The tools generally used by the glazier are the diamond for cutting, laths or straight edges, tee square, measuring rule, glazing knife, hacking knife and hammer, duster, sash tool, two-foot rule and a glazier's cradle for carrying the glass. Glazier's materials are glass, putty, priming or paint, sprigs, wash-leather or india-rubber for door panels, size, black. The glass is supplied by the manufacturer and cut to the sizes required for the particular work to be executed. Putty is made of whiting and linseed oil, and is generally bought in iron kegs of ½ or 1 cwt.; the putty should always be kept covered over, and when found to be getting hard in the keg a little oil should be put on it to keep it soft. Priming is a thin coat of paint with a small amount of red lead in it. In the majority of cases after the sashes for the windows are fitted they are sent to the glazier's and primed and glazed and then returned to the job and hung in their proper positions. When priming sashes it is important that the rebates be thoroughly primed, else the putty will not adhere. All wood that is to be painted requires before being primed to have the knots coated with knotting. When the priming is dry, the glass is cut and fitted into its place; each pane should fit easily with about $\frac{1}{16}$ in. play all round. The glazier runs the putty round the rebates with his hands, and then beds the glass in it, pushing it down tight, and then further secures it by knocking in small nails, called glaziers' sprigs, on the rebate side. He then trims up the edges of the protruding putty and bevels off the putty on the rebate or outside of the sash with a putty knife. The sash is then ready for painting. Large squares and plate glass are usually inserted when the sashes are hung to avoid risks of breakage. For inside work the panes of glass are generally secured with beads (not with putty), and in the best work these beads are fixed with brass screws and caps to allow of easy removal without breaking the beads and damaging the paint, etc. In the case of glass in door panels where there is much vibration and slamming, the glass is bedded in wash-leather or india-rubber and secured with beads as before mentioned. The most common glass and that generally used is clear sheet in varying thicknesses, ranging in weight from 15 to 30 oz. per sq. ft., *i.e.,* from $\frac{1}{16}$ to $\frac{3}{16}$ in. thick.

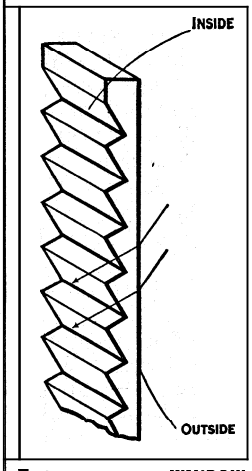

FIG. 1.—PRISM WINDOW GLASS, SHOWING INTERNAL ARRANGEMENT OF PRISMS GIVING MOST EFFICIENT DIFFUSION

Lead Lights.—Lead light glazing is the glazing of frames with small squares of glass, which are held together by strips of lead; these are secured by means of copper wire to iron saddle-bars, which are let into mortices in the wood frames or stone jambs. The strips of lead are soldered at the angles, the glass is placed between the strips, and the lead is flattened over the edges to secure it. Lead lights originated in days when glass could only be made in small pieces, and when, therefore, it was necessary to join the small pieces together to glaze a window of any size. In modern days the method is used only to obtain a picturesque effect. To look really well, the lead "cames" or strips should be $\frac{5}{8}$ in. wide. In modern lead lights the lead strips are often reinforced with steel to make saddle-bars unnecessary. In a patent "copper-lite" glazing, thin connecting strips of copper are substituted for lead by a method which produces a rigid panel of small squares.

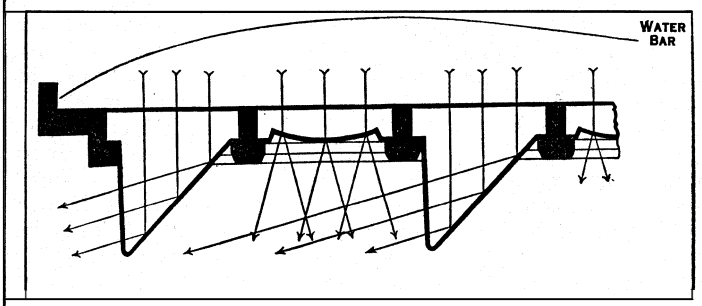

FIG. 2.— SECTION OF PRISM PAVEMENT USED TO LIGHT BASEMENTS
The thick glass prisms are set in square iron frames, and serve to diffuse the light as indicated by arrows

Wired Glass.—Wired rolled plate or wired cast plate, usually ¼ in. thick, has wire netting embedded in it to prevent the glass from falling in case of fire; its use is obligatory in London for all lantern- and sky-lights, and for screens and doors on the staircases of public and warehouse buildings, in accordance with the London Building Act. It is also used for the decks of ships and for port and cabin lights, as it is much stronger than plain glass, and if fractured is held together by the wire. Patent prismatic

rolled glass, or "refrax" (fig. 1), consists of an effective application of the well-known properties of the prism; it absorbs all the light that strikes the window opening, and diffuses it in the most efficient manner possible through the darkest parts of the room. It can be fixed in the ordinary way or placed over the existing glass. Pavement lights (fig. 2) and stallboard lights are constructed with iron frames in small squares and glazed with thick prismatic glass, and are used to light basements. They are placed on the pavement and under shop fronts in the portion called the stallboard, and are also inserted in iron coal plates.

Roof Glazing.-She glazing of roofs demands the use of metal sashes; wood is only used in inferior work. The fixing of pieces of glass to metal bars raises technical points which are met in many different ways, covered by a host of patents. Usually a bar of T section is employed, and the edges of the glass secured with strips of lead. It is not difficult to devise systems of this sort in which allowance is made for the effects of heat upon the metal, and for condensation. In one method the steel is entirely covered with lead to make painting unnecessary.

GLAZUNOV, ALEXANDER CONSTANTINOVICH (1865–1936), Russian composer. was born in St. Petersburg (Leningrad) Aug. 10, 1865, the son of a publisher and bookseller. He showed an early talent for music, and studied, on the advice of Balakirev, with Rimsky-Korsakov. At the age of sixteen he composed a symphony (afterwards elaborated and published as op. 5), but his opus 1 was a quartet in D, followed by a pianoforte suite on S-a-c-h-a, the diminutive of his name Alexander. In 1884, helped to some extent by Liszt, he began to make a name outside Russia. His first symphony was played that year at Weimar, and he appeared as a conductor at the Paris exhibition in 1889. In 1897 he conducted his fourth and fifth symphonies in London. In 1900 he became professor at the St. Petersburg conservatoire, and in 1906 director. Glazunov is a leading representative of the modern Russian school, and a master of orchestration though his tendency as compared with most contemporary Russian composers is towards classical form. Nevertheless his music is full of colour, and, on occasion, descriptive. His fine ballet, Raymonda, shows that he also shares to the full the Russian love for oriental splendour and movement. In short if his leanings are classical he is a classicist à la Russe, and in any event, a great master of his art and craft. Of his many compositions, the most famous are perhaps, among the orchestral works, the noble sixth symphony, in C minor (op. 58); among those for solo instruments, the theme and variations for pianoforte (op. 72), and the fine violin concerto in A minor (op. 73); and among those for the stage (very few in number) the ballet Raymonda (op. 57), already mentioned.

GLEBE, in ecclesiastical law the land devoted to the maintenance of the incumbent of a church. Burn (Ecclesiastical Law, *s.v.* "Glebe Lands") says: "Every church of common right is entitled to house and glebe, and the assigning of them at the first was of such absolute necessity that without them no church could be regularly consecrated. The house and glebe are both comprehended under the word manse, of which the rule of the canon law is, sancitum est ut *unicuique* ecclesiae *unus mansus* integer absque *ullo* servitio *tribuatur.*" In the technical language of English law the fee-simple of the glebe is said to be in abeyance, that is, it exists "only in the remembrance, expectation and intendment of the law." But the freehold is in the parson, although at common law he could alienate the same only with the consent of the bishop and patron. The disabling statutes of Elizabeth (Alienation by bishops, 1559, and Dilapidations, etc., 1571) made void all alienations by ecclesiastical persons, except leases for the term of 21 years or three lives. By an Act of 1842 (5 and 6 Vict. c. 27, Ecclesiastical Leases) glebe land and buildings may be let on lease for farming purposes for 14 years or on an improving lease for 20 years. But the parsonage house and ten acres of glebe situate most conveniently for occupation must not be leased. By the Ecclesiastical Leasing Acts of 1842 (5 and 6 Vict. c. 108) and 1858 glebe lands may be let on building leases for not more than 99 years and on mining leases for not more than 60 years. The Tithe Act 1842, the Glebe Lands Act 1888 and various other Acts make provision for the sale, purchase, exchange and gift of glebe lands. In Scots ecclesiastical law, the manse now signifies the minister's dwelling-house, the glebe being the land to which he is entitled in addition to his stipend. All parish ministers appear to be entitled to a glebe, except the ministers in royal burghs proper, who cannot claim a glebe unless there be a landowner's district annexed; and even in that case, when there are two ministers, it is only the first who has a claim.

See H. W. Cripps *Law of Church and Clergy* (5th ed. enlarged, 1869); Sir R. J. Phillimore *Ecclesiastical Law* of *England* (2nd ed. 1895); G. P. Leach *Tithe Acts* (6th ed. 1896); J. H. Dart *Vendors and Purchasers* (7th ed. 1905).

GLEDITSIA, a genus belonging to the pea or pulse family (Leguminosae), embraces 12 species of thorny shrubs and trees. These are widely distributed through the warmer regions of Asia and America. Fierce, branched thorns feature the twigs and even the bole of certain forms which, when planted in hedge rows, form an impenetrable barrier. Two trees of secondary importance, the honeylocust (G. triacanthos), and the waterlocust (G. *aquatica*) are indigenous to the eastern and southern United States.

GLEE, a musical term signifying, broadly speaking, a piece of concerted vocal music, generally unaccompanied, and for male voices, though exceptions are found to the last two restrictions. The number of voices ought not to be less than three. As regards musical form, the glee has affinities with the madrigal (*q.v.*) though the two forms are by no means identical. Thus, while the madrigal does not show a distinction of contrasted movements, this feature is absolutely necessary in the glee. The originator of the glee in its modern form mas Dr. Arne (1710–1778), and among other leading glee writers, all Englishmen, may be mentioned Webbe (1740–1816), Horsley (1774–1858), Callcott (1807–1882), and Stephens (1821–1892).

GLEICHEN, LORD EDWARD (Albert Edward Wilfred) (1863–1937), British major-general, was born on Jan. 1, 1863, eldest son of Admiral Prince Victor of Hohenlohe-Langenburg and Laura, daughter of Admiral Sir George Seymour. He was educated at Charterhouse, and passed through Sandhurst into the Grenadier Guards in 1881. He saw service in Egypt (1884–85). He served in the South African War, where he won the D.S.O. Later he was military attaché at Berlin and at Washington. During World War I he commanded the 37th Division (1915–16), and then returned to the intelligence department of the War Office. He retired with the rank of major-general in 1919. He was the author of several books on the various missions in which he was employed. He died in London, Dec. 14, 1937.

GLEICHEN, two groups of castles in Germany, thus named from their resemblance to each other (Ger. gleich=like). The first is a group of three, each situated on a hill in Thuringia between Gotha and Erfurt. One of these called Gleichen, the Wanderslebener Gleiche (1,221 ft. above the sea), was besieged unsuccessfully by the emperor Henry IV. in 1088. After belonging to the elector of Mainz the castle became the property of Prussia in 1803.

The second castle is called Miihlburg (1,309 ft. above the sea). This existed as early as 704 and was besieged by Henry IV. in 1087. It came into the hands of Prussia in 1803. The third castle, Wachsenburg (1,358 ft.), is still inhabited and contains a collection of weapons and pictures collected by the former duke of Saxe-Coburg-Gotha, whose family obtained possession of it in 1368. It was built about 935 (see Beyer, Die drei *Gleichen,* Erfurt, 1898). The other group consists of two castles, Neuen-Gleichen and Alten-Gleichen. Both are in ruins and crown two hills about 2 m. S.E. from Gottingen.

GLEIG, GEORGE ROBERT (1796–1888), British divine and author, son of George Gleig, bishop of Brechin (1753–1840), was born at Stirling, and educated at Glasgow University and Balliol College, Oxford. He served with distinction in the Peninsular War (1813–14), and in the American War, in which he was thrice wounded. Resuming his studies at Oxford, he was ordained priest in 1820, was chaplain-general of the forces (1844–75) and inspector-general of military schools (1846–57). From 1848 till his death he was prebend of Willesden in St. Paul's cathedral During the last sixty years of his life he was a prolific, if not

very scientific, historical writer. Those of his works which deal with contemporary campaigns have historical value. They include: *Life of Sir Thomas Munro* (3 vols., 1830); *The Leipsic Campaign* (1831); *Story of the Battle of Waterloo* (1847); *Sale's Brigade in Afghanistan* (1847); biographies of Lord Clive (1848), the duke of Wellington (1862), and Warren Hastings (1848).

GLEIM, JOHANN WILHELM LUDWIG (1719–1803), German poet, was born on April 2, 1719 at Ermsleben, near Halberstadt. He studied law at Halle, where he founded the so-called *Anacreontik,* with other young poets. He was successively secretary to Prince William of Brandenburg-Schwedt at Berlin, to Prince Leopold of Dessau, and secretary (1747), of the cathedral chapter at Halberstadt. "Father Gleim" was the title accorded to him throughout all literary Germany on account of his generosity to young poets. He looked with some suspicion on their revolutionary tendencies, but helped them none the less. Gleim himself wrote feeble imitations of Anacreon, Horace and the minnesingers, a dull didactic poem entitled *Halladat oder das rote Buch* (1774), and collections of fables and romances. Of higher merit are his *Preussische Kriegslieder von einem Grenadier* (1758), inspired by the campaigns of Frederick II. Gleim died at Halberstadt on Feb. 18, 1803.

Gleim's *Sämtliche* Werke appeared in 7 vols. in the years 1811–13.

GLEIWITZ, a town in the Prussian province of Silesia, on the Klodnitz, and the railway between Oppeln and Cracow, 40 mi. S.E. of the former town. Pop. (1875) 14,156; (1939) 117,668. Gleiwitz is the centre of the mining industry of Upper Silesia. There are also foundries with which are connected machine manufactories and boilerworks, and manufactories of wire, chemicals, glass, cement and paper. The town is rather more than a mile north of the old frontier between Germany and Poland.

GLENALMOND, a glen of Perthshire, Scotland, south-east of Loch Tay. It comprises the upper two-thirds of the course of the Almond, or a distance of 20 m. For the greater part it follows a direction east by south, but at Newton Bridge it inclines sharply to the south-east for 3 m., and narrows to such a degree that this portion is known as the Small (or Sma') Glen. At the end of this pass the glen expands and runs eastwards as far as the well-known public school of Trinity college, where it may be considered to terminate. The most interesting spot in the glen is that traditionally known as the grave of Ossian.

GLENCAIRN, EARLS OF. The 1st earl of Glencairn in the Scottish peerage was ALEXANDER CUNNINGHAM (d. 1488), a son of Sir Robert Cunningham of Kilmaurs in Ayrshire. Made a lord of the Scottish parliament as Lord Kilmaurs not later than 1469, Cunningham was created earl of Glencairn in 1488; and a few weeks later he was killed at the battle of Sauchieburn whilst fighting for King James III. against his rebellious son, afterwards James IV. His son and successor, ROBERT (d. *c.* 1490), was deprived of his earldom by James IV., but before 1505 this had been revived in favour of Robert's son, CUTHBERT (d. *c.* 1540), who became 3rd earl of Glencairn, and whose son WILLIAM (*c.* 1490–1547) was the 4th earl. This noble, an early adherent of the Reformation, was during his public life frequently in the pay and service of England.

William's son, ALEXANDER, the 5th earl (d. 1574), was a more pronounced reformer than his father, whose English sympathies he shared, and was among the intimate friends of John Knox. He anticipated Lord James Stewart, afterwards the regent Murray, in taking up arms against the regent, Mary of Guise, in 1558. When in Aug. 1561 Mary queen of Scots returned to Scotland, Glencairn was made a member of her council; he changed sides more than once, and was found fighting against Mary at Carberry Hill and at Langside. The earl, who was a violent iconoclast, died on Nov. 23, 1574. His short satirical poem against the Grey Friars is printed by Knox in his *History of the Reformation.*

JAMES, the 7th earl (d. c. 1622), took part in the seizure of James VI, called the raid of Ruthven in 1582. WILLIAM, the 9th earl (*c.* 1610–64), was a somewhat lukewarm Royalist during the Civil War. In March 1653 Charles II. gave him temporary command of the Royalist forces in Scotland, and the insurrection of this year is generally known as Glencairn's rising. After its failure he was betrayed and imprisoned; when Charles II. was restored he became lord chancellor of Scotland. He died at Belton, Haddingtonshire on May 30, 1664.

GLENCOE, a glen in Scotland, situated in the north of Argyllshire. Beginning at the north-eastern base of Buchaille Etive, it takes a gentle north-westerly trend for 10 m. to its mouth on Loch Leven, a salt-water arm of Loch Linnhe. On both sides it is shut in by wild and precipitous mountains and its bed is swept by the Coe—Ossian's "dark Cons,"-which rises in the hills at its eastern end. About half-way down the glen the stream forms the tiny Loch Triochatan. Towards Invercoe the landscape acquires a softer beauty. The late Lord Strathcona, in 1894, purchased the heritage of the Macdonalds of Glencoe. The principal mountains on the south side are the various peaks of Buachaille Etive, Stob Dearg (3,345 ft.), Bidean nam Bian and Meall Mor, and on the northern side the Pap of Glencoe, Sgor nam Fiannaidh and Meall Dearg. Points of interest are the Devil's Staircase, a steep, boulder-strewn "cut" across the hills to Fort William; the Study; the cave of Ossian, where tradition says that he was born, and the Iona cross erected in 1883 by a Macdonald in memory of his clansmen who perished in the massacre of 1692. About 1 m. beyond the head of the glen is Kingshouse inn, a relic of the old coaching days. Now the Glencoe excursion is usually made from Oban. One mile to the west of the Glen lies the village of BALLACHULISH, celebrated for slate quarries, worked since 1760. Ballachulish is a station on the L.M.S.R. The pier and ferry are some 2 m. W. of the village.

GLEN COVE, a city of Nassau county, New York, on the north shore of Long Island, 22 mi. N.E. of the Brooklyn borough hall. It is served by the Long Island railroad. The population in 1940 was 12,415. Glen Cove was settled in 1668; chartered as a city in 1918; and has a commission form of government.

GLENDALE, a rapidly growing city of Los Angeles county, Calif., U.S.A., 6 mi. from the heart of Los Angeles, at the southern extremity of the San Fernando valley. It is served by the Pacific Electric, the Southern Pacific and the Union Pacific railways. The population was 2,746 in 1910; 13,536 in 1920; 62,736 in 1930; and 82,582 in 1940 by the federal census. The elevation of the city varies from 400 to 2,000 ft. It is a popular residential suburb and is also developing rapidly as an industrial centre. There are 209 industries, with 5,883 workers earning $11,362,700 annually and with an aggregate factory output in 1939 valued at $117,740,000. Glendale was incorporated in 1906.

GLENDALOUGH, VALE OF, 8½ mi. N.N.W. of Rathdrum, Co. Wicklow, Ireland, noted for its ecclesiastical ruins. Here, early in the 6th century, Kevin lived as a hermit for four years and later founded a monastery which, despite many Danish raids, remained for some centuries an important ecclesiastical and educational centre. There was a succession of bishops until 1214 when the see was united to that of Dublin. In close proximity are a round tower, 110 ft. high and 52 in circumference, St. Kevin's kitchen or church which measures 25 ft. by 15, with a high pitched roof and round belfry, the cathedral, about 73 ft. in total length by 51 in width, a Lady chapel, chiefly remarkable for its doorway of wrought granite, a priest's house (restored), and slight remains of St. Chiaran's church. Here is also St. Kevin's cross, a granite monolith never completed; and the enclosure is entered by a fine though dilapidated gateway. Other remains are Trinity or the Ivy Church, towards Laragh, and St. Saviour's monastery, while on the upper lough are Reefert Church, the burial-place of the O'Toole family, and Teampull-na-skellig, the church of the rock. St. Kevin's bed is a cave above the lough, to which attaches the legend of St. Kevin's hermitage.

GLENDOWER, OWEN [OWAIN GLYN DWR] (1359?–1415), the last independent prince of Wales, more correctly described as Owain ab Gruffydd. lord of Glyndyvrdwy in Merioneth, was a man of good family, with two great houses, Sycharth and Glyndyvrdwy in the north, besides smaller estates in south Wales. His father was called Gruffydd Vychan, and his mother Helen; on both sides he had pretensions to be descended from the old Welsh princes. Owen was probably born about 1359, studied law at Westminster, was squire to the earl of Arundel, and a witness

for Grosvenor in the famous Scrope and Grosvenor lawsuit in 1386. Afterwards he was in the service of Henry of Bolingbroke, the future king. Welsh sympathies were, however, on the side of Richard II., and combined with a personal quarrel to make Owen the leader of a national revolt.

The lords of Glyndyvrdwy had an ancient feud with their English neighbours, the Greys of Ruthin. Reginald Grey neglected to summon Owen, as was his duty, for the Scottish expedition of 1400, and then charged him with treason for failing to appear. Owen thereupon took up arms, and when Henry IV. returned from Scotland in September he found north Wales ablaze. A hurried campaign under the king's personal command was ineffectual. In the spring of 1401 Owen was raiding in south Wales. A second campaign by the king in the autumn was defeated, through bad weather and the Fabian tactics of the Welsh. Owen had already been intriguing with Henry Percy (Hotspur), who during 1402 held command in north Wales, and with Percy's brother-in law, Sir Edmund Mortimer. During the winter sf 1401–1402 he treated with the rebel Irish, the Scots and the French. In the spring he attacked Ruthin, and took Grey prisoner. in the summer he defeated the men of Hereford under Edmund Mortimer at Pilleth, near Brynglas, in Radnorshire. Mortimer was taken prisoner and treated with such friendliness as to make the English doubt his loyalty; within a few months he married Owen's daughter. In the autumn the English king was for the third time driven "bootless home and weather-beaten back." In May 1403 Henry of Monmouth was allowed to sack Sycharth and Glyndyvrdwy unopposed. Owen had a greater plot in hand. The Percies were to rise in arms, and meeting Owen at Shrewsbury, overwhelm the prince before help could arrive. But Owen was defeated near Carmarthen on July 12, and Percy was crushed at Shrewsbury ten days later. But the Welsh revolt was still formidable. Owen styled himself openly prince of Wales, established a regular government, and called a parliament at Machynlleth. As a result of a formal alliance the French sent troops to his aid, and in the course of 1404 the great castles of Harlech and Aberystwith fell into his hands.

In the spring of 1405 the tide turned. Prince Henry defeated the Welsh at Grosmont in March, and twice again in May. Scrope's rebellion in the North prevented the English from following up their success. The earl of Northumberland took refuge in Wales, and the tripartite alliance of Owen with Percy and Mortimer (transferred by Shakespeare to an earlier occasion) threatened a renewal of danger. But the English under Prince Henry gained ground steadily, and the recovery of Aberystwith, after a long siege (1408), marked the end of serious warfare. In February 1409 Harlech was recaptured, and Owen's wife, daughter and grandchildren were taken prisoners. According to Adam of Usk Owen died in 1415. Welsh legend represents him as spending a peaceful old age with his sons-in-law at Ewyas and Monington in Herefordshire, till his death and burial at the latter place. The dream of an independent and united Wales was never nearer realization than under Owen's leadership. The disturbed state of England helped him, but he was indeed a remarkable personality, and has become a national hero. Sentiment and tradition have magnified his achievements, and confused his career with tales of portents and magical powers. Owen left many bastard children; his legitimate representative in 1433 was his daughter Alice, wife of Sir John Scudamore of Ewyas.

The facts of Owen's life must be pieced together from scattered references in contemporary chronicles and documents; perhaps the most important are Adam of Usk's *Chronicle* and Ellis's *Original Letters*. On the Welsh side something is given by the bards Iolo Goch and Lewis Glyn Cothi. For modern accounts consult J. H. Wylie's *History of England under Henry IV.* (4 vols., 1884–1898); A. C. Bradley, *Owen Glyndwr* (1904); and Professor Tout's article in the *Dictionary of National Biography*. For further references *see* the Bibliography (1915) compiled by D. Rhys Phillips.

GLENELG, CHARLES GRANT, BARON (1778–1866), eldest son of Charles Grant (*q.v.*), chairman of the directors of the East India Company, was born in India on Oct. 26, 1778, and was educated at Magdalene college, Cambridge, of which he became a fellow in 1802. Called to the bar in 1807, he entered parliament for the Inverness burghs in 1807. He was a lord of the treasury (1813-19), secretary to the lord lieutenant of Ireland (1819), vice-president of the board of trade (1823–27), and president in 1828. Joining the Whigs, he was president of the board of control under Earl Grey and Lord Melbourne from Nov. 1830 to Nov. 1834. At the board of control Grant was primarily responsible for the act of 1833, which altered the constitution of the Government of India. In April 1835 he became secretary for war and the colonies, and was created Baron Glenelg. His differences with Sir Benjamin d'Urban (*q.v.*), governor of Cape Colony, were serious; but more so were those with King William IV. and others over the administration of Canada. He was still secretary when the Canadian rebellion broke out in 1837; his wavering and feeble policy was fiercely attacked in parliament; he became involved in disputes with the earl of Durham, and the movement for his supersession found supporters even among his colleagues in the cabinet. In Feb. 1839 he resigned. Grant has been called "the last of the Canningites." He died at Cannes on April 23, 1866, when his title became extinct.

GLENELG, a municipal town and watering place of Adelaide county, South Australia, 63 m. by raii S.S.W. of the city of Adelaide. It is connected with Adelaide by two lines of railway. In the vicinity is the "Old Gum Tree" under which South Australia was proclaimed British territory by Governor Hindmarsh in 1836.

