyledons; the vascular bundles run parallel in the internodes, but a horizontal interlacement occurs at the nodes. In grasses of temperate climates branching is rare at the upper nodes of the culm, but it is characteristic of the bamboos and many tropical grasses. In many bamboos they are long and spreading or drooping and copiously ramified, in others they are reduced to hooked spines. One genus (*Dinochloa,* a native of the Malay archipelago) is scandent, and climbs over trees roo ft. or more in height. Olyra *latifolia,* a widely-spread tropical species, is also a climber, but on a smaller scale.

Grass-culms grow with great rapidity, as is most strikingly seen in bamboos, where a height of over roo ft. is attained in from two to three months, and many species grow two, three or even more feet in twenty-four hours.

Leaves.—These present special characters usually sufficient for ordinal determination. They are solitary at each node and arranged in two rows, the lower often crowded, forming a basal tuft. They consist of two distinct portions, the sheath and the blade. The sheath is often of great length, and generally completely surrounds the culm, forming a firm protection for the internode, the younger basal portion of which, including the zone of growth, remains tender for some time. As a rule it is split down its whole length, thus differing from that of Cyperaceae which is almost invariably (Eriospora is an exception) a complete tube; in some grasses, however (species of Poa, Bromus and others), the edges are united. The sheaths are much dilated in *Alopecurus vaginatus* and in a species of Potamochloa, in the latter, an East Indian aquatic grass, serving as floats. At the summit of the sheath, above the origin of the blade, is the ligule, a usually membranous process of small size (occasionally reaching 1 in. in length) erect and pressed around the culm. It is rarely quite absent, but may be represented by a tuft of hairs (very conspicuous in Pariana). It serves to prevent rain-water, which has run down the blade, from entering the sheath. *Melica uniflora* has in addition to the ligule, a green erect tongue-like process, from the line of junction of the edges of the sheath.

The blade is frequently wanting or small and imperfect in the basal leaves, but in the rest is long and set on to the sheath at an angle. The usual form is familiar—sessile, more or less ribbon-shaped, tapering to a point, and entire at the edge. The chief modifications are the articulation of the deciduous blade on to the sheath, which occurs in all the Bambuseae (except *Planotia*) and in *Spartina stricta;* and the interposition of a petiole between the sheath and the blade, as in bamboos, Leptaspis, *Pharus, Pariana, Lophatherum* and others. In the latter case the leaf usually becomes oval, ovate or even cordate or sagittate, but these forms are found in sessile leaves also (Olyra, Panicum). The venation is strictly parallel, the midrib usually strong, and the other ribs more slender. In *Anomochloa* there are several nearly equal ribs and in some broad-leaved grasses (Bambuseae, Pharus, *Leptaspis*) the venation becomes tessellated by transverse connecting veins. The tissue is often raised above the veins, forming longitudinal ridges, generally on the upper face; the stomata are in lines in the intervening furrows. The thick prominent veins in Agropyrum occupy the whole upper surface of the leaf. Epidermal appendages are rare, the most frequent being marginal, saw-like, cartilaginous teeth, usually minute, but occasionally (Danthonia scabra, Panicum serratum) so large as to give the margin a serrate appearance. The leaves are occasionally woolly, as in *Alopecurus lanatus* and one or two *Panicums.* The blade is often twisted, frequently so much so that the upper and under faces become reversed. In dry country, *e.g.,* sand dune, the blades of grasses are often folded on the midrib, or rolled up. The rolling is effected by bands of large wedge-shaped cells—motor-cells—between the nerves; the loss of water by these cells as they dry, causes the blade to curl towards the face on which they occur. The rolling up acts as a protection from too great loss of water, the exposed surface being specially protected to this end by a strong cuticle, the majority or all of the stomata occurring on the protected surface. The stiffness of the blade, which becomes very marked in dry-country grasses, is due to the development of girders of thick-walled mechanical tissue which follow the course of all or the principal veins.

Inflorescence.—This possesses an exceptional importance in grasses, since, their floral envelopes being much reduced and the sexual organs of very great uniformity, the characters employed for classification are mainly derived from the arrangement of the flowers and their investing bracts. Various interpretations have been given to these glumaceous organs and different terms employed for them by various writers. It may, however, be considered as settled that the whole of the bodies known as glumes and paleae, and arranged externally to the flower, form no part of the floral envelopes, but are of the nature of bracts. These are arranged so as to form *spikelets,* and each spikelet may contain one, as in Agrostis, two, as in *Aira,* three, or a great number of flowers, as in *Briza, Triticum;* in some species of Eragrostis there are nearly 60. The flowers are, as a rule, placed laterally on the axis (raclzilla) of the spikelet, but in one-flowered spikelets they appear to be terminal, and are probably really so in *Anthoxanthum* and in two anomalous genera, *Anomochloa* and *Streptochaeta.*

In immediate relation with the flower itself, and often entirely concealing it, is the *palea* or pale ("upper pale" of most systematists). This organ is peculiar to grasses among Glumiflorae (the series to which belong the two families Gramineae and Cyperaceae), and is almost always present, certain Oryzeae and Phalarideae being the only exceptions. It is of thin membranous consistence, usually obtuse, often bifid, and possesses no central rib or nerve, but has two lateral ones, one on either side; the margins are frequently folded in at the ribs, which thus become placed at the sharp angles. The pale is generally considered to represent a single bracteole, characteristic of Monocotyledons, the binerved structure being the result of the pressure of the axis of the spikelet during the development of the pale, as in Iris and others.

The flower with its pale is sessile, and is placed in the axil of another bract in such a way that the pale is exactly opposed to it, though at a slightly higher level. It is this second bract or flowering glume which has been generally called by systematists the "lower pale," and with the "upper pale" was formerly considered to form an outer floral envelope. The two bracts are, however, on different axes, one secondary to the other, and cannot therefore be parts of one whorl of organs. They are usually quite unlike one another, but in some genera (*e.g.,* most *Festuceae*) are very similar in shape and appearance.

The flowering glume has generally a more or less boat-shaped form, is of firm consistence, and possesses a well-marked central

midrib and frequently several lateral ones. The midrib in a large proportion of genera extends into an appendage termed the *awn,* and the lateral veins more rarely extend beyond the glume as sharp points (e.g., *Pappophorum*). The form of the flowering glume is very various, this organ being plastic and extensively modified in different genera. It frequently extends downwards a little on the rachilla; in *Leptaspis* it is formed into a closed cavity by the union of its edges, and encloses the flower, two styles projecting through the pervious summit. Valuable characters for distinguishing genera are shown from the awn. This presents itself variously developed from a meresubulatepoint to an organ several inches in length, and when complete (as in *Andropogoneae*, Aveneae and Stipeae) consists of two well-marked portions, a lower twisted part and a terminal straight portion, usually set in at an angle with the former, sometimes trifid and occasionally beautifully feathery. The lower part is most often suppressed, and in the large group of the Paniceae awns of any sort are very rarely seen. The awn may be either terminal or may come off from the back of the flowering glume. When terminal the awn has three fibro-vascular bundles, when dorsal only one; it is covered with the stomate-bearing epidermis.

The flower with its palea is thus sessile in the axil of a floriferous glume, and in a few grasses (*Leersia,* Coleanthus, *Nardus*) the spikelet consists of nothing more, but usually (even in uniflorous spikelets) other glumes are present. Of these the two placed distichously opposite each other at the base of the spikelet never bear any flower in their axils, and are known as the empty or barren *glumes.* They are the "glumes" of most writers. They very rarely differ much from one another, but one may be smaller or quite absent (*Panicum, Setaria, Paspalum, Lolium*), or both be altogether suppressed, as above noticed. They are commonly firm and strong, often enclose the spikelet, and are rarely provided with long points or imperfect awns. Generally speaking they do not share in the special modifications of the flowering glumes, and rarely themselves undergo modification, chiefly in hardening of portions (Sclerachne, *Manisuris, Anthephora,* Peltophorum), so as to afford greater protection to the flowers or fruit. But it is usual to find, besides the basal glumes, a iew other empty ones, and these are in two- or more-flowered spikelets (*Triticum*) at the top of the rachilla (numerous in Lophatherum), or in uniflorous ones below and interposed between the floral glume and the basal pair.

The axis of the spikelet is frequently jointed and breaks up into articulations above each flower. Tufts or borders of hairs are frequently present (Calamagrostis, Phragmites, Andropogon), and are often so long as to surround and conceal the flowers. The axis is often continued beyond the last flower or glume as a bristle or stalk.

Involucres or organs outside the spikelets also occur and are formed in various ways. Thus in *Setaria,* Pennisetum, etc., the one or more circles of simple or feathery hairs represent abortive branches of the inflorescence; in *Cenchrus* these become consolidated, and the inner ones are flattened so as to form a very hard globular spiny case to the spikelets. Bracts of a more general character subtending branches of the inflorescence are singularly rare in Gramineae, in marked contrast with Cyperaceae, where they are so conspicuous. The remarkable ovoid involucre of *Coix,* which becomes of stony hardness, white and polished (then known as "Job's tears," *q.v.*), is also a modified bract or leaf-sheath.

Any number of spikelets may compose the inflorescence, and their arrangement is very various. In the spicate forms, with sessile spikelets on the main axis, the latter is often dilated and flattened (*Paspalum*), or is more or less thickened and hollowed out (*Stenotaphrum,* Rottboellia, *Tripsacum*), when the spikelets are sunk and buried within the cavities. Every variety of racemose and paniculate inflorescence obtains, and the number of spikelets composing those of the large kinds is often immense. Rarely the inflorescence consists of very few flowers; thus *Lygeum Spartum,* one of the esparto grasses and the most anomalous of European grasses, has but two or three large uniflorous spikelets, which are fused together at the base, and have no basal glumes, but are enveloped in a large, hooded, spathe-like bract.

Flower.—This is characterized by remarkable uniformity. The perianth is represented by very rudimentary, small, fleshy scales arising below the ovary, called *lodicules;* they are elongated or truncate, are sometimes fringed with hairs, and are in contact with the ovary. Their usual number is two, and they are placed collaterally at the anterior side of the flower, that is, within the flowering glume. They are generally considered to represent the inner whorl of the ordinary monocotyledonous (liliaceous) perianth, the outer whorl of these being suppressed as well as the posterior member of the inner whorl. This latter is present almost constantly in Stipeae and *Bambuseae,* which have three lodicules, and in the latter group they are occasionally more numerous. In *Streptochaeta* there are six lodicules, alternately arranged in two whorls. Sometimes, as in *Anthoxanthum,* they are absent. In *Melica* there is one large anterior lodicule resulting presumably from the union of the two which are present in allied genera. The function of the lodicules is the separation of the pale and glume to allow the protrusion of stamens and stigmas; they effect this by swelling and thus exerting pressure on the base of these two structures. Where, as in Anthoxanthum, there are no lodicules, pale and glume do not become laterally separated, and the stamens and stigmas protrude only at the apex of the floret. Grass-flowers are usually hermaphrodite, but there are very many exceptions. Thus it is common to find one or more imperfect (usually male) flowers in the same spikelet with bisexual ones, and their relative position is important in classification. *Holcus* and *Arrhenatherum* are examples in English grasses; and as a rule in species of temperate regions separation of the sexes is not carried further. In warmer countries monoecious and dioecious grasses are most frequent. In such cases the male and female spikelets and inflorescence may be very dissimilar, as in maize, Job's tears, *Euchlaena, Spinifex,* etc.; and in some dioecious species this dissimilarity has led to the two sexes being referred to different genera. In other grasses. however, with the sexes in different plants (e.g., *Brizopyrum, Distichlis,* Eragrostis capitata, *Gynerium*), no such dimorphism obtains. *Amphicarpum* is remarkable in having cleistogamic flowers borne on long radical subterranean peduncles which are fertile, whilst the conspicuous upper paniculate ones, though apparently perfect, never produce fruit. Something similar occurs in Leersia oryzoides, where the fertile spikelets are concealed within the leaf-sheaths.

Androecium.—In the vast majority there are three stamens alternating with the lodicules, and therefore one anterior, *i.e.,* opposite the flowering glume, the other two being posterior and in contact with the palea. They are hypogynous, and have long and very delicate filaments, and large, linear or oblong two-celled anthers, dorsifixed and ultimately very versatile, deeply indented at each end, and commonly exserted and pendulous. Suppression of the anterior stamen sometimes occurs, or the two posterior ones may be absent. There is in some genera (Oryza, most *Bambuseae*) another row of three stamens, making six in all. The stamens become numerous (ten to forty) in the male flowers of a few monoecious genera (Pariana, *Luziola*). In *Ochlandra* they vary from seven to thirty, and in *Gigantochloa* they are monadelphous.

Gynoecium.—The pistil consists of a single carpel, opposite the pale in the median plane of the spikelet. The ovary is small, rounded to elliptical, and one-celled, and contains a single slightly bent ovule sessile on the ventral suture (that is, springing from the back of the ovary); the micropyle points downwards. It bears usually two lateral styles which are quite distinct or connate at the base, sometimes for a greater length; each ends in a densely hairy or feathery stigma. Occasionally there is but a single style, as in *Nardus,* which corresponds to the midrib of the carpel. The very long and apparently simple stigma of maize arises from the union of two. Many of the bamboos have a third, anterior, style.

Comparing the flower of Gramineae with the general monocotyledonous plan as represented by Liliaceae and other families, it will be seen to differ in the absence of the outer row and

the posterior member of the inner row of the perianth-leaves, of the whole inner row of stamens, and of the two lateral carpels, whilst the remaining members of the perianth are in a rudimentary condition. But each or any of the usually missing organs are to be found normally in different genera, or as occasional developments.

Pollination and Germination.—Grasses are generally wind-pollinated, though self-fertilization occurs. A few species, as we have seen, are monoecious or dioecious, while many are polygamous (having unisexual as well as bisexual flowers as found in many members of the tribes Andropogoneae and Paniceae), and in these the male flower of a spikelet always blooms later than the hermaphrodite, so that its pollen can only effect cross-fertilization upon other spikelets in the same or another plant. Of those with only bisexual flowers, many are strongly protogynous (the stigmas protruding before the anthers are ripe), such as *Alopecurus* and *Anthoxanthum,* but generally the anthers protrude first and discharge the greater part of their pollen before the stigmas appear. The filaments elongate rapidly at flowering-time, and the lightly versatile anthers empty an abundance of finely granular, smooth pollen through a longitudinal slit. Some flowers, such as rye, have lost the power of effective self-fertilization, but in most cases both forms, self- and cross-fertilization, seem to be possible. Thus the species of wheat are usually self-fertilized, but cross-fertilization is possible since the glumes are open above, the stigmas project laterally, and the anthers empty only about one-third of their pollen in their own flower and the rest into the air. In some cultivated races of barley, cross-fertilization is precluded, as the flowers never open.

Fruit *and* Seed.—The ovary ripens into a usually small ovoid or rounded fruit, which is entirely occupied by the single large seed, from which it is not to be distinguished, the thin pericarp of the fruit being completely united to the testa of the seed. To this peculiar fruit the term caryopsis has been applied (more familiarly "grain"); it is commonly furrowed longitudinally down one side (usually the inner, but in *Coix* and its allies, the outer), and an additional covering is not unfrequently provided by the adherence of the persistent palea, or even also of the flowering glume ("chaff" of cereals). From this type there are a few deviations; thus in Sporobolus, etc., the pericarp is not united with the seed but is quite distinct, dehisces, and allows the loose seed to escape. Sometimes the pericarp is hard, forming a nut, as in some genera of *Bambuseae,* while in other *Bambuseae* it becomes thick and fleshy, forming a berry often as large as an apple. In *Melocanna* the berry forms an edible fruit 3 or 4 in. long, with a pointed beak of 2 in. more; it is indehiscent, and the small seed germinates whilst the fruit is still attached to the tree, putting out a tuft of roots and a shoot, and not falling till the latter is 6 in. long. The position of the embryo is plainly visible on the front side at the base of the grain. On the other, posterior, side of the grain is a more or less evident, sometimes punctiform, sometimes elongated or linear mark, the hilum, the place where the ovule was fastened to the wall of the ovary. The form of the hilum is constant throughout a genus, and sometimes also in whole tribes.

The testa is thin and membranous but occasionally coloured, and the embryo small, the great bulk of the seed being occupied by the hard farinaceous endosperm (albumen) on which the nutritive value of the grain depends. The outermost layer of endosperm, the aleurone-layer, consists of regular cells filled with small proteid granules; the rest is made up of large polygonal cells containing numerous starch-grains in a matrix of proteid which may be continuous (horny endosperm) or granular (mealy endosperm). The embryo presents many points of interest. Its position is remarkable, closely applied to the surface of the endosperm at the base of its outer side. This character is absolute for the whole order, and effectually separates Gramineae from Cyperaceae. The part in contact with the endosperm is plate-like, and is known as the *scutellum;* the surface in contact with the endosperm shows a special epithelial layer concerned in absorption of materials from the endosperm. In some grasses there is a small scale-like appendage opposite the scutellum, the *epiblast.* Three structures have been claimed as representing the cotyledon:—(I) the scutellum, connected by vascular tissue with the vascular cylinder of the main axis of the embryo which it more or less envelops; (2) the cellular outgrowth of the axis, the epiblast, small and inconspicuous as in wheat, or larger as in *Stipa;* (3) the coleoptile or germ-sheath, arising on the same side of the axis and above the scutellum, enveloping the plumule in the seed and appearing above ground as a generally colourless sheath from the apex of which the plumule ultimately breaks. The development of these structures, especially in relation to the origin of the vascular bundles which supply them, favours the view that the scutellum and coleoptile are highly differentiated parts of a single cotyledon.

Germination.—In germination the coleorhiza lengthens, ruptures the pericarp and fixes the grain to the ground by developing numerous hairs. The radicle then breaks through the coleorhiza, as do also the secondary rootlets where, as in the case of many cereals, these have been formed in the embryo. The germ-sheath grows vertically upwards, its stiff apex pushing through the soil, while the plumule is hidden in its hollow interior. Finally the plumule escapes, its leaves successively breaking through at the tip of the coleoptile. The scutellum meanwhile feeds the developing embryo by absorbing from the endosperm. The growth of the primary root is limited; sooner or later adventitious roots develop from the axis above the radicle which they ultimately exceed in growth.

Means of Distribution.—Various methods of scattering the grain have been adopted, in which parts of the spikelet or inflorescence are concerned. Short spikes may fall from the culm as a whole; or the axis of a spike or raceme is jointed so that one spikelet falls with each joint as in many Andropogoneae and Hordeae. In many-flowered spikelets the rachilla is often jointed and breaks into as many pieces as there are fruits, each piece bearing a glume and pale. These arrangements are, with few exceptions, lacking in cultivated cereals though present in their wild forms, so far as these are known. Such arrangements are disadvantageous for the complete gathering of the fruit, and therefore varieties in which they are not present would be preferred for cultivation. The persistent bracts (glume and pale) afford an additional protection to the fruit; they protect the embryo, which is near the surface, from too rapid wetting and, when once soaked, from drying up again. They also decrease the specific gravity, so that the grain is more readily carried by the wind, especially when, as in *Briza,* the glume has a large surface compared with the size of the grain, or when, as in *Holcus,* empty glumes also take part; in Canary grass (Phalaris) the large empty glumes bear a membranous wing on the keel

The awn which is frequently borne on the flowering glume is also a very efficient means of distribution, catching into fur of animals or plumage of birds, or as often in Stipa forming a long feather for wind-carriage. In Tragus the glumes bear numerous short hooked bristles. The fleshy berries of some Bambuseae favour distribution by animals..

The awn is also of use in burying the fruit in the soil. Thus in *Stipa,* species of Avena, Heteropogon and others the base of the glume forms a sharp point which will easily penetrate the ground; above the point are short stiff upwardly pointing hairs which oppose its withdrawal. The long awn, which is bent and closely twisted below the bend, acts as a driving organ; it is very hygroscopic, the coils untwisting when damp and twisting up when dry. The repeated twisting and untwisting, especially when the upper part of the awn has become fixed in the earth or caught in surrounding vegetation, drives the point deeper and deeper into the ground. Such grasses often cause harm to sheep by catching in the wool and boring through the skin.

A peculiar method of distribution occurs in some alpine and arctic grasses, which grow under conditions where ripening of the fruit is often uncertain. The entire spikelet, or single flowers, are transformed into small-leaved shoots which fall from the axes and readily root in the ground. Some species, such as Poa *stricta,* are known only in this viviparous condition; others, like our British species *Festuca ovina* and Poa *alpina,* become vivi-

parous under the special climatic conditions.

Classification.—Gramineae are sharply defined from all other plants. The only family closely allied is Cyperaceae, and the points of difference between the two may be here brought together. The best distinctions are found in the position of the embryo in relation to the endosperm—lateral in grasses, basal in Cyperaceae—and in the possession by Gramineae of the 2-nerved palea below each flower. Less absolute characters, but generally trustworthy and more easily observed, are the feathery stigmas, the always distichous arrangement of the glumes, the usual absence of more general bracts in the inflorescence, the split leaf-sheaths, and the hollow, cylindrical, jointed culms—some or all of which are wanting in all Cyperaceae. The same characters will distinguish grasses from the other glumiferous orders, Restiaceae, and Eriocaulonaceae, which are besides further removed by their capsular fruit and pendulous ovules. To other monocotyledonous families the resemblances are merely of adaptive or vegetative characters. Some Commelinaceae and Marantaceae approach grasses in foliage; the leaves of *Allium,* etc., possess a ligule; the habit of some palms reminds one of the bamboos; and Juncaceae and a few Liliaceae possess an inconspicuous scarious perianth. There are about 450 genera containing about 4,500 well-defined species. About 100 species, grouped in 42 genera, occur in Great Britain. According to A. S. Hitchcock about 1,500 species, grouped in 144 genera, are found in the United States.

The great uniformity among the very numerous species of this vast family renders its *classification* very difficult. The difficulty has been increased by the confusion resulting from the multiplication of genera founded on slight characters, and from the description (in consequence of their wide distribution) of identical plants under several different genera.

No characters for main divisions can be obtained from the flower proper or fruit (with the exception of the character of the hilum), and it has therefore been found necessary to trust to characters derived from the usually less important inflorescence and bracts.

The following arrangement has been proposed by Professor Eduard Hackel in his monograph on the order.

A. Spikelets one-flowered, rarely two-flowered as in *Zea*, falling from the pedicel entire or with certain joints of the rachis at maturity. Rachilla not produced beyond the flowers.

a. Hilum a point; spikelets not laterally compressed.

α Fertile glume and pale hyaline; empty glumes thick, membranous to coriaceous or cartilaginous, the lowest the largest. Rachis generally jointed and breaking up when mature.

1. Spikelets unisexual, male and female in separate inflorescences or on different parts of the same inflorescence. 1. *Maydeae.*

a. Spikelets bisexual, or male and bisexual, each male standing close to a bisexual. 2. *Andropogoneae.*

β Fertile glume and pale cartilaginous, coriaceous or papery; empty glumes more delicate, usually herbaceous, the lowest usually smallest, Spikelets falling singly from the unjointed rachis of the spike or the ultimate branches of the panicle. 3. *Paniceae.*

b. Hilum a line; spikelets laterally compressed. 4. *Oryzeae.*

B. Spikelets one- to indefinite-flowered; in the one-flowered the rachilla frequently produced beyond the flower; rachilla generally jointed above the empty glumes, which remain after the fruiting glumes have fallen. When more than one-flowered, distinct internodes are developed between the flowers.

a. Culm herbaceous annual; leaf-blade sessile, and not jointed to the sheath.

α Spikelets upon distinct pedicels and arranged in panicles or racemes.

I. Spikelets one-flowered.

i. Empty glumes 4. 5. *Phalarideae.*

ii. Empty glumes 2. 6. *Agrostideae.*

II. Spikeiets more than one-flowered.

i. Fertile glumes generally shorter than the empty glumes, usually with a bent awn on the back. 7. *Aveneae.*

ii. Fertile glumes generally longer than the empty, unawned or with a straight, terminal awn. g. *Festuceae.*

β Spikelets crowded in two close rows, forming a one-sided spike or raceme with a continuous (not jointed) rachis. 8. *Chlorideae.*

γ Spikelets in two opposite rows forming an equal-sided spike. 10. *Hordeae.*

b. Culm woody, at any rate at the base, leaf-blade jointed to the sheath, often with a short, slender petiole. 11. *Bambuseae.*

Tribe 1. *Maydeae. Zea Mays* (maize, *q.v.*, or Indian corn). *Tripsacum,* 2 or 3 species in subtropical America north of the equator; *Ty. dactyloides* (gama grass) extends northwards to Illinois and Connecticut; it is used for fodder and as an ornamental plant. *Coix Lacryma- Jobi* (Job's tears) *q.v.*

Tribe 2. *Andropogoneae* (mainly tropical). The spikelets are arranged in spike-like racemes, and generally in pairs consisting of a sessile and stalked spikelet at each joint of the rachis. Many are savannah grasses, in various parts of the tropics, for instance the large genus *Andropogon, Elionurus* and others. *Saccharum officinarum* (sugar-cane). *Sorghum,* an important tropical cereal known as black millet or *durra* (q v.). *Imperata* is a widespread tropical genus; one species *I. arundinacea* is the principal grass of the alang-alang fields in the Malay Archipelago; it is used for thatch. *Vossia,* an aquatic grass, often floating, is found in western India and tropical Africa. In the swampy lands of the upper Nile it forms, along with a species of *Saccharurn,* huge floating grass barriers. In *Andropogon Nardus,* a native of India, but also cultivated, the rhizome, leaves and especially the spikelets of which contain a volatile oil, which on distillation yields the citronella oil of commerce. A closely allied species, *A. Schoenanthus* (lemon-grass), yields lemon-grass oil; a variety is used by the negroes in western Africa for haemorrhage. *Themeda Forskalii,* which occurs from the hlediterranean region to South Africa and Tasmania, is the kangaroo grass of Australia, where, as in South Africa, it often covers wide tracts.

Tribe 3. *Paniceae* (tropical to subtropical; a few temperate), a second flower, generally male, rarely hermaphrodite, is often present below the fertile flower. *Paspalurn* is a large tropical genus, most abundant in America, especially on the pampas and canipos; many species are good forage plants, and the grain is sometimes used for food. *Panicum,* a very polymorphic genus, and one of the largest in the order, is widely spread in all warm countries; together with species of *Paspalum* they form good forage grasses in the South American savannahs and campos. *Panicum Crus-galli* is a polymorphic cosmopolitan grass, which is often grown for fodder; in one form *(P. frumentaceum)* it is cultivated in India for its grain. *P. miliaceum* is millet (*q.v.*), and P. *altissimum,* Guinea grass. *Digitaria sanguinalis* is a very widespread grass, in Bohemia it is cultivated as a food-grain; it is also the crab-grass of the southern United States, where it is used for fodder.

Setaria italica, Hungarian grass, is extensively grown as a food-grain both in China and Japan, parts of India and western Asia, as well as in Europe, where its culture dates from prehistoric times; it is found in considerable quantity in the lake dwellings of the Stone age.

In *Cenchrus* the bristles unite to form a tough spiny capsule; *C. tribuloides* (bur-grass) and other species are troublesome weeds in North and South America, as the involucre clings to the wool of sheep and is removed with great difficulty. *Pennisetum typhoideum* is widely cultivated as a grain in tropical Africa. *Spinifex,* a dioecious grass, is widespread on the coasts of Australia and eastern Asia, forming an important sand-binder. The female heads are spinose with long bracts, fall entire when ripe and are carried away by wind or sea, becoming finally anchored in

the sand and falling to pieces.

Tribe 4. *Oryzeae* (mainly tropical and subtropical). The spikelets are sometimes unisexual, and there are often six stamens. *Leersia* is a genus of swamp grasses, one of which *L. oryzoides* occurs in the north temperate zone of both old and new worlds, and is a rare grass in Surrey, Sussex and Hampshire. *Zizania aquatica* (Tuscarora or Indian rice) is a reed-like grass growing over large areas on banks of streams and lakes in North America and north-east Asia. The Indians collect the grain, *Oryza sativa* (rice, *q.v.*), for food. *Lygeum Spartum,* with a creeping stem and stiff rush-like leaves, is common on rocky soil on the high plains bordering the western Mediterranean, and is one of the sources of esparto.

Tribe 5. *Phalarideae* (a few are South African and Australasian; the others are more widely distributed, and represented in the British flora). *Phalaris arundinacea,* is a reed-grass found on the banks of British rivers and lakes; a variety with striped leaves known as ribbon-grass is grown for ornament. *P. canariensis* (Canary grass, a native of southern Europe and the Mediterranean area) is grown for bird-food and sometimes as a cereal. *Anthoxanthum odoratum,* the sweet vernal grass of our flora, owes its scent to the presence of coumarin, which is also present in the closely allied genus *Hierochloe,* which occurs throughout the temperate and frigid zones.

Tribe 6. *Agrostideae* (occurring in all parts of the world; a number are British). *Aristida* and *Stipa* are large and widely distributed genera, occurring especially on open plains and steppes; the conspicuously awned persistent flowering glume forms an efficient means of dispersing the grain. *Stipa pennata* is a characteristic species of the Russian steppes. *St. spartea* (porcupine grass) and other species are plentiful on the North American prairies. *St. tenacissima* is the Spanish esparto grass (*q.v.*), known in North Africa as halfa or alfa. *Phleum pratense* (timothy) is a valuable fodder grass, as also is *Alopecurus pratensis* (foxtail). *Sporobolus,* a large genus in the warmer parts of both hemispheres, but chiefly America, derives its name from the fact that the seed is ultimately expelled from the fruit. *Agrostis* is a large world-wide genus, but especially developed in the north temperate zone, where it includes important meadow-grasses. *Ammophila arundinacea (Psamma arenaria)* (Marram grass) with its long creeping stems forms a useful sand-binder on the coasts of Europe, North Africa and the Atlantic states of America.

Tribe 7. *Aveneae* (seven genera are British). *Holcus lanatus* (Yorkshire fog, soft grass) is a common meadow and wayside grass with woolly or downy leaves. *Aira* is a genus of delicate annuals with slender hair-like branches of the panicle. *Deschampsia* and *Trisetum* occur in temperate and cold regions or on high mountains in the tropics; *T. pratense* (*Avena flavescens*) with a loose panicle and yellow shining spikelets is a valuable fodder-grass. *Avena fatua* is the wild oat and *A. sativa* the cultivated oat (*q.v.*). *Arrhenatherum avenaceum,* a perennial field grass, native in Britain and central and southern Europe, is cultivated in North America.

Tribe 8. *Chlorideae* (chiefly in warm countries). The only British representative is *Cynodon Dactylon* (dog's tooth, Bermuda grass) found on sandy shores in the south-west of England; it is a cosmopolitan, covering the ground in sandy soils, and forming an important forage grass in many dry climates (Bermuda grass of the southern United States, and known as durba, dub and other names in India). Species of *Chloris* are grown as ornamental grasses. *Bouteloua* with numerous species (mesquite grass, grama grass) on the plains of the south-western United States, afford good grazing. *Eleusine indica* is a common tropical weed; the nearly allied species E. *coracana* is a cultivated grain in the warmer parts of Asia and throughout Africa. *Buchloe dactyloides* is the buffalo grass of the North American prairies, a valuable fodder.

Tribe 9. *Festuceae* (tropical, temperate, arctic and alpine forms) Many are important meadow-grasses; 15 are British. *Gynerium argenteum* (pampas grass) is a native of southern Brazil and Argentina. *Arundo* and *Pkragmites* are tall reed-grasses (*see* REED) Several species of *Triodia* cover large areas of the interior of Australia, and from their stiff, sharply pointed leaves are very troublesome. *Eragrostis,* one of the larger genera of the order, is widely distributed in the warmer parts of the earth; many species are grown for ornament and E. *abyssinica* is an important food-plant in Abyssinia. *Koeleria cristata* is a fodder-grass. *Briza media* (quaking grass) is a useful meadow-grass. *Dactylis glomerata* (cocksfoot), a perennial grass with a dense panicle, common in pastures and waste places, is a useful meadow-grass. It has become naturalized in North America, where it is known as orchard grass, as it will grow in shade. *Cynosurus cristatus* (dog's tail) is a common pasture-grass. *Poa,* a large genus widely distributed in temperate and cold countries, includes many meadow and alpine grasses; eight species are British; *P. annua* is the very common weed in paths and waste places; *P. pratensis* and *P. trivialis* are also common grasses of meadows, banks and pastures, the former is the "June grass" or "Kentucky blue grass" of North America; *P. alpina* is a mountain grass of the northern hemisphere and found also in the Arctic region. The largest species of the genus is *Poa flabellata* which forms great tufts 6–7 ft. high with leaves arranged like a fan. *Glyceria fluitans,* manna-grass, so-called from the sweet grain, is one of the best fodder grasses for swampy meadows; the grain is an article of food in central Europe. *Festuca* (fescue) is also a large and widely distributed genus, but found especially in the temperate and cold zones; it includes valuable pasture grasses, such as F. *ovina* (sheep's fescue), *F. rubra;* nine species are British. The closely allied genus *Bromus* (brome grass) is also widely distributed but most abundant in the north temperate zone; *B. erectus* is a useful forage grass on dry chalky soil.

Tribe 10. *Hordeae* (about 19 genera, widely distributed; six are British). *Nardus stricta* (mat-weed), found on heaths and dry pastures, is a small perennial useless grass with slender rigid stem and leaves. *Lolium perenne,* ray- (or by corruption rye-) grass, is common in waste places and a valuable pasture-grass; *L. italicum* is the Italian ray-grass; L. *temulentum* (darnel) has many of its grains infected with a fungus which is passed on from generation to generation. *Secale cereale,* rye (*q.v.*), is cultivated mainly in northern Europe. *Agropyrum repens* (couch grass) has a long creeping underground stem, and is a troublesome weed in cultivated land; the widely creeping stem of *A. junceum,* found on sandy sea-shores, renders it a useful sand-binder. *Triticum sativum* is wheat (*q.v.*), and *Hordeum sativum,* barley (*q.v.*). *H. murinum,* wild barley, is a common grass in waste places. *Elymus arenarius* (lyme grass) occurs on sandy sea-shores in the north temperate zone and is a useful sand-binder.

Tribe 11. *Bambuseae.* Contains 23 genera, mainly tropical. *See* BAMBOO.

Distribution. — Grasses are the most universally diffused of all flowering plants. There is no district in which they do not occur, and in nearly all they are a leading feature of the flora. In number of species Gramineae comes considerably below Compositae and Leguminosae, the two most numerous orders of phanerogams. but in number of individual plants it probably far exceeds either; whilst from the wide extension of many of its species, the proportion of Gramineae to other orders in the various floras of the world is much higher than its number of species would lead one to expect. In tropical regions, where Leguminosae is the leading order, grasses closely follow as the second, whilst in the warm and temperate regions of the northern hemisphere, in which Compositae takes the lead, Gramineae again occupies the second position.

While the greatest number of species is found in the tropical zone, the number of individuals is greater in the temperate zones, where they form extended areas of turf. Turf- or meadow-formation depends upon uniform rainfall. Grasses also characterize steppes and savannahs, where they form scattered tufts. The bamboos are a feature of tropical forest vegetation, especially in the monsoon region. As the colder latitudes are entered the grasses become relatively more numerous, and are the leading family in Arctic and Antarctic regions The only countries where the order plays a distinctly subordinate part are some extra-tropical regions

of the southern hemisphere, Australia, the Cape, Chile, etc. The proportion of graminaceous species to the whole phanerogamic flora in different countries varies from nearly $\frac{1}{4}$ in the Arctic regions to about $\frac{1}{25}$ at the Cape; in the British Isles it is about $\frac{1}{12}$.

The principal climatic cause influencing the number of graminaceous species appears to be amount of moisture. A remarkable feature of the distribution of grasses is its uniformity; there are no great centres for the order, as in Compositae, where a marked preponderance of endemic species exists; and the genera, except some of the smallest or monotypic ones, have usually a wide distribution.

Many grasses are almost cosmopolitan, such as the common reed, *Phragmites communis*; and many range throughout the warm regions of the globe, *e.g., Cynodon Dactylon, Eleusine indica, Imperata arundinacea, Sporobolus indicus,* etc., and such weeds of cultivation as species of *Setaria, Echinoclzloa.* Several species of the north temperate zone, such as *Poa nemoralis,* P. *pratensis, Festuca ovitza, F. rubra* and others are absent in the tropics but reappear in the antarctic regions; others (*e.g., Phleum alpinum*) appear in isolated positions on high mountains in the intervening tropics. No tribe is confined to one hemisphere and no large genus to any one floral region; facts which indicate that the separation of the tribes goes back to very ancient times.

Of specially remarkable species *Lygeum* is found on the seasand of the eastern half of the Mediterranean basin, and the minute *Coleanthus* occurs in three or four isolated spots in Europe (Norway, Bohemia, Austria, Normandy), in North-east Asia (Amur) and on the Pacific coast of North America (Oregon, Washington). Many remarkable endemic genera occur in tropical America, including *Anomochloa* of Brazil, and most of the large aquatic species with separated sexes are found in this region. The only genus of flowering plants peculiar to the arctic regions is the beautiful and rare grass *Pleuropogon Sabinii,* of Melville Island.

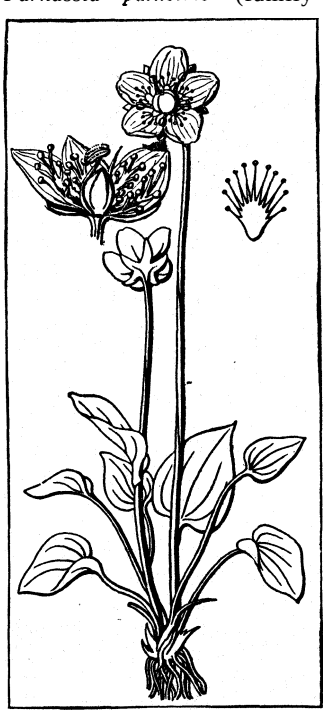
GRASSHOPPER, a name applied to insects belonging to the families *Tettigoniidae* and *Acridiidae* of the order ORTHOPTERA (q v.). They are especially remarkable for their leaping powers, due to the great development of the hind legs, and also for their stridulation which is generally, but not always, a function of the male only. The *Acridiidae,* or short-horned grasshoppers, have short and rather stout antennae, 3-jointed tarsi and an inconspicuous ovipositor. Stridulation is produced by the rasping of a row of peg-like joints, on the inner side of the femur of each hind leg, against the hardened veins of the fore-wings, thus causing the latter to vibrate: auditory organs are present on either side of the base of the abdomen. Included in this family are most of the common grasshoppers of the countryside, together with the locusts and certain more highly specialized forms. The eggs are laid in the ground or more rarely, in decaying wood: they are deposited in masses of 30–100 or more, each mass being enclosed in a kind of capsule formed of a hardened secretion. These insects are voracious devourers of vegetation both in their young and adult stages, and the name locust is often applied to any member of this family; in its strict usage the term only refers to certain destructive species that at times greatly increase in numbers and migrate considerable distances in large swarms (*see* LOCUST). The *Tettigoniidae,* or long-horned grasshoppers, were formerly termed *Locustidae:* they have long thread-like antennae, 4-jointed tarsi and a prominent ovipositor. Stridulation is produced by the rasping action of the base of the left fore-wing, where it bears a row of denticles, against a smooth area of tense membrane on the right fore-wing, and auditory organs are present on the tibiae of the fore legs. These insects are less markedly herbivorous than the *Acridiidae* and some of them are carnivorous or omnivorous. The eggs are not enclosed in capsules and are either laid in the ground, or in neat rows cut in stems, or on leaves, etc. Some forms are wingless and live on the ground or in caves, while the winged species mainly frequent bushes and trees. The bright green Katydids *(Pfzaneropterinae)* of the United States are the most notorious stridulators, and the large green *Phasgonura viridissima* occurs in the south of England, where it attracts attention from its strident call. (A. D. I.)

GRASSI, GIOVANNI BATTISTA (1854–1925), Italian zoologist, was born on March 27, 1854, at Rovellasca, and died in Rome on May 4, 1925. He graduated in medicine at Pavia, and after studying zoology at Heidelberg and Wiirzburg, was appointed professor of zoology at Catania in 1883, and of comparative anatomy at the University of Rome in 1895. He was made a senator in 1908. Grassi's important researches concern the life-history of intestinal worms, of protozoa and of eels, the Chaetognatha, the social life of the termites, the Phylloxera, the sporozoan malarial parasite of the mosquito and the transmission of malaria in man. His chief publications are: *I Chetognati* (1883); *I progenitori degli Insetti e dei Miriapodi, L'Japyx e la Campodia* (1886); *Contribuzione allo studio dei parassiti malarici* (1892, with R. Faletti); *Studi di un zoologo sulla malaria* (1900); *Flagellati viventi nei Termiti* (1917).

A complete bibliography with a good account of Grassi's work is given in *Commemorazione del socio nazionale Prof. Battista Grassi* (Castello, 1927).

GRASS OF PARNASSUS, a small herbaceous plant, *Parnassia palustris* (family Saxifragaceae), found on wet moors and bogs in Great Britain but less common in the south. The nhite regular flower is rendered very attractive by a circlet of scales, opposite the petals, each of which bears a fringe of delicate filaments ending in a yellow knob. These glisten in the sunshine and look like a drop of honey. Honey is secreted by the base of each of the scales.



GRASS OF PARNASSUS

At left is flower with front sepals, etc., removed to show pistil, nectaries and two of stamens. one of which has lost its anther and the other is in a position ready to shed pollen at touch on to stigma of visiting insect. On right is honey-bearing scale

There are about 25 species of *Parnassia,* found in north temperate regions, but chiefly in mountain bogs. Besides P. *palustris,* several other species occur in North America, mostly in the northern U.S. and Canada.

GRASSQUIT, the name applied to small finches of the genera *Sporophila* and *Tiaris* common in tropical and sub-tropical America and the West Indies. One species, S. *morelleti,* officially named Sharpe's seed-eater, ranges into the United States as far as south-eastern Texas, and two others, *T. bicolor* and *T. canora,* the melodious grassquit, occur as stragglers. The birds, about 4 in. long, dull coloured. without song, feed on seeds.

GRASS-TREE (*Xanthorrhoea hastilis*), a well-known Australian plant represented by five species and belonging to the family Liliaceae. One of the species (*X. preissii*) is commonly known as Black-boy. The plants have the habit of an aloe, with a long spike of flowers superficially resembling that of the bulrush. A resin is obtained from the bases of the old leaves.

GRASS VALLEY, a city of Nevada county. California, U.S.A., 60 mi. N.E. of Sacramento; served by highways closely intersecting U.S. highway 40, also the Southern Pacific overland

route It is the centre of the largest goid-producing district of the Pacific coast and gateway to Sierran playgrounds, both summer and winter. It is noted for its gold-rush landmarks. Pop. (1940), 5,701.

GRATIAN (FLAVIUS GRATIANUS AUGUSTUS), Roman emperor 375–383, son of Valentinian I. by Severa, was born at Sirmium in Pannonia, on April 18 or May 23, 359. On Aug. 24, 367, he received from his father the title of Augustus. On the death of Valentinian (Nov. 17, 375) the troops in Pannonia proclaimed his infant son (by a second wife Justina) emperor under the title of Valentinian II. (*q.v.*). Gratian acquiesced in their choice; reserving for himself the administration of the Gallic provinces, he handed over Italy, Illyria and Africa to Valentinian and his mother, who fixed their residence at Milan. The division, however, was merely nominal, and the real authority remained in the hands of Gratian. The eastern portion of the empire was under the rule of his uncle Valens. In May 378 Gratian completely defeated the Lentienses, the southernmost branch of the Alamanni, at Argentaria, near the site of the modern Colmar.

When Valens met his death fighting against the Goths near Adrianople on Aug. 9 in the same year, the government of the eastern empire devolved upon Gratian, but feeling himself unable to resist unaided the incursions of the barbarians. he ceded it to Theodosius (Jan. 379). With Theodosius he cleared the Balkans of barbarians. Gratian governed at first with energy and success, but gradually he sank into indolence, occupied himself chiefly with hunting, and became a tool in the hands of the Frankish general Merobaudes and bishop Ambrose. By taking into his personal service a body of Alani, and appearing in public in the dress of a Scythian warrior, he aroused the contempt and resentment of his Roman troops. A Roman named Maximus raised the standard of revolt in Britain, and invaded Gaul with a large army, upon which Gratian, who was then in Paris, being deserted by his troops, fled to Lyons, where, through the treachery of the governor, he was delivered over to one of the rebel generals and assassinated on Aug. 25, 383.

During the reign of Gratian orthodox Christianity for the first time became dominant throughout the empire. In dealing with pagans and heretics Gratian, who during his later years was greatly influenced by Ambrose, bishop of Milan, exhibited severity and injustice at variance with his usual character. He prohibited heathen worship at Rome; refused to wear the insignia of the pontifex maximus as unbefitting a Christian; removed the altar of Victory from the senate-house at Rome, in spite of the remonstrance of the pagan members of the senate, and confiscated its revenues; forbade legacies of real property to the Vestals; and abolished other privileges belonging to them and to the pontiffs.

For Gratian's treatment of the heretics the church histories of the period should be consulted.

See Ammianus Marcellinus xxvii.–xxxi.; Aurelius Victor, *Epit.* 47; Zosimus iv. vi.; Ausonius (Gratian's tutor) especially the *Gratiarum actio pro consulatu;* Symmachus x. epp. 2 and 61; Ambrose, *De fide,* prolegomena to *Epistolae* 11, 17, 21 *Consolatio de obitu Valentiniani;* H. Richter, *Das weströmische Reich, besonders unter den Kaisern Gratian, Valentinian II. und Maximus* (1865); A. de Broglie, *L'Église et l'empire romain au IVe siècle* (4th ed., 1882); H. Schiller, *Geschichte der römischen Kaiserzeit* (1883–86), iii., iv. 31–33; Gibbon, *Decline and Fall,* ch. 27; *R.* Gumpoltsberger, *Kaiser Gratian* (1879); *T.* Hodgkin, *Italy and her Invaders* (1892), vol. i.; J. Wordsworth in Smith's *Dictionary of Christian Biography.*

GRATIANUS, FRANCISCUS, compiler of the *Concordia discordantium canonum* or *Decretum Gratiani,* and founder of the science of canon law, was born about the end of the 11th century, and at an early age entered the Camaldulian monastery of Classe near Ravenna, whence he afterwards removed to that of San Felice in Bologna, where he prepared the *Concordia,* which on internal evidence seems to have been completed before 1150. He is said to have been bishop of Chiusi.

For the *Decretum Gratiani* and its history *see* CANON LAW. The best edition is that of Friedberg *(Corpus juris canonici,* Leipzig, 1879). Compare Schultze, *Zur Geschichte der Litteratur über das Decret Gratians* (1870), *Die Glosse zum Decret Gratians* (1872), and *Geschichte der Quellen und Litteratur des kanonischen Rechts* (3 vols., Stuttgart, 1875).

GRATTAN, HENRY (1746–1820), Irish statesman, son of James Grattan, for many years recorder of Dublin, was born in Dublin on July 3, 1746. At Trinity college, Dublin, he began a lifelong devotion to classical literature and especially to the great orators of antiquity. He was called to the Irish bar in 1772, but never seriously practised. Like Flood he cultivated his natural genius for eloquence by study of good models, including Bolingbroke and Junius. Flood influenced Grattan's political aims; and it was through no design on Grattan's part that when Lord Charlemont brought him into the Irish parliament in 1775, in the very session in which Flood damaged his popularity by accepting office, Grattan quickly superseded his friend in the leadership of the national party. His speeches were packed with epigram, and expressed with rare felicity of phrase; his terse and telling sentences were richer in profound aphorisms and maxims of political philosophy than those of any other statesman save Burke; he possessed the orator's incomparable gift of conveying his own enthusiasm to his audience and convincing them of the loftiness of his aims.

The principal'object of the national party was to set the Irish parliament free from constitutional bondage to the English privy council. The menacing attitude of the Volunteer Convention at Dungannon greatly influenced the decision of the government in 1782 to resist the agitation no longer. It was through ranks of volunteers drawn up outside the parliament house in Dublin that Grattan passed on April 16, 1782, to move a declaration of the independence of the Irish parliament. "I found Ireland on her knees," Grattan exclaimed, "I watched over her with a paternal solicitude; I have traced her progress from injuries to arms, and from arms to liberty. Spirit of Swift, spirit of Molyneux, your genius has prevailed! Ireland is now a nation!" After a month of negotiation the claims of Ireland were conceded. The gratitude of his countrymen to Grattan found expression in a parliamentary grant of £100,000, which had to be reduced by one half before he would consent to accept it.

One of the first acts of "Grattan's parliament" was to prove its loyalty to England by passing a vote for the support of 20,000 jailors for the navy. Grattan himself never failed in loyalty to the crown and the English connection. He desired moderate parliamentary reform, and, unlike Flood, he favoured Catholic emancipation. The Irish House of Commons was still subject to the influence of corruption, which the English government had wielded through the Irish borough owners, known as the "undertakers," or more directly through the great executive officers. "Grattan's parliament" had no control over the Irish executive. The great majority of the people were excluded as Roman Catholics from the franchise; two-thirds of the members of the House of Commons were returned by small boroughs at the absolute disposal of single patrons. It was to give stability and true independence to the new constitution that Grattan pressed for reform. Having quarrelled with Flood over "simple repeal" Grattan also differed from him on the question of maintaining the Volunteer Convention. He opposed the policy of protective duties, but supported Pitt's commercial propositions in 1785 for establishing free trade between Great Britain and Ireland, which, however, had to be abandoned.

In general Grattan supported the government for a time after 1782, and in particular spoke and voted for the stringent coercive legislation rendered necessary by the Whiteboy outrages in 1785; but as the years passed without Pitt's personal favour towards parliamentary reform bearing fruit in legislation, he gravitated towards the opposition, agitated for commutation of tithes in Ireland, and supported the Whigs on the regency question in 1788. In 1792 he succeeded in carrying an Act conferring the franchise on the Roman Catholics; in 1794 in conjunction with William Ponsonby he introduced a reform bill which was even less democratic than Flood's bill of 1783. The defeat of Grattan's mild proposals helped to promote more extreme opinions, which, under French revolutionary influence, were now becoming heard in Ireland.

In 1794 Lord Fitzwilliam became lord-lieutenant of Ireland. It was arranged that Grattan should bring in a Roman Catholic

emancipation bill, and that it should then receive government support. But finally it appeared that the viceroy had either misunderstood or exceeded his instructions; and on Feb. 19, 1795, Fitzwilliam was recalled. The English cabinet was now determined firmly to resist the Catholic demands, with the result that Ireland rapidly drifted towards rebellion. Grattan warned the Government in a series of masterly speeches of the lawless condition to which Ireland had been driven, but his words were unheeded. He retired from parliament in May 1797, and departed from his customary moderation by attacking the government in an inflammatory "Letter to the citizens of Dublin." The rebellion of 1798 was sternly and cruelly repressed. The project of a legislative union between the British and Irish parliaments was taken up in earnest by Pitt's government. Grattan from the first denounced the scheme with implacable hostility.

When in 1799 the government brought forward their bill it was defeated in the Irish House of Commons. Grattan was still in retirement. His popularity had temporarily declined, and the fact that his proposals for parliamentary reform and Catholic emancipation had become the watchwords of the rebellious United Irishmen had brought upon him the bitter hostility of the governing classes. He was dismissed from the privy council; his portrait was removed from the hall of Trinity College; the Merchant Guild of Dublin struck his name off their rolls. But the threatened destruction of the constitution of 1782 quickly restored its author in the affections of the Irish people. On Jan. 1j, 1800 the Irish parliament met for its last session; on the same day Grattan secured by purchase a seat for Wicklow; and at a late hour, while the debate was proceeding, he appeared to take his seat. "There was a moment's pause, an electric thrill passed through the House, and a long, wild cheer burst from the galleries." (Lecky, Leaders of Public *Opinion in* Ireland.) Grattan's strength gave way when he rose to speak and he obtained leave to address the House sitting. For more than two hours he kept his audience spellbound by a flood of epigram, of sustained reasoning, of eloquent appeal. After prolonged debates Grattan, on May 26, spoke finally against the committal of the bill, ending with an impassioned peroration in which he declared, "I will remain anchored here with fidelity to the fortunes of my country, faithful to her freedom, faithful to her fall." (Grattan's Speeches, iv. 23). These were the last words spoken by Grattan in the Irish parliament.

For the next five years Grattan took no active part in public affairs; in 1805 he became a member of the parliament of the United Kingdom. He modestly took his seat on one of the back benches, till Fox brought him forward to a seat near his own, exclaiming, "This is no place for the Irish Demosthenes!" When Fox and Grenville came into power in 1806 Grattan was offered, but refused to accept, an office in the government. In the following year he showed the strength of his judgment and character by supporting, in spite of consequent unpopularity in Ireland, a measure for increasing the powers of the executive to deal with Irish disorder. Roman Catholic emancipation, which he continued to advocate with unflagging energy though now advanced in age, became complicated after 1808 by the question whether a veto on the appointment of Roman Catholic bishops should rest with the crown.

Grattan supported the veto, but a more extreme Catholic party was now arising in Ireland under the leadership of Daniel O'Connell and Grattan's influence gradually declined. He seldom spoke in parliament after 1810, the most notable exception being in 1815, when he separated himself from the Whigs and supported the final struggle against Napoleon. His last speech of all, in 1819, contained a passage referring to the union he had so passionately resisted, which exhibits the statesmanship and at the same time the equable quality of Grattan's character. His sentiments with regard to the policy of the union remained, he said, unchanged; but "the marriage having taken place it is now the duty, as it ought to be the inclination, of every individual to render it as fruitful, as profitable and as advantageous as possible." He died on June 6, 1820, and was buried in Westminster Abbey close to the tombs of Pitt and Fox. His statue is in the outer lobby of the Houses of Parliament at Westminster. Grattan had married in 1782 Henrietta Fitzgerald, a lady descended from the ancient family of Desmond, by whom he had two sons and two daughters.

The most searching scrutiny of his private life only increases the respect due to the memory of Grattan as a statesman and the greatest of Irish orators. Sydney Smith said with truth of Grattan soon after his death: "No government ever dismayed him. The world could not bribe him. He thought only of Ireland; lived for no other object; dedicated to her his beautiful fancy, his elegant wit, his manly courage, and all the splendour of his astonishing eloquence."

(C.)

GRATTIUS [FALISCUS], Roman poet, of the age of Augustus, author of a poem on hunting (Cynegetica), of which 541 hexameters remain. He was possibly a native of Falerii. The only reference to him in any ancient writer is incidental (Ovid, *Ex Ponto,* iv. 16. 33). He describes various kinds of game, methods of hunting, the best breeds of horses and dogs.

There are editions by R. Stern (1832); E. Bahrens in *Poetae Latini Minores* (i., 1879) and G. G. Curcio in *Poeti Latini Minori* (i., 1902), with bibliography; critical edition with notes by P. J. Enk, Zutphen, 1918; *see* also H. Schenkl, *Zur Kritik des G.* (1898). There is *a* translation by Christopher Wase (1654).

GRATZ, HEINRICM (1817–1891), German-Jewish historian, was born at Xions, Posen, on Oct. 31, 1817, and died at Munich on Sept. 7, 1891. He received a desultory education, but spent three years at Oldenburg as assistant and pupil of S. R. Hirsch. He matriculated in 1842 at Breslau, then the headquarters of Abraham Geiger, the leader of Jewish reform, whose attitude repelled him. Gratz remained a conservative, in spite of the radical views on the Bible and tradition which made him an opponent of Hirsch. He fought for freedom of thought, but not of ritual practice. In 1853 he became famous by the publication of the fourth volume of his history of the Jews, in which he dealt with the Talmud. In 1869 he became a professor of Breslau university. His *Geschichte* der *Juden* (11 vols. 1853–1875, Eng. trs. 5 vols. 1889–95) is a work of genius, in spite of his somewhat biassed judgments, and in particular his lack of sympathy with

'Sydney Smith's *Works,* ii. 166–167.

mysticism. Gratz was also a considerable biblical critic.

A full bibliography of Grätz's works and a memoir are given in the Jewish Quarterly Review iv., 194. A full memoir was prefixed to the "index" volume of the History in the American re-issue of the English translation (6 vols. Philadelphia, 1898).

GRAUDENZ: see GRUDZIANZ.

GRAUN, KARL HEINRICH (1701–1759), German composer, the youngest of three brothers, all musicians, was born on May 7, 1701, at Wahrenbriick, Saxony. Graun's beautiful soprano voice secured him an appointment in the choir at Dresden. At an early age he composed a number of sacred cantatas and other pieces for the church service. He completed his studies under Johann Christoph Schmidt (1664–1728), and profited much by the Italian operas which were performed at Dresden under the composer Lotti. He made his début as a tenor in opera at Brunswick, in a work by Schiirmann, an inferior composer of the day; but not being satisfied with the arias assigned him he rewrote them, and in the result was commissioned to write a complete opera for the next season. This work, *Polydorus* (1726), and five other operas, together with two settings of the Passion, belong to the Brunswick period. In 1735 Frederick the Great, at that time crown prince of Prussia, engaged Graun for his private chapel at Rheinsberg. There he remained for five years, and wrote a number of cantatas, mostly to words written by Frederick himself in French, and translated into Italian by Boltarelli. On his accession to the throne in 1740, Frederick sent Graun to Italy to engage singers for a new opera to be established at Berlin. Graun remained a year on his travels singing in the chief cities of Italy. After his return to Berlin he was appointed conductor of the royal orchestra (*Kapellmeister*) and in this capacity he wrote 28 operas, all to Italian words, of which the last, *Merope* (1756), is perhaps the best. It was however in his oratorio Der Tod Jesu (1755) that he revealed to the full his powers and produced a work which gained for him the highest applause. In Germany indeed Der Tod Jesu long held a place similar to that occupied by The Messiah in England, being regularly performed in Holy Week for a century and a half after the composer's death. The Te Deum written to celebrate the victory of Prague (1757) was another of Graun's sacred choral works which found great favour and showed him at his best. Graun died on Aug. 8, 1759, at Berlin, in the same house in which, 32 years later, Meyerbeer was born.

See K. Mennicke, Hasse und die *Brüder* Graun *als* Sinfoniker (1906), in which a thematic catalogue of Graun's works will be found.

GRAVAMEN, a complaint or grievance, the ground of a legal action, and particularly the more serious part of a charge against an accused person. In English the term is used chiefly in ecclesiastical cases, being the technical designation of a memorial presented from the Lower to the Upper House of Convocation, setting forth grievances to be redressed, or calling attention to breaches in church discipline.

GRAVE. (1) A place dug out of the earth in which a body is laid for burial (see DEAD, DISPOSAL OF THE; BURIAL). The verb "to grave," is used of the making of incisions in a hard surface (see ENGRAVING). (2) A title, now obsolete, of a local administrative official for a township in certain parts of Yorkshire and Lincolnshire; it also appears in the form "grieve," which in Scotland and Northumberland is used for sheriff (*q.v.*), and for a bailiff or under-steward. It is probably connected with the German graf, count, and thus appears as the second part of many Teutonic titles, such as landgrave, burgrave and margrave. "Grieve," on the other hand, seems to be a form of O.E. gerefa, reeve; (3) To grave a ship's bottom is to clean it in a specially constructed dock, called a "graving dock."

GRAVE CREEK MOUND, a prehistoric earthwork, near Moundsville, Marshall county, West Virginia, known since 1734, as appears from the date cut in a tree growing from its summit. It is the largest of the conical type of mounds in the United States, having a basal diameter of 320 feet, a height of 70 feet, and about 1,870,000 cu. ft. of solid contents. It is symmetrical in form and has a depression in the top. In 1838 excavation disclosed a burial vault at the base and another 30 ft. above, each built of logs and covered with stones. The lower contained two human skeletons, the upper vault one; and with each were thousands of shell beads. mica ornaments; copper bracelets, and several stone articles, including, it was said, one with an inscription which gave rise to much discussion. Subsequent investigation, however, failed to establish the authenticity of the stone or to prove that it came from the mound.

GRAVEL or **PEBBLE-BEDS,** the name given to deposits of rounded or sub-angular, water-worn stones, mingled with finer material such as sand or clay. The word "gravel" is adapted from the O.Fr. gravele, mod. gravelle, dim. of grave, coarse sand, seashore, Mod. Fr. *grève*. In petrology, the word is used in a technical sense for material of diameter greater than zmm., material of smaller diameter being termed sand. The deposits of gravel are produced by the attrition of rock-fragments by moving water —the tides, waves of the sea and lakes, and the flow of rivers. Extensive beds of gravel (shingle-beaches) are formed at the present day on coasts where suitable rocks are exposed to the attack of the atmosphere and of waves. In consequence of the continuous movement by shore-currents, intensified during storms, the coasts are often protected and the gravel caused to accumulate by the building of groynes, sea-walls and piers. Where the pebbles are swept aiong to a projecting cape or into a quieter area, they may form nazes (*e.g.,* Orfordness, Dungeness) or long spits (Chesil Bank), or submarine banks.

In many parts of Eritain, Scandinavia and North America, there are marine gravels in every respect resembling those of the sea-shore, at levels considerably above high-tide. These gravel terraces (or "raised-beaches") often extend for great distances and are indication that the sea at one time stood higher than it does at present.

River-gravels occur most commonly in the middle and upper parts of streams where the currents are active in times of flood. Ancient terraces of gravel are often found at levels considerably above those of the present rivers. They mark the greater activity of the streams or are evidence of uplift of the country, whereby the rivers have been able to cut their beds to a lower level.

The pebbles of gravels resemble those of conglomerates (*q.v.*), which are pebble-beds cemented by calcareous, siliceous or other material. (P. G. H. B.)

GRAVELINES (Flem. Gravelinghe), a seaport town of northern France, in the department of Nord and arrondissement of Dunkerque, near the mouth of the Aa, 15 mi. S.W. of Dunkirk on the railway to Calais. Pop. (1936) 2,057. The canalization of the Aa by a count of Flanders about the middle of the 12th century led to the foundation of Gravelines (grave-linghe, meaning "count's canal"). It finally passed from the Spaniards to the French by the Treaty of the Pyrénées in 1659. It is fortified by a double circuit of ramparts and by a tidal moat.

The river is canalized and opens out beneath the fortifications into a floating basin. Its trade has suffered owing to the nearness of Calais and Dunkirk and the silting up of the channel to the sea. It is a centre for the cod and herring fisheries. Imports consist ordinarily of timber from Northern Europe and coal from England, to which eggs and fruit are exported. Gravelines has paper-manufactories, sugar-works, fish-curing works, salt-refineries, chicory-roasting factories, a cannery for preserved vegetables, and an important timber-yard. The greater part of the population of Gravelines dwells in the maritime quarter of Petit-Fort-Philippe at the mouth of the Aa, and in the village of Les Huttes (to the east of the town), which is inhabited by the fisher-folk.

GRAVELOTTE, a village of Lorraine near Metz, famous as the scene of the battle of Aug. 18, 1870, between the Germans under King William of Prussia and the French under Marshal Bazaine (see METZ and FRANCO-GERMAN WAR). The battlefield extends from the woods which border the Moselle above Metz to Roncourt, near the river Orne. Other villages which played an important part in the battle of Gravelotte were Saint Privat, Amanweiler or Amanvillers and Sainte-Marie-aux-Chênes, all lying to the north of Gravelotte.

GRAVES, ALFRED PERCEVAL (1846–1931), Irish writer, was born in Dublin on July 22, 1846, the son of the bishop of Limerick. He was educated at Windermere College, and took high honours at Dublin University. In 1869 he entered the Civil

Service as clerk in the Home Office; he was an inspector of schools from 1875 to 1910. He was a constant contributor of prose and verse to the *Spectator, The Athenaeum, John Bull* and *Punch,* and took a leading part in the revival of Irish letters and in the pan-Celtic movement. He was for twelve years secretary and twice president of the Irish Literary Society, and is the author of the famous ballad of "Father O'Flynn" and many other songs and ballads. In collaboration with Sir C. V. Stanford he published *Songs of Old Ireland* (1882), *Irish Songs and Ballads* (1893), the airs of which are taken from the Petrie MSS., and *Songs of Erin* (1901); the airs of his *Irish Folk Songs* (1897) and *Irish Countryside Songs* (1908) were arranged by Charles Wood. In addition to many editions of Erse poetry he edited and translated Welsh poems.

GRAVES, ROBERT RANKE (1895–), English poet and author, the son of A. P. Graves, the Irish song-writer, author of "Father O'Flynn." Robert Graves was educated at Charterhouse, and at St. John's college, Cambridge. During the World War he served in France with the Royal Welsh Fusiliers, and was seriously wounded on the Somme. He has published since 1915 several volumes of poetry, and critical essays.

His *Collected Poems* were published in 1927 and 1938. His prose works include:—*On English Poetry* (1921); *the Meaning of Dreams* (1924); *Contemporary Technique of Poetry* (1925); *Goodbye to All That* (1929); *I, Claudius* (1934).

GRAVES: WINES OF. The wines of Graves are those made from grapes grown in the vineyards of the Graves district of Bordeaux. This district, which owes its name to its gravel soil, begins just outside Bordeaux; it extends about five and a half miles west of that city and thirteen miles to the south, along the left bank of the river Garonne.

There are both red and white wines of Graves, the red being the best, although the white wines are better known than the red, under the name of Graves.

The red wines of Graves are usually sold under the name of the Estate or Chbteau where they are made. The finest Graves is the wine of Chbteau Haut-Brion, which ranks with the three first growths of the Médoc. Chbteau Haut-Brion is in the Commune, or parish of Pessac, where are situated other Chbteaux famous for the excellence of their red wines, such as Chbteau La Mission Haut-Brion, Chbteau Pape Clément, etc. The other communes, or parishes, of the Graves district, which are renowned for the quality of their red wines are the following: Léognan, Martillac, Villenave d'Ornon and Mérignac.

The red wines of Graves are softer, rounder, "fleshier," than the wines of the Médoc, and they do not last so long, nor do they possess, a very few of the best growths excepted, the same refined delicacy or "breed"; their bouquet is quite distinctive.

The white wines of Graves are not nearly so fine as the red: they are a most useful and agreeable type of wine, neither too sweet nor too dry, and they are usually consumed when quite young, as they are not likely to improve appreciably by age. They are sometimes sold under the name of their birthplace, the name of the parish, estate, chbteau or vineyard where they were made; they are also sometimes sold under some fancy name, the name of some imaginary or historical person or place, registered as a trade-mark; but the majority of the white wines of Graves reach the public merely under the name of Graves, being blends of white wines from the Graves district from different vineyards and possibly also from different vintages. *(See* WINE.)

(A. L. S.)

GRAVESEND, municipal borough, river-port and market town in the Gravesend parliainentary division of Kent, England, on the Thames opposite Tilbury Fort, 22 mi. S.E. of London by the S.R. Pop. (1938) 39,740. Area 7.2 sq.mi.

In the Domesday Survey "Gravesham" is among the bishop of Bayeux's lands, and a "hythe" or landing-place is mentioned. In 1401 Henry IV granted the men of Gravesend the sole right of conveying in their own vessels all persons travelling between London and Gravesend; this was confirmed by Edward IV in 1462. Elizabeth's incorporation of 1562 vested the government in 2 portreeves and 12 jurats, but a later charter (1568) reduced the portreeves to 1. Charles I incorporated the town anew under a "mayor, jurats and inhabitants," and a further charter of liberties was granted by James II in 1687.

From the early 17th century Gravesend was the chief station for East Indiamen. A custom house was built in 1782. Queen Elizabeth established Gravesend as the point where the corporation of London should welcome in state eminent foreign visitors arriving by water. State processions by water from Gravesend to London had previously taken place, as in 1522, when Henry VIII escorted the emperor Charles V.

"Princess" Pocahontas, who died when preparing to return home from a visit to England in 1617, was buried in the old church. Gravesend extends 2 mi. along the river bank, occupying the slopes of Windmill hill. The older lower town is irregular with narrow streets.

The town pier was erected in 1834, and the terrace pier in 1845, when local river-traffic by steamboat was specially prosperous. It is a principal pilot station, and vessels wait here for the tide to come up to London. It is also a yachting centre. Milton parish church is a Decorated (14th cent.) and Perpendicular building. East of the town are the earthworks originally constructed in the reign of Charles II. Gravesend is within the Port of London and it is here that all vessels arriving from foreign countries are visited for health purposes. It has some import trade in coal, lime and timber, and fishing is carried on. Other industries are papermaking, boatbuilding and iron founding. Fruit and vegetables are largely grown for the London market. From 1867 to 1918 Gravesend returned one member to parliament.

GRAVIES. A gravy is a sauce made from the juices and fats extracted from meats in cooking. The term is also applied to the thickened liquid of stews. Ordinary meat gravies are distinguished from sauces by their predominating element (osmazome), which gives them their characteristic meat flavour. A plain meat gravy is the diluted juices of meat. It may be made: *(a)* by pouring hot water over a dripping pan, adding salt and pepper and boiling until the sediment in the pan has coloured to a brown colour; where a plain gravy is not well coloured, extra colouring may be added in the form of browned flour or of an artificial colouring made for the purpose; (b) by stewing shank-ends of legs of mutton or other bones, gravy beef, etc., to form a stock; (c) by artificial means; *i.e.,* gravy powders sold for the purpose. Meat gravies are often thickened with flour, and milk is sometimes added. Gravy is used with roast meat, game and poultry, but where meat is stuffed with forcemeat it is usual to serve a thickened gravy. In certain cases it is advisable to have extra flavouring added to the gravy, such as garlic, spices, walnut or mushroom ketchup, lemon juice, etc. Generally speaking, these are used for stews and inferior meats, etc., to give extra flavour. For varnishing galantines, savoury rolls, etc., glaze is used. This is made by reducing a good brown gravy (generally made from brown stock) until it is of sticky, glaze-like consistency.

(J. A. SI.)

GRAVINA, a town and episcopal see of Apulia, Italy, in the province of Bari, 36 m. S.W. from Bari by rail (29 m. direct), 1,148 ft. above sea-level. Pop. (1936) 21,909 (town), 23,208 (commune). The town perhaps occupies the site of the ancient Blera, a post station on the Via Appia. The cathedral is mainly of the 15th century. The town is surrounded with walls and towers, and a castle of the emperor Frederick II. rises above the town. which later belonged to the Orsini, dukes of Gravina; just outside it are dwellings and a church (S. Michele), all of which have been hewn in the rock.

GRAVING DOCK, a narrow basin, closed by gates or by a caisson, in which a vessel may be placed and from which the water may be pumped or let out, leaving the vessel supported on blocks. In this way the ship is left dry and accessible for the purposes of examination, cleaning and repairs of the underwater parts of the hull. In British ports the term "dry dock" is more often used than graving dock. The word "graving" was originally used to denote the cleaning of a ship's bottom by means of scraping or burning and coating with tar. (See DOCKS.)

(N. G. G.)

GRAVITATION, in physical science is that mutual action between masses of matter by virtue of which every such mass tends toward every other with a force varying directly as the product of the masses and inversely as the square of their distances apart. Although the law was first clearly and rigorously formulated by Sir Isaac Newton, the fact of the action indicated by it was more or less clearly seen by others. Even Ptolemy had a vague conception of a force tending toward the centre of the earth which not only kept bodies upon its surface, but in some way upheld the order of the universe. John Kepler inferred that the planets move in their orbits under some influence or force exerted by the sun; but the laws of motion were not then sufficiently developed, nor were Kepler's ideas of force sufficiently clear, to admit of a precise statement of the nature of the force. C. Huygens and R. Hooke, contemporaries of Newton, saw that Kepler's third law implied a force tending toward the sun which, acting on the several planets, varied inversely as the square of the distance. But two requirements necessary to generalize the theory were still wanting. One was to show that the law of the inverse square not only represented Kepler's third law, but his first two laws also. The other was to show that the gravitation of the earth, following one and the same law with that of the sun, extended to the moon. Newton's researches showed that the attraction of the earth on the moon was the same as that for bodies at the earth's surface, only reduced in the inverse square of the moon's distance from the earth's centre. He also showed that the total gravitation of the earth, assumed as spherical, on external bodies, would be the same as if the earth's mass were concentrated at its centre. This led at once to the statement of the law in its most general form.

The law of gravitation states that two masses M_1 and M_2, distant d from each other, are pulled together each with a force GM_1M_2/d^2 where G is a constant for all kinds of matter—the gravitation constant. The acceleration of M_2 towards M_1 or the force exerted on it by M_1 per unit of its mass is therefore GM_1/d^2.

The aim of the experiments to be described here may be regarded either as the determination of the mass of the earth in grammes, most conveniently expressed by its mass ÷ its volume, that is, by its mean density A, or the determination of the gravitation constant G. Corresponding to these two aspects of the problem there are two modes of attack. Suppose that a body of mass m is suspended at the earth's surface where it is pulled with a force w vertically downwards by the earth—its weight. At the same time let it be pulled with a force p by a measurable mass M which may be a mountain, or some measurable part of the earth's surface layers, or an artificially prepared mass brought near m, and let the pull of M be the same as if it were concentrated at a distance d. The earth pull may be regarded as the same as if the earth were all concentrated at its centre, distant R.

Then $$w=G\cdot\tfrac{4}{3}\pi R^3\Delta m/R^2=G\cdot\tfrac{4}{3}\pi R\Delta m \qquad (1)$$

and $$p=GMm/d^2 \qquad (2)$$

By division $$A=\frac{3M}{4\pi Rd^2}\cdot\frac{w}{p}$$

If then we can arrange to observe w/p we obtain A, the mean density of the earth.

But the same observations give us G also. For, putting $m=w/g$ in (2), we get

$$G=\frac{d^2}{M}\cdot\frac{p}{w}\cdot g,$$

In the second method of attack the pull p between two artificially prepared measured masses M_1, M_2, is determined when they are a distance d apart, and since $p=GM_1M_2/d^2$ we get at once $G=pd^2/M_1M_2$. But we can also deduce **A.** For putting $w=mg$ in (1) we get

$$\Delta=\frac{3}{4}\cdot\frac{g}{G}\cdot\frac{1}{\pi R}.$$

Experiments of the first class in which the pull of a known mass is compared with the pull of the earth may be termed experiments on the mean density of the earth, while experiments of the second class in which the pull between two known masses is directly measured may be termed experiments on the gravitation constant.

We shall, however, adopt a slightly different classification for the purpose of describing methods of experiment, viz.:—

(1) Comparison of the earth pull on a body with the pull of a natural mass as in the Schiehallien experiment.

(2) Determination of the attraction between two artificial masses as in Cavendish's experiment.

(3) Comparison of the earth pull on a body with the pull of an artificial mass as in experiments with the common balance.

It is interesting to note that the possibility of gravitation experiments of this kind was first considered by Newton, in both of the forms *(1)* and *(2)*. In the *System* of *the World* (3rd ed., 1737, p. *40)* he calculates that the deviation by a hemispherical mountain, of the earth's density and with radius 3 m., on a plumb line at its side will be less than *2* minutes. He also calculates (though with an error in his arithmetic) the acceleration towards each other of two spheres each a foot in diameter and of the earth's density, and comes to the conclusion that in either case the effect is too small for measurement. In the *Principia,* bk. iii., prop. x., he makes a celebrated estimate ihdt the earth's *mean* density is five or six times that of water. Adopting this estimate, the deviation by an actual mountain or the attraction of two terrestrial spheres would be of the orders calculated, and regarded by Newton as immeasurably small.

Whatever method is adopted the force to be measured is very minute. This may be realized if we here anticipate the results of the experiments, which show that in round numbers $\mathbf{A}=5\cdot5$ and $G=\frac{1}{15,000,000}$ when the masses are in grammes and the distances in centimeters.

1. Comparison of the Earth Pull with That of a Natural Mass.—*Bouguer's* Experiments.—The earliest experiments were made by Pierre Bouguer about 1740, and they are recorded in his Figure de la *terre* (1749). They were of two kinds. In the first he determined the length of the seconds pendulum, and thence g at different levels. Thus at Quito, which may be regarded as on a table-land 1,466 toises (a toise is about *6.4* ft.) above sea-level, the seconds pendulum was less by $\frac{1}{1,331}$ than on the Isle of Inca at sea-level. But if there were no matter above the sea-level, the inverse square law would make the pendulum less by $\frac{1}{1,118}$ at the higher level. The value of g then at the higher level was greater than could be accounted for by the attraction of an earth ending at sea-level by the difference & – & = &, and this was put down to the attraction of the plateau *1,466* toises high or the attraction of the whole earth was *6,983* times the attraction of the plateau. Using the rule, now known as "Young's rule," for the attraction of the plateau, Bouguer found that the density of the earth was 4.7 times that of the plateau, a result certainly much too large.

In the second kind of experiment he attempted to measure the horizontal pull of Chimborazo, a mountain about 20,000 ft. high, by the deflection of a plumb-line at a station on its south side. Suppose that two stations are fixed one on the side of the mountain due south of the summit, and the other on the same latitude but some distance westward, away from the influence of the mountain. If at the second station a star is observed to pass the meridian, for simplicity we will say directly overhead, then a plumb-line will hang down exactly parallel to the observing telescope. If the mountain were away it would also hang parallel to the telescope at the first station when directed to the same star. But the mountain pulls the plumb-line towards it and the star appears to the north of the zenith and evidently mountain pull/earth pull = tangent of the angle of displacement of zenith

Bouguer observed the meridian altitude of several stars at the two stations, and after making the necessary corrections he concluded that the earth was nearly *13* times as dense as the mountain, a result several times too large. But the work was carried on under enormous difficulties owing to the severity of the weather, and no exactness could be expected. The importance of the experiment lay in its proof that the method was possible.

Maskelyne's Experiment.—In 1774 Nevil Maskelyne *(Phil.* Trans., 1775. p. *495)* made an experiment on the deflection of the

plumb-line by Schiehallien, a mountain in Perthshire, which has a short ridge nearly east and west, and sides sloping steeply on the north and south. He selected two stations on the same meridian, one an the north, the other on the south slope, and by means of a zenith sector, a telescope provided with a plumb-bob, he determined at each station the meridian zenith distances of a number of stars. From a survey of the district made in the years 1774–1776 the geographical differences of latitude between the two stations was found to be 42·94 seconds, and this would have been the difference in the meridian zenith distances of the same star at the two stations in the absence of the mountain. But at the north station the plumb-bob was pulled south and the zenith was deflected northwards, while at the south station the effect was reversed. Hence the angle between the zeniths, or the angle between the zenith distances of the same star at the two stations was 54·2 seconds, or the double deflection of the plumb-line was 54·2–42·94, say 11.26 seconds. The computation of the attraction of the mountain on the supposition that its density was that of the earth was made by Charles Hutton from the results of the survey (Phil. Trans., 1778, p. 689). He found that the deflection should have been greater in the ratio 17,804:9,933 say 9:5, whence the density of the earth comes out at $\frac{9}{5}$ that of the mountain. Hutton took the density of the mountain at 2.5, giving the mean density of the earth 4.5, a figure revised later by Playfair (Phil. *Trans.*, 1811, p. 347).

Airy's *Experiment.*—In 1854 Sir G. B. Airy (Phil. Trans., 1856, p. 297) carried out at Harton pit near South Shields an experiment which consisted in comparing gravity at the top and at the bottom of a mine by the swings of the same pendulum, and thence finding the ratio of the pull of the intervening strata to the pull of the whole earth. The principle of the method may be understood by assuming that the earth consists of concentric spherical homogeneous shells, the last of thickness h equal to the depth of the mine. Let the radius of the earth to the bottom of the mine be R, and the mean density up to that point be A. This will not differ appreciably from the mean density of the whole. Let the density of the strata of depth h be δ. Denoting the values of gravity above and below by g_a and g_b we have

$$g_b = G \cdot \tfrac{4}{3} \cdot \frac{\pi R^3 \Delta}{R^2} = G \cdot \tfrac{4}{3}\pi R \Delta$$

and

$$g_a = G \cdot \tfrac{4}{3} \cdot \frac{4 \cdot R^3 \Delta}{(R+h)^2} \cdot + G \cdot 4\pi h \delta$$

since the attraction of a shell h thick on a point just outside it is

$$G \cdot 4\pi(R+h)^2 h\delta/(R+h)^2 = G \cdot 4\pi h\delta.$$

Therefore

$$g_a = G \ \tfrac{4}{3}\pi \cdot R \cdot \Delta \left(1 - \frac{2h}{R} + \frac{3h}{R}\frac{\delta}{\Delta}\right) \text{ nearly,}$$

whence

$$\frac{g_a}{g_b} = 1 - \frac{2h}{R} + \frac{3h}{R} \cdot \frac{\delta}{\Delta}.$$

$$\frac{\Delta}{\delta} = \frac{3h}{R} \Big/ \left(-1 + \frac{2h}{R} + \frac{g_a}{g_b}\right).$$

Stations were chosen in the same vertical, one near the pit head, another 1,250 ft. below in a disused working, and a comparison clock was fixed at each station. Two invariable seconds pendulums were swung, and interchanged at intervals. The final result taking into account the ellipticity and rotation of the earth is A = **6·565**.

Von Sterneck's Experiments.—(Mitth. des K.U.K. Mil. Geog. *Inst. zu Wien,* ii., 1882, p. 77; 1883, p. 59; vi., 1886, p. 97.) R. von Sterneck repeated the mine experiment in 1882–1883 at the Adalbert shaft at Pribram in Bohemia and in 1885 at the Abraham shaft near Freiberg. He swung two invariable half seconds pendulums simultaneously, one at the surface, and the other below, interchanging them at intervals. Von Sterneck introduced a most important improvement by comparing the swings of the two invariable pendulums with the same clock which by an electric circuit gave a signal at each station each second. This method eliminated clock rates and began a new era in the determination of local variations of gravity. The values which von Sterneck obtained for A were not consistent, but increased with the depth of the second station, probably due to local irregularities in the strata which could not be directly detected.

All the experiments to determine A by the attraction of natural masses are open to the serious objection that we cannot determine the distribution of density in the neighbourhood with any approach to accuracy. The experiments with artificial masses next

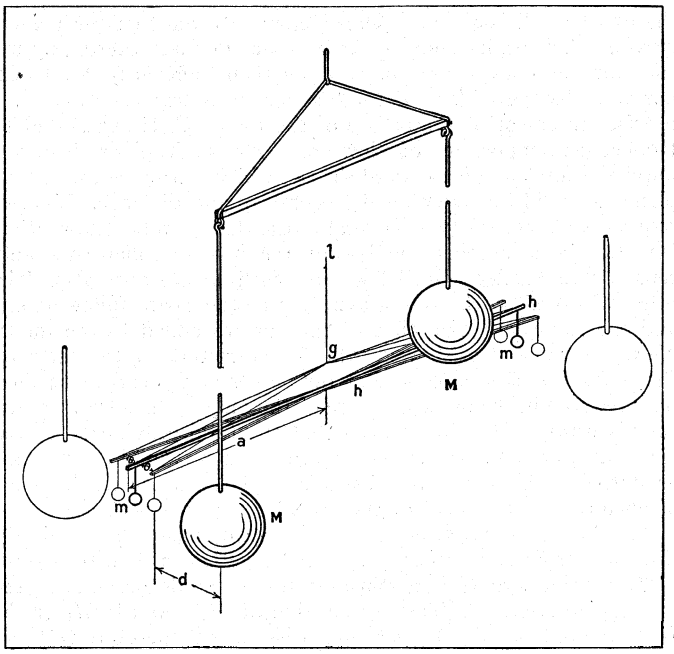

FIG. 1.—**EXPERIMENT** PROPOSED BY MICHEL, AND COMPLETED LATER BY CAVENDISH

to be described give much more consistent results, and the experiments with natural masses are now only of use in showing the existence of irregularities in the earth's superficial strata when they give results deviating largely from the accepted value.

ii. Determination of **the** Attraction Between **Two** Artificial **Masses.**—*Cavendish's* Experiment.—(Phil. Trans., 1798, p. 469.) This celebrated experiment was planned by the Rev. John Michell. He completed an apparatus for it but did not live to begin work with it. After Michell's death the apparatus came into the possession of Henry Cavendish, who largely reconstructed it, and in 1797–1798 carried out the experiment. The essential feature of it consisted in the determination of the attraction of a lead sphere 12 in. in diameter on another lead sphere 2 in. in diameter, the distance between the centres being about 9 in., by means of a torsion balance. Fig. 1 shows how the experiment was carried out. A torsion rod hh 6 ft. long, was hung by a wire *lg*. From its ends depended two lead balls *mm* each 2 in. in diameter. The position of the rod was determined by a scale fixed near the end of the arm, the arm itself carrying a vernier moving along the scale which was viewed by a distant telescope. The torsion balance was enclosed in a case and outside this two lead spheres MM each 12 in, in diameter hung from an arm which could turn round an axis in the line of gl. Suppose that first the spheres are placed so that one is at a distance d in front of the left hand ball *m* and the other is the same distance behind the right hand ball m. The two will conspire to pull the balls so that the left end of the rod moves forward. Now let the big spheres be moved round so that one is in front of the right ball and the other behind the left ball. The pulls are reversed and the left end moves backward. The angle 2θ between its two positions is (if we neglect cross attractions of right sphere on left ball and left sphere on right ball) four times as great as the deflection of the rod due to the approach of one sphere to one ball. The work of Cavendish was undoubtedly very accurate for a pioneer experiment and was not really improved upon until about a century later. After making various corrections the result obtained is **A** = 5·448.

Reich's *Experiments.*—In 1838 F. Reich published an account of a repetition of the Cavendish experiment carried out on the same general lines, though with somewhat smaller apparatus. (*Versuche über* die mittlere Dichtigkeit der Erde *mittelst* der *Drehwage*, Freiberg, 1838; "Neue: Versuche mit der Drehwage," *Leipzig* Abh. Math. Phys. i., 1852 p. 383.) The chief differences consisted in the methods of measuring the times of vibration and the deflection, and the changes were hardly improvements. His result after revision was A = 5.49. In 1852 he published an account of further work giving as result A = 5·58.

Baily's Experiment.—In 1841–1842 Francis Baily made a long series of determinations by Cavendish's method and with apparatus nearly of the same dimensions (*Memoirs* of the Royal *Astron. Soc.* xiv.). The attracting masses were 12 in. lead spheres and as attracted balls he used various masses, lead, zinc, glass, ivory, platinum, hollow brass, and finally the torsion rod alone without balls. The suspension was also varied, sometimes consisting of a single wire, sometimes being bifilar. There were systematic errors running through Baily's work, which it is impossible now wholly to explain. These made the resulting value of Δ shorn a variation with the cature of the attracted masses and a variation with the temperature. His final result A = 5·6747 is not of value compared with later results.

Boys' *Experiment.*—Professor C. V. Boys having found that it is possible to draw quartz fibres of practically any degree of fineness, of great strength and true in their elasticity, determined to repeat the Cavendish experiment, using his newly invented fibres for the suspension of the torsion rod. (Phil. *Trans.* A., 1895. pt. i., p. 1). He began by an inquiry as to the best dimensions for the apparatus, and concluded that these should be reduced until further reduction would make the linear quantities too small to be measured with exactness, for reduction of the dimensions enables variations in temperature and the consequent air disturbances to be reduced, and the experiment in other ways becomes more manageable. Professor Boys took as the exactness to be aimed at 1 in 10,000. He further saw that reduction in length of the torsion rod with given balls is an advantage. Boys avoided difficulties due to the attraction of the second attracting sphere by suspending the balls from the ends of the torsion rod at different levels and by placing the attracting masses at these different levels. Fig. 2 represents diagrammatically a vertical section of the arrangement. The torsion rod was a small rectangular mirror about 2.4 cm. long. From the sides of this mirror gold balls were hung by quartz fibres at levels differing by 15 cm. The attracting masses were lead spheres, about 11 cm. in diameter and weighing about 7.4 kgm. each, so arranged that the moment of the attraction was a maximum. The torsion rod mirror reflected a distant scale by which the deflection could be read. The time of vibration was recorded on a chronograph. The result of the experiment, probably the best yet made, was $\Delta = 5{\cdot}527$; $G = 6{\cdot}658 \times 10^{-8}$.

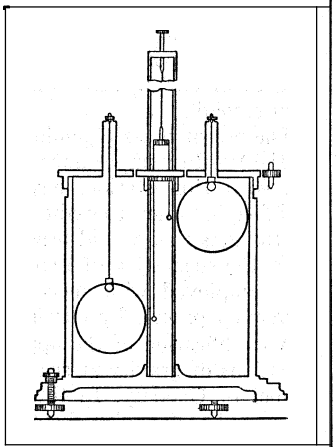

FIG. 2.—SECTIONAL DIAGRAM OF PROFESSOR BOYS'S APPARATUS

Braun's Experiment.—In 1896 Dr. K. Braun S.J., gave an account of a very careful and excellent repetition of the Cavendish experiment with apparatus much smaller than that used in the older experiments, yet much larger than that used by Boys. (Denkschr. Akad. *Wiss.* Wien. math. *naturw* Cl. 64, p. 187, 1896.) A notable feature of the work consisted in the suspension of the torsion apparatus in a receiver exhausted to about 4 mm. of mercury, a pressure at which convection currents almost disappear while radiometer forces have hardly begun. The attracted balls weighed 54 gm. each and were 25 cm. apart. The attracting masses were spheres of mercury each weighing 9 kgm. and brought into position outside the receiver. Braun used both the deflection method and the time of vibration method suggested to Reich by Forbes. The methods gave almost identical results and his final values are to three decimal places the same as those obtained by Boys.

G. K. Burgess's Experiment.—This was a Cavendish experiment in which the torsion system was buoyed up by a float in a mercury bath (*Thèses présentées à* la *faculté* des sciences de Paris *pour* obtenir *le titre* de docteur de *l'université* de Paris, 1901.) The attracted masses could thus be made large (2 kgm.), and yet the suspending wire could be kept fine. From the centre of the beam depended a vertical steel rod with a varnished copper hollow float at its end, entirely immersed in mercury covered with dilute sulphuric acid to remove irregularities due to varying surface tension acting on the steel rod. The size of the float was adjusted so that the torsion fibre of quartz 35 cm. long had only to carry a weight of 5 to 10 gin. The results gave A= 5·55 and $G = 6{\cdot}64 \times 10^{-8}$.

Eotvos's *Experiment.*—In the course of investigations on local variations of gravity by means of the torsion balance, R. Eötvös devised a method for determining *G* somewhat like the vibration method used by Reich and Braun (*Ann.* der Physik *und Chemie*, 1896, 59, p. 354). Two pillars were built up of lead blocks 30 cm. square in cross section, 60 cm. high and 30 cm. apart. A torsion rod somewhat less than 30 cm. long with small weights at the ends was enclosed in a double-walled brass case of as little depth as possible, a device which secured great steadiness through freedom from convection currents. The suspension was a platinum wire about 150 cm. long. The torsion rod was first set in the line joining the centres of the pillars and its time of vibration was taken. Then it was set with its length perpendicular to the line joining the centres and the time again taken. From these times Eotvos was able to deduce the provisional value $G = 6{\cdot}6\text{j} \times 10^{-8}$, whence A= 5.53.

Wilsing's Experiment.—We may perhaps class with the Cavendish type an experiment made by J. Wilsing, in which a vertical "double pendulum" was used in place of a horizontal torsion system (Publ. des *astrophysikalischen* Observ. *zu Potsdam*, 1887, No. 22, vol. vi. pt. ii.; pt. iii. p. 133). Two weights each 540 gm. were fixed at the ends of a rod 1 metre long, supported so that it could vibrate about a vertical position. Two attracting masses, cast-iron cylinders each 325 kgm., were placed, say, one in front of the top weight on the pendulum and the other behind the bottom weight, and the position of the rod was observed in the usual mirror and scale way. Then the front attracting mass was dropped to the level of the lower weight and the back mass was raised to that of the upper weight, and the consequent deflection of the rod was observed. The result obtained was A = 5·579.

iii. Comparison of the Earth Pull on a Body with the Pull of an Artificial Mass by Means of the Common Balance.—The principle of the method is as follows: Suppose a sphere of mass m and weight w to be hung by a wire from one arm of a balance. Let the mass of the earth be E and its radius be R. Then $w = GEm/R^2$. Now introduce beneath m a sphere of mass M and let *d* be the distance of its centre from that of *m*. Its pull increases the apparent weight of *m* say by δw. Then $\delta w = \text{GMm/d}^2$. Dividing we obtain $\delta w/w = MR^2/Ed^2$, whence $E = MR^2w/d^2\delta w$ and since $g = GE/R^2$, G can be found when E is known.

Von Jolly's Experiment (Abhand. der k. *bayer.* Akad. der *Wiss.* 2 Cl. xiii. Bd. I. Abt. p. 157, and xiv. Bd. 2 Abt. p. 3). In the first of these papers Ph. von Jolly described an experiment in which he sought to determine the decrease in weight with increase of height from the earth's surface. Von Jolly fixed a balance at the top of his laboratory and from each pan depended a wire supporting another pan 5 metres below. Two 1-kgm. weights were first balanced in the upper pans and then one was moved from an upper to the lower pan on the same side. A gain of 1·5 mgm. was observed after correction for greater weight of air displaced at the lower level. The inverse square law would give a slightly greater gain dnd the deficiency was ascribed to the configuration of the land near the laboratory.

In the second paper a second experiment was described in which a balance was fixed at the top of a tower and provided as before with one pair of pans just below the arms and a second pair hung from these by wires 21 metres below. Four glass globes were prepared equal in weight and volume thus eliminating air corrections. Two of these were filled each with 5 kgm. of mercury and then all were sealed up. The two heavy globes were then placed in the upper pans and the two light ones in the lower. The two on one side were now interchanged and a gain in weight of about 31·7 mgm. was observed. Then a lead sphere about 1 metre diameter was built up under one of the lower pans and the experiment was repeated. Through the attraction of the lead sphere on the mass of mercury when below, the gain was greater by 0·589 mgm. This result gave $A = 5.692$.

Experiment *of Richarz* and *Krigar-Menzel.*—In 1884 A. Konig and F. Richarz proposed a similar experiment which was ultimately carried out by Richarz and 0. Krigar-Menzel (*Anhang zu* den Abhand. der k. *preuss.* Akad. der Wiss. *zu* Berlin 1898). In this experiment a balance was supported somewhat more than 2 metres above the floor and with scale pans above and below as in von Jolly's experiment. Weights each 1 kgm. were placed, say, in the top right pan and the bottom left pan. Then they were shifted to the bottom right and the top left, the result being, after corrections for change in density of air displaced through pressure and temperature changes, a gain in weight of 1·2453 mgm. on the right due to change in level of 2.2628 metres. Then a rectangular column of lead 210 cm. square cross section and 200 cm. high was built up under the balance between the pairs of pans. On repeating the weighings there was now a decrease on the right when a kgm. was moved on that side from top to bottom while another was moved on the left from bottom to top. This decrease was 0·1211 mgm. showing a total change due to the lead mass of $1.2453 + 0.1211 = 1.3664$ mgm. and this is obviously four times the attraction of the lead mass on one kgm. The changes in the positions of the weights were made automatically. The results gave $A = 5.05$ and $G = 6.685 \times 10^{-8}$.

Poynting's *Experiment.*—In 1878 J. H. Poynting published an account of a preliminary experiment on the same lines as that of von Jolly but on a much smaller scale, which he had made to show that the common balance was available for gravitational work (Phil. *Trans.,* vol. 182, A, 1891, p. 565). In 1891 he gave an account of the full experiment carried out with a larger balance and with much greater care. The balance had a 4 ft. beam. The scale pans were removed, and from the two arms were hung lead spheres each weighing about 20 kgm. at a level about 120 cm. below the beam. The balance was supported in a case above a horizontal turn-table with axis vertically below the central knife edge, and on this turn-table was a lead sphere weighing 150 kgm. the attracting mass, and at double the distance from the centre, a second balancing weight. The centre of the larger sphere was 30 cm. below the level of the centres of the hanging weights. The turn-table could be rotated between stops so that the attracting mass was first immediately below the hanging weight on one side, and then immediately under that on the other side. After all corrections the results gave $A = 5.493$ and $G = 6.698 \times 10^{-8}$.

General Remarks.—The earlier methods in which natural masses were used have disadvantages as already pointed out, which render them now quite valueless. Of later methods the Cavendish appears to possess advantages over the common balance method in that it is easier to ward off temperature variations, and so avoid convection currents, and probably less difficult to determine the actual value of the attracting force. For the present the values determined by Boys and Braun may be accepted as having the greatest weight and we therefore take

Mean density of the earth = 5·527
Constant of gravitation $G = 6.658 \times 10^{-8}$.

Probably $A = 5.53$ and $G = 6.66 \times 10^{-8}$ are correct to 1 in 500.

The Intensity *of* Gravity.—Measurements of the force of gravity have long been made by means of the pendulum, and prior to the middle of the 18th century, a small weight suspended by a thin thread was usually employed. The length was adjusted so that the pendulum vibrated a little faster or slower than the pendulum of a clock, and observations were made by the method of coincidences. Later, the clock pendulum itself was used for the measurement of gravity, and a pendulum of this type was used on Captain Cook's voyage round the world.

About the year 1818, Captain Henry Kater employed the invariable pendulum for determining the variation in the length of the pendulum vibrating seconds at the principal stations of the Trigonometrical Survey of Great Britain (Phil. Trans. 1819, p. 337). For many years this type of pendulum was widely used, until the introduction of the half seconds pendulum.

In 1817 Kater introduced his compound reversible pendulum, which was based on the theorem of Huygens, that the centres of suspension and oscillation of a compound pendulum are reciprocal (*Phil.* Trans. 1818, p. 33). The pendulum was fitted with two sets of knife-edges so arranged that the period of vibration was the same about both of them. When this adjustment had been made the distance between the knife edges was equal to the length of the simple pendulum of the same period. The length of the seconds pendulum was then obtained by dividing by the square of the period expressed in seconds, while the absolute value of the intensity of gravity could be determined from measurements of the distance between the knife edges, and the period of vibration.

A great advance in gravity apparatus occurred in 1882 when von Sterneck introduced the quarter-metre invariable pendulum which beat half-seconds, and was more readily protected from all extraneous influences than the larger and more cumbersome equipment. The apparatus now usually employed comprises a set of three one-quarter-metre invariable pendulums with agate knife edges, arranged to swing on three separate agate planes, together with a dummy or temperature indicating pendulum. These pendulums are swung within an evacuated air-tight double walled metal chamber.

The agate planes are carefully levelled by means of two small pendulums carrying levels in their heads, and the three invariable pendulums are then mounted in the three supporting V's. Light, reflected from the mirrors of the two side pendulums, is deflected through a window in the cover into the observing telescope, by means of two prisms situated near the centre, while the thermometer is visible through a second window.

A flash apparatus enables coincidences to be observed between the swinging pendulum and a clock or chronometer, an electromagnet in circuit with which operates a shutter at the end of each second.

The use of brass pendulums rendered a temperature correction of the greatest importance, and on account of the magnitude of this correction, stations have always been set up in a room of a building in order to reduce considerably the large temperature fluctuations that would otherwise occur.

On the suggestion of Lenox-Conyngham, invar pendulums have been employed with success, and the troublesome temperature correction practically eliminated.

A modification of the apparatus used by Meinesz in his determinations of gravity at sea was made in 1926 for the Cambridge School of Geodesy. In this apparatus, an airtight and partially evacuated rectangular chamber encloses a support carrying three invar half-second pendulums, mounted in a row with their knife edges parallel, so that they oscillate in the same plane. Each pendulum is fitted with a knife-edge of stellite, firmly wedged into the head, the central portions of which are polished to form mirrors. Light proceeding from a distant lamp is reflected first to one of the outer pendulums, then to the middle one and finally to the eye or the camera. The beam of light will oscillate up and down as though reflected by a hypothetical pendulum, the phase angle of which is always equal to the difference between the phase angles of the two actual pendulums. This difference is undisturbed by horizontal accelerations which affect the chamber as a whole, and the instrument can thus be used in cases where a perfectly stable platform is not available. Intermittent illumination is pro-

vided each second by means of a shutter operated electrically from a standard clock, and the resulting record becomes a sine curve, the amplitude and period being the same as those of the hypothetical pendulum.

Measurement of Gravity at Sea.—A number of attempts have been made to determine gravity at sea, and it is now possible to make these measurements with a degree of accuracy comparable with that obtainable on land. Early in the present century Hecker (*Zentralbureau der internationalen Erdmessung*, 1903, 1908, and 1910) endeavoured to compare the pressure as given by a hypsometer, with that indicated by a mercury barometer, while in another method he observed the height of a sealed mercury barometer.

Difficulties were encountered due to the ship's oscillatory motion, which gave rise to "pumping" of the mercury in the barometers and so rendered the results to some extent unreliable. Trouble was also experienced with the hypsometer thermometers, probably as a result of repeated boiling for extended periods.

In 1914 when the British Association visited Australia, Duffield *(Proc. Roy. Soc.* 1916) made determinations of gravity at sea during the voyages out and home, by means of 3 apparatuses designed respectively to measure gravity, (a) by means of a gravity barometer, (b) by means of photographic registering barometers of Hecker's design, (c) by a comparison of readings of mercury and aneroid barometers of special design.

Although the last named method yielded results which seemed promising, it suffered from the disadvantage of using barometers which were open to the atmosphere, and as experiments indicated unsuspected difficulties with such instruments this method was discontinued.

Subsequent voyages in 1922 and 1923 enabled Duffield *(Geoph. Supplement,* Roy. Astron. Soc. 1924, p. 161) to make determinations with new instruments including one designed to give a continuous record during the voyage. As a result of this work Duffield concluded that in general the value of gravity decreases as the depth of the water increases.

More accurate determinations of gravity at sea were made by Dr. F. A. Vening Meinesz *(Geog. Journ.,* June 1925, p. 501), on board the submarine K. II. of the Royal Dutch Navy during a voyage from Holland to Batavia in 1923. The apparatus employed was the half-second invariable pendulum apparatus of the Von Sterneck type, fitted with four isochronous pendulums suspended from the same plate, and arranged to oscillate in opposite phases, two by two, in planes at right angles. Their oscillations were recorded photographically, and when the apparatus was displaced from the vertical, as by the motion of the ship, the rays of light reflected from the mirrors of the two opposing pendulums were found to diverge vertically. The pendulums were of brass, which led to difficulties in connection with their large temperature corrections.

Gravity observations were made at 31 points and the average anomaly for all the stations is 0·012 dyne by the Bowie formula, while for 10 stations in the Indian Ocean the average anomaly is 0·009 dyne.

Meinesz made further investigations in 1926 on a second submarine voyage to Java with an improved apparatus *(Geographical Journal,* 1928, p. 144). This new apparatus contained 3 practically isochronous pendulums swinging in the same plane as in the Cambridge apparatus and combined in twos for the elimination of disturbances due to horizontal accelerations. The principle of the method is, not to record each pendulum separately, but to get at once the difference of their angles of elongation. The resulting records have the same appearance as that of a single pendulum undisturbed by horizontal accelerations. The apparatus was supported in double gimbals in order to avoid sliding of the pendulums due to the pitching of the vessel, and in this way bigger angular deviations of the boat could be tolerated.

As a result of this voyage, Meinesz found that over the Atlantic and Pacific Oceans, there are excesses of gravity extending over large areas, which, it has been pointed out, may be caused partially by a depression of the geoid with regard to the spheroid. It is not likely however that the excess resulting from this cause will be more than a small fraction of the positive anomalies that have been found, and it is improbable that the anomalies can be wholly explained in this way.

In general, the results obtained at sea give the impression of greater regularity than those obtained on land, as may be expected from the fact that the upper layer of water immediately below the instrument is homogeneous, and the disturbing masses in the solid crust are farther away from the station. The gravity results obtained by Meinesz compel us to accept extensive disturbances of isostatic equilibrium, and until the value of gravity is known with reasonable accuracy over the whole surface of the earth, it will be practically impossible to decide whether these disturbances are located only in the earth's crust, or whether there are also deep-seated anomalies.

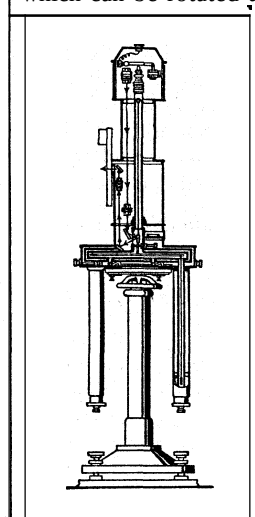
FIG. 3.—SUSPENDED SYSTEM OF AN EÖTVÖS TORSION BALANCE

Local Variations of **Gravity.**—Previous to 1888 researches on gravity were confined almost exclusively to investigations with the pendulum and the bubble level, but Eötvös *(Ann. der Phys. und Chem* B59, 1896, p. 354) followed a new line, and endeavoured to measure the variation of the force of gravity in the vicinity of a point, or more exactly to determine the derivatives of its components. As these variations are extremely small in comparison with the total force, Eotvos concluded that the method to be employed should measure the differences of gravity directly rather than the force of gravity itself, and he designed a torsion balance which was capable of determining these variations with a considerable degree of accuracy. This instrument, fig. 3, differs from the earlier Cavendish balance in that it consists of a light horizontal beam, which supports at its extremities two weights, at different vertical heights, the whole being carried on a very fine torsion wire and enclosed in a double or treble-walled metal case which can be rotated about a vertical axis. A mirror attached to the centre of the beam enables its position to be observed by means of a scale and telescope, or by an equivalent optical system.



BY COURTESY OF MESSRS. L. OERTLING, LTD

FIG. 4.—EÖTVÖS TORSION BALANCE—OERTLING AUTOMATIC PHOTO-VISUAL TYPE

In the instrument made by Süss, observations are taken visually, and the instrument is rotated by hand to the next azimuth position after each reading, but in other types, *e.g.,* Bamberg and Oertling, fig. 4, the observations are recorded photographically, and the instrument rotated into the next azimuth mechanically.

In order to reduce the dimensions of the instrument, without reducing the sensitivity unduly, or employing very thin wires, Schweydar introduced a Z-shaped beam, having one weight rigidly fixed above and the other below the plane of the beam. A reduction in the length of the torsion wire enables the height of the instrument to be reduced to 120 cm., the centre of gravity of the suspended system remaining 70 cm. above the ground as in the larger model.

By redesigning the beam system so as to be totally irresponsive to curvature effects, Shaw and Lancaster-Jones have introduced the gravity gradiometer, a single beam instrument by which the gradient may be determined from only three observations. The suspended system consists of a series of masses arranged in plan at the apices of a regular polygon, one mass being mounted well above the beam on a rigid light support, instead of being suspended below, and the remaining masses fixed directly to the beam. The height of the instrument is thus reduced considerably while a reduction in the length of the beam to 4·5 cm. results in more rapid operation and in increased compactness and portability of the instrument.

If U is the potential of the gravitational force, n_α the scale reading of the beam after coming to rest in the azimuth position a, n the scale reading corresponding to no torsion on the wire, D the distance of the scale from the mirror, K the moment of inertia of the suspended system, m the mass of the lower weight suspended at a distance h below the beam, and at a horizontal distance l from the axis of suspension, τ the torsion coefficient of the suspension wire, and x, y, and z the axes horizontally along the beam, perpendicular to it, and vertically downwards respectively, it can be shown that

$$n_\alpha - n = \frac{2DK}{\tau}\left[\left(\frac{\partial^2 U}{\partial y^2} - \frac{\partial^2 U}{\partial x^2}\right)\frac{\sin 2\alpha}{2} + \frac{\partial^2 U}{\partial x\,\partial y}\cos 2\alpha\right] + \frac{2Dmhl}{\tau}\left[\frac{\partial^2 U}{\partial y\,\partial z}\cos\alpha - \frac{\partial^2 U}{\partial x\,\partial z}\sin\alpha\right]$$

which may be also written

$$n_\alpha - n = -\frac{2DK}{\tau}\left[U_\Delta\frac{\sin 2\alpha}{2} + U_{xy}\cos 2\alpha\right] + \frac{2Dmhl}{\tau}\left[U_{yz}\cos\alpha - U_{xz}\sin\alpha\right]$$

In this equation the five quantities n, U_Δ, U_{xy}, U_{yz} and U_{xz} are unknown factors, so that by taking readings of n_α (the position of equilibrium of the beam) in five different azimuth settings, these factors can be determined from the resulting five equations.

By using two beams placed side by side and oriented oppositely, another unknown value of n is introduced, making six unknowns in all, but as for each setting of such a double instrument, two readings are made, one on each beam, it is possible to obtain a complete solution by taking observations in three azimuth settings of the instrument, so that the speed of operation is thus increased.

The magnitudes U_{yz} and U_{xz} are the components of the gravity "gradient" in the north and east directions respectively, and represent the increase, per unit distance in the horizontal plane in theserespective directions, of the vertical component of gravity. The maximum "gradient of gravity" is the resultant of these components, its value being $[(U_{yz})^2+(U_{xz})^2]^{\frac{1}{2}}$ and its direction is given by $\tan\mu = U_{yz}/U_{xz}$. The other two magnitudes U_Δ and U_{xz} give the "curvature value," or the deviation of the level surface of gravity from the spheroid. This is measured by the difference of the reciprocals of the principal radii of curvature $\frac{1}{\rho_1}$ and $\frac{1}{\rho_2}$, ρ_1 being the minimum and ρ_2 the maximum radius of curvature,

$$\frac{1}{\rho_1} - \frac{1}{\rho_2} = -\frac{U_\Delta}{g}\sec 2\lambda \quad \text{or} \quad \tan 2\lambda = -\frac{2U_{xy}}{U_\Delta}$$

where λ is the angle between the plane of principal curvature and the plane xz. The instrument is extremely sensitive to certain extraneous influences, such as radiation and rapid change of temperature, and precautions are taken to provide adequate protection against these sources of disturbances. The suspended beam system is surrounded by an enclosure consisting of three metallic walls, while the instrument itself is set up in a double walled hut specially designed to be light-proof and thermally insulating. The sensitivity of the instrument is such that the unit chosen for expressing the results and known as the Eotvos Unit (E), is 1×10^{-9} C.G.S. unit, and the determination of the gradient and curvature values at any station may generally be regarded as accurate to one Eotvos unit (1E). Increased sensitivity would be readily obtainable if desired but would not be justified on account of the errors resulting from the topographical relief of the ground in the vicinity of the station.

The variation in gravity between the poles of the earth and the equator is registered by this instrument, for by Helmert's 1896 formula

$$g = 978(1\times0{\cdot}00053\sin^2\phi) \text{ C.G.S. units}$$

where ϕ is the latitude.

From this we find that

$$U_{xz} = 8{\cdot}15\sin 2\phi\times10^{-9}$$

and

$$U_\Delta = 5{\cdot}15(1+\cos 2\phi)\times10^{-9}$$

both of which are measurable by the Eotvos torsion balance, and give rise to "normal" corrections which have to be introduced in every practical field survey, in order to determine the local anomalies.

The choice of suitable stations is an important consideration, for objects close to the instrument have an appreciable effect on its readings, so that unless a site is chosen free from such "terrain" irregularities, their effect must be computed from data obtained by levelling radially to a distance of 100 ft. Levels are taken in eight directions from the balance station, and the heights of the surface above the base of the instrument measured at certain fixed distances. The gradient correction is found to decrease far more rapidly with distance than the curvature effect, so that it is determined far more readily, the accurate computation of the curvature effect in rough or broken country being a matter of great difficulty. The practice of relying on gradient values only is increasing, except in flat localities where curvatures can be employed to advantage. The ground outside the 100 ft. boundary, but within a radius of 1,000 ft. of the station, may be sufficiently irregular to have an appreciable influence on the Eotvos values at the station, although, owing to the comparative remoteness of these irregularities from the station, their effect, known as the *topographical* effect, is usually relatively small. Special corrections must also be made for such features as embankments, walls and cuttings, in the vicinity of the station. When all the normal and superficial effects have been determined, and the necessary corrections made, the resultant values of U_Δ, U_{xy}, U_{xz} and U_{yz} will be due entirely to variations of structure and density below the ground, and are known as subterranean effects. To enable these effects to be interpreted, they are plotted to a suitable scale on a plan of the survey, on which the isogams, or lines of equal intensity of gravity, are also plotted.

GRAY, **ASA** (1810–1888), American botanist, was born in Paris, Oneida county (N.Y.), on Nov. 18, 1810. From Dr. James Hadley, professor of chemistry and materia medica, he obtained his first instruction in science (1825–26). In the spring of 1827 he first began to collect and identify plants. His formal education, such as it was, ended in Feb. 1831, when he graduated in medicine from the Fairfield Medical school. In 1836 his first botanical textbook appeared under the title *Elements of Botany,* followed in 1839 by *Botanical Text-Book* for *Colleges, Schools and Private Students,* which developed into his *Structural Botany.* He published later *First Lessons in Botany and Vegetable Physiology* (1857); *How Plants Grow* (1858); *Field, Forest and Garden Botany* (1869); and *How Plants Behave* (1872). These books served the purpose of developing popular interest in botanical studies. His most important work, however, was his *Manual of the Botany of the Northern United States,* within its geographical limits an indispensable book for the student of American botany, the first edition of which appeared in 1848.

Throughout his life Gray was a diligent writer of book reviews on natural history, and his reviews themselves often became treatises of literary and scientific value. The greater part of Gray's strictly scientific labour was devoted to a *Flora* of North America, the plan of which originated with his early teacher and associate, John Torrey of New York. The second volume of Torrey and Gray's *Flora* was completed in 1843; but for 40 years thereafter Gray gave up a large part of his time to the preparation of his *Synoptical Flora* (1878). Gray's enthusiastic labours in the then new field of discovery and systematization of North American

flora placed him at the head of American botanists and on a level with the most famous botanists of the world. In 1856 he published *Statistics of the Flora of the Northern United States.* This paper was followed in 1859 by a memoir on the botany of Japan and its relations to that of North America, which Sir J. D. Hooker called "in point of originality and far-reaching results its author's *opus magnum.*"

From 1855 to 1875 Gray was both a keen critic and a sympathetic exponent of the Darwinian principles, having been for years in close correspondence with Darwin. His religious views were those of the evangelical bodies in the Protestant Church; so that, when Darwinism was attacked as equivalent to atheism, he was in position to answer effectively the unfounded allegation that it was fatal to the doctrine of design. He openly avowed his conviction that the present species were not special creations, but rather were derived from previously existing species; and he made his avowal with frank courage, when to the clerical mind evolution meant atheism.

In 1842 Gray accepted the Fisher professorship of natural history in Harvard university. He soon brought together, chiefly by widespread exchanges, a herbarium which became the largest and most valuable in America, and a library where previously there had been none, and arranged the small garden already existing. Thereafter the development of these botanical resources was part of his regular labours. Everything he originated and developed has been enlarged, improved, and placed on stable foundations. He himself made large contributions to the establishment. His scientific life was mainly spent in the herbarium and garden in Cambridge; but his labours there were relieved by numerous journeys to differentparts of the United States and to Europe, all of which contributed to his work on the *Synoptical Flora.* He received from learned societies at home and abroad abundant evidence of their profound respect for his attainments and services. He died in Cambridge (Mass.), on Jan. 30, 1888.

His *Letters* (1893) were edited by his wife; and his *Scientific Papers* (1888) by C. S. Sargent. (C. W. E.)

GRAY, DAVID (1838–1861), Scottish poet, son of a handloom weaver, was born at Merkland, near Glasgow. He went to London in 1860 with Robert Buchanan with the idea of finding literary work. Monckton Milnes (Lord Houghton) befriended him, and tried in vain to persuade him to return home. The poet was attacked by tuberculosis, and Milnes sent him to Torquay; there he was seized by a longing for his old home, and went home to die. "The Luggie," Gray's best poem, published eventually (1862) through the efforts of Sydney Dobell, is a reverie in which the scenes and events of his childhood and his early aspirations are mingled with the music of the stream which he celebrates. The series of sonnets, "In the Shadows," was composed during the latter part of his illness.

GRAY, ELISHA (1835–1901), American electrician, was born in Barnesville, Belmont county (O.), on Aug. 2, 1835. He worked as a carpenter and in a machine-shop, reading in physical science at the same time, and for five years studied at Oberlin college, where he taught for a time. He then investigated the subject of telegraphy and in 1867 patented a telegraphic switch and annunciator. Experimenting in the transmittal of electro-tones and of musical tones by wire, he utilized in 1874 animal tissues in his receivers, and filed, on Feb. 14, 1876, a caveat for the invention of a telephone, only a few hours after the filing of an application for a patent by Alexander Graham Bell. *See* TELEPHONE.

Gray's experiments won for him the decoration of the Legion of Honour at the Paris Exposition of 1878. He was for a time a manufacturer of electrical apparatus, particularly of his own inventions; and was chief electrical expert of the Western Electric Company of Chicago. At the Columbian Exposition of 1893 Gray was chairman of the International Congress of Electricians. He died at Newtonville (Mass.), on Jan. 21, 1901. Among his later inventions were appliances for multiplex telegraphy and the telautograph, a machine for the electric transmission of handwriting. He experimented in the submarine use of electric bells.

Gray wrote, besides scientific addresses and monographs, *Telegraphy and Telephony* (1878) and *Electricity and Magnetism* (1900).

GRAY, JOHN DE (d. 1214), bishop of Norwich, entered Prince John's service, and at his accession (1199) was rapidly promoted in the church till he became bishop of Norwich in September 1200. King John by attempting to force him into the primacy in 1205 started the long and fatal quarrel with Pope Innocent III. who quashed his election in favour of Langton. De Gray was a hard-working royal official, using his position to enrich himself and his family. In 1209 he was sent to Ireland as justiciar. He attempted to extend the English frontier northward and westward, and fought a number of campaigns on the Shannon and in Fermanagh. But in 1212 he was defeated by Art O'Maelsechlainn. He assimilated the coinage of Ireland to that of England, and tried to effect a similar reform in Irish law. De Gray was a good financier, and could always raise money: this probably explains the favour he enjoyed from King John. In 1213 he brought over from Ireland 500 knights to the great muster at Barham Downs, when Philip Augustus was threatening to invade England. After John's reconciliation with Innocent he was exempted from the general pardon, and was forced to go in person to Rome to obtain it. He so completely won over Innocent that the pope sent him back with papal letters recommending his election to the bishopric of Durham (1213); but he died Oct. 18, 1214, at St. Jean d'Audely in Poitou on his homeward journey. For the contest with the papacy over the see of Canterbury *see* LANGTON, STEPHEN.

GRAY, PATRICK GRAY, 6TH BARON (d. 1612), was descended from Sir Andrew Gray (c. 1390–1490) of Broxmouth and Foulis, who played a leading part in Scottish politics and was created a Scottish peer as Lord Gray, probably in 1445.

Brought up as a Protestant, and early married to the daughter of Lord Glamis, he soon repudiated his wife and became a Roman Catholic. By treachery and intrigue he gained the favour of James (afterwards king of England) which he retained throughout his life. In 1584 he acted as an intermediary between James and Elizabeth, whose support he gained by promoting a plot to secure the fall of the earl of Arran. Three years later he was again despatched to England, ostensibly to save Mary's life, but his representations had no weight, and her execution led to his fall from power in Scotland. Though imprisoned and proved guilty of many crimes, he was saved by the king's favour, and rose to further honours. In 1609 he succeeded his father as 6th Baron Gray and died in 1612. In 1585 Gray married Mary Stewart and had by her six daughters and a son Andrew (d. 1663) who succeeded him as 7th baron.

GRAY, ROBERT (1809–1872), first bishop of Cape Town and metropolitan of South Africa, was born at Bishop Wearmouth. Durham, on Oct. 3, 1809, and was the son of Robert Gray, bishop of Bristol. He was educated at Eton and Oxford, and took orders in 1833. After holding various English livings, he was consecrated bishop of Cape Town in 1847. In 1853 he was appointed metropolitan of South Africa in view of the contemplated establishment of the suffragan dioceses of Graham's Town and Natal. In that capacity his coercive jurisdiction was called in question in the case of Bishop Colenso (*q.v.*), and the judicial committee of the privy council decided against him. During his episcopate Bishop Gray effected a much-needed organization of the South African church, to which he added five new bishoprics, all carved out of the original diocese of Cape Town. He died on Sept. 1, 1872.

See H. L. Farrer, *Life of Robert Gray, Bishop of Capetown* (1876, 2nd ed., 1883).

GRAY, SIR THOMAS (d. c. 1369), English chronicler, was present at the battle of Neville's Cross in 1346; in 1355, whilst acting as warden of Norham Castle, he was made a prisoner, and during his captivity in Edinburgh Castle he studied the English chroniclers, Gildas, Bede, Ranulf, Higden and others, Released in

1357 he was appointed warden of the east marches towards Scotland in 1367, and he died about 1369. Gray's work, the *Scalacronica* (so called, perhaps, from the scaling ladder in the crest of the Grays), is a chronicle, written in Norman-French, of English history from the earliest times to about the year 1362. It is valuable for the account of the wars between England and Scotland, in which the author's father and the author himself took part.

The *Scalacronica* was summarized by John Leland in the 16th century; the part dealing with the period from 1066 to the end, together with the prologue, was edited for the Maitland Club by J. Stevenson (1836); and the part from 1274 to 1362 was translated into English by Sir Herbert Maxwell (Glasgow, 1907). In the extant manuscript, which is in Corpus Christi College, Cambridge, there is a gap extending from about 1340 to 1355, and Gray's account of this period is only known from Leland's summary.

GRAY, THOMAS (1716–1771), English poet, the fifth and sole surviving child of Philip and Dorothy Gray, was born in London on Dec. 26, 1716. His mother's maiden name was Antrobus, and with her sister Mary she kept a millinery shop in Cornhill. The premises belonged to Philip Gray, a money-scrivener, who married Dorothy in 1706 and lived with her in the house, the sisters renting the shop from him and supporting themselves by its profits. Philip Gray was selfish and brutal, and in 1735 his wife took some abortive steps to obtain a separation from him. It was at his mother's expense that Gray went to Eton in 1727, where he was confided to the care of her brother, William Antrobus, one of the assistant-masters, during some part at least of his school-life.

At Eton Gray's closest friends were Horace Walpole, Richard West, and Thomas Ashton, afterwards fellow of Eton; they were studious and literary, and took little part in the amusements of their fellows. In 1734 Gray matriculated at Peterhouse, Cambridge, and at this time made the firmest and most constant friendship of his life with Thomas Wharton of Pembroke college. On March 29, 1739, he started with Walpole for a long continental tour, for the expenses of which it is probable that his father, for once, came in some measure to his assistance. In Paris, Gray cultivated a taste for the French classical dramatists, especially Racine, whom he afterwards tried to imitate in the fragmentary "Agrippina"; he had already learned Italian and made translations from Dante, Guarini and Tasso. In Italy he made a long sojourn, principally at Florence, but Rome, Naples and Herculaneum are also described in Gray's letters, sometimes vividly, always amusingly, and in his notes are almost catalogued. At length in April 1741 Gray and Walpole set out northwards for Reggio. Here they quarrelled, and with two friends, John Chute and Francis Whithed, Gray went to Venice to see the doge wed the Adriatic on Ascension Day. Thence he returned home attended only by a *laquais* de *voyage*, visiting once more the Grande Chartreuse, where he left in the album of the brotherhood the beautiful alcaics, *O Tu severa Religio loci.*

On his return in 1741, London was Gray's headquarters for more than a year, with occasional visits to Stoke Poges, to which his mother and Mary Antrobus had retired from business to live with their sister, Mrs. Rogers. The year 1742 was, for him, fruitful in poetic effort, of which, however, much was incomplete. The "Agrippina," the *De principiis cogitandi,* the splenetic "Hymn to Ignorance" in which he contemplates his return to the university, remain fragments; but besides the two poems already mentioned, the "Ode on a Distant Prospect of Eton College" and the "Hymn to Adversity," perhaps the most faultless of his poems, were written before the close of the summer. After hesitating between Trinity Hall and Peterhouse, he returned to the latter, probably as a fellow-commoner. He had hitherto neglected to read for a degree; he proceeded to that of LL.B. in 1744. In 1745 a reconciliation with Walpole was effected through the kind offices of Chute's sister. In 1748 he first came before the public, but anonymously, in Dodsley's *Miscellany,* in which appeared the Eton ode, the ode on spring, and that on the cat.

There was little to break the monotony of his days till 1750, when from Stoke he sent Walpole "a thing to which he had at last put an end." The "thing" was the "Elegy." It was shown about in manuscript by his admiring friend; it was impudently pirated, and Gray had it printed by Dodsley in self-defence. The publication led to the one incident in Gray's life which has a touch of romance. At Stoke house had come to live the widowed Lady Cobham, who learnt that the author of the "Elegy" was her neighbour. A platonic affection sprang up between Gray and Miss Speed, her protégée; rumour, upon the death of Lady Cobham, said that they were to be married, but the lady escaped this mild destiny to become the Baroness de la Peyrière, afterwards Countess Viry, and a dangerous political *intriguante.*

In 1753 all Gray's completed poems, except the sonnet on the death of West, were published by Dodsley in a volume illustrated by Richard Bentley, the son of the master of Trinity. Already in 1752 he had almost completed "The Progress of Poesy," in which, and in "The Bard," the imagery is largely furnished forth by mountain and torrent. These odes were the first-fruits of the press which Walpole had set up at Strawberry Hill. and were printed together there in 1757. Though they did not attain the popularity of the "Elegy," these poems marked an epoch in the history of English poetry, and the influence of "The Bard" may be traced even in that great but very fruitful imposture, the pseudo-Ossian of Macpherson. Gray yields to the impulse of the Romantic movement; he has long been an admirer of ballad poetry; before he wrote "The Bard" he had begun to study Scandinavian literature, and the two "Norse Odes," written in 1761, were in style and metrical form strangely anticipative of Coleridge and Scott. Meanwhile his Cambridge life had been vexed by the riotous fellow-commoners of Peterhouse; the authorities treated his complaints with scant respect, and he migrated to Pembroke college. "I left my lodgings," he said, "because the rooms were noisy, and the people of the house dirty."

In 1758 Gray lived quietly at Stoke; in 1759 he made a very long sojourn in town, where in 1761 he witnessed the coronation of George III. In his last years he visited various picturesque districts of Great Britain, exploring great houses and ruined abbeys, noting and describing in the spirit now of the poet, now of the art critic, now of the antiquary. In 1752 he travelled in Yorkshire and Derbyshire; in 1764 in the Lowlands of Scotland, and thence went to Southampton and its neighbourhood. In 1765 he revisited Scotland. His most notable achievement in this direction was his journey among the English lakes; and even in 1770, the year before his death, he visited with his young friend Norton Nicholls "five of the most beautiful counties of the kingdom." In 1768 the duke of Grafton offered him the professorship of modern history which in 1762 he had vainly endeavoured to obtain from Bute, and in 1769 he wrote the "Installation Ode" upon the appointment of Grafton as chancellor of the university. He was contemplating a journey to Switzerland to visit his youthful friend de Bonstetten when, in the summer of 1771, he was seized with a sudden illness when dining in his college hall. He died on July 30, 1771, and was laid beside his beloved mother in the churchyard of Stoke Poges.

Owing to his shyness and reserve he had few intimate friends, but to these his loss was irreparable. His friendship with the young, after his migration to Pembroke college, is a noteworthy trait in his character; with the elderly "Levites" of the place he was less in sympathy; in the polemics of the university he was somewhat of a free lance, and lampoons of his were privately circulated with much effect. In literature he was regarded as an innovator, for like Collins he revived the poetic diction of the past, and the adverse judgments of Johnson and others upon his work are in fact a defence of the current literary traditions. Few men have published so little to so much effect; few have attained to fame with so little ambition. His favourite maxim was "to be employed is to be happy," and in pursuance of this end he made himself one of the best Greek scholars at Cambridge in the interval between Bentley and Porson. He had a fine taste in music, painting and architecture; and his correspondence includes a wide survey of European literature, with criticisms of a singularly fresh and modern cast. He was a refined Epicurean in his habits, and a deist rather than a Christian in his religious beliefs; but his friend, Mrs. Bonfoy, had "taught him to pray" and he was keenly alive to the dangers of a flippant scepticism.

In a beautiful alcaic stanza he pronounces the man supremely happy who in the depths of the heart is conscious of the "fount of tears," and his characteristic melancholy, except in the few hours when it was indeed black, was not a pitiable state; rather, it was one secret of the charm both of the man and of the poet.

A very complete bibliography will be found in *The Poetical Works of Thomas Gray* (ed. J. Bradshaw, Aldine edition, 1891). *See* also W. Mason, *The Poems of Mr. Gray, to which are prefixed memoirs of his life and wrztings* (1775; reprinted, with additions, by T. J. Mathias, 1814); J. Nichols, *Illustrations of the Literary Hzstory of the Eighteenth Century,* vol. VI. (1817–58), for the true story of Gray's migration to Pembroke college; *The Works of Thonzas Gray* (ed. J. Mitford, 1836–43); *The Correspondence of T Gray and W. Mason* (ed. J. Mitford, 1853); Matthew Arnold's essay on Gray in T. H. Ward's *The English Poets,* vol. 3 (1880; 2nd ed., 5 vol., 1883–1918); Edmund Gosse, *Gray* in the Eng. Men of Letters Series (1882, 2nd ed. 1889), and his editions of *Tlze Works of Thomas Gray in prose and verse* (4 vol., 1884); D C. Tovey, *Gray and his Friends* (1890), and his edition of *The Letters of Thonzas Gray* in Bohn's Standard Library (3 vol., 1900–12). (D. C. To.; X.)

GRAY or **GREY, WALTER DE** (d. 1255), English prelate and statesman, nephew of John de Gray, bishop of Norwich, was educated at Oxford. He owed his rapid preferment to the favour of King John. He became the king's chancellor in 1205, and in 1210 was elected bishop of Lichfield by the chapter at the king's orders. But the papal legate quashed the election. He became bishop of Worcester in 1214, resigning his office of chancellor in the same year. Gray was with John when the king signed Magna Carta in June 1215; in the autumn he left England on the king's business, and during his absence was forced into the archbishopric of York, owing his election to the good offices of John and of Innocent III. He took action against the French invaders on the accession of Henry III. and played a leading part during the young king's minority. When Henry took over the Government he continued to employ de Gray, who carried out many important diplomatic missions and acted as the king's chief justiciar during Henry's absence in France (1242–1243). As archbishop of York de Gray's insistence on his right to have his cross borne erect in the southern provinces involved him in a dispute with Archbishop Stephen Langton, and he maintained his claim to the point of absenting himself from the king's second coronation in May 1220. The archbishop of Canterbury had an interview with him at Lincoln in 1222 on the subject, but no decision was reached. Later the archbishop absented himself altogether from public business for a time, but in 1255 he visited London to attend a meeting of parliament, and died at Fulham on May 1, 1255. Gray was always anxious to assert his archiepiscopal authority over Scotland, and sought to assert it on the occasion of the coronation of Alexander II., but Innocent III., who desired the continued independence of the Scottish Church, intervened in favour of the Scotch claim. De Gray built the south transept of the minster at York and is said to have built the west front of Ripon cathedral.

GRAY, a town of eastern France, in the department of Haute-Saône, situated on the bank of the Saône, 36 mi. W.S.W. of Vesoul by rail. Pop. (1936) 5,939. Gray was founded in the 7th century. Its fortifications were destroyed by Louis XIV. It gave its name to the distinguished English family of de Gray, Gray or Grey, mentioned in Doniesday as tenants in Oxfordshire.

The town has a busy port. Three bridges unite it to the railway station, from which lines branch off to Auxonne, Dijon, Besançon and Culmont-Chalindrey. The principal buildings are the Gothic church, restored in the style of the Renaissance with a modern portal, and the hôtel de ville, built by the Spaniards in 1568.

Gray has tribunals of first instance and of commerce, a chamber of commerce and a small museum. It has large flour-mills and manufactures machinery and iron goods. There is also a considerable transit traffic in goods mainly by river from the south of France and the colonies, and trade in iron, corn, provisions, vegetables, wine, wood, etc.

GRAYLING, the name for fishes of the genus Thymallus, of the family Salmonidae, distinguished by rather large scales, a small mouth with feeble teeth, and a long dorsal fin, with 20 to 24 rays. Six species are known from the rivers of Europe, Siberia and northern North America. They are excellent for the table. (See SALMON AND SALMONIDAE.)

GRAYS (or GRAYS THURROCK), a parish and ward in Thurrock urban district, Essex, England, on the Thames, 20 mi. S.E. from London by the L.M.S.R. Pop. (1931) 18,172. The church of SS. Peter and Paul retains some Norman work. The Gray family held the manor for three centuries from 1149. Roman remains have been found near by; and some quarries contain large mammalian remains. The town has trade in lime and cement. The naval training vessels "Warspite" and "Exmouth" are there.

GRAZ, the capital of the Austrian province of Styria, on both banks of the Mur, at the opening of this valley into the broad fertile basin known as the Grazer Feld; annexed to Germany in 1938. The town (pop., 1939, 210,175) is enclosed on three sides by forested heights of the Styrian alps, a small outlier of which, the Schlossberg, dominates the old town on the left bank of the river. This height (1,545 ft. and about 350 ft. above the general level of the town), which can be ascended by cable tramway, was an important fortified stronghold from pre-Roman times, but since 1839 has been laid out with beautiful parks, and on its top is a bell-tower (11 ft.), and a clock tower (92 ft.). Fine panoramas are to be seen of the town, the Mur valley and the mountains, to the north the Schockel (4,745 ft.), to the north-west the Upper Styrian alps, to the south-west the Koralps and to the south the Possruck. At the foot of the Schlossberg to the west lies the river and to the east the town park with many marble and bronze monuments.

In the old town cluster the principal buildings of note. The 16th century Landhaus in Renaissance style, the 17th century Zeughaus or arsenal, maintained as it was 250 years ago, with its rich collection of 15th–17th century weapons, and the 19th century town hall in German Renaissance style and the 11th century castle, now used as government offices, are worthy of mention. Amongst the many ecclesiastical buildings the most important is the 15th century cathedral of St. Aegidius, mainly in late Gothic, though later decorations and modifications in Baroque have altered the original purity of style. The interior is remarkable for its costly stained-glass windows, shrines and paintings. In the vicinity is the mausoleum church in Baroque style (1614–1714).

Graz is rich in educational institutions, at the head of which is the university, founded in 1586 by the Austrian archduke Charles Francis and restored in 1827 after an interruption of 45 years. It is magnificently housed with well-equipped laboratories and a rich library and was attended before 1938 by some 2,000 students annually. There is also a technical college, founded in 1814 by the archduke John Baptist, who also founded the Joanneum museum (1811).

The museum has extensive collections of antiquities and natural history specimens in its old building and in the collections illustrative of the development of Styrian culture.

The outer suburbs of the town include the numerous factories, and this is particularly true of those on the right bank of the river, between it and the railway. For its active trade three factors are responsible, viz., the local situation at the contact of mountain and fertile Tertiary downland, the position with reference to important routes from Danube to Adriatic and their branching towards the Hungarian plain, and the presence of good lignite in the vicinity (Koflach). In addition to an active trade in the cereals, fruit and wine of the hill lands, large manufactures have developed. Iron and steel works, physical and optical instrument factories, brewing, milling, leather and paper and cloth industries, the preparation of chemicals, printing and lithographic trades and great railway workshops are amongst its major operations while visitors to the many interesting places and spas in the neighbourhood swell the growing volume of trade.

The early history of the town is obscure and it is first definitely mentioned in a document of A.D. 881, after which it became the residence of the rulers of Styria. Its strength and importance in the 15th and 16th centuries are exemplified by successful resistances to Hungarian (1481) and Turkish (1529, 1532) attacks. Protestantism established itself early here (1530) and flourished until oppressive measures by the archduke Charles restored the authority of Rome. After a long and fairly quiescent

period the town figured largely in the Napoleonic Wars, being held by the French in 1797 and again in 1805, while in 1809 the citadel on the Schlossberg was blown up by Marshal Macdonald in accordance with the terms of the peace of Vienna, only the bell-tower and clock-tower being left. The development of the town was most rapid during the 19th century, when it received many civic privileges through the interest of the archduke John.

See also STYRIA; *G.* Fels, *Graz* und *seine Umgebung* (Graz, 1898); J. Solch, *Das Grazer Hügelland* (Vienna, 1921).

GRAZIER. One who grazes or pastures and rears cattle for the market. (*See* AGRICULTURE: GRASS AND GRASSLAND; CATTLE.)

GRAZZINI, ANTONIO FRANCESCO (1503–1583), Italian author, was born at Florence on March 22, 1503. In 1540 he was one of the founders of the Academy of the Humid (degli Umidi) afterwards called "della Fiorentina," and in 1582 founded, with L. Salviati, the Accademia della Crusca. In both societies he was known as *Il* Lasca or *Leuciscus.* He died on Feb. 18, 1583. Il Lasca ranks as one of the great masters of Tuscan prose. His principal works are Le Cene (1756 mod. ed. by Verzone, 1890), a collection of stories in the manner of Boccaccio, and a number of prose comedies (mod. ed., 1859), La *Gelosia,* La *Spiritata,* I Parentadi, La Arenga, La *Sibilla,* La *Pinzochera, L'Arzigogolo.* These comedies were written in reaction against the classical Italian manner, but in fact Grazzini went for his subjects to the same sources as his opponents.

He also edited the works of Berni. In 1868 Adamo Rossi published in his *Ricerche per le biblioteche di Perugia* three "novelle" *by* Grazzini, from a MS. of the 16th century in the "Comunale" of Perugia. *See* G. Gentile, *Delle comedie* di *A. F. Grazzini* (1896).

GREASEWOOD, a North American shrub (*Sarcobatus vermiculatus*) of the goosefoot family (Chenopodiaceae), and a characteristic plant of strongly alkaline and saline soils in the high plains of the Rocky Mountain region from Montana to Mexico. It is a much branched, somewhat spiny shrub, 2 ft. to 10 ft. high, with small, fleshy, toothless and stalkless leaves. The creosote-bush (*q.v.*), certain species of salt-bush (*q.v.*), and various other plants are also called greasewood.

GREAT ATLANTIC AND PACIFIC TEA COMPANY, THE, an American corporation operating a large chain of food stores through the United States and Canada. The first store was opened in New York city in 1859; others were quickly added, and the business extended to the principal Eastern cities, thus establishing the first of the retail chain store systems. Originally the stores handled teas and coffee exclusively; later a full line of groceries was added, and later still meat markets have been established in some stores and new combination stores opened with grocery, meat and produce departments. The company in 1935 operated about 15,000 stores scattered throughout the United States and Canada.

The earlier stores were operated by the Great American Tea Company, but this name was soon changed to the present title. The business was incorporated in 1903 in New Jersey and this corporation was in 1935 the operating company. Financial or holding companies were incorporated in 1916 in New York and in 1925 in Maryland, the latter company owning the entire capital stock of the operating company. The capitalization, as of March. 1935, consisted of $26,036,200 of 7% preferred stock, and of 1,150,000 shares of voting and 963,748 shares of non-voting common stock without par value carried in the balance sheet at $36,390,340. There were as of the same date 8.991 employee stockholders. (J. A. HA.)

GREAT AWAKENING, a remarkable religious revival centring in New England in 1740–43, but covering all the American colonies by 1750. Its way was prepared by Jonathan Edwards (*q.v.*) who, in 1734, inaugurated at Northampton the revival that, in 1740–41, was taken up by George Whitefield (*q.v.*) in Massachusetts and Connecticut. He and his untrained clerical and lay followers roused by their emotional and dramatic preaching their hearers to so high a pitch of excitement and made such violent attacks on the many clergy who did not join them, that it became necessary for Edwards personally to reprimand Whitefield; and when the latter returned to the colonies from England in 1744 he found that the faculties of Harvard and Yale had officially "testified" and "declared" against him and that most pulpits were closed to him.

The Awakening resulted in the formation of some separatist Churches, which died out or became Baptist congregations; and the religious apathy of New England during the late 18th century may have been, at least in part, due to the reaction against the gross methods often employed. (*See* also REVIVAL, RELIGIOUS.)

See Joseph Tracy, *The Great Awakening* (Boston, 1842); Frederick M. Davenport, *Primitive Traits in Religious Revivals* (1905).

GREAT BARRIER REEF: see BARRIER REEF.

GREAT BARRINGTON, a town of Berkshire county, Mass., U.S.A., on the Housatonic river in the southern Berkshire hills. It is served by the New York, New Haven and Hartford railroad. The area is 45 sq.m., and the population in 1940 was 5.824. Mountains, forests, meadows, lakes and streams make the region one of charming scenery, and there are many hotels and private summer homes in the town. A number of 18th century farmhouses still stand, and quiet old villages may still be found in secluded spots. The principal manufactures are cotton yarn, bedspreads, fine writing papers, tools, dies and adding machines. The town was incorporated in 1761, and from then until 1787 it was the county seat. During the Shay's Rebellion it was a centre of disaffection William Cullen Bryant, who lived there as lawyer and who mas the town clerk from 1816 to 1825, embodied the Indian legend of Monument Mountain (just north of Great Barrington) in one of his poems.

GREAT BASIN, THE, so named by John C. Frémont, who was the first to gain an adequate conception of its character and extent, is a roughly triangular region including about 200,000 sq m. in the western part of the United States, between the Wasatch mountains and the Sierra Nevada. It is about 800 m. long from north to south and about 500 m. broad in its widest part, at its north end. Most of it is in Nevada and Utah, but a large part is in California, and it includes small areas in Oregon, Idaho and Wyoming. It is not, as its name might suggest, a single basin-shaped depression that gathers its waters to a common centre, but it is divided into many independent drainage basins, the water of none of which finds outlet from the region. Its surface features are diverse, including flat valleys and rugged mountains with high peaks. The general level of the basin is highest near its centre, from which it descends notably toward the south. Death valley and the valley that contains the Salton sea, both in southern California, lie in part below sea-level. The whole of the Great Basin has been considered a vast desert, although that term is more properly applied only to the Great Salt Lake and Carson deserts, in its northern part, and to the Mojave, Ralston and Amargosa deserts, in its southvestern part. It includes salty and alkaline deposits, barren mud playas into which water that falls in rainstorms gathers for short periods and stony wastes where mountain streams have formed alluvial fans at their mouths. Many of the mountains and valleys trend north and south and appear to be of a peculiar type, exhibiting what has been called basin-range or fault-block structure, a type that has long been a subject of study and discussion by geologists.

The climate in widely separated parts of the Great Basin and at its greatly diiferent altitudes ranges from nearly tropical to cool. The region is dry, the average annual rainfall being about 3 in. in its southern part and 10 to 12 in. in its northern part. The precipitation occurs mostly in short local showers, some of them so violent that they are called cloudbursts. The water of these storms cuts deep arroyos but soon evaporates. Few of the mountain streams flow out upon level land, and the water of those that do soon disappears or is dissipated by evaporation. In the northern part of the basin there are many permanent lakes, which, having no outlets, are saline. The largest of these is Great Salt Lake (*q.v.*). Among the other lakes in the northern part of the basin are Bear, Utah and Sevier lakes, and, farther west, Eagle, Pyramid, Winnemucca and Walker lakes and the Carson lakes. Humboldt river, the largest stream in the Great Basin, feeds North Carson lake.

On the higher levels in central Utah there are straggling forests, mainly of pine and cedar, and in northern Nevada scattered clumps of brush, among which greasewood *(Sarcobatus)* and several kinds of sagebrush (*Artemisia*) are most abundant. Most of the lowlands and lower mountains are treeless. Cottonwoods grow along the streams, and plants that can endure salt thrive along the margins of the bare playas. In the southern part of the basin grey desert plants and species of cactus and other thorny growths are common. In the spring the barren-looking land in places brings forth many beautiful and delicate flowers. Agriculture is restricted to a few irrigable areas, but sheep and cattle are grazed in some places. The vegetation becomes more varied and abundant with increase of altitude. Some of the most productive metal mines in the world have been developed in this region. The Mormons have planted orchards, gardens and fields of grain on the east side of Great Salt Lake. The Salt Lake desert, which lies west of the lake and which Frémont visited in 1842, is still a desert, and the Great Basin as a whole is very sparsely settled. A hundred thousand years ago the climate was much moister. In the northern part there were then two large lakes, Lake Bonneville and Lake Lahontan

See John C. Frémont, (2nd) *Report of the Exploring Party to the Rocky Mountains* **(1845)**; G. **K.** Gilbert in *Surveys West of the One Hundredth Meridian,* vol. iii.; Clarence King and others, *Report of the Fortieth Parallel Survey; G. K.* Gilbert, "Lake Bonneville," U.S. Geological Survey *Monograplz* **I.** (1890); also I. C. Russell, "Lake Lahontan," *id., Monograph* XI **(1885).** For a history of the discussion of basin-range or fault-block structure *see* G. K. Gilbert, "Studies of Basin-Range Structure," U.S. Geological Survey, *Professional Paper 153* **(1928).** *(G.* McL. Wo.)

GREAT BEAR LAKE, an extensive sheet of fresh water in the north-west of Canada, between 6j° and 67° N., and 117° and 123° W. It is of very irregular shape, has an estimated area of 11,660 sq.mi., a depth of 270 ft., and is upwards of 200 ft above the sea

GREAT BEND, a city of central Kansas, U.S.A., on the Arkansas river and federal highway 50N, at an altitude of 1.843 ft.; the county seat of Barton county. It is served by the Missouri Pacific and the Santa Fe railways. The population in 1940 federal census was 9,044. It has grain elevators and flour mills, and is a shipping point for wheat, live stock and other agricultural products. The city was founded about 1870 and incorporated in 1871. It was on the old Santa Fe trail, which passed through the courthouse square. East of the city are the ruins of Fort Zarah (established 1864), from which soldiers escorted wagon trains through the dangerous stretch beyond. The region west of Great Bend was the home of vast herds of buffalo, antelope and deer. and was a famous hunting ground for the Indians of the plains, and the scene of innumerable conflicts among the tribes. Near Great Bend was the alleged site of the mythical city of Quivira, sought by Coronado.

GREAT BRITAIN, the official title of the political unity of England, Wales and Scotland. The name was formally adopted in 1707 at the date of the union of the crowns of England and Scotland; but it had been used informally by many writers for a long time previous to that date. The following article deals with those subjects which concern Great Britain as a whole, *e.g.,* constitution, defense, finance and economics, etc. For those subjects which essentially concern each country separately, *e.g.,* geography, geology, population, religious denominations, etc., the articles ENGLAND; SCOTLAND; WALES should be consulted. *(See* also BRITISH EMPIRE; ENGLISH HISTORY; IRELAND, NORTHERN; IRISH FREE STATE; LOCAL GOVERNMENT and UNITED KINGDOM.)

CONSTITUTION

The British is unique among existing constitutions in antiquity of origin, length of endurance, continuity of growth, adaptability to circumstance and extent of influence. In the course of close on nine (we might say 13) centuries of practically uninterrupted evolution, it has served in turn a feudal society, an all-but-absolute monarchy, an aristocracy, and the rule of the *bourgeoisie;* and has now adapted itself to the service of democracy. From the comparatively simple task of providing a form of government for a small. sparsely populated, backward and unimportant island, dangling off the northwest coast of Europe, it was called upon in time to develop and elaborate machinery for controlling the greatest empire that the world has ever seen, and more recently to modify that machinery to befit the senior partner in a commonwealth of free and equal nations, each of which now possesses similar institutions of its own. Its range of influence has not been limited to the Anglo-Saxon race, nor even to countries with a background of kindred law. For even nations that grew up on a Roman foundation superimposed a structure of Anglo-Saxon institutions. And, indeed, practically every civilized nation, and some that could hardly be called civilized, have, at one time or another, followed suit.

Much of the peculiar genius of the constitution is attributable to the fact that it is partly "unwritten" and wholly "flexible." It is futile to search the statute book and the law reports for the details of this constitution, since some of its most vital institutions and most of its rules of procedure are either utterly, like the cabinet, or almost, like the prime minister, unknown to the law. And, although the law gradually extends its scope, it barely keeps pace with the ever fresh developments in constitutional practice. However, a fundamental change in the law affecting relationship of Great Britain with the dominions was made by the Statute of Westminster, 1931, which gave legal efiect to sentiments expressed at the Imperial conferences of 1911 and 1926. Among other provisions of major constitutional importance, the statute abrogated the home government's powers (long obsolete) of disallowing and reserving bills passed by dominion legislatures and gave statutory force to the convention that the British parliament could not pass laws affecting the dominions without their consent.

Moreover, even such portions of the constitution as are defined by law are in no way specially privileged, all law, whether public or private, being subject to the authority of one and the same parliament. It cannot be said, however, that this has always been the case. In the middle ages, apart from the prescriptive rights of various grades of society, *e.g.,* clergy and baronage, certain enactments, *e.g.,* Magna Carta, were regarded as peculiarly sacrosanct. and the principles of the common law itself might be interpreted but not changed. In the 17th century, the doctrine of fundamental law was used by parliament against the crown, and in the 18th when parliament was sovereign, by the people against parliament. The Acts of Union with Scotland and Ireland contained clauses which were meant to be inviolable, And the United States, on their succession, embodied the doctrine in their constitution. The everlasting problem of reconciling sovereignty with liberty was thus solved by the simple process of docking, as it were, a piece off each. A century or so later, Great Britain reached an alternative solution by vesting sovereignty in the people who theoretically could now only abuse their sovereignty and their liberty at their own expense. But since the sovereignty of the people means in practice the rule of the majority, there are many who proclaim the need of safeguards against abuse of sovereignty by temporary majorities, and the argument constitutes, perhaps, the main moral sanction for the retention in some form or other of the house of lords.

Again, as a result of the rule of an uncodified common law, the ordinary tribunals will enforce any legislation affecting the constitution, so that government officials are amenable to the law which regulates the relations of private citizens. It has been claimed that there is no *loi administratif.* But the technical disabilities of the subject in suing the crown, the power of "subordinate legislation" conferred on government departments, the spread of bureaucracy as a result, partly of defense legislation during World Wars I and II, and partly of the increased socialization of the state—all these factors contribute to that outstanding constitutional problem, namely the continual encroachment of the executive, either by using the prerogative or by the presumed exercise of statutory powers, upon the rights and liberties of the subject.

The absence of a *loi administratif* on the one hand, and, on the other, the possibility in spite of this, of executive encroachment in judicial and legislative spheres. are both symptomatic of yet another characteristic of the constitution. The functions of

government are not segregated in watertight compartments. In other words, there is no "separation of powers." On the contrary, the several departments interlace and overlap. Thus the executive, as well as including the lord chancellor, the attorney-general and the solicitor-general, has seats in the legislature; the legislature dismisses and indirectly appoints the executive, and one portion of it is a final court of appeal; and the judiciary, in addition to its connection with ministry and parliament, is continually legislating by interpretation.

Crown.—This interlocking of the organs of central government is due to their common origin in the *curia regis* of the Norman kings, a body which performed all the functions of government without differentiating between them. It was the king's court meeting to do the king's business, and the same is true of all the descendants to which in course of time with the multiplication and elaboration of business it gave birth, although the sovereign has long since ceased to attend in person, save on formal occasions at his privy council and in his high court of parliament. In Anglo-Saxon times the monarchy was elective, but the choice of the Witan was restricted to the members of one family. Feudal theory after the Conquest gradually assimilated the descent of the crown to the descent of an estate in land, thus substituting an hereditary and territorial for an elective and personal basis. Later on, parliament was occasionally called upon to bolster up the doubtful legality of a successful candidate to the throne, and so parliamentary became a rival to hereditary title. In spite of the additional support lent temporarily to the latter by the theory of Divine Right, it was the former that triumphed eventually at the Revolution, and the crown is now held in hereditary succession as limited and defined in the Act of Settlement of 1701.

The feudal theory according to which the king was merely the greatest of feudal lords was gradually undermined by the idea of a national king, and the improvement of the royal status may be traced in the parallel growth of the law of treason and of the theory of the prerogative. The ruin of the baronage in the Wars of the Roses left the crown for the time being without a rival, and, when a little later the church became erastianized, Henry VIII could with justice claim to be "king, emperor and pope" in his own dominions. But the national need of an autocrat passed with the century. Parliament, now fully grown, took up the challenge of Divine Right, and the Stuarts, in pursuit of the shadow, lost the substance of power. At the Revolution sovereignty passed to parliament. William III was no dummy; but, during the subsequent reigns of a woman and two foreigners, the royal authority rapidly declined, and George III's tardy attempt to restore it ended in disaster. "Economical" reform at the end of the 18th century made the commons, and parliamentary reform early in the 19th made the constituencies, independent of royal manipulation, and the logic of party government in tingeing all policies with partisanship finally obliged the sovereign, save at moments of crisis when the exercise of his discretion became unavoidable, to undertake no public acts except on the advice of ministers. But the influence of the monarch, though difficult to estimate, should not be underrated. He is kept fully informed, his advice is taken and his consent obtained to all measures; and, of course, with the growth of the empire, and more especially since the recognition of the dominions as co-equal partners with the mother country, the crown has achieved unique significance as at once the symbol and chief constitutional safeguard of imperial union.

The limitation upon the monarch's freedom of action without the advice of his ministers precipitated a constitutional crisis in 1936, when Edward VIII desired to marry Mrs. Wallis Warfield Simpson. Finding both the home and dominion governments opposed to a morganatic union, on Dec. 10 the king executed an Instrument of Abdication, and the following day parliament passed His Majesty's Declaration of Abdication Act, 1936. This legislation, the first affecting the dominions under the terms of the Statute of Westminster, amended the Act of Settlement of 1701 by excluding Edward (who became the duke of Windsor) and his descendants from succession to the throne and provided that the Royal Marriages Act of 1772 should not apply to him.

Parliament authorized the monarch, by the Regency Act of 1937, to appoint counsellors of state to exercise specified royal functions in the event of his absence from the country or his temporary incapacity to act. Those to be appointed counsellors of state by letters patent were the wife or husband of the sovereign and the four persons who were next in succession to the throne, excluding any person who would be disqualified from being regent.

Judiciary.—In Anglo-Saxon times the earliest fornis of customary law were administered in three sets of courts: (1) national, those of the hundred and of the shire; (2) private, those of the thegns and of the lords of manors, and (3) municipal, those of the chartered boroughs. After the Conquest the local courts were slowly superseded by central courts and judges whose power emanated from the king, and the infinite varieties of customary law thus gave place to, or were welded into, one common law. This process was mainly achieved by extension of the use of royal writs, by introducing and extending the use of the jury (at first only employed where royal interests were concerned), by the institution and regulative influence of itinerant justices, who provided the necessary link between central and local government, and by the evolution from the *curia regis* of the three courts of common law at Westminster—Common Pleas, King's Bench and Exchequer. But, since the common law only developed slowly and procedure lagged behind the needs of a progressive society, the *curia* was still called upon to mitigate and to supplement. Part of these duties devolved on the chancellor, who, originally the king's secretary, rose to be chief of the royal counsellors, mainly because from his office were issued the royal writs. For this reason, and because he could act on his own initiative, suitors increasingly addressed their petitions to him personally; and an overworked council was only too glad to delegate such duties to him. Thus in the 14th century there slowly evolved a court of chancery which in the 15th achieved independence of the council. Its acts were general and registered as a matter of record whereas the procedure of the council was summary and secret. For this and other reasons chancery jurisdiction became ultimately confined to civil cases, while criminal matters continued to be dealt with by council. Thus there grew up, in spite of the jealousy of common lawyers, a body of equity rules alongside the common law, and the administration of the two was finally fused by the Judicature Act of 1873.

As far as appellate jurisdiction was provided for, errors of the Common Pleas were amended by the King's Bench; errors of the Exchequer from 1357 by the Court of Exchequer Chamber, composed of the chancellor and treasurer with other expert associates; and another court, which also became known as the Exchequer Chamber, was created in 1585 to amend errors of the King's Bench. Writs of error from the King's Bench and from the Exchequer Chamber, and, after 1675, appeals by way of petition for a rehearing from chancery, could be brought to the house of lords. As a result of the Judicature Act of 1873 and subsequent supplementary acts, all the existing superior courts were consolidated into one Supreme Court of Judicature consisting of two primary divisions: (a) The High Court of Justice, with the subdivisions—Chancery; King's Bench; Probate, Divorce and Admiralty: and (b) the Court of Appeal from the decisions of the judges of each of these divisions. The old chancery procedure by way of petition for a rehearing was extended to the courts of common law, the decisions of which could till then only be questioned by alleging error apparent on some part of the proceedings. The house of lords became the final court of appeal from all the courts (other than ecclesiastical) of Great Britain, though the Administration of Justice (Appeals) Act of 1934 stipulated that there could be no such appeal unless either the court of appeal or the house of lords itself gave leave. The judicial personnel of the house of lords, together with dominion and Indian judges, constituted the judicial committee of the privy council, which was the final court of appeal from the rest of the empire and from the ecclesiastical courts of Great Britain; its jurisdiction was abolished in some instances, and from Canada appeal lay to the privy council only by special leave of the dominion supreme court.

Executive.——The curia *regis*, composed of the tenants-in-chief, royal officials and anyone else whom the king chose to summon, expanded or contracted according to the nature of its work. Daily routine would be left mainly to officials; the more serious the business the larger the attendance of tenants-in-chief; and on occasions of greatest importance the officials formed a numerically insignificant technical element in a large feudal assembly. The epithets employed to distinguish the larger and smaller gatherings achieved in time a technical significance until at last the larger assembly developed into the great council and the parliament, the smaller into the king's council. The latter, in spite of baronial machinations, had become, by the time of Henry VII, the instrument of the crown, and was used by the Tudors as the medium of prerogative government. True offspring of an undifferentiated curia, its authority was not confined to the exercise of any one function. Thus, though from it was to evolve the national executive, it retained also powers of legislation by ordinance and proclamation only vaguely subordinate to statute and common law, and a wide, if undefined, jurisdiction supplementary to the common iaw. Part of the latter had devoived on chancery, and much of the mercantile and marine business was absorbed by the court of admiralty constituted in the middle of the 14th century; but the stupendous labour involved in the Tudor conception of conciliar government necessitated further subdivision and specialization; and thus, just as in earlier times for analogous reasons the curia had given birth and place to a number of descendant courts and councils, so now the king's council and its functions were split up and divided between the privy council, the courts of Star Chamber, of Requests, and of High Commission, and such local offshoots as the courts and councils of the north, and of Wales and the Marches. But conciliar government, though popular and necessary for a time, aroused, and finally succumbed to, the jealousy of common lawyers and of parliament. Already in 1610, its legislative powers virtually disappeared as a result of the ruling in the Case of Proclamations that the latter could not create a new offense, and the Long Parliament swept away the council's jurisdiction in England. Thus, at the Restoration, of all the offspring of the king's council, there survived only the privy council; with nothing left of its former legislative authority, save the right by proclamation to admonish subjects to keep the law, or, by order in council, to fill in the details of measures enacted in general outline and principle by parliament; with its executive function already in course of usurpation by one of its own committees, out of which in time evolved the cabinet; and with its judicial powers confined to hearing appeals from places outside England. By an act of 1832 it was also constituted the final court of appeal in ecclesiastical causes. But the whole of its appellate jurisdiction, its last effective function, was transferred in the following year to a judicial committee. And the privy council, which has now nearly 300 members (the numbers increased in proportion as its importance declined), may be described as a purely formal body, meeting on purely formal occasions, to transact purely formal business.

The cabinet, which in the 17th century evolved from a committee of the privy council as the effective national executive, was composed of an inner ring of confidential advisers of the crown. The king at first presided, but, when George I for lack of English ceased to attend, his place was taken by a minister, usually the first lord of the treasury, who in time became known as the prime minister. The latter, normally the head of the party commanding a majority in the house of commons, is appointed by the sovereign, with whose consent he in turn appoints the rest of the ministry and decides, though his choice is in practice narrowly restricted, which of them shall be members of the cabinet. Just as their predecessors sat originally in the parliament chamber, so now are all ministers members of one or other house of parliament, according as to whether they are peers or commoners. And they are individually and collectively responsible to crown, prime minister and parliament. Ministerial salaries were revised by the Ministers of the Crown Act, 1937. The person who was prime minister and first lord of the treasury received a salary of £10,000 per annum, while others holding cabinet ofiices received salaries ranging from £5,000 to £2,000 each year. Every former prime minister was granted an annual pension of £2,000, and a like sum was paid as salary to the leader of the parliamentary opposition.

LEGISLATURE

Parliament was originally a periodical public assembly of the *curia regis* at its fullest expansion. It was therefore competent to perform all functions of government. But the one mainly stressed was the judicial function, for law-declaring precedes law-making. Any subject might present a petition, and parliament acted as a clearinghouse for such petitions, referring the suitor to the appropriate court and reserving for its own consideration in full assembly only such cases as were particularly difficult, protracted or important. In the 13th century, however, the practice of summoning occasionally and experimentally delegates, sometimes from the shires, sometimes from the boroughs, and sometimes from both simultaneously, was instituted for certain purposes. One of these was the granting of money. To the demand for money the commons replied with a demand for the granting of the petitions they had brought with them; and the more important of these petitions they began to present, for greater backing, not individually, but collectively as a body. Thus evolved the idea that money is granted in return for the redress of grievances. And considerations of these common petitions came to occupy so much of parliament's time, that it was obliged more and more to leave the private petitions to be dealt with by council or chancery after parliament had broken up. In other words, it was abandoning the righting of individual wrongs, a judicial function, in favour of the righting of the wrongs of the nation, a legislative function. And the attendance of knights and burgesses, who were at first merely an alien element briefly interrupting the ordinary routine of an occasional parliament, came to be essential to the life of the parliament.

But theory outlasted fact, and parliament, although now definitely legislative, was still regarded as a "high court," and as such its jurisdiction was limited. It could not interfere with the common law, nor with the prescriptive rights of the baronage, and, even as late as the 18th century, judges would sometimes treat its enactments as bad judgments and refuse to enforce them, if they seemed to run counter to the principles of common law. It was Henry VIII, more than anyone else, who helped parliament to climb by precedents towards a sovereignty which it finally wrested from his successors at the Revolution of 1688. For, though despotic, he liked to preserve legal forms and, still more, to shelve responsibility. Thus even to his most unconstitutional actions, *e.g.,* the erastianization and spoliation of the church, he made parliament his partner; and particularly did he flatter the pretensions of the commons of whom he had no fear. He took them under his roof. And from the moment they entered St. Stephen's chapel the commons became an integral part of parliament even in their private deliberations, instead of, as till then, only when they stood at the bar of the parliament chamber. The walls of the latter were no longer the boundaries of parliament, but only of the house of lords which together with the house of commons, from now on made up the parliament.

House of Lords.—In the parliament chamber sat originally the king, his counsellors, and his greater tenants-in-chief, lay and spiritual. But the sovereign is now only present on rare and formal occasions, and with the growth of the doctrine of the peerage, the presence of commoners became anomalous, so that counsellors who were neither peers nor bishops, preferred, unless incapacitated by tenure of judicial office, to seek election to the commons. The total membership in the house of lords of about 740 comprises peers who hold their seats by hereditary right or by the creation of the sovereign (about half of them created since 1906); law lords (peers who hold or have held high judicial office, and life peers specially appointed); spiritual peers (two archbishops and 24 bishops of the church of England); Scottish representative peers (16 elected for the duration of parliament); and Irish representative peers (elected for life, but vacancies being no longer filled). The Parliament Act of 1911 disabled the house of lords from rejecting or amending any bill certified by the speaker to

be a money bill, and limited their veto on other bills to three successive sessions within two years; it also reduced the maximum duration of a parliament from seven to five years. Offsetting the monopoly of parliamentary taxation enjoyed by the commons, the house of lords became a court of appeal (see above, ***Judiciary),*** hearing being left to those members who were past or present holders of high judicial office or law lords specially appointed for life.

House of Commons.—The commons grew so greatly in power as the result of Henry VIII's encouragement, of the presence of the privy councillors, of the increased duration of parliaments, and of the impecunious condition of the government, that, within almost a century of achieving a house of their own. they were able to abolish the other two branches of the legislature. king and house of lords. The latter never fully recovered from its temporary, though illegal, abolition. But much of the apparent superiority of the lower house in the 18th century must be discounted when we reflect that so many of its members were either in receipt of government bribes or sinecures or nominees of borough proprietors, very often peers. It was only after "economical" reform had to some extent purified the house, and parliamentary reform the constituencies, that the commons really came to overshadow the house of lords, which in its turn had become corrupted by wholesale creations, now that a peerage was about the only reward or bribe that government could still offer for faithful political support. Finally, the extension of the franchise by stages culminating in universal suffrage has made the house representative of practically all adults in the kingdom except the individuals who compose the house of lords.

The house of commons consists (1943) of 61j members. 300 of them representing county divisions and 303 borough (*i.e.,* urban) constituencies, while 12 come from the universities; 13 of the total number represent Northern Ireland. The minimum age of a member is 21 years. Those disqualified for membership include clergymen of the Church of England, ministers of the Church of Scotland, Roman Catholic clergymen, government contractors and sheriffs. Provision was first made in 1911 for salaries of £400 per annum to all members of the commons (but not of the lords), other than those receiving salaries as officers of the house, as ministers or as officers of His Majesty's household; the Appropriation Act of 1937 increased salaries to £600 per annum.

GUARANTEES OF LIBERTY

Franchise.—The knights of the shire from 1430 to 1832 were elected in the county courts by the forty-shilling freeholders. Representation in the counties. therefore, though arbitrary (since other forms of tenure were ignored), was not the monopoly of class or wealth. But in the boroughs no such uniformity prevailed, and, as time went by, the franchise tended to become more and more restricted. For in early days popular indifference was content to leave the duty of nominating representatives to the authorities, who thus in time developed a prescriptive monopoly, and charters of incorporation, issued later on, when representation had come to be regarded as a privilege, usually conferred (or were interpreted as conferring) the exclusive right of election on the governing body.

But, in condemning the old electoral system, critics usually base their calculations on the proportion of voters to population (2% in England, 2 per thousand in Scotland, at the close of the 18th century), forgetting that representation was not meant to be of population, but of communities, and that, just as the county court stood for the county, so the corporation might stand for the borough. Later. it is true, other theories arose as to what ought to be the basis of representation, and land, property and taxation had each their champions, who had no difficulty in demonstrating the hopelessness of the system from the point of view of their respective ideals. But a sounder indictment would stress the point that the system had ceased to do what it was intended to do—had ceased, in fact, to represent communities. For many boroughs returning members to parliament had decayed and some had actually ceased to exist, while many large and flourishing towns remained unrepresented; and, in county and borough alike, the franchise, as a result of corruption, was no longer a political privilege so much as an extremely marketable property. It was the agitation of the American colonies and the disasters resulting from George III's attempt at personal government that at last aroused public interest in the matter. But reformers were divided on the question of compensation for expropriated borough owners, and the French Revolution and Napoleonic wars afforded an excuse for shelving the subject for another generation. The Reform Act of 1832 marked the first stage in the process, continued by the acts of 1867, 1884, 1885 and 1918. of extending the franchise to all adult males and reshaping constituencies into fairly equal electoral districts. The act of 1918 further conceded the principle of female suffrage, and the act of 1928 carried that concession to its logical conclusion by placing women on the same footing as men.

Liberty of the Subject.—The freedom of the individual, apart from the protection afforded by the franchise, is secured indirectly "by the strict maintenance of the principles that no man can be arrested or imprisoned except . . . under some legal warrant or authority, and . . . by the provision of adequate legal means for the enforcement of this principle." The most important of such means is the writ of habeas *corpus* which enables the judiciary to review the actions of the executive, while the jury system protects the subject from judicial abuses; and the Bill of Rights reinforced by the Mutiny act (called since 1881 the Army act) removes the threat to liberty inherent in the existence of a standing army. Freedom of discussion and freedom of the press are secured by the law of libel (and more especially by Fox's Libel Act, 1792) and amount to "the right to write or say anything which a jury, consisting of 12 shopkeepers, think it expedient should be said or written." The citizen is further protected in airing his views and grievances: by the right to petition, secured by the Bill of Rights; by the right of public meeting, all meetings being legal until some illegal act has been committed; and by the right of association.

Curtailment of Liberty.—During time of war or national emergency the common good necessitated drastic limitation on individual freedom In World War I the Defence of the Realm acts (D.O.R.A.), 1914–15, abridged the common law rights of the subject in many directions. The Emergency Powers Act, 1920, permanent successor to this wartime measure, became effective only by proclamation of an emergency; the proclamation could last only for a month at a time (but might be renewed), and emergency regulations under the act could continue in force for only a week unless parliament voted for their continuance. The act was brought into operation for a coal strike in 1921 (with three monthly continuances) and for a general strike in 1926 (with seven monthly continuances).

On the eve of World War II parliament passed the Emergency Powers (Defence) Act, 1939, which authorized the making of defense regulation~by order in council; unlike D.O.R A., the regulations were subject to possible annulment by parliament within 28 days of being made. Some of the regulations created criminal offenses (as looting and sabotage), while others gave blank powers to be filled in by ministerial orders. Further wartime limitations upon individual freedom were imposed by the Control of Employment Act, 1939, later superseded by an amending Emergency Powers (Defence) (No. 2) Act, 1940, which gave complete governmental control over persons and property. Under a Civil Defence Duties (Compulsory Enrolment) order millions of men and women were compelled to serve part time or whole time as fire guards or in the wardens, rescue and casualty services, and after Jan. 1942 those working part time were no longer allowed to resign from their civil defense employment. The judiciary was also affected by wartime conditions. An Administration of Justice (Emergency Provisions) Act, 1939, relaxed statutory requirements for the sittings and jurisdiction of courts (and also dealt a new and severe blow to the right of trial by jury), while a Courts (Emergency Powers) Act, 1939, protected those unable to pay their debts because of circumstances attributable to the war, by preventing certain remedies from being exercised save by consent of the court.

CHURCH

Religious liberty, of which the first landmark is the Toleration Act of 1689, has been gradually attained by the repeal, one after another, of the many statutes penalizing persons not of the Anglican persuasion.

Until the time of Henry VIII there was no church of England, but only two provinces of the Church Universal in England. The church had its own head, the pope, its own law. the canon law, and each province, Canterbury and York, had its own officials, archbishops and bishops. its own assembly, convocation, and its own courts of law. This diarchy of church and state was bound to lead to friction, more especially as the border line was vague and disputed and jurisdiction in some matters overlapped. Yet ecclesiastics, more than any other section of society, influenced the shaping of the constitution. They filled the chief offices of state; they were a permanent majority in the parliament chamber; for a time even representatives of the lower clergy attended the parliament; and for a century or more after the Conquest the archbishop of Canterbury had the chief say in determining the succession. After the Reformation their political influence declined. Few of them sat at the council board, and the disappearance of abbots and priors with the dissolution of the monasteries left them in a minority in the lords. And yet the final settlement under Elizabeth left the organization of the church to outward appearances much as it had always been. The sovereign, it is true, was now supreme governor of the church, but the latter continued for a time to exist parallel to, and not as a department of, the state, and it was not really until the Revolution of 1688 that the royal supremacy became nominal and parliament's authority paramount over the church as over the state. The ecclesiastical courts survived unchanged, though supervision and discipline were mainly seen to by the Court of High Commission (till its abolition in 1641) and appeals might now be carried to chancery (after 1832 to the privy council); and each province retained its convocation, though its meetings in future depended on the sovereign's will and it might legislate only with his consent. As regards the clergy itself, the total of archbishops and diocesan bishops was raised by Henry VIII to 26. There are (1942) 43, but still only 26, viz., the two archbishops, the bishops of London, Winchester and Durham, and 21 other diocesans in order of seniority, have seats in the lords. There are numerous suffragan and assistant bishops. The regulars were abolished altogether with the monasteries, not to be restored until the 19th century, and the seculars were released by degrees from their vow of celibacy.

The final result of the Reformation, then, may be summed up as the abolition of the dual control of church and state, the transference to the state of complete control over the church, and the substitution for the canon law of the king's ecclesiastical law. Among later constitutional developments it is only necessary to mention: (1) The substitution of parliamentary for royal control, as a result after the Revolution of the sovereignty of parliament and of the development of cabinet government, whereby the crown's powers have become vested in a ministry responsible to parliament; (2) the growth of religious toleration with the result that membership of the church has ceased to be a necessary qualification for full rights in the state; and (3) the grant of a measure of legislative autonomy to the Established Church by the National Assembly of the Church of England (Powers) Act (1919). As a result of repeated quarrels between the two houses of convocation, the latter was silenced in 1717 and not allowed to resume its sessions until 1852. Soon afterwards, annual church congresses began to be held in which laymen took part, and in 1885 a house of laymen was formed in Canterbury, and another a little later in York, elected by the diocesan conferences for the purpose of conferring with the respective convocations From 1904 to 1919, there met annually a representative church council composed of the three houses in the two provinces sitting together; and the act of 1919 delegated to the newly constituted assembly of the church, subject always to the control of parliament. powers of legislature affecting the affairs of the church.

WALES, SCOTLAND AND IRELAND

Wales was incorporated with England in 1536, receiving the same law and being granted representation in parliament. The crowns of England and Scotland were united in 1603 on the accession of James I (and VI), and their parliaments in 1707. The resulting parliament of Great Britain was to contain 16 representative Scottish peers, elected for each parliament by the whole body of Scottish peers, and 45 (now 74, by act of 1918) representatives of shires and boroughs. Scotland, however. retained her own legal system and her own Presbyterian Church. Ireland, when united nith Great Britain in 1801, contributed to the parliament of the United Kingdom 28 representative Irish peers elected for life, one archbishop and three bishops (the ecclesiastics disappeared with Irish Disestablishment in 1869), and 100 (later 105) members of the commons. However, by the Irish Free State (Agreement) Act (1922), Southern Ireland was granted dominion status, leaving only Northern Ireland to be represented in the commons by 13 members out of the total of 615.

DEFENSE: ARMY

Historical. — Prior to the Norman Conquest the armed force of England was essentially a national militia. Every freeman was bound to bear arms for the defense of the country, or for the maintenance of order. To give some organization and training to the levy, the several sheriffs had authority to call out the contingents of their shires for exercise. The *fyrd,* as the levy was named, was available for home service only, and could not be moved even from its county except in the case of emergency.

Yet even in those days the necessity of some more permanent force was felt, and bodies of paid troops were maintained by the kings at their own cost. Thus Canute and his successors, and even some of the great earls kept up a household force (*huscarles*). The English army at Hastings consisted of the *fyrd* and the corps of *huscarles.*

The English had fought on foot; but the mailed horseman had now become the chief factor in war, and the Conqueror introduced into England the system of tenure by knight-service familiar in Normandy. This was based on the unit of the feudal host, the constabularia of ten knights, the Conqueror granting lands in return for finding one or more of these units (in the case of great barons) or some fraction of them (in the case of lesser tenants). The obligation was to provide knights to serve, with horse and arms, for forty days in each year at their own charges. This obligation could be handed on by sub-enfeoffment through a whole series of under-tenants. The system being based, not on the duty of personal service, but on the obligation to supply one or more knights (or it might be only the fraction of a knight), it was early found convenient to commute this for a money payment known as "scutage" (see KNIGHT-SERVICE and SCUTAGE). This money enabled the king to hire mercenaries, or pay such of the feudal troops as were willing to serve beyond the usual time. The feudal system had not, however, abrogated the old Saxon levies, and from these arose two national institutions — the posse *comitatus,* liable to be called out by the sheriff to maintain the king's peace, and later the militia (*q.v.*). The posse *comitatus,* or power of the county, included all males able to bear arms, peers and spiritual men excepted; and though primarily a police force it was also bound to assist in the defense of the country. This levy was organized by the Assize of Arms under Henry II (1181), and subsequently under Edward I (1285) by the so-called "Statute of Winchester," which determined the numbers

and description of weapons to be kept by each man according to his property, and also provided for their periodical inspection. The early Plantagenets made much use of mercenaries. But the weakness of the feudal system in England was preparing, through the 12th and 13th centuries, a nation in arms absolutely unique in the middle ages. The Scottish and Welsh wars were, of course, fought by the feudal levy, but this levy was far from being the mob of unwilling peasants usual abroad, and from the fyrd came the English archers, whose fame was established by Edward I's wars, and carried to the continent by Edward III. Edward III realized that there was better material to be had in his own country than abroad, and the army with which he invaded France was an army of national mercenaries, or, more simply, of English soldiers. The army at Creçy was composed exclusively of English, Welsh and Irish. From the pay list of the army at the siege of Calais (1346) it appears that all ranks were paid, no attempt being made to force even the feudal nobles to serve abroad at their own expense The funds for the payment of these armies were provided partly from the royal revenues, partly from the fines paid in lieu of military service, and other fines arbitrarily imposed, and partly by grants from parliament. As the soldier's contract usually ended with the war, and the king had seldom funds to renew it even if he so wished, the armies disbanded of themselves at the close of each war. To secure the services of the soldier during his contract, acts were passed (18 Henry VI c. 19; and 7 Henry VII c. 1) inflicting penalties for desertion, and in Edward VI's reign an act "touching the true service of captains and soldiers" was passed, somewhat of the nature of a Mutiny act.

It is difficult to summarize the history of the army between the Hundred Years' War and 1642. The final failure of the English arms in France was soon followed by the Wars of the Roses, and in the long period of civil strife the only national force remaining to England was the Calais garrison. Henry VIII was a soldier-king, but he shared the public feeling for the old bow and bill, and English armies which served abroad did not, it seems, win the respect of the advanced professional soldiers of the continent. In 1519 the Venetian ambassador described the English forces as consisting of 150,000 men whose peculiar, though not exclusive, weapon was the long bow (Fortescue, *British Army*, i, 117). The national levy made in 1588 to resist the Armada and the threat of invasion produced about 750 lancers (heavy-armed cavalry), 2,000 light horse and 56,000 foot, beside 20.000 men employed in watching the coasts. The small proportion of mounted men is very remarkable in a country in which Cromwell was before long to illustrate the full power of cavalry on the battlefield. It is indeed not unfair to regard this army as a miscellaneous levy of inferior quality.

It was in cavalry that England was weakest, and by three different acts it was sought to improve the breed of horses. Perhaps the best organized force in England at this time was the London volunteer association which ultimately became the Honourable Artillery company. At Flodden the spirit of the old English yeomanry triumphed over the outward form of continental battalions which the Scots had adopted, and doubtless the great victory did much to retard military progress in England. The chief service of Henry VIII to the British army was the formation of an artillery train, in which he took a special interest. Before he died the forces came to consist of a few permanent troops (the bodyguard and the fortress artillery service), the militia or general levy, and the paid armies which were collected for a foreign war and disbanded at the conclusion of peace, and were recruited on the same principle of indents which had served in the Hundred Years' War. In the reign of Mary, the old Statute of Winchester was revised (1553), and the new act provided for a readjustment of the county contingents and in some degree for the rearmament of the militia. But, from the fall of Calais up to the battle of the Dunes a century later, the intervention of British forces in foreign wars was always futile and generally disastrous. During this time, however, the numerous British regiments in the service of Holland learned, in the long war of Dutch independence, the technique of war as it had developed on the continent since 1450. Thus it was that in 1642 there were many hundreds of trained and war-experienced officers and sergeants available for the armies of the king and the parliament. By this time bows and bills had long disappeared even from the militia, and the Thirty Years' War, which, even more than the Low Countries. offered a career for the adventurous man, contributed yet more trained officers and soldiers to the English and Scottish forces. So closely indeed was war now studied by Englishmen that the respective adherents of the Dutch and the Swedish systems quarrelled on the eve of the battle of Edgehill.

The home forces of England had, as has been said, little or nothing to revive their ancient renown. Instead, they had come to be regarded as a menace to the constitution. In Queen Elizabeth's time the demands of the Irish wars had led to frequent forced levies, and the occasional billeting of the troops in England also gave rise to murmurs, but the brilliancy and energy of her reign covered a great deal, and the peaceful policy of her successor removed all immediate cause of complaint. But after the accession of Charles I we find the army a constant and principal source of dispute between the king and parliament. Charles, wishing to support the Elector Palatine in the Thirty Years' War, raised an army of 10,000 men. He was already encumbered with debts, and the parliament refused all grants, on which he had recourse to forced loans. The army was sent to Spain, but returned without effecting anything, and was not disbanded, as usual, but billeted on the inhabitants. The billeting was the more deeply resented as it appeared that the troops were purposely billeted on those who had resisted the loan. Forced loans, billeting and martial law—all directly connected with the maintenance of the army—formed the main substance of the grievances set forth in the Petition of Right. In accepting this petition, Charles gave up the right to maintain an army without consent of parliament; and when in 1639 he wished to raise one to act against the rebellious Scots, parliament was called together, and its sanction obtained, on the plea that the army was necessary for the defense of England. This army again became the source of dispute between the king and parliament, and finally both sides appealed to arms.

The first years of the Great Rebellion (*q.v.*) showed primarily the abundance of good officers produced by the wars on the continent, and in the second place the absolute inadequacy of the military system of the country. It was clear, at the same time, that when the struggle was one of principles and not of dynastic politics, excellent recruits, far different from the wretched levies who had been gathered together for the Spanish war, were to be had in any reasonable number. These causes combined to produce the "New Model" which, originating in Cromwell's own cavalry and the London trained bands of foot, formed of picked men and officers, severely disciplined, and organized and administered in the right way, quickly proved its superiority over all other armies in the field, and in a few years raised its general to supreme civil power. Feb. 15, 1645, was the birthday of the British standing army, and from its first concentration at Windsor park dates the scarlet uniform.

When Cromwell sent his veterans to take part in the wars of the continent they proved themselves a match for the best soldiers in Europe. On the restoration of the monarchy in 1660 the army, now some 80,000 strong, was disbanded. It had enforced the execution of Charles I, it had dissolved parliament, and England had been for years governed under a military regime. Thus the most popular measure of the Restoration was the dissolution of the army. Only Monk's regiment of foot (now the Coldstream Guards) survived to represent the New Model in the army of today. At the same time the troops (now regiments) of household cavalry, and the regiment of foot which afterwards became the Grenadier Guards, were formed, chiefly from Royalists, though the disbanded New Model contributed many experienced recruits. The permanent forces of the crown came to consist once more of the "garrisons and guards," maintained by the king from the revenue allotted to him for carrying on the government of the country. The "garrisons" were commissioned to special fortresses—the Tower of London, Portsmouth, etc. The "guards" comprised the sovereign's bodyguards ("the yeomen of the guard" and

"gentlemen-at-arms," who had existed since the times of Henry VII and VIII), and the regiments mentioned above. Even this small force, at first not exceeding 3,000 men, was looked on with jealousy by parliament, and every attempt to increase it was opposed. The acquisition of Tangier and Bombay, as part of the dower of the infanta of Portugal, led to the formation of a troop of horse (now the 1st Royal Dragoons) and a regiment of infantry (the and, now Queen's R. W. Surrey, regiment) for the protection of the former; and a regiment of infantry (afterwards transferred to the East India company) to hold the latter (1661). These troops, not being stationed in the kingdom, created no distrust; but whenever, as on several occasions during Charles's reign, considerable armies were raised, they were mostly disbanded when the occasion ceased. Several regiments, however, were added to the permanent force, including Dumbarton's regiment (the Royal Scots, nicknamed Pontius Pilate's Bodyguard)—which had a long record of service in the armies of the continent, and represented the Scots brigade of Gustavus Adolphus's army—and the 3rd Buffs, representing the English regiments of the Dutch army and through them the volunteers of 1572, and on Charles's death in 1685 the totai force of 'guards and garrisons" had risen to 16,500, of whom about one-half formed what we should now call the standing army.

James II, an experienced soldier and sailor, was more obstinate than his predecessor in his efforts to increase the army, and Monmouth's rebellion afforded him the opportunity. A force of about 20,000 men was maintained in England, and a large camp formed at Hounslow. James even proposed to disband the militia, and although the proposal was instantly rejected, he continued to add to the army till the Revolution deprived him of his throne. The army which he had raised was to a great extent disbanded, the Irish soldiers especially, whom he had introduced in large numbers on account of their religion, being all sent home.

The condition of the army immediately engaged the attention of parliament. The Bill of Rights had definitely established that "the raising or keeping of a standing army within the kingdom, unless it be by the consent of parliament, is against the law," and past experience made them very jealous of such a force. But civil war was imminent, foreign war certain; and William had only a few Dutch troops, and the remains of James's army, with which to meet the storm. Parliament therefore sanctioned a standing army, trusting to the checks established by the Bill of Rights and Act of Settlement, and by placing the pay of the army under the control of the commons. An event soon showed the altered position of the army. A regiment mutinied and declared for James. It was surrounded and compelled to lay down its arms; but William found himself without legal power to deal with the mutineers. He therefore applied to parliament, and in 1689 was passed the first Mutiny act, which, after repeating the provisions regarding the army inserted in the Bill of Rights, and declaring the illegality of martial law, gave power to the crown to deal with the offenses of mutiny and desertion by courts-martial. From this event is often dated the history of the standing army as a constitutional force (but *see* Fortescue, *British Army*, i, 335).

Under William the old regiments of James's army were reorganized, retaining, however, their original numbers, and three of cavalry and eleven of infantry (numbered to the 28th) were added. In 1690 parliament sanctioned a force of 62,000 men, but on peace being made in 1697 the commons immediately passed resolutions to the effect that the land forces be reduced to 7.000 men in England and 12.000 in Ireland. The War of the Spanish Succession quickly obliged Great Britain again to raise a large army, at one time exceeding 200,000 men; but of these the greater number were foreign troops engaged for the continental war. Fortescue (op. *cit.* i, 555) estimates the British forces at home and abroad as 70,000 men at the highest figure. After the peace of Utrecht the force was again reduced to 8,000 men in Great Britain and 11.000 in the plantations (*i.e.* colonies) and abroad. From that time to the present the strength of the army has been determined by the annual votes of parliament, and though frequently the subject of warm debates in both houses, it has ceased to be a matter of dispute between the crown and parliament. The following table shows the main fluctuations from that time onward—the peace years showing the average peace strength, the war years the maximum to which the forces were raised:

Peace		*War*	
Year	*Number*	*Year*	*Number*
1750	18,857	1745	74,187
1793	17,013	1761	67,776
1822	71,790	1777	90,734
1857	156,995	1812	245,996
1866	203,404	1856	275,079

Note.—Prior to 1856 the British forces serving in India are not included.

During William's reign the small English army bore an honourable part in the wars against Louis XIV, and especially distinguished itself under the king at Steinkirk, Neerwinden and Namur. In the great wars of Queen Anne's reign the British army under Marlborough acquired a European reputation. The cavalry, which had called forth the admiration of Prince Eugene when passed in review before him after its long march across Germany (1704), especially distinguished itself in the battle of Blenheim, and Ramillies, Oudenarde and Malplaquet were added to the list of English victories. But the army as usual was reduced at once, and even the cadres of old regiments were disbanded, though the alarm of Jacobite insurrections soon brought about the re-creation of many of these. During the reign of the first and second Georges an artillery corps was organized, and the army further increased by five regiments of cavalry and thirty-five of infantry. Although Fontenoy (*q.v.*) was a day of disaster for the English arms, it did not lower their reputation, but rather added to it. Six regiments of infantry won the chief glory of Prince Ferdinand's victory of Minden (*q.v.*) in 1759. About this time the first English regiments were sent to India, and the 39th shared in Clive's victory at Plassey. During the first half of George III's reign the army was principally occupied in America; and though the conquest of Canada may be counted with pride among its exploits, this page in its history is certainly the darkest. English armies capitulated at Saratoga and at Yorktown, and the mar ended by the evacuation of the revolted states of America and the acknowledgment of their independence.

In the 18th century, regiments were still raised almost as in the days of the Edwards. The crown contracted with a distinguished soldier, or gentleman of high position, who undertook to raise the men, receiving a certain sum as bounty-money for each recruit. In some cases, in lieu of money, the contractor received the nomination of all or some of the officers, and recouped himself by selling the commissions. This system—termed "raising men for rank"—was retained for many years. and originally helped to create the "purchase system" of promotion. For the maintenance of the regiment the colonel received an annual sum sufficient to cover the pay of the men, and the expenses of clothing and of recruiting. Sometimes, when casualties were numerous, the allowance was insufficient to meet the cost of recruiting, and special grants were made. In war time the ranks were also filled by released debtors, pardoned criminals, and impressed paupers and vagrants. Where the men were raised by voluntary enlistment, the period of service was a matter of contract between the colonel and the soldier, and the engagement was usually for life; but exceptional levies were enlisted for the duration of war, or for periods of three or five years. As for the officers, the low rate of pay and the purchase system combined to exclude all but men of independent incomes. The barrack accommodation in Great Britain at the beginning of the 18th century only sufficed for 5,000 men; and though it had gradually risen to 20.000 in 1792, a large part of the army was constantly in camps and billets—the latter causing endless complaints and difficulties.

The first efforts of the army in the long war with France did not tend to raise its reputation amongst the armies of Europe. The campaigns of allied armies under the duke of York in the Netherlands, in which British contingents figured largely, were uniformly unsuccessful (1793–94 and 1799), though in this respect they resembled those of almost all soldiers against the "New French" army. The policy of the younger Pitt sent thousands of the best soldiers to unprofitable employment. and indeed to death,

in the West Indies. At home the administration was corrupt and ineffective, and the people generally shared the contemptuous feeling towards the regular army which was then prevalent in Europe. But a better era began with the appointment of Frederick Augustus, duke of York, as commander-in-chief of the army. He did much to improve its organization, discipline and training, and was ably seconded by commanders of distinguished ability. Under Abercromby in Egypt, and under Lake, Wellesley and others in India, the British armies again attached victory to their standards. Later, Napoleon's threat of invading England excited her martial spirit to the highest pitch to which it had ever attained. Finally, her military glory was raised'by the series of successful campaigns in the Peninsula, until it culminated in the great victory of Waterloo; and the army emerged from the war with the most solidly founded reputation of any in Europe.

The great augmentations required during the war were effected partly by raising additional regiments, but principally by increasing the number of battalions, some regiments being given as many as four. On the conclusion of peace these battalions were reduced. but the regiments were retained, and the army was permanently increased from about 20,000, the usual peace establishment before the war, to an average of 80,000. The duke of York, on first appointment to the command, had introduced a uniform drill throughout the army, which was further modified according to Sir David Dundas's system in 1800; and, under the direction of Sir John Moore and others, a new system of training and discipline was developed, in which the mind and spirit were cultivated, not merely the muscle. In the Peninsula the army was permanently organized in divisions, usually consisting of two brigades of three or four battalions each, and one or two batteries of artillery.

The period which elapsed between Waterloo and the Crimean War is marked by a number of Indian and colonial wars, but by no organic changes in the army, with perhaps the single exception of the Limited Service act of 1847, by which enlistment for ten or 12 years, with power to re-engage to complete 21, was substituted for the life enlistments hitherto in force, The army went to sleep on the laurels and recollections of the Peninsula. The duke of Wellington, for many years commander-in-chief, was too anxious to hide it away in the colonies in order to save it from further reductions or utter extinction, to attempt any great administrative reforms. The force which was sent to the Crimea in 1854 was an agglomeration of battalions, individually of fine quality, but unused to working together, without trained staff, administrative departments or army organization of any kind. The lesson of the winter before Sevastopol was dearly bought, but was not thrown away. From that time several war ministers and one commander-in-chief laboured perseveringly at the thankless and difficult task of reforming army organization. Foremost in the work was Sidney Herbert (Lord Herbert of Lea), the soldier's friend, who fell a sacrifice to his labours (1861), but not before he had done much for the army. The whole system of administration mas revised. In 1854 it was inconceivably complicated and cumbersome. The "secretary of state for war and colonies," sitting at the colonial office, had a general but vague control, practically limited to times of war. The "secretary at war" was the parliamentary representative of the army. The commander-in-chief was responsible to the sovereign alone in all matters connected with the discipline, command or patronage of the army, but to the secretary at war in financial matters. The master-general and board of ordnance were responsible for the supply of material on requisition, but were otherwise independent, and had the artillery and engineers under them. The commissariat department had its headquarters at the treasury, and until 1852 the militia were under the home secretary. In 1854 the business of the colonies was separated from that of war, and the then secretary of state assumed control over all the other administrative officers. In the following year the secretary of state was appointed secretary at war also, and the duties of the two offices amalgamated; the commissariat office was transferred to the war department; and the board of ordnance abolished, its functions being divided between the commander-in-chief and the secretary of state. The minor departments were gradually absorbed, and the whole administration divided under two great chiefs, sitting at the war office and Horse Guards respectively. In 1870 these two were welded into one, and the war office now existing was constituted.

Corresponding improvements were effected in every branch. The system of clothing the soldiers was altered, the contracts being taken from the colonels of regiments, who received a money allowance instead, and the clothing supplied from government manufactories. The pay, food and general condition of the soldier were improved; his ordinary education and the military education of the officer were taken in hand.

The Indian Mutiny of 1857, followed by the transference of the government of India, led to important changes. The East India company's white troops were amalgamated with the queen's army, and the whole reorganized.

But it is not a British habit to profit by military experience. The mere fact that the difficulties of 1854 and 1857 had been surmounted ultimately led the nation and its representatives to forget their cost and waste. And the nationwide rejoinder to the French threats of 1859—the creation of the Volunteer force—contributed to a false sense of security. Thus the two obvious lessons of the German successes of 1866 and 1870—the power of a national army for offensive invasion, and the rapidity with which such an army when thoroughly organized could be moved—created the greatest sensation in England. The year 1870 is, therefore, of prime importance in the history of the regular forces and the ensuing period of reform is connected indissolubly with the name of Edward, Lord Cardwell, secretary of state for war 1869–1874. In the matter of organization the result of his labours was seen in the perfectly arranged expedition to Ashanti (1874); as for recruiting, the introduction of short service and reserve enlistment together with many rearrangements of pay, etc., helped to treble the number annually enlisted as well as to build up a reserve which in the Boer War yielded 80,000 men to maintain the strength of the army in the field. The localization of the army, subsequently completed by the territorial system of 1882, was commenced under Cardwell's regime, and a measure which encountered much powerful opposition at the time, the abolition of the purchase of commissions, was also effected by him (1871). The machinery of administration was improved, and autumn manoeuvres were practised on a scale hitherto unknown in England. In 1871 certain powers over the militia, formerly held by lords-lieutenant, were transferred to the crown, and the auxiliary forces were placed directly under the generals commanding districts. In 1881 came an important change in the infantry of the line, which was entirely remodelled in two-battalion regiments bearing territorial titles. This measure (the "linked battalion" system) aroused great opposition; it was dictated chiefly by the necessity of maintaining the Indian and colonial garrisons at full strength, and was begun during Lord Cardwell's tenure of office, the principle being that each regiment should have one battalion at home and one abroad, the latter being fed by the former, which in its turn drew upon the reserve to complete it for mar. On these general lines the army progressed up to 1899, when the severe trials of the Boer War hastened fresh schemes of reform, leading up to Richard Haldane's "territorial" scheme (1908), which put the organization of the forces in the United Kingdom on a new basis.

Cardwell had left office before one of his most important reforms had been completed, organizing the forces in the United Kingdom in larger formations so that they could be employed as a field army, of which the strength was based solely upon the number of troops serving abroad, not upon any estimate of war requirements. The question of the uses to which such an army would be put was one that had never been properly determined. The army school of thought visualized an invasion of the British Isles and the primary need for a large field army to deal with such an emergency. while the navy considered that, given sufficient naval strength, invasion by foreign armies could be prevented by action at sea. The army view was reflected in the organization of the higher formations. These consisted of army corps, composed not only of regular forces but also of auxiliary elements under no

obligation to proceed abroad. One of the first steps taken by Haldane was to advocate "clear thinking" in connection with army problems, and he developed the general staff, initiated by his predecessor, Arnold Forster, to undertake this important but hitherto neglected branch of military preparation. Within a few months, three principles had been laid down and officially accepted to govern the military defense of the empire. The first of these was the essential need for a navy strong enough to ensure the safety of troops crossing the seas. This was a natural outcome from Cardwell's system of cutting down oversea garrisons to a bare minimum on the assumption that the troops in the United Kingdom could be sent as reinforcements to any part of the world in times of emergency. The second principle was that of local provision for military defense in all parts of the empire, to the utmost extent to which such provision could be furnished. The third was that of mutual military support in times of emergency.

Instead of paper army corps, available only for home defense, the Haldane reforms provided for the organization of the troops in the United Kingdom in six infantry divisions, one cavalry division, and line of communication troops, as an "expeditionary force" (composed entirely of reguiarsj available for oversea service either as reinforcements for the small garrisons of different parts of the empire in the event of internal or external menace; or, if need be, as a field army capable of fulfilling treaty obligations. Furthermore, the need for strong drafts of men to keep units in the field in a protracted campaign was realized. In the Manchurian War of 1904–5 the Russians had made the mistake of reinforcing their field army with fresh formations, while leaving the veteran units already in the field to melt away for want of drafts to replace wastage in personnel. In order to avoid this mistake in British military policy, the militia was called upon to provide drafts of trained men in time of war for the expeditionary force, and its name was changed to the "special reserve" of the regular army.

A further point that was realized was that, whether the British Isles were, or mere not, subject to the menace of invasion, they could not be left denuded of troops. Material in man power lay readily to hand in the force of yeomanry and volunteers who, from patriotic motives, had volunteered to take part in the military defense of the United Kingdom in grave emergencies and to spend such time as they could spare from their civil vocations in undergoing training for the purpose. Lacking neither in zeal nor in numbers, they lacked all else required by a field army in the way of organization and training in higher units and most of the transport, material and equipment, of which the provision comes under the term understood by the expression "mobilization." Units of the different arms and departments had sprung up haphazard, according to the preference expressed by those who had been instrumental in raising them. No attention had been paid to the proportion of each arm and department needed for a grouping in such higher formations as divisions. In face of opposition and criticism similar to that faced by Cardwell, Haldane, with the loyal co-operation of the units concerned, used this material to establish the territorial force, of which the first units appeared under arms in April 1908. The act which established this force provided that either the units or the individuals serving therein might volunteer for oversea service in grave emergencies. The extent to which this appeal met with response during the years 1914–18 belongs to the story of World War I (*q.v.*). By Dec. 1914, 2,413 officers and 66,805 other ranks in the territorials were serving abroad. By April 1917 these numbers had risen respectively to 17,859 and 487,237. Up to the close of 191j, the voluntary direct enlistments in war time into the territorial force numbered 725,842. Apart from individuals who volunteered for the regular army, the yeomanry provided one complete division for oversea service, the territorial force of all arms 24 divisions.

Thirty "New Army" divisions were also raised on a plan instituted by Lord Kitchener to supplement the 11 "regular" divisions employed overseas. The need for more troops compelled parliament to pass a conscription measure in March 1916, drafting men between the ages of 18 and 40, though soldiers were not to be sent out of the United Kingdom until their 19th birthday; the maximum age was later raised to 45 and, in 1918, to 50, while because of the imminent peril youths of 18 were also sent to fight in France. In Dec. 1918 the British field army comprised 4 mounted and 67 infantry divisions, of which all excepting one mounted (cyclist) and 4 infantry divisions were serving outside the United Kingdom. With a total establishment of 256.798, the British regular army began World War I with an actual peace strength of 247,432, an army reserve of 145,347, and "special reserve" of 63.933. The territorial force. with an establishment of 316,094, numbered 268,777, including 766 members of the officers' training corps, also established by Haldane, with an establishment fixed at 1,110. Between the outbreak of war and conclusion of the armistice, England provided 4,006,158, Scotland 557,618, Wales and Monmouthshire 272,924 and Ireland 134,202 men for the British army, a total of nearly 5,000,000 for the United Kingdom. The total permanent wastage in British (Isles) military personnel up to Jan. 1919 amounted to 1,892,100, including 500,000 killed or died of wounds or other causes overseas, and about 37,000 in the United Kingdom.

Roughiy speaking the number of British troops serving in various expeditionary forces at the time of the armistice in Nov. 1918 may be put at about 2,100,000, with 1,380,000 in the United Kingdom (excluding about 250,000 volunteers), 94,000 in India, and 11,200 as garrisons of defended ports. Total about 3,600,000. Some idea of the strain brought upon the British army in the days of unrest in the world after the armistice can be gathered from a return showing that the numbers demobilized up to May 26, 1920 amounted to the vast total of 163,563 officers and 3,595,717 other ranks, altogether nearly 3,660,000; while during the same period grave military responsibilities were undertaken in North Russia (up to Oct. 1919), in East Russia (Vladivostok), in Germany (Cologne area of occupation), in Arabia, in Trans-Caucasia (up to April 1919), in the Caucasus (up to Aug. 1919), in Mesopotamia, Syria (up to Jan. 1920), Palestine and East Africa, involving fighting in most of those areas, as well as in India and in Ireland; that Britain was still technically at war with Turkey, and actively at war with Afghanistan (May to Aug. 1919). The tale is told elsewhere of these operations, and of the strain brought subsequently upon the army by operations in India; in attempting to hold neutral zones covering the Dardanelles and Bosporus when the Turkish army had been allowed years to recuperate after the conclusion of an armistice in Oct. 1918; in attempting to maintain order in Ireland; and in military activities elsewhere. (G. G. A.; X.)

Notwithstanding the necessity to preserve order in, and to defend increased areas of territory in Asia and Africa, it was the policy of the British government for some years following World War I to maintain military forces of minimum strength. It was not until the training season of 1925, when four regular divisions and an extemporized cavalry division took part in army manoeuvres for the first time in 12 years, that normal conditions of peace organization and training again began to prevail. Behind this small expeditionary force stood a reconstituted territorial army of 14 divisions, liable to overseas service in grave emergencies, to whom a definite promise had been made that, in such circumstances, they would go as units, and not be called upon to provide drafts for the regular army, although that force had lost the "special reserve" which formed so valuable a feature of the Haldane reforms.

Year by year, however, hope for enduring peace in Europe gradually waned. Great Britain was in the forefront at every attempt to concert international amity, and not even the failure of the Conference for the Reduction and Limitation of Armaments in 1933 sufficed to persuade the country's leaders that the necessity for rearmament was inescapable. Nevertheless, the growing strength of potential adversaries began to make it imperative to introduce into the army some degree of modernization in weapons and organization. The territorial army was accorded full status in 1937, gaining access to the same standards and sources of instruction as the regular army, and the following year, after the deeper implications of the Munich pact had been

understood, a definite rearmament program was undertaken. Army life was made more attractive to junior officers in 1938, promotion by vacancy up to the rank of major being abolished, every subaltern automatically becoming a captain in eight years, and every captain a major in another nine years. Early in 1939 parliament sanctioned the doubling of the strength of the territorial army, and in May of that year Great Britain, for the first time in her history, introduced peacetime conscription, the Military Training act requiring all youths of 20–21 years of age to undergo a special course of training for six months.

THE EVE OF WORLD WAR II

Recruitment and Service. — Until the measure of compulsion introduced in May 1939, all recruiting for the British army had been on a voluntary basis. For the regular army, normal engagements were for long service (12 years with the colours) or short service (in part with the colours and in part, to total 12 years, in the reserve); short periods of enlistment (one to four years) were also possible for all arms. Men enlisting on a normal engagement for general service were between the ages of 18 and 25. For the territorial army, enlistment for all arms was from 18 to 38 years, the term of service being four years; members were required to attend an annual training camp and to carry out prescribed annual drills.

Organization and Strength. — The peacetime composition of the regular army in the United Kingdom (excluding British troops in India) was five infantry divisions (14 brigades), one mobile division (two cavalry brigades and one tank brigade) and two anti-aircraft brigades. One anti-aircraft brigade constituted a supplementary reserve, and the territorial army was composed of 12 infantry divisions (36 brigades), five anti-aircraft divisions (22 brigades), one tank brigade and three cavalry brigades. The Officers' Training corps provided students at schools (junior division) and universities (senior division) with elementary military training to provide a potential reserve of young officers to meet a national emergency.

While the regular army counted 237,736 men on July 1, 1939, the authorized establishment when the year began was 162,707. At that time, the establishment for other troops in Great Britain provided for the army reserve (estimated), 144,000; supplementary reserve, 67,945; territorial army, 249,480; and Officers' Training corps (officers and permanent staff), 1,034. This made a total of 625,166 officers and men available at home stations.

Colonial Forces. — While the self-governing dominions maintained their own permanent and nonpermanent military forces, Great Britain was responsible for the defense of the colonies and protectorates. On the assumption that reinforcement by sea in times of emergency would always be a practicable proposition a mere handful of British troops were kept abroad, though permanent forces (in all totalling about 2,000) included the Royal Malta artillery and the Hongkong and Singapore Royal artillery. Except that one British battalion was stationed in Jamaica with a detachment in Bermuda, the West Indies, the Americas and the islands in the Atlantic depended for their defense upon volunteer forces. East African possessions had, besides armed native police forces, the King's African rifles and the Somaliland Camel corps (regular troops with native personnel), and in Kenya Colony a territorial force in which service was compulsory for Europeans. In West Africa local defense was provided primarily by the Royal West African Frontier Force (also regular troops with native personnel), comprising the Nigeria and Gold Coast regiments, the Sierra Leone battalion and the Gambia company. In South Africa, outside the Union (for which *see* SOUTH AFRICA, UNION OF), Basutoland and Bechuanaland had native armed police forces, the Rhodesias had white volunteers, and Swaziland a British rifle club and native police. Colonial possessions in Asia and islands in the Indian ocean had similar forms of protection. Volunteer defense forces were maintained in Ceylon, Hongkong, the Straits Settlements and Mauritius; British North Borneo had a police force of various races, liable for military service; the Federated Malay States maintained volunteer forces of Europeans, Indians, Malays and Chinese; and Johore, in the Unfederated Malay States, had native regulars and volunteers as well as a European volunteer corps. In the Pacific ocean, small defense forces and armed police were found in Fiji, the Gilbert and Ellice islands, and the Solomon islands.

Territories placed under the mandate of Great Britain had restricted defense facilities. Local forces in Palestine and Trans-Jordan consisted of the Trans-Jordan Frontier force, a military unit, and the Palestine Police and the Trans-Jordan Police (or Arab Legion), armed constabulary; the Cameroons and Togoland had armed police; in Tanganyika Territory were battalions of the King's African Rifles and also the Tanganyika Police force.

Egypt, the Anglo-Egyptian Sudan, Aden and the Arabian hinterland are dealt with elsewhere, and see the information under INDIA for defense responsibilities that fell upon the British army. In connection with the principle of mutual defense, *see* also AUSTRALIA, CANADA, SOUTH AFRICA, UNION OF and NEW ZEALAND.

Higher Command. — The government of the British army was vested in the crown, command being placed in the hands of the army council. The army council, of which the secretary of state for war was president, included the chief of the imperial general staff, adjutant-general, quartermaster-general, master-general of the ordnance and financial secretary. The war office included the army council, departments, a board for selection of officers for promotion to lieutenant-colonel and higher ranks, and the judge-advocate-general's office. Excepting when in training camps or on actual military service, the territorial army was administered by county associations. The committee of imperial defense, of which the prime minister was chairman, had no executive powers, being an advisory and consultative body concerned with the co-ordination of defense policy.

Military Education. — Principal military educational establishments were the Royal Military academy, Woolwich (for artillery, engineer and signal corps cadets), the Royal Military college, Sandhurst (for cadets of cavalry, infantry and other arms), the Senior Officers' school, Sheerness (for senior regimental officers), and the Royal Staff college, Camberley (for the staff). Various other schools for specialists were also conducted, and an Imperial Defense college in London was for senior officers of the army, navy and air force. (*See* further OFFICERS and TRAINING CORPS, OFFICERS'.)

THE ARMY OF WORLD WAR II

On Sept. 3, 1939, the day Great Britain declared war against Germany, the Military Training act of the previous May was superseded by the National Service (Armed Forces) act, which extended the liability for military service to all men between the ages of 18 and 41 years. At the outbreak of war, too, the territorial army, the strength of which had been doubled in the spring of 1939, was merged with the regular army. With the increased demand for men in the armed forces the maximum age for compulsory service was raised from 41 to 51 in 1941, and in order to provide a pool of partially trained youths, the war office recognized the army cadets and also the junior and senior training corps, which had carried on the work performed prior to hostilities by the Officers' Training corps. Educational institutions for cadet-officers were closed when war began. Thereafter all commissions granted to officers were temporary and were obtainable only after passing through officer-cadet training units, candidates having to serve first in the ranks. Various independent organizations co-operated with the war office in providing educational facilities of a general nature in all units of the army.

Composition. — The infantry, main bulk of the army, was affected in its work by mechanization. While troop-carrying companies of the royal army service corps transported most of the men, headquarter, company and platoon trucks carried ammunition, tools, heavier weapons and packs. In rifle battalions, carrier platoons were provided with small tracked, armoured vehicles for light Bren machine guns, tommy guns, anti-tank rifles and 2-in. and 3-in. mortars. Machine-gun battalions, entirely motorized, were equipped with medium machine guns, and reconnaissance battalions rode in light cars, carriers, motorcycle combinations and motorcycles.

Afrer German occuparion of rhe continental coastline in 1940 the British army developed a force of commando troops for offensive landing operations of a temporary, hit-and-run nature. Information raids were conducted for reconnaissance or the capture of prisoners; nuisance raids affected the morale of German defenders and encouraged civilian resistance; and strategic raids effected destruction of definite military objectives. The men, volunteers from the army, navy or air force, were given intensive and elaborate training and furnished with a special lightweight equipment which included a formidable jackknife. With the close co-operation of the royal air force, the army also trained parachute troops (paratroops) for offensive operations behind enemy lines.

The tank corps of World War I was succeeded by the royal tank regiment, and this, in 1939, was united with mechanized cavalry and yeomanry units to constitute the royal armoured corps. Light tanks performed the reconnaissance previously carried out by cavalry; cruiser tanks, more heavily armoured. attacked under mobile conditions of open warfare, and infantry tanks, organized into army tank battalions, assisted infantry attacking enemy positions; armoured car regiments of the R.A.C. were employed in fighting reconnaissance ahead of attacking troops.

With the exception of mule-borne mountain and pack artillery and super-heavy guns on railway mountings, all artillery in World War II was mechanized The field branch, which included anti-tank artillery, supported the armoured and infantry divisions; the anti-aircraft branch had heavy, light and small guns for both static and mobile defense; and the coast artillery branch comprised counterbombardment, close defense and searchlight units. The royal engineers consisted of a field (or combat) branch working with the divisions and corps; lines of communication troops providing construction, electrical and mechanical services and the like; and transportation services, concerned with railways, ports and inland water transport. Companies were also trained in bomb disposal and in the location of anti-tank minefields. Stemming from the royal engineers was the royal corps of signals, formed in 1920, which operated wire and wireless telegraph and telephone services and also maintained communication by motorcycle despatch riders and pigeons. The British army service corps, the supply and transport branch of the army, brought up foodstuffs by land or water, moved the infantry, carried the heavy stores of the engineers and drove the vehicles of the British army medical corps and the British army dental corps. The supply and maintenance of all stores for all units of the army was the primary duty of the British army ordnance corps.

The Queen Mary's army auxiliary corps of World War I was the pattern for the auxiliary territorial service, which was organized in 1938 and became the largest of the women's services; it was granted full military status on April 10, 1941, pay being roughly two-thirds that for male soldiers of equivalent ranks. Following passage of the National Service Act, 1941, single women between 20 and 30 were drafted into the A.T.S. Besides working as cooks, telephonists and drivers of army vehicles, the women were employed in radio-location, almost every duty with anti-aircraft batteries except actual operation of the guns, and in kine-theodolite duties.

The local defense volunteers were organized in May 1940, to supplement field troops, and in November were incorporated in the army as the home guard; enrolment became compulsory in March 1942, for all men from 17 to 6j in civil defense regions. Fully equipped, men served a maximum of 48 hours every four weeks, receiving subsistence allowances while on duty but no pay. Their primary role was defense, to delay the enemy until regular formations moved to the attack. Men up to 50 years of age were also enrolled in the pioneer corps, which built huts and defenses for the army and cleared debris after cities had been bombed; open to alien volunteers, it contained many European refugees.

At the outbreak of war the regulars, with their reserves, and including British components of the Indian army, numbered about 400,000, and a like number were in the territorials. These numbers were augmented by volunteers and conscripts, and though heavy casualties were suffered abroad, the armed forces in Great Britain by the middle of 1942 were put at 1,500,000–2,000,000 men. This was exclusive of the auxiliary territorial service and the home guard, the latter amounting to 2,000,000–3,000,000 men. At that time Britain had nearly four times as many men serving abroad as the four dominions — Australia, New Zealand, Canada and South Africa — had serving outside their respective territories. On the western front (France and Belgium) there were 70 times as many troops from Britain as from the whole of the rest of the empire; more than half the forces involved in the first and second Libyan campaigns, and in Eritrea, were from Britain; no dominions or colonial troops participated in the campaign in Norway; and in Greece and Crete the percentages of British army forces were 33 and 46 respectively. By Sept. 1941, total empire casualties were over 183,000, and up to Jan. 1942 71% of all empire casualties suffered on land were men from Great Britain.

DEFENSE: NAVY

Historical. — For over 1,000 years the navy of Britain has written the history of a small island people who developed, by virtue of their power upon the sea, into the senior partner of a great empire. The earliest sea fights in which English ships took part were fought in the years A.D. 833 and A.D. 840, during the reigns of Ecgbert and Ethelwulf, the first kings of England. The invasions of the Norsemen forced the English people to defend themselves by some form of national organization and each shire was called upon to provide ships in proportion to its size and wealth. These ships were inferior to those of the vikings who held the upper hand until Alfred the Great (A.D. 871–901), with his powerful newly built fleet, defeated them in A.D. 878. Alfred's ships, which were the first "king's ships," were swifter, steadier and higher out of the water than those of the Norsemen and some had as many as 60 oars. The same means of providing a navy was employed by Alfred's successors, that is, a few ships which were the private property of the king were reinforced by the ships of the shires, and later by a feudal contribution from certain privileged coastal towns.

The Norman Conquest. — Up till the time of the Norman Conquest little development took place in the ships. They were large open boats, long and narrow, propelled by from 30 to 60 oars with a square sail for use when winds were favourable. Further protection was obtained by arranging the shields of the soldiers along the bulwarks. Such was the "Mora" in which William the Conqueror came to England in 1066. The Norman kings made no great change in the organization of their navy. The king's ships, the forerunners of the national navy of today, formed the chief fighting force. The coastal counties or shires were required to supply, when called upon, ships for the king's service, fully manned and equipped. Bailiffs or port reeves were appointed who kept a strict account of all ships in their areas and it was their duty to see that they arrived at the rendezvous appointed by the king. This system whereby the coastal towns bore some of the responsibility for the naval defense of the realm, remained in force until the 17th century. A third source of supply was obtained by granting privileges to certain seaport towns, which in return, as a feudal contribution, maintained a certain number of ships, ready to supplement the king's ships. Of these the Cinque Ports (*q.v.*) were the most important and from the 11th to the 13th centuries they played a prominent part. They were always inclined to piracy amongst themselves and at the expense of other English seaport towns. This brought about their downfall and by the time of Edward III (1327–77) they had ceased to form

part of the national sea defenses.

The number of the king's ships varied from time to time. In 1205, King John maintained a fleet of 50 galleys or "long ships" in various ports and William of Wrotham, Dean of Taunton, was appointed "keeper of the king's ships," the first record of any form of central administration of naval affairs. During the time of the Crusades in the 12th and 13th centuries, the fighting ships, built solely for battle, still retained the form of the long, narrow, swift galley propelled by oars alone: or if rigged with a mast and sail these were removed before going into action. The larger and clumsier merchant ships of this period had a permanent mast and square sail and relied upon oars as a secondary means of propulsion. When prepared for war these ships were fitted with built-up castles at each end from which missiles could be thrown into any ship alongside. In time the ships became rounder in shape with built-in fighting castles, and relied almost entirely upon an elementary form of sail, with only one mast. By the beginning of the reign of Edward III (1327–77) the fighting galley had almost disappeared from the English fleet, and the ships which defeated the French at Sluys in 1340 and the Spaniards off Winchelsea ten years later were sailing ships only.

The Plantagenet Navy.—Until towards the end of the 14th century the English navy was successful upon the narrow seas and suffered no real reverse. King John claimed the sovereignty of the seas after the destruction of the French fleet at Damme in Flanders in 1213: his successors upheld the claim but Edward III was the first king to enforce it. In the declining years of his reign, however, and during the troublous times of Richard II (1377–99) the navy was neglected and fell into decay. Soon after Henry IV (1399–1413) came to the throne, the southern coast of England was ravaged by the French. The country was distracted by internal wars and there were no king's ships to form a defense. So desperate was the position that the king was forced in 1406–07 to call upon the merchant shipowners to provide ships to defend the realm. This saved the situation for the time but it was not until after the accession of Henry V (1413–22) that the prestige of England was re-established upon the sea. He reorganized and rebuilt his fleet; with it he drove the Genoese allies of France out of the channel and by its aid before his death became the virtual master of France.

Gunpowder was invented in the beginning of the 14th century but it was not until the end of the century that guns began to be used afloat, and the first record of an English ship carrying guns is in a ship called the "Christopher of the Tower" in 1410. The guns were very small, designed as mankillers rather than to damage the structure of the ships, and they were mounted in embrasures in the forward and after castles. The necessity of carrying many guns led to an increase in the size of warships and some of the ships built by Henry V were of nearly 1,000 tons.

In spite of the troublous times of the Wars of the Roses, the English fleet maintained the command of the narrow seas and slow but steady progress was made in the construction and rig of the ships. By the end of the reign of Edward IV (1461–83) the English ships had developed to the standard of those of the Mediterranean powers. They carried three to four masts and a bowsprit and set as many as six sails, but the hulls, though larger and better built, did not differ in shape from the ships of a century earlier.

The Tudor Navy.—The reign of Henry VII (1485–1509) marked the real beginning of England's sea power. The voyages of Columbus, Vasco da Gama and the Cabots, in the last decade of the 15th century had startled the old world and turned the attention of all maritime nations towards the possibilities of overseas trade. Under the influence of Henry VII the English nation ceased to be merely an island people, concerned only with coastwise traffic, and began to develop into a hardy race of seamen who took the English ships through the seas of the world. The king subsidized private enterprise and trade and built great ships such as the "Regent" and "Sovereign," and he constructed the first drydock at Portsmouth. These ships were armed merchantmen, capable of carrying large cargoes, and the "Regent" is said ta have carried 225 small breechloading guns. At about this time great strides were made in the size and power of artillery and the heavy muzzle loading gun was invented. Henry VIII (1509–47) took the keenest interest in his fleet and armed his ships with this new and heavy ordnance, thus introducing an entirely new factor into naval warfare. The guns were so heavy that they had to be mounted on the lower or cargo decks. Holes were cut in the ship's sides for the guns to fire through and so began the development of the fighting ship capable of firing broadsides to damage the hull and rigging of the enemy. The ships of Henry VIII, unlike those of his father, were built exclusively as fighting ships, and soon after he came to the throne the "Mary Rose," the first of the long line of British battleships, was laid down. Henry had ample funds from the plunder of the; church and he laid down 85 "king's ships," great and small. Of these the "Henri Grace à Dieu" or "Great Harry" was the most magnificent and powerful ship of her time, and carried heavy ordnance on her lower decks and a large number of smaller guns in her upperworks,

Henry VIII formed the first central navy office for the administration of the fleet. His navy board, constituted by letters patent on April 24, 1546, consisted of a lieutenant of the admiralty, a treasurer, a comptroller, a surveyor, a clerk of the ships and other minor officials. The board was charged with the building and the upkeep of the ships and with the supply of stores, victuals and pay. The lord high admiral (or later the commissioners for executing that office) had complete political and military control over the fleet and issued commissions to its officers, but exercised only a nominal control over the navy board. This dual system of government of the navy remained in force, with the addition of various departments, until after the close of the Napoleonic Wars. The records of the time are incomplete, but as far as can be ascertained, the navy at the end of the reign of Henry VIII consisted of 53 ships of a total of 11,270 tons, armed with 2,185 guns and manned by 3,000 men, more than half of whom were soldiers.

The Elizabethan Navy.—During the disturbed reigns of Edward VI (1547–53) and Mary (1553–58) the navy was reduced to a bad state. Edward VI did his best to develop the growing seaborne trade of the country and took the first steps towards expelling the Hansa merchants, but the navy was neglected, and Mary, through lack of sea power, was unable to hold Calais. Queen Elizabeth (1558–1603) on her accession at once took steps to restore the navy to the position it had held in the days of her father. During the first 20 years of her reign, although not at war, she encouraged the exploits of Hawkins, Drake, Frobisher, Raleigh and a score of others on the Spanish Main and in other parts of the world. Many improvements took place in shipbuilding and in organization. When John Hawkins was placed in charge of the queen's ships in 1577 he introduced a new plan of shipbuilding by increasing the length of the ships in proportion to their beam. This produced ships completely outclassing their predecessors in speed and sailing qualities and carrying more guns upon the broadside. The "Revenge," the first ship completed upon the new plan was so successful that numbers of the old ships were rebuilt upon the same lines. It was with ships of the new type that Drake, in his expedition to Cadiz In 1587 "singed the king of Spain's beard." Taking only four ships into the harbour he engaged and quickly defeated the whole fleet of Spanish galleons who were totally unable to withstand the broadside fire of the heavy ordnance of the English ships. This battle established the "broadside battleship" as the fighting ship of the future and sounded the death knell of the oar propelled galleon that had held sway in the Mediterranean for 1,000 years.

Two notable advances in organization of the personnel marked this period. In 1582 a graduated scale of pay for officers and men was, for the first time, introduced and a fund was started for the relief of sick and wounded seamen. All men employed in the navy were subject to a small deduction from their pay which was paid into the famous "Chatham chest." This fund was administered by the commissioner of Chatham dockyard and by four other commissioners elected by the seamen.

The Cadiz expedition postponed the threatened Spanish invasion of England for a year and in 1588 the Great Armada sailed. It was composed, chiefly, of merchant ships which carried few if any guns. The Spanish ships were short, had tremendous freeboard and were probably little improvement upon Henry VII's "Regent" of 100 years before. The English fleet consisted of 34 "queen's ships" and a number of merchant ships, large and small, all more modern than the Spaniards The superior speed and handiness of the English ships enabled them to choose their own range for their heavy guns and the Great Armada was severely handled during its disastrous week of sailing up Channel. Forced by fireships to move in panic, nhilst at anchor off Gravelines the Spaniards were driven into the North sea by a southwesterly gale. Unable to join the army of the duke of Parma in the Netherlands, the Armada was chased by the English until their ammunition was exhausted; scattered by wild weather in the northern seas, only a remnant returned to Spain to tell the sorry tale. During the last 15 years of Elizabeth's reign the English fleet was uniformly successful and when she died her navy consisted of 42 ships of 17,000 tons, manned by 8.000 men, more than three-quarters of whom were seamen.

The Stuart Navy.—On his accession James I (1603–25) made peace with Spain under such humiliating terms that the sea power of England faded until she became almost negligible upon the sea. English ships were forbidden to trade in certain seas or even to defend themselves if attacked. under penalty of being treated as pirates. Despite this, Hudson, Baffin, Raleigh and others showed that English sailors still dared to sail the seas. James was interested in shipbuilding and strongly supported his master shipwright, Phineas Pett, but the king's ships were allowed to go to rack and ruin and the administration mas corrupt. The powerful fleet built up during the previous 100 years almost ceased to exist and when a naval expedition was fitted out to attack Cadiz by Charles I (1625–49), the whole breed of Elizabethan sailors had disappeared. Military officers commanded the ships and, out of the 100 required, only nine of the king's ships were found in a fit condition to serve. The flagship of the expedition the "Ark Royal" had fought against the Armada and some of the ships carried the same sails that they had used in 1588. Most of the merchant ships requisitioned were in a like case and the expedition was a failure. A similar fate befell two expeditions to the Isle de RC in the attempt to support the Protestant Alliance. These disasters awoke the king to the state of the navy, but the royal revenue being insufficient to rebuild the fleet he levied the ship money (*q.v.*) tax. The successive levies of this tax, although they laid the basis of the first royal and national fleet, proved to be one of the main causes of the Great Rebellion. In spite of the long period of naval depression, the art of shipbuilding had made great strides and the "Sovereign of the Seas," the first of the "ship nioney" fleet was the finest ship that had ever been built. She carried 100 guns arranged in three tiers and was the first of the English "three-deckers." Charles's efforts to rebuild the fleet were of no avail and by 1640 the Dutch had become the greatest sea power and practically drove the English off the sea.

The Commonwealth Navy.—During the Civil War the navy at first supported the parliamentarians, but afterwards joined the royal forces. On the defeat of the royalists the fleet left for Holland, where under Prince Rupert and aided by the Dutch, it ruined English trade. At the beginning of the Commonwealth (1649–60) no small craft or coasting vessel dared to put to sea from English ports, but in 1649, Robert Blake was given the command at sea and the regeneration of the navy fell into his able hands. In seven years, Blake defeated the royalist fleet under Prince Rupert, the Portuguese, the Dutch, the Algerian pirates and the Spaniards and made the English fleet for the first time a power in the Mediterranean. During the first Dutch War (1653–54) twelve desperate sea fights were fought in which both sides covered themselves with glory and the war ended in favour of Great Britain. In this war Blake found that the merchant ships which supplemented the fleet were untrustworthy in action and thenceforward parliament built its own ships and supplied its own officers. Codes of fighting instructions and of discipline were published that formed the basis of the Articles of War most of which still remain in force. Under the Commonwealth zoo warships were built and the fleet was brought to a high state of efficiency.

The Restoration.—In the first years of the reign of Charles II squadrons of the fleet were sent to Bombay and to the West Indies to suppress piracy, and Tangier was acquired as a base, only to be evacuated in 1685. The term "royal navy" came into use, and lads of gentle birth were trained as officers, but ill-treatment of the crews caused bitter discontent. James, duke of York, the lord high admiral, was successful as an administrator rather than at sea, his able secretary of the admiralty being Samuel Pepys (*q.v.*). Corruption and waste of money voted for the navy caused the fleet to be ill equipped when the second Dutch War broke out in 1665, though Monk and Prince Rupert were able to score some successes. An inglorious and disastrous war ended after a Dutch raid on the Medway with the signing in 1667 of the Peace of Breda, favourable to the Dutch. With great difficulty a small fleet was fitted out for the third Dutch War (1672–74), and French co-operating squadrons proved inefficient allies. Dutch Admiral De Ruyter was uniformly successful, but though the war brought little credit to the navy, the Netherlands were exhausted and England was left stronger at sea than any other maritime state. On the flight of James II after the Revolution of 1688 the fleet took no active part in preventing the landing of William III (1688–1702). War broke out with France in 1689 and after a small success at Bantry bay and a defeat off Beachy head the fleet under Admiral Russell, with the aid of the Dutch, destroyed the French fleet at the battles of Barfleur and Cape La Hogue. The war dragged on for another five years during which the English fleet constantly raided the French coast.

The War of Spanish Succession (*q.v.*).—Peace was signed at Ryswick in 1697, but it was short lived, for four years later the War of the Spanish Succession broke out. The navy held the command of the narrow seas and Marlborough's armies were transported without interference to win the victories of Ramillies, Blenheim and Oudenarde. The ships of England won renown the world over during the reign of Queen Anne (1702–14). Admiral Rooke destroyed the French and Spanish fleets at Vigo in 1702. He defeated the French Toulon fleet off Malaga and, in 1704, he captured Gibraltar, whilst four years later Sir John Leake secured Minorca, after having twice raised the siege of Gibraltar. Shovell, Benbow and Martin all added renown to the British fleet and when in 1713 the Treaty of Utrecht was signed, England retained her position as mistress of the seas.

At the death of Queen Anne, the material strength of the navy was 247 ships of 170,000 tons, manned by officers inured by ten years of successful war. The beginning of the Georgian era brought success to the country, but the navy was starved and impoverished. The personnel was neglected, the design of ships became careless and ships in the dockyards were poorly maintained. Parliament reduced the expenditure upon the navy to less than one-half, at a time when English responsibilities were increasing all over the world and the service suffered in all departments from the political corruption of the times.

The War of Austrian Succession.—When the War of the Austrian Succession broke out in 1739, the fleet was in a grave state of inefficiency. Vernon failed utterly before Cartagena in the West Indies and was recalled in disgrace. Matthews, a gallant and able admiral, did his best in the Mediterranean with an inefficient and inexperienced squadron, lacking in frigates and even in supplies. He was recalled, mas made the scapegoat of the politicians and was dismissed from the service with disgrace. Anson was sent on a voyage round the norld with six small ships and sailed for South America in 1740 on a voyage around the world. his six small ships rotten and badly found, and his crew of old pensioners sickly. Surmounting disaster after disaster, he harried the Spaniards on the coast of Peru, circumnavigated the globe and returned with only one ship, the "Centurion." though with an immensely rich prize to boot. Anson commenced his successful administration at the admiralty in 1744, and he defeated the

French heavily off Finisterre in 1747, as did Hawke off the same place later in the year. These victories terminated the war, peace being signed at Aix-la-Chapelle in **1748.**

At the admiralty, Anson introduced many reforms, including formation of the royal marines in 1755, and by compelling the navy office, for the first time, to render accounts to the admiralty, dockyards were brought into a state of order and some of the peculation checked. Adoption of the coppering of the bottoms of ships improved the speed and sea-keeping qualities of naval vessels.

The Seven Years' War.—At outbreak of hostilities in **1756** Byng was sent to the Mediterranean with an inadequate force to relieve Minorca, his failure being followed by court martial and sentence of death. Hawke and Rodney in the Channel, and Boscawen in the Mediterranean, frustrated a French invasion in 1759. Hawke's victory over the French in Quiberon bay and Saunders's strategy in the St. Lawrence enabled Wolfe's army to take Quebec, while the royal navy held its own in the East and in the West Indies. With the Peace of Paris in **1763** Britain was dominant on the North American continent and in India, and Minorca had been recovered. During the 12 years of peace that followed, Byron, Wallis and Carteret explored the Pacific and Cook discovered New Zealand and Australia, though under the administration of Lord Sandwich the British navy suffered the greatest state of corruption and incapacity ever known in its annals.

The American War of Independence.— The outbreak of the American War of Independence (1775–81) found the fleet in a deplorable condition, with unseaworthy and ill equipped ships distributed in weak and unsupported units. The French who had thoroughly reorganized their fleet, joined the revolting colonies in 1779 and inflicted heavy reverses upon the British at sea and by 1780 England found herself at war with France, Spain and Holland simultaneously. Gibraltar was constantly besieged and in 1776 the American colonies declared their independence and were able to maintain it. Such was the pass to which the neglect of the navy had brought the country. But Lord Anson's sound administration bore fruit. Parker in the West Indies, Keppel and Kempenfelt in home waters and Hughes in the East Indies, all men trained under Lord Anson, eventually established British supremacy in those seas. Finally, in **1782,** Lord Rodney, by his great victory over De Grasse at the battle of the Saints off Guadaloupe, brought the war with France to a successful conclusion. The treaty of Versailles, signed in **1783,** was followed by a few years of peace during which every effort was made to maintain the fleet in a state of efficiency. The organization of the dockyards was thoroughly overhauled and under the administration of the younger Pitt, money voted for the upkeep of the fleet was used only for that purpose.

The French Revolutionary Wars.—The royal navy was ready when the French Revolutionary wars broke out in **1792.** Hood occupied Toulon in 1793; Howe defeated the French fleet on the "Glorious First of June," 1794, and Hood captured Corsica; and the British were victorious over the French in 1795 off Genoa, L'Orient and Hyères. Before 1796 closed Britain was at war with France, Spain and Holland: the Cape of Good Hope was captured, but the British fleet had been withdrawn from the Mediterranean to Gibraltar. The next year the Spaniards were defeated off Cape St. Vincent.

The Mutiny.— Poor pay, bad food, the use of the press gang and harsh treatment, conditions ignored by the admiralty, precipitated respectful but firm protests by the seamen at Spithead and at Plymouth in April 1797. Delay in carrying out promised reforms led to an outbreak in the fleet at the Nore, led by a disgraced officer named Parker who made unreasonable demands which the men of the western ports repudiated. The mutiny was suppressed after stern measures, and in October the fleet at the eastern port fought and defeated the Dutch at the battle of Camperdown.

The Napoleonic Wars.—Nelson lost his right arm in an unsuccessful attack upon Santa Cruz. A French invasion of Ireland was frustrated by Warren in 1798, and with Nelson's defeat of the French at the battle of the Nile the British regained command of the Mediterranean and reoccupied Minorca. Following the surrender of the Dutch fleet in 1799, the defense of Acre by Sir Sidney Smith broke Napoleon's dream of an eastern empire; Malta was taken in 1800; and the Danes were defeated at Copenhagen by Parker and Nelson in 1801. The fleet prevented Napoleon invading England, and with France exhausted and peace welcome to Britain, the treaty of Amiens was signed in March **1802.**

The peace proved to be but a breathing space and when Napoleon declared war in **1803,** the British fleet at once assumed a dominant position at sea. Napoleon's vast preparations for invading England failed through lack of command of the sea. Wherever a French and later a Spanish fleet was in port, a British force waited patiently outside. Cornwallis commanded in the Channel, keeping a close watch upon Brest and Rochefort, Lord Keith guarded the Downs, Sir Robert Calder and Sir John Orde were stationed off Ferrol and Cadiz. In the Mediterranean, Nelson, with only 11 ships of the line, lacking in frigates and with no base to fall back upon, maintained for two years a watch upon Toulon and Cartagena. In these two years many single ship actions were fought the world over, but no clash between the main fleets took place until late in 1805. Then, at last, the French and Spanish fleets put to sea. Evading Nelson in a gale of wind, Villeneuve was chased to the West Indies and back to fight an indecisive action with Calder off Finisterre. The French fleet retired into Cadiz and the combined fleet put to sea in October and met Nelson and its fate off Cape Trafalgar. Once again a British victory at sea removed the terror of a French invasion, and although the war with France lasted for ten more years, the French fleet did not again dare to encounter the royal navy.

The Continental System.—Napoleon sought to cripple Britain's trade by closing all ports of Europe to her ships under the "continental system." In reply, Britain bombarded Copenhagen, capturing 70 Danish naval ships, occupied Heligoland in **1807** and despatched the Walcheren expedition for the relief of Antwerp two years later. With Europe closed to her, Britain turned to other markets throughout the world, adding Mauritius, Guiana, Ceylon, St. Lucia and the Cape to the empire. The continental system was broken in 1812 by Russia throwing off the French yoke, but not before war between Great Britain and the United States. This unfortunate war was, at first, not treated seriously by the admiralty. British ships fell victims to their opponents in **1812,** but the following year American ports were blockaded and in **1814** the war was ended by the treaty of Ghent, in which no single point of the original quarrel found a mention. After Waterloo, Napoleon fled to the coast and surrendered on board H.M.S. "Bellerophon," summing up the effect of Britain's sea power in one sentence: "In all my plans I have always been thwarted by the British fleet."

The 19th Century.— For a hundred years Britain's supremacy upon the sea continued unchallenged. The Barbary pirates were bombarded at Algiers **(1816);** British seamen helped liberate the South American republics (1820–23); at Navarino British, French and Russian vessels fought the last battle of sailing battleships, freeing Greece from the Turks **(1827);** and by the bombardment of Acre the Turkish empire was saved by British ships from an Egyptian attack **(1840).** The royal navy saved Turkey twice more, in the Crimea (1855) and at the Dardanelles, which they held against the Russians **(1878).** During the century the hydrographic department of the navy charted all the world, the results of their labours being used by ships of all nations.

The Admiralty Office.—In **1832** a great reform was introduced in the administration of the navy by the amalgamation of the navy board and the admiralty. The dual control of the fleet, which had existed since **1546** was swept away and there came into being the board of admiralty (*q.v.*) and the admiralty office. This office has been altered in detail from time to time to meet the changing requirements of the fleet, but British naval administration remains, in principle, unaltered since **1832.** Many far reaching reforms were introduced in the conditions of service

of the seamen and in life on board, one of the most important being the introduction, in 1825, of the system of monthly payments to the lower deck. The principle of continuous long service bred for the royal navy a professional personnel to no small extent hereditary both for officers and men. The Naval academy at Portsmouth, formed in 1729 to train young officers was, in 1808, renamed the Royal Naval college. Fifty years later H.M.S. "Britannia" was attached to the college and in 1863 the "Britannia" was transferred to Dartmouth, there providing training for young officers for 40 years. In 1903 the "Britannia" was transferred to a new Royal Naval college at Dartmouth, and a new system of training engineer officers was started.

The Coming of Steam.—Great changes were brought about after the close of the Napoleonic wars through the introduction of steam. The admiralty looked upon the new invention with disfavour and by 1822 the navy possessed only one small paddle steamer. Chief objection to adoption of steam in ships of the line was that the paddle wheels interfered with the mounting of the guns on the broadside. Successful trials with the screw propeller in 1845 removed this objection, and when the Crimean War broke out in 1854, Great Britain possessed a fleet of wooden battleships fitted with auxiliary steam engines and screw propellers.

Shell and Armour.—The royal navy regarded with suspicion the shell gun introduced by the French and Russians early in the 19th century, but its value was proved in the Crimean War, which also sounded the death knell of the old wooden battleship. The invention of the Armstrong gun in 1858 also helped to change British naval opinion, and 1860 saw the building of the "Warrior," the first iron warship. A ship of 9,200 tons, she could steam 14½ knots and was successful as a full rigged ship; with her twenty-eight 7-in. guns, mounted behind a belt of armour, she was the most powerful fighting ship of her day.

The Transition Period of Naval Architecture.—Eleven ironclad ships were being built for the navy by 1861. Retention of masts and yards at first was a problem for constructors, who had also to design machinery to work the much heavier guns. The broadside arrangement gave place to a central battery type, with a few heavy guns mounted in an armoured citadel in the centre of the ship. This method was in turn superseded by the revolving turret containing one or two heavy guns. The first seagoing turret ships in the British fleet were the "Monarch" and "Captain," carrying four 12-in. guns in pairs in turrets amidships. Both ships mere fully rigged and had a large spread of canvas. In 1870 the "Captain" while under sail in the Bay of Biscay, capsized and foundered with the loss of nearly all hands and this disaster brought about the final abolition of masts and yards. In the next decade a number of different types of ship were evolved in the search for the standard modern battleship and, by 1880, the British battle fleet was a collection of samples, no more than two ships being alike. It became recognized that the strength of a modern fleet depended to a great extent upon the similarity of the units composing it and hence the policy of building battleships and cruisers in classes was instituted. In 1880 the "Admiral" class, the first group of battleships built as a class, were laid down. With their heavy guns mounted in pairs at each end and a broadside battery of smaller guns, these ships were the prototype of the battleships of the world for the next 25 years.

Growth of the Modern Navy.—The Naval Defense act of 1889 closed the transition period and laid down a settled building policy for the modern navy. The "Royal Sovereign" class, with the "Hawke" and "Intrepid" classes of cruisers, were the first outcome of the act and the battle fleet was gradually built up by the "Majestic." "London," "Duncan" and "King Edward VII" classes, which, with their contemporary cruisers, joined the fleet in successive groups, each more powerful than its predecessor. The invention of the watertube boiler, followed by the turbine, and the use of oil fuel, revolutionized engineering practice and greatly increased the speed and endurance of all classes of ships. The first destroyer, the "Havock," was built in 1893 and was followed by a host of others of ever increasing size and speed. Large armoured cruisers came into being. ships of high speed, moderate protection and heavy armament and 1901 saw the building of the first British submarine. In this department of naval warfare England had been outstripped by France, which had ordered its first submarine as early as 1888. This boat, the "Gymnote," was launched in 1888. Naval science made rapid strides in the closing years of the 19th century, especially in naval gunnery and in the use of the torpedo. Early in the 20th century the German menace, then "a cloud no bigger than a man's hand" was met by the gradual concentration of Great Britain's naval strength in home waters and by increased activity in training and practice.

The "Dreadnought" Era.—In 1905 the whole forces of naval science were embodied in the design of one ship, the "Dreadnought." Built with rapidity and secrecy, she sailed on her trials exactly a year after her first keel plate was laid. A battleship of 18,000 tons and 21 knots, she mounted ten 12-in. guns in five double turrets. In offensive power, protection and speed she eclipsed any fighting ship that had ever been built and she marked a new epoch in warship construction. The "Dreadnought" was followed by nine other ships with the same armament and in 1910 a new and powerful 13.5 gun passed successfully through its trials. With this gun the "Orion," "King George V" and "Iron Duke" classes were armed and by 1914, 12 of these ships were in commission. Meanwhile the armoured cruiser had developed into a new type of capital ship, the battle cruiser, ships with the armament of a battleship, in which protection was sacrificed to speed. Cruiser duties with the fleet devolved upon yet another new type, the light cruiser, which appeared in 1913. These little ships of 3,000 to 4,000 tons were unprotected, but had great speed and were armed with 6-in. guns.

By the middle of 1914 the British fleet was at the highest state of power and efficiency that it had ever attained in its long history. The ships were all that the scientific knowledge of the time could make them, the administration was sound and highly efficient, the dockyards were in first class order and nothing was lacking to equip the fleet. More important still, the long service personnel, officers and men, were incomparable and had been trained in the belief that a great war was coming in their time. The high command at sea was in the hands of a band of seamen who, when the test came, proved their worth. Under them, in 1914, the royal navy calmly faced the uncertainties of the titanic struggle before it, and for its performance therein reference must be made elsewhere (see WORLD WAR I: Naval).

(S. T. H. W.)

THE NAVY AFTER WORLD WAT' I

At the armistice in Nov. 1918, more than 1,350 vessels were flying the white ensign, this great number including 42 battleships and battle cruisers and 786 cruisers, destroyers, submarines and other small fighting craft, while the remainder were trawlers, minesweepers and other auxiliaries. A large building program was rigidly curtailed, and by 1920 the ships in commission had been reduced to 332 and the numbers of officersand men brought down from 407,000 to 176,000. In 1921 by the Washington treaty (*q.v.*) the numbers and size of capital ships were limited and cruisers were restricted to 10,000 tons, their guns being 8-in.

Following the armistice a flotilla of over 700 vessels removed the minefields around the coast, and until the close of 1920 naval units supported unsuccessful opponents of Soviet Russia in the Baltic, the White sea and the Black sea. A strong British fleet at Constantinople (Istanbul) supported Allied peace negotiations with Turkey, and elsewhere in Europe the presence of British warships had a pacifying and stabilizing effect.

Redistribution of the Fleet.—With disbandment of the Grand Fleet in April 1919, an Atlantic fleet and Mediterranean squadron were formed, but within three years the general strategic situation required strengthening of the latter to full fleet size. Seven cruiser squadrons were also formed for service in various parts of the world, small sloops at each foreign station helping police trade routes and visiting outlying parts of the empire. Great Britain had only one battleship of post-Jutland de-

sign, while the United States had three and Japan two, and in order to equalize the quota in this type as agreed in the Washington treaty, the "Nelson" and "Rodney" were laid down in 1922 and completed in 1927.

A scientifically trained and efficient naval staff was built up during World War I, and continued afterward as part of the board of admiralty. While the heavy gun maintained its pride of place as the chief weapon of the navy, the torpedo was increased in power and range, and the rapid development of the aeroplane introduced a new factor into naval tactics.

A naval wing formed part of the royal flying corps, which was constituted on April 13, 1912, and it was transferred to the navy on July 1, 1914, as the royal naval air service. The latter was merged with the royal flying corps on April 1, 1918, to form the royal air force, in 1924 the naval branch becoming the fleet air arm. The navy was given complete operational control afloat, and the air ministry was responsible for the administration of squadrons when ashore. Since some 70% of the flying personnel came from the navy and only 30% from the R.A.F., difficulties arose, and in 1937 the admiralty was given complete control of the fleet air arm both afloat and ashore, though the R.A.F. continued to give initial training to all pilots and also operated the shore-based aircraft of the coastal command. Air bases taken over by the admiralty from the R A.F., and others specially constructed, were designated ships and given names, and the fleet air arm established shore headquarters at Lee-on-the-Solent. A short-service branch was created in 1938 to build up a reserve of trained officer pilots, and naval seamen were enabled to volunteer for service in the fleet air arm in the ratings of observer's mate and gunner. A considerable aircraft carrier construction program was initiated, and fighting ships were increasingly equipped with from one to four aircraft and a launching catapult.

At the London Naval conference of 1930 the signatories agreed not to lay down any of the replacement ships of 35,000 tons which they were entitled to build under the terms of the Washington treaty during 1931–36 inclusive. Great Britain, the United States and Japan also agreed to reduce the number of their capital ships to 15, 15 and nine respectively, but rivalry in the Mediterranean made a like limitation agreement between France and Italy impracticable. When naval representatives of the major powers met again in London in 1935–36 to seek an accord to replace the Washington (1921) and London (1930) treaties, shortly due to expire, there was considerable disagreement. The Japanese delegation withdrew after failing to have quantitative limitation placed first on the agenda, thus once more setting in motion competitive naval construction. Italv likewise declined to sign a new treaty, being affronted by continuance of the League of Nations sanctions against her on account of the invasion of Abyssinia. However, Great Britain, the United States and France reached agreement on some phases of naval strengths and on advance notification of building programs. These three powers signed a protocol in 1938 raising the maximum tonnage of capital ships to 45,000 tons, and later in the year Italy signified her adherence to the 1936 agreement.

In 1935, at a time when the policy of disarmament had greatly reduced the strength of the navy, Britain found herself on the brink of war with Italy. Following the fascist demands made upon Abyssinia in September, almost the entire home fleet was despatched to the Mediterranean, and on Oct. 14 the British government adopted a policy of neutrality under the Hague convention of 1907 forbidding Italian ships carrying supplies to Africa to stay in British ports more than 24 hours and allowing them ship supplies sufficient only to reach the nearest Italian port. Open hostilities at sea were only narrowly averted.

Early in 1937 the royal navy co-operated with vessels of other powers acting as a non-intervention committee in patrolling the waters around Spain to prevent shipment of materials to either combatant in the civil war then raging. Britain and France withdrew from this patrol in September of that year, and in a conference at Nyon, Switzerland, they agreed to a joint patrol of the 5,000 miles of trade routes through the Mediterranean, the royal navy supplying 60% of the 60 destroyers employed.

Germany and Great Britain signed an agreement on June 18, 1935, giving the former a permanent naval ratio of 35% of the latter's fleet (but 45% on submarines), and on July 17, 1937, Britain signed naval limitation treaties with Germany and Soviet Russia, both of whom accepted the general scheme of limitation of armaments reached at the 1935–36 London Naval conference. It was not long, however, before Hitler began to speak frankly of the path of conquest along which he was determined to lead Germany. At the launching on Feb. 14, 1939, of the "Bismarck," the nazis' first 35,000-ton battleship, he declared that Germany's submarine fleet would be built up to parity with Britain, and on April 28 he announced to the reichstag the abrogation of the 1937 naval limitation treaty with Great Britain (which, incidentally, he had reaffirmed on Sept. 30, 1938, following signature of the Munich pact).

By this time, when it had become increasingly evident that a clash with Germany, and possibly her allies, could not be long postponed, the royal navy was far weaker than it had been at the outset of World War I, particularly with respect to capital ships. Compared with 1914, Britain alone among the world's chief naval powers had not increased the number of her submarines by 1939, though, in common with other nations, she had more destroyers ready for action. The only three nations to show increases in all the three categories of cruisers, destroyers and submarines were the United States, Italy and Japan. A type of naval vessel new in World War II was the aircraft carrier, Great Britain leading all naval powers in 1939 in having 12 such ships either built or building. The League of Nations ***Armaments*** Year-Book for 1940 provided the statistical information for the later data in the accompanying table of comparative naval strengths at the outset of both world-wide conflicts.

Comparative Naval Strengths at Outset of World Wars I and II

THE NAVY IN WORLD WAR II

The operations in which the royal navy were engaged are recorded in the article WORLD WAR II (*q.v.*). By the spring of 1942 more than 500 new fighting ships were completed, of which only 100 had been under construction or on order when hostilities commenced. The number included 160 additional destroyers and some 190 corvettes, the latter a type newly designed to operate far from shore against German U-boats; they were 190 ft. long and had a speed of 17 knots. Motor torpedo boats 70 ft. long and with a speed of 40 knots were also built for submarine chasing in narrow or sheltered waters. Submarine depot ships were constructed to serve as floating bases for the rest of crews and the overhaul of the vessels, and canteen boats were provided to resupply naval ships in harbour in a minimum of time. Many tugs and other small boats were engaged in salvage work, towing into port ships damaged by enemy action or, when that was impracticable, saving as much cargo and equipment as possible. Ex-fishing

boats were organized into an auxiliary patrol service to form a look-out cordon around British shores, converted trawlers and pleasure steamers engaged in mine sweeping and mine laying, and balloon barrage ships were stationed off the coast (and in some cases accompanied convoys) to discourage low-flying air attack. Other small vessels were employed on the boom defenses and in contraband examination, and larger merchant ships were taken into the navy for use as armed merchant cruisers. An air-sea rescue service (known to airmen as the "Salvation Army"), was formed in the spring of 1941 to save crews of aeroplanes shot down at sea.

Some 92,000 officers and men, all volunteers, were serving in the navy at the start of the rearmament program, and when war broke out in 1939, 46,000 reservists were called up. More men were conscripted for naval duty under the terms of the National Service (Armed Forces) Act, 1939, and some 10,000 boys at a time were undergoing preliminary training for the navy or the merchant marine at schools of the navy league sea cadet corps, a voluntary association. From 1937 defense courses were given to officers of the merchant navy, and from 1938 to the men of the service. The Royal Naval college was closed when war broke out, ofiicers then being obtained from members of the royal naval volunteer reserve having some previous knowledge of the sea. In 1940 a scheme was introduced for the commissioning as officers of selected naval ratings (who were given the same three months' training as the R.N.V.R.), and thenceforth all temporary officers were taken from the lower deck.

The women's royal naval service replaced various categories of naval personnel in shore establishments (as it had done in World War I). Besides performing customary feminine tasks, the Wrens replaced sailors in tenders, ferry boats and small craft, worked as armourers, meteorologists, cipher experts and wireless operators, maintained and serviced machine guns and aircraft ashore, and as naval architects helped in planning the construction of warships. An autonomous organization, the Wrens did not come under British naval law, unlike the women's auxiliaries of the army and air force, which were subject to the regulations and discipline of those respective branches of the armed services.

At outbreak of war the fleet air arm possessed some 340 first-line aircraft, two-thirds of them land planes borne aboard aircraft carriers and the remainder amphibian flying boats carried in capital ships and cruisers. In 1940, after the fall of France, the responsibilities of the fleet air arm in the defense of British shores became so overwhelming that the coastal command of the royal air force was called upon to aid in the battle of the Atlantic This resulted in operational control of the coastal command being transferred to the admiralty, though administration, manning and maintenance remained in the hands of the R.A.F.

The navy was called upon in World War II for convoy duty of unprecedented immensity, up to 80% of Britain's total military production being sent overseas under naval escort to all parts of the world as well as every soldier for whom shipping space could be found. Out of the thousands of ships convoyed by the royal navy less than one in 200 was lost by enemy action. While many great liners became actually part of the navy, the merchantmen which carried food, arms, raw materials and the troops remained part of the merchant navy and were manned by civilian seamen. British losses were heavy. the following being the numbers of ships reported destroyed down to April 9, 1942:

Capital ships and battle-cruisers	1	Fleet minesweepers	5	Trawlers and whalers	140
Aircraft carriers	4	Monitor	1	Drifters	16
Cruisers	18	Gunboats	1	Auxiliary mine-sweepers	7
Minelayer	1	Corvettes	11	Fleet tugs	2
Destroyers	72	Armed merchant cruisers	14	;Miscellaneous auxiliaries	20
Submarines	37	Armed yachts	13		
Sloops	8				

Including: Royal Australian navy, 1 cruiser, 1 destroyer, 1 trawler; Royal Canadian navy, 2 destroyers, 3 corvettes (2 lent by the British), 1 armed yacht, 1 trawler; South African Naval service, 1 trawler; Royal Indian navy, 1 corvette, 3 miscellaneous auxiliaries; Royal Norwegian navy, 1 destroyer (British, manned by the Norwegians); Free French Naval forces, 1 corvette (lent by the British),

The heavy losses in destroyers were made good to a considerable extent by the transfer to Great Britain in Aug. 1940, of 50 over-age American destroyers. At the same time the United States obtained 99-year leases for sea and air bases at eight points on British territory in the western hemisphere, some of these leases being given in exchange for the destroyers and the others as outright gifts. The United States government also permitted repair of British warships in its dockyards long before the United States entered the war.

DEFENSE: *AIR* FORCE

Historical.— Military aviation in Great Britain dated from 1910, when the corps of royal engineers acquired a single Wright biplane. An air battalion of the royal engineers was formed on April 1, 1911, one company concerned with lighter-than-air craft and a second with aeroplanes, and that same year a few naval officers were also allowed to learn to fly. In 1912 the army and navy jointly established a central flying school on Salisbury plain, and on April 13, 1912, the royal flying corps was created. with a naval wing and a military wing. On July 1. 1914, the naval wing became the royal naval air service (see ***Navy,*** above), and with the outbreak of World War I the next month the royal flying corps constituted the aviation service of the British army in France.

World War I.—The slow and ill-armed aeroplanes with which four squadrons of the royal flying corps first saw action were replaced in 1916 by craft good enough to obtain temporary ascendancy over the Germans, and military commanders came to realize that aeroplanes were of value not alone for reconnaissance but for fighting and bombing as well. An air board established in 1917 brought about great expansion of the personnel and equipment of the royal flying corps, and on April 1, 1918, the royal naval air service and the R.F.C. were merged to constitute the royal air force, the former being termed the fleet air arm. Control was then vested in an air council operating through an air ministry, the secretary of state for air becoming a member of the cabinet. During the last year of the war an independent force of the R A.F. was formed for service in France, conducting operations in one area of the conflict without reference or subordination to army or navy commands. The accomplishments of the air services are recorded in the article WORLD WAR I (*q.v.*). By the time the armistice was signed in Nov. 1918, the R.A.F. was the largest aviation branch possessed by any of the combat-

ants. Personnel then numbered 27,333 officers and 263,410 other ranks, the 188 operational squadrons at home and abroad, and numerous training squadrons, being furnished with 22,647 aeroplanes and 103 airships. Casualties from Aug. 4, 1914, to Nov. 11, 1918, were as follows:

	Officers	*Other* ranks	Total
Killed	4,579	1,587	6,166
wounded	5,369	1,876	7,245
Missing and prisoners	2,794	334	3,128
Interned	45	39	84

The Years Preceding World War II.—With conclusion of World War I there began a drastic reduction in the strength of the royal air force, by 1920 only 25 squadrons continuing in existence with personnel numbering 28,000 officers and men. Some increase was sanctioned in 1923, but such slow progress was made that the program had not been completed by 1933, the year Hitler acquired power. The growing menace from Germany compelled the government to plan further considerable expansion in aerial defense in 1935–36, and by a scheme of "shadow factories" motor car manufacturers were called upon to produce aeroplane parts and later special factories were built at government expense and managed by approved aircraft manufacturers. The Gosport School of Special Flying, established in 1917, became two years later the Central Flying school and was removed to Upavon, where it trained instructors; during 1927–35 the school was at Wittering, then returned to Upavon. An Air Force college opened at Cranwell in 1920 trained cadets for commissions as pilots, and an R A F. staff college for senior officers was established at Andover two years later. In 1937 a College of Imperial Defense was created in London and was attended by members of all three fighting services, in rotation, R.A.F. officers commanding it. Youths were trained in the nonflying, noncommissioned ranks at an apprentices school at Halton, near Wendover.

A reserve of air force officers was formed in 1923, and the following year a scheme of short-service commissions was introduced, men between 18 and 22 years joining the R.A.F. for five years of service. In order to increase the pool of pilots, in 1925 an auxiliary air force of civilians trained in their spare time was formed, and the government encouraged establishment of flying clubs and of university air squadrons. Balloon units of the R.A.F. were created in 1936, and balloon squadrons of the auxiliary air force in 1938, these units operating the extensive balloon barrage in the ensuing war. The observer corps, ancillary (not auxiliary) to the R.A.F., was organized also in 1936 on a voluntary basis for visual and acoustic observation, and a month before the war broke out in 1939 it was taken over by the air ministry; its services proved of such value that in 1941 it was granted the prefix "royal." The royal air force volunteer reserve, which came into operation in Jan. 1937, recruited men 18–25 years of age for part-time instruction over a minimum period of five years, pilots receiving a retaining fee of £25 and appropriate allowances while under training. As a further means of interesting men in aviation, a civil air guard set up in 1938 provided inexpensive flying experience, and many good pilots were obtained from it subsequently for war service. Boys were encouraged to join the air wing of the officers' training corps or squadrons of the air defense cadet corps, the latter sponsored by the Air League of the British Empire. The women's royal air force had undertaken both domestic and technical administrative work in World War I, and when the auxiliary territorial service (for women) was established in 1938 special air force companies were included. These latter, in June 1939, formed the nucleus of the women's auxiliary air force, which became the first organization for British women to wear the same badges of rank as its parent service. The W.A.A.F. was given full status as part of the crown forces in World War II by the Defense (Women's Forces) Regulations, 1941, and varied tasks which its members performed both in Great Britain and the middle east included the care of parachutes, balloon operating, meteorology, radio-location, bomb plotting and ciphering.

British experience with lighter-than-air craft proved unfortunate following World War I. The "R-34," a rigid airship, crossed the Atlantic to the United States and returned in July 1939, being the first aircraft of any type to accomplish the double journey without mishap. In 1921 the "R-38," at that time the world's largest airship, was sold to the United States and renamed the "ZR-2," only to break amidships while undergoing trials near Hull. The Royal Airship works, Cardington, and the airship section at Pulham were discontinued, but they were reopened in 1924 and the "R-33" and the "R-36" were reconditioned under supervision of a newly constituted directorate of airship development. Satisfactory experimental flying was done by two new vessels, the "R-100" and "R-101," in 1929, and in July-August of the next year the former flew to Montreal and returned. In Oct. 1930, the "R-101" set out for India but crashed in flames near Beauvais, France, 47 of her personnel of 54, including the secretary of state for air, losing their lives. The "R-100" was broken up in her hangar and operation of lighter-than-air craft ceased. though an airship research department of the air ministry continued to exist until the outbreak of World War II.

World War II.—The royal air force in Great Britain was divided into four main commands at the time hostilities commenced in 1939: the fighter command, whose most important duty was the defense of the British Isles; the bomber command, the offensive branch; the coastal command, responsible for reconnaissance, U-boat hunting, guarding convoys and sea rescues; and the army cooperation command, which worked with the army in reconnaissance, photography, bombing, dropping supplies and transport. In addition, there were maintenance, balloon and training commands. Overseas commands were mainly responsible for keeping open the air and sea routes of the empire. Commands were divided into groups, which were again divided into stations; each of these last had several squadrons, and each of the latter comprised three flights of three aeroplanes. By March 1939, the first-line strength at home was 1,750 aircraft, and in July parliament sanctioned increase in establishment to 150,000 officers and men. The part played by the royal air force in defense of Great Britain and in service overseas is recorded in the article WORLD WAR II (*q.v.*).

Early in 1939 civil training schools for airmen were incorporated in the R.A.F., and in May an Empire Air Training scheme was set up whereby men from Great Britain and the dominions were jointly given intermediate and advanced pilot training in Australia, South Africa, Southern Rhodesia and Canada, but principally the last. In June 1941 facilities were also afforded for the instruction of British airmen in the United States. Plans were developed for the training of 4,000 pilots annually at army schools and a further 3,000 at civilian flying schools, together with 1,000 navigators at the Pan-American Navigation school, Miami. That part of the program in which the United States army participated was discontinued in July 1942, due to the further extension of the Empire Air Training scheme and American need to use the whole of its own resources.

An air transport auxiliary of men and women pilots was formed to ferry aeroplanes within Great Britain between the aerodromes and factories and repair plants under the R.A.F. department of production; this latter was detached in May 1940, to constitute a separate ministry of aircraft production, its head having a seat in the war cabinet. From Oct. 1940 all aeroplanes with a sufficiently long range were flown to Great Britain from factories in North America, the crossing being accomplished in as little as 7½ hours. At first operated by the Atlantic ferry organization ("Atfero") under the ministry of aircraft production, responsibility was transferred to the air ministry in Aug. 1941, the personnel then constituting the R.A.F. ferry command. When the fleet air arm was transferred to the jurisdiction of the admiralty in 1937 (see **Navy,** above), the coastal command was continued as part of the R.A.F., and in 1940 the latter was also placed under naval operational direction in order to facilitate unified action against enemy aircraft and shipping far out to sea. Responsibility for the defense of aerodromes lay with the army authorities until Jan. 1942, when the task was taken over by a

newly formed R.A.F. regiment trained for that sole purpose.

Following the surrender of France in the summer of 1940 the royal air force collaborated with the army in training soldiers as parachute troops ("paratroops"), organized in a branch of the army known as the special air service. The air defense cadet corps and other units at schools and universities were succeeded in Feb. 1941 by the air training corps, which trained boys over 16 years of age for eventual entry into the R.A.F. or the fleet air arm, and boys too young for the A.T.C. were able to join the Air Scouts, a newly-formed section of the Boy Scout movement. With the growing need for men trained in the care of electrical and other scientific equipment, a civilian technical corps was organized in 1940, members being recruited in the United States for service in air force, military and naval repair and maintenance establishments, industrial centres and training schools.

From the outbreak of war the royal air force volunteer reserve became the principal means of entry into air service, all enlisted men going through it and all commissions in the general duties (nonflying) branch being given to men in the R.A.F.V.R. Within the framework of that organization were also the Eagle Squadron, formed on Oct. 8, 1940, of volunteer pilots from the United States, and separate air forces of Poles, Dutch, Norwegians and Free French, while Belgians and Czechs were also included. The bulk of the personnel of the royal air force both at home and overseas was British, however, and Britain continued to manufacture most of the aeroplanes employed. The respective proportions of men and machines in the spring of 1942 was as follows:

		United Kingdom	Overseas
Air crews	British	67%	83%
	Dominions	26%	15%
	Allied Nations	7%	2%
Male ground personnel .	British	**97%**	**99%**
	Dominions	2%	1%
	Allied Nations	1%	—
Aircraft of operational type	British	87%	75%
	American	13%	25%

NATIONAL FINANCE

British Finance After 1793.—The revolutionary and Napoleonic Wars (1793–1815) imposed such a strain on English finances as to throw all previous wars into the shade. The total cost is estimated to have exceeded £800,000,000. War expenditure began gradually. By 1795 it had reached about £20,000,000 a year. At first no taxation worth mentioning nas imposed; all was borrowed. In 1797 the restriction of cash payments by the Bank of England marked a new stage. By a great effort tax revenue was raised from £19,000,000 in 1796 to £32,500,000 in 1799.

A notable novelty was the income tax. As imposed by Pitt in 1798, this tax (at the rate of 2s. in the pound) was based on personal declarations of income by the taxpayers. It was impossible to secure full and honest declarations or to check evasion, and the yield of about £5,500,000 a year was disappointing. The peace secured by the treaty of Amiens in 1802, transitory though it turned out to be, was accompanied by the repeal of the income tax. On the other hand additional customs and excise duties were imposed and in 1803, when the war broke out again, the tax revenue reached £40,000,000.

Henry Addington, who was then prime minister and chancellor of the exchequer, reimposed the income tax, but with an important and indeed epoch-making change. He established the system of taxation *at* source, **Incomes were** *to* **be declared** *so* **far as** *possible* by those who paid them (such as the tenant of land or the borrower on mortgage) instead of by those who received them, and the tax collected accordingly. This proved to be the solution both of the problem of war taxation at the time, and of the problem of income taxation in the future. The rate of income tax, at first 1*s.* in the pound, was raised in 1807 to 2*s.* and the tax at that rate regularly yielded from £12,000,000 to £14,000,000 a year.

The yield of taxation was swollen all round by an inflated paper currency and a high price level, and in the years 1813 to 1815 an average annual revenue of £79,000,000 was provided towards an average expenditure of £104,000,000. Customs and excise yielded an average of £44,000,000 and income tax £14,500,000. Indirect taxes had been constantly added to, and eventually attained a degree of complexity and vexatiousness which has become notorious (and immortalized by Sidney Smith's witty description).

Though tax revenues had been thus drastically extended in the latter part of the war, the deficits still necessitated very heavy borrowing. The practice was followed of issuing stock far below par; 5% and 4% stocks were issued, it is true, as well as 3 per cents, but the 3 per cents predominated and were being plentifully issued even at times when 5 per cents could not be sold at par. In the whole period 1793–1816 the funded debt was increased by £566,600,000 *net* (stock redeemed out of the sinking fund and held by the National Debt commissioners being deducted). The net proceeds in money were only £368,600,000. The floating debt (which had been £10,000,000 in 1792) had risen to £50,000,000. In 1814 it had been £60,000,000.

Added to the pre-existing debt this made a total of £846,000,000, and the annual charge for interest was some £32,000,000, including terminable annuities amounting to £1,898,000, which were not represented in the capital of the debt. The difficulty of meeting this burden was increased when the government was deprived by an adverse vote of the house of commons in 1816 of the income tax. The years following the peace were a period of falling prices and depression. Rigorous economy (with which the name of Joseph Hume is associated as an indefatigable critic of government extravagance) brought down expenditure below £60,000,000 a year, and by 1834 even below £50,000,000. Yet the oppressive and vexatious system of indirect taxation had to be continued to make ends meet.

Some relief was soon obtained from the conversion of the debt. The government had the right to repay the 3 per cents and the 4 per cents at par. In 1821 this option enabled them to convert the 3 per cents to 4 per cents (with an increase of 5% in nominal capital). The stock converted amounted to £150,000,000 and the saving in interest was £1,200,000 a year. Two further conversions (1824 and 1830) reduced the 4 per cents to $3\frac{1}{2}$ and saved a further £1,000,000 a year. In 1844 the $3\frac{1}{2}$ per cents were in turn converted to a new stock bearing $3\frac{1}{4}$% for ten years, and thereafter 3%. Thus the funded debt had been reduced to a uniform 3%. But the relief thus gained was restricted to the stocks which had originally yielded more than 3%. The burden of the 3 per cents which had amounted in 1815 to £547,000,000 could be diminished in no other way than by the operation of the sinking fund, till the yield of gilt-edged securities at market prices fell below 3%.

The sinking fund instituted by Pitt had become an absurdity; an enormous sum had to be applied every year to the redemption of debt, even when the requisite revenue was not forthcoming. Money was even raised by the creation of floating debt to redeem funded stock. After tentative amendments this ambitious but unpractical plan was swept away in 1829 in favour of a simple provision requiring the actual excess of revenue over expenditure in any year to be applied to the reduction of debt. This provision, termed "the old sinking fund," remained in effect until 1923.

For 20 years after 1815 there were as a rule moderate surpluses. In 1836 and 1837 heavy borrowing became necessary to provide £20,000,000 of compensation to the proprietors of slaves emancipated in the West Indies.

It was a time of bad trade, and in the years that followed *there* **were serious** *deficits,* aggravated in 1840 by the **adoption**

of the penny post, which involved a loss of revenue of £1,000,000 a year. Financial difficulties were a contributory cause of the discredit and fall of Lord Melbourne's government in 1841.

The Coming of Free Trade.—The budget fell into the masterful hands of Sir Robert Peel, who as prime minister and first lord of the treasury quite overshadowed Henry Goulburn, the chancellor of the exchequer.

The path to solvency was found in the revival of the income tax. At a rate of 7d. in the pound it yielded £5,000,000 a year. The deficit in 1841 had been £2,100,000, and the new tax provided a margin to admit of important reforms. It was the age of the classical economists and their championship of free trade. A beginning had been made with the mitigation of protective customs duties in 1825 by Robinson and Huskisson. Peel in his budget of 1842 made an important further advance. He repealed numerous vexatious duties which yielded comparatively little revenue, but which hampered trade. A further instalment of similar reforms came in 1845. The repeal of the corn laws in 1846 can hardly be regarded as a fiscal measure; the slight loss of revenue counted for little in comparison with the major issues raised.

The traditions of Peel were carried on by the so-called Peelite party, the section of Conservative Free Traders who played a conspicuous part in politics till 1859, and thereafter contributed to the creation of the modern Liberal Party. Peel's successor in finance was Gladstone, the outstanding figure in that sphere in the 19th century.

Customs duties came to be confined to products which were not produced in Great Britain or which could be subjected to excise duties. From repeal of the sugar duties in 1874 until their reimposition in 1901 the only commodities taxed were tea, coffee, cocoa, tobacco, dried fruits and alcoholic liquors. Gladstone. finding it possible to reduce the income tax to 2*d*. in the pound in 1874, proposed to repeal it altogether, but with the fall of his government the tax was soon increased. The treasury continued the tradition of severe economy begun after 1815. the chancellor of the exchequer having to sanction the expenditure of all other departments.

Progress with debt redemption was slow. In 1853, on the eve of the Crimean War, the debt amounted to £769,000,000, and the war (costing £69,000,000 in all) added £39,000,000 to this total. Apart from the rather fortuitous surpluses of revenue over expenditure, there was no systematic sinking fund. Gladstone in 1863 started a new system of "terminable annuities" for the purpose of redeeming debt. **A** sum of £5,000,000 3 per cents, in which savings bank deposits were invested, was cancelled, and in place of the interest the exchequer was made liable to pay an annuity for 22 years including instalments of capital sufficient to accumulate during that period to the equivalent of the stock cancelled. The system was further developed, and in 1875 the annuities amounted to £3,500,000.

New Sinking Fund, 1875.—Sir Stafford Northcote, Conservative chancellor of the exchequer, created a systematic sinking fund, setting up a fixed debt charge of £28,000,000 a year, ample to cover interest and terminable annuities and to provide a margin for debt redemption (the "new sinking fund"). The proviso that surplus revenue be applied to the redemption of debt (the "old sinking fund"), still remained in operation. Surpluses of revenue and debt were frequently diverted through the annual Finance act from debt redemption to expenditure more or less of a capital nature.

In the last quarter of the 19th century, a period of low rates of interest, the 3 per cents rose to par, and would have risen higher but for the government's right to repay them at par. In 1888 £514,000,000 of 3 per cents were converted to a new stock (new Consols) yielding 2¾% for 15 years and thereafter 2½%. Following the resignation of Gladstone in 1894 a turning point in financial policy was reached. Expenditure began to mount rapidly, and soon the South African War (1899–1902, costing £223,000,000) added £159,000,000 to the debt (yielding £152,000,000 of cash).

The growth of British expenditure is illustrated by the following table (in £ millions):

†Assigned revenues under acts of 1888 and subsequent years. This item was excluded from the Exchequer Account and the financial statement till 1906.

**Estimates from last peace-time budget.

Expenditure from 1894 to **1915.**—The 21 budgets which intervened between Gladstone's resignation and the outbreak of World War I had more than doubled the expenditure Of the increase of £108½ millions £47 millions were for defense, and £22 millions for old age pensions and social insurance. The remaining £40 millions were partly the result of natural growth (including £16 millions for the post office). The period was one of rising prices, so that a part of the growth was only apparent.

Sir William Harcourt, Liberal chancellor of the exchequer (immediately prior to Gladstone's retirement in 1894), applied to death duties the principle of a graduated tax. A small estate paid 1% or 2%, while one above £1,000,000 paid 8%. Towards the cost of the South African War, £71,000,000 was raised by taxation. Income and indirect taxes were increased, and new taxes comprised a coal export duty (1901) and import duties on sugar (1901) and wheat (1902). The coal and wheat duties were repealed in 1903, the latter because of the controversies regarding protection which it threatened. Joseph Chamberlain's campaign for colonial preference followed immediately (see PROTECTION).

Remissions of taxation and big repayments of debt became possible after return of a Liberal government in 1905 because of good trade. The debt charge, raised by Austen Chamberlain to £28,000,000, was temporarily further increased. While income tax remained at 1s. in the pound, earned incomes below £2,000 a year, through a system of differentiation, paid 9*d*. only. New demands were made on the exchequer in 1908 by Herbert Asquith's Old Age Pensions act, and shortly this was followed by the health and unemployment insurance projects of David Lloyd George.

The budget of 1909, with an enormous estimated deficit, raised a great constitutional crisis. The taxation of "land values," especially the "unearned increment" of economic rent, and heavy increases in public house license duties evoked much opposition. Estate duties were graduated more steeply, the duties on spirits and tobacco were raised, and a supertax, or additional income tax, was placed on large incomes. Incomes above £5,000 were taxed 6d. in the pound on the excess over £3,000, and at the same time income tax on unearned income was increased from 1*s*. to 1*s*. 2*d*. Although it had been a constitutional convention since the 17th century that the house of lords could not amend a money bill, it could not be prevented from rejecting one, and this was what the lords did to the Finance bill of 1909.

Parliament **Act,** 1911.—Two successive general elections in 1910 were required to enable the government to pass the budget (April 1910) and the Parliament Act, 1911, which limited the powers of the lords and almost destroyed their power over finance. Further taxation became necessary in 1914, estate duties being increased, the income tax on unearned incomes going from 1*s*. 2*d*. to 1*s*. 3*d*. (earned remaining at 9*d*.), and **supertax** being

further extended. Supertax was applied to all incomes over £3,000, and was more elaborately graduated (the rate on the excess of an income over £8,000 was 1s. 4d. in the pound). The estimated yield for a full year was thereby raised from £3,300,000 to £7,770,000 (see INCOME TAX: *In* Practise).

The following table shows the growth of taxation in the century preceding World War I (in £ millions):

	1820	1840	1859–60	1879–80	1893–94	1908–09	1914–15*

*Estimates from last peace-time budget.

Finance in World War I.—The budget position could not be disassociated from the state of credit generally after commencement of hostilities in Aug. 1914. The outbreak of war threw the stock exchanges and foreign bill markets (above all in London) into utter disorder. The government was forced to step in and to proclaim a moratorium for debts, statutory power was taken for the treasury to issue legal tender currency notes for £1 and 10s. and the government guaranteed advances by the Bank of England to acceptors to pay off pre-moratorium bills.

The war was costing about £1,000,000 a day, and for initial expenses advances of £14,720,000 were obtained from the Bank of England on "ways and means" (i.e., under the powers annually conferred by the Consolidated Fund act and Appropriation act). Successive issues of treasury bills followed, additional taxation was imposed and a loan of £350,000,000 (3½% at 95, redeemable 1925–28) was issued. Because of the advances to the government and large imports of gold, the Bank of England was unable to control the money market. From 5% when banks reopened on Aug. 7, the bank rate fell to 3% in September, and even lower in November, and by Feb. 1915 the market rate was below 2%.

Growth of Inflation.—At last, in March 1915, severe measures were taken to counteract the growing inflation, which had already caused a considerable rise of prices. The Bank of England came into the money market as a borrower at call on the same footing as the discount houses. and lent the proceeds to the Government. The money was accumulated in balances, and public deposits at the bank rose from £27,000,000 at the end of Feb. to £114,000,000 at the end of March and other deposits fell to £90,000,000. On April 13 a new departure was made, in that treasury bills in unlimited quantities were placed continuously on sale at fixed rates of interest to all comers. But the rates were still low (2¼% for 3 months, 3⅝% for 6 months. 3¾% for longer maturities). Public deposits rose to £130,000,000 and more. It was the treasury bill rate, and not the bank rate, which regulated the money market.

By that time the cost of the war had risen to £3,000,000 a day and exceeded one-third of the national income (even if this be assumed to have risen in proportion to prices, which were 25% higher than in 1913). This outlay (after a modest contribution from the tax revenue had been deducted) far exceeded the amount that the people could save. But inflation only made the situation worse. That the cost of the war was itself swollen by the high prices was the least part of the evil. Easy credit makes trade profitable. because it encourages buying and consumption. It directs savings away from gilt-edged investments into trade. In 1915 conditions were extremely abnormal, but, for all that, this tendency was at work. Lavish expenditure by the public on consumable goods was competing with the Government, not only for the investment of the available savings, but for the employment of the available labour and productive power. Inflation, once started, continued throughout the war and for some time afterwards and only spasmodic and half-hearted attempts were taken to check it till 1920, when prices had risen to three times above the pre-war level.

R. McKenna, in June 1915, brought out the second war loan (4½% at par, redeemable 1925–45). It was for no specified totai amount. The banks again undertook to subscribe for a very large amount, but the loan was planned much more for the ordinary investor and less for the money market than the 3½% loan of November. It also remained open longer, and there was more propaganda. Subscribers were given the right to convert their holdings into any future long-dated war loan. Holders of 33 per cents or of consols were allowed to convert these securities into the new loan if they subscribed in addition a certain amount of cash to it. The loan yielded £587,000,000 of cash, but £200,000,000 came from the banks and the balance was but a modest contribution from genuine savings towards the growing expense of the war.

"Pegging" the Exchange.—While the loan was still being subscribed, ominous signs of weakness began to appear. Tlie rise of prices was resumed. The exchange on New York fell below $4.80 to the £1 sterling; at the end of August it dropped to $4.50. The government sought a remedy in the sale of gold and securities in New York. Gold received in 1914 and deposited at Ottawa, gold displaced from circulation by currency notes, gold extracted from the precious reserves of France and Russia, all were drawn upon. The total net imports of gold into the U.S. in 1915 were $420,000,000, of which two-thirds came in the second half of the year. The British government collected American securities from British holders, and either sold them or pledged them in America. There was also direct borrowing in America, starting with the Anglo-French loan of Oct. 1915 ($500,000,000, five-year 5 per cents at 98).

By means of these resources it became possible to "peg" the exchange at $4.764. That measure made inflation more ruinous to the country than before. Inflation creates an excess of imports, which can be corrected, if the gold standard is abandoned, by an adverse movement in the exchanges. If the government prevents that adverse movement by undertaking to sell foreign currencies to all comers, the excess of imports continues, and the government has to pay for it. There were obstacles to imports in 1916 (especially lack of shipping), but the burden assumed by the government was still a formidable one. The British government also had to supply the necessary resources for pegging the French franc.

What was needed above all was the cessation of inflationary finance. The 4½% war loan had been of some assistance, In Aug. 1915 the lowest rate for treasury bills was fixed at 4½%. In September new taxation was imposed calculated to yield over £100,000,000 in a complete year, and in May 1916 further increases brought the revenue for the year 1916–17 above £500,000,000. But the cost of the war had risen to £4,500,000 a day and the rise of prices above the peacetime level exceeded 50%. In Dec. 1915 five-year 5% exchequer bonds were put continuously on sale, but yet in March 1916 the floating debt (treasury bills and ways and means advances) was almost £600,000,000.

In July 1916 the bank rate was raised to 6%, and the treasury bill rate to 5½. The effect of bank rate on borrowing depends on the profits of trade; 6% is by normal standards a very high rate but in face of the profits promised by an orgy of inflation it counts as low. At any rate it was not high enough to have much effect in 1916. The sale of five-year exchequer bonds (raised to 6% in Oct. 1916) continued till Jan. 1917. A. Bonar Law, who had become chancellor of the exchequer in Dec. 1916, then decided on a third World War loan.

This took two forms: 5 per cents at 95 (redeemable 1929–47) and income-tax free 4 per cents at par (redeemable 1929–42). A "depreciation fund," equal to ⅛% per month, was to be applied to buying up stock in the market whenever it was below the issue price. The amount asked for was unlimited, and the zeal of the public was stimulated by intensive propaganda. It was wisely decided to ask for no direct subscriptions from the banks. The

cash raised was £816,000,000, and treasury bills subscribed amounted to £124,000,000. In addition, holders of 4½% war loan and of the exchequer bonds since issued were entitled to convert into the new stock. The total amount created was £2,067,000,000 of 5 per cents and £52,000,000 of 4 per cents.

Even after this great effort the floating debt at the end of the financial year (March 31, 1917) amounted to £680,000,000. Prices were almost double the peacetime level. Growing difficulty mas experienced in providing resources for the support of the American exchange. The vast quantities of gold sent to the United States (whose net imports of gold from Jan. 1915 to March 1917 amounted to $1,192,000,000) not only paid for goods, but brought about a credit inflation and rise of prices there. Indeed otherwise the discrepancy in value between the pound and the dollar would have been far too great for any pegging operation to be feasible. But the effect of the credit inflation in America was to make borrowing there more difficult in face of the insistent demands of trade for all available supplies of capital. It was found possible to raise loans of $250,000,000 in Aug. 1916, $300,000,000 in Oct. 1916 and $250,000,000 in Jan. 1917, but the market was growing more and more reluctant.

America Enters the War, 1917.—All such anxieties were dispelled by the entry of the United States into the war in April 1917. Thenceforward the necessary resources both for supporting the exchange and for buying food and materials were advanced to the British and Allied governments by the American government itself. The British government continued to provide funds to enable the Allies to buy goods in England, but the amount lent was about equal to the amount borrowed from the American government. Inflation in the United States was accelerated and the export of gold was then prohibited. The price index rose from 162 in March 1917 (100 being the average of 1913) to 203 in Nov. 1918. The English price index in Nov. 1918 was 229. The cost of the war to the British exchequer had risen to £7,000,000 a day. Bank rate had been reduced to 5½% on Jan. 18 and to 5% on April 5, 1917.

After the 5% war loan, borrowing was effected through exchequer bonds, rechristened in Sept. 1917 "national war bonds." They were 5 per cents, but were repayable on maturity at a premium (2% on the 5-year bonds, 3% on the 7-year and 5% on the 10-year), and were convertible at the holder's option into 5% war loan at 9j (*i.e.,* a £100 bond would buy £10j 5*s.* 3*d.* of war loan). There were also income-tax free 4% 10-year bonds, repayable at par, and convertible into 4% war loan. National war bonds were continuously on offer till the armistice and thereafter till May 1919 (those issued after Jan. 1919 having no conversion rights).

Much attention had been given to the attraction of savings from the working classes. Special facilities were given for the purchase of the 43% war loan of 1915 in bonds of small denominations. In 1916 a special issue of war savings certificates was started. The subscriber paid 15*s.* 6d. for a certificate entitling him to £1 after five years, and he could obtain repayment at any time at the sacrifice of a part of the accumulated interest. The interest accumulating, and not payable periodically, was not liable to income tax, and to prevent too extensive an evasion of income tax by well-to-do holders, the amount of certificates which could be held by any one person was limited to £500.

On March 31, 1919, the national debt amounted to £7,481,000,000, an increase of £6,775,000,000 since March 31, 1914. The external debt was £1,365,000,000, or, if certain items which could be set off against debts due to the British government from Canada, France, Italy and Russia be omitted, £1,179,000,000. The internal floating debt was £1,339,000,000 (exclusive of treasury bills amounting to £73,000,000, included in external debt) including £455,000,000 of ways and means advances; the latter included sums lent by government departments (partly from the currency notes account, partly from trading accounts and many other sources). But a large part was money borrowed at call through the Bank of England from the money market, extra interest being paid for foreign-owned balances.

Taxation in World War I.—Though there were heavy increases in indirect taxation, far the greater part of the war taxation was direct, as the following comparison shows:—

Taxation in Peace and War

Source of revenue	1914–15 (peace estimate)	1918–19
	£ millions	£ millions
Customs and excise	75'3	162·2
Incometax	48·1	255·6
Supertax	5·8	35·6
Excess profits duty	..	285·0
Otherdirecttaxes	42·1	45'9
Otherrevenue	35·8	104·7
	207·1	889·0

The rate of income tax had been raised to 2*s.* 6d. in 1915–16 and to 5*s.* in 1916–17. In 1918–19 the rate was raised to 6s.; the effect of this last increase was not fully seen till 1919–20, when the yield was £317,000,000. Supertax rates had likewise been raised, and the highest zones of income paid 4s. 6d. The biggest tax of all was the excess profits duty, which had been imposed by McKenna, in Sept. 1915. This was a tax on the excess of the profits made by any firm or company in the year of assessment over the annual profits made before the war (computed in the case of a business established since the outbreak of war from its capital). Administratively it was an offshoot of the income tax, for the income tax assessments disclosed both the current profits of a business and its prewar standard. The rate of tax was at first 50%, and was raised in 1916 to 60% and in 1917 to 80%. Excess profits duty was a powerful corrective of inflation. It provided £645,000,000 revenue in the three years 1916–17 to 1918–19, and £540,000,000 more in the difficult years that followed. It diminished the evil tendency of inflation to accentuate the inequalities of wealth. By it the extravagant profits which made trading enterprises unduly attractive to capitalists, in competition with the needs of the government, were materially reduced. Excess profits duty was never anything but a makeshift. It was full of anomalies and minor injustices. But these, in the emergency of the time, were as dust in the balance compared to its advantages.

The indirect taxes imposed included import duties on motorcars, clocks and watches, musical instruments and cinema films —officially known as the new import duties, but more commonly called the McKenna duties. They are noteworthy as being the first protective duties imposed since the days of the Peelites, except the ephemeral corn duty of 1902.

Cost of World War I.—An exact calculation of the cost of World War I to Great Britain would be impossible, and what follows can be regarded as no more than an approximation. The day after the declaration of war with Germany the government obtained from parliament a vote of credit of £100,000,000, for "expenses, beyond those provided for in the ordinary grants of parliament, arising out of the existence of a state of war." Certain services, such as naval and military operations, maintenance of trade, relief of distress, were specifically mentioned, but the total was not divided into subheads like an ordinary vote. Till March 1919 the cost of the war was met from successive votes of credit. The total audited expenditure from votes of credit was £8,417,000,000. The table on p. 695 shows the principal details.

Civil departments drew on votes of credit for any expenditure in excess of their own votes, attributable to the war. Some items so met (*e.g.,* for cost of living bonus to civil servants) were not part of the cost of the war. But on the other hand the ordinary votes bore many war charges such as the civil pay of staff absent on military service, or the cost of administrative work arising out of the war. The total includes £1,665,000,000 of loans to allies and dominions. This burden, though relieved at the time by advances from the Canadian and American governments, eventually fell upon the shoulders of the hard-pressed British taxpayer, who was also confronted with the problem of the American debt.

Vote of Credit Expenditures

*Mainly sales of war stocks, ships, etc., but exclusive of reparations.
†Excess of receipts over expenditure.

A further net sum of £22,250,000 was provided through the civil contingencies fund (advances, 1919–20, £64,500,000; repayments, 1919–20 to 1921–22, £42,250,000). The total net war expenditure is thus (in £ millions):—

Total World War I Expenditure

	British Expenditure	Loans to Allies, etc.	Total
Votes of credit	6,084	1,665	7,749
Subsequent years	376	166	542
	6,460	1,831	8,291

Advances *from* Allies were (in £ millions).—

United States	865
Canada	184
France, Russia and Italy (gold)	136
	1,185
Voluntary contributions from India and colonies (principal only) up to 1923	90
	1,275

This may be regarded as reducing the net "immediate burden" of advances to allies to £556,000,000. The burden of war pensions, actuarially capitalized at some date in the midst of the war, may be put at £1,000,000,000. (R. G. H.; X.)

Finance During 1919–29.—Burdened with heavy war commitments, the budget for 1919–20 brought the prospect of a large deficit. In June a new 4% loan was offered for subscription in two forms, the funding loan, at 80, redeemable 1960–90; and victory bonds, at 85, repayable by annual drawings at 100. The twin ioans yielded £475,000,000, but £92,000,000 had been subscribed by the banks, so that the real contribution towards sound finance was only £383,000,000. The price level rose from *217* in April 1919 to 313 in April *1920* (1913 being 100), and with an abyss of inflation seemingly opening the treasury bill rate was put up to 6½% and the bank rate to 7%. The export of gold had been prohibited, and with the tremendous fall in prices caused by the high bank rate the peril of inflation vanished. The loan issues of 1919 and an issue of 5¾% exchequer bonds in Feb. 1920 were mostly used up in meeting a budgetary deficit and a large amount of maturing bonds, and in April *1921* a new 3½% conversion loan on terms corresponding to a price of *62* was offered in exchange for the 5-year and 7-year national war bonds, but the loan was a failure.

A further batch of national war bonds were converted into 3½% conversion loan in *1922* on the basis of a price of about 75. Of the j-year national war bonds, maturing Oct. 1924 to Sept. 1925, only £36,000,000 of the original total of £62,000,000 remained outstanding in April 1924. Meanwhile the total of the great 5% war loan had been swollen by conversions from national war bonds to £2,100,000,000, and in 1924 a 4½% security redeemable loan was offered to holders at *97*, the amount thus converted being £148,000,000. In order to deal with the maturities of the 10-year national war bonds and some other maturities. in 1927 a new funded stock, *4%* consols, was issued, and this was followed by a further issue of 3½% conversion stock and an offer of 5% treasury bonds convertible at the holder's option into *4%* consols.

Sinking Fund.—The debt due to World War I made the fixed debt charge under the act of 1875 obsolete. The "old sinking fund" remained in operation, and under the Finance Act of 1920 a surplus of revenue over expenditure could be applied to debt redemption as it accrued. The Finance Act of 1923 repealed the fixed debt charge arrangement and established a ne sinking fund, the saving of interest going in diminution of expenditure; surpluses, however, remained as before applicable to debt redemption.

Taxation.—With a heavy deficit due to the war, the year 1919–20 saw additional duties placed on beer and spirits, though the excess profits duty was reduced from 80% to 40%. In that budget year preferences in revenue duties were also introduced for such products of the British empire as sugar, tobacco and tea. Despite the end of war deficits in 1920–21, duties on beer and spirits were further increased, the super-tax was raised, a new tax on the profits of limited companies was introduced, and the excess profits duty was brought to *60%*.

Steady remissions of taxation followed. Excess profits duty was repealed *(1921);* corporation profits tax was first halved (1923), and then repealed (1924); income tax was reduced from *6s.* to *5s.* (1922), to *4s. 6d.* (1923) and to *4s. (1925);* and the duties on beer (1923), sugar (1924) and tea (1924) were reduced. The McKenna duties were repealed in 1924 but reimposed the next year, and the Safeguarding of Industries act,

1925, imposed a number of protective duties, while customs and excise duties were placed on silk and artificial silk. The year 1925–26 ended with a deficit due to a subsidy granted to the coal mines, and towards making this good the sinking fund was raised from £50,000,000 to £60,000,000 and further taxes imposed, including one on betting. The Finance Act, 1927, merged the super-tax into one tax with the income tax under the name of surtax, having the same basis of assessment. The sinking fund rose to £65,000,000 in 1927–28, and to offset it payment of some duties was hastened and minor increases made in certain taxation. Industrial production was given encouragement in 1928–29 by a considerable remission of local taxes on farmland, farm buildings and livestock, and although a tax was placed on gasoline for the first time the close of the decade following World War I saw Britain's financial position greatly strengthened. Nevertheless, the national debt at this period amounted to a load per capita three times that obtaining in France, the European country next heaviest in debt.

American Debt.—At the armistice in 1918 Britain's war indebtedness to the United States on account of credit for goods purchased in America amounted to $3,800,000,000. Subsequent like credit for $300,000,000 and unpaid interest (spontaneously suspended by the U.S. government in 1919), brought the total war debt due the United States by Great Britain in Jan. 1923 to $4,600,000,000, the loan being in the form of an obligation payable "on demand" and yielding interest at 5%. At this time nearly $8,000,000,000 was due Britain on account of war loans to her allies and dominions, as well as a little over one-fifth of German reparations.