GLENGARRIFF or **GLENGARIFF,** a tourist resort in Co. Cork, Eire, on an inlet of Bantry bay, 11 mi. from Bantry. A mountain road from Macroom, and a branch line from the north, facilitate tourist traffic. The harbour has been described by Thackeray.

GLEN GREY, a division of the Cape province south of the Stormberg, adjoining on the east the Transkeian Territories. Population c. 65,800. Chief town, Lady Frere, 32 mi. N.E. of Queenstown. The district is well watered and fertile, and large quantities of cereals are grown. Over 96% of the inhabitants are of the Zulu-Xosa (Kafir) race, and a considerable part of the district was settled during the Kafir wars of Cape Colony by Tembu (Tambookies) who were granted a location by the colonial Government in recognition of their loyalty to the British. Act No. 25 of 1894 of the Cape parliament, passed at the instance of Cecil Rhodes, which laid down the basis upon which is effected the change of land tenure by natives from communal to individual holdings, and also dealt with native local self-government and the labour question, applied in the first instance to this division, and is known as the Glen Grey Act (see CAPE COLONY: History). The provisions of the Act respecting individual land tenure and local self-government were in 1898 applied, with certain modifications, to the Transkeian Territories. The division is named after Sir George Grey, governor of Cape Colony 1854–61.

GLEN RIDGE, a residential borough of Essex county, New Jersey, U.S.A., 6 mi. N. of Newark; served by the Erie and the Lackawanna railways. Population in 1930 was 7,365; 1940, 7,331.

GLENS FALLS, a city of Warren county, New York, U.S.A., on the Hudson river, 52 mi. above Albany. It is on federal highways 4 and 9; has an airport; and is served by the Delaware and Hudson railway. The population was 16,638 in 1920 (89% native white) and was 18,836 in 1940 by the federal census. The principal residence streets are arched with superb elms. It is a busy manufacturing city, making especially shirts and collars, cement, pulp and paper, dresses and blouses, wallpaper and pigments. The retail sales in 1940 were $15,568,000.

There are valuable quarries of black marble and limestone in the vicinity. On the river bank, under a beautiful concrete bridge, is the entrance to the cave which figures in J. Fenimore Cooper's The Last of the *Mohicans*. Glens Falls was settled in 1763, by a group of Quakers under the leadership of Abraham Wing. At first it was called Wing's Falls, but in 1788 the name was changed to satisfy a debt of honour (so the story goes) owed by Wing to Colonel Johannes Glen of Schenectady. During the revolution the village suffered from the armies of Burgoyne, Schuyler and Gates, and was burned to the ground in 1780, but because of the valuable water power and advantageous location it was soon rebuilt. It was chartered as a city in 1908.

GLENTILT, a glen in the extreme north of Perthshire, Scotland, following a south-westerly direction excepting for the last 4 m., when it runs due south to Blair Atholl. It is watered by the Tilt. Carn nan Gabhar (3,671 ft.) is the highest hill in the Beinn-a-Ghlo range which dominates the glen from the east side. Marble of good quality is occasionally quarried.

GLIDING is a generic term for the art of flying a heavier than air craft similar to an aeroplane but not provided with an engine. It includes in its scope both gliding proper and soaring. In a gliding flight, the apparatus loses altitude continually throughout its course, never rising above its starting point. In soaring flight, however, the machine is carried aloft by the rising air currents and is capable of completing manoeuvres high above the point of departure.

The history of American gliding is mainly a record of the scientific achievement of the great pioneers, Chanute, Montgomery, Wilbur and Orville Wright. In the first half of the 19th century the English pioneers, Cayley, Henson and Stringfellow, made valuable theoretical investigations and model flight experiments. It is this group of workers who may be said to have "invented" the aeroplane. But their invention would never have been reduced to practice without the subsequent efforts of the early exponents of gliding.

Captain Le Bris, a French sailor, carried out the first significant glider work in the '70s, building gliders with wings shaped like those of an albatross and with a boat-shaped body. Le Bris made many remarkable glides, but he succeeded more by instinct than by scientific skill, and did not make any substantial contribution to the science of flight. The most famous exponent of gliding was undoubtedly Otto Lilienthal, who with his brother Gustav began to make experiments in 1867. Lilienthal realized that data were needed for success and accumulated much information from a study of the flight of birds. He was perhaps the first man to understand the superiority of the cambered or curved surface over the flat plate. In 1891 he built his first man-carrying glider, with a framework of peeled willow rods covered with tough cotton fabric. He attached himself to the glider by thrusting his arms through padded rubber tubes and holding on to a cross bar. His body hung in the air during flight and he attempted to control and stabilize the plane by moving his body. Percy Pilcher of England added a horizontal plane to the glider: his sole contribution. Both Lilienthal and Pilcher lost their lives in their experiments.

In 1896, at the age of 64, Octave Chanute began to make gliding flights in America. He built a five-deck glider and followed this by a triplane and finally by a biplane. This was the famous Chanute biplane, the wings being held together by vertical posts and diagonal wires forming a Pratt truss. This has been used frequently by biplane designers. Chanute discarded Lilienthal's method of securing control and substituted a rudder and articulated wings. The wings could be swerved fore and 'aft to provide both longitudinal and lateral control although the pilot's body still hung beneath the glider. Chanute's biplane weighed 23 pounds and, with the pilot, 178 pounds. So stable did he make his gliders that his 2,000 flights were without a single accident.

John J. Montgomery, was the first American to use gliding as a means of aerodynamic study. Between 1883 and 1894 he was almost continuously engaged in fruitful experimentation. His first glider was a tandem wing affair united by a framework to which a seat was suspended, and provided with a horizontal tail which could be elevated or depressed by pulleys. The wings were cambered or curved like those of a gull. Lateral balance was achieved by motion in the seat. In his first flight, he jumped into the air without a previous run and found himself launched upon an 8 to 12 mile an hour wind, executing a 600-foot glide. This experiment led him to build a second glider using flat surfaces (probably to increase stability). An attempt at lateral stability was made by placing a diagonal hinge in the wing so that a portion of it might fold back against the restraining action of a spring to relieve undue pressure under the action of a gust. The control was improved but the lifting power was poor because of the flat surfaces. In a third glider, the wings were made like those of a soaring vulture. The machine was perfectly controllable but the lift was inferior even to the second machine. In 1903 Montgomery undertook experiments to determine the proper form of wing surface. He stretched a cable between two mountains and liberated various models. In 1904, at San Juan he extended his experiments on this principle with a man-carrying glider, and made observations on the effects of wind currents.

Montgomery's last achievement was to build his largest glider weighing 45 pounds and patterned after his first machine. This was launched on April 29, 1905 from a hot air balloon at an altitude of 4000 feet. The flight lasted 20 minutes during which the pilot, Daniel Maloney, an experienced parachute jumper, performed many complex manoeuvres.

The next great American exponents of gliding were the Wright brothers. Their first plan was to construct a glider which could be used as a man-carrying kite in a steady breeze. For their flights they selected the Kill Devil sand hills near Kitty Hawk, N. C. which provided strong steady breezes. Through some errors in calculation, their man-carrying glider, tried out in 1900, proved a failure as a kite and they turned to gliding. The glider of 1900, though a biplane, differed in many respects from the Chanute glider. The pilot lay prone on the upper wing to reduce resistance, the vertical rudder was discarded and the horizontal rudder was placed forward. By warping the wings, they secured lateral control.

The Wrights' most successful glider was built in 1902. As a result of previous experiments, they now decided to use a vertical rudder, subsequently made adjustable. In September and October 1902, nearly 1000 flights were made, several of which covered distances of over 600 feet. The great glider achievement of the Wright brothers was in securing complete control by combining the horizontal rudder, with an adjustable vertical rudder, and warping the wings. It was this perfect control that made their gliding so safe, and which enabled them to proceed to the building of the first successful power plane. While the Wrights from 1903 onwards devoted the greater part of their energies to power-driven craft, they never lost their interest in gliding.

With more powerful controls, and the horizontal rudder in the rear, many long glides were made by the Wright brothers, the longest being of a duration of 9 minutes 45 seconds. This remained the record until Hentzen, a German, in August 1922, remained soaring aloft in the Rhine valley for 3 hours and 6 minutes.

From the time of the Wrights' endurance record in 1911 until Glenn Curtiss, whose interest was awakened by the German flights in 1922, began glider construction, no experiments were carried on in the United States. Curtiss built a flying boat hull with the tail surfaces carried on outriggers. The glider weighed 150 pounds and was launched by being towed by a motor boat. It performed admirably.

In Germany gliding reached a high state of popularity after the World War for two reasons. First, the Versailles Treaty prevented the construction of large aeroplanes. Second, the meteorological conditions in the Rhine valley, providing continuous upward currents of air, were most favourable to soaring flight.

In the United States, on the other hand, full sway was given to the construction of powered craft, and meteorologically suitable localities such as Kitty Hawk were found to be difficult of access from large centres of population. However, in the past decade, many gliding societies have sprung up whose members have offered the world keen competition.

The remarkable flights of 1922 in Germany were achieved by a radical departure from the past. That year witnessed the advent of the first true sailplane. The sailplane, unlike the heavier, cruder machines hitherto used, is a highly refined glider as light and as perfect aerodynamically as possible.

Technically, it is a glider which has a sinking speed of 0.8 meter per second which is equivalent to saying that it is a machine that will soar in a wind that rises vertically upwards at a speed of $1\frac{3}{4}$ miles per hour. The first machine of this type was the German "Vampyr."

Up to 1922 soaring was of a strictly topographical nature with the utilization of currents deflected upwards by local hills. Such

flights were hazardous and limited by the extent of the range of hills. An increased knowledge of meteorology gave rise to several methods of soaring by which long distance flights could be made. Of these, thermal soaring and thunderstorm flight are most important. Thermal currents are formed by heat rising from the ground under certain conditions, as those existing on a hot summer afternoon, On reaching the cooler upper atmosphere, the moisture in the thermal current sometimes condenses, forming a cumulus cloud. A cumulus cloud therefore indicates thermal currents and soaring flights can be made by circling in this current. Thunderstorm flight is accomplished by keeping near the boundary between two masses of air, one warm and the other cool, which is present during such a meteorological disturbance. Since 1922, constant refinement in design and improved methods of flight have resulted in continuously better performance. Until the early thirties, all gliding records mere held by Germany and Austria with little or no competition from other countries. Within the past ten years. however, England, Russia and the United States have taken an active interest in gliding with the result that records have been flying back and forth between countries with amazing rapidity.

In 1926, Kegel of Germany astonished the aeronautical world by flying 34mi. in a thunderstorm. By 1940, such a flight would be considered hardly worth mention in the local papers of such soaring centres as Elmira, New York. For in that year the world's airline distance record, held by a Russian woman pilot, O. Klepikova, stood at 465.53 miles. The record for a more difficulttype of feat, that of flying to a pre-announced goal was held by another Russian, P. Savtzov, and stood at 267.96 miles. German pilots held the three other 1940 records considered most significant. Bernard Flinsch had flown 189.91 mi. then returned to his point of launching. Erwin Ziller had flown to an altitude of 22,434 ft. above his starting point. Kurt Schmidt had remained aloft 36 hours and 3j minutes. National records for the United States in 1940 had reached creditable levels. Woodbridge P. Brown held the airline distance record of 263 miles. Lieutenant Robert M. Stanley had soared to 17,264ft. above the soaring ridge at Elmira. A flight of 24 hours and 14 minutes by Lieutenant William Cocke, Jr., although established in 1931, still stood as the longest by an American citizen.

Modern soaring planes, flown by skilled pilots using modern technique, are capable of really amazing performances. They can be put through most of the acrobatic manoeuvres practised by pilots of powered planes. In 1933, the American Jack O'Meara made 86 consecutive loops, only to have his record broken by the Russian Simonov who performed 300 loops in 193j. Sailplanes have been flown with at least six persons aboard. The world's record flight with two persons aboard has been extended to 385.1 miles. As mentioned above, very long distances have been flown to pre-announced destinations and even to pre-announced points followed by a return to the starting point.

In Aug. 1934 Jack O'Meara, one of America's most outstanding glider pilots, flew a three-glider train from New York city. Three gliders were fastened, one behind the other, to a Waco J5 aeroplane, by means of light piano wire cables. The plane started on its run, and when it had reached a speed of 15 m.p.h. the gliders took off. After a 1,000-ft. run the entire train, Waco and all, were in the air. At Philadelphia Prof. R. E. Franklin, who was piloting the rear glider, unhooked and landed. At Baltimore Stanley Smith, who was then in the rear glider, unhooked and landed. At Washington, Jack O'Meara, the sponsor of the demonstration, unhooked the last glider and landed. Since gliders retard an aeroplane only 3 or 4 m.p.h. each and since they generally ride with a slack tow wire anyhow, O'Meara predicted the day when roaring transport planes mill tow whole trains of gliders.

On May 10, 1940 the German army attacked Belgium, The Netherlands and Luxembourg. In order to take certain bridges and the Albert Canal in Belgium, the Germans used glider trains, each consisting of eight gliders towed by an old transport plane. These trains were towed over their objectives, where the gliders cut loose one after the other. Each glider contained six fully armed German soldiers, an adequate supply of hand-grenades to be thrown at defenders before landing, and tommy-guns for use both before and after landing. Thus each old transport plane, capable of carrying probably ten or twelve soldiers, towed a load oi 48 fully armed soldiers, depositing them in groups of six. Gliders were also used in the taking of the Belgian forts, particularly the Eben Emael forts, which resisted for approximately a week. The conquest of the island of Crete by the Germans in May 1941, was almost entirely by an air invasion in which gliders played a very prominent part as troop transports.

Barringer, *Flight Without Power* (1940); Soaring Society of America, Inc., *Soaring,* official periodical (1937–1940). (A. KL.; X.)

How to Glide.—Modern soaring planes owe their high performance characteristics to (1) a high aspect ratio of the wing *(see* ASPECT RATIO and AEROPLANE. Wing lengths are generally from 30 to 50 feet, chord depths from four to five feet), (2) an extremely '(clean" aerodynamic shaping of the streamlined fuselage and other parts, and, (3) a very light although adequately rigid construction, generally of plywood and fabric but latterly in many instances of duraluminum metal. The controls of gliders and sailplanes are similar in action to those of aeroplanes. Instruments most commonly carried are the air speed indicator, the bank-and-turn indicator, the altimeter and some type of sensitive instrument to indicate rate of climb or descent. Extensive gliding and soaring activities were at first limited to regions in which air men could find reasonably steady winds blowing up hillside slopes. For best results slopes were sought rising from plains or from broad valley floors to a hill-top from 100 to 300 feet high. An ideal slope was one which rose from the plain at first slowly, then more abruptly as it neared a rounded crest. From such a hill-top, gliders were launched most commonly by the so-called "shock-cord" method. A hook attached to the nose of the glider engaged a ring to which was fastened two long lengths of rubber-stranded rope similar to that used in the shock-absorbing units of aeroplane landing gears. One or more persons mould hold the glider stationary by grasping a short line fixed to its fuselage. Usually at least two other persons would stretch out each rubber-stranded rope until it reached its maximum stretch. Then at a shouted signal, those holding the glider released it. Those stretching the ropes ran forward. The glider sprang forward and rose into the air, dropping the ring from its nose hook as it did so. From this point the subsequent flight varied with the nature of the aircraft involved. If it was of crude design its pilot could proceed out over the valley only in ever-descending flight. If of more advanced design, the pilot frequently was able to climb in the winds blowing up the face of the slope and remain for substantial periods in flight "crabbing" back and forth along the crest of the ridge.

Such were the main elements of the launching technique developed in Germany in the first decade after the World War of 1914–18. Young Americans were quick to substitute, first the "auto-tow" then the "winch-tow" technique. In the first a rope or cable 500 feet or more in length is connected between the glider and the rear of an automobile. As the automobile moves across the field the glider rises much as a kite rises until several hundred feet in the air. At this point a hook and ring mechanism attached to the nose of the glider disengages the rope and the pilot is free to practise turns or other evolutions in a glide back to the field (or out over the valley if the launching takes place on a hill-top, but this is obviously no longer necessary). High-speed winches driven by automobile engine power have come into use as substitutes for the moving automobile. A final launching technique, used only by the most experienced pilots, is the aeroplane tow in which the sailplane is actually towed into the air behind a power-driven aircraft to be cut loose at any desired altitude.

Once launched, the pilot must if he wishes to soar, immediately search out some current of air which is actually rising in relation to the surface of the earth beneath him. Experienced pilots find such currents (1) along hillside slopes, (2) beneath and within cumulus clouds, and, (3) along "fronts" between warm and cold air masses. Long distance flights are frequently achieved through the use of all three types of currents. Altitude records are almost invariably set on flights within thunderhead cumuli. "Ridge soaring" is of limited use except in attempts merely to remain in the air for long durations. (D. SE.)

GLINKA, FEDOR NIKOLAYEVICH (1788–1880), Russian poet and author, a cousin of the composer, was born at Smolensk in 1788. He was educated for the army, and served in the Austrian campaign of 1805. He then retired to his estate, but served again in the campaigns of 1812–14. For some time he commanded a regiment under Count Miloradovich, military governor of St. Petersburg. Under suspicion of revolutionary tendencies he was, in 1820, banished to Petrozavodsk, but was after a time allowed to return to St. Petersburg. Glinka was an independent and original writer, whose work was never fully appreciated during his life-time. He is one of the few Russian poets who have chosen principally biblical subjects; he was something of a mystic, and his verse has been compared with that of Vaughan and Herbert.

His works include martial songs, the descriptive poem *Kareliya* (*Carelia, or the Captivity of Martha Joanovna,* 1830), and a metrical paraphrase of the book of Job. Some translations are published in C. T. Wilson's *Russian Lyrics* (1887).

GLINKA, MICHAEL IVANOVICH (1803–1857), Russian composer, was born at Novospassky, Smolensk, on June 2, 1803. The folk-music of his native province made a deep impression on the child, and he himself said that perhaps the songs he heard in his early days suggested the idea to him of making use of the national music in his compositions. At 13 he was sent to an aristocratic school at St. Petersburg, the Blagorodrey Pension, where he studied music under Carl Maier and John Field, the Irish composer and pianist, who had settled in Russia. In his 17th year he had already begun to compose romances and songs. From 1824 to 1828 he held a post in the civil service in St. Petersburg, and mixed in the literary and scientific society of the capital, where he had the reputation of being a good mathematician and something of a scientist. His thorough musical training began in 1830, when he spent three years in Italy studying the works of and modern Italian masters. His thorough knowledge of the requirements of the voice may be connected with this course of study, but the study of Italian music did not wean him from his early passion for Russian national melody. His training as a composer was finished under the contrapuntist Dehn, with whom he stayed for several months at Berlin. In 1833 he returned to Russia, and devoted himself to operatic composition. On Sept. 27 (Oct. 9, N.S.), 1836, his opera *A Life for the Tsar* (the libretto by Baron de Rosen) was produced at St. Petersburg. This was the turning-point in Glinka's life, and in Russian music, for the production marks the beginning of a Russian school of national music. The story is taken from the invasion of Russia by the Poles early in the 17th century, and the hero, Ivan Susanin, is a peasant. Glinka has wedded this patriotic theme to inspiring music. His melodies, moreover, show distinct affinity to the popular songs of the Russians, so that the term "national" may justly be applied to them. His appointment as imperial chapelmaster and conductor of the opera of St. Petersburg followed. His second opera *Russlan and Ludmila,* founded on Pushkin's poem, did not appear till 1842. Musically it was a great advance on *A Life jor the Tsar,* but it had less popular success. Just as in his first opera he had contrasted Russian and Polish music, so in the second, Oriental themes were set over against Russian melodies. An overture and four entre-actes to Kukolnik's drama *Prince Kholmsky* followed. In 1844 Glinka went to Paris, where he made the acquaintance of Berlioz, and a mutual admiration sprang up between the two composers. Glinka's *Jota Aragonesa* (1847), and the symphonic work on Spanish themes, *Une Nuit à Madrid,* reflect the musical results of two years' sojourn in Spain. On his return to St. Petersburg he wrote and arranged several pieces for the orchestra, amongst which the so-called *Kamarinskaya* achieved popularity beyond the limits of Russia. He also composed numerous songs and romances. In 1852 he went abroad for the third time; he now wrote his autobiography, orchestrated Weber's *Invitation à la valse,* and began to consider a plan for a symphonic work on Gogol's *Taras-Bulba.* But he now developed a passion for ecclesiastical music, and went to Berlin to study the ancient church modes. Here he died suddenly on Feb. 2, 1857.

See H. Berlioz, *Michael Glinka* (Milan, 1874); M. D. Calvocoressi, "Glinka," *Les Musiciens Célèbres* (Paris).

GLOBE, a city of Arizona, U.S.A., 75 mi. E. by S. of Phoenix, on federal highways 60 and 70 and the Southern Pacific railway; the county seat of Gila county. Pop. was 7,157 in 1930; 6,141 in 1940, federal census. It is the centre of a cattle-raising and copper-mining region. The Globe-Miami district has outranked the Bisbee district in production of copper (139,800,000 lb. in 1940), and has stood third in the United States. Silver, gold, asbestos, manganese, vanadium, tungsten and cinnabar also are mined, and there are coal fields and quicksilver properties in the vicinity. Roosevelt dam and reservoir are 25 mi. northwest. Coolidge dam, completed in 1930, is 30 mi. south. Globe was founded about 1874, and was incorporated as a city in 1907.

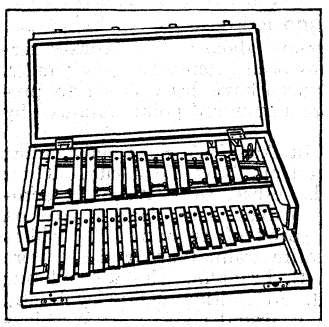
GLOBE: *see* MAP.

GLOBE-FISH or **SEA-HEDGEHOG,** the name of some sea-fishes of the families Diodontidae and Tetrodontidae, which have the faculty of inflating their stomachs with air or water. Their jaws resemble the beak of a parrot, the bones and teeth being coalesced into one sharp-edged mass. By means of these they are able to break off branches of corals, and to masticate other hard substances on which they feed. Usually they are of a short, thick, cylindrical shape, with powerful fins. Their body is covered with tough skin, without scales, but provided with variously formed spines. When they inflate their capacious stomachs they assume a globular form, and the spines protrude, forming a defensive armour. A fish thus blown out turns over and floats belly upwards, driving before the wind and waves. Many of these fishes are highly poisonous when eaten. They are most numerous in the tropics; a few species live in large rivers, as, for instance, *Tetrodon fahaka,* of the Nile. Nearly 100 species are known.

GLOBEFLOWER, any plant of the genus *Trollius* of the family Ranunculaceae (*q.v.*). They take their name from the special shape and formation of the flower. There are several species including the American globeflower (*T. laxus*), native to eastern North America, and the common globeflower (*T. europaeus*) which is extensively cultivated.

GLOBIGERINA, a genus of perforate *Foraminifera* (*q.v.*) of pelagic habit, and formed of a conical spiral aggregate of spheroidal chambers with a crescentic mouth. The shells accumulate at the bottom of moderately deep seas to form "Globigerina ooze" and are preserved thus in the chalk. *Hastigerina* only differs in the "flat" spiral.

GLOCKENSPIEL, or ORCHESTRAL BELLS, an instrument of percussion of definite musical pitch, used in the orchestra, and made in two or three different styles. The oldest form of *glockenspiel* consisted of a set of bells of graduated size mounted pyramid-fashion on a frame and played by one performer by means of steel hammers. The lyre-shaped *glockenspiel,* or steel harmonica *(Stahlharmonika),* is a newer model, which has instead of bells 12 or more bars of steel, graduating in size according to their pitch. These bars are fastened horizontally across two bars of steel set perpendicularly in a steel frame. Wagner has used the *glockenspiel* with exquisite effect in the fire scene of the last act of *Die Walküre* and in the peasants' waltz in the last scene of *Die Meistersinger.* When chords are written for the *glockenspiel,* as in Mozart's *Magic Flute,* the keyed harmonica is used. It consists of a keyboard having a little hammer attached to each key, which strikes a bar of glass or steel when the key is depressed.



BY COURTESY OF BOOSEY AND CO., LTD.
THE GLOCKENSPIEL CONSISTED ORIGINALLY OF A SET OF TUNED BELLS, WHICH WERE STRUCK WITH A HAMMER, BUT LATER, BARS OF STEEL OF VARYING LENGTH, ATTACHED TO A FRAME WERE SUBSTITUTED

GLOGAU, a town in the Prussian province of Silesia, Germany, 59 mi. N.W. of Breslau. Pop. (1939) 35,371. Early in the 11th century it withstood a siege by the emperor Henry V.; and in 1157 it was set on fire. In 1252 the town, restored by Henry I., became the capital of a principality of Glogau, and in 1482 town

and district were united to the Bohemian crown. During the Thirty Years' War Glogau suffered greatly. In 1741 the Prussians took it by storm and utilized it as a base during the Seven Years' War. After the battle of Jena (1806) it fell to the French; and was held against Russian and Prussian besiegers after the battle of Katzbach in 1813, for many months. Glogau is built partly on an island and partly on the left bank of the Oder. The cathedral, in the Gothic, and a castle (now used as a courthouse), in the Renaissance style, are notable. Glogau carries on extensive trade by river and rail. Industries include iron founding, machinery-building, tobacco, starch and sugar. It has also lithographic works and its book trade is celebrated.

GLORIA, in general a doxology or ascription of praise, specifically two ancient Latin hymns Gloria *in excelsis* and Gloria Patri, referred to sometimes as the Greater and the Lesser Doxology respectively, and employed in the services of the Catholic Church.

The former, known as the angelic hymn. on the strength of a passage in Luke (ii. 14), is an important part of the Ordinary of the Mass; the latter is appended to the singing of the psalms.