A sum of $100,000,000 on account was paid to the United States by Britain, and in March 1923 Stanley Baldwin, chancellor of the exchequer, visited Washington and negotiated a debt repayment agreement. Under its terms, the suspended interest was reduced to 4½%, and future interest was fixed at 3% for 10 years and thereafter at 33%. The capital was to be paid off by instalments in 62 years, starting at ½% ($23,000,000) and rising gradually so as to keep the annual obligation for interest and principal together approximately fixed at about $161,000,000 for 10 years and $184,000,000 thereafter. Great Britain had the option of paying the debt either in "U.S. gold coin of the present standard of weight and fineness" or in gold bullion or in bonds of the United States; and might postpone the payment of half of any annual instalment at 90 days advance notice and for a period not exceeding two years.

The Young plan of 1929 had fixed a basis for payment of war debts among European nations and reparations by Germany, and in view of the serious international economic situation, on June 20, 1931 President Hoover granted a one-year suspension of war debt payments to America in return for a similar suspension of Germany's reparation payments to European powers; the sums postponed while the moratorium was in effect were to be paid over a period of 10 years, beginning July 1. 1933. The principles of the Hoover moratorium were extended by Great Britain at the same time to India and her dominions. Nations signatory to the Lausanne pact in 1932 agreed to the reduction of reparations by about 90%, but a "gentlemen's agreement" between Germany's principal creditors declared that the pact would be effective only after a satisfactory settlement had been reached between them and their own creditors. In fact, no reparation payments were subsequently forthcoming from Germany, and the United States, which was not represented at Lausanne, denied the request of Great Britain (and France) to review the debt situation.

Britain made her customary half-yearly payment of principal and interest to the United States on Dec. 15, 1932, and in April of the following year Prime Minister Ramsay MacDonald discussed the subject of the debt with President Franklin D. Roosevelt in Washington. No conclusion was reached between them, and on June 15, 1933, Britain made a token payment of $10,000,000 in silver instead of the sum of $75,950,000 then due. The ensuing world economic conference, in London, failed to reach any understanding regarding the American debt. and on Dec. 15, 1933, Britain made a second token payment on account of war

*These amounts were applied in purchasing and paying off debt during the respective years, and under the Finance acts, 1923 and 1924 respectively, did not become Old Sinking Fund, but were deemed to be expenditure within the meaning of the Sinking Fund Act, 1875.

†Under Section 24 (1) of the Finance Act, 1928, this surplus was issued from the exchequer to the Rating Relief Suspense account.

‡Budget estimate as modified by Finance Act, 1928.

§The concession for income tax relief on life insurance premiums made during passage of finance bill was estimated to reduce this by £2 50,000.

‖Budget estimate as modified by Finance (No. 2) Act, 1931.

¶This surplus was used for issues in 1938–39 under the Defence Loans Act, 1937, as prescribed in section 1 (3) of that act.

♀The concession for income tax relief in respect of children over 16 undergoing training made during the passage of the finance bill was estimated to reduce this by £100,000.

indebtedness to the United States, on this occasion of $7,500,000 in U.S. currency. Although congress passed the Johnson act, 1934, prohibiting any government in default to the United States on war debt payments in whole or in part from floating their financial obligations upon the American market, no further payments were made to the United States by Great Britain. As of Dec. 15, 1934, the capital amount of Britain's war debt to the United States was $4,368,000,000. The British government continued at each half-yearly payment date to state that failure to pay did not imply repudiation of its obligations, and that it felt any move for a new settlement should come from the United States. (See INTER-ALLIED DEBTS.)

Finance During 1929–39.—Philip Snowden's budget of 1930–31, first of a Labour government in Great Britain, came at a time when a new economic depression had set in, and in order to secure revenue the standard rate of income tax was increased by 6d. to 4s. 6*d*., the initial rate of surtax rose from 9*d*. to 1s. in the pound, and the rate of duty on estates was raised. The situation worsening in 1931, Britain had two budgets within the year, the first introduced by Philip Snowden and the second by the national cabinet which succeeded the Labour government. The gold standard was abandoned on Sept 21. the income tax was increased to js. and a 50% tax was placed on imported manufactured and semi-manufactured goods. The 1932–33 budget made no provision for payment of the American war debt or for payment to Britain of reparation and war debts due to her, and a substantial saving was effected by conversion of £2,085,000,000 5% internal war loan into a new 3½% loan. Improvement continuing, the income tax fell to 4s. 6d. in 1934, other taxes were reduced, a 3% funding loan of £150,000,000 was over-subscribed, and by September the gold reserve amounted to £192,500,000, the highest figure in the country's history.

By the year 1936 industrial production reached record proportions and made possible flotation of two new loans at rates lower than ever before, one being for £100,000,000 of treasury bonds at 1% and the other for £200,000,000 of 2½% funding bonds. The growing deterioration in international relations caused, however, a steadily growing cost of defense measures, appropriations for the purpose of £124,250,000 in 1935–36 rising three years later to £319,600,000 (and even those estimates did not match the actual expenditure). Part of the expense was met by introduction in 1937 of the National Defense Contribution, a tax of 5% on corporations and of 4% on other businesses.

In 1939–40, the financial year during which war broke out, defense and war expenditure reached the figure of £1,141,000,000. Two budgets were introduced By the first, brought in by Sir John Simon, the rates of surtax were increased and the tobacco duty was raised 1½*d*. an ounce. The cost of government had risen more than fourfold since the eve of World War I, due not alone to the burden of heavy armament programs but also because of the increasing extent to which the country was supporting social services of many types. The table on p. 696 details the amount budgeted annually for revenue and expenditure, and the actual sums received and expended.

The total of governmental expenditure annually shown in the table on p. 696 is broken down into votes and other items in the financial statement for the decade preceding World War II.

Finance in World War II.—When hostilities broke out Britain's debt burden was already double that obtaining in the United States, and because of the necessity for financing the war a severely regimented economy was imposed upon the country. Sir John Simon introduced a second budget in Sept. 1939. It raised the standard rate of income tax from 5*s*. 6d. to 7*s*., and the reduced rate on the first £135 of taxable income was lifted from 1*s*. 8*d*. to 2s. 4*d*. Surtaxes were again raised, while death duties on estates between £10,000 and £50,000 were increased by 10% and on estates over £50,000 by 20%. A further 1*d*. a pint on beer and 1½*d*. an ounce on tobacco was imposed, together with higher duties on wines. An armaments profits duty of 60% on purely armament businesses had been imposed in the first budget of 1939, and this was now replaced by an excess profits tax of 60% applicable to all trades and businesses; the latter was an alternate to the National Defense Contribution, business having to pay whichever tax yielded the greater sum.

In the year 1940–41 there were again two budgets. The first was introduced in April 1940 by Sir John Simon. The standard rate of income tax was increased from 7*s*. to 7s. 6d. in the £. The reduced rate was increased from 2*s*. 4*d*. to 3*s*. 9*d*. but was extended to cover the first £165 of taxable income (instead of the first £135). The duty on beer was again raised 1*d*. a pint, and the duty on tobacco by 3*d*. an ounce. The duty on matches was doubled. Heavy increases were also made in postal rates. The inland letter postage was increased from 1½*d*. to 2½*d*., and post cards were raised from 1*d*. to ad. Increases were also made in telegraph and telephone charges. Finally, the chancellor announced in general terms his intention to impose a purchase tax, At that time Sir John Simon did not propose altering the rate of excess profits tax, but on June 5, 1940, Sir Kingsley Wood (who had succeeded Sir John Simon as chancellor of the exchequer) announced that the rate of excess profits tax would be increased from 60% to 100% as from April 1, 1940.

The end of the year 1940 found Great Britain bearing up under the most crushing tax burden in its history. The second budget in that year was introduced on July 23 by Sir Kingsley Wood. The standard (normal) income tax rate for the year 1940–41 was raised to 8s. 6*d*., though personal allowances (exemptions) for individuals remained unchanged at £100 for a single person, £170 for a married couple and £50 for each child; the first £165 of taxable income was taxed at 5*s*., or 25%. Income tax on wage and salary earners was to be deducted at the source by employers. Besides numerous other new and increased consumer taxes, the maximum rate of death duties was raised to 65% on the largest estates. The purchase tax announced in April was introduced. luxuries paying 33⅓% (a figure later raised to 66⅔%) of the wholesale value, and semi-necessities bearing a tax of 12½%. Food, drink, children's clothing, fuel, light and commodities already taxed were exempt.

The budget for 1941–42 may be considered the first one based on the requirements of total war. It was the largest in the country's history, both on the side of expenditures and on the side of receipts. While the total outlay for the fiscal year far exceeded £5,000,000,000 sterling, the figures submitted in

*Includes broadcasting. †These were pre-war estimates

the budgetary statement did not include the value of supplies expected from the United States. The problem of avoiding an inflation of prices and the cost of living was to be met by eliminating the "inflationary gap"—the excess of total private and governmental expenditures over the total goods and services available for purchase. This emphasis on the inflationary gap, a conceptual innovation of great importance, implicitly recognized that the budget deficit as such was irrelevant for the problem of war finance. The chancellor of the exchequer was more interested, therefore, in offsetting the inflationary gap, which he estimated at about £500,000,000, rather than the budget deficit of £2,420,597,000. Since closing the gap necessitated reduction of total expenditures, and since the government expenditure was necessary for the war effort, it was evident that private expenditure would have to be reduced, otherwise inflation would be inevitable. It was proposed that half the gap be met by increased taxation and half by increased saving on the part of the public.

The new taxes were obtained from increased individual and business levies. Income tax became 50% on incomes over £110 a year in the case of an unmarried worker, and £270 for a married worker with two children, some 2,000,000 taxpayers being affected for the first time. The surtax on incomes over £20,000 continued at 47½%, the figure it had reached in the second budget of 1939; this was in addition. of course, to the 50% income tax, so that in the highest income brackets the total tax was 97½%. The surtaxes were so graded as to constitute an effective ceiling on personal income at about £6.000 after payment of taxes; to retain this amount required a gross income in the neighbourhood of £100,000.

This drastic curb on personal income indicated a trend of thought in democratic states that was paralleled by a system of "forced savings" which John Maynard Keynes, the British economist, had been the first to propose. This latter plan was put into effect by means of three types of postwar credits: (1) All income tax paid as a result of decreased allowances (lowered exemptions) introduced in April 1941 was credited to the taxpayer for refund after the war in the form of an account in the Post Office savings bank, the maximum such refund being £65 a year; (2) all members of the armed forces, as from Jan. 1942, were also credited in Post Office savings accounts with a portion of their daily pay, 6d. for men and 4d. for women; and (3) 20% of all excess profits duty paid at the 100% rate was to be refunded after the war (less income tax), to be used for the purposes of reconstruction. These two measures, income ceiling and compulsory saving, undoubtedly represented the longest step ever taken by a democratic nation toward the redistribution of income by taxation. The growth in the proportion of the national income devoted to taxation is illustrated in the following table:

	1938	1940	1941
	(£ million)		
(1) National income	4,595	5,585	6,338
(2) Direct taxes, War Damage Act contributions and premiums, etc.	534	768	1,215
(3) Indirect taxes, rates, mar risks insurance premiums, etc., *less* subsidies	630	850	1,103
(4) Excess of tax liabilities over payments	30	213	239
(5) Total tax liabilities, *i.e.*, sum of (2)+(3)+(4)	1,194	1,831	2,557
	(Percentages)		
(6) Total tax liabilities as a percentage of national income	26	33	40

In order to help provide the means to pay for purchases in the United States, the treasury compulsorily acquired British holdings of American securities for disposal there, and a further method of financing British orders in America was provided by the United States in 1941 by passage of the Lend-Lease act. In July of that year the Reconstruction Finance corporation also made a loan to Britain of $425,000,000 at 3% for 15 years, the principal being covered by deposit with the Federal Reserve Bank of New York of $500,000,000 of British-owned American securities and $700,000,000 of similar assets producing $30,000,000 to cover interest and amortization. By July 31, 1942, $390,000,000 of the loan had been spent, and $38,928,797 repaid.

By the close of 1941 British war expenditures reached £11,750,000 daily, and the total war expenditure aggregated £8,300,000,000. The government expended £12 5,000,000 in stabilizing prices in the year ended April 1942, subsidies being paid on such agricultural products as beet sugar, wheat, meat, milk and eggs, grants being made in respect of fertilizers, grassland plowing and field drainage, and coal mines also being subsidized. The proportion of resources absorbed by government expenditure in 1941 is shown in the following table:

	1941 (£ million)
(1) Total government expenditure (central and local), exclusive of lend-lease aid, at market prices	5,107
Less	
(2) Government expenditure otherwise than on goods and services	925
(3) Government expenditure on goods and services at market prices	4,182
(4) Personal expenditure on consumption at market prices	4,550
Plus	
(5) Subsidies	139
Less	
(6) Indirect taxes on consumption	826
(7) Adjusted personal expenditure on consumption	3,863
(8) Sum of (3) + (7)	8,045

The figure £8,045,000,000 was not a measure of the national income but was the net national income at market prices plus net disinvestment less the excess of indirect taxes on consumption over subsidies.

BANKING

Beginnings of British Banking.—The origins of banking in Great Britain are obscure. (*See* BANKS, HISTORY OF.) Historical evidence begins after the Restoration of 1660, when, in London, there was a group of goldsmith-bankers conducting deposit banking (then termed "keeping running cash"), discounting commercial bills of exchange and dealing in bullion and foreign coin; the group financed the government of Charles II and therefore was dependent on it for the safety of depositors' money. From the "goldsmith's note" (his receipt for cash entrusted to him) came both the bank note and the cheque, which developed speedily. Private banking thus antedated foundation of the Bank of England by at least 30 years.

Further development of private banking was checked after 1694 by the rise of the Bank of England (*q.v.*), which was given the monopoly of note issue. The industrial changes of the late 18th century and the Napoleonic wars combined to give impetus to provincial banks, which circulated local paper currencies—unlike the private London bankers, who employed only the notes of the Bank of England. The privileges of the Bank of England were first breached in 1826 when (following the crisis of the preceding year) joint stock banking was permitted outside a radius of 65 miles from London. In 1833 joint stock banks were permitted within this radius, but without the right of note issue.

The right given to the Rank of England in 1826 to open branches in the provinces aroused the ire of the country bankers, who were also threatened by the rise of the joint stock banks. Their dispute was terminated by the Bank Act of 1844, which limited the right of note issue, and gradually the subject became overshadowed in importance by the right of access to the money market. The Companies Act of 1862 granted limited liability to banks, and this became the general form of company organization by banks after the failure of the City of Glasgow bank in 1879.

Thus 1880 may be regarded as the date when the specifically modem period of English joint stock banking began. Scots banking history commenced with foundation of the Bank of Scotland in 1695, and continued with establishment of the Royal Bank of Scotland in 1727 and the British Linen bank in 1746. Although small local joint stock banks and private partnerships survived for a period, Scotland appreciated earlier than did England the advantages of branch banking having a small note issue and large scale joint stock management. After the crisis of 1825 the £1 note was withdrawn in England and Wales but retained in Scotland, and the Bank Act of 184; made it almost impossible for new joint stock banks to be set up in Scotiand at aii. Though the Scots banks gradually came within the sphere of London, Scots banking continued to be governed by a law and a tradition of its own.

Amalgamation of British Banks.—The fusion of banking establishments became general because of the compensation of risks which operations over a wide area permitted; the necessity of attracting deposits by a wide network of branches; the desire to facilitate the convenience of customers by as wide an extension of services as was possible; and the fact that a large bank required a smaller proportionate cash reserve than did a small bank. By 1914 the number of joint stock banks had fallen to 38, their branches had risen to 5.869, their capitals and reserves amounted to £82,000,000 and their deposits stood at £896,000,000. During 1918–19 each of the five leading banks absorbed a member of the group immediately below them in strength: Barclays absorbing the London Provincial and South Western; the Westminster taking over Parr's; Lloyds, the Capital and Counties; the Midland, the London Joint Stock bank; and the National Provincial, the Union of London and Smiths bank. At the same time, the Bank of Liverpool began to form a new and powerful sixth group, by taking over a London clearing bank (Martins), the Halifax Commercial bank, the Palatine Bank and Cocks, Biddulph & Co., adding to its power in 1927 by absorbing the Lancashire and Yorkshire bank.

British banking institutions also moved into Scotland, the Midland bank taking over the Clydesdale bank and the North of Scotland bank; Barclays controlling the British Linen bank; Lloyds controlling the National Bank of Scotland; and the Royal Bank of Scotland being fused with Deacon's bank. The Midland also took over the Belfast Banking Co. Barclays extended its interests overseas through Barclays (Dominion, Colonial and Overseas) bank, Lloyds was represented in India and South America and the Westminster in Ireland and on the continent, while Lloyds and the National Provincial jointly owned a European subsidiary.

Changes After World War I.—The emergency treasury note issue introduced during the course of hostilities was amalgamated in 1928 with the note issue of the Bank of England. At this period gold was leaving the country in steadily mounting volume, and to check it the bank rate was raised by successive steps until, in Sept. 1929, it reached 6470, the highest figure in eight years. With the collapse of the great speculative boom in the United States, bank credit in Britain became easy in 1930, but within two years the banking institutions were in a bleak period. their net profits decreasing because of the unusually low yield from treasury bills, short-term government securities and discounted bills. In order to control exchange and prevent undue fluctuation, the Finance Act of 1932 established an Exchange Equalization account of £150,000,000 (later increased to £350,000,000), and shortly the bank rate fell to 2%. the lowest figure for 35 years.

After 1932 the policy of the government, carried out by the Rank of England, was to make credit cheap and plentiful. Since the gold reserves of the bank greatly increased. this expansion of credit could be carried out without any need for heavy purchases of securities by the bank. Although the Exchange Equalization account held part of the nation's gold reserve, the account was operated under the general direction of the government by the Bank of England, custodian of the entire gold reserve of the country. At this period other functions of the Bank of England included: (a) The sole right of note issue in England and Wales (as had been the case for nearly 250 years); its notes were legal tender and not convertible into gold. (b) It was the government's banker and adviser upon monetary matters, and it was also responsible for administration of the national debt. (c) As the "bankers' bank" it held part of the cash reserves of the joint stock and other commercial banks. (d) It was the controller of the supply and cost of credit, and by fixing the bank rate it roughly determined the general level of short-term interest rates; by buying or selling securities it could expand or contract commercial bank cash and the general supply of credit; and, as the lender of last resort, it could always lend to approved borrowers, at its own price, when other sources of credit failed. (e) Besides being an unofficial but effective link between the government and the City financial centre, it was in contact with foreign central banks and the Bank for International Settlements.

The gold reserve of the Bank of England totalled £192,500,000 in Sept. 1934, the highest figure in its history, and three years later the note circulation reached the then record amount of more than £500,000,000. The Exchange Equalization account sustained heavy gold losses in 1938, with the result that in the first week of the next year it had to take over £200,000,000 of the gold of the Bank of England. Since this reduced the bank's gold from £326,000,000 to £126,000,000, the fiduciary issue of notes was raised from £230,000,000 to £400,000,000 in order to prevent a corresponding contraction in the total note issue. The Currency and Bank Notes Act of March 1939, abolished the old statutory valuation of 84*s*. 11*d*. per fine ounce of gold and empowered the bank and the treasury to value the bank's gold at a price approximately the London market gold price of the day; when this change took place on March 1 the bank's gold was written up to 148s. 5*d*. per ounce, and its total value from £126,000,000 to £226,000,000; this last increase permitted the fiduciary note issue to be fixed at £300,000,000, but the old power of varying the fiduciary issue by administrative action was retained.

Banking in World War II.—The banks underwent great strain in facilitating the functioning of defense industries after outbreak of war. They also assisted the treasury in mobilizing foreign balances and American securities in the hands of British investors, turning them over to the Bank of England against payment in the sterling equivalent. Since it was necessary to concentrate all gold reserves in the Exchange Equalization account, legislation was quickly passed to give effect to the change, and thereafter the Bank of England held only a nominal amount of gold to obviate a reduction in the note issue; the fiduciary issue was raised from £300,000,000 to £580,000,000.

The war naturally brought several other changes in the banking situation. On Aug. 24, 1939, the bank rate was raised from 2% to 470, the change, the first since 1932, being a precautionary measure designed to check war speculation and to force financial institutions to put their affairs in order. All foreign exchange transactions were also brought under governmental control, the administrative side of the work being entrusted to the Bank of England. In order to restore a regime of cheap and plentiful money, both to promote confidence and to keep down the cost of governmental borrowing, the bank rate was reduced to 3% on Sept. 27 and once more to 2% on Oct. 25, 1939.

The 44% conversion loan was turned into 2% 3–5 year bonds in Feb. 1940, and $2\frac{1}{2}$% national war bonds were issued after the fall of France in the summer of that year. Foreign exchange control was strengthened, and a system of special accounts was set up through agreements with foreign countries and also with some leading American banks. Since payments for exports and im-

ports, and other international transactions, passed almost entirely through these accounts, virtually all exchange transactions went through the authorities at the official rate of exchange, very few reaching the New York free market in sterling; the latter, therefore, was practically killed, the government securing complete control over all foreign exchange resources.

Although most of the excess of war expenditure over government revenue was covered by new loans, the deficiency in 1941 added another £984,000,000 to the floating debt, which thus reached a new high record of £3,610,770,000; most of it was borrowed from banks in the form of treasury deposit receipts, which came to supersede treasury bills. With markets for new capital closed and investment overseas prohibited, for the first time on record investments of the banks exceeded their total of loans. The burden on British banking due to the war effort was considerably lessened by increased government financing of war production in 1941 and by the operation of the Lend-Lease act of the United States. After reaching a new high level in the first few months of the war, the volume of bank loans tended to decrease, the comparative figures being £1,015,000,000 sterling in Dec. 1939, and £839,000,000 sterling in Sept. 1941. On the other hand, security holdings, chiefly government bonds, rose sharply, and total deposits reached a new high level of £3,115,000,000. This was accompanied by an increase in the price level, but the operation of the extensive economic control measures adopted by the government tended to reduce the acceleration of price increases occasioned by war conditions.

The note circulation grew notably in 1941, to £780,000,000 as compared with £630,000,000 the preceding year; the chief cause of the rise was the growing war industrial activity, which was reflected in a record volume of employment and a consequent growth in pay rolls. This growth in the note circulation necessitated two increases in the fiduciary issue during the year, on April 30 and Aug. 30, effected by a transfer of securities from the banking to the issue department of the Bank of England. Two new issues of 2½% national war bonds were made in 1941, the first maturing in 1946–48 and the second in 1949–51; there was also an issue of 3% savings bonds, 1955–65.

ECONOMICS AND TRADE

What has been attempted in the ensuing sections is to present an account, largely statistical, of the economic condition of Great Britain between 1918 and 1939. Since then the war has profoundly changed British economic organization, but figures comparable to those cited, which would reflect the extent of these changes, have not in most cases been released by the government. Wherever possible, however, the more significant wartime developments have been indicated.

SECTION 1: POWER RESOURCES

Coal.—Coal is by far the most important source of power in the British Isles. The amount of coal reserves has been variously estimated at different dates, but it is probable that there are between 150,000 and 200,000 million tons still to be mined. At present rates of consumption (1943) the coal now known to exist should last for between four and five centuries. If, however, account was taken of probable and possible reserves, there should be enough coal to last seven centuries, and there would be a further extension if means were found of using the small coal now so largely wasted For a discussion of this important matter *see* COAL AND COAL MINING.

There is no definite evidence of the use of coal in Great Britain till between A.D. 1230 and 1240, when Northumbrian grants are extant of the right to take "sea-coal," probably coal eroded and washed up on the shore. Outcrop mining seems to have begun in the northern coal field at the end of the century. In the 14th century elementary shafts began to be sunk, and from the 16th century onwards fairly considerable quantities of coal for domestic uses were being brought to London from the northern pits by sea. But by modern standards production was still small; in 1800 it was about 10,000,000 tons a year, and it was not until the development of the steam engine that coal mining rose to its full importance.

The coal fields of England are generally arranged in three groups, the *Southern, Midland* and *Northern,* comprising *Southern,* the South Wales, Forest of Dean, Somersetshire and Gloucestershire and Kentish fields; *Midland,* comprising the Yorkshire, Nottinghamshire, Lancashire, North Wales, Staffordshire, Leicestershire, Warwickshire and some smaller fields; *Nortlzern,* comprising the fields of Northumberland, Durham, Cumberland and Scotland.

The following tables from the *Annual Reports* of the secretary for mines, show the output of coal in Great Britain and its distribution for the years 1913, 1924 and 1938:

Tonnage of Coal Produced, Shipped Abroad, and Available for Consumption in Great Britain in the Years 1913, 1924 and 1938

A. General distribution of the coal available

	Million tons		
	1913	1924	1938
Output of coal in Great Britain	287·35	267·12	227·02
Quantity shipped abroad.			
Exports of coal	73·40	61·65	35.86
" " coke	1·24	2·81	1·99
" " manufactured fuel	2·05	1·07	0·34
Coal shipped for the use of steamers engaged in the foreign trade	21·03	17·69	10·49
Total quantity of coal shipped abroad	98.34	84.87	49.63
Coal, and the coal equivalent of coke and manufactured fuel imported and retained	0·02	0·01	0·01
Quantity of coal available for home consumption for all purposes	183·85	180·36	175·14

B. Consumption of coal in Great Britain

	Million tons		
	1913	1924	1938
1. Gas works	16·7	16·66	18·20
2. Electricity generating stations belonging to authorized undertakings and to railway and tramway authorities	4·9	7·70	14·93
3. Railway companies (for locomotive use)	13·2	13·51	12·52
4. Vessels engaged in the coastwise trade (bunkers)	1·9	1·27	1·15
5. Iron works (pig iron)	21·2	14·23	11·56
6. Steel and iron works (other than pig iron)	10·2	10·34	7·18
7. Collieries (engine fuel)	18·0	16·57	11·86
8. Domestic coal, including miners' coal (approximate)	40·0	100·08	97.74
9. General manufactures and all other purposes	57·7		
Total	183·8	180·36	175·14

Water Power.—Any accurate estimate of the potential water power resources of Great Britain is impossible, no data being available. The most important potential sources of water power are in the highlands of Scotland, North Wales and Cumberland, but throughout the industrial era the rivers, notably those of Lancashire, Yorkshire and North Derbyshire, have been used for industrial power purposes. As the output of coal developed and the scale of manufacture increased, many of the early water power installations fell into disuse, but of recent years, owing no doubt to the improvement of steam turbines and electrical appliances, the use of these rivers has tended to revive. On the other hand, British rivers can never be used as sources of electric power to an extent comparable with those of the Scandinavian countries or Italy; similarly, vast water power projects such as those of the United States are impracticable in Great Britain,

The only exhaustive study of the water power resources of the country was made by the water power resources committee, appointed by the board of trade, whose report was published in

1921. In their report this committee, after considering the various schemes submitted to it, came to the conclusion that those which were economically possible could not at most generate more than 40% of the electricity then generated by public and transport authorities. In view of the discouraging nature of this report there has been only a limited extension of the use of water power for the generation of electricity. In 1938 the capacity of water power plant under the control of the Electricity commission was less than 4% of the total capacity of Great Britain.

Fuel Oil.—The production of petroleum in Great Britain has hitherto been negligible, though there is no doubt that supplies do exist, and that these, though small, could probably in some instances be worked remuneratively.

Prior to 1918 very little working had taken place, but in that year the government commenced to carry out extensive investigations. Petroleum has been found to exist in Derbyshire, Nottinghamshire, North Staffordshire, Yorkshire (near Rotherham), Cumberland, Lancashire, Shropshire and certain parts of Scotland. Many of these discoveries, however, were merely small seepages noted in the working of coiiieries, and none had hitherto proved of commercial importance.

Oil shale exists in large quantities in Dorsetshire, Somersetshire, Norfolk, Lincolnshire, Yorkshire, Midlothian, Linlithgowshire and Lanarkshire. The most important fields in England are at Kimmeridge and Corton in Dorsetshire, the former covering 2,900 ac. and the latter 1,500 ac., the total estimated shale tonnage being 23,000,000 and 32,000,000 respectively and the estimated total quantity of oil (imperial gallons) 455,000,000 and 442,000,000. Only the Scottish deposits have, however, so far been successfully worked, the Scottish industry having been active since 1850. The Scottish Geological Survey has estimated the reserves of shale in that country as follows:

	Tons
Midlothian ..	163,500,000
Linlithgowshire	416,540,000
Lanarkshire ..	16,630 000

BIBLIOGRAPHY.—The *Annual Reports* of the Secretary for Mines; the ***Final Report*** of the Water Power Resources Committee (1921).

SECTION 2: MINERALS AND MINING

Coal Output.—Great Britain's industrial supremacy during the 18th and 19th centuries was founded on her magnificent coal mines. The output of coal in Great Britain and Ireland and the number of persons employed at the mines since 1873. are given in the following tables compiled from the ***Annual*** Reports of the secretary for mines.

Average for decennial period, or year	Tons of coal	Persons employed
1873–1882	138,086,800	503,428
1883–1892	169,921,705	571,719
1893–1902	203,322,846	732,391
1903–1912	253,983,464	957,848
1913–1922	241,109,385	1,091,391
1923–1932	233,125,846	1,021,692
1933	207,112,243	797,294
1934	220,726,298	797,699
1935	222,248,822	779,502
1936	228,448,356	777,874
1937	240,409,436	803,359
1938	227,015,308	802,443

The table at the top of the next column, from the same reports, gives the number of persons employed in the various counties, and shows the geographical distribution of the industry.

The figures for 1913–22 and for the years after 1922 show that the position of the industry has undergone a serious change. Since the early 1920s the coal industry has, in fact, been one of the sore spots of the British economic system. It had reached its peak of prosperity in the years preceding 1914; during World War I it was under government control, and in the years immediately following the course of international events prevented it from seriously feeling the direct effects of the postwar slump until 1924.

Average ***Number of*** *Persons Employed in Coal* ***Mining*** *in the* ***Principal Districts*** *in Great* ***Britain,*** *1924* ***and*** *1938*

Principal districts	1924	1938
England and Wales		
Northumberland.	64,997	45,640
Durham	174,756	115,520
Yorkshire	195,326	144,654
Lancashire, Cheshire and North Wales	124,675	68,036
Derbyshire, Nottinghamshire and Leicestershire	138,035	101,105
Staffordshire, Shropshire, Worcestershire and Warwickshire	95,029	67,905
South Wales and Monmouth	250,065	135,970
Cumberland, Westmorland, Forest of Dean, Kent and Somersetshire	29,056	22,056
Total, England and Wales	1,071,919	700,886
Scotland	141,805	90,002
Total, Great Britain	1,213,724	790,888

Until 1921 wages and hours of labour in the industry were governed by regulations which had been put into force during the war, but in 1921, after a three-months' stoppage, the miners secured a minimum wage, increases in pay, and the prospect of shorter hours. This agreement was made possible by a government subsidy of £10,000,000 to the mineowners. The agreement lasted till April 1924, and when a further stoppage became imminent, the government granted further subsidies and appointed a royal commission under Sir Herbert Samuel to survey the position. The report of the Samuel commission did not prove acceptable to either side, and the miners ceased work on May 1, 1926. They did not return until the following November, by which time the resources of the unions were completely exhausted. The miners were forced to accept an increase of hours, and wages were to be settled by district agreements.

Meanwhile the position of the industry, both in relation to world trade and the national economy, was becoming clearer. Before 1914 the margin of profit depended largely on the capacity of the industry to export, which in turn depended on the facts that nearly all the important British coal fields were within 25 miles of the sea and that the output per man-shift was higher in Britain than in any other European coal fields except those of Upper Silesia. After 1918 the European countries began again to compete with British coal mines for the export market, and at the same time considerable advances in methods of production were being made abroad while scarcely any improvements were being made in Great Britain. In 1913 the output per man-shift in Great Britain was 21.5 cwt., and in 1930 it was 21.6, but during the same period it had improved from 18.6 to 26.6 in the Ruhr, from 23.6 to 28.6 in Silesia and from 16.2 to 24.5 in Holland. The stoppage of 1926 also compelled foreign buyers to obtain coal elsewhere, and some of the markets then lost were subsequently never fully regained. The following table shows the decline of British coal exports to the principal European markets:

Coal Exports *(Thousands* ***of*** *tons)*

Destination	1913	1927	1930	1935	1938	1939
U.S.S.R.	5,998	19	39	—	—	—
Sweden	4,563	2,182	1,767	2,527	2,655	3,747
Norway	2,298	1,574	1,202	1,311	1,366	1,848
Denmark	3,034		1,921	3,175	2,997	3,594
Germany	8,952	4,241	4,926	2,900	3,687	2,826
Netherlands	2,018	2,314	2,860	1,503	889	1,525
Belgium	2,031	2,232	3,445	631	658	757
France	12,776	9,262	12,969	7,130	6,155	5,711
Italy	9,647	6,792	7,167	3,189	2,260	2,771
Spain	2,534	2,361	1,712	1,234	—	
Portugal	1,202	—	1,136	1,039	714	771

The Samuel commission was fully alive to the disadvantages under which the British coal industry laboured owing to its methods of production and its lack of proper organization, and its recommendations with respect to reorganization in large measure

determined the course of parliamentary legislation since then. The Mining Industry act of 1926 was passed to facilitate amalgamation of mines so that they could be worked on a more economicalbasis. The Coal Mines act of 1930 attempted to proceed further with the process of reorganization into larger and more efficient units and to introduce a greater degree of compulsion. In addition, executive boards were set up to determine quotas of production for each coal-mining district, and provisions were made for the sale and transfer of quotas within each district. This act was only partially successful in overcoming the opposition of the owners to amalgamation but the provisions concerning quotas succeeded in maintaining price levels and were extended until 1938, when the coal industry again received the attention of parliament. The Coal act of that year provided for the vesting of all the unworked coal in Great Britain in a Coal commission, which was empowered to acquire it from the owners for a sum which had been set by a special tribunal at £66,450,000, and to administer the leases held by the mining companies. At the same time the commission received far wider powers than had previously been granted to enforce reorganization and amalgamation. On July 1, 1942, the date set by the act, the commission took over its rights in unmined coal, but its plans for organization were suspended in 1939 by the outbreak of war.

In spite of every effort, the British coal industry was never able to recover the position it held before 1914. After 1926 there was some measure of reorganization and some improvement in methods of production, but in certain districts it proved impossible to resuscitate the declining industry. The falling off in coal exports was one of the principal reasons for the unrelieved industrial depression which afflicted the "special areas" of South Wales, Durham and Cumberland until 1939.

After the outbreak of war in Sept. 1939 it became necessary to increase coal production to keep pace with increasing war production. Though numbers of miners were brought back to the mines from unemployment or from other occupations, at the same time many others were called up for military service. Shortages of coal were barely averted in the winters of 1940–41 and 1941–42. It was necessary during 1941 to bring 33,000 men back to the mines from other industries and in 1942 over 11,000 men were brought back from the armed forces. It became clear that these measures were inadequate to avert further possibilities of shortage and the most important step in the reorganization of the coal industry was taken on June 11, 1942 (three weeks before the Coal commission took over the royalties), when the house of commons approved the White Paper on Coal (Cmd. 6364), in which it was stated that:

In order to ensure that all practicable means of increasing output are adopted without delay and pressed vigorously, private interests being subordinated to the over-riding needs of increased production, the government have decided to assume full control over the operation of the mines, and to organize the industry on the basis of national service, with the intention that the organization now to be established will continue pending a final decision by parliament on the future of the industry.

Other Minerals.—The following table from the eighteenth Annual *Report* of the secretary for mines gives the British output of some of the principal minerals since 1913:

Year	*Tons*	*Year*	*Tons*
1913	7,442,249	1936	5,960,968
1919	5,200,696	1937	7,138,760
1924	5,017,303	1938	5,164,149
1935	4,547,426	1939	5,308,416

Iron Ore.—Iron ore is very much the most important of these minerals, and it will be seen that production declined considerably during the decade 1923–32, though it recovered again in 1934. The quantity of imports is considerable:

The great bulk of British iron ore is produced in England, the most productive counties being Yorkshire, Lincolnshire, Northamptonshire, Cumberland and Staffordshire. The richest ores come from Cumberland, Lancashire and Staffordshire.

Tin Ore.—Tin ore is obtained almost exclusively from Cornwall. The fall in production (to 2,050 tons in 1935) was accompanied by an increase in retained imports, as follows:

Year	*Tons*	*Year*	*Tons*
1913	34,592	1936	51,954
1919	35,737	1937	50,935
1924	59,308	1938	55,492
1935	45,217	1939	54,044

The capture of Malaya by the Japanese early in 1942 and the consequent cutting off of the principal source of imports inevitably led to increased home production of tin.

Lead.—The British output of lead declined between 1919 and 1925, and there was a consequent increase of imports. After 1926 production increased and the imports of ore fell off. The most productive counties are Flint, Durham and Derbyshire. The ore found in the Isle of Man contains a considerable proportion of silver. Imports were as follows:

Year	*Tons*	*Year*	*Tons*
1913	18,453	1936	62
1919	4,435	1937	566
1924	8,015	1938	191
1935	74	1939	1,230

The above figures for lead ore do not, however, give an accurate account of the British consumption of lead, since for the same years the total imports of pig lead were:

Year	*Tons*	*Year*	*Tons*
1913	204,136*	1936	355,124
1919	217,610*	1937	372,868
1924	235,673	1938	407,173
1935	316,485	1939	339,513

*Includes sheets.

Copper.—Copper is found mostly in Cornwall. At one time the United Kingdom supplied almost three-quarters of the copper of the world. Since 1932, however, copper-mining in Great Britain has been abandoned, and the United States is now (1943) by far the principal producer.

The copper imports into Great Britain (for home consumption) have been:

Year	*Tons*	*Year*	*Tons*
1913	133,375	1936	31,209
1919	30,914	1937	30
1924	39,174	1938	57
1935	31,351	1939	1,893

For the same years imports of unwrought copper (blocks, ingots, etc.) were:

Year	*Tons*	*Year*	*Tons*
1913	104,678	1936	287,572
1919	109,319	1937	390,683
1924	130,729	1938	354,665
1935	301,562	1939	326,344

Zinc.—Zinc occurs mainly in North Wales, the north of England, the Isle of Man and the county of Dumfries. The falling off in production between 1920 and 1936 was mainly due to the closing down of mines in Cumberland, which were capable of producing over 7,000 tons of ore yearly. The import figures are:

Year	*Tons*	*Year*	*Tons*
1913	64,670	1936	129,449
1919	78,552	1937	151,238
1924	61,428	1938	157,319
1935	152,031	1939	177,502

For the same years imports of crude zinc were:

Year	Tons	Year	Tons
1913	45,004	1936	170,839
1919	94,226	1937	176,673
1924	124,035	1938	165,049
1935	147,947	1939	167,300

China Clay (Kaolin).—This mineral is of great importance in the ceramic, papermaking, bleaching and chemical industries. The whole British supply is derived from Cornwall. The following figures give the production since 1913:

Decennial average or year	Tons	Decennial average or year	Tons
1913–1922	809,794	1935	940,579
1923–1932	992,819	1936	1,026,863
1933	776,621	1937	1,116,826
1934	890,680	1938	854,724

Imports are negligible in quantity.

Fluorspar.—This mineral is of considerable importance in the manufacture of steei and other branches of metallurgy. The British production Erst became substantial at the beginning of the 20th century. Since 1913 the quantities produced have been as follows:

Decennial average or year	Tons	Decennial average or year	Tons
1913–1922	44,173	1935	31,146
1923–1932	36,697	1936	32,962
1933	28,058	1937	42,160
1934	34,216	1938	33,331

BIBLIOGRAPHY.—*Annual Reports* of the Secretary for Mines; *Annual Statements of the Trade and Navigation of the U.K.*, issued by the Board of Trade; Political and Economic Planning, *Coal Planning* (Report no. 127) and *The British Coal Industry*, 1936. (R. C. BD.)

SECTION 3: INDUSTRIES

Industrial Development.— The change from peasant to industrial civilization in Great Britain is thus described by J. L. and Barbara Hammond in *The Rise of Modern Industry* (1925):

The wants of the ordinary man were supplied in the early middle ages, as in the days of Greece and Rome, either by himself and his family, or by his neighbours; in the next stage these wants were supplied by special persons plying a craft, in a village or small town, organised sometimes in guilds; in the third stage the provision of those needs became the business of individual or group production and large scale merchanting; in the fourth it became the business of large scale production. At that point the world passes to the industrial age; to an age in which commerce and finance are no longer aspects, growing in importance, yet still aspects of its life, but the basis on which a society depends.

Though England was comparatively late in becoming a great commercial power she was the first to develop the industrial system. Before the discovery of America and of the Cape route to the east trade centred in the Mediterranean and the Mediterranean nations were the chief European traders. The opening of the Atlantic routes transferred commercial supremacy to the nations possessing coast lines facing them. First came the monopoly of Spain, broken by the defeat of the Armada in 1588; from that time till 1660 the Dutch led, their chief rivals being Britain and France. From 1660 till the end of the 18th century the two latter countries fought for commercial supremacy which then passed to Britain. It was the development of large scale commerce in Britain that made possible the development of her industrial system, since without wide markets the capital required for the development of machine production would not have been forthcoming. All through the 17th and 18th centuries England was developing her overseas trade, and her home market side by side.

The 18th century was marked by a long period of stable government at home. The development of the road system in the 17th century, and of the canals in the 18th made the home market easy of access, while the establishment of a colonial empire stimulated overseas trade.

These were favourable conditions for industrial development, and this was helped forward by the Protestant refugees from Antwerp at the end of the 16th century, the Huguenot refugees after the revocation of the Edict of Nantes and by the Dutch immigrants who followed William III. By these were laid the foundations of British cotton, silk and other industries.

More important still was the existence of great coal supplies. which were made mobile by the development of the canal system. It was British coal that made possiblr the creation of a large iron and steel industry, and the development of machine production and of the steam engine. But this development could not have been brought about without the existence of enterprise and imagination of a high order, and the 18th century was the period which saw the birth of those inventions which made the industrial system a possibility. James Watt's first patent was taken out in 1769 and by the end of the century the steam engine was in use in mines, foundries, cotton mills, etc. The iron industry, dependent during the 17th and early 18th centuries on charcoal, began to languish with the gradual exhaustion of British forests. Coal began to be used effectively in blast furnaces as early as 1709. The use of coal in forges was made effective about 178j, thus altering the whole aspect of the iron industry, and the introduction of the steam engine was rhe finishing touch. The output of pig iron rose from 25,000 tons in 1720 to 68,000 tons in 1788; to 253,000 tons in 1806; and to 1,347,000 in 1839

The cotton industry had a similar story. In spite of the exceptionally favourable climatic conditions in Lancashire, the English industry only consumed about 2,000,000 lb. of raw cotton annually during the early part of the 18th century. The invention of the flying shuttle for weaving in 1733 and of the spinning "jenny" less than 30 years later revolutionized the industry. Until 1785, however, the mills had to depend on water power. That year marked the introduction of the steam engine and the creation of the great cotton industry, which was to become the greatest exporting industry of the country, sending no less than 80% of its huge annual production overseas. In 1833 this industry, which 100 years before had used little more than 2,000,000 lb. of raw cotton annually, was importing no less than 300,000,000 lb.

"From the 12th to the 19th centuries the woollen industry was the premier English industry, and as such was largely responsible for the growth of the country's wealth and so for the accumulation of capital which has rendered possible the development of the homeland and the empire" (Stamp and Beaver, *The British Isles*, p. 442). Originally the greater part of the wool produced in the country was shipped abroad for manufacture, but weaving gradually increased in importance and by the end of the 15th century "England was largely a nation of sheep-farmers and clothmakers." During the 16th and 17th centuries there were various periods, especially in the first half of the 17th century. when the industry suffered severely from foreign competition. but eventually the English cloth trade surpassed that of Flanders, and by the end of the 17th century woollen manufactures made up two-thirds of England's export trade. Workshops were scattered all over the country wherever the conditions of wool supply and running water for power purposes made the locality convenient. To this day the industry is very much more scattered than the cotton industry, although the great majority of it is now centred in the West Riding of Yorkshire whither it migrated when use of coal for power purposes began to develop.

Subject to the above differences, the woollen industry followed very much the same course as cotton.

The story of these great industries was repeated in others and it may be said that before the introduction of railway transport during the second quarter of the 19th century factory production was established in every important branch of industry. The establishment of the railways was the crowning achievement, enormously facilitating as it did the mobility of the working population, the supply of raw material and distribution of the finished commodities. With it the industrial system reached its characteristic form. The only further fundamental change was the introduction of the use of electrical power in the 1880s.

As to the general development of British industry, the first three-quarters of the 19th century saw a very rapid increase of production and export. From the middle of the century onwards,

however, the rate of increase in exports of manufactured goods began to fall, while the rate of increase of imports was accelerated. This tendency was a marked feature of the period after 1919.

1919 to 1939.—The immediate effect of the cessation of hostilities at the end of 1918 was to create a boom in industry and trade which lasted for a little over 18 months. By the end of 1920 there were clear signs of depression, which reached its peak in the winter of 1921–22. This depression was partly due to currency disturbances abroad, but it was felt most in industries in which foreign competition was severest: coal mining, iron and steel, shipbuilding and cotton. Though 1924 saw a general return to prosperity, the industries just mentioned failed to recover from the depression; unemployment was rife in them, and it gradually became clear that England was becoming divided into two economic units, the prosperous south and the depressed north (with which must be included South Wales), where most of the industries alluded to were concentrated.

Elsewhere, however, the period 1924–29 was one of prosperity; employment remained steady and foreign currencies had been stabilized New industries sprang up, and some, such as the manufacture of motor cars and electrical goods, made unprecedented progress.

Late in 1929 financial crisis in the United States was the forerunner of a world depression in trade and industry of exceptional severity. Unemployment rose alarmingly, and recovery was unusually slow, since it was not marked until 1937. As in 1924 the newer industries recovered first, and those which were already suffering most continued depressed. Recovery was aided by the abandonment of the gold standard, and the government hoped to stimulate it by the adoption of protective tariffs. The attempt made at the Ottawa conference to weld the empire into an economic unit was not so successful.

It seemed in 1938 that another period of depression was approaching, but the development of rearmament produced an improvement in the coal mining, steel and shipbuilding trades.

There is little doubt that British industry was ill-fitted to meet the difficulties with which it was faced between 1918 and 1938. It was only gradually realized that a return to trade conditions as they were in 1913 would never come, and that the productive capacity of certain industries was greatly in excess of the demand. Equipment was out-of-date and capital for modernization difficult to obtain; organization and marketing badly needed overhauling. Only the newer industries, like the motor-car industry, were able to follow the example of the United States and develop mass-production. It took many bitter years to convince owners and employers in the depressed industries that the closing down of uneconomical works, amalgamation and reorganization offered them their only hope of salvation.

This, however, is not the whole picture, in spite of the fact that problems of industry and unemployment were urgent throughout the period. London and southern England, on the whole, grew and prospered, largely at the expense of the depressed areas, and in certain fields of international trade Great Britain more than held her own.

Some idea of the progress of the principal industries during the 20th centurv can be formed from the various censuses of production. Before 1907 no such census had been undertaken; another was begun in 1912, but not completed owing to World War I. Thereafter they were made in 1924, 1930 and 1935. In comparing the figures for these years some allo ance must be made for variations in the purchasing power of money; for instance, 1907 figures should be increased by about 50% for accurate comparison with 1924.

Public Utilities and Power.—In 1938 the amount of coal used in gas works and for the generation of electricity by public undertakings was 33,130,000 tons, or 28.2% of the total home consumption. Of this 18,200,000 tons were used for gas and 14,930,000 tons for electricity. The figures for electricity, it should be stated, cover only transport companies and local authorities and companies supplying power, but not industrial concerns generating their own power.

Domestic consumption accounts for about 65% of the total production of gas and about 25% of the electricity generated by companies and local authorities.

Gas.—The products of the gas industry for 1907, 1924, 1930 and 1935 are shown in the following table:

Products	1907	1924	1930	1935
Gas made	*Millions of cubic ft.*	*Millions of cubic ft.*	*Millions of cubic ft.*	*Millions of cubic ft.*
By local authorities	125,760	176,955	193,249	191,537
Total	70,527	96,496	109,058	111,863
	196,287	273,451	302,307	303,400
	Tons	*Tons*	*Tons*	*Tons*
Coke & breeze (totals)	7,584,000	7,981,000	8,000,000	7,640,000
Tar	654,000	667,000	859,000	951,000
	Th. gal.	*Th. gal.*	*Th. gal.*	*Th. gal.*
	—	24,348	17,167	22,967
	Tons	*Tons*	*Tons*	*Tons*
Pitch	85,000	121,000	91,000	108,000
Sulphate of ammonia	105,000	128,000	105,100	75,000
	Th. gal.	*Th. gal.*	*Th. gal.*	*Th. gal.*
Benzol	46	1,903	4,718	17,509
Saphtha	347	570	569	901
Tar oil, creosote oil, etc.	8,519	21,312	16,182	17,746
Av. no. employed	83,440	106,282	113,838	118,671

The industry is about equally divided between companies and local authorities and very little change has occurred in this respect during the period.

Generation of Electricity.—Electricity is generated in Great Britain by three main types of undertakings:

1. Statutory undertakings generating for public utility purposes.
2. Undertakings generating for use wholly or mainly in connection with railways and tramways.
3. Power equipment maintained by industrial services.

The following table shows the amount of electricity generated in 1935 by undertakings in classes 1 and 2. The figures for the London Passenger Transport board have been included with local authorities Quantities are in millions of board of trade units (kilowatt-houts).

Electricity generated	Public supply undertakings		Transport undertakings		Total
	Companies	Local authorities	Companies	Local authorities	
	Mill. B.T.U. (Kw. hr.)	Mill. B.T.U. (Kw. hr.)	Mill. B.T.U. (Kw. hr.)	Mill. B.T.U. (Kw. hr.)	Mill. B.T.U. (Kw. hr.)
Under direction of Central Electricity board	6,438	8,872	3	—	15,313
Independently by undertakers	1,645	963	354	894	3,856
Total	8,083	9,835	357	894	19,169

The next tables give particulars for 1930 and 1935 of electricity supplied and work done for which a direct charge was made:

1930		Companies	Local authorities	Total
Lighting, heating, cooking	Mill. B.T.U.	1,489·8	3,874·5	5,364.3
	£'000	14,587	29.952	42,539
Power	Mill. B.T.U.	3,170·3	5,004·8	8,175·1
	£'000	8,654	13,937	22,591
Public lighting	Mill. B.T.U.	41·4	210·4	251·8
	£'000	295	982	1,277
Traction	Mill. B.T.U.	714·8	1,286·7	2,001·5
	£'000	1,405	3,168	4,573
Total supplies to consumers	Mill. H.T.U.	5,416·3	10,376·4	15,792·7
	£'000	24,941	46,039	70,980

Imports of Iron and Steel and Manufactures Thereof
(In tons)

Product	1913	1924	1938
Pig iron	184,774	287,221	395,151
Ferro-alloys	31,934	20,443	47,606
Blooms, billets and slabs			
Iron	513,988	707,257	150
Steel			314,989
Steel sheet bars			33,606
Tin-plate bars	345,503	377,897	305
Wire rods	95,196	73,883	60,021

Wire manufactures	55,739	50,187	29,508
Iron bars, rods, angles, etc.	141,452	42,402	3,683
Other manufactures	525,868	444,811	329,862
Total	4,969,225	3,851,435	1,961,951

*Steel castings and forgings only.

Tin-plate Trade.—Production and employment figures have been as follows:

Year	Tons	Total output	Average number employed
1907	637,000	£8,425,000	20,628
1924	923,600	£21,132,000	27,968
1938	857,800	£15,520,000	25,271
1935	625,300	£13,663,000	21,985

Non-ferrous Metals.—The following tables show the value of the gross output and the average employment in the principal branches of industry manufacturing non-ferrous metals:

Copper and Brass (Smelting, Rolling and Casting)

Year	Total output	Average number employed
1907	£17,285,000	21,448
1924	£22,916,000	26,478
1930	£20,994,000	24,974
1935	£21,343,000	28,052

Other Non-ferrous Metals (Smelting, Rolling and Casting)

1907	£8,985,000	8,233
1924	£31,760,000	22,366
1930	£26,539,000	22,311
1935	£33,249,000	22,366

Finished Brass Trade

1907	£6,797,000	38,916
1924	£10,165,000	32,335
1930	£10,730,000	32,439
1935	£11,542,000	34,824

Increases over the period before 1914 have been substantial, especially in the production of aluminum and of tin manufactures. The next table gives the import and export figures:

	1924	1930	1935	1939
Total of non-ferrous metals and manufactures thereof:				
Imports	£32,717,394	£29,362,996	£28,000,118	£38,695,897
Exports	15,658,397	12,037,798	14,076,230	12,653,561

Engineering.—The following are the relative figures of certain branches of engineering production:

	1907 (£'000)	1924 (£'000)	1930 (£'000)	1935 (£'000)
Electrical machinery	4,214	17,617	21,164	23,236
Electric wires and cables	5,262	18,660	19,157	17,066
Other electrical apparatus, contract work, etc.	13,897	32,684	47,353	61,462

One item absent from the 1907 figures, but included since in the totals, is for wireless apparatus. It increased from £4,845,000 in 1924 to £13,253,000 in 1935.

The foreign trade position of the electrical industry is very satisfactory, since Great Britain's position as the chief exporting country in the world is challenged only by the United States, Germany (which easily led the world before 1914) having dropped back in the race. In spite of setbacks due to the depression of the early 1930s the industry is still expanding steadily.

Value of Exports in Thousands of £

	1913	1919	1924	1933	1937	1938
Exports	..	*	3,372	2,439	4,082	3,104
Wire and cables	3,577	3,049	4,477	1,614	4,397	4,318
Telegraph and telephone apparatus						
Radio	290	421	1,036	1,256	1,653	1,795
Other			1,800	1,074	2,112	2,913
Other electrical goods	1,518	3,545	3,369	2,753	4,376	4,404
Electrical machinery	2,269	1,903	5,325	2,636	5,685	7,894
Total exports	7,654	8,918	18,807	9,333	18,223	21,324

*Figures not available.

The average number of persons employed in electrical engineering establishments in 1924 was 150,884; in 1935 it was 247,948.

Machinery.

Output of Certain Principal Products (£'000)

	1924	1930	1935
Locomotives, traction and road rollers	5,801	6,906	4,944
Prime movers, boilers and boiler house plant	16,418	12,465	12,586
Textile machinery, parts and accessories	19,116	12,398	12,316
Machinetools	3,594	4,964	6,735
Printing, bookbinding, etc., machines	2,571	3,748	3,398
Agricultural machinery	3,365	2,808	2,930
Mining machinery	2,480	2,429	3,010
Sewing machines	3,725	3,524	2,745

The average number of persons employed in these groups in 1935 was 432,811.

Imports and Exports (£'000)

	1913	1919	1924	1935	1938
Imports					
Machinery (total)	7,267	15,020	11,116	13,225	21,836
Exports					
Machine tools	1,013	2,286	1,362	2,243	4,473
Internal combustion engines	5,210	1,265	2,910	2,995	3,395
Other engines		2,533	1,815	654	771
Sewing machines	2,367	1,770	2,429	1,430	1,262
Textile machinery	8,282	8,427	10,831	6,914	8,407
Other machinery and parts	14,461	12,558	19,369	16,549	25,498

Motor and Cycle Trades.—Production figures in quantities and values for the motor and cycle trades were as follows:

		1907	1924	1935
Complete motor vehicles (including commercial)	No.	9,800	133,400	377,561
	£'000	3,323	34,757	58,354
Complete chassis (including commercial)	No.	2,000	22,454	63,697
	£'000	859	8,113	13,661
Motorcycles	No.	3,800	120,422	64,690
	£'000	139	5,877	2,624
Cycles	No.	623,800	704,352	1,987,000
	£'000	3,441	3,859	6,664
Engines and parts	£'000	3,144	29,366	47,218

It is interesting to note the decline of the popularity of the motor cycle in more recent years, due largely, no doubt, to the much greater comparative reduction in the average selling value of motor cars as is shown in the following table.

Year	Motor vehicles		Complete chassis		Motor cycles	Cycles
	Private	Commercial vehicles	For private cars	For commercial vehicles		
	£ each	£ each	£ each	£ each	£ each	£each
1924	264·2	239·0	397·9	336·0	48·9	5'5
1930	204·9	265·7	254·5	374·3	41·3	3'9
1935	147·9	198·0	147·9	250·0	40·56	3'35

This reduction of cost was brought about by the introduction of mass production which the motor car industry, following the example of the United States, was one of the first to introduce.

Persons employed

1907	53,639
1924	169,288
1935	224,568

Import and export figures are given in the next table.

The motor car industry enjoyed a measure of tariff protection, with but one brief interval, from 1915 on, and was enabled to develop while other industries were still feeling all the effects of foreign competition in the home market.

After the outbreak of war in 1939 the industry suffered for a time from declining markets and it was not until after the fall of France that it was fully mobilized for war production. An important section of the industry was transferred to the manufacture of aeroplanes, but in 1942 it was producing tanks and other military vehicles at the rate of 257,000 a year.

Motor Cars and Chassis (Value in Millions of £)

Year	Imports				Exports			
	Cars		Chassis		Cars		Chassis	
	No.	£	No.	£	No.		No.	£
1913	6,820	1·7	7,958	1·9	7,595	2·4	1,234	0.5
1919	4,365	1·3	2,240	0·7	1,514	1·0	678	0·5
1924	14,717	3·0	12,459	1·8	19,315	5·1	9,735	2·3
1927	19,340	3·6	13,359	1·6	17,877	4·6	17,819	3·8
1935	12,395	2·0	3,006	0·3	46,167	6.3	21,726	2.6
1936	11,766	2·1	3,263	0·4	54,543	6·8	27,079	3·2
1937	18,652	2·5	4,787	0·6	57,395	7·5	41,069	4·7
1938	10,586	1·5	1,651	0·2	47,507	7·1	34,978	4·0

Aircraft Trade.—Production figures for the census years from 1924 onwards were:

	1924	1930	1935
Value of products (£'000)	4,554	8,688	13,919
Aeroplanes No. (with and without engines) (£'000)	503	1,459	1,807
	1,904	3,376	4,602
Aeroplane engines No. sold separately (£'000)	884	1,973	3,030
	1,479	2,131	3,918
Average number of persons employed	11,735	21,322	35,032
Number of establishments	20	47	52

The foregoing figures reflect the very satisfactory progress of a young industry, but the actual number of aeroplanes produced in 1935 was still considerably less than the number produced in 1918. Although the production of military aeroplanes was steadily increased from 1938 onwards, it was not until after the middle of 1940 that the full urgency for an air force capable of repelling German attacks became apparent. Aeroplane production was undertaken on a previously unparalleled scale during the last part of the year, and for a time became the most vital part of the British war effort. The rate of production was more than maintained and by the first quarter of 1942 it was double that of the last quarter of 1940. Unofficial estimates put the 1942 rate at about 2,500 aeroplanes a month.

Cotton. Cotton Spinning.—No effective comparison can be made between 1907 and 1924 or later years, since no particulars were recorded in 1907 of the output of yarn used for manufacturing purposes by the spinning firms.

The figures for 1924, 1930 and 1935 are as follows:

Kind of output		1924	1930	1935
Goods made for sale				
Cotton yarn, including sewing cotton:				
Single and Doubled	th. lb.	1,528,318	1,167,029	1,340,831
	£'000	187,947	76,097	69,945

*So far as recorded

The exports of yarn for the years 1913, 1924, 1930, 1935 and 1938 have been as follows:

	Lb.	£
1913	210,099,000	15,006,291
1924	163,056,000	27,782,126
1930	136,988,—	14,469,350
1935	141,675,000	11,161,702
1938	122,950,000	9,674,911

Cotton Weaving.—The total figures for cotton goods manufactured together with their value in the census years were as follows:

	1907	1924	1930	1935
~, a linear yards	7,076,203	5,588,808	3,100,000	3,081,138
1,000 square yards	..	6,026,060	3,320,000	3,385,522
Th. cwt.	..	10,344	6,540	6,987
Net selling value	£81,578,000	163,447,000	64,946,000	53,886,000

Cotton Piece Goods.—The following are the export and import figures for piece goods for 1913, 1924, 1930, 1935 and 1939.

		Yards	£
1913	Exports	7,075,252,000	97,775,855
	Imports	125,658,987	3,375,158
		Square yards	
1924	Exports	4,443,959,500	153,448,106
	Imports	41,5-7,202	3,436,342
1930	Exports	2,406,776,700	61,305,421
	Imports	82,105,032	4,698,661
1935	Exports	1,948,431,000	39,531,954
	Imports	29,321,673	1,043,970
1939	Exports	1,393,375,000	31,982,988
	Imports	33,104,700	1,152,724

The aggregate number of persons employed in cotton spinning and weaving for the census years were as follows:

	Males	Females	Total
1907	219,980	352,082	572,062
1924	197,087	330,690	527,777
1930	143,860	245,529	389,389
1935	128,338	220,981	349,319

With 1918 the cotton industry declined seriously, and it was unlikely that it would ever regain the position in world trade it once occupied. The foregoing figures show that it had little share in the partial recovery enjoyed by many industries between 1935 and 1938.

The causes of this decline were twofold: increased competition abroad and insufficient adaptability within the industry at home. Improved methods of production rendered obsolete much of the equipment of the Lancashire cotton mills, but replacements were not made, and the industry was unable to organize itself more economically by such means as amalgamation, joint marketing schemes, etc. Countries such as India and China which were formerly customers themselves became producers, and the rapid expansion of the Japanese cotton industry introduced the severest competition in world markets.

The Cotton Industry act, designed to reduce the excess capacity of the industry and to increase consumption, was passed in Aug. 1939, but the coming of war prevented it from having the desired immediate effect. During the war many of the cotton factories have been taken over and converted for various types of war production.

Woollen and Worsted Trades. Semi-manufactured Products.—The totals of semi-manufactured products for the years 1907, 1924, 1930 and 1935 are given below (in thousands of lb.).

	1907*	1924	1930	1935
Tops or slubbing	243,500	285,529	224,417	307,452
Noils	30,000	35,035	26,163	35,037
Yarns	452,000	553,787	385,989	543,065

"Includes Ireland.

Woollen and Worsted Fabrics.—The total values of woollen and worsted fabrics for the same years were as follows:

1907	1924	1930	1935
£40,294,000	£89,578,000	£59,960,000	£61,614,000

The following foreign trade figures may be quoted:

	1913	1924	1930	1935	1939
Woollen and worsted yarns	*Thousands of pounds*				
Imports	32,994	17,801	19,058	1,528	5,108
Exports	80,415	65,893	49,573	59,000	31,999
Woollen and worsted tissues	*Thousands of* square yards				
Imports	65,183*	31,386	39,642	4,881	12,075
Exports	168,374*	221,563	113,753	116,982	98,035

*Linear yards.

The wool industry to some degree followed the same course as the cotton industry between 1918 and 1938, though its decline was far less serious. It was, however, subjected to similar foreign competition, losing considerable markets in the far east, and as partial recovery came after the depression years there was growing concern over redundancy of plant, with consequent attention to schemes of control and planning.

Other developments affecting the industry were the increased use of artificial silk and attempts abroad to find substitutes for wool, Within the industry itself there was an increased demand for woollens at the expense of worsteds, and for knitted fabrics at the expense of woven ones. Such factors influenced regional unemployment, since the various branches of the industry are highly localized.

The following table gives the average number employed in the industry in the census years:

1907	1924	1930	1935
264,021	274,397	230,342	242,209

Silk and Artificial Silk.—Output and employment figures are as follows:

Year	Value of gross output	Average number employed
1907	£5,236,000	32,198
1924	£20,299,000	39,932
1930	£28,730,000	69,830
1935	£36,110,000	81,825

This industry showed a steady expansion, due entirely to the recent development of artificial silk. It is significant that before 1924 there are no statistics of production distinguishing artificial silk from silk, but in 1924 the output of natural silk and mixtures was valued at £3,558,000 and that of artificial silk and mixtures at £3,308,000. By 1935 the balance of production had changed remarkably; natural silk and mixtures had decreased to £1,579,000, but the value of artificial silk and mixtures had reached a total of £17,028,000.

It is also significant of the development of the industry that since 1924 exports have overtaken and passed imports. and that till 1939 the excess of exports over imports was steadily growing.

Total of Artificial Silk, Yarn and *Manufactures*

	1924	1930	1935	1939
Imports	£5,515,178*	£7,545,626*	£2,948,759	£1,957,670
Exports	4,310,225	5,934,853*	3,985,781	4,674,993

*Excludes apparel and embroidery. For 1939 apparel only excluded.

Hosiery.—The term "hosiery" covers practically all knitted fabrics, and the strength of the industry is due to the tendency, already noted, in favour of knitted fabrics at the expense of woven fabrics.

Year	Value of gross output	Average number of employees
1907 . .	£9,074,000	51,213
1924 . .	£42,495,000	95,529
1930 . .	£39,563,000	105,836
1935 . .	£39,486,000	115,273

Clothing Trades.—The total value of goods made and work done in Great Britain and Northern Ireland during the years 1907, 1924, 1930 and 1935 was as follows:

Year	Value of gross output	Average number employed
1907 . .	£64,692,000	442,075
1924 . .	£183,227,000	473,698
1930 . .	£180,604,000	492,616
1935 . .	£179,116,000	535,886

Included in the above totals are the following industries:

Tailoring, Millinery, etc.

Year	Value of gross output	Average number employed
1924 .	£109,106,060	296,369
1930 . .	£112,632,000	323,468
1935 . .	£116,770,000	362,334

Boot and Shoe Trades.

Year	Value of gross output	Average number employed
1907 . .	£23,011,000	126,826
1924 . .	£50,695,000	130,500
1930 . .	£45,195,000	116,452
1937 . .	£40,180,000	116,567

The following are the import and export figures for boots and shoes in the years 1913, 1924, 1930, 1935 and 1939:

Year	Imports	Exports
1913 . .	£839,133	£4,194,276
1924 . .	1,819,514	5,023,875
1930 . .	1,506,440	4,048,166
1935 . .	698,140	1,436,941
1939 . .	1,191,746	1,398,086

Leather Trades.—Output and employment have been as follows:

	1907	1924	1930	1935
Fellmongery £'000	2,201	4,718	3,186	2,652
Average number employed	1,764	2,405	2,358	2,431
Tanning and dressing . .				
Undressed £'000 .	8,688	14,902	12,639	10,838
Dressed £'000	6,023	12,660	11,909	11,989
Average number employed	28,910	30,413	28,506	30,286
Leather goods £'000 .	3,504	5,112	5,002	5,676
Average number employed .	22,548	15,493	15,137	17,816

The following are the import and export figures for the years 1913, 1924, 1930, 1935 and 1939 for leather (dressed and undressed):

Year	Imports	Exports
1913	£10,572,100	£3,467,388
1924	13,531,040	5,329,802
1930	13,741,563	4,005,575
1935	7,705,799	3,181,569
1939 .	7,563,365	3,346,338

The figures for leather manufactures (excluding apparel):

Year	Imports	Exports
1913	£1,058,321	£1,810,852
1924	863,334	1,776,302
1930	1,514,311	1,256,331
1935	378,477	569,381
1939	234,815	703,672

Timber Trades.—Output figures have been as follows:

	1907	1924	1930	1935
Value of gross output . .	£16,911,000	£30,334,000	£27,276,000	£29,127,000
Sawmill products (included in totals above) .	£9,646,000	£15,689,000	£15,178,000	£14,997,000

Average Number of Employees

1907	78,223	1930	57,536
1924	66,246	1935	59,830

Great Britain was once heavily forested, but centuries of timber cutting and clearing have denuded the country of the original forests. Europe as a whole has about 31% of its surface covered with timber, but Great Britain, in spite of its well-wooded appearance, has barely 4% of its surface thus covered. It was estimated in 1926 that there are roughly 3,000,000 ac. of woodland of all types in the island. Nevertheless, in spite of the enormous growth of population since the middle ages, there are fairly extensive areas of unproductive heath and moorland which could well be reafforested.

World War I showed how dependent Great Britain was on imported timber, and stocks of native trees were seriously depleted to meet wartime needs. In 1919 a Forestry commission was set up to meet the situation, and it embarked on a scheme for planting 1,777,000 ac. over a period of 80 years. By the end of 1938 it had acquired 1,097,000 ac. of which 340,638 had been planted. A special feature of the activities of the commission from 1936 onwards was its attempt to combine reafforestation with relief of the distressed areas in northern England and South Wales.

Great Britain is still dependent on imported timber, and has felt the loss of imports from the Scandinavian countries since 1939. The following table indicates the extent of imports in the years before the present war. Exports are negligible.

Hewn	£20,181,033	£3,657,629	£2,634,590	£1,148,064	£1,040,203
Sawn .		34,543,316	28,247,986	23,125,247	23,083,284
Planed or dressed		3,436,869	3,394,946	4,073,989	5,622,795
Other .		9,432,870	8,587,019	7,168,957	7,382,412
Total		£51,070,684	£42,774,541	£35,516,257	£37,128,694

Building Materials.—The products for 1907, 1924, 1930 and 1935 are as follows:

Clay and Building Materials **Trades**

Year	Value of gross output	Average number persons employed
1907 . .	£ 9,599,000	—
1924 . .	9,599,000	20,307
1930 . .	13,930,000	29,731
1935 . .	15,045,000	30,561

It should be noted that the figures for 1930 and 1935 include returns made by certain firms which were assigned to the building and contracting trade for 1924. The number of persons employed in 1930 by these firms was about 2,000.

Several items of interest are included under these headings. Thus, tar-paving and other road materials in 1930 were valued at £6,360,000 (Great Britain) whereas the total for 1907 was only £308,000, including Ireland. This reflects the increasing wear and tear on the roads through motor traffic.

Another symptom is the heading of £1,649,000 for contract and job work on roads in 1924 (including paving materials used) for which no counterpart is to be found in the earlier year. Other items which increased materially owing to the development of new methods of construction were artificial stone, and roofing felts.

Cement Trade.—Output figures for cement have been:

	1924		1930		1935	
	Quantity (thousand tons)	Selling value (£000)	Quantity (thousand tons)	Selling value (£000)	Quantity (thousand tons)	Selling value (£000)
Cement production (for building and engineering and other purposes)	3,233	6,994	5,056	7.799	59,579	8,757

Building and Contracting Trade.

Year	Value of gross output	Average number of persons employed
1907 . .	£ 87,967,000	513,993
1924 . .	193,494,000	514,353
1930 . .	194,288,000	453,807
1935 . .	187,561,000	434,374

Furniture, Cabinet-making and Upholstery Trades.

Year	Gross output	Average number employed
1907 . .	£12,063,000	76,415
1924 . .	£26,108,000	67,555
1930 . .	£33,815,000	91,948
1935 . .	£33,015,000	91,093

The import and export figures for furniture and cabinet ware are:

Year	Imports	Exports
1913	£446,037	£1,274,759
1924	599,353	1,316,936
1930	916,297	1,128,887
1935	409,314	489,021
1939	269,607	391,765

Chemical and Allied Trades.—The total output of chemical manufactures in 1907 was valued at £24,025,000. The figures for 1924, 1930 and 1935 are as follo s:

	1924	1930	1935
Drugs and medicinal preparations . . .	£15,680,000	£16,015,000	£19,692,000
Dyes and dyestuffs . .	6,237,000	5,003,000	8,044,000
Other coal tar products .	6,428,000	5,373,000	5,226,000
Other chemical manufactures. . .	26,127,000	26,262,000	35,799,000
Totals . . .	54,472,000	52,653,000	68,761,000

Average Number Employed

1907	52,257	1930	70,475
1924	66,962	1935	77,611

The dominating position in the British chemical industry is held by Imperial Chemical Industries, Ltd., which was formed in 1926 with a capital of £65,000,000 through the amalgamation of Brunner, Mond and Co., United Alkali Co. (manufacturers of industrial chemicals), Nobel Industries, Ltd. (explosives), and the British Dyestuffs Corporation, Ltd.

When war broke out in 1914 British factories were equipped for manufacture of explosives only on a small scale, and the industry had to be expanded rapidly with government assistance. The position with regard to dyes and dyestuffs was even worse, since over 80% of the world output came from Germany and only 2% from Great Britain. As a result the German patents were revoked and by 1917 the essential requirements of the country were being met. After the war the strategic importance of the industry was fully realized, and it was maintained by means of the Dyestuff (Import Regulations) act which came into force in 1921 and prohibited imports except under license. Though Germany recaptured the greater part of the export trade that had formerly been hers, British output of dyestuffs in 1937 was 31,633 tons as against 63,000 tons in Germany.

The development of the chemistry of dyes is of great importance to photography, which is dependent on it for practically all its recent advances

The imports and exports of chemical manufactures are given below. It will be seen that, except for dyes and dyestuffs, British exports considerably exceed the imports.

	1913	1924	1930	1935	1939
Products other than Drugs and Dyestuffs					
Imports	£6,898,926	£7,802,122	£6,938,463	£6,470,779	£9,322,227
Exports .	13,638,696	17,672,280	14,877,273	13,250,113	14,293,650
Dyes and Dyestuffs					
Imports .	3,082,916	2,839,760	2,396,066	2,331,074	3,013,643
Exports	311,386	1,010,982	996,157	1,571,337	1,621,330
Drugs and Medicines					
Imports	1,984,635	2,246,443	2,167,622	1,291,641	1,817,014
Exports .	2,351,781	3,119,835	2,835,857	3,038,997	3,252,410
Painters' Colours, etc.					
Imports	1,369,316	1,728,850	2,069,237	1,507,991	1,767,305
Exports.	3,231,525	3,675,276	3,249,189	3,468,056	3,620,795
Total					
Imports	13,335,795	14,617,175	13,571,388	11,601,484	15,920,189
Exports .	19,533,388	25,478,373	21,958,476	21,328,503	22,788,185

Paint, Colour and Varnish Trades.

Year	Gross output	Average number employed
1907 . .	£8,562,000	13,840
1924 . .	£16,948,000	18,502
1930 . .	£19,528,000	21,292
1935 . .	£22,140,000	24,893

Imports and exports of these trades have already been given in the table for the chemical trades.

Soap, Candle and Perfumery Trades.

Year	Gross output	Average number employed
1907 . .	£12,218,000	18,718
1924 . .	£33,073,000	29,166
1930 . .	£29,101,000	27,005
1935 . .	£26,308,000	91,114

China and Earthenware Trades.—The figures for the four years, including all branches, were as follows:

Year	Gross output	Average number employed
1907 . .	£7,585,000	68,168
1924 . .	£17,483,000	69,402
1930 . .	£14,603,000	69,873
1935 . .	£14,079,000	67,775

Glass Trade.

Year	Gross output	Average number employed
1924 . .	£12,962,000	36,849
1930 . .	£13,713,000	39,571
1935 . .	£17,056,000	45,869

In spite of vicissitudes corresponding to general trade cycles. the record of the glass industry is, on the whole, one of development and expansion. The manufacture of glass has been revolutionized since the beginning of the 20th century through the replacement of old methods by automatic and semi-automatic

machines, which have enormously increased productive capacity. New uses for glass have been found, *e.g.* in motor cars, and many new types of glass have been developed.

The following table gives the import and export figures for glass and glassware:

	1913	1924	1930	1935	1939
Imports	£3,449,420	£4,580,417	£5,348,850	£3,817,857	£2,244,166
Exports	1,207,918*	2,499,534	[illegible]	1,530,023	1,676,805

*The Classification is "Glass, Plate and Sheet," which includes all glass and glassware, exclusive of bottles, prior to 1920.

Rubber. — In 1938 Great Britain imported 3,866,511,000 lb. of raw rubber, of which 3,049,917,000 lb. were retained for manufacturing; in 1935 3,951,289,000 lb. were imported, of which 2,884,320,000 lb. were retained.

In 1935 the gross output of the rubber trade was £28,069,000, and the table shows the values of the principal rubber manufactures over the census years.

	1907	1924	1930	1935
Rubber tires and tubes	£2,824,000	£10,540,000	£15,818,000	£18,325,000
Heels and soles	£314,000	£819,000	£840,000	£825,000
Other	£4,882,000	£9,620,000	£9,262,000	£8,919,000
Persons employed	24,039	47,496	52,165	55,593

The following are the import and export figures for rubber tires and tubes for the years 1913, 1924, 1930, 1935 and 1939.

Year	Imports	Exports
1913	£2,778,949	£1,294,197
1924	3,037,145	**2,729,838**
1930*	434,035	4,475,371
1935	**123,660**	3,226,508
1937	**221,505**	2,972,393

*From April 12, 1927, rubber tires and tubes exported or imported with and forming part of the equipment of complete vehicles, or of chassis, or fitted to wheels, exported or imported separately are included with "Vehicles, Motor Cars." Prior to this date, such tires and tubes are included with "Rubber tires and tubes."

The rubber industry of Great Britain, like that of the United States, suffered severe dislocation when early in 1942 the Japanese, by occupying Malaya and the Dutch East Indies, captured the principal sources of the world's rubber supply.

Printing and Bookbinding Trades.

Tear	Value of gross output	Average number employed
1907	£24,709,000	174,116
1924	£56,769,000	**168,638**
1930	£56,597,000	167,849
1935	£55,474,000	164,706

The output of newspapers and periodicals made great increases:

Year	Value of gross output	Average number employed
1907	£13,548,000	46,786
1924	£45,298,000	56,724
1930	£51,606,000	71,434
1935	£50,372,000	**78,448**

BIBLIOGRAPHY.—Political and Economic Planning: *The British Iron and Steel Industry* (1933); The British Cotton Industry (1934); *The* Supply of Electricity in Great Britain (1936); Annual Statement of the Trade of the *United Kingdom* (1939); Third, Fourth and Fifth Censuses of Production; Electricity Commission, Annual Reports of *Commissioners; Generation of Electricity in Great Britain* (annual); Forestry Commission, *Annual* Reports; Central Electricity Board, *Annual* Reports; British Iron and Steel Federation, Statistics of the Iron and Steel *Industry* of *the* United Kingdom.

Wartime Organization of Industry.—Comparatively little had been done before Sept. 1939 to put British industry on a war footing, although a certain amount of effective planning had been begun. In the aircraft industry, for instance, "shadow" factories had been organized, and new factories, as well as extensions of existing ones, had been authorized during 1938. But, in spite of many governmental controls, British industry, during the first eight months of war, followed a "business as usual" policy.

The complete reorganization of industry on a wartime basis did not begin until after the fall of France. First the aircraft industry, and gradually every other industry, was brought to the maximum of war production, until only the barest needs of the civilian population were supplied by such factories as were allowed to continue producing their usual products.

Government Controls.—Until March 1942 production was directed by a production executive under the war cabinet. Under the production executive there mere four main committees, and decentralization of the handling of production problems was achieved through the work of 11 regional boards.

An important change in the governmental system was announced in March 1942. The minister of production was to be "responsible for the duties hitherto discharged by the production executive, including the settlement of production priorities, the work of the regional boards, and the allocation of all industrial capacity, except shipyard capacity."

Under the Emergency Powers act, the government specified that it should control: (a) the production, storage, distribution and consumption of all articles, and the price at which they might be sold or hired, and (b) charges for any aspect of essential work.

Many steps were taken to ensure the employment of machinery, materials and labour with maximum economy. Censuses were taken of all types of machinery, and the Machine Tool Control of the ministry of supply was strict in removing tools which were not fully employed. The regional boards and capacity clearing centres were active in exposing delays and bottlenecks. Finally, the government had the power to appoint a controller to manage any business when it deemed it necessary.

Concentration of *Industry.*—In March 1941 the president of the board of trade initiated a new plan for concentrating production of civilian and export goods in a reduced number of factories. In each industry a number of firms were to select "nucleus" firms to handle all their production. The latter were to work full time, and would be guaranteed adequate labour and raw materials. The remaining firms were closed or converted for the duration of the war, their labour, machinery and factory-space thus becoming available for the production of war goods.

By April 1, 1942, after one year of operation, "concentration" had released 195,560 workers from 31 industries, and it was expected that an additional 30.000 workers would be released. Factory space thus made available was reallocated by the board of trade, and during the first year 52,000,000 sq.ft. of space was thus reallocated, one-third for production, two-thirds for storage.

Control of Labour.—In June 1940 steps were taken to prevent competitive bidding for skilled workers. An order was issued providing that workers in essential industries could be engaged only through the ministry of labour's employment exchanges.

The Essential Work order, first introduced in April 1941, and extended to particular industries by a lengthy series of further orders, laid down: (1) that in all undertakings engaged in "essential" work certain fixed standards of wages and employment should be observed, (2) that in all essential undertakings every worker was to receive a guaranteed minimum wage, and (3) that no worker might give up his job and no employer discharge a worker without the permission of the local officer of the ministry of labour.

By Oct. 1941 19,000 undertakings had been scheduled under the various orders, including undertakings in the merchant navy, coal mining, building and civil engineering, iron and steel, dock labour, agriculture, railways, shipbuilding and cotton manufacturing. By June 1942 8,000,000 workers were covered under the Essential Work orders.

Within industry itself there was a considerable growth of joint (*i.e.*, employers' and employees') machinery for the regulation

of wages and working conditions. A further striking development in collaboration was the formation of joint production advisory committees within the factories to stimulate production.

Production. — Production was dispersed as much as possible so that no industry could be put out of action by bombing, and much use was made of small firms, both for experimental work and for the manufacture of parts which were assembled elsewhere. Tanks, for instance, were assembled from parts made in as many as 6,000 small shops.

No specific figures for output were issued, but it was clear that by mid-1942 British production was nearing its peak It was authoritatively stated that, using the production of Jan, 1941 as equivalent to 100, production in June 1942 had reached the equivalent of 244 for aircraft, and 289 for "other warlike stores."

SECTION 4: EXTERNAL COMMERCE

British commerce received an enormous development after the first quarter of the 19th century. In 1826 the aggregate value of the imports into and exports from the United Kingdom amounted to no more than £88,758,678; while the total rose to £110,559,538 in 1836 and to £205,625,831 in 1846. In 1856 the aggregate of imports and exports had risen to £311,764,507, in 1866 to £534,195,956 and in 1876 to £631,931,305. Thus the commercial transactions of the United Kingdom with foreign states and British colonies increased more than sevenfold in the course of 50 years,

The important fact in connection with the foreign commerce of the United Kingdom is that there was a steady increase in imports, but there was no corresponding steady increase in exports of British produce and manufactures. Many industries, which formerly were mainly in British hands, were developed on the continent of Europe, in America and, to some extent in the East. The movement began in 1872. Up to that time the exports of British home produce had kept on increasing with the imports, although at a lesser rate, and far inferior aggregate value; but a change took place in the latter year. While the imports continued their upward course. gradually rising from £354,693,624 in 1872 to £375,154,703 in 1876, the exports of British produce fell from £256,257,347 in 1872 to £200,639,204 in 1876. The decline in eyports, regular and steady throughout the period, and with a tendency to become more pronounced every year, affected all the principal articles of British home produce.

The external trade of the United Kingdom from 1875 onward is shown by the following table. It gives the total values of net imports, exports and re-exports.

EXTERNAL TRADE OF THE UNITED KINGDOM
Net Imports, British Exports and Re-exports
A. TOTAL TRADE, ALL CLASSES

Average for period or year	Net imports £'000s	British exports £'000s	Re-exports £'000s

1938	217,673	56,920	30,251
1939	216,947	54,391	24,544

*In 1920 a reclassification was adopted in the *Annual Statement of the Trade of the United Kingdom*. The figures on the second line are in accordance with the new classification and comparable with those for 1920 and later years

The figures in the table show for the earlier period a steady upward movement in both imports, exports and re-exports subject only to a decline in the five years 1885–89. The figures for 1919 and 1920 reflect the tremendous inflation of prices in those years, since they exceed by almost 2½ and 3 times respectively the average value of the imports for 1910–13, although the actual increase was only about 89·7% and 87.8% respectively over the 1913 imports. After 1919 there mas a continued decline in the value of some important export commodities: textiles, coal, ships, iron and steel, but between 1924 and 1929 the value of nearly every other class of British exports showed an increase. In 1931, however, at the height of the depression, the disparity between imports and exports became so serious that Great Britain abandoned the gold standard and turned from free trade to protection. It was hoped to build up a system of imperial preference so that empire markets should be held, and at the same time to use the tariff as a means of bargaining with other countries; but, while

D. CLASS III. *Articles Wholly or Mainly Manufactured*

Period	Net Imports £'000's	British Exports £'000's	Re-exports £'000's

1939	227,959	337,452	9,930

*In 1920 a reclassification was adopted in the *Annual Statement of the Trade of the United Kingdom.* The figures on the second line are in accordance with the new classification and comparable with those for 1920 and later years.

it is true that some industries were undoubtedly stimulated by protection, most economists agree that this change of policy was not the primary cause of Great Britain's recovery from depression. The plain fact is that "the depreciation of sterling and the adoption of protection left the volume of British exports much lower, and the amount of unemployment appreciably higher, than before the great depression." (F. Benham, *Greet Britain under Protection* [Macmillan], pp. 222–223.)

In 1933 both exports and imports started on an upward course which continued until 1939. The 1940 imports reflect the flow of war materials from the United States.

The excess of imports over exports, which has been a feature of British trade balances since 1872 and which rose as high as £463,000,000 in 1926, is counterbalanced by the so-called "invisible" exports. These consist of the earnings of British shipping, insurance, commissions and London financial services. To them must be added the income from overseas investments. Together all these items pay for the imports which ate not balanced by British exports. Their extent is shown hy the following table, which covers the 12 years before the outbreak of World War 11.

Balances of Credits and Debits in the Transactions (other than Lending and Repayment of Capital) between the United Kingdom and all other Countries (in millions of £)

	1927	1928	1929	1930	1931	1932	1933	1934	1935	1936	1937	1938
Balance of merchandise trade	−387	−352	−381	−386	−408	−287	−263	−294	−260	−345	−442	−377
Balance of government transactions	+1	+15	+24	+19	+14	−24	−2	+7	−2	−3	−4	−13
Net shipping income	+140	+130	+130	+105	+80	+70	+65	+70	+75	+85	+130	+100
Income from overseas investments	+250	+250	+250	+220	+170	+150	+150	+170	+180	+200	+210	+260
Short term interest and commissions	+63	+65	+65	+55	+30	+25	+30	+30	+30	+35	+40	+35
Other items	+15	+15	+15	+15	+10	+15	+10	+10	+10	+10	+10	—
Balance of current items	+82	+123	+103	+28	−104	−51	—	−7	+33	−18	−56	−55

While this table does not include capital movements, it suggests reasons why Great Britain was able, as in 1928, to bear an apparently adverse trade balance of £352,000,000. On the other hand, the overall adverse balance of current items amounting to £100,000,000 in 1931, together with the drain of gold from the country, caused the abandonment of the gold standard and the adoption of protective tariffs. The table also suggests that Great Britain's recovery from the depression was due to internal causes, and not to a revival of exports since in the very prosperous year of 1937 there was nevertheless an adverse overall foreign balance of about £56,000,000.

The next table, which relates to the years from 1900 onwards, shows the total external trade in figures adjusted to the average values of certain significant years and also the percentage variation when each of the selected years is reckoned as 100.

Owing to fluctuations in the value of money and also to the fact that trade with Eire is now recorded as external trade, comparison of overseas trade with that of 1913 is becoming more and more uncertain. The board of trade therefore evaiuated the foreign trade declared figures for groups of years at average prices for certain selected years, and so the figures for the years in each group are strictly comparable with those for the standard years.

Between 1913 and 1930, the percentage of the total British trade which was with the empire changed little. After the Ottawa conference of 1932, however, trade with the empire increased. This is clearly shown in the following table:

Class of trade	1913	1930	1938	1913	1930	1938
	£'000	£'000	£'000	%	%	%
Imports from:						
Foreign countries	577,544	746,799	548,696	75·13	74·54	59·61
British empire	191,191	255,088	371,742	24·87	25·46	40·39
All countries	768,735	1,001,887	920,438	100·00	100·00	100·00

All countries	109,567	77,181	61,608	~ c o	100·00	100·00

The next table shows the geographical distribution of British trade for the years 1913, 1924, 1930, 1935 and 1938. Imports from Europe declined, but re-exports increased. The effects of Japanese competition are visible in the decline of exports to Asia, while the increase in trade with Oceania is largely the result of the Ottawa agreements.

Year and class of trade	Europe	Africa	Asia	North America	South America	Oceania
	%	%	%	%	%	%
Imports						
1913	40·53	6·10	12·71	23·85	9·07	7·74

SECTION 5: SHIPPING AND SHIPBUILDING

A. Shipping. — The movement of British shipping since 1910 is shown by the table below.

Tonnage of Vessels Entered and Cleared at British Ports

Year	Entered		Cleared	
	British	Foreign	British	Foreign
1910–1913 average	42,828,465	30,712,572	43,075,761	30,934,772
1919	30,119,801	19,532,508	30,151,666	18,949,357
1920	33,217,400	22,500,423	34,005,131	23,337,570
1921	34,528,777	20,778,359	34,278,251	21,500,915
1922	44,187,598	32,057,988	45,383,518	32,112,701
1923	51,393,266	38,969,527	51,904,150	38,316,868
1924	52,271,099	34,785,477	53,393,996	35,385,873
1925	52,020,734	31,997,047	52,839,274	32,450,835
1926	53,270,145	29,008,178	53,426,971	29,180,846
1927	55,834,754	34,607,558	56,301,107	34,995,873
1928	56,562,225	34,453,020	57,579,223	34,683,290
1929	58,849,441	37,775,186	59,276,167	37,922,837
1930	57,449,265	40,093,813	56,918,404	40,674,476
1931	52,017,825	37,201,804	52,313,928	37,643,745
1932	48,996,679	35,668,514	49,286,812	35,825,727
1933	47,790,087	36,739,219	48,338,880	37,021,235
1934	47,143,367	38,215,422	47,177,785	38,302,761
1935	46,840,294	38,699,029	47,286,438	38,829,148
1936	48,099,958	40,667,489	48,640,346	40,784,070
1937	50,147,928	43,952,340	50,542,678	43,969,881
1938	49,976,026	41,903,511	49,962,023	42,202,552

A feature of the situation before 1914 was the steady increase in British tonnage accompanied by a considerably more rapid increase in German, Scandinavian, Dutch and Spanish tonnages. In 1890 British tonnage represented 71% of total entrances and clearances, but the average proportion for 1910–13 was 57% only. From 1919 to 1928 British shipping seemed to be recovering its position, and in 1928 the percentage of entrances and clearances rose to 67%. Later, however, it steadily declined and in 1938 was 57%, a proportion almost identical with that of 1913.

World War I brought about a great change in the relative position of the chief maritime countries. An immense quantity of tonnage was destroyed by combatants, the total being estimated at 14,202,000 tons, of which Great Britain's loss was 5,202,000 tons. On the other hand, the United States of America added to its fleet no less than 6,729,000 tons. The net loss of tonnage was, therefore, 7,473,000 tons. The German merchant marine, however, which in 1913 numbered 5,082,061 tons was in 1921 reduced to 717,450 tons, by surrender of reparation tonnage to the Allies.

The war years and those immediately succeeding witnessed a very high rate of construction. The result was that world shipping, which in 1914 aggregated 45,409,000 tons and in 1918 had sunk to below 39,000,000 tons, had increased to 47,897,000 tons by the middle of 1919, and to 70,131,000 tons by 1931. It sank in 1935 to 64,886,000 tons, but by 1939 it had risen again to 69,440,000 tons.

The movement of shipping freights from 1910 to 1938 is illustrated by the *Economist* index figures as follows, the year 1913 being taken as 100.

Year	Index	Year	Index
1910	72·61	1928	98.8
1911	83·32	1929	96.8
1912	112·56	1930	79·1
1913	100·00	1931	79·5
1920	438.52	1932	75·4
1921	158·40	1933	72·7
1922	122'02	1934	73'9
1923	106·69	1935	74'4
1924	113·44	1936	84.6
1925	109'22	1937	128·3
1926		1938	not available
1927	109·64		

*Freights abnormal owing to coal dispute. No comparable index figures calculated.

It will be seen that aiter 1918 freights rose to unprecedentedly high levels, fell sharply in 1921, and then declined till in 1928 they reached levels below those of 1913. The depression brought another slump in 1930, with slow recovery from 1933 to 1935 and a sharp rise in 1937.

The total number of persons employed on vessels of a gross tonnage of 100 tons or over, engaged in home and foreign trade, was 236,188 in 1930. The number sank to 182,391 in 1935, and in 1938 it was 191,599.

B. Shipbuilding. — The total value of the gross output in the census years of ships and for all classes of work, including repairs, for private shipyards in the United Kingdom, together with the average number employed, is shown in the following table:

Year	Value of output	Average number employed
1907 . .	£37,091,000	188,312
1924 . .	£54,272,000	141,867
1930 . .	£62,724,000	133,453
1935 . .	£35,814,000	82,020

The next table, taken from Lloyd's *Annual Summary of Shipbuilding*, gives the tonnage of merchant vessels launched in the United Kingdom and the total tonnage for the world from 1908 until the outbreak of the war in 1939:

Year	United Kingdom	World total	Year	United Kingdom	World total
1908 .	929,669	1,833,286	1924 . .	1,439,885	2,247,751
1909 .	991,066	1,602,957	1925 . .	1,048,633	2,103,404
1910 .	1,143,169	1,957,853	1926 . .	639,568	1,674,977
1911 .	1,803,844	2,650,140	1927 . .	1,225,873	2,285,679
1912 .	1,738,514	2,901,769	1928 . .	1,445,920	2,699,239
1913 .	1,932,153	3,332,882	1929 . .	1,522,623	2,793,210
1914 .	1,683,553	2,852,753	1930 . .	1,478,563	2,889,472
1915 .	659,910	1,291,638	1931 . .	502,487	1,617,115
1916 .	668,325	1,688,080	1932 . .	187,794	726,501
1917 .	1,162,896	2,937,786	1933 . .	133,115	489,016
1918 .	1,348,120	5,447,444	1934 . .	459,877	967,419
1919 .	1,620,442	7,144,549	1935 . .	499,011	1,302,080
1920 .	2,055,624	5,861,666	1936 . .	856,257	2,117,924
1921 .	1,538,052	4,341,679	1937 . .	920,822	2,690,580
1922 .	1,021,981	2,467,084	1938* . .	1,030,375	3,033,593
1923 .	645,651	1,643,181	1939* . .	295,338	1,239,157

*January-June only.

Fluctuations shown in the foregoing table were shared fairly equally by British and foreign shipyards, but the table also illustrates the significant decline of shipbuilding in the United Kingdom. In 1913 the output of British yards constituted 58% of the world total, but for each year since 1931 it has only been about 30%.

One development in shipbuilding in which British yards had only a limited share was the construction of motor ships. Their increasing popularity was due, first, to the disorganization of the world coal industry between 1919 and 1926 and, second, to a growing demand for oil tankers and the enormous increase in the use of fuel oils. A comparison, based on a table given in *Lloyd's Register*, is given of the numbers of steel motor ships of 100 gross tons and upwards launched in the United Kingdom and in the rest of the world from 1928 to 1937:

Year	United Kingdom	Other countries	Year	United Kingdom	Other countries
1928 .	75	209	1933 .	24	165
1929 .	75	246	1934 .	47	199
1930 .	140	251	1935 .	60	251
1931 .	37	265	1936 .	120	330
1932 .	10	123	1937 .	98	432

While Great Britain was behind the rest of the world in the proportion of motor tonnage built, much pioneering work was done there in the development of the high pressure steam turbine and of the electric drive.

At the outbreak of the war in Sept. 1939, the Germans immediately began a campaign of unrestricted sinking of merchant shipping. The occupation of Norway and the Atlantic coast of France in 1940 gave German submarines a far greater number of ports from which to operate than in World War I. British losses were heavy. By the end of June 1941, when the publication of shipping losses was suspended, the admiralty had announced the sinking of 1,074 British merchant ships, totaling 4,605,132 tons. Later in the year Mr. Churchill announced in the house of commons the sinking of a further 750,000 tons in the four months July–October.

Strenuous efforts were made to replace these losses. By expediting loading and unloading in port the time of turn-around was reduced by an average of nearly two-and-a-half days. Construction of merchant shipping was greatly increased, so that in the last quarter of 1941 twice as much was built as in the quarter before the war. But, as in the previous war, Great Britain was forced, in spite of such efforts, to rely largely on American shipyards to make good submarine losses.

SECTION 6: TRANSPORT AND COMMUNICATIONS

Railways. — The first line of railway for regular passenger service, that from Stockton to Darlington, 14 mi. in length, was opened on Sept. 27, 1825. The first really important railway was the line from Manchester to Liverpool, opened on Sept. 15, 1830. The first sod for the London-Birmingham railway was cut at Chalk Farm, London, on June 1, 1834. All the great railway systems of England sprang into existence within less than ten years after the opening of the London-Birmingham line.

The railway companies were at first only authorized to construct and maintain the permanent way, charging tolls to the owners of locomotives and wagons and coaches which used the lines. The next step was that they became providers of the locomotives which hauled the privately owned wagons and coaches. Finally the companies have become providers also of the wagons and coaches, except in the case of mineral wagons on the L.M.S., Southern and G.W. railways.

There were 40 mi. of railway in Great Britain in 1825, 293 by 1835, and in 1850 a total of 6,621 mi. The number of passengers carried per mile of railway increased from 4,860 in 1832 to nearly 12,000 in 1842.

The following table illustrates further developments:

Year*	Mileage	Capital issued	Number of passengers	Traffic receipts		Percentage of working expenses to receipts
				Total	Per mile	
1860	10,433	£348,130,127	163,435,678	£27,766,622	£2,661	47·00

*Includes Ireland up to 1909.

At the outbreak of war in 1914 the government took complete control of the railways, guaranteeing the companies their prewar revenues. The fact that the war lasted for more than four years, and involved a far-reaching rearrangement and redistribution of the trade and traffic of the country, made the strict terms of the agreement practically inapplicable. A large sum of money was required to put the companies back into their prewar condi-

tion of repair and efficiency. Rolling stock had been removed to other countries, stations closed, permanent way and other plant allowed to fall into comparative disrepair, staff seriously depleted, and the arrangements for routing of traffic widely altered. The costs of operation had also risen enormously.

The government, foreseeing the difficulties which would arise if control were suddenly removed, passed in 1919 the Ministry of Transport act, which gave the minister powers to control the operation and charges of all existing means of internal transport. Later there was passed the Railways act, 1921, under which:

1. The 120 railways of Great Eritain were amalgamated into four large groups, the Southern, the Great Western, the London, Midland and Scottish, and the London and North Eastern. (The passenger transport of London and its suburban areas was separately amalgamated and placed under the London Passenger Transport board in 1933.)

2. A new tribunal called the Railway Rates tribunal was set up, its most important function being the regulation of fares and rates and conditions of carriage.

The Railway Rates tribunal was responsible for introducing a new classification of merchandise into 21 classes to determine freight charges, a n it drew up a schedule of standard charges to which the companies were obliged to adhere. Somewhat more latitude was allowed the companies in determining passenger fares. The principle by which rates were fixed was defined in the act when it stipulated that they should "yield, with efficient and economical working and management, an annual net revenue equivalent to the aggregate net revenues in the year 1913 of the constituent companies." This was £50,000,000, a figure which actually had never been reached except in 1941, when the railways were again under government control.

Under the 1921 act the relations of the companies and their employees were to be governed by an elaborate system of conciliation councils, of which the chief were the Central Wages board and the National Wages board. In addition, the companies received from the government £60,000,000 in final settlement of all war claims—a sum which brought to nearly £150,000,000 the amount thus paid.

The economic condition of the railways after World War I was dominated by their rigid cost structure on the one hand and the emergence of formidable competition from road transport on the other. The railways were badly hit by the world slump of 1929–32, and the companies made a vigorous attempt to cut costs by reducing wages by 10%. A cut of less than 5% was secured, but the companies gave notice of their intention to withdraw from the National Wages board and the Central Wages board. After a temporary breakdown new conciliation machinery was established in 1935, and the railway owners concentrated their attention on the fight against the competition of road transport.

Under the 1921 act the railway companies were not allowed to maintain any road services, and it was not till 1928 that this provision was relaxed. Thereafter they attempted to acquire and maintain some of the services which had been competing against them. But the situation was far from satisfactory. A royal commission, appointed in 1928, issued its lengthy and inconclusive final report on the co-ordination and development of transport in 1931, and in the following year a conference of rail and road experts, under the chairmanship of Sir Arthur Salter, made a number of more restricted, but more practical, recommendations, some of which were embodied in the Road and Rail Traffic act of 1933. By this act local traffic commissioners were empowered to license vehicles carrying goods, authorize routes and prevent duplication. This system worked fairly well until 1938, when the railway companies began an agitation for freedom from legislative shackles.

On the outbreak of war in 1939 the minister of transport took control of the railway companies and the London Passenger Transport board. The railways were to be paid a sum based on the prewar profits which in 1941 was altered to a fixed annual payment of £43,000,000.

The following table shows the receipts of the four great companies during the years immediately preceding World War II:

Company	Passenger train traffic	Goods train traffic	Ianeous	Total
Southern				
1936	£16,090,002	£4,919,267	£247,145	£21,256,414
1937	16,919,613	4,930,809	263,158	22,113,580
1938	16,987,497	4,751,575	272,979	22,012,051
Great Western				
1936	11,062,282	15,421,213	245,945	26,729,440
1937	11,489,143	16,362,507	259,196	28,110,846
1938	11,454,000	15,132,563	242,577	26,829,140
L.M.S.				
1936	25,963,192	37,850,108	649,542	64,462,842
1937	26,994,311	39,573,155	666,614	67,234,080
1938	27,976,728	36,485,663	649,724	64,212,115
L.N.E.R.				
1936	16,970,552	29,531,142	381,791	46,883,485
1937	17,625,031	31,072,401	389,249	49,086,681
1938	17,357,161	28,890,878	408,076	46,656,115

Canals.—The majority of the canals in Great Britain were built during the early stages of the industrial revolution and before the railway era, so that they fell more and more into disuse with the development of more modern methods of transport.

The British canal system labours under serious disadvantages in comparison with the much greater systems on the continent. British canals are narrow; the frequent locks slow down transport; there is a good deal of duplication; and multiplicity of ownership has hindered the most economical working. Nevertheless, there are still over 3,000 miles of canals and inland waterways in operation, and the amalgamation in 1930 of eight canal companies into the Grand Union Canal company enabled 300 miles of waterway, linking London and the Midlands, to be improved so as to accommodate 100-ton barges.

During World War I the use of canals for transport increased considerably, and with 1939 there had been a similar increase. A central canal committee was set up in 1941 to co-ordinate six regional committees, and the canals, which before World War II tarried an annual total of 15,000,000 tons, were handling much larger quantities, particularly of coal, under government supervision.

Roads.—"The high road, a hundred years ago, was not the grass-grown desert of the present time; it was alive with traffic and gaiety," wrote Thackeray in *The Virginians* (1857). His point of view was that of the railway age, but recent years have seen a return to the conditions of the 18th century on a scale previously undreamed of. The modernization of British roads owes most to the passage of the Development and Road Improvement Funds act of 1909, which based the road improvement fund on the proceeds of a gasoline tax and provided for its nationwide administration.

The enormous increases in expenditure on roads and their upkeep are shown in the following table:

Expenditure, Other than Loan Charges, on Highways and Bridges

Pear	England and Wales	Scotland
1912–13	£14,553,336	£1,322,721
1923–24	45,263,096	5,432,955
1929–30	58,637,317	6,832,374
1934–35	46,306,000	5,195,000
1936–37	52,785,000	5,743,000

British roads are distinguished as main roads (class I), secondary (class II), and unclassified; in 1936 "trunk" roads were added to the classification. Under the Roads act of 1929 contributions from the road fund to the local authorities for building and upkeep may reach 60% for class I roads and 50% for others. The road fund is financed not from taxes on vehicles but by parliamentary grant. In 1938 the mileage of roads of all classes was 153,757 for England and Wales and 25,873 for Scotland, making a total of 179,630 mi. for Great Britain.

The great extension in the use of roads is due, of course, to the development of the internal combustion engine. There were

17,810 motor vehicles in Great Britain in 1904, 45,020 in 1906 and 388,860 by 1914. Increases since then are shown in the table below, which gives the number of licensed vehicles in 1922, 1930 and 1938.

Motor Vehicles in Great Britain

Licenses current on November 30 (approximate)	9	1930	1938
Totai motor licenses Including	933,308	1,969,649	2,883,285
Cars taxed on horse-power	293,740	959,353	1,819,376
Cycles	352,340	508,241	370,240
Goods vehicles	158,856	340,545	483,865
Motor hackneys	72,263	83,177	75,003
Horse-drawn vehicles	237,342	53,015	9,274

After 1918 the more striking developments in road transport were the establishment of rural bus services, which opened up the English countryside, and the growth of public haulage services, which seriously competed with the railways.

To cope wirh rhe constantiy growing volume of rramc on the roads various measures were adopted. Ribbon development, *i.e.*, the building of houses for mile5 on either side of main roads leading out of towns to the detriment of traffic, was restricted by an act of 1935. More and more by-passes were built so that main-road traffic could skirt the towns on the route. The Trunk Roads act of 1936 put 4,460 mi. of main roads under the direction of the ministry of transport instead of the local authorities to ensure their uniform development. But Great Britain had nothing comparable to the German *Reichsautobahnen.*

From Sept. 1939 onwards war conditions greatly affected the use of the roads. In July 1940 the manufacture and sale of new cars was stopped, and fuel shortages so diminished the use of private cars that it was estimated in April 1942 that at least 75% of them had been laid up. On June 30 of the same year rationing of gasoline for private cars ceased, and private motoring was no longer possible.

On the other hand, there was no slackening in the use of motor vehicles for the carrying of goods and passengers, and in Oct. 1941 the government took steps to acquire from public haulage concerns a fleet of over 2,000 motor trucks for the rapid conveyance from one part of the country to others of foodstuffs and similar essential supplies. By mid-1942, however. the fuel problem was becoming serious, and steps were being taken to supply passenger and haulage vehicles with producer-gas equipment.

Tramways. — An act passed in 1870 to facilitate the construction of tramways throughout the country marked the beginning of their modern development. but they did not spread rapidly until after 1890. After 1924 they declined, and in 1931 the royal commission on transport regarded them as obsolescent because, they "caused much unnecessary congestion and considerable unnecessary danger to the public." It therefore recommended that they should be gradually eliminated.

The development of tramway enterprise in the United Kingdom as shown by the mileage open, the paid-up capital, gross receipts. working expenses and number of passengers carried, has been as folloms:

Year*	Miles open	Paid-up capital	Gross receipts	Working expenses	Passengers carried
1890	948	£13,502,026	£3,214,743	£2,402,800	526,369,328
1895	982	14,111,521	3,733,690	2,878,490	661,760,461
1900	1,177	20,582,692	5,445,629	4,075,352	1,065,374,347
1905	2,117	51,501,410	9,917,026	6,565,049	2,068,913,226
1913	2,4851	72,972,000	14,338,000	9,014,000	3,096,168,000
1924	2,624	91,294,000	29,434,000	22,882,000	4,443,327,000
1930	1,979	79,909,000	21,131,000	15,722,000	3,531,950,000
1938	1,008	67,837,000	12,936,000	10,484,000	2,357,471,000

*From 1890 to 1913 Irish figures are included

The number of tramcars licensed in 1924 was 14,448; in 1938 it was 7,207.

Civil Aviation. — Air transport first became a commercial reality after World War **I.** the first commercial passenger plane crossing to Paris in Aug. 1919. The first air mail contract was made by the government in the following November. In 1924 the British air lines merged in the state-aided enterprise of Imperial Airways Ltd., a £1,000,000 company with government representation on the board. In 1939 another important merger took place when Imperial Airways and British Airways (the principal competitor of Imperial Airways after 1924) became, by aet of parliament, the government-controlled British Overseas Air ays corporation.

Great Britain is ill-suited to internal air communications, since distances are so short that the saving of time made possible by flying is of comparatively little consequence. The early air services between Britain and the various parts of the continent were always regarded as steppingstones to the time when it would be possible to link the whole empire by air. The formation of Imperial Airways was the first step in the development of such services.

From 1921 to 1927 the royai air force conducted an air maii service between Cairo and Baghdad, and this was taken over by Imperial Airways as soon as it had established its service to Cairo on a satisfactory basis. At first there were difficulties to contend with in Europe, since various European countries placed restrictions on aircraft flying across their territory, but in 1938 the normal route to Cairo was via Marseilles, Brindisi and Athens.

From Egypt, routes were extended in various directions. The Baghdad service went on first to Basra and then, in 1929, to Karachi. Eventually an agreement was reached with the Indian government and the service was extended to Delhi, Calcutta and Singapore and finally, in 1934, afler negotiations with the Australian government, to Sydney. Hongkong was linked to the service in 193**j.**

Services were also extended southwards, first to Nairobi in 1931 and then to Cape Town in 1932. Various branch lines connected the west coast of Africa with the system.

The next step was obviously the development of a transatlantic service, and here Great Britain was behind not only the United States but continental countries such as Germany and Italy as well, but during 1937, trials were flown across the Atlantic and a regular service instituted from Bermuda to New York.

In the extension of all these services the carrying of mails either preceded or began simultaneously with the carrying of passengers. Airmail rates were steadily lowered until the postmaster general (Sir Kingsley Wood) announced the empire airmail scheme, under which all first-class mail would be carried at tho normal rate of 1½*d.* an ounce. The service to South and East Africa was inaugurated in 1937, and in 1938 it was extended to India, Malaya. Australia and Hongkong.

The following table furnishes some details of the progress of British commercial aviation:

Regular **Air** *Services: Totals for All Companies*

Year	No. of flights	Passengers carried	Tons of cargo carried		Aircraft mileage
			Mails	Freight	
1928	4,800	27,300	83	730	916,000
1930	5,800	24,000	116	716	1,222,000
1932	9,100	48,200	139	633	1,793,000
1933	23,200	79,100	171	743	2,638,000
1934	51,600	135,100	250	1,172	4,557,000
1935	87,200	200,000	714	1,898	8,412,000
1936	81,300	236,300	977	2,147	9,584,000
1937	87,800	244,400	1,608	2,353	10,773,000
1938	95,100	222,200	3,453	2,527	14,331,000

The coming of war in 1939 brought great changes in civil aviation. The government was already in control of British Overseas Airways, and inland airlines were taken over in Eeb. 1940. The empire airmail scheme had to be suspended. The principal wartime developments in transatlantic flying, however, took place

in 1941, 400 crossings being made by British Overseas Airways on the northern route in 18 months. When the service began in Nov. 1940, the journey took 16 hours, but two years later it frequently took no more than 8.

Nevertheless, progress was made. New Zealand was linked to the empire services in April 1940, and in June 1940 regular services to Lisbon, which immediately assumed the utmost importance, were inaugurated. In 1942 British Overseas Airways were still flying over routes of more than 50,000 miles. Communications with the middle east were maintained via Lisbon, Bathurst and Freetown, and Khartoum. In the summer of 1940 the "horseshoe" route from South Africa to Sydney via India and Singapore came into operation, and it was maintained as far as Calcutta after the Japanese occupation of Burma, Malaya and the East Indies. An agreement with the Brazilian government in Nov. 1941 foreshadowed further links between Africa and the two American continents. From 1939 onwards, however, practically all new commercial aircraft in operation were of American origin, since British factories were concerned solely with war production.

Communication. *The* Post *Office.*—The first inland post was established in England in 1635. Early charges were 2*d*. per 80 mi., 4*d*. for 140 mi., 6d. for greater distances in England, 8*d*. to Scotland. At first the volume of correspondence was very small, and Scott in The Heart of Midlothian mentions that one day in the late 17th century the mail from London to Edinburgh consisted of a single letter. The institution of mail coaches in 1784 marked a great step forward. Mails were first sent by rail in 1830, and the penny post was established in 1840. The sending of telegrams was originally in the hands of various telegraph companies, the transfer to the state taking place in 1870. After 1880 the then novel and undeveloped system of telephony was carried on under licence from the state, being held to be within the state telegraph monopoly. The National Telephone company gradually absorbed all other licencees, and obtained a licence which expired in 1911. The state, however, had control of all trunk lines. The National Telephone company's system was transferred to the post office on Jan. 1, 1912. The number of exchanges increased from 1,566 in 1910 to 3,971 in 1925, and 5,715 in 1938; the number of telephone stations increased from 619,399 in 1910 to 1,357,908 in 1925 and 3,235,498 in 1938. The use of automatic exchanges developed after World War I. By the end of 1927 these were working in over 60 provincial towns, and the first automatic exchange in London was opened at Holborn in that year. The same year witnessed a great extension of telephone connection with foreign countries and in the succeeding years further extensions of the service gradually made it possible to speak by telephone or radiotelephone to practically any town in the world as well as to passenger ships at sea. A popular innovation which gave an impetus to the use of the telephone was the introduction in 1933 of the shilling trunk call between any two points in Great Britain after 7 P.M.

The two following tables give some idea of the magnitude of the business handled by the post office. First are given the numbers of letters, telegrams and telephone calls handled per annum, then the balances in the expenditure and income accounts for each of the services. It should be mentioned in connection with the second table that there was an overall deficit in the post office accounts for the years 1920, 1921 and 1922, but after that the balance was always favourable.

	1938–39	1939–40
Letters, etc., handled	8,150,000,000	7,360,000,000
Parcels	184,000,000	192,674,000
Airmail letters (imperial and foreign)	91,233,000	46,508,000
Telegrams		
Inland	50,395,000	54,710,000
International	8,915,000	9,147,000
Telephone calls		
Trunk—inland	111,553,000	117,446,000
international	2,064,000	922,000
Local	2,123,400,000	2,076,000,000

Surplus or Deficit after Charging Interest on Capital

Year ended March 31	Postal	Telegraph	Telephone	Total
1928	£8,843,768	£1,380,829*	£ 107,319	£7,570,348
1929	9,245,306	757,237*	524,695	9,012,764
1930	9,658,770	800,312*	513,214	9,371,672
1931	9,849,904	1,005,669*	343,219	9,187,454
1932	10,869,520	809,574*	571,848	10,631,794
1933	11,484,497	838,301*	409,521	11,055,717
1934	11,568,679	653,591*	1,392,929	12,308,017
1935	10,010,819	621,225*	1,684,983	11,944,567

1939			429,460	11,227,880

*Deficit.

An interesting development during World War II was the institution in Aug. 1941 of the airgraph mail to the forces in the middle east. The letters are written on special forms and then photographed on miniature film. The film is flown to its destination, and the addressee receives a print from the negative. The system was soon extended to cover British forces serving in all points between Iran, Egypt and Somaliland, and was also made available for civilian mail to Kenya. The Canadian government adopted it for letters to and from Canadian forces in Great Britain, and in all 14,500,000 airgraph letters were sent during the first six months during which the scheme was in operation.

Cables and Wireless *Telegraphy.*—It would be difficult to exaggerate what the submarine cable has done to develop and cement the British empire. The first cable was laid across the Channel in 1850, and the Atlantic was finally conquered in 1866. In 1922, when the Eastern Telegraph company, the group which practically controlled the whole system. celebrated its jubilee, the total mileage of cable in the world had grown from under 1,000 to 325,000 and the capital invested in this one group alone to £25,000,000, with a total for all companies of about £60,000,000. The system, protected as it is by the royal navy. was of extraordinary importance during World War I, for whereas Germany was at a very early stage completely isolated, the British cables were only cut by the enemy at two points and these were quickly restored. Some idea of the potentialities of the cable in the way of speed can be gathered from the cable "Derby" in 1927, when the results of the race reached

Egypt and S. Africa	in 2 seconds
India	within 5 "
S. America	within 11 "
Australia	in 32 "
Straits Settlements	" 45 "
China	" 51 "

while the message of H.M. the king announcing the opening of the British empire exhibition in 1925 travelled 31.560 miles in 80 seconds.

For some years after 1918 there was severe competition between the cable and wireless companies. In 1924, for instance, the Marconi company entered into a contract with the government to provide beam stations for communication with Canada, Australia, India and South Africa. In 1928, however, the Imperial Wireless and Cable conference recommended the co-ordination of these services, and as a result Cables and Wireless Ltd. was formed and now controls most of the extra-European communications from Great Britain.

The post office, however, controls the British end of cables to the continent of Europe, and maintains the Rugby radio station, as well as a number of subsidiary stations. The Rugby station can, if necessary, duplicate a number of cable services, and, in addition to its long-distance telegram and telephone facilities, regularly send out news broadcasts to subscribers in all parts of the world.

A comparatively recent development in the telegraphic service is the transmission of photographs and drawings, particularly of news photographs. As early as 1927 attempts were made to work out plans for a two-way service with the United States for trans-

mitting pictures by television, but experience showed that for long-distance transmission the cable was then far superior to wireless.

SECTION 7: AGRICULTURE AND FISHERIES

Agriculture.—In spite of the rapid growth of manufactures and commerce in Great Britain after the middle 1800s, agriculture remains the largest industry of the country. It employs well over 1,000,000 persons. The area devoted to it in 1938 was about four-fifths of the country's land—over 45,334,000 ac. out of the total area of 56,200,000 ac. The agricultural output of Great Britain in 1938 was probably worth £275,000,000.

The agricultural land is classified into three groups—arable, permanent grass and uncultivated rough grazings. The ioiiowing table shows the area of each in 1924 and 1938:

(*Thousands of Acres*)

		England and Wales	Scotland	Total
Arable land	1924	10,929	3,273	14,202
	1938	8,878	2,983	11,861
Permanent grass	1924	14,948	1,442	16,390
	'938	15,833	1,577	17,410
Rough grazings	1924	4,946	9,673	14,619
	1938	5,61 j	10,448	16,063

The total area in each category is not very dissimilar, but the distribution varies considerably as between Scotland and England and Wales. In Scotland over two-thirds of the land used for agriculture is uncultivated rough grazings, mostly of mountain type, while more than two-thirds of the cultivated area is arable land; in England and Wales three-fifths of the cultivated area is under permanent grass and only one-sixth of the total agricultural land is rough grazings. In these circumstances the number of persons employed per acre is much lower in Scotland than in England and Wales.

Apart from the stringencies of war periods, when special efforts were made to produce as much home-grown grain as possible, economic influences had for many years prior to 1939 led to the laying down of arable land to permanent grass. The increased production of grains in the new countries of the world caused prices of grain to fall and the production of meat and milk to become relatively more profitable. The extent to which arable cultivation was reduced between 1871 and 1938 may be seen from the following figures:

(*Thousands of Acres*)

Average of Years	England and Wales		Scotland		Great Britain	
	Arable land	Permanent grass	Arable land	Permanent grass	Arable land	Permanent grass
1871–75	14,766	11,799	3,476	1,085	18,242	12,884
1881–85	13,747	13,838	3,604	1,195	17,351	15,033
1891–95	12,676	15,116	3,543	1,356	16,219	16,472
1901–05	11,914	15,545	3,463	1,429	15,377	16,974
1911–15	11,131	16,013	3,313	1,494	14,444	17,507
1921–25	11,144	14,805	3,298	1,422	14,442	16,227
1926	10,548	15,128	3,194	1,499	13,742	16,627
1938	8,878	15,833	2,983	1,577	11,861	17,410

The reduction in the arable area has been relatively less rapid in Scotland than in England and Wales possibly owing to the fact that much of Scotland's arable land would very quickly revert to rough grazings if left for many years under grass Changes have however been much less marked in some parts of England than in others, the eastern counties, where rainfall is small and good permanent pasture is difficult to maintain, showing the smallest decreases in arable land.

Areas Devoted to Chief Crops.—The three chief grain crops have not shared equally in the reduction of the corn area; indeed, the area under oats increased, the decrease being confined to wheat and barley. In the fifty years from 1871–75 to 1921–25 the area under wheat was reduced by about one-half and that of barley by over one-third, while the acreage of oats was increased temporarily by one-eighth. The heavy reduction in the wheat acreage, as compared with other cereals, was no doubt mainly a result of the greater fall in price of this grain, while the increase in the acreage of oats was apparently due to the substitution of this crop for other cereals, as the bulk of it is used for feeding to stock on farms and its selling value is not the chief consideration. The relatively low prices for grain crops since 1921, as compared with most other classes of farm produce, have led to further reductions in the area of grains.

Acreage of Grain Crops in Great Britain
(*Thousands of Acres*)

	Average 1871–75	Average 1921–25	Average 1928–37
Wheat	3,527	1,803	1,592
Barley	2,367	1,510	1,022
Oats	2,672	3,009	2,406

Nearly one-half of the total acreage of wheat in Great Britain is to be found in the ten eastern counties of England from the East Riding to the Thames as far inland as Bedford and Huntingdon, while over one-half of the barley acreage is in the same ten counties. The acreage of oats on the other hand is fairly evenly distributed throughout the country, this being by far the chief grain crop in the nest and north where the total arable area is smallest. The density of the wheat crop is greatest in Cambridge and Huntingdon, and passing from these counties it becomes gradually less dense in all directions except for two or three counties in the east of Scotland in which appreciable areas are grown. Barley is most densely grown in Norfolk and Rutland, and generally is a much more important crop along the seaboard from the Thames to the Moray firth than in the middle or west of the country.

The area devoted to potatoes did not follow the decline in the arable area, but increased, in spite of a slight falling-off for several years after 1925. This increase in the potato acreage was necessary to meet the requirements of the rising population. Potatoes are grown most extensively in Lancashire and Cheshire in the west of England and in the south of Lincoln and the Isle of Ely in the east. After 1880 the acreage of potatoes changed little in Lancashire and Cheshire, but in the eastern counties named above and in the adjoining counties the acreage was trebled between 1880 and 1930. Potatoes are also an important crop in some of the eastern counties of Scotland.

The acreage of mangolds was maintained until 1925, owing to the value of this crop as a food for dairy cattle, the numbers of which had increased. On the other hand, turnips and swedes. which are expensive crops to grow and are more liable than mangolds to damage by pests and adverse weather conditions, have been grown on rapidly declining areas, so that they occupy less than one-half the area of 70 years earlier. The acreage of clover and rotation grasses has shown comparatively little reduction.

Acreage of Certain Arable Crops and Bare Fallow in Great Britain
(*Thousands of Acres*)

	Average 1871–75	Average 1921–25	Average 1928–37
Potatoes	623	652	615
Turnips and swedes	2,129	1,249	930
Mangolds	340		258
Sugar beet		23	306
Clover and rotation grasses	4,389	4,017	3,777
Bare fallow		441	393

With the aid of the sugar subsidy sugar beet has become a crop of importance in the last few years.

Yields.—The crop statistics show little change in the productivity of the land since produce statistics were first collected in 1885 (though such figures as were available for the years 1939–42 showed a slight rise in many crops). The Report on the agricultural output of England and Wales, 1927, stated:

"For practically all farm crops except potatoes the period of maximum yield was approximately the ten-year period 1901–10, and especially the latter half of the period, in which it was rare to find any crop yielding in any year less than the average for the previous decade. For this the weather must have been mainly responsible as also for the falling off which occurred shortly before the outbreak of war. Subsequently, yields were probably affected by war conditions owing to the shortage of labour and fertilizers, but since the end of the war there has been an apparent recovery. . . . Although this variation in yields is of interest it appears in the main to be due to climatic conditions over which the farmer has no control. There is no evidence of a general increase in the actual productivity of crops nor the reverse, as one would hesitate to attribute the declining average yields of recent years to any cause other than the weather and to some extent, war conditions. In the case of wheat, beans and mangolds, notwithstanding the decline in recent years, the general level is still well above that of the early years, a condition which does not, however, apply to other crops, particularly barley."

The average yields per acre of the chief crops in Great Britain have been as follows:—

	1885–94	1901–10	1917–26	1928–37
	Cwt.	Cwt.	Cwt.	Cwt.
Wheat	16·2	17·5	17·4	17·9
Barley	15·8	16·0	15·1	16·3
Oats	13·6	14·3	14·0	15·9
Beans	14·0	16·2	15·5	16·3
Seed hay	28.2	30·1	28.8	28·0
Meadow hay	23·9	23.8	21'1	20·1
Hops	7'7	9·0	11·9	12·5
	Tons	Tons	Tons	Tons
Potatoes	5·8	6·1	6.2	6·7
Turnips and swedes	13·1	14·4	13·9	13·2
Mangolds	17·4	20'0	19·3	18·5

Livestock.—With the conversion of arable land to grass livestock have become of increasing importance in the agriculture of Great Britain, but the increase has been confined to cattle. Pigs fluctuated about a mean which showed little change for many years, and then their numbers began to increase rapidly; sheep steadily declined in numbers until quite recently.

Cattle.—Cattle occupy a predominating position in British agriculture, accounting far about 40% of the total output from the farms of Great Britain. In the 50 years from 1871–75 to 1921–25 the total number of cattle increased by 20%, while the increase in the dairy herd was even greater, the addition being nearly 40%. Since then these rates of increase have been maintained. In neither case, however, did the increase keep pace with the increase in population, the number of the dairy herd per 1,000 of population being 10% less and of other cattle about 20% less in the later than in the earlier period. The needs of the increasing population for fresh milk were met by the additions to the dairy herd, but this was not the case as regards butter and cheese, of which more has been imported as the years have advanced. Similarly more and more beef has been imported to supply the increased demand.

The numbers of cattle in Great Britain during the 67 years 1871–1938 have been as follows:—

(*Thousands*)

Average of years	Cows and heifers in milk or in calf	Other cattle	Total cattle
1871–75	2,204	3,609	5,813
1881–85	2,353	3,757	6,110
1891–95	2,562	4,078	6,640
1901–05	2,627	4,147	6,774
1911–15	2,825	4,272	7,097
1921–25	3,053	3,942	6,995
1926	3,207	4,244	7,451
1938	3,576	4,454	8,030

The check in the increase in the number of cattle in 1921–25 resulted from an extensive slaughter of calves at the end of the war food control, due primarily to the decontrol of veal prices in advance of those of other meat, but since 1921 there have been increases each year, and in 1938 the number was the largest ever recorded. The density of cattle on the land is naturally larger in the grass areas of the west of the country than in the east; for example, Norfolk, Suffolk, Essex and Cambridge in England, and Berwick, Roxburgh and Selkirk in Scotland have fewer than 140 cattle per 1,000 ac., whilst the northwestern counties of England and Wales as far south as Salop and Staffs, one or two of the southwestern counties of England (notably Cornwall), and some of the southwestern counties of Scotland have over 300 cattle per 1,000 ac. of cultivated land. The greatest concentration of dairy cattle is in Cheshire, where there are 250 per 1,000 ac. of land, and the group of counties centred on Cheshire—including Flint, Laacashire, Derby and Stafford—forms an area in which dairying is more intensive than in any other part of the country. Somerset, Dorset and Wiltshire in the southwest of England, and Ayr, Lanark and Wigtown in the southwest of Scotland are also areas where dairying is carried on very largely, there being over 150 dairy cattle per 1,000 ac, in each of these counties. Many counties on the eastern side of the country, on the other hand, have fewer than 50 dairy cattle per 1,000 ac. of cultivated land. Increases in the number of dairy cattle have taken place in all parts of the country during the past 70 years.

Sheep.—The number of sheep in Great Britain, though fluctuating to some extent, has on the whole declined during the last 70 years. The ravages of liver fluke and unfavourable weather in the first decade of this period caused a sharp fall which was subsequently partially recovered, while the numbers were reduced very sharply towards the end of World War I, and immediately thereafter, since when there has been a good recovery. Between 1920 and 1926 the flocks of the country were increased by 4,320,000 or 22%. Changes in the number of sheep in different parts of Great Britain have, however, varied considerably, as will be seen from the following table:

	Number of sheep (in thousands)		
	England and Wales	Scotland	Great Britain
1871–75	21,529	7,161	28,790
1881–85	18,431	6,883	25,314
1891–95	19,873	7,409	27,280
1901–05	18,471	7,178	25,649
1911–15	17,859	7,015	24,874
1921–25	14,385	6,826	21,211
1926	16,859	7,203	24,062
1938	17,913	7,969	25,882

During the years covered by the table the numbers of sheep have been maintained in Scotland and increased in Wales, the whole of the reduction being confined to England. A subdivision of the figures for England, however, would show that there was practically no reduction in the northern counties, while in the eastern counties recent numbers were less than one-third those of 1871–75, and in every other part of England except the southwest the decreases were about 50% during the same period. The reduction in the sheep population, therefore, has been most drastic in the arable counties, and sheep breeding has made headway or at least held its own in those areas where costs are low owing to the existence of extensive rough grazings on hill land. The sheep population is naturally most dense in the mountain districts, in several counties reaching up to one per acre of the total agricultural area, including rough grazings, while in some parts of the eastern counties they run lower than one for every 10 acres. In very few counties, however, are sheep much more dense on the ground than in Kent, where there are 110 per 100 ac., the marsh lands of that county being very heavily stocked with sheep.

Pigs.—Since pigs may be bred much more quickly than other farm live stock there are relatively much more rapid changes in the numbers from year to year, and consequently sharper rises

and falls in prices. During the past 70 years the numbers have moved up and down with fair regularity every five years, with little change in the general level.

Number of Pigs in Great Britain

1871–75	2,485,000	1911–1j	2,585,000
1881–85	**2,433,000**	1921–25	2,825,000
1891–95	2,483,000	1926	2,345,000
1901–05	2,491,000	**1938**	3,821,000

Pigs are kept much more largely in the eastern counties of England than in most other districts, though in Cornwall, Kent, Isle of Wight, Cheshire and Flint there are comparatively large numbers. The numbers in Scotland are relatively small; 200,000 was exceeded for the first time in 1934, and in 1938 there were 257,000.

Poultry.—There are many more poultry on the farms of Great Britain than formerly. The earliest figures available relate to 1908, when there were 32,360,000 fowls in Great Britain; in 1926 there were 41,600,000, and in 1938 there were 59,920,000. Lancashire stands easily first in point of numbers, while East Sussex comes second

Value of Agricultural Output.— The Ministry of Agriculture estimated that the value of the farm produce sold off farms or consumed in farm households in 1938 in England and Wales was £224,500,000, and if similar figures were available for Scotland it would probably be found that the value of the agricultural output of Great Britain would be in the neighbourhood of £270,000,000 to £280,000,000. Of this output livestock and livestock products account for the bulk—at least 70%. (For other particulars see AGRICULTURE, CENSUS OF.)

It should be explained that the sums received from the sale of livestock and livestock products have to cover the cost of growing those grain, root and fodder crops used for feeding to livestock, and it is only those proportions of the crops which are sold off the farms which are valued as crops in the above figures.

Sizes of Agricultural Holdings.— The total number of agricultural holdings in Great Britain in 1938 was 439,989, of which about 275,000 were of under 50 ac. of cultivated land. The numbers in each of several size groups are as follows:—

Number and Size of Holdings in Great Britain

Above	1 and not exceeding 5 acres	78,803
"	5 " " " 20 "	109,122*
"	20 " " " 50 "	87,468*
"	50 " " " 100 "	71,715
"	100 " " " 150 "	**37,664**
"	150 " " " **300** "	**41,022**
"	**300** acres	14,195
Total		439,989

*Approximate.

While it is true that there are at least 50,000 and perhaps more than 100,000 holdings of agricultural land which are separately included in the agricultural returns without being economic farm units, since they are small pieces of land attached to residential properties, or detached fields separately returned, etc., the figures in the table indicate the very large number of separate farm units in the country. Since 1895 there has been a fairly steady reduction in the number of holdings, especially in those under 20 ac. in extent, but as very many of these are not economic farm units and there are indications that the number of such holdings has declined rapidly in recent years, it is not possible to estimate whether the number of economic small holdings has increased or decreased. Since 1895 there has been no very marked change in the number of holdings of from 20 to 300 ac., but the number above 300 ac. has declined steadily. **A** classification of the holdings above 20 ac. in extent in England and Wales (excluding certain special types of holding), accounting for over 93% of the whole of the agricultural land, shows that holdings consisting mainly of grass land (70% or over of permanent grass) are the most numerous. Of the total number of holdings about 33%, comprising a fairly similar percentage of the total acreage of cultivated land, are owned by the occupiers.

Persons Employed.— From the statistics which are available it is not easy to arrive at the number of people engaged in agriculture. For example, there are many occupiers of agricultural holdings of an economic nature whose main source of income is from other employment, and they would not describe themselves as farmers in the census enumeration. Further, many workers, especially females, who are employed very largely on farm work describe themselves as general labourers, and in the case of women as married women. It is clear, however, from the population censuses of the past 60 years that the number of persons employed in agriculture (excluding horticulture) in Great Britain has declined considerably, from about 1,500,000 in 1871 to about 1,170,000 in 1931. This reduction was probably the result of several causes, among which the decrease of arable cultivation and the increased use of machinery are no doubt the most important.

Capital Invested.— The capital invested in agriculture in England and Wales was estimated in 1931 at £925,000,000, of which £645,000,000 was the value of the land, including farm houses and buildings, and £280,000,000 the working capital of the occupiers of the iand. Assuming similar figures per acre for Scotland, for cultivated land and rough grazing respectively, the total capital invested in the whole of Great Britain in agriculture would amount to nearly £1,176,000,000.

Agriculture After 1939.—Large quantities of British foodstuffs are normally imported, but one of the effects of the war was to stop or curtail many of these imports. The German occupation of Denmark and Holland in 1940 cut off the principal sources of dairy products, while Australia and New Zealand, other food-supplying countries, were so distant as to make transport uneconomical. Thanks to the Lend-Lease agreement, however, Great Britain was able to secure large stocks of foodstuffs from the United States.

The ministry of agriculture from the outset of World War II was able to apply lessons learned during the unrestricted submarine campaign of 1917, and the need of conserving shipping space for urgent war materials was foreseen. A plowing-up campaign was inaugurated, with the result that by 1942 an extra 6,000,000 ac. (an increase of 50% over the prewar total) had been brought under the plow. The wheat acreage was increased by one-third, and that for oats from 2,500,000 to 4,000,000 ac.; the area under potatoes increased from 700,000 to 1,000,000 ac. There were also by 1942 over 1,750,000 allotments (practically double the prewar figure) and between 2,000,000 and 3,000,000 private gardens growing vegetables.

Production was increased on a comparable scale. The total output of vegetables increased from 2,500,000 to 4,000,000 tons. and sugar-beet production reached the maximum capacity of the existing factories. It was estimated that increased production in 1942 represented a saving of 5,000,000 tons of shipping space.

Problems of labour were to some extent overcome by the increased use of agricultural machinery. The number of tractors in use was increased by more than 50%, with the result that British agriculture became the most highly mechanized in Europe. The Women's Land Army, numbering over 28,000 in 1942, was formed to work on farms, and harvests were gathered with the aid of students and even of prisoners of war.

BIBLIOGRAPHY.—Agricultural: *Journal* of the Ministry of Agriculture and Fisheries; *Occupational Census* (1931); *The Agricultural Output of England and Wales* (1930–31); Astor and Rowntree, *British Agriculture* (1938); A. Smith, *Agriculture's Challenge to the Nation;* Political and Economic Planning; *Agricultural Research in Great Britain* (1938).

Fisheries.— Great Britain's sea fishing industry is among the most important in the world. The principal kinds of fish caught are herring, cod. haddock, plaice and hake, classed as wet fish, and amongst shellfish, oysters, crabs and lobsters. The annual consumption of wet fish is about 40 lb. per head of the population. and with improvements in the methods of preservation (by refrigeration) and transport, consumption should be increased. The principal grounds frequented by British fishermen are the North sea, Iceland, Faroe, south of Ireland, west of Scotland, Barents sea, west of Ireland, Irish sea and English Channel. **A** notable event of 1927 was the opening of new halibut fisheries off the

Greenland coast. This was made possible by the adoption of new methods of brine freezing.

The following table shows the number and total of fishing vessels on the register in Great Britain for certain years from 1913 to 1938. The decrease in total numbers of vessels is to some extent offset by the gradual conversion from sail and steam to motor propulsion.

Fishing Vessels on the Register in Great Britain

Year	Total vessels	Net tonnage
1913	17,465	319,060
1924	16,013	288,960
1930	13,099	179,127
1935	12,583	268,656
1938	11,822	245,404

In England and Wales the number of fishermen employed in sea fishing declined from 45.382 in 1913, to 30,587 in 1937. In Scotland the total number of fishermen and shore-workers also declined from 86,271 to 53,274 in the same period.

The total quantities and values of wet fish and shellfish of British and foreign taking landed in England and Wales for 1913, 1926 and 1938 were as follows:

Years	British taking				Foreign taking	
	Total wet fish		Value of shellfish		Wet fish	
	Quantity	Value			Quantity	Value
	Cwt.	£	£	£	Cwt.	£
1913	16,152,374	10,009,326	327,363	10,336,689	178,668	131,631
1926	12,504,138	12,700,657	501,501	13,202,158	698,227	965,807
1938	15,532,692	12,233,209	408,637	12,641,846	331,704	446,747

The total quantities and value of fish landed in Scotland for the same years were as follows:

Years	Total catch	
	Quantity (excluding shellfish)	Value (including shellfish)
1913	7,828,350 cwt.	£3,997,717
1926	7,402,052 "	4,888,139
1938	5,498,250 "	3,994,954

For 1938 the total figures for Great Britain were as follows:

	Weight	Value
British caught:		
England and Wales	15,532,629 cwt.	£12,233,209
Scotland	5,498,250 "	3,994,954
Shellfish (Great Britain)		488,490
Totals	21,030,942 cwt.	£16,716,649
Foreign caught (including shellfish)	1,701,441 cwt.	£3,170,637

Despite the decline in numbers of vessels engaged in fishing and in the numbers employed, the amount of fish landed showed a tendency to increase during the 20 years before World War II, in spite of the fact that exports of fish declined. Exports are shown in the table below.

Exports of Fish of British Taking or Curing

Year	Quantity	Value
1913	10,998,771 cwt.	£7,503,468
1924	8,142,816 "	8,438,243
1930	7,173,671 "	7,039,973
1935	4,588,064 "	3,750,926
1938	4,381,587 "	3,870,262

The most important factor in the export trade is salted herrings, which represent about 70% of the total. The canned fish industry of the country is peculiar as Britain imports the great bulk of the canned fish (principally salmon and sardines) which is consumed and exports most of what is actually canned in the country—herring. British freshwater fisheries, in spite of serious attempts made between 1914 and 1918, have never contributed substantially to the feeding of our population, though there is a considerable annual importation of eels from the continent.

Very considerable attention has been given since 1919 to research and organization in the fishing industry. A great deal of research was carried out by the government and under government direction (ministry of agriculture and fisheries). Government vessels continuously studied the movements, habits and feeding of fish both inshore and at sea. Research was carried out in hydrography and into methods of capture, into the breeding and cleansing of shellfish, etc. The total amount expended by the state in these investigations in the year ending March 31, 1938, was £20,443.

SECTION 8: SOCIAL AND INDUSTRIAL CONDITIONS

Population and Employment. — On the next page is given a table, based on the decennial censuses, which shows the figures for the total population aged ten years or more and then the number employed. This is followed by a breakdown of the employed population according to the principal branches of industry

In comparing figures for any industry from the different census years account should always be taken of the growth of population. It should also be noticed that 1921, though a depression year, was a prosperous year compared with 1931, and that the fall in 1931, as compared with 1921, which is apparent in some industries, does not reflect normal conditions.

Over the period of 50 years covered by the table there has been an absolute decline in the numbers occupied in agriculture, and a proportionate decline in those employed in fishing and in the manufacture of textiles. That there should be more than proportionate increases in the numbers engaged in the manufacture of chemicals, metals and machines is only natural in view of the increasing mechanization of our civilization.

A more detailed analysis of the census returns has revealed further interesting details about changes in occupation which have a genuine social significance. There has been a marked decrease in the numbers of those engaged in personal services, but considerable increases in those employed in the government service and in providing sport and entertainment.

Distribution of Population. — In 1937 a royal commission was appointed to inquire into the distribution of the industrial population. Its report was not published till 1940 but it sharply focused attention on certain well-known tendencies which had been in progress for over a century. The growth of large cities is not a phenomenon peculiar to Great Britain, but England (as distinct from Scotland) is the most thickly populated area in Europe, and it is necessary for the proper utilization of the natural resources of the country that the spread of population should be controlled.

Two tables from the commission's report are given, showing first the distribution of the whole population and then the distribution of the occupied population. They are best commented on in the terms of the report:

These tables illustrate the outstanding feature of the geographical distribution of the industrial population in modern times, namely, its concentration to an increasing extent in particular areas of the country. The seven specified areas constitute only 27% of the total area of Great Britain. In 1801 they contained about 45% and in 1931 (the latest year for which figures are available) 73% of the occupied population. . . .

Over the 19th century the total and occupied population of all the specified areas, except the Midland group of counties, increased both absolutely and proportionately to the country as a whole. Early in the present century signs of a change began to appear in some areas; both Lancashire and Mid-Scotland lost ground between 1901 and 1911 in relation to the country as a whole. Since the war [of 1914–18]

that experience has become more widespread: between 1921 and 1931 the proportion of the total population declined in Lancashire from **12.6** to **12.3,** in Northumberland and Durham from **4.6** to **4.4,** in Mid-Scotland from **6.2** to 5.8, and in Glamorgan and Monmouth from **3.6** to 3.2. . . . So far as the distribution of industrial population is concerned, those changes are completely overshadowed by the experience of London and the home counties where the occupied population has increased both absolutely and relatively, to a far greater extent than in any other part of Great Britain.

These changes of population reflect economic changes. The continued depression in the special areas, and the decline of coal mining, cotton and shipbuilding, tended to drive workers away from the areas and industries concerned to the southeast where industry was expanding and comparative prosperity was to be found.

Prices and Wages.—Any statistical account of variations in the standard of living must be based on a correlation of prices and wages. The difficulty, however, of carrying such an investigation back for any long period is very great. Economic historians can chart with some degree of reliability the courses of prices, but sheer dearth of information prevents anything but fairly general statements about wages and employment more than a century ago.

Prices.—It is only possible to illustrate satisfactorily the course of prices by index numbers compiled for wholesale prices. It is true that these do not represent the prices paid by the actual consumer, but retail prices fluctuate so much between different localities and even different retailers, that representative data are practically unobtainable, especially for past times. On the other hand, wholesale quotations for the principal commodities are easily obtained. It is thought, however, that retail prices do follow generally the same course as do the wholesale prices.

According to W. T. Layton (*An Introduction* to the *Study* of Prices, **1920,** p. **18)** a comparison of specific wholesale and retail prices, where both sets of figures are available, seems to show that though the fluctuations of retail prices are less violent than those of wholesale prices, the changes in the general level over a long period are always in the same direction and in most cases of the same extent.

The table on p. 724, based on one compiled by Layton (ib. p. **150)** from Jevons's index number from 1800 to 1865, and Sauerbeck's from **1865** to 1914 shows the fluctuation of wholesale prices from 1800 to 1914.

Prices from 1800 to **1820** were abnormally high (the figure of 235 for the year 1800 comparing with 100 of the year 1900) and subject to violent fluctuations owing to the disturbance caused by the Napoleonic wars. The years **1820** to **1825** saw a boom in trade due to the rapid development of transatlantic commerce. This was accompanied by an inflation of credit and deflation of banking reserves, ending in a serious crisis. About 25 years of falling prices followed, until after 1850 an upward movement was started by the discoveries of gold in California and Australia. The continued fall throughout the three last decades of the century is related to a steady decline in the gold output and the gradual adoption of the gold standard by various countries, leading to an increased demand for gold, while the rise in prices after 1900 follows an upward movement in the volume of gold production, due to the development of South African supplies. Intermediate events of note were the world financial crises of 1856–57 and 1863–64, the Overend Gurney failure of **1866,** the Austrian, American and German crises of **1873,** which caused a fall not interrupted till the trade revival of 1879; the French and American crises of **1882** and 1884, the Baring crisis of 1890, followed by an American crisis in **1893,** the effects of which were felt till **1897,** the South African War of 1900, which interrupted this succeeding revival and the steady upward movement of trade and prices from 1903 until the outbreak of World War I, interrupted only by the American financial crisis of 1907.

The effects of World War I require separate mention. During the war the gold standard was abandoned and the currency

divorced from gold. As a result we find that the high level record attained during the Napoleonic wars was easily surpassed (more than 33⅓%) by the figure which was reached in July 1920.

The course of prices since 1920 is shown in a table published in the Ministry of Labour Gazette which shows the average percentage increase on all commodities month by month as compared with July 1914. It should be noted that, since July 1914 equals 100, the comparative figure for any month since 1920 is found by adding 100 to the figure given in the table.

Average Percentage Increases as Compared with July 1914

Year	Jan.	Feb.	March	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
1920	125	130	130	132	141	150	152	155	161	164	176	169

1941	96	97	97	98	100	100	99	99	99	99	100	101
1942	100	100	100	99	100	99						

It will be seen that, apart from seasonal fluctuations, prices fell steadily from the end of 1920 until the middle of 1924. After a slight rise late in 1924 the downward course continued with little interruption until 1935, when they began rising slowly again. This rise continued from the beginning of the war in 1939, but the table shows clearly the results of government efforts first to check any rapid rise in prices and then to stabilize as much as possible the cost of living. Food prices in particular were held in check, and in March 1942 were only 25% above those of the month before the war, the index figure for food alone being 60 on April 1, 1942.

War stabilization of prices was achieved by various means. The board of trade was empowered to fix maximum prices on goods and services, and to limit margins of profit. Rents were also stabilized. The food ministry fixed prices on a wide range of foods, and prices paid to farmers for produce were determined by negotiation with the ministry. Government subsidies, amounting to over £120,000,000 for 1941, helped to make this stabilization possible.

Wages.—Commensurate with the rise in prices during 1914–18, wages rose sharply and continued to do so until 1920, when the average percentage increase over the 1914 level reached 180. From 1921 to 1923 they dropped rapidly and, as the following table shows, remained fairly stable between 1924 and 1938, in spite of serious fluctuations in employment. The table is based on the average for 1924, which is reckoned as 100, and this in turn represents a 70% increase over the 1914 figure, The table gives half-yearly averages.

Index Numbers Showing the General Course of Weekly Rates of Wages (Average for 1924=100)

Year	June	December	Year	June	December
1924	99%	101	1932	95	94%
1925	102	101½	1933	94	94
1926	101½	101½	1934	94%	94%
1927	101	100	1935	95%	96
1928	99	99	1936	98	99
1929	99	98½	1937	101½	103½
1930	98%	98	1938	106	106
1931	97	95%.			

After the outbreak of World War II wages again rose considerably. According to the ministry of labour statistics, the average weekly earnings of all industrial workers exceeded the rates of Oct. 1938 by 30% in July 1940, and by 46% in Jan. 1942. It will be seen that during this period wages rose more rapidly than prices.

Real Wages.—When prices rise rapidly there is a natural tendency for wages to follow them, but, unless they overtake prices, the wage-earner, of course, is no better off for his higher pay. It is worth inquiring in what ways the condition of the British wage-earner substantially changed after the late 1900s, and to do this it is necessary to investigate the relationship between prices and wages in order to discover changes in "real" wages.

In his book already referred to, Layton worked out a table showing the relation between prices, wages and employment for each year from 1850 to 1910. It is now agreed that statistics from 1850 to 1880 are not sufficiently precise for such an attempt, but it is fairly clear that, subject to fluctuations in 1865–68 and 1874–79 especially, real wages rose by about 33% during this period of 30 years. The best and most recent table is given by A. L. Bowley, Wages and *Income Since 1860* (1937), p. 30, which covers the years from 1880 to 1936. This table, on p. 725, takes the year 1914 as 100, gives the index figures for wages and for the cost of living, and correlates the two in a quotient which supplies the index to the real wages.

The changes that have occurred in this period are best summed up in Professor Bowley's own words:

The increase in real wages has at no time in the past 40 years been rapid. Up to the date of the war (of 1914–18) there had been no progress for 15 or 20 years. Over the war period the increase in the average money wage would have been no greater than the rise of prices, if there had not been a shifting of occupations and methods of payment. Since 1924 the rather considerable rise has been because prices have fallen faster than wages. These movements are not enough to account for the progress that is evident to anyone who has observed ehe wage-earning classes during the period. The development of social expenditure . . . has through old-age pensions and the many insurance services beeh an enormous help . . . and the reduction of hours of work in 1919–20 has had far-reaching effects.

The rise in wages, outstripping rising prices, which has occurred since 1938 and which has already been mentioned, has been counterbalanced by increased taxation, compulsory savings and

rationing. which limit the goods that can be purchased. The reduction of unemployment rather than any rise in the standard of living is the principal benefit which wartime conditions have brought to the wage-earners of Great Britain.

Hours **of** Work.—Between 1914 and 1939 the hours of labour were reduced in nearly all industries, the following table given in the *Ministry* of Labour *Gazette* showing the aggregate amount for the whole country:

Year	Approximate number of work-people nhose hours of labour were		Aggregate net increase (+) or decrease (−) in weekly hours
	Increased	Reduced	
1919	1,150	6,305,000	−40,651,000
1920	2,000	570,000	− 2,114,000
1921	31,500	12,900	+ 14,500
1922	16,000	302,700	− 93,000
1923	325,000	9,600	+ 108,750
1924	13,150	16,150	+ 12,500
1925	1,300	3,925	− 11,750
1926	934,200	340	+ 3,984,650
1927	18,700	1,700	+ 59,000
1928	1,400	2,000	− 200
1929	4,050	1,050	+ 8,750
1930	13,175	349,225	− 873,500
1931	294,000	111,000	+ 142,000
1932	6,000	3,750	+ 7,000
1933	2,500	12,500	− 36,000
1934	529	5,000	− 11,500
1935	2,450	43,700	− 153,850
1936	600	160,600	− 804,500
1937	1,500	390,650	− 960,000
1938	1,950	166,650	− 371,100
1939	—	380,000	− 1,380,000

By 1939 the working week had been generally fixed by collective agreement at 44–48 hours for adult males, excluding overtime, and by the Factory act of 1937 at a 48-hour maximum for women and young persons. At the outbreak of war extensions were permitted with the approval of factory inspectors and after consultation with managements and trade unions. At the spring crisis of 1940, the ministry of supply ordered contractors to work a full 7-day week. Most munitions plants worked two 12-hour shifts, or 70–75 hours weekly. There were similar long hours in aircraft factories and shipyards. Only where it was possible to organize a three-shift system was the maximum week limited to 56 hours.

It was found, however, that in spite of these long hours production began to decrease. The causes were fatigue, ill-health and accidents. The Industrial Health Research board reported that there was little gain, and probably an actual loss, if working hours exceeded 60–65 for men and 55–60 for women. Accordingly, the ministry issued a memorandum stressing the need for maintaining maximum production by adjusting hours of labour. They recommended, wherever machines could be run non-stop, the adoption of three shifts and a 55–56 hour week as soon as sufficient skilled labour could be made available. Where it was not available. a 60-hour week was permitted for men, and the provisions of the Factory act were restored for women and young persons, subject to modification in an emergency.

Unemployment.— Between 1900 and 1914 the percentage of workers unemployed had never risen above 8% and the average for the years 1911 to 1914 was under 3%. On the other hand, since 1918 unemployment has been one of Great Britain's most serious problems. Since the Unemployment Insurance act came into operation in Nov. 1920, accurate statistics have been available. From 1923 to 1929 the average number of insured persons unemployed was about 10%; at the height of the depression it rose in 1932 to 21.9%, and by 1936 had only fallen to 13%.

A table (below) issued by the ministry of labour shows the actual numbers of workers included in these percentages and brings the figures down to the end of 1941

It will be seen that unemployment reached its apex in 1932, and that from 1934 to the outbreak of World War II there was slow but steady improvement. After the outbreak of World War II the unemployment figures reached the 1927–28 level, but by 1941 there was less unemployment than at any time since World War I. In some industries. in fact, and particularly in coal mining and shipbuilding, acute shortages of labour were beginning to be felt.

Year	Average numbers on the registers of employment exchanges in Great Britain and Northern Ireland		
	Wholly unemployed	Temporarily stopped	Unemployed casual workers
1926	911,963	448,534	78,256
1927	769,982	278,018	68,144
1928	869,573	309,359	75,972
1929	900,553	268,595	79,440
1930	1,347,840	527,720	98,941
1931	1,994,471	587,719	115,678
1932	2,136,052	574,315	102,675
1933	2,037,517	456,743	94,098
1934	1,763,911	369,002	88,150
1935	1,706,783	312,757	86,581
1936	1,491,051	251,568	79,081
1937	1,284,123	205,369	67,509
1938	1,433,248	380,484	67,625
1939	1,308,212	220,990	60,599
1940	829,458	165,962	39,252
1941	314,507	62,124	14,890

Relief of Unemployment.— Prior to 1911, assistance to the unemployed had only been given by the poor law authorities in the form of relief on the ground of destitution. In that year was passed the first Unemployment Insurance act. It covered only 2,250,000 workpeople, out of some 14,000,000, being confined to the building, woodworking, engineering and shipbuilding trades, which were at that time peculiarly affected by unemployment. The premium under the scheme was contributed compulsorily by the employer, the workman, and the state in equal shares, and benefit was at the rate of 7*s*. per week. *In* 1916 the scope of the act was extended so as to cover certain trades which had been excessively expanded to meet the war emergency, against the anticipated postwar deflation, and in 1918, an emergency act was passed to provide relief for all persons thrown out of employment by the cessation of the war; this scheme was not covered by premium contributions, and it was ultimately succeeded by a new Unemployment Insurance act of 1920. This act covered about 12,000,000 persons, *i.e.*, speaking generally, all industrial workers with the exception of agricultural and domestic employees.

When the act came into force unemployment was increasing and for the next ten years there followed a series of amending acts extending the limits of insurance and making various financial adjustments. To enable benefits to be paid it became necessary for the unemployment fund to obtain loans from the exchequer which ultimately reached £115,000,000. In 1930 a royal commission was appointed to determine whether the fund could become self-supporting and many of its recommendations were incorporated in the Unemployment act of 1934. A consolidating act was passed in 1935, and in the following year unemployment insurance was extended to cover agricultural workers. Further minor modifications and extensions in the scheme were made in *1938*, 1939 and 1940.

Unemployment insurance, which formerly covered all workers earning up to £250 a year was extended to non-manual workers earning up to £420 a year. Contributions to the fund are shared equally by the state, the employer and the worker. A worker's contributions are paid weekly by means of stamps at the following rates:

Class of person	General scheme		Agricultural scheme	
	Males	Females	Males	Females
Aged 21 to 65	10*d*.	9*d*.	3½*d*.	3*d*.
Aged 18 to 20	9*d*.	8*d*.	3*d*.	2½*d*.
Aged 16 to 17	5*d*.	4½*d*.	2d.	1½*d*.
Under 16	2*d*.	2*d*.	1½*d*.	1*d*.

Benefit allowances are not paid until the worker has at least 30 payments to his credit within the maximum period of two years, and the payments made in any one year are limited to *156* days under the general scheme and *300* days under the agricultural scheme. The weekly rates of benefits are as follows:

Class of person	General scheme		Agricultural scheme	
	Males	Females	Males	Females
Aged 21 to 65	20*s*.	18*s*.	18*s*.	15*s*.
Aged 18 to 20	16*s*.	14*s*.	15*s*.	12*s*.
Aged17	9*s*.	7*s*.6*d*.	7*s*.6*d*.	6*s*.
Under 17	6*s*.	5*s*.	5*s*.	4*s*.

In addition, weekly allowances for dependents may be paid. These amount to 10*s*. under the general scheme and 9*s*. under the agricultural scheme if the dependent is an adult; for dependent children the amount is 4s. each for the first two, and 3s. each for others.

Since 1934 there has also been an Unemployment Assistance board, mhich has power to make payments to unemployed persons who are not eligible for benefits under the insurance schemes. Payments are adjusted in accordance with the need of the applicant. The cost of this relief is borne by the exchequer.

There are no exact figures for the number of persons in Great Britain insured against unemployment, but ministry of labour estimates suggest that numbers increased from 11,000,000 in *1922* to 14,000,000 in *1936*. In 1939 the estimate gave 15,157,000 persons in Great Britain and Northern Ireland as insured under the general scheme and 741,000 under the agricultural scheme. The Unemployment Insurance fund, as has already been mentioned, was forced during the depression to obtain advances from the exchequer mhich by 1934 had totalled £115,000,000. This debt was then funded, and more favourable industrial conditions in succeeding years have enabled the fund to show a credit balance. As a result, outstanding debt had been discharged by the end of *1941*. Nevertheless, in spite of the favourable balances the statutory committee in its 1941 report felt that owing to the abnormal conditions of the war and the uncertainty of the future, it could not recommend any improvement in rates or benefits, nor state categorically that the fund was likely to be more than reasonably sufficient to discharge its liabilities.

Employment Exchanges.—In connection with the unemployment insurance scheme the ministry of labour maintains numerous employment exchanges. On becoming unemployed a worker must register at an exchange in order to receive his insurance benefits, and it is the function of the exchange to find him fresh employment as soon as possible. There is a central exchange, and a large number of local agencies, as well as some specialized exchanges for particular types of workers, such as agricultural workers and juveniles who have just left school. The extent of this service, which has been in operation for over *30* years, is shown by the fact that in *1938* a total of 3,191,340 vacancies was notified to the various employment agencies and 2,739,288 were filled.

Mention should also be made of certain subsidiary services provided by the ministry of labour. Where employment is scarce in a worker's district but available for him elsewhere he can be granted fares for himself and his family, and financial aid to meet the cost of removal and resettlement. In addition, the exchange can arrange for him to attend one of its training institutions in order to acquire a new skill if there is little prospect of employment in his normal occupation. After the outbreak of World War II, the problem of transferring workers from peacetime industries to war work assumed large proportions; the ministry's training centres proved inadequate for the numbers of workers involved, and arrangements were made, wherever possible, to train skilled workers in the factories in which they would be employed.

Other Remedies for Unemployment.--Other methods adopted by the state to deal with the problem of unemployment after *1920* included the provision and subsidizing of relief work in various forms. Among the classes of work thus subsidized were road work, land drainage, water supply, forestry, etc. There were also two schemes designed for the general stimulation of trade, viz., the "trade facilities" and "export credit" schemes.

Trade Facilities and Export Credits.—Under the first of these the treasury was empowered to guarantee the interest and capital of loans raised for expenditure calculated to promote employment. The guarantees were mainly confined to public utility undertakings between the years *1921* and *1928*. The total so guaranteed was about £75,000,000 and by March *31*, 1939, the amount outstanding had been reduced to £27,000,000.

The export credit scheme was initiated in 1920, and has been amended several times since then. The board of trade is authorized to grant exporters credits in connection with exports to foreign countries and to insure risks not otherwise insurable on reasonable terms.

After the outbreak of war in 1939 the scheme was extended, not to relieve unemployment but to maintain certain trade relations that were felt to be of importance.

Special Areas.—The unrelieved depression over a long period in the regions of Durham and the Tyneside, Cumberland and South Wales caused them in 1935 to be designated "special areas." Commissioners were appointed to superintend and organize relief work, and between 1935 and 1939 over £16,000,000 had been spent on various schemes initiated by the commissioners. New industries were brought to the depressed areas under subsidy, and numerous schemes for public works have been developed.

Emigration.—It has been pointed out by some authorities that the phenomenally high unemployment figures of the between-wars period were due in some measure to the natural increase of population and the decline of emigration. The ministry of labour's statistical survey of 1927 stated that, in spite of increased numbers of unemployed during the previous decade, the actual number of workers in employment was higher than it had ever been before. If there had been emigration on the scale of the years before 1914, the available supply of labour in Great Britain might even have been inadequate for the needs of industry at that time.

Figures are given on p. *727* showing the relation of outward to inward British passengers in the traffic between the United Kingdom and countries outside Europe.

The decline of emigration after 1919 was largely due to restrictions on immigration imposed by the United States and the dominions. The United States Immigration act of 1924 imposed a rigorous quota on the number of immigrants admitted in each year, and the dominions strongly opposed unrestricted immigra-

Excess of Outward over Inward British Passengers in Traffic Between the United Kingdom and Extra-European Countries

1911	261,809	1928	82,830
1912	268,485	1929	92,537
1913	241,997	1930	23,540
1919	27,002	1931	−35,429
1920	172,747	1932	−48,906
1921	118,938	1933	−28,839
1922	99,882	1934	−12,573
1923	190,383*	1935	−11,101
1924	88,441	1936	− 9,786
1925	77,098	1937	− 4,033
1926	103,962	1938	2,734
1927	87,504		

*From April 1, 1923, exclusive of passengers who departed from or arrived at ports in the Irish Free State

tion on the ground that it would be liable to disturb their internal economies.

It is noteworthy that from 1931 to 1937 there were more arrivals in than departures from Great Britain. This reversal of a century-old trend was due to the fact that the depression was world-wide and that emigrants who had been unable to succeed abroad tended to return home.

Health Insurance and **Old Age** Pensions.—National health insurance for workers, and old age, widows' and orphans' pensions are closely linked together in Great Britain owing to the fact that a weekly contribution entitles the worker to the benefits of both schemes, although they are administered separately.

In the 18th and 19th centuries the principal means available to the worker for insuring himself against sickness or other disabilities was to become a member of a friendly society, to which he paid his regular contribution. But friendly societies were only for the better-paid and more thrifty workers; for the less fortunate there was nothing but charity and poor law relief. By various acts of parliament between 1911 and 1936 national health insurance has been made compulsory for workers, and all workers earning less than £250 a year between the ages of 14 and 65 are members of the scheme.

Benefits are obtainable through the local authorities or through the friendly societies, which have been incorporated into the plan. They include (1) medical benefit, consisting of free medical treatment and medicines; (2) payments during incapacity from work owing to illness to the extent of 15*s*. a week for men, and 10*s*.–12*s*. a week for women; (3) disablement benefits of 7*s*. 6*d*. a week for men and 5*s*.–6*s*. a week for women; and (4) a maternity benefit of 40*s*. to an insured woman or wife of an insured man.

Contributions to the National Health Insurance fund are made in equal amounts by employer and employee, and the state adds an additional amount equivalent to one-seventh of the receipts on behalf of men and one-fifth of those for women. The fund has shown a surplus since its inception. The estimated number of workers insured in Great Britain increased from 16,019,000 in 1924 to 21,127,000 in 1938. The receipts of the fund in 1938 were £44,217,000, and the amount expended on benefits and administration was £5,976,000. At the end of the year the fund had an accumulated balance of £143,619,000.

The first Old Age Pensions act was passed in 1908 and it provided a pension of 5*s*. a week for old people over the age of 70. In 1925 the first contributory scheme for pensions was introduced and it has been extended by various acts of which the latest was passed in 1940. Pensions of 10*s*. a week are payable to an insured man when he reaches the age of 65 and to his wife when she reaches the age of 60; insured unmarried women become eligible for pensions at the age of 60. Pensions are also paid to widows of insured men, with additional allowances for children under the school-leaving age, and to orphans. Supplementary pensions of varying amounts are paid to pensioners requiring additional assistance providing that they can establish their need.

By an act of 1937 the pension scheme was extended to so-called "black-coat" workers, but on a voluntary basis. Those whose incomes are less than £400 a year are eligible to contribute.

In 1938, 20,678,499 persons in Great Britain were contributing to the pensions scheme, and 1,945,509 were receiving benefits under it. In the same year the pensions service was costing £48,158,951, of which £17,000,000 came from a parliamentary grant.

The worker's weekly contribution to the combined health insurance and pensions scheme is 11*d*. for men and 8½*d*. for women. A similar amount is contributed by the employer.

SECTION 9: HOUSING

One of the greatest social problems has always been to ensure that an increasing population was adequately housed. Even before 1914 British housing fell sadly short of the ideal standard. According to the census of 1911 no fewer than $\frac{1}{10}$ of the population were living in overcrowded conditions, *i.e.*, more than two to a room (including living rooms). The shortage extended to both town and country and in addition a number of the working class houses in occupation were dilapidated and insanitary, large areas in many cities being characterized as slum areas. At the end of World War I, there was estimated to be a shortage of houses of between 300.000 and 400,000, in addition to considerable arrears of work to be done in slum clearance and making good defective dwellings. This deficit had arisen from two causes. There had been a distinct slowing up of the normal rate of building from 1910 to 1914, and during the war very few working class houses were built at all. The estimated normal annual requirements to meet the natural increase of the population are 70,000 new houses and 30,000 to replace those which go out of use for various causes.

The position at the conclusion of hostilities was further complicated by the great shortage of building materials and building trade workers, with a concomitant rise in the cost of building. Therefore not only was there a severe shortage of houses, but it seemed impossible that houses to make good this shortage could be supplied by normal methods at rents which would be within the means of the working classes to pay and which would adequately remunerate the capital expended. It was generally felt that to leave the solution of this problem to the play of ordinary economic forces would involve an intolerable strain upon the health and social stability of the nation and it became necessary to take special measures. Local authorities had already under existing legislation (the principal acts being the Housing act of 1890 and the Housing and Town Planning act of 1909) considerable powers of providing for the working classes, and improving the standard of existing houses. On July 31, 1919 was passed a new act, mhich completely transformed the position of those authorities, converting what had been a power into a positive obligation, and enabling the state to reimburse them all expenditure exceeding the produce of a penny rate, incurred for this purpose.

Since 1920 there has been a series of housing acts, but it can be stated that housing policy between 1920 and 1938 falls into two periods. In the first, which extended up to about 1930, housing was encouraged by means of government subsidies mhich were granted not only to local authorities but to private enterprise as well. By the end of 1928 a total of 826,973 subsidized and 447,127 unsubsidized houses had been built. In spite, however, of so much building, it gradually became apparent that most of the new houses were being let at a rental beyond the means of most labourers, and in 1931 the ministry of health reported that:

> The policy previously followed by all governments had been to concentrate almost exclusively on the provision of new houses in order to increase the total pool of accommodation available for the working classes. While a limited amount of slum clearance was undertaken . . . there is a considerable amount of evidence, in the reports of medical officers of health, and elsewhere, that there has been discouragingly little improvement in the worst cases of overcrowding and unhealthy conditions.

From 1928 onwards increasing financial stringency was felt, and the subsidies were gradually withdrawn. First, in 1928 and 1929 they were withdrawn from private enterprise; then, in the next year they were withdrawn from the local authorities for all dwellings except "class C" houses, or cheap houses which could be rented to the poorest classes. Finally, in 1933 all subsidies except those which would make slum clearance possible were stopped.

Nevertheless, more new houses have been built in Great Britain

since the withdrawal of subsidies than during the subsidy period. Tuo factors made this possible. In the first place, the depression had lowered building costs. Secondly, after the abandonment of the gold standard, the bank rate had been lowered from 6% in Sept. 1931, to 2% in June 1932, and this had been followed by an all-round drop in the rates of interest. In spite, therefore, of the depression and of the withdrawal of subsidies there was an actual increase in the numbers of houses built instead of a decrease, and there is little doubt that the prosperity of the building trade was one of the decisive factors in bringing about Great Britain's recovery from the depression.

The following table will illustrate the developments to which reference has just been made. It gives the numbers of houses built in each year, and classifies them so as to show whether they were built by local authorities or by private enterprise, and whether they were subsidized or unsubsidized. The number of new dwellings built between 1920 and 1939 reached a total of over 4,000,000.

Number of Houses Built with and without State Assistance in Each Year, 1920 to 1939

Years ended March 31	Houses built by local authorities	Houses built by private enterprise: With state assistance	Houses built by private enterprise: Without state assistance	Total
	England and Wales			
1921	16,000	12,000	6,000†	34,000

NOTE.—For the purpose of this return each self-contained flat or tenement in a multiple building is counted as a separate house.

*Houses built with state assistance. Information is not available in regard to the number of houses built by local authorities without state assistance in these years.

†The figures in this column exclude houses having a rateable value exceeding £78 (or £105 in the Metropolitan police district).

‡Inclusive of houses built by the Second Scottish National Housing company (Housing Trust, Ltd), on behalf of government: 1,632 in 1927, 910 in 1928, and 10 in 1929.

§This figure includes 260 houses built under guarantee under Section 3 of the Housing (Financial Provisions) (Scotland) Act, 1933, and is for the year to March 31, 1935.

The next two tables show the expenditure on housing of local authorities. The first gives the capital expenditure, the second the expenditure from revenue.

Expenditure from Capital

Year	Amount	Year	Amount
1918–19	£ 131,717	1928–29	£38,087,741
1919–20	4,843,448		42,935,207*
1920–21	52,209,923	1929–30	42,803,395
1921–22	81,725,737	1930–31	37,402,116
1922–23	29,644,503	1931–32	39,599,874
1923–24	11,303,043	1932–33	28,240,994
1924–25	24,034,123	1933–34	30,642,799
1925–26	46,967,785	1934–35	29,321,175

1935–36	7,509,287	29,666,156	37,175,443
1936–37	7,879,761	30,245,304	38,125,065

If the housing problem became acute as a result of World War I, World War II produced many more problems. Evacuation and the attempt to shift sections of the populace to less populated regions led to overcrowding where none had existed before, and many adjustments were necessary. Far more serious was the bombing of Britain at the end of 1940 and early in 1941. It was officially stated in June 1942 that of the 13,000,000 homes in Great Btitain one in every five had been damaged or destroyed by bombs. Inevitably, too, undamaged houses suffered for lack of essential repairs, since demolition or repairs to damaged houses had to come first. Postwar Britain faced a rehousing problem of unparalleled magnitude.

Under the War Damage act of 1941 the government set up the War Damage commission and introduced a system of compulsory insurance. The act was made retroactive so that it should cover all damage since the beginning of the war. Premiums equivalent to half the annual rateable value, but payable over five years, covered the period from Sept. 1939 to Aug. 1941, and later the risk period was extended to the end of Aug. 1942. If the building is a total loss, compensation is withheld till after the war with interest accruing at 2½%. If the building is not a total loss the War Damage commission pays the cost of repairs. But payment of compensation and repairs are governed by public interest in relation to town and country planning, and the commission works in close touch with the reconstruction authorities. In certain areas of London, Liverpool and Birmingham substantial repairs were forbidden so that replanning schemes after the war might be facilitated.

SECTION 10: SAVINGS INSTITUTIONS

Apart from deposits in the joint-stock and other banks and in building and co-operative societies, and investmehts in securities and property of all kinds, British savings are held in three main forms, namely, deposits at the trustee savings banks, the post Office savings bank, and the holdings of savings certificates. The establishment of the savings bank in Great Britain dates from the

year 1799, when the first private bank was founded The post office savings banks were founded in **1861,** at which date there were over £40,000,000 invested in the trustee banks. The government institutions gradually overhauled the other system, and st the end of the century, whereas the trustee: banks had only increased their deposits to about 50 millions, the post office banks had over 140 million deposits.

The intermediate development of the post office savings banks is shown by the following table:—

Year ending December 31	Average number of accounts	Average amount of deposits	Average balance in each account	Average number of offices
		£	£	
1863–68 . .	663,000	7,000,000	11 3 5	3,290
1869–74 . .	1,373,000	18,000,000	13 5 3	4,498
1875–80 . .	1,889,000	29,000,000	15 12 5	5,742
1881–85 . .	3,088,000	42,000,000	13 11 3	7,348
1886–90 . .	2,248,000	59,000,000	13 16 10	9,025
1891–95 . .	5,776,000	83,000,000	14 7 0	10,888

In 1938, the last year for which figures covering the United Kingdom are available, 30,820,000 deposits were made, and in the same year the withdrawals numbered 17,804,000. The interest credited to depositors was £11,803,000, and the total sum standing to their credit at the end of the year was £509,293,000.

The following are the figures for the total amount standing to the credit of depositors in the United Kingdom at the end of 1914 and in certain succeeding years:

Post Office Savings. Amount Due Depositors

Year	Amount	Year	Amount
1914 . . .	£190,533,000	1931 . . .	£289,441,000
1918 . . .	234,633,000	1933 . . .	326,654,000
1921 . . .	264,157,000	1937 . . .	470,495,000
1923 . . .	273,071,000	1938 . . .	509,293,000
1925 . . .	285,491,000		

In 1916 the national savings movement was instituted. The instrument adopted was the "war savings certificate," a government security, registered and non-negotiable, and accumulating compound interest over a fixed period free of income tax. After the end of the war the war savings committee and war savings certificate dropped the word "war" from their titles and became part of a national savings organization which now embraces local committees, savings associations, regional conferences and a national savings assembly which meets annually. The certificate costs 16*s.* and its value after ten years is 24*s.* Certificates are repayable at any time at the option of the holder, but owing to the exemption from income tax, it has been thought necessary to limit the individual holding to £500. The following figures show the actual amounts subscribed under the scheme year by year. and the net amounts subscribed after deducting repayments:

Savings Certificates Issued up to March 31, 1939

Period	Actual amount subscribed at 15*s.* 6*d.* or 16*s.* per certificate	Net amount subscribed after deducting payments
April 1, 1927 to March 31, 1928 . .	£37,408,766	£ 9,375,549*
" 1, 1928 " " 31, 1929 . .	41,873,775	1,209,468*
" 1, 1929 " " 31, 1930 . .	42,099,160	3,197,595*

GREAT CIRCLE. The circle in which a sphere is cut by a plane is called a "great circle," when the cutting plane passes through the centre of sphere. Treating the earth as a sphere, the meridians of longitude are all great circles. Of the parallels of latitude, the equator only is a great circle. The shortest line joining any two points is an arc of a great circle. For "great circle sailing," *see* NAVIGATION.

GREAT DIVIDING RANGE, a name given to the eastern and southeastern highlands of Australia. It is applicable in so far as it forms the main watershed between coastwards and inward-flowing drainage on these sides, but misleading in that the highlands in question are a belt of plateaus rather than mountain ranges in the ordinary sense. (See AUSTRALIA.)

GREAT FALLS, the second largest city of Montana, U.S.A.. 110 mi. N E. of Helena, at an altitude of 3,333 ft., on the Missouri river, opposite the mouth of the Sun river, 12 mi. above the falls of the Missouri (92 ft. high) from which it derives its name; a port of entry and the county seat of Cascade county. It is on federal highways 87, 89 and 91, and is served by the Chicago, Milwaukee, St. Paul and Pacific and the Great Northern railways There is an airport. Pop. (1940) 29,928. The area of the city is 8.35 sq.mi. It has a fine system of parks, connected by 74.4 mi. of boulevards. The assessed valuation of property in 1940 was $94,826,362. The region is rich in minerals of many kinds, including oil, and is the most productive agricultural and stock-raising area of the state. Great Falls is an important distributing, commercial, financial and manufacturing centre. It is the headquarters of the customs district of Montana and Idaho. Bank clearings for 1940 were $44,428,371. There is a federal land office in the city. Of 348,000 potential h.p., 235,000 has been developed. The manufacturing industries include oil refineries, railroad shops, packing plants and the electrolytic plant of the Anaconda Copper Mining company, which performs the final step in the process begun at the reduction works in Anaconda on ores from the Montana and Idaho mines, zinc plant and a wire mill, as well as two flour mills, two bakeries, two breweries, or a total of 49 miscellaneous manufactures.

The retail sales in 1939 were $20,422,000; wholesale sales, $15,808,000.

Lewis and Clark visited this neighbourhood in 1805, and held here the first 4th of July celebration west of Lake Superior. The city was founded in 1883. by Paris Gibson of St. Paul, Minn., and was incorporated in 1888. Near by are the four falls of the Missouri river, the Belt mountains and the Sun River valley. Within 40 mi. are the Lewis and Clark and the Jefferson national forests. Near the city is Giant springs, one of the largest in the world, which has a daily flow of 388,000,000 gal. of water, at a temperature of 52° F. the year round. Great Falls has a civic centre with an auditorium, an arena with ice rink and an exhibition hall. All city administrative offices are housed in this building.

GREAT HARWOOD, urban district, Clitheroe parliamentary division, Lancashire, England, 4½ mi. N.E. of Blackburn, on the L.M.S. railway. The population of Great Harwood in 1938 was 11,040. Area, 4.48 sq.mi.

The inhabitants are employed in cotton mills and collieries in the vicinity.

GREATHEAD, JAMES HENRY (1844–96), British engineer. was born at Grahamstown, South Africa, on Aug. 6, 1844. He learned the shield system of tunnelling which bears his name from P. W. Barlow, who proposed to build underground railways in London on this system. In 1869 Greathead built a subway under the Thames near the Tower. He invented, among other things. the "Ejector" fire-hydrant. The Greathead shield system was used in constructing the City and South London railway, which was opened in 1890. Greathead was also concerned with the Waterloo and City and the Central London underground railways He died at Streatham, London, on Oct. 21, 1896.

GREAT LAKES, THE. The Great Lakes and their connecting waterways are in general along the boundary between the United States and Canada between 75° and 92° W. of Greenwich. In 1909 the United States and Great Britain signed a treaty known as the "Boundary Waters Treaty," whereby the waters between the United States and Canada were guaranteed free and open to the inhabitants of both countries on equal terms, and principles governing the use of boundary waters were laid down. An international joint commission consisting of three members from Canada and three members from the United States was established. Neither the United States nor Canada has found it necessary or desirable to organize any defences on the boundary between the two countries or maintain ships of war in the Great Lakes for over 100 years. The channels in the connecting waterways and the sailing courses in the open lakes cross and recross the international boundary many times.

The Great Lakes and their connecting waterways are the most important unit of inland waterway transportation in the world, and have been of great economic importance in the development of the North American continent. Their drainage basin has an area of about 300,000 sq.m., approximately 60% lying within the United States. The water surface of the lakes and rivers themselves covers 96,000 square miles. The total distance, measured along the steamer track from Duluth to the outlet of Lake Ontario, is 1,160 miles. Their outlet to the Atlantic ocean is through the St. Lawrence river.

Dimensions, elevations and other descriptive details of each of the lakes and connecting waterways are given in the following table, the data being derived from the bulletin and charts of the U.S. Lake Survey:

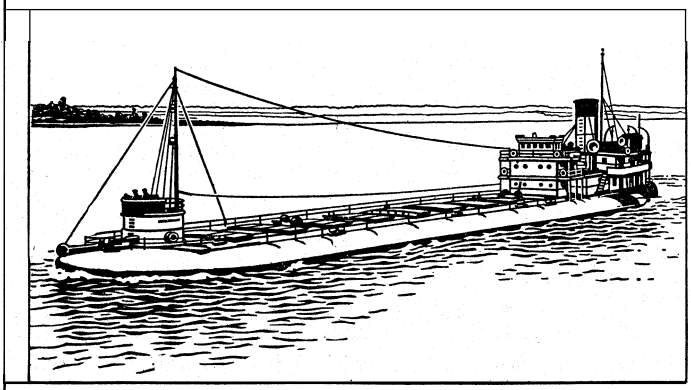
Lakes	Length	Width	Area of water surface	Total area of basin	Maximum recorded depth	Mean elevation approved low water datum	Ordinary fluctuations; water surface	Average date of opening of navigation	Average date of closing of navigation
	Miles	Miles	Square miles	Square miles	Feet	Feet	Feet		
Superior	350	160	31,810	80,700	1,180	601·6	2·5	April 23	Dec. 9
Michigan	307	118	22,400	69,040	870	579.6	2.8	April 12	Dec. 15
Huron	206	101	23,010	72,600	750	579.6	2.6	April 6	Dec. 17
St. Clair	26	24	460	6,420	26	573·8	..	March 30	Dec. 18
Erie	241	57	9,940	34,690	210	570·8	3·0	March 29	Dec. 17
Ontario	193	53	7,540	34,640	738	244·5	3'3	April 5	Dec. 18

Rivers	Length	Least width	Greatest width	Limiting depth at low water	Current in navigated portions	Discharge at mean stage
	Miles	Feet	Feet	Feet	Miles per hour	Cubic foot seconds*
St. Mary's	63	300	24,000	21	1–3½	..
Straits of hiackinac	30	10,900	100,000	110	..	47,000
St. Clair	40	800	5,100	20	1–5	203,000
Detroit	31	1,900	19,000	22	1–6	208,000
Upper Niagara	20	1,500	8,000	10–23	1–7	207,000
Lower Niagara	15	210	2,600	30	1–2½	207,000
St. Lawrence (to Montreal)	179	1,200	40,000	14	1–6	240,000

*In its original condition the mean stage discharge of the St. Mary's river was about 78,000 cu.ft. per second. The flow of this river is now entirely controlled by regulating works.

Traffic. — During the 1926 navigation season 137,000,000 tons of freight, valued at over $2,000,000,000, moved over the Great Lakes. This commerce consists primarily of bulk freight such as iron ore, wheat, limestone and coal. The cost of transporting freight on the bulk carriers of the Great Lakes is cheaper than that of any other inland transportation for equal haul in the world. Freight rates are from one-seventh to one-tenth of the rates per ton mile for similar transportation on the railroads of the country. The tonnage passing through the locks at Sault Ste. Marie is steadily increasing. The average for the years 1922–26 was 80,000,000 tons, while for the years 1917 to 1921 it was 74,000,000 tons. In 1926 it amounted to a total of 85,679,087 tons of freight, valued at $1,063,875,987. Of this traffic 10,374,000 tons was down-bound grain, 57,549,700 tons was iron ore down-bound, and 14,439,000 tons was coal up-bound. About 50% of the grain, 1% of the iron ore and 5% of the coal was carried in Canadian vessels, the remainder in vessels of the United States. Traffic through the Detroit river in 1926 amounted to 95,003,604 tons, valued at $1,179,944,762. Package freight has not developed in anything like the same proportions as has bulk freight, the total on the lakes averaging about 2,500,000 tons per annum.

Connecting Waterways (*see* table). — The critical points in the navigation of the lakes are the connecting waterways. The channels in their waterways are exceptionally free from silting. Periodic dredging is necessary at a few localities only. On account of the great volumes of commerce, and of the many miles of channel with a narrow margin between keel and channel bottom, extensive sweeping is done annually to ensure that channels in hard bottom are free from accidental obstructions. The Lake Carriers' Association, a federation including nearly all the owners of freight-carriers on the lakes, have formed an efficient system of communication and supervision which permits them to take advantage of water conditions and load their vessels to the greatest possible depth. The deepening and widening of the connecting channels authorized some years ago have practically been completed; and at many of the most critical points, such as the Neebish channels below Sault Ste. Marie and the channels between Lakes Huron and Erie, separate up-bound and down-bound passageways are maintained. On the upper lakes the minimum width of channels used for two-way traffic is 500ft., whereas 300ft. is the least width of channel now used for one-way traffic. Towards the close of the navigation season, the blockade of one-way chan-



BY COURTESY OF THE CANADIAN NATIONAL RAILWAYS

WHALE-BACKED OIL-TANKER SPECIALLY BUILT FOR THE GREAT LAKES
Ships of 10,000 tons' capacity traverse the Great Lakes, the annual shipping through the Sault Ste. Marie canal being greater in tonnage than that through the Suez canal. A distinct type of ship, similar to that shown, has been evolved for carrying oil, grain and mineral ore on the lakes

nels in the St. Mary's river by ice is a fairly frequent occurrence.

The excavated portions of the channels have an aggregate length of about 82m., much of which is in rock and boulder bottom. Their cost to June 30, 1927, including the cost of St. Mary's Falls canal and locks, but excluding maintenance, has been $44,754,832.83. The project depths of these channels range from 20 to 23ft. below datum. The only portions having a project depth of 20ft. lie in soft bottom, and in these reaches the available depth has been increased by the wash from the propellers of the procession of vessels passing through them. Little if any of the channel has actually a depth less than 21ft. below datum. The dimensions of the locks in the St. Mary's Falls are as follows:

Name of lock	Length between gates	Usable length	Width	Depth on upper sill	Depth on lower sill	Lift
Weitzel* .	515	480	80 60 at gates	16	12·6	20·5
Poe . .	800	773 to lower gate 677 to intermediate gate	100	22	18	20·5
Davis .	1,350	1,300	80	24·5	24·5†	20·5
Fourth .	1,350	1,300	80	24·5	24·5†	20·5
Canadian	900	860	60	18·2	18·2	20·5

Note (1) All lengths are given in feet.
(2) All depths and lift are in feet and are referred to datum, which is 601·1 above and 580·6 below the locks, respectively, corresponding to Lake Superior datum of 601·6 and Lake Huron datum of 579·6.
*Not used at present.
†Depth over lock floors, which are higher than lower sills.

The total expenditures by the United States upon connecting channels and harbours, amounting to over $160,000,000, are more than paid for each year by the present savings in transportation costs effected.

Studies made in 1928 by the U.S. war department will undoubtedly lead to the deepening of inter-lake channels, but no work has been authorized by the U.S. Congress. To deepen all down-bound channels to permit their use by vessels of 24ft. draft when lake levels are at datum will cost about $26,000,000. Up-bound channels will cost $11,000,000 for similar deepening. The costs for 22ft. draft are $16,000,000 and $7,000,000 respectively.

Between Lake Erie and Lake Ontario where the Welland canal overcomes the falls and rapids of the Niagara river navigation is still restricted to a 14ft. draft. This canal has 25 lift locks, with a total lift of 326¾ feet. These locks are each 270ft. long (usable length about 2jjft.) by 45ft. wide, and were designed to have 14ft. depth on the sills. The Dominion of Canada is now constructing a new Welland canal which will admit the largest existing lake freighters. The southern portion of the new canal is chiefly an enlargement of the old canal. The northern portion follows a new location entering Lake Ontario at Port Weller about 3m. E. of the terminus of the old canal. The new canal will be a5m. long, with a total lockage of 326½ feet. It will have four single locks, one flight of three double locks, and one guard lock. The locks have a usable length of 820ft., a clear width of 80ft., and 30ft. depth of water on the sill at lowest lake stages. All locks have a lift of about 46 feet. The gates are of the mitring type. The canal prism is 200ft. wide at the bottom, 310ft. wide at the water line, and from 25 to 26½ft. deep at low water. All masonry structures are so designed as to allow an ultimate deepening to 30ft. at low water. The estimated total cost of the canal is $115,600,000. The construction of this canal was commenced in 1913. It was largely suspended during the World War, but was later resumed, and it is estimated that the canal will be opened to navigation about 1930.

In the past more than 90% of the freight movement of the Great Lakes and all of the large vessels have been confined to the lakes above the Niagara river. The opening of the new Welland canal will admit the largest freighters to Lake Ontario and the St. Lawrence river above Ogdensburg and open these waters to the highly developed commerce of the upper lakes.

Harbours.—Originally the mouths of rivers were used as harbours on the lakes. It was necessary to dig out the bars which usually formed at the lake entrance, and later piers were constructed at river mouths which contracted the area of flow and tended to keep the channels scoured out. Still later, breakwaters were built in the lakes to protect pier entrances from wave action. As conditions became more congested in the rivers, the breakwaters were extended to form large outer harbours. These structures were originally stone-filled timber cribs, the tops of which, after the timber decayed, were replaced by concrete or stone. The more recently constructed breakwaters are formed of a line of concrete caissons sunk side by side, or of a long rubble mound composed of stones varying from half a ton to 10 and 12 tons in weight, more or less carefully placed. Some of these outer harbours are as much as four and five miles long and afford ample protection to the largest lake vessels. Maintenance dredging must be carried on at all times in most of the harbours of the Great Lakes. About 65 harbours on the upper lakes jexciuding Lake Ontario) have an authorized project depth of 19ft. or more at low water; many others have been improved so as to be available for smaller vessels.

Carriers. — The aggregate gross registered tonnage in 1927 of the entire lake fleet, including both United States and Canadian vessels, vessels in the package and automobile trade, barges, etc., but excluding passenger steamers and car ferries, is given in the report of the Lake Carriers' Association as 2,887,427 gross registered tons. The number of vessels was 765. During the five year period 1922–26 there were built 30 new bulk freight-carriers with a carrying capacity, on 20ft. draft, of 395,192 net tons. During the same period 12 steel bulk freighters were lost on the lakes, eight of which had a carrying capacity in excess of 3,000 gross tons each. The standard bulk freight-carrier on the lakes (except Ontario) is a vessel with machinery in the stern, navigating bridge far forward and quarters for crew both forward and aft. The vessel is long, narro and deep, with maximum possible cargo capacity for its displacement. The cargo is open, without intermediate decks, but is usually divided into three compartments by cross bulkheads. Cargo is handled through large hatches extending nearly full width of the deck spaced uniformly at 12ft. or 24ft. centres. This type of freighter is generally regarded as the most economical bulk freight-carrier yet devised and while admirably suited for the lakes' trade is not suitable for ocean navigation. The standard bulk freighter has no equipment for handling cargo although some self-unloaders, largely used for carrying limestone, have been developed. The larger freighters have engines of about 2,500 h.p. and are designed with a cargo-carrying capacity of from 13,000 to 15,000 net tons and for a speed of about 10·5 statute miles per hour. The largest boat on the lakes in 633ft. long, 70ft. in beam and 29ft. moulded depth. Except for several motor ships with diesel engines there has been no marked change in the type of freighters built in recent years. The highly specialized freight-handling equipment at the terminals has resulted in remarkable economies in loading and unloading and quick turn round for vessels. The record for handling cargo between shore and ship is 16½min. for loading 12,508 tons of ore, and 3hr. and 5min. for unloading the same cargo. The package and passenger-carrying steamers are in general of the same design as boats in coastwise service along the Atlantic seaboard. The car ferries are strongly built and maintain service throughout the entire year.

About 30 important passenger lines are in regular operation upon the Upper Great Lakes, exclusive of the companies operating day-excursion boats and passenger ferries. Most of these lines operate only during the navigation season, although in certain instances, notably in the case of the Pere Marquette Line steamers which operate across Lake Michigan, passenger service is maintained throughout the year. Several of the lines offer especially good passenger accommodations and attractive long-distance cruises. Other lines operating between important cities, notably those running between Detroit, Cleveland and Buffalo, in overnight

service, carry a heavy passenger traffic in luxurious boats, some of which are of exceptionally large size. Two of the latest passenger steamers, the "Greater Detroit" and "Greater Buffalo," are said to be the largest inland waterway passenger steamers in the world. They are steel vessels of the side-wheel type, 550ft. length overall; width, over guards, 100ft.; draft, 16ft.; speed, 21 statute miles per hour. Sleeping accommodations are provided for 1,200 passengers. These boats are in operation between Detroit and Buffalo. Passenger steamers usually have accommodations for automobiles and for a limited amount of express freight.

Diversions.—The period of low rainfall occurring during the years just prior to 1926 brought down the levels of the lakes and with other factors created new low levels. The minimum recorded monthly mean levels during the navigation season since 1860, taking the latter as from May to November inclusive, were as follows:

	Low level	Standard datum
Lake Superior (May 1926)	600·2	601·6
Lake Michigan . (Nov. 1925)	577.7	579·6
Lake Huron . (,, 1925)	577·7	579.6
Lake Erie (,, 1925)	570·45	570·8

For all the lakes except Lake Superior the standard datum planes are two feet below the mean level of these lakes for the period 1860–75. The datum plane for Lake Superior is one foot below the mean level of that lake for the same period. The datum planes were intended to represent low-water conditions, but not the extreme minimum lake levels during the navigation season. At the time of their adoption the minimum recorded monthly mean levels during the navigation season had been below datum as follows: on Lake Superior 0·8ft., Lakes Michigan and Huron 0·5ft., Lake Erie 0·1ft. and Lake Ontario 1·1 feet.

The effect of the present diversions and outlet changes is estimated as follows:

Cause	Amount of diversion cubic feet per second	Effect, in feet, on levels of lakes	
		Michigan Huron	Erie
Diversion Chicago sanitary district and City of Chicago (average 1921–25) .	8,660	−0·5	−0·4
Welland canal . .	3,100	−0·04	−0·15
Black Rock canal . . .	1,000	−0 01	−0 0j
Changes in St. Clair river .		−0·6	
Total		−1·15	−0 6

Upon the opening of the new Welland ship canal the lowering of Lake Erie, due to increased diversion for navigation purposes, will be increased to 0·7 foot. Any additional deepening of channels in St. Clair river will further lower the levels of Lakes Huron and Michigan.

A dike on which sluice gates are installed has been constructed across the St. Mary's river near Sault Ste. Marie. The gates, are operated under the supervision of an international board of control in order to maintain water-levels in Lake Superior and to compensate for diversions on both the Canadian and the American sides at Sault Ste. Marie for power purposes.

The construction of compensating works in the Niagara and St. Clair rivers, designed to raise the level of Lake Erie by 0·7 foot and of Lakes Huron and Michigan by one foot, have been recommended by a joint board of engineers appointed by the Canadian and U.S. Governments. The locks include a series of submerged rock sills in St. Clair river with crests 31ft. below datum, and a timber crib dike, stone weir and submerged rock sills in the Niagara river.

The question of diversion of water from Lake Michigan into the Chicago drainage canal for the purpose of sewage disposal has not been settled. The Supreme Court of the United States decided against the Chicago drainage district in a suit instituted to enjoin the district against withdrawing water. However, in order to permit the Chicago sanitary commission to prepare plans and construct works necessary to take the place of the prevailing system of sewage disposal, temporary authority to divert 8,500 cu.ft. of water per second from Lake Michigan was granted by the U.S. War Department for a period of five years under certain conditions, which, when carried out, will permit the reduction and perhaps the eventual discontinuance of the diversion for sewage purposes. The question is of importance because of the enormous losses claimed by shipping interests on account of lower water-levels. The matter is again before the Supreme Court of the United States as a result of an action brought by some of the States to restrain the Chicago drainage district from diverting water from Lake Michigan. The report to the court made by former chief justice, Chas. E. Hughes, who was designated as special master, was to the effect that the permit granted by the War Department is valid and effective according to its terms. Final decision in the matter has not been made.

Outlets to the Sea.—The Chicago drainage canal from Lake Michigan at Chicago to Joliet, Ill., the Illinois and Michigan canal from Joliet to La Salle, Ill., and the improved waterways of the Illinois and Mississippi rivers, give a continuous water route from Lake Michigan to the Gulf of Mexico. This route, however, will accommodate at present only very small, shallow-draft boats, and is but little used. The various Federal, State and other agencies concerned are now engaged in works that will deepen this through waterway to nine feet. The U.S. War Department engineers have surveyed and studied several routes for a canal between Lake Erie and the Ohio river, but these reports have to date been unfavourable. It was found that the benefits would be out of proportion to the cost, which would be in excess of $100,000,000 for gft. depths. Unfavourable reports have also been made on a proposed ship canal following *in* general the line of the New York State barge canal.

The New York State barge canal has replaced the old Erie canal. It connects with the Great Lakes at Tonawanda on Niagara river, and at Oswego on Lake Ontario. The present 12ft. depth of canal is designed for use by barges and boats drawing 10½ feet.

The St. Lawrence river from its source at the outlet of Lake Ontario to the Atlantic at Belle Isle strait is 1,184m. in length. For purposes of navigation the river may be considered in three portions; the broad estuary below Father Point, 66 1m. in length; the section 342m. in length from Father Point to Montreal which has been improved for navigation by ocean vessels; and the section 181m. in length between Montreal and Lake Ontario, in which there is a fall of approximately 225ft., and which has been canalized at all rapids and is available for small vessels of 14ft. draft. The problem of providing a channel through the St. Lawrence for ocean shipping is now the subject of negotiation between the Canadian and U S. Governments. (See ST. LAWRENCE RIVER.)

By treaty stipulation the amount of water that may be diverted from the Niagara river for power purposes has been limited to 36,000 cu.ft. per sec, on the Canadian side and 20,000 cu.ft. per sec. on the United States side. Of the Canadian diversion all but about 10,000 cu.ft. per sec. is used by the Hydro-electric Power Commission of Ontario in three plants, the largest of which, near Queenstown, has a gross head of over 300ft. and develops about 450,000 h.p. from the nine turbo-generators installed. Of the American diversion practically all the water is utilized by one concern with an installation of 560,000 horse-power. Three of the units of the latter company are rated at 70,000 h.p. each and are the largest hydro-electric units in existence. At all the plants, electricity is generated at 11,000 volts, 25 cycles. Much is used in nearby electro-chemical industries for the manufacture of aluminium, ferro-silicon, carborundum, artificial graphite, liquid chlorine, calcium carbide, cyanamide and other products. The remainder is transmitted to various cities for miscellaneous uses, The maximum distance to which this power is transmitted is somewhat in excess of 200 miles.

GREAT MOTHER OF THE GODS, the ancient Oriental-Greek-Roman deity commonly known as Cybele (q.v.) in Greek and Latin literature from the time of Pindar. She was also known under many other names, some of which were derived from famous places of worship: as Dindymene from Mt. Dindymon. Cybele is her favourite name in ancient and modern literature, while Great Mother of the Gods, or Great Idaean Mother of the Gods (*Mater Deum Magna, Mater Deum Magna Idaea*), the most frequently recurring epigraphical title, was her ordinary official designation.

The legends agree in locating the rise of the worship of the Great Mother in Asia Minor, in the region of loosely defined geographical limits which comprised the Phrygian empire of prehistoric times and was more extensive than the Roman province of Phrygia. Her best known early seats of worship were Mt. Ida, Mt. Sipylus, Cyzicus, Sardis, and Pessinus, the last-named city, in Galatia near the borders of Roman Phrygia, finally becoming the strongest centre of the cult. But the existence of numerous very similar non-Phrygian deities indicates that she was merely the Phrygian form of the nature deity of all Asia Minor.

From Asia Minor, the cult of the Great Mother spread first to Greek territory. It found its way into Thtace at an early date, was known in Boeotia by Pindar in the 6th century, and entered Attica near the beginning of the 4th century. At Peiraeus, where it probably arrived by way of the Aegean islands, it existed privately in a fully developed state, that is, accompanied by the worship of Attis (q.v.), at the beginning of the 4th century, and publicly two centuries later. The Greeks from the first saw in the Great Mother a resemblance to their own Rhea, and finally identified the two completely, though the Asiatic peculiarities of the cult were never universally popular with them. In her less Asiatic aspect; *i.e.,* without Attis, she was sometimes identified with Ge and Demeter. It was in this phase that she was worshipped in the *Mētrōon* at Athens.

In 204 B.C., in obedience to the Sibylline prophecy which said that whenever an enemy from abroad should make war on Italy he could be expelled and conquered if the Idaean Mother were Brought to Rome from Pessinus, the cult of the Great Mother, together with her sacred symbol, a small meteoric stone reputed to have fallen from the heavens, was transferred to Rome and established in a temple on the Palatine (Livy xxix. 10–14). Her identification by the Romans with Maia, Ops, Rhea, Tellus, and Ceres contributed to the establishment of her worship on a firm footing. By the end of the republic it had attained prominence, and under the empire it became one of the three most important cults in the Roman world, the other two being those of Mithras and Isis. Epigraphic and numismatic evidence prove it to have penetrated from Rome as a centre to the remotest provinces. During the brief revival of paganism under Eugenius in A.D. 394, occurred the last appearance of the cult in history. Besides the temple on the Palatine, there also existed minor shrines of the Great Mother in the present Piazza S. Pietro, on the Sacra Via on the north slope of the Palatine, near the junction of the Almo and the Tiber rivers, south of the city (*ibid.,* 311–14).

In all her aspects, Roman, Greek, and Oriental, the Great Mother was characterized by essentially the same qualities. Most prominent among them was her universal motherhood. She was the great parent of gods and men, as well as of the lower orders of creation. Especial emphasis was placed upon her maternity over wild nature. She was called the Mountain Mother; her sanctuaries were almost invariably upon mountains, and frequently in caves; lions were her faithful companions. Her especial affinity with wild nature was manifested by the orgiastic character of her worship. Her attendants, the Corybantes, were wild, half demonic beings. Her priests, the Galli, were eunuchs attired in female garb, with long hair fragrant with ointment. Together with priestesses, they celebrated her rites with wild music and dancing until their frenzied excitement found its culmination in self-scourging, self-laceration, or exhaustion. Self-emasculation sometimes accompanied this delirium of worship on the part of candidates for the priesthood.

Though her cult sometimes existed by itself, in its fully developed state the worship of the Great Mother was accompanied by that of Attis (q.v.). The cult of Attis never existed independently. There is no positive evidence to prove the existence of the cult publicly in this phase in Greece before the 2nd century *B.C.,* nor in Rome before the empire, though it may have existed in private.

The philosophers of the late Roman empire interpreted the Attis legend as symbolizing the relations of Mother Earth to her children the fruits. In this interpretation they were not far wrbng, for Cybele and all her kind are embodiments of the earth's fertility.

At Rome the immediate direction of the cult of the Great Mother devolved upon the high priest, *Archigallus,* called *Attis,* a high priestess, *Sacerdos Maxima,* and its support was derived, at least in part, from a popular contribution, the *stips.* Besides other priests, priestesses, and minor officials, such as musicians, curator, etc., there were certain colleges connected with the administration of the cult, called *cannophori* (reed-bearers) and *dendrophori* (branch-bearers). The quindecimvirs exercised a general supervision over this as over all other authorized foreign cults. Roman citizens were at first forbidden to take part in its ceremonies, and the ban was not removed until the time of the empire.

The main public event in the worship of the Great Mother was the annual festival, which took place originally April 4, and was followed next day by the *Megalesia,* games instituted in her honour on the introduction of the cult. Under the empire, from Claudius on, the *Megalesia* lasted six days, April 4 to 10, and the original one day of the religious festival became an annual cycle of festivals extending from March 15–27, in the following order:

(1) March 15, *Canna intrat,* the sacrifice of a six-year-old bull, the high priest, a priestess and the *cannophori* officiating, the last hamed carrying reeds in procession in commemoration of the exposure of the infant Attis on the reedy banks of the stream Gallus in Phrygia.

(2) March 22, *Arbor intrat,* the bearing in procession of the sacred pine, emblem of Attis' self-mutilation, death and immortality, to the temple on the Palatine, the symbol of the Mother's cave, by the *dendrophori,* a guild of workmen who made the Mother, among other deities, a patron.

(3) March 24, *Dies sanguinis,* a day of mourning, fasting and abstinence, especially sexual, commemorating the sorrow of the Mother for Attis. The frenzied dance and self-laceration of the priests and the self-mutilation of neophytes, were special features of the day. The *taurobolium* (q.v.) was often performed on this day, on which probably took place the initiation of mystics. *See* also CRIOBOLIUM.

(4) March 25, *Hilaria.* All mourning was put off, and good cheer reigned in token of the return of the sun and spring, which was symbolized by the renewal of Attis's life.

(5) March 26, *Requietio,* a day of rest and quiet.

(6) March 27, *Lavatia,* the crowning ceremony of the cycle. The silver statue of the goddess, with the sacred meteoric stone, the *Acus,* set in its head, was borne in gorgeous procession and bathed in the Almo, the remainder of the day being given up to rejoicing and entertainment, especially dramatic representation of the legend of the deities of the day.

The Great Mother is especially prominent in the art of the empire. No work of the first class, however, was inspired by her. She appears usually with mural crown and veil, well draped, seated on a throne, and accompanied by two lions. Other attributes which often appear are the patera, tympanum, cymbals, sceptre, garlands, and fruits. Attis and his attributes, the pine, Phrygian cap, pedum, syrinx, and torch, also appear. In literature she is the subject of frequent mention, but no surviving work of importance, with the exception of Catullus lxiii., is due to her inspiration. Her importance in the history of religion is very great, for her cult, like the other mystic worships, at once

formed a rival to Christianity and acted as a stepping stone to it. *(See* MYSTERY.)

GREAT NORTHERN RAILWAY COMPANY. The Great Northern's genealogy began in 1857 with the chartering of the Minnesota and Pacific railway by the State of Minnesota, a road that was soon taken over by the St. Paul and Pacific railway. Ten miles of actual railroad were then built between St. Paul and St. Anthony, now Minneapolis, upon which service was established in 1862, the first in the North-west.

In 1875, Mr. J. J. Hill and a group of associates began reorganizing the St. Paul and Pacific, then in the hands of receivers, into the St. Paul, Minneapolis and Manitoba railway. Under the leadership of Mr. Hill this new road expanded rapidly, despite the lack of Government aid then considered so essential to the construction of new lines. By 1888 the line reached central Montana and five years later the Rockies had been crossed through the elusive Marias Pass and service established between the Twin Cities and Puget Sound. It was during this latter period that the present Great Northern Railway Company was formed.

In 1939 the Great Northern ranked among the leading railroads of the United States. It operated 8,069mi. of line in ten states and two Canadian provinces, covering a territory extending from the Great Lakes to the Pacific ocean. It also owned a half interest in the Chicago, Burlington and Quincy railroad, and in the Spokane, Portland and Seattle Ry. Easy grades and low mountain crossings, only 5,213 ft. in the Rockies and 2,883 ft. in the Cascades, mark the main line of the Great Northern. It keeps in service nearly 1,000 locomotives, 825 passenger cars and approximately 50,000 freight cars. Its freight service varies from the branch line way freight to the fast through freights operating between the Twin Cities and Puget Sound. Its passenger service ranges from short haul transportation by rail motor cars and branch line trains to fast transcontinental service between Chicago and the Pacific coast.

Freight traffic carried by the Great Northern includes, principally, grain, iron ore, dairy products, and lumber. The railway's passenger service is augmented by tourist operations in Glacier National park in Montana. The Great Northern is the only line serving the park.

GREAT REBELLION (1642–52), a generic name for the civil wars in England and Scotland, which began with the raising of King Charles I.'s standard at Nottingham on Aug. 22, 1642, and ended with the surrender of Dunottar Castle to the Parliament's troops in May 1652. It is usual to classify these wars into the First Civil War of 1642–46, and the Second Civil War of 1648–52. During most of this time another civil war was raging in Ireland. Its incidents had little or no connection with those of the Great Rebellion, but its results influenced the struggle in England to a considerable extent.

FIRST CIVIL WAR (1642–46)

It is impossible rightly to understand the events of this most national of all English wars without some knowledge of the motive forces on both sides. On the side of the king were enlisted the deep-seated loyalty which was the result of two centuries of effective royal protection, the pure cavalier spirit foreshadowing the courtier era of Charles II., but still strongly tinged with the old feudal indiscipline, the militarism of an expert soldier nobility, well represented by Prince Rupert, and lastly a widespread distrust of extreme Puritanism, which appeared unreasonable to Lord Falkland and other philosophic statesmen and intolerable to every other class of Royalists. The foot of the Royal armies was animated in the main by the first and last of these motives; in the eyes of the sturdy rustics who followed their squires to the war the enemy were rebels and fanatics. To the cavalry, which was composed largely of the higher social orders, the rebels were, in addition, bourgeois, while the soldiers of fortune from the German wars felt all the regular's contempt for citizen militia. Thus in the first episodes of the First Civil War moral superiority tended to be on the side of the king. On the other side, the causes of the quarrel were primarily and apparently political, ultimately and really religious, and thus the elements of resistance in the Parliament and the nation were at first confused, and, later, strong and direct.

Democracy, moderate republicanism and the simple desire for constitutional guarantees could hardly make head of themselves against the various forces of royalism, for the most moderate men of either party were sufficiently in sympathy to admit compromise. But the backbone of resistance was the Puritan element, and this waging war at first with the rest on the political issue soon (as the Royalists anticipated) brought the religious issue to the front. The Presbyterian system, even more rigid than that of Laud and the bishops—whom no man on either side supported save Charles himself—was destined to be supplanted by the Independents and their ideal of free conscience, but for a generation before the war broke out it had disciplined and trained the middle classes of the nation (who furnished the bulk of the rebel infantry, and later of the cavalry also) to centre their whole willpower on the attainment of their ideals. The ideals changed during the struggle, but not the capacity for striving for them, and the men capable of the effort finally came to the front and imposed their ideals on the rest by the force of their trained wills.

Material force was throughout on the side of the Parliamentary party. They controlled the navy, the nucleus of an army which was in process of being organized for the Irish war, and nearly all the financial resources of the country. They had the sympathies of most of the large towns, where the trained bands, drilled once a month, provided cadres for new regiments. Further, by recognizing the inevitable, they gained a start in war preparations which they never lost. The earls of *Warwick, Essex* and Manchester, and other nobles and gentry of their party, possessed great wealth and territorial influence. (N.B. The names of Parliamentarians and Covenantors are in italics for simplicity of distinction.) Charles, on the other hand, although he could, by means of the "press" and the lords-lieutenant, raise men without authority from Parliament, could not raise taxes to support them, and was dependent on the financial support of his chief adherents, such as the earls of Newcastle and Derby. Both parties raised men when and where they could, each claiming that the law was on its side—for England was already a law-abiding nation—and acting in virtue of legal instruments. These were, on the side of the Parliament, its own recent "Militia Ordinance"; on that of the king, the old-fashioned "Commissions of Array." In Cornwall the Royalist leader, Sir Ralph Hopton, indicted the enemy before the grand jury of the county as disturbers of the peace, and had the posse *comitatus* called out to expel them. The local forces in fact were everywhere employed by whichever side could, by producing valid written authority, induce them to assemble.

The Royalist and Parliamentarian Armies.—This thread of local feeling and respect for the laws runs through the earlier operations of both sides almost irrespective of the main principles at stake. Many a promising scheme failed because of the reluctance of the militiamen to serve beyond the limits of their own county, and, as the offensive lay with the king, his cause naturally suffered far more therefrom than that of the enemy. But the real spirit of the struggle was very different. Anything which tended to prolong the struggle, or seemed like want of energy and avoidance of a decision, was bitterly resented by the men of both sides, who had their hearts in the quarrel and had not as yet learned by the severe lesson of Edge Hill that raw armies cannot bring wars to a speedy issue. In France and Germany the prolongation of a war meant continued employment for the soldiers but in England "we never encamped or entrenched . . . or lay fenced with rivers or defiles. . . . " 'Twas the general maxim of the war—Where is the enemy? Let us go and fight them. Or . . . if the enemy was coming. . . . Why, what should be done! Draw out into the fields and fight them." This passage from the Memoirs *of* a Cavalier, ascribed to Defoe, though not contem-

porary evidence, is an admirable summary of the character of the Civil War. Even when in the end a regular professional army is evolved—as in the case of Napoleon's army—the original decision-compelling spirit permeated the whole organization. From the first the professional soldiers of fortune, be their advice good or bad, are looked upon with suspicion, and nearly all those Englishmen who loved war for its own sake were too closely concerned for the welfare of their country to attempt the methods of the Thirty Years' War in England. The formal organization of both armies was based on the Swedish model, which had become the pattern of Europe after the victories of Gustavus Adolphus, and gave better scope for the moral of the individual than the old-fashioned Spanish and Dutch formations in which the man in the ranks was a highly finished automaton.

Campaign of 1642.—When the king raised his standard at Nottingham on Aug. 22, 1642, war was already in progress on a small scale in many districts, each side endeavouring to secure, or to deny to the enemy, fortified country houses, territory, and above all arms and money. Peace negotiations went on in the midst of these minor events until there came from the Parliament an ultimatum so aggressive as to fix the warlike purpose of the still vacillating court at Nottingham, and, in the country at large, to convert many thousands of waverers to active Royalism. Ere long Charles—who hitherto had less than 1,500 men—was at the head of an army which, though very deficient in arms and equipment, was not greatly inferior in numbers or enthusiasm to that of the Parliament. The latter (20,000 strong exclusive of detachments) was organized during July, August and September about London, and moved thence to Northampton under the command of Robert, earl of Essex.

At this moment the military situation was as follows. Lord Hertford in south Wales, Sir Ralph Hopton in Cornwall, and the young earl of Derby in Lancashire, and small parties in almost every county of the west and the midlands, were in arms for the king. North of the Tees, the earl of Newcastle, a great territorial magnate, was raising troops and supplies for the king, while Queen Henrietta Maria was busy in Holland arranging for the importation of war material and money. In Yorkshire opinion was divided, the royal cause being strongest in York and the North Riding, that of the Parliamentary party in the clothing towns of the West Riding and also in the important seaport of Hull. The Yorkshire gentry made an attempt to neutralize the county, but a local struggle soon began, and Newcastle thereupon prepared to invade Yorkshire. The whole of the south and east as well as parts of the midlands and the west and the important towns of Bristol and Gloucester were on the side of the Parliament. A small Royalist force was compelled to evacuate Oxford on Sept. 10.

On Sept. 13 the main campaign opened. The king—in order to find recruits amongst his sympathizers and arms in the armouries of the Derbyshire and Staffordshire trained bands, and also to be in touch with his disciplined regiments in Ireland by way of Chester—moved westward to Shrewsbury, Essex following suit by marching from Northampton to Worcester. Near the last-named town a sharp cavalry engagement (Powick Bridge) took place on the 23rd between the advanced cavalry of Essex's army and a force under Prince Rupert which was engaged in protecting the retirement of the Oxford detachment. The result of the fight was the instantaneous overthrow of the rebel cavalry, and this gave the Royalist troopers a confidence in themselves and in their brilliant leader which was not destined to be shaken until they met *Cromwell's* Ironsides.

Rupert soon withdrew to Shrewsbury, where he found many Royalist officers eager to attack Essex's new position at Worcester. But the road to London now lay open and it was decided to take it. The intention was not to avoid a battle, for the Royalist generals desired to fight Essex before he grew too strong, and the temper of both sides made it impossible to postpone the decision; in Clarendon's words, "it was considered more counsellable to march towards London, it being morally sure that the earl of Essex would put himself in their way," and accordingly the army left Shrewsbury on Oct. 12, gaining two days' start of the enemy, and moved south-east via Bridgnorth, Birmingham and Kenilworth. This had the desired effect. Parliament, alarmed for its own safety, sent repeated orders to Essex to find the king and bring him to battle. Alarm gave place to determination when it was discovered that Charles was enlisting papists and seeking foreign aid. The militia of the home counties was called out, a second army under the earl of *Warwick* was formed round the nucleus of the London trained bands, and Essex, straining every nerve to regain touch with the enemy, reached Kineton, where he was only 7 m. from the king's headquarters at Edgecote, on the 22nd.

Battle of Edge Hill.—Rupert promptly reported the enemy's presence, and his confidence dominated the irresolution of the king and the caution of Lord Lindsey, the nominal commander-in-chief. Both sides had marched widely dispersed in order to live, and the rapidity with which, having the clearer purpose, the Royalists drew together helped considerably to neutralize Essex's superior numbers. During the morning of the 23rd the Royalists formed in battle order on the brow of Edge Hill facing towards Kineton. Essex, experienced soldier as he was, had distrusted his own raw army too much to force a decision earlier in the month, when the king was weak; he now found Charles in a strong position with an equal force to his own 14,000, and some of his regiments were still some miles distant. But he advanced beyond Kineton, and the enemy promptly left their strong position and came down to the foot of the hill, for, situated as they were, they had either to fight wherever they could induce the enemy to engage, or to starve in the midst of hostile garrisons. Rupert was on the right of the king's army with the greater part of the horse, Lord Lindsey and Sir Jacob Astley in the centre with the foot, Lord Wilmot (with whom rode the earl of Forth, the principal military adviser of the king) with a smaller body of cavalry on the left. In rear of the centre were the king and a small reserve. Essex's order was similar. Rupert charged as soon as his wing was deployed and before the infantry of either side was ready. Taking ground to his right front and then wheeling inwards at full speed he instantly rode down the Parliamentary horse opposed to him. Some infantry regiments of Essex's left centre shared the same fate as their cavalry. On the other wing Forth and Wilmot likewise swept away all that they could see of the enemy's cavalry, and the undisciplined Royalists of both wings pursued the fugitives in wild disorder up to Kineton, where they were severely handled by John *Hampden's* infantry brigade (which was escorting the artillery and baggage of Essex's army). Rupert brought back only a few rallied squadrons to the battlefield, and in the meantime affairs there had gone badly for the king. The right and centre of the Parliamentary foot (the left having been brought to a halt by Rupert's charge) advanced with great resolution, and being at least as ardent as, and much better armed than, Lindsey's men, engaged them fiercely and slowly gained ground. Only the best regiments on either side, however, maintained their order, and the decision of the infantry battle was achieved mainly by a few Parliamentary squadrons.

One regiment of Essex's right wing only had been the target of Wilmot's charge, the other two had been at the moment invisible, and, as every Royalist troop on the ground, even the king's guards, had joined in the mad ride to Kineton, these, Essex's life-guard, and some troops that had rallied from the effect of Rupert's charge—amongst them Captain Oliver *Cromwell's*—were the only cavalry still present. All these joined with decisive effect in the attack on the left of the royal infantry. The king's line was steadily rolled up from left to right, the Parliamentary troopers captured his guns and regiment after regiment broke up. Charles himself stood calmly in the thick of the fight, but he had not the skill to direct it. The royal standard was taken and retaken, Lindsey and Sir Edmund Verney, the standard-bearer, being killed. By the time that Rupert returned both sides were incapable of further effort and disillusioned as to the prospect of ending the war at a blow.

On the 24th Essex retired, leaving Charles to claim the victory and to reap its results. Banbury and Oxford were reoccupied by the Royalists, and by the 28th Charles was marching down the

Thames valley on London. Negotiations were reopened, and a peace party rapidly formed itself in London and Westminster. Yet field fortifications sprang up around London, and when Rupert stormed and sacked Brentford on the 12th of November the trained bands moved out at once and took up a position at Turnham Green, barring the king's advance. *Hampden,* with something of the fire and energy of his cousin *Cromwell,* urged *Essex* to turn both flanks of the royal army via Acton and Kingston, but experienced professional soldiers urged him not to trust the London men to hold their ground while the rest manoeuvred. *Hampden's* advice was undoubtedly premature. A Sedan or Worcester was not within the power of the Parliamentarians of 1642, for, in Napoleon's words, "one only manoeuvres around a fixed point," and the city levies at that time were certainly not, *vis-à-vis* Rupert's cavalry, a fixed point. As a matter of fact, after a slight cannonade at Turnham Green on the 13th, *Essex's* two-to-one numerical superiority of itself induced the king to retire to Reading. Turnham Green has justly been called the Valmy of the English Civil War. Like Valmy, without being a battle, it was a victory, and the tide of invasion came thus far, ebbed, and never returned.

The Winter of 1642-43.—In the winter, while *Essex* lay inactive at Windsor, Charles by degrees consolidated his position in the region of Oxford. The city was fortified as a *reduit* for the whole area, and Reading, Wallingford, Abingdon, Brill, Banbury and Marlborough constituted a complete defensive ring which was developed by the creation of smaller posts from time to time. In the north and west, winter campaigns were actively carried on. "It is summer in Yorkshire, summer in Devon, and cold winter at Windsor," said one of *Essex's* critics. At the beginning of December Newcastle crossed the Tees, defeated *Hotkam,* the Parliamentary commander in the North Riding, and relieved the pressure on York. *Lord Fairfax* and his son *Sir Thomas,* who commanded for the Parliament in Yorkshire, had to retire to the district between Hull and Selby, and Newcastle was free to turn his attention to the Puritan "clothing towns" of the West Riding —Leeds, Halifax and Bradford. The townsmen, however, showed a determined front, the younger *Fairfax* with a picked body of cavalry rode through Newcastle's lines to help them, and about the end of January the earl gave up the attempt to reduce the towns. He continued his march southward, however, and gained ground for the king as far as Newark, so as to be in touch with the Royalists of Nottinghamshire, Derbyshire and Leicestershire, and to prepare the way for further advance when the queen's convoy should arrive from over-seas.

In the west Sir Ralph Hopton and his friends, having obtained a true bill from the grand jury against the Parliamentary disturbers of the peace, placed themselves at the head of the county militia and drove the rebels from Cornwall, after which they raised a small force for general service and invaded Devonshire (November 1642). Subsequently a Parliamentary army under the earl of *Stamford* was withdrawn from South Wales to engage Hopton, who had to retire into Cornwall. There, however, the Royalist general was free to employ the militia again, and thus reinforced he won a victory over a part of *Stamford's* forces at Bradock Down near Liskeard (Jan. 19, 1643) and resumed the offensive. About the same time Hertford, no longer opposed by *Stamford,* brought over the South Wales Royalists to Oxford, and the fortified area around that place was widened by the capture of Cirencester on Feb. 2. Gloucester and Bristol were now the only important garrisons of the Roundheads in the west. In the midlands, in spite of a Parliamentary victory won by *Sir William Brereton* at Nantwich on Jan. 28, the Royalists of Shropshire, Staffordshire and Leicestershire soon extended their influence through Ashby-de-la-Zouch into Nottinghamshire and joined hands with their friends at Newark. Further, around Chester a new Royalist army was being formed under Lord Byron, and all the efforts of *Brereton* and of *Sir John Gell,* the leading supporter of the Parliament in Derbyshire, were required to hold their own, even before Newcastle's army was added to the list of their enemies.

Lord Brooke, who commanded for the Parliament in Warwickshire and Staffordshire and was looked on by many as *Essex's* eventual successor, was killed in besieging Lichfield cathedral on March 2, and, though the cathedral soon capitulated, *Gell* and *Brereton* were severely handled in the indecisive battle of Hopton Heath near Stafford on March 19, and Prince Rupert, after an abortive raid on Bristol (March 7), marched rapidly northward, storming Birmingham en route, and recaptured Lichfield cathedral. He was, however, soon recalled to Oxford to take part in the main campaign. The position of affairs for the Parliament was perhaps at its worst in January. The Royalist successes of November and December, the ever-present dread of foreign intervention, and the burden of new taxation which the Parliament now found itself compelled to impose, disheartened its supporters. Disorders broke out in London, and, while the more determined of the rebels began thus early to think of calling in the military assistance of the Scots, the majority were for peace on any conditions. But soon the position improved somewhat; *Stamford* in the west and *Brereton* and *Gell* in the midlands, though hard pressed, were at any rate in arms and undefeated, Newcastle had failed to conquer the West Riding, and *Sir William Waller,* who had cleared Hampshire and Wiltshire of "malignant~," entered Gloucestershire early in March, destroyed a small Royalist force at Highnam (March 24), and secured Bristol and Gloucester for the Parliament.

Finally, some of Charles's own intrigues opportunely coming to light, the waverers, seeing the impossibility of plain dealing with the court, rallied again to the party of resistance, and the series of negotiations called by the name of the Treaty of Oxford closed in April with no more result than those which had preceded Edge Hill and Turnham Green. About this time too, following and improving upon the example of Newcastle in the north, Parliament ordered the formation of the celebrated "associations" or groups of counties banded together by mutual consent for defence. The most powerful and best organized of these was that of the eastern counties (headquarters Cambridge), where the danger of attack from the north was near enough to induce great energy in the preparations for meeting it, and at the same time too distant effectively to interfere with these preparations. Above all, the Eastern Association was from the first guided and inspired by *Colonel Cromwell.*

The Plan of Campaign, 1643.—The king's plan of operations for the next campaign, which was perhaps inspired from abroad, was more elaborate than the simple "point" of 1642. The king's army, based on the fortified area around Oxford, was counted sufficient to use up *Essex's* forces. On either hand, therefore, in Yorkshire and in the west, the Royalist armies were to fight their way inwards towards London, after which all three armies, converging on that place in due season, were to cut off its supplies and its sea-borne revenue and to starve the rebellion into surrender. The condition of this threefold advance was of course that the enemy should not be able to defeat the armies in detail, *i.e.,* that he should be fixed and held in the Thames valley; this secured, there was no purely military objection against operating in separate armies from the circumference towards the centre. It was on the rock of local feeling that the king's plan came to grief. Even after the arrival of the queen and her convoy, Newcastle had to allow her to proceed with a small force, and to remain behind with the main body, because of Lancashire and the West Riding, and above all because the port of Hull, in the hands of the *Fairfnxes,* constituted a menace that the Royalists of the East Riding refused to ignore. Hopton's advance too, undertaken without the Cornish levies, was checked in the action of Sourton Down (Dartmoor) on April 25, and on the same day *Waller* captured Hereford. *Essex* had already left Windsor to undertake the siege of Reading, the most important point in the circle of fortresses round Oxford, which after a vain attempt at relief surrendered to him on April 26. Thus the opening operations were unfavourable, not indeed so far as to require the scheme to be abandoned, but at least delaying the development until the campaigning season was far advanced.

Victories of Hopton.—Affairs improved in May. The queen's long-expected convoy arrived at Woodstock on the 13th. The

earl of Stamford's army, which had again entered Cornwall, was attacked in its selected position at Stratton and practically annihilated by Hopton (May 16). This brilliant victory was due above all to Sir Bevil Grenville and the lithe Cornishmen, who, though but 2,400 against 5,400 and destitute of artillery, stormed "Stamford Hill," killed 300 of the enemy, and captured 1,700 more with all their guns, colours and baggage. Devon was at once overrun by the victors. *Essex's* army, for want of material resources, had had to be content with the capture of Reading, and a Royalist force under Hertford and Prince Maurice (Rupert's brother) moved out as far as Salisbury to hold out a hand to their friends in Devonshire, while Waller, the only Parliamentary commander left in the field in the west, had to abandon his conquests in the Severn valley to oppose the further progress of his intimate friend and present enemy, Hopton. Early in June Hertford and Hopton united at Chard and rapidly moved, with some cavalry skirmishing, towards Bath, where Waller's army lay. Avoiding the barrier of the Mendips, they moved round via Frome to the Avon. But *Waller,* thus cut off from London and threatened with investment, acted with great skill, and some days of manoeuvres and skirmishing followed, after which Hertford and Hopton found themselves on the north side of Bath facing Waller's entrenched position on the top of Lansdown Hill. This position the Royalists stormed on July 5.

The battle of Lansdown was a second Stratton for the Cornishmen, but this time the enemy was of different quality and far differently led, and they had to mourn the loss of Sir Bevil Grenville and the greater part of their whole force. At dusk both sides stood on the flat summit of the hill, still firing into one another with such energy as was not yet expended, and in the night Waller drew off his men into Bath. "We were glad they were gone," wrote a Royalist officer, "for if they had not, I know who had within the hour." Next day Hopton was severely injured by the explosion of a wagon containing the reserve ammunition, and the Royalists, finding their victory profitless, moved eastward to Devizes, closely followed by the enemy. On July 10 Waller took post on Roundway Down, overlooking Devizes, and captured a Royalist ammunition column from Oxford. On the 11th he came down and invested Hopton's foot in Devizes itself, while the Royalist cavalry, Hertford and Maurice with them, rode away towards Salisbury. But although the siege was pressed with such vigour that an assault was fixed for the evening of the 13th, the Cornishmen, Hopton directing the defence from his bed, held out stubbornly, and on the afternoon of July 13 Prince Maurice's horsemen appeared on Roundway Down, having ridden to Oxford, picked up reinforcements there, and returned at full speed to save their comrades. Waller's army tried its best, but some of its elements were of doubtful quality and the ground was all in Maurice's favour. The battle did not last long. The combined attack of the Oxford force from Roundway and of Hopton's men from the town practically annihilated Waller's army. Very soon afterwards Rupert came up with fresh Royalist forces, and the combined armies moved westward. Bristol, the second port of the kingdom, was their objective, and in four days from the opening of the siege it was in their hands (July 26), *Waller* with the beaten remnant of his army at Bath being powerless to intervene. The effect of this blow was felt even in Dorsetshire. Within three weeks of the surrender Prince Maurice with a body of fast-moving cavalry overran that county almost unopposed.

Adwalton Moor.—Newcastle meanwhile had resumed operations against the clothing towns, this time with success. The Fairfaxes had been fighting in the West Riding since January with such troops from the Hull region as they had been able to bring across Newcastle's lines. They and the townsmen together were too weak for Newcastle's increasing forces, and an attempt was made to relieve them by bringing up the Parliament's forces in Nottinghamshire, Derbyshire, Lincolnshire and the Eastern Association. But local interests prevailed again, in spite of *Cromwell's* presence, and after assembling at Nottingham, the midland rebels quietly dispersed to their several counties (June 2). The Fairfaxes were left to their fate, and about the same time Hull itself narrowly escaped capture by the queen's forces through the treachery of Sir John *Hotham,* the governor, and his son, the commander of the Lincolnshire Parliamentarians. The latter had been placed under arrest at the instance of Cromwell and of Colonel Hutchinson, the governor of Nottingham Castle; he escaped to Hull, but both father and son were seized by the citizens and afterwards executed. More serious than an isolated act of treachery was the far-reaching Royalist plot that had been detected in Parliament itself, for complicity in which Lord Conway, Edmund Waller the poet, and several members of both Houses were arrested. The safety of Hull was of no avail for the West Riding towns, and the Fairfaxes underwent a decisive defeat at Adwalton (Atherton) Moor near Bradford on June 30. After this, by way of Lincolnshire, they escaped to Hull and reorganized the defence of that place. The West Riding perforce submitted.

The queen herself with a second convoy and a small army under Henry (Lord) Jermyn soon moved via Newark, Ashby-de-la-Zouch, Lichfield and other Royalist garrisons to Oxford, where she joined her husband on July 14. But Newcastle (now a marquis) was not yet ready for his part in the programme. The Yorkshire troops would not march on London while the enemy was master of Hull, and by this time there was a solid barrier between the royal army of the north and the capital. Roundway Down and Adwalton Moor were not after all ,destined to be fatal, though peace riots in London, dissensions in the Houses, and quarrels amongst the generals were their immediate consequences. A new factor had arisen in the war—the Eastern Association.

Cromwell and the Eastern Association.—This had already intervened to help in the siege of Reading and had sent troops to the abortive gathering at Nottingham, besides clearing its own ground of "malignants." From the first *Cromwell* was the dominant influence. Fresh from Edge Hill, he had told *Hampden,* "You must get men of a spirit that is likely to go as far as gentlemen will go," not "old decayed serving-men, tapsters and such kind of fellows to encounter gentlemen that have honour and courage and resolution in them," and in January 1643 he had gone to his own county to "raise such men as had the fear of God before them and made some conscience of what they did." These men, once found, were willing, for the cause, to submit to a rigorous training and an iron discipline such as other troops, fighting for honour only or for profit only, could not be brought to endure. The result was soon apparent. As early as the 13th of May, Cromwell's regiment of horse—recruited from the horse-loving yeomen of the eastern counties—demonstrated its superiority in the field in a skirmish near Grantham, and in the irregular fighting in Lincolnshire during June and July these Puritan troopers distinguished themselves by long and rapid marches that may bear comparison with almost any in the history of the mounted arm. When Cromwell's second opportunity came at Gainsborough on July 28, the "Lincolneer" horse who were under his orders were fired by the example of Cromwell's own regiment, and Cromwell, directing the whole with skill, and above all with energy, utterly routed the Royalist horse and killed their general, Charles Cavendish.

In the meantime the army of Essex had been inactive. After the fall of Reading a serious epidemic of sickness had reduced it to impotence. On June 18 the Parliamentary cavalry was routed and *John Hampden* mortally wounded at Chalgrove Field near Chiselhampton, and when at last Essex, having obtained the desired reinforcements, moved against Oxford from the Aylesbury side, he found his men demoralized by inaction, and before the menace of Rupert's cavalry, to which he had nothing to oppose, he withdrew to Bedfordshire (July). He made no attempt to intercept the march of the queen's convoys, he had permitted the Oxford army, which he should have held fast, to intervene effectually in the midlands, the west and the south-west, and Waller might well complain that Essex, who still held Reading and the Chilterns, had given him neither active nor passive support in the critical days preceding Roundway Down. Still only a few voices were raised to demand his removal, and he was

shortly to have an opportunity of proving himself in an active campaign. The centre and the right of the three Royalist armies had for a moment (Roundway to Bristol) united to crush Waller, but their concentration was short-lived. Plymouth was to Hopton's men what Hull was to Newcastle's—they would not march on London until the menace to their homes was removed. Further, there were dissensions among the generals which Charles was too weak to crush, and consequently the original plan reappears—the main Royalist army to operate in the centre, Hopton's (now Maurice's) on the right, Newcastle on the left towards London. While waiting for the fall of Hull and Plymouth, Charles naturally decided to make the best use of his time by reducing Gloucester, the one great fortress of the Parliament in the west.

Siege and Relief of **Gloucester.**—This decision quickly brought on a crisis. While the earl of Manchester (with *Cromwell* as his lieutenant-general) was appointed to head the forces of the Eastern Association against Newcastle, and Waller was given a new army wherewith again to engage Hopton and Maurice, the task of saving Gloucester from the king's army fell to Essex, who was heavily reinforced and drew his army together for action in the last days of August. Resort was had to the press-gang to fill the ranks, recruiting for *Waller's* new army was stopped, and London sent six regiments of trained bands to the front, closing the shops so that every man should be free to take his part in what was thought to be the supreme trial of strength.

On the 26th, all being ready, Essex started. Through Aylesbury and round the north side of Oxford to Stow-on-the-Wold the army moved resolutely, not deterred by want of food and rest, or by the attacks of Rupert's and Wilmot's horse on its flank. On Sept. 5, just as Gloucester was at the end of its resources, the siege was suddenly raised and the Royalists drew off to Painswick, for Essex had reached Cheltenham and the danger was over. Then, the field armies being again face to face and free to move, there followed a series of skilful manoeuvres in the Severn and Avon valleys, at the end of which the Parliamentary army gained a long start on its homeward road via Cricklade, Hungerford and Reading. But the Royalist cavalry under Rupert, followed rapidly by Charles and the main body from Evesham, strained every nerve to head off Essex at Newbury, and after a sharp skirmish on Aldbourne Chase on Sept. 18 succeeded in doing so. On the 19th the whole Royal army was drawn up, facing west, with its right on Newbury and its left on Enborne Heath. Essex's men knew that evening that they would have to break through by force—there was no suggestion of surrender.

First Battle of **Newbury,** September 20,1643.—The ground was densely intersected by hedges except in front of the Royalists' left centre (Newbury Wash) and left (Enborne Heath), and, practically, Essex's army was never formed in line of battle, for each unit was thrown into the fight as it came up its own road or lane. On the left wing, in spite of the Royalist counterstrokes, the attack had the best of it, capturing field after field, and thus gradually gaining ground to the front. Here Lord *Falkland* was killed. On the Reading road itself Essex did not succeed in deploying on to the open ground on Newbury Wash, but victoriously repelled the royal horse when it charged up to the lanes and hedges held by his foot. On the extreme right of the Parliamentary army, which stood in the open ground of Enborne Heath, took place a famous incident. Here two of the London regiments, fresh to war as they were, were exposed to a trial as severe as that which broke down the veteran Spanish infantry at Rocroi in this same year. Rupert and the Royalist horse again and again charged up to the squares of pikes, and between each charge his guns tried to disorder the Londoners, but it was not until the advance of the royal infantry that the trained bands retired, slowly and in magnificent order, to the edge of the heath. The result of it all was that Essex's army had fought its hardest and failed to break the opposing line. But the Royalists had suffered so heavily, and above all the valour displayed by the rebels had so profoundly impressed them, that they were glad to give up the disputed road and withdraw into Newbury. Essex thereupon pursued his march, Reading was reached on the 22nd after a small rearguard skirmish at Aldermaston, and so ended one of the most dramatic episodes of English history.

Hull and Winceby.—Meanwhile the siege of Hull had commenced. The Eastern Association forces under Manchester promptly moved up into Lincolnshire, the foot besieging Lynn (which surrendered on Sept. 16) while the horse rode into the northern part of the county to give a hand to the Fairfaxes. Fortunately the sea communications of Hull were open. On Sept. 18 part of the cavalry in Hull was ferried over to Barton, and the rest under *Sir* Thomas *Fairfax* went by sea to Saltfleet a few days later, the whole joining Cromwell near Spilsby. In return, the old Lord *Fairfax,* who remained in Hull, received infantry reinforcements and a quantity of ammunition and stores from the Eastern Association. On Oct. 11 *Cromwell* and *Fairfax* together won a brilliant cavalry action at Winceby, driving the Royalist horse in confusion before them to Newark, and on the same day Newcastle's army around Hull, which had suffered terribly from the hardships of continuous siege work, was attacked by the garrison and so severely handled that next day the siege was given up. Later, Manchester retook Lincoln and Gainsborough, and thus Lincolnshire, which had been almost entirely in Newcastle's hands before he was compelled to undertake the siege of Hull, was added in fact as well as in name to the Eastern Association.

Elsewhere, in the reaction after the crisis of Newbury, the war languished. The city regiments went home, leaving Essex too weak to hold Reading, which the Royalists reoccupied on Oct. 3. At this the Londoners offered to serve again, and actually took part in a minor campaign around Newport Pagnell, which town Rupert attempted to fortify as a menace to the Eastern Association and its communications with London. Essex was successful in preventing this, but his London regiments again went home, and *Waller's* new army in Hampshire failed lamentably in an attempt on Basing House (Nov. 7), the London trained bands deserting *en* bloc. Shortly afterwards Arundel surrendered to a force under Sir Ralph, now Lord Hopton (Dec. 9).

The "Irish **Cessation"** and the Solemn League and Covenant.—Politically, these months were the turning-point of the war. In Ireland, the king's lieutenant, by order of his master, made a truce with the Irish rebels (Sept. 15). Charles's chief object was to set free his army to fight in England, but it was believed universally that Irish regiments—in plain words, papists in arms—would shortly follow. Under these circumstances his act united against him nearly every class in Protestant England, above all 'brought into the English quarrel the armed strength of Presbyterian Scotland. Yet Charles, still trusting to intrigue and diplomacy to keep Scotland in check, deliberately rejected the advice of Montrose, his greatest and most faithful lieutenant, who wished to give the Scots employment for their army at home. Only ten days after the "Irish cessation," the Parliament at Westminster swore to the Solemn League and Covenant, and the die was cast. It is true that even a semblance of Presbyterian theocracy put the "Independents" on their guard and definitely raised the question of freedom of conscience, and that secret negotiations were opened between the Independents and Charles on that basis, but they soon discovered that the king was merely using them as instruments to bring about the betrayal of Aylesbury and other small rebel posts. All parties found it convenient to interpret the Covenant liberally for the present, and at the beginning of 1644 the Parliamentary party showed so united a front that even Pym's death (Dec. 8, 1643) hardly affected its resolution to continue the struggle.

The troops from Ireland, thus obtained at the cost of an enormous political blunder, proved to be untrustworthy after all. Those serving in Hopton's army were "mutinous and shrewdly infected with the rebellious humour of England." When *Waller's* Londoners surprised and routed a Royalist detachment at Alton (December 13, 1643), half the prisoners took the Covenant. Hopton had to retire, and on Jan. 6, 1644 Waller recaptured Arundel. Byron's Cheshire army was in no better case. Newcastle's retreat from Hull and the loss of Gainsborough had completely changed

the situation in the midlands, *Brereton* was joined by the younger *Fairfax* from Lincolnshire, and the Royalists were severely defeated for a second time at Nantwich (January 25). As at Alton, the majority of the prisoners (amongst them Colonel George Monk) took the Covenant and entered the Parliamentary army. In Lancashire, as in Cheshire, Staffordshire, Nottinghamshire and Lincolnshire, the cause of the Parliament was in the ascendant. Resistance revived in the West Riding towns, Lord *Fairfax* was again in the field in the East Riding, and even Newark was closely besieged by Sir *John Meldrum*. More important news came in from the north. The advanced guard of the Scottish army had passed the Tweed on Jan. 19 and the marquis of Newcastle with the remnant of his army would soon be attacked in front and rear at once.

Newark and **Cheriton** (March 1644).—As in 1643, Rupert was soon on his way to the north to retrieve the fortunes of his side. Moving by the Welsh border, and gathering up garrisons and recruits snowball-wise as he marched, he went first to Cheshire to give a hand to Byron, and then, with the utmost speed, he made for Newark. On March 20, 1644 he bivouacked at Bingham, and on the 21st he not only relieved Newark but routed the besiegers' cavalry. On the 22nd Meldrum's position was so hopeless that he capitulated on terms. But, brilliant soldier as he was, the prince was unable to do more than raid a few Parliamentary posts around Lincoln, after which he had to return his borrowed forces to their various garrisons and go back to Wales—laden indeed with captured pikes and muskets—to raise a permanent field army. Nor could he be in all places at once. Newcastle was clamorous for aid. In Lancashire, only the countess of Derby, in Lathom House, held out for the king, and her husband pressed Rupert to go to her relief. Once, too, the prince was ordered back to Oxford to furnish a travelling escort for the queen, who shortly after this gave birth to her youngest child and returned to France. The order was countermanded within a few hours, it is true, but Charles had good reason for avoiding detachments from his own army. On March 29, Hopton had undergone a severe defeat at Cheriton near New Alresford. In the preliminary manoeuvres and in the opening stages of the battle the advantage lay with the Royalists. But Royalist indiscipline ruined everything. A young cavalry colonel charged in defiance of orders, a fresh engagement opened, and at the last moment *Waller* snatched a victory out of defeat. Worse than this was the news from Yorkshire and Scotland. Charles had at last assented to Montrose's plan and promised him the title of marquis, but the first attempt to raise the Royalist standard in Scotland gave no omen of its later triumphs. In Yorkshire Sir Thomas *Fairfax,* advancing from Lancashire through the West Riding, joined his father. Selby was stormed on April 11, and thereupon Newcastle, who had been manoeuvring against the Scots in Durham, hastily drew back, sent his cavalry away, and shut himself up with his foot in York. Two days later the Scottish general, Alexander Leslie, Lord *Leven,* joined the Fairfaxes and prepared to invest that city.

Plans of Campaign for 1644.—The original plan of the Parliamentary "Committee of Both Kingdoms," which directed the military and civil policy of the allies after the fashion of a modern cabinet, was to combine Essex's and *Manchester's* armies in an attack upon the king's army, Aylesbury being appointed as the place of concentration. Waller's troops were to continue to drive back Hopton and to reconquer the west, *Fairfax* and the Scots to invest Newcastle's army, while in the midlands Brereton and the Lincolnshire rebels could be counted upon to neutralize, the one Byron, the others the Newark Royalists. But Waller, once more deserted by his trained bands, was unable to profit by his victory of Cheriton, and retired to Farnham. *Manchester,* too, was delayed because the Eastern Association was still suffering from the effects of Rupert's Newark exploit—Lincoln, abandoned by the rebels on that occasion, was not reoccupied till May 6. Moreover, Essex found himself compelled to defend his conduct and motives to the Committee of Both Kingdoms, and as usual was straitened for men and money. But though there were grave elements of weakness on the other side, the Royalists considered their own position to be hopeless. Prince Maurice was engaged in the fruitless siege of Lyme Regis, Gloucester was again a centre of activity and counterbalanced Newark, and the situation in the north was practically desperate. Rupert himself came to Oxford (April 25) to urge that his new army should be kept free to march to aid Newcastle, who was now threatened—owing to the abandonment of the enemy's original plan—by Manchester as well as by *Fairfax* and *Leven.* There was no further talk of the concentric advance of three armies on London. The fiery prince and the methodical earl of Brentford (Forth) were at one at least in recommending that the Oxford area with its own garrison and a mobile force in addition should be the pivot of the field armies' operations. Rupert, needing above all adequate time for the development of the northern offensive, was not in favour of abandoning any of the barriers to *Essex's* advance. Brentford, on the other hand, thought it advisable to contract the lines of defence, and Charles, as usual undecided, agreed to Rupert's scheme and executed Brentford's. Reading, therefore, was dismantled early in May, and Abingdon given up shortly afterwards.

Cropredy Bridge.—It was now possible for the enemy to approach Oxford, and Abingdon was no sooner evacuated than (May 26) *Waller's* and Essex's armies united there—still, unfortunately for their cause, under separate commanders. From Abingdon Essex moved direct on Oxford, *Waller* towards Wantage, where he could give a hand to *Massey,* the energetic governor of Gloucester. Affairs seemed so bad in the west (Maurice with a whole army was still vainly besieging the single line of low breastworks that constituted the fortress of Lyme) that the king despatched Hopton to take charge of Bristol. Nor were things much better at Oxford; the barriers of time and space and the supply area had been deliberately given up to the enemy, and Charles was practically forced to undertake extensive field operations with no hope of success save in consequence of the enemy's mistakes. The enemy, as it happened, did not disappoint him.

The king, probably advised by Brentford, conducted a skilful war of manoeuvre in the area defined by Stourbridge, Gloucester, Abingdon and Northampton, at the end of which Essex, leaving Waller to the secondary work, as he conceived it, of keeping the king away from Oxford and reducing that fortress, marched off into the west with most of the general service troops to repeat at Lyme Regis his Gloucester exploit of 1643. At one moment, indeed, Charles (then in Bewdley) rose to the idea of marching north to join Rupert and Newcastle, but he soon made up his mind to return to Oxford. From Bewdley, therefore, he moved to Buckingham—the distant threat on London producing another evanescent citizen army drawn from six counties under Major-General Browne—and Waller followed him closely. When the king turned upon *Browne's* motley host, *Waller* appeared in time to avert disaster, and the two armies worked away to the upper Cherwell. Brentford and Waller were excellent strategists of the 17th century type, and neither would fight a pitched battle without every chance in his favour. Eventually on June 29 the Royalists were successful in a series of minor fights about Cropredy Bridge, and the result was, in accordance with continental custom, admitted to be an important victory, though Waller's main army drew off unharmed. In the meantime, Essex had relieved Lyme (June 15) and occupied Weymouth, and was preparing to go farther. The two rebel armies were now indeed separate. *Waller* had been left to do as best he could, and a worse fate was soon to overtake the cautious earl.

Campaign of **Marston** Moor.—During these manoeuvres the northern campaign had been fought to an issue. Rupert's courage and energy were more likely to command success in the English Civil War than all the conscientious caution of an Essex or a Brentford. On May 16 he left Shrewsbury to fight his way through hostile country to Lancashire, where he hoped to re-establish the Derby influence and raise new forces. Stockport was plundered on the 25th, the besiegers of Lathom House utterly defeated at Bolton on the 28th. Soon afterwards he received a large reinforcement under General Goring. which included 5,000 of Newcastle's cavalry. The capture of the almost defenceless town of Liverpool—undertaken as usual to allay local fears—did not delay Rupert more than three or four days, and he then turned

towards the Yorkshire border with greatly augmented forces. On June 14 he received a despatch from the king, the gist of which was that there was a time-limit imposed on the northern enterprise. If York were lost or did not need his help, Rupert was to make all haste southward via Worcester. "If York be relieved and you beat the rebels' armies of both kingdoms, then, but otherways not, I may possibly make a shift upon the defensive to spin out time until you come to assist me."

Charles did manage to "spin out time." But it was of capital importance that Rupert had to do his work upon York and the allied army in the shortest possible time, and that, according to the despatch, there were only two ways of saving the royal cause, "having relieved York by beating the Scots," or marching with all speed to Worcester. Rupert's duty, interpreted through the medium of his temperament, was clear enough. Newcastle still held out, his men having been encouraged by a small success on June 17, and Rupert reached Knaresborough on the 30th. At once *Leven, Fairfax* and Manchester broke up the siege of York and moved out to meet him. But the prince, moving still at high speed, rode round their right flank via Boroughbridge and Thornton Bridge and entered York on the north side. Newcastle tried to dissuade Rupert from fighting, but his record as a general was scarcely convincing as to the value of his advice. Rupert curtly replied that he had orders to fight, and the Royalists moved out towards Marston Moor (*q.v.*) on the morning of July 2, 1644 The Parliamentary commanders, fearing a fresh manoeuvre, had already begun to retire towards Tadcaster, but as soon as it became evident that a battle was impending they turned back. The battle of Marston Moor began about four in the afternoon. It was the first real trial of strength between the best elements on either side, and it ended before night with the complete victory of the Parliamentary armies. The Royalist cause in the north collapsed once for all, Newcastle fled to the continent, and only Rupert, resolute as ever, extricated 6,000 cavalry from the *débâcle* and rode away whence he had come, still the dominant figure of the war.

Independency. — The victory gave the Parliament entire control of the north, but it did not lead to the definitive solution of the political problem, and in fact, on the question of Charles's place in a new constitution, the victorious generals quarrelled even before York had surrendered. Within three weeks of the battle the great army was broken up. The Yorkshire troops proceeded to conquer the isolated Royalist posts in their country, the Scots marched off to besiege Newcastle-on-Tyne and to hold in check a nascent Royalist army in Westmorland. Rupert in Lancashire they neglected entirely. Manckester and Cromwell, already estranged, marched away into the Eastern Association. There, for want of an enemy to fight their army was forced to be idle, and Cromwell and the ever-growing Independent element quickly came to suspect their commander of lukewarmness in the cause. Waller's army, too, was spiritless and immobile. On July 2, despairing of the existing military system, he made to the Committee of Both Kingdoms the first suggestion of the New Model. "My lords," he wrote, "till you have an army merely your own, that you may command, it is . . . impossible to do anything of importance." *Browne's* trained band army was perhaps the most ill-behaved of all—once the soldiers attempted to murder their own general. Parliament in alarm set about the formation of a new general service force (July 12), but meantime both Waller's and *Browne's* armies (at Abingdon and Reading respectively) ignominiously collapsed by mutiny and desertion. It was evident that the people at large, with their respect for the law and their anxiety for their own homes, were tired of the war.

Only those men—such as *Cromwell*—who had set their hearts on fighting out the quarrel of conscience, kept steadfastly to their purpose. Cromwell himself had already decided that the king himself must be deprived of his authority. and his supporters were equally convinced. But they were relatively few. Even the Eastern Association trained bands had joined in the disaffection in Waller's army, and that unfortunate general's suggestion of a professional army, with all its dangers, indicated the only means of enforcing a peace such as Cromwell and his friends desired. There was this important difference, however, between *Waller's* idea and Cromwell's achievement — that the professional soldiers of the New Model were disciplined, led, and in all things inspired by "godly" officers. Godliness, devotion to the cause, and efficiency were indeed the only criteria Cromwell applied in choosing officers. Long before this he had warned the Scottish major-general Lawrence *Crawford* that the precise colour of a man's religious opinions mattered nothing compared with his devotion to them, and had told the committee of Suffolk, "I had rather have a plain russet-coated captain that knows what he fights for and loves what he knows than that which you call a 'gentleman' and is nothing else. I honour a gentleman that is so indeed . . . but seeing it was necessary the work must go on, better plain men than none." If "men of honour and birth" possessed the essentials of godliness, devotion and capacity, Cromwell preferred them, and as a fact only seven out of thirty-seven of the superior officers of the original New Model were not of gentle birth.

Lostwithiel. — But all this was as yet in the future. Essex's military promenade in the west of England was the subject of immediate interest. At first successful, this general penetrated to Plymouth, whence, securely based as he thought, he could overrun Devon. Unfortunately for him he was persuaded to overrun Cornwall as well. At once the Cornishmen rose, as they had risen under Hopton, and the king was soon on the march from the Oxford region, disregarding the armed mobs under Waller and Browne. Their state reflected the general languishing of the war spirit on both sides, not on one only, as Charles discovered when he learned that Lord Wilmot, the lieutenant-general of his horse, was in correspondence with *Essex.* Wilmot was of course placed under arrest, and was replaced by the dissolute General Goring. But it was unpleasantly evident that even gay cavaliers of the type of Wilmot had lost the ideals for which they fought, and had come to believe that the realm would never be at peace while Charles was king. Henceforward it will be found that the Royalist foot, now a thoroughly professional force, is superior in quality to the once superb cavalry, and that not merely because its opportunities for plunder, etc., are more limited.

Materially, however, the immediate victory was undeniably with the Royalists. After a brief period of manoeuvre, the Parliamentary army, now far from Plymouth found itself surrounded and starving at Lostwithiel, on the Fowey river, without hope of assistance. The horse cut its way out through the investing circle of posts, Essex himself escaped by sea, but Major-General *Skippon,* his second in command, had to surrender with the whole of the foot on Sept. 2. The officers and men were allowed to go free to Portsmouth, but their arms, guns and munitions were the spoil of the victors. There was now no trustworthy field force in arms for the Parliament south of the Humber, for even the Eastern Association army was distracted by its religious differences, which had now at last come definitely to the front and absorbed the political dispute in a wider issue. Cromwell already proposed to abolish the peerage, the members of which were inclined to make a hollow peace, and had ceased to pay the least respect to his general, Manchester, whose scheme for the solution of the quarrel was an impossible combination of Charles and Presbyterianism. Manchester for his part sank into a state of mere obstinacy, refusing to move against Rupert, even to besiege Newark, and actually threatened to hang Colonel Lilburne for capturing a Royalist castle without orders.

Operations of Essex's, **Waller's** and Manchester's Armies. — After the success of Lostwithiel there was little to detain Charles's main army in the extreme west, and meanwhile Banbury, a most important point in the Oxford circle, and Basing House (near Basingstoke) were in danger of capture. Waller, who had organized a small force of reliable troops, had already sent cavalry into Dorsetshire with the idea of assisting Essex, and he now came himself with reinforcements to prevent, so far as lay in his power, the king's return to the Thames valley. Charles was accompanied of course only by his permanent forces and by parts of Prince Maurice's and Hopton's armies — the Cornish

levies had as usual scattered as soon as the war receded from their borders. Manchester slowly advanced to Reading, Essex gradually reorganized his broken army at Portsmouth, while *Waller,* far out to the west at Shaftesbury, endeavoured to gain the necessary time and space for a general concentration in Wiltshire, where Charles would be far from Oxford and Basing and, in addition, outnumbered by two to one. But the work of rearming *Essex's* troops proceeded slowly for want of money, and *Manchester* peevishly refused to be hurried either by his more vigorous subordinates or by the Committee of Both Kingdoms, saying that the army of the Eastern Association was for the guard of its own employers and not for general service. He pleaded the renewed activity of the Newark Royalists as his excuse, forgetting that Newark would have been in his hands ere this had he chosen to move thither instead of lying idle for two months.

As to the higher command, things had come to such a pass that, when the three armies at last united, a council of war, consisting of three army commanders, several senior officers, and two civilian deiegates from the Committee, was constituted. When the vote of the majority had determined what was to be done, *Essex,* as lord general of the Parliament's first army, was to issue the necessary orders for the whole. Under such conditions it was not likely that Waller's hopes of a great battle at Shaftesbury would be realized. On Oct. 8 he fell back, the royal army following him step by step and finally reaching Whitchurch on Oct. 20. Manchester arrived at Basingstoke on the 17th, Waller on the 19th and Essex on the 21st. Charles had found that he could not relieve Basing (a mile or two from Basingstoke) without risking a battle with the enemy between himself and Oxford; his policy was still, as before Marston Moor, to "spin out time" until Rupert came back from the north; he therefore took the Newbury road and reiieved Donnington Castle near Newbury on the 22nd. Three days later Banbury too was relieved by a force which could now be spared from the Oxford garrison.

But for once the council of war on the other side was for fighting a battle, and the Parliamentary armies, their spirits revived by the prospect of action and by the news of the fall of Newcastle and the defeat of a sally from Newark, marched briskly. On the 26th they appeared north of Newbury on the Oxford road. Like Essex in 1643, Charles found himself headed off from the shelter of friendly fortresses, but beyond this fact there is little similarity between the two battles of Newbury, for the Royalists in the first case merely drew a barrier across Essex's path. On the present occasion the eager Parliamentarians made no attempt to force the king to attack them; they were well content to attack him in his chosen position themselves, especially as he was better off for supplies and quarters than they.

Second Newbury.— The second battle of Newbury is remarkable as being the first great manoeuvre-battle (as distinct from "pitched" battle) of the Civil War. A preliminary reconnaissance by the Parliamentary leaders (Essex was not present, owing to illness) established the fact that the king's infantry held a strong line of defence behind the Lambourn brook from Shaw (inclusive) to Donnington (exclusive), Shaw House and adjacent buildings being held as an advanced post. In rear of the centre, in open ground just north of Newbury, lay the bulk of the royal cavalry. In the left rear of the main line, and separated from it by more than a thousand yards, lay Prince Maurice's corps at Speen, advanced troops on the high ground west of that village, but Donnington Castle, under its energetic governor Sir John Boys, formed a strong post covering this gap with artillery fire.

The Parliamentary leaders had no intention of flinging their men away in a frontal attack on the line of the Eambourn, and a flank attack from the east side could hardly succeed owing to the obstacle presented by the confluence of the Lambourn and the Kennet, hence they decided on a wide turning movement via Chieveley, Winterbourne and Wickham Heath, against Prince Maurice's position—a decision which, daring and energetic as it was, led only to a modified success, for reasons which will appear. The flank march, out of range of the castle, was conducted with punctuality and precision, The troops composing it were drawn from all three armies and led by the best fighting generals, *Waller*, Cromwell, and Essex's subordinates *Balfour* and *Skippon.* Manchester at Clay Hill was to stand fast until the turning movement had developed, arid to make a vigorous holding attack on Shaw House as soon as *Waller's* guns were heard at Speen. But there was no commander-in-chief to co-ordinate the movements of the two widely separated corps, and consequently no co-operation. *Waller's* attack was not unexpected. and Prince Maurice had made ready to meet him. Yet the first rush of the rebels carried the entrenchments of Speen Hill, and Speen itself, though stoutly defended, fell into their hands within an hour, Essex's infantry recapturing here some of the guns they had had to surrender at Lostwithiel. But meantime Manchester, in spite of the entreaties of his staff, had not stirred from Clay Hill. He had made one false attack already early in the morning, and been severely handled, and he was aware of his own deficiencies as a general. A year before this he would have asked for and acted upon the advice of a capable soldier, such as Cromwell or *Crawford*, but now his mind was warped by a desire for peace on any terms, and he sought only to avoid defeat pending a happy solution of the quarrel. Those who sought to gain peace through victory were meanwhile driving Maurice back from hedge to hedge towards the open ground at Newbury, but every attempt to emerge from the lanes and fields was repulsed by the royal cavalry, and indeed by every available man and horse, for Charles's officers had gauged Manchester's intentions, and almost stripped the front of its defenders to stop Waller's advance. Nightfall put an end to the struggle around Newbury, and then—too late —*Manchester* ordered the attack on Shaw House. It failed completely in spite of the gallantry of his men, and darkness being then complete it was not renewed.

In its general course the battle closely resembled that of Freiburg (*q.v.*), fought the same year on the Rhine. But, if Waller's part in the battle corresponded in a measure to Turenne's, *Manchester* was unequal to playing the part of Condé, and consequently the results, in the case of the French won by three days' hard fighting, and even then comparatively small, were in the case of the English practically nil. During the night the royal army quietly marched away through the gap between Waller's and Manchester's troops. The heavy artillery and stores were left in Donnington Castle, Charles himself with a small escort rode off to the north-west to meet Rupert, and the main body gained Wallingford unmolested. An attempt at pursuit was made by *Waller* and Cromwell with all the cavalry they could lay hands on, but it was unsupported, for the council of war had decided to content itself with besieging Donnington Castle. A little later, after a brief and half-hearted attempt to move towards Oxford, it referred to the Committee for further instructions. Within the month Charles, having joined Rupert at Oxford and made him general of the Royalist forces vice Brentford, reappeared in the neighbourhood of Newbury. Donnington Castle was again relieved (Nov. g) under the eyes of the Parliamentary army, which was in such a miserable condition that even Cromwell was against fighting, and some manoeuvres followed, in the course of which Charles relieved Basing House and the Parliamentary armies fell back, not in the best order, to Reading. The season for field warfare was now far spent, and the royal army retired to enjoy good quarters and plentiful supplies around Oxford.

***The Self-denying* Ordinance.**—On the other side, the dissensions between the generals had become flagrant and public, and it was no longer possible for the Houses of Parliament to ignore the fact that the army must be radically reformed. Cromwell and Waller from their places in parliament attacked Manchester's conduct, and their attack ultimately became, so far as *Cromwell* was concerned, an attack on the Lords, most of whom held the same views as Manchester, and on the Scots, who attempted to bring Cromwell to trial as an "incendiary." At the crisis of their bitter controversy Cromwell suddenly proposed to stifle all animosities by the resignation of all officers who were members of either House, a proposal which affected himself not less than Essex and Manchester. The first "self-denying ordinance" was moved on Dec. g, and provided that "no member of either house

shall have or execute any office or command . . .," etc. This was not accepted by the Lords, and in the end a second "self-denying ordinance" was agreed to (April 3, 1645), whereby all the persons concerned were to resign, but without prejudice to their reappointment. Simultaneously with this, the formation of the New Model was at last definitely taken into consideration. The last exploit of *Waller,* who was not re-employed after the passing of the ordinance, was the relief of Taunton, then besieged by General Goring's army. *Cromwell* served as his lieutenant-general on this occasion, and we have Waller's own testimony that he was in all things a wise, capable and respectful subordinate. Under a leader of the stamp of *Waller, Cromwell* was well satisfied to obey, knowing the cause to be in good hands.

Decline of the Royalist Cause.—A raid of Goring's horse from the west into Surrey and an unsuccessful attack on General Browne at Abingdon were the chief enterprises undertaken on the side of the Royalists during the early winter. It was no longer "summer in Devon, summer in Yorkshire" as in January 1643. An ever-growing section of Royalists, amongst whom Rupert himself was soon to be numbered, were for peace; many scores of loyalist gentlemen, impoverished by the loss of three years' rents of their estates and hopeless of ultimate victory, were making their way to Westminster to give in their submission to the Parliament and to pay their fines. The new plan, suggested probably by Rupert, had already been tried with strategical success in the summer campaign of 1644. As we have seen, it consisted essentially in using Oxford as the centre of a circle and striking out radially at any favourable target—"manoeuvring about a fixed point," as Napoleon called it. It was significant of the decline of the Royalist cause that the "fixed point" had been in 1643 the king's field army, based indeed on its great entrenched camp, Banbury-Cirencester-Reading-Oxford, but free to move and to hold the enemy wherever met, while now it was the entrenched camp itself, weakened by the loss or abandonment of its outer posts, and without the power of binding the enemy if they chose to ignore its existence, that conditioned the scope and duration of the single remaining field army's enterprises.

The New Model Ordinance.—For the present, however, Charles's cause was crumbling more from internal weakness than from the blows of the enemy. Fresh negotiations for peace which opened on Jan. 29 at Uxbridge (by the name of which place they are known to history) occupied the attention of the Scots and their Presbyterian friends, the rise of Independency and of *Cromwell* was a further distraction, and over the new army and the Self-denying Ordinance the Lords and Commons were seriously at variance. But in February a fresh mutiny in *Waller's* command struck alarm into the hearts of the disputants. The "treaty" of Uxbridge came to the same end as the treaty of Oxford in 1643, and a settlement as to army reform was achieved on Feb. 15. Though it was only on March 25 that the second modified form of the ordinance was agreed to by both Houses, *Sir Thomas Fairfax* and *Philip Skippon* (who were not members of parliament) had been approved as lord general and major-general (of the infantry) respectively of the new army as early as Jan. 21. The post of lieutenant-general and cavalry commander was for the moment left vacant, but there was little doubt as to who would eventually occupy it.

Victories of **Montrose.**—In Scotland, meanwhile, Montrose was winning victories which amazed the people of the two kingdoms. Montrose's royalism differed from that of Englishmen of the 17th century less than from that of their forefathers under Henry VIII. and Elizabeth. To him the king was the protector of his people against Presbyterian theocracy, scarcely less offensive to him than the Inquisition itself, and the feudal oppression of the great nobles. Little as this ideal corresponded to the Charles of reality, it inspired in Montrose not merely romantic heroism but a force of leadership which was sufficient to carry to victory the nobles and gentry, the wild Highlanders and the experienced professional soldiers who at various times and places constituted his little armies. His first unsuccessful enterprise has been mentioned above. It seemed, in the early stages of his second attempt (August 1644), as if failure were again inevitable, for the gentry of the northern Lowlands were overawed by the prevailing party and resented the leadership of a lesser noble, even though he were the king's lieutenant over all Scotland. Disappointed of support where he most expected it, Montrose then turned to the Highlands. At Blair Athol he gathered his first army of Royalist clansmen, and good fortune gave him also a nucleus of trained troops. A force of disciplined experienced soldiers (chiefly Irish Macdonalds and commanded by Alastair of that name) had been sent over from Ireland earlier in the year, and, after ravaging the glens of their hereditary enemies the Campbells, had attempted without success, now here, now there, to gather the other clans in the king's name. Their hand was against every man's, and when he finally arrived in Badenoch, Alastair Macdonald was glad to protect himself by submitting to the authority of the king's lieutenant.

There were three hostile armies to be dealt with, besides—ultimately—the main Covenanting army far away in England. The duke of *Argyll,* the head of the Campbells, had an army of his own clan and of Lowland Covenanter levies, Lord *Elcho* with another Lowland army lay near Perth, and Lord *Balfour of Burleiglz* was collecting a third (also composed of Lowlanders) at Aberdeen. Montrose turned upon *Elcho* first, and found him at Tippermuir near Perth on the 1st of September 1644. The Royalists were about 3,000 strong and entirely foot, only Montrose himself and two others being mounted, while *Elcho* had about 7,000 of all arms. But *Elcho's* townsmen found that pike and musket were clumsy weapons in inexperienced hands, and, like Mackay's regulars at Killiecrankie fifty years later, they wholly failed to stop the rush of the Highland swordsmen. Many hundreds were killed in the pursuit, and Montrose slept in Perth that night, having thus accounted for one of his enemies.

Balfour of Burleigh was to be his next victim, and he started for Aberdeen on the 4th. As he marched, his Highlanders slipped away to place their booty in security. But the Macdonald regulars remained with him, and as he passed along the coast some of the gentry came in, though the great clan of the Gordons was at present too far divided in sentiment to take his part. Lord *Lewis Gordon* and some Gordon horse were even in *Balfour's* army. On the other hand, the earl of Airlie brought in forty-four horsemen, and Montrose was thus able to constitute two wings of cavalry on the day of battle. The Covenanters were about 2,500 strong and drawn up on a slope above the How Burn just outside Aberdeen (Sept. 13, 1644). Montrose, after clearing away the enemy's skirmishers, drew up his army in front of the opposing line, the foot in the centre, the forty-four mounted men, with musketeers to support them, on either flank. The hostile left-wing cavalry charged piecemeal, and some bodies of troops did not engage at all. On the other wing, however, Montrose was for a moment hard pressed by a force of the enemy that attempted to work round to his rear. But he brought over the small band of mounted men that constituted his right wing cavalry, and also some musketeers from the centre, and destroyed the assailants, and when the ill-led left wing of the Covenanters charged again, during the absence of the cavalry, they were mown down by the close-range volleys of Macdonald's musketeers. Shortly afterwards the centre of *Balfour's* army yielded to pressure and fled in disorder. Aberdeen was sacked by order of Montrose, whose drummer had been murdered while delivering a message under a flag of truce to the magistrates.

Inverlochy.—Only *Argyll* now remained to be dealt with. The Campbells were fighting men from birth, like Montrose's own men, and had few townsmen serving with them. Still there were enough of the latter and of the impedimenta of regular warfare with him to prevent *Argyll* from overtaking his agile enemy, and ultimately after a "hide-and-seek" in the districts of Rothiemurchus, Blair Athol, Banchory and Strathbogie, Montrose stood to fight at Fyvie Castle, repulsed *Argyll's* attack on that place and slipped away again to Rothiemurchus. There he was joined by Camerons and Macdonalds from all quarters for a grand raid on the Campbell country; he himself wished to march into the Lowlands, well knowing that he could not achieve the decision in the Grampians, but he had to bow, not for the first time nor the last, to local importunity. The raid was duly executed, and the Camp-

bells' boast, "It's a far cry to Loch Awe," availed them little. In December and January the Campbell lands were thoroughly and mercilessly devastated, and Montrose then retired slowly to Loch Ness, where the bulk of his army as usual dispersed to store away its plunder.

Argyll, with such Highland and Lowland forces as he could collect after the disaster, followed Montrose towards Lochaber, while the Seaforths and other northern clans marched to Loch Ness. Caught between them, Montrose attacked the nearest. The Royalists crossed the hills into Glen Roy, worked thence along the northern face of Ben Nevis, and descended like an avalanche upon Argyll's forces at Inverlochy (Feb. 2, 1645). As usual, the Lowland regiments gave way at once—Montrose had managed in all this to keep with him a few cavalry—and it was then the turn of the Campbells. Argyll escaped in a boat, but his clan, as a fighting force, was practically annihilated, and Montrose, having won four victories in these six winter months, rested his men and exultingly promised Charles that he would come to his assistance with a brave army before the end of the summer.

Organization of the New Model Army.—To return to the New Model. Its first necessity was regular pay; its first duty to serve wherever it might be sent. Of the three armies that had fought at Newbury only one, Essex's, was in a true sense a general service force, and only one, Manchester's, was paid with any regularity. *Waller's* army was no better paid than Essex's and no more free from local ties than *Manchester's*. It was therefore broken up early in April, and only 600 of its infantry passed into the New Model. Essex's men, on the other hand, wanted but regular pay and strict officers to make them excellent soldiers, and their own major-general, *Skippon*, managed by tact and his personal popularity to persuade the bulk of the men to rejoin. *Manchester's* army, in which Cromwell had been the guiding influence from first to last, was naturally the backbone of the New Model. Early in April Essex, Manclzester and *Waller* resigned their commissions, and such of their forces as were not embodied in the new army were sent to do local duties, for minor armies were still maintained, General *Poyntz's* in the north midlands, General *Massey's* in the Severn valley, a large force in the Eastern Association, General *Browne's* in Buckinghamshire, etc., besides the Scots in the north.

The New Model originally consisted of 14,400 foot and 7,700 horse and dragoons. Of the infantry only 6,000 came from the combined armies, the rest being new recruits furnished by the press. The Puritans had by now disappeared almost entirely from the ranks of the infantry. Per contra the officers and sergeants and the troopers of the horse were the sternest Puritans of all, the survivors of three years of a disheartening war. There was considerable trouble during the first months of Fairfax's command, and discipline had to be enforced with unusual sternness. As for the enemy, Oxford was openly contemptuous of "the rebels' new brutish general" and his men, who seemed hardly likely to succeed where Essex and Waller had failed. But the effect of the Parliament's having "an army all its own" was soon to be apparent.

First Operations of 1645.—On the Royalist side the campaign of 1645 opened in the west, whither the young prince of Wales (Charles II.) was sent with Hyde (later earl of Clarendon), Hopton and others as his advisers. General (Lord) Goring, however, now in command of the Royalist field forces in this quarter, was truculent, insubordinate and dissolute, though on the rare occasions when he did his duty he displayed a certain degree of skill and leadership, and the influence of the prince's counsellors was but small. As usual, operations began with the sieges necessary to conciliate local feeling. Plymouth and Lyme were blocked up, and Taunton again invested. The reinforcement thrown into the last place by Waller and Cromwell was dismissed by Blake (then a colonel in command of the fortress and afterwards the great admiral of the Commonwealth), and after many adventures rejoined Waller and Cromwell. The latter generals, who had not yet laid down their commissions, then engaged Goring for some weeks, but neither side having infantry or artillery, and both finding subsistence difficult in February and March and in country that had been fought over for two years past, no results were to be expected. Taunton still remained unrelieved, and Goring's horse still rode all over Dorsetshire when the New Model at last took the field.

Rupert's Northern March.—In the midlands and Lancashire the Royalist horse, as ill-behaved even as Goring's men, were directly responsible for the ignominious failure with which the king's main army began its year's work. Prince Maurice was joined at Ludlow by Rupert and part of his Oxford army early in March, and the brothers drove off *Brereton* from the siege of Beeston Castle and relieved the pressure on Lord Byron in Cheshire. So great was the danger of Rupert's again invading Lancashire and Yorkshire that all available forces in the north, English and Scots, were ordered to march against him. But at this moment the prince was called back to clear his line of retreat on Oxford. The Herefordshire and Worcestershire peasantry, weary of military exactions, were in arms, and though they would not join the Parliament, and for the most part dispersed after stating their grievances, the main enterprise was wrecked. This was but one of many ill-armed crowds—"Clubmen" as they were called—that assembled to enforce peace on both parties. A few regular soldiers were sufficient to disperse them in all cases, but their attempt to establish a third party in England was morally as significant as it was materially futile. The Royalists were now fighting with the courage of despair; those who still fought against Charles did so with the full determination to ensure the triumph of their cause, and with the conviction that the only possible way was the annihilation of the enemy's forces, but the majority were so weary of the war that the earl of *Manchester's* Presbyterian royalism—which had contributed so materially to the prolongation of the struggle—would probably have been accepted by four-fifths of all England as the basis of a peace. It was, in fact, in the face of almost universal opposition that *Fairfax* and *Cromwell* and their friends at Westminster guided the cause of their weaker comrades to complete victory.

Cromwell's Raid.—Having without difficulty rid himself of the Clubmen, Rupert was eager to resume his march into the north. It is unlikely that he wished to join Montrose, though Charles himself favoured that plan, but he certainly intended to fight the Scottish army, more especially as after Inverlochy it had been called upon to detach a large force to deal with Montrose. But this time there was no Royalist army in the north to provide icfantry and guns for a pitched battle, and Rupert had perforce to wait near Hereford till the main body, and in particular the artillery train, could come from Oxford and join him. It was on the march of the artillery train to Hereford that the first operations of the New Model centred. The infantry was not yet ready to move, in spite of all Fairfax's and *Skippon's* efforts, and it became necessary to send the cavalry by itself to prevent Rupert from gaining a start. Cromwell, then under *Waller's* command, had come to Windsor to resign his commission as required by the Self-denying Ordinance. Instead, he was placed at the head of a brigade of his own old soldiers, with orders to stop the march of the artillery train. On April 23 he started from Watlington north-westward. At dawn on the 24th he routed a detachment of Royalist horse at Islip. On the same day, though he had no guns and only a few firearms in the whole force, he terrified the governor of Bletchingdon House into surrender. Riding thence to Witney, Cromwell won another cavalry fight at Bampton-in-the Bush on the 27th, and attacked Faringdon House, though without success, on the 29th. Thence he marched at leisure to Newbury. He had done his work thoroughly. He had demoralized the Royalist cavalry, and, above all, had carried off every horse on the country-side. To all Rupert's entreaties Charles could only reply that the guns could not be moved till May 7, and he even summoned Goring's cavalry from the west to make good his losses.

Divergent Purposes.—Cromwell's success thus forced the king to concentrate his various armies in the neighbourhood of Oxford, and the New Model had, so *Fairfax* and *Cromwell* hoped, found its target. But the Committee of Both Kingdoms on the one side, and Charles, Rupert and Goring on the other, held different views. On May 1 *Fairfax*, having been ordered to relieve Taunton, set out from Windsor for the long march to that place; meeting *Cromwell* at Newbury on the 2nd, he directed the lieu-

tenant-general to watch the movements of the king's army, and himself marched on to Blandford, which he reached on May 7. Thus *Fairfax* and the main army of the Parliament were marching away in the west while Cromwell's detachment was left, as Waller had been left the previous year, to hold the king as best he could.

On the very evening that *Cromwell's* raid ended, the leading troops of Goring's command destroyed part of Cromwell's own regiment near Faringdon, and on the 3rd Rupert and Maurice appeared with a force of all arms at Burford. Yet the Committee of Both Kingdoms, though aware on the 29th of Goring's move, only made up its mind to stop *Fairfax* on the 3rd, and did not send off orders till the 5th. These orders were to the effect that a detachment was to be sent to the relief of Taunton, and that the main army was to return. *Fairfax* gladly obeyed, but long before he came up to the Thames valley the situation was again changed. Rupert, now in possession of the guns and their teams, urged upon his uncle the resumption of the northern enterprise, calculating that with *Fairfax* in Somersetshire, Oxford was safe. Charles accordingly marched out of Oxford on the 7th towards Stow-on-the-Wold, on the very day, as it chanced, that *Fairfax* began his return march from Blandford. But Goring and most of the other generals were for a march into the west, in the hope of dealing with Fairjax as they had dealt with Essex in 1644. The armies therefore parted as Essex and Waller had parted at the same place in 1644, Rupert and the king to march northward, Goring to return to his independent command in the west. Rupert, not unnaturally wishing to keep his influence with the king and his authority as general of the king's army unimpaired by Goring's notorious indiscipline, made no attempt to prevent the separation, which in the event proved wholly unprofitable. The flying column from Blandford relieved Taunton long before Goring's return to the west, and Colonel *Weldon* and Colonel Graves, its commanders, set him at defiance even in the open country. As for *Fairfax,* he was out of Goring's reach preparing for the siege of Oxford.

Charles in the Midlands.---On the other side also the generals were working by data that had ceased to have any value. Fairfax's siege of Oxford, ordered by the Committee on the 10th of May, and persisted in after it was known that the king was on the move, was the second great blunder of the year and was hardly redeemed, as a military measure, by the visionary scheme of assembling the Scots, the Yorkshiremen and the midland forces to oppose the king. It is hard to understand how, having created a new model army "all its own" for general service, the Parliament at once tied it down to a local enterprise, and trusted an improvised army of local troops to fight the enemy's main army. In reality the Committee seems to have been misled by false information to the effect that Goring and the governor of Oxford were about to declare for the Parliament, but had they not despatched *Fairfax* to the relief of Taunton in the first instance the necessity for such intrigues would not have arisen. However, *Fairfax* obeyed orders, invested Oxford, and, so far as he was able without a proper siege train, besieged it for two weeks, while Charles and Rupert ranged the midlands unopposed. At the end of that time came news so alarming that the Committee hastily abdicated their control over military operations and gave *Fairfax* a free hand. "Black Tom" gladly and instantly abandoned the siege and marched northward to give battle to the king.

Meanwhile Charles and Rupert were moving northward. On May 11 they reached Droitwich, whence after two days' rest they marched against Brcreton. The latter hurriedly raised the sieges he had on hand, and called upon Yorkshire and the Scottish army there for aid. But only the old Lord Fairjax and the Yorkshiremen responded. *Leven* had just heard of new victories won by Montrose, and could do no more than draw his army and his guns over the Pennine chain into Westmorland in the hope of being in time to bar the king's march on Scotland via Carlisle.

Dundee.—After the destruction of the Campbells at Inverlochy, Montrose had cleared away the rest of his enemies without difficulty. He now gained a respectable force of cavalry by the adhesion of Lord Gordon and many of his clan, and this reinforcement was the more necessary as detachments from *Leven's* army under *Baillie* and *Hurry*—disciplined infantry and cavalry—were on the march to meet him. The Royalists marched by Elgin and through the Gordon country to Aberdeen, and thence across the Esk to Coupar-Angus, where *Baillie* and Hurry were encountered. A war of manoeuvre followed, in which they thwarted every effort of the Royalists to break through into the Lowlands, but in the end retired into Fife. Montrose thereupon marched into the hills with the intention of reaching the upper Forth and thence the Lowlands, for he did not disguise from himself the fact that there, and not in the Highlands, would the quarrel be decided, and was sanguine—over-sanguine, as the event proved—as to the support he would obtain from those who hated the kirk and its system. But he had called to his aid the semi-barbarous Highlanders, and however much the Lowlands resented a Presbyterian inquisition, they hated and feared the Highland clans beyond all else. He was equally disappointed in his own army. For a war of positions the Highlanders had neither aptitude nor inclination, and at Dunkeld the greater part of them went home. If the small remnant was to be kept to its duty, plunder must be found, and the best objective was the town of Dundee. With a small force of 750 foot and horse Montrose brilliantly surprised that place on April 4, but *Baillie* and Hurry were not far distant, and before Montrose's men had time to plunder the prize they were collected to face the enemy.

Montrose's retreat from Dundee was considered a model operation by foreign students of the art of war (then almost as numerous as now), and what surprised them most was that Montrose could rally his men after a sack had begun. The retreat itself was remarkable enough. *Baillie* moved parallel to Montrose on his left flank towards Arbroath, constantly heading him off from the hills and attempting to pin him against the sea. Montrose, however, halted in the dark so as to let *Baillie* get ahead of him and then turned sharply back, crossed *Baillie's* track, and made for the hills. *Baillie* soon realized what had happened and turned back also, but an hour too late. By the 6th the Royalists were again safe in the broken country of the Esk valley. But Montrose cherished no illusions as to joining the king at once; all he could do, he now wrote, was to neutralize as many of the enemy's forces as possible.

Auldearn.—For a time he wandered in the Highlands seeking recruits. But soon he learned that *Baillie* and *Hurry* had divided their forces, the former remaining about Perth and Stirling to observe him, the latter going north to suppress the Gordons. Strategy and policy combined to make Hurry the objective of the next expedition. But the soldier of fortune who commanded the Covenanters at Aberdeen was no mean antagonist. Marching at once with a large army (formed on the nucleus of his own trained troops and for the rest composed of clansmen and volunteers) Hurry advanced to Elgin, took contact with Montrose there, and, gradually and skilfully retiring, drew him into the hostile country round Inverness. Montrose fell into the trap, and Hurry took his measures to surprise him at Auldearn so successfully that (May 9) Montrose, even though the indiscipline of some of Hurry's young soldiers during the night march gave him the alarm, had barely time to form up before the enemy was upon him. But the best strategy is of no avail when the battle it produces goes against the strategist, and Montrose's tactical skill was never more conspicuous than at Auldearn. Alastair Macdonald with most of the Royalist infantry and the Royal standard was posted to the right (north) of the village to draw upon himself the weight of Hurry's attack; only enough men were posted in the village itself to show that it was occupied, and on the south side, out of sight, was Montrose himself with a body of foot and all the Gordon horse. It was the prototype, on a small scale, of Austerlitz. Macdonald resisted sturdily while Montrose edged away from the scene of action, and at the right moment and not before, though Macdonald had been driven back on the village and was fighting for life amongst the gardens and enclosures, Montrose let loose Lord Gordon's cavalry. These, abandoning for once the pistol tactics of their time, charged home with the sword. The enemy's right wing cavalry was scattered in an instant, the nearest infantry was promptly ridden down, and soon Hurry's army had ceased to exist.

Campaign of **Naseby.**—If the news of Auldearn brought *Leven* to the region of Carlisle, it had little effect on his English allies. *Fairfax* was not yet released from the siege of Oxford, in spite of the protests of the Scottish representatives in London. *Massey,* the active and successful governor of Gloucester, was placed in command of a field force on May 25, but he was to lead it against, not the king, but Goring. At that moment the military situation once more changed abruptly. Charles, instead of continuing his march on to Lancashire, turned due eastward towards Derbyshire. The alarm at Westminster when this new development was reported was such that *Cromwell,* in spite of the Self-Denying Ordinance, was sent to raise an army for the defence of the Eastern Association. Yet the Royalists had no intentions in that direction. Conflicting reports as to the condition of Oxford reached the royal headquarters in the last week of May, and the eastward march was made chiefly to "spin out time" until it could be known whether it would be necessary to return to Oxford, or whkther it was still possible to fight *Leven* in Yorkshire—his move into Westmorland was not yet known—and invade Scotland by the easy east coast route.

Goring's return to the west had already Seen countermanded and he had been directed to march to Harborough, while the South Wales Royalists were also called in towards Leicester. Later orders (May 26) directed him to Newbury, whence he was to feel the strength of the enemy's positions around Oxford. It is hardly necessary to say that Goring found good military reasons for continuing his independent operations, and marched off towards Taunton regardless of the order. He redressed the balance there for the moment by overawing *Massey's* weak force, and his purse profited considerably by fresh opportunities for extortion, but he and his men were not at Naseby. Meanwhile the king, at the geographical centre of England, found an important and wealthy town at his mercy. Rupert, always for action, took the opportunity, and Leicester was stormed and thoroughly pillaged on the night of May 30–31. There was the usual panic at Westminster, but, unfortunately for Charles, it resulted in *Fairfax* being directed to abandon the siege of Oxford and given *carte blanche* to bring the Royal army to battle wherever it was met.

On his side the king had, after the capture of Leicester, accepted the advice of those who feared for the safety of Oxford —Rupert, though commander-in-chief, was unable to insist on the northern enterprise—and had marched to Daventry, where he halted to throw supplies into Oxford. Thus *Fairfax* in his turn was free to move, thanks to the insubordination of Goring, who would neither relieve Oxford nor join the king for an attack on the New Model. The Parliamentary general moved from Oxford towards Northampton so as to cover the Eastern Association. On June 12 the two armies were only a few miles apart, *Fairfax* at Kislingbury, Charles at Daventry, and, though the Royalists turned northward again on the 13th to resume the Yorkshire project under the very eyes of the enemy, *Fairfax* followed close. On the night of the 13th Charles slept at Lubenham, *Fairfax* at Guilsborough. *Cromwell,* just appointed lieutenant-general of the New Model, had ridden into camp on the morning of the 13th with fresh cavalry from the eastern counties, Colonel *Rossiter* came up with more from Lincolnshire on the morning of the battle, and it was with an incontestable superiority of numbers and an overwhelming moral advantage that *Fairfax* fought at Naseby (*q.v.*) on June 14. The result of the battle, this time a decisive battle, was the annihilation of the royal army. Part of the cavalry escaped, a small fraction of it in tolerable order, but the guns and the baggage train were taken, and, above all, the splendid Royal infantry were killed or taken prisoners to a man.

Effects of **Naseby.**—After Naseby, though the war dragged on for another year, the king never succeeded in raising an army as good as, or even more numerous than, that which *Fairfax's* army had so heavily outnumbered on June 14. That the fruits of the victory could not be gathered in a few weeks was due to a variety of hindrances rather than to direct opposition—to the absence of rapid means of communication, the paucity of the forces engaged on both sides relatively to the total numbers under arms, and from time to time to the political exigencies of the growing quarrel between Presbyterians and Independents. As to the latter, within a few days of Naseby, the Scots rejoiced that the "back of the malignants was broken," and demanded reinforcements as a precaution against "the insolence of others," *i.e., Cromwell* and the Independents—"to whom alone the Lord has given the victory of that day." *Leven* had by now returned to Yorkshire, and a fortnight after Naseby, after a long and honourable defence by Sir Thomas Glemham, Carlisle fell to *David Leslie's* besieging corps. Leicester was reoccupied by *Fairfax* on the 18th, and on the 20th *Leven's* army, moving slowly southward, reached Mansfield.

This move was undertaken largely for political reasons, *i.e.,* to restore the Presbyterian balance as against the victorious New Model. *Fairfax's* army was intended by its founders to be a specifically English army and *Cromwell* for one would have employed it against the Scots almost as readily as against malignants. But for the moment the advance of the northern army was of the highest military importance, for *Fairfax* was thereby set free from the necessity of undertaking sieges. Moreover, the publication of the king's papers taken at Naseby gave *Fairfax's* troops a measure of official and popular support which a month before they could not have been said to possess, for it was now obvious that they represented the armed force of England against the Irish, Danes, French, Lorrainers, etc., whom Charles had for three years been endeavouring to let loose on English soil. Even the Presbyterians abandoned for the time any attempt to negotiate with the king, and advocated a vigorous prosecution of the war.

Fairfax's Western Campaign.—This, in the hands of *Fairfax* and *Cromwell,* was likely to be effective. While the king and Rupert, with the remnant of their cavalry, hurried into South Wales to join Sir Charles Gerard's troops and to raise fresh infantry, *Fairfax* decided that Goring's was the most important Royalist army in the field, and turned to the west, reaching Lechlade on the 26th, less than a fortnight after the battle of Naseby. One last attempt was made to dictate the plan of campaign from Westminster, but the Committee refused to pass on the directions of the Houses, and he remained free to deal with Goring as he desired. Time pressed; Charles in Monmouthshire and Rupert at Bristol were well placed for a junction with Goring, which would have given them a united army 15,000 strong. Taunton, in spite of *Massey's* efforts to keep the field, was again besieged, and in Wilts and Dorset numerous bands of Clubmen were on foot which the king's officers were doing their best to turn into troops for their master. But the process of collecting a fresh royal army was slow, and Goring and his subordinate, Sir Richard Grenville, were alienating the king's most devoted adherents by their rapacity, cruelty and debauchery. Moreover, Goring had no desire to lose the independent command he had extorted at Stow-on-the-Wold in May. Still, it was clear that he must be disposed of as quickly as possible, and *Fairfax* requested the Houses to take other measures against the king (June 26). This they did by paying up the arrears due to *Leven's* army and bringing it to the Severn valley. On July 8 *Leven* reached Alcester, bringing with him a Parliamentarian force from Derbyshire under *Sir John Gell.* The design was to besiege Hereford.

Langport.—By that time *Fairfax* and Goring were at close quarters. The Royalist general's line of defence faced west along the Yeo and the Parrett between Yeovil and Bridgwater, and thus barred the direct route to Taunton. *Fairfax,* however, marched from Lechlade via Marlborough and Blandford—hindered only by Clubmen—to the friendly posts of Dorchester and Lyme, and with these as his centre of operations he was able to turn the headwaters of Goring's river-line via Beaminster and Crewkerne. The Royalists at once abandoned the south and west side of the rivers—the siege of Taunton had already been given up—and passed over to the north and east bank. Bridgwater was the right of this second line as it had been the left of the first; the new left was at Ilchester. Goring could thus remain in touch with Charles in South Wales through Bristol,

and the siege of Taunton having been given up there was no longer any incentive for remaining on the wrong side of the water-line.

But his army was thoroughly demoralized by its own licence and indiscipline, and the swift, handy and resolute regiments of the New Model made short work of its strong positions. On July 7, demonstrating against the points of passage between Ilchester and Langport, *Fairfax* secretly occupied Yeovil. The post at that place, which had been the right of Goring's first position, had, perhaps rightly, been withdrawn to Ilchester when the second position was taken up, and *Fairfax* repaired the bridge without interruption. Goring showed himself unequal to the new situation. He might, if sober, make a good plan when the enemy was not present to disturb him, and he certainly led cavalry charges with boldness and skill. But of strategy in front of the enemy he was incapable. On the news from Yeovil he abandoned the line of the Yeo as far as Langport without striking a blow, and *Fairfax,* having nothing to gain by continuing his détour through Yeovil, came back and quietly crossed at Long Sutton, west of Ilchester (July 9). Goring had by now formed a new plan. A strong rear-guard was posted at Langport and on high ground east and north-east of it to hold *Fairfax,* and he himself with the cavalry rode off early on the 8th to try and surprise Taunton. This place was no longer protected by *Massey's* little army, which *Fairfax* had called up to assist his own. But *Fairfax* who was not yet across Long Sutton bridge, heard of Goring's raid in good time, and sent *Massey* after him with a body of horse.

Massey surprised a large party of the Royalists at Ilminster on the gth, wounded Goring himself, and pursued the fugitives up to the south-eastern edge of Langport. On the 10th *Fairfax's* advanced guard, led by Major *Bethel* of *Cromwell's* own regiment, brilliantly stormed the position of Goring's rearguard east of Langport, and the cavalry of the New Model, led by *Cromwell* himself, swept in pursuit right up to the gates of Bridgwater, where Goring's army, dismayed and on the point of collapse, was more or less rallied. Thence Goring himself retired to Barnstaple. His army, under the regimental officers, defended itself in Bridgwater resolutely till July 23, when it capitulated. The fall of Bridgwater gave *Fairfax* complete control of Somerset and Dorset from Lyme to the Bristol channel. Even in the unlikely event of Goring's raising a fresh army, he would now have to break through towards Bristol by open force, and a battle between Goring and *Fairfax* could only have one result. Thus Charles had perforce to give up his intention of joining Goring—his recruiting operations in South Wales had not been so successful as he hoped, owing to the apathy of the people and the vigour of the local Parliamentary leaders—and to resume the northern enterprise begun in the spring.

Schemes of Lord Digby.—This time Rupert would not be with him. The prince, now despairing of success and hoping only for a peace on the best terms procurable, listlessly returned to his governorship of Bristol and prepared to meet *Fairfax's* impending attack. The influence of Rupert was supplanted by that of Lord Digby. As sanguine as Charles and far more energetic, he was for the rest of the campaign the guiding spirit of the Royalists, but as a civilian he offended the officers by constituting himself a sort of confidential military secretary to the king, and he was distrusted by all sections of Royalists for his reckless optimism. The resumption of the northern enterprise, opposed by Rupert and directly inspired by Digby, led to nothing. Charles marched by Bridgnorth, Lichfield and Ashbourne to Doncaster, where, on Aug. 18, he was met by great numbers of Yorkshire gentlemen with promises of fresh recruits. For a moment the outlook was bright, for the Derbyshire men with *Gell* were far away at Worcester with *Leven,* the Yorkshire Parliamentarians engaged in besieging Scarborough Castle, Pontefract and other posts. But two days later he heard that *David Leslie* with the cavalry of *Leven's* army was coming up behind him, and that, the Yorkshire sieges being now ended, Major-General *Poyntz's* force lay in his front. It was now impossible to wait for the new levies, and reluctantly the king turned back to Oxford, raiding Huntingdonshire and other parts of the hated Eastern Association *en route.*

Montrose's Last **Victories.**—*David Leslie* did not pursue him. Montrose, though the king did not yet know it, had won two more battles, and was practically master of all Scotland. After Auldearn he had turned to meet *Baillie's* army in Strathspey, and by superior mobility and skill forced that commander to keep at a respectful distance. He then turned upon a new army which *Lindsay,* titular earl of Crawford, was forming in Forfarshire, but that commander betook himself to a safe distance, and Montrose withdrew into the Highlands to find recruits (June). The victors of Auldearn had mostly dispersed on the usual errand, and he was now deserted by most of the Gordons, who were recalled by the chief of their clan, the marquess of Huntly, in spite of the indignant remonstrances of Huntly's heir, Lord Gordon, who was Montrose's warmest admirer. *Baillie* now approached again, but he was weakened by having to find trained troops to stiffen *Lindsay's* levies, and a strong force of the Gordons had now been persuaded to rejoin Montrose.

The two armies met in battle near Alford on the Don; little can be said of the engagement save that Montrose had to fight cautiously and tentatively as at Aberdeen, not in the decision-forcing spirit of Auldearn, and that in the end *Baillie's* cavalry geve way and his infantry was cut down as it stood. Lord Gordon was amongst the Royalist dead (July 2). The plunder was put away in the glens before any attempt was made to go forward, and thus the Covenanters had leisure to form a numerous, if not very coherent, army on the nucleus of *Lindsay's* troops. *Baillie,* much against his will, was continued in the command, with a council of war (chiefly of nobles whom Montrose had already defeated, such as *Argyll, Elcho* and *Balfour*) to direct his every movement. Montrose, when rejoined by the Highlanders, moved to meet him, and in the last week of July and the early part of August there were manoeuvres and minor engagements round Perth. About Aug. 7 Montrose suddenly slipped away into the Lowlands, heading for Glasgow. Thereupon another Covenanting army began to assemble in Clydesdale. But it was clear that Montrose could beat mere levies, and *Baillie,* though without authority and despairing of success, hurried after him. Montrose then, having drawn *Baillie's* Fifeshire militia far enough from home to ensure their being discontented, turned upon them on Aug. 14 near Kilsyth. *Baillie* protested against fighting, but his aristocratic masters of the council of war decided to cut off Montrose fram the hills by turning his left wing.

The Royalist general seized the opportunity, and his advance caught them in the very act of making a flank march (August 15). The head of the Covenanters' column was met and stopped by the furious attack of the Gordon infantry, and Alastair Macdonald led the men of his own name and the Macleans against its flank. A breach was made in the centre of *Baillie's* army at the first rush and then Montrose sent in the Gordon and Ogilvy horse. The leading half of the column was surrounded, broken up and annihilated. The rear half, seeing the fate of its comrades, took to flight, but in vain, for the Highlanders pursued *à outrance.* Only about one hundred Covenanting infantry out of six thousand escaped. Montrose was now indeed the king's lieutenant in all Scotland.

Fall of **Bristol.**—But Charles was in no case to resume his northern march. *Fairfax* and the New Model, after reducing Bridgwater, had turned back to clear away the Dorsetshire Clubmen and to besiege Sherborne Castle. On the completion of this task, it had been decided to besiege Bristol, and on Aug. 23—while the king's army was still in Huntingdon, and Goring was trying to raise a new army to replace the one he had lost at Langport and Bridgwater—the city was invested. In these urgent circumstances Charles left Oxford for the west only a day or two after he had come in from the Eastern Association raid. Calculating that Rupert could hold out longest, he first moved to the relief of Worcester, around which place *Leven's* Scots, no longer having *Leslie's* cavalry with them to find supplies, were more occupied with plundering their immediate neighbourhood for food than with the siege works. Worcester was relieved on Sept. 1 by the king. *David Leslie* with all his cavalry was already on the march to meet Montrose, and *Leven* had no alternative but to draw off

his infantry without fighting Charles entered Worcester on the 8th, but he found that he could no longer expect recruits from South Wales. Worse was to come. A few hours later, on the night of the 9th–10th, Fairfax's army stormed Bristol. Rupert had long realized the hopelessness of further fighting—the very summons to surrender sent in by *Fairfax* placed the fate of Bristol on the political issue—the lines of defence around the place were too extensive for his small force, and on the 11th he surrendered on terms. He was escorted to Oxford with his men, conversing as he rode with the officers of the escort about peace and the future of his adopted country.

Charles, almost stunned by the suddenness of the catastrophe, dismissed his nephew from all his offices and ordered him to leave England, and for almost the last time called upon Goring to rejoin the main army—if a tiny force of raw infantry and disheartened cavalry can be so called—in the neighbourhood of Raglan. But before Goring could be brought to withdraw his objections Charles had again turned northward towards Montrose. A weary march through the Welsh hills brought the royal army on Sept. 22 to the neighbourhood of Chester. Charles himself with one body entered the city, which was partially invested by the Parliamentarian colonel *Michael* Jones, and the rest under Sir Marmaduke Langdale was sent to take Jones's lines in reverse. But at the opportune moment Poyntz's forces, which had followed the king's movements since he left Doncaster in the middle of August, appeared in rear of Langdale, and defeated him in the battle of Rowton Heath (Sept. 24), while at the same time a sortie of the king's troops from Chester was repulsed by Jones. Thereupon the royal army withdrew to Denbigh, and Chester, the only important seaport remaining to connect Charles with Ireland, was again besieged.

Philiphaugh.—Nor was Montrose's position, even after Kilsyth, encouraging, in spite of the persistent rumours of fighting in Westmorland that reached Charles and Digby. Glasgow and Edinburgh were indeed occupied, and a parliament summoned in the king's name. But Montrose had now to choose between Highlanders and Lowlanders. The former, strictly kept away from all that was worth plundering, rapidly vanished, even Alastair Macdonald going with the rest. Without the Macdonalds and the Gordons, Montrose's military and political resettlement of Scotland could only be shadowy, and when he demanded support from the sturdy middle classes of the Lowlands, it was not forgotten that he had led Highlanders to the sack of Lowland towns. Thus his new supporters could only come from amongst the discontented and undisciplined Border lords and gentry, and long before these moved to join him the romantic conquest of Scotland was over.

On Sept. 6 David Leslie had recrossed the frontier with his cavalry and some infantry he had picked up on the way through northern England. Early on the morning of the 13th he surprised Montrose at Philiphaugh near Selkirk. The king's lieutenant had only 650 men against 4,000, and the battle did not last long. Montrose escaped with a few of his principal adherents, but his little army was annihilated. Of the veteran Macdonald infantry, 500 strong that morning, 250 were killed in the battle and the remainder put to death after accepting quarter. The Irish, even when they bore a Scottish name, were, by Scotsmen even more than Englishmen, regarded as beasts to be knocked on the head. After Naseby the Irishwomen found in the king's camp were branded by order of *Fairfax;* after Philiphaugh more than 300 women, wives or followers of Macdonald's men, were butchered. Montrose's Highlanders at their worst were no more cruel than the sober soldiers of the kirk.

Digby's Northern Expedition.— Charles received the news of Philiphaugh on Sept. 28, and gave orders that the west should be abandoned, the prince of Wales should be sent to France, and Goring should bring up what forces he could to the Oxford region. On Oct. 4 Charles himself reached Newark (whither he had marched from Denbigh after revictualling Chester and suffering the defeat of Rowton Heath). The intention to go to Montrose was of course given up, at any rate for the present, and he was merely waiting for Goring and the Royalist militia of the west—each in its own way a broken reed to lean upon. A hollow reconciliation was patched up between Charles and Rupert, and the court remained at Newark for over a month. Before it set out to return to Oxford another Royalist force had been destroyed.

On Oct. 14, receiving information that Montrose had raised a new army, the king permitted Langdale's northern troops to make a fresh attempt to reach Scotland. At Langdale's request Digby was appointed to command in this enterprise, and, civilian though he was, he led it boldly and skilfully. His immediate opponent was Poyntz, who had followed the king step by step from Doncaster to Chester and back to Welbeck, and he succeeded on the 15th in surprising Poyntz's entire force of foot at Sherburn. Poyntz's cavalry were soon after this reported approaching from the south, and Digby hoped to trap them also. At first all went well and body after body of the rebels was routed. But by a singular mischance the Royalist main body mistook the Parliamentary squadrons in flight through Sherburn for friends, and believing all was lost took flight also. Thus Digby's cavalry fled as fast as Poyntz's and in the same direction, and the latter, coming to their senses first, drove the Royalist horse in wild confusion as far as Skipton. Lord Digby was still sanguine and from Skipton he actually penetrated as far as Dumfries.

But whether Montrose's new army was or was not in the Lowlands, it was certain that *Leven* and Leslie were on the Border, and the adventure soon came to an end. Digby, with the mere handful of men remaining to him, was driven back into Cumberland, and on Oct. 24, his army having entirely disappeared, he took ship with his officers for the Isle of Man. Poyntz had not followed him beyond Skipton, and was now watching the king from Nottingham, while Rossiter with the Lincoln froops was posted at Grantham. The king's chances of escaping from Newark were becoming smaller day by day, and they were not improved by a violent dispute between him and Rupert, Maurice, Lord Gerard and Sir Richard Willis, at the end of which these officers and many others rode away to ask the Parliament for leave to go over-seas. The pretext of the quarrel mattered little, the distinction between the views of Charles and Digby on the one hand and Rupert and his friends on the other was fundamental—to the latter peace had become a political as well as a military necessity.

Meanwhile South Wales, with the single exception of Raglan Castle, had been overrun by the Parliamentarians. Everywhere the Royalist posts were falling. The New Model, no longer fearing Goring, had divided, *Fairfax* reducing the garrisons of Dorset and Devon, Cromwell those of Hampshire. Amongst the latter was the famous Basing House, which was stormed at dawn on Oct. 14 and burnt to the ground. *Cromwell,* his work finished, returned to headquarters, and the army wintered in the neighbourhood of Crediton.

End of the First War.—The military events of 1646 call for no comment. The only field army remaining to the king was Goring's, and though Hopton, who sorrowfully accepted the command after Goring's departure, tried at the last moment to revive the memories and the local patriotism of 1643, it was of no use to fight against the New Model with the armed rabble that Goring turned over to him. Dartmouth surrendered on Jan. 18, Hopton was defeated at Torrington on Feb. 16, and surrendered the remnant of his worthless army on March 14. Exeter fell on April 13. Elsewhere, Hereford was taken on Dec. 17, 1645, and the last battle of the war was fought and lost at Stow-on-the-Wold by Lord Astley on March 21, 1646. Newark and Oxford fell respectively on May 6 and June 24. On August 31 Montrose escaped from the Highlands. On the 19th of the same month Raglan Castle surrendered, and the last Royalist post of all, Harlech Castle, maintained the useless struggle until March 13, 1647. Charles himself, after leaving Newark in November 1645, had spent the winter in and around Oxford, whence, after an adventurous journey, he came to the camp of the Scottish army at Southwell on May 5, 1646.

SECOND CIVIL WAR (1648–52)

The close of the First Civil War left England and Scotland in

the hands potentially of any one of the four parties or any combination of two or more that should prove strong enough to dominate the rest. Armed political Royalism was indeed at an end, but Charles, though practically a prisoner, considered himself and was, almost to the last, considered by the rest as necessary to ensure the success of whichever amongst the other three parties could come to terms with him. Thus he passed successively into the hands of the Scots, the Parliament and the New Model, trying to reverse the verdict of arms by coquetting with each in turn. (From this point onwards the names of the Scots Covenanters, formerly the allies of the Parliamentarians, but now their opponents are not italicized.) The Presbyterians and the Scots, after Cornet *Joyce* of *Fairfax's* horse seized upon the person of the king for the army (June 3, 1647), began at once to prepare for a fresh civil war, this time against Independency, as embodied in the New Model—henceforward called the Army. After making use of its sword, its opponents attempted to disband it, to send it on foreign service, to cut off its arrears of pay, with the result that it was exasperated beyond control, and remembering not merely its grievances but also the principle for which it had fought, soon became the most powerful political party in the realm. From 1646 to 1648 the breach between army and parliament widened day by day until finally the Presbyterian party, combined with the Scots and the remaining Royalists, felt itself strong enough to begin a second civil war.

The English War.—In February 1648 Colonel Poyer, the Parliamentary governor of Pembroke Castle, refused to hand over his command to one of *Fairfax's* officers, and he was soon joined by some hundreds of officers and men, who mutinied, ostensibly for arrears of pay, but really with political objects. At the end of March, encouraged by minor successes, Poyer openly declared for the king. Disbanded soldiers continued to join him in April, all South Wales revolted, and eventually he was joined by Major-General Laugharne, his district commander, and Colonel Powel. In April also news came that the Scots were arming and that Berwick and Carlisle had been seized by the English Royalists. *Cromwell* was at once sent off at the head of a strong detachment to deal with Laugharne and Poyer, but before he arrived Laugharne had been severely defeated by Colonel *Horton* at St. Fagans (May 8).

The English Presbyterians found it difficult to reconcile their principles with their allies when it appeared that the prisoners taken at St. Fagans bore "We long to see our King" on their hats; very soon in fact the English war became almost purely a Royalist revolt, and the war in the north an attempt to enforce a mixture of Royalism and Presbyterianism on Englishmen by means of a Scottish army. The former were disturbers of the peace and no more. Nearly all the Royalists who had fought in the First Civil War had given their parole not to bear arms against the Parliament, and many honourable Royalists, foremost amongst them the old Lord Astley, who had fought the last battle for the king in 1646, refused to break their word by taking any part in the second war. Those who did so, and by implication those who abetted them in doing so, were likely to be treated with the utmost rigour if captured, for the army was in a less placable mood in 1648 than in 1645, and had already determined to "call Charles Stuart, that man of blood, to an account for the blood he had shed." On May 21 Kent rose in revolt in the king's name. A few days later a most serious blow to the Independents was struck by the defection of the navy, from command of which they had removed Vice-Admiral Batten, as being a Presbyterian. Though a former lord high admiral, the earl of Warwick, also a Presbyterian, was brought back to the service, it was not long before the navy made a purely Royalist declaration and placed itself under the command of the prince of Wales.

But *Fairfax* had a clearer view and a clearer purpose than the distracted Parliament. He moved quickly into Kent, and on the evening of June 1 stormed Maidstone by open force, after which the local levies dispersed to their homes, and the more determined Royalists, after a futile attempt to induce the City of London to declare for them, fled into Essex. In Cornwall, Northamptonshire, North Wales and Lincolnshire the revolt collapsed as easily. Only in South Wales, Essex and the north of England was there serious fighting. In the first of these districts *Cromwell* rapidly reduced all the fortresses except Pembroke, wherd Laugharne, Poyer and Powel held out with the desperate courage of deserters. In the north, Pontefract was surprised by the Royalists, and shortly afterwards Scarborough Castle declared for the king. *Fairfax,* after his success at Maidstone and the pacification of Kent, turned northward to reduce Essex, where, under their ardent, experienced and popular leader Sir Charles Lucas, the Royalists were in arms in great numbers. He soon drove the enemy into Colchester, but the first attack on the town was repulsed and he had to settle down to a long and wearisome siege *en règle.* A Surrey rising, remembered only for the death of the young and gallant Lord Francis Villiers in a skirmish at Kingston (July 7), collapsed almost as soon as it had gathered force, and its leaders, the duke of Buckingham and the earl of Holland, escaped, after another attempt to induce London to declare for them, to St. Albans and St. Neots, where Holland was taken prisoner. Buckingham escaped overseas.

Lambert in the North.—By July 10 therefore the military situation was well defined. *Cromwell* held Pembroke, *Fairfax* Colchester, *Lambert* Pontefract under siege; elsewhere all serious local risings had collapsed, and the Scottish army had crossed the Border. It is on theadventures of the latter that the interest of the war centres. It was by no means the veteran army of *Leven,* which had long been disbanded. For the most part it consisted of raw levies, and as the kirk had refused to sanction the enterprise of the Scottish parliament, David Leslie and thousands of experienced officers and men declined to serve. The duke of Hamilton proved to be a poor substitute for Leslie; his army, too, was so ill provided that as soon as England was invaded it began to plunder the countryside for the bare means of sustenance.

Major-General *Lambert,* a brilliant young general of 29, was more than equal to the situation. He had already left the sieges of Pontefract and Scarborough to Colonel *Rossiter,* and hurried into Cumberland to deal with the English Royalists under Sir Marmaduke Langdale. With his cavalry he got into touch with the enemy about Carlisle and slowly fell back, fighting small rearguard actions to annoy the enemy and gain time, to Bowes and Barnard Castle. Langdale did not follow him into the mountains, but occupied himself in gathering recruits and supplies of material and food for the Scots. *Lambert,* reinforced from the midlands, reappeared early in June and drove him back to Carlisle with his work half finished. About the same time the local horse of Durham and Northumberland were put into the field by *Sir A. Hesilrige,* governor of Newcastle, and under the command of Colonel *Robert Lilburne* won a considerable success (June 30) at the river Coquet. This reverse, coupled with the existence of Langdale's force on the Cumberland side, practically compelled Hamilton to choose the west coast route for his advance, and his army began slowly to move down the long *couloir* between the mountains and the sea. The campaign which followed is one of the most brilliant in English history.

Campaign of Preston.—On July 8 the Scots, with Langdale as advanced guard, were about Carlisle, and reinforcements from Ulster were expected daily. *Lambert's* horse were at Penrith, Hexham and Newcastle, too weak to fight and having only skilful leading and rapidity of movement to enable them to gain time. Far away to the south *Cromwell* was still tied down before Pembroke, *Fairfax* before Colchester. Elsewhere the rebellion, which had been put down by rapidity of action rather than sheer weight of numbers, smouldered, and Prince Charles and the fleet cruised along the Essex coast. *Cromwell* and *Lambert,* however, understood each other perfectly, while the Scottish commanders quarrelled with Langdale and each other. Appleby Castle surrendered to the Scots on July 31, whereat *Lambert,* who was still hanging on to the flank of the Scottish advance, fell back from Barnard Castle to Richmond so as to close Wensleydale against any attempt of the invaders to march on Pontefract. All the restless energy of Langdale's horse was unable to dislodge him from the passes or find out what was behind that impenetrable cavalry screen.

The crisis was now at hand. *Cromwell* had received the surrender of Pembroke on the 11th, and had marched off, with his men unpaid, ragged and shoeless, at full speed through the midlands. Rains and storms delayed his march, but he knew that Hamilton in the broken ground of Westmorland was still worse off. Shoes from Northampton and stockings from Coventry met him at Xottingham, and, gathering up the local levies as he went, he made for Doncaster, where he arrived on Aug. 8, having gained six days in advance of the time he had allowed himself for the march. He then called up artillery from Hull, exchanged his local levies for the regulars who were besieging Pontefract, and set off to meet *Lambert*. On the 12th he was at Wetherby, *Lambert* with horse and foot at Otley, Langdale at Skipton and Gargrave, Hamilton at Lancaster, and Sir George Monro with the Scots from Ulster and the Carlisle Royalists (organized as a separate command owing to friction between Monro and the generals of the main army) at Hornby. On the 13th, while *Cromwell* was marching to join *Lambert* at Otley, the Scottish leaders were still disputing as to whether they should make for Pontefract or continue through Lancashire so as to join Lord Byron and the Cheshire Royalists.

Preston Fight.--On the 14th *Cromwell* and *Lambert* were at Skipton, on the 15th at Gisburn, and on the 16th they marched down the valley of the Ribble towards Preston with full knowledge of the enemy's dispositions and full determination to attack him. They had with them horse and foot not only of the army, but also of the militia of Yorkshire, Durham, Northumberland and Lancashire, and withal were heavily outnumbered, having only 8,600 men against perhaps 20,000 of Hamilton's command. But the latter were scattered for convenience of supply along the road from Lancaster, through Preston, towards Wigan, Langdale's corps having thus become the left flank guard instead of the advanced guard. Langdale called in his advanced parties, perhaps with a view to resuming the duties of advanced guard, on the night of the 13th, and collected them near Longridge. It is not clear whether he reported *Cromwell's* advance, but, if he did, Hamilton ignored the report, for on the 17th Monro was half a day's march to the north, Langdale east of Preston, and the main army strung out on the Wigan road, Major-General Baillie with a body of foot, the rear of the column, being still in Preston. Hamilton, yielding to the importunity of his lieutenant-general, the earl of Callendar, sent Baillie across the Ribble to follow the main body just as Langdale, with 3,000 foot and 500 horse only, met the first shock of *Cromwell's* attack on Preston Moor. Hamilton, like Charles at Edgehill, passively shared in, without directing, the battle, and, though Langdale's men fought magnificently, they were after four hours' struggle driven to the Ribble. Baillie attempted to cover the Ribble and Darwen bridges on the Wigan road, but *Crornwell* had forced his way across both before nightfall. Pursuit was at once undertaken, and not relaxed until Hamilton had been driven through Wigan and Winwick to Uttoxeter and Ashbourne. There, pressed furiously in rear by *Cromwell's* horse and held up in front by the militia of the midlands, the remnant of the Scottish army laid down its arms on Aug. 25.

Various attempts were made to raise the Royalist standard in Wales and elswhere, but Preston was the death-blow. On Aug. 28, starving and hopeless of relief, the Colchester Royalists surrendered to Lord *Fairfax*. The victors in the Second Civil War were not merciful to those who had brought war into the land again. On the evening of the surrender of Colchester, Sir Charles Lucas and Sir George Lisle were shot. Laugharne, Poyer and Powel were sentenced to death, but Poyer alone was executed on April 25, 1649, being the victim selected by lot. Of five prominent Royalist peers who had fallen into the hands of the Parliament, three, the duke of Hamilton, the earl of Holland and Lord Capel, one of the Colchester prisoners and a man of high character, were beheaded at Westminster on March 9. Above all, after long hesitations, even after renewal of negotiations, the army and the Independents "purged" the House of their ill-wishers, and created a court for the trial and sentence of the king. The more resolute of the judges nerved the rest to sign the death-warrant, and Charles was beheaded at Whitehall on Jan. 30.

Cromwell in Ireland. — The campaign of Preston was under. taken under the direction of the Scottish parliament, not the kirk, and it needed the execution of the king to bring about a union of all Scottish parties against the English Independents. Even so, Charles II. in exile had to submit to long negotiations and hard conditions before he was allowed to put himself at the head of the Scottish armies. The marquis of Huntly was executed for taking up arms for the king on March 22, 1649. Montrose, under Charles's directions, made a last attempt to rally the Scottish Royalists early in 1650. But Charles merely used Montrose as a threat to obtain better conditions for himself from the Covenanters, and when the noblest of all the Royalists was defeated (Carbisdale, April 27), delivered up to his pursuers (May 4), and executed (May 21, 1650), he was not ashamed to give way to the demands of the Covenanters, and to place himself at the head of Montrose's executioners. His father, whatever his faults, had at least chosen to die for an ideal, the Church of England. Charles II. now proposed to regain the throne by allowing Scotland to impose Presbyterianism on England, and dismissed all the iaithfui Cavaliers who had followed him to exiie.

Meanwhile, Ireland, in which a fresh war, with openly anti-English and anti-Protestant objects, had broken out in 1648, was thoroughly reduced to order by *Cromwell*, who beat down all resistance by his skill, and even more by his ruthless severity, in a brief campaign of nine months (battle of Rathmines near Dublin, won by Colonel *Michael Jones*, Aug. 2, 1649; storming of Drogheda, Sept. 11, and of Wexford, Oct. 11, by *Cromwell;* capture of Kilkenny, March 28, 1650, and of Clonmel, May 10). *Cromwell* returned to England at the end of May 1650, and on June 26 *Fairfax,* who had been anxious and uneasy since the execution of the king, resigned the command-in-chief of the army to his lieutenant-general, The pretext, rather than the reason, of *Fairfax's* resignation was his unwillingness to lead an English army to reduce Scotland.

The Invasion of **Scotland.**—This important step had been resolved upon as soon as it was clear that Charles II. would come to terms with the Covenanters. From this point the Second Civil War becomes a war of England against Scotland. Here at least the Independents carried the whole of England with them. No Englishman cared to accept a settlement at the hands of a victorious foreign army, and on June 28, five days after Charles II. had sworn to the Covenant, the new lord general was on his way to the Border to take command of the English army. About the same time a new militia act was passed that was destined to give full and decisive effect to the national spirit of England in the great final campaign of the war. Meanwhile the motto *frappez fort, frappez vite* was carried out at once by the regular forces. On July 19, 1650 *Cromwell* made the final arrangements at Berwick-on-Tweed. Major-General *Harrison,* a gallant soldier and an extreme Independent, was to command the regular and auxiliary forces left in England, and to secure the Commonwealth against Royalists and Presbyterians. *Cromwell* took with him *Fleetwood* as lieutenant-general and *Lambert* as major-general, and his forces numbered about 10,000 foot and 5,000 horse. His opponent David Leslie (his comrade of Marston Moor) had a much larger force, but its degree of training was inferior, it was more than tainted by the political dissensions of the people at large, and it was, in great part at any rate, raised by forced enlistment. On July 22 *Cromwell* crossed the Tweed. He marched on Edinburgh by the sea coast, through Dunbar, Haddington and Musselburgh, living almost entirely on supplies landed by the fleet which accompanied him — for the country itself was incapable of supporting even a small army — and on the 29th he found Leslie's army drawn up and entrenched in a position extending from Leith to Edinburgh.

Operations Around Edinburgh. — The same day a sharp but indecisive fight took place on the lower slopes of Arthur's Seat, after which *Cromwell,* having felt the strength of Leslie's line, drew back to Musselburgh. Leslie's horse followed him up sharply, and another action was fought, after which the Scots assaulted Musselburgh without success. Militarily Leslie had the best of

it in these affairs, but it was precisely this moment that the kirk party chose to institute a searching three days' examination of the political and religious sentiments of his army. The result was that the army was "purged" of 80 officers and 3,000 soldiers as it lay within musket shot of the enemy. *Cromwell* was more concerned, however, with the supply question than with the distracted army of the Scots. On Aug. 6 he had to fall back as far as Dunbar to enable the fleet to land supplies in safety, the port of Musselburgh being unsafe in the violent and stormy weather which prevailed. He soon returned to Musselburgh and prepared to force Leslie to battle. In preparation for an extended manoeuvre three days' rations were served out. Tents were also issued, perhaps for the first time in the civil wars, for it was a regular professional army, which had to be cared for, made comfortable and economized, that was now carrying on the work of the volunteers of the first war.

Even after *Cromwell* started on his manoeuvre, the Scottish army was still in the midst of its political troubles, and, certain though he was that nothing but victory in the field would give an assured peace, he was obliged to intervene in the confused negotiations of the various Scottish parties. At last, however, Charles II. made a show of agreeing to the demands of his strange supporters, and Leslie was free to move. *Cromwell* had now entered the hill country, with a view to occupying Queensferry and thus blocking up Edinburgh. Leslie had the shorter road and barred the way at Corstorphine Hill (Aug. 21). *Cromwell,* though now far from his base, manoeuvred again to his right, Leslie meeting him once more at Gogar (Aug. 27). The Scottish lines at that point were strong enough to dismay even *Cromwell,* and the manoeuvre on Queensferry was at last given up. It had cost the English army severe losses in sick, and much suffering in the autumn nights on the bleak hillsides.

Dunbar.—On the 28th *Cromwell* fell back on Musselburgh, and on the 31st, after embarking his non-effective men to Dunbar, Leslie followed him up, and wished to fight a battle at Dunbar on Sunday, Sept. 1. But again the kirk intervened, this time to forbid Leslie to break the Sabbath, and the unfortunate Scottish commander could only establish himself on Doon Hill *(see* DUNBAR) and send a force to Cockburnspath to bar the Berwick road. He had now 23,000 men to *Cromwell's* 11,000, and proposed, *faute de mieux,* to starve *Cromwell* into surrender. But the English army was composed of "ragged soldiers with bright muskets," and had a great captain of undisputed authority at their head. Leslie's, on the other hand, had lost such discipline as it had ever possessed, and was now, under outside influences, thoroughly disintegrated. *Cromwell* wrote home, indeed, that he was "upon an engagement very difficult," but, desperate as his position seemed, he felt the pulse of his opponent and steadily refused to take his army away by sea. He had not to wait long. It was now the turn of Leslie's men on the hillside to endure patiently privation and exposure, and after one night's bivouac, Leslie, too readily inferring that the enemy was about to escape by sea, came down to fight. The battle of Dunbar (*q.v.*) opened in the early morning of Sept. 3. It was the most brilliant of *Cromwell's* victories. Before the sun was high in the heavens the Scottish army had ceased to exist.

Royalism in Scotland.—After Dunbar it was easy for the victorious army to overrun southern Scotland, more especially as the dissensions of the enemy were embittered by the defeat of which they had been the prime cause. The kirk indeed put Dunbar to the account of its own remissness in not purging their army more thoroughly, but, as *Cromwell* wrote on Sept. 4, the kirk had "done its do." "I believe their king will set up on his own score," he continued, and indeed, now that the army of the kirk was destroyed and they themselves were secure behind the Forth and based on the friendly Highlands, Charles and the Cavaliers were in a position not only to defy *Cromwell,* but also to force the Scottish national spirit of resistance to the invader into a purely Royalist channel. *Cromwell* had only received a few drafts and reinforcements from England, and for the present he could but block up Edinburgh Castle (which surrendered on Christmas eve), and try to bring up adequate forces and material for the siege of Stirling—an attempt which was ,frustrated by the badness of the roads and the violence of the weather. The rest of the early winter of 1650 was thus occupied in semi-military, semi-political operations between detachments of the English army and certain armed forces of the kirk party which still maintained a precarious existence in the western Lowlands, and in police work against the moss-troopers of the Border counties. Early in February 1651, still in the midst of terrible weather, *Cromwell* made another resolute but futile attempt to reach Stirling. This time he himself fell sick, and also his losses had to be made good by drafts of recruits from England, many of whom came most unwillingly to serve in the cold wet bivouacs that had been reported. The tents were evidently issued for regular marches, not for cross-country manoeuvres against the enemy. These manoeuvres, as we have seen, often took several days. The *bon général ordinaire* of the 17th and 18th centuries framed his manoeuvres on a smaller scale so as not to expose his expensive and highly trained soldiers to discomfort and the consequent temptation to desert.

The English Militia.—About this time there occurred in England two events which had a most important bearing on the campaign. The first was the detection of a widespread Royalist-Presbyterian conspiracy—how widespread no one knew, for those of its promoters who were captured and executed certainly formed but a small fraction of the whole number. *Harrison* was ordered to Lancashire in April to watch the north Welsh, Isle of Man and Border Royalists, and military precautions were taken in various parts of England. The second'was the revival of the militia. Since 1644 there had been no general employment of local forces, the quarrel having fallen into the hands of the regular armies by force of circumstances. The New Model, though a national army, resembled Wellington's Peninsular army more than the soldiers of the French Revolution and the American Civil War. It was now engaged in prosecuting a war of aggression against the hereditary foe over the Border—strictly the task of a professional army with a national basis. The militia was indeed raw and untrained. Some of the Essex men "fell flat on their faces on the sound of a cannon." In the north of England *Harrison* complained to *Cromwell* of the "badness" of his men, and the lord general sympathized, having "had much such stuff" sent him to make good the losses in trained men. His recruits were unwilling drafts for foreign service, but in England the new levies were trusted to defend their homes, and the militia was soon triumphantly to justify its existence on the day of Worcester.

Inverkeithing.—While David Leslie organized and drilled the king's new army beyond the Forth, *Cromwell* was, slowly and with frequent relapses, recovering from his illness. The English army marched to Glasgow in April, then returned to Edinburgh. The motives of the march and that of the return are alike obscure, but it may be conjectured that, the forces in England under *Harrison* having now assembled in Lancashire, the Edinburgh-Newcastle-York road had to be covered by the main army. Be this as it may, *Cromwell's* health again broke down and his life was despaired of. Only late in June were operations actively resumed between Stirling and Linlithgow. At first *Cromwell* sought without success to bring Leslie to battle, but he stormed Callendar House near Falkirk on July 13, and on July 16 he began the execution of a brilliant and successful manoeuvre. A force from Queensferry, covered by the English fleet, was thrown across the Firth of Forth to Northferry. *Lambert* followed with reinforcements, and defeated a detachment of Leslie's army at Inverkeithing, on the 20th. Leslie drew back at once, but managed to find a fresh strong position in front of Stirling, whence he defied *Cromwell* again.

At this juncture *Cromwell* prepared to pass his whole army across the firth. His contemplated manoeuvre of course gave up to the enemy all the roads into England, and before undertaking it the lord general held a consultation with *Harrison,* as the result of which that officer took over the direct defence of the whole Border. But his mind was made up even before this, for on the day he met *Harrison* at Linlithgow three-quarters of his whole army had already crossed into Fife. Burntisland, surrendered to

Lambert on the 29th, gave *Cromwell* a good harbour upon which to base his subsequent movements. On July 30 the English marched upon Perth, and the investment of this place, the key to Leslie's supply area, forced the crisis at once. Whether Leslie would have preferred to manoeuvre *Cromwell* from his vantage-ground or not is immaterial; the young king and the now predominant Royalist element at headquarters seized the long-awaited opportunity at once, and on the 31st, leaving *Cromwell* to his own devices, the royal army marched southward to raise the royal standard in England.

The Third Scottish Invasion of England. — Then began the last and most thrilling campaign of the Great Rebellion. Charles II. expected complete success. In Scotland, *vis-à-vis* the extreme Covenanters, he was a king on conditions, and he was glad enough to find himself in England with some thirty solidly organized regiments under Royalist officers and with no regular army in front of him. He hoped, too, to rally not merely the old faithful Royalists, but also the overwhelming numerical strength of the English Presbyterians to his standard. His army was kept well in hand, no excesses were allowed, and in a week the Royalists covered 150 m. On Aug. 8 the troops were given a well-earned rest between Penrith and Kendal.

But the Royalists were mistaken in supposing that the enemy was taken aback by their new move. Everything had been foreseen both by *Cromwell* and by the Council of State in Westminster. The latter had called out the greater part of the militia on the 7th. Lieutenant-General *Fleetwood* began to draw together the midland contingents at Banbury, the London trained bands turned out for field service no fewer than 14,000 strong. Every suspected Royalist was closely watched, and the magazines of arms in the country-houses of the gentry were for the most part removed into the strong places. On his part *Cromwell* had quietly made his preparations. Perth passed into his hands on Aug. 2, and he brought back his army to Leith by the 5th. Thence he despatched *Lambert* with a cavalry corps to harass the invaders. *Harrison* was already at Newcastle picking the best of the county mounted troops to add to his own regulars. On the 9th Charles was at Kendal, *Lambert* hovering in his rear, and *Harrison* marching swiftly to bar his way at the Mersey. *Fairfax* emerged for a moment from his retirement to organize the Yorkshire levies, and the best of these as well as of the Lancashire, Cheshire and Staffordshire militias were directed upon Warrington, which point *Harrison* reached on the 15th, a few hours in front of Charles's advanced guard. *Lambert*, too, slipping round the left flank of the enemy, joined *Harrison*, and the English fell back (16th), slowly and without letting themselves be drawn into a fight, along the London road.

Campaign of *Worcester*. — *Cromwell* meanwhile, leaving *Monk* with the least efficient regiments to carry on the war in Scotland, had reached the Tyne in seven days, and thence, marching 20 m. a day in extreme heat — with the country people carrying their arms and equipment — the regulars entered Ferrybridge on the 19th, at which date *Lambert*, *Harrison* and the north-western militia were about Congleton. The lord general had during his march thrown out successively two flying columns under Colonel *Lilburne* to deal with the Lancashire Royalists under the earl of Derby. *Lilburne* entirely routed the enemy at Wigan on Aug. 25. It seemed probable that a great battle would take place between Lichfield and Coventry about Aug. 25 or 26, and that *Cromwell*, *Harrison*, *Lambert* and *Fleetwood* would all take part in it. But the scene and the date of the *dénouement* were changed by the enemy's movements. Shortly after leaving Warrington the young king had resolved to abandon the direct march on London and to make for the Severn valley, where his father had found the most constant and the most numerous adherents in the first war, and which had been the centre of gravity of the English Royalist movement of 1648. Sir Edward Massey, formerly the Parliamentary governor of Gloucester, was now with Charles, and it was hoped that he would induce his fellow-Presbyterians to take arms. The military quality of the Welsh border Royalists was well proved, that of the Gloucestershire Presbyterians not less so, and, based on Gloucester and Worcester as his father had been based on Oxford, Charles II. hoped, not unnaturally, to deal with an Independent minority more effectually than Charles I. had done with a Parliamentary majority of the people of England. But even the pure Royalism which now ruled in the invading army could not alter the fact that it was a Scottish army, and it was not an Independent faction but all England that took arms against it.

Charles arrived at Worcester on Aug. 22, and spent five days in resting the troops, preparing for further operations, and gathering and arming the few recruits who came in. It is unnecessary to argue that the delay was fatal; it was a necessity of the case foreseen and accepted when the march to Worcester had been decided upon, and had the other course, that of marching on London via Lichfield, been taken the battle would have been fought three days earlier with the same result. As affairs turned out *Cromwell* merely shifted the area of his concentration two marches to the south-west, to Evesham. Early on the 28th *Lambert* surprised the passage of the Severn at Upton, 6 m. below Worcester, and in the action which followed Massey was severely wounded. *Fleetwood* followed *Lambert*. The enemy was now only 16,000 strong and disheartened by the apathy with which they had been received in districts formerly all their own. *Cromwell*, for the first and last time in his military career, had a two-to-one numerical superiority.

The "Crowning Mercy." — He took his measures deliberately. *Lilburne* from Lancashire and Major *Mercer* with the Worcestershire horse were to secure Bewdley Bridge on the enemy's line of retreat. *Lambert* and *Fleetwood* were to force their way across the Teme (a little river on which Rupert had won his first victory in 1642) and attack St. John's, the western suburb of Worcester. *Cromwell* himself and the main army were to attack the town itself. On Sept. 3, the anniversary of Dunbar, the programme was carried out exactly. *Fleetwood* forced the passage of the Teme, and the bridging train (which had been carefully organized for the purpose) bridged both the Teme and the Severn. Then *Cromwell* on the left bank and *Fleetwood* on the right swept in a semicircle 4 m. long up to Worcester. Every hedgerow was contested by the stubborn Royalists, but *Fleetwood's* men would not be denied, and *Cromwell's* extreme right on the eastern side of the town repelled, after three hours' hard fighting, the last desperate attempt of the Royalists to break out. It was indeed, as a German critic, Hoenig, has pointed out, the prototype of Sedan. Everywhere the defences were stormed as darkness came on, regulars and militia fighting with equal gallantry, and the few thousands of the Royalists who escaped during the night were easily captured by *Lilburne* and *Mercer*, or by the militia which watched every road in Yorkshire and Lancashire. Even the country people brought in scores of prisoners, for officers and men alike, stunned by the suddenness of the disaster, offered no resistance.

Charles escaped after many adventures, but he was one of the few men in his army who regained a place of safety. The Parliamentary militia were sent home within a week. *Cromwell*, who had ridiculed "such stuff" six months ago, knew them better now. "Your new raised forces," he wrote to the House, "did perform singular good service, for which they deserve a very high estimation and acknowledgment." Worcester resembled Sedan in much more than outward form. Both were fought by "nations in arms," by citizen soldiers who had their hearts in the struggle, and could be trusted not only to fight their hardest but to march their best. Only with such troops would a general dare to place a deep river between the two halves of his army or to send away detachments beforehand to reap the fruits of victory, in certain anticipation of winning the victory with the remainder. The sense of duty which the raw militia possessed in so high a degree, ensured the arrival and the action of every column at the appointed time and place. The result was, in brief, one of those rare victories in which a pursuit is superfluous — a "crowning mercy," as *Cromwell* called it. There is little of note in the closing operations. *Monk* had completed his task by May 1652; and Scotland, which had twice attempted to impose its will on England, found itself reduced to the position of an English province under martial law.

GREAT SALT LAKE, a large body of shallow, briny water in north-western Utah, U.S.A., situated about 4,200 ft. above sea-level. The lake was first accurately described by John C. Frémont in 1845, and was carefully surveyed in 1849 and 1850 by Capt. Howard Stansbury. The lake and the surrounding region were studied in 1890 by G. K. Gilbert, who gave a detailed description of it and of an earlier and greater lake, Lake Bonneville *(see* UTAH) that covered its site and a large adjacent area.

Great Salt Lake has no outlet and is fed chiefly by the Jordan, Weber and Bear rivers, which flow from the mountains east and south-east of the lake. Since 1850 its area has varied from 1,750 to about 1,500 sq.m., its present area, and its mean depth has varied from 25 to 15 feet. The seasonal variation in its level, due to melting snow on the mountains, is about 16 inches. The inflow of water and the area of the lake have been diminished by irrigation, which increases evaporation. The salinity of the lake increases as its area decreases. The water has contained from 14 to 23% of saline matter, principally sodium chloride. Its average salinity is now nearly six times that of the ocean. It contains also sodium sulphate and other minerals. Although the waters of the Jordan, Weber and Bear rivers are considered fresh, they carry into the lake enough mineral matter to keep its water nearly at the point of saturation.

When the temperature of the water falls below 20° F the salt begins to be precipitated. Salt is obtained from the lake and marketed profitably, but not in quantities large enough to reduce perceptibly the salinity of the water. The lake contains several islands and is crossed west of Ogden by the Southern Pacific railway, over what is called the Lucin cut-off, a trestle and a gravel fill about 27 m. long. Its bed consists mainly of sand, but along its shores there are crusts of common salt, sodium sulphate and gypsum. The specific gravity of the water is so great that a swimmer can not sink in it. In the lake are a few species of seaweed (algae), the larvae of two genera of flies (*Ephydra* and *Tipula*), an insect belonging to the genus ***Corixa*** and a brine shrimp *(Artemia).*

Lake Bonneville was more than 1,000 ft. above the level of Great Salt Lake, and lasted long enough to form beaches that can still be plainly traced. Below the Bonneville terraces there are others, the most conspicuous of which form what is called the Provo shore line, which is 625 ft. above the present level of Great Salt Lake.

See I. C. Russell, *Lakes of North America* (New York, 1895); J. E. Talmage, *The Great Salt Lake, Present and Past* (Salt Lake City, 1900); G. K. Gilbert sketch in U.S. Geological Survey *Bulletin* 612, pp. 94–96 (Washington 1915). (G. McL. Wo.)

GREAT SERPENT MOUND. A remarkable prehistoric earthwork, so called from its shape, on a narrow crescentic spur, about 100 ft. high, flanked by Brush creek and East creek, in Adams county, Ohio. Commencing with the partiy obliterated head, at the very point of the spur, and proceeding to the tail, one comes to an enlargement, suggestive of the enlarged neck of the cobra, formed by an outer wall on each side beginning at the small head and uniting in the rear. Within this area is a wall, oval in plan, enclosing a low mound 15 ft. in diameter. In each side of the outer wall is an opening or gateway, and behind the interior oval is a slightly curved cross-wall. From the union of the main walls to the end of the tail the serpent body is represented by a single embankment, fairly uniform in size, but diminishing gradually toward the tip, having serpentine bends and ending with a coil of two complete turns. Following the curves and bends the entire length of the structure is 1,330 ft. and its width 15 to 20 feet. The height of the embankment probably never exceeded 4 feet. The most reasonable suggestion respecting the enlargement and its inner oval is that when the neck and head are restored, the oval marks the position of the heart of the reptile and in all probability was the place where were performed the ceremonies in connection with the strange structure.

GREAT SLAVE LAKE (ATHAPUSCOW), a lake of Mackenzie district, Northwest Territories, Canada, between 60° 50′ and 62° 55′ N. and 108° 40′ and 117° W., 391 ft. above the sea. It is 325 mi. long, from 15 to 50 mi. wide, and includes an area of 11,172 sq.mi. The water is very clear and deep. The coast line is irregular and deeply indented by large bays, and its north-eastern shores are rugged and mountainous. The western shores

are well wooded, but the northern and eastern are barren. The lake freezes over completely each winter. The shore waters begin to freeze about Oct. 15; navigation opens about June 10. The bulk of the water empties by the Mackenzie river into the Arctic ocean. The lake was discovered in 1771 by Samuel Hearne.

GREAT SOUTHERN OCEAN, the name given to the belt of water which extends almost continuously round the globe between the parallel of 40° S. and the Antarctic circle (669' S). The fact that the southern extremity of South America is the only land extending into this belt gives it special physical importance in relation to tides and currents, and its position with reference to the Antarctic ocean and continent makes it convenient to regard it as a separate ocean from which the Atlantic. Pacific and Indian oceans radiate. (See OCEAN AND OCEANOGRAPHY)

GREAT WAR, THE, 1914-1918: see WORLD WAR I.

GREAT WESTERN RAILWAY COMPANY. A British railway company, incorporated in 1835 to construct a line of railway between Bristol and London; now serves territory embraced within a triangle bounded by lines drawn from London to Liverpool, Liverpool to Fishguard and Penzance, and Penzance to London. Its headquarters are at Paddington station, the London terminus of the railway. The capital of the company exceeds 163 millions sterling. Its trains run over 9,066 mi. of track along which there are about 1,700 stations and halts. The rolling stock consists of approximately 3,600 locomotives, 9,000 passenger train vehicles and 82,000 freight train vehicles. The staff numbers 102,352 and the annual wage bill exceeds £18,000,000. During the year 1938 the railway carried 149,000,000 passengers and 64,000,000 tons of freight. The fastest "start to stop" train (Cheltenham Spa express) runs from Swindon to London at 71·3 m.p.h. and the non-stop run by the Cornish Riviera express (London to Plymouth, 225¾ mi.) is accomplished in four hours. The locomotive, carriage and wagon works of the railway are at Swindon. The company operates steamship services between Fishguard and Ireland and to the Channel Islands, and is associated with companies operating road and air transport services in the territory served by the railway. (F. J. C. P.; X.)

GREBE, the name for aquatic birds of the family *Podicipedidae,* containing several genera including *Podiceps* and Centropelma. Grebes are distinguished by the rudimentary tail, the legs placed far back on the body for diving, the flattened tarsi to diminish water resistance, and the elongated toes furnished with broad lobes of skin in lieu of webs.

Of the five European species, P. *fluviatilis* is the well-known little grebe or dabchick, which has a wide range in the Old World. The great crested grebe (*P. cristatus*) is also a wide-ranging species The subarctic red-necked grebe (P. *griseigena*) inhabits Europe and America, as does P. *auritus,* the horned or Slavonian grebe. Various other species inhabit North America, among which may be mentioned the western grebe (*Aechmophorus occidentalis*) with a long slender neck and black and white plumage; and the pied-billed grebe (*Podilymbus podiceps*), the best known grebe in eastern U.S.A. Several more are found in South America, of which the most remarkable is the flightless C *micropterus* of Lake Titicaca.

The plumage, short and close, is usually some shade of brown above, white and glossy below. Grebes are migratory for the most part. The nest consists of a mass of water-weeds, in a shallow cup on which the chalky white eggs are laid, the parent covering them before leaving the nest. The eggs are usually quite wet, but the heat of the decaying vegetation helps to keep the temperature up The young are clad in striped black, white, and brown down.

The parents are often seen carrying the young on their back. If danger threatens they take them under their wings and dive with them.

Most species develop special nuptial adornments in the spring in both sexes, in the form of crests or tufts, and very remarkable mutual courtship ceremonies have been described (see COURTSHIP OF ANIMALS).

GRECO, EL: see THEOTOCOPULI, DOMENICO.

GREECE, in the modern sense, is a state which obtained its independence from Turkey by force of arms in the earlier part of the 19th century, and was declared a kingdom in 1830. Initially it consisted of a small area within the narrowed and dissected tongue of land which prolongs the Balkan peninsula to the south, together with some of the islands of the Aegean sea. It did not include even the greater part of the lands where Greeks predominated in the population, and where the Greek mode of life was that best adapted to the natural conditions. Nor, as the sequel showed, did it contain productive areas enough to form the economic basis of an independent unit in the modern world. In the period between the date of the founding of the kingdom and 1923, when by the treaty of Lausanne new changes were made in the frontiers, the Greek state underwent a progressive, though not uninterrupted, process of territorial expansion. Although that expansion took place at the expense of Turkey, it was not, as might be supposed, only a process of "redeeming" more and more Greeks from the control of Turkish overlords. Such an extension over lands occupied predominantly by peoples of Greek sympathies did occur, though it was not complete. In addition, particularly in the period which opened with the Balkan wars of 1912–13, there was a spread into areas, such as Macedonia and Thrace, where the Greek element was far from being the only one, and where the national sympathies of the existing inhabitants were not regarded as of prime importance. The possession of these areas did, however, offer certain well-marked economic advantages; in particular they include plains and basins capable of large-scale grain production. The result is that the Greece whose frontiers were delimited by a long series of treaties—all violated by Germany in its invasion of 1941—was not geographically a unit.

Modern Position.—Almost as important are the facts that, by the beginning of the year 1925, all the lands included within the Hellenic republic, which was established in 1924, were inhabited by a predominantly Greek population, and that only comparatively small numbers of Greeks lived outside their limits. This was the result of vast migrations which, beginning with the Balkan wars, culminated in the period 1922–24, when some 1,350,000 Greek refugees were ejected from Asia Minor, and had to find homes within the Greek state. Many of these were settled in Greek Macedonia and Greek Thrace, from which large numbers of Turks were removed to Anatolia. There had been earlier migrations within the peninsula also which had reduced the number of non-Greek peoples within these areas.

These enforced movements, which brought most of the scattered Greeks of the near east within the ring-fence of the enlarged Greek state, were a complete reversal of a long historical process, for, from the Classical period onwards, the lands geographically Greek had always been centres of dispersion; a movement inwards towards a centre was quite a nevi phenomenon in Greek history The two outstanding features of Greece as delimited in the period after World War I were thus that it contained a predominantly Greek population settled within an area not all of which was suitable for the characteristic modes of life, or had a tradition of Greek culture. Further. while in the earlier stages of its existence modern Greece contained a proportion only of the Greeks of the Mediterranean area, the majority of these now lived within its borders. Before the years when frontiers in what had been Turkish lands began to change with startling rapidity, there were two groups of Greeks, those of the kingdom, and those living in other lands to whom the kingdom represented an idealized motherland. After the end of 1924 the numbers of the latter were greatly diminished, and the two groups were faced with the need of living together within a limited and yet diverse territory.

Greece has an area of about 50,000 sq.mi., not much less than that of England, and in 1938 had an estimated population of more than 7,000,000. It is thus scantily peopled, as indeed one would expect from its generally mountainous and barren nature In the island of Crete it extends south of lat. 35°, and in Thrace approaches though it does not reach lat. 42°. Its northern limit thus reaches the latitude of Rome, its southern that of Sfax on the east coast of Tunisia, and the Peloponnesus or Morea corresponds in position to the island of Sicily The first Greece, that of 1830, lay wholly in latitudes corresponding to those of the extreme south of peninsular Italy and the island of Sicily.

Original Greece.—That original Greece consisted of (1) The Peloponnesus, the almost insular prolongation of the Greek peninsula proper, to which it is attached only by the low and narrow Isthmus of Corinth, now cut through by the Corinth Canal; (2) a part of the Greek peninsula proper; (3) certain of the Aegean islands. Till the troubled period which began with the Balkan wars the additions were comparatively small. The most notable were the Ionian islands (1864), and the plain of Thessaly (1878), in the northern transitional area where the Greek peninsula begins to merge into the wider one to the north. The last period brought the addition of more islands, including the large one of Crete, and of the northern continental strip from the line of the lower Maritsa westward to the shores of the Ionian Sea. It brought also the bid for a part of the western shore of Asia Minor, and the failure of that bid, with the resultant expulsion of the Asiatic Greeks. Up to 1913 Turkey was the enemy, and the struggle was in essence one to free from its grasp territories which from the Turkish standpoint were purely marginal and relatively insignificant. In the later period not only was Turkey fighting for her existence but the Greek advance to the north brought them into direct contact—and sometimes conflict—with the Balkan nations of Serbia and Bulgaria and the incipient Albanian nation. Nor were these states the only ones. In so complex and interlocked a grouping of political units as is Modern Europe no set of small states can be allowed to work out its destiny unhampered by external interference; at every stage the greater powers took a hand if not always in the fray at least in the settlements.

The frontiers of Greece were thus fixed as the result of the interaction of two sets of forces, the Greek national spirit acting from within and the pressure of other peoples imposing checks from without. That national spirit again was in origin a response to a definite and highly peculiar set of natural conditions which prevail in parts of the areas surrounding the Aegean. Any account of the geography of the Greek lands should start from the region where these conditions show their fullest development, and where therefore the characteristically Greek spirit may be expected in its most typical form.

The Greek Islands.—There can be no doubt as to the position of this region. From the very beginnings of history that particular type of culture which for convenience we call Greek, using the word in a very wide and generalised form, has been maritime, and certain islands and island groups have printed it with its most distinctive features. One island group in particular must be noted. To the south of the Aegean, forming a broken bridge between the Greek mainland and Asia Minor, lies a roughly circular archipelago of small islands, the Cyclades. Nearly in the centre of the group lies the small island of Syros (Syra) with the very much smaller and rocky island of Delos to the east of it. Much further to the south, separated by an island-free stretch of sea, lies an island festoon, forming an interrupted semi-circle between the extreme south of the Peloponnesus and the south-east of Asia Minor. Crete, the central, and by far the largest island of the festoon, may, in relation to the Cyclades, be regarded as "continental." It has an area of 3,328 sq.miles, while Naxos, the largest of the Cyclades, extends only to 173 sq.m., Syros to 31 sq m. and the islet of Little Delos only covers about 1 sq.m. If Crete was the seat of the development of the first great Aegean civilization, that of the Minoan period, yet it may be said that the culture type received a great part of its specific imprint in the smaller islands.

Particularly significant in this connection is the way in which Syros (Syra) and Delos leap into prominence at successive periods of history. In the Aegean Copper Age (3000–2400 B.C.) the Cyclades, with Syros as the commercial capital, were a great centre of Aegean trade. That trade had a varied basis. In the first place the islands contain a variety of useful rocks and minerals, some of which have a limited distribution of Mediterranean Lands. Particularly notable are the obsidian of Melos, so important in early days since the flint of other parts of Europe is absent in Mediterranean Lands; the marble of Paros and Naxos and the latter's emery; the metallic ores of Seriphos of which the small supplies of copper were especially valuable in early days; and the widely distributed potter's clay. Second the number and arrangement of the islands, combined with the nature of the prevailing winds, made primitive navigation easy. Commodities with which to trade, and an environment which encouraged the growth of a sea-faring population, might not have sufficed, however, to give the men of Syros (Syra) and the other islands their significance as traders and middlemen had it not been for subsidiary causes. Among these were such facts as that the resources of the islands are strictly limited, even when supplemented by fishing, so that a powerful motive existed for developing sea-trade; that ease of navigation is not limited to the archipelago but is characteristic of a wider surrounding area; and that the lands which can thus be reached have both greater and more varied resources. Thus there was not only the possibility of multiple contacts with other peoples, but a willingness to learn, a susceptibility to new ideas, were conditions of survival. Even in the Copper Age the islanders had learnt to stimulate trade by working up their own raw material, and their weapons, their pottery, their marble vases and figurines were widely distributed.

That first predominance of Syros (Syra) as a Cycladean centre was lost as Crete rose to greatness in the Bronze Age, and the main seaways shifted further south. It has, however, been generally true that whenever there is no part of the surrounding area of outstanding importance then the advantages of the central position of the Cyclades display themselves by the rise of a great mart within. Thus during the earlier part of the 19th century, when Athens and its port of Piraeus were slowly recovering from the effects of Turkish misrule, it was on Syra that one of the chief ports of the Eastern Mediterranean was established. Its importance only declined as the Piraeus developed. Delos, sacred formerly to Apollo, whose reputed birthplace it was, but of no importance except for its harbour, shows similar conditions. In the 5th century B.C. it was the centre of the marine confederacy established under the presidency of Athens. Some centuries later it became a great trade centre, especially for the slave trade. During the Turkish period both Syra and Delos became centres of piracy, piracy being a natural development under unfavourable conditions in areas which in happier times are foci of legitimate trade. That the same qualities which made the Aegean folk great sea-traders made them also effective pirates is shown by the characteristic habit of building the villages on sites relatively remote from the sea and out of sight from it—so as to offer no temptation to the passing sea-brigand, and give to the inhabitants a chance of a warning before an attack.

Greek Culture and its Geographical Basis.—If then the Cyclades may be regarded as the source from which some of the essential elements of Greek culture flowed, a question arises as to the characters to which they owe this distinction. Not, it seems clear, only to the island position combined with Mediterranean relief, natural vegetation and climate; for a similar combination occurs in, *e.g.*, the Dalmatian islands where an indigenous culture of high standard did not arise. Nor can it be associated directly with the Mediterranean crop plants and methods of cultivation, for the plants can be grown, by identical methods, in many other parts of the Mediterranean Lands. Nor can the importance of the varied, if limited, mineral resources be over-emphasised, for Sardinia and Corsica show that parts of the western Mediterranean have equally varied and more extensive deposits. The root of the matter is to be sought in the combination of ease of movement over the sea, and the diversity and natural advantages of the regions which could be reached by sea-routes. Both require fuller analysis.

The Aegean is characterised both by its multiplicity of islands and by the articulation of its eastern and western shores. Of the islands the Cyclades and the southern semi-circle have been already noted. The Northern Sporades, or "scattered islands," may be mentioned as another group which, with Lemnos and other islands to the north-east, form a third broken bridge between the European and Asiatic shores, of special importance because it leads, as it were, to the entrance to the Dardanelles and thus to the Black Sea. In addition to these linking belts both shores show a multiplicity of coastal islands and peninsulas. The former, as is notably the case with the large island of Euboea off the coast

of Greece, may be separated by channels so narrow as to appear part of the mainland; the latter are complex and diversified, enclosing sheltered gulfs and bays. Everywhere, that is to say, the land is deeply inter-penetrated by the sea; everywhere havens innumerable are available. Here then is no empty, inhospitable sea.

Further, the climate is highly favourable to the sailor, at least during the summer season. Fog is rare and the bright sunshine means that the alternation of land and sea breezes takes place with great regularity. The land breeze will take the mariner out of his haven in the early morning before the sun has come to its strength, and the sea breeze can be used to bring him back to his own or another harbour. These alternating air currents prevail in the neighbourhood of land, that is, aid the sailor at the two critical points of his course. But in the open the dominant summer winds, particularly in July and August, are those northerly ones which the Ancient Greeks called Etesian. In the Aegean the Etesian wind has a north-easterly direction, and its late summer strength is important because it brings home adventurers who have gone in search of the corn, the fish and the furs of the Black Sea Lands. More than this, the wind sets going currents which, flowing from north to south in the centre, with a return in the opposite direction along the coasts, facilitate to-and-fro journeys. Finally, winds and currents alike bring traffic from the Cyclades to Crete. But Crete is already outside the Aegean air circulation, and more exposed to the winds which blow down the west coast of the Greek peninsula and are chiefly north-westerly. Those winds carry ships towards Egypt and the Asiatic margin.

Crete faces northward to the Aegean world and to the wider and contrasted worlds which can be reached from its north-eastern corner; eastward lie the copper island of Cyprus and the Syrian shore; southward is Africa and that great centre of early civilization, Egypt. It was certainly the great intermediary by which the culture of the Orient was transmitted to Europe, but it was through the intervention of the smaller Aegean islands that that culture was adapted and diversified, introduced into the coastal areas of the adjacent mainlands and became essentially Greek.

The Greek Lands.—Beginning then with this conception of Greek culture as an island product, limited in its development on the smaller islands by want of space, and spreading inevitably into those parts of the surrounding lands which were sufficiently penetrated by the sea to show certain island features, we are in a position to make an intelligible survey of the areas politically Greek.

1. The Islands.—The islands form naturally a first division. While the Cyclades and the Northern Sporades formed part of the first Greece of 1830, and the Ionian islands, from Corfu in the north through the currant-producing islands ending in Zante, formerly a British protectorate, were ceded in 1863 and handed over in 1864, the fate of the others was not decided till the first quarter of the present century. Crete was ceded by Turkey finally in 1913. The previous year, during the war between Turkey and Italy, the large island of Rhodes, off south-western Asia Minor, and the twelve smaller neighbouring islands forming the Dodecanese, were occupied by the latter power, and remain in its possession. Greek claims to the remaining Aegean islands have been admitted with the exception of Imbros, Tenedos and the small Rabbit islands, retained by Turkey as a necessary part of the defences of the Dardanelles. With these exceptions all the Aegean islands are now politically Greek.

They have always been very definitely Greek so far as population is concerned, for the possible modes of life, including cultivation of the garden type, fishing and sea-trading are those for which the Greeks show more aptitude than any other of the Near Eastern peoples. Nor is there, as in parts of the Greek mainland, any considerable stretch of territory where these occupations are excluded, which might invite settlement by non-Greek peoples. In many cases also the islands enjoyed a relative freedom during the Turkish period which helped to maintain a national spirit, and enabled the islanders to carry on their traditional role of guardians and disseminators of the characteristic culture. Even the migrations constantly tending to take place—inward as conditions proved particularly intolerable on the mainlands east or west, outward, as when Athens and the Piraeus were able to take over much of the trade of Syra—were but a repetition of those which had occurred throughout historical time.

The Ionian islands include Corfu, Leukas (Santa Maura), Cephalonia, Ithaca and Zante, with others. They owe their importance primarily to the fact that Cephalonia, Ithaca and Zante, with parts of the adjacent mainland, constitute the main currant-producing area of the world. The plant requires for complete success a delicate combination of conditions of soil and climate, the former requiring to be dry, stony and lime-containing, and this comparatively small strip of country is very favourable. It is hardly too much to say that at the outset Modern Greece had its basis in the currant trade, hence the intense desire for the incorporation of the Ionian islands. But dependence on a luxury product of this kind involves great risk, especially when the area of production is so small; for a long period the whole economic life of Greece depended on the currant crop, itself limited to a small part of the state territories, and there forming practicaliy the oniy crop.

The question at once arises why the typical Mediterranean products, which form important articles of export from such countries as Italy, Spain and the Atlas lands, were not also available in quantity in Greece. Such products are yielded by many of the islands, both Ionian and Aegean, in considerable amount. On the other hand production, in relation to home demand, is generally limited on the mainland, so that much of that demand has to be met by island produce, thus reducing the surplus available for export.

In detail it may be noted that the olive, though widespread, is most extensively grown in the Peloponnesus and the Ionian islands. Olive oil stands third in the list of exports, but by value it ranks much lower than currants, owing to the fact that it is used universally in the Greek lands, and not all of these can supply their own needs. Wine is even more widely produced, though again the islands rank high among the producing areas. Some, such as Cephalonia in the Ionian group, and Santorin, Melos and Naxos in the Cyclades, yield wines which are of value in external commerce, but most of the Greek wines are of poor quality, and rendered distasteful to non-Greek palates by the addition of resin obtained from the Aleppo pine. This addition increases its keeping and, it is said, also its thirst-quenching qualities, but practically limits its consumption to Greek lands. Oranges and other citrus fruits are produced especially in Corfu, where the moist climate and mild winters are very favourable, also in some of the Cyclades, such as Naxos, in the Peloponnesus, especially the south, as well as in Chios and Crete. But as we have seen the last two did not become Greek till the present century, and production on the Greek mainland is generally not extensive, except in the south of the Peloponnesus. The line marking the northern limit of the tree in the mainland runs surprisingly far south, for it crosses Attica, some 5° lat. south of the orange-producing region of the French Riviera. This is associated with the absence of any transverse mountain range in the Greek peninsula to give protection from continental winds. Greece as a whole is thus not one of the great orange-exporting countries of the Mediterranean, and this is true generally of other fruits, despite their wide extension, particularly in the islands.

The crop which ranked in the period after 1918 as most important so far as export trade is-concerned was, curiously enough, tobacco, exports of tobacco greatly exceeding those of currants. If the Greek extension northwards had as one of its prime motives the desire to obtain cereal-producing lands to supplement the small yield of the Greek lands proper, another reason, equally important, was the need of obtaining areas which would produce tobacco as an article of export. Parts of Macedonia are particularly well suited to tobacco production, but it is very interesting to find that the cultivation of the plant is spreading in the islands, sometimes at the expense of the vine. This must be regarded as a reflex effect on the old lands of the acquisition of the new, for the cultivation of "Turkish" tobacco was well established

in the northern areas before it became Greek. In the Cyclades, Amorgos produces tobacco for export, and great efforts are being made to extend its cultivation to Chios.

Generally it may be said that the islands produce among them all the characteristic Greek crops, but with the exception of currants, olive oil and as yet small amounts of tobacco, the greater part of their agricultural produce is absorbed by the home market.

If peace could have been preserved, it was to be expected that the islands off the west coast of Asia Minor which became Greek would increase their productivity to a notable extent. Chios, which is reputed to be the most fertile of all the Aegean islands, had a population of 75,680 in 1938 as against 61,873 in 1920.

2 *The Peloponnesus.*—This may be compared to a hand, attached to the arm-like Greek peninsula by an almost severed wrist. The thumb is formed by the Argolis peninsula, and while the fifth finger is missing, the other three are represented by elongated promontories, separated by the Gulfs of Laconia and Messenia Between the most easterly of these promontories and the Argolis peninsula, with its girdle of islands, lies the Gulf of Nauplia. To the north the Gulf of Patras, widening beyond the narrows of the Strait of Lepanto into the Gulf of Corinth, is separated from the head of the Gulf of Aegina, or Saronic Gulf, by the isthmus of Corinth, about 33 m. wide at its narrowest point, and falling to some 260 ft. above sea-level. Since even in ancient times small boats could be dragged across the portage of the isthmus, the Peloponnesus was always potentially an island, and with the piercing of the Corinth canal it has become actually insular. Further, no point within it is much more than 30 m. from the nearest sea.

It is all the more curious to find that in the life of the area the sea has counted for relatively little, and that in some respects it is more "continental," more Balkan, than are the parts of Central Greece lying to the north of the Gulf of Corinth. The appearance of an Albanian element in the population may be associated with the presence of a central upland block, repeating many of the characters of the mountains which traverse the whole western side of the Balkan peninsula. But a small-scale relief map shows, particularly to the west, to the north and to the east at the head of the Gulf of Nauplia, coastal plains, and these one would expect to be in close connection with the sea. But except to the north, where the Gulf of Corinth with its ports gives free access to seaways, and, if to a more limited extent, in the east where Argolis juts out into the Aegean, pointing to the Cyclades and Crete, a certain remoteness from the main currents of Greek life, a remoteness summed up in the ancient contrast between Athens and Sparta, is characteristic. This has its geographical basis in the difficulty in making effective contact with the sea. Good ports are few and not always well placed in relation to areas of settlement. The land also tends to fall into series of compartments, more or less sharply separated from one another. Even where, as in the case of the basin of Sparta, these take the form of fertile lowlands relatively near the coast, there are barriers to free communication which, however insignificant in themselves, have acted as checks to the transport of goods. Generally we may say that the characteristic settlement of mainland Greece, well exemplified by Athens, consists of three elements, a rock of refuge, a productive plain and a port on the margin of the plain. But in the Peloponnesus the third element is either absent, or has only rarely a close relation to the other two.

The central upland is mainly though not wholly included in the modern department of Arcadia, and is surrounded by a peripheral zone in which lowland basins alternate with mountains and uplands. This peripheral belt is included in the departments of Corinth and Argolis to the north-east and Achaia and Elis to the north-west, with those of Laconia and Messenia to the south. Along the northern border of Arcadia lie three mountain groups, all rising well above 7,000 ft., forming, from west to east, Olonos, Chelmo and Ziria. To the south of this mountain belt there stretches in eastern Arcadia an upland area of markedly karstic characters. Owing to the presence of the limestone rocks the streams tend to flow underground for much of their course, the water disappearing into great chasms, so that there is no surface flow to the sea. All the usual features of karst lands are present, Thus where the surface is covered by non-porous material, derived from impure limestone rocks after the carbonate has been removed in solution, water is held up in lakes, such as those of Peneus and Stymphalus, or in swamps. The water level in the swamps varies with the height of the underground water-table, and maize can be sown on the wet land, to ripen as the water drains away in full summer. Springs are also abundant at the base of the rocks which surround the *polyen,* or basins, with their covering of red earth. These basins tend to occur in rows, and in classical times each was the site of a settlement, placed where spring water was available, and maintained by the produce of the lands. To-day only Tripolitsa is of any importance, and it contains but 14,000 inhabitants. It lies on the railway which crosses the Peloponnesus diagonally, connecting Corinth with the port of Kalamata on the Messenian Gulf. The basins generally yield wheat and maize in the damper areas, with vines on the drier slopes and fruit-trees, which are of the Central European rather than the Mediterranean type because of the elevation (over 1,800 ft.). The aloofness of this part of Arcadia is thus well marked.

Western Arcadia, despite the fact that a greater variety of rocks is present, limestones ceasing to predominate, is in scarcely better case. It has a normal river system, being drained by the Alpheus and its numerous tributaries. This has encroached to some extent on the gathering ground of the Eurotas, the only other considerable river of the Peloponnesus, which flows southward through the basin of Sparta to the Gulf of Laconia. The Alpheus, after leaving Arcadia, enters the Ionian Sea through Elis and Achaia. It does not, however, connect western Arcadia with the sea, for both the main stream and its tributaries pass through steep-sided gorges, which form a great obstacle to communication. Though there are fertile sections on the course of the streams, western Arcadia as a whole is a poor country, mostly devoted to stock-raising, especially of sheep, and with remnants only of its ancient forests.

To the north-west lies the department of Elis and Achaia, hilly in the interior but with a fairly extensive coastal plain. This forms an important part of the currant-producing lands of Greece, but in classical times was aloof and neglected. The ancient town of Olympia, on the lower Alpheus, reminds us that it was neutral ground, on which the various Greek peoples could meet in friendly rivalry. Patras (61,278) has taken over under modern conditions the earlier function of Corinth, to which it is connected by a railway. It is the largest town in the Peloponnesus.

Passing eastwards along the Gulf we come to the terraced area of Corinth, typically Greek in that the productive lands lie in close relation to the sea. In early days Corinth had a double importance in its command both of a seaway and a land route. So long as the journey round Cape Matapan in the south represented a dangerous adventure, its possible avoidance by the isthmus portage had a value which it lost with improvements in methods of navigation. The town at the same time guarded the road into the Peloponnesus from the north.

The Argolis peninsula is for the most part barren and mountainous, though the islands and some fertile areas at its extremity had importance in classical times. Its great interest, however, lies in the fertile though dry Argos basin at the head of the Gulf. This plain, despite the low rainfall due to the sheltered position, and the limited possibilities of irrigation, has always been important. It is on the road to the north, for a pass leads over to Corinth; the ruins of Mycene and Tiryns recall the fact that it is within reach of Crete, while the modern town of Argos stands on the site of the ancient one. The port of Nauplia (7,163) was the first capital of Modern Greece.

The hill country of central Arcadia is continued southwards into two ranges which form the promontories bounding the Gulf of Laconia. The eastern range, the Malevo or Parnon, does not rise much above 6,000 ft., but the western, the Taygetus, bears in Hagios Elias (7,904 ft.) the culminating point of the Peloponn-

nesus, and is peculiarly bare. barren and rocky. Between the two what was probably once a continuation of the Gulf has been filled up by the waste brought down by the Eurotas river. It is not, however, a continuous plain, for a rocky bar, cut through by the stream in a gorge, divides the upper basin, containing the town of Sparta, from a swampy and unhealthy, though fertile coastal plain. The basin of Sparta, now as always the heart of Laconia, is small, under 50 sq.m. in extent, ringed round by mountains, but fertile and well-watered by the springs which bubble up at the base of the encircling rocks. The nearest road to the sea is by a difficult route across the Taygetus to the Messenian port of Kalamata, while the apparently direct route by the river is impeded by the rocky bar already mentioned. Further the Gulf coast is unsuited for the establishment of a good port, and the insignificant one of Gythion is some distance to the west of the Eurotas mouth. The Aegean coast of the eastern promontory is steep and inhospitable. Sparta has thus always been isolated, and despite the fertility of its basin, which yields olives with oranges and other fruits, it is now merely a small town.

Messenia is a softened, more open repetition of Laconia, with a westward outlook. The river Psamios represents as it were the Eurotas, and there is a similar if less marked division into an upper and a lower basin. But in addition to Kalamata (28,955) within the Gulf of Messenia, there are ports on the western coast. which is not inaccessible, for the mountains of Messenia are lower and less continuous than those of Laconia. Pylos or Navarino, on the western coast of the most westerly promontory, has a fine harbour, little used because of the small hinterland. In Messenia the climate is milder and moister than in Laconia and much of the region is of great productivity. Currants are extensively produced, also mulberry trees, olives, figs, oranges and there are even some date palms. Kalamata is the capital and has important oil and wine industries.

3. Central Greece.—This region extends from the great depression marked by the Gulfs of Corinth and Aegina to where the transverse Othrys range forms the southern boundary of the plains of Thessaly. It presents at first sight an appearance of great complexity, especially on the east, where the great island of Euboea is separated from the mainland by the Gulf of Petalia and by a series of channels which at Chalkis narrow to the width of a river. But three quite simple sets of facts give the key to the structure. In the centre is a mountain backbone, forming the continuation of the Pindus range. Its constituent elements have a general north-to-south direction, and are broken off sharply to the south in the region of the narro s which separate the wider Gulfs of Patras and Corinth. Eastwards three ridges come off this main chain nearly at right angles. The most northerly is the already-mentioned Othrys range. Then comes Mt. Oeta (7,080 ft.), which is continued into a lower ridge extending in a south-easterly direction through Phocis. Further south a longer ridge may be regarded as having its origin in Mt. Parnassus (8,064 ft.), and being continued through Helicon and the lower mountains which separate the lowlands of Attica from those of Boeotia. The ridge then bends southward to end in the promontory of Sunium Parnassus is separated by a narrow valley, containing the temple town of Delphi, from the loftier Giona (8,242 ft.) to the west, the highest mountain of the first Greece.

These two sets of mountain ridges may be regarded as forming the skeleton of Central Greece. The third important structural element is constituted by a series of transverse depressions, partly filled up by recent deposits, and then forming the sites of the chief settlements since early days. They are best considered in relation to the transverse ridges, along whose margins they lie. The most southerly is the plain of Attica, lying at the base of the ridge which extends south-eastwards from Parnassus. Bordering as it does the Gulf of Aegina it shows a wonderful combination of advantages. North of the ridge, and south of that which forms a continuation of the Oeta massif, lies the plain of Boeotia. It is less favourably placed than that of Attica, in particular because it does not confront the open sea but only the channels due to the presence of the island of Euboea. It is, however, fairly extensive, and the draining of the former L Copais has notably increased the area of cultivatable ground. A further point of interest is that the depression to which it owes its origin is as it were continued beyond the central backbone, on the western side of the peninsula. There, in south-western Aetolia, is a lowland traversed by the river Aspropotamus, and the lagoon coast of Missolonghi tells the same story of faulting and depression. At the base of the Othrys range, again, a third area of depression is traversed by the river Spercheios which enters the Gulf of Lamia. This has likewise its counterpart on the west in the Gulf of Arta with its surrounding lowland.

All these three areas of depression include fertile lands, producing the usual Greek crops, all contain modern towns, sometimes replacing old ones but often on the same site. But the plain of Attica with the town of Athens may be taken as illustrating the main features.

The plain consists essentially of the basins of Athens and Eleusis, both fertile. Very important are the limestone hills which rise above the surface of the plain, one of which forms the Acropolis. Since, further, the limestones overlie non-porous rocks, and springs tend to gush out at the junction, there was, at least in early days, an adequate water-supply. The topography of the hills to the north, combined with the nature of the double isthmus of Megara and Corinth, separated by an intervening hill belt, forces the land road from the north to pass through the plain. Even more important is the wealth of ports on the north coast of the Gulf of Aegina and on its islands. If modern sea-traffic is concentrated on the Piraeus, in early times it was of much importance that the men of Attica could not only reach the sea at many points, but that the sea once reached was rich in sheltered havens.

Athens, at the time of the foundation of Modern Greece, was a miserable village, while the Piraeus consisted of only a few huts. Within a period of less than one hundred years it grew to be a great modern town with a population approaching 400,000. As compared with Patras, the other chief port of the old Greece, and that from which a considerable part of the exports is sent out, the Piraeus receives 60% of the total import trade of Greece. If on the one hand the regular steamship services with Constantinople and Smyrna go far to explain the direction of Greek ambitions, the extent of the connections throughout the whole Mediterranean Sea helps to explain that intense interest in politics with which the modern Greeks are reproached. The linking of the town to the main railway system of Europe has not altered the fact that its prime importance is a centre of sea-traffic and that in a part of the world where political frontiers have shown great instability. It is but natural that the modern men of Athens should be more intent on discussing ways and means of taking advantage of the constant changes in the surrounding lands than in cultivating a garden now too small to provide much for the dense population which occupies it.

Athens and the Piraeus form now practically a twin city, which shows the beginnings at least of considerable industries. The tendency for these to be established near the port is due to the fact that whether they depend mainly upon home-produced raw material or that obtained from non-Greek lands, this tends to be sea-borne. Among the industries which are developing rapidly are textiles, including cotton, woollen and silk goods: leather goods; soap and candles, based on local supplies of olive oil; metallurgical industries, based largely on island products; chemicals, including fertilisers, phosphates being largely imported from Tunisia; the beginnings of an engineering industry, and so forth.

4. Northern Greece.—North of a line from the Gulf of Arta to the crest of the Othrys range a material change occurs in the characters of the lands. It has been expressed by saying that to the south is the land of olive groves, to the north that of oak forests: to the south are skies eternally blue, to the north those dimmed by cloud in summer no less than in winter. As a picturesque statement of a contrast the statement may serve, for already there is something continental in the landscape, a replacement of the Greek multiplicity of detail by broader structural features. No minute study of the map is needed to bring out the fundamental division into an eastern and a western sec-

tion. The western, mountainous, aloof, backward, forms Epirus, "the continent," passing without natural division line into Southern Albania. Eastward, mountains and hills ring round the broad plains of Thessaly, productive but giving a less full life to their cultivators than do the smaller basins of Central Greece; largely cut off from the sea despite their extensive river system; accessible, if with some difficulty, both from the north and the south by land; forming granaries eagerly fought for and held with tenacity by often alien overlords. Even the productivity itself is clouded by a doubt. The multifarious crops of the true Greek lands have the great advantage that no natural calamity can diminish the yield of all throughout the long growing season. But Thessaly, with its wider spaces, its fewer but more extensively cultivated crops, shares already the continental risk of crop failure, for the weather prevailing during a short period determines whether there shall be famine or plenty.

Little need be said of Epirus. It is mainly an upland, karstic area, fitted especially for sheep-rearing, and showing all the usual karstic features. There is a considerable Albanian, and also a Vlach element in the population, but neither people presents a "racial" problem, as their members are easily assimilated by the Greeks. The coast is inhospitable so that there are no ports of any significance, and internal communication, as usual in karstic areas, is difficult. As exceptions to the general statement that the land is mainly fitted for pastoral industries, the fairly extensive plains which fringe the north shore of the Gulf of Arta may be noted. There are also upland basins which include fertile lands, the most important being that in which stands Jannina, the departmental capital. It is placed on the shores of a considerable lake, which has the usual karstic feature of varying greatly in extent and depth at the different seasons of the year, as the level of the ground water in the surrounding limestones varies. As usual maize is grown on the lands which are submerged in winter and dry out in full summer; the fact is interesting because it must mean that such areas can support a denser population than in the days before the discovery of America brought this useful cereal to the Old World.

Thessaly consists essentially of two lowland basins, the western centring round Trikkala (18,682) and the eastern round Larissa (23,899). The two basins are linked by the Peneios river which cuts through the rocky ridge which separates them. But after its north-easterly course through the Larissa plain the river is constrained to cut through the wider and higher upland which separates the plain from the sea. This it does in the beautiful Vale of Tempe, lying between the great massif of Mt. Olympus (9,793 ft.) to the north, and the much lower Ossa to the south. Still further south the same ridge bears Pelion on its surface, and is continued into the Magnesian peninsula, which bends round in a hook-shaped promontory, almost enclosing the circular Gulf of Volo. That Gulf is itself a depression comparable to the two plains, but smaller and flooded with sea-water, and it has a similar upland rim. By its northern side stands the port of Volo, communicating by passes across the rim both with Trikkala and with Larissa, and thus serving both. The main railway is forced close to the coast by the Olympus massif, but thereafter traverses the Larissa plain and enters Central Greece after crossing the Othrys range.

Olympus itself is an outpost of the Macedonian upland, and separates the basins of Thessaly from the more important plain which centres round the great port of Salonika. Geographically, indeed, Thessaly, with its great estates, worked by poverty-stricken peasants, who still keep memories of the Turkish period, marks the transition to troubled Macedonia, with all its unsolved problems. Politically also it may be said that the inclusion of Thessaly within Modern Greece provided part of the stimulus which led to the Greek advance into Macedonia and Thrace, regarded as stages on the way to Constantinople.

5. Greek Macedonia and *Thrace*.—These new and truly continental lands, which have not yet adjusted themselves to the changed conditions resulting from the Turkish retreat, may be said to have their heart in the plain of Salonika. Structurally the plain is comparable to Thessaly, but a Thessaly with a difference. Nor does that difference consist mainly, as one might suppose, in the open access to the sea, symbolised by the size of the town and port of Salonika. Salonika (236,524), second only in size to Athens, and the only other large town of the republic, did not in the days before the Greek occupation owe its importacce to the surrounding plain, fertile and potentially productive as that plain is. It was the convergence of internal lines of communication upon the plain, the distant rather than the immediate hinterland, which determined the rise of a notable port here. Even the existing railway connections—to Belgrade via Uskub to the north; to Monastir to the north-west; to Constantinople to the east; to Athens via Larissa to the south—hardly give an adequate picture of the extent to which it is the natural outlet of the greater part of the Balkan peninsula. It is a point of convergence of land-ways as Athens is a centre of sea-ways. Its significance is increased by the fact that the other north Aegean ports are poor in themselves, and have only difficult access to the interior. Prior to the Balkan wars the racial patchwork of Turkish Macedonia was reflected in the jumble of nationalities in Salonika, where Jews of Spanish descent formed the largest single element in a community which included representatives of all the Balkan peoples and foreigners in addition. It was described indeed as a kind of permanent fair, set up in a convenient spot, but having little relation to its immediate surroundings. Though some 70,000 Jews are said to remain, the population is now mainly Greek, and, as we have already seen, this is true also of the comparatively narrow strip which extends eastward to the Maritsa line. From a large part of its former hinterland Salonika, despite the Yugoslav Free Zone, is now cut off by political frontiers.

The Salonika plain is traversed by the Lower Vardar and its numerous tributaries, and it is to the size of the river that it owes its importance, owing to the way in which the main stream and the tributaries open up lines of communication. Otherwise it does not differ greatly, save in size, from the similar but smaller basins further east, such as those of Seres and Drama. Each member of the series shows much the same features—a low region, floored by waste from the surrounding hills, usually marshy and malarious, but suitable for the production of wheat and tobacco, particularly in the Drama basin, with maize, rice in the marshy areas, cotton and other crops. The higher, drier lands around yield vines and fruit-trees, mulberry trees for silkworm rearing and so forth. Even within the uplands proper, particularly that very extensive tract of upland which extends westward from the edge of the Salonika plain, basins occur in which a certain amcunt of cultivation can be carried on.

Salonika lies well to the east of the marshy Vardar delta, in a little bay at the base of the mountainous and trident-shaped Khalkidike peninsula. The most easterly of the prongs of the trident, that of Athos, bears the monasteries and hermitages of Mount Athos, forming an ecclesiastical quasi-republic, a relic of mediaeval Byzantinism on the edge of a world which is rapidly growing modern. All the monks belong to the Orthodox Church, but though Greek communities predominate, Russian, Serbian and Bulgarian ones also occur. The religious, to the number of about 5,000, till their own lands, and through the Turkish period were guardians of the Byzantine tradition. Many of the monasteries are rich, owning fiefs on the mainland, and the usual accusations of ignorance, idleness and intrigue have been brought against their occupants.

The Greek government recognized on Sept. 10, 1926, the autonomous form of government existing on Mount Athos for centuries, and ratified it by articles 106–109 of the constitution.

A depression, marked by lakes, leads directly eastwards from Salonika across the base of the Khalkidike peninsula, but the main railway finds an exit at the north-eastern angle of the plain, and enters the lower Struma valley, which forms the productive basin of Seres. This has no port of its own, but the next basin, that of Drama, though not drained seawards by a river, has a fair port in Kavala, greatly coveted by the Bulgars. Opposite lies the wooded island of Thasos. From Drama the railway, by a somewhat difficult route over the rim of the basin, reaches the valley of the Mesta river, often regarded as forming the eastern

GREECE BEFORE GERMAN OCCUPATION

limit of Macedonia. Beyond, in Western or Greek Thrace, lies a lowland area with a fairly dense population and having as port the poor harbour of Dédéagatch, which was for a time Bulgarian. The Lower Maritsa forms the boundary with Turkey, but the town of Adrianople has been returned to that power.

Pallis, "Racial Migrations in the Balkans," *Geographical Journal,* LXVI. (1925).

HISTORY; ANCIENT TO 146 B.C.: GENERAL

The present article is not intended to supply an "Outline of Greek History." The plan followed in these volumes, in which the subject of Greek history is treated of in a large number of separate articles, allows of the narrative of events being given in a more satisfactory form under such headings as ATHENS, SPARTA, PELOPONNESIAN WAR (*qq.v.*). The character of the history itself suggests a further reason why a general article upon Greek history should not be confined to, or even attempt, a narrative of events. A sketch of Greek history is not possible in the sense in which a sketch of Roman history, or even of English history, is possible. Greek history is not the history of a single state. When Aristotle composed his work upon the constitutions of the Greek states, he found it necessary to extend his survey to no less than 158 states. Greek history is thus concerned with more than 150 separate and independent political communities. Nor is it even the history of a single country. The area occupied by the Greek race extended from the Pyrenees to the Caucasus, and from southern Russia to northern Africa. It is inevitable, therefore, that a mere narrative should give a false perspective. Such a sketch is apt to resolve itself into the history of a few great movements and of a few leading states, and to confine itself, at any rate for the greater part of the period dealt with, to the history of Greece in the narrower sense, *i.e.*, of the Greek peninsula. For the identification of Greece with Greece proper there may be some degree of excuse when we come to the 5th and 4th centuries. In the period that lies behind the year 500 B.C. Greece proper forms but a small part of the Greek world. In the 7th and 6th centuries we must look outside Greece for the most active life of the Greek people and the most brilliant manifestations of the Greek spirit. The present article, therefore, will be concerned with the causes and conditions of events, rather than with the events themselves; it will attempt analysis rather than narrative.

(1) THE MINOAN ANC MYCENAEAN AGES

When does Greek history begin? Whatever may be the answer that is given to this question, it will be widely different from any that could have been proposed half a century ago. Then the question was, How late does Greek history begin? Today the question is, How early does it begin? Grote suggested that the first Olympiad (776 B.C.) should be taken as the starting point of the history of Greece, in the proper sense of the term "history." At the present moment the tendency would seem to be to go back as far as the 3rd or 4th millennium B.C. in order to reach a starting point. The results of archaeological research during the last 50 years have produced this startling change in the attitude of historical science towards the problem. When Grote published the first volumes of his *History* of *Greece* (1846), archaeology was in its infancy. Its results, so far as they affected the earlier periods of Greek history, were scanty, and its methods were unscientific. The methods have been gradually perfected by numerous workers in the field; but the results, uhich have so profoundly modified our conceptions of the early history of the Aegean area, are principally due to the discoveries of two men, Heinrich Schliemann and Sir Arthur Evans. A full account of these discoveries will be found elsewhere (see AEGEAN CIVILIZATION and CRETE). Schliemann's labours began with the excavations on the site of Troy in the years 1870–73. He passed on to the excavations at Mycenae in 1876 and to those at Tiryns in 1884. The discoveries of these years revealed to us the Mycenaean age, and carried back the history to the middle of the 2nd millennium. The discoveries of Sir Arthur Evans in the island of Crete belong to a later period. The work of excavation was begun in 1900, and was carried on in subsequent years. It has revealed to us the Minoan age, and enabled us to trace back the development and origins of the civilization for a further period of 1,000 or 1,500 years.

The Evidence of Excavation.— If, then, by "Greek history" is to be understood the history of the lands occupied in later times by the Greek race (*i.e.*, the Greek peninsula and the Aegean basin), the beginnings of the historymust be carried back some 2,000 years before Grote's proposed starting point. If, however, "Greek history" is taken to mean the history of the Greek people, the determination of the starting point is far from easy. For archaeology does not as yet supply any certain answer to the question of race. Were the creators of the Minoan and Mycenaean civilization Greeks or were they not? In some degree the Minoan evidence has modified the answer suggested by the Mycenaean. The two chief difficulties in the way of attributing either the Minoan or the Mycenaean civilization to an Hellenic people are connected respectively with the script and the religion. The excavations at Cnossus have yielded thousands of tablets written in the linear script. There is also evidence that a script, although a different script, was in use among the Mycenaeans as well. If Greek was the language spoken at Cnossus and Mycenae, how is it that all attempts to decipher the scripts have hitherto failed? The Cretan excavations, again, have taught us a great deal as to the religion of the Minoan

age; they have, at the same time, thrown a new light upon the evidence supplied by Mycenaean sites. It is no longer possible to ignore the contrast between the cults of the Minoan and Mycenaean ages, and the religious conceptions which they imply, and the cults and religious conceptions prevalent in the historical period. On the other hand, the argument derived from Mycenaean art, in which we seem to trace a freedom of treatment which is akin to the spirit of later Greek art, and is in complete contrast to the spirit of Oriental art, has received striking confirmation from the remains of Minoan art. The decipherment of the scripts would at once solve the problem. We should at least know whether the dominant race in Crete in the Minoan age, or on the mainland of Greece in the Mycenaean age, spoke an Hellenic or a non-Hellenic dialect. In the meanwhile, possibly until the tablets are read, at any rate until further evidence is forthcoming, any answer that can be given to the question must necessarily be tentative and provisional. *(See* AEGEAN CIVILIZATION.)

It has already been implied that this period of the history of Greece may be subdivided into a Minoan and a Mycenaean age. In the Mycenaean age itself, two periods must be distinguished; the earlier, to which belong the objects found in the shaft-graves, and the later, to which belong the beehive-tombs and the remains of the palaces. To this latter period belong also the palace at Tiryns, and the beehive-tombs discovered elsewhere on the mainland of Greece, and one of the cities on the site of Troy. The pottery of this period is as characteristic of it, both in its forms (*e.g.*, the "stirrup" or "false-necked" form of vase) and in its peculiar glaze, as is the architecture of the palaces and the beehive-tombs. Although the chief remains have been found on the mainland of Greece itself, the art of this latter period is found to have extended as far north as Troy and as far east as Cyprus. On the other hand, hardly any traces of it have been discovered on the west coast of Asia Minor, south of the Troad. The earlier period of the Mycenaean age may be regarded as extending from 1600 to 1400 *B.C.*, and the later period as extending from 1400 to 1200 **B.C.**, or even later. The Minoan age is of far wider extent. Its latest period corresponds to the earlier period of the Mycenaean age. This is the period called by Sir Arthur Evans "Late Minoan." To it belong the Great Palace at Cnossus and the linear system of writing. The "Middle Minoan" period, to which the earlier palace belongs, is characterized by the pictographic system of writing and by polychrome pottery of a peculiarly beautiful kind. Sir Arthur Evans proposes to carry back this period as far as 2500 B.C. Even behind it there are traces of a still earlier civilization. Thus the Minoan age, even if limited to the middle and later periods, will cover at least a thousand years. More recent discoveries have proved that an art, hardly inferior in its way to the art of the classical period, and a civilization which implies the command of great material resources, were flourishing in the Aegean perhaps a thousand years before the siege of Troy.

Oriental Influence.— To the question, "What is the origin of this civilization? Is it of foreign derivation or of native growth?" it is not possible to give a direct answer. On the one hand, it was developed from a culture which was common to the whole Aegean basin and extended as far to the west as Sicily. On the other hand, foreign influences contributed largely to the process of development. Egyptian influences, in particular, can be traced throughout the "Minoan" and "Mycenaean" periods. The developed art, however, both in Crete and on the mainland, displays characteristics which are the very opposite of those which are commonly associated with the term "oriental." Egyptian work, even of the best period, is stiff and conventional; in the best Cretan work, and, in a less degree, in Mycenaean work, we find an originality and a freedom of treatment which remind one of the spirit of the Greek artists. The civilization is, in many respects, of an advanced type. The Cretan architects could design on a grand scale, and could carry out their designs with no small degree of mechanical skill. At Cnossus we find a system of drainage in use, which is far in advance of anything known in the modern world before the 19th century. The art of the Minoan age is hardly inferior to that of the age of Peisistratus. It is a civilization, too, which has long been familiar with the art of writing. But it belongs entirely to the Bronze Age. Iron is not found until the very end of the Mycenaean period, and then only in small quantities. Nor is this the only point of contrast between the culture of the earliest age and that of the historical period in Greece. The so-called Phoenician alphabet, in use among the later Greeks, is unknown in the earliest age. Its systems of writing, both the earlier and the later, are syllabic in character, and analogous to those in vogue in Asia Minor and Cyprus. In the art of war, the chariot is of more importance than the foot-soldier, and the latter, unlike the Greek hoplite, is lightly clad, and trusts to a shield large enough to cover the whole body, rather than to the metal helmet, breastplate and greaves of later times *(see* ARMS AND ARMOUR). The political system appears to have been a despotic monarchy, and the realm of the monarch to have extended to far wider limits than those of the "city-states" of historical Greece. It is, perhaps, in the religious practices of the age, and in the ideas implied in them, that the contrast is most apparent. Neither in Crete nor on the mainland is there any trace of the worship of the "Olympian" deities. The cults in vogue remind us rather of Asia than of Greece. The worship of pillars and of trees carries us back to Canaan, while the double-headed axe, so prominent in the ritual of Cnossus, survives in later times as the symbol of the national deity of the Carians. The beehive-tombs, found on many sites on the mainland besides Mycenae, are evidence both of a method of sepulture and of ideas of the future state, which are alien to the practice and the thought of the Greeks of history.

(2) THE HOMERIC AGE

Alike in Crete and on the mainland the civilization disclosed by excavation comes abruptly to an end. In Crete we can trace it back from c. 1200 B.C. to the Neolithic period. From the Stone Age to the end of the Minoan age the development is continuous and uninterrupted. But between the culture of the Early Age and the culture of the Dorians, who occupied the island in historical times, no connection whatever can be established. Between the two there is a great gulf fixed. It would be difficult to imagine a greater contrast than that presented by the rude life of the Dorian communities in Crete when compared with the political power, the material resources and the extensive commerce of the earlier period. The same gap between the archaeological age and the historical exists on the mainland also. The solution of continuity is here less complete. Mycenaean art continues, here and there, in a debased form down to the 9th century, a date to which we can trace back the beginnings of the later Greek art. On one or two lines (*e.g.*, architecture) it is even possible to establish some sort of connection between them. But Greek art as a whole cannot have evolved from Mycenaean art. We cannot bridge over the interval that separates the latter art, even in its decline, from the former. What then is the relation of the Heroic or Homeric Age (*i.e.*, the age whose life is portrayed for us in the poems of Homer) to the Earliest Age? It, too, presents many contrasts to the later periods. On the other hand, it presents contrasts to the Minoan Age, which, in their way, are not less striking. Is it then to be identified with the Mycenaean Age? Schliemann unhesitatingly identified Mycenaean with Homeric. He even identified the shaft-graves of Mycenae with the tombs of Agamemnon and Clytemnestra. Subsequent inquirers, while refusing to discover so literal a correspondence between things Homeric and things Mycenaean, did accept a general correspondence between the Homeric Age and the Mycenaean. Where it is a case of comparing literary evidence with archaeological, an exact coincidence is not of course to be demanded. The case for a general correspondence appears prima facie a strong one. Much in Homer seems to find confirmation or explanation in Schliemann's finds. Mycenae is Agamemnon's city; the plan of the Homeric house agrees fairly well with the palaces at Tiryns and Mycenae; the forms and the technique of Mycenaean art serve to illustrate passages in the poems; such are only a few of the arguments that have been urged. The late Professor Ridgeway demonstrated, once and for all, that Mycenaean is not Homeric

pure and simple He insisted upon differences as great as the resemblances Iron is in common use in Homer; it is practically unknown to the Mycenaeans. The Homeric dead are cremated; the Mycenaean are buried. The gods of Homer are the deities of Olympus, of whose cult no traces are to be found in the Mycenaean Age It can hardly be doubted that Professor Ridgeway has succeeded in proving that much that is Homeric is post-Mycenaean. It is possible that different strata are to be distinguished in the Homeric poems. There are passages which seem to assume the conditions of the Mycenaean Age; others presuppose the conditions of a later age. The latter passages may reflect the circumstances of the poet's own times, while the former ones reproduce those of an earlier period. If so, the substitution of iron for bronze must have been effected in the interval between the earlier and the later periods.

The Homeric State. — The question whether the makers of the Minoan and Mycenaean civilizations were Greeks must still be regarded as open. No such question can be raised as to the Homeric Age. The Achaeans may or may not have been Greek in blood. What is certain is that the Achaean Age forms an integral part of Greek history. Alike on the religious and the political sides, Homer is the starting-point of subsequent developments. With regard to religion it is sufficient to refer to the judgment of Herodotus, that it was Homer and Hesiod who were the authors of the Greek theogony (ii 53 *οὗτοί εἰσι οἱ ποιήσαντες θεογονίην Ἕλλησι*). It is a commonplace that Homer was the Bible of the Greeks. On the political side, Greek constitutional development would be unintelligible without Homer. When Greek history, in the proper sense, begins, oligarchy is almost universal. Everywhere, however, an antecedent stage of monarchy has to be presupposed. In the Homeric system monarchy is the sole form of government, but monarchy already well on the way to being transformed into oligarchy. In the person of the king are united the functions of priest, of judge, and of leader in war. He belongs to a family which claims divine descent and his office is hereditary. He is no despotic monarch. He is compelled by custom to consult the council (*boulē*) of the elders, or chiefs. He must ask their opinion, and, if he fails to obtain their consent, he has no power to enforce his will. Even when he has obtained the consent of the council, the proposal still awaits the approval of the assembly (agora) of the people.

Homeric Society. — Thus in the Homeric state we find the germs not only of the oligarchy and democracy of later Greece, but also of all the various forms of constitution known to the Western world. And a monarchy such as is depicted in the Homeric poems is clearly ripe for transmutation into oligarchy. The chiefs are addressed as kings (*basilēes*), and claim, equally with the monarch, descent from the gods. In Homer, again, we can trace the later organization into tribe (*phulē*), clan (genos), and phratry, which is characteristic of Greek society in the historical period, and meets us in analogous forms in other Aryan societies. The *genos* corresponds to the Roman gens, the *phulē* to the Roman tribe, and the phratry to the curia. The importance of the phratry in Homeric society is illustrated by the well-kno n passage (Iliad ix. 63) in which the outcast is described as "one who belongs to no phratry" (*aphrētōn*). The society is, of course, based upon slavery, but it is slavery in its least repulsive aspect. The treatment which Eumaeus and Eurycleia receive at the hands of the poet of the Odyssey is highly creditable to the humanity of the age. A society which regarded the slave as a mere chattel would have been impatient of the interest shown in a swineherd and a nurse. It is a society, too, that exhibits many of the distinguishing traits of later Greek life. Feasting and quarrels are of more moment to the heroes than to the contemporaries of Pericles or Plato; but "music" and "gymnastic" (understood in a more restricted sense) are as distinctive of the age of Homer as of that of Pindar. There is retrogression in the historical period. Woman in Homeric society enjoys a greater freedom, and receives greater respect, than in the Athens of Sophocles and Pericles.

(3) THE GROWTH OF THE GREEK STATES

The Greek world at the beginning of the 6th century B.C. presents a picture in many respects different from that of the Homeric Age. The Greek race is no longer confined to the Greek peninsula. It occupies the islands of the Aegean, the western seaboard of Asia Minor, the coasts of Macedonia and Thrace, of southern Italy and Sicily. Scattered settlements are found as far apart as the mouth of the Rhone, the north of Africa, the Crimea and the eastern end of the Black Sea. The Greeks are called by a national name, Hellenes, the symbol of a fully-developed national self-consciousness. They are divided into three great branches, the Dorian, the Ionian, and the Aeolian, names almost, or entirely unknown to Homer. The heroic monarchy has nearly everywhere disappeared. In Greece proper, south of Thermopylae, it survives, but in a peculiar form, in the Spartan state alone. What is the significance and the explanation of contrasts so profound?

Dorian Invasion. — It is probable that the explanation is to be found, directly or indirectly, in a single cause, the Dorian invasion. In Homer the Dorians are mentioned in one passage only (Odyssey xix. 177). They there appear as one of the races which inhabit Crete. In the historical period the whole Peloponnese, with the exception of Arcadia, Elis and Achaea, is Dorian. In northern Greece the Dorians occupy the little state of Doris. and in the Aegean they form the population of Crete, Rhodes and some smaller islands. Thus the chief centres of Minoan and Mycenaean culture have passed into Dorian hands, and the chief seats of Achaean power are included in Dorian states. Greek tradition explained the overthrow of the Achaean system by an invasion of the Peloponnese by the Dorians, a northern tribe, which had found a temporary home in Doris. The story ran that, after an unsuccessful attempt to force an entrance by the Isthmus of Corinth, they had crossed from Naupactus, at the mouth of the Corinthian Gulf, landed on the opposite shore, and made their way into the heart of the Peloponnese, where a single victory gave them possession of the Achaean states. Their conquests were divided among the invaders into three shares, for which lots were cast, and thus the three states of Argos, Sparta and Messenia were created. Much in this tradition is impossible or improbable. It is improbable that the conquest should have been either as sudden, or as complete, as the legend represents But there are indications that the conquest was gradual, and that the displacement of the older population was incomplete The improbability of the details affords, however, no ground for questioning the reality of the invasion. The tradition can be traced back at Sparta to the 7th century B.C. (Tyrtaeus, quoted by Strabo, p. 362), and there is abundant-evidence, other than that of legend, to corroborate it. There is the Dorian name, to begin with. If it originated on the coast of Asia Minor, where it served to distinguish the settlers in Rhodes and the neighbouring islands from the Ionians and Aeolians to the north of them, how came the great and famous states of the Peloponnese to adopt a name in use among the petty colonies planted by their kinsmen across the sea? Or, if Dorian is simply Old Peloponnesian, how are we to account for the Doric dialect or the Dorian pride of race?

There are great differences between the literary Doric, the dialect of Corinth and Argos, and the dialects of Laconia and Crete; there are affinities between the dialect of Laconia and the non-Dorian dialects of Arcadia and Elis. But all the Doric dialects are distinguished from all other Greek dialects by certain common characteristics. Perhaps the strongest sentiment in the Dorian nature is the pride of race. Indeed, it looks as if the Dorians claimed to be the sole genuine Hellenes. How can we account for an indigenous population, first imagining itself to be immigrant, and then developing a contempt for the rest of the race, equally indigenous with itself, on account of a fictitious difference in origin? Finally. there is the archaeological evidence. The older civilization comes to an abrupt end, on the mainland at least, at the very period to which tradition assigns the Dorian migration. 'Its development is greatest, and its overthrow most complete, precisely in the regions occupied by the Dorians and the other tribes, whose migrations were traditionally connected with theirs. It is hardly too much to say that the archaeologist

would have been compelled to postulate an inroad into central and southern Greece of tribes from the north, at a lower level of culture, in the course of the 12th and 11th centuries B.C., if the historian had not been able to direct him to the traditions of the great migrations (*metanastaseis*), of which the Dorian invasion was the chief.

With the Dorian migration Greek tradition connected the expansion of the Greek race eastwards across the Aegean. In the historical period the Greek settlements on the western coast of Asia Minor fall into three clearly defined groups. To the north is the Aeolic group, consisting of the island of Lesbos and twelve towns, mostly insignificant, on the opposite mainland. To the south is the Dorian *hexapolis,* consisting of Cnidus and Halicarnassus on the mainland, and the islands of Rhodes and Cos. In the centre comes the Ionian dodecapolis, a group consisting of ten towns on the mainland, together with the islands of Samos and Chios. Of these Greek settlements the Ionian is incomparably the most important. The Ionians also occupy Euboea and the Cyclades. Although Cyprus (and possibly Pamphylia) had been occupied by settlers from Greece in the Mycenaean age, Greek tradition puts the colonization of Asia Minor and the islands of the Aegean after the Dorian migration. Both the Homeric and the archaeological evidence seem to point to the same conclusion. Between Rhodes on the south and the Troad on the north scarcely any Mycenaean remains have been found. Homer is ignorant of any Greeks east of Euboea. If the poems are earlier than the Dorian invasion his silence is conclusive. If the poems are some centuries later than the invasion, they at least prove that, within a few generations of that event, it was the belief of the Greeks of Asia Minor that their ancestors had crossed the seas after the close of the Heroic Age. It is probable, too, that the names Ionian and Aeolian, the former of which is found once in Homer, and the latter not at all, originated among the colonists in Asia Minor, and served to designate first the members of the Ionic and Aeolic *dodecapoleis.* The only Ionia known to history is in Asia Minor. It does not follow that Ionia is the original home of the Ionian race. It almost certainly follows, however, that it is the original home of the Ionian name.

Hellenes. — It is less easy to account for the name Hellenes. The Greeks were profoundly conscious of their common nationality, and of the gulf that separated them from the rest of mankind. They themselves recognized a common race and language, and a common type of religion and culture, as the chief factors in this sentiment of nationality (see Herod. viii. 144). ((Hellenes" was the name of their common race, and "Hellas" of their common country. In Homer there is no distinct consciousness of a common nationality, and consequently no antithesis of Greek and Barbarian (see Thuc. i. 3). Nor is there a true collective name. There are indeed Hellenes (though the name occurs in one passage only, Iliad ii. 684) and there is a Hellas; but Homer's Hellas, whatever its precise signification may be, is, at any rate, not equivalent either to Greece proper or to the land of the Greeks; his Hellenes are the inhabitants of a small district to the south of Thessaly. It is possible that the diffusion of the Hellenic name was due to the Dorian invaders. Its use can be traced back to the first half of the 7th century.

Monarchy and Oligarchy. — Not less obscure are the causes of the fall of monarchy. It cannot have been the immediate effect of the Dorian conquest, for the states founded by the Dorians were at first monarchically governed. It may, however, have been an indirect effect of it. The power of the Homeric kings is more limited than that of the rulers of Cnossus, Tiryns or Mycenae. In other words, monarchy is already in decay at the epoch of the invasion. The invasion, in its effects on wealth, commerce and civilization, is almost comparable to the irruption of the barbarians into the Roman empire. The monarch of the Minoan and Mycenaean Age has extensive revenues at his command; the monarch of the early Dorian states is little better than a petty chief. Thus the interval, once a wide one, that separates him from the nobles, tends to disappear. The decay of monarchy was gradual; much more gradual than is generally recognized. There were parts of the Greek world in which it still survived in the 6th century, *e.g.,* Sparta, Cyrene, Cyprus, and possibly Argos and Tarentum. Both Herodotus and Thucydides apply the title "king" (basileus) to the rulers of Thessaly in the 5th century. The date at which monarchy gave place to a republican form of government must have differed, and differed widely, in different cases. The traditions relating to the foundation of Cyrene assume the existence of monarchy in Thera and in Crete in the middle of the 7th century (Herod. iv. 150 and 154), and the reign of Amphicrates at Samos (Herod. iii. 59) can hardly be placed more than a generation earlier. In view of our general ignorance of the history of the 7th and 8th centuries, it is hazardous to pronounce these instances exceptional. On the other hand, the change from monarchy to oligarchy was completed at Athens before the end of the 8th century, and at a still earlier date in some of the other states. The process, again, by which the change was effected was, in all probability, less uniform than is generally assumed. There are very few cases in which we have any trustworthy evidence, and the instances about which we are informed refuse to be reduced to any common type. In Greece proper our information is fullest in the case of Athens and Argos. In the former case, the king is gradually stripped of his powers by a process of devolution. In place of an hereditary king, ruling for life, we find three annual and elective magistrates, between whom are divided the executive, military, and religious functions of the monarch (see ARCHON). At Argos the fall of the monarchy is preceded by an aggrandisement of the royal prerogatives. There is nothing in common between these two cases, and there is no reason to suppose that the process elsewhere was analogous to that at Athens. Everywhere, however, oligarchy is the form of government which succeeds to monarchy. Political power is monopolized by a class of nobles, whose claim to govern is based upon birth and the possession of land, the most valuable form of property in an early society. Sometimes power is confined to a single clan (*e.g.,* the Bacchiadae at Corinth); more commonly, as at Athens, all houses that are noble are equally privileged. In every case there is found, as the adviser of the executive, a boulē, or council, representative of the privileged class. Without such a council a Greek oligarchy is inconceivable. The relations of the executive to the council doubtless varied. At Athens the real authority was exercised by the archons[1]; in many states the magistrates were probably subordinate to the council (cf. the relation of the consuls to the senate at Rome). And the way in which the oligarchies used their power varied also. The cases in which the power was abused are naturally the ones of which we hear, for an abuse of power gave rise to discontent and was the ultimate cause of revolution. We hear little or nothing of the cases in which power was exercised wisely. Happy is the constitution which has no annals! Oligarchy held its ground for generations, or even for centuries in a large proportion of the Greek states; and a government which, like the oligarchies of Elis, Thebes or Aegina, could maintain itself for three or four centuries cannot have been merely oppressive.

Trade. — The period of the transition from monarchy to oligarchy is the period in which commerce begins to develop and trade routes to be organized. Greece had been the centre of an active trade in the Minoan and Mycenaean epochs. The products of Crete and of the Peloponnese had found their way to Egypt and Asia Minor. The overthrow of the older civilization put an end to commerce. The seas became insecure and intercourse with the East was interrupted. Our earliest glimpses of the Aegean after the period of the migrations disclose the raids of the pirate and the activity of the Phoenician trader. With the 8th century trade begins to revive, and the Phoenician retires before his Greek competitor. For some time to come, however, no clear distinction is drawn between the trader and the pirate. The pioneers of Greek trade in the West are the pirates of Cumae (Thuc. vi. 4). The rapid development of Greek commerce in the 7th and 6th centuries must have been assisted by the great discovery of the early part of the former century, the invention of coined money.

[1] If the account of early Athenian constitutional history given in the *Athenaiōn* ***Politeia*** were accepted, it would follow that the archons were inferior in authority to the Eupatrid Boulē, the Areopagus.

To the Lydians, rather than the Greeks, belongs the credit of the discovery; but it was the genius of the latter race that divined the importance of the invention and spread its use. The coinage of the Ionian towns goes back to the reign of Gyges (c. 675 B.C.). And in Ionia commercial development is earliest and greatest. In the most distant regions the Ionian is first in the field. Egypt and the Black Sea are both opened up to Greek trade by Miletus, the Adriatic and the Western Mediterranean by Phocaea and Samos. Of the twelve states engaged in the Egyptian trade in the 6th century all, with the exception of Aegina, are from the eastern side of the Aegean (Herod. ii. 178). On the western side the chief centres of trade during these centuries were the islands of Euboea and Aegina and the town of Corinth. The Aeginetan are the earliest coins of Greece proper (c. 650 B.C.); and the two rival scales of weights and measures, in use amongst the Greeks of every age, are the Aeginetan and the Euboic. Commerce naturally gave rise to commercial leagues, and commercial relations tended to bring about political alliances. Foreign policy even at this early epoch seems to have been largely determined by considerations of commerce. Two leagues, the members of which were connected by political as well as commercial ties, can be recognized. At the head of each stood one of the two rival powers in the island of Euboea. Chalcis and Eretria. Their primary object was doubtless protection from the pirate and the foreigner. Competing routes were organized at an early date under their influence, and their trading connections can be traced from the heart of Asia Minor to the north of Italy. Miletus, Sybaris and Etruria were members of the Eretrian league; Samos, Corinth, Rhegium, Zancle (commanding the Straits of Messina), and Cumae, on the Bay of Kaples, of the Chalcidian. The wool of the Phrygian uplands, woven in the looms of Miletus, reached the Etruscan markets by way of Sybaris; through Cumae, Rome and the rest of Latium obtained the elements of Greek culture. Greek trade, however, was confined to the Mediterranean area. The Phoenician and the Carthaginian navigators penetrated to Britain; they discovered the passage round the Cape two thousand years before Vasco da Gama's time. The Greek sailor dared not adventure himself outside the Black Sea, the Adriatic and the Mediterranean. Greek trade, too, was essentially maritime. Ports visited by Greek vessels were often the starting-points of trade routes into the interior; the traffic along those routes was left in the hands of the natives (see, *e.g.*, Herod. iv. 24). Geography is the invention of the Greeks. The first maps were made by them (in the 6th century); and it was the discoveries and surveys of their sailors that made map-making possible.

Colonization. — The period of colonization, in its narrower sense, extends from the middle of the 8th to the middle of the 6th century. Greek colonization is, however, merely a continuation of the process which at an earlier epoch had led to the settlement, first of Cyprus, and then of the islands and coasts of the Aegean. From the earlier settlements the colonization of the historical period is distinguished by three characteristics. The later colony acknowledges a definite metropolis ("mother-city"); it is planted by a definite oecist (*oikistēs*); it has a definite date assigned to its foundation[1]. It would be a mistake to regard Greek colonization as commercial in origin, in the sense that the colonies were in all cases established as trading-posts. This was the case with the Phoenician and Carthaginian settlements, most of which remained mere factories; and some of the Greek colonies (*e.g.*, many of those planted by Miletus on the shores of the Black Sea) bore this character. The typical Greek colony, however, was neither in origin nor in development a mere trading-post. It was, or it became, a *polis*, a city-state, in which was reproduced the life of the parent state. Nor was Greek colonization, like the emigration from Europe to America and Australia in the 19th century, simply the result of over-population. The causes were as various as those which can be traced in the history of modern colonization. Those which were established for the purposes of trade may be compared to the factories of the Portuguese and Dutch in Africa and the Far East. Others were the result of political discontent, in some form or shape; these may be compared to the Puritan settlements in New England. Others again were due to ambition or the mere love of adventure (see Herod. v. 42, et seq., the career of Dorieus). But however various the causes, two conditions must always be presupposed — an expansion of commerce and a growth of population. Within the narrow limits of the city-state there was a constant tendency for population to become redundant until, as in the later centuries of Greek life, its growth was artificially restricted. Alike from the Roman colonies, and from those founded by the European nations in the course of the last few centuries, the Greek colonies are distinguished by a fundamental contrast. It is significant that the contrast is a political one. The Roman colony was in a position of entire subordination to the Roman state, of which it formed a part. The modern colony was, in varying degrees, in political subjection to the home government. The Greek colony was completely independent from the first. The ties that united a colony to its metropolis were those of sentiment and interest; the political tie did not exist. There were exceptions. The colonies established by imperial Athens closely resembled the colonies of imperial Rome. The cleruchy (*q.v.*) formed part of the Athenian state, the cleruchs kept their status as citizens of Athens and acted as a military garrison. And if the political tie, in the proper sense, was wanting, political relations sprang out of commercial or sentimental ones. Thus Corinth interfered twice to save her colony Syracuse from destruction, and Megara brought about the revolt of Byzantium, her colony, from Athens. Sometimes it is not easy to distinguish political relations from a political tie (*e.g.*, the relations of Corinth, both in the Persian and Peloponnesian Wars, to Ambracia and the neighbouring group of colonies). When we compare the development of the Greek and the modern colonies we shall find that the development of the former was even more rapid than that of the latter. The differences of race, of colour and of climate, with which the chief problems of modern colonization are connected, played no part in the history of the Greek settlements. The races amongst whom the Greeks planted themselves were in some cases on a similar level of culture. Where the natives were still backward or barbarous, they came of a stock either closely related to the Greek, or at least separated from it by no great physical differences. Amalgamation with the native races was easy, and it involved neither physical nor intellectual degeneracy as its consequence. Of the races with which the Greeks came in contact the Thracian was far from the highest in the scale of culture; yet two of the greatest names in the Great Age of Athens are those of men who had Thracian blood in their veins, Cimon and the historian Thucydides. In the absence of any distinction of colour, no insuperable barrier existed between the Greek and the hellenized native. The demos of the colonial cities was largely recruited from the native population[1], nor was there anything in the Greek world analogous to the "poor whites" or the "black belt." Of hardly less importance were the climatic conditions. In this respect the Mediterranean area is unique. There is no other region of the world of equal extent in which these conditions are at once so uniform and so favourable. Nowhere had the Greek settler to encounter a climate which was either unsuited to his labour or subversive of his vigour. That in spite of these advantages so little, comparatively speaking, was effected in the work of hellenization before the epoch of Alexander and the Diadochi, was the effect of a single counteracting cause. The Greek colonist, like the Greek trader, clung to the shore. He penetrated no farther inland than the sea-breeze. Hence it was only in islands, such as Sicily or Cyprus, that the process of hellenization was complete.

The Tyrants. — To the 7th century belongs another movement of high importance in its bearing upon the economic, religious and literary development of Greece, as well as upon its constitutional history. This movement is the rise of the "tyrannis." In the political writers of a later age the word possesses a clear-cut connotation. From other forms of monarchy it is distinguished

[1] The dates before the middle of the 7th century are in most cases artificial, *e.g.*, those given by Thucydides (book vi.) for the earlier Sicilian settlements. *See* J. P. Mahaffy, ***Journal*** of ***Hellenic*** *Studies*, ii. *164* ff.

[1] At Syracuse the demos makes common cause with the Sicel serf-population against the nobles (Herod. vii. 155).

by a twofold differentiation. The *turannos* is an unconstitutional ruler, and his authority is exercised over unwilling subjects. In the 7th and 6th centuries the line was not drawn so distinctly between the tyrant and the legitimate monarch. Even Herodotus uses the words "tyrant" and "king" interchangeably (*e.g.*, the princes of Cyprus are called "kings" in v. 110 and "tyrants" in v. 109), so that it is sometimes difficult to decide whether a legitimate monarch or a tyrant is meant (*e.g.*, Aristophilides of Tarentum, iii. 136, or Telys of Sybaris, v. 44). But the distinction between the tyrant and the king of the Heroic Age is a valid one. It is not true that his rule was always exercised over unwilling subjects; it is true that his position was always unconstitutional. The Homeric king is a legitimate monarch; his authority is invested with the sanctions of religion and immemorial custom. The tyrant is an illegitimate ruler; his authority is not recognized, either by customary usage or by express enactment. But the word "tyrant" was originally a neutral term; it did not necessarily imply a misuse of power. The origin of the tyrannis is obscure. The word *turannos* has been thought, with some reason, to be Lydian. Probably both the name and the thing originated in the Greek colonies of Asia Minor, though the earliest tyrants of whom we hear in Asia Minor (at Ephesus and Miletus) are a generation later than the earliest in Greece itself, where, both at Sicyon and at Corinth, tyranny appears to date back to the second quarter of the 7th century. It is not unusual to regard tyranny as a universal stage in the constitutional development of the Greek states and as a stage that occurs everywhere at one and the same period. In reality, tyranny is confined to certain regions, and is not a phenomenon peculiar to any one age or century. In Greece proper, before the 4th century B.C., it is confined to a small group of states round the Corinthian and Saronic Gulfs. The greater part of the Peloponnese was exempt from it, and there is no good evidence for its existence north of the Isthmus, except at Megara and Athens. It plays no part in the history of the Greek cities in Chalcidice and Thrace. It was rare in the Cyclades. The regions in which it finds a congenial soil are two, Asia Minor and Sicily. Thus it is incorrect to say that most Greek states passed through this stage, or to assume that they passed through it at the same time. There is no "Age of the Tyrants." Tyranny began in the Peloponnese a hundred years before it appears in Sicily, and disappeared in the Peloponnese almost before it began in Sicily. In the latter the great age of tyranny comes at the beginning of the 5th century; in the former it is at the end of the 7th and the beginning of the 6th. At Athens the history of tyranny begins after it has ended both at Sicyon and Corinth. There is, indeed, a period in which tyranny is non-existent in the Greek states; roughly speaking, the last sixty years of the 5th century. But with this exception, there is no period in which the tyrant is not to be found. The greatest of all the tyrannies, that of Dionysius at Syracuse, belongs to the 4th century. Nor must it be assumed that tyranny always comes at the same stage in the history of a constitution; that it is always a stage between oligarchy and democracy. At Corinth it is followed by oligarchy, that lasts, with a brief interruption, for two hundred and fifty years. At Athens it is not immediately preceded by oligarchy. Between the Eupatrid oligarchy and the rule of Peisistratus there comes the timocracy of Solon. These exceptions do not stand alone. The cause of tyranny is, in one sense, uniform. In the earlier centuries, at any rate, tyranny is always the expression of discontent; the tyrant is always the champion of a cause. But it would be a mistake to suppose that the discontent is necessarily political, or that the cause which he champions is always a constitutional one. At Sicyon it is racial. Cleisthenes is the champion of the older population against their Dorian oppressors (see Herod. v. 67, 68). At Athens the discontent is economic rather than political; Peisistratus is the champion of the Diacrii, the inhabitants of the poorest region of Attica. The party strifes in the early history of Miletus, which doubtless gave the tyrant his opportunity, are concerned with the claims of rival industrial classes. In Sicily the tyrant is the ally of the rich and the foe of the *demos*, and the cause which he champions, both in the 5th century and the 4th, is a national one, that of the Greek against the Carthaginian. We may suspect that in Greece itself the tyrannies of the 7th century are the expression of an anti-Dorian reaction. It can hardly be an accident that the states in which the tyrannis is found at this epoch, Corinth, Megara, Sicyon, Epidaurus, are all of them states in which a Dorian upper class ruled over a subject population. In Asia Minor the tyrannis assumes a peculiar character after the Persian conquest. The tyrant rules as the deputy of the Persian satrap. Thus in the East the tyrant is the enemy of the national cause; in the West, in Sicily, he is its champion.

Tyranny has analogies in Roman history, in the power of Caesar, or of the Caesars; in the despotisms of mediaeval Italy; or even in the Napoleonic empire. Between the tyrant and the Italian despot there is indeed a real analogy; but between the Roman principate and the Greek tyrannis there are two essential differences. In the first place, the principate was expressed in constitutional forms, or veiled under constitutional fictions; the tyrant stood altogether outside the constitution. And, secondly, at Rome both Julius and Augustus owed their position to the power of the sword. The power of the sword, it is true, plays a large part in the history of the later tyrants (*e.g.*, Dionysius of Syracuse); the earlier ones, however, had no mercenary armies at their command. We can hardly compare the bodyguard of Peisistratus to the legions of the first or the second Caesar.

The view taken of the tyrannis in Greek literature is almost uniformly unfavourable. In this respect there is no difference between Plato and Aristotle, or between Herodotus and the later historians (except Thucydides). His policy is represented as purely selfish, and his rule as oppressive. Herodotus is influenced partly by the traditions current among the oligarchs, who had been the chief sufferers, and partly by the odious associations which had gathered round tyranny in Asia Minor. The philosophers write under their impressions of the later tyrannis, and their account is largely a priori. We seldom find any attempt, either in the philosophers or the historians, to do justice to the real services rendered by the tyrants. Their first service was constitutional. They helped to break down the power of the old aristocratic houses, and thus to create the social and political conditions indispensable to democracy. The tyrannis involved the sacrifice of liberty in the cause of equality. When tyranny falls, it is never succeeded by the aristocracies which it has overthrown. It is frequently succeeded by an oligarchy, in which the claim to exclusive power is based upon wealth, or the possession of land. It would be unfair to treat this service as one that was rendered unconsciously and unwillingly. Where the tyrant asserted the claims of an oppressed class, he consciously aimed at the destruction of privilege and the effacement of class distinctions. Hence it is unjust to treat his power as resting upon mere force. A government which can last eighty or a hundred years, as was the case with the tyrannies at Corinth and Sicyon, must have a moral force behind it. It must rest upon the consent of its subjects. The second service which the tyrants rendered to Greece was political. Their policy tended to break down the barriers which isolated each petty state from its neighbours. In their history we can trace a system of widespread alliances, which are often cemented by matrimonial connections. The Cypselid tyrants of Corinth appear to have been allied with the royal families of Egypt, Lydia and Phrygia, as well as with the tyrants of Miletus and Epidaurus, and with some of the great Athenian families. In Sicily we find a league of the northern tyrants opposed to a league of the southern; and in each case there is a corresponding matrimonial alliance. Anaxilaus of Rhegium is the son-in-law and ally of Terillus of Himera; Gelon of Syracuse stands in the same relation to Theron of Agrigentum. Royal marriages have played a great part in the politics of Europe. In the comparison of Greek and modern history it has been too often forgotten how great a difference it makes, and how great a disadvantage it involves, to a republic that it has neither sons nor daughters to give in marriage. In commerce and colonization the tyrants continued the work of the oligarchies to which they succeeded. Greek trade owed its expansion to the intelligent efforts of the oligarchs who ruled at Miletus and Corinth, in Samos, Aegina and Euboea;

but in Miletus, Corinth, Sicyon and Athens, there was a further development, and a still more rapid growth, under the tyrants. In the same way, the foundation of the colonies was in most cases due to the policy of the oligarchical governments. They can claim credit for the colonies of Chalcis and Eretria, of Megara, Phocaea and Samos, as well as for the great Achaean settlements in southern Italy. The Cypselids at Corinth, and Thrasybulus at Miletus, are instances of tyrants who colonized on a great scale.

Religion under the Tyrants.—In their religious policy the tyrants went far to democratize Greek religion. The functions of monarchy had been largely religious; but, while the king was necessarily a priest, he was not the only priest in the community. There were special priesthoods, hereditary in particular families, even in the monarchial period; and upon the fall of the monarchy, while the priestly functions of the kings passed to republican magistrates, the priesthoods which were in the exclusive possession of the great families tended to become the important ones. Thus, before the rise of tyranny, Greek religion is aristocratic. The cults recognized by the state are the sacra of noble clans. The religious prerogatives of the nobles helped to confirm their political ones, and, as long as religion retained its aristocratic character. it was impossible for democracy to take root. The policy of the tyrants aimed at fostering popular cults which had no associations with the old families, and at establishing new festivals. The cult of the wine-god, Dionysus, was thus fostered at Sicyon by Cleisthenes, and at Corinth by the Cypselids; while at Athens a new festival of this deity, which so completely overshadowed the older festival that it became known as the Great Dionysia, probably owed its institution to Peisistratus. Another festival, the Panathenaea, which had been instituted only a few years before his rise to power, became under his rule, and thanks to his policy, the chief national festival of the Athenian state. Everywhere we find the tyrants the patrons of literature. Pindar and Bacchylides, Aeschylus and Simonides found a welcome at the court of Hieron. Polycrates was the patron of Anacreon, Periander of Arion. To Peisistratus has been attributed the first critical edition of the text of Homer, a work as important in the literary history of Greece as was the issue of the Authorized Version of the Bible in English history. To judge fairly of tyranny and of its contributions to the development of Greece, we must remember the states in whose history the period of greatest power coincides with the rule of a tyrant, such as Corinth and Sicyon, Syracuse in the jth, and again in the 4th century; and probably Samos and Miletus. In the case of Athens the splendour of the Great Age blinds us to the greatness of the results achieved by the policy of the Peisistratids.

Literature and the Arts.—With the overthrow of this dynasty tyranny disappears from Greece proper for more than a century. During the century and a half which had elapsed since its first appearance the whole aspect of Greek life, and of the Greek world, had changed. The development was as yet incomplete, but the lines on which it was to proceed had been clearly marked out. Political power was no longer the monopoly of a class. The struggle between the "few" and the "many" had begun; in one state at least (Athens) the victory of the "many" was assured. The first chapter in the history of democracy was already written. In the art of war the two innovations which were ultimately to establish the military supremacy of Greece, hoplite tactics and the trireme, had already been introduced. Greek literature mas no longer synonymous with epic poetry. Some of its most distinctive forms had not yet been evolved; indeed, it is only quite at the end of the period that prose-writing begins; but both lyric and elegiac poetry had been brought to perfection. In art, statuary was still comparatively stiff and crude; but in other branches, in architecture, in vase-painting and in coin-types, the aesthetic genius of the race had asserted its pre-eminence. Philosophy, the supreme gift of Greece to the modern world, had become a living power. Some of her most original thinkers belong to the 6th century. Criticism had been applied to everything in turn: to the gods, to conduct, and to the conception of the universe. Before the Great Age begins, the claims of intellectual as well as of political freedom had been vindicated. It was not, however, in Greece proper that progress had been greatest. In the next century the centre of gravity of Greek civilization shifts to the western side of the Aegean; in the 6th century it must be looked for at Miletus, rather than at Athens. To estimate how far the development of Greece had advanced, or to appreciate the distinctive features of Greek life at this period, we must study Ionia, rather than Attica or the Peloponnese. Almost all that is greatest and most characteristic is to be found on the eastern side of the Aegean. The great names in the history of science and philosophy before the beginning of the 5th century—Thales, Pythagoras, Xenophanes, Heracleitus, Parmenides, Anaximander, Hecataeus; names which are representative of mathematics, astronomy, geography, and metaphysics, are all, without exception, Ionian. In poetry, too, the most famous names, if not so exclusively Ionian, are connected either with the Asiatic coast or with the Cyclades. Against Archilochus and Anacreon, Sappho and Alcaeus, Greece has nothing better to set, after the age of Hesiod, than Tyrtaeus and Theognis. Reference has already been made to the greatness of the Ionians as navigators, as colonizers and as traders. In wealth and in population, Miletus, at the epoch of the Persian conquest, must have been far ahead of any city of European Greece. Sybaris, in Magna Graecia, can have been its only rival outside Ionia. There were two respects, however, in which the comparison was in favour of the mother-country. In warfare, the superiority of the Spartan infantry was unquestioned; in politics, the Greek states showed a greater power of combination than the Ionian.

(4) THE PERSIAN WARS

Finally, Ionia was the scene of the first conflicts with the Persian. Here were decided the first stages of a struggle which was to determine the place of Greece in the history of the world. The rise of Persia under Cyrus was the turning-point of Greek history. Hitherto the Greek had proved himself indispensable to the oriental monarchies with which he had been brought into contact. In Egypt the power of the Saite kings rested upon the support of their Greek mercenaries. Amasis (569–525 B.C.), who is raised to the throne as the leader of a reaction against the influence of the foreign garrison, ends by showing greater favour to the Greek soldiery and the Greek traders than all that were before him. With Lydia the relations were originally hostile; the conquest of the Greek fringe is the constant aim of Lydian policy, Greek influences, however, seem to have quickly permeated Lydia. and to have penetrated to the court. Alyattes (610–560 B.C.) marries an Ionian wife, and the succession is disputed between the son of this marriage and Croesus, whose mother was a Carian. Croesus (560–546 B.C.) secures the throne, only to become the lavish patron of Greek sanctuaries and the ally of a Greek state. The history of Hellenism (*i.e.*, of the diffusion of Greek civilization in non-Hellenic states) had begun. The rise of Cyrus closed the East to Greek enterprise and Greek influences. In Persia we find the antithesis of all that is characteristic of Greece—autocracy as opposed to liberty; a military society organized on an aristocratic basis, to an industrial society, animated by a democratic spirit; an army, whose strength lay in its cavalry, to an army, in which the foot-soldier alone counted; a morality, which assigned the chief place to veracity, to a morality which subordinated it to other virtues; a religion, which ranks among the great religions of the world, to a religion, which appeared to the most spiritual minds among the Greeks themselves both immoral and absurd. Between two such races there could be neither sympathy nor mutual understanding. In the Great Age the Greek had learned to despise the Persian, and the Persian to fear the Greek. In the 6th century it was the Persian who despised, and the Greek who feared. The history of the conflicts between the Ionian Greeks and the Persian empire affords a striking example of the combination of intellectual strength and political weakness in the character of a people. The causes of the failure of the Ionians to offer a successful resistance to Persia, both at the time of the conquest by Harpagus (546–545 B.C.) and in the Ionic revolt (499–494 B.C.), are not far to seek. The centrifugal forces always tended to prove the stronger in the Greek system, and

nowhere were they stronger than in Ionia. The tie of their tribal union proved weaker, every time it was put to the test, than the political and commercial interests of the individual states. A league of jealous commercial rivals is certain not to stand the strain of a protracted struggle against great odds. Against the advancing power of Lydia a common resistance had not so much as been attempted. Miletus, the greatest of the Ionian towns, had received aid from Chios alone. Against Persia a common resistance was attempted. The Panionium, the centre of a religious amphictyony (see ANPHICTYONY), became for the moment the centre of a political league. At the time of the Persian conquest Miletus held aloof. She secured favourable terms for herself, and left the rest of Ionia to its fate. In the later conflict, on the contrary, Miletus is the leader in the revolt. The issue was determined by the selfish policy of the leading states. In the sea-fight at Lade (494 B.C.) the decisive battle of the war, the Milesians and Chians fought with desperate courage. The day was lost thanks to the treachery of the Samian and Lesbian contingents.

The causes of the successful resistance of the Greeks to the invasions of their country, first by Datis and Artaphernes (490 B.C.), in the reign of Darius, and then by Xerxes in person (480–479 B.C.), are more complex. Their success was partly due to a moral cause. And this was realized by the Greeks themselves. They felt (see Herod. vii. 104) that the subjects of a despot are no match for the citizens of a free state, who yield obedience to a law which is self-imposed. But the cause was not solely a moral one. Nor was the result due to the numbers and efficiency of the Athenian fleet, in the degree that the Athenians claimed (see Herod. vii. 139). The truth is that the conditions, both political and military, were far more favourable to the Greek defence in Europe than they had been in Asia. (See GRAECO-PERSIAN WARS.)

(5) THE GREAT AGE

The effects of the repulse of Persia were momentous in their influence upon Greece. The effects upon Elizabethan England of the defeat of the Spanish Armada would afford quite an inadequate parallel. It gave the Greeks a heightened sense, both of their own national unity and of their superiority to the barbarian, while at the same time it helped to create the material conditions requisite alike for the artistic and political development of the 5th century. Other cities besides Athens were adorned with the proceeds of the spoils won from Persia, and Greek trade benefited both from the reunion of Ionia with Greece, and from the suppression of piracy in the Aegean and the Hellespont. Do these developments justify us in giving to the period, which begins with the repulse of Xerxes, and ends with the victory of Philip, the title of "the Great Age"? If the title is justified in the case of the 5th century, should the 4th century be excluded from the period? At first sight, the difference between the 4th century and the 5th may seem greater than that which exists between the 5th and the 6th. On the political side, the 5th century is an age of growth, the 4th an age of decay; on the literary side, the former is an age of poetry, the latter an age of prose. In spite of these contrasts, there is a real unity in the period which begins with the repulse of Xerxes and ends with the death of Alexander. It is an age of maturity in politics, in literature, and in art; and this is true of no earlier age. Nor can we say that the 5th century is, in all these aspects of Greek life, immature as compared with the 4th, or, on the other hand, that the 4th is decadent as compared with the 5th. On the political side, maturity is, in one sense, reached in the earlier century. There is nothing in the later century so great as the Athenian Empire. In another sense, maturity is not reached till the 4th century. It is only in the later century that the tendency of the Greek constitutions to conform to a common type, democracy, is (at least approximately) realized, and it is only in this century that the principles upon which democracy is based are carried to their logical conclusion. In literature, if we confine our attention to poetry, we must pronounce the 5th century the age of completed development; but in prose it is different. The style even of Thucydides is immature, as compared with that of Isocrates and Plato. In philosophy, however high may be the estimate that is formed of the genius of the earlier thinkers, it cannot be disputed that in Plato and Aristotle we find a more mature stage of thought. In art, architecture may perhaps be said to reach its zenith in the 5th, sculpture in the 4th century.

Systems of Government. — In its political aspect, the history of the Great Age resolves itself into the history of two movements, the imperial and the democratic. Hitherto Greece had meant, politically, an aggregate of independent states, very numerous, and, as a rule, very small. The principle of autonomy was to the Greek the most sacred of all political principles; the passion for autonomy the most potent of political factors. In the latter half of the 6th century Sparta had succeeded in combining the majority of the Peloponnesian states into a loose federal union; so loose, however, that it appears to have been dormant in the intervals of peace. In the crisis of the Persian invasion the Peloponnesian League was extended so as to include all the states which had espoused the national cause. It looked on the morrow of Plataea (*q.v.*) and Mycale (the two victories, won simultaneously, in 479 B.C., by Spartan commanders, by which the danger from Persia was finally averted) as if a permanent basis for union might be found in the hegemony of Sparta. The sense of a common peril and a common triumph brought with it the need of a common union; it was Athens, however, instead of Sparta, by whom the first conscious effort was made to transcend the isolation of the Greek political system and to bring the units into combination. The league thus founded — the Delian League (*q.v.*) established in 477 B.C.—was under the presidency of Athens, but it included hardly any other state amongst those that had conducted the defence of Greece. It was formed, almost entirely, of the states which had been liberated from Persian rule by the great victories of the war. The Delian League, even in the form in which it was first established, as a confederation of autonomous allies, marks an advance in political conceptions upon the Peloponnesian League. Provision is made for an annual revenue, for periodical meetings of the council, and for a permanent executive. It is a real, though imperfect, federation. There were defects in its constitution which rendered it inevitable that it should be transformed into an empire. Athens was from the first "the predominant partner." The fleet was mainly Athenian, the commanders entirely so; the assessment of the tribute was in Atheniaq hands; there was no federal court appointed to determine questions at issue between Athens and the other members; and, worst omission of all, the right of secession was left undecided. By the middle of the century the Delian League has become the Athenian empire. Henceforward the imperial idea, in one form or another, dominates Greek politics. Athens failed to extend her authority over the whole of Greece. Her empire was overthrown; but the triumph of autonomy proved the triumph of imperialism. The Spartan empire succeeds to the Athenian, and, when it is finally shattered at Leuctra (371 B.C.), the hegemony of Thebes, which is established on its ruins, is an empire in all but name. The decay of Theban power paves the way for the rise of Macedon.

Thus throughout this period we can trace two forces contending for mastery in the Greek political system. Two causes divide the allegiance of the Greek world, the cause of empire and the cause of autonomy. The formation of the Delian League did not involve the dissolution of the alliance between Athens and Sparta. For seventeen years more Athens retained her place in the league, "which had been established against the Mede" under the presidency of Sparta in 480 B.C. (Thuc. i. 102). The ascendancy of Cimon and the Philolaconian party at Athens was favourable to a good understanding between the two states, and at Sparta in normal times the balance inclined in favour of the party whose policy is best described by the motto "quieta non movere."

The Peloponnesian War. — In the end, however, the opposition of the two contending forces proved too strong for Spartan neutrality. The fall of Cimon (461 B.C.) was followed by the so-called "First Peloponnesian War," a conflict between Athens and her maritime rivals, Corinth and Aegina, into which Sparta was ultimately drawn. Thucydides regards the

hostilities of these years (460–454 B.C.), which were resumed for a few months in 446 B.C., on the expiration of the Five Years' Truce, as preliminary to those of the great Peloponnesian War (*q.v.*), 431–404 B.C. The real question at issue was in both cases the same. The tie that united the opponents of Athens was found in a common hostility to the imperial idea. It is a complete misapprehension to regard the Peloponnesian War as a mere duel between two rival claimants for empire. The ultimatum presented by Sparta on the eve of the war demanded the restoration of autonomy to the subjects of Athens. There is no reason for doubting her sincerity in presenting it in this form. It would, however, be an equal misapprehension to regard the war as merely a struggle between the cause of empire and the cause of autonomy. Corresponding to this fundamental contrast there are other contrasts, constitutional, racial and military. The military interest of the war is largely due to the fact that Athens was a sea power and Sparta a land one. As the war went on, the constitutional aspect tended to become more marked. At first there were democracies on the side of Sparta, and oligarchies on the side of Athens. In the last stage of the war, when Lysander's influence was supreme, we see the forces of oligarchy everywhere united and organized for the destruction of democracy. In its origin the war was certainly not due to the rivalry of Dorian and Ionian. This racial, or tribal, contrast counted for more in the politics of Sicily. than of Greece; and, though the two great branches of the Greek race were represented respectively by the leaders of the two sides, the allies on neither side belonged exclusively to the one branch or the other. Still, it remains true that the Dorian states were, as a rule, on the Spartan side, and the Ionian states, as a rule, on the Athenian — a division of sentiment which must have helped to widen the breach and to intensify the animosities.

The Athenian Empire. — As a political experiment the Athenian empire possesses a unique interest. It represents the first attempt to fuse the principles of imperialism and democracy. It is at once the first empire in history possessed and administered by a sovereign people, and the first which sought to establish a common system of democratic institutions amongst its subjects'. The experiment failed, partly owing to the inherent strength of the oligarchic cause, partly owing to the exclusive character of ancient citizenship.

The Athenians themselves recognized that their empire depended for its existence upon the solidarity of democratic interests (*see* Thuc. iii. 47; Ps.-Xen., *de Rep. Ath.* i. 14, iii. 10). An understanding existed between the democratic leaders in the subject-states and the democratic party at Athens. Charges were easily trumped up against obnoxious oligarchs, and conviction as easily obtained in the Athenian courts of law. Such a system forced the oligarchs into an attitude of opposition. How much this opposition counted for was realized when the Sicilian disaster (413 B.C.) gave the subjects their chance to revolt. The organization of the oligarchical party throughout the empire, which was effected by Lysander in the last stage of the war, contributed to the overthrow of Athenian ascendancy hardly less than the subsidies of Persia. Had Athens aimed at establishing a community of interest between herself and her subjects, based upon a common citizenship, her empire might have endured. It would have been a policy akin to that which secured the permanence of the Roman empire. And it was a policy which found advocates when the day for it was past (*see* Aristophanes, *Lysistrata*, 574, *et seq.*; *cf.* the grant. of citizenship to the Samians after Aegospotami, *Inscr., Gr.* ii. 5. 1b.). But the policy pursued by Athens in the plenitude of her power was the reverse of the policy pursued by Rome in her treatment of the franchise. It is hardly an exaggeration to say that the fate of the empire was sealed by the law of Pericles (451 B.C.), by which the franchise was restricted to those who could establish Athenian descent on both sides. It was not merely that the process of amalgamation through intermarriage was abruptly checked; what was more serious was that a hard and fast line was drawn, once and for all, between the small body of privileged rulers and the great mass of unprivileged subjects. Maine (*Early Institutions*, lecture 13) has classed the Athenian empire with those of the familiar Oriental type, which attempt nothing beyond the raising of taxes and the levying of troops. The Athenian empire cannot, indeed, be classed with the Roman, or with the British rule in India; it does not, however, deserve to be classed with the empires of Cyrus or of Jenghiz Khan. Though the basis of its organization, like that of the Persian empire under Darius, was financial, it attempted, and secured, objects beyond the mere payment of tribute and the supply of ships. If Athens did not introduce a common religion, or a common system of education, or a common citizenship, she did introduce a common type of political institutions, and a common jurisdiction[1]. She went some way, too, in the direction of establishing a common system of coins and of weights and measures. A common language was there already. In a word, the Athenian empire marks a definite stage of political evolution.

The Mature Democracy. — The nther great political movement of the age was the progress of democracy. Before the Persian invasion democracy was a rare phenomenon in Greek politics. Where it was found it existed in an undeveloped form, and its tenure of power was precarious. By the beginning of the Peloponnesian War it had become the prevalent form of government. The great majority of Greek states had adopted democratic constitutions. Both in the Athenian sphere of influence and in the colonial world outside that sphere, democracy was all but the only form of constitution known. It was only in Greece proper that oligarchy held its own. In the Peloponnese it could count a majority of the states; in northern Greece at least a half of them. The spread of democratic institutions was arrested by the victory of Sparta in the East, and the rise of Dionysius in the West. There was a moment at the end of the 5th century when it looked as if democracy was a lost cause. Even Athens was for a brief period under the rule of the Thirty (404–403 B.C.). In the regions which had formed the empire of Athens the decarchies set up by Lysander were soon overthrown, and democracies restored in most cases; but oligarchy continued to be the prevalent form in Greece proper until Leuctra (371 B.C.), and in Sicily tyranny had a still longer tenure of power. By the end of the Great Age oligarchy has almost disappeared from the Greek world, except in the sphere of Persian influence. The Spartan monarchy still survives; a few Peloponnesian states still maintain the rule of the few; here and there in Greece itself we meet with a revival of the tyrannis; but, with these exceptions, democracy is everywhere the only type of constitution. And democracy has developed as well as spread. At the end of the 5th century the constitution of Cleisthenes, which was a democracy in the view of his contemporaries, had come to be regarded as an aristocracy (Aristot. *Ath. Pol.* 29.3). We can trace a similar change of sentiment in Sicily. As compared with the extreme form of constitution adopted at Syracuse after the defeat of the Athenian expedition, the democracies established two generations earlier, on the fall of the tyrannis, appeared oligarchical. The changes by which the character of the Greek democracies was revolutionized were four in number: the substitution of the lot for election, the abolition of a property qualification, the payment of officials and the rise of a class of professional politicians. In the democracy of Cleisthenes no payment was given for service, whether as a magistrate, a juror or a member of the boulē. The higher magistracies were filled by election, and they were held almost exclusively by the members of the great Athenian families. For the highest office of all, the archonship, none but *Pentakosiomedimnoi* (the first of the four Solonian classes) were eligible. The introduction of pay and the removal of the property qualification formed part of the reforms of

[1] It has been denied by some writers (*e.g.*, by A. H. J. Greenidge) that Athens interfered with the constitutions of the subject-states. For the view put forward in the text, the following passages may be quoted: Aristotle, *Politics* 1307 b 20; Isocrates, *Panegyricus*, 105, 106, *Panathenaicus*, 54 and *68*; Xenophon, *Hellenica*, iii. 4.7; Ps.-Xen. *Athen. Constit.* i. *14*, iii. 10.

[1] The evidence seems to indicate that all the more important criminal cases throughout the empire were tried in the Athenian courts. In civil cases Athens secured to the citizens of the subject-states the right of suing Athenian citizens, as well as citizens of other subject-states

Pericles. The lot had been substituted for election a generation earlier (487 B.C.)[1]. What is perhaps the most important of all these changes, the rise of the demagogues, belongs to the era of the Peloponnesian War. From the time of Cleisthenes to the outbreak of the war every statesman of note at Athens, with the exception of Themistocles (and, perhaps, of Ephialtes), is of aristocratic birth. Down to the fall of Cimon the course of Athenian politics is to a great extent determined by the alliances and antipathies of the great clans. With the Peloponnesian War a new epoch begins. The chief office, the strategin, is still as a rule held by men of rank. But leadership in the ecclesia has passed to men of a different class. The demagogues were not necessarily poor men. Cleon was a wealthy man; Eucrates, Lysicles and Hyperbolus were, at any rate, tradesmen rather than artisans. The first "labour member" proper is Cleophon (411–404 B.C.), a lyre-maker. They belonged, however, not to the land-owning, but to the industrial classes; they were distinguished from the older race of party-leaders by a vulgar accent, and by a violence of gesture in public speaking, and they found their supporters among the population of the city and its port, the Peiraeus, rather than among the farmers of the country districts. In the 4th century the demagogues, though under another name, that of orators, have acquired entire control of the ecclesia. It is an age of professionalism, and the professional soldier has his counterpart in the professional politician. Down to the death of Pericles the party-leader had always held office as strategos. His rival, Thucydides, son of Melesias, forms a solitary exception to this statement. In the 4th century the divorce between the general and the statesman is complete. The generals are professional soldiers, who aspire to no political influence in the state, and the statesmen devote themselves exclusively to politics, a career for which they have prepared themselves by a professional training in oratory or administrative work. The ruin of agriculture during the war had reduced the old families to insignificance. Birth counts for less than nothing as a political asset in the age of Demosthenes.

The City State.—But great as are the contrasts which have been pointed out between the earlier and the later democracy, those that distinguish the ancient conception of democracy from the modern are of a still more essential nature. The differences that distinguish the democracies of ancient Greece from those of the modern world have their origin, to a great extent, in the difference between a city-state and a nation-state. Many of the most famous Greek states had an area of a few square miles; the largest of them was no larger than an English county. Political theory put the limit of the citizen-body at 10,000. Though this number was exceeded in a few cases, it is doubtful if any state, except Athens, ever counted more than 20,000 citizens. In the nation-states of modern times, democratic government is possible only under the form of a representative system; in the city-state representative government was unnecessary, and therefore unknown. In the ancient type of democracy a popular chamber has no existence. The ecclesia is not a chamber in any sense of the term; it is an assembly of the whole people, which every citizen is entitled to attend, and in which every one is equally entitled to vote and speak. The question raised in modern political science, as to whether sovereignty resides in the electors or their representatives, has thus neither place nor meaning in ancient theory. In the same way, one of the most familiar results of modern analysis, the distinction between the executive and the legislative, finds no recognition in the Greek writers. In a direct system of government there can be no executive in the proper sense. Executive functions are discharged by the ecclesia, to whose decision the details of administration may be referred. The position of the strategoi, the chief officials in the Athenian democracy of the 5th century, was in no sense comparable to that of a modern cabinet. Hence the individual citizen in an ancient democracy was concerned in, and responsible for, the actual work of government to a degree that is inconceivable in a modern state. Thus participation in the administrative and judicial business of the state is made by Aristotle the criterion of the citizen (πολίτης ἐστὶν ὁ μετέχων κρίσεως καὶ ἀρχῆς, Aristot. Politics, p. 1275 a 20). A large proportion of the citizens of Athens, in addition to frequent service in the courts of law, must in the course of their lives have held a magistracy, great or small, or have acted for a year or two as members of the boulē.[1] There was nothing corresponding to a permanent civil service in the ancient state. Much of the work of a government office would have been transacted by the Athenian boulē. Political and administrative questions of great importance came before the popular courts of law. Hence the ordinary citizen of an ancient democracy, in the course of his service in the boulē or the law-courts, acquired an interest in political questions, and a grasp of administrative work, which none but a select few can hope to acquire under the conditions of the modern system. Where there existed neither a popular chamber nor a distinct executive, there was no opportunity for the growth of a party-system. There were, of course, political parties at Athens and elsewhere—oligarchs and democrats, conservatives and radicals, a peace-party and a war-party, according to the burning question of the day. There was, however, nothing equivalent to a general election, to a cabinet (or to that collective responsibility which is of the essence of a cabinet), or to the government and the opposition. Party organization, therefore, and a party system, in the proper sense, were never developed. The evils incident to the ancient form of democracy do not include the "boss," the caucus and the spoils-system.

Ancient Democracy and Privilege.—Besides these differences, which, directly or indirectly, result from the difference of scale, there are others, hardly less profound, which are not connected with the size of the city-state. Perhaps the most striking contrast between the democracies of ancient and of modern times is to be found in their attitude towards privilege. Ancient democracy implies privilege; modern democracy implies its destruction. In the more fully developed democracies of the modern world (*e.g.*, in the United States, or in Australia), the privilege of class is unknown; in many of them even the privilege of sex has been abolished. Ancient democracy was bound up with privilege as much as oligarchy was. The transition from the latter to the former was effected by enlarging the area of privilege and by altering its basis. In an oligarchical state citizenship might be confined to 10% of the free population; under a democracy 50% might enjoy it. In the former case the qualification might be wealth or land; in the latter case it might be, as it was at Athens, birth, *i.e.*, descent, on both sides, from a citizen family. But, in both cases alike, the distinction between a privileged and an unprivileged body of free-born residents is fundamental. To the unprivileged class belonged, not only foreigners temporarily resident (xenoi) and aliens permanently domiciled (metoikoi), but also those native-born inhabitants of the state who were of foreign extraction, on one side or the other[2]. The privileges attaching to citizenship included, in addition to eligibility for office and a vote in the assembly, such private rights as that of owning land or a house, or of contracting a marriage with one of citizen status. The citizen, too, was alone the recipient of all the various forms of pay (*e.g.*, for attendance in the assembly, for service in the boulē or the law-courts, or for the celebration of the great festivals) which are so conspicuous a feature in the developed democracy of the 4th century. The metoikoi could not even plead in a court of law in person, but only through a patron (προστάτης). It is intelligible that privileges so great should be jealously guarded. In the democracies of the modern world naturalization is comparatively easy; in those of ancient Greece admission to the franchise was rarely accorded. In modern times, again, we are accustomed to connect democracy with the emancipation of women. It is true that not all democratic constitutions grant them the suffrage; but although they may be denied public

[1] After this date, and partly in consequence of the change, the archonship, to which the lot was applied, loses its importance. The *strategoi* (generals) become the chief executive officials. As the lot was never substituted for election in their case, the change had less practical meaning than might appear at first sight. (See ARCHON; STRATEGUS.)

[1] For an estimate of the numbers annually engaged in the service of Athens, *see* Aristot. *Ath. Pol.* 24.3.

[2] Foreign is not used here as equivalent to non-Hellenic. It means "belonging to another state, whether Greek or barbarian."

rights, the growth of popular government has been almost everywhere accompanied by an extension of their private rights, and by the removal of the restrictions imposed by law, custom or public opinion upon their freedom of action. In ancient Greece the democracies were as illiberal in their policy as the oligarchies. Women of the respectable class were condemned to comparative seclusion. They enjoyed far less freedom in 4th-century Athens than in the Homeric Age. It is not in any of the democracies, but in conservative Sparta that they possess privilege and exercise influence.

Slavery. — The most fundamental of all the contrasts between democracy in its ancient and in its modern form remains to be stated. The ancient state was inseparable from slavery. In this respect there was no difference between democracy and the other forms of government. No inconsistency was felt, therefore, between this institution and the democratic principle. Modern political theory has been profoundly affected by the conception of the dignity of labour; ancient political theory tended to regard labour as a disqualification for the exercise of political rights. Where slavery exists, the taint of it will inevitably cling to all labour that can be performed by the slave. In ancient Athens (which may be taken as typical of the Greek democracies) unskilled labour was almost entirely slave-labour, and skilled labour was largely so. The arts and crafts were, to some extent, exercised by citizens, but to a less extent in the 4th than in the 6th century. They were, however, chiefly left to aliens or slaves. The citizen-body of Athens in the age of Demosthenes has been stigmatized as consisting in great measure of salaried paupers. There is, doubtless. an exaggeration in this. It is, however, true, both that the system of state-pay went a long way towards supplying the simple wants of a southern population, and that a large proportion of the citizens had time to spare for the service of the state. Had the life of the lower class of citizens been absorbed in a round of mechanical labours, as fully as is the life of our industrial classes, the working of an ancient democracy would have been impossible. In justice to the ancient democracies it must be conceded that, while popular government carried with it neither the enfranchisement of the alien nor the emancipation of the slave, the rights secured to both classes were more considerable in the democratic states than elsewhere. The lot of the slave, as well as that of the alien, was a peculiarly favourable one at Athens. The pseudo-Xenophon in the 5th century (*De rep. Ath.* 1. 10–12) and Plato in the 4th (*Republic*, p. 563.B), prove that the spirit of liberty with which Athenian life was permeated, was not without its influence upon the position of these classes. When we read that critics complained of the opulence of slaves, and of the liberties they took, and when we are told that the slave could not be distinguished from the poorer class of citizens either by his dress or his look, we begin to realize the difference between the slavery of ancient Athens and the system as it was worked on the Roman *latifundia* or the plantations of the New World.

The Spartan Empire. — It had been anticipated that the fall of Athens would mean the triumph of the principle of autonomy. If Athens had surrendered within a year or so of the Sicilian catastrophe, this snticipation would probably have been fulfilled. It was the last phase of the struggle (412–404 B C) that rendered a Spartan empire inevitable. The oligarchical governments established by Lysander recognized that their tenure of power was dependent upon Spartan support. while Lysander himself, to whose genius, as a political organizer not less than as a commander, the triumph of Sparta was due, was unwilling to see his work undone. The Athenian empire had never included the greater part of Greece proper; since the Thirty Years' Peace its possessions on the mainland, outside the boundaries of Attica, were limited to Naupactus and Plataea. Sparta, on the other hand, attempted the control of the entire Greek world east of the Adriatic. Athens had been compelled to acknowledge a dual system; Sparta sought to establish uniformity. The attempt failed from the first. Within a year of the surrender of Athens, Thebes and Corinth had drifted into an attitude of opposition, while Argos remained hostile. It was not long before the policy of Lysander succeeded in uniting against Sparta the very forces upon which she had relied when she entered on the Peloponnesian War. The Corinthian War (394–387 B.C.) was brought about by the alliance of all the second-class powers — Thebes, Athens, Corinth, Argos — against the one first-class power, Sparta. Though Sparta emerged successful from the war, it was with the loss of her maritime empire, and at the cost of recognizing the principle of autonomy as the basis of the Greek political system. It was already evident, thus early in the century, that the centrifugal forces were to prove stronger than the centripetal. Two further causes may be indicated which help to explain the failure of the Spartan Empire. In the first place Spartan sea-power was an artificial creation. History seems to show that it is idle for a state to aspire to naval supremacy unless it possesses a great commercial marine. Athens had possessed such a marine; her naval supremacy was due not to the mere size of her fleet, but to the numbers and skill of her seafaring population. Sparta had no commerce. She could build fleets more easily than she could man them. A single defeat (at Cnidus, 394 B.C.) sufficed for the ruin of her sea-power. The second cause is to be found in the financial weakness of the Spsrtan state. The Spartan treasury had been temporarily enriched by the spoils of the Peloponnesian War, but neither during that war, nor afterwards, did Sparta succeed in developing any scientific financial system. Athens was the only state which either possessed a large annual revenue or accumulated a considerable reserve. Under the conditions of Greek warfare, fleets were more expensive than armies. Not only was money needed for the building and maintenance of the ships, but the sailor must be paid, while the soldiers served for nothing. Hence the power with the longest purse could both build the largest fleet and attract the most skilful seamen.

The **Theban** Hegemony. — The battle of Leuctra transferred the hegemony from Sparta to Thebes, but the attempt to unite Greece under the leadership of Thebes was from the first doomed to failure. The conditions were less favourable to Thebes than they had been to Athens or Sparta. Thebes was even more exclusively a land-power than Sparta. She had no revenue comparable to that of Athens in the preceding century. Unlike Athens and Sparta, she had not the advantage of being identified with a political cause. As the enemy of Athens in the 5th century, she was on the side of oligarchy; as the rival of Sparta in the 4th, she was on the side of democracy; but in her bid for primacy she could not appeal, as Athens and Sparta could, to a great political tradition, nor had she behind her, as they had, the moral force of a great political principle. Her position, too, in Boeotia itself was insecure. The rise of Athens was in great measure the result of the *synoecism* (συνοικισμός) of Attica. All inhabitants of Attica were Athenians. But "Boeotian" and "Theban" were not synonymous terms. The Boeotian league was an imperfect form of union, as compared with the Athenian state, and the claim of Thebes to the presidency of the league was, at best, sullenly acquiesced in by the other towns. The destruction of some of the most famous of the Boeotian cities, however necessary it may have been in order to unite the country, was a measure which at once impaired the resources of Thebes and outraged Greek sentiment. It has been often held that the failure of Theban policy was due to the death of Epameinondas (at the battle of Mantineia, 362 B.C.). For this view there is no justification. His policy had proved a failure before his death. Where it harmonized with the spirit of the age, the spirit of dissidence, it succeeded; where it attempted to run counter to it, it failed. It succeeded in destroying the supremacy of Sparta in the Peloponnese; it failed to unite the Peloponnese on a new basis. It failed still more signally to unite Greece north of the Isthmus. It left Greece weaker and more divided than it found it (see the concluding words of Xenophon's Hellenica). It would be difficult to overestimate the importance of his policy as a destructive force; as a constructive force it effected nothing*. The Peloponnesian system which Epameinondas overthrew had lasted two hundred years. Under Spartan leadership the Peloponnese had enjoyed almost complete immunity from invasion and compar-

[1]It failed even to create a united Arcadia or a strong Messenia.

ative immunity from *stasis* (faction). The claim that Isocrates makes for Sparta is probably well-founded (Archidamus, 64–69; during the period of Spartan ascendancy the Peloponnesians were "the happiest of the Greeks"). Peloponnesian sentiment had been one of the chief factors in Greek politics; to it, indeed, in no small degree was due the victory over Persia. The Theban victory at Leuctra destroyed the unity, and with it the peace and the prosperity, of the Peloponnese. It inaugurated a period of misery, the natural result of civil strife and invasion, to which no parallel can be found in the earlier history (see Isocrates, Archidamus, 65, 66). It destroyed, too, the Peloponnesian sentiment of hostility to the invader. The bulk of the army that defeated Mardonius at Plataea came from the Peloponnese; at Chaeronea no Peloponnesian state was represented.

(6) THE RISE OF MACEDON AND ALEXANDER THE GREAT

The question remains, Why did the city-state fail to save Greece from conquest by Macedon? Was this result due to the inherent weakness either of the city-state itself, or of one particular form of it, democracy? It is clear, in any case, that the triumph of Macedon was the effect of causes which had long been at work. If neither Philip nor Alexander had appeared on the scene, Greece might have maintained her independence for another generation or two; but, when invasion came, it would have found her weaker and more distracted, and the conquerors might easily have been less imbued with the Greek spirit, and less sympathetic to Greek ideals, than the great Macedonian and his son. These causes are to be found in the tendencies of the age, political, economic and moral. Of the two movements which characterized the Great Age in its political aspect, the imperial and the democratic, the one failed and the other succeeded. The failure and the success were equally fatal to the chances of Greece in the conflict with Macedon. By the middle of the 4th century Greek politics had come to be dominated by the theory of the balance of power. This theory, enunciated in its coarsest form by Demosthenes, had shaped the foreign policy of Athens since the end of the Peloponnesian War. As long as Sparta was the stronger, Athens inclined to a Theban alliance; after Leuctra she tended in the direction of a Spartan one. At the epoch of Philip's accession the forces were everywhere nicely balanced. The Peloponnese was fairly equally divided between the Theban and the Spartan interests, and central Greece was similarly divided between the Theban and the Athenian. Farther north we get an Athenian party opposed to an Olynthian in Chalcidice, and a republican party, dependent upon the support of Thebes, opposed to that of the tyrants in Thessaly. Thus the political conditions of Greece, both in the north and in the south, invited interference from without. And the triumph of democracy in its extreme form was ruinous to the military efficiency of Greece. On the one side there was a monarchical state, in which all powers, civil as well as military, were concentrated in the hands of a single ruler; on the other, a constitutional system, in which a complete separation had been effected between the responsibility of the statesman and that of the commander.

The Causes of Decline. — It could not be doubtful with which side the victory would rest. The cause which Aristotle assigns for the decay of the Spartan state — a declining population (see Politics, p. 1270 a) — might be extended to the Greek world generally. The loss of population was partly the result of war and civil strife — Isocrates speaks of the number of political exiles from the various states as enormous — but it was also due to a declining birth-rate, and to the exposure of infants. Aristotle, while condemning exposure, sanctions the procuring of abortion (Politics, 1335 b). It is probable that both ante-natal and post-natal infanticide were rife everywhere, except among the more backward communities. The materials for forming a trustworthy estimate of the populadon of Greece at any given epoch are not available; there is evidence to prove that the military population of the leading Greek states at the era of the battle of Chaeroneia (338 B.C.) fell far short of what it had been at the beginning of the Peloponnesian War. The decline in population had been accompanied by a decline in wealth, both public and private; and while revenues had shrunk, expenditure had grown. It was a century of warfare; and warfare had become enormously more expensive, partly through the increased employment of mercenaries, partly through the enhanced cost of material. The power of the purse had made itself felt even in the 5th century; Persian gold had helped to decide the issue of the great war. In the politics of the 4th century the power of the purse becomes the determining factor. The public finance of the ancient world was singularly simple in character, and the expedients for raising a revenue were comparatively few. The distinction between direct and indirect taxation was recognized in practice, but states as a rule were reluctant to submit to the former system. The revenue of Athens in the 5th century was mainly derived from the tribute paid by her subjects; it was only in time of war that a direct tax was levied upon the citizen-body. In the age of Demosthenes the revenue derived from the Athenian Confederacy was insignificant. The whole burden of the expenses of a war fell upon the 1,200 richest citizens, who were subject to direct taxation in the dual form of the Trierarchy and the *Eisphora* (property-tax). The revenue thus raised was wholly insufficient for an effort on a great scale; yet the revenues of Athens at this period must have exceeded those of any other state.

Venality and Corruption. — The economic history of Greece is discussed in a subsequent article. But it is to moral rather than to political or economic causes that the failure of Greece in the conflict with Macedon is attributed by the most famous Greek statesmen of that age. Demosthenes is never weary of insisting upon the decay of patriotism among the citizens and upon the decay of probity among their leaders. Venality had always been the besetting sin of Greek statesmen. Pericles' boast as to his own incorruptibility (Thuc. ii. 60) is significant as to the reputation of his contemporaries. In the age of Demosthenes the level of public life in this respect had sunk at least as low as that which prevails in many states of the modern world. Corruption was certainly not confined to the Macedonian party. The best that can be said in defence of the patriots, as well as of their opponents, is that they honestly believed that the policy which they were bribed to advocate was the best for their country's interests. The evidence for the general decay of patriotism among the mass of the citizens is less conclusive. The battle of Megalopolis (331 B.C.), in which the Spartan soldiery "went down in a blaze of glory," proves that the spirit of the Lacedaemonian state remained unchanged. But at Athens it seemed to contemporary observers — to Isocrates equally with Demosthenes — that the spirit of the great days was extinct (see Isocr. On the Peace, 47.48). It cannot, of course, be denied that public opinion was obstinately opposed to the diversion of the Theoric Fund to the purposes of the war with Philip. It was not till the year before Chaeroneia that Demosthenes succeeded in persuading the assembly to devote the entire surplus to the expenses of the war. Nor can it be denied that mercenaries were far more largely employed in the 4th century than in the 5th. In justice, however, to the Athenians of the Demosthenic era, it should be remembered that the burden of direct taxation was rarely imposed, and was reluctantly endured, in the previous century. It must also be remembered that, even in the 4th century, the Athenian citizen was ready to take the field, provided that it was not a question of a distant expedition or of prolonged service. In the two expeditions sent to Euboea, the cavalry force that took part in the battle of Mantineia, and the army that fought at Chaeroneia, the troops were citizens. For distant expeditions, or for prolonged service, a citizen-militia is unsuited. The substitution of a professional for an unprofessional force is explained, partly by the change in the character of Greek warfare, and partly by the operation of the laws of supply and demand. There was a time when warfare meant a brief campaign in the summer months against a neighbouring state. It came to mean prolonged operations against a distant enemy. Athens was at war, *e.g.*, with Philip, for eleven years continuously (357–346 B.C.). If winter campaigns in Thrace were unpopular at this epoch, they were hardly less unpopular in the epoch of the Peloponnesian War. In the days of her greatness, too, Athens

freely employed mercenaries, but in the navy rather than the army. In the age of Pericles the supply of mercenary rowers was abundant, the supply of mercenary troops inconsiderable. In the age of Demosthenes incessant warfare and ceaseless revolution had filled Greece with crowds of homeless adventurers. The supply helped to create the demand. The mercenary was as cheap as the citizen-soldier, and much more effective. On the whole, then, it is a mistake to regard the prevalence of the mercenary system as the expression of a declining patriotism. It would be nearer the mark to treat the transition from the voluntary to the professional system as cause rather than effect: as one among the causes which contributed to the decay of public spirit in the Greek world.

(7) ALEXANDER TO THE ROMAN CONQUEST (336–146 B.C.)

Federal Government. — In the history of Greece proper during this period the interest is mainly constitutional. It may be called the age of federation. Federation, indeed, was no novelty in Greece. Federal unions had existed in Thessaly, in Boeotia and elsewhere, and the Boeotian league can be traced back at least to the 6th century Two newly-founded federations, the Chalcidian and the Arcadian, play no inconsiderable part in the politics of the 4th century. But it is not till the 3rd century that federation attains to its full development in Greece, and becomes the normal type of polity. The two great leagues of this period are the Aetolian and the Achaean. Both existed in the 4th century, but the latter, which was dissolved shortly before the beginning of the 3rd century, becomes important only after its restoration in 280 **B.c.**, about which date the former, too, first begins to attract notice. The interest of federalism lies in the fact that it marks an advance beyond the conception of the city-state. It is an attempt to solve the problem which the Athenian empire failed to solve, the reconciliation of the claims of local autonomy with those of national union. The federal leagues of the 3rd century possess a further interest for the modern world, in that there can be traced in their constitutions a nearer approach to a representative system than is found elsewhere in Greek experience. A genuine representative system, it is true, was never developed in any Greek polity. What we find in the leagues is a sort of compromise between the principle of a primary assembly and the principle of a representative chamber. In both leagues the nominal sovereign was a primary assembly, in which every individual citizen had the right to vote. In both of them, however, the real power lay with a council (*boulē*) composed of members representative of each of the component states[1].

Alexander's Empire. — The real interest of this period, however, is to be looked for elsewhere than in Greece itself. Alexander's career is one of the turning-points in history. He is one of the few to whom it has been given to modify the whole future of the human race. He originated two forces which have profoundly affected the development of civilization. He created Hellenism (*q.v.*), and he created for the western world the monarchical ideal. Greece had produced personal rulers of ability, or even of genius; but to the greatest of these, to Peisistratus, to Dionysius, even to Jason of Pherae, there clung the fatal taint of illegitimacy. As yet no ruler had succeeded in making the person of the monarch respectable. Alexander made it sacred. From him is derived, for the West, that "divinity that doth hedge a king." And in creating Hellenism he created, for the first time, a common type of civilization, with a common language, literature and art, as well as a common form of political organization. In Asia Minor he was content to reinforce the existing Hellenic elements (cf. the case of Side, Arrian, *Anabasis,* i. 26.4). In the rest of the East his instrument of hellenization was the *polis*. He is said to have founded no less than seventy cities, destined to become centres of Greek influence, the great majority in lands in which city-life was almost unknown. In this respect his example was emulated by his successors. The eastern provinces were soon lost, though Greek influences lingered on even in Bactria and across the Indus. It was only the regions lying to the west of the Euphrates that were effectively hellenized, and the permanence of this result was largely due to the policy of Rome. But, after all deductions have been made, the great fact remains that for many centuries after Alexander's death Greek was the language of literature and religion, of commerce and of administration throughout the Nearer East. Alexander created a universal empire as well as a universal culture. His empire perished at his death, but its central idea survived — that of the municipal freedom of the Greek *polis* within the framework of an imperial system. Hellenistic civilization may appear degenerate when compared with Hellenic; when compared with the civilizations which it superseded in non-Hellenic lands, it marks an unquestionable advance. Greece left her mark upon the civilization of the West as well as upon that of the East, but the process by which her influence was diffused was essentially different. In the East Hellenism came in the train of the conqueror, and Rome was content to build upon the foundations laid by Alexander. In the West Greek influences were diffused by the Roman conquest of Greece. It was through the ascendancy which Greek literature, philosophy and art acquired over the Roman mind that Greek culture penetrated to the nations of western Europe. The civilization of the East remained Greek. The civilization of the West became and remained Latin, but it was a Latin civilization that was saturated with Greek influences. The ultimate division, both of the empire and the church, into two halves, finds its explanation in this original difference of culture. (See HELLENISM and MACEDONIAN EMPIRE.)

[1] It is known that the councillors were appointed by the states in the Aetolian League; it is only surmised in the case of the Achaean.

(8) ANCIENT AUTHORITIES

I. Earliest Period. — For the earliest periods of Greek history, the so-called Minoan and Mycenaean, the evidence is purely archaeological. It is sufficient here to refer to the article AEGEAN CIVILIZATION. For the next period, the Heroic or Homeric Age, the evidence is derived from the poems of Homer. In any estimate of the value of these poems as historical evidence, much will depend upon the view taken of the authorship, age and unity of the poems. For a full discussion of these questions see HOMER.

II. To End of Fifth Century **B.C.**—For the period that extends from the end of the Heroic Age to the end of the Peloponnesian War[1] the two principal authorities are Herodotus and Thucydides. Not only have the other historical works which treated of this period perished (those at least whose date is earlier than the Christian era), but their authority was secondary and their material chiefly derived from these two writers. In one respect then this period of Greek history stands alone. Indeed, it might be said, with hardly an exaggeration, that there is nothing like it elsewhere in history. Almost our sole authorities are two writers of unique genius, and they are writers whose works have come down to us intact. For the period which ends with the repulse of the Persian invasion our authority is Herodotus. For the period which extends from 478 to 411 we are dependent upon Thucydides. In each case, however, a distinction must be drawn. The Persian Wars form the proper subject of Herodotus; the Peloponnesian War is the subject of Thucydides. The interval between the two wars is merely sketched by Thucydides; while of the period anterior to the conflicts of the Greek with the Persian, Herodotus does not attempt either a complete or a continuous narrative. His references to it are episodical and accidental. Hence our knowledge of the Persian Wars and of the Peloponnesian War is widely different in character from our knowledge of the rest of this period. In the history of these wars the lacunae are few; in the rest of the history they are alike frequent and serious. In the history, therefore, of the Persian and Peloponnesian Wars little is to be learnt from the secondary sources. Elsewhere, especially in the interval between the two wars, they become relatively important.

Herodotus. — In estimating the authority of Herodotus (*q.v.*) we must distinguish between the invasion of Xerxes and all that is earlier. Herodotus' work was published soon after 430 B.C., *i.e.*, about half a century after the invasion. Much of his infor-

[1] Strictly speaking, to 411 B.C. For the last seven years of the war our principal authority is Xenophon, *Hellenica,* i., ii.

mation was gathered in the course of the preceding twenty years. Although his evidence is not that of an eye-witness, he had had opportunities of meeting those who had themselves played a part in the war, on one side or the other (*e.g.*, Thersander of Orchomenos, ix. 16). In any case, we are dealing with a tradition which is little more than a generation old, and the events to which the tradition relates, the incidents of the struggle against Xerxes, were of a nature to impress themselves indelibly upon the minds of contemporaries. Where, on the other hand, he is treating of the period anterior to the invasion of Xerxes, he is dependent upon a tradition which is never less than two generations old, and is sometimes centuries old. His informants were, at best, the sons or grandsons of the actors in the wars (*e.g.*, Archias the Spartan. iii. 55). Moreover, the invasion of Xerxes, entailing, as it did, the destruction of cities and sanctuaries, especially of Athens and its temples, marks a dividing line in Greek history. It was not merely that evidence perished and records were destroyed. What, in reference to tradition, is even more important, a new consciousness of power was awakened, new interests were aroused, and new questions and problems came to the front. The former things had passed away; all things were become new. A generation that is occupied with making history on a great scale is not likely to busy itself with the history of the past. Consequently, the earlier traditions became faint and obscured, and the history difficult to reconstruct. As we trace back the conflict between Greece and Persia to its beginnings and antecedents, we are conscious that the tradition becomes less trustworthy as we pass back from one stage to another. The tradition of the expedition of Datis and Artaphernes is less credible in its details than that of the expedition of Xerxes, but it is at once fuller and more credible than the tradition of the Ionian revolt. When we get back to the Scythian expedition, we can discover but few grains of historical truth.

The criticism of Herodotus as an historian begins with Thucydides. Perhaps the two clearest examples of this criticism are to be found in Thucydides' correction of Herodotus' account of the Cylonian conspiracy (Thuc. i. 126, cf. Herod. v. 71) and in his appreciation of the character of Themistocles—a veiled protest against the slanderous tales accepted by Herodotus (i. 138). In Plutarch's tract "On the Ill-nature of Herodotus" there is much that is suggestive, although his general standpoint, viz., that Herodotus was in duty bound to suppress all that was discreditable to the valour or patriotism of the Greeks, is not that of the modern critic. It must be conceded to Plutarch that he makes good his charge of bias in Herodotus' attitude towards certain of the Greek states. The question, however, may fairly be asked, how far this bias is personal to the author, or how far it is due to the character of the sources from which his information was derived. He cannot, indeed, altogether be acquitted of personal bias. His work is, to some extent, intended as an *apologia* for the Athenian empire. In answer to the charge that Athens was guilty of robbing other Greek states of their freedom, Herodotus seeks to show, firstly, that it was to Athens that the Greek world, as a whole, owed its freedom from Persia, and secondly, that the subjects of Athens, the Ionian Greeks, were unworthy to be free. This leads him to be unjust both to the services of Sparta and to the qualities of the Ionian race. As a rule, however, the bias apparent in his narrative is due to the sources from which it is derived. Writing at Athens, in the first years of the Peloponnesian War. he can hardly help seeing the past through an Athenian medium. It was inevitable that much of what he heard should come to him from Athenian informants, and should be coloured by Athenian prejudices. We may thus explain the leniency which he shows towards Argos and Thessaly, the old allies of Athens, in marked contrast to his treatment of Thebes, Corinth and Aegina, her deadliest foes. In his intimacy with members of the great Alcmaeonid house we probably have the explanation of his depreciation of the services of Themistocles, as well as of his defence of the family from the charges brought against it in connection with Cylon and with the incident of the shield shown on Pentelicus at the time of Marathon (v. 71, vi. 121–124). His failure to do justice to the Cypselid tyrants of Corinth (v. 92), and to the Spartan king, Cleomenes, is to be accounted for by the nature of his sources—in the former case, the tradition of the Corinthian oligarchy; in the latter, accounts, partly derived from the family of the exiled king Demaratus and partly representative of the view of the ephorate. Much of the earlier history is cast in a religious mould, e g., the story of the Mermnad kings of Lydia in book i., or of the fortunes of the colony of Cyrene (iv. 145–167). In such cases we cannot fail to recognize the influence of the Delphic priesthood. The moralizing tendency observable in Herodotus is partly to be explained by the fact that much of his information was gathered from priests and at temples, and was given in explanation of votive offerings, or of the fulfilment of oracles. Hence the determination of the sources of his narrative has become one of the principal tasks of Herodotean criticism. In addition to the current tradition of Athens, the family tradition of the Alcmaeonidae, and the stories to be heard at Delphi and other sanctuaries, there may be indicated the Spartan tradition, in the form in which it existed in the middle of the 5th century; that of his native Halicarnassus, to which is due the prominence of its queen Artemisia; the traditions of the Ionian cities, especially of Samos and Miletus (important both for the history of the Mermnadae and for the Ionian Revolt); and those current in Sicily and Magna Graecia, which were learned during his residence at Thurii (Sybaris and Croton, v. 44, 45; Syracuse and Gela, vii. 153–167). Among his more special sources we can point to the descendants of Demaratus, who still held, at the beginning of the 4th century, the principality in the Troad which had been granted to their ancestor by Darius (Xen. Hell. iii. 1.6), and to the family of the Persian general Artabazus, in which the satrapy of Dascylium (Phrygia) was hereditary in the 5th century. Possibly some of his information about Persian affairs may have been derived, at first or second hand, from Zopyrus, son of Megabyzus, whose flight to Athens is mentioned in iii. 160.

His use of written material is more difficult to determine. It is generally agreed that the list of Persian satrapies, with their respective assessments of tribute (iii. 89–97), the description of the royal road from Sardis to Susa (v. 52–54), and of the march of Xerxes, together with the list of the contingents that took part in the expedition (vii. 26–131), are all derived from documentary and authoritative sources. From previous writers (*e.g.*, Dionysius of Miletus, Hecataeus, Charon of Lampsacus and Xanthus the Lydian) it is probable that he has borrowed little, though the fragments are too scanty to permit of adequate comparison. His references to monuments, dedicatory offerings, inscriptions and oracles are frequent.

The chief defects of Herodotus are his failure to grasp the principles of historical criticism, to understand the nature of military operations, and to appreciate the importance of chronology. In place of historical criticism we find a crude rationalism (*e.g.*, ii. 45, vii. 129, viii. 8). Having no conception of the distinction between occasion and cause, he is content to find the explanation of great historical movements in trivial incidents or personal motives. Thus, in his account of the Ionian revolt, he fails to discover the real causes either of the movement or of its result. Indeed, it is clear that he regarded criticism as no part of his task as an historian. Again and again he gives two or more versions of a story. We are thus frequently enabled to arrive at the truth by a comparison of the discrepant traditions. It would have been fortunate if all ancient writers who lacked the critical genius of Thucydides had been content to adopt the practice of Herodotus. His accounts of battles are always unsatisfactory. The great battles, Marathon, Thermopylae, Salamis and Plataea, present a series of problems. This result is partly due to the character of the traditions which he follows—traditions which were to some. extent inconsistent or contradictory, and were derived from different sources; it is, however, in great measure due to his inability to think out a strategical combination or a tactical movement. The battle of Plataea, as described by Herodotus, is wholly unintelligible. Most serious of all his deficiencies is his careless chronology. Even for the 5th century, the data which he affords are inadequate or ambiguous The interval between the Scythian expedition and the Ionian revolt is described by a vague expres-

sion. In the history of the revolt itself though he gives us the interval between its outbreak and the fall of Miletus, he does not give us the interval between this and the battle of Lade, nor does he indicate with sufficient precision the years to which the successive phases of the movement belong. Throughout the work professed synchronisms too often prove to be mere literary devices for facilitating a transition from one subject to another. In the 6th century a whole generation, or more, disappears in his historical perspective. The attempts to reconstruct the chronology of this century upon the basis of the data afforded by Herodotus have completely failed.

In spite of all such defects Herodotus is an author, not only of unrivalled literary charm, but of the utmost value to the historian. If much remains uncertain or obscure, even in the history of the Persian Wars, it is chiefly to motives or policy, to topography or strategy, to dates or numbers, that uncertainty attaches. It is to these that a sober criticism will confine itself.

Thucydides.—Thucydides (*q.v.*) is at once the father of contemporary history and the father of historical criticism. From a comparison of i. 1, i. 22 and v. 26, we may gather both the principles to which he adhered in the composition of his work and the conditions under which it was composed. It is seldom that the circumstances of an historical writer have been so favourable for the accomplishment of his task. Thucydides was a contemporary, in the fullest sense of the term, of the Twenty-Seven Years' War. He had reached manhood at its outbreak, and he survived its close by at least half-a-dozen years. And he was more than a mere contemporary. As a man of high birth, a member of the Periclean circle, and the holder of the chief political office in the Athenian state. the strategia, he was not only familiar with the business of administration and the conduct of military operations, but he possessed in addition a personal knowledge of those who played the principal part in the political life of the age. His exile in the year 424 afforded him opportunities of visiting the scenes of distant operations (*e.g.*, Sicily), and of coming in contact with the actors on the other side. He spared no pains to obtain the best information available in each case. He began collecting materials for his work from the very beginning of the war. Indeed, it is probable that much of books i.–v. 24 was written soon after the Peace of Nicias (421), just as it is possible that the history of the Sicilian expedition (books vi. and vii.) was originally intended to form a separate work. The work, as a whole, appears to have been composed in the first years of the 4th century, after his return from exile in 404, when the material already in existence must have been revised and largely recast. There are exceedingly few passages which seem to have been overlooked in the process of revision. The impression left upon the reader's mind is that the point of view of the author, in all the books alike, is that of one writing after the fall of Athens.

The task of historical criticism in the case of the Peloponnesian War is widely different from its task in the case of the Persian Wars. It has to deal, not with facts as they appear in the traditions of an imaginative race, but with facts as they appeared to a scientific observer. Facts, indeed, are seldom in dispute The question is rather whether facts of importance are omitted, whether the explanation of causes is correct, or whether the judgment of men and measures is just. Such inaccuracies as have been brought home to Thucydides on the strength, *e.g.*, of epigraphic evidence, are, as a rule, trivial. His most serious errors relate to topographical details in regard to which he was dependent on the information of others. Sphacteria (see PYLOS) is a case in point. Nor have the difficulties connected with the siege of Plataea been cleared up. Where, on the contrary, he is writing at first hand his descriptions of sites are surprisingly correct. The most serious charge as yet brought against his authority as to matters of fact relates to his account of the Revolution of the Four Hundred, which seems, at first sight, to be inconsistent with the documentary evidence supplied by Aristotle's Constitution of Athens (*q.v.*). It may be questioned, however, whether the documents have been correctly interpreted by Aristotle. On the whole, it is probable that the general course of events was such as Thucydides describes, though he failed to appreciate the position of Theramenes *and* the Moderate party, and was clearly misinformed on some important points of detail. Much is omitted that would not be omitted by a modern writer. Such omissions are generally due to the author's conception of his task. Thus the internal history of Athens is passed over as forming no part of the history of the war. It is only where the course of the war is directly affected by the course of political events (*e.g.*, by the Revolution of the Four Hundred) that the internal history is referred to. However much it may be regretted that the relations of political parties are not more fully described, especially in book v., it cannot be denied that from his standpoint there is logical justification even for the omission of the ostracism of Hyperbolus. There are omissions, however, which are not so easily explained, as that of the raising of the tribute in 425 B.C. (see DELIAN LEAGUE).

Nowhere is the contrast between the historical methods of Herodotus and Thucydides more apparent than in the treatment of the causes of events. The distinction between the occasion and the cause is constantly present to the mind of Thucydides, and it is his tendency to make too little rather than too much of the personal factor. Sometimes, however, it may be doubted whether his explanation of the causes of an event is adequate ur correct. In tracing the causes of the Peloponnesian War itself, modern writers are disposed to allow more weight to the commercial rivalry of Corinth; while in the case of the Sicilian expedition, they would actually reverse his judgment. To us it seems that the very idea of the expedition implied a gigantic miscalculation of the resources of Athens and of the difficulty of the task. His judgments of men and of measures have been criticized by writers of different schools and from different points of view. Grote criticized his verdict upon Cleon, while he accepted his estimate of the policy of Pericles. More recent writers, on the other hand, have accepted his view of Cleon, while they have selected for attack his appreciation alike of the policy and the strategy of Pericles. He has been charged, too, with failure to do justice to the statesmanship of Alcibiades[1].

There are cases, undoubtedly, in which the balance of recent opinon will be adverse to the view of Thucydides. There are many more in which the result of criticism has been to establish his view. That he should occasionally have been mistaken in his judgment and his views is certainly no detraction from his claim to greatness.

On the whole, while the criticism of Herodotus has tended seriously to modify our view of the Persian Wars, as well as of the earlier history, the criticism of Thucydides has affected but slightly our view of the course of the Peloponnesian War. The labours of recent workers in this field have borne most fruit where they have been directed to subjects neglected by Thucydides, such as the history of political parties, or the organization of the empire.

Diodorus and **Plutarch.**—Of the secondary authorities for this period the two principal ones are Diodorus (xi. 38 to xii. 37) and Plutarch. Diodorus is of value chiefly in relation to Sicilian affairs, to which he devotes about a third of this section of his work and for which he is almost our sole authority. His source for Sicilian history is Timaeus (*q.v.*), himself a Sicilian, who wrote in the 3rd century B.C. For the history of Greece proper during the *Pentēkontaëteris* (the period between the Persian and the Peloponnesian Wars), Diodorus contributes comparatively little of importance. Isolated notices of particular events (*e.g.*, the synoecism of Elis, 471 B.C., or the foundation of Amphipolis, 437 B.C.), which appear to be derived from a chronological writer, may generally be trusted. The greater part of his narrative is, however, derived from Ephorus, who seems to have had before him little authentic information for this period of Greek history other than that afforded by Thucydides' work. Four of Plutarch's Lives are concerned with this period, viz., Themistocles, Aristeides, *Cimon,* and Pericles. From the Aristeides little can be gained. The *Cimon,* on the other hand, contains much that is valuable; such as the account of the battle of the Eurymedon (chs. 12 and 13). To the Pericles we owe several quotations from the Old Comedy.

[1] For a defence of Thucydides' judgment on all three statesmen, see E. Meyer, *Forschungen,* ii. 296–379.

Two other of the Lives, *Lycurgus* and Solon, are among our most important sources for the early history of Sparta and Athens respectively. Of the two (besides *Pericles*) which relate to the Peloponnesian War, Alcibiades adds little to what can be gained from Thucydides and Xenophon; the Nicias, on the other hand, supplements Thucydides' narrative of the Sicilian expedition with many valuable details, which, it may safely be assumed, are derived from the contemporary historian, Philistus of Syracuse. Among the most valuable material afforded by Plutarch are the quotations, which occur in almost all the Lives, from the collection of Athenian decrees formed by the Macedonian writer Craterus, in the 3rd century B.C.

The Constitutions.—Two other works may be mentioned in connection with the history of Athens. For the history of the Athenian constitution down to the end of the 5th century B.C., Aristotle's *Constitution* of Athens (*q.v.*) is our chief authority. The other Constitution of Athens, erroneously attributed to Xenophon, a tract of singular interest both on literary and historical grounds, throws a good deal of light on the internal condition of Athens, and on the system of government, both of the state and of the empire, in the age of the Peloponnesian War, during the earlier years of which it was composed.

Epigraphical Sources.—To the literary sources for the history of Greece, especially of Athens, in the 5th century B.C., must be added the epigraphic. Few historical inscriptions have been discovered which date back beyond the Persian wars. For the latter half of the 5th century they are both numerous and important. Of especial value are the series of Quota-lists, from which can be calculated the amount of tribute paid by the subject-allies of Athens from the year 454 B.C. onwards. The great majority of the inscriptions of this period are of Athenian origin. They relate, as a rule, to questions of organization, finance and administration, as to which little information is to be gained from the literary sources.

III. The 4th Century to the Death of **Alexander.**—Of the historians who flourished in the 4th century the sole writer whose works have come down to us is Xenophon. It is a singular accident of fortune that neither of the two authors, who at once were most representative of their age and did most to determine the views of Greek history current in subsequent generations, Ephorus (*q.v.*) and Theopompus (*q.v.*), should be extant. It was from them, rather than from Herodotus, Thucydides or Xenophon, that the Roman world obtained its knowledge of the history of Greece in the past, and its conception of its significance. Both were pupils of Isocrates, and both, therefore, bred up in an atmosphere of rhetoric. Hence their popularity and their influence. The scientific spirit of Thucydides was alien to the temper of the 4th century, and hardly more congenial to the age of Cicero or Tacitus. To the rhetorical spirit, which is common to both, each added defects peculiar to himself. Theopornpus is a strong partisan, a sworn foe to Athens and to democracy. Ephorus, though a military historian, is ignorant of the art of war. He is also almost incredibly careless and uncritical. Only a few fragments remain of either writer, but Theopompus was largely used by Plutarch in several of the Lives, while Ephorus continues to be the main source of Diodorus' history, as far as the outbreak of the Sacred War (Fragments of Ephorus in Miiller's Fragmenta historicorum *Graecorum,* vol. i.; of Theopompus in Hellenica Oxyrhynchia, *cum Theopompi* et *Cratippi fragmentis,* ed. B. P. Grenfell and A. S. Hunt, 1909).

Xenophon.—It may be at least claimed for Xenophon (*q.v.*) that he is free from all taint of the rhetorical spirit. As a witness, he is both honest and well-informed. But, if there is no justification for the charge of deliberate falsification, he had strong political prejudices, and his narrative has suffered from them. His historical writings are the Anabasis, an account of the expedition of the Ten Thousand, the Hellenica and the *Agesilaus,* a eulogy of the Spartan king. Of these the Hellenica is far the most important for the student of history. It consists of two distinct parts (though there is no ground for the theory that the two parts were separately written and published), books i. and ii., and books iii. to vii. The first two books are intended as a continuation of Thucydides' work. They begin, quite abruptly, in the middle of the Attic year 411/10, and they carry the history down to the fall of the Thirty, in 403. Books iii. to vii., the *Hellenica* proper, cover the period from 401 to 362, and give the histories of the Spartan and Theban hegemonies down to the death of Epameinondas. There is thus a gap of two years between the point at which the first part ends and that at which the second part begins. The two parts differ widely, both in their aim and in the arrangement of the material. In the first part Xenophon attempts, though not with complete success, to follow the chronological method of Thucydides, and to make each successive spring, when military and naval operations were resumed after the winter's interruption, the starting-point of a fresh section. The resemblance between the two writers ends, however, with the outward form of the narrative. All that is characteristic of Thucydides is absent in Xenophon. The latter writer shows neither skill in portraiture, nor insight into motives. He is deficient in the sense of proportion, and he knows nothing of the distinction between occasion and cause. Perhaps his worst fault is a lack of imagination. It was not given to Xenophon, as it was to Thucydides, to discriminate between the circumstances that are essential and those that are not essential to the comprehension of the story. In spite, therefore, of its wealth of detail, his narrative is frequently obscure. In the first two books, though there are omissions (*e.g.,* the loss of Nisaea, 409 B.C.), they are not so serious as in the last five, nor is the bias so evident. If the account of the rule of the Thirty given in Aristotle's Constitutzon *of* Athens be accepted, Xenophon must have deliberately misrepresented the course of events to the prejudice of Theramenes. But it is at least doubtful whether Aristotle's version can be sustained against Xenophon's, though there are mistakes as to details in the latter writer's narrative, and less than justice is done to the policy and motives of the "Buskin." The *Hellenica* was written, it should be remembered, at Corinth, after 362 B.C. More than forty years had thus elapsed since the events recorded in the first two books, and after so long an interval, accuracy of detail, even where the detail is of importance, is not always to be expected. In the second part the chronological method is abandoned. A subject once begun is followed out to its natural ending, so that sections of the narrative which are consecutive in order are frequently parallel in point of date. A good example of this will be found in book iv. In chapters 2 to 7, the history of the Corinthian war is carried down to the end of 390, so far as the operations on land are concerned, while chapter 8 contains an account of the naval operations from 394 to 388 B.C. In this second part of the *Hellenica* the author's disqualifications for his task are more apparent than in the first two books. The more he is acquitted of bias in his selection of events and in his omissions, the more clearly does he stand convicted of lacking all sense of the proportion of things. Down to Leuctra (371 B.C.) Sparta is the centre of interest, and it is of the Spartan state alone that a complete or continuous history is given. After Leuctra, if the point of view is no longer exclusively Spartan, the narrative of events is hardly less incomplete. Throughout the second part of the Hellenica omissions abound which it is difficult either to explain or justify. The formation of the Second Athenian Confederacy of 377 B.C., the foundation of Megalopolis and the restoration of the Messenian state are unrecorded. Yet the writer who passes them over without mention thinks it worth while to devote more than one-sixth of an entire book to a chronicle of the unimportant feats of the citizens of the petty state of Phlius. No attempt is made to appraise the policy of the great Theban leaders, Pelopidas and Epameinondas. The former, indeed, is mentioned only in a single passage, relating to the embassy to Susa in 368 B.C.; the latter does not appear on the scene till a year later, and receives mention but twice before the battle of Mantineia. An author who omits from his narrative some of the most important events of his period, and elaborates the portraiture of an Agesilaus, while not attempting the bare outline of an Epameinondas, may be honest; he may even write without a consciousness of bias; he certainly cannot rank among the great writers of history.

Diodorus.—For the history of the 4th century Diodorus assumes a higher degree of importance than belongs to him in the

earlier periods. This is partly to be explained by the deficiencies of Xenophon's Hellenica, partly by the fact that for the interval between the death of Epameinondas and the accession of Alexander we have in Diodorus alone a continuous narrative of events. Books xiv. and xv. of his history include the period covered by the *Hellenica*. More than half of book xiv. is devoted to the history of Sicily and the reign of Dionysius, the tyrant of Syracuse. For this period of Sicilian history he is, practically, our sole authority. In the rest of the book, as well as in book xv., there is much of value, especially in the notices of Macedonian history. Thanks to Diodorus we are enabled to supply many of the omissions of the *Hellenica*. Diodorus is, *e.g.*, our sole literary authority for the Athenian naval confederation of 377. Book xvi. must rank, with the Hellenica and Arrian's Anabasis, as one of the three principal authorities for this century, so far, at least, as works of an historical character are concerned. It is our authority for the Social and the Sacred Wars, as well as for the reign of Philip. It is a curious irony of fate that, for what is perhaps the most momentous epoch in the history of Greece, we should have to turn to a writer of such inferior capacity. For this period his material is better and his importance greater: his intelligence is as limited as ever. Who but Diodorus would be capable of narrating the siege and capture of Methone twice over, once under the year 354, and again, under the year 352, of giving three different numbers of years (eleven, ten and nine) in three different passages (chs. 14, 23 and 59) for the length of the Sacred War, or of inserting a conclusion of peace between Athens and Philip in 340 B.C., after the failure of his attack on Perinthus and Byzantium? Among the subjects which are omitted is the peace of Philocrates. For the earlier chapters, which bring the narrative down to the outbreak of the Sacred War, Ephorus, as in the previous book, is Diodorus' main source. His source for the rest of the book, *i.e.*, for the greater part of Philip's reign, cannot be determined. It is generally agreed that it is not the Philippica of Theopompus.

Historians of Alexander's Reign.—For the reign of Alexander our earliest extant authority is Diodorus, who belongs to the age of Augustus. Of the others, Q. Curtius Rufus, who wrote in Latin, lived in the reign of the emperor Claudius, Arrian and Plutarch in the 2nd century A.D. Yet Alexander's reign is one of the best known periods of ancient history. The Peloponnesian War and the twenty years of Roman history which begin with 63 B.C. are the only two periods which we can be said to know more fully or for which we have more trustworthy evidence. For there is no period of ancient history which was recorded by a larger number of contemporary writers, or for which better or more abundant materials were available. Of the writers actually contemporary with Alexander there were five of importance—Ptolemy, Aristobulus, Callisthenes, Onesicritus and Nearchus; and all of them occupied positions which afforded exceptional opportunities of ascertaining the facts. Four of them were officers in Alexander's service. Ptolemy, the future king of Egypt, was one of the *somatophulakes* (we may, perhaps, regard them as corresponding to Napoleon's marshals); Aristobulus was also an officer of high rank (see Arrian, Anab. vi. 29. 10); Nearchus was admiral of the fleet which surveyed the Indus and the Persian Gulf, and Onesicritus was one of his subordinates. The fifth, Callisthenes, a pupil of Aristotle, accompanied Alexander on his march, and was admitted to the circle of his intimate friends. A sixth historian, Cleitarchus, was possibly also a contemporary; at any rate he is not more than a generation later. These writers had at their command a mass of official documents, edited and published after Alexander's death by his secretary, Eumenes of Cardia; the records of the marches of the armies, which were carefully measured at the time; and the official reports on the conquered provinces. That these documents were made use of by the historians is proved by the references to them which are to be found in Arrian, Plutarch and Strabo. We have, in addition, in Plutarch numerous quotations from Alexander's correspondence with his mother, Olympias, and with his officers. The contemporary historians may be roughly divided into two groups. On the one hand there are Ptolemy and Aristobulus, who, except in a single instance, are free from all suspicion of deliberate invention. On the other hand, there are Callisthenes, Onesicritus and Cleitarchus, whose tendency is rhetorical. Nearchus appears to have allowed full scope to his imagination in dealing with the wonders of India, but to have been otherwise veracious. Of the extant writers Arrian (*q.v.*) is ,incomparably the most valuable. His merits are twofold. As the commander of Roman legions and the author of a work on tactics, he combined a practical with a theoretical knowledge of the military art, while the writers whom he follows in the Anabasis are the two most worthy of credit, Ptolemy and Aristobulus. We may well hesitate to call in question the authority of writers who exhibit an agreement which it would be difficult to parallel elsewhere in the case of two independent historians. It may be inferred from Arrian's references to them that there were only eleven instances in all in which he found discrepancies between them. The most serious drawback which can be alleged against them is an inevitable bias in Alexander's favour. It would be only natural that they should pass over in silence the worst blots on their great commander's fame. Next in value to the Anabasis comes Plutarch's Life of *Alexander*, the merits of which, however, are net to be gauged by the influence which it has exercised upon literature. The Life is a valuable supplement to the Anabasis, partly because Plutarch, as he is writing biography rather than history (for his conception of the difference between the two see the famous preface, Life of Alexander, ch. i.), is concerned to record all that will throw light upon Alexander's character (*e.g.*, his epigrammatic sayings and quotations from his letters); partly because he tells us much about his early life, before he became king, while Arrian tells us nothing. Plutarch writes in an uncritical spirit; he formed no clear conception and drew no consistent picture of Alexander's character. Book xvii. of Diodorus and the Hisforiae Alexandri of Curtius Rufus are thoroughly rhetorical in spirit. It is probable that in both cases the ultimate source is the work of Cleitarchus.

The Orators.—Towards the end of the 5th century a fresh source of information becomes available in the speeches of the orators, the earliest of whom is Antiphon (d. 411 B.C.). Lysias is of great importance for the history of the Thirty (see the speeches against Eratosthenes and Agoratus), and a good deal may be gathered from Andocides with regard to the last years of the 5th and the opening years of the next century. At the other end of this period Lycurgus, Hypereides and Deinarchus throw light upon the time of Philip and Alexander. The three, however, who are of most importance to the historian are Isocrates, Aeschines and Demosthenes.

Isocrates.—Isocrates (*q.v.*), whose long life (436–338 B.C.) more than spans the interval between the outbreak of the Peloponnesian War and the triumph of Macedon at Chaeroneia, is one of the most characteristic figures in the Greek world of his day. To comprehend that world the study of Isocrates is indispensable; for in an age dominated by rhetoric he is the prince of rhetoricians. It is difficult for a modern reader to do him justice, so alien is his spirit and the spirit of his age to ours. He is frequently monotonous and prolix; at the same time, as the most famous representative of rhetoric, he was read from one end of the Greek world to the other. He was the friend of Evagoras and Archidamus, of Dionysius and Philip; he was the master of Aeschines and Lycurgus amongst orators and of Ephorus and Theopompus amongst historians. No other contemporary writer has left so indelible a stamp upon the style and the sentiment of his generation. It is a commonplace that Isocrates is the apostle of Panhellenism. It is not so generally recognized that he is the prophet of Hellenism. Doubtless he had no conception of the extent to which the East was to be hellenized. He was, however, the first to recognize that it would be hellenized by the diffusion of Greek culture rather than of Greek blood. His Panhellenism was the outcome of his recognition of the new forces and tendencies which were at work in the midst of a new generation When Greek culture was becoming more and more international, the exaggeration of the principle of autonomy in the Greek political system was becoming more and more absurd. He had sufficient insight to be aware that the price paid for this

autonomy was the domination of Persia; a domination which meant the servitude of the Greek states across the Aegean and the demoralization of Greek political life at home. His Panhellenism led him to a more liberal view of the distinction between what was Greek and what was not than was possible to the intenser patriotism of a Demosthenes. In his later orations he has the courage not only to pronounce that the day of Athens as a first-rate power is past, but to see in Philip the needful leader in the crusade against Persia. The earliest and greatest of his political orations is the *Panegyricus*, published in 380 B.C., midway between the peace of Antalcidas and Leuctra. It is his *apologia* for Panhellenism. To the period of the Social War belong the *De pace* (355 B.C.) and the *Areopagiticus* (354 B.C.), both of great value as evidence for the internal conditions of Athens at the beginning of the struggle with Macedon. The *Plataicus* (373 B.C.) and the *Archidamus* (366 B.C.) throw light upon the politics of Boeotia and the Peloponnese respectively. The *Panathenaicus* (339 B.C), the child of his old age, contains little that may not be found in the earlier orations. The *Philippus* (346 B.C.) is of peculiar interest as giving the views of the Macedonian party.

Demosthenes.—With the estimate of character and statesmanship of the orator Demosthenes (*q.v.*) we are not here concerned. With regard to his value as an authority for the history of the period, it is to his speeches, and to those of his contemporaries, Aeschines, Hypereides, Deinarchus and Lycurgus, that we owe our intimate knowledge, both of the working of the constitutional and legal systems, and of the life of the people, at this period of Athenian history. From this point of view his value can hardly be overestimated. As a witness, however, to matters of fact, his authority can no longer be rated as highly as it once was. The orator's attitude towards events, both in the past and in the present, is inevitably different from that of the historian. The object of a Thucydides is to ascertain a fact, or to exhibit it in its true relations. The object of a Demosthenes is to make a point, or to win his case. In their dealings with the past the orators exhibit a levity which is almost inconceivable to a modern reader. Andocides, in a passage of his speech *On the Mysteries* (§ 107), speaks of Marathon as the crowning victory of the campaign against Xerxes; in his speech *On the Peace* (§ 3) he confuses Miltiades with Cimon, and the Five Years' Truce with the Thirty Years' Peace. Though the latter passage is a mass of absurdities and confusion, it was so generally admired that it was incorporated by Aeschines in his speech *On the Embassy* (@ 172–6). If such was their attitude towards the past; if, in order to make a point, they do not hesitate to pervert history, is it likely that they would conform to a higher standard of veracity in their statements as to the present—as to their contemporaries, their rivals or their own actions? It has come to be recognized that no statement as to a matter of fact is to be accepted, unless it receives independent corroboration, or unless it is admitted by both sides.

The speeches of Demosthenes may be conveniently divided into four classes according to their dates. To the pre-Philippic period belong the speeches *On the Symmories* (354 B.C.), *On Megalopolis* (352 B.C.), *Against Aristocrates* (351 B.C.), and, perhaps, the speech *On Rhodes* (?351 B.C.). These speeches betray no consciousness of the danger threatened by Philip's ambition. The policy recommended is one based upon the principle of the balance of power. To the succeeding period, which ends with the peace of Philocrates (346 B.C.), belong the *First Philippic* and the three *Olynthiacs*. To the period between the peace of Philocrates and Chaeronea belong the speech *On the Peace* (346 B.C.), the *Second Philippic* (344 B.C.), the speeches *On the Embassy* (343 B.C.) and *On the Chersonese* (341 B.C.), and the *Third Philippic*. The masterpiece of his genius, the speech *On the Crown*, was delivered in 330 B.C., in the reign of Alexander. Of the three extant speeches of Aeschines (*q.v.*) that *On the Embassy* is of great value, as enabling us to correct the misstatements of Demosthenes.

IV. Later Authorities.— For the period from the death of Alexander to the fall of Corinth (323–146 B.C.) our literary authorities are singularly defective. For 'the Diadochi (*q.v.*) Diodorus (books xviii.–xx.) is our chief source. These books form the most valuable part of Diodorus' work. They are mainly based upon the work of Hieronymus of Cardia, a writer who combined exceptional opportunities for ascertaining the truth (he was in the service first of Eumenes, and then of Antigonus) with an exceptional sense of its importance. Hieronymus ended his history at the death of Pyrrhus (272 B.C.), but, unfortunately, book xx. of Diodorus' work carries us no farther than 303 B.C., and of the later books we have but scanty fragments. The narrative of Diodorus may be supplemented by the fragments of Arrian's *History of the events after Alexander's death* (which reach, however, only to 321 B.C.), and by Plutarch's *Lives* of *Eumenes* and of *Demetrius*. For the rest of the 3rd century and the first half of the and we have his *Lines* of *Pyrrhus*, of *Aratus*, of *Philopoemen*, and of *Agis and Cleomenes*. For the period from 220 B.C. onwards Polybius (*q.v.*) is our chief authority (*see* ROME: *Ancient History*). In a period in which the literary sources are so scanty great weight attaches to the epigraphic and numismatic evidence.

BIBLIOGRAPHY.—The literature which deals with the history of Greece in its various periods, departments and aspects, is of so vast a bulk that all that can be attempted here is to indicate the most important and the most accessible of the works of a general character. It may be pointed out that a full bibliography will be found at the end of each of the volumes of the *Cambridge Ancient History*.

General Histories of Greece.—There are only three general histories of Greece written by English scholars that call for mention here. George Grote's *History of Greece* was published originally in 12 volumes, 1846–56 (new ed. 1888). Grote had his faults and his limitations. His prejudices are strong and his scholarship is weak; he had never visited Greece, and he knew little or nothing of Greek art; and, at the time at: which he wrote, the importance of coins and inscriptions was imperfectly apprehended. In spite of every defect, houever, his work is the greatest history of Greece that has yet been written. It is not too much to say that nobody knows Greek history till he has mastered Grote. *The History of Greece*, by the late J. B. Bury, Regius Professor of Modern History in the University of Cambridge (2nd ed., 1922), in one volume, is a work on a far less elaborate scale than Grote's. Of a different character from the *Histories* of Grote and Bury, is *The Cambrrdge Ancient History*, edited by J. B. Bury, S. A. Cook and F. E. Adcock, and published by the Cambridge University Press. This work, which is in course of publication, is intended, when complete, to deal with the history of the ancient world down to the fall of the Roman empire, vols. iv.–vii. being mainly concerned with the history of Greece. The plan of the *Ancient History* is similar to that of the *Cambridge Modern History* and the *Cambridge Mediaeval History*, different chapters being assigned to different scholars, chiefly English and American.

Of general histories by foreign scholars, the following may be mentioned: K. J. Beloch, *Griechische Geschichte*, ed. 2. (Strasbourg, 1912–27); E. Cavaignac, *Histoire de l'Antiquité*, vols. 1–3 (1913–14); G. Busolt, *Griechische Geschichte*, ed. 2. (Gotha, 1893–1904) (differs in character from other histories of Greece, the writer's object being to refer in the notes, which constitute five-sixths of the book, to the views of every writer, in any language, upon every controverted question; it is indispensable as a work of reference for any serious study of Greek history); Eduard Meyer, *Geschichte des Altertums* (Stuttgart, 1893–1902) (the ablest work on Greek history since Grote's; of the five volumes which have appeared, vols. ii.–v. are principally concerned with the history of Greece, and carry the narrative down to a few years later than the death of Epameinondas); M. Rostovtzeff, *A History of the Ancient World*, trans. J. D. Duff (Oxford, 1926).

Works bearing on the History of Greece: Iwan Müller, *Handbuch der Klassischen Altertumswissenschaft* (Munich, various dates); K. F. Hermann, *Lehrbuch der griechischen Antiquitäten*, new ed. (Tübingen, various dates); A. Gercke and E. Norden, *Einleitung in die Altertumswissenschaft*, ed. 2. (Leipzig and Berlin, 1914); Pauly-Wissowa, *Realencyklopadie der Klassischen Altertumswissenschaft* (Stuttgart, 1893) (in progress); H. F. Clinton, *Fasti Hellenici*, 3rd ed. (Oxford, 1841), (a work of which English scholarship may well be proud; it is still invaluable for the study of Greek chronology).

Among works on Epigraphy may be mentioned: *Inscriptiones Graecae* (1924); E. L. Hicks and G. F. Hill, *Manual of Greek Historical Inscriptions*, new ed., 1 vol. (Oxford, 1901); W. Dittenberger, *Sylloge Inscriptionum Graecarum*, 3rd ed. (Berlin, 1915–17).

Among works on Numismatics, the English reader may refer to: B. V. Head, *Historia numorum*, 2nd ed. (Oxford, 1911); G. F. Hill, *Handbook of Greek and Roman Coins* (1899); P. Gardner, *History of Ancient Coinage, 700–300 B.C.* (Oxford, 1918). (E. M. WA)

ECONOMIC AND SOCIAL DEVELOPMENT OF ANCIENT GREECE

Life in Ancient Greece.—The conditions under which the men of the ancient world lived were so different from those

of the life of the present day that it is difficult to realise, and perhaps impossible to realise fully, even the main circumstances of an existence in which factors which are in some respects the chief determinants of modern life played no part; and this although life even in western Europe up to the end of the 18th century in many ways approximates in respect to its economics more closely to the life of the men of the fifth century before Christ than it does to that of the present day. The effect of rapid means of communication on the problems of material existence has been so great that the problems themselves have for the last hundred years ceased to be of that gravity which the men of previous centuries had every reason to recognise. Before that time individuals and states were largely concerned with devising means of securing a margin of safety in respect to material life, a margin which varied from age to age in accordance with the variations of race, time and geographical situation. If the Roman government at the height of its power, and at a time when means of communication had been greatly improved, showed anxiety for the food supply of that Italy which was dominant in the Mediterranean world, it may be imagined that in the period preceding the great economic organisation introduced by the Roman Principate the peoples of the Mediterranean region, peoples no one of which at the height of its power had controlled the visible food supply of the world so widely or so absolutely, had far graver cause for anxiety on the same subject, an anxiety such as would be, under ordinary circumstances, the main factor, or, even under the most favourable circumstances possible in those ages, a main factor, in moulding the life of the individual and the policy of the state.

The modifications introduced into the problem of the world's food supply by the introduction of steam power into communications by land and sea, and by the invention of the telegraph, can be best realised by a consideration of the facts of past, or even of contemporary, history. Within the memory of thousands now living a famine due to widespread failure of craps carried off hundreds of thousands of people in India, because the absence of adequate means of communication rendered it impossible even for a sympathetic government to supply the deficiency in time to save the lives of a large percentage of those suffering from the famine. The Chinese government, owing to lack of communications, has never been able to cope with the chronic famines in regions of that country; and the obvious impossibility of so doing seems to have led it to regard such disasters with apathetic indifference.

What must have been in antiquity the case of a people whose crops had failed—in ages in which, supposing that the scarcity affected only part of a political unit, government sympathy would be determined by political expediency, and the help of other members of the unit would be almost certainly restricted by the smallness of the surplus, if any, of their own harvest, and immeasurably impeded by the badness and slowness of communication? And what would be the case when such a disaster fell on the whole of a political unit? Enough is known of the spirit and circumstances of antiquity to say that help from outside would not be forthcoming from other political units, which had probably hut little food produce to spare from the annual yield, to a political unit which had probably no means of paying for that which could be spared, even supposing that supplies could be moved into the affected region in time to save any part of the situation.

But it is possible to illustrate the economic conditions of ancient life to an English-speaking reader by examples drawn from nearer home. A single case of starvation in the British isles evokes universal horror at the present day. Nearly all Englishmen and Americans know something of English history; but their interest is apt to be directed by preference to the stories of wars and battles, and by compulsion to the growth of English law and the British constitution How many of them ever realise that in the period between the Saxon settlement and the end of the first half of the 14th century not merely thousands, but hundreds of thousands, of English people perished of famine or of the terrible diseases which semi-starvation brought in its train—and this in a land in which the percentage of productive area was far greater than in the lands of the Mediterranean region, and when the acreage under cereal cultivation was in the later centuries of the period considerably greater than at the present day?

It is necessary to recognise brutal facts of this nature in order to realise the conditions under which the ancient world lived. It is also necessary to realise that variations in social and political conditions vary in direct ratio to the extent to which the hardness of the conditions of physical life can or cannot be alleviated. Poverty in the widest sense is an impediment to the advance of civilisation.

The Reasons for Migration.— The peoples of the ancient world did not always solve the problem of existence on the same lines. It was, for instance, natural that a race which lived in a region where the natural conditions were hard, and means of living peculiarly precarious, should seek to conquer lands where the conditions were more favourable. This impulse must have been at the root of the great movements of peoples at various periods in ancient history from the comparatively inhospitable lands of central and northern Asia to the more fertile and more favoured regions of Europe and parts of western Asia. This gave rise to secondary impulses. The invaders drove in front of them the original inhabitants of the regions which they seized; and these in their turn forced their way into regions in which they had not dwelt aforetime. These movements are recurrent, not merely in the dim tradition of legend, but in the pages of recorded history. They are peculiarly prominent in the legendary history of the Greek people.

In various recorded instances such invaders did not expel or massacre the population of the region they occupied, but constituted themselves as a superior class which kept the original population in a position of quasi-serfdom as tillers of the soil. This was notoriously the case with the Dorian invaders of Greece. It was also the case with the Celtic invaders of Galatia, of Gaul, and of Britain, a fact which ancient historians recorded in the case of Galatia, and archaeology and ethnology have established in the case of Gaul and Britain. A successful invasion of this type placed the invaders outside the fear of starvation. They were free from the general anxiety with regard to daily bread; free to turn their thoughts to other things outside the problem of material daily existence. In other cases the invaders merged with the invaded. In many they expelled or exterminated them.

There can be little doubt that these movements, invasions and settlements were not inspired by mere lust of conquest for conquest's sake, but by the desire to solve or ease by conquest the problem of material existence: to banish that spectre of possible starvation which ever haunted the ancient world. The danger of failure of crops was ever present. Populations which were not militarily dominant in the land in which they lived could only supply the deficiency by either raiding the lands of neighbours whose crops had not failed, or by piratical expeditions to lands over sea. "For in early times the Hellenes and the barbarians of the coast and islands, as communication by sea became more common, were tempted to turn pirates, under the conduct of their most powerful men, the motives being to serve their own cupidity *and* to support *the* needy." (Thuc. i. 5.) A danger still greater, because on a larger scale, arose when the population of a region became greater than the home products of the land could support.

A people which is obsessed by the struggle of daily existence must remain backward in the development of the arts and ideas of civilisation. The great civilisations of the early world developed in the rich regions of the Nile and the Euphrates where, save under very exceptional circumstances, a living was easily won from the soil, and the land produced even more than the population could consume. But it is also significant that in these wealthy lands the population evolved methods, such as irrigation and so forth, which increased the productiveness of the cultivated regions, and brought into cultivation areas originally arid.

The First Civilisation.— These general circumstances must be taken into account in consideration of the beginnings and development of any great civilisation, ancient or modern; and, as Greece was a land of peculiarly marked characteristics, their

effect on the development of the civilisation of the Greek race is very marked and, consequently, easily traceable.

Starting with the major premiss that ease of existence is necessary for the development of civilisation, and that that ease could in the ancient world be attained in only three ways: by a conquest which resulted in the conquering race being able to set itself up as a ruling and privileged class exploiting an inferior race as tillers of the soil: by raiding on land or by sea: by improving methods of cultivation and developing trade: it is plain that the last of these could only be developed in regions and at times undisturbed by racial movements. The former were the expedients of an unsettled world.

Greece and the Greeks passed through all these three phases. It is little more than fifty years ago that the discoveries of Schliemann revealed to an astonished world a civilisation which existed in Greece long before anything which can be called a historic period, a civilisation which by some strange caprice legend had forgotten, though it had preserved the name of that family which ruled at Mycenae while still the authors of this civilisation held sway in Peloponnese. Curiously enough tradition had preserved in the Minos legend a reminiscence of that Cretan civilisation which was the parent of that at Mycenae. But the Minos legend was regarded in modern times as a myth until when, a little more than thirty years ago, Evans disclosed to a still more astonished world the remains of the great palace at Cnossos (see CRETE), a few miles south of the modern Candia. This appears to have been the main centre of this civilisation; but other minor centres of it have been since discovered in various parts of Crete. Those best qualified to judge of it have come to the conclusion that the people who evolved it were not Indo-Europeans; and Africa has been suggested as their original home. It was, relative to the time, an advanced civilisation evolved apparently in Crete itself, and not imported from abroad. It had won a footing at some unknown date on the Asiatic coast of the Aegean, and, seemingly in the first half of the second millennium before Christ, had established offshoots on the Greek mainland, first at Tiryns in the Argolid, and later at Mycenae, Sparta, in Boeotia, and in south-east Thessaly on the Pagasaetic Gulf. The most essential feature of the later Minos legend is that this Cretan monarch exercised a tlzalassocracy (sea-power) in the Aegean; and the sites where remnants of this civilisation have been discovered confirm the legend that it was that of a people in command of the sea. It was thus a civilisation due to the fact that the control of sea communications rendered those who evolved it more or less free from the anxieties of food supply. They found themselves in a position to develop those arts which are a part of material civilisation. It is significant for the Greece of later times that this Cretan people developed to a high degree the art of draughtsmanship and painting. In building and architecture too they must have been, judging from the remains of their palaces, far in advance of any other Mediterranean race of the time except the Egyptians. This again is significant for later times.

Racial parricide brought their civilisation to a close in Crete. The final downfall of Cnossos, which took place about **1500** B.C., seems to have been the work of those Cretan colonists who had been settled at Tiryns, Mycenae and elsewhere on the mainland of Greece. (See AEGAEAN CIVILISATION.)

The period of Mycenaean predominance and civilisation in Greece was brought to an end by a series of invasions from the north.

The Invasions. — The first of these invasions was that of the Achaeans. **A** branch of this people seems to have been settled in Thessaly from the very earliest times. But the invaders came in all probability from the lands to the north of Greece. They destroyed the power of the Mycenaean dynasts and Achaean chiefs took their place at such centres as Mycenae and Sparta. (Another theory founded on the very uncertain evidence at present available is that the Achaeans descended on the Peloponnese as early as 2000 B.C. and formed a ruling minority among a population akin to that which had evolved the civilisation of Crete; and that some centuries after their settlement the civilisation of Crete made its way into Peloponnese, and was adopted by the Achaean dynasts.) The Homeric epics depict their life in the period during which they dominated Greece. the life of a dominant military minority which has taken over the material elements of a civilisation superior to their own, but has not adopted its usages or ideas. From this time forward for several centuries the daily life of the inhabitants of Greece was too hard and too anxious for them to have time to give thought to the attainment of the higher arts of civilisation. Several centuries of turmoil, settlement and unsettlement followed, in which the strong had to give their whole minds to battling for what they had got, and the weak to getting what they could get. If, as has been suggested, the tradition of the Trojan War enshrines the historical fact that the Achaeans were seeking to free the passage of the Hellespont, then it is fairly certain that the question of food supply was pressing on the land, and relief was even thus early being sought from the rich corn region of the north Euxine.

The Achaean dominion in Greece may not have lasted more than a century. Thesprotian and Boeotian movements southwards disturb middle Greece. Achaeans driven from Thessaly evict the Ionian population of the northern fringe of Peloponnese; and finally the great Dorian invasion overruns the whole of that peninsula, and so, somewhere about **I150** B.C. (or, according to others, **1200** B.c.) brings to an end the Achaean dominion. The new race of still ruder civilisation than the Achaean, establishes itself as a dominant military caste in various of the southern regions of Greece.

Food Shortage and Tyrants. — The social and economic development of the next five centuries was slow. The aftermath of the storms of invasion took long to pass away. Of the details of what passed in the centuries which immediately followed the coming of the Dorians nothing is known.

Greece was too small and too poor to support both its old population and the successive waves of new comers; and first Ionians, and later Aeolians and others sought a refuge on the Asiatic coast of the Aegean[1]. But even so the pressure of population in Greece itself, a land of which only a little more than one-fifth is cultivable, seems to have been great. Even on the richer Asiatic coast the food situation does not seem to have been secure, for the Ionians of that region are resorting to the Euxine at a very early date. On the European side the new invaders, not originally sea-faring peoples, gradually develop some skill in navigation under the compulsion of circumstances; and one result of their activities and those of the Asiatic Greeks is that they gradually oust from the Aegean those Phoenicians who had stepped into the gap caused by the fall of the Cretan sea power. That the Phoenicians had various settlements on the islands and coasts of the Aegean is undoubtedly the case; but the Greeks of a later age were apt to attribute to their remembered presence various things which went back to the almost forgotten Mycenean age.

But living was precarious; and in Greece itself men's minds were so cumbered with the problem of the material that they had no time nor inclination to give thought to the intellectual life.

Experience in navigation led to the growth of trade, and with its profits some of the Greek states began to solve the food question by getting the means to purchase supplies from abroad instead of using the older method of piratical raiding. This must have relieved, but obviously did not cure, the economic evils of the age. The growth of a class which did not draw its living from the land in a country in which the land had been almost the sole source of livelihood was certain to eventuate in social and political changes. The landless man and the poor landholder now found an ally in the commercial class whose social and political jealousy of the dominant landed aristocracy made it quite ready to make common cause with other enemies of the aristocrat. The dynasts and nobility had owed their position to the necessity which the disorders of the past had imposed on the people generally of having leaders who could rally the population to resistance to the aggressor. But that time had passed away; and probably with its passing the aristocracy had declined in fighting power.

[1]Some put the Aeolian migration before the Ionian.

Moreover the tradition of later times ascribed unanimously to this period a growing demand on the part of the poorer classes for better conditions of life. The old aristocracies sought to save the situation by sending off the discontented to new settlements overseas, and thus in the earlier half of the 8th century began that system of colonisation which was to have so marked an influence on the cultural development of the Greek race. But even this could not save the old aristocratic system; and kingdoms and aristocracies fell one after the other before the attacks of the discontented classes.

The newly acquired power of the many had to be consolidated if it were not to succumb once more to aristocracy; and so the leaders of popular movements found in many cases but little difficulty in concentrating in their own hands the control of the movement, and so establishing those tyrannies which the Greek democrat of later days regarded with even more dislike than the aristocracies which had preceded them. Yet many of these tyrants were enlightened men who, in a hard, practical and sometimes brutal way, did much towards the development of Greek life on those lines which made the great period of the fifth century a reaiisabie possibiiity. Many of them directed coionisation on lines which brought relief and profit to the states concerned.

Colonisation and Trade.— These Greek *piéds-à-terre* abroad made trade easier, and, consequently, larger and more productive. Planted in the richer lands of the Mediterranean and its branches their existence facilitated the getting of foreign foodstuffs, and their promotion of trade increased the means of purchase. The food problem became less pressing in some, at any rate, of the states of Greece. Men came to regard the morrow with less apprehension, and so began to turn their thoughts to other things; and an easier mode of existence gave them the leisure for so doing. Some writers of modern times have descanted on the development of Greek ideas by contact with the races with which the colonies brought them into contact. That men's minds are enlarged by increased knowledge of the world is of course the case; but such advances as the Greek made in civilisation during the two centuries of colonisation cannot be ascribed to any impulse from outside the race, but to development within the Greek race itself. The Asiatic Greeks were doubtless influenced by the material civilisation of Lydia; but, so far as it is known, it was a civilisation from which no intellectual impulse could be derived. The colonies of the European Greeks were planted on the shores of peoples inferior in civilisation to the Greeks themselves. The power of Greek *νόμος* (custom) was not to be shaken until the Greeks came into contact with a civilisation which had some intellectual elements unrepresented in their own. It was increased trade and resultant wealth and leisure which began to modify the Greek world, because it gave the Greek the time to think.

As trade developed the Greek began to see more clearly where his profits lay. Manufactured articles, especially pottery and textile fabrics, brought much gain in a world where manufacture was in its infancy. The products of the vine and the olive were of peculiar value at a time when the cultivation of them was much more restricted than in later times. Of this side of Greek agriculture the history is only known in the case of Attica in the 6th century; but it may be regarded as fairly certain that the trading states of the 8th and 7th centuries, Corinth, Chalcis, Eretria, Sicyon, Megara and Corcyra, not to mention the Asiatic cities, began to find that the hillslopes were better adapted to vine and olive cultivation than to the growth of cereals.

No longer haunted by the spectre of want, afforded a certain leisure by the increase of wealth, men's minds turned to other than material interests, and a revival of art began. New essays in literature were attempted. The epics and sagas of the heroic age had gradually declined into a dreary balladry which concerned itself largely with the lineage of those noble families which supported a balladmonger. The old families were now passing into the background. Men wanted something more than the praise of families to which they did not belong; and so lyric poetry came from the country to the town, and was there elaborated by poetic genius. Composers of chronology anticipated the historians, and writers of route books the geographers of a later age.

Rise of Athens.— While between 800 and 600 B.C. the trading states especially had advanced in cultural development, a development in which the comparatively rich community of Sparta had shared, other Greek states, especially Attica, had remained in a more backward condition. Attica was still the typical self-centred Greek agricultural community. Lying away from the main land routes of the country, a region whose tracks were only culs-de-sac, it had been less affected than other states by the turmoil of the period of the invasions. Apart from its remoteness, the poverty of its soil had never attracted the invading settler; and so it had not till the opening of the sixth century felt the pressure of overpopulation. But it began to feel it then; and the dangerous discontent which resulted led to the appointment of Solon as arbiter between conflicting interests. The food question was pressing. The situation of a certain class of small cultivators was desperate. Taught, it may be, by the experience of other states, he determined to develop Attica as a trading state, so that by the export of manufactured articles the land might have the means of purchasing the corn it so sorely needed. A drastic law made instruction in crafts practically compulsory. This reform had eventually an enormous effect. The evidence from Sicily shows that Attic trade with that island, which at the beginning of the century was practically nil, had developed so much by the end of it that it had become a formidable rival to that of Corinth. His agricultural reforms were not so successful. It is indeed the case that the distressed class of the *Hektemoroi* disappears, probably converted by his reforms into small owners instead of tenants; but a large, and probably distinct, class, the Diacrii, who cultivated the hillslopes, were so badly situated that thirty years after Solon's time they established a leader, Peisistratus, as tyrant in their interest. His tyranny, though intermittent, did wonders for agricultural development. His main policy was to convert the Diacrii from the error of their ways of agriculture, and to provide them with the capital necessary for the establishment of vine and olive cultivation on those slopes where an attempted cultivation of cereals could only result, at best, in chronic failure. An acre of hillslope under the vine and olive produced that which could purchase far more corn than ever that acre could grow. From his time forward Attic agriculture enjoyed a prosperity which only the ravages of war could impair. Solon and Peisistratus revolutionised the economic position of Attica.

It is evident that the last part of the sixth century introduced a new and troublesome factor into Athenian life, unemployment. The old historians refer to it in the fifth century; but it had its roots in the sixth in all probability. They never say, however, to what cause it was due; but analogies from other periods in ancient history make it probable that it was due to the competition of slave labour, especially in manufactures.

In the great fifth century the economic, social and intellectual development is largely centred in Attica; though in this century, as in the last, the greatest intellectual movement of the time originated in the Greek world outside Greece itself. Previous centuries had solved two of the main factors in the question of food supply, sources and purchasing power. There remained another, the safeguarding of the avenues from the sources. That was solved by the great Athenian fleet which the revenues from that empire formed in the period succeeding the Persian War of 480–479 rendered possible. The insecure passage to the Euxine was rendered safe from Persian or other interference. Of the literary development in this century enough is said elsewhere. But this fact with regard to it must be emphasised, that it was largely due to that security of economic conditions which had been attained gradually in previous centuries, and was greatly enhanced in the present one by the victory over Persia.

Life in the Fifth Century B.C.— It is perhaps impossible to realise the life of the average Greek of the fifth century. All that appears in, or can be deduced from, extant literature is the life of a select few at Athens. To the majority of Greeks life year in and year out was passed in days of work on the land, ploughing, sowing and reaping the corn crops, tending the vineyards and olive grounds. They loved the work. They loved too

the interludes of little country festivals, and enjoyed such visits to the city as they made for business purposes or to see the sights and hear the latest drama. In the trading and manufacturing cities there were the craftsmen and sailors, though the large manufacturers employed slaves largely. Still there must have been considerable numbers of small craftsmen working on their own account.

For the rest the people as a whole were very unsophisticated, very impressionable and very superstitious. Progressive in political ideas, they were singularly conservative of the superstitions of religion, and quite ready to kill anyone who slighted, or seemed to slight, their age-old religious beliefs. They were more quick-witted than other races of the time; but, like other races of their type, had more capacity for conceiving the end than for devising the means.

Imaginative writers of modern times have written Greek history in such a way as to convey the impression that Athens in this century was full of potential Aeschyluses and Pericleses. No century can produce many men of outstanding genius. The glory of the fifth century is that it produced more than any other century in the long history of the old world. The idealised society of Thucydides' version of the funeral speech of Pericles has been taken as a true picture of social life in Athens in the latter half of the century, regardless of the very different picture implied in the contemporary plays of Aristophanes. Thucydides drew the picture of an ideal, not of an actuality.

The intellectual life of the time was lived by the learned few, the sophists or teachers, and those who had money enough and leisure enough to attend their lectures. The mass of the Greek people went meanwhile its own way: doing its daily work: getting as much enjoyment as possible out of life: but not worrying itself about abstract questions of a philosophical nature, the discussion of which it could not afford to hear. Only such intellectual matter as promised to bring some material gain appealed to the average man.

In the sixth century the Ionian cities of Asia had taken the lead in intellectual development. It was from Sicily that the next great movement came. Between 470 and 460 the states of the island passed from tyranny to democracy. Hitherto the Greek had left the art of persuasion to those who had the gift of eloquence. Certain clever heads in Sicily, however, conceived the idea that the art ran on certain lines which could easily be reduced to rules such as any man could learn under proper instruction. This was the beginning of rhetoric. It was naturally taken up keenly by those who had ambitions in the new democratic politics. But it was further recognised that underneath this practical science lay a more abstract science, that of Politics: so teachers of this arose. The sophists who taught it sailed with the wind, justifying Athenian imperialism by the dictum that the state existed by convention, the concession of the strong to the weak, and not by any divine ordering of nature, and flattering those who could afford to attend their lectures by laying down that only the wise should rule, that is to say, those who bad studied politics under them.

The general result of the intellectual movement was that both the wise and the unwise sought political distinction by two different roads, the wise by two abortive attempts at revolution, the unwise by a disastrous essay at world dominion. Socrates was the last great intellectual figure of the fifth century, teacher of doctrines which would have made the world and its people better had they only been able to interpret them aright. Some, like Critias, misinterpreted them to their own undoing, others, the mass of the Athenian people, to the undoing of the teacher.

The Change in the Fourth Century.— Then comes the fourth century, the history of which is the story of what is in some of its aspects that of the greatest failure in history. A century which produced Plato and Aristotle ought to have been great. Their works are in their different ways absolutely unique in literature. They summarize and expand the teachings of the past age, carrying far beyond their previous limits all the ideas which had emanated ultimately from the natural philosophy of Ionia and the political philosophy of Sicily. For the present consideration it is the practical side of their teaching which is important. Each in his different way tries (by suggesting forms of constitution other than those under which the race had fallen into political decadence) to rescue that Greek world which was so much to him from the political and social disaster to which it is rushing. But the Greek world was past saving.

The material life of the fourth century presents problems the solution of which is, in the absence of evidence, impossible at the present day. Despite the almost incessant warfare and political turmoil of the time the Greek states are in a better financial position than they were in the fifth century. They can face expenditure which would have ruined them in the previous age. Greek commerce must have expanded. Its decline begins with the gradual introduction of a gold standard into Mediterranean trade, rendered possible by the enormous mass of Persian gold which was let loose on the world by the conquests of Alexander the Great.

The Currency Crisis of the Third Century.— By the time that the third century begins the trader of European Greece is seeking to save the commercial situation by acquiring gold for currency purposes. The Thasian gold mines were either worked out, or at any rate did not supply anything like the requisite quantity of the precious metal. In the lands of barbarism there were two regions from which it might be acquired, that in western Dacia, the modern Transylvania, and a smaller one in the extreme north of Illyria. Within the old area of Dacia there have been found in modern times considerable hoards of Thasian coins of the third century the presence of which can only be accounted for by the purchase of gold in the region on the part of the mine-owners in Thasos and on the neighbouring mainland. Corcyra in the same period developed colonising activity up the east coast of the Adriatic, at Black Corcyra and elsewhere, probably with intent to get into touch with the Illyrian gold region.

Scientific financial statistics can rarely be drawn from the records of ancient history; but there is good reason to believe that the ratios of value between gold and silver which in the fifth century had been 10:1, had in the third century risen to $13\frac{1}{3}$:1; so something had to be done if Greek trade with its silver standard was to be saved. The success of the efforts at salvation was partial. The trading cities of the south Italian coast fell rapidly into commercial decline. Even the wealthy Sicily ceases to hold in the world the prominent position she had held in the fifth century. In Greece Corinth alone maintained that impregnable trade position which her situation afforded her. For the rest the tendency was for the centre of gravity of Greek trade to revert once more after several centuries to the east coast of the Aegean, especially to Rhodes. The position of that island on the route from Greece to the Syrian ports, and on what was probably the most popular route to Egypt, had always promoted its trade development. The Athenian tribute lists of the latter half of the fifth century suggest that Rhodes was developing rapidly as a trade centre at that time, though it is not possible to say why. During the third century and the earlier part of the second she was by far the greatest trading centre in the Greek-speaking world, a position due to the fact that she maintained her independence of the kingdoms of the Diadochi, and was at the meeting point of the trade of the three great realms of the Macedonian kings, of the Seleucids of Asia and of the Ptolemies of Egypt. The importance of the Aegean as a centre of trade in the world of that period is shown by the eagerness of the otherwise self-centred and, economically speaking, self-satisfied rulers of Egypt to get a footing in it.

Rhodes almost dominated the commercial world of the Levant until Roman political morality, debased by the growth of commercialism, established a rival centre at Delos, arid thus with gross ingratitude impaired enormously the prosperity of a state which had been one of her most faithful allies. But Rhodes had already illustrated the connection between national prosperity and intellectual advancement by becoming one of the great schools of the world of the time.

A special and peculiarly puzzling problem of fourth century economics is the financial crisis in Sparta early in the century,

brought about by the impoverishment of many of the Spartiate landholders. To such a state were they reduced that they were unable to pay their contributions to the communal life, and thus lost their privileged political status. This is one of the inexplicable enigmas among the many connected with the history of that enigmatic state. *(See* SPARTA.)

Perhaps the most difficult problem of ancient economic life is the part which currency played in it. Dearness of money is a disturbing element even in the modern world where currency is relatively far more abundant than it ever was, even under the most favourable circumstances, in the world of Greece or even of Rome. The control of currency when coined money is scarce brings enormous profits to those who control it. The ancient world recognized this and disliked it It regarded gain made by barren metal as contrary to nature. Currency did certainly at its first introduction into Mediterranean commerce create considerable economic difficulties. Some modern critics have ascribed to it the economic difficulties of Solon's time. But these were probably due to cruder causes. Currency had come to stay whether the thinkers of the ancient world disliked it or not.

The dominating position of Athens in the world of the fifth century may have been largely due to the fact that she controlled the two main sources of silver bullion accessible to the Greeks. The finances of the Athenian empire could not have been supported by the tribute alone; and customs duties at Piraeeus brought in what was relatively but a small sum.

From the profits of Laureion alone she was, ere ever any tribute came to her, able to pay the expenses of the creation and upkeep of a fleet such as the Greek world had never known. When the mines of Thasos and the opposite mainland fell largely, if not wholly, under her control, the profits of selling silver to a Greek trading world with a silver standard, and, in the main, a silver currency, must have been very great. In the fourth century and even later Attic coinage is circulating far beyond the bounds pf the Greek world; and the barbarians of central Asia will only accept coinage with the Attic stamp. The gradual introduction of a gold standard must have greatly weakened her position; and the introduction of Roman coinage into the East must have destroyed it. But, in a world where means of communication are few, slow and expensive, the man, corporation or state which has large control of currency can buy at a cheap rate from those who have goods to dispose of, and want, not exchange, but a medium of exchange. The dominant position of the great companies of Roman *negotiatores* in the last century of the Republic must have been largely due to a wide control of the floating currency capital of the world of their day.

Slave and Free Labour. — That slavery as an institution lay largely at the basis of ancient life is unquestionably the case; but that it played the overwhelming part which some modern authorities have attributed to it is not true. The mass of the population of the ancient world was too poor to afford the purchase of a single slave; and as an institution it is chiefly connected with some capitalist class. In Greece the small farmer worked his own land, partly because it was almost a hereditary instinct with him to do so, partly because he did not want assistance outside his own family, and, if he had wanted it, could not have afforded to purchase slave labour. In Greek domestic life slavery played comparatively little part. It was in manufactures and crafts, in factories on some scale owned by men with capital, that the slave played most part in Greece. Arguments have been put forward in modern times with intent to show that slave labour was cheaper or more expensive than free labour. It may be taken as at least probable that those who employed slave labour did so either because there was a shortage in the free labour market, or because it was cheaper. The investment of capital in slave labour is a marked feature in ancient economics. As to the relative cost of free and slave labour, that would depend on the circumstances of the time: the wealth of a community at any given age, and the supply of slaves in the market, a supply largely dependent on the wars of the time. After the Persian wars of the fifth century slaves were cheap, and trade and capital greatly increased, so that it is probable that slave labour, especially in Athens, caused unemployment among the lower classes of the citizens. At other times data of wages seem to show that free labour was cheaper than that of slaves. The economic circumstances, which varied greatly in different periods, produced the variation in values.

The moral attitude of the Greek world towards slavery until the middle of the fourth century was quite simple — that slavery, having existed from time immemorial, was a natural institution, and therefore morally justifiable in the case of inferior races. In Aristotle's day certain philosophers raised the question of its justifiability, taking up a position which Aristotle himself refused to accept. Later still the Stoics raised the question in a more emphatic form; and, though theorising could not kill so old an institution, yet it did undoubtedly lead men in general to deal more humanely with the slave. In any case the Greek had always shown to the servile class a consideration which was not general in the ancient world.

The period of the Diadochi which intervenes between Alexander and the subjection of the Greek world to Roman sway is one of such contrasts that it is difficult to estimate whether in respect to civilisation it marks an advance or decline as compared with former things. The Hellenistic world was harassed by war and disorder due to the clash of ambitions among the successors of Alexander. Egypt was least disturbed by this turmoil; and so Alexandria became a centre of intellectual culture where the learning of the past was studied and preserved by the greatest scholars of the age. The wealth and the comparative peacefulness of the life of Rhodes attracted the teachers and litterateurs of the time; while Athens, treated by reason of its past reputation with more respect and political tolerance than it perhaps deserved, maintained a disputatious intellectual life which busied itself with matters of little moment to any save those who discussed them.

POST-CLASSICAL AND MEDIAEVAL HISTORY

1. The Period of **Roman** Rule. — (i.) *Greece under the Republic* (146–127 B.C.) After the collapse of the Achaean League (*q.v.*) the Senate appointed a commission to reorganize Greece as a Roman dependency. Corinth, the chief centre of resistance, was destroyed; the national and cantonal federations were dissolved, commercial intercourse between cities was restricted, and the government transferred from the democracies to the propertied classes, whose interests were bound up with Roman supremacy. Some favoured states like Athens and Sparta retained their rights as *civitates* liberae, the other cities continued to enjoy local self-government, but probably were subjected to payment of tribute. General powers of supervision were entrusted to the governor of Macedonia, who could reserve cases of high treason for his decision, and in case of need send troops into the country. The internal disorder which remained over from the previous political revolutions was checked by the historian Polybius, whom the Senate deputed to mediate between the litigants Greece was seriously disturbed during the first Mithridatic War (88–84 B.C.), when many of its cities sided with Mithridates (*q.v.*). The success which the invader experienced in detaching the Greeks from Rome is partly to be explained by the way in which his agents incited the imperialistic ambitions of cities like Athens, partly by his promises of support to the democratic parties. The result of the war was disastrous to Greece. Apart from the confiscations and exactions by which the Roman general L. Cornelius Sulla punished the disloyal communities, the extensive and protracted campaigns left Central Greece in a ruinous condition During the last decades of the Roman republic oppression by officials who traversed Greece from time to time and demanded lavish entertainments and presentations in the guise of *viaticum* or *aurum coronarium* was not unknown. Still greater nas the suffering

produced by the rapacity of Roman traders and capitalists. It is recorded that Sicyon was reduced to sell its most cherished art treasures in order to satisfy its creditors. A further hindrance to Greek prosperity was the diversion of trade which followed upon the establishment of direct communication between Italy and the Levant. The coast districts and islands suffered considerably from swarms of pirates who freely plundered the chief trading places and sanctuaries; the most notable of such visitations was experienced in 69 B.C. by the island of Delos. This evil came to an end with the general suppression of piracy in the Mediterranean by Pompey (67 B.C.), who settled some of his captives on the desolated coast of Achaea.

In the conflict between Julius Caesar and Pompey the Greeks provided the latter with a part of his excellent fleet. In 48 B.C. the decisive campaign was fought on Greek soil, and the resources of the land were severely taxed by the requisitions of both armies. As a result of Caesar's victory at Pharsalus the whole country fell into his power, but the treatment which it received was on the whole lenient. After the murder of Caesar the Greeks supported the cause of Brutus (42 B.C.), but were too weak to render much service. They subsequently passed into the hands of M. Antonius, who imposed further exactions to defray the cost of his wars. The extensive levies and requisitions which he made in 31 B.C. for his campaign against Octavian exhausted the country so completely that after the battle of Actium Octavian had to take prompt measures to avert a general famine. The depopulation which resulted from the civil wars was partly remedied by the settlement of colonists at Corinth and Patrae by Julius Caesar and Octavian; on the other hand, the foundation-of Nicopolis (*q.v.*) by the latter merely had the effect of transferring the people from the country to the city.

(ii.) The Early *Roman* Empire (27 B.C.–A.D. 323).—Under the emperor Augustus Thessaly was incorporated with Macedonia; the rest of Greece was converted into the province of Achaea, under the control of a senatorial proconsul resident at Corinth. Several states, including Athens and Sparta, retained their rights as free cities. The provincials were encouraged to send delegates to a synod which met at Argos to consider the general interests of the country and to uphold national Hellenic sentiment; the Delphic amphictyony was revived and extended so as to represent in a similar fashion northern and central Greece.

Economic conditions did not greatly improve under the empire. Although new industries sprang up to meet the needs of Roman luxury, and Greek marble, textiles and table delicacies were in demand, the only cities which regained a flourishing trade were the partly Italian communities of Corinth and Patrae. Commerce languished in general, and the soil was mainly abandoned to pasturage. Such wealth as remained was amassed in the hands of a few great landowners and capitalists; the middle class continued to dwindle, and many people became dependent on doles and largesses.

After a long period of stress, the European Hellenes relapsed into a resigned frame of mind. Seeing no future before them, the inhabitants were content to dwell in contemplation amid the glories of the past. National pride was fostered by the undisguised respect with which the leading Romans treated Hellenic culture. A healthy social tone repressed the ostentatious display of wealth, and good taste long checked the spread of gladiatorial contests beyond the Italian community of Corinth. In order to perpetuate their old culture, the Greeks continued to set great store by classical education, and in Athens they possessed one of the chief universities in the Roman empire. The highest representatives of this type of old-world refinement are to be found in Dio Chrysostom and especially in Plutarch of Chaeroneia (*q.v.*). The Greeks had so far lost their warlike qualities that they supplied scarcely any recruits to the army. They retained too much local patriotism to crowd into the official careers of senators or imperial servants. Although in the 1st century A.D. the astute Greek man of affairs and the Graeculus *esuriens* of Juvenal abounded in Rome, both these classes were mainly derived from the less pure-blooded population beyond the Aegean. The influx of Greek rhetoricians and professors into Italy during the 2nd and 3rd centuries was balanced by the large number of travellers who came to Greece to frequent its sanatoria, and admire its works of art; the abundance in which these latter were preserved is strikingly attested in the extant record of Pausanias (about A.D. 170).

In A.D. 15 the Greeks petitioned Tiberius to transfer the administration to an imperial legate. This new arrangement was sanctioned, but only lasted till A.D. 44, when Claudius restored the province to the senate. The years 66 and 67 were marked by a visit of the emperor Nero, who made a prolonged tour in order to display his artistic accomplishments at the various national festivals. In return for the flattering reception accorded to him he besto ed freedom and exemption from tribute upon the country. But this favour was speedily revoked by the emperor Vespasian; and it was neutralized at the outset by the wholesale depredations of Nero among the Greek collections of art. Important material benefits were conferred by Hadrian, who made a lengthy visit to Greece. Besides erecting public works in many cities, he relieved Achaea of arrears of tribute and exempted it from various imposts. He fostered national sentiment by establishing a new pan-Hellenic congress at Athens. In the 3rd century Greece again experienced danger from foreign invasions. Already in 175 a tribe named Costoboci had penetrated into central Greece, but was there broken up by the local militia. In 253 a threatened attack was averted by the stubborn resistance of Thessalonica. In 267–268 the province was overrun by Gothic bands, which captured Athens and some other towns, but were finally repulsed by the Attic levies under Dexippus, the historian, and exterminated with the help of a Roman fleet.

(iii.) The Late Roman Empire.—After the reorganization of the empire by Diocletian, Achaea occupied a prominent position in the "diocese" of Moesia. Under Constantine I. Macedonia was a "diocese" of the "prefecture" of Illyricum, and was subdivided into the "eparchies" of Thessaly, Achaea (including some of the Ionian and Aegean Islands), "Old" Epeiros (including Corfu and Ithaca), and Crete while the other Greek islands formed an "eparchy" of the "diocese" of Asia. A complex hierarchy of imperial officials was introduced and the system of taxation elaborated so as to yield a steady revenue to the central power. The levying of the land-tax was imposed upon the δεκάπρωτοι or "ten leading men," who, like the Latin decuriones, were entrusted henceforth with the administration in most cities. The tendency to reduce all constitutions to the Roman municipal pattern became prevalent under the rulers of this period, and many were stereotyped by the general regulations of the Codex Theodosianus (438). Although the elevation of Constantinople to the rank of capital was prejudicial to Greece, which felt the competition of the new centre of culture and learning and had to part with numerous works of art to embellish its privileged neighbour, the general level of prosperity in the 4th century was rising. Commercial stagnation was checked by a renewed expansion of trade consequent upon the diversion of the trade routes to the east from Egypt to the Euxine and Aegean Seas. Agriculture remained depressed, and many small proprietors were reduced to serfdom; but the fiscal interests of the government called for the good treatment of this class, whose growth at the expense of the slaves was an important step in the gradual equalization of the entire population under the central despotism which restored solidarity to the Greek nation.

This prosperity received a sharp set-back by a series of unusually severe earthquakes in 375 and by the irruption of a host of Visigoths under Alaric (395–396), whom the imperial officers allowed to overrun the whole land unmolested and the local levies were unable to check. Though ultimately hunted down in Arcadia and induced to leave the province, Alaric had time to execute systematic devastations which crippled Greece for decades. The arrears of taxation which accumulated in consequence were

MEDIAEVAL AND ANCIENT GREECE

1. Monastery of St. Stephen, founded by the Byzantine emperor Andronicus III. in the 14th century; one of the 14 meteora or "hanging" monasteries built on isolated rocks in Thessaly, northern Greece. This monastery is separated from the around behind by a deep narrow chasm, which is spanned by a drawbridge (seen at the left centre of the picture). 2. Ruins at Delphi, uncovered on the spot known as the Marmaria. They comprise: two limestone Doric temples of the 4th and 5th centuries, one dedicated to *Athena Pronaia,* the other to *Athena Ergane;* and the Tholos, a circular marble building with Corinthian columns of the 5th century B.C.

reniitted by Theodosius II., the husband of an Athenian, in 428

The emperors of the 4th century attempted to stamp out by edict the old pagan religion. but except for the decree of Theodosius I. by which the Olympic games were interdicted (394), these measures had no great effect, and indeed were not rigorously enforced. Paganism survived in Greece till about 600—in the Laconian mountains still later. The sure footing gained by the Christian Church upon the Greeks was strengthened by the judicious manner in which the clergy, unsupported by official patronage and often out of sympathy with the Arian emperors, identified itself with the interests of the people. Though in the days when the orthodox Church found favour at court corruption spread among its higher branches, the clergy as a whole rendered conspicuous service in opposing the arbitrary interferences of the central government and in upholding the Hellenic tongue and culture.

The separation of the eastern and western provinces of the empire ultimately had an important effect in restoring the language and customs of Greece to their predominant position in the Levant. This result, however, was long retarded by the romanizing policy of Constantine and his successors. The emperors of the 5th and 6th centuries had no regard for Greek culture, and Justinian I. actively counteracted Hellenism by propagating Roman law in Greece, by impairing the powers of the self-governing cities, and by closing the philosophical schools at Athens (529). In course of time the inhabitants had so far forgotten their ancient culture that they abandoned the name of Hellenes for that of Romans (*Rhomaioi*). For a long time Greece continued to be an obscure and neglected province, with no interests beyond its church and its commercial operations, and its culture declined rapidly. Its history for some centuries dwindles into a record of barbarian invasions, plagues and earthquakes. In the 5th century Greece was only subjected to brief raids by Vandal pirates (466–474) and Ostrogoths (482). In Justinian's reign irruptions by Huns and Avars took place, but led to no far-reaching results. The emperor had endeavoured to strengthen the country's defences by repairing the fortifications of cities and frontier posts (530), but his policy of supplanting the local guards by imperial troops and so rendering the natives incapable of self-defence was ill-advised.

Towards the end of the century mention is made for the first time of a big incursion by Slavonic tribes (581). These invaders are to be regarded as the forerunners of a steady movement of immigration by which a considerable part of Greece passed for a time into foreign hands. The newcomers, consisting mainly of Slovenes and Wends, occupied the mountainous inland, where they mostly led a pastoral life; the natives retained some strips of plain and dwelt secure in their walled towns, among which the newly-built fortresses of Monemvasia, Corone and Calamata soon rose to prosperity. The Slavonic element, to judge by the geographical names in that tongue which survive, is specially marked in N.W. Greece and Peloponnesus; central Greece appears to have been protected against them by the fortress-square of Chalcis, Thebes, Corinth and Athens. The central government took no steps to dislodge the invaders, until in 783 the empress Irene sent an expedition which reduced most of the tribes to pay tribute. In 807 a desperate attempt by the Slavs to capture Patras was foiled; henceforth their power steadily decreased and their submission to the emperor was made complete by 850. A powerful factor in their subjugation was the Greek clergy, who by the 10th century had christianized and largely hellenized all the foreigners save a remnant in the peninsula of Maina.

II. The Byzantine Period.—In the 7th century the Greek language made its way into the imperial army and civil service, but European Greece continued to have little voice in the administration. The land was divided into four "themes" under a yearly appointed civil and military governor. Imperial troops were stationed at the chief strategic points, while the natives contributed ships for naval defence. During the dispute about images the Greeks were the backbone of the image-worshipping party, and the iconoclastic edicts of Leo III. led to a revolt in 727 which, however, was easily crushed by the imperial fleet; a similar movement in 823. when the Greeks sent 350 ships to aid a pretender, met with the same fate. The firm government of the Isaurian dynasty seems to have benefited Greece, whose commerce and industry again flourished. In spite of occasional set-backs due to the depredations of pirates, notably the Arab corsairs the Greeks remained the chief carriers in the Levant until the rise of the Italian republics, supplying all Europe with its silk fabrics.

In the 10th century Greece experienced a renewal of raids from the Balkan tribes. The Bulgarians made incursions after 929 and sometimes penetrated to the Isthmus; but in 995 their strength was broken by a crushing defeat on the Spercheios at the hands of the Byzantine army, and after a still greater victory, Basil II. "the Bulgar-slayer," in 1018 prayed in the church which had arisen out of the Parthenon. Yet their devastations greatly thinned the population of northern Greece, and after 1084 Thessaly was occupied without resistance by nomad tribes of Vlachs. In 1084 also Greece was subjected to the first attack from the new nations of the west, when the Sicilian Normans gained a footing in the Ionian islands. The same people made a notable raid upon the seaboard of Greece in 1146, and sacked the cities of Thebes and Corinth. The Venetians also appear as rivals of the Greeks, and after 1122 their encroachments in the Aegean Sea began. In spite of these attacks, the country on the whole maintained its prosperity.

III. The Latin Occupation and Turkish Conquest.—The capture of Constantinople and dissolution of the Byzantine empire by the Latins (1204) brought in its train an invasion of Greece by Frankish barons. The natives, who had long forgotten the use of arms and dreaded no worse oppression from their new masters, submitted almost without resistance, and practically only the N.W. corner of Greece, where Michael Angelus, a Byzantine prince, founded the "despotat" of Epirus, was saved from foreign occupation. The rest of the country was divided up between a number of Frankish barons, chief among whom were the princes of Achaea (or Peloponnese) and "grand lords" of Thebes and Athens, the Venetians, who held commercial stations at different maritime points, and the islands of Crete, and ultimately Euboea, and various Italian adventurers who mainly settled in the Cyclades which became "the duchy of the Archipelago" with Naxos as its capital. The conquerors transplanted their own language, customs and religion to their new possessions, and endeavoured to institute the feudal system of land-tenure, but they allowed the natives to retain their law and internal administration and confirmed proprietors in possession of their land on payment of a rent; the Greek church was subordinated to the Roman archbishops, and its dignitaries exiled. It later regained its former control over the people.

Greek history during the Latin occupation loses its unity and has to be followed in several threads. In the north the "despots" of Epirus extended their rule to Thessaly and Macedonia, but eventually were repulsed by the Asiatic Greeks of Nicaea, and after a decisive defeat at Pelagonia (1259) reduced to a small dominion in Epirus, while Thessaly from 1271 to 1318 was governed by a branch line of the Epirote dynasty, when it was united with the Catalan duchy of Athens. In 1349 it was conquered along with Epirus by Stephen Dushan, tsar of Serbia. In 1393 it was annexed by the Ottoman Turks, who in 1479 wrested the last fortress in Epirus from its latest possessors, the Beneventine family of Tocco, which from 1357 had held the Palatine County of Cephalonia, likewise annexed by the Turks in 1479 but soon occupied by the Venetians.

The leading power in central Greece was the Burgundian house de la Roche, which established a mild and judicious government in Boeotia and Attica, and which in 1261 was raised to ducal rank by the French king Louis IX. A conflict with the Grand Catalan Company resulted in a disastrous defeat of the Franks on the Boeotian Cephissus (1311) and the occupation of central Greece by the Spanish mercenaries, who seized for themselves the barons' fiefs and installed princes from the Sicilian house of Aragon as dukes of Athens and soon of Neopatras (Hypate). These absentees after 77 years of oppressive rule and constant wars with their neighbours the Catalans were expelled by the Floren-

tine Lord of Corinth, Nerio Acciaiuoli. The new dynasty, whose peaceful government revived its subjects' industry, survived a brief Venetian occupation, but was deposed by Sultan Mohammed II., who annexed Athens in 1456, and Thebes with the rest of Boeotia in 1460.

The conquest of the Peloponnese was effected by two French knights, William Champlitte and Geoffrey Villehardouin, the latter of whom founded a dynasty of "princes of all Achaea." The rulers of this line were men of ability, who controlled their barons and spiritual vassals with a firm hand and established good order throughout their province. The Franks of the Morea maintained as high a standard of culture as their compatriots at home, while the natives grew rich enough from their industry to pay considerable taxes without discontent. The climax of the Villehardouins' power was attained under Prince William, who subdued the Byzantine Gibraltar of Monemoasia and the mountaineers of Maina (1246–1249). In 1259, however, the same ruler was involved in the war between the rulers of Epirus and Nicaea, and being captured at the battle of Pelagonia, could only ransom himself by the cession of the Frankish quadrilateral of Monemoasia, Maina, Mistrã and perhaps Geraki in 1262 to the restored Byzantine empire. This Byzantine province with its capital at Mistrã after 1348 was treated with great care by the Byzantine monarchs, who sought to repress the violence of the local aristocracies by sending their kinsmen to govern under the title of "despots." On the other hand, with the extinction of the Villehardouin dynasty the Frankish province fell into anarchy; at the same time the numbers of the foreigners were constantly dwindling through war, and as they disdained to recruit them by intermarriage, the preponderance of the native element in the Morea eventually became complete. Thus by 1400 the Byzantines recovered control over almost the whole peninsula and apportioned it among several "despots," and in 1432 the last Frankish prince of Achaea died and the whole of the Peloponnese was Greek. But the mutual quarrels of these princes soon proved fatal to their rule. Already in the 14th century they had employed Albanians and the Turkish pirates who harried their coasts as auxiliaries in their wars. The Albanians largely remained as settlers, and the connection with the Turks could no longer be shaken off. In spite of attempts to fortify the Isthmus (1415) an Ottoman army penetrated into the Morea and imposed a tribute on the'inhabitants in 1423. An invasion of central Greece by the despot Constantine, afterwards the last Greek emperor, was punished by a renewed raid in 1446. In 1457, his brother, the despot Thomas withheld the tribute which he had recently stipulated to pay, but was reduced to obedience by an expedition under Mahommed II. (1458). His quarrels with his brother Demetrius and inability to pay the tribute was punished by an invasion attended with executions and deportations on a large scale, and by the annexation of the Morea to Turkey (1460).

MODERN HISTORY

The Turkish Dominion till 1800.—Under the Ottoman government Greece proper was split up into six *sanjaks* or military divisions: (1) Morea, (2) Epirus, (3) Thessaly, (4) Euboea, Boeotia and Attica, (5) Aetolia and Acarnania, (6) the rest of central Greece, with capitals at Nauplia, Yannina, Trikkala, Negropont (Chalkis), Karlili and Lepanto; further divisions were subsequently composed of Crete and the islands. In each *sanjak* a number of fiefs were apportioned to Turkish settlers, who were bound in return to furnish some mounted men for the sultan's army, the total force thus held in readiness being over 7,000. The local government was left in the hands of the *demogérontes* or primates in each community, who also undertook the farming of the taxes and the policing of their districts. Law was usually administered by the Greek clergy. The natives were not burdened with large imposts, but suffered under the method of raising the land-tithes, the capitation-tax, the requisition of forced labour and the tribute of children for the janissaries (*q.v.*), as well as under oppression from Turkish or native local potentates, which the weak central government was powerless to suppress. The new rulers met with singularly little opposition. The dangerous elements of the population had been cleared away by Mohammed's executions; the rest were content to absorb their energies in agriculture and commerce, which in spite of preferential duties and capitulations to foreign powers largely fell again into the hands of Greeks. Another important instrument by which the people were kept down was their own clergy, whom the Turkish rulers treated with marked favour and so induced to acquiesce in their dominion.

In the following centuries Greece was often the theatre of war in which the Greeks played but a passive part. Two wars with Venice (1463–79, 1499–1503) put the Turks in possession of the last Venetian strongholds on the mainland, except Nauplia and Monemvasia, lost in 1540. But the issue was mainly fought out at sea. Greek ships and sailors were frequently requisitioned for the Turkish fleets, and the damage done to the Greek seaboard by the belligerents and by fleets of adventurers and corsairs brought about the depopulation of many islands and coast-strips. The conquest of the Aegean, except Tenos, by the Ottomans was completed by 1566; but Venice retained Crete till 1669 and never lost Corfu until its cession to France in 1797.

In 1684 the Venetians took advantage of the preoccupation of Turkey on the Danube to attack the Morea. By 1687 they had conquered almost the whole peninsula, and also captured Athens and Lepanto; but the former town had soon to be abandoned, and with their failure to capture Negropont (1688) the Venetians were brought to a standstill. By the peace of Karlowitz (1699) the Morea became a possession of Venice. The new rulers, in spite of the commercial restrictions which they imposed in favour of their own traders, checked the impoverishment and decrease of population (from 300,000 to 86,000) which the war had caused. But their rule, though mild, was not popular, and the population failed to support them when the Ottomans again attacked the Morea (1715), which by the peace of Passarowitz (1718) again became a Turkish dependency. The gaps left about this time in the Greek population were largely made up by an immigration from Albania.

The condition of the Greeks improved in the 18th century. Already in the 17th century the personal services of the subjects had been commuted into money contributions, and since 1676 the tribute of children had fallen into abeyance. Greek officials were increasingly used in the Turkish civil service and privileges were accorded to the Greek clergy throughout the Balkan countries. The education of the Greeks, which had always remained on a comparatively high level, was rapidly improved by the foundation of new schools and academies, especially at Yannina.

At the beginning of the 19th century Greece was still under Turkish domination; but the decadence of the Ottoman empire already showed in the weakening of the central power, the spread of anarchy in the provinces, the ravages of the janissaries, and the establishment of practically independent sovereignties or fiefs, such as those of Mehemet of Bushat at Skodra and of Ali Pasha of Tepelen at Yannina. In some of the remoter districts, indeed, the authority of the Turks had never been completely established; among the Greeks, the Mainotes in the extreme south of the Morea and the Sphakiote mountaineers in Crete had never been completely subdued. Resistance to Ottoman rule was maintained sporadically in the mountainous districts by the Greek *klephts* or brigands and by the pirates of the Aegean; the armatoles (*q.v.*) or bodies of Christian warriors, recognized by the Turks as a local police, often differed little in their proceedings from the brigands whom they were appointed to pursue.

The Greek Revolution.—The Greek Revolution of 1821, like the Serbian of 1804, owed much to Russia, who coveted Constantinople for herself. The policy of inciting the Greek Christians to revolt against their oppressors, first adopted in the reign of Anna, was put into practical operation by Catharine II., whose favourite, Orlov, appeared in the Aegean with a fleet in 1769 and landed in the Morea, where he organized a revolt. The attempt proved a failure; Orlov re-embarked, leaving the Greeks at the mercy of the Turks, and terrible massacres took place at Tripolitza, Lemnos and elsewhere, and the ravages of the Albanians completed what their Turkish comrades began.

By the treaty of Kutchuk-Kainarji (1774) Russia obtained a vaguely defined protectorate over the Orthodox Greek subjects in Turkey, and the Greek traders the valuable right to sail under the Russian flag.

Under the influence of the French Revolution the sentiment of nationality and an ardent desire for political freedom awoke in the Greeks. The national awakening was preceded by a literary revival. Literary societies, like that of the *Philomousoi* at Athens came into existence; schools were founded; the philological labours of Coraes (*q.v.*) which created the modern written language, furnished the nation with a mode of literary expression; the songs of Rhigas of Velestino fired the enthusiasm of the people. In 1815 was founded the celebrated *Philiké* Hetairia, or friendly society, a revolutionary organization with centres at Moscow, Bucharest, Trieste, and in all the cities of the Levant; it collected subscriptions, issued manifestos, distributed arms and made preparations for the coming insurrection. The revolt of Ali Pasha of Yannina against the authority of the sultan in 1820 formed the prelude to the Greek uprising; this despot, who had massacred the Greeks by hundreds, now declared himself their friend, and became a member of the *Hetairia*. In March 1821 Alexander Ypsilanti, a former aide-de-camp of the Tsar Alexander I., and president of the Hetairia, entered Moldavia from Russian territory at the head of a small force; in the same month Archbishop Germanos of Patras unfurled the standard of revolt at Hagia Lavra near Kalavryta in the Morea.

Independence of Greece.—For the history of the prolonged struggle which followed, see GREEK INDEPENDENCE, WAR OF. The warfare was practically brought to a close by the annihilation of the Egyptian fleet at Navarino by the fleets of Great Britain, France and Russia on Oct. 20, 1827. Nine months previously, Count John Capo d'Istria (*q.v.*), formerly minister of foreign affairs of the tsar Alexander, had been elected president of the Greek republic for seven years beginning on Jan. 18, 1828. By the protocol of London (March 22, 1829) the Greek mainland south of a line drawn from the Gulf of Arta to the Gulf of Volo, the Morea and the Cyclades were declared a principality tributary to the sultan under a Christian prince. The limits drawn by the protocol of London were confirmed by the treaty of Adrianople (Sept. 14, 1829), by which Greece was constituted an independent monarchy; but a new protocol (Feb. 3, 1830), moved the boundary line down to the Aspropotamo, the Spercheios and the Gulf of Lamia. Prince Leopold of Saxe-Coburg-Gotha, to whom the throne of this reduced kingdom was offered, declined it. Capo d'Istria, whose Russian proclivities and arbitrary government gave great offence to the Greeks, was assassinated at Nauplia (Oct. 9, 1831), and a state of anarchy followed.

By the convention of London (May 7, 1832) Greece was declared an independent kingdom under the protection of Great Britain, France and Russia, with Prince Otho, son of King Louis I. of Bavaria, as king. The frontier line, now traced from the Gulf of Arta to the Gulf of Lamia, was fixed by the arrangement of Constantinople (July 21, 1832). King Otho's despotic rule, and his employment of Bavarian advisers and troops, to the exclusion of the Greeks, was unpopular. On Sept. 15, 1843 a military revolt compelled the king to dismiss the Bavarians and accept a constitution. A responsible ministry, a senate nominated by the king, and a chamber elected by universal suffrage were now instituted. Mavrocardatos, the leader of the English party, became the first prime minister, but was replaced after the ensuing elections by a coalition of the French and Russian parties under Kolettes and Metaxas. On the outbreak of hostilities between Russia and Turkey in 1853 the Greeks displayed sympathy with Russia; armed bands were sent into Thessaly, and an insurrection was fomented in Epirus in the hope of securing an accession of territory. In order to prevent further hostile action on the part of Greece, British and French fleets made a demonstration against the Peiraeeus, which was occupied by an Anglo-French force during the Crimean War. Meanwhile, a new generation had arisen, with which the childless and irresolute Otho was unpopular. In 1862 a military revolt broke out, and a national assembly pronounced his deposition. In the following year Prince William George of Schleswig-Holstein-Sonderhurg-Gliicksburg, designated by the British government, was elected by the National Assembly with the title "George I., king of the Hellenes." Under the treaty of London (July 13, 1863) the change of dynasty was sanctioned by the three protecting powers, Great Britain undertaking to cede to Greece the seven Ionian Islands (*q.v.*), which since 1815 had formed a commonwealth under British protection.

Accession of George 1.—After an interregnum. marked by heavy street-fighting in Athens between the rival factions of "The Plain" and "The Mountain," the new sovereign arrived in Athens on Oct. 29, 1863, and in the following June the British authorities handed over the Ionian Islands to a Greek commissioner. King George thus began his reign under favourable auspices, the patriotic sentiments of the Greeks being flattered by the acquisition of new territory. He was, however, soon confronted with constitutional difficulties; party spirit ran riot at Athens, and the ministries which he appointed proved shortlived. At last the new constitution, which established a highly democratic, unicameral system, was passed in 1864. This, the second constitution voted since the establishment of the kingdom, remained in force till 1911. In 1865 Count Sponneck, the king's tactless Danish adviser, left Greece, and the attention of the nation was concentrated on the affairs of Crete (*q.v.*). The revolution which broke out in that island received moral and material support from the Greek government, with the tacit approval of Russia; military preparations were pressed forward at Athens, and cruisers were purchased, and although the king discouraged this provocative attitude, and eventually dismissed the bellicose cabinet of Koumoundouros, relations with the Porte grew ever worse, and Hobart Pasha, with a Turkish fleet, made a demonstration off Syra. The Cretan insurrection was crushed in the spring of 1869, and a conference of the powers, which assembled that year at Paris, imposed a settlement of the Turkish dispute on Greece, but took no steps on behalf of the Cretans. In 1875, after an acute constitutional crisis, Charilaos Tricoupis, who but ten months previously had been imprisoned for denouncing the crown in a newspaper article, was summoned to form a cabinet. This remarkable man, the greatest statesman whom modern Greece had hitherto produced, exercised an extraordinary influence over his countrymen. His principal opponent, Theodoros Delyanni, succeeded in rallying a strong body of adherents, and political parties, hitherto divided into numerous factions, centred around these two figures.

The Frontier of 1881.—In 1877 the outbreak of the Russo-Turkish War produced a fever of excitement in Greece. A coalition cabinet, the "great" or "oecumenical" ministry, now came into existence under the presidency of the veteran Kanares; in reality, however, it was controlled by Tricoupis, who, recognizing the unpreparedness of the country, resolved on a pacific policy. The capture of Plevna by the Russians brought about the fall of the "oecumenical" ministry, and Koumoundouros and Delyanni, who succeeded to power, ordered the invasion of Thessaly. The treaty of San Stefano (1878) checked these activities, and left Greece without the extension she desired; but the Congress of Berlin, where her delegates obtained a hearing, suggested a rectification of her frontier between herself and Turkey. It was suggested that the new line should extend from the valley of the Peneus on the east to the mouth of the Kalamas, opposite the southern extremity of Corfu, on the west. A Graeco-Turkish commission having failed to reach agreement, Greece invoked the arbitration of the powers, and in 1880 a conference of ambassadors at Berlin approved a line which was practically that suggested by the congress. Turkey, however, refused to accept it, and the Greek army was once more mobilized; but by a convention signed at Constantinople in July 1881, the demarcation was entrusted to an international commission. The line drawn ran westwards from a point between the mouth of the Peneus and Platamona to the summits of Mounts Kritiri and Zygos, thence following the course of the river Arta to its mouth. An area of 13,395 sq. kilo., with a population of 300,000, was thus added to the kingdom, while Turkey was left in possession of Yannina, Metzovo and the rest of Epirus except the district of Arta. The ceded territory was occupied by Greek troops before the close of the year.

Tricoupis and **Delyanni.**—In 1882 Tricoupis came into power at the head of a strong party. With the exception of three brief intervals, he continued in office for the next 12 years. The reforms which he introduced during this period were generally unpopular, and most of them were cancelled during the intervals uhen his opponent Delyanni occupied the premiership. The same want of continuity proved fatal to the somewhat ambitious financial programme which he now inaugurated. While pursuing a cautious foreign policy, he shared the national desire for expansion, but thought it necessary first to develop the material resources of the country. With this view he made railways and endeavoured to attract foreign capital to the country, and the confidence which he inspired in financial circles abroad enabled him to contract a number of loans and to better the financial situation by a series of conversions. In April 1885 Tricoupis fell from power, and a few months later the indignation excited in Greece by the revolution of Philippopolis placed Delyanni once more at the head of a warlike movement. The army and fleet were again mobilized with a view to exacting territorial compensation for the aggrandizement of Bulgaria, and several conflicts with the Turkish troops took place on the frontier. The powers, after repeatedly inviting the Delyanni cabinet to disarm, established a blockade of Peiraeeus and other Greek ports (May 8, 1886), France alone declining to co-operate. Delyanni resigned (May 11) and Tricoupis, who succeeded to power, issued a decree of disarmament. Hostilities, however, continued on the frontier, and the blockade was not raised till June 7. Tricoupis had now to face the serious financial situation brought about by the military activity of his predecessor. He imposed heavy taxation, which the people, for the time at least, bore without murmuring, and inspired such confidence abroad that Greek securities maintained their price in the foreign market. Meanwhile the Cretan difficulty had become once more a source of trouble to Greece. In 1889 Tricoupis was grossly deceived by the Turkish government, which, after inducing him to dissuade the Cretans from opposing the occupation of certain fortified posts, issued a firman annulling many important provisions in the constitution of the island. The indignation in Greece was intense, and popular discontent was increased when the Bulgarians succeeded in obtaining the *exequatur* of the sultan for a number of bishops in Macedonia. In 1890 Tricoupis was beaten at the elections, but reappointed by the king in view of the financial situation, to which Delyanni proved unequal. He resigned again in May 1893. The Sotiropoulos-Rhalles ministry which followed effected a temporary settlement with the national creditors, but Tricoupis, returning to power in the autumn, at once annulled the arrangement, and introduced a series of arbitrary measures which provoked the severest criticism throughout Europe and exposed Greece to the determined hostility of Germany. A law was hastily passed which deprived the creditors of 70% of their interest, and the proceeds of the revenues conceded to the monopoly bondholders were seized (Dec. 1893). Long negotiations followed, resulting in an arrangement which was subsequently reversed by the German bondholders. In Jan. 1895 Tricoupis resigned office and died at Cannes on April 11, 1896.

The Cretan Question.—National sentiment had been depressed for a time by the economic misfortunes of Greece; but a secret patriotic society, known as the *Ethniké* Hetairia, now began to develop prodigious activity, enrolling members from every rank of life and establishing branches in all parts of the Hellenic world. The society had been founded in 1894 by a handful of young officers who considered that the military organization of the country was neglected by the government; its principal aim was the preparation of an insurrectionary movement in Macedonia, which, owing to the activity of the Bulgarians and the reconciliation of Prince Ferdinand with Russia, seemed likely to be withdrawn forever from the domain of Greek irredentism. The outbreak of another insurrection in Crete supplied the means of creating a diversion for Turkey while the movement in Macedonia was being matured; arms and volunteers were shipped to the island, but Delyanni, who had succeeded Tricoupis in 1895, loyally aided the powers in the restoration of order by advising the Cretans to accept the constitution of 1896. The unrest and agitation in Crete, however, continued and culminated in an outbreak at Canea on Feb. 4, 1897.

Delyanni now announced that the government had abandoned the policy of abstention. Two warships were despatched to Canea, and a torpedo flotilla, commanded by Prince George, left Peiraeeus, ostensibly to protect Greek subjects in Crete. Delyanni was still anxious to avoid a definite rupture with Turkey, but the Ethnikk Hetairia had found means to influence several members of the ministry and to alarm the king. Prince George soon withdrew from Cretan waters owing to the decisive attitude adopted by the commanders of the international squadron. A note was addressed to the powers, declaring that Greece could no longer remain a passive spectator of events in Crete, and on Feb. 13, 1,joo men, under Colonel Vassos, embarked at Peiraeeus. On the same day a Greek warship fired on a Turkish steam yacht which was conveying troops from Candia to Sitia. Landing near Canea Colonel Vassos announced the occupation of Crete in the name of King George; but his advance on Canea was arrested by the international occupation of that town, and after a few engagements with the Turkish troops and irregulars he withdrew into the interior of the island. Proposals for the coercion of Greece were now put forward by Germany, but Great Britain declined to take action until an understanding had been reached on the future government of Crete. Eventually collective notes were addressed to the Greek and Turkish governments announcing the decision of the powers that (1) Crete could in no case in present circumstances be annexed to Greece; (2) in view of the delays caused by Turkey in the application of the reforms, Crete should be endowed with an effective autonomous administration under the suzerainty of the sultan. Greece was summoned to remove its army and fleet within six days, and Turkey was warned that its troops must for the present be concentrated in the fortified towns and ultimately withdrawn. The action of the powers exasperated the populace of Athens, who demanded war with Turkey and the annexation of Crete, and the government drew up a reply to the powers in which, while expressing the conviction that autonoiny would prove a failure, it indicated its readiness to withdraw some of the ships, but declined to recall the army. Meanwhile troops, volunteers and munitions of war were hurriedly despatched to the Turkish frontier in anticipation of an international blockade of the Greek ports, but the powers contented themselves with a pacific blockade of Crete.

On March 29 the crown prince assumed command of the Greek troops in Thessaly, and a few days later hostilities were precipitated by the irregular forces of the *Ethniké Hetairia,* which attacked several Turkish outposts near Grevena. On April 17 Turkey declared war. A brief and disastrous campaign followed (see GRAECO-TURKISH WAR), After the evacuation of Larissa on the 24th, great discontent prevailed at Athens; Delyanni was dismissed (April 29); his successor, Rhalles, after recalling the army from Crete (May 9) invoked the mediation of the powers, and an armistice was concluded on the 19th. The conditions of peace put forward by Turkey included a war indemnity of £10,000,000 and the retention of Thessaly; the latter demand, however, was resolutely opposed by Great Britain, and the indemnity was subsequently reduced to £4,000,000. The terms agreed to by the powers were rejected by Rhalles; the chamber, however, refused him a vote of confidence and King George summoned Zaimes to power (Oct. 3). The definitive treaty of peace, which was signed at Constantinople on Dec 6, gave Turkey a slight modification of the frontier. Her troops finally evacuated Thessaly in June 1898. An immediate result of the war was the institution of an international financial commission at Athens, charged with the control of certain revenues assigned to the service of the national debt. The state of the country after the conclusion of hostilities was deplorable; the towns of northern Greece and the islands were crowded with destitute refugees from Thessaly; violent recriminations prevailed at Athens, and the position of the dynasty seemed endangered; but a reaction set in, in consequence of an attempt to assassinate King George (Feb. 28, 1898). In the autumn the powers, on the initiative of Russia, decided

to entrust Prince George of Greece with the government of Crete; on Nov. 26 he was formally appointed high commissioner, and landed in Crete on Dec. 21 (see CRETE).

Macedonian Agitation.—In April 1899 Zaimes gave way to Theotokes, the chief of the Trikoupist party. In May 1901 a meeting took place at Abbazia, under the auspices of the Austro-Hungarian government, between King George and King Charles of Rumania with a view to the conclusion of a Graeco-Rumanian understanding directed against the growth of Slavonic, and especially Bulgarian, influence in Macedonia. Owing to Rumanian propaganda, however, the compact was short-lived. The internal situation was unstable; owing partly to the Macedonian situation and partly to disturbances in the currant-growing districts. Ten ministries were formed within six years under Theotokes, Delyanni, Rhalles and Zaimes. Delyanni nas assassinated on June 13, 1905, and at last, in April 1906, Theotokes secured a large majority. In the meanwhile the friendship of Turkey had been cultivated, bands were sent into Macedonia to counteract the Bulgarian influence and relations had become very strained with Bulgaria and (since 1905) with Rumania. On Sept. 26, 1906, Prince George, who had resigned the high commissionership of Crete, returned to Athens; the designation of his successors was accorded by the protecting powers to King George as a satisfaction to Greek national sentiment (see CRETE). The great increase in the activity of the Greek bands in Macedonia during the following spring and summer led to the delivery of a Turkish note at Athens (July 1907), which was supported by representations of the powers.

In Oct. 1908 the proclamation by the Cretan assembly of union with Greece threatened fresh complications, the cautious attitude of the Greek government leading to an agitation in the army, which came to a head in 1909. On July 18 a popular demonstration against his Cretan policy led to the resignation of Theotokes. His successor, Rhalles, announced a programme of military and economical reform. The army, however, took matters into its own hands, and on Aug. 23 Rhalles was replaced by Mavromichales, the nominee of the "Military League." For the next six months constitutional government was practically superseded by that of the league, which in Jan. 1910 summoned Venizelos from Crete as its political adviser. On Feb. 7, 1910, Mavromichales resigned, and his successor, Dragoumis, accepting Venizelos' suggestion of a national assembly, persuaded the league to dissolve on receiving the king's assurance that such an assembly would be convened—a promise fulfilled on March 31.

But the obstruction of the party leaders soon obliged Venizelos to take the premiership himself and to appeal once more to the electorate. When the second revisionary National Assembly met on Jan. 22, 1911, he took office at the head of an overwhelming majority. During the following 18 months the constitution was revised, internal administration was thoroughly overhauled, army and navy were remodelled under French and British missions.

The Balkan Wars.—A treaty was signed with Bulgaria (May 1912) who had already signed a treaty with Serbia for the partition of Macedonia, and in October, the first Balkan War (*q.v.*) broke out. Turkey offered Greece the island of Crete and other concessions to remain neutral. Venizelos, however, realized the importance of including Greece in the new grouping. The long-excluded Cretan deputies were admitted to the Greek Chamber and Greece declared war on Turkey on Oct. 18, 1912.

The Balkan allies gained rapid success. The Greek army cleared Macedonia and occupied Salonika; the fleet blockaded the Dardanelles. Greece refused to sign the armistice obtained from the other allies (Dec. 3) but joined the conference which met a fortnight later in London. Hostilities were re-opened on Feb. 3, 1913. But after Adrianople had surrendered to Bulgarians and Serbs, Scutari to the Montenegrins, and Yannina to the Greeks under Prince Constantine—who 12 days later (March 18) became king on the assassination of his father George I. at Salonika—Turkey by the Treaty of London (May 30) signed away to the Balkan allies all her territory in Europe west of a line drawn from Midia on the Black sea to Enos on the Aegean sea, leaving the Powers to settle the problems of Albania and the Aegean Islands.

Disputes between the late allies led to the conclusion of a defensive alliance between Greece and Serbia in June, followed by war with Bulgaria (June 30). The treaty of Bucharest (Aug. 10, 1913) excluded Bulgaria from the Aegean port of Kavalla (*q.v.*) and carried the frontier of Greek Macedonia eastwards to the river Mesta and northwards to Doiran and Florina.

The Aegean Islands.—The Powers assigned to Greece (Conference of London, Feb. 1914) all the islands of the Aegean occupied by the Greek fleet during the war, with the exception of Tenedos and Imbros and of the islands of the Dodecanese (*q.v.*) which Italy had occupied in 1912 as security for the Turkish fulfilment of the first Treaty of Lausanne pledging her good faith that her occupation should be temporary. After the World War, Venizelos negotiated an agreement with Signor Tittoni (July 29, 1919) by which all these islands except Rhodes were to revert to Greece unconditionally. This was renewed by the Graeco-Italian treaty of Aug. 10, 1920, with the addition that, if Great Britain gave Cyprus to Greece, Italy would allow a plebiscite in Rhodes on union with Greece, but not till 1935. These Tittoni agreements were repudiated by Italy, who remained in occupation of the Dodecanese after the non-ratification of the Treaty of Sèvres By the Treaty of Lausanne (July 24, 1923) Turkey renounced in favour of Italy all rights over the Dodecanese, and recognized Greek sovereignty over the remaining islands as conferred by the Conference of London, subject to certain provisions for their demilitarization, with the exception of Imbros and Tenedos. which were retroceded to Turkey on condition that they should enjoy full local autonomy—a condition which remained unfulfilled.

The World War.—Greece thus emerged from the Balkan wars with a very large acquisition of territory in Epirus, Macedonia, Crete and the Aegean Islands, with a total population of over 1,800,000, or almost as much as that of "Old Greece." Turkey's refusal to recognize the ruling of the London Conference was accompanied by a boycott of Greek shipping and an organized persecution of the Greeks in Asia Minor. But her evident intention of re-opening hostilities with Greece was anticipated by the outbreak of the World War. While King Constantine inclined to Germany, Venizelos' government strongly supported the Western powers, and prepared to move against Bulgaria, if necessary, in accordance with the Graeco-Serb treaty.

In Feb. 1915, when Britain definitely required Greek help for attacking the Dardanelles, the proposals of Venizelos for specific Greek forces to co-operate with the British fleet were unanimously approved by his own majority in the Chamber, and by a Crown Council of all the political leaders in the kingdom. King Constantine however dismissed Venizelos and dissolved the Chamber (April 10, 1915). The new premier, Gounaris, represented Venizelos as inspired only by love of war and hatred of the king. King Constantine was thus brought into party politics as a personal opponent of Venizelos and leader of the policy of neutrality. In mid-June the electors nevertheless returned the Liberal (Venizelist) party with a majority. But when Venizelos, after a delay excused by the king's illness, at last returned to office (Aug. 22), his efforts to immobilize Bulgaria by threatening Greek action were useless, because Germany had already been secretly informed that Greek neutrality would be guaranteed by King Constantine even in the event of a Bulgarian attack on Serbia. Bulgaria mobilized on Sept. 19, 1915, and King Constantine allowed his prime minister to order a counter-mobilization, and even to suggest to Britain and France that they might reinforce the Graeco-Serbian co-operation with some of their own troops, a suggestion which led to the Allied landing at Salonika. But as soon as Venizelos, on the eve of the Bulgarian attack, explained once more his policy of defending Serbia and received a vote of confidence, he was abruptly dismissed, and M. Zaimes was put up to explain that the Graeco-Serbian Treaty had a "purely Balkan character." The Chamber was again dissolved and elections held in December. The Liberals abstained from the polls, as a protest against this second and unconstitutional dissolution, and a government was formed under M. Skouloudes (Nov. 6), who declared "very benevolent neutrality" towards the Entente.

The "Three Protecting Powers," Britain, France and Russia, demanded certain administrative changes which might prevent any connivance between the government and the German espionage (June 21, 1916). The Greek army, which owing to the known sentiments of its general staff threatened the Allied base at Salonika, was at last demobilized; whereupon the Bulgarians invaded Macedonia and seized Kavalla. Meanwhile King Constantine frequently changed his premiers, and asked the French or British minister to suggest terms on which it might suit him to abandon his "neutrality." When, in August, Rumania joined the Allies and the king still refused to move, Venizelos seceded to Salonika (Sept. 25, 1916) with General Dangles and Admiral Condouriotes, set up a provisional government and began to organize a state militant. The Allies at first refused official recognition to the Salonika government. At Athens the French admiral suggested that King Constantine might surrender some of his war material. The king was understood to consent; but when French and British marines landed to take delivery they were shot down by Greek troops (Dec. 1, 1916).

The Allies then broke off relations with the king, but, owing to the hesitations of Russia and Italy, did not demand his abdication till June 1917. He retired to Switzerland (June 12) and his second son Alexander was put on the throne. Venizelos returned to Athens as prime minister, recalled the Chamber, which had been unconstitutionally dissolved in Nov. 1915, and formally declared war against Germany, Turkey and Bulgaria (June 29). In July 1918, 250,000 Greek troops shared in the Macedonian offensive which culminated in the capitulation of Bulgaria (Sept. 30, 1918).

Treaty of **Sèvres** and Fall of **Venizelos.**—By the Treaty of Neuilly (*q.v.*) to which was annexed a Graeco-Bulgarian convention for the protection of racial minorities, etc. (Nov. 27, 1919), Bulgaria was cut off from the Aegean, the Allies undertaking to ensure her an "economic outlet." The Treaty of Sèvres (*q.v.*) (Aug. 10, 1920) assigned to Greece the greater part of Thrace, and also the basin and *Hinterland* of Smyrna under a strictly controlled régime. Greek troops had landed at Smyrna at the request of the Supreme Council on May 15, 1919. Venizelos had meanwhile lost touch with his people, and the government at Athens had proved incompetent. The resulting discontents were exploited by Constantine's agents. King Alexander having died (Oct. 25) and his younger brother Prince Paul having refused the government's offer of the throne, the restoration of King Constantine became the real issue at the general election. On Nov. 14, 1920, Venizelos was heavily defeated at the polls. He resigned, and with many of his ministers left the country. A government was formed by the aged Demetrios Rhalles which entrusted the regency to the Dowager Queen Olga. After a plebiscite King Constantine returned to Athens (Dec. 19, 1920). The Allied Powers refused to recognize him officially, withdrew their financial assistance, and agreed to reconsider the Treaty of Sèvres, which though signed had not been ratified. Greece was isolated; France and Italy both, overtly or covertly, supported Turkey, and Great Britain declined to embark on Eastern adventures.

Graeco-Turkish War.—Yet the new premier M. Kalogeropoulos (Feb. 7, 1921) and his successor M. Gounaris (April 7) rejected the moderate proposals of a conference of the Three Powers (Britain France and Italy) which met in London (Feb. 21) to reconsider the Treaty of Sèvres; and instead promoted an offensive which, after seizing Afiun Qarahisar and Eskishehr, was disastrously defeated. King Constantine left for Smyrna, rejecting the friendly mediation of the Allied Powers. The Greek forces opened their new offensive in July, but in August were defeated on the river Sakkaria with very heavy losses. King Constantine returned to Athens and Gounaris and his foreign minister Baltatzes left for London and placed the interests of Greece without reserve in the hands of Lord Curzon. Meanwhile the French "Franklin-Bouillon" agreement with Kemal had been signed at Angora on the anniversary of Navarino (Oct. 20) and Lord Curzon's ability to make peace was limited by the difficulty of coming to a preliminary agreement with France and Italy. Gounaris gave up all claim to the balance of credits guaranteed to Greece by the Allies during the Great War and received in return permission to raise a loan on the open market. When the Near East Conference met in Paris, proposals for an armistice and the evacuation of Asia Minor by the Greek army were transmitted to Athens and the two Turkish governments of Constantinople and Angora.

A few days before, Gounaris had privately addressed to Lord Curzon a desperate appeal for help. On May 11, 1922, he resigned and joined M. Stratos in a coalition under the premiership of M. Protopapadakes, who had previously as Minister of Finance raised a forced internal loan by cutting in half all the bank-notes in circulation. The first act of the new government was to remove the commander-in-chief, General Papoulas, and to appoint in his stead General Hadjianestes. In July the government had the independence of Ionia proclaimed by the high commissioner of Smyrna, M. Sterghiades. The Turks attacked on Aug. 26 and entered Smyrna on Sept. 9, 1922; five days later the whole city, with the exception of the Turkish quarter, was burned to the ground.