For further particulars and for discussion of the Gloria in music, see MASS; also LITURGY, MISSAL and EUCHARIST.

GLORIOSA, a small genus of bulbous plants of the family Liliaceae, natives of tropical Asia and Africa. They have slender stems which climb by tendril-like prolongations of the narrow generally lanceolate leaves. The flowers, which are borne in the upper leaf-axils, are very handsome, the six, generally narrow, orange or red petals are bent back and stand erect, the six stamens projecting beyond them.

They are grown as greenhouse plants or outdoors in summer and often called climbing-lily or glory-lily.

GLOSS AND GLOSSARY. The Greek word γλῶσσα (glossa), meaning originally a tongue, then a language or dialect, gradually came to denote any obsolete, foreign, provincial, technical or otherwise peculiar word or use of a word (see Arist. Rket. iii. 3, 2). The making of collections and explanations of such γλῶσσαι was at a comparatively early date a well-recognized form of literary activity. Even in the 5th century B.C., among the many writings of Abdera was included a treatise entitled Περι Ὁμήρου ἢ ὀρθοεπείης καὶ γλωσσέων. It was not, however, until the Alexandrian period that the γλωσσογράφοι, glossographers (writers of glosses), or glossators, became numerous.

Of many of these perhaps even the names have perished; but Athenaeus the grammarian (c. A.D. 250) alone alludes to no fewer than 35. Among the earliest was Philetas of Cos (d. c. 290 B.C.), the elegiac poet, who was the compiler of a lexicographical work entitled Ἄτακτα or Γλῶσσαι (sometimes Ἄτακτοι γλῶσσαι). Next came his disciple Zenodotus of Ephesus (early 3rd century B.C.), the compiler of Γλῶσσαι Ὁμηρικαί (uncommon words in Homer); he was succeeded by his greater pupil Aristophanes of Byzantium (c. 260–180 B.C.), whose great compilation Περὶ λέξεων (still partially preserved in that of Pollux), is known to have included Ἀττικαὶ λέξεις, Λακωνικαὶ γλῶσσαι, and the like. From the school of Aristophanes issued more than one glossographer of name,—Diodorus, Artemidorus (Γλῶσσαι, and a collection of λέξεις ὀψαρτυτικαί), Nicander of Colophon (Γλῶσσαι, of which some 26 fragments still survive) and Aristarchus (c. 210 B.C.), the famous critic, whose numerous labours included an arrangement of the Homeric vocabulary (λέξεις) in the order of the books. Contemporary with the last named was Crates of Mallus, who, besides making some new contributions to Greek lexicography and dialectology, was the first to create at Rome a taste for similar investigations in connection with the Latin idioms. From his school proceeded Zenodotus of Mallus, the compiler of Ἐθνικαὶ λέξεις or γλῶσσαι, a work said to have been designed chiefly to support the views of the school of Pergamum as to the allegorical interpretation of Homer.

Of later date were Didymus (Chalcenterus, 1st cent. B.C.), who made collections of λέξεις τραγωδουμέναι κωμικαί, etc.; Apollonius Sophista (c. 20 B.C.), whose Homeric Lexicon has come down to modem times; and Neoptolemus, known distinctively as ὁ γλωσσογράφος. In the beginning of the 1st century of the Christian era Apion, a grammarian and rhetorician at Rome during the reigns of Tiberius and Claudius, followed up the labours of Aristarchus and other predecessors with Γλῶσσαι Ὁμηρικαί, and a treatise Περὶ τῆς Ῥωμαϊκῆς διαλέκτου; Heliodorus or Herodorus was another almost contemporary glossographer; Erotian also, during the reign of Nero, prepared a special glossary for the writings of Hippocrates. To this period also Pamphilus, the author of the Λειμών, from which Diogenianus and Julius Vestinus afterwards drew so largely, most probably belonged. In the following century one of the most prominent workers in this department of literature was Aelius Herodianus, whose treatise Περὶ μονήρους λέξεως has been edited in modern times, and whose Ἐπιμερισμοί we still possess in an abridgment; also Pollux, Diogenianus (Λέξις παντοδαπή), Julius Vestinus (Ἐπιτομὴ τῶν Παμφίλου γλωσσῶν) and especially Phrynichus, who flourished towards the close of the and century, and whose Eclogue *nominum* et verborum Atticorum has frequently been edited.

To the 4th century belong Ammonius of Alexandria (c. 389), who wrote Περὶ ὁμοίων καὶ διαφόρων λέξεων, a dictionary of words used in senses diffcrnt from those employed by older and approved writers; Hesychius, whose Λεξικόν, has come down only in a 15th-century recension. From the 5th century date, Cyril, the celebrated patriarch of Alexandria (one form of his work is the basis of Συναγωγὴ λέξεων χρηόιμων); Orus of Miletus (Περὶ πολυσημάντων λέξεων), and Orion of Egyptian Thebes who flourished in Alexandria, c. 425.

The Compilations **of** Justhian. — To a special category of technical glossaries belongs a large and important class of works relating to the law-compilations of Justinian. Although the emperor forbade under severe penalties all commentaries (ὑπομνήματα) on his legislation, yet indices (ἴνδικες) and references (παράτιτλα), as well as translations (ἑρμηνεῖαι κατὰ πόδα) and paraphrases (ἑρμηνεῖαι εἰς πλάτος), were expressly permitted, and lavishly produced. Among the numerous compilers of alphabetically arranged λέξεις Ῥωμαϊκαί or Λατεινικαί, and γλῶσσαι νομικαί (glossae nomicae), Cyril and Philoxenus are particularly noted; but the authors of παραγραφαί, or σημειώσεις, whether ἔξωθεν or ἔσωθεν κείμεναι are too numerous to mention. A collection of these παραγραφαὶ τῶν παλαιῶν, combined with νέαι παραγραφαί on the revised code called τὰ βασιλικά, was made about the middle of the 12th century by a disciple of Michael Hagiotheodorita. The collection of these glossaries is known as the Glossa ordinarza τῶν βασιλικῶν.

In Italy, also, during the period of the Byzantine ascendancy, and later, after the total extinction of Byzantine sway in the West, various glossae (glosae) and scholia on the Justinian code and various legal treatises were produced. The series of legal glossators was closed by Accursius (*q.v.*) with the compilation known as the *Glossa* ordinaria or *magistralis,* the authority of which soon became very great. For some account of the glossators on the canon law, see CANON LAW.

Latin, like Greek glossography, had its origin chiefly in the practical wants of students and teachers, of whose names we only know a few. No doubt even in classical times collections of glosses ("glossaries") were compiled, to which allusion seems to be made by Varro (De ling. Lat. vii. 10, "tesca, aiunt sancta esse qui glossas scripserunt") and Verrius-Festus (166[b]. 6 "naucum . . . glossematorum . . . scriptores fabae grani quod haereat in fabulo"). The *scriptores* glossematorum were distinguished from the learned glossographers like Aurelius Opilius, Servius Clodius, Aelius Stilo, L. Ateius Philol., whose liber *glossematorum* Festus mentions (181[a]. 18).

Verrius Flaccus (who died under Tiberius), and his epitomists, Festus and Paulus, have preserved many treasures of early glossographers who are now lost to us. He copied Aelius Stilo, author of De verborum *significatu,* Aurelius Opilius, Ateius Philologus, the treatise De *obscuris Catonis.* He often made use of Varro and was also acquainted with later glossographers. Perhaps we owe to him the glossae asbestos. Festus was used by Pseudo-Philoxenus (see below).

In late classical and mediaeval Latin, *glosa* was the vulgar and

romanic, glossa the learned form. The diminutive glossula occurs in Dioinedes (426. 26) and elsewhere. The same meaning is borne by *glossarium,* which also occurs in the modern sense of "glossary," as do the words glossa, glossae, glossulae, *glossemata,* expressed in later times by *dictionarium, dictionarius, vocabularium, vocabularius* (see DICTIONARY). Glossa and glossema are synonyms, signifying (a) the word which requires explanation; or (b) such a word (called *lemma*) together with the interpretation (*interpretamentum*); or (c) the interpretation alone.

The Bilingual Glossaries.—The bilingual (Gr.-Lat., Lat.-Gr.) glossaries also point to an early period, and were used by the grammarians (1) to explain the peculiarities (idiomata) of the Latin language by comparison with the Greek, and (2) for instruction in the two languages. The most important remains of bilingual glossaries are two well-known lexica; one (Latin-Greek), formerly attributed, but wrongly, to Philoxenus (consul A.D. 525), clearly consists of two closely allied glossaries (containing glosses to Latin authors, as Horace, Cicero, Juvenal, Virgil, the Jurists, and excerpts from Festus), worked into one by some Greek grammarian, or a person who worked under Greek influence (his alphabet runs A, B, G, D, E, etc.); the other (Greek-Latin) is ascribed to Cyril (Stephanus says it was found at the end of some of his writings), and is considered to be a compilation of not later than the 6th century. Furthermore, the bilingual medico-botanic glossaries had their origin in old lists of plants, as Pseudo-Apuleius in the treatise De *herbarum virtutibus,* and Pseudo-Dioscorides; the glossary, entitled Hermeneuma, printed from the Cod. Vatic. reg. Christ. 1260, contains names of diseases.

Of Latin glossaries of the first five or six centuries of the Roman emperors few traces are left, if we except Verrius-Festus. Of this early period we know by name only Fulgentius and Placidus. All that we know of the second of these tends to show that he lived in north Africa in the 6th century, from whence his glosses came to Spain, and were used by Isidore and the compiler of the Liber glossarum (see below). These glosses we know from (1) Codices Romani (15th and 16th centuries); (2) the Liber *glossarum;* (3) the Cod. Paris. nov. acquis. 1298 (11th century), a collection of glossaries, in which the Placidus-glosses are kept separate from the others. (Fabius Planciades) Fulgentius (c. A.D. 468–533) wrote Expositio sermonum antiquorum in 62 paragraphs, each containing a lemma (sometimes two or three) with an explanation giving quotations and names of authors. Next to him come the glossae Nonianae, which arose from the contents of the various paragraphs in Nonius Marcellus' work being written in the margin without the words of the text; these epitomized glosses were alphabetized and afterwards copied for other collections. In a similar way arose the glossae *Eucherii* or glossae spiritales secundum Eucherium *episcopum* found in many mss., which are an alphabetical extract from the formulae *spiritalis* intelligentiae of St. Eucherius, bishop of Lyons, c. 434–450. The so-called Malberg glosses, found in various texts of the Lex Salica, are not glosses in the ordinary sense of the word, but precious remains of the parent of the present literary Dutch, namely, the Low German dialect spoken by the Salian Franks who conquered Gaul from the Romans at the end of the 5th century. The antiquity and the philological importance of these glosses may be realized from the fact that the Latin translation of the Lex Salica probably dates from the end of the 5th century. See Jac. Grimm's preface to Joh. Merkel's ed. (1850), and H. Kern's notes to J. H. Hessels's ed. (1880) of the Lex Salica.

The Middle Ages.—During the 6th, 7th and 8th centuries glossography developed in various ways; old glossaries were worked up into new forms, or amalgamated with more recent ones. It ceased, moreover, to be exclusively Latin-Latin, and interpretations in Germanic (Old High German, Anglo-Saxon) and Romanic dialects took the place of or were used side by side with earlier Latin ones. Among Celtic glosses the most important are Old Irish, and of these Bishop Cormac's and O'Davoren's have been edited by Whitley Stokes, the former also by Kuno Meyer. The origin and development of the late classic and mediaeval glossaries preserved to us can be traced with certainty. While reading the manuscript texts of classical authors, the Bible or early Christian and profane writers, students and teachers, on meeting with any obscure or out-of-the-way words which they considered difficult to remember or to require elucidation, wrote above them, or in the margins, interpretations or explanations in more easy or better-known words. The interpretations written above the line are called "interlinear," those written in the margins of the mss. "marginal glosses." Again, mss. of the Bible were often provided with interlinear literal translations. (i.) From these glossed mss. and interlinear versions glossaries were compiled; that is, the obscure and difficult Latin words, together with the interpretations, were excerpted and collected in separate lists, in the order in which they appeared in the mss., with the names of the authors or the titles of the books whence they were taken or placed at the head of each separate collection. In this arrangement each article by itself is called a gloss; when reference is made only to the word explained it is called the lemma, while the explanation is termed the *interpretamentum.* In most cases the form of the lemma was retained just as it stood in its source, and explained by a single word, so that we meet with lemmata in the accusative, dative and genitive, explained by words in the same cases, *e.g.,* the forms of verbs being treated in the same way. Of this first stage in the making of glossaries, many traces are preserved, in the late 8th century Leyden Glossary (ed. J. H. Hessels), where chapter iii. contains words or glosses excerpted from the Life of St. Martin by Sulpicius Severus; chs. iv., v. and xxxv. glosses from Rufinus, and so forth. (ii.) By a second operation the glosses came to be arranged in alphabetical order according to the first letter of the lemma, but still retained in separate chapters. Of this second stage the Leyden Glossary contains traces also. (iii.) The third operation collected all the accessible glosses in alphabetical order, in the first instance according to the first letters of the lemmata. Here the names of the authors or the titles could no longer be preserved, and consequently the sources of the glosses became uncertain. (iv.) A fourth arrangement collected the glosses according to the first two letters of the lemmata, as in the Corpus Glossary and in the still earlier Cod. Vat. 3321 (Goetz, *Corp.* iv. 1 sqq.), where even many attempts were made to arrange them according to the first three letters of the alphabet. A peculiar arrangement is seen in the Glossae *affatim* (Goetz, *Corp.* iv. 471 sqq.), where all words are alphabetized, first according to the initial letter of the word and then further according to the first vowel in the word (a, e, i, o, u.)

No date or period can be assigned to any of the above stages or arrangements. For instance, the first and second are both found in the Leyden Glossary (end of 8th century) whereas the Corpus Glossary (beginning of 8th century) represents already the fourth stage. For the purpose of identification titles have been given to the various nameless collections of glosses, derived partly from their first lemma, partly from other characteristics, as glossae *abstrusae;* glossae abavus major and minor; g. *affatim;* g. ab absens; g. *abactor;* g. Abba *Pater;* g. a, a; g. Vergilianae; g. nominum; g. Sangallenses.

Isidore and His Successors.—A chief landmark in glossography is represented by the Origines (Etynzologiae) of Isidore (d. 636), an encyclopaedia in which he, like Cassiodorus, mixed human and divine subjects together, and the etymological part of which (book x.) became a great mine for later glossographers. His principal source is Servius, the fathers of the church, and Donatus. Next comes the Liber glossarum, chiefly compiled from Isidore, but with all articles arranged alphabetically; its author lived in Spain c. A.D. 690–750; he has been called Ansileubus, but this name may be merely that of some owner of a copy of the book. Here come, in regard to time, some Latin glossaries already largely mixed with Germanic, more especially Anglo-Saxon interpretations: (1) the Corpus Glossary (ed. J. H. Hessels, W. M. Lindsay), of the beginning of the 8th century, in Corpus Christi college, Cambridge; (2) the Leyden Glossary (end of 8th century, ed. Hessels, Plac. Glogger), in Leyden ms. Voss. Q° Lat 69; (3) the Epinal Glossary, written in the beginning of the 9th century and published in facsimile by the London Philol. Society from the ms. at Epinal; (4) the ***Glossae Amplonianae, i.e.,*** three gloss-

aries preserved in the Amplonian library at Erfurt, known as Erfurt[1], Erfurt[2] and Erfurt[3], which are arranged alphabetically according to the first or the first two letters of the lemmata.

The first great glossary or collection of various glosses and glossaries is that of Salomon, bishop of Constance, who died A.D. 919. An edition of it was printed *c.* 1475 at Augsburg as *Salemonis ecclesie Constantiensis episcopi glosse ex illustrissimis collecte auctoribus.* Its sources are the *Liber glossarum,* the glossary preserved in the 9th-century ms. *Lat Monac.* 14429, and the *Abavus* major Gloss. The *Liber glossarum* has also been the chief source for the important (but not original) glossary of Papias, of A.D. 1053, who also wrote a grammar chiefly compiled from Priscian. It is also the source of (1) the *Abba Pater* Glossary, published by G. M. Thomas (*Sitz. Ber. Akad. Münch.,* 1868, ii. 369 *sqq.)*; (2) the Greek glossary *Absida lucida;* and (3) the Lat.-Arab. glossary in the *Cod. Leid. Scal. Orient.* No. 231 (published by Seybold in *Semit. Studien,* Heft xv.–xvii., 1900). The Paulus-Glossary is compiled from the second Salomon-Glossary (*abacti magistratus*), the *Abavus major* and the *Liber glossarum,* with a mixture of Hebraica.

Osbern of Gloucester (*c.* 1123–1200) compiled the glossary entitled *Panormia* (ed. Angelo Mai as *Thesaurus novus Latinitatis,* from Cod. Vatic. reg. Christ. 1392), giving derivations, etymologies, testimonia collected from Paulus, Priscian, Plautus, Horace, Virgil, Ovid, Mart. Capella, Macrobius, Ambrose, Sidonius, Prudentius, Josephus, Jerome, etc. Osbern's material was also used by Hugucio, whose compendium was still more extensively used (Goetz enumerates 103 mss. of his treatise).

Johannes **de Janua.**—The great work of Johannes de Janua, entitled *Summa quae vocatur catholicon,* dates from the year 1286, and mostly uses Hugucio and Papias; its classical quotations are limited, except from Horace; it quotes the Vulgate by preference; it excerpts Priscianus, Donatus, Isidore, the fathers of the church; it borrows many Hebrew glosses, especially from Jerome; it mentions the *Graecismus* of Eberhardus Bethuniensis, the works of Hrabanus Maurus, the *Doctrinale* of Alexander de Villa Dei, and the *Aurora* of Petrus de Riga.

The gloss mss. of the 9th and 10th centuries are numerous, but a diminution becomes visible towards the 11th. A peculiar feature of the late middle ages are the medico-botanical glossaries based on earlier ones. The additions consisted in Arabic words with Latin explanations, while Greek, Latin, Hebrew and Arabic, interchange with English, French, Italian and German forms. Of glossaries of this kind we have (1) the *Glossae alphita;* (2) *Sinonoma Bartholomei,* of the end of the 14th century, ed. J. L. G. Mowat; (3) the compilations of Simon de Janua *(Clavis sanationis,* end of 13th century), and of Matthaeus Silvaticus (*Pandectae medicinae,* 14th century).

Of biblical glossaries we have a large number, mostly mixed with glosses on other, even profane, subjects, as Hebrew and other biblical proper names, and explanations of the text of the Vulgate in general, and the prologues of Hieronymus. So we have the *Glossae veteris ac novi testamenti* (beginning "Prologus graece latine praelocutio sive praefatio") in numerous mss. of the 9th to 14th centuries, mostly retaining the various books under separate headings. Special mention should be made of Guil. Brito, who lived about 1250, and compiled a *Summa* (beginning "difficiles studeo partes quas Biblia gestat Pandere") which gave rise to the *Mammotrectus* of Joh. Marchesinus, about 1300, of which we have editions of 1470, etc.

Finally we may mention such compilations as the *Summa Heinrici* (the *Breviloquus,* which drew its chief material from Papias, Hugucio, Brito, etc.); the *Vocabularium Ex quo;* the various *Gemmae* and *Vocabularia rerum.*

BIBLIOGRAPHY.—The modern historical interest in glosses and glossaries began with J. Scalicer (1540–1609), who in his edition of Festus made great use of Ps.-Philoxenus, which enabled O. Muller, the later editor of Festus, to follow in his footsteps. Scaliger also planned the publication of a *Corpus glossarum,* and left behind a collection of glosses known as *glossae Isidori.* The study of glosses was greatly furthered through the publication, in 1573, of the bilingual glossaries by Henri Stephanus (Estienne). In 1600 Bonav. Vulcanius republished the same glossaries, adding (1) the glossae *Isidori,* which now appeared for the first time; (2) the *Onomasticon;* (3) *notae* and *castigationes,* derived from Scaliger. In 1606 Carolus and Petrus Labbaeus published. with the help of Scaliger, another collection of glossaries, republished, in 1679, by Du Cange, after which the 17th and 18th centuries produced no further glossaries, though glosses were constantly used or referred to by scholars at Leyden, where a rich collection of glossaries had been obtained by the acquisition of the Vossius library. In the 19th century came Osann's *Glossarii Latini specimen* (1826); the glossographical publications of Angelo Mai *(Classici auctores,* vols. iii., vi., vii., viii., 1831–36, containing Osbern's *Panormia,* Placidus and various glosses from Vatican mss.); Fr. Oehler's treatise (1847) on the *Codex Amplonianus* of Osbern, and his edition of the three Erfurt glossaries, so important ior Anglo-Saxon philology; in 1854 G. F. Hildebrand's *Glossarium Latinum* (an extract from *Abavus minor),* preserved in a Cod. Paris. lat. 7690; 1857, Thomas Wright's vol. of Anglo-Saxon glosses, which were republished with others in 1884 by R. Paul Wiilcker under the title *Anglo-Saxon and Old English Vocabularies;* L. Diefenbach's supplement to Du Cange, entitled *Glossarium Latino-Germanicum mediae et infimae aetatis;* Ritschl's treatise (1870) on Placidus, which called forth an edition (1875) of Placidus by Deuerling; G. Loewe's *Prodomus Corporis Glossariorum Latinorum* (1876), and other treatises by him, published after his death by G. Goetz (Leipzig, 1884): 1888. the second volume of Goetz's own great *Corpus glossarium Latinorum,* of which seven volumes (except the first) had seen the light by 1907, the last two being separately entitled *Thesaurus glossarum emendatarum,* containing many emendations and corrections of earlier glossaries by the author and other scholars; 1885, H. Sweet, Latin-Anglo-Saxon glossaries in *Oldest English Texts;* 1890, J. H. Hessels, apograph of the Corpus Glossary, 1906 of the Leyden Glossary; 1900, Arthur S. Napier, *Old English Glosses,* collected chiefly from Aldhelm mss.; 1921, W. M. Lindsay, *Corpus Glossary* and *The Corpus, Epinal, Erfurt, and Leyden Glossaries;* 1922, Lindsay, *Palaeographia Latina.*

Among encyclopaedic articles the chief are Tolkiehn's article "Lexicographic" and G. Goetz's article "Lateinische Glossographie" in Pauly's *Realencyklopadie.* By the side of Goetz's *Corpus* stands the great collection of Steinmeyer and Sievers, *Die altlzochdeutschen Glossen* (4 vols., 1879–98), containing a vast number of glosses culled from Bible mss. and mss. of classical Christian authors. Besides the works of the editors of, or writers on, glosses, already mentioned, we refer here to a few others: De-Vit (at end of Forcellini's *Lexicon);* J. H. Gallée (*Altsächs. Sprachdenkm.,* 1894); K. Gruber (*Hauptquellen des Corpus, Epin. u. Erfurt Gloss,* Erlangen, 1904); W. Heraeus *(Die Sprache des Petronius und die Glossen,* Leipzig, 1899); W. Meyer-Lubke ("Zu den latein. Glossen" in *Wiener Stud.* xxv. go *sqq.)*; Henry Nettleship, *Lectures and Essays;* R. Reitzenstein, *Geschichte der Griechischen Etymologika* (1897); on the three Philemons, *see* L. Cohen in *Philologus* 57 (N.F. ii.), 353–67; (many important articles in *Anglia, Englische Studien, Archiv j. latein. Lexicographie, Romania, Zeitschr. fur deutsches Alterthum, Journal of English and Germanic Philology, American Journal of Philology, Classical Review.* Lindsay and J. H. Thomson, *Ancient Lore in Mediaeval Latin Glossaries* (1921) is an important guide to the problem of gloss-derivation.

(J. H. HES.; C. **T. O.**)

GLOSSOP, market town and municipal borough in the High Peak parliamentary division, Derbyshire, England, 13 mi. E. of Manchester by the L.N.E.R. Pop. (1938) 18,300. Area, 5.2 sq.mi. It is the chief seat of the cotton manufacture in Derbyshire, and has also woollen and paper mills, dye, print and bleaching works. The town consists of three main divisions, the Old Town (or Glossop proper), Howard Town (or Glossop Dale) and Mill Town. In the neighbourhood is Glossop hall, formerly the seat of Lord Howard, lord of the manor, but acquired by the corporation and housing Kingsmoor mixed boarding school. On a hill near the town is Melandra castle, the site of a Roman fort guarding Longdendale and the way into the Peak District. To the north, in Longdendale, there are five reservoirs belonging to the water-supply system of Manchester, formed by damming the Etherow, a stream which descends from the high moors northeast of Glossop. Glossop was among the lands of William Peverel. The town was incorporated in 1866.

GLOUCESTER, GILBERT DE CLARE, EARL OF (1243–1295), 8th earl of Gloucester and 9th earl of Clare, was born at Christchurch, Hampshire, on Sept. 2, 1243. He married Alice of Angoulême, niece of king Henry III., succeeded his father in July 1262, and joined the baronial party led by Simon de Montfort. With Simon Gloucester was at the battle of Lewes in May 1264, when the king himself surrendered to him, and after this victory he was one of the three persons selected to nominate a council. Soon, however, he quarrelled with Simon. Leaving London for his lands on the Welsh border he met Prince Edward, afterwards king Edward I., at Ludlow, just after his escape from captivity, and contributed largely to the prince's victory at Evesham in August

1265. But this alliance was as transitory as the one with Leicester. Gloucester championed the barons who had surrendered at Kenilworth in November and December 1266, and after putting his demands before the king, secured possession of London (April 1267). The earl quickly made his peace with Henry III. and with Prince Edward. Under Edward I. he spent several years in fighting in Wales, or on the Welsh border; in 1289 when the barons were asked for a subsidy he replied on their behalf that they would grant nothing until they saw the king in person (nisi *prius personaliter viderent* in Anglia *faciem regis*), and in 1291 he was fined and imprisoned on account of levying private war on Humphrey de Bohun, earl of Hereford. Having divorced his wife Alice, he married in 1290 Edward's daughter Joan, or Johanna (d. 1307). The "Red Earl," as he is sometimes called, died at Monmouth on Dec. 7, 1295, leaving in addition to three daughters a son, Gilbert, earl of Gloucester and Clare, killed at Bannockburn.