Revolution of **Chios.**—The government resigned on Sept. 8 after ordering the demobilization of the troops. Many units landed on Chios; and there a revolution headed by Colonel Plasteras broke out on Sept. 26. King Constantine left the country and died in the following January at Palermo. His eldest son, George, became king. Eight of his principal ministers and advisers indicted by a special commission of enquiry were tried before an extraordinary court-martial of 11 officers. Six of the accused (Gounaris, Stratos, Baltatzes, Theotokes, Protopapadakes and Hadjianestes) were shot (Nov. 28, 1922). The executions shocked Europe, and Great Britain withdrew her minister from Athens. A small but efficient army, re-formed on the Thracian frontier under the command of General Pangalos, greatly strengthened the hands of the Greek representative (Venizelos, who had consented to represent his country abroad) at the second conference of Lausanne which finally succeeded in signing peace with the Turks on July 24, 1923.

Refugees and Minorities.—Meanwhile the revolutionary government after proclaiming an amnesty for all political offences was confronted with the problem of the 1,400,000 refugees from Asia Minor. A loan of £10,000,000 was raised (Dec. 1924) the administration of which was guaranteed by the League of Nations. In 18 months the Refugee Settlement Commission of the League of Nations had settled more than half-a-million refugees in new villages and urban districts throughout Greece. This settlement increased the homogeneity of population on the Greek frontiers, where the problem of alien minorities had already been reduced by a system of exchanging populations, embodied in the Graeco-Bulgarian Convention (1919) for the voluntary emigration of minorities and the Graeco-Turkish Convention (Jan. 30, 1923) for the compulsory exchange of Moslem and Greek-orthodox minorities. The non-Greek population in Greek Thrace and Macedonia was reduced to a very small figure.

Establishment of a Republic.—The revolutionary government attempted to return to a constitutional government. An attempted counter-revolution, with which it was sought, without evidence, to connect George II., was suppressed in Oct. 1923. This strengthened republican feeling, and the army and navy officers, especially General Pangalos and Captain Hadjikyriakos exercised such pressure that the government, to avoid disorder, requested the king to absent himself during the meeting of the national assembly which was to decide the future of the throne. On Dec. 18, 1923, the king and queen left for Rumania. Admiral Condouriotes was again appointed regent, and Venizelos, in response to an invitation, returned to Greece (Jan. 4, 1924), but only temporarily, in order to put an end to civil war. The revolutionary committee resigning he was, however, obliged to accept the premiership. The agitation of the officers' league, which was now re-formed and demanded the immediate proclamation of a republic, caused Venizelos, who had proposed a plebiscite, to resign (Feb. 4) and leave Greece (March 10). His successor, M. Kaphandares, also resigned, and a government was formed by M. Papanastasiou, who proposed to settle the fate of the throne

by a resolution of the Chamber, to he ratified by a subsequent plebiscite. After the king had refused a generous offer, if he would abdicate voluntarily, the republic was proclaimed on March 25, 1924. The plebiscite was held on April 13; 758,742 voted for the republic and 325,322 for a monarchy. Admiral Condouriotes became provisional president of the republic.

International Relations.--On Aug. 27, 1923, the murder of the Italian member of the Graeco-Albanian frontier commission had led to the bombardment of the defenceless town of Corfu (*q.v.*) by Italy. The dispute was settled by the League of Nations, but Greece had to pay a heavy indemnity. In July 1924 a frontier incident occurred with Bulgaria at Tareis. Here again Greece accepted the ruling of the League; but Yugoslavia, considering that the Greek attitude might have effects which she did not desire on her own Macedonian population, denounced her alliance with Greece on Nov. 27. The Greek Chamber therefore refused, on Feb. 3, 1925, to ratify the protocol regarding Bulgarian minorities which its representatives had signed in Geneva on Sept. 29, 1924. Negotiations for a fresh Graeco-Yugoslav alliance were at once re-opened in Belgrade, but broke down over the Yugoslav demand for controi and exploitation uf the railway from Ghevgeli to Salonika and an extension of the Yugoslav free zone in Salonika. Meanwhile, a dispute had arisen with Turkey. At the conference of Lausanne the Turks had consented to maintain the Oecumenical Patriarch at the Phanar, provided that he exercised no civil or administrative powers. On Jan. 30, 1925, however, they expelled the holder of the office on the ground that he was not domiciled in Constantinople, and therefore an exchangeable subject under the Treaty of Lausanne. The dispute was settled, after an appeal to the League, by the resignation of the Patriarch and the election of another.

A second frontier incident with Bulgaria at Demir-kapu on Oct. 13 was also brought before the League which awarded damages against Greece.

General Pangalos Dictator. — Meanwhile the new National Assembly had not yet succeeded in voting the new constitution. On June 26, 1925, the premier, M. Michalakopoulos, was compelled to resign by an ultimatum from General Pangalos and Admiral Hadjikyriakos, who formed a government, the former being minister president, and dissolved the assembly. General Plasteras was expelled from Athens and two officials publicly hanged for embezzlement under a decree which made the death penalty retrospective. In November Pangalos admitted two royalists to his cabinet; but on Jan. 3, 1926, and in subsequent proclamations he announced that the senatorial and parliamentary elections would be indefinitely postponed and that his government had decided to concentrate all executive and administrative powers in its own hands; the press was forbidden to publish any articles written by the Republican chiefs. Admiral Hadjikyriakos and M. Sechiotes immediately resigned. At the Ministry of Finance M. Tantalides issued a forced loan similar to that of 1922, cutting 25% off the notes in circulation, while General Pangalos issued a decree regulating the length of ladies' skirts.

General Pangalos, now dictator as well as premier, exiled to Santorin MM. Kaphandares and Papanastasiou and General Kondyles, and, upon the resignation of the president on March 19, fixed the presidential election for April 4 and 11, and laid down the rules for the contest, in which he was himself a competitor. The republican leaders united on the candidature of M. Demertzes, a moderate royalist and ex-minister of marine, who, however, withdrew when General Pangalos failed to give the desired guarantees for freedom of election. In these circumstances the dictator, as sole candidate, was elected president. He then sought a premier who would be a puppet, and finally persuaded M. Eutaxias, an old ex-minister of the time of Delyannes, to accept the post. His brief premiership was chiefly remarkable for the conventions with Yugoslavia, signed by M. Rouphos, who had remained at the Foreign Office. These conventions were considered unfavourable to Greece, and, before they could be ratified, the dictatorship was over. On Aug. 22 General Kondyles, assisted by the dictator's own republican guard under Cclonel Zervas, made a bloodless coup *d'état* in the absence of the dictator at Spetsai: General Pangalos endeavoured to escape on a torpedo boat, but was captured without resistance off Cape Matapan, and ultimately imprisoned in Fort Izzeddin in Crete. Admiral Condouriotes "resumed" the presidency with General Kondyles as premier till a general election should express the popular will. The premier's dissolution of the republican guard led on Sept. 9 to bloodshed such as Athens had not witnessed for many years, and the communists seized the opportunity to intervene. The elections, held on Nov. 7 with immense precautions, passed off in perfect quiet. The royalists participated, and the republican majority was so small that, for the second time in Greek history, an "oecumenical" government of all the party chiefs (except the communists) was formed under the premiership of M. Zaïmis. This cabinet was reconstituted on Aug. 11, 1927, and again on Feb. 7, 1928. A crisis was caused by the return of Venizelos. The Government eventually resigned, May 29, and Venizelos took office. Elections (Aug. 19) gave the Liberals an overwhelming majority. On Sept. 23 Venizelos signed a Pact of Amity with Italy, and negotiations began with Turkey and Yugoslavia. On Dec. 12 a law was passed creating a Senate of 120 members, to be made up of 92 members elected by the people, 18 chosen by professional bodies, and 10 by the Chamber and Senate.

The Return of **Venizelos.**—In 1928 Venizelos, who had been in retirement for six years, returned to power. Elections of the chamber on Aug. 19, 1928, resulted in a victory of the Republican party which received 227 seats, among them 186 Venizelist Liberals, while the Royalist party had only 22 and the Metaxists 1.

On July 3 Venizelos had become prime minister and had ordered a change in the methods of election, abolishing proportional representation.

The elections ended in a landslide for Venizelos. In 1929 for the first time since 1862 there was a meeting of the senate, which was reintroduced by the new constitution of June 3, 1927, to consist of 120 members elected partly by the people, partly by parliament, and partly by professional co-operation. On Dec. 14, 1929, the former Prime Minister Alexander Zaimis was elected president of the republic.

The year 1930 mas marked by the conclusion of the Graeco-

Turkish accord of June 10, which terminated the long-standing hostilities between the two countries.

In addition to a definite settlement of the exchange of populations, agreements were drawn up and ratified concerning neutrality and friendship and the establishment of a naval equilibrium.

In the same year at a Balkan conference in Athens, plans were drawn up for a union of the Balkan states. On Dec. 31, 1930, the Refugee Settlement commission could be disbanded after having concluded its task successfully.

On Jan. 31, 1930, women were granted the right to vote at municipal elections.

The year 1932 witnessed a grave financial crisis and the gold standard had to be abandoned. Venizelos resigned. Gen. Theodore Pangalos, who had attempted an unsuccessful coup in 1930, was banished. The Royalist leader P. Tsaldaris formed a cabinet, which, however, fell in Jan. 1933. A brief troubled time followed, with a temporary return to power of Venizelos and an attempted coup d'état by Gen. Plastiras. The elections of March 5, 1933, gave the Royalist Popular party 13; seats and the Venizelists 111.

As a result, Tsaldaris formed a new cabinet on March 10. On Sept. 14 a ten-year non-aggression pact was concluded with Turkey.

After long-lasting rivalries, Tsaldaris and Venizelos on April 21, 1934, agreed upon the re-election of Pres. Zaimis and the reintroduction of proportional representation.

The Return of Monarchy.--On March 1, 1935, a military revolt tried to put Venizelos again into power and to strengthen the republican regime.

After a few days of violent fighting Marshal Kondyles suppressed the revolt, and Venizelos and many of his followers had to flee abroad. The result of this attempt was the return of King George II, who had been forced to leave Greece on Dec. 18, 1923. On Oct. 10 Kondyles, a "strong man" with fascist leanings, overthrew the government, held a plebiscite on Nov. 3 under rather irregular conditions, and could report a 98% vote for the monarchy.

On Nov. 25 the king returned and tried a regime of reconciliation. Venizelos was pardoned, many political prisoners were released, and the elections of Jan. 26, 1936, held in comparative freedom, gave the Venizelist Liberals 135 seats, the Royalists 125 seats and the group led by Metaxas 9 seats, while the communists received 14. But the death of Kondyles on Jan. 31 and of Venizelos on March 18 removed the two principal actors from the scene.

On April 13 Gen. John Metaxas formed a new cabinet, and on Xug. 4 dissolved the parliament and introduced a virtual dictatorship.

The Dictatorship. — For four years Metaxas ruled the country, against many protests and efforts to overthrow his dictatorship. He carried through a number of social reforms, improved the army, introduced a semi-fascist regime, proclaiming the "Third Hellenic Civilization" based upon the Spartan tradition. German economic penetration of the country proceeded apace, while co-operation with Turkey against a possible Italian attack was stressed. At the outbreak of the war in 1939 the independence of Greece was guaranteed by Great Britain.

Greece in War. — Unfortunately, the Balkan countries could not agree on any common defence policy. In Aug. 1940, the Italian press launched violent attacks against the Greeks, accusing them of persecuting Albanians in the Greek Epirus. On Oct. 28 Italy presented an ultimatum to Greece demanding the occupation of strategic points by the Italian forces. As Greece rejected the demands, Italian troops began to move from Albania into Greece.

Very soon, however, the heroic valour of the Greek soldiers, fighting for their freedom, and the complete military inefficiency and lack of morale on the part of the fascist forces, led to unexpected victories on the part of the Greeks. By Nov. 10 the fascists were in full retreat and the Greek army succeeded in occupying large parts of Albania with the important centres of Argyrokastron and Koritza.

Fighting in bitter cold, the Greeks were able to thwart all fascist attempts at recovery, though these efforts were directed later by Signor Mussolini himself.

On Jan. 29, 1941, Metaxas died suddenly, and was followed as prime minister by Alexander Korizis, a former governor of the National Bank of Greece. British forces helped Greece to organize her resistance against Italy. The Greek situation, however, became critical when Germany joined the war to save her Italian ally.

The successful thrust of the formidable German war machine into Greece through Bulgaria and Yugoslavia ended, in spite of the courageous resistance of the Greeks and their British allies, with the evacuation of the Greek mainland. On April 19 Korizis committed suicide, and a military government was formed for a few days; then Emmanuel Tsouderos, an economist and a native of Crete, assumed the premiership. On April 23 the Greek army of the Epirus surrendered to the Germans and the Greek king and government fled to Crete.

Gen. Tsolakoglou, the commander of the surrendering army, became head of a nazi-controlled government in Athens after the Germans had occupied the city on April 28. Meanwhile the legitimate Greek government declared its intention of carrying on the struggle, supported by the British.

The legitimate Greek government and the king established themselves first at Crete, but the German attack of May 1941 forced them to abandon the island and take refuge in Egypt. The Greek merchant marine continued to render valuable service to the common cause of Great Britain and the Allies.

Defence. — The budget effectives in the Greek army in 1938 numbered about 65,000 in addition to 5,164 officers. The organization on a peace footing provided for four army corps. Nine infantry divisions were with the army corps, and two divisions and a brigade directly under the ministry of war. There were also two cavalry divisions and an air force. The air force was small, consisting in 1938 of about 120 planes. The navy in 1938 was composed of one armoured cruiser dated 1910 but later refitted, one light cruiser, 10 destroyers, 13 torpedo boats, eight mine-layers, six submarines and a number of other craft. Twelve destroyers were to be built between 1937 and 1940, but by 1940 only two had been completed. Two submarines were also projected.

ECONOMY AND FINANCE

Area and Population. — The area of Greece at the beginning of the 20th century was about 24,400 square miles. The Balkan wars of 1912–13 resulted in the addition of New Greece, consisting of Macedonia, Epirus, Crete and a number of islands in the Aegean, with an area of about 21,600 square miles, making the total area of the country about 46,000 square miles in 1914. After the war of 1914–18, Greece occupied Thrace and a part of the vilayet of Aidin in Asia Minor, and these occupations were confirmed by the treaties of Neuilly and Sèvres. But, as the result of the Asia Minor campaign, Greece in 1922 evacuated Asia Minor and eastern Thrace in favour of Turkey, and by the treaty of Lausanne in 1923 she also retroceded Imbros and Tenedos.

The area of Greece after these changes, was (1940) about 50,150 sq.mi.

The population of Old Greece (census of 1907) was 2,631,952, and that of New Greece (census of 1913) was 2,101,014. A census taken in 1920 gave the total population as 5,536,371, including Thrace.

The number should have been reduced by the subsequent cession of territory and by the transfer of Muslim inhabitants of Greece to Turkey. But these circumstances were balanced by the natural increase of population and the influx of some 1,400,000 refugees from Turkey after the war in Asia Minor, so that the figure returned by the 1940 census was 7,336,000.

The various racial migrations which have been brought about

by the wars from 1912 onwards, whether voluntary or compulsory, involving the transfer, in either direction, of nearly 2,500,000 Greeks. Bulgarians and Turks, have had the result of introducing homogeneity in the regions affected, where before there was great diversity. Thus the proportion of Greeks in the population of Macedonia and western Thrace, which stood at 43 and 36 per cent before the Balkan wars, was in 1925, 88 and 62 per cent.

Of-Greek populations abroad the most important now remaining are those in Constantinople, the Dodecanese, Cyprus, Egypt and the United States. Fresh emigration to the latter country has been reduced to insignificant proportions by the restrictions imposed in 1921. The remittances to the mother country from Greeks established abroad form a considerable item in the annual trade balance.

Agriculture. — Greece is mainly an agricultural country, about three-quarters of its population being occupied in agricultural pursuits. In 1937 the total area under cultivation was 6,038,745 ac., the forest area 5,944,059 ac., of which the majority was state owned. Only one-fifth of the land is cultivable.

The greater part of the cultivated area is devoted to cereals, of which; however, the production is far from sufficient for the consumption of the country. Considerable surfaces are also taken up by olive trees and vines, while certain districts are affected to the two valuable products, tobacco and currants. for which Greece is specially known and which form the staple of her export. Figs, oranges and other fruit are plentiful. Cotton and rice are cultivated on a small scale.

Minerals. — The country has a large variety of mineral deposits, but they are worked only to a moderate extent. The principal minerals are lignite, iron, iron pyrites, magnesite, chroinite, lead and Naxos emery, as well as the famous marbles. Marine salt is produced in large quantities for home consumption.

Industry.—The development of industry on a large scale is hindered by lack of a native coal supply and by scarcity of capital. But high protective duties and the influx of refugee labour have combined with other factors to give it a considerable impetus of recent years. In order of importance, the first place is occupied by the manufacture of alimentary products, olive oil, wine, spirits, flour, confectionery, etc. Next in order are cotton, wool, silk, jute and other textiles, among which the carpet industry deserves special mention as having been introduced by the refugees from Turkey.

Soap, chemicals, leather, cigarettes and building materials are manufactured in considerable quantity and there are numerous minor industries.

Labour is protected by special legislation dealing with hours, the health and security of workmen, compensation for accidents, wage disputes, employment of women and children, etc., and the resolutions of the Washington Labour Conference are observed.

Commerce and Transport. — The principal articles of export are tobacco, currants, olive oil and wine. Cereals take the first place among the imports, followed by textiles, coal, sugar and a variety of other commodities.

The imports largely exceed the exports, the difference being accounted for by shipping and commercial profits, by remittances from Greeks in other countries, by interest on investments held abroad, and by the influx of public and private capital into the country.

The railway system has been linked up with those of Europe since 1916, via Salonika-Nish-Belgrade. Commercial air services connecting Athens with Brindisi and Constantinople were established in 1927; and the mercantile marine is considerable, its range of activity extending far beyond the limits of the special commerce of the country, thus contributing in no small degree to the national resources.

Public Finance. — Taxation is heavy, and import and consumption duties form the mainstay of the revenue, in contrast with the yield from direct taxes which is relatively small. The public debt charge absorbs about one-third of the total. A large part of the debt is secured by assigned revenues under the control of the International Financial Commission, established in 1898.

The economic situation of Greece during the early years of the present century, up to the outbreak of the Balkan War in 1912, was marked by a steady if moderate progress. Industrial enterprises for local purposes were established in considerable number. Communications by road and railway were extended, and large additions were made to the mercantile marine. The premium on gold gradually declined, and finally disappeared in 1909. By the Valaoritis law of 1910, providing for the automatic issue and withdrawal of notes against gold or foreign exchange, the currency was definitely stabilized at par on the gold exchange system, to the great advantage of the general economy and the credit of the country.

The state of the public finances, though less satisfactory, also showed signs of improvement at the latter end of the period. A series of deficits from 1907 to 1909 had to be met out of a portion of the proceeds of a ne foreign loan raised for this and other purposes in 1910. At the same time, a program of fresh taxation was introduced, including income tax and succession duties, with the result that the accounts up to 1912 showed a substantial surplus of revenue over expenditure. The varying interest on the old gold loans, payable out of surplus revenues in the hands of the International Financial commission, marked a sensible upward progress.

The Balkan Wars of 1912 and 1913 threw a considerable strain on the resources and finances of Greece, which was, however, relieved in some measure by the material assistance rendered by Greeks abroad. Immediate war expenses were defrayed chiefly out of the balance of the 1910 loan and the proceeds of various provisional loans, which were liquidated by means of a new consolidated loan issued in 1914, and taken up for the greater part in Paris and London. This loan was secured on the revenues assigned to the International Financial commission, an institution which, though regarded as an encroachment on the sovereign rights of the country, has been found useful on repeated occasions as a means of providing security for fresh loans.

The economic strength of Greece was greatly enhanced by the acquisition of territories of both actual and potential value, including the important port of Salonika, the rich tobacco-growing districts of Drama and Kavalla and extensive fertile areas in Macedonia.

The World War of 1914–18. — After the outbreak of the war, and during the period of neutrality of Greece. which lasted from 1914 until 1917, there was a considerable accumulation of private wealth in the form of foreign balances, arising out of shipping and other profits which it was difficult, owing to war restrictions, to realize in actual goods. At the same time the country suffered severely from internal conflicts, from the economic blockade of Old Greece in 1916–7 and from the prolonged mobilization and war preparations. Noteworthy economic events during this period were: the law of 1915 facilitating the formation of co-operative societies; the connection, in 1916, of the railway system of Greece with those of Europe; and the agrarian legislation of 1917, which provided for the expropriation of large estates in favour of the peasants, and at the same time prohibited the alienation or mortgage of the peasants' holdings and their subdivision at death.

The entry of Greece into the war in 1917 involved a large increase in military and naval expenditure. Fresh taxation was imposed, including a tax on war profits, and a certain sum was raised by an internal loan and by the issue of national defence bills But the bulk of the funds required was provided by advances in kind from the allied powers and by credits opened by the latter for expenditure in Greece, against which payments were effected in notes by the Greek government. These credits were treated as cover for the note issue. The very considerable expansion in the paper currency which resulted from these arrangements did not cause at first too heavy a demand for exchange, for the factors which contributed to strengthen the foreign balances during the period of neutrality continued to operate until the end of the war. Thus the internal war expenditure of Greece, and part of that of the allies as well, was defrayed for the time being out of the resources of the country.

With the close of the war, however, and the suppression of restrictions on trade, the accumulated purchasing power of the

country made itself felt in a large demand for foreign goods. Large purchases of Greek and other securities were made in foreign markets, and the depreciating currencies of Europe offered an attractive field for the speculator. The resultant pressure on the exchange funds of the note issue was so great that before the end of 1919 the available reserves were exhausted, the exchanges began to fall away from the gold parity, and the Valaoritis law became a dead letter. In the course of 1920 a portion of the allied credits was realized, but this was quickly absorbed by purchases of supplies, and the excess of imports reached unprecedented proportions.

Effects of the **Graeco-Turkish** War.—At the same time, the government found itself involved in fresh liabilities in connection with the military operations in Asia Minor. To raise the considerable funds required. recourse was had to a large internal lottery loan, to issues of national defence bills, to loans from the national bank and, finally, to inflationary issues of paper money. The fall in the exchanges was accelerated by the withdrawal of financial support and credits by the allies on the return of King Constantine in 1920. By the end of that year the drachma had lost 60% of its gold value. This depreciation of the currency reacted unfavourably on the budget, while the prosecution of the Asia Minor campaign entailed ever-increasing expenditure. In 1921 and 1922 issues of paper money and national defence bills were effected on a large scale, without authority from the International Financial commission, taxes were raised and a forced loan was extracted from noteholders by compelling them to surrender one-half of each note in exchange for a government bond. The disaster in Asia Minor in 1922 reduced the finances and credit of the country to the lowest ebb, and by the end of the year its securities were quoted on the international markets at prices yielding 20% to the investor, while the drachma had lost 94% of its gold value. This collapse of the monetary unit, with the concomitant rise in the price level, profoundly disturbed economic conditions throughout the country, and caused serious losses among particular sections of the community. The bulk of the public debt being on a gold basis, the real charge of its service on the state finances was not greatly reduced by the depreciation. (See also DRACHMA.)

Refugee Settlement. — The influx from Asia Minor and Thrace of a vast number of destitute refugees threw a fresh burden on the resources of the country, and enlisted the sympathy and assistance of foreign countries, especially of England and America. Under the auspices of the League of Nations an independent refugee settlement commission was set up in 1923, for the establishment of the refugees, and a refugee loan was issued in 1924, in London, New York and Athens, guaranteed by revenues assigned to the International Financial commission. Meanwhile, the government made strenuous efforts to put its finances in order. Considerable fresh taxation was imposed in 1923, including a capital levy to be spread over five years, which has given very mediocre results. The floating debt was largely increased in 1923 and 1924. A fresh uncovered issue of paper money was made in 1923, and at the same time a law was passed authorizing further issues against cover in funds abroad. The exchange, after violent fluctuations, settled down in 1924 to about one-tenth of the gold parity. By 1925 public finances had so far recovered that the government was able to allocate special revenues to the reduction of the floating debt, and to present a balanced budget.

But this equilibrium was disturbed by fresh expenditure, for military and other purposes, under the Pangalos regime, and by a renewed fall in the exchanges, due to an inflationary banking policy. In 1926, a second forced loan was raised from noteholders, who were compelled to surrender one-quarter of each note in exchange for a government bond, and a third forced loan from holders of national defence bills, who had to accept a ten-year bond in exchange for one-half of these bills at maturity. But such measures, while providing temporary relief for the situation, did nothing to correct the current deficit, which, in spite of additional taxation, continued to increase The exchanges took a fresh turn for the worse, the drachma falling to one-eighteenth of its gold parity, as a result of the general lack of confidence, which made itself felt also in the domain of commerce and industry. Severe money stringency prevailed, the rate of interest rose to very high levels, and many concerns found themselves in difficulties due to overtrading and immobilization of capital during the previous fen years.

Financial Reconstruction. — The new coalition government which came into power in Dec. 1926 took vigorous measures to redress the financial situation. By means of fresh taxation, reductions in expenditure and postponement of certain liabilities, the budget estimates were balanced. The aid of the League of Nations was invoked with a view to obtaining a loan for the liquidation of arrears, the further settlement of refugees and the stabilization of the currency. The approval of the league was given to a loan for this threefold object, subject to the adoption of a scheme of banking and monetary reform, involving the establishment of an independent central bank of issue on modern lines and the introduction of a new fiduciary system. The loan was issued on advantageous terms early in 1928, the main portion being taken up in London and New York. Meanwhile the war debts to Great Britain and the United States were funded on terms satisfactory to the country, the settlement of the latter being coupled with the grant of a new loan from the United States government to supplement that floated under the auspices of the League of Nations. The effects of this successful financial policy made themselves felt in all directions. The prestige and credit of the country enjoyed a marked enhancement. The exchanges recovered and remained stable at about one-fifteenth of gold parity. Renewal of confidence showed itself in the attraction of capital from abroad, in easier rates of interest, and in an improvement in the state of commerce and industry.

General **Survey.**—The country as a whole showed remarkable powers of recuperation after a period of ten years of war, defrayed largely out of her own resources, and culminating in a great national disaster. The refugee population tended to become an asset instead of a burden. The expropriation of agricultural properties for the benefit of refugee and other peasants was accelerated, on terms very unfavourable to the owners, by special legislation. The settlement of refugees on the land extended the cultivated area and increased the production of crops, while large numbers found employment in other occupations and gave an impetus to the nascent industries of the country. The consuming power of the population increased both absolutely and per capita. The mercantile marine, which had been reduced by nearly two-thirds during the war through sales and enemy action, was restored to its original strength. There was a considerable expansion in building, industrial and other enterprise. Numerous projects were undertaken, with the aid of foreign capital, for the improvement of railways, roads and works of development. Finally, 1928 found Greece in process of achieving financial stability, though burdened with an increased public debt and future liabilities, which involved heavy taxation and severe restriction of expenditure. The extrication of the country from its embarrassments was due in no small measure to the beneficent intervention of the League of Nations.

GREEK **ARCHAEOLOGY.** The liberation of Greece (1821–29) made the scientific and thorough exploration of her ancient remains possible to many such scholars as Böckh and

Foucart, the epigraphists; Newton, the discoverer of the Mausoleum; Penrose and Dorpfeld who revealed the wonders of Athenian architecture; Brunn and Furtwangler, Ross and Beulé. To-day a well organized Greek archaeological service is actively engaged in preserving and conserving antiquities, and there are American, Austrian, British, French, German and Italian archaeological schools in Athens devoted to the same object in collaboration with the Greek authorities.

Use of Subject. — The genius of the Greek people laid down for the whole western world the foundations of the study of literature, art, philosophy and science, including geometry, astronomy and mathematics, and such subjects as zoology and botany. The Greek histories we possess, both those of Greek writers themselves and those produced by modern scholars based on wider sources of information, deal in the main with political affairs, and hardly touch on the culture of this gifted people from whom our civilization is derived. Political history is apt to describe exclusively political manoeuvres, diplomatic and internal, the personalities of statesmen and generals, and the progress of campaigns and battles. The material circumstances of life, public and private, are rarely discussed and rhe generai rendency of culture at any given period and the various influences which affected it are seldom taken into consideration. Yet the trend of thought in all forms of art, the fashion for a particular type of beauty, the popular style of the age, are essential factors in building up the moral character of a people. The basic information for most of the elements necessary for this study is to be obtained from a proper use of archaeological evidence. The sources for Greek archaeology lie in two spheres, the literary and the material. From the literature of ancient Greece we derive information about the social, political and economic life of the Greeks and some also about the material surroundings of their life. But literature, except a few authors such as Pausanias who travelled in Greece about the time of Hadrian, did not consciously aim at describing this life for us, The descriptions and allusions given were meant for a public already well familiar with such life from personal experience, and therefore are of comparatively little value unless they can be checked by comparison with the actual objects. It is the function of archaeology to supply the material objects so far as they can be found and identified, and to interpret them.

Excavations. — Except in certain cases where temples such as the Parthenon or the Temple of Apollo at Bassae have, though sadly damaged, stood erect from those days to the present, or fortifications such as those of Messene or Aegosthena have similarly survived the assaults of man and time, the materials for Greek archaeology have to be recovered by excavation from the earth which has covered and so preserved them. Objects may be found by casual excavation by farmers tilling their lands, or by deliberate excavation intent on recovering the treasures of the past. Many important objects have been revealed accidentally by the builder or even by the fisherman's net as in the case of the bronze youth from Marathon. Most has been revealed by deliberate excavation, the only correct method, but it must be scientific, because all excavation is in a sense destruction. The very act of digging and of removing objects from the ground destroys their context. For instance a group of vases and jewellery found together in a tomb tell its story; they date each other, and give a picture of the culture of their age. If; however, the jewellery be removed without keeping the pottery with it or at least taking proper note of it, that jetvellery like the Aegina treasure in the British Museum can tell us hardly half its story. Similarly a nest of vases found under the foundations of a temple gives a *terminus* post *quem* for its building, but if the vases are removed and no observations made as to their position and relationship their value as historical evidence is lost. Thus many of the objects exhibited in museums are archaeologically dumb because they have been found either in the operations, usually illicit, of a professional excavator who digs for plunder to supply the cabinets of collectors or museums, or in the excavations of irresponsible archaeologists. Never was the urgent need of patience, accuracy, and detailed observation more conspicuously demonstrated than in the case of the excavation of the sanctuary of Artemis Orthia at Sparta where thousands of small objects of all periods were found around the ruins of a temple and its altar. It was only the skilled restraint of the archaeologists, who slowly removed the earth almost inch by inch, that unravelled the complicated stratification, and gave us not only the history of one of the most important Spartan temples, but also an invaluable record of the culture of Sparta through 600 of the most momentous years of its existence. The change of soil, the various materials used in building, and all apparently minute points must be constantly watched and this record of the stratification if not made by the excavator can never be made by another and so irretrievable damage may be done. A carelessly conducted excavation is even more disastrous than the burning of a library, for the archaeological evidence it has destroyed can never be replaced.

Objects Found. — Objects from excavations may be found in the ruins of ancient temples and sanctuaries, or in those of public buildings such as theatres or colonnaded market-places, or fortifications, or in those of private houses, or in tombs, perhaps the most fruitful source of all. Tombs are more apt to yield complete objects, temples and public buildings yield inscriptions, and both they and houses produce quantities of fragmentary small objects of everyday use which give us the stratification of culture on any particular site. In this way the evidence obtained from tombs and that from temples or inhabited sites supplement each other.

HISTORY OF EXCAVATION

Scientific archaeological exploration of ancient Greek remains was rather long delayed, though a French expedition had undertaken some researches at Olympia in 1829. Some of the earliest archaeological expeditions worked on the coast of Asia Minor among the Greek colonies rather than on the sites of the motherland. Thus Newton's work at Halicarnassus and Cnidus which enriched the British Museum with the remains of the Mausoleum and the Demeter of Cnidus and Wood's patient search for the Artemisium at Ephesus, though among the earliest excavations carried out with definite scholarly aims, belong rather to Asia Minor than to Greece.

German. — Not till 1875, however, were the great German excavations at Olympia begun, under a special treaty with the Greek Government. This expedition under the leadership of Curtius, Adler and Treu, after six arduous campaigns, revealed what was left of the temples and other buildings of the Panhellenic sanctuary of Olympia. Rich finds rewarded the efforts of the excavators, the pedimental sculptures of the great temple of Zeus, the Winged Victory by Paeonius, and greatest treasure of all, the Hermes of Praxiteles, the only undoubted original by one of the greatest masters of Greek sculpture. These sculptures, whose date is indisputable, are of unrivalled value for the history of Greek art. Since then German expeditions have done important work at several other sites. At Thera the ancient town has been cleared and gives an excellent picture of an island community in the latter part of the classical age, while rich tombs of the early iron age were also found. At Athens the theatre of Dionysus was excavated and also a large part of the Dipylon cemetery, providing much fresh information about Athenian funeral customs. After preliminary campaigns in the early cemeteries of Samos, most useful for the light thrown on early Ionian art, especially the vases, the famous temple of Hera there has been laid bare and the history of another of the sacred sites of Greece is being made known. This and similar work on the temples of Aphrodite and Aphaea at Aegina has yielded valuable facts towards the study of architecture, and the results of the complete excavation of the Aphaea temple now enable us to study in their right context the famous sculptures from it at Munich.

Greek. — Greece has taken a foremost part in the rediscovery and preservation of her treasures, and apart from many minor researches has carried out several major excavations — the Acropolis at Athens, at Eleusis, the Amphiaraeum by Oropus and at Epidaurus. The history of the Acropolis was entirely rewritten by the results of excavation. The successive stages of the Parthenon and the temples planned to precede it on the same site, the earlier Propylaea, and the old Athena temple all show

how closely the architectural monuments of the prime of Athens are to be co-ordinated with the history of the city herself. Fresh fragments of the sculptures of the Parthenon were found, but the most surprising artistic find was the hoard of statues damaged and overthrown in the Persian invasion of 480 B.C., which had been subsequently used to fill up a hollow during rebuilding. These, though damaged are at least unrestored originals, and show by the plentiful traces of bright painting still extant on them how the Greeks intended their sculptures to appear. A fundamental date for the history of Greek vase painting was another of the more important facts determined. At Eleusis the Hall of Mysteries was discovered and the progressive enlargement of this and of the sacred enclosure indicate both the gradual increase of culture and prosperity in Greece during the 6th and 5th centuries B.C., and the growth of the importance of the shrine itself. Many important sculptures and inscriptions were found. The Amphiaraeum and Epidaurus were the centres of cults connected with healing, but the latter is the more important as the central shrine of Asclepius himself. Here the whole sanctuary has been cleared with the theatre and all the subsidiary buildings. Valuable architectural results were obtained, and sculptures illustrating the style of Timotheus, a leading artist of the 4th century, with many historical inscriptions, and others giving interesting details about visitors to the shrine and their cures. This whole group of buildings with the theatre, accommodation for patients, gymnasium and music-hall gives a vivid picture of the life of a Greek spa during the first two centuries after Christ. The central sanctuary of the Aetolians at Thermon has been cleared and valuable material for the history of the development of architecture was unearthed and many important inscriptions. At Lycosura in the ruins of the temple were found the greater part of a colossal group by Damophon, a leading sculptor of the and century B.C.

French. — The French school has excavated Delphi, the seat of the famous oracle of Apollo, which has produced sculptures of the first rank, such as the bronze charioteer, a masterpiece from the hand of an artist still unknown, and the marble frieze of the Cnidian treasury, a gem of archaic art. Besides these, the innumerable "treasuries" and shrines, the theatre and other buildings have added much fresh material for the study of architecture, and an immense harvest of inscriptions. At Delos the French have cleared the sanctuary of Apollo with its many temples and colonnades, but the complicated nature of the site makes the unravelling of its history rather difficult. A large part of the Hellenistic town has been cleared with its streets, houses, warehouses, port and theatre, and this combined with the sacred associations of the site, gives a panorama of the active life and trade of this town, a sanctuary of Panhellenic renown and a free port, the great entrepôt of the Aegean, especially for slaves. As the island itself produces little or nothing to sustain the life of even a small population and water is scarce, provisions of all kinds must have been extensively imported. Among other sites where French explorers have worked is Tegea, where the temple of Athena Alea has been excavated and some heads and other fragments of the pedimental sculptures have been recovered. These, though battered, are originals from the hand of Scopas, a master of the 4th century, a contemporary and rival of Praxiteles.

American. — The Americans, now about to undertake the arduous project of excavating the agora of Athens and the other buildings sacred and profane around it, have previously concentrated their efforts on Corinth, the most flourishing commercial city on the Greek mainland next to Athens itself. In 146 B.C. Mummius overthrew all its buildings except the temple of Apollo, some columns of which still stand. The Americans have cleared a large part of the Agora and a short length of the road leading to the port of Lechaeum, and have identified the theatre and other public buildings. The excavations show how complete was the rebuilding that took place when Caesar sent a colony to the site and how thorough was the destruction by Mummius. The elaborate arrangements for the water supply of the city have been revealed in the fountains of Peirene and Glauke. The former which dates back to the 6th century emphasizes the importance attached by the tyrants to making proper provision for this essential for'the well-being of their subjects. The ruins of Corinth indicate that this too was a prosperous city, and that the site was eminently adapted by nature for a trading centre. An American expedition also excavated the Heraeum, the national sanctuary of Argos. This site was continuously occupied from the early bronze age till late classical times, and was especially rich in finds of the archaic period of art that illustrate the varied influence notably those from the east, affecting Greece at that date. The architecture of the temple rebuilt after a fire in 423 B.C. and of the other buildings in the precinct forms an interesting contrast to Attic work of the same date; in addition a few interesting sculptures were discovered.

British. — The first British excavation was that of Megalopolis, and apart from the problems involved in the architecture of the theatre and the Thersilion, the council chamber of the Arcadian confederacy, the results hardly came up to expectations. Otherwise apart from valuable contributions to Aegean archaeology by excavations in Crete, at Mycenae, in Melos and in Thessaly, the great excavations of the British school have been at Sparta. Here the classic sanctuaries of Artemis Orthia and Athena Chalcioecus and of Helen and Menelaus have been discovered, and entirely new light has been thrown on Spartan art which now appears to have been extremely flourishing in the archaic period when oriental and Ionian influence were much in evidence. In later times only the growth of a narrow military policy stifled the natural Hellenic tendency towards artistic expression in all the accompaniments of life. The tracing of the walls has determined the size of the city and the excavation of the theatre and the innumerable inscriptions of the early imperial period show that Sparta flourished under the Pax Romana as a provincial capital.

Other nations have taken an active part in excavations in Greece. The Austrians have been at work in Elis, the Dutch at Argos, the Danes at Lindos, the Czechs at Samothrace and the Swedes at Calaureia, while the latter and the Italians have specially distinguished themselves in Aegean archaeology.

SEVEN BRANCHES OF ARCHAEOLOGY

Greek archaeology subdivides naturally into seven branches. These are: —

I. Topography. — This is naturally linked with geography and consists in the exploration of Greek lands and the noting of the ancient ruins they contain, the observation of their natural resources, and finally the co-ordination of the results of such research with the knowledge of the country to be derived from ancient writers. This sifting of the evidence forms the basis of our knowledge of the political and historical geography of Greece. A full understanding of the physical aspects of the country and its natural products, mineral or other, coupled with as full a survey as is possible of the ruins of ancient towns and hamlets, is essential to enable us to picture the land where the drama of Greek history was played, and art and literature had their birth. A classic example of topographical work is Leake's *Travels in Northern Greece* and a modern work of the same type is Stahlin's *Das Hellenische Thessalien*, while Frazer's monumental *Commentary on Pausanias* is the outstanding instance of an attempt to stabilize our knowledge of Greece by the correlation of archaeological and literary material and of ancient and modern topography;

II. Epigraphy. — The study of ancient inscriptions which may vary from a grave inscription of a few words to lengthy laws or decrees and fall into two large groups: (A) Inscriptions proper, by which we mean words inscribed on monuments or objects to denote their purpose, often mentioning the name of the deity or person concerned. These subdivide into: (1) Epitaphs, perhaps the largest class of all; these can be of historical importance, as, for instance, the epitaph of Dexileos, an Athenian cavalryman who fell in the Corinthian War about 395 B.C.; (2) Dedications, varying from the official dedication of a building to a word or two scratched on a small bronze offered to a god. The serpent column from Delphi (now in the Hippodrome at Constantinople) recording the names of the Greek cities that won the battle of Plataea against the Persians, and the bronze Etruscan helmet

dedicated by Hieron, king of Syracuse, at Olympia after the battle of Cumae (now in the British Museum) show the historical value of such inscriptions. The fragments of the metrical dedication of the Athenians celebrating their victories over Boeotia and Chalcis in 506 B.C. is a useful check on the accuracy of Herodotus who quotes it. Most of the inscriptions celebrating victories at games, such as the famous inscription of Damonon of Sparta, who boasted that he and his son had won more races than anyone else, fall into this class. (3) Honorary inscriptions, such as the lines inscribed on the bases of statues erected to persons like Alexander and Hadrian, or those recording honours granted by a State to citizens or to natives of other States, when the honours usually consisted of the right to a front seat at festivals and *proxenia* and certain exemptions and immunities. (See INSCRIPTIONS.) (B) Documents both public and private or, on another classification, sacred and profane. These subdivide into: (1) Treaties and alliances, such as the treaty between Athens, Mantinea and Argos, which corrects the text quoted by Thucydides; (2) Laws such as the famous laws of Gortyn, which from their archaic language and their legal contents rank high in importance; (3) Decrees of the State or letters from kings, Roman emperors, or some other authority, regulating the affairs of subordinate States, such as the decrees of Eressos about tyrants which were confirmed by letters of Philip Arrhidaeus and Antigonus; (4) Financial records such as the famous tribute lists which form the basis for the study of Athenian finance in the 5th century, or the records of the treasures of the temple at Delos; (5) Building inscriptions such as those of the Erechtheum at Athens which give important architectural details; (6) Lists of names such as those recording the manumission of slaves, some of which from Athens give interesting information about trades, and lists of soldiers killed in battle or of ephebi; (7) Boundary stones recording political boundaries, the limits of sacred areas and the bounds of private property, the last including mortgage stones which give the name of the mortgagee and the amount of the mortgage. Among miscellaneous inscriptions come the potsherds scratched with the names of politicians which were used in voting at an ostracism in Athens. Several of these bear the name of Themistocles himself, others that of Xanthippus, the father of Pericles, and yet others the name of the great political opponent of Pericles, Thucydides the son of Melesias, whose ostracism in 444 B.C. left Pericles free to carry out his policy.

III. **Numismatics,** the study of Greek coins, which includes complicated subjects such as metrology, weight standards, the ratio of the metals to one another as well as the classification of the coins themselves and their study as original objects of art.

IV. **Architecture,** the study of Greek construction which has had a profound influence on subsequent building. Apart from the great temples such as the Parthenon at Athens and all the smaller shrines, there are hundreds of ancient buildings of more secular use, such as the Propylaea or gateway to the Acropolis at Athens, the Stoa of Attalus in the market of Athens, and the theatres, colonnades, and other buildings to be found on every important Greek site. With them can be grouped fortifications and private houses. The study of the gradual development of Greek architecture, and the methods by which the ancients overcame the problems confronting them, provide lessons of the greatest value to modern architects. True, of many Greek buildings little more than the foundations exist, but a study of these and of the fallen blocks of the superstructure enables us to reconstruct the building on paper even if only in part, and the evidence of a single stone when observed by the trained eye may lead to important results. Thus the discovery of the foundations of a building is of the greatest assistance in visualizing it.

V. Ceramics, the study of ancient pottery, which has in recent years been highly developed. Broken pottery is the commonest of all objects found on an ancient site, and is intrinsically the most worthless, and therefore for the archaeologist in many ways the most valuable, for it is unlikely to be stolen or to be forged. Whole vases found in tombs have of course a market value, but these may have no archaeological value if removed from the ground by illicit or irresponsible excavators. Thus on the excavation of an ancient site it is a *priori* probable that the latest pottery will be found near the surface and the oldest deepest down, and so on. (See STRATIGRAPHY and SEQUENCE DATING.) Thus by careful excavation stratum by stratum the archaeologist can obtain a stratified sequence of the potsherds from any given site. These can be dated by the evidence of inscriptions or by that previously obtained from other sites, and thus provide a ceramic history of the site in question and a test by which buildings and other objects can be dated in their turn, and they even serve to correct false impressions or ideas that have hitherto held the field. A classic instance of stratification is the "Persian Stratum" on the Acropolis of Athens which consists of damaged objects used as filling on the restoration of the buildings on the Acropolis after the destruction of Athens in 480 B.C. The study, too, of the pottery that prevails in a given stratum shows the commercial and cultural influences prevailing at that period and throws light on the economic or political orientation of the city where it is found, and on the social customs and the prosperity of its citizens. There are of course pitfalls for the unwary or the inexperienced. The strata are not always laid down on mathematically level ground, but may slope down the side of a mound. The earlier strata may be dug into in laying the foundations of a later building and so be partially disturbed, but proper observation of this enables the later building to be more nearly dated. Again, when the accumulation of debris over a long period of years has made a mound, the site may be levelled for later constructions by cutting off the top and throwing down to the sides as was done at Troy by the builders of the 9th, or Graeco-Roman city. Further, when in early days a particular type of pottery has been very commonly used on a site the soil becomes so full of fragments of it that every later stratum can hardly help containing a few pieces. This sometimes leads to error, as occasionally attempts are made to date a building by the earliest objects found in it. As a rule unless there are special circumstances to be taken into account a building, tomb or whatever it is should be dated by the latest object found.

Greek pottery divides into the following groups:—

Neolithic.—This in turn subdivides into that found on the mainland and that found in Crete. (See AEGEAN CIVILIZATION.)

Bronze Age, which has three divisions: Early, about 3,500–2,200 B.C.; Middle 2,200–1,600 B.C.; Late 1,600–1,100 B.C.; and the pottery of these three periods is further subdivided according to the regions where it is found as Minoan, Cycladic or Helladic. Under Middle Minoan comes the pottery formerly called Kamares ware, under Early Helladic Urfirnis ware, under Middle Helladic Minyan ware and Matt-painted ware, and the pottery called Mycenaean is to be classified according to its provenance as Late Minoan, Late Cycladic or Late Helladic. Each of the three divisions of the Bronze age has further chronological subdivisions. (See AEGEAN CIVILIZATION.)

Early Iron Age.—The pottery of this period is still far from well known and is marked by the gradual predominance of geometric ornament, by the introduction of new shapes, by a different quality of paint, and in general by an artistic decadence which so often coincides with an improvement in the material concomitants of life.

Geometric Pottery.—By 900 B.C. the Iron Age was well established in Greece and the geometric style of ornament predominated. This is sometimes known as Dipylon pottery, because it first became known from vases found in the cemetery outside the Dipylon gate at Athens. About 800–750 B.C. the geometric style began to modify under the influence of oriental motives derived through the Greek colonies on the coast of Asia Minor and Cyprus, and probably, too, through contact with Phoenician traders. This modification is known as Phaleron ware from the site of its first discovery. Then about 750 B.C. what is known as Proto-Corinthian pottery had a great vogue. This consists of small vases delicately made with fine linear ornamentation carefully designed and often combined with friezes of animals and warriors, well and minutely drawn. These vases are called Sicyonian, from the view recently advanced that they were manufactured there. They are, however, the forerunners in many

respects of the next great phase of Greek pottery.

Orientalizing.—Towards the end of the 8th century B.C. oriental influence which had gradually permeated the geometric style became the chief characteristic of Greek pottery. Just as the geometric style, though uniform, had many local variations all over Greece according to the circumstances of the place of manufacture and of the quality of the clay employed, so now the orientalizing style throughout the Greek world produced a great number of local styles, and many of these have not yet been definitely placed. The style flourished more in the islands and along the Asiatic littoral where we find Aeolic, Clazornenian, Milesian, Samian, Rhodian, Delian and Melian wares. Even Naucratis had a special fabric of its own, and on the mainland we have Corinthian, Chalcidian, Boeotian, Attic and Laconian wares. Many of these local wares, like the Boeotian and the Laconian developed on their own lines in the succeeding periods, but never attained to any great importance, for Attic pottery eclipsed the rest of the Greek fabrics and became the great standard. It seems to have been extensively exported, especially to Etruria, where its products found a ready market among the Etruscan nobles. Thus Attic pottery from the 6th century onwards is the great centre of Greek ceramics, and we have two main stj-les: (1) Black-figured ware in which the designs are painted in black on the red ground of the vase and picked out with incisions and with added purple or white paint. This ware flourished during the 6th century, and shortly before 500 B.C. gave way to another style which was practically its converse; (2) Red-figured ware, in which the ground is painted black and the designs are reserved in the red colour of the vase, while details are rendered with black lines. These last two classes of pottery, from the elegance and beauty of their drawing, rank more as paintings than as pottery. With them must be grouped a contemporary ware in which the designs were painted on a white ground. Particularly noticeable are the white *lekythoi* which were made specially to be placed in graves and decorated with unfixed paint. These provide us with some of the best Greek paintings and drawings known.

With the degeneration of the red-figured style in Attica at the close of the 5th century the Greek colonies in Italy took the lead and produced quantities of large vases decorated in a florid and over elaborate style. In Greece itself the red-figured wares gave place to less pretentious vases intended more for use than as works of art. Good pottery covered with the excellent black glaze which was the secret of the Attic potters, was produced in great quantities, but the ornament was limited to incisions assisted by simple patterns in white paint laid on the black surface. Certain simple forms of white grounded ware were still made, but ordinary designs of flowers, fruit, musical instruments and the like were the sole decoration. The principal decorated ware from the 4th century onwards was moulded pottery which includes a large class of vases usually known as Megarian bowls. These are often covered with a uniform black glaze which is seldom of good quality and in later examples tends to be thin and grey. The decoration at first consisted of figure subjects as on the earlier black and red-figured wares, and Homeric subjects were specially popular. Designs based on the acanthus, shells, scales and other motives popular in Greek decorative art are common and figures of Erotes are often added. With these comes a class of black pottery ornamented with moulded medallions or figures applied to the surface. Here the motives employed are usually figures of maenads, satyrs, and other Dionysiac subjects, amazons and gods and goddesses. Moulded wares became popular in Italy as Arretine pottery and so spread throughout the Roman world as "Samian Ware" (now usually called terra *sigillata*) which was the characteristic tableware of the first two centuries of the Christian era. Two probable reasons may be assigned for the decay of Greek pottery after the 5th century. The general increase of wealth and luxury due to the renewed intercourse with the riches of Asia especially after the campaigns of Agesilaus and Alexander, inspired the upper classes, the patrons of the vase painters, with the fashion of using silver plate for their tables. At the same time the new age of adventure beginning in the 4th century caused a change in art which was henceforward practised more for its own sake than as the means of ennobling objects of ordinary domestic and social use.

VI. Sculpture, which properly comes under art and embraces all forms of plastic and toreutic, and can be subdivided into the following groups: (1) Sculpture proper, which is limited to figures carved in the round or in relief by the artist direct from the stone or marble. A minor branch is gem engraving in which subjects are carved either in intaglio or in cameo directly on the stone; (2) Modelling, which applies to figures small or large modelled in clay intended as independent works of art or else as models for large figures to be executed in marble or bronze. The votive terra-cotta statuettes which are found in such numbers in excavating Greek sanctuaries and tombs, though usually cast in moulds, fall into this class and so do the well-known Tanagra and similar figurines which were made in moulds for funeral furniture; (3) Metal casting especially bronze, the favourite material for many of the greatest Greek sculptors. Polyclitus for instance worked principally in this technique. A subdivision of this group is jewellery made by casting in gold and silver small objects which were then fitted together to make earrings, necklaces, and other ornaments; (4) Metal chasing, which is practically confined to the precious metals; (5) Carving in materials other than stone or marble, which is usually restricted to small objects such as statuettes of ivory, but in the earlier days of Greek art according to the literary evidence there were statues of wood which have not been preserved.

VII. Painting. — We have nothing left of the frescoes or easel pictures of the great masters of Greek painting like Polygnotus or Apelles and a history of Greek painting has to be constructed mainly from the literary sources. The vase paintings, however, of the Attic black and red-figured styles and of the white grounded vases supply much beautiful and valuable material for estimating the style and manner of the Greek painters. The painted grave stones from Pagasae which are not earlier than the 4th century represent industry rather than art, but still provide useful evidence as to methods and technique.

None of the seven branches of Greek archaeology are absolutely independent for they often over-lap each other. Inscriptions may be found on buildings, on statues, on vases and on coins. Coins themselves, being struck from engraved dies in intaglio approach one of the subdivisions of sculpture, and ceramics and vase-painting are also closely connected. Famous statues, too, were often imitated in coin types. Then topography and study of the ancient remains from the geographical point of view take into account practically all the other branches. Thus a hoard of coins containing a large number of bronze coins of a city, the site of which is doubtful may solve its identification. Still every Greek archaeologist, though he naturally specializes in one or two branches only, should have a sound working knowledge of the others.

CHRONOLOGICAL DIVISIONS

In addition to the seven great branches which divide Greek archaeology according to subject, there are two chronological divisions, the pre-historic and the historic. It is hard to say where the first ends and the second begins, but for practical purposes the division may be put at 776 B.C., the Greeks' own traditional date for the first Olympiad and the beginning of their chronology.

Prehistoric. — The prehistoric age subdivides into the usual periods: Palaeolithic, Neolithic, Bronze Age, Early Iron Age. The Palaeolithic Age is not yet established for Greece, though a few isolated palaeoliths are reported. The Neolithic and Bronze Ages are described under AEGEAN CIVILIZATION. The Early Iron Age is a natural evolution from the last phase of the Bronze Age affected by the infiltration of external elements, probably northern, which the Greeks described as the Dorian Invasion or the Return of the Heracleidae. It is characterized by the use of the "geometric" pottery mentioned above, iron swords of a Danubian type, bronze safety-pin brooches often with spiral ornaments, bronze figurines of animals, long bronze pins and sometimes ivory plaques and figurines. This culture is not that of a particular

tribe or people, but of a phase in the evolution of Greek art, for in the civilization of a people community of inspiration is more important than community of race. Early in the 8th century a great increase in oriental influence due partly to Phoenicians and Etruscans and partly to the Greek colonies in Asia Minor inaugurated the orientalizing period of Greek art and here the historic age begins.

Historic.—With this, the classical age, our outlook is different. In the time of unwritten history or legend archaeology itself is history, because the incidents of a people's life are reflected in its material remains. In other words prehistoric archaeology is a manuscript from which history can be deciphered. On the other hand in the classical age history is written. Archaeology then becomes an illuminator and interpreter of history and is best studied under its separate branches described above which form the subjects of special articles. (See ARCHITECTURE, ART, CERAMICS, EPIGRAPHY, NUMISMATICS.)

RELATIONS TO OTHER COUNTRIES

Greek archaeology is not complete in itself, because inevitably it impinges upon the archaeology of the countries that are the neighbours of Greece. Man is a social animal and lives by contact with his own kind. Archaeology is one way of studying the material results of the contact of man and man. Similarly no race can live for long in a state of complete isolation and the result of the contact between one race and another is reflected in their archaeology which thus provides a means of gauging the extent of the influence of one race upon another. For pre-historic times there is archaeological evidence that Greece was in contact with surrounding races. The marked influence which Egypt and Crete exerted upon each other is well known. So we find connections between the Aegean civilization and Palestine, Cyprus and Asia Minor, where Troy is the classic example. Northwards there are clear evidences of intercourse between prehistoric Greece and Macedonia and the Danubian and Carpathian areas. Westwards there are hints of relations with Italy, and the Aegean civilization (*q.v.*) touched Sicily and Sardinia. So no true student of the Aegean civilization can appreciate its full value without considering its neighbours and in chronology the Egyptian connections are of vital importance. With the beginning of the classical period and the dawn of history the relations of Greek archaeology naturally became more intricate. The connection with Egypt and Asia Minor still remains and there is great uncertainty as to the amount of the debt of Greece to Phoenicia during the orientalizing age. These contacts are of the utmost value for chronological questions. Northwards again Macedonia, Thrace, and the Danubian and Euxine districts become of genuine historical importance through their contacts with Greek archaeology. The dating of the monuments in those regions is due in large part to our knowledge of Greece. For the Adriatic the same holds true and further west in Italy the case is far stronger. Sicily and southern Italy were studded with Greek colonies and their relations with the indigenous cultures provide a reflex of their relative importance and also most useful chronological comparisons, and Etruscan archaeology is throughout illuminated by our knowledge of Greece. Sardinia, the east coast of Spain and the south coast of France were fringed with Greek colonies, and so Greek archaeology illustrates these with great profit to history. These instances show how important it is not to allow the detailed study of Greek archaeology to exclude all view of any other. Two further points of the utmost importance for study of human development occur for note. When Alexander overran the Persian empire and through Macedonia made Greece mistress of the Near East he spread Greek culture which is illustrated by hundreds of monuments throughout the East as far as the borders of India. The influence of Greece on Asia is revealed by Greek archaeology and it was upon this union of East and West that the foundations of Christianity were laid. Secondly, when Rome became mistress of the Mediterranean the culture she adopted was that of Hellenistic Greece, the very culture which Alexander and his successors had propagated. Greek archaeology reveals this to us in the houses of Rome and Pompeii and the adoption by Rome of Hellenistic culture, which Greek archaeology verifies, assisted the rapid growth of Christianity under the Roman empire. Constantine's official adoption of Christianity was one of the greatest landmarks in world history and Greek archaeology helps in no small measure to appreciate why and how this change was inevitable.

MUSEUMS

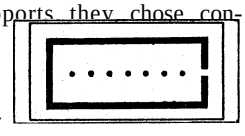
The materials for the study of Greek archaeology are housed in various museums all over Europe and in America. The museums of Greece take precedence because their contents are mainly the product of scientific excavations and have not lost their contexts and the sculptures they contain have not suffered from restoration. The National museum at Athens is famous for its sculptures, vases, bronzes, the Acropolis museum for archaic sculptures, the Epigraphical museum for inscriptions. The museums of Olympia, Delphi and Delos house the great finds from the excavations of those sites and that of Candia contains the finds from Cnossus and Crete in general. Other important museums in Greece are those at Thebes, Volos (for paintings), Samos (for sculptures), Nauplia and Corinth (both for prehistoric pottery), Sparta (for Spartan art), Thera, Corfu, Chalcis, Thermon and several others. In Italy Rome leads the way with the Museo delle Terme for sculpture, the Vatican for sculpture and vases, the Capitoline museums for sculpture and the Villa Giulia for vases. At Naples the National museum has unrivalled sculptures, as also has the Uffizi at Florence, where in the Museo Archeologico are Greek objects found in Etruria. The museums of Palermo for sculpture, Syracuse for vases, Taranto for vases and terra-cottas are important, and there are many other museums with Greek objects all over Italy. In France the Louvre is the principal museum with great treasures of Greek art. In Germany there are many museums. Berlin has in the State museums fine sculptures and vases and in the Ethnological museum Schliemann's finds from Troy. At Munich the Glyptothek contains the Aegina pedimental figures and other sculptures and the Museum fur Antike Kleinkunst contains valuable vases. Dresden (Albertinum), Cassel, Heidelberg, Hildesheim and other German towns have good collections. In Great Britain the British Museum in London has the Elgin hfarbles and a fine series of vases, the Fitzwilliam museum in Cambridge and the Ashmolean at Oxford have vase collections, too, and the latter a fine prehistoric collection as well. In Turkey the Constantinople museum has good sculptures and some of the finds from Troy, and in Egypt the Alexandria museum has a good collection of objects illustrating the later stages of Greek art. In Denmark at Copenhagen the Ny-Carlsberg Glyptothek has sculptures and the National museum vases. In Holland the Scheurleer museum at The Hague and the Leyden museum, and in Belgium the Musée du Cinquantenaire at Brussels have good vases and terra-cottas. In Russia the Hermitage museum at Leningrad has sculptures and vases, and several of the south Russian towns such as Odessa have good collections from the Greek colonies on the Black Sea. In America the Metropolitan museum in New York and the Museum of Fine Arts in Boston both have good collections of sculpture and vases, while the university museums at Baltimore, Philadelphia, and Harvard have useful collections.

BIBLIOGRAPHY.—The publication of the results of research in all seven branches of Greek archaeology and of the material yielded by excavations is catered for by a large number of periodicals in the principal countries of Europe and in America and by the issue by specialists and others of learned monographs treating some particular section of the whole field. The principal periodicals are: in Greece the *Ephemeris Archaiologike,* and the *Archaiologikon Deltion;* in Austria the *Jahreshefte* of the Austrian Archaeological institute, in France the *Revue Archtologique* and the *Bulletin de Correspondance Hellénique;* in Germany by the *Jahrbuch* of the German Archaeological institute, the *Athenische Mitteilungen,* and many others; in Great Britain by the *Journal of Hellenic Studies* and the *Annual of the British School at Athens;* in Italy by the *Monumenti Antichi* of the Accademia dei Lincei and the *Annual* of the Italian school at Athens; and in the United States by the *American Journal of Archaeology.* The monographs dealing with special aspects of Greek archaeology fall into three classes (1) Monumental collections or catalogues of a particular class of object, such as the great Corpus of Greek inscriptions *(Inscriptiones Graecae)* issued by the Berlin academy or the *Corpus Vasorum Antiquorum* published under the auspices of the *Union Acadtmique Internationale* and scientific catalogues of famous museums such as the German catalogue of the Vatican sculptures and

the British catalogue of the Capitoline collections and the British Museum catalogue of Greek coins. (2) Comprehensive publications of the objects found in great excavations with full and scientific commentaries such as the German publications of the excavations at Olympia, Thera and Aegina; the French publications dealing with Delphi and Delos which are still in progress; and the Greek publications dealing with Epidaurus and the Acropolis at Athens. (3) Monographs on particular topics which range from handbooks of the usual type for students, such as the histories of Greek sculpture by E. Gardner, Overbeck, Collignon, and Picard, to scientific monographs of the first class which lay the foundations for the study of a particular subject. Here we can class in topography Woodhouse's Aetolia; in epigraphy Cavaignac's treatise on the *Trésor d'Athènes;* in numismatics Svoronos' Nomismata ton Ptolemaion; in architecture Penrose's Principles of *Athenian* Architecture, and the American monograph on the Erechtheum; in Ceramics Beazley's books on Attic black and red-figured vases; in sculpture Joubin's Sculpture *Archaïque,* or Furtwangler's Masterpieces and in painting Pfuhl's Meisterwerke Griechischer Zeichnung und Malerei. Of equal importance are the great portfolios of plates of sculpture and of portraits published by Messrs. Bruckmann of Munich. See also A. Michaelis, Ancient Marbles in Great Britain (1882), and A Century of Archaeological Discoveries (1908); J. P. Droop, Archaeological Excavation (1915).

(A. J. B. W.)

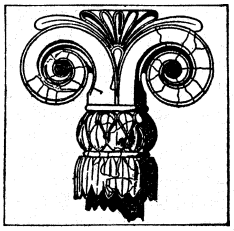
GREEK ARCHITECTURE. To the Greeks fell the rôle of inventing the grammar of conventional forms on which all subsequent European architecture was based. The materials at their disposal, wood and stone as well as mud, induced them to adopt a post-and-lintel system, as in Egypt (see EGYPTIAN ARCHITECTURE), instead of massive walls and vaults, as in Mesopotamia (see WESTERN ASIATIC ARCHITECTURE; ARCHITECTURAL ARTICLES, etc.). However, for moulding their supports they chose conventional rather-than naturalistic forms, therein resembling their Aegean predecessors; particularly Greek was the patient genius with which they perfected every element, rarely deviating from the forward path to invent new forms or new solutions of old problems. This conservative adherence to older types led to such masterpieces as the Parthenon and Erechtheum.



FROM ANDERSON & SPIERS AND DINSMOOR, "THE ARCHITECTURE OF ANCIENT GREECE" (BATSFORD)

FIG. 1.—TEMPLE AT NEANDRIA

Primitive Period **(1100–600 B.C.).**—While Greek domestic architecture began with the Dorian invasion, monumental religious architecture first appeared in the 9th century. Mere open areas with altars (Aegina, Sparta, Ephesus) no longer sufficed when gods were represented in large images, requiring special temples. The houses of men furnished the patterns: from the circular nomadic hut developed the horseshoe or apsidal plan (Eretria, Gonnoi), the oblong plan with curved walls (Thermon), and eventually the normal straight-sided oblong, the axis running east-and-west, and the entrance always at one end. A porch (pronaos) might be added in front, a sanctuary (adytum) at the rear. Walls were of mud-brick resting on stone socles, their free ends (antae and door jambs) encased in wooden sheathing. Simultaneously the roof developed from the nomadic thatched beehive, through the long ogival mud-brick vault, to the sloping hipped roof with wooden rafters, supported by girders resting on the side walls.

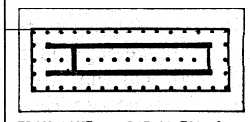


FROM SAME SOURCE AS FIG. 1

FIG. 2.—PROTO-IONIC CAPITAL

In wider temples these cross girders had to be reinforced by columnsplaced in single file along the main axis (Selinus, Prinias, Locri, Sparta, Neandria, Samos). Thus came into Greek architecture the characteristic post-and-lintel system. At first mere wooden posts, these internal supports were gradually moulded on opposite sides of the Aegean sea into two different types. Proto-Doric and Proto-Ionic. The former, with its circular moulded capital and square abacus, was copied in wood from such surviving Aegean works as the Lion Gate at Mycenae. The Proto-Ionic type originated as an elongated capital, early transformed into stone; slender unfluted shafts (sometimes with special bases) were capped by garlands of drooping leaves from which spring vertical volutes (Lesbos, Neandria, Larissa), an Egyptian motive transmitted by Phoenicians and Hittites.

In an open pronaos, a central column repeated the axial colonnade (Locri, Prinias); next, because central columns obscured the cult image, the axis was opened by using two internal colonnades and so two columns in-antis on the front. Thus the column first appeared on the exterior and introduced a new problem, the creation of an entablature. The transverse girder formed the architrave, a single solid beam in the Doric, compounded of superposed planks (fascias) in the Ionic; upon this rested the ends of ceiling beams, heavy and widely spaced (triglyphs) in the Doric, light and closely spaced (dentils) in the Ionic. Mutular eaves formed by overhanging rafters characterized the Doric cornice; the Ionic was merely hollowed to shed rainwater. The light wooden Ionic entablature is best known through imitations in native rock-cut tombs of Asia Minor; the Doric forms are revealed through the survival of terracottas which protected the bulky timbers, black or blue triglyphs casing the fibrous ends of ceiling beams, gaily painted terracotta metopes occupying the interstices, and facings with conventional patterns on the cornice. The ridge of the hipped roof was soon prolonged to the front, forming a gable (pediment), the rear end sometimes remaining hipped (Thermon, Sparta). The gutter (*sima*) which had hitherto crowned the cornice on all four sides was only momentarily retained under the pediment (Syracuse, Geloan treasury at Olympia); but the mutules, equally anachronistic symbols of rafters under a pediment, remained even on the façade. Semicircular terracotta tiles covered the joints between the concave pan tiles, terminating at the eaves in semicircular antefixes.



FROM SAME SOURCE AS FIG. 1

FIG. 3.—TEMPLE AT THERMON

While the Ionians limited themselves to the pronaos in-antis, the emergence of the column and the development of the order inspired Dorian architects to further embellishments. The pronaos might be repeated in a rear porch (*opisthodomus*), or the whole temple surrounded by a peristyle. From the five lines of the flank walls and the axial and flank colonnades resulted pentastyle façades (Thermon), two internal colonnades required hexastyle facades (Heraeum at Olympia); the flanks were long in proportion, with 15 or 16 columns. The height of the wooden columns, $1\frac{3}{8}$ axial spacings (Olympian Heraeum) each of $4\frac{3}{8}$ diameters (Argive Heraeum), seems to have been 7 diameters; the entablature was about two-fifths of the column height.

Archaic Period **(600-500 B.C.).**—The new-rich western colonies transformed the peripteral temple into limestone; the Ionian East soon followed with the greater splendour of marble. But the motherland of Hellas remained conservative; during eight centuries the columns of the Olympian Heraeum were gradually replaced in stone; as late as 513 B.C. marble was limited to one ostentatious temple façade (Delphi). Limestone, however, was coated with fine marble stucco; sandstone was often used in the West for carved members; terracotta cornice revetments were gradually eliminated and the terracotta gutters and even roof tiles replaced in more important temples by marble.

A few primitive types of plans survived, either apsidal (Delphi, Athens, Corinth, Olympia) or with axial colonnades (Olympia, Delos, Paestum, Metapontum). The simple diastyle in-antis plan long prevailed in Hellas; at Athens a double temple had porches at both ends. But the most favoured temple plan was the hexastyle peripteral, sometimes (in Sicily) with the facade doubled for greater magnificence. The opisthodomus (rear porch) was customary in Hellas, the closed adytum (secret chamber) in the West; the interior might have two rows of columns (in Hellas) or none at all (in Sicily). The East outdid the West by doubling the colonnade on all sides, giving the octastyle dipteral plan (Ephesus, Samos, Magnesia), imitated also at Athens (Olympeium); at Corcyra and Selinus ("GT") the inner lines of columns were omitted, becoming pseudodipteral; at Acragas (Olympeium), while retaining the same vast total dimensions as at Selinus, the number of columns was reduced and the scale thereby so enlarged

EXAMPLES OF DORIC TEMPLES

1. Temples at Paestum; at the right the so-called Basilica, really an archaic temple (*c.* 540 B.C.). At the left the so-called Temple of Poseidon (*c.* 460 B.C.), showing heavy transitional proportions relieved by numerous flutes: one of the best preserved of Greek temples (for interior see fig. 5)
2. Temple of Apollo at Corinth (*c.* 540 B.C.), showing the seven standing columns, with sturdy archaic proportions, monolithic shafts, and high architrave (frieze and cornice missing). View from interior, with Acrocorinth in background
3. Temple of Zeus at Olympia (c. 465–457 B.C.); Libon of Elis, architect. East front (restored), showing heavy proportions as at Paestum because of its transitional date and colossal scale, the effect being relieved by pediment sculpture (the shields are Roman additions). Overthrown by earthquakes, little now existing above the Platform level
4. The Parthenon on the Acropolis at Athens (447–432 B.C.); Ictinus and Callicrates, architects. The masterpiece of the Doric style, with the lighter proportions of the culminating period. This west front is nearly intact apart from the loss of the pediment sculptures; the flank colonnades were partly demolished by bombardment in 1687 (for interior see fig. 7)
5. Interior of the Temple of Poseidon at Paestum (see fig. 1), showing the usual Doric treatment with superposed tiers of heavy Doric columns to support the ceiling
6. Interior of the Temple of Apollo at Bassae (*c.* 450–420 B.C.); Ictinus, architect. This shows the later scheme of employing single tiers of slender Ionic columns to support the ceiling, even though the temple is Doric externally
7. Interior of the Parthenon (see fig. 4) from the west, with the internal colonnades (in two tiers as at Paestum) and walls and parts of the flank colonnades blown out by the explosion. The dark patch of pavement in the distance is the site of the gold-and-ivory statue

IONIC AND CORINTHIAN TEMPLES

1. The Erechtheum on the Acropolis at Athens (*c.* 421–405 B.C.); Mnesicles probably the original architect. View from the southwest, showing the irregular plan resulting from the limitations imposed on the architect by religion. There are three different Ionic orders (the east porch of six columns, one visible at extreme right; the north tetrastyle porch at extreme left, compare fig. 4; the sham portico of four engaged columns at the west) and at the south is the Caryatid porch. Rebuilt by the Greek authorities, 1903–1908. 2. Temple of Athena Nikė (Nikė Apteros) at Athens (c. 426 B.C.) as seen from the northeast; Callicrates, architect. An Ionic temple of miniature size, designed with special regard for its situation on a bastion of the Acropolis. 3. Temple of Apollo at Didyma near Miletus (332 B.C.–A.D. 41), Paeonius and Daphnis, architects. Detail of colossal east façade, showing special stairway in the centre, adapted to human requirements, and varied column bases. 4. North porch of the Erechtheum (see fig. 1), the open proportions and elaborate decoration contrasting with the solidity and simplicity of the neighbouring Parthenon. 5. The Olympieum at Athens (174 B.C.–A.D. 131); Cossutius, architect. The only colossal Corinthian temple of the Greek period, with heavily proportioned columns; the frieze and cornice exist only in fragments. In the background appears the Acropolis

GREEK RELIGIOUS PRECINCTS

1. Athenian Treasury at Delphi (*c.* 515 B.C.), in the form of a small Doric temple, executed wholly in marble, originally with elaborate sculptured decoration (of which only casts of the metopes are in place). Rebuilt by the French authorities 1903–06, by fitting together the scattered fragments
2. The Propylaea of the Acropolis at Athens (437–432 B.C.); Mnesicles, architect. Inner or east front, showing the form of the Doric central porticoes, and the middle intercolumniation widened for processions. The parts above the columns were overthrown by an explosion about 1645, and rebuilt by the Greek authorities 1909–17. At the right appears the unfinished wall of the proposed northeast hall
3. The Propylaea at Athens (cf. fig. 2), showing outer or west front (injured by bombardment in 1687) and steeply sloping approach, with enframing wings at north and south (the latter not shown) terminating in pedestals which were to have enframed gateways to lower precincts. Upon the frustration of the latter portion of the scheme, the Temple of Athena Niké was built on the south (426 B.C., see Plate II., fig. 2), and the great pedestal of Agrippa on the north (174 B.C.), at extreme left
4. The Great Altar of Zeus at Pergamum, built for Eumenes II. (197–159 B.C.), Detail of the reconstruotion in Berlin, showing podium decorated with colossal frieze, interrupted by stairs which ascend to a colonnaded court enclosing the altar. Only the foundations remain on the actual site

GREEK MONUMENTS AND SECULAR BUILDINGS

1. Tower of the Winds at Athens (*c.* 100 B.C.), designed by the astronomer Andronicus Cyrrhestes; view showing one of the two porches, each of which was composed of two Corinthian columns. Sundials on each of the eight sides, an allegorical frieze of the eight winds at the top, a conical roof surmounted by an octagonal capital and a bronze Triton as weather-vane, completed the design. 2. Grave stele of Hegeso (soon after 400 B.C.), tombstone of wide pedimental type from the Ceramicus cemetery at Athens: slightly projecting lateral antae enclosing scene of parting in relief. 3. Choragic Monument of Lysicrates at Athens (334 B.C.), showing the earliest external use of Corinthian columns, the six intervals filled with thin walls, and the conical roof and trefoil finial originally supporting a bronze tripod. 4. Grave stele of Bion (4th century B.C.), tombstone of narrow type from the Ceramicus cemetery at Athens, with palmette acroterion embellished with acanthus leaves, and two rosettes above the relief. 5. Theatre of Dionysus at Athens (*c.* 350–325 B.C.), on the south slope of the Acropolis, showing the marble thrones forming the lowest tier, and the ordinary limestone seats rising behind (*cf.* Plate V., fig. 2). 6. Grave stele of a maiden (4th century B.C.), tombstone of narrow type from the Ceramicus cemetery at Athens, with funeral vase (loutrophoros) in relief and mourning Siren as acroterion

that the intervals were filled with walls, becoming pseudoperipteral. The employment of colossal dimensions, with stylobates measuring up to 180×365 ft., column diameters up to 14 ft. (Acragas), column spacings up to 28¾ ft. (Ephesus), afforded the tyrants of this period opportunities for lavish display.

The geographical cleavage between the styles continued. The western temples at Syracuse, Selinus, Acragas, Paestum, Pompeii, Tarentum, Metapontum and Corcyra, and those in Hellas at

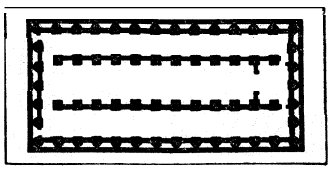
Athens, Rhamnus, Delphi, Eretria, Aegina and Corinth, all were Doric. In the East, Naucratis, Ephesus, Samos, Naxos, Paros, Chios, Miletus and Magnesia furnish important landmarks of the archaic Ionic development. The Doric temple invaded the East, at Assos, suffering the intrusion of the Ionic frieze; reciprocally the Ionic temple penetrated the West, at Locri and Hipponium.

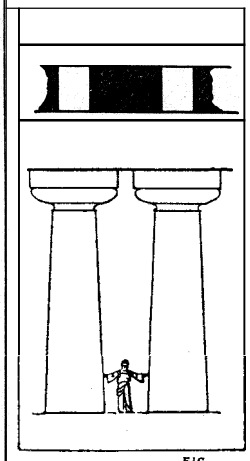
In the Doric order the sudden change of material, and timidity as to the strength of stone, caused violent changes. Not only were column shafts often constructed as monoliths, but proportions became heavier, with column heights ranging from 6½ to 4 diameters as they increased in size, and with intervals as close as ¾ diameter, so that the spreading capitals were nearly contiguous. With growing confidence, larger columns were eventually raised to 5 or even 5⅝ diameters, with intervals up to 1⅔ diameters; only for constructive reasons were the colossal columns at Acragas limited to 4½ diameters, the intervals at Selinus and Acragas to 1¼ and ⅞ diameters. Spacings and diameters were often enlarged on the facades in Hellas; uniform diameters but different spacings characterize the western peristyles. Bulky architraves, and other members in proportion, made the height of the entablature more than half of the column, this proportion being reduced gradually to two-fifths or three-eighths.

The heavy shafts were relieved by tapering and by flutes, 16 to 50 in number, 20 being the final preference. The hollow necking and astragal inherited from Aegean prototypes gradually disappeared, until three or four incisions alone distinguished necking from shaft. The abacus spreading to 2½ times the upper column diameter (forming slabs up to 13 ft. square), making the echinus curve almost horizontal, contracted and the echinus stiffened Triglyphs at first appeared only above columns, leaving horizontal oblong metopes between; interpolated triglyph: next reduced the metopes to vertical oblongs, which gradually approached squareness, the half mutules above the narrow metopes then becoming of full width. Relief sculpture succeeded painting in the metopes and pediments, changing in the latter to free statues; human and animal forms replaced the semicircular acroteria, and the antefixes changed from semicircles to prismatic forms, surmounted by palmettes. Such vagaries as flutes ending in petals, the echinus carved with rosettes or lotus, the architrave carved as a frieze or crowned by heavy Ionic mouldings, the frieze omitted, triglyphs unrelated to columns, pentaglyphs substituted for triglyphs—these show that the style was yet in a formative and uncanonized stage.



FROM SAME SOURCE AS FIG. 1
FIG. 7.—OLYMPIUM AT ACRAGAS

The Ionic column, carrying a lighter entablature and longer habituated to stone, was more slender from the very beginning (about 8 diameters), with greater intervals (1½ to 2⅓ diameters); particularly noteworthy were the enormous intervals of the façades. Bases became more complex, a torus horizontally fluted above and a disc fluted or with two deep scotias below. The shaft had narrow flutes with sharp arrises, 18 to 48 according to size, the flutes later deepening with separating fillets, 24 in number. The capitals show pendent leaves transformed into egg-and-dart, at first deeply undercut; volutes changing direction to the horizontal and becoming connected; "canals" at first convex, then concave, with "eyes" appearing late in the development; the abacus long and narrow. Exceptional were sculptured lower drums and rosetted volutes at Ephesus, flowered neckings at Naucratis, Samos and Locri. Though the entablature was friezeless, broad bands of relief sculpture were inserted wherever possible, as on the sima at Ephesus. But in Hellas a new type of Ionic entablature was created to vie with Doric proportions; the fascias of the architrave were suppressed, the dentils omitted and a high frieze inserted between architrave and cornice (Ionic treasuries at Delphi).

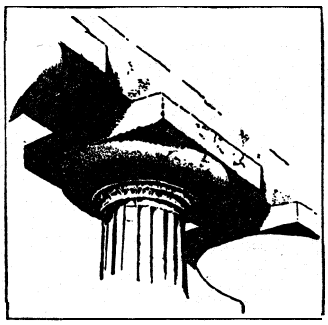


SAME SOURCE AS FIG 1
FIG. 8.—EARLY ARCHAIC DORIC PROPORTIONS

Both orders were awkward at the corners of peristyles. In the Doric, the difficulty lay in reconciling triglyph and column spacings, while bringing a triglyph out to the corner of the entablature; in the West it was met hy widening the angle triglyph or the adjacent metope, in Hellas by contracting the end columnar interval; finally, metope expansion was combined with column contraction. In the Ionic, the bracket capital seemed incapable of turning the corner, until at Ephesus was devised an awkward L-shaped capital with an angle volute.

Other forms displaying the versatility of the archaic designers were the hybrid Doric-Ionic capitals of Amyclae, the basket capitals of Delphi, and the use of human figures as supports, both male (Atlantes of Acragas) and female (Caryatids of Delphi). Other types of buildings yielded new opportunities,—simple temple-like treasuries (Olympia, Delphi), the square hypostyle hall (Telesterion) at Eleusis, the archaic circular tholos at Delphi, the apsidal senate-house at Olympia, altars as at Miletus and Delphi, the throne at Amyclae, porticoes such as the Athenian Stoa at Delphi, the primitive orchestra circle at Athens, and elaborate fountains built by the tyrants (Athens, Megara, Corinth, Samos). And in some of these minor works, as in votive columns and grave monuments, migratory architects mingled the styles.

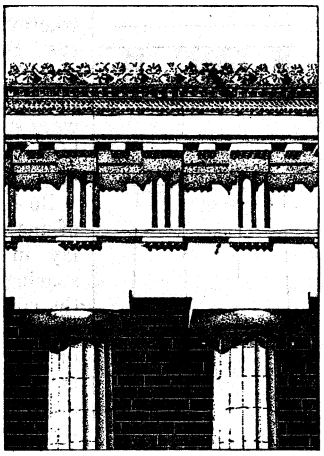
Transitional Period (500–450 B.C.).—The grammar of forms and the types of buildings having been largely determined, the next step was that of refinement. The problem was all the more concentrated because the political subjection of the East now restricted architectural initiative to the Doric style of Hellas and the West, which, furthermore, received fresh impetus from the victories over Persia and Carthage. And in particular at Athens the discovery of copious marble quarries contributed to the refinement of design.



FROM KOLDERWEY AND PUCHSTEIN, "DIE GRIECHISCHEN TEMPLE IN VUTERITALISU UND SICILISU" (JULIUS SPRINGER)
9.—DORIC CAPITALS

Freedom was now abandoned in favour of strict canonization, resulting almost in monotony. Hexastyle peripteral Doric temples became universal: in Hellas at Sunium, Athens (the unfinished Older Parthenon), Aegina, Delphi and Olympia; in the West at Syracuse, Himera, Gela, Caulonia, Acragas, Croton and Paestum (with simple *in-antis* plans at Acragas and Camarina). Work was continued on the never-finished colossi at Selinus and Acragas, with distinct changes of details. A reaction toward heavier proportions is everywhere noticeable; the column height ranged between 5⅖ and 43 diameters, the intervals between 1¼ and 1 diameter with smaller or larger columns; the entablature remained about two-fifths of the column height. In the West, columns were of uniform diameters and (except at Paestum) uniformly spaced on front and flank, apart from the contracted end intervals; but in

Hellas some emphasis of the front, either with heavier columns or with wider spacing, was still prevalent; or the corner columns alone might be enlarged. The West adopted the opisthodomus of Hellas, sometimes in addition to the adytum; but cella colonnades appeared in the West only at Paestum, apart from the huge octastyle at Selinus. Such internal colonnades were two (at Selinus three) storeys in height, separated by architraves and carrying only ceiling and roof; the few known galleries (Aegina, Olympia) were later insertions; and the stone staircases (Selinus, Acragas, Paestum) ascended merely to storerooms above the ceilings.



FROM SAME SOURCE AS FIG. 1

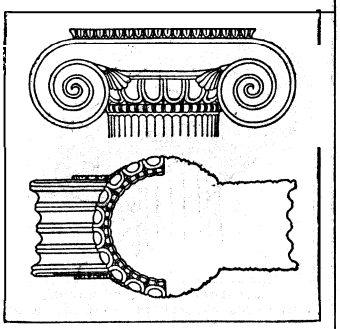
FIG. 10.— ENTABLATURE AT SELINUS (RESTORED)

In this period the Ionic temple first appeared in Hellas (Sunium), with the peristyle strangely confined to one front and one flank, and with the typical mainland form of entablature without fascias or dentils.

Among other types of buildings, additional treasuries at Olympia, the reconstructed oblong Telesterion at Eleusis and the similar Cnidian Lesche (clubhouse) at Delphi, the Old Propylon of the Athenian Acropolis, great porticoes such as the Royal and Painted Stoas at Athens, the reformed Athenian theatre with wooden scene buildings, and the imitation of the oriental gridiron city plan at Miletus, all paved the way for the masterpieces of the following period.

The Culmination at Athens (450–400 B.C.).—The middle period of the evolution centred at Athens, which signed peace with Persia in 448 B.C., and now in the absence of military requirements was free to use the wealth of the Athenian confederacy in rebuilding the temples ruined by the Persians. Under the personal initiative of Pericles, and in the hands of architects like Ictinus, Callicrates and Mnesicles, and the sculptors Phidias and Callimachus, Greek architecture reached its zenith.

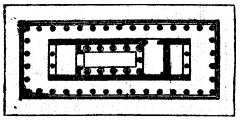
The Doric style of Hellas naturally retained the leading place, and was employed not only in hexastyle temples at Bassae, Rhamnus, Sunium and Athens ("Theseum"), but also in the octastyle Parthenon on the Acropolis; besides these erected by Athenian architects, we find hexastyles near Argos (Heraeum), at Acragas (temple of Concord), Segesta and Delos (the last prostyle). Most of these structures were comparatively small, owing their effect rather to perfection of design and execution, and, in the case of those in Attica, to the beauty of marble. Columns were now more slender, 6 to 53 diameters high, with intervals of $1\frac{2}{3}$ to $1\frac{1}{4}$ diameters, as columns were smaller or larger; the entablature was reduced to one-third of the column height. Only Bassae retained the older system with heavier columns on the main façade and reduced spacing on both flanks; elsewhere uniformity prevailed, except at the corners. Cella colonnades were omitted except in the work of Ictinus and at the Argive Heraeum; Ictinus obtained a new effect by returning the colonnade across the back, at Bassae separating adytum from cella (the lateral columns being engaged to the flank walls), in the Parthenon forming an ambulatory around the statue. The false gallery with two storeys of Doric columns appeared for the last time in the Parthenon and Argive Heraeum; a single Ionic order was preferred at Bassae (with three Corinthian capitals across the rear) and in the rear chamber of the Parthenon. The coalescence of the styles was marked by the inclusion of other Ionic elements, mouldings and continuous friezes (Parthenon, Theseum, Sunium). Sculptured reliefs in friezes and metopes, pediments filled with statues and crowned by great floral acroteria, these and the fine mouldings and the marble ceilings enhanced by colour and gilding, broad masses of colour on triglyphs and in shadowed cornice soffits further relieved the simplicity of Doric forms.



BY COURTESY OF JAPES CRAMER WATT

FIG. 11.— ARCHAIC IONIC CAPITAL

The Ionic style was also employed independently in three non-peripteral temples at Athens (on the river Ilissus, the Nike temple and Erechtheum on the Acropolis); its foothold in Hellas was now assured. The amphiprostyle tetrastyle plan was preferred, though in the Erechtheum the rising ground at the east so elevated the stylobate that six columns were required in the width; and the tetrastyle portico originally planned for the west end was revolved to the north flank to respect the sacred olive-tree. balanced by the miniature Caryatid portico on the south, and replaced on the west by a sham portico of engaged columns, producing an irregular T-shaped plan. Columns tended toward slenderness but with great variety of proportion, from $7\frac{6}{7}$ to 10 diameters, with intervals from 2 to 3 diameters, as columns were smaller or larger; the Doric rule was reversed to emphasize Ionic lightness. Bases, after an experimental flaring type at Bassae, assumed the Attic profile with one scotia between two tori. Capitals, apart from the experimental form at Bassae with angular volutes connected by an arched cushion without an abacus, remained elongated brackets; those of the Erechtheum were specially enriched by intermediate fillets in the volutes, inlaid gilded stems ending in palmettes, an extra torus moulding with coloured glass beads, and a flowered necking. The architrave, plain at first, soon resumed its fascias; but the frieze had come to stay and in consequence the dentils were omitted, except in the Caryatid Portico which reproduces the Asiatic form; and with these higher proportions the entablature was one-fourth or two-ninths of the column height. Rampant antefixes above the sima of the Erechtheum, and its elaborately carved mouldings, exceptional in the 5th century, foreshadow the elaboration of the following period.



FROM BORRMANN, "GESCHICHTE DER BAUKUNST" (ALFRED KRONER VERLAG)

FIG. 12.—TEMPLE AT BASSAE

Another symptom of change was the creation of a third style, the Corinthian, first appearing inside the temple at Bassae. Like the Ionic capitals in the same colonnade, the Corinthian capitals represent an attempt to invent a form symmetrical on all sides, the basket capitals of Delphi being further elaborated with acanthus leaves, scrolls and palmettes.

Among buildings other than temples, the Propylaea at Athens take first rank in brilliance of conception. A cruciform plan 224 ft. in length (about equal to the Parthenon) would have formed a frontispiece across the west end of the Acropolis. with wings projecting westward to enframe the ascent; by war and priestly conservatism the design was curtailed until it resembled a lopsided T, only 154 ft. in length. The central building, with its Doric hexastyles and pediments dominating the low hipped roofed north and south arms and west wings (without columns except on the return faces of the wings), formed the entrance, the central intercolumniation widened 6 ft. to allow the passage of festal processions, and the five doorways graded in width like the intercolumniations, with heights varying in proportion; the west ceiling was supported by six Ionic columns in immediate juxtaposition with the Doric Hardly less notable were the redesigned Telesterion at Eleusis. a great square with four rows of five columns within (planned with an outer pseudodipteral colonnade), and the Odeum at Athens with internal columns arranged in nine rows of nine; both had clerestory lanterns above the roofs. Corresponding advances in city planning were the importation of the gridiron system to Hellas (Peiraeeus) and the West (Thurii), and the in-

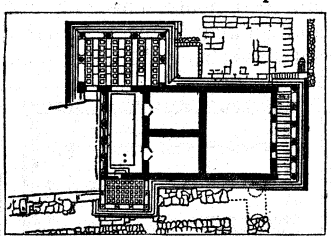


FIG. 13.— ERECHTHEUM. DRAWN BY GORHAM P. STEVENS

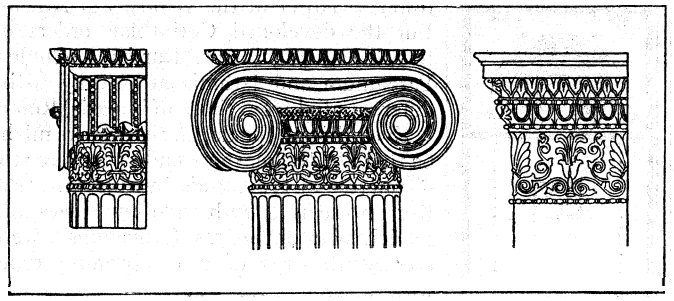
vention of the fan system at Rhodes.

In these buildings, beauty of proportion was enhanced by "optical refinements," almost a speciality of the culmination. The curve of the platform, rising $\frac{3}{4}$ to $4\frac{3}{8}$ in. in a circular arc with a radius as great as $3\frac{1}{2}$ miles, gave vitality and corrected any sagging illusion in the colonnade. The entasis or swelling outline of the column shaft, preventing any sensation of concavity, attained its maximum ($\frac{1}{4}$ to $\frac{3}{4}$ in.) at half of the height, though in earlier



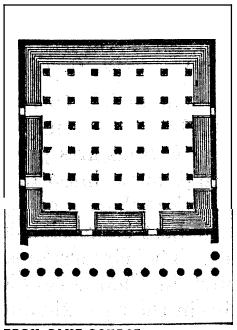
FROM LETHABY, 'FRAGMENTS FROM GREEK BUILDINGS (BATSFORD)

FIG. 14.—IONIC CAPITAL

and later periods it was much more pronounced. The inward inclination of the column axes (from $\frac{3}{8}$ to $3\frac{3}{8}$ in.) gave a pyramidal illusion of greater stability, the axes of the flank colonnades of the Parthenon meeting more than a mile above the pavement; walls, antae and other supposedly vertical surfaces might show similar inclinations. And the manner in which the various members were adjusted to each other, preserving these delicate relations and yet keeping the joints invisible, represents a triumph of calculation and stonecutting.

Fourth Century (400–300 B.C.).—The displacement of the political centre from Athens successively to Spasta, Thebes, Macedonia and Asia Minor was accompanied by unmistakable evidence of a decline from aesthetic perfection. The service of the gods began to be subordinated to that of men, and from the temple attention was diverted to a great variety of structures corresponding to the varied requirements of a more complex civilization. Even in religious architecture the striving for diversity and innovation is manifest in the increase of excessive ornament.

In Hellas the Doric style was still preferred for temples, but, incapable of further perfection, was now modified. Hexastyle plans (Delphi, Epidaurus, Tegea, Nemea, Stratos, Delos, Ptoon and Olympia) were often shortened by omitting the opisthodomus; temples at Delphi and Epidaurus were hexastyle prostyle. Columns were more slender ($5\frac{7}{8}$ to $6\frac{3}{8}$ diameters) and entablatures correspondingly lower (one-quarter of the column height), the reduction occurring in architrave and cornice while the frieze remained high to preserve the squareness of metopes. The enrichment of the sima by carved *rinceaux* and rampant antefixes was counterbalanced by the loss of such delicacies as the hyperbolic echinus profile. Following the example of Bassae, Corinthian internal columns were employed at Tegea, Stratos and Nemea, Ionic at Epidaurus; an inner row of Ionic columns lined a Doric facade at Delphi.

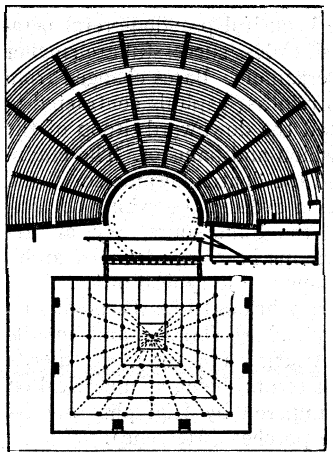


FROM SAME SOURCE AS FIG 12

FIG. 15.—TELESTERION

More important was the Ionic Renaissance in Asia Minor. Not only hexastyle plans as at Priene, but colossal octastyles again became the fashion, at Ephesus repeating the archaic plan, at Sardis omitting the inner flank colonnades and becoming semipseudodipteral. Even the decastyle plan with 120 external columns appeared at Miletus, with the cella unroofed (hypaethral). Column proportions continued to be slender ($8\frac{3}{4}$ to $9\frac{3}{4}$ diameters high). though because of the enormous dimensions the intervals were contracted ($1\frac{3}{7}$ to $1\frac{5}{6}$ diameters); some façades (Sardis, Ephesus) show however enormous central spacings. Such abnormal embellishments as sculptured pedestals, bases, drums and capitals were confined to the larger temples. The entablature always lacks the frieze (except at Miletus where the work was protracted into Roman times), and hence is only one-sixth or one-seventh of the column height. Only in Hellas (tholos at Olympia) or in non-religious and hence less conservative Asiatic structures, executed with collaborators from Hellas (Mausoleum at Halicarnassus), did the frieze penetrate the entablature, now always in combination with dentils, giving the more satisfactory proportion of one-quarter of the column height.

Important buildings other than temples were erected in both styles. In the Doric a peristyle at Thoricus, treasuries at Delphi, choragic monuments at Athens, tholoi at Delphi and Epidaurus, the huge dodecastyle facade of the Telesterion at Eleusis and the analogous assembly-hall (Thersilion) at Megalopolis, porticoes up to 550 ft. in length as at Corinth, the Arsenal of 430 ft. at the Piraeus. the Lion tomb at Cnidus (another Doric intrusion in the East), all testify to the vitality of the style. The tholos was reproduced in the Ionic style at Olympia; monumental Ionic tombs in Asia Minor, the Nereid monument at Xanthus (a temple raised on a lofty pedestal) and the Mausoleum at Halicarnassus (with a pyramid in turn elevated above a peristyle of 36 columns, attaining a height of 136 ft), have remained unsurpassed in their field.

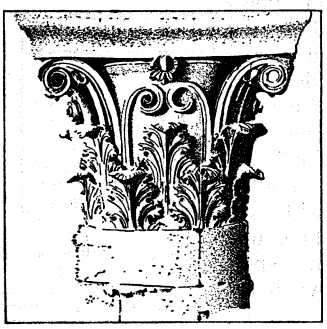


FROM SAME SOURCE AS FIG. 12

FIG 16.—THERSILION AT MEGALOPOLIS

The Corinthian capital was developed as a secondary feature inside temples at Tegea, Nemea, Stratos and Miletus, inside tholoi at Delphi, Epidaurus and Olympia; but not until 334 B.C. was the style used independently and externally in a choragic monument at Athens, with an entablature devised by combining Attic frieze with Asiatic dentils.

A few non-columnar designs require special mention. The Attic tomb stele with its ever-deepening frame of miniature antae and entablature, or with an elaborate floral acroterion, became extinct as the century ended. But the theatre, now provided with a stone auditorium encircling more than half of the orchestra (Athens, Epidaurus, Eretria), its one-storeyed scene building (also in stone) containing several great openings and flanked by projecting pavilions (parascenia, at Athens exceptional in being colonnaded), was yet in its infancy. The stadium, either round-ended or rectangular, repeated the theatre form. The marketplace (agora) became, if not strictly rectangular, at least more formal; and the newly founded or rebuilt cities of the period followed the gridiron plan (Priene and Cnidus).



FROM SAME SOURCE AS FIG. 14

FIG 17.—CORINTHIAN CAPITAL

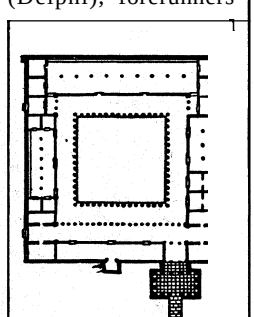
Hellenistic Period (300–100 B.C.).—The even balance between East and West which had characterized the preceding century was overthrown by the transference of the political centres to the oriental kingdoms of Alexander's successors, resulting in the domination of the oriental elements in Greek architecture. The Doric style, now on the downward path, appeared chiefly in small temples, either *in-antis* (Selinus, Acragas, Taormina, Ilium) or prostyle (Pergamum, Lycosura, Samothrace, Gortyna, Oropos); belated peripteral hexastyles occur at Acragas, Pergamum and Lebadea —the last symbolic, the abandoned scheme of an eastern monarch (174 B.C) A proposal to erect a Doric temple at Teos was actually countermanded in favour of the Ionic style; architects frankly wrote that "sacred buildings ought not to be constructed of the Doric order" because of the difficulty of spacing

triglyphs and columns. The few who adhered to the style sought new methods of appeal: engaged columns, lighter proportions with slender columns (up to 7 or 7¼ diameters) and thin entablatures requiring the interpolation of extra triglyphs; columns with Ionic fluting or even bases; the echinus, abacus and taenia moulded. Wall surfaces were modelled, with emphasized joints and belt courses. The cella might even have an internal apse (Lebadea, Samothrace), or projecting aisles at the sides (Lusoi).

The Ionic style, now the successor rather than rival of the Doric, is best exemplified in three beautiful pseudodipteral octastyles (Messa, Smintheum, Magnesia); less successful are smaller examples at Teos, Magnesia and Pergamum. Bases changed from the Asiatic to the Attic form, with plinths; capitals contracted in length; the rising echinus eliminated the downward droop of the cushion, and *rinceaux* filled the cushion and baluster. The entablature included the Attic frieze, and the dentils became small and meaningless, being used as decoration even in the raking cornice. These forms, and this moment of the Ionic supremacy, are reflected in the volume wherein Vitruvius interpreted Greek architecture to the Romans, using the Ionic as the typical order.

Now, however, the Ionic supremacy began to be threatened by the Corinthian style, best exemplified at Tralles and in the dipteral octastyle Olympieum at Athens (174 B.C.). Its merits were most obvious in peristyles, the capital being symmetrical on all sides and the entablature unhampered by triglyphs; but its popularity extended even to distyle porches (Messene).

Even more important than temples, however, were numerous other types of buildings. Monumental sacrificial altars rose at Syracuse (74×653 ft.), Pergamum (the "Seat of Satan," 112×120 ft.), Priene, and Magnesia. Doric porticoes surrounding the temples (Ephesus, Priene, Magnesia); vast stoas built by Hellenistic kings for the cities of Asia (Pergamum, Assos, Priene) and Hellas (Delos, Delphi, Athens, Megalopolis, Olympia), or, with slight modifications, used as market-halls (Aegae, Alinda, Assos) and libraries (Pergamum); monumental propylaea (Samothrace, Delos, Lindos, Epidaurus, Olympia and Selinus), the tholos at Samothrace, the hypostyle hall at Delos and gymnasia (Epidaurus, Priene); all repeated earlier forms with slight variation. The long "Hall of the Bulls" at Delos surmounted at one end by a tower, the soaring lighthouse of 400 ft. at Alexandria, and small seeate-houses with semicircular or rectangular auditoria imitated from the theatre (Miletus, Priene), were innovations. The theatre itself received a colonnaded stone proscenium before the scene building, of which the great openings were elevated to an upper storey (Oropos, Epidaurus, Priene, Ephesus). Commemorative monuments were more lofty, high pedestals (Delphi, Athens) or pair of columns supporting entablatures (Delphi), forerunners of the Roman triumphal arch. Private houses changed from the megaron type to the peristyle court (Priene, Delos), and in their likeness were designed great hotels with central courts (Epidaurus, Olympia). The market-place became a formally enclosed rectangle (Magnesia) rather than a picturesque group of colonnades and public buildings. The roads outside the city gates were lined with an ever increasing variety of sepulchral monuments, including the Mausoleum type (Acragas, Mylasa) and tumuli with vaulted chambers (Pergamum).

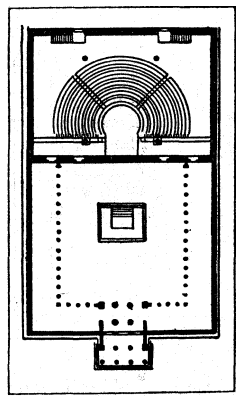


FROM BORRMANN, "GESCHICHTE DER BAUKUNST" (ALFRED KRONER VERLAG)

FIG. 18.—GYMNASIUM

The conauest of the Orient had brought Greece intb contact with the arch and vault, now freely used in supporting great masses over openings, as in city gates, retaining walls, corridors, staircases and sepulchral chambers. Sloping or intersecting barrel vaults were not uncommon. The post-and-lintel system was by no means supplanted, but the vaulting system of the Orient was being perfected, ready for the Romans to assimilate with their Etruscan traditions *(see* ROMAN ARCHITECTURE).

Graeco-Roman Period (100 B.C.–A.D. 300).—Many of the buildings erected in Greek lands during the Roman domination were still characteristically Greek. Doric was used in propylaea at Athens and Eleusis, and in temples at Eleusis and Kourno. Greek Ionic appears in the circular temple on the Athenian Acropolis, in a propylon at Priene, and particularly in a series of octastyle pseudodipteral temples in Asia Minor (Aezani, Ancyra, Aphrodisias). A hybrid Corinthian style with mixed Doric-Ionic entablatures occurs at Eleusis and Paestum. A simple type on Corinthian capital was used in the clock-tower ("Tower of the Winds") at Athens. But the developed Corinthian orders of temples at Sagalassus, Euromus, Cnidus, Pargamum and Isthmia are hardly to be differentiated from those of imperial Rome.



FROM BORRMANN, "GESCHICHTE DER BAUKUNST" (ALFRED KRONER VERLAG)

FIG. 19.—BOULEUTERION

Even though the decorative orders might be those of Rome, some buildings were still distinctive in type. Side by side with true Roman theatres, with wide low stages and semicircular orchestras (Appendus), were erected theatres of a compromise type, with equally wide but lofty stages and three-quarter circular orchestras (Termessus); both types had lofty scene buildings incrusted with columns, sometimes connecting with colonnades at the top of the auditorium. The stadium likewise remained characteristically Greek, with further elaboration, such as semicircles at both ends and colonnades at the top. The interior of the Telestrion at Eleusis was rebuilt in a Greek form, though with a new disposition of the columns. But the basilicas, baths, triumphal arches and other forms which flourished everywhere in Greece and Asia Minor at this epoch can with more propriety be considered as part of the purely Roman development.

GREEK ART. It is proposed in the present article to give a brief account of the history of Greek art and of the principles embodied in that history. The products of the various arts practised by a people constitute an objective and most important record of the spirit of that people. But all nations have not excelled in the same way: some have found their best expression in architecture, some in music, some in poetry. The Greeks most fully embodied their ideas in two ways, first in their splendid literature, both prose and verse, and secondly, in their plastic and pictorial art, in which matter they have remained to our days among the greatest instructors of mankind. The three arts of architecture, sculpture and painting were brought by them into a focus; and by their aid they produced a visible splendour of public life such as has seldom been elsewhere attained.

The volume of the remains of Greek civilization is so vast, and the learning with which these have been discussed is so ample, that it is hopeless to attempt to find in a work like the present any complete account of either. Rather we shall be frankly eclectic, choosing for consideration such results of Greek art as are most noteworthy and most characteristic. In some cases it will be

2. Theatre at Epidaurus (*c.* 325 B.C.); Polycleitus the Younger, architect. View showing the circular orchestra 66¾ ft. in diameter, with the foundation for the central altar, the surrounding auditorium occupying three-fifths of the circumference, the left entrance (parodos) gateway. The scene building, of which only the foundations remain, is of later construction

possible to give a reference to a more detailed treatment of particular monuments in these volumes under the heading of their authors or the places to which they belong. Architectural detail is relegated to ARCHITECTURE and allied articles. Coins and gems (*q.v.*) are treated apart, as are vases (POTTERY AND PORCELAIN); in the article ARCHAEOLOGY will be found many references bearing on the rediscovery of Greek art and on the discovery of individual monuments and sites; and in the bibliography which closes this article an effort is made to direct those who wish for further information in any particular branch of our subject.

THE GENERAL PRINCIPLES OF GREEK ART

The study of Greek art is one which is eminently progressive. It has over the study of Greek literature the immense advantage that its materials increase far more rapidly. And it may well be maintained that a sound and methodic study of Greek art is as indispensable as a foundation for an artistic and archaeological education as the study of Greek poets and orators is as a basis of literary education. The extreme simplicity and thorough rationality of Greek art make it an unrivalled field for the training and exercise of the faculties which go to the making of the art critic and art historian.

Before proceeding to sketch the history of its rise and decline, it is desirable briefly to set forth the principles which underlie it *(see* also P. Gardner's *Principles of Greek Art).*

As the literature of Greece is composed in a particular language, the grammar and syntax of which have to be studied before the works in poetry and prose can be read, so Greek works of art are composed in what may be called an artistic language. To the accidence of a grammar may be compared the mere technique of sculpture and painting; to the syntax of a grammar correspond the principles of composition and grouping of individual figures into a relief or picture. By means of the rules of this grammar the Greek artist threw into form the ideas which belonged to him as a personal or a racial possession.

No nation is in its works wholly free from the domination of climate and geographical position; least of all a people so keenly alive to the influence of the outer world as the Greeks. They lived in a land where the soil was dry and rocky, far less hospitable to vegetation than that of western Europe, while the land horizon was on all sides bounded by hard and jagged lines of mountain. The sky was extremely clear and bright, sunshine for a great part of the year almost perpetual, and storms, which are more than passing gales, rare. It was in accordance with these natural features that temples and other buildings should be simple in form and bounded by clear Lines. Such forms as the cube, the oblong, the cylinder, the triangle, the pyramid abound in their constructions. Just as in Switzerland the gables of the chalets match the pine-clad slopes and lofty summits of the mountains, so in Greece, amid barer hills of less elevation, the Greek temple looks thoroughly in place. But its construction is related not only to the surface of the land, but also to the character of the race. Émile Boutmy, in his interesting *Philosophie de l'architecture en Grèce,* has shown how the temple is a triumph of the senses and the intellect, not primarily emotional, but showing in every part definite purpose and design. It also exhibits in a remarkable degree the love of balance, of symmetry, of a mathematical proportion of parts and correctness of curvature which belong to the Greek artist.

Here, however, our concern is not with the purposes or arrangements of a temple, but with its sculptural decoration, and we would note that elaborate decoration is reserved for those parts of the temple which have, or at least appear to have, no strain laid upon them. It is true that in the archaic age experiments were made in carving reliefs on the lower drums of columns (as at Ephesus) and on the line of the architrave (as at Assus). But such examples were not followed. Nearly always the spaces reserved for mythological reliefs or groups are the tops of walls, the spaces between the triglyphs, and particularly the pediments surmounting the two fronts, which might be left hollow without danger to the stability of the edifice. Detached figures in the round are in fact found only in the pediments, or standing upon the tops of the pediments. And metopes are sculptured in higher relief than friezes.

"When we examine in detail even the simplest architectural decoration, we discover a combination of care, sense of proportion, and reason. The flutings of an Ionic column are not in section mere arcs of a circle, but made up of a combination of curves which produce a beautiful optical effect; the lines of decoration, as may be best seen in the case of the Erechtheum, are cut with a marvellous delicacy. Instead of trying to invent new schemes, the mason contents himself with improving the regular patterns until they approach perfection, and he takes everything into consideration. Mouldings on the outside of a temple, in the full light of the sun, are differently planned from those in the diffused light of the interior. Mouldings executed in soft stone are less fine than those in marble. The mason thinks before he works and while he works, and thinks in entire correspondence with his surroundings." *(Principles of Greek Art,* p. 44.)

Greek architecture, however, is treated under ARCHITECTURE; we will therefore proceed to speak briefly of the principles exemplified in sculpture. Existing works of Greek sculpture fall easily into two classes. The first comprises what may be called works of substantive art, statues or groups made for their own sake and to be judged by themselves. Such are cult-statues of deities from temple and shrine, honorary portraits of rulers or of athletes, dedicated groups and the like. The second comprises decorative sculptures, such as were made, usually in relief, for the decoration of temples and tombs and other buildings, and were intended to be subordinate to architectural effect.

Speaking broadly, it may be said that the works of substantive sculpture in our museums are in the great majority of cases copies of doubtful exactness and very various merit. The Hermes of Praxiteles (Pl. VI., fig. 3) is almost the only marble statue which can be assigned positively to one of the great sculptors; we have to work back towards the productions of the peers of Praxiteles through works of poor execution, often so much restored in modern times as to be scarcely recognizable. Decorative works, on the other hand, are very commonly originals, and their date can often be accurately fixed, as they belong to known buildings. They are thus infinitely more trustworthy and more easy to deal with than the copies of statues of which the museums of Europe, and more especially those of Italy, are full. They are also more commonly unrestored. But yet there are certain disadvantages attaching to them. Decorative works, even when carried out under the supervision of a great sculptor, were but seldom executed by him. Usually they were the productions of his pupils or masons. Thus they are not on the same level of art as substantive sculpture. And they vary in merit to an extraordinary extent, according to the capacity of the man who happened to have them in hand, and who was probably but little controlled. Every one knows how noble are the pedimental sculptures of the Parthenon. But there is no reason why they should be so vastly superior to the frieze from Phigalia; nor why the heads from the temple at Tegea should be so fine, while those from the contemporary temple at Epidaurus should be comparatively insignificant. From the records of payments made to the sculptors who worked on the Erechtheum at Athens it appears that they were ordinary masons, some of them not even citizens, and paid at the rate of 60 drachms (about 60 francs) for each figure, whether of man or horse, which they produced. Such piece-work would not, in our days, produce a very satisfactory result.

1. Works of substantive sculpture may be divided into two classes, the statues of human beings and those of the gods. The line between the two is not, however, very easy to draw, or very definite. For in representing men the Greek sculptor had an irresistible inclination to idealize, to represent what was generic and typical rather than what was individual, and the essential rather than the accidental. And in representing deities he so fully anthropomorphized them that they became men and women, only raised above the level of everyday life and endowed with a superhuman stateliness. Moreover, there was a class of heroes represented largely in art who covered the transition from men to gods. For example, if one regards Hercules as a deity and Achilles as a

man of the heroic age and of heroic mould, the line between the two will be found to be very narrow.

Nevertheless one may for convenience speak first of human and afterwards of divine figures. It was the custom from the 6th century onwards to honour those who had done any great achievement by setting up their statues in conspicuous positions. The earliest example we have is the portraits of the twins Cleobis and Biton from Delphi mentioned by Herodotus (Pl. II., fig. 3). Another of the earliest examples is that of the tyrannicides, Harmodius and Aristogiton, a group, a copy of which has come down to us (Pl. II., fig. 7). Again, people who had not won any distinction were in the habit of dedicating to the deities portraits of themselves or of a priest or priestess, thus bringing themselves, as it were, constantly under the notice of a divine patron. The rows of statues before the temples at Miletus, Athens and elsewhere came thus into being. But from the point of view of art, by far the most important class of portraits consisted of athletes who had won victories at some of the great games of Greece, at Olympia, Delphi or elsewhere. Early in the 6th century the custom arose of setting up portraits of athletic victors in the great sacred places. We have records of numberless such statues executed by all the greatest sculptors. When Pausanias visited Greece he found them everywhere far too numerous for complete mention.

It is the custom of studying and copying the forms of the finest of the young athletes, combined with the Greek habit of complete nudity during the sports, which lies at the basis of Greek excellence in sculpture. Every sculptor had unlimited opportunities for observing young vigorous bodies in every pose and in every variety of strain. The natural sense of beauty which was an endowment of the Greek race impelled him to copy and preserve what was excellent, and to omit what was ungainly or poor. Thus there existed, and in fact there was constantly accumulating, a vast series of types of male beauty, and the public taste was cultivated to an extreme delicacy. And of course this taste, though it took its start from athletic customs, and was mainly nurtured by them, spread to all branches of portraiture, so that elderly men, women, and at last even children, were represented in art with a mixture of ideality and fidelity to nature such as has seldom been reached by the sculpture of any other people.

The statues of the gods began with stiff and ungainly figures cut out of the trunk of a tree. In the Greece of late times there were still standing rude pillars, with the tops sometimes cut into a rough likeness to the human form. And in early decoration of vases and vessels one may find Greek deities represented with wings, carrying in their hands lions or griffins, bearing on their heads lofty crowns. But as Greek art progressed it grew out of this crude symbolism. In the language of Brunn, the Greek artists borrowed from Oriental or Mycenaean sources the letters used in their works, but with these letters they spelled out the ideas of their own nation. What the artists of Babylon and Egypt express in the character of the gods by added attribute or symbol, swiftness by wings, control of storms by the thunderbolt, traits of character by animal heads, the artists of Greece work more and more fully into the sculptural type; modifying the human subject by the constant addition of something which is above the ordinary level of humanity, until we reach the Zeus of Pheidias or the Demeter of Cnidus. When the decay of the high ethical art of Greece sets in, the gods become more and more warped to the merely human level. They lose their dignity, but they never lose their charm.

2. The decorative sculpture of Greece consists not of single figures, but of groups; and in the arrangement of these groups the strict Greek laws of symmetry, of rhythm, and of balance, come in. We will take the three most usual forms, the pediment, the metope and the frieze, all of which belong properly to the temple, but are characteristic of all decoration, whether of tomb, trophy or other monument.

The form of the pediment is triangular; the height of the triangle in proportion to its length being about 1:8. The conditions of space are here strict and dominant; to comply with them requires some ingenuity. To a modem sculptor the problem thus presented is almost insoluble; but it was allowable in ancient art to represent figures in a single composition as of various sizes, in correspondence not to actual physical measurement but to importance. As the more important figures naturally occupy the midmost place in a pediment, their greater size comes in conveniently. And by placing some of the persons of the group in a standing, some in a seated, some in a reclining position, it can be so contrived that their heads are equidistant from the upper line of the pediment.

The statues in a Greek pediment, which are after quite an early period usually executed in the round, fall into three, five or seven groups, according to the size of the whole. As examples to illustrate this exposition we take the two pediments of the temple at Olympia, the most complete which have come down to us, which are represented in figs. 13 and 14.

The metopes were the long series of square spaces which ran along the outer walls of temples between the upright triglyphs and the cornice. Originally they may have been left open and served as windows; but the custom came in as early as the 7th century, first of filling them in with painted boards or slabs of stone, and next of adorning them with sculpture. The metopes of the Treasury of Sicyon at Delphi (Pl. IV., fig. 5) are as early as the first half of the 6th century. This recurrence of a long series of square fields for occupation well suited the genius and the habits of the sculptor. As subjects he took the successive exploits of some hero such as Heracles or Theseus, or the contemporary groups of a battle. His number of figures was limited to two or three, and these figures had to be worked into a group or scheme, the main features of which were determined by artistic tradition, but which could be varied in a hundred ways so as to produce a pleasing and in some degree novel result.

With metopes, as regards shape, may be compared the reliefs of Greek tombs, which also usually occupy a space roughly square, and which also comprise but a few figures arranged in a scheme generally traditional. A figure standing, giving his hand to one seated, two men standing hand in hand, or a single figure in some vigorous pose, is sufficient to satisfy the simple and severe taste of the Greeks.

In regard to friezes, which are long reliefs containing figures ranged between parallel lines, there is more variety of custom. In temples the height of the relief from the background varies according to the light in which it was to stand, whether direct or diffused. Almost all Greek friezes, however, are of great simplicity in arrangement and perspective. Locality is at most hinted at by a few stones or trees, never actually portrayed. There is seldom more than one line of figures, in combat or procession, their heads all equidistant from the top line of the frieze. They are often broken up into groups; and when this is the case, figure will often balance figure on either side of a central point almost as rigidly as in a pediment. An example of this will be found in the sections of the Mausoleum frieze shown in Plate IV., figs. 1 and 2. Some of the friezes executed by Greek artists for semi-Greek peoples, such as those adorning the tomb at Trysa in Lycia, have two planes, the figures in the background being at a higher level.

The rules of balance and symmetry in composition which are followed in Greek decorative art are still more clearly to be discerned in the paintings of vases, which must serve, in the absence of more dignified compositions, to enlighten us as to the methods of Greek painters. Great painters would not, of course, be bound by architectonic rule in the same degree as the mere workmen. But in any case the fact must never be lost sight of that Greek painting of the earlier ages was of extreme simplicity. It did not represent localities, save by some slight hint; it had next to no perspective; the colours used were but very few even down to the days of Apelles. Most of the great pictures of which we hear consisted of but one or two figures; and when several figures were introduced they were kept apart and separately treated, though, of course, not without relation to one another. Idealism and ethical purpose must have predominated in painting as in sculpture and in the drama and in the writing of history. The laws of balance and symmetry in Greek drawing are perhaps best shown in the decoration of vases (*see* POTTERY).

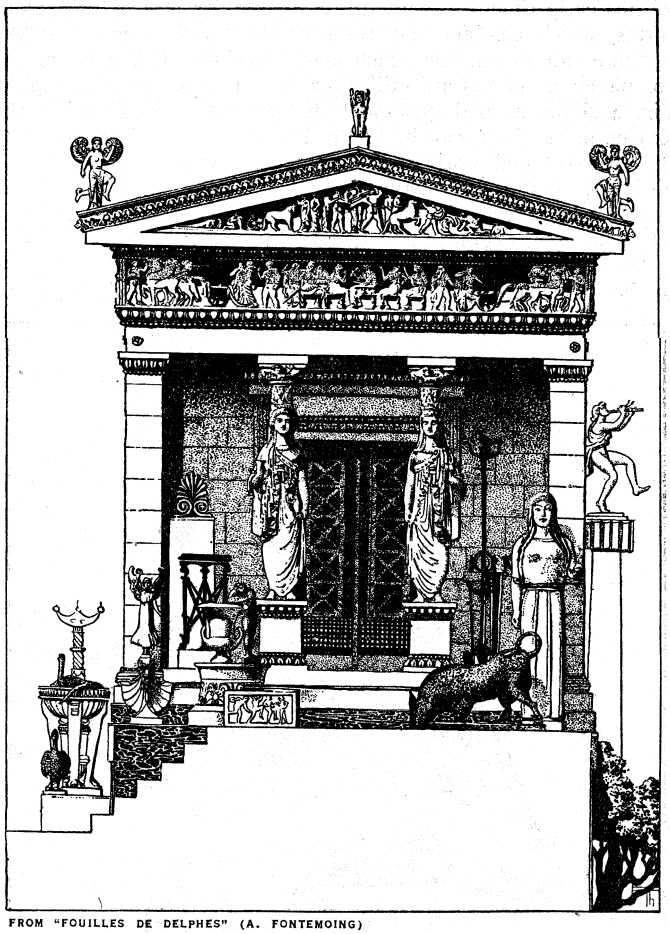
HISTORIC SKETCH

To begin with, there was a rise of national art, after the destruction of the Minoan and Mycenaean civilizations of early Greece by the irruption of tribes from the north *(see* ARCHAEOLOGY), and then the Roman age of Greece, after which the Greek art works in the service of the conquerors *(see* ROMAN ART). The period (roughly 800–?50 B.C.) is divided into four sections: (1) to the Persian Wars, 480 B.C.; (2) the period of the early schools of art, 480–400 B.C.; (3) that of the later great schools, 400–300 B.C.; (4) that of Hellenistic art, 300–50 B.C. In dealing with these successive periods this article is confined to sculpture and painting, which in Greece are closely connected. The arts — pottery, gem-engraving, coin-stamping and the like — are treated under their separate headings, and the reader is also referred to the biographical accounts of the chief artists (PHEIDIAS, PRAXITELES, APELLES, etc.).

PERIOD I. 800–480 B.C.

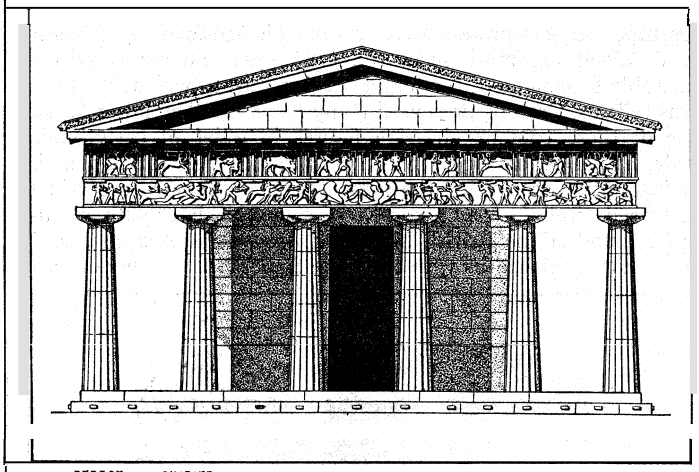
The Aegean or Mycenaean civilization was for the most part destroyed by what appears to have been a gradual invasion from the north: its racial character is much in dispute. though archaeological evidence abundantly proves that it was the conquest of a more by a less rich and civilized race. In the graves of the period (900–600 B.C.) is found none of the wealthy spoil which has made celebrated the tombs of Mycenae and Vaphio (*q.v.*). The



FROM "FOUILLES DE DELPHES" (A. FONTEMOING)

FIG. 1.— RESTORATION OF THE TREASURY OF CNIDUS. IONIC STYLE

character of the pottery and the bronze-work which is found in these later graves reminds one of the funerary art of Hallstatt and other sites belonging to what is called the bronze age of North Europe. Its predominant characteristic is the use of geometrical forms, the lozenge, the triangle, the maeander, the circle with tangents, in place of the elaborate spirals and plant-forms which mark Mycenaean ware. For this reason the period from the 9th to the 7th century in Greece passes by the name of "the Geometric Age." It is commonly held that in the remains of the geometric age is traced the influence of the Dorians, who, coming in as a hardy but uncultivated race, probably of purer Aryan blood than the previous inhabitants of Greece, not only brought to an end the wealth and the luxury which marked the Mycenaean age, but also replaced an art which was in character essentially southern by one which belonged rather to the north and the west. The great difficulty inherent in this view, a difficulty which has yet to be



FROM PERROT AND CHIPIEZ, 'HISTOIRE DE L ART' (CHAPMAN AND HALL; AND HACHETTE & CO.)

FIG. 2.— RESTORATION OF THE TEMPLE AT ASSUS, SHOWING THE FRIEZE OF ARCHAIC DECORATIVE SCULPTURES ALONG THE ENTABLATURE

met, lies in the fact that some of the most abundant and characteristic remains of the geometric age which we possess come. not from Peloponnesus, but from Athens and Boeotia, which were never conquered by the Dorians. For the early history of Greek work in gold and bronze we must refer to the articles BRONZE arid GOLDSMITHS' AND SILVERSMITHS' WORK.

Architecture and Sculpture. — The Greek temple in its character and form gives the clue to the whole character of Greek art It is the abode of the deity, who is represented by his sacred image; and the flat surfaces of the temple offer a great field to the sculptor for the depicting of sacred legend. The process of discovery has emphasized the line which divides Ionian from Dorian architecture and art. The Ionians were a people more susceptible than were the Dorians to oriental influences. The dress, the art, the luxury of western Asia attracted them with irresistible force We may suspect, as Brunn has suggested, that Ionian artists worked in the great Assyrian and Persian palaces (and that the wall reliefs of those palaces were in part their handiwork. Some of the great temples of Ionia have been excavated in recent times, notably those of Apollo at Miletus, of Hera at Samos, and of Artemis at Ephesus. Very little, however, of the architecture of the 6th century temples of those sites has been recovered, though the French, who have been excavating at Delphi more or less continuously since 1892, have successfully restored the treasury of the people of Cnidus (fig. 1), which is quite a gem of Ionic style. the entablature is supported in front not by pillars but by two maidens or Corae, and a frieze runs all round the building above. But though this building is of Ionic type, it is scarcely in the technical sense of Ionic style, since the columns have not Ionic capitals, but are carved with curious reliefs. The Ionic capital proper is developed in Asia by degrees (see ARCHITECTURE, ORDER and CAPITAL; also Perrot and Chipiez, *Hist.* de *l'art,* vii. ch. 4)

The Doric temple is not wholly of European origin, yet it was developed mainly in Hellas and the west. The most ancient example is the Heraeum at Olympia, next to which come the fragmentary temples of Corinth and of Selinus in Sicily. With the early Doric temple we are familiar from examples which have survived in fair preservation to our own days at Agrigentum in Sicily, Paestum in Italy, and other sites.

Of the decorative sculpture which adorned these early temples we have more extensive remains than we have of actual construction. It will be best to speak of them under their districts. On the coast of Asia Minor, the most extensive series of archaic decorative sculptures which has come down to us is that which adorned

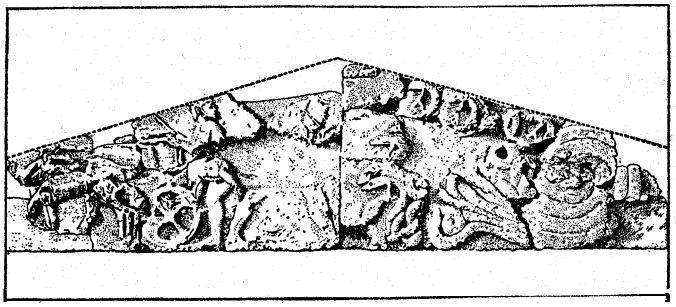
the temple of Assus (fig. 2). These were placed in a unique position on the temple, a long frieze running along the entablature, with representations of wild animals, of centaurs, of Heracles seizing Achelous, and of men feasting, scene succeeding scene without much order or method. The only figures from Miletus which can be considered as belonging to the original temple destroyed by Darius, are the dedicated seated statues, some of which, brought away by Sir Charles Newton in the middle of the 19th century, are now preserved at the British Museum. At Ephesus J. T. Wood was more successful (1869–74) and recovered considerable fragments of the temple of Artemis, to which, as Herodotus tells us, Croesus presented many columns. The lower part of one of these columns, bearing figures in relief of early Ionian style, has been put together at the British Museum; and remains of inscriptions recording the presentation by Croesus are still to be traced. Reliefs from a cornice of somewhat later date are also to be found at the British Museum. Among the Aegean islands, Delos has furnished us with the most important remains of early

FROM COLLIGNON, "SCULPTURE GRECQUE"

FIG. 3.— STATUE OF NIKE OR VICTORY OF DELOS (RESTORED)

art. French excavators have there found a very early statue of a woman dedicated by one Nicandra to Artemis, a figure which may be instructively compared with another from Samos, dedicated to Hera by Cheramues. The Delian statue is in shape like a flat beam; the Samian, which is headless, is like a round tree. The arms of the Delian figure are rigid to the sides; the Samian lady has one arm clasped to her breast. A great improvement on these inexpressive figures is marked by another figure found at Delos, and connected, though perhaps incorrectly, with a bases recording the execution of a statue by Archermus and Micciades, two sculptors who stood, in the middle of the 6th century, at the head of a sculptural school at Chios. The representation (fig. 3) is of a running or flying figure, having six wings, like the seraphim in the vision of Isaiah, and clad in long drapery. It may be a statue of Nike or Victory, who is said to have been represented in winged form by Archermus. The figure, with its neatness and precision of work, its expressive face and strong outlines, certainly marks great progress in the art of sculpture. When the early sculpture of Athens is examined, reason is found to think that the Chian school had great influence in that city in the days of Peisistratus.

Athenian Sculpture. At Athens, in the age 650–480, may be traced two quite distinct periods of architecture and sculpture. In the earlier of the two periods, a rough limestone was used alike for the walls and the sculptural decoration of temples; in the later period it was superseded by marble, whether native or imported. Every visitor to the museum of the Athenian Acropolis stands astonished at the groups which decorated the pediments of Athenian temples before the age of Peisistratus — groups of large size, rudely cut in soft stone, of primitive workmanship, and painted with bright red, blue and green, in a fashion which makes no attempt to follow nature, but only to produce a vivid result. The two largest in scale of these groups seem to have belonged to the pediments of the early 6th century temple of Athena. On



FROM "ATHEN. MITTEIL. DEUTSCH. ARCH." INST. X. 237

FIG. 4.— ATHENIAN PEDIMENT REPRESENTING HERACLES SLAYING THE LERNAEAN HYDRA WHILE IOLAUS HOLDS THE REINS OF THE CHARIOT

other smaller pediments, perhaps belonging to shrines of Heracles and Dionysus, there are conflicts of Heracles with Triton or with other monstrous foes. It is notable how fond the Athenian artists of this early time are of exaggerated muscles and of monstrous forms, which combine the limbs of men and of animals; the measure and moderation which mark developed Greek art are as completely absent as are skill in execution or power of grouping. Fig. 4 shows a small pediment in which appears in relief the slaying of the Lernaean hydra by Heracles. The hero strikes at the many-headed water-snake, somewhat inappropriately, with his club. Iolaus, his usual companion, holds the reins of the chariot which awaits Heracles after his victory. On the extreme left a huge crab comes to the aid of the hydra.

There can be little doubt that Athens owed its great start in art to the influence of the court of Peisistratus, at which artists of

FROM "ATHEN. MITTEIL. DEUTSCH. ARCH."

FIG. 5.— ATHENA STRIKING AT A PROSTRATE FOE, FROM A MARBLE PEDIMENT ON THE TEMPLE OF ATHENA

all kinds were welcome. There was a gradual transformation in sculpture, in which the influence of the Chian and other progressive schools of sculpture was visible, not only in the substitution of island marble for native stone, but in increased grace and truth to nature, in the toning down of glaring colour, and the appearance of taste in composition. A transition between the

older and the newer is furnished by the well-known statue of the calf-bearer, an Athenian preparing to sacrifice a calf to the deities, which is made of marble of Hymettus, and in robust clumsiness of forms is not far removed from the limestone pediments The sacrificer has been commonly spoken of as Hermes or Theseus, but he seems rather to be an ordinary human votary.

In the time of Peisistratus or his sons a peristyle of columns was added to the old temple of Athena; and this necessitated the preparation of fresh pediments. These were of marble. In one of them was represented the battle between gods and giants; in the midst Athena herself striking at a prostrate foe (fig 5). In these figures no eye can fail to trace remarkable progress. On about the same ltvel of art are the charming statues dedicated to Athena, which were set up in the latter half of the 6th century on the Acropolis, whose graceful though conventional forms and delicate colouring make them one of the great attractions of the Acropolis museum. We show a figure (fig. 6) which is the work of the sculptor Antenor, who was also author of a celebrated group representing the tyrant-slayers, Harmodius and Aristogiton. To the same age belong many other votive reliefs of the Acropolis, representing horsemen, scribes and other votaries of Athena.

FIG. 6.— FIGURE BY ANTENOR, UNRESTORED

Dorian Sculpture. From Athens we pass to the seats of Dorian art. And in doing so we find a complete change of character. In place of draped goddesses and female figures, there are nude male forms. In place of Ionian softness and elegance, hard, rigid outlines, strong muscular development, a greater love of and faithfulness to the actual human form — the influence of the palaestra rather than of religion. To the known series of archaic male figures modern exploration has added many examples. More especially may be mentioned figures from the temple of Apollo Ptoos in Boeotia, probably representing the god himself. Still more noteworthy are two colossal nude figures of Cleobis and Biton remarkable both for force and for rudeness, found at Delphi, the inscriptions of which prove them to be the work of an Argive sculptor. (Pl. II., fig 3) In the island of Crete was found the upper part of a draped figure, whether male or female is not certain, which should be an example of the early Daedalid school, whence the art of Peloponnesus was derived; it is hardly a characteristic product of that school; rather the likeness to the dedication of Nicandra is striking

Another remarkable piece of Athenian sculpture, of the time of the Persian Wars, is the group of the tyrannicides Harmodius and Aristogiton, set up by the people of Athens, and made by the sculptors Critius and Nesiotes. These figures were hard and rigid in outline, but showing some progress in the treatment of the nude. Copies are preserved in the museum of Naples (Pl. II., fig. 7).

Olympia, Sparta, Selinus. Next in importance to Athens, as a find-spot for works of early Greek art, ranks Olympia. Olympia, however, did not suffer like Athens from sudden violence, and the explorations there have brought to light a continuous series of remains, beginning with bronze tripods of the geometric age and ending at the barbarian invasions of the 4th century AD. Notable among the 6th century stone-sculpture of Olympia are the pediment of the treasury of the people of Megara, in which is represented a battle of gods and giants, and a huge rude head of Hera which seems to be part of the image worshipped in the Heraeum. Its flatness and want of style should be noted.

Among the temples of Greece proper the Heraeum of Olympia stands almost alone for antiquity and interest, its chief rival, besides the temples of Athens, being the other temple of Hera at Argos It appears to have been originally constructed of wood, for uhich stone was by slow degrees, part by part, substituted In the time of Fausanias one of the pillars was still of oak, and at the present day the varying diameter of the columns and other structural irregularities bear witness to the process of constant renewal which must have taken place. The early small bronzes of Olympia form an important series, figures of deities standing or striding, warriors in their armour, athletes with exaggerated muscles, and women draped in the Ionian fashion, which did not become unpopular in Greece until after the Persian Wars.

Excavations at Sparta have revealed interesting monuments belonging to the worship of ancestors, which seems in the conservative Dorian states of Greece to have been more strongly developed than elsewhere. On some of these stones, which doubtless belonged to the family cults of Sparta, are shown the ancestor seated holding a wine-cup, accompanied by his faithful horse or dog; on some we see the ancestor and ancestress seated side by side (fig. 7), ready to receive the gifts of their descendants, who appear in the corner of the relief on a much smaller scale. The male figure holds a wine-cup, in allusion to the libations of wine made at the tomb. The female figure holds her veil and the pomegranate, the recognized food of the dead. A huge serpent stands erect behind the pair. The style of these sculptures is as striking as the subject:—lean, rigid forms with set-ere outline, carved in a very low relief, the surface of which is not rounded but flat. The name of Selinus in Sicily, an early Megarian colony, has long been associated with some of the most curious of early sculptures, the metopes of ancient temples, representing the exploits of Heracles and of Perseus. Even more archaic metopes have in recent years been brought to light, one representing a seated sphinx, one the journey of Europa over the sea on the back of the amorous bull, a pair of dolphins swimming beside her. In simplicity and rudeness of work these reliefs remind us of the limestone pediments of Athens (fig. 4), but they are of another and a severer style; the Ionian laxity is wanting.

Delphi. The French excavations at Delphi add a new and important chapter to the history of 6th century art. Of the archaic temple of Apollo, built as Herodotus tells us by the Alcmaeonidae

BY COURTESY OF THE OLD MUSEUM, BERLIN

FIG. 7.—SPARTAN TOMBSTONE REPRESENTING ANCESTOR WORSHIP

of Athens, the only sculptural remains which have come down to us are some fragments of the pedimental figures. Of the treasuries which contained the offerings of the pious at Delphi, the most archaic of which there are remains is that belonging to the people of Sicyon. To it appertains a set of exceedingly primitive metopes. One depicts Idas and the Dioscuri driving off cattle (Pl. IV., fig. 5); another, the ship Argo; another, Europa on the bull, others merely animals, a ram or a boar. The treasury of the people of Cnidus (or perhaps Siphnos) is in style some half a century later

(see fig. 1). To it belongs a long frieze representing a variety of curious subjects: a battle, perhaps between Greeks and Trojans, with gods and goddesses looking on; a gigantomachy in which the figures of Poseidon, Athena, Hera, Apollo, Artemis and Cybele

FIG. 9.— METOPE FROM SELINUS. EUROPA ON BULL. NOW AT PALERMO

can be made out, with their opponents, who are armed like Greek hoplites; Athena and Heracles in a chariot; the carrying off of the daughters of Leucippus by Castor and Pollux; Hephaestus with his fire. The treasury of the Athenians, erected at the time of the Persian Wars, was adorned with metopes of singularly clear-cut and beautiful style, but very fragmentary, representing the deeds of Heracles and Theseus.

The most interesting and important of all Greek archaic sculptures are the pediments of the temple at Aegina (*q.v.*). These groups of nude athletes fighting over the corpses of their comrades are preserved at Munich, and are familiar to artists and students. But the very fruitful excavations of Prof. Furtwangler put them in quite a new light. Furtwangler (*Aegina: Heiligtum der Aphaia*) entirely rearranged these pediments, in a way which removed the extreme simplicity and rigour of the composition, and introduced far greater variety of attitudes and motive. We repeat here these new arrangements (fig. 8), the reasons for which must be sought in Furtwängler's great publication. The individual figures are not much altered, as the restorations of Thorwaldsen, even when incorrect, have now a prescriptive right of which it is not easy to deprive them. Beside the pediments of Aegina must be set the remains of the pediments of the temple of Apollo at Eretria in Euboea, the chief group of which (Pl. I., fig. 4), Theseus carrying off an Amazon, is one of the most finely executed works of early Greek art.

PERIOD II. 480–400 B.C.

The most marvellous phenomenon in the whole history of art is the rapid progress made by Greece in painting and sculpture during the 5th century B.C. As in literature the 5th century takes us from the rude peasant plays of Thespis to the drama of Sophocles and Euripides; as in philosophy it takes us from Pythagoras to Socrates; so in sculpture it covers the space from the primitive works made for the Peisistratidae to some of the most perfect productions of the chisel.

In architecture the 5th century is ennobled by the Theseum, the Parthenon and the Erechtheum, the temples of Zeus at Olympia, of Apollo at Phigalia, and many other central shrines, as well as by the Hall of the Mystae at Eleusis and the Propylaea of the Acropolis. Some of the most important of the Greek temples of Italy and Sicily, such as those of Segesta and Selinus, date from the same age. It is, however, only of their sculptural decorations, carried out by the greatest masters in Greece, that we need here treat in any detail.

Painting.— It is the rule in the history of art that innovations and technical progress are shown earlier in the case of painting than in that of sculpture. a fact easily explained by the greater ease and rapidity of the brush compared with the chisel. That this

was the order of development in Greek art cannot be doubted. But our means for judging of the painting of the 5th century are very slight. The noble paintings of such masters as Polygnotus, Micon and Panaenus, which once adorned the walls of the great porticos of Athens and Delphi, have disappeared. There remain only the designs drawn rather than painted on the beautiful vases of the age, which in some degree help us to realize, not the colour-

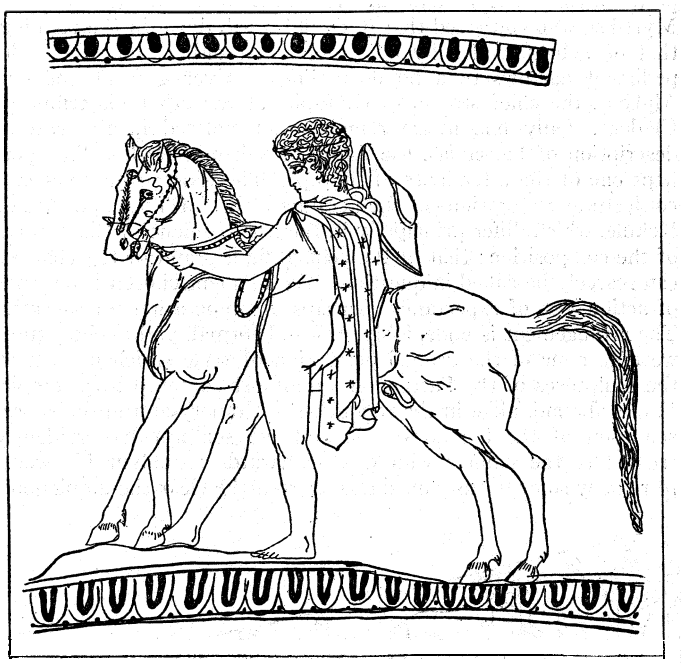
ing or the charm of contemporary paintings, but the principles of their composition and the accuracy of their drawing.

Polygnotus of Thasos was regarded by his compatriots as a great ethical painter. His colouring and composition were alike very simple, his figures quiet and statuesque, his drawing careful and precise. He won his fame largely by incorporating in his works the best current ideas as to mythology, religion and morals. In particular his painting of Hades with its rewards and punishments, which was on the walls of the building of the people of Cnidus at Delphi, might be considered as a great religious work, parallel to the paintings of the Campo Santo at Pisa or to the



FROM "ARCH. ZEIT."

FIG. 11.—VASE PAINTING. 5TH CENTURY B.C.

painted windows of such churches as that at Fairford. But he also introduced improvements in perspective and greater freedom in grouping.

It is fortunate for us that the Greek traveller Pausanias has left very careful and detailed descriptions of some of the most important of the frescoes of Polygnotus, notably of the Taking of Troy and the Visit to Hades, which were at Delphi. A comparison of these descriptions with vase paintings of the middle of the 5th century has enabled us to discern with great probability the principles of Polygnotan drawing and perspective. Prof Robert has even ventured to restore the paintings on the evidence of vases. There is represented one of the scenes depicted on a vase found at Orvieto (fig. 10), which is certainly Polygnotan in character. It represents the slaying of the children of Niobe by Apollo and Artemis. Here may be observed a remarkable perspective. The different heights of the rocky background are represented by lines traversing the picture on which the figures stand;

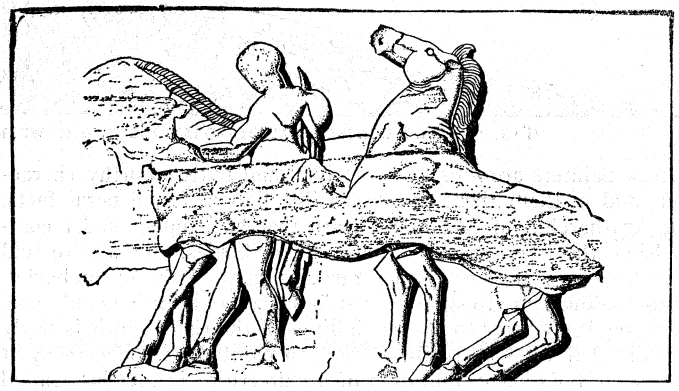


FIG. 12.—A GROUP FROM THE PANATHENAIC FRIEZE OF THE PARTHENON

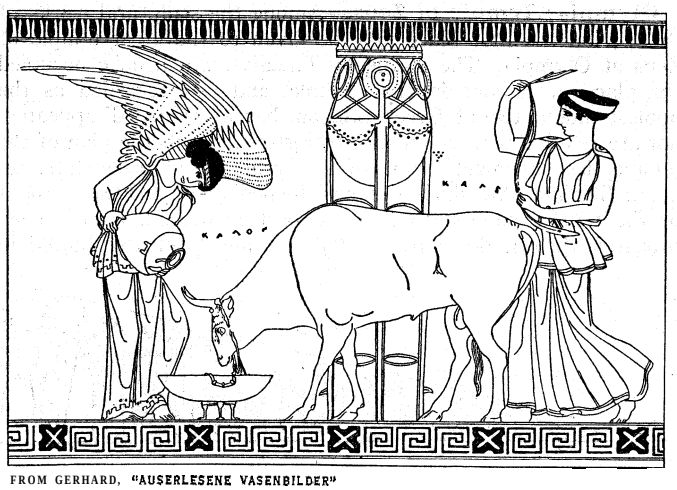
but the more distant figures are no smaller than the nearer. The forests of Mount Sipylus are represented by a single conventional tree. The figures are beautifully drawn, and full of charm; but there is a want of energy in the action.

There can be little doubt that the school of Polygnotus exercised great influence on contemporary sculpture. Panaenus, brother of Pheidias, worked with Polygnotus, and many of the gruupings found in the sculptures of the Parthenon remind us of those usual with the Thasian master. At this simple and early stage of art there was no essential difference between fresco-painting and coloured relief, light and shade and aerial perspective being unknown. Two vase-paintings are shown, one (fig. 11), a group of man and horse which closely resembles figures in the Panathenaic frieze of the Parthenon (fig. 12); the other (fig. 13), representing Victory pouring water for a sacrificial ox to drink, which reminds us of the balustrade of the shrine of Wingless Victory at Athens.

Most writers on Greek painting have supposed that after the middle of the 5th century the technique of painting rapidly im-



FROM GERHARD, "AUSERLESENE VASENBILDER"

FIG. 13.— VASE PAINTING OF NIKE AND BULL, 5TH CENTURY B.C.

proved. This may well have been the case; but there is little means of testing the question. Such improvements would soon raise such a barrier between fresco-painting and vase-painting—which by its very nature must be simple and architectonic—that vases can no longer be used with confidence as evidence for contemporary painting. The stories told us by Pliny of the lives of

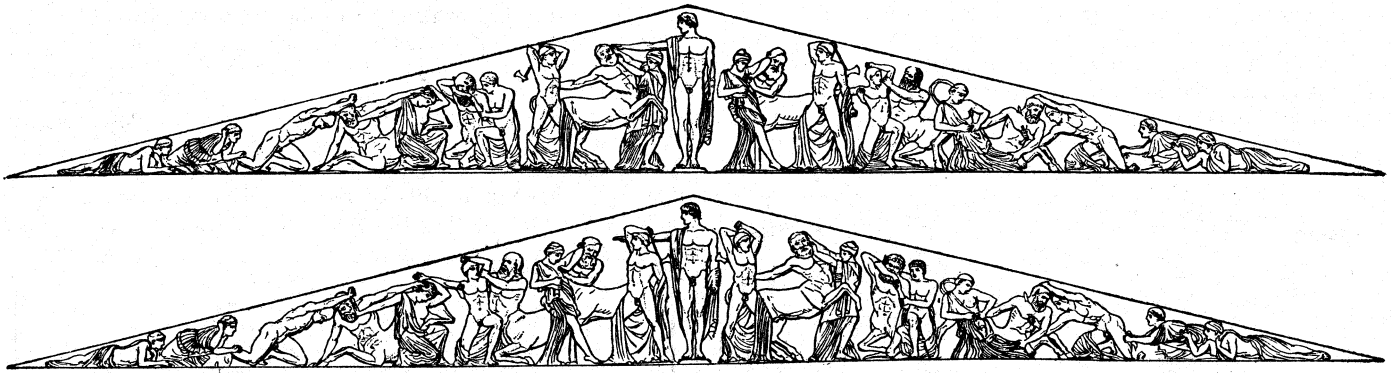


FIG. 14.— TWO CONJECTURAL RESTORATIONS OF THE WESTERN PEDIMENT OF THE GREAT TEMPLE OF ZEUS AT OLYMPIA

Greek painters are mostly of a trivial and untrustworthy character, and in them there are discernible only a few general facts. Of Agatharchus of Athens we learn that he painted, under compulsion, the interior of the house of Alcibiades, and we are told that he painted a scene for the tragedies of Aeschylus or Sophocles, thus leading some to suppose that he attempted illusive landscape. But this is contrary to the possibilities of the time, and it is fairly certain that what he really did was to paint the wooden front of the stage building in imitation of architecture; in fact he painted a permanent architectural background, and not one suited to any particular play. Of other painters who flourished at the end of the century, such as Zeuxis and Aristides, it will be best to speak under the next period.

It is now generally held, in consequence of evidence furnished by tombs, that the 5th century saw the end of the making of vases on a great scale at Athens for export to Italy and Sicily. And, in fact, few things in the history of art are more remarkable than the rapidity with which vase-painting at Athens reached its highest point and passed it on the downward road. At the beginning of the century black-figured ware was scarcely out of fashion, and the masters of the severe red-figured style, Pamphaeus, Epictetus and their contemporaries, were in vogue. The schools of Euphronius, Hiero and Duris belong to the age of the Persian wars. With the middle of the century the works of these makers are succeeded by unsigned vases of most beautiful design, some of them showing the influence of Polygnotus. In the later years of the century, when the empire of Athens was approaching its fall, drawing becomes laxer and more careless, and in the treatment of drapery we frequently note the over-elaboration of folds, the want of simplicity, which begin to mark contemporary sculpture.

Olympia: Temple **of** Zeus.—Among the sculptural works of this period the first place may be given to the great temple of Zeus at Olympia. The statue by Pheidias, which once occupied the place of honour in that temple, and was regarded as the noblest monument of Greek religion, has of course disappeared, nor are we able with confidence to restore it. But the plan of the temple, its pavement, some of its architectural ornaments, remain. The marbles which occupied the pediments and the metopes of the temple have been in large part recovered, having been probably thrown down by earthquakes and gradually buried in the alluvial soil. The utmost ingenuity and science of the German archaeologists have been employed in the recovery of the composition of these groups; and, although doubt remains as to the places of some figures. and their precise attitudes, we may fairly say that we know more about the sculpture of the Olympian temple of Zeus than about that of any other great Greek temple. The exact date of these sculptures is not certain, but with some confidence they may be placed between 470–460 B.C. (In speaking of them the opinion of Dr. Treu is followed, whose masterly work in vol. iii. of the great German publication on Olympia is a model of patience and of science.) In the eastern pediment (fig. 15), as Pausanias tells us, were represented the preparations for the chariot-race between Oenomaus and Pelops, the result of which was to determine whether Pelops should find death or a bride and a kingdom. In the midst, invisible to the contending heroes, stood Zeus the supreme arbiter. On one side of him stood Oenomaus with his wife Sterope, on the other Pelops and Hippodameia, the daughter of Oenomaiis, whose position at once indicates that she is on the side of the newcomer, whatever her parents may feel. Next on either side are the four-horse chariots of the two competitors, that of Oenomaiis in the charge of his perfidious groom Myrtilus, who contrived that it should break down in the running, that of Pelops tended by his grooms. At either end, where the pediment narrows to a point, reclines a river god, at one end Alpheus, the chief stream of Olympia, at the other his tributary Cladeus. Only one figure remains, not noticed in the careful description of Pausanias, the figure of a handmaid kneeling, perhaps one of the attendants of Sterope. The illustration gives two conjectural restorations of the pediment, that of Treu and that of Kekulé, which differ principally in the arrangement of the corners of the composition; that of the central figures and of the chariots can scarcely be called in question. The moment chosen is one, not of action, but of expectancy, perhaps of preparation for sacrifice. The arrangement is undeniably stiff and formal, and in the figures we note none of the trained perfection of style which belongs to the sculptures of the Parthenon, an almost contemporary temple. Faults abound, alike in the rendering of drapery and in the representation of the human forms, and the sculptor has evidently trusted to the painter who was afterwards to colour his work, to remedy some of his clumsiness, or to make clear the ambiguous.

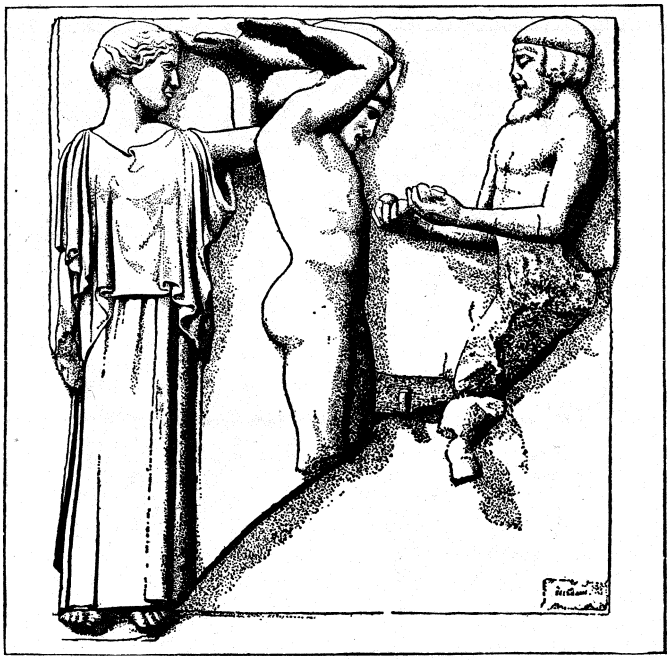
Nevertheless there is in the whole a dignity, a sobriety and a simplicity, which reconcile us to the knowledge that this pediment was certainly regarded in antiquity as a noble work, fit to adorn even the palace of Zeus. In the western pediment (fig. 14), the subject is the riot of the Centaurs when they attended the wedding of Peirithous in Thessaly, and, attempting to carry off the



FROM "OLYMPIA," VOL. III., E. TREU, EDITOR

FIG. 16.— METOPEFROM THE TEMPLE OF ZEUS AT OLYMPIA REPRESENTING ONE OF THE 12 LABOURS OF HERACLES (UNRESTORED)

bride and her comrades, were slain by Peirithous and Theseus. In the midst of the pediment, invisible like Zeus in the eastern pediment, stands Apollo, while on either side of him Theseus and Peirithous attack the Centaurs with weapons hastily snatched. Our illustration gives two possible arrangements. The monsters are in various attitudes of attempted violence, of combat and defeat; with each grapples one of the Lapith heroes in the endeavour to rob them of their prey. In the corners of the pediment recline female figures, perhaps attendant slaves, though the farthest pair may best be identified as local Thessalian nymphs, looking on with the calmness of divine superiority, yet not wholly unconcerned in what is going forward. Though the composition of the two pediments differs notably, the one bearing the impress of a parade-like repose, the other of an overstrained activity, the style and execution are the same in both, and the shortcomings must be attributed to the inferior skill of a local school of sculptors compared with those of Athens or of Aegina. It even appears likely that the designs also belong to a local school. Pausanias, it is true, says that the pediments were the work of Alcamenes, the pupil of Pheidias, and of Paeonius, a sculptor of Thrace, respectively; but it is almost certain that he was misled by the local guides, who would naturally be anxious to connect the sculptures of their great temple with well-known names.

The metopes of the temple are in the same style of art as the pediments, but the defects of awkwardness and want of mastery are less conspicuous, because the narrow limits of the metope exclude any elaborate grouping. The subjects are provided by the 12 labours of Heracles; the figures introduced in each metope are but two or at most three; and the action is simplified as much as possible. The example shown (fig. 16), represents Heracles holding up the sky on a cushion, with the friendly aid of a Hesperid nymph, while Atlas, whom he has relieved of his usual burden, approaches bringing the apples which it was the task of Heracles to procure.

Another of the fruits of the excavations of Olympia is the Floating Victory by Paeonius, unfortunately faceless (fig. 17), which was set up in all probability in memory of the victory of the Athenians and their Messenian allies at Sphacteria in 425 B.C. The inscription states that it was dedicated by the Messenians and people of Naupactus from the spoils of their enemies, but the name of the enemy is not mentioned in the inscription. The statue of Paeonius, which comes floating down through the air with drapery borne backward, is of a bold and innovating type, and its influence may be traced in many works of the next age.

Delphic Charioteer.— Among the discoveries at Delphi none is so striking and valuable to us as the life-size statue in bronze of a charioteer holding in his hand the reins. Homolle maintained this to be part of a chariot-group set up by Polyzalus, brother of Gelo and Hiero of Syracuse, in honour of a victory won in the chariot-race at the Pythian games at Delphi (fig. 18). The charioteer is evidently a high-born youth, and is clad in the long chiton which was necessary to protect a driver of a chariot from the rush of air. The date would be about 480–470 B.C. Bronze groups representing victorious chariots with their drivers were among the noblest and most costly dedications of antiquity; the present figure is our only satisfactory representative of them. In style the figure is very notable, tall and slight beyond all contemporary examples. The contrast between the conventional decorousness of face and drapery and the lifelike accuracy of hands and feet is very striking, and indicates the clashing of various tendencies in art at the time when the great style was formed in Greece.

Myron.— The three great masters of the 5th century, Myron, Pheidias and Polyclitus are all in some degree known to us from their works. Of Myron we have copies of two works, the Marsyas with Athena (Pl. II., fig. 8), and the Discobolus. The Marsyas (a copy in the Lateran Museum) represents the Satyr so named in the grasp of conflicting emotions, eager to pick up the flutes which Athena has thrown down, but at the same time dreading her displeasure if he does so. More recently the Athena also has been identified. The Discobolus has usually been judged from the examples in the Vatican and the British Museum, in which the anatomy is modernized and the head wrongly put on. There are now photographs of the very superior replica in the Lancelotti gallery at Rome, the pose of which is much nearer to the original. The illustration represents a restoration made at Munich, by combining the Lancelotti head with the Vatican body (Pl. II., fig. 6).

FROM "OLYMPIA" VOL. III.

FIG. 17.—FLOATING VICTORY BY PAEONIUS. *c.* 425 B.C. (RESTORED)

Pheidias.—Of the works of Pheidias we have unfortunately no certain copy, excepting the small replicas at Athens of his Athena Parthenos. The larger of these was found in 1880: it is very clumsy, and the wretched device by which a pillar is introduced to support the Victory in the hand of Athena can scarcely be supposed to have belonged to the great original. Tempting theories have been published by Furtwängler (*Masterpieces of Greek* Sculpture) and other archaeologists, which identify copies of the Athena Lemnia of Pheidias, his Pantarces, his Aphrodite Urania and other statues; but doubt hangs over all these attributions.

A more pertinent and more promising question is, how far one may take the decorative sculpture of the Parthenon, since Lord Elgin's time the pride of the British Museum, as the actual work of Pheidias, or as done from his designs. Here again we have no conclusive evidence; but it appears from the testimony of inscriptions that the pediments at all events were not executed until after Pheidias's death.

Of course, the pediments and frieze of the Parthenon (*q.v.*),

whose work soever they may be, stand at the head of all Greek decorative sculpture. Whether we regard the grace of the composition, the exquisite finish of the statues in the round, or the delightful atmosphere of poetry and religion which surrounds these sculptures, they rank among the masterpieces of the world. The Greeks esteemed them far below the statue which the temple was made to shelter; but to us, who have lost the great figure in ivory and gold, the carvings of the casket which once contained it are a perpetual source of instruction and delight. The whole is reproduced by photography in A. S. Murray's *Sculptures of the Parthenon.*

An abundant literature has sprung up in regard to these sculptures, but it will suffice here to mention the discussions in Furtwangler's *Masterpieces,* and the very ingenious attempts of Sauer to determine by a careful examination of the bases and backgrounds of the pediments as they now stand how the figures must have been arranged in them. The two ends of the eastern pediment (Pl. I., figs. 1, 2, 3), are the only fairly well-preserved part of the pediments.

FIG 18.— BRONZE CHARIOTEER FROM DELPHI. 480–470 B.C.

Among the pupils of Pheidias who may naturally be supposed to have worked on the sculptures of the Parthenon, the most notable were Alcamenes and Agoracritus. Some fragments remain of the great statue of Nemesis at Rhamnus by Agoracritus, and an interesting light has been thrown on Alcamenes by the discovery at Pergamum of a professed copy of his Hermes set up at the entrance to the Acropolis at Athens (Pl. I., fig. 6). This, however, is conventional and archaistic in style, and we can scarcely regard it as typical of the master. Another noted contemporary who was celebrated mainly for his portraits was Cresilas, a Cretan. Several copies of his portrait of Pericles exist, and testify to the lofty and idealizing style of portraiture in this great age.

There have been found also admirable sculpture belonging to the other important temples of the Acropolis, the Erechtheum and the temple of Nike. The temple of Nike is the earlier, being possibly a memorial of the Spartan defeat at Sphacteria. The Erechtheum belongs to the end of our period, and embodies the delicacy and finish of the conservative school of sculpture at Athens just as the Parthenon illustrates the ideas of the more progressive school. The reconstruction of the Erechtheum has been a task which has long occupied the attention of archaeologists *(see* the paper by Stevens in the *American Journal of Archaeology,* 1906). The illustration (Pl. IV., fig. 9), shows one of the maidens, called both Corae and Caryatides, who support the entablature of the south porch of the Erechtheum, in her proper setting. This use of the female figure in place of a pillar is based on old Ionian precedent *(see* fig. 1), and is not altogether happy; but the idea is carried out with remarkable skill, the perfect repose and solid strength of the maiden being emphasized.

Polyclitus.—Beside Pheidias of Athens must be placed the greatest of early Argive sculptors, Polyclitus. His two typical athletes, the Doryphorus or spear-bearer (Pl. I., fig. 5), and the Diadumenus, have long been identified, and though the copies are not first-rate, they recover the principles of the master's art. Among the bases discovered at Olympia, whence the statues had been removed, are three or four which bear the name of Polyclitus, and the definite evidence furnished by these bases as to the position of the feet of the statues which they once bore has enabled archaeologists, especially Furtwangler, to identify copies of those statues among known works. Copies of Polyclitan works have also been discovered, and at Delos was found a copy of the Diadumenus, which is of much finer wcrk than the statue in the British Museum from Vaison. The Boston Museum of fine arts has a very beautiful statue of a young Hermes, who but for the wings on the temples might easily pass as a boy athlete of Polyclitan style (Pl. III.). In fact, as regards the manner of Polyclitus besides Roman copies of the Doryphorus and Diadumenus, there is quite a gallery of athletes, boys and men, who all claim relationship, nearer or more remote, to the school of the great Argive master, and in the Ashmolean museum is a very beautiful bronze head of the Polyclitan school (Pl. IV., fig. 6). It might have been hoped that the excavations, made under the leadership of Prof. Waldstein (Walston) at the Argive Heraeum, would have brought enlightenment to us as to the style of Polyclitus. Just as the sculptures of the Parthenon are the best monument of Pheidias, so it might seem likely that the sculptural decoration of the great temple which contained the Hera of Polyclitus would show us at large how his school worked in marble, but unfortunately the fragments of sculpture from the Heraeum are few. The most remarkable is a female head, which may perhaps come from a pediment (fig. 19). But archaeologists are not in agreement whether it is Polyclitan in style or whether it rather resembles in style Attic works. Other heads and some highly-finished

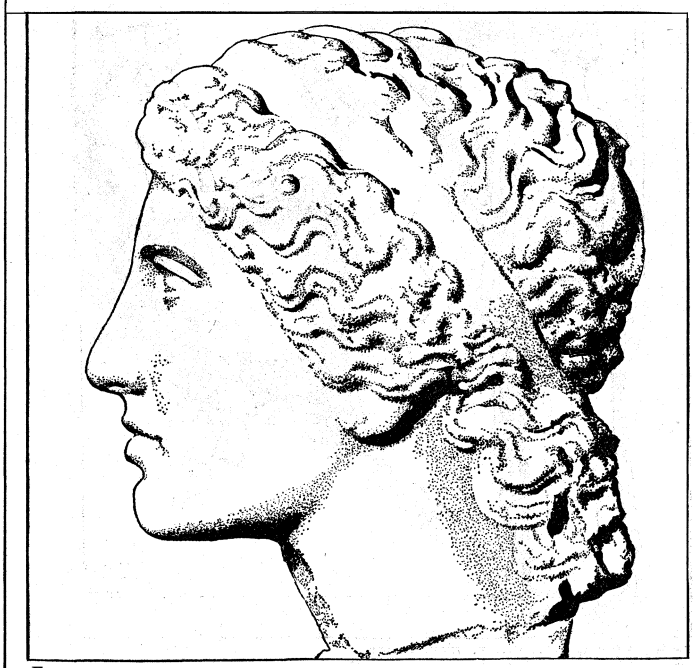


FIG. 19.— MARBLE FEMALE HEAD EXCAVATED AT THE ARGIVE HERAEUM

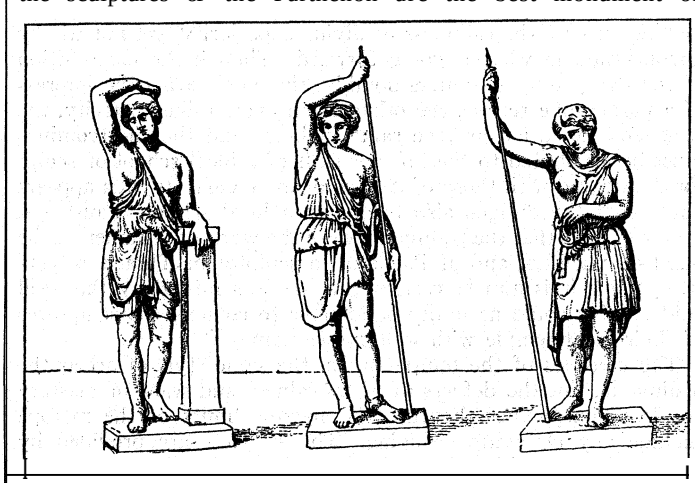

FIG. 20.— TYPES OF 5TH CENTURY AMAZONS RESTORED BY MICHAELIS

fragments of bodies come apparently from the metopes of the same temple. (See also ARGOS.)

Another work of Polyclitus was his Amazon, made it is said in competition with his great contemporaries, Pheidias, Cresilas and Phradmon, all of whose Amazons were preserved in the great temple of Artemis at Ephesus. In the museums are many statues of Amazons representing 5th century originals. These have usually been largely restored, and it is no easy matter to discover their original type. Prof. Michaelis has recovered successfully three types (fig. 20). The attribution of these is a matter of controversy. The first has been given to Polyclitus; the second seems to represent the Wounded Amazon of Cresilas; the third has by some archaeologists been assigned to Pheidias. It does not represent a wounded Amazon, but one alert, about to leap upon her horse with the help of a spear as a leaping pole.

FIG. 21.–FRAGMENT OF A FRIEZE OF THE VIENNA TOMB. ABOVE: ULYSSES SHOOTING SUITORS; BELOW: BOAR HUNTING

Lycia.—It is impossible to devote little more than a passing mention to the sculpture of other temples and shrines of the later 5th century, which nevertheless deserve careful study. The frieze from the temple of Apollo at Phigalia, representing Centaur and Amazon battles, is familiar to visitors of the British Museum, where, however, its proximity to the remains of the Parthenon lays stress upon the faults of grouping and execution which this frieze presents. It seems to be the work of local Arcadian artists. More pleasing is the sculpture of the Ionic tomb called the Nereid monument, brought by Sir Charles Fellows from Lycia. Here we have not only a series of bands of relief which ran round the tomb, but also detached female figures, whence the name which it bears is derived, though these women with their fluttering drapery may be not nymphs of the sea, but personifications of sea-breezes.

Lycian sculpture is well represented by the friezes, now in the Vienna Museum, which adorned a heroon near Gyeul Bashi and date from not much later than the middle of the 5th century. In the midst of the enclosure was a tomb, and the walls of the enclosure itself were adorned within and without with a great series of reliefs, mostly of mythologic purport. Many subjects which but rarely occur in early Greek art, the siege of Troy, the adventure of the Seven against Thebes, the carrying off of the daughters of Leucippus, Ulysses shooting down the Suitors, are here represented in detail. Prof. Benndorf, who has published these sculptures in an admirable volume, is disposed to see in them the influence of the Thasian painter Polygnotus. Anyone can see their kinship to painting, and their subjects recur in some of the great frescoes painted by Polygnotus, Micon and others for the Athenians. Like other Lycian sculptures, they contain non-Hellenic elements; in fact Lycia forms a link of the chain which extends from the miall-reliefs of Assyria to works like the columns of Trajan and of Antoninus, but is not embodied in the more purely idealistic works of the highest Greek art. A small part of the frieze of the Vienna tomb is shown in fig. 21; in this fragment are two scenes. one directly above the other; in the upper Clysses, accompanied by his son Telemachus, is in the act of shooting the suitors, who are reclining at table in the midst of a feast; a cup-bearer, possibly Melanthius, is escaping by a door behind Ulysses; and in the lower is the central group of a frieze representing the hunting of the Calydonian boar, the boar being shown—as is usual in the best period of Greek art—as an ordinary animal and no monster.

Portraits.— Archaeologists formerly paid little attention to an interesting branch of Greek art, that of sculptured portraits, but the known portraits of the 5th century now include Pericles, Herodotus, Thucydides, Anacreon, Sophocles, Euripides, Socrates and others. As might be expected in a time when style in sculpture was so strongly pronounced, these portraits, as we may see from later copies, are notably ideal. They represent the great men whom they portray not in the spirit of realism. Details are neglected, expression is not elaborated; the sculptor tries to represent what is permanent in his subject rather than what is temporary. Hence these portraits do not seem to belong to a particular time of life; they only represent a man in the perfection of physical force and mental energy. And the race or type is clearly shown through individual traits. In some cases it is still disputed whether statues of this age represent deities or mortals, so notable are the repose and dignity which even human figures acquire under the hands of 5th century masters. The Pericles after Cresilas in the British Museum and the athlete-portraits of Polyclitus, are good examples.

PERIOD III. 400-300 B.C.

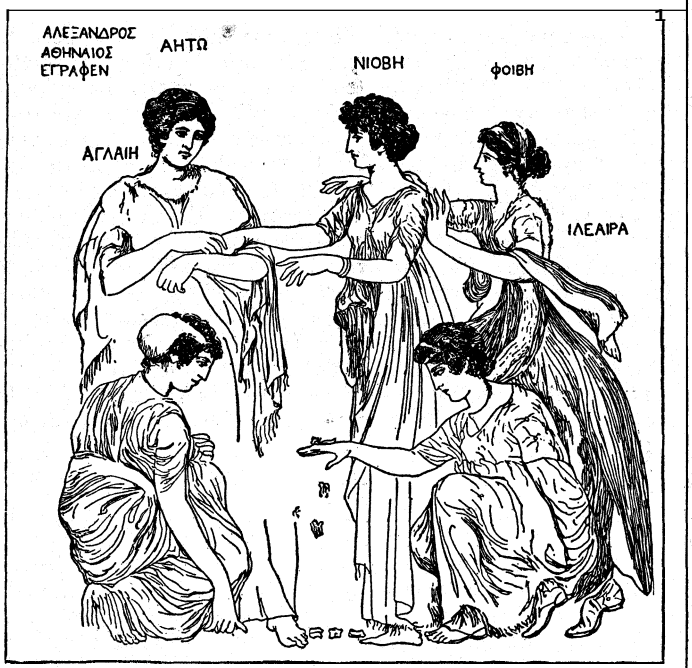
The high ideal level attained by Greek art at the end of the 5th century is maintained in the 4th. There cannot be any question of decay in it save at Athens, where undoubtedly the loss of religion and the decrease of national prosperity acted prejudicially. But in Peloponnesus the time was one of expansion; several new and important cities, such as Messene, Megalopolis and Mantinea, arose under the protection of Epaminondas. And in Asia the Greek cities were still prosperous and artistic, as were the cities of Italy and Sicily which kept their independence. On the whole there is during this age some diminution of the freshness and simplicity of art; it works less in the service of the gods and more in that of private patrons; it becomes less ethical and more sentimental and emotional. On the other hand, there can be no doubt that technique both in painting and sculpture advanced with rapid strides; artists had a greater mastery of their materials. and ventured on a wider range of subject.

In the 4th century no new temples of importance rose at Athens; the Acropolis had taken its final form; but at Messene, Tegea, Epidaurus and elsewhere, very admirable buildings arose. The remains of the temple at Tegea are of wonderful beauty and finish; as are those of the theatre and the so-called *Tholus* of Epidaurus. In Asia Minor vast temples of the Ionic order arose, especially at Miletus and Ephesus. The colossal pillars of Miletus astonish the visitors to the Louvre; while the sculptured columns of Ephesus in the British Museum (Pl. IV., fig. 8), show a high level of artistic skill. The Mausoleum erected about 350 B.C. at Halicarnassus in memory of Mausolus, king of Caria, and adorned with sculpture by the most noted artists of the day, was reckoned one of the wonders of the world. It has been in part restored in the British Museum, where also are models of various conjectural restorations. A small part of the sculptural decoration representing a battle between Greeks and Amazons is shown (Pl. IV., figs. 1 and 2), wherein the energy of the action and the careful balance of figure against figure are remarkable. We possess also the fine portraits of Mausolus himself and his wife Artemisia, which stood in or on the building, as well as part of a gigantic chariot with four horses which surmounted it.

Another architectural work of the 4th century, in its way a gem, is the structure set up at Athens by Lysicrates, in memory of a choragic victory. This still survives, though the reliefs with which it is adorned have suffered severely from the weather.

The 4th century is the brilliant period of ancient painting. It opens with the painters of the Asiatic school, Zeuxis and Parrhasius and Protogenes, with their contemporaries Nicias and Apollodorus of Athens. Timanthes of Sicyon or Cythnus, and Euphranor of Corinth. It witnesses the rise of a great school at

Sicyon, under Eupompus and Pamphilus, which was noted for its scientific character and the fineness of its drawing, and which culminated in Apelles, the painter of Alexander the Great, and probably the greatest master of the art in antiquity. To each of these painters a separate article is given, fixing their place in the history of the art. Of their paintings, unfortunately, but a very inadequate notion can be formed. Vase-paintings, which in the 5th century give us some notion at least of contemporary drawing, are less careful in the 4th century. Now and then are found on them figures admirably designed, or successfully foreshortened; but these are rare occurrences. The art of the vase decorator has ceased to follow the methods and improvements of contemporary fresco painters, and is pursued as a mere branch of commerce.



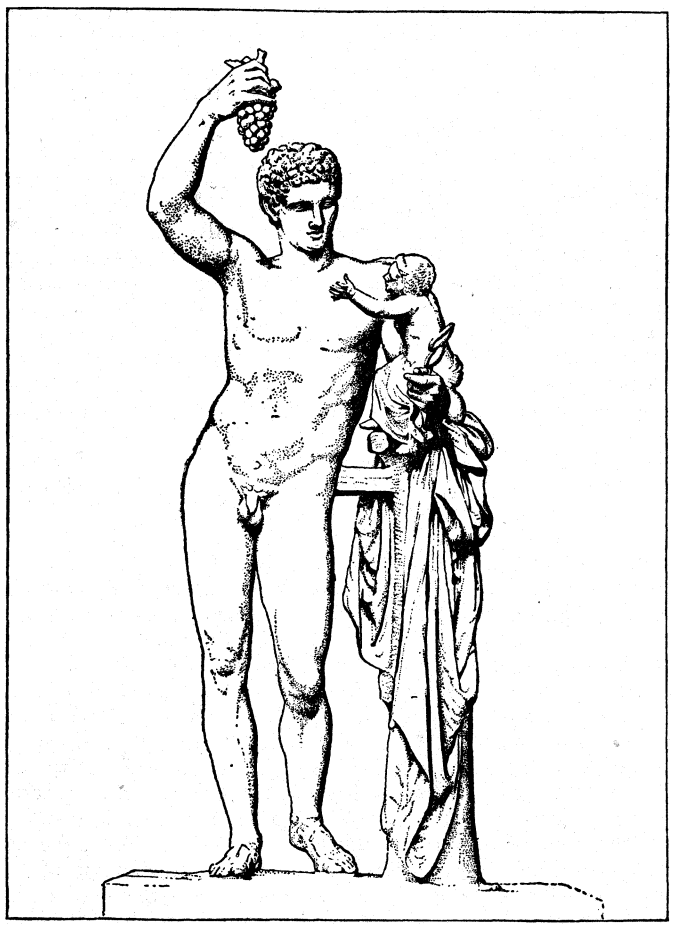
BY COURTESY OF THE NATIONAL MUSEUM, NAPLES

FIG. 22.— DRAWING OF WOMEN PLAYING AT KNUCKLEBONES. 400 B.C.

But very few actual paintings of the age survive, and even these fragmentary remains have with time lost the freshness of their colouring; nor are they in any case the work of a noteworthy hand. Our illustration (fig. 22), represents the remains of a drawing on marble, showing a group of women playing knucklebones. It was found at Herculaneum. Though signed by one Alexander of Athens, who was probably a worker of the Roman age, Prof. Robert is right in maintaining that Alexander only copied a design of the age of Zeuxis and Parrhasius. In fact the drawing and grouping is so closely like that of reliefs of about 400 B.C. that the drawing is of great historic value, though there is no colouring. Several other drawings of the same class have been found at Herculaneum, and on the walls of the Transtiberine Villa at Rome (now in the Terme museum).

Praxiteles.—Until about 1880 the knowledge of the great Greek sculptors of the 4th century was derived mostly from the statements of ancient writers and from Roman copies, or what were supposed to be copies, of their works, but there is now at least one undoubted original work of Praxiteles as well as sculptures executed under the immediate direction of, if not from the hand of, other great sculptors of that age—Scopas, Timotheus and others. Among all the discoveries made at Olympia in 1877 none has become so familiar to the artistic world as that of the Hermes of Praxiteles, a first-rate Greek original by one of the greatest of sculptors. Before its discovery almost all the statues in our museums were either late copies of Greek works of art, or else the mere decorative sculpture of temples and tombs, but the Hermes can be submitted to the strictest examination, and it can be seen in every line and touch that there is the work of a great artist. This is more than can be said of any of the literary remains of antiquity—poem. play or oration. Hermes is represented by the sculptor (Pl. VI., fig. 3), in the act of carrying the young child Dionysus to the nymphs who were charged with his rearing. On the journey he pauses and amuses himself by holding out to the child-god a bunch of grapes, and watching his eagerness to grasp them. To the modern eye the child is not a success; only the latest art of Greece is at home in dealing with children. But the Hermes, strong without excessive muscular development, and graceful without leanness, is a model of physical formation, and his face expresses the perfection of health, natural endowment and sweet nature. The statue can scarcely be called a work of religious art in the modern or Christian sense of the word but from the Greek point of view it is religious, as embodying the result of the harmonious development of all human faculties and life in accordance with nature.

The Hermes not only added to our knowledge of Praxiteles, but also confirmed the received views in regard to him. Already many works in galleries of sculpture had been identified as copies of statues of his school. Noteworthy among these are, the group at Munich representing Peace nursing the infant Wealth, from an original by Cephisodotus, father of Praxiteles; copies of the Cnidian Aphrodite of Praxiteles, especially one in the Vatican which is here illustrated (Pl. VI., fig. 6), and a torso in the British Museum (PI. VI., fig. 5); copies of the Apollo slaying a lizard (Sauroctonus), of a Satyr (in the Capitol museum), and



FROM "OLYMPIA"

FIG. 23.— THE HERMES OF PRAXITELES FROM OLYMPIA (RESTORED)

others. These works, which are noted for their softness and charm, make understandable the saying of ancient critics that Praxiteles and Scopas were noted for the pathos of their works, as Pheidias and Polyclitus for the ethical quality of those they produced. But the pathos of Praxiteles is of a soft and dreamy character; there is no action, or next to none; and the emotions which he rouses are sentimental-rather than passionate. Scopas was of another mood. The discovery of the Hermes naturally set archaeologists searching in the museums of Europe for other works, which may from their likeness to it in various respects be

set down as Praxitelean in character. In the case of many of the great sculptors of Greece — Strongylion, Silanion, Calamis and others — it is of little use to search for copies of their works, since there is little trustworthy evidence on which to base our enquiries; but in the case of Praxiteles one really stands on a safe level.

Naturally it is impossible in these pages to give any sketch of the results. some almost certain, some very doubtful, of the researches of archaeologists in quest of Praxitelean works. But we may mention a few works which have been claimed by good judges as coming from the master himself. Professor Brunn claimed as work of Praxiteles a torso of a satyr in the Louvre, in scheme identical with the well-known satyr of the Capitol. Professor Furtwangler puts in the same category a delicately beautiful head of Aphrodite at Petworth. And his translator, Mrs. Strong, regards the Aberdeen head of a young man in the British Museum as the actual work of Praxiteles. Certainly this last head does not suffer when placed beside the Olympian head of Hermes.

At Mantinea (*q.v.*) there was found a basis whereon stood a group of Latona and her two children. Apollo and Artemis. made supposedly by Praxiteles. This base bears reliefs representing the musical contest of Apollo and Marsyas, with the Muses as spectators, reliefs very pleasing in style, and quite in the manner of Attic artists of the 4th century. But of course they cannot be ascribed to the hand of the master himself; great sculptors did not themselves execute the reliefs which adorned temples and other monuments, but reserved them for their pupils. Yet the graceful figures of the Muses of Mantinea suggest how much was due to Praxiteles in determining the tone and character of Athenian art in relief in the 4th century. Exactly the same style which marks them belongs also to a mass of sepulchral monuments at Athens, and such works as the Sidonian sarcophagus of the Mourning Women, to be presently mentioned.

Scopas.—Excavation on the site of the temple of Athena Alea at Tegea (*q.v.*) in 1883 and later resulted in the recovery of works of the school of Scopas. Pausanias tells that Scopas was the architect of the temple, and so important in the case of a Greek temple is the sculptural decoration, that it can scarcely be doubted that the sculpture also of the temple at Tegea was under the supervision of Scopas, especially as he was more noted as a sculptor than as an architect. In the pediments of the temple were represented two scenes from mythology, the hunting of the Calydonian boar and the combat between Achilles and Telephus. To one or other of these scenes belong several heads of local marble discovered on the spot, which are very striking because of their extraordinary life and animation. Unfortunately they are so much injured that they can scarcely be made intelligible except by the help of restoration; one is therefore illustrated, the helmeted head, as restored by a German sculptor (Pl. IV., fig. 3; 4); its strong bony frame and its depth from front to back are not less noteworthy than the parted lips and deeply set and strongly shaded eye; the latter features impart to the head a vividness of expression such as has been found in no previous work of Greek art, but which sets the key to the developments of art which take place in the Hellenistic age. A draped torso of Atalanta from the same pediment has been fitted to one of these heads. Hitherto Scopas was known, setting aside literary records, only as one of the sculptors who had worked at the Mausoleum. Ancient critics and travellers, however, bear ample testimony to his fame, and the wide range of his activity, which extended to northern Greece, Peloponnese and Asia Minor. His Maenads and his Tritons and other beings of the sea were much copied in antiquity. But perhaps he reached his highest level in statues such as that of Apollo as leader of the Muses, clad in long drapery; a head of Apollo found in the Mausoleum, now in the British Museum, is almost certainly a work of Scopas.

Timotheus, Bryaxis, **Leochares.**—In the interesting precinct of Aesculapius at Epidaurus have been found specimens of the style of an Athenian contemporary of Scopas, who worked with him on the hfausoleum. An inscription which records the sums spent on the temple of the Physician-god, tells that the models for the sculptures of the pediments, and one set of acroteria or roof adornments, were the work of Timotheus. Of the pedimental figures and the acroteria considerable fragments have been recovered, and it may be assumed with confidence that at all events the models for these were by Timotheus. It is strange that the unsatisfactory arrangement whereby a noted sculptor makes models and some local workman the figures enlarged from those models, should have been tolerated by so artistic a people as the Greeks. The subjects of the pediments appear to have been the common ones of battles between Greek and Amazon and between Lapith and Centaur. There are fragments of some of the Amazon figures, one of which striking downwards at the enemy, is here shown (fig. 27). Their attitudes are vigorous and alert; but the work shows little delicacy of detail. Figures of Nereids riding on horses, which were found on the same site, may very probably be roof ornaments (acroteria) of the temple. There are also several figures of Victory, which probably were acroteria on some smaller temple, perhaps that of Artemis. A base found at Athens; sculptured with figures of horsemen in relief, bears the name of Bryaxis, and was probably made by a pupil of his. Probable conjecture assigns. to Leochares the originals copied in the Ganymede of the Vatican, borne aloft by an eagle (Pl. IV., fig. 7), and the noble statue of Alexander the Great at Munich (*see* LEOCHARES). Thus it may fairly be said that students are now acquainted with the work of all the great sculptors who worked on the Mausoleum — Scopas, Bryaxis, Leochares and Timotheus; and are in a far more advantageous position than were the archaeologists of 1880 for determining the artistic problems connected with that noblest of ancient tombs.

The **School of** Argos and Sicyon. — This was contemporary with the Athenian school of Praxiteles; and of it Lysippus was the most distinguished member. Lysippus continued the academic traditions of Polyclitus, but he was far bolder in his choice of subjects and more innovating in style. Gods, heroes and mortals alike found in him a sculptor who knew how to combine fine ideality with a vigorous actuality. He was at the height of his fame during Alexander's life. and the grandiose ambition of the great Macedonian found him ample employment, especially in the frequent representation of himself and his marshals.

There have been discovered none of the actual works of Lysippus; but the best evidence for his style will be found in the statue of Agias, an athlete (Pl. VI., fig. 1), found at Delphi, and shown by an inscription to be a marble copy of a bronze original by Lysippus. The Apoxyomenus of the Vatican (man scraping himself with a strigil) (Pl. VI., fig. 2) has hitherto been regarded as a copy from Lysippus; but of this there is no evidence, and the style of that statue belongs rather to the 3rd century than the 4th. The Agias, on the other hand, is in style contemporary with the works of 4th century sculptors.

Of the elaborate groups of combatants with which Lysippus enriched such centres as Olympia and Delphi, or of the huge bronze statues which he erected in temples and shrines, no adequate notion can be formed. The recent excavations at Cyrene have produced a figure of Alexander of which the head is of remarkable style, and probably Lysippic in type (Pl. VI., fig. 8); a pupil of Lysippus, Eutychides, made a very original and charming statue of the city of Antioch, seated above the river Orontes. The type was widely copied in later sculpture (Pl. VII., fig. 9).

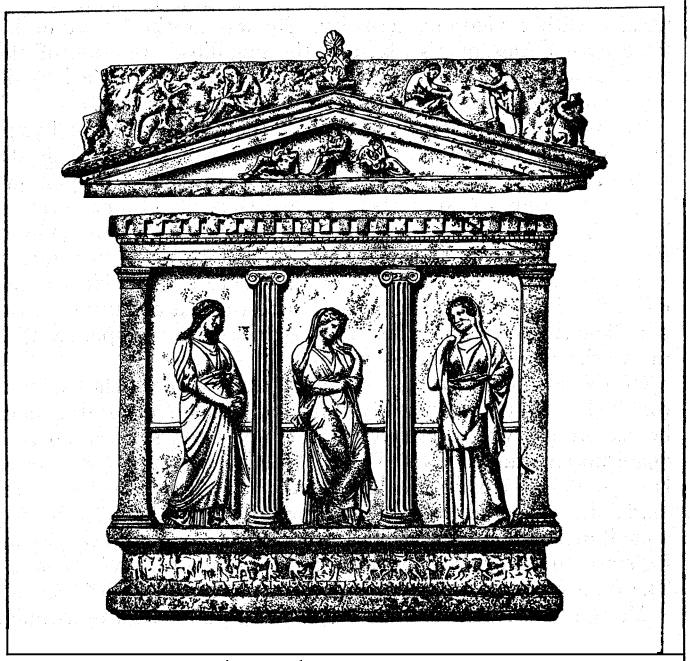
Many noted extant statues may be attributed with probability to the latter part of the 4th or the earlier part of the 3rd century. The celebrated group at Florence representing Niobe and her children falling before the arrows of Apollo and Artemis is certainly a work of the pathetic school, and may be by a pupil of Praxiteles. Niobe, in an agony of grief, which is in the marble tempered and idealized, tries to protect her youngest daughter from destruction (Pl. VII., fig. 1). Whether the group can have originally been fitted into the gable of a temple is a matter of dispute.

Two great works preserved in the Louvre are so noted that it is but necessary to mention them, the Aphrodite of Melos (Pl. VI., fig. 4), in which archaeologists are now disposed to see the influence of Scopas, and the Victory of Samothrace (Pl. VII., fig. 2), an original set up by Demetrius Poliorcetes after a naval

victory won at Salamis in Cyprus in 306 B.C. over the fleet of Ptolemy, king of Egypt.

Nor can two works be passed over without notice so celebrated as the Apollo of the Belvedere in the Vatican (Pl. VI., fig. 7), and the Artemis of Versailles. The Apollo is now by most archaeologists regarded as probably a copy of a work of Leochares, to whose Ganymede it bears a superficial resemblance. The Artemis is regarded as possibly due to some artist of the same age. But it is by no means clear that either of these figures can be removed from among the statues of the Hellenistic age. The old theory of Preller, which saw in them copies from a trophy set up to commemorate the repulse of the Gauls at Delphi in 278 B.C., has not lost its plausibility.

Sarcophagi of **Sidon.**—This may be the most appropriate place for mentioning the remarkable find made at Sidon in 1886 of a number of sarcophagi, which once doubtless contained the remains of kings of Sidon. They are now in the museum of Constantinople, and are admirably published by Hamdy Bey and T. Reinach (*Une Nécropole royale à* ***Sidon,*** 1892–96). The sarcophagi in date cover a considerable period. The earlier are made on Egyptian models, the covers shaped roughly in the form of a human body or mummy. The later, however, are Greek in form, and are clearly the work of skilled Greek sculptors, who seem to have been employed by the grandees of Phoenicia in the adornment of their last resting-places. Four of these sarcophagi in particular claim attention, and in fact present examples of Greek art of the 5th and 4th centuries in several of its aspects. To the 5th century belong the tomb of the Satrap, the reliefs of which bring to light the activities and glories of some unknown king, and the Lycian sarcophagus, so called from its form, which resembles that of tombs found in Lycia, and which is also adorned with reliefs which have reference to the past deeds of the hero buried in the tomb, though these deeds are represented, not in the Oriental manner directly, but in the Greek manner, clad in



FROM HAMDY AND REINACH, "NÉCROPOLE À SIDON"

FIG. 24.— TOMB OF MOURNING WOMEN AT SIDON, 4TH CENTURY B.C.

mythological forms. To the 4th century belong two other sarcophagi. One of these is called the Tomb of Mourning Women. On all sides of it alike are ranged a series of beautiful female figures, separated by Ionic pillars, each in a somewhat different attitude, though all attitudes denote grief (fig. 24). The pediments at the ends of the cover are also closely connected with the mourning for the loss of a friend and protector, which is the theme of the whole decoration of the sarcophagus. Depicted in them are the telling of the news of the death, with the results in the mournful attitude of the two seated figures, The mourning women must be taken, not as the representation of any persons in particular, but generally as the expression of the feeling of a city. Such figures are familiar to us in the art of the second Attic school; there are parallels to the sarcophagus among the 4th century sepulchral reliefs of Athens. The attribution of the workmanship of this beautiful sarcophagus to some sculptor trained in the school of Praxiteles cannot be mistaken. And it is a conjecture full of probability that it once contained the body of Strato, king of Sidon, who ruled about 380 B.C., and who was *proxenos* or public friend of the Athenians.

More celebrated is the astonishing tomb called that of Alexander, though there can be no doubt that, although it commemorates the victories and exploits of Alexander, it was made not to hold his remains, but those of some ruler of Sidon who was high in his favour. Among all the monuments of antiquity which have come down to us, none is more admirable than this, and none more characteristic of the Greek genius. The illustration shows, in two lines, the composition which adorned one of the sides of this sarcophagus. It represents a victory of Alexander, probably that of the Granicus (fig. 25). On the left can be seen the Macedonian king charging the Persian horse, on the right his general Parmenio, and in the midst a younger officer, perhaps Cleitus. Mingled with the chiefs are foot-soldiers, Greek and Macedonian, with whom the Persians are mingled in unequal fray. What most strikes the modern eye is the remarkable freshness and force of the action and the attitudes. Those, however, who have seen the originals have been specially impressed with the colouring, whereof, of course, our reproduction gives no hint, but which is applied to the whole surface of the relief with equal skill and delicacy. There are other features in the relief on which a Greek eye would have dwelt with special pleasure—the exceedingly careful symmetry of the whole, the balancing of figure against figure, the skill with which the result of the battle is hinted rather than depicted. The composition is one in which the most careful planning and the most precise calculation are mingled with freedom of hand and expressiveness in detail. The faces in particular show more expression than would be expected in art of the previous century. Authorities are unable as yet to assign an author or even a school to the sculptor of this sarcophagus; it comes to us as a new and striking phenomenon in the history of ancient art. The reliefs which adorn the other sides of the sarcophagus are almost equally interesting. On one side is Alexander again, in the company of a Persian noble, hunting a lion. The short sides also show scenes of fighting and hunting. In fact it can scarcely be doubted that if there was but a clue to the interpretation of the reliefs, they would be found to embody historic events of the end of the 4th century. There are only a few other works of art, such as the Bayeux tapestry and the Column of Trajan, which bring contemporary history so vividly before our eyes. The battles with the Persians represented in some of the sculpture of the Parthenon and the temple of Nike at Athens are treated conventionally and with no attempt at realism; but here the ideal and the actual are blended into a work of consummate art, which is at the same time, to those who can read the language of Greek art, a historic record. The portraits of Alexander the Great which appear on this sarcophagus are almost contemporary, and the most authentic likenesses of him. The great Macedonian exercised so strong an influence on contemporary art that a multitude of heads of the age, both of gods and men, and even the portraits of his successors, show traces of his type.

There are yet to be mentioned what are among the most charming and the most characteristic products of the Greek chisel, the beautiful tombs, adorned with seated or standing portraits or with reliefs, which were erected in great numbers on all the main roads of Greece. A great number of these from the Dipylon cemetery are preserved in the Central museum at Athens, and impress all visitors by the gentle sentiment and the charm of grouping which they display.

PERIOD IV. 300-50 B.C.

There can be no question but that the period which followed the death of Alexander, commonly called the age of Hellenism,

FROM HAMDY AND REINACH, "NÉCROPOLE À SIDON"

FIG. 25.— PAINTED RELIEF ADORNING ONE SIDE OF A SARCOPHAGUS CALLED THE TOMB OF ALEXANDER. PROBABLY REPRESENTING THE VICTORY AT GRANICUS. SIDON. 4TH CENTURY B.C.

was one of great activity and expansion in architecture. The number of cities founded by himself and his immediate successors in Asia and Egypt was enormous. The remains of these cities have in a few cases (Ephesus, Pergamum, Assus, Priene, Alexandria) been partially excavated. But the adaptation of Greek architecture to the needs of the semi-Greek peoples included in the dominions of the kings of Egypt, Syria and Pergamum is too vast a subject to be entered upon here.

Painting during this age ceased to be religious. It was no longer for temples and public stoae that artists worked, but for private persons; especially they made frescoes for the decoration of the walls of houses, and panel pictures for galleries set up by rich patrons. The names of very few painters of the Hellenistic age have come down to us. There can be no doubt that the character of the art declined, and there were no longer produced great uorks to be the pride of cities, or to form an embodiment for all future time of the qualities of a deity or the circumstances of scenes mythical or historic. But at the same time the mural paintings of Pompeii and other works of the Roman age, which are usually more or less nearly derived from Hellenistic models, prove that in technical matters painting continued to progress. Colouring became more varied, groups more elaborate, perspective was worked out with greater accuracy, and imagination shook itself free from many of the conventions of early art. Pompeian painting, however, must be treated of under Roman, not under Greek art. There is shown a single example, to depict the elaboration of painting at Alexandria and elsewhere, the wonderful Pompeian mosaic (fig. 28), which represents the victory of Alexander at Issus. This work being in stone has preserved its colouring; and it stands at a far higher level of art than ordinary Pompeian paintings. This, on the contrary, is certainly copied from the work of a great master. It is instructive to compare it with the sarcophagus illustrated in fig. 2j, which it excels in perspective and in the freedom of individual figures, though the composition is much less careful and precise. Alexander charges from the left (his portrait being the least successful part of the picture), and bears down a young Persian; Darius in his chariot flees towards the right; in the foreground a young knight is trying to manage a restive horse. It will be observed how very simple is the indication of locality: a few stones and a broken tree stand for rocks and woods.

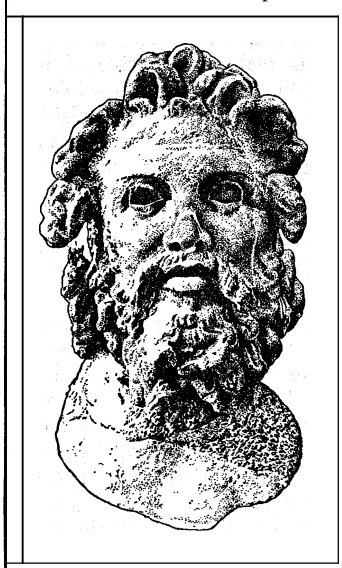


FIG. 26.— THE HEAD OF THE TITAN ANYTUS, ONE OF THE COLOSSAL HEADS FOUND AT LYCOSURA

Among the original sculptural creations of the early Hellenistic age, a prominent place is claimed by the statue of Fortune, typifying the city of Antioch (Plate VII., fig. 9), a work of Eutychides, a pupil of Lysippus. Of this we possess a small copy, which is sufficient to show how worthy of admiration was the original. We have a beautiful embodiment of the personality of the city, seated on a rock, holding ears of corn, while the river Orontes, embodied in a young maie figure, springs forth at her feet.

Almost the only remaining work of the early 3rd century which shows imagination is the above-mentioned statue typifying

the city of Antioch by Eutychides, a pupil of Lysippus. Sculptors often worked on a colossal scale, producing such monsters as the colossal Apollo at Rhodes, the work of Chares of Lindus, which was more than 100ft. in height; but they did not show freshness or invention, and for the most part contented themselves with varying the types produced in the great schools of the 4th century. The wealthy kings of Syria, Egypt and Asia Minor formed art galleries, and were lavish in their payments; but it has often been proved in the history of art that originality cannot be produced by mere expenditure.

A great artist, whose date has been disputed, but who is now assigned to the Hellenistic age, Damophon of Messene, is known from his actual works. He set up in the shrine of the *Mistress* (Despoena) at Lycosura in Arcadia a great group of figures consisting of Despoena, Demeter, Artemis and the Titan Anytus. Three colossal heads found on the spot probably belong to the three last-mentioned deities. The illustration is of the head of Anytus, with wild disordered hair and turbulent expression (fig. 26). Dr. Dorpfeld argued, on architectural grounds, that shrine and images alike must be given to a later time than the 4th century; and this judgment is now confirmed by inscriptional and otner evidence.

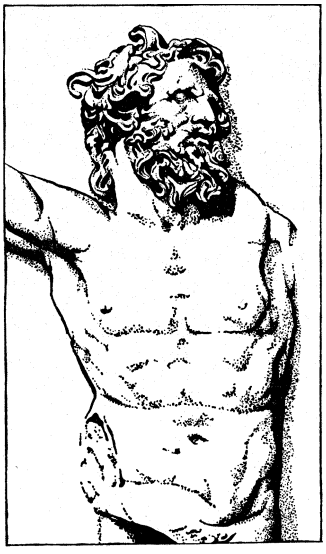

FIG. 27.— GIANT FROM THE GREAT ALTAR OF PERGAMUM; SHAGGY HAIR, FIERCE EXPRESSION, AND HUGE MUSCLES PROBABLY DERIVED FROM THE GALATIANS

In one important direction sculpture certainly made progress. Hitherto Greek sculptors had contented themselves with studying the human body whether in rest or motion, from outside. The dissection of the human body, with a consequent increase in knowledge of anatomy, became usual at Alexandria in the medical school which flourished under the Ptolemies. This improved anatomical knowledge soon reacted upon the art of sculpture. Works such as the Fighter of Agasias in the Louvre (Pl. VII., fig. 7), and in a less degree the Apoxyomenus (Pl. VI., fig. 2), display a remarkable internal knowledge of the human frame, such as could only come from the habit of dissection. Whether this was really productive of improvement in sculpture may be doubted. But it is impossible to withhold one's admiration from works which show an astonishing knowledge of the body of man down to its bony framework, and a power and mastery of execution which have never since been surpassed.

With accuracy in the portrayal of men's bodies goes of necessity a more naturalistic tendency in portraiture. The art of portraiture was at a high ideal level in the Pheidian age; and even in the age. of Alexander the Great, notable men were rendered rather according to the idea than the fact. To a base and mechanical naturalism Greek art never at any time descended. But from 300 *B.C.* onwards there is a marvellous series of portraits which may be termed rather characteristic than ideal, which are very minute in their execution, and delight in laying emphasis on the havoc wrought by time and life on the faces of noteworthy men. Such are the portraits of Demosthenes, of Antisthenes, of Zeno and others, which exist in our galleries. And it was no long step from these actual portraits to the invention of characteristic types to represent the great men of a past generation, such as Homer and Lycurgus, or to form generic images to represent weather-beaten fishermen or toothless old women.

Altar of Perpamum.— The knowledge of the art of the later Hellenistic age is greatly indebted to the German Archaeological institute, the systematic labours of which since 1875 have resulted in recovering the remains of Pergamum, the fortress-city which was the capital of the dynasty of the Philetaeri. Among the ancient buildings of Pergamum none was more ambitious in scale and striking in execution than the great altar used for sacrifices to Zeus, a monument supposed to be referred to in the phrase of the Apocalypse "where Satan's throne is." This altar, like many great sacrificial altars of later Greece, was a vast erection to which one mounted by many steps, and its outside was adorned with a frieze which represented on a gigantic scale, in the style of the 2nd century *B.C.*, the battle between the gods and the giants. This enormous frieze (see PERGAMUM) is now one of the treasures of Berlin, and it cannot fail to impress visitors by the size of the figures, the energy of the action, and the strong vein of sentiment which pervades the whole, giving it a certain air of modernity, though the subject is strange to the Christian world. In early Greek art the giants where they oppose the gods are represented as men armed in full panoply, "in shining armour, holding long spears in their hands," to use the phrase in which Hesiod describes them. But in the Pergamene frieze the giants are strange compounds, having the heads and bodies of wild and fierce barbarians, sometimes also human legs, but sometimes in the place of legs two long serpents, the heads of which take with the giants themselves a share in the battle. Sometimes also they are winged. The gods appear in the forms which had been gradually made for them in the course of Greek history, but they are usually accompanied by the animals sacred to them in *cultus,* between which and the serpent-feet of the giants a weird combat goes on. We can conjecture the source whence the Pergamene artist derived the shaggy hair, the fierce expressions, the huge muscles of his giants (fig. 27); probably these features came originally from the Galatians, who at the time had settled in Asia Minor, and were spreading the terror of their name and the report of their savage devastations through all Asia Minor. The victory over the giants clearly stands for the victory of Greek civilization over Gallic barbarism; and this meaning is made more emphatic because the gods are obviously inferior in physical force to their opponents, indeed, a large proportion of the divine combatants are goddesses. Yet everywhere the giants are overthrown, writhing in pain on the ground, or transfixed by the weapons of their opponents; everywhere the gods are victorious, yet in the victory retain much of their divine calm.

The piecing together of the frieze at Berlin has been a labour of many years; it is now complete, and there is a special museum devoted to it. Some of the groups have become familiar to students from photographs, especially the group which represents Zeus slaying his enemies with thunderbolts, and the group wherein Athena seizes by the hair an overthrown opponent, who is winged, while Victory runs to crown her, and beneath is seen Gaia, the earth-goddess who is the mother of the giants, rising out of the ground, and mourning over her vanquished and tortured children.

Another and smaller frieze which also decorated the altar-place gives us scenes from the history of Telephus, who opposed the landing of the army of Agamemnon in Asia Minor and was overthrown by Achilles; it is quite fragmentary, but was pieced together by Dr. Schneider in the *Jahrbuch* of the German Archaeological institute for 1900.

Since the Renaissance Rome has produced a continual crop of works of Greek art of all periods, partly originals brought from Greece by conquering generals, partly copies, such as the group at Rome formerly known as Paetus and Arria, and the overthrown giants and barbarians which came from the elaborate trophy set up by Attalus at Athens, of which copies exist in many museums. A noted work of kindred school is the group of Laocoon and his sons (Pl. VII., fig. 5), signed by Rhodian sculptors of the 1st century *B.C.*, which has been perhaps more discussed than any work of the Greek chisel, and served as a peg for the aesthetic theories of Lessing and Goethe. In our days the histrionic and strained character of the group is regarded as greatly diminishing its interest, in spite of the astounding skill and knowledge of the human body shown by the artists. To the same school belong the late representations of Marsyas being flayed by the victorious Apollo, a somewhat repulsive subject, chosen by the artists of this age as a means for displaying their accurate knowledge of anatomy.

On what a scale some of the artists of Asia Minor would work

FIG. 28.—BATTLE OF ISSUS AFTER THE MOSAIC IN THE NAPLES MUSEUM

is shown us by the enormous group, by Apollonius and Tauriscus of Tralles, which is called the Farnese Bull, and which represents how Dirce was tied to a wild bull by her stepsons Zethus and Amphion.

Rome.—The extensive excavations and alterations which have taken place at Rome in recent years have been very fruitful; the results may be found partly in the palace of the Conservatori on the Capitol, partly in the Museo delle Terme. Among statues found in our own days none excel in interest some bronzes of large size dating from the Hellenistic age. In the figure of a seated boxer (Pl. VII., fig. 4), in scale somewhat exceeding life, attitude and gesture are expressive. Evidently the boxer has fought already, and is awaiting a further conflict. His face is cut and swollen; on his hands are the terrible caestus, here made of leather, and not loaded with iron, like the caestus described by Virgil. The figure is of astounding force; but though the face is brutal and the expression savage, in the sweep of the limbs there is nobility, even ideal beauty. To the last the Greek artist could not set aside his admiration for physical perfection. Another bronze figure of more than life-size is that of a king of the Hellenistic age standing leaning on a spear. He is absolutely nude, like the athletes of Polyclitus. Another large bronze presents us with a Hellenistic type of Dionysus.

Beside the bronzes found in Rome we may set those retrieved from the sea on the coast of Cythera, the contents of a ship lost on the way from Greece to Rome. The date of these statues has been disputed, but, even if executed in the Roman age, they go back to originals of the 5th and 4th centuries. The most noteworthy among them is a beautiful athlete (Pl. VI., fig. g), standing with hand upraised, which reflects the style of the Attic school of the 4th century.

After 146 B.C. when Corinth was destroyed and Greece became one of the Roman provinces, Greek art, though by no means extinct, worked mainly in the employ of the Roman conquerors (see ROMAN ART).

GREEK FIRE, the name applied to inflammable and destructive compositions used in warfare during the middle ages and particularly by the Byzantine Greeks at the sieges of Constantinople. The employment of liquid fire is represented on Assyrian bas-reliefs. At the siege of Plataea (429 B.C.) the Spartans attempted to burn the town by piling up against the walls wood saturated with pitch and sulphur and setting it on fire (Thuc. ii. 77), and at the siege of Delium (424 B.C.) a cauldron containing pitch, sulphur and burning charcoal, was placed against the walls and urged into flame by the aid of a bellows, the blast from which was conveyed through a hollow tree-trunk (Thuc. iv. 100). Aeneas Tacticus in the following century mentions a mixture of sulphur, pitch, charcoal, incense and tow, which was packed in wooden vessels and thrown lighted upon the decks of the enemy's ships. Later, as in receipts given by Vegetius (c. A.D. 350), naphtha or petroleum is added, and some nine centuries afterwards the same substances are found forming part of mixtures described in the later receipts (which probably date from the beginning of the 13th century) of the collection known as the Liber *ignium* of Marcus Graecus. In subsequent receipts saltpetre and turpentine make their appearance, and the modern "carcass composition," containing sulphur, tallow, rosin, turpentine, saltpetre and crude antimony, is a representative of the same class of mixtures, which became known to the Crusaders as Greek fire but were more usually called wildfire. Greek fire, properly so-called, was, however, of a somewhat different character. It is said that in the reign of Constantine Pogonatus (648–685) an architect named Callinicus, who had fled from Heliopolis in Syria to Constantinople, prepared a wet fire which was thrown out from siphons (*τὸ διὰ τῶν σιφώνων ἐκφερόμενον πῦρ ὑγρόν*), and that by its aid the ships of the Saracens were set on fire at Cyzicus and their defeat assured. The art of compounding this mixture, which is also referred to as *πῦρ θαλάσσιον*, or sea fire, was jealously guarded at Constantinople, and the possession of the secret on several occasions proved of great advantage to the city. The nature of the compound is somewhat obscure. It has been supposed that the novelty introduced by Callinicus was saltpetre, but this view involves the difficulty that that substance was apparently not known till the 13th century, even if it were capable of accounting for the properties attributed to the wet fire. Lieut.-Col. H. W. L. Hime, after a close examination of the available evidence, concludes that what distinguished Greek fire from the other incendiaries of the period was the presence of quicklime, which was well known to give rise to a large development of heat when brought into contact with water. The mixture, then, was composed of such materials as sulphur and naphtha with quicklime, and took fire spontaneously when wetted—whence the name of wet fire or sea fire; and portions of it were "projected and at the same time ignited by applying the hose of a water engine to the breech" of the siphon, which was a wooden tube, cased with bronze. A revival of the idea, if transformed in character by modern chemistry, was seen in the flame-throwers (*q.v.*) of the World War of 1914–18 and the War in Europe of 1939–

See H. W. L. Hime, *Gunpowder and Ammunition, their Origin and Progress* (London, 1904).

GREEK INDEPENDENCE, WAR OF, the name given to the great rising of the Greek subjects of the sultan against the Ottoman domination, which began in 1821 and ended in 1833 with the establishment of the independent kingdom of Greece. The circumstances that led to the insurrection and the general diplomatic situation by which its fortunes were from time to time affected are described elsewhere (see GREECE: History; TURKEY: History). If we exclude the abortive invasion of the Danubian principalities by Prince Alexander Ypsilanti (March 1821), which collapsed ignominiously as soon as it was disavowed by the tsar, the theatre of the war was confined to continental Greece, the Morea and the adjacent narrow seas. Its history may, broadly speaking, be divided into three periods: the first (1821–24), during which the Greeks, aided by numerous volunteers from Europe, were successfully pitted against the sultan's forces alone; the second, from 1824, when the disciplined troops of Mehemet Ali, pasha of Egypt, turned the tide against the insurgents; the third, from the intervention of the European Powers in the autumn of 1827 to the end.

When, on April 2, 1821, Archbishop Germanos, head of the Hetaeria in the Morea, raised the standard of the cross at Kalavryta as the signal for a general rising of the Christian population, the circumstances were highly favourable. In the Morea itself, in spite of plentiful warning, the Turks were wholly unprepared; while the bulk of the Ottoman army, under Kurshid Pasha, was engaged in the long task of reducing the intrepid Ali, pasha of Iannina (see ALI, Pasha of Iannina). Another factor, and that the determining one, soon came to the aid of the Greeks. In warfare carried on in such a country as Greece, sea-girt and with a coast deeply indented, inland without roads and intersected with rugged mountains, victory—as Wellington was quick to observe—must rest with the side that has command of the sea. This was assured to the insurgents at the outset by the revolt of the maritime communities of the Greek archipelago. The Greeks of the islands had been accustomed from time immemorial to seafaring; their ships were well armed, to guard against the Barbary pirates and rovers of their own kin; lastly, they had furnished the bulk of the sailors to the Ottoman navy which, now that this recruiting ground was closed, had to be manned hastily with impressed crews of dock-labourers and peasants. The Turkish fleet, "adrift in the Archipelago"—as the British seamen put it—though greatly superior in tonnage and weight of metal, could never be a match for the Greek brigs, manned as these were by trained, if not disciplined, crews.

Outbreak of the Insurrection.—The war was begun by the Greeks without definite plan and without any generally recognized leadership. The force with which Germanos marched from Kalavryta against Patras was composed of peasants armed with scythes, clubs and slings, among whom the "primates" exercised a somewhat honorary authority. The town itself was destroyed, but the citadel remained in the hands of the Turks till 1828. Meanwhile, in the south, leaders of another stamp had appeared: Petros, bey of the Maina (*q.v.*) chief of the Mavromichales, who at the head of his clan attacked Kalamata and put the Mussulman inhabitants to the sword; and Kolokotrones, a notable brigand once in the service of the Ionian government, who—fortified by a vision of the Virgin—captured Karytaena and slaughtered its infidel population. Encouraged by these successes the revolt spread rapidly; within three weeks there was not a Mussulman left in the open country. The flames of revolt now spread across the Isthmus of Corinth: early in April the Christians of Dervenokhoria rose, and the whole of Boeotia and Attica quickly followed suit; at the beginning of May the Mussulman inhabitants of Athens were blockaded in the Acropolis. In the Morea, meanwhile, a few Mussulman fortresses still held out. One by one they fell, and everywhere were repeated the same scenes of butchery. The horrors culminated in the capture of Tripolitsa, the capital of the vilayet. In September this was taken by storm; Kolokotrones rode in triumph to the citadel over streets carpeted with the dead; and the crowning triumph of the Cross was celebrated by a cold-blooded massacre of 2,000 prisoners of all ages and both sexes. This completed the success of the insurrection in the Morea, where only Patras, Nauplia, and one or two lesser fortresses remained to the Turks.

Meanwhile, north of the Isthmus, the fortunes of war had been less one-sided. In the west Khurshid's lieutenant, Omar Vrioni (a Mussulman Greek of the race of the Palaeologi), had inflicted a series of defeats on the insurgents, and relieved the Acropolis; but the rout of Mohammed Pasha, who was coming to his aid in the defile of Mount Oeta, forced him to retreat and the campaign of 1821 ended with the retirement of the Turks into Thessaly. The month of April had witnessed the revolt of the principal Greek islands, Spetsae, Psara, Hydra and Samos. Their fleets were divided into squadrons, of which one, under Tombazes, was deputed to watch for the entrance of the Ottomans into the archipelago, while the other under Andreas Miaoulis sailed to blockade Patras and watch the coasts of Epirus. At sea, as on land, the Greeks opened the campaign with hideous atrocities.

General Character of the War.—These inauspicious begin-

nings, indeed, set the whole tone of the war, which was frankly one of mutual extermination. On both sides the coinbatants were barbarians, without discipline or competent organization. At sea the Greeks rapidly developed into mere pirates, and even Miaoulis, for all his high character and courage, was often unable to prevent his captains from sailing home at critical moments, when pay or booty failed. On land the presence of a few educated Phanariots, such as Demetrios Ypsilanti or Alexander Mavrocordato, was powerless to inspire the rude hordes with any sense of order or of humanity in warfare; while every lull in the fighting was the signal for internecine conflicts due to the rivalry of the leaders. Their cause, indeed, was helped more by the impolitic reprisals of the Turks than by the heroism of the insurgents. All Europe stood aghast at the news of the execution of the Patriarch Gregorios of Constantinople (April 22, 1821) and the wholesale massacres that followed. The cause of Greece was now that of Christendom, of the Catholic and Protestant West, as of the Orthodox East. European Liberalism, too, gagged and fettered under Metternich's "system," recognized in the Greeks the champions of its own cause; while even conservative statesmen, schooled in the memories of ancient Hellas, saw in the struggle a fight of civilization against barbarism. This latter belief, which was, moreover, flattering to their vanity, the Greek leaders were astute enough to foster; the propaganda of Adamantios Coraes (*q.v.*) had done its work; and wily brigands, like Odysseus of Ithaka, assuming the style and trappings of antiquity, posed as the champions of classic culture against the barbarian. All Europe, then, hailed with joy the exploit of Constantine Kanaris, who on the nigl t of June 18–19 succeeding in steering a fireship among the Turkish squadron off Scio, and burned its flagship.

Expedition **of** Dramali, **1822.**—Meanwhile Sultan Mahmud, now wide awake to the danger, had been preparing for a systematic effort to suppress the rising. The threatened breach with Russia had been avoided by Metternich's influence on the tsar Alexander; the death of Ali of Iannina had set free the army of Khurshid Pasha, who was charged with the task of reducing the Morea. In the spring of 1822 two Turkish armies advanced southwards: one, under Omar Vrioni, along the coast of western Hellas, the other, under Ali, pasha of Drama (Dramali), through Boeotia and Attica. Omar was held in check by the mud ramparts of Missolonghi; but Dramali crossed the Isthmus and with the over-confidence of a conquering barbarian advanced to the relief of the hard-pressed garrison of Nauplia. He crossed the perilous defile of Dervenaki unopposed; and at the news of his approach most of the members of the Greek Government assembled at Argos fled in panic terror. Demetrios Ypsilanti, however, with a few hundred men joined the Mainote Karayanni in the castle of Larissa, which crowns the acropolis of ancient Argos. This held Dramali in check, and gave Kolokotrones time to collect an army. The Turks, in the absence of the fleet which was to have brought them supplies, were forced to retreat (Aug. 6); the Greeks, inspired with new courage, awaited them in the pass of Dervenaki, where the undisciplined Ottoman host, thrown into confusion by an avalanche of boulders hurled upon them, was annihilated. In western Greece Omar Vrioni stoutly opposed and was forced to abandon the siege of Missolonghi and retire northwards.

Civil War Among the Greeks.—The victorious outcome of the year's fighting had a disastrous effect upon the Greeks. Their victories had been due mainly to the guerilla leaders; Mavrocordato, whose character and antecedents had marked him out as the natural head of the new Greek state, in spite of his successful defence of Missolonghi, had been discredited by failures elsewhere, and the Greeks thus learned to despise their civilized advisers and to underrate the importance of discipline. The temporary removal of the common peril let loose all the sectional and personal jealousies and the year 1823 witnessed the first civil war between the Greek parties. These internecine feuds might easily have proved fatal to the cause of Greece. All semblance of discipline and cohesion had vanished from the Greek fleet. Had Khosrev, the new Ottoman admiral, been a man of enterprise, he might have regained the command of the sea and, with it, that of the whole situation. But the fate of his predecessor had filled him with a lively terror of Kanaris and his fireships; he contented himself with a cruise round the coasts of Greece. On land the Turks gained some initial successes, but in the end the harassing tactics of the guerilla bands forced them back northwards. At the end of the year the Greeks were once more free to renew their internecine feuds. Just when these feuds were at their height, in January, 1824, the most famous of the Philhellenes who sacrificed themselves for the cause of Greece, Lord Byron, arrived at Missolonghi. The year was destined to be a fateful one for the Greek cause. The large loans raised in Europe, while providing the Greeks with the sinews of war, provided them also with fresh material for strife. To the struggle for power was added a struggle for a share of this booty, and a second civil war broke out, Kolokotrones leading the attack on the forces of the Government. Early in 1825 the Government was victorious and Kolokotrones was in prison.

Intervention of **Mehemet Ali.**—A new and more terrible danger now threatened Greece. Sultan Mahmud, despairing of suppressing the insurrection by his own power, had reluctantly sumnianed to his aid Mehemet **Ali,** pasha of Egypt, whose well equipped fleet and disciplined army were now thrown into the scale against the Greeks. Crete, subdued a year previously, now became the base of operations against the Greeks. On June 19, the Egyptian fleet, under Ibrahim Pasha, sailed from Alexandria. Khosrev, too. emboldened by this new sense of support, ventured to sea, and although his attack on Samos was frustrated by Miaoulis's fireships, he succeeded in joining Ibrahim off Budrun; two indecisive engagements followed with the united Greek fleet on Aug. 5 and 10. The object of Ibrahim was to reach Suda Bay with his transports, which the Greeks should at all costs have prevented. A first attempt was defeated by Miaoulis on November 16, but the Greek admiral was unable to keep his fleet together, thus leaving the sea unguarded. Ibrahim again set sail, and reached Suda without striking a blow. Here he completed his preparations and, on February 24, 1825, landed at Modon in the Morea with a force of 4,000 regular infantry and 500 cavalry. The rest followed, without the Greeks making any effort to intercept them. The conditions of the war were now completely changed. The Greeks, who had been squandering the money provided by the loans, affected to despise the Egyptian invaders, but they were soon undeceived. Ibrahim had laid siege to Navarino, and after some delay a Greek force of some 7,000 very mixed men was sent to its relief. On April 19 they were met by Ibrahim at Krommydi with 2,000 regular infantry, 400 cavalry and four guns. The Greek entrenchments were stormed at the point of the bayonet by Ibrahim's fellahin at the first onset and the defenders broke and fled. The news of this disaster, and of the fall of Pylos and Navarino that followed, struck terror into the Greek Government; and in answer to popular clamour Kolokotrones was taken from prison and placed at the head of the army. But his guerrilla tactics were powerless against Ibrahim, who marched northward, seized Tripolitsa and made this the base from which his columns marched to devastate the country far and wide.

Reshid "Kutahia" Besieges **Missolonghi.**—Meanwhile from the north the Ottomans were making another supreme effort. The command of the army that was to operate in west Hellas had been given to Reshid "Kutahia," pasha of Iannina, an able general and a man of determined character. On April 6, after bribing the Albanian clansmen to neutrality, he passed the defile of Makrynoros, which the Greeks had left undefended, and May 7 opened the second siege of Missolonghi. For twelve months the population held out, repulsing the attacks of the enemy, refusing every offer of honourable capitulation. This resistance was rendered possible by the Greek command of the sea, Miaoulis from time to time entering the lagoons with supplies; it came to an end when this command was lost. In Sept. 1825 Ibrahim, at the order of the sultan, had joined Reshid before the town; piecemeal the outlying forts and defences now fell, until the garrison staked all on a final sortie. This took place on the night of April 22, 1826; but a mistaken order threw the ranks of the Greeks into disorder. The Turks entered the town pell-mell with the retreating crowd.

Karaiskakis.—The fall of Missolonghi, followed as this was by the submission of many of the more notable chiefs, left Reshid free to turn his attention to east Hellas, where Gouras had been ruling as a practically independent chief and in the spirit of a brigand. The peasants of the open country welcomed the Turks as deliverers and Reshid's conciliatory policy facilitated his march to Athens, which fell at the first assault on Aug. 25, siege being at once laid to the Acropolis, where Gouras and his troops had taken refuge. Round this the war now centered; for all recognized that its fall would involve that of the cause of Greece. In these straits the Greek Government entrusted the supreme command of the troops to Karaiskakis, an old retainer of Ali of Iannina, a master of the art of guerilla war, and, above all, a man of dauntless courage and devoted patriotism. A first attempt to relieve the Acropolis, with the assistance of some disciplined troops under the French Col. Fabvier, was defeated at Chaidari by the Turks. The garrison of the Acropolis was hard pressed and the death of Gouras (October 13) would have ended all, had not his heroic wife taken over the command and inspired the defenders with new courage. For months the siege dragged on, while Karaiskakis fought with varying success in the mountains, a final victory at Distomo (February 1827) over Omar Vrioni securing the restoration to the Greek cause of all continental Greece, except the towns which were actually held by the Turks.

Cochrane and Church.—It was at this juncture that the Greek Government, reinforced by a fresh loan from Europe, handed over the chief command at sea to Lord Cochrane (earl of Dundonald) and that of the land forces to General Church, both Miaoulis and Karaiskakis consenting to serve under them. Cochrane and Church at once concentrated their energies on the task of relieving the Acropolis. Already, on February 5, Gen. Gordon had landed and entrenched himself on the hill of Munychia, near the ancient Piraeus. When Church and Cochrane arrived, a general assault on the Ottoman camp was decided on. This was preceded, on April 25, by an attack, headed by Cochrane, on the Turkish troops established near the monastery of St. Spiridion, the result of which was to establish communication between the Greeks at Munychia and Phalerum. The monastery held out for two days longer, when the Albanian garrison surrendered on terms, but were massacred by the Greeks as they were marching away under escort. For this miserable crime Church has, by some historians, been held responsible by default; it is clear, however, from his own account that no blame rests upon him *(see* his MS. *Narrative,* vol. i. chap. ii. p. 34). The assault on the Turkish main camp was fixed for May 4; but, unfortunately, a chance skirmish brought on an engagement the day before, in the course of which Karaiskakis was killed, an irreparable loss in view of his prestige with the wild *armatoli.* The assault on the following day was a disastrous failure. The Greeks, advancing prematurely over broken ground and in no sort of order, were fallen upon in flank by Reshid's horsemen and fled in panic. Church held Munychia till the 27th, when he sent instructions for the garrison of the Acropolis to surrender. On June 5 the remnant of the defenders marched out with the honours of war, and continental Greece was once more in the power of the Turks. Had Reshid at once advanced over the Isthmus, the Morea also must have been subdued; but he was jealous of Ibrahim and preferred to return to Iannina to consolidate his conquests.

Renewed Anarchy.—The fate of Greece was now in the hands of the Powers, who after years of diplomatic wrangling had at last realized that intervention was necessary if Greece was to be saved for European civilization. The worst enemy of the Greeks was their own incurable spirit of faction, and a third civil war had only been prevented by the arrival of Cochrane and Church. Under their influence a new National Assembly met at Troezene in March 1827 and elected as president Count Capo d'Istria (*q.v.*), formerly Russian minister for foreign affairs; at the same time a new constitution was promulgated which, when the very life of the insurrection seemed on the point of flickering out, set forth the full ideal of Pan-Hellenic dreams. Anarchy followed; war of Rumeliotes against Moreotes, of chief against chief; rival factions bombarded each other from the two forts at Nauplia over the stricken town, and in derision of the impotent government. Finally, after months of inaction, Ibrahim began once more his systematic devastation of the country. To put a stop to this the Powers decided to intervene by means of a joint demonstration of their fleets, in order to enforce an armistice and compel Ibrahim to evacuate the Morea (Treaty of London, July 6, 1827). The refusal of Ibrahim to obey, without special instruction from the sultan, led to the entrance of the allied British, French and Russian fleet into the harbour of Navarino and the battle of October 20, 1827 *(see* NAVARINO). This, and the two campaigns of the Russo-Turkish War of 1828–29, decided the issue.

BIBLIOGRAPHY.—There is no trustworthy history of the war, based on all the material now available, and all the existing works must be read with caution, especially those by eye-witnesses, who were too often prejudiced or the dupes of the Greek iactions. The best-known works are: G. Finlay, *Hist. of the Greek Revolution* (2 vols., London. 1861); T. Gordon, *Hist. of the Greek Revolution* (London, 1833); C. W. P. Mendelssohn-Bartholdy, *Geschichte Griechenlands,* etc. *(Staatengeschichte der neuesten Zeit)* (2 vols., Leipzig, 1870–74); F. C. H. L. Pouqueville, *Histoire de la rtgtntration de la Grèce,* etc. (4 vols., Paris, 1824),—the author was French resident at the court of Ali of Iannina and afterwards consul at Patras; Count A. Prokesch-Osten, *Geschichte des Abfalls der Griechen vom tiirkischen Reich,* etc. (6 vols., Vienna, 1867), the last four volumes consisting of *pièces justificatives* of much value. *See* also W. Alison Phillips, *The War of Greek Independence* (London and New York, 1897), a sketch compiled mainly from the above-mentioned works. Of great value also are the 29 volumes of Correspondence and Papers of Sir Richard Church, now in the British Museum (Add, mss. 36,543–36,571). For further reierences *see* the bibliography appended to W. Alison Phillips's chapter on "Greece and the Balkan Peninsula" in the *Cambridge Modern History,* x. 803.

(W. A. P.)

GREEK LANGUAGE. This term is commonly applied to the tongues of both ancient and modern Greece. These, however, differ so much that it is necessary to deal with them in separate sections.

Of both the alphabet is as follows:

Name	Sign	Conventional equivalent	Name	Sign	Conventional equivalent
Alpha	Α α	A	Nu	Ν ν	N
Beta	Β β	B	Xi	Ξ ξ	X
Gamma	Γ γ	G	Omicron	Ο ο	short O
Delta	Δ δ	D	Pi	Π π	P
			Rho	Ρ ρ	R
			Sigma	Σ σ ς	S
Epsilon	Ε ε	long E	Tau	Τ τ	T
Zeta	Ζ ζ		Upsilon	Υ υ	U
Eta	Η η		Phi	Φ φ	PH
Theta	Θ θ	Short E	Chi	Χ χ	CH
Iota	Ι ι	Z (DZ)	Psi	Ψ ψ	PS
Kappa	Κ κ	long E	Omega	Ω ω	long O
Lambda	Λ λ	TH			
Mu	Μ μ	I			
		K			
		L			

ANCIENT

Greek, one of the European languages, was spoken in one or other of its forms (dialects) in the Balkan peninsula on the west coast of Asia Minor, in south Italy and Sicily and in the islands of the Ionian and Aegean seas. By the fourth century B.C. the political supremacy of Athens and the greatness of Attic literature had caused the Attic dialect to become the basis of a *lingua franca* for all Greeks, which in the long run superseded the other dialects. The conquests of Alexander the Great caused Greek (in the form of this *lingua franca* or *κοίνη* to become the speech of the whole Near East (Asia Minor, Syria, Mesopotamia, Egypt). Under the Romans these regions continued to use Greek, and at the present day Russians and Serbians use a modified form of the Greek alphabet.

Authenticity of Our Texts.—Documents written in Greek have reached us, some in the originals, others in copies. The *originals* are: (a) inscriptions, decrees, treaties, temple inventories dedications, etc., engraved on stone and found in Greece and all over the Near East; the earliest may date from the eighth century B.C. and they become numerous in the fifth and later

centuries; (b) documents (letters, contracts, petitions, accounts, etc.) written on papyrus between the late fourth century B.C. and the eighth century A.D., and preserved by the dry sands of Egypt, from which the excavations, mainly of the end of the 19th and beginning of the 20th century, have brought them to light in large numbers (see PAPYROLOGY). Papyri have not been recovered from other parts of the Greek-speaking world (except at Herculaneum, where they nere buried by the eruption of Vesuvius in A.D. 79), but legal documents written on vellum in the second and first centuries B.C. have been found at Sâlihîyeh (the ancient Dura-Europos, in Mesopotamia), and at Avroman (Parthia).

The copies, on which we rely for our knowledge of almost all Greek literary works, are written at first on papyrus, and later on vellum or paper. For long the oldest known Greek mss. were those containing the Greek Bible, written on vellum and dating from the 4th and 5th centuries A.D., and the texts of other Greek works rested on vellum (later paper) mss. which were (in general) not older than the 9th and 10th centuries A.D. These remain the broadest basis of our knowledge, but recent excavations have brought to light papyrus mss., some mere scraps, others very substantial rolls or books, of Homer and other classical texts, a few of them written in the 3rd, 2nd and 1st centuries B.C., and many of them in the earliest centuries of the Christian era. In a number of cases we have recovered papyrus copies of works which had perished, no copies having reached us in mediaeval mss. (see GREEK LITERATURE).

Important accessions to our knowledge of the language, its pronunciation, spelling and vocabulary, have resulted from the recovery of so many well-authenticated texts. So long as the mediaeval copies were the only source of our knowledge it was impossible to have much confidence in the spelling which they offered, and certain variations which they exhibited, *e.g.* the variation between ει and ι (*τειμή-τιμή*; *ἀποτεῖσαι-ἀποτῖσαι*, etc.) presented a little understood problem. Moreover, the grammatical treatises of Herodian (2nd century A.D.), Choeroboscus (6th century A.D.) and others, show that these problems presented themselves already in the early centuries of the Christian era; these grammarians drew up lists of words recommending particular spellings in doubtful cases. It remained doubtful, however, how far the grammarians could be regarded as knowing the truth or as providing a trustworthy criterion for the correction of the mss.

The inscriptions and papyri often provide evidence which settles once and for all a disputed question of spelling. They often carry us back to a time when speech-sounds which later became identical were still distinct from one another. For instance, the inscriptions and papyri of any date earlier than about 150 B.C. are almost wholly free from the hesitation between ΕΙ and ι. They have ΕΙ without exception in certain words (*e.g.* *ἀποτεῖσαι* "to pay") and ι without exception in certain others (*e.g.*, *τιμή*). Before 150 B.C. (approximately) the two spellings represented distinct sounds; after 150 B.C. the sounds were identical; and the spellings ει and ι were interchangeable. Again the Greek of the 3rd century B.C. possessed the long diphthongs αι ηι ωι (the spelling ᾳ ῃ ῳ is not older than the 12th century A.D.). From the end of the and century B.C. they are written a η *w* without the iota. The uniformity with which this happens, and the appearance of the iota in the wrong place (spellings like ἄνωι for ἄνω are frequent) shows that the iota, which must have been pronounced in the 3rd century B.C., had ceased to be pronounced in the 1st century B.C., and was sometimes added in writing by persons who thought (rightly or wrongly) that they knew the older spelling. At least one erroneous restoration of iota has been perpetuated. Where our mediaeval mss. (even the most accurate of them) and late inscriptions give us *ῥαιθυμεῖν*, the papyri of the 3rd century B.C. have *ῥαθυμεῖν* (without iota), which must be the original and only correct spelling. Unlike *ῥᾴδιος*, the word can never have been pronounced with an iota. Many of the inscriptions and still more of the papyri are written by persons of little education, whose spelling tends to be phonetic; their very errors throw light on the pronunciation. One instance must suffice: the word *ἑαυτοῦ* in inscriptions and papyri of the 1st century B.C. is often written *ἑατοῦ*, whereas *αὐτοῦ* is not written *ἀτοῦ*. The reason is that *ἑαυτοῦ* was pronounced at first *ἑᾶυτοῦ* (being derived by contraction from *ἑο αὐτοῦ* like the Ionic *ἑωυτοῦ* which has a different type of contraction) later *ἑᾶτοῦ*. By the study of such spelling-variations the chief changes in the pronunciation of Greek can be dated with considerable accuracy. Many of the changes which mark the passage from ancient to modern Greek took place in the three or four centuries preceding and the three or four centuries following the Christian era. The language of the period (2nd century A.D.) in which Herodian spoke and wrote was already so different from Attic that his spelling-rules must be assumed to be based not on observation of contemporary pronunciation (it was in fact the divergence between this and the traditional spelling which made spelling-rules a necessity) but on antiquarian research, and in this field the modern investigator has the advantage over him.

Nature of the Tradition of the Accents.—Greek texts, whether on stone, papyrus, vellum or paper, are usually written without spaces between the words, and the continuous use of breathings and accents is found only in mediaeval mss. from the 9th century onwards. Inscriptions (with rare exceptions) and non-literary papyri are entirely without breathings and accents. The same is often true of literary papyri, but these are sometimes more or less sporadically marked with breathings and accents, esgecially if epic, dramatic or lyric texts. The accentuated literary papyri are in the main not older than the opening centuries of our era. On the other hand, the features of pronunciation of which breathings and accents are the written signs are more ancient than the use of the signs. From numerous references in Greek authors, and especially from Apollonius Dyscolus and his son Herodian, who wrote in the 2nd century A.D., we learn many details of the accentuation of Greek, which was a variation of pitch; the syllable marked with the acyte accent was high-pitched, the others, those which in the printed books are marked with the grave accent or with no mark at all, were spoken on the low pitch, while circumflexed syllables, were spoken on a descending pitch, the first part of the syllable being higher than the second. Such is the most probable inference from the statements of grammarians and certain other evidence (*e.g.* the marks found in accented papyri, and the scanty remains of Greek music), though several points are still disputed.

The general accuracy, and at the same time the great antiquity, of the traditional accentuation of Greek in modern printed editions may be proved by means of a comparison between it and the accentuation of Vedic Sanskrit; the two exhibit a number of striking coincidences which point to an unbroken oral tradition in both cases from the hypothetical parent "Indo-European." In 1876 Karl Verner demonstrated that certain consonant changes in Germanic could be explained if the position of the accent thus observed in Greek and Sanskrit were admitted to have existed at one time in Germanic also. The antiquity of the distinction between the acute and the circumflex has been demonstrated by a comparison with the accentuation of modern Lithuanian, in which a corresponding distinction has been observed.

The breathings and accentual marks found in our text of a classical author, such as Plato, cannot have been copied, even at many removes, from his autograph: Plato cannot have written more than the bare series of letters forming the words. It is, however, clear that he pronounced an h or a high pitch even when he did not put it down in writing, and that those who, in transmitting his text to us, inserted the breathings and accentual marks (in the main Byzantine scholars of the 9th century) were guided by contemporary living speech (the position of the accent is in general still the same in Modern Greek), and by antiquarian knowledge to a very large measure of success.

Varieties of Early Greek.—The language of the inscriptions from the 7th to the 4th century B.C. presents varieties of two kinds, varieties of alphabet and spelling, and varieties of dialect.

(1) Varieties of alphabet and spelling. The Greek alphabet is an adaptation of the Semitic alphabet, and differs according

to locality and date. One of these differences throws much light on the language, viz., the varying mode of representing ε sounds and o sounds.

The contraction of ε+ε (ĕ+ĕ) must obviously have resulted, to begin with, in a long ē, and similarly the contraction of o+o must have given ō. Hence EL in the 4th century Attic (and later Greek) form ἐπεστάτει (from ἐπεστάτε-ε) must have been pronounced from the beginning not as a diphthong, but as a long ē, and similarly the ου of μισθοῦμεν (from μισθόομεν) must have been from the first pronounced ō, not as a diphthong ου. In the oldest inscriptions these sounds are in fact written ε and o (επεστατε, μισθομεν). When ει and ov are thus demonstrably monophthongs, they are called "spurious diphthongs."

In the local Attic and many other alphabets there was no vowel-symbol η (H), and no ω (Ω). In such alphabets E had to represent three sounds, viz., ε (as in φέρω), I (as in ἐπεστατε) and the other kind of ē which was written η when that letter was introduced (ανεθεκε, later ανεθηκε). Similarly o had to represent o (in φερομεν), ō (in μισθομεν) and the other ō which was later written ω (δορον later δῶρον).

But ει and ου are not always spurious diphthongs. In εἶμι ("I shall go") the EL is, in origin at least, a diphthong (Lith. *einù*, "I go," Lat. eo from ei-o through *e[y]-o*, *i-tur* from *ei-tur;* Gr. ἴμεν shows the i-element bereft of the e). In εἰλήλουθα the υ is the same as in ἤλυθον, so that ου is here in origin a genuine diphthong. In early inscriptions, ει and ου are in certain words fixed and not capable of alternating with ε and o. Thus εἶπε, δοκεῖ (from δοκέ-ει), πρεσβεία, πειθομένοις, ἔπει (Dat. of ἔπος), ἐπεί ('(when"), εἰ, ἀτέλεια, οὐκ, οὐδένος, are constant spellings, of course without accents even in an inscription (Dittenberger, Sylloge[3] 64), which has only ε and o in place of the later "spurious diphthongs" (ἓναι, τρῆς, τῶ δέμο, τῶ Διὸς, 73 Ὀλυμπίο, οἰκοῦντες, etc.). Thus the early inscriptions sometimes yield information attainable in no other way, *e.g.* they tell us that οὐκ, οὗτος, εἶπε and φέρεις φέρει have genuine diphthongs.

The spurious diphthongs sometimes owe their origin to what is known as "compensatory lengthening." Just as the long ā in πᾶς arises from a lengthening of the ă in *πάνς (from *παντ-ς *cf.* Genitive παντ-ός) to compensate for the loss of the v, so the nominative *τιθέντ-ς became *τιθένς and then τιθεῖς, which is written τιθες on the older inscriptions, τιθεὶς in later Attic, and τιθής in some other dialects.

At the end of the 5th century B.C. the local Ionic alphabet, which possessed the vowel signs η and ω in addition to ε and o, began to supersede the other Greek alphabets. It was officially adopted at Athens in place of the Attic alphabet in 403 B.C., and by the end of the 4th century it was in general use throughout Greece.

The ē and ō which resulted from contraction and compensatory lengthening were not everywhere written in the same way in the 4th century B.C. In some dialects we find not τελεῖτε, τιθεὶς, διδούς, but τελῆτε, τιθής, διδώς. Within the Doric area both spellings are found (*e.g.* in some places ἦμεν, in others εἶμεν, from *es*-men, infinitive of the verb "to be"). The difference is perhaps one not of pronunciation, but only of spelling.

The distinction between genuine and spurious diphthongs shows itself even after general adoption of the Ionic alphabet in the case of contractions with a preceding vowel; *e.g.* ὁράεις ὁράει, which have the genuine ει, become ὁρᾶις ὁρᾶι (ὁρᾷς ὁρᾷ in mediaeval mss.), but ὁράειν, which has the spurious EL, becomes ὁρᾶν. Similarly in οὐκέθ' ὁμῶς τιμῆς ἔσεαι (Il. 9, 605), τιμῆς is the contracted form of τιμήεις, which has the spurious ει (τιμη-[ϝ]εις from -ὲεντ-ς *cf.* gen. -εντ-ος, Sanskrit *-vant-*). In Il. 3, 13, where the mss. have κονίσαλος ὤρνυτ' ἀελλὴς, Buttmann's conjecture, that the last word is a contraction of ἀελλήεις ('eddying," involves only a change of accent (to ἀελλῆς): it would be a mistake to write, as he proposed, ἀελλῆς.

The study of the ancient Greek language is based on written documents and the textual critic seeks to restore and interpret the actual letters of the autograph, in cases where this autograph has not reached us.

The mediaeval mss. offer texts written in the Ionic alphabet, and in a spelling which, at its most accurate, is that of the 3rd century B.C., but more often shows signs of the passing of the centuries between that date and the 9th and 10th centuries A.D. The spelling of the 3rd century B.C. is clearly not appropriate to authors who wrote in the 5th century B.C. (especially the beginning of it), or earlier; in the case of Homer the composition of the poems was earlier than the knowledge of writing in Greece.

Many of the great Athenians (Sophocles, Euripides, Aristophanes, Thucydides) wrote in the secondhalf of the 5th century. They may well have used the Ionic alphabet, which inscriptions prove to have been used at Athens some decades before 403 B.C. Aeschylus, who wrote in the first half of the 5th century, is more likely to have used the Attic alphabet, employed in fragments of the earlier lyrics which are painted on Attic vases of the 6th and 5th centuries. The old spellings may well have survived longest in the case of the oldest books (Homer, Hesiod, Theognis, Alcman, etc.).

The study of the Homeric poems from this point of view has led to tangible results. In the older alphabets of Greece, ε and ϝ as already mentioned, can stand for ē and ā ("spurious" ει and ov), and a single consonant is written where the later practice is to write it double (ἀλογλωσος = ἀλλογλώσσους). Both features are to be seen in τειχιοσης (= Τειχιούσσης) in a Milesian inscription of the 6th century B.C. In the line καιροσέων δ' ὀθονέων ἀπολείβεται ὑγρὸν ἔλαιον (Od. 7. 107) καιροσέων is the archaic spelling of καιρουσσέων, a word which was so rare that the rhapsodes of the 6th century did not understand what they found in their written texts of Homer. In this way the spelling escaped modernization. The word ἀνηρείψαντο which is given by our mss. of Il. 20, 234 is a mistake for ἀνηρέψαντο as we now know from the forms ἀ[να]ρέψατο in a Paean of Pindar and ἀναρεψαμένη in mss. of Hesiod (Theog. 990). In Il. 7, 434 ἔγρετο means '(gathered, assembled," and is the archaic spelling of the aor. of ἀγείρω (later written ἤγρετο). It was mistaken for the aor. of ἐγείρω (ἔγρετο "arose") and to this mistake it owes its preservation. In Il. 5, 293: αἰχμὴ δ' ἐξελύθη ('came out") παρὰ νείατον ἀνθερεῶνα the poet clearly meant ἐξέλυθε, the unaugmented form corresponding to the augmented ἐξήλυθε; because it resembled the aorist passive of ἐκλύω and because the metre demanded a long vowel in the last place, it became ἐξελύθη.

The two instances just given (ἔγρετο, ἐξελύθη) show us a Homer written in an alphabet which possessed no H, but used E instead.

Certain other indications point to a time when the poems existed only in oral transmission and had not yet been written down. Bentley showed that many irregularities in the metre vanished when once it was admitted that at the time of the composition of the poems the language possessed the sound w (written ϝ in dialect-inscriptions, but nowhere written in our mss. of Homer).

The traces of this sound consist of lengthenings of a preceding vowel (*e.g.*, κᾱλός is really καλϝός—this form occurs in a Boeotian inscription of the 7th century B.C.), and of cases of hiatus (*e.g.*, ὅπα ἀρνῶν Il. 4, 435—the dialect inscriptions have ϝαρήν, ϝαρνός).

Bentley's observations were true, but more recently it has been recognized that some lines in the poems may have been composed when the w-sound was already lost from the language. It is probable that the composing of the poems extended over a long period, within which the w ceased to be pronounced.

In Il. 24, 154 ὅς ἄξει is defective both metrically and in point of sense; the parallel ὅς a' ἄξει (line 183) shows that the poet meant in 154 8s ϝh' ἄξει, where ϝhε is the older form of the Attic ἑ (Doric ϝε and Pamphylian ϝhε are found in inscriptions). Such cases (there are several of them) bring out clearly the reality of the sound w in Homer. In a number of other respects the spelling which we find in our mss. of Homer can be shown to be unoriginal. The first person plur. subj. of ἔστην is written στείομεν (Il. 15, 297), instead of στήομεν as the analysis requires (the root is στᾱ, *cf.* Lat. *stāre*, which gives Ionic στη-, and the sign of the subjunctive in unthematic verbs is a short -o- or -ε-). The later Ionic form στέωμεν (which arose by a regular

change of -ηο- to -εω- *cf.* βασιλῆος: βασιλέως) occurs in Il. 11. 348. The reciters found στεομεν in their written texts of Il. 15. 297, and lengthened the ε to ē (which they wrote ει, as we have seen), because, as the living form was στέωμεν, it did not occur to them that στεομεν was the old way of writing στήομεν. The group -go- thus came to be written -ειο- in many other words as well.

The word εἰνάτερες was believed by Herodian to be the plural of εἰνάτηρ. Inscriptions have proved however that the nominative sing. was ἐνάτηρ, and εἰνάτερες is the poet's arbitrary way of modifying the word ἐνάτερες in order to fit it into a hexameter. Here again, the lengthening of ε is expressed by the spurious diphthong, the introduction of which into the text can hardly be much older than the 4th century B.C. Other examples of ει and ου resulting from metrical lengthening are εἰν ἀγορῇ, Πειρίθοος, δουλιχόδειρος (for δολυχόδερϝος) οὐλόμενος, Οὐλύμποιο, and many others. The numerous forms of which ὀρόωντες, ὀράασθαι are specimens, in which the older do, ăε seem to have become ow and aā, have no parallel in dialect inscriptions. The poets (whether in writing or in oral composition) must have used the forms ὁράοντες, ὁράεσθαι. In the course of the transmission the later contracted forms ὁρῶντες, ὁρᾶσθαι tended to be substituted, but the metre compelled the reciters to "pull out" the contracted forms into ὀρόωντες and ὀράασθαι, by prefixing in each case to the long vowel (which resulted from the contraction) its short form (*o*, ***a***). Forms, such as ναιετάει, which did not survive (there was no ναιετῶ in later Greek), were not exposed to this modernizing tendency, and were left untouched.

Distinct from differences of alphabet and spelling are differences between the spoken forms of the language in different places, *i.e.*, differences of dialect. Our knowledge of the dialects is derived mainly from inscriptions of the 6th, 5th, 4th and 3rd centuries B.C.; from the time of the Athenian supremacy the Attic dialect begins to supersede the others, so that many documents show a mixture of non-Attic and Attic elements. In later centuries there were revivals of the use of dialects in inscriptions, but their artificial character is proved by the presence in them of forms which earlier inscriptions show to have been long obsolete, *e.g.* ῥαψάϝυδος (=ῥαψῳδός) in a late Boeotian inscription, whereas earlier Boeotian inscriptions indicate that ϝ between vowels had long been lost. The literary documents written in dialect are often of larger compass than the inscriptions, and therefore in some ways more instructive, especially for the vocabulary; but the variations in the manuscript tradition (*e.g.*, of Hippocrates and Herodotus) constitute a difficulty which only the inscriptions can help us to overcome. The inscriptions have in fact enabled us to pick our way with greater certainty among the variants, and to detect (for instance) the fact that the consistent absence of the so-called ν ἐφελκυστικόν from our mss. of Herodotus is not a feature of the Ionic dialect, but is the result of unintelligent editing by some unknown ancient critic; the Ionic inscriptions have this ν in even greater profusion than the Attic (Ion. ἐποίειν where Att. has ἐποίει).

The main dialect divisions are: (1) Ionic, of which Attic is a sub-dialect; (2) Aeolic; (3) Arcadian and Cyprian; (4) Doric. In the 6th and 5th centuries B.C. the local distribution was as follows: Ionic was spoken in the central part of the coast of Asia Minor, in many of the Aegean islands, in Euboea and the Chalcidian peninsula, and (in its Attic form) in Attica. Aeolic is the collective name of the dialects spoken in the northern part of the Asiatic coast (Aeolis) including Lesbos, and (with a Doric admixture) in Thessaly and Boeotia. Arcadian and Cyprian are named from the places in which they were spoken; the recognition of their close resemblance in spite of the great distance between them was one of the surprises which resulted from the discovery of Arcadian and Cyprian inscriptions and of the deciphering of the Cyprian syllabary in the '70s and '80s of the 19th century. Lastly Doric in many varieties was spoken in the Peloponnese (except Arcadia) in north-\vest Greece (Locris, Phocis, Epirus) in the more southerly Aegean islands, especially Thera, Crete, Cos, Rhodes, and on the neighbouring part of the Asiatic coast.

Colonists took with them the dialect of the mother-city; we find Ionic spoken in several Milesian settlements on the Black sea coast, and Doric in Syracuse and other Doric foundations in Sicily and south Italy.

Such, in outline, is the geographical distribution of the Greek dialects at the period when they become known to us. For an earlier period we have to rely mainly on the evidence of Greek historians (especially Herodotus and Thucydides). From them we learn that there was in early times a migration from Epirus into the Aeolic land of Thessaly, which drove before it another migration from Thessaly into Boeotia. At the time of the Trojan War, according to Thucydides, the later Boeotians were not yet in Boeotia. From Herodotus, Strabo and Pausanias, we learn of the former presence of Ionians in Cynuria, and on the shores of the Saronic gulf. The resemblance between the land-enclosed Arcadian dialect and the distant Cyprian is less surprising when we find that Arcadian was at one time spoken as far south as the promontory of Taenarum. This is proved by the name of the festival to Poseidon which was celebrated there, viz., Πο*h*οιδαια. The dialect of Taenarum in historical times was Laconian (Doric), in which σ between vowels had become h. Accordingly Πο*h*οιδαια is the Laconized form of Ποσοιδαια, and an Arcadian inscription proves that Ποσοιδαν was the Arcadian name of the god. It may be inferred that Arcadian was once spoken throughout the Peloponnese and perhaps over a still wider area, before it was overwhelmed and shut in by the Dorian migration.

Greek and **the Other** Indo-European Languages, — The dialects show considerable differences from one another in respect of sounds, inflexions, syntax and vocabulary, and the comparison of the dialects with one another often throws light on the past, enabling us to reconstruct an earlier condition of the Greek language. In this reconstruction use is made at the same time of a comparison with the other Indo-European languages. In what follows an attempt will be made to indicate briefly some of the more important sound-changes to which Greek owes its differences from the other languages.

Of the consonants which the parent speech had, Greek has lost inter-vocalic y and s; Sanskrit *tráyas* "three" and Greek (Cretan) τρέες are both descended from Indo-Eur. *trĕyĕs;* Sanskrit *tras-ati* "trembles" and Greek rpt-w come from tres-. At the beginning of a word both y and s became h: ὅς (rel. pron.) corresponds to Sanskrit yas (Indo-Eur. yos), and the article ὁ to Sanskrit sa (Indo-Eur. so). Sometimes *y* became ζ (Sanskrit *yug-*dm, Gr. ζυγόν). The earliest records of many dialects show a complete loss of the sound w (*e.g.*, ὄϊς [ofs] from Indo-Eur. *owis*, cf. Lat. ovis) but other dialects retain this sound (which is written ϝ [digamma]), *e.g.*, ὄϝινς (accus. plur.) is found in an Argive inscription of the 5th century B.C.

The loss of these three sounds often left two vowels standing next one another in a word; this was at first tolerated, but later led to contraction into a single vowel. These contractions occurred in the main after the composition of the Homeric poems, and the method of contraction difiers in different dialects. Hence forms like ναιετάει in Homer, and the contrast between (*e.g.*) Att. τιμῶ, τιμᾷ and Dor. τιμῶ, τιμῇ or between Att. φιλῶ and Ion. φιλέω.

In combination with liquids and nasals y, *s* and w often caused a lengthening of the preceding vowel before disappearing; ἔτεινα (pronounce ἔτ̄ηνα) arose from ἔ-τεν-s-α, τείνω (pron. τ̄ηνω) from τεν-yω, Ion. ξεῖνος (pron. ξ̄ηνος) from ξένϝος (πρόξενϝος occurs in an inscription). Here too, the dialects diverge; the details are too complex to be enumerated here.

A y following a guttural, dental or labial stop combined with it into a single sound: φυλακ-yω became φυλάσσω, μεθ-yος (*cf.* Lat. *medius*, Sanskrit madhyas) became μέσσος and then μέσος, μεγ-γων became μέζων (Ion.), χαλεπ-yω became χαλέπτω.

A nasal before σ (which generally arose, as in μέσος, from a dental +*y*, sometimes from a dental +*s*) disappeared in most dialects (*e.g.*, Att. πᾶσα from πάνσα, τιθεῖσα from τιθένσα) leaving behind it a lengthened vowel. Some dialects, however,

retained the -νσ- combination (Arc. πάνσα).

When the numerous long vowels which arose from contraction and from compensatory lengthening are left out of account, the remainder of the Greek vowels are found to be, in the main, survivals from the parent speech: e.g., μάτηρ (Dor. etc.), Lat. māter; δῶρον, Lat. dō-num; (ϝ)ίς, Lat. vīs; μῦς, Lat. mūs; πλῆ-το, Lat. plē-nus; ἄγω, Lat. ago; ὄ(ϝ)ις, Lat. ovis; φέρω, Lat. fero; sometimes when most of the languages agree in ă (πατήρ, pater, etc.) Sanskrit has ĭ (pitar-); in such cases the parent-form is believed to have had an indistinct vowel like the first o in potato.

Indo-Eur. t, p, d, b have survived unchanged in Greek (some instances will be found among the words already quoted). Sanskrit has the sounds dh, bh; these go back to Indo-Eur. dh, bh, which have yielded Greek θ, φ (pronounced like t, p, in the Irish pronunciation of English), e.g., Sanskrit bhar-, Lat. fero, Greek φέρω, Sanskrit dadhdmi, Lith. di-ti (infin. "to lay"), Greek τίθημι.

The Indo-Eur. gutturals are of two kinds, technically called palatals and labio-velars.

The palatals appear in Greek as κ, γ, χ, in Latin as c, g, h, and as gutturals in Celtic and Germanic: e.g., κύων, Lat. canis; tiyw, Lat. ago; χιών, Lat. hiems. In the Eastern group of Indo-Eur. languages (Indo-Iranian, Armenian, Slavonic and Baltic) they appear as sibilants, e.g., Sanskrit śvā (stem Sun) "dog," ajati "he drives," himàs "frost, snow," Lith. Sun- "dog," žiemà and Slav. zima "winter."

The labio-velars were sounds of the qu or kʷ type. They survive more or less clearly in Latin quis, ni-n-guit. In some languages they drop the u or w element, and become k, g and gh (so in Sanskrit). Sometimes they appear as p, b; e.g., Oscan pis corresponding to Latin quis, Old Irish ben "woman" corresponding to English queen. In the Greek dialects they tend to appear before a and o vowels as labials (χ, β, φ) e.g., ποινή, Avestan kaēna "punishment," Lith. kaina "price" (all from Indo-Eur. kwoinā); -βόρος, Lat. -vorus, Sankr. -garáś "swallowing"; φόνος, Sanskrit ghanás (from Indo-Eur. gwhonos). Before e and i vowels they tend to appear as dentals, e.g., τίνω, τεῖσαι (from kwĭ-, kwei-, forms of the same root as in ποινή), τις, Lat. quis, θείνω, Sanskrit hanti "he kills," Hittite kuenzi "he kills" (Indo-Eur. gʷhen-ti, from the same root as φόνος, ἔπεφνε, πέφαται). In Aeolic the labials appear even before e-vowels, e.g., πήλοι "far," Att. τῆλε; Boeot. πέτταρες, Att. τέτταρες, Dor. τέτορες (cf. Lat. quatuor). Occasionally a labio-velar develops into a Greek guttural, often owing to the neighbourhood of u, e.g., βου-κόλος with the same ending as αἰ(γ)-πόλος, cf. Lat. colo, in-quil-inus; κύκλος, Lith. kãklas "neck," Eng. wheel; γυνή, Boeot. βανά, Eng. queen. The pronoun τις appears in Thessalian as κις; for πότερος, πῶς Herodotus has κότερος, κῶς.

The Greek πατράσι (dat. pl. of πατήρ) corresponds very closely (even in respect of the accent) to the Sanskrit Locative pitṛ́ṣu. In this, as in many Sanskrit words, r functions as a vowel. This "sonant" r as it is called, is descended from the same sound in the parent-speech. In the other langages the result is r preceded or followed by a short vowel: Greek ρᾰ or ἄρ, Lat. or, Lith. ir, Ger. ur, etc. The variation in the quality of the vowel is a sign that it has been separately developed in each language. The same phenomenon is observed in the case of l, m and n. So-nant m, for example, is observed in the word for 100, Indo-Eur. kmtom, Lat. centum, Lith. šimtas, Ger. hund; Greek ἑ-κατόν and Sanskrit śatám indicate that sonant m became a in these languages. The same ᾰ from m̥ or n̥ (to use the technical notation of these sounds) is found in πόδ-α from ποδ-m̥ (which has the same ending as the o-stem Zpyo-v [from-o-m], Lat. illu-m), and in γεγράφαται (from γεγράφn̥ται) which has the same ending as λέλυ-νται.

The Aeolic dialect has po and not pa in place of the sonant, e.g. στρότος and not στρατός from stṛtos.

BIBLIOGRAPHY.—*Texts.* A list of editions of Greek authors, inscriptions and papyri will be found in Pt. I (Oxford, 1925) of the 9th ed. of Liddell and Scott's Greek-English Lexicon (see below). For Facsimiles see PALAEOGRAPHY. *Grantmars.* The fullest reference work (it is not always up to date) is R. Kuhner's *Ausführliche Grammatik der griechischen Sprache*, 3rd ed. by F. Blass and B. Gerth, 1890–1904. For details of the spelling of Greek inscriptions and papyri the best works are K. Meisterhans, *Grammatik der attischen Inschriften* (3rd ed. by E. Schwyzer, 1900); W. Cronert, *Memoria Graeca Herculanensis*, Leipzig (1903) (compares the Herculaneum papyri with the other papyri, inscriptions and mss.); E. Mayser, *Grammatik der griechischen Papyri aus der Ptolemaerzeit* (esp. vol. I [Leipzig, 1906]; vol. 2 [1926] contains the syntax); H. St. J. Thackeray, *Grammar of the Old Testament in Greek*, I, Cambridge, 1909; J. H. Moulton, *Grammar of New Testament Greek*, vol. I (3rd ed.), Edinburgh, 1908; vol. 2, pts. i. and ii. revised by W. F. Howard, 1919, 1920; F. Blass, *Grammatik des Neutestamentlichen* Griechisch, 5th ed. by A. Debrunner, Gottingen, 1921. The language of Homer is treated in D. B. Monro, *Homeric Grammar*, 2nd ed. Oxford, 1891; J. Wackernagel, *Sprachliche Untersuchungen zu Homer*, Gottingen, 1916; K. Meister, *Die Homerische Kunstsprache*, Leipzig, 1921. The dialects are treated by C. D. Buck, *Introduction to the Greek Dialects* (grammar, texts, vocabulary, rev. ed. 1928) and by F. Bechtel, *Die Griechischen Dialekte*, 1921–24 (grammar only). A convenient collection of dialect-inscriptions is E. Schwyzer, *Dialectorum graecarum exempla epigraphic~potiora*, Leipzig, 1923 (with index). The relation of Greek to the other Indo-Eur. languages is studied in K. Brugmann, *Griechische Grammatik*, 4th ed. revised by A. Thumb, Munich, 1913, and in Brugmann and Delbruck's large Grundriss der vergleichenden Grammatik der Indogermanischen Sprachen, 2nd ed., Strassburg 1897–1916; more briefly in A. Meillet, *Introduction à l'étude comparative des langues indo-européennes*, 1908 (and later eds.). Lexicons. The Thesaurus Linguae Graecae of H. Stephanus (Henri Etienne), first published in 1572, was greatly enlarged by K. B. Hase and the brothers W. and L. Dindorf (Paris, 1831–65) and remains valuable, but does not cover the inscriptions and papyri. The vocabulary of the non-literary papyri is covered by F. Preisigke, Wdrterbuch der griechischen Papyrusurkunden, which was rapidly published at Berlin in 1924 and the following years. The papyri and inscriptions are included in the new (9th) ed. of Liddell and Scott's Greek-English Lexicon, revised and enlarged by H. Stuart Jones with the assistance of R. McKenzie and with the co-operation of many scholars, which is in course of publication. The New Testament vocabulary is treated in J. H. Moulton and G. Milligan's Vocabulary of the Greek Testament illustrated from the papyri and other non-literary sources (Pt. VI. carrying the work down to ῥώννυμι appeared in 1926). The best etymological dictionary is E. Boisacq, *Dictionnaire* dtymologique de la langue grecque, Heidelberg-Paris, 1916. For the numerous special lexicons, see H. Schone, *Repertorium griechischer Wörterverzeichnisse* und Speziallexika, Leipzig, 1907. (R. McK.)

MODERN

Apart from numerous differences in dialect, there are two broad types of language used in modern Greece, viz., the "pure," or καθαρεύουσα and the "popular," or δημοτική, to use the most dignified of the terms employed to distinguish them. The former is a conscious and artificial return to Ancient Greek, and is taught in schools, and used for official purposes and generally by newspapers; the latter is the natural language of the people, and embodies a good many foreign words which have crept into the language in the course of later Greek history. The "popular" is primarily a spoken language, that of the Greek songs and ballads, and as such has not a fixed orthography, but it possesses the force of a living language, and is largely employed by modern writers of poetry and fiction. Tendencies towards compromise may be observed between the "purist" and "popular" schools.

Phonetics.—One broad distinction between Ancient Greek and the modern language is that the ancient accent was a "pitch" or "musical" accent, the modern is a "stress" accent, so that if a line of ancient Greek poetry, say of Homer, is read aloud with the modern stress value assigned to the accented syllables, the rhythm is destroyed, and the modern Greek can only regain its effect by arbitrarily shifting the stress accent in such a way that the values of the ancient quantities are approximately reproduced.

This change in the effect, though not in the position, of the accent in Modern Greek has resulted in a levelling out of vowel values, although the ancient vowel forms are retained in writing, α is pronounced, continental fashion, as ah (father); ε as eh (led); η, ι, υ have all the same value -ee (see); ο and ω oh (cope). Of the diphthongs, αι is pronounced as ε; ει, OL, υι as η, etc.; ου as oo (brood); αυ as ahv, except before the hard consonants (κ, χ, τ, χ, φ, θ, σ), when it is pronounced ahf. Similarly ευ is pronounced as ev and ef respectively, ηυ as em and eef. The consonants approximate to the sounds of the corresponding English consonants, with these exceptions: β is pronounced as v; γ as hard

gh, except before ε, η, ι, υ, αι, ευ, οι, υι, when *it has the value c f y; when doubled or before* κ, *it has the value of ng; 6 is sounded as th (the),* φ *as f;* χ *as ch in Scotch loch, but before the vowels and diphthongs mentioned under* γ *it is soft, as in German ich;* ψ *has the value of ps. To express the equivalents of English b, d and hard g, Modern Greek uses pa,* ντ *and* γκ *respectively. In the middle of words, a after* μ *has a b sound, e.g.,* ἔμπορος = émboros; τ *after v ad sound, e.g.,* ἐντροπή = endropée. *The final v of the article and the initial a or τ of the following word also undergo a change of sound. Thus* τὸν πατέρα *tom batéra,* τὴν τέχνην *teem déchneen. The above are the main rules for pronunciation, though some refinements of minor importance for the English student are omitted. The accented syllable is strongly stressed, so much so that the beginner seems* only *to catch the accented syllable. The distinction between acute, grave and circumflex is immaterial for speaking, but is generally retained in writing after the manner of Ancient Greek. There is no aspirate in pronunciation, though the signs for rough and smooth breathing are retained in writing.*

Grammar. — *The "popular" language diverges from Ancient Greek far more than the "purist," both as regards forms and the* shifting of *accent. Full information can be obtained from some* of *the works mentioned in the Bibliography.*

Declension. — *Modern Greek has lost the dual. Except in the very "purist" style and in a few stereotyped phrases, it has also lost the dative case; in place of this, cis or* πρός *with the accusative, the accusative alone, or the genitive is substituted. For the genitive,* ἀπό *with the accusative is often used, or the simple accusative. As regards substantives in general, though the "purist" language practically follows the classical, the following features of the "popular" should be noted: words of the first declension ending in -a, -η, -as or -ης, have plural in -ες. In the second declension there is a tendency to favour neuters, e.g.,* τὸ χερί *for* ἡ χείρ. *In the third, Popular Greek adopts accusative singular of feminine nouns as nominative, e.g.* μητέρα, τρίχα, *etc., and the accusative plural of masculine nouns, e.g.,* πατέρας, γέροντας, *etc. Often masculine forms in this declension are shifted to* the second, *e.g., yipwv to* γέρος, γόνυ *to* γόνατον, *etc. Note also that the plural of nouns of the third declension are often augmented by a syllable, e.g.* παπᾶς, *priest, plural* παπάδες; παπουτζῆς, *shoemaker; plural,* παπουτζήδες.

Adjectives. — *"Popular" usage retains -η in the feminine after p and in words compounded with a- negative, e.g.,* ἄσπρη, ἄμορφη, *and prefers* uncontracted *adjectives, e.g.,* χρυσός *for* χρυσοῦς. *In forming comparatives* πλέον *is much used with the positive form. To express "than" after comparatives the following are used: genitive case,* ἤ *or* παρά *with nominative, or ha6 with accusative. To express superlatives, the definite article is used with the comparative form, e.g., 6* καλύτερος.

Pronouns. — *In case of* ἐγώ *and* σύ *note accusative singular* ἐμένα, ἐσένα *and genitive plural* μᾶς, σᾶς; *in* αὐτός *genitive singular* τοῦ, τῆς *and genitive plural* τῶ(ν), τούς. *The curious indeclinable expression* τοῦ λόγου μου, σου, του, της for *myself, etc. is worth remarking; in possessive pronouns* ἰδικός, *e.g. 6* ἰδικός μου υἱός *my own son; in relative pronouns, 6 baoios and* ὁποῦ *(indeclinable) = who; in indefinite pronouns,* κάτι, *something;* τίποτε *anything, nothing;* κανείς *anyone, no one;* καθείς, *any, every, and expressions like* κάθε ἄνθρωπος, *everyman;* κάποιος, *a certain;* κάμποσος, *scveral. Of interrogatives, note* τί *invariable, e.g.,* τί bpa εἶνε; *what's the time?* τί λογῆς; *of what sort?*

Numerals. — *The general usage follows the classical, but "popular" Greek has many divergent forms, such as* ἕξε (6), τριάντα (30), σαράντα (40), πενῆντα (50), ἑξῆντα (60), *etc. The following miscellaneous expressions may be noted:* ἑκατομμύριον *(million),* δωδεκάς *(dozen),* δύο φοραίς *(twice),* τρία τέταρτα (¾), δύο ἀπὸ τὰ πέντε (⅖), δύο στὸ πέντε (½), ἕξε τοῖς ἑκατόν (6%), μισὴ ὥρα *(half-hour),* εἰς τὰς πέντε *(5 o'clock),* τρεῖς καὶ τέταρτο (3.15), ἕξε παρὰ εἴκοσι (5.40), εἴκοσι Φεβρουαρίου εἰς τὰ χίλια ἐννακόσια εἰκοσιοκτώ (20th *Feb.,* 1928).

Conjugation. — *The Modern Greek verb* has *no dual, optative* or *infinitive. The optative is expressed by* εἴθε *vh e.g.,* εἴθε *vh* ἦτο *would that it had been, the infinitive by* νά *followed by the* subjunctive, *e.g.,* θέλω νὰ γράφω, *I want to write. There is a* tendency to *substitute the w ending fcr* μι, *e.g.,* δεικνύω, *and to* abandon *contracted verbs, e.g.,* χρυσόνω *takes the place of* χρυσόω. *The auxiliary verbs* ἔχω *and* θέλω *have largely taken the place of the old tense forms;* θέλω *is generally used in its abbreviated form* θά *thus* θά εἶμαι, *I shall be;* ἔχω λάβει, *I have received;* θὰ εἶχον λάβει, *I should have receiaed. In these examples* λάβει is *an invariable* form, *corresponding (according to some) to an infinitive without v, according to others, to the* 3rd *singular aorist subjunctive and as such sometimes written* λάβῃ. *The corresponding passive form is* ληφθῆ — ἔχω ληφθῆ, *I have been received. For the imperative,* ἄς *with the subjunctive is largely used, e.g.,* ἄς γράφῃ, *let him write. It should be observed that for the forms described as subjunctive, the corresponding indicative forms,* γράφει, *etc., are freely used. The invariable present participle form ending in* -οντας *should be noted, e.g.,* bvras, *being,* γράφοντας, *writing. As to the principles of the Modern Greek verb with regard to time, the most important distinction is between the continuous (present) and the momentary (aorist), e.g.,* θὰ γράφω *I shall be writing, and* θὰ γράψω, *I shall write. In conditionals, classical refinements have been largely obliterated:* ἐάν *or* ἄν *is commonly used with the indicative, e.g.,* ἐάν εἶχε γράψει, ἤθελον μάθει, *If he had written, I should have learned; thus* θέλω *has ousted ancient* ἄν *in the apodosis.*

Vocabulary. — *The "purists" go to Ancient Greek for their vocabulary, and are anxious to oust all foreign words. To meet modern conditions, they introduce many neologisms, coined on analogy with the ancient language; e.g.,* ἀσύρματος τηλεγραφία, *wireless telegraphy;* ῥαδιοτηλεγράφημα, *wireless telegram;* δακτυλογραφία, *typewriting;* συνάλλαγμα, *bill of exchange;* ὑπάλληλος, *employee;* καρβουνότουβλα, *briquettes;* ταχυδρομεῖον, *post-office;* ἁμαξοστοιχία, *railway train;* ἀτμόπλοιον, *steamer;* ὑποβρύχιον, *submarine;* θωρηκτόν, *warship;* εὔελπις, *cadet;* σύνταγματάρχης, *colonel;* ἀεροπλάνον, *aeroplane;* πολυβόλον, *machine-gun;* περίστροφον, *revolver, etc.*

The foreign words still surviving in "popular" language mirror the vicissitudes of post-classical Greece; they are naturally far more common in the literature of mediaeval Greece than they *are to-day. The principal languages from which such words are drawn are Latin, Italian and Romance languages (reminiscent of the settlements of the crusading Latins in Greece), Slav, Walachian, Albanian, and above all Turkish (in which may* be *included some earlier Arabic survivals). Examples:*

Latin.—ἀκκουμβῶ, *lean;* ἄρματα, *arms;* βάρκα, *boat;* βέργα, *rod;* βοῦλλα, *seal;* κάμπος, *field;* κουρσεύω, *be pirate;* παλάτιον, *palace;* πλουμίζω, *adorn;* σπίτι, *house;* στράτα, *street;* ταβέρνα, *tavern.*

Italian and **Romance.**—ἀρμάδα, *fleet;* βελοῦδο, *velvet;* γάτα, *cat;* κάλτσα, *stocking;* καπέλλο, *hat;* καπετάνιος, *captain;* κουμπάρος, *best-man;* λεβάντες, *E. Wind;* λίστα, *list;* μοῦτσος, *cabin-boy;* ντάμα, *lady;* πέννα, *pen;* πονέντες, *W. Wind;* πόρτον, *harbour;* ῥιμάρω, *rhyme;* σαλόνι, *saloon;* τιμόνι, *tiller;* φορτοῦνα, *storm. It is sometimes difficult to distinguish between borrowings from Latin and Italian and Romance languages.*

Slav.—βάλτος, *marsh;* γοῦνα, *fur;* κουνέλι, *rabbit;* ῥοῦχα, *clothes.*

Walachian.—βλάχος, *rustic;* κατσίβελος, *gypsy.*

Albanian.—κοπέλα, *girl;* λουλούδι, *flower.*

Turkish *and* **Arabic.**—ἀμπᾶς, *serge;* γάϊδαρος, *ass;* δραγουμάνος, *interpreter;* ζαγάρι, *hunting-dog; (Ar.);* καδῆς, *judge;* καζάνι, *cauldron;* καΐκι, *boat;* καλαφατίζω, *caulk* (Ar.)*;* κέφι, *good humour;* κιόσκι, *kiosk;* λουφές, *pay;* μαιμοῦ, *monkey;* μουσαφίρης, *guest;* μπαρούτι, *gunpowder;* ντουλάπι, *cupboard;* ὀντᾶς, *room;* παζάρι, *bazaar;* παπούτσι, *shoe;* παράδες, *money;* ῥακί, *spirits;* ῥαχάτι, *ease;* σαράγι, *palace;* σαράφης, *money-changer (Ar.);* σεφέρι, *war;* τζάμι, *glass;* τζαμί, *mosque;* τεμπέλης, *lazy;* τουμπεκί, *tobacco;* φλιτζάνι, *cup;* χαμπάρι, *news;* χάνι, *inn;* χαράτσι, *tribute;* χαρτζιλίκι, *pocket-money;* χατίρι, *favour.*

GREEK LAW. The basis for the development of Greek law was laid by the rise in Greece of city-states (poleis). Primitively all Greeks were tribal; or, to use their own term, ethnic. But between 1200 and 800 B.C. among those of them who had entered the area of the Aegean civilization tribes were replaced by city-states. Of Greek tribal law little need be said. Its source was twofold. For the most part it issued from kindred-groups—families and brotherhoods (*phratries*)—by which also in this event it was enforced. But it likewise sprang from the tribal government—kings, elders and assemblies; and tribal, and even intertribal, pressure operated to produce or maintain a general sameness in the rules and regulations of the lesser groups. Tribal law, and the law of the early city-states as well, consisted of customary rules preserved by popular memory. So long as they were thus intangible they could be changed only unconsciously by the slow processes of social growth. Thus, they seemed unchangeable. Nor did the gods withhold their hands after they had laid down the fundamental ordinances. From Zeus there came to every king, so Homer tells us, the dooms (themistes) according to which he settled disputes (11. ix. 99).

Tribal justice had as jts mainspring self-help. Its course may be illustrated in cases of homicide. Fear of vengeance at the hands of the kindred of the slain man drove his slayer, whether guilty or innocent, to seek exile, sanctuary or the protection of his blood-brothers. But to avoid the feuds, to which acts of violence and reprisals gave rise, recourse was had to commutation, and if this proved inefficacious, to arbitration. The oldest Greek trial of which we have record was one arising out of a dispute between a slayer and avenger as to the receipt or non-receipt of blood-money. The hearing was held publicly, in the place of assembly, and was attended by partisans of both contestants, who were restrained by public officers (heralds). The "daysman" (ἴστωρ) was supported by the elders. They sat on "polished stones in the sacred circle," and in their midst lay two pieces of gold to be awarded either to the disputant who made good his contention or to the elder who declared most righteously the rule of law (δίκη) governing the case (*Il.* xviii. 497–508).

The scope of self-help was wider than the scope of kinsmen-help. The adulterer, no less than the homicide, could be dealt with directly by the party aggrieved; but since unmitigated self-help was socially suicidal, even if he were caught in *flagrante delicto* he might be ransomed if a bondsman went surety for him (Od. viii. 344–599). Where death or violence were not its normal accompaniments the practice of affirming rights solely by self-help lasted longer. Until a late date a creditor might seize the person of his debtor for nonfulfillment of contract. Long after the rights of talio and "distress" had been subordinated to state law they continued to be legitimate remedies of international law.

The Iliad and Odyssey of Homer are the sole contemporary source for early Greek law. They reflect its condition in the period of transition from the tribe to the city-state. Between Homer and the 7th century revolutionary changes in constitutional law occurred. They affected comparatively little the rules applicable within the family sphere; but the autonomy of the kinsmen-groups in pursuing private vengeance was radically affected by the coming to prevalence of an attitude toward homicide that lifted murder out of the category of ordinary acts of violence; the slayer was thought to pollute the entire community. So the state could no longer remain neutral.

The defects of unwritten laws were not so much their vagueness as their failure to cover new situations. They might coerce facts and outlaw novelties, like those of the ancient Spartans and the modern Albanians. But where new situations developed in spite of them, a frontier region of uncertainty arose in which the magistrates were unguided and unrestrained. Such was the characteristic aspect of justice in the "iron age" in which Hesiod wrote (700 B.C.). An obvious remedy was to separate the determining of law from the passing on facts and to leave one function only to magistrates. The function Rome left them was the one Athens took from them. In c. 683 B.C. it created a body of six "determiners of customs" (thesmothetai: *cf.* the Persian databara), to whom, it may be assumed, the chief magistrates (archon, *q.v.* polemarch, king) were bound to refer for an authoritative definition of the "law" that bore on disputes brought before them.

In the 7th century the Greek city-states began putting their laws into writing. The method used was to entrust the task of determining all the laws and issuing them in the form of a code to a single individual described as a "law-determiner" (*nomothetes*). The early codes have all perished except for a few isolated passages; so that our direct knowledge of them is slight. But we may say that laws were, on the one hand, instructions issued for the guidance of boards and officials in the performance of their public duties, and, on the other hand, rules of general application containing prohibitions with their attendant penalties, and specifications as to what should be done in certain contemplated acts or situations. Since the rules were linked up for enforcement with definite organs of government, the entire code was arranged under the heads of the competent public authorities.

Greek law-codes were accordingly a blend of public law, including the forms to be observed by priests in public worship, and private law. A pre-condition for their publication was the spread of literacy. Since they were demanded because of the inadequacy of traditions, they naturally appeared first in the colonies and in progressive states. The earliest nomothetes is said to have been Zaleucus of Locri in Magna Graecia. Charondas of Catana was perhaps a younger contemporary. Other famous law-givers were Dracon of Athens (c. 621 B.C.), Pittacus of Mitylene and Philolaus of Corinth. The historical reality of Lycurgus of Sparta, Theseus of Attica, and even Minos of Cnossus has been sustained by some recent writers, and the divinity of Zaleucus, Charondas, and even Draco has been affirmed by others; unwisely in both instances.

Since each city-state had its own law it is apparent that strictly there was no such thing as Greek law, but only hundreds of local codes. And indeed in the sense in which England developed a common law and France "received" another, there was no possibility for a common law to arise in Greece, unless it be in the area of the short-lived Athenian empire (477–405 B.C.). The common law which Greece possessed was simply the law that was common to all its numerous codes. This need not have been inconsiderable. The law given by Zaleucus to Locri was adopted by Sybaris; that given by Charondas to Catana was shared by the other Chalcidian cities in Sicily and Italy, and what is even more remarkable, it was not only drawn on by Thurii, but also used in Mazaca in Cappadocia. None the less cases of migratory codes were exceptional. The unity of Greek law, such as it was, depended rather upon the possession by all Greeks of a common stock of legal principles. This was partly an inheritance from a distant past. The rules governing marriage, right of succession (anchisteia), the disposition of heiresses, adoption—family life in general—were everywhere similar because they were derived from ancient Hellenic ideas. But it was also the outcome of

reciprocal borrowing. Commerce in Greece was at all times international in part and largely in the hands of metics. The ideas of commercial right and wrong were established in the international ports and on the high seas by a kind of mental and moral barter. They were brought to greater precision by the negotiation of commercial treaties (*σύμβολα*); and finally they became so consolidated that Demosthenes (xxxv. 45) could affirm that the laws governing commercial cases "were everywhere identical."

Between the 7th and 4th centuries codes tended to converge. The movement of law had to conform to the general movement in Greece, which was towards greater and greater uniformity. But there was an inevitable relation between laws and the character of states; and since for a long time noble or class-states, which had existed generally at the time laws were first codified, persisted in certain parts of Greece, the convergence was at first on two types of law rather than on one—an aristocratic type and a democratic type. The former is well illustrated in the laws of Gortyn in Crete.

As these have reached us, they consist of earlier and later portions, the latter a supplement made at *c.* 450 B.C. In this collection, *especially* in its earlier portions, the rules of a class-state predominated. A magistrate, unassisted by jurors, judged cases, and there was a special judge for the privileged class. The right to make a will was not recognized. Women inherited as well as men. The penalties for offences varied with personal status. For private seizure of an alleged wrong-doer in advance of trial a fine of 10 staters was imposed if he was a freeman, one of 5 if he was a slave. Rape of a free man or woman was penalized by 100 staters, rape of an apetairos by 10, and of a serf by 5; but if the violator was a slave the penalty was doubled. The number of witnesses required to prove an allegation varied similarly; five, for example, to convict a free man, three to convict an apetairos, one to convict a serf. In the event of conflict the law defined which witnesses "were nearer," that is, should prevail.

The other type of code emphasized by contrast what the Greeks called isonomia. This meant, in terms of public law, the admission of all free-born native adult males to equal share in the assemblies in which sovereign action was taken, and, in terms of private law, the cancelling of all class distinctions. Athens is the classic example of this type; and the influence, power and policy of Athens helped greatly to spread throughout Greece the principles of law for which it itself stood. Historically there was a connection between political and legal equality, and in Athens both were realized finally on a basis of self-government in 507 B.C., after the expulsion of the Peisistratids. But they were not inseparable. In Boeotia, for example, a way was found to reserve participation on equal terms in the sovereign assemblies to citizens of the middle and upper classes without giving them any rights under private law which all free-born native adults did not also have. Those owning a certain amount of property simply became "councillors"; and councillors alone were organized for the transaction of public business. For a brief time after the fall of the Four Hundred in 411 B.C. Athens itself adopted this form of *isonomia.* There the experiment failed politically and was not repeated.

Growth of **Law in** Athens.—In the centre of Greek law, as we know it, stands the law of Athens. It was first codified by Dracon. The thought then uppermost in the minds of the Athenians was to fix once for all existing customs. Stability, presumed for the law while it was unwritten, was naturally presumed for the written law also. But, owing, as it seemed, to the rapacity of the rich and the extravagant hopes of the poor, the situation became so acute within a generation that Solon, archon for the year 594 B.C., on being given the full power of the state to reconcile the warring factions, took the extreme step of issuing a new code of laws. The only part of Dracon's code which he retained unchanged was the law of homicide. The constitutional provisions, including those regulating judicial procedure, were profoundly altered, notably by a rule, pregnant with history, authorizing appeal from judicial decisions of magistrates to a popular assembly organized as a court (heliaia). All free-born adult males native in Attica were given the public-law rights of isonomia—membership on equal terms in Assembly and heliaia. For classes based on birth Solon substituted classes based on property. These new classes were recognized in the distribution of public offices and services. Were they also recognized in the assessment of legal penalties? There is no conclusive evidence on the point. The spirit of the Solonian constitution was hostile to their maintenance. It struck at the roots of privilege by including wrongs done to citizens individually in the category of wrongs done to the state. In all cases (excepting homicide), which involved more than business settlements, Solon established the right of any citizen whatsoever to appear as public prosecutor.

Solon regarded law-making as an abnormal function of government and he bound the Athenians by oath not to resort to it again for 100 years. This attitude toward it persisted under the Peisistratids, who preserved Solon's laws while administering them to serve their own ends. Cleisthenes, too, was an extra-constitutional law-maker. But at some point, not precisely determinable, between the time of Cleisthenes and the downfall of the Four Hundred in 411 B.C., the method of legislating through suspension of the constitution in favour of an autocratic *nomothetes* was abandoned for the more democratic method of vesting the law-giving power in a board of nomothetai; and it was according to the more modern method that the *régime* of the Five Thousand was inaugurated in August 411 B.C. and the democratic laws re-enacted on the overthrow of the Thirty and the Ten in 403 B.C. On the latter occasion it proved necessary both to make a general revision of the laws and to issue a new code. The legislative work was entrusted to a corps of 1,000 representatives taken from the demes, half by lot and half by popular vote (the *nomothetai*). This body issued the laws, old and new, in the form of drafts (*συγγραφαί*) and put them in the hands of a commission of "publishers" (*anagrapheis*) for editing. This body had them cut on stone slabs in the King's Porch, where also the old code had been inscribed.

Thus far legislation was an occasional and not a regular function of government. But this view of it was now abandoned. Athens had henceforth a process by which the laws might be changed annually. It was initiated at the first meeting each year of the Assembly. Votes were then taken on the laws, section by section, to determine whether or not they seemed adequate; first on the laws concerning the Councils; secondly, on those classified as general (*κοινοί*); thirdly, on those relating to the nine archons, and finally on those relating to the other magistrates. For the defence of laws judged inadequate five attorneys were elected; and during the succeeding three weeks anyone who chose might bring forward substitutes for laws under indictment and have them posted on the state bulletin boards. Then, at its third meeting the Assembly ordered *nomothetai* to be chosen. The nomothetai—on one occasion 1,001 in number (Dem. xxiv. 27)—were selected from the jurors (dicasts) empanelled for the year. In this particular they resembled a court. Their proceedings, too, were in the form of a trial with pleas by the proponents of changes and counter-pleas by the attorneys for the defendant laws. But since their presiding officers consisted of the identical type of presidency used in the Assembly, they also resembled the sovereign political body. Their decisions, too, were reached as in an Assembly and not in a court—by open vote. Unlike a decree a law could be enacted only after due notice had been given and the public interests had been defended by counsel. It emanated from a body carefully selected to ensure the representation of every section of the population, not, like a decree, from the group of citizens who chanced to be present at a particular meeting of the Assembly. The nomothetai were dicasts; but they rendered a political not a judicial verdict. Hence unlike the action of a court, it was subject to suspension, like the action of the Assembly, if indicted for illegality, and became definitely binding only when reaffirmed by a regular tribunal.

The code was a thing of many complex interrelations. An alteration at one point might produce unsuspected trouble at others. The officials who had most to do with law-enforcement were the thesmotlzetai. It was therefore made incumbent upon them to examine the code carefully in the course sf their

administration, and, if they found in it obsolete articles not so designated, or articles which contradicted or duplicated one another, to put on the bulletin boards the editorial revisions they deemed necessary. For the validation of these clerical corrections an ordinary meeting of the Assembly was competent, but it was held constructively to have been a session of nomofhetai. A much less innocuous participation of the Assembly in legislation is demonstrated by documents for the period following c. 360 B.C. Impeded in action it wished to take by lack of legal authority, the Assembly passed votes requiring the chairmen and president who should preside at the first session of nomothetai to present for consideration the additions to the laws it desired. This may have led to an over-weakening of constitutional law (Dem. xx. 89 sqq.); but so long as this was fused with private law there was no alternative. The magistrates' courts, being incompetent to render judicial decisions except in trifles, were incapable of developing a *ius* honorarium. Neither could law in Athens be court-made, since every verdict of the dicasts was independent of every other verdict.

Until the age of Pericles, the Athenians entrusted the function of acting as "guardian of the laws" to the Areopagus. Then they did away with it as being derogatory to popular sovereignty. Yet the laws had to be safeguarded, not perhaps against the dentos itself—for like the king the demos could do no wrong—but against individuals in Council and Assembly who should mislead it. The remedy applied was to hold all makers of motions at meetings of these bodies liable to public actions for illegality (γραφαὶ παρανόμων), thus placing the protection of the laws in the large category of public interests for the vindication of which each and every citizen in good standing might assume the rôle of state prosecutor. The test of illegality was that the motion should seek to accomplish something prohibited by the laws. There was, however, nothing illegal in persuading the Assembly to use decrees (*psephismata*) to fill gaps in the laws; and in the 5th century, when legislation was still a quasi-revolutionary activity, this course was frequently followed. It was by means of decrees primarily that law was built up for the empire. The constitution of the council itself was extended by decree. New magistracies were created in this way. Decrees were therefore often indistinguishable from laws in subject matter, and since the courts were required to take account of them both, they might have precisely the same force as laws. Yet there was a fundamental difference between the two. A decree could be abrogated by a new decree without ceremony, whereas a law stood until annulled by further legislation. The revisions of 411–10 and 403 B.C. must have conferred the superior status of laws on many rules which theretofore had rested on decrees alone; and thenceforth the Athenians lessened the need for decrees to trespass on the province of laws by providing for annual legislation. Naturally they made the proposers of new laws liable to the same form of public action as the proposers of new decrees. And indeed they went even farther than this; they made them liable to public prosecution if the laws originated by them were found within a year to be inexpedient. After the twelve months had expired, laws, like decrees, alone were indictable, not their authors.

Official transcripts of the laws were ordered to be made on stone tablets in 410–04 B.C.; and to this measure we owe the preservation, though in a very fragmentary condition, of Dracon's law on involuntary homicide (I.G. I. 115), Cleisthenes' law on the Council of the Five Hundred (I.G. I. 114), and a law of uncertain date governing grants of maintenance in the prutaneion (I.G. I. 77). On the occasion of the revision made in 403 B.C. a new text was issued in the Ionic alphabet then officially adopted. The new laws passed during the following 80 years were attached to the code in the form of the minutes of the sessions of *nomo*thetai in which they originated, and like the laws of Rome they were regularly cited by the names of their proposers. A small number of these novellae has come into our possession textually, three in inscriptions (I.G. II. 140, 333, 244). Most of the laws that have reached us, whether in whole or in part or in paraphrase, were entered by ancient grammarians at points where they seemed to be called for in the speeches of the Attic orators. These and others, culled from lexicographers and scholiasts and elsewhere, are collected in Telfy's Corpus *Juris Attici* (Pest and Leipzig, 1868). The descriptive portion of Aristotle's *Constitution* of Athens (§§42–70), composed between 329 and 322 B.C. was based directly on the code of that epoch. Though it is confined to an exposition of public law and has reached us without its final portions, it is by far the most extensive abstract of the Athenian laws that we possess.

So far as we can judge from the specimens preserved, the laws of Athens were drafted in simple language. Some ancient phrases survived in their older portions. In style they resembled the laws of the Twelve Tables rather than the matured legislation of republican Rome. No attempt was made in them completely, to define parties or objects concerned by the use of synonymous terms and to adhere rigorously thereafter to the definitions once made—a defect that opened the way to subterfuge in litigation (Lysias, x. 15), but was less troublesome in the equitable processes of the dicastic courts than it would have been in courts guided by strict law. The laws dealt with concrete situations that had arisen in actual experience. Hence they were adequate through being numerous and detailed rather than through embodying principles that were capable of wide application. The distinctions between the hundred and more actions open to suitors were drawn with acuteness, if not with over-subtlety. The rules of procedure were "at times casual and incomplete (set practice being taken for granted), at times minutely specific." Penalties for "criminal" offences were remarkable for their severity—a reflex doubtless of the passion and intensity of their political life; they included death (with circumstances of atrocious cruelty in the case of common malefactors); fines that were often confiscatory; total or partial disfranchisement; and detention, but not imprisonment. The code was thought not to measure up to the standards of contemporary jurisprudence; but when it was refashioned by Demetrius of Phalerum to give effect to the Peripatetic theory of society (317 B.C.), the Athenians would have none of it. On the expulsion of the unpopular *nomo*thetes—his office was an anachronism, no less than many of his laws—they revived the "laws of Solon," revised them to suit the altered circumstances and republished them (307–304 B.C.).

The task of abstracting the law of Athens (or of Greece) from the instructions of magistrates, and setting it out under appropriate headings for comparison with Roman and other systems of law, has been undertaken by modern scholars, notably lawyers. But from the nature of the materials, which also precludes any attempt to summarize the laws under their original headings, we must content ourselves here with citing the works by Beauchet, Partsch, Mitteis, Vinogradoff and Weiss mentioned in the bibliography.

Judicial System of Athens in the 4th Century.—Except for (1) a special group of public actions, itself divisible into subgroups, suits fell into two general categories: (2) dikai, or private suits, and (3) graphai, or public suits.

1. The special actions may be thought of as a residuum of the means in use before Solon for dealing with crimes against the state. The small fines (ἐπιβολαί) imposable by administrative officials upon citizens who disputed their authority represented another such residuum. Their common characteristic is that the council and assembly or the magistrates were competent to punish, if they chose, without observing the regular forms of judicial procedure. The most striking example of executive justice is apagoge (with its variants endeixis and *hyphegesis*), the arrest and detention of malefactors (κακοῦργοι, *e.g.*, thieves) caught in the act or of persons (exiles, state debtors and the like) caught exercising rights of which they had been legally deprived. If the prisoners admitted their guilt the "eleven" were authorized to inflict summarily the penalties prescribed, ordinarily death; otherwise, they, or exceptionally the thesmothetai, had to conduct the case as a public action.

By far the most important of these special forms was impeachment (εἰσαγγελία). Typically it may be described as the process designed to cover acts that may be loosely defined as treason. The offences were at first left indeterminate, but eventually a law

was elaborated including among them, specifically, treason and conspiracy to commit treason; betrayal of a city, ship, army or fleet; unauthorized traffic with an enemy, residence in his country or service in his army; the acceptance by a public man of bribes as a consideration for misleading the demos. From actions of this type many causes *célèbres* arose, notably the trial of the eight generals who commanded in the battle of Arginusae. The denunciation might be presented to either the council or the assembly and accepted or rejected by them. If accepted, the defendant was arrested and if the matter was grave he was kept in prison pending trial. The council drew up the definite proposal for action, in the one instance on its own initiative, in the other at the request of the assembly. If the penalty deemed sufficient was a fine of 500 drachmae or less, the council was fully competent to impose it. Otherwise it transmitted its proposal, through the agency of the thesmothetai, to the Assembly, which had thereupon to decide either to try the case itself, which it did by the process used in enacting a decree, or, as was more usual, to hand it over to a dicastery. The penalty was ordinarily death with confiscation of property. The dead bodies of traitors were cast beyond the boundaries of Attica. "Presentment" (προβολή) was somewhat similar to impeachment. Actions regarding contraband (+bats) and wrongful possession of public property (ἀπογραφή) were also special in that those who prosecuted them paid court fees, as in civil suits, but received half or three-fourths of the penalty. This was the prime source of sycophancy (the trade of informing).

2. **Dikai.**—The characteristic feature of dikai was that the right to bring them rested upon the possession by the plaintiff of a private interest. But they fall into two altogether different classes: (a) actions for homicide, and (b) civil suits.

(a.) Because of its antiquity the law of homicide contained a relic of the primitive practice of self-help. It placed the obligation of seeking redress for homicide upon the kinsmen of the slain man—upon his father, brothers and sons as prosecutors, and upon his cousins, sons of cousins, male relatives by marriage and blood-brothers (*phratores*) as co-prosecutors. A man belonging to the inner group alone had the right to bring action; or, more probably, his was the prior right, since in cases where it was permissible to arrange a settlement (αἴδεσις), even the blood-brothers were competent to act if none of the nearer relatives existed. Dracon had recognized the essential difference that exists between wilful murder and other kinds of homicide; but it was a distinction that did not permit any discrimination in the religious ritual of the occasion; the king-archon presided and voted at all trials, the courts sat in holy places in the open air, and pending trial the accused was excluded from the agora and all shrines and religious ceremonies, but not imprisoned. When the offence charged was wilful murder, or wounding or poisoning or arson with intent to kill, and the victim was an Athenian, the Areopagus as a whole formed the court, it sat on Ares' Hill, and the penalty, when life was taken, was death; otherwise exile. Other kinds of homicide were regarded as of lesser seriousness, and a board of judges called Eplzetai—originally a commission, perhaps, of 51 Areopagites, later a panel of dicasts—constituted the tribunal. The place in which the trial was held varied with the nature of the defence. To the Palladium belonged cases of involuntary homicide and instigation thereto, the penalty being temporary exile; also suits for killing non-citizens—slaves, metics, and foreigners. To the Delphinium belonged cases of justifiable killing, and to the Phreatto, accusations against citizens already in exile. The defendant pleaded from a boat anchored off the shore so as not to pollute the country by setting foot on it. In the Prytaneum the king-archon had the phulobasileis, instead of the Areopagus or the *Ephetai,* associated with him as judges, and to it belonged trials which were purely ceremonial in character—where the "doer" was unknown or an animal or, as in the obsolete English law of "deodands," something inanimate. The objects found guilty were cast beyond the frontiers.

(b.) Civil suits could be brought only by the parties interested or their legal representatives. Their entry was governed by the general principle of Athenian law that magistrates should accept cases arising in the sphere of their own administration; but the principle was inapplicable to magistrates mhcse duties were mainly or wholly judicial. Of these the thesmothetai were comparatively unimportant in civil suits. The other two—the Introducers and the Forty—received civil suits only. The competence of the Introducers was limited to suits which by reason of their special urgency had to be brought to trial within a month of the filing of the complaint (δικαὶ ἔμμηνοι); but not all such suits came to them. Those that they received were actions arising from non-restitution of dowry, from loans that were in the nature of an accommodation—where the rate of interest was low (12% or less) or the security poor—from transactions with business associates, partners, or bankers, and from trierarchies. Also actions for assault. For each pair of *phulae* there was one Introducer.

Of the Forty, four acted for each *phule.* If the object of litigation was worth 10 drachmae or less they settled it with full authority. Otherwise they referred it to a public arbitrator (διαιτητής), whose business was first of all to reconcile the parties. Failing in this he heard the case. If his decision was accepted by both parties it was final. But if the loser chose to appeal from it, the arbitrator sealed up in caskets all the papers submitted at the hearing, ihuse of each litigant separateiy, and referred the case back to the section of the Forty whence it came. This had then to take it to a public court, where the usual course was followed.

It was characteristic of civil-suits that the winner had himself to obtain the rights awarded; but if he encountered resistance he could bring a suit of ejectment. The feature of this class of actions that calls for special notice was the provision for compulsory arbitration. It applied to all civil suits that came before the Forty either directly, or indirectly from other magistrates. Excepting the monthly suits, which would not brook delay, most disputes about property, sales, leases, contracts, debts, etc., implicating either citizens (office-holders and non-office-holders alike) or metics and other privileged aliens had to be submitted to arbitration. The task of arbitrating was reserved exclusively to the last class of citizens on the roll of those liable for military service; in other words, the Athenians in their 60th year. The appointment of the arbitrator for each case was made by lot and the arbitrator on whom the lot fell could not decline to serve, unless he were holding office or absent from the country, without incurring the penalty of disfranchisement, to which he was also liable, on complaint to the whole body of arbitrators, if he abused his position. The state had more confidence in the average capacity of its sexagenarians than it had in their public spirit and integrity. But what of the litigants? That they would respect the findings of an obviously incompetent arbitrator, however unbiassed he might be, was not to be expected. The essence of the system was "that in a large number of disputes the constitution did not compel two quiet citizens to face the ordeal of a trial in court, but provided a cheap and simple and reasonable means of getting justice" (Wyse).

3. **Graphai.**—The judicial vindication of a public interest was the object of these suits. They could be entered by any citizen in good standing. He might be himself the aggrieved party, but in that event, even if the award was pecuniary, it fell to the state, which in all cases exacted the penalty. As in private suits, so in public, the magistrates were confined to a passive rôle: before taking action they had to wait till private individuals filed complaints with them. The principle that executive competence determined judicial competence also prevailed.

Accordingly the generals and the other army officers were alone competent to receive suits for infractions of military duty. To the archon and the polemarch came suits (private or public as the case demanded) concerning matters of family—the rights of widows, orphans, minors and heiresses, the management and division of family property, the appointment of guardians or patrons, etc.—to the archon, if they involved citizens; to the polemarch, if they involved metics and other privileged aliens. The king-archon received suits concerning religious matters—impiety, hereditary priesthoods, the share of *genê* and priests in sacrificial offerings and the like. Since over 100 species of suits are known, divided about equally between dikai and graphai, it is impossible here to give a complete classification of suits and magistrates. But

the rôle of ihe *thesmothetai* calls for special comment. The six men constituting this board had duties to perform in connection both with making and administering the law which make it almost unintelligible that they should have been elected by lot (after 487 B.C.) and changed every year. They acted as intermediaries of the Council and the Assembly in cases which went to the courts from either of these bodies; and they were alone competent to receive indictments of decrees and laws and their authors, as well as of officials who presided at sessions of the deliberative and legislative assemblies. They also received actions against the generals. Besides offences against the state many offences against society were within their competence — theft, adultery, bribery and corruption of officials, councillors, and dicasts; usurpation of rights of citizenship, sycophancy, falsification or suppression of records, etc. Their civil suits were incidental.

The correct entry of suits required no small acquaintance with law on the part of average citizens, but so did the entire judicial system. The magistrates who accepted entries, with unimportant exceptions, were always new to their office and possessed neither more nor less legal training than litigants. All litigants had to be their own attorneys. The state depended wholly upon private initiative to set the judicial processes in motion. What was everybody's business proved to be the business of a low rather than a high type of citizen; so that the community was harassed by blackmailing and sycophants. Suits were as thick in Athens as leaves in Vallombrosa. Instead of employing fisticuffs or duelling or lawyers the Athenians went to law. It has been said that they were a nation of lawyers; but it has been also said that they were a nation without lawyers. And both statements are true.

The duty of assessing the evidence and rendering the verdict devolved upon tribunals on which sat jurors (Areopagites, ephetai, dicasts) ranging in number from 201 to 2,500 and exceptionally to 6,000. The Areopagus was a fixed body of about 220 members made up of ex-archons; and cases of wilful murder came to it automatically. Seeing that the archons were elected by lot with regard to local distribution, the Areopagites were simply typical Athenians; but they entered the tribunal fresh from an exceptional experience with the whole judicial system, and as the years passed they acquired a close knowledge of the law and physiognomy of murder. Hence their judgments enjoyed in marked degree general respect.

The king-archon was the only magistrate for whom the tribunal was fixed in advance. The rest had to apply to the *thesmothetai,* who assigned panels of dicasts to them by lot, 201 or 401 for ordinary civil cases, 501 or 1,001 for ordinary public cases. The *thesmothetai* determined on which one of the days fixed by them for sessions each magistrate should have his case tried and in which court-house the trial should be held. The selection of the panel of dicasts for each court-house was made on the day of the trial by a most intricate process of lot (Aristotle. *Constitution* of Athens, §63 sqq.). Its objects were fivefold; to ensure (1) that each individual in each of the ten sections into which the *heliaia* was divided should have a like chance to serve; (2) that every panel, containing, as it must, a like number of dicasts from each *phule,* should reproduce in miniature the whole people for which constructively it was to act; (3) that no one whatsoever should know in advance of the entrance of the dicasts into the court-house who was to judge any particular case; (4) that no one should impersonate the dicasts selected; (5) that dicasts who failed to turn up in the court-house should not receive their daily stipend of 3 obols. There was no mistaking the intention of the Athenians: they desired every panel to speak with the voice of all Athens, uninfluenced by bribery, intimidation, or collusion. And they got their wish.

The sorting of the evidence was made at a preliminary hearing (anakrisis). There the elements of the proof and disproof were assembled — the statements under oath of the parties, the depositions of witnesses, laws, decrees, contracts, and the like. The testimony of slaves was admissible only when elicited by torture; that of women and minors was admissible only in murder cases, and that of the parties to the suit was not admissible at all. Hearsay evidence was excluded. The cross-examination of witnesses was not permitted. Till 403 B.C. the pleadings were oral, but written pleadings, found necessary in cases appealed under the system of public arbitration, were adopted generally early in the 4th century. There were permissible ways of barring suits by contesting their admissibility. A civil suit might be dropped at any time. The prosecutor, however, must proceed with a public suit once it was instituted or pay a fine of 1,000 drachmae and forfeit the right to bring further actions, and he incurred the same penalty if he failed to secure one-fifth of the dicasts' votes. Court fees were collected in civil suits. Public suits more than paid for themselves by fines and confiscations. There were careful rules to govern default.

The presidency of the tribunal belonged either to the *thesmothetai* or ordinarily, to the magistrate who was connected with the suit in its earlier stages. The president had to see that the trial followed the course laid down by law, and, since his legal training was no greater than that of the litigants and dicasts, he had no claim or right to intervene further. Precedents having no legal standing, no one was needed to assess their bearing. The dicasts were in fact under oath to disregard them and to make decisions solely on the evidence and arguments presented, giving effect to laws and decrees where these sufficed, otherwise to their own sense of right. The proceedings in court consisted essentially of arguments addressed to the dicasts by the plaintiff and the defendant personally and by friends (not paid professional advocates) who appeared to support either party with their reputation and court experience. At the proper places the statements and depositions contained in the *dossier* of the preliminary hearing were read by the clerk of the court and acknowledged under oath by the litigants and the witnesses. The law authorized actions to compel the appearance of witnesses and the production by third parties of relevant documents, which, too, were read from the dossier by the clerk. A time, greater in public than in private suits, was set for the entire argument. Half of it was given to each party, and the water-clock (klepsudra), by which it was apportioned, was stopped during the reading. An inarticulate litigant would normally leave the burden of the argument to his supporters, and the practice was general for the main speeches to be prepared by professional speech-writers (*logographoi*), whose art consisted in no small degree in concealing their handiwork. If we except the disreputable tribe of sycophants, from whom speakers took special pains to distinguish themselves, this was the only professional class produced by the administration of law in Athens. They were accomplished pleaders, versed in the intricacies and pitfalls of the law, adepts in appealing to the prejudices of the dicasts; and since some of them were active in instituting public suits, they might come very near to being lawyers.

Once the arguments were concluded the dicasts voted, without discussion, either to acquit or to condemn. The utmost care was taken to preserve secrecy and honesty in the balloting. If the vote was against the defendant, but the bare decision did not suffice to dispose of the case, an argument upon the penalty ensued, at the end of which the dicasts balloted to decide whose estimate, the winner's or the loser's, should be accepted. The court was powerless to substitute an estimate of its own, but a compromise could be reached if the litigants chose to meet each other half way in their estimates. An appeal from the verdict was possible only in cases of non-culpable default; or on the ground of perjury, and then only if notice to contest the verdict on this score were given before the dicasts voted.

We do not possess the dossier of a single trial. The opposing arguments have seldom reached us. The speeches of the Attic orators were published as masterpieces of eloquence. They do not form a case-book of Athenian law. What they reveal is the sort of argument to which the dicasts were thought to be responsive. In public cases appeals were made to their ignorance, prejudices and cupidity, which, if successful, must have made their verdicts travesties of justice; and we know that in times of great political excitement they succeeded all too frequently. But the courts were a political as well as a judicial body. They were there to give the *coup de grâce* to discredited politicians; they were the heirs of ostracism. In private cases the speeches were often

such as might be addressed to modern juries; and we have little reason to impugn the verdicts. The vicious tendencies of the judicial system are obvious; the contamination of justice by politics; the weakening of responsibility through its diffusion among so many jurors; the rendering of unlike decisions in like cases. But the correctives were also present; the unexampled familiarity of common man with law and legal practice; and their unique experience in taking collective action in large bodies. History contains no other instance of justice so thoroughly organized to accord with the principles of radical democracy. The Athenians were so situated that they did not feel the need either of delegating their government to picked representatives or of entrusting their justice to experts specialized in law. The Romans enshrined their justice in their great system and profession of the law, and, thus safeguarded in their private rights, left their government to autocrats.

GREEK LITERATURE. The literature of Greece is doubly unique among those of Europe. In the first place, it developed, up to quite modern 'times, mainly from within, foreign influences being almost if not entirely absent; all other European nations have been influenced, more or less profoundly, from without. In the second, it and it alone has a continuous history, extending from the second millennium B.C. to the present day. It is convenient to divide it into three periods, Ancient, Mediaeval, and Modern, whereof the first may be again subdivided into (1) Early, to about the end of the Persian Wars (first quarter of the fifth century B.C.); (2) Attic, to about 300 B C.; (3) Hellenistic, to the beginning of the Mediaeval period, conventionally fixed at the beginning of Justinian's reign (529 A.D.).

1. EARLY PERIOD

(a) **Epic and Pre-epic Literature.** When the *Achaioi* (to use Homer's commonest name for them) entered Greece about the middle of the second millennium B.C., it appears that they spoke a common language which was already showing distinct traces of dialectical differences. They possessed some rudiments of literature already, as hymns, harvest-songs, war-songs, dirges and the like, probably of more or less fixed form as to content and metre. These were probably oral, and we know them mostly from mentions in Homer, although a few surviving fragments of popular songs give us an idea of what they may have been like. Heroic ballads, celebrating notable men past and present, must also have been in vogue, and from the ballad-mongers developed in time a school of epic poetry, which for us is represented by its greatest master, Homer (*q.v.*), an extraordinary genius who, probably about 950 B.C., composed the *Iliad* and *Odyssey,* utilizing his vast knowledge of the current sagas and myths, and undoubtedly including, after the manner of all great masters of literature, many reminiscences of the style and matter of earlier pieces. His work was in all probability reduced to writing by himself; the metre was the hexameter[1] (*q.v.*), a form so complicated that it must have had a long history before he used it; his language is most reasonably explained as an artificial literary speech, generally intelligible, but not identical with any one local dialect; the place of composition was undoubtedly somewhere in Asia Minor, hence the language, although by no means identical with, has a considerable affinity to that form of Greek afterwards known as Ionic.

Many modern authorities unhesitatingly and uncompromisingly reject, in all its forms, the theory of the multiple authorship of the Homeric poems, commenced in antiquity by the so-called *chorizontes* or separators (*sc.,* of the author of the *Odyssey* from the poet of the *Iliad)* and revived in modern times, first by Wolf, his predecessors and successors, then by the authors of the various theories, such as that of Grote, which suppose one or both of the poems to have grown from a considerable, but still comparatively short, nucleus. The details of this controversy must be left to the article HOMER; but a statement of the position taken up with regard to it is necessary to make intelligible the chronology of much of this sketch. The separatist theory is ultimately due to that habit of mind which finds it difficult to assume the existence of a transcendent genius. Every argument on which it rests has again and again been refuted.

The Homeric poems, then, existed in substantially their present form by about the beginning of the last millenium B.C. They were published, if that term can be used, chiefly by the recitations of a gild of professional poets and reciters, (rhapsodes, ῥαψῳδοί iit. "song-sewers") the so-caiied *Homeridai* (clan oi Homer, a common form of gild-name). They were thus exposed to the numerous small changes in detail which naturally attend oral transmission, such as the substitution of current for obsolete words and forms, the addition or omission of single lines, groups of lines, possibly here and there even short episodes, and so forth. But, although aberrant texts were thus produced, it seems probable that there existed from early times more authentic copies, going back ultimately to the poet's own ms. Hence when the Alexandrian critics, and perhaps before them Peisistratus of Athens (sixth century B.C.), attempted to produce an authentic and reliable text, they were not left to mere conjecture or weighing of probabilities, but had at their disposal a certain number of mss. which contained genuinely old tradition, not unrecognizably deformed.

With this simultaneous preservation and deformation of the text went imitation and supplementing, not by additions to the *Iliad* and *Odyssey,* but by the composition of new poems, which told those parts of the heroic legends which Homer had not touched upon. The authors of these works were Ionians, as were the *Homeridai,* to whom indeed it is highly likely that at least the earlier poets of this group belonged.

The grammarian Proclus (A.D. 140) has preserved the names and subjects of some of these; but the fragments are very scanty. The *Nostoi* or *Homeward Voyages,* by Agias (or Hagias) of Troezen, filled up the gap of ten years between the *Iliad* and the *Odyssey;* the *Lay of Telegonus,* by Eugammon of Cyrene, continued the story of the *Odyssey* to the death of Odysseus by the hand of Telegonus, the son whom Circe bore to him. Similarly the *Cyprian Lays* by Stasinus of Cyprus, ascribed by others to Hegesias (or Hegesinus) of Salamis or Halicarnassus, was introductory to the *Iliad;* the *Aethiopis* and the *Sack of Troy,* by Arctinus of Miletus, and the *Little Iliad,* by Lesches of Mytilene, were supplementary to it. These and many other names of lost epics—some taken also from the Theban myths *(Thebais, Epigoni, Oedipodea)*—serve to show how prolific were the followers of Homer *(see* CYCLE).

The epic poetry of Ionia celebrated the great deeds of heroes in the old wars. But in Greece proper there arose another school of epic, which busied itself with religious lore and ethical precepts, especially in relation to the rural life of Boeotia. This school is represented by the name of Hesiod. The legend spoke of him as vanquishing Homer in a poetical contest of Chalcis in Euboea; and it expresses the fact that, to the old Greek mind, these two names stood for two contrasted epic types. He is conjecturally placed about 850–800 B.C.; but some would refer him to the early part of the 7th century B.C. His home was at Ascra, a village in a valley under Helicon, whither his father had migrated from Cyme in Aeolis on the coast of Asia Minor. In Hesiod's *Works and Days* we have the earliest example of a didactic poem. The seasons and the labours of the Boeotian farmer's year are followed by a list of the days which are lucky

[1] ἔπος, the "verse" *par excellence,* hence the name epic (ἐπική, properly "written in hexameters," *sc.* "poetry.").

or unlucky for work. The Theogony, or "Origin of the Gods," describes first how the visible order of nature arose out of chaos; next, how the gods were born. Though it never possessed the character of a sacred book, it remained a standard authority on the genealogies of the gods. So far as a corrupt and confused text warrants a judgment, the poet was piecing together—not always intelligently—the fragments of a very old cosmogonic system, using for this purpose both the hymns preserved in the temples and the myths which lived in folklore. A school of Hesiodic poets grew up, whose works included several long narrative poems, such as the Ἠοῖαι, including the *Wooers* of Helen (whereof a fragment has been recovered from Egypt) and others. The Shield of Heracles is, at least in form, an episode of the Ἠοῖαι; it is 480 lines long and much influenced by Iliad xviii. (the Arms of Achilles). A religious purpose was essentially characteristic of the Hesiodic school. Its poets treated the old legends as relics of a sacred history, and not merely, in the Ionian manner, as subjects of idealizing art. Such titles as the Maxims of Cheiron and the Lay of *Melampus*, the seer—lost poems of the Hesiodic school—illustrate its ethical and its mystic tendencies

The *Homeric* Hymns are a collection of pieces, some of them very short, in hexameter verse. Their traditional title is—*Hymns* or *Preludes* of Homer and the Homeridai. The second of the alternative designations is the true one. The pieces are not "hymns" used in formal worship, but "preludes" or prefatory addresses (προοίμια) with which the rhapsodists ushered in their recitations of epic poetry. The "prelude" might be addressed to the presiding god of the festival, or to any local deity whom the reciter wished to honour. The pieces (of which there are 33) range in date perhaps from 750 to 500 B.C. (though some authorities assign dates as late as the 3rd and 4th centuries AD.; see ed. by Sikes and Allen, *e.g.* p. 228), and it is probable that the collection was formed in Attica, for the use of rhapsodists. The style is an imitation of Homer's, in a much more recent form of Greek, but there are also several traces of the Hesiodic or Boeotian school. The principal "hymns" are (1) to Apollo (generally treated as two or more hymns combined in one); (2) to Hermes; (3) to Aphrodite; and (4) to Demeter. The hymn to Apollo, quoted by Thucydides (iii. 104) as Homer's, is of peculiar interest on account of the lines describing the Ionian festival at Delos. Two celebrated pieces of a sportive kind passed under Homer's name. The lost Margites—a comic poem on one "who knew many things but knew them all badly"—is regarded by Aristotle as the earliest germ of comedy, and was possibly as old as 700 B.C. Only a few lines remain. The *Batracho(myo)machia,* or Battle of the Frogs and Mice is of highly uncertain date[1].

(b) Elegiac poetry. Homer and his Ionian successors had used the hexameter as a vehicle for elevated narrative of adventure; the Hesiodic school had found another use for it, namely serious didactic works, such as in a later age were generally set forth in prose, a medium not then recognized as a literary form. But all this while a political change had been operating. Greece had passed from the empire of Agamemnon which Homer described to independent kingdoms and baronies; these in turn gave place to oligarchies, and by the seventh century this system in turn was showing clear signs of decay. Hence the individual, the private citizen, was assuming daily greater relative importance. Yet it seems to have been felt that so noble a measure as Homeric or even Hesiodic verse was hardly suitable for the expression of his sentiments; a lighter form, the elegiac couplet (*q.v.*) was invented, and rapidly became the medium for all manner of compositions, including dirges, love-songs, recruiting-songs, and what we should call essays suitable for prose. The new medium became very popular and spread far beyond the Ionian race, as witness the Megarian Theognis (sixth century), who used it for a long series of reflections on personal, ethical and political matters, still extant, the Athenian Solon (somewhat earlier, about 639–559), and Tyrtaeus (seventh century), a man of uncertain nationality, who became the interpreter of contemporary Spartan aspirations. The name *elegos* is of uncertain origin, but certainly the first elegists were Ionians (Callinus of Ephesus, first half of the seventh century, is the earliest known). It never quite died out, and after being rather less in favour during the next period of literature, it revived in the Alexandrian epoch. An important offshoot is the epigram, for which it is the favourite, although never the only, metre (cf. ALEXANDRIAN SCHOOL).

(c) Iambic poetry. Another Ionian invention, destined to become an exceedingly important medium, was the iambic. This form (*q.v.*), literally the "shooting" or "darting" metre (from ἰάπτειν *cf.* the jesting handmaid Iambe in the legend of Demeter, *q.v.*) had nothing whatever to do with the hexameter, or with epic tradition, being closely akin to the rhythm of ordinary speech (Aristotle, Rhet. iii. 1408b 33), and therefore very well suited to realistic compositions. In fact, the most famous masters of it (Archilochus of Paros, about 650, Hipponax of Ephesus, about a hundred years later) were celebrated as lampooners. For this purpose, the form known as the *skazon* or limping iambus was especially adapted. But other subjects, notably fable, were handled, and Semonides (not Simonides) of Amorgus, a writer of uncertain, but fairly early date, has left us an amusing iambic poem on women, which explains how they were created from various beasts (mares, sows, and so on), the few good ones being made out of bees. To this same period belongs, traditionally, the Phrygian Aesop (Aisopos), to whom later ages attributed a great number of beast-fables. These, or some of them, were current from the time of Archilochus on; those which we now have are one and all late, whether in prose or in verse (see A. Chambry, *Aesopi* fabulae, Paris 1925, and Halliday, Greek and Roman Folklore, New York 1927, p. 101). In the fifth century. Athenian writers used iambics for the dialogue of both tragedy and comedy.

(d) Personal lyric. Hitherto the centre had been Ionia; but the neighbouring Aeolians had meanwhile developed a quite different form of composition, the lyric, which may be described briefly as short songs, on personal topics, or at least treating their topic in an intensely personal manner. As indicated by the name, they were meant to be sung to the lyre; the traditional accompaniment of the elegy was the oboe (αὐλός see AULOS). Traditionally, the lyre had originally but four strings, giving the tetrachord (see MUSIC, Greek *Music*), but an improvement attributed to Terpander of Lesbos (670) gave it seven strings, thus producing the octave. Lesbos, in the 7th century B.C., had attained some naval and commercial importance. But the strife of oligarchy and democracy was active; the Lesbian nobles were often driven by revolution to exchange their luxurious home-life for the hardships of exile. It is such a life of contrasts and excitements, working on a sensuous and fiery temperament, that is reflected in the fragments of Alcaeus, to which, in recent years, some small additions have been made from Egyptian papyri. The other great representative of the Aeolian lyric is Sappho, the only woman of Greek race who is known to have possessed poetical genius of the first order. Her fragments, which also have been supplemented by Egyptian discoveries, show together with extraordinary powers of expression, a very wide range of subject, from badinage to the most intense passion. Anacreon of Teos, in Ionia, may be classed with the Aeolian lyrists in so far as the matter and form of his work resembled theirs, though the dialect in which he wrote was mainly the Ionian. A few fragments remain from his hymns to the gods, from love-poems and festive songs. The collection of short pieces, often very pretty, which passes current under his name date only from the 10th century. The poems which it comprises are of various age and authorship, probably ranging in date from c. 200 B.C. to A.D. 400 or 500.

(e) Choral lyric. The last comers to Greece, the Dorians, had so far contributed nothing of their own. But about the time of Sappho, a new school of poetry arose in Sparta, under the guidance of a Sardian, one Alcmaeon, or, as the Dorians called him, *Alkman,* and it spread rapidly among Doric-speaking peoples. This was choral lyric, voicing, not individual sentiments,

[1] Some attribute it, as well as the *Margites,* to Pigres of Halicarnassus, the supposed brother of the Carian queen Artemisia, who fought on the side of Xerxes at the battle of Salamis.

but those of a community or part of a community. The chief fragment which survives of his work is a parthenion, or song intended for a chorus of girls, and it is still decidedly individual in tone, the members of the choir addressing all manner of remarks to each other. In Sicily a greater writer, so far as we can judge, rose up in the person of Stesichorus, who lived for the most part in Himera, and wrote, not of course in the Laconian dialect used by Alkman, but still in Doric, which was the speech of most Sicilian Greeks. He seems to have written choral pieces on a grand scale, dealing with epic themes. Arion (*q.v.*) of Methymna in Lesbos is said to have given the dithyramb a literary form and Ibycus of Rhegium apparently wrote poems partaking of both Dorian and Aeolic character. But the Boeotians again entered the field, as they had done in the days of epic poetry; the considerable fragments of their poetess Corinna, who lived in the fifth century, show that their dialect was used for choral lyric and therefore that the tradition of long poems, partly narrative in character, was established there also. Meanwhile, the new fashion was reflected upon some parts of Ionia.

In the fifth century we find three great lyric poets, all professional, writing to order and for pay, all using a dialect more or less Doric, and all writing poems to be sung by choirs, in elaborate metres, arranged generally on the principle of strophe, antistrophe, and epode (see STROPHE); yet none of them a Dorian by nationality. Simonides of Ceos was an Ionian, and lived part of his life at Athens; his nephew was Bacchylides, of whose pretty and neat writings Egypt has provided us with a fairly large sample; and the greatest of them all was Pindar (*Pindaros*) of Thebes, who claimed Dorian descent, but was a thorough Boeotian. The fragments which alone remain of the first (556–468) show that he lacked neither power, sweetness, nor variety; he did not confine himself to lyric, for several of the finest epigrams in all Greek are of his writing. Pindar (518–*c.* 442) is represented for us by his epinikian odes, *i.e.*, choral songs in celebration of victories at the various great games, and by large fragments of other forms of ode, as parthenia, hymns, dirges and dithyrambs. All, especially the first, are marked by an extraordinary richness of expression, made extremely difficult for us by the use not only of a somewhat artificial dialect but of a highly conventional style, full of bold and striking metaphors, often very strange to our taste. Compared with him, Bacchylides gives the impression of writing more by rule than by inspiration, and of already presenting traces of degeneration; that lyric poetry did decline markedly is clear from what we have left of Timotheus of Miletus (died 357), whose Persae is a model of designed obscurity, forced would-be elevation of style, and general bad taste.

(f) Prose. It remains only to say that the first use of prose as a literary medium is found among the *logographi* (*q.v.*) and philosophers of Ionia; and that their influence was sufficient to make Ionic continue as the recognized medium for historical composition and for some kinds of scientific treatise (notably medical; it is the language of the whole Hippocratic corpus) for a considerable time.

2. ATTIC LITERATURE

(a) Tragedy. It had thus become the established convention that works of a conversational tone should be in Ionic, and in iambics, and that choral odes should be in Doric. A form of literature arose which, with modifications, combined these traditions and made a new means of expression. This was Tragedy, the first great contribution of Athens to literature. Arising out of the worship of Dionysus, although the details are very obscure, it developed, traditionally under Thespis in the sixth century, into a series of narrative odes relating to the history of that god, or of other divine and heroic figures, interspersed with episodes, as they were called, in which an actor represented some adventure by means of narrative or of dialogue with the chorus. After becoming somewhat more of a regular drama under Phrynichus, Pratinas, and Choerilus, it passed into the hands of Aeschylus (524–456), who became the real founder of tragedy by introducing a second actor, and thus rendering the dialogue independent of the chorus. At the same time the chorai song — hitherto the principal part of the performance — became subordinate to the dialogue; and drama was mature. Aeschylus is also said to have made various improvements of detail in costume and the like; the system of the "trilogy" and the "tetralogy" is further ascribed to him, — the "trilogy" being properly a series of three tragedies connected in subject. such as the Agamemnon, *Choëphori, Eumenides*, which together form the Oresteia, or Story of Orestes. The "tetralogy" is such a triad with a "satyric drama" added — that is, a drama in which satyrs (*q.v.*) formed the chorus. The fragmentary Zchneutae of Sophocles and the Cyclops of Euripides are the only extant specimens of a satyric drama. In the seven tragedies which alone remain of the 70 which Aeschylus is said to have composed, besides the grandeur, at times rugged and obscure, of the whole, there is a strain of speculative thought markedly theological in tone. Sophocles, who was born some 30 years after Aeschylus, is the most perfect artist of the ancient drama. No one before or after him gave to Greek tragedy so high a degree of ideal beauty. or appreciated so finely the possibilities and the limitations of its sphere. He excels especially in drawing character; his *Antigone*, his Ajax, his Oedipus — indeed, all the chief persons of his dramas — are typical studies in the great primary emotions of human nature. He gave a freer scope to tragic dialogue by adding a third actor; and in one of his later plays, the Oedipus at *Colonus*, a fourth actor is required. From the time when he won the tragic prize against Aeschylus in 468 to his death in 40j B.C. he was the favourite dramatist of Athens. Euripides was but some 15 years younger than Sophocles; but when he entered on his poetical career, the old inspirations of tragedy were already failing. Euripides marks a period of transition in the drama, and is, in fact, a mediator between the classical and the romantic. He was imbued with the new intellectual scepticism of the day; and the speculative views which were conflicting in his own mind are reflected in his plays. He had much picturesque and pathetic power; he was a master of expression; and he shows ingenuity in devising fresh resources for tragedy-especially in the development of a type of plot alien to that of New Comedy (see below), exemplified in his *Ion*, which turns on the recognition of a long-lost son under exciting and romantic circumstances. This, and his fondness for characters drawn from everyday life, were noted by ancient critics as well as by moderns; the latter is a commonplace in Aristophanes, the former insisted upon in the recently discovered Life of *Euripides* by Satyrus (3rd century B.C.). All the great tragic poets of Attica were remarkably prolific. Aeschylus was the reputed author of 70 tragedies, Sophocles of 113, Euripides of 92; and there were others whose productiveness was equally great.

(b) Comedy. Comedy also arose out of the worship of Dionysus (its name is derived from κῶμος, see DRAMA), though again the details are obscure. The Dorians perhaps, first added dialogue to the comic chorus. Susarion, a Dorian of Megara, exhibited, about 580 B.C., pieces of the kind known as "Megarian farces." Epicharmus of Cos (who settled at Syracuse) gave literary form to the Doric farce, and treated in burlesque style the stories of gods and heroes, and subjects taken from everyday life. His Syracusan contemporary Sophron (c. 450) was a famous writer of mimes, chiefly scenes from low-class life. The most artistic form of comedy seems, however, to have been developed in Attica. The greatest names before Aristophanes are those of Cratinus and Eupolis; but from about 470 B.C. there seems to have been a continuous succession of comic dramatists, amongst them Plato Comicus, the author of 28 comedies, political satires and parodies after the style of the Middle Comedy. Aristophanes came forward as a comic poet in 427 B.C., and retained his popularity for about 40 years. He presents a perhaps unique union of bold fancy, exquisite humour, critical acumen and lyrical power. His 11 extant comedies may be divided into three groups, according as the licence of political satire becomes more and more restricted. In the *Acharnians*, Knights, Clouds, *Wasps* and Peace (425–421) the poet uses unrestrained freedom. In the Birds, Lysistrata, *Thesmophoriazusae* and Frogs (414–405) a greater reserve may be perceived.

Lastly, in the *Ecclesiazusae* and the Plutus (392–388) personal satire is almost wholly avoided. The same general tendency continued. The so-called "Middle Comedy" (390–320) represents the transition from the Old Comedy, or political satire, to satire of a literary or social nature; its chief writers were Antiphanes of Athens and Alexis of Thurii. The "New Comedy" (320–250) resembled the modern "comedy of manners."

Its chief representative was Menander (342–291), the author of 105 comedies. Fragments have been discovered of seven of these, and in the case of at least three, *Epitrepontes* (The Arbitration), Perikeiromene (The Eton Crop) and Samia (The Girl from Samos), the plot can be fairly well made out. The chief characters are respectable middle-class Athenians; there are no outstandingly heroic figures and no utter villains. The story is of a kind which was then fairly new, but afterwards became exceedingly hackneyed, later comedians and also novelists copying Attic New Comedy ad nauseam. The *Epitrepontes* will serve as a sample. Two country fellows have got possession of an exposed infant and quarrel as to who shall have the jewelry found with it. They refer the dispute to an old gentleman, Smicrines (Mr. Smallways), who decides it for them. Smicrines has a daughter, Pamphile (Miss Lovely), recently married to a young Athenian, Charisius (Mr. Charming), who, to his horror, discovers that his wife has already borne a child. He therefore seeks consolation from a woman of the town, Habrotonon (Love-at-ease). Onesimus (Helpful, Charisius's slave) now finds, in the possession of one of the rustics, a ring belonging to his master, which had been lost in an encounter with an unknown girl at a nocturnal festival. After some complications, it turns out that the child is Pamphile's and that Charisius is the father; the missing end of the play no doubt showed a general reconciliation.

The merit of such a piece lies in the just, though slight, drawing of character, and in a certain rather faded elegance of style. Menander was hugely admired in antiquity, but he had neither the joyous exuberance of Aristophanes nor the vigour of his own Latin imitators (see LATIN LITERATURE). So far from Terence being dimidiatus Menander, it is rather the Athenian who is dimidiatus Terentius. Other prominent writers of this class were Diphilus, Philemon, Posidippus and Apollodorus of Carystus. About 330 B.C. Rhinthon of Tarentum revived the old Doric farce in his Hilarotragoediae or travesties of tragic stories. These successive periods cannot be sharply or precisely marked off. The change which gradually passed over the comic drama was simply the reflection of the change which passed over the political and social life of Athens. The Old Comedy, as we see it in the earlier plays of Aristophanes, was probably the most powerful engine of public criticism that has ever existed in any community. Unsparing personality was its essence. The comic poet used this recognized right on an occasion at once festive and sacred, in a society where every man of any note was known by name and sight to the rest. (See DRAMA: Greek.)

(*c*) **Historical Prose.** It has already been said that prose began in Ionia; hence we find that the first great historical writer, a Dorian by birth and strongly pro-Athenian in sentiment, writes in Ionian. Herodotus of Halicarnassus set out to make an "enquiry" (ἱστορίη) into the great wars between Greece and Persia, and incidentally into the events leading up to that struggle, and the men and manners of the countries directly or indirectly involved. To this task he brought a marvellous gift of lively narrative, a critical mind, tempered by respect for all forms of religion and relish for a good story (whence two characteristic turns of expression, a refusal to go any further with his narrative lest he trespass on a ἱερὸς λόγος, or legend which should properly be told only to the initiates in some mystery-cult; and the telling in full of a tale which he says he himself does not believe), and an interest in all things human which makes him the father, not only of history, but of anthropology. To this must be added a knowledge of the many theories of history, geography, and the development of religious cult then prevalent. The result is a work of inexhaustible interest, generally fully reliable when the author speaks from his own knowledge, and always delightful.

Herodotus was born in 484 B.C.; and his history was probably not completed before the beginning of the Peloponnesian War (431 B.C.). As might be expected, he owes much of his technique and not a little of his subject matter to earlier writers, notably Hecataeus; (see LOGOGRAPHI); but when we turn to the larger aspects of his work, Herodotus stands forth as an artist whose conception and whose method were his own. His history has an epic unity. Various as are the subordinate parts, the action narrated is one, great and complete; and the unity is due to this, that Herodotus refers all events of human history to the principle of divine Nemesis. His weaknesses are lack of insight into political and strategic cause and effect, and a lack of interest in the history of political institutions. Both his strength and his weakness are seen most clearly when he is contrasted with that other historian who was strictly his contemporary and who yet seems divided from him by centuries.

Thucydides was only thirteen years younger than Herodotus; but the intellectual space between the men is so great that they seem to belong to different ages. Herodotus is the last great Ionian, Thucydides the first great Attic prose writer. Herodotus is the first artist in historical writing; Thucydides is artist and thinker as well. Herodotus interweaves two threads of causation —human agency, represented by the good or bad qualities of men, and divine agency, represented by the vigilance of the gods on behalf of justice. Thucydides concentrates his attention on the human agency (without, however, denying the other), and strives to trace its exact course. Hence, while the older historian may be said to write a prose epic, the younger and greater, without sacrificing an iota of exactness and truth, has all the concentrated interest of a drama. The subject of Thucydides is the Peloponnesian War. In resolving to write its history, he was moved, he says, by these considerations. It was probably the greatest movement which had ever affected Hellas collectively. It was possible for him as a contemporary to record it with approximate accuracy. And this record was likely to have a general value, over and above its particular interest as a record, seeing that the political future was likely to resemble the political past. This is what Thucydides means when he calls his work "a possession for ever." The speeches which he ascribes to the persons of the history are, as regards form, his own essays in rhetoric of the school to which Antiphon belongs. As regards matter, they are always so far dramatic that the thoughts and sentiments are such as he conceived possible for the supposed speaker. They thus take the place of the comment which a modern historian would make in his own person, and serve as the chorus to his tragedy. Xenophon of Athens (430–*c.* 354) has not the grasp either of the dramatist or of the philosopher. His work does not possess the higher unity either of art or of science. The true distinction of Xenophon consists in his thorough combination of the practical with the literary character. He was an accomplished soldier, who had done and seen much. He was also a good writer, who could make a story both clear and lively. But the several parts of the story are not grouped around any central idea, such as a divine Nemesis is for Herodotus, or such as Thucydides finds in the nature of political man: The seven books of the *Hellenica* form a supplement to the history of Thucydides, beginning in 411 and going down to 362 B.C. The chief blot on the *Hellenica* is the author's partiality to Sparta, and in particular to Agesilaus. Some of the greatest achievements of Epameinondas and Pelopidas are passed over in silence. On the whole, Xenophon is perhaps seen at his best in his narrative of the Retreat of the Ten Thousand—a subject which exactly suits him. *The* Education of Cyrus is our earliest historical romance, and that is its chief interest. The Recollections of *Socrates* fail lamentably to reveal a character which Xenophon admired but never understood; their historical value has been much exaggerated. In his minor pieces on various subjects Xenophon appears as the earliest essayist. It may be noted that one of the essays erroneously ascribed to him—that On the Athenian Polity—is probably the oldest specimen in existence of literary Attic prose.

His contemporaries Ctesias of Cnidus and Philistus of Syracuse

wrote histories of Persia and Sicily. In the second half of the 4th century a number of histories were compiled by literary men of little practical knowledge, who had been trained in the rhetorical schools. Such were Ephorus of Cyme and Theopompus of Chios, both pupils of Isocrates; and the writers of Atthides (chronicles of Attic history), the chief of whom were Androtion and Philochorus. Timaeus of Tauromenium was the author of a great work on Sicily, and introduced the system of reckoning by Olympiads.

(d) **Oratory.** The steps by which an Attic prose style was developed, and the principal forms which it assumed, can be traced most clearly in the Attic orators. Every Athenian citizen who aspired to take part in the affairs of the city, or even to be qualified for self-defence before a law-court, required to have some degree of skill in public speaking; and an Athenian audience looked upon public debate, whether political or forensic, as a competitive trial of proficiency in a fine art. Hence the speaker, no less than the writer, was necessarily a student of finished expression; and oratory had a more direct influence on the general structure of literary prose than has ever perhaps been the case elsewhere. A systematic rhetoric took its rise in Sicily, where Corax of Syracuse (466 B.C.) devised his Art of *Words* to assist those who were pleading before the law-courts; and it was brought to Athens by his disciple Tisias. The teaching of the Sophists, again, directed attention to grammar and logic; and Gorgias of Leontini gave an impulse at Athens to the taste for elaborate rhetorical brilliancy.

Antiphon represents the earliest, and what has been called the grand, style of Attic prose; its chief characteristics are a grave, dignified movement, a frequent emphasis on verbal contrasts, and a certain austere elevation. The interest of Andocides is mainly historical; but he has graphic power. Lysias, the representative of the "plain style," breaks through the rigid mannerism of the elder school, and uses the language of daily life with an ease and grace which though the result of study, do not betray their art. He is, in his own way, the canon of an Attic style; and his speeches written for others, exhibit also a high degree of dramatic skill. Isocrates, whose manner may be regarded as intermediate between that of Antiphon and that of Lysias, wrote for readers rather than for hearers. The type of literary prose which he founded is distinguished by ample periods, by studied smoothness and by the temperate use of rhetorical ornament. From the middle of the 4th century B.C. the Isocratic style of prose became general in Greek literature. The speeches of Isaeus in will-cases are interesting,—apart from their bearing on Attic life,—because in them we see, as Dionysius says, "the seeds and the beginnings" of that technical mastery in rhetorical argument which Demosthenes carries to perfection. Isaeus has also, in a degree, some of the qualities of Lysias. Demosthenes excels all other orators not only in power but in variety; his political speeches, his orations in public or private causes, show his consummate and versatile command over all the resources of the language. In him the development of Attic prose is completed, and the best elements in each of its earlier phases are united. The modern world can more easily appreciate Demosthenes as a great natural orator than as an elaborate artist. But, in order to apprehend his place in the history of Attic prose, we must remember that the ancients felt him to be both; and that he was even reproached by detractors with excessive study of effect. Aeschines is the most theatrical of the Greek orators; he is vehement, and often brilliant, but seldom persuasive. Hypereides was, after Demosthenes, probably the most effective; he had much of the grace of Lysias, but also a wit, a fire and a pathos which were his own. Portions of six of his speeches, found in Egypt between 1847 and 1890, are extant. The one oration of Lycurgus which remains to us is earnest and stately, reminding us both of Antiphon and of Isocrates. Deinarchus was merely a bad imitator of Demosthenes. There seems more reason to regret that Demades is not represented by larger fragments. The decline of Attic oratory may be dated from Demetrius of Phalerum (318 B.C.), the pupil of Aristotle. He forms a connecting link between Athens and Alexandria, where he found refuge after his downfall and promoted the foundation of the famous library.

(e) **Philosophical Prose.** The 5th and 4th centuries saw the abandonment of verse (still used by Parmenides) as a medium for serious philosophic works, and the development, at Athens, of a style and vocabulary suited to philosophy. The greatest name is that of Plato. The literary genius shown in his dialogues is many-sided: it includes dramatic power, remarkable skill in parody, a subtle faculty of satire, and, generally, a command over the finer tones of language. In passages of continuous exposition, where the argument rises into the higher regions of discussion, Plato's prose takes a more decidedly poetical colouring—never florid or sentimental, however, but lofty and austere. In Plato's later works, notably the Laws, we can perceive the influence of Isocrates on his style. Aristotle's influence on the form of Attic prose literature would probably have been considerable if his Rhetoric had been published while Attic oratory had still a vigorous life before it. But in this, as in other departments of mental effort, it was Aristotle's lot to set in order what the Greek intellect had done in that creative period which had now come to an end. Of his own style, which Cicero praises, we can hardly judge, for the surviving works are rather of the nature of lecture notes than of finished literary performances. Accurate and showing full mastery of an elaborate technical vocabulary, they are often condensed to the point of obscurity or so free of ornament as to be cold and dry. Theophrastus, his pupil and his successor in the Lyceum, opens the new age of research and scientific classification with his extant works on botany, but is better known to modern readers by his lively Characters, the prototypes of such sketches in English literature as those of Hall, Overbury and Earle.

3. HELLENISTIC LITERATURE

The intensely active life of the independent Greek city states was plainly a most important factor in their literature and art. Once the individual Greek ceased to be a relatively important unit of a small self-governing community, his inspiration, although not his technical skill, dwindled, and no more works of the very first order were produced after the conquest of Greece by Philip II. of Macedon. Then came Alexander's conquests; Greek civilization was diffused over Asia and the East by means of Greek colonies in which Asiatic and Greek elements were mingled. The life of such settlements, under the monarchies into which Alexander's empire broke up, could not be animated by the spirit of the Greek commonwealths in the old days of political freedom. But the externals of Greek life were there—the temples, the statues, the theatres, the porticos. Ceremonies and festivals were conducted in the Greek manner. In private life Greek usages prevailed. Greek was the language most used; Greek books were in demand. The mixture of races would always in some measure distinguish even the outward life of such a community from that of a pure Greek state; and the facility with which Greek civilization was adopted would vary in different places. Syria, for example, was rapidly and completely Hellenized; Judaea resisted the process to the last. In Egypt a Greek aristocracy of office, birth and intellect existed side by side with a distinct native life. But, viewed in its broadest aspect, this new civilization may be called Hellenism. Hellenism (*q.v.*) means the adoption of Hellenic ways; and it is properly applied to a civilization, generally Hellenic in external things, pervading people not necessarily or exclusively Hellenic by race. What the Hellenic literature was to Hellas, that the Hellenistic literature was to Hellenism. The literature of Hellenism has the Hellenic form without the Hellenic soul. A great writer is always something more than an individual; thus Sophocles may be said to embody Periclean Athens, Virgil, Augustan Rome, Shakespeare, Elizabethan England. But the Hellenistic writers, subjects of empires that were none of their own creation, had no longer a community which they could symbolize.

This is not, however, to say that Hellenistic literature has no interest or value. On the contrary, there has perhaps never been a time when so many respectable works of the second class were

produced, both in verse and in prose, and the study of the writers from about 300 B.C. onwards is full of variety and even fascination. There were many who had something to say, and very many who studied how best to say it, a process which gave rise to a considerable amount of good criticism but also to a too exclusive cult of mere outward form.

(a) **Poetry.** Neglecting the enfeebled survival of the older forms (for personal and choral lyric, dramas of all kinds, epics and elegies all continued to be written), we may take Alexandria as the centre of the new poetical movements. Details are given in the article ALEXANDRIAN SCHOOL; for our present purposes it is enough to remark on the highly finished and to a great extent original craftsmanship of Callimachus and his disciples. When it is considered that, apart from many technical improvements in metre, they produced the short story in verse (epullion), the purely literary didactic poem, the pastoral, and one might almost add the epigram as a literary genre, it is evident that they are not to be neglected in a survey of literature; and their influence, exerted principally through their Roman pupils, has been very great. In general it may be said of their poetry that, lacking breadth and deep inspiration, it succeeded best when it limited itself most, as in the exquisite Idylls of Theocritus, which set out to give a somewhat idealized picture of little scenes from country or town life; and that when it failed most lamentably, as in the inordinately dull puzzle-verse of Lycophron, it did so chiefly from lack of that instinctive good taste which is one of the leading characteristics of genuine Hellenic art.

(*b*) **Literary prose.** The Hellenistic empires had an imperial speech, the so-called *κοινή* or common dialect, before whose influence all the local dialects rapidly vanished—witness the facts that inscriptions in them become more and more obviously artificial, when they occur at all, and that the modern Greek dialects show hardly a trace of the old ones, being almost all local developments of the *κοινή*. Naturally the question arose how best to use this new speech, which was expressive and varied although it lacked the peculiar virtues of the old national speeches, in the best way. In Asia Minor a new school of expression grew up, known as Asianism, in which one of the greatest names was that of Hegesias of Magnesia (about 250 B.C.). Its characteristics were an inordinate love of short, balanced, elaborately rhythmical clauses, making full use of every ornament which the earlier rhetoricians from Gorgias on had evolved, and too often sacrificing sense to sound. Most of the works of these writers are completely lost, but enough fragments remain to show us that we have their influence at work in several Latin writers, such as the younger Seneca, and that Asianism is one of the forces which went to form the style of St. Paul.

The extravagances of Asianism brought about a reaction, however, and there grew up a different school of oratory in Rhodes, which claimed to go back to Aeschines, that orator having retired there after his defeat by Demosthenes. It combined with the periodic structure of Attic prose much of the Asianic ornament, used in a less excessive fashion. That it had real merit is apparent from the fact that in a later age Cicero and Caesar were pupils of a rhetorician of this school, Apollonius Molon (Cicero, *Brutus*, 312, 316; Suetonius, Divus *Iulius*, 4, 1).

(*c*) **Scientific prose.** The scientific and scholarly activity of this period and the next was immense, and there developed a style which, without wholly neglecting literary graces (as for example, the avoidance of hiatus which Isocrates had inculcated) was on the whole plain, workmanlike and unaffected, with a large technical vocabulary appropriate to the critic, mathematician, naturalist, geographer or writer on medicine.

(*d*) **Philosophical prose and verse.** Many philosophers of this age wrote an atrocious style; that of Epicurus (*q.v.*) is particularly bad. But there grew up, especially among the Cynics (*q.v.*) a tendency to appeal to the conscience of the ordinary man by means of short lectures or sermons (*διατριβαί*), and these gave rise to compositions in verse having the same end, which we may consider forerunners of Roman satire, particularly that of Horace and Persius. An outstanding name here is that of Cercidas (third century B.C.), of whose *meliamboi* we have now some specimens, recovered from Egypt; see J. U. Powell, Collectanea Alexandrina, p. 201.

The later, or Graeco-Roman period of Hellenistic literature may be dated from the Roman subjugation of Greece. Rome now gradually became the point to which the greatest workers in every kind were drawn. Greek literature had already made a home there before the close of the 2nd century B.C. Sulla brought a Greek library from Athens to Rome. Such men as Cicero and Atticus were indefatigable collectors and readers of Greek books. The power of speaking and writing the Greek language became an indispensable accomplishment for highly educated Romans, till in the third century A.D. it nearly drove out Latin as a literary medium. Rome became more and more the rival of Alexandria, not only as possessing great libraries, but also as a seat of learning at which Greek men of letters found appreciation and encouragement. Greek poetry, especially in its higher forms, rhetoric and literary criticism, history and philosophy, were all cultivated by Greek writers at Rome.

The first part of the Graeco-Roman period may be defined as extending from 146 B.C. to the close of the Roman republic. At its commencement stands the name of one who had more real affinity than any of his contemporaries with the great writers of old Athens, and who, at the same time, saw most clearly how the empire of the world was passing to Rome. The subject of Polybius (c. 205–120) was the history of Roman conquest from 264 to 146 B.C. His style, plain and straightforward, proclaims him a scientist rather than a rhetorician. But the distinction of Polybius is that he is the last Greek writer who in some measure retains the spirit of the old citizen-life. He chose his subject with a motive akin to that which prompted the history of Thucydides—namely, because, as a Greek citizen, he felt intensely the political importance of those wars which had given Rome the mastery of the world. The chief historical work which the following century produced—the Universal History of Diodorus Siculus (fl. c. 50 B.C.)—resembled that of Polybius in recognizing Rome as the political centre of the earth; but Diodorus is a mere compiler, useful because he draws on older works now lost, but often exceedingly dull.

Classicism and Atticism. Hellenistic literature always tended to classicize, *i.e.*, to imitate the great ancient writers instead of striking out new lines of thought or expression. About the last century B.C. there arose a particular form of this, known as Atticism. Rightly admiring,—for many of them were good critics,—the style of the great Attic prosateurs, most of the literary men of the time set themselves deliberately to write in their language, which had not been spoken for some two hundred years. It was as if English writers of to-day were to confine themselves to the style and vocabulary of Addison; but the movement was successful, and coloured all the literary prose of that and succeeding epochs. Not one of the Atticizers has real merit, save Lucian; it is to the credit of Plutarch (about 46—after 120 A.D.) that he Atticizes but little; the scientific writers, such as Strabo the geographer and the physician Galen, generally wrote literary Hellenistic; many of the philosophers, including the Christian apologists and the great Jewish thinker Philon of Alexandria (first century A.D.), being Platonists, wrote more or less Platonic prose; the earlier Christian writers, notably those of the New Testament, generally did not classicize at all, but were influenced by the Hebraizing Greek of the Septuagint. Excessive attention to form gave rise to the phenomenon known as the second sophistic, when a number of writers and orators arose who showed a most extraordinary virtuosity in handling their artificial language, combined with a lack alike of taste and of thought.

In the manifold prose work of this period, four principal departments may be distinguished. (1) History, with Biography, and Geography. History is represented by Dionysius of Halicarnassus—also memorable for his criticisms on the orators and his effort to revive a true standard of Attic prose—by Cassius Dio, Josephus, Arrian, Appian, Herodian, Eusebius and Zosimus. In biography, the foremost names are Plutarch, Diogenes Laertius and Philostratus; in geography, Hipparchus of Nicaea, Strabo,

Ptolemy and Pausanias (2) *Erudition* and *Science*. Under this head may be mentioned such as the lexicon of Julius Pollux, and the lost works drawn upon by Harpocration and Hesychius, Hephaestion's treatise on metre, and Herodian's system of accentuation; the commentaries of Galen on Plato and on Hippocrates; the learned miscellanies of Athenaeus, Aelian and Stobaeus; and the *Stratagems* of Polyaenus. (3) *Rhetoric* and *Belles-Lettres*. The most popular writers on the theory of rhetoric were Hermagoras, Hermogenes, Aphthonius and Cassius Longinus — the last the reputed author of the essay *On Sublimity*. Among the most renowned teachers of rhetoric — now distinctively called "Sophists," or rhetoricians — were Dio Chrysostom, Aelius Aristides, Themistius, Himerius, Herodes Atticus and Libanius. Akin to the rhetorical exercises were various forms of ornamental or imaginative prose — dialogues, letters, essays or novels. Lucian, in his dialogues, exhibits more of the classical style and of the classical spirit than any writer of the later age; he has also a remarkable affinity with the tone of modern satire, as in Swift or Voltaire. The emperor Julian was the author both of orations and of satiricai pieces.

Recent discoveries have thrown more light on the history of the Greek novel, a *genre* which begins about a hundred years before our era with the 'Milesian Tales of Aristeides, and continues down to early mediaeval times with the works of such writers as Chariton, Achilles Tatius, Longus, Heliodorus, and others. In all of these, the plot is much the same; a pair of lovers are separated or for some reason unable to marry, until, after all manner of extraordinary adventures, often suggestive of a cinematograph film, they are made happy. New Comedy is one of the principal sources for characters and part at least of the plot; but the influence of Oriental romances may reasonably be inferred. Some Christian novels of an edifying type were written; the most famous is the *Recognitions* falsely ascribed to Clement of Rome, which survives in a Latin translation and is a strange mixture of theology, thaumaturgy, and the re-union of long-lost relatives. The same age gave birth to large collections of the fictitious letters of famous historical and literary characters, as Phalaris, Themistocles, Hippocrates, Socrates, Euripides and many others, besides letters from persons wholly imaginary, as some of Alciphron's and all those of Aelian. New Comedy again, and occasionally pastoral poetry, was drawn upon for incidents and language. (4) *Philosophy* is represented chiefly by Epictetus and Marcus Aurelius, in both of whom the Stoic element is the prevailing one; by the Neoplatonists, such as Plotinus, Porphyry, Iamblichus; and by Proclus, of that eclectic school which arose at Athens in the 5th century A.D.

The Greek poetry of this period presents no work of high merit. Babrius versified the Aesopic *Fables;* the two Oppiani wrote didactic poems on fishing and hunting; Nonnus and Quintus Smyrnaeus made elaborate essays in epic verse; and Orphism produced some poems and hymns. The so-called Sibylline Oracles, in hexameter verse, range in date from about 170 B.C. to A.D. 700. By far the most pleasing compositions in verse which have come to us from this age are some of the short poems in the Greek Anthology.

The 4th century may be said to mark the beginning of the last stage in the decay of literary Hellenism. From that point the decline was rapid and nearly continuous. Christianity had now learned from it all that it was willing to learn, and a large Christian literature existed, estranged from the old ideals. In A.D. 529 Justinian put forth an edict by which the schools of heathen philosophy were formally closed. The act had at least a symbolical meaning. It is necessary to guard against the supposition that such assumed landmarks in political or literary history always mark a definite transition from one order of things to another. But it is practically convenient to use such landmarks.

The above sketch represents our knowledge at the time of writing. But the study of Greek literature is continually advancing, partly by new discoveries, partly by re-consideration of the old ones. To speak of the former only, within the last generation we have found, among Egyptian rubbish-heaps, besides a large number of fragmentary mss. of authors already known, several poems of Bacchylides, of whom previously we knew practically nothing; much of Pindar; the *Constitution* of *Athens* (*q.v.*), generally ascribed to Aristotle; the *Ichneutai* of Sophocles, battered, indeed, but in large part intelligible; a great part of the *Hypsipyle* of Euripides; the plays of Menander already mentioned; the Mimes of Herodas; a considerable fragment of a historian, not certainly identified, of the fourth century B.C. (the "Oxyrhynchus Historian"), and very numerous smaller fragments of many authors from Hesiod down. These are the more important literary discoveries; in addition, we have many scraps of popular compositions, songs, farces of the Alexandrian music-halls, and the iike, and thousands of non-literary documents, as private letters, official correspondence, records and accounts, both public and private, and the like. Herculaneum long ago yielded a number of badly-charred but not wholly illegible rolls, the private library of some one interested in the later Epicurean philosophy; the present excavations (1928) may at any moment produce more books, perhaps containing lost works of great importance. Inscriptions, moreover, are constantly being discovered, and have already furnished us with several hymns and paeans, the compendium of Epicurcanism known as the Testa ment of Diogenes of Oenoanda, and much other interesting information, throwing often a welcome light on the development of literature or philosophy. Hence a final history of the subject cannot be written, so long as there is still work of exploration to do; and even supposing that all is accomplished, and the last possible scrap of material found and commented upon, still the productions of so great and fertile a genius as that of Greece would need re-interpretation for each succeeding century.

BIBLIOGRAPHY.—The best general work is W. von Christ's *Geschichte drr griechischen Literatur,* in *I.* v. Miiller's *Handbuch der Altertumswissenschaft* (now in process of revision under the editorship of W. Otto); the sixth edition (Munich, 1912–24), revised by W. Schmid and O. Stahlin, contains a good bibliography. W Schmid and O Stählin, *Geschzchte der Griechischen Literatur* (1929) is excellent; A. Puech, *Histoire de la Litterature Grecque* (1928–30); A. and M. Croiset, *Histoire de la littkrature grecque* (1887–95, 5 vols.) is good, but no longer up to date. Small manuals and text-books are numerous; a few of the best are A. and M. Croiset, *Manuel d'histoire de la lit. grecque* (1900; Eng. trans., by G. F. Heffelbower, N.Y., 1904); (Sir) R. C. Jebb, in *Conzpanion to Greek Studies* (1916); *U.* v. Wilamowitz-Moellendorf in *Dze Kultur der Gegenwart* has the advantage of being revised at fairly frequent intervals. H. N. Fowler, *A history of ancient Greek literature* (revised ed. *N.Y.* 1923) is useful chiefly for its bibliography. L. Laurand (in *Manuel des Études grecques et latines,* 1925) gives a good outline. For histories and sketches of parts of the literature, besides the bibliographies given under individual authors, A. Couat, *La poésie alexandrine* (1882); *F.* Susemihl, *Geschiclzte der griechischen Literatur in der Alexandrinerzeit* (1891–92) may be named, although both are now out of date; more modern is U.v. Wilamowitz-Moellendorf's *Hellenistische Dichtung.* For the continually increasing works on new discoveries, recourse must be had to Bursian's *Jahresberichte* and *The Year's Work in Classical Studies;* a few useful volumes are E. Diehl, *Supplementurn Lyricum* (1910), H. v. Arnim, *Supplementurn Euripideum* and *E.* Diehl, *Supplementum Sophocleum* (both 1913); J. V. Powell and E. A. Barber, *New Chapters in the History of Greek Literature;* E. Lobel, *Sappho* (1925) and *Alcaeus* (1927); J. *U.* Powell, *Collectanea Alexandrina* (1925); and A. W. Pickard-Cambridge, *Dithyramb, Tragedy and Comedy* (1927). BYZANTINE LITERATURE

By "Byzantine literature" is generally meant the literature, written in Greek, of the so-called Byzantine period. There is no justification whatever for the inclusion of Latin works of the time of the East Roman empire. The close of the Byzantine period is clearly marked by the year 1453, at which date, with the fall of the Eastern empire, the peculiar culture and literary life of the Byzantines came to an end. It is only as regards the beginning of the Byzantine period that any doubts exist. There are no sufficient grounds for dating it from Justinian, as was formerly often done. In surveying the whole development of the political, ecclesiastical and literary life and of the general culture of the Roman empire, and particularly of its eastern portion, we arrive, on the contrary, at the conclusion that the actual date of the beginning of this new era—*i.e.,* the Christian-Byzantine, in contradistinction to the

Pagan-Greek and Pagan-Roman—falls within the reign of Constantine the Great.

The reign of Constantine the Great undoubtedly marks the beginning of a new period in the most important spheres of national life, but it is equally certain that in most of them ancient tradition long continued to exercise an influence. Sudden breaches of continuity are less common in the general culture and literary life of the world than in its political or ecclesiastical development. This is true of the transition from pagan antiquity to the Christian middle ages. Many centuries passed before the final victory of the new religious ideas and the new spirit in public and private intellectual and moral life. The last noteworthy remnants of paganism disappeared as late as the 6th and 7th centuries. The last great educational establishment which rested upon pagan foundations—the University of Athens—was not abolished till A.D. 529. The Hellenizing of the seat of empire and of the State, which was essential to the independent development of Byzantine literature proceeds yet more slowly. The first purely *Greek* emperor was Tiberius II. (578–582); but the complete Hellenizing of the character of the State had not been accomplished until the 7th century.

In order to estimate rightly the character of Byzantine literature and its distinctive peculiarities, in contradistinction to ancient Greek, it is imperative to examine the great difference between the civilizations that produced them. The Byzantine did not possess the homogeneous, organically constructed system of the ancient civilization, but was the outcome of an amalgamation of which Hellenism formed the basis. For, although the Latin character of the empire was at first completely retained, even after its final division in 395, yet the dominant position of Greek in the Eastern empire gradually led to the Hellenizing of the State.

In spite of the dominant position of Greek in the Eastern empire, a linguistic and national uniformity such as formed the foundation of the old Latin *Imperium Romanum* never existed there. It might have been expected that the Hellenizing of the political system of the Eastern empire would have likewise entailed the Hellenizing of the non-Greek portions of the empire. Such, however, was not the case; for all the conditions precedent to such a development were wanting. The Greeks did not possess that enormous political energy and force which enabled the Romans to assimilate foreign races, and moreover they were confronted by sturdy Oriental, mostly Semitic, peoples, who were by no means so easy to subjugate as were the racially related inhabitants of Gaul and Spain.

The influence of Greek culture then, was very slight; how little indeed it penetrated into the Oriental mind is shown by the fact that, after the violent Arab invasion in the south-east corner of the Mediterranean, the Copts and Syrians were able to retain their language and their national characteristics, while Greek culture almost completely disappeared. The one great instance of assimilation of foreign nationalities by the Greeks is the Hellenizing of the Slavs, who from the 6th century had migrated into central Greece and the Peloponnese. All other non-Greek tribes of any importance which came, whether for longer or for shorter periods, within the sphere of the Eastern empire and its civilization—such as the Copts, Syrians, Armenians, Georgians, Rumanians, Serbs, Bulgarians, Albanians—one and all retained their nationality and language. The complete Latinizing of the West has accordingly no counterpart in a similar Hellenizing of the East.

Though the character of Byzantine culture is mainly Greek, and Byzantine literature is attached by countless threads to ancient Greek literature, yet the Roman element forms a very essential part of it. The whole political character of the Byzantine empire is, despite its Greek form and colouring, genuinely Roman. Legislation and administration, the military and naval traditions, are old Roman work, and as such, apart from immaterial alterations, they continued to exist and operate, even when the State in head and limbs had become Greek. *Rhomaioi* was the most common popular term for Greeks during the Turkish period, and remains so still. The old glorious name "Hellene" was used under the empire and even during the middle ages in a contemptuous sense—"Heathen"—and has only in quite modern times, on the formation of the kingdom of "Hellas," been artificially revived. The vast organization of the Roman political system could not but exercise in various ways a profound influence upon Byzantine civilization; and it often seemed as if Roman political principles had educated and nerved the unpolitical people to great political enterprise. The Roman influence has left distinct traces in the Greek language; Greek of the Byzantine and modern period is rich in Latin terms for conceptions connected with the departments of justice, administration and the imperial court.

Oriental Influences.—But by far the most momentous and radical change wrought on the old Hellenism was effected by Christianity; and yet the transition was, in fact, by no means so abrupt as one might be led to believe by comparing the Pagan-Hellenic culture of Plato's day with the Christian-Byzantine of the time of Justinian. For the path had been most effectually prepared for the new religion by the crumbling away of the ancient belief in the gods, by the humane doctrine of the Stoics, and, finally, by the mystic intellectual tendencies of Neoplatonism. Moreover, in many respects Christianity met paganism halfway by adapting itself to popular usages and ideas and by adopting important parts of the pagan literature. The whole educational system especially, even in Christian times, was in a very remarkable manner based almost entirely on the methods and material inherited from paganism. Next to the influences of Rome and of Christianity, that of the East was of importance in developing the Byzantine civilization, and in lending Byzantine literature its distinctive character. Much that was Oriental in the Eastern empire dates back to ancient times, notably to the period of Alexander the Great and his successors. In Egypt, Palestine and Syria, in Asia Minor as far inland as Mesopotamia, Greek and Oriental characteristics were often blended. In respect to the wealth and the long duration of its Greek intellectual life, Egypt stands supreme. It covers a period of nearly 1,000 years from the foundation of Alexandria down to the conquest of Egypt by the Arabs (A.D. 643). The soil of Egypt proved itself especially productive of Greek literature under the Cross (Origen, Athanasius, Arius, Synesius), in the same way as the soil of North Africa was productive of Latin literature (Tertullian, Cyprian, Lactantius, Augustine). Monastic life, which is one of the chief characteristic elements of Christian-Byzantine civilization, had its birth in Egypt.

Syria and Palestine came under the influence of Greek civilization at a later date than Egypt. In these, Greek literature and culture attained their highest development between the 3rd and the 8th centuries of the Christian era. Antioch rose to great influence, owing at first to its pagan school of rhetoric and later to its Christian school of exegesis. Gaza was renowned for its school of rhetoric; Berytus for its academy of law. It is no mere accident that sacred poetry, aesthetically the most valuable class of Byzantine literature, was born in Syria and Palestine. In Asia Minor, the cities of Tarsus, Caesarea, Nicaea, Smyrna, Ephesus, Nicopolis, etc., were all influential centres of Greek culture and literature. For instance, the three great fathers of Cappadocia, Basil, Gregory of Nyssa, and Gregory of Nazianzus, all belonged to Asia Minor. If all the greater Greek authors of the first eight centuries of the Christian era, *i.e.*, the period of the complete development of Byzantine culture, be classified according to the countries of their birth, the significant fact becomes evident that nine-tenths come from the African and Asiatic districts, which were for the most part opened up only after Alexander the Great, and only one-tenth from European Greece. The whole literature of Egypt, Syria and Asia Minor cannot, despite its international and cosmopolitan character, disavow the influence of the Oriental soil on which it was nourished. Yet the growth of too strong a local colouring in its literature was repressed, partly by the checks imposed by ancient Greek tradition, partly by the spirit of Christianity which reconciled all national distinctions. Even more clearly and unmistakably is Oriental influence shown in the province of Byzantine art, as Joseph Strzygowski has conclusively proved.

Language.—The greater portion of the Greek literature from

the close of ancient times down to the threshold nf modern history was written in a language identical in its principal features with the common literary language, the so-called *Koinē*, which had its origin in the Alexandrian age. This is the literary form of Greek as a universal language, though a form that scintillates with many facets, from an almost Attic diction down to one that approaches the language of everyday life such as we have, for instance, in the New Testament. From what has been already said, it follows that this stable literary language cannot always have remained a language of ordinary life. For, like every living tongue, the vernacular Greek continually changed in pronunciation and form, as well as in vocabulary and grammar, and thus the living language surely and gradually separated itself from the rigid written language. This progressive tendency might well have led, in the 11th and 12th centuries, to the founding in the Greek vernacular of a new literary language similar to the promising national languages and literature which, at that period, in the Romance countries, developed out of the despised popular idiom. In the case of the Byzantines, unfortunately, such a radical change never took place. All attempts in the direction of a popular reform of the literary language, which were occasionally made in the period from the 6th to the 10th centuries, were in turn extinguished by the resuscitation of classical studies, a movement which, begun in the 9th century by Photius and continued in the 11th by Psellus, attained its full development under the Comneni and the Palaeologi. Thus the language of the Byzantine writers of the 11th–15th centuries is almost Old Greek in colour; artificially learnt by grammar, lexicon and assiduous reading, it followed Attic models more and more slavishly; to such an extent that, in determining the date of works, the paradoxical principle holds good that the more ancient the language the more recent the author.

Owing to the artificial return to ancient Greek, the contrast that had long existed with the vernacular was now for the first time fully revealed. The gulf between the two forms of language could no longer be bridged; and this fact found its expression in literature also. While the vulgarizing authors of the 6th–10th centuries, like the Latin-writing Franks (such as Gregory of Tours), still attempted a compromise between the language of the schools and that of conversation, we meet after the 12th century with authors who freely and naturally employed the vernacular in their literary works. They accordingly form the Greek counterpart of the oldest writers in Italian, French and other Romance languages. That they could not succeed like their Roman colleagues, and always remained the pariahs of Greek literature, is due to the all-powerful philological-antiquarian tendency which existed under the Comneni and the Palaeologi. Yet once more did the vernacular attempt to assert its literary rights, *i.e.,* in Crete and some other islands in the 16th and 17th centuries. Though for the time being foiled by the classical reaction of the 19th century, the vernacular seems destined to gain the upper hand at all events in literature of an imaginative character.

The whole Byzantine intellectual life, like 'that of the Western mediaeval period, is dominated by theological interests. Theology accordingly, in literature too, occupies the chief place, in regard to both quantity and quality. Next to it comes the writing of history, which the Byzantines cultivated with great conscientiousness until after the fall of the empire. All other kinds of prose writing, *e.g.,* in geography, philosophy, rhetoric and the technical sciences, were comparatively neglected, and such works are of value for the most part only in so far as they preserve and interpret old material. In poetry, again, theology takes the lead. The poetry of the Church produced works of high aesthetic merit and enduring value. In secular poetry, the writing of epigrams especially was cultivated with assiduity and often with ability. In popular literature poetry predominates, and many productions worthy of notice, new both in matter and in form, are met with here.

Theology.—The great classical period of Greek theological literature is that of the 4th century. Various factors contributed to this result—some of them positive, particularly the establishment of Christianity as the official religion and the protection accorded to it by the State; others negative, *i.e.,* the heretical movements, especially Arianism, which at this period arose in the east of the empire and threatened the unity of the doctrine and organization of the Church. It was chiefly against these that the subtle Athanasius of Alexandria directed his attacks. The learned Eusebius founded a new department of literature, church history. In Egypt, Antonius (St. Anthony) founded the Greek monastic system; Synesius of Cyrene, like his greater contemporary Augustine in the West, represents both in his life and in his writings the difficult transition from Plato to Christ. At the centre, in the forefront of the great intellectual movement of this century, stand the three great Cappadocians, Basil the Great, the subtle dogmatist, his brother Gregory of Nyssa, the philosophically trained defender of the Christian faith, and Gregory of Nazianzus, the distinguished orator and poet. Closely allied to them was St. Chrysostom, the courageous champion of ecclesiastical liberty and of moral purity. To modern readers the greater part of this literature appears strange and foreign; but, in order to be appreciated rightly, it must be regarded as the outcome of the period in which it was produced, a period stirred to its depths by religious emotions.

The glorious bloom of the 4th century was followed by a perceptible decay in theological intellectual activity. Independent production was in succeeding centuries almost solely prompted by divergent dogmatical views and heresies, for the refutation of which orthodox authors were impelled to take up the pen. In the 5th and 6th centuries a more copious literature was called into existence by the Monophysites, who maintained that there was but *one* nature in Christ; in the 7th century by the Monothelites, who acknowledged but *one* will in Christ; in the 8th century by the Iconoclasts and by the new teaching of Mohammed. One very eminent theologian, whose importance it has been reserved for modern times to estimate aright—Leontius of Byzantium (6th century)—was the first to introduce Aristotelian definitions into theology, and may thus be called the first scholastic. In his works he attacked the heretics of his age, particularly the Monophysites, who were also assailed by his contemporary Anastasius of Antioch. The last great heresy, which shook the Greek Church to its very foundations, the Iconoclast movement, summoned to the fray the last great Greek theologian, John of Damascus (Johannes Damascenus). Yet his chief merit lies not so much in his polemical speeches against the Iconoclasts, and in his much admired but over-refined poetry, as in his great dogmatic work, *The Fountain of Knowledge,* which contains the first comprehensive exposition of Christian dogma.

Among theologians after John of Damascus must be mentioned: the emperor Leo VI., the Wise (886–911), who wrote numerous homilies and church hymns, and Theodorus of Studium (759–8-26), who in his numerous writings affords us instructive glimpses of monastic life. Pre-eminent stands the figure of the patriarch Photius. Yet his importance consists less in his writings, which often, to a remarkable extent, lack independence of thought and judgment, than in his activity as a prince of the Church. For he it was who carried the differences which had already repeatedly arisen between Rome and Constantinople to a point at which reconciliation was impossible, and was mainly instrumental in preparing the way for the separation of the Greek and Latin Churches accomplished in 1054 under the patriarch Michael Cerularius. All literature, including theology, experienced a considerable revival under the Comneni. In the reign of Alexius I. Comnenus (1081–1118), Euthymius Zigabenus wrote his great dogmatic work, the *Dogmatic Panoply,* which, like *The Fountain of Knowledge* of John of Damascus in earlier times, was partly positive, furnishing an armoury of theology, partly negative and directed against the sects. To the writings against ancient heresies were next added a flood of tracts, of all shapes and sizes, "against the Latins," *i.e.,* against the Roman Church, and among their authors must also be enumerated an emperor, the gifted Theodore II. Lascaris (1254–58). For the greatest Byzantine "apologia" against Islamism we are indebted to another emperor, Manuel II. Palaeologus (1391–1425), who by learned discussions tried to make up for the deficiency in martial prowess shown by the Byzantines in their struggle with the Turks. On the whole, theological literature was in the last century of the empire almost completely

occupied with the struggles for and against the union with Rome. Considering the supremacy of the theological party in Byzantium, it was but natural that religious considerations should gain the day over political; and this was the view almost universally held by the Byzantines in the later centuries of the empire; in the words of the chronicler Ducas: "it is better to fall into the hands of the Turks than into those of the Franks."

Hagiography. — Hagiography, *i.e.,* the literature of the acts of the martyrs and the lives of the saints, forms an independent group and one comparatively unaffected by dogmatic struggles. The main interest centres here round the objects described, the personalities of the martyrs and saints themselves. The authors, on the other hand — the Acts of the *Martyrs* are mostly anonymous — keep more in the background than in other branches of literature. The man whose name is mainly identified with Greek hagiography, Symeon Metaphrastes, is important not as an original author, but only as an editor. Symeon revised in the 10th century, according to the rhetorical and linguistic principles of his day, numerous old Acts of the Martyrs, and incorporated them in a collection consisting of several volumes, which was circulated in innumerable copies, and thus to a great extent superseded the older original texts. These Acts of the Martyrs, in point of time, are anterior to our period; but of the Lives of Saints the greater portion belong to Byzantine literature. From the popular Lives of Saints, which for the reading public of the middle ages formed the chief substitute for modern "belles lettres," it is easy to trace the transition to the religious novel. The most famous work of this class is the history of BARLAAM AND JOSAPHAT (*q.v.*).

Religious Poetry. — The religious poetry of the Greeks primarily suffered from the influence of the ancient Greek form, which was fatal to original development. The oldest work of this class is the hymn, composed in anapaestic monometers and dimeters, which was handed down in the manuscripts with the Paedagogus of Clement of Alexandria (d. about 215), but was probably not his work. The next piece of this class is the famous "Maidens' Song" in the Banquet of St. Methodius (d. about 311), in which many striking violations of the old rules of quantity are already apparent. More faithful to the tradition of the schools was Gregory of Nazianzus. But, owing to the fact that he generally employed antiquated versification and very erudite language, his poems failed to reach the people or to find a place in the services of the church. It became more and more patent that, with the archaic metre which was out of keeping with the character of the living language, no genuine poetry suited to the age could possibly be produced. Fortunately, an entirely new form of poetical art was discovered, which conferred upon the Greek people the blessings of an intelligible religious poetry — the rhythmic poem. This no longer depended on difference of quantity in the syllables, which had disappeared from the living language, but on the accent. Yet the transition was not affected by the substitution of accent for the old long syllables; the ancient verse form was entirely abandoned, and in its stead new and variously constructed lines and strophes were formed. In the history of the rhythmic sacred poetry three periods are clearly marked — the preparatory period; that of the hymns; and that of the *Canones.* About the first period we know, unfortunately, comparatively little. It appears that in it church music was in the main confined to the insertion of short songs between the Psalms or other portions of Holy Writ and the acclamations of the congregation. The oldest rhythmic songs date from Gregory of Nazianzus — his "Maidens' Song" and his "Evening Hymn." Church poetry reached its highest expression in the second period, in the grand development of the hymns, *i.e.,* lengthy songs comprising from 20 to 30 similarly constructed strophes, each connected with the next in acrostic fashion. Hymnology, again, attained its highest perfection in the first half of the 6th century with Romanos, who in the great number and excellence of his hymns dominated this species of poetry, as Homer did the Greek epic. From this period dates, moreover, the most famous song of the Greek Church, the so-called *Acathistus,* an anonymous hymn of praise to the Virgin Mary, which has sometimes, but erroneously, been attributed to the patriarch Sergius.

Church poetry entered upon a new stage, characterized by an increase in artistic finish and a falling off in poetical vigour, with the composition of the *Canones,* songs artfully built up out of eight or nine lyrics, all differently constructed. Andreas, archbishop of Crete (c. 650–720), is regarded as the inventor of this new class of song. His chief work, "the great Canon," comprises no fewer than 250 strophes. The most celebrated writers of *Canones* are John of Damascus and Cosmas of Jerusalem, both of whom flourished in the first half of the 8th century. Later, sacred poetry was more particularly cultivated in the monastery of the Studium at Constantinople by the abbot Theodorus and others. As regards the rhythmic church poetry, it may now be regarded as certain that its origin was in the East. Old Hebrew and Syrian models mainly stimulated it, and Romanos (*q.v.*) was especially influenced by the metrical homilies of the great Syrian father Ephraem (d. about 373).

History. — In profane literature the writing of history takes the first place, as regards both form and substance. In the Byzantine period all historical accounts fall under one of two groups, entirely different, both in form and in matter, (1) historical works, the authors of which described, as did most historians of ancient times, a period of history in which they themselves had lived and moved, or one which only immediately preceded their own times; and (2) chronicles, shortly recapitulating the history of the world. This latter class has no exact counterpart in ancient literature. The most clearly marked stage in the development of a Christian-Byzantine universal history was the chronicle (unfortunately lost) written by the Hellenized Jew, Justus of Tiberias, at the beginning of the and century of the Christian era; this work began with the story of Moses.

Byzantine histories of contemporary events do not differ substantially from ancient historical works, except in their Christian colouring. Yet even this is often very faint and blurred owing to close adherence to ancient methods. Apart from this, neither a new style nor a new critical method nor any radically new views appreciably altered the main character of Byzantine historiography.

The outstripping of the Latin West by the Greek East, which after the close of the 4th century was a self-evident fact, is reflected in historiography also. After Constantine the Great, the history of the empire, although its Latin character was maintained until the 6th century, was mostly written by Greeks: *e.g.,* Eunapius (c. 400), Olympiodorus (c. 450), Priscus (c. 450), Malchus (c. 490), and Zosimus, the last pagan historian (c. 500), all of whom, with the exception of Zosimus, are unfortunately preserved to us only in fragments. Historiography received a great impulse in the 6th century. The powerful Procopius and Agathias (*q.v.*), tinged with poetical rhetoric, described the stirring and eventful times of Justinian, while Theophanes of Byzantium, Menander Protector, Johannes of Epiphaneia and Theophylactus of Simocatta described the second half of the 6th century. Towards the close of the 6th century also flourished the last independent ecclesiastical historian, Evagrius, who wrote the history of the church from 431 to 593. There now followed, however, a lamentable falling off in production. From the 7th to the 10th century the historical side is represented by a few chronicles, and it was not until the 10th century that, owing to the revival of ancient classical studies, the art of writing history showed some signs of life. Several historical works are associated with the name of the emperor Constantine VII. Porphyrogenitus. To his learned circle belonged also Joseph Genesius, who at the emperor's instance compiled the history of the period from 813 to 886. A little work, interesting from the point of view of historical and ethnographical science, is the account of the taking of Thessalonica by the Cretan Corsairs (A.D. 904), which a priest, Johannes Cameniata, an eyewitness of the event, has bequeathed to posterity. There is also contained in the excellent work of Leo Diaconus (on the period from 959 to 975) a graphic account of the bloody wars of the Byzantines with the Arabs in Crete and with the Bulgarians. A continuation was undertaken by the philosopher Michael Psellus in a work covering the period from

976 to 1077. A valuable supplement to the latter (describing the period from 1034 to 1079) was supplied by the jurist Michael Attaliata. The history of the Eastern empire during the Crusades was written in four considerable works, by Nicephorus Bryennius, his learned consort Anna Comnena, the "honest Aetolian," Johannes Cinnamus, and finally by Nicetas Acominatus in an exhaustive work which is authoritative for the history of the 4th Crusade. The melancholy conditions and the ever increasing decay of the empire under the Palaeologi (13th–15th centuries) are described in the same lofty style, though with a still closer following of classical models. The events which took place between the taking of Constantinople by the Latins and the restoration of Byzantine rule (1203–61) are recounted by Georgius Acropolita, who emphasizes his own share in them. The succeeding period was written by the versatile Georgius Pachymeres, the erudite and high-principled Nicephorus Gregoras, and the emperor John VI. Cantacuzenus. Lastly, the death-struggle between the East Roman empire and the mighty rising power of the Ottomans was narrated by three historians, all differing in culture and in style, Laonicus Chalcocondyles, Ducas and Ceorgius Phranrzes. With then; may be classed a fourth (though hc lived outside the Byzantine period), Critobulus, a high-born Greek of Imbros, who wrote, in the style of the age of Pericles, the history of the times of the sultan Mohammed II. (down to 1467).

Chronicles. — The essential importance of the Byzantine chronicles (mostly chronicles of the history of the world from the Creation) consists in the fact that they in part replace older lost works, and thus fill up many gaps in our historical survey (*e.g.*, for the period from about 600 to 800, of which very few records remain). They lay no claim to literary merit, but are often serviceable for the history of language. Many such chronicles were furnished with illustrations. The authors of the chronicles were mostly monks, who wished to compile handbooks of universal history for their brethren and for pious laymen; and this explains the strong clerical and popular tendency of these works. And it is due to these two qualities that the chronicles obtained a circulation abroad, both in the Rest and also among the peoples Christianized from Byzantium, *e.g.*, the Slavs, and in all of them sowed the seeds of an indigenous historical literature. Thus the chronicles, despite the jejuneness of their style and their uncritical treatment of material, were for the general culture of the middle ages of far greater importance than the erudite contemporary histories designed only for the highly educated circles in Byzantium. The oldest Byzantine chronicle of universal history preserved to us is that of Malalas (6th century), which is also the purest type of this class of literature. In the 7th century was completed the famous Easfer or *Paschal* Chronicle (*Chronicon* Paschale). About the end of the 8th or the beginning of the 9th century Georgius Syncellus compiled a concise chronicle, which began with the Creation and was continued down to the year 284. At the request of the author, when on his death-bed, the continuation of this work was undertaken by Theophanes Confessor, who brought down the account from A.D. 284 to his own times (A.D. 813). This exceedingly valuable work of Theophanes was again continued (from 813–961) by several anonymous chroniclers. Of great influence on the age that followed was Georgius Monachus, only second in importance as chronicler of the early Byzantine period, who compiled a chronicle of the world's history (from Adam until the year 843, the end of the Iconoclast movement), far more theological and monkish in character than the work of Theophanes. Among later chroniclers Johannes Scylitzes stands out conspicuously. His work (covering the period from 811 to 1057), as regards the range of its subject-matter, is something between a universal and a contemporary history. Georgius Cedrenus (c. 1100) embodied the whole of Scylitza's work, almost unaltered, in his *Universal* Chronicle. In the 12th century the general increase in literary production was evident also in the department of chronicles of the world From this period dates, for instance, the most distinguished and learned work of this class, the great universal chronicle of John Zonaras. In the same century Michael Glycas compiled his chronicle of the world's history, a work written in the old popular style and designed for the widest circles of readers. Lastly, in the 12th century, Constantine Manasses wrote a universal chronicle in the so-called "political" verse.

Only two works dealing with geography and topography need be mentioned, viz, the 6th century Christian Topography of Cosmas Indicopleustes which contains important information as to Byzantine trade, and the Ancient History (*Patria*) of *Constantinople*.

Philosophy. — Ancient Greek philosophy under the empire sent forth two new shoots — Neopythagoreanism and Neoplatonism. It was the latter with which moribund paganism essayed to stem the advancing tide of Christianity. The last great exponent of this philosophy was Proclus in Athens (d. 485). The dissolution, by order of Justinian, of the school of philosophy at Athens in 529 was a fatal blow to this nebulous system, which had long since outlived the conditions that made it a living force. In the succeeding period philosophical activity was of two main kinds; on the one hand. the old philosophy, *e.g.*, that of Aristotle. was employed to systematize Christian doctrine, while, on the other, the old works were furnished with copious commentaries and paraphrases. Leontius of Byzantium had already introduced Aristotelian definitions into Christology; but the real founder of mediaeval ecclesiastical philosophy was John of Damascus. Owing, however, to his having early attained to canonical authority, the independent progress of ecclesiastical philosophy was arrested; and to this it is due that in this respect the later Byzantine period is far poorer than is the West. In the 11th century philosophical studies experienced a satisfactory revival, mainly owing to Michael Psellus, who brought Plato as well as Aristotle again into fashion.

Ancient rhetoric was cultivated in the Byzantine period with greater ardour than scientific philosophy, being regarded as an indispensable aid to instruction. It would be difficult to imagine anything more tedious than the numerous theoretical writings on the subject and the examples of their practical application. None the less, among the rhetorical productions of the time are to be found a few interesting pieces, such as the Philopatris, in the style of Lucian, which gives us a remarkable picture of the times of Nicephorus Phocas (10th century). A very charming representative of Byzantine rhetoric is Michael Acominatus, who, in addition to theological works, wrote numerous occasional speeches, letters and poems.

The Sciences. — In the field of scientific production, which can be accounted literature in the modern acceptation of the term only in a limited sense, Byzantium was dominated to an extravagant and even grotesque extent by the rules of what in modern times is termed "classical scholarship." The numerous works which belong to this category, such as grammars, dictionaries, commentaries on ancient authors, extracts from ancient literature, and metrical and musical treatises, are of little general interest, although of great value for special branches of philological study, *e.g.*, for tracing the influences through which the ancient works handed down to us have passed, as well as for their interpretation and emendation; for information about ancient authors now lost; for the history of education; and for the underlying principles of intellectual life in Byzantium. The most important monument of Byzantine philology is, perhaps, the Library of the patriarch Photius. Photius, who in the year 850 was about 30 years of age, set himself with admirable energy to the task of making ancient literature, now for the most part dead and forgotten, known once more to his contemporaries, thus contributing to its preservation. He gave an account of all that he read, and in this way composed 280 essays, which were collected in what is commonly known as the Library or Myriobiblon. The character of the individual sketches is somewhat mechanical and formal; a more or less complete account of the contents is followed by critical discussion, which is nearly always confined to the linguistic form With this work may be compared in importance the great Lexikon of Suidas, which appeared about a century later, a sort of encyclopaedia, of which the main feature was its articles on the history of literature.

The contributions of the Byzantines to jurisprudence, mathe-

matics and military science can merely be alluded to, as falling outside the domain of literature proper. Under Justinian the *Institutes* and the *Digest* were translated into Greek, and the *Novels* issued in Greek form. Under Leo the Wise and Constantine VII. Porphyrogenitus (9th and 10th centuries) came the great compilations of law known as the *Basilica* (Τὰ βασιλικά). The Canon law was an important contribution of the Byzantines to jurisprudence. Such work as the Byzantines did in mathematics and astronomy was mainly under Perso-Arabian influence, but their writings on military science are numerous and excellent. That on tactics, associated with the name of Leo VI., the Wise, may be specially mentioned.

Profane Poetry.—Of profane poetry—in complete contrast to sacred poetry—the general characteristic was its close imitation of the antique in point of form. All works belonging to this category reproduce the ancient style and are framed after ancient models. The metre is, for the most part, either the Byzantine regular 12-syllable trimeter, or the "political" verse; more rarely the heroic and Anacreontic measures.

Epic popular poetry, in the ancient sense, begins only with the vernacular Greek literature *(see* below); but among the literary works of the period there are several which can be compared with the epics of the Alexandrine age. Nonnus (c. 400) wrote, while yet a pagan, a fantastic epic on the triumphal progress of the god Dionysus to India, and, as a Christian, a voluminous commentary on the gospel of St. John. In the 7th century, Georgius Pisides sang in several lengthy iambic poems the martial deeds of the emperor Heraclius, while the deacon Theodosius (10th century) immortalized in extravagant language the victories of the brave Nicephorus Phocas.

To these may be added some voluminous poems, which in style and matter must be regarded as imitations of the ancient Greek romances. They all date from the 12th century, a fact evidently connected with the general revival of culture which characterizes the period of the Comneni. Two of these romances are written in the duodecasyllable metre, viz., the story of Rodanthe and Dosicles by Theodorus Prodromus, and an imitation of this work, the story of Drusilla and Charicles by Nicetas Eugenianus; one in "political" verse, the love story of Aristander and Callithea by Constantine Manasses, which has only been preserved in fragments, and lastly one in prose, the story of Hysmine and Hysminias, by Eustathius (or Eumathius) Macrembolita, which is the most insipid of all. These Byzantine romances are of interest chiefly by way of contrast to the romances in the vernacular produced in the 13th and 14th centuries, partly under Eastern, but more particularly under Western influence. The Byzantine are artificial and repulsive; the popular have the breath of life, and may be regarded as really heralding the rise of true Greek popular poetry.

The objective point of view which dominated the whole Byzantine period was fatal to the development of a profane lyrical poetry. At most a few poems by Johannes Geometres and Christophorus of Mytilene and others, in which personal experiences are recorded with some show of taste, may be placed in this category. The dominant form for all subjective poetry was the epigram, which was employed in all its variations from playful trifles to long elegiac and narrative poems. Georgius Pisides (7th century) treated the most diverse themes. In the 9th century Theodorus of Studium had lighted upon the happy idea of immortalizing monastic life in a series of epigrams. The same century produced the only poetess of the Byzantine period, Casia, from whom we have several epigrammatic productions and church hymns, all characterized by originality. Epigrammatic poetry reached its highest development in the 10th and 11th centuries, in the productions of Johannes Geometres, Christophorus of Mytilene and John Mauropus. Less happy are Theodorus Prodromus (12th century) and Manuel Philes (14th century). From the beginning of the 10th century also dates the most valuable collection of ancient and of Byzantine epigrammatic poems, the *Anthologia Palatina (see* ANTHOLOGY).

Dramatic poetry, in the strict sense of the term, was as completely lacking amang the Byzantine Greeks as was the condition precedent to its existence, namely, public performance. Apart from some moralizing allegorical dialogues (by Theodorus Prodromus, Manuel Philes and others), we possess only a single work of the Byzantine period that, at least in external form, resembles a drama: the *Sufferings of Christ* (Χριστὸς Πάσχων). This work, written probably in the 12th century, or at all events not earlier, is a cento, *i.e.*, is in great measure composed of verses culled from ancient writers, *e.g.*, Aeschylus, Euripides and Lycophron; but it was certainly not written with a view to dramatic production.

Vernacular Greek Literature.—The vernacular literature stands alone, both in form and in contents. We have here remarkable originality of conception and probably also entirely new and genuinely mediaeval matter. While in the artificial literature prose is pre-eminent, in the vernacular literature, poetry, both in quantity and quality, takes the first place, as was also the case among the Latin nations, where the vulgar tongue first invaded the field of poetry and only later that of prose. Though a few preliminary attempts were made (proverbs, acclamations addressed by the people to the emperor, etc.), the Greek vernacular was employed for larger works only from the 12th century onwards; at first in poems, of which the major portion were cast in "political" verse, but some in the trochaic eight-syllabled line. Towards the close of the 15th century rhyme came into use. The subjects treated in this vernacular poetry are exceedingly diverse. In the capital city a mixture of the learned and the popular language was first used in poems of admonition, praise and supplication. In this oldest class of "vulgar" works must be reckoned the *Spaneas*, an admonitory poem in imitation of the letter of Pseudo-Isocrates addressed to Demonicus; a supplicatory poem composed in prison by the chronicler Michael Glycas, and several begging poems of Theodorus Prodromus (Ptochoprodromos). In the succeeding period erotic poems are met with, such as the Rhodian love songs preserved in a ms. in the British Museum (ed. W. Wagner, Leipzig, 1879), fairy-tale-like romances such as the *Story of Ptocholeon*, etc. Great epic poems, in which antique subjects are treated, such as the legends of Troy and of Alexander, form a separate group. To these may be added romances in verse after the manner of the works written in the artificial classical language, *e g., Callimachus and Chrysorrhoë, Belthandrus and Chrysantza, Lybistrus and Rhodamne*, also romances in verse after the Western pattern, such as *Phlorius* and *Platziaphlora* (the old French story of *Flore et Blanchefleur*). Curious are also sundry legends connected with animals and plants, such as an adaptation of the famous mediaeval animal fables of the *Physiologus*, a history of quadrupeds, and a book of birds, both written with a satirical intention, and, lastly, a rendering of the story of Reynard the Fox. Of quite peculiar originality also are several legendary and historical poems, in which famous heroes and historical events are celebrated. There are, for instance, poems on the fall of Constantinople, the taking of Athens and Trebizond, the devastating campaign of Timur, the plague in Rhodes in 1498, etc. In respect of importance and antiquity the great heroic epic of Digenis Akritas stands pre-eminent. It is not without reason that Dieterich finds in this 10th century epic the earliest germs of Greek popular poetry as contrasted with the artificial products of Byzantinism. The scenes are laid in the eastern marches of the Byzantine empire, and the poem has little to do with the capital. The conversion of the Emir indeed betrays Byzantine piety, and there are numerous oriental touches. But the Emir's son, Digenis Akritas, in his feeling for nature and strong family affections has much in common with the Greek pallikar of the klephtic ballads. In these respects the poem may be regarded as the forerunner of such works as the great Cretan national romance, the *Erotokritos* and as forecasting much that is best in modern Greek popular poetry.

The importance of Byzantine culture and literature in the history of the world is beyond dispute. The Christians of the East Roman empire guarded for more than 1,000 years the intellectual heritage of antiquity against the violent onslaught of the barbarians. They also called into life a peculiar mediaeval culture and literature, They communicated the treasures of the

old pagan as well as of their own Christian literature to neighbouring nations; first to the Syrians, then to the Copts, the Armenians, the Georgians; later, to the Arabians, the Bulgarians, the Serbs and the Russians. Through their teaching they created a new East European culture, embodied above all in the Russian empire, which, on its religious side, is included in the Orthodox Eastern Church, and from the point of view of nationality touches the two extremes of Greek and Slav. Finally the learned men of the dying Byzantine empire, fleeing from the barbarism of the Turks, transplanted the treasures of old Hellenic wisdom to the West, and thereby fertilized the Western peoples with rich germs of culture.

BIBLIOGRAPHY.—General sources: K. Krumbacher, *Geschichte der Byzantinischen Literatur* (2nd ed., 1897), supplemented in *Die byzantinische Zeitschrift* (1898, etc.) and the *Byzantinisclzes Archiv.;* the Russian periodical *Vizantiisky Vremennik* (1894, etc.), after a lapse in consequence of the war and revolution in Russia, has now been resumed, and vol. xxiv. (1923–26) has appeared. Other Journals at present devoted to Byzantine studies are *Byzantinische-Neugriechische Jakrbiicher* with *Beihefte* (Berlin and Athens, 1920, etc.); Ἑταιρεία Βυζαντινῶν Σπουδῶν, founded at Athens in 1919; *Byzantion,* published at Brussels since 1924; K. Dieterich, *Geschichte der byzantinischen und neugriechischen Litteratur* (2nd ed., 1909); G. Montelatici, *Storia della Letteratura bizantina* (Manuali Hoepli, 1916); W. von Christ, *Gesclzichte der griechischen Litteratur* (Miiller's Handbiicher), Teil II., Hälfte II. (A.D., 100–530) (6th ed., 1924). Some account of Byzantine literature will be found in J. B. Bury, *A History of the Eastern Roman Empire* (1912), and in *Cambridge Mediaeval History,* vol. iv. (1927). A good bibliography of recent works dealing with all sides of Byzantine life is given by Norman H. Baynes, *The Byzantine Empire* (Home University Library, 1925).

Special studies: G. Wartenberg, *Das mittelgriechische Heldenlied von Digenis Akritas* (Wissenschaftliche Beilage zum Jahresbericht des Lessing-Gymn. zu Berlin, 1897); J. B. Bury, *Romances of Chivalry on Greek soil* (1911); Schissel von Fleschenberg, *Entwicklungsgeschichte des griechischen Romanes im Altertum* (1913); G. Soyter, *Byzantinische Dichtung* (1930); C. Neumann, *Griechische Geschichtsschreiber und Geschichtsquellen im zwölften Jahrhundert* (Anna Comnena, Th. Prodromus, etc., 1888).

Language: Grammar: A. N. Jannaris (Giannaris), *An Historical Greek Grammar* (1897); A. Dieterich. "Untersuchungen zur Geschichte der griechischen Sprache von der hellenistischen Zeit bis zum 10ten Jahrhundert," in *Byzant. Archiv.* i. (1898). Glossary: Ducange, *Glossarium ad scriptores mediae et infimae Graecitatis* (1688), in which particular attention is paid to the "vulgar" language; E. A. Sophocles, *Greek Lexicon of the Roman and Byzantine Periods* (3rd ed., 1888).

Theology: Chief work, A. Ehrhard in Krumbacher's *Gesclzichte der Byz. Lit.,* pp. 1–218. For the ancient period, *cf.* the works on Greek patrology (under article FATHERS OF THE CHURCH). Collective edition of the Fathers (down to the 15th century); *Patrologia, series Graeca* (ed. by Migne, 161 vols., 1857–66). Church poetry: A collection of Greek-Church hymns was published by W. Christ and M. Paranikas, entitled *Anthologia Graeca carminum Christianorum* (1871). Many unedited texts, particularly the songs of Romanos, were published by Cardinal J. B. Pitra, under the title *Analecta sacra spicilegio Solesmenri parata* (1876). A complete edition of the hymns is edited by K. Krumbacher.

Historical literature: A collective edition of the Byzantine historians and chroniclers mas begun under Louis XIV., and continued later (1648–1819), called the *Paris Corpus.* This whole collection was on B. G. Niebuhr's advice republished with some additions (Bonn, 1828–78), under the title *Corpus scriptorum historiae Byzantinae.* The most important authors have also appeared in the *Biblzotheca Teubneriana.* A few Byzantine and oriental historical works are also contained in the collection edited by J. B. Bury (1898 *seq.*), *Études dur l'Histoire de Byzance* 2 vols. (1930). To these should be added K. N. Sathas, *Bzbliotheca Graeca Medii Aevi* (7 vols, 1872–94).

Vernacular Greek literature: The most important collective editions are: W. Wagner, *Mediaeval Greek Texts* (1870) *Carmina Graeca Medii Aeai* (1874), *Trois Poèmes grecs du moyen âge* (1881); E. Legrand, *Collection de monuments pour servir à l'étude de la langue néo-hellénique* (in 26 parts, 1869–75), *Bibliothèque grecque vulgaire* (in 8 vols., 1880–96). It should be noted that many of the texts included in these collections should more properly be classed under Modern Greek Literature. (K. K.; F. H. M.)

MODERN LITERATURE

After the capture of Constantinople, the destruction of Greek national life and the almost total effacement of Greek civilization naturally involved a more or less complete cessation of Greek literary productions in the regions subjected to the rule of the barbarous conqueror. Learned Greeks found a refuge away from their native land; they spoke the language of foreign peoples, and when they wrote books they often used those languages, but in most cases they also wrote in Greek.

Frankish Influence. — It is, however, a mistake to regard 1453 as a sharp dividing line between Byzantine and Modern Greek literature. It is true that the fall of Constantinople marked the end of what is usually known as Byzantinism, except in so far as this, as we shall see, has been artificially revived in modern Greece. The germs of modern Greek popular poetry can be detected as early as the 10th century in the epic of Digenis Akritas (who may be regarded as a forerunner of the klephts), and still more in the Greek romantic poems of the 13th and 14th centuries, some of which, such as *Belthandros and* Chrysantza, while retaining marked Oriental features, have been vivified by the influence of Western Romance; conversely others, such as *Imberios* and *Margarona,* though essentially French, have in their Greek adaptation received many Greek popular features. More directly due to the conquest by the Franks is the *Chronicle of the Morea,* which in its Greek form dares from rhe 14th century. Here again the Greek vernacular language is employed. Italian influence had a predominating share in producing the flourishing Cretan literature of the 16th and 17th centuries, presently to be described. The literary debt of modern Greece to the Crusaders has hardly received sufficient recognition. The beginnings of the characteristic modern Greek lyric poem, the principal themes of which are love and death, can also be traced to the period of the Frankish domination. In this connection the Rhodian love-songs of the 14th century and the Cretan poem The Fair *Shepherdess* (see below) may be specifically mentioned.

K. Dieterich has shown that modern Greece has really inherited two literary styles — the consciously classicizing, which may be called Byzantine, and the really living popular, which was greatly promoted by the invigorating influence of the Frankish invaders. In what follows this main division will be kept in mind, and in a very brief sketch of this character it is more profitable to outline the progress of these two literary streams with the aid of a comparatively small number of representative names and works than to fill the few columns available with a string of names, which can, in the absence of specimens of their works, have but little meaning. It is also natural that greater prominence should be given to works written in the vernacular, though their actual bulk may be less, than to the numerous classicizing productions which seem likely to have but little lasting influence on the development of modern Greek literature.

Cretan Literature.--We shall, accordingly, begin with a brief description of the very vigorous and remarkable Cretan literature of the 16th and 17th centuries, which flourished under the Venetian occupation of the island, and was brought to a premature and much to be regretted close by the Turkish capture of Candia in 1669. The development of this literature can be followed in its main outlines thanks to the excellent work done in recent times by Cretan scholars, notably by Dr. S. A. Xanthoudidis. We can trace the progress made in versification from the rude rhymed 15-syllable "political" lines of Georgios Choumnos in his paraphrase of Genesis and Exodus, written early in the 16th century and introducing a wealth of biblical legend, to the finished handling of the same metre by Vincenzo Cornaro in his great romantic poem, the Erotokritos, which probably dates from the middle of the 17th century, describing the trials and sorrows of two lovers, Aretousa, the daughter of Herakles, king of Athens, and Erotokritos, the son of the king's counsellor, whose love is finally crowned with a happy issue. The poem, despite its admixture of Oriental and feudal elements (*e.g.,* the prominence given to the tourney) is a genuinely Cretan production, and is, notwithstanding its great length, a powerful and interesting work, deserving to be called the national poem of Crete. In connection with the *Erotokritos* should be mentioned the interesting series of Cretan dramas. The best known, though not the best of these, the *Erophile* of Georgios Hortatzis, written about 1600, had certainiy an influence on the Erotokritos. The drama, the scene of which is laid at Memphis in Egypt, describes the tragic history of the

love of Panaretos, adopted into his court at an early age by Philogonos the king of Egypt, for the king's daughter Erophile, resulting in the violent deaths of all three principal characters. The drama, which owes much to the Italian, is structurally interesting for the introduction of a chorus and interludes dealing with the enchantment of Rinaldo by the sorceress Armida, an episode taken from the Gerusalemme Liberata of Tasso. These Cretan plays also include comedies, such as the *Stathis* and Fortunatus, which, though in the main borrowed from the Italian and ultimately going back to Plautine and Terentian comedy, are interesting for the introduction of local characters and colouring. But the real gems of the Cretan drama are the pastoral comedy called *Gyparis* and the "mystery play," the Sacrifice of *Abraham,* both anonymous. The former dates from about 1600 and describes the conversion to love of two shepherd girls who have previously scorned it. The character-drawing of the girls and their lovers, the old father Yannoulis and the old nurse Phrosyne, is masterly and humorous, and local Cretan colour abounds. The comedy is in many respects extraordinarily modern. The Sacrifice of *Abraham* has in its kind an almost equal charm. It is said to have been printed as early as 1535, but this is not improbably a mistake for 1635. Though in form a "mystery play," it is really a highly sympathetic study of family life, and herein is infinitely superior to the numerous mystery plays on the same subject in other languages. All the characters are alive, from the principals Abraham, Sarah and Isaac, to the four servants, Syban, Sofer, Ada and Tamar.

Crete possesses also an interesting series of popular songs, and in connection with these a charming pastoral poem already mentioned — The Fair Shepherdess — deserves to be better known. It is usually coupled with the name of Nikolaos Drymitinos of Apokorona, who published the version he selected in 1627. More than one version of the poem is known in modern survivals. The theme is that of a shepherd-lad who meets and falls in love with a shepherd-girl, is compelled to leave her, but promises to return in a month. He is delayed by illness, and after two months comes back only to find that she has pined away into death. The language of this attractive Cretan literature has naturally incorporated a good many Venetian words, but its character generally is that of a vigorous native tongue, which shows of course its peculiar Cretan forms and idioms.

Popular Songs and Klephtic Ballads. — The popular song, as exemplified by *The* Fair Shepherdess and other Cretan poems, has its counterpart in the folk-songs of the Aegean islands and of Cyprus. Here too strong family feeling, love and death predominate. Death is personified in the form of Charos, so prominent in all Greek popular poetry, who struggles with his victim, is sometimes worsted, but as a rule triumphs in the conflict. The same elements, modified to suit the particular circumstances, also appear in the songs of the klephts who in their mountain fastnesses maintained a struggle against their Turkish oppressors. Most of these klephtic ballads date from the 18th century, are anonymous, and are an excellent example of an entirely spontaneous poetry composed in popular language and in the 15-syllable verse, rhymed or unrhymed. They breathe the aroma of the forests and mountains, and, like so much of Greek popular poetry, lend a voice to the trees, the rocks, the rivers and to the mountains themselves, which sing the prowess of the klepht, bewail his death, and comfort his disconsolate wife or mother. In these again we find the prominence of Charos and the strong family affection so characteristic of genuinely popular Greek poetry.

Classicizing Greek. — We must turn for a while from this attractive and spontaneous poetry, which we shall again meet with in the 19th century revival, though in not quite so spontaneous a form, in order to trace very briefly the main progress of what may be called classicizing or Byzantine Greek from the fall of Constantinople to the time of Greek independence.

The services of Greeks, such as John Argyropoulos, Demetrios Chalcocondyles, Constantine and John Lascaris and others, who after 1453 spread a knowledge of Greek in the West and enriched Western libraries with Greek manuscripts, should not be forgotten. They stimulated the study of ancient philosophy, and it was at the close of the 15th century that the great controversy arose over the merits of the Platonic and Aristotelian philosophies, championed respectively by Gemistos Pletho and Georgios Gennadios. Of historical works written in the 16th and 17th centuries in the literary language, fostered by the patriarchate and the schools founded at Constantinople, Bucharest, Jassy and elsewhere, may be mentioned the history of the patriarchate by Manuel Malaxos, a history of Constantinople from 1391 to 1578 by Theodosios Zygomalas, and a history of the Ottoman empire by Demetrios Cantemir, Hospodar of Moldavia. Great encouragement was also given to Greek culture and to the printing of works in Greek by the Hospodars of Walachia in the 17th century. A curious instance of this is the translation into Greek in 1686 of an Italian account of the siege of Vienna in 1683, made by a scholarly Cretan, Jeromias Cacavelas, at the instance of Scherban Cantacuzenos, Hospodar of Walachia. Of considerable interest, both philologically and historically, are the earlier chronicles of Cyprus of the 15th century by Leontios Machaeras and Georgios Boustronios, which are written in the Cypriote dialect.

Phanariote Literary Activity. — In the 18th century the educational work which has been noted for the 17th century was carried on, and modern Greece owes a debt of gratitude to the Greek clergy, the great Phanariote families of Constantinople, and also to wealthy Greek merchants, who fostered schools and issued educational works in Greek from the printing presses of Venice, Trieste and Vienna. This work had an important influence in preparing the Greeks for their emancipation from the Turkish yoke. Literature during this period was mainly theological, but a good many books of an educational character were also produced. Representative names are those of two distinguished prelates, Nikephoros Theotokis (1731?–1800) and Eugenios Vulgaris (1715–1806), both natives of Corfu, who wrote in the literary language in defence of Greek orthodoxy, but also produced works on mathematics, physics, geography, archaeology and philosophy, besides translations. In connection with the Phanariotes of Walachia should be mentioned the remarkable figure of Constantine Dapontes, who produced many works in verse of a moralizing and religious character. These men may seem to lack originality and their language to be artificial, but considering the dark circumstances of the Greek people their work was really of inestimable value.

The greatest name, however, among the forerunners of the Greek revival is that of Adamantios Korais (1748–1833), who, though resident for most of his life in Paris, exercised an enormous influence on his Greek contemporaries, partly by his unwearying issue of editions of Greek classical authors, accompanied by stirring patriotic introductions, partly by his efforts to reform the language — on a classical basis, it is true, but always in a spirit of moderation.

Representative names among the classicizing poets of this time are Constantine Rhigas (1760–98), who wrote patriotic poems (poems in the popular language have sometimes been wrongly attributed to him), Christopoulos (1772–1847), who wrote verses of an Anacreontic character, and Jacobos Rizos Neroulos (1778–1850), who wrote tragedies, comedies and lyrics. Only one name need be mentioned of those who carried on this tradition throughout the 19th century, but that is an outstanding one — Alexandros Rizos Rhangavis (Rhangabé, 1810–92), who was a writer of extraordinary fertility and considerable charm in the classicizing style: his productions include odes, hymns, ballads, narrative poems, tragedies and comedies, and several prose works — a history of ancient Greece, a history of modern Greek literature, novels, and works on ancient art and archaeology. These works are perhaps somewhat hardly dealt with by Dieterich on account of his preference for works in the vernacular, which is certainly better suited to imaginative writings. They are, however, excellent representatives of the literature in favour for the greater part of the period in which Rhangavis wrote — works in the "academic-learned" style. Followers of this school in poetry in the 19th century were numerous, of whom John Karasoutsas (1824–73) and Demetrios Paparrhegopoulos (1843–73) may be mentioned. Their main themes are partly patriotic and partly contemplative.

Poetry in the Vernacular. — In poetry at all events the vernacular style has now definitely gained the upper hand. The real founder of this school was Dionysios Solomos (1798–1857), who used the dialect of the Ionian islands. His greatness lies rather perhaps in his influence than in his actual achievement; of his works, the famous *Ode to Liberty* and the *Lambros*, a study of a stricken conscience, may be specially mentioned. Several excellent poets adopted the Ionian dialect for their work, *e.g.*, Andreas Kalvos (1796–1869) and Julius Typaldos (1814–83). Others preferred the language of the klephtic ballads, the vernacular of the Epirus district, such as Georgios Terzetis (1806–74), Aristotle Valaoritis (1824–79), whose *Funeral Ode* carries on the Charos tradition, John Vilaras (1771–1823), Georgios Zalakostas (1805–57), and many others. As has been said, the popular language has won a decisive victory with the present generation of Greek lyric poets. Only two names will here be mentioned, but they must be regarded as the chief inspirers of a very flourishing school of present-day Greek lyric poets. These are Kostis Palamas (b. 1859), whose most remarkable work is perhaps the narrative lyrical poem *The King's Flufe*, published in 1910, the scene of which is laid in Byzantium, but whose theme is the continuity of the Greek spirit. Palamas stands rather apart in his philosophizing tendencies, and Georgios Drosinis (b. 1859) is, in his lyrics dealing with love and death and the charms of nature and in his idylls which revive popular sagas, more typical of the spirit of Greek popular poetry.

The classicizing language was unsuited to the production of a really living drama. Hence, although numerous dramas were written in this language in the 19th century, notably by Rhangavis, whose *Dukas* pictures the taking of Constantinople by the Crusaders, and by Demetrios Vernadakis, whose *Maria Doxapatri* also deals with the fall of Constantinople, they did little towards laying the foundations of a really national drama. The more recent employment of the popular language for the drama under the influence of John Psichari *(see* below) and the choice of themes relating to contemporary life have given plays fresh vitality. The names of J. Kambisis (1872–1902), G. Xenopoulos and Spyros Melas may be mentioned.

Vernacular Prose. — The name of John Psichari (1854–1929) stands out as the apostle of the vernacular. He opened his campaign by the publication in 1888 of a satiric account of a journey to Greece (My *Journey)*, and it must be allowed that his teaching had a very great influence on the employment of the vernacular for prose works of an imaginative character. Novels dealing with country and maritime life are amongst the most popular of recent Greek literary productions, in contradistinction to the tendency to translate foreign works of fiction which prevailed during a large part of the 19th century. D. Vikelas (b. 1835), however, though writing in the literary language, really led the way to a native school of novelists with his *Loukis Laras*, an historical romance dealing with the massacre in Chios in 1822, and E. Roidis (1835–1904), produced a historical-satirical romance in his *Pope Joan.* Foremost names of writers of tales and novels in the popular language are those of G. Drosinis, Papadiamandis (1851–1911), Karkavitzas (1866–1923) and Ephthaliotis. The recently deceased G. Souris created a peculiar form of political satire in his weekly newspaper the *Romids*, in which current political and social topics were reviewed in verse of a popular character.

Finally we glance at prose works of a serious or scientific kind produced since the War of Independence. These are naturally written in the literary style. Here, continuing the Eyzantine tradition, historical works bulk largely. Mention must be made of the *History of the Revolution* by Spiridon Trikoupis, a work distinguished by impartiality and fine style, and of the *History of the Greek Nation* by *K.* Paparrhegopoulos, which in its later parts shows independent research. Sakellarios wrote on the topography and history of Cyprus. Of "local" histories of this type, a good example is the recently published *History of Chios* by Georgios *I.* Zalotas, a work remarkable for thoroughness of research. Scholarship and philological research really fall outside the domain of pure literature, but it would be wrong to omit mention of a name like that of K. N. Sathas, whose industry in collecting mediaeval and later Greek texts, if not always equalled by his accuracy, is worthy of high praise. G. N. Hatzidakis has really laid the foundations of scientific research in modern Greek philology, and S. A. Xanthoudidis has done much to promote an appreciation of the Cretan literature of the 16th and 17th centuries.

(J. D. B.; F. H. M.)

The Living Language. — The troubled years from 1910 to 1928 were marked by one event of capital importance to thk literature of modern Greece, the all but total conquest of the entire literary field by the spoken language, commonly called the demotic or romaïc, after a century's struggle with the official or scholastic tongue, called the pure or catharévoussa.

In 1910, Kostis Palamas published the remarkable narrative lyrical poem *The King's Flute*, in which he celebrates, in the moving atmosphere of Byzantium, the continuity of Greek throughout the ages. In *The Immutable Life* he appears as a bold innovator, inspired by French intellectualism, and definitely establishes his position as a poet of world wide fame. Before losing himself in memories of his childhood, as he does in his next work *(Longings for the Lagoon*, 1912) he shows that he possesses the eternal spirit of ancient Hellas, of Byzantium and of modern Greece. He is a poet of the intellect and of thought, whose work, while showing the influence of Western symbolism, is yet filled with imagery and with glowing verbal music. In works such as *Iambs and Anapaests* and *The Grave* he has given expression to the deepest emotions. He was strongly influenced by the prophetic genius of John Psichari, a master in every *genre* of prose, who introduced into Greece all the most recent linguistic theories. Without his example it is unlikely that Palamas would have succeeded in realizing his powers. So was founded the new School of Athens. Palamas, himself an occasional novelist and critic, became the centre of the popular renaissance.

Among the stylists pure and simple of the school we find John Gryparis, a disciple of Hérédia; Laurence Mavilis, strongly influenced by Italian literature, who was killed in the war of 1912; the Baudelairean Papantoniou Costas Ouranis; Aristos Cambanis, whose work is chaste and, if anything, a little cold; and the delicate genius of Malakassis, who owes much to Moreas and to *The Intermezzo.* Peter Vlastos wanders from sphere to sphere, revelling in subtlety of rhythm and metre. All the storied past of Greece comes to life in his work. Apart from these, the dreamy Lambros Porphyras has written his *Shadows;* Sotiris Skipis has sung of his longings for his own country *(Song of Apollo)* and the sufferings of the fugitives from Anatolia. Myrtiotissa in his moving work has sung of passion, while G. Souris and Pol Arcas have turned to satire, and Drosinis, forerunner of many others, has produced his picturesque idylls.

But apart from simple melodists like these tardy Parnassians, the newer poets venture even farther than Palamas into uncharted territory. Among them are Angelos Sikelianos, who rediscovered the secrets of the ancient myths of sea and land, and who hymns the greatness of life; Rigas Golphis, bitter, eloquent and passionate; the fiery Varnalis, Ph. Yophyllis, who embodies in his work the minutest details of modern life, and Kavaphis, who, apart from the others, evokes, in a strange and unadorned style, the Alexandrian decadence which resembles his own depression.

Modern Greek prose is unusually rich both in *conte* and in the novel. The scattered but recently collected work of Papadiamandis, who disappeared in 1908, remains unequalled. Carcavitsas and Ephthaliotis painted the sea and the islands, and left models for others, as also did the regretted poet, novelist, critic and translator, C. Hatzopoulos. Costis Passayannis, Vlakhoyannis and the Epirote Ch. Christovassilis (d. 1937) are writers of the heroic and the picturesque. D. Voutyras is more deeply moved by the troubles of the working classes. There are also C. Theotokis of Corfu, who combined criticism of society with the study of character, and showed himself in his novels, *The Slaves in their Chains* and *The Life and Death of Karavelas*, as a cruel and unrelenting realist, also C. Paroritis, the powerful author of *Red He-Goat*, and Madame J. Dendrinos, who excels in depicting the ravages of passion. No one, however, in the novel or the theatre has excelled G. Xenopoulos, the creator of a whole gallery

of pictures of Zante and Athens *(Isabel,* Woman from *Three Aspects).*

But Xenopoulos is not alone among Greek dramatists. Paulos Nirvânas, that fine critic and subtle observer, brought Ibsenism into fashion. Spyros Melas and Pandelis Horn achieved remarkable work with a high social aim, D. Tangopoulos distinguished himself in philosophical drama and N. Poriotis shows in *Rhodopi* that tragedy in verse is still to be found in Greece. Among the younger writers Constantinides in *Photinoula* reveals himself as a coming dramatist, and Valsa wrote a model of philosophic comedy in *The Council* of *Ministers.*

In other spheres, we may mention the names of J. Dragoumis as a critic, of Philindas and of Triandoephyllides in philology and the study of language, while we must not forget the well-known Psuchares, Lambros in history, Politis in folklore, Andréades in political and social economy, Xenopoulos, Nirvânas and Cambanis in literary criticism, Voutieridis in the history of literature. The influence of the literary reviews is shown by the fact that modern Greek literature is becoming more and more Westernized in inspiration and form and ceasing to be Byzantine. (P. LEB.)

GREEK MUSIC: *see* MUSIC.

GREEK RELIGION. The religion of the Greeks, now no longer absurdly abused nor foolishly idealized can, in the light of modern scholarship, be seen for what it really was. It comprises elements—savage, barbarous, and civilized, although the first two have been somewhat exaggerated. It developed without any authoritative sacred writing, such as the Bible, or the Koran, or any inflexible and unquestionable tradition to hamper or guide it. It was, according to circumstances, now more backward. now more progressive; yet always retaining certain characteristics which we may describe as normal. namely, a belief in a number, not verv large, of gods, generally human in form and largely human in mind (anthropomorphic polytheism), and, for the most part *(see,* however, MYSTERY) an absence of other-worldliness. Its history extends over some 2,000 years, beginning about the middle of the second millennium B.C.

When the Hellenes entered Greece, probably from the north but perhaps also from Asia Minor *(see* GREECE: History), they appear to have been advanced and progressive barbarians, rapidly developing a civilization of their own, and ready to adopt and modify what they found good in other civilizations. They spoke a common tongue, the language we know as classical Greek, probably already divided into more or less well-defined dialects. They were of the stock variously known as Aryan, Indo-Germanic, Indo-European or Wiro, if indeed this was racially one stock and not a complex. Like some other Wiros at least (notably the Hindus and Italians), they had the cult of a sky-god, the "Bright One" or "Bright Father," in their language Zeus, or Zeus Pater. They had also, or soon acquired, certain other deities, notably Apollo, Poseidon, Demeter, perhaps Ares, Hermes and others. These they may have occasionally conceived of as bestial in shape, but probably for the most part as anthropomorphic.

They found a population already mixed. In Greece there had long dwelt a people, or group of peoples, whom we know as Helladic. In Crete, and perhaps on the mainland also, was the advanced civilization which we call Minoan. Either this was largely adopted by the Helladic peoples, or the invaders adopted it and imposed it on their new subjects, or both occurred; at any rate, it reached Greece and formed the Mycenaean (sometimes called the late Helladic) culture. These peoples also had a religion, in which we cannot at present distinguish Cretan from Helladic elements, and therefore are obliged to treat it as a whole. We can say that it included the worship of a great goddess[1], or of several great goddesses, whom we almost certainly may trace in Hera and Artemis, probably in Athena, and perhaps in Aphrodite also; certainly in many minor figures, such as Ariadne and Britomartis. Of gods, other than a child-god, we hear little; but the figure of Hyacinthus alone (*q.v.*) would be enough to prove that male figures were not wholly wanting. It is, however, a great mistake to suppose that all goddesses are pre-Greek; Demeter reveals herself as genuine Greek by her name, though no doubt she assimilated pre-Hellenic elements; Hestia (*q.v.*) is the Holy Hearth, a figure well known and widespread among Wiros. We must examine each figure, god or goddess, separately, using all the evidence philology, archaeology, and comparative religion can give us, to determine its origin. Finally we must reckon with the possibility that the other great nations which fringed the Mediterranean—Hittite, Semitic and Egyptian peoples—left their impress on early Greek religion, for, although former scholars may have made rash use of this hypothesis, the influence, at least, of Egypt on Crete is past all doubt[2].

If we try to classify and analyse the facts, we shall at once be struck with the contrast between such civilized cults as those of Zeus, Athena, Apollo, high personal divinities to whom the attributes of a progressive morality could be attached, and practices that long survived in backward communities, such as the Arcadian worship of the thunder and the winds, the cult of Zeus Κεραυνός "the thunder" at Mantineia and Zeus Καππώτας in Laconia, who is none other than the mysterious meteoric stone that falls from heaven. These are examples of a religious view in which certain natural phenomena or objects are regarded as mysteriously divine or sacred in their own right and a personal divinity has not yet emerged or been separated from them. Hestia is a similar figure.

Fetishism.—Akin to animism is fetishism, a term which properly denotes the worshipful or superstitious use of objects made by art and invested with mysterious power, so as to be used like amulets for the purposes of protective magic or for higher

[1]This does not mean that the Cretans were matrilineal, a theory for which there is no real evidence. *See* L. R. Farnell, in *Archiv für Religionswissenschaft* (1904); H. J. Rose, in *Folk-Lore,* vol. xxii. and xxxvii.

[2]V. Bérard has recently revived the discredited theorv of a prevalent Phoenician influence in his ingenious but uncritical work, *L'Origine des cultes arcadiens.* M. *P.* Foucart believes in verv early borrowing from Egypt, as explaining much in the religion of Demeter and Dionysus; see *Les Grands Mystères d'Éleusis* and *Le Culte de Dionysus en Attique.*

purposes of communion with the divinity. From the earliest discoverable period down to the present day fetishism has been a powerful factor in the religion of the Graeco-Roman world. The importance of the sacred stone and pillar in the "Mycenaean" or "Minoan" period which preceded Homer has been impressively shown by Sir Arthur Evans, and the same fetishistic worship continued throughout the historic ages of classic paganism. It is a reasonable conjecture that the earliest anthropomorphic images of divinities, which were beginning to make their appearance by the time of Homer, were themselves evolved by slow transformation from the upright sacred column. And the altar itself may have arisen as another form of this; the simple heap of stones, such as those erected to Hermes by the wayside and called Ἑρμαῖοι λόφοι, may have served both as a place of worship and as an *agalma* that could attract and absorb a divine potency into itself. Hence the fetishistic power of the altar was fully recognized in Greek ritual, and hence also in the cult of Apollo Agyieus the god and the altar are called by the same name.

It has been supposed that the ancestors of the historic Greeks, before they were habituated to conceive of their divinities as in human form, worshipped divine beasts. But we must not suppose it to be a general law of religious evolution that "theriomorphism" must always precede anthropomorphism and that the latter transcends and obliterates the former. The two systems can exist side by side, and savages of low religious development can conceive of their deities as assuming at one time human, at another bestial, shape. Now the developed Greek religion was devotedly anthropomorphic, and herein lay its strength and its weakness; nevertheless, the advanced Hellene could imagine his Dionysus entering temporarily into the body of the sacrificial bull or goat, and the men of Phigaleia in Arcadia were attached to their horse-headed Demeter, and the primitive Laconians possibly to a ram-headed Apollo. Theriolatry in itself, *i.e.,* the worship of certain animals or species of animals as of divine power in their own right, apart from any association with higher divinities, can scarcely be traced among the Greek communities at any period. The wolf might at one time have been regarded as the incarnation of Apollo, the wolf-god, and here and there we find faint traces of a wolf-sacrifice and of offerings laid out for wolves. But the occasional propitiation of wild beasts may fall short of actual worship. The Athenian who slew a wolf might give it a sumptuous funeral, probably to avoid a blood-feud with the wolf's relatives, yet the Athenian State offered rewards for a wolf's head. Nor did any Greek individual or State worship flies as a class, although a small oblation might be thrown to the flies before the great sacrifice to Apollo on the Leucadian rock, to please them and to persuade them not to worry the worshippers at the great solemnity, where the reek of roast flesh would be likely to attract them.

Theriolatry is not totemism (*q.v.*), and the attempt to find the latter institution in Greece is now generally recognized as mistaken[1]. The totemism of savages does not appear to affect Greek religion in any such way as to suggest a natural explanation for any of the peculiar phenomena of early Hellenic polytheism. Here and there we have traces of a snake-tribe in Greece, the Ὀφιεῖς in Aetolia, the Ὀφιογενεῖς in Cyprus and Parium, but we are not told that these worshipped the snake, though the latter clan were on terms of intimacy with it. Where the snake was actually worshipped in Hellenic cult — the cases are few and doubtful — it may have been regarded as the incarnation of the ancestor or as the *avatar* of the under-world divinity.

Human Sacrifice. — As to human sacrifice, which is not strictly a savage custom, while encouraged at one time by the Delphic oracle, it was becoming rare and repellent to the conscience by the 6th century B.C.; but it was not wholly extinct in the Greek world even by the time of Porphyry.

We can now observe the higher aspects of the advanced polytheism. And at the outset we must distinguish between mythology and religion strictly understood, between the stories about the divinities and the private or public religious service. It is true that the former often arise from the latter, as in the case of Dionysus (*q.v.*). Yet Greek mythology as a whole was irresponsible, without reserve; and unchecked by dogma or sacerdotal prohibition; and frequently it sank below the level of the current religion, which was almost free from the impurities which shock the modern reader of Hellenic myths. Nor again did anyone feel himself called upon to believe any particular myth; in fact, faith, understood as the will to believe certain dogmatic statements about the nature and action of divinity, is a concept which was neither named nor recognized in Hellenic ethics or religious doctrine; only, if a man proclaimed his disbelief in the existence of the gods and refused to join in the ritual of the community, he would become "suspect," and might at times be persecuted by his fellows. Greek religion was not so much an affair of doctrine as of ritual, and the most illuminative sources of our knowledge of it are the ritual-inscriptions and other State documents, the private dedications, the monuments of religious art and certain passages in the literature, philology and archaeology being equally necessary to the equipment of the student.

Homer and Post-Homeric **Period.**—We are tempted to turn to Homer as the earliest authority. But Homer's audience was a relatively enlightened nobility, in no way primitive. He shows us a pantheon already to some extent systematized, a certain hierarchy and family of divinities in which the supremacy of Zeus is established as incontestable. And the characteristically Greek anthropomorphic impulse is already at its height in the Homeric poems. The deities are already clear-cut, individual personalities of distinct ethos, plastically shaped figures such as the later sculpture and painting could work upon, not vaguely conceived *numina* like the forms of the old Roman religion, nor "personifications" of natural phenomena. Athena and Apollo are simply Athena and Apollo, divine personages with certain powers and character, as real for their people as Christ and the Virgin for Christendom. By the side of these, though generally in a subordinate position, we find that Homer recognized certain divinities that we may properly call nature-powers, such as Helios, Gaia, and the river deities, forms descending probably from a remote animistic period, but maintaining themselves within the popular religion till the end of paganism. Again, though Homer may talk and think at times with levity and *banalité* about his deities, his deeper utterances impute an advanced morality to the supreme God. His Zeus is on the whole a power of righteousness, never being himself the author of evil — an idea revealed in the opening passage of the Odyssey — but protecting the good and punishing the wicked. Vengeance, indeed, was one of the attributes of divinity both for Homer and the average Greek of the later period, as it is in Judaic and Christian theology, though Plato and Euripides protested strongly against such a view. But the Homeric Zeus is equally a god of pity and mercy, and the man who neglects the prayers of the sorrowful and afflicted, who violates the sanctity of the suppliant and guest, or oppresses the poor or the wanderer, may look for divine punishment. Though not regarded as the physical author of the universe or the Creator, he is, in a moral sense, the father of gods and men. And though the sense of sin and the need of piacular sacrifice are expressed in the Homeric poems, the relations between gods and men that they reveal are on the whole genial and social; the deity sits unseen at the good man's festal sacrifice, and there is a simple apprehension of the idea of divine communion. There is also indeed a glimmering of the dark background of the nether world, and the chthonian powers that might send up the Erinys to fulfil the curse of the wronged. Yet on the whole the religious atmosphere is generally cheerful and bright; freer than that of the later ages from the taint of magic and superstition; nor is Homer troubled much about the life after death; he scarcely recognizes the cult of the dead (see HERO) and is not oppressed by fear of the ghost-world.

This Homeric or "Olympian" system retains a certain life almost to the end of paganism, and it is a serious mistake to suppose that it had lost its hold upon the people of the 5th and 4th century B.C. We find it, indeed, enriched in the post-Homeric period with new figures of prestige and power; Dionysus, of whom Homer had only faintly heard, becomes a high god with a worship full of promise for the future. Demeter and Kore, whom Homer knew well enough, hut could not use for his epic purposes, attract the

[1] *See* H. J. Rose, *Primitive Culture in Greece* (1925), p. 47 ff.

ardent affections and hopes of the people; and Asclepios, whom the old poet did not recognize as a god, wins a conspicuous place in the later shrines. The deities remain anthropomorphic, and appear as clearly defined individuals. Zeus is still supreme; the other gods are clear-cut personalities, but in function rather less clear, for a popular god tended to take on new departments and a once rustic deity to go to town with his people. The moral ideas that we find in the Homeric religion are amply attested by cult records of the later period, which are nearly always euphemistic, the doubtful title of Demeter Erinys being possibly an exception. The important cults of Zeus *Hikesios* and *Prostropaios,* the suppliant's protecting deity, embody the ideas of pity and mercy that mark advanced religion; and many momentous steps in the development of morality and law were either suggested or assisted by the State religion. For example, the sanctity of the oath, the main source of the secular virtue of truthfulness, was originally a religious sanction, and though the Greek may have been prone to perjury, yet the Hellenic, like the Hebraic religious ethics, regarded it as a heinous sin. The sanctity of family duties, the sacredness of the life of the kinsman, were ideas fostered by early Hellenic religion before they generated principles of secular ethics. In the post-Homeric period, the development of the doctrine of purity, which was associated with the Apolline religion, combining with a growing dread of the ghost-world, stimulated and influenced in many important ways the evolution of the Greek law concerning homicide'. And the beginnings of international law and morality were rooted in religious sanctions and taboo. In fact, Greek state-life was indebted in manifold ways to Greek religion, and the study of the Greek oracles alone would supply sufficient testimony of this. In many cases the very origin of the State was religious, the earliest *polis* sometimes having arisen under the shadow of the temple.

Yet as Greek religion was always in the service of the State, and the priest a State official, society was the reverse of theocratic. Secular advance, moral progress, and the march of science could never long be thwarted by religious tradition; on the contrary, speculative thought and artistic creation were considered as attributes of divinity. We may say that the religion of Hellas penetrated the whole life of the people, but rather as a servant than as a master.

Distinct and apart from these public worships and those of the clan and family were the mystic cults of Eleusis, Andania and Samothrace, and the private services of the mystic brotherhoods. (*See* MYSTERY.) Here we find a strong salvationist tendency, the promise of salvation relying on mystic communion with the deity. Also a new and vital principle is at work; Orphism is the only force in Greek religion of a clear missionary and universalist tendency[2].

The later history of Greek paganism is mainly concerned with its gradual penetration by oriental ideas and worships, the result being θεοκρασία or syncretism, mysticism and a tendency towards monotheism In its turn the resulting Hellenistic religion influenced the doctrine, organization, and terminology of Christianity: to what extent is one of the most interesting problems of comparative religion, for the study of which a minute knowledge of the ritual and the mystic cults of Hellas is one of the essential conditions.

BIBLIOGRAPHY.—Preller, *Griechische Mythologie* (4th ed. by C. Robert, 1887) is antiquated in regard to theory, but still of some value for collection of materials. GREELEY, HORACE (1811–1872), American journalist and statesman, was born at Amherst, N.H., on Feb. 3, 1811. His parents were exceedingly poor and he secured little education. At 14 he became an apprentice in the printing office of *The Northern Spectator* at East Poultney, Vt. Here he developed a passion for politics and came to be depended upon for more or less of the editing of the paper. In June 1830 *The Northern Spectator* was suspended. Experiencing difficulties in obtaining employment, he went to New York.

Printer and Editor.— In Jan. 1833 Greeley formed a partnership with Francis V. Story, a fellow-workman, and undertook the printing of the *Morning Post,* the first cheap paper published in New York. The paper failed in less than three weeks. They still had a *Bank Note Reporter* to print, and soon got the printing of a tri-weekly paper, the *Constitutionalist.* Greeley was soon asked by James Gordon Bennett to go into partnership with him in starting *The Herald,* but declined the venture. On March 2, 1834, Greeley and Winchester, his new partner, issued the first number of *The New Yorker,* a weekly literary and news paper. By the end of the third year *The New Yorker* had reached a circulation of 9,500 copies, and had sustained a total loss of $7,000. It was published seven years (until Sept. 20, 1841), and was never profitable, but it was widely popular, and it gave Greeley, who was its sole editor, much prominence.

By 1838 he had gained such standing as a writer that he was selected by Thurlow Weed, William H. Seward and other leaders of the Whig Party, for the editorship of a campaign paper entitled *The Jeffersonian,* published at Albany. So satisfactory was this campaign sheet that on May 2, 1840, some time after the nomination by the Whig Party of William Henry Harrison for the presidency, Greeley began the publication of a new weekly campaign paper *The Log Cabin.* It was a brilliant political success, but was not profitable, and in Sept. 1841 Greeley merged his weekly papers, *The Log Cabin* and *The New Yorker,* into *The Weekly Tribune* which soon attained a circulation of a quarter of a million. In the meantime (April 10, 1841) he had begun the publication of a daily newspaper called *The Tribune.*

From the founding of *The Tribune* Greeley was popularly identified with this paper and its share in public discussion of the time is his history. It was a financial success, and his assured income should have placed him beyond pecuniary worry. But he lacked business thrift, inherited a disposition to endorse for his friends, and was often unable to distinguish between deserving applicants for aid and adventurers. He was thus frequently straitened, and, as his necessities pressed, he sold successive interests in his newspaper.

A Supporter of Causes.—From the outset it was a cardinal principle with Greeley to hear all sides, and to extend a special hospitality to new ideas. In March 1842 *The Tribune* began to give one column daily to a discussion of the socialistic doctrines of Charles Fourier, contributed by Albert Brisbane, father of the later well-known Arthur Brisbane. From boyhood he believed in a protective tariff, and throughout his active life he was its most trenchant advocate and propagandist, both in the columns of *The Tribune* and in public debate. He opposed woman suffrage on the ground that the majority of women did not want it and never would. Greeley aided practical efforts, however, for extending the sphere of woman's employments. He opposed the theatres, and for a time refused to publish their advertisements. He held the most rigid views on the sanctity of marriage and against easy divorce, and vehemently defended them in controversies with Robert Dale Owen and others. He practised and pertinaciously advocated total abstinence from spirituous liquors. He denounced the repudiation of State debts or the failure to pay interest on them. Greeley was zealous for Irish repeal, once held a place in the "Directory of the Friends of Ireland," and contributed liberally to its support.

Anti-slavery Leader. — It is as an anti-slavery leader, and as perhaps the chief agency in educating the mass of the Northern people to that opposition through legal forms to the extension of slavery which culminated in the election of Lincoln and the Civil war, that Greeley's main work was done. Incidents in it were his vehement opposition to the Mexican War as a scheme for more slave territory, the assault made upon him in Washington by Congressman Albert Rust of Arkansas in 1856, an indictment in Virginia in the same year for circulating incendiary documents, perpetual denunciation of him in Southern newspapers and speeches, and the hostility of the Abolitionists, who regarded his course as too conservative. His anti-slavery work culminated in his appeal to President Lincoln, entitled "The Prayer of Twenty Millions," in which he urged "that all attempts to put down the rebellion and at the same time uphold its inciting cause" were preposterous and futile, and that "every hour of deference to slavery" was "an hour of added and deepened peril to the Union."

The Politician.—Greeley's political activity, first as a Whig, and then as one of the founders of the Republican Party, was incessant; but he held few offices. His failure to hold greater political favour was due chiefly to his candour and idiosyncrasy. In 1848–49 he served a three months' term in Congress, filling a vacancy. He introduced the first bill for giving small tracts of Government land free to actual settlers, and published an exposure of abuses in the allowance of mileage to members, which corrected the evil. In the Republican National convention in 1860, serving as a delegate for Oregon, Greeley actively opposed Seward and did much to prevent the success of that statesman, and to bring about instead the nomination of Abraham Lincoln. In 1861 he was a candidate for U.S. senator, but was defeated. At the outbreak of the war he favoured allowing the Southern States to secede, provided a majority of their people at a fair election should so decide.

When the war began he urged the most vigorous prosecution of it. In 1864 he urged negotiations for peace with representatives of the Southern Confederacy then in Canada, and was sent by President Lincoln to confer with them. They were found to have no sufficient authority. At the close of the war, contrary to the general feeling of his party, he urged universal amnesty and impartial suffrage as the basis of reconstruction. In 1867 his friends again wished to elect him to the U.S. Senate, but he was defeated. Later he signed the bail bond of Jefferson Davis, and this provoked a torrent of public indignation. The second volume of his popular history of the Civil War was just issued, and the subscribers in their anger refused by thousands to receive it. An unsuccessful attempt was also made to expel him from the Union League Club of New York. In 1867 he was a delegate-at-large to the convention for the revision of the State Constitution, and in 1869 and 1870 he was the Republican candidate for controller of the State and member to Congress respectively, but was defeated.

Leader of Liberal **Republicans.**—Greeley was dissatisfied with Grant's administration, and became its sharp critic. The discontent which he did much to develop ended in the organization of the Liberal Republican Party, which held its national convention at Cincinnati in 1872, and nominated Greeley for the presidency. The tide of feeling ran strongly in his favour until the Democrats. his life-long opponents, also nominated him. His old party associates regarded him as a renegade; the Democrats gave him a half-hearted support. In August he made a series of campaign speeches which were regarded at the time by both friends and opponents as among the most brilliant continuous exhibitions of varied intellectual power ever made by a candidate in a presidential canvass. General Grant received in the election 3,597,070 votes, Greeley 2,834,079.

Closing Events. — He had resigned his editorship of *The Tribune* immediately after the nomination; he now resumed it cheerfully; but it was soon apparent that his powers had been overstrained. For years he had suffered greatly from insomnia. During the intense excitement of the campaign the difficulty was increased. Returning from his campaign tour, he went immediately to the bedside of his dying wife, and for some weeks had practically no sleep at all. This resulted in delirium. He died on Nov. 29, 1872 His funeral was a simple but impressive public pageant. The body lay in state in the City Hall, where it was viewed by thousands of mourners. The ceremonies were attended by the president and vice-president of the United States, the chief justice of the Supreme Court, and a large number of eminent public men of both parties. He had been the target of constant attack during his life. But his death revealed the high regard in which he was generally held as a leader of opinion and faithful public servant. He was a Universalist, and for many years was a conspicuous member of the leading Universalist church in New York.

His published works are: *Hints Toward Reforms* (1850); *Glances at Europe* (1851); *History of the Struggle for Slavery Extension* (1856); *Overland Journey to San Francisco* (1860); *The American Conflict* (1864–66); *Recollections of a Busy Life* **(1858;** new edition, with appendix containing an account of his later years, his argument with Owen **on** marriage and divorce, and miscellanies, **1873);** *Essays on Political Economy* (1870); and *What I Know of Farming* (1871). He also assisted his brother-in-law, J. F. Cleveland, in editing *A Political Text-book* (1860), and supervised **for** many years the annual issues of *The Whig Almanac* and *The Tribune Almanac,* comprising extensive political statistics.

The best Lives of Greeley are those by J. Parton (1855; new ed., 1872) and **W. A.** Linn (1903). Lives have also been written by L. U. Reavis (1872), L. D. Ingersoll **(1873);** F. N. Zabriskie (1890) and D. **C.** Seitz **(1926);** and there is a *Memorial of Horace Greeley* (1873).

GREELEY, a city of Colorado, U.S.A., 52 mi. N. by E. of Denver, on the South Platte river, at an elevation of 4,637 ft.; the county seat of Weld county. It is on federal highways 34 and 85; is served by the Colorado and Southern and the Union Pacific railways. The population was 10,958 in 1920 (90% native white), and was 15,995 in 1940 by federal census. The city is the trading centre of a rich irrigated agricultural and coal-mining region, and has flour and beet-sugar mills. It is the seat of the Colorado State College of Education (established 1889), which has an enrolment of 1,665 in the winter and nearly 3,000 in the summer quarter.

Greeley was founded in 1870 by Nathan Cook Meeker (1817–79), agricultural editor of the New York *Tribune,* with the support of Horace Greeley, after whom it was named. The Union Colony of Colorado, organized and chartered for the purpose, bought 11,000ac. of land and sold it to its members, colonists mainly from New England and New York, using the proceeds for public improvements. The town was organized in 1871 and incorporated as a city in 1886.

GREELY, ADOLPHUS WASHINGTON (1844–1935), American soldier and scientist, was born at Newburyport, Mass., March 27, 1844. Enlisting in 1861 as a private in the Civil War, he rose to be brevet major. In 1867 he was appointed second lieutenant in the regular army and became chief signal officer and brigadier general. While commanding at Lady Franklin bay, one of the 13 international circumpolar stations, 1881–84, he reached, in 1882, 83° 24' N., 42° 45' W., the farthest N. at that time. Two relief expeditions failed to reach him, and when the third, under Capt. Schley, rescued him at Cape Sabine, all but seven of his party were dead. From 1887 to 1906 he administered the Weather bureau and the Signal Corps. Under him were built more than 25,000m. of cables and telegraph lines in Alaska, China, Cuba, Porto Rico and the Philippine Islands. Promoted major general in 1906, he conducted relief operations in San Francisco and put down the Ute rebellion. He served with the international telegraph conference, London, 1904, at the request of the British Government and was dean of the American delegation to the wireless conference at Berlin that year. He wrote extensively on meteorological, electrical, geographical and other subjects. His most popular volumes are *Three Years of Arctic Service* (1886); *Handbook of Polar Discoveries* (1909); *True Tales of Arctic Heroism* (1912); *Handbook of Alaska* (1925); *Reminiscences of Adventure* (1927); and *Polar Regions of the Twentieth Century* (1928).

GREEN, DUFF (1791–1875), American journalist, politician, and private agent of President John Tyler (1841–45) and of the Department of State at various times in Great Britain, France, Texas, and Mexico, first gained national importance by

editing *The United States Telegraph* (Washington, 1825–35), the organ of Jacksonian democracy. In 1830–31, however, he followed John C. Calhoun (whose son Andrew Pickens had married his daughter Margaret) in the latter's break with President Jackson. From 1835 until the death of President Harrison and the succession of Tyler (whose nomination for vice-president Green is said to have suggested), he was in a very unsettled condition. For a time he edited with R. K. Crallé *The Reformer*, a radically partisan, free trade and states' rights weekly, and a daily; but he got into difficulties and withdrew; and the panic of 1837 and the subsequent depression appears to have crippled him financially. By 1840 he was seeking Whig support for election as government printer. As early as 1839, Duff Green had planned a visit to Great Britain "to sell stock"; and in the fall of 1841 President Tyler sent him there as a private or personal agent, possibly without any definite object in view. Green immediately became excited over the power of the Bank of England in American business, over British anti-slavery interests in Texas, and over the activities of the Anti-Corn Law League. Later on in the same year he returned with a project for a commercial treaty which might undermine the American Whig Tariff of 1842, a protective measure which was just being enacted into law. When this appeared impracticable, he attempted, apparently, some form of co-operation with British free traders and established *The Republic* in New York to advocate free trade and the candidacy of Calhoun for president. But after Calhoun accepted appointment as secretary of state under Tyler and refused to be a candidate for president, Green gave up *The Republic* and went to Galveston, Texas, as United States consul. His purpose was, of course, to facilitate the annexation of Texas; for while in London, in 1843, with Ashbel Smith, the Texan minister to Great Britain and France, he had reported the British anti-slavery interest in Texas in such a way as to precipitate the movement for annexation. Within a short time President Jones, of the Republic of Texas, resented Green's interference and revoked his *exequator*. In 1849, Green served the United States Government effectively in arranging the payment of money due to Mexico under the Treaty of Guadalupe Hidalgo by exchange instead of in specie.

There is no satisfactory biography of Duff Green. *See* his *Facts and Suggestions* (1866); and *Southern Historicat Association Publications, VII.*, 160. **(T. P. Ma.)**

GREEN, GEORGE (1793–1841), English mathematician, was born on July 14, 1793, at Sneinton, near Nottingham. He went into his father's business as a miller and his mathematics were practically self-taught. It is probably for this reason that Green used unusual methods of his own in solving the physical problems in which he was interested. In 1828 he published, by subscription, at Nottingham his *Essay on the Application of Mathematical Analysis to the Theory of Electricity and Magnetism*. In this memoir he generalized and extended Poisson's electric and magnetic investigations. He introduced the term "potential," and used what is now known as Green's theorem to investigate its properties in the case of magnetic and electric fields. This memoir was practically unknown until Lord Kelvin had it reprinted in 1846; it was followed in 1832 and 1833 by papers on the laws of equilibrium of fluids, on attractions in n-dimensional space and on the motion of a fluid agitated by vibrations of a solid ellipsoid. At the age of 40 he went to Cambridge where he was fourth wrangler in 1837. He was elected to a fellowship at Caius college in 1839, but ill-health compelled him to return to Sneinton, where he died on March 31, 1841.

His collected papers, *The Mathematzcal Papers of the Late George Green*, were edited by N. M. Ferrers (1871).

GREEN, JOHN RICHARD (1837–1883), English historian, was born at Oxford on Dec. 12, 1837, and educated at Magdalen college school and at Jesus college, where he obtained an open scholarship. On leaving Oxford he took orders and became the incumbent of St. Philip's, Stepney, where he was much loved by his parishioners. In 1868 he took the post of librarian at Lambeth, but his health was already breaking down and he was attacked by consumption. His *Short History of the English People* (1874) at once attained extraordinary popularity, and was afterwards expanded in a work of four volumes (1877–80). Green is pre-eminently a picturesque historian; he had a vivid imagination and a keen eye for colour. His chief aim was to depict the progressive life of the English people rather than to write a political history of the English state. In accomplishing this aim he worked up the results of wide reading into a series of brilliant pictures. His later histories, *The Making of England* (1882) and *The Conquest of England* (1883), are more soberly written than his earlier books, and are valuable contributions to historical knowledge. Green died at Mentone on March 7, 1883. He was a singularly attractive man, of wide intellectual sympathies and an enthusiastic temperament. Mrs. Humphry Ward's *Robert Elsmere* is said to be drawn from him. In 1877 Green married Miss Alice Stopford, herself a good historian. Among her important works are *Town Life in the 15th Century* (1894), *The Making of Ireland and its Undoing* (1908), *History of the Irish State to 1914* (1925), and *Studies from Irish History* (1926–27). Mrs. Green became a member of the Irish Senate in 1922, and died in 1929.

See the *Letters of J. R. Green* (1901), edit. by Leslie Stephen.

GREEN, MATTHEW (1696–1737), English poet, had a post in the custom house, and died unmarried at his lodging in Nag's Head Court, Gracechurch Street, in 1737. His chief poem, *The Spleen*, an epistle to Mr. Cuthbert Jackson advocating cheerfulness, exercise and a quiet content as remedies, was printed with a preface by Richard Glover in 1737.

Green's poems are printed in Chalmers' *Works of the English Poets*, vol. xv. (1810), and were edited by Richardson King Wood (1925).

GREEN, THOMAS HILL (1836–1882), English philosopher, the most typical English representative of *Neo-Kantianism* or *Neo-Hegelianism*, was born on April 7, 1836, at the rectory of Birkin, Yorkshire. He was educated at Rugby and Balliol college, Oxford, of which he was, in 1860, elected fellow. His life, henceforth, was devoted to teaching in the university — from 1878 until his death (at Oxford on Mar. 26, 1882) as Whyte Professor of Moral Philosophy. His lectures form the substance of his two most important works, viz., the *Prolegomena to Ethics* and the *Lectures on the Principles of Political Obligation* published posthumously.

Hume's empiricism, combined with a belief in Spencer's biological evolution, coloured English thought during the third quarter of the 19th century. By reducing mind to a series of unrelated atomic sensations, this teaching destroyed the possibility of knowledge, and, by representing man as a "being who is simply the result of natural forces," it made any theory of conduct unmeaning; for life in any intelligible sense implies a personal self which (1) *knows* what to do, (2) has *power* to do it.

Green, in reacting to the attitude of his day, raised again the question of man's relation to nature. To ask "What is man?" is to ask "What is experience?" for experience means that of which I am conscious. The facts of consciousness which alone we are justified in asserting to exist, are valid evidence for whatever is logically involved in them. Now the chief characteristic of man is *self*-consciousness. The simplest mental act, the act of sense-perception, is never merely a *change*, physical or psychical, but the *consciousness* of a change, and of a distinction between the self and the object. Knowledge consists, in its simplest equally with its most complex constituents, of the work of the mind. To know is to relate. The assumption of Locke and Hume that the work of the mind is arbitrary because not "given to" man is unjustified by the results of exact science, with the distinction, universally recognized, which such science draws between truth and falsehood, between the real and "mere ideas." This (obviously valid) distinction logically involves the consequence that the object of knowledge is an intelligible ideal reality, a system of thought relations. The existence of this ideal whole presupposes a "principle which renders all relations possible and is itself determined by none of them"; an eternal self-consciousness which knows in whole what we know in part. To God the world *is*, to man the world *becomes*.

Carrying this analytical method into moral philosophy, Green held that ethics applies to the peculiar conditions of social life that investigation into man's nature by metaphysics began,

The pre-supposition of ethics is the spiritual nature of man. Self-reflection reveals to us human capacity, human function, with, consequently, human responsibility. It brings out certain potentialities in the realization of which man's true good must consist. The idea of some "end" or "good" which man presents to himself as desirable for the realization of his true self, constitutes motive, and the determination to realize the self in some definite way constitutes an "act of will," which is neither arbitrary nor externally determined. The identification of the self with such a motive is a self-determination, which is at once both rational and free. Freedom is not a supposed ability to do anything but the power to identify one's self with that true good which reason reveals as one's true good. This good consists in the realization of personal character; hence the final good, *i.e.,* the moral ideal, as a whole, can be realized only in some society of persons who, while retaining their individuality, find this perfection attainable only when their separate individualities are integrated as part of a social whole. Society is as necessary to form persons as persons are to constitute society.

The iaw of our being, so reveaied, involves civic or political duties. Moral goodness cannot be limited to the cultivation of self-regarding virtues, but consists in the attempt to realize in practice that moral ideal which self-analysis has revealed to us as our ideal. From this arises the ground of political obligation, for the institutions of political or civic life are the concrete embodiment of our moral ideas. As society exists only for the proper development of persons, these institutions are valuable according as they develop the moral character of individual citizens. It is obvious that the final moral ideal is not realized in actually existing civic institutions but the same analysis which demonstrates this deficiency points the direction for a true development. Hence arises the conception of rights and duties which should be maintained by law, as opposed to those actually maintained; with the further consequence that it may become occasionally a moral duty to rebel against the state in the interest of the state itself, that is, in order better to subserve that function which constitutes the raison *d'être* of the state. The state does not consist in any definite concrete organization formed once for all. It represents a "general will" which is a desire for a common good. Its basis is not an external coercive authority but the spiritual recognition, on the part of the citizens, of that which constitutes their true nature. "Will, not force, is the basis of the state."

Green's teaching was, directly and indirectly, the most potent philosophical influence in England during the later 19th century, while his personal example in practical municipal life did much to bring the universities more into touch with the people. His criticism of the older empiricism, and the cogency of the reasoning by which his constructive theory is supported is generally recognized. His position, however, presents important difficulties. No explanation is given of the fact (obvious in experience) that the spiritual entities of the Universe appear material. Certain elements in feeling seem to resist any attempt to explain them in terms of thought. Again, there is a certain vagueness about Green's spiritual principle and its reproduction in individuals as well as about his idea of moral perfection.

BIBLIOGRAPHY.—Green's *Prolegomena to Ethics* appeared in **1883,** and R. L. Nettleship's standard edition of his *Works* in **3** vols. in 1888. The *Principles of Political Obligation* was published separately in 1901. *See* Andrew Seth (Pringle Pattison), *Hegelianism and Personality;* articles in *Mind* (1884) by *A.* J. Balfour and H. Sidgwick, in the *Academy* (xxviii. 242 and xxv. 297) by S. Alexander, and in the *Philosophical Review* (vi., 1897) by S. S. Laurie; W. H. Fairbrother, *Philosophy of T. H. Green* (1896); *D.* G. Ritchie, *The Principles* of *State Interference* (1891); *H.* Sidgwick, *Lectures on the Ethics of T. H. Green* (1902); *J.* H. Muirhead, *The Service of the State: Four Lectures on the Political Teaching of T. H. Green* (1908); A. W. Benn, *English Rationalism in the XIXth Century* (1906); *J.* MacCunn, Six *Radical Thinkers* (1910). *Y.* L. Chin, *The Political Theory of Thomas Hill Green* (1920).

GREEN, VALENTINE (1739–1813), British engraver, was born at Halesowen. He became a pupil of a line engraver at Worcester and in 1765 he migrated to London and began work as a mezzotint engraver. He became a member of the Incorporated Society of Artists in 1767, and an associate-engraver of the Royal Academy in 1775. During his career he produced some 400 plates after portraits by Reynolds and other British artists, and by many old masters. He was one of the first to apply mezzotint to the translation of pictorial compositions and portraits.

See Alfred Whitman, *Valentine Green* (1902).

GREEN, WILLIAM (1873–), American labour leader and president of the American Federation of Labor, was born March 3, 1873 at Coshocton, Ohio. He was educated in public schools and began as a young man to interest himself in the labouring conditions of Ohio coal mines. From 1900 to 1906 he was a sub-district president of the United Mine Workers of America, and from 1912 to 1924 international secretary-treasurer of that union. In 1913 he was appointed a member of the executive council of the American Federation of Labor. He was elected president of the A.F. of L. on Dec. 19, 1924, and was thereafter re-elected for many successive terms. After the formation of the Congress of Industrial Organizations in 1935, he fought a progressively bitter duel with John L. Lewis for leadership of American labour. Green accused his rival of high handed methods of organization, and of attempting to establish a labour dictatorship

GREENAWAY, KATE (1846–1901), English artist and book illustrator, was born in London Mar. 17, 1846. She began to exhibit drawings in 1868. Her illustrations for children (*e.g.,* for Little Folks, 1873, et seg.) attracted much attention. In 1877 she began to draw for the Illustrated London News. In the year 1879 she produced *Under the Window,* of which 150,000 copies are said to have been sold.

Then followed The Birthday Book, Mother Goose, Little Ann, and other books for children, which had an enormous success and are now very highly valued. "Toy-books" though they were, these little works created a revolution in book illustration; they were praised by John Ruskin (Art of England and Fors Clavigera), by Ernest Chesneau and Arsène Alexandre in France, by Dr. Muther in Germany, and by leading art critics throughout the world. In 1890 Kate Greenaway was elected a member of the Royal Institute of Painters in Water Colours, and in 1891, 1894 and 1898 she exhibited water-colour drawings, including illustrations for her books, at the gallery of the Fine Art Society (by which a representative selection was exhibited in 1902). Kate Greenaway's use of the quaint costume of the beginning of the 19th century lent humour to her fancy, and so captivated the public taste that it has been said that "Kate Greenaway dressed the children of two continents." From 1883 to 1897, with a break only in 1896, she issued a series of Kate Greenaway's Almanacs. Although she illustrated The Pied Piper of *Hamelin* and other works, the artist preferred to provide her own text; the numerous verses which were found among her papers after her death show real talent. She had great charm of character, but was extremely shy of public notice, and not less modest in private life. She died at Hampstead on Nov. 6, 1901.

See M. H. Spielmann and *G.* S. Layard, *Life* of *Kate Greenaway* (1905).

GREENBACK PARTY, the name for the American Independent National Party, which held its first national convention in 1874. Its earliest appearance in a presidential campaign was in 1876, when its candidate, Peter Cooper, received 81,740 votes. It advocated increasing the volume of greenbacks (*q.v.*), forbidding bank issues, and the paying in greenbacks of all Government bonds not expressly payable in coin. In 1878, after fusing with certain labour groups, it changed its name to the Greenback Labor Party. By this and other fusions the party in that year (a period of very hard times) cast over 1,000,000 votes and elected 14 congressmen. In 1880 it joined with other labour reformers and cast 308,578 votes for its presidential candidate, James B. Weaver, and elected 8 congressmen. In 1884 its candidate, Benjamin F. Butler, received only 175,370 votes, and the party disintegrated soon thereafter. Many of its adherents later joined the Populist Party, which was organized in 1891.

GREENBACKS, a form of paper currency in the United States, so named from the green colour used on the backs of the notes. They are treasury notes, and were first issued by the

government in 1862, "as a question of hard necessity," to provide for the expenses of the Civil War. The government, following the example of the banks, had suspended specie payment. The new notes were therefore for the time being an inconvertible paper currency, and, since they were made legal tender, were really a form of fiat money. The first act, providing for the issue of notes to the amount of $150,000,000, was that of Feb. 25, 1862; the acts of July 11, 1862 and March 3, 1863 each authorized further issues of $150,000,000. The notes soon depreciated in value, and at the lowest were worth only 35 cents on the dollar. The act of April 11, 1866 authorized the retirement of $10,000,000 of notes within six months and of $4,000,000 per month thereafter; this was discontinued by act of Feb. 4, 1868. On Jan. 1, 1879 specie payment was resumed, and the nominal amount of notes then stood at $346,681,000.

GREEN BAY, a city of eastern Wisconsin, U.S A., at the south end of Green bay (Lake Michigan) where the Fox river empties into it, 114m. N. of Milwaukee; a port of entry and the county seat of Brown county. It is on Federal highways 41 and 141, has an airport, and is served by the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific and the Green Bay and Western railways, by interurban motorbus, by common and contract motor carriers and by lake and river steamers. The population was 31,017 in 1920 (88% native white) and was 46,235 in 1940 by federal census. The city lies on high level ground on both sides of the river. It has a fine harbour, usually open from early April until December. The commerce of the port in 1940 amounted to 2,621,201 tons. There are large paper mills and other important manufacturing industries, with an output in 1937 valued at $29,279,963. Large quantities of cheese and other dairy products, canned goods and machinery are shipped. The assessed valuation of property in 1940 was $54,667,005; bank clearings amounted to $43,040,431. Five miles southwest of the city is the state reformatory (opened 1899). Green Bay is the oldest town in Wisconsin and the seat of the earliest Roman Catholic bishopric established in the northwest. The "Tank cottage" (in Tank park), built by Joseph Roy, a French-Canadian *voyageur,* in 1766, near the mouth of the river, is reputed to be the oldest house in the state. In 1634 Jean Nicollet came to this region and found (probably at the Red banks, 10 mi. below the present city) a village of Winnebago Indians, whom at first he took for Chinese. Radisson, Groseilliers and other *coureurs des bois* were visitors between 1654 and 1658; Joliet and Marquette in 1673; Le Sueur and Perrot in 1683–85. Claude Jean Allouez, the Jesuit missionary, had his mission at the Red banks before he established it permanently 5 mi. up the river at Rapides des Pères in 1671–72. In 1718–20 Ft. St. Francis was built at the mouth of the river, and in 1745 the first permanent settlement in the state mas made at La Baye (within the present boundaries of Green Bay) by Augustin de Langlade. The fort was occupied by a British garrison from 1761 to 1763, and again for a short time during the War of 1812. Until 1816, when the American fort (Ft. Howard) was garrisoned, the inhabitants of La Baye were regarded as British subjects. Fur traders employed by John Jacob Astor were stationed here as early as 1810, and about 1820 Astor put up a warehouse and other buildings. For many years there were two distinct settlements, Astor and Navarino, which were united in 1839 as Green Bay. The city was chartered in 1854, and in 1893 Ft. Howard was consolidated with it. From about 1890 it was an important lumber centre. The first newspaper in Wisconsin, the Green Bay *Intelligencer,* began publication here in 1833.

GREENCASTLE, a city of Indiana, U.S.A., on the Big Walnut river, half way between Indianapolis and Terre Haute; the county seat of Putnam county. It is served by the Chicago, Indianapolis and Louisville, the Big Four and the Pennsylvania railways. The population was 3,780 in 1920 (95% native white) and was 4,872 in 1940 by federal census. It is in a blue-grass region which makes heavy shipments of grain and live stock, and has lumber, zinc, and steel mills, stone quarries, and a large cement plant. Greencastle was settled about 1820 and was chartered as a city in 1861. It is the seat of De Pauw university, a Methodist Episcopal institution, founded in 1837 as Indiana Asbury university, and re-named in 1884 after Washington C. De Pauw (1822–87) who made a liberal gift in 1883. The endowment in 1941 exceeded $6,000,000, and the enrolment was about 1,500.

GREEN DRAGON *(Arisaema dracontiunz),* a North American plant of the arum family (Araceae), found chiefly in low woods from Maine to Ontario and Minnesota and southward to Florida and Texas. It is a somewhat fleshy perennial rising from a cluster of acrid corms and bearing a single large leaf, ¾ ft. to 4 ft. long. which is pedately divided into 5 to 17 oblong leaflets, and a single flower stalk (scape) ending in a spadix with a short basal flower-bearing portion and long, slender tip, sometimes 7 in. long, protruding beyond the green, tubular but not hooded ensheathing spathe. The fruit, a cluster of orange-yellow berries. ripens in the autumn. Because of its inconspicuous flowering parts, this interesting aroid, though abundant in many parts of its range, is much less known than its showy relative, the jack-in-the-pulpit (*q.v.*). *(See* ARACEAE; CALLA; GOLDEN CLUB.)

GREENE, GEORGE WASHINGTON (1811–1883), American historian, was born at East Greenwich (R.I.), on April 8, 1811, the grandson of Maj.-Gen. Nathanael Greene. He entered Brown university in 1824, left in his junior year on account of ill-health, was in Europe during the next 20 years, except in 1833–34, when he was principal of Kent academy at East Greenwich, and was the U.S. consul at Rome from 1837 to 1845. He was instructor in modern languages in Brown university (1848–52); and in 1871–75 was non-resident lecturer in American history in Cornell university. He died at East Greenwich (R.I.), on Feb. 2, 1883. His works include: *Historical View of the American Revolution* (1865); *Life of Nathanael Greene* (1867–71); *The German Element in the War of American Independence* (1876); and a *Short History of Rhode Island* (1877).

GREENE, MAURICE (1695–1755) English composer, was born in London and became a chorister of St. Paul's Cathedral, where he studied under Charles King, and then under Richard Brind, organist of the cathedral from 1707 to 1718, whom, on his death in the last-named year, he succeeded. Nine years later he became organist and composer to the chapel royal, on the death of Dr. Croft. In 1730 he was elected to the chair of music in the university of Cambridge. Dr. Greene was a voluminous composer of church music, showing contrapuntal skill and sound musical scholarship and his collection of *Forty Select Anthems* became a standard work of its kind. He died on Dec. 1, 1755.

GREENE, NATHANAEL (1742–1786), American general, son of a Quaker farmer and smith, was born at Potowomut, in the township of Warwick, R.I., on Aug. 7 (not, as has been stated, June 6), 1742. At Coventry, R.I., where he went in 1770, he was the first to urge the establishment of a public school. In the same year he was chosen a member of the legislature of Rhode Island, to which he was re-elected in 1771, 1772 and 1775. He sympathized strongly with the Whigs and in 1774 joined the local militia. At this time he began to study the art of war. His zeal in attending to military duty led to his expulsion from the Society of Friends.

In 1775, in command of the contingent raised by Rhode Island, he joined the American forces at Cambridge, and on June 22 was appointed a brigadier by Congress. To him Washington assigned the command of the city of Boston after it was evacuated by Howe in March 1776. On Aug. 9, 1776 he was promoted to be one of the four new major generals and was put in command of the Continental troops on Long Island, but severe illness prevented his taking part in the battle of Long Island. Greene was placed in command of Ft. Lee, and on Oct. 25 succeeded Gen. Israel Putnam in command of Ft. Washington. Greene ordered Col. Magaw, who was in immediate command, to defend the place until he should hear from him again, and reinforced it to meet Gen. Howe's attack. Nevertheless, the blame for the losses of Fts. Washington and Lee was put upon Greene, but without his losing the confidence of Washington, who assumed the responsibility. At Trenton Greene commanded one of the two American columns; he commanded the reserve at Brandywine, and was prominent in the battle of Germantown, though his troops arrived late.

At the request of Washington, on March 2, 1778, he accepted the office of quartermaster general (succeeding Thomas Mifflin), and succeeded with it as well as anyone could under the circumstances, meanwhile continuing to command troops in the field. In August he resigned the office of quartermaster general, after a struggle with Congress over the interference in Army Administration by the Treasury board On Oct. 4 he succeeded Gates as commander-in-chief of the Southern army, and took command at Charlotte, N.C., on Dec. 2. The army was weak and badly equipped and was opposed by a superior force under Cornwallis. Greene decided to divide his own troops, thus forcing the division of the British as well. This strategy led to Gen. Daniel Morgan's victory of Cowpens, S.C., Jan. 17, 1781, and to the battle at Guilford Court House, N.C., March 15, in which after having weakened the British troops by continued movements, Greene was defeated indeed, but only at such cost to the victor that Tarleton called it "the pledge of ultimate defeat." Three days after this battle Cornwallis withdrew toward Wilmington. Greene allowed Cornwallis to march north to Virginia and then turned swiftly to the reconquest of the inner country of South Carolina. This, in spite of a reverse sustained at Lord Rawdon's hands ai Hobkirk's Hill (April 25) he achieved by the end of June, the British retiring to the coast. Greene then gave his forces a six weeks' rest, and on Sept. 8, with 2,600 men, engaged the British under Lieut. Col. James Stuart at Eutaw Springs; the battle, although tactically drawn, so weakened the British that they withdrew to Charleston, where Greene penned them during the remaining months of the war. Greene's Southern campaign showed remarkable strategic features that remind one of those of Turenne, the commander whom he had taken as his model in his studies before the war. He excelled in dividing, eluding and tiring his opponent by long marches, and in actual conflict forcing him to pay for, a temporary advantage a price that he could not afford.

South Carolina and Georgia voted Greene liberal grants of lands and money. On the Georgia estate, Mulberry Grove, 14m. above Savannah, he settled in 1785, after twice refusing (1781 and 1784) the post of secretary of war, and there he died of sunstroke on June 19, 1786.

BIBLIOGRAPHY.—*See* the *Life of Nathanael Greene* (1867–71), by his grandson, George W. Greene, and the biography (1893), by Brig. Gen. F. V. Greene, in the "Great Commanders Series." His letters are in the University of Michigan library.

GREENE, ROBERT (1558–1592), English dramatist and miscellaneous writer, was baptized at Norwich on July 11, 1558. He entered St. John's college, Cambridge, as a sizar in 1575 and took his B.A. thence in 1579, proceeding M.A. in 1583 from Clare Hall. His life at the university was, according to his own account, spent "among wags as lewd as himself, with whom he consumed the flower of his youth." In 1588 he was incorporated at Oxford, so that on some of his title pages he styles himself "utriusque Academiae in Artibus Magister"; and Nashe humorously refers to him as "utriusque Academiae Robertus Greene." Between the years 1578 and 1583 he had travelled abroad, according to his own account very extensively, visiting France, Germany, Poland and Denmark, besides learning at first-hand to "hate the pride of Italie" and to know the taste of that poet's fruit, "Spanish mirabolones." After taking his M.A. degree, he went to London, and his earliest extant literary production was in hand as early as 1580. By his own account he rapidly sank into the worst debaucheries of the town, though Nashe declares that he never knew him guilty of notorious crime. It is possible that he, as well as his bitter enemy, Gabriel Harvey, exaggerated the looseness of his conduct. His marriage, which took place in 1585 or 1586, failed to steady him; if Francesco, in Greene's pamphlet *Never too Late to Mend* (1590), is intended for the author himself, it had been a runaway match; but the fiction and the autobiographical sketch in the *Repentance* agree in their account of the unfaithfulness and desertion which followed on the part of the husband. In his last years he made war on the cut-purses and "conny-catchers" with whom he came into contact in the slums, and whose doings he fearlessly exposed in his writings. He tells us how at last he was friendless "except [they] were in a fewe alehouses," where he was respected on account of the score he had run up. The story of his death is told by Gabriel Harvey, whose family Greene had attacked in the prose-tract *A Quip for an Upstart Courtier, or a Quaint Dispute between Velvet Breeches and Cloth Breeches* (1592). After a banquet where the chief guest had been Thomas Nashe, Greene had fallen sick "of a surfeit of pickle herringe and Rennish wine." At the house of a poor shoemaker near Dowgate, deserted by all except his compassionate hostess (Mrs. Isam) and two women—one of them the sister of a notorious thief named "Cutting Ball," and the mother of his illegitimate son, Fortunatus Greene—he died on Sept. 3, 1592. Shortly before his death he wrote under a bond for £10 which he had given to the good shoemaker, the following words addressed to his long-forsaken wife: "Doll, I charge thee, by the loue of our youth and by my soules rest, that thou wilte see this man paide; for if hee and his wife had not succoured me, I had died in the streetes.—Robert Greene."

Four Lefters and Certain Sonnets, Harvey's attack on Greene, appeared almost immediately after his death. Nashe took up the defence of his dead friend and ridicuied Harvey in *Strange News* (1593); and the dispute continued for some years. But, before this, the dramatist Henry Chettle published a pamphlet from the hand of the unhappy man, entitled *Greene's Groat's-worth of Wit bought with a Million of Repentance* (1592), containing the story of Roberto, who may be regarded, for practical purposes, as representing Greene himself. In it he exhorted to repentance three of his *quondam* acquaintance. Of these three Marlowe was one—to whom and to whose creation of "that Atheist Tamberlaine" he had repeatedly alluded. The second was Peele, the third probably Nashe. But the passage addressed to Peele contained a transparent allusion to a fourth dramatist, who was an actor likewise, as "an vpstart crow beautified with our feathers, that with his *Tygres heart wrapt in a player's hyde* supposes hee is as well able to bombast out a blanke-verse as the best of you; and being an absolute Iohannes-fac-totum, is in his owne conceyt the onely shake-scene in a countrey." The phrase italicized parodies a passage occurring in *The True Tragedie of Richard, Duke of York*, etc., and retained in Part III. of *Henry VI.* If Greene (as many eminent critics have thought) had a hand in *The True Tragedie*, he must here have intended a charge of plagiarism against Shakespeare. But while it seems more probable that (as the late R. Simpson suggested) the upstart crow beautified with the feathers of the three dramatists is a sneering description of the actor who declaimed their verse, the *animus* of the whole attack (as explained by Dr. Ingleby) is revealed in its concluding phrases. This "shake-scene," *i.e.*, this *actor* had ventured to intrude upon the domain of the regular staff of playwrights—their monopoly was in danger!

Two other prose pamphlets of an autobiographical nature were issued posthumously. Of these, *The Repentance of Robert Greene, Master of Arts* (1592) bears traces of having been improved from the original; while *Greene's Vision* was certainly not, as the title-page avers, written during his last illness.

Altogether not less than 35 prose-tracts are ascribed to Greene. Nearly all of them are interspersed with verses; in their themes they range from the "misticall" wonders of the heavens to the familiar but "pernitious sleights" of the sharpers of London. His "love-pamphlets" brought upon him the outcry of Puritan censors. The earliest of his novels, as they may be called, *Mamillia*, was licensed in 1583. Part ii., of which, though probably completed several years earlier, the earliest extant edition bears the date 1593, had a sequel, *The Anatomie of Love's Flatteries*, which contains a review of suitors recalling Portia's in *The Merchant of Venice*. *The Myrrour of Modestie* (the story of Susanna) (1584); *The Historie of Arhasto, King of Denmarke* (1584); *Morando, the Tritameron of Looe*, a rather tedious imitation of the *Decameron* (1584); *Planetomachia* (1585) (a contention in story-telling between Venus and Saturn); *Penelope's Web* (1587) (another string of stories); *Alcida, Greene's Metamorphosis* (1588) and others, followed. In these popular productions he appears very distinctly as a follower of John Lyly; indeed two of Greene's novels are by their titles announced as a kind of

sequel to the parent romance: *Euphues his Censure to Philautus* (1587), *Menaphon. Camilla's Alarum to Slumbering Euphues* (1589), named in some later editions *Greene's Arcadia.* This pastoral romance, written in direct emulation of Sidney's, with a heroine called Samila, contains St. Sephestia's charming lullaby, with its refrain "Father's sorowe, father's joy." On his *Pandasto, The Triumph of Time* (1588) Shakespeare founded *A Winter's Tale;* in fact, the novel contains the entire plot of the comedy, except the device of the living statue; though some of the subordinate characters in the play, including Autolycus, were added by Shakespeare, together with the pastoral fragrance of one of its episodes.

Greene's *Never too Late* (1590) has a vivacity and truthfulness of manner which savour of an 18th century novel rather than of an Elizabethan tale concerning the days of "Palmerin, King of Great Britain." Philador, the prodigal of *The Mourning Garment* (1590), is obviously also in some respects a portrait of the writer. The experiences of the Roberto of *Greene's Groat's-worth of Wit* (1592) are even more palpably the experiences of the author himself, though they are possibly overdrawn—for a born rhetorician exaggerates everything, even his own sins. Besides these and the posthumous pamphlets on his repentance, Greene left realistic pictures of the very disreputable society to which he finally descended, in his pamphlets on "conny-catching": *A Notable Discovery of Coosnage* (1591), *The Blacke Bookes Messenger. Laying open the Life and Death of Ned Browne, one of the most Notable Cutpurses, Crossbiters and Conny-catchers that ever lived in England* (1592). Much in Greene's manner, both in his romances and in his pictures of low life, anticipated what proved the slow course of the actual development of the English novel; and it is probable that his true *métier,* and that which best suited the bright fancy, ingenuity and wit of which his genius was compounded, was pamphlet-spinning and story-telling rather than dramatic composition.

Only four plays remain to us of which Greene was indisputably the sole author. The earliest of these seems to have been the *Comicall History of Alphonsus, King of Arragon* (*c.* 1587), written in emulation as well as in direct imitation of Marlowe's tragedy. In the *Honourable History of Friar Bacon and Friar Bungay* (not known to have been acted before Feb. 1592, but probably written in 1589) Greene once more attempted to emulate Marlowe; and he succeeded in producing a masterpiece of his own. *Friar Bacon* remains a dramatic picture of English Elizabethan life with which *The Merry Wives* alone can vie. *The History of Orlando Furioso, one of the Twelve Peeres of France,* known to have been acted on Feb. 21, 1592, is a free dramatic adaptation of Ariosto, Harington's translation of whom appeared in 1591. In *The Scottish Historie of James IV.* (*c.* 1591, licensed for publication 1594) the story has no pretence to be historical, but is taken from one of Giraldi Cinthio's tales. It contains a prelude and some dances between the acts—"presented by Oboram, King of Fayeries," who is, however, a very different person from the Oberon of *A Midsummer Night's Dream. George-a-Greene the Pinner of Wakefield* (acted 1593, printed 1599), a delightful picture of English life fully worthy of the author of *Friar Bungay,* has been attributed to him on slight evidence. The conjecture as to his supposed share in the plays on which the second and third parts of *Henry* VI. are founded has been already referred to. He was certainly joint author with Thomas Lodge of the curious drama called *A Looking Glasse for London and England* (acted in 1592 and printed in 1594)—a dramatic apologue conveying to the living generation of Englishmen the warning of Nineveh's corruption and prophesied doom, often reproduced as a street puppet play.

Greene's dramatic genius has nothing in it of the intensity of Marlowe's tragic muse; nor perhaps does he ever equal Peele at his best. His comic humour is undeniable, and he had the gift of light and graceful dialogue. His diction is overloaded with classical ornament, but his versification is easy and fluent, and its cadence is at times singularly sweet. He creates his best effects by the simplest means; and he is indisputably one of the most attractive of early English dramatic authors.

Greene's dramatic works and poems were edited by Alexander Dyce. His complete works were edited for the Huth Library by A. B. Grosart (15 vols. 1881–86); by J. C. Collins (2 vols., 1905); and by T. H. Dickinson (Mermaid Series, 1909). Grosart's edition contains a translation of Nicholas Storojhenko's monograph on Greene (Moscow, 1878). An account of his pamphlets is to be found in J. J. Jusserand's *English Novel in the Time of Shakespeare* (Eng. trans., 1890). *See* also F. M. Bodenstedt, in *Shakespeare's Zeitgenossen und ihre Werke* (1858); *W.* Bernhardi, *Robert Greenes Leben und Schriften* (1874); an introduction by A. W. Ward to *Friar Bacon and Friar Bungay* (1886, 4th ed., 1901); C. R. Gayley, "Robert Greene: His Life and the Order of his Plays in *Representative English Comedies* (vol. i., 1903); and an account by E. K. Chambers in *The Elizabethan Stage* (vol. iii. 1923) where other references will be found.

GREENER, WILLIAM (1806–1869), gunmaker and inventor, was born at Felling near Newcastle-on-Tyne in 1806 and began business in Newcastle in 1829. In 1844 he removed to Birmingham. His most important invention, the first expansive rifle bullet, consisted of an oval ball a diameter and a half in length, with a flat end, perforated, in which a cast metallic taper plug was inserted. *(See* AMMUNITION.) In 1843 he patented a process with W. E. Stait for the manufacture of pencils from the hard graphite carbon deposited in the interior of gas retorts. *(See* LIGHTING.) Other valuable inventions followed, the most important being the cape rifle. *(See* RIFLE.)

His son William Wellington Greener (1834–1921) invented the treble-wedgefast mechanism of modern shotguns in 1865—perfected in 1873.

BIBLIOGRAPHY.—*See W.* Greener, *The Gun* (1834); *The Science of Gunnery* (1841); *W.* W. Greener, *The Breechloader and How to Use it* (1892 and 10 subsequent editions); *Sharpshooting for Sport and War* (1900); G. T. Teasdale-Buckell, *Experts on Guns and Gunnery* (1900).

GREENFIELD, a city of central Indiana, U.S.A., 21 mi. E. of Indianapolis, on federal highway 40, the Pennsylvania railroad and Brandywine creek; the county seat of Hancock county. The population in 1930 was 4,188; in 1940 it was 4,821. It is the centre of a fertile agricultural land, has a food-canning plant, a textile factory and a bacteriological laboratory. Founded in 1828, it was incorporated 1850. It is the birthplace of James Whitcomb Riley, whose old home is a public shrine.

GREENFIELD, a town of northwestern Massachusetts, U.S.A., on the Connecticut river; county seat of Franklin county. It is the eastern terminus of the Mohawk trail, and is served by the Boston and Maine railroad. It has an area of 21 sq.mi., and a population in 1930 of 15,500; 15,672 in 1940 federal census. It is a busy trading centre, and has diversified manufacturing industries, producing more screw-cutting tools than any other place. The factory output in 1937 was valued at $7,401,635. It is an important highway and railroad junction. Greenfield was settled in 1686 and incorporated as a district of Deerfield in 1753 and as a separate town in 1775. It was a centre of disaffection during the Shay's Rebellion.

GREENFIELD, a village of Highland county, Ohio, U.S.A., 47 mi. S. by W. of Columbus; served by the Baltimore and Ohio and the Detroit, Toledo and Ironton railways. The population was 4,344 in 1920 (94% native white) and was 4,228 in 1940 by the federal census. There are large stone quarries and a variety of manufacturing and commercial industries. Cattle-shipping and poultry-packing are important. Greenfield has a unique public school system. with a fine plant (elementary, high and vocational schools grouped together on a large campus) erected at a cost of $3,000,000, largely contributed by one of the citizens.

GREENFINCH or **GREEN LINNET,** *Ligurinus chloris,* is a common European bird. The cock, in his plumage of yellowish-green and yellow, is finely coloured but heavily built, and his song is hardly to be commended. The hen is less brightly tinted. The species pervades almost the whole of Europe, and in Asia reaches the river Ob. It extends to Palestine, but is unknown in Egypt. It is, however, abundant in north-west Africa. In the north-east of Asia and its adjacent islands occur two allied species—L. *sinica, L. kawarahiba.*

GREENHEART, one of the most valuable of timbers, the produce of *Ocotea rodioei,* family Lauraceae, a large tree, native

of British Guiana and Surinam. From the bark and the fruits of the tree is obtained the febrifuge principle bibirine. Greenheart wood is of a dark-green colour, sap wood and heart wood being only distinguished with difficulty. The heart wood is one of the most durable of all timbers, and its value is greatly enhanced by the fact that it is proof against the ravages of many marine borers which rapidly destroy piles and other submarine structures of most other kinds of wood available for such purposes. Greenheart is one of the strongest of all woods, and is exceedingly dense, its specific gravity being about 1150. It is extensively used for keelsons, beams, engine-bearers and planking, etc., but its excessive weight unfits it for many purposes for which its other properties would render it eminently suitable.

GREENHILL, SIR ALFRED GEORGE (1847–1927), English mathematician, born in London on Nov. 29, 1847, was educated at Christ's Hospital and St. John's college, Cambridge. He held the posts of fellow and lecturer in mathematics at Emmanuel college, Cambridge (1873–76), and professor of mathematics to the advanced class of artillery officers, Woolwich (1876–1906). He retired in 1906, and occupied himself with activities connected with the Royal Society and the London Mathematical Society. Greenhill was a member of many foreign learned societies; and received many academic honours. including a knighthood in 1908. He died in London on Feb. 10, 1927.

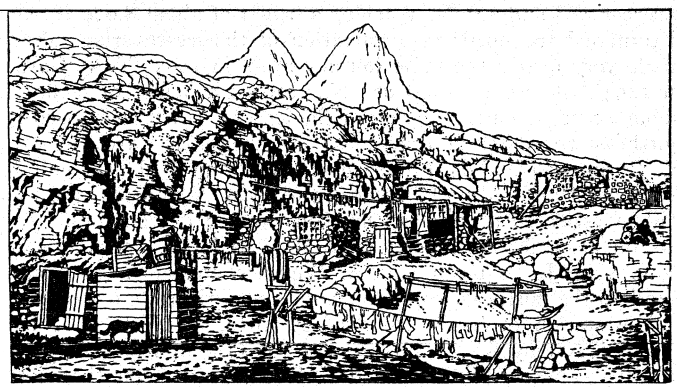
Greenhill's mathematical work consisted of original contributions to dynamics, hydrodynamics and elasticity. In these he made extensive use of elliptic functions and also applied the sigma-functions due to Weierstrass. The investigation of the problem of the steadiness of flight of a projectile due to rifling and the amount of rifling required for various types of projectile was very warmly received at Woolwich. He applied elliptic functions to the investigation of special problems for the advisory committee on aeronautics and he issued two reports, the first on *Stream Line Motion past a Plane Barrier* (1910), and a supplementary report dealing with curved boundaries in 1916. Another well known problem solved by Greenhill was that of the greatest height a vertical shaft can attain without bending under its own weight. He tested his solution by the measurement of the heights of trees. Greenhill wrote *Hydrostatics* (1894), *Differential and Integral Calculus* (1886), *Applications of Elliptic Functions* (1882), *Notes on Dynamics* (1908).

See obituary notice *by* Love in *Journal of the London Mathematical Society,* vol. iii. *(1928).*

GREENLAND, world's largest island, lying mostly within the Arctic circle; area about 840,000 sq.mi.; more than 700,000 are ice-covered. Denmark is sovereign, but the U.S. assumed a temporary protectorate in 1941. It is not connected with any portion of Europe or America except by suboceanic ridges; but in the extreme north it is separated only by a narrow strait from Ellesmere island in the Canadian Arctic archipelago. The Faroe-Icelandic ridge, about 300 fathoms deep at its deepest, unites Greenland with Iceland (across Denmark strait), the Faroes and Scotland, and another ridge apparently joins northeast Greenland and Spitsbergen. A similar submarine ridge crosses Davis strait. Peary Land, in the north, is an integral part of Greenland and is not separated by a strait. Its most northerly point is Cape Morris Jesup in 83° 39' N. Cape Farewell, the most southerly point (on a small island), is in 59" 45' N. The extreme length of Greenland is about 1,650 mi. while its extreme breadth, which occurs about 70° N. is nearly 800 miles.

The southern and southwestern coasts have been known since the 10th century, when Norse settlers appeared there, but the communication between the Norse settlements and Norway was broken off in the 15th century, and the Norsemen's knowledge of their distant colony was gradually lost. The south and west coast of Greenland was rediscovered by John Davis in July 1585, though previous explorers, as Rining, Cortereal, Frobisher and others, had seen it, and at the end of the 16th and the beginning of the 17th century the work of Davis (1586–88), Hudson (1610) and Baffin (1616), in the western seas, afforded some knowledge of the west coast. This was added to by later explorers and whalers. Among explorers who, in the 19th century, were specially connected with the north-west coast may be mentioned E. A. nglefield (1852), who sailed into Smith sound, E. K. Kane (1853–55) who worked northward through Smith sound into Kane basin, and C. F. Hall (1871) who explored the strait (Kennedy) and Robeson channels to the north of this.

The northern east coast was sighted by Hudson (1607) in about 73° 30′ N. (C. Hold with Hope), and during the 17th century and later this northern coast was probably visited by many Dutch whalers. The first who gave more accurate information was the Scottish whaler, Capt. W. Scoresby, Jr. (1822), who, with his father, explored the coast between 69° and 75° N., and gave the first fairly trustworthy map of it. Captains Edward Sabine and D. Clavering (1823) visited the coast between 72° 5′ and 75° 12′ N. and met the only Eskimo ever seen in this part of Greenland. The German expedition in 1870, under C. Koldewey, reached 77° N. (Cape Bismarck); and the duke of Orleans in 1905 ascertained that this point was on an island and penetrated farther north to about 78° 16′. From this point the north-east coast remained unexplored until a Danish expedition under Mylius Erichsen, with J. P. Koch, in 1906–08 explored it, discovering North-east Foreland, the easternmost point. A. Wegener explored the ice sheet along that coast. E. Mikkelsen in 1910 mapped Danmark fjord *(see* ARCTIC REGIONS). The southern part of the east coast was first explored by the Dane, W. A. Graah (1829–30), between Cape Farewell and 65° 16′ N. In 1883–85 the Danes, G. Holm and T. V. Garde, mapped the coast from Cape Farewell to Angmagsalik in 66" N. A. E. Nordenskiold, in the "Sophia," landed near Angmagsalik in 65" 36' N. in 1883. Capt. C. Ryder in 1891–92, mapped the large Scoresby sound, Lieut. G. Amdrup, in 1899, explored the coast from Angmagsalik, north to 67° 22' N. In 1899 Dr. A. G. Nathorst explored the land between Franz Josef fjord and Scoresby fjord, where the large King Oscar fjord, connecting Davy sound with Franz Josef fjord, was discovered. In 1900 Amdrup explored the still unknown east coast from 69° 10′ N. south to 67° N. In 1926 J. M. Wordie added details to the coast between Sabine island and Davy sound and in 1926–27 L. Koch explored from Scoresby sound to Danmark harbour.



UMANAK. ONE OF THE MOST NORTHERLY SETTLEMENTS IN THE WORLD
Umanak is situated in latitude 70° 40' N. Nevertheless, it is not always freezing there, and during the two or three months of mild weather its inhabitants, whose primitive dwellings are seen, grow broccoli, lettuce and, sometimes, turnips

Towards the close of the 19th century several explorers gave attention to the North of Greenland, including L. A. Beaumont of the Nares expedition (1876); J. B. Lockwood, of the Greely expedition (1882), and R. E. Peary on several journeys (1892, 1895, and 1901). For details *see* ARCTIC REGIONS.

The scanty exploration of the great ice-cap, or inland ice. which covers the whole of the interior of Greenland, has been prosecuted chiefly from the west coast. In 1751 Lars Dalager, a Danish trader, took some steps in this direction from Frederikshaab. In 1867 E. Whymper and R. Brown made the first attempt of modern times to penetrate the interior, but failed. In 1870 A. E. Nordenskiöld and S. Berggren walked 35 m. inland from the head of Aulatsivik fjord to an elevation of 2,200 feet. Jens Jensen reached, in 1878, the Jensen Nunataks (5,400 ft. above the sea), about 45 m. from the western margin in 62" 50′ N. Nordenskiöld penetrated, in 1883, about 80 m. inland in 68° 20′ N., and

two Lapps of his expedition went still farther on skis to about 43° W., at an elevation of 6,600 ft. Peary and Maigaard reached in 1886 about 100 mi. inland, a height of 7,500 ft. in 69° 30′ N. Nansen, with five companions, in 1888 made the first complete crossing of the inland ice, working from the east coast to the west, about 64° 25′ N., and reached a height of 8,922 ft. Peary and Astrup, in 1892, crossed the northern part of the inland ice between 78° and 82° N., reaching a height of about 8,000 ft., and determined the northern termination of the ice-covering. Peary made very nearly the same journey again in 1895. T. V. Garde, in 1893, between 61° and 62" N., reached a height of 7,080 ft. about 60 mi. from the margin of the ice. M. Ericksen crossed its northeastern corner in 1907 and E. Mikkelsen in 1910. In 1912 K. Rasmussen and P. Freuchen crossed from Inglefield gulf to Danmark fjord and back. In 1913 the Swiss, A. de Quervain, who had investigated the ice cap in 1909, crossed it from Disco bay to Angmagsalik, reaching a greatest altitude of 8,364 ft. The same year J. P. Koch and A. Wegener crossed from Louise Land on the northeast coast to near Proven, rising to 9,500 ft.

The station of Thule, founded in 1910, in North Star bay (76° 32′ N.) by K. Rasmussen, was the base of five Danish expeditions under Rasmussen and L. Koch, which after that date, explored the north of Greenland and investigated the Eskimo tribes. In 1926–27 L. Koch continued his researches in the Scoresby sound district on the east coast. In 1926–27 W. H. Hobbs made meteorological researches at high altitudes in the Holstenborg district.

In the winter of 1930–31 a British expedition made weather observations high on the inland ice 40 mi. north of the Arctic circle; at the same time a three-man German expedition wintered 300 mi. farther north. In 1933 a University of Michigan and Pan-American Airways group went up still farther. Greenland weather is of fundamental importance for predicting conditions on the north Atlantic and in western Europe, and is particularly vital in an epoch of aerial warfare—hence the results of research were not mads; public during World War II.

Coasts.—The coasts of Greenland are deeply indented with fjords. The coast-lines of Melville bay and around North-east Foreland are to some degree exceptions; and on the east side of Peary Land the mountains recede inland, and there is shoal water far out from the coast. Numerous small islands lie off the coasts. The largest is Disko (3,200 sq.mi.), off the west, at 70° N.

The extensive glaciation of the east coast is evidently owing to the north polar current carrying the ice masses from the north polar basin southwestward along the land, and giving it an entirely arctic climate down to Cape Farewell. In some parts the interior ice-covering extends down to the outer coast, while in other parts its margin is situated more inland, and the ice-bare coast-land is deeply intersected by fjords extending far into the interior, where they are blocked by enormous glaciers, which discharge icebergs into them. Scoresby sound has a length of about 180 mi. from the outer coast to the point where it is blocked by the glaciers. Franz Josef fjord with its branch, King Oscar fjord, communicating with Davy sound, forms a system of fjords on a similar huge scale. These fjords are very deep; like the Norwegian fjords they have, probably, a threshold with shallow water near their mouths. Soundings seem to indicate that the fjords continue as deep submarine valleys on the coastal shelf. These fjords are drowned valleys of erosion and not of tectonic origin. On the west coast there are also many great fjords. One of the best known is the great Godthaab fjord (or Baals revier) north of 64° N. Along the east coast there are many high mountains, exceeding 6,000 ft. and 7,000 ft. in height. In the region of Angmagsalik the most prominent peak is Ingolf's fjeld in 66" 20′ N., about 6,000 ft., which is seen from far out at sea. This is probably the Blaaserk (*i.e.*, Blue Sark or blue shirt) of the old Norsemen, their first landmark on their way from Iceland to the Öster Bygd, on the southwest coast of Greenland. The highest mountains near the inner branches of Scoresby sound are about 7,000 ft. The Petermann Spitze, near the shore of Franz Josef fjord is estimated to be 11,000 ft., and is the highest mountain in Greenland.

Along the west coast of Greenland the mountains are generally not quite so high, but even here peaks of 5,000 and 6,000 ft. are not uncommon. As a whole the coasts are unusually mountainous, and Greenland forms in this respect an interesting exception, as there is no other known land of such a size so filled along its coasts on all sides with high mountains and deep fjords and valleys.

The Ice Sheet.—The interior of Greenland is covered by the "inland ice," an enormous sheet of ice burying all valleys and mountains far below its surface. Its area is 700,000 to 720,000 sq.mi., and it is by far the greatest glacier of the northern hemisphere. Occasionally there emerge lofty isolated rocks known as nunataks (an Eskimo word). The ice-sheet rises in the interior to a level of 8,000 ft. and (on the Arctic circle) 10,000 ft., and descends gradually toward the coasts or the bottom of the fjords, discharging a great part of its yearly drainage as icebergs in the fjords on the west and east coasts. The surface of the ice-sheet forms in a transverse section from the west to the east coast a regular curve approaching an arc of a wide circle but with greater elevation toward the east. If the ice-sheet lies on high ground, as is probable, its thickness must be at least 1,000 ft. In the interior the surface of the ice is composed of loose dry snow, which never melts, but is carried outward to the borders, where also there is heavier snowfall. The snow is often carried off the ice by the outward blowing winds and pours through the mountain rim of Greenland, and is piled up in valleys as snow drift glaciers or is carried out onto the sea-ice and forms snow deltas. Near its margin the ice-sheet is broken up by numerous crevasses. The steep ice-walls at the edge show, especially where the motion of the ice is slow, a distinct striation, which indicates the strata of annual precipitation with the intervening thin seams of dust (Nordenskiold's cryoconite). This is partly dust blown onto the surface of the ice from the ice-bare coast-land, and partly the dust of the atmosphere brought down by the falling snow. In the rapidly-moving glaciers of the ice-fjords this striation is not distinctly visible.

The ice-sheet of Greenland must be considered as a viscous mass which, by the vertical pressure in its interior, is pressed outwards and slowly flows toward the coasts. Here the ice converges into the valleys and moves with increasing velocity, in the form of glaciers, into the fjords, where they break off as icebergs. After A. Helland had, in July 1875, discovered the amazingly great velocity, up to 64¾ ft. in 24 hours, with which the glaciers of Greenland move into the sea, the margin of the ice-sheet and its glaciers was studied by several expeditions. K. J. V. Steenstrup during several years, Captain Hammer in 1879–80, Captain Ryder in 1886–87, Dr. E. von Drygalski in 1891–93, and several American expeditions in later years, all examined the question closely. The highest known velocities of glaciers were measured by Ryder in the Upernivik glacier (in 73" N.) where he found a velocity of 125 ft. in 24 hours, and an average velocity during several days of 102 ft. It was, however, ascertained that there is a great difference between winter and summer. There seem to be periodical oscillations in the extension of the glaciers and the ice-sheet similar to those that have been observed on the glaciers of the Alps and elsewhere. Numerous glacial marks, such as polished striated rocks, moraines, erratic blocks, etc., prove that the whole of Greenland, even the small islands and skerries outside the coast, has once been covered by the ice-sheet.

Numerous raised beaches and terraces, containing shells of marine mollusca, etc., occur along the whole coast of Greenland, and indicate that this large island has been raised, or the sea has sunk, in post-glacial times. In the north, along the shores of Smith sound, these traces of the gradual upheaval of the land, or sinking of the sea, are very marked; but they are also very distinct in the south, although not found so high above sea-level, which seems to show that the upheaval has been greater in the north. The elevation of the raised beaches varies between 150 and 480 ft. There is a common belief that during recent times the west and southwest coast has been sinking, but the indications are not decisive.

Geology and Structure. — The geological structure of Greenland can be judged only from the ice-free marginal zone. This island appears to be a mountainous plateau in which Archaean rocks predominate, but in the northern half there are considerable areas of younger rocks. The extreme north, including most of Peary Land and the equally ice-free areas of Nyeboe and Hall Lands, are built of early Palaeozoic sandstones and limestones. To the south there is a belt of Silurian limestones well seen in Washington Land, while in the Smith sound region there are Cambrian sandstones which lie remarkably horizontal and undisturbed. All these series are continued into Ellesmere island. The Palaeozoic rocks of the west as well as Lower, Middle and Upper Carboniferous and Permian beds occur also on the north-east side. Volcanic activity and much faulting took place in East Greenland at the close of the Palaeozoic period. The lowest Mesozoic beds are Lower Triassic sandstones and shales in about **74"** N. on the east coast. Later Triassic beds occur farther south on the same coast, and Rhaetic plant beds are abundant in Jameson Land. Jurassic beds (Lias, Dogger, Kimmeridge and Portland) are found only on the east between Jameson Land and Danmark Harbour. Cretaceous beds occur on both east and west, but chiefly the west, where coal is found in the Cretaceous sandstones of the eastern edges of Disko island and the borders of Nugsuaq peninsula. The abundant plant fossils in those rocks give clear indication of a warm, temperate climate persisting until Tertiary times. Tertiary lavas, either surface flows or intrusive sills, are associated on both sides with rocks of that age and cover them in places. The sedimentary Tertiaries are chiefly sandstone, with a little coal. Disko island, Nugsuaq and Svartenhule peninsulas on the west, and Sabine and Kuhn islands and adjacent regions on the east, are the chief Tertiary basalt areas.

L. Koch has suggested that Greenland consists of two plateaus divided about 70° N., where the ice-sheet is lowest. With this break he associates the belt of volcanic activity which continues into Iceland, northern Ireland and Scotland. It may be noted that in this belt warm springs occur in Disko island (temp. 66° F.), in Scoresby sound (140° F.) and on Hold with Hope. In any case the whole of Greenland is part of the Laurentian shield of Canada. In the North and on the northeast there can be traced the continuation of the Caledonian foldings of Europe and Spitsbergen. These cause the high mountains of Peary Land and their westward continuation into Ellesmere island, and are associated with an overthrust in the Franz Josef fjord area.

Minerals. — The only known commercial source of natural cryolite, necessary for the electrolytic production of aluminum, is at Ivigtut. Native iron of meteoric origin has been found at Ovifak on Disko island and at Cape York. Since John Ross's voyage in **1818** it has been known to exist there, and from it the Eskimo got iron for their weapons. In **1897** Peary brought the largest nodule (weighing 90 tons) to New York. This iron is considered to be of meteoric origin, but the Disko island deposit has now been proved to be telluric. Graphite is abundant, particularly near Upernivik. Copper has been observed at several places, but only in nodules and laminae of limited extent; and coal of poor quality is found in the districts about Disko bay and Umanak fjord, and a little is mined. Steatite or soapstone has long been used by the natives for the manufacture of lamps and vessels.

Climate. — The climate is very uncertain, the weather changing suddenly from bright sunshine to dense fog or heavy falls of snow and icy winds. The January mean at Ivigtut is **18"** F. and at Upernivik −7° F. The July means are 49° and 42°. **A** branch of the North Atlantic drift flows north on the east side of Davis strait and accounts for relatively high temperatures in southwest Greenland. On the east coast temperatures are lower than on the west, for the ice sheet is more developed on its eastern side, and a cold current washes the coast. On the coasts, particularly the southwest, frost is rare in June, July and August, and the summer warmth is appreciable. Rainfall, which is mainly in summer, is heavy in the southwest, but light elsewhere. Snow may fall in any month of the year. In the lofty interior temperatures are always low, ranging from about 14° F. in summer to perhaps −90° F. in winter. These low temperatures are caused by radiation from the snow surface, which also causes great range between day and night. Over the interior lies a permanent anti-cyclone from which cold winds glide outwards to the coasts. These winds, heated by compression and blowing down valleys, sometimes give rise to warm, relatively dry, fohn winds. On the ice-sheet, precipitation as snow or ice-crystals is slight, especially away from the edges. Mists are not uncommon in the interior and occur frequently on the coasts in summer. Greenland is thought to be the source of much of the weather changes of the northern hemisphere.

AN ESKIMO FAMILY OF GREENLAND
Existing on sea food, the Eskimo lives near the coast. His hut is usually of stone covered with turf, and his clothes are fashioned from furs and bird skins

Fauna and Flora. — The land mammals of Greenland are decidedly more American than European; the musk-ox, lemming, polar wolf, Eskimo and the dog — probably also the reindeer — have all come from America, while the other land mammals, the polar bear, fox, arctic hare, stoat are circumpolar forms. The species of seals and whales are, if anything, more American than European, and so to some extent are the fishes. The seals include the hooded or bladder nose, the harp or saddle back, the thong seal, walrus and several smaller ones. Of the 51 species of birds breeding in Greenland, **23** are permanent dwellers and **28** leave in winter. Of the visitors, 60% come from America. About 390 species of vascular plants are found, of which about **316** probably come from America, and **74** from Europe. Of these **74** some 50 may have been brought by the early Norsemen. A few species may possibly have survived the maximum glaciation. About **70** species are circumpolar, 15 endemic and the rest common both to America and Europe or Asia.

In the south a few goats, sheep and cattle have been introduced. The whaling industry was formerly prolific off the west coast, but decayed when the right whale nearly disappeared. The white whale fishery of the Eskimo, however, continued, and sealing is important; walruses are also caught and sometimes narwhal. There are also important fisheries for cod, caplin, halibut, red fish and *nepisak;* a shark is taken for the oil from its liver; and sea-trout are found in the streams and small lakes of the south. Norwegian trawlers sometimes work in Davis strait. On land, reindeer were formerly hunted, to their practical extinction in the south; musk ox are found in the north and the east. The eider-duck, guillemot and ptarmigan are in some parts valuable for food. Eggs of seabirds are collected. Valuable fur is obtained from the white and blue fox and the polar bear and excellent down from the eider-duck.

At Umanak (70° 40′ N.) is the most northern garden in the world. Broccoli and radishes grow well, turnips (but not every year), lettuce and chervil succeed sometimes, but parsley cannot be raised. At Jacobshavn (69° 12 N.), only some 15 mi. from the ice-sheet, gardening succeeds well; broccoli and lettuce grow; spinach produces large leaves; chervil, pepper-grass, leeks, parsley and turnips grow well; radishes are sown and gathered twice during the summer (June to August). In the south, in the Julianehaab district, even flowering plants, such as aster, nemophilia and mignonette are cultivated, and broccoli, spinach, sorrel, chervil, parsley, rhubarb, turnips, lettuce, radishes grow well. Potatoes give fair results when they are cared for properly; carrots grow to a thickness of 1½ in., while cabbage does poorly. Strawberries and cucumbers have been ripened in a forcing frame. In the "Kongespeil" (King's Mirror) of the 13th century it is stated that the old Norsemen tried in vain to raise barley.

The wild vegetation in the height of summer is, in favourable

situations, profuse in individual plants, though scanty in species. There are no forests. In the north, where the lichen-covered or ice-worn rocks do not protrude, the ground is covered with a carpet of mosses, creeping dwarf willows, crowberries and similar plants, while the flowers most common are the andromeda, the yellow poppy, pedicularis, pyrola, etc., besides the "flowering" mosses; but in South Greenland there is something in the shape of bush, the dwarf birches even rising a few feet in very sheltered places, the willows may grow higher than a man, and the vegetation is less arctic and more abundant. The Eskimo probably migrated southward along the west coast during the period of the Norse colonies. No doubt they reached the east coast round Cape Farewell. Rasmussen has shown that a route by the north coast is almost impassable, owing to lack of hunting grounds. All west coast Eskimo probably have now some Danish blood and are called Greenlanders.

Government and Trade.—The trade of Greenland had been, until the German occupation of Denmark in 1940, a monopoly of the Danish crown, dating from 1774. It was administered in Copenhagen by a government board, Styrelsen af *Kolonierne i* Gronland, and in the country by various government officials. For government and trade the west coast was divided into two inspectorates, the southern extending to 67° 40' N., the northern comprising the rest of the country; the respective seats of government being at Godthaab and Godhavn. These inspectorates were ruled by two Danish inspectors, responsible to the director for Greenland in Copenhagen. Each of the inspectorates was divided into districts, each district having, in addition to the chief settlement or coloni, under a Danish factor, several outlying posts and Eskimo hunting stations, each presided over by a native factor (udligger) who was responsible to the colonibestyrer or factor of the district. These trading settlements, which dot the coast for a distance of 1,000 mi., are over 60 in number; the chief ones following the west coast northward, are these: in the south inspectorate Sydproven, the largest settlement; Julianehaab, near which are remains of the early Norse settlements of Eric the Red and his companions (the *Øster-Bygd*); Frederikshaab, in which district are the cryolite mines of Ivigtut; Godthaab, the principal settlement of all, in the neighbourhood of which are also early Norse remains (the Vester-Bygd); Sukkertoppen, a most picturesque locality; and Holstenborg. In the north inspectorate the chief centres are: Egedesminde, on an islet at the mouth of Disko bay; Christianshaab, one of the pleasantest settlements in the north, and Jakobshavn, on the inner shores of the same bay; Godhavn (cr Lievely) on the south coast of Disko island, formerly an important seat of the whaling industry; and later the seat of a Danish station for scientific research; Ritenbenk; Umanak; Upernivik; and Tasiusak. The station at Thule in 76° 32′ N. is privately owned. On the east coast Angmagsalik, in 65° 30′ N., was established in 1894, and new settlements on Scoresby sound were started in 1925. The east coast settlements were not under the inspector for Greenland. Government ships arrived and left between May and November. For the rest of the year navigation was stopped, though the winter months form the busy seal-killing season. The principle upon which the government acted was to give the natives low prices for their produce, but to sell them European articles of necessity at prime cost, and other stores, such as bread, at prices that scarcely paid for the purchase and freight, while no merchandise was charged, on an average, more than 20% over the cost price in Denmark. In addition, the Greenlanders were allowed to order goods from private dealers on paying freight at fixed rates. The prices to be paid for European and native articles were fixed every year, the prices current in Danish and Eskimo being printed and distributed by the government. Out of the payment five-sixths was given to the sellers, and one-sixth devoted to the Greenlanders' public fund, spent in "public works," in charity and on other unforeseen contingencies. This was the only tax. The object of the monopoly was solely for the good of the Greenlanders, to prevent spirits being sold to them, and the vice, disease and misery which usually attend the collision between natives and civilization of the trader's type being introduced into the primitive arctic community. The inspectors, in addition to being trade superintendents, were magistrates, but serious crime was very rare. There were no police. Though the officials were all-powerful, local councils of *parsissaet* were organized in 1857 in every district. To these parish councils delegates were sent from every station. No Danes were eligible. The council had the disposal of 20% of the annual profits made on produce purchased within the confines of each district. It held two sessions every year, and the discussions were entirely in the Eskimo language. In addition to their functions as guardians of the poor, the parish members had to investigate crimes and punish misdemeanours, settle litigations and divide inheritances. They could impose fines for small offenses not worth sending before the inspector, and, in cases of high misdemeanour, had the power of inflicting corporal punishment. A special paper currency was in use in Greenland.

A Danish coloni in Greenland might seem to many not to be a cheerful place at best; though in the long summer days they would certainly find some of those on the southern fjords comparatively pleasant. The fact is, however, that most people who have lived some time in Greenland long to go back. There are generally in a coloni three or four Danish houses, built of wood and pitched over, in addition to storehouses and a blubber-boiling establishment. The Danish residents may include, besides a coloni-bestyrer and his assistant, a *missionair* or clergyman, at a few places also a doctor, and perhaps a carpenter and a schoolmaster. In addition there are generally from 20 to several hundred Eskimo, who live in huts built of stone and turf, each entered by a short tunnel. Lately, their houses in the *colonis* have also to some extent been built of imported wood. For ecclesiastical purposes Danish Greenland was reckoned in the province of the bishop of Zealand. The Danish mission in Greenland had a yearly grant from the state. The Moravian mission, which used to work in Greenland, retired from the country in 1900. At Godthaab there is a seminary from which Greenlanders who wished to be ordained went to Copenhagen. All settlements have schools, generally under native teachers. There are two monthly newspapers in Eskimo. Wireless stations were built at Godthaab, Godhavn, Julianshaab and Angmagsalik. The trade of Greenland decreased in modern times, and the Danish state had an annual deficit of about £30,000 on the administration of Greenland. This would have been greater had not the cryolite royalties brought in large sums (cryolite was outside the government monopoly). In 1938 the mine produced 48,501 tons, of which 60% went to Denmark and most of the rest to the United States. The annual value of imports from Denmark, consisting of manufactured goods, foodstuffs, etc., was $669,000 in 1938. Exports, including seal oil, seal, fox, bird and bear skins, fish products and eider-down, with some worked skins, were valued at $376,000 in 1938. But cryolite amounted to 80% of total exports, and was valued at $1,518,000. Walrus tusks and hides and the famous Greenland falcons, important articles of export in the days of the Norse colonists, are of little or no significance.

When war broke out in Sept. 1939, Greenland was forced to reorient her trade relationships, and New York displaced Copenhagen as the key point for export and import arrangements. These were regularized, and a United States protectorate was established by the agreenient of April 9, 1941 (see History, below). Local Danish officials and the existing Danish system continued to function almost exactly as described above.

Population.—The population in 1941 was about 18,000, including about 600 Danes, many of whom are employed at the cryolite mines. Hans Egede, in the middle of the 18th century, estimated the population then at 30,000, but this was probably a large overestimate. The decrease may chiefly have been due to infectious diseases, especially a very severe epidemic of smallpox. During the last half of the 19th century there was, on the whole, a slight increase of the native population. The population of the east coast is small and has decreased within historic times. Several hundreds live at Angmagsalik and a few of recent importation on Scoresby sound. In the region of Scoresby fjord and Franz Josef fjord, numerous ruins of Eskimo settlements are found, and in 1823 Clavering met Eskimo there, but they have

since died out or wandered south. A little tribe of Eskimo living in the region of Cape York, near Smith sound—the so-called "Arctic Highlanders" or Polar Eskimo—number about 240.

History.—In the beginning of the 10th century the Norwegian Gunnbjorn, who was the son of Ulf Kráka, is reported to have found islands to the west of Iceland, and he may have seen the southeast coast of Greenland. In 982, Eric the Red sailed from Iceland to find Gunnbjörn's land, and he spent three years on its southwestern coasts exploring the country. On his return to Iceland in 985 he called the land Greenland, in order to make people more willing to go there, and in 986 started again from Iceland with 25 ships, of which 14 reached Greenland, where a colony was founded on the southwest coast. Eric built his house at Brattalid, just north of the present Julianehaab. Other settlers followed and in a few years two colonies had been formed, one called Österbygd, in the present district of Julianehaab, comprising later about 190 farms, and another called Vesterbygd, farther north, on the west coast, in the present district of Godthaab, comprising later about 90 farms. At the height of their prosperity the colonists numbered about 3,000. Numerous ruins indicate the location of these colonies. When the Norsemen came to Greenland they found various traces of *Skraeling* (the meaning of the word is uncertain; it means possibly elves or fairies); but the sagas do not report that they actually met natives. Somewhat later they met the Eskimo farther north, on the west coast, in the neighbourhood of Disko bay, where the Norsemen went to catch seals, walrus, etc. The Eskimo were probably migrating south at that time. Christianity was introduced by Leif Ericsson about 1000, and in 1126 Greenland got its own bishop, who resided at Gardar on Igaliko fjord. There were 12 churches, including a cathedral, a monastery and a nunnery in Österbygd, and four churches in Vesterbygd. The last bishop died in 1540, but from 1377 to that date the bishops did not reside in Greenland. Greenland was a republic until 1261, when the colonists swore allegiance to the king of Norway. At the dissolution of the union between Norway and Denmark, in 1814, neither Greenland, Iceland nor the Faroes were mentioned, and they were therefore retained by Denmark.

After the middle of the 14th century communications with Norway became infrequent. The trade was a crown monopoly and was conducted by an annual ship (Knarren). The growing dominance in Norway's shipping of the Hanseatic league, which had no interest in Greenland, brought the trade to an end. The last vessel from Greenland returned to Norway in 1410, but vessels in the Icelandic fish trade probably visited Iceland till the end of that century. When J. Davis visited Greenland in 1585 there was no sign of the Norse colonists. Excavations in the Norse burial grounds show European influences of the 15th century in the style and texture of the clothes, with little or no trace of Eskimo culture. Skeletons which show malformation, rickets and low stature, and include an undue proportion of infants and youths, evidence extermination by excessive intermarriage or by adverse conditions of life. There is no indication of absorption into the Eskimo race or of destruction by Eskimo onslaught. It was not until 1721 that the first of the modern settlements was formed, near Godthaab, by the Norwegian missionary, Hans Egede. Many of the 18th century colonists were convicts, but gradually the new colonies prospered, in spite of a devastating smallpox epidemic in 1733–34. In 1774 trade became a government monopoly. From 1807 to 1814 communications with Europe were cut off owing to the war. A century later, World Wars I and II again restricted shipping with Greenland, but not to the extent of causing real want. Until 1917 Denmark's sovereignty extended only over the west coast, between Cape Farewell and 74° 30' N., and the one trading station oi Angmagsalik in the east. In that year, however, it was extended to embrace the whole island, which led to a dispute with Norway regarding hunting and sealing rights on the east coast. Five years later, for the first time in history, the king of Denmark visited Greenland.

On April 9, 1941, a year after the German occupation of Denmark, Henrik de Kauffmann, Danish minister to Washington, signed an agreement which made Greenland a temporary protectorate of the United States. Danish sovereignty was recognized, and the arrangement was to last only for the war emergency; the U.S. obtained the right to build bases for planes, radio and weather stations, and to "do any and all things necessary" to hold these positions. De Kauffmann was of course dismissed by the nazi-controlled government in Copenhagen, but he stayed on in Washington, convinced that he had done the thing the Danish government and people really desired. Within a few months the U.S. was at war with Germany and was using Greenland's strategic position and resources.

GREENLAW (a "grassy hill"), a village of Berwickshire, Scotland. Pop. (1931) 528. It is situated on the Blackadder, 62¼ mi. S.E. of Edinburgh by the L.N.E. railway. Rebuilt in the 17th century, it takes the place of an older settlement a mile to the south-east. About 3 mi. south is Hume castle, founded in the 13th century. Pop. of civil parish (1931) 889.

GREENLEAF, SIMON (1783–1853), American jurist, was born at Newburyport (Mass.), on Dec. 5, 1783. He died at Cambridge (Mass.), on Oct. 6, 1853. Greenleaf's principal work is a *Treatise on the Law of Evidence* (3 vol., 1842–53). He also published *Examination of the Testimony of the Four Evangelists by the Rules of Evidence administered in the Courts of Justice, with an account of the Trial of Jesus* (1846).

GREEN MONKEY, a west African representative of the guenon monkeys, technically known as *Cercopithecus callitrichus.* It is olive green above, with white whiskers and belly.

GREEN MOUNTAINS are a part of the Appalachian system of North America extending from the Massachusetts border northwards through the centre of the State of Vermont to the Canadian line. For two-thirds of the length of the State the range is only slightly broken, forming a water-parting between the streams which flow W. or N.W. into Lake Champlain or the Hudson river and those flowing S.E. into the Connecticut river; but further north the range is cut deep by the valleys of the Winooski and Lamoille rivers. The ranges, about 30 mi. wide in southern Vermont, narrow down to 1 mi. wide at Mount Mansfield and broaden again to the north. The crest line is generally more than 2,000 ft; 32 summits are over 3.000 ft.; and the following peaks exceed 4,000 ft.: Mount Mansfield, 4.406 ft.; Killington Peak, 4,241 ft.; Lincoln, 4,135 ft.; Camel's Hump, 4,083 ft.; and Jay Peak, 4,018 ft. Smuggler's Notch, just north of Mt. Mansfield, is one of Vermont's wonders. Here one finds a rocky wooded canyon with walls of solid rock on either side rising almost perpendicularly 1,000 ft. or more; the massive chin of Mt. Mansfield towers majestically 3,000 ft. above. The entire range, except four of the highest peaks, is heavily wooded with spruce, maple, beech, and birch; a fact which probably suggested the name. The region is made accessible to tourists by railways, highways, and within the mountains, by the "Long Trail" of the Green Mountain Club which traverses the entire length of the range.

See W. *C.* O'Kane, *Trails and Summits of the Green Mountains* (1926); *Guide Book of the Long Trail* (10th ed., 1935); and T. W. Dale in the *Annual Report of the U.S. Geological Survey* (1894–95).

GREENOCK (*grĕn'ŏk*), municipal burgh and seaport, Renfrewshire, Scotland, on the S. shore of the Firth of Clyde, 23 mi. W. by N. of Glasgow by the L.M.S.R. (four stations), 21 mi. by the river and firth. Pop. (1940) 81,700. The town has a water frontage of nearly 4 mi. and rises gradually to the hills behind the

town in which are situated, about 3 m. distant, Loch Thom and Loch Gryfe, sources of water supply for domestic use and for power. The streets are laid out on the comparatively level tract behind the firth, the older thoroughfares and buildings lying in the centre. The west end contains a fine esplanade, 1½ m. long, running from Prince's pier to Ft. Matilda. The bay is protected by a sandbank that ends here, and is hence known as the Tail of the Bank. The fairway between this bank, which begins to the west of Dumbarton, and the southern shore constitutes the safest anchorage in the upper firth. Electric tramways connect with Port Glasgow on the east and Gourock on the west. The annual rainfall amounts to 64 in. and Greenock thus has the reputation of being the wettest town in Scotland.

Modern public buildings include the municipal buildings; the custom house on the old steamboat quay; the county buildings; and the Watt Institution, founded in 1837 by a son of the famous engineer, James Watt, and containing the public library, the Watt scientific library and the marble statue of James Watt by Sir Francis Chantrey. Adjoining the latter are the museum and lecture hall, the gift of James McLean, opened in 1876. The schools include the Greenock academy for secondary education. The old North Kirk (1591), with its pre-Raphaelite windows, has been moved to Seafield to allow of the extension of the ship-building yards. A large cemetery in the south-western district contains the tomb of Burns' "Highland Mary," removed from the North Kirk graveyard. The parks and open spaces include Wellington park, Well park in the heart of the town (these were the gift of Sir Michael Shaw-Stewart), Whin hill, and Lady Alice and Lady Octavia parks.

Greenock is under a town council with provost and bailies. It is a parliamentary burgh, represented by one member. The staple industries are shipbuilding and sugar refining (1763). Greenock-built vessels have always been esteemed, and many Cunard, P. & O. and other liners have been constructed in the yards. Other industries include the manufacture of engines, marine and otherwise; the making of sailcloth, ropes, paper, woollen and worsted goods, and general engineering, and there are distilleries, an aluminium factory, a flax-spinning mill, and a torpedo factory. Ships and machinery are the chief exports and raw sugar the chief import. The seal and whale fisheries, once vigorously prosecuted, are extinct, but the fishing-fleets are considerable. The first harbour (finished in 1710) has been periodically added to and improved, and there are now seven tidal harbours, Garvel graving dock and other dry docks, and an "always afloat" dock, the entrances to which are closed by caissons to keep in 32 ft. of water at low tide. The quay walls are over 3 m. in length. The large Princess pier is a centre for passenger traffic on the Clyde, and to and from English and Scottish ports.

In the early 17th century Greenock was a fishing village of one row of thatched cottages. In 1635 it was erected by Charles I. into a burgh of barony under a charter granted to John Shaw, the government being administered by a baron-bailie, or magistrate, appointed by the superior. Its commercial prosperity received an enormous impetus from the Treaty of Union (1707), under which trade with America and the West Indies rapidly developed. The American War of Independence suspended progress for a brief interval, but revival set in in 1783, and within the following seven years shipping trebled in amount. Meanwhile Sir John Shaw by charter (dated 1741 and 1751) had empowered the householders to elect a council of nine members, which proved to be the most liberal constitution of any Scots burgh prior to the Reform act of 1832, when Greenock was raised to the status of a parliamentary burgh with the right to return one member to parliament. Greenock was the birthplace of James Watt and Dr. John Caird (1820–1898), principal of Glasgow University. Rob Roy is said to have raided the town in 1715.

GREENOCKITE, a rare mineral composed of cadmium sulphide, CdS, occurring as small, brilliant, honey-yellow crystals or as a canary-yellow powder. Crystals are hexagonal with hemimorphic development, being differently terminated at the two ends; they are translucent to transparent, and have an adamantine to resinous lustre; hardness 3–39; specific gravity 4·9. Crystals have been found only at one or two places in the neighbourhood of Glasgow, where they occur singly on prehnite in the amygdaloidal cavities of basaltic igneous rocks. At all other localities the mineral is represented only as a powder dusted over the surface of zinc minerals, especially blende and calamine, which contain a small amount of cadmium replacing zinc.

GREENORE, a seaport and watering place on Carlingford lough, Co. Louth, Eire. Pop. (1936) 221. Passenger steamers cross regularly to and from Holyhead, Wales. A steam ferry crosses the lough. In the vicinity is a raised beach, some 10 ft. above the present sea-level.

GREENOUGH, GEORGE BELLAS (1778–1855), English geologist, was born in London on the 18th of January 1778. He studied mineralogy at Freiburg under Werner, travelled in various parts of Europe and the British Isles, and worked at chemistry at the Royal Institution. He was elected F.R.S. in 1807, and was one of the founders of the Geological Society of London in 1807. He was the first chairman of that society, and was three times president. His famous *Geological Map of England and Wales,* in six sheets (1819; 2nd ed. 1839) was to a large extent based on the original map of William Smith; but much new information was embodied. He also prepared a *Geological Map of India* (1854). He died at Naples on April 2, 1855.

GREEN RIBBON CLUB, THE, had its meeting-place at the King's Head tavern in Chancery lane, and was originally known as the "King's Head club." Founded about the year 1675 as a resort for members of the political party hostile to the court, the name was changed about 1679 to the Green Ribbon club, in reference to the bow or "bob" of green ribbon which the members were in the habit of wearing in their hats, as a badge convenient for mutual recognition in street brawls. The president was either Lord Shaftesbury or Sir Robert Peyton, M.P. for Middlesex, who afterwards turned informer. Roger North tells us that "they admitted all strangers that were confidingly introduced, for it was a main end of their institutions to make proselytes, especially of the raw estated youth newly come to town." Thomas Dangerfield (*q.v.*) supplied the court with a list of 48 members of the Green Ribbon club in 1679; and although Dangerfield's numerous perjuries invalidate his unsupported evidence, it receives some confirmation from a list given to James II. by Nathan Wade in 1685 (Harleian mss. 6845), while a number of more eminent personages are mentioned in The *Cabal,* a satire published in 1680, as also frequenting the club. Among those who appear to have been members are the duke of Monmouth, Halifax, Shaftesbury, Buckingham, Macclesfield, Cavendish, Bedford, Herbert of Cherbury; Scroop, Mulgrave and Shadwell; Falconbridge, Henry Ireton and Claypole; and rogues of the type of Dangerfield and Oates. An allusion to Dangerfield, notorious among his other crimes and treacheries for a seditious paper found in a meal-tub, is found in connection with the club in The *Loyal Subjects' Litany,* in which occur the lines—

> From the dark-lanthorn Plot, and the Green Ribbon Club
> From brewing sedition in a sanctified Tub,
> *Libera nos, Domine.*

The genius of Shaftesbury found in the Green Ribbon club the means of constructing the first systematized political organization in England. North relates that "every post conveyed the news and tales legitimated there, as also the malign constructions of all the good actions of the Government, especially to places where elections were depending, to shape men's characters into fit qualifications to be chosen or rejected." The club was responsible for promoting the Exclusion bill; and the popish plot was deliberately stimulated by members who went about in silk armour, supposed to be bullet proof, and carrying in their pockets the weapon of offence invented by Stephen College and known as the "Protestant flail." In the general election of Jan. and Feb. 1679, the Whig interest throughout the country was managed and controlled by a committee sitting at the club in Chancery lane; and the agitation of the petitioners in 1679 was engineered there. The petitions were prepared in London and sent down to every part of the country, where paid canvassers took them from house to house collecting signatures with an air of authority that made refusal

difficult. The great "pope-burning" processions in 1680 and 1681, on the anniversary of Queen Elizabeth's accession, were also organized by the club. They ended by the lighting of a huge bonfire in front of the club windows; and, as they proved an effective means of inflaming the religious passions of the populace, it was at the Green Ribbon club that the mobile *vulgus* first received the nickname of "the mob." The activity of the club was, however, short-lived. The fiasco of the Exclusion bill damaged its influence, and after the flight of Shaftesbury, the confiscation of the City of London's charter, and the discovery of the Rye House plot, in which many of its members were implicated, it declined rapidly. In 1685 John Ayloffe, who was found to have been "a clubber at the Ring's Head tavern and a green-ribbon man," was executed in front of the premises on the spot where the "pope-burning" bonfires had been kindled; and although the tavern was still in existence in the time of Queen Anne, the club which made it famous did not survive the accession of James II. The precise situation of the King's Head tavern, described by North as "over against the Inner Temple gate," was at the corner of Fleet street and Chancery lane, on the east side of the latter thoroughfare.

See Roger North, *Examen* (1740); Anchitell Grey, *Debates* of *the House* of Commons, *1667–84*, vol. viii. (1769); Sir John Bramston, *Autobiography* (1845); Sir George Sitwell, The *First* Whig (Scarborough, 1894), containing an illustration of the Green Ribbon Club and a pope-burning procession.

GREENS. The formation and maintenance of fine turf for putting greens has been the subject of systematic research in America since 1919. This article is a summary of the chief results that have been published in The Bulletin of the *U.S.* Golf *Association* Green *Section* (Washington, D.C.)

The finest turf is composed of certain varieties of bent grass. The best is velvet bent (Agrostis *canina*). Then comes creeping bent (*A.* stolonifera) and then common bent (A. *vulgaris*); seaside bent (A. nzaritima) is also used on suitable soils. Red Fescue (Festuca *rubra*) is a beautiful fine grass, but does not form a dense turf when cut very close, owing to the axils from which the young shoots arise being well above the ground. In the bent grasses these axils are so low that they are not injured by the very close cutting that is necessary on a golf green.

The best seed to use is South German mixed bent, which usually consists of 80 to 85% of A. vulgaris, 15% of A. *canina* and a trace of A. stolonifera. This should be used at the rate of 3 to 5 lb. per 1,000 square feet.

The vegetative method of propagation has been successfully applied to creeping bent, which is almost a non-seeding variety. The runners or stolons are strung out in rows in a nursery. With proper attention to cultivation a dense mass of these stolons are produced in a few months. They are cut up into lengths of about 2in. and broadcast on the ground, that is prepared as for sowing. There should be one piece of grass to each square inch. The whole is covered about tin. with a fine compost and lightly rolled. With daily watering for about two weeks each piece of grass that contains a node will root, under favourable conditions, and with proper treatment a perfect turf will result. There are a great many strains of creeping bent. The American workers have selected two, called "Metropolitan" and "Washington," which are most suitable from their resistance to the fungoid disease known as brown patch, and from the fact that the blades of grass grow vertically upwards. "Metropolitan" seems to be slightly the better for the climatic conditions in Great Britain. Velvet bent can also be propagated by the vegetative method, but it does not spread so rapidly. The turf is even finer than that obtained with creeping bent.

Treatment of Established Greens.—Cutting should be as close as possible, provided that the turf is not "scalped." They must be cut once a day in the growing season. Neglect of this, especially with bent greens, will result in a fluffy and grained condition of the turf. Should this occur, the greens must be well raked, cut close and top dressed with compost as described below.

The American workers have definitely established the fact that it is most advantageous to apply fertilizers that will slowly render the soil markedly acid, the optimum being about pH 3.8. It has been found that at this reaction the fine grasses grow luxuriantly, whilst coarse grasses, clovers and most weeds and also worms and grubs disappear. This result is achieved by regular dressings of either the sulphate or phosphate of ammonia, the former being generally used because of its lower price. To avoid scorching the grass it should be applied at the rate of 3 lb. per 1,000sq.ft., and well watered in by a fine spray immediately afterwards. If a water supply is not available it must be applied on a rainy day. The dressings should be given every fortnight or every month from March to September. During hot dry weather it is advisable to limit the amount to 2 lb. per 1,000 square feet. On a very alkaline chalk soil it may take from three to four years to reach the desired acidity. After this the amounts used can be decreased. It must be added that sulphate of ammonia should not be used on young grass. Further, that treatment with lime, basic slag or any other alkaline fertilizer is most undesirable.

Systematic topdressing has been shown to be essential, particularly with bent greens under treatment with sulphate of ammonia. Otherwise a mat of fluffy turf will develop, which it is impossible to cut and which is most undesirable for putting purposes. The compost should be made up of equal parts of loamy soil, sharp rand and well rotted stable manure, leaf mould nr other organic matter. It should also contain about 20 lb. of ammonium sulphate per load (cubic yard). The whole must be well screened so that there are no lumps to interfere with play. One load is broadcast over 5,000sq.ft., well worked into the roots with the back of a rake and then lightly watered, especially if it contains any sulphate of ammonia. This dressing should be given monthly from March to September, The old practice of using one heavy dressing of manure in the winter is objectionable and harmful, as it tends to smother the grass and seriously to increase the risk of infection from grubs and worms.

The risk of trouble with earth worms and grubs like leather jackets is much decreased if the soil be rendered sufficiently acid. Before this result is obtained, worms are best removed by use of mercuric chloride (corrosive sublimate). Three ounces are dissolved in a wooden bucket. The solution is poured into a 50gal. tank and well mixed. This is distributed over 1,000sq.ft. and then the ground is thoroughly soaked with water. It must be remembered that it is a deadly poison. The operation must be carried out on a mild day between November and April. Where there is any risk of infection by leather jackets or similar grubs, the addition of 5 lb. of arsenate of lead to each load of topdressing will give excellent results.

GREENSAND. A geological term having a double significance. Among the sedimentary rocks (*q.v.*) it is used to indicate a sand or sandstone with abundant grains of glauconite. Stratigraphically fhe name is used for several sub-divisions of the Cretaceous system (*q.v.*).

GREENSBORO, a city in the Piedmont section of North Carolina, U.S.A., 80 mi. N.W. of Raleigh; the county seat of Guilford ccunty. It is on federal highways 29, 70, 220 and 421; is served by the Atlantic and Yadkin and the Southern railways; and has a municipal airport. The population was 53,569 in 1930 (26.2% Negroes) and it increased to 59,319 in 1940 by the federal census. It has a large wholesale trade, is an important insurance centre, and has numerous and varied manufacturing industries, with an output in 1939 valued at $43,285,153. The cotton mills, which make chiefly blue denim, had in 1941 more than 6,700 looms and 275,000 spindles. The city has fine public buildings, a memorial stadium seating 10,000, and a park system which provides an acre to each 50 inhabitants. The assessed valuation of property in 1940 was $88,000,000, and bank clearings amounted to $253,077,000. In the city are the Greensboro college for women (Methodist; chartered 1838) and the woman's college of the University of North Carolina (1892); also there are three colleges for Negroes. Six miles west is Guilford college, founded in 1837 by the Society of Friends, and seventeen miles east is Elon college (Christian), chartered in 1889. Greensboro was founded in 1808, in the exact centre of the county, to be the new county seat, in place of Martinsville, where the battle of Guilford Court House was fought on March 15, 1781, and was named after General Nathanael Greene, hero of the battle. The battlefield. 6 mi. N.W.

of the city, has been made a national park. The town was organized in 1829 and chartered as a city in 1870. Since 1923 it has had a commission-manager form of government.

GREENSBURG, a city of southeastern Indiana, U.S.A., on a branch of Sand Creek. The county seat of Decatur county, it is known for the tree on its courthouse tower. It is served by the Big Four railway. The population in 1930 was 5,702; in 1940, 6,065. Its industries are farming, stock raising, stone quarrying and manufacturing.

GREENSBURG, a city of Pennsylvania, U.S.A., 30 mi. E. by S. of Pittsburgh, on the Lincoln highway and the Pennsylvania railroad, at an altitude of 1,100 ft.; the county seat of Westmoreland county. The population was 16,508 in 1930 and 16,743 in 1940. Including the adjacent suburbs, the local estimate for 1940 was 28,905. It is in the heart of the bituminous coal fields of western Pennsylvania, and natural gas is abundant. There are large coke ovens, railroad repair shops and over 30 varieties of smaller industrial establishments. The annual value of the manufactured products is estimated at $10,000,000. Greensburg (named after Gen. Nathanael Greene) was settled in 1771, immediately after the opening of the state road built along the trail followed by General Forbes on his march to Fort Duquesne in 1758. It was made the county seat in 1787; was incorporated as a borough in 1799; and became a city in 1928. Near Greensburg, during the Conspiracy of Pontiac, was fought the battle of Bushy Run (Aug. 5–6. 1763), when Colonel Henry Bouquet by a stratagem gained a decisive victory over the Indians. Three miles northeast of the city, at the village of Hanna's Town (almost completely destroyed by the Indians on July 13, 1782) the first court west of the Alleghenies opened on April 6, 1773.

GREENSHANK (Tringa nebularia), one of the largest of the sandpipers. The long olive-coloured legs of this species distinguish it from two allied species (T. *totanus* and T. *erythropus*) having red legs and called redshanks. The greenshank is a native of the northern parts of the old world, but in winter it wanders far to the south from South Africa to Australia. Almost as bulky as a woodcock, it is of a more slender build. The cock exhibits the gesticulations in which the males of so many *Limicolae* indulge during the breeding season—with variations of its own. It breeds in Scotland, Norway, Sweden and Finland, and thence to Kamchatka.

GREENSTONE, in geology, an old term used by many of the earlier writers to indicate fine-grained dark-coloured and often considerably decomposed and altered basic igneous rocks, either intrusive or extrusive. It is still—like "felsite" (*q.v.*)—a useful word in descriptive field geology, since it indicates the appearance and general character of the rock, but does not imply anything definite as to its exact nature and composition, which may be determined later by laboratory methods.

GREENVILLE, a city of Montcalm county, Michigan, U.S.A., 35 mi. N.E. of Grand Rapids; on the Grand Trunk and the Pere Marquette railways. The population was 4,304 in 1920 (90% native white) and was 5,321 in 1940 by the federal census. It is an important potato market and has refrigerator factories and other manufacturing industries. The city was founded about 1844 by John Green and incorporated in 1870.

GREENVILLE, a city of western Mississippi, U.S A., on the Mississippi river, 95 mi. north of Vicksburg, at the centre of the Yazoo delta; the county seat of Washington county. It is served by the Columbus and Greenville and the Yazoo and Mississippi Valley railways and by river steamers and barges. The population in 1930 was 14,807; in 1940 it was 20,892. Greenville is surrounded by agricultural land which produces the bulk of the long-staple cotton used. A new bridge was built spanning the Mississippi river at this point, giving a direct transcontinental route by way of federal highway 82. The principal industries are cotton compresses, cotton-seed oil mills and wood-working plants. The country produces corn, oats, alfalfa clover and herds of beef cattle and hogs. The city is protected from floods by an embankment extending from Memphis to Vicksburg, and the flood heights have been lowered from 6 to 12 ft. by cutoffs. Old Greenville just south of the present site, was the county seat of Jefferson county until 1825, and later of Washington county. Part of it caved into the river, and during the Civil War the town was burned by Federal forces soon after the capture of Memphis. The present site was then adopted for rebuilding. Greenville was incorporated as a town in 1870 and as a city in 1886.

GREENVILLE, a city of eastern North Carolina, U.S.A., on the Tar river; the county seat of Pitt county. It is served by the Atlantic Coast Line and the Norfolk Southern railways and by freight service on the inland waterway and Tar river. Pop. (1930) 9,194; (1940) 12,674 by the federal census. It is a shipping point for tobacco and other agricultural products, and is the seat of the East Carolina teachers college (established 1907).

GREENVILLE, a city of western Ohio, U.S.A., 36 mi. N.W. of Dayton, on Greenville creek, at an altitude of 1,050 ft.; the county seat of Darke county. It is served by the Baltimore and Ohio, the Big Four and the Pennsylvania railways. The population was 7,036 in 1930 and 7,745 in 1940. It has various manufacturing industries and is the trade centre for a fertile agricultural region, producing largely grains and tobacco. Greenville occupies the site of an Indian village and of Ft. Greenville, built by Gen. Anthony Wayne in 1793 and burned in 1796. Here on Aug. 3, 1795, Gen. Wayne concluded a treaty with 12 Indian tribes, by which they ceded to the United States a considerable part of Ohio and smaller tracts in Illinois, Indiana and Michigan, and the United States promised to pay them $20,000 worth of goods immediately and an annuity forever. The chief Tecumseh lived there from 1805 to 1809, and there in July, 1814, a second Indian treaty, securing the aid of several tribes in the war with Great Britain, was negotiated by Gen. W. H. Harrison and Lewis Cass. Permanent settlement dates from 1808, when the town was laid out. It was made the county seat in 1809; incorporated as a town in 1838 and chartered as a city in 1887.

GREENVILLE, a borough of Mercer county, Pa., U.S.A., 80 mi. N. of Pittsburgh, on the Shenango river. It is served by the Bessemer and Lake Erie, the Erie and the Pennsylvania railways. The population was 8,628 in 1930 and 8,149 in 1940. It has railroad repair shops, and its manufactures include steel cars, bridges and tanks. Thiel college (Lutheran; coeducational), opened in 1866 at Monaca, in Beaver county, was moved to Greenville in 1870. Greenville was founded in 1798.

GREENVILLE, a city of northwestern South Carolina, U.S.A., on the Reedy river; the county seat of Greenville county. It is on federal highways 25, 29 and 276; has a municipal airport; snd is served by the Charleston and Western Carolina, the Piedmont and Northern (electric) and the Southern railways. The population in 1930 was 29,154 (37.3% Negroes) and was 34,734 in 1940 by federal census. For the area within 2.5 mi. of the centre of the city, the population for 1940 was 74,767. Greenville lies amid beautiful mountain scenery, at an altitude of 1,040 ft., near the foot of the Blue Ridge. The incorporated area is a circle with an area of five sq.mi., but for economic and social purposes the urban unit includes a fringe of textile mills and a village population of 30,000 just outside the corporate limits. It is an important cotton market, handling 1,000,000 bales a year and is one of the principal textile centres of the south. The 35 textile establishments in the county in 1940 had 20,879 looms and 684,008 spindles, and manufactured 4,500 different patterns of cloth, from heaviest duck to fine silks, voiles and shirtings. The Southern Textile exposition is held there in alternate years. The city has various industries complementary to the spinning and weaving of cotton, such as bleaching, finishing and dyeing, and it is possible there to see the entire process of production, from the growing of the staple to the turning out of garments ready to wear. There are also sundry diversified industries, including plants making equipment for the textile mills and a meat-packing house. Greenville is the seat of Furman university for men (Baptist; opened 1852), which grew out of an institution established elsewhere in 1826; and of Greenville Woman's college (Baptist), established in 1854. The site of the city is part of a tract that was ceded to South Carolina by the Cherokee Indians on May 20, 1777. In 1797 a town was laid out there for the county seat, and was named Pleasantburg, and in 1831 the name was changed to Greenville.

The city was chartered in 1868.

GREEMVILLE, a city of northeastern Texas, U.S.A., 48 mi. N.E. of Dallas, near the headwaters of the Sabine river; the county seat of Hunt county. It is on federal highways 67 and 69 and state highways 24 and 34, and is served by the Louisiana Railway and Navigation company, the Missouri-Kansas-Texas, the St. Louis Southwestern and the Texas Midland railways. Pop. (1940) 13,995. It is a wholesale distribution point in northeast Texas, with an annual business in excess of $10,000,000. It is the retail trading centre for a cotton-growing and farming area. There are manufactures, with more than 600 workers in needlework alone. The U.S. cotton field station, devoted to the development of improved varieties of cotton and to the control of cotton diseases, is there. Greenville was settled in 1844; chartered as a city in 1875; and in 1907 adopted a commission form of government.

GREENWICH, a southeastern metropolitan borough of London, England, bounded north by the river Thames, east by Woolwich, south by Lewisham and west by Deptford. Pop. (1938) 95,770. It is first noticed in the reign of Ethelred, when it was a station of the Danish fleet (1011–1014). It has a river-frontage of 4½ m., the Thames making two deep bends, enclosing the Isle of Dogs on the north and a similar peninsula on the Greenwich side. Greenwich is connected with Poplar on the north shore by the Greenwich tunnel to the Isle of Dogs (Cubitt Town), and by the Blackwall Tunnel to a point between the East and West India Docks. The main thoroughfare from west to east is Woolwich Road, representing the old high road through Kent, the Roman Watling Street.

The most noteworthy buildings are the hospital and the observatory. Greenwich hospital, as it is still called, became in 1873 a Royal Naval college. On the site once stood Greenwich House, a royal residence as early as 1300, granted by Henry V. to Thomas Beaufort, duke of Exeter, from whom it passed to Humphrey, duke of Gloucester, who improved it and named it *Placentia.* It did not revert to the crown till his death in 1447. It was the birthplace of Henry VIII., Queen Mary and Queen Elizabeth, and here Edward VI. died. The building was enlarged by Edward IV., by Henry VIII., who made it one of his chief residences, by James I. and by Charles I., who erected the "Queen's House" for Henrietta Maria. The tenure of land from the crown "as of the manor of East Greenwich" became at this time a recognized formula, and occurs in a succession of American colonial charters from those of Virginia in 1606, 1609 and 1612 to that of New Jersey in 1674. Along with other royal palaces Greenwich was at the Revolution appropriated by the Protector, but it reverted to the crown on the restoration of Charles II., by whom it was pulled down; and the west wing of the present hospital was erected and designed by Inigo Jones. Parts were built by Queen Anne and King William and designed by Sir Christopher Wren. In its unfinished state it was assigned by the patent of William and Mary to certain of the great officers of state, and it was opened as a hospital for seamen in 1705. The walls and ceilings of the painted hall were painted by Sir James Thornhill with various emblematic devices, and it is hung with portraits of the most distinguished admirals and paintings of the chief naval battles of England. In the Queen Anne range is the Royal Naval museum. In the upper quadrangle is a bust of Nelson by Chantrey, and there are various other memorials and relics. Formerly 2,700 retired seamen were boarded, and 6,000 out pensioners received stipends out of its funds; but by the act of 1865 the Admiralty granted liberal pensions in lieu of board to those willing to quit the hospital; by the act of 1869 they were compelled to leave and it was devoted to the accommodation of the students of the Royal Naval college, the Infirmary being granted to the Seamen's Hospital Society.

To the south of the hospital is Greenwich park (185 ac.). It was enclosed by Humphrey, duke of Gloucester, and laid out by Charles II., and contains a fine avenue of Spanish chestnuts planted in his time. In it is the Royal Observatory, built in 1675 for the advancement of navigation and nautical astronomy. From it the exact time is conveyed each day at one o'clock by electric signal to the chief towns throughout the country: British. and the majority of foreign geographers reckon longitude from its meridian. A standard clock and measures are seen at the entrance. The new magnetic pavilion lying 400 yd. to the east was completed in 1899, to avoid the disturbance of instruments which would be occasioned by the iron used in the principal building. South of the park lies the open common of Blackheath, mainly within the borough of Lewisham, and in the east the borough includes the greater part of Woolwich common. The parish church of Greenwich, in Church Street, is dedicated to St. Alphege, archbishop, who was martyred here by the Danes in 1012.

At Greenwich an annual banquet of cabinet ministers, the whitebait dinner, formerly took place. This ceremony arose out of a dinner held annually at Dagenham, by the commissioners for engineering works carried out there in 1705-10 to save the lowlands from flooding. To one of these dinners Pitt was invited, and was subsequently accompanied by some of his colleagues. Early in the 19th century the venue of the dinner, now a ministerial function, was transferred to Greenwich, and celebrated at the "Ship," an hotel of ancient foundation. The banquet continued till 1868, was revived in 1874–80, and was held for the last time in 1894.

The parliamentary borough of Greenwich returns one member. Two burgesses were returned in 1577, but it was not again represented till 1832.

GREENWICH, a town of Fairfield county, Conn., U.S.A., on Long Island sound, in the extreme southwest of the state, 28 mi. N.E. of New York city. It consists of nine self-contained sections, five with their own post offices and four of these five with railroad stations, including Cos Cob, Riverside and Old Greenwich. It is served by the New York, New Haven and Hartford railroad and by motorbus lines. The population of the town in 1920 was 22,123; (1930) 33,112; (1940) 35,509. The town occupies 48 sq.mi. of gently rolling land, rising from the sea level to an elevation of 550 ft., and presents a beautiful panorama of bays, coves, lakes, rivers, hills, woods and valleys. It is primarily a residential community, the home of many New York businessmen, artists and writers. There are beautiful estates, clubs, hotels and facilities for all kinds of sports; the northern part of the town is covered with a network of 330 mi. of bridle paths. Greenwich was settled in 1614 as a part of New Amsterdam. The Dutch relinquished their claim in 1650; six years later the town submitted to the New Haven colony; in 1662 it was one of the first towns of the colony to submit to Connecticut. On the old post road is the inn (built about 1729 and restored as a memorial in 1901) where Israel Putnam was surprised by Tryon in Feb. 1779, and, according to tradition, escaped by riding down a steep flight of stone steps. The borough of Greenwich was incorporated in 1858 and made a part of the town in 1931.

GREENWOOD, FREDERICK (1830–1909), an English journalist and man of letters, was born in London. In 1862, when Thackeray resigned the editorship of the *Cornhill,* Greenwood became joint editor with G. H. Lewes. In 1864 he was appointed sole editor, a post which he held until 1868. Greenwood then conceived the idea of an evening newspaper, which, in addition to the news, should contain authoritative and impartial articles by outside contributors on literature, art and public affairs. Canning's *Anti-Jacobin* and the *Saturday Review* of 1864 were the joint models he had before him. The idea was taken up by George Smith, and the *Pall Mall Gazette* was launched in Feb. 1865, with Greenwood as editor. Within a few years he had come to exercise a great influence on public affairs. His views ripened from what was described as philosophic Liberalism into Conservatism. No minister in Great Britain, Gladstone declared, ever had a more able, a more zealous, a more effective supporter for his policy than Lord Beaconsfield had in Greenwood. It was on the suggestion of Greenwood that Beaconsfield purchased in 1875 the Suez canal shares of the Khedive Ismail; the British Government being ignorant, until informed by Greenwood, that the shares were for sale and likely to be bought by France. It was characteristic of Greenwood that he declined to publish the news

of the purchase of the shares in the *Pall Mall* before the official announcement was made.

Early in 1880 the *Pall Mall* changed owners, and the new proprietor required it to support Liberal policy. Greenwood at once resigned his editorship, but in May a new paper, the *St. James's Gazette*, was started for him by Henry Hucks Gibbs (afterwards Lord Aldenham), and in the new paper Greenwood was a pungent critic of the Gladstone administration (1880–85) and an independent supporter of Lord Salisbury. His connection with the *St. James's Gazette* ceased in Aug. 1888, when the paper changed hands. The *Anti-Jacobin*, which he started in 1891, lasted for only a year. Greenwood continued to write on political and social questions in various papers. Towards the end of his life his political views reverted in some respects to the Liberalism of his early days. He died at Sydenham on Dec. 14, 1909.

GREENWOOD, JOHN (d. 1593), English Puritan and Separatist (the date and place of his birth are unknown), was educated at Corpus Christi college, Cambridge. By 1586 he was the recognized leader of the London Separatists, many of whom had been imprisoned at various times since 1567. Greenwood was arrested early in Oct. 1586, and the following May was committed to the Fleet prison. During his imprisonment he wrote some controversial tracts in conjunction with his fellow-prisoner Henry Barrowe. He was certainly at large in Sept. 1592, when he was elected "teacher" of the Separatist church. Meanwhile he had written (1590) "An Answer to George Gifford's pretended Defence of Read Prayers." On Dec. 5 he was again arrested; and the following March was tried, together with Barrowe, and condemned to death on a charge of "devising and circulating seditious books." After two respites, one at the foot of the gallows, he was hanged on April 6, 1593.

See B. Brook, *Lives of the Puritans* **(1813)**; *H.* **M.** Dexter, *The Congregationalism of the last three hundred years* **(1880)** and *The England and Holland of the Pilgrims* (1905); *F.* **J.** Powicke, *Henry Barrow* and *the Exiled Church of Amsterdam* (1900).

GREENWOOD, a city of western Mississippi, U.S.A., on the Yazoo river, 135 mi. S. by W. of Memphis; the county seat of Leflore county. It is served by the Columbus and Greenville and the Yazoo and Mississippi Valley railways. The population was 11,123 in 1930 and was 14,767 in 1940 (52% white) by the federal census. It ships great quantities of cotton (in 1939–40, 483,700 bales of cotton were handled by three local compresses), and has saw mills, furniture factories, wood-working plants and canneries, besides cotton gins and compresses and cotton-seed oil mills. Greenwood was incorporated in 1844. It has a commission form of government. The city and the county were named after the Choctaw chief, Greenwood Leflore, whose mansion "Malmaison" (built in 1854) stands a few miles from the city, equipped and furnished practically as he left it.

GREENWOOD, a city in the Piedmont section of western South Carolina, U.S.A., at an altitude of 670ft.; the county seat of Greenwood county. It is on Federal highway 25, and is served by the Charleston and Western Carolina, the Georgia and Florida, the Piedmont and Northern (electric), the Seaboard Air Line and the Southern railways. The population was 8,703 in 1920 (33% negro) and was 13,020 in 1940 by the federal census. It is an important trading centre for the western part of the state; is the seat of Lander college for women (1872). Greenwood was founded in 1824; had its first post office in 1837, first railroad in 1852, and first charter in 1857. A manufacturing centre, it ranks fifth in the state in annual pay roll of manufacturing plants.

GREGARINA. Parasitic single-celled animals (Protozoa), which occur chiefly in the intestines, and sometimes also in the body-cavity of various animals, and are characterized chiefly by their manner of reproduction. Almost all of them are harmless. *(See* PROTOZOA.)

GREGOIRE, HENRI (1750–1831), French revolutionist and constitutional bishop of Blois, son of a peasant, was born at Vého near Lunéville, on Dec. 4, 1750. Educated at the Jesuit college at Nancy, he became *cure'* of Emberménil and a teacher at the Jesuit school at Pont-à-Mousson. In 1783 he was crowned by the academy of Nancy for his *Éloge de* la *poésie,* and in 1788 by that of Metz for an *Essai sur la régénération physique et morale des Juifs.* He was elected in 1789 by the clergy of the *bailliage* of Nancy to the states-general, where he became conspicuous in the group of deputies of Jansenist or Gallican sympathies who supported the Revolution. He presided at the permanent sitting of sixty-two hours while the Bastille was being attacked by the people, and made a vehement speech against the enemies of the nation. He subsequently took a leading share in the abolition of the privileges of the nobles and the Church. Under the new civil constitution of the clergy, to which he was the first priest to take the oath (Dec. 27, 1790), he was elected bishop by two departments. He selected that of Loire-et-Cher, taking the old title of bishop of Blois, and for ten years (1791–1801) ruled his diocese with exemplary zeal. In the first session of the National Convention (Sept. 21, 1792) he proposed the abolition of the kingship, asserting that "kings are in the moral order what monsters are in the natural." On Nov. 15, he demanded the king's trial, and was elected president of the Convention. During the trial of Louis XVI., being absent on a mission for the union of Savoy to France, he wrote a letter urging the condemnation of the king, but omitting the words *à mort;* and later proposed in the Convention that the penalty of death should be suspended.

When on Nov. 7, 1793 Gobel, bishop of Paris, resigned his episcopal office at the bar of the Convention, Grégoire refused to abjure either his religion or his office. His courage won the day and the hubbub subsided in cries of "Let Grégoire have his way!" Throughout the Terror, in spite of attacks in the Convention and in the press, he appeared in the streets in his episcopal dress and daily read mass in his house. After Robespierre's fall he spoke in support of the reopening of the churches on Dec. 21, 1794. He initiated measures for restraining vandalistic fury against monuments of art, and devoted his attention to the reorganization of the public libraries and technical education. On the establishment of the new constitution, Grégoire was elected to the Council of 500, and after the 18th Brumaire he became a member of the Corps Législatif, then of the Senate (1801). He took the lead in the national church councils of 1797 and 1801, but was opposed to Napoleon's policy of reconciliation with the Holy See, and after the signature of the concordat he resigned his bishopric (Oct. 8, 1801). He voted with the minority in the Senate against the proclamation of the empire, but he was subsequently created a count of the empire and officer of the Legion of Honour. During the later years of Napoleon's reign he travelled in England and Germany, but returned in 1814 and was concerned in the overthrow of the Empire.

Grégoire, as a revolutionist and a schismatic bishop, was an object of double loathing to the clerical and ultra-royalist faction. He was expelled from the Institute and forced into retirement, but his influence was still felt and feared. His work, *De la constitution française de l'an 1814,* (1814) in which he commented on the Charter from a Liberal point of view, reached its fourth edition in 1819. In that year he was elected to the Lower Chamber by the department of Isère. By the powers of the Quadruple Alliance this event was regarded as of the most sinister omen, and the question was even raised of a fresh armed intervention in France under the terms of the secret treaty of Aix-la-Chapelle. Louis XVIII. decided on a modification of the franchise; the Dessolle ministry resigned; and the first act of Decazes, the new premier, was to carry a vote in the chamber annulling the election of Grégoire. From this time onward the ex-bishop lived in retirement, occupying himself in literary pursuits. He died on May 20, 1831.

To the last Grégoire remained a devout Catholic, fulfilling his obligations as a priest; but he refused to modify his revolutionary principles. The refusal of the archbishop of Paris to allow him the last sacrament roused great excitement in Paris, and the government had to take precautions to avoid riots.

Besides several political pamphlets, Grégoire was the author of *Histoire des sectes religieuses, depuis le commencement du siècle dernier jusqu'à l'époque actuelle* (2 vols., 1810); *Essai historique sur les libertés de l'église gallicane* **(1818)**; *De l'influence du Christianisme sur la condztion des femmes* **(1821)**; *Histoire des confesseurs des empereurs, des rois, et d'autres princes* **(1824)**; *Histoire du mariage des prêtres en France* **(1826)**. *Grégoireana, ou résumé général de la conduite, des*

actions, et des écrits de M. le comte Henri Gre'goire, preceded by a biographical notice by Cousin d'Avalon, was published in 1821; and the *Mémoires . . . de Gre'goire,* with a biographical notice by H. Carnot, appeared in 1837 (2 vols.). *See* also A. Debidour, *L'Abbé Gre'goire* (1881); *A.* Gazier, *Études sur l'histoire religieuse de la Révolution Française* (1883); *L.* Maggiolo, *La Vie et les oeuvres de l'abbé Gre'goire* (Nancy, 1884), and numerous articles in *La Révolution Française; E.* Meaume, *Étude hist. et biog. sur les Lorrains révolutionnaires* (Nancy, 1882); and A. Gazier, *Études sur l'histoire religieuse de la Révolution Française* (1887).

GREGORAS, NICEPHORUS *(c.* 1295–1360), Byzantine historian, man of learning and religious controversialist, was brought up at Heraclea in Pontus. At an early age he settled at Constantinople, where he won the favour of Andronicus II. In 1326 Gregoras proposed (in a still extant treatise) certain reforms in the calendar, very similar to those introduced by Gregory XIII. in 1582. When Andronicus was dethroned (1328) by his grandson Andronicus III., Gregoras retired into private life. But after the death of the elder Andronicus, Gregoras won the favour of his grandson and was appointed to conduct the negotiations (for a union of the Greek and Latin churches) with the ambassadors of Pope John XXII. (1333). Gregoras was then famous as a teacher, but was ruined by his opposition to Palamas in the Hesychast controversy. After the doctrines of Palamas had been recognized at the synod of 1351, Gregoras, who refused to acquiesce, was practically imprisoned in a monastery for two years. Nothing is known of the end of his life. His chief work is his *Roman History,* in 37 books, of the years 1204 to 1359, which supplements and continues the work of George Pachymeres. This work and that of John Cantacuzene supplement and correct each other and should be read together. The other writings of Gregoras, which (with a few exceptions) still remain unpublished, attest his great versatility. Amongst them may be mentioned a history of the dispute with Palamas; biographies of his uncle and early instructor John, metropolitan of Heraclea, and of the martyr Codratus of Antioch; funeral orations for Theodore Metochita and the two emperors Andronicus; commentaries on the wanderings of Odysseus and on Synesius's treatise on dreams; tracts on orthography and on words of doubtful meaning; a philosophical dialogue called *Florentius; or, Concerning Wisdom;* astronomical treatises on the date of Easter and the preparation of the astrolabe; and an extensive correspondence.

EDITIONS: in Bonn *Corpus scriptorum hist. Byz.,* by *L.* Schopen and I. Bekker, with life and list of works by J. Boivin (1829–55); J. P. Migne, *Patrologia graeca,* cxlviii., cxlix.; *see* also C. Krumbacher, *Geschichte der byzantinischen Literatur* (1897); *R.* Guilland, *Essai sur Nicéphore Grégoras* (1926), with bibliography.

GREGORIAN CALENDAR or **NEW STYLE,** the calendar substituted for the ancient church calendar—founded on two erroneous suppositions, namely, that the year contains $365\frac{1}{4}$ days and that 235 lunations are exactly equal to nineteen solar years—in March 1582 by Pope Gregory XIII. It was introduced into Spain, Portugal and part of Italy the same day as at Rome; France and Germany followed and it has since been received in almost all Christian countries. For the computation of the Gregorian calendar *see* CALENDAR.

GREGORIAN MUSIC. The most famous division of the ecclesiastical monodic music of the early and mediaeval church, which is comprehensively known as Plainsong or Plainchant. This is so called because of the part which Pope Gregory I. (d. 604) took in reforming and standardizing it. *See* GREGORY, ST.; MUSIC (Sec. 3); PLAINSONG.

GREGOROVIUS, FERDINAND (1821–1891), German historian, was born at Niedenburg on Jan. 19, 1821, and studied at Konigsberg. He lived for over 20 years in Italy, and died at Munich on May 1, 1891. His great work *Geschichte der Stadt Rom in Mittelalter* (Stuttgart, 1859–72; Eng. trans., 13 vols., 1894–1900), covers the period A.D. 400 to 1534.

His *Römische Tagebücher* were edited by F. Althaus (Stuttgart, 1892), and were translated into English as the *Roman Journals of F. Gregorovius,* by *A.* Hamilton (1907); J. Hoenig, F. *Gregorovius, der Geschichtschreiber der Stadt Rom* (Stuttgart, 1921).

GREGORY, ST., OF NAZIANZUS *(c.* 329–*c.* 389). surnamed Theologus, one of the four great fathers of the Eastern Church, was born at or near Nazianzus, Cappadocia, where his father, also named Gregory. had lately become bishop. After studying at the two Caesareas, Alexandria and Athens, he was induced by Basil (*q.v.*) to share his religious seclusion in Pontus, and there prepared the Φιλοκαλία, a sort of chrestomathy compiled with Basil's help from the writings of Origen. Gregory was ordained about 361, and though made bishop of Sasima, a small village near Tyana, about 372, he seems to have lived at Nazianzus, assisting his aged father, on whose death (374) he retired to Seleucia in Isauria for some years. Towards 378–379 the small remnant of the orthodox party in Constantinople requested him to undertake the resuscitation of their cause, so long borne down by the Arians. His success was immediate, the famous five discourses on the Trinity delivered there earning for him the distinctive appellation of *theologus.* With the arrival of Theodosius in 380 came the visible triumph of the orthodox cause. The metropolitan see was then conferred upon Gregory, and after the assembling of the second oecumenical council in 381 he received consecration from Meletius. In consequence, however, of a spirit of discord which appeared at his promotion, he soon resigned his dignity and withdrew into retirement. The rest of his days were spent partly at Nazianzus in ecclesiastical affairs, and partly on his neighbouring patrimonial estate at Arianzus. His festival is celebrated in the Eastern Church on Jan. 25, and in the Western on May 9.

Gregory's extant works, which consist of poems, epistles and orations, were published by Hervagius (Basle, 1550); by Billius (Paris, 1609, 1611); by Caillau (1840) and by Migne in *Patrol. Graec.,* vols. 35–38. The *Theological Orations* (ed. *A. J.* Mason) appeared separately at Cambridge in 1899. Of the poems, which include epigrams, elegies and an autobiographical sketch, the *editio princeps* is that of Aldus (1504). Partial English translations were made by Drant (1568), by Boyd (1826) and by Newman. A translation of selected orations and letters appeared in *The Library of Nicene Fathers,* vol. 7.

See C. Ullmann, *Gregorius von Nazianz, der Theologe* (1825; Eng. trans., 1857); A. Bénoit, *St. Gre'goire de Nazianze* (1877); Montaut, *Revue critique de quelques questions historiques se rapportant à St. Grégoire de Nazianze* (1879); M. Guignet, *S. Gre'goire de Nazianze* (1911) and H. Pinault, *Le Platonisme de S. Gre'goire de Nazianze* (1925); full bibliography in Herzog's *Realencyk.*

GREGORY, ST., OF NEOCAESAREA (C. 213–*c.* 270), known as THAUMATURGUS (the miracle-worker), was born of noble pagan parents at Neocaesarea in Pontus. He studied law, but at Caesarea met Origen, and became his convert (A.D. 233). He was consecrated bishop of his native town (C. 240), and in spite of the Decian persecution (250–251) converted nearly the whole city during his office of 30 years. He was active at the first synod of Antioch (A.D. 264–265), which condemned the heresies of Paul of Samosata; and the rapid spread in Pontus of a Trinitarianism approaching the Nicene type is attributed largely to his influence. His festival is observed on Nov. 17.

Gregory's works, which include the *Panegyricus in Origenem, Metaphrasis in Ecclesiasten, Epistola canonica* and *Expositio fidei,* throw light on the personality and method of Origen, on the organization of the church in Pontus and on Gregory's orthodox Trinitarian doctrine.

Editions by G. Voss (Mainz, 1604), Fronto Ducaus (Paris, 1622) and Migne, *Patr. Graec.* x. Eng. trans. in *Ante-Nicene Fathers,* vi. *See* Herzog-Hauck, *Realencyk.* vii. for full bibliography.

GREGORY, ST., OF NYSSA *(c.* 331–*c.* 396), one of the four great fathers of the Eastern Church, and younger brother of Basil the Great, was born probably at Neocaesarea. In 371 or 372 he was ordained by Basil to the bishopric of Nyssa, a small town in Cappadocia, and there parted from his wife Theosebia, who became a deaconess. His strict orthodoxy concerning the Trinity and the Incarnation made him peculiarly obnoxious to the Arians, and in 375 the synod of Ancyra, convened by Demetrius the Arian governor of Pontus, condemned him for alleged irregularities in his election and in the administration of the finances of his diocese. In 376 he was exiled, and did not return till the publication of the edict of Gratian in 378. Shortly afterwards he took part in the synod which met at Antioch in Caria to consider the Meletian schism. At the Council of Constantinople in 381, he was a conspicuous champion of orthodoxy, and in 382 he was commissioned to set in order the churches of Arabia, in connection

with which mission he also visited Jerusalem. In 394 he was present at the synod held in Constantinople under the presidency of Nectarius to settle ecclesiastical disorders in Arabia. The exact date of Gregory's death is unknown. His festival is observed by the Greek Church on Jan. 10, and by the west on March 9.

Gregory of Nyssa was not so able an administrator as his brother Basil, nor so magnificent an orator as Gregory of Nazianzus, but he excelled them both as a speculative and constructive theologian. His teaching, though strictly trinitarian, shows considerable freedom, and in many points, affinities with Origen, as in his Christology and his doctrine of final restoration.

Gregory's numerous works may be classified under five heads: (1) Treatises in doctrinal and polemical theology, the most important of which are that *Against Eunomius,* which defends the Nicene creed against Arianism and vindicates the character of Basil; the *Oratio catechetica* or defence of Christianity against pagans and Jews; *On Faith,* against the Arians; *On Common Notions,* in explanation of the terms in current employment with regard to the Trinity; *Ten Syllogisms,* against the Manichaeans; *To Theophilus,* against the Apollinarians; *Against Fate* and *De anima et resurrectione.* (2) Practical treatises, including the tracts *On Virginity* and *On Pilgrimages* and the *Canonical Epistle* upon the rules of pênance. (3) Expository and homiletical works, including the *Hexaemeron,* and the discourses *On the Creation of Man, On the Titles of the Psalms, On the Sixth Psalm, On Ecclesiastes.* (4) Biographical, consisting chiefly of funeral orations. (5) Letters.

The works were edited by Fronton le Duc (Paris, **1615, 1618** and 1638), by Migne, *Patrol. Graec.*, vols. **44-46** and by **V.** Jaegar (Berlin, 1921 *seq.*). G. H. Forbes edited the *Hexaemeron* and the *De opificio hominis* (Burntisland, **1855** and 1861), and F. Oehler the *Opera dogmatica* **(1865).** There hare been numerous editions of single treatises, *e.g.,* the *Oratio catechetica* (J. G. Krabinger, Munich, **1838;** J. H. Srawley, 1903), and Eng. trans. of the Letters and select works in *The Library of Nicene Fathers,* vol. 5 **(1893).** Monographs cited in Hauck-Herzog's *Realencyk.* vii.

GREGORY, ST., OF TOURS (538–594), historian of the Franks, was born in the chief city of the Arverni (the modern Clermont-Ferrand) on Nov. 30, 538. His real name was Georgius Florentius, but he was called Gregory after his maternal great-grandfather, the bishop of Langres. Gregory belonged to an illustrious senatorial family, many of whose members held high office in the church and bear honoured names in the history of Christianity.

Gregory lost his father early and was taken to Clermont-Ferrand to be brought up by his uncle Gallus and by his successor, Avitus, and there he received his education. Among profane authors he read the first six books of the Aeneid and Sallust's history of the Catiline conspiracy, but his education was mainly religious. The principles of religion he learnt from the Bible, Sulpicius Severus and some lives of saints, but to patristic literature and the subtleties of theology he remained a stranger. In 563, at the age of twenty-five, he was ordained deacon. Falling seriously ill, he went to Tours to seek a cure at the tomb of St. Martin. At Tours he lived with Euphronius, and so great was the young man's popularity that, on the death of Euphronius in 573, the people unanimously designated him bishop.

At that time Tours belonged to Austrasia, and King Sigebert hastened to confirm Gregory's election. After the assassination of Sigebert (575), the province was ruled by Chilperic for nine years, during which period Gregory displayed the greatest energy in protecting his town and church from the Frankish king. He had to contend with Count Leudast, the governor of Tours; despite all the king's threats, he refused to give up Chilperic's son Meroving, who had sought refuge from his father's wrath at the sanctuary of St. Martin; and he defended Bishop Pretextatus against Chilperic, by whom he had been condemned for celebrating the marriage of Merovech and Queen Brunhilda. In 580 Gregory was himself accused before a council at Berny of using abusive language against Queen Fredegond, but he cleared himself of the charge by an oath and was acquitted. On the death of Chilperic, Tours remained for two years (584–85) in the hands of Guntram, but when Guntram adopted his nephew Childebert, Sigebert's son, it again became Austrasian. This change was welcome to Gregory, who often visited the court. In 586 he was at Coblenz, and on his return to Yvois (the modern Carignan) visited the stylite Wulfilaic; in 588 we hear of him at Metz and also at Chalon-sur-Saône, whither he was sent to obtain from King Guntram the ratification of the pact of Andelot; in 593 he was at Orleans, where Childebert had just succeeded his uncle Guntram. In the intervals of these journeys he governed Tours with great firmness, repressing disorders and reducing the monks and nuns to obedience. He died on Nov. 17, 594.

Gregory left many writings, of which he himself gives an enumeration at the end of his *Historia Francorum:* "Decem libros Historiarum, septem Miraculorum, unum de Vita Patrum scripsi; in Psalterii tractatu librum unum commentatus sum; de Cursibus etiam ecclesiasticis unum librum condidi." The ten books of history are discussed below. The seven books of miracles are divided into the *De gloria martyrum,* the *De virtutibus sancti Juliani,* four books of *Miracula sancti Martini,* and the *De gloria confessorum,* the last dealing mainly with confessors who had dwelt in the cities of Tours and Clermont. The *Vitae patrum* consists of twenty biographies of bishops, abbots and hermits belonging to Gaul. The commentary on the Psalms is lost, the preface and the titles of the chapters alone being extant. The treatise *De cursibus ecclesiasticis,* discovered in 1853, is a liturgical manual for determining the hour of divers nocturnal offices by the position of the stars. Gregory also left a life of St. Andrew, translated from the Greek, and a history of the Seven Sleepers of Ephesus, translated from Syriac.

His most important work, however, is the *Historia Francorum,* which is divided into three parts. The first four books, which were composed at one time, cover the period from the creation of the world to the death of Sigebert in 575. The first book, which is a mere compilation from the chronicles of St. Jerome and Orosius, is of no value. The second book, from 397 to 511, deals with the invasions of the Franks, and is based on the histories of Sulpicius Alexander and Renatus Profuturus Frigeridus, now lost; on the catalogues of the bishops of Clermont and Tours; on some lives of saints, *e.g.,* Remigius and Maxentius, now lost; on the annals of Arles and Angers, now lost; and on legends, either collected by Gregory himself from oral tradition, or cantilenes or epics written in the Latin and Germanic languages. In the third and fourth books the earlier part is based on materials collected from men older than himself; of the later events he was himself an eye-witness. The fifth and sixth books, up to the death of Chilperic (584), deal with matters within his own experience. The first six books are often separate in the mss.; and it was these alone that were used by the chronicler Fredegarius in his abridgment of Gregory's history. To the first six books Gregory subsequently added chapters on the bishops Salonius and Sagittarius, and on his quarrels with Felix of Nantes. The authenticity of these chapters has been undeservedly attacked by Catholic writers. Books vii. to x., from 584 to 591, were written in the form of a diary; of each important event, as it occurred, he inserted an account in his book. The last six books are of great historical value.

Gregory was at great pains to be an impartial writer, but in this he was not always successful. His devotion to Austrasia made him very bitter against, and perhaps unjust to, the sovereigns of Neustria, Chilperic and Fredegond. As an orthodox Christian, he had no good word for the Arians. He excuses the crimes of kings who protected the church, such as Clovis, Clotaire I. and Guntram, but had no mercy for those who violated ecclesiastical privileges. This attitude, no doubt, explains his hatred for Chilperic. But if Gregory's historical judgments are suspect, he at least concealed nothing and invented nothing; and we can correct his judgments by his own narrative.

BIBLIOGRAPHY.—T. Ruinart brought out a complete edition of Gregory's works at Paris in **1699.** The best modern complete edition is that of W Arndt and B. Krusch in *Mon. Germ. hist. script. rer. Merov.* (vol. i., 1885). Of the many editions of the *Historia Francorum* may be mentioned those of Guadet and Taranne in the *Soc. de l'hist de France (4* vols, with Fr. trans, 1836–38), of Omont (the first six books; a reproduction of the Corvey ms) and of G. Collon

(the last four books; a reproduction of the Brussels ms. No. 9, 403). Gregory's hagiographic works were published by H. Bordier in the *Soc. de l'hist. de France* (4 vols., with Fr. trans., 1857–64). *Cf.* J. W. Löbell, *Gregor von Tours und seine Zeit* (2nd ed., Leipzig, 1868); G. Monod, "Etudes critiques sur les sources de l'histoire mérovingienne" in the *Bibl. de l'École des Hautes Études* (1872); G. Rurth, "Grégoire de Tours et les Ctudes classiques au VI^e^ siècle" in the *Revue des questions historiques* (xxiv. 586 *seq.*, 1878); Max Bonnet, *Le Latin de Grégoire de Tours* (1890). For details, *see* Ulysse Chevalier, *Biobibliographie* (2nd ed.). (C. PF.)

GREGORY THE ILLUMINATOR (257?–337?), the reputed founder of the Armenian Church, was, according to legend, the son of Anak, head of the Parthian clan of Suren, who was bribed by the Sassanid king of Persia to assassinate the Armenian king, Chosroes. Anak was slain by his victim's soldiers; Gregory was rescued by his Christian nurse, carried to Caesarea in Cappadocia, and brought up a Christian. When he refused to assist Tiridates, now king of Armenia, in offering pagan sacrifice, and his parentage became revealed, he was confined to a pit at Artashat for fourteen years. About 301 Tiridates killed the nun Ripsimé, who had sought Eis protection against Diocletian. Providence, incensed at such cruelty, turned Tiridates into a wild boar and afflicted his subjects with madness; but his sister had a revelation to bring Gregory out of his pit. The king consented, the saint was permitted to preach, and after his vision of Christ at Vagarshapat. Christianity became the national faith of Armenia About 290 Gregory went to Caesarea, where Leontius ordained and consecrated him vicar-general of Armenia. This ordination is historical, though the vision at Vagarshapat was invented later by the Armenians when they broke with the Greeks, in order to give to their church the semblance, if not of apostolic, at least of divine origin.

About 315, Tiridates went with Gregory, Aristaces, son of Gregory, and Albianos, head of the other priestly family, either to Rome or to Sardica, to make a pact with Constantine, newly converted to the faith. In 325 he sent Aristaces to the Council of Nice, and Gregory is related to have added a clause to the creed which Aristaces brought back. About 332, Gregory became a hermit on Mount Sebuh where he died.

Gregory did not really convert Great Armenia, for it had been already converted by Syrian missionaries to the Adoptionist or Ebionite faith which was dominant in the far East, and was afterwards known as Nestorianism. Marcionites and Montanists had also worked in the field. Gregory persuaded Tiridates to destroy the last relics of paganism, and carried out in the religious sphere his sovereign's policy of detaching Great Armenia from the Sassanid realm and allying it with the Graeco-Roman empire and civilization. He set himself to Hellenize or Catholicize Armenian Christianity, and in furtherance of this aim set up a hierarchy dependent on the Cappadocian.

BIBLIOGRAPHY.—Agathangelus's *Life of Gregory*, which is highly embellished with miraculous stories, was compiled about 450. It was published in Armenian by the Mechitarists at Venice in 1835, and in Greek by Lagarde in 1889. *See* also S. Weber, *Die Catholische Kirche in Armenien* (Freiburg, 1903, with bibliography); C. Fortescue, *The Armenian Church* (1872); *H.* Gelzer, *Die Anfange der armenischen Kirche* (Leipzig, 1895) (*Sächs. Gesells. der Wissensch.*); *v.* Gutschmid, *Kleine Schriften* (Leipzig, 1892); Arshak Ter Mikelian, *Die arm. Kirche* (Leipzig, 1892); Malan, S. *Gregory the Illuminator* (Rivingtons, 1868).

GREGORY, the name of 16 popes and one anti-pope.

SAINT GREGORY, surnamed the Great (c. 540–604), the first pope of that name, and the last of the four doctors of the Latin Church, was born in Rome, the son of a wealthy patrician. His mother was Silvia, who is commemorated as a saint on Nov. 3. About 573, Gregory held the office of prefect of the city of Rome; but about 574, feeling irresistibly attracted to the religious life, he resigned his post, founded six monasteries in Sicily and one in Rome, and in the last—the famous monastery of St. Andrew—became a monk. In 579 Pope Pelagius II. appointed him "apocrisiarius," or resident ambassador, at the imperial court in Constantinople. Some seven years later he was made abbot of his old monastery at Rome where he completed his well-known exposition of Job, and delivered lectures on the Heptateuch, the books of Kings, the Prophets, the book of Proverbs and the Song of Songs. To this period Bede's incident of the English slave-boys (if indeed it be accepted as historical) ought to be assigned. Passing one day through the Forum, Gregory saw some handsome slaves offered for sale, and enquired their nation. "Angles," was the reply. "Good," said the abbot, "they have the faces of angels, and should be coheirs with the angels in heaven. From what province do they come?" "From Deira." "Deira. Yea, verily, they shall be saved from God's ire (de *ira*) and called to the mercy of Christ. How is the king of that country named?" "Aella." "Then must Alleluia be sung in Aella's land." Gregory determined personally to undertake the conversion of Britain, and with the pope's consent actually set out upon the mission, but on the third day of his journey he was overtaken by messengers recalling him to Rome. In 590 Pelagius II. died of the plague, and the clergy and people unanimously chose Gregory as his successor. The abbot tried to avoid the dignity and petitioned the emperor Maurice not to ratify his election, but he was consecrated on Sept. 3, 590.

As pope, Gregory surrounded himself with clerics and monks, with whom he lived as though he were still in a monastery, and in spite of constant ill-health, ministered unceasingiy to the physical and spiritual needs of his people. During his pontificate the papal estates increased in value, while at the same time the grievances of the tenants were redressed and their general position materially improved. Gregory's principal fault as a man of business was that he was too lavish of his revenues.

Within the strict bounds of his patriarchate, he wisely tolerated local deviations from Roman usage (*e.g.*, in the ritual of baptism and confirmation), and took pains to enforce the celibacy of the clergy, the trial of clerics only in ecclesiastical courts, the deprivation of clerics who had lapsed into scandalous offences, and the division of the revenues of each church into equal parts, to be assigned to the bishop, the clergy, the poor and the repair of the church.

Regarding the churches which lay outside the strict limits of his patriarchate, in northern Italy, Spain, Gaul, Africa and Illyricum and also in the East, Gregory tried to increase the authority of the Roman See. Rome, as the see of the Prince of the Apostles, was by divine right "the head of all the churches." The decrees of councils would have no binding force "without the authority and consent of the apostolic see": appeals might be made to Rome against the decisions even of the patriarch of Constantinople: all bishops, including the patriarchs, if guilty of heresy or uncanonical proceedings, were subject to correction by the pope. On the other hand he respected the rights of metropolitans and disapproved of unnecessary interference within the sphere of their jurisdiction canonically exercised. In Italy Gregory occupied an almost regal position. He boldly stepped into the place which the emperors had left vacant and the Lombard kings had not the strength to seize. For the first time in history the pope appeared as a political power, a temporal prince. He appointed governors to cities, issued orders to generals, provided munitions of war, sent his ambassadors to negotiate with the Lombard king and concluded a private peace.

A strong supporter of monasticism, Gregory tried to enforce a strict observance of the Rule of St. Benedict (of whom, it may be noted, he was the earliest biographer), and to protect the monks from episcopal oppression by issuing *privilegia*, or charters in restraint of abuses, in accordance with which the jurisdiction of the bishops over the monasteries was confined to spiritual matters. He forbade monks to minister in parish churches, ordaining that any monk who was promoted to such ecclesiastical cure should lose all rights in his monastery and should no longer reside there. Of his missionary enterprises, the most important was the two-fold mission to Britain—of St. Augustine in 596, of Mellitus, Paulinus and others in 601. Gregory also made strenuous efforts to uproot paganism in Gaul, Italy, Sicily, Sardinia and Corsica, Arianism in Spain, Donatism in Africa, Manichaeism in Sicily, the heresy of the Three Chapters in Istria and northern Italy. Towards the Jews he acted with lenity, protecting them from persecution and securing them the enjoyment of their legal privileges. The so-called "simoniacal heresy," particularly prevalent in Gaul, Illyri-

cum and the East, he repeatedly attacked, and also the Gallican abuse of promoting laymen to bishoprics.

Gregory's work in connection with the liturgy and church music is a subject of dispute. If we are to credit a 9th century biographer, Gregbry abbreviated and otherwise simplified the Sacramentary of Gelasius, producing a revised edition with which his own name has become associated, and which represents the groundwork of the modern Roman Missal. Rut though it is certain that he introduced three changes in the liturgy (viz., the addition of some words in the prayer *Hanc igitur,* the recitation of the Pater Noster immediately before the fraction of the Host, and the chanting of the Alleluia after the Gradual besides at paschal time) and two others in the ceremonial (forbidding deacons to perform any musical portion of the service except the chanting of the gospel, and subdeacons to wear chasubles), no evidence warrants belief that the Gregorian Sacramentary is his work. A doubtful tradition ascribes to Gregory the compilation of an Antiphonary, the revision and rearrangement of the system of church music, and the foundation of the Roman *schola cantorum.*

Finally, as Fourth Doctor of the Latin Church, Gregory is the last of the great Latin Fathers and the first representative of mediaeval Catholicism. The importance of his teaching lies mainly in its simple summarization of the doctrine of Augustine and in its detailed exposition of contemporary religious conceptions which had not hitherto been defined (*e.g.,* the views on angelology and demonology, on purgatory, the Eucharist and the efficacy of relics). From his time to that of Anselm no teacher of equal eminence arose in the church.

Gregory died on March 12, 604, and was buried in the portico of the basilica of St. Peter, in front of the sacristy. Translations took place in the 9th, 1 jth and 17th centuries, and the remains now rest beneath the altar in the chapel of Clement VIII.

BIBLIOGRAPHY.—Of Gregory's writings, which appeared at Paris (1518) and in Migne's *Patrol. Lat.,* vols. 75–79, and at other times, the following are generally accepted as genuine:—

Epistolarum libri xiv., Moralium libri xxxv., Regulae pastoralis liber, Dialogorum libri iv., Homiliarum in Ezechielem prophetam libri ii., Homiliarum in Evangelia libri ii. The *Epistolae* have been published separately by P. Ewald and L. M. Hartmann in the *Mon. Germ. hist.* (1887–99). Eng. trans. of selected epistles and the *Pastoral Care* in *Nicene and Post-Nicene Fathers,* vols. 12 and 13, and a trans. of *Magna Moralia* appeared in "The Library of the Fathers" (1844). An old Eng. trans. of the *Life of St. Benedict* was edited by H. Coleridge (1874) and of the Dialogues by E. G. Gardner (1911). *See* Gregory of Tours, *Historia Francorum* (in Migne's *Patrol. Lat.* vol. 71) and the *Liber pontificalis* (ed. Duchesne 1884)—both practically contemporary. *See* also G. J. Lau, *Gregor I. der Grosse* (Leipzig, 1845); L. Pingaud, *La Politique de Saint Grégoire le grand* (1872); F. W. Kellett, *Gregory the Great and his relations with Gaul* (1889); *T.* Bonsmann, *Gregor* I. *der Grosse, ein Lebensbild* (1890); C. Howorth, *Gregory the Great* (1912); Snow, *St. Gregory the Great* (2nd ed. 1924); and the bibliographies in Chevalier, *Répertoire des sources historiques du moyen âge,* and A. Potthast, *Bibliotheca historica medii aevi.*

GREGORY II., pope from 715 to 731, succeeded Constantine I. whom he accompanied to Constantinople in 710. To spread Christianity in Germany, Gregory gave special encouragement to the mission of St. Boniface, whom he consecrated bishop in 722. He was a staunch adherent of the East Roman empire, which still exercised sovereignty over Rome, Ravenna and some other parts of Italy, and he impeded as far as possible the progress of the Lombards. About 726, however, he came into conflict with the emperor Leo the Isaurian on account of the excessive taxation of the Italians, and, later, on account of his iconoclastic edicts. Leo endeavoured to rid himself of the pope by violence, but Gregory, supported by the people of Rome and by the Lombards, succeeded in eluding the emperor and died peacefully on Feb. 11, 731.