See references under MONTFORT, SIMON DE.

GLOUCESTER, HUMPHREY, DUKE OF (1391–1447), the fourth son of Henry IV. by Mary de Bohun, was born in 1391. He was created duke of Gloucester by Henry V. at Leicester on May 16, 1414. He served in the war next year, and was wounded at Agincourt, where he owed his life to his brother's valour. In the second invasion of France Humphrey commanded the force which during 1418 reduced the Cotentin and captured Cherbourg. Afterwards he joined the main army before Rouen, and took part in subsequent campaigns till January 1420. He then went home to replace Bedford as regent in England, and held office till Henry's own return in February 1421. He was again regent for his brother from May to September 1422.

Henry V. measured Humphrey's capacity, and by his will named him merely deputy for Bedford in England. Humphrey at once claimed the full position of regent, but the parliament and council allowed him only the title of protector during Bedford's absence, with limited powers. He married (1422) Jacqueline of Bavaria, heiress of Holland, to whose lands Philip of Burgundy had claims. In October 1424 Humphrey took up arms in his wife's behalf, but after a short campaign in Hainault went home, and left Jacqueline to be overwhelmed by Burgundy. His marriage was annulled in 1428. Returning to England in April 1425 he entangled himself in a quarrel with the council and his uncle Henry Beaufort, and stirred up a tumult in London. Open war was averted only by Beaufort's prudence, and Bedford's hurried return. With some difficulty Bedford effected a formal reconciliation at Leicester in March 1426. To check his indiscretion the council, in November 1429, had the king crowned, and so put an end to Humphrey's protectorate, but during Henry VI.'s absence in France he acted as warden in England. The defection of Burgundy roused English feeling, and Humphrey won popularity as leader of the war party. In 1436 he commanded in a short invasion of Flanders. In 1441 Eleanor Cobham, his former mistress, whom he had married (about 1430), was charged with practising sorcery against the king, and Humphrey had to submit to see her condemned, and her accomplices executed. Nevertheless, he continued to thwart Suffolk, who was pow taking Beaufort's place in the council, by opposing the king's marriage to Margaret of Anjou. Under Suffolk's influence Henry VI. grew to distrust his uncle altogether. The crisis came in the parliament of Bury St. Edmunds in February 1447. Immediately on his arrival there Humphrey was arrested, and four days later, on Feb. 23, he died.

Humphrey was buried at St. Albans Abbey, in a fine tomb, which still exists. He was long remembered, in spite of his bad political record, as the good Duke Humphrey, on account of his liberal patronage of scholars and of learning. He had been a great collector of books, many of which he presented to the university of Oxford. He contributed also to the building of the Divinity School, and of the room still called Duke Humphrey's library. His books were dispersed at the Reformation and only three volumes of his donation now remain in the Bodleian library. Titus Livius, an Italian in Humphrey's service, wrote a life of Henry V. at his patron's bidding. Other Italian scholars, as Leonardo Aretino, benefited by his patronage. Amongst English men of letters he befriended Reginald Pecock, Whethamstead of St. Albans, Capgrave the historian, Lydgate and Gilbert Kymer, who was his physician and chancellor of Oxford university. A popular error found Humphrey a fictitious tomb in St. Paul's Cathedral. The adjoining aisle, called Duke Humphrey's Walk, was frequented by beggars and needy adventurers. Hence the 16th-century proverb "to dine with Duke Humphrey," used of those who loitered there dinnerless.

The most important contemporary sources are Stevenson's *Wars of the English in France,* Whethamstead's *Register,* and Beckington's *Letters* (all in Rolls Ser.), with the various *London Chronicles,* and the works of Waurin and Monstrelet. For his relations with Jacqueline *see* F. von Löher's *Jacobiia von Bayern und ihre Zeit* (2 vols., Nordlingen, 1869). For other modern authorities consult W. Stubbs's *Constitutional History;* J. H. Ramsay's *Lancaster and York; Political History of England,* vol. iv.; R. Pauli, *Pictures of Old England,* pp. 373–401 (1861); and K. H. Viekers, *Humphrey, Duke of Gloucester* (1907). For Humphrey's correspondence with Piero Candido Decembrio *see* the *English Historical Review,* vols. x., xix., xx.

GLOUCESTER, RICHARD DE CLARE, EARL OF (1222–1262), 7th earl of Gloucester and 8th earl of Clare, was born on Aug. 4, 1222. He succeeded his father in October 1230. About 1258 Gloucester became a leader of the barons in their resistance to the king, and he was prominent during the proceedings which followed the Mad Parliament at Oxford in 1258. In 1259, however, he quarrelled with Simon de Montfort, earl of Leicester; the dispute, begun in England, was renewed in France and he was again in the confidence and company of the king. This attitude, too, was only temporary, and in 1261 Gloucester and Leicester were again working in concord. Gloucester died on July 15, 1262.

GLOUCESTER, ROBERT, EARL OF (d. 1147), was a natural son of Henry I. of England. He was born, before his father's accession, at Caen in Normandy; but the exact date of his birth, and his mother's name are unknown. His father married him to a daughter of Robert Fitz Hamon, heiress of the lordships of Gloucester and Glamorgan. About 1121 the earldom of Gloucester was created for his benefit. After his father's death, he was sedulously courted by the rival parties of his half-sister the empress Matilda and of Stephen. He tendered his homage to Stephen upon strict conditions, the breach of which should be held to invalidate the contract. But in 1137 Robert left England for Normandy, renewed his relations with the Angevin party, and in 1138 sent a formal defiance to the king. Returning to England in 1139, he revolted, and won the greater part of western England and the south Welsh marches for the empress. By the battle of Lincoln (Feb. 2, 1141), in which Stephen was taken prisoner, the earl made good Matilda's claim to the whole kingdom. He accompanied her to Winchester and London; but was captured by the king's supporters after the siege of Winchester. He was exchanged for Stephen, and after his release continued to fight for Matilda until his death on Oct. 31, 1147. Robert hardly deserves the extravagant praise which is lavished upon him by William of Malmesbury. The sympathies of the chronicler are too obviously influenced by the earl's munificence towards literary men.

See the *Historia novella* by William of Malmesbury (Rolls edition); the *Historia Anglorum* by Henry of Huntingdon (Rolls edition); J. H. Round, *Geoffrey de Mandeville* (1892); and O. Rossler. *Kaiserin Mathilde* (1897).

GLOUCESTER, THOMAS OF WOODSTOCK, DUKE OF (1355–1397), seventh and youngest son of the English king Edward III., was born at Woodstock on Jan. 7, 1355. Having married Eleanor (d. 1399), daughter and co-heiress of Humphrey de Bohun, earl of Hereford, Essex and Northampton (d. 1373), Thomas became constable of England, and was made earl of Buckingham by his nephew, Richard II., at the coronation in July 1377. He helped to defend the English coasts against the attacks of the French and Castilians, led an army through northern and central France, and unsuccessfully besieged Nantes.

Returning to England early in 1381, Buckingham found that his brother, John of Gaunt, duke of Lancaster, had married his wife's sister, Mary Bohun, to his own son, Henry, afterwards King Henry IV. The relations between the brothers, already somewhat strained, were not improved by this proceeding. After taking some part in crushing the rising of the peasants in 1381, Buckingham became more friendly with John of Gaunt; and while

marching with the king into Scotland in 1385 was created duke of Gloucester. Lancaster having left the country, Gloucester headed the party opposed to the royal advisers, Michael de la Pole, earl of Suffolk and Robert de Vere, earl of Oxford, whose recent elevation to the dignity of duke of Ireland had aroused profound discontent. Gloucester forced on the dismissal and impeachment of Suffolk; was a member of the commission appointed in 1386 to reform the kingdom and the royal household; and took up arms when Richard began proceedings against the commissioners. After defeating Vere at Radcot in December 1387 the duke and his associates entered London to find the king powerless in their hands. Gloucester was restrained by his colleagues from deposing the king; but, as the leader of the "lords appellant" in the "Merciless Parliament," (February 1388), he took a savage revenge upon his enemies.

In 1396 uncle and nephew were again at variance. Gloucester disliked the peace with France and Richard's second marriage with Isabella of France; it was asserted that the duke was plotting to seize the king. On July 11, 1397 he was arrested by the king himself at his residence, Pleshey castle, Essex. He was taken at once to Calais, and it is probable that he was murdered by order of the king on Sept. 9 following. Gloucester had one son, Humphrey (c. 1381–1399), who died unmarried, and four daughters, the most notable of whom was Anne (c. 1380–1438), who was successively the wife of Thomas, 3rd earl of Stafford, Edmund, 5th earl of Stafford and William Bourchier, count of Eu. Gloucester is supposed to have written *L'Ordonnance d'Angleterre* pour *le* camp *à l'outrance, ou gaige* de *bataille.*

GLOUCESTER (abbreviated as pronounced *Glo'ster*), city, county and parliamentary borough, port and county town, Gloucestershire, England, on the river Severn, 114 mi. W. of London. Pop. (1938) 56,520. Area, 7.2 sq.mi. It is served by the G.W. and L.M.S. railways. The Berkeley ship canal runs S.W. to Sharpness docks in the Severn estuary (16½ mi). Gloucester is sheltered by the Cotswolds and the Forest of Dean.

The cathedral originates in the foundation of an abbey in 681, the present church being founded (1072–1104) and its first mitred abbot being appointed in 1381. Gloucester lay in the see of Worcester until 1541 when the separate see was constityted, with John Wakeman, last abbot of Tewkesbury, as first bishop. The diocese covers the greater part of Gloucestershire, with small parts of Wiltshire, Oxfordshire, Worcestershire, Herefordshire and Warwickshire. The cathedral consists of a Norman nucleus, with additions in every style of Gothic architecture. It is 420 ft. long, and 144 ft. broad, with a beautiful 1 jth century pinnacled tower rising 22 j feet. The nave is massive Norman with Early English roof; the crypt, aisles and chapels are Norman, as is the chapter-house. The crypt is one of the four apsidal cathedral crypts in England. The south porch is Perpendicular, with fan-tracery roof, as also is the north transept, the south being transitional Decorated. The choir has Perpendicular tracery over Norman work, with an apsidal chapel on each side. The splendid late Decorated east window is partly filled with ancient glass. Between the apsidal chapels is a cross Lady chapel, and north of the nave are the cloisters, a very early example of fan-tracery, the carols or stalls for the monks' study and writing lying to the south. There are shrines of Edward II, Robert Curthose (eldest son of the Conqueror), Bishop Warburton, Dr. Jenner and others. The Festival of the Three Choirs is held annually in this cathedral and those of Worcester and Hereford in turn.

Quaint gabled and timbered houses preserve the ancient aspect of the city. None of the old public buildings is left, but the New Inn (1450) in Northgate street is a beautiful timbered house. Bishop Hooper's Lodging (16th century) was opened as an English Folk museum in 1935. Of the churches St. Mary de Lode, with a Norman tower and chancel, is on the site of a Roman temple which became the first Christian church in Britain; St. Mary de Crypt is a cruciform structure of the 12th century, the church of St. Michael is said to have been connected with the ancient abbey of St. Peter; and St. Nicholas church, originally of Norman erection. Near St. Mary de Crypt are remains of Greyfriars and Blackfriars monasteries, and of the city wall. Early vaulted cellars remain under the Fleece and Saracen's Head inns.

There are three endowed schools: the King's school, refounded in 1541; the school of St. Mary de Crypt, founded in 1539 by Dame Joan Cooke, and Sir Thomas Rich's Blue Coat hospital (1666). The first Sunday school was held in Gloucester, being originated by Robert Raikes, in 1780.

Gloucester possesses match works, foundries. marble and slate works, saw-mills, chemical works, rope works, flour-mills, engines and agricultural implements, and boat and ship-building yards. Gloucester was declared a port in 1882. The Gloucester-Berkeley ship canal (opened 1827) has a depth of water of 15 ft at Gloucester, irrespective of tides. Principal imports are timber and grain; and exports, coal, salt, iron, manufactured articles and bricks. The salmon and lamprey fisheries in the Severn are valuable. The tidal bore in the river attains its extreme height just below the city, and sometimes surmounts the weir in the western branch of the river.

History. — Gloucester (Caer Glow, Gleawecastre, Gleucestre) was the Roman municipality or colonia of *Glevum,* founded by Nerva A.D. 96–98. Its situation and the foundation in 681 of the abbey of St. Peter by Aethelred favoured the growth of the town; and before the Conquest Gloucester was a borough with a royal residence and a mint. It has been granted numerous charters and was incorporated by Richard III in 1483, being made a county in itself. The chartered port of Gloucester dates from 1580. Numerous fairs have been granted. The iron trade of Gloucester dates from before the Conquest, tanning was carried on before the reign of Richard III, pin-making and bell-founding were introduced in the 16th, and the long-existing coal trade became important in the 18th century. The cloth trade flourished from the 12th to the 16th century. The sea-borne trade in corn and wine existed before the reign of Richard I. The town formerly returned two members to parliament, but after 1885 returned one member.

GLOUCESTER, a city of Essex county, Massachusetts, 28 mi. N.E. of Boston, occupying 31 sq.mi. on Cape Ann; a port of entry, a summer resort and great salt-fishing port. It is served by the Boston and Maine railroad, by motorbus and by steamers to Boston. The resident population was 24,204 in 1930 and 24,046 in 1940 by the federal census; in some summers this population is almost doubled by visitors.

Rock-bound coasts, bald hills, bold and precipitous ledges, acres of boulders interspersed by small tracts of vegetation, quaint old village streets, houses dating from the 18th and even the 17th centuries and luxurious modern estates combine to make a picturesque region.

Within the city limits are the summer resorts of Magnolia, Annisquam, Bass Rocks and Eastern Point. Non-resident taxpayers are listed from every city and most towns of Massachusetts, and many other states.

On the coast at Magnolia is Rafe's chasm, a fissure 60 ft. deep and 6 to 10 ft. wide, cut into the rock ledge for a distance of 200 ft.; and near its entrance is the reef of Norman's Woe, celebrated in Longfellow's "Wreck of the Hesperus." The city's harbour is deep and commodious, but the traffic of the port has declined to only a part of its former volume, as much of the coal now comes in by rail and much of the general merchandise by rail and motor truck. Fishing (rosefish, pollock, cod, haddock, mackerel, hake, cusk, halibut) is the principal occupation, as it has been for three centuries. Many fishermen are Portuguese, Italian and Scandinavian immigrants. In 1939 the total catch landed at Gloucester was 75,766,000 lb.; this figure, however. represented only a part of the total catch of Gloucester vessels, as many ships land their products at Boston, Portland and other ports. The vessels range from the Capes of Virginia to Greenland and Iceland, and the length of their trips varies from a few days to

three or four months The curing, boning, and packing of the fish, and the making of glue and other by-products, are important subsidiary industries. The beautiful dark granite of the Cape is quarried at several places in Gloucester and the adjoining town of Rockport. This industry, dating from 1823, has furnished stone for government fortifications, the Woolworth Building in New York, and the towers of the Brooklyn bridge. The aggregate product of all the manufacturing industries in 1937 was valued at $7,519,207.

In 1605 Champlain sailed around the Cape, which he called Cap *aux* Isles, and in 1606 he mapped the harbour and named it Le Beau Port. A settlement was made in 1623 by English fishermen sent out by the Dorchester company, and in 1642 the town was incorporated. It was chartered as a city in 1874. During the 18th century and half of the 19th Gloucester had a considerable foreign trade. The fishing industry has had fluctutions in prosperity; a continuous evolution of methods and types of craft; and a history of daring, fortitude, hardships, heroism, and adventure. In 1923 a monument was erected to the 8,000 men who since 1830 had lost their lives in the fisheries.

Gloucester life has been described in many books: Rudyard Kipling, Captains Courageous; Elizabeth Stuart Phelps-Ward, *A Singular* Life and Old Maid's Paradise; James B. Connolly, *Out* of *Gloucester* (1902), The Deep Sea's Toll (1905), *The* Crested Seas (1907), and Gloucester Fishermen (1927).

GLOUCESTER CITY, a city of Camden county, New Jersey, on the Delaware river, opposite Philadelphia, adjoining Camden on the south. It is served by the Pennsylvania-Reading Seashore railway. Population was 12,162 in 1920; 13,796 in 1930; 13,692 in 1940, by federal census. Manufactures include paper, cotton and silk fabrics and rugs; the aggregate product in 1937 was valued at $8,102,256. Near the site of Gloucester City the Dutch in 1623 planted the short-lived colony of Fort Nassau. Permanent settlement dates from 1677, and a town (at first called Axwamus) was laid out in 1689. During the Revolution it was frequently occupied, and several skirmishes were fought in the vicinity. The most important was a successful attack on a detachment of Hessians, Nov. 25, 1777, by American troops commanded by Gen. Lafayette.

The city was chartered in 1868.

GLOUCESTERSHIRE, a county of the west midlands of England, bounded by Worcestershire, Warwickshire, Oxfordshire, Berkshire, Wiltshire, Somerset, Monmouth and Herefordshire. Its area is 1,254.7 sq.mi.

Physical **Features.**—The outline is very irregular, but three physical divisions are well marked—the hills, the vale and the forest. (1) The first (the eastern part of the county) lies among the uplands of the Cotswold hills (*q.v.*) whose westward face, the escarpment made by the Lower Oolites (Jurassic), is a line of heights of an average elevation of 700 ft., but exceeding 1,000 ft. at some points. This line bisects the county from south-west to north-east. The watershed between the Thames and Severn lies close to it, Thames Head near Cirencester and most of the upper feeders of the Thames being in Gloucestershire. (2) The "Vale" division is the rich valley of the lower Severn which can be separated into the vale of Gloucester and the vale of Berkeley. This great river receives, near Tewkesbury, the Stratford Avon which joins it on the left. The latter is to be distinguished from the Bristol Avon, which rises in the county as an eastward flowing stream of the Cotswolds, sweeps round through Wiltshire, pierces the hills through a narrow valley which becomes a gorge where the Clifton suspension bridge crosses it below Bristol, and enters the Severn estuary at Avonmouth. For 17 m. from its mouth it forms the boundary between Gloucestershire and Somersetshire, and for 8 m. it is an important commercial waterway connecting the port of Bristol with the sea. The third great tributary of the Severn is the Wye. From its mouth in the estuary, 8 m. north of that of the Bristol Avon, it forms the county boundary for 16 m. northward and above this, over two short reaches of its beautiful winding course, it is again the boundary.

(3) Between the Wye and the Severn lies the Forest of Dean, which unlike the majority of English forests, maintains its ancient character. The minor rivers of the county are never long. The vale is at no point within the county wider than 24 m., and so does not permit the formation of any considerable tributary to the Severn from the Dean hills on the one hand or the Cotswolds on the other. The Leadon rises east of Hereford, and joins the Severn near Gloucester. In the southern part, the Stroudwater traverses a narrow, picturesque and populous valley, and the Little Avon flows past the town of Berkeley, joining the Severn estuary on the left. The Frome runs southward to the Bristol Avon at Bristol. The principal northern feeders of the Thames are the Churn rising in the Seven Springs, above Cheltenham, the Coln, a noteworthy trout-stream, the Windrush and the Evenlode. The Churn and the Coln form the eastern county boundary along parts of the course.

Geology.—Gloucestershire is divided geologically into two distinct sections by a line passing from north to south, from the eastern side of the Malvern hills to Keynsham (east of Bristol). This divides the Mesozoic rocks on the east from the Palaeozoic and older rocks on the west and is an important structural feature. In the north of the county it separates, by means of a great fault, the Pre-Cambrian gneisses of the Malverns from the Trias of the Severn valley. The fault passes southward between the Old Red Sandstone (with some Carboniferous) and the Trias, to May Hill, which elevation is formed of Silurian shales, grits and limestones (with a small outcrop of Pre-Cambrian grits at Huntley). Thence the boundary line continues southward to the Severn still being between the two great red sandstone formations.

Rising up almost sheer from the Severn on the west is the plateau of the Forest of Dean which is a basin of Carboniferous rocks (limestones, shales, grits and coal-measures), resting upon the Old Red Sandstone, the Carboniferous limestones forming scarp faces round most of the outlier. South of the Severn is the Bristol coal-field, with Silurian rocks and included volcanic rocks north and north-east of it. The Silurian occurs as inliers (*e.g.,* Tortworth) and Old Red Sandstone rocks crop out beneath the Carboniferous of the coal-field. Liassic and Triassic rocks also occur, resting upon the older rocks. In the vale of the Severn, east of the great boundary line, the structure is comparatively simple. Between the Malvern-fault and a line from Newnham through Tewkesbury is an area of Trias and east of this, stretching to the Jurassic escarpment of the Cotswolds, is a broad belt of Liassic clay with Rheatic rocks (with famous bone beds) at their base. It is the soils from these two rocks which yield such excellent crops. With the exception of alluvial deposits, and glacial and fluvio-glacial drifts and gravels, there are no rocks in the county newer than the Oxford clay, a small outcrop of which occurs near Lechdale.

History and Early Settlement.— The most interesting prehistoric feature of Gloucestershire is its wealth of long Barrows (see O.G.S. Crawford: Ord. Survey, Professional Papers. New Series No. 6, 1922). Almost as striking is the absence of Beaker pottery so abundant in Wiltshire to the south and Oxfordshire to the east. The lower Severn valley was apparently largely forest and swamp in early times. The Cotswolds are again remarkably poor in brooches of the first period of La Tène though Wiltshire and Oxfordshire are again rich. In Roman times the famous Fosse way from Bath to Lincoln ran east of the Cotswold ridge with Corinium (Cirencester) as a station on it, and branches west to Glevum (Gloucester), south-east and east. There were numerous Roman villas not far from these roads.

The English conquest of the Severn Valley began in 577. The Hwiccas who occupied the district were a West Saxon tribe, but their territory had become a dependency of Mercia in the 7th century, and was not brought under West Saxon dominion until the 9th century. No important settlements were made by the Danes. Gloucestershire probably originated as a shire in the 10th century, and is mentioned by name in the Anglo-Saxon Chronicle in 1016. Towards the close of the 11th century the boundaries were readjusted to include Winchcomb, and at the same time the forest district between the Wye and the Severn was added to Gloucester. The divisions of the county for a long time remained very unsettled and Gloucestershire formed part of Harold's

earldom at the time of the Norman invasion, but it offered slight resistance to the Conqueror. In the wars of Stephen's reign the cause of the empress Maud was supported by Robert of Gloucester who had rebuilt the castle at Bristol, and the castles at Gloucester and Cirencester were also garrisoned on her behalf. Bristol and Gloucester actively supported the Yorkist cause during the Wars of the Roses. In 1643 Bristol and Cirencester were captured by the Royalists, but the latter was recovered in the same year, and Bristol in 1645. Gloucester was garrisoned for the parliament throughout the struggle.

On the sub-division of the Mercian diocese in 680 the greater part of modern Gloucestershire was included in the diocese of Worcester, and shortly after the Conquest constituted the archdeaconry of Gloucester. The district west of the Severn, with the exception of a few parishes was within the diocese of Hereford. In 1541 the diocese of Gloucester was created, its boundaries being identical with those of the county. On the erection of Bristol to a see in 1542 the deanery of Bristol was transferred from Gloucester to that diocese. In 1836 the sees of Gloucester and Bristol were united; but in 1897 the diocese of Bristol was recreated, and included the deaneries of Bristol, Stapleton and Bitton. After the conquest extensive lands and privileges were acquired by the church, the abbey of Cirencester alone holding seven hundreds. The large estates held by William Fitz Osbern, earl of Hereford, escheated to the Crown in 1075. The Berkeleys have held lands in Gloucestershire from the time of the Domesday Survey, and the families of Basset, Tracy, Clifton, Dennis and Poyntz have figured prominently in the annals of the county. Gilbert de Clare, earl of Gloucester, and Richard of Cornwall claimed extensive lands and privileges in the shire of the 13th century, and Simon de Montfort owned Minsterworth and Rodley. In the Cotswold region the churches typically show Romanesque work and Perpendicular work thus illustrating two special periods of economic development in the county related to the manors and the wool trade respectively.

Bristol was made a county in 1373, and in 1483 Richard III. created Gloucester an independent county, and both have continued to rank as independent counties, with separate jurisdiction, county rate and assizes. The chief officer of the Forest of Dean was the warden, who was generally also constable of St. Briavel castle. The first justice-seat for the forest was held at Gloucester castle in 1282, the last in 1635.

Iron was worked in the county in Roman times and later, and the forest district was one of the chief sources of iron in the country until the 16th century. The Cotswolds became famous for their sheep flocks and wool in the 15th century, which witnessed the expansion of such interesting towns as Chipping Campden which retains many interesting features. Many of the forests had tanneries, and boat building was carried on thanks to the timber available. Silk weaving was introduced in the 17th century and prospered in the Stroud valley. These varied industrial developments promoted the building of an interesting type of stone house specially characteristic around the Cotswolds. The abundance of clay on the edges of the plains promoted industries of bricks, tiles and potteries. Accessory industries, such as the making of pins, buttons, lace, stockings, rope and sailcloth grew up in the 17th and 18th centuries and a good deal of flax was grown. The advent of coal and steam machinery ended the modified and somewhat reduced woollen industry, but the presence of water power and of fullers' earth led the district (especially Stroud) to specialize in the manufacture of broadcloth. Gloucester was a port of some consequence and Bristol (*q.v.*) very important. The Cotswold area, especially Cheltenham, has become a residential area in modern times and the advent of the motor-car contributed to this development.