GREGORY III., pope from 731 to 741, condemned the iconoclasts at a council convened at Rome in 731, and, like his predecessor Gregory II., stimulated the missionary labours of St. Boniface, on whom he conferred the pallium.

GREGORY IV., pope from 827 to 844. His name is chiefly associated with the quarrels between Lothair and Louis the Pious, in which he espoused the cause of the former, for whom, in the Campus Mendacii (*Lügenfeld,* field of lies), as it is usually called (833), he secured by his treachery a temporary advantage. The institution of the feast of All Saints is usually attributed to this pope. He died on Jan. 25, 844.

GREGORY V., pope from 996 to 999, a great-grandson of the emperor Otto the Great. Until the council of Pavia (997) his rival was the anti-pope John XVI., whom the people of Rome, in revolt against the will of the youthful emperor Otto III., had chosen after having expelled Gregory. The most memorable acts of his pontificate were those arising out of the contumacy of the French king, Robert, who submitted after a sentence of excommunication Gregory died suddenly, and not without suspicion of foul play, on Feb. 18, 999. Twenty-two of his bulls are in Migne's *Patrol Lat.,* vol. 137.

GREGORY VI., pope from 1045 to 1046. As Johannes Gratianus he had earned a reputation for learning and probity, and in 1045 he bought the pontificate from his unworthy godson Benedict IX. At a council held by the emperor Henry III. at Sutri in 1046, he was accused of simony, deposed and banished to Germany.

GREGORY VII. (HILDEBRAND) SAINT, pope from 1073 to 1085, was born of humble parents in Tuscany *c.* 1023, and was educated in the convent of St. Mary on the Aventine at Rome where he became a Benedictine. As chaplain to the exiled Gregory VI., he lived for a year at Cologne acquiring an intimate knowledge of the political and ecclesiastical conditions of Germany. He returned to Rome with Bishop Bruno of Toul, who became Pope Leo IX. (1048–54). Under him Hildebrand was made a cardinal subdeacon and administrator of the patrimony of St. Peter and acted as a legate in France, where he was occupied *inter alia* with the question of Berengarius of Tours (*q.v.*). On the death of Leo IX. he went as the envoy of the Romans to the German court, to conduct the negotiations with regard to his successor. The emperor pronounced in favour of Bishop Gebhard of Eichstadt, who, as Victor II. (1055–57), again employed Hildebrand as his legate to France. When Stephen IX. (Frederick of Lorraine) was raised to the papacy, without previous consultation with the German court, Hildebrand and Bishop Anselm of Lucca were despatched to Germany to secure a belated recognition. Stephen, however, died before his return, and, by the hasty elevation of Bishop Johannes of Velletri, the Roman aristocracy made a last attempt to recover their influence in papal appointments. Hildebrand, however, secured the election of Bishop Gerhard of Florence. The reign of Nicholas II. (1059–61) saw three great transactions —the *rapprochement* with the Normans in the south of Italy, the alliance with the democratic and, subsequently, anti-German movement of the Patarenes in the north, and the legal enactment which transferred the papal election to the College of Cardinals. In these measures Hildebrand, already a dominant personality on the Curia, though he was only an archdeacon played a large part. Under Alexander II. (1061–73) Hildebrand became the soul of the Curial policy, and sagaciously utilized the general political conditions, especially in Germany.

On Alexander's death, he became Pope Gregory VII. It is proof of the popular faith in his qualifications that, although the circumstances of his election invited assault in 1073, no attempt was then made to set up a rival pontiff. When, however, the opposition against him had gone so far as to produce a pretender to the chair, his long and undisputed possession tended to prove the original legality of his papacy; and the appeal to irregularities at its beginning only assumed the appearance of a mere biased attack. On May 22 he received sacerdotal ordination, and on June 30 episcopal consecration.

The focus of the ecclesiastico-political projects of Gregory VII. is to be found in his relationship with Germany. The young Henry IV. was compelled by the Saxon rebellion to come to amicable terms with the pope at any cost. Consequently in May 1074 he did penance at Nuremberg in presence of the legates to expiate his intimacy with the members of his council banned by Gregory, took an oath of obedience, and promised his support in the work of reforming the church. This attitude, however, he abandoned so soon as he gained the upper hand of the Saxons by

his victory at Hohenburg on the Unstrut (June 9, 1075), and he now attempted to reassert his rights of suzerain in upper Italy without delay. He sent Count Eberhard to Lombardy to combat the Patarenes; nominated the cleric Tedaldo to the archbishopric of Milan; and finally endeavoured to establish relations with the Norman duke, Robert Guiscard. Gregory's severe reprimands infuriated Henry and his court, and their answer was the hastily convened national council in Worms, which met on Jan. 24, 1076. In a document full of gross accusations the bishops renounced their allegiance. In another King Henry pronounced him deposed, and the Romans were required to choose a new pope. Two bishops were despatched to Italy in company with Count Eberhard under commission of the council, and they succeeded in procuring a similar act of deposition from the Lombard bishops in the synod of Piacenza. The communication of these decisions to the pope was undertaken by the priest Roland of Parma, and he was fortunate enough to gain an opportunity for speech in the synod, which had barely assembled in the Latcran church, and there to deliver his message announcing the dethronement of the pontiff. Such indignation was aroused that it was only due to the moderation of Gregory himseif that the envoy was not cut down on the spot. On the following day the pope excommunicated the German king, divested him of his dignity and absolved his subjects from the oaths sworn to him. The excommunication of the king made a profound impression both in Germany and Italy. In Germany there was a general revulsion of sentiment in favour of Gregory, and the particularism of the princes utilized the auspicious moment for prosecuting their anti-regal policy under the cloak of respect for the papal decision. In October, they met at Tribur to elect a new German king, and Henry was only saved from the loss of his sceptre by their failure to agree on the question of his successor. They settled that, if, on the anniversary of his excommunication, Henry still lay under the ban, the throne should be considered vacant. Henry wisely went to Italy in person and did penance before Gregory at Canossa. The reconciliation was only effected after prolonged negotiations and definite pledges on the part of the king, though no basis was gained for a settlement of the great questions at issue — notably that of investiture. A new conflict was inevitable because Henry IV. naturally considered the sentence of deposition repealed with that of excommunication; while Gregory on the other hand, intent on reserving his freedom of action, gave no hint on the subject at Canossa.

That the excommunication of Henry IV. was simply a pretext for the opposition of the rebellious German nobles is manifest. They persisted in their policy after his absolution, and set up a rival king in the person of Duke Rudolph of Swabia (Forchheim, March 1077). Gregory tried to remain neutral but finally decided for Rudolph of Swabia in consequence of his victory at Flarchheim (Jan. 27, 1080), and again pronounced the excommunication and deposition of King Henry (March 7, 1080). Rudolph died on Oct. 16, and a new claimant — Hermann of Luxemburg — was put forward in Aug. 1081. The king refused to acknowledge the ban on the ground of illegality, and the council summoned at Brixen on June 25, 1080, pronounced Gregory deposed and nominated the archbishop Guibert of Ravenna as his successor. In 1081 Henry opened the conflict against Gregory in Italy. The latter had now fallen on evil days, and he lived to see 13 cardinals desert him, Rome surrendered by the Romans to the German king, Guibert of Ravenna enthroned as Clement III. (March 24, 1084), and Henry crowned emperor by his rival, while he himself had to flee from Rome.

As regards other countries, Gregory had attempted to establish a claim of suzerainty on the part of the see of St. Peter, and to secure the recognition of its rights of possession. On the ground of "immemorial usage" Corsica and Sardinia were assumed to belong to the Roman Church. Spain and Hungary were also claimed as her property, and an attempt was made to induce the king of Denmark to hold his realm as a fief from the pope. Philip I. of France, by his simony and the violence of his proceedings against the church, provoked a threat of summary measures; and excommunication, deposition and the interdict, appeared to be imminent in 1074 In England, William the Conqueror interfered autocratically with the management of the church, forbade the bishops to visit Rome, filled bishoprics and abbeys, and evinced little anxiety when the pope prohibited him from commerce or commanded him to acknowledge himself a vassal of the apostolic chair.

For Gregory, the church, as a divine institution, had been entrusted with the task of embracing all mankind in a single society in which the divine will is the only law; and the pope, *qua* head of the church, had been made the vice-gerent of God on earth, so that disobedience to him implies disobedience to God. He looked on the worldly State as an unhallowed edifice whose character is sufficiently manifest from the fact that it abolishes the equality of man, and that it is built up by violence and injustice. In practice he acknowledged the existence of the State as a dispensation of Providence, described the coexistence of church and State as a divine ordinance, and emphasized the necessity of union between the *sacerdotium* and the *imperium*. But he always upheld the superiority of the church and claimed the right of excommunicating and deposing incapable monarchs, and of confirming the choice of their successors. The question of appointment to spiritual offices — the so-called *investiture* — brought the controversy over the relation between church and Stare to a head. By the first law (1075) the right of investiture for churches was in general terms denied to the laity. In 1078 neglect of this prohibition was made punishable by excommunication, and, by a further decree of the same year, every investiture conferred by a layman was declared invalidand its acceptance pronounced liable to penalty. It was, moreover, enacted that every layman should restore, under pain of excommunication, all lands of the church, held by him as fiefs from princes or clerics; and that, henceforward, the assent of the pope, the archbishop, etc., was requisite for any investiture of ecclesiastical property. Finally in 1080 the forms regulating the canonical appointment to a bishopric were promulgated. The election was to be conducted by the people and clergy under the auspices of a bishop nominated by the pope or metropolitan; after which the consent of the pope or archbishop was to be procured. In so legislating, Gregory tried to withdraw the appointment to episcopal offices from the influence of the king. If lay investiture could be abolished the king would be deprived of his control over the great possessions assigned to the church by himself and his predecessors, and he could have no security that the duties attached to those possessions would be discharged for the benefit of the empire. The bishops in fact were to retain their position as princes of the empire, but the bond between them and the empire was to be dissolved: they were to owe allegiance only to the pope (see INVESTITURE).

In the internal government of the church, Gregory wished to see all important matters of dispute referred to Rome; appeals were to be addressed to himself, and he arrogated the right of legislation, the Roman synods being merely the instruments of his will. Among the methods employed to break the resistance of the higher prelates, with whom he was often in conflict, the despatch of legates proved peculiarly effective. The regulation, again, that the metropolitans should apply at Rome in person for the pallium schooled them in humility. This battle for papal omnipotence is connected with his championship of compulsory celibacy among the clergy and his attack on simony. In 1074 Gregory required all to renounce their obedience to those bishops who showed indulgence to their clergy in the matter of celibacy. In the following year he commanded the laity to accept no ministrations from married priests and deprived these clerics of their revenues. His war on simony culminated in his declaration in 1078 that consecration by a simoniac was null and void.

The pontificate of Gregory VII. came to a melancholy close, for he died an exile in Salerno on May 25, 1085. Too much the politician, too rough in his methods, too exclusively the representative of the Roman see, he had made more enemies than friends, for in the whirlpool of secular politics the religious side of his character was never sufficiently developed to allow the vice-gerent of Christ to be heard instead of the hierarch in his official acts. Nevertheless it was he who formulated the ideal of the papacy as a structure embracing all peoples. He took the first step towards the codification of ecclesiastical law and the definite ratification

of the claims of the apostolic chair as corner-stones in the church's foundation. He educated the clergy and the lay world in obedience to Rome; and, finally, it was due to his efforts that the celibacy of the clergy became customary in Catholic Christianity. Gregory was canonized by Benedict XIII. in 1729.

BIBLIOGRAPHY.—Gregory's works are printed in Migne's *Patrol. Lat.*, vol. 148. Most of his letters and decrees are collected in the *Registrum* (ed. P. Jaffé, *Bibliotheca rerum Germanicarum*, ii., 1865). Further letters were printed by Jaffé under the title of *Epistolae collectae*. The *Dictatus Papae*—27 sentences on the rights of the pope,—which is given in the Registrum is not the work of Gregory. *See* Voigt, *Hildebrand als Papst Gregorius VII.* (1846); G. Meyer von Knonau, *Jahrbücher des deutschen Reichs unter Heinrich IV. und Heinrich V.* (4 vols., 1890–1903); W. Martens, *Gregor VII., sein Leben und Werken* (2 vols., Leipzig, 1904); C. Mirbt, *Die Publizistik im Zeitalter Gregors VII.* (Leipzig, 1894); A. Hauck, *Kirchengeschichte Deutschlands* (3 vols., Leipzig, 1894); A. H. Mathew, D.D., *Life and Times of Hildebrand, Pope Gregory VII.* (1910); A. Fliche, *S. Grégoire VII.* (2nd ed. 1920) and *La Réforme Grégorienne* (1924); A. Potthast, *Bibl. hist. medii aevi* and Jaffé, *Regesta pontificum Romanorum* (2nd ed. 1885–88).

GREGORY VIII., antipope from 1118 to 1121, had been archbishop of Braga. Suspended by Paschal II. in 1114 on account of a dispute with the Spanish primate and papal legate, the archbishop of Toledo, he went to Rome and regained favour to such an extent that he was employed by the pope on important legations. He opposed the extreme Hildebrandine policy, and, on the refusal of Gelasius II. to concede the emperor's claim to investiture, he was proclaimed pope by Henry V. on March 8, 1118. He was excommunicated by Gelasius II. in April 1118, and by Calixtus II. at the synod of Reims (Oct. 1119). He died in exile at the convent of La Cava.

The life of Gregory VIII. by Baluzius in *Baluzii miscellanea*, vol. 1, ed. by J. D. Mansi (Lucca, 1761), is an excellent vindication.

GREGORY VIII. (*Alberto de Mora*), pope from Oct. 21 to Dec. 17, 1187, a native of Benevento and Praemonstratensian monk, successively abbot of St. Martin at Laon, cardinal-deacon of San' Adriano al foro, cardinal-priest of San Lorenzo in Lucina, and chancellor of the Roman Church, was elected to succeed Urban III. He died at Pisa while engaged in making peace between the Pisans and Genoese in order to secure their help in the new crusade which he was urging for the recovery of Jerusalem.

His letters are in Migne, *Patrol. Lat.*, vol. 202. Consult J. M. Watterich, *Pontif. Roman. vitae*, vol. 2 (Leipzig, 1862), Jaffé, *Regesta pontif. Roman.*; J. Langen, *Geschichte der romischen Kirche von Gregor VII. bis Innocenz III.* (Bonn, 1893); P. Nadig, *Gregors VIII. 57tägiges Pontifikat* (Basle, 1890).

GREGORY IX. (*Ugolino Conti* de Segni), pope from March 19, 1227, to Aug. 22, 1241, was a nobleman of Anagni and probably a nephew of Innocent III. He studied at Paris and Bologna, and, having been successively archpriest of St. Peter's, papal chaplain, cardinal-deacon of Sant' Eustachio, cardinal-bishop of Ostia, first protector of the Franciscans, and papal legate in Germany under Innocent III. and Honorius III., succeeded the latter in the papacy. On Sept. 29, 1227, he excommunicated the emperor Frederick II. for continued neglect of his vows and refusal to undertake the crusade. When Frederick finally set out the following June without making submission to the pope, Gregory raised an insurrection against him in Germany, and forced him in 1230 to beg for absolution. The Romans, however, disapproved of the temporal power and exiled the pope (June 1, 1231). Hardly had this contest been brought to an end favourable to the papacy (May 1235) when Gregory came into fresh conflict with Frederick II. He again excommunicated the emperor and released his subjects from their allegiance (March 24, 1239). Frederick, on his side, invaded the Papal States and prevented the assembling of a general council convoked for Easter 1241.

Gregory systematized the Inquisition and entrusted it to the Dominicans. He supported Henry III. against the English barons, and protested against the Pragmatic Sanction of Louis IX. of France. He sent monks to Constantinople to negotiate for church unity, but without result. He permitted free study of Aristotle, and issued (1234) an important new compilation of decretals which he prescribed in the bull Rex *pacificus* should be the standard text-book in canon law at Bologna and Paris. Gregory was famed for his learning, his blameless life, and his strength of character. He died on Aug. 22, 1241, while Frederick II. was advancing against him.

For his life *see* his Letters in *Monumenta Germaniae historica* (1883); "Les Registres de Grégoire IX.," ed. L. Auvray in *Bibiothlaue des écoles françaises d'Athènes et de Rome* (1890 *seq.*); A. Potthast, *Regesta pontif. Roman.* (1875) and "Registri dei Cardinali Ugolino d' Ostia et Ottaviano degli Ubaldini," ed G. Levi in *Fonti per la storia d' Italia* (1890). *See* J. Felten, *Papst Gregor IX.* (Freiburg i. B., 1886); J. Marx, *Die Vita Gregorii IX.* (1889); P. Balan, *Storia di Gregorio IX.* (3 vols., Modena, 1872); T. Frantz, *Der grosse Kampf zwischen Kaisertum u. Papsttum zur Zeit des Hohenstaufen Friedrich II.* (1903); W. Norden, *Das Papsttum u. Byzanz* (1903), and bibliography in Herzog-Hauck's *Realencyklopädie.*

GREGORY X. (*Tebaldo Visconti*), pope from Sept. 1, 1271, to Jan. 10, 1276, was born at Piacenza in 1208, and became archdeacon of Liége. While accompanying Edward of England on the crusade, he was elected pope and was consecrated on March 27, 1271. He summoned the 14th general council at Lyons in 1274, for the purpose of considering the eastern schism, the condition of the Holy Land, and the abuses in the church. The Greeks were persuaded to consent to a union for the time being, and Rudolph of Habsburg renounced at the council all imperial rights in the States of the Church. Gregory issued the constitution determining for the first time the form of conclave at papal elections. He was on his way to Rome to crown Rudolph when he died at Arezzo on Jan. 10, 1276.

Gregory's registers were published by J. Guiraud in the *Bibliothèque des écoles françaises d'Athènes et de Rome* (1892–98).

GREGORY XI. (*Pierre Roger de Beaufort*), pope from Dec. 30, 1370, to March 27, 1378, born in Limousin in 1330, was created cardinal-deacon of Sta. Maria Nuova by his uncle, Clement VI. His efforts to establish peace between France and England and to aid the Eastern Christians against the Turks were fruitless. He introduced many reforms in the monastic orders and vigorously opposed heresy. He consulted Catherine of Siena, to whom the transference of the papal see back to Italy (Jan. 17, 1377) was almost entirely due. He issued several bulls to the archbishop of Canterbury, the king of England, and the University of Oxford, commanding an investigation of Wycliffe's doctrines. Gregory was learned and full of zeal for the church, but irresolute and guilty of nepotism.

See H. J. Tomaseth, "Die Register u. Secretare Urbans V. u. Gregors XI." in *Mitteilungcn des Instituts für osterreichische Geschichtsforschung* (1898); J. P. Kirsch, *Die Rückkehr dcr Päpste Urban V. u. Gregor XI. von Avignon nach Rom* (Paderborn, 1898); J. B. Christophe, *Histoire de* la *papauté pendant le XIVe siècle* (vol. 2, 1853).

GREGORY XII. (*Angelo Cornaro* or *Correr*), pope from Nov. 30, 1406, to July 4, 1415, was born of a noble family at Venice about 1326. Successively bishop of Castello, Latin patriarch of Constantinople, cardinal-priest of San Narco, and papal secretary, he was elected to succeed Innocent VII. under the express condition that, should the antipope Benedict XIII. at Avignon renounce his claim, he also would renounce his, so that the long schism might be terminated. As pope, he concluded a treaty with his rival at Marseilles, by which a general council was to be held at Savona in Sept. 1408, but King Ladislaus of Naples brought the negotiations to nought. Gregory had promised not to create more cardinals, and when he did so, in 1408, his former cardinals deserted him and, with the Avignon cardinals, convoked the council of Pisa, which proclaimed in July 1409 the deposition of both popes and the election of Alexander V. Gregory, still supported by Naples, Hungary, Bavaria, and by Rupert, king of the Romans, found protection with Ladislaus, and in a synod at Cividale del Friuli banned Benedict and Alexander. John XXIII., having succeeded to the claims of Alexander in 1410, concluded a treaty with Ladislaus, by which Gregory was banished from Naples on Oct. 31, 1411. The pope presented his resignation to the council of Constance on July 4, 1415, and died at Recanati on Oct. 18, 1417.

GREGORY XIII. (Ugo *Buoncompagno*), pope from 1572 to 1585, was born on Jan. 7, 1502, in Bologna, where he taught, until called to Rome (1539) by Paul III., who employed him in various offices. He was prominent in the council of Trent, 1562–63. In

1564 he was made cardinal by Pius IV., and, in the following year, sent to Spain as legate. On May 13, 1572, he was chosen pope to succeed Pius V. Having failed to rouse Spain and Venice against the Turks, Gregory attempted to form a general coalition against Protestants. He subsidized Philip II. in his wars in the Netherlands; aided the Catholic League in France; incited attacks upon Elizabeth by way of Ireland. With the aid of the Jesuits, whose privileges he multiplied, he conducted a vigorous propaganda. Among his noteworthy achievements are the reform of the calendar on Feb. 24, 1582 (*see* CALENDAR); the improved edition of the *Corpus juris canonici,* 1582; the splendid Gregorian Chapel in St. Peter's; the fountains of the Piazza Navona; the Quirinal Palace; and many other public works. To meet the expenses entailed, Gregory resorted to confiscation, on the pretext of defective titles or long-standing arrearages, but with disastrous results to the public peace. Gregory died on April 10, 1585.

See Maffei, *Annales Gregorii XIII.* (2 vols., 1742) and bibliography in *Cambridge Mod. Hist.* iii.

GREGORY XIV. (*Nicoló Sfondrato),* pope 1590–91, was born in Cremona on Feb. 11, 1535, studied in Perugia and Padua, became bishop of his native place in 1560, took part in the Council of Trent, 1562–63, became a cardinal in 1583 and was elected to the papacy on Dec. 5, 1590. During his short pontificate the States of the Church suffered dire calamities, famine, epidemic and a fresh outbreak of brigandage. Gregory was completely subservient to Philip II.; he aided the league, excommunicated Henry of Navarre, and threatened his adherents with the ban; but the effect of his intervention was only to rally the moderate Catholics to the support of Henry, and to hasten his conversion. Gregory died on Oct. 15, 1591.

See M. Facini, *Il pontificales di Greqorio XIV.* (1911).

GREGORY XV. (*Alessandro Ludovisi*) was born on Jan. 9, 1554, in Bologna, where he taught. He was made archbishop of his native place and cardinal by Paul V., whom he succeeded as pope on Feb. 9, 1621. He aided the emperor in the Thirty Years' War and the king of Poland against the Turks, and endorsed the claims of Maximilian of Bavaria to the electoral dignity. Gregory founded the Congregation of the Propaganda, encouraged missions, fixed the order to be observed in conclaves, and canonized Ignatius Loyola, Francis Xavier, Philip Neri and Theresa de Jesus. He died on July 8, 1623.

See the extended bibliography in Herzog-Hauck, *Realencyklopiidie.*

GREGORY XVI. *(Bartolommeo Alberto Cappellari*), pope from 1831 to 1846, was born at Belluno on Sept. 18, 1765, and entered the order of the Camaldoli. Soon after the restoration of Pius VII. he became vicar-general of the Camaldoli, councillor of the Inquisition, prefect of the Propaganda, examiner of bishops, and in 1825 cardinal. On Feb. 2, 1831, he was chosen to succeed Pius VIII. After the revolution, which necessitated the calling in of Austrian troops, the French occupied Ancona in March 1832 and thus threw the Papal States into complete confusion. When they withdrew in 1838, there was comparative peace for the next 13 years. The embarrassed financial condition in which Gregory left the States of the Church was due to his lavish expenditure in architectural and engineering works, and his magnificent patronage of learning. His pontificate was marked by the development of those ultramontane ideas which were ultimately formulated, under the presidency of his successor Pius IX., by the council of the Vatican. He died on June 1, 1846.

M. Bernasconi, *Acta Gregorii Papae XVI.,* vols. 1–4 (1901 *seq.*); F. Neilson, *Hist. of the Papacy in the 19th Century* (1906), and bibliography in Herzog-Hauck, *Realencyklopadie,* vol. vii. (Leipzig, 1899).

GREGORY, EDWARD JOHN (1850–1909), British painter born at Southampton, began to work at the age of 1j in the engineer's drawing office of the Peninsula and Oriental Shipping Company. Afterwards he studied at South Kensington and, about 1871, he entered on a successful career as an illustrator. He developed also into an admirable painter in oil and water colour. He was elected associate of the Royal Academy in 1883, academician (R.A.) in 1898 and president of the Royal Institute of Painters in 1898. His work was distinguished by remarkable technical qualities, by exceptional firmness and decision of draughtsmanship and by unusual certainty of handling. His "Marooned," a water colour, is in the National Gallery of British Art. Many of his pictures were shown at Burlington House at the winter exhibition of 1909–10, after his death at Marlow on June 22, 1909. He exhibited many good portraits at the Academy but his water colours brought the highest price at a sale of his pictures at Christie's in 1905.

GREGORY, ISABELLA AUGUSTA, LADY (1852–1932), Irish playwright and author, was born on March 5, 1852, the youngest daughter of Dudley Persse of Roxborough, Co. Galway. In 1881 she married Sir William Gregory, a well-known Irish M.P. She produced many plays, essays, volumes of folklore, versions of ancient sagas and romances concerning early Irish heroes, and did much to popularize the Anglo-Irish dialect of English as spoken in the west. She translated for the Abbey Theatre several of Molière's plays into this dialect under the title of *The Kiltartan Molière* (1910). Her work as playwright and director of the Abbey Theatre, in association with W. B. Yeats, was extreme!~fruitful This theatre war opened in 1904 and Lady Gregory told its story in *Our Irish Theatre* (1914). Sir Hugh Lane, whose life she wrote, *Hugh Lane's Life and Achievement* (1920), was her nephew.

Among Lady Gregory's other works are: *Cuchulain of Muirthemne* (1902); *Gods and Fighting Men* (1904); *Seven Short Plays* (1909); *The Kiltartan History Book* (1909); *Irish Folk History Plays* (1912); *The Golden Apple* (1916); *The Kiltartan Poetry Book* (1919); *The Dragon* (1920).

GREGORY, JAMES (1638–1675), Scottish mathematician and astronomer, was educated at the grammar school of Aberdeen and at Marischal college of that city. In 1663 he published his treatise *Optica promota,* in which he described his great invention, the Gregorian reflecting telescope. About 1665 he went to the university of Padua, where he studied for some years, and in 1667 published *Vera circuli et hyperbolae quadratura,* in which he discussed infinite convergent series for the areas of the circle and hyperbola. In 1668 he published also at Padua *Geometriae pars universalis,* in which he gave a series of rules for the rectification of curves and the mensuration of their solids of revolution. He was elected F.R.S., and was professor of mathematics successively at the universities of St. Andrews (1669–74) and Edinburgh (1674–75).

GREIFENBERG, a town in the Prussian province of Pomerania, Germany, on the Rega, 45 mi. N.E. of Stettin on the railway to Kolberg. Pop. (1939), 10,581. It has two ancient gateways and its church of St. Mary dates from the 13th century. Manufactures of cement, sugar and bricks are carried on. Greifenberg possessed municipal rights as early as 1262, and in the 14th and 15th centuries had a considerable shipping trade, but it decayed during the Thirty Years' War.

GREIFENHAGEN, a town in the Prussian province of Pomerania, on the Reglitz, 12 m. S.S.W. of Stettin by rail. Pop. (1933) 8,952. Greifenhagen, built in 1230, was raised to the rank of a town and fortified about 1250. In 1679 it came into the possession of Brandenburg. Its prosperity depends chiefly on agriculture and it has a considerable trade in cattle. There are also felt manufactures and saw mills.

GREIFSWALD, a town in the Prussian province of Pomerania, Germany, on the Ryk, 3 mi. from its mouth on the Baltic, and 20 mi. S.E. from Stralsund by rail. Pop. (1939) 38,310. Greifswald was founded about 1240 by traders from the Netherlands. In 1250 it received a town constitution and Liibeck rights from the duke of Pomerania. In 1270 it joined the Hanse towns. It remained in the possession of the Swedes after the peace of Westphalia. In 1713 it was desolated by the Russians; and it came into the possession of Prussia in 1815. The industries mainly consist of fish-curing, and the manufacture of surgical instruments and machinery (particularly for agriculture), and the commerce in the export of corn, wood and fish. Greifswald is, however, best known to fame by reason of its university, which was founded during the year 1456, and famous for its faculty of medicine.

GREIN, JACOB THOMAS (1862–1935), naturalized (1925), British dramatic critic, was born in Amsterdam on Oct. 11, 1862, and educated in Holland, Germany and Belgium. He was the founder of the Renaissance theatre, and of the People's theatre, Whitechapel (1923), and after 1916 was the president of the French Players. He was dramatic critic for several English publications, notably the *Sunday Times*, the *Weekly Sketch* and the *Illustrated London News*. In 1925 he was appointed consul-general ior Liberia in London. Grein began his life work of relating the theatre with contemporary culture by introducing the plays of Ibsen into England. His publications include: *Dramatic Criticism* (5 vols., 1899–1905); *A Drama of Charity and some Impressions of London Life 1885–1910* (1910); *The World of the Theatre* (1921); *The New World of the Theatre* (1924).

GREISEN (in French, *Izyalomicte),* a modification of granite, consisting essentially of quartz and white mica, and characterized by the absence of felspar and biotite. In the hand specimen the rock has a silvery glittering appearance from the abundance of lamellar crystals of muscovite, but many greisens have much of the appearance of a paler granite. The commonest accessory minerals are tourmaline, topaz, apatite, fluorspar and iron oxides; a little felspar more or less altered may also be present and a brown mica which is biotite or lithionite. The tourmaline in section is brown, green, blue or colourless, and often the same crystal shows many different tints. The white mica forms mostly large plates with imperfect crystalline outlines. The quartz is rich in fluid enclosures. Apatite and topaz are both colourless and of irregular form.

Greisen occurs typically in belts or veins intersecting granite. At the centre of each vein there is usually a fissure which may be open or filled with quartz. The greisen bands are from 1in. up to aft. or more in thickness. At their outer edges they pass gradually into the granite, for they contain felspar crystals more or less completely altered into aggregates of white mica and quartz. The transition between the two rocks is perfectly gradual, a fact which shows that the greisen has been produced by alteration of the granite. Vapours or fluids rising through the fissure have been the agents which effected the transmutation. They must have contained fluorine, boron and probably also lithium, for topaz, mica and tourmaline, the new minerals of the granite, contain these elements. The alumina for these minerals is supplied by the biotite and felspar of the granite, but it is noteworthy that albite is not replaced by the soda white mica, paragonite. The change is pneumatolytic, induced by the vapours set free by the granite magma when it cools. Probably the rock was at a relatively high temperature at the time. A similar type of alteration, the development of white mica, quartz and tourmaline, is found sometimes in sedimentary rocks around granite masses.

Greisen is closely connected with schorl rock both in its mineralogical composition and in its mode of origin. The latter is a pneumatolytic product consisting of quartz and tourmaline, and often contains white mica, thus passing by all stages into greisen. Both of these rocks frequently carry small percentages of tin oxide (cassiterite) and may be worked as ores of tin, and the central filling of the fissure often contains much wolfram, as in Cornwall, where they are common—as also in Saxony, Tasmania and other centres of tin-mining. Many other greisens occur in which no tin is found. The analyses show the composition

	SiO_2	Al_2O_3	Fe_2O_3	FeO	CaO
Granite	70·17	15·07	·88	1·79	1·13
Greisen	69·42	15·65	1·25	3·30	·63

	MgO	K_2O	Na_2O	Fl	B_2O_3
Granite	1·11	5'73	2.69	·15	tr.
Greisen	1·02	4·06	·27	3·36	·59

of Cornish granite and greisen. They make it clear that there has been an introduction of fluorine and boron and a diminution in the alkalis during the transformation of the granitic rock into the greisen. (J. S. F.)

GREIZ, a town of Germany in the *Land* of Thuringia, on the right bank of the White Elster, near the borders of Saxony, and 66 mi. by railsouth from Leipzig. Pop. (1939) 38,945. Greiz (formerly *Grewcz)* is apparently a town of Slav origin. From the 12th century it was governed by *advocati (Vogte),* but in 1236 it came into the possession of Gera, and in 1550 of the younger line of the house of Plauen. It was ravaged by fire in 1494 and in 1802. The old town is on the right bank and the new town on the left bank of the river. The principal buildings are the old chbteau on a rocky hill overlooking the town, and the old town church dating from 1225. The industries include dyeing and the manufacture of machinery, woollen goods (for which it is famous), shawls and paper.

GRENADA, the southernmost of the Windward Islands, British West Indies. It lies between 11° 58′ and 12° 15′ N. and between 61° 35' and 61° 50′ W., being 140 m. S.W. of Barbados and 85 m. N. by W. of Trinidad. In shape oval, it is 21 m. long, 12 m. broad at its maximum and has an area of 133 sq.m. It owes much of its beauty to a well-wooded range of mountains traversing the island from N. to S. and throwing off from the centre spurs which form picturesque and fertile valleys. The highest point is Mount Catharine (2,750 ft.). Lower ground in the south-east and north-west is devoted to cultivation and cattle raising. The island is of volcanic origin with raised limestone beaches in the extreme north. Red and grey sandstones, hornblende and argillaceous schist are found in the mountains, porphyry and basaltic rocks also occur; sulphur and fuller's earth are worked. In the centre, at the height of 1,740 ft. above the sea, is the Grand Etang, a circular lake, 13 acres in extent, occupying the site of an ancient crater. Near it is a large sanatorium. In the north-east is a larger lake, Lake Antoine, also occupying a crater, almost at the sea level. The island is watered by several short rivers, mainly on the east and south; there are numerous fresh water springs, as well as hot chalybeate and sulphurous springs. The south-eastern coast is much indented with bays. The climate is good, the temperature equable and epidemic diseases are rare. In the low country the average yearly temperature is 82° F, but it is cooler in the heights. The rainfall is very heavy, in some parts 200 in a year. The rainy season lasts from May to December, but refreshing showers frequently occur during other parts of the year. The average annual rainfall at St. George is 79.07 in., and at Grand Etang 164 in. Excellent climate and good sea-bathing have made Grenada a health resort. Good roads and by-ways intersect it in every direction. The soil is extraordinarily fertile, producing cocoa and spices, especially nutmegs. The staple exports, sent chiefly to Great Britain, are cocoa, nutmegs and mace and cotton. Barbados gets most of its firewood from Grenada. Sugar is still grown, and rum and molasses are made for local consumption.

Elementary education is chiefly in the hands of the various denominations with government grants-in-aid. There are, however, a few government secular schools and government-aided secondary schools for girls and a grammar school for boys. The board of education is nominated by the government, and small fees are charged in all schools. The governor of the Windward Islands resides in Grenada and is administrator of it. The legislative council has 7 *ex-officio* members, including the governor, and 7 crown nominees. English is universally spoken, but the negroes use a French *patois,* which, however, is gradually dying out. Only 2% of the inhabitants are white, the rest being negroes and mulattoes with a few East Indians. The capital, St. George, in the south-west, is built upon a lava peninsula jutting into the sea and forming one side of its land-locked harbour. It is surrounded by an amphitheatre of hills, up the sides of which climb the red-brick houses of the town. At the extremity of the peninsula is Fort St. George, with a saluting battery. The ridge connecting Fort St. George with Hospital Hill is tunnelled to give access to the two parts of the town lying on either side. The population in 1938 was 6,500. There are four other towns—on the west coast Gouyave, or Charlotte Town, and 4 mi. N. of it Victoria; on the north coast Sauteurs; and Grenville at the head of a wide bay on the east. They are all in frequent communication

with the capital by steamer. The political division of Grenada (pop., 1940, 90,586) includes the island of Carriacou (9,358).

History.—Grenada was discovered in 1498 by Columbus, who named it Conception. Neither the Spanish nor the British, to whom it was granted in 1627, settled on the island. The governor oi Martinique, du Parquet, purchased it in 1650, and the French were well received by the Caribs, whom they afterwards exterminated with great cruelty. In 1665 Grenada passed into the hands of the French West India Company, and was administered by it until its dissolution in 1674, when the island passed to the French Crown. Cocoa, coffee and cotton were introduced in 1714. During the wars between Great Britain and France, Grenada capitulated to the British forces in 1762, and was formally ceded next year by the Treaty of Paris. The French, under Count d'Estaing, recaptured the island in 1779, but it was restored to Great Britain by the Treaty of Versailles in 1783. A rebellion against the British rule, instigated and assisted by the French, occurred in 1795, but was quelled by Sir Ralph Abercromby in the following year. The emancipation of the slaves took place in 1837, and by 1877 it was deemed necessary to introduce East Indian labour. Grenada, with cocoa as its staple, grown principally by peasant landholders, did not experience similar depression to that which overtook the sugar-growing islands of the West Indies.

See *Grenada Handbook.*

GRENADES, from the French word for a pomegranate, because of a resemblance in shape to the fruit. A grenade is a small metal missile, usually filled with high explosive, which may be thrown by hand or projected with the aid of a rifle. Grenades may also be charged with poison gas and incendiary or smoke-producing compositions, but the essential features of the various kinds remain the same. Gunpowder grenades, made of wood, bronze and other materials, were used in the 16th century, but the term was also used to imply an explosive shell fired from a gun; this has survived to modern times in the German Granate. Hand missiles were employed after about 1660, by special troops called "grenadiers" (*q.v.*), and were in common use during the wars of the 17th and 18th centuries. They became obsolete in the 19th century but were revived later in a high explosive form at the siege of Port Arthur in 1904 and in the trench fighting of the World War. Grenades are described as percussion or time

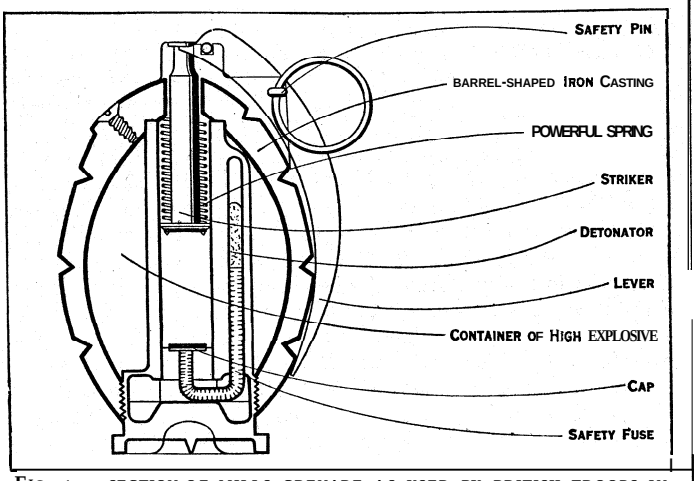

FIG. 1.— SECTION OF MILLS GRENADE AS USED BY BRITISH TROOPS IN THE WORLD WAR. THIS TYPE WAS PARTICULARLY SAFE TO HANDLE. THE 5-SECOND SAFETY FUSE GIVING TIME TO TAKE COVER IN CASE OF ACCIDENTAL DROPPING

grenades, according as to whether they explode on impact or after a definite time interval.

Hand Grenades.—At the commencement of the World War, the limited supply of grenades in the British army was of the percussion type, in which a needle in the head of the grenade is by direct impact caused to fire the detonator, a head-on fall being ecsured by means of tail streamers. At a later date, an all-ways fuse was suggested which would fire the grenade in whatever position it alighted. The main disadvantage of the percussion type is the danger of it exploding if accidentally dropped after being made "live" prior to throwing by the withdrawal of the safety piu or other safety device. These considerations led to the adoption of time grenades as being safer in action and allowing time in case of accident for the bomber to get clear or throw away the grenade. Furthermore, time grenades are more easily improvised than percussion ones, and during the period of severe shortage of munitions in the World War, many such grenades were constructed locally out of any handy receptacle. For this purpose a short projecting length (usually jsec.) of safety fuse terminating in a detonator (for high explosive fillings) within the grenade was employed. Various friction or strike and cap combinations were used to ignite the fuse before throwing.

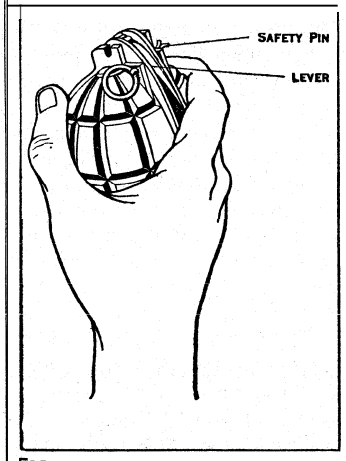

FIG. 2.— THE CORRECT METHOD OF HOLDING A MILLS GRENADE
When the safety pin has been withdrawn, pressure of the forefinaer holds lever to grenade until released in throwing

The principle of the time grenade is represented in its greatest perfection in the Mills grenade (set: fig. 1), invented during the war, of which enormous quantities were supplied to the British forces. It consists of a barrel-shaped iron casting, externally grooved in segments to ensure good fragmentation, and of a size to be conveniently clasped in the hand, weighing 1 lb. and containing 2½ to 3 oz. of high explosive; amatol or ammonal in powder form is convenient. The essential principle is that the ignition of the time arrangement (the safety fuse) is caused mechanically, as soon as the grenade is thrown. This is effected by the release of a striker actuated by a powerful spring which until then is restrained by a lever. On withdrawing the safety pin, this lever is still held to the grenade by the thrower's fingers (see fig. 2), but on the grenade leaving his hand, the loose lever flies off and a cap is struck which, ignites the jsec. length of safety fuse, which in turn fires the detonator and explodes the grenade.

Rifle Grenades.—Previous to the World War rifle grenades had been designed in order to obtain an increase of range beyond the restricted limits of hand throwing. These grenades were of the percussion type with a steel tail rod, which was inserted about 10in. into the muzzle of the ordinary service rifle and propelled by the gases from a blank cartridge, which impinges on the tail rod. The rodded rifle grenade, however, was not only unhandy, but tended to cause damage to the rifle. This led to the introduction by the French of the discharger-cup or tromblon, a short cylindrical cup attached to the muzzle of the rifle. The grenade is placed in this cup and propelled from it by the gases from a blank cartridge fired in the rifle, acting on the base of the grenade. The Mills grenade can be adapted for firing from a discharger-cup by the addition of a gas check plate, which is screwed into the base; the side of the discharger-cup holds the loose lever in position until the grenade is projected clear, when it flies off and sets the grenade in action. In this way rifle and hand grenades can be made practically interchangeable, thus simplifying both supply and transport in the field.

Future Design.—The tendency of future design is in the direction of percussion grenades, which are considered to be more effective than time ones, chiefly in that no time is given in which to get clear or to throw back the grenade before it explodes, in the event of the time fuse being too long in its burning. The chief difficulty to surmount is so to design the grenade that it is safe if dropped vertically by accident, but is made "live" in the space of a short flight. Other essential conditions are to act in any position of impact or fall after throwing, to be interchangeable with trifling adjustment as a hand or rifle grenade, to be weatherproof and mudproof and to be simple in manufacture and use.

BIBLIOGRAPHY.—G. M. Ainslie, *Hand Grenades* (1917); G. Dyson, *Grenade Fighting (New York,* 1917). *See also the official Text Book on Service Ammunition.*

GRENADIER, originally a soldier whose special duty it was to throw hand-grenades. The latter were in use for a considerable time before any special organization was given to the troops who were to use them.

The grenadier companies were formed always of the most powerful men in the regiment and, when the grenade ceased to be used, they maintained their existence as the "crack" companies of their battalions, taking the right of the line on parade and wearing the distinctive grenadier headdress. This system was almost universal, and the typical infantry regiment of the 18th and early 19th century had a grenadier and a light company besides its "line" companies. In the British and other armies these *élite* companies were frequently taken from their regiments and combined in grenadier and light infantry battalions for special service, and Napoleon carried this practice still further in the French army by organizing brigades and divisions of grenadiers (and correspondingly of *voltigeurs).* Indeed the companies thus detached from the line practically never returned to it, and this was attended with serious evils, for the battalion at the outbreak of war lost perhaps a quarter of its best men, the average men only remaining with the line. This special organization of grenadiers and light companies lasted in the British army until about 1858. In the Prussian service the grenadiers became permanent and independent battalions about 1740, and the gradual adoption of the four-company battalion by Prussia and other nations tended still further to place the grenadiers by themselves and apart from the line. Thus in various continental armies the title of "grenadiers" is borne by line regiments, indistinguishable, except for details of uniform and as a *corps d'élite,* from the rest. In the British Army the title survives in the Grenadier Guards. (See GUARDS.) The title "grenadier" was, however, revived in its original sense during the World War, when every infantry battalion had sub-units composed of men trained in and primarily used for throwing or firing grenades.

GRENADINES, a chain of islets (about 600) in the Windward Islands, West Indies. They stretch for 60 m. from N.E. to S.W. between St. Vincent and Grenada. Some are a few square miles in extent, others are merely rocky hummocks. For purposes of administration they are divided between St. Vincent and Grenada. Bequia, the chief island in the St. Vincent group, is long and narrow: Area 6 sq.m. Owing to lack of water it is only slightly cultivated, but game is plentiful. Admiralty bay, on the west side, is a safe and commodious harbour. Carriacou, attached to Grenada, is the largest of the group, 7 m. long, 2 m. wide and 13 sq.m. in extent. **A** ridge of hills, rising to an altitude of 700 ft., runs from N.E. to S.W. There are two good harbours on the west coast, Hillsborough bay on which stands Hillsborough, the chief town, and Tyrell bay, farther south. The island is thickly populated, the negro peasantry occupying small lots and working on the *métayage* system (*q.v.*). Cotton and cattle are the chief exports. Pop. of the group, mostly on Carriacou, about 7,000.

GRENCHEN (1,606 ft.). **a** town in the canton of Solothurn, Switzerland, at the south foot of the Jura. Pop. (1941) 10,900, mostly German-speaking Protestants. It is a centre of the watch-making industry, and stands on the Solothurn-Biel and Moutier-Biel railways.

GRENFELL. GEORGE (1849–1906), English Baptist missionary and explorer of the Congo, was born at Sancreed, near Penzance, on Aug. 21, 1849, and educated at Birmingham. After some years in a business firm, Grenfell entered'the Baptist college, Bristol (1873), and in 1874 was sent by the Baptist missionary society to the Cameroons, with Alfred Saker, where for some years he explored the rivers inland. In Jan. 1878 he joined the Rev. T. J. Comber in exploring the Lower Congo. In 1884 he made an independent survey of the Congo up to the Equator, at a point 18° long E. From 1884 to 1887 he made five further voyages in a river steamer, built under his own supervision, and the results of his journeys were published by the Royal Geographical Society (1886), from whom he received the founder's medal. In 1891 he acted as Belgian plenipotentiary in the Portuguese negotiations for the settlement of the frontier of the Lunda. In 1900 he began to explore the Aruwimi river, and by Nov. 1902 had reached Mawambi. He was responsible in 1903 for a commission of enquiry sent by King Leopold to enquire into the Belgian methods of administration, which Grenfell had begun to distrust, but their report was unsatisfactory. Grenfell died at Basoko on July 1, 1906.

See W. H. Bentley, *Life on the Congo* (introd. by G. Grenfell, 1887); H. H. Johnston, *George Grenfell and the Congo,* 2 vols. (1908); G. Hawker, *Life of George Grenfell* (1909); *S.* J. Dickins, *Grenfell of the Congo* (1910).

GRENFELL, JULIAN HENRY FRANCIS (1888–1915), British soldier and poet, was born in London on March 30, 1888. In 1910 he joined the 1st (Royal) Dragoons and in 1911 was transferred to S. Africa with his regiment. He fought with great courage and distinction in the World War, and died in hospital in Boulogne of a head wound, on May 13, 1915.

Except for his poem "Into Battle," which appeared in the *Times* on the day of the announcement of his death, and which is considered to rank among the finest modern war poems, his poetry is the embodiment of a zest for life and a love of nature. His poems include "To a Black Greyhound," "Hymn to the Fighting Boar," and "The Hills," reprinted in several anthologies.

GRENFELL, SIR WILFRED THOMASON, K.C.M.G., M.D. (1865–1940), British medical missionary, was born on Feb. 28, 1865 at Parkgate, Cheshire. He was educated at Marlborough and Oxford, where he took the degree of M.D., and studied medicine at the London Hospital under Sir Frederick Treves. At his suggestion Grenfell, in 1889, joined the Royal National Mission for Deep Sea Fishermen and for three years cruised with it in the North Sea as medical missionary. In 1892 he went to Labrador as first medical missionary and there did great work, building hospitals, establishing homes and missions for the inhabitants, and organizing industrial schemes. Besides the work he did locally in Labrador and northern Newfoundland, culminating in the opening by King George of the Seamen's institute at St. John's in 1912, Grenfell lectured in Canada, America and England in order to raise funds, and the mission expanded rapidly until, in 1912, its English, American and Canadian branches were united by the formation in New York of the International Grenfell Association, of which Grenfell became superintendent. During the early part of the World War he was attached as major to the Harvard Surgical Unit in France. He was created K.C M.G. in 1927 and retired in 1935

Grenfell's publications include: *Vikings of Today (1895); The Harvest of the Sea* (1905); *Labrador: the Country and its People* (1909, re-issued 1913 and 1922); *Adrift on an Ice-Pan* (1910); *A Labrador Doctor* (1919, abridged 1925); *Northern Neighbours* (1923); *Religion in Everyday Life* (1926); *The Romance of Labrador* (1934).

See B. J. Mathews, *Wilfred Grenfell, the Master Mariner* (1924) and *F.* L. Waldo, *Grenfell: Knight-Errant* of *the North* (Phila., 1924).

GRENOBLE, the ancient capital of the Dauphin6 in south-east France, now of the Isilre department, 75 mi. by rail from Lyons. Pop. (1936) 95,806. It is one of the most strongly fortified cities in Europe. Built at a height of 702 ft. the greater part of the town rises on the left bank of the Isère. The newer part has wide thoroughfares and modern buildings. The original town (of but small extent) was built on the right bank of the Isilre at the southern foot of the Mont Rachais, which is now covered by a succession of fortresses 885 ft. above the town.

Grenoble is the seat of a bishopric, founded in the 4th century. It was formerly a suffragan of Vienne and is now in the ecclesiastical province of Lyons. The most remarkable building is the late 15th century Palais de Justice, on the site of the old palace of the Parlement of the Dauphiné. Opposite is the church of St. André (13th century), formerly the chapel of the dauphins of the Viennois. The cathedral church of Notre Dame is a building dating in part from the 11th century. The church of St. Laurent is the oldest in the city (11th century) and has a crypt dating from Merovingian times. The town library has a rich collection of mss. (7,000) and printed books (250,000 vols.) which in great part belonged till 1793 to the monastery of the Grande Chartreuse. There is a natural history museum which contains numerous geological specimens from the districts of the Dauphin6 and Savoy. The university and a hospital founded

in the 15th century are notable institutions. There is also a radio broadcasting station.

The staple industry is the manufacture of kid gloves, most of the so-called *gants Jouvin* being made there. There are about 80 glove factories.

Other articles produced are artificial cements, liqueurs, linen goods, copper goods, paper peltry, leather goods, oriental goods, straw hats and carved furniture.

Grenoble occupies the site of Cularo, a village of the Allobroges, fortified by Diocletian and Maximian at the end of the 3rd century. Its present name is a corruption of Gratianopolis, in honour of Gratian (4th century). After passing under the power of the Burgundians (c. 440) and the Franks (532) it became part of the kingdom of Provence (879–1032). On the break-up of that kingdom a long struggle for supremacy ensued between the bishops of the city and the counts of Albon, the latter winning in the 12th century, taking the title of Dauphins of the Viennois in the 13th century. In 1349 Grenoble was ceded with the rest of the Dauphiné to France, but retained its municipal privileges. In 1562 it was sacked by the Protestants. hut in 1572 the firmness of its governor saved it from a repetition of the Massacre of St. Bartholomew. In 1590 Lesdiguières (1543–1626) took the town in the name of Henry IV and constructed its fortifications. quays, etc. In 1788 the attempt of the king to weaken the power of the parlement of Grenoble roused the people to arms, and the "day of the tiles" (June 7, 1788) is memorable for the defeat of the royal forces. In 1790, on the formation of the department of the Isère, Grenoble became its capital. Grenoble was formerly much subject to floods, especially from the Drac. One of the worst took place in 1219, while that of 1778 was known as the *déluge* de la Saint *Crépin.* In World War II, Grenoble was occupied by the Italians in Nov. 1942, when, after the landing of the allied troops in North Africa, the total axis occupation of metropolitan France took place. After the Italian surrender to the allies (Sept. 1943), the town mas taken over by the Germans.

GRENVILLE, SIR BEVIL (1596–1643), Royalist soldier in the English Civil War (see GREAT REBELLION), was educated at Exeter college, Oxford. As member of Parliament, first for Cornwall, then for Launceston, Grenville supported Sir John Eliot and the opposition, and his intimacy with Eliot was lifelong. In 1639, however, he appears as a royalist going to the Scottish War in the train of Charles I. The reasons for this change of front are unknown. At any rate he was a very valuable recruit to the royalist cause, being "the most generally loved man in Cornwall." Sir Bevil fought at Bradock Down and was killed at the head of the Cornish infantry on July 5, 1643, at Lansdowne, near Bath, where a monument to him has been erected.

See Lloyd, *Memoirs of Excellent Personages (1668)*; S. R. Gardiner, *History of the English Civil War* (vol. i. *passim).*

GRENVILLE, GEORGE (1712–70), English statesman, second son of' Richard Grenville and Hester Temple, afterwards Countess Temple, was born on Oct. 14, 1712, educated at Eton and at Christ Church, Oxford, and called to the bar in 1735. He entered parliament in 1741 as member for Buckingham, and continued to represent that borough till his death. In December 1744 he became a lord of the admiralty in the Pelham administration. He allied himself with his brother Richard and with William Pitt in forcing their chief to give them promotion by obstructing business. In June 1747 he became a lord of the treasury, and in 1754 treasurer of the navy and privy councillor. As treasurer of the navy in 1758 he introduced and carried a bill which established an improved system of paying the wages of seamen. He remained in office in 1761, when his brother Lord Temple and his brother-in-law Pitt resigned upon the question of the war with Spain, and was leader of the House of Commons under the Bute administration. In May 1762 he was appointed secretary of state, and in October first lord of the admiralty; and in April 1763 he became first lord of the treasury and chancellor of the exchequer. His administration saw the prosecution of Wilkes and the passing of the American Stamp act, which led to the first symptoms of alienation between America and the mother country. Grenville was disliked by George III., and when the marquis of Rockingham was induced to form a ministry in July 1765, he was dismissed. He never again held office, and died on Nov. 13, 1770.

BIBLIOGRAPHY. — *The Grenville Papers, being the Correspondence of Richard Grenville, Earl Temple, K.G., and the Right Hon George Grenville, their Friends and Contemporaries,* were published at London in 1852, and afford the chief authority for his life. But *see* also H. Walpole's *Memoirs of the Rezgn of George II.* (1845); Lord Stanhope's *History of England* (1858); Lecky's *History of England* (1885); and E. D. Adams, *The Influence of Grenville on Pitt's Foreign Policy* (Washington, 1904).

GRENVILLE or **GREYNVILE, SIR RICHARD** (*c.* 1541–1591), British naval commander, was born of an old Cornish family about 1541. His grandfather, Sir Richard, had been marshal of Calais in the time of Henry VIII., and his father commanded and was lost in the "Mary Rose" in 1545. In 1585 he commanded for his cousin, Sir Walter Raleigh, the fleet of seven vessels carrying colonists to Roanoke island in the present North Carolina, and captured a Spanish vessel on his way back. In 1586 he carried provisions to Roanoke, and, finding the colony deserted, left a few men to maintain possession. During the two years before the Armada (1588) he was engaged in organizing the defence of western England. In 1591, Lord Thomas Howard was sent to intercept the homeward-bound treasure-fleet of Spain, with Grenville as second in command on board the "Revenge," a ship of 500 tons which had been commanded by Drake against the Armada in 1588. At the end of August, Howard with 16 ships lay at anchor to the north of Flores in the Azores. On the 31st he received news from a pinnace, sent by the earl of Cumberland, who was then off the Portugal coast, that a Spanish fleet of 53 vessels was then bearing up to the Azores to meet the treasure-ships. Being hopelessly outmatched, Howard gave orders to weigh anchor and stand out to sea. But, by some misunderstanding, the "Revenge" was delayed, and cut off from her consorts by the Spaniards. Grenville resolved to try to break through the middle of the Spanish line. His ship was becalmed under the lee of a huge galleon, and after a hand-to-hand fight lasting through fifteen hours against fifteen Spanish ships and a force of five thousand men, the "Revenge" with her hundred and fifty men was captured. Grenville himself was carried on board the Spanish flag-ship "San Pablo," and died a few days later. His exploit is commemorated in Tennyson's ballad of "The Revenge."

GRENVILLE (or **GRANVILLE), SIR RICHARD,** BART., cr. 1630 (1600–1658), English Royalist, grandson of the famous seaman of the same name, entered the army, and served under Buckingham at Cadiz and in the La Rochelle expedition. He was ruined by lawsuits with his wife and her relations, and imprisoned. He escaped to Germany, returning to England to join the king's army against the Scots in 1633. From 1641 to 1643 he served in Ireland, but on his return to England was re-arrested and forced to join the Parliamentary army. But he joined Charles at Oxford and served in the west of England. Many charges of abuse of power, misappropriation of war funds and insubordination (especially to Goring and Hopton) were made against him, and in Jan. 1646 he was arrested. He then went to Holland, and was with Charles II. in exile until he had to leave the court after bringing accusations against Edward Hyde, afterwards earl of Clarendon. He died in 1658 and was buried at Ghent.

Grenville wrote a partisan account of affairs in the west of England —printed in T. Carte's *Original Letters* (1739)—to which Clarendon drew up an answer, the bulk being afterwards incorporated in his *History.* In 1654 Grenville wrote his *Single Defence against all Aspersions of all Malignant Persons.* This is printed in the *Works* of George Granville, Lord Lansdowne (1736), where Lansdowne's *Vindication* of his kinsman, Sir Richard, against Clarendon's charges is also found. *See* also Clarendon, *History of the Rebellion,* edit. by W. D. Macray (Oxford, 1888); and R. Granville, *The King's General in the West* (1908).

GRENVILLE, THOMAS (1755–1846), English bibliophile, was born on Dec. 31, 1755. He was, with one interval, a member of parliament from 1780 to 1818, and for a few months during 1806 and 1807 president of the board of control and first lord of the admiralty. He is more famous as a book-collector than

as a statesman; he bequeathed his large and valuable library to the British Museum, where it is still preserved under his name.

He died in London on Dec. 17, **1846.**

A catalogue of the Grenville library was published by H. J. Payne and H. Foss, *Bibliotheca Grenvilliana* (3 vols., 1842–48).

GRENVILLE, WILLIAM WYNDHAM GRENVILLE, BARON (1759–1834), English statesman, youngest son of George Grenville, was born on Oct. 2j, 1759, and educated at Eton and Christ Church, Oxford. In Feb. 1782 Grenville was elected member for the borough of Buckingham, and in the following September he became secretary to his brother, Earl Temple, lord lieutenant of Ireland. He left office in June 1783, but in December he became paymaster-general of the forces under William Pitt, and in **1786** vice-president of the committee of trade. In **1787** he was sent on a mission to The Hague and Versailles with reference to the affairs of Holland. In Jan. **1789** he was chosen speaker of the House of Commons, but vacated the chair in the same year on being appointed secretary of State for the home department; about the same time he resigned his other offices, but he became president of the board of control, and in November 1790 was created a peer as Baron Grenville. In 1791 he was transferred to the foreign office, retaining his post at the board of control until 1793. Although his ability was appreciated by Pitt, the two often differed on important matters. In Feb. 1801 he resigned office with Pitt because George III. would not consent to the introduction of any measure of Roman Catholic relief, and in opposition he gradually separated himself from his former leader. When Pitt returned to power in **1804** Grenville refused to join the ministry unless his political ally, Fox, was also admitted thereto; this was impossible and he remained out of office until Feb. 1806, when, after Pitt's death, he became the nominal head of a coalition Government. Though unfortunate in its conduct of foreign affairs, this ministry deserves to be remembered for its passage of the act abolishing the slave trade **(1807).** Its influence, however, was weakened by the death of For, and in consequence of a minute drawn up by Grenville and some of his colleagues the king demanded from his ministers an assurance that in future they would not urge upon him any measures for the relief of Roman Catholics. They refused to give this assurance and in March 1807 they resigned

Lord Grenville never held office again, although requested to do so on several occasions. He continued to take part in public life, supported Roman Catholic emancipation, and, during the remaining years of his active political career, which ended in **1823,** he generally voted with the Whigs. He died on Jan. 12, **1834.**

See the *Dropmore MSS.* for Grenville's correspondence, and the report on this publication by the Historical Manuscripts Commission.

GRENZMARK (Grenzmark Posen-West Preussen), Germany, an administrative district (*Regierungsbezirk*) of the Prussian province of Pomerania. From 1919 to 1939 it comprised what remained to Germany of the former provinces of Posen and West Prussia, with an area of 2,991 sq.mi. and a population in 1925 of 136,919. After Hitler's conquest of Poland in 1939, it was extended to include the former lands of Germany; Polish families were deported, and their houses and farms given to German-speaking settlers, many of whom were uprooted in the Baltic provinces and "brought home to the reich." The area of the enlarged Grenzmark was 4,421 sq.mi., and the population (1939) 478,521. The district is a low plateau, highest in the north. covered with glacial and related deposits, and dotted with small lakes. It is agricultural and pastoral. the chief crops being cereals and potatoes, and the industries are brewing and the manufacture of agricultural machinery and starch. A little tobacco is grown and manufactured, while there is some trade in timber and leather.

GRESHAM, SIR THOMAS (1519–1579), London merchant, the founder of the Royal Exchange, was descended from an old Norfolk family, and was the son of Sir Richard Gresham, a London merchant knighted by Henry VIII. He went to Caius college, Cambridge, and was apprenticed for eight years to his uncle. Sir John Gresham. In 1543 he was admitted a member of the Mercers' Company, and went to the Low Countries, where he lived for some years, carrying on business and acting as an agent for Henry VIII. In 1551 owing to the mismanagement of Sir William Dansell, "king's merchant," Gresham was called in to advise the English Government. He was allowed to apply his own methods, many of them quite arbitrary and unfair, for raising the value of the pound sterling on the "bourse" of Antwerp, and in a few years nearly all Edward VI.'s debts were discharged. Except for a short period during Mary's reign, he remained financial agent of the crown until he was obliged to leave Antwerp on March **19, 1567,** on the outbreak of the war in the Low Countries. He was at the time on embassy to the duchess of Parma at Brussels. He continued his business as merchant and financial agent of the Government, though living in London. Elizabeth kept Lady Mary Grey a prisoner in his house from June **1569** to the end of 1572.

In **1565** Gresham proposed to the court of aldermen of London to build at his own expense a bourse of exchange, if they would purchase a suitable piece of ground. He reimbursed himself by letting out the upper part of the building as shops. He died on Nov. **21,** 1579. The bulk of his property was bequeathed to his widow with the stipulation that after her decease his residence in Bishopsgate street, and the rents accruing from the Royal Exchange should be vested in the hands of the corporation of London and the Mercers' Company for the purpose of instituting a college in which seven professors should lecture on astronomy, geometry, physic, law, divinity, rhetoric and music. The lectures were given in the original building from **1597** until **1768** when it was converted into an excise office. The Royal Exchange was then used for them until the present building was erected in **1843.**

A notice of Gresham is contained in Fuller's *Worthies* and Ward's *Gresham Professors;* but the fullest account of him, as well as of the history of the Exchange and Gresham College is that by J. M. Burgon in his *Life and Times of Sir Thomas Gresham* (2 vols., 1839). *See* also a *Brief Memoir of Sir Thomas Gresham* (1833); *The Life of Sir Thomas Gresham, Founder of the Royal Exchange* (1845); and F. R. Salter, *Sir Thomas Gresham, 1518–1579* (1925).

GRESHAM, WALTER QUINTON (1832–1895), American statesman and jurist, was born near Lanesville, Ind., on March 17, **1832.** He spent two years in an academy at Corydon, Ind., and one year at the Indiana State university at Bloomington, then studied law, and in **1854** was admitted to the bar. He was active as a campaign speaker for the republican ticket in 1856, and in **1860** was elected to the Indiana house of representatives. In **1861** he became colonel of volunteer infantry; in **1862** he commanded a brigade, and in **1863** he was appointed brigadier-general of volunteers. In **1864** he commanded a division in Sherman's Atlanta campaign, and before Atlanta, on July 20, he received a wound which forced him to retire from active service, and left him lame for life. In **1865** he was breveted major-general of volunteers. After the war he practised law at New Albany, Ind., and in **1869** was appointed by President Grant U.S. district judge for Indiana. In April, **1883.** he succeeded Timothy O. Howe (1816–83) as postmaster-general in President Arthur's cabinet, taking an active part in the suppression of the Louisiana lottery, and in Sept. **1884,** succeeded Charles **J.** Folger as secretary of the treasury. In the following month he resigned to accept an appointment as U.S. circuit judge. Gresham was a candidate for the republican presidential nomination in **1884** and **1888.** Gradually, however, he grew out of sympathy with the republican leaders and policy, and in **1892** advocated the election of the democratic candidate, Grover Cleveland, for the presidency. From March **7, 1893,** until his death at Washington on May **28,** 1895, he was secretary of State in President Cleveland's cabinet.

GRESHAM'S LAW, in economics, the name suggested in 1857 by H. D. Macleod for the principle of currency which may be briefly summarized — "bad money drives out good." Macleod gave it this name, which has been universally adopted, under the impression that the principle was first explained by Sir Thomas Gresham in 1558. In reality it had been well set forth by earlier economic writers, notably Oresme and Copernicus. Macleod states the law in these terms: the worst form of currency in circulation regulates the value of the whole currency and drives all other forms of currency out of circulation. Gresham's law applies

where there is under-weight or debased coin in circulation with full-weight coin of the same metal; where there are two metals in circulation, and one is undervalued as compared with the other, and where inconvertible paper money is put into circulation side by side with a metallic currency. *See* further BIMETALLISM; MONEY.

GRESSET, JEAN BAPTISTE LOUIS (1709–1777), French poet and dramatist, was born at Amiens. His poem *Vert Vert* (1734) is his main title to fame, though in his later years he regretted the frivolity which enabled him to produce this delightful work. Gresset, who had taken novice's orders in the Society of Jesus at 16, found himself famous. He left Rouen, went up to Paris, where he found refuge in the same garret which had sheltered him when a boy at the Collège Louis le Grand, and there wrote *La Chartreuse* (1734), *Carême impromptu,* and *Lutrin vivant* (1735). Complaints were made to the Jesuit fathers of the alleged licentiousness of his verses, the real cause of complaint being the ridicule which *Vert Vert* seemed to throw upon the whole race of nuns and the anti-clerical tendency of the other poems. Gresset was expelled the order. He wrote for the theatre *Edouard III,* a tragedy (1740); *Sidnei* (1745), a comedy; and *Le Méchant* (1747), esteemed by Brunetière the best verse comedy of the French 18th century theatre, not excepting even the *Métromanie* of Alexis Piron. Gresset was admitted to the Academy in 1748. Then, still young, he retired to Amiens, where his relapse from the discipline of the church became the subject of the deepest remorse. He died at Amiens on June 16, 1777.

The best edition of his poems is A. A. Rénouard's (1811). *See* Jules Wogue, *J. B. L. Gresset* (1894).

GRETCHANINOV, ALEXANDER TIKHONOVICH (1864–), Russian composer, was born in Moscow on Oct. 26, 1864. He was first a pupil of Safonov at Moscow conservatorium and afterwards entered Petersburg conservatorium, where he studied theory and composition under Rimsky-Korsakov. He is known principally as a composer of songs but has also written two operas, *Dobrinya Nikitich* and *Sister Beatrice;* incidental music to plays; a string quartet and an unpublished symphony. His opera *Sister Beatrice* gave offence by its representation of the Virgin and had to be withdrawn. His vocal music includes: Songs, opp. 1, 5, 7, 15, 20; "musical picture" for bass solo, chorus and orch.; and 12 choruses, opp. 4, 10, 11, 12, 16.

GRETNA, a city of southeastern Louisiana, U.S.A., on the Mississippi river, opposite New Orleans; the capital of Jefferson parish. It is served by the Missouri Pacific, the Southern Pacific, and the Texas and Pacific railways, and by the industrial belt line which makes connections among all the roads entering New Orleans. The population was 7,197 in 1920 (27% Negro) and was 10,879 in 1940 by the federal census. There are large oil refineries and other industrial plants. The city was incorporated in 1913.

GRETNA GREEN, village and parish, southeast Dumfriesshire, Scotland, about 8 m. E. of Annan, 9 m. N.N.W. of Carlisle, and ¾ m. from the river Sark, here the dividing-line between England and Scotland, with a station on the L.M.S.R. The L.N.E.R. has a station at Gretna on the English side of the Border. Up till 1754, when Lord Hardwicke's act abolishing clandestine marriages came into force, the ceremony had commonly been performed in the Fleet prison in London. After that date runaway couples were compelled to seek the hospitality of Scotland where it sufficed for them to declare their wish to marry in the presence of witnesses. At Gretna Green, the Scottish border-village, the ceremony was usually performed by the blacksmith, but the tollkeeper, ferryman or in fact any person might officiate, and the toll-house, the inn, or, after 1826, Gretna hall was the scene of many such weddings. As many as 200 couples were married at the toll-house in a year. The traffic was practically ended in 1856, when the law required one of the contracting parties to reside in Scotland three weeks previous to the event.

During the World War a temporary manufacturing township for the provision of cordite was created on a tract of land some 10 m. long and from 1 to 2 m. wide, with Gretna Green in its centre. The buildings fell largely into two groups, one at Dornoch to the W., and one, about 7 m. E., at Mossband and Longtown. The whole undertaking cost over £9,000,000, and employed at one time 24,700 persons. It was sold in 1924, although Labour members of Parliament made efforts to secure its use as a national peace-time factory. Pop. of Gretna civil parish (1931) 2,857.

GRÉTRY, ANDRÉ ERNEST MODESTE (1741–1813), Belgian operatic composer, was born at Liége on Feb. 8, 1741, his father being a poor musician. He was a choir boy at the church of St. Denis. In 1753 he became a pupil of Leclerc and later of Renekin and Moreau. But of greater importance was the practical tuition he received by attending the performance of an Italian opera company. Here he heard the operas of Galuppi, Pergolesi and other masters, and determined to complete his own studies in Italy. He spent five years at the Collège de Liége at Rome, where he worked under Casali. He made his first success in *La Vendemmiatrice,* an Italian intermezzo or operetta, composed for the Aliberti theatre in Rome. Study of the score of one of Monsigny's operas, decided Grétry to devote himself to French comic opera and he returned to Paris with this intention, though at first he had a hard struggle. Then he had the good luck to obtain a libretto (*Le Huron*), from Marmontel, which he set to music in less than six weeks; the performance of the work in August 1768 met with unparalleled success. Two other operas, *Lucile* and *Le Tableau parlant,* soon followed, and thenceforth Grétry's position as the leading composer of comic opera was safely established. Altogether he composed some fifty operas. His masterpieces are *Zémire et Azor* (1771), *L'Amant jaloux* (1778), *L'Épreuve villageoise* (1784), and *Richard Coeur de Lion* (1784). In the last-named occurs the famous song, *O Richard, ô mon roi, l'univers t'abandonne,* which was sung at the banquet—"fatal as that of Thyestes," remarks Carlyle—given by the bodyguard to the officers of the Versailles garrison on October 3, 1789. Grétry was not uninfluenced by the great events he witnessed, but *La Rosière républicaine* and *La Fête de la raison* have none of the sincerity of *Richard Coeur de Lion.* He died on Sept. 24, 1813.

See Michael Brenet, *Vie de Grétry* (Paris, 1884); Joach. le Breton, *Notice historique sur la vie et les ouvrages de Grétry* (Paris, 1814); A. Grétry (his nephew), *Grétry en famille* (Paris, 1814); Felix van Hulst, *Grétry* (Liége, 1842); L. D. S., *Notice biographique sur Grétry* (Bruxelles, 1869). A full bibliography of Grétry's works is given in the art. by L. de la Laurencie in the *Encyclopédie de la Musique et Dictionnaire du Conseuvatoire: France XVII^e and XVIII^e Siècles.* The works themselves, both musical and literary, have been published complete in a carefully prepared edition issued at the instance of the Belgian Government.

GREUZE, JEAN BAPTISTE (1725–1805), French painter, was born at Tournus, in Burgundy, on Aug. 21, 1725, and is generally said to have formed his own talent; this is, however, true only in the most limited sense, for at an early age his inclinations, though thwarted by his father, were encouraged by a Lyonnese artist named Grandon, who enjoyed during his lifetime considerable reputation as a portrait-painter. Grandon not only persuaded the father of Greuze to give way to his son's wishes, and permit the lad to accompany him as his pupil to Lyons, but, when at a later date he himself left Lyons for Paris he carried young Greuze with him. Settled in Paris, Greuze worked from the living model in the school of the Royal Academy, but did not attract the attention of his teachers; and when he produced his first picture, "Le Père de famille expliquant la Bible à ses enfants," considerable doubt was felt and shown as to his share in its production. By other and more remarkable works of the same class Greuze soon established his claims beyond contest, and won for himself the notice and support of the well-known connoisseur La Live de Jully, the brother-in-law of Madame d'Épinay. In 1755 Greuze exhibited his "Aveugle trompé," upon which, presented by Pigalle the sculptor, he was immediately *agréé* by the Academy. Towards the close of the same year he left France for Italy, probably in order to silence those who taxed him with ignorance of "great models of style," but the Italian subjects which formed the entirety of his contributions to the Salon of 1757 showed that he had been put on a false track, and he speedily returned to the source of his first inspiration. In 1759, 1761 ("L'Accordée de village"—Louvre), and 1763 Greuze exhibited with ever-increasing success; in 1765

he reached the zenith of his powers and reputation. In that year he was represented by no fewer than 13 works, amongst which may be cited "La Jeune Fille qui pleure son oiseau mort," "La Bonne Mère," "Le Mauvais fils puni" (Louvre) and "La Malédiction paternelle" (Louvre). The Academy took occasion to press Greuze for his diploma picture, the execution of which had been long delayed, and forbade him to exhibit on their walls until he had complied with their regulations. *"J'ai vu la lettre,"* says Diderot, *"qui est un modèle d'honnêteté et d'estime; j'ai vu la réponse de Greuze, qui est un modkle de vanité et d'impertinence: il fallait appuyer cela d'un chef d'oeuvre, et c'est ce que Greuze n'a pas fait."* Greuze wished to be received as a historical painter, and produced a work to vindicate his right to despise his qualifications as a *peintre de genre.* This unfortunate canvas—"Sevère et Caracalla" (Louvre)—was exhibited in 1769 side by side with Greuze's portrait of Jeaurat (Louvre) and his admirable "Petite Fille au chien noir." The Academicians received their new member with all due honours, but at the close of the ceremonies the director addressed Greuze in these *words—"Monsieur, l'Académie vous a reçu, mais c'est comme peintre de genre; elle a eu égard à vos anciennes productions, qui sont excellentes, et elle a fermé les yeux sur celle-ci, qui n'est digne ni d'elle ni de vous."* Greuze, greatly incensed, quarrelled with his *confrères,* and ceased to exhibit until, in 1804, the revolution had thrown open the doors of the Academy to all the world. In the following year, on March 4, 1805, he died in the Louvre in great poverty.

The brilliant reputation which Greuze acquired seems to have been due to the nature of his subjects. He gave expression in art to that return to nature which inspired Rousseau's attacks upon an artificial civilization. The touch of melodramatic exaggeration in his work finds an apology in the firm and brilliant play of line, in the freshness and vigour of the flesh tints, in the enticing softness of expression (often obtained by almost an abuse of *méplats*), by the alluring air of health and youth, by the sensuous attractions, in short, with which Greuze invests his lessons of bourgeois morality. As Diderot said of "La Bonne Mère," *"ca prêche la population."* One of Greuze's pupils, Madame Le Doux, imitated with success the manner of her master; his daughter and granddaughter, Madame de Valori, also inherited some traditions of his talent. Madame de Valori published in 1813 a comédie-vaudeville, *Greuze, ou l'accordée de village,* to which she prefixed a notice of her grandfather's life and works, and the *Salons* of Diderot also contain, besides many other particulars, the story at full length of Greuze's quarrel with the Academy. Four of the most distinguished engravers of that date, Massard père, Flipart, Gaillard and Levasseur, were specially entrusted by Greuze with the reproduction of his subjects, but there are also excellent prints by other engravers, notably by Cars and Le Bas.

GREVILLE, CHARLES CAVENDISH FULKE (1794–1865), diarist, a great-great-grandson through his father of the 5th Baron Brooke, and son of Lady Charlotte Bentinck, daughter of the 3rd Duke of Portland, formerly a leader of the Whig party, and first minister of the Crown, was born on April 2, 1794. Much of his childhood was spent at his grandfather's house at Bulstrode. He was one of the pages of George III., and was educated at Eton and at Christ Church, Oxford; but he left the university early, having been appointed private secretary to Earl Bathurst before he was 20. The interest of the duke of Portland had secured for him the secretaryship of the island of Jamaica, which was a sinecure office, the duties being performed by a deputy, and the reversion of the clerkship of the council. Greville entered upon the discharge of the duties of clerk of the council in ordinary in 1821, and continued to perform them for nearly 40 years. He therefore served under three successive sovereigns,—George IV., William IV. and Victoria,—and although no political or confidential functions are attached to that office, it is one which brings a man into habitual intercourse with the chiefs of all the parties in the State.

Greville took an occasional part in the transactions of his day, and was much consulted in the affairs of private life. Until 1855 when he sold his stud he was an active member of the turf, and he trained successively with Lord George Bentinck and with the duke of Portland. His fame is entirely due to the posthumous publication of a portion of a Journal or Diary which it was his practice to keep during the greater part of his life. These papers were given by him to his friend Henry Reeve a short time before his death (Jan. 18, 1865), with an injunction that they should be published, as far as was feasible, at not too remote a period after the writer's death. The journals of the reigns of George IV. and William IV. (extending from 1820 to 1837) were accordingly so published in obedience to his directions about ten years after that event. Five large editions were sold in little more than a year, and the demand in America was as great as in England. These journals were a faithful record of the impressions made on the mind of a competent observer, at the time, by the events he witnessed and the persons with whom he associated.

Greville records not so much public events as the private causes which led to them; and perhaps no English memoir-writer has left behind him a more valuable contribution to the history of the 19th century. Greville published anonymously, in 1845, a volume on the *Past and Present Policy of England to Ireland,* in which he advocated the payment of the Roman Catholic clergy; and he was also the author of several pamphlets on the events of his day.

His brother, HENRY GREVILLE (1801–1872), attach6 to the British embassy in Paris from 1834 to 1844, also kept a diary, of which part was published by Viscountess Enfield, *Leaves from the Diary of Henry Greville* (1883–84).

See the preface and notes to the ***Greville Memoirs*** by Henry Reeve. The memoirs appeared in three sets—one from 1817 to 1837 (1875, 3 vols.), and two for the period from 1837 to 1860, three volumes in 1885 and two in 1887. When the first series appeared in 1875 some passages caused extreme offence. The copies issued were as far as possible recalled and passages suppressed. A new edition, containing some hitherto unpublished material from the ms. was prepared by P. W. Wilson in 1927.

GREVIN, JACQUES (*c.* 1539–1570), French dramatist, was born at Clermont and studied medicine at the University of Paris. He became a disciple of Ronsard, and was one of the band of dramatists who sought to introduce the classical drama in France. The comedies of Grévin show considerable affinity with the farces and *soties* that preceded them. His first play, *La Maubertine,* was lost, and formed the basis of a new comedy, *La Trésorière,* first performed at the college of Beauvais in 1558, though it had been originally composed at the desire of Henry II. to celebrate the marriage of Claude, duchess of Lorraine. In 1560 followed the tragedy of *Jules César,* imitated from the Latin of Muret, and a comedy, *Les Ebahis,* the most important but also the most indecent of his works. Grévin became in 1561 physician and counsellor to Margaret of Savoy, and died at her court in Turin in 1570.

The *Théâtre* of Jacques Grévin was printed in 1562, and in the ***Ancien Théâtre français,*** vol. iv. (1855–56). ***See*** L. Pinvert, *Jacques Grévin* (1899).

GREVY, FRANÇOIS PAUL JULES (1807–1891), French statesman, president of the republic, was born at Mont-sous-Vaudrey, Jura, on Aug. 1j, 1807. An advocate by profession, and a strong republican, he was deputy for Jura to the constituent assembly (1848). Foreseeing the election of Louis Bonaparte as president, he proposed to vest the executive power in the president of the council, elected and removable by the assembly, *ie.*, the suppression of the office of president of the republic. He was, consequently, excluded from public life until 1868, when he took a prominent place in the Republican Party. Grévy was president of the national assembly (Feb. 16, 1871, to April 2, 1873), president of the chamber of deputies (1876–79), and on the resignation of Marshal MacMahon, president of the republic (Jan. 30. 1879). He was an excellent president, but, unfortunately, after accepting (Dec. 18, 1885) a second term of office, a serious scandal arose by the exposure of the traffic in the decorations of the Legion of Honour carried on by his son-in-law, Daniel Wilson

Grévy was not directly implicated, and did not fully realize his situation. Resignation was forced on him (Dec. 2, **1887**). He died at his native place on Sept. **9**, 1891.

See his *Discours politiques et judiciaires* (2 vols., 1888), edit. L. Delabrousse. Also A. Barbou, *Jules Grévy* (1879); and E. Zevort, *La présidence de Jules Grévy* (1898).

GREW, NEHEMIAH (1641–1712), English plant anatomist and physiologist, son of Obadiah Grew (1607–1688), Nonconformist vicar of St. Michael's, Coventry, was born in Warwickshire. He graduated at Cambridge in **1661**, and took his M.D. at Leyden in **1671**. He then settled in London as a practitioner. In **1672** he published his *Anatomy of Vegetables Begun* and in **1673** his *Idea of* a *Phytological History*. Four years later he became secretary of the Royal Society. In **1682** appeared his famous *Anatomy of Plants* with seven appended papers on chemistry. Grew died in London on March **25**, 1712.

See L. C. Miall, *The Early Naturalists* (1912).

GREY, ALBERT HENRY GEORGE, 4TH EARL (1851–1917), British administrator, the son of General Charles Grey, Queen Victoria's private secretary, and grandson of the 2nd earl, the prime minister, was born on Nov. 28, 1851; he was educated at Harrow and at Trinity college, Cambridge, where he graduated with a first class in law and history in **1873**. As his uncle, the 3rd earl, had no children, Albert Grey was the heir-presumptive to the earldom. He sat in parliament as a Liberal, first for South Northumberland, and then for the Tyneside Division, from 1880 to **1886**. He was an enthusiastic social reformer, and a wholehearted imperialist. He was one of the **93** dissentient Liberals who by voting against the Liberal Government decided the fate of the Home Rule bill of **1886**. He lost his seat in the ensuing general election and did not reappear in parliament till he succeeded his uncle in the earldom in **1894**. The interval had been largely filled with travel—chiefly along the by-ways of the British empire. He was appointed in **1895**, after the Jameson raid, administrator of Rhodesia in succession to Dr. Jameson. There he became a close friend and ardent admirer of Cecil Rhodes, and on returning to England, he joined, in **1899**, the board of the Chartered Company.

He went as governor-general to Canada in 1904, and his term of office was twice prolonged, until Oct. **1911**. After his return to public life in England, he devoted himself to propaganda in favour of imperial federation and proportional representation. He showed much interest in agriculture and endeavoured to assist licensing reform by the foundation of the Public House Trust. He died at Howick, Northumberland, on Aug. **29**, 1917, leaving, by his wife Alice Holford, a son who succeeded him in the earldom.

See Harold Beebie, *Albert, fourth Earl Grey,* **a** *last word* (1917).

GREY, CHARLES GREY, 2ND EARL (1764–1845), English statesman, eldest surviving son of General Sir Charles Grey, afterwards 1st Earl Grey, was born at Fallodon, near Alnwick, on March 13, **1764**. General Grey (1729–180**j**), who was a younger son of the house of Grey of Howick, had already begun a career of active service which, like the political career of his son, covered nearly half a century. At the peace of Amiens, he was rewarded with a peerage, as Baron Grey of Alnwick, being created in **1806** Earl Grey and Viscount Howick. His elder brother, Sir Henry Grey of Howick, the head of the family, had supported the government in parliament.

Young Grey was returned for Northumberland in **1786**, and came forward as a vigorous assailant of the government of Pitt. He was hailed by the opposition, and associated with Fox, Burke and Sheridan as a manager in the Hastings impeachment. Grey became the trusted lieutenant of Fox, whom he was destined to succeed in the leadership of the party. As time went on, some differences arose between the two men on the conduct of the war, but there was never any open breach, and their personal relations remained those of close friendship. Grey was a pioneer of parliamentary reform. He joined the "Society of Friends of the People" for promoting the reform of the franchise, he presented their petition to parliament, and in 1793 he moved the reference of this petition to a parliamentary committee. Fox did nothing to discourage this activity, but he did not support it. At a later date Grey passed some rather bitter criticism on the "Society." But at the time he had no doubts on the opportuneness of the agitation. But Pitt suppressed the movement with a strong hand. Grey moved the impeachment of Pitt, and he next promoted the equally foolish "Secession." Since the parliament did not properly represent the nation, and refused to reform itself or to impeach the minister, the opposition announced their intention of "seceding," or systematically absenting themselves from parliament. This movement was originated by Grey, Lauderdale and the duke of Bedford. Pitt easily defeated the secession manoeuvre, and Grey himself reappeared to protest against the Act of Union with Ireland, moved by his interest in Irish affairs.

When Pitt died in 1806 the All the Talents ministry was formed under Grenville, with Fox foreign secretary and Grey, now Lord Howick, first Lord of the Admiralty. On Fox's death Grey became foreign secretary, and leader of the House of Commons. When the cabinet proposed to concede a portion of the Catholic claims. George demanded of them an undertaking never to propose similar measures again. This was refused, and the Grenville-Grey cabinet retired in March 1807. In the same year Grey's father died, and Grey went to the Upper House. Opposition united Grey and Grenville for a time, but the parties finally split on foreign policy. When Napoleon returned from Elba in **1815**, Grenville followed the traditions of Pitt, and supported the ministry in at once renewing hostilities. Grey followed those of Fox, and maintained the right of France to choose her own governors, and the impossibility of checking the reaction in the emperor's favour Grenville and Grey gradually drifted apart. Grey was in a small minority in opposing the suspension of the Habeas Corpus Act in **1817**, and the part taken by Grey in opposing the bill for Queen Caroline's divorce, though it won for him the respect of the nation, sealed the exclusion of himself and his few friends from office during the king's life. When in 1827 Grey came forth to denounce the ministry of Canning, he declared that he stood alone in the political world. His words were soon justified, for when Lord Goderich resigned, the remnant which had hitherto supported Grey, hastened to support the ministry of the duke of Wellington.

In 1827 Grey seemed to stand forth the solitary and powerless relic of an extinct party. In **1830** we find that party restored to its old numbers and activity, supreme in parliament, popular in the nation, and Lord Grey at its head. The duke of Wellington's foolish declaration against parliamentary reform suddenly deprived him of the confidence of the country, and a coalition of the Whigs and Canningites became inevitable. Grey was sent for by William IV. on Nov. **16, 1830**, and formed a coalition cabinet, pledged to reform. The question of the place to be offered to the indispensable Brougham nearly wrecked his cabinet-making, but the king in the end consented to Brougham's taking the chancellorship. Grey then appointed a committee of four to study the question and prepare a moderate measure of reform. Grey himself was an old-fashioned Whig, and, when he took office, did not foresee how far he would go in reform. But now, faced with a formidable agitation, he saved the country from revolution by driving through a bold measure of reform. In his youth he had assailed Pitt's administration because Pitt's administration threatened with extinction the political monopoly of that landed interest to which he belonged In his old age, on the contrary, unable to check the progress of the wave, he swam with it, and headed the movement which compelled that landed interest to surrender its monopoly.

The second reading (March 22, **1831**) of the first Reform Bill was carried in the Commons by a majority of one. On April 22 parliament was dissolved. The second reading was carried in the new parliament (July **8**) by a majority of **136**. When the bill had at length passed the Commons after months of debate. it was Grey's task to introduce it to the Lords. It was rejected (Oct. 8) by a majority of 41. Grey had the prudence and courage to remain in office, with the intention of introducing a third Reform Bill in the next session. The last months of **1831** were the beginning of a political crisis such as England had not seen

since 1688. The two extreme parties, the Ultra-Radicals and the Ultra-Tories, were ready for civil war. Between them stood the ministry and the majority of intelligent peace-loving Englishmen. The second reading in the commons was passed in December by a majority of 162. On April 9 Grey moved the second reading in the lords. A sufficient number of the opposition temporized; and the second reading was allowed to pass by a majority of nine. Their intention was to mutilate the bill in committee. On May 7, Lyndhurst secured a motion to postpone certain clauses by a majority of 35 against the government. Grey now reluctantly asked the king, by a unanimous minute from the cabinet, to give authority for the creation of peers to swamp the opposition. He himself disliked the step, but the younger members of his cabinet were insistent. But William IV, at first favourable to reform, was alienated by the violent state of opinion. He rejected the proposal of his ministers, and accepted their resignation, May 9, 1832. The duke of Wellington undertook the hopeless task, in which Peel declined to join, of constructing a ministry which should pass a restricted or sham Reform bill. After a week of the profoundest agitation throughout the country, the king, beaten and mortified, was forced to send for Grey and Brougham. He now angrily and reluctantly yielded to the creation of peers. The threat was sufficient, the necessary number of peers abstained, and the bill became law.

Grey took but little part in directing the legislation of the reformed parliament. Never anxious for power, he had executed the arduous task of 1831–32 rather as a matter of duty than of inclination, and he found an opportunity of retiring over the renewal of the Irish "coercion" bill. It became clear in the discussion on the bill that Lord Althorp, the leader of the house of commons, was privately opposed to retaining those clauses which it was his duty to push through the house. Lord Althorp resigned, and Grey, who was now seventy, resigned also. His voluntary withdrawal enabled Lord Althorp to return to his post and to proceed with the bill in its milder form. Grey was succeeded by Lord Melbourne; but no other change was made in the cabinet.

During most of his remaining years Grey continued to live in retirement at Howick, where he died on July 17, 1845, in his eighty-second year.

See Gen. C. Grey, *Charles 2nd Earl Grey. Some Account of His Life and Opinions* (1861); *Correspondence of Earl Grey and William IV* (2 vols., 1867), ed. Henry, 3rd Earl Grey; Le Strange, *Correspondence of Princess Lieven and Earl Grey 1824–34* (1890); and memoirs of the period; *see* also G. *M.* Trevelyan, *Lord Grey of the Reform Bill* (1920).

GREY, SIR GEORGE (1812–1898), British colonial governor and statesman, only son of Lieutenant-Colonel Grey of the 30th Foot, was born in Lisbon on April 14, 1812, eight days after the death of his father at the storming of Badajoz. He passed through Sandhurst with credit, and received his commission in 1829. His lieutenancy was dated 1833, and his captaincy 1839, in which year he sold out and left the army. In 1836 the Royal Geographical society accepted his offer to explore the northwest region of West Australia, and accordingly he landed at Hanover bay at the end of 1837. The surrounding country he found broken and difficult, and his hardships were aggravated by the tropical heat and his ignorance of the continent. In a skirmish with the natives, in which he was speared near the hip, he showed great courage, and put the assailants to flight, shooting the chief, who had wounded him. After a brave endeavour to continue his journey his wound forced him to retreat to the coast, whence he sailed to Mauritius to recruit. Next year he again essayed exploration, this time on the coast to the north and south of Shark's bay. He had three whale-boats and an ample supply of provisions, but by a series of disasters his stores were spoilt by storms, his boats wrecked in the surf, and the party had to tramp on foot from Gantheaume bay to Perth, where Grey, in the end, walked in alone, so changed by suffering that friends did not know him. In 1839 he was appointed governor-resident at Albany, and during his stay there married Eliza, daughter of Admiral Spencer, and also prepared for publication an account, in two volumes, of his expeditions.

In 1840 he returned to England, to be immediately appointed by Lord John Russell to succeed Colonel Gawler as governor of south Australia. Reaching the colony in May 1841, he found it in the depths of a depression caused by mismanagement and insane land speculation. By rigorously reducing public expenditure, and forcing the settlers to quit the town and betake themselves to tilling their lands, and with the opportune help of valuable copper discoveries, Grey helped the infant colony to emerge from the slough. In 1845, when the little settlements in New Zealand were involved in a native war, he was sent to save them. The Maori chiefs made their submission. The governor gained the veneration of the Maori tribes, in whose welfare he took a close personal interest, and of whose legends and myths he made a valuable and scholarly collection, published in New Zealand in 1855 and reprinted thirty years afterwards. Grey presently became involved in harassing disputes with the colonists, who organized an active agitation for autonomy. In the end a constitution, partly framed by Grey himself, was granted them, and Grey, after eight years of despotic but successful rule, was transferred to Cape Colony.

In south Africa Grey thwarted a formidable Kaffir rebellion in the eastern provinces, and pushed on the work of settlement by bringing out men from the German Legion and providing them with homes. He gained the respect of the British, the confidence of the Boers, the admiration and the trust of the natives. The Dutch of the Free State and the Basuto chose him as arbitrator of their quarrels. When the news of the Indian Mutiny reached Cape Town he strained every nerve to help Lord Canning, despatching men, horses, stores and £60,000 in specie to Bombay. He persuaded a detachment, then on its way round the Cape as a reinforcement for Lord Elgin in China, to divert its voyage to Calcutta. Finally, in 1859, Grey almost reached what would have been the culminating point of his career by federating South Africa. Persuaded by him, the Orange Free State passed resolutions in favour of this great step, and their action was welcomed by Cape Town. But the colonial office disapproved of the change, and when Grey attempted to persevere with it Sir Edward Bulwer Lytton recalled him. A change of ministry during his voyage to England displaced Sir Edward Bulwer Lytton. But though the duke of Newcastle reinstated Grey, it was with instructions to let federation drop.

In 1861 the colonial office sent him as governor to New Zealand, where an inglorious native war in Taranaki had just been succeeded by an armed truce. Grey did his best to avert war, but it came in 1863, and spread from province to province. Ten thousand regulars and as many colonial riflemen were employed to put it down. The imperial troops were badly handled, and Grey, losing patience, became involved in bitter disputes with their commanders. As an example to the former he himself attacked and captured Weraroa, the strongest of the Maori stockades, with a handful of militia, a feat which delighted the colonists, but made him as much disliked at the war office as he now was at Downing street. Moreover, Grey had no longer real control over the islands. New Zealand had become a self-governing colony, and though he vindicated the colonists generally when libellous imputations of cruelty and land-grabbing were freely made against them in London, he crossed swords with his ministers when the latter confiscated 3,000,000 acres of tribal land belonging to the insurgent Maori. Yet a condition of something like tranquillity had been reached in 1867, when he received a curt intimation from the duke of Buckingham that he was about to be superseded. The colonists bade farewell to him in 1868 in an outburst of gratitude and sympathy; but his career as a colonial governor was at an end. Returning to England, he delivered many able speeches advocating what later came to be termed Imperialism, and stood for Newark.

Discouraged, however, by the official Liberals, he withdrew and turned again to New Zealand. In 1872 he was given a pension of £1,000 a year, and settled down on the island of Kawau, not far from Auckland, which he bought, and where he passed his leisure in planting, gardening and collecting books. In 1875, on the invitation of the Auckland settlers, he became superintendent of their province, and entered the New Zealand house of representatives. He became premier of New Zealand in 1877. Man-

hood suffrage, triennial parliaments, a land-tax, the purchase of large estates and the popular election of the governor, were leading points of his policy. All these reforms, except the last, he lived to see carried; none of them were passed by him. For the fifteen years after the fall of his ministry in 1879 he remained a solitary and pathetic figure in the New Zealand parliament, respectfully treated, courteously listened to, but never again invited to lead. In 1894, he left New Zealand, and made his home in London, where he died on Sept. 20, 1898.

Lives of Sir George Grey have been written by W. L. and L. Rees (1892), Professor G. C. Henderson (1907) and J. Collier (1909).

(W. P. RE.; X.)

GREY, HENRY GREY, 3RD EARL (1802–1894), English statesman, was born on Dec. 28, 1802, the son of the 2nd Earl Grey, prime minister at the time of the Reform Bill of 1832. As Viscount Howick, he sat in the house of commons, first for Winchelsea, and then for Northumberland. He was under-secretary for the colonies in his father's ministry in 1830, and then laid the foundation of his great knowledge of and interest in colonial affairs. He belonged to the more advanced party of colonial reformers, sharing the views of Edward Gibbon Wakefield on questions of land and emigration, and he resigned in 1834 from dissatisfaction that slave emancipation was made gradual instead of immediate. In 1835 he entered Lord Melbourne's cabinet as secretary at war, but in 1839 he again resigned, disapproving of the more advanced views of some of his colleagues. He became colonial secretary in 1846, and the six years of his administration effected a revolution in the relations between England and her colonies. Grey was the first minister to proclaim that the colonies were to be governed for their own benefit and not for the mother-country's; the first systematically to accord them self-government so far as then seemed possible; the first to introduce free trade into their relations with Great Britain and Ireland. The concession by which colonies were allowed to tax imports from the mother-country ad *libitum* was not his; he protested against it, but was overruled. In the West Indies he suppressed, if he could not overcome, discontent; in Ceylon he put down rebellion; in New Zealand he suspended the constitution he had himself accorded, and yielded everything into the masterful hands of Sir George Grey. The least successful part of his administration was his treatment of the convict question at the Cape of Good Hope, which seemed an exception to his rule that the colonies were to be governed for their own benefit and in accordance with their own wishes, and subjected him to a humiliating defeat. After his retirement he wrote a history and defense of his colonial policy in the form of letters to Lord John Russell, a dry but instructive book (Colonial Policy of Lord John Russell's Administration, 1853). He resigned with his colleagues in 1852 and never again held office.

During the remainder of his long life he exercised a vigilant criticism on public affairs. His principal parliamentary appearances were when he moved for a committee on Irish affairs in 1866. and when in 1878 he passionately opposed the policy of the Beaconsfield cabinet in India. He died on Oct. g, 1894.

GREY, LADY JANE (1537–1554), for 9 days queen of England, was the great-granddaughter of Henry VII. She was the daughter of Henry Grey, marquess of Dorset by his wife, Lady Frances Brandon, daughter of Princess Mary of England by her second marriage with Charles Brandon, duke of Suffolk.

She was born at Bradgate, Leicestershire about 1537. Her parents bestowed more than ordinary care upon her education. and she became the marvel of the age for her acquirements. She spoke and wrote Greek and Latin with an accuracy that satisfied even such critics as Ascham and her tutor Dr. Aylmer, afterwards bishop of London. She also acquired some knowledge of at least three Oriental tongues, Hebrew, Chaldee and Arabic. In his Schoolmaster Ascham records her devotion to her studies and the harshness she experienced from her parents. Learning was her solace; in reading Demosthenes and Plato she found a refuge from domestic unhappiness. At nine years old Thomas, Lord Seymour, obtained her wardship, and induced her parents to let her stay with him, even after the death of his wife, Queen Catherine Parr, by promising to marry her to his nephew. King Edward VI. Lord Seymour, however, was attainted of high treason and beheaded in 1549. Jane returned to her studies at Bradgate. But the duke of Somerset was beheaded three years after his brother and, the dukedom of Suffolk having become extinct by the deaths of Charles Brandon and his two sons, the title was conferred upon the marquess of Dorset, Jane's father. Jane was now constantly at court. Northumberland, who was all-powerful, endeavoured to secure his position by family alliances. His fourth son, Lord Guilford Dudley, was accordingly wedded to Lady Jane Grey about the end of May 1553. The bride went to live with her husband's parents, whom she disliked, and the misery of her marriage brought on a severe illness. The match had the full approval of Edward VI., who was now persuaded by Northumberland to break through his father's will and make a new settlement in favour of Lady Jane of the crown by deed. The document was witnessed by the signatures of all the council and of all but one of the judges; but the judges were obtained only with difficulty by threats and intimidation.

Edward VI. died on July 6, 1553, and it was announced to Lady Jane that she was queen. She was sixteen years of age. The news was a most unwelcome surprise; she fainted and for some time resisted all persuasions to accept the fatal dignity, but she yielded. The better to mature their plans the cabal had kept the king's death secret for some days; Queen Jane's proclamation was issued on the 10th. Mary, however, had received early intimation of her brother's death, and, retiring from Hunsdon into Norfolk, gathered round her the nobility and commons of those parts. The army with which Northumberland went to oppose her began to melt away. The earl of Oxford had declared for Queen Mary; and as the council procured a meeting at Baynard's Castle, revoked their former acts as done under coercion, and caused the lord mayor to proclaim Queen Mary, which he did (July 19) amid the shouts of the citizens. The duke of Suffolk told his daughter that she must lay aside her royal dignity; she replied that she relinquished most willingly a crown that she had only accepted out of obedience to him and her mother, and her nine days' reign was over.

Lady Jane and her father were committed to the Tower; but Suffolk procured a pardon. Lady Jane, her husband Dudley and others were arraigned for high treason at the Guildhall (Nov. 14). She pleaded guilty, and was sentenced to death. The execution of the sentence was delayed, but the participation of her father the duke of Suffolk in the Wyat rebellion sealed her fate. She and her husband were beheaded on Feb. 12, 1554, her husband on Tower Hill, and herself within the Tower an hour afterwards, amidst universal sympathy and compassion.

GREY DE WILTON and **GREY DE RUTHYN.** The first Baron Grey de Wilton was Reginald de Grey, who was summoned to parliament as a baron in 1295 and who died in 1308. Reginald's son John, the 2nd baron (1268–1323), was one of the lords ordainers in 1310. The later barons Grey de Wilton were descended from John's eldest son Henry (d. 1342), while a younger son Roger (d. 1353) was the ancestor of the barons Grey de Ruthyn.

WILLIAM, 13TH LORD GREY DE WILTON (d. 1562), who succeeded to the title on the death of his brother Richard, about 1520, fought in France during the concluding years of Henry VIII.'s reign, and was one of the leaders of the victorious English army at the battle of Pinkie in 1547. He was then employed on the Scottish marches and in Scotland, and in 1549 he was engaged in sup-

pressing the rebellion in Oxfordshire and in the west of England; in 1551 he was imprisoned as a friend of the fallen protector, the duke of Somerset, and he was concerned in the attempt made by John Dudley, duke of Northumberland, to place Lady Jane Grey on the English throne in 1553. He was pardoned by Queen Mary and was entrusted with the defence of Guînes; in January 1558 he was forced to surrender the town and for some time he remained a prisoner in France. Under Elizabeth, Grey was again employed on the Scottish border, and besieged Leith in May 1560. He died at Cheshunt, Hertfordshire, on Dec. 25, 1562.

See his son Arthur's *Commentary of the Services and Charges of William, Lord Grey of Wilton, K.G.,* edited by Sir P. de M. Grey Egerton (Camden Society, 1847).

Grey's elder son ARTHUR, 14TH LORD GREY DE WILTON (1536–1593), was during early life with his father in France and in Scotland; he fought at the battle of St. Quentin and helped to defend Guines and to assault Leith. In July 1580 he was appointed lord deputy of Ireland, and after an initial defeat in Wicklow was successful in reducing many of the rebels to a temporary submission. He must be held responsible for the massacre of 600 Italians and Spaniards at Smerwick in November 1580. Grey frequently implored the queen to recall him, and in August 1582 he was allowed to return to England *(see* E. Spenser, *View of the State of Ireland,* edited by H. Morley, 1890, and R. Bagwell, *Ireland under the Tudors,* vol. iii., 1890). While in Ireland Grey was served as secretary by Edmund Spenser and he figures as Artegall in book v. of the *Faerie Queene.* Grey was one of the commissioners who tried Mary queen of Scots, and he took part in the preparations for the defence of England against the Spaniards in 1588. His account of the defence of Guines was used by Holinshed in his *Chronicles.*

GREY OF FALLODON, EDWARD GREY, 1ST VISCOUNT (1862–1933), English statesman, was educated at Winchester and at Balliol College, Oxford, and succeeded his grandfather, the 2nd baronet, at the age of 20. Sir Edward Grey entered the House of Commons as Liberal member for Berwick-on-Tweed in 1885, but he was best known as a country gentleman with a taste for sport, and as amateur champion tennis-player. His interest in politics was rather languid, but he was a disciple of Lord Rosebery, and in the 1892–95 Liberal ministry he was under-secretary for foreign affairs. In this position he earned a reputation as a politician of thorough straightforwardness and grit, and as one who would maintain British interests independently of party; and he shared with Asquith the reputation of being the ablest of the Imperialists who followed Lord Rosebery. Though outside foreign affairs he played but a small part in the period of Liberal opposition between 1895 and 1905, he retained public confidence as one who was indispensable to a Liberal administration. When Campbell-Bannerman's cabinet was formed in Dec. 1905 he became foreign minister.

Grey had previously announced that the Liberal Government would maintain Lord Lansdowne's policy of an *entente* with France and an alliance with Japan, and during the general election of Jan. 1906 he was asked by France, who was being pressed by Germany about Morocco, whether, in case of a Franco-German war, she could reckon on British assistance in arms. He replied that he could promise nothing which would not be fully endorsed by public opinion, but that, if war were forced on France through the *entente* respecting Morocco, he believed British public opinion would rally to her support. The French Government then suggested conversations between military experts.

After consulting the prime minister, the chancellor of the exchequer and the war minister, he agreed, on the understanding that such conversations should in no way bind the British Government. The Algeciras conference on Morocco followed in the spring of 1906, and the constant support which, on his instructions, the British representatives accorded to the French, helped to produce a satisfactory result and to strengthen the Anglo-French *entente.* In 1907 he came to an understanding with Russia. He concluded a convention with her about Persia, by which the integrity of that country was to be maintained, but Britain recognized that Russia had rights and interests in the northern zone and Russia recognized that Britain had rights and interests in the southern zone. In the same year he forwarded Anglo-American friendship by sending James Bryce to Washington as British ambassador; and concluded a convention with Spain binding the Powers to maintain the *status quo* in the Strait of Gibraltar and neighbouring waters.

In 1908—the year in which Asquith, an intimate friend of Grey, became Prime Minister—the European situation was considerably modified by the assertion in October by Prince Ferdinand of the independence of Bulgaria and his assumption of the title of king, and the simultaneous annexation by Austria-Hungary of Bosnia and Hercegovina, which she had administered under the treaty of Berlin. These strokes of policy moved the indignation of both the Russian people and the Russian Government; but the German Emperor announced that he would stand by his Austrian ally in "shining armour"; and Grey, though he protested against the infraction of the public law of Europe, was naturally unable to promise Russia anything more than diplomatic support. The action of the Central Powers confirmed him in the view that it was they who might be the principal danger to European peace; but he was able to keep on friendly terms with them.

The labours of the foreign office, coupled with membership of the House of Commons, left him little leisure for forwarding the general policy of the Government. Nevertheless, as occasion arose, he defended all the principal controversial measures. His main preoccupation, however, was British relations with Germany, who gave dramatic notice of her dissatisfaction with the spread of French aims and influence in Morocco by dispatching, at the beginning of July 1911, the gunboat "Panther" to the north-west African coast at Agadir, to protect, it was alleged, German interests. In view of this further attempt to test, and if possible loosen, the *entente,* he issued a warning through the mouth of Lloyd George speaking at the Mansion House, that Britain intended at all hazards to maintain her place among the Powers. The warning sufficed to make Germany lower her tone, and subsequently Grey explained to Parliament that the foreign policy of the Government was a continuation of Lord Lansdowne's and had got rid of the constant trouble with France and Russia; that British friendship with these Powers, far from constituting a hostile encirclement of Germany, afforded a guarantee that neither would pursue an aggressive policy towards her; but that, when a nation had the biggest army and was increasing its already big navy, it was natural that other Powers should be apprehensive.

While a section of Radicals and Labour men were suspicious of Grey's policy, public opinion in general (including the Conservative opposition) supported him and was pleased when in the following year his able services were marked by the very unusual distinction, for a commoner, of the Order of the Garter. In the beginning of 1912 he was a party to sending Lord Haldane on an informal mission to Berlin to reassure the emperor and his Government as to the pacific intentions of Britain and to probe the intentions of Germany. The Cabinet formally notified the German Government that Britain would neither make, nor join in, any unprovoked attack on Germany. But nothing would content the German Government but an absolute pledge by Britain of neutrality if Germany were engaged in war—a pledge which Grey naturally could not give. Largely in consequence of this ominous rebuff, he exchanged letters on Nov. 22, 1912 with the French ambassador, agreeing that, if either Britain or France had grave reason to expect an attack by a third power or a menace to the general peace, both governments would consult whether they should co-operate and what measures they should take in common. Still he found himself able to work in general harmony with the German Government in the efforts of the Powers, in conference in London, to preserve general peace, in spite of the Balkan wars of 1912–13, ending in the ill-omened Treaty of Bucharest.

In this matter the diplomacy of Germany had appeared so reasonable that he was taken aback by her unyielding attitude in the negotiations arising out of the Austro-Serbian dispute. As soon as he heard of the Austrian ultimatum delivered at Belgrade on July 23, 1914, he realized at once that Russia could not allow

Serbia to be crushed. and exerted himself in the most strenuous fashion to save Europe from the threatened catastrophe. Acting generally in conjunction with France and Russia, one or both, but in face of a lukewarm or hostile Germany, he urged upon Austria the extension of the alarmingly short time-limit of 48 hours; he proposed indefatigably various schemes for conciliation and conference; he pressed upon Serbia the necessity of going as far as possible to meet Austria. In fact, Serbia accepted almost the whole of the Austrian demands; but Austria would be content with nothing less than complete submission, and on the expiry of the time-limit declared war on Serbia. On July 29 Germany, asserting that war was inevitable if Russia attacked Austria, endeavoured to purchase the neutrality of England by undertaking, if England remained neutral, to make no territorial acquisitions at the expense of France — an undertaking which did not extend to the French colonies — and by promising to respect Belgian integrity, after the War, if Belgium had not sided against Germany. Grey next day absolutely refused to make any bargain of the sort at the expense of France and Belgium. In view of the apparent threat to Belgium, he asked France and Germany whether they were prepared to rcspcct Belgian neutrality provided it was not violated, and he asked Belgium whether she would remain neutral. France and Belgium both replied affirmatively, while Germany temporized. Hopeful negotiations which had been begun directly between Russia and Austria were wrecked by a German ultimatum to Russia to countermand her mobilization; and on Monday, Aug. 3, Germany declared war on France.

The moment for decision had come for Great Britain. Russia had asked her to declare herself against Germany and so give the German general staff pause; France had asked her to co-operate as Germany was about to invade French territory. The cabinet had hitherto been divided, a strong section pressing for the preservation of neutrality, and so Grey had been unable to reply favourably to either Russia or France. But now Germany had declared war on France and was apparently about to disregard the neutrality of Belgium. The Opposition, through Bonar Law, tendered support for active measures to aid France and Russia; and Grey with a Cabinet rallying, with few exceptions, to his view, was able to make an appeal in the House of Commons on Aug. 3 for public and parliamentary support to a policy of action. The speech finally decided a wavering public opinion; with the exception of some Radicals and extremist Labour men, all parties, including the Irish Nationalists, accepted the necessity of war. Grey demanded next day that Germany should respect the neutrality of Belgium, and, on the German refusal, England went to war.

One of Grey's first tasks was to turn the association of the Powers fighting Germany and Austria into an alliance, which bound its members to fight in common, and make peace in common. In the course of the negotiations for this purpose he did not hesitate to guarantee the support of Great Britain for the attainment of long-cherished national objects, provided that these did not conflict with the aims of liberation and self-development common to the Allies: the most striking case being the promise, after Turkey entered the war on the side of the Central Powers, that Russia should have Constantinople. Much of his time and attention was occupied by difficult questions arising out of the blockade of Germany and the consequent interference with the trade of neutrals. Public opinion in Great Britain constantly complained that the blockade was not enforced with sufficient strictness; while the United States, as the principal neutral, harassed the British Government by repeated notes, denouncing the methods of the British navy as unnecessarily prejudicial to American trade and contrary to international law. He was perhaps more successful in his answers to the Americans than in his justification to the British public; and a large body of opinion in America accepted his explanations as reasonable.

The tenure of the Foreign Office by a statesman so high-minded, sincere and experienced as Grey was everywhere regarded as such a valuable asset for Great Britain that it appeared only natural and fitting for Asquith, when contemplating the formation of a coalition government in May 1915, to lay down, as one of the essential conditions. that there should be no change in the office of Foreign Secretary. No one could refute with such authority the intermittent assertions of the German chancellor that it was England and not Germany that was responsible both for the origin and for the continuance of the war. When the pacifists called for negotiations in May 1916, he showed that when the Germans professed a readiness for peace it was only for a peace on the basis that Germany had won and the Allies were beaten; but the Allies were not beaten, and the first step towards peace would be taken when Germany began to recognize the fact. Credit must be given to Grey for facilitating, in the early summer of 1915, the entry of Italy — till May 3 a member of the Triple Alliance — into the War against the Central Powers. It was, however, a bitter disappointment to him that his grave warnings failed to prevent Bulgaria, in the autumn of the same year, from taking the field against the Allies. Allied troops were sent to Salonika, and he offered Cyprus to Greece in order to induce her to carry out her treaty obligations and go to Serbia's aid against Bulgaria. But on this issue King Constantine won the support of his people against Venezelos and Serbia was crushed befcre help could reach her.

In July 1916 an affection of the eyes, which had been giving him increasing trouble, made it advisable that he should have as much relief from work as possible, and he accepted a peerage. When a few months later, in December, his friend and chief, Asquith, was succeeded in the premiership by Lloyd George, failing eyesight and political comradeship both united to determine him to bring his 11 years' tenure of the Foreign Office to a close. He had served for a longer consecutive period than any predecessor, and in his official methods he carried out his own precept — that foreign policy required not striking effects nor bold strokes but careful steering.

After his resignation Lord Grey took little or no part in public life for several years. Though he never regained normal vision, rest and quiet gradually worked a decided improvement in his eyesight. But, with the exception of a three months' mission in 1919 to the United States to deal with questions arising out of the peace, he did not definitely emerge from his retirement till 1922. It was the time of the decadence of the coalition government and Lord Grey urged that it was not trusted and should come to an end, which happened within a few months; he was also anxious to resuscitate the Liberal party. In foreign affairs he pressed for the re-establishment of good relations with France, and for the arrangement of an inclusive peace pact, beginning with France. When such a pact was concluded at Locarno in 1925 he welcomed it warmly. But the cause to which he devoted most of his energy was that of the League of Nations. He was especially anxious that Germany should be included as a member at the earliest possible date, and maintained that this should be the only business of the spring meeting of the League in 1926, which unfortunate13 separated without effecting it. In Aug. 1928 Lord Grey was elected Chancellor of Oxford University.

Much of his time in these years was taken up in the compilation of a straightforward narrative and vindication of his course in foreign policy, which was published in 1925 under the title *Twenty-five* Years, *1892–1916*. He had published in 1899 another volume on *Fly-Fishing*, his favourite recreation. In 1885 he married Dorothy, daughter of Shallcross F. Widdrington, of Newton Hall, Northumberland. She was killed in a carriage accident in 1906, and in 1922 Lord Grey married, as his second wife, Pamela, sister of George Wyndham, and widow of the 1st Lord Glenconner, a woman of wide sympathies, who died on Oct. 19, 1928. Lord Grey died Sept. 7, 1933. (G. E. B.)

See Viscount Grey, *Twenty-Five Years, 1892–1916,* 2 vol. (1925); H. Lutz, *Lord Grey und der Weltkrieg (1927.* Eng. trans. by E. W. Dickes, 1928).

GREYHOUND RACING. Greyhound racing was first introduced as an artificial form of the old-time sport of coursing, but it has nothing in common with it except that the same sort of dog is used for both. In racing, a dummy hare, propelled mechanically round a set track, is used as a quarry, which the dogs never catch — except by accident.

First Developments. — Greyhound racing first attained prominence in the United States of America after the World War, but there is evidence that it had its inception in England. There are on record particulars of a meeting which took place in a field near the Welsh Harp, Hendon, in 1876, for the purpose of demonstrating a form of greyhound racing almost exactly similar in principle to the modern form. The dogs were raced after an artificial hare which was drawn, by means of a windlass, along a rail laid in the grass over a straight track of 400 yards. But the innovation received insufficient encouragement to keep it alive. It seems that public ideas of sport at that time were not satisfied by the mere racing of greyhounds, for when a year or two later enclosed coursing was introduced the objection was raised that it was more like racing than coursing, and it soon died out. Coursing men realized that sheer racing is inimical to the traditional principles of the sport.

After nearly 50 years, owners of greyhounds in general viewed with marked disfavour the efforts to establish greyhound racing in England. Its success in America prompted an American company to send over representatives with a view to beginning operations in England, but they failed to secure sufficient support. As greyhound racing became popular in America, another effort was made to introduce it into England, and this time the result was the formation of a private company called the Greyhound Racing Association, which opened a large racing track at Manchester in July 1926. Greyhound owners viewed the scheme askance, and so few of them could be induced to enter dogs for the races that the Association was obliged itself to buy dogs to fill the entries for the first few meetings. But the racing and the opportunities it afforded for betting made an immediate appeal to the public of Manchester, and large numbers of spectators were attracted. Once it had been demonstrated that there was money in greyhound racing, a general rush ensued among speculators all over the country to form companies and secure sites for the laying out of tracks. Between the beginning of January and the end of Sept. 1927, as many as 68 such companies were registered. At a few places public opinion ranged itself against what was regarded as a mere money-making spectacle; but most of the companies found a ready patronage, and enormous crowds flocked to some of the bigger centres. Moreover, the apparent success of greyhound racing quickly found a reflection among enterprising speculators in many other countries. It soon became established in Australia, and projects for laying out tracks were started as far afield as India, Egypt and China. In Belgium a primitive form of racing, in which the greyhounds ran over a straight track, at the end of which their owners stood calling them, as in whippet racing, gained some popularity during the World War, and it spread to some extent to France; but this was eclipsed by "mechanical hare" racing when its success became evident in England.

The Methods of Racing. — It is not necessary to look very far to understand the success of greyhound racing. The greyhound itself is a dog of beautiful lines, and there is an undoubted thrill in seeing him at full stretch in close competition with others. But it is to be observed at any meeting that the majority of spectators are much less interested in this aspect of the racing than in the actual result of the races and the money that is to be won and lost in betting. This, combined with the fact that most meetings are held in the evening, when working people have leisure to attend, has been a large influence in attracting spectators. Moreover, greyhound racing provided something entirely new to the public, both in conception and presentation. The methods adopted on the tracks of the Greyhound Racing Association may be taken as an example, for upon them most of the other tracks have been modelled The arena resembles an up-to-date football ground, oval in shape, with accommodation for spectators provided all round it in grand stands or open terraced banking. The actual track, which is usually of grass, is brilliantly illuminated at night by means of powerful electric lights, while the rest of the ground is in semi-darkness during the races. The dummy hare runs round the outside edge of the track, propelled by concealed mechanism, which is controlled by an official stationed in the top of a tower, from which he can regulate its speed according to the pace of the dogs. At the end of the race the hare is switched into a tunnel, which is closed to the dogs by means of a trap-door.

Usually not more than six dogs compete in each race. Each dog wears a racing coat bearing a distinctive number and colour, and at the start the dogs are placed in separate divisions of a starting box, from which they can see the hare begin a circuit of the course. As the hare flashes past the box the dogs are released simultaneously by the raising of the front of the box. For the fair running of the races a good deal depends on the control of the speed of the hare. If the leading dog is allowed to gain too much on it, he may be induced to swing out after it at the bends in the track, and thus lose ground, while the dogs in the rear, seeing it farther round the bend, may keep close to the inside edge and gain an advantage. It is inevitable that there should be occasionally jostling round the bends, which sometimes leads to fighting, and, although a form of muzzle is worn by each dog, fighting has been an unpleasant feature (1928) of several meetings.

Races are usually of either 500 yards or 525 yards, and at the same distances races over hurdles are also run; and the times of the winners are recorded to hundredths of seconds. The speed of greyhounds has always been an interesting matter of discussion and speculation, but opportunities for making comparative records of it have seldom occurred before the introduction of racing. In order to provide as close races as possible between dogs of different calibre, the Greyhound Racing Association adopted a system of grading competitors on the form shown in trials or actual racing, and entering them for races only against dogs of more or less equal merit. The times recorded have shown that the fastest greyhounds run over 525 yards flat at an average speed of more than 35 miles an hour, and over hurdles at an average speed of more than 33 miles an hour.

Controlling Bodies. — With the rapid extension of greyhound racing and the multiplication of companies formed to participate in it, the question of establishing an authoritative controlling body arose. Many people imagined that greyhound racing could at once assume a status equal to that of the great British sports, overlooking the fundamental difference that exists between a sport that is pursued for the sake of sport by the main body of its adherents and a form of entertainment introduced purely for the profit of its promoters. The Greyhound Racing Association very early in its career sought the recognition and co-operation of the National Coursing Club, which at once decided that "the activities of the Greyhound Racing Association have nothing to do with the sport of coursing as legislated for by the Rules of the National Coursing Club." Nevertheless, the Association made one of its rules that no dog should be allowed to race on its track unless the dog had been registered in the National Coursing Club's *Greyhound Stud Book*, and the Association continued to seek the good will and support of the prominent coursing men and clubs. With so many rival companies in the field, efforts to concentrate the control of greyhound racing as a whole in one body proved unavailing, and eventually the Greyhound Racing Association vested control of racing on its tracks in an independent committee consisting of Lord Chesham (chairman), the Earl of Westmorland, and Captain H. E. de Trafford, with Major C. L. C. Clarke as honorary secretary. This committee was empowered to draw up rules, to issue licences to stewards and trainers, and in effect to control the actual racing and organization of meetings on the Association's tracks. Meanwhile, a group of rival companies joined in forming a controlling body, called the Canine and Greyhound Racing Control Board, for their tracks. Before long, steps were again taken to found a single controlling body, and early in 1928 the representatives of the chief tracks met and formed the National Greyhound Racing Club. The constitution of the club was designed to be similar to that of the Jockey Club, and Captain E. A. V. Stanley, Lieut.-Gen. Sir Edward Bethune and Major D. B. Corbet were appointed stewards, with Lord Chesham, Lord Loch and Captain Arthur Hope members of a standing committee.

GREYHOUND RACING IN ENGLAND AND AMERICA

1. Greyhounds at the Morevale Kennels, Denham, Bucks just released from the starting box. A mechanical hare is timed to flash past as the door swings open
2. A race at Hialeah Florida U.S.A. Ordinarily six greyhounds run the course of 500–525 yds. The track is usually off grass
3. Dogs chasing mechanical hare, in the foreground. The hare, which runs around the outside edge of the track, is propelled by concealed machinery; its course is controlled by an official stationed in a tower
4. 'Speedball," one of the fastest American dogs, leading in a race at Hialeah Florida. Each dog, as shown above, wears a muzzle as a safeguard against fighting on the curves. The fastest greyhounds attain a speed of 35 miles an hour

The United States.—The sport of racing greyhounds has never gained wide popularity in the United States. Attempts have been made to introduce it in various places, but only in Florida and California have these ventures met with any particular success. Probably the first attempt to introduce the sport was made in Colorado in the '90s. The dogs were raced by the Bartel brothers, of Denver, who invested generously in good racing dogs imported from England. For a time, coursing was popular in the Rocky Mountain States. From there, the interest spread to California. For many years, dog racing was conducted in the outskirts of San Francisco. In a measure it was successful, but after a while it dawned upon the public that the man who owned the track owned the competing dogs and both the handicapper and starter were in his employ. There had been betting on the events. The dogs ran after live hares, and these victims furnished the only honest part of the combination.

It was not until the mechanical hare had been perfected and brought into use that Florida became the scene of greyhound racing. The mechanical hare appeased the humanitarians who objected to the use of live victims for the races. The sport flourished a bit with this objection removed but again there began to be suspicions of tampering with the dogs. It was probably because of such suspicions that attempts to introduce the sport at both Atlantic City and Newark resulted in large financial losses for the promoters. The only way in which greyhound racing can be successful in the United States is to have it run along the lines followed by the horse racing interests or the greyhound racing supporters in England. (F. F. D.)

GREYLAG: *see* GOOSE.

GREYMOUTH, a seaport of New Zealand, the principal port on the west coast of South island, in Grey county. It stands on the small estuary of the Grey or Mawhera river, has a good harbour, and railway communication with Hokitika, Reefton and Christchurch. The district is both auriferous and coal-bearing. The coal-mines have attendant industries in coke, bricks and fireclay. The timber, wool and flax trade is also well developed.

GREYTOWN or SAN JUAN DEL NORTE, a port of Nicaragua on the Caribbean sea, at the mouth of the northern channel of the delta of the San Juan river, close to the Costa Rican border. Pop. (1940) 571. Greytown was at one time the chief port of Nicaragua on the Caribbean, and between 1850 and 1870, when the route across Nicaragua was the most comfortable and luxurious line of travel between eastern United States and California, was the terminus of the Atlantic steamers and the starting point of the river boats which carried travellers up the San Juan river, and across Lake Nicaragua, whence they took a 12 mile stage ride to the Pacific port of San Juan del Sur, to continue their journey to San Francisco. Bluefields was also, during the period of the British protectorate over the Mosquito coast, the leading port and the chief residence of the English; the name by which the town is still known, Greytown, is the English designation, the official Nicaraguan name being San Juan del Norte. The loss of its prime position as a port is due to the shifting sands of the San Juan river, which have now virtually closed the northern delta entrance and left the Costa Rican and border channels the chief means of entry and exit to the river. In 1850, the channel at Greytown was 25 ft. deep, but by 1875 it had decreased to 5 ft., eliminating the site as a port of entry for sea-going vessels.

The harbour of San Juan del Norte was discovered by Columbus, and was linked with the traffic into Nicaragua by Capt. Diego Machua, who in 1529 sailed down the San Juan river from the lake. In 1796, San Juan was made a port of entry by Spanish royal charter, and new defences were built just prior to the Independence, in 1821. The British seized the port in 1848, by virtue of their protectorate over the Mosquito coast, and held it until 1860, when, following the Treaty of Managua, the territory was turned over to Nicaragua.

GREUWACKE or **GRAUWACKE** (a German word signifying a grey earthy rock), a term, formerly more generally used by British geologists than at the present day, for impure, composite gritty rocks belonging to the Palaeozoic systems. They correspond to the sandstones, grits and finer-grained conglomerates and breccias of the later periods. Attempts have been made to limit the term to those rocks formed from the disintegration of basic igneous and pyroclastic rocks, as distinct from arkose, sandstone, etc., which are formed from acid rocks. In view of the various denotations of the term greywacke, its use in geological literature seems now undesirable. The greywackes are mostly grey or brown dull-coloured sandy rocks containing a great variety of minerals (such as quartz, felspar, calcite, iron oxides, garnet, epidote, etc.) and rock-fragments (felsite, chert, slate, gneiss, quartzite, etc.). (P. G. H. B.)

GRIBEAUVAL, JEAN BAPTISTE DE (1715–1789), French artillery general, was born at Amiens on Sept. 15, 1715. He entered the French royal artillery in 1732, and in 1752 became captain of a company of miners. He was lent to the Austrian army on the outbreak of the Seven Years' War, and served as a general officer of artillery. After his return to France he was made inspector of artillery, but he had to wait until 1776 before he became first inspector and was able to carry out the reforms in the artillery arm which are his chief title to fame. *See* ARTILLERY; and for fuii details Gribeauval's own *Table des constructions des principaux attirails de l'artillerie . . . de M. de Gribeauval,* and the *règlement* for the French artillery issued in 1776.

See Hennébert, *Gribeauval, lieutenant-général des armées du roy* (1896)

GRIBOYEDOV, ALEXANDER SERGEYEVICH (1795–1829), Russian dramatic author, was born on Jan 4, 1795 at Moscow, where he studied at the university from 1806 to 1812. He then obtained a commission in a hussar regiment, but resigned it in 1816. Next year he entered the civil service, and in 1818 was appointed secretary of the Russian legation in Persia, whence he was transferred to Georgia. He had commenced writing early, and had produced on the stage at St. Petersburg (Leningrad) in 1816 a comedy in verse, translated from the French, called *The Young Spouses,* which mas followed by other pieces of the same kind. But neither these nor the essays and verses which he wrote would have been long remembered but for the immense success gained by his comedy in verse, *Gore' ot uma,* or *The Mischief of Being Clever* (Eng. trans. by B. Pares, 1925). A satire upon Russian society, or, as a high official styled it, "A pasquinade on Moscow," its plot is slight, its merits consisting in its accurate representation of certain social and official types—such as Famousov, the lover of old abuses, the hater of reforms; his secretary, Molchanin, servile fawner upon all in office; the aristocratic young liberal and Anglomaniac, Repetilov; contrasted with whom is the hero of the piece, Tchatsky, the ironical satirist, just returned from the west of Europe, who exposes and ridicules the weaknesses of the rest, his words echoing that outcry of the young generation of 1820 which reached its climax in the military insurrection of 1825, and was then sternly silenced by Nicholas. Griboyedov wrote this play during his stay at Tiflis (where he had come, on leave, in 1821) as diplomatic secretary to General Ermolov. *Gore' ot uma* is undoubtedly one of the great comedies of European literature. He spent the summer of 1823 in Russia, completed his play and took it to St. Petersburg. There it was rejected by the censorship. Many copies were made and privately circulated, and Griboyedov read it to literary circles in St. Petersburg and Moscow, but the first edition was only printed in 1833, four years after his death. Only once did he see it on the stage, when it was acted by the officers of the garrison at Erivan. He returned to Georgia to General Ermolov's headquarters, in 1825, and after the revolt of Dec. 14 was arrested as a notorious liberal and sent to St. Petersburg, where he succeeded in exculpating himself. He returned to serve with his relative Count Paskievitch-Erivansky during a campaign against Persia, negotiated the peace of Turkmanchai (Feb. 20, 1828) and took the treaty to St. Petersburg. He considered devoting himself to literature and commenced a romantic drama, *A Georgian Night.* But he was suddenly sent to Persia as minister-plenipotentiary to supervise the execution of the treaty. Soon after his arrival at Tehran the Russian embassy was stormed on account of the refuge given there to Russian subjects from Persian harems

Griboyedov was killed during this attack (Feb. 11, 1829).

GRID, in a vacuum tube such as is used in electrical communication is an electrode having openings through which the electron stream, between cathode and anode, may pass. The relative potential of the grid controls the current flowing between the anode and the cathode.

GRID LEAK, is a resistor, usually of very high resistance, used in association with a condenser and connected directly or indirectly between the cathode and the grid of a vacuum tube in a radio receiving set.

GRIEG, EDVARD HAGERUP (1843–1907), Norwegian composer, was born on June 15, 1843, in Bergen, where his father, Alexander Grieg, was English consul. The Grieg (formerly Greig) family were of Scottish origin, the composer's grandfather having emigrated after Culloden. His mother, Gesine Hagerup, belonged however to a pure Norwegian peasant family; and it is from her that Grieg appears to have derived his musical talent. She began to give her son lessons on the pianoforte when he was six and his first composition, "Variations on a German melody," was written at the age of nine. In the autumn of 1858, at the recommendation of Ole Bull (*q.v.*), young Grieg entered the Leipzig Conservatorium, where he came under the influence of the Mendelssohn and Schumann romantic school. From Leipzig he went, in 1863, to Copenhagen where he studied for a short time with Niels Gade and Emil Hartmann, both composers representing a sentimental strain of Scandinavian temperament, from which Grieg emancipated himself in favour of the harder inspiration of Richard Nordraak. "The scales fell from my eyes," said Grieg afterward of his acquaintance with Nordraak. "For the first time I learned through him to know the northern folk tunes and my own nature. We made a pact to combat the effeminate Gade-Mendelssohn mixture of Scandinavianism, and boldly entered upon the new path along which the northern school at present pursues its course." A kind of crusade in favour of Norwegian national music resulted, and in the winter of 1864–1865 Grieg founded the Copenhagen concert-society Euterpe for the production of the works of young Norwegian composers. During the winters of 1865–1866 and 1869–1870 Grieg was in Rome where he met Liszt, who played his piano concerto at sight from the ms. and gave it his enthusiastic approbation. In the autumn of 1866 he settled in Christiania. In 1872 the Royal Musical Academy of Sweden made him a member; in 1874 the Norwegian Storthing granted him an annual stipend of 1,600 kronen. In 1888 he played his pianoforte concerto and conducted his "two melodies for strings" at a Philharmonic concert in London, and visited England again in 1891, 1894 and 1896. He died at Bergen on Sept. 4, 1907.

As a composer Grieg's strength lies in his strong nationalistic colouring, in his exquisite lyrical feeling and in his command of the picturesque and romantic, as exemplified in his lovely and world-famous music to Ibsen's *Peer Gynt,* or in the suite for stringed orchestra, *Aus Holbergs Zeit,* and hardly less so in the equally beautiful and well-known piano concerto. As regards his songs they may be said to be generally the more spontaneous the more closely they conform to the simple model of the *Volkslied.* Yet the much sung *Ich liebe dich* is a song of a diiferent kind, which has hardly ever been surpassed for the perfection with which it depicts a strong momentary emotion; while such other familiar examples as *Solvejg's Lied* and *Ein Schwann* are equally beautiful and characteristic. Bülow called Grieg the "Chopin of the North," and the phrase may pass though the range of appeal and the quality of the inspiration in Chopin are of course far greater; nor has the national movement inaugurated by Grieg shown promise of great development. He may be regarded rather as the pioneer of a musical mission which was perfectly carried out by himself alone.

See La Mara, *Edvard Grieg* (Leipzig, 1898); Henry T. Finck, *Edvard Grieg* (1906) and *Grieg and his Music* (1919); R. H. Stein, *Grieg* (1921).

GRIERSON, SIR JAMES MONCRIEFF (1859–1914), British soldier, was born at Glasgow on Jan. 27, 1859, and joined the Royal Artillery in 1877. Noted from the outset as an exceptionally keen student of his profession, from 1896 to 1900 he was military attaché at Berlin. As a colonel he was with Lord Roberts during the advance from Bloemfontein into the Transvaal; but he was then transferred to China to act as British military representative on the staff of Count Waldersee, commander-in-chief of the Allied forces against the Boxers. In 1904 he was appointed director of military operations. He commanded the 1st Division at Aldershot from 1906–10, and was in 1912 put in charge of the Eastern command. On the outbreak of the World War Sir J. Grierson was selected for the command of the II. Army Corps. He proceeded to France, but died suddenly on Aug. 17, 1914.

See D. S. Macdiarmid, *Life of Sir James Moncrieff Grierson* (1923).

GRIESBACH, JOHANN JAKOB (1745–1812), German biblical critic, was born at Butzbach on Jan. 4, 1745, and was educated at Frankfort-on-the-Main, at Tubingen, Leipzig and Halle, where he became professor in 1773. Two years later he was translated to Jena, where he died, March 24, 1812.

Griesbach's fame rests upon his New Testament criticism. His critical edition of the New Testament, which appeared at Halle (3 vols., 1774–75, partial 3rd ed. 1827), was based on the Elzevir edition.

GRIESBACH, a German watering-place in the Land of Baden, in the valley of the Rench, 1,800 ft. above the sea, 6 m. west of Freudenstadt in Wiirttemberg. It is celebrated for its saline chalybeate waters, which were used as early as the 16th century. Pop. (1933) 839. From 1665 to 1805 Griesbach was part of the bishopric of Strassburg.

GRIFFE, in architecture, a small ornament, generally triangular, which fills the space between the round torus of a column base and the square corner of the plinth below; sometimes known as a spur. The use of the griffe is particularly characteristic of the later Romanesque period; it usually takes the form of a group of leaves or a single curling leaf. Grotesque animals are occasionally found.

GRIFFENFELDT, PEDER, COUNT *(Peder Schumacher)* (1635–99), Danish statesman, was born at Copenhagen on Aug. 24, 1635, of a wealthy trading family. He was a precocious child, and received an excellent education. In 1654 Schumacher was sent abroad to complete his studies. From Germany he proceeded to the Netherlands, staying at Leiden, Utrecht and Amsterdam, and passing in 1657 to Queen's college, Oxford, where he lived three years. In the autumn of 1660 Schumacher visited Paris, shortly after Mazarin's death, when the young Louis XIV. first seized the reins of power. Schumacher seems to have been profoundly impressed by the administrative superiority of a strong centralized monarchy; and, in politics, as in manners, France ever afterwards was his model. The last year of his travels was spent in Spain, where he obtained a thorough knowledge of the Castilian language and literature. On his return to Copen-

hagen, in 1662, Schumacher found the monarchy established on the ruins of the aristocracy. He secured the protection of Kristoffer Gabel, the king's confidant, and in 1663 was appointed the royal librarian. A romantic friendship with the king's bastard, Count Ulric Frederick Gyldenlove, consolidated his position. In 1665 Schumacher obtained his first political post as the king's secretary, and the same year composed the memorable Kongelov (see DENMARK, History).

On the death of Frederick III. (Feb. 9, 1670) Schumacher was the most trusted of all the royal counsellors. He alone was aware of the existence of the new throne of walrus ivory embellished with three silver life-size lions, and of the new regalia, both of which treasures he had, by the king's command, concealed in a vault beneath the royal castle. Frederick III. had also confided to him a sealed packet containing the Kongelov, which was to be delivered to his successor alone. Schumacher had been recommended to his son by Frederick III. on his deathbed When, on Feb. 9, 1670, Schumacher delivered the Kongelov to Christian V., the king bade all those about him withdraw, and after being closeted a good hour with Schumacher, appointed him his "Obergeheimesekreter." His promotion was rapid. In July, 1670, he was ennobled under the name of Griffenfeldt; in November, 1673, he was created a count, a knight of the Elephant and, finally, imperial chancellor. In the course of the next few months he gathered into his hands every branch of the government.

On May 2j, 1671, the dignities of count and baron were introduced into Denmark "to give lustre to the court"; a few months later the order of the Danebrog was instituted as a fresh means of winning adherents by marks of favour. Griffenfeldt was the originator of these new institutions. To him monarchy was the ideal form of government. But he had also a political object. Griffenfeldt saw that, in future, the first at court would be the first everywhere. He promoted trade and industry by the revival of the *Kammer* Kollegium, or board of trade, and the abolition of some of the most harmful monopolies. Both the higher and the provincial administrations were reformed and centralized; and the positions and duties of the magistrates, who now also received fixed salaries, were exactly defined. In the last three years of his administration, Griffenfeldt gave himself entirely to the conduct of the foreign policy of Denmark. He aimed at restoring Denmark to the rank of a great power by carefully nursing her resources, and in the meantime securing and enriching her by alliances, which would bring in large subsidies while imposing a minimum of obligations. This policy demanded: first, peace, especially peace with Denmark's most dangerous neighbour, Sweden; and, secondly, a sound financial basis, which he expected the wealth of France to supply. Next, Denmark was to beware of making enemies of France and Sweden at the same time. An alliance, on fairly equal terms, between the three powers, would, in these circumstances, be the consummation of Griffenfeldt's "system"; an aliiance with France to the exclusion of Sweden would be the next best policy; but an alliance between France and Sweden, without the admission of Denmark, was to be avoided at all hazards. But, despite Griffenfeldt's open protests and subterraneous counter-mining, war was actually declared against Sweden in 1675, and his subsequent policy seemed so obscure and hazardous that his enemies found an opportunity to destroy him.

On March 11, 1676, Griffenfeldt was arrested in the king's name and conducted to the citadel, a prisoner of state. On May 3 he was tried by an extraordinary tribunal of 10 dignitaries, and conducted his own defence on a variety of charges. For 46 days before his trial he had been closely confined in a dungeon without lights, books or writing materials. Every legal assistance was illegally denied him. Nevertheless he proved more than a match for his accusers. But he was condemned to degradation and decapitation. The primary offence of the ex-chancellor was the taking of bribes, which no twisting of the law could convert into a capital offence, while the charge of treason had not been substantiated. Griffenfeldt was pardoned on the scaffold, his sentence being commuted to life-long imprisonment. Denmark's greatest statesman lingered out his life for 22 years in a lonely state-prison, first in the fortress of Copenhagen, and finally at Munkholm on Trcndhjem fjord. He died at Trondhjem on March 12, 1699.

See *Danmark's Riges Histoire,* vol. v. (1897–1905); Jorgenson, *Peter Schumacher-Griffenfeldt* (1893–94); *O.* Vaupell, *Rigskansler* Grev *Griffenfeldt*(1880–82); Bain, *Scandtnavia,* cap. x. (Cambridge, 1905); K. Fabricius, *Griffenfeldt* (1910), and *Kongeloven* (1920).

(R. N. B.; X.)

GRIFFIN (O'GRIOBTA, O'GREEVA), **GERALD** (1803–1840), Irish novelist and dramatic writer, was born at Limerick. Having written a tragedy, *Aguire,* which was highly praised by his friends, he set out in 1823 for London with the purpose of "revolutionizing the dramatic taste of the time by writing for the stage." In spite of the recommendations of John Banim, he had a hard struggle. The Noyades, an opera entirely in recitative, was produced at the English Opera House in 1826; and the success of Holland Tide Tales (1827) led to Tales of the Munster *Festivals* (3 vols., 1827), which were still more popular. In 1829 appeared his fine novel, *The* Collegians, afterwards successfully adapted for the stage by Dion Boucicault under the title of The *Colleen Bawn.* He followed up this success with other novels, and a number of lyrics touched with his native melancholy. But he became doubtful as to the moral influence of his writings, and sought admission into a society of the Christian Brothers at Dublin, in Sept. 1838, under the name of Brother Joseph. He died at Cork of typhus fever on June 12, 1840. Before adopting the monastic habit he burned all his manuscripts; but *Gisippus,* a tragedy which he had composed before he was 20, accidentally escaped destruction, and in 1842 was put on the Drury Lane stage by Macready with great success.

The collected works of Gerald Griffin were published in 1842–43 in eight volumes, with a *Life* by his brother William Griffin, M.D.; an edition of his *Poetical and Dramatic Works* (1895) *by* C. G. Duffy; and a selection of his lyrics, with a notice by George Sigerson, is included in the *Treasury* of *Irish Poetry,* edit. *by* Stopford A. Brooke and T. W. Rolleston (1900).

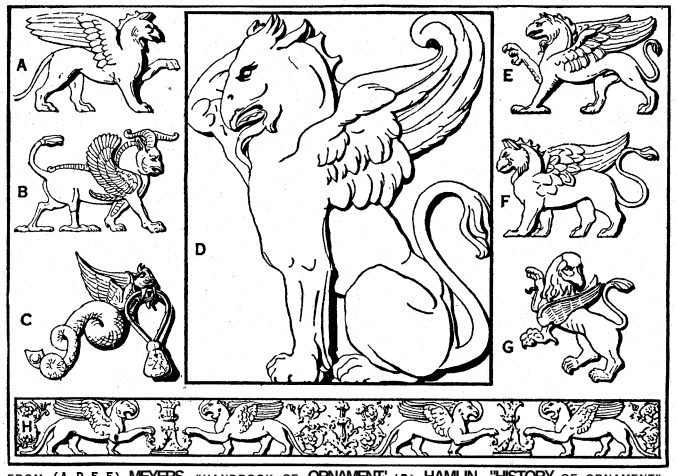
GRIFFIN, SIR LEPEL HENRY (1838–1908), Anglo-Indian administrator, was born at Watford, Herts, on July 20, 1838. He was educated at Brighton and Harrow, and in 1859 entered the Indian civil service, being appointed assistant commissioner in the Punjab on Nov. 17, 1860, and permanent chief secretary of the Punjab in Nov. 1878. In the later part of the Afghan War, Griffin was chosen to superintend the negotiations at Kabul, where he was only responsible to the military commander Sir Frederick (Earl) Roberts. Griffin carried the negotiations to a successful conclusion, establishing friendly relations with Abdur Rahman, whom he helped to set on the Afghan throne. Griffin was made C.S.I. in 1879 and K.C.S.I. in 1881. In Feb. 1881 he became agent to the governor-general in central India, where he remained until his retirement in Jan. 1889. After his retirement Griffin became chairman of the Imperial Bank of Persia, and from 1894 until his death he was chairman of the East India Association. He died in London on March 9, 1908.

His works include *Punjab Chiefs* (Lahore 1865); *The Law of Inheritance to Sikh Chiefships previous to the Annexation* (Lahore, 1869); *The Rajas of the Punjab* (Lahore 1870; 2nd ed. London 1873); *The Great Republic* (a criticism of the U.S.A. 1884); *Famous Monuments of Central India* (1886); and *Ranjit Singh* (Rulers of India series, 1892).

GRIFFIN, a city of Georgia, U.S.A., 43m. S. of Atlanta; the county seat of Spalding county. It is on Federal highway 41, and is served by the Central of Georgia and the Southern railways. The population was 10,321 in 1930; 1940 was 13,222. Its manufacturing industries include cotton mills with an aggregate of about 5,000 looms and 140,000 spindles in 1940. A United States agricultural experiment station and test-farm is on the outskirts of the city. Griffin was founded in 1840 and chartered as a city in 1846.

GRIFFIN, GRIFFON or **GRYPHON,** in the natural history of the ancients, the name of a rapacious creature represented with four legs, wings and a beak—the fore part resembling an eagle and the hinder a lion. In addition, some writers describe the tail as a serpent (from Fr. *griffon,* Lat. *gryphus,* Gr. γρύψ). This animal, which was supposed to watch over gold mines and hidden treasures, and to be the enemy of the horse, was consecrated to the Sun; and the ancient painters represented the chariot of the

Sun as drawn by griffins. According to Spanheim, those of Jupiter and Nemesis were similarly provided. The griffin of Scripture is probably the osprey, and the name is now given to a species of vulture. The griffin was said to inhabit Asiatic Scythia, where gold and precious stones were abundant; and when strangers approached to gather these the creatures leapt upon them and tore them in pieces, thus chastising human avarice and greed.



FROM (A,D,E,F) MEYERS, "HANDBOOK OF ORNAMENT" (B) HAMLIN, "HISTORY OF ORNAMENT" (CENTURY CO.); (H) D'ESPOUY, "FRAGMENTS ANTIQUES."

GRIFFIN

A, Greek. B, Syrian. C, on the bronze door of cathedral at Troia. D, French Renaissance. E, Roman. F, Renaissance. G, from cathedral of Monreale, Sicily. H, Frieze from temple of Antoninus and Faustina, Rome

The one-eyed Arimaspi waged constant war with them, according to Herodotus. Sir John de Mandeville, in his *Travels,* described a griffin as eight times larger than a lion.

The griffin is frequently seen as a charge in heraldry (*q.v.*).

GRIFFITH, ARTHUR (1872–1922), Irish politician, was born in Dublin on March 31, 1872 and began his working life as a printer. When the Irish party was divided over the Parnell case, Griffith, like Dublin artisans in general, sided with Parnell and against the clergy. But the rancorous quarrels which then disfigured Irish politics disgusted young men and led them to despair of success along constitutional lines. New organizations came into existence in Dublin, the most important being the Gaelic League for the revival of the Irish language. Griffith joined this movement, but his main activities were with the Celtic Literary Society, the leading figure of which was William Rooney. Over and above all these minor groups there existed the Irish Republican Brotherhood or Fenian Society, of which Griffith became a member. He went to South Africa in 1896, owing to lack of employment in Dublin, but home-sickness brought him back to Ireland in 1898. In 1899 *The United Irishman,* a weekly paper, was established.

Early Writings and Aims.—At first Rooney counted for more in the new movement than Griffith, for he possessed that personal magnetism in which Griffith was lacking; yet after his death in 1901, the paper strengthened rather than weakened. No such journalism had appeared in Dublin since the time of Young Ireland. It was savagely political; but its politics had an idealism which was foreign to the agrarian revolution. Griffith cared passionately for the things of the mind; his own writing had the beauty of trenchant steel; and he welcomed contributions from the best writers in Ireland, W. B. Yeats, "A. E." and the rest. No contributor expected to be paid, for all knew that Griffith himself lived on a pittance.

Griffith's aim was both destructive and constructive. He sought first to divert his countrymen from the attempt to win self-government through parliamentary action at Westminster, and secondly to persuade them to work for it in their own country. Although all his intimate associates were Fenians, he recognized that the majority of Irish Nationalists did not think separation from Britain possible. He therefore resigned membership of the I.R.B., and aimed at winning over the separatists to work for a parliament in Ireland united to that of England only by the link of the Crown. As a means to this end, he proposed passive resistance and an appeal to moral force. Payment of taxes was to be refused. Members elected to parliament were to absent themselves from Westminster, and to sit in Ireland as a council and govern only by the assent of the nation. Tribunals were to be set up to which cases should be brought.

Rise of **Sinn Féin.**—This policy was first publicly announced at a meeting in Dublin in Oct. 1902. The body which met called itself Cumann na nGaedheal or "Society of the Gaels." But the name chosen to represent their policy was Sinn FCin, "Ourselves"—Irish words which in their proverbial use mean roughly "Stand together." The name was soon transferred from the policy to its adherents. Candidates were put forward at municipal elections and by 1906 there were 14 Sinn Féiners on the Dublin corporation. But Griffith's propaganda was mainly confined to the capital; and in 1907 a member of the Irish party, who resigning his seat, stood for re-election as a Sinn Féiner, was defeated.

The new policy at first did not make much headway. Resistance to taxation proved difficult because all taxation except income tax was indirect, and a large proportion of income tax payers were unionists. The only effective forces were the personality and the pen of Arthur Griffith. His paper changed its name in 1906 when damages for libel were awarded against the *United Irishman.* That journal disappeared, and re-emerged as *Sinn Féin.* In 1907, when the Parliamentary party had suffered a reverse, *Sinn Féin* appeared as a daily paper, but this experiment soon had to be abandoned, and after another bankruptcy *Eire* became its name. Griffith wrote no books: but he published in 1905 a pamphlet called *The Resurrection of Hungary* which described how an almost vanished language had been restored to national use, and how the elected deputies of an ancient nation, through a policy of abstention from the Austrian Assembly, gained full freedom under a dual monarchy.

The Volunteer Movement.—Griffith, during these years, taught the rising generation to despise and distrust not only the methods but the character of those who were then leading the main national movement and he was not too scrupulous in his modes of attack. Yet when it became clear in 1911 that a Home Rule Bill was seriously intended, he announced his intention not to hamper Redmond. But the measure proposed was wholly unlike his ideal and he condemned it root and branch, his most furious opposition being directed against that partition of Ireland which he was later constrained to accept. In the shaping of events, neither he nor his paper counted for much till the growth of the Ulster Volunteers revived the hopes of the physical force party. Griffith supported the counter-organization of the Irish Volunteers by word and deed. He was one of those who received the rifles landed at Howth in July 1914. At the outbreak of the World War the Volunteers split, nine-tenths of them adhering to Redmond in support of the British cause but the remainder, active and determined, remained in Ireland; and Griffith's paper was their main organ. The censorship attacked it, but instead of *Eire,* there came out *Scissors and Paste,* a journal consisting of extracts from war news arranged to give an impression very unfavourable to the Allies. It was only one of many journals. Griffith had founded a school, a "mosquito press" and had set the example of tenacity and courage.

The Easter Rising.—The Easter Rising of 1916 was a surprise to the majority of Irishmen Griffith took no part in it, and thereby lost influence with the extremists. But the British authorities remedied this by putting him into Frongoch, the detention camp in Wales, which became a crowded academy of Sinn FCin. Yet when, in July 1917, the prisoners were released, de Valera was chosen as their leader. Griffith proposed this election at the convention of Sinn FCin, while he himself returned to his desk, re-issuing his paper as *Nationality;* this also was suppressed and re-appeared as ***Eire*** Og. He was again put in jail in 1918 At the general election after the armistice, Sinn FCin swept the board outside Ulster, and Griffith's policy was put into force. The elected members (such as were not in prison) assembled as Dail Eireann, the Irish parliament. But, going beyond Griffith's plan. they declared for an Irish republic, electing de Valera as president and Griffith as vice-president. Both these men were then prison-

ers; but after some months the president escaped and Griffith was liberated.

Griffith as Leader. — During de Valera's absence in America, from June 1919 to the close of 1920, Griffith acted as head of the "Irish Republic." His policy now was carried out in its entirety. The elected bodies, county councils and municipalities refused to take orders from the British authorities in Dublin Castle; Sinn Féin courts were set up and functioned with notable success; income tax was withheld. But these forms of passive resistance were effective only because active resistance was in progress. Griffith neither launched nor controlled the guerilla war, to the pressure of which England finally yielded. During that struggle, power rested with Collins and other young men. Yet Griffith had still a great part to play. When the truce was proclaimed and negotiations were opened in July 1921, de Valera refused to accept the responsibility of abating the full separatist demand. Griffith thereupon undertook the leadership of the delegation which finally secured the inclusion in the treaty of the substance of Sinn Féin's original demand.

Many of those who supported him would not accept the full consequences of the treaty, and when Mr. de Valera resigned, Griffith was elected president, not of the Free State, but of the republic, and the army continued to be in theory the republican army. To meet the difficulty, Griffith set up a provisional government with Michael Collins as chairman to carry on till a general election should have ratified the treaty. This resulted in an illogical division of authority, and as months passed Griffith's public utterances as president were often contradicted by the action or inaction of the provisional government. During the final discussions with the British government in June 1922, concerning the treaty, he interviewed the leading Irish unionists and pledged himself to secure them full representation in the public life of the Free State. His conception of Ireland was less narrowly Gaelic than that of Sinn Féin in general. After the elections on June 16, when a plain verdict was given for acceptance of the treaty, the government was at last forced to take action against the mutinous section of the army. Civil war began on June 27. In July the main bodies of the Irregulars were everywhere decisively beaten, and on Aug. 11 a force sent round by sea occupied Cork, the last important town to be regained. On the morning of Aug. 12 Griffith fell dead suddenly on the way to his office in Dublin. The strain had killed him, and the completion of his life work was left to a younger generation. Essentially he must rank as a publicist, an educator, an inspirer of action. Few men in history have accomplished more for their country than he by his unpaid pen. (S. G.)

GRIFFITH, SIR RICHARD JOHN (1784–1878), Irish geologist, was born in Dublin on Sept. 20, 1784. In 1809 he was appointed by the Irish commissioners to inquire into the nature and extent of the bogs in Ireland, and the means of improving them. In 1812 he was elected professor of geology and mining engineer to the Royal Dublin Society. He made a geological map of Ireland, and in 1825 executed the boundary survey of Ireland, the object of which was to ascertain and mark the boundaries of every county, barony, parish and townland in preparation for the ordnance survey. This work was finished in 1844. He was also called upon to assist in preparing a bill for the general valuation of Ireland; the act was passed in 1826, and Griffith acted as commissioner of valuation, 1868. On "Griffith's valuation" the local and public assessments were made. New and improved editions of his geological map were published in 1835, 1839 and 1855. For this great work and his other services to science he was awarded the Wollaston medal by the Geological Society in 1854, In 1850 he was made chairman of the Irish Board of Works, and in 1858 he was created a baronet. He died in Dublin on Sept. 22, 1878.

Among his many geological works the following map be mentioned: *Outline of the Geology of Ireland* (1838); *Notice respecting the Fossils of the Mountain Limestone of Ireland, as compared with those of Great Britain, and also with the Devonian System* (1842). *See* memoirs in *Quart. Journ. Geol. Soc.* xxxv. *39;* and *Geol. Mag.,* 1878, p. 524, with bibliography.

GRIFFITH, SIR SAMUEL WALKER (1845–1920), Australian lawyer and statesman. was born at Merthyr Tydfil on June 21, 1845, the son of the Rev. Edward Griffith. afterwards of Brisbane, He was educated at the university of Sydney. In 1867 he was called to the bar in Queensland, New South Wales and Victoria. He became Q.C. in 1876. He entered the legislative assembly of Queensland (1872). After holding a series of high offices he became (1903) the first chief justice of the Australian Commonwealth, and held that office until 1919. He was the chief bulwark of the Conservative cause in Australia and his clear intellect, never influenced by passion and rarely by sympathy, has left a deep stamp on Australian life. He published *The Queensland Criminal Code,* and a translation of Dante's *Divina Commedia* (1912). He died at Brisbane on Aug. 9, 1920.

GRIFFITHS, JOHN WILLIS (1809–1882), American naval architect, was born in New York city on Oct. 6, 1809. He was apprenticed to his father's trade of shipwright, and at the age of 19 laid the lines of the frigate "Macedonia." In 1835 he suggested the ram for the bow of warships; in 1836 published a series of articles embodying his ideas on shipbuilding in the *Advocate,* at Portsmouth, Va.; in 1842 gave a series of lectures on naval architecture in New York city and elsewhere, the first notable discourses on the subject to be given in the United States. In the same year he opened a free school for instruction in shipbuilding. In 1841, he proposed departures from the accepted standards in ship construction, exhibiting a model at the American Institute in February of that year, and in 1843 began the construction of a ship embodying his proposals for William H. Aspinwall, a New York-China merchant. This ship, christened the "Rainbow" and launched in 1845, was the first renowned clipper, and introduced a new era in shipbuilding.

Continuing his experiments, Griffiths invented, in 1848, iron keelsons for wooden ships, and in 1851 exhibited a steamboat model at the World's Exhibition in London, which attracted wide attention. Three years later he built for William Norris of Philadelphia, a steamer which made the record for speed between Havana and New Orleans. He became co-editor and associate proprietor of the *Nautical Magazine* and *Naval Journal* in 1856, but upon his appointment by the U.S. Government as special naval constructor in 1858, the magazine ceased publication. He then built the U.S. gunboat "Pawnee" incorporating several new features, including twin screws and a drop bilge, which was one of the widest and lightest draught vessels of similar displacement ever built. Then followed a series of inventions: bilge keels to prevent rolling in 1863, a timber bending machine which he used with success in the "New Era," Boston, 1870, and triple screws for great speed in 1866. He was engaged by the U.S. Government in 1871–72 to erect timber bending machinery, and in 1872 built the "Enterprise" for the Government at Portsmouth, N.H. His timber bending machines were awarded two prizes at the Centennial Exposition in Philadelphia in 1876. In 1879–82, he was engaged in editorial work on the *American Ship,* a New York city weekly journal. He died in Brooklyn, N.Y., on April 29, 1882.

His *Treatise on Marine and Naval Architecture* (2 vol. 1850) was republished in England, and brought him recognition from many maritime nations. His other published works include: *The Shipbuilder's Manual* (2 vol., *1853);* *The Progressive Shipbuilder* (2 vol., 1875–76).

GRIGNARD REAGENTS. Magnesium is unique amongst the chemical elements in the application which it finds in synthetic organic chemistry by virtue of its power of dissolving readily in solutions of many organic compounds which contain chlorine. bromine, or iodine as a constituent atom in their molecules. Thus. if magnesium is added to methyl iodide dissolved in pure dry ether, a vigorous ebullition soon develops, and after a short time the magnesium completely disappears. The solution obtained is termed a Grignard reagent, so named after its discoverer V. Grignard who first carried out this reaction in 1900. In the previous year P. Barbier had found that magnesium may be used to bring about the synthesis of the organic compound dimethylheptenol, and this suggested the above experiment to Grignard. Magnesium will dissolve in ethereal solutions of a wide range of substances which are constituted similarly to methyl iodide (alkyl and aryl halides and substituted derivatives of these), but all halogen compounds of this class do not react with equal facility. In all cases success in the preparation of these reagents depends on the use of

pure materials; the presence of water must be carefully avoided, or immediate decomposition of the reagents will be brought about.

Grignard reagents have proved of the greatest utility in organic chemistry as a means of effecting the syntheses of an extensive variety of substances. The preparation of the Grignard reagent methyl magnesium iodide, and the synthesis of phenylmethylcarbinol by means of this afford a typical illustration of the manner in which these reagents are prepared and used. Methyl iodide dissolved in ether is slowly added to magnesium covered with ether. Reaction soon commences and is carefully regulated by efficient cooling. When this stage of the reaction is complete, benzaldehyde dissolved in ether is added drop by drop to the well-cooled and vigorously stirred solution. Each drop causes a hissing sound on striking the Grignard solution and an additive compound between the reagent and benzaldehyde shortly begins to separate. Decomposition of this by means of water and dilute acid yields phenylmethylcarbinol dissolved in the ethereal layer, from which it is separated, after drying, by distillation. As benzaldehyde and methyl magnesium iodide can react to give products other than phenylmethylcarbinol (viz., benzyl alcohol, acetophenone, phenyl styryl ketone, dibenzoylmethane, and $\alpha\alpha'$-diphenyldiethyl ether), it is necessary in the experiment above described to adhere to exact conditions with regard to quantities and details of working.

Symbolically the preparation of phenylmethylcarbinol is represented as follows:

(1) Preparation of reagent: $CH_3I+Mg \rightarrow CH_3{\cdot}MgI$

(2) Formation of additive compound:

$$C_6H_5{\cdot}CH=O+CH_3{\cdot}MgI \rightarrow C_6H_5{\cdot}CH\begin{matrix}OMgI\\CH_3\end{matrix}$$

(3) Decomposition of additive compound:

$$C_6H_5{\cdot}CH\begin{matrix}OMgI\\CH_3\end{matrix}+H_2O \rightarrow C_6H_5{\cdot}CH\begin{matrix}OH\\CH_3\end{matrix}+Mg\begin{matrix}I\\OH\end{matrix}$$

Although the Grignard reagent is represented as $CH_3{\cdot}MgI$ in (1), each molecule is actually combined with some of the solvent ether. Thus by evaporation of the ethereal solution under specified conditions, a compound of the composition $CH_3MgI\ (C_2H_5)_2O$ may be obtained, but the exact structure of this remains a matter for varied opinion. By heating more strongly, $CH_3{\cdot}MgI$ may be prepared. The ethereal solution is, however, employed for synthetic purposes, and the equation is represented as above, since the products formed by the use of Grignard reagents may be accurately accounted for whilst ignoring the combined ether of the reagent.

The reaction given is one of a general type, namely, the reaction between Grignard reagents and compounds containing the carbonyl grouping ($>C=O$). By such reactions, alcohols, unsaturated hydrocarbons, and acids may be readily prepared. Frequently in addition to the carbonyl group a second grouping may also undergo reaction as in the formation of tertiary alcohols from esters. Many reactions of types quite different from these are known, however, and the examples here cited provide only the most fragmentary indication of the application of Grignard reagents; for detailed summaries of original investigations *see* Alex. McKenzie, *British Association Report*, 1907, p.273; Henry Wren, "Organometallic Compounds of Zinc and Magnesium" (1913); Chemical Society (London), *Annual Reports*, 1915, vol. xii., p. 97; 1925, vol. xxii., p. 121. (A. M. W.)

GRIGOROVICH, DMITRI VASILIEVICH (1822–1900), Russian writer, was born on March 31, 1822, at Simbirsk. He began his career as an artist, but in 1846–47 made his mark in literature by stories of peasant life, *The Village*, and *Anton Goremyka*. In these he attempted a description of village life from the village point of view; but the importance of the books lies rather in the idea than in actual performance. After 1860 he gave up fiction except for occasional magazine stories. His real service to Russian literature was his instant appreciation of Dostoievsky and Chekhov. He died on Jan. 3, 1900, at St. Petersburg (Leningrad).

GRILLE, a French term for an enclosure in either iron or bronze; there is no equivalent in English, "grating" applying more to a horizontal frame of bars over a sunken area, and "grate" to the iron bars of an open fireplace The finest examples of the grille are those known as the *rejas*, which in Spanish churches form the enclosures of chapels, such as the *reja* in the Capilla Real at Granada in wrought iron partly gilt (1522). Similar grilles are employed to protect the ground-floor windows of mansions not only in Spain but in Italy and Germany. The finest grilles in Italy are the enclosures of the tombs of the Della Scalas at Verona (end of 13th century), in Germany the grille of the cenotaph of Maximilian at Innsbruck (early 16th century) and in France those which enclose the Place Stanislaus, the Place de la Carrière and the churches of Nancy, which were wrought by Jean Lamour in the middle of the 18th century. Generally, however, throughout Germany the wrought iron grilles are fine examples of forging, and they are employed for the enclosures of the numerous fountains, in the tympana of gateways, and for the protection of windows.

GRILLPARZER, FRANZ (1791–1872), the greatest dramatic poet of Austria, was born in Vienna, on Jan. 15, 1791. His father, severe, pedantic, a staunch upholder of the liberal traditions of the reign of Joseph II., was an advocate of some standing; his mother, a nervous, finely-strung woman, belonged to the well-known musical family of Sonnleithner. After a desultory education, Grillparzer entered in 1807 the University of Vienna as a student of jurisprudence; but two years later his father died, leaving the family in straitened circumstances, and Franz, the eldest son, was obliged to turn to private tutoring. He became a clerk in the Lower Austrian revenue administration, and in 1818 poet to the Hofburgtheater, and a clerk in the *Hofkammer* (exchequer); in 1832 he became director of the archives of that department, and in 1856 retired from the civil service.

In 1817 the first representation of his tragedy *Die Ahnfrau* made him famous, but before this he had written a long tragedy in iambics, *Blanca von Castilien* (1807–09), which was obviously modelled on Schiller's *Don Carlos;* also the dramatic fragments *Spartacus* and *Alfred der Grosse* (1809). *Die Ahnfrau* is a gruesome "fate-tragedy" in the trochaic measure of the Spanish drama, already made popular by Adolf Miillner in his *Schuld;* but Grillparzer's work is a play of real poetry, and reveals an instinct for dramatic as opposed to merely theatrical effect, which distinguishes it from other "fate-dramas" of the day. *Die Ahnfrau* was followed by *Sappho* (1818), a drama in the classic spirit of Goethe's *Tasso.* In 1821 appeared *Das goldene Vliess,* a trilogy which had been interrupted in 1819 by the death of the poet's mother—in a fit of depression she had taken her own life—and a subsequent visit to Italy. Opening with a powerful dramatic prelude in one act, *Der Gastfreund,* Grillparzer depicts in *Die Argonauten* Jason's adventures in his quest for the Fleece; while *Medea,* a tragedy of noble classic proportions, contains the culminating events of the story. The theme is similar to that of *Sappho,* but the scale on which it is represented is larger; it is again the tragedy of the heart's desire, the conflict of the simple happy life with that sinister power—be it genius, or ambition—which upsets the equilibrium of life. The end is bitter disillusionment, the only consolation renunciation.

For his historical tragedy *Konig Ottokars Glück und Ende* (1823, but owing to difficulties with the censor, not performed until 1825), Grillparzer chose one of the most picturesque events in Austrian domestic history, the conflict of Ottokar of Bohemia with Rudolph von Habsburg. He reproduced the motley world of the old chronicler, without losing sight of the exigencies of the theatre; the fall of Ottokar is but another text from which the poet preached the futility of endeavour and the vanity of worldly greatness. A second historical tragedy, *Ein treuer Diener seines Herrn* (1826, performed 1828), attempts to embody a more heroic gospel; but the subject—the superhuman self-effacement of Bankbanus before Duke Otto of Meran—proved too uncompromising an illustration of Kant's categorical imperative of duty to be palatable in the theatre.

With these historical tragedies began the darkest ten years in the poet's life. They brought him into conflict with the Austrian censor—a conflict which grated on Grillparzer's sensitive soul, and was aggravated by his position as a civil servant; in 1826 he paid a visit to Goethe in Weimar, and was able to compare the enlightened conditions which prevailed in the little Saxon duchy with the intellectual thraldom of Vienna. In the winter of 1820–21 he had met for the first time Katharina Frohlich (1801–79), and

the acquaintance rapidly ripened into love on both sides; but whether owing to a presentiment of mutual incompatibility, or merely owing to Grillparzer's conviction that life had no happiness in store for him, he shrank from marriage. Whatever the cause may have been, the poet was plunged into an abyss of misery and despair to which his diary bears heart-rending witness; his sufferings found poetic expression in the fine cycle of poems bearing the significant title *Tristia ex Ponto* (1835).

To these years we owe the completion of two of Grillparzer's greatest dramas, *Des Meeres und der Liebe Wellen* (1831) and *Der Traum, ein Leben* (1834). In the former tragedy, a dramatization of the story of Hero and Leander, he returned to the Hellenic world of *Sappho,* and produced what is perhaps the finest of all German love-tragedies. His mastery of dramatic technique is here combined with a ripeness of poetic expression and with an insight into motive which suggests the modern psychological drama of Hebbel and Ibsen; the old Greek love-story of Musaeus is, moreover, endowed with something of that ineffable poetic grace which the poet had borrowed from the great Spanish poets, Lope de Vega and Calderon. *Der Traum, ein Leben,* Grillparzer's technical masterpiece, is in form perhaps even more Spanish; it is also more of what Goethe called a "confession." The aspirations of Rustan, an ambitious young peasant, are shadowed forth in the hero's dream, which takes up nearly three acts of the play; ultimately Rustan awakens from his nightmare to realize the truth of Grillparzer's own pessimistic doctrine that all earthly ambitions and aspirations are vanity; the only true happiness is contentment with one's lot, "des Innern stiller Frieden und die schuldbefreite Brust." *Der Traum, ein Leben* was the first of Grillparzer's dramas which did not end tragically, and in 1838 he produced his only comedy, *Weh' dem, der liigt.*

But *Weh' dem, der liigt,* in spite of its humour of situation, its sparkling dialogue and the originality of its idea—namely, that the hero gains his end by invariably telling the truth, where his enemies as invariably expect him to be lying—was too strange to meet with approval in its day. Its failure was a blow to the poet, who turned his back for ever on the German theatre. In 1836 Grillparzer paid a visit to Paris and London, in 1843 to Athens and Constantinople. Then came the Revolution which struck off the intellectual fetters under which Grillparzer and his contemporaries had groaned in Austria, but the liberation came too late for him. Honours were heaped upon him; he was made a member of the Academy of Sciences; Heinrich Laube, as director of the Burgtheater, reinstated his plays on the repertory; he was in 1861 elected to the Austrian *Herrenhaus;* his 80th birthday was a national festival, and when he died in Vienna, on Jan. 21, 1872, the mourning of the Austrian people was universal. With the exception of a beautiful fragment, *Esther* (1861), Grillparzer published no more dramatic poetry after the fiasco of *Weh' dem, der liigt,* but at his death three completed tragedies were found among his papers. Of these, *Die Jiidin von Toledo,* an admirable adaptation from the Spanish, has won a permanent place in the German classical repertory; *Ein Bruderzwist im Hause Habsburg* is a powerful historical tragedy and *Libussa* is perhaps the ripest, as it is certainly the deepest, of all Grillparzer's dramas.

Although Grillparzer was essentially a dramatist, his lyric poetry is in the intensity of its personal note hardly inferior to Lenau's. As a prose writer, he has left one powerful short story, *Der arme Spielmann* (1848), and a volume of critical studies on the Spanish drama, which shows how completely he had succeeded in identifying himself with the Spanish point of view.

Grillparzer's brooding, unbalanced temperament, his lack of will-power, his pessimistic renunciation and the bitterness which his self-imposed martyrdom produced in him, made him peculiarly adapted to express the mood of Austria in the epoch of intellectual thraldom that lay between the Napoleonic wars and the Revolution of 1848; his poetry reflects exactly the spirit of his people under the Metternich régime, and there is a deep truth behind the description of *Der Traum, ein Leben* as the Austrian *Faust.* His fame was in accordance with the general tenor of his life; even in Austria a true understanding for his genius was late in coming, and not until the centenary of 1891 did the German-speaking world realize that it possessed in him a dramatic poet of the first rank; in other words, that Grillparzer was no mere "Epigone" of the classic period, but a poet who, by a rare assimilation of the strength of the Greeks, the imaginative depth of German classicism and the delicacy and grace of the Spaniards, had opened up new paths for the higher dramatic poetry of Europe.

Grillparzer's *Sämtliche Werke* are edited by A. Sauer, in 20 vols. (5th ed., Stuttgart, 1892–94); also, since the expiry of the copyright in 1901, innumerable cheap reprints. *Briefe und Tagebucher,* edit. by *C.* Glossy and A. Sauer (2 vols., Stuttgart, 1903). *Jahrbuch dcr Grillparzer-Gesellschaft,* edit. by *K.* Glossy (the publication of the Grillparzer Society) (Vienna, 1891 **ff.**). *See* also *H.* Laube, *Franz Grillparzers Lebensgeschichte* (Stuttgart, 1884); J. Volkelt, *Franz Grillparzer als Dichter des Tragischen* (Nordlingen, 1888); E. Reich, *Franz Grzllparzers Dramen* (Dresden, 1894); A. Ehrhard, *Franz Grillparzer* (Paris, 1900, German trans. by M. Necker, Munich, 1902); H. Sittenberger, *Grillparzer, sein Leben und Wirken* (1904); Gustav Pollak, F. *Grzllparzer and the Austrian Drama* (1907); *F.* E. Gruber, *Franz Grzllparzer und seine Buhnenwerke* (1922). Of Grillparzer's works, translations have appeared in English of *Sappho* (1820, by *J.* Bramsen; 1846, by E. B. Lee; 1855, by L. C. Cumming; 1876, by E. Frothingham); and of *Medea* (1879, by F. W. Thurstan and J. A. Wittmann). Byron's warm admiration of *Sappho (Letters and Journals,* v. 171) is well known, while Carlyle's criticism, in his essay on *German Playwrights* (1829), is interesting as expressing the generally accepted estimate of Grillparzer in the first half of the 19th century. *See* the bibliography in K. Goedeke's *Grundriss zur Geschichte der deutschen Dichtung,* 2nd ed., vol. viii. (1905). **(J. G. R.)**

GRIMALD or **GRIMOALD, NICHOLAS** (1519–1562), English poet, was born in Huntingdonshire, the son probably of Giovanni Baptista Grimaldi, who had been a clerk in the service of Empson and Dudley in the reign of Henry VII. He studied both at Cambridge and Oxford. In 1547 he was lecturing on rhetoric at Christ Church, and shortly afterwards became chaplain to Bishop Ridley, who, when he was in prison, desired Grimald to translate Laurentius Valla's book against the alleged *Donation* of *Constantine,* and the *De gestis Basiliensis Concilii* of Aeneas Sylvius (Pius II.). His connection with Ridley brought him under suspicion, and he was imprisoned in the Marshalsea. It is said that he escaped the penalties of heresy by recanting his errors. Grimald contributed to the original edition (June 1557) of *Songes and Sonettes* (commonly known as *Tottel's Miscellany),* 40 poems, only ten of which were retained in the second edition published in the next month. He translated (1553) Cicero's *De officiis* as *Marcus Tullius Ciceroes thre bokes of duties* (2nd ed., 1556). Two Latin tragedies also are extant; *Archipropheta sive Johannes Baptista,* printed at Cologne in 1548, probably performed at Oxford the year before, and *Christus redivivus* (Cologne, 1543), edited by Prof. J. M. Hart (for the Modern Language Association of America, 1886, separately issued 1899). As a poet Grimald is memorable as the earliest follower of Surrey in the production of blank verse. He writes sometimes simply enough, as in the lines on his own childhood addressed to his mother, but in general his style is artificial.

See C. *H.* Herford, *Studies in the Literary Relations of England and Germany* (pp. 113–119, 1886); *A Catalogue of printed books . . . by writers bearing the name of Grimaldi* (ed. *A. B.* Grimaldi), printed 1883; and Arber's reprint of *Tottel's Miscellany.*

GRIMALDI, GIOVANNI FRANCESCO (1606–1680), Italian architect, painter and engraver, was born at Bologna. He studied art under the Caracci and under Albani. In 1626 he went to Rome and was appointed architect to Pope Paul V., and was also patronized by succeeding popes. In 1649 he was invited to France by Cardinal Mazarin, and for about two years was employed on the decoration of the Palais Mazarin (now the Bibliothéque Nationale) and of other buildings. Returning to Rome in 1651 he was made president of the Academy of St. Luke; and in that city he died on Nov. 28, 1680. Paintings by Grimaldi are preserved in the Quirinal and Vatican palaces, in the church of S. Martino a'Monti and in the Borghese and Doria Galleries.

GRIMALDI, JOSEPH (1779–1837), most celebrated of English clowns, was born in London on Dec. 18, 1779, the son of an Italian actor. When less than two years old he was brought upon Drury Lane stage; at the age of three he appeared at Sadler's Wells; and he did not retire until 1828. As the clown of

pantomime he was considered without an equal, his greatest success being in *Mother Goose,* at Covent Garden (1806 and often revived). Grimaldi died on May 31, 1837. His *Memoirs* (2 vols., 1838), were edited by Charles Dickens.

GRIMKE, SARAH MOORE, and **ANGELINA EMILY** (1792–1873) and (1805–1879), American reformers, born in Charleston (S.C.)—Sarah on Nov. 6, 1792, and Angelina on Feb. 20, 1805. In 1821 Sarah, then visiting Philadelphia, became a Quaker; so, too, did Angelina, who joined her in 1829. Both sisters were strong abolitionists. In 1836 they came to New York. Angelina then published her *Appeal to the Christian Women of the South,* and at the end of that year Sarah wrote an *Epistle to the Clergy of the Southern States.* In the same year, at the invitation of the American Anti-slavery Society, Angelina, accompanied by Sarah, began giving talks on slavery, first in private and then in public. While the sisters were in Massachusetts the General Association of Congregational Ministers of Massachusetts issued a letter calling on the clergy to close their churches to women exhorters. Garrison denounced the attack on the Grimké sisters and Whittier ridiculed it in his poem, "The Pastoral Letter," Angelina pointedly answered *Miss Beecher on the Slave Question* (1837) in letters in the *Liberator.* Sarah, who had never forgotten that her studies had been curtailed because she was a girl, contributed to the Boston *Spectator* papers on "The Province of Woman" and published *Letters on the Condition of Women and the Equality of the Sexes* (1838), the real beginning of the "woman's rights" movement in America, and at the time a cause of anxiety to Whittier and others, who urged upon the sisters the prior importance of the anti-slavery cause. In 1838 Angelina married Theodore Dwight Weld (1803–95). She and her husband, accompanied by Sarah, resided at Fort Lee (N.J.), from 1838 to 1840, then at Belleville (N.J.). They conducted a school for black and white alike at Eagleswood, near Perth Amboy. Sarah died on Dec. 23, 1873, and Angelina on Oct. 26, 1879. *See* Catherine H. Birney, *The Grimké Sisters* (1885).

GRIMM, FRIEDRICH MELCHIOR, BARON VON (1723–1807), French author, the son of a German-pastor, was born at Ratisbon on Dec. 26, 1723. He studied at Leipzig, where he came under the influence of Gottsched and J. A. Ernesti, and was afterwards attached to the household of Count Schonberg. In 1748 he accompanied August Heinrich, Count Friesen, to Paris as secretary, and he is said by Rousseau to have acted for some time as reader to Frederick, the young hereditary prince of Saxe-Gotha. In 1753 Grimm, following the example of the abbé Raynal, began a literary correspondence with various German sovereigns. Raynal's letters, *Nouvelles littéraires,* ceased early in 1755, and, with the aid of friends (especially Diderot and Mme. d'Épinay) during his temporary absences from France, he carried on the correspondence, which consisted of two letters a month, until 1773, eventually counting among his subscribers Catherine II. of Russia, Stanislas Poniatowski, king of Poland, and many princes of the smaller German States. It was probably in 1754 that Grimm was introduced by Rousseau to Mme. d'Épinay, with whom he soon formed a *liaison* which led to an irreconcilable rupture between him and Rousseau, the latter in his resentment giving in his *Confessions* a wholly mendacious portrait of Grimm's character. In 1755, Grimm became *secrétaire des commandements* to the duke of Orleans, and in this capacity accompanied Marshal d'Estrées on the campaign of Westphalia in 1756–57. He was named envoy of the town of Frankfort at the court of France in 1759, but was deprived of his office for criticizing the comte de Broglie in a despatch intercepted by Louis XV. He was made a baron of the Holy Roman Empire in 1775.

His introduction to Catherine II. took place at St. Petersburg in 1773, at the marriage of Wilhelmine to the tsarevich Paul. He became minister of Saxe-Gotha at the court of France in 1776, but in 1777 he again left Paris on a visit to St. Petersburg, where he remained for nearly a year in daily intercourse with Catherine. He acted as Paris agent for the empress in the purchase of works of art, and executed many confidential commissions for her. In 1783 and the following years he lost his two most intimate friends, Mme. d'Épinay and Diderot. In 1792 he emigrated, and in the next year settled in Gotha, where his poverty was relieved by Catherine, who in 1796 appointed him minister of Russia at Hamburg. On the death of Catherine he took refuge with Mme. d'Épinay's granddaughter, Émilie de Belsunce, comtesse de Bueil. He died at Gotha on Dec. 19, 1807.

The correspondence of Grimm was not divulged during his lifetime. It embraces nearly the whole period from 1750 to 1790, but the volumes from 1773 were chiefly the work of his secretary, Jakob Heinrich Meister. At first he contented himself with giving views on literature and art and indicating very slightly the contents of the principal new books; but gradually his criticisms became more extended and trenchant, and he touched on nearly every subject—political, literary, artistic, social and religious—which interested contemporary Paris.

Grimm's *Correspondance litte'raire, philosophique et critique . . . , depuis 1753 jusqu'en 1769,* was edited, with many excisions, by J. B. A. Suard and published at Paris in 1812, in 6 vols., 8vo; *deuxième partie, de 1771 à 1782,* in 1812 in 5 vols., 8vo; and *troisième partie, pendant une partie des années 1775 et 1776, et pendant les années 1782 d 1790 inclusivement,* in 1813 in 5 vols. 8vo. A supplementary volume appeared in 1814; the whole was collected and published by M. Jules Taschereau, with the assistance of A. Chaudé, in a new edition (Paris, 1829, 15 vols. 8vo.); the *Correspondance inédite, et recueil de lettres, poésies, morceaux, et fragments retranchés par la censure impériale en 1812 et 1813* was published in 1829. The standard edition is that of M. Tourneux (16 vols., 1877–82). Grimm's *Mémoire historique sur l'origine et les suites de mon attachement pour l'impératrice Catherine II. jusqu' au décès de sa majestt impèriale,* and Catherine's correspondence with Grimm (1774–96) were published by J. Grot in 1880, in the *Collection* of the Russian Imperial Historical Society. She treats him very familiarly, and calls him Héraclite, Georges Dandin, etc. At the time of the Revolution she begged him to destroy her letters, but he refused, and after his death they were returned to St. Petersburg. Grimm's side of the correspondence, however, is only partially preserved. He signs himself "Pleureur." Some of his letters, besides the official correspondence, are included in the edition of M. Tourneux; others are contained in the *Erinnerungen einer Urgrossmutter* of *K.* von Bechtolsheim, edited (Berlin, 1902) by Count C. Oberndorff. *See* also Mme. d'Épinay's *Mémoires;* Rousseau's *Confessions; E.* Scherer, *Melchior Grimm* (1887); Sainte-Beuve, *Causeries du lundi,* vol. vii.; and K. *A.* Georges, *Friedrich Melchior Grimm* (Hanover and Leipzig, 1904).

GRIMM, JACOB LUDWIG CARL (1785–1863), German philologist and mythologist, was born on Jan. 4, 1785, at Hanau, in Hesse-Cassel. His father, who was a lawyer, died while he was a child, and the mother was left with very small means; but her sister, who was lady of the chamber to the landgravine of Hesse, helped to support and educate her numerous family. Jacob, with his younger brother Wilhelm (b. Feb. 24, 1786), was sent in 1798 to the public school at Cassel. The two brothers studied law at Marburg. The lectures of Savigny (*q.v.*) on Roman law taught Grimm to realize what it meant to study any science. Savigny's lectures also awakened in him that love for historical and antiquarian investigation which forms the basis of all his work. In Savigny's well-provided library Grimm first turned over the leaves of Bodmer's edition of the Old German minnesingers and other early texts. In the beginning of 1805 Savigny, who had removed to Paris, invited him to help him in his literary work. Grimm passed a very happy time in Paris, strengthening his taste for the literatures of the middle ages by his studies in the Paris libraries Towards the close of the year he returned to Cassel, where his mother and Wilhelm had settled, and obtained a small clerkship in the War Office. In 1808 he was appointed superintendent of the private library of Jerome Buonaparte, king of Westphalia, and auditor to the State council. After the expulsion of Jerome and the reinstalment of an elector, Grimm was appointed in 1813 secretary of legation, to accompany the Hessian minister to the headquarters of the allied army. In 1814 he was sent to Paris to demand restitution of the books carried off by the French, and in 1814–15 he attended the congress of Vienna as secretary of legation. On his return he was again sent to Paris on the same errand as before. Meanwhile Wilhelm had received an appointment in the Cassel library, and in 1816 Jacob was made second librarian under Volkel. The brothers removed next year to Gottingen, where Jacob received the appointment of professor and librarian, Wilhelm that of under-librarian. Jacob Grimm lectured on legal antiquities, historical grammar, literary history,

and diplomatics, explained Old German poems, and commented on the *Germania* of Tacitus. In 1837, being one of the seven professors who signed a protest against the king of Hanover's abrogation of the constitution, he was dismissed from his professorship, and banished from the kingdom of Hanover. The brothers returned to Cassel, and in 1840 went to Berlin, where they both received professorships, and were elected members of the Academy of Sciences. Jacob seldom lectured, but worked with his brother at the great dictionary. He died on Sept. 20, 1863, working up to the last. He was never ill, and worked on all day, without haste and without pause.

The purely scientific side of Grimm's character developed slowly. He seems to have felt the want of definite principles of etymology without being able to discover them, and indeed even in the first edition of his grammar (1819) he seems to be often groping in the dark. The first work he published, *Über den altdeutschen Meistergesang* (1811), was of a purely literary character. Yet even in this essay Grimm showed that *Minnesang* and *Meistersang* were really one form of poetry, of which they merely represented different stages of development. and also announced his important discovery of the invariable division of the *Lied* into three strophic parts. His text-editions were mostly prepared in common with his brother. In 1812 they published the two ancient fragments of the *Hildebrandslied* and the *Weissenbrunner Gebet*, Jacob having discovered what till then had never been suspected—the alliteration in these poems. However, Jacob had little taste for text-editing, and, as he himself confessed, the evolving of a critical text gave him little pleasure. He therefore left this department to others, especially Lachmann, who soon turned his brilliant critical genius, trained in the severe school of classical philology, to Old and Middle High German poetry and metre. Both brothers were attracted from the beginning by all national poetry, whether in the form of epics, ballads or popular tales. They published in 1816–18 an analysis and critical sifting of the oldest epic traditions of the Germanic races under the title of *Deutsche Sagen*. They collected all the popular tales they could find, partly from the mouths of the people, partly from mss. and books, and published in 1812–15 the first edition of those *Kinder- und Hausmärchen* which have carried the name of the brothers Grimm into every household of the civilized world, and founded the science of folk-lore. The closely allied subject of the satirical beast epic of the middle ages also had a great charm for Jacob Grimm, and he published an edition of the *Reinhart Fuchs* in 1834. His first contribution to mythology was the first volume of an edition of the Eddaic songs, undertaken conjointly with his brother, published in 1815, which, however, was not followed by any more. The first edition of his *Deutsche Mythologie* appeared in 1835. This great work covers the whole range of the subject, tracing the mythology and superstitions of the old Teutons back to the very dawn of direct evidence, and following their decay and loss down to the popular traditions, tales and expressions of his time.

Of all his more general works the boldest and most far-reaching is his *Geschichte der deutschen Sprache*, where at the same time the linguistic element is most distinctly brought forward. He laboriously collects the scattered words and allusions to be found in classical writers, and endeavours to determine the relations in which the German language stood to those of the Getae, Thracians, Scythians, and many other nations whose languages are known only by doubtfully identified, often extremely corrupted remains preserved by Greek and Latin authors. Grimm's results have been greatly modified by the work of later scholars; but his book will always be one of the most fruitful and suggestive that have ever been written. His *Deutsche Grammatik* was the outcome of his purely philological work. Grimm himself did not at first intend to include all the languages in his grammar; but he soon found that Old High German postulated Gothic, that the later stages of German could not be understood without the help of the Low German dialects, including English, and that the rich literature of Scandinavia could as little be ignored. The first edition of the first part of the *Grammar* appeared in 1819, the second in 1822. While the first edition gives only the inflections, in the second volume phonology takes up no fewer than 600 pages, more than half of the whole volume. Grimm had, at last, awakened to the full conviction that all sound philology must be based on rigorous adhesion to the laws of sound-change. Up to Grimm's time philology was nothing but a more or less laborious and conscientious dilettanteism, with occasional flashes of scientific inspiration; he made it into a science. His advance must be attributed mainly to the influence of his contemporary R. Rask. Even in Grimm's first editions his Icelandic paradigms are based entirely on Rask's grammar, and in his second edition he relied almost entirely on Rask for Old English. His debt to Rask can only be estimated at its true value by comparing his treatment of Old English in the two editions; the difference is very great. To Rask belongs the merit of having first distinctly formulated the laws of sound-correspondence in the different languages.

Grimm's Law.—The question, Who discovered what is known as *Grimm's law?* is a difficult one. This law of the correspondence of consonants in the older Indo-germanic, Low and High German languages respectively was first fully stated by Grimm in the second edition of the first part of his grammar. The correspondence of single consonants had been more or less clearly recognized by several of his predecessors: but the one who came nearest to the discovery of the complete law was the Swede J. Ihre, who established a considerable number of "literarum permutationes." Rask, in his essay on the origin of the Icelandic language, gives the same comparisons, with a few additions. As Grimm in the preface to his first edition expressly mentions this essay of Rask, there is every probability that it gave the first impulse to his own investigations. But there is a wide difference between the isolated permutations of his predecessors and his comprehensive generalizations. The extension of the law to High German is also entirely his own. The importance of Grimm's generalization in the history of philology cannot be overestimated, and even the mystic completeness and symmetry of its formulation, although it has proved a hindrance to the correct explanation of the causes of the changes, impressed the popular mind, and gave it a vivid idea of the paramount importance of law, and the necessity of disregarding mere superficial resemblance.

The grammar was continued in three volumes, treating principally of derivation, composition and syntax, which last was left unfinished. Grimm then began a third edition, of which only one part, comprising the vowels, appeared in 1840, his time being afterwards taken up mainly by the dictionary. The grammar stands alone for comprehensiveness, method and fullness of detail. Every law, every letter, every syllable of inflection in the different languages is illustrated by an almost exhaustive mass of material. It has served as a model for all succeeding investigators. Diez's grammar of the Romance languages is founded entirely on its methods, which have also exerted a profound influence on the wider study of the Indo-Germanic languages in general.

In the great German dictionary Grimm undertook a task on so large a scale as to make it impossible for him and his brother to complete it themselves. The dictionary, as far as it was worked out by Grimm himself, may be described as a collection of disconnected antiquarian essays of high value. Grimm's patriotism and love of historical investigation received their fullest satisfaction in the study of the language, traditions, mythology, laws and literature of his own countrymen and their nearest kindred. But from this centre his investigations were pursued in every direction as far as his unerring instinct of healthy limitation would allow. He was equally fortunate in the harmony that subsisted between his intellectual and moral nature. He made cheerfully the heavy sacrifices that science demands from its disciples, without feeling any of that envy and bitterness which often torment weaker natures; and although he lived apart from his fellow men, he was full of human sympathies. His was the very ideal of the noblest type of German character.

The following is a complete list of his separately published works, those which he published in common with his brother being marked with a star. For a list of his essays in periodicals, etc., see vol. v. of his *Kleinere Schriften*, from which the present list is taken. *Über den altdeutschen Meistergesang* (Gottingen, 1811); **Kinder- und Hausmarchen* (Berlin, 1812–15) (many editions);

**Das Lied von Hildebrand und das Weissenbrunner Gebet* (Cassel, 1812); *Altdeutsche Walder* (Cassel, Frankfort, 1813–16, 3 vols.); **Der arme Heinrich von Hartmann von der Aue* (1815); *Irmenstrasse und Irmensäule* (1815); **Die Lieder der alten Edda* (1815); *Silva de romances viejos* (1815); **Deutsche Sagen* (1816–18, 2nd ed., 186j–66); *Deufsche Grammatik* (Gottingen, 1819, 2nd ed., Gottingen, 1822–40) (reprinted 1870 by W. Scherer, Berlin); *Wuk Stephanovitsch's kleine serbische Grammatik, verdeutscht mit einer Vorrede* (Leipzig and Berlin, 1824); *Zur Recension der deutschen Grammatik* (Cassel, 1826); **Irische Elfenmarchen, aus dem Englischen* (Leipzig, 1826); *Deutsche Rechtsaltertiimer* (Gottingen, 1828, 2nd ed., 1854); *Hymnorum veteris ecclesiae XXVI. interpretatio theodisca* (Gottingen, 1830); *Reinhart Fuchs* (1834); *Deutsche Mythologie* (Gottingen, 1835, 3rd ed., 1854, 2 vols.); *Taciti Germania edidit* (Gottingen, 183j); *Über meine Entlassung* (Basle, 1838); (together with Schmeller) *Lateinische Gediclzte des X. und XI. Jahrhunderts* (Gottingen, 1838); *Sendschreiben an Karl Lachmann iiber Reinhart Fuchs* (1840); *Weistiimer*, Th. i. (Gottingen, 1840) (continued, partly by others, in j parts, 1840–69); *Andreas und Elene* (Cassel, 1840); *Frau Aventure* (1842); *Geschtchte der deutschen Sprache* (Leipzig, 1848, 3rd ed., 1868, 2 vols.); *Das Wort des Besitzes* (1850); **Deutsches Worterbuch*, Bd. i. (Leipzig, 1854); *Rede auf Wilhelm Grimm und Rede iiber das Alter* (1868, 3rd ed., 1865); *Kleinere Schriften* (1864–70, 5 vols.).

(H. Sw.; X.)

Grimm's *Selbstbiographie* is printed in his *Kleinere Schriften*. His correspondence with other savants has been printed at intervals from 1877 onwards. *See* W. Scherer, *Jacob Grimm* (2nd ed. 1885; new ed., 1925); and various monographs by R. Steig.

GRIMM, ROBERT (1881–), Swiss socialist, was born on April 16, 1881. From 1899 to 1905 he worked as a foreman printer in Switzerland and abroad. From 1906 to 1909 he acted as secretary to the labour organization at Basle, and from 1909 edited the *Berner Tagwacht* for nine years. During the latter period he was elected (1916) member of the *grand conseil bernois*, of which he became president in 1922–23. In 1911 he was elected *conseiller national* and was an active leader of the Swiss socialist party. In 1919, owing to his conduct during the general strike of 1918, he was sentenced to six months' imprisonment on a charge of inciting to disorder. These events also led to his defeat in the election of president of the *Conseil national* in 1926, although he was the official candidate of his party.

Grimm is the author of *Histoire de la Suisse dans les luttes de classe*.

GRIMM, WILHELM CARL (1786–1859). For the chief events in the life of Wilhelm Grimm *see* article on Jacob Grimm above. As Jacob himself said in his celebrated address to the Berlin Academy on the death of his brother, the whole of their lives were passed together. In their schooldays they had one bed and one table in common, as students they had two beds and two tables in the same room, and they always lived under one roof, and had their books and property in common. Nor did Wilhelm's marriage in any way disturb their harmony. As Cleasby said ("Life of Cleasby," prefixed to his *Icelandic Dictionary*, p. lxix.), "they both live in the same house, and in such harmony and community that one might almost imagine the children were common property." Cleasby describes Wilhelm as "an uncommonly animated, jovial fellow." He was, accordingly, much sought in society, which he frequented much more than his brother.

His first work was a spirited translation of the Danish *Kaempeviser, Altdanische Heldenlieder*, published in 1811–13, which made his name at first more widely known that that of his brother. Of his other works the most important is *Deutsche Heldensage* (2nd ed. 1868).

GRIMMA, German town in the *Land* of Saxony, on the left bank of the Mulde, 19 m. S.E. of Leipzig. Pop. (1939) 13,942. Of Sorbian origin, it is first mentioned in 1203. Among the principal buildings are the Schloss built in the 12th century, and long a residence of the margraves of Meissen and the electors of Saxony; the town-hall, dating from 1442, and the famous school Fiirstenschule (*Illustre Moldanum*), erected by the elector Maurice on the site of the former Augustinian monastery in 1550. Among the industries of the town are machine building and dyeworks, while paper and gloves are manufactured there. In the immediate neighbourhood are the ruins of the Cistercian nunnery from which Catherine von Bora fled in 1523, and the village of Doben with an old castle.

GRIMMELSHAUSEN, HANS JAKOB CHRISTOFFEL VON (*c.* 1625–1676), German author, was born at Gelnhausen. At the age of ten he was kidnapped by Hessian soldiery, and with them saw military life in the Thirty Years' War; at its close he entered the service of Franz Egon von Fürstenberg, bishop of Strasbourg, and in 166j was made *Sckultheiss* (magistrate) at Renchen, Baden. In 1669 he published *Der abenteuerliche Simplicissimus, Teutsch, d h. die Beschreibung des Lebens eines seltsamen Vaganten, genannt Melchior Sternfels von Fuchsheint*, the greatest German novel of the 17th century. It is modelled on the picaresque romances of Spain, and, beginning with the childhood of its hero, describes his adventures in the Thirty Years' War. The realistic detail with which these pictures are presented makes the book a valuable historical document. Towards the end Grimmelshausen over-indulges in allegory, and finally loses himself in a Robinson Crusoe story.

Among his other works are the so-called *Simplicianische Schriften: Die Erzbetriigerin und Landstörtzerin Courasche (c.* 1669); *Der seltsame Springinsfeld* (1670) and *Das wunderbarliclze Vogelnest* (1672). His satires, such as *Der teutsche Michel* (1670), and "gallant" novels, like *Dietwald und Amelinde* (1670) are of inferior interest. He died at Renchen on Aug. 17, 1676.

There are numerous modern editions of *Simplicissimus*, and the *Simplicianische Schriften* have been published by H. Kurz (1863–64), J. Tittmann (Leipzig, 1877), and Scholte (1923). A reprint of the first edition of the novel was edited by R. Kogel for the series of *Neudrucke des 16. und 17. Jahrhzinderts* (1880); it was first published in an Eng. trans. in 1912. *See* the introductions to these editions; also F. Antoine, *Étude sur le Simplicissimus de Grimmelshausen* (1882); *A.* Bechtold, *J. J. C. von Grimmelshausen und seine Zeit . . .* (1914); Lochner, *Ein deutscher Mensch im 17ten Jahrhundert* (1924).

GRIMOARD, PHILIPPE HENRI, COMTE DE (1753–181j), French soldier and military writer, became one of Louis XVI.'s most valued counsellors in political and military matters, served in Louis's military cabinet, and was marked out as future minister of war. His scheme of defence (1791) proved later of great assistance to the Committee of Public Safety but his military career was ended by the revolution.

His numerous works include: *Histoire des dernières campagnes de Turenne* (1780); *Troupes légères et leur emploi* (1782); *Conquêtes de Gzrstave-Adolphe* (Stockholm and Neufchatel, 1782–91); *Recherches sur la force de l'armée française depuis Henri IV. jusqu'en 1805* (1806); and (with Servant) *Tableau historique de la guerre de la Révolution 1792–1794* (1808).

GRIMSBY or **GREAT GRIMSBY,** a municipal, county and parliamentary borough of Lincolnshire, England, on the south shore of the Humber and 155 mi. N. from London by the L.N.E.R. Pop. (1938) 92,320. Area, 9 2 sq.mi. Grimsby (*Grimesbi*) is associated with the Danish invasions of the 8th century. It was a borough by prescription as early as 1201, in which year King John granted the burgesses a charter similar to that of Northampton. Henry III in 1227 granted to "the mayor and good men" of Grimsby, that they should hold the town for a yearly rent of £111, and confirmed the same in 1271. These charters were confirmed by later sovereigns. A governing charter was given by James II in 1688. In 1201 King John granted the burgesses an annual fair for 15 days, beginning on May 25. Three annual fairs are now held. Grimsby returned two members to the parliament in 1298, but in 1833 the number was reduced to one which it still sends. The church of St. James. in the older part of the town, is Early English, with fine details but poorly restored. The chief buildings are that containing the town hall and the grammar school (a foundation of 1547), and the exchange. Grimsby is a bishopric suffragan in the diocese of Lincoln.

In the time of Edward III Grimsby was an important seaport, but the haven became obstructed by silt from the Humber. At the beginning of the 19th century a subscription was raised by the

proprietors of land in the neighbourhood for improving the harbour, and an act was obtained by which they were incorporated. The fishing trade had become so important by 1800 that it was necessary to construct a new dock. The proximity of the town to the great fishing centres in the North sea accounts for its modern rise as a fishing centre. With the improvement in the harbour after 1846, the rise of the great industrial areas in the midlands, and the ever-increasing population of London, the railway companies, particularly what is now the L.N.E.R., ran lines into Grimsby, so that the fish might be taken rapidly to these great centres. At the same time the advent of the steam trawler greatly enlarged the area covered by the fishing fleets, reaching from the arctic circle to the Mediterranean. Grimsby also trades in timber used for pit props in the industrial regions and exports coal. The fishing trade increased largely after 1910, and the port became one of the greatest fish centres in the world. Of the nine docks existing in 1943, three were fish docks and three graving docks. The third fish dock was opened in 1934 and covers 35 ac. though an additional 39 ac. of reclaimed land are available for industrial development. The total dock area is 139 ac., of which 64 ac. are fish docks. There is also a regular passenger service to Dutch, Danish and south Swedish ports. In 1912 the railway company built Immingham dock, a port 6 mi. farther up the Humber, for vessels too large to enter Grimsby.

GRIMSTON, SIR HARBOTTLE (1603–1685), English politician, born at Bradfield Hall, near Manningtree on Jan. 27, 1603, and educated at Emmanuel college, Cambridge, he became a barrister of Lincoln's Inn, recorder of Harwich in 1634, and recorder of Colchester (1638). In 1648 he succeeded his father as 2nd baronet, and in the Convention Parliament of 1660 he was chosen speaker. This office he lost at the dissolution of the parliament, but he was a member of the commission which tried the regicides, and in Nov. 1660 he was appointed master of the rolls. He died on Jan. 2, 1685. Grimston translated from Norman French the law reports of the judge, Sir George Coke (1560–1642).

On the death of his son Samuel in 1700, the baronetcy became extinct. The grandson of Sir Harbottle's eldest daughter Mary succeeded to the estates of his great uncle.

See G. Burnet, *History of My Own Time,* edit. *O.* Airy (1900).

GRIMTHORPE, EDMUND BECKETT, 1ST BARON (1816–1905), son of Sir Edmund Beckett Denison, was born on May 12, 1816. He was educated at Eton and Trinity college, Cambridge. He was called to the bar at Lincoln's Inn in 1841, became Q.C. in 1854, and was for many years a leader of the parliamentary bar. From 1877 to 1900 he mas chancellor and vicar-general of York, and he was raised to the peerage in 1886. He was interested in astronomy, horology and architecture, more especially Gothic ecclesiastical architecture. The tower clock of the Houses of Parliament was constructed after Lord Grimthorpe's designs. He undertook in the late 'seventies to "restore, repair and refit" the abbey of St. Albans. His treatment of the roof. the new west front. and the windows inserted in the terminations of the transepts, excited a storm of adverse criticism. He died on April 29, 1905.

GRINDAL, EDMUND (1519?-1583), successively bishop of London, archbishop of York and archbishop of Canterbury, was the son of a farmer of Hensingham, Cumberland. He was educated at Magdalene and Christ's Colleges and then at Pembroke Hall, Cambridge, where he was elected fellow in 1538. He proceeded M.A. in 1541, was ordained deacon in 1544 and was proctor and Lady Margaret preacher in 1548–49. Probably through the influence of Ridley, who had been master of Pembroke Hall, Grindal was selected as one of the Protestant disputants during the visitation of 1549. When Ridley became bishop of London, he made Grindal one of his chaplains and gave him the precentorship of St. Paul's. He was soon promoted to be one of Edward VI.'s chaplains and prebendary of Westminster, and in Oct. 1552 was one of the six divines to whom the Forty-two articles were submitted for examination.

The death of Henry VIII, frustrated Grindai's proposed elevation to the episcopal bench. He abandoned his preferments on Mary's accession and made his way to Strasbourg, and then to Frankfurt, where he endeavoured to compose the disputes between the "Coxians" (see Cox, RICHARD), who regarded the 1552 Prayer Book as the perfection of reform, and the Knoxians, who wanted further simplification. He returned to England in 1559, was appointed one of the committee to revise the liturgy, and one of the Protestant representatives at the Westminster conference. In July he was also elected Master of Pembroke Hall in succession to the recusant Dr. Thomas Young (1514–80) and Bishop of London in succession to Bonner.

Grindal himself was, however, inclined to be recalcitrant from different motives. He had qualms about vestments and other traces of "popery" as well as about the Erastianism of Elizabeth's ecclesiastical government. His Protestantism was robust enough; he did not mind recommending that a priest "might be put to some torment." But he was loath to execute judgments upon English Puritans; he had not that firm faith in the supreme importance of uniformity and autocracy which enabled Whitgift to persecute with a clear conscience nonconformists whose theology was indistinguishable from his own. As it was, his attempts to enforce the use of the surplice evoked angry pretests, especially in 1565, when considerable numbers of the nonconformists were suspended; and Grindal of his own motion denounced Cartwright to the Council in 1570.

In 1570 Grindal was translated to the archbishopric of York, where Puritans were few and coercion would be required mainly for Roman Catholics. By Burghley's influence he was chosen to succeed Parker as archbishop of Canterbury in 1576. Burghley wished to conciliate the moderate Puritans and advised Grindal to mitigate the severity which had characterized Parker's treatment of the nonconformists. Grindal indeed attempted a reform of the ecclesiastical courts, but his metropolitical activity was cut short by a conflict with the arbitrary temper of the queen. Elizabeth required Grindal to suppress the "prophesyings" or meetings for discussion which had come into vogue among the Puritan clergy, and she even wanted him to discourage preaching; she would have no doctrine that was not inspired by her authority. Grindal remonstrated, claiming some voice for the Church, and in June 1577 was suspended from his jurisdictional, though not his spiritual, functions for disobedience. He stood firm, and in January 1578 Secretary Wilson informed Burghley that the queen wished to have the archbishop deprived. She was dissuaded from this extreme course, but Grindal's sequestration was continued in spite of a petition from Convocation in 1581 for his reinstatement. Elizabeth then suggested that he should resign; this he declined to do, and after making an apology to the queen he was reinstated towards the end of 1582. While making preparations for his resignation, he died on July 6, 1583, and was buried in Croydon parish church. He left considerable benefactions to Pembroke Hall, Cambridge, Queen's College, Oxford, and Christ's College, Cambridge; he also endowed a free school at St. Bees, and left money for the poor of St. Bees, Canterbury, Lambeth and Croydon.

Strype's *Life of Grindal* is the principal authority; *see* also *Dict. Nat. Biogr.* and, besides the authorities there cited, Gough's General Index to Parker Soc. Publ.; Acts of the Privy Council; Cal. of Hatfield mss.; Dixon's *Hist. of the Church of England;* Frere's volume in Stephens' and Hunt's series; *Cambridge Mod. Hist.* vol. iii.; Gee's *Elizabethan Clergy;* Birt's *Elizabethan Religious Settlement;* and Pierce's *Introduction to the Marprelate Tracts* (1908).

GRINDELWALD, a valley in the Bernese Oberland, and one of the chief resorts of tourists in Switzerland. It is shut in on the south by the Wetterhorn, Mettenberg and Eiger, between which are two famous glaciers. On the north it is sheltered by the Faulhorn range, while on the east the Great Scheidegg pass leads over to Meiringen; and on the south-west the Little Scheidegg or Wengern Alp (railway across) divides it from Lauterbrunnen. The main village is connected with Interlaken by a rack railway (13 m.). The valley possesses excellent pastures, as well as fruit trees though little corn is grown. It is watered by the Black Liitschine. a tributary of the Aar. The parish church is 3 468 ft. above sea-level. The population is practically all Protestant and German-speaking The valley was originally inhabited by serfs of various

great lords in summer for the sake of pasturage. A chapel in a cave was superseded about 1146 by a wooden church, replaced about 1180 by a stone church, which was pulled down in 1793 to erect the present building. Gradually the Austin canons of Interlaken bought out all the other owners in the valley, but when that house was suppressed in **1528** by the town of Bern the inhabitants gained their freedom. The houses near the hotel Adler bear the name of Gydisdorf, but the name Grindelwald is usually given to the assemblage of hotels and shops between Gydisdorf and the railway station.

GRINDING-MACHINES. This important group of machine-tools comprises designs for grinding practically every shape in metal work, including cylindrical (both external and internal), parallel and tapered forms, plane faces, curved and irregular outlines, and difficult forms such as gear teeth and screw threads. That extremely fine quantities of metal can be removed, is proved by the micrometer devices used for adjusting the wheel, which register to one ten-thousandth part of an inch. Emery and corundum wheels, formerly the only kinds of abrasive devices available, are now largely supplanted by the artificial products of the electric furnace, which offers great choice of fine or coarse wheels. Some of the finest work is performed in the grinding out of small holes, for which the spindles carrying the tiny wheels can be run at 50,000 revolutions per minute without undue friction and heating.

In most grinding machines, it is usual to give mechanical guidance to the work or to the wheel, in order to produce true surfaces, the work being supported upon a flat rest, and manoeuvred by the hands to produce flat faces or curves. Disc grinders form an important class, used for finishing all sorts of nuts, levers, spanners and numerous objects having flat or curved surfaces; abrasive cloth is cemented to a steel disc, which remains always flat, and is run safely at a high speed without need for a safety-guard. The pieces of work are held by the hand on a flat rest (which can be tilted for bevel grinding), and are rocked to and fro across the disc by the oscillation of the arm on a supporting bar. Double disc grinders have two discs set face to face, the articles being passed in between them to have each face ground off parallel and simultaneously. Many machines have the disc horizontal, in which case the work is laid on and allowed to grind itself by the pressure of gravity. If extra finish is desired, ground work is polished by machines carrying bobs or buffs charged with fine abrasive powder. Also for this work an endless band is run over pulleys and the objects to be polished are held against it by the operator.

The first attempts at mechanical guidance were developed in the lathe, the slide-rest being fitted with an emery wheel instead of a steel cutting tool. This led to the design of grinding-machines built on the same principle, but with proper protection of the bearings and slides, the fine grit and the water applied to cool the work being very destructive to the running surfaces. There are now two distinct kinds of machine, the plain and the universal. The latter will undertake a more extensive range of operations than the former, and has a pair of heads fitted upon a table which can be swivelled on a stud (fig. 1); graduations at the end of the table indicate the desired amount of swivel. The work has countersinks drilled in its ends, to rest on the point-centres, and is driven by a clamp or dog secured to it by a screw, and rotated by a pin standing out from the dead-centre pulley. Neither centre revolves in this method, and the most accurate results are obtained by the absence of any minute adverse influences from the driving spindle, which might cause eccentric running. Shafts being ground must be supported at the back in opposition to the pressure of the grinding wheel, otherwise vibrations develop. Steadies are employed, with wood, steel, or bronze shoes making contact with a portion of the curve. For grinding the faces of discs, and inside surfaces, a chuck is substituted for the dead-centre pulley, and the live-centre pulley then does the driving of the spindle with the chuck. Short tapers are ground by swivelling the driving head or the wheel slide.

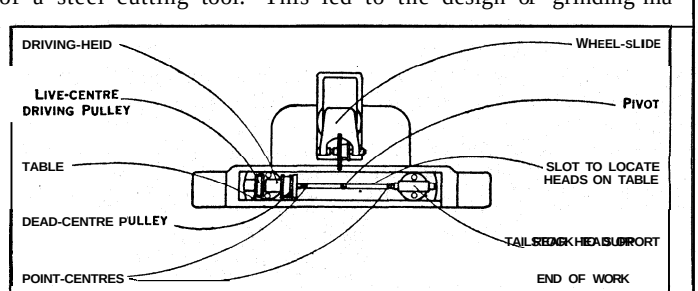


FIG. 1.— PLAN VIEW SHOWING THE PRINCIPLE OF A UNIVERSAL CYLINDRICAL GRINDING MACHINE

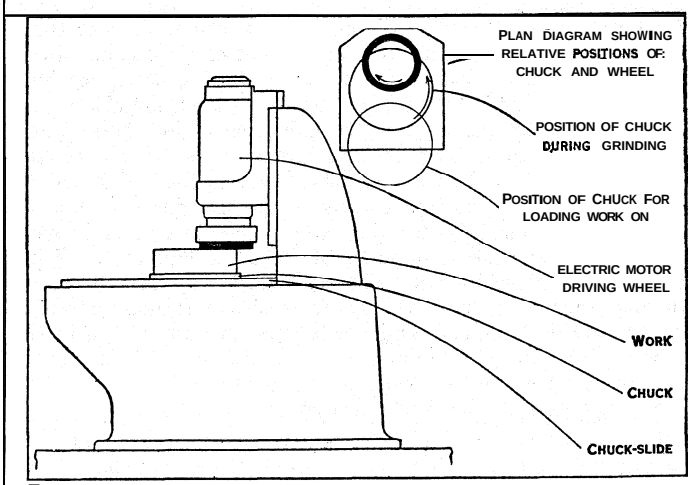

FIG. 2.— VERTICAL-SPINDLE ROTARY-TABLE SURFACE GRINDING MACHINE

When the table feeds to and fro for the successive cuts of the wheel on a long shaft, an automatic feed device sets the wheel in deeper at each pass. This traverse motion is eliminated in wide-wheel or plunge-cut grinding, a trued wheel, sometimes many inches in width, being fed directly against the revolving piece, and completing the outline without any lateral pass. A great many pins, bolts, short shafts, etc., for motor work are ground thus. Crankshafts are finished with great accuracy on modifications of the plain grinder, the crank being chucked so that its main journal bearings revolve in an orbit, and the crank-pins run concentrically. Cams are ground with the help of a master-cam which causes a movement between wheel and cam to evolve the contour. Modifications of the cylindrical grinding machine are constructed for tool and cutter sharpening, numerous special fittings being utilized to sharpen drills, counterbores, saws, milling-cutters and various blades and knives. An exception to the usual practice of supporting cylindrical work upon point centres is met with in the centreless grinders, which finish all sorts of pins, studs, rollers, etc., of moderate length, by a peculiar means of guidance between two wheels.

Internal Grinding.— These deal specially with the various bushes, rings, collars and other pieces needing internal trueing. Hardened gear wheels are also trued in the bore, to make sure that the teeth will run truly. One type of internal grinding machine has a driving head with a chuck to hold and revolve the work at a moderate speed, while the small wheel revolving at high speed is passed in by a slide from end to end of the hole Diameter control is exercised by a transverse adjustment of the slide. When it is not feasible to rotate the work, as is the case with many cylinder and pump castings, a planetary head is used This has the grinding spindle contained within a drum, which can be driven round at relatively low speed, and the grinding spindle may be set anywhere from a concentric position to the full radius of the hole. (See CYLINDER.) These machines are built in both horizontal and vertical types; the latter shape is chosen for grinding out the holes in locomotive and other rods, duplex machines finishing both ends of a rod at once. The radial slot in a link can also be ground by means of a swinging arm pivoted from a centre a suitable distance away.

Flat grinding is performed on several types of machines. In the rotary table design a vertical spindle usually has a chuck, on

which the articles are held by clamps or by magnetism, and an edge wheel travels across. Sometimes a cup- or ring-wheel is brought down by a slide from above. The larger machines of this class assume the shape of fig. z, but the rotating table is mounted in a slide, to enable the work to be loaded on to the chuck in the out position *(see* the plan) and then slide up to the working position. An alternative to the rotary table is a long rectangular one sliding straight under the wheel; or such a table may have two magnetic rotary chucks, one being under the wheel in action, while the other is free, and being cleaned off and reloaded in readiness for another transfer under the wheel. The machine is thus always in continuous operation.

Long and bulky specimens are often ground on a plainer machine with long table feeding between two uprights. A cross-rail on these, adjustable for height, carries the grinding-wheel slide and this may be fed across the rail to cover the whole width of the table. The horizontal face grinding-machine is another design which has a long table on which big castings can be secured. The wheel is large and grinds over the complete area of the work exposed to it. Such wheels are not made as a solid big ring whirh is expensive and liable to contain flaws; a circle of blocks or segments is gripped in the body. Any fracture can be remedied cheaply by the substitution of a new segment or two.

The finest method of finishing gear teeth and screw threads is by grinding. In the case of the former a thin flat-faced wheel is accurately controlled so as to move round a true curve, thereby generating the shape on each flank of each tooth in turn. Or a *form* wheel passes across and grinds the adjacent flanks simultaneously. The shape of the wheel is given by a diamond under control of mechanism which ensures the maintenance of an accurate curve at all times. Screw thread flanks are ground with a carefully trued wheel, guided by a machine which eliminates small errors present in the screw, as previously cut in the lathe or arising from the hardening process. (F. H.)

GRINGOIRE or **GRINGORE, PIERRE** *(c.* 1480--I539), French poet and dramatist, was born about the year 1480, probably at Caen. In his first work, *Le Chasteau de labour* (1499), *a* didactic poem in praise of diligence, he narrates the troubles following on marriage. A young couple are visited by Care, Need, Discomfort, etc.; and other personages common to mediaeval allegories take part in the action. In Nov. 1501 Gringoire was in Paris directing the production of a mystery play in honour of the archduke Philip of Austria, and in subsequent years he received many similar commissions. The fraternity of the *Enjants sans Souci* advanced him to the dignity of *Mbre Sotte* and afterwards to the highest honour of the gild, that of *Prince des Sots.* For twenty years Gringoire seems to have been at the head of this illustrious *confrérie.* As *Prince des Sots* he exercised an extraordinary influence. At no time was the stage. rude and coarse as it was, more popular as a true exponent of the popular mind Brotherhoods of the kind existed all over France. In Paris there were the *Enfants sans Souci,* the *Basochiens,* the *Confrérie de la Passion* and the *Souverain Empire de Galilke;* at Dijon there were the *Mère Folle* and her family; in Flanders the *Société des Arbalktriers* played comedies; at Rouen the *Cornards* or *Conards* yielded to none in vigour and fearlessness of satire. On Shrove Tuesday 1512, when the dispute with Julius II. was at its height, Gringoire, who was the accredited defender of the policy of Louis XII., represented the *Jeu du Prince des Sots et Mère Sotte. Mère Sotte* was disguised as the Church, and disputed the question of the temporal power with the prince. The political meaning was even more thinly veiled in the second part of the entertainment, a morality named *L'Homme obstiné,* the principal personage representing the pope. The performance concluded with a farce. Gringoire adopted for his device on the frontispiece of this trilogy, *Tout par Raison, Raison par Tout, Par tout Raison.* He has been called the *Aristophane des Halles.* The Church was further attacked in a poem printed about 1510, *La Chasse du cerf des cerfs (serf des serfs,* i.e. *servus servorum*), under which title that of the pope is thinly veiled. About 1514 he wrote his mystery of the *Vie de Monseigneur Saint-Louis par personnages* in nine books for the *confrkrie* of the masons and carpenters. I-Ie became in 1518 herald at the court of Lorraine, with the title of Vaudemont, and married Catherine Roger, a lady of gentle birth. During the last twenty years of a long life he became orthodox, and dedicated a *Blason des hérétiques* to the duke of Lorraine.

His works were edited by C. d'Héricault and A. de Montaiglon for the *Bibliothique elzivirienne* in 1858. This edition was supplemented by a second volume in 1877 by Montaiglon and James de Rothschild. These volumes include the works already mentioned, except *Le Chasteau de labour,* and in addition, *Les Folles Entreprises* (1 jog), a collection of didactic and satirical poems, chiefly ballades and rondeaux, one section of which is devoted to the exposition of the tyranny of the nobles, and another to the vices of the clergy; *L'Entreprise de Venise (c.* 1 jog), a poem in seven-lined stanzas,, giving a list of the Venetian fortresses which belonged, according to Gringoire, to other powers; *L'Espoir de paix* (1st ed. not dated; another, 1510), a verse treatise on the deeds of "certain popes of Rome," dedicated to Louis XII.; and *La Coqueluche* (1510), a verse description of an epidemic, apparently influenza. For details of his other satires, *Les Abus du monde* (1509), *Complainte de trop tard marié, Les Fantasies du monde qui rigne;* of his religious verse, *Chants royaux* (on the Passion, 1527), *Heures de Notre Dame* (1525); and a collection of tales in prose and verse, taken from the *Gesta Romanorurn,* entitled *Les Fantasies de Mère Sotte* (1516): *see* G. Brunet, *Manuel du libraire* (*s.v.* Gringore). Most of Gringoire's works conclude with an acrostic giving the name of the author. The *Chasteau de labour* was translated into English by Alexander Barclay and printed by Wynkyn de Worde in 1506. Barclay's translation was edited (1905) with his original for the Roxburghe Club by A. W. Pollard, who provided an account of Gringoire, and a bibliography of the book. *See* also, for the *Jeu du Prince des Sots,* Petit de Julleville, *La Comidie et les moeurs en France au moyen âge,* pp. 151–168 (Paris, 1886); for *Saint Louis,* the same author's *Les Mystires,* i. 331 *et seq.,* ii. 583–597 (1880), with further bibliographical references; and E. Picot, *Gringore* et *les comédiens italiens* (1877). The real Gringoire cannot be said to have many points of resemblance with the poet described in Victor Hugo's *Notre-Dame de Paris,* nor is there more foundation in fact for the one-act prose comedy of Theodore de Banville.

GRINNELL, a city of Poweshiek county, Ia., U.S.A., near the centre of the State, at an altitude of about 1,000 feet. It is on federal highway 36, and is served by the Minneapolis and St. Louis and the Rock Island railways. The population in 1940 was 5,210 federal census. Grinnell has the charm of elm-shaded streets, well kept lawns and comfortable homes. It is the seat of Grinnell college, founded in 1847 by three pioneer settlers in Iowa, Congregationalists and graduates of Yale college, and the "Iowa Band" of 12 graduates of Andover Theological seminary, who went west in 1843 as educational missionaries. The college was opened at Davenport in 1848 as Iowa college, moving to Grinnell in 1859, but not changing its name until 1909. The city was settled in 1854, and was named after one of its founders, Josiah Bushnell Grinnell (1821–91), a Congregational clergyman, friend of John Brown, and a representative in Congress, 1863–67. It was incorporated as a town in 1865 and as a city in 1882.

GRIQUALAND EAST and **GRIQUALAND WEST,** historical division of the Cape province of the Union of South Africa. Griqualand East is bounded on the north-east by Natal, and on the north-west by Basutoland. It was named after the settlement there in 1862 of Griquas under Adam Kok, their chief centre being Kokstad. The region forms part of the Transkeian Territories and is described under Kaffraria, Cape Colony and South Africa.

Griqualand West, also named after its Griqua inhabitants, is part of the inner plateau of South Africa, and lies north of the Orange river, being bounded by Bechuanaland, the Transvaal, and the Orange Free State *(see* CAPE COLONY and SOUTH AFRICA, UNION OF). The climate is dry; the only perennial rivers are in the eastern districts, through which the Vaal flows. Severe thunderstorms sometimes occur. It is mainly a pastoral area, but its chief wealth is its diamonds. Alluvial digging centres occur at Barkly West (*q.v.*), Windsorton, Warrenton.

History. — At the end of the 18th century a horde known as Bastaards, descendants of Dutch farmers and Hottentot women, led a nomadic life on the plains south of the Orange river. In 1803 a missionary named Anderson induced a number of the Bastaards with their chief Barend Barends to settle north of the river, and a mission station was formed at a place where there was a strong flowing fountain, now disappeared, which gave the name of Klaarwater to what is now known as Griquatown or Griquastad.

Klaarwater became a retreat for other Bastaards, Hottentot refugees, Kaffirs and Bechuanas. From Little Namaqualand came a few half-breeds and others under the leadership of Adam Kok, son of Cornelius Kok and grandson of Adam Kok (c. 1710–95), a man of mixed white and Hottentot blood who is regarded as the founder of the modern Griquas. The settlement prospered, and the tribesmen abandoned the name of Bastaards in favour of that of Griquas, some of them professing descent from a Hottentot tribe, originally settled near Saldanha bay, called by the early Dutch settlers at the Cape Chariguriqua or Grigriqua. Adam Kok and Barends having moved eastward in 1820, those who remained behind elected as their head man a teacher in the mission school named Andries Waterboer, who successfully administered the settlement. Meanwhile Adam Kok and his companions had occupied part of the country between the Modder and Orange rivers, and in a short time had exterminated the Bushmen inhabiting that region. Kok died about 1835, and after a period of civil strife was succeeded by his younger son, Adam Kok III., who in Nov. 1843 signed a treaty placing himself under British protection. Eventually finding himself straitened by the Boers of the newly established Orange Free State, he removed in 1861–63 with his people, some 3,000 in number, to the region (then depopulated by Kaffir wars) now known as Griqualand East. His sovereign rights to all territory north of the Orange he sold to the Free State for £4,000. He founded Kokstad (*q.v.*) and died in 1876. Waterboer, the principal Griqua chief, had entered into treaty relations with the British Government as early as 1834, and received a subsidy of £150 a year. He was succeeded in 1852 by his son Nicholas Waterboer, under whom the condition of the Griquas declined.

The discovery of diamonds along the banks of the Vaal in 1867 entirely altered the fortunes of the country, and by the end of 1869 the rush to the alluvial diggings had begun. At the diggers' camps the Griquas exercised no authority, but over part of the district either the South African Republic or the Orange Free State claimed sovereignty. At Klip Drift (now Barkly West) the diggers formed a regular Government and elected Theodore Parker as their president. Most of the diggers being British subjects, the high commissioner of South Africa interfered, and a Cape official was appointed magistrate at Klip Drift, President Parker resigning office in Feb. 1871. Over the "dry diggings," at Kimberley which had just been discovered,[1] the Orange Free State asserted jurisdiction. The land was, however, claimed by Nicholas Waterboer, who, on the advice of his agent, David Arnot, petitioned the British to take over his country. This Great Britain consented to do, and on Oct. 27, 1871, proclamations were issued by the high commissioner receiving Waterboer and his Griquas as British subjects and defining the limits of his territory. It included the area claimed by the Transvaal but given to Waterboer by the award of R. W. Keate, lieutenant-governor of Natal, an award made shortly before the annexation proclamations. The Free State Boers in particular were greatly incensed by the action of the British Government, but the dispute was settled in 1876 by the payment of £90,000 by the British to the Free State, in full settlement of their rights.

The diggers found the British administration did little for their benefit, and a period of disorder ensued. In July 1873 the territory was made a Crown colony. The Government remained unpopular, the diggers complaining of its unrepresentative character, the heavy taxation exacted, and the inadequate protection of property. They formed a society for mutual protection, and the discontent was so great that an armed force was sent (early in 1875) from the Cape to overawe the agitators. At the same time measures were taken to render the Government more popular. The settlement of the dispute with the Free State paved the way for the annexation of Griqualand to the Cape Colony on Oct. 1j, 1880. Griqualand East also came under the Cape as part of the Transkei Territories. Here the Griquas preserved some measure of autonomy, but numbers of Europeans settled in the district.

[1]The order of discovery of the chief mines was:—Dutoitspan, Sept. 1870; Bultfontein, Nov. 1870; De Beers, May 1871; Colesberg Kop (Kimberley), July 1871.

See KIMBERLEY, CAPE COLONY, TRANSVAAL and ORANGE FREE STATE. For early history and an account of life at the diggings, 1871–75, consult G. McCall Theal's *Compendium of the History and Geography of South Africa* (1878), ch. xl. and xli., and the later editions of his *History of South Ajrica;* Gardner F. Williams, *The Diamond Mines of South Africa* (New York and London, 1902); *See* also J. Campbell, *Travels in South Africa* (1815), *Travels . . . A Second Journey . . .* (2 vols., 1822); the Blue Books C. 459 of 1871 and C. 508 of 1872 (which contains the Keate award); *Papers relating to Her Majesty's Colonial Possessions,* part ii. (1875), and A. Wilmot, *Life of Sir Richard Southey* (sometime lieutenant-governor of Griqualand) (1904). For the Griqua people consult G. W. Stow, *The Native Races of South Africa,* ch. xvii.–xx. (1905).

GRISAILLE is the name given to the preliminary underpainting of the subject of a picture, executed in a monochrome of grey or brown, previous to the application of colour. It is, in effect, a kind of brush drawing in thin oil-paint, usually highly finished, to which the colour scheme is applied. It was commonly used thinly but certain masters used it in impasto afterwards applying the colour in glazes.

It differs from *camaïeu,* in which two tints are used.

Its use dates from early times as Zeuxis is said to have employed both grisaille and camaieu but it was not in general use until the 15th century when it was practised by Flemish and Italian masters. It played some part in the development of chiaroscuro, as, without the aid of colour, the painter had to concentrate on light and shade for his effect.

Correggio is said to have used it extensively and Van Dyck left many small paintings in grisaille which he carried no further. Prud'hon was addicted to the use of grisaille, sometimes substituting a light blue tint for the more usual grey or brown, but he more often spoilt his pictures by the use of bitumen. Oudry considered the practice a dangerous one on account of the large amount of white used in it.

In the present day when direct painting is the general practice, grisaille is rarely used.

GRISELDA, a heroine of romance. She is said to have been the wife of Walter, marquis of Saluces or Saluzzo, in the 11th century, and her misfortunes were considered to belong to history when they were handled by Boccaccio and Petrarch, although the probability is that Boccaccio borrowed his narrative from a Provençal fabliau. He included it in the recitations of the tenth day (Decanzerone), and must have written it about 1350. Petrarch related it in a Latin letter in 1373, which was printed by Ulrich Zel about 1470 and often subsequently. Chaucer followed Petrarch's version in the Canterbury Tales. The story was dramatized by Thomas Dekker, Henry Chettle and W. Haughton in 1603.

An example of the many ballads of Griselda is given in T. Deloney's *Garland of* Good *Will* (1585), and the 17th century chapbook, The History of Patient *Grisel* (1619), was edited by H. B. Wheatley (1885) for the Villon Society.

GRISI, GIULIA (1811–1869), Italian opera-singer, daughter of one of Napoleon's Italian officers, was born in Milan on July 28, 1811. She came of a family of musical gifts, her maternal aunt Josephina Grassini (1773–1850) being a favourite opera-singer both on the continent and in London; her mother had also been a singer, and her elder sister Giudetta and her cousin Carlotta were both exceedingly talented. Giulia was trained for a musical career, and made her stage début in 1828 in Rossini's *Zelmira.* Later at Milan she was the first Adalgisa in Bellini's *Norma,* in which Pasta took the title-part. Grisi appeared in Paris in 1832, as Semiramide in Rossini's opera, and had a great success. She played at the Thebtre Italien for sixteen years, from 1832 to 1849, while in the summers from 1834 onwards she appeared in London. Her voice was a brilliant dramatic soprano, and her established position as a prima donna continued for thirty years. In 1835 Bellini wrote *I Puritani* for the great quartet of singers, Grisi, Lablache, Rubini and Tamburini, and the tradition of their great performance was long remembered in London and Paris. Later Mario took the place of Rubini, and for them Donizetti wrote Don Pasquale. In 1854 Grisi toured with Mario in America. She had married Count de Melcy in 1836, but the marriage was dissolved; in 1856 she married Mario (*q.v.*). She died in Berlin on Nov. 29, 1869.

GRISON *(Galictis vittata),* a carnivorous mammal. of the family *Mustelidae,* common in Central and South America and Mexico. It is about the size of a marten, and is bluish grey above and dark brown below. The grison lives on small mammals and birds, and in settled districts is destructive to poultry. Allamand's grison (*G. allamandi*), with the same range, is larger. The tayra or taira (*G. barbara),* about as large as an otter, ranges from Mexico to Argentina. It hunts in companies *(see* CARNIVORA).

GRISONS or GRAUBÜNDEN, the most easterly of the Swiss cantons and the largest, though relatively sparsely populated. Pop. (1941) 127,934, giving a density per sq.mi. of 46. Its area is 2,746 sq m , of which more than a half is classed as "productive" (forests covering about one fifth of the total), but it has 138.6 sq.m. of glaciers, ranking in this respect next after the Valais and before Bern. The whole canton is mountainous, the principal glacier groups being those of the Todi, N. (11,887 ft.), of Medels, S.W. (10,509 ft), of the Adula Alps, S W. (Rheinwaldhorn, 11,149 ft), with the chief source of the Rhine, of the Bernina, S E. (13,304 ft.), the most extensive, of the Albula, E. (Piz Kesch, 11,228 ft.), and of the Silvretta, N.E. (Piz Linard, 11,201 ft.). The principal valleys are those of the upper Rhine and of the upper Inn (or Engadine, *q.v.*). The three main sources of the Rhine are in the canton. The valley of the Vorder Rhine is called the Bundner Oberland, that of the Mittel Rhein the Val Medels, and that of the Hinter Rhein (the principal), in different parts of its course, the Rheinwald, the Schams valley and the Domleschg valley, while the upper valley of the Julia is named the Oberhalbstein. Other streams join the Ticino and so the Po, the Adda, and the Adige. The inner valleys are the highest in Central Europe, and among the loftiest villages are Juf, 6,998 ft. (the highest permanently inhabited village in the Alps), at the head of the Avers glen, and St. Moritz, 6,037 ft., in the Upper Engadine. Below Chur, near Malans, good wine is produced, while in the Val Mesocco, etc., maize and chestnuts flourish. Forests and the mountain pasturages are the chief source of wealth. The lower pastures maintain a fine breed of cows. There are many mineral springs. The climate, save on the southern slope of the Alps, is severe. Many strangers visit different spots in the canton, especially Davos (*q.v.*), Arosa and the Engadine. A railway runs from Maienfeld to Chur (the capital, *q.v.*), sending off a branch line from Landquart to Davos. From Chur the line bears west to Reichenau whence one branch runs beneath the Albula Pass to St. Moritz, and another up the Vorder Rhine valley to Disentis. There are carriage roads across the passes leading towards Italy.

The German-speaking part of the population live mainly around Chur and Davos, the Italian-speaking in the Val Mesocco, Val Bregaglia and the valley of the Poschiavo. The characteristic tongue of the Grisons is a survival of an ancient Romance language which has a scanty printed literature, but is still widely spoken. It is distinguished into two dialects: the Romonsch which prevails in the Bundner Oberland and in the Hinter Rhein valley, and the Ladin that survives in the Engadine and in the neighbouring valleys of Bergun, Oberhalbstein and Munster. There are, however, in these regions German-speaking people, mostly due to immigration from the Upper Valais in the 13th century. Many of the population are engaged in attending to the wants of tourists, but there is a considerable trade with Italy, particularly in the wines of the Valtellina. Some lead and silver mines were formerly worked, but are now abandoned.

The canton is divided into 14 administrative districts, and includes 224 communes. It sends members to the Federal *Standerat,* and to the Federal *Nationalrat.* The cantonal constitution has created a legislature *(Grossrat — no* numbers fixed by the constitution) elected by universal suffrage. The "obligatory referendum" obtains in the case of all laws and important matters of expenditure and revisions of the constitution.

History. — The greater part (excluding the three Italian speaking valleys) of the modern canton of the Grisons formed the southern part of the province of Raetia (probably the aboriginal inhabitants, the Raeti, were Celts rather than, as was formally believed, Etruscans), set up by the Romans after their conquest of the region in 15 B.C. The Romanized inhabitants were to a certain extent Teutonized under the Ostrogoths (AD. 493–537) and under the Franks (from 537 onwards). Governors called *Praesides* are mentioned in the 7th and 8th centuries, while members of the same family occupied the episcopal see of Coire (founded 4th to 5th centuries). About 806 Charles the Great made this region into a county, but in 831 the bishop procured for his dominions exemption ("immunity") from the jurisdiction of the counts, while before 847 his see was transferred from the Italian province of Milan to the German province of Mainz (Mayence) and was thus cut off from Italy to be joined to Germany. The bishop became a prince of the empire in 1170 and later allied himself with the rising power (in the region) of the Habsburgers. This led in 1367 to the foundation of the League of God's House or the *Gotteshausbund,* chiefly in order to stem his rising power, rhe bishop entering it in 1392. In 1395 the abbot of Disentis, the men of the Lugnetz valley, and the great feudal lords of Räzuns and Sax, joined in 1399 by the counts or Werdenberg, formed another League, called the *Oberbund* (as comprising the highlands in the Vorder Rhine valley) and also wrongly the "Grey League" (as the word interpreted "grey" is simply a misreading of *graven* or counts, though the false view has given rise to the name of Grisons or Graubiinden for the whole canton). Finally, in 1436, the third Raetian League was founded by the former subjects of the count of Toggenburg, whose dynasty then became extinct; they include the inhabitants of the Prattigau, Davos, Maienfeld, the Schanfigg valley, Churwalden, and the lordship of Belfort (*i.e.,* the region round Alvaneu), and formed ten bailiwicks, whence the name of the league—*Zehngerichtenbund* or League of ten Jurisdictions. In 1450 the *Zehngerichtenbund* concluded an alliance with the *Gotteshausbund* and in 1471 with the *Oberbund;* but of the so-called perpetual alliance at Vazerol, near Tiefenkastels, there exists no authentic evidence in the oldest chronicles, though diets were held there. In 1496 the possessions of the extinct counts of Toggenburg passed to the elder Habsburgers, the head of whom, Maximilian, was already emperor-elect, and desired to maintain the rights of his family there and in the Lower Engadine. Hence in 1497 the *Ober Bund* and in 1498 the *Gotteshausbund* became allies of the Swiss Confederation. War broke out in 1499, but was ended by the great Swiss victory (May 22, 1499) at the battle of the Calven gorge (above Mals) which, added to another Swiss victory at Dornach (near Basel), compelled the emperor to recognize the *practical* independence of the Swiss and their allies of the empire. In 1526, by the Articles of Ilanz, the last remaining traces of the temporal jurisdiction of the bishop of Coire was abolished. In 1512 the three Leagues conquered from Milan the rich and fertile Valtellina, with Bormio and Chiavenna, and held these districts as subject lands till in 1797 they were annexed to the Cisalpine Republic. After the emperor had *formally* recognized, by the treaty of Westphalia (1648), the independence of the Swiss Confederation, the rights of the Habsburgers in the Prattigau and the Lower Engadine were bought up (1649 and 1652). In 1803, after a brief inclusion in the Helvetic Republic, it entered, under the name of Canton of the Grisons or Graubünden, the reconstituted Swiss Confederation.

GRISWOLD, RUFUS WILMOT (1815–1857), American editor and compiler, was born in Benson, Vt., on Feb. 15, 1815. He was a Baptist clergyman for a time, then became a journalist in New York city, and succeeded Poe as editor of *Graham's Magazine* (Philadelphia). As literary executor he edited, together with James R. Lowell and N. P. Willis, the writings (1850) of Edgar Allan Poe. He died in the City of New York on Aug. 27, 1857.

See *Passages from the Correspondence and Other Papers of Rufus W. Griswold* (1898), edited by his son, W. M. Griswold; and "The Poe-Griswold Controversy" by Killis Campbell, *Modern Language Association Publications,* vol. xxxiv., pp. 436–464 (Baltimore, 1919).

GRIVET, a monkey, often seen in menageries, *Cercopithecus sabaeus,* of the guenon group, allied to the green monkey. It is common throughout equatorial Africa. The chin, whiskers, a band across the forehead, and the under parts are white and the head and back olive-green.

GRIZZLY BEAR (*Ursus horribilis),* the most dangerous and, on the average, the largest of all living bears, its only rival being the polar bear (*q.v.*). An inhabitant of western North America, this bear originally ranged from Mexico to Alaska and from the Pacific coast far into the prairies. It is now, however, restricted to the wilder parts of the Rocky mountains and Sierra Nevada, reaching its greatest development, both as regards size and numbers, in the north. The fur is variable in colour, but is most commonly brownish yellow, with a black stripe on the back and reddish mane. An average large specimen of the grizzly bear may be 9 ft. long and 1,000 lb. in weight. (*See* BEAR, CARNIVORA.)

GROAT, a name applied as early as the 13th century on the continent of Europe to any large or thick coin (adapted from the Dutch *groot,* great, thick; *cf.* Ger. *Groschen;* the Med. Lat. *grossus* gives Ital. *grosso,* Fr. *gros.* as names for the coin). The groat was almost universally a silver coin, but its value varied considerably, as well at different times as in different countries. The English groat was first coined in 1351, of a value somewhat higher than a penny. The continuous debasement of both the penny and the groat left the latter finally worth four pennies. The issue of the groat was discontinued after 1662, but a coin worth fourpence was again struck in 1836. Its issue was again discontinued in 1856.

GROCER, literally one who sells by the gross, a wholesale dealer; in modern usage, one who deals in general supplies for the table and for domestic use. The name, as a general one for dealers by wholesale—"engrossers" as opposed to "regrators," the retail dealers—is found with the commodity attached; thus in the *Munimenta Gildhallae* ("Rolls" series) ii. 1,304 (quoted in the *New English Dictionary)* is found an allusion to *grossours de vin, cf. groser of fysshe, Surtees Misc.* (1888) 63, for the customs of Malton (quoted *ib.).* The specific application of the word to one who deals either by wholesale or retail in tea, coffee, cocoa, dried fruits, spices, sugar, and all kinds of articles of use or consumption in a household is connected with the history of the Grocers' Company of London, one of the 12 "great" livery companies. In 1345 the pepperers and the spicers amalgamated and were known as the Fraternity of St. Anthony. The name "grocers," however, first appears during 1373 in the records of the company.

See J. Aubrey Rees, *The Grocery Trade* (1910).

GROCYN, WILLIAM (1446?–1519), English scholar, was born at Colerne, Wiltshire. He was a scholar and fellow of New college, Oxford, reader in divinity in Magdalen college, and in 1485 became prebendary of Lincoln cathedral. About 1488 Grocyn left England for Italy, and before his return in 1491 he had visited Florence, Rome and Padua, and studied Greek and Latin under Demetrius Chalchondyles and Politian. As lecturer in Exeter college he found an opportunity of indoctrinating his countrymen in the new Greek learning.

Erasmus says in one of his letters that Grocyn taught Greek at Oxford before going to Italy. He seems to have lived in Oxford until 1499, but when his friend Colet became dean of St. Paul's in 1504 he was settled in London. He was chosen by his friend to deliver lectures in St. Paul's. He also counted Linacre, William Lily, William Latimer and More among his friends, and Erasmus writing in 1514 says that he was supported by Grocyn in London, and calls him "the friend and preceptor of us all." He held several preferments, including the wardenship of All Hallows college at Maidstone, Kent.

He died in 1519, and was buried in the collegiate church at Maidstone.

Linacre acted as the executor of his estate.

An interesting account of Grocyn written by Professor Burrows appeared in the Oxford Historical Society's *Collectanea* (1890).

GRODNO, one of the former Lithuanian governments of western Russia, which, after World War I was, as regards its northern part, in dispute between Poland and Lithuania.

The government of the Polish republic occupied practically the whole area and created an administrative province of Bialystok (*q.v.*).

Grodno's area under Russian rule was 14,926 sq.mi. and its population was somewhat under two millions, mainly White Russians (54%), with large Jewish (17.4%) and Polish (10%) elements, also Lithuanians and Germans.

Prior to 1795, when it was annexed by Russia, it had been Polish for centuries.

Grodno is called, by the Lithuanians, Gardinas. Immediately after the revolution of 1917 there was much shuffling of provinces and territories; for some years the districts and areas bordering on Russia were in a state of flux; by a system of gradual assimilation some of the territories were absorbed with the soviet union —others were simply annexed.

During the early part of World War II Grodno (that is, the northern part of the Polish province of Bialystok) was occupied by soviet troops and, by the German-Russian partition agreement of Sept. 28, 1939, was allotted to the U.S.S.R. The small portion that had remained a part of Lithuania was also annexed to the soviet union when that nation absorbed the Baltic states in 1940.

Shortly after Germany attacked the U.S.S.R. in June 1941, Grodno passed under German rule.

Except for some hills (not exceeding 925 ft.) in the north, Grodno is a uniform plain, and is drained chiefly by the Bug, Niemen, Narev and Bobr, all navigable. There are also several canals, the most important being the Augustowo and Oginsky. Granites and gneisses crop out along the Bug; Cretaceous, and especially Tertiary, deposits elsewhere. The soil is mostly sandy, and in the district of Grodno and along the rivers is often drift-sand. Forests, principally of Coniferae, cover more than one-fourth of the area. Amongst them are some of vast extent, *e.g.,* those of Grodno (410 sq.mi.) and Bialowieza (376 sq.mi.), embracing wide areas of marshy ground. In the last mentioned forest the wild ox survived, having been jealously preserved since 1803. Peat bogs, sometimes as much as 4 to 7 ft. thick, cover extensive districts. The climate is wet and cold, the annual mean temperature being 44.5° F, the January mean 22.5° and the July mean 64.5". The rainfall amounts to 21½ in.; hail is frequent. Agriculture is the predominant industry, and over 2¼ million acres are arable. The crops principally grown are potatoes, rye, oats, wheat, flax, hemp and some tobacco. Horses, cattle and sheep are bred in fairly large numbers. There is, however, a certain amount of manufacturing industry, especially in woollens, distilling and tobacco. There are also other factories which produce silk, shoddy, and leather. The district is crossed by the main lines of railway from Warsaw to Leningrad and from Warsaw to Moscow.

GRODNO, a town of Poland in the province of Bialystok, on the Niemen, 160 mi. by rail N.E. of Warsaw on the main line to Leningrad. Pop. (1931) 49,818, nearly two-thirds Jews. It has two old castles and two churches. Tobacco factories and distilleries are important; machinery, soap and candles are also

made. Once part of the principality of Lithuania, Grodno was frequently ravaged by the Teutonic knights. After the union with Poland in 1569, it became one of the two meeting-places of the Polish-Lithuanian diet.

The second partition of Poland was signed at Grodno during the year 1792.

In World War II Grodno was occupied by the U.S.S.R. from 1939 to 1941, when it was taken by German troops.

GROEMER, WILHELM (1867–1939), German general, was born on Nov. 22, 1867, at Ludwigsburg, Wiirttemberg. In 1912 he was attached to the railway section of the general staff, and was its chief during the mobilization of 1914. From May 27, 1916 to Aug. 1917 he was departmental head of the War Office. He went to the eastern front as divisional commander and leader of an army corps in Aug. 1917, and in 1918 was chief of staff of the army group under the command of Linsingen and afterwards of Eichhorn. In Nov. 1918 he succeeded Ludendorff as quartermaster-general, but retired as a protest against the signature of the Treaty of Versailles. After the revolution he joined the Democratic Party. He was minister of communications (June, 1920–Aug. 1923) and csnibated the proposals for the reversion of the state railways to private ownership. He wrote *Der Weltkrieg und seine Probleme* (1920). *He* was minister of defence, 1928–1932, and of the interior, 1931–32.

GROEN VAN PRINSTERER, GUILLAUME (1801–1876), Dutch politician and historian, was born at Voorburg, near The Hague, on Aug. 21, 1801. He studied at Leyden university, and acted (1829–33) as secretary to King William I. of Holland. He became the leader of the so-called anti-revolutionary party, both in the second chamber, of which he was for many years a member, and outside. In Groen the doctrines of Guizot and Stahl found an eloquent exponent. They permeate his controversial and political writings and historical studies, of which his *Handbook of Dutch History* (in Dutch) and *Maurice et Barnevelt* (in French, 1875, a criticism of Motley's *Life of Van Olden-Barnevelt)* are the principal. Groen was violently opposed to Thorbecke, whose principles he denounced as ungodly and revolutionary. He died at The Hague on May 19, 1876. He is best known as the editor of the *Archives et correspondance de la maison d'Orange* (12 vols., 1835–45), a great work of patient erudition.

See Bos, *Groen van Prinsterer en zijn tijd* (2 vols., 1886–91).

GROIN, in architecture, the edges formed at the intersections of two vaults at an angle to each other. If the vaults intersect at right angles and are of the same height and radius, these intersections will all lie on a vertical plane at 45° to the planes of the two vaults. If, however, one vault is lower than the other, or the curvatures are different, winding and distorted curves will result. Both the Roman and Renaissance constructors of vaults frequently regularized the rib shapes and slightly warped the surfaces of the vaults until they met at this regularized groin line. Thus in the coved, penetrated ceilings of the 16th century, where an elliptical vault was intersected by smaller vaults besides, the groins would often be given simple segmental curves, meeting at a point in the centre of each penetration, and the smaller vaults forming the penetrations given a surface almost conical in order to meet this line. The term Welsh groin is often applied to the groin resulting from such an intersection of a smaller cross vault with a higher main vault. In the mediaeval period, when ribbed vaulting became common, the ribs under the groins (groin ribs or diagonal ribs), being built first, were usually on curves lying in a simple plane. The web, or filling in of small stones between the ribs, could be warped or twisted at will, so as to start correctly from the wall or cross ribs of different sizes and yet meet over the groin rib. *(See* VAULT.)

GROLIER, JEAN, VICOMTE D'AGUISY (1479–1565), French bibliophile, was born at Lyons, was the friend of Budé, the patron of Aldus, and was called the Maccenas of men of letters by his contemporaries. Of his great library of 3,000 volumes, dispersed in 1675, some 350 are known to be in existence. They are richly bound and bear their owner's *ex libris* "Grolerii Lugdunensis, et Amicorum." Grolier made the acquaintance of Aldus while he was French ambassador in Italy (1510–35).

See Leroux de Lincy, *Recherches sur Jean Grolier* (1866).

GROLMANN, KARL WILHELM GEORG VON (1777–1843), Prussian general of infantry, was born in Berlin on July 30, 1777. He entered an infantry regiment when scarcely thirteen, and received rapid promotion. As a subaltern he became intimate with Scharnhorst, and after the defeat of Jena (1806) was one of his active assistants in the reorganization of the Prussian army. He served as a volunteer in the Spanish army throughout the Peninsular War, returning to Prussia in 1813. He joined the general staff, and was engaged throughout the campaigns of 1813 and 1814. He was now appointed quartermaster-general to Bliicher. The most famous incident in his life is his persuasion of Gneisenau to press forward to Wellington's assistance at Waterloo *(see* WATERLOO CAMPAIGN and GNEISENAU). After the peace of 1815 Grolmann served on the general staff, at the ministry of war, and as commander-in-chief at Posen, where he died on June 1, 1843. General von Grolinann supervised and provided much of the material for von Damitz's *Gesch. des Feldzugs 1815* (Berlin, 1837–1838), and *Gesch. des Feldzugs 1814 in Frankreich* (Berlin, 1842–1843j.

See V. Conrady, *Leben und Wirken des Generals Karl von Grolmann* (1894–96).

GROMATICI or **AGRIMENSORES,** the name for land-surveyors amongst the Romans, from Lat. *groma* or *gruma,* a surveyor's measuring appliance. The art of surveying was probably at first in the hands of the augurs, who from early times had made use of sighting instruments for marking out the rectangular consecrated space *templum* containing the *tabernaculum* in which the augur observed the omens given by birds. The first professional surveyor mentioned is L. Decidius Saxa, who was employed by Anthony in the measurement of camps (Cicero, *Philippics,* xi. 12, xiv. 10). The subsequent increase in the number of military colonies, the settlement of Italian peasants in the provinces, the general survey of the empire under Augustus, the separation of private from State domains, led to the formation of a recognized professional class of highly-paid surveyors, some of whom were even honoured with the title *clarissimus.* Their duties required not only geometrical but also legal knowledge, as their decisions were considered authoritative in matters relating to the distribution of lands. This led to the institution of special training schools and the growth of a special literature, chiefly between the 1st and 6th centuries A.D. The earliest of the gromatic writers was Frontinus (*q.v.*), whose *De agrorum qualitate,* written from A.D. 81–96, dealt more with the legal aspect of the art. Extracts of it are preserved in the commentary of Aggenus Urbicus, a Christian schoolmaster. Under Trajan a certain Balbus wrote a manual of geometry for land surveyors *(Expositio et ratio omnium formarum et mensurarum).* Also, under Trajan, Hyginus makes a definite reference to the use of the groma for laying out agricultural holdings. Later was Siculus Flaccus *(de condicionibus agrorum,* extant), while the most curious treatise on the subject, written in barbarous Latin and entitled *Casae litterarum,* is the work of a certain Innocentius (4th–5th century). The *Gromatici veteres* contains extracts from official registers (probably 5th century) of land surveys, lists and descriptions of boundary stones, and extracts from the Theodosian Codex. According to Mommsen, the collection had its origin during the 5th century in the office of a diocesan governor of Rome, who had a number of surveyors under him. The *agrimensores* have been known by various names, e.g., *decempedator* (with reference to the instrument used); *finitor, mensor castrorum* in republican times; *togati Augustorum* as imperial civil officials; *professor, auctor* as professional instructors.

The best work on the Gromatici is by Blume Lachmann and Rudorff (1848) with supplementary volume, *Die Schriften der römischen Feldmesser* (1852); *see* also *Letters of Cassiodorus; P.* de Tissot, *La Condition des Agrimensores dans Pancienne Rome* (1879) G. Rossi, *Groma e squadro* (Turin, 1877); articles by *G.* Humbert in Daremberg and Saglio's *Dictionnaire des antiquités,* and by Teuffel-Schwabe, *Hist. of Roman Literature,* 58; *Geographical Journal,* vol. lxix. (1927) contains an illustrated article by Col. Sir Henry Lyons "Ancient Surveying Instruments" (p. 132).

GRONINGEN, the most northerly province of Holland, bounded south by Drente, west by Friesland and the Lauwers Zee,

north and north-east by the North Sea and the mouth of the Ems with the Dollart, and on the south-east by Germany. German troops occupied the province in 1940. It includes the islands of Boschplaat and Rottumeroog, belonging to the group of Frisian islands (*q.v.*). Area, 883 sqmi.; pop. (1938) 421,605. The sandy tongue of the Hondsrug extends from the Drente plateau almost up to the capital. West, north and north-east of this the province is flat and consists of sea-clay or sand and clay mixed, except where patches of low and high fen occur on the Frisian borders. Low fen predominates to the east of the capital. The south-east of the province is of high fen resting on diluvial sand largely reclaimed. The morass on the German border was long considered as the natural protection of the eastern frontier, and with the view of preserving its impassable condition neither agriculture nor cattle-rearing was permitted until 1824, and it was only in 1868 that the work of reclamation began. The gradual extension of the seaward boundaries of the province owing to the process of littoral deposits may be traced by a triple line of sea-dikes marking the successive stages in this advance. The rivers of Groningen descending from the Drente plateau meet at the capital, whence they are continued by the Reitdiep to the Lauwers Zee (being discharged through a lock), and by the Ems canal (1876) to Delfzyl. The south-eastern comer of the province is traversed by the Westerwolde Aa, which discharges into the Dollart. The railways belong to the northern section of the State railways, and afford communication with Germany via Winschoten. Agriculture is the main industry and the proportion of landowners is a very large one. The ancient custom called the *beklem-recht,* or lease-right, doubtless accounts for this. By this custom a tenant-farmer is able to bequeath his farm, as he holds his lease in perpetuity.

The chief agricultural products are barley, oats, wheat, and in the north-east flax is also grown, and exported to South Holland and Belgium. On the higher clay grounds cattle-rearing and horse-breeding are also practised. together with butter and cheese making. Potatoes are cultivated. Coast fisheries are considerable. Groningen (*q.v.*) is the only large town. Delfzyl, formerly an important fortress for the protection of the ancient sluices on the river Delf, has benefited by the construction of the Ems (Eems) ship-canal connecting it with Groningen, and has a harbour, ordinarily importing wood. Appingedam and Winschoten are very old towns with cattle and horse markets.

GRONINGEN, a town of Holland, capital of the province of the same name, at the confluence of the two canalized rivers the Drentsche Aa and the Hunse (which are continued to the Lauwers Zee as the Reit Diep), 16 mi. N. of Assen and 33 mi. E. of Leeuwarden by rail. Pop. (1940) 120,015.

History. — The town of Groningen belonged originally to the *pagus,* or gouw, of Triantha (Drente), the countship of which was bestowed by the emperor Henry II. on the bishop and chapter of Utrecht in 1024. In 1040 Henry III. gave the church of Utrecht the royal domain of Groningen, and in the deed of gift the "villa Cruoninga" is mentioned. At first the bishops were too strong for the townsmen, and down to the 15th century an episcopal prefect, or burgrave, had his seat in the city, his authority extending over the neighbouring districts known as the Gorecht. Gradually, however, the burghers. aided by the neighbouring Frisians, succeeded in freeing themselves from the episcopal yoke. The city was walled in 12 5j; before 1284 it had become a member of the Hanseatic league; and by the end of the 14th century it was practically a powerful independent republic, which exercised an effective control over the Frisian Ommelande between the Ems and the Lauwers Zee. In 1440 Bishop Dirk II. finally sold to the city the rights of the see of Utrecht over the Gorecht.

The medieval constitution of Groningen, unlike that of Utrecht, was aristocratic. Merchant gild there was none; and the craft gilds were without direct influence on the city government, which held them in subjection. Membership of the governing council, which selected from its own body the four rationales or burgomasters, was confined to men of approved "wisdom," and wisdom was measured in terms of money. This Raad of wealthy burghers gradually monopolized all power. The bishop's bailiff (schout), with his nominated assessors (*scabini*), continued to exercise jurisdiction, but members of the Raad sat on the bench with him, and an appeal lay from his court to the Raad itself. The council was supreme and in 1439 it decreed that no one might trade in all the district between the Ems and the Lauwers Zee except burghers, and those who had purchased the burwal (right of residence in the city) and the freedom of the gilds. In 1536 the city passed into the hands of Charles V., and in the great wars of the 16th century suffered all the miseries of siege and military occupation. From 1581 onwards, Groningen, still held by the Spaniards, was constantly at war with the "Ommelanden" which had declared against the king of Spain. In 1672 the town was besieged by the bishop of Miinster, but it was successfully defended, and in 1698 its fortifications were improved under Coehoorn's direction. The French Republicans were in control from Feb. 1795 until 1814. The fortifications of the city were destroyed in 1874. German troops occupied Groningen during the invasion of May 1940.

Buildings, etc.—The ancient part of the town is still surrounded by the former moat, and in the centre lies a group of open places. The chief church is the Martini-kerk, dating from 1477, and an organ constructed by the famous scholar and musician Rudolph Agricolo, who was born near Groningen in 1443. The Aa church dates from 1465, but was founded in 1253. The provincial museum of antiquities contains interesting Germanic antiquities, as well as medieval and modern collections of porcelain, pictures, etc. The old Ommelanderhuis was built in 1509.

The university of Groningen, founded in 1614, has among its auxiliary establishments an observatory and a library which contains a copy of Erasmus' New Testament with marginal annotations by Luther. Groningen is the centre from which several important canals radiate. Hence steamers ply in all directions, and there is a regular service to Emden and the islands of Borkum and Schiermonnikoog. Groningen is the most important town in the north of Holland, with brick houses of the 16th and 17th centuries still standing. As capital of the province, and because of its natural position, Groningen ordinarily maintains a considerable trade, chiefly in oil-seed, grain, wood, turf and cattle. The chief industries are flax-spinning, sugar refining, book printing, and it also manufactures beer, tobacco, cotton and woollen stuffs, furniture and pianos; besides which there are numerous goldsmiths and silversmiths.

GRONLUND, LAURENCE (1846–1899), American socialist, was born in Copenhagen, Denmark, on July 13, 1846. He graduated at the University of Copenhagen in 1865, began the study of law, removed to the United States in 1867, taught German in Milwaukee, was admitted to the bar in 1869 and practised law in Chicago. He became a writer and lecturer on socialism and was for a time connected with the work of the Socialist Labor Party. After a period of service in the bureau of labour statistics, he returned to the lecture field, and was an editorial writer for the New York and Chicago American from 1898 until his death in New York city on Oct. 1j, 1899. His principal works are: The Coming Revolution (1880); The Co-operative Commonwealth in its Outlines (1884); *Ça* Ira, or Danton in *the* French Revolution (1888); Our Destiny, the Influence of Socialism *on Morals* and Religion (1890); and The New Economy (1898).

GRONOVIUS (the latinized form of GRONOV), **JOHANN FRIEDRICH** (1611–1671), German classical scholar and critic, was born at Hamburg. In 1643 he was appointed professor of rhetoric and history at Deventer, and in 1658 to the Greek chair at Leyden, where he died (see also FABRETTI, RAPHAEL). Besides editing, with notes, Statius, Plautus, Livy, Tacitus, Aulus Gellius and Seneca's tragedies, Gronovius was the author, amongst numerous other works, of *Commentarius* de sestertiis (1643) and of an edition of Hugo Grotius' De jure *belli* et *pacis* (1660). His Observationes contain a number of brilliant emendations.

See J. E. Sandys *Hist.* of Class. Schol. ii. (1908); F. A. Eckstein in Ersch and Gruber's *Allgemeine* Encyklopadie.

GROOM, in modern usage a male servant attached to the stables, whose duties are to attend to the cleaning, feeding, currying, and care generally of horses. The earliest meaning of the word appears to be that of a boy, and in 16th and 17th century literature it frequently occurs, in pastorals, for a shepherd lover.

Later it is used for any male attendant, and thus survives in the name for several officials in the royal household, such as the grooms-in-waiting, and the grooms of the great chamber. The groom-porter, whose office was abolished by George III., saw to the preparation of the sovereign's apartment, and, during the 16th and 17th centuries, provided cards and dice for playing. To him were submitted all questions of gaming within the court.

GROOT, GERMARD (1340–1384), otherwise Gerrit or Geert Groet, in Latin Gerardus Magnus, a preacher and founder of the society of Brothers of Common Life (*q.v.*), was born at Deventer in the diocese of Utrecht. After studying at Paris, where he imbibed nominalistic tendencies, and at Cologne, he visited the papal court at Avignon about 1366. Soon afterwards he was appointed to a canonry in Utrecht and to another in Aix-la-Chapelle. In 1374 he experienced a conversion which led him to retire for three years to the Carthusian monastery at Munnikhuizen near Arnhem. In 1379, having received ordination as a deacon, he became missionary preacher throughout the diocese of Utrecht. The success which followed his labours was immense; according to Thomas à Kempis the people left their business and their meals to hear his sermons, so that the churches could not hold them. His violent denunciation of the prevailing sins of the laity and clergy provoked hostility, and accusations of heterodoxy were brought against him.

It was in vain that Groot emitted a *Publica Protestatio*. The bishop was induced to issue an edict which prohibited from preaching all who were not in priest's orders, and an appeal to Urban VI. was without effect. At some period (perhaps 1381, perhaps earlier) he visited the famous mystic Johann Ruysbroeck, prior of the Augustinian canons at Groenendael near Brussels; at this visit was formed Groot's attraction for the rule of the Augustinian canons. At the close of his life he was asked by some clerics to form them into a religious order, and Groot resolved that they should be canons regular of St. Augustine, but he died before a foundation could be made. In 1387, however, a site was secured at Windesheim, and here was established the monastery that became the cradle of the Windesheim congregation of canons regular. Groot lived to preside over the first days of his other creation, the society of Brothers of Common Life. He died of the plague at Deventer in 1384.

The chief authority for Groot's life is Thomas à Kempis, *Vita Gerardi Magni* (Eng. trans, J. P. Arthur, *The Founders of the New Devotion*, 1905); also the *Chronicon Windeshemense* of Johann Busch (ed. K. Grube, 1886). *See* S. Kettlewell, *Thomas à Kempis and the Brothers of Common Life* (1882); F. R. Cruise, *Thomas à Kempis* (1887) and details in Herzog-Hauck, *Realencyklopadie* (ed. 3).

(E. C. B.; X.)

GROOVE-TOOTHED SQUIRREL, a large Bornean squirrel, *Rhithrosciurus macrotis,* representing a genus by itself. The tail is large and fox-like, and the ears are tufted and the flanks marked by black and white bands.

GROS, ANTOINE JEAN, BARON (1771–1835), French painter, was born at Paris on March 16, 1771. His father, who was a miniature painter, began to teach him to draw at the age of six. Towards the close of 1785 Gros entered the studio of David. The death of his father threw Gros, in 1791, upon his own resources. In 1793 he left France for Italy. He studied Rubens at Genoa. He was presented to Josephine Beauharnais and through her to Bonaparte. On Nov. 15, 1796, Gros was present with the army near Arcola when Bonaparte planted the tricolor on the bridge. Gros seized on this incident, and showed by his treatment of it that he had found his vocation. Bonaparte gave him the post of "inspecteur aux revues," which enabled him to follow the army, and in 1797 nominated him on the commission charged to select the spoils which should enrich the Louvre. In 1799, having escaped from the besieged city of Genoa, Gros made his way to Paris. His "esquisse" (Musée de Nantes) of the "Battle of Nazareth" gained the prize offered in 1802 by the consuls, but was not carried out, owing it is said to the jealousy of Junot felt by Napoleon; but he indemnified Gros by commissioning him to paint his own visit to the pest-house of Jaffa. "Les Pestiférés de Jaffa" (Louvre) was followed by the "Battle of Aboukir" 1806 (Versailles) and the "Battle of Eylau," 1808 (Louvre).

These subjects painted under an impulse of real events made him the artist of the Napoleonic *epos*. As long as the military element remained bound up with French national life, Gros received from it a fresh and energetic inspiration which carried him to the very heart of the events which he depicted; but as the army and its general separated from the people, Gros ceased to find the nourishment necessary to his genius, and the defect of his artistic position became evident. Trained in the sect of the Classicists, he was shackled by their rules, even when—by his naturalistic treatment of types, and appeal to picturesque effect in colour and tone—he seemed to run counter to them. The decoration of the dome of St. Geneviève (begun in 1811 and completed in 1824) is the only work of Gros's later years which shows his early force and vigour. The "Departure of Louis XVIII." (Versailles), the "Embarkation of Madame d'Angoulême" (Bordeaux), the plafond of the Egyptian room in the Louvre, and finally his "Hercules and Diomedes," exhibited in 1835, testify that Gros's efforts—in accordance with the frequent counsels of his old master David—to stem the rising tide of Romanticism, served but to damage his once brilliant reputation. Exasperated by criticism and the consciousness of failure, Gros sought refuge in the grosser pleasures of life. On June 26, 1835 he was found drowned along the Seine. Although a classicist, he encouraged young Gericault; while his own treatment of colour made him unwittingly a precursor of the romantic movement.

See Delécluze, *Louis David, son école et son temps* (1855); Julius Meyer, *Geschzchte der Modernen französischen Malerei* (1867); Jean Baptiste Delestive (pupil of Gros) *Gros, sa vie e ses ouvrages* (1867); G. Dargenty, *Le baron Gros* (1887).

GROSART, ALEXANDER BALLOCH (1827–1899), Scottish divine and literary editor, son of a building contractor, was born at Stirling on June 18, 1827, and died at Dublin on March 16, 1899. He edited the works of numerous Puritan divines, the "Fuller Worthies Library," the "Chertsey Worthies Library," the "Huth Library Series" and various other works. Grosart was unwearied in searching for rare books, and brought to light much literature formerly almost inaccessible.

GROSBEAK, a name indefinitely applied to many thick-billed birds. It is one of the names of the hawfinch (*q.v.*) but is generally used in combination. The pine-grosbeak (*Pinicola enucleator*) is a finch (*q.v.*) inhabiting the conifer woods of the New and Old Worlds, moving southwards in large flocks with the approach of winter. In structure and habits it resembles a bullfinch, but is larger; in plumage it is much like a crossbill (*q.v.*). It has many smaller allies. The cardinal grosbeak or Virginian nightingale *(Cardinalis cardinalis)* inhabits eastern U.S.A., south of 40° N. lat. The cock bird is bright red in colour and possesses a fine song. The hen is less conspicuous in both respects. Many other American birds are called grosbeaks, of which the rose-breasted grosbeak (*Zamelodia ludoviciana)* is the best known. For "sociable grosbeak," *see* WEAVER-BIRD.

GROSE, FRANCIS (c. 1730–1791), English antiquary, was born at Greenford, Middlesex. Grose early showed an interest in heraldry and antiquities, and his father procured him a position in the Heralds' college. In 1763, being then Richmond Herald, he sold his tabard, and shortly afterwards became adjutant and paymaster of the Hampshire militia. The fortune left him by his father being squandered, he began to turn to account his excellent education and his powers as a draughtsman. In 1757 he had been elected fellow of the Society of Antiquaries. In 1773 he began to publish his *Antiquities of England and Wales,* completed in 1787. In 1789 he set out on an antiquarian tour through Scotland, and in the course of this journey met Burns, who composed in his honour the famous song beginning "Ken ye aught o' Captain Grose," and in that other poem, still more famous, "Hear, land o' cakes, and brither Scots," warned all Scotsmen of this "chield among them taking notes." He died in Dublin on June 12, 1791.

Grose was a sort of antiquarian Falstaff—at least he possessed in a striking degree the knight's physical peculiarities; but he was a man of true honour and charity, a valuable friend, an inimitable boon companion. His humour, his varied knowledge and his good nature all contributed to make him a favourite in society.

Grose's works include ***The*** *Antiquities of England and Wales*

(6 vols., 1773–87); *Advice to the Officers of the British Army* (1782), a satire in the manner of Swift's *Directions to Servants; A Guide to Health, Beauty, Riches and Honour* (1783), a collection of advertisements of the period, with characteristic satiric preface; *A Classical Dictionary of the Vulgar Tongue* (1785); *A Treatise on Ancient Armour and Weapons* (1785–89); Darrell's *History of Dover* (1786); *Military Antiquities* (2 vols., 1786–88); *A Provincial Glossary* (1787); *Rules for Drawing Caricatures* (1788); *The Antiquities of Scotland* (2 vols., 1789–91); *Antiquities of Ireland* (2 vols., 1791), edited and partly written by Ledwich. *The Grumbler,* 16 humorous essays, appeared in 1791 after his death; and in 1793 *The Olio,* a collection of essays, jests and bits of poetry, highly characteristic of Grose was printed.

A capital full-length portrait of Grose by N. Dance is in the first volume of the *Antiquities of England and Wales,* and another is among Kay's *Portraits.* A versified sketch of him appeared in the *Gentleman's Magazine,* lxi. 660. See *Gentleman's Magazine,* lxi. 498, 582; Noble's *Hist. of the College of Arms,* p. 434; *Notes and Queries,* passim.

GROSS. Apart from the direct meaning of the word (thick, bulky), and such figurative senses as coarse, vulgar or flagrant, the chief uses are whole, entire, without deduction, as opposed to "net," or as applied to that which is sold in bulk as opposed to "retail." As a unit of tale, "gross" equals 12 dozen, 144, sometimes known as "small gross," in contrast with "great gross," *i.e.,* 12 gross, 144 dozen. As a technical expression in English common law, "in gross" is applied to an incorporeal hereditament attached to the person of an owner. *(See* EASEMENT.)

GROSSENHAIN, German town in the *Land* of Saxony, 20 m. N. from Dresden, on the main line of railway to Berlin. Pop. (1939) 16,331. The industries include manufactures of woollen stuffs, leather, glass, chemicals, carriages and machinery.

GROSSETESTE, ROBERT (c. 1175–1253), bishop of Lincoln, and one of the greatest of mediaeval statesmen and philosophers, was born of humble parents at Stradbrook, Suffolk. About 1197, he graduated at Oxford where he had become proficient in law, medicine and the natural sciences. Some ten years later he took his divinity degree, and soon after this event, as the outstanding teacher at Oxford, he was appointed Master of the Oxford Schools, a status which was first termed "Chancellor" in the Legatine Ordinance of 1214. In 1229 when the Franciscans established their first school at Oxford, Grosseteste was secured as their reader in theology. According to Roger Bacon, who was a severe critic, Grosseteste was pre-eminent among his contemporaries for his knowledge of the natural sciences and of mathematics. Between 1214 and 1231 Grosseteste held in succession the archdeaconries of Chester, Northampton and Leicester. In 1232, he resigned all his preferments except one prebend at Lincoln. But he retained the office of chancellor, and in 1235 accepted the bishopric of Lincoln, an appointment which he held until his death on Oct. 9, 1253.

Grosseteste's scheme to reform morals and clerical discipline throughout his vast diocese, brought him into conflict with more than one privileged corporation, in particular with his own chapter, and it was only in 1245 that by a personal visit to the papal court at Lyons, he secured a favourable verdict. His zeal for reform led him to advance, on behalf of the courts-Christian, pretensions which it was impossible that the secular power should admit. He twice incurred a well-merited rebuke from Henry III. upon this subject; although it was left for Edward I. to settle the question of principle in favour of the state. The devotion of Grosseteste to the hierarchical theories of his age is attested by his correspondence with his chapter and the king. Against the former he upheld the prerogative of the bishops; against the latter he asserted that it was impossible for a bishop to disregard the commands of the Holy See. Where the liberties of the national church came into conflict with the pretensions of Rome he stood by his countrymen. Of royal exactions he was impatient.

It was, however, soon made clear that the king and pope were in alliance to crush the independence of the English clergy; and from 1250 onwards Grosseteste openly criticized the new financial expedients to which Innocent IV. had been driven by his desperate conflict with the Empire. While visiting Innocent in 1250, the bishop laid before the pope and cardinals a written memorial in which he ascribed all the evils of the Church to the malignant influence of the Curia. It produced no effect, although the cardinals felt that Grosseteste was too influential to be punished for his audacity. In 1251 he protested against a papal mandate enjoining the English clergy to pay Henry III. one-tenth of their revenues for a crusade, and in 1253 against a command to provide in his own diocese for a papal nephew.

In literary and speculative activities, Grosseteste found some release from his ecclesiastical and political cares. He was familiar with the Neo-Platonic materials introduced into the West by the Arabians, with their scientific treatises and with the newly translated works of Aristotle. He himself contributed to the revival of learning by his commentaries on Aristotle, and by his Greek-Latin translations of the Ethics, of the works of the pseudo-Dionysius and of the *De Fide Orth.* of the Damascene; hence Grosseteste, rather than Albert the Great, must be credited with having introduced Aristotle into the West. The peculiar originality of his mind is further manifested by his profound interest in science, by his exaltation of mathematics, by his enthusiasm for the study of languages, by his treatises on husbandry and politics, by his poetical compositions and by his concern for music and ecclesiastical architecture. His philosophy, which represents the first attempt to reconcile the doctrines of Augustine and of Aristotle, is full of interest, especially in its denial of the eternity of the world, and in its doctrines of light as the origin of corporeity, of the stars as composed of the four elements, of the active intellect in man, of angelology and of the divine knowledge of singulars.

BIBLIOGRAPHY.—An account of the mss. and editions of Grosseteste's works is given in the preface to Baur's edition of the scientific opuscula published in vol. ix. of the series *Beiträge zur Gesch. der Phil. des Mittelalters* (Munster, 1912). The *Letters* were edited by H. R. Luard in the Rolls Series (1861) and the famous memorial to the pope is printed in the appendix to E. Brown's *Fasciculus rerum expetendarum et fugiendarum* (1690). A French poem, *Le Chastel d'amour,* was edited by R. F. Weymouth for the Philological Society in 1864. For Grosseteste's life and work *see* F. S. Stevenson, *Robt. Grosseteste* (1899); Baur, *Die Philosophie des Grosseteste* in Bd. xviii. of the *Beiträge* series (1917); *see* also A. G. Little, *The Grey Friars in Oxford* (1899); and "The Franciscan School at Oxford," *Arch. Fran. Hzst.* (1926); P. Duhem, *Le Système du Monde* (5 vols. 1913, foll.); and Überweg, *Gesch. der Philosophie* (Bd. ii., 1928).

GROSSETO, a town and episcopal see of Tuscany, capital of the province of Grosseto, 90 mi. S.S.E. of Pisa by rail. Pop. (1936) 15,988 (town), 26,428 (commune). It is 38 ft. above sea-level. Fortifications constructed by Francis I. (1574–87) and Ferdinand I. (1587–1609) form a hexagonal enciente with projecting bastions, with two gates only. The small cathedral begun in 1190 and rebuilt in 1294, is of red and white marble, in the Italian Gothic style. The citadel was built in 1311 by the Sienese. Grosseto is on the main line from Pisa to Rome.

The town dates from the middle ages. In 1138 the episcopal see was transferred thither from Rusellae. In 1224, with the rest of the Maremma, of which it is the capital, it came under the dominion of Siena. By the peace of 1559, however, it passed to Cosimo I of Tuscany. In 1745 malaria had reduced the population to 648, though in 1224 it had 3,000 men who bore arms. Leopold I renewed drainage operations, and by 1836 the population had risen to 2,392. Grosseto was bombed by Allied planes in World War II.

GROSSI, TOMMASO (1791–1853), Lombard poet and novelist, was born at Bellano, on the Lake of Como, on Jan. 20, 1791. He studied law at Pavia, and began to practise in Milan; but the Austrian Government, suspecting his loyalty, interfered with his prospects, and in consequence Grossi was a simple notary all his life. He wrote in the Milanese dialect the battle poem *La Prineide,* in which he described the tragic death of Prina, chief treasurer dusing the empire, in the streets of Milan in 1814. His *The Golden Rain* (La *Pioggia d' oro)* and *The Fugitive* (La *Fuggitiva)* secured him the friendship of Porta and Manzoni. He wrote the narrative poems *Ildegonda* (1814) and *Ulrico and Lida* (1837); the epic *I Lombardi alla prima crociata* (1826); and an historical romance *Marco Visconti* (1834), inspired by Manzoni, He wrote little after 1838, and died at Milan on Dec. 10, 1853. His

collected poems were published in 1877 (Milan).

See C. Cantù, *Vita ed opere di Tommaso Grossi* (1854); *M.* Chini, *Le teorie dei romantici intorno al poema epico "I lonzbardi alla prima crociata" di Tommaso Grossi* (Lanciano, 1920).

GROSSMITH, GEORGE (1847–1912), English comedian, was born on Dec. 9, 1847, the son of a law reporter and entertainer of the same name. After some years of journalistic work he started about 1870 as a public entertainer, with songs and recitations; but in 1877 he began a long connection with the Gilbert and Sullivan operas at the Savoy Theatre, London, in *The Sorcerer*. For 12 years he had the leading part, his capacity for "patter-songs," and his humorous acting, dancing and singing marking his creations of the chief characters in the Gilbert and Sullivan operas as the expression of a highly original individuality. In 1889 he left the Savoy, and again set up as an entertainer, visiting all the cities of Great Britain and the United States, but retiring in 1901. Among other books he wrote *The Reminiscences of a Society Clown* (1888); and, with his brother Weedon (*q.v.*), *The Diary of a Nobody* (1894). He died at Folkestone, March 1, 1912. His two sons, Laurence and George, Jr., were both actors, the iatter, a weii-known figure, dying June 6, 1935, aged 61.

GROSSMITH, WEEDON (1853–1919), brother of above, born in London, June 9, 1853. Educated as a painter, he exhibited at the Royal Academy and Grosvenor Gallery, but in 188j joined a theatrical company and toured the provinces and America. In 1894 he assumed management of Terry's theatre, appearing there and elsewhere until 1917. He died in London, June 14, 1919.

GROSVENOR, GILBERT HOVEY (1875–), American editor, geographer, and writer, was born in Constantinople, Turkey, Oct. 28, 1875. He was graduated from Amherst college, A.B. *magna cum laude*, 1897; A.M., 1901. Honorary degrees: LL.D., Georgetown university, 1921; Litt.D., Amherst, 1926; LL.D., William and Mary college, 1930; Sc.D., South Dakota School of Mines, 1935.

Since 1899, Dr. Grosvenor has directed the world-wide educational, scientific, and research work of the National Geographic Society, of which he is president, and its beautifully illustrated *National Geographic Magazine*, of which he is the editor. Under his leadership the society has grown from a local membership of 900 to a world enrolment of more than 1,100,000.

Under Dr. Grosvenor's administration the National Geographic Society has sent out numerous expeditions which have carried the society's flag to both the North and South Poles, to the loftiest ascent yet made into the stratosphere (72,395ft.), to the greatest ocean depth yet reached (3,028ft.), and other expeditions have studied the stars, the seas, deserts, jungles, microscopic marvels, and uncovered rich lost chapters of mankind's progress.

In addition to his numerous articles in the *National Geographic Magazine*, Dr. Grosvenor wrote "Explorations of the Nineteenth Century" for the annual report of the Smithsonian Institution, 1900, the historical summary of polar exploration for Peary's *The North Pole*, and edited *Scenes From Every Land*, *Flags of tlze World* and *The Book of Birds*, the first comprehensive work containing illustrations in colour of all the major species of American birds north of Mexico, and many other volumes published by the National Geographic Society for its membership.

Actively interested in the conservation and protection of wild life, Gilbert Grosvenor has encouraged the nesting of birds at his home, "Wild Acres," at Bethesda, Maryland. His estate holds the Audubon Society and U.S. Biological Survey record for the largest number of land birds nesting in one acre adjacent to a house in the United States, Named for Gilbert Grosvenor are Lake Grosvenor, on the Alaska peninsula; Mount Grosvenor, Szechwan Province, China; Grosvenor glacier, in Peru; and Gilbert Grosvenor trail and mountain range in Antarctica. Gilbert Grosvenor married Oct. 23, 1900, Elsie May Bell, daughter of Alexander Graham Bell, inventor of the telephone.

GROS VENTRES, a tribe of North American Indians of Algonquian stock. The name is said to have reference to the greediness of the people, but more probably originated from their prominent tattooing. They are settled at Fort Belknap agency, Montana. The name has also been given to other tribes, *e.g.*, the Hidatsa or Minitari. now at Fort Berthold, North Dakota.

GROTE, GEORGE (1794–1871), English historian of Greece, was born on Nov. 17, 1794, at Clay Hill, near Beckenham, Kent, of a well-known family of bankers originating from Bremen. He was sent to the Sevenoaks grammar school and afterwards to Charterhouse, but at the age of 16 he entered the bank in which his father was a partner. In 1820 he married Harriet Lewin.

In 1817 Grote came under the influence of David Ricardo, and through him of James Mill and Jeremy Bentham. His first published work, the *Statement of the Question of Parliamentary Reform* (1821), was a reply to Sir James Mackintosh's article in the *Edinburgh Review* advocating popular representation, vote by ballot and short parliaments. In April 1822 he published in the *Morning Chronicle* a letter against Canning's attack on Lord John Russell, and edited, or rather re-wrote, some papers of Bentham, which he published as *Analysis of the Influence of Natural Religion on the Temporal Happiness of Mankind, by Philip Beauchamp* (1822). The book was published in the name of Richard Carlile, then in gaol at Dorchester. From 1826 to 1830 he worked with J. S. Mill and Henry Brougham in the organization of the new "university" in Gower street. He was a member of the council which organized the faculties and the curriculum of University college, London; but in 1830, owing to a difference with Mill as to an appointment to one of the philosophical chairs, he resigned his position. In 1849 he was re-elected to the council, in 1860 he became treasurer, and on the death of Brougham (1868) president. He became a member of the senate in 1850 and was vice-chancellor in 1862. He presented to the college the *Marmor Homericum*, and finally bequeathed the reversion of £6,000 for the endowment of a chair of philosophy of mind and logic. He succeeded his friend Henry Hallam as a trustee of the British Museum in 1859, and took part in the reorganization of the departments of antiquities and natural science.

At his father's death, in 1830, he became manager of the bank and took a leading position among the city Radicals. In 1831 he published his *Essentials of Parliamentary Reform* (an elaboration of his previous *Statement)*, and in Dec. 1832 entered parliament as one of the members for the City of London. He sat in the House of Commons until 1841, representing the Benthamite school of "philosophic radicalism." During these years of active public life his interest in Greek history and philosophy increased, and after a trip to Italy in 1842 he devoted himself to literature. In 1846 the first two volumes of the *History of Greece* appeared, and the remaining,ten between 1847 and 1856. In 1847 he visited Switzerland to study a condition of things in some sense analogous to that of the ancient Greek States. This visit resulted in the publication in *The Spectator* of seven weekly letters, later collected in book form. *Plato and the Otlzer Companions of Sokrates (3* vols.) appeared in 1865, but the work on Aristotle he was not destined to complete. He had only finished the *Organon* (2nd ed., 1880) when he died on June 18, 1871; he was buried in Westminster Abbey. It is on his *History of Greece* that Grote's reputation mainly rests. It contains information collected from all sources, simply arranged and expressed in direct, forcible language.

BIBLIOGRAPHY.—The *History of Greece* passed through five editions, the fifth (10 vols., 1888) being final. It was published in Everyman's Library (1907) and in a condensed form in the same year by J. M. Mitchell and M. O. B. Caspari. Grote's *Minor Works* were published by Alexander Bain (1873). *See* Mrs. Grote's *Personal Life of George Grote* (1873) and article in *Dict. Nat. Biog.* by G. Croom Robertson.

GROTEFEND, GEORG FRIEDRICH (1775–1853), German epigraphist, was born at Münden in Hanover on June 9, 1775. He studied at Gottingen, and became conrector of the Frankfurt gymnasium, and then director of the gymnasium at Hanover. He published some important works on the Umbrian and Oscan dialects, on the coins of Bactria and other subjects. But it was in the East rather than in the West that Grotefend did his greatest work. The cuneiform inscriptions of Persia had for some time been attracting attention in Europe; exact copies of them had been published by the elder Niebuhr, who lost his eyesight over the work; and Grotefend's friend, Tychsen of Rostock, believed that he had ascertained the characters in the

column, now known to be Persian, to be alphabetic. At this point Grotefend took the matter up. His first discovery was communicated to the Royal Society of Gottingen in 1800, and reviewed by Tychsen two years afterwards. In 1815 he gave an account of it in Heeren's great work on ancient history, and in 1837 published his *Neue Beiträge zur Erläuterung der persepolitanischen Keilschrift.* Three years later appeared his *Neue Beiträge zur Erläuterung der babylonischen Keilschrift.* His discovery may be summed up as follows: (1) that the Persian inscriptions contain three different forms of cuneiform writing, so that the decipherment of the one would give the key to the decipherment of the others; (2) that the characters of the Persian column are alphabetic and not syllabic; (3) that they must be read from left to right; (4) that the alphabet consists of 40 letters, including signs for long and short vowels; and (5) that the Persepolitan inscriptions are written in Zend (which, however, is not the case), and must be ascribed to the age of the Achaemenian princes. The process whereby Grotefend arrived at these conclusions illustrates his persevering genius *(see* CUNEIFORM). He died Dec. 15, 1853.

GROTESQUE, a type of ornament in architecture, painting or sculpture, consisting of fanciful combinations of animals and foliated forms. The word is also commonly applied to any whimsical design or decorative style.

GROTIUS, HUGO (1583–1645), in his native country Huig van Groot, Dutch publicist and statesman, was born at Delft on April 10, 1583. The Groots were descended from the French noble family of de Cornets, and this cadet branch had taken the name of Groot on the marriage of Hugo's great-grandfather with a Dutch heiress. Hugo's father had four times served the office of burgomaster of Leyden, and was one of the three curators of the university of that place. Hugo Grotius wrote good Latin verses at nine, was ripe for the university at 12, and at 15 edited the encyclopaedic work of Martianus Capella. At 15 he accompanied Count Justin of Nassau, and the grand pensionary J. van Oldenbarneveldt on their special embassy to the court of France. He took the degree of doctor of law at Leyden, and entered on practice as an advocate.

In 1600 Grotius edited the remains of Aratus, with the versions of Cicero, Germanicus and Avienus. Some Latin lines on the siege of Ostend spread his fame beyond the circle of the learned. He wrote three dramas in *Latin:— Christus patiens; Sophomphaneas,* on the story of Joseph and his brethren; and *Adamus exul,* a production still remembered as having given hints to Milton. The *Sophomphaneas* was translated into Dutch by Vondel, and into English by Francis Goldsmith (1652); the *Christus patiens* into English by George Sandys (1640).

In 1603 the States-General appointed Grotius historiographer, though he was but 20 years of age. He then became advocate-general of the fisc for the provinces of Holland and Zeeland In 1608 he married Marie Reigersberg, a woman of great capacity and noble disposition.

In the winter of 1604 Grotius composed (but did not publish) a treatise entitled *De jure praedae.* The ms. remained unknown till 1868, when it was edited by Prof. Fruin. It shows that the principles and the plan of the celebrated *De jure belli,* which was not composed till 1625, more than 20 years after, had already been conceived by a youth of 21. The chief difference between the two treatises is the substitution of more cautious and guarded language, less dogmatic affirmation, more allowance for exceptions and deviations. The *Jus pacis* was an addition introduced first in the later work. The *De jure praedae* shows that Grotius was drawn to this subject by a special occasion presented by his professional engagements. He was retained by the Dutch East India company as their advocate. One of their captains, Heemskirk, had captured a rich Portuguese galleon in the Straits of Malacca. The right of a private company to make prizes was hotly contested in Holland, and denied by the stricter religionists, especially the Mennonites. In maintaining the lawfulness of Heemskirk's action Grotius was led to investigate the grounds of the lawfulness of war in general. It was necessary to his defence of Heemskirk that he should show that the Portuguese pretence that Eastern waters were their private property was untenable. Grotius maintains that the ocean is free to all nations. Years afterwards the jealousies between England and Holland gave importance to the novel doctrine of the *mare liberum,* broached in the tract by Grotius, a doctrine which Selden set himself to refute in his *Mare clausum* (1632). In his *De antiquitate reipublicae Batavae* (1610) Grotius vindicates, on grounds of right, prescriptive and natural, the revolt of the United Provinces against the sovereignty of Spain.

Grotius, when he was only 30, was made pensionary of the city of Rotterdam. In 1613 he formed one of a deputation to England, in an attempt to adjust those differences which gave rise afterwards to a naval struggle disastrous to Holland. Though the mediating views in the great religious conflict between Catholic and Protestant, by which Grotius was afterwards known, had been arrived at by him by independent reflection, yet he was probably confirmed in them by finding in England a developed school of thought of the same character already in existence. After his return from England Grotius sought to find some mean term in which the two hostile parties of Remonstrants and Anti-remonstrants, or as they were subsequently called Arminians and Gomarists *(see* REMONSTRANTS), might agree. A form of edict drawn by Grotius was published by the States, recommending mutual toleration, and forbidding ministers in the pulpit to handle the disputed dogmas. But the stadtholder, Maurice of Nassau, supported the orthodox party—a party to which he inclined the more readily that Oldenbarneveldt, the grand pensionary, the man whose uprightness and abilities he most dreaded, sided with the Remonstrants.