Antiquities. — At Chedworth, near Cirencester, there are well preserved remains of Roman baths. The cathedrals of Gloucester and Bristol, the magnificent abbey church of Tewkesbury, and the church of Cirencester with its great Perpendicular porch, are described under their separate headings. Of the abbey of Hayles near Winchcomh, founded in 1246, little more than the foundations are left. Most of the old market towns have fine parish churches. At Deerhurst near Tewkesbury, and Cleevc near Cheltenham, there are churches of special interest on account of their pre-Norman work. The Perpendicular church at Lechlade is unusually perfect; and that at Fairford built (c. 1500), contains a remarkable series of stained glass windows. The great decorated Calcot Barn is an interesting relic of the monastery of Kingswood near Tetbury. The castle at Berkeley is a splendid example of a feudal stronghold. Thornbury castle is a fine Tudor ruin. Near Cheltenham is a fine 15th century mansion of timber and stone, which contains a tiled floor from Hayles abbey. Near Winchcomb is Sudeley castle (15th century). At Great Badminton is the mansion and vast domain of the Beauforts.

Agriculture, Industries **and Communications.**—About three-quarters of the total area of 800.373 ac. was under cultivation in 1939, and of this about 74½% uas in permanent grass. Wheat is the chief grain crop (32,299 ac. in 1939), but oats and barley are also important. In the vale, the deep rich black (Lias) or red (Trias) loamy soil is well adapted for pasturage, and a moist mild climate favours the growth of grasses and root crops, of which the principal is turnips and swedes (7,017 ac.). The cattle, save on the frontier of Herefordshire, are mostly shorthorns, of which many are fed for distant markets, and many reared and kept for dairy purposes. The rich grazing tract of the vale of Berkeley produces butter and the "double Gloucester" cheeses, and the vale of Gloucester is the chief grain-growing district. A feature of the county is its apple and pear orchards (14,582 ac. in 1939), chiefly for the manufacture of cider and perry, which are attached to every farm. The Cotswold district is comparatively barren except in the valleys, but it has been famous since the 15th century for the breed of sheep named after it. Oats and barley are here the chief crops. The National Trust owned 1,725 ac. in the county in 1942.

The most important industrial centre of the county is Bristol. As a port and with an extensive trade with the West Indies, such industries as the manufacture of tobacco, cocoa and chocolate, sugar refining and soap have become important. The leading industry, however, is the aircraft manufacture. There are also iron foundries, chemical and engineering uorks, shipbuilding yards, breweries and factories making glass, earthenware and furniture. The district around Stroud has long been, and still is, famous for the manufacture of woollen cloth, a type known as broadcloth. Hardware is also made in this neighbourhood. Gloucester manufactures railway carriages and wagons, agricultural implements and pins. Being a port, it has foundries, shipbuilding yards, chemical works and rope factories. In other scattered parts of the county, gloves and silk manufactures and engineering are carried on. Coal is mined in the forest of Dean and the Bristol coal fields, limestone and freestone are quarried in the Cotswolds, bricks and tiles manufactured from the Lias clays. There are a number of important public schools and colleges in the county and Bristol is the seat of a university.

Railway communications are provided by the G.W. and L.M.S. companies. Of the G.W. railway, the main line serves Bristol from London. It divides at Bristol, one section serving the south-western counties, another via the Severn Tunnel, south Wales. A more direct route by this tunnel, between London and south Wales, is provided by a line from Wootton Bassett on the main line, running north of Bristol by Badminton and Chipping Sodbury. Other G.W. lines are that from Swindon on the main line, by the Stroud valley to Gloucester, crossing the Severn there, and continuing into Wales, with branches into Herefordshire; the Oxford and Worcester trunk line, crossing the north-east of the county, connected with Cheltenham and Gloucester by a branch through the Cotswolds from Chipping Norton junction and also by a branch from Andoversford with Cirencester. A line from Cheltenham runs by Broadway to Honeybourne. The East Gloucester line of the G.W. railway from Oxford terminates at Fairford. The west-and-north line of the L.M.S. railway follows the vale from Bristol by Gloucester and Cheltenham with a branch into the Forest of Dean by Berkeley, crossing the Severn at Sharpness by a great bridge 1,387 yd. in length, with 22 arches. The coal-field of the Forest of Dean is served by several branch

lines. In the north Tewkesbury is served by an L.M.S. branch (Ashchurch-Malvern). The Thames and Severn canal, rising to a summit level in the tunnel through the Cotswolds at Sapperton, is continued from Wallbridge (Stroud) by the Stroudwater canal, and gives communication between the two rivers. The Berkeley Ship canal (16½ mi.) connects the port of Gloucester with its output of Sharpness on Severn. There were 2,916 mi. of county roads in 1942.

Population and Administration.— The area of the administrative county is 1,209 sq.mi. and the population was estimated in 1938 at 343,600. Population movements caused by World War II raised the total county population by 7% between Sept. 1939 and Feb. 1941. The county contains 29 hundreds; is divided into four parliamentary divisions; contains two cities, Bristol and Gloucester; four municipal boroughs, Bristol (county borough), Gloucester (county borough), Cheltenham and Tewkesbury; and six urban districts, Cirencester, Charlton Kings, Nailsworth, Stroud, Kingswood and Mangotsfield. There are several old small ancient market towns. Gloucestershire is principally in the diocese of Gloucester, but part is in that of Bristol and small parts in those of Worcester and Oxford. It has one court of quarter sessions and there are 25 petty sessional divisions.

Gloucestershire was represented in parliament in 1290 and returned two members. Bristol and Gloucester acquired representation in 1295, Cirencester in 1572 and Tewkesbury in 1620. In 1832 the county returned four members in two divisions; Bristol, Gloucester, Cirencester, Stroud and Tewkesbury returned two members each, and Cheltenham returned one member. The act of 1868 reduced the representation of Cirencester and Tewkesbury to one member each. By the act of 1918, the county was divided into four divisions, viz., those of Cirencester and Tewkesbury, the forest of Dean, Stroud and Thornbury divisions each returning one member. Bristol returns five members, Cheltenham and Gloucester one each.

GLOVE, a covering for the hand, commonly with a separate sheath for each finger.

The use of gloves is of high antiquity, and apparently was known even to the pre-historic cave dwellers. In Homer Laertes is described as wearing gloves in his garden. Herodotus tells how Leotychides filled a glove with money received as a bribe, and Xenophon records that the Persians wore fur gloves having separate sheaths for the fingers. Among the Romans also there are occasional references to the use of gloves. Varro remarks that olives gathered with the bare fingers are better than those gathered with gloves. In the northern countries the general use of gloves would be more natural than in the south, and it is not without significance that the most common mediaeval Latin word for glove (guantus or *wantus*, Mod. Fr. gant) is of Teutonic origin (O.H.G. want). Among the Germans and Scandinavians, in the 8th and 9th centuries, the use of gloves, fingerless at first, would seem to have been but universal; and in the case of kings, prelates and nobles they were often elaborately embroidered and bejewelled. This was more particularly the case with the gloves which formed part of the pontifical vestments. In war and in the chase gloves of leather, or with the backs armoured with articulated iron plates, were early worn; yet in the Bayeux tapestry the warriors on either side fight ungloved. So far as the records go, there is no evidence to prove that gloves were in general use in England until the 13th century. It was in this century that ladies began to wear gloves as ornaments; they were of linen and sometimes reached to the elbow. It was, however, not till the 16th century that Queen Elizabeth set the fashion for wearing them richly embroidered and jewelled.

Symbolical Uses.—Of the symbolical uses of the glove one of the most widespread during the middle ages was the practice of tendering a folded glove as a gage for waging one's law. The origin of this custom is probably not far to seek. The promise to fulfil a judgment of a court of law, a promise secured by the delivery of a wed or gage, is one of the oldest of all enforceable contracts. This gage was originally a chattel of value. which had to be deposited at once by the defendant as security into his adversary's hand; and that the glove became the formal symbol of such deposit is doubtless due to its being tha most convenient loose object for the purpose.

FROM PLANCHÉ, "CYCLOPAEDIA OF COSTUME"

LEFT, A GLOVE OF MARY QUEEN OF SCOTS, 1542–1587. RIGHT, GLOVES OF WILLIAM OF WYKEHAM, BISHOP OF WINCHESTER. 1367-1404

Associated with this custom was the use of the glove in the wager of battle. The glove here was thrown down by the defendant in open court as security that he would defend his cause in arms; the accuser by picking it up accepted the challenge. This form is still prescribed for the challenge of the king's champion at the coronation of English sovereigns, and was actually followed at that of George IV. (see CHAMPION).

The use of the glove as a pledge of fulfilment is exemplified also by the not infrequent practice of enfeoffing vassals by investing them with the glove; similarly the emperors symbolized by the bestowal of a glove the concession of the right to found a town or to establish markets, mints and the like. Conversely, fiefs were held by the render of presenting gloves to the sovereign. The most notable instance in England, however, is the grand serjeanty of finding for the king a glove for his right hand on coronation day, and supporting his right arm as long as he holds the sceptre.

Pontifical Gloves are liturgical ornaments peculiar to the Western Church and proper only to the pope, the cardinals and bishops, though the right to wear them is often granted by the Holy See to abbots, cathedral dignitaries and other prelates. According to the present use the gloves are of silk and of the liturgical colour of the day, the edge of the opening ornamented with a narrow band of embroidery or the like, and the middle of the back with a cross. They may be worn only at the celebration of mass (except masses for the dead) and only until the ablution before the canon of the mass.

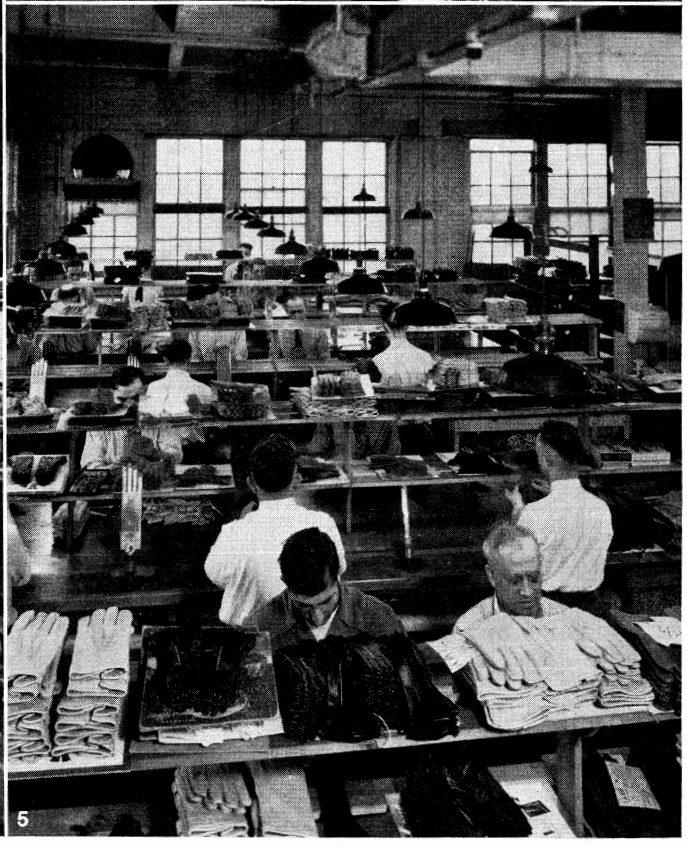
During the middle ages the occasions on which pontifical gloves were worn were not so carefully defined as now, the use varying in different churches. Nor were the liturgical colours prescribed. Liturgical gloves have not been worn by Anglican bishops since the Reformation, though they are occasionally represented as wearing them on their effigies.

Gloves made of thin indiarubber or of white cotton, which may be thoroughly and easily sterilized, are worn by many surgeons while performing operations.

GLOVE MANUFACTURE. Modern gloves fall naturally into two main groups: (1) leather gloves; (2) fabric and knitted gloves. The character of a leather glove depends partly upon the type of skin used, but more particularly upon the processes by which the leather is produced.

Glove Skins.—A large variety of skins are used by the trade; but the humble sheep supplies the bulk of the raw material. Apart from sheepskin, the principal skins used for grain (or glace') glove leathers (*i.e.*, those finished on the hair side of the skin) are kid, goat (chevrette) and lamb. French "national" skins from milk-fed kids are used extensively for ladies' high grade gloves; Tuscany, French "regord" and Kasan (Russia) lambskins are of high repute. In the grain group, also, the genuine Cape or South African hairy sheep furnish a strong, pliant leather for men's gloves. Many so-called "Capes," however, are made

GLOVE MANUFACTURE



BY COURTESY OF HANSEN GLOVE CORPORATION

MANUFACTURING LEATHER AND FABRIC GLOVES

1. Sorting and inspecting skins in the leather room of a glove factory
2. Cutting leather gloves by hand
3. Cutting fabric gloves. A large piece of material slides under a double clicking machine, which cuts a dozen gloves at a time
4. Sewing leather and fabric gloves on power machines
5. Ironing and pressing gloves on hollow forms filled with live steam

from Spanish, oriental or domestic sheepskins. Pig-skin and colt-skin are used for gloves to some extent in America, and dog-skins are occasionally made into glove leather.

For velvet finished gloves, reindeer and buckskins yield the finest leathers, but they are expensive. The diminutive North African gazelle (a tiny creature, so small that three skins barely suffice for a single pair of gloves), the Arabian (or Mocha) sheep, and Sudanese sheep also furnish capital leather for velvet finishes. Suede leathers (*i.e.*, those finished on the Aesh side of the skin) are produced from kid, lamb and sheep-skins. Sheep-skins, again, furnish most of the raw material for so-called "chamois," or washleather gloves, and also for what in the trade are called "doeskins."

Many glove manufacturers dress and dye skins for their own use; others purchase glove leather ready dressed. The skins are first partly cleansed in tanks or pits filled with water. They are then de-haired, the flesh side of the skins being painted with a solution of slaked lime and sodium sulphide or lime and red arsenic, which loosens the hair or wool and facilitates its removal by hand or machine. Any flesh adhering to the skin is next removed by "beaming" or "fleshing." Beaming is a hand operation, the skin being laid across a sloping beam let into the floor and the operative shaving away the flesh with a beaming knife. In the fleshing machine, which performs the same operation, the knives are mounted spirally upon a revolving cylinder, under which the skins are passed as through a mangle. The cleansed skins are steeped for some weeks in pits or vats containing a solution of slaked lime to loosen the sweatglands and hair cells and to remove grease, dirt, etc. Liming also makes the skins plumper. More washing follows, and the hides are then placed in a "puer" (or "bate") consisting either of a solution of dog manure, or a chemical solution of pancreatic extracts in combination with ammonium salts. "Drenching" is the next stage, wherein the raw material of the glove is immersed in vats containing a fermenting infusion of flour, pea-meal or bran, in which the skins swell or "rise" still more. Alternatively skins are pickled in a weak solution of sulphuric acid and salt. "Puering" and "drenching" or "pickling" complete the reduction of the hides to a soft, porous, pulpy, gelatinous condition which facilitates the entry of the dressing ingredients into the fibres of the skins. Further rinsings and cleansings follow, and the skins are then gently scraped with a scudding knife to remove the last vestige of hair or scum.

Dressing. — Dressing proper follows. There are several processes which may be adopted, according to the type of leather required and the practice of the factory. Different factories use different methods to produce the same kind of leather.

The "tawing" method, or white dressing, is very commonly used. A typical tawing mixture consists of 4 parts alum, 2 parts salt, 1 part egg-yolk and 5 parts flour. Sometimes a little vegetable oil is added. The mixture is dissolved in water (about 12 lb. to 2 gal.) and is applied by means of a drum-tumbler — a vessel shaped like a drum, the inner sides of which are fitted with pegs. The drum rotates on its own axis, and the pegs knead the mixture into the skins. Subsequently the skins are "stoved," or dried in heated chambers and emerge in the "crust" stage, resembling a piece of damp washleather which has dried hard in the sun. They are softened by "staking," a process in which the hides are drawn (flesh side downwards) over a blunt metal tool, fixed to a short stake or post set in the floor. Machine staking is now much used, especially for strong skins. The skins are later pared to an even thickness and usually stored for long periods before dyeing. Colour is applied either by brushing the dye on the outer surface of the leather, or by immersion in a drum tumbler. Vegetable or bark dyes are much used; but aniline and coal tar colours are suitable.

The foregoing process is much used for dressing *glace'* leathers, such as kid, lamb, nappa (a German term used to distinguish a drum-dyed article from a brush-dyed), and many so-called "Capes." *Glace'* or grain leathers are finished by polishing the grain side with a lamb's wool pad, a glass slicker or a revolving felt wheel. Suede (named after Sweden, the country of its origin) is tanned hy an alum and salt process, but It is finished by buffing the flesh surface on an emery wheel. Real "mochas" are dressed with lactic acid, alum and egg yolk; but the grain is first frized (raised with a frizing knife) and the grain side finished by buffing with emery and pumice.

Bark tanning (in which oak, chestnut, gambier, sumach and other barks are used) is adopted for leathers like genuine "Cape," goat, colt, pig and similar heavy-weight skins.

An oil tannage is used to produce so-called "chamois" leather and washleather. For these, "Aeshers" (the flesh section of the split sheep-skins) are dressed with cod-oil in a "stocking" machine, which pummels the oil into the leather. The process is sometimes termed "samming," and it involves repeated applications of oil, each dressing being followed by stove drying. Reindeer and buckskins are often oil-dressed, as are some "degrains"—leather with the grain "frized" or shaved off. These are then dyed as required. White washable leather is tanned by drumming skins in a solution of sodium carbonate and formaldehyde, later treating them with an emolient of egg-yolk and neat-foot or olive-oil. Much progress has been made since 1920 with chrome dressing, and an entirely new range of coioured washable gloves is available in consequence. This process is much used for washable grain leathers, particularly in America; but velvet finished, especially "degrains" made from frized gazelle or Cape, Spanish and Sudanese sheep are successfully treated in this way. The tannage is effected by drumming in a solution of chrome salts, after which the skins are treated with an oil emulsion. "Doe-skins" are usually oil-dressed sheep-skins or lamb-skins dyed with a liquid clay dye. In America, they are dressed by the formaldehyde process. Gazelle, antelope and the various deer-skins are often "degrained" (or frized) and dressed with a velvet finish. Sometimes the white tannage is used and sometimes the formaldehyde or chrome process.

Glove-cutting. — Glove-cutting is a twofold operation. The cutters first stretch and manipulate the skins, and then cut them into oblong "tranks" of leather. Several tranks are placed together in a punching press fitted with a "calibre" (knives shaped like a double thumbless hand) and the shaped glove is punched out at one operation. "Fourchettes" (pieces for the sides of the fingers) and thumb pieces are punched out separately.

The work of sewing is principally a cottage industry. Hand sewing is preferred for the highest class of work; but machine sewing is general. Three special types of stitch are used: — (1) "round seam" (for light-weight gloves), in which the edges of the leather are brought together, back to back, and each stitch goes through the leather, and over the edge; (2) "prix-seam" (for heavy-weight gloves), in which the edges are brought together and the stitching goes through and through, parallel to the edge; and (3) "pique," in which one edge is lapped over the other, and the stitches sewn through. When sewn, the gloves are dressed on heated metal "hands" and ironed and polished ready for boxing. Fur gloves are made in much the same way, except that the fur is cut by hand.

The annual production of leather gloves fluctuates considerably; fashion and the severity of winter weather have an important bearing on demand. The principal centres of manufacture are France, the United States, Italy, Germany, Czechoslovakia, England, Belgium, Luxemburg and Canada.

The French industry dates from the 11th century. It is carried on at Grenoble, Millau, St. Junien and Niort, and there are large dressing yards at Annonay in the Ardeche. Though France is the largest glove manufacturing country in the world, no figures of the annual production are available. The output is chiefly in kids, lambs and light-weight suedes and washables, and more than 75% of the output is exported.

The glove industry of the United States dates from 1760, when Sir William Johnson introduced a colony of Scottish glovers from Perth. These founded the town of Gloversville, Fulton county (N.Y.), the chief seat of the industry. Production (chiefly of heavier types) has increased very rapidly since the World War, and has reached 3,500,000 dozen pairs annually. The majority are sold in the home market.

Czechoslovakia (Bohemia) manufactures mainly kid, nappa and chamois gloves. Annual output exceeds 1,250,000 dozen pairs, and the bulk are exported. Prague is the chief centre, and Kaadan (or Caadan) is famous for cheap washables.

The German industry is centred in Bavaria, Munich being the principal centre; and there are factories in Berlin. A large part of the output (kid, suede, nappa and lined gloves) is exported, shipments totalling over 500,000 dozen annually. The output of leather gloves is about 1,500,000 dozen pairs.

The chief Italian glove town is Naples (where cheap kid and lamb gloves are made); Milan, Turin and Genoa are smaller centres producing better quality gloves. Over 50% of production is exported, and annual shipments increased from 200,000 dozen pairs in 1921 to 750,000 dozen in 1925, but fell to 500,000 dozen in 1926.

The British leather glove industry is centred mainly at Worcester and Yeovil; but it is carried on in many scattered hamlets in the west country and in Oxfordshire. Annual output fluctuates between 750,000 and 1,000,000 dozen pairs; large quantities of lined and heavy-weight gloves being made.

Fabric Gloves.—Fabric gloves are of two kinds: (1) gloves cut from knitted cotton or silk fabric; and (2) knitted woollen gloves or "Ringwoods." The fabric for the former is knitted on warp-knitting machines of the Atlas or Milanese type, bleached or dyed and sometimes finished to simulate suede or washable or any other velvet-finished leather by treatment on an emery or other buffing wheel, or by teazles. The fabric glove is cut out and sewn much in the same way as a leather glove. Germany manufactures the bulk of the world's supplies, about 7,000,000 dozen pairs. The industry is centred around Chemnitz (Saxony). The annual production is largely exported, the value of the annual shipments fluctuating between 40,000,000 and 70,000,000 marks. Fabric gloves are also made in France at Paris and Lyons and in the English glove centres. Superfine silk gloves are made in New Jersey, U.S.A.

Woollen gloves are made in hosiery mills. The seamless type is produced, partly on circular knitting machines (wrist and hand) and partly on flat hand-operated machines (thumbs and fingers). Wrought gloves are usually knitted on straight bar machines, which enable various designs to be worked. The gloves are seamed on a cup-seaming machine. Leicester, Nottingham and the Scottish border towns are the main centres of manufacture.

GLOVER, RICHARD (1712–1785), English poet, son of Richard Glover, a Hamburg merchant, was born in London and educated at Cheam in Surrey. In 1737 he published an epic poem in praise of liberty, *Leonidas,* which was thought to have a special reference to the politics of the time; and being warmly commended by the prince of Wales and his court, it soon passed through several editions. In 1761 he entered parliament as member for Weymouth. He died on Nov. 25, 1785. Glover was one of the reputed authors of *Junius;* but his claims—which were advocated in an *Inquiry concerning the author of the Letters of Junius* (1815), by R. Duppa—rest on very slight grounds.

Glover's other works include *London* (1739), a poem; *Hosier's Ghost* (1739), a ballad directed against the Spaniards; *Athenaid* (1787), an epic; and his diary, *Memoirs . . . from 1742 to 1757* (1813).

GLOVERSVILLE, a city of Fulton county, New York, in the foot-hills of the Adirondacks, 45m. N.W. of Albany. It is served by the Fonda, Johnstown and Gloversville railroad, connecting at Fonda, 7m. S., with the New York Central. The population was 22,075 in 1920 (82% native white) and 23,329 in 1940. The dominating industry, as the name suggests, is the making of gloves. There are many factories making silk and leather gloves and mittens, supplemented by many home-workers, as well as tanneries, leather-finishing plants and other subsidiary industries.

Gloversville, Johnstown and adjacent country districts make a considerable part of all the gloves manufactured in the United States. The industry was introduced by a colony of Perthshire families who were settled in the region by Sir William Johnson about 1760. By 1809 their goods had begun to find markets beyond the neighbourhood, and by 1825 the industry was firmly established. The settlement of Gloversville began about 1770. Until 1828, when the present name was adopted, it was called Stump City. The village was incorporated in 1851, and in 1890 it became a city.

GLOW-WORM, the wingless female of the beetle *Lampyris noctiluca,* whose power of emitting a greenish-white light has been familiar for many centuries. The luminous organs of the glow-worm consist of cells similar to those of the fat-body, grouped into paired masses in the ventral region of the hinder abdominal segments. The light given out by the wingless female insect is believed to attract the flying male, whose luminous organs are rudimentary. The common glow-worm is a widespread European and Siberian insect, generally distributed in England and ranging in Scotland northwards to the Tay, but unknown in Ireland. Exotic species of *Lampyris* are similarly luminous, and light-giving organs are present in many genera of the family *Lampyridae* from various parts of the world. Frequently—as in the south European *Luciola italica*—*both* sexes are provided with wings, and both emit light. These luminous, winged Lampyrids are generally known as "fire-flies." In correspondence with their power of emitting light, the insects are nocturnal.

Elongate centipedes of the family *Geophilidae,* certain species of which are luminous, are sometimes mistaken for the true glow-worm.

GLOXINIA, a charming decorative plant, *Sinningia speciosa,* a member of the family Gesneriaceae and a native of Brazil. The species has given rise under cultivation to numerous forms showing a wonderful variety of colour, and hybrid forms have also been obtained between these and other species of *Sinningia.* A good strain of seed will produce many superb and charmingly coloured varieties. The plants are usually propagated, however, by planting the leaves on soil, when as in *Begonia* a new plant develops, arising from the base of the petiole. *Gloxinia* is also the proper botanical name of six tropical American plants of the same family.

GLOZEL. The hamlet of Glozel is 20 km. south-east of Vichy, department of Allier. On March 1, 1924, the son of a local farmer named Fradin discovered the remains of a glass furnace of some antiquity of a type not uncommon in that region. In April 1925 Dr. Morlet, in consulting practice at Vichy, got into touch with Fradin, whose excavations continued. These included three bricks engraved before baking with alphabetic form signs, and the complete apparatus of a glass manufactory. Details were published by Dr. Morlet and Fradin. By the beginning of 1926 twenty-one inscribed tablets had been found. Nine further tablets with new characters were found. In August 1926 M. Salomon Reinach, the distinguished scholar, visited Glozel and has given the weight of his authority in support of the authenticity of the objects thus discovered.

The attention of the learned world was drawn to Glozel by a letter from M. Reinach published in the London *Times.* He pointed out that the discoveries included objects akin to the Neolithic cultures of the Aegean, one of them being an idol in the shape of a violin, inscriptions closely related to those found in 1894 in an early Portuguese dolman and numerous engravings of animals on pebbles, in a degenerate Magdalenian style. Obviously, the most surprising objects were the inscribed clay tablets. If genuine and if datable to a remote period, many theories of the origin of the alphabet would need revision and the whole question of the content and scope of Neolithic civilization would have to be considered. It is the peculiar virtue of archaeology that it offers us from time to time discoveries which produce *a* revolution of hypotheses based on earlier, less accurate, less ample, data. Every science, too, demands periodic revision of its fundamental hypotheses. It is necessary, therefore, that discoveries

of this nature should be completely free from. doubt in order that their value as keys to accurate knowledge may be utilised.

The authenticity of these discoveries was criticised by the Abbé Breuil in *Anthropologie* xxxvi. 1926, pp. 543–558. Reinach contributed an article to *The* Antiquary's Journal supporting his views. In June, 1927, Mr. O. G. S. Crawford, the editor of Antiquity published an article in which, profiting by a visit to Glozel, he concluded that the majority of the objects were certainly forgeries. Some there were which, in his opinion, were genuine antiquities though not prehistoric and his emphatic opinion is that the inscriptions, engravings and the majority of the other finds are forgeries and that those who believe in their authenticity have been the victims of a hoax (Antiquity March and June, 1927). In September 1927 the International Institute of Anthropology at its meeting in Amsterdam appointed a Commission to visit Glozel to examine the site and the objects found therein and to pronounce their opinion upon the authenticity of the discoveries.

By this time the French government had taken official action to recognize the site as one of scientific importance meriting the protection of the law. The Commission consisted of eight members from Spain, France, Alsace, Great Britain, Belgium, Switzerland and Czecho Slovakia, one of whom was unable to take part in its investigations and deliberations. In November 1927 the Commission visited Glozel, examined and tested the site and the objects already found and reported unanimously the antiquity of the material discovered at Glozel had not been proved. It was admitted that authentic material of an early date may have been introduced by natural methods. In a series of articles in the Mercure de France Dr. Morlet maintained the authenticity of the discoveries, hotly repudiated the suggestion that the scientific world had been hoaxed, and vigorously criticized the methods and findings of the Commission. A remarkable degree of acrimony characterizes the controversy which has arisen and reference to the Law Courts has been made.

See ***Revue Anthropologique,*** Supplement No. 10–12, 1927.

GLUCINUM, an alternative name for the metal beryllium (*q.v.*). When L. N. Vauquelin in 1798 published in the *Annales* de chimie an account of a new earth obtained by him from beryl he refrained from giving the substance a name, but in a note to his paper the editors suggested glucine, from γλυκύς, sweet, in reference to the alleged taste of its salts, whence the name glucinum or glucinium (symbol Gl. or sometimes G).

GLUCK, CHRISTOPH WILLIBALD (1714–1787), operatic composer, German by birth, French by his place in art, was born at Weidenwang, near Neumarkt, in the upper Palatinate, on July 2, 1714. His father was gamekeeper to Prince Lobkowitz; and from his 12th to his 18th year he received a good general education, including music lessons, at the Jesuit school of Kommatan, near Prince Lobkowitz's estate in Bohemia. At the age of 18 he went to Prague, where he studied under Czernohorsky, and maintained himself by hand-to-mouth musical jobs, sometimes at village fairs and dances. Prince Lobkowitz introduced him to the best families of the Austrian nobility; and when in 1736 he proceeded to Vienna he was hospitably received at his protector's palace. Here he met Prince Melzi, an ardent lover of music, whom he accompanied to Milan, continuing his education under Giovanni Battista San Martini (or Sammartini), a great musical historian and contrapuntist, whose al fresco style of chamber-music was an important if unconscious step towards the dramatic orchestration of the future. Gluck soon becomes a fluent writer, producing nine operas at various Italian theatres between 1741 and 1745. Unimportant as they are in the light of his mature art, they were so well received that in 1745 he was invited to London to compose for the Haymarket, where he produced La Caduta *dei giganti* and followed it by a revised version of an earlier opera. He also appeared in London as a performer on the musical glasses (see HARMONICA).

The poor success of his two operas, as well as that of a pasticcio entitled *Piramo* e Tisbe, shortened his London visit. But his stay in England was not without important consequences for his future. Gluck at this time was rather less than an ordinary producer of Italian opera. Handel said that Gluck "knows no more counterpoint than my cook." which was probably true, seeing that that cook was an excellent bass singer who performed in many of Handel's own operas. Musical cookery demands more counterpoint than Gluck ever mastered; and, if Gluck did not as yet see any connection between counterpoint and drama, he learnt much from the surprising discovery that arias which in their original setting had been much applauded lost all effect when adapted to new words in the pasticcio. Handel's criticism was by no means irrelevant. The use of counterpoint is independent of contrapuntal display; its real and final cause is a certain depth of harmonic expression which Gluck attained only in his most inspired moments, and for want of which many of his subtle details are dangerously like oversights. And in later years his own mature view of the importance of harmony, which he upheld in long arguments with Grétry, who believed only in melody, shows that he knew that the dramatic expression of music must strike below the surface. Ai this early period he was simply producing operas on Handel's, or rather Hasse's lines without a sign of mastery. Yet the failure of his pasticcio is profoundly significant, since it shows that already the effect of his music depended upon its characteristic treatment of dramatic situations. This characterizing power was as yet only thus indirectly evident, and the art of music needed all the new resources of the rising sonata-forms (*q.v.*) before it could break through its architectural and decorative restraints and enter into dramatic regions at all.

The chamber music of Sammartini had already indicated to Gluck a style incompatible with the older art, and a short trip to Paris brought him into contact with the classic traditions and the declamatory style of the French opera—things which an intelligent prophet might have foreseen to be of immense importance to a pupil of Sammartini. Little change, however, is to be found in the works produced by Gluck with varying success during the 15 years after his return from England. His first opera written for Vienna, La *Semiramide* riconosciuta, is again a fashionable opera seria, and little more can be said of *Telemacco*, although 30 years later Gluck was able to use most of its overture and an energetic duet in one of his greatest works, Armide, and to adapt another number to the sublime purposes of a still greater work, *Iphigénie* en *Tauride*.

Gluck settled permanently at Vienna in 1756, having two years previously been appointed court chapel-master, with a salary of 2,000 florins, by the empress Maria Theresa. He had already received the order of knighthood from the pope after the success of two of his works in Rome. During the long interval from 1756 to 1762 Gluck seems to have been meditating his plans for the reform of the opera, producing little more than the ballet Don Giovanni and some French airs nouveaux with pianoforte. Several later pieces d'occasion, such as *Il* Trirzofo di *Clelia* (1763), are still written in the old manner. But already in 1762 Orfeo ed *Euridice* had revolutionized the whole art of music. Gluck had for the first time deserted Metastasio for Raniero Calzabigi, who, as Vernon Lee suggests, was in all probability the immediate cause of the formation of Gluck's new ideas. He was a hot-headed dramatic theorist with a violent dislike for Metastasio, who had hitherto dominated the whole sphere of operatic libretto. Calzabigi reduced the operatic scheme from a complicated plot designed for working in three arias in each act for each of seven expensive singers, to the simplest possible means of expressing and concentrating the obvious emotions aroused by a classical myth.

In Orfeo there are only three characters besides the chorus. The chorus itself has to play a different part in each scene; human mourners in the first act; Furies in the first part of the second act, Elysian shades in the second part, and a rejoicing human crowd when, as in Monteverde's pioneer work of 150 years earlier, the pathos of the story becomes intolerable to the poet, the composer, and the audience, so that Eurydice has to be galvanized back into life and received with Orpheus and the thaumaturgic Amor by a triumphant chorus and a long series of ballets. For the rest, the pathos of the music is among the

greater experiences of the art. Even in the first act, which is occupied, until the sudden entry of Eros (Amor), entirely with the chorus of mourners and the lament of Orpheus at Eurydice's tomb, there is no feeling of monotony, no lack of dramatic power, and no lapse from the highest activity of the composer's imagination. Nothing like it had been dreamt of before, and one of its most interesting features is that it is neither histrionic nor realistic. The echoes of Orpheus's cadences by a cor anglais behind the scene are sheer gratuitous poetry as far transcending real echoes as Shelley's skylark transcends a real bird. The central feature of *Orfeo* is, of course, his conquest of the Furies who would bar his way to Eurydice. Gluck lived to master more complex situations, but neither he nor anyone else ever achieved, even with Wagner's resources, a more perfect and touching piece of music-drama. From the cavernous reverberations of the first chords of the orchestra, interrupted by the approaching sounds of Orpheus's harp, to the last subdued assent of the vanquished Furies, the dramatic and musical power are of the highest order.

The Furies sing throughout in the rhythm  chi mai nel | Erebo

until they are reduced to interrupting Orpheus's gathering flow of melody by "No:—No," at first thunderous, then softer. For the later productions in Paris, Gluck had to rewrite the castrato-alto part of Orpheus for a tenor, with transpositions ruinous to the key-system of the whole; but this did not impair the wonderful power of Orpheus's declamation. The inspiration is fully maintained in the following Elysian scene, an even greater test of the composer's depth of feeling.

No surprise should be felt that Orpheus was followed by work of no importance. Even reformers of opera must live; and Gluck's five great reform-operas were enough to occupy him but not enough to support him for the remaining 25 years of his life. Besides, he constantly drew upon his inferior works for whole movements in his greatest. In *1767* Gluck and Calzabigi followed up *Orfeo* by a similar work on a larger scale. Gluck's dedication of the score to the grand-duke of Tuscany is the Magna Charta of opera. "I have tried," he wrote, "to reduce music to its real function, that of seconding poetry by intensifying the expression of sentiments and the interest df situations without interrupting the action by needless ornament. I have accordingly taken care not to interrupt the singer in the heat of the dialogue, to wait for a tedious ritornel, nor do I allow him to stop on a sonorous vowel, in the middle of a phrase, in order to show the nimbleness of a beautiful voice in a long cadenza." Less obvious and far more important is his principle that the orchestral instruments shall be "combined in accordance with the passions represented," an epitome of the whole difference between symphonic (or dramatic) orchestration and the decorative schemes of the continuo period. *(See* CHAMBER MUSIC and INSTRUMENTATION.)

Vienna was no easy town to conquer by principles apparently so hostile to music for music's sake; and neither *Alceste* nor ***Paris*** *and Helena (1769)* was received as cordially as Gluck had hoped. He therefore eagerly accepted the chance of bringing his art into contact with the encyclopaedists and dramaturgists of Paris, where his enthusiastic admirer, the *bailli* Le Blanc du Roullet, attaché of the French embassy at Vienna, set in motion the project of an opera for the Paris stage. Racine's *Iphigénie en Aulide* was the subject chosen. Obstacles, usual and unusual, were removed chiefly by the intervention of Gluck's former pupil, the dauphiness Marie Antoinette, and the opera was eventually performed at the Académie de Musique, on April *19,* 1774.

Heated controversy immediately emphasized the importance of the new work, both in its musical and in its literary aspects. At first the upholders of French music were no more favourable to Gluck than the connoisseurs of Italian singing; they forgot that Lulli was no more a Frenchman than Gluck, and they could see only that Gluck was no Rameau. Marmontel, La Harpe and D'Alembert were his opponents, the Abbé Arnaud and others his enthusiastic friends. Rousseau had the sense to change his mind. Beginning as a violent partisan of Italian music, when Gluck himself asserted the merits and possibilities of French music, he acknowledged his genius, although he did not always understand it, as for example when he suggested that in *Alceste,* "Divinités du Styx," perhaps the most majestic of all Gluck's arias, ought to have been set as a rondo. But in a letter, written shortly before his death, to Dr. Burney, Rousseau gives a close and appreciative analysis of *Alceste,* the first Italian version of which Gluck had submitted to him for suggestions; and when after the first performance of the French version the composer exclaimed, *"Alceste* est *tombée,"* Rousseau replied, *"Oui, mais elle est tombée du ciel."*

The contest turned to fresh issues when Piccinni, a celebrated and by no means incapable composer, came to Paris as the champion of the Italian party at the invitation of Madame du Barry, who held a rival court to that of the young princess *(see* OPERA). It is a mistake to see in the war of Gluckists and Piccinnists a foreshadowing of the Wagnerian controversy; the issues were merely those of cliques, and anybody who has the patience to read Piccinni's music will be amused at his pathetic attempts to copy Gluck in every point where public applause had justified the shocking risks Gluck was always taking. Gluck was by far the better musician, but contemporaries could see the weaknesses of his technique as easily as they could see the vaguely different weaknesses of Piccinni's. Gluck's gift of melody was sublime, and Piccinni's was by no means contemptible; and both composers had the gift of making incorrect music sound agreeable. Gluck's indisputable dramatic power did not concern upholders of music for music's sake, and was no ground of opposition to the Piccinnists as far as they could understand it. The rivalry between the two composers was soon skilfully engineered into a quarrel. In 1777 Piccinni was given a libretto by Marmontel on the subject of *Roland,* to Gluck's intense disgust, as he had already begun an opera on that subject himself. This, and the failure of attempts in a lighter style furbished up from earlier works at the instigation of Marie Antoinette, inspired Gluck to produce his *Armide,* which appeared four months before Piccinni's *Roland* was ready, and raised a storm of controversy, admiration and abuse. Gluck did not anticipate Wagner more clearly in his dramatic reforms than in his caustic-temper; and, as in Gluck's own estimation, the difference between *Armide* and *Alceste* is that "l'un (Alceste) doit faire pleurer et l'autre faire Cprouver une voluptueuse sensation," it was extremely annoying for him to be told by Laharpe that he had made Armide a sorceress instead of an enchantress, and that her part was "une criaillerie monotone et fatiguante." He replied to Laharpe in a long public letter worthy of Wagner in its venom and its effect in immortalizing its recipient.

Gluck's next work was *Iphigénie en Tauride,* the success of which finally disposed of Piccinni, who produced a work on the same subject at the same time and who is said to have acknowledged Gluck's victory. It was followed by *Echo et Narcisse,* the comparative failure of which greatly disappointed Gluck; and during the composition of another opera, *Les Danaïdes,* an attack of apoplexy compelled him to give up work. He left Paris for Vienna, where he lived for several years in dignified leisure, disturbed only by failing health which ended in his death on Nov. 15, *1787.* Burney gives a charming account of a day with Gluck, whom he visited in the same week as he visited Metastasio.

The dramatic importance of Gluck's reforms is apt both to overshadow and to idealize his merit as a musician. Where Gluck differs from the greatest musicians is in his absolute dependence on literature for his inspiration. Where his librettist failed him (as often in his last complete work, *Écho et Narcisse),* he had no first-rate routine to lean upon; and, even in the finest works of his French period, the less emotional situations are sometimes set to music which has little but historic interest. A mere inability to set a bad text to good music might be a sign rather of good literary sense than of poor musicianship. But it points to a certain weakness as a musician that Gluck could not be inspired except by the more emotional features of his libretti. When he was inspired he was unquestionably the first and only essen-

tially dramatic composer before Mozart, except the miraculous and untimely born Purcell.

To begin with, he could invent sublime melodies; and his power of producing great musical effects by the simplest means was nothing short of Handelian. Moreover, if Haydn is the father of modern orchestration, the writer of the preface to *Alceste* is its godfather. He was by no means the first to use the timbre of instruments with a sense of emotional effect, for Bach and Handel well knew how to give a whole aria or whole chorus an appropriate tone by means of a definite scheme of instrumentation. But it is just such definite schemes that impeded the progress of music-drama. Gluck did not treat instruments as part of a decorative design, any more than he so treated musical forms. His instrumentation changes with every shade of feeling in the dramatic situation. Strings, oboes and flutes were an ordinary accompaniment for an aria; nor was there anything unusual in making the wind instruments play in unison with the strings for the first part of the aria, and writing a passage for one or more of them in the middle section. But it was an unheard-of thing to make this passage consist of isolated long appoggiaturas once every two bars in rising sequence on the first oboe, answered by deep pizzicato bass notes, while Agamemnon in despair cries: "J'entends retentir dans mon sein le cri plaintif de la nature." Gluck is a master of tragic irony and subconscious confession. When, for instance, in *Iphigknie en Tauride,* Orestes gasps "Le calme rentre dans mon coeur," the agitated rhythms of the strings belie him. Again, the power of orchestral climax shown in the oracle scene in *Alceste* was a thing inconceivable in older music and on that plane of absolute masterpieces that no later music can supersede. Its influence in Mozart's *Idomeneo* is obvious at a first glance.

The capacity for broad melody always implies a true sense of form, whether that be developed by skill or not; and Gluck's form is inspired not merely by melody but by a magnificent sense of free phrase-rhythm, worthy of the mature sonata-style of Mozart. And his power in persistent quantitative rhythms is Wagnerian. Hence he had plenty of resource for replacing by better things the civilization he destroyed. Moreover he, in consultation with his librettist, achieved great skill in holding together entire scenes, or even entire acts, by dramatically apposite repetitions of short arias and choruses. And thus in large portions of his finest works the music, in spite of frequent full closes, seems to move *pari passu* with the drama in a manner which for naturalness and continuity is surpassed only by the finales of Mozart and the entire operas of Wagner. This continuity is most impressive in both scenes of the second act of *Orfeo*. The damage done to the key-system of these perfectly unified scenes by the Parisian transposition of Orpheus's part is, as previously noted, dreadful, but easily remedied by transposing Orpheus's part back again; and in a suitable compromise between the two versions *Orfeo* remains Gluck's most perfect and inspired work. The emotional power of the music is such that the ruin of the story by a happy ending is a real relief from tension; it is like the gesture of Shakespeare's last works, where we know all about the tragic issues and may as well dismiss them with fairy-tales. Moreover, Gluck's genius was of that high order which is as great in happiness as in grief. He failed only in the business capacities of artistic technique; and there is less business in *Orfeo* than in any other music-drama. It was Gluck's first great inspiration, and his theories had not had time to become doctrinaire, though Calzabigi was disposed to magnify his office.

Alceste contains Gluck's grandest music and is also very free from weak pages; but in its original Italian version the third act had no adequate climax, a defect wholly inadmissible in Paris, where, after continual retouchings a part for Hercules was, in Gluck's absence, added by Gossec; and three pages of Gluck's music, dealing with the supreme crisis where Alceste is rescued from Hades (either by Apollo or by Hercules) were no longer required in performance and have been lost. The Italian version cannot help us to restore this passage, in which Gluck's music now stops short just where we realize the full height of his power. The stiffness of Gossec's rhythm reveals the immense distance Gluck had travelled from all contemporaries as well as from the old ways; and the comparison between the Italian and French *Alceste* measures the pace of Gluck's development between 1767 and 1775. It would have been far easier for Gluck to write a new opera if he had not been so justly attached to his second Italian masterpiece. So radical are the differences that in retranslating the French libretto into Italian for performance with the French music not one line of Calzabigi's original text can be retained.

In *Iphigénie en Aulide* and *Iphigénie en Tauride,* Gluck shows signs that the doctrinaire is beginning to gain on the spontaneous artist. This, at least, is the general impression left in a reflective memory, though one indignantly denies it on renewing acquaintance with the works in performance. Gluck had not, in *Orfeo,* gone out of his way to avoid rondos, or we should have had no "Che farb senza Euridice." We read with a respectful smile his assurance to the *bailli* Le Blanc du Roullet that "you would not believe *Armide* to be by the same composer" as *Alceste.* But there is no question that *Armide* is a very great work, full of melody, colour and dramatic point; and that Gluck has availed himself of every suggestion that his libretto afforded for orchestral and emotional effects of type almost entirely new to him. He has been absurdly blamed for his inability to write erotic music. The intention of the work is no more erotic than that of Tasso's *Gierusalemme liberata.* Love is a baleful enchantment, viewed through the eyes of crusading knights. Even so, the conflict of passions, where Armide summons the demons of Hate to exorcise love from her heart, and her courage fails her as soon as they begin, has never, even in *Alceste,* been treated with more dramatic musical power. The work as a whole is unequal, partly because Quinault's go-year-old poem had far too much action in it to suit Gluck's methods, but it shows, as does no other opera until Mozart's *Don Giovanni,* a sense of the *development* of characters, as distinguished from the mere presentation of them as fixed types.

In *Iphigénie en Aulide* and *Iphige'nie en Tauride,* the very subtlety of the finest features reveals a self-consciousness which, when inspiration is lacking, becomes mannerism. Moreover, in both cases the libretti, though skilfully derived from Racine and Corneille, are more complicated than those of Gluck's first masterpieces; and where inspiration fails, the awkward technique has lost its earlier naïveté. Still, these works are immortal, and their greatest passages are equal to anything in *Alceste* and *Orfeo. Iphige'nie en Tauride* is indeed, as realized by Gluck, an amazingly spiritual work to find its way to the operatic stage and prove itself so effective there. We must agree with Gluck's contemporaries to call *Echo et Narcisse* a failure. As in *Orfeo,* the pathetic story is ruined by a violent happy ending, but here this artistic disaster takes place before the pathos has begun to move us. Prettiness was the highest possibility of the subject; and with Gluck beauty, without emotional impulses, was less than skin-deep. The great Pelletan-Damcke *édition de luxe* of Gluck's French operas includes this work, gives only the French version of *Orphée,* and excludes *Paride e Elena* which was never given in Paris. A modern full score of *Yaride e Elena* is a desideratum to complete the study of Gluck's work with Calzabigi, to whom he owed more than he owed to France. Perhaps this may be given in the miniature scores inaugurated in 1927 by that of *Iphigknie en Tauride* with an excellent preface and critical revision by H. Abert (Eulenburg). (D. F. T.)

GLÜCKSBURG, a town of Germany, in the Prussian province of Schleswig-Holstein, on the Flensburg Fjord, 6 m. N.E. from Flensburg by rail. Pop. (1933) 1,792. It is a sea-bathing resort. The castle occupies the site of a former Cistercian monastery.

GLÜCKSTADT, a town of Germany, in the Prussian province of Schleswig-Holstein, on the right bank of the Elbe, 28 m. N.W. of Altona, by rail. Pop. (1933) 6,839. It was founded by Christian IV. of Denmark in 1617, fortified in 1620, and soon became an important trading centre. In 1627–28 it was besieged unsuccessfully by the Imperialists under Tilly. In 1814 it was

blockaded and its fortifications were demolished. In 1830 it was made a free port. It came into the possession of Prussia with the rest of Schleswig-Holstein in 1866.

The inhabitants are chiefly engaged in herring fishery, but have suffered frequent losses from inundations.

GLUCOSE occurs abundantly in animals and plants, either alone or in combination, combined with fructose (fruit-sugar or laevulose) as sucrose (cane-sugar), with galactose as lactose (milk-sugar), with itself as maltose (malt-sugar), and so on. It is an aldose (aldehyde-alcohol) of the hexose class, having the formula $C_6H_{12}O_6$, and is also known as grape sugar or dextrose. The latter name refers to the fact that its solutions rotate the plane of polarized light to the right. (See CARBOHYDRATES.) When pure, it is a white, crystalline powder, but it is more often seen as a yellowish, highly concentrated syrup of a sickly sweet taste; it is also obtainable as warty masses of its hydrate, $C_6H_{12}O_6{\cdot}H_2O$. Glucose is readily prepared from starch or from cane sugar by the action of dilute acids, and is easily fermented by yeast to give alcohol. It is excreted in considerable quantities by persons suffering from diabetes mellitus. It has very many uses in the food industries, as a sweetening agent and as a substitute for cane-sugar in various processes where fermentation plays an essential rôle, and to a lesser extent in pharmacy. (See DEXTRIN.)

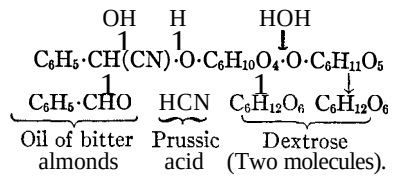
GLUCOSIDES, NATURAL. The term glucoside is applied to a large number of substances present in plants, which on hydrolysis by acids furnish a sugar and a second product. The sugar is usually dextrose, alone or mixed with other sugars such as rhamnose. The second product may be anything which can occur in a plant, from methyl alcohol to a complex alkaloid, so long as it contains a hydroxyl group capable of forming an ether linkage (see CHEMISTRY: Organic) with either a simple or a complex sugar. The complex sugars (polysaccharides) may themselves be regarded as glucosides since they consist of ethers formed from two or more simple sugars.

It is probable that the formation of glucosides provides the plant with a means of storing in a harmless form, materials such as prussic acid and reactive aldehydes, required for future use and capable by means of enzymes of liberation in small quantities as required. Further, glucosides are usually at least sparingly soluble in water, and since only soluble substances are transportable in a plant, by movements of sap, it is at least a useful working hypothesis to assume that the plant converts into glucosides (a) harmful or useless substances, which must be transported to the barks, fruit rinds, seed coats, etc., where they can do no harm and will eventually be shed; (b) necessary but harmful substances, which may be useful later on; (c) decorative substances, such as floral pigments, formed in the leaves and transported at the proper season to the flowers, fruits, etc.