In 1618 Prince Maurice disbanded the civic guards in the various cities of Guelders, Holland and Zeeland, and occupied the places with troops on whom he could rely. The States of Holland sent a commission, of which Grotius was chairman, to Utrecht, with the view of strengthening the hands of their friends, the Remonstrant party, in that city. But the stadtholder entered the city with troops on the night of July 26, 1618. On the early morning of the 31st the civic guard was disarmed—Grotius and his colleagues saving themselves by a precipitate flight. But it was only a reprieve. The grand pensionary, Oldenbarneveldt, the leader of the Remonstrant party, Grotius and Hoogerbeets were arrested, brought to trial and condemned—Oldenbarneveldt to death, and Grotius to imprisonment for life and confiscation of his property. In June 1619 he was immured in the fortress of Louvestein near Gorcum His confinement was rigorous, but after a time his wife obtained permission to share his captivity. Grotius returned in captivity to the classical pursuits of his youth, making Latin translations of Greek tragedians and other writers.

The ingenuity of Madame Grotius at length devised a mode of escape. The books which he had done with were sent out in a chest along with his linen. After a time the warders began to let the chest pass without opening it. Madame Grotius prevailed on her husband to allow himself to be shut up in it at the usual time. The two soldiers who carried the chest out complained that it was so heavy "there must be an Arminian in it." "There are indeed," said Madame Grotius, "Arminian books in it." The chest was carried to the house of a friend, where Grotius was released. He was then dressed like a mason with hod and trowel, and so conveyed over the frontier. His first place of refuge was Antwerp, from which he proceeded to Paris, where he arrived in April 1621. In October he was joined by his wife. There he was presented to the king, Louis XIII., who granted him a pension of which only small instalments were ever paid. In 1623 the president Henri de Même lent him his château of Balagni near Senlis (dep. Oise), and there Grotius passed the spring and summer of that year. De Thou gave him facilities to borrow books from the superb library formed by his father.

In these circumstances the *De jure belli et pacis* was composed. The achievement would have been impossible, but for the fact that Grotius had with him the first draft of the work made in 1604. In March 1625 the printing of the *De jure belli,* which had taken four months, was completed, and the edition despatched to the fair at Frankfort. Though his book brought him no profit it brought him a great and enduring reputation. Grotius hoped

that his fame would soften the hostility of his enemies in Holland, but he was disappointed. He then accepted service under Sweden, in the capacity of ambassador to France. He never enjoyed the confidence of the court to which he was accredited, and in 1645 he demanded and obtained his recall. He was not happy at Stockholm, and he asked permission to leave. He was driven by a storm on the coast near Danzig. He got as far as Rostock, where he found himself very ill. There he died on Aug. 29, 1645.

Value of His Work.—Grotius combined a wide circle of general knowledge with a profound study of one branch of law. History, theology, jurisprudence, politics, classics, poetry,—all these fields he cultivated. His commentaries on the Scriptures were the first application on an extensive scale of the principle affirmed by Scaliger, that, namely, of interpretation by the rules of grammar without dogmatic assumptions. As in many other points Grotius inevitably recalls Erasmus, so he does in his attitude towards the great schism. Grotius thought that a basis for reconciliation of Protestant and Catholic might be found in a common piety, combined with reticence upon discrepancies of doctrinal statement. His *De veritate religionis Christianae* (1627), a presentment of the evidences, is so written as to form a code of common Christianity, irrespective of sect. The little treatise became widely popular, gaining rather than losing popularity in the 18th century. It became the classical manual of apologetics in Protestant colleges, and was translated for missionary purposes into Arabic (by Pococke, 1660), Persian, Chinese, etc. His *Via et votum ad pacem ecclesiasticam* (1642) was a detailed proposal of a scheme of accommodation. Like all men of moderate and mediating views. he was charged by both sides with vacillation. The true interpretation of Grotius's mind appears to be an indifference to dogmatic propositions, produced by a profound sentiment of piety. He approached parties as a statesman approaches them, as facts which have to be dealt with, and governed, not suppressed in the interests of some one of their number.

His *Annals of the Low Countries,* begun as an official duty while he held the appointment of historiographer, was being continued and retouched by him to the last. It was not published till 1657, by his sons Peter and Cornelius.

Grotius was a great jurist, and his *De jure belli et pacis* (Paris, 1625), though not the first attempt in modern times to ascertain the principles of jurisprudence, went far more fundamentally into the discussion than any one had done before him. The fundamental idea of the book is the law of nature; he recognized and stated clearly that the sovereignty of the new national States of Europe did not involve anarchy in the absence of a common superior but that prior to any political organization there still exists law, based on reason and the nature of man as a social being. For the content of that law he went to the Roman *jus gentium,* the generalization by the praetor of the customs of the peoples with whom he had to deal, which had been itself rationalized into a law of nature under the influence of Stoicism, and thereby laid down the other fundamental doctrine of international law, that the primary evidence of what that law is is the existing practice of nations.

For a complete bibliography of the works of Grotius, *see* Lehmann, *Hugonis Grotii manes vindicati* (Delft, 1727), which also contains a full biography. Of this Latin life De Burigny published a *réchauffée* in French (2 vols., 1752). Other lives are: Van Brandt, *Historie van het Leven H. de Groot* (2 vols., Dordrecht, 1727); Von Luden, *Hugo Grotius nach seinen Schicksalen und Schriften dargestellt* (1806); *Life of Hugo Grotius,* by Charles Butler of Lincoln's Inn (1826). The work of the Abbé Hély contains a life of Grotius. *See* also *Hugo Grotius,* by L. Neumann (1884); *Opinions of Grotius,* by *D.* P. de Bruyn (1894).

Grotius's theological works were collected in 3 vols. at Amsterdam (1644–46; reprinted London, 1660; Amsterdam, 1679; and again Amsterdam, 1698). His letters were printed first in a selection, *Epistolae* ad *Gallos* (Leyden, 1648), abounding, though an Elzevir, in errors of the press. They were collected in *H. Grotii epistolae quotquot reperiri potuerunt* (Amsterdam, 1687). A few may be found scattered in other collections of *Epistolae.* Supplements to the large collection of 1687 were published at Haarlem, 1806; Leyden, 1809; and Haarlem, 1829. The *De jure belli* was translated into English by Whewell (3 vols., 1853); into French by Barbeyrac (2 vols., Amsterdam, 1724); into German in Kirchmann's *Philosophische Bibliothek* (3 vols., Leipzig, 1879). (M. PA.; X.)

GROTON, a town of New London county, Connecticut, U.S.A., on the east bank of the Thames river, opposite New London. It is served by the New York, New Haven and Hartford railroad. The population was 10,770 in 1930, and was 10,910 in 1940 by the federal census. It has a large submarine-building shipyard, a thread mill and other industries, and is the site of the U.S. submarine base. The town was settled about 1650 and incorporated in 1704.

GROTTAFERRATA, a village of Italy, province of Rome, 13 m. southeast from Rome by electric tramway, and 2½ m. south of Frascati, 1,080 ft. above sea-level, in the Alban Hills. The name (in its Latin form, Crypta ferrata, *i.e.,* the crypt with an iron grille) probably comes from an older building, perhaps an oratory, perhaps originally an ancient tomb, which served as the foundation for the campanile. Pop. (1936) 2,089 (town), 4,621 (commune). The Greek monastery of Basilians founded by S. Nilus in 1002 under the Emperor Otho III, occupies the site of a large Roman ville. It was fortified (end 15th century) by Cardinal Giuiiano della Rovere (afterwards Pope Julius II.), whose arms may be seen about it. The church with its fine campanile belongs to the 12th century, and the originai portai, with a mosaic over it, is still preserved, as is also the mosaic of the apse. The chapel of S. Nilus contains frescoes by Domenico Zampieri (Domenichino) of 1610, illustrating the life of the saint. The abbot's palace has a fine Renaissance portico, and contains local antiquities. An *omophorion* (*see* PALLIUM) of the 11th or 12th century, with scenes from the Gospel in needlework, and a chalice of the 15th century with enamels are among its treasures. The library contains valuable MSS., among them one from the hand of S. Nilus (965); and a palaeographical school, for the copying of MSS. in the ancient style, is maintained.

See T. Ashby in *Papers of the British School at Rome,* v. (London, 1910), 228 *sqq.;* F. Tomassetti, *Campagna Romana,* iv. (Rome, 1926), 279 *sqq.* (T. A.)

GROUCHY, EMMANUEL, MARQUIS DE (1766–1847), marshal of France, was born in Paris on Oct. 23, 1766, and entered the army. He served in La Vendée (1793), in the Army of Ireland (1796–1797), and in the campaign against the Russians and Austrians, being taken prisoner at Novi. On his release he returned to France and from 1801 onwards was employed by Napoleon in important military and political positions. At the Restoration he was deprived of the post of colonel-general of *chasseurs à cheval* and retired. He joined Napoleon on his return from Elba and was made marshal and peer of France. In the Waterloo campaign he was appointed to command the right wing to pursue the Prussians *(see* WATERLOO CAMPAIGN). After the great disaster, Grouchy gathered up the wrecks of Napoleon's army and retired to Paris, where he resigned his command to Marshal Davout. He was court-martialed for his partial failure at Waterloo and exiled in America, till amnestied in 1821. On his return to France he was reinstated as general. In 1830 Louis Philippe gave him back the marshal's bâton and restored him to the Chamber of Peers. He died at St. Etienne on May 29, 1847.

His publications include: *Observations sur la rélation de la campagne de 1815 par le général de Gourgaud* (Philadelphia and Paris 1818); *Réfutation de quelques articles des memoires de M. le Duc de Rovigo* (1829) and other defences of his military policy.

See his *Memoires* (ed. Marquis de Grouchy, 1873–74), Gen. Marquis de Grouchy, *Le Général Grouchy en Irlande* (1866); *Le Martchal Grouchy du 16 au 18 juin, 1815* (1864); *Appel à l'histoire sur les faits de l'aile droite de l'armée française* (Paris, n.d.); *Sévère Justice sur ler faits . . . du 28 juin au 3 juillet 1815* (1866) and the literature of the Waterloo campaign.

GROUND BASS, in music, a form of bass which is repeated again and again unaltered, while the music above is constantly varied. The *chaconne* (*q.v.*) and the *passacaglia* are familiar forms of which this device constitutes an essential feature. *(Sea* VARIATIONS.)

GROUND BEETLE, the name for members of a family of Coleoptera, the *Carabidae,* comprising 13,000 species and forming the largest and most typical family of Adephaga. In many *Carabidae* the hind wings are reduced or absent, and the elytra fused together along the suture, the hind legs being adapted for rapid movement. They are world-wide in their dis-

tribution being represented in the Arctic regions and on almost all of the oceanic islands, and can be traced back in fossil history to Liassic times. See COLEOPTERA.

GROUND-HOG: See WOODCHUCK.

GROUND-HOG DAY (February 2, Candlemas), so called in the United States because of the fanciful supposition that the ground-hog or woodchuck (*q.v.*) then emerges from winter sleep (See HIBERNATION) to observe the approach of spring. If the ground-hog sees his shadow, he retires to his burrow for six weeks more of winter, but, if the day is cloudy, he remains above ground, confident of continuing mild weather. This association of the ground-hog with Candlemas day is an American variation of the tradition, long widespread in the Christian world, that a sunny Candlemas presages a cold spring. It is reflected in the Scottish saying: "If Candlemas is fair and clear, there'll be two winters in the year," and in the rural maxim: "February, second day, have half your corn and half your hay." (See CANDLEMAS.)

GROUND-ICE, ice formed at the bottom of streams while the temperature of the water is above freezing-point. Everything points to radiation as the prime cause of the formation of ground-ice. It is formed only under a clear sky, never in cloudy weather; it is most readily formed on dark rocks, and never under any covering such as a bridge, and rarely under surface-ice. On a cold clear night the radiation from the bottom is excessive, and loosely-grown spongy masses of anchor-ice form on the bottom. On the next bright sunny day heat from the sun may detach them and they will rise to the surface with considerable force. Probably a thin film of stationary water rests upon boulders and sand over which a stream flows, and this, becoming frozen owing to radiation, forms the foundation for the anchor-ice and produces a surface upon which the descending frazil-ice (see below) can lodge. The ice which rises to the surface has a spongy texture and frequently carries gravel with it. This "anchor-ice," as it was called by Canadian trappers, frequently forms dams across narrow portions of rivers where the floating masses are caught.

"Frazil-ice" is a Canadian term from the French for "forge-cinders." It is surface ice formed in spicules and carried downwards in water agitated by winds or rapids. The frazil-ice may render swiftly moving water turbid with ice crystals. (See H. T. Barnes, Ice Formation with special Reference to Anchor-ice and Frazil-ice, 1906.)

GROUND-NUT (Apios *tuberosa*), a North American plant of the pea family (Leguminosae), called also Indian potato, native to moist low grounds from New Brunswick, Canada, to Minnesota, U.S.A., and southward to Florida and Texas. It is a twining perennial, climbing to a height of several feet, with leaves composed of five to seven ovate leaflets, and bearing in late summer showy clusters of rather large, fragrant, chocolate-brown flowers. From the root are produced strings of starchy edible tubers, 1 to 2 in. long, with a somewhat nutty flavour. These tubers were used for food by the Delawares, Iroquois and other American Indians, and it is recorded that the Pilgrims, during their first winter in Massachusetts, "were enforced to live on ground-nuts." Concerning its possibilities of utilization Asa Gray observed that, except for the prior cultivation of the potato, the ground-nut might have been developed into a food plant of high economic value. In Great Britain the name ground-nut is given to the fruit of Arachis hypogaea, commonly known as peanut (*q.v.*) in the United States.

GROUND or **REASON** is that which is regarded as justifying a certain judgment or belief. See THOUGHT, LAWS OF and LOGIC.

GROUND-PEARL, the outer pearly coverings of encysted pupae of scale insects (*q.v.*) of the genus Margarodes. They are collected and strung into necklaces, particularly in South Africa and the Bahamas.

GROUND RENT. The accepted meaning of ground rent is the rent at which land is let for the purpose of improvement by building, *i.e.*, a rent charged in respect of the land only and not in respect of the buildings to be placed thereon. It thus conveys the idea of something less than a rack rent (see RENT); and accordingly, if a vendor described property as property for which he paid a "ground rent," without any further explanation of the term, a purchaser would not be obliged to accept the property if it turned out to be held at a rack rent. But while a rack rent is generally higher in amount than a ground rent, the latter is usually better secured, as it carries with it the reversionary interest in buildings and improvements put on the ground after the date at which the ground rent was fixed, and accordingly ground rents have been held a good investment (see TRUST AND TRUSTEES). A devise of "ground rent" carries not only the rent but the reversion. Where a tenant is compelled, in order to protect himself in the enjoyment of the land in respect of which his rent is payable, to pay ground rent to a superior landlord (who is of course in a position to distrain on him for it), he is considered as having been authorized by his immediate landlord to apply his rent, due or accruing due, in this manner, and the payment of the ground rent will be held to be payment of the rent itself or part of it. A lodger should make any payment of this character under the Law of Distress Amendment Act 1908 (s. 3; and see RENT). Ground rents are apportionable (see APPORTIONMENT).

In Scots law, the term "ground rent" is sometimes used in the above sense in relation to the rent stipulated for on building leases, but it has no technical significance. Owing to the limited nature of leasehold rights, builders and other improvers of land in Scotland have generally insisted upon acquiring the right of property in the land taken by them in return for an annual payment economically equivalent to a ground rent, but legally distinct from rent. Where the land in question is not subject to prohibition against subinfeudation this has generally been done by a subfeu, the *reddendo* or feu-duty of which is the economic equivalent of ground rent. Where subinfeudation is prohibited the procedure in modern times has been by way of Contract of *Ground* Annual, a complex conveyancing device whereby the builder becomes proprietor, of and under the former feudal superior, in return for a payment lo the former vassal of a ground annual economically equivalent, alone or in conjunction with an existing feu-duty, to a ground rent.

"Ground rents" in the English sense do not seem to be in general use in the United States, but they obtain in Pennsylvania. They are rent services and not rent charges — the statute Quia *Emptores* never having been in force in Pennsylvania. Ground rents are also found in Maryland and to a lesser extent in Ohio.

A ground rent being a freehold estate, created by deed and perpetual in duration, no presumption could, at common law, arise from lapse of time, that it had been released. But now, by statute (Act of April 27, 1855, s. 7), a presumption of release or extinguishment is created where no payment, claim or demand has been made for the rent, nor any declaration or acknowledgment of its existence made or given by the owner of the premises subject to it, for the period of 21 years. Ground rents were formerly irredeemable after a certain time. But the creation of irredeemable ground rents is now forbidden (Pennsylvania Act 7 Assembly, April 22, 1850).

For English law see Foa, Landlord and Tenant; for American law, Bouvier, Law Dictionary; Bingham and Andrews, Financing Real Estate. (A. W. R.; J. WA.)

GROUNDSEL, Senecio *vulgaris,* an annual, glabrous, or more or less woolly plant of the family Compositae, having a branched succulent stem 6 to 15 in. in height, pinnatifid irregularly and coarsely-toothed leaves, and small cylindrical heads of yellow tubular florets enveloped in an involucre of numerous narrow bracts; the ribbed fruit bears a soft, feathery, hoary tuft of hairs (*pappus*). The plant is indigenous to Europe, whence it has been introduced into all temperate climates. It is often a troublesome weed, flowering throughout the year, and propagating itself rapidly by means of its light feathery fruits; it is used as a food for cage-birds. The groundsel tree, Baccharis *halimifolia,* a native of the North American sea-coast from Massachusetts southward to Florida and Texas, is a shrub of the same family attaining 6 ft. to 12 ft. in height, and having angular branches, obovate, somewhat scurfy leaves, and flowers larger than but similar to those of common groundsel. The long white pappus of the female plant renders it a conspicuous object in autumn. The groundsel tree

is sparingly cultivated for ornament. *See* RAGWORT; SENECIO.

GROUND-SQUIRREL, one of the names for a group of (chiefly) North American striped terrestrial squirrel-like rodents, generally known as chipmunks. They are allied to squirrels, from which they are distinguished by the possession of cheek-pouches. The sides and back are marked with light stripes bordered by dark bands; the ears are small, and without tufts, and the tail short. With the exception of one Siberian species *(Tamias asiaticus),* chipmunks are confined to North America where they are represented by the common chipmunk (T, *striatus)* of the eastern United States and by some 35 western species *(Eutanzias).* Various spermophiles *(Clitellus)* of the Mississippi Valley prairies are called ground-squirrels, as are also the spiny-squirrels *(Xerus, Euxerus,* and *Atlantoxerus*) of Africa. *(See* SPERMOPHILE; SPINY SQUIRREL.)

GROUND WIRE. used in a radio set, is a conductive connection to the earth.

GROUP CAPTAIN. An officer's rank of the Royal Air Force (Great Britain) introduced on August 27, 1919. A "group" consists of a number of air force squadrons and other ancillary service units, the number varying with requirements, and the officer commanding this formation is the Group Captain. The rank, however, is not confined to the commander of a group but is also held by officers commanding training units and depots. It is equivalent to the rank of captain of 3 years' seniority in the Royal Navy and to a colonel in the British army. *(See* OFFICERS.)

GROUPER, a general name in America for certain sea-bass of the genus *Epinephelus* and allied genera. The commonest is the red grouper *(E. morio)* found in the Atlantic from Virginia to Brazil, a valuable food-fish, grey in colour, red about the snout. *E. adscensionis,* also known from Africa, is another important food-fish. To this group belongs the jewfish *(q.v.). (See* BASS.)

GROUP INSURANCE: *see* LIFE INSURANCE; INSURANCE, INTRODUCTION TO.

GROUP MARRIAGE, the marriage of several men with several women. It has been found among various peoples who practise polyandry *(q.v.)*—in Tibet, India and Ceylon. In many of these cases we are told that if one of the brothers who have a wife in common brings a new wife. he shares, or has to share, her with his brothers. And that in the other cases, also, the group marriage has arisen as a combination of polygyny with polyandry may be inferred from the facts that both in Tibet and India polyandry is much more prevalent than group marriage; that the latter occurs there nowhere except side by side with polyandry; and that the occasional combination of polygyny with polyandry, when the circumstances permit it, is easy to explain, whereas no satisfactory reason has been given for the opinion held by some sociologists that polyandry has developed out of an earlier stage of group marriage. It is possible that Caesar's well-known statement about the marriages of the ancient Britons, if correct, likewise refers to a combination of polygyny with polyandry. He says: "In their domestic life they practise a form of community of wives, ten or twelve combining in a group, especially brothers with brothers and fathers with sons."

While genuine group marriage has been found only side by side with polyandry, there are peoples—such as the Chukchee, the Herero in South-West Africa, the Masai and Akamba in East Africa, certain communities in New Guinea, and some Australian tribes—who have a kind of sex communism, in which several men have the right of access to several women, although none of the women is properly married to more than one of the men. Thus the *pirrauru* relation among the Central Australian Dieri and the *piraungaru* relation among their neighbours, the Urabunna, almost exclusively imply sexual licence. Yet these relations have been considered to give support to the hypothesis of ancient group marriage in Australia, according to which the men of one division or class had as wives the women of another division or class. Marriages of this sort do not exist anywhere in Australia at the present time; and no person becomes a *pirrauru* or *piraungaru* as a matter of course on account of his or her status. An agreement must be made with the husband, the *pirrauru* may hale to pay for it, and the relation may even be of very short duration (in the case of a visitor); while the *piraungaru* requires the consent of the woman's elder brothers. These institutions may, partly at least, owe their origin to circumstances not unlike those which have led to more or less similar customs in other parts of the world. From various parts of Australia we hear of the difficulty the young native has in getting a wife on attaining manhood, and the *pirrauru* or *piraungaru* custom may serve as a substitute for regular marriage in the case of young men who have to remain unmarried or who have only got old women as wives. But it is also evident that the old and influential men largely make use of that custom to their own advantage. And we must also remember another fact, which is elsewhere found in connection with polyandry, namely, the necessity of a married woman to have a protector and guardian during the temporary absence of her husband. A man has sexual rights over a woman who is *pirrauru* or *piraungaru* to him chiefly, if not exclusively, while her husband is away, and on such occasions only does she live with him, enjoying his protection.

The existence of an early state of group marriage has been assumed from a variety of other customs, such as the lending or exchange of wives, the sexual intercourse to which a girl is subject before her marriage, the licence allowed at the performance of certain ceremonies when the ordinary rules of morality are more or less suspended, the levirate, and the use of classificatory terms of relationship which group together under single designations many distinct degrees and kinds of relationship. There seem, however, to be much more satisfactory explanations of these customs than to regard them as survivals of earlier group marriage; and the theory set forth by certain writers, that group marriage is the earliest form of marriage out of which the others have gradually developed seems to be in no way justified.

GROUPS. In mathematics one frequently encounters sets of operations having the property that when two operations are carried out in succession the result is one that could be reached by a single operation of the set. Such a set of operations is called a *closed set,* and the property of closure is called the *group property.* A simple illustration is given by the four numbers, $1, -1, \sqrt{-1}$, and $-\sqrt{-1}$ of ordinary algebra where the effect of multiplying in succession any number by two of the set is the same as multiplying by a definite third. A formal definition of a group is given later under abstract groups.

SUBSTITUTION GROUPS

Among the first closed sets of operations to be studied were closed sets of substitutions on letters or symbols. To such a closed set Galois gave the name *group.* A letter substitution, or, briefly, a *substitution,* is the operation of replacing a set of symbols or letters by the same set of symbols or letters arranged in a different order; *e.g.,* the notation

$$s=\begin{pmatrix} x_1 & x_2 & x_3 & x_4 & x_5 & x_6 \\ x_2 & x_3 & x_1 & x_5 & x_4 & x_6 \end{pmatrix}$$

indicates that each letter in the upper row is replaced by the letter under it in the second row. The same operation may be indicated by the notation

$$s=(x_1x_2x_3)(x_4x_5),$$

where the first parenthesis means that x_1 is replaced by x_2, x_2 by x_3, and x_3 by x_1, thereby closing the cycle. This notation can be still further abbreviated by writing only the subscript in the cycle. Thus, $s=(123)(45)$.

Every substitution may be expressed in the rvcle notation where no two cycles contain a common letter. If each of the n letters is replaced by itself, the substitution is called the iden-

tical substitution and is denoted by the figure 1. If the n letters be operated on by a given substitution s and the letters in the new order be operated upon by a second substitution t, the result is a new arrangement and the replacing of the letters in the original order by the final order is a third substitution called the product of s and t and denoted by st. Multiplication of two substitutions is not in general commutative. For example, if $s=(x_1x_2x_3)$ and $t=(x_1x_2)$, $st=(x_2x_3)$ and $ts=(x_1x_3)$. A substitution consisting of a single cycle of two letters is called a transposition. Every substitution may be resolved into the product of transpositions and in more than one way. A fundamental property of all substitutions is that the number of transpositions into which a given substitution may be resolved is either always even or always odd. The product of two even, or of two odd substitutions, is even, and the product of an odd and an even substitution is odd.

Multiplication is associative, *i.e.*, $(st)u=s(tu)$, so that the meaning of stu is unambiguous. The product of a substitution s taken m times as a factor is written s^m. Since the associative law holds, powers of substitutions follow the index law of ordinary algebra. In symbols, $s^m \cdot s^n = s^{m+n}$. Moreover, $s^0=1$. Since the number of possible substitutions on n letters is finite, in the series $1, s, s^2, s^3, \ldots$ there must sometime arise a repetition such that $s^{m+n}=s^n$ and consequently $s^m=1$. The smallest positive integer m for which $s^m=1$, is called the order of the substitution. Corresponding to any given substitution s there is another denoted by s^{-1} such that $ss^{-1}=s^{-1}s=1$. This substitution s^{-1} is called the reciprocal of s. To see that s^{-1} always exists, it suffices to note that $s \cdot s^{m-1}=1$, so that $s^{-1}\equiv s^{m-1}$. The possible n-factorial substitutions on n letters form a group, which contains the identical element and an inverse for every element in the group.

ABSTRACT GROUPS

A group may be defined without reference to the properties of the particular elements of which it is composed. Indeed, these elements need have no mathematical properties other than those defined by the rules of combination. When so defined the group is called an abstract group. An abstract group is defined by E. H. Moore to be a system consisting of a set of elements a, b, c, ... and a mode of combination, ordinarily called multiplication, which satisfies the following postulates:

(1) The product of any two elements a and b of the set, whether a and b denote two distinct elements or the same element, is a unique element c, which is an element of the set. In symbols, ab=c.

(2) The associative law for multiplication holds; *i.e.*,

$$(ab)c=a(bc)=\text{abc}.$$

(3) The system contains a so-called identical element **I** such that $aI=Ia=a$ for every element a of the set.

(4) Corresponding to any element a of the set there is in the set a reciprocal element a^{-1} such that $aa^{-1}=a^{-1}a=\mathbf{I}$.

A group is said to be finite or infinite according as the number of elements is finite or infinite. By the aid of postulates (3) and (4) it is easy to prove the following theorem: (3a) If $ab=ab'$, then $b=b'$, and if ab=a'b, then a=a'. For it is only necessary to note that left-hand multiplication of both members of the first equation by a^{-1} gives $b=b'$, and right-hand multiplication of both members of the second by b^{-1} gives $a=a'$. On the other hand, if the number of elements in the group is finite and (3a) be assumed as a postulate along with (1) and (2), it is easy to prove (3) and (4) as theorems. If the group is infinite it is not possible to prove (3) and (4) without assuming a further postulate: (4a). If two elements a and b are given, a third element c, unique in each case, is determined by any one of the three equations, ac=b, ca=b, ab=c. For finite groups the proposition (4a) is a direct consequence of postulates (1), (2), (3) and (4). A finite group may be defined by three postulates, (1), (2) and (3a), and an infinite group by the four postulates, (1), (2), (3a) and (4a) (Weber).

The elements of a closed set do not necessarily form a group since they need satisfy postulate (1) alone. Closed sets lacking the identical element and the inverse elements have been called semi-groups. The positive integral powers of a number which is neither zero nor a root of unity form a semi-group. The number of elements in a finite group is called the order of the group. If there exists within a group G a set which satisfies the group property, *i.e.*, postulate (1), this set is called **a** subgroup of G. A group for which the product of every two elements is commutative is called an *Abelian* group. The simplest example is the group composed of the powers of a single substitution of prime order. The customary notation for a group whose elements are a, b, c, ... is $G=[a, b, c, \ldots]$.

Examples of Groups.—I. The n-factorial substitutions on n letters form a group of order n! called the symmetric *group*. The even substitutions of the symmetric group form a sub-group of order $\frac{n!}{2}$ called the alternating group. The odd substitutions of the symmetric group, or, for that matter, of any substitution group, do not form a group since the product of two odd substitutions is even. A substitution group is said to be transitive if it contains at least one substitution which will replace an arbitrary given letter by another arbitrary given letter, otherwise it is intransitive. Transitivity is not an essential property of a group since the same group may be represented by both transitive and intransitive substitution groups.

2. The rotations of a regular solid into itself form a group in which the product of two elements is defined to be the rotation equivalent to the two rotations performed in succession. Included among these rotation groups are the dihedral groups which are obtained by rotating regular polygons into themselves, or what amounts to the same thing, rotating double right pyramids with regular bases into themselves. The rotations of a polygon into itself without turning it over form a cyclic group. The groups of the cube and the dodecahedron are the same as those of their respective polar figures, the octahedron and the icosahedron. The polyhedral groups, *i.e.*, the cyclic, dihedral, tetrahedral, octahedral and icosahedral groups, complete the enumeration of the finite rotation groups.

3. The totality of linear fractional transformations of the form $z'=\dfrac{\alpha z+\beta}{\gamma z+\delta}$ for which the determinant $\alpha\delta-\beta\gamma=1$ form a group for which multiplication is defined by the elimination of z' from two transformations

$$S: z'=\frac{\alpha_1 z+\beta_1}{\gamma_1 z+\delta_1}, \qquad T: z''=\frac{\alpha_2 z'+\beta_2}{\gamma_2 z'+\delta_2}.$$

The determinant of the product S T will be the product of the determinants of the two transformations. The identical transformation is obtained by making $\alpha=6=1$ and $\beta=\gamma=0$, and the inverse is found by solving the transformation for z in terms of z'. If the linear fractional transformation has the form

$$z'=\frac{(d+ic)z-(b-ia)}{(b+ia)z+d-ic}$$

where $a=\xi\sin\frac{\theta}{2}$, $b=\eta\sin\frac{\theta}{2}$, $c=\zeta\sin\frac{\theta}{2}$, $d=\cos\frac{\theta}{2}$, and ξ, η, ζ are the co-ordinates of a point on a sphere of unit radius with centre at the origin, it represents a rotation through angle θ about the diameter through the point (ξ, η, ζ). The points z and z' of the $x+iy$-plane are the stereographic projections from the north pole of the sphere upon its equatorial plane of the point (f, η, ζ) and the point into which (f, η, ζ) is rotated. This formula, known as Cayley's rotation formula, gives all the polyhedral groups, which are the only finite groups that can be represented as groups of linear fractional transformations on one variable. (See F. Klein's *Vorlesungen über* das Ikosaeder.)

Closely related to the polyhedral groups are the crystallographic groups whose operations are rotations, reflections, or combinations of these. Every so-called symmetry group defines a definite crystal system, and, conversely, every crystal belongs to a symmetry group. (See Hilton's Mathematical *Crystallo-*

graphy.) Groups of linear and linear fractional transformations will be discussed in a later section. If a, β, γ, δ are rational integers subject to the condition $\alpha\delta-\beta\gamma=1$, an infinite discrete group, known as the modular group, is obtained. The modular group plays a fundamental rôle in the theory of the elliptic functions.

Isomorphism.—Two groups are said to be simply isomorphic when the following conditions hold:

1. A one-to-one correspondence can be established between the elements of the two groups.

2. If to two elements s and t of one group correspond two elements S and T respectively of the other, to the product st corresponds the product ST.

From the point of view of abstract groups, two simply isomorphic groups, are identical; or, we may say they differ only in their mode of representation. The tetrahedral group is simply isomorphic with the alternating group on four letters; the octahedral group is simply isomorphic with the symmetric group on four letters; and the icosahedral group is isomorphic with the alternating group on five letters.

The prime importance of substitution groups lies in the fact that according to a fundamental theorem due to Cayley (sometimes attributed to Jordan), any finite group of order N is simply isomorphic with a transitive substitution group on N letters. To prove Cayley's theorem, let the elements of the group G be

$$G=[1, s_2, s_3, \cdots, s_N].$$

If s_i be any element of the group, the products

$$s_1s_i,\ s_2s_i,\ s_3s_i, \cdots, s_Ns_i$$

will be the elements of the group in some order. It follows that

$$S_i=\begin{pmatrix} s_1, & s_2, & s_3, & \cdots, & s_N \\ s_1s_i, & s_2s_i, & s_3s_i, & \cdots, & s_Ns_i \end{pmatrix}$$

is a substitution on the letters $s_1, s_2, \ldots, s_N$. Similarly, if s_j be a second element of G, there is formed on the N letters a second substitution S_j which corresponds to s_j. It follows that the product S_iS_j is in the set $S_1, S_2, \ldots$ and, moreover, corresponds to the product s_is_j in G. The group $\Gamma=[S_1, S_2, \cdots, S_N]$, simply isomorphic with G, is transitive and the number of elements is equal to the number of letters. Such a group is called regular. One of the important problems in the group theory is that of finding the smallest number of letters by means of which a given group can be represented as a group of substitutions. Such substitution groups will not be regular except in special cases. If the groups G and G' are p-fold and q-fold isomorphic respectively to a group Γ, then G and G' are said to be ($p-q$)-fold isomorphic to each other.

PROPERTIES INDEPENDENT OF THE MODE OF REPRESENTATION OF A GROUP

If N be the order of a group G and r the order of a sub-group H, then r is an integral divisor of N. For, let the subgroup be $H=[h_1=1, h_2, h_3, \cdots, h]$ and let g_2 be any element of G not found in H. The elements of the set $h_1g_2, h_2g_2, h_3g_2, \cdots, h_rg_2$ are all distinct by (3a), and none are found in H. Proceeding in this manner, the elements of G can be arranged in the form of a rectangle whose dimensions are r by p. In this rectangle no element is repeated for if $h_sg_i=h_tg_j$, $(i\neq j)$, then $g_j=h_t^{-1}h_sg_i$ is an element already enumerated. It follows that $N=\rho r$. The integer $p=\frac{N}{r}$ is called the index of H under G. This theorem, due to Lagrange, is the chief cornerstone of the theory of finite groups.

The set of elements in the ith row may be written Hg_i and is called a right-hand co-set of G with respect to H. The group G may then be indicated by the notation

$$G=H+Hg_2+Hg_3+\cdots+Hg_\rho.$$

Similarly, G can be expressed in terms of left-hand co-sets so that

$$G=H+g_2'H+g_0'H+\cdots+g_\rho'H,$$

where $g_2', g_3', \cdots, g_\rho'$ are suitably chosen. In particular, the group may be expressed in the form

$$G=H+g_2^{-1}H+g_3^{-1}H+\cdots+g_\rho^{-1}H,$$

where the elements of $g_i^{-1}H$ are the reciprocals of the elements of Hg_i.

Dedekind has expressed G in terms of double co-sets Rgi H. Thus

$$G=RH+Rg_2H+Rg_3H\cdots$$

Invariant Sub-groups.—An element $h'=g^{-1}hg$, where h is an element of a group H and g is either an element of H, or of a larger group G containing H, is called a transform of h, or a conjugate of h. The set of elements obtained by transforming all the elements of H form a group H'. For if h_i and h_j be two elements of H, the product $g^{-1}h_ig\cdot g^{-1}h_jg=g^{-1}h_kg$ is again in the set of transforms. The group H' is called a conjugate of H and is simply isomorphic to it. We may write $H'=g^{-1}Hg$.

If a subgroup H of a group G be transformed in succession by all the elements of G, a set of groups H, H', H'', ..., all conjugate to H is obtained. The group H_0, composed of the elements common to the conjugate groups H, H', H'', ..., has the important property that $g^{-1}H_0g=H_0$ for every element g of G. Such a group is called a *self-conjugate subgroup*, or an invariant subgroup, or a normal divisor, of G. The alternating group $G_{n!}$ is an invariant subgroup of the symmetric group $G_{n!}$.

Simple Groups.—A group G which contains no invariant subgroup except the trivial cases of the identity and the group itself is called a simple group; otherwise it is composite. Every group of prime order is simple. A fundamental theorem is that the alternating group on n letters is simple except for the single case $n=4$. The icosahedral group which is simply isomorphic with the alternating group on 5 letters, is the smallest simple group of composite order. The orders of the remaining simple groups of composite order less than 2000 are 168, 360, 504, 660, 1092.

The number of simple groups of composite order is infinite. Dickson in his Linear Groups with an *Exposition* of the Galois Field Theory has enumerated 78 known simple groups of composite orders less than one billion. Of the 53 whose orders are less than one million, all but 3 belong to known infinite systems of simple groups. There are two distinct simple groups of order 20,160. Dickson has shown further that there is an infinite number of orders corresponding to which there exist more than one type of simple group. It is known that a group cannot be simple if its order N has one of the forms p^α, $p^\alpha q^\beta$, $pqr\ldots$ or $p^2q^2r^2(p, q, r, \cdots)$distinct primes; or if it has fewer than 6 prime factors ($N>2000$); or if it is not divisible by one of the numbers 12, 16, 56 ($N=2n$). So far no simple group of odd composite order has been discovered.

Factor Groups.—If G_1 be an invariant subgroup of a group

$$G=G_1+G_1g_2+G_1g_3+\cdots+G_1g_\rho,\ \left(\rho=\frac{N}{N_1}\right),$$

the co-sets of G with respect to G_1 may be looked upon as the elements of a group. The product $G_1g_i\cdot G_1g_k$ is interpreted to mean the totality of distinct elements of the form $gg_ig'g_j$ as g and g' run through the elements of G_1. Since G_1 is invariant in G, $g_iG_1=G_1g_i$ and $G_1G_1=G_1$. It follows that

$$G_1g_i\,.\,G_1g_j=G_1\cdot g_iG_1\,.\,g_j=G_1G_1g_ig_j=G_1g_k.$$

The product of two co-sets is a co-set and the co-sets form a group $\Gamma=[G_1, G_1g_2, G_1g_3, \cdots, G_1g_\rho]$ when and only when G_1 is invariant. This group is called the quotient, or factor group, or the *complementary group* of G_1 with respect to G and is usually written $\frac{G}{G_1}$. The co-set G_1 is the identical element and the element G_1g^{-1} is inverse to G_1g. Between the groups G and $\frac{G}{G_1}$ there is an (N_1-1)-fold isomorphism.

Series of Composition.—An invariant subgroup G_1 of G which is contained in no other invariant subgroup of G is called a maximal invariant subgroup of G. The series G, G_1, $G_2, \cdots, 1$, terminating with the identity group, in which every group is a

maximal invariant subgroup of the preceding group is called a series of *composition* of G. The integers $e_1, e_2, e_3, \cdots$ defined to denote the respective indices of $G_1, G_2, \cdots$ under the preceding group are called the factors of *composition* of G. The factor groups $\frac{G}{G_1}, \frac{G_1}{G_2}, \frac{G_2}{G_0}, \cdots$ are all simple. For if $\frac{G_i}{G_{i+1}}$ had an invariant subgroup, G_i would contain a proper invariant subgroup G'_{i+1} which would contain G_{i+1}.

If the factors of composition are all prime numbers, the group is said to be solvable, a term carried over from the theory of equations (see EQUATIONS, THEORY OF), where it is shown that the necessary and sufficient condition that an equation be solvable by radicals is that its group have only prime numbers for its factors of composition. If a group has more than one series of composition, the theorem of Camille Jordan published in his *Traité des Substitutions* in 1870, asserts that the factors of composition are, apart from their order, the same for every series of composition. Jordan's theorem is a direct consequence of a more general theorem published in 1889 by Hölder proving that the factor groups $\frac{G}{G_1}, \frac{G_1}{G_2}, \frac{G_2}{G_3}, \cdots$ are identical in some order with the factor groups for any other series of composition.

Conjugate Sets of Elements. — If s be any operation of a group G, the distinct elements $s_1, s_2, \ldots, s_h$ obtained by transforming s by every element of G is called a complete *conjugate set*. Clearly, s itself will be found in the set and, moreover, the complete set of transforms of any element s_i of the set is identical with the complete set obtained from s. If t be any element in the group not in the set determined by s, a new complete set of elements conjugate to t may be found. In this way the elements of the group G may be separated into non-overlapping complete conjugate sets. If h_i be the number in a set and r the number of complete conjugate sets, the order N of G may be written

$$N = h_1 + h_2 + \ldots h_r.$$

Since the identical element is transformed into itself by every element at least one h is unity. If the group is Abelian, every h is unity. Every h is a divisor of the order N of the group.

An element which is commutative with every element of the group is called an isolated element. The totality of the isolated elements form an Abelian subgroup called the *central* of G. For any two elements s and t there is a unique third element c such that $st = tsc$ so that $c = s^{-1}t^{-1}st$. This element c was called by R. Dedekind the commutator of s and t. The commutators of a group G do not necessarily form a group but they generate a group. This group, which may be identical with G, is an invariant subgroup C of G called the commutator group. It has the property that it is the smallest invariant subgroup of G for which the factor group G/C is Abelian.

Sylow's Theorem. — Our knowledge of the structure of finite groups depends largely upon a set of closely related theorems of which Sylow's theorem was the first to be proven. In a paper of fundamental importance published in 1872, L. Sylow showed that if p^a is the highest power of a prime p contained in the order of a group G, then G must contain at least one subgroup of order p^a and that if there are more than one, they form a conjugate system whose number is $1 + kp$, where k is a positive integer. Such groups are called Sylow subgroups.

It is shown that a group whose order is p^a contains subgroups of orders $p^{\alpha-1}, p^{\alpha-2}, \ldots, p^2, p$, whence it follows that G contains subgroups of order p^r for $r \leqq \alpha$. Froebenius extended Sylow's theorem by showing that the number of subgroups of order p^r, $(r < a)$, is also $1 + kp$. However, the subgroups of order p^r, $(r < a)$, do not necessarily form a conjugate set. Sylow proved that every group whose order is a power of a prime is solvable. Froebenius reached the same result for groups whose orders have the forms $N = pqr \ldots$ or $N = p^a q$ where $p, q, r \ldots$ are distinct primes, while Burnside showed that if $N = p^\alpha q^\beta$ the group is solvable.

Abelian Groups. — An Abelian group, i.e., a group whose elements are all commutative, has the property that there exist within the group a set of elements $A_1, A_2, A_3, \ldots$ of orders $a_1, a_2, a_3, \ldots$ such that every element θ of the group may be expressed in the form

$$\theta_1 = A_1^{\alpha_1} A_2^{\alpha_2} A_3^{\alpha_3} \cdots, \quad (\alpha_i = 0, 1, 2, \cdots, a_i - 1).$$

The elements $A_1, A_2, A_3, \ldots$ form a base, the elements of which may be selected in more than one way.

In particular, the elements may be selected so that their orders are powers of the prime factors occurring in the order of the group.

An Abelian group G of order $p_1^{n_1}, p_2^{n_2}, \ldots, p_s^{n_s}$ is the direct product of Abelian groups $G_{p_1}, G_{p_2}, \ldots, G_{p_s}$ of orders $p_1^{n_1}, p_2^{n_2}, \ldots, p_s^{n_s}$, respectively. It follows that the problem of determining all Abelian groups of any given order is solved when we know the possible types of Abelian groups whose orders are prime powers.

The distinct types of Abelian groups whose orders are p^n are given by the form

$$P_1^{s_1} P_2^{s_2} P_3^{s_3} \ldots P_t^{s_t} \quad (s_i = 0, 1, 2, 3, \cdots, p^{n_i} - 1)$$

where $P_1, P_2, \ldots, P_t$ are generators of orders $p^{n_1}, p^{n_2}, \ldots, p^{n_t}$, and $n = n_1 + n_2 + \ldots + n_t$ is any partition of n. Thus, there are three distinct Abelian groups of order p^3 corresponding to the partitions $3, 2+1, 1+1+1$, of 3.

The type of an Abelian group of order p^n is completely specified by the partition.

The Isomorphisms of a Group with Itself. — If $G = [s_1 = 1, s_2, s_3, \ldots, s_N]$ be a group and t an element not commutative with every element of G, the conjugate group

$$G' = [s_1' = 1, s_2', s_3', \cdots, s_N'],$$

where $s_i' = t^{-1} s_i t$, $(i = 1, 2, \ldots, N)$, is simply isomorphic with G. If t be an element of G, then G' is identical with G though its elements do not necessarily occur in the same order. We have, therefore, an isomorphism of the group with itself. If G is Abelian, a correspondence which shows the group to be isomorphic to itself may be set up by making each element correspond to its inverse.

The isomorphism in which each element corresponds to itself is called the identical isomorphism. For a group of order 2 the identical isomorphism is the only one possible. In every other case there exist isomorphisms different from the identical isomorphism.

An isomorphism of a group with itself defines a substitution

$$S' = \begin{pmatrix} 1, & s_2, & s_3, & \cdots, & s_N \\ 1, & s_2', & s_3', & \cdots, & s_N' \end{pmatrix}$$

and the totality of the isomorphisms form an intransitive substitution group L isomorphic to G. An isomorphism determined by taking the transforms $t^{-1}s_i t$ of all the elements of G is called a *cogredient* isomorphism. All other isomorphisms of G with itself are called contragredient. An important theorem is that the cogredient isomorphisms of a group G form an invariant subgroup of the group of isomorphisms.

LINEAR GROUPS

Linear Homogeneous Substitutions. — A generalization of the notion of a letter substitution of far-reaching importance is the linear homogeneous substitution on n independent variables $y_1, y_2, \ldots, y_n$ given by the n equations

$$A: \begin{cases} z_1 = a_{11}y_1 + a_{12}y_2 + \cdots + a_{1n}y_n \\ z_2 = a_{21}y_1 + a_{22}y_2 + \cdots + a_{2n}y_n \\ \cdots \\ z_n = a_{n1}y_1 + a_{n2}y_2 + \cdots + a_{nn}y_n \end{cases}$$

or, briefly, $A: z_i = \sum_{j=1}^{n} a_{ij}y_j, \quad (i = 1, 2, \ldots, n);$

or, still more briefly, $z = A(y)$.

The matrix of the coefficients a_{ij} is called the *matrix* of the substitution and the corresponding determinant is the determinant of the *substitution*. A substitution is completely determined by its matrix so that the same notation may be used for both.

The study of groups of linear homogeneous substitutions may be looked upon as a special chapter in the theory of matrices. The matrix and determinant of a substitution are denoted respectively by

$$A=(a_{ij})=\begin{vmatrix} a_{11}\,a_{12}\cdots a_{1n}\\ a_{21}\,a_{22}\cdots a_{2n}\\ \cdot\quad\cdot\quad\cdots\quad\cdot\\ a_{n1}a_{n2}\cdots a_{nn}\end{vmatrix},\ \text{and}\ a=|a_{ij}|=\begin{vmatrix} a_{11}\,a_{12}\cdots a_{1n}\\ a_{21}\,a_{22}\cdots a_{2n}\\ \cdot\quad\cdot\quad\cdots\quad\cdot\\ a_{n1}a_{n2}\cdots a_{nn}\end{vmatrix}.$$

The product AB of the substitution A the substitution

$$B: y_j=\sum_{k=1}^{n} b_{jk}\,x_k,\qquad (j=1,\ 2,\cdots,\ n)$$

is found by eliminating the y's from the equations for A and B. We may write $(z)=A(y)=A[B(x)]=AB(x)$. The resultant is a linear substitution

$$AB=C: z_i=\sum_{k=1}^{n} p_{ik}\,x_k,\qquad (i=1,\cdots,\ n),$$

where $p_{ik}=\sum_{j=1}^{n} a_{ij}b_{jk}$; *i.e.*, the element in the ith row and the kth column of C is found by taking the sum of the products of the elements of the ith row of A by the corresponding elements of the kth column of B. The identity is that substitution for which $a_{ii}=1$ $(i=1,\cdots,n)$, and all other coefficients are zero. If the determinant $a\neq 0$, the substitution A^{-1} found by solving the n equations A for $y_1, y_2,\cdots, y_n$ is the inverse of A.

From the formula for the coefficient p_{ik}, of the ith row and the jth column of C, it follows that the determinant of the product of two substitutions is the product of their determinants. The associative law for multiplication holds. It follows that the totality of linear homogeneous substitutions with determinants different from zero form a group, which is in the general case an infinite group. However, by placing proper restrictions on the coefficients a_{ij}, it is possible to find finite groups of linear homogeneous substitutions known by the briefer designation linear groups.

A fundamental theorem in linear transformations is that if two sets of variables $y_1, y_2,\cdots, y_n$ and $x_1, x_2,\cdots, x_n$ be related by a linear transformation

$$S: y_i=\sum_{j=1}^{n} s_{ij}x_j\quad (i=1,\cdots,n,\ |s_{ik}|\neq 0)$$

and if the y's be subjected to a transformation

$$A: y_i'=\sum_{j=1}^{n} a_{ij}y_j\qquad (i=1,\ 2,\cdots,\ n),$$

the x's will undergo a linear transformation $A'=S^{-1}AS$. To prove the theorem, let $(y')=S(x')$, $(y')=A(y)$. Then

$$x'=S^{-1}(y')=S^{-1}A(y)=S^{-1}AS(x).$$

The matrix $A'=S^{-1}AS$ is called the *transform* of A with respect to S.

Every group of substitutions on n letters (and consequently every finite group) is simply isomorphic with a linear group on n variables. For, let

$$s=\begin{vmatrix} x_1,\ x_2,\cdots,\ x_n\\ \xi_1,\ \xi_2,\cdots,\ \xi_n\end{vmatrix}\ \text{and}\ t=\begin{vmatrix} \xi_1,\ \xi_2,\cdots,\ \xi_n\\ \eta_1,\ \eta_2,\cdots,\ \eta_n\end{vmatrix}$$

be two letter substitutions where ξ_i and η_i are permutations of the n letters xi. If s and t be made to correspond to the linear homogeneous substitutions

$$A: x_1=\xi_1,\quad x_2=\xi_2,\cdots,\ x_n=\xi_n,$$

and

$$B: \xi_1=\eta_1,\quad \xi_2=\eta_2,\cdots,\ \xi_n=\eta_n,$$

the product st will correspond to the product AB. A substitution having the form

$$y_1=\mu_1x_1,\ \ y_2=\mu_2x_2,\cdots,\ y_n=\mu_nx_n$$

is called a multiplication. If all the multipliers μ_i are equal, the substitution is called a similarity substitution, and is commutative with every substitution.

The Characteristic **Equation.**—Whether or not a linear substitution is of finite order depends upon the form to which its matrix may be transformed. To this end it is convenient to make use of the so-called characteristic equation of the substitution. This equation may be obtained as follows: If the variables $x_1, x_2, x_3,\cdots, x_n$ be looked upon as homogeneous point coordinates in space of $n-1$ dimensions, a point is unchanged if its co-ordinates be transformed by a linear substitution A into $\lambda x_1, \lambda x_2,\cdots,\lambda x_n$. It follows that λ must satisfy the equation

$$\phi(\lambda)\equiv\begin{vmatrix} a_{11}-\lambda & a_{12} & \cdots a_{1n}\\ a_{21} & a_{22}-\lambda\cdots a_{2n}\\ \cdot & & \cdots\ \cdot\\ a_{n1} & a_{n2} & \cdots a_{nn}-\lambda\end{vmatrix}=0,$$

or, briefly $\phi(\lambda)=0$. The same equation is found if we suppose that $\sum_{i=1}^{n} c_ix_i$ is a linear form which is changed into a multiple of itself by the substitution A, for then $\sum_{i,j=1}^{n}c_ia_{ij}x_j\equiv\lambda\sum_{i=1}^{n} c_ix_i$ whence

$$\sum_{i=1}^{n} c_ia_{ij}=\lambda c_j,\ (j=1,\ 2,\cdots,\ n).$$

The result of eliminating the c's from these n equations is $\phi(\lambda)=0$.

The equation $\phi(\lambda)=0$ is called the characteristic *equation* of A. The determinant $\phi(\lambda)$ is the characteristic *determinant* and the matrix $A-XI$, where I is the unit matrix, formed by subtracting λ from the elements in the principal diagonal of the matrix A, is the characteristic matrix of A. The characteristic determinants and characteristic equations of A and $A'=S^{-1}AS$ are identical. The equation $\phi(\lambda)=0$ has no zero root since the absolute term is $|a_{ij}|\neq 0$. The sum of the roots, $a_{11}+a_{22}+a_{33}+\cdots+a_{nn}$, is called the characteristic of the substitution.

One fundamental property, at once apparent, of a substitution of finite order is that the roots of the characteristic equation $\phi(\lambda)=0$ must be roots of unity, for if the linear form $\sum_{i=1}^{n}c_ix_i$ is changed into λ times itself and if $A^m=1$, then must $A^m=1$. Another fundamental property, not so easily demonstrated, is that if A is of finite order there is a substitution S such that the transform $S^{-1}AS$ is a multiplication

$$y_1=\omega_1x_1,\quad y_2=\omega_2x_2,\cdots,\ y_n=\omega_nx_n,$$

where $\omega_1, \omega_2,\cdots, \omega_n$ are roots of unity called the multipliers of A. Since the characteristic equation of a substitution and its transform are the same it follows that $\omega_1, \omega_2,\cdots, \omega_n$ are the roots of $\phi(\lambda)=0$. If the group is Abelian, all its elements can be transformed simultaneously into multiplications. The first publication of the classical theorem that every substitution of finite order can be transformed into a multiplication was given by Jordan in 1877. Subsequent proofs were given by Lipschitz, Kronecker, Weyr, Moore, Maschke, and Rost.

Collineation Groups.—Every linear group G contains at least one similarity substitution. The totality of these form an invariant subgroup H. From the viewpoint of geometry, every substitution in H leaves the point $(x_1, x_2,\cdots, x_n)$ unchanged. If G contains another substitution, the product HA, forms a class of substitutions all of which transform $(x_1, x_2,\cdots, x_n)$ into the same new point and all of which transform three given collinear points into the same three new collinear points. The class of substitutions HA,, or any given element of the class, which may be called a representative of the class, is called a collineation. It may happen even when G is an infinite group, that the number of collineations is finite. If $I, A_2, A_3,\cdots, A_j$ represent the classes of the group $G=H+HA_2+\cdots+HA_j$, the group G/H is called a Collineation Group.

From the linear homogeneous substitution $y=A(x)$ we obtain a linear fractional substitution

$$A': w_i=\frac{a_{i1}z_1+a_{i2}z_2+\cdots+a_{in-1}z_{n-1}+a_{in}}{a_{n1}z_1+a_{n2}z_2+\cdots+a_{nn-1}z_{n-1}+a_{nn}},\ (i=1,\ 2,\cdots,\ n),$$

by dividing the first $n-1$ equations of A by the last, member by member, then replacing $\frac{y_i}{y_n}$ by w_i and $\frac{x_i}{x_n}$ by z_i. The linear fractional group is simply isomorphic with the corresponding collineation group.

Reducible and Irreducible Groups.—A linear group on the n variables $x_1, x_2, \ldots, x_n$ is called reducible if it is possible to find n_1 linear functions $\xi_1, \xi_2, \cdots, \xi_{n_1}, (n_1<n)$, of the n variables which are transformed among themselves by every substitution of the group; otherwise, it is irreducible. Every matrix of a reducible group may be transformed by a suitably chosen matrix into the form

$$\begin{pmatrix} A, & 0 \\ C, & D \end{pmatrix},$$

where A is a square matrix of order n_1, D a square matrix of order $n-n_1$, C a matrix of $n-n_1$ rows and n_1 columns and 0 a zero matrix of $n-n_1$ columns and n_1 rows. A reducible group is completely reducible; that is to say, there exist r sets of linear functions

$$\xi_{i1}, \xi_{i2}, \cdots, \xi_{in_i}, \quad (i=1, 2, \cdots, r)$$

of the variables $x_1, x_2, \ldots, x_n$ such that the functions of each set are transformed among themselves by every operation of the group. A reducible group is said to be intransitive (H. Maschke) and each set of linear functions $\xi_{i1}, \xi_{i2}, \ldots, \xi_{ini}$ is a set of intransitivity.

A problem of chief interest in the theory of linear groups is the determination of those irreducible linear groups which furnish representations for given abstract groups since from the irreducible representations any representation can be derived. This problem was most successfully studied by Frobenius in a series of memoirs published in the Berliner Sitzungsberichte between 1896 and 1903, in which he originated and developed the theory of group characteristics. Frobenius' theory has been simplified and extended by Schur, Burnside, Dickson, and Blichfeldt.

An abstract group $G=[S_1=1, S_2, S_3, \cdots, S_N]$ is said to be represented by a group of linear substitutions

$$\Gamma=[s_1=1, s_2, s_3, \cdots, s_N']$$

when to every element S_i of G there corresponds a linear substitution s_i with square matrix A_{s_i} of order m such that $A_{s_i} \cdot A_{s_j}=A_{s_i s_j}$, and, further, that not every A_{s_i} is singular. Under these assumptions it follows that no A_{s_i} is singular. If the matrices A_{s_i} are not all distinct, the group Γ is multiply isomorphic with G. Two representations

$$\Gamma=[s_1=1, s_2, s_3, \ldots, s_N'] \text{ and } \Gamma'=[s_1'=1, s_2', \cdots, s_N']$$

are equivalent if there exists a linear substitution t on the m symbols with matrix T such that $T^{-1}A_{s_k}T=A'_{s_k}$ for every k, otherwise the representations are distinct.

The Group Matrix.—If x be any quantity, the scalar product Ax is formed by multiplying each element of the matrix A by x. If, now, $x_{s_1}, x_{s_2}, \ldots, x_{s_n}$ be n independent variables, we may form the matric sum $A=\sum A_{s_i}x_{s_i}$. This new matrix A formed by adding all the elements in the ith row and jth column of each constituent matrix to form the element in the ith row and jth column of A is called the group matrix corresponding to the representation of the group G by the linear group Γ. The elements of the group matrix will be homogeneous linear forms in $x_{s_1}, x_{s_2}, \cdots, x_{s_n}$; *e.g.*, the cyclic group on three elements $s_1=1$, $s_2=(123)$, $s_3=(132)$ is isomorphic with the group of matrices

$$\begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix}, \quad \begin{vmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{vmatrix}, \quad \begin{vmatrix} 0 & 0 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{vmatrix}.$$

So that the group matrix is

$$A=\begin{vmatrix} x_1 & x_2 & x_3 \\ x_3 & x_1 & x_2 \\ x_2 & x_3 & x_1 \end{vmatrix}$$

The n^2 elements of the group matrix are linear forms in the n independent variables x. In case A is a reducible group matrix, it is equivalent to a matrix

$$A=\begin{vmatrix} A_1 & 0 & 0 & 0 \\ 0 & A_2 & 0 & 0 \\ \cdot & \cdot & \cdot & \cdot \\ 0 & 0 & 0 & A_r \end{vmatrix}$$

where A_i are irreducible group matrices of orders $n_1, n_2, \ldots, n_r$, called the irreducible components of A.

If a reducible group matrix A be equivalent to a second matrix A' of the same type with irreducible components $A_1', A_2', \cdots, A_r'$, the components of A and A' will be equivalent in some order. It follows that the number of distinct components is invariant for a given group matrix. The determinant of an irreducible matrix is an irreducible function of the variables x. Moreover, the necessary and sufficient condition that two irreducible group matrices shall be equivalent is that their determinants shall be identical.

When a group G given as a regular letter substitution group is represented by a linear group Γ having the form

$$x'_1=x_\alpha, \quad x_2=x_\beta, \quad x_3=x_\gamma \cdots$$

where $\alpha, \beta, \gamma \ldots$ are the subscripts 1, 2, 3 $\ldots$ in some order the group matrix A of Γ is said to be regular. When the group matrix A is transformed into its completely reduced form, it will be found that each component $A_1, A_2, \ldots, A_r$ is repeated exactly n_s times, where n_s is the order of the component matrix, and that the number of distinct components is equal to the number of conjugate sets of elements in the group. It follows that the number r of non-equivalent transitive linear groups into which a regular substitution group breaks up is equal to the total number of sets of conjugate elements in the group.

Group Characters.—If an abstract group G be represented by a group of linear transformations $\Gamma=[s_1=1, s_2, s_3, \ldots, s_N']$ with matrices $A_{s_1}, A_{s_2}, \cdots, A_{s_N}$, to each matrix will correspond a characteristic equation whose roots, which are the multipliers of A, are roots of unity. The sum of these multipliers will be the sum of the coefficients in the principal diagonal of the matrix. This sum has already been defined to be the characteristic of the linear transformation s and is denoted by

$$\chi(s)=a_{11}+a_{22}+\cdots+a_{nn}.$$

Since the characteristic equations of a matrix and its transform are identical, there are exactly r distinct characteristics of any irreducible representation Γ_i of G where r is the number of conjugate sets in Γ_i. These r characteristics, usually denoted by

$$\chi_1^i, \quad \chi_2^i, \cdots, \chi_r^i$$

are called a set of characteristics or a character of Γ_i. For a given group G there are exactly r sets of characteristics corresponding to the r irreducible representations of G.

The far-reaching character of the theory of group characteristics is indicated by the theorem which asserts that the necessary and sufficient condition that two representations of a group of finite order by means of linear substitutions shall be equivalent, is that the characteristics of each set of conjugates shall be the same in both representations. Not only does the theory throw important light upon the theory of linear groups themselves but its application has led to the discovery of important theorems concerning abstract groups not otherwise proven. One of the most important of these is Burnside's proof that every group, whose order is of the form $p^\alpha q^\beta$ (p and q prime), is solvable.

Group Invariants.—In the early part of this article, it was noted that to the various groups of letter substitutions correspond functions of the letters which are unchanged by every element of the group. If $x_1, x_2, \ldots, x_n$ be the roots of an equation, every symmetric function S is unchanged by all the substitutions of the symmetric group. Every function having the form $S_1(x_1, x_2, \cdots, x_n)+\sqrt{\Delta}S_2(x_1, x_2, \ldots, x_n)$, where Δ is the discriminant of the x's, is unchanged by the substitutions of the

alternating group. In general, if under the substitutions of a given group G a function ϕ takes p values $\phi_0, \phi_1, \phi_2, \cdots, \phi_{p-1}$, any symmetric function of $\phi_0, \phi_1, \cdots, \phi_{p-1}$ will be unchanged by every substitution of G. (See THEORY OF EQUATIONS.)

Similarly, if the independent variables $x_1, x_2, \cdots, x_n$ operated on by a group G of linear substitutions be changed into the n linear functions $x_1^{(s)}, x_2^{(s)}, \cdots, x_n^{(s)}$, any rational function $F(x_1, x_2, \cdots, x_n)$ is called an *invariant* of the group if

$$F(x_1^{(s)}, x_2^{(s)}, \cdots, x_n^{(s)} \equiv F(x_1, x_2, \cdots, x_n),$$

for every element s of G. Clearly, as in the case of letter substitutions, if $f(x_1, x_2, \ldots, x_n)$ be any rational function, not identically zero, any symmetric function of the N functions $f(x_1^{(s)}, x_2^{(s)}, \cdots, x_n^{(s)})$ will be an *invariant* of the group. Since the n variables $x_1, x_2, \ldots, x_n$ are independent, any $n+1$ invariants must be connected by an algebraic equation. That n algebraically independent invariants actually exist may be proven easily. Given n algebraically independent invariants, it is always possible to find an $(n+1)$st invariant such that every other invariant can be expressed rationally in terms of the $n+1$. A further important theorem is that if F be an invariant of an irreducible group it is not possible by means of any linear substitution to express F as a function of fewer than n variables. No small part of the value of the group theory to other branches of mathematics depends upon the existence of invariants with respect to certain groups which thereby furnish a means of classification of functions.

Linear Substitutions Whose Coefficients Are Marks of a Galois Field.—So far it has been assumed that coefficients of the substitutions of the linear group were ordinary algebraic numbers. Many results of extraordinary elegance and simplicity are obtained by considering these coefficients as numbers or marks in a Galois field. Afield may be defined as a set of elements or marks $u_1, u_2, \ldots$, such that the rational operations of algebra may be performed on the numbers of the field and the results are again numbers of the field. A Galois field, for which the customary abbreviation is GF[p^n], consists of p^n marks where p is a rational prime and n is a positive rational integer.

If $l_{\xi_1, \xi_2, \ldots, \xi_m}$ represent a letter or symbol and the ξ's be allowed to run through the marks of a Galois field, the symbol represents p^{nm} letters. The linear homogeneous substitution

$$A : \xi' = \sum_{j=1}^{m} a_{ij}\xi_j, \ (i = 1, 2, \cdots, m), \ |a_{ij}| \neq 0,$$

where a_{ij} are marks of GF[p^n], may be shown to be an analytic representation of a substitution on the p^{nm} letters. The totality of such substitutions must then form a finite group called the general linear homogeneous group denoted by the symbol $GLH[m, p^n]$. The same results may be reached by defining the group as a group of linear homogeneous substitutions on m arbitrary independent variables &, &, . . . , ξ_m. It follows that the transformation group whose matrices are formed from marks of a Galois field may be represented as a group of letter substitutions on p^{nm} letters.

The order of the GLH $[m, p^n]$ is

$$N = (p^{nm}-1)(p^{nm}-p^n)(p^{nm}-p^{2n}) \cdots (p^{nm}-p^{n(m-1)}).$$

From the $GLH(m, p^n)$ the linear fractional group $LF(m, p^n)$, on $m-1$ non-homogeneous variables, is formed as in the section on Collineation Groups. The order of the $LF(m, p^n)$ is

$$\frac{1}{d}(p^{nm}-1)p^{n(m-1)}(p^{n(m-1)}-1)\, p^{n(m-2)} \cdots (p^{2n}-1)p^n,$$

where d is the greatest common divisor of m and p^n-1. This group has the extraordinary property that for every case except two, viz., $m-2$, $p^n=2$, and $m=2$, $p^n=3$, it is simple. For a comprehensive development of these ideas the reader is referred to Dickson's Linear *Groups* with an Exposition of the Galois Field Theory.

CONTINUOUS TRANSFORMATION GROUPS

Essentially different from the groups already mentioned are the transformation *groups* studied by Sophus Lie and his pupils. The system of n equations

$$T : x_i' = f_i(x_1, x_2, \cdots, x_n | a_1, a_2, \cdots, a,), \ (i = 1, 2, 3, \cdots, n)$$

with parameters $a_1, a_2, \ldots, a$, determine a transformation of the variables $x_1, x_2, \cdots, x_n$ into the variables $x_1', x_2', \cdots, x_n'$, provided the equations can be solved for $x_1, x_2, \cdots, x_n$. The transformation may be written briefly

$$T : x_i' = f_i(x|a), \quad (i = 1, 2, \cdots, n).$$

If, as the parameters $a_1, a_2, \ldots, a$, vary, $f_i(x|a+\partial a) - f_i(a)$ approaches zero with ∂a, the totality of all transformations thus obtained form a continuous *transformation* group of ∞^r elements under the following conditions:

(1) The functions f_i considered as functions of $x_1, x_2, \ldots, x_n$ must be independent.

(2) The parameters $a_1, a_2, \ldots, a$, must be essential, that is to say, a transformation cannot be expressed by means of a smaller number of parameters. For this it is necessary and sufficient that the j's shall not all satisfy a differential equation of the form

$$\sum_{i=1}^{r} A_i(a_1, a_2, \cdots, a_r) \frac{\partial f}{\partial a_i} = 0.$$

(3) The product $T_a T_b$ of two transformations T_a and T_b is expressible in the same form

$$x_i'' = f_i(x|c), \quad (i = 1, 2, \cdots, n),$$

where c_k is a function of $a_1, a_2, \cdots, a$, and $b_1, b_2, \ldots, b_r$ alone for $k = 1, 2, \ldots, r$.

(4) The associative law for multiplication holds.

(j) The system of transformations contains the identical transformation. That is, there is a system of values $a_1^0, a_2^0, \cdots, a_r^0$ of the parameters a such that

$$x_i = f_i(x|a^0) = x_i, \quad (i = 1, 2, 3, \cdots, n).$$

From (5) it follows directly that to every transformation T of the group there is in the group an inverse transformation T^{-1} such that $TT^{-1} = T^{-1}T = 1$.

Infinitesimal Transformations.—Corresponding to every transformation group with r parameters, there is a general infinitesimal transformation also containing r parameters and giving rise to ∞^{r-1} infinitesimal transformations. The group is generated by any r independent infinitesimal transformations. The determination of the infinitesimal transformations and their relation to the finite equations of the group are best shown by considering a particular group.

The group whose transformations have the form

$$T : x'_i = \frac{a_{i1}x_1 + a_{i2}x_2 + a_{i3}}{a_{31}x_1 + a_{32}x_2 + a_{33}}, \ (i = 1, 2), \ |a_{ij}| \neq 0,$$

is called the projective group of the plane. It contains eight essential parameters and has the characteristic property that every transformation of the group transforms a straight line into a straight line. If the parameters a_{ij} be given the values

$$a_{ij} = \epsilon_{ij} + \alpha_{ij}\delta t, \text{ where } \begin{cases} \epsilon_{ij} = 1 \text{ for } i = j \\ \epsilon_{ij} = 0 \text{ for } i \neq j \end{cases},$$

∂t is an arbitrary infinitesimal, and α_{ij} are arbitrary constants, the expressions for x_1' and x_2' with higher powers of ∂t discarded may be written in the form

$$x_1' = x_1 + \xi\, t\partial, \quad x_2' = x_2 + \eta \text{ at},$$

where $\xi = a + cx_1 + dx_2 + kx_1x_2$ and $\eta = b + ex_1 + gx_2 + hx_1x_2 + kx^2_2$. Of the eight constants a, b, c, . . . , which are linear combinations of α_{ij}, only seven are essential since the infinitesimal kdt is not essentially different from the arbitrary infinitesimal dt.

For any arbitrary function $f(x, y)$

$$df = \frac{\partial f}{\partial x}\partial x + \frac{\partial f}{\partial y}\partial y = \left(\xi\frac{\partial f}{\partial x} + \eta\frac{\partial f}{\partial y}\right) t\partial,$$

since $dx_1 = x_1' - x_1 = \xi\partial t$ and $dx_2 = x_2 - x_2 = \eta\partial t$. The symbol Uf defined by the equation

$$Uf = \xi\frac{\partial f}{\partial x} + \eta\frac{\partial f}{\partial y} = \xi p + \eta q, \quad \left(p = \frac{\partial f}{\partial x}, \ q = \frac{\partial f}{\partial y}\right)$$

is called the symbol of the infinitesimal transformation. It is made up of the sum of the eight simpler ones, viz.,

$$p, q, xp, \text{YP}, xq, yq, x^2p, +xyq, xyp+y^2q,$$

each multiplied by the appropriate constant chosen from the set $a, b, c, \ldots$. The finite equations for the group will be obtained by integrating the simultaneous system

$$\frac{dx}{a+cx_1+dy_1+hx_1^2+kx_1y_1} = \frac{dy}{b+ex_1+gy_1+hx_1y_1+ky_1^2} = dt,$$

subject to the initial condition that when $t=0$, $x_1=x$ and $y_1=y$.

For two infinitesimal transformations, U_1f and U_2f it is easy to show that

$$U_1(U_2f)-U_2(U_1f)=(U_1\xi_2-U_2\xi_1)p+(U_1\eta_2-U_2\eta_1)q,$$

which is again an infinitesimal transformation. The left member of this equation (Lie's *Klamnzerausdruck)* is denoted by $(U_1\ U_2)$. Denoting by $U_1f,\ U_2f, \cdots, U_8f$ of the simpler infinitesimal transformations given above, one obtains for the general projective group of the plane the important result:

$$(U_i\ U_k)=\sum_1^8 c_{iks}\ U_sf \quad (i,k=1,2,3,\ldots,8).$$

This formula is a special case of a very general theorem which asserts that the necessary and sufficient condition that r-independent infinitesimals shall generate a group is that for every pair U_i, U_k the expression $(U_i\ U_k)$ is expressible linearly in $U_1, U_2, \ldots, U_r$. The general theory which proceeds upon similar lines may be found in Lie's *Continuierliche Gruppen* or in admirably brief and succinct form in the article "Kontinuierliche Transformations Gruppen" in the *Encyclopaedie der Mathematischen Wissenschaften*, by *L.* Maurer and H. Burkhardt.

Applications. — The applications of the theory of continuous transformation groups are manifold. One of the most important is the application to the theory of differential equations. A simple, but characteristic result, is that for every ordinary differential equation $Xdx-$Ydy$=0$, whose integral curves are transformed into themselves by an infinitesimal transformation $Uf=\xi p+\eta q$ the expression $(X\eta-y\xi)^{-1}$ is an integrating factor.

Lie made the theory the starting point for a profound study of the foundations of geometry. He reached the important result which may be stated as follows: Every real continuous group of transformations in a space of three or more dimensions nhose points have free infinitesimal mobility may be transformed by real point transformations into a transitive $\frac{n(n+1)}{}$-parameter projective group of one of the three following kinds:

(1) The group of Euclidean motions in the space.

(2) A projective group which leaves invariant the imaginary quadric surface

$$x_1^2+x_2^2+\ldots+x_n^2+1=0.$$

(3) A projective group which leaves invariant the real quadric surface

$$x_1^2+x_2^2+\cdots+x_n^2-1=0.$$

The first relates to the Euclidean or parabolic geometry, the second to the elliptic and the third to the hyperbolic geometry corresponding to spaces of constant zero, positive and negative curvature respectively. Each geometry is completely characterized by its group.

In 1884 Poincaré pointed out that to every complex number system taken over the field of ordinary complex numbers and having n linearly independent units, there corresponds a simply transitive group of homogeneous transformations linear in n parameters, and conversely. It follows that the theory of hypercomplex numbers in the ordinary complex number field may be identified with the theory of certain types of continuous transformation groups. *(See* L. E. Dickson, *Algebras and their Arithmetics* Chap. III).

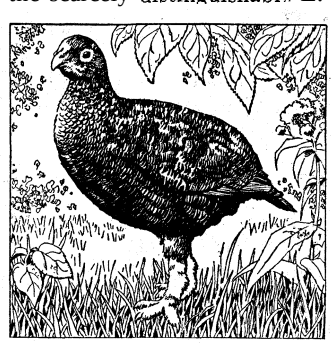
GROUSE, applied particularly to the bird *Lagopus scoticus*, the red grouse, the only species of bird peculiar to the British Isles, where it inhabits the moors, feeding on the heather shoots. It is distinguished from the closely allied and subarctic willow-grouse, *L. lagopus*, by the fact that it does not turn white in winter, and is rarely found away from heather. *L. lagopus* has the same rich chestnut-brown on the head, neck, and breast when in summer plumage, and ranges from Scandinavia to Siberia and from the Aleutian Islands to Newfoundland. A third species of the genus, which also turns white in winter, is the ptarmigan (*q.v.*) (L. *mutus*), which is replaced in America, Greenland, and Iceland by the scarcely distinguishable L. *rupestris*. A large form, L. *hemileucurus* inhabits Spitsbergen, while L. *leucurus* is confined to the northern Rockies.



RED GROUSE. THE ONLY SPECIES OF BIRD CONFINED TO THE BRITISH ISLES. WHERE IT OCCURS IN SCOTLAND AND NORTHERN ENGLAND

The bird to which the name grouse originally belonged is the blackcock (*q.v.*) or black grouse (*Tetrao tetrix*).

In America is the forest-dwelling *Bonasa umbellus*, the ruffed grouse or beech-partridge, in which males "drum" on a log in spring; while other New World forms include *Canachites canadensis*, the spruce partridge; *Centrocercus urophasianus*, the sage grouse, in which, as in the blackcock, the males assemble at definite tournament grounds in spring; *Pedioecetes*, the sharp-tailed grouse; and *Tympanuchus* the prairie-hen, with the sexes unusually similar in appearance.

See Elliot's *Monograph of the Tetraoninae*, and Baird, Brewer, and Ridgway's *North American Birds;* also the article on SHOOTING.

GROVE, SIR GEORGE (1820–1900), English writer on music, was born at Clapham on Aug. 13, 1820. He was articled to a civil engineer, and worked for two years in a factory near Glasgow. In 1841 and 1845 he was employed in the West Indies, erecting lighthouses in Jamaica and Bermuda. In 1849 he became secretary to the Society of Arts, and in 1852 to the Crystal Palace. In this capacity he threw all the weight of his influence into the task of promoting the best music of all schools in connection with the weekly and daily concerts at Sydenham, which had a long and honourable career under the direction of Mr. (afterwards Sir) August Manns. Without Sir George Grove that eminent conductor would hardly have succeeded in doing what he did to encourage young composers and to educate the British public in music. Grove's analyses of the Beethoven symphonies,

and the other works presented at the concerts, set the pattern of what such things should be; and it was as a result of these, and of the fact that he was editor of Macmillan's Magazine from 1868 to 1883, that the scheme of his famous Dictionary of Music and Musicians, published from 1878 to 1889 (2nd edition, edited by J. A. Fuller Maitland, 1904–07; 3rd ed., 1927 and 4th with supplement, 1940, both edited by H. C. Colles [1879–1943]), was conceived and executed. When the Royal College of Music was founded in 1882 he was appointed its first director, receiving knighthood. He died at Sydenham May 28, 1900.

See C. L. Graves, Life and Letters of Sir George Grove (1904).

GROVE, SIR WILLIAM ROBERT (1811–96), English judge and man of science, was born on July 11, 1811 at Swansea, South Wales. He went to Brasenose College, Oxford, and in 1835 was called to the bar at Lincoln's Inn. Grove occupied his leisure with scientific studies. His researches dealt very largely with electro-chemistry and with the voltaic cell, of which he invented several varieties. One of these, the Grove gas-battery, which is of special interest, was based on his observation that a current is produced by a couple of platinum plates standing in acidulated water and immersed, the one in hydrogen, the other in oxygen. In 1846 he published his book on The Correlation of Physical Forces. In 1871 he was made a judge of the Common Pleas and remained on the bench till 1887. He died in London on Aug. 1, 1896.

A selection of his scientific papers is given in the sixth edition of The Correlation of Physical Forces, published in 1874.

GROVE does not appear in any other Teutonic language, and the New English Dictionary can refer it to no Indo-European root; Skeat connects it with "grave," to cut, and makes the original meaning a glade cut through a wood, a small group of trees smaller than a wood, growing naturally or planted in particular shapes in a park, etc. Groves have been connected with religious worship from the earliest times. (See TREE-CULTS.)

"Grove" was used by the authors of the Authorized Version to translate two Hebrew words: (1) *'ēshel*, Gen.xxi.33, 1.Sam.xxii. 6, rightly given in the Revised Version as "Tamarisk"; (2) *asherah* in many places in the Old Testament. The *asherah*, a wooden post erected at the Canaanitish places of worship, and by the altars of Yahweh, may have represented a tree.

GROVE CITY, a borough of Mercer county, Pa., U.S.A., on Wolf creek, 65m. N. of Pittsburgh. It is served by the Bessemer and Lake Erie railroad. The population in 1920 was 4,944 (96% native white) and was 6,296 in 1940 by the federal census. It is a coal-mining and dairying centre, with varied industries producing gas and diesel engines, hand-wrought aluminum specialties, motor truck and bus bodies, foundry and machine shop products, lumber and brooms. Grove City college, opened as an academy in 1876, occupies a campus over 100 ac. and has about 1,000 students. The borough of Grove City, previously the town of Pine Grove, was incorporated in 1883.

GROWTH may be defined as increase in volume or in bulk, and as such it may apply to anything, alive or dead. The most important use of the term is that which concerns the growth of living organisms, or organic growth, for growth is one of the fundamental properties of life.

Growth in Plants.—It is a peculiarity of the higher plants (trees, shrubs, etc.) that they grow actively throughout life, although this growth may in other than tropical climates be restricted to certain seasons. The apex of the stem is called the growing-point, and it is made up of a number of small, simple cells, capable of rapid multiplication. The simplicity of such cells is expressed by calling them embryonic or undifferentiated, and this condition is to be contrasted with that of older cells which are more complicated in structure (differentiated) and less easily capable of growth. New cells are thus continuously being produced and left behind by the growing-point as it moves further up. The material of which the new cells are composed is derived from the building up of new living matter or protoplasm out of food. The chief factor in the upward growth of the stem of a plant, however, is the absorption of water by the cells at some little distance beneath the growing-point. The result of this process is that the cells become distended and elongated, and it illustrates the fact that growth may be due to the inflating effect of non-living substances (such as water), as well as to the production of new living matter. The apex of the root is provided with a growing-point analogous to that of the stem, differing in that it is protected by a cap of cells which prevents the growing-point itself from being injured in its downgrowth through the soil. The root similarly elongates by the absorption of water by the cells.

In addition to growing in length, the stems and roots of dicotyledons and gymnosperms are capable of another kind of growth, which results in the increase of their diameter. This is brought about by the formation of a cylindrical zone of embryonic cells, called the cambium, which, as its cells divide, produces new bast on the outside and new wood on the inside. In climates outside the tropics, this growth is seasonal, which accounts for the growth-rings characteristic of cross-sections of stems.

Abnormal growths in plants are to be found in the case of galls, which are developed in response to the irritation caused by certain kinds of insects in the process of depositing their eggs, and in the development of these eggs.

Growth in Animals.—Growth is an important factor in the development of an animal from the egg to the adult, and also in regeneration, which is the replacement of lost parts. In some animals, and especially those which live in water, there appears to be no definite limit to the size to which they grow; that is to say that they grow throughout life. Maximum size is then determined by the time at which death occurs, and by the actual rate of growth. In other animals, such as birds and mammals, however, there is a fixed final adult size depending on a limit set by the bony skeleton. Insects also have a fixed adult size. When this size has been reached, only that small amount of growth takes place which is necessary for the repair of wear and tear and for the healing of wounds. The tissues whose cells are capable of multiplication throughout life are relatively undifferentiated (epidermis, blood-corpuscles, certain glands), whereas highly differentiated tissues such as nerve-cells never divide any more after birth in mammals. Elongated animals such as earthworms and tape-worms have a special growth-zone, where the cells are embryonic and multiply to produce new segments which are intercalated in the body. This growth-zone is just in front of the hind end of the earthworm, and just behind the front end of the tape-worm; it is the nearest approach among animals to the growing-point of plants. In many cases the growth of animals may be seasonal as in bony fish, where the age and the size of the animal is proportional to the number and size of the growth-rings on the scales. Abnormal growths in animals take the form of galls, as in some corals, or of tumours or cancers. These latter are groups of cells which start or continue to divide and grow at a time when they would not normally be doing so. Tumours may grow more or less fast, and they may lose the differentiated structure which they possessed more or less completely, and return to the embryonic condition. The fast-growing tumours which sometimes also invade the neighbouring tissues are called malignant, while more slowly-growing tumours are described as benign.

All these cases of growth in animals have involved increase in the number of the cells. Growth by the increase in volume of cells without their multiplication is much rarer and less important than in plants, but two striking examples may be mentioned. The growth of the egg-cell by accumulation of yolk is a case of inflation by non-living matter, leading to such huge cells as the yolk of the ostrich's egg. The cells of the womb of a pregnant female mammal increase in volume very considerably, and keep pace with the increasing size of the contained embryo. After the birth of the latter, the cells of the womb return to their original volume. If the growth of the womb had taken place by cell-multiplication, return to the original size would be impossible.

Growth and Function.—Continued excessive use of a part of an animal's body generally leads to the enlargement of that part, resulting in what may be called functional growth. A well-known case of this kind is the growth of the muscles of the body of athletes. Other examples are to be found in the compensatory hypertrophy which takes place in one member of a pair of organs

if the other member of the pair is lost. This is shown in the case of the kidneys in man and other mammals, for when one kidney is removed, the other grows to the size of two normal kidneys. In addition to its effect on adult animals, function is an important factor in development, where, after a certain point is reached, it is necessary for the normal differentiation and growth of certain organs (see EXPERIMENTAL EMBRYOLOGY).

The Rate of Growth. — The irregular shapes of animals and plants make it difficult or impossible to obtain accurate measurements of their volume. This difficulty is overcome by obtaining their weight, which is proportional to their volume. By weighing at successive intervals of time, it is possible to study the speed at which organisms grow, and to express it diagrammatically in the form of a graph. The curve of such a graph, of weight plotted against time, is usually of a characteristic S-like or sigmoid shape. It shows that the organism grows most rapidly where the slope of the curve is steepest, which is when roughly half the time has elapsed. This fact can be brought out more clearly by plotting against time, not the total weight of the organism, but the additions to its weight which it has made during certain constant intervals of time. This curve, of increments plotted against time, has a peak in the centre, corresponding to the steepest point in the curve of total weight plotted against time. However, these curves do not convey a perfect impression of the rate of growth, because no allowance is made for the relative size of the growing organism. A small organism increasing its weight by one pound is obviously growing faster than a larger organism increasing its weight by the same amount. The relative speed of growth can be expressed by taking the additions of weight made during constant intervals of time, and expressing them as percentages of the total weight of the organism at the start of each of these intervals of time. Such a curve, of percentage intervals plotted against time, shows that growth is relatively most rapid at the start of development, and that thereafter its rate decreases. This is interesting, for it is at the start that the cells are the most embryonic, and they get progressively more differentiated with time. The decrease in the relative rate of growth appears partly to be due to the decreased growth-capacity of differentiated cells, partly to true ageing, and partly to the difficulties put in the way of growth by mere increase in bulk. The rate of growth of tissues in regeneration is of the same nature as that during development.

It is now necessary to return to the curve of total weight plotted against time, because its sigmoid shape is similar to that which characterises curves of certain chemical reactions called autocatalytic. In such a reaction, the speed of the reaction itself is accelerated by a substance (catalyser) which is a product of the selfsame reaction. As the reaction proceeds, more of this substance is produced, and the more of it there is, the faster the reaction goes on, up to a point when half the material on which the reaction is working is used up. After this point, the speed of the reaction decreases through lack of "fuel." The similarity between the two curves has led to the view that growth itself is an autocatalytic chemical reaction. Some of the reactions which are concerned in growth are possibly autocatalytic (such as the synthesis of nuclear matter during the cleavage of the egg), but it is not justified to regard growth as a whole as autocatalytic until chemical proof, now absent, is forthcoming, since S-shaped curves may result from various types of chemical process. In this connection, it may be mentioned that experiments on the growth of the nucleus of certain Protozoa and embryos of sea-urchins at different temperatures, have given reason to believe that physical processes (such as imbibition, with temperature coefficients of zero or negative sign) are involved together with chemical processes (with positive temperature coefficients in the neighbourhood of Q_{10}-2).

Growth and **Cell-multiplication.**—Since living matter is divided up into cells, and true growth means the production of more living matter, it entails cell-growth, or cell-multiplication (by cell-division), or both. Now, the volume of a cell often stands in a quantitative relation to the volume of its nucleus. This has been shown experimentally in a number of cases in which it has been possible to alter the normal quantity of nuclear matter present in the cell. By causing eggs to develop parthenogenetically, the cells are made to contain only half the normal quantity of nuclear material, and the volume of such cells is half the normal. This relation can be expressed mathematically, and is called the nucleo-cytoplasmic ratio. It varies with the tissue, the stage of development, and with external conditions. Normally, all the cells of an organism contain an equal quantity of nuclear material, and it is found that for most types of tissue, at a given stage and under certain conditions, there is a characteristic normal cell-magnitude. It follows that since within a tissue cell-volume is more or less constant, tissue-growth is dependent on cell-division. Tissue-growth by cell-growth alone (as in the case of the egg, or of the womb) is exceptional.

Interesting cases of growth are to be observed among the Arthropoda. These animals, which include Insects and Crustacea, are characterised by the possession of a hard outer "shell," which is shed at intervals. Growth can only take place in jerks, during the intervals of time between the shedding of one shell and the formation of a new one. On comparing such animals after successive moults, it is common to find that their linear dimensions have been increased by a coefficient of about 1.26. This figure is approximately the cube root of 2, and consequently, if each of the three linear dimensions has been multiplied by 1.26, the volume of the animal has doubled. This would be expected if at each moult every cell of the body divided once, and the daughter-cells grew up to the characteristic cell-size. It is, however, not yet known if this is the correct interpretation.

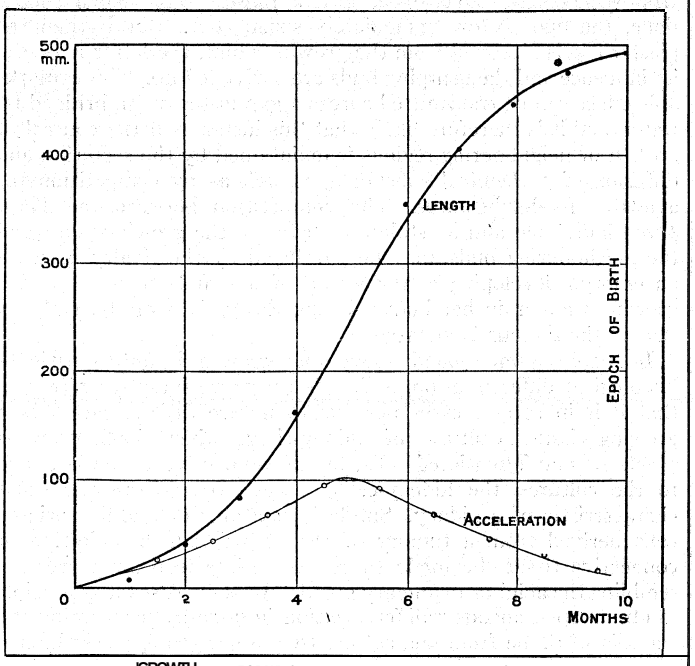
Growth and **Differentiation.**—As indicated in the article EXPERIMENTAL EMBRYOLOGY, the term differentiation is applied to two different classes of phenomena. There is in the first place morphological differentiation or change of shape, and this is brought about by variations in the speed of growth in different directions. Such processes are responsible for the modelling of the embryo out of the more or less spherical egg, and differential growth may therefore be regarded as the main cause of morphological differentiation. On the other hand, there is histological differentiation, or change in substance and structure of the cells themselves, resulting in the characters which distinguish one kind of tissue from another. The ability of a cell to divide is related to its degree of histological differentiation. The more embryonic or undifferentiated a cell is, the more easily can it divide, and the more easily can tissues which are composed of such cells grow. On the contrary, a high degree of histological differentiation impedes cell-division and growth. Experimental evidence on this subject is obtained from the study of tissue-culture. Normal tissues removed from an organism and cultivated in *vitro* tend to lose their differentiation, and grow as sheets of embryonic cells, sometimes even coming to resemble the rapidly-dividing cells of malignant tumours. Had these tissues remained in the organism, they would not have multiplied in this way if at all. When two normal tissues such as epithelium and connective tissue are cultivated together, they affectone another mutually in such a way that each maintains its differentiation. Should one of the two tissues die or be removed, the other undergoes dedifferentiation (*q.v.*) and grows rapidly. Loss of differentiation is therefore a factor in the power of growth. Further cases bearing on this subject will be found below in connection with growth-control.

The Raw Materials of Growth. — True growth involves the production of new living matter or protoplasm, and this has to be synthesised from the food. Protoplasm contains proteins, which are highly complex chemical compounds composed of a number of amino-acids. The latter contain carbon, hydrogen, oxygen, nitrogen and sometimes other elements such as sulphur. One of the chief distinctions between plants and animals lies in the difference between the powers which these two types of organisms possess of synthesising protoplasm, and it is therefore necessary to treat them separately.

The requirements of a plant are very simple. The carbon is obtained from the carbon dioxide in the air, with the help of the green pigment chlorophyll and the energy of sunlight. Nitrogen is obtained from nitrates in watery solution in the soil, and this water may also contain the other necessary elements as simple salts. With these ingredients and the atmospheric oxygen ob-

tained in respiration, the plant is able to build up proteins, carbohydrates and fats.

Animals, on the other hand, are unable to synthesise protoplasm from the simple food-constituents which suffice for the plant. Some of the simplest animals or Protozoa (*q.v.*) are capable of using substances such as ammonium glycerophosphate, but the majority of animals require for their food proteins, carbohydrates and fats. In other words, animals require the products which have been elaborated out of simpler substances by plants.



FROM THOMPSON, 'GROWTH AND FORM" (CAMBRIDGE UNIVERSITY PRESS)

FIG. 1.— GRAPH ILLUSTRATING THE PRENATAL GROWTH OF CHILD
The thick line shows the curve of total length plotted against time. The thin line represents the curve of increments of length (made during a given constant interval of time) against time; it shows the acceleration in the rate of growth

From the point of view of growth, carbohydrates and fats are important on account of the energy which they provide when they are oxidized. or burnt in the body; but since thev contain no nitrogen and nitrogen is present in protoplasm, the proteins, which are the only nitrogen-containing constituents of an animal's food. are of chief significance. This is not the place in which to deal extensively with the problem of nutrition, but attention may be called to a few points. Lysine is an amino-acid which is lacking from certain proteins such as gliadin, and animals fed on gliadin can maintain themselves in good health, but they cannot grow. Lysine is therefore necessary for growth, and these facts indicate that the processes which are concerned in the maintenance of protoplasm which has already been formed are not the same as those which are involved in the production of new protoplasm. An interesting point in connection with gliadin is that the young of gliadin-fed mothers grow normally so long as they are being suckled, showing that the mother can synthesise growth-promoting amino-acids, but when these young are fed on gliadin themselves, as stated above, they cease growing.

The Energy Necessary for Growth. — The synthesis of the complex organic compounds which constitute protoplasm involves an expenditure of energy. Ultimately, since plants are the prime producers of these compounds, the necessary energy is supplied by sunlight and by atmospheric oxygen. In normal animal tissues, the construction of proteins out of amino-acids absorbs the energy provided by the combustion of other substances (mostly carbohydrates and fats) with oxygen. If a growing embryo is deprived of oxygen, it obtains energy not by burning its carbohydrate (sugar), but by fermenting it and breaking it down to lactic acid. This process is called glycolysis, and since it does not require any oxygen, it belongs to the class of processes which are called anaerobic. A number of bacteria normally obtain their energy in this way, but normal growing embryonic tissues cannot derive sufficient energy from glycolysis, and die if deprived of oxygen. If, however, after being deprived of oxygen, a growing embryo is supplied with oxygen again, provided that it is still alive, the glycolysis ceases, and it reverts to the ordinary method of deriving energy by burning the sugar. This fact is of great interest and importance, because it is found that growing tumours habitually derive energy from glycolysis; so much so that even when oxygen is plentifully supplied to them they do not discontinue their anaerobic method of obtaining energy. It may be mentioned that malignant tumours derive relatively more energy anaerobically than do benign tumours.

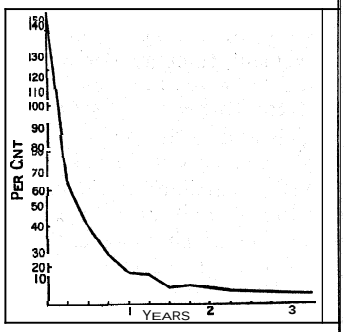
Growth-promoting Substances. — In addition to the raw materials and to the energy which are necessary for growth, a growing organism needs some other substances, which, although they do not contribute building material for the construction of new protoplasm, are nevertheless essential for the carrying out of the processes which result in that construction. These substances fall into two classes: — vitamins and internal secretions, which latter may be produced by specialized glands, or by ordinary cells of the body under certain conditions.

Vitamins (*q.v.*), or accessory food-factors, are well-known to be necessary in a diet, both for the maintenance of health and for growth. The quantity of vitamins necessary to allow of growth is insignificantly small compared with the amount of growth which their presence allows, and it is therefore clear that vitamins act in a manner similar to that characteristic of chemical catalysers. It is also known that an organic substance produced by seaweed is necessary for the growth of. the microscopic plants called diatoms, and this substance is of importance because diatoms are at the beginning of the food-chain which ends in marketable marine fish. In a similar way, fermented peat produces a substance which greatly accelerates the growth of plants.

Of the internal secretions or hormones (*q.v.*) produced by special glands, those secreted by the thyroid, the anterior pituitary and the cortex of the adrenal must be mentioned. Thyroid secretion raises the rate of metabolism of the tissues, and lack or excess of it may therefore affect a tissue's growth. The extent to which this occurs depends on the tissue, for a tadpole deprived of thyroid will grow nevertheless, but a mammal similarly deprived when young will remain small and undeveloped. Again, within an animal, the degree of susceptibility to thyroid varies with the tissue, for when excess of thyroid is given to a tadpole, well-defined regions of the body (future limb-buds, lungs and tongue) respond by active growth, while other regions are unaffected, and as a result of the competition for foodstuffs may even be inhibited (*e.g.*, tails). The secretion of the anterior pituitary stimulates the growth of various tissues. An excess of this secretion in mammals results in an exaggerated growth of the bones of the limbs and jaws, while a deficiency of it prevents young mammals from growing. The secretion of the cortex of the adrenal is mentioned here because, although its function in the body of the vertebrate animal which possesses it is still obscure, it has a powerful growth-stimulating effect when given to such invertebrates as water-fleas (*Daphnia*) and pond-snails (Limnaea).

When a piece of tissue is removed from an animal and cultivated in vitro (*see* TISSUE-CULTURE) it will not grow well unless a substance obtained from embryos is added to it. This substance, which is called embryo-extract, appears to be derived from the embryo's liver, and it is remarkable in that it is not specific in its action, because embryo-extract derived from a bird will promote growth in mammalian tissues. Adult tissues are deficient in this substance. However, if adult tissue is killed and kept aseptically at body-temperature, disintegrative processes set in, resulting in what is called autolysis, in the course of which a very powerful growth-stimulant is produced. This substance, known as autolysed extract, when added to a tissue-culture, produces a violent onset of growth which lasts for about two days and then stops. It is probable that this substance is normally concerned in the process of repair of tissues after injury When cells are damaged and killed in the body, they autolyse and produce enough of the autolysed extract to stimulate neighbouring cells to grow, divide and

replace the injured cells. Another interesting feature of autolysed extract is the fact that its effects are similar to those obtained when an extract from a growing tumour is added to a tissue-culture. It appears therefore that apart from the already-mentioned difference, as regards glycolysis in the presence of oxygen, between normal tissues and tumours, the former possess the growth-stimulant of autolysed extract only occasionally (*e.g.*, after damage), whereas the latter possess it permanently. It is further interesting to notice that extracts from malignant tumours have a more powerful growth-stimulating effect than those from benign tumours. White blood-corpuscles also appear to produce a growth-stimulant, the presence of which is necessary for the cicatrization of a wound.



FROM CHILD, "SENESCENCE AND REJUVENESCENCE" (CHICAGO UNIVERSITY PRESS)

FIG. 2.—CURVE OF HUMAN GROWTH FROM BIRTH TO THREE YEARS

This curve, showing the relative rate of growth, is obtained by plotting against time the increments of weight made during a given constant interval of time, expressed as a percentage of the total weight

Experiments on the cultivation of plant tissues in vitro have shown that the presence of vascular bundles is necessary for the growth of potato tissue. In the vascular bundles are structures called "companion-cells," and their appearance suggests that they are the source of the growth-promoting substance which is concerned with growth in diameter of the stem. Injury to the cells of a plant may also result in the production of growth-stimulating substances called "wound-hormones," which are suggestive of the autolysed extract of damaged animal tissues.

There are a few other cases in which the presence of substances or of organisms is known or believed to be responsible for growth. Here may be mentioned the effect of tar, which, when applied to the skin of rats, results in the production of tumours. The production of galls in plants is in some way associated with the laying of eggs by certain insects, and their development. A kind of tumour of the alimentary canal in rats is associated with the presence of a parasitic nematode worm (Gongylonema) which infests the cockroach as its alternative host. Lastly, there is the virus which is regarded by Gye as one of the factors responsible for the growth of tumours.

The Control **of** Growth. — The stoppage of growth on the part of the tissues of an animal which has a more or less fixed final adult size appears to be due, not to the loss of the power to grow, but to an inhibition. Certain lobsters are characterized by the possession of one large and one small claw. If the large claw is not lost, the small claw does not grow any more. If however the large claw is lost, then the small one grows and becomes large, while a small claw is regenerated on the stump of the lost large claw. Some restraining influence is therefore present, and exerted in preventing tissues from growing beyond their normal size. When normal tissues are removed from an organism and cultivated in vitro, this restraining influence is removed, whereupon they de-differentiate and grow. Further, this growth can continue in vitro for a period of time longer than the normal length of life of the animal from which the tissues were taken. This has been shown in the case of cultures of tissue from chicks, which have been kept growing for over a dozen years, and show no signs of stopping.

The nature of the restraining influence is very problematical. It seems that the region of the body where the rate of protoplasmic activity of the tissues is highest (see AXIAL GRADIENTS) exerts a physiological dominance over the other regions. The case of the sea-squirt Perophora is described in the article EXPERIMENTAL EMBRYOLOGY: Dedifferentiation, and it is only necessary here to recall the fact that under certain conditions the Perophora-individual can stop the growth of its stolon (or stalk) while under other circumstances the stolon grows and absorbs the individual. In plants, the phenomenon known as correlation is in many ways comparable. It is found that the growing-point of the stem prevents the buds immediately beneath it from shooting out, and this inhibitory influence extends for a certain distance beneath the growing-point: beneath this zone the buds do grow out unhindered. The range of this inhibitory influence can be reduced by subjecting a portion of the stem within the sphere of dominance to conditions which depress vital activities, and it can be abolished altogether by cutting off the growing-point or simply by preventing it from growing by covering it with a plaster cap. When this is done, the buds below immediately sprout out. But if then the plaster cap is removed from the growing-point, the latter reasserts its influence and the usurping buds are shrivelled up. This remarkable effect can be transmitted across a gap in the stem, bridged by water, and it is therefore likely that this instance of the control of growth of neighbouring regions is maintained by the secretion and diffusion of a chemical substance, as well as by competition for available food-substances. The competition between the *Perophora*-individual and its stolon, or between the growing-point and the neighbouring buds, may be paralleled by the rivalry between an embryo developing in the womb of a female mammal and a growing tumour in her body: during the growth of the embryo, that of the tumour is arrested.

It has been mentioned above that growth is antagonistic to histological differentiation, and it is therefore interesting to find that it is in certain cases possible to induce differentiation in a growing tissue. Cultures of kidney-tissue when alone, grow as sheets of undifferentiated cells, but if connective tissue is added to the cultures, the kidney-cells proceed to re-form the tubes characteristic of a kidney. Similarly, cultures of undifferentiated cells derived from a tumour of the breast, can, by addition of connective tissue, be made to redifferentiate into structures resembling the acini of mammary glands. In some cases it is possible to obtain spontaneous redifferentiation in vitro by performing the transfer of tissue from one culture to another (the process known as subculturing, which is necessary in order to supply the tissues with fresh food-substances) very carefully, so as to avoid damaging the cells and thereby stimulating them to grow and divide.

Mention must be made of substances which definitely stop growth, and which seem to be present in increasing amounts in old animals. A substance has been found which stops the growth of tumours. It is obtained by repeatedly injecting extracts of the tumour into an animal, the blood of which eventually produces an antiserum. This antiserum, when injected into an animal possessing a tumour of this kind, stops its growth.

Heterogonic Growth. — Information of great interest is obtained from a study of the relative sizes of parts of animals at different absolute sizes. It is found in the case of the antlers of deer that the ratio between the weight of the antler and the weight of the body is not the same at all sizes: it increases with increasing body-weight, both in the individual life-history and also in comparing adult deer, so that the larger the deer the relatively larger are its antlers. Another case is that of the width of the abdomen of the common shore-crab (*Carcinus*). In the male crab, the width of the abdomen is proportional to the length of the body at all sizes. In the female, however, the width of the abdomen increases relatively to the length of the body at increasing sizes of the latter, throughout life. Several other instances might be given of the same phenomenon: the relative increase in the size of the claw in certain male crabs; in the length of the mandibles in male stag-beetles; in the size of the head in neuter ants; in the size of the face in dogs. Such organs are said to show *heterogonic* growth. In all these cases, the relative growth-rates of the heterogonic organ and of the rest of the body remain constant during long periods: As a rule, it is found that the weight of the heterogonic organ (y) is proportional to the weight of the rest of the body (x) raised to a power, usually between 1·25 and 2·0. Thus,

$$y = bx^k,$$

where b and k are constants. Heterogonic growth is of interest for the following reasons. First, animals showing long-continued heterogonic growth of any part have no definitive shape, since it varies with absolute size. Next, when several species of animal in a genus have a heterogonic organ (such as antlers in deer), the species which are absolutely larger will in general have the rela-

tively larger lreterogonic organ. The introduction of a constant differential growth-rate such as results in positive heterogony, explains the progressive enlargement of an organ during evolution, if for some other reason the absolute size of the body increases (which it often does). This may happen in different groups of related animals, in each of which the heterogonic organ seems to appear independently. This phenomenon, which has been attributed to a mysterious process of "orthogenesis," thus receives its explanation for it is a fact that absolute size does increase in such cases, as for instance in the Titanotheria (*q.v.*). Conversely, negative heterogony, and decrease of body-size, may lead to the reduction and disappearance of structures in evolution.

Growth and Reduction.— While growth is ordinarily held to mean increase in size, it may be mentioned that the opposite sometimes happens, and it is possible for animals or parts of animals to "grow" smaller. In some cases, the fulfilment of the ordinary course of development entails the reduction in size of some parts, such as the tail and the gills in the tadpole, and most of the larval body in developing sea-urchins. In the case of the *Perophora*-individual and its stolon already mentioned, the growth of the one is accompanied by the reduction of the other. Further, just as function tends to increase the size of the functioning organ, so lack of function results in its reduction and atrophy.

Reduction of whole animals is not so common, and is in any case not be expected in the higher forms which possess a skeleton of non-living material. Nevertheless, sea-urchin larvae are capable of reduction under certain conditions, and thereby of unmaking the skeletal struts which support their arms. Jelly-fish and hydroid polyps are capable of extreme reduction, and the case of flatworms is especially interesting, for when owing to starvation their size is reduced to a fraction of what it was, they are not only smaller but younger, as judged by the rate of protoplasmic activities of their tissues. In their case, reduction has been accompanied by dedifferentiation and has resulted in rejuvenescence. Lastly, it may be mentioned that reduction can take place in an animal as highly organized as is the sea-squirt Clavellina, where it results in a small ball of relatively undifferentiated cells, which is nevertheless capable of redeveloping into a fully-formed Clavellina.

Growth Limits.— An animal with a positive heterogonic structure such as a pair of antlers must not exceed a certain size, or the structure becomes so large as to render it difficult for the animal to gain a living. This appears to have been the case with the now extinct Irish "elk" (really a giant fallow-deer). Numerbus examples might be given of limits to growth which affect phylogeny rather than ontogeny, *i.e.,* of limiting factors which do not prevent an animal from growing but which result in its death if it exceeds a certain size, and thereby abolish its chance of leaving offspring. In the higher terrestrial animals, the weight of the body is supported by the legs. The weight of the body is proportional to its volume, or to the cube of its linear dimensions. The strength of the legs, however, is proportional to their cross-sectional area, or to the square of the linear dimensions. It follows that when the absolute size of such animals increases, the weight of the body increases out of proportion to the increased strength of the supporting legs. If the skeletal material could be altered from bone to anything stronger, a margin of safety might be retained, but this is of course impossible, and the result is that there is a maximum size beyond which land-animals must not grow, for if they did, their legs would have to be so massive as to be immovable, and such animals could not live. The elephants appear to be close to this maximum limit. It is to be noticed that this limiting factor does not apply to animals which live in water and which are not supported by their limbs. The whales therefore have been able to grow to sizes vastly greater than any that would be possible for terrestrial animals.

GROYNE, a framed structure of timber or a low wall of masonry or concrete run out over a foreshore into the sea, in a direction approximately at right angles to the coast line, for the purpose of arresting the lateral travel of sand and shingle and thus raising the foreshore level as a barrier against the encroachment of the sea. On the coasts of Holland and Belgium low groynes constructed of fascine mattress-work and rubble stone are commonly employed. Groynes similar in form to those used on sea-shores, and also, in many cases, built up of rubble or fascine work, are employed for training the flow of rivers, protecting their banks from erosion, and deepening their channels. Such groynes are built out over the river banks and bed transversely to the flow of the current and are termed spur-groynes (see RIVER AND RIVER ENGINEERING). The word groyne appears to have been used originally to denote any wail run uul transversely to the shore. In the United States of America the word is spelt groin both in architecture and as applied to sea-defence works. (See COAST PROTECTION AND LAND RECLAMATION.) (N. G. G.)

GROZNYI, a town which, though situated in the Chechen Autonomous Area of the R.S.F.S.R., belongs administratively to the North Caucasian Area. It is on the Zunzha river in 43° 20′ N. 45° 42′ E., and is on the railway from Makach-Kala (Petrovsk) to Vladikavkaz.

Its population (1939) was 172,468. The naphtha area to the northwest of the town began to be exploited in 1893 and another area to the southeast in 1913.

Groznyi has a much higher percentage of natural oil fountains than the Baku region, especially in the new area. Its oil differs in quality from that of Baku giving less kerosene and more paraffin. It has naphtha and paraffin refineries and electric sawmills. **A** pipe line to Tuapse has been constructed to cheapen the cost of export, and another to Poti. The new plant erected in Groznyi and in Tuapse has considerably increased production.

Groznyi and Makach-Kala are also connected by pipe, and there are refineries in Makach-Kala. The administrative offices for the Chechen (Checheno-Ingushsk) Autonomous Area are situated in Groznyi, and a training college for Chechen teachers is in the town.

GRUDZIADZ (Ger. *Graudenz*), **a** town of Poland in the province of Pomorze, on the Vistula. Pop. (1939) 54,000. It possesses three Roman Catholic and two Protestant churches, and a synagogue. It was founded by the Teutonic knights in the 13th century, and came under the rule of Poland by the peace of Thorn in 1466. In 1772 it was seized by Prussia at the first partition of Poland, and was returned to Poland in 1918. Germany again seized it in the first week of World War II.

GRUIFORMES, an order of birds, the best-known members of which are the cranes (*q.v.*). (See also ORNITHOLOGY, SUN-BITTERN, TRUMPETER.)

GRUMBACH, WILHELM VON (1503–1567), German adventurer, born on June 1, 1503, chiefly known through his connection with the so-called "Grumbach feuds" (Grumbachsche *Händel*), the last attempt of the German knights to destroy the power of the territorial princes. He was attached to the court of Casimir, prince of Bayreuth (d. 1527), and fought against the peasants during the rising in 1j24 and 1525. About 1540 Grumbach became associated with Albert Alcibiades, prince of Bayreuth, whom he served both in peace and war. After the conclusion of the peace of Passau in 1552, Grumbach assisted Albert in his career of plunder in Franconia and was thus able to take some revenge upon his enemy, Melchior von Zobel, bishop of Wiirzburg. Grumbach held his lands in fief from the bishops of Wiirzburg, and had held office at the court of Conrad of Bibra, who was bishop from 1540 to 1544. Albert's career, however, was

checked by his defeat at Sievershausen in July 1553 and his subsequent flight into France, and the bishop seized Grumbach's lands. The knight obtained an order of restitution from the imperial court of justice (*Reichskammergericht*), but he was unable to execute it; and in April 1558 some of his partisans seized and killed the bishop. Grumbach fled to France. Returning to Germany he pleaded his cause, unsuccessfully, before the diet at Augsburg in 1559. He had found a new patron in John Frederick, (*q.v.*) duke of Saxony, whose father, John Frederick, had been obliged to surrender the electoral dignity to the Albertine branch of his family. Grumbach suggested to the duke a general rising of the German knights as a means to the recovery of the electorate. Magical charms were employed against the duke's enemies, and communications from angels were invented which helped to stir up the zeal of the people. In 1563 Grumbach attacked Würzburg, seized and plundered the city and compelled the chapter and the bishop to restore his lands. He was consequently placed under the imperial ban, but John Frederick refused to withdraw his protection. Meanwhile Grumbach planned the assassination of the Saxon elector, Augustus; proclamations were issued calling for assistance; and alliances both without and within Germany were concluded. In Nov. 1566 John Frederick was placed under the ban, which had been renewed against Grumbach earlier in the year, and Augustus marched against Gotha. A mutiny led to the capitulation of the town. Grumbach was tortured, and barbarously executed at Gotha on April 18, 1567. John Frederick was imprisoned for life.

See F. Ortloff, *Geschichte der Grumbachschen Händel* (Jena, 1868–70), and J. Voigt, *Wilhelm von Grumbach und seine Händel* (Leipzig, 1846–47).

GRUMENTUM, an ancient town in Lucania, 33 m. S. of Potentia by direct road through Anxia, and 52 m. by the Via Herculia, at the point of divergence of a road eastward to Heraclea. It seems to have been native Lucanian, not a Greek settlement. In 215 B.C. the Carthaginian general Hanno was defeated under its walls, and in 207 B.C. Hannibal made it his headquarters. In the Social War its strong fortress seems to have been held by both sides at different times. Its site is a ridge on the right bank of the Aciris (Agri) about 1,960 ft. above sea-level, ½ m. below the modern Saponara, which lies much higher (2,533 ft.). Its ruins (all of the Roman period) include those of its enceinte in *opus reticulatum*, with scanty traces of a large amphitheatre (arena 205 by 197 ft), the only one in Lucania, except that at Paestum.

GRÜN. HANS BALDUNG (*c.* 1480–1545), commonly called Grün, a well-known German painter, was born at Weyersheim am Turm near Strasbourg. His family derived from Gmund in Swabia. In 1509 Grün purchased the freedom of the city of Strasbourg, and resided there till 1512, when he moved to Freiburg-im-Breisgau. There he painted his masterpiece, which was placed on the high altar of the Freiburg cathedral in 1516. He purchased anew the freedom of Strasbourg in 1517, resided in that city, and died a member of its town council 1545.

Though nothing is known of Grun's education, it may be inferred from his style that he was no stranger to the school of which Durer was the chief; his work is however more baroque and fantastic than Durer's. Grun's prints were often mistaken for those of Durer; and Durer himself was well acquainted with Grun's woodcuts and copper-plates in which he traded during his trip to the Netherlands (1520). Grün was a great draughtsman; his line was sure and his form plastic; many of his drawings have survived, including a complete sketchbook in the print room at Carlsruhe. As a portrait painter he is well known. His portrait of the Margrave of Baden is in the Munich gallery. The National Gallery, London, and the Vienna Gallery also possess portraits by him. Like Durer and Cranach, Grun became a hearty supporter of the Reformation. He was present at the diet of Augsburg in 1518, and one of his woodcuts represents Luther under the protection of the Holy Ghost, which hovers over him in the shape of a dove.

BIBLIOGRAPHY.—A complete list of Grün's paintings and drawings is given in G. V. Terey, *Studien zur Deutschen Kunstgeschichte:* Hans Baldung Gen. Grien (1894); his engravings and woodcuts in J. *A.* V. Bartsch, *Peintre-Graveur,* vol. vii. (1803–21) and in J. D. Passavant, *Peintre-Graveur,* vol. iii. *(1860);* the sketch book at Carlsruhe was published by M. Rosenberg, *Hans Baldung Grün* (1889). *See* **also** H. Curjel, *Hans Baldung Grien* (Munich, 1923).

GRÜNBERG, a town in Prussian Silesia, Germany, on an affluent of the Oder, and on the railway from Breslau to Stettin via Küstrin, 36 mi. N.W. of Glogau. Pop. (1939) 26,140. There are manufactures of cloth, paper, machinery, sugar and shoddy. The prosperity of the town depends chiefly on the vine culture, for besides manufacturing wine it exports grapes.

GRUNDTVIG, NIKOLAI FREDERIK SEVERIN (1783–1872), Danish poet, statesman and divine, was born at the parsonage of Udby in Zealand on Sept. 8, 1783. At the close of his university life at Copenhagen he made Icelandic his special study, until in 1805 he took the position of tutor in a house on the island of Langeland. The next three years were spent in the study of Shakespeare, Schiller and Fichte. His cousin, the philosopher Henrik Steffens, had returned to Copenhagen in 1802 full of the teaching of Schelling, and his lectures and the early poetry of Öhlenschläger opened the eyes of Grundtvig to the new era in literature. His first work, *On the Songs in the Edda,* attracted no attention. Returning to Copenhagen in 1808 he achieved greater success with his *Northern Mythology,* and again in 1809–11 with a long epic poem, the *Decline of the Heroic Life in the North.*

The boldness of the theological views expressed in his first sermon in 1810 offended the ecclesiastical authorities, and he retired to a country parish as his father's assistant for a while. From 1812 to 1817 he published five or six works, of which the *Rhyme of Roskilde* is the most remarkable. From 1816 to 1819 he was editor of a polemical journal entitled *Dannevirke,* and in 1818 to 1822 appeared his Danish paraphrases (6 vols.) of Saxo Grammaticus and Snorri.

In 1825 he published a pamphlet, *The Church's Reply,* against H. N. Clausen, who was professor of theology in the university of Copenhagen. Grundtvig was publicly prosecuted and fined, and for seven years he was forbidden to preach, years which he spent in publishing a collection of his theological works, in paying two visits to England, and in studying Anglo-Saxon. In 1832 he obtained permission to preach again, and in 1839 he became priest of the church of Vartov hospital, Copenhagen, a post he continued to hold until his death. In 1837–41 he published *Songs for the Danish Church,* a rich collection of sacred poetry; in 1838 he brought out a selection of early Scandinavian verse; in 1840 he edited the Anglo-Saxon poem of the *Phœnix,* with a Danish translation. He visited England a third time in 1843. From 1844 until after the first German war Grundtvig took a prominent part in politics. In 1861 he received the titular rank of bishop, but without a see.

The chief characteristic of his theology was the substitution of the authority of the "living word" for the apostolic commentaries, and he desired to see each congregation a practically independent community. His patriotism was almost a part of his religion, and he established popular schools where the national poetry and history should form an essential part of the instruction. His followers are known as Grundtvigians. He was married three times, the last time in his 76th year. He died on Sept. 2, 1872.

Grundtvig holds a unique position in the literature of his country; he has been styled the Danish Carlyle. He was above all things a man of action, not an artist; and the formless vehemence of his writings, which have had a great influence over his own countrymen, is hardly agreeable or intelligible to a foreigner. The best of his poetical works were published in a selection (7 vob., 1880–89) by his eldest son, Svend Hersleb Grundtvig (1824–83), who was an authority on Scandinavian antiquities, and made an admirable collection of old Danish poetry *(Danmarks gamle Folkeviser,* 1853–83, 5 vols.; completed in 1891 by A. Olrik).

His correspondence with Ingemann was edited by S. Grundtvig (1882); his correspondence with Christian Molbech by L. Schroder (1888); *see* also *F.* Winkel Horn, *Grundtvigr Liv og Gjerning* (1883); an article by F. Nielsen in Bricka's *Dansk Biografisk Lexikon;* and *F.* Gronning, R F *S. Gruntvig* (8 vols., 1907–14).

GRUNDY, SYDNEY (1848–1914), English dramatist, was born at Manchester on March 23, 1848, son of Alderman Grundy. He was educated at Owens college, Manchester, and was called to the bar in 1869, practising in Manchester until 1876. He

became well known as an adapter of plays, his early successes being The Snowball (Strand theatre, 1879) from Oscar, ou le *mari* qui *trompe sa* femme by MM. Scribe and Duvergne, and In *Honour Bound* (1880) from Scribe's Une *Chaîne*. Among his most successful adaptations was the charming Pair of Spectacles (1890) from Les *Petits Oiseaux* of MM. Labiche and Delacour. Grundy died on July 4, 1914.

GRUNDY, MRS., the name of an imaginary English character, who typifies the disciplinary control of the conventional "proprieties" of society over conduct, the tyrannical pressure of the opinion of neighbours on the acts of others. The name appears in a play of Thomas Morton, Speed the Plough (1798), in which one of the characters, Dame Ashfield, continually refers to what her neighbour Mrs. Grundy will say as the criterion of respectability. Mrs. Grundy is not a character in the play, but is a kind of "Mrs. Harris" to Dame Ashfield.

GRUNEWALD, MATHIAS, German painter, active between 1500 and 1530, at Frankfurt, Mainz, Aschaffenburg and in Upper Alsace. Although he was one of the greatest artists of his time, and was ranked by Melanchthon with Ddrer and Cranach, very iittie is known of his life. He was an overpowering personality, the last and greatest representative of the German Gothic; for although he lived at a time when the Italian Renaissance was penetrating into Germany, his forms and figures are conceived as expressions of strong accentuated feelings rather than as rhythmic parts of a co-ordinated organic unity. His representations of the Crucifixion are among the most passionate and moving scenes produced in art. His colour is rich and glowing, and his effects of chiaroscuro seem to presage the art of Rembrandt. His earliest work extant is the "Flagellation," dated 1503 in Munich. Of the same period are the "Crucifixion" in Basle, and his great masterpiece in the Colmar museum, which consists of nine paintings forming part of a large four-winged altarpiece which also contained carved figures by another artist. In 1517 he was commissioned to paint an altarpiece for the Maria Schnee chapel at Aschaffenburg. The centrepiece representing the Virgin is now in the church of Stuppach near Mergentheim, and the right wing with the "Foundation of S. Maria Maggiore" is in the museum at Freiburg. Soon afterwards Griinewald became court painter to Albrecht of Brandenburg, cardinal and elector of Mainz.

Griinewald's powerful and expressive drawings are to be seen in the galleries of Berlin, Dresden, Vienna, Karlsruhe, Oxford, Paris, Stockholm and Erlangen. A whole book of his drawings was recently discovered in the possession of the Savigny family, and was acquired by the Berlin museum.

See H. A. Schmid, *Gemalde und Zeichnungen von M. Griinewald* (1907–11); O. Hagen, M. *Grünewalde* (1919); M. J. Friedlander, *Der Isenheimer Altar* (1908), *Die Grunewalde Zeichnungen der Sammlung Savigny* (1926), and *Die Zeichnungen von M. Grünewalde* (1927). *See* also J. K. Huysman's appreciation in his novel, *La Bas* (1891).

GRUNTER, GRUNT or **DRUM,** names applied to fishes of the family Sciaenidae, on account of the noise, of uncertain origin, they emit under water. The best-known species is *Pogonias* chromis of the Atlantic coast of America, from Uruguay northwards, which may reach a weight of 100 lb. This heavily built fish feeds mainly on molluscs and is a great pest of the oyster fisheries (see OYSTER). The fresh-water drum (*Aplodinotus grunniens*) is common in the Mississippi valley, where it is esteemed for food.

GRUTER or **GRUYTERE, JAN** (1560–1627), a critic and scholar of Dutch parentage by his father's side and English by his mother's, was born at Antwerp. To avoid religious persecution his parents while he was still young came to England; and for some years he studied at Cambridge, after which he went to Leyden. In 1586 he was appointed professor of history at Wittenberg, but as he refused to subscribe the Formula concordiae he was unable to retain his office. From 1589 to 1592 he taught at Rostock, after which he went to Heidelberg, where in 1602 he was appointed librarian to the university.

Gruter's chief works were his *Inscriptiones antiquae totius orbis Romani* (Heidelberg, 1603), and *Lampas, sive fax artium liberalium* (Frankfurt, 1602–34).

GRUYERE (Ger. Greyerz), a district in the south-eastern portion of the Swiss canton of Fribourg, famed for its cattle and its cheese. It is composed of the middle reach (from Montbovon to beyond Bulle) of the Sarine or Saane valley, with its tributary glens of the Hongrin, the Jogne and the Trême. It forms an administrative district of the canton of Fribourg, its population being mainly French-speaking and Romanists. From Montbovon (11 m. by rail from Bulle) there are mountain railways leading S.W. past Les Avants to Montreux (14 m.), and E. up the Sarine valley to Saanen or Gessenay (14 m.), and by a tunnel to the Simme valley and Spiez on the Lake of Thun. The modern capital of the district is the small town of Bulle (Ger. Boll), with a 13th-century castle and 4,134 inhabitants. But the historical capital is the town of Gruykres, on a steep hill above the left bank of the Sarine, at a height of 2,713 ft. above sea-level and with an old castle. The town has 1,465 inhabitants. The castle was the seat of the counts of the Gruykre, first mentioned in 1073 The name is said to come from the word gruyer, meaning the officer of woods and forests, but the counts bore the canting arms of a crane (gruej, which are seen ail over the castle and the town. In 1555 the domains were sold to Bern and Fribourg. Bern took the upper Sarine valley, while Fribourg took the rest of the county, which it added to Bulle and Albeuve (taken in 1537 from the bishop of Lausanne), and to the lordship of Jaun in the Jaun or Jogne valley (bought in 1502–04 from its lords), in order to form the present administrative district of Gruyère.

GRYNAEUS, SIMON (1493–1541), German scholar and theologian, son of Jacob Gryner, a Swabian peasant, was born at Vehringen, and studied at Vienna. In 1524 he became professor of Greek at Heidelberg; from 1526 onwards he also held the chair of Latin. His religious views drove him from Heidelberg in 1529. After some years as professor of Greek at Basle, he reorganized the University of Tiibingen, returning to Basle before 1536, when he assisted in drafting the so-called First Helvetic Confession. He represented the Swiss divines at the Worms Conference (1540) between Catholics and Protestants. He died of plague at Basle on Aug. 1, 1541. A brilliant scholar, a mediating theologian, and personally of lovable temperament, his influence was great and wisely exercised. Erasmus and Calvin were among his correspondents. His chief works were Latin versions of Plutarch, Aristotle and Chrysostom.

See Bayle, *Dictionnaire;* W. T. Streuber in Hauck's *Realencyklopädie* (1899); and for bibliography, Streuber, S. *Grynaei epistolae* (1847).

GRYPHIUS, ANDREAS (1616–1664), German lyric poet and dramatist, was born on Oct. 11, 1616, at Grossglogau, Silesia, where his father was a clergyman. The family name was Greif, latinized, according to the prevailing fashion, as Gryphius. Left early an orphan and driven from his native town by the troubles of the Thirty Years' War, he received his schooling in various places. In 1634 he became tutor to the sons of the jurist Georg von Schonborn (1579–1637), imperial count-palatine (Pfalzgraf). Schönborn, who recognized Gryphius's genius, crowned him *poëta laureatus,* gave him the diploma of master of philosophy, and bestowed on him a patent of nobility, though Gryphius never used the title. After Schonborn's death Gryphius went to Leiden, where he remained six years, both hearing and delivering lectures. Here he fell under the influence of the great Dutch dramatists, Pieter Cornelissen Hooft and Joost van den Vondel. After travelling in France, Italy and South Germany, Gryphius settled in 1647 at Fraustadt, where he began his dramatic work, and was syndic of Glogau from 1650 until his death on July 16, 1664.

Gryphius was a man of morbid disposition, and his melancholy temperament, fostered by the misfortunes of his childhood, is largely reflected in his lyrics, of which the most famous are the Kirchhofsgedanken (1656). His best works are his comedies, one of which, *Absurda Comica,* oder Herr Peter Squentz (1663), is based on the episode of Pyramus and Thisbe in The Mzdsummer Night's Dream. Die geliebte Dornrose (1660), written in a Silesian dialect, is simple and graceful, and ranks high among the comparatively small number of German dramas of the 17th century. *Horribilicribrifax* (1663), founded on the Miles *gloriosus*

of Plautus, is a rather laboured attack on pedantry. Besides these three comedies, Gryphius wrote five tragedies, modelled on Seneca and Vondel. They are *Carolus Stuardus* (1649), *Leo Armenius* (1646), *Katharina von Georgien* (1657), *Cardenio und Celinde* (1657), the only bourgeois tragedy earlier than Lessing, and *Papinianus* (1663). No German dramatic writer before him had risen to so high a level, nor had he worthy successors until about the middle of the 18th century.

A complete edition of Gryphius's dramas and lyric poetry was published by H. Palm in the Stuttgart Literarische Verein (3 vols., 1878, 1882, 1884).

See O. Klopp, *Andreas Gryphius als Dramatiker* (1851); J. Hermann, *Über Andreas Gryphius* (1851); *T.* Wissowa, *Beiträge zur Kenntniss von Andreas Gryphius' Leben und Schriften (1876);* J. Wysocki, *Andreas Gryphius et la tragédie allemande au XVII^e siècle;* V. Mannheimer, *Die Lyrik des Andreas Gryphius* (1904); and *W.* Flemming, *Andreas Gryphius und die Buhne* (1921).

GSTAAD (3,450 ft.), a health resort and centre for winter sports in the canton of Berne, Switzerland, on the upper Saane. It has a station on the railway Montreux–Bernese Oberland. It is the starting point of the route over the Col-de-Pillon to Diablerets. Gstaad belongs to the commune of Saaner, which had a total pop. (1930) of 6,330, mostly Protestant and German-speaking.

GUACO, HUACO or **GUAO,** also Vejuco and Bejuco, terms applied to various Central and South American and West Indian plants, in repute for curative virtues. What is most commonly recognized in Colombia as guaco is *Mikania amara* (*Pl. équinox.* ii. 84, pl. 105, 1809), a climbing plant of the tribe *Eupatorieae* of the Compositae, affecting moist and shady situations, and having a much-branched and deep-growing root, variegated, serrate, opposite leaves and dull-white flowers in axillary clusters. The whole plant emits a disagreeable odour. It is stated that the Indians of Central America take guaco and boldly catch dangerous snakes, which writhe in their hands as though touched by a hot iron (B. Seemann, *Hooker's Journ. of Bot.* v. 76, 1853). The odour alone of guaco has been said to cause in snakes a state of stupor and torpidity; and Humboldt, who observed that the near approach of a rod steeped in guaco-juice was obnoxious to the venomous *Coluber corallinus,* was of opinion that inoculation with it imparts to the perspiration an odour which makes reptiles unwilling to bite. The drug is not used at all in modern therapeutics.

GUADALAJARA, a province of central Spain, formed in 1833 of districts from New Castile; bounded north by Segovia, Soria and Saragossa, east by Saragossa and Teruel, south by Cuenca and west by Madrid. The estimated population in 1939 was 206,194, the area 4,676 sq. miles. The province forms part of the uptilted north-eastern edge of the Meseta, and consequently the high ground is in the north, while the southern section of the province slopes into the plateau basin of New Castile. The northern highlands reach almost 7,000 ft. in places, as in La Cebollera (6,955 ft.) and Ocejon (6,775 ft.) in the Guadarrama mountains. The Sierra de Albarracin form an important group on the extreme south-east of the province. The ways through the northern mountains are few, the main pass being over the Sierra Ministra, which carries the railway from Madrid to Calatayud and the north The southern section, composing part of the Tagus basin, is watered by its tributaries, the Tajuna, Henares, Jarama and Gallo. The climate of this area, as of Castile, is continental in type, marked by the severity of its winter cold and summer sun. The soil varies very much in quality from place to place, but is fertile in many regions, notably in the cornlands of Alcarria towards the south. Few of the cork and oak forests which formerly covered the mountains have escaped destruction, and the higher lands are mainly pasture for sheep and goats. Grain, olive oil, wine, saffron, silk and flax are produced, but agriculture naturally suffers in this difficult country. Common salt and silver are mined, while deposits of iron, lead and gold were worked by the Romans. The manufacture of coarse cloth and pottery are a typical feature of the towns and villages. The Madrid-Saragossa railway traverses the province for 70 m., but the roads are naturally difficult. Guadalajara (*q.v.*) is the capital, and the only town of any considerable size. Molina de Aragon, a fortified town built at the foot of the Parameras de Molina (2,500–3,500 ft.), and on the right bank of the Gallo, is of some importance as an agricultural centre. Sigiienza, on the railway, is an episcopal city, with a fine Romanesque cathedral dating from the 11th century.

Guadalajara is probably the ancient *Segontia,* founded in 218 B.C., by refugees from Saguntum. The province was the scene of bitter fighting in the civil war of 1936–39, and government forces won a brilliant victory over a Nationalist army driving south from Sigiienza. A large proportion of the Nationalist force was made up of Italian volunteers.

GUADALAJARA, the capital of the Spanish province of Guadalajara, on the left bank of the river Henares, and on the Madrid-Saragossa railway, 35 mi. E.N.E. of Madrid. Pop. (1940) 18,470. Guadalajara is a picturesque town, occupying a somewhat sterile plain, 2,100 ft. above the sea. Under Roman and Visigothic rule it was known as *Arriaca* or *Caraca;* its present name, which sometimes appears in mediaeval chronicles as *Godelfare,* represents the *Wad-al-hajarah,* or "Valley of Stones," of the Moors, who occupied the town from 714 until 1081, when it was captured by Alvar Yañez de Minaya, a comrade of the more famous Cid. The church of Santa Maria contains the image of the "Virgin of Battles," which accompanied Alphonso VI. of Castile (1072–1109) on his campaigns against the Moors. The palace of the ducal house del-Infantado is in the Mudejar style, and the *panteon,* or mausoleum of the Mendoza family, added between 1696 and 1720 to the 13th-century church of San Francisco, is remarkable for the rich sculpture of its tombs. Manufactures of soap, leather and woollen fabrics superseded the original cloth-weaving industry for which Guadalajara was famous. In March 1937 a Nationalist force was' defeated near Guadalajara.

See Spanish Lib. of Information, *Spain* (Jan. 1942).

GUADALAJARA, an inland city of Mexico and capital of the State of Jalisco, 275 mi. (direct) W.N.W. of the Federal capital, in lat. 20° 41′ 10″ N., long. 103° 21′ 15″ W. Pop. (1910) 123,506; (1940) 228,049. Guadalajara is served by the Mexican Central railway and the Southern Pacific of Mexico running from Nogales on the American border. The city is in the Antemarac valley near the Rio Grande de Santiago, 5,092ft. above sea-level. Its climate is dry, mild and healthy, though subject to sudden changes. The city is well built, with straight and well-paved streets, numerous plazas, public gardens and shady promenades. Its public services include tramways and electric lighting, the Juanacatlán falls of the Rio Grande near the city furnishing the electric power. Guadalajara is an episcopal see, and its cathedral, built between 1571 and 1618, is one of the largest and most elaborately decorated churches in Mexico. The Government palace, which, like the cathedral, faces upon the *plaza mayor,* is generally considered one of the finest specimens of Spanish architecture in Mexico. Other institutions are the university, the mint, built in 1811, the modern national college and high schools, a public library of over 28,000 volumes, an episcopal seminary, an academy of fine arts, the Teatro Degollado, and the large modern granite building of the penitentiary. There are many interesting churches and 11 conventual establishments in the city. Charitabla institutions of a high character are also prominent, among which are the Hospicio, which includes an asylum for the aged, infirm, blind, deaf and dumb, foundlings and orphans. The city has a good water-supply, derived from springs and brought in through an aqueduct 8m. long. Guadalajara is surrounded by a fertile agricultural district and is an important commercial town. It is also widely known for the artistic pottery manufactured by the Indians of the city and of its suburb, San Pedro. Among other prominent industries are the manufacture of cotton and woollen goods, leather, furniture, hats and sweetmeats. Guadalajara was founded in 1531 by Nuño de Guzmán, and became the seat of a bishop in 1549. The Calderón bridge near the city was the scene of a serious defeat of the revolutionists under Hidalgo in Jan. 1811. The severe earthquake of May' 31, 1818, partially destroyed the two cathedral steeples; and that of March 11, 1875, damaged many of the larger buildings

GUADALQUIVIR (ancient *Baetis,* Moorish *Wadi al Kebir,* "the Great River"), a river of southern Spain. What is regarded as the main stream rises 4,475 ft. above sea-level between the Sierra de Cazorla and Sierra del Pozo, in the province of Jaen. It does not become a large river until it is joined by the Guadiana Menor on the left. and the Guadalimar on the right. Below Coria it traverses the series of broad fens known as Las Marismas. the greatest area of swamp in the Iberian Peninsula. Below Sanlúcar the river enters the Atlantic after a total course of 360 m. It drains an area of 21,865 square miles. In the time of the Moors it was navigable up to Cordova, but owing to the accumulation of silt in its lower reaches it is now only navigable up to Seville by vessels of 1,200 to 1,500 tons. Navigation has now been facilitated by the new cut, known as the Corte de Tablada, and swing-open bridge.

GUADELOUPE, French colony, West Indies, between Montserrat on the N., and Dominica on the S., between 15° 59′ and 16° 20′ N. and 61° 31′ and 61° 50′ W. It consists of two entirely distinct islands, separated by a narrow arm of the sea, Rivière Salée (Salt river), 100 ft. to 400 ft. wide and navigable for small vessels. The western island. a rugged mass of ridges, peaks and lofty uplands, is called Basse-Terre, while the eastern and smaller island, the real low-land, is known as Grande-Terre. A sinuous ridge runs through Basse-Terre from N. to S. In the north-west Grosse Montagne (2,370 ft.), radiates sharp spurs in all directions; near the middle of the west coast are the twin heights of Les Mamelles (2,536 ft. and 2,368 ft.). Farther south is La Soufrière (4,900 ft.). In 1797 this volcano was active, and in 1843 its eruptions laid several towns in ruins; but a few thermal springs and solfataras are now its only activity. In the extreme south is the jagged Caraibe (2,300 ft.). Basse-Terre is extremely beautiful, with cloud-capped mountains clothed in luxuriant vegetation. Grande-Terre rises to only 450 ft., and has extensive sugar plantations. The plain is composed mainly of limestone and a conglomerate of sand and broken shells known as *maçonne du bon dieu,* much used for building. The bay between the two sections of Guadeloupe on the north is called Grand Cul-de-sac Marin, that on the south Petit Cul-de-sac Marin. Basse-Terre (364 sq.m) is 28 m. long by 12 m. to 15 m. wide; Grande-Terre (255 sq m) is 22 m. long from N. to S., of irregular shape, with a long peninsula, Chateaux Point, stretching from the south-eastern extremity. Basse-Terre has several streams, which flood suddenly in the rainy season, but Grande-Terre has very few springs, and depends on ponds and cisterns.

Basse-Terre has old eruptive rocks covered by recent great volcanic cones, together with deposits derived from denudation of the older rocks. Grande-Terre has nearly horizontal limestones conformable upon a series of fine tuffs and ashes, the whole belonging probably to the Eocene and Oligocene. Occasional late Pliocene marl and limestone rest unconformably upon these older beds; and near the coast there are raised modern coral reefs.

The mean annual temperature is 78° F, and the minimum 61° F, and the maximum 101° F. From July to November heavy rains fall, the annual average on the coast being 86 in, while in the interior it is much greater. Guadeloupe is subject to violent storms. In 1825 a hurricane destroyed the town of Basse-Terre, and Grand Bourg in Marie Galante suffered similarly in 1865. The soil is rich and fruitful, 30% is cultivated and half of this is planted with sugar. The other crops include cereals, cocoa, cotton, manioc, yams and rubber; tobacco, vanilla, coffee and bananas are grown, but in smaller quantities. St. Anne, Pointe-à-Pitre and Le Moule and Basse-Terre have sugar *usines.* The forests of the island of Basse-Terre are valuable but, being difficult of access, are not worked Salt and sulphur are the only minerals extracted, and there are factories for rum, liqueurs, chocolate, besides fruit-canning works and tanneries Exports (1925) 154,871,706 francs, imports 132,566,419 fr.; the commerce is chiefiy with France.

Guadeloupe has a few white officials and planters, a few East Indian immigrants from the French possessions in India, and the rest negroes and mulattoes These mulattoes are famous for their grace and beauty of both form and feature. Women greatly outnumber men, and illegitimate births are very numerous. Pop. (1936) 304,239.

The governor is assisted by a privy council, a director of the interior, a procurator-general and a paymaster, and an elected legislative council of 30 members. The colony, a department of France, is represented in the French parliament by a senator and two deputies. Elections show the mulatto gaining power.

The seat of government, of the Apostolic administration and of the court of appeal is at Basse-Terre (13,638), on the south-west of that island, a picturesque. healthy town on an open roadstead. Pointe-8-Pitre (30,465), the largest town, lies in Grande-Terre near the mouth of the Rivière Salée. Its excellent harbour has made it the chief port and commercial capital of the colony. Le Moule (15,279) on the east coast of Grande-Terre has a large sugar export, despite its poor harbour Of the other towns, St. Anne (10,033), Morne à l'Eau (8,742), Petit Canal (7,000), St François (5 670), Petit Bourg (5 650) and Trois Rivières (5,372), are the most imnortant.

Round Guadeloupe are grouped La Desirade, 6 m. E., a narrow rugged island 10 sqm. in area; Marie Galante, 16 m. S E.; Les Saintes, a group of seven small islands, 7 m. S., one of the strategic points of the Antilles, with a magnificent naval harbour: St. Martin, 142 m. N.N.W ; and St. Bartholomew, 130 m. N N.W.

History.—Guadeloupe was discovered by Columbus in 1493, who named it from the monastery of S. Maria de Guadalupe at Estremadura in Spain In 1635 l'Olive and Duplessis took possession in the name of the French Company of the Islands of America, and l'Olive exterminated the Caribs with great cruelty. Four chartered companies were ruined in their attempts to colonize the island, and in 1674 it passed to the French crown and long remained a dependency of Martinique. After failures in 1666. 1691 and 1703, the British captured the island in 1759, and held it for four years. Guadeloupe was finally separated from Martinique in 1775, but it remained under the governor of the French Windward Islands. In 1782 Rodney defeated the French near the island, and the British again took it in April 1794, but in the following summer they were driven out by Victor Hugues with the assistance of slaves freed for the purpose. In 1802 Bonaparte, then first consul, sent an expedition to the island in order to re-establish slavery, but, after a heroic defence, many of the negroes preferred suicide to submission. In 1810, the British once more occupied the island, but, in spite of its cession to Sweden by the treaty of 1813 and a French invasion in 1814, they did not withdraw till 1816. Between 1816 and 1825 the code of laws peculiar to the island was introduced. Municipal institutions were established in 1837; and slavery was finally abolished in 1848 Guadeloupe, with much of the West Indies and Florida, was devastated by a tropical hurricane in the middle of September, 1928. Plantations were wrecked and buildings destroyed in the towns. The French government recorded 660 deaths in the island

GUADET, MARGUERITE ELIE (1758–1794), French Revolutionist, was born at St. Emilion near Bordeaux on July 20, 1758, and became a lawyer. He was elected to the Legislative Assembly, and was largely instrumental in forcing the king to accept the Girondist ministry of March 15, 1792. As president of the Assembly, he vigorously opposed the insurrectionary Commune of Paris on Aug. 10. 4 s deputy to the Convention (Sept) he voted for an appeal to the people at the trial of Louis XVI, and for the death sentence, but with a respite pending appeal In March 1793 during the war in La Vendée he refused to co-operate with Danton, whom he held responsible for the September massacres. He was involved in the fall of the Girondists, and guillotined on June 17, 1794.

See J. Guadet, *Les Girondins* (1889); and F. A. Aulard, *Les Orateurs de la législative et de la convention* (2nd ed., 1906).

GUADIANA (anc. *Anus,* Moorish *Wadi Ana*), a river of Spain and Portugal. The Guadiana was long believed to rise in the lowland known as the Campo de Montiel, where a chain of small lakes, the Lagunas de Ruidera, are linked together by the Guadiana Alto or Upper Guadiana. This stream flows north-westward from the last lake and vanishes underground within 3 m. of the river Zancara or Giguela. About 22 m. S.W. of the point of disappearance, the Guadiana Alto was believed to re-emerge in the form of several large springs, which form numerous lakes near the Zancara and are known as the "eyes of the Guadiana"

(*los* ojos de *Guadiana*). The stream which connects them with the Zancara is called the Guadiana Bajo or Lower Guadiana. It is now known that the Guadiana Alto has no such course, but flows underground to the Zancara itself, which is the true "Upper Guadiana." The Zancara rises near the source of the Júcar, in the east of the tableland of La Mancha; thence it flows westward, assuming the name of Guadiana near Ciudad Real, and reaching the Portuguese frontier 6 m. S.W. of Badajoz. In piercing the Sierra Morena it forms a series of foaming rapids, and begins to be navigable only at Mertola, 42 m. from its mouth. From the neighbourhood of Badajoz it forms the boundary between Spain and Portugal as far as a point near Monsaraz, where it passes into Portuguese territory, with a southerly direction. At Pomarão it again becomes a frontier stream and forms a broad estuary 25 m. long. It enters the Gulf of Cadiz between the Portuguese town of Villa Real de Santo Antonio and the Spanish Ayamonte, after a total course of 510 m. Its mouth is divided by sandbanks into many channels. The Guadiana drains an area of 31,940 square miles. Its principal tributaries are the Zujar, Jabalón, Matachel and Ardila from the left; the Bullaque, Ruecas, Botoa, Degebe and Cobres from the right.

GUADIX, a city of southern Spain, in the province of Granada; on the left bank of the river Guadix, a subtributary of the Guadiana Menor, and on the Madrid-Valdepeiias-Almeria railway. Pop. (1930), 21,949. Guadix occupies part of an elevated plateau among the northern foothills of the Sierra Nevada. Guadix el Viejo, 5 m. N.W., was the Roman Acci, and, according to tradition, the seat of the first Iberian bishopric, in the 2nd century. After 711 it rose to some importance as a Moorish fortress and trading station, and was renamed *Wad* Ash, "Water of Life." It was surrendered without a siege to the Spaniards, under Ferdinand and Isabella, in 1489. Guadix is surrounded by ancient walls, and was formerly dominated by a Moorish castle. It is an episcopal see of great antiquity. The cathedral was built in the 18th century on the site of a mosque. The city was once famous for its cutlery. It has some trade in wool, cotton, flax, corn and liqueurs. The warm mineral springs of Graena, much frequented during the summer, are 6 m. W.

GUADUAS, a town of the department of Cundinamarca, Colombia, 53 mi. N.W. of Bogotá on the old road between that city and the Magdalena river port of Honda. Pop. (1938) 2,011, chiefly Indians or of mixed blood. It stands in a narrow and picturesque valley formed by spurs of the Eastern Cordillera, and on a small stream bearing the same name, which is that of rhe South American bamboo (*guaduas*), found in great abundance along its banks. Sugar-cane and coffee are cultivated in the vicinity, and fruits of various kinds are produced in great abundance. The elevation of the town is 3.353 ft. above the sea, and it has a remarkably uniform temperature throughout the year. Guaduas has a pretty church facing upon its plaza, and an old monastery now used for secular purposes. Guaduas was founded in 1614.

GUAHIBAN, an independent linguistic stock of South American Indians, so called from the Guahibas, one of its most important tribes. The tribes composing this stock occupy or once occupied a large area in eastern Colombia, which extended from the Orinoco river westward between the Meta and Vichada rivers to the eastern slopes of the Andes. Some outlying tribes, however, such as the Churoyas, Cofanes and Macas, were much farther south, extending as far as the upper Caqucta and Aguarico rivers. The Guahibas (Guaybas) and the closely affiliated Chiricoas are described as a purely nomadic hunting and fishing folk, going almost naked. They are wandering traders, thievish, and adepts at cheating, and were likened by the early writers to gipsies. No adequate modern studies of these tribes appear to have been made.

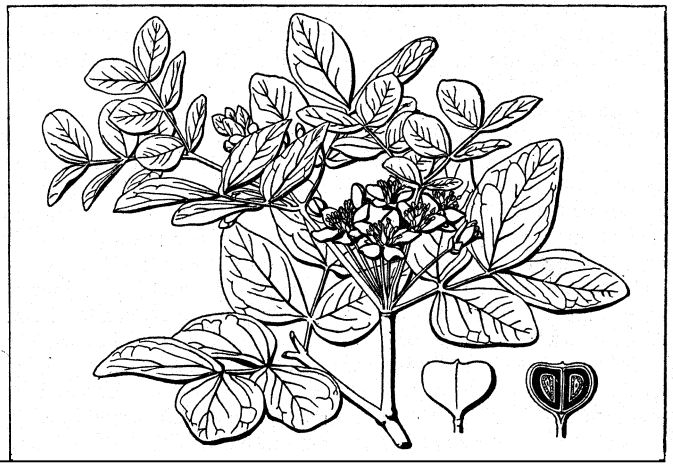
See J. Rivero, *Historia* de las *Misiones* de *los* Llanos de *Casanare*, etc. (1736, new ed. Bogota, 1883); J. Chaffanjon, *L'Orenoque* et *le* Caura (Paris, 1889).

GUAIACOL, $CH_3{\cdot}O{\cdot}C_6H_4{\cdot}OH$, the monomethyl ether of catechol (*q.v.*) and a constituent of beechwood-tar.

GUAIACUM (gwī′ạ-kŭm), a genus of trees of the order *Zygophyllaceae*. The guaiacum or lignum vitae tree G. *officinale*, is a native of the West Indies and the north coast of South America, where it attains a height of 20ft. to 30ft. Its branches are numerous, flexuous and knotted; the leaves opposite and pinnate, with caducous stipules, and entire, glabrous, obovate or oval leaflets, arranged in two or, more rarely, three pairs; the flowers are in axillary clusters (cymes), and have five oval pubescent sepals, five distinct pale-blue petals three times the length of the sepals, 10 stamens, and a two-celled superior ovary. The fruit is about $\frac{3}{4}$in. long, with a leathery pericarp, and contains in each of its two cells a single seed (see fig. 1). G. sanctum grows in the Bahamas and Cuba, and at Key West in Florida. It is distinguished from G. *officinale* by its smaller and narrow leaflets, which are in four to five pairs, by its shorter and glabrous sepals, and five-celled and five-winged fruit. G. *arboreum,* the guaiacum tree of Colombia, is found in the valley of the Magdalena up to altitudes 800 metres (2,62jft.) above sea-level, and reaches considerable dimensions. Its wood is of a yellow colour merging into green, and has an almost powdery fracture; the flowers are yellow and conspicuous; and the fruit is dry and four-winged.

The lignum vitae of commerce, so named on account of its high repute as a medicinal agent in past times, is procured from G. *officinale,* and in smaller amount from G. sanctum. It is exported in large logs or blocks, generally divested of bark, and presents in transverse section very slightly marked concentric rings of growth, and scarcely any traces of pith; with the aid of a magnifying glass the medullary rays are seen to be equidistant and very numerous. The outer wood is pale yellow and devoid of resin; the inner which is by far the larger proportion, is dark greenish-brown, contains in its pores 26% of resin, and has a specific gravity of 1·333, and therefore sinks in water. Owing to the diagonal and oblique arrangement of the successive layers of its fibres, the wood cannot be split; and on account of its hardness, density and durability it is much valued for the manufacture of ships' pulleys, rulers, skittle-balls, mallets etc.

Chips or turnings of the heartwood of G. *officinale* (lignum *guaiaci*) are employed in the preparation of the liquor sarsae *compositus* concentratus of British pharmacy. They may be recognized by being either yellow or greenish-brown in colour, and by turning bluish-green when treated with nitric acid, or when



FLOWERING BRANCH OF THE LIGNUM VITAE TREE (GUAIACUM OFFICINALE). SMALL FIGURES SHOW AN ENTIRE FRUIT AND A LONGITUDINAL SECTION

heated with corrosive sublimate, and green with solution of chloride of lime. Guaiacum resin is obtained from the wood as a natural exudation; by heating billets about 3ft. in length, bored to permit of the outflow of the resin; or by boiling chips and raspings in water to which salt has been added to raise the temperature of ebullition. It occurs in rounded or oval tears, or in large brownish or greenish-brown masses, translucent at the edges; fuses at 85°C.; is brittle, and has a vitreous fracture, and a slightly balsamic odour, increased by pulverization and by heat; and is at first tasteless when chewed, but produces subsequently a sense of heat in the throat. It is readily soluble in alcohol,

ether, chloroform, creosote, oil of cloves and solutions of caustic alkalies; with glycerine it gives a clear solution, and with nitrous ether a bluish-green gelatinous mass. It is blued by various oxidizing agents, *e.g.* ozone. The chief constituents are three distinct resins: *guaiaconic acid,* $C_{19}H_{20}O_5$ (70%), *guaiac acid,* which is closely allied to benzoic acid, and *guaiaretic acid.* Like all resins, these are insoluble in water, soluble in alkalies, but precipitated on neutralization of the alkaline solution.

Guaiacum wood was first introduced into Europe by the Spaniards in 1508 but the first edition of the *London Pharmacopoeia* in which the resin is mentioned is that of 1677. Guaiacum resin is given medicinally in doses of 5–1j grains. Its important preparations in the British Pharmacopoeia are the *mistura guaiaci* (dose ½–1oz.), the ammoniated tincture of guaiacum (dose ½–1 drachm), in which the resin is dissolved by means of ammonia, and the trochiscus or lozenge, containing three grains of the resin. This lozenge is undoubtedly of value when given early in cases of sore throat, especially of rheumatic origin. Guaiacum resin differs pharmacologically from other resins in being less irritant, so that it is absorbed from the bowel and exerts remote stimulant actions, notably upon the skin and kidneys. The drug is useful both in acute and chronic sore throat, in chronic constipation and chronic gout and other forms of chronic arthritis.

The tincture of guaiacum is universally used as a test for the presence of blood, or rather of haemoglobin, in urine or other secretions. A single drop of the freshly-prepared tincture should be added to, say, an inch of urine in a test-tube. The resin is at once precipitated, yielding a milky fluid. If "ozonic ether" (an ethereal solution of hydrogen peroxide) is now poured gently into the test-tube, a deep blue coloration is produced along the line of contact if haemoglobin is present. The reaction is due to the oxidation of the resin by the peroxide of hydrogen — such oxidation occurring only if haemoglobin is present to act as an oxygen-carrier.

GUALDO TADINO, a town and episcopal see of Umbria. Italy (anc. *Tadinum,* on the Via Flaminia, 1 mi. to the W.), 1,755 ft. above sea-level, province of Perugia, 22 mi. N. of Foligno by rail. Pop. (1936), town, 3,667, commune, 12,701. The cathedral has a good rose-window; and the picture gallery contains 15th century paintings by Umbrian artists. The town is still surrounded by walls. Art pottery is made here. In the plain below, near the ancient Tadinum, Narses defeated and slew Totila in 552.

GUALEGUAY, a town on the river of the same name in Argentina, 32 mi. above the confluence of the Gualeguay river with the Ibucuy branch of the Paraná, and about 120 mi. N.N.W. of Buenos Aires. The port of Gualeguay is Puerto Ruiz, 5 mi. below, with which Gualeguay is connected by tramway. It is also on a branch of the Entre Rios railway. It is a stock-raising centre, its establishment dating from 1783. Pop. (est. 1940) 10,000. The town has a meat-chilling plant, tanneries, shoe factories, soap factories and flour mills. Wheat, maize and flax-seed are produced in the tributary region. Gualeguay is to be distinguished from Gualeguaychu, which is some 50 mi. north-east.

GUALEGUAYCHU, a town and river port of the Province of Entre Rios, Argentina, on the river of the same name, 11 mi. above its confluence with the Uruguay and about 130 mi. N.W. of Buenos Aires. The population in 1940 was estimated at 29,000. Gualeguaychu is the centre of an important cattle-raising country, and meat is chilled and beef extract manufactured in the town. There are also tanneries and shoe factories. Gualeguaychu is on a branch of the Entre Rios railway, and is also served by river steamers.

GUALO, CARDINAL (*fl.* 1216), was sent to England by Pope Innocent III in 1216. He supported John with all the weight of papal authority. After John's death he crowned the infant Henry III, and as representing the pope, Henry's suzerain, he claimed the regency and divided the chief power with William Marshal, earl of Pembroke. He proclaimed a crusade against the French, and, after the peace of Lambeth, forced Louis to make a public profession of penitence (1217). He ruled the church with an absolute hand until he made his departure from England in 1218.

GUAM, the largest and most populous of the Marianas islands, in the North Pacific, in 13° 26' N. lat. and 144° 39' E. long., about 1,823 mi. E. by S. of Hongkong, about 1,506 mi. E. of Manila, and 5,053 mi. W. by S. of San Francisco. Guam passed into U.S. possession after the Spanish-American War. It was occupied by the Japanese on Dec. 12, 1941, after the attack on Pearl Harbor.

Physical Features. — The northern half of the island is a plateau, rising 400 ft. or 500 ft. above sea level. There are heavy woods, except where plots are cleared for cultivation. The southern half is broken by hills, mostly barren, but the intervening valleys are quite fertile and there are a number of streams. The highest peak is Lamlam, which reaches a height of 1,313 ft. Apra, located on the middle of the west coast, is the only good harbour; it is about 3½ mi. across and is divided into an inner and outer harbour by a peninsula and an island.

The physical appearance of town and countryside in Guam reflects three different cultural influences on the history and life of the island. The native shacks, constructed of bamboo and coconut thatch, are familiar throughout the Pacific islands. The thick-walled houses with balconies where the more well to do town dwellers live are Spanish in architectural design; and the long rule of Spain is also reflected in the many churches and chapels. Baseball grounds, soda fountains and a few motor cars reflect the newer influence of the United States.

With a mean annual temperature of about 81°F., Guam has a fairly agreeable and equable climate; but it often suffers from destructive typhoons, which bring heavy losses in lives and property. One such typhoon occurred in July 1918; in three hours the crops for the year had been destroyed, many houses were unroofed and the streams were in flood Equally destructive was a typhoon which struck the island on Nov. 3, 1940. Not only was the output of Guam's principal export, copra, heavily reduced as a result of this disaster (while Guam has a capacity to export 3,000 tons of copra in a year, the actual export in 1940–41 was less than 100 tons), but the number of swine and poultry on the island had to be reduced because of the shortage of coconut feed. The government endeavoured to relieve the distress by remitting taxes and providing more work on public projects.

Population. — The population of Guam, exclusive of the United States naval station personnel, was 11,806 in 1910, 13,275 in 1920, 18,509 in 1930 and 22,290 in 1940. The 1940 population comprised 20,177 natives, 785 white persons, 569 Filipinos, 326 Japanese, 324 Chinese and 109 Negroes. The natives are of Chamorro (Indonesian) stock, with a considerable admixture of Spanish and Tagalog (Filipino) blood. Their international status was a rather peculiar one, because they had never been granted United States citizenship. Unlike the Filipinos, they showed no desire for independence and were inclined rather to plead for recognition as United States citizens. The area of Guam is 206 sq.mi. The population of Agana, the chief city and capital, was 10,004 in 1940.

Government. — Guam has been administered directly by the navy department. The governor, who is also commandant of the naval station, is an officer with the rank of captain. His legislative and executive power is unlimited, and there is no local authority who can call him to account. There is a congress (the last election was held on March 8, 1941), with a house of council (16 members) and a house of representatives (27 members). Its powers are purely advisory, and it keeps in contact with the governor through committees of three members chosen from each house. The administration includes departments of law, judiciary, education, health, agriculture, industries, police, military affairs, records and accounts and customs and immigration. There is a mimeographed daily newspaper, the *Guam* Eagle. Guam has been treated as a special naval area, and only government vessels and specially licensed freighters may call there. As one of the stations on the Pan American Airways clipper route, it acquired a good deal of transit traffic.

Finances and Education. — The revenues for the fiscal year 1940 amounted to $283,619, the expenditures to $259,626. Revenue mas derived from land taxes, licences, court fees, customs and revenue collections and productive industries. The Bank of Guam is the sole banking institution, established by the naval government in 1915.

About 20% of the public income is expended on education. Primary education is compulsory between the ages of 7 and 12. There were in 1940, 23 primary schools, five industrial schools, 1 high school and 1 school for Americans, besides 1 private school. The average enrolment was 4,694, of whom 4,556 were in public schools. Teaching is in English, and industrial courses are emphasized.

Industry and Trade. — Agriculture is the main occupation of Guam, a sawmill and a coco-nut oil soap factory being the only industrial enterprises, apart from construction enterprises for naval purposes. Farming is mainly developed along the southern coast of the island. Copra is the main commercial crop; vegetables, corn, mangoes

and bread-fruit are grown. Swine and poultry are kept for local consumption.

Guam has a strikingly unfavourable balance of trade, which was accentuated by the typhoon of Nov. 1940. Guam's imports were $642,935.63 in 1940 and $994,010.91 in 1941, while exports were $102,574.65 in 1940 and $84,278.16 in 1941. (These figures in each case refer to the fiscal year, which ends on June 30.) The heavily unfavourable balance of trade is largely explained by the fact that a considerable part of the imports is for the needs of the naval station and its personnel. A source of incoming currency is the expenditure of the Pan American Airways and its transit passengers. The hotel which was first put up for the accommodation of these passengers was destroyed by the typhoon of Nov. 1940, and mas replaced by a more commodious building. A number of gasoline storage tanks was installed by Pan American Airways and by the Standard Oil Company of California during 1941.

History.—Guam u-as discovered by Magellan in 1521. He was so much annoyed by the thefts which were committed by the natives that he gave the whole group of islands to which Guam belongs the name Islas de los Ladrones (Thieves' islands). This name has still persisted to some extent, although the official name of the group was later established as Mariana, in honour of the widow of King Philip IV of Spain.

There was no attempt to conquer Guam until the latter part of the 17th century, when the Spaniards subdued the island after considerable bloodshed. It remained a Spanish possession until 1898, when the U.S. warship "Charlestown" steamed into the harbour of Apra and commenced to shell the old fort. The Spanish governor, cut off from communication with the outside world, took this as a friendly salute and surrendered the island without opposition when the situation was explained to him. Guam was ceded to the United States, and the other islands of the Marianas were sold by Spain to Germany in 1899.

After World War I, Japan, which had occupied the German island possessions north of the equator, received these South Sea islands (the Marianas, Caroline and Marshall groups) as a mandate under the League of Nations. Japan retained possession of the islands after it quit the league in 1935.

Guam was entirely demilitarized after the Washington treaty of naval limitation of 1922. The position of Guam in a U.S.-Japanese war was certain to be precarious, because the island is surrounded by the Micronesian islands, which Japan controls. The nearest of these islands, Rota, is only about 30 mi to the north of Guam

The question of fortifying Guam came up sporadically for consideration after Japan had denounced the Washington treaty and thereby opened the way to fortification of the island possessions of other powers. Congress was never willing to appropriate funds for this purpose, partly because of the belief that such a move might precipitate war with Japan, partly because of doubt in the minds of some naval experts as to whether Guam, in its exposed position, could be made secure against air bombardment. Some funds for harbour improvement and provision of air facilities were voted in 1941; and a number of skilled workers were brought over from the United States in that year.

But the force at Guam, some 400 marines and about 155 sailors, was quite inadequate to protect an island which, with its fairly extensive coast line, offered a number of opportunities for landing to an attacking force. The Japanese effected landings in Guam in the first days of the mar with the U.S., and the occupation of the island was apparently completed on Dec. 12, 1941.

Cox, *The Island of Guam,* rev. by Mrs. Allen H. White, 1925 (1926); The *Annual Report* of the naval governor (1941); U.S. Bureau of Census, *Census of Guam.* (W. H. CH)

GUAN, the name applied to members of the Penelopinae, closely allied to the *Cracinae* or curassows. They comprise a number of genera of which *Penelope* and *Ortalis* are the largest. Nearly all have a bare throat, from which, in many forms, hangs a wattle. Save for a few which extend to Central and North America and the Antilles, the guans are confined to the South American continent. Like curassons, guans are in great measure of arboreal habit. They readily become tame, but the cases in which they have been induced to breed in confinement are few.

GUANABACOA (an Indian name meaning "site of the naters"), a town of Cuba, in Havana province, about 6 mi. E. of Havana. Pop. (1938) 54,758. Guanabacoa is served by railway to Havana, with which it is connected by the Regla ferry across the bay; a good motor road connects it with the capital. It is picturesquely situated amid woods, on high hills which present a fine view. There are medicinal springs in the town, and deposits of liquid bitumen in the neighbouring hills. The town is essentially a residential suburb of the capital, and has some rather pretty streets and squares and some old and interesting churches (including Nuestra Señora de la Asuncion, 1714–21). Just outside the city is the church of Potosi with a famous "wonder-working" shrine and image. An Indian pueblo of the same name existed here before 1555, and a church was established in 1576. Already at the end of the 17th century Guanabacoa was the fashionable summer residence of Havana. It enjoyed its greatest popularity in this respect from the end of the 18th to the middle of the 19th century. The Key West cable now lands at Little Morro, the port of Guanabacoa, which was taken by the English in 1762.

GUANACO or **HUANACA,** the larger of the two wild representatives in South America of the camel tribe, the other being the vicuña. The guanaco (*Lama huanacus*), stands nearly 4 ft. at the shoulder, with gracefully curved neck and long slender legs, the hind pair bearing two naked patches. The hair is long and soft, of a fawn colour above and white beneath. Guanaco are found throughout the southern half of South America, from Peru to Cape Horn. They live in herds, usually of from six to thirty, and are exceedingly timid and difficult of approach. Their cry is something between the belling of a deer and the neigh of a horse. The chief enemies of the guanaco are the Patagonian Indians and the puma, as it forms the principal food of both. Its flesh is palatable although wanting in fat, while its skin forms the chief clothing material of the Patagonians. Guanaco are easily domesticated. They take readily to the water. They regularly deposit their droppings on the same spot—a habit appreciated by the Peruvian Indians, who use these deposits for fuel. Guanaco also have favourite localities in which to die, as appears from the great heaps of their bones found in particular spots.

GUANACO, A SOUTH AMERICAN REPRESENTATIVE OF THE CAMEL TRIBE

GUANAJAY, a town of western Cuba, in Pinar del Rio province, about 36 mi. (by rail) S.W. of Havana. Pop. (1938 census) 15,784. Guanajay is served by the west branch of the United railways of Havana, of which it is the west terminus. The town lies among hills, has an excellent climate, and in colonial times was an acclimatization station for troops; it now has considerable repute as a health resort.

GUANAJUATO or **SANTA FE DE GUANAJUATO,** a city of Mexico and capital of the state of the same name 1 j5 mi. (direct) N.W. of Mexico city. Pop. (1921) 19,408; (est. 1940) 40,000. The city is built in the Caiiada de Marfil at the junction of three ravines about 6,500 ft. above the sea, and its narrow, tortuous streets rise steeply as they follow the ravines upward to the mining villages clustered about the opening of the mines in the hillsides. Enclosing the city are the steep, barren mountain sides honeycombed with mines. The climate is semi-tropical and is considered healthful. The noteworthy public buildings and institutions are an interesting old Jesuit church with arches of pink stone and delicate carving, eight monasteries, the government palace, a mint dating from 1812, a national college, the fine Teatro Juárez, and the Panteón, or public cemetery, with catacombs below. The Alhóndiga de Granaditas, originally a public granary, was used as a fort during the war of independence, and is celebrated as the scene of the first battle (1810) in that long struggle. Mining is the principal interest and occupation of the people, and the population fluctuates with the activity of the mines. The silver mines of the vicinity were long considered the richest in Mexico, the celebrated Veta Madre (mother lode) even being described as the richest in the world. The railway outlet for the city consists of a short branch of the Mexican Central, which joins the trunk line at Silao. Guanajuato was founded in 1554. It attained the dignity of a city in 1741.

GUANAJUATO or **GUANAXUATO,** an inland state of Mexico; area, 11.808 sq. miles. It is one of the most densely populated states of the republic; pop. (1910) 1,081,651; (1930)

987,801. The State lies wholly within the limits of the great central plateau of Mexico, and has an average elevation of about 6,000 feet. The surface of its northern half is broken by the Sierra Gorda and that of the centre by the Sierra de Guanajuato, but its southern half is covered by fertile plains, called the *"Bajio,"* largely devoted to agriculture. It is drained by the Río Grande de Lerma and its tributaries, which in places flow through deeply eroded gorges. The climate is semi-tropical and healthy, and the rainfall, 20 to 30in., and coming in the summer, is sufficient to ensure good results in agriculture and stock-raising. Indian corn, beans, barley and wheat are grown. The principal industry of the State is mining, the mineral wealth being enormous. Among its mineral products are silver, gold, tin, lead, mercury, copper and opals. Silver has been extracted since the early days of the Spanish conquest, over $800,000,000 having been taken from the mines during the subsequent three and a half centuries. Some of the more productive of these mines, or groups of mines, are the Veta Madre (mother lode), the San Bernabé lode, and the Rayas mines of Guanajuato, and the La Valenciana mine, the output of which is said to have been $226,000,000 between 1766 and 1826. The industrial establishments include flour mills, tanneries and leather factories, cotton and woollen mills, distilleries, foundries and potteries. The Mexican Central and the Mexican National railway lines cross the State from north to south, and the former operates a short branch from Silao to the State capital and another westward from Irapuato to Guadalajara. The capital is Guanajuato, and other important cities and towns are León or León de las Aldamas (pop. [1930] 99,457); Celaya (pop. [1910] 23,062; [1921] 24,035), an important railway junction 22m. by rail W. from Querétaro, and known for its manufactures of broadcloth, saddlery, soap and sweetmeats; Irapuato (pop. [1910] 21,469; [1921] 20,657), a railway junction and commercial centre, 21m. S. by W. of Guanajuato; Silao (pop. [1910] 14,059; [1921] 12,943), a railway junction and manufacturing town (woollens and cottons), 14m. S.W. of Guanajuato; Salamanca (pop. [1910] 13,497; [1921] 9,922) on the Mexican Central railway and Lerma river, 25m. S. by E. of Guanajuato, with manufactures of cottons and porcelain; and Acámbaro (pop. [1910] 11,080; [1921] 15,317), a prosperous town of the plain, 76m. S.S.E. of Guanajuato.

GUANCHES, the aboriginal inhabitants of the Canary islands. Strictly the Guanches were the primitive inhabitants of Teneriffe, where they seem to have preserved racial purity to the time of the Spanish conquest, but the name came to be applied to the indigenous populations of all the islands. The Guanches, now extinct as a distinct people, were an offshoot of the Berbers of northern Africa. They are of the Cro-Magnon type (Boule, *Fossil* Malt, 1923. p. 288). The Carthaginians under Hanno found the archipelago uninhabited, but saw ruins of great buildings. This suggests that the Guanches were not the first inhabitants, and that this extreme westerly migration of Berbers took place between the time of which Pliny wrote and the conquest of northern Africa by the Arabs. Many of the Guanches fell in resisting the Spaniards, many were sold as slaves, and many conformed to the Roman Catholic faith and married Spaniards.

Such remains as there are of their language, a few expressions and the proper names of ancient chieftains still borne by certain families, connect it with the Berber dialects. In many of the islands signs are engraved on rocks. In the ravines of Las Balos are some genuine Libyan inscriptions. The rock inscriptions are Numidic. In two of the islands (Teneriffe and Gomera) the Guanche type has been retained with more purity than in the others. No inscriptions have been found in these two islands, perhaps because the true Guanches did not know how to write. In the other islands numerous Semitic traces are found, and in all of them are the rock-signs.

The political and social institutions of the Guanches varied. In some islands hereditary autocracy prevailed; in others the government was elective. In Teneriffe all the land belonged to the chiefs who leased it to their subjects. In Grand Canary suicide was regarded as honourable, and on a chief inheriting, one of his subjects threw himself over a precipice. In Lanzarote polyandry was practised; elsewhere monogamy. But everywhere the women were respected, an insult offered any woman by an armed man being a capital offence. The Guanches generally wore garments of goat-skins, and others of vegetable fibres, which have been found in the tombs of Grand Canary. Ornaments, necklaces of wood, bone and shells, worked in different designs, beads of baked earth, cylindrical and of all shapes, with smooth or polished surfaces, mostly black and red in colour, were chiefly in use. They painted their bodies; the *pintaderas,* baked clay objects like seals in shape, having been used solely for painting the body in various colours. They manufactured rough pottery, mostly without decorations, or ornamented by means of the finger-nail. The polished battle-ax was more used in Grand Canary, while stone and obsidian, roughly cut, were commoner in Teneriffe. They had, besides, the lance, the club, sometimes studded with pebbles, and the javelin, and they seem to have known the shield. They lived in natural or artificial caves in the mountains. In districts where cave-dwellings were impossible, they built small round houses and even practised rude fortification. In Palma the old people were at their own wish left to die alone. After bidding their family farewell they were carried to the sepulchral cave, nothing but a bowl of milk being left them. The Guanches embalmed their dead; many mummies have been found in an extreme state of desiccation, each weighing not more than 6 or 7 lb. The process of embalming varied. In Teneriffe and Grand Canary the corpse was simply wrapped up in goat and sheep skins, while in other islands a resinous substance was used to preserve the body, which was then placed in a cave difficult of access, or buried under a tumulus. The work of embalming was reserved for a special class, women for female corpses, men for male. Bodies were often simply hidden in caves or buried.

There was a general belief in a supreme being, called Acoran, in Grand Canary, Achaman in Teneriffe, Eraoranzan in Hierro, and Abora in Palma. The women of Hierro worshipped a goddess called Moneiba. According to tradition the male and female gods lived in mountains whence they descended to hear the prayers of the people. In other islands the natives venerated the sun, moon, earth and stars. A belief in an evil spirit was general. The demon of Teneriffe was called Guayota and lived in the peak of Teyde, which was the hell called Echeyde. In times of drought the Guanches drove their flocks to consecrated grounds, where the lambs were separated from their mothers in the belief that their plaintive bleatings would melt the heart of the Great Spirit. During the religious feasts all war and even personal quarrels were stayed.

See "Harvard African Studies" vol. vii. (1925); E. A. Hooton, *Canary Islands.*

GUANIDINE, a colourless, deliquescent, crystalline solid readily soluble in water or alcohol; it occurs in both vegetable and animal kingdoms. Guanidine, $HN{:}C(NH_2)_2$, is found in the juice of sugar beet, in etiolated vetch seedlings and in the embryo of the chick. It was first prepared by A. Strecker, who oxidized guanine with potassium chlorate and hydrochloric acid, and is also formed by oxidizing egg albumin or gelatin with a soluble permanganate. Many synthetic processes have been devised for the preparation of guanidine of which the best known is the heating of ammonium thiocyanate to 180–190° C; thiourea, formed as an intermediate product, changes into guanidine thiocyanate with elimination of hydrogen sulphide. E. A. Werner and J. Bell recommend the heating to 120° C of an intimate mixture of ammonium thiocyanate and dicyanodiamide (obtained commercially from calcium cyanamide). After heating for several hours, the melted mass is extracted with water, and the concentrated aqueous extracts give 90% yields of guanidine thiocyanate (1920). Guanidine has strongly alkaline properties: it absorbs carbon dioxide from the air and forms well-defined crystalline salts with mineral and organic acids. Its relationship with the more complex products of animal metabolism is shown by the fact that when its carbonate is condensed with methylglycine (sarcosine) it yields creatine and creatinine.

Guanidine has played an important part in the development of the chemistry of nitrogen compounds. Mixed with nitric and sul-

phuric adds it furnishes nitroguanidine, $HN{:}C(NH_2){\cdot}NH{\cdot}NO_2$ (colourless needles decomposing at 230°), which on reduction with zinc dust and acetic acid gives rise to aminoguanidine, $HN{:}C(NH_2){\cdot}NH{\cdot}NH_2$. This amino compound undergoes hydrolysis with dilute acids or alkalis in two stages, yielding first semicarbazide, $O{:}C(NH_2){\cdot}NH{\cdot}NH_2$ (colourless prisms, m.p. 96° C), a valuable reagent for aldehydes and ketones, and secondly carbon dioxide, ammonia and hydrazine. The final stage of hydrolysis is of special interest as being one of the earlier methods adopted for the preparation of hydrazine, $NH_2{\cdot}NH_2$ (J. Thiele, 1892). By the action of nitrous acid on aminoguanidine nitrate, diazoguanidine nitrate is produced, $NH{:}C(NH_2){\cdot}NH{\cdot}N_2{\cdot}NO_3$. This diazo-compound is decomposed by caustic alkalis into cyanamide and an alkali salt of hydrazoic acid, N_3H, another of the nitrogen hydrides.

See "Guanidine," Thorpe, *Dictionary of Applied Chemistry* (1922); *E.* Abderhalden, *Biochemisches Handlexikon,* vol. iv., 783; vol. ix., 187 (1911 and 1915).

GUANO (a Spanish word from the Peruvian *huanu,* dung), the excrement of birds, found as large deposits on certain islands off the coast of Peru, and on others situated in the southern ocean and off the west coast of Africa. The large proportions of phosphorus in the form of phosphates and of nitrogen as ammonium oxalate and urate renders it a valuable fertilizer. Bats' guano, composed of the excrement of bats, is found in certain caves in New Zealand and elsewhere; it is similar in composition to Peruvian guano.

GUANTA, a port on the Caribbean coast of the State of Anzoátegui, Venezuela, 12 m. N.E. of Barcelona, with which it is connected by rail. It dates from the completion of the railway to the coal mines of Naricual and Capiricual nearly 12 m. beyond Barcelona, and was created for the shipment of coal. The harbour is horseshoe-shaped, with its entrance, 1,998 ft. wide, protected by an island less than 1 mi. off the shore. The entrance is easy and safe; the harbour affords secure anchorage for large vessels, with deep water along the new cement wharf. Pop. (1936 census), 1,196. Guanta has become the best port on this part of the coast, and the trade of Barcelona and that of a large inland district have been transferred to it. A prominent feature in its trade is the shipment of live cattle. Among its other exports are sugar, coffee, cacao, tobacco and fruit.

GUANTANAMO, a town and United States naval base, 40 m. east of Santiago near the eastern end of the south coast of Cuba. It possesses a land-locked harbour of two basins, about 4 m. wide and 10 m. long from north to south. A narrow entrance gives protection from storms and safety from surprise attacks by sea. The port is actually the town of Caimanera, on the harbour, and Guantbnamo is 20 m. north, on the Guantbnamo and Western railway. Pop. (1938) 68,372, and the rich tributary valley of Guantánamo brings this up to 60,000. Guantbnamo is 572 m. from Havana, with which it is connected by the United railroads and the Cuba railway, and also by the Central highway. Guantánamo bay is held by the United States as a naval base under treaty. The railway and highway connection to Havana and the route through the Straits of Florida to the mainland constitute an important factor in the strategy of the Caribbean sea (*q.v.*). The region around Guantánamo is a rich sugar and banana country.

Guantbnamo bay was named Cumberland bay in 1741 when Admiral Edward Vernon and Gen. Thomas Wentworth landed an English force to attack Santiago. After their retirement, fortifications were begun, and the bay has since been recognized as of great strategic importance. At the end of the 18th century French refugees from Haiti landed, and in 1822 founded the town of Guantánamo. These French families still dominate the life of the town. Sugar and the American naval base have, since the Spanish-American War, changed the atmosphere and character of the town and region, to one of activity and industry, as contrasted with the old French-Creole atmosphere which in earlier days brought the fashionable residents of Havana to Guantbnamo for the summer season.

GUARANA, the plant *Paullinia Cupana* (or *P.* sorbilis) of the natural order *Sapindaceae,* indigenous to the north and west of Brazil. It has a smooth erect stem; large pinnate alternate leaves with five oblong-oval leaflets; narrow panicles of short-stalked flowers; and ovoid fruit about as large as a grape, and containing usually one seed shaped like a minute horse-chestnut. Guarana, guarana bread, or Brazilian cocoa, is prepared from the seeds as follows. In October and November, when ripe, the seeds are sun-dried, to admit of the ready removal by hand of the white aril; ground in a stone mortar or deep dish or hard sandstone; the powder, moistened with water, is made into a paste with a certain proportion of whole or broken seeds, and worked up usually into rolls 5–8in. in length, and 12–16 oz. in weight. After drying by heat, the guarana is packed between broad leaves in sacks or baskets. Thus prepared, it is of extreme hardness, has a brown hue, a bitter astringent taste, and an odour faintly resembling that of roasted coffee. An inferior kind is manufactured by admixture of cocoa or cassava. Rasped or grated into sugar and water, guarana forms a popular beverage in South America.

The properties of guarana as a nervous stimulant and restorative are due to the presence of caffeine or theine. In addition, guarana yields the glucoside saponin, with tannin, starch, gum, three volatile oils and an acrid green fixed oil.

GUARANIS, a group of South American Indian tribes, forming an important subdivision of the Tupian (*q.v.*) linguistic stock. At the time of the first arrival of Europeans, the Guarani tribes were spread over the region east of the Paraguay river in what is now Paraguay and the adjacent Argentine states of Corrientes and Missiones, and extended eastwards along the upper Uruguay river some distance into the Brazilian states of Santa Caterina and Rio Grande do Sul. In the early portion of the sixteenth century, in part at least owing to Spanish attacks, a considerable body left their homes and migrated westward to Bolivia, where, as the Chiriguanos and Guarayos, they settled in the Andean foothills and edge of the Chaco, expelling the older Chane and other Arawakan tribes.

The Guaranis, originally a very numerous people, were sedentary agriculturists, living in large palisaded villages of wood and thatch houses, and presented a strong contrast to the nomad hunting tribes to the west and south. The Guaranis became widely known as a result of the activities of the Jesuit missions —the Doctrinas de Guaranies — founded among them in the early years of the seventeenth century. The Missions comprised in all some thirty settlements, where the Jesuits, in spite of attacks by slave-raiders from the Portuguese territories (who in 1628–30 alone carried off 60,000 Indians) built up a community of great interest, which lasted until the expulsion of the Order in 1768. In their primitive state the Guaranis often went entirely naked, and wore as their most characteristic ornament a long pendant labret in the lower lip. Although essentially agricultural, raising corn, manioc and sweet potatoes, they had a bad reputation for killing and eating prisoners taken in war. They appear to have had trade with the border regions of the Inca empire, whence they secured small quantities of gold ornaments and metal objects, which through them reached the Atlantic coast, where a few examples were found in the possession of the people by the earliest European explorers.

See P. de Charlevoix, *The History of Paraguay* (1769); *P.* Hernández, *Organización Social de las Doctrinas Guaranies de la Compañia de Jesús* (Barcelona, 1913); M. S. Bertoni, *La Civilizacion Guarani* (Puerto Bertoni, 1922).

GUARANTEE. In law, a guarantee is a contract to answer for the payment of some debt, or the performance of some duty, in the event of the failure of another person who is primarily liable for such payment or performance. In order that there may be a contract of guarantee there must be a primary liability, present or future, of a principal debtor, and a promise made for valuable consideration by a third party (called the "surety" or "guarantor") to the creditor to discharge that liability if the principal debtor does not. The promise of the surety must be such that liability only arises in the event of the failure of the principal debtor to meet his obligations.

A contract of guarantee must be distinguished from a contract of indemnity. If A says to B, who is about to sell goods to C,

"Let C have the goods; if he does not pay you, I will," this is an offer of a guarantee on the part of A. But if A says to B, "Let C have the goods; I will see you paid," A's promise to pay is an original liability to indemnify B against any loss which he may incur in letting C have the goods, and not a promise to answer for C's debt. (*Birkmyr* v. *Darnell*, 1704, 1 Sm. L.C. 12th ed. p. 335) So "if a man says to another, 'If you will at my request put your name to a bill of exchange, I will save you harmless', that is a contract of indemnity. It is not a responsibility for the debt of another. It amounts to a contract by one that, if the other will put himself in a certain situation, the first will indemnify him against the consequences" (*per* Pollock, C.B. in *Batson* v. *King*, 1859, *4 H.* & N. at p. 740). The distinction is important, for a contract of guarantee is not enforceable unless it is evidenced by some note or memorandum in writing, whereas no written note or memorandum of the agreement is required in the case of a contract of indemnity.

The common law requisites of a contract of guarantee in no way differ from those essential to the formation of any other contract. That is to say, they comprise the mutual consent of the parties, competency in contract, and, unless the guarantee be under seal, valuable consideration. The consideration may consist of some advantage given to, or conferred on, the principal debtor by the creditor at the surety's request, *e.g.*, an advance of money to the principal debtor. Or it may take the form of a forbearance on the part of the creditor at the surety's request to sue the principal debtor. In some guarantees the consideration is given once for all, as where a third person guarantees that, in consideration of a lessor granting a lease, he will be answerable for the lessee paying the rent and performing the covenants; in other cases it is supplied from time to time, as where a guarantee is given to secure the balance of a running account at a banker's, or a balance of a running account for goods supplied. (*See* the judgment of Lush, L. J. in *Lloyd's* v. *Harper*, 1881, 16 Ch. D. at pp. 319, 320).

The statutory requisites of a contract of guarantee are prescribed by s. 4 of the Statute of Frauds 1689 (29 Car. II. c. 3), which provides that "no action shall be brought whereby to charge the defendant upon any special promise to answer for the debt, default, or miscarriage of another person . . . unless the agreement upon which such action shall be brought, or some memorandum or note thereof, shall be in writing and signed by the party to be charged therewith, or by some other person thereunto lawfully authorized." A promise to give a guarantee is as much within the statute as the guarantee itself. But a promise to procure another person to sign a guarantee for the debt of another is not within the statute, though the guarantee would be. The statute does not invalidate a verbal contract of guarantee, but only renders it unenforceable by action. It may, therefore, be available in support of a defence to an action, and money paid under it cannot be recovered.

To satisfy s. 4 of the Statute of Frauds, the agreement, or the note or memorandum thereof, must set out all the material terms of the guarantee; it must name or unmistakably identify the parties thereto, and must also state the liability guaranteed and the time during which the guarantee is to continue. It is not necessary that the agreement, or memorandum, should contain any statement of the consideration given to the surety in return for the guarantee (Mercantile Law Amendment Act 1856, s. 3). The agreement, or memorandum, must be signed by the surety or by some duly authorized agent on his behalf. In the case of a joint and several guarantee all the sureties must sign the agreement or memorandum, otherwise none will be liable thereunder (*National Provincial Bank of England* v. *Brackenbury*, 1906, 22 T.L.R. 797).

The promise of a *del credere* agent (*q.v.*) which binds him in consequence of the higher consideration he receives to make no sale on behalf of his principal except to persons who are solvent, and renders him liable for any loss that may result from the non-fulfilment of his promise, is not within the statute, and need not be in writing, for, though such promise may terminate in a liability to pay the debt of another, that is not the *immediate* object for which the consideration is given (*Coutourier* v. *Hastie*, 1852, 8 Exch. 40, 56).

A contract of guarantee may be limited to a single transaction, or may cover a number of transactions extending over a period of time—as where a guarantee is given in respect of money to be advanced, or goods to be supplied, to the principal debtor—and remains a standing security until it is revoked either by act of the parties or by death of the surety. It is then called a continuing guarantee. A cause of action thereon arises in respect of each item of account (whether principal or interest) as soon as that item falls due and is unpaid, and, consequently, the Statute of Limitations begins to run in the guarantor's favour in respect of each item from that moment (*Parr's Banking Co. Ltd.* v. *Yates*, 1898, 2 *Q.* B. 460).

Liability of Surety.—Before the surety can be rendered liable on his guarantee, the principal debtor must have made default. When, however, this has occurred, the creditor, in the absence of express agreement to the contrary, may sue the surety, without even informing him of such default having taken place, or requiring him to pay, and before proceeding against the principal debror or resorring to securities for the debt received from the latter. The surety's liability is limited to the amount which he has undertaken to pay on default of the principal debtor. This amount may be equal to the sum due from the principal debtor, or it may be less than such sum. If the guarantee is one which the surety has entered into jointly with others, he is still liable to pay the whole amount he has agreed to pay on the debtor's default, unless the guarantee otherwise expressly provides. His right of contribution against his co-sureties may be a partial indemnity, but cannot, in the absence of agreement binding the creditor, compel the creditor to proceed against the other sureties. Should the surety become bankrupt, either before or after default has been made by the principal debtor, the creditor will have to prove against his estate. This right of proof is regulated by s. 30 of the Bankruptcy Act 1914, which is most comprehensive in its terms.

Rights of Surety Against Principal Debtor.—The surety can recover, with interest, from the principal debtor all money properly paid when due on account of the guarantee, provided of course that the guarantee was made with the principal debtor's consent. In the event of the principal debtor's bankruptcy, the surety can, if the creditor has not already proved in respect of the guaranteed debt, prove against the bankrupt's estate, not only in respect of payments made before the bankruptcy of the principal debtor, but also, it seems, in respect of the contingent liability to pay under the guarantee. The surety is also entitled to enforce against the debtor the rights which the creditor enjoyed with respect to the debt in question. Moreover, a surety has the right *before* payment to compel the principal debtor to relieve him from his liability by paying off the debt, if the debt is actually due and the surety admits liability. In such a case it is not necessary to prove that the creditor has refused to sue the principal debtor (*Ascherson* v. *Tredegar Dry Dock and Wharf Co. Ltd.*, 1909, 2 Ch. 401).

Rights of Surety Against the Creditor.—The surety, on payment of the debt, is entitled to the benefit of the securities in the hands of the creditor, whether he knew of them or not at the time of contracting; including all securities which the creditor may have acquired since the date of contracting; and where, by the default or laches of the creditor, such securities have been lost or rendered otherwise unavailable, the surety is discharged *pro tanto*. If the surety is surety for part of the debt only, his rights to the securities also are but partial (*Goodwin* v. *Gray*, 1874, 22 *W.R.* 312). On this subject the Mercantile Law Amendment Act 1856, s. 5, provides that '(every person who, being surety for the debt of another, or being liable with another for any debt or duty, shall pay such debt or perform such duty, shall be entitled to have assigned to him, or to a trustee for him, every judgment, specialty, or other security which shall be held by the creditor in respect of such debt or duty, whether such judgment, specialty, or other security shall or shall not be deemed at law to have been satisfied by the payment of the debt or per-

formance of the duty, and such person shall be entitled to stand in the place of the creditor, and to use all the remedies, and if need be, and upon a proper indemnity, to use the name of the creditor in any action or other proceeding, at law or in equity, in order to obtain from the principal debtor, as the case may be, indemnification for the advances made and loss sustained by the person who shall have so paid such debt or performed such duty; and such payment or performance so made by such surety shall not be pleadable in bar of any such action or other proceeding by him; provided always, that no co-surety, co-contractor, or co-debtor, shall be entitled to recover from any other co-surety, co-contractor, or co-debtor, by the means aforesaid, more than the just proportion to which, as between those parties themselves, such last-mentioned person shall be justly liable."

Right of Surety Against Co-sureties.—A surety on payment of the debt, or more than his proportion, is entitled to contribution from his co-sureties in respect of the excess. This right is not founded originally upon contract, but upon a principle of equity, though it is now established to be the foundation of an action. It exists whether the sureties are bound jointly, or jointly and severally, and whether they are bound by the same or different instruments. If the principal debtor makes default, all must contribute equally, if each is a surety to an equal amount, and if not equally, then proportionately to the amount for which each is a surety (*Ellesmere Brewery Co.* v. *Cooper and Others* 1896, Q. B. 75). In counting the number of sureties for this purpose, those unable to pay are not reckoned. Thus where four sureties are jointly and severally bound in a surety bond, and one of them pays the amount of the bond, but one of the remaining three sureties is insolvent, the right of contribution against the two other sureties is for thirds, not for fourths, of the sum paid *(per* Lord Esher, *M.R., ibid.,* at p. 80). But a surety is not entitled to call upon his co-sureties for contribution until he has paid more than his proportion, either of the whole debt or of that part which remains unpaid, even though his co-sureties have not been required by the creditor to pay anything *(Ex porte Snowdon,* 1881, 17 Ch. D. 44). And so where the debt guaranteed is payable by instalments, a surety cannot call on his co-sureties to contribute until he has paid more than his proportion of the entire debt. The fact that he has paid more than his share of the instalments which have come due will not entitle him to contribution (*Stirling* v. *Burdett,* 1911, 2 Ch. 418).

A surety against whom judgment has been obtained by the principal creditor for the full amount of the debt can, before paying the amount, maintain an action against his co-sureties to compel them to contribute towards the common liability, and where the principal creditor is a party to the action, the surety may obtain an order directing the co-sureties to pay their proportions to the creditor (*Wolmershausen* v. *Gullick,* 1893, 2 Ch. 514).

The right of contribution is not the only right possessed by a surety against his co-sureties; he is also entitled to a share in every counter-security which his co-sureties may have obtained from the principal debtor, and such security must be brought into hotchpot, in order that the ultimate burden may be distributed between the sureties equally, even though the co-sureties consented to become sureties only upon the terms of having the security *(Steel* v. *Dixon,* 1881, 17 Ch. D. 825).

Discharge of Surety.—The surety will be discharged on any of the grounds which suffice to terminate contracts in general, and also on the following which are peculiar to contracts of guarantee. In the case of a guarantee for the fidelity of a servant, the non-disclosure by the employer to the surety of the fact that the servant had previously been guilty of dishonesty in his employment will avoid the contract although such non-disclosure was not fraudulent *(London General Omnibus Co. Ltd.* v. *Holloway,* 1912, 2 K.B. 72). On the other hand, in the case of a guarantee given to a banker to secure an overdraft, the mere non-disclosure by the banker to the surety of the fact that, at the time when he signed the bond, the customer was already indebted to the banker for the full amount of the credit and payment had been requested by the banker, will not avoid the contract, for the bank cannot reasonably be taken as affirming, by mere silence respecting earlier dealings, the financial ability of the customer whom the surety is asked to guarantee *(Hamilton* v. *Watson,* 1845, 12 Cl. & F. 109). Fraud subsequent to the execution of the guarantee (as where, for example, the creditor connives at the principal debtor's default) will certainly discharge the surety. Again, a material alteration made in the terms of the contract between the crrditor and the principal debtor, without the assent of the surety, will discharge the surety, unless it is self-evident that the alteration cannot prejudice the surety; the surety himself being the judge as to the materiality of the alteration *(Holme* v. *Brunskill,* 1878, 3 Q.B.D. 495).

Giving time to the principal debtor without the surety's consent will discharge the surety, and for this reason, because the creditor by giving time deprives the surety of his right to pay off the debt which he has guaranteed and to sue the principal debtor *(Samuel* v. *Howarth,* 1817, 3 Mer. 272). But to produce this result there must be a binding contract to extend the time for payment, not merely by a forbearance of the creditor to enforce his rights, and the contract must be with the principal debtor. A contract with a stranger, or even with a co-surety, to give time to the principal debtor, will not prevent the surety discharging the debt and pursuing his remedy over against the principal debtor, and will not discharge the surety from liability *(Frazer* v. *Jordan,* 1858, 8 E. & B. 303; *Clarke* v. *Birley,* 1889, 41 Ch. D. 422).

To the rule that time given to a principal debtor discharges a surety there is an important exception. **A** surety is not released by an agreement to give time to the debtor if the creditor expressly reserves his rights against the surety. The reasons why the reservation by the creditor of his rights against the surety does not release the latter are (i.) because it rebuts the implication that the surety was meant to be discharged, and (ii.) because it prevents the rights of the surety against the principal debtor being impaired, for the principal debtor, by consenting to the creditor reserving his rights, impliedly agrees that the surety shall have recourse against him, and he may, notwithstanding the agreement, pay the creditor and enforce his rights against the debtor *(Kearsley* v. *Cole,* 1847, 16 *M.* & W. 128, at p. 135). The rule also does not apply where time is given to the principal debtor after a judgment has been recovered by the creditor against both the principal debtor and the surety; the judgment creates a new liability in respect of which the judgment debtors are in the same position *(in re* a *Debtor,* 1913, 3 K.B. 11).

An absolute release of the principal debtor will discharge the surety. But a covenant not to sue the principal debtor, qualified by a reservation of rights against the surety, allows the surety to retain all his remedies against the principal debtor and will not discharge him from liability *(Price* v. *Baker and Another,* 1855, 24 L.J.Q.B. 130). A release by the creditor of one of two or more co-sureties will discharge all *(Evans* v. *Brembridge,* 1856, 25 L.J. Ch. 334). This is not so, however, if the sureties contract severally (*Ward* v. *National Bank of New Zealand,* 1883, 8 App. Cas. 755).

A surety is discharged if the creditor takes a new security from the principal debtor in lieu of the original one, or by his wilful neglect or default loses the securities which he holds, or deals with the securities in such a way as to deprive the surety of the means of recouping himself by them.

A guarantee, the consideration for which is given once for all (as where a third person guarantees that in consideration of the lessor granting a lease, he will be answerable for the lessee paying the rent), cannot be determined by the surety, and does not cease on his death *(Lloyd's* v. *Harper,* 1881, 16 Ch. D. 290). On the other hand, when the consideration for a guarantee is fragmentary, supplied from time to time, and therefore divisible (as where a guarantee is given to secure the balance of a running account at a banker's), the surety may at any time terminate the guarantee, and notice of death of the surety will put an end to his liability (*Coulthart* v. *Clementson,* 1880, 5 Q B.D. 42). But the death of one of the co-sureties under a joint and several continuing guarantee does not by itself determine the future liability of the sur-

viving co-sureties *(Beckett & Co. v. Addyman,* 1882, 9 Q.B.D. 783). A continuing guarantee given either to a firm or to a third person in respect of the transactions of a firm is, in the absence of agreement to the contrary, revoked as to future transactions by any change in the constitution of the firm (Partnership Act, 1890, s. 18). A surety who has executed a guarantee on the faith that another person will also become a surety is wholly discharged from liability if that other person refuses to do so, or for any other reason does not join in the guarantee *(Evans v. Brernbridge,* 1853, 2j L.J. Ch. 334). A discharge in bankruptcy of the principal debtor, or the acceptance by his creditors of a composition or scheme, will not release from liability a person who was surety for his debts (Bankruptcy Act 1914, s. 28, subs. 4; s. 16, subs. 20).

The Statutes of Limitation bar the right of action against a surety after 20 years if the guarantee was under seal; and in the case of other guarantees, after six years from the date of the accrual of the cause of action, that is to say from the date on which the creditor might have sued the surety. Where, by the express terms of the guarantee, the surety is only liable to pay after demand, time does not begin to run until after demand to pay has been made upon him.

See Sir S. A. T. Rowlatt, *Law of Principal and Surety* (2nd ed., 1926); T. Hewitson, *Suretyship, its Origin and History* (1927).

(C. GA.)

THE UNITED STATES

There have been repeated efforts by American courts and legal writers to distinguish a surety from a guarantor; the efforts have failed, since hardly two of them find the same line of distinction. hence, in the United States as in England the two terms are substantially synonymous. But in some American States the memorandum of a contract of guarantee still requires to state the consideration, if the contract is to be enforceable. Furthermore, laches in the creditor's dealing with any security he may hold, to be sufficient in American law to discharge the creditor's claim against the surety, must either involve affirmative action, or must consist in failing to take simple, standard, business-like precautions: such as recording a mortgage, or so presenting a negotiable note as to keep the endorsers from being discharged. But mere failure to enforce the security before it depreciates in value will not in the United States be considered such laches, the judicial view being that the surety's remedy is to pay off the debt and then realize on the security himself. It is hard to see why the surety should be forced thus to strain his resources; it is equally hard to reconcile the harshness against the surety of this rule with the extreme leniency found in discharging him by reason merely of extension of time to the principal. The two lines of precedent grew up separately, and did not come into contact until both were set. Two other divergences from the English law as stated above need notice: the periods of the Statute of Limitations differ among the American States; and the fact that a surety stipulated that a co-surety be procured, or other condition be fulfilled, will not, commonly, discharge him as against a creditor who has relied upon surety's signature without notice of stipulation or condition.

Corporate Suretyship.— In the United States a great and growing part of suretyship business is now in the hands of professional surety companies, which write surety bonds for a premium calculated on loss-expectancies, and which in cases involving any considerable risk take measures to assure themselves oi indemnity, in advance of loss. In the case of such "compensated sureties" the courts have tended distinctly to tighten up the law in favour of the creditor, so that the older tendency to construe the contract narrowly, and employ every possible loophole to let the surety out, is now limited to the cases out of which it originally grew: those of the friend or family member who has lent his credit, without compensation, in an individual case. Hence the bonds of surety companies are approaching, in law as in social function, policies of insurance. They are perhaps of peculiar importance in the field of guaranteeing the fidelity of trusted employes or of public officers (where the check-up system of the bonding companies goes some distance toward anticipatory prevention of frauds) and in that of contracts for building and public works. It should be noted that these bonding companies are not, like most corporations, without charter power to enter into binding contracts of suretyship; also that the larger modern business corporations are now commonly being given charter power to become surety at least for their own subsidiaries. Hence guaranteed bonds are becoming familiar in the market. To be distinguished from suretyship, in law though not in function, is the growing practice among bankers of accepting negotiable paper (see BILL OF EXCHANGE) on behalf of their customers for a commission; this is not in strictness suretyship, not only because the customer's obligation in all probability ceases when the banker's is given, but because, in any event, the customer's liability must be conditional on prior dishonour by the banker.

Bail Bonds.—A field of suretyship, finally, which deserves special mention because of the abuses encountered in practice, is that of the bail bonds given to secure the supposedly temporary release of persons charged with crime. The bail is forfeited if the accused disappears; this is supposed to force the bondsman to keep a constant eye on the accused. But the practice of allowing professional bondsmen to sign bonds totalling far in excess of their available assets, together with the difficulty of getting suit prosecuted against such as are politically influential, has made this phase of suretyship a serious hindrance to convictions.

See Arnold, "Suretyship and Guaranty" (1927), *Missouri Crime Survey,* Part V. (1526). (K. N. L.)

GUARANTY TRUST COMPANY OF NEW YORK, THE, a large United States trust company with (March 31, 1940) resources of $2,653,187,645.96 and a staff of 4,063 employees, was organized in 1864 as the New York Guaranty and Indemnity Company, with a capital of $100,000. The present name was adopted in 1896. The company absorbed the Fifth Avenue Trust Company and the Morton Trust Company in 1910, and the Standard Trust Company in 1912.

The following table indicates the growth of the company:

Date	Capital	Surplus and Undivided profits	Deposits
June 30, 1905	$ 2,000,000	$ 5,709,817	$ 67,966,612
June 23, 191j	10,000,000	22,214,671	281,005,094
June 30, 1925	25,000,000	20,369,140	577,221,465
June 30, 1935	90,000,000	177,067,129	1,412,601,413

The offices of the company were first located on Broad street adjoining the present Stock Exchange, but in 1891 moved to the Mutual Life Insurance building at Pine, Cedar and Nassau streets. In 1913 the main office was moved to its present site at 140 Broadway. The company operates three offices in New York City, two in London and one in each of the following cities: Paris, Havre, Liverpool, Brussels and Antwerp. It was one of the first American banks to open a branch office in Europe. Several of its European offices were appointed official depositories for Government funds during the World War. During the war, the company's bond department, in four out of five war loan campaigns, placed more subscriptions than any other organization in the United States. In 1920 the bond department was incorporated as the Guaranty Company of New York, with capital stock of $5,000,000, owned by the Trust Company. Dissolution of the Guaranty Company, required under the provisions of the Banking Act of 1933, became effective June 16, 1934. The merger in May, 1929, of the Guaranty Trust Company and the National Bank of Commerce, both of New York City, created an institution with resources exceeding $2,000,000,000, the largest Trust Company in the western hemisphere. The name Guaranty Trust Company was retained.

(H. W. CA.)

GUARATINGUETÁ, a city of Brazil in the eastern part of the state of São Paulo, 124 mi. N.E. of the city of São Paulo. Population of the municipality (1940), 29,660. The city, ahich was founded in 1651, stands on a fertile plain 3 mi. from the Paraiba river, and is the commercial centre of one of the oldest agricultural districts of the state. The district produces large quantities of coffee, and some sugar, Indian corn and beans. The city dwellings are for the most part constructed of rough wooden frames covered with mud, called tapia by the natives, and roofed with curved tiles. The São Paulo branch of the Brazilian Central

Railway passes through the city, by which it is connected with Rio de Janeiro on one side and São Paulo and Santos on the other.

GUARAUNAN (WARRAUNAN), an independent linguistic stock of South American Indians, so called from the Warraus (Guaraunos), its most important tribe. The tribes of this stock occupied at the time of the first European contact, the coast regions of British Guiana from the Essequibo river westward to the Orinoco delta. At an earlier period, they seem to have extended over a wider territory, having been crowded into their historic habitat as a result of the dislocation of peoples consequent on the Carib invasion. The Warraus are a hunting and fishing folk. practising some agriculture and famous as canoemen. Physically they are of short stature. They wear only small bast breechclouts and live in communal houses of thatch, often built on piles or on tree stumps cut off several feet above ground. They thus escape the floods in the Orinoco delta region. The bow and spear are their main weapons. They make pottery but no textiles. Polygamy is usual and the chiefs often have a large number of wives. These chiefs have considerable power and inherit their position in the matrilineal line. Puberty ceremonies for both girls and boys resemble those of the neighbouring Arawakan (*q.v.*) tribes, and involve for the boys, tests of bravery and endurance. The dead are buried, wrapped in a hammock or sometimes sunk in the river until the flesh has been entirely removed by fish, when the bones are packed in a basket, and suspended from the roof of the house. Mimetic dances, in which various animals and birds are represented, play a prominent part in their religious ritual.

See Everard *Im* Thurn, *Among the Indians of British Guiana* (London, 1883); R. Schomburgk, *Reisen* in *Britisch Guiana,* etc. (Leipzig, 1848); W. L. Roth, *An Inquiry into the Animism and Folklore of the Guiana Indians* (*30th* ***Rep.*** *Bureau of American Ethnology*); *An Introductory Study of the Arts, Crafts and Customs of the Guiana Indians (38th* ***Rep.*** *Bureau of American Ethnology).*

GUARDA, an episcopal city of Portugal on the Guarda-Abrantes and Lisbon-Villar Formoso railways. Pop. (1930) 7,158. It is 3,370 ft. above sea-level, at the north-eastern extremity of the Serra da Estrella, overlooking the fertile valley of the river Côa. It contains a ruined castle, a fine 16th century cathedral and a sanatorium for consumptives. Its industries comprise the manufacture of coarse cloth. In 1199 Guarda was founded, on the site of the Roman Lencia Oppidana, by Sancho I. of Portugal, who intended it to be a "guard" against Moorish invasion. The administrative district of Guarda coincides with north-eastern Beira; pop. (1935) 273,299, (1940) 294,539; area 2,122 sq.mi.

GUARDI, FRANCESCO (1712–1793), Venetian painter, born at Pinzolo, a Tyrolese mountain village. He was a pupil of Antonio Canale and excelled in painting views of Venice. Guardi is noticeable for spirited touch, sparkling colour, atmospheric effects and picturesquely sketched figures. Two large pictures in the Museo Correr, Venice, representing a "Masquerade in the Ridotto" and a "Reception Room in a Convent" are remarkable for their harmonious colour, true values and freedom of execution. Many of his works are to be found in England and nine in the Louvre.

See George *A.* Simonson, *Francesco Guardi* (1904); G. Fiocco, *Francesco Guardi* (1923).

GUARDIAN. For the position of guardians of the poor see POOR LAW, and for the legal relations between a guardian and his ward see INFANT, MARRIAGE and ROMAN LAW.

GUARDS AND HOUSEHOLD TROOPS. The practice of maintaining bodyguards is of great antiquity, and possibly is the origin of organized armies. Thus there is often no clear distinction between the inner ring of personal defenders and the select corps of trained combatants who are at the chief's entire disposal. Famous examples of corps that fell under one or both these headings are the "Immortals" of Xerxes, the Mamelukes, Janissaries, the *Huscarles* of the Anglo-Saxon kings, and the Russian Strelitz (*Stryeltsi*). In modern times the distinction of function is better marked, and the fighting men who are more intimately connected with the sovereign than the bulk of the army can be classified as to duties into "Household Troops," who are in a sense personal retainers, and "Guards," who are a corps *d'élite* of combatants. But the dividing line is not so clear as to any given body of troops. Thus the British Household Cavalry is part of the combatant army as well as the sovereign's escort.

Yeomen of the Guard and Gentlemen-at-Arms.— The oldest of the household or bodyguard corps in the United Kingdom is the Icing's Bodyguard of the "Yeomen of the Guard" (*q.v.*), formed at his accession by Henry VII. The "nearest guard," the personal escort of the sovereign, is the "King's Bodyguard of the Honourable Corps of Gentlemen-at-Arms," created by Henry VIII. at his accession in 1509. Formed possibly on the pattern of the "Pensionnaires" of the French kings—retainers of noble birth who were the predecessors of the *Maison* du Roi (see below)—the new corps was originally called "the Pensioners." The importance of such guards regiments in the general development of organized armies is illustrated by a declaration of the House of Commons, made in 1674, that the militia, the pensioners and the Yeomen of the Guard were the only lawful armed forces in the realm. But with the rise of the professional soldier and the corresponding disuse of arms by the nobles and gentry, the Gentlemen-at-Arms (a title which came into use in James II.'s time, though it did not become that of the corps until William IV.'s) retaining their noble character, became less and less military. Burke attempted without success in 1782 to restrict membership to officers of the army and navy, but the necessity of giving the corps an effective military character became obvious when, on the occasion of a threatened Chartist riot, it was called upon to do duty as an armed body at St. James's Palace. The corps was reconstituted on a purely military basis in 1862, and from that date only military officers of the regular services who have received a war decoration are eligible for appointment. The office of captain, however, is political, the holder (who is always a peer) vacating it on the resignation of the Government of which he is a member. The corps consists at present of captain, lieutenant, standard bearer, clerk of the cheque (adjutant), sub-officer and 39 Gentlemen-at-Arms.

The Royal Company of Archers.— The king's bodyguard for Scotland was constituted in its present form in the year 1676, by an act of the privy council of Scotland. An earlier origin has been claimed for the company, some connecting it with a supposed archer guard of the kings of Scotland. In the above-mentioned year, 1676, the minutes of the Royal Company begin by stating, that owing to "the noble and usefull recreation of archery being for many years much neglected, several noblemen and gentlemen did associate themselves in a company for encouragement thereof . . . and did apply to the privy council for their approbation . . . which was granted." For about 20 years at the end of the 17th century, perhaps owing to the adhesion of the majority to the Stuart cause, its existence seems to have been suspended. But in 1703 a new captain-general, Sir George Mackenzie, Viscount Tarbat, afterwards earl of Cromarty, was elected, and he procured for the company a new charter from Queen Anne. The rights and privileges renewed or conferred by this charter were to be held of the Crown for the *reddendo* of a pair of barbed arrows. The history of the Royal Company since 1703 has been one of great prosperity. Large parades were frequently held, and many distinguished men marched in the ranks. Several of the leading insurgents in 1745 were members, but the company was not at that time suspended in any way.

In 1822 when King George IV. visited Scotland, it was thought appropriate that the Royal Company should act as his majesty's bodyguard during his stay, especially as there was a tradition of a former archer bodyguard. They thus came to perform the duties usually assigned to the Gentlemen-at-Arms, duties which they have carried out during subsequent State visits.

King George IV. authorized the company to take, in addition to their former name, that of "The King's Body Guard for Scotland." and presented to the captain-general a gold stick, thus constituting the company part of the royal household. In virtue of this stick the captain-general of the Royal Company takes his place at a coronation or similar pageant immediately behind the gold stick of England. The lieutenants-general of the company have silver sticks; and the council, which is the executive body of

the company, possess seven ebony ones. George IV. further appointed a full-dress uniform to be worn by members of the company at court, when not on duty as guards, in which latter case the ordinary field dress is used.

Household Cavalry and Foot Guards.—Corps of the gentlemen-at-arms or yeoman type do not of course count as combatant troops—if for no other reason at least because they are armed with the weapons of bygone times. The British Guards and household troops that are armed. trained and organized as part of the army are the Household Cavalry and the Foot Guards.

The Household Cavalry consists of two regiments, and has its origin, as have certain of the Foot Guard regiments, in the ashes of the "New Model" army disbanded at the restoration of Charles II. in 1660. In that year the "1st or His Majesty's Own Troop of Guards" formed during the king's exile of his cavalier followers, was taken on the strength of the army. The 2nd troop was formerly in the Spanish service as the "Duke of York's Guards," and was also a cavalier unit. In 1670, on Monk's death, the original 3rd troop (Monk's Life Guards, renamed in 1660 the "Lord General's Troop of Guards") became the 2nd (the queen's) troop, and the duke of York's troop the 3rd. In 1685 the 1st and 2nd troops were styled Life Guards of Horse, and two years later the blue-uniformed "Royal Regiment of Horse," a New Model regiment that had been disbanded and at once re-raised in 1660 was made a household cavalry corps. In 1690, being encamped in Ireland, together with some of King William III.'s Dutch regiments, the name of "The Oxford Blues"—after Aubrey, earl of Oxford, its colonel—became attached to it as a means of distinction from Lord Portland's Dutch regiment of Blue Guards. There were also from time to time other troops of Guards, the best known of which were the 4th (English) Troop, 1686–89; 4th (Dutch) Troop, 1689–99; 4th (Scots) Troop, 1661–1746; 1st Troop of Horse Grenadier Guards, 1693–1788; 2nd (Scots) Troop of Horse Grenadier Guards, 1702–88. The 3rd and 4th Troops were disbanded in 1746.

The whole were reorganized in 1788, the two remaining troops absorbing the two troops of Horse Grenadier Guards, to form the 1st and 2nd Regiments of Life Guards, and as such they remained until 1922, when the two regiments were amalgamated into a composite regiment designated "The Life Guards (1st and 2nd)." From 1750 to 1819 the Blues bore the name of "Royal Horse Guards Blue," which in 1819 was changed to "Royal Horse Guards (The Blues)." The general distinction between the uniforms of the red Life Guard and the blue Horse Guard still exists. The Life Guards wear scarlet tunics with the blue collars and cuffs and the Royal Horse Guards blhe tunics with scarlet collars and cuffs. Both wear steel cuirasses on state occasions and on guard duty. The head-dress is a steel helmet with drooping horsehair plume (white for Life Guards, red for Horse Guards). In full dress white buckskin pantaloons and long knee-boots are worn. Amongst the peculiarities of these corps *d'élite* is the survival of the old custom of calling non-commissioned officers "corporal of horse" instead of sergeant, and corporal-major instead of sergeant-major, the wearing by trumpeters and bandsmen in full dress of a black velvet cap, a richly laced coat with a full skirt extending to the wearer's knees and long white gaiters.

The Foot Guards comprise the Grenadier Guards (three battalions), the Coldstream Guards (three battalions), the Scots Guards (two battalions), the Irish Guards (one battalion) and the Welsh Guards (one battalion). The Grenadiers represent a royalist infantry regiment which served with the exiled princes in the Spanish army and returned at the Restoration in 1660. The Grenadiers, successively the King's Royal Regiment of Guards, the four Foot Guards and the 1st or Grenadier Regiment of Foot Guards, received the title "Grenadier" in 1815, in commemoration of their services at Waterloo.

The Coldstream Guards are a New Model regiment, and were originally called the Lord General's (Monk's) regiment of Foot Guards. Their popular title, which became their official designation in 1670, is derived from the fact that the army with which Monk restored the monarchy crossed the Tweed into England at the village of Coldstream, and that his troops (which were afterwards, except the two units of horse and foot of which Monk himself was colonel, disbanded) were called the Coldstreamers. The two battalions of Scots (Foot) Guards, which regiment was separately raised and maintained in Scotland after the Restoration, marched to London in 1686 and 1688 and were brought on to the English establishment in 1707. In George III.'s reign they were known as the 3rd Guards, and from 1831 to 1877 (when the present title was adopted) as the Scots Fusilier Guards.

The Irish Guards (one battalion) were formed in 1902, after the South African War, as a mark of Queen Victoria's appreciation of the services rendered by the various Irish regiments of the line. (The "Irish Guards" of the Stuarts took the side of James II., fought against William III. in Ireland and lost their regimental identity in the French service, to which the officers and soldiers transferred themselves on the abandonment of the struggle.) The Welsh Guards were formed in 1915. In view of there being a Scots and an Irish regiment the claim of Wales had become obvious, but no opportune moment for their creation had arrived until the World War. The dress of the Foot Guards is generally similar in all five regiments, scarlet tunic with blue collars, cuffs and shoulder-straps, blue trousers and high, rounded bearskin cap. The regimental distinctions most easily noticed are these. The Grenadiers wear a small white plume in the bearskin, the Coldstreams a similar red one, the Scots none, the Irish a blue-green and the Welsh a green and white one. The buttons on the tunic are spaced evenly for the Grenadiers, by twos for the Coldstreams, by threes for the Scots. by fours for the Irish and by fives for the Welsh. The band of the modern cap is red for the Grenadiers, white for the Coldstreams, "diced" red and white (chequers) for the Scots, green for the Irish and black for the Welsh. Former privileges of Foot Guard regiments, such as higher brevet rank in the army for their regimental officers, are now abolished, but Guards are still subject exclusively to the command of their own officers, and the officers of the Foot Guards, like those of the Household Cavalry, have special duties at court. Neither the Household cavalry nor the Foot Guards normally serve abroad in peace time, but with the latter, exceptions have several times been made to meet special circumstances. Guards' brigades served in the Napoleonic Wars and in several subsequent campaigns, whilst a Guards' division was formed in the World War.

The sovereigns of France had guards in their service in Merovingian times and their household forces appear from time to time in the history of mediaeval wars. Louis XI. was, however, the first to regularize their somewhat loose organization, and he did so to such good purpose that Francis I. had no fewer than 8,000 guardsmen organized, subdivided and permanently under arms. The senior unit of the Gardes *du* Corps was the famous company of Scottish archers (Compagnie *écossaise* de la Garde du Corps *du* Roi), which was originally formed (1418) from the Scottish contingents that assisted the French in the Hundred Years' War. Scott's Quentin Durward gives a picture of life in the corps as it was under Louis XI. In the following century, however, its regimental history becomes somewhat confused. Two French companies were added by Louis XI. and Francis I. and the Gardes du Corps came to consist exclusively of cavalry. About 1634 nearly all the Scots then serving went into the "regiment d'Hébron" and thence later into the British regular army (see HEPBURN, SIR JOHN). Thereafter, though the titles, distinctions and privileges of the original Archer Guard were continued, it was recruited from native Frenchmen, preference being (at any rate at first) given to those of Scottish descent. At its disbandment in 1791 along with the rest of the Gardes *du* Corps, it contained few, if any, native Scots. There was also, for a short time (1643–60), an infantry regiment of Gardes *écossaises*.

In 1671 the title of *Maison Militaire* du Roi was applied to that portion of the household that was distinctively military. It came to consist of four companies of the Gardes *du* Corps, two companies of *Mousquetaires* (cavalry, formed 1622 and 1660), one company of *Chevaux légers* (1570), one of Gendarmes de la *Maison* Rouge and one of Grenadiers *à Cheval* (1676), with one company of Gardes de la Porte and one called the Cent-Suisses,

the last two being semi-military. This large establishment, which did not include all the guard regiments, was considerably reduced by the count of St. Germain's reforms in 1775, all except the *Gardes du Corps* and the *Cent-Suisses* being disbanded. The whole of the *Maison du Roi,* with the exception of the semi-military bodies referred to, was cavalry.

The *Gardes françaises,* formed in 1563, did not form part of the *Maison.* They were an infantry regiment, as were the famous *Gardes suisses,* originally a Swiss mercenary regiment in the Wars of Religion, which was, for good conduct at the combat of Arques, incorporated in the permanent establishment by Henry IV. in 1589 and in the Guards in 1615. At the revolution, contrary to expectation, the French Guards sided openly with the constitutional movement and were disbanded. The Swiss Guards, however, being foreigners, and therefore unaffected by civil troubles, retained their exact discipline and devotion to the court to the day on which they were sacrificed by their master to the bullets of the Marsellais and the pikes of the mob (Aug. 10, 1792). Their tragic fate is commemorated by the well-known monument called the "Lion of Lucerne," the work of Thorvaldsen, erected near Lucerne in 1821. The "Constitutional," "Revolutionary" and other guards that were created after the abolition of the *Maison* and the slaughter of the Swiss are unimportant, but through the "Directory Guards" they form a nominal link between the household troops of the monarchy and the corps which is perhaps the most famous "Guard" in history. The Imperial Guard of Napoleon had its beginnings in an escort squadron called the Corps of Guides, which accompanied him in the Italian campaign of 1796–97 and in Egypt. On becoming first consul in 1799 he built up out of this and of the guard of the Directory a small corps of horse and foot, called the Consular Guard, and this, which was more of a fighting unit than a personal bodyguard, took part in the battle of Marengo. The Imperial Guard, into which it was converted on the establishment of the empire, was at first of about the strength of a division. As such it took part in the Austerlitz and Jena campaigns, but after the conquest of Prussia Napoleon augmented it, and divided it into the "Old Guard" and the "Young Guard." Subsequently the "Middle Guard" was created, and by successive augmentations the corps of the guard had grown to be 57,000 strong in 1811–12 and 81,000 in 1813. It preserved its general character as a *corps d'élite* of veterans to the last, but from about 1813 the "Young Guard" was recruited directly from the best of the annual conscript contingent. The officers held a higher rank in the army than their regimental rank in the Guards. At the first Restoration an attempt was made to revive the *Maison du Roi,* but in the constitutional régime of the second Restoration this semi-mediaeval form of bodyguard was given up and replaced by the *Garde Royale,* a selected fighting corps. This took part in the short war with Spain and a portion of it fought in Algeria, but it was disbanded at the July Revolution. Louis Philippe had no real guard troops, but the memories of the Imperial Guard were revived by Napoleon III., who formed a large guard corps in 1853–54. This, however, was open to an even greater degree than Napoleon I.'s guard to the objection that it took away the best soldiers from the line. Since the fall of the empire in 1870 there have been no guard troops in France. The duty of watching over the safety of the president is taken in the ordinary roster of duty by the troops stationed in the capital. The "Republican Guard" is the Paris gendarmerie, recruited from old soldiers and armed and trained as a military body.

In Austria-Hungary, before the break-up of the empire, there were only small bodies of household troops (Archer Body Guard, Trabant Guard, Hungarian Crown Guards, etc.) analogous to the British Gentlemen-at-Arms or Yeomen of the Guard. Similar forces, the "Noble Guard" and the "Swiss Guard," are maintained in the Vatican.

In Imperial Russia the Guard was organized as an army corps. It possessed special privileges, particularly as regards officers' advancement.

In Germany as an empire the distinction between armed retainers and "Guards" was well marked. The army was for practical purposes a unit under imperial control, while household troops ("castle-guards" as they are usually called) belonged individually to the various sovereigns within the empire. The "Guards," as a combatant force in the army, were those of the king of Prussia and constituted a strong army corps. This had grown gradually from a bodyguard of archers, and, as in Great Britain, the functions of the heavy cavalry regiments of the Guard preserved to some extent the name and character of a body guard *(Gardes du Corps).* The senior foot guard regiment was also personally connected with the royal family. The conversion of a palace-guard to a combatant force was due chiefly to Frederick William I., to whom drill was a ruling passion, and who substituted effective regiments for the ornamental "Trabant Guards" of his father. A further move was made by Frederick the Great in substituting for Frederick William's expensive "giant" regiment of guards, a larger number of ordinary soldiers, whom he subjected to the same rigorous training and made a *corps d'élite.* Frederick the Great also formed the body guard alluded to above. Nevertheless in 1806 the Guard still consisted only of two cavalry regiments and four infantry regiments, and it was the example of Napoleon's Imperial Guard which converted this corps into a corps of all arms.

GUÁRICO, a large inland State of Venezuela, and having a river of the same name. Pop. (1942), 135,369. It extends across the northern *llanos* to the Orinoco and Apure rivers and is devoted almost uholly to pastoral pursuits, exporting cattle, horses and mules. hides and skins, cheese and some other products. The capital is San Juan de los Morros, pop. (1936), 4,560, and the other principal towns are Valle de la Pascua (pop. 4,870); Calabozo, the old capital of the state (pop. 4,735); Zaraza (pop. 3,871) on the Unare river, nearly 150 mi. S E. of Caracas; and Altagracia de Orituco (pop. 3,490).

GUARIENTO, Italian painter of Padua. He is mentioned in Paduan records as early as 1338. In 1365 he was invited by the Venetian authorities to paint a Paradise, and some incidents of the war of Spoleto, in the great council-hall of Venice. These works were greatly admired at the time, but disappeared under over-paintings of later periods. In 1903 the fresco of "Paradise" was uncovered and transferred on canvas. It is now on view at the Doge's Palace. His works in Padua have suffered much. In the church of the Eremitani are allegories of the Planets, and, in its choir, some small sacred histories in dead colour, such as an Ecce Homo; also, on the upper walls, the life of St. Augustine, with some other subjects. A few fragments of other paintings by Guariento are still extant in Padua In the gallery of Bassano is a Crucifixion by him. He is the first Paduan artist to detach himself under the influence of Giotto from the Byzantine tradition. He died between 1368 and 1370.

See L. Testi, *Storia della Pittura Veneta I.* (1909).

GUARINI, GIOVANNI BATTISTA (1537–1612), Italian poet, author of the *Pastor fido,* was born at Ferrara on Dec. 10, 1537, just seven years before the birth of Tasso. He studied both at Pisa and Padua, and, before he was 20, became professor of moral philosophy in his native city. In 1567 he entered the service of Alphonso II., duke of Ferrara. Guarini aimed at State employment as the serious business of his life, and was sent on various embassies and missions by the duke. But he spent his time and money to little purpose, suffered from the spite and ill-will of two successive secretaries to the duke,—Pigna and Montecatini,—quarrelled with his old friend Tasso and at the end of 14 years of service found himself half-ruined, with a large family and no prospects. When Tasso was condemned to S. Anna, the duke promoted Guarini to the vacant post of court poet. He found the position uncongenial, and retired in 1582 to his ancestral farm, the Villa Guarina, where he wrote the *Pastor fido.* In 1585 he was at Turin superintending the first public performance of his drama, whence Alphonso recalled him to Ferrara, and gave him the office of secretary of State. This reconciliation did not last long. Guarini moved to Florence, then to Rome, and back again to Florence, to the court of Ferdinand de' Medici. He found a patron for a time in Francesco Maria of Urbino, and finally took

refuge in his native Ferrara. which, since the death of Alphonso, had devolved to the papal see. Here, and at the Villa Guarina, his last years were passed in study, lawsuits and polemical disputes with his contemporary critics, until 1612, when he died at Venice in his 75th year.

The Pastor *fido* (first published in 1590) is a pastoral drama, *tragicommedia* pastorale, composed not without reminiscences of Tasso's *Aminta*. Here and there the taste of the 17th century makes itself felt in frigid conceits and forced antitheses; nor does Guarini abstain from sententious maxims which reveal the moralist rather than the poet. Yet these are but minor blemishes in a masterpiece of diction, glittering and faultless like a polished bas-relief of hard Corinthian bronze. That a single pastoral should occupy so prominent a place in the history of literature seems astonishing, until we reflect that Italy, upon,the close of the 16th century, expressed itself in the Pastor *fido,* and that the influence of this drama was felt through all the art of Europe till the epoch of the Revolution. It is not a mere play. The sensual refinement proper to an age of social decadence found in it the most exact embodiment, and made it the code of gallantry for the next two centuries.

The best edition of the Pastor fido is the 20th, published at Venice (Ciotti) in 1602. A modern edition is that in *Scrittori d'Italia,* ed. by Brognoligo (Bari, 1914). For Guarini's miscellaneous Rime, the Ferrara edition (4 vols., 1737) may be consulted. His polemical writings, Verato *primo* and secondo, and his prose comedy called *Idropica,* were published at Venice, Florence and Rome, between 1588 and 1614.

GUARINO, also known as VARINUS, and surnamed from his birthplace FAVORINUS, PHAVORINUS or CAMERS (*c.* 1450–1537), Italian lexicographer and scholar, was born at Favera near Camerino, studied Greek and Latin at Florence under Politian, and afterwards became for a time the pupil of Lascaris. Having entered the Benedictine Order, he devoted himself to Greek lexicography; and in 1496 published his *Thesaurus* cornucopiae et fzorti Adonidis, a collection of 34 grammatical tracts in Greek. For some time he was tutor to Giovanni dei Medici (afterwards Leo X.), and also keeper of the Medicean library at Florence. In 1514 Leo appointed him bishop of Nocera. In 1517 he published a translation of the *Apophthegmata* of Joannes Stobaeus, and in 1523 appeared his *Etymologicum magnum,* sive thesaurus *universae* linguae Graecae ex *multis variisque autoribus collectus,* a compilation which has been frequently reprinted.

GUARINO (GUARINUS) DA VERONA (1370–1460), one of the Italian restorers of classical learning, was born in 1370 at Verona, and studied Greek at Constantinopie, where for five years he was the pupil of Manuel Chrysolaras. On his return to Italy he brought back a number of Greek mss. He supported himself as a teacher of Greek; in 1436 he became, through the patronage of Lionel, marquis of Este, professor of Greek at Fernra; and in 1438 and following years he acted as interpreter for the Greeks at the councils of Ferrara and Florence. He died at Ferrara on Dec. 14, 1460.

His principal works are translations of Strabo and of some of the Lives of Plutarch, a compendium of the Greek grammar, of Chrysolaras, and a series of commentaries on Persius, Juvenal, Martial, and on some of the writings of Aristotle and Cicero. See Rosmini, Vita e *disciplina* di Guarino (1805–06); Sabbadini, Guarino Veronese (1885); Sandys, *Hist.* Class. *Schol.* ii. (1908); *Epistolario* de Guarino Veronese (2 vols. and commentary) in Miscellanea di *Storia* Veneta, 8, 11, 14. (1915–19).

GUARNIERI or GUARNERIUS, a celebrated family of violin-makers of Cremona. The first was Andreas (c. 1626–1698), who worked with Antonio Stradivari in the workshop of Nicolo Amati (son of Geronimo). Violins of a model original to him are dated from the sign of "St. Theresa" in Cremona. His son Giuseppe (1666–*c.*1739) made instruments at first like his father's, but later in a style of his own with a narrow waist; his son, Pietro "of Venice" (b. 1695), was also a fine maker. Another son of Andreas, Peter (Pietro Giovanni), commonly known as "Peter of Cremona" (b. 16jj), moved from Cremona and settled at Mantua, where he too worked "sub signo Sanctae Teresae." Peter's violins again showed considerable variations from those of the other Guarnieri. Hart, in his work on the violin, says, "There is increased breadth between the sound-holes; the sound-hole is rounder and more perpendicular; the middle bouts are more contracted, and the model is more raised."

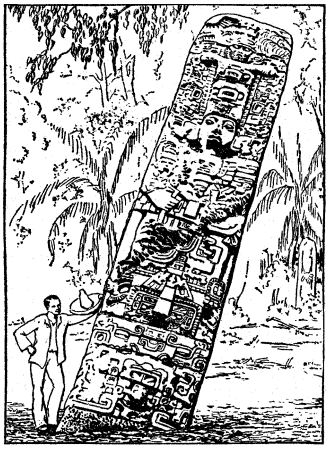
The greatest of all the Guarnieri, however, was a nephew of Andreas, Giuseppe, known as "Giuseppe del Gesù" (1687–1745), whose title originates in the I.H.S. inscribed on his tickets. His master was Gaspar di Salo. His conception follows that of the early Brescian makers in the boldness of outline and the massive construction which aim at the production of tone rather than visual perfection of form. The great variety of his work in size, model, etc., represents his various experiments in the direction of discovering this tone. A stain or sap-mark, parallel with the finger-board on both sides, appears on the bellies of most of his instruments. Since the middle of the 18th century spurious instruments ascribed to this master have been abundant. It was not until Paganini played on a "Joseph" that the taste of amateurs turned from the sweetness of the Amati and the Stradivarius violins in favour of the robuster tone of the Joseph Guarnerius. Paganini's instrument is preserved in the Municipal Palace of Genoa. (*See* VIOLIN.)

GUASTALLA, a town and episcopai see of Emilia, Italy, province of Reggio, 18 m. N. by rail of Reggio, on the south bank of the Po, 79 ft. above sea-level. It is also connected by rail with Parma and Mantua (via Suzzara). Pop (1936) 3,934 (town); 13,723 (commune). The cathedral dates from the 10th century. Guastalla was founded by the Lombards in the 7th century. In 1307 it was seized by Giberto da Correggio of Parma In 1403 it passed to Guido Torello, cousin of Filippo Maria Visconti of Milan. In 1539 it was sold by the last female descendant of the Torelli to Ferrante Gonzaga. In 1621 it was made the seat of a duchy, but in 1748 it was added to the duchies of Parma and Piacenza.

GUATEMALA, the most populous and the second largest country of Central America. The name was formerly applied to the captain-generalcy of Spain which included not only the five Central American countries, extending southward to approximately the present northern border of the Republic of Panama, but also included, to the northward, most of the present Mexican State of Chiapas. Following the independence from Spain in 1821, and the separation of the Central American countries from the Mexican empire of Iturbide two years later, the name Guatemala was applied to the region formerly included in 10 of the 15 provinces; *i.e.,* Chiapas was retained by Mexico and the provinces of Honduras, San Salvador, Nicaragua and Costa Rica became individual entities, recognized as such even through the various attempts to form a Central American Union out of the five countries. (See CENTRAL AMERICA, where, also, the early history of Guatemala is told.) The origin of the name, Guatemala, is certainly Indian, but its derivation and meaning are undetermined. Some students suggest that the original form was Quauhtematlan (which would indicate an Aztec rather than a Mayan origin, a thing most unlikely) meaning "land of the Eagle," and others hold its origin was Uhatezmala, meaning "Mountain vomiting water," referring to the so-called Volcano of Water, or "Agua" which destroyed Ciudad Vieja (*q.v.*), the first Spanish capital of the captain-generalcy.

The present republic of Guatemala lies between 13° 42' and 17° 49' N., and 88" 10′ and 92" 30' W. Its area is approximately 42,353 sq.mi., making it thus slightly smaller than Nicaragua, in claimed extent, for boundary disputes and incomplete surveys make all areas and most population figures extremely "approximate" in Central America. The population of Guatemala (1940 census) was 3,284,269, or about 77 inhabitants to the square mile; the country has a coast line of about 70 mi. on the Caribbean and 200 m. on the Pacific shores. Its boundaries on the north and west, which touch Mexico, were fixed by treaty, finally on May 8, 1899, which set the Suchiate river, from the Pacific inland, as the start of an irregular line which runs generally northwestward until it strikes the parallel of 17° 49' N., which it follows to the border of Belize, or British Honduras. The eastern border, with Belize, follows the meridian of 89° 20' W., southward to the River Sarstoon, which it follows eastward to the Gulf of Honduras on the Caribbean sea; this boundary was set by the

treaty of July 9, 1893. The Gulf of Honduras, an arm of the Caribbean, forms the short shoreline of Guatemala on Atlantic waters. The boundary with Honduras on the east was long in dispute, but, by treaty in 1930, was submitted to the arbitration of the United States, Chile and Costa Rica, and a final decision rendered in 1933. The award was "essentially on the basis of status quo of operation," and made the Motagua river the frontier in most of the disputed area. The south-eastern boundary with Honduras has never been in serious dispute, and the south-eastern line touching on El Salvador is accepted and marked, chiefly along natural lines.



MAYAN MONUMENT DISCOVERED IN THE JUNGLES OF GUATEMALA WHERE IT HAD STOOD FOR OVER A THOUSAND YEARS

Physical **Description.**—Guatemala is divided into five regions—the lowlands of the Pacific coast; the volcanic mountains of the Sierra Madre; the so-called plateaux immediately north of these; the mountains of the Atlantic versant; the plain of Petén.

(1) The Pacific coastal plains extend along the entire southern seaboard, with a mean breadth of 50mi., and link together the belts of similar territory in Salvador and the district of Soconusco in Chiapas, Mexico.

This region is now being developed as a tropical agricultural section of considerable importance.

(2) The precipitous barrier of the Sierra Madre, which, closes in the coastal plains on the north, is similarly prolonged into Salvador and Mexico. It is known near Guatemala City as the Sierra de las Nubes, and enters Mexico as the Sierra de Istatán. It forms the main watershed between the Pacific and Atlantic river systems. Its summit is not a well-defined crest, but is often rounded or flattened into a table-land. The direction of the great volcanic cones, which rise in an irregular line above it, is not identical with the main axis of the Sierra itself, except near the Mexican frontier, but has a more southerly trend, especially towards Salvador; here the base of many of the igneous peaks rests among the southern foothills of the range. It is, however, impossible to subdivide the Sierra Madre into a northern and a volcanic chain, for the volcanoes are isolated by stretches of comparatively low country; at least 13 considerable streams flow down between them, from the main watershed to the sea. The volcanic cones rise directly from the central heights of the Sierra Madre, above which they tower; for in reality their bases are, as a rule, farther south, to the east of Tacaná, on the Mexican frontier. Tajumulco (13,812ft.) is the loftiest peak in Central Americn, according to the best estimates, although Tacaná (usually accepted as 13,33jft.) is given as 13,976ft. by some. The other principal volcanoes are: Acatenango (12,972ft.); Fuego (*i.e.*, "fire," 12,581ft.), which derived its name from its activity at the time of the Conquest; Santa Maria Quezaltenango (12,361ft.), which was in frequent eruption between 1902 and 1928 after centuries of quiescence, in which its slopes became overgrown with dense forests; Agua (*i.e.*, "water," 12,310ft.), so named in 1541 because it destroyed the old city of Guatemala with a deluge from its flooded crater; Zunil (11,588ft.); and Atitlán, overlooking the lake of the same name, active from the mid-16th century to 1843. Pacaya, which mas in frequent eruption during the Colonial era, has less altitude (8,344ft.), but with its four distinct peaks stands out prominently.

(3) The so-called plateaux which extend north of the Sierra Madre are in fact high valleys, rather than table-lands, enclosed by mountains. A better idea of this region is conveyed by the native name *Altos*, or highlands, although the section so designated by the Guatemalans includes the northern declivity of the Sierra Madre. The mean elevation is greatest in the west (Altos of Quezaltenango) and least in the east (Altos of Guatemala). A few of the streams of the Pacific slope actually rise in the Altos, and force a way through the Sierra Madre at the bottom of deep ravines. One large river, the Chixoy, escapes northwards towards the Atlantic.

(4) The relief of the mountainous country which lies north of the Altos and drains into the Atlantic is varied by innumerable terraces, ridges and underfalls; but its general configuration has been compared with the appearance of a "stormy sea breaking into parallel billows."

The parallel ranges extend east and west with a slight southerly curve towards their centres. A range called here the Sierra de Chama, which, however, changes its name frequently from place to place, strikes eastward towards British Honduras, and is connected by low hills with the Cockscomb mountains; another similar range, the Sierra de Santa Cruz, continues east to Cape Cocoli between the Polochic and the Sarstoon rivers, and a third, the Sierra de las Minas or, in its eastern portion, Sierra del Mico, stretches between the Polochic and the Motagua. Between Honduras and Guatemala the temporarily accepted frontier is that along the Sierra de Merendón.

(5) The great plain of Petén, which comprises about one-third of the whole area of Guatemala, belongs geographically to the Yucatan peninsula, and consists of level or undulating country, covered with grass or forest. Its population numbers less than two per square mile, although many districts have a wonderfully fertile soil and abundance of water. The greater part of this region is uncultivated, and only utilized as pasture by the Indians, who form the majority of its inhabitants, and as a source of chicle, the basis of chewing gum.

Petén was for centuries, however, the site of great cities of the later Maya empire and much of the important archaeological work now being done in Central America is in this region. It is also the scene of petroleum prospecting.

Guatemala is well watered, not only on the eastern slopes (as is common along the American continents) but also on the Pacific slope and in the highlands. On the western side of the sierras the versant is short, and the streams, while very numerous, are consequently small and rapid; but on the eastern side a number of the rivers attain a very considerable development. The Motagua, whose principal head stream is called the Rio Grande, has a course of about 250mi., and is navigable to within 90mi. of the capital, which is situated on one of its confluents, the Rio de las Vacas. It forms a delta on the south of the Gulf of Honduras. Of similar importance is the Polochic, which is about 180mi. in length, and navigable about 70mi. above the river-port of Telemán. Before reaching the Colfo Amatique it passes through the Golfo Dulce, or Lake Izabal, and the Golfete Dulce. A vast number of streams, among which are the Chixoy, the Guadalupe and the Rio de la Pasión, unite to form the Usumacinta, which in its early stages passes along the Mexican frontier, and then flowing on through Chiapas and Tabasco, falls into the Bay of Campeche. The Chiapas follows a similar course.

There are several extensive lakes in Guatemala. The lake of Petén, or Laguna de Flores, in the centre of the department of Petén, is an irregular basin about 27mi. long, with an extreme breadth of 13 miles. In an island in the western portion stands Flores, a town well known as the centre of the archaeological work now being carried on. On the shore of the lake is the stalactite cave of Jabitsinal, of local celebrity; and in its depths, according to the popular legend, may still be discerned the stone image of a horse that belonged to the conqueror, Hernando Cortés. The Golfo Dulce is, as its name implies, a fresh-water lake, although it is virtually an arm of the Caribbean comparable on a smaller scale to Lake Maracaibo in Venezuela. It is about 36mi. long, and would be of considerable value as a harbour if the bar at the mouth of the Rio Dulce did not prevent the upward passage of seafaring vessels. As a contrast the Lake of Atitlán is a beautiful land-locked basin encompassed with lofty mountains. About 9mi. south of the capital lies the Lake of Amatitlán with the town of the same name (*q.v.*). On the borders of Salvador and Guatemala there is the Lake of Guija, about 20mi. long and 12 broad, at a height of 2,100ft. above the sea. It is connected by the river

Ostuma with the Lake of Ayarza which lies about 1,000 ft. higher, at the foot of the Sierra Madre.

The geology, fauna and flora of Guatemala are discussed in the article CENTRAL AMERICA. The bird-life of the country is remarkably rich; one bird of magnificent plumage, the quetzal (Trogon *resplendens*), has been chosen as the national emblem.

Climate.—The climate is healthy, even on the coasts, where the malarial fever that was so long the curse of the country has been largely conquered by a growing adoption of modern sanitation. The rainy season in the interior lasts from May to October, but on the coast often continues until December. The coldest month is January, and the warmest is May.

The average rainfall is heavy, especially on the Atlantic slope, where the prevailing winds are charged with moisture from the Gulf of Mexico or the Caribbean sea; at Tual, a high station on the Atlantic slope, it reaches 195 in.; in central Guatemala it is only 27 inches. Towards the Atlantic rain often occurs in the dry season, and there is a local saying near the Golfo Dulce that "it rains 13 months in the year." Fogs are not uncommon. In Guatemala, as in other parts of Central America, each of the three climatic zones, cold, temperate and hot, has its special characteristics, described in the article on CENTRAL AMERICA.

Natural Products.—The minerals discovered in Guatemala include gold, silver, lead, tin, copper, mercury, antimony, coal, salt and sulphur; but it is uncertain if many of these exist in quantities sufficient to repay exploitation.

Gold is obtained at Las Quebradas near Izabal, silver in the departments of Santa Rosa and Chiquimula, salt in those of Santa Rosa and Alta Verapaz. During the 17th century gold-washing was carried on by English miners in the Motagua valley, and is said to have yielded rich profits; hence the name of "Gold Coast" was not infrequently given to the Atlantic littoral near the mouth of the Motagua.

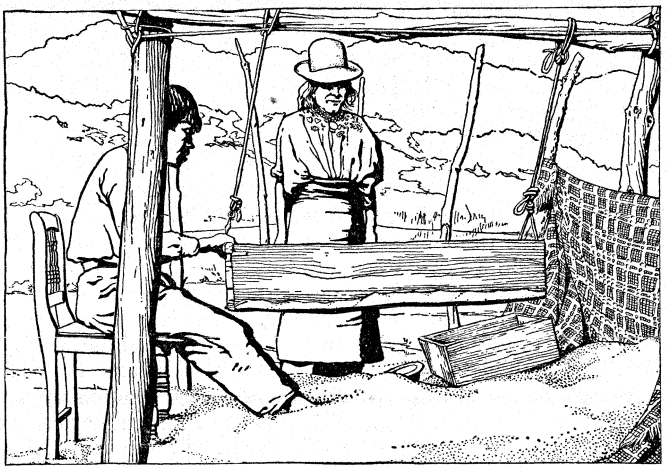
The area of forest has not been seriously diminished except in the west. Besides chicle, and a small quantity of wild rubber of the *Castillao elastica,* it yields many valuable dye-woods and cabinet-woods, such as cedar, mahogany and logwood.

Fruits, grain and medicinal plants are obtained in abundance, especially where the soil is largely of volcanic origin, as in the Altos and Sierra Madre. Parts of the Petén district are equally fertile, but not greatly developed.

The vegetable products of Guatemala include coffee, cocoa, sugar-cane, bananas, oranges, vanilla, aloes, agave, ipecacuanha, castor-oil, sarsaparilla, cinchona, tobacco, indigo, chicle, rubber and the wax-plant.

Inhabitants.—Guatemala's population, 2,004,900 by the 1921 census, 3,044,490 (official estimate 1938) and 3,284,269 (1940 census), is composed of at least 60% Indian, approximately 30% mixed blood whites and Indians and less than 5% pure white. The balance, of roughly 5%, are negroes and mixtures of Indian and negro, the latter proudly calling themselves "Carib Indians" in some sections, and probably, on the Caribbean shores, the descendants of the original Carib and Mosquito Indians and the slaves brought in by the Spaniards. The pure negro population is now largely if not entirely an importation from the British West Indies, brought in recent years by the fruit companies to furnish the labour for the banana plantations. Prior to the extensive sanitation of the Caribbean lowlands, chiefly in the beginning by the banana companies, the Indians refused to come down to the fever-infested sections where their traditions, as the ruins of earlier civilizations seem to bear out, hold that vast numbers of their ancestors died in tropical plagues in centuries past.

The Indian population of Guatemala is more nearly aboriginal in its habits and life than in any similar section of North or probably of South America. The existent tribes have been only sketchily studied, for the anthropology and ethnology of Central America are still almost untilled scientific soil, although it is known of course that the living Indians of Guatemala come, in general, from the Maya or from the yet older and less highly developed kindred Quiché strains (see MAYA). The Indian country is in the highlands, the "Altos" above described. It is estimated that at least 18 different Indian languages are spoken in Guatemala, and in the highland hinterland the tribes, with their distinctive dress, still rigorously maintained and distinguishing village from village as well as tribe from tribe, are sharply separated from one another in manners and language, Spanish being the only common tongue, and that unknown to thousands. The Governments of Guatemala, from the Spaniards down to to-day, have handled the Indians by converting the *caciques,* or tribal and



MAYA-QUICHE INDIANS OF THE UPLANDS ENGAGED IN WINNOWING WHEAT
Wheat is raised by these Indians above an altitude of 8,000 ft. Domestic animals trample the grain, and it is then winnowed in a cradle-like screen

village chieftains, into Government officials, and the control by the central Government of the Indian provinces is virtually feudal in form, the representative of the central authority still being a military official, of varying rank, according to the importance of his post. The Indians, however, form the basis of the army, and many pure blooded Indians have risen high in military rank, the common soldier remaining Indian, however, with his loyalty represented by his affection for his immediate superiors, a trait which has been of considerable importance in time of threatened revolution. The barefooted Indian soldier, with his canvas leggings binding his khaki uniform to his bare ankles, remains the basis of Guatemalan Government, so far as the preservation of public order is concerned; and his *caciques*—dignified Indian chieftains dressed in elaborately embroidered robes, with kilts and tartans of their village and with ornate staffs of office—are the representative of an authority more absolute than that wielded by the white or mixed-blood officer who is nominally the political chief of the area.

The Indians differ but slightly in physical mien, being of dark copper skin, stocky build, with coarse, straight black hair, high cheek-bones and low forehead, although the suggestion of the oriental type comes in more often than in Mexico, and almost as much as in the Indians of the highlands of Bolivia and Peru, in South America. In their tribal life, the Indians are deeply loyal, but outwardly secretive. Nominally belonging to the Roman Catholic faith, they have many strange tribal dances, and the festivals of the church are made the occasion for rites often associated with images either on or quite outside the church altars; an immense folk-lore, with particular reference to witchcraft and disease, has been noted but only partially analysed by local and foreign students.

The Indian, forming the chief labour supply of the country (with the exception of the imported negroes who are almost entirely confined to the Caribbean littoral) are handled in feudal fashion by the coffee planters and by the officials who must assist them. The abuses of earlier days, in the virtual slavery or peonage on the coffee plantations, have been somewhat ameliorated in recent years, but the wage is still miserably small, the system of debt indenture is widespread, with the Indians evading it by assuming varied Spanish names—their own are so difficult to pronounce or at least to reduce to paper that the landlords encourage the exchange—or by disappearing from their highland villages when the picking season begins on the coffee plantations. A practice growing in use amongst the coffee planters is to purchase

estates in the highlands, where the Indians are given free use of the tiny farming sections in the confined plains between the hills, their only obligation being a guarantee to come and work at the coffee picking at regular wages when the landlord calls upon them.

Guatemala city is the capital and largest city. A census of the city taken in 1940 gave a total of 163,826. Other cities and towns, with 1940 populations are: Quezaltenango, 33,538; Totonicapán, 5,623; Escuintla, 6,158; Antigua, 12,601; Sololá, 3,750; Huehuetenango, 4.980; Champerico, 894; Cobán, 8,001. *Municipios* with 1940 populations are: Chiquimula. 10,868; Jalapa. 9,968; Livingston, 5,151; Puerto Barrios, 15,784; Quiché, 3,259; Retalhuleu, 6,549; San José, 382; Zacapa, 14,443.

Political Organization. — The present constitution of Guatemala dates from Dec. 11, 1879, although it was preceded by two others, those of 1851 and 1876, following the separation of Guatemala from the Central American Federation. The Government is divided into the three branches, executive, judiciary and legislature. Citizenship is determined either by birth in the republic or Guatemalan parentage, and includes nationals of the other Central American republics who are resident in Guatemala, unless they expressly elect to belong to the country of their original nationality. Suffrage is limited to males over 21 who have income or livelihood, and to soldiers over 18. Education is free, compulsory and non-religious. The various guarantees in the constitution may be suspended by the executive in time of crisis, with the approval of the council of ministers. This "suspension of guarantees" is usually loosely translated into English as "putting the country under martial law," but is not comparable to this situation, as it means primarily the temporary strengthening of the police power by making inactive the usual legal subterfuges by which offenders may avoid arrest or escape penalties. The legislative branch of the national Government consists of one chamber only, with one member for every 30,000 inhabitants of the country. The members of this national assembly are elected by popular vote every four years, election of half the body being held biennially. The national assembly also canvasses the vote for president, and may elect the president, in case there is no majority, from the three leading candidates. It elects three of the seven members of the council of state, and from its own membership eight of the nine members of a permanent commission to act during recess.

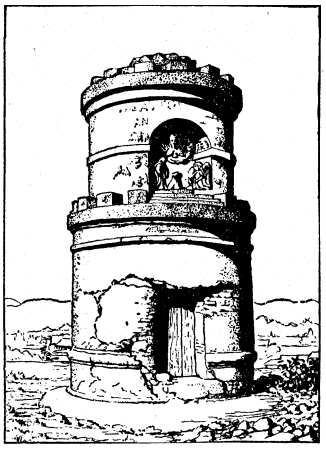
The executive power rests in the president, who is elected for a six-year term by popular vote, and is ineligible for re-election for 12 years after leaving office. This restriction was imposed in the course of amendments made in 1935, and a specific exception was made in favour of the incumbent president, General Jorge Ubico, whose term is spkcified as expiring July 11, 1943. There is no vice-president; instead the assembly elects three "designates," who succeed, in order, in the event of presidential disability. If the disability be permanent the designate calls a new election within six months. The president appoints the cabinet, whose members may not, however, be within four degrees of relationship to him. They are responsible to the president and have the right to sit in the assembly and to take part in its deliberations. The council of state, four of whose members are named by the president, three by the assembly, is a purely advisory, but nonetheless important, body. Its members serve terms of four years. The judiciary consists of a supreme court, six courts of appeal and courts of first instance. Judges are chosen by direct popular vote and serve for a term of four years. For administrative purposes the country is divided into 20 departments, each presided over by a *jefe politico* or prefect appointed direct by the president. The municipalities are governed by *alcaldes* (or mayors) and councils chosen by direct vote of the people; these have the power to assess and collect local revenues. The prefect, representing the Central Government, has authority to amend the ordinances and enactments of the councils of the towns in his department. The police power is handled both by local constabulary in the towns and by the military, and is generally efficient and effective. There is some public care of the unfortunate, but, in general. eleemosynary work is left to the religious denominations, chiefly Roman Catholic.

Education. — Education is free, laical and compulsory. Until recent years it was quite backward, but the regime of President Ubico placed considerable emphasis on reducing illiteracy and extending the school system. In 1933 and 1937 enrolment was as follows:

	Primary schools			Normal, secondary and technical schools		
	No. of schools	Teachers	Enrolment	No. of schools	Teachers	Enrolment
1933	1,913	4,052	94,834	31	938	3,752
1937	2,508	5,136	141,007	79	1,457	5,213

Mining, business and agricultural enterprises are obliged by law to maintain schools where there is no Government school within 2km. distance. In 1937, there were 877 private primary schools, with 1,533 teachers and 32,302 pupils, and 41 private secondary and miscellaneous schools, with 446 teachers and 670 pupils.

In higher education there is the University of Guatemala established in 1918, where courses in law, medicine, engineering, art and music are given. There are two institutes for the education of teachers in Guatemala city, one for men. Similar normal schools are maintained at Quezaltenango and at Chiquimula. The National library contains about 20,000 volumes.



THE TOWER OF THE FIRST CHURCH BUILT IN THE VALLE DE LAS VACAS

Religion. — The prevailing form of religion in Guatemala is Roman Catholic, the church claiming virtually 90% of the population as communicants. The archbishop of Guatemala is the primate of Central America and the church influence is very powerful. There are some Protestant missionaries and mission schools. The Indians are theoretically Roman Catholics, but occasionally in some regions their religious practices are influenced by their not always coherent race memories of idolatrous conditions and practices, and some of the great Christian festivals bring out practices not entirely in accord with the strictest tenets of the church. On the other hand, much of the white population is notably and frankly religious, and while this is somewhat divided on political lines, and the church has at times been accused of opposing the prevailing liberal Government with serious consequences, the religious attitude of the people of the higher classes has not been greatly affected.

Finance. — Guatemala's unit of currency is the quetzal, so named after the national bird, and equal in value to the U.S dollar. The national revenues during the fiscal years ending in 1936, 1937 and 1938, showed surpluses over expenditures of from $725,000 to $1,752,000 a year. Revenues were respectively $10,488,525, $11,605,415 and $12,497,464, in those years. The budget for 1938–39 was theoretically balanced at $10,332,650, and allotted funds as follows to the several branches of government: Legislature, $125,544; Executive, $216,000; Judiciary, $2 51,796; Interior, $1,825,000; Foreign Affairs, $380.000; War, $1,880,000; Education. $1,265,000; Development (Fomento), $1,075,000; Agriculture, $700,000; Treasury, $1,085,000; Public Debt, $1,260,310; miscellaneous, $270,000. Revenues were derived (1937–38) as follows: taxes and contributions, $10,957,535; public services, $737,967; inheritance taxes, $301,357; sale of State-monopolized commodities and other products, $405,727, and totalled $12,497,464, the highest recorded since 1930.

Public Debt. — In 1939 the internal public debt was $18,400,000; the external, $5,352,604 in dollars. and £1,490,620 in sterling. The entire external debt has been in default since 1933.

Defence. — The Guatemalan army is theoretically made up of

CITY AND COUNTRY LIFE IN GUATEMALA

1. Church in Textepec near Antigua. Indian pack trains gather morning and evening in the plaza in front of the church
2. Looking down upon Sololá and Lake Atitlán with the volcanic cone of Mt. Atitlan in the distance. The lake, 6,000 ft. above sea level, apparently lies in an ancient crater
3. An old Spanish church in Antigua. One tower which was damaged in the earthquake of 1773 has never been rebuilt
4. A white church on the mountain ridge overlooking Quezaltenango, the place of worship of one of the Indian tribes of the highlands.
5. View of a business street in Guatemala city, showing the pavement laid by the Spaniards centuries ago, and the peaked ox-carts
6. The hospital maintained by the United Fruit Company at Quiragua
7. Women carrying chickens and vegetables to market. The woman at the left is holding a baby in a reboso swung from her shoulders
8. Indian weaving a reed mat or *petate*, an indispensable domestic article, used as a bed at night, and as a raincoat, or a covering for any burden at other times
9. Indian carriers of the highlands transporting burdens in cacastes, box-like frames balanced on the back by means of a long stick
10. Maya-Quiché Indians of the uplands winnowing wheat in a cradle-like screen. The *zarape* (right) protects the grain from strong winds
11. Ruins of Escuela de Cristo (School of Christ), an imposing Spanish building at Antigua damaged in the earthquake of 1773
12. A Guatemalan Indian with his wife and child standing against the woven cornstalk fence which surrounds his little garden

all the males of the white and mixed population, who are subject to call to arms from the age of 18 onward. Under the treaty of Feb. 7, 1923, with the other Central American countries, the army contains 5,200 officers and men, the officers being the product of the official military schools where excellent instruction and training are given, and the rank and file of the army largely made up of Indians. The effective strength of the army subject to call is about 57,000 active and 30,000 reserve. The army budget in 1938–39 was $1,880,000.

Industries. — The chief industry is coffee-growing, which normally supplies 70 to 80% of all exports. Exports in 1937–38 totalled 950,946 quintals (one quintal equals 101.43lb.) compared with 1,015,099 in 1936–37 and 1,175,286 in 1935–36 Half of the coffee normally goes to the United States, a fourth to Germany.

As an offset to losses because of low prices of coffee, Guatemala has put considerable emphasis on the banana industry which had its beginnings in the early 20th century. Development of the industry has had far-reaching effects on the entire economy of the country, in enhancing railroad revenue and developing rapid steamship transportation to other countries. The principal producer is the United Fruit Company, owner of 16,000 acres. In addition to its own production it buys that of independent planters ($663,174 worth in 1937). Its average employment is 4,700 persons (1937), and expenditure for wages and salaries $1,750,000 annually, and pays around $500,000 a year in taxes, or nearly 5% of the national revenues.

Since 1934 there has been a heavy increase in banana production on the Pacific coast. In that year only 12.3% of the total of 5,367,366 stems was produced on the Pacific. In 1938 total production was 9,376,593 stems, of which 37.9% was produced on the Pacific coast.

Area under cultivation, in manzanas (one manzana equals 1,727ac.) and production in quintals of the principal crops in 1937–38 was as follows (production indicated in parentheses): coffee, 169.722 (1,229,294); bananas, 46,498 (10,723,216 stems); corn, 444,627 (6,220,928); beans, 69,789 (800,678); wheat, 24,174 (231,555); sugar cane, 22,447 (1,015,772); rice, 11,615 (144,454).

Livestock. — The total of livestock is increasing. In 1938, there were 532,257 cattle, 240,939 sheep, 162,743 swine, 96,215 horses, 38,736 mules and asses and 22.201 goats.

Mining. — Gold (130kg. in 1937) and some lead and sulphur are mined The Shell Oil Company of Guatemala was granted permits in 1937 to explore for oil in the departments of Izabal, Alta Verapaz and Petén.

Manufacturing. — Manufacturingis entirely for domestic consumption, and includes flour milling, sugar refining, brewing, distilling, shoe manufacturing and tanning.

Commerce. — Exports are coffee, largely, and bananas, with some chicle. Imports are machinery, automobiles, luxuries, textiles, shoes and furniture. In recent years the United States has been supplying around two-thirds the imports and taking nearly half the exports, and Germany a third of the imports, and buying around 15% of exports. Exports and imports from 1935 to 1939 totalled:

	1935	1936	1937	1938	'939
Imports	$ 9,599,025	$11,511,947	$16,742,907	$16,761,388	$15,296,000
Exports	12,471,330	15,106,264	16,108,610	16,336,263	16,985,000
Total	$22,070,355	$26,618,211	$32,851,517	$33,097,651	$32,281,000

Communications. — The railway system of Guatemala is controlled by the International Railways of Central America, connecting with Salvador and, at Suchiate, with the National Railways of Mexico. The main line runs from Puerto Barrios, on the Caribbean, through the capital city, to San José on the Pacific. with shorter connecting lines to the Pacific port of Champerico and elsewhere. In addition there are several banana company railroads. Total railway length is 850 miles.

In 1938 there were 5,588km. of highway in service, 1,477km. under construction and 627km. in project. During that year 200 km. of new highway were constructed In 1939 the inter-American highway through Guatemala included 273mi of all-weather road, out of a total of 316 miles.

Air transport service is maintained with direct connections with Mexico, British Honduras, El Salvador and Honduras, and through them with all parts of the Americas.

Maritime transportation is principally through Puerto Barrios on the Caribbean and Champerico on the Pacific.

The telegraph lines of the Government cover the country effectively, and in addition there are three wireless stations, at Guatemala, Quezaltenango and Puerto Barrios. The telephone system in Guatemala city is good, and there are long distance lines controlled by the fruit companies. The All America cables enter from the Pacific side, at San José, and are available to the country via the Government telegraph lines.

History.—The history of Guatemala, as linked with Central America in general, has been given under that heading. Rafael Carrera (1814–65), the great conservative president of Guatemala. was the leader under whom the separate republic of Guatemala was formed after the dissolution of the Central American Federation, in 1839. In 1851, Carrera defeated the Federalist forces from Honduras and Salvador at La Arada, near Chiquiniula. close to the Honduran frontier, and the name year the new constitution was promulgated and Carrera elected president an office which in 1854 was conferred upon him for life. The struggle for the domination of Central America went on, with Carrera as the supporter of the conservative and clerical forces. He was aided at one time by Costa Rica and Nicaragua, and occupied San Salvador in the course of a campaign which resulted in his becoming the dominant figure and virtual power behind the Government of all five of the Central American countries. Carrera died in office. being succeeded by General Cerna, in April, 1865. The liberal elements of Guatemala grew in strength after Carrera's death and in May, 1871, President Cerna was deposed and later the archbishop and the Jesuits were exiled Justo Rufino Barrios (1835–85), the liberal leader who had directed the opposition to the conservatives, was elected liberal president of Guatemala in 1873. He was a militant advocate of the Central American Union and sought to impose it by arms when his peaceful overtures failed. He invaded Salvador in 1885. met his former friend President Zaldivar of Salvador in battle and Barrios fell in the contest, on April 2, 1885. He was succeeded by Gen. Manuel Barillas, nho quickly made peace with Salvador and the other three Central American countries.

General José Maria Reina Barrios was elected president in 1892, re-elected in 1897 and assassinated on Feb. 8, 1898. Succeeded by Vice-president Morales, the power passed, by election to Manuel Estrada Cabrera (1857–1924) in the fall of the same year. Estrada Cabrera ruled, continued in office by frequent re-elections, until April, 1920, when he was forced to resign in the face of a revolutionary movement which had spread to the national assembly. Estrada Cabrera, as dictator of Guatemala. was responsible for many improvements in the line of education, railways and industrial development, but was bitterly opposed by a large proportion of the substantial elements of the country. In 1906, his predecessor in the presidency. Gen. Manuel Barillas, invaded Guatemala, and soon Salvador, Costa Rica and Honduras were arrayed against Estrada Cabrera, with Nicaragua inactive but unfriendly. The situation was saved by the intervention of the United States and a subsequent meeting of representatives of the five republics in Washington, where the treaties of 1907 were drawn up.

The Unionist movement of 1920 became, in Guatemala, a movement against Estrada Cabrera, and, as noted, he was forced to resign, after a brief but lively revolutionary campaign, confined solely to the capital. The national assembly, naming Carlos Herrera, a conservative and unionist, as first designate, he was elevated to the presidency. A man of culture and wide experience, President Herrera began the rehabilitation of the country, and the restoration of the capital from the ruin following the earthquake of 1917–18. On Oct. 10, 1921, he signed, with Honduras and Salvador, the pact for the Central American Union.

On Dec. 7, 1921 the liberals overthrew Herrera and in March following Gen. José Maria Orellana mas elected president. Under his able administration until his death in October 1926, and there-

after under that of his successor Gen. Lázaro Chacón, the country progressed in stability and peace. But on Dec. 16, 1930 the latter was overthrown as a result of a coup d'état, executed by Gen. Manuel Orellana. Unable to secure recognition from the United States in accordance with the treaty of 1923, Orellana was soon compelled to resign. And in February 1931 Gen. Jorge Ubico was elected president for a six-year term. In 1935 a constituent assembly extended his term until 1943. Under Ubico's rule Guatemala successfully emerged from the economic depths of the early 1930s, and underwent many material improvements, notably in highway development, and made laudable and noteworthy advances in education. A novel provision initiated by President Ubico was the requirement that all public officials, upon assuming office, should file statements of their personal financial conditions. The Ubico regime, however, has been a rigid dictatorship, characterized by repression of civil liberties. Guatemala declared neutrality in the European war in Sept. 1939, and followed closely the lead of the United States. At the same time there arose vociferous demands for the annexation of British Honduras on the ground of British failure to comply with the boundary treaty of 1859.

GUATEMALA, NUEVA GUATEMALA or **NEW GUATEMALA,** the capital city of the Central American republic of the same name, was founded, on its present site, following an earthquake which in 1773 wrecked the older capital, now known as Antigua (*q.v.*) (Antigua Guatemala), the government being formally transferred to the present site in 1779. Guatemala lies at an altitude of 4,877 ft. above the sea on a virtually isolated tableland surrounded, except foi one side, by deep gullies, or *barrancas,* and in the opinion of its founders destined to be free from earthquakes, a hope which was weakened by a destructive tremor in 1874, and blasted when. in 1917–18, the city was virtually razed to the ground by a series of earthquake shocks. The site was not abandoned, however, and Guatemala has since been rebuilt on the same streets and building lots as before.

Guatemala lies 75 mi. by railroad from San José, the Pacific port, and 198 mi. from Puerto Barrios, the Caribbean port and terminus of the International railways of Central America. It is also connected by rail with Ayutla, at the Mexican border (180 mi. distant), and with San Salvador and other cities of the adjoining republic of El Salvador, by an extension of the International railways from the station of Zacapa, on the Guatemala-Barrios line. Guatemala City enjoys the excellent climate which characterizes highland cities of the tropics, which have even temperatures of relative coolness. The temperature averages 72° F, the highest being 85° and the lowest 50°, on the average. The sun, at midday. is glaring and hot, but the city is very comfortable in the shade at all hours.

The population, in 1940, was 163,826. It is the largest and most important city in Central America, and is the home of the ambassador of Mexico, the United States legation and consulate general, and the legations and consuls general or consuls of many other countries. It is the commercial centre of the country, the headquarters of the many banks and agencies of foreign banking institutions. It is the centre of the Guatemalan coffee trade, the chief source of one of the finest of the so-called "mild" coffees of commerce, and has a number of small industries. including a brewery, shoe and soap factories, furniture and cigar factories and tanneries. It has several good hotels and one excellent one, the latter being a recent construction of reinforced concrete, a type of building material which is being used extensively for store and office buildings, clubs and private residences. There are also American, French, German and Spanish operated hostelries which cater for their nationals and visitors

Guatemala is laid out on the usual gridiron pattern of the Hispanic-American city, comparatively wide streets being included in the plan.

Guatemala's streets were paved for many years with flagstones 18 to 24 in. square, the stone being cut by hand and brought for a considerable distance Settling and minor earthquakes and the heavy shocks of 1917 and 1918, made these streets extremely rough. as well as painfully glaring, as they had always been, in the sunlight, but in 1928, a new system of waterworks and drainage — the city lies on a gentle slope and has always enjoyed excellent health conditions — was begun, which includes a new paving system. The city is well lighted with electricity, which is now furnished by a North American company at rates which make the use of electricity for cooking a growing practice.

(W. THO.; X.)

GUATOAN, an independent linguistic stock of South American Indians, made up of the single tribe of the Guatos. The small surviving remnant of the Guatos live on the Bolivian-Brazilian border, along the upper Paraguay river, chiefly about lakes Gaiba and Uberaba. It is probable that formerly they held a larger area. The Guatos are pre-eminently river folk, living most of their life in their dugout canoes. They erect small temporary thatched shelters, occupied by a single family and always isolated rather than grouped in villages. Their dress consists of a breech-clout and short kilt. Their weapons are the bow and spear, and they live mainly on the products of rhe chase and on fish.

See M. Schmidt, *Indianer Studien in Zentral-Brazilien* (1905).

GUATUSO, an almost extinct Indian tribe dwelling on the forest-covered plains of San Carlos in northern Costa Rica. An aura of romance, now dispelled, has credited them with white skins and red hair. Their tongue is a Chibchan dialect, and their culture is of South American type.

See Karl Sapper, "Ein Besuch bei den Guatuso in Costa Rica," in *Globus,* Band. lxxvi. (Braunschweig, 1899).

GUAVA, the name applied to the fruits of species of *Psidium,* a genus of the Myrtle family (Myrtaceae). The species which produces the bulk of the guava fruits of commerce is P. *Guajava,* a small tree from 15 to 20 ft. high, a native of tropical America and the West Indies. It bears short-stalked ovate or oblong leaves, with strongly marked veins, and covered with a soft tomentum or down. The flowers are borne on axillary stalks, and the fruits vary much in size, shape and colour, numerous forms and varieties being cultivated. The variety of which the fruits are most valued is the white guava (*P. Guajava,* var. *pyriferum*). The fruits are pear-shaped, about the size of a hen's egg, covered with a thin bright yellow skin filled with soft pulp, also light yellowish and having a pleasant sweet-acid and aromatic flavour. P. *Guajava,* var. *pomiferum,* produces a more globular or apple-shaped fruit, the red guava. The pulp of this variety is darker than the former and not of so fine a flavour, therefore the first named is most esteemed for eating; both, however, are used in the preparation of preserves known as guava jelly and guava cheese, which are made in the West Indies and imported thence to England; the fruits are too perishable to allow of their importation in their natural state. Both varieties have been introduced into various parts of the East where they have become naturalized.

P. variabile (also known as P. *Cattleyanum),* a tree of from 10 to 20 ft. high, a native of Brazil (the Araçá or Araçá de Praya), is the purple or strawberry guava. The fruit, which is abundantly produced in the axils of the leaves, is large, spherical, of a fine deep claret colour; the rind is pitted, and the pulp soft, fleshy, purplish, reddish next the skin, but becoming paler towards the middle and in the centre almost or quite white. It has an agreeable flavour, which has been likened to that of a strawberry. At the time of the Spanish discovery the guava was in cultivation from Peru northward to Mexico. In the United States guavas are grown in Florida and California.

GUAYAMA, a town situated on a broad and fertile plain some 200 ft. above sea level in the southern part of Puerto Rico near the Caribbean sea Pop (1940), 16,913. The population of

the municipal district was 30,511 in 1940.

Guayama is an Indian name and means the "Region of Fire," so named because before the Spanish occupancy the prolonged drought season dried the vegetation and fires were frequent. Since the American occupation, however, an extensive irrigation service has transformed the district into one of the richest and most prosperous in the island. The town has communication north, east and west by first class highways with motor-bus service and daily mail. It has also rail service with Ponce and other sections to the west. A branch of the great military highway built by the Spaniards extends from Cayey to Guayama. whose scenic attractions are unsurpassed. Sugar is the principal product, the district being one of the largest producers of the island. Fruits, coffee and tobacco are also produced. The town has first-class schools, hospitals, waterworks and electric lights. (H. M. T.)

GUAYAQUIL or **SANTIAGO DE GUAYAQUIL,** a city and port of Ecuador, capital of the province of Guayas, on the right bank of the Guayas river. 33 mi. above its entrance into the Gulf of Guayaquil. in 2° 1' 18" S., 79° 51' 46.2 j" W. Pop. (1942 est) 159,937. The city is on a comparatively level plain, extending southward from the base of three low hills called Santa Carmen de la Cruz, between the river and the partially filled waters of the Estero Salado. It is about 30 ft. above sea level; the lower parts of the town are partially flooded in the rainy season, but this has recently been improved by raising and paving streets. The old town is the upper or northern part, and is inhabited by the poorer classes, its streets being badly paved, crooked and pestilential. The great fire of 1896 destroyed a large part of the old town, and some of its insanitary conditions were improved in rebuilding. The southern part is the business and residential quarter of the better classes. The buildings were chiefly of wood and the streets only surface-drained, but sewerage systems have been installed and in some sections only stone or concrete may be used for building. An imposing governor's palace has recently been built of concrete. Other public buildings are the bishop's palace, town hall, cathedral and nine churches, national college, episcopal seminary and schools of law and medicine, theatre, two hospitals, custom-house, several asylums and charitable institutions and a new concrete municipal building containing a library and museum. Guayaquil is also the seat of a university with faculties of law, medicine, engineering, economics, social sciences and architecture. The upper floors in business streets project over the walks, forming covered arcades.

The year is divided into a wet (Jan. to May) and a dry season. During the former the hot days are followed by nights of drenching rain. The mean annual temperature is about 78° to 79° F., but the dry or summer season is considered pleasant and healthful. Malaria, bilious fevers ("Guayaquil fever") and yellow fever were formerly prevalent in Guayaquil; but the engineering and hygienic achievements which have been accomplished by the government in cooperation with the Rockefeller foundation have so greatly improved the sanitary conditions of the city that it now has an A-I rating in terms of the stringent requirements of the Pan-American sanitary code.

The water supply is brought in iron mains from the Cordilleras 53 mi. distant. The mains pass under the Guayas river and discharge into a distributing reservoir on Santa Ana hill, north of the city. There are several urban and interurban railways, the important ones being the Empresa Eléctrica del Ecuador, the Empresa de Carros Urbanos and the Customs House railway. A railway and highway are planned which will connect Guayaquil with Babahoyo, and one of the most travelled roads in Ecuador runs from Guayaquil to Salinas. Regular plane service is maintained with Quito, and Panagra planes stop overnight in the city.

Guayaquil has telephone and electric light services. and telegraph communication is through the "All American Cables, Inc." whose cable lands at the small port of Salinas about 100 mi. west. Connected by rail with Guayaquil, the port is a fashionable resort noted for its beach, fishing and climate. Railway connection was established with Quito (278 mi) in 1908. Steamboats go to the producing districts of the province along the Guayas river and its tributaries, on which boats run regularly as far up as Babahoyo (80 mi.) in the dry season, and for a distance of 40 mi. on the Rio Daule. Smaller boats navigate about 200 mi. of this river system. Nearly all the exports of Ecuador are shipped through the port of Guayaquil. The Guayas river is navigable up to Guayaquil for steamers drawing 22 ft.; larger vessels anchor at Puná, 40 mi. below Guayaquil, where cargoes and passengers are transferred to lighters and tenders. At Guayaquil there is a quay along the river front but the water alongside does not exceed 18 ft. and steamers anchor a considerable distance out in the Guayas. The principal exports are described in the article ECUADOR.

Santiago de Guayaquil was founded on July 25, 1535, by Sebastián de Benalcazar at the mouth of the Rio Babahoyo. then moved to the "estero" (at that time named Dima) and finally located on its present site by Francisco de Orellana in 1537. It was captured and sacked several times by pirates and freebooters in 1624 (by the Dutchman Jacob Heremite Clark), in 1683 (Edward David's crew) and in 1709. Owing to the flimsy construction of its buildings Guayaquil has been repeatedly burned, the greater fires occurring in 1707, 1764, 1865, 1896 and 1899. The city was made the see of a bishop in 1837.

GUAYAS or EL GUAYAS, a maritime province of Ecuador, embracing the extensive lowland surrounding the Gulf of Guayaquil, which lies between the base of the Andes and the belt of coastal hills. Population (1942 est.) 413,668; area 8,330 sq.mi. The province is traversed by numerous rivers, for the most part tributaries of the Guayas, which enters the guli from the north. The climate is one of high average temperatures (77° to 80° F.), high humidity and abundant rains during the rainy season (Dec. to June). Rainfall, however, diminishes perceptibly from north to south, and southward from the Santa Elena peninsula the region is semiarid. The natural vegetation reflects the moisture conditions; the forest (selva) of the north gives way to deciduous scrub forest and patches of savanna in the south, while the floodplains of the Guayas and its tributaries are covered for the most part with wet savannas and strips of forest along the rivers. The Guayas lowland is divided into two types of surface: the floodplain and alluvial fans, the latter being well-drained and exceedingly fertile. Agriculture and the collection of forest products are the chief industries. The staple products are cacao, coffee, cattle, sugar cane, cotton, tobacco and rice. In the Guayas lowland the area devoted to cattle grazing is far more extensive than that which is devoted to cacao, but in terms of exports cacao is infinitely more important than cattle. Production of cacao in Ecuador once amounted to more than 15% of the world's total; since 1928 it has rarely exceeded 4%. This decrease has seriously affected the wealth of the government and the economy of Guayas, which produces and exports the major share of the crop. The forest products of the province include tagua nuts, cinchona bark, rubber and the fibre of the toquilla palm, from which Panama hats are made. The only producing oil field in Ecuador is in Guayas near the tip of the Santa Elena peninsula. Although the field is important to Ecuador, its production is negligible in relation to the total production in Latin America.

There are no large towns in the province other than Guayaquil, provincial capital and chief port and commercial city of the republic. Commerce and transportation rely principally upon small boats and barges, but the Coast railway now links Guayaquil with Salinas on the Santa Elena peninsula, and the Guayaquil and Quito railway traverses the eastern half of the province. (R. W. RD.)

GUAYCURUAN, an independent linguistic stock of South American Indians, so called from the Guaycurus, its best known tribe. The tribes of this stock lived in the Argentine Chaco in the region west of the Paraná and Paraguay rivers, from a little above Santa FC nearly to the mouth of the Pilcomayo and extending westward north of the Salado river, nearly to the foothills of the Andes. After the early period of Spanish settlement, the Guaycuruan tribes expanded eastward some distance across the Paraná below Corrientes, and farther north, penetrated into southern Matto Grosso in Brazil. The Toba are the best known tribe of the

stock to-day, the Abipones (*q.v.*), made famous by the missionary Dobrizhoffer in the 18th century, being now extinct.

See D. G. Brinton, "The Linguistic Cartography of the Chaco Region" (Proc. *Amer. Philos. Soc.* vol. xxxvii); L. Kersten, "Die Indianerstamme des Gran Chaco," etc. (Internat. Archzv. *fur Ethnographie,* vol. xvii pp. 1–75).

GUAYMAS or **SAN JOSE DE GUAYMAS,** a seaport of Mexico, in the state of Sonora, on a small land-locked bay opening into the Gulf of California a few miles west of the mouth of the Yaqui river, in lat. 27° 58′ N., long. 110° 58′ W. Pop. (1930) 8,534. The harbour is one of the best on the west coast of Mexico, and the port is a principal outlet for the products of the large state of Sonora. The town stands on a small, arid plain. nearly shut in by mountains, and has a very hot, dry climate. It is connected with the railways of the U.S. by a branch of the Southern Pacific of Mexico from Nogales, Sonora, and is 265 mi. S.W. of the frontier town of Nogales, where that line enters Mexico. The exports include gold, silver, hides and pearls.

GUAYMI, an Indian tribe who inhabit the mountains of western Panama between the Chiriqui volcano and the river Belen, and linguistically allied to the Chibcha of South America. During the Spanish colonial epoch they were dominated by missionaries, but have since reverted to their natural living conditions. The ancestors of the Guaymi are regarded as the makers of gold images and ceramics found in ancient graves throughout western Panama.

See H. Pittier, "Little-known parts of Panama," in National *Geographic* Magazine, vol. xxiii, No. 7 (1912).

GUAYULE (*Parthenium argentatum*), a much-branched low shrub of the Compositae family, characteristic of the desert areas of northern Mexico and adjacent parts of Texas, and cultivated in Arizona and California as a commercial source of rubber. The small leaves are silvery pubescent on both surfaces. While the rubber that this plant produces was known to the natives of Mexico in prehistoric times, public attention to it developed only in the last decades of the 19th century. It was only after the beginning of the 20th century that commercial production of rubber from this species was initiated. The capital investment in the guayule rubber industry is large. See F. E. Lloyd, Guayule (*Parthenium argentatum* Gray), *A Rubber-Plant* of the *Chihuahan* Desert. 1-213. illus. (1911). Carnegie Inst. Publ. 139

GUBBIO, a town and episcopal see of Umbria, Italy (anc. *Iguvium* [*q.v.*]; med. *Eugubium*), province of Perugia, 23 mi N.N.E. from Perugia by road; by rail 13 mi. N.W. of Fossato di Vico (on the line between Foligno and Ancona) and 70 mi. E.S.E of Arezzo. Pop. (1936) 7,432 (town); 33,727 (commune). Gubbio is at the foot and on the steep slopes of Monte Calvo, 1.568 to 1,735 ft. above sea level, at the entrance to the gorge which ascends to Scheggia, probably on the site of the ancient Umbrian town. The Palazzo dei Consoli, on the north side of the Piazza della Signoria, is a huge two-storied Gothic edifice with a tower (1332–46). It contains the famous Tabulae *Iguvinae,* and a collection of paintings of the Umbrian school, of furniture and of majolica. Being on the slope, palace and piazza are raised on arched substructures. On the south side of the piazza is the Palazzo Podestà, begun in 1349.

Above the Piazza della Signoria, at the highest point of the town, is the Palazzo Ducale, erected by the dukes of Urbino in 1474–80; the Palazzo Beni, lower down. The Palazzo Accoramboni is a Renaissance structure, with a fine entrance arch. Opposite the Palazzo Ducale is the 12th century cathedral of SS. Mariano e Jacopo. The interior contains some good pictures by Umbrian artists, a fine episcopal throne in carved wood, and a fine Flemish cope given by Pope Marcellus II (1555) in the sacristy. The whole town is full of specimens of mediaeval architecture. On May 15 three colossal nooden pedestals, each over 30 ft. high, and crowned by statues of SS. Ubaldo, Antonio and Giorgio, are carried through the town, and then, in a wild race, up to the church of S. Ubaldo on the mountainside (2,690 ft.). (See H. M. Bower, *The* Elevation and *Procession* of *the Ceri* at Gubbio, London 1897.)

After its reconstruction with the help of Narses (see IGUVIUM) the town remained subject to the exarchs of Ravenna, and, after the destruction of the Lombard kingdom in 774, formed part of the donation of Charlemagne to the pope. In the 11th century struggles it was generally on the Ghibelline side. In 1151 it repelled an attack of several neighbouring cities, and formed from this time a republic governed by consuls. In 1155 it was besieged by the emperor Frederick I, but saved by the intervention of its bishop, S. Ubaldo, and was granted privileges by the emperor. In 1203 it had its first podesta. In 1387, after various political changes, it came under the dukes of Urbino until, in 1624, the whole duchy was ceded to the pope.

Gubbio was the birthplace of Oderisio. a famous miniature painter (1240–99), mentioned by Dante as the honour of his native town. In the 14th and 15th centuries a branch of the Umbrian school of painting flourished here, the most famous masters of which were Guido Palmerucci (1280–1345) and several members of the Nelli family, particularly Ottaviano (d. 1444), whose best work is the "Madonna del Belvedere" in S. Maria Nuova at Gubbio (1404). Another work by him is the group of frescoes including a large "Last Judgment," and scenes from the life of St. Augustine, in the church of S. Agostino.

Gubbio occupies a far more important place in the history of majolica. In a decree of 1438 a *vasarius vasorum pictorum* is mentioned, who probably was not the first of his trade. The art was brought to perfection by Giorgio Andreoli, generally known as Maestro Giorgio (see POTTERY AND PORCELAIN).

See *A.* Colasanti, *Gubbio* (Bergamo, 1905); L. McCracken, *Gubbio* (1905).

GUBEN, a town in the Prussian province of Brandenburg, Germany, at the confluence of the Lubis with the Neisse, 28 mi. S.S.E. of Frankfort-on-Oder, on railways to Breslau, Halle and Forst. Pop. (1939) 45,249. Guben, of Wendish origin, is mentioned in 1207 and received civic rights in 1235. It was surrounded by walls in 1311, about which time it came into the possession of the margrave of Brandenburg, from whom it passed to Bohemia in 1368. In 1635 it came into the possession of the elector of Saxony, and in 1815 it was, with the rest of lower Lusatia, united to Prussia. The principal industries are the spinning and weaving of wool, dyeing and the manufacture of pottery ware, hats, cloth, paper and machinery.

GUBERNATIS, ANGELO DE, COUNT (1840–1913), Italian man of letters, was born at Turin on April 7, 1840, and educated there and at Berlin, where he studied oriental languages. In 1862 he was appointed professor of Sanskrit at Florence, but having married a cousin of the anarchist Bakunin and become interested in his views, he resigned. He was reappointed in 1867; and in 1891 he was transferred to the University of Rome. He founded several important reviews, and in 1887 became director of the Giornale della *società* asiatica. In 1878 he started the *Dizionario biografico* degli scrittori *contemporanei.* His oriental and mythological works include the *Piccola enciclopedia indiana* (1867), the Fonti *vediche* (1868), a famous work on Zoological *Mythology* (in English, 1872), and another on plant mythology, Mythologie des *plantes* (1878). He died on Feb. 27, 1913, at Rome.

GUCHKOV, ALEXANDER (1862–1936), Russian politician, was born in Moscow. He studied at the universities of Moscow and Berlin. He helped to found the Russian "Octobrist" party. In 1910 Guchkov was elected president of the Duma, but as Stolypin became more reactionary, the Octobrists lost their raison *d'être,* and Guchkov eventually resigned the presidentship of the Duma. During World War I he was in charge of the Red Cross organization on the German front. When the March Revolution of 1917 broke out Guchkov became minister of war, but resigned on May 5. Later, he took refuge in Paris.

GUDBRANDSDAL, a geographic and cultural district of south central Norway, comprising the valley of the Laagen R. from Lake Mjösen to its source in Lake Lesjeskogen, together with tributary valleys and the vast stretches of the encircling fjells. Though the fjells (including the famed Dovre-fjell) are barren and rugged and the mountains are covered with eternal snow, the narrow valley and its slopes, where arable, are richly fertile. The crude forest economy of the 17th and 18th centuries

has disappeared, but the region still produces much timber. Lillehammer, at the southern end, is a thriving town; other communities are small. The district offers excellent fishing and hunting, especially for fowl. A railway and motor road through the valley connect Oslo with Trondheim, and from Dombås both rail and road lead to Åndalsnes. Like the other valleys of the country. Gudbrandsdal has developed its own culture and dialect but has long possessed a deeply national sentiment.

GUDEMAN, ALFRED (1862–), American classical scholar, was born in Atlanta, Ga.. on Aug. 26, 1862. He graduated at Columbia university in 1883 and in 1888 took his Ph.D. degree at the University of Berlin. From 1890 to 1893 he was reader in classical philology at Johns Hopkins university, from 1893 to 1902 professor in the University of Pennsylvania and from 1902 to 1904 professor in Cornell university. In 1904–16 he was assistant editor of the *Thesaurus* linguae Latinae—a unique distinction for an American Latinist, as was also the publication of his critical edition, with German commentary, of Tacitus's *Agricola* in 1902 by the Weidmannsche Buchhandlung of Berlin.

GUDGEON (*Gobio* gnhin, sometimes called *G. fluviatilis*), a cyprinid fish inhabiting Europe and northern Asia. It rarely exceeds a length of 8 in.; it has a barbel at each corner of the mouth, and a row of blackish spots along the side of the body; it frequents sandy or gravelly shallows. Other species of Gobio inhabit China and Japan.

GUDIN, THEODORE (1802–1880), French marine painter, mas born at Paris, April 15, 1802. He studied for a time under Anne Louis Girodet de Roussy. In 1838 Louis Philippe dispatched him to Algeria to paint a series of pictures of the French navy. Of the resulting 90 works which Gudin painted during the next ten years, more than half were hung in the galleries at Versailles. He was official marine painter under both Louis Philippe and Napoleon III. He died April 11, 1880.

GUDRUN (KUDRUN), a Middle High German epic, written probably in the early 13th century, not long after the *Nibelungenlied*, the influence of which may be traced upon it. It is preserved in a single ms. which was prepared for Maximilian I, and was discovered in 1820 in the castle of Ambras in Tirol. The author was an unnamed Austrian poet, but the story itself belongs to the cycle of Scandinavian sagas. The epic falls into three parts—the adventures of King Hagen of Ireland, the romance of Hettel, king of the Hegelingen, who woos and wins Hagen's daughter Hilde, and the more or less parallel story of how Heraig, king of Seeland, wins, in opposition to her father's wishes, Gudrun, the daughter of Hettel and Hilde. Gudrun is carried off by a king of Normandy, and her kinsfolk, who are in pursuit, are defeated in a great battle on the island of Wiilpensand off the Dutch coast. The finest parts of the epic are those in which Gudrun, a prisoner in the Norman castle, refuses to become the wife of her captor, and is condemned to do the most menial work of the household. Here, 13 years later, Herwig and her brother Ortwin find her washing clothes by the sea; on the following day they attack the Norman castle and carry out the long-delayed retribution.

Gudrun is composed in stanzas similar to those of the *Nibelungenlied*, except that the last line of each stanza does not contain the extra accented syllable characteristic of the *Nibelungen* metre.

The best editions are by K. Bartsch (4th ed., 1880), B. Symons (1883) and E. Martin (2nd ed., 1901). A translation into English by M. P. Nichols appeared at Boston, U.S.A., in 1889.

GUÉBRIANT, JEAN BAPTISTE BUDES, COMTE DE (1602–1643), marshal of France, was born near St. Brieuc on Sept. 2, 1602, of an old Breton family. In the Thirty Years' War he commanded (1638–39) the French contingent in the army of Bernard of Saxe-Weimar. Upon the death of Bernard he received the command of his army, and tried, in conjunction with J. Baner (1596–1641), the Swedish general, a bold attack upon Regensburg (1640). His victories of Wolfenbiittel (1641) and Kempen (1642) won for him the marshal's bâton. He was mortally wounded at Rottweil on Nov. 17, 1643. See A. Brinzinger in *Württembergische Vierteljahrschrift für* Landesgeschichte (1902); Vicomte de Noailles, Le *Maréchal* de *Guébriant* (1913).

GUEBWILLER (Ger. *Gebweiler*), capital of an arrondissement in the department of Haut Rhin (Alsace-Lorraine), France, at the foot of the Vosges, on the Lauch, 13 mi. S. of Colmar. Pop. (1936) 10,577. From the 8th century it belonged to the religious foundation of Murbach. The town was ravaged during the Thirty Years' War and in 1789 the monastic buildings were laid in ruins. Occupied by the French in World War I, it was retaken by the Germans during World War II. The church of St. Leodgar dates from the 12th century; the old Dominican convent is used as a market and concert hall. The chief industries are spinning and dyeing, and manufacture of cloth and machinery; quarrying is carried on and the town is celebrated for its white wines. It has a sub-prefecture.

GUEDALLA, PHILIP (1889–), English author, was born March 12, 1889. He was educated at Oxford university and practised law for a time after his graduation, but retired from the profession in 1923 to devote his time to writing. He ran for parliament as a member of the Labour party a number of times. In 1940 he was made chairman of the Latin-American section of the British Ministry of Information.

Guedalla wrote a number of histories and biographies which had wide popular appeal. Among his best-known books are a biography of Wellington, *The* Duke (1931); The *Hundred* Years (1936); The *Hundredth Year* (1940) and a biography of Britain's World War II prime minister, *Mr. Churchill* (1941).

GUELDER ROSE, so-called from Guelderland, its assumed source, is commonly called snowball or snowball bush in the United States. It is *Viburnum opulus sterilis*, a sterile-flowered variety of the cranberry tree (V. *opulus*) which is native throughout the north temperate zone. The guelder rose is much cultivated for its showy, spring-flowering, ball-like clusters of white, sterile flowers; but, lacking fruit, it does not have the showy autumnal colour of the red berries of the cranberry tree. See VIBURNUM.