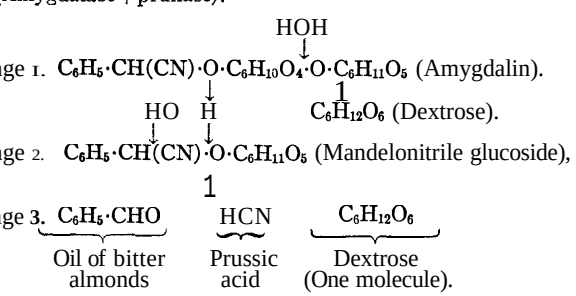
This hypothesis at least accounts for the extraordinary variety of the second, non-saccharine, hydrolytic products of glucosides. Among them are to be found a large number of phenolic glucosides, such as arbutin and phloridzin, yielding on hydrolysis the phenols, hydroquinone and phloretin; aromatic alcohol glucosides, like salicin, a much-valued analgesic in medicine, which on hydrolysis furnishes dextrose and saligenin (*o*-hydroxybenzyl alcohol); an interesting group of acid-glucosides represented by gaultherin, the form in which winter-green oil (methyl salicylate) is stored in the plant from which this popular American flavouring agent was formerly drawn, though now largely replaced by synthetic methyl salicylate. Less popular, but probably more useful are convolvulin and jalapin, the active principles of the purgative drugs, scammony and jalap (*q.v.*). These on hydrolysis yield acids somewhat similar to those found in castor oil, where they are combined with glycerine instead of dextrose. Mention must also be made of the saponins, an extensive and widely distributed series of glucosides, which subserve the purposes of man in such diverse ways as providing beer with a good "head" when it is not of the quality to acquire one naturally, forming the basis of detergent materials for delicate fabrics, assisting the suspension of oily fluids so that they become "miscible" with water, as in many well-known disinfectants, and finally in the manufacture of "foaming" fire extinguishers. Another class of glucosides, the mustard-oil group, found in something like a thousand genera of the natural order cruciferae, supply Englishmen with their national condiment, mustard (*q.v.*). Nor can the highly toxic glucosides, digitoxin, digitalin, strophanthin and ouabain, which with other similar substances form the group of "cardiac glucosides," be omitted, since they are indispensable in medicine whether used as such, or as the drugs digitalis (*q.v.*), strophanthus (*q.v.*) or acokanthera. The two latter also retain a certain amount of anthropological interest, being still popular as arrow poisons in some of the more remote parts of Africa. Glucosides also minister to man's aesthetic needs, since most of the yellow, red, and blue floral and other pigments occur in plants in the form of "flavonol" and "anthocyan" glucosides; thus the beautiful blue tint of the pansy is due to a rhamnoside of the pigment delphinidin, and the red of the scarlet geranium to a diglucoside of the pigment pelargonidin. (*See* ANTHOCYANINS AND ANTHOXANTHINS.)

Much light has been thrown on the structure of natural glucosides by the study of the synthetic α and β-methyl glucosides, that is, the monomethyl ethers of dextrose (see CHEMISTRY: Organic and SUGARS) particularly in their specific relationship to enzymes (*q.v.*); and it is now known that most natural glucosides can be regarded as β-glucosides, and that the enzymes, such as emulsin, which accompany them in plants and are capable of either decomposing or recomposing the glucosides, depending upon the conditions obtaining at the moment, are β-enzymes. This reversible activity of the enzymes towards glucosides consists in the addition or withdrawal of the elements of water at vulnerable points. Thus, using the conventional signs and symbols of the chemist, the decomposition of amygdalin, one of the oldest and best known of the glucosides, can be represented thus:—

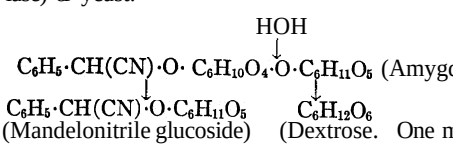
1. Unregulated decomposition of amygdalin by acids or emulsin.



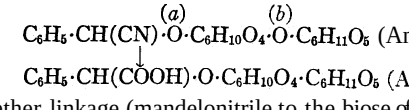
2. Regulated decomposition of amygdalin by acids or emulsin (Amygdalase+prunase).



3. Decomposition of amygdalin by a cold aqueous extract (amygdalase) of yeast.



4. Action of alkalis or strong acids on amygdalin.



(a) =ether linkage (mandelonitrile to the biose of amygdalin).
(*b*) =ether linkage of dextrose to dextrose to form the biose of amygdalin.

In this diagram, line 1 represents the complex unregulated action of acids or emulsin upon amygdalin, the latter being decomposed into one molecule each of benzaldehyde and prussic

acid, which together constitute oil of bitter almonds, and two molecules of dextrose.

Line 2 shows that the apparently simple reaction represented by line 1 really consists of t o reactions, the complex sugar (biose) of amygdalin being split up first, yielding one molecule each of dextrose and a new and simpler substance, dextromandelonitrile glucoside, found in the form of prunasin in the wild cherry bark (*Prunus* serotina) and in Cerasus *padus*. In the second stage, dextromandelonitrile glucoside is decomposed into one molecule each of dextrose, benzaldehyde and prussic acid. The demonstration of these two stages is possible because the two reactions progress at different rates and by stopping at a certain point *d*-mandelonitrile glucoside can be isolated. So far as the action of enzymes is concerned, the first stage alone is brought about by a cold water extract of yeast, which contains amygdalase, and the second by an enzyme, prunase, which appropriately occurs with prunasin. Prunase has no action on amygdalin itself. This demonstration also shows that emulsin must be a mixture of at least two enzymes, amygdalase and prunase. Line 3 is the first stage of line 2 repeated to represent the action of amygdalase alone. Line 4 is interesting as showing what happens when amygdalin is treated with alkalis or strong acids; the molecule remains intact and only the nitrile group (·CN) is hydrolysed producing a carboxyl group (·COOH) and liberating ammonia, in accordance with the general behaviour of such groups. (*See* CHEMISTRY: Organic.)

The laevorotatory isomeride of mandelonitrile glucoside, and the racemic isomeride, also occur in nature in the form of the glucosides sambunigrin in the young branches of the elder, and prulaurasin in the leaves of the cherry laurel. These are all called "cyanogenetic glucosides" because on hydrolysis they yield prussic acid; other examples are dhurrin from the tropical grass, which yields the food-grain, called "dhurra," and linamarin or phaseolunatin, which yields acetone, prussic acid and dextrose on hydrolysis and is widely distributed in nature. Both these have on several occasions been the cause of poisoning cases in man or animals.

BIBLIOGRAPHY.—J. J. L. van Rijn, Die Glykoside (1900); E. F. Armstrong, The Simple Carbohydrates and *the* Glucosides (1924). The second of these books contains an excellent bibliography.

(T. A. H.)

GLUE, a valuable agglutinant, consisting of impure gelatin and widely used as an adhesive medium for wood, leather, paper and similar substances. Glues and gelatins merge into one another by imperceptible degrees. The difference is conditioned by the degree of purity; the more impure form is termed glue and is only used as an adhesive, the purer forms, termed gelatin, have other applications, especially in culinary operations and confectionery. (See GELATIN.) It is only necessary to state here that gelatigenous or glue-forming tissues occur in the bones, skins and intestines of all animals, and that by extraction with hot water these agglutinating materials are removed, and the solution on evaporating and cooling yields a jelly-like substance—gelatin or glue.

Glues may be most conveniently classified according to their sources: bone glue, skin glue and fish glue; these may be regarded as impure forms of bone gelatin, skin gelatin and isinglass.

Bone Glue.—For the manufacture of glue the bones are supplied fresh or after having been used for making soups; Indian and South American bones are unsuitable, since, by reason of their previous treatment with steam, both their fatty and glue-forming constituents have been already removed (to a great extent). On the average, fresh bones contain about 50% of mineral matter, mainly calcium and magnesium phosphates, about 12% each of moisture and fat, the remainder being other organic matter. The mineral matter reappears in commerce chiefly as artificial manure; the fat is employed in the candle, soap and glycerin industries, while the other organic matter supplies glue.

The separation of the fat, or "de-greasing of the bones" is affected (1) by boiling the bones with water in open vessels; (2) by treatment with steam under pressure; or (3) by means of solvents. The last process is superseding the first two, which give a poor return of fat—a valuable consideration—and also involve the loss of a certain amount of glue. Many solvents have been proposed; the greatest commercial success appears to attend Scottish shale oil and natural petroleum (Russian or American) boiling at about 100° C. The vessels in which the extraction is carried out consist of upright cylindrical boilers, provided with manholes for charging, a false bottom on which the bones rest; and with two steam coils—one for heating only, the other for leading in "live" steam. There is a pipe from the top of the vessel leading to a condensing plant. The vessels are arranged in batteries. In the actual operation the boiler is charged with bones, solvent is run in, and the mixture gradually heated by means of the dry coil; the spirit distils over, carrying with it the water present in the bones; and after a time the extracted fat is run off from discharge cocks in the bottom of the extractor. A fresh charge of solvent is introduced, and the cycle repeated; this is repeated a third and fourth time, after which the bones contain only about 0·2% of fat, and a little of the solvent, which is removed by blowing in live steam under 70 to 80 lb. pressure. The de-greased bones are now cleansed from all dirt and flesh by rotation in a horizontal cylindrical drum covered with stout wire gauze. The attrition accompanying this motion suffices to remove the loosely adherent matter, which falls through the meshes of the gauze; this meal contains a certain amount of glue-forming matter, and is generally passed through a finer mesh, the residuum being worked up in the glue-house, and the flour which passes through being sold as a bone-meal, or used as a manure.

The bones, which now contain 5 to 6% of glue-forming nitrogen and about 60% of calcium phosphate, are next treated for glue. The most economical process consists in steaming the bones under pressure (15 lb. to start with, afterwards 5 lb.) in upright cylindrical boilers fitted with false bottoms. The glue-liquors collect beneath the false bottoms, and when of a strength equal to about 20% dry glue they are run off to the clarifiers. The first runnings contain about 65 to 70% of the total glue; a second steaming extracts another 25 to 30%. For clarifying the solutions ordinary alum is used, one part being used for 200 parts of dry glue.

The clear liquors are now concentrated to a strength of about 32% dry glue in winter and 35% in summer. This is invariably effected in vacuum pans—open boiling yields a dark-coloured and inferior product. Many types of vacuum plant are in use; the Yaryan form, invented by H. T. Yaryan, is perhaps the best, and the double effect system is the most efficient. After concentration the liquors are bleached by blowing in sulphur dioxide, manufactured by burning sulphur; by this means the colour can be lightened to any desired degree. The liquors are now run into galvanized sheet-iron troughs, 2ft. long, 6in. wide and 5in deep, where they congeal to a firm jelly, which is subsequently removed by cutting round the edges, or by warming with hot water, and turning the cake out. The cake is sliced to sheets of convenient thickness, generally by means of a wire knife, *i.e.*, a piece of wire placed in a frame. Mechanical slicers acting on this principle are in use. Instead of allowing the solution to congeal in troughs, it may be "cast" on sheets of glass, the bottoms of which are cooled by running water. After congealing, the tremulous jelly is dried; this is an operation of great nicety: the desiccation must be slow and is generally effected by circulating a rapid current of air about the cakes supported on nets set in frames.

Skin Glue.—In the preparation of skin glue the materials used are the parings and cuttings of hides from tan-yards, the ears of oxen and sheep, the skins of rabbits, hares, cats, dogs and other animals, the parings of tawed leather, parchment and old gloves, and many other miscellaneous scraps of animal matter. Much experience is needed in order to prepare a good glue from such heterogeneous materials; one blending may be a success and another failure. The raw material or "stock" is first steeped for from two to ten weeks, according to its nature. in wooden vats or pits with lime water, and afterwards carefully dried and stored The object of the lime steeping is to remove any blood and flesh which may be attached to the skin, and to form a lime soap with the fatty matter present. The "scrows" or glue pieces, which may be kept a long time without undergoing change, are washed with a dilute hydrochloric acid to remove all lime, and then very thoroughly with water; they are now allowed to drain and dry.

The skins are then placed in hemp nets and introduced into an open boiler which has a false bottom, and a tap by which liquid may be run off. As the boiling proceeds test quantities of liquid are from time to time examined, and when a sample is found on cooling to form a stiff jelly, which happens when it contains about 32% dry glue, it is ready to draw off. The solution is then run to a clarifier, in which a temperature sufficient to keep it fluid is maintained, and in this way any impurity is permitted to subside. The glue solution is then run into wooden troughs or coolers in which it sets to a firm jelly. The cakes are removed as in the case of bone glue (see above), and, having been placed on nets, are, in the Scottish practice, dried by exposure to open air. This primitive method has many disadvantages: on a hot day the cake may become unshapely, or melt and slip through the net, or dry so rapidly as to crack; a frost may produce fissures, while a fog or mist may precipitate moisture on the surface and occasion a mouldy appearance. The surface of the cake, which is generally dull after drying, is polished by washing with water. The practice of boiling, clarification, cooling and drying, which has been already described in the case of bone glue, has been also applied to the separation of skin glue.

Fish Glue.—Whereas isinglass, a very pure gelatin, is yielded by the sounds of a limited number of fish, it is found that all fish offals yield a glue possessing considerable adhesive properties. The manufacture consists in thoroughly washing the offal with water, and then discharging it into extractors with live steam. After digestion, the liquid is run off, allowed to stand, the upper oily layer removed, and the lower gluey solution clarified with alum. The liquid is then filtered, concentrated in open vats, and bleached with sulphur dioxide. Fish glue is a light-brown viscous liquid which has a distinctly disagreeable odour and an acrid taste; these disadvantages to its use are avoided if it be boiled with a little water and 1% of sodium phosphate, and 0.025% of saccharine added.

Properties of Glue.—A good quality of glue should be free from all specks and grit, have a uniform, light brownish-yellow, transparent appearance, and should break with a glassy fracture. Steeped for some time in cold water it softens and swells up without dissolving, and when again dried it ought to resume its original properties. Under the influence of heat it entirely dissolves in water, forming a thin syrupy fluid with a not disagreeable smell. The adhesiveness of different qualities of glue varies considerably; the best adhesive is formed by steeping the glue, broken in small pieces, in water until they are quite soft, and then placing them with just sufficient water to effect solution in the glue-pot. The hotter the glue, the better the joint; remelted glue is not so strong as the freshly prepared; and newly manufactured glue is inferior to that which has been long in stock. A well-prepared joint may withstand a pull of about 700 lb. per sq. in. The following table, after Kilmarsch, shows the holding power of glued joints with various kinds of woods.

Wood	Lb. per sq. in. With grain	Across grain
Beech	852	434.5
Maple	484	346
Oak	704	302
Fir	605	132

Special Glues, Cements, etc.—By virtue of the fact that the word "glue" is frequently used to denote many adhesives, which may or may not contain gelatin, there will now be given an account of some special preparations. These may be conveniently divided into: (1) liquid glues, mixtures containing gelatin which do not jelly at ordinary temperatures but still possess adhesive properties; (2) water-proof glues, including mixtures containing gelatin, and also the "marine glues," which contain no glue; (3) glues or cements for special purposes, *e.g.*, for cementing glass, pottery, leather, etc., for cementing dissimilar materials, such as paper or leather to iron.

Liquid Glues.—The demand for liquid glues is mainly due to the disadvantages—the necessity of dissolving and using while hot—of ordinary glue. They are generally prepared by adding to a warm glue solution reagent which destroys the property of gelatinizing. The reagents in common use are acetic acid; magnesium chloride, used for a glue employed by printers; hydrochloric acid and zinc sulphate; nitric acid and lead sulphate; and phosphoric acid and ammonium carbonate.

Water-proof Glues.—Numerous recipes for water-proof glues have been published; glue, having been swollen by soaking in water, dissolved in four-fifths its weight of linseed oil, furnishes a good water-proof adhesive; linseed oil varnish and litharge, added to a glue solution, is also used; resin added to a hot glue solution in water, and afterwards diluted with turpentine, is another recipe. The best glue is said to be obtained by dissolving one part of glue in one and a half parts of water, and then adding one-fiftieth part of potassium bichromate. Alcoholic solutions of various gums, and also tannic acid, confer the same property on glue solutions. The "marine glues" are solutions of india-rubber, shellac or asphaltum, or mixtures of these substances, in benzene or naphtha. Jeffrey's marine glue is formed by dissolving india-rubber in four parts of benzene and adding two parts of shellac; it is extensively used, being easily applied and drying rapidly and hard. Another water-proof glue which contains no gelatin is obtained by heating linseed oil with five parts of quicklime; when cold it forms a hard mass, which melts on heating.

There are innumerable recipes for adhesives specially applicable to certain substances and under certain conditions. For repairing glass, ivory, etc., isinglass (*q.v.*), which may be replaced by fine glue, yields valuable cements. Bookbinders employ an elastic glue obtained from an ordinary glue solution and glycerin, the water being expelled by heating; an efficient cement for mounting photographs is obtained by dissolving glue in ten parts of alcohol and adding one part of glycerin; portable or mouth glue—so named because it melts in the mouth—is prepared by dissolving one part of sugar in a solution of four parts of glue. An india-rubber substitute is obtained by adding sodium tungstate and hydrochloric acid to a strong glue solution.

See Thomas Lambert, *Glue, Gelatine and their Allied Products* (1905); *R.* L. Fernbach, *Glues and Gelatine* (1907); *H.* C. Standage, *Agglutinants* of *all Kinds for all Purposes* (1907).

GLUTARIC ACID is found in the wash water from sheep's wool and in the unripe sap of sugar beet. It crystallizes in large monoclinic prisms which melt at 97·5° C, and distils between 302° and 304° *C*, practically without decomposition. It is soluble in water, alcohol and ether. Its chemical composition is $CO_2H{\cdot}CH_2{\cdot}CH_2{\cdot}CH_2{\cdot}CO_2H$, and it is prepared synthetically by conversion of trimethylene bromide into cyanide and hydrolysis of the latter; or from acetoacetic ester (*q.v.*), which, in the form of its sodium derivative, condenses with β-iodopropionic ester to form acetoglutaric ester,

$$CH_3{\cdot}CO{\cdot}CH(CO_2C_2H_5){\cdot}CH_2{\cdot}CH_2{\cdot}CO_2C_2H_5,$$

from which glutaric acid is obtained by hydrolysis. It is also obtained when sebacic, stearic and oleic acids are oxidized with nitric acid. By long heating the acid is converted into its anhydride, and glutarimide is obtained by distillation of ammonium glutarate.

GLUTATHIONE, in physiological chemistry, a compound of glutamic acid and cysteine, which, by its catalytic action, promotes oxidation in living tissues. The energy required for the processes of life is mainly supplied by oxidations which occur in every living cell or tissue. The materials concerned in such oxidations are not directly attacked by the molecular oxygen with which they are in contact. Living tissues contain however certain agents which "activate" the molecules either of the oxygen or of the materials to be burnt, and by so raising the chemical potential of the systems involved induce oxidations.

For the most part such results are brought about in the living cell by substances which partake of the nature of enzymes (*q.v.*), being easily destroyed by heat at relatively low critical temperatures. Certain oxidations in the cell are however secured by a chemical mechanism which cannot in any accepted sense be classed as enzymic. It involves the properties of certain sulphur compounds which contain the *thiol*, or –SH, group. The hydrogen of this structural group is susceptible of easy oxidation, and its oxidative removal results in the formation of a *disulphide* group, –S–S–. Two molecules of the thiol compound are thus concerned in

the change as shown in the following simplified scheme:

$$2\cdot X-SH + \tfrac{1}{2}O_2 \rightarrow X-S-S-X + H_2O$$

The disulphide form under suitable conditions may be again reduced to the thiol form, and the two forms may co-exist in adjustable equilibrium with a variety of oxidizing and reducing substances.

Most living cells and tissues contain a substance displaying the properties thus described. Its molecule contains linked together two of the amino-acid groupings which are present in proteins. It is a dipeptide composed of glutamic acid and cysteine (see PROTEINS), and has received the name of glutathione. The cysteine moiety carries the thiol (-SH) group through which the biological influence sf the substance is exerted (see CYSTINE). It is clear from what has been already said that such a substance may assume—when respectively reduced or oxidized—two related forms which, since in what follows we have only to think of the sulphur groupings, may for simplicity's sake be written as GSH and GSSG. In the living cell the substance (whether oxidized or reduced) is present in very low concentration, but it is not there as a source of energy. It is a permanent constituent of the cell promoting by its presence the oxidation of other substances.

The nature of the influence of glutathione in the cell is sufficiently indicated by the following considerations. Its reduced form, GSH, is, in the presence of traces of iron (which are always available in the living cell), readily oxidized by molecular oxygen. The oxidized form, GSSG, which then results is itself however freely reduced by certain other constituents in the living cell capable of yielding the necessary hydrogen. If for convenience we denote such tissue constituents by the expression $T-H_2$, the process involved may be thus represented:

$$\text{(a)}\quad 2GSH + \tfrac{1}{2}O_2 \rightarrow GSSG + H_2O,$$
$$\text{(b)}\quad GSSG + T-H_2 \rightarrow 2GSH + T.$$

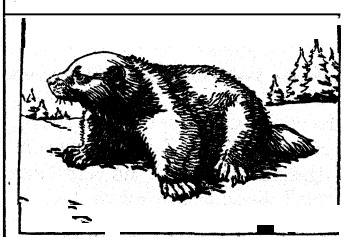
The significance of the events thus symbolized resides in the circumstances that cell materials which are not oxidized directly by molecular oxygen (or oxidized with extreme slowness) are freely, though indirectly, oxidized through the progress of the above reactions. The glutathione acts, so to speak, as a carrier of hydrogen from tissue materials to oxygen. It will be clear that by acting in this way as an intermediary a very small amount of the substance may promote the oxidation of an unlimited amount of material. Incidentally it may be noted that the mobilization of hydrogen on such lines promotes other aspects of oxidation in the cell. Its removal may convert a saturated molecule into one less saturated, rendering it more prone to oxidation in general. Moreover, during the spontaneous oxidation of the SH group hydrogen peroxide may arise, and this, in the presence of cell agencies known as peroxidases, may bring about secondary oxidations.

Glutathione when separated from the tissues and purified is obtained as a snow-white amorphous powder. Alike in its oxidized and reduced form it is exceedingly soluble in water. It resists the action of the hydrolytic enzymes of the tissues, but on boiling with mineral acids it is resolved into its constituent amino-acids.

(F. G. H.)

GLUTEN, a tough, tenacious, ductile, somewhat elastic, nearly tasteless, and greyish-yellow albuminous substance, obtained from the flour of wheat by washing in water, in which it is insoluble. Gluten, when dried, loses about two-thirds of its weight, becoming brittle and semi-transparent; when strongly heated it crackles and swells, and burns like feather or horn. It is soluble in strong acetic acid, and in caustic alkalis, which latter may be used for the purification of starch in which it is present. When treated with ·1 to ·2% solution of hydrochloric acid it swells up, and at length forms a liquid resembling a solution of albumin, and *laevorotatory* as regards polarized light. Moistened with water and exposed to the air, gluten putrefies and evolves carbon dioxide, hydrogen, and sulphuretted hydrogen, and in the end is almost entirely resolved into a liquid, which contains *leucin* and ammonium phosphate and acetate. On analysis, gluten shows a composition of about 53% of carbon, 7% of hydrogen, and nitrogen 15 to 18%, besides oxygen, and about 1% of sulphur, and a small quantity of inorganic matter. According to H. Ritthausen, it is a mixture of *glutencasein* (Liebig's vegetable fibrin), *glutenfibrin, gliadin* (Pflanzenleim), *glutin* or vegetable gelatin, and mucedin, which are all closely allied to one another in chemical composition. It is the gliadin which confers upon gluten its capacity of cohering to form elastic masses, and of separating readily from associated starch. In the so-called gluten of the flour of barley, rye, and maize, this body is absent (H. Ritthausen and U. Kreusler). The gluten yielded by wheat which has undergone fermentation or has begun to sprout is devoid of toughness and elasticity. These qualities can be restored to it by kneading with salt, lime water, or alum. Gluten is employed in the manufacture of gluten bread and biscuits for the diabetic, and of chocolate, and also in the adulteration of tea and coffee. For making bread it must be used fresh, as otherwise it decomposes and does not knead well. Granulated gluten is a kind of vermicelli, made in some starch manufactories by mixing fresh gluten with twice its weight of flour.

GLUTTON or **WOLVERINE** (Gulo luscus), a carnivorous mammal of the weasel family, Mustelidae (see CARNIVORA). The legs are short, the feet large, the claws sharp and curved, and the tail thick and bushy. The fur, blackish-brown, with a broad band of chestnut on the sides of the body, consists of an undergrowth of short woolly hair, mixed with long, straight hairs, the latter giving it a shaggy appearance. Like all Mustelidae, the glutton possesses anal glands secreting a foetid-smelling, yellowish fluid. It inhabits the northern regions of the world, but is most abundant in arctic North America. A voracious animal, it feeds on small mammals, birds and carrion, and causes great annoyance to the trapper by robbing his traps of both bait and captives. Although inquisitive, the wolverine is both cunning and cautious. It has the habit of stealing and hiding all sorts of articles. The rutting season is in March, and the female brings forth four or five young in June or July, in defence of which she is exceedingly bold. It is nocturnal in habits, spending the day in its burrow. The fur is of some commercial value.



INE (GULO LUSCUS); IT BELONGS TO THE WEASEL FAMILY. AND IS PLENTIFUL IN CANADA, WHERE IT OBSTRUCTS FUR TRAPPERS BY STEALING FROM THEIR TRAPS

GLYCAS, MICHAEL, Byzantine historian (according to some a Sicilian, according to others a Corfiote), flourished during the 12th century A.D. His chief work is his *Chronicle* of events from the creation of the world to the death of Alexius I. Comnenus (1118). Glycas was also the author of a treatise and a number of letters on theological questions. A poem of some 600 "political" verses, written during his imprisonment on a charge of slandering a neighbour and containing an appeal to the emperor Manuel, is still extant. The exact nature of his offence is not known, but the answer to his appeal was that he was deprived of his eye-sight by the emperor's orders.