GUELPH, a city of Ontario, Canada, 45 mi. W. of Toronto, on the river Speed and the Canadian National steam and electric and Canadian Pacific railways. Pop. (1941) 23,273. It is a fine agricultural centre, and exports grain, fruit and livestock. It contains the Ontario Agricultural college. The river affords abundant waterpower for flour mills, sawmills, woollen mills and numerous factories. The city contains the only linen mill in Canada.

GUELPHS AND GHIBELLINES, originally the names of two German parties formed in the 12th century around the families to which respectively belonged the dukes of Saxony and Bavaria and the lords of Hohenstaufen. The rivalry between these two families determined much of the history of Germany in the 12th century, and the names in question were employed at an early date in Italy, where the Ghibellines formed the party of the emperor Frederick I, and the Guelphs formed the party opposed to him. In the next century the terms acquired a wider sense; the Ghibellines still formed the Imperialist party, but the term Guelph lost all trace of its original association with dynastic rivalries in Germany and became applied to the supporters of the papacy in its struggle against the empire. Long after this struggle had become a matter of history these names survived in Italian civic politics, ofteq denoting factions whose origin had no real connection with the rivalry of empire and papacy in an earlier age.

Of the terms themselves, Guelph represents the old German personal name *Hwelp*, originally perhaps a nickname (it corresponds to the English word "whelp"), but borne by many persons of rank, notably Welf, duke of Bavaria in the 11th century. Ghibelline is a form of the place-name, Waiblingen, an ancient possession of the lords Hohenstaufen, and not far from the castle of that name.

GUENEVERE, the wife of Ring Arthur. Geoffrey of Monmouth, who calls her Guanhumara, makes her a Roman lady, but the general tradition is that she was of Cornish birth and daughter to King Leodegrance. Wace, who, while translating Geoffrey, evidently knew and used popular tradition, combines these two, asserting that she was of Roman parentage on the mother's side but cousin to Cador of Cornwall, by whom she was brought up. The tradition relating to Guenevere is decidedly confused: the Welsh

Triads know no fewer than three Gwenhwyfars. Giraldus Cambrensis, relating the discovery of the royal tombs at Glastonbury, states that the body found was that of Arthur's second wife. The prose *Merlin* gives Guenevere a bastard half-sister of the same name, who strongly resembles her, and the prose *Lancelot* relates how this lady, trading on the likeness, persuades Arthur that she is the true Guenevere, and the queen the bastard supplanter. This episode of the false Guenevere is very perplexing. The relations with early Irish tradition, where the name appears as Findabhair (Guenevere) add another element to the confusion.

To the majority of English readers Guenevere is best known in connection with her liaison with Lancelot, a story which forms no part of the early Arthurian tradition. The Lancelot-Guenevere romance took form and shape in the latter part of the 12th century, amid the artificial atmosphere encouraged by such patronesses of literature as Eleanor of Aquitaine and her daughter Marie, Comtesse de Champagne (for whom Chrétien de Troyes wrote his *Chevalier de la Charrette,* where Lancelot first appears as Guenevere's lover), and reflects the low social morality df a time when love between husband and wife was declared impossible. The tradition of Guenevere's infidelity is, however, of much earlier date, and probably formed part of the genuine Arthurian tradition. The stories vary; sometimes she is the unwilling victim of an abduction, sometimes she figures in a guilty flight with her lover. The *Vita Gildae* relates how she was carried off by Melwas, king of Aestiva Regis (Somerset), to Glastonbury, whither Arthur, at the head of an army, pursued the ravisher. A fragment of a Welsh poem seems to confirm this tradition, which certainly lies at the root of the story of her abduction by Meleagant, told by Malory. In the *Lanzelet* of Ulrich von Zatzikhoven the abductor is Falerin, a magician. The story in these forms represents an other-world abduction. A curious fragment of Welsh dialogue, printed by Sir John Rhys, appears to represent Kay as the abductor. In the chronicles, and the romances based upon them, the abductor is Mordred, and the queen is no unwilling victim. On the final defeat of her lover she retires to a convent, where she takes the veil and is no more heard of; Wace says, emphatically:

ne fu oie ne véue,
ne fu trovée, ne séue,
por la vergogne del mesfait
et del pecié qu'ele avoit fait (11, 13,627–30)

Layamon, who certainly utilized insular tradition, says that she was reported to have drowned herself, and that her memory and that of Mordred were hateful in every land, so that none would offer prayer for their souls. The truth seems to be that we are dealing here with a mixture of mythic elements and pseudo-historic tradition. The story of Guenevere's abduction belongs to the former, that of her betrayal of her husband, with a near relative, and consequent flight, to the latter.

See Sir J. Rhys, *Studies on the Arthurian Legend* (1891); J. L. Weston, *The Legend of Sir Lancelot* (1901); R. S. Loomis, *Celtic Myth and Arthurian Romance* (1928). (J. L. W.)

GUENON (gą̄′-nǫ̇n), the name applied to the monkeys of the African genus *Cercopithecus,* the Ethiopian representatives of the Asiatic macaques.

GUERET, a town of central France, capital of the department of Creuse, situated 48 m. N.E. of Limoges on the Orleans railway. Pop. (1936) 7,726. Guéret grew up round an abbey founded in the 7th century, and in later times became the capital of the district of Marche. The Hôtel des Monneyroux (used as a prefecture), a mansion of the 15th century, is the only building of importance. It is the seat of a prefect and a court of assizes, and has a tribunal of first instance, and a chamber of commerce. The industries include leather-making and the manufacture of basket-work, tiles, hosiery and wooden shoes, and there is trade in agricultural produce and cattle.

GUEREZA, a long-tailed black and white Abyssinian monkey, *Colobus guereza,* characterized by a long pendent mantle of white hair; the name is sometimes extended to embrace all the African thumbless monkeys of the genus *Colobus.* These are the African representatives of the Indo-Malay langurs (*Semnopithecus),* with which they agree in their slender build, long limbs and tail, although differing by the rudimentary thumb.

GUERICKE, OTTO VON (1602–1686), German natural philosopher, was born at Magdeburg, in Prussian Saxony, on Nov. 20, 1602. Having studied law and mathematics in Germany and at Leyden, he visited France and England, and in 1636 became engineer-in-chief at Erfurt. In 1627 he was elected alderman of Magdeburg, and in 1646 mayor of that city and a magistrate of Brandenburg. His leisure was devoted to scientific pursuits, especially in pneumatics. Incited by the discoveries of Galileo, Pascal and Torricelli, he attempted the creation of a vacuum. After a number of partially successful experiments he invented the air-pump (1650). Besides investigating other phenomena connected with a vacuum, he constructed an electrical machine which depended on the electrification of a rotating ball of sulphur; and he made successful researches in astronomy, predicting the periodicity of the return of comets. In 1681 he gave up office, and retired to Hamburg, where he resided until his death on May 11, 1686.

His principal observations are given in his work, *Experimenta nova, ut vocant, Magdeburgica de vacuo spatio* (Amsterdam, 1672). He is also the author of a *Geschichte der Belagerung und Eroberung von Magdeburg. See F. W.* Hoffmann, *Otto von Guericke* (1874).

GUERIDON, a small table to hold a lamp or vase, supported by a tall column or a human or mythological figure. This piece of furniture, often very graceful and elegant, originated in France towards the middle of the 17th century. In the beginning the table was supported by a negro or some exotic figure, and there is some reason to believe that it took its name from the generic appellation of the young African groom or '(tiger," who was generally called "Guéridon," or as we should say in English "Sambo."

GUERILLA: *see* GUERRILLA.

GUERIN, PIERRE NARCISSE, BARON (1774–1833), French painter, was born at Paris on May 13, 1774, a pupil of Jean Baptiste Regnault. "Marcus Sextus" (Louvre), exhibited at the Salon of 1799, brought him before the public and excited enthusiasm partly due to the subject,—a victim of Sulla's proscription returning to Rome to find his wife dead and his house in mourning—in which an allusion was found to the actual situation of the *émigrés.* In 1802 Guérin produced "Phaedra and Hippolytus" (Louvre); in 1810, after his return to Paris from Rome where he studied two years he again achieved a great success with "Andromache and 'Pyrrhus" (Louvre). Guérin's success was ensured by the skilful selection of highly melodramatic situations, treated with the strained and pompous dignity proper to the art of the first empire. He died on July 16, 1833.

See Julius Meyer, *Geschichte der französischen Malerei* (1867).

GUÉRIN DU CAYLA, GEORGES MAURICE DE (1810–1839), French poet, was born at the château of Le Cayla in Languedoc. He joined for a short time the group formed by Lamennais (*q.v.*) at La Chênaie. Early in 1833 he went to Paris, where he taught at the Collège Stanislas. In Nov. 1838 he married a Creole lady of some fortune. He died on July 19, 1839. In the *Revue des deux mondes* for May 15, 1840, there appeared a notice of Maurice de Guérin by George Sand, to which she added two fragments of his writings—one a composition in prose entitled the *Centaur,* and the other a short poem. His *Reliquiae* (2 vols., 1861), including the *Centaur,* his journal, a number of his letters and several poems, was edited by G. S. Trébutien, and accompanied with a biographical and critical notice by Sainte-Beuve. A new edition, with the title *Journal, lettres* et *poèmes,* followed in 1862; and an English translation of it was published at New York in 1867. Though Maurice de Guérin was essentially a poet, his prose is more striking and original than his poetry. Its peculiar and unique charm arises from his strong and absorbing passion for nature, a passion of pagan intensity.

The name of EUGÉNIE DE GUÉRIN (1805–48), sister of Maurice de Guérin, was closely associated with her brother's work. Her *Journals* (1861, Eng. trans., 1865) and her *Lettres* (1864, Eng. trans., 1865) indicated the possession of gifts of as rare an order as his, though of a different kind. In her case mysticism assumed a form more strictly religious, and she continued to

mourn her brother's loss of his early Catholic faith. She died on May 31, 1848.

See the notices by George Sand and Sainte-Beuve referred to above; Sainte-Beuve, *Causeries du lundi* (vol. xii.) and *Nouveaux Lundis* (vol. iii.); G. Merlet, *Causeries sur les femmes et les livres* (1865); Selden, *L'Esprit des femmes de notre temps* (1864); Marelle, *Eugénie et Maurice de Guérin* (Berlin, 1869); Harriet Parr, *M. and E. de Guérin, a monograph* (1870); and Matthew Arnold's essays on Maurice and Eugénie de Guérin, in his *Essays in Criticism.*

GUERNIERI or **WERNER** (*fl.* 1350), a celebrated mercenary captain, was a member of the family of the dukes of Urslingen. He served the Pisans (1340–43), but afterwards collected a troop of adventurers which he called the Great Company, and with which he plundered Tuscany and Lombardy. He then entered the service of Louis I. the Great, king of Hungary and Poland, whom he assisted to obtain possession of Naples. When dismissed from this service his ravages culminated in the sack of Anagni in 1358. He is said to have worn a breastplate with the inscription, "The enemy of God, of pity and of mercy."

GUERNSEY, the second largest of the Channel islands, and the westernmost of the important members of the group, its chief town, St. Peter Port, on the east coast (in 2° 33' W., 49° 27' N.) being 30 mi. from the nearest French coast to the east. The island, roughly triangular, is $9\frac{1}{4}$ mi. long from N.E. to S.W. and has an extreme breadth of $5\frac{1}{4}$ mi. and an area of 24.46 sq.mi. Pop. (1931) with associated islands 42,138, excluding visitors. The island was occupied by German forces June 30, 1940, after the fall of France. Many civilians and the garrison had been evacuated.

The island is flat and low in the north, but rises gradually to a plateau (height above 300 ft.) in the south. The fracturing of the granitic rocks has resulted in steep-sided valleys and rectangular bays, separated from one another by rocky headlands. The scenery of the south coast, with the bays of Moulin Huet, Saints and Petit Bot is noted. The west side of the island has a gradual slope and longer, wider valleys with a low, rocky coast and open bays (Rocquaine, Perelle, Vazon, Cobo, etc.) exposed to the Atlantic. On the sheltered eastern side are the two ports, St. Peter Port and St. Sampson, the harbour of St. Sampson being the remnant of an arm of the sea, which formerly isolated the Vale and L'Ancresse in the N.E. from the rest of the island.

The soil is generally a light sandy loam. Its fertility was formerly maintained by the use of "vraic" or seaweed. This plant has its place in the folklore and traditional festivals of the island and the cutting of it, both for manure and fuel, is still regulated by law. The climate is mild and equable and the annual sunshine record is high, averaging 1,905 hours In consequence, the island is popular as a winter. as well as summer, resort.

The typical form of settlement in Guernsey is that of separate farms, but there are old hamlets in the valleys and around some churches which were formerly related to open fields with communal cultivation. The origin of settlement in the island is obscure, but it is a region rich in megalithic monuments of Armorican type and most of the churches are definitely on sites of prehistoric sanctity. Celtic saints have left their trace in legend and dedication; there is also a Norse element in the population. About the 11th century, most of the land was apportioned to Norman manors, but the usual organization became modified owing to absentee lords. Fishing supplemented cultivation, and in the 17th and 18th centuries, Guernsey developed maritime adventure, including privateering for the English kings against the French during the frequent wars. The introduction of root crops (parsnips) and, with them, of a deep plough and associated agricultural co-operation, brought agricultural prosperity, but the end of privateering with the peace of 1815, meant a crisis for Guernsey in spite of its ships and shipyards and its utilization as a place for storage and maturation of southern wines. In the mid-19th century, a great local effort led to building of harbours preluding the development of rapid communications. Owing to its slope northward and its somewhat exposed position, Guernsey is not warm enough in summer to grow grapes and tomatoes intensively in the open. It therefore specializes in cultivation under glass and large areas are covered with glasshouses. Of the male population, 34.5% are agriculturalists. Guernsey has a separate herd of dairy cattle of great value. Some stone. which is quarried in the neighbourhood of St. Sampson, is shipped from that port, but the stone trade is on the decline.

Guernsey is united with Alderney, Sark, Herm and the adjacent islets to form the bailiwick of Guernsey, separate from Jersey (*see* CHANNEL ISLANDS for constitution). Guernsey is divided into ten parishes with St. Peter Port, its chief town, as one. The population of St. Peter Port in 1931 was 16.318, excluding visitors. The population of the bailiwick of Guernsey nearly doubled between 1821 and 1901. There is good Romanesque work in the church of St. Michael, Vale, and the church of St. Peter Port is a notable building. Remains of monastic buildings are seen at Vale and on Lihou island, north of Rocquaine bay.

GUERRAZZI, FRANCESCO DOMENICO (1804–1873), Italian publicist and patriot, born at Leghorn on Aug. 12. 1804, was educated for the law at Pisa, and began to practise in his native place. Mazzini made his acquaintance, and with Carlo Bini they started a paper. the *Indicatore*, at Leghorn in 1829. which was quickly suppressed. Guerrazzi himself had to endure several terms of imprisonment for his activity in the cause of Young Italy, and his most famous novel *Assedio di Firenze* (1834) was written in prison. He was the most powerful Liberal leader at Leghorn, and in 1848 became a minister, with some idea of exercising a moderating influence in the difficulties with the grand-duke of Tuscany. In 1849, when the latter fled, he was first one of the triumvirate with Mazzini and Montanelli, and then dictator, but on the restoration he was arrested and imprisoned for three years. His *Apologia* was published in 1852. He was exiled to Corsica. On his return he became a deputy at Turin (1862–1870). He died at Leghorn on the 25th of September 1873. His works include the novels *Isabella Orsini* (1845) and *Beatrice Cenci* (1854). His *Opere* were collected at Milan (1868).

See Carducci's edition of his letters (1880–82, 2 vols.); Guastalla, *La vita e le opere di F. D. Guerrazzi, 1804–35* (1903), and Busolli, F. *D. Guerrazzi* (1912).

GUERRERO, FRANCISCO (*c.* 1528–1599), Spanish composer, was born at Seville about 1528. He became a pupil of Morales and was one of the most important of the Spanish group who came under Italian influence in the second half of the 16th century. At eighteen he was made maestro de capilla at Jaen. His next appointment was at Malaga, and in 1554 he became maestro de capilla of Seville cathedral. He died on Nov. 8, 1599. Many of his works have been preserved, the most important being: a volume of *Sacrae cantiones* for 4 and 5 voices (1555); *Magnificats* (Louvain 1563); *Liber primus Missarum F. Guerrero Hispalensis Odei phonasco autore* (Paris, Du Chemin 1566), containing 4 masses in 5 parts, 5 masses in 4 parts, motets in 5 and 6 parts and a *Pater noster* in 8 parts (a copy of this is in the Imperial library, Vienna); motets, published in Vienna 1570, 1589; masses, published in Rome 1582. Eslava's famous collection: *Lira sacro-hispana* (1869) contains Guerrero's Passion according to St. Matthew for four voices and the Passion according to St. John for five voices, 3 motets for 5 voices and a four-part mass. For a complete list, *see* Eitner: *Quellenlexikon. See* also the article *Guerrero* by J. R. Sterndale-Bennett in Grove's Dictionary.

GUERRERO, a Pacific coast State of Mexico, bounded north-west by Michoacán, north by Mexico (State) and Morelos, north-east and east by Puebla and Oaxaca, and south and west by the Pacific. Area, 24,885 sq. miles. Pop., largely composed of Indians and mestizos (1930), 641,690. The State is roughly broken by the Sierra Madre del Sur and its spurs, which cover its entire surface with the exception of the low coastal plain (averaging about 20m. in width) on the Pacific. The valleys are usually narrow, fertile and heavily forested, but difficult of access. The State is divided into two distinct zones—the *tierras calientes* of the coast and lower river courses where tropical conditions prevail, and the *tierras templadas* of the mountain region where the conditions are sub-tropical. The latter is celebrated for its agreeable and healthy climate, and for the variety and character of its products. The principal river of the State is the Rio de las Balsas or Mescala, which, having its source in Tlaxcala, flows entirely across the State from west to east, and then southward to the Pacific on

the frontier of Michoacán. This river is 429m. long and receives many affluents from the mountainous region through which it passes, but its course is very precipitous and its mouth obstructed by sand bars. The agricultural products include cotton, coffee. tobacco and cereals, and the forests produce rubber, vanilla and various textile fibres. Mining is undeveloped, although the mineral resources of the State include silver, gold, mercury, lead, iron, coal, sulphur and precious stones. The capital, Chilpancingo or Chilpancingo de los Bravos (pop. [1921] 5,955), is a small town in the Sierra Madre about 110m. from the coast and zoom. S. of the Federal capital. It is a well-built town on the old Acapulco road. and is celebrated in the history of Mexico as the meeting-place of the revolutionary congress of 1813, which issued a declaration of independence. Chilpancingo was badly damaged by an earthquake in January 1902 and 1907. Other important towns are Tixtla de Guerrero, formerly the capital (pop. [1921] 5,512), 3m. N.E. of Chilpancingo; Chilapa (pop. [1921] 7,510), Iguala (pop. [1921] 10,855) and Acapulco (*q.v.*).

GUERRILLA, a term currently used to denote war carried on by bands in any irregular and unorganized manner; erroneously written "guerilla," being the diminutive of the Span. *guerra,* war. The position of irregular combatants was one of the subjects dealt with at the Peace Conference of 1899, and the rules there adopted were reaffirmed at the conference of 1907. They provide that irregular bands in order to enjoy recognition as belligerent forces shall (a) have at their head a person responsible for his subordinates, (b) wear some fixed distinctive badge recognizable at a distance, *(c)* carry arms openly and (d) conform in their operations to the laws and customs of war. The rules, however, also provide that in case of invasion the inhabitants of a territory who on the approach of the invading enemy spontaneously take up arms to resist it, shall be regarded as belligerent troops if they carry arms openly and respect the laws and customs of war, although they may not have had time to become organized in accordance with the above provisions. These rules were borrowed almost word for word from the project drawn up at the Brussels international conference of 1874, which, though never ratified, was practically incorporated in the army regulations issued by the Russian government in connection with the war of 1877–78. *Cf.* BRIGANDAGE. (T. B.)

SCIENCE OF GUERRILLA WARFARE

This study of the science of guerrilla, or irregular, warfare is based on the concrete experience of the Arab Revolt against the Turks 1916–1918. But the historical example in turn gains value from the fact that its course was guided by the practical application of the theories here set forth.

The **Arab** Revolt began in June, 1916, with an attack by the half-armed and inexperienced tribesmen upon the Turkish garrisons in Medina and about Mecca. They met with no success, and after a few days' effort withdrew out of range and began a blockade. This method forced the early surrender of Mecca, the more remote of the two centres. Medina, however, was linked by railway to the Turkish main army in Syria, and the Turks were able to reinforce the garrison there. The Arab forces which had attacked it then fell back gradually and took up a position across the main road to Mecca.

At this point the campaign stood still for many weeks. The Turks prepared to send an expeditionary force to Mecca, to crush the revolt at its source, and accordingly moved an army corps to Medina by rail. Thence they began to advance down the main western road from Medina to Mecca, a distance of about 250 miles. The first 50 miles were easy, then came a belt of hills 20 miles wide, in which were Feisal's Arab tribesmen standing on the defensive: next a level stretch, for 70 miles along the coastal plain to Rabegh, rather more than half-way. Rabegh is a little port on the Red Sea, with good anchorage for ships, and because of its situation was regarded as the key to Mecca. Here lay Sherif Ali, Feisal's eldest brother, with more tribal forces, and the beginning of an Arab regular army, formed from officers and men of Arab blood who had served in the Turkish Army. As mas almost inevitable in view of the general course of military thinking since Napoleon, the soldiers of all countries looked only to the regulars to win the war. Military opinion was obsessed by the dictum of Foch that the ethic of modern war is to seek for the enemy's army, his centre of power, and destroy it in battle. Irregulars would not attack positions and so they were regarded as incapable of forcing a decision.

While these Arab regulars were still being trained, the Turks suddenly began their advance on Mecca. They broke through the hills in 24 hours, and so proved the second theorem of irregular war—namely, that irregular troops are as unable to defend a point or line as they are to attack it. This lesson was received without gratitude, for the Turkish success put the Rabegh force in a critical position, and it was not capable of repelling the attack of a single battalion, much less of a corps.

In the emergency it occurred to the author that perhaps the virtue of irregulars lay in depth, not in face, and that it had been the threat of attack by them upon the Turkish northern flank which had made the enemy hesitate for so long. The actual Turkish flank ran from their front line to Medina, a distance of some 50 miles: but, if the Arab force moved towards the Hejaz railway behind Medina, it might stretch its threat (and, accordingly, the enemy's flank) as far, potentially, as Damascus, 800 miles away to the north. Such a move would force the Turks to the defensive, and the Arab force might regain the initiative. Anyhow, it seemed the only chance, and so, in Jan. 1917, Feisal's tribesmen turned their backs on Mecca, Rabegh and the Turks, and marched away north 200 miles to Wejh.

This eccentric movement acted like a charm. The Arabs did nothing concrete, but their march recalled the Turks (who were almost into Rabegh) all the way back to Medina. There, one half of the Turkish force took up the entrenched position about the city, which it held until after the Armistice. The other half was distributed along the railway to defend it against the Arab threat. For the rest of the war the Turks stood on the defensive and the Arab tribesmen won advantage over advantage till, when peace came, they had taken 35,000 prisoners, killed and wounded and worn out about as many, and occupied 100,000 square miles of the enemy's territory, at little loss to themselves. However, although Wejh was the turning point its significance was not yet realized. For the moment the move thither was regarded merely as a preliminary to cutting the railway in order to take Medina, the Turkish headquarters and main garrison.

Strategy **and** Tactics.--However, the author was unfortunately as much in charge of the campaign as he pleased, and lacking a training in command sought to find an immediate equation between past study of military theory and the present movements—as a guide to, and an intellectual basis for, future action. The text books gave the aim in war as "the destruction of the organized forces of the enemy" by "the one process battle." Victory could only be purchased by blood. This was a hard saying, as the Arabs had no organized forces, and so a Turkish Foch would have no aim: and the Arabs would not endure casualties, so that an Arab Clausewitz could not buy his victory. These wise men must be talking metaphors, for the Arabs were indubitably winning their war . . . and further reflection pointed to the deduction that they had actually won it. They were in occupation of 99% of the Hejaz. The Turks were welcome to the other fraction till peace or doomsday showed them the futility of clinging to the window pane. This part of the war was over, so why bother about Medina? The Turks sat in it on the defensive, immobile, eating for food the transport animals which were to have moved them to Mecca, but for which there was no pasture in their now restricted lines. They were harmless sitting there; if taken prisoner, they would entail the cost of food and guards in Egypt: if driven out northward into Syria, they would join the main army blocking the British in Sinai. On all counts they were best where they were, and they valued Medina and wanted to keep it. Let them!

This seemed unlike the ritual of war of which Foch had been priest, and so it seemed that there was a difference of kind. Foch called his modern war "absolute" In it two nations professing

incompatible philosophies set out to try them in the light of force. A struggle of two immaterial principles could only end when the supporters of one had no more means of resistance. An opinion can be argued with: a conviction is best shot. The logical end of a war of creeds is the final destruction of one, and Salammbo the classical textbook-instance. These were the lines of the struggle between France and Germany, but not, perhaps, between Germany and England, for all efforts to make the British soldier hate the enemy simply made him hate war. Thus the "absolute war" seemed only a variety of war; and beside it other sorts could be discerned, as Clausewitz had numbered them, personal wars for dynastic reasons, expulsive wars for party reasons, commercial wars for trading reasons.

Now the Arab aim was unmistakably geographical, to occupy all Arabic-speaking lands in Asia. In the doing of it Turks might be killed, yet "killing Turks" would never be an excuse or aim. If they would go quietly, the war would end. If not, they must be driven out: but at the cheapest possible price, since the Arabs were fighting for freedom, a pleasure only to be tasted by a man alive. The next task was to analyse the process, both from the point of view of strategy. the aim in war, the synoptic regard which sees everything by the standard of the whole, and from the point of view called tactics, the means towards the strategic end, the steps of its staircase. In each were found the same elements, one algebraical, one biological, a third psychological. The first seemed a pure science, subject to the laws of mathematics, without humanity. It dealt with known invariables, fixed conditions, space and time, inorganic things like hills and climates and railways, with mankind in type-masses too great for individual variety, with all artificial aids, and the extensions given our faculties by mechanical invention. It was essentially formulable.

In the Arab case the algebraic factor would take first account of the area to be conquered. A casual calculation indicated perhaps 140,000 square miles. How would the Turks defend all that—no doubt by a trench line across the bottom, if the Arabs were an army attacking with banners displayed . . . but suppose they were an influence, a thing invulnerable, intangible, without front or back, drifting about like a gas? Armies were like plants, immobile as a whole, firm-rooted, nourished through long stems to the head. The Arabs might be a vapour, blowing where they listed. It seemed that a regular soldier might be helpless without a target. He would own the ground he sat on, and what he could poke his rifle at. The next step was to estimate how many posts they would need to contain this attack in depth, sedition putting up her head in every unoccupied one of these 100,000 square miles. They would have need of a fortified post every four square miles, and a post could not be less than 20 men. The Turks would need 600,000 men to meet the combined ill wills of all the local Arab people. They had 100,000 men available. It seemed that the assets in this sphere were with the Arabs, and climate, railways, deserts, technical weapons could also be attached to their interests. The Turk was stupid and would believe that rebellion was absolute, like war, and deal with it on the analogy of absolute warfare.

Humanity in Battle.—So much for the mathematical element; the second factor was biological, the breaking-point, life and death, or better, wear and tear. Bionomics seemed a good name for it. The war-philosophers had properly made it an art. and had elevated one item in it, "effusion of blood," to the height of a principle. It became humanity in battle, an art touching every side of our corporal being. There was a line of variability (man) running through all its estimates. Its components were sensitive and illogical, and generals guarded themselves by the device of a reserve, the significant medium of their art. Goltz had said that when you know the enemy's strength, and he is fully deployed, then you know enough to dispense with a reserve. But this is never. There is always the possibility of accident, of some flaw in materials, present in the general's mind: and the reserve is untonsciously held to meet it. There is a "felt" element in troops, not expressible in figures, and the greatest commander is he whose intuitions most nearly happen. Nine-tenths of tactics are certain, and taught in books: but the irrational tenth is like the kingfisher flashing across the pool and that is the test of generals. It can only be ensued by instinct, sharpened by thought practising the stroke so often that at the crisis it is as natural as a reflex.

Yet to limit the art to humanity seemed an undue narrowing down. It must apply to materials as much as to organisms. In the Turkish Army materials were scarce and precious, men more plentiful than equipment. Consequently the cue should be to destroy not the army but the materials. The death of a Turkish bridge or rail, machine or gun, or high explosive was more profitable than the death of a Turk. The Arab army just then was equally chary of men and materials: of men because they being irregulars were not units, but individuals, and an individual casualty is like a pebble dropped in water: each may make only a brief hole, but rings of sorrow widen out from them. The Arab army could not afford casualties. Materials were easier to deal with. Hence its obvious duty to make itself superior in some one branch, guncotton or machine guns, or whatever could be most decisive. Foch had laid down the maxim, applying it to men, of being superior at the critical point and moment of attack. The Arab army might apply it to materials. and be superior in equipment in one dominant moment or respect.

For both men and things it might try to give Foch's doctrine a negative twisted side, for cheapness' sake, and be weaker than the enemy everywhere except in one point or matter. Most wars are wars of contact, both forces striving to keep in touch to avoid tactical surprise. The Arab war should be a war of detachment: to contain the enemy by the silent threat of a vast unknown desert, not disclosing themselves till the moment of attack. This attack need be only nominal, directed not against his men, but against his materials: so it should not seek for his main strength or his weaknesses, but for his most accessible material. In railway cutting this would be usually an empty stretch of rail. This was a tactical success. From this theory came to be developed ultimately an unconscious habit of never engaging the enemy at all. This chimed with the numerical plea of never giving the enemy's soldier a target. Many Turks on the Arab front had no chance all the war to fire a shot, and correspondingly the Arabs were never on the defensive, except by rare accident. The corollary of such a rule was perfect "intelligence," so that plans could be made in complete certainty. The chief agent had to be the general's head (de Feuquière said this first), and his knowledge had to be faultless, leaving no room for chance. The headquarters of the Arab army probably took more pains in this service than any other staff.

The Crowd in Action.—The third factor in command seemed to be the psychological, that science (Xenophon called it diathetic) of which our propaganda is a stained and ignoble part. It concerns the crowd, the adjustment of spirit to the point where it becomes fit to exploit in action. It considers the capacity for mood of the men, their complexities and mutability, and the cultivation of what in them profits the intention. The command of the Arab army had to arrange their men's minds in order of battle, just as carefully and as formally as other officers arranged their bodies: and not only their own men's minds, though them first: the minds of the enemy, so far as it could reach them: and thirdly. the mind of the nation supporting it behind the firing-line, and the mind of the hostile nation waiting the verdict, and the neutrals looking on.

It was the ethical in war, and the process on which the command mainly depended for victory on the Arab front. The printing press is the greatest weapon in the armoury of the modern commander, and the commanders of the Arab army being amateurs in the art, began their war in the atmosphere of the 20th century, and thought of their weapons without prejudice, not distinguishing one from another socially. The regular officer has the tradition of 40 generations of serving soldiers behind him, and to him the old weapons are the most honoured. The Arab command had seldom to concern itself with what its men did, but much with what they thought, and to it the diathetic was more than half command. In Europe it was set a little aside and entrusted to men outside the General Staff. But the Arab army

was so weak physically that it could not let the metaphysical weapon rust unused It had won a province when the civilians in it had been taught to die for the ideal of freedom: the presence or absence of the enemy was a secondary matter.

These reasonings showed that the idea of assaulting Medina, or even of starving it quickly into surrender, was not in accord with the best strategy. Rather, let the enemy stay in Medina, and in every other harmless place, in the largest numbers. If he showed a disposition to evacuate too soon, as a step to concentrating in the small area which his numbers could dominate effectively, then the Arab army would have to try and restore his confidence, not harshly, but by reducing its enterprises against him. The ideal was to keep his railway just working, but only just, with the maximum of loss and discomfort to him.

The Turkish army was an accident, not a target. Our true strategic aim was to seek its weakest link, and bear only on that till time made the mass of it fall. The Arab army must impose the longest possible passive defence on the Turks (this being the most materially expensive form of war) by extending its own front to the maximum. Tactically it must develop a highly mobile, highly equipped type of force, of the smallest size, and use it successively at distributed points of the Turkish line, to make the Turks reinforce their occupying posts beyond the economic minimum of 20 men The power of this striking force would not be reckoned merely by its strength. The ratio between number and area determined the character of the war, and by having five times the mobility of the Turks the Arabs could be on terms with them with one-fifth their number.

Range over Force.—Success was certain, to be proved by paper'and pencil as soon as the proportion of space and number had been learned. The contest was not physical, but moral, and so battles were a mistake. All that could be won in a battle was the ammunition the enemy fired off. Napoleon had said it was rare to find generals willing to fight battles. The curse of this war was that so few could do anything else. Napoleon had spoken in angry reaction against the excessive finesse of the 18th century, when men almost forgot that war gave licence to murder. Military thought had been swinging out on his dictum for 100 years, and it was time to go back a bit again. Battles are impositions on the side which believes itself weaker, made unavoidable either by lack of land-room, or by the need to defend a material property dearer than the lives of soldiers. The Arabs had nothing material to lose, so they were to defend nothing and to shoot nothing. Their cards were speed and time, not hitting power, and these gave them strategical rather than tactical strength. Range is more to strategy than force. The invention of bully-beef had modified land-war more profoundly than the invention of gunpowder.

The British military authorities did not follow all these arguments, but gave leave for their practical application to be tried. Accordingly the Arab forces went off first to Akaba and took it easily. Then they took Tafileh and the Dead Sea; then Azrak and Deraa, and finally Damascus, all in successive stages worked out consciously on these theories. The process was to set up ladders of tribes, which should provide a safe and comfortable route from the sea-bases (Yenbo, Wejh or Akaba) to the advanced bases of operation. These were sometimes 300 miles away, a long distance in lands without railways or roads, but made short for the Arab Army by an assiduous cultivation of desert-power, control by camel parties of the desolate and unmapped wilderness which fills up all the centre of Arabia, from Mecca to Aleppo and Baghdad.

The Desert and the Sea.—In character these operations were like naval warfare, in their mobility, their ubiquity, their independence of bases and communications, in their ignoring of ground features, of strategic areas, of fixed directions, of fixed points. "He who commands the sea is at great liberty, and may take as much or as little of the war as he will": he who commands the desert is equally fortunate. Camel raiding-parties, self-contained like ships, could cruise securely along the enemy's land-frontier, just out of sight of his posts along the edge of cultivation. and tap or raid into his lines where it seemed fittest or easiest or most profitable, with a sure retreat always behind them into an element which the Turks could not enter.

Discrimination of what point of the enemy organism to disarrange came with practice. The tactics were always tip and run; not pushes, but strokes. The Arab army never tried to maintain or improve an advantage, but to move off and strike again somewhere else. It used the smallest force in the quickest time at the farthest place. To continue the action till the enemy had changed his dispositions to resist it would have been to break the spirit of the fundamental rule of denying him targets.

The necessary speed and range were attained by the frugality of the desert men, and their efficiency on camels. In the heat of summer Arabian camels will do about 250 miles comfortably between drinks: and this represented three days' vigorous marching. This radius was always more than was needed, for wells are seldom more than 100 miles apart. The equipment of the raiding parties aimed at simplicity, with nevertheless a technical superiority over the Turks in the critical department. Quantities of light machine guns were obtained from Egypt for use not as machine guns, but as automatic rifles, snipers' tools, by men kept deliberately in ignorance of their mechanism, so that the speed of action would not be hampered by attempts at repair. Another special feature was high explosives, and nearly every one in the revolt was qualified by rule of thumb experience in demolition work.

Armoured Cars.—On some occasions tribal raids were strengthened by armoured cars, manned by Englishmen. Armoured cars, once they have found a possible track, can keep up with a camel party. On the march to Damascus, when nearly 400 miles off their base, they were first maintained by a baggage train of petrol-laden camels, and afterwards from the air. Cars are magnificent fighting machines, and decisive whenever they can come into action on their own conditions. But though each has for main principle that of "fire in movement," yet the tactical employments of cars and camel-corps are so different that their use in joint operations is difficult. It was found demoralizing to both to use armoured and unarmoured cavalry tcgether.

The distribution of the raiding parties was unorthodox. It was impossible to mix or combine tribes, since they disliked or distrusted one another. Likewise the men of one tribe could not be used in the territory of another. In consequence, another canon of orthodox strategy was broken by following the principle of the widest distribution of force, in order to have the greatest number of raids on hand at once, and fluidity was added to speed by using one district on Monday, another on Tuesday, a third on Wednesday. This much reinforced the natural mobility of the Arab army, giving it priceless advantages in pursuit, for the force renewed itself with fresh men in every new tribal area, and so maintained its pristine energy. Maximum disorder was, in a real sense its equilibrium.

An Undisciplined Army.—The internal economy of the raiding parties was equally curious. Maximum irregularity and articulation were the aims. Diversity threw the enemy intelligence off the track. By the regular organization in identical battalions and divisions information builds itself up, until the presence of a corps can be inferred on corpses from three companies. The Arabs, again, were serving a common ideal, without tribal emulation, and so could not hope for any esprit de corps. Soldiers are made a caste either by being given great pay and rewards in money, uniform or political privileges; or, as in England, by being made outcasts, cut off from the mass of their fellow-citizens. There have been many armies enlisted voluntarily: there have been few armies serving voluntarily under such trying conditions, for so long a war as the Arab revolt. Any of the Arabs could go home whenever the conviction failed him. Their only contract was honour.

Consequently the Arab army had no discipline, in the sense in which it is restrictive, submergent of individuality, the Lowest Common Denominator of men. In regular armies in peace it means the limit of energy attainable by everybody present: it is the hunt not of an average, but of an absolute, a roo-per-cent standard, in which the 99 stronger men are played down to the

level of the worst. The aim is to render the unit a unit, and the man a type, in order that their effort shall be calculable, their collective output even in grain and in bulk. The deeper the discipline, the lower the individual efficiency, and the more sure the performance. It is a deliberate sacrifice of capacity in order to reduce the uncertain element, the bionomic factor, in enlisted humanity, and its accompaniment is *compound* or social war, that form in which the fighting man has to be the product of the multiplied exertions of long hierarchy, from workshop to supply unit, which maintains him in the field.

The Arab war, reacting against this, was *simple* and individual. Every enrolled man served in the line of battle, and was self-contained. There were no lines of communication or labour troops. It seemed that in this articulated warfare, the sum yielded by single men would be at least equal to the product of a compound system of the same strength, and it was certainly easier to adjust to tribal life and manners, given elasticity and understanding on the part of the commanding officers Fortunately for its chances nearly every young Englishman has the roots of eccentricity in him. Only a sprinkling were employed, not more than one per 1,000 of the Arab troops. A larger proportion would have created friction, just because they were foreign bodies (pearls if you please) in the oyster: and those who were present controlled by influence and advice, by their superior knowledge, not by an extraneous authority.

The practice was, however, not to employ in the firing line the greater numbers which the adoption of a "simple" system made available theoretically. Instead, they were used in relay: otherwise the attack would have become too extended. Guerrillas must be allowed liberal work-room. In irregular war if two men are together one is being wasted. The moral strain of isolated action makes this simple form of war very hard on the individual soldier, and exacts from him special initiative, endurance and enthusiasm. Here the ideal was to make action a series of single combats to make the ranks a happy zlliance of commanders-in-chief. The value of the Arab army depended entirely on quality, not on quantity. The members had to keep always cool, for the excitement of a blood-lust would impair their science, and their victory depended on a just use of speed, concealment, accuracy of fire. Guerrilla war is far more intellectual than a bayonet charge.

The Exact Science of Guerrilla Warfare. — By careful persistence, kept strictly within its strength and following the spirit of these theories. the Arab army was able eventually to reduce the Turks to helplessness, and complete victory seemed to be almost within sight when General Allenby by his immense stroke in Palestine threw the enemy's main forces into hopeless confusion and put an immediate end to the Turkish war. His too-greatness deprived the Arab revolt of the opportunity of following to the end the dictum of Saxe that a war might be won without fighting battles. But it can at least be said that its leaders worked by his light for two years, and the work stood. This is a pragmatic argument that cannot be wholly derided. The experiment, although not complete, strengthened the belief that irregular war or rebellion could be proved to be an exact science, and an inevitable success, granted certain factors and if pursued along certain lines.

Here is the thesis: Rebellion must have an unassailable base, something guarded not merely from attack, but from the fear of it: such a base as the Arab revolt had in the Red Sea ports, the desert, or in the minds of men converted to its creed. It must have a sophisticated alien enemy, in the form of a disciplined army of occupation too small to fulfil the doctrine of acreage: too few to adjust number to space, in order to dominate the whole area effectively from fortified posts. It must have a friendly population, not actively friendly, but sympathetic to the point of not betraying rebel movements to the enemy. Rebellions can be made by 2% active in a striking force, and 98% passively sympathetic. The few active rebels must have the qualities of speed and endurance, ubiquity and independence of arteries of supply. They must have the technical equipment to destroy or paralyze the enemy's organized communications, for irregular war is fairly Willisen's definition of strategy, "the study of communication," in its extreme degree, of attack where the enemy is not. In 50 words: Granted mobility, security (in the form of denying targets to the enemy), time, and doctrine (the idea to convert every subject to friendliness), victory will rest with the insurgents, for the algebraical factors are in the end decisive, and against them perfections of means and spirit struggle quite in vain.

(*T. E.* LA.)

GUERRINI, OLINDO (1845–1916), Italian poet, who wrote under the name of Lorenzo Stechetti, was born at Sant' Alberto, Ravenna, and became university librarian at Bologna, where he died on Oct. 21, 1916. His *Postuma* (1877), a volume of *canzoniere,* made him known as the leader of the "verist," as opposed to the idealistic, school of Italian lyrical poets. His poems were collected and published as *Rime* di *Lorenzo Stechetti* (1903).

GUESDE, JULES [Mathieu Basile] (1845–1922), French socialist, was born in Paris on Nov. 11, 1845. He had begun his career as a clerk in the French home office, but at the outbreak of the Franco-German War he was editing *Les Droits de I'homme* at Montpellier, and had to take refuge at Geneva in 1871 from a prosecution instituted on account of articles which had appeared in his paper in defence of the Commune. In 1876 he returned to France to become one of the chief French apostles of Marxian collectivism, and was imprisoned for six months in 1878 for taking part in the first Parisian International Congress. After the amnesty of 1878 he edited at different times *Les Droits de l'homme, Le Cri du peuple, Le Socialiste,* but his best-known organ was the weekly *Égalité.* He had been in close association with Paul Lafargue, and through him with Karl Marx, whose daughter he married. With Marx and Lafargue he drew up the collectivist and revolutionary programme accepted by the national congress of the Labour party at Havre in 1880, which laid stress on the formation of an international labour party working by revolutionary methods. Next year at the Reims congress the orthodox Marxian programme of Guesde was opposed by the "possibilists," who rejected the intransigeant attitude of Guesde for the "reformist" policy of Benoît Malon. At the congress of St. Étienne the difference developed into separation, those who refused all compromise with a capitalist government following Guesde, while the "reformists" formed several groups. Guesde took his full share in the consequent discussion between the Guesdists, the Blanquists, the possibilists, etc. In 1893 he was returned to the Chamber of Deputies for Lille (7th circonscription) with a large majority over the Christian Socialist and Radical candidates. He brought forward various proposals in social legislation forming the programme of the Labour party, without reference to the divisions among the Socialists, and on Nov. 20, 1894 succeeded in raising a two-days' discussion on the collectivist principle in the Chamber of Deputies.

In 1900 he fiercely opposed Jaurils, who advocated the participation of Socialists in the Government. In 1902 he was not re-elected, but resumed his seat in 1906. In 1903 there was a formal reconciliation at the Reims congress of the sections of the party, which then took the name of the Socialist party of France. Guesde, nevertheless, continued to oppose the opportunist policy of Jaurès, whom he denounced for supporting one bourgeois party against another. But he gradually lost ground, and many of his adherents joined the "reformist" section under Jaurils. His defence of the principle of freedom of association led him, incongruously enough, to support the religious Congregations against Émile Combes. During the World War he was minister without portfolio from August 1914 to October 1915. Besides the numerous political and socialist pamphlets written by Guesde. he also published during 1901 two volumes of his various speeches in the Chamber of Deputies entitled *Quatre ans de lutte de classes 1893–1898.* He died on July 28, 1922, at Saint Naudi (Charente-Inférieure).

Guesde's works were *Essai* de *Catéchisme socialiste* (1878); *Collectivisme et Socialisme* (1879); *Services publics et Socialisme* (1884); *Le Socialisme au jour le jour* (1899); and, with Sangnier, *Christianisme* et *Socialisme* (1905).

See Zévaès, *Les Guesdistes* (1911), and references under SOCIALISM.

GUEŠOV, IVAN EVSTRATIEV (1849–1924), Bulgarian politician, was born at Philippopolis in Feb. 1849. He was educated at Philippopolis, and at Owens college, Manchester. In 1872 he returned to Bulgaria. In 1877 he was arrested by the Turkish governor and condemned to death for political propaganda against Turkish rule, but was saved by the intervention of the British and American consuls. He then began to send accounts of the Turkish atrocities to the *Times* and the *Daily News* (London). In 1878 Guešov became general manager of the Bulgarian National bank at Sofia, and was minister of finance from 1894 to 1897. He was elected president of the Sobranie (National Assembly) in 1901 and became prime minister in March 1911. As such, he concluded the alliances which formed the basis of the Balkan Alliance of 1912. On May 30, 1913, owing to King Ferdinand's failure to support his moderate policy, which might have averted the second Balkan War, GueSov resigned. During World War I he retired from politics and became president of the Bulgarian Red Cross. He died at Sofia on March 11, 1924.

Guešov published well-documented accounts and defenses of his policy in two short but important works: *L'Alliance Balkanique* (1915; Eng. trans., *The Balkan League*, 1915) and *La Genèse* de *la Guerre Mondiale* (Berne, 1919).

GUEST, one who receives hospitality in the house of another (Ger. *Gast,* cognate with Lat. *hostis,* originally a stranger; in Class. Lat. an enemy; *cf.* host). "Guest" is also applied in biology to a parasite.

GUEST, KEEN AND NETTLEFOLDS, LIMITED. This British joint stock company was registered in 1900 to acquire the businesses of Guest and Co., ironmasters, steel-makers and colliery proprietors, and that of The Patent Nut and Bolt company Ltd. who, in addition to being ironmasters and colliery owners, manufacture iron and steel railway fastenings, etc. In 1902 the screw manufacturing firm of Nettlefolds Ltd. was acquired, and so the name of the company became Guest, Keen and Nettlefolds Ltd. In 1920 a controlling interest was acquired in John Lysaght Ltd., manufacturers of black and galvanized sheets, in Joseph Sankey and Sons Ltd., makers of panel sheets, steel furniture and parts for the motor trades, and in Bayliss, Jones and Bayliss, Ltd., makers of railway fastenings, fencing and telegraph ironwork. In 1921–24 control was taken of a number of important collieries. These are not directly owned, the company's interest being represented by shareholdings in Powell Duffryn collieries. In addition, the company has a considerable interest in Guest, Keen, Baldwin's Iron & Steel Co., Ltd. (Cardiff and Port Talbot), producing rails, plates, billets and sections, and in The Orconera Iron Ore Co., Ltd., at Bilbao, Spain.

In these operations the company employs (1939) an issued and fully paid share capital of more than £12,500,000, and there are debentures for £1,493,221.

The chief businesses amalgamated in this great company have a long and romantic history. The business of Guest and Co. was established in the 18th century, and was one of the pioneer firms in the manufacture of iron. Developments made it the largest producer of coal, iron and steel in South Wales. The Dowlais Iron Works, belonging to Guest and Co., was established as long ago as 1758. The first steel rails made by the Bessemer process were rolled at these works in 1865.

The Heath-street works at Birmingham were established by the late John Sutton Nettlefold in 1826. Joseph Chamberlain, father of the late Rt. Hon. Joseph Chamberlain, became a partner of his brother-in-law J. S. Nettlefold, in 1854. The late Rt. Hon. Joseph Chamberlain, M.P., also became a partner in the business but retired in 1874. (L. C. M.)

GUEUX, LES or "THE BEGGARS," a name assumed by the confederacy of nobles and other malcontents, who in 1566 opposed Spanish tyranny in the Netherlands. The leaders of the nobles, who signed a solemn league known as "the Compromise," by which they bound themselves to assist in defending the rights and liberties of the Netherlands against the civil and religious despotism of Philip II, were Louis, count of Nassau, and Henry, count of Brederode. On April 5, 1566, permission was obtained for the confederates to present a petition of grievances, called "the request," to the regent, Margaret, duchess of Parma. About 250 nobles marched to the palace accompanied by Louis of Nassau and Brederode. The regent was at first alarmed at the appearance of so large a body, but one of her councillors, Berlaymont by name, was heard to exclaim, "What, madam, is your highness afraid of these beggars *(ces gueux)?"* The appellation was not forgotten. At a great feast held by some 300 confederates at the Hôtel Culeinburg three days later, Brederode in a speech declared that if need be they were all ready to become "beggars" in their country's cause. The words caught on, and the hall resounded with loud cries of *"Vivent les gueux!"* ("Long live the beggars!"). The name became henceforward a party appellation. The patriot party adopted the emblems of beggarhood, the wallet and the bowl, as trinkets to be worn on their hats or their girdles. The original league of "Beggars" was short-lived, crushed by the iron hand of Alva, but its principles survived and were to be ultimately triumphant.

In the year 1569 the prince of Orange, who had now openly placed himself at the head of the party of revolt, granted letters of marque to a number of vessels manned by crews of desperadoes drawn from all nationalities. These fierce corsairs under the command of a succession of daring and reckless leaders—the best known of whom is William de la Marck, lord of Lumey—were called *"Gueux de mer,"* or "Sea Beggars." At first they were content with plundering both by sea and land and carrying their booty to the English ports where they were able to refit and replenish their stores. This went on till 1572, when Queen Elizabeth suddenly refused to admit them to her harbours. Having no longer any refuge, the Sea Beggars in desperation made an attack upon Brill, which they seized by surprise in the absence of the Spanish garrison on April 1, 1572. Encouraged by their unhoped-for success, they sailed to Flushing, which was also taken by a *coup de main.* The capture of these two towns gave the signal for a general revolt of the northern Netherlands, and is regarded as the real beginning of the War of Dutch Independence.

GUEVARA, ANTOÑIO DE (c. 1480–1545), Spanish chronicler and moralist. He held successively the offices of court preacher, court historiographer, bishop of Guadix and bishop of Mondedo. His earliest work, entitled *Libro llamado Relox de Principes, en el qual va encorporado el muy famoso libro de Marco Aurelio* (1529) is a didactic novel, after the manner of Xenophon's *Cyropaedia.* It was often reprinted in Spanish; and before the close of the century had also been translated into Latin, Italian, French and English, one English translation being by J. Bourchier (1546) and another by T. North. It is difficult now to account for its extraordinary popularity, its thought being neither just nor profound, while its style is stiff and affected. It gave rise to a literary controversy, however, of great bitterness and violence, the author having ventured without warrant to claim for it an historical character, appealing to an imaginary "manuscript" in Florence. Other works of Guevara are the *Decada de Césares* (1539); the *Epistolas familiares* (1539–45), sometimes called "The Golden Letters," and the *Libro de los invenfores del arte de marear* (1539).

GUEVARA, LUIS VELEZ DE: *see* VÉLEZ DE GUEVARA, LUIS.

GUHAYNA: *see* ARABS.

GUIANA, in general, the region lying north of the Amazon river, south of the Orinoco river and the Atlantic ocean, and east of the southern arm of the upper Orinoco, and comprising an area of roughly 690,000 sq.mi. at the northeastern corner of the continent of South America. Specifically, the term is now applied to the three small European colonies (combined area, more than 178,500 sq.mi.) on the northern coast of the continent, British, Dutch and French Guiana, which constitute the only European holdings on the continent of South America. Venezuela, however, calls the easternmost portion of her territory "Guiana," and Brazil's territories along the northern bank of the Amazon and south of the colonies are properly Brazilian Guiana.

The origin of the name Guiana, Gayana or Guayana is the subject of doubt and conjecture. Sir Robert Schomburgk has suggested that the name was derived from a small river, a tribu-

tary of the Orinoco, called the Waini or Guainia. It has also been suggested that the name Guayana was an Indian word signifying "wild coast," a theory supported by the old Dutch map of Hartsinck, where the region is called "Guiana Caribania of de Wilde Kust." The late Colonel G. E. Church (q*v.*) held, however, that the name came from that of the Indian tribes found there when it was discovered, a group well known in Brazil, the Guayana tribes, called by earlier writers, Guianas, Goyana, Guayana, etc.

The three Guiana colonies, with which this article will alone treat, are British Guiana, extending from Venezuela, the boundary having been settled by award of the king of Italy in 1904 (see VENEZUELA) eastward to the left bank of the Corentyne river; Dutch Guiana, or Surinam. from the right bank of the Corentyne to the left bank of the Maroni river; French Guiana, or Cayenne, from the right bank of the Maroni to the left bank of the Oyapock river, which forms its boundary with Brazil.

Physical Geography.— The combined area of the three colonies is approximately 178,500 sq.mi, and the physical characteristics are approximately the same in all. There is an alluvial plain 18 ro 50 mi. in width, much of it below rhe ievei of rhe sea ar high tide, but protected in nature by mangrove bush and where there is cultivation, by dikes and canals This plain rises gradually to a height of 10 to 15 ft. above mean sea level. The second area in all the countries is a somewhat higher plateau marked by wide savannahs, traversed by sand dunes and rising to the hills of the third zone, which reach a height of 2,000 ft. or more, covered densely with tropical forests, almost impenetrable by land and lining the shores of the innumerable streams. The second zone is cultivated in part, particularly in Dutch Guiana, where the choice of these inland plains for cultivation at first made the developed portion of the Dutch colony much less agreeable, climatically, than the lowland section developed in British Guiana, which is swept by the trade winds from the northeast ten months of the year. The further interior, the third section, is broken by hills and heavily forested mountains and here chiefly are found the tropical woods and gums. The highest point of the upland is on Mount Roraima (8,59j ft.), on the western boundary of British Guiana, in the Roraima Range. A sandstone formation, interbedded with volcanic rocks, extends from Mount Roraima to the Potaro and Essequibo rivers and' thence eastward. An immense number of rivers, with their tributaries, cut the land and make travel almost impossible excepting along these streams. Moreover, the rivers rise and fall with the rains and are broken by rapids and waterfalls, making travel difficult, uncertain and always slow.

Nearly all of Guiana is a worn-down plateau of ancient schist and gneiss overlain in places, especially in the southern part of British Guiana, by beds of Mesozoic sandstone, into which have been intruded dikes and sheets of diabase and other igneous rocks. The mineral products are diamonds, gold and bauxite. The gold is won from placers, uhich appear to have been formed from the schist and intrusive rocks.

Climate.— The climate of the Guianas is tropical, but is saved from being oppressive by the trade winds from the northeast, which sweep the coastal regions between October and July. August and September usually being dull and oppressive. The average temperature during the season of the trade winds is about 80°, while in the interior the dank forests shut off the breezes and make the hedt oppressive and the nights, while cool, offer slight relief.

As in other tropical countries. the temperature variation between day and night is not great. Ranges of temperature as recorded in Surinam show the following means: daily, 77·54°–88·38° F.; monthly. 76·1°–78·62°; yearly, 70·52°–90·14°. British Guiana has a similar range. Diurnal variation is greater in the interior. Rainfall varies from region to region, with abundant rain in December and January, and from May to early August, and relatively little in other months. The rainy season on the savannahs, however, is from May to September. The shorter dry season in February and March is important in the agricultural economy as the season of planting. In Surinam, the rainfall is about 90 in on the coast, and 60–80 in. inland, while it averages around 130 in. at Cayenne. Annual averages at certain British Guiana points over a 9-year period or longer are: Georgetown, 91·6 in.; Berbice, 75 in.; Mackenzie, 65 mi. inland on the Demerara, 103·17 in.; Dadanawa and St. Ignatius mission, in the Rupununi district, 58·51 in. and 64.76 in.; some interior mountain regions have 130–140 in. or more.

Population.— While the inhabitants of the three colonies vary both as to total numbers and with regard to the proportion and nature of the European classes, the Guianas have a population which is extremely cosmopolitan, yet at the same time characteristic. The inhabitants of the three Guianas total about 550,000. The native Indians represent a small proportion of the total, about 9,000 in British, 3,000 in Dutch and 2,500 in French Guiana. Both the British and Dutch colonies have a large population (relatively) of East Indians, imported beginning about 1850 in large numbers (now about 143,000 in British and 75,000 in Dutch Guiana) and Chinese and Japanese add to the mixture. The underlying population, however, is descended from Negro slaves. Included among them are the bush Negroes, or Djukas, whose ancestors escaped into the jungle prior to the abolition of slavery in the coionies and formed a caste of their own. In common with many Negroes of the coast, they have a religion and pantheon of gods of their own, as well as a distinctive language recognized throughout the Guianas. This language is based on a bastard English with which is incorporated many Indian, African, Dutch and Portuguese words.

Flora and Fauna.— The vegetation is inost luxuriant and its growth perpetual. Indigenous trees and plants abound in the utmost variety, while many exotics have readily adapted themselves to local conditions. Along the coast is a belt of courida and mangrove—the bark of the latter being used for tanning—forming a natural barrier to the inroads of the sea, but one which—very unwisely—has been in parts almost ruined to allow of direct drainage. The vast forests afford an almost inexhaustible supply of valuable timbers; greenheart and mora, largely used in shipbuilding and for wharves and dock and lock gates; silverbally, yielding magnificent planks for all kinds of boats; and cabinet woods, such as cedar and crabwood. 'There may be seen great trees, struggling for life one with the other, covered with orchids —some of great beauty and value—and draped with falling *lianas* and vines. Giant palms fringe the riverbanks and break the monotony of the mass of smaller foliage. Many of the trees yield gums, oils and febrifuges, the bullet tree being bled extensively for balata, a gum used largely in the manufacture of belting. Valuable varieties of rubber have also been found in several districts. On the coast, plantains, bananas and mangoes grow readily and are largely used for food, while several districts are admirably adapted to the growth of limes. Oranges, pineapples, star apples, granadillas, guavas are among the fruits; maize, cassava, yams, eddoes, tannias, sweet potatoes and ochroes are among the vegetables, while innumerable varieties of peppers are grown and used in large quantities by all classes. The avocado grows readily. In the lagoons and trenches many varieties of water lilies grow wild, the largest being the famous Victoria *regia.*

Guiana is full of wild animals, birds, insects and reptiles. Among the wild animals are the tapir, manatee, sloth, anteater, armadillo, several kinds of deer: monkeys and the puma and jaguar. The last is seen frequently down on the coast, attracted from the forest by the cattle grazing on the front and back pasture lands of the estates. Among the birds may be mentioned the carrion crow (an invaluable scavenger), vicissi and muscovy ducks, snipe, teal, plover, pigeon and the ubiquitous kiskadee or *qu'est que* **dit,** a species of shrike—his name derived from his shrill call. These are all found on the coast. In the forest are maam (anamon), maroudi (wild turkey), the beautiful bellbird with note like a silver gong, great flocks of macaws and parrots, and other birds of plumage of almost indescribable richness and variety. On the coast the trenches and canals are full of alligators, but the great cayman is found only in the rivers of the interior. Among the many varieties of snakes are huge constricting anacondas, deadly bushmasters, labarrias and rattlesnakes. Among other reptiles are the two large lizards. the salumpenta (an active enemy of the barn-door fowl) and the iguana, whose flesh when cooked re-

sembles chicken. The rivers, streams and trenches abound with fish, crab and shrimp. The last-named is consumed in enormous quantities by the East Indian coolies and the blacks.

Economics and Trade.—The three Guianas, although the smallest political units in South America in point of size and third smallest in area, have a production and trade that are far from negligible. British Guiana vies with Brazil for second place in world diamond production, and the three colonies together supply an important portion of the world's balata and bauxite.

The interest of the world in the Guianas has from the first been in trade. The traders of the early period exchanged their cargoes for good values in cotton, tobacco and forest gums. The Dutch sought tobacco in their early voyages, but sugar early became the most promising of the products and slaves were brought from Africa to cultivate the cane in the uplands away from the buccaneers of the coasts. In later years, and particularly in British Guiana after the British first took possession in **1796,** cotton became an important crop, but the abolition of the slave traffic in **1807** struck a hard blow to both sugar and cotton. Coffee has been and still is a most important crop in all the Guianas and cacao has had its turn, although it has suffered from blight much as has the cacao of Ecuador. All of the colonies produce balata from mild jungle trees, and this, too, is a product of interest and importance to the highly industrialized countries.

Only a small proportion of the soil of the Guianas is cultivated, 136,000 ac. or 0·3 of 1%, in British Guiana, being the largest area and the largest proportional cultivation of the three colonies. The plantations have shrunk in number since the end of the slave traffic, and the labour problem is an almost insurmountable barrier to great progress. The territory under cultivation, to a large extent lying along the coast, is subject to overflow at high tide, and the Zeelanders who came to British and Dutch Guiana in early days introduced there a system of dikes, against the sea on the one side, with trenches behind them, and often, too, against inundation from the rivers. The complicated system of canals and drains which are necessary often occupy as much as 10% of the area of the plantations or estates, and in addition apparently preclude the use of machinery in the sugar fields, which if it were available, would go far to neutralize the lack of labour in these rich but none too healthy colonies.

History.—The Guiana coast was sighted and noted by Christopher Columbus (*q.v.*) in **1498,** but he made no landing, although his one landing upon the continent of South America was on the peninsula of Paria, the northeastern extremity of what is now Venezuela, just north of Venezuelan Guiana. It was also noted by Amerigo Vespucci (*q.v.*) and Alonzo de Ojeda, in 1499 and in 1500 Vicente Yáñez Pinzón, who discovered the Amazon river, skirted these shores closely and probably explored some of the rivers; the River Oyapock, the eastern boundary of French Guiana, was called, before the Dutch, by his name, Rio Pinzón.

The legend of El Dorado, "the gilded man," who was reputed to cover himself with pure gold, although usually associated more with Colombia, was also localized in Guiana. It was this legend, of which he read in the papers of captured ships, that led Sir Walter Raleigh (*q.v.*) to ascend the Orinoco in 1595, to send Lawrence Keymis on the same search in **1596,** and to go again himself, for the last time, in **1617** on an expedition which ended in tragic disaster.

The Dutch apparently made their first trade contacts with Guiana in 1598, although they had been skirting the coast of the Caribbean (the Spanish "main" or mainland) since 1580. By 1613 these hardy explorers and traders had three or four settlements on the coast of Demerara and Essequiho (which with Cerbice now form British Guiana), eastward of the mouth of the Orinoco, and by **1616** they had penetrated inland. During the same period the French and also the English were establishing their trading posts in Cayenne (now French Guiana) and in Surinam (Dutch Guiana). The French early took predominance in the more eastern region, along the Oyapock at the beginning. and there they still remain. By **1652** the English had substantial interests in Surinam, and in **1663** Charles II issued letters patent to Lord Willoughby of Parham and Lawrence Hyde, second son of the earl of Clarendon, granting them the region between the Coppename and Maroni rivers, comprising 120 mi. of the coastland from east to west, of mhat is now Surinam.

It was this stretch of territory, regarded as excellent (as it is) for the growing of sugar cane, that Holland willingly accepted from England in exchange for New Amsterdam (the present New York city) and the entire Dutch colony of New Netherlands, lying along the Hudson. This transfer was made under the treaty of Breda in **1667,** and left the English without possessions or claims in Guiana. The Dutch West India company, which had been formed in **1621,** had taken over Essequibo, over whose destinies it exercised sovereign rights for **170** years. The Dutch made their first settlement in the Berbice river in **1624,** thus founding the third of the three colonies which were later to form present British Guiana. Berbice was independent of the other Dutch colonies, but Dutch settlement continued to strengthen itself throughout all of mhat is now British and Dutch Guiana. In **1657** colonies of Zeelanders had settled on the Pomeroon, Moruca and Demerara rivers, and in **1674** the New Dutch West India company, succeeding the old, which had failed, was formed; in **1682** this new company received Guiana by charter from the states-general.

This was in the heyday of the slave traffic, the plantations were in full swing, worked by blacks from Africa, and the colonies were very prosperous. In **1683,** the company sold one-third of its Guiana holdings to the city of Amsterdam, and another third to Cornelis van Aessens, lord of Sommelsdijk. The Chartered society of Surinam was formed by the three owners of Guiana, the New Dutch West India company holding in addition the trade in slaves, the most lucrative of all the commerce, but allowing the Chartered society to import slaves on their own account, however, on payment of a fine to the company.

Sommelsdijk had agreed to take the post of governor of the colony at his own expense. He travelled thither and lived and died there. He brought the Indians under control, disciplined the ruffian soldiery, and built the important canal which bears his name. He set up a substantial provincial government, including a high court of justice, and contributed much to 'agriculture, amongst other things introducing the cultivation of the cocoanut palm. His notable five-year reign was ended on June 17, **1688,** when he nas murdered in a mutiny of his soldiers. Sommelsdijk's widow offered his third portion of the Guianas for sale to William II of England, but it was finally purchased for 700,000 florins, by the city of Amsterdam. In 1732, Berbice was given a constitution and status as an independent colony, and in 1773 Demerara, which had been administered as a part of Essequibo, was also constituted as an independent colony. In **1781,** British privateers took possession of the three colonies which make up present-day British Guiana, and Lord Rodney placed them under the rule of the Governor of Barbados. In **1782** they were recaptured, this time by the French, who were then the allies of the Dutch, and in **1783** they passed again to the possession of Holland, by the terms of the peace settlement. In **1784** Essequibo and Demerara were again united under one governor and the town of Stabroek (now Georgetown) was fixed as the capital.

In **1796** the British again captured Essequibo, Demerara and Berbice and held them until the peace of Amiens in 1802, when they were returned to Holland only to be taken again by the British in **1803,** to be held until formally ceded in 1814–15, in the settlement following the close of the Napoleonic wars.

(W. THO.; X.)

BRITISH GUIANA

The only British possession in South America was formally ceded in 1814–1j. Three colonies were in **1831** consolidated into one, divided into three counties, Berbice from the Corentyne river to Abary creek, Demerara from Abary to Boerasirie creek, Essequibo from the Boerasirie to the Venezuelan frontier. This boundary line with Venezuela long remained in dispute. The Dutch, while British Guiana was theirs, claimed the whole watershed of the Essequibo river, while the Venezuelans said the Spanish province of Guayana had extended to the Essequibo.

In 1840 Sir Robert Schomburgk suggested the "Schomburgk line"; and later, though no agreement was arrived at, modifications were made. In 1886 Great Britain located outposts at points along "the modified Schomburgk line" and for some years Guiana police and Venezuelan soldiers faced one another across Amacura creek in the Orinoco mouth and at Yuruan up the Cuyuni river After a presidential message to the congress of the U S.A (1895) an international commission made its a ard at Paris in 1899 (ree VENEZUELA) Neither party gained its extreme claim, the line laid down differing but little from the original Schomburgk line. Demarcation by a joint commission (Venezuela and British Guiana) was completed in 1904. Owing to the impassability of the country, the commissioners suggested a deviation to follow the watersheds of the Caroni, Cuyuni and Mazaruni rivers and the two governments agreed. In 1902 the delimitation of the boundary with Brazil was referred to the arbitration of the king of Italy, who in June 1904 awarded most of the area in dispute to British Guiana. The demarcation has since been carried out The present area is 89,480 sq mi.

Population. — The population by the 1931 census was 310,933, and was officially estimated at 341 237 in 1939 East Indians (143,000), and Negroes (131,000) make up the bulk of the population. Other racial groups are: Europeans other than Portuguese, 2,200; Portuguese, 9,000; Chinese, 3.600; mixed, 42,000; aborigines (Arawaks, Caribs, Wapisianas, Warraws, etc.), 9,000. The country can support "at least a million additional population," however, in the opinion of the British Guiana Refugee commission. The chief cities are Georgetown, the capital, at the mouth of the Demerara river (1939 pop. 68,818) and New Amsterdam, at the mouth of the Berbice (1939 pop 9,379). Each has a mayor and town council with statutory power to impose rates. There are 25 village districts and 64 country districts, each with its own council

Physical Geography. — The seaboard is flat and below the level of high water; the forest belt is swampy along the rivers but rising betueen them; the savannahs lie inland of the forest belt, the high tablelands are grass-covered and practically treeless, and rise to mountain ranges. A rough inclined plain, starting at some 900 ft. above sea level at the source of the Takutu in the southwest, but only some 400 ft. at that of the Corentyne in the southeast, slopes down gradually to the alluvial flats. The eastern part is forested; the wrstern is level savannah, with woodlands along the rivers. The coastal fluviomarine deposits extend inland 25 mi. to 30 mi., ending against beds of sandy clay which form an extensive undulating region stretching back to the forest-covered hills. Roughly parallel to the coast line are the dunes, indicating the lines of a former coast, and still farther back are the higher "sand hills" of granite or diabase with thick coarse white sand.

West to east are the Pacaraima and Merumé mts , and the lesser Kanuku mts. (2,000 ft.), while the Acarahy mts., densely-wooded (2,500 ft.), form the southern boundary and the watershed between the Essequibo and Amazon. The mountains rise in terraces and broad plateaus, with steep sandstone scarps. They are mostly flat-topped, and their average height is about 3,500 ft. The Pacaraima mts. reach 9,433 ft. at Roraima, which springs as a wall of red rock 1,500 ft. high out of forest-clad slopes. Its summit is a tableland some 12 sq mi. Mt. Kukenaam, of similar structure, rises above 8,500 ft. Other conspicuous summits (about 7,000 ft.) are Iwalkarima, Eluwarima, Ilutipu and Waiakapiapu. The southern part of the Pacaraima range comprises rugged hills and rock-strewn valleys, but to the north where the sandstone assumes the table-shaped form there are dense forests, and waterfalls may descend nearly 2,000 ft. sheer, as at Roraima and Kukenaam. Long ranges of hills 2,000 up to 3,000 ft., traversing the gneissose plains are either old intrusions of diabase and gabbro or later ones of dolerite The rocks of these ranges are the colony's main source of gold

Rivers. — The rivers are practically the only highways inland from the coast. The Essequibo rises in the Acarahy mts., and flows north for about 600 mi. to an estuary nearly 15 mi. wide. Craft drawing 20 ft. may go up 50 mi.; beyond this pomt are cataracts. Some 7 mi. below the first series of rapids it is joined by the Mazaruni, itself joined by the Cuyuni some 4 mi. farther up By the Awaricura, which joins the Rupununi tributary of the Essequibo, the Pirara, a tributary of the Amazon, may be reached, —an example of the interesting series of itabos connecting nearly all South American rivers with one another On the Potaro branch is the famed Kaieteur fall, which drops from a tableland of sandstone and conglomerate into a deep valley 822 ft. below For the first 741 ft. the water falls as a perpendicular column, thence as a sloping cataract. The river above the fall is about 400 ft. wide, while the actual water ay of the fall itself varies from 120 ft. in dry weather to nearly 400 ft. in rainy seasons. The Kaieteur can now be reached on the fifth day from Georgetown The Demerara's source is known only to Indians, but is near 5° N. The last 70 of the river's 200 mi. are navigable to vessels which can get over the bar (19 ft. draught). The Berbice river rises in about 3° 40' N., and in 3° 53′ N. is within 9 mi. of the Essequibo. Its mouth is 2½ mi. wide; vessels of 12 ft. draught can go up 105 mi., those of 7 ft. draught, 175 mi., above which are cataracts. The Corentyne which rises in a divide 400 ft. high in parts has cataracts in upper reaches only less fine than Kaieteur; its lower 150 mi. are navigable and beautiful and its estuary is 14 mi wide The Abary, Mahaicony and Mahaica, between Berbice and Demerara, and the Boerasirie between Demerara and Essequibo are large streams or creeks which fall into the Atlantic direct. Forest rivers are dark brown from humus, savannah streams milky white.

Government and Administration. — Executive power is vested in a governor advised by an executive council. Legislative authority was until July 18, 1928 vested in the court of policy consisting of the governor who presided and without whose permission no legislation could be initiated, seven other official members and eight elected members. This body had, however, no financial authority, all taxation and expenditure being dealt with by the combined court, consisting of the court of policy with six financial representatives. In 1927 a parliamentary commission was appointed to report on the economic condition of the colony and recommended certain constitutional changes. These recommendations were subsequently adopted by the home government and promulgated by an order in council which superseded the old court of policy and the combined court by a legislative council consisting of the governor as president, ten official members, and 19 unofficial members (14 of whom are elected). The (male) franchise is based upon certain small property qualifications. The Roman-Dutch law. modified by orders in council and local statutes, governs actions in the civil courts, but the criminal law is founded on that of England. The Church of England and the Church of Scotland are both established, and grants-in-aid are also given to the Roman Catholic and Wesleyan Churches and to several other denominations. The revenue and expenditure now each amount annually to an average of a little over £1,300,000. About one-half of the revenue is produced by import duties, and about one-fifth by excise. The public debt on Dec. 31, 1939, was £21,304,462.

Education. — The system of primary education is denominational and is mainly supported from the general revenue. Secondary education is privately provided in Georgetown and Berbice, aided by government grants, and given for boys at Queen's college, an undenominational government institution where the course of instruction is the same as at a public school in England. The Guiana scholarship, open to boys and girls, carries a university or professional training in England.

In 1939 there were 177 primary schools, with a total roll of 51,971, and 61 schools in remote areas with 3,189 pupils.

Industries and Trade. — The principal exports and their value in 1939 were: sugar. $8,134,190; bauxite, $2,889,368; bullion and coin (primarily raw gold), $1,060,794; rice, $582,547; rum, $446,383; diamonds, $424,860; molasses, $279,318; timber, $274,763; balata, $194,433; charcoal, $59,688; perfumery, $25,936; and copra, $22,420. Export values totalled as follows: 1937, $13,507,460; 1938, $13,327,301; 1939, $14,727,075.

Imports are chiefly flour, machinery, cotton goods, metal goods, fish, boots and shoes and meat. Canada normally takes around 50% of all exports, Great Britain about 35%, the United States

6%, and the British West Indies 5%. From 45% to 50% of imports are normally supplied by Great Britain, 15% to 20% by Canada, 10% to 15% by the United States, and 4% by the British West Indies. Import values totalled as follows: 1937, $11,554,508; 1935, $10,620,972; 1939, $10,807,506.

Agriculture.—Cultivation of rice has made great strides in the 20th century. In 1873 16,000 tons were imported; by 1925 there was an export of 7.748 tons, and 12,501 tons in 1939, principally to the West Indies. Production of sugar and its by-products provides employment for a third of all wage earners. The world oversupply of this commodity has, however, materially affected the sugar market with adverse effects on the colony.

Mining.—Prospecting for gold began in 1880, and from 250 oz in 1884, the output rose to 138,527 oz. in 1893–94, an all-time high; by 1925, however, it had fallen to 6,000 oz., but increased to 41,919 oz. in 1938, the highest since 1914. Diamond production is a 20th century development. Diamond prospectors, or "pork-knockers," have swarmed the Mazuruni and other rivers in the northwest district. In 1923 the diamond output was in excess of $5,000,000 value, but has declined to a tenth of that arnount.

The greatest mineral production is now bauxite, the source of aluminium. Demand for it has been tremendously increased with the world development of aviation. Bauxite deposits are found in the vicinity of the Demerara river and in the northwest district. In 1939 exports reached 476,014 tons, and in 1940 increased by over 60,000 tons. Most of this output went to Canada.

Timber.—Around 86% of the area of the colony is timber, but only a fair amount is cut. Greenheart, an almost indestructible wood, is the most important. Until an embargo on imports was laid after the outbreak of the war in Europe in 1939, timber imports exceeded exports. During 1940 experiments were made looking to possible use in the development of a pulp paper industry.

Money.—The money of account is dollars and cents, with the dollar exchangeable at $4.86 to the pound sterling. The unit of land measure is the Rhynland rood, roughly equal to 12 feet 4 inches. A Rhynland acre contains 300 square roods.

Inland Communication.—There are two government-owned railway lines, one from Georgetown along the right bank of the Demerara and across to Rosignol, on the left bank of the Berbice, opposite New Amsterdam, a distance of 60½ mi., the other from Vreed-en-Hoop, on the left bank of the Demerara near its mouth, to Parika at the mouth of the Essequibo, 18½ mi. distant.

Roads aggregating 272 mi. in length and having a fair motoring surface, extend along the coast lands from the Corentyne (at Skeldon) to Charity, on the Pomeroon, and along the lower reaches of the principal rivers for short distances, but do not penetrate inland. Inland communication is primarily by water, but there are some important dirt roads, notably the 104-mi. Bartica-Potaro road, constructed through loans from the Colonial Development fund. From it a so-mi. road to Issano landing, on the Mazuruni, arid several shorter roads branch out. In the northwest district there are 57 mi. of roadway, part of it suitable for motor traffic. A cattle trail is maintained by the government between Takama on the Berbicc and Annai on the Rupununi, 182 mi. distant, with a branch to Arakeva, opposite Wismar (on the Demerara).

Steamboat lines connect Georgetown with the northwest district, with Bartica, and with the upper Pomeroon. Others run from Parika to Bartica and from New Amsterdam up the Berbice to Paradise. These are supplemented by ferries across the Demerara, Berbice and Essequibo, and by launch services.

Communication to the interior, especially to Rupununi, regarded as the best colonization area, is thoroughly inadequate. In 1939 Lt. Col. R. U. Nicholas, U.S. army engineer corps, as a member of the British Guiana Refugee commission, made an intensive study of possible transportation development to the interior. He recommended against the long-discussed railway to the Brazilian border and, estimating that a 345-mi. trunk road from Bartica to Dadanawa, in the Rupununi district, would cost an initial $8,799,000, and if widened and macadamized an eventual $30,568,000, urged further study of the possibilities of water transportation development.

Early in 1940, the colony's director of public works, after aerial and other surveys, set forth several alternative projects, and recommended an all-water route from Georgetown up the Demerara, thence by canal to the Berbice, and up that river, using lock canals to pass around the rapids and waterfalls, then by way of another canal to the Essequibo at a point opposite Primos inlet. The concluding stages would be by the Essequibo and the Rupununi to Yupukari. From Yupukari a canal to the Ireng, which forms the boundary with Brazil and whose tributaries mingle with those of the Rupununi during the rainy season, would permit an eventual all-water route to Manáos on the Amazon in the wet season. Alternative combination rail-highway-water routes were also presented.

History.—Following the adjustment of the boundary controversy and the delimitation of the frontier, little of note occurred in British Guiana and the colony and its development possibilities were virtually ignored by the imperial government until 1937. In that year serious labour disorders in Trinidad, Jamaica, British Guiana and other colonies occurred and brought about appointment in 1938 of the West Indies Royal commission, with Lord Moyne as its chairman, to study social and economic conditions in the British colonies in tropical America. The commission's recommendations, published in 1940, dealt mainly with the area as a whole (see WEST INDIES). Despite wartime conditions, however, some of them were embodied in the West Indies Development act of 1940. Under its authority, previous imperial loans aggregating £190,149 to British Guiana were written off, and an immediate grant of £52,000 for drainage and other development was made.

The *British Guiana Refugee Commission.*—Meanwhile, late in 1938, the British government had made a tentative offer of lands in the interior of British Guiana as a possible site for settlement of involuntary refugees from Europe, and in Feb. 1939, the British Guiana Refugee commission, which included experts on colonization, tropical diseases and sanitation, highway engineering, agronomy, soil ecology, and other aspects of tropical agriculture, made aerial and land surveys of three sections of the colony aggregating over 40,000 sq mi. in extent: the region south of lat. 5° and west of the Essequibo, the corresponding area east of that river, and the northwest district. On the basis of this and of other previous studies, it submitted a report which, in summary, declared that "uhile not ideal for middle Europeans" and "not suitable for immediate large scale settlement," there were soils suitable for permanent agriculture and that natural resources made possible a correlated industrial development, and recommended immediate trial settlements of 3,000 to 5,000 young colonists, aided by skilled technicians Cost of settlements of 5,000, including transportation to British Guiana, was roughly computed at $3,000,000 for two years. The Kanuku mountain district in the south was regarded as the best suited area of all. Recommendations for an industrial centre in the vicinity of Bartica and for development of transportation routes into the interior were likewise made. On very conservative estimates, given adequate financing and proper technical direction and supervision, it was declared that, allowing 5 ac. of productive land per person (twice the usually accepted standard), "the colony could support at least a million additional population." These conclusions presumed a balanced and roughly self-sufficient economy carried on entirely by uhites.

Preparations for the proposed trial settlements were begun, but outbreak of the war in Europe in Sept. 1939 forced an indefinite postponement. Although large-scale development in British Guiana was not possible under existing war conditions, the war brought two new stimuli. Under war needs the coastal area expanded its agriculture in order more nearly to attain self-sufficiency, while the Anglo-United States "destroyer-base" agreement of Sept. 1940 injected a new factor. Under the latter, the United States selected sites for an aerodrome 25 mi. up the Demerara and a seaplane base near Suddie at the mouth of the Essequibo. Actual occupation of these bases was effected by United States forces on July 21, 1941.

SURINAM OR DUTCH GUIANA

Dutch Guiana, or Surinam, as it is more properiy caiied, is a colonial dependency of the Netherlands in northeastern South America between 2° and 6° N. lat. and 53°50′ and 58°20′ W. long. It is bounded on the east by French Guiana, on the south by Brazil, on the west by British Guiana, and on the north by the Atlantic ocean, and has a coast line of about 240 mi. The area is 54,291 sq.mi. The capital and chief port is Paramaribo (1940, pop. 54,853). The only other town of any importance is Nieuw Nickerie (pop. 3.788).

The five main rivers are the Corentyne or Corentyn (Dutch, *Corantijn*), the Maroni (Dutch. *Marowijne*), on the border with French Guiana, and the Coppename, Saramacca and Surinam. All flow northward. The Corentyne is navigable for about 70 mi and vessels of six-foot draught can ascend it for 150 mi. The Surinam and Maroni are also navigable, the former for roo mi to 10 foot draught, and the latter for 40 mi. The interior is cut with hills, rising to 3.800 ft. in the mountain known as Wilhelmina Kette, in the west. The mountainous, forested region to the south, and along the border with Brazil, is virtually unexplored. Geology and climate, flora and fauna, are described under the general heading of the Guianas.

Population.—As of Jan. 1, 1940, the population was officially computed at 177,980, including an estimated 19,032 bush Negroes and 2,616 Indians in the jungle. In 1935 there were 65,186 Negroes (not including Djukas), 40,777 British Indians. 33.386 Javanese, 2,076 Chinese, 1,938 Europeans, of whom 953 were born in the Netherlands, and 3,480 "others," besides bush Negroes and Indians in the jungle. The bush Negroes, or Djukas, descendants of escaped slaves who fled to the interior. have considerable autonomy. The East Indians—Javanese and British Indians—have been brought in to meet labour demands arising since the abolition of slavery in 1863, and are employed on sugar and other plantations and in Paramaribo. Forty per cent of the whites are concentrated in Paramaribo

Health conditions are not particularly satisfactory. There are the usual tropical diseases, and malaria is especially common. Drinking water is ordinarily obtained from roof drainage. Paramaribo has a few wells, but the water from them is poor and is little used except in drought No towns have regularly organized sewage systems.

Education and Charity.— There are 132 schools, nearly a third of them in Paramaribo, with 21,278 pupils in 1940, of whom 11,100 were in Paramaribo. Of these schools 43 are government and all but six of the remainder government-subsidized In addition there are 33 mission schools in the jungle. The government supports in whole or in part several orphan asylums, hospitals and religious and other philanthropic institutions.

Religion.— In 193j the religious affiliations of the population were as follows: Moravians, 30,754; Roman Catholics. 28,450; Netherlands Reformed, 8,120; Lutherans, 3,040; Mennonites, 527; African Methodists 313; Baptists. 67; Mohammedans, 40,860; Hindus 30,360; Confucians, 1,220; Jews, 780; not enumerated, 2,352.

Government.— Surinam is the only Netherlands colony on the American mainland. It has an appointed governor and executive council, and a partly elected legislative council, "the states." For administrative purposes there are 16 districts. The judicial organization includes three district courts, with a supreme court which sits at Paramaribo. The judiciary is appointed by the crown.

Finance.— Under normal conditions, government revenue is derived from import, export and excise duties, and property and income taxes, with a heavy Netherlands government subsidy to cover the annual deficit. In 1939 expenditures were 6,962,014 florins, revenues 4,034,476 florins, against a 1935–39 average of 6,436,836 and 3,958,489 florins respectively.

Economics and Trade.—The chief agricultural products are sugar (1937: 15,564 tons), coffee (1937: 52,131 bags), rum, molasses, rice (1937: 35,355 tons), maize, groundnuts, plantains, bananas, tobacco, coco-nuts, oranges and peas. Cacao, formerly important, has been virtually wiped out by the "witch broom" disease.

Gold and bauxite are the principal mineral products Gold workings date from 1876, and are almost entirely placer. The peak of production was reached in 1912, when some 1,180,000 gr. were shipped. By 1926 this had declined to 250,656 gr., but rose subsequently to 443,487 gr. in 1935. The following four years averaged 406,217 gr. but declined to 344,820 gr. in 1939. Bauxite has been commercially exploited since 1916. The mines are southeast of Paramaribo and the ore is loaded directly on ocean steamers at Moengo on the Cottari river, 104 mi. from the capital. Virtually the entire output goes to the United States. Export totals have risen sharply, from a total of 115.189 tons in 1935 to 504,062 tons in 1939, and under wartime demands the volume increased even more in 1940 and 1941.

In spite of the number and extent of precious woods in the interior, balata is the only important forest product. The value of balata exports in 1939 was 437.062 florins.

Sugar and its products formerly constituted the chief exports, but coffee now leads agricultural products (592,786 fl. value in 1939), with sugar and sugar products second (453.661 fl. value, 90% of which was raw sugar). Rice. which is exported to Venezuela and the West Indies, is third (381,813 fl. value). The most important export is now bauxite, which in 1939 contributed 66.5% of all export values (5,293,747 fl.). Imports (principally manufactured articles, especially cotton goods, machinery and foodstuffs) normally come chiefly from the Netherlands and the United States.

External Trade of Surinam, 1937–39 (in florins)

Communications.— Paramaribo, the only seaport, is served by various steamship lines from Europe and the United States, and is a regular stop on the Pan American Airways Miami-Buenos Aires route.

There is local steamship service from Paramaribo to the small ports of Nickerie, Gattice, Albina, etc., and government steamers also go each week to Georgetown, British Guiana. The rivers furnish the chief means of interior communication. They are joined by cross channels and canals. River transportation is not satisfactory, for droughts make it uncertain and the rainy season causes floods. There is one railway, the Lawa, 107 mi. long, from Paramaribo to Dam. Highways are in a primitive state, and the only important road, some 35 mi. in length, serves the gold mines. The plantations and the towns are all located on rivers.

History.— The political history is uneventful, after the periods described in the general history of Guiana. In 1828, Surinam and the Dutch West Indian islands were placed under a single governor, who resided at Paramaribo, but were separated again in 1848. Slavery was abolished in 1863, and an arrangement with the Brit-

ish for control of the coolie traffic was drawn up in 1870. The interest of the home government, which had waned with the decline of sugar in the 19th century, was renewed. Expeditions for scientific study, laboratories and establishments for agricultural research, expositions of products from Surinam in Holland, have been evidence of this interest.

BIBLIOGRAPHY.—The literature in English is scarce and much of it inaccurate. J. G. Stedman, *Narrative of a Five Years' Expedition Against the Negroes of Surinam* (2nd ed., 2 vol., 1806); *Encyclopaedie van Nederlawdsck West-Indie*, ed. by *H*. D. Benjamins and J. F. Snelleman (The Hague, 1914–17); J. W. Vandercook, *Tom Tom* (1926); *E*. Sluiter, "Dutch Guiana, a Problem in Boundaries," *Hisp. American Hist. Rev*. (Feb. 1933); *Statistical Annual of Surinam* (in Eng. and Neth.). Of the older works on Surinam the first rank is held by Jan Jacob Hartsinck's *Beschryving van Guiana, of de Wilde Kust, in Zuid Amerika*. Extracts from this work, selected for their bearing upon British boundary questions, were translated and annotated by J. A. J. de Villiers (London, 1897). *See* also *British Guiana: Bibliography*.

FRENCH GUIANA

FRENCH GUIANA, or Cayenne, lies at the northeastern extremity of the continent, between 2° and 3" N. and 51° and 53" W. It is bounded on the west by Dutch Guiana, the river Maroni marking the boundary, on the north by the Atlantic ocean, east and south by Brazil; the east and southeast boundary is along the Oyapock river, and the south along the crest of the Tumucumaque (Tumuc Humac) mountains. The area is 35,126 sq.mi., some 3,500 sq.mi. of which is French Guiana proper, the balance constituting the dependent territory of the Inini.

Both boundaries of French Guiana were long in dispute and have been settled only recently. The Brazilian boundary was determined by the Swiss government in 1900, setting the boundary at the Oyapock river and the Tumucumaque (Tumuc Humac) mountains. The dispute with Dutch Guiana was settled by the emperor of Russia in 1891.

The physical geography of French Guiana is in general like that of British and Dutch Guiana, but a large proportion of the lowland coast is covered with dense jungle and mangrove swamps. Fifteen rivers, rising in the mountains, flow through the colony to the sea. Practically all the inhebited portion of the colony is in the lowland section, where the heat is less oppressive. The climate is not healthy and in the earlier years of the colony's history the French convicts and exiles in the penal settlements fell easy victims to tropical diseases and Cayenne was known as a pesthole from which few returned.

The population according to the 1936 census was 37,000, of whom 27,000 were French citizens. Convicts, including those already released but still obliged to remain within the colony, numbered 6,091. In addition there were 4,000 natives subjected to census, or a grand total of 37,000 exclusive of uncounted Indians in the interior. All hut 4,000 of those counted resided in French Guiana proper. Cayenne, the capital, had 11,704 inhabitants.

Political Organization.— French Guiana is divided into three distinct zones, the colony proper, made up of 14 districts along the coast, the penal settlement, embracing the area around the mouth of the Maroni river and the fles du Salut (including "Devil's island"), off the coast, and the large and scantily populated dependent territory of the Inini, administered separately since 1930. Until 1940 the colony was administered by an appointed governor, assisted by a privy council of seven members, and sent one deputy to the French parliament. Local government was in the hands of an elected eight-member general council and of elected municipal councils. The political changes in France which followed the fall of the Third Republic were reflected in French Guiana by practically complete suppression of representative government. The territory of Inini is governed directly by the governor of French Guiana, who performs his duties under the title of governor of the Territory of the Inini.

French Guiana's budget for 1941 anticipated expenditures of 22,397,807.70 francs, 1,500,000 francs less than in 1940. The budget for Inini called for expenditures of 3,698,100 francs.

The penal settlement was established by decree in 1852, and from that date until 1867, some 18,000 exiles were sent to Guiana; then for about twenty years, the bulk of these unfortunates were sent to New Caledonia (*q.v.*). In 1885–87 Cayenne was designated specifically as the place of banishment for confirmed criminals and convicts sentenced for more than eight years of hard labour. The penal settlement is entirely separated from the life of the colony, the mainland settlement containing the majority of the criminals and the islands being used for the more desperate.

Primary education has been free and nonreligious since 1889. At Cayenne there are three elementary schools, a high school and a secondary school which offers normal school training, all under state control, and one parochial school. Each town of any size has one or two primary schools. The religious community is chiefly Roman Catholic.

Economics and Trade.— Economically, French Guiana lags far behind the other Guianas and is the least developed European colony in America. This is due largely to the economic prostration brought about by the abolition of slavery in 1848, which virtually destroyed the plantation system, and to the presence of the penal settlement. Only some 7,000 to 9,000 ac. are under cultivation, and almost the only agricultural products exported are rum, bananas and some coffee and cacao.

Forests cover most of the area, including practically all of Inini, and are rich in commercial gums and all the tropical hardwoods of commerce. The principal forest products are lumber and essence of rose water, which provide around 35% of all exports other than gold. The most exotic export is mounted butterflies, of which 105 lb. were exported in 1939 and 66 lb. in 1940. Gold, obtained through placer mining, especially from Inini, makes up from 80% to 90% of all export values. From 1938 to 1940 the export of gold dust averaged 1,148.9 kg. annually. Nearly all the exports (over 98% in 1939) are normally taken by France.

The main imports are cattle, salted and canned meats and other preserved foodstuffs, wheat and flour, rice, tobaccos and liquors, and miscellaneous manufactured goods. In the two decades ending in 1939 approximately two-thirds of all imports was supplied regularly by France, around 10% by French colonies, and most of the remainder bv the United States.

The external trade of French Guiana in 1938 was: imports, 66,610,000 francs, exports, 48,215,000 francs, falling to 61,584,000 francs and 47,490,000 francs, respectively, in 1939.

Communications.— The only railway (12 km. in length) is from St. Laurent to St. Jean, within the penal settlement, and is not ordinarily used for public transportation. There are some highways on the coast, and interior communication is primarily by trail and by navigable rivers. Steamers can penetrate 50 mi. into the interior, but all other river communication is by canoe.

Cayenne is the principal port. St. Laurent du Maroni, St. Georges du Oyapock and Regina (on the Approuague river) are important chiefly for coastwise service. Cayenne is a regular stop on the New York to Buenos Aires service of the Pan American Airways.

History.— Henri IV's death prevented the colonization of French Guiana following a reconnoitring expedition sent out in 1604, and it was not until 1626 that the first settlement was made on the Sinnamary by traders from Rouen. Cayenne mas founded similarly in 1635, but later organizations, most of them starting in Rouen, failed in 1643, 1645 and 1652. The Dutch held possession for a few years after 1654, another ambitious organization in France failed in 1664, and in 1674 the colony passed to the control of the crown. Colbert, then finance minister, turned his genius to its reorganization, and success seemed promising, until a disastrous military expedition against Dutch Guiana in 1686 again set the colony hack.

Few efforts were made in the succeeding years, but despite the unpleasant experiences of the past, in 1763 another major tragedy took place. Choiseul, the prime minister, and his cousin Praslin obtained a concession for the territory between the Kourou and Maroni rivers, and sent out an immense number, said to be 12,000, of volunteer colonists, chiefly from Alsace and Lorraine. They went without adequate preparation, found neither food nor water for their sustenance, and died miserably; only 918 remained alive in 1765.

During the French Revolution, Cayenne was used as a place of exile of royalists, and suffering and tragedy followed all of these unfortunate bands. One group of 600 exiled in 1797 was landed on the Sinnamary without shelter or food, and two-thirds perished. In 1809 the colony was taken by the English and Portuguese.

French Guiana was awarded to the French in 1814, and turned over by the Portuguese in 1817. Efforts were made again to induce the French to colonize it, a steam sugar mill was set up in 1822, and a fairly successful colony was established at Nouvelle Angoulême in 1824. The emancipation of the slaves in 1848 caused a severe setback, which was followed by attempts to colonize free blacks from Africa, one such colony being brought over in 1853. In 1852 French Guiana was made the site of the penal settlement, which has had a deterrent effect on voluntary development from France.

BIBLIOGRAPHY.—An English book of description as well as biography, is by Mrs Blair Niles, *Condemned to Devil's Island* (1927). The French penal settlements have a large bibliography of their own. A detailed bibliography of French Guiana will be found in Ternaux-Compans. *Notice kistorique de la Guyane Française* (Paris, 1843). Among other works, *see* H. A. GUIART or **GUIARD, GUILLAUME** (d. c. 1316), French chronicler and poet, was probably born at Orleans, and served in the French army in Flanders in 1304. He lived at Arras and then in Paris, thus being able to consult the large store of manuscripts in the abbey of St. Denis, including the *Grandes chroniques de France*. Afterwards he appears as a *ménestrel de bouche*. Guiart's poem *Branche des royaulx lignages* was written

and then rewritten between 1304 and 1307, in honour of the French king Philip IV., and in answer to the aspersions of a Flemish poet. Its 21,000 verses deal with the history of the French kings from the time of Louis VIII.; but it is only really important for the period after 1296 and for the war in Flanders from 1301 to 1304, for which it is a high authority. It was first published by J. A. Buchon (Paris, 1828), and again in tome xxii. of the *Recueil des historiens des Gaules et de la France* (1865).

See A. Molinier, *Les Sources de l'histoire de France,* tome iii. (1903).

GUIBERT or **WIBERT** (*c.* 1030–1100), of Ravenna, antipope under the title of Clement III. from June 25, 1080 until September 1100, was born at Parma between 1020 and 1030 of the noble imperialist family, Corregio. He was appointed by the empress Agnes, chancellor and, after the death of Pope Victor II. (1057), imperial vicar of Italy. He strove to uphold the imperial authority during Henry IV.'s minority, and presided over the synod at Basel (1061). Guibert lost the chancellorship in 1062. In 1073, through the influence of Empress Agnes and the support of Cardinal Hildebrand, he obtained the archbishopric of Ravenna and swore fealty to Alexander II. and his successors. He seems to have been at first on friendly terms with Gregory VII., but soon quarrelled with him over the possession of the city of Imola, and henceforth was recognized as the soul of the imperial faction in the investiture contest. He allied himself with Cencius, Cardinal Candidus and other opponents of Gregory at Rome, and, on his refusal to furnish troops or to attend the Lenten synod of 1075, he was ecclesiastically suspended by the pope. He was probably excommunicated at the synod of Worms (1076) with other Lombard bishops who sided with Henry IV., and at the Lenten synod of 1078 he was banned by name. The emperor, having been excommunicated for the second time in March 1080, convened 19 bishops of his party at Mainz on May 31, who pronounced the deposition of Gregory; and on June 25 he caused Guibert to be elected pope by 30 bishops assembled at Brixen. Guibert was installed in the Lateran and consecrated as Clement III. on March 24, 1084. One week later, on Easter Sunday, he crowned Henry IV. and Bertha in St. Peter's. Clement survived not only Gregory VII. but also Victor III. and Urban II., maintaining his title to the end and in great measure his power over Rome and the adjoining regions. Excommunication was pronounced against him by all his rivals. He was driven out of Rome finally by crusaders in 1097, and sought refuge in various fortresses on his own estates. St. Angelo, the last Guibertist stronghold in Rome, fell to Urban II. on Aug. 24, 1098. Clement, on the accession of Paschal II. in 1099, prepared to renew his struggle but was driven from Albano by Norman troops and died at Civita Castellana in September 1100.

See J. Langen, *Geschichte der romischen Kirche von Gregor VII. bis Innocenz III.* (Bonn, 1893); Jaffé-Wattenbach, *Regesta pontij. Roman* (2nd ed., 1885–88); K. J. von Hefele, *Conciliengeschichte,* vol. v. (2nd ed.); F. Gregorovius, *Rome in the Middle Ages,* vol. iv., trans. by Mrs. G. W. Hamilton (London, 1900–02); and O. Köhncke, *Wibert von Ravenna* (Leipzig, 1888). (C. H. H.)

GUIBERT, JACQUES ANTOINE HIPPOLYTE, COMTE DE (1743–1790), French general and military writer, was born at Montauban, and at the age of 13 accompanied his father, Charles Bénoit, comte de Guibert (1715–1786), chief of staff to Marshal de Broglie, throughout the war in Germany, and won the cross of St. Louis and the rank of colonel in the expedition to Corsica (1767). His *Essai général de tactique* (1770) appeared in numerous subsequent editions and in English, German and even Persian translations (extracts also in Liskenne and Sauvan, *Bibl. historique et militaire,* 1845). His *Défense du système de guerre moderne,* a reply to his many critics (Neuchâtel, 1779) is a reasoned and scientific defence of the Prussian method of tactics, which formed the basis of his work when in 1775 he began to co-operate with the count de St. Germain in a series of much-needed and successful reforms in the French army. In 1777, however, St. Germain fell into disgrace, and his fall involved that of Guibert, who was promoted to the rank of *maréchal de camp* and relegated to a provincial staff appointment. In his semi-retirement he vigorously defended his old chief St. Germain against his detractors. On the eve of the Revolution he was recalled to the War Office, but in his turn he became the object of attack and he died, practically of disappointment, on May 6, 1790.

See Toulongeon, *Eloge vdridique de Guibert* (1790); Madame de Stäel, *Eloge de Guibert;* Bardin, *Notice historique du général Guibert* (1836); Flavian d'Aldeguier, *Discours sur la vie et les écrits du comte de Guibert* (Toulouse, 1855); Count Forestie, *Biographie du comte de Guibert* (Montauban, 1855); Count zur Lippe, "Friedr. der Grosse und Oberst Guibert" (*Militär-Wochenblatt,* 1873, 9 and 10).

GUIBERT OF NOGENT (1053–1124), historian and theologian, was born of noble parents at Clermont-en-Beauvoisis, and studied at the Benedictine abbey of Flavigny (Flaviacum) or St. Germer, where he devoted himself at first to the secular poets, and later changed to theology, through the influence of Anselm of Bec, afterwards of Canterbury. In 1104, he became head of the abbey of Notre Dame de Nogent. Of his works which appeared at Paris in 1651 and in Migne's *Patrol. Lat.,* vols. 156 and 184, the chief are his interesting autobiography, *De vita sua, sive monodiarum,* and his history of the first crusade, *Gesta Dei per Francos.* The former was translated into English by C. C. Swinton Bland (1926).

See H. von Sybel, *Geschichte des ersten Kreuzzuges* (Leipzig, 1881); B. Monod, *Le Moine Guibert et son temps* (1905); and *Guibert de Nogent; histoire de sa vie* (ed. G. Bourgin, 1907).

GUICCIARDINI, FRANCESCO (1483–1540), Italian historian and statesman, was born at Florence on Mar. 6, 1483. He studied at the universities of Ferrara and Padua, and at that time contemplated a career in the church. Owing, however, to the opposition of his father, he turned his attention to law, and at the age of 23 was appointed by the Signoria of Florence to read the *Institutes* in public. He advanced his political prospects by his marriage with Maria Salviati. In 1512 the Signoria sent him on a mission to the court of Ferdinand of Spain, and Guicciardini issued from this first trial of his skill with an assured reputation for diplomacy, which in the Italy of that time implied an ability to meet plot with counterplot, and parry force with sleight of hand.

In 1515 Leo. X. took him into service, and made him governor of Reggio and Modena. In 1521 Parma was added to his rule, and in 1523 he was appointed viceregent of Romagna by Clement VII. Guicciardini was thus virtual master of the papal States beyond the Apennines, during a period of great difficulty. In 1526 Clement made him lieutenant-general of the papal army. In this capacity he witnessed from a distance the sack of Rome and the imprisonment of Clement, without being able to rouse the duke of Urbino into activity. Clement did not withdraw his confidence, and in 1531 Guicciardini was advanced to the governorship of Bologna, the most important of all the papal lord-lieutenancies. This post he resigned in 1534 on the election of Paul III., preferring to follow the fortunes of the Medicean princes.

It may here be noticed that though Guicciardini served three popes through a period of 20 years, he hated the papacy with a deep bitterness, attributing the woes of Italy to the ambition of the church. The same discord between his private opinions and his public actions may be traced in his later conduct. Guicciardini believed that the best form of government was a commonwealth administered upon the type of the Venetian constitution; and we have ample evidence to prove that he had judged the tyranny of the Medici at its true worth. Yet he did not hesitate to place his powers at the disposal of the most vicious members of that house for the enslavement of Florence. In 1527 he had been declared a rebel by the Signoria on account of his well-known Medicean prejudices; and in 1530, deputed by Clement to punish the citizens after their revolt, he revenged himself with a cruelty and an avarice that were long and bitterly remembered. When he returned to Florence in 1534, he did so as the creature of the dissolute Alessandro de' Medici, and he pushed his servility so far as to defend this infamous despot at Naples in 1535, before the bar of Charles V., from the accusations brought against him by the Florentine exiles (*Op. ined.* vol. ix.). He won his cause; but he justified the reproaches of his contemporaries, who describe him as a cruel, venal, grasping seeker after power, eager to support a despotism for the sake of honours, offices and emoluments

secured for himself by a bargain with the oppressors of his country. Varchi, Nardi, Jacopo Pitti and Bernardo Segni are unanimous upon this point; but it is only the publication of Guicciardini's private mss. that has made us understand the force of their invectives. After the murder of Duke Alessandro in 1537, Guicciardini espoused the cause of Cosimo de' Medici, a boy unused to the game of statecraft, hoping to rule Florence as grand vizier under this inexperienced princeling. But Cosimo displayed the genius of his family for politics, and dismissed him. Guicciardini spent his last years in the composition of the Storia *d'Italia.* He died at Florence on May 23, 1540.

The Storia d'Italia (1561–64) dealt with the period 1494–1532; it was translated into most European languages. It is a masterpiece of scientific history, and is remarkable for treating the history of Italy for the first time as a national whole, and not as the accumulation of separate principalities and republics. The whole tangled skein of Italian politics, in that involved and stormy period, is unravelled with a patience and insight that are above praise. The Storia *d'Italia* was undoubtedly the greatest historical work that had appeared since the beginning of the modern era, though it owes its greatness in part to the importance of the period with which it deals. It remains the most solid monument of Italian reason in the 16th century, the final triumph of that Florentine school of philosophical historians which included Machiavelli, Segni, Pitti, Nardi, Varchi, Francesco Vettori and Donato Giannotti.

Though Guicciardini lived through that agony of the Italian people, he does not seem to be aware that he is writing a great historical tragedy, and never ceases to be an impartial spectator—a cold and curious critic. He maintained that the explanation of historical events could only be traced in the detailed study of human character and motive. His writing is therefore overburdened with detail which, although it tends to destroy the proper perspective of his work, very accurately portrays the principles underlying his method.

Up to the year 1857 the fame of Guicciardini as a writer, and the estimation of him as a man, depended almost entirely upon the *Storia d'Italia,* and on a few ill-edited extracts from his aphorisms. At that date the Guicciardini family entrusted to Giuseppe Canestrini the publication of his hitherto inedited mss. The works thus brought to light include (1) the Ricordi politici, consisting of about 400 aphorisms on political and social topics, which illustrate Guicciardini's conviction that man is naturally actuated by the basest motives; (2) the observations on Machiavelli's Discorsi, which very clearly show his lack of political idealism; (3) the Storia Fiorentina, an early work; (4) the Dialogo del reggimento di *Firenze,* also probably an early work, in which the forms of government suited to an Italian commonwealth are discussed, and illustrated by the vicissitudes of Florence up to the year 1494; and (5) Discorsi *politici,* composed during his Spanish legation. Taken in combination with Machiavelli's treatises, the *Opere* inedite furnish a comprehensive body of Italian political philosophy anterior to the date of Fra Paolo Sarpi.

See Rosini's edition of the Storia d' *Italia* (10 vols., Pisa, 1819) and the *Opere* inedite (ed. Canestrini, 10 vols., 1857). See also Agostino Rossi, Francesco Guicciardini e *il* governo Fiorentino (2 vols., Bologna, 1896).

GUICHARD, KARL GOTTLIEB (1724–1775), soldier and military writer, known as QUINTUS ICILIUS, was born at Magdeburg in 1724, of a family of French refugees. He was educated for the Church, but sought and obtained a commission in the Dutch army, making the campaigns of 1747–48 in the Low Countries. In 1757 his *Mémoires* militaires *sur les* Grecs et les Romains appeared at the Hague; and in Jan. 1758 he entered the service of Frederick the Great, remaining for nearly 18 months in the royal suite. Guichard's Prussian official name of Quintus Icilius was the outcome of a friendly dispute with the king (see Nikolai, Anekdoten, vi. 129–145; Carlyle, Frederick the Great, viii. 113–114). He was appointed to the command of a free battalion. This corps he commanded throughout the later stages of the Seven Years' War, his battalion, as time went on, becoming a regiment of three battalions, and Quintus himself recruited seven more battalions of the same kind of troops. His command was almost always with the king's own army in these campaigns, but for a short time it fought in the western theatre under Prince Henry. When not on the march he was always at the royal headquarters, and it was he who brought about the famous interview between the king and Gellert (see Carlyle, Frederick the *Great,* ix. 109; Gellert, Briefwechsel *mit* Demoiselle *Lucius,* ed. Ebert, Leipzig, 1823, pp. 629–631) on the subject of national German literature. He was made lieutenant-colonel in 1765, and in 1773, in recognition of his work *Mémoires* critiques et *historiques* sur *plusieurs points d'antiquités* militaires, dealing mainly with Caesar's campaigns in Spain (Berlin, 1773), was promoted colonel. He died at Berlin on May 13, 1775.

GUICHEN, LUC URBAIN DE BOUEXIC, COMTE DE (1712–1790), French admiral, was born at Fougères on June 21, 1712, and entered the navy in 1730. When France had become the ally of the Americans in the War of Independence, he hoisted his flag as rear-admiral in the Channel fleet, and was present at the battle of Ushant (July 27, 1779). In March of the following year he was sent to the West Indies to fight Rodney. In the action to leeward of Martinique (April 17), Guichen narrowly escaped disaster. He gave no further opportunity of bringing him to close action, and brought his fleet back to Brest for repairs. In December 1781 Guichen was sent to the West Indies with stores and reinforcements. On the 12th Admiral Kempenfelt, who had been sent out by the British Government to intercept him, sighted the French admiral in the Bay of Biscay through a temporary clearance in a fog, and attacked the transports, twenty of which were captured and the rest put to flight. Guichen died on Jan. 13, 1790.

See vicomte de Noailles, *Marins* et soldats *français* en *Amérique* (1903); and E. Chevalier, *Histoire* de la marine *française* pendant la *guerre* de *l'indépendence américaine* (1877).

GUIDE, an agency for directing or showing the way, specifically a person who leads or directs a stranger over unknown or unmapped country, or conducts travellers and tourists through a town, or over buildings of interest.

A particular class of guides is employed in mountaineering; these are not merely to show the way, but stand in the position of professional climbers with an expert knowledge of rock and snowcraft, who are in dangerous expeditions an element of safety for the whole party.

This professional class of guides arose in the middle of the 19th century when Alpine climbing became recognized as a sport (see MOUNTAINEERING), though long before that the guiding of travellers on their way to or from Italy had been a well organized occupation in mediaeval Switzerland, and many little touches in the *Divina Commedia* show that Dante was writing from actual experience of real, if minor, mountains under a real guide.

GUIDI, CARLO ALESSANDRO (1650–1712), Italian lyric poet, was born at Pavia on June 14, 1650. As chief founder of the well-known Roman academy called "L'Arcadia," he had a share in the reform of Italian poetry, corrupted by the extravagances of the poets Marini and Achillini and their school. Guidi's most celebrated song is that entitled *Alla Fortuna* (To Fortune). In 1681 he published at Parma his poems, his lyric tragedy Amal*asunta* in Italy, and two pastoral dramas Daphne and *Endymion.* His poetical version of the six homilies of Pope Clement XI. proved to be the indirect cause of the author's death. Guidi was on his way to present a copy to the pope, when he found a serious typographical error; he took it so much to heart that he was seized with an apoplectic fit at Frascati and died (June 12, 1712).

See G. Capsoni, Alessandro Guidi (1896).

GUIDICCIONI, GIOVANNI (1480–1541), Italian poet, was born at Lucca on Feb. 25, 1480, and died at Macerata. He was bishop of Fossombrone and president of Romagna. The *Rime* (mod. ed., 2 vols., 1912) and Letters of Guidiccioni are models of elegant and natural Italian style.

GUIDO OF AREZZO (c. 990), a musician who lived in the 11th century, is also known as Guido Aretinus, Fra Guittone, and Guy of Arezzo. He has been called the father of modern music, and a portrait of him in the refectory of the monastery of Avellana bears the inscription *Beatus* Guido, inventor *musicae.* Of his life little is known, and that little is chiefly

derived from the dedicatory letters prefixed to two of his treatises and addressed respectively to Bishop Theodald of Arezzo, and Michael, a monk of Pomposa and Guido's pupil and friend. At his first appearance in history Guido was a monk in the Benedictine monastery of Pomposa, where he taught singing and invented his educational method, by means of which, according to his own statement, a pupil might learn in five months what formerly it would have taken him ten years to acquire. Envy and jealousy, however, drove him from the monastery and he went to live at Arezzo, where, about 1030, he received an invitation to Rome from Pope John XIX. He obeyed the summons, and the pope himself became his first and apparently one of his most proficient pupils. In Rome he met again his former superior, the abbot of Pomposa, who seems to have induced him to return to Pomposa. Thenceforward the particulars of his life are scanty but it is known that at one period he worked in the Benedictine monastery of St. Maur des Fosses where he invented his novel system of notation and taught the brothers to sing by it. In codex 763 of the British Museum the composer of the "Micrologus," which gives an account of his method and other works by him is always described as Guido de Sancto Mauro

But whatever the details of his life there is no room for question as to the importance of his musical reforms and innovations. He it was who for the first time systematically used the lines of the staff, and the intervals or *spatia* between them. There is also little doubt that the names of the first six notes of the scale, *ut, re, mi, fa, sol, la,* still in use in France and Italy, were introduced by him. They were derived from the first syllables of six lines of a hymn addressed to St. John the Baptist, the initial notes of each line of which happened to form the scale, C, D, E, F, G, A, the lines in question being as follows:—

Ut queant laxis *re*sonare fibris
Mira gestorum famuli tuorum,
Solve polluti *labii* reatum,
Sancte Joannes.

Further Guido is generally credited with the introduction of the F clef and with writings on music which are amply sufficient to account for the high esteem in which he was ultimately held by his contemporaries. The precise year of his death is unknown.

The most important of Guido's treatises, and those which are generally acknowledged to be authentic, are *Micrologus Guidonis de disciplina artis musicae,* dedicated to Bishop Theodald of Arezzo, and comprising a complete theory of music, in 20 chapters; *Musicae Guidonis regulae rhythmicae in antiphonarii sui prologum prolatae,* written in trochaic decasyllabics of anything but classical structure; *Aliae Guidonis regulae de ignoto cantu, identidem in antiphonarii sui prologum prolatae;* and the *Epistola Guidonis Michaeli monacho de ignoto cantu,* already referred to. These are published in the second volume of Gerbert's *Scriptores ecclesiastici de musica sacra.* A very important manuscript unknown to Gerbert (the *Codex bibliothecae Uticensis,* in the Paris library) contains an antiphonarium and gradual undoubtedly belonging to Guido. *(See* SOL-FA and TONIC SOL-FA.)

Angeloni, *G. d'Arezzo* (1811); Kiesewetter, *Guida von Arezzo* (1840); Kornmüller, "Leben und Werken Guidos von Arezzo," in Habert's *Jahrb.* (1876); Antonio Brandi, G. *Aretino* (1882); *G.* B. Ristori, *Biografia di Guido monaco d'Arezzo* (1868); and a life by Gastoué in the *Dict. d'archéologie* (Paris, 1924). *(See* also HEXACHORD, MUSIC and MUSICAL MOTATION.)

GUIDO OF SIENA. The name of this Italian painter is of interest in the history of art, on the ground that, if certain assumptions regarding him could be accepted as true, he would be the earliest representative of a new school of neo-Byzantine art which flourished in Siena in the 13th century. The case stands thus. A large painting of the "Virgin and Child Enthroned," which was once in the church of San Domenico at Siena and is now in the Palazzo Pubblico bears a rhymed Latin inscription, giving the painter's name as Gu . . . o de Senis, with the date 1221: Milanesi alleged that the inscription had been tampered with and should read 1281, while Prof. Wickhoff maintained that the date 1221 was genuine. Recent art criticism has inclined towards the latter view. Milanesi thinks that the work in S. Domenico is due to Guido Graziani, of whom no other record remains earlier than 1278, when he is mentioned as the painter of a banner.

See Milanesi, *Della vera eta di Guido, in Giorn. stor. dyli. Arch Toscani* III. (1859); Wickhoff, *Arch. Stor. dell' arte* III. (1890); Langton Douglas, *History of Siena* (1902); Weigelt, *Duccio di Buoninsegna* (1911); Siren, *Tosk. Maler* im *13. Jahr.* (1922).

GUIDO RENI (1575–1642), Italian painter of the Bolognese school, and one of the most admired artists of the period of incipient decadence in Italy, was born at Calvenzano near Bologna on Nov. 4, 1575. He studied under Denys Calvaert, a Flemish painter, who was at the head of an academy of design at Bologna. He then worked under the Caracci for a short time. Guido was faithful to the eclectic principle of the Bolognese school of painting. On one occasion Annibale Caracci made the remark that a style might be formed reversing that of Caravaggio in such matters as the ponderous shadows and the gross common forms; this observation germinated in Guido's mind, and he endeavoured after some such style, aiming constantly at suavity. Towards 1602 he went to Rome which remained his headquarters for 20 years. Here, in the pontificate of Paul V. (Borghese), he was greatly noted and distinguished. In the garden-house of the Rospigliosi Palace he painted the vast fresco which is justly regarded as his masterpiece—"Phoebus and the Hours preceded by Aurora." It is beyond doubt a work of pre-eminent beauty and attainment; it is stamped with pleasurable dignity, without being effeminate. The pontifical chapel of Montecavallo was assigned to Reni to paint; but, being straitened in payments by the ministers, the artist made off to Bologna. He was fetched back by Paul V. with ceremonious Cclat, and lodging, living and equipage were supplied to him. In 1622 he was called to Naples to paint the chapel of S. Gennaro, but he had to abandon this work in order to escape from the persecution of Ribera and other artists. He returned to Rome; and then resettled in Bologna. He had taught as well as painted in Rome, and he left pupils behind him; but on the whole he did not stamp any great mark upon the Roman school of painting, apart from his own numerous works in the papal city.

In Bologna Guido lived in great splendour, and established a celebrated school, numbering more than two hundred scholars. He himself drew in it, even down to his latest years. He now left Bologna hardly at all; in one instance, however, he went off to Ravenna, and, along with three pupils, he painted the chapel in the cathedral with his admired picture of the "Israelites gathering Manna." His prosperity was not to last till the end, for he was dissipated, and an inveterate gambler. In his decline he sold his time at so much per hour to a number of picture dealers. Half-heartedness, half-performance, blighted his product; self-repetition and mere mannerism, with affectation for sentiment and vapidity for beauty, became the art of Guido. He died in Bologna on Aug. 18, 1642; and was buried with great pomp in the church of S. Domenico.

Of his numerous scholars, Simone Cantarini, named I1 Pesarese, Giacomo Semenza and Francesco Gessi were among the more distinguished. Guido's most characteristic style exhibits a prepense ideal, of form rather than character, and silvery, somewhat cold, colour. His best works have beauty, great amenity, artistic feeling and high accomplishments of manner with a certain element of generalization. Both in Rome and wherever else he worked he introduced increased softness of style, which was then designated as the modern method. His pictures are mostly Scriptural or mythologic in subject, and between two and three hundred of them are to be found in various European collections. He painted very few portraits. The so-called Beatrice Cenci in the Barberini Palace was wrongly attributed to him. Many etchings are attributed to him—some from his own works, and some after other masters.

Of other works not already noticed, the following should be named:—in Bologna, the "Massacre of the Innocents," and the "Pietà"; in the Dresden Gallery, an "Ecce Homo"; in Milan (Brera Gallery), "Saints Peter and Paul"; in Genoa (church of S Ambrogio), the "Assumption of the Virgin"; in Berlin, "St. Paul the I-Irrmit and St. Anthony in the Wilderness"; in Munich, "Apollo and Marsyas"; in Rome (Capitol) "Mary Magdalene"; (Vatican) "The Crucifixion of St. Peter," an early work under the

influence of Caravaggio. The Louvre contains eight of his pictures, the National Gallery of London seven.

For the life and works of Guido Reni, *see* Bolognini, *Vita di Guido Reni (1839)*; Passeri, *Vite de' pittori;* and Malvasia, *Felsina Pittrice;* also Lanzi, *Storia pittorica.*

GUIENNE, an old French province which corresponded roughly to the *Aquitania Secunda* of the Romans and the archbishopric of Bordeaux. In the 12th century it formed with Gascony the duchy of Aquitaine, which passed under the dominion of the kings of England by the marriage of Eleanor of Aquitaine to Henry II.; but in the 13th, through the conquests of Philip Augustus, Louis VIII. and Louis IX., it was confined within the narrower limits fixed by the treaty of Paris (1259). It is at this point that Guienne becomes distinct from Aquitaine. It then comprised the Bordelais (the old countship of Bordeaux), the Bazadais, part of Périgord, Limousin, Quercy and Rouergue, the Agenais ceded by Philip III. (the Bold) to Edward I. (1279), and (still united with Gascony) formed a duchy extending from the Charente to the Pyrenees. This duchy was held on the terms of homage to the French kings, an onerous obligation; and both in 1296 and 1324 it was confiscated by the kings of France on the ground that there had been a failure in the feudal duties. At the treaty of Brétigny (1360) Edward III. acquired the full sovereignty of the duchy of Guienne, together with Aunis, Saintonge, Angoumois and Poitou. The victories of du Guesclin and Gaston Phoebus, count of Foix, restored the duchy soon after to its 13th-century limits. In 1451 it was conquered and finally united to the French crown by Charles VII. In 1469 Louis XI. gave it in exchange for Champagne and Brie to his brother Charles, duke of Berry, after whose death in 1472 it was again united to the royal dominion. Guienne then formed a government which from the 17th century onwards was united with Gascony. The government of Guienne and Gascony, with its capital at Bordeaux, lasted till the end of the *ancien régime.* Under the Revolution the departments formed from Guienne proper were those of Gironde, Lot-et-Garonne, Dordogne, Lot, Aveyron and the chief part of Tarn-et-Garonne.

GUILBERT, YVETTE (1869–), French *diseuse,* was born in Paris. She soon won an immense vogue by her rendering of songs drawn from Parisian lower-class life, or from the humours of the Latin Quarter, *les Quatre-z-Etudiants* and the *Hôtel du numéro trois* being among her early triumphs. Her adoption of an habitual yellow dress and long black gloves, her studied simplicity of diction, and her ingenuous delivery of songs charged with *risque'* meaning, made her famous. She owed something to M. Xanrof, who for a long time composed songs especially for her, and perhaps still more to Aristide Bruant, who wrote many of her *argot* songs. She made successful tours in England, Germany and America. In 1895 she married Dr. M. Schiller. In later years she discarded something of her earlier manner, and sang songs of the "pompadour" and the "crinoline" period in costume.

She published the novels *La Vedette* and *Les Demi-vieilles,* both in *1902,* and ***La*** *Chanson de ma vie (mes mémoires)* in 1927.

GUILDFORD, municipal borough and county town of Surrey, England, in the Guildford parliamentary division, 30 mi. S.W. of London by the Southern railway. Pop. (est. 1938) 39,840 Area 11.2 sq.mi. Guildford (Gyldeford, Geldeford), a possession of King Alfred, was a royal borough throughout the middle ages. It owed its rise to its command of trade routes. It is first mentioned as a borough in 1131. Henry III granted its inhabitants in 1256 freedom from all toll throughout the kingdom and a county court. Elizabeth in 1580 confirmed earlier privileges, and other charters were granted in 1603, 1626 and 1686. The borough was incorporated in 1486. During the middle ages the government of the town rested with a powerful merchant guild. Guildford sent two members to parliament from 1295 to 1867 and one member from then until 188;. Edward II granted two fgirs, at the feast of St. Matthew (Sept. 21) and at Trinity, respectively. Henry VII granted fairs on the feast of St. Martin (Nov. 11) and St. George (April 23). Fairs in May for the sale of sheep and in November for the sale of cattle are still held. The market rights date at least from 1276, and three weekly markets are still held. The cloth trade which formed the staple industry at Guildford in the middle ages is now extinct. Some old streets contain gabled houses, with quaint lattices and curious doorways. Well-preserved ruins of a Norman castle stand above the town. The church of St. Mary is Norman and Early English, with later additions; its aisles retain their eastward apses. The foundation stone of the new cathedral, on Stag hill, was laid in 1936. The guild hall dates from 1683. Abbot's hospital, founded by Archbishop Abbot in 1619, is a Tudor brick building. The Royal Free grammar school was founded in 1509, and incorporated by Edward VI in 1552. There is also a technical school. The town has flour mills and iron foundries, and a large trade in grain, and livestock fairs are held. Formerly a bishopric suffragan under Winchester, Guildford was constituted a diocese in 1927.

GUILDS. (The spelling *guild* is now the common English spelling, but there are many reasons for preferring the older spelling *gild.)* Mediaeval gilds were voluntary associations formed for the mutual aid and protection of their members. Among the gildsmen there was a strong spirit of fraternal co-operation or Christian brotherhood, with a mixture of worldly and religious ideals—the support of the body and the salvation of the soul. Early meanings of the root *gild* or *geld* were expiation, penalty, sacrifice or worship, feast or banquet, and contribution or payment; it is difficult to determine which is the earliest meaning, and we are not certain whether the gildsmen were originally those who contributed to a common fund or those who worshipped or feasted together. Their fraternities or societies may be divided into three classes: religious or benevolent, merchant and craft gilds. The last two categories, which do not become prominent anywhere in Europe until the 12th century, had, like all gilds, a religious tinge, but their aims were primarily worldly, and their functions were mainly of an economic character.

Origin.—Various theories have been advanced concerning the origin of gilds. Some writers regard them as a continuation of the Roman *collegia* and *sodalitates,* but there is little evidence to prove the unbroken continuity of existence of the Roman and Germanic fraternities. A more widely accepted theory derives gilds wholly or in part from the early Germanic or Scandinavian sacrificial banquets. This view does not seem to be tenable, for the old sacrificial carousals lack two of the essential elements of the gilds, namely, corporative solidarity or permanent association and the spirit of Christian brotherhood. Dr. Max Pappenheim has ascribed the origin of Germanic gilds to the northern "foster-brotherhood" or "sworn-brotherhood," which was an artificial bond of union between two or more persons. After intermingling their blood in the earth and performing other peculiar ceremonies, the two contracting parties with grasped hands swore to avenge any injury done to either of them. The foster-brotherhood seems to have been unknown to the Franks and the Anglo-Saxons, the nations in which mediaeval gilds first appear; and hence Dr. Pappenheim's conclusions, if tenable at all, apply only to Denmark or Scandinavia.

No theory on this subject can be satisfactory which wholly ignores the influence of the Christian Church. Imbued with the idea of the brotherhood of man, the Church naturally fostered the early growth of gilds and tried to make them displace the old heathen banquets. The work of the Church was, however, directive rather than creative. Gilds were a natural manifestation of the associative spirit which is inherent in mankind. The same needs produce in different ages associations which have striking resemblances, but those of each age have peculiarities which indicate a spontaneous growth. It is not necessary to seek the germ of gilds in any antecedent age or institution. When the old kin-bond or *maegth* was beginning to weaken or dissolve, and the State did not yet afford adequate protection to its citizens, individuals naturally united for mutual help.

Gilds are first mentioned in the Carolingian capitularies of 779 and 789, and in the enactments made by the Synod of Nantea early in the 9th century, the text of which has been preserved in the ecclesiastical ordinances of Hincmar of Reims (A.D. 852). The capitularies of 805 and 821 also contain vague references to sworn unions of some sort, and a capitulary of 884 prohibits

villeins from forming associations "vulgarly called gilds" against those who have despoiled them. The Carolingians evidently regarded such "conjurations" as "conspirations" dangerous to the State. The gilds of Norway, Denmark and Sweden are first mentioned in the 11th, 12th and 14th centuries respectively; those of France and the Netherlands in the 11th.

Many writers believe that the earliest references to gilds come from England. The laws of Ine speak of *gegildan* who helped one another pay the *wergeld*, but it is not quite certain that they were members of gild fraternities in the later sense. These are more clearly referred to in England in the second half of the 9th century, though we have little information concerning them before the 11th century. To the first half of that century belong the statutes of the fraternities of Cambridge, Abbotsbury and Exeter. They are important because they form the oldest body of gild ordinances extant in Europe. The thanes' gild at Cambridge afforded help in blood-feuds, and provided for the payment of the *wergeld* in case a member killed anyone. The religious element was more prominent in Orcy's gild at Abbotsbury and in the fraternity at Exeter; their ordinances exhibit much solicitude for the saivation of the brethren's souls. The Exeter giid also gave assistance when property was destroyed by fire. Prayers for the dead, attendance at funerals of gildsmen, periodical banquets, the solemn entrance oath, fines for neglect of duty and for improper conduct, contributions to a common purse, mutual assistance in distress, periodical meetings in the gildhall—in short, all the characteristic features of the later gilds already appear in the statutes of these Anglo-Saxon fraternities. Some Continental writers, in dealing with the origin of municipal government throughout western Europe, have, however, ascribed too much importance to the Anglo-Saxon gilds, exaggerating their prevalence and contending that they form the germ of mediaeval municipal government. This view rests almost entirely on conjecture; there is no good evidence to show that there was any organic connection between gilds and municipal government in England before the coming of the Normans. It should also be noted that there is no trace of the existence of either craft or merchant gilds in England before the Norman Conquest. Commerce and industry were not yet sufficiently developed to call for the creation of such associations.

Religious Gilds after the Norman Conquest.—Though we have not much information concerning the religious gilds in the 12th century, they doubtless flourished under the Anglo-Norman kings, and we know that they were numerous, especially in the boroughs, from the 13th century onward. In 1388 parliament ordered that every sheriff in England should call upon the masters and wardens of all gilds and brotherhoods to send to the king's council in Chancery, before Feb. 2, 1389, full returns regarding their foundation, ordinances and property. They throw much light on the functions of the gilds. Their ordinances are similar to those of the above-mentioned Anglo-Saxon fraternities. Each member took an oath of admission, paid an entrance fee, and made a small annual contribution to the common fund. The brethren were aided in old age, sickness and poverty, often also in cases of loss by robbery, shipwreck and conflagration; for example, any member of the gild of St. Catherine, Aldersgate, was to be assisted if he "fall into poverty or be injured through age, or through fire or water, thieves or sickness." Alms were often given even to non-gildsmen; lights were supported at certain altars; feasts and processions were held periodically; the funerals of brethren were attended; and masses for the dead were provided from the common purse or from special contributions made by the gildsmen. Some of the religious gilds supported schools, or helped to maintain roads, bridges and town-walls, or even came, in course of time, to be closely connected with the government of the borough; but, as a rule, they were simply private societies with a limited sphere of activity. They are important because they played a prominent rôle in the social life of England, especially as eleemosynary institutions, down to the time of their suppression in 1547. Religious gilds, closely resembling those of England, also flourished on the Continent during the middle ages.

The Gild Merchant.—The merchant and craft fraternities are particularly interesting to students of economic and municipal history. The gild merchant came into existence in England soon after the Norman Conquest, as a result of the increasing importance of trade, and it may have been transplanted from Normandy. Until clearer evidence of foreign influence is found, it may, however, be safer to regard it simply as a new application of the old gild principle, though this new application may have been stimulated by Continental example. The evidence seems to indicate the pre-existence of the gild merchant in Normandy, but it is not mentioned anywhere on the Continent before the 11th century. It spread rapidly in England, and from the reign of John onward we have evidence of its existence in many English boroughs. But in some prominent towns, notably London, Colchester, Norwich and the Cinque Ports, it seems never to have been adopted. In fact it played a more conspicuous rôle in the small boroughs than in the large ones. It was regarded by the townsmen as one of their most important privileges. Its chief function was to regulate the trade monopoly conveyed to the borough by the royal grant of *giida mercatoria*. A grant of this sort implied that the gildsmen had the right to trade freely in the town, and to impose payments and restrictions upon others who desired to exercise that privilege. The ordinances of a gild merchant thus aim to protect the brethren from the commercial competition of strangers or non-gildsmen. More freedom of trade was allowed at all times in the selling of wares by wholesale, and also in retail dealings during the time of markets and fairs. The ordinances were enforced by an alderman with the assistance of two or more deputies, or by one or two masters, wardens or keepers. The *Morwenspeches* were periodical meetings at which the brethren feasted, revised their ordinances, admitted new members, elected officers and transacted other business.

Historians have expressed divergent views regarding the early relations of the craftsmen and their fraternities to the gild merchant. One of the main questions in dispute is whether artisans were excluded from the gild merchant. Many of them seem to have been admitted to membership. They were regarded as merchants, for they bought raw material and sold the manufactured commodity; no sharp line of demarcation was drawn between the two classes in the 12th and 13th centuries. Separate societies of craftsmen were formed in England soon after the gild merchant came into existence; but at first they were few in number. The gild merchant did not give birth to craft fraternities or have anything to do with their origin; nor did it delegate its authority to them. In fact, there seems to have been little or no organic connection between the two classes of gilds. As has already been intimated, however, many artisans probably belonged both to their own craft fraternity and to the gild merchant, and the latter, owing to its great power in the town, may have exercised some sort of supervision over the craftsmen and their societies. When the king bestowed upon the tanners or weavers or any other body of artisans the right to have a gild, they secured the monopoly of working and trading in their branch of industry. Thus with every creation of a craft fraternity the gild merchant was weakened and its sphere of activity was diminished, though the new bodies were subsidiary to the older and larger fraternity. The greater the commercial and industrial prosperity of a town, the more rapid was the multiplication of craft gilds, which was a natural result of the ever-increasing division of labour. The old gild merchant remained longest intact and powerful in the smaller boroughs, in which, owing to the predominance of agriculture, few or no craft gilds were formed. In some of the larger towns the crafts were prominent already in the 13th century, but they became much more prominent in the first half of the 14th century. Their increase in number and power was particularly rapid in the time of Edward III., whose reign marks an era of industrial progress. Many master craftsmen now became wealthy employers of labour, dealing extensively in the wares which they produced. The class of dealers or merchants, as distinguished from trading artisans, also greatly increased and established separate fraternities. When these various unions of dealers and of craftsmen embraced all the trades and branches of production in

the town, little or no vitality remained in the old gild merchant; it ceased to have an independent sphere of activity. The tendency was for the single organization, with a general monopoly of trade, to be replaced by a number of separate organizations representing the various trades and handicrafts. In short, the function of guarding and supervising the trade monopoly split up into various fragments, the aggregate of the crafts superseding the old general gild merchant. This transference of the authority of the latter to a number of distinct bodies and the consequent disintegration of the old organization was a gradual spontaneous movement—a process of slow displacement, or natural growth and decay, due to the play of economic forces—which, generally speaking, may be assigned to the 14th and 15th centuries, the very period in which the craft gilds attained the zenith of their power. While in most towns the name and the old organization of the gild merchant thus disappeared and the institution was displaced by the aggregate of the crafts towards the close of the middle ages, in some places it survived long after the 15th century either as a religious fraternity, shorn of its old functions, or as a periodical feast, or as a vague term applied to the whole municipal corporation.

On the Continent of Europe the mediaeval gild merchant played a less important rôle than in England. In Germany, France and the Netherlands it occupies a less prominent place in the town charters and in the municipal polity, and often corresponds to the later fraternities of English dealers established either to carry on foreign commerce or to regulate a particular part of the local trade monopoly.

Craft Gilds.—A craft gild usually comprised all the artisans in a single branch of industry in a particular town. Such a fraternity was commonly called a "mistery" or "company" in the 15th and 16th centuries, though the old term "gild" was not yet obsolete, "Gild" was also a common designation in north Germany, while the corresponding term in south Germany was *Zunft*, and in France *métier*. These societies are not clearly visible in England or on the Continent before the early part of the 12th century. With the expansion of trade and industry the number of artisans increased, and they banded together for mutual protection. Some German writers have maintained that these craft organizations emanated from manorial groups of workmen, but strong arguments have been advanced against the validity of this theory (notably by F. Keutgen). It is unnecessary to elaborate any profound theory regarding the origin of the craft gilds. The union of men of the same occupation was a natural tendency of the age. In the 13th century the trade of England continued to expand and the number of craft gilds increased. In the 14th century they were fully developed and in a flourishing condition; by that time each branch of industry in every large town had its gild. The development of these societies was even more rapid on the Continent than in England.

Their organization and aims were in general the same throughout western Europe. Officers, commonly called wardens in England, were elected by the members, and their chief function was to supervise the quality of the wares produced so as to secure good and honest workmanship. Therefore, ordinances were made regulating the hours of labour and the terms of admission to the gild, including apprenticeship. Other ordinances required members to make periodical payments to a common fund, and to participate in certain common religious observances, festivities and pageants. But the regulation of industry was always paramount to social and religious aims; the chief object of the craft gild was to supervise the processes of manufacture and to control the monopoly of working and dealing in a particular branch of industry.

We have already called attention to the gradual displacement of the gild merchant by the craft organizations. The relations of the former to the latter must now be considered more in detail. There was at no time a general struggle in England between the gild merchant and the craft gilds, though in a few towns there seems to have been some friction between merchants and artisans, There is no exact parallel in England to the conflict between these two classes in Scotland in the 16th century, or to the great Continental revolution of the 13th and 14th centuries, by which the crafts threw off the yoke of patrician government and secured more independence in the management of their own affairs and more participation in the civic administration. The main causes of these conflicts on the Continent were the monopoly of power by the patricians, acts of violence committed by them, their bad management of the finances and their partisan administration of justice. In some towns the victory of the artisans in the 14th century was so complete that the whole civic constitution was remodelled with the craft fraternities as a basis. A widespread movement of this sort would scarcely be found in England, where trade and industry were less developed than on the Continent, and where the motives of a class conflict between merchants and craftsmen were less potent. Moreover, borough government in England seems to have been mainly democratic until the 14th or 15th century; there was no oligarchy to be depressed or suppressed. Even if there had been motives for uprisings of artisans such as took place in Germany and the Netherlands, the English kings would probably have intervened. True, there were popular uprisings in England, but they were usually conflicts between the poor and the rich; the crafts as such seldom took part in these tumults. While many Continental municipalities were becoming more democratic in the 14th century, those of England were drifting towards oligarchy, towards government by a close "select body." As a rule the craft gilds secured no dominant influence in the boroughs of England, but remained subordinate to the town government. Whatever power they did secure, whether as potent subsidiary organs of the municipal polity for the regulation of trade, or as the chief or sole medium for the acquisition of citizenship, or as integral parts of the common council, was, generally speaking, the logical sequence of a gradual economic development, and not the outgrowth of a revolutionary movement by which oppressed craftsmen endeavoured to throw off the yoke of an arrogant patrician gild merchant.

Two new kinds of craft fraternities appear in the 14th century and become more prominent in the 15th, namely, the merchants' and the journeymen's companies. The misteries or companies of merchants traded in one or more kinds of wares. They were preeminently dealers, who sold what others produced. Hence they should not be confused with the old gild merchant, which originally comprised both merchants and artisans, and had the whole monopoly of the trade of the town. In most cases, the company of merchants was merely one of the craft organizations which superseded the gild merchant.

In the 14th century the journeymen or yeomen began to set up fraternities in defence of their rights. The formation of these societies marks a cleft within the ranks of some particular class of artisans—a conflict between employers, or master artisans, and workmen. The journeymen combined to protect their special interests, notably as regards hours of work and rates of wages, and they fought with the masters over the labour question in all its aspects. The resulting struggle of organized bodies of masters and journeymen was widespread throughout western Europe, but it was more prominent in Germany than in France or England. This conflict was indeed one of the main features of German industrial life in the 15th century. In England the fraternities of journeymen, after struggling a while for complete independence, seem to have fallen under the supervision and control of the masters' gilds; in other words, they became subsidiary or affiliated organs of the older craft fraternities.

An interesting phenomenon in connection with the organization of crafts is their tendency to amalgamate, which is occasionally visible in England in the 15th century, and more frequently in the 16th and 17th. A similar tendency is visible in the Netherlands and in some other parts of the Continent already in the 14th century. Several fraternities—old gilds or new companies, with their respective cognate or heterogeneous branches of industry and trade—were fused into one body. In some towns all the crafts were thus consolidated into a single fraternity; in this case a body was reproduced which regulated the whole trade monopoly of the borough, and hence bore some resemblance to the old gild merchant.

In dealing briefly with the modern history of craft gilds we may confine our attention to England. In the Tudor period the policy of the Crown was to bring them under public or national control. Laws were passed, for example in 1503, requiring that new ordinances of "fellowships of crafts or misteries" should be approved by the royal justices or by other Crown officers; and the authority of the companies to fix the price of wares was thus restricted. The statute of 5 Elizabeth c. 4 also curtailed their jurisdiction over journeymen and apprentices (see APPRENTICESHIP).

The craft fraternities were not suppressed by the statute of 1547 (1 Edward VI.). They were indeed expressly exempted from its general operation. Such portions of their revenues as were devoted to definite religious observances were, however, appropriated by the Crown. The revenues confiscated were those used for "the finding, maintaining or sustentation of any priest or of any anniversary, or obit, lamp, light or other such things." This has been aptly called "the disendowment of the religion of the misteries." Edward VI.'s statute marks no break of continuity in the life of the craft organizations. Even before the Reformation, however, signs of decay had already begun to appear, and these multiplied in the 16th and 17th centuries. The old gild system was breaking down under the action of new economic forces. Its dissolution was due especially to the introduction of new industries, organized on a more modern basis, and to the extension of the domestic system of manufacture. Thus the companies gradually lost control over the regulation of industry, though they still retained their old monopoly in the 17th century, and in many cases even in the 18th. In fact, many craft fraternities still survived in the second half of the 18th century, but their usefulness had disappeared. The mediaeval form of association was incompatible with the new ideas of individual liberty and free competition, with the greater separation of capital and industry, employers and workmen, and with the introduction of the factory system. Intent only on promoting their own interests and disregarding the welfare of the community, the old companies had become an unmitigated evil. Attempts have been made to find in them the progenitors of the trade unions, but there seems to be no immediate connection between the latter and the craft gilds. The privileges of the old fraternities were not formally abolished until 1835; and the substantial remains or spectral forms of some are still visible in other towns besides London.

GUILD SOCIALISM, the name of a school of Socialist thought which became prominent in Great Britain in the second decade of the 20th century, and spread thence to other parts of the world, especially the English-speaking countries. Its governing idea is that of seli-government in industry—the application of democratic principles to industrial as well as to political affairs—and the organization of the economic life of the community on a "functional" basis. As the name implies. Guild Socialism has. in the minds of its founders, a relation to the forms of industrial organization which existed throughout the mediaeval world, and is based on an attempt, in some measure, to apply mediaeval ideas to the solution of modern problems. This does not mean that Guild Socialists wish to restore the mediaeval guild system, or that Guild Socialism has any necessary connection with the attempt to revive handicraft in place of machine production. This element was indeed present in the early stages, but had dropped away before it acquired any wide influence.

The origin of the movement is to be found in the work of an architect, Arthur J. Penty, who published The Restoration of the Guild System in 1906, and of A. R. Orage, for many years editor of the New *Age,* in which journal the new doctrine gradually developed in the next few years. The fruit of this development was the book, National *Guilds,* written by S. G. Hobson and edited by A. R. Orage, first published in the *New* Age in 1912. In this work, Guild Socialism first assumed its distinctive form as an attempt to convert the trade unions to the idea of "workers' control" in industry, and to create with their aid self-governing functional organizations for the government of industry in conjunction with the State.

So far the guild movement had not spread beyond a small circle of theoretical adherents. But in the years before 1914 a great wave of Labour unrest spread over Great Britain. There were many strikes, and a new spirit of economic revolt entered into the trade union movement. At the same time the doctrines of Industrial Unionism were imported from America, and those of Syndicalism from France; and both these doctrines found numerous adherents among the younger trade unionists, and excited vigorous controversy. Guild Socialism was influenced by these movements, and was more and more presented as a reconciliation of Syndicalist and Socialist doctrines. Like the Syndicalists, it denounced bureaucracy and State control. Unlike them, it repudiated Anarchism, and recognized the necessity of the State as an instrument of political organization and control. It was not, however, until a group of the younger men began, in 1913, regularly to advocate Guild Socialism in the newly founded Daily Herald that the movement attained to any widespread influence. And it was not until 1915 that it assumed, with the foundation of the National Guilds League by G. D. H. Cole, W. Mellor, M. B. Reckitt and others, an organized form.

The industrial situation during the World War undoubtedly helped the growth of the new movement. For the War, by making necessary large and frequent changes in industrial organization, profoundly stirred the trade unions, and created in the minds of trade unionists a keen desire for control and self-government in industry. During the War the influence of Guild Socialism was widely felt in the shop stewards' movement (*q.v.*), and in the redrafting of many trade union programmes, so as to include the demand for "workers' control." Thus, the Miners' Federation, which before the War had demanded nationalisation and State administration of the mines, changed its programme in 1918 to a demand for national ownership and democratic control by the workers, and put forward its new Guild Socialist claim before the famous Sankey Commission of 1919. The Socialist bodies, such as the Independent Labour Party and the Labour Party itself, also altered their programmes so as to include the demand for some measure of workers' control in industry.

Immediately after the War Guild Socialism spread still more rapidly, and entered on a new phase with the formation of actual working guilds, under trade union auspices, in the building and other industries. The National Building Guild and its local centres executed, between 1920 and 1922, a number of important housing contracts, and were generally agreed to have done excellent work. But it had no capital. and the abandonment of the Addison housing scheme in 1921 was fatal to it. Driven to depend on bank and commercial credits, it overtraded and got into financial difficulties, which in 1922 led to its collapse. Certain of its local centres, however, survived, and mere still active for some years longer as were the tailoring guilds in Glasgow and Leeds, the piano workers' guild in London, and certain others.

Guild Socialism and **Collectivism.**—These practical ventures, however, were, from the standpoint of the main body of

Guild Socialists, only of minor importance. For the guild was for them essentially a part of the mechanism of a Socialist community, and "guilds" formed in a capitalist society could be guilds only in a quite incomplete sense. Guild Socialism involves the ownership of industries by the whole community, as well as their administration by the "workers by hand and brain" (a phrase originally coined by the Guild Socialists) engaged in them. It is essentially a Socialist doctrine, accepting the Socialist idea of public ownership, and differing from the Collectivist, or State Socialist, school of thought only in its insistence on the idea of industrial self-government and its hostility to bureaucracy and political control of industrial affairs. Guild Socialists differ, indeed, in their views about the form and structure of the State in a guild society. Some believe in the continued supremacy of the State as the political organ of government, while others hold that the State in its present form is destined to disappear, and to be replaced by a sort of federal authority representing the community in its various functional aspects. This latter view, has been associated with the philosophical ideas of political Pluralism. It must not be confused with proposals for "industrial self-government" under capitalist control.

Industrial self-government is, for the Guild Socialists, the application to economics of a general principle that is of far wider significance. They believe that democracy can be real only if it is "functional"—that is, if it is specifically related to each of the main activities of society. It is absurd, they hold, to speak of political democracy when industry is organised on autocratic lines; for the conditions of a man's daily work will inevitably affect his attitude and status as a citizen. Moreover, the existing economic system fails because it does not call out what is best in men. Instead of a co-operative fellowship of service we have contending groups of masters and men, alike wasted by "the sickness of an acquisitive society" (Tawney). It is necessary so to organise the economic and social system as to make each service a responsible fellowship, whose members are "on their honour" to do their best in the interest of all.

As a distinct body of doctrine, Guild Socialism reached its highest point in the years immediately after the war. Thereafter, it gradually dissolved. The National Guilds League was wound up and with its disappearance the formal existence of the movement came to an end. But its influence survived, and many of its once hotly-contested doctrines received a modified acceptance among Socialists in Great Britain. It has left an abiding mark on both trade union and Socialist policy, and is likely to contribute an important element to future Socialist schemes for the reorganization of industry. Its thesis that "economic power precedes political power" is, indeed, still rejected by Socialist politicians; but the Guild Socialists' insistence that the power which goes with responsibility must be diffused to the widest possible extent among the whole mass of the people, and that this diffusion, on functional lines, is the necessary condition of democratic health in the body politic is now part of the common stock of Socialist doctrine.

GUILFORD, BARONS AND EARLS OF. FRANCIS NORTH, 1st Baron Guilford (1637–85), was the third son of the 4th Baron North (see NORTH, BARONS), and was created Baron Guilford in 1683, after becoming lord keeper in succession to Lord Nottingham. He had been an eminent lawyer, solicitor-general (1671), attorney-general (1673), and chief-justice of the common pleas (1675), and in 1679 was made a member of the council of thirty and, on its dissolution, of the cabinet. He was a man of wide culture and a staunch royalist. In 1672 he married Lady Frances Pope, daughter and co-heiress of the earl of Downe, who inherited the Wroxton estate; and he was succeeded as 2nd baron by his son Francis (1673–1729), whose eldest son Francis (1704–go), after inheriting first his father's title as 3rd baron, and then (in 1734) the barony of North from his kinsman the 6th Baron North, was in 1752 created 1st earl of Guilford. His first wife was a daughter of the earl of Halifax, and his son and successor Frederick was the English prime minister, commonly known as Lord North, his courtesy title while the 1st earl was alive.

FREDERICK NORTH, 2nd earl of Guilford, but better known by his courtesy title of Lord North (1732–92), prime minister of England during the important years of the American War, was born on April 13, 1732, and was educated at Eton and Christ Church, Oxford. At 22 years of age, he was elected M.P. for Banbury, of which town his father was high steward; and he sat for the same town in parliament for nearly 40 years. In 1759 the duke of Newcastle made him a lord of the treasury, and he held this office under Lord Bute and George Grenville till 1765. On the fall of the first Rockingham ministry in 1766 he was sworn of the privy council, and made paymaster-general by the duke of Grafton. In December 1767, on the death of the brilliant Charles Townshend, he was made chancellor of the exchequer. North succeeded Grafton as premier in March 1770, and continued in office for 12 of the most eventful years in English history. George III. had at last overthrown the ascendancy of the great Whig families, and found in North a pliant instrument. The path of the minister in parliament was a hard one; he had to defend measures which he had not designed, and of which he had not approved, and this too in a House of Commons in which all the oratorical ability of Burke and Fox was against him, and when he had only the purchased help of Thurlow and Wedderburne to aid him. The most important events of his ministry were those of the American War of Independence. He cannot be accused of causing it, but one of his first acts was the retention of the tea-duty, and he introduced the Boston Port bill in 1774. When war had broken out he earnestly counselled peace, and it was only the earnest solicitations of the king not to leave his sovereign again at the mercy of the Whigs that induced him to defend a war which from 1779 he knew to be both hopeless and impolitic. In March 1782, he insisted on resigning after the news of Cornwallis's surrender at Yorktown. He had been rewarded for his assistance to the king by honours for himself and sinecures for his relatives, but in April 1783 North formed a famous coalition with C. J. Fox (*q.v.*), and became secretary of state with him under the nominal premiership of the duke of Portland. The coalition ministry went out of office on Fox's India bill in December 1783, and North, who was losing his sight, gave up politics. He succeeded to his father's earldom in 1790, and died on Aug. j, 1792.

Donne (1867); Horace Walpole, *Journal of the Reign of George III.* (1859), and *Memoirs of the Reign of George III.*, edited by G. F. R. Barker (1894); Lord Brougham, *Historical Sketches of Statesmen*, vol. i. (1839); Earl Stanhope, *History of England* (1858); Sir T. E. May, *Constitutional History of England* (1863–65); and W. E. H. Lecky, *History of England in the 18th century* (1878–90).

GUILFORD, a town, including a borough of the same name, in New Haven county, Conn., U.S.A., on Long Island sound, 16 m. E. by S. of New Haven. It is served by the New York, New Haven and Hartford railroad. The population of the town was 3,544 in 1940; of the borough, 1,986. The 12 acre green is shaded by fine old trees, and on an eminence commanding a view of the sound is a stone house, built in 1639 for a meeting-house, parsonage and fortification, which was restored in 1898 and made a state museum. Guilford was founded in 1639 as an independent colony by some 25 families from Kent, Surrey and Sussex, under the leadership of the Rev. Henry Whitfield, on land they bought from the Indians. The colony was at first known by the Indian name Menuncatunk. In 1643, for considerations of safety, it became a member of the New Haven jurisdiction, but with the understanding that Guilford planters who were not church mem-

bers should have certain rights in town meeting; and from 1661 until 1664 it was active in urging submission to Connecticut, which did away with the church-state and the restriction of the suffrage to freemen. Guilford was the birthplace of Fitz-Greene Halleck, the poet; and of Samuel Johnson, the first president of King's college (now Columbia university). The borough was incorporated in 1815.

GUILLAUMAT, MARIE LOUIS ADOLPHE (1863–1940), French soldier, was born at Bourgneuf, Charente Inférieure, Jan. 4, 1863. He left the military school of St. Cyr in 1884, and became a captain in 1893. He served for three years in Tongking with the Foreign Legion and during the Boxer rising in 1900 was in Tientsin where he received his first wound. In 1903 he was appointed professor of military history at St. Cyr and in 1908 lecturer on infantry tactics. After being director of infantry at the ministry of war from 1911, he became *chef de cabinet* to the minister of war, M. Messimy, in 1914. At the outset of the World War, Guillaumat, who had already taken part in 12 campaigns, commanded a division at the battle of the Marne and later in the Argonne. Subsequently, in command of the I. Army Corps, he took a notable part in the battles of Verdun and the Somme. In Dec. 1916 he was given the command of the II. Army in front of Verdun and directed the attack of Aug. 20, 1917, which succeeded in freeing the position.

In Dec. 1917 he was sent to Salonika as commander-in-chief of the armies in the East *(see* SALONIKA CAMPAIGNS) but was recalled in July 1918 to take command of the entrenched camp at Paris in face of the enemy advance. He urged the launching of an offensive in Macedonia both at the Inter-Allied War Council at Versailles and before the British War Cabinet; and on Sept. 4, 1918, at the London conference, his advice was adopted. In Oct. 1918 Gen. Guillaumat was given the command of the V. Army on the Aisne for the final advance. After the war he was president of the commission of inquiry into the surrender of the frontier fortresses and later was elected a member of the Conseil Supérieur de la Guerre. After being entrusted with a mission to Athens, where he drew up a plan for the reorganisation of the Greek army, he took command of the army of occupation in the Rhineland at the end of 1924. He was minister of war in June but in July 1926 returned to his command in the Rhineland.

GUILLAUME, CHARLES ÉDOUARD (1861–1938), French physicist, was born at Fleurier, Switzerland, Feb. 15, 1861. Educated at Neuchbtel, he became a *docteur-ès-sciences,* and devoted himself to the study of practical physics. He is principally known for his invention of the metal invar, an alloy of nickel and steel which, having a coefficient of linear expansion of only ·0000008 for one degree Centigrade, is in general use as a material for standard measures and instruments of precision. In 1920 he was awarded the Nobel Prize for physics and he became director of the international bureau of weights and measures.

Guillaume's works include: *Traité pratique de la thermométrie de précision* (1889); *Les radiations nouvelles; Les rayons X, etc.* (1896); *Les applications des aciers au nickel* (1904); *Détermination du volume du kilogramme d'eau* (1910); *Compensation des horloges et des montres* (1921); *Les récents progrès du système métrique* (1907–21).

GUILLAUME, JEAN BAPTISTE CLAUDE EUGENE (1822–1905), French sculptor, was born at Montbard on July 4, 1822, and studied under Cavelier, Millet and Barrias, at the École des Beaux-Arts, Paris, which he entered in 1841, and where he gained the *prix de Rome* in 1845 with "Theseus finding on a rock his Father's Sword." He became director of the École des Beaux-Arts in 1864, and director-general of fine arts from 1878 to 1879, when the office was suppressed. His monuments are to be found in the public squares of the chief cities of France.

GUILLAUME DE LORRIS (*fl.* 1230), author of the earlier section of the *Roman de la Rose,* derives his name from a township in the department of Loiret. Nothing else is positively known of him. A rubric in the poem puts Jean de Meun's continuation 40 years after Guillaume's death, which therefore used to be dated about 1260; but since Jean de Meun's own work has recently been thrown back, Guillaume's has been fixed before 1240. He tells us he dreamt the dream which forms the substance of the poem in his 20th year, and began to "rhyme it" five years later. The continuation shows more intellectual vigour than Guillaume's portion, but the earlier part is perhaps the more original. The great features of his work are the almost unsurpassed beauty of his word-pictures, and the allegorical setting, which, though now wearisome, was in his time effective. He had, of course, predecessors (Raoul de Houdenc, the troubadours, and others); but it was Guillaume who fixed the style.

For an attempt to identify de Lorris *see* L. Jarry, *Guillaume de L. et le testament d'Alphonse de Poitiers* (1881); P. Paris, in *Hist. litt. de la France,* vol. xxiii. For Chaucer's translation, see *Skeat,* vol. i.

GUILLAUME DE PALERNE (WILLIAM OF PALERNE), hero of romance. The French verse romance was written at the desire of a Countess Yolande, probably daughter of Baldwin IV., count of Flanders. The English poem in alliterative verse was written about 1350 by a poet called William. Guillaume, a foundling, is brought up at the court of the emperor of Rome, and loves his daughter Melior. The lovers flee into the woods disguised in bearskins. Alfonso, who is Guillaume's cousin and a Spanish prince, has been changed into a wolf by his step-mother's enchantments. He provides food and protection for the fugitives, and Guillaume eventually triumphs over Alfonso's father, and wins back from him his kingdom. The benevolent wer-wolf is disenchanted, and marries Guillaume's sister.

See *Guillaume de Palerne,* ed. *H.* Michelant (Soc. d. anc. textes fr., 1876); and W. W. Skeat (E. E. Text Soc., extra series No 1, 1867).

GUILLAUME D'ORANGE, also known as Fierabrace, St. Guillaume de Gellone, and the Marquis au court nez, was the central figure of the southern cycle of French romance, called by the *trouvères* the *geste* of Garin de Monglane. This cycle has a measure of unity, the poems being episodic rather than independent. Ms. Royal 20 D xi. (British Museum) contains 18 *chansons* of the cycle. Guillaume, son of Thierry and Alde, daughter of Charles Martel, was born in the north of France about the middle of the 8th century. He became one of the best soldiers of Charlemagne, and in 790 Charles's son Louis the Pious was put under his charge. He subdued the Gascons, and defended Narbonne against the infidels. In 793 Hescham, the successor of Abd-al-Rahman II., proclaimed a holy war against the Christians, and collected an army of 100,000 men, half of it against the Asturias, half against France. Guillaume met him at Villedaigne, and was defeated, but only after a resistance which so far exhausted the Saracens that they were compelled to retreat to Spain. He took Barcelona from the Saracens in 803, and in the next year founded the monastery of Gellone (now Saint Guilhem-le-Désert), of which he became a member in 806. He died there in the odour of sanctity in 812.

No less than 13 historical personages bearing the name of William have been thought to have their share in the formation of the legend. William, count of Provence, son of Boso II., delivered southern France from a Saracen invasion by his victory at Fraxinet in 972, and ended his life in a cloister. William Towhead (*Tête d'étoupe*), duke of Aquitaine (d. 983), showed a fidelity to Louis IV. paralleled by Guillaume d'Orange's service to Louis the Pious. The cycle of *chansons* which form the *geste* of Guillaume reposes on the traditions of the Arab invasions, from the battle of Poitiers (732) onwards, and on the French conquest of Catalonia from the Saracens. In the Norse version Guillaume appears in his historical environment, as a chief under Charlemagne; but plays a leading part in the *Couronnement Looys,* describing the formal association of Louis in the empire at Aix (813, the year after Guillaume's death), and after the battle of Aliscans it is from the emperor Louis that he seeks reinforcements. This anachronism arises from the fusion of the epic Guillaume with the champion of Louis IV., and from the fact that he was a general of Louis the Pious, who was titular king of Aquitaine under his father. The inconsistencies between the real and the epic Guillaume are often left standing in the poems. The personages associated with Guillaume in his Spanish wars belong to Provence, and have names common in the south. The most famous are Beuves de Comarchis, Ernaud de Girone, Aïmer le chétif, so called from his long captivity with the Saracens. The separate

existence of Aïmer, who refused to sleep under a roof, and spent his life in warring against the infidel, is proved. He was Hadhemar, count of Narbonne, who in 809 was one of the leaders sent by Louis against Tortosa. No doubt the others had historical prototypes. In the hands of the trouvkres they became all brothers of Guillaume, and sons of Aymeri de Narbonne, grandson of Garin de Monglane. Nevertheless when Guillaume seeks help from Louis he finds all his relations in Laon, in accordance with his historic Frankish origin.

The central fact of the geste is the battle of the Archant or Aliscans, in which perished Guillaume's heroic nephew, Vezian or Vivien. At the eleventh hour he summoned Guillaume to his help against the Saracens. Guillaume arrived too late, was himself defeated, and returned alone to his wife Guibourc. This event is related in a Norman-French transcript of an old French chanson de geste, the *Chançun* de *Willame*—brought to light in 1901 at the sale of the books of Sir Henry Hope Edwardes—and in the *Covenant Vivien*, a recension of an older French chanson. *Aliscans* continues the story, telling how Guillaume obtained reinforcements from Laon, and how, with the help of the comic hero, the scullion Rainouart, he avenged his nephew's death. Rainouart turns out to be the brother of Guillaume's wife Guibourc, who was before her marriage the Saracen princess and enchantress Orable. Two other poems are consecrated to his later exploits, *La Bataille Loquifer*, the work of a French Sicilian poet, Jendeu de Brie (*fl.* 1170), and Le *Moniage* Rainouart. The starting-point of Herbert of Dammartin (*c.*1170) in *Foucon* de *Candie* (Candie=Gandia in Spain?) is the return of Guillaume from the battle; and the Italian compilation I *Nerbonesi* seems in some cases to represent an earlier tradition than the later of the French chansons, although its author Andrea di Barberino wrote towards the end of the 14th century. The minnesinger Wolfram von Eschenbach based his *Willehalm* on a French original which must have differed from our versions. The variations in the story of the defeat of Aliscans, and the numerous inconsistencies of the narratives have occupied many critics. Aliscans (Aleschans, Elysii Campi) was, however, generally taken to represent the battle of Villedaigne, and to take its name from the cemetery outside Arles. Wolfram von Eschenbach even mentions the tombs which studded the field of battle. Indications that this tradition was not unassailable were not lacking before the discovery of the *Chançun* de *Willame,* which, although preserved in a very corrupt form, represents the earliest recension of the story, dating at least from the beginning of the 12th century. It seems probable that the Archant was situated in Spain near Tortosa, and that Guillaume started from Barcelona, not from Orange, to his nephew's help. The account was modified by successive trouvkres, and the uncertainty of their methods may be judged by the fact that in the *Chançun* de *Willame* two accounts (11. 450–1326 and 11. 1326–2420) of the fight appear to be set side by side. Le *Couronnement* Looys, *Le* Charroi de *Nîmes* (12th century) in which Guillaume enumerates his services to the terrified Louis, and Aliscans (12th century), with the earlier *Chançun,* are among the finest of the French epic poems. The figure of Vivien is among the most heroic elaborated by the trouvkres, and the giant Rainouart has a touch of Rabelaisian humour.

The *chansons de geste* of the cycle are: *Enfances Garin de Monglane* (15th century) and *Garin de Monglane* (13th century), on which is founded the prose romance of *Guérin de Monglane,* printed in the 15th century by Jehan Trepperel and often later; *Girars de Viane* (13th century, by Bertrand de Bar-sur-Aube), ed. P. Tarbé (Reims, 1850); *Hernaut de Beaulande* (fragment 14th century); *Renier de Gennes,* which only survives in its prose form; *Aymeri de Narbonne* (*c.* 1210) by Bertrand de Bar-sur-Aube, ed. L. Demaison (Soc. des anc. testes fr., 2 vols., 1887); *Les Enfances Guillaume* (13th century); *Les Narbonnais,* ed. H. Suchier (Soc. des anc. textes fr., 2 vols., 1898), with a Latin fragment dating from the 11th century, preserved at The Hague; *Le Couronnement Looys* (ed. *E.* Langlois, 1888), *Le Charroi de Nîmes, La Prise d'Orange, Le Covenant Vivien, Aliscans,* which were edited by W. J. A. Jonckbloet in vol. i. of his *Guillaume d'Orange* (The Hague, 1854); a critical test of *Aliscans* (Halle, 1903, vol. i.) is edited by E. Wienbeck, W. Hartnacke and P. Rasch; *Loquifer* and *Le Moniage Rainouart* (12th century); *Bavon de Commarchis* (13th century), recension of the earlier *Siège de Barbastre,* by Adenès li Rois, ed. A. Scheler (Brussels, 1874); *Guibert d'Andrenas* (13th century); *La Prise de Cordres* (13th century); *La Mort Aimeri de Narbonne,* ed. J. Couraye de Parc (Soc. des Anciens Testes fr. 1884); *Foulque de Candie* (ed. P. Tarbé, Reims, 1860); *Le Moniage Guillaume* (12th century); *Les Enfances Vivien* (ed. C. Wahlund and H. v. Feilitzen, Uppsala and Paris, 1895); *Chançun de Willame* (Chiswick Press, 1903), described by P. Meyer in *Romania* (xxxiii. 597–618). The ninth branch of the *Karlamagnus Saga* (ed. *C. R.* Unger, 1860) deals with the *geste* of Guillaume. *I. Nerbonesi* is edited by J. G. Isola (Bologna, 1877, etc.).

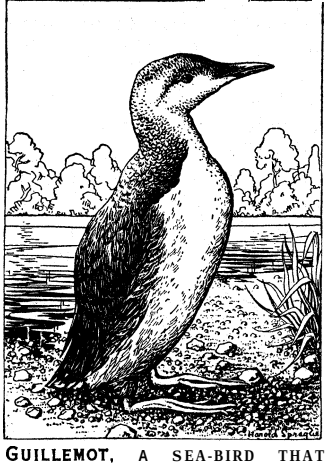
GUILLAUMIN, ARMAND (1841–1927), French landscape painter and engraver, an important member of the Impressionist movement.' He was born in Paris on Feb. 16, 1841, and he spent his boyhood at Moulins-sur-Allier. At the age of 17 he went to Paris and earned his living as an employee in the administration of the city. In his spare time he studied drawing under the sculptor, Caillouette, and he painted views in the neighbourhood of Montmartre and Meudon, and on the banks of the Seine. He also worked on portraiture and still-life. In 1874 he took part in an exhibition of Impressionist paintings with C. Pissaro, C. Monet and Sisley. In 1892 he was in a position to give up his post and to concentrate entirely on his art. After that date he painted many seascapes both on the Atlantic and Mediterranean coasts. His execution is direct, bold and sometimes vehement, his colour harmonious. He is represented in the following public collections:—Paris (Luxembourg and Petit Palais), Rouen, Limoges, Brussels, Munich, Moscow and in the Art institute at Chicago.

GUILLEMOT, or, as it is usually called in U.S.A., MURRE, a sea-bird breeding on the rocky coasts of the North Atlantic in vast numbers. This bird, *Uria aalge,* is a member of the auk family and, like the rest of the Alcidae, it winters in the open sea. A second species, Brunnich's Guillemot (U. lomvia), inhabits the Atlantic coasts of North America with *U.* aalge. Other species occur farther northward, on the west coast of North America and elsewhere. The black guillemot, *U.* grylle, known to sailors as the dovekie, is almost entirely black in summer plumage. Unlike the common form, which lays a single egg, the black guillemot produces two or three in a clutch. The so-called bridled or ringed guillemot is a variety of *U.* aalge with a white mark resembling a bridle round its eye. It is worth mention as a good example of a quite distinct variation found in considerable numbers in nature, but not intergrading with the normal. It is probably due to a Mendelian mutation.



GUILLEMOT, A SEA-BIRD THAT BREEDS ON THE BRITISH COAST AND FLIES SEAWARD FOR THE WINTER MONTHS

GUILLOCHE, in architecture, an ornament consisting of a band which is represented as curled round a series of circles placed in a row. The pattern may have its origin in basketry as it has a form similar to that made by the withes that are wound round and between the vertical reeds. Like the fret (*q.v.*) the guilloche is found in many parts of the world and in many periods.

GUILLON, MARIE NICOLAS SYLVESTRE (1760–1847), French ecclesiastic, was born in Paris on Jan. 1, 1760. He was librarian and almoner in the household of the princess de

Lamballe, and when in 1792 she was executed, he fled to the provinces, where under the name of Pastel he practised medicine, He afterwards served in turn under Napoleon, the Bourbons and the Orleanists, and became canon of St. Denis, bishop of Morocco and dean of the Sorbonne. Among his many works are a *Collection des brefs du pape Pie VI.* (1798), *Bibliothèque choisie des pères grecs et latins* (1822, 26 vols.) and a French translation of Cyprian with notes (1837, 2 vols.).

GUILLOTINE, the instrument for inflicting capital punishment by decapitation, introduced into France at the period of the

THE DEATH OF ST. MATTHEW. AFTER A GERMAN WOODCUT OF 1539
The martyrdom of St. Matthew, one of the twelve Apostles, is disputed, it being stated by some authorities that he died a natural death. But the woodcut is interesting as showing that execution by the guillotine or diele was practiced in Germany during the middle ages

Revolution. It consists of two upright posts surmounted by a cross beam, and grooved so as to guide an oblique-edged knife, the back of which is heavily weighted to make it fall swiftly and with force when the cord by which it is held aloft is let go. Previous to the period when it obtained notoriety under its Present name it had been in use in Scotland, England and various parts of the Continent. There is still preserved in the antiquarian museum of Edinburgh the rude guillotine called the "maiden" by which the regent Morton was decapitated in 1581. The last persons decapitated by the Scottish "maiden" were the marquis of Argyll in 1661 and his son the earl of Argyll in 1685. It would appear that no similar machine was ever in general use in England; but until 16jo there existed in the forest of Hardwick, which was coextensive with the parish of Halifax, West Riding, Yorkshire, a mode of trial and execution called the gibbet law, by which a felon convicted of theft within the liberty was sentenced to be decapitated by a machine called the Halifax gibbet. A print of it is contained in a small book called *Halifax and its Gibbet Law* (1708), and in Gibson's edition of Camden's *Britannia* (1722). In Germany the machine was in general use during the middle ages, under the name of the *Diele,* the *Hobel* or the *Dolabra.* Two old German engravings, the one by George Penez, who died in 1550, and the other by Heinrich Aldegrever, with the date 1553, represent the death of a son of Titus Manlius by a similar instrument, and its employment for the execution of a Spartan is the subject of the engraving of the 18th symbol in the volume entitled *Symbolicae quaestiones de universo genere,* by Achilles Bocchi (1555). From the 13th century it was used in Italy under the name of *Mannaia* for the execution of criminals of noble birth. The *Chronique de Jean d'Anton,* first published in 183j, gives minute details of an execution in which it was employed at Genoa in 1507; and it is elaborately described by Père Jean Baptiste Labat in his *Voyage en Espagne et en Italie en 1730.* It is mentioned by Jacques, viscomte de Puységur, in his *Mémoires* as in use in the south of France, and he describes the execution by it of Marshal Montmorency at Toulouse in 1632. For about a century it had, however, fallen into general disuse on the continent; and Dr. Guillotin, who first suggested its use in modern times, is said to have obtained his information regarding it from the description of an execution that took place at Milan in 1702, contained in an anonymous work entitled *Voyage historique et politique de Suisse, d'Italie, et d'Allemagne.*

Guillotin, who was born at Saintes, May 28, 1738, and elected to the Constituent Assembly in 1789, brought forward on Dec. 1 of that year two propositions regarding capital punishment, the second of which was that "in all cases of capital punishment it shall be of the same kind — that is, decapitation — and it shall be executed by means of a machine." The reasons urged in support of this proposition were that in cases of capital punishment the privilege of execution by decapitation should no longer be confined to the nobles, and that it was desirable to render the process of execution as swift and painless as possible. After satisfactory experiments had been made with the machine on several dead bodies in the hospital of Bicêtre, it was erected on the Place de Grève for the execution of the highwayman Pelletier on April 25, 1792. While the experiments regarding the machine were being carried on, it received the name *Louisette* or La *Petite Louison,* but the mind of the nation seems soon to have reverted to Guillotin, who first suggested its use; and in the *Journal des révolutions de Paris* for April 28, 1792, it is mentioned as *la guillotine,* a name which it thenceforth bore both popularly and officially.

GUIMARÃES, a town of northern Portugal, 36 m. N.E. of Oporto by the Trofa-Guimarães branch of the Oporto-Corunna railway. Pop. (1930) 9,541. Guimarães is a very ancient town with Moorish fortifications. It occupies a low hill, skirted on the north-west by a small tributary of the river Ave. The citadel founded in the 11th century by Count Henry of Burgundy, was in 1094 the birthplace of his son Alphonso, the first king of Portugal. The font in which Alphonso was baptized is preserved, among other interesting relics, in the collegiate church of Santa Maria da Oliveira, "St. Mary of the Olive," a Romanesque building of the 14th century, which occupies the site of an older foundation. The convent of São Domingos, now a museum of antiquities, has a fine 12th–13th century cloister; the town hall is built in the blend of Moorish and Gothic architecture known as Manueline. Guimarães has a flourishing trade in wine and farm produce; it also is engaged in the manufacture of cutlery, linen, leather and preserved fruits. Near the town are Citania, the ruins of a prehistoric Iberian city, and the hot sulphurous springs of Taipas.

GUIMARD, MARIE MADELEINE (1743–1816), French dancer, was born in Paris on Oct. 10, 1743. For 2j years she was the star of the Paris Opéra, and became even more famous by her love affairs, especially by her long liaison with the prince de Soubise. Her magnificent house at Pantin had a private theatre, where Collé's *Partie* de *chasse de Henri IV.* which was prohibited in public, and most of the *Proverbes* of Carmontelle (Louis Carrogis, 1717–1806), and similar licentious performances were given to the delight of high society. In 1772, in defiance of the archbishop of Paris, she opened a gorgeous house with a theatre seating 500 spectators in the Chaussée d'Antin. In this Temple of Terpsichore, as she named it, the wildest orgies took place. In 1786 her property was sold by lottery for her benefit for 300,000 francs. After her retirement in 1789 she married Jean Etienne Despréaux (1748–1820), dancer, song-writer and playwright.

GUINEA, the general name applied to part of the western coast region of equatorial Africa, and also to the gulf formed by the great bend of the coast line eastward and then southward. In the widest acceptation of the term, the Guinea coast may be said to extend from 13° N. to 16° S., from the neighbourhood of the Gambia to Cape Negro. Southern or Lower Guinea comprises the coasts of Gabun and Loango, the Congo and Angola, and Northern or Upper Guinea stretches from the river Casamance to and inclusive of the Niger delta, the Cameroons occupying a middle position. In a narrower use, Guinea is the coast only from Cape Palmas to the Gabun estuary. Originally,

however, Guinea was supposed to begin as far north as Cape Nun, opposite the Canary Islands, and Gomes Azurara, a Portuguese historian of the 15th century, is said to be the first authority who brings Guinea south to the Senegal.

The derivation of the name is uncertain, but is probably taken from Ghinea, Ginnie, Genni or Jenné, a town and kingdom in the basin of the Niger, famed for the enterprise of its merchants and dating from the 8th century A.D. The name Guinea is found on maps of the middle of the 14th century, but it did not come into general use in Europe till towards the close of the 15th century. Guinea may, however, be derived from Ghana (or Ghanata) the name of the oldest known state in the western Sudan. Its capital, also called Ghana, was west of the Niger, and is generally placed some 200 m. west of Jenné. (*See* L. Desplagnes in *La Géographie,* xvi. 329.)

By the early traders the coast of Upper Guinea was given names founded on the productions characteristic of the different parts. The Grain coast, that part of the Guinea coast extending for 500 m. from Sierra Leone eastward to Cape Palmas received its name from the export of the seeds of several plants of a peppery character, called variously grains of paradise, Guinea pepper and melegueta. The name Grain coast was first applied to this region in 1455.

Towards the end of the 18th century Guinea pepper was supplanted in Europe by peppers from the East Indies. The name is seldom used, the Grain coast being divided between the British colony of Sierra Leone and the republic of Liberia. The Ivory coast extends from Cape Palmas to 3° W. and obtained its name from the ivory it exported. Eastwards of the Ivory coast are the Gold and Slave coasts. The Niger delta was for long known as the Oil rivers.

Few questions in historical geography have been more keenly discussed than that of the first discovery of Guinea by the navigators of modern Europe. Lancelot Malocello, a Genoese, in 1270 reached at least as far as the Canaries. The first direct attempt to find a sea route to India was, it is said, also made by Genoese, Ugolino and Guido de Vivaldo, Tedisio Doria and others who equipped two galleys and sailed south along the African coast in 1291. Beyond the fact that they passed Cape Nun there is no trustworthy record of their voyage.

In 1346 a Catalan expedition started for "the river of gold" on the Guinea coast; its fate is unknown. The French claim that between 1364 and 1410 the people of Dieppe sent out several expeditions to Guinea; and Jean de Béthencourt, who settled in the Canaries about 1402, made explorations towards the south. At length the consecutive efforts of the navigators employed by Prince Henry of Portugal—Gil Eannes, Diniz Diaz, Nuno Tristam, Alvaro Fernandez, Cadamosto, Usodimare and Diego Gomez—made known the coast as far as the Gambia, and by the end of the 15th century the whole coast was familiar to Europeans.

Nordenskiöld, *Periplus* (Stockholm, 1897); Charles de la Roncière, *La Dtcouverte de l'Afrique au Moyen Age* (Cairo vols, i. and ii., 1925, vol. iii., 1927).

GUINEA, a gold coin at one time current in the United Kingdom. It was first coined in 1663, in the reign of Charles II., from gold imported from the Guinea coast of West Africa by a company of merchants trading under charter from the British crown—hence the name. Many of the first guineas bore an elephant on one side, this being the stamp of the company; in 1675 a castle was added. Issued at the same time as the guinea were five-guinea, two-guinea and half-guinea pieces. The current value of the guinea on its first issue was twenty shillings It was subsidiary to the silver coinage, but this latter was in such an unsatisfactory state that the guinea in course of time became over-valued in relation to silver, so much so that in 1694 it had risen in value to thirty shillings. The rehabilitation of the silver coinage in William III.'s reign brought down the value of the guinea to 21s. 6d. in 1698, at which it stood until 1717, when its value was fixed at twenty-one shillings. This value the guinea retained until its disappearance from the coinage. It was last coined in 1813, and was superseded in 1817 by the sovereign. In 1718 the quarter-guinea was first coined. The third-guinea was first struck in George III.'s reign (1787). To George III.'s reign also belongs the "spade-guinea," a guinea having the shield on the reverse pointed at the base or spade-shaped.

GUINEA-FOWL, a well-known gallinaceous bird, so called from the country whence it was brought to Europe. It was known to the Romans but was probably reintroduced by the Portuguese in the 16th century.

The ordinary guinea-fowl of the poultry-yard (*see* also POULTRY AND POULTRY-FARMING) is *Numida meleagris.* Under domestication few varieties have arisen. We may mention total and partial albinism and forms with legs bright orange instead of greyish brown. The sexes are alike. The home of this species is West Africa from the Gambia to the Gaboon. It has been imported into the Cape Verde islands, where, as in some of the Greater Antilles and in Ascension, it has run wild. Representing the species in South Africa we have *N. coronata* which is numerous from the Cape Colony to Ovampoland, and *N. papillosa* which replaces it in the west as far as the Zambesi. Madagascar has *N. mitrata,* distinguishable by its red crown and extending to East Africa. This bird has been introduced to Rodriguez. Abyssinia is inhabited by *N. ptilorhyncha,* which differs from the foregoing by the absence of red about the head. Darwin (*Anim. and Pl. under Domestication,* i. 294), gives this as the original stock of the modern domestic birds, but obviously by an accidental error. The finest species known is *Acryllium vulturinum* of Somaliland, conspicuous by the bright blue in its plumage, the hackles in the lower part of its neck, and its long tail. All these guinea fowls except the last are characterized by having the crown bare of feathers and elevated into a bony "helmet," but there is another group in which a thick tuft of feathers ornaments the top of the head. This contains four or five species inhabiting Africa, the best known being *Guttera cristata* from Sierra Leone. This bird is remarkable for the structure of its *furcula,* or merry thought, where the head is a hollow cup opening upwards, into which the trachea dips, and then emerges on its way to the lungs. Allied to the genus *Numida,* but distinguished therefrom by the possession of spurs and the absence of a helmet are *Agelastes* and *Phasidus,* from western Africa.

Polygamous and gregarious, guinea-fowls lay many eggs on the ground. The flocks are noisy. The birds feed on the ground but normally roost in the trees.

See Elliot, *Monograph of the Phasianidae.*

GUINEA-PIG, the domesticated form of the cavy (q.v.).

GUINEA-WORM (*Dracontiasis*), a disease due to the *Dracunculus* or *Filaria medinensis,* a filarious nematode like a horse-hair, whose most frequent habitat is the subcutaneous and intramuscular tissues of the legs and feet. It is common on the Guinea coast, and in many other tropical and subtropical regions, and sometimes amounts to an epidemic. The black races are most liable, but Europeans are not exempt. The worm lives in water, and appears to have an intermediate host for its larval stage. It is doubtful whether the worm penetrates the skin of the legs directly or enters the body by the mouth as a larva.

GUINES, a town in the interior of Havana province, Cuba, about 30 m. S.E. of Havana. Pop. (1931) 30,922. It is situated on a plain, in the midst of a rich plantation district, chiefly devoted to the cultivation of tobacco. The first railway in Cuba was built from Havana to Guines between 1835 and 1838. A good highway connects Giiines with the capital. The puebla of Guines, which was built on a great private estate of the same name, dates back to about 1735.

GUINGAMP, a town of north-western France, capital of an arrondissement in the department of Côtes-du-Nord, on the right bank of the Trieux, 20 mi. W.N.W. of St. Brieuc on the railway to Brest. Pop. (1936) 7,912. Guingamp was the chief town of the countship (subsequently the duchy) of Penthièvre. The Gothic chapel of Grâces is near Guingamp. Its chief church, Notre-Dame de Bon-Secours, dates from the 14th to the 16th centuries; two towers rise on each side of the richly sculptured western portal and a third surmounts the crossing. A famous statue of the Virgin, the object of one of the most important "pardons" or religious pilgrimages in Brittany, stands in one of the two northern porches. The central square is decorated by a graceful fountain in the Renaissance style, restored in 1743. Remains of the ramparts and of the Château of the dukes of Penthièvre, which belong to the 15th century, still survive. Guingamp is the seat of a sub-prefect and of a tribunal of first instance. It is an important market for dairy cattle, and its industries include flour-milling, tanning, leather-dressing, furniture making and the manufacture of wool, wax, hosiery, wooden-shoes and sheet iron. Guingamp is a tourist centre.

GUINNESS, the name of a family of Irish brewers. The firm was founded by ARTHUR GUINNESS, who about the middle of the 18th century owned a modest brewing-plant at Leixlip. a village on the river Liffey. In or about 1759 Arthur Guinness (d. 1855), purchased a small porter brewery at St. James's Gate, Dublin. By careful attention to the purity of his product, coupled with a shrewd perception of the public taste, he built up a considerable business. But his third son, BENJAMIN LEE GUINNESS (1798–1868), may be regarded as the real maker of the firm, of which about 1825 he was given sole control. The trade in Guinness's porter and stout had been confined hitherto to Ireland, but Guinness established agencies in the United Kingdom, on the continent, in the British colonies and in America. The export trade soon assumed huge proportions; the brewery was continually enlarged, and Guinness, who in 1851 was elected first lord mayor of Dublin, became the richest man in Ireland. He spent some of his wealth on the restoration of St. Patrick's cathedral, Dublin. He represented Dublin city in parliament as a Conservative from 1865 till his death, and in 1867 was created a baronet. He was succeeded in the control of the business by Sir Arthur Edward Guinness (b. 1840), his eldest, and Edward Cecil Guinness (b. 1847), his third, son. Sir ARTHUR EDWARD GUINNESS was in 1880 raised to the peerage as Baron Ardilaun, and disposed of his share in the brewery to his brother Edward Cecil Guinness. In 1886 EDWARD CECIL GUINNESS disposed of the brewery, the products of which were then being sent all over the world, to a limited company, in which he remained the largest shareholder. Edward Cecil Guinness was raised to the peerage in 1891 as Baron Iveagh, created Earl of Iveagh (*q.v.*) in 1919 and died in 1927, was succeeded by his son, Rupert, Viscount Elvedon. The ordinary capital of the company has been increased to £7,500,000, and in one year the total taxation has exceeded £16,000,000. Three thousand men are employed in the Guinness breweries.

GUINOBATAN, a municipality of the province of Albay, Luzon, Philippine Islands, on the Inaya river, 9 mi. W. by N. of Albay. Pop. (1939) 26,419 (a gain of 1,306 since 1918), of whom 13,442 were males, and 23 were whites. Abaci (Manila hemp) is produced in the surrounding country. and there are lime deposits of some value. The vernacular is Bikol. Of the inhabitants aged 6 to 19, inclusive, 33·1% in 1939 attended school, and of those 19 years old and over 55·9% were reported as literates.

GUIPÚZCOA, a maritime Basque province of northern Spain bounded north by the bay of Biscay, west by the province of Vizcaya (Biscay), south and south-east by Alava and Navarre and north-east by the river Bidassoa, here the frontier of France. The area is 728 sq.mi.; estimated population (Dec. 31, 1939) 345,312 or 474.4 per sq.mi. Situated on the northern side of the Cantabrian mountains at their junction with the Pyrenees the province has a deeply dissected and highly picturesque surface with a much indented coastline and numerous harbours none of which are of the first importance, the chief are Snn Sebastian, Pasajes, Guetaria, Deva and Fuenterrabia. The rivers, Deva, Urola, Oria, Urumea, Bidassoa are all short, rapid and unnavigable. The climate is mild and moist and the soil is mostly rather infertile clay in the valleys; in spite of this cultivation is careful, but the province has to import grain. Gorse and heath occur on the windswept areas and there are forests of oak, chestnut, pine, with a good deal of holly and arbutus. Apple orchards are numerous and much cider is made. The province is rich in minerals such as iron, lignite, lead, copper, zinc and cement, zinc being important. Fisheries are important; cod, tunny, sardines and oysters being procured. There are ferruginous and sulphurous springs in many places, and these and the mild climate attract summer visitors. The province is concerned with international trade via the French frontier and its custom house on the Bidassoa is the most important in Spain, but it is chiefly remarkable for its development of local industries. Cotton and linen stuffs are made at Irun, Renteria, Villabona, Vergara and Azpéitia, baskets at Zumarraga, arms and gold work at Eibar, Plasencia and Elgoibar, chemicals at San Sebastian, Onati and Irun. Paper and timber-work are developed at San Sebastian, Irun, Onati and Tolosa The Pasajes district is famed for its wines and liqueurs and large numbers are employed in this industry. The main railway line from Madrid northward to the French frontier runs through the province and it has loops to most of the important industrial centres. In consonance with the development of industries, roads are numerous and on the whole good in this province which, after Madrid, Barcelona and Vizcaya, is the most densely peopled in Spain. On the steep Cantabrian slopes roads are difficult and in rural areas there the ox cart is still widely used. The capital is San Sebastian (officially Guipúzcoa), with a pop. (1940) of 98,141. There is much emigration but the birth rate is high, and there is also immigration from other parts of Spain. The province is fairly prosperous industrially. Basque Nationalists (not the Nationalists under Franco) were strongly Loyalist in 1936, but were subdued in April and May 1937, by an enemy column under Gen. Emilio Mola. Many escaped to France. See Th. Lefebvre, Les modes de vie *dans les Pyrénées atlantiques* (1933).

GUISBOROUGH or **GUISBROUGH,** urban district and market town, Cleveland parliamentary division, North Riding of Yorkshire, England, 10 mi. E.S.E. of Middlesbrough by a branch of the L.N.E. railway. Pop. (est. 1938) 8,040. Area, 28.16 sq.mi. It lies in a narrow, fertile valley at the foot of the Cleveland hills. Ruins of an Augustinian priory, founded in 1129, are at the eastern extremity of the town. The church contains some fine decorated work, and the chapter house and parts of the conventual buildings may be traced. Considerable fragments of Norman and transitional work remain. Among the historic personages buried within its walls was Robert Bruce, Lord of Annandale, the competitor for the throne of Scotland, and the grandfather of King Robert the Bruce. The church of St. Nicholas is Perpendicular. greatly restored. The grammar school was founded in 1561. About 1 mi. S.E. of the town is a sulphurous spring discovered in 1822, The neighbouring district is rich in iron-stone and its working forms the chief industry of the town. There are also tanneries and breweries.

GUISE, a town of northern France, in the department of Aisne, on the Oise, 31 mi. N. of Laon by rail. Pop. (1936) 6,961. The scene of the German stand of Oct. 1918 is near Guise, which suffered much damage during the World War, 1914–18. The town was formerly the capital of the district of Thiérache and afterwards of a countship. There is a château dating in part from the middle of the 16th century, which was converted into barracks during World War I. Camille Desmoulins was in 1762 born in the town. The chief industry is the manufacture of iron stoves and heating apparatus, carried on on the co-operative system advocated by Fourier, in works founded by J. B. A. Godin (*q.v.*). (For an account of the battle of Guise see FRONTIER, BATTLES OF THE.)

GUISE, HOUSE OF, a cadet branch of the house of Lorraine. René II., duke of Lorraine (d. 1508), united the two branches of the house of Lorraine. From his paternal grandmother, Marie d'Harcourt, René inherited the countships of

Aumale, Mayenne, Elbeuf, Lillebonne, Brionne and other French fiefs, in addition to the honours of the elder branch, which included the countship of Guise, the dowry of Marie of Blois on her marriage in 1333 with Rudolph or Raoul of Lorraine. René's eldest surviving son by his marriage with Philippa, daughter of Adolphus of Egmont, duke of Gelderland, was Anthony, who succeeded his father as duke of Lorraine (d. 1544), while the second, Claude, count and afterwards duke of Guise, received the French fiefs. The Guises, though naturalized in France, continued to interest themselves in the fortunes of Lorraine, and their enemies were always ready to designate them as foreigners. The partition between the brothers Anthony and Claude was ratified by a further agreement in 1530, reserving the lapsed honours of the kingdoms of Jerusalem, Sicily, Aragon, the duchy of Anjou and the countships of Provence and Maine to the duke of Lorraine. Of the other sons of René II., John (1498–1550) became the first cardinal of Lorraine, while Ferri, Louis and Francis fell fighting in the French armies at Marignano (1515), Naples (1528) and Pavia (1525), respectively.

CLAUDE OF LORRAINE, count and afterwards 1st duke of Guise (1496–1550), was born on Oct. 20, 1496. He was educated at the French court, and at 17 allied himself to the royal house of France by a marriage with Antoinette de Bourbon (1493–1583) daughter of François, count of Vendôme. Guise distinguished himself at Marignano (1515), and was long in recovering from the 22 wounds he received in the battle; in 1521 he fought at Fuenterrabia, when Louise of Savoy ascribed the capture of the place to his efforts; in 1522 he defended northern France, and forced the English to raise the siege of Hesdin; and in 1523 he obtained the government of Champagne and Burgundy; defeating at Neufchbteau the imperial troops who had invaded his province. In 1525 he destroyed the Anabaptist peasant army, which was overrunning Lorraine, at Lupstein, near Saverne (Zabern). On the return of Francis I. from captivity, Guise was erected into a duchy in the peerage of France, though up to this time only princes of the royal house had held the title of duke and peer of France. The Guises, as cadets of the sovereign house of Lorraine and descendants of the house of Anjou, claimed precedence of the Bourbon princes. Their pretensions and ambitions inspired distrust in Francis I., although he rewarded Guise's services by substantial gifts in land and money. The duke distinguished himself in the Luxemburg campaign in 1542, but for some years before his death he effaced himself before the growing fortunes of his sons. He died on April 12, 1550.

He had been supported in all his undertakings and intrigues by his brother JOHN, cardinal of Lorraine (1498–1550), who had been made coadjutor of Metz at the age of three. The cardinal was archbishop of Reims, Lyons and Narbonne, bishop of Metz, Toul, Verdun, Thérouanne, Luçon, Albi, Valence, Nantes and Agen, and before he died had squandered most of the wealth which he had derived from these and other benefices. Part of his ecclesiastical preferments he gave up in favour of his nephews. He became a member of the royal council in 1530, and in 1536 was entrusted with an embassy to Charles V. Although a complaisant helper in Francis I.'s pleasures, he was disgraced in 1542, and retired to Rome. He died at Nogent-sur-Yonne on May 18, 1550. He was extremely dissolute, but as an open-handed patron of art and learning, as the protector and friend of Erasmus, Marot and Rabelais he did something to counter-balance the general unpopularity of his calculating and avaricious brother.

Claude of Guise had 12 children, among them Francis, 2nd duke of Guise; Charles, 2nd cardinal of Lorraine (1524–74), who became archbishop of Reims in 1538 and cardinal in 1547; Claude, marquis of Mayenne, duke of Aumale (1526–73), governor of Burgundy, who married Louise de Brézé, daughter of Diane de Poitiers, thus securing a powerful ally for the family; Louis (1527–78), bishop of Troyes, archbishop of Sens and cardinal of Guise; René, marquis of Elbeuf (1536–66), from whom descended the families of Harcourt, Armagnac, Marsan and Lillebonne; Mary of Lorraine (*q.v.*), generally known as Mary of Guise, who after the death of her second husband, James V. of Scotland, acted as regent of Scotland for her daughter Mary, queen of Scots; and Francis (1534–63), grand prior of the order of the Knights of Malta. The solidarity of this family, all the members of which through three generations cheerfully submitted to the authority of the head of the house, made it a formidable factor in French politics.

FRANCIS OF LORRAINE, 2nd duke of Guise (1519–1563), "le grand Guise," was born at Bar on Feb. 17, 1519. As count of Aumale he served in the French army, and was nearly killed at the siege of Boulogne in 1545 by a wound which brought him the name of "Balafré." Aumale was made (1547) a peerage-duchy in his favour, and on the accession of Henry II. the young duke, who had paid assiduous court to Diane de Poitiers, shared the chief honours of the kingdom with the constable Anne de Montmorency. Both cherished ambitions for their families, but the Guises were more unscrupulous in subordinating the interests of France to their own. Montmorency's brutal manners, however, made enenues where Guise's grace and courtesy won him friends. Guise was a suitor for the hand of Jeanne d'Albret, princess of Navarre, who refused, however, to become a sister-in-law of a daughter of Diane de Poitiers and remained one of the most dangerous and persistent enemies of the Guises. He married in Dec. 1548 Anne of Este, daughter of Ercole II., duke of Ferrara, and through her mother Renée, a granddaughter of Louis XII., of France. In the same year he had put down a peasant rising in Saintonge with a humanity that compared very favourably with the cruelty shown by Montmorency to the town of Bordeaux. He made preparations in Lorraine for the king's German campaign of 1551–52. He was already governor of Dauphine, and now became grand chamberlain, prince of Joinville, and hereditary seneschal of Champagne, with large additions to his already considerable revenues. He was charged with the defence of Metz, which Henry II. had entered in 1551. He reached the city in Aug. 1552, and rapidly gave proof of his great powers as a soldier and organizer by the skill with which the place, badly fortified and unprovided with artillery, was put in a state of defence. Metz was invested by the duke of Alva in October with an army of 60,000 men, and the emperor joined his forces in November. An army of brigands commanded by Albert of Brandenburg had also to be reckoned with. Charles was obliged to raise the siege on Jan. 2, 1553, having lost, it is said, 30,000 men before the walls. Guise used his victory with rare moderation and humanity, providing medical care for the sick and wounded left behind in the besiegers' camp. The subsequent operations were paralysed by the king's suspicion and carelessness, and the constable's inactivity, and a year later Guise was removed from the command. He followed the constable's army as a volunteer, and routed the army of Charles V. at the siege of Renty on Aug. 12, 1554. Montmorency's inaction rendered the victory fruitless, and a bitter controversy followed between Guise and the constable's nephew Coligny, admiral of France, which widened a breach already existing.

The conclusion of a six years' truce at Vaucelles (1556) disappointed Guise's ambitions, and he was the main mover in the breach of the treaty in 1558, when he was sent at the head of a French army to Italy to the assistance of Pope Paul IV. against Spain. Guise, who perhaps had in view the restoration to his family of the Angevin dominion of Naples and Sicily, crossed the Alps early in 1557, and after a month's delay in Rome, where he failed to receive the promised support, marched on the kingdom of Naples, then occupied by the Spanish troops under Alva. He seized and sacked Campli (April 17), but was compelled to raise the siege of Civitella. Meanwhile the pope had veered round to a Spanish alliance, and Guise, seeing that no honour was to be gained in the campaign, wisely spared his troops, so that his army was almost intact when, in August, he was hastily summoned home to repel the Spanish army which had invaded France from the north, and had taken St. Quentin. On reaching Paris in October Guise was made lieutenant-general of the kingdom, and proceeded to prepare for the siege of Calais. The town was taken, after six days' fighting, on Jan 6, 1558, and this success was followed up by the capture of Guînes, Thionville and Arlon, when the war was ended by the treaty of Câteau Cambrésis (1559).

Although his brother, the cardinal of Lorraine, was one of the negotiators, this peace was concluded against the wishes of Guise, and was regarded as a triumph of the constable's party. The Guises were provided with a weapon against Montmorency by the bishop of Arras (afterwards Cardinal Granvella), who gave to the cardinal of Lorraine at an interview at Péronne in 1558 an intercepted letter proving the Huguenot leanings of the constable's nephews.

On the accession in 1559 of Francis II., their nephew by marriage with Mary Stuart, the royal authority was practically delegated to Guise and the cardinal, who found themselves beyond rivalry for the time being. They had, however, to cope with a new and dangerous force in Catherine de' Medici, who was now for the first time free to use her political ability. The incapacity, suspicion and cruelty of the cardinal, who controlled the internal administration, roused the smaller nobility against the Lorraine princes. A conspiracy to overturn their government was formed at Nantes, with a needy Périgord nobleman named La Renaudie as its nominal head, though the agitation had in the first instance been fostered by the agents of Louis I., prince of Condé. The Guises were warned of the conspiracy while the court was at Blois, and for greater security removed the king to Amboise. La Renaudie, nothing daunted, merely postponed his plans; and the conspirators assembled in small parties in the woods round Amboise. They had, however, been again betrayed and many of them were surrounded and taken before the coup could be delivered; one party, which had seized the château of Noizay, surrendered on a promise of amnesty given "on his faith as a prince" by James of Savoy, duke of Nemours, a promise which, in spite of the duke's protest, was disregarded. On March 19, 1560, La Renaudie and the rest of the conspirators openly attacked the château of Amboise. They were repelled; their leader was killed; and a large number were taken prisoners. The merciless vengeance of the Guises was the measure of their previous fears. For a whole week the torturings, quarterings and hangings went on, the bodies being cast into the Loire, the young king and queen witnessing the bloody spectacle day by day from a balcony of the château.

The cruel repression of this "conspiracy of Amboise" inspired bitter hatred of the Guises, since they were avenging a rising rather against their own than the royal authority. They now entrenched themselves with the king at Orleans, and the Bourbon princes, Anthony, king of Navarre, and his brother Condé, were summoned to court. The Guises convened a special commission to try Condé, who was condemned to death; but the affair was postponed by the chancellor, and the death of Francis II in December saved Condé. Guise then made common cause with his old rival Montmorency and with the Marshal de Saint André against Catherine, the Bourbons and Coligny. This alliance, constituted on April 6, 1561, and known as the triumvirate, aimed at the annulment of the concessions made by Catherine to the Huguenots. The cardinal of Lorraine fomented the discord which appeared between the clergy of the two religions when they met at the colloquy of Poissy in 1561, but in spite of the extreme Catholic views he there professed, he was at the time in communication with the Lutheran princes of Germany, and in Feb. 1562 met the duke of Württemberg at Zabern to discuss the possibility of a religious compromise.

The signal for civil war was given by an attack of Guise's escort on a Huguenot congregation at Vassy (March 1, 1562). Although Guise did not initiate the massacre, and although, when he learned what was going on, he even tried to restrain his soldiers, he did not disavow their action. When Catherine de' Medici forbade his entry into Paris, he accepted the challenge, and on March 16, he entered the city, where he was a popular hero, at the head of 2,000 armed nobles. The provost of the merchants offered to put 20,000 men and two million livres at his disposal. In September he joined Montmorency in besieging Rouen, which was sacked as if it had been a foreign city, in spite Guise's efforts to save it from the worst horrors. At the battle of Dreux (Dec. 19, 1562) he commanded a reserve army, with which he saved Montmorency's forces from destruction and inflicted a crushing defeat on the Huguenots. The prince of Condé was his prisoner, while the capture of Montmorency by the Huguenots and the assassination of the Marshal de Saint-André after the battle left Guise the undisputed head of the Catholic party. He was appointed lieutenant-general of the kingdom, and on Feb. 5, 1563, he appeared with his army before Orleans. On the 19th, however, he was shot by the Huguenot Jean Poltrot de Méré as he was returning to his quarters, and died cn the 24th of the effects of the wound. Guise's splendid presence, his generosity and humanity and his almost unvarying success on the battlefield made him the idol of his soldiers. He attended personally to the minutest details, and Monluc complains that he even wrote out his own orders. The mistakes and cruelties associated with his name were partly due to the evil counsels of his brother Charles, the cardinal, whose cowardice and insincerity nere the scorn of his contemporaries. The negotiations of the Guises with Spain dated from the interview with Granvella at Péronne, in 1558, and after the death of his brother the cardinal of Lorraine was constantly in communication with the Spanish court, offering, in the event of the failure of direct heirs to the Valois kings, to deliver up the frontier fortresses and to acknowledge Philip II. as king of France. His death in 1574 temporarily weakened the extreme Catholic party.

Of the children of Francis "le Balafré" five survived him: Henry, 3rd duke of Guise; Charles, duke of Mayenne (1554–1611) (*q.v.*), who consolidated the League; Catherine (1552–96), who married Louis of Bourbon, duke of Montpensier, and encouraged the fanaticism of the Parisian leaguers; Louis, second cardinal of Guise, afterwards of Lorraine (1555–88), who was assassinated with his brother Henry; and Francis (1558–73).

HENRY OF LORRAINE, 3rd duke of Guise (1550–1588), born on Dec. 31, 1550, was 13 years old at the time of his father's death, and grew up under the domination of a passionate desire for revenge. Catherine de' Medici refused to take steps against Coligny, who was formally accused by the duchess of Guise and her brothers-in-law of having incited the murder. In 1j66 she insisted on a formal reconciliation at Moulins between the Guises and Coligny, at which, however, none of the sons of the murdered man was present. Henry and his brothers mere, however, compelled in 1572 to sign an ambiguous assent to this agreement Guise's widow married James of Savoy, duke of Nemours, and the young duke at 16 went to fight against the Turks in Hungary. On the fresh outbreak of civil war in 1567 he returned to France and served under his uncle Aumale. In the autumn of 1568 he received a considerable command, and speedily came into rivalry with Henry of Valois, duke of Anjou. He had not inherited his father's generalship, and his rashness and headstrong valour more than once brought disaster on his troops, hut the showy quality of his fighting brought him great popularity in the army. In the defence of Poitiers in 1569 with his brother, the duke of Mayenne, he showed more solid abilities as a soldier. On the conclusion of peace in 1570 he returned to court, where he made no secret of his attachment to Margaret of Valois. His pretensions were violently resented by her brothers, who threatened his life, and he saved himself by a precipitate marriage with Catherine of Cleves (daughter of Francis of Cleves, duke of Nevers, and Margaret of Bourbon), the widow of a Huguenot nobleman. Antoine de Crog, prince of Porcien. Presently he ended his disgrace by an apparent reconciliation with Henry of Valois and an alliance with Catherine de' Medici. He was an accomplice in the first attack on Coligny's life, and when permission for the massacre of Saint Bartholomew had been extorted from Charles IX. he roused Paris against the Huguenots, and satisfied his personal vengeance by superintending the murder of Coligny.

Henry was now the acknowledged chief of the Catholic party, and the power of his family was further increased by the marriage (1575) of Henry III. with Louise of Vaudémont, who belonged to the elder branch of the house of Lorraine. In a fight at Dormans (Oct. 10, 1575), the only Catholic victory in a disastrous campaign, Guise received a face wound which won for him his father's name of Balafré and helped to secure the passionate attachment of the Parisians. He refused to acquiesce in the treaty of Beaulieu (May 5, 1576), and with the support of the

GENEALOGICAL TABLE OF THE HOUSE OF GUISE

René II. (who united the two branches of the house of Lorraine), duke of Lorraine, and Philippa of Gelderland, had (besides two older boys who died in childhood, and four unmarried daughters)

- Antoine, duke of Lorraine, †1544, ancestor of the dukes of Lorraine and the house of Mercoeur.
- Claude, 1st duke of Guise, †1550, =Antoinette of Bourbon.
  - Francis, 2nd duke of Guise, †1563, =Anne of Este.
    - Henry, 3rd duke, †1588=Catherine of Cleves (and had 14 children),
      - Charles, 4th duke of Guise, †1640.
        - Henry, archbishop of Reims, and 5th duke, †1664.
        - Marie, called Mlle. de Guise, succeeded to the duchy in 1675 and sold her rights to Louis Augustus, duke of Maine.
        - Louis, chevalier of Guise and duke of Joyeuse, †1654.
          - Louis-Joseph, 6th duke of Guise, †1671.
            - Francis-Joseph, 7th and last duke of Guise, †1675.
        - And 8 more.
      - Claude, duke of Chevreuse, =Marie de Rohan, widow of the duke of Luynes.
      - Louis, 3rd cardinal of Guise, †1621.
      - And 11 more.
    - Charles, duke of Mayenne, †1611.
      - Henry, duke of Mayenne, †1621.
    - Louis, 2nd cardinal of Guise, †1588.
    - Catherine= Louis de Bourbon, duke of Montpensier.
    - And 5 others.
  - Charles, 2nd cardinal of Lorraine, †1574.
  - Claude, marquis of Mayenne and duke of Aumale, †1573, =Louise de Brézé
    - Charles, duke of Aumale, †1631.
  - Louis, 1st cardinal of Guise, †1578
  - Francis, grand prior.
  - René, marquis of Elbeuf, †1566.
    - Charles, duke of Elbeuf, †1605.
  - Marie= (1) duke of Longueville, (2) James V. of Scotland.
    - Mary Stuart, queen of Scots.
  - And 5 others.
- John, 1st cardinal of Lorraine.
- Ferri, killed at Marignano.
- Louis, killed at Naples.
- Francis, killed at Pavia.

†Date of death

Jesuits proceeded to form a "holy league" for the defence of the Roman Catholic Church. The terms of enrolment enjoined offensive action against all who refused to join. This association had been preceded by various provincial leagues among the Catholics, notably one at Péronne. Condé had been imposed on this town as governor by the terms of the peace, and the local nobility banded together to resist him. This, like the Holy League itself, was political as well as religious in its aims, and was partly inspired by revolt against the royal authority. In the direction of the League Guise was hampered by Philip of Spain, who subsidized the movement, while he also had to submit to the dictation of the Parisian democracy. Ulterior ambitions were freely ascribed to him. It was asserted that papers seized from his envoy to Rome, Jean David, revealed a definite design of substituting the Lorraines, who represented themselves as the successors of Charlemagne, for the Valois; but these papers were probably a Huguenot forgery. Henry III. eventually placed himself at the head of the League, and resumed the war against the Huguenots; but on the conclusion of peace (Sept. 1577) he seized the opportunity of disbanding the Catholic associations. The king's jealousy of Guise increased with the duke's popularity, but he did not venture on an open attack, nor did he dare to avenge the murder by Guise's partisans of one of his personal favourites, Saint-Mégrin, who had been set on by the court to compromise the reputation of the duchess of Guise. This incident supplied Alexandre Dumas *père* with the subject of his *Henri III.* et *sa cour* (1829).

Meanwhile the duke had entered on an equivocal alliance with Don John of Austria. He was also in constant correspondence with Mary of Lorraine, and meditated a descent on Scotland in support of the Catholic cause. But the great riches of the Guises were being rapidly dissipated, and in 1578 the duke became a pensioner of Philip II. When in 1584 the death of the duke of Anjou made Henry of Navarre the next heir to the throne, the prospect of a Huguenot dynasty roused the Catholics to forget their differences, and led to the formation of a new league of the Catholic nobles. At the end of the same year Guise and his brother, the duke of Mayenne, with the assent of other Catholic nobles, signed a treaty at Joinville with Philip II., fixing the succession to the crown on Charles, cardinal of Bourbon, to the exclusion of the Protestant princes of his house. In March 1585 the chiefs of the League issued the Declaration of Péronne, exposing their grievances against the Government and announcing their intention to restore the dignity of religion by force of arms. On the refusal of Henry III. to accept Spanish help against his Huguenot subjects, war broke out. The chief cities of France declared for the League, and Guise, who had recruited his forces in Germany and Switzerland, took up his headquarters at Châlons, while Mayenne occupied Dijon, and his relatives, the dukes of Elbeuf, Aumale and Mercoeur, roused Normandy and Brittany. Henry III. accepted, or feigned to accept, the terms imposed by the Guises at Nemours (July 7, 1585). The edicts in favour of the Huguenots were immediately revoked.

Guise added to his reputation as the Catholic champion by defeating the German auxiliaries of the Huguenots at Vimory (Oct. 1587) and Auneau (Nov. 1587). The protestations of loyalty to Henry III. which had marked the earlier manifestoes of the League were modified. Obedience to the king was now stated to depend on his giving proof of Catholic zeal and showing no favour to heresy. In April 1588 Guise arrived in Paris, where he put himself at the head of the Parisian mob, and on May 12, known as the Day of the Barricades, he actually had the crown within his grasp. He refused to treat with Catherine de' Medici, who was prepared to make peace at any cost, but restrained the populace from revolution and permitted Henry to escape from Paris. Henry came to terms with the League in May, and made Guise lieutenant-general of the royal armies. The estates-general, which were assembled at Blois, were devoted to the Guise interest, and alarmed the king by giving voice to the political as well as the religious aspirations of the League. Guise remained at the court of Blois after receiving repeated warnings that Henry meditated treason. On Dec. 25 he was summoned ta the king's chamber during a sitting of the royal council, and was murdered by assassins carefully posted by Henry III. himself. The cardinal of Lorraine was murdered in prison on the next day. The history of the Guises thenceforward centres in the duke of Mayenne (*q.v.*).

By his wife, Catherine of Cleves, the third duke had 14 children: among them Charles, 4th duke of Guise (1571–1640); Claude, duke of Chevreuse (1578–1657), whose wife, Marie de Rohan, duchess of Chevreuse, became famous for her intrigues; Louis (1585–1621), 3rd cardinal of Guise, archbishop of Reims, remembered for his liaison with Charlotte des Essarts, mistress of Henry IV.

CHARLES, 4th duke of Guise (1571–1640), was imprisoned for three years after his father's death. He married Henriette Catherine de Joyeuse, widow of the duke of Montpensier. His eldest son predeceased him, and he was succeeded by his second son HENRY (1614–64), who had been archbishop of Reims, but renounced the ecclesiastical estate and became 5th duke. He made an attempt (1647) on the crown of Naples, and was a prisoner in Spain from 1648 to 1652. A second expedition to Naples in 1654 was a fiasco. Me was succeeded by his nephew, LOUIS JOSEPH (1650–1671), as 6th duke. With his son, FRANCIS JOSEPH (1670–75), the line failed; and the title and estates passed to his great-aunt, Marie of Lorraine, duchess of Guise (1615–88), daughter of the 4th duke, and with her the title became extinct. The title is now vested in the family of the Bourbon-Orleans princes.

BIBLIOGRAPHY.—A number of contemporary documents relating to the Guises are included by L. Cimber and F. Danjou in their *Archives curieuses de l'histoire de France* (1834, etc.). Vol. iii. contains a soldier's diary of the siege of Metz, first published in Italian (Lyons, 1553), accounts of the sieges of Calais (Tours, 1558), of Thionville (1558); vol. iv. an account of the tumult of Amboise from the *Mdmoires* of Condé, and four accounts of the affair of Vassy; vol. v. four accounts of the battle of Dreux, one dictated by Guise, and accounts of the murder of Guise; vol. xi. accounts of the Parisian revolution of 1558; and vol. xii. numerous pamphlets and pieces dealing with the murder of Henry of Guise and his brother. An account of the murder of Guise and of the subsequent measures taken by Mayenne, which was supplied by the Venetian ambassador, G. Mocenigo, to his Government, is printed by H. Brown in the *Eng. Hist. Rev.* (April 1895). For the foreign policy of the Guises, and especially their relations with Scotland, there is abundant material in the English *Calendar of State Papers* of Queen Elizabeth (Foreign Series) and in the correspondence of Cardinal Granvella. The memoirs of Francis, duke of Guise, covering the years 1547 to 1563, were published by Michel and Poujoulat in series 1, vol. iv. of their *Coll. de mémoires*. Among contemporary memoirs *see* especially those of the prince of Condé, of Blaise de Monluc and of Gaspard de Saulx-Tavannes. *See* also J. B. H. du Trousset de Valincourt, *La Vie de F. de Lorraine, duc de Guise* (1681); A. de Ruble, *L'Assassinat de F. de Lorraine, duc de Guise* (1897), where there is a list of the ms. sources available for a history of the house; R. de Bouillé *Hist. des ducs de Guise* (4 vols., 1849); H. Forneron, *Les Guise et leur époque* (2 vols., 1887); H. M. Williams, *The Brood of False Lorraine: the History of the Ducs de Guise, 1496–1588* (2 vols., 1918).

GUITAR (Fr. guitarre, Ger. *Guitarre,* Ital. chitarra), a musical instrument strung with gut strings twanged by the fingers, having a body with a flat back and graceful incurvations in complete contrast to the members of the family of the lute (*q.v.*), whose back is vaulted,

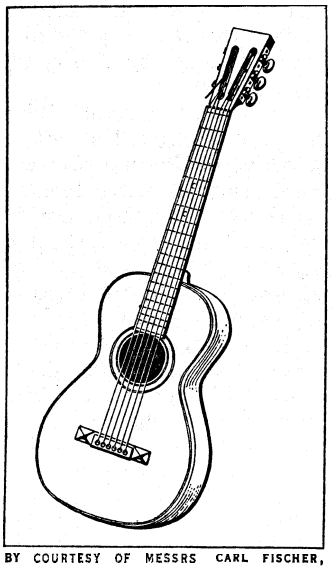
The construction of the instrument is of paramount importance in assigning to the guitar its true position in the history of musical instruments, midway between the cithara (*q.v.*) and the violin. The mediaeval stringed instruments with neck fall into two classes, characterized mainly by the construction of the body: (1) those which, like their archetype the cithara, had a body composed of a flat or delicately arched back and soundboard joined by ribs; (2) those which, like the lyre, had a body consisting of a vaulted back over which was glued a flat soundboard without the intermediary of ribs.

The latter method of construction predominates among oriental instruments and is greatly inferior to the first. A striking proof of this inferiority is afforded by the fact that instruments with vaulted backs, such as the rebab or rebec, although extensively represented during the middle ages in all parts of Europe by numerous types, have shown but little or no development

during the course of some 12 centuries, and have dropped out one by one from the realm of practical music, leaving only the mandolin as survivor.

The guitar must be referred to the first of these classes, having been derived from the cithara, both structurally and etymologically.

One of the earliest representations of a guitar in Western Europe occurs in a Passionale from Zwifalten, AD. 1180, now in the Royal Library at Stuttgart. St. Pelagia, seated on an ass, holds a rotta, or cithara in transition, while one of the men-servants leading her ass holds her guitar. Both instruments have three strings and the characteristic guitar outline with incurvations, the rotta differing in having no neck.



BY COURTESY OF MESSRS CARL FISCHER, INC

A MODERN SIX-STRINGED GUITAR

GUITAR FIDDLE *(Troubadour Fiddle),* a modern name bestowed retrospectively upon certain precursors of the violin, possessing characteristics of both guitar and fiddle. The name "guitar fiddle" is intended to emphasize the fact that the instrument, in the shape of the guitar, which during the middle ages represented the most perfect principle of construction for stringed instruments with necks, adopted at a certain period the use of the bow from instruments of a less perfect type, the rebab and its hybrids. The use of the bow with the guitar entailed certain structural changes in the instrument. The large central rose sound-hole was replaced by lateral holes of various shapes; the flat bridge, suitable for instruments whose strings were plucked, gave place to the arched bridge required in order to enable the bow to vibrate each string separately; the arched bridge, by raising the strings higher above the sound-board, made the stopping of strings on the neck extremely difficult if not impossible—a matter which was adjusted by the addition of a finger-board of suitable shape and dimensions. At this stage the guitar fiddle possesses the essential features of the violin, and may justly claim to be its immediate predecessor, not so much through the viols (which were the outcome of the Minnesinger fiddle with sloping shoulders) as through the intermediary of the Italian *lyra,* a guitar-shaped bowed instrument with from seven to 12 strings. From such evidence as we now possess, it would seem that the evolution of the early guitar with a neck from the Greek cithara took place under Greek influence in the Christian East *(see* GUITAR).

GUITRY, LUCIEN GERMAIN (1860–1925), French actor, was born in Paris on Dec. 13, 1860, and died there on June 1, 1925. He first appeared at the Gymnase, immediately after leaving the Conservatoire in *La Dame aux Camélias* (1878). His style of acting, sparing in gesture and theatrical effects, at first surprised rather than pleased the public and the critics; this impression was still stronger when, in 1891, he played with studied restraint in the part of Kean, which had been created by the romantic actor Frédérick Lemaitre. Sarah Bernhardt asked him to play at the Théâtre de la Renaissance, and it was here that he achieved his first successes. He appeared in plays of the most varied character, from Maurice Donnay's *Amants* (1895) to Anatole France's *Crainquebille.* It was perhaps in Bernstein's plays that he reached his zenith. He succeeded in representing the utmost frenzy of passion with the greatest economy of method; his acting was exceedingly restrained and at the same time marvellously expressive. From 1919 onwards he frequently acted in the plays of his son, M. Sacha Guitry; he was remarkably successful in creating the principal parts in *Pasteur* and *Mon Père avait Raison.* The last part he played was in *On ne joue pas pour s'amuser* (1925).

GUITRY, SACHA (1885–), French dramatist, born at St. Petersburg on Feb. 21, 1885, was the son of the actor Lucien Guitry. He was only 21 when he achieved a success with his first play, *Nono.* This was followed by *Chez les Zoaques* (1906), *Petite Hollande* (1908), *Le Scandale de Monte Carlo* (1908); *Le Veilleur de Nuit* (1911)—one of his best plays—and *Le Beau Mariage* (1912). The latter contains scenes of rich comedy which almost suggest a comparison with Molibre. Sacha Guitry generally acts in his own plays; it is difficult to draw an absolute distinction between his work as an actor and as a playwright, for his art is always to some extent in the nature of improvisation. For this reason his plays act far better than they read. His output is enormous; by 1928 he had written about 60 plays. Special mention is due to those which he wrote for his father to act in: *Deburau* (1918), *Béranger* (1920) and *Pasteur* (1923), which form a series of pictures of a strikingly original character. His more serious plays include *Jacqueline,* the plot of which is taken from a story by H. Duvernois, and *Un Sujet de Roman,* in which Sarah Bernhardt acted with Lucien Guitry. See *Sacha Guitry* (1926) in the series *Ecrivains et poètes d'aujourd'hui.*

GUITTONE D'AREZZO *(c.* 1230–1294), Italian poet. Fra Guittone, who belonged to the religious and military order of the Cavalieri di Santa Maria, wrote sonnets and love poems, which can be studied in a good modern edition, *Le rime di Fra Guittone* (1901), by Pelligrini. He is more famous as the writer of the earliest extant letters written in the Italian language; they are addressed to various eminent contemporaries.

See Pellizzari *La vita e le opere di Guittone d'Arezzo* **(1906).**

GUIZOT, FRANÇOIS PIERRE GUILLAUME (1787–1874), French historian and statesman, was born at Nimes on Oct. 4, 1787, of Protestant parents. His father perished on the scaffold (April 8, 1794), and the boy was brought up by his mother in Geneva. In 1805 he began the study of law in Paris, living in the house of M. Stapfer, formerly Swiss minister in France, as tutor. He also contributed to the *Publiciste,* and married (1812) Pauline Meulan, who was also a contributor to Suard's journal. After her death, in 1827, Guizot married her niece, Elisa Dillon (d. 1833). The son of this marriage, Maurice Guillaume (1833–1892) became a well known scholar and writer.

Under the Empire, Guizot devoted himself exclusively to literary works, which included, among others, a translation of Gibbon's *Decline and Fall.* This work led to his appointment (1812) to the chair of modern history at the Sorbonne. But, though he took no public part in politics, he was closely associated with leading Liberals, notably with Royer-Collard, who secured for him the position of secretary-general of the Ministry of the Interior at the first Restoration. During the Hundred Days he returned to his literary pursuits. He then went to see Louis XVIII. at Ghent, and, in the name of the Liberal Party, told him frankly that the open adoption of a liberal policy was the essential condition of a permanent monarchy. The advice was ill-received by the king's advisers, and the visit itself brought him into disgrace with the Bonapartists.

After the second Restoration Guizot had two short spells of official work, as secretary-general of the Ministry of Justice (1815–16) and as a director at the Ministry of the Interior (1819–20). He was one of the leaders of the *Doctrinaires,* monarchists who desired a *juste milieu* between absolutism and democracy. Their motives were honourable. Their views were philosophical. But they were opposed alike to the democratic spirit of the age, to the military traditions of the empire, and to the bigotry and absolutism of the court. They lived by a policy of resistance; they perished by another revolution (1830). They are remembered more for their constant opposition to popular demands than by their undoubted services.

In 1820, when the reaction was at its height after the murder of the duc de Berri and the fall of the ministry of the duc Decazes, Guizot was deprived of his offices, and from 1822 to 1828 even his course of lectures were interdicted. He was now one of the leaders of the Liberal opposition to the Government of Charles X. His numerous works at this period include: *Histoire des origines du gouvernement représentatif* (1821–22, 2 vols.; Eng. trans.

1852); *Histoire de la révolution d'Angleterre depuis Charles Ier à Charles II.* (2 vols., 1826–27; Eng. trans., 1838), revised by him in his later years; *Histoire de la civilisation en Europe* (1828; Eng. trans. by W. Hazlitt, 3 vols., 1846); and *Histoire de la civilisation en France* (4 vols., 1830). In addition he published during this period two great collections of sources for English and French history, a revised translation of Shakespeare, essays and pamphlets.

Hitherto Guizot's fame rested on his merits as a writer on public affairs and as a lecturer on modern history. In Jan. 1830 he was elected by Lisieux to the Chamber of Deputies, and he retained that seat during the whole of his political life. His first speech in the chamber was in defence of the celebrated address of the 221, in answer to the menacing speech from the throne, which was followed by the dissolution of the chamber, and was the precursor of another revolution. On July 27 Guizot was called upon by his friends Casimir-Périer, Laffitte, Villemain and Dupin to draw up the protest of the Liberal deputies against the royal ordinances of July, whilst he applied himself with them to control the revolutionary character of the late contest. Personally, Guizot deprecated a change in the hereditary line of succession. But once convinced that it was inevitable, he became one of the most ardent supporters of Louis-Philippe. From August to November Guizot was minister of the interior. He had now passed into the ranks of the Conservatives, and for the next 18 years was the most determined foe of democracy, the unyielding champion of "a monarchy limited by a limited number of bourgeois." In Marshal Soult's Government formed on Oct. 11, 1832, Guizot was minister of public instruction. Guizot applied himself in the first instance to carry the law of June 28, 1833, establishing and organizing primary education. The branch of the Institute of France known as the Académie des Sciences Morales et Politiques, suppressed by Napoleon, was revived by Guizot. Some of the old members of this learned body—Talleyrand, Siéyès, Roederer and Lakanal—again took their seats there, and new members were elected. The "Société de l'Histoire de France" was founded for the publication of historical works; and a vast publication of mediaeval chronicles and diplomatic papers was undertaken at the expense of the State *(see* HISTORY; and FRANCE, *History).*

The object of the cabinet of Oct. 1832 was to organize a Conservative Party, and to resist the Republican faction, which threatened the existence of the monarchy. The real strength of the ministry lay not in its nominal heads, but in the fact that in this Government and this alone, Guizot and Thiers acted in cordial co-operation. But in 1840 parliamentary difficulties arose and Guizot was not sorry to accept the post of ambassador in London, which withdrew him for a time from parliamentary contests. This was in the spring of 1840, and Thiers succeeded shortly afterwards to the Ministry of Foreign Affairs.

Thiers' policy regarding the Syrian question led France to the brink of war, until the king put an end to the crisis by refusing his assent to the military preparations of Thiers, and by summoning Guizot from London to form a ministry and to aid his majesty in what he termed "ma lutte tenace contre l'anarchie." Thus began, under dark and adverse circumstances, on Oct. 29, 1840, the administration in which Guizot remained the master-spirit for nearly eight years. He himself took the portfolio of foreign affairs, to which he added some years later, on Soult's retirement, the ostensible rank of prime minister. His first care was the restoration of amicable relations with the other Powers of Europe. His success in calming the troubled elements and healing the wounded pride of France was due mainly to the indomitable courage and splendid eloquence with which he faced a raging opposition, gave unity and strength to the Conservative Party, and appealed to the thrift and prudence of the nation rather than to their vanity and their ambition. In his pacific task he was fortunately seconded by the formation of the Peel administration in England, in the autumn of 1841. Lord Palmerston held (as it appears from his own letters) that war between England and France was, sooner or later, inevitable. Guizot held that such a war would be the greatest of all calamities, and certainly never contemplated it. In Lord Aberdeen, the foreign secretary, Guizot found a friend and an ally. Both of them held the common interest of peace and friendship to be paramount; and when differences arose, as they did arise, in remote parts of the world—in Tahiti, in Morocco, on the Gold Coast—they were reduced by this principle to their proper insignificance.

The history of Guizot's administration is dealt with in the article FRANCE; *History.* It was the longest and the last which existed under the constitutional monarchy of France, and bears the stamp of the great qualities and the great defects of his political character, for he was throughout the master-spirit of that Government. He united and disciplined the Conservative Party, which had been broken up by previous dissensions and ministerial changes. No one ever doubted the purity and disinterestedness of Guizot's own conduct. He despised money; he lived and died poor; and though he encouraged the fever of money-getting in the French nation, his own habits retained their primitive simplicity. But some of his instruments were mean; he employed them to deal with meanness after its kind. Gross abuses and breaches of trust came to light, and under an incorruptible minister the administration was denounced as ccrrupt.

Of his parliamentary eloquence it is impossible to speak too highly. It was terse, austere, demonstrative and commanding—not persuasive, not humorous, seldom adorned, but condensed with the force of a supreme authority in the fewest words. He was essentially a ministerial speaker, far more powerful in defence than in opposition. Like Pitt he was the type of authority and resistance, unmoved by the brilliant charges, the wit, the gaiety, the irony and the discursive power of his great rival. Nor was he less a master of parliamentary tactics and of those sudden changes and movements in debate which, as in a battle, sometimes change the fortune of the day. His confidence in himself, and in the majority of the chamber which he had moulded to his will, was unbounded; and long success and the habit of authority led him to forget that in a country like France there was a people outside the chamber elected by a small constituency, to which the minister and the king himself were held responsible.

After the fall of the monarchy in 1848 Guizot found a temporary refuge in Paris and then escaped via Belgium to London, where he arrived on March 3.

He stayed in England about a year, devoting himself again to history. He published two more volumes on the English revolution, and in 1854 his *Histoire de la rkpublique d'Angleterre et de Cromwell* (2 vols., 1854), then his *Histoire du protectorat de Cromwell et du rétablissement des Sfuarts* (2 vols., 1856). He also published an essay on Peel, and the extensive *Mkmoires pour servir à l'histoire de mon temps* (g vols., 1858–68). His speeches were included in his *Histoire parlementaire de la France* (5 vols., 1863).

Guizot survived the fall of the monarchy and the Government he had served 26 years. He was of no party, a member of no political body; no murmur of disappointed ambition, no language of asperity, ever passed his lips; it seemed as if the fever of oratorical debate and ministerial power had passed from him and left him a greater man than he had been before, in the pursuit of letters, in the conversation of his friends, and as head of the patriarchal circle of those he loved. The greater part of the year he spent at his residence at Val Richer, an Augustine monastery near Lisieux in Normandy, which had been sold at the time of the first Revolution. His two daughters, who married two descendants of the illustrious Dutch family of De Witt, kept his house. One of his sons-in-law farmed the estate. And here Guizot devoted his later years with undiminished energy to literary labour, which was in fact his chief means of subsistence. Proud, independent, simple and contented he remained to the last; and these years of retirement were perhaps the happiest and most serene portion of his life. He was a member of three of the five academies into which the Institute of France is divided. In these learned bodies Guizot continued for nearly 40 years to take a lively interest and to exercise a powerful influence. He was the jealous champion of their independence. His voice had the greatest weight in the choice of new candidates; the younger generation of French writers never looked in vain to him for encouragement; and his

constant aim was to maintain the dignity and purity of the profession of letters. In the consistory of the Protestant church in Paris Guizot exercised a similar influence. He remained through life a firm believer in the truths of revelation, and a volume of *Meditations on* the Christian *Religion* was one of his latest works.

As his grandchildren grew up around him, Guizot began to direct their attention to the history of their country. From these lessons sprang his last and not his least work, the *Histoire* de France *racontée à* mes *petits enfants,* which came down to 1789, and was continued to 1870 by his daughter Madame Guizot de Witt from her father's notes (7 vols., 1870). Guizot died on Sept. 12, 1874.

GUJARAT, a region of India, Bombay Presidency. In the widest sense it includes the whole area of Gujarati speech, *i.e.,* the northern districts and states of the presidency from Palanpur to Daman, with Kathiawar and Cutch; but it is more properly confined to the country north of the Narbada and east of the Rann of Cutch and Kathiawar. The name is used officially for the north division of the Bombay Presidency, which includes Ahmedabad, Broach, Kaira, Surat, Thana and the Panch Mahals, with an area of 13,579 sq.m. The name, also given to a district in the Punjab, is derived from the Gujars, who passed into India from the north-west, established a kingdom in Rajputana, and spread south in A.D. 400–600. The ancient Hindu capital was Anhilvada; the Mohammedan dynasty, which ruled from 1396 to 1572, founded Ahmedabad, which is still the largest city; but Gujarat owed much of its historical importance to the seaports of Broach, Cambay and Surat. Its fertile plain, with regular rainfall and many rivers, is styled the "garden of India." Gujarat gives its name to the vernacular of northern Bombay, viz., Gujarati, one of the three great languages of that Presidency. It has an ancient literature and a peculiar character.

GUJARATI and **RAJASTHANI LANGUAGES,** two members of the western subgroup of the intermediate group of Indo-Aryan languages (*q.v.*). (See HINDUSTANI.) The two languages are closely connected and might almost be termed co-dialects of the same form of speech. Together they occupy an almost square block of country, some 400m. broad, reaching from near Agra and Delhi on the river Jumna to the Arabian sea. Gujarati (properly Gujarati) is spoken in Gujarat, the northern maritime province of the Bombay Presidency, and also in Baroda and the native States adjoining. Rajasthani (properly *Rājasthānī* from *"Rājasthān,"* the native name for Rajputana) is spoken in Rajputana and the adjoining parts of Central India.

Gujarati is an intermediate language derived from a mixture of the Apabhramia forms of Saurāṣṭrī and Saurasēnī, in which the latter predominated. On the other hand, on the east and north-east it has Rajasthani, into which it merges so gradually and imperceptibly that at the conventional border-line, in the State of Palanpur, the inhabitants of Rajputana say that the local dialect is a form of Gujarati, while the inhabitants of Gujarat say that it is Rajasthani.

Language. — Gujarati has no important local dialects, but there is considerable variation in the speeches of different classes of the community. Parsees and Muslims (when the latter use the language—as a rule the Gujarat Muslims speak Hindustani) have some striking peculiarities of pronunciation, the most noticeable of which is the disregard by the latter of the distinction between cerebral and dental letters. The uneducated Hindus do not pronounce the language in the same way as their betters, and this difference is accentuated in northern Gujarat, where the lower classes substitute *ē* for i, c for k, *ch* for kh, *s* for *c* and ch, *h* for *s,* and drop h as readily as any cockney. There is also (as in the case of the Muslims) a tendency to confuse cerebral and dental consonants, to substitute r for d and l, to double medial consonants, and to pronounce the letter *ā* as *å,* something like the a in "all." The Bhils of the hills east of Gujarat also speak a rude Gujarati, with special dialectic peculiarities of their own, further mixed with corruptions of Marathi idioms in Nimar and Khandesh, where we have almost a new language.

Rajasthani has numerous dialects, each State claiming one or more of its own. All Raiasthani dialects can. however. be easily classed in four well-defined groups, a north-eastern, a southern, a western and an east-central. The north-eastern (Mēwātī) is that form of Rajasthani which is merging into the Western Hindi of the Midland. It is a mixed form of speech. Similarly, the southern (Mālvī) is much mixed with the neighbouring Bundēlī form of Western Hindi. The western (Mārwāṛī) spoken in Marwar and its neighbourhood, and the east-central (Jaipuri) spoken in Jaipur and its neighbourhood, may be taken as the typical Rajasthani dialects.

(Abbreviations:—Skr.=Sanskrit. Pr.=Prakrit. Ap.=Apabhraṁśa. G.=Gujarātī. R.=Rājasthānī. H.=Hindōstānī.)

Vocabulary.—The vocabulary of both Gujarati and Rajasthani is very free from *tatsama* words. The great mass of both vocabularies is tadbhava (see INDO-ARYAN LANGUAGES). Gujarati has perhaps more *tatsama* words than Rajasthani, but their employment is not excessive. On the other hand, Parsees and Muslims employ Persian and Arabic words with great freedom; while, owing to its maritime connections, the language has also borrowed occasional words from other parts of Asia and from Europe. This is specially marked in the strange dialect of the Kathiawar boatmen who travel all over the world as lascars on the great steamships. Their language is a mixture of Hindustani and Gujarati with a heterogeneous vocabulary.

Phonetics.—With a few exceptions, the sound-system of the two languages is the same as that of Sanskrit (*q.v.*). The sibilants *s* and *ś* are colloquially pronounced *h* (as in several outer languages), especially in the north. An original aspirate is, however, often dropped. Standard G. is fond of pronouncing an h where it is not written, as in *amē,* we, pronounced *ahmē.* In other respects both G. and R. closely. agree in their phonetical systems with the Apabhramia form of Saurasēnī Prakrit from which the Midland language is derived.

Declension. — Gujarati retains the neuter gender of Sanskrit and Prakrit. Moreover, the neuter gender is often employed to indicate living beings of which the sex is uncertain. In R. there are only sporadic instances of the neuter, which grow more and more rare as we approach the Midland. Nouns in both G. and R. may be weak or strong. Long forms corresponding to the Eastern Hindi *ghoṛawā,* a horse, are not much used, but we frequently meet another long form made by suffixing a pleonastic termination in R., where it is used contemptuously. In G. and R. this termination in *-ā* has survived, but for all nouns as the case sign of the agent and locative cases. The general oblique case is the same as the nominative, except in the case of strong masculine and neuter nouns in *ō* and *ũ* respectively. This *-ā*-termination is characteristic of the outer band of languages, and is derived from the Apabhramia genitive form in *-āha.*

In G. the nominative and oblique plural for all nouns are formed by adding *ō* to the oblique form singular, but in the neuter strong forms the oblique singular is nasalized. The real plural is the same in form as the oblique singular in the case of masculines, and as a nasalized oblique singular in the case of neuter strong forms, and the added *õ* is a further plural termination, making a double plural, which is often dropped. In R. the nominative plural of masculine nouns is the same in form as the oblique case singular, and the oblique plural ends in 6. The feminine has *ã* both in the nominative and in the oblique plural.

The general oblique case can be employed for any case except the nominative, but, in order to define the meaning, it is customary to add postpositions.

Strong adjectives agree with the nouns they qualify in gender,

number and case. Weak adjectives are immutable

Pronouns closely agree with those found in Hindustani.

Conjugation.—The old present has survived as in Hindustani and other Indian languages. The derivation of the G. 1 plural is unknown. The imperative closely follows but as usual has no termination in the second person singular.

In R. the future may be formed by adding gd (cf. Hindustani *gā*), Id or *lā* to the old present. The *gō* and 16 agree in gender and number with the subject, but *lā* is immutable. Another form of the future has *s* or h for its characteristic letter, and is the only one employed in G.

In G. the infinitive is simply the neuter of the future passive participle. The participles are employed to form finite tenses. If the verb is transitive the passive meaning of the past participle comes into force. The subject is put into the case of the agent, and the participle inflects to agree with the object, or, if there is no object, is employed impersonally in the neuter (in G.) or in the masculine (in R.). In Hindustani, if the object is expressed in the dative, the participle is also employed impersonally, in the masculine; in G. and R., even if the object is in the dative, the past participle agrees with it. The idiom of R. is exactly the same, except that the masculine must be used where G. has the neuter. The future passive participle is construed in much the same way, but the subject may be put into the dative.

G. also forms a past participle in *ēlō* (*cālēlō*), one of the many survivals of the outer language.

The usual verbs substantive are as follows: G. *chũ,* R. *hũ* or *chũ,* I am, which are conjugated regularly as old presents, and G. *hatō,* R. *hō* or ckd, was, which is a past participle, like the Hindustani (*q.v.*) *thō*. The use of this base is one of the outer band survivals. Using these as auxiliaries the finite verb makes a whole series of periphrastic tenses. A present definite is formed by conjugating the old present tense (not the present participle) with the present tense of the verb substantive. In G. and R., however, the imperfect is formed with the present participle as in H. So, as in H., we have a perfect and a pluperfect. The R. periphrastic tenses are made on the same principles. With the genitive of the G. future passive participle, we have a kind of gerundive.

The same series of derivative verbs occurs in G. and R. as in H. Thus, we have a potential passive (a simple passive in G.) formed by adding *ā* to the base, and a causal by adding *āv* or *āḍ*. A new passive may be formed in G. from the causal. Several verbs have irregular past participles. The compound verbs are numerous.

Literature. — The literature of Rajputana includes a number of bardic chronicles and a considerable religious literature, still in ms. Most of the authors wrote in Braj Bhasha, the Hindu literary dialect of Hindustani. In Marwar the literature falls into two branches, one called *Pingal* and couched in Braj *Bhasha,* and the other called *Dingal* and couched in Rajasthani.

An important side of Gujarati literature is its bardic chronicles. Modern Gujarati literature mostly consists of translations or imitations of English works. An investigation of the Rajputana Bardic Chronicles was undertaken by L. P. Tessitori under the auspices of the Asiatic Society of Bengal, but was brought to an abrupt conclusion by the death of the writer after he had published some contributions to the *Journal* of the Society.

BIBLIOGRAPHY.—Volume ix. of the Linguistic Survey of India contains a full and complete account of Gujarati and Rajasthani, including their various dialectic forms.

For Rajasthani, see S. H. Kellogg, Grammar of the Hindi Language (2nd ed., 1893). In this are described several dialects of Rajasthani. *See* also Rām Karn Śarmā, *Mārwāri* Vycikarana (Jodhpur, 1901) (a Marwari grammar written in that language), and G. Macalister, *Specimens* of the Dialects spoken in the State of Jaipur (contains specimens, vocabularies and grammars) (Allahabad, 1898). *See* also "Notes on the Grammar of the Old Western Rājasthānī" by L. P. Tessitori in Indian Antiquary, 1914–15 (vols. xliii.–xlv.).

For Gujarati, there are numerous grammars, amongst which we may note W. St. C. Tisdall, *Simplified* Grammar of the *Gujarati* Language (1892) and (the most complete) G. P. Taylor, *The Student's* Gujarati Grammar (2nd ed., Bombay, 1908). As for dictionaries, the most authoritative is the *Narma-kōś* of Narmadā Śankar (Bhaunagar and Surat, 1873), in Gujarati throughout. For English readers we may mention Shahpurji Edalji's (2nd ed., Bombay, 1868), the introduction to which contains an account of Gujarati literature by J. Glasgow, Belsare's (Ahmedabad, 1895), and Karbhari's (Ahmedabad, 1899).

GUJRANWALA, a town and district of British India, in the Punjab. The town is situated 40 m. N. of Lahore by rail. It is of modern growth, and owes its importance to the father and grandfather of Maharaja Ranjit Singh, whose capital it formed during the early period of the Sikh power. Pop. (1931), 58,716. There are manufactures of brassware, jewellery and silk and cotton scarves.

The DISTRICT comprises an area of 2,309 sq.m. In 1921 the population was 736,138. It seems likely that the district once contained the capital of the Punjab, at an epoch when Lahore had not begun to exist. We learn from the Chinese Buddhist pilgrim, Hiuan Tsang, that about the year 630 he visited a town known as Tse-kia (or Taki), the metropolis of the whole country of the five rivers. A mound near the modern village of Asarur has been identified by some as the site of the ancient capital. Under Mohammedan rule the district flourished for a time; but a mysterious depopulation fell upon the tract. and the whole region seems to have been almost entirely abandoned. On the rise of Sikh power, Charat Singh took possession of the village of Gujranwala, and here his grandson the great Maharaja Ranjit Singh was born. In 1847 the district came under British influence in connection with the regency at Lahore; and in 1849 it was included in the territory annexed after the second Sikh war. The district was the scene of serious riots during the unrest of 1919. A large export trade is carried on in cotton, wheat and other grains. The district is served by the main line and branches of the North-Western railway. The entire aspect of the district has been altered by recent extensions of irrigation, from the Lower Chenab canal in 1892 and from the Upper Chenab canal in 1912.

GUJRAT, a town and district of British India, in the Punjab. The town stands about 5 m. from the right bank of the river Chenab, 70 m. N. of Lahore by rail. Pop. (1931) 26,511. It is built upon an ancient site, formerly occupied, according to tradition, by two successive cities, the second of which is supposed to have been destroyed in 1303, the year of a Mongol invasion. More than 200 years later either Sher Shah or Akbar founded the existing town. Though standing in the midst of a Jat neighbourhood, the fort was first garrisoned by Gujars, and took the name of Gujrat. The fort stands in the centre of the town. The neighbouring shrine of the saint Shah Daula serves as a kind of asylum for lunatics. The town has manufactures of furniture, brass-ware, boots, cotton goods and shawls.

The DISTRICT OF GUJRAT comprises a narrow wedge of sub-Himalayan plain country, possessing few natural advantages. A range of low hills, known as the Pabbi, traverses the northern angle. They are composed of a friable Tertiary sandstone and conglomerate, destitute of vegetation, and presenting a mere barren chaos of naked rock, deeply scored with ravines.

Numerous relics of antiquity stud the surface of the district. A mound now occupied by the village of Moga or Mong has been identified by some as the site of Nicaea, the city built by Alexander the Great on the field of his victory over Porus. In 1846 Gujrat first came under the supervision of British officials. Two years later the district became the theatre for the important engagements which decided the event of the second Sikh war. After several bloody battles in which the British were unsuccessful, the Sikh power was irretrievably broken at the battle of Gujrat in February 1849. The Punjab then passed by annexation under British rule.

The district comprises an area of 2,250 sq.m. In 1931 the population was 922,427. The district has a large export trade in wheat and other grains, oil, wool, cotton and hides. The main line and the Sind-Sagar branch of the North-Western railway traverse it.

The southern part of the district has since 1915 received irrigation for the Upper Jhelam Canal and it contains the headworks of the Lower Jhelam Canal.

GULA, a Sumerian goddess, patroness of Medicine, the consort of Nin-urta. She is identical with another goddess, known as Bau, though it would seem that the two were originally independent. The name Bau is more common in the oldest period and

gives way in the post-Khammurabic age to Gula. Other names borne by this goddess are Nin-Karrak, Ga-turn-dug and Nin-din-dug, the latter signifying "the lady who restores to life." The designation well emphasizes the chief trait of Bau-Gula which is that of healer. She is often spoken of as "the great physician," and accordingly plays a specially prominent rôle in incantations and incantation rituals intended to relieve those suffering from disease. She is, however, also invoked to curse those who trample upon the rights of rulers or those who do wrong with poisonous potions. As in the case of Nin-urta, the cult of Bau-Gula is prominent in Lagash and in Nippur, but her principal cult was at Isin. While generally in close association with her consort, she is also invoked by herself, and thus retains a larger measure of independence than most of the goddesses of Babylonia and Assyria. She appears in a prominent position on the designs accompanying the Kudurrus boundary-stone monuments of Babylonia, being represented by a statue attended by a dog when other gods and goddesses are merely pictured by their shrines, by sacred animals or by weapons. In neo-Babylonian days her cult continued to occupy a prominent position, and Nebuchadrezzar II speaks of no less than three chapels or shrines within the sacred precincts of E-Zida in the city of Borsippa, besides a temple in her honour at Babylon.

Another deity, namely the heaven god Anu is often called *Gula,* for the word means simply "the great one."

GULBARGA, a city of India, in the Nizam's dominions, 70 m. S.E. of Sholapur. Pop. (1931) 41,083. Originally Hindu, it was made the capital of the Bahmani kings when that dynasty established their independence in the Deccan in 1347, and it remained such until 1422. The palaces, mosques, fort and tombs of these kings still stand half-ruined. The most notable building is a mosque modelled after that of Cordova in Spain, and almost unique in India as being entirely covered in. Since the opening of a station on the Great Indian Peninsula railway, Gulbarga has become an important centre of trade, with cotton-spinning and weaving mills, ginning and pressing factories and flour, paint and oil mills. State offices have been built between the town and the railway station. It is also the headquarters of the largest division of Hyderabad and a district of the same name, with an area of 6,975 sq.m., and pop. (1931) 1,225,008.

GULDEN. The monetary unit of Holland and the Dutch East Indies, variously termed the "Guilder" or, generally, "Florin." It dates from 1847, when Holland adopted the gold standard.

The florin was originally a silver coin, divided into 20 stivers, and until a comparatively modern date, London quoted the Dutch exchange in florins and stivers. Owing to the fall in the value of silver last century, the silver standard was abandoned in 1873, and after two years, the gold standard was adopted. The par of exchange with the pound was formerly Fl.12.107 to the pound, and at par in New York the florin was equivalent to 40.196 cents. Since 1936 the parity is indeterminate.

The florin occupied an unique position during the war, as it was probably the most important of the neutral currencies, and pounds, francs and marks were regularly quoted against it. It thus provided the only test of the relative financial strength of the belligerent nations, and it was in Amsterdam that the weakness of the mark was first revealed. Like other neutral currencies, the florin was affected by the war and the post-war inflation boom, and while for many years after the war it was worth more even than sterling, it failed for a long time to get on terms with the dollar. At the end of 1920, it was quoted at 30.92 cents, it averaged 33.64 cents in 1921, improved to 39 10 cents in 1923, only to slip back to 38 22 cents in 1924. In 1925, Holland returned to the gold standard, but was affected by the depression of the 1930s and the outbreak of war in 1939 which again disrupted all dealings in international exchange.

As regards its internal purchasing power, wholesale prices rose from 100 in 1913 to 376 in 1918, the closing year of the war. This proved the peak, and by Oct., 1927, the index figure had slipped back to 150. This was commensurate with British and American index figures, though a little on the high side.

Notes ore issued by the Bank and by the Government, as in England, but in Holland the vast majority of notes emanate from the Bank. The amount in circulation at the end of 1927 was Fl.811,000,000, as against Fl.313,000,000 in 1913. Until as late as 1923, the note circulation was over Fl.1,098,000,000, but it is notorious that during the periods of the collapse of the mark, Germany was to some extent dependent upon neighbouring currencies for the proper conduct of her internal trade. It was the collapse of the mark which also accounted for the growth of the Amsterdam money market during the years immediately succeeding the war. With the stabilization of the mark, Amsterdam declined in importance as an international financial centre, though in 1927 Holland occupied a more important position in this respect than she did before the World War. Her future position is difficult to forecast since 1939. (See CURRENCY.) (N. E. C.; X.)

GULFPORT, a city of southeastern Mississippi, U.S.A., on Mississippi sound (Gulf of Mexico), about half-way betneen Mobile and New Orleans; a port of entry and the county seat of Harrison county. It is on federal highways 49 and go (the Old Spanish trail), and is served by the Illinois Central and the Louisville and Nashville railways, and by numerous ocean steamship lines. The population was 12,547 in 1930 (17% Negroes) and nas 15,195 in 1940 by the federal census. Gulfport has an area of 15 sq.mi., with a frontage of 6 mi. on the gulf and a good deep-water harbour (constructed since 1901). The shore is protected by a 7-mi. sea wall of reinforced concrete, faced with steps leading from the promenade along the top down to the bathing beaches below. The commerce of the port consists largely of receipts of lumber, salt of potash, phosphate rock and acid phosphate, fish and oysters, groceries, grain and sugar, and shipments of lumber, staves and headings, creosoted piling, cotton-seed cake and meal, rosin, glucose and crushed oyster shells. There are lumber mills and several small manufacturing plants, the largest being a shirt factory employing 1,000 people. Gulfport is both a summer and a winter resort, and is the seat of a U.S. veterans' bureau hospital. Harrison county was the second in the United States to provide a county health department and as a result malaria and hookworm disease have been practically eliminated and tuberculosis reduced to relatively few cases. Gulfport was founded in 1898.

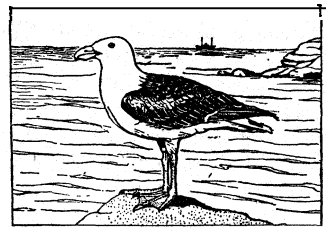
GULF STREAM, the name applied to the North Atlantic, current which issues from the Gulf of Mexico and after being reinforced by a branch of the trade-wind current off Florida, flows north-eastward along the eastern coast of North America (from which it is separated by a narrow strip of cold water—the Cold *Wall*), to a point east of the Grand Banks off Newfoundland. The initial Gulf Stream is a narrow, deep current, and its greatest velocity is estimated at over 4 m.p h., but it tends to drag other water along with it. As mote water becomes involved its speed decreases to about 10 m. per day and its boundaries become indefinite, so that it is recognized by its temperature and colour rather than by its motion. East of the Banks it tends to fuse with the Labrador current and its character changes so considerably that new names are given to it, *e.g.,* North Atlantic Drift (see ATLANTIC OCEAN.)

GULFWEED, in botany, a popular name for species of the brown seaweeds (Phaeophyta) belonging to the genus *Sargassum,* more particularly the species (*Sargassum* natans) that grows in free-floating masses in the Gulf stream and the Sargasso sea. *Sargassum* natans was observed by Columbus, and is remarkable among seaweeds for its form, which resembles branches bearing leaves and berries; the latter are hollow floats answering the same purpose as the bladders in another brown seaweed, *Fucus vesiculosus,* common round the British Isles between high and low water.

GULL, the common name for sea-birds of the family Laridae, sub-family Larinae.

Perhaps the most beautiful of all gulls is the ivory gull (*Pagophila eburnea*), which breeds in the high Arctic. The plumage is

pure white, the legs black. The well-known kittiwake (Rissa *tridactyla*) inhabits the seas of the northern hemisphere, breeding as far south as the coasts of Britain; in this species the hind toe is lacking. Of the numerous species of the genus *Larus,* the largest are the glaucous and greater black-backed gulls (L. *glaucus* and *L. marinus*), of which the former is circumpolar, the latter nearly so, not occurring, however, between Labrador and Japan. These species are more or less raptorial in their habits, eating the eggs, young, and even adults of many other birds. L. *minutus* of Europe is the smallest species. The black-headed gull, L. *ridibundus,* breeds in large colonies in marshes, but most species prefer cliffs. The silvery gull (L. *novae-hollandiae*) has a southern habitat. The rare and beautiful roseate gull (*Rhodostethia rosea*) is recognized by the pink tinge in its plumage; it is an Arctic form. Sabine's gull, *Xerna sabinii,* breeds in Arctic America and Siberia. It has a forked tail. Franklin's gull (L. *franklini*) inhabits the interior of North America, breeding in marshes. It is the only bird with a monument to it—there being one in Salt Lake City to commemorate its services in the destruction of grasshoppers. The herring gull (L. argentatus) is the commonest Atlantic species.



BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

THE PACIFIC GULL, A POWERFULLY WINGED SEA-BIRD THAT INHABITS THE WESTERN SHORES OF THE UNITED STATES, FEEDING ON FISH AND SHIPS' FOOD REFUSE

GULLAH, the name of a tribe of negroes brought from the west coast of Africa to the slave States of Georgia and South Carolina in the early 18th century, and to the dialect spoken by them and by their lingual descendants to-day along the coast of these States and on the sea islands nearby. Whatever their origin, the Gullah negroes were a potent force on the coast plantations of South Carolina, where, isolated in large numbers in the rice and cotton fields, "they seized upon the peasant English used by some of the early settlers and the white servants of the wealthy colonists, wrapped their clumsy tongues about it . . . and enriched with certain expressive African words it issued through their flat noses and thick lips in so workable a form that it . . . became in time the accepted negro speech of the lower districts of South Carolina and Georgia." The salient characteristics of "Gullah," which cannot be read without a glossary, are the use of "who" for "a" and "er"; of one gender for three as "e" for he, she, it; "um" for him, her, it and them; "Uh shum" for "I saw him," "I have seen them," and the total disregard of singular and plural numbers. Perhaps the truth of the statement that Gullah is the worst negro English in the United States can be exemplified best by the quotation used by Mr. Bennett in the Literary Review for Dec. 9, 1922: A negro in protesting to a white hunter against taking a new position on a deer run says, "No Shuh Shuh! Ef 'e duh dey, de dee duh no dey-dey, ef 'e no dey, de dee duh dey-dey" (No Sir, if you go there, the deer will not go there, if you don't go, the deer will).

For Gullah at its best in the quaint simile, wit, and philosophy of its users and for a glossary, see Ambrose E. Gonzales, The Black Border, *Gullah* Stories of *the Carolina* Coast (Charleston, S.C., 1922).

GULLSTRAND, ALLVAR (1862–1930), Swedish physician, was born on June 5, 1862, at Landskrona. In 1894 he became professor of diseases of the eye at Uppsala, and in 1913 was appointed professor of physiological and physical optics at the same university. His investigations concerned the general laws of dioptrics, a new conception of the theory of optical images; the extrication of the optical images in the eye, and the eye's relation to the diffusion of light. In 1911 he was awarded the Nobel prize for medicine. Among Gullstrand's works are *Allgemeine* Theorie der *monochromatischen* Aberrationen (1900), Die *optische Abbildung* in *heterogenen* Medien *und* die *Dioptrik der Kristallinse* des Menschen (1908) and *Einführung* in *die Methoden* der *Dioptrik* des *Auges* des *Menschen* (1911). He received the honorary degree of Sc.D. at Dublin in 1912.

GULLY, JOHN (1783–1863), English boxer and politician, was born at Wick, near Bath, on Aug. 21, 1783, the son of an innkeeper. In 1805 he was matched against Henry Pearce, the "Game Chicken," before the duke of Clarence (afterwards William IV.), and was beaten after fighting 64 rounds, which occupied an hour and seventeen minutes. In 1807 he twice fought Bob Gregson, the Lancashire giant, for 200 guineas a side, winning on both occasions. As the landlord of the "Plough" tavern in Carey Street, London, he retired from the ring in 1808, and took to horse-racing. In 1827 he lost £40,000 by backing his horse "Mameluke" (for which he had paid 4.000 guineas) for the St. Leger. In partnership with Robert Ridskale, in 1832, he made £85,000 by winning the Derby and St. Leger with "St. Giles" and "Margrave." In partnership with John Day he won the Two Thousand Guineas with "Ugly Buck" in 1844, and two years later he took the Derby and the Oaks with "Pyrrhus the First" and "Mendicant," in 1854 the Two Thousand Guineas with "Hermit," and in the same year, in partnership with Henry Padwick, the Derby with "Andover." He bought Ackworth Park, near Pontefract, and was M. P. from Dec. 1832 to July 1837. In 1862 he purchased the Wingate Grange estate and collieries. Gully died on March 9, 1863.

GULPAIGAN, one of the smaller provinces of Persia, lying north-west of Isfahan province. It is mainly agricultural and a good deal of opium and wool are produced.

The administrative centre is Gulpaigan, a straggling town with a population according to Lorini of 9,000, on the road from Isfahan to Hamadan, where good wood-carving is carried on and coarse woollen yarns made.

It is surrounded with orchards, and there is a large export of carved wooden spoons to all parts of Persia.

GUM ARABIC, an exudation from various varieties of acacia, much used in the arts (see GUMS).

GUMBEL, KARL WILHELM VON, BARON (1823–1898), German geologist, was born at Dannenfels, in the Palatinate of the Rhine, on Feb. 11, 1823. He was professor of geognosy in Munich and director of the geological survey in Bavaria. His geological map of Bavaria appeared in 1858; the official memoir descriptive of the detailed work, entitled *Geognostische Beschreibung* des *Königreichs Bayern* was issued in three parts (1861, 1868 and 1879. He wrote Geologie von *Bayern* (1884–1894), an elaborate treatise on geology, with special reference to the geology of Bavaria. In 1861 Giimbel introduced the term Rhaetic for the uppermost division of that system; he supported at first the view of the organic nature of *Eozoon* (1566 and 1876), he devoted special attention to Foraminifera, and described those of the Eocene strata of the northern Alps (1868); he dealt also with Receptaculites (1875) which he regarded as a genus belonging to the Foraminifera. He died on June 18, 1898.

GUM BENJAMIN: see **BENZOIN.**

GUMBINNEN, a town in the Prussian province of East Prussia, Germany, on the Pissa, 70 mi. E. of Konigsberg. Pop. (1939) 24,691. Frederick William I in 1724 raised Gumbinnen to the rank of a town, and in 1732 brought to it a number of persons who had been driven from Salzburg by religious persecution. The manufacture of agricultural machinery, cotton and linen weaving, tanning, brewing and distilling are the principal industries. There are horse and cattle markets.

GUMBO or OKRA, an herbaceous hairy annual plant (Hibiscus *esculentus*) of the mallow family (Malvaceae), of the old world tropics and widely cultivated or naturalized in tropical and sub-tropical countries. The leaves are cordate, and 3- to 5-lobed, and the flowers yellow, with a crimson centre; the fruit or pod, the *Bendi-Kai* of the Europeans of southern India, is a tapering, 10-angled capsule, 4 in. to 10 in. in length, except in the dwarf varieties, and contains numerous oval dark-coloured seeds, hairy at the base. The unripe fruit is eaten either pickled or prepared like asparagus. It is also an ingredient in various dishes, *e.g.,* the gumbo of the southern United States, and on account of the large amount of mucilage it contains, it is extensively used for thickening broths and soups. The fruit is grown on a large scale in the vicinity of Constantinople. The seeds of the gumbo are used as a substitute for coffee. From their demulcent and emolli-

ent properties, the leaves and immature fruit have long been in repute in the east for use in poultices and fomentations.

The musk mallow or abelmosk *(Hibiscus abelmoschus)*, a related plant indigenous to India, and cultivated in most warm regions of the globe, is a low, slightly woody plant, bearing a conical 5-ridged pod about 3 in. in length, within which are numerous brown reniform seeds, smaller than those of H. *esculentus*. The seeds possess a musky odour, due to an oleo-resin and are known to perfumers under the name of *ambrette*, now mostly of synthetic origin.

The seeds are used in Africa as beads. The plant yields an excellent fibre, and, being rich in mucilage, is employed in upper India for clarifying sugar. The best-perfumed seeds are reported to come from Martinique.

See P. Alpinus, *De plantis Aegypti* (Venice, 1592); *G.* Watt, *Dictionary of the Economic Products of India* (1905).

GUMMIC ACID: *see* ARABIC ACID.

GUMS. The generic name given to a class of uncrystallizable substances, composed of carbon, hydrogen and oxygen, which occur widely in plants, and to a limited extent in animals. Their characteristic property is that they form viscous solutions or mucilages either by dissolving in water (soluble gums) or by absorbing many times their own volume of that solvent (insoluble gums). Commercial gums contain more or less mineral matter, chiefly calcium, magnesium and potassium. A little nitrogen is also often present; but it is not an essential constituent. In this the gums differ from the gelatins, glues and proteins, which form solutions of a similar character; but which are definitely nitrogenous bodies.

The best known gum is *gum arabic* (gum acacia), which has been used in the arts from the earliest times. It is a product of the various varieties of acacia which grow widely throughout Africa and in India and Australia. The gum exudes from the tree, the process being sometimes assisted by making incisions in the bark. The world's supply of gum arabic is obtained chiefly from the Sudan (especially from the province of Kordofan) and from the French colony of Senegal, while smaller quantities come from Northern Nigeria, Morocco, India and Australia. In the Sudan (where the trees are often cultivated in groves) and in Senegal the grey-barked acacia, *Acacia Senegal*, is the chief gum-producing tree. The Sudanese name for this tree is *hashab*. The gum is collected in the dry season and shipped to European parts where it is sorted into grades for the market.

The origin and function of the gums in plant life is not yet clearly understood. They are generally regarded, in the case of trees at least, as being due to the breaking down of cellular tissue; but while some authorities hold that they are normal products of plant metabolism, others believe that they are caused by an unorganized ferment or enzyme produced by an invading fungus, and others again suggest that they are due to bacterial action. It is said that the more sickly the tree the better the yield of gum; but of course in such cases it may be that a body typical of healthy life in the plant is being overproduced owing to functional disturbances, without the intervention of fungi or bacteria. It is certain that soil, climate and season affect the yield from a given variety of tree.

Gum arabic comes on the market in the form of rounded or vermiform nodules or "tears." The best qualities are Sudan or Kordofan gum (also known as *hashab* gum and picked Turkey gum) and *gomme blanche* from Senegal. These are colourless or slightly yellow; whereas the lower grades have a distinctly yellow colour. The most remarkable property of gum is the viscous colloidal solution it forms with water *(see* COLLOIDS). It is insoluble in alcohol and the addition of the latter in sufficient quantity to an aqueous solution precipitates the gum.

Chemistry of Gum.—Up to the middle of the 19th century when modern organic chemistry was still in its infancy, it was supposed that living matter was composed of a relatively small number of compounds which were called proximate principles, and we find the gums classed among the "proximate principles of the vegetals" (W. T. Brande, *Manual of Chemistry*, 1848). In 1854 Neubauer showed that the chief constituent of commercial gum arabic was an acid substance which he called *arabin* or *arabic acid*. This body was composed of carbon, hydrogen and oxygen, and analysis appeared to show that the two latter elements were in the proportion in which they are present in water. The gums were, therefore, placed among the carbohydrates (*q.v.*). In 1868 Scheibler obtained, by the decomposition of arabin, a new sugar which he called arabinose. Notwithstanding this important discovery, the chemistry of the gums remained obscure for many years, no doubt because their uncrystallizable character made purification difficult and uncertain. The key to the problem was finally found by C. O'Sullivan, in a series of researches, the results of which appeared in the journal of the Chemical Society between 1884 and 1901. By introducing a novel method of treatment, O'Sullivan was able to show that arabin consisted of an acid nucleus to which a number of molecules of the sugars galactose and arabinose were chemically united. To the acid he gave the formula $C_{23}H_{38}O_{22}$ and the name *arabic acid*, while to arabin he assigned the formula

$$2C_{10}H_{16}O_8,4C_{12}H_{20}O_{10},C_{23}H_{30}O_{18}$$

and named it di-arabinan-tetragalactan-arabic *acid*. The words arabinan and galactan refer respectively to two molecules of the sugars arabinose ($C_5H_{10}O_5$) and galactose ($C_6H_{12}O_6$) *minus* two molecules of water. It will be observed that the acid in the compound is *minus* $4H_2O$.

It is interesting to note that the *pectins* which cause fruit juices to "gel" in the making of jam have recently been shown to consist of compounds of sugars with an acid.

Gum tragacanth is the chief insoluble gum. It is derived from various species of Astragalus occurring in south-west Europe, Greece and Turkey. It consists of a mixture of several gum acids combined with sugars (O'Sullivan).

Gums have a great variety of uses, all of which depend on their viscoscity or their adhesiveness. The best qualities are used in clearing liqueurs, in sizing silk, textiles and paper, in confectionery, pharmacy and calico printing. Inferior kinds find application in the manufacture of stationery, matches and ink.

Gum resins are mixtures of gums and resins exuded by certain plants. The best known are ammoniacum, asafoetida, galbanurn, gamboge, myrrh and olibanum or frankincense.

For the history of the gums *see* Fliickiger and Hanbury's *Pharmacographia*. For the chemistry see H. H. Robinson, Report of the British Association, 1906, p. 227. For a general account, with statistics of production *see* Bulletin of the Imperial Institute, vol. 6, 1908; also H. S. Blunt, *Gum Arabic, with special reference to its Production in the Sudan* (Oxford, 1926).

See also DEXTRIN. For Chewing-gum, *see* CHICLE. (T. D)

GUMTI, a river of northern India. It rises in a depression in the Pilibhit district of the United Provinces, and after a sinuous but generally south-easterly course of 500 m. past Lucknow and Jaunpur joins the Ganges in Ghazipar district. At Jaunpur it is spanned by a fine 16th-century bridge, and is navigable by small vessels. There is also a small river of the same name in the Tippera district of Assam.

GÜMÜLJINA or KOMOTINA, capital of the dept. of Rhodope in western Thrace, Greece. Pop. (1928, last census before World War II) 30,136. Giimiiljina is situated on the river Karaja-Su, south of the eastern extremity of the Rhodope range of mountains and 13 mi. inland from the Aegean sea. The district produces wheat, maize, barley and tobacco; sericulture and viticulture are both practised on a limited scale. A cattle fair is held annually on Greek Palm Sunday. Copper and antimony are found in the neighbourhood. The town went to Greece in 1918 and was occupied by Bulgaria in 1941.

GUMUS, a Shangalla tribe, in the mountainous district of Fazogli on the Sudan-Abyssinian frontier; others are settled on the banks of the Blue Nile. They live in independent groups. Gumz in the native tongue signifies "people," and the sub-tribes have distinctive names. The Gumus are nature-worshippers, God and the sun being synonymous. On ceremonial occasions they carry parasols of honour *(see* SHANGALLA).

GUMUSH-KHANEH or GÜMÜŞANE, the chief town of a vilayet of the same name in Asiatic Turkey, situated on high

ground (4,400 ft.) in the valley of the Kharshut Su, about ½ m. S. of the Trebizond-Erzerum *chaussée*. The silver mines from which the place takes its name were noted in ancient times and are mentioned by Marco Polo. Population 16,846.

GUN: see SMALL ARMS, THE DEVELOPMENT OF.

GUN, MACHINE, a mechanically operated military small arm capable of numerous discharges without reloading, commonly employing the same ammunition as the official shoulder weapon of the country by which used, but materially heavier than such weapon and hence usually fired from a rigid mount (bipod or tripod) Made in light types for use from the shoulder and chambered for short-range pistol cartridges it is called a sub-machine gun. Larger calibres, however, up to 1in. (25mm.) are also produced; quick-firing guns of still larger bore are classified as ARTILLERY (*q.v.*). Semi-automatic ("self-loading") rifles, operating as they do on principles identical with those found in machine gun mechanisms, will be treated at the end of this article. For semi-automatic (commonly miscalled "automatic") pistols, see PISTOL.

HISTORY

The machine gun dates from a period almost as remote as that of the first shoulder weapon, since the military has ever sought means for developing large volumes of fire by small numbers of individual soldiers. The first practical efforts toward this end involved the mounting, on rude carts, of parallel rows of muskets, or musket barrels, arranged in conjunction with some device whereby the ignition of a single quick-burning fuse joining the firing mechanisms of the entire assembly would result in the simultaneous, or nearly simultaneous, discharge of all the pieces. The idea, with variations, persisted to the American Civil War, being exemplified in the Billinghurst and Requa gun of that period. Dating from remote periods, numerous crude attempts at producing a rapid-fire, musket-calibre weapon are recorded. But no truly efficient machine gun could take shape until a satisfactory metallic cartridge had been evolved. This happened in the early 1860s, and forthwith appeared a gun invented by Dr. Richard J. Gatling of Chicago, Ill., and destined to write history in no small way. It consisted of a number of barrels (usually five to ten) of musket calibre, mounted parallel one to another and equidistantly spaced about a central shaft around which they rotated. Actuated by a hand crank which could be turned fast or slowly at the will of the operator and so control the rate of fire, the loading of any individual barrel (by gravity feed from a cartridge container above the gun) was accomplished during the period in which it was making one-half of a revolution about the central shaft. Firing then took place, followed by extraction and ejection during the second half-revolution. An extremely efficient weapon for its period, the Gatling saw service in many armies, and a number of wars, until the forepart of the 20th century when it finally

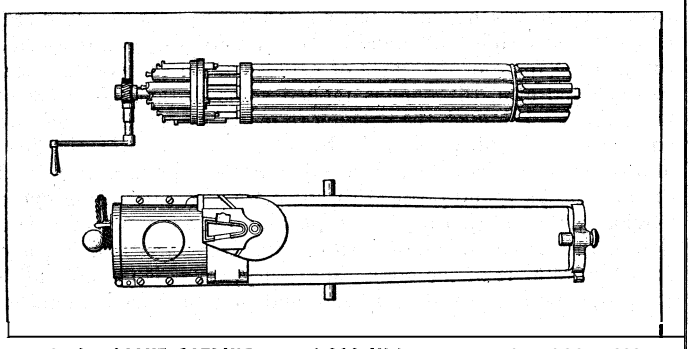


FIG. 1.—LIGHT GATLING GUN (.300 IN.) USED AT SANTIAGO, 1898

gave way to pieces in which the energy of discharge, rather than the right arm of the gunner, furnished the operating power. The next machine gun to receive serious attention was the Montigny (Belgo-French) "Mitrailleuse" (c. 1870), a weapon with 37 (sometimes less) stationary barrels of rifle calibre, assembled side by side in a large bundle, the whole encased (as in the later Gatlings) in a cylindrical metal tube and so giving the appearance (side view) of a cannon of substantial bore. Fitted with a detachable 37-chambered breech-block, several of which could be kept loaded and available for quick replacement, it was, like the Gatling, fired by the manual operation of a crank. This released, in slow or quick succession as circumstances might indicate, from 1 to 37 firing pins corresponding to the chambers in the breech-block, each of which was, of course, aligned with a different barrel. Developed by the French behind closed doors (it was originally a Belgian invention), it was the famous "secret weapon" of the Franco-Prussian war of 1870–71 and when properly used (*i.e.*, solely to augment infantry fire power), proved quite successful. But the continuous and erroneous tactical employment of the piece as an artillery weapon (it was mounted on a wheeled carriage like a field gun)—as were the first Gatlings—resulted in general failure and the unwarranted discredit of a really superior device.

It was not long, however, before other successful manually actuated machine guns of rifle calibre, usually embodying two or more barrels positioned side by side and fed by gravity, as in the Gatling, from magazines above, had been perfected and by various nations, adopted. Of these perhaps the best–known examples were the Gardner and the Nordenfeld.

But in 1884 appeared an invention destined, with others that soon followed, to supplant entirely the hand-actuated weapon. This was Hiram S. Maxim's recoil-operated arm. Three classes of recoil-operated pieces are recognized, viz., the long- and short-recoil types, and the "simple blow-back." In the last-named, the barrel remains stationary at all times, whereas in the first two instances it undergoes varying degrees of rearward movement when the piece is discharged. In the "long-recoil" system, barrel and breech-block travel backward over a distance somewhat exceeding the length of the cartridge employed, being brought finally to a stop against a suitable buffer. A spiral "return-spring," compressed during the movement just completed, now drives the barrel back to its firing position, the breech-block remaining retracted. As the barrel goes forward, the extractor in the breech-block removes the fired case from the chamber and it is ejected. The block itself now advances, driven by a second spring, which, like the barrel-return spring, was compressed during the rearward movement of barrel and block. In this new movement the block picks up a cartridge from the magazine and inserts it into the chamber.

Classical examples of the long-recoil system are the Chauchat light machine gun used by French and Americans in the World War of 1914–18, the Remington auto-loading rifle and shotgun (United States) and various Mauser shoulder rifles (Germany).

In the short-recoil system, barrel and block travel rearward together for but a fraction of an inch. During this period the projectile emerges from the muzzle, and the residual gas pressure in the bore of the arm has been reduced to within safe working limits. If barrel and block separate while the pressure remains high, the primer in the fired cartridge case is liable to be blown from its seat, or the case to rupture, or both, the latter event always, and the former often, "jamming" the piece until the condition can be corrected. Some suitable device now causes barrel and block to "unlock" and separate, the former coming to a stop, the latter continuing rearward (carrying with it the fired case, which is so extracted, and next ejected) until halted. Then, under the influence of a conventional spiral return-spring, it reverses its rearward motion to one in the opposite direction, plucking from the magazine a new cartridge as it goes forward and inserting it into the chamber, its inertia meanwhile driving the barrel back into its forward (firing) position.

Needless to say, in both long- and short-recoil systems—of the latter the Maxim and its Vickers modification (both British) and the (heavy) Browning (American) are probably the most illustrious exponents—mechanisms are provided at some point in the operative cycle for "cocking" the piece (*i.e.*, making it ready to fire). Discharge then takes place as soon as the chamber contains a new cartridge and the breech is properly locked—this without the intervention of the operator in so-called "full-automatic" arms, or only after pressure on the trigger in those of "semi-automatic" type. Most machine guns can be fired either way.

In the simple blow-back system mere inertia of the block (with or without attached deadweights) plus that of the return spring delays the opening of the breech until the period of dangerous chamber pressures is terminated. Obviously, such a design is best employed in weapons of low power (it would require a bolt assembly weighing 27lb. to operate a high-power army rifle on the blow-back principle) and is therefore usually found only in those of .22 rim-fire calibre, although the Winchester company

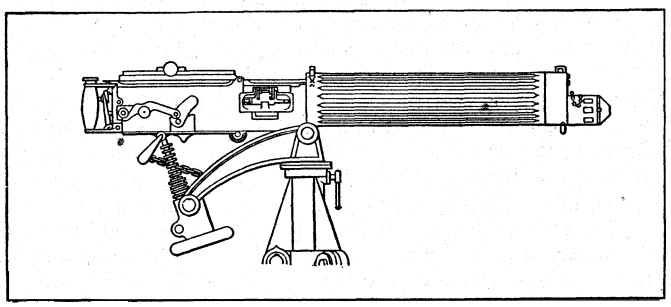

FIG. 2.— VICKERS MACHINE GUN (GREAT BRITAIN)

(United States) has produced several successful sporting rifles on this system in substantial calibres (*i.e.,* up to .401in.).

In. addition, there are various types of "delayed blow-back" mechanisms, in which the rearward thrust of the burning powder gases on the head of the cartridge case, and through this, to the face of the breech-block, is caused to work initially at a mechanical disadvantage as through the interposition of a toggle joint the eccentricity of the toggle link in which is held smail at the beginning in order to delay the breaking of the elbow joint.

Examples are the Schwarzlose machine gun—Austria; the Borchardt and Luger self-loading pistols—Germany; the Pedersen semi-automatic shoulder rifle—United States. Another popular delayed blow-back mechanism embodies a lug-bearing bolt of the type present in the conventional bolt-action rifle, the lugs on this fitting into slots or recesses in the receiver, the terminal slope of the channels leading into which, approaches so closely to a right angle that it takes an appreciable time for the thrust on the bolt face to cause the lugs to unlock. Once started backward, its cycle duplicates in effect that of the bolt in the short-recoil system, save that the return spring acts upon it with a twisting motion in order to effect its rotation and the proper reseating of the lugs when it again reaches its forward position. A classical example of this system is the Thompson shoulder-rifle —United States. During the early 1930s, this type of action (as developed by Pedersen in a calibre of ·276″) barely missed being officially adopted by the United States.

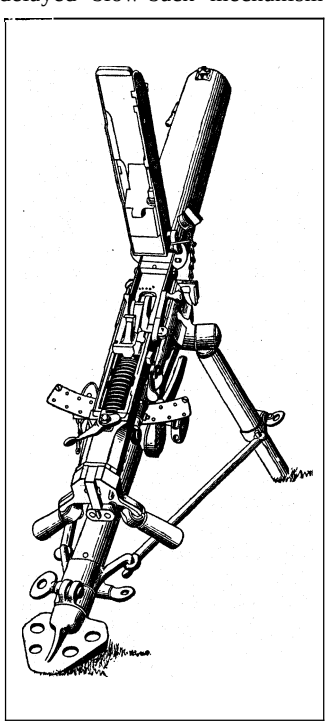

FIG. 3.—SCHWARZLOSE MACHINE GUN (AUSTRIA)

In the toggle-joint varieties the block or bolt is returned to firing position without rotation. Actions of the delayed blow-back type require, however, the use of lubricated cartridge cases, since in such mechanisms, barrel and block commence to unlock and separate while gas pressures are still dangerously high. Under these conditions, the thin forward end of the conventional (unlubricated) cartridge case will be gripping the walls of the chamber so tightly, due to this pressure within the case, that it cannot "let go." But the head of the case, drawn backward by the extractor and at the same time urged rearward by the powerful gases within, insists on leaving the chamber. The result is a rupture of the case body, usually about ½in. ahead of the extractor groove. Lubrication of the case, however (accomplished in the Schwarzlose by the mechanical injection of a drop of oil into the chamber at each loading; in the Thompson by oiled felt pads; and in the Pedersen by an invisible wax coating which covers the case). enables its walls to disengage themselves from the chamber, even at high pressures, and permits satisfactory functioning of the piece. Other semi-automatic mechanisms which have been successfully produced include the "blow-forward" type (as in the Schwarzlose automatic pistol) wherein the breech remains stationary, the barrel moving forward a certain distance on firing, leaving the empty cartridge case gripped by the extractor in the breech face. Some suitable device now ejects the case, and the barrel, returning under spring pressure to its original position, envelops and chambers a new cartridge awaiting it in the magazine. Yet another system, in which the barrel remains rigid as in the simple blow-back, involves the use of the "setback" of the primer cup, this not being supported by the face of the bolt, but allowed to recoil for a short distance to the rear in a hole in the axis thereof. Gas pressure within the case supplies the necessary energy, and the cap in its short travel gathers enough momentum to strike an "actuator" rod with sufficient force to cause this to unlock the bolt from the barrel and start the

FIG. 4.— THOMPSON SUB-MACHINE GUN (VERTICAL FOREGRIP) WITH PO-CARTRIDGE CAPACITY BOX MAGAZINE AND CUTTS COMPENSATOR

former on a movement to the rear which initiates the usual cycle of extraction and ejection, reloading, cocking and firing. Early models of the Garand semi-automatic shoulder rifle (United States) operated on this principle, although it is by no means new, patents covering it having been issued to Maxim in England a year before he secured others on his more conventional mechanism of the short-recoil variety.

Gas Operated.—A second major class of machine weapons is the gas-operated type; familiar examples are the Browning-Colt, its Marlin modification and the Lewis—all American. In these, some slight portion of the explosion gases is diverted from the task of driving forward the projectile, and applied to operating the mechanism of the piece. The basic idea is old, having been partially developed for use in a revolver by Paulson (England) 1886, prior to which Orbea (Spain) had produced a revolver embodying a mechanism whereby the empty, fired case was ejected through the force of the gases of explosion. In the conventional gas-operated arm, the bore is tapped some distance forward of the breech and through the opening so made, gases are led off into an expansion chamber below the barrel where, acting on the head of a piston, they drive this rearward to unlock the breech, retract the breech-block, and proceed to complete the usual firing cycle. Obviously the location of the gas port, and the manner of operation of the piston, are subject to considerable variation. Further, no actual tapping of the bore is necessary, for it is possible after the projectile has already emerged, and pressures have therefore fallen to moderate figures, to trap some of the gases in an expansion chamber screwed on to the muzzle of the piece, as in certain later models of the Garand rifle, there to energize a rearward-moving actuating rod which unlocks the breech-block from the barrel and so starts the operating cycle. Or the rod may move forward (*e.g.,* the Bang rifle) accomplishing the same end through a system of links between it and the block.

Opponents of the gas-operated system point to the inevitable accumulation of carbon in the expansion chamber and the necessity for eventually removing this, as contrasted with no such draw-

back present in recoil-operated weapons. Proponents of the former praise the advantages of a rigid barrel (possible with this form of construction) as against one moving rearward and then forward—a condition obtaining in all recoil-operated weapons save those on the simple blow-back and primer-setback systems—the former inapplicable to high-pressure ammunition; the latter not sufficiently flexible in its ability to handle cartridges with varying powder charges and bullet weights to make it very reliable from a military standpoint.

Intermediate Types.—The line of demarcation between the machine gun and the shoulder rifle is not a hard and fast one. Thus the United States subsequent to the World War of 1914–18 modified its Browning automatic shoulder rifle (gas-operated) into a light machine gun by adding a muzzle bipod, altering the buttplate, etc. Still lighter forms of machine gun are the "sub-machine gun" types, exemplified by the (German) Bergmann and the (American) Thompson. These are commonly lightweight weapons chambering ammunition of low power (pistol calibres) and designed to be fired from the shoulder, though the Thompson may, by removal of its detachable stock, be adapted to firing from the hip. Such weapons have distinct, though somewhat limited uses (because of their short range and low penetrating power) but are immensely valuable under conditions requiring a large volume of fire at nearby unarmoured targets, They employ detachable and quickly replaceable box-type magazines with capacities of from 20 to 100 rounds in contrast with the military machine gun in which the ammunition is ordinarily supplied in woven web belts of 250 rounds capacity. For aircraft use, belts of metal links were developed after the World War of 1914–18, these disintegrating as the cartridges are withdrawn from them. Other devices have been perfected to convert the conventional military, semi-automatic pistol into a multi-shot arm, such as the 32-shot drum magazine attachable to the German Luger, long flat extension box magazines for the Colt ·45 semi-automatic pistol, and the "hush, hush" Pedersen device, developed in the United States during the World War of 1914–18, wherein by the removal of the bolt from the conventional army rifle, and the substitution of a special breech assembly (plus slight modification of the receiver) the weapon was converted into a semi-automatic arm firing 40 rounds of ammunition of pistol calibre without reloading. The war ended before this ingenious mechanism could receive trial under actual service conditions.

The Semi-automatic Rifle.—This type of weapon, though not perfected until after 1900, has a history dating back well into the 19th century. One of the first of such mechanisms to be evolved (c. 1870) comprised a revolving-cylinder arm, fitted with a long counter-recoil spring, its forward end fixed in the stock. Its rear end was attached to a supernumerary buttplate located a short distance behind the conventional one, a long rod hinged to this and passing through the hollow core of the spring, actuating a set of links at its forward end, movement of which rotated the cylinder and cocked the hammer. On firing, the gun mass was driven rearward until the two buttplates came into contact, the forward end of the actuating rod meanwhile initiating the motions of revolution, and cocking, the spiral spring at the same time undergoing compression. Recoil completed, the expansion of this spring now drove the rear buttplate back to its initial position. Pressing the trigger fired the piece and the cycle mas repeated. Here then were all the usual functions of a semi-automatic arm with the exception of ejection. Only a few years later (1884) Maxim came forward with a similar device to be built into a Winchester tube-magazine, lever-action rifle (Model 1876) wherein ejection was added to the other features, the actuating rod in this instance causing movements of the finger lever necessary to accomplish this. This was apparently the first really workable, if somewhat crude, semi-automatic rifle, though there is no evidence to indicate that either Maxim's device, or that which preceded it, was ever commercially exploited. The next military semi-automatic mechanism of record consisted of a Model 1888 Mannlicher (Austrian) rifle of 8mm. calibre converted into a self-loading arm of the long-recoil type. Thereafter other systems were developed in profusion, until, apart from those tried and discarded, there were, at the commencement of the European War in 1939, probably some score in active production in Europe and America. Most of these were embodied in low-power (·22 rim-fire) weapons built on the simple blow-back system, but numerous others, both sporting and military, handled ammunition of great power and range. As to the system of choice, a polemic was still raging between the advocates of the gas-operated and recoil-operated types, the end of which was not in sight.

In the United States the most popular (sporting) system appeared to be the Remington (long-recoil), though the Winchester (straight blow-back) had many advocates. The Standard (gas-operated) introduced about 1915, had met with little success, and was soon discontinued. The United States military had adopted the Garand (gas-operated) though the admirers of another military arm of short-recoil type (the Johnson) were very numerous.

Cooling Systems.—Semi-automatic weapons of shoulder type are designed not for such rapid fire but that their barrels may be cooled by normal radiation into the surrounding air. It is, however, not uncommon to surround at least the rear portions of these (with which the hand of the operator may come in contact) with perforated metal sleeves, or a wood casing, to avoid burnt fingers. The sub-machine type of self-loading arm is also conventionally air-cooled, either by surrounding the barrel with a succession of fins (for radiation) concentric with the bore, or with a perforated metal sleeve as above. In the heavier weapons (fired from bipods and tripods), air-cooling may be employed, or, if intended for long bursts of firing, the barrel may be encased in a jacket filled with water. This slowly evaporates when the piece becomes hot and for some time the obvious solution of passing the steam thus generated (and so often revealing the position of the piece) through a flexible hose into a receptacle of water, where it condensed and could be re-used, was overlooked. Measures for condensation were finally adopted, however, in connection with all water-cooled weapons. These may therefore be fired faster and longer than the air-cooled type, but possess the disadvantage of greater complexity and weight (conferred by the jacket and its water content), plus the fact that they require water for successful operation. Flash-hiders are devices screwed onto the muzzles of machine guns to conceal the brilliant spurt of flame which issues therefrom during night operations, readily revealing their locations to the enemy. A muzzle-brake is an attachment, somewhat similar in appearance to a flash-hider, which consists essentially of a tube, the axis of which is pierced for the passage of the projectile. Around this axis is disposed a series of discs or baffles against which the expanding powder gases impinge on emergence from the bore. Their impact against these tends to throw the whole gun mass forward, and so to neutralize, in some measure, its tendency to move rearward under the influence of recoil.

Rates of Fire.—Heavy machine guns commonly operate at cyclic rates of 500–700 shots per minute, as do "sub-machine guns" though bursts of more than a few shots at one time are seldom employed. Semi-automatic shoulder rifles (*e.g.*, the Garand) are capable, in the hands of the super-expert, of 100 aimed shots per minute, but a very much less rate is to be expected under service conditions.

Some of the old hand-operated machine guns (*e.g.*, the Gatling) were able to discharge up to 1,200 rounds a minute, but few operators could stand the punishment of manipulating them at such speeds. However, equal rates are today sought and attained in light machine guns for aircraft and anti-aircraft use. where the target is moving so rapidly that, once caught in the sights of the piece, it is of vital importance to unloose as many rounds as possible in its direction before it vanishes.

GUNA, a town and military station in Central India, in the state of Gwalior. After the Mutiny, it became the headquarters of the Central India Horse, whose commanding officer acts as ex officio assistant to the resident of Gwalior.

GUNCOTTON, the final product of the intensive treatment of cotton with a mixture of nitric and sulphuric acids, is a white inodorous, tasteless solid, retaining the structure of the original cotton (see EXPLOSIVES). It is insoluble in water, alcohol, ether and glacial acetic acid, but dissolves in acetone, alkyl acetates and nitrobenzene. When the strongest acids are employed in nitration, the amount of nitrogen present as nitrate in the nitrated cotton approximates to 14·14%. If cellulose, the essential constituent of the cotton fibre, be regarded as having the simplest empirical formula, $C_6H_{10}O_5$, then guncotton is trinitrocellulose (cellulose trinitrate), $C_6H_7O_2(O{\cdot}NO_2)_3$. With a doubled formula for cellulose, as $C_{12}H_{20}O_{10}$, guncotton becomes hexanitrocellulose, $C_{12}H_{14}O_4(O{\cdot}NO_2)_6$. Vieille, who stated (1882) that nitration of cellulose occurred in eight stages, assumed that cellulose was $C_{24}H_{40}O_{20}$. Of these nitration products only the undeca- and deca-nitrocelluloses, $C_{24}H_{29}O_9(O{\cdot}NO_2)_{11}$ and $C_{24}H_{30}O_{10}(O{\cdot}NO_2)_{10}$, have the characteristic property essential to guncotton of being insoluble in a mixture of ether and alcohol. This property distinguishes guncotton from the less nitrated celluloses which are referred to as collodion cotton or soluble nitrocellulose owing to the fact that they dissolve in the ether–alcohol solvent. Guncotton has superior explosive properties to those of collodion and has been extensively employed in conjunction with nitroglycerine for the production of cordite, the British service explosive. The blending of the two ingredients is brought about by acetone, but by the use of collodion with a larger proportion of nitroglycerine a cordite is obtainable without the employment of acetone.

During the mid-19th century, numerous attempts were made, particularly in Austria, to employ guncotton alone and unmodified as a military propellent, the necessity for tempering its explosive violence by colloiding processes being as yet unrecognized All ended in failure.

GUNDULIĆ, IVAN (1588–1638), known also as Giovanni Gondola, Croatian poet, was born at Ragusa on Jan. 8, 1588. His father, Franco Gundulić, once the Ragusan envoy to Constantinople and councillor of the republic, gave him an excellent education. He studied the "humanities" with the Jesuit, Father Muzzi, and philosophy with Father Ricasoli. After that he studied Roman law and jurisprudence in general. He was member of the Lower Council and once served as the chief magistrate of the republic. He died on Dec. 8, 1638. He made many translations from contemporary Italian poets into Serbian. He is known to have written 18 works, of which 11 were dramas, mostly translations from the Italian, but of these only three have been fully preserved, others having perished during the great earthquake and fire in 1667. His greatest and justly celebrated work is an epic, entitled Osman, in 20 cantos. It is the first political epic on the Eastern Question, glorifying the victory of the Poles over Turks and Tatars in the campaign of 1621, and encouraging a league of the Christian nations, under the guidance of Vladislaus, the king of Poland, for the purpose of driving away the Turks from Europe. The 14th and 15th cantos are lost. It is generally believed that the Ragusan Government suppressed them out of consideration for the Sultan, the protector of the republic, those two cantos having been violently anti-Turkish.

Osman was printed for the first time in Ragusa in 1826, the two missing cantos being replaced by songs written by Pietro Sorgo (or Snrkochevid). From this edition Francesco Appendini made an Italian translation (1827). The best editions are those of the South Slavonic Academy in Agram (1877) and the edition published in Semlin (1889) by Yovan Boshkovich. In the edition of 1844 (Agram) the last cantos, 14 and 15 were replaced by very fine compositions of the Serbo-Croatian poet, Maiuranif. The complete works of Gundulif have been published in Agram, 1847, by V. Babukić and by the South Slavonic Academy of Agram in 1889.

GUNG'L, JOSEF (1810–1889), Hungarian composer and conductor, was born on Dec. 1, 1810, at Zsámbék, Hungary. He was bandmaster in an Austrian regiment, but in 1843 established an orchestra in Berlin, with which he toured Europe and America. He died at Weimar on Jan. 31, 1889. Gung'l's dances number over 300, perhaps the most popular being the "Amoretten" and "Dreams on the Ocean" waltzes.

GUN-METAL. A kind of bronze; an alloy of copper and tin which gained its name from the use of bronze for ordnance. The cse of such an alloy for guns became obsolete with the manufacture of steel ordnance. Hard bronze for gun-metal was composed of 16 parts of copper to 2 of tin. The use of gun-metal is now confined to engine parts which need considerable strength but for which steel cannot be used.