Editions: "Chronicle and Letters," in J. P. Migne, *Patrologia Graeca,* clviii.; poem in E. Legrand, *Bibliothèque grecque vulgaire,* i.; *see* also *F.* Hirsch, *Byzantinische Studien* (1876); C. Krumbacher in *Sitzungsberichte bayer. Acad., 1894;* C. *F.* Bahr in Ersch and Gruber's *Allgemeine Encyklopädie.*

GLYCERIDES are one of Nature's usual modes of storing up reserves, in the vegetable or animal realms, in the form of stable compounds containing carbon, hydrogen, and oxygen. They constitute, in fact, over 90% of the substances present in vegetable and animal oils, fats, and waxes (*qq.v.*), and the terms glyceride and fat are frequently, but not quite correctly, used interchangeably. All naturally occurring glycerides appear to be associated with a small amount (½–2%) of non-glyceridic substances called non-saponifiable or unsaponifiable matter, which have little direct industrial importance, but probably a very profound physiological significance, since they include the sterols and the fat-soluble vitamins (*q.v.*).

In order to understand the modern uses of fats (see OILS AND FATS; WAX) it is necessary to have some knowledge of the chemi-

cal structure of the glycerides. This is fortunately very simple in general outline, although complicated in detail. Glycerides belong to the class of compounds called "esters" by the chemist. In simple terms, an ester is the salt of an acid with an alcohol, just as sodium chloride is the salt formed by the union of sodium hydroxide and hydrochloric acid; a simple example of an ester is ethyl acetate, from ordinary alcohol and acetic acid, a volatile liquid with a fruity smell. The glycerides are built up from the alcohol, glycerol $C_3H_5(OH)_3$, and fatty acids (*q.v.*) of which for the moment we may take the most common, oleic acid, $C_{17}H_{33}\cdot COOH$, as an example. The essential nature of a glyceride glycerol ester may therefore be grasped by the following comparison:

Sodium hydroxide, NaOH. Hydrochloric acid, HCl. Sodium chloride, NaCl *(salt).*

Ethyl alcohol, C_2H_5OH. Acetic acid, $CH_3\cdot COOH$. Ethyl acetate, $CH_3\cdot COO\cdot C_2H_5$ *(ester)*

Glycerol, $C_3H_5(OH)_3$. Oleic acid, $C_{17}H_{33}\cdot COOH$. Tri-olein $(C_{17}H_{33}\cdot COO)\cdot C_3H_5$ (fat)

Complications set in when it is recollected (a) that glycerol has three points at which an acid group may enter (just as, for example, iron hydroxide $Fe(OH)_3$ unites with three acidic groups whilst sodium hydroxide NaOH only combines with one, *i.e.*, is "monobasic") and (b) that at least 20 different fatty acids are common in nature, of which from about five to 15 are generally present in any single natural fat. Even if, in a hypothetical case, we assume the presence of only three acids X, Y, Z in a glyceride, we can envisage the possibility of the formation of no less than 18 distinct triglycerides, of which the following are examples:

$CH_2\cdot OX$	$CH_2\cdot OY$	$CH_2\cdot OX$	$CH_2\cdot OX$	$CH_2\cdot OY$	$CH_2\cdot OX$
$CH\cdot OX$	$CH\cdot OY$	$CH\cdot OY$	$CH\cdot OZ$	$CH\cdot OX$	$CH\cdot OX$
$CH_2\cdot OX$	$CH_2\cdot OY$	$CH_2\cdot OZ$	$CH_2\cdot OY$	$CH_2\cdot OZ$	$CH_2\cdot OY$

When, as in actual fact, the number of acids present is greater, the number of possible variations becomes enormous.

Very little is, indeed, yet known definitely as to the actual structure of different fats, although the occurrence of any one simple triglyceride, *e.g.*, tri-olein, or tri-palmitin, is now known to be much less common than was formerly supposed. The properties (consistency, melting-point, "drying" or "non-drying" character, etc.) of any fat are determined partly by the manner in which the different fatty acids are linked up with the glycerol, and partly, indeed mainly, by the nature of the fatty acids (*q.v.*) (see also OILS, FATS AND WAXES; GLYCERISE; SOAP, and articles on individual oils, fats and waxes).

GLYCERINE (GLYCEROL), $C_3H_5(OH)_3$, in pharmacy *Glycerinum,* was discovered by Scheele in olive oil in 1779 and named *ölsüss.* Chevreul studied it more fully in connection with his work on the fats about 1813 and gave it its present name (Gr. γλυκύς, sweet); whilst Pelouze (1836), Berthelot and others established its formula as a trihydric alcohol, $C_3H_5(OH)_3$, and its connection with the fats and oils, which are formed by the replacement of the hydrogen of the OH groups in glycerine by radicals of the higher fatty acids (see GLYCERIDES). In addition to the fatty oils, which are the largest source of glycerine, the latter is combined, partly with fatty acids and at the same time with derivatives of phosphoric acid (as glycerophosphatides), in certain substances characteristic of specific animal structures, such as lecithin (eggs, various organs) and kephalin (brain, liver and other organs).

Glycerine is also a normal product (about 3%) of the alcoholic fermentation of sugar by yeast, and is therefore present in wine and beer. as was originally shown by Pasteur in 1858. Neuberg (1912) and others have shown that, if the fermentation be carried out in presence of certain salts such as sodium sulphite, sugar can be made to yield as much as 25% of its weight of glycerine, and this observation was utilised on a large technical scale by the Central Powers in the World War. In effect this process means that, if the supply of glycerine from fats falls short of the demand, it may in future be supplemented by fermentation glycerine from molasses or other cheap sugar material.

Properties.—Glycerol (pure glycerine) is a colourless, odourless. viscous liquid with an insipid sweet taste (sp. gr. 1.2647 at 15°C.; refractive index n_D 1.4758 at 12·5°C.). It boils at 290°C. with some decomposition at atmospheric pressure, and is unchanged under diminished pressure (*e.g.*, 182°/20mm. and 155°/5mm.). Its melting-point is 20°C., but owing to the ease with which it exists in the supercooled state, it is rarely seen in the solid state. It is exceedingly hygroscopic, miscible with water or alcohol in all proportions, but less soluble in ether.

The bacterial fermentation of many fats, especially those of marine animals, in presence of water not infrequently causes some of the glycerine to be transformed into a related dihydric alcohol or glycol known as *trimethylene* glycol, $CH_2(OH)\cdot CH_2\cdot CH_2(OH)$; this substance can be separated from glycerine during refining and finds application for certain of the purposes for which glycerine itself is used. It may be added that a simpler glycol, ethylene glycol, $CH_2(OH)\cdot CH_2(OH)$, which can be produced from ethylene (in coke-oven or other gas) or alcohol, is coming to the fore as a potential competitor with glycerine.

Manufacture.—Practically the whole of the glycerine of commerce is still derived from the fatty oils, and most of this comes into the hands of the glycerine refiner in the form of soap-lyes (see SOAP). In the ordinary soap-pan the fats have been saponified by means of aqueous caustic soda and the resulting soap salted out by brine; the clear aqueous (saline) liquors contain the whole of the glycerine from the fat and the latter forms about 3 to 5% of the soap-lye (as it is termed) whilst all the added salt is also present. Other means of splitting the fats are also employed, for example, by heating them in presence of a little lime with a current of steam at about 140°C. (120 lbs. per sq.in. steam-pressure) in autoclaves, by heating them with water and a special chemical known as the Twitchell agent, or by fermentation with an enzyme (lipase) in presence of water. The aqueous lyes from the autoclave, Twitchell, or lipase processes will contain up to 15% of glycerine and but little saline matter.

Crude glycerine is made by simple concentration of the lyes or sweet waters without distillation of the glycerine. The lyes (especially if from the soap-pan) are first of all treated with oxide of iron and/or lime to coagulate and remove traces of soap and other impurities, and the clarified liquor is then heated under a vacuum of 25–28 inches of mercury (usually in a double-effect evaporator) until the glycerine content of the residue reaches at least 80%. After removal of any solid salts which have separated from the liquor, the product forms what is technically known as "crude glycerine." Soap-lye crude contains about 10% of salt and 80% of glycerine; autoclave, etc., crudes contain about 86% of glycerine and less than 1% of saline matter. But economic considerations on the fat-splitting side make saponification in the open soap-pan the more usual procedure. Most of the soap-lye crude is distilled to give the more refined qualities of glycerine, but some of the other type finds use in printer's inks, in "anti-freeze" compositions, plastic clays, etc.

Dynamite Glycerine.—The most important single outlet for glycerine is probably its use, after nitration, in blasting and other explosives such as dynamite, cordite, etc. (see NITRO-GLYCERINE). To this end it is necessary to have glycerine free from solid impurities and containing about 95% of glycerol. This is secured by distillation of crude glycerine under much reduced pressure (28–29 inches of mercury) by the aid of a current of superheated steam. Several systems of glycerine stills are in operation, the favourite being that designed by van Ruymbeke, in which, by means of an "expansion chamber" heated by the same steam as that which heats the centre of the still, the injected steam regains the temperature lost by its expansion under vacuum and enters (in fine jets) into the heated crude glycerine in the still at exactly the same temperature as that of the latter. The mixed glycerine and steam vapours pass over into condensers in which they are fractionally separated and the dynamite glycerine is collected. In later systems, such as those of Wood or Garrigue, multiple stills are arranged in series and the distillation process made continuous; the superheated steam may be made to pass through a pre-heated spray of the crude glycerine.

Dynamite glycerine should have a sp. gr. 1·261–1·262 and contain not more than 0·05% of mineral ash. It is usually pale yel-

low in colour, but can be converted into an almost white product ("industrial white *glycerine*") by treatment with charcoal.

Finally, chemically pure glycerine is produced by a further distillation of the once-distilled dynamite glycerine, followed by treatment with charcoal. Chemically pure (C.P.) glycerine should contain no impurity other than moisture; its sp. gr. is 1.26 (97–98% glycerol) but for trade purposes it is also supplied at, for example, sp. gr. 1·25 (93%) or 1·24 (90%). Arsenic, lead and copper must be completely absent, the mineral ash should not exceed 0·01%, and the total non-volatile residue, 0·05%.

Technical Uses.—C.P. glycerine is used very largely for medicinal and pharmaceutical purposes as a solvent for drugs, a component of emollient solutions, ointments and plasters, and in some purgative remedies; it also finds use as a preservative against fermentation and is thus employed in preserving meat and flesh products, in anatomical preparations, in vaccine lymph, etc. It is also used in the tobacco, snuff and spirit trades. In addition to its use in the manufacture of explosives dynamite glycerine (or the industrial white variety) is employed in various ways, for example, in the textile industries, as a lubricant where mineral or other oils are inadmissible, in hydraulic presses, for fiiiing gas meters, in the preparation of plastic materials, in the paper, ink, soap and leather industries. (T. P. H.)

GLYCOGEN (IN RELATION TO MUSCULAR CONTRACTION): *see* MUSCLE AND MUSCULAR EXERCISE.

GLYCOLS, the generic name applied to dihydric alcohols on account of their sweet taste (see CHEMISTRY: Organic). The simplest member of the series, ethylene glycol, $HO{\cdot}CH_2{\cdot}CH_2{\cdot}OH$, is a colourless, fragrant, oily liquid boiling at 197·4° C, melting at −17·4° C and having a specific gravity of 1.125 at 0° C. It resembles glycerine (glycerol) in sweetness and in being completely miscible with water. Its importance lies mainly in the fact that it serves as a substitute for glycerine in the production of a high explosive, ethylene dinitrate, $NO_2{\cdot}O{\cdot}CH_2{\cdot}CH_2{\cdot}O{\cdot}NO_2$, the successive processes of manufacture being as follows:—Ethylene gas, produced by passing alcohol vapour over charcoal impregnated with phosphoric acid at 400° C, is treated with chlorine water so that the ethylene is always in excess. In these circumstances ethylene chlorohydrin, $HO{\cdot}CH_2{\cdot}CH_2{\cdot}Cl$, is produced as a liquid miscible with water (boiling point 128–132° C). When warmed with milk of lime the chlorohydrin is converted into ethylene glycol and this dihydric alcohol on treatment with nitric and sulphuric acids, as in the preparation of nitroglycerine (*q.v.*) from glycerine, is converted into ethylene dinitrate, an oily explosive liquid (boiling point 114–116° C, specific gravity, 1.496/15° C), which has the advantage over nitroglycerine of not freezing in cold weather (see EXPLOSIVES). A more complex nitro explosive may be prepared by nitrating a solution of a carbohydrate (*q.v.*) in ethylene glycol (Hibbert, U.S. Patent 1216367 1917).

Higher glycols, *e.g.*, α-propylene glycol, $CH_3{\cdot}CH(OH){\cdot}CH_2OH$, and 2:3-butylene glycol, $CH_3{\cdot}CH(OH){\cdot}CH(CH_3){\cdot}OH$, are also syrupy liquids of comparatively high boiling points. They are prepared from the corresponding propylene, $CH_3CH{:}CH_2$, or symmetrical butylene, $CH_3{\cdot}CH{:}CH{\cdot}CH_3$, through their chlorohydrins by treating these substances with milk of lime. Certain complex glycols, termed pinacones or more appropriately pinacols, are produced by the reduction of ketones (*q.v.*). For example, acetone when reduced either electrolytically or with sodium and water furnishes the simplest pinacol, 2:3-dimethyl-2:3-butanediol, $HO{\cdot}C(CH_3)_2{\cdot}C(CH_3)_2{\cdot}OH$, a crystalline solid melting at 38° C and boiling at 172° C. When distilled with dilute sulphuric acid this pinacol is transformed by loss of water into pinacoline, methyl tertiary butyl ketone, $(CH_3)_3C{\cdot}CO{\cdot}CH_3$, a liquid boiling at 106° C, insoluble in water and having an odour of peppermint.

GLYCONIC, a form of Aeolic verse, which may be described as a combination of one or more dactyls (or perhaps choriambi) with shorter feet.

It has many forms, as ⏑⏑–⏑⏑–⏑⏑–⏑⏑
or ⏑⏑–⏑⏑–⏑⏑ (acephalous glyconic)
or grato Pyrrha sub antro (Pherecratic).

But the commonest is ⏑⏑–⏑⏑–⏑⏑, often called simply a glyconic; this is a great favourite of Catullus and Horace, as sic te diva *potens Cypri;* it may be imitated in English by immemorial harmonies. The name is from Glycon, a lyric poet.

GLYCOSE: see SUGAR.

GLYOXALINES owe their interest to the fact that they are degradation products of certain alkaloids (*q.v.*), and that a member of the group arises from the decomposition of sugars such as glucose with ammonia. They are organic compounds of carbon, hydrogen and nitrogen, and contain the ring system shown in I. They are also called iminazoles.

(I.)  (II.) 
The glyoxalines are generally colourless, crystalline bases, and can be produced synthetically by the condensation of glyoxal and similar ortho-diketones with ammonia and aldehydes.

Glyoxaline itself (formula I.) is obtained by condensing together glyoxal, ammonia and formaldehyde; it melts at 90° C and boils at 263° C, 4(or 5)-*Methylglyoxaline* (formula II.) is formed by the action of zinc hydroxide and ammonia on grape sugar (glucose) and other hexoses and pentoses. The methylation of 4-methylglyoxaline with dimethyl sulphate and alkali gives rise simultaneously to 1:4- and 1:5-dimethylglyoxalines indicating that methylglyoxaline behaves during methylation as a tautomeric substance (see ISOMERISM).

Glyoxaline has a marked physiological activity—substitution of methyl for hydrogen in the imino-group increases the toxic action. The pilocarpine alkaloids, which contain the glyoxaline or iminazole nucleus and yield glyoxaline derivatives on distillation with soda lime, are substances of therapeutic interest (see PILOCARPINE). (G. T. M.)

GLYPH, a vertical channel in a frieze.

GLYPTODON, a gigantic extinct South American genus of edentate mammals, the type of a group, the Glyptodontia or tortoise-armadillos, in which the carapace is all in one piece, composed wholly of polygonal bony plates united together without any of the movable rings of the armadillos. The skull is short, with deep jaw and fluted teeth (whence the name), the backbone is welded into a rigid tube, and a complex joint in the neck permits the head to be retracted within the shell as in tortoises. The limb bones are stout and the feet short, rounded, with hoofs instead of claws on the toes. In Glyptodon and the related *Glyptotherium* of North America there are four toes on each foot in front and five behind, and the tail is encased in a series of movable rings. *Doedicurus,* of the South American Pleistocene, the largest known glyptodont, has three toes on each foot in front and four behind, and a tail-tube covered by horny spikes. The pattern of the plates composing the carapace differs in each genus.

The glyptodonts originated in South America where they are represented during the middle and later Tertiary by smaller and more primitive genera. In the Upper Pliocene and Pleistocene they invaded North America as far north as the Southern United States, but are now extinct everywhere. (W. D. M.)

GLYPTOTHEK, a gallery for the exhibition of sculpture, a term first employed at Munich, where a museum so called was built to exhibit the sculptures from the temple of Aegina.

GMELIN, the name of a family of German scientists. First of any consequence was Johann Georg Gmelin (1674–1728), apothecary and chemist of distinction. Of greater fame was Leopold Gmelin (1788–1855) great-grandson of Johann Georg. Leopold studied medicine and chemistry at Göttingen, Tübingen, and Vienna, and in 1813 began to lecture on chemistry at Heidelberg, where he subsequently became a professor in chemistry and medicine. He is remembered for his discovery of potassium ferrocyanide in 1822 and for his important *Handbuch der Chemie* (1st ed. 1817–19, 4th ed 1843–55). He resigned his chair in 1852 and died the following year. His father's cousin, Christian Gottlob Gmelin (1792–1860), was one of the first to devise a process for the artificial manufacture of ultramarine (1828); he also observed the red colouration given to a flame by lithium salts.

G-MEN, or Government Men. popular term for special agents of the United States Department of Justice, Bureau of Investigation. The phrase is supposed to have obtained currency after the capture of George ("Machine Gun") Kelly in Sept. 1933.

GMÜND, a town of Germany, in the *Land* of Württemberg,[1] on the Rems, 31 mi. E.N.E. of Stuttgart by rail. Pop. (1939) 22,072. It was surrounded by walls early in the 12th century. It received town rights from Frederick Barbarossa, and after the extinction of the Hohenstaufen became a free imperial town. In 1803 it passed to Wiirttemberg. The church of the Holy Cross, St. John's church, dating from the time of the Hohenstaufen, and the pilgrimage church of the Saviour are notable. Clocks and watches, optical instruments and gold and silver work are the chief manufactures. Trade is in precious stones.

GMUNDEN, an old town in Upper Austria at the issue of the river Traun from the lake of that name. It is a favourite summer health resort, for it lies about 1,400 ft. above sea-level amidst delightful scenery and has a variety of lake, brine, pine-cone and other baths, and is an excellent centre for excursions to the Traun fall and other features of scenic interest in Salzkammergut. It shares, also, in the salt industry of this region. Pop. (1939) 10,909.

See F. Krackowizer, *Geschichte der Stadt Gmunden in Oberosterreich* (1898–1901).

GNAT, the common English name for various kinds of smaller flies (*see* DIPTERA), including more especially mosquitoes (*q.v.*) and other forms with piercing mouth-parts, *e.g.,* buffalo gnats (fam. *Simuliidae*).

GNATCATCHER, the name given to birds of the American subfamily *Polioptilinae* of the warblers (*Sylviidae*). Some 15 species are recognized. Gnatcatchers are small, slender, greyish birds, and build beautiful lichen-covered nests. The best known species is the blue-grey gnatcatcher, *Polioptila caerula,* of the eastern United States, in which the male has a black forehead.

GNATIA (also GNATHIA, EGNATIA or IGNATIA), near Fasano, an ancient city of the Pevcetii, and their frontier town towards the Sallentini (*i.e.,* of Apulia towards Calabria), a port on the Via Traiana when a short cut from Butunti (mod. Bitonto) joined it, 38 m. S.E. of Barium. Roman remains include part of the city walls and objects now in museums at Fasano and at Bari.

See Ashby and Gardner, *Papers Brit. School at Rome,* viii., 161, *166, sqq.*

GNEISENAU, AUGUST WILHELM ANTON, COUNT NEITHARDT VON (1760–1831), Prussian field marshal, son of a Saxon officer named Neithardt, was born on Oct. 27, 1760, at Schildau, near Torgau. He assumed the name of Gneisenau from the lost estates of the family in Austria. After two years' study at Erfurt he entered the Austrian army in 1779, and transferred in 1782 to the service of the margrave of Baireuth-Anspach. With one of that prince's mercenary regiments in English pay he fought in the War of American Independence, and returning in 1786, applied for Prussian service. Gneisenau served in Poland, 1793–1794, and in the next ten years devoted himself to military study, for which a quiet garrison life at Jauer gave him opportunity. In 1796 he married Caroline von Kottwitz. In 1806 he was one of Hohenlohe's staff-officers, fought at Jena, and commanded a provisional infantry brigade which fought under Lestocq in the Lithuanian campaign. Early in 1807 Gneisenau was commandant at Colberg, which, small and ill-protected as it was, succeeded in holding out until the peace of Tilsit. For this service he received the much-prized order *"pour le mérite,"* and was promoted lieutenant-colonel.

A wider sphere of work was now opened to him. As chief of engineers, and a member of the reorganizing committee, he played a great part, with Scharnhorst, in the reorganization of the Prussian army. His energy aroused the suspicion of the dominant French, and Stein's fall was followed by Gneisenau's retirement. But, after visiting Russia, Sweden and England, he returned to Berlin and resumed his place as a leader of the patriotic party. In open military work and secret machinations his energy and patriotism were equally tested, and with the outbreak of the War of Liberation, Gneisenau, now a major-general, became Bliicher's quartermaster-general. With Bliicher, Gneisenau served to the capture of Paris; his military character was the exact complement of Blücher's, and under this happy guidance the young troops of Prussia, often defeated but never discouraged, fought their way into the heart of France. The plan of the march on Paris was specifically the work of the chief-of-staff. In reward for his distinguished service he was made a count.

In 1815, once more chief of Blucher's staff, Gneisenau played a conspicuous part in the Waterloo campaign (*q.v.*). When the old field marshal was disabled at Ligny, Gneisenau assumed the control of the Prussian army.

The precise part taken by Gneisenau in the events which followed is much debated. Gneisenau distrusted Wellington, who, he considered, had left the Prussians in the lurch at Ligny, and even considered falling back on the Rhine. Bliicher, however, soon recovered from his injuries, and, with Grolmann, the quartermaster-general, he managed to convince Gneisenau. The relations of the two may be illustrated by Brigadier-General Hardinge's report. Bliicher burst into Hardinge's room at Wavre, saying *"Gneisenau* has *given* way, and we are to march at once to your chief." On the field of Waterloo, however, Gneisenau was quick to realize the magnitude of the victory, and he carried out the pursuit with relentless vigour. In 1816 he was appointed to command the VIII. Prussian Corps, but soon retired. In 1818 he was made governor of Berlin and member of the *Staatsrat.* In 1825 he became general field-marshal. In 1831 he was appointed to the command of the Army of Observation on the Polish frontier, with Clausewitz as his chief-of-staff. At Posen he was struck down by cholera and died on Aug. 24, 1831.

See his *Briefe 1809–15,* ed. Pflugk-Harttung (1913); also *G.* H. Pertz, *Das Leben des Feldmarschalls Grafen Neithardt von Gneisenau,* vols. 1–3 (1864–69); vols. 4 and 5. H. Delbrück, *Das Leben des G. F. M. Grafen von Gneisenau* (2 vols., 3rd ed., 1907), based on Pertz's work, but containing much new material; W. von Unger, *Gneisenau* (1914).

GNEISS, in geology a term originally used by the miners of the Erzgebirge to designate the country rock in which the mineral veins occur. The word is of Slavonic origin meaning "rotted," or "decomposed," in allusion to the altered character of the country rock in the immediate vicinity of the ore veins. It has gradually passed into acceptance as a generic term signifying a large and varied series of rocks with a banded and usually foliated structure in which layers of minerals with a granular texture alternate with thin layers composed of lamellar or fibrous minerals, usually in parallel arrangement. The foliation may be frequently interrupted and the ease of splitting of the rock is usually much less in evidence than in the case of schists (*q.v.*). Gneisses, however, may also be built up wholly of granular minerals, the gneissose structure being given by the alternation of bands of different mineral composition, *e.g.,* pyroxene-gneiss.

As used in its widest sense, gneiss is a structural term rather than a name applied to rocks of a particular mineral composition or genesis. Thus gneisses may be of igneous or metamorphic origin, and have a great range of chemical composition. The minerals of the granular bands usually consist of quartz, felspar (orthoclase, microcline, plagioclase) or both, and the lamellar or fibrous bands are usually composed of chlorite, mica (muscovite, biotite), graphite, amphibole, sillimanite, etc.

According to their origin, gneisses are sub-divided broadly into three groups: *(a)* Primary gneisses, *(b)* Ortho-gneisses and (c) Para-gneisses.

Primary gneisses are plutonic igneous rocks possessing a banded structure, in which a parallel arrangement of the lamellar or fibrous minerals (if present) is evident. These rocks owe their structures to a flow movement in a magma in which crystallization has already progressed. Primary gneisses are often of granitic composition and build up great areas of Archaean terranes. Much of the Lewisian gneiss of Scotland, the Laurentian gneiss of Canada and the igneous gneisses of other Continental shields are rocks of this character. The setting up of gneissic banding in a fluid magma by flow movement pre-supposes a magmatic hetero-

[1] There are two places of this name in Austria. (1) Gmünd, a town in Lower Austria, (2) a town in Carinthia, with a Gothic church.

geneity which in nature arises either by imperfect differentiation or by the incorporation of foreign material within the magma. In many Archaean shields the granite-gneisses are characterized by containing numerous bands of rock, usually of the nature of amphibolites or hornblende-schists, representing basic igneous rocks of earlier date incorporated in the magma during intrusion. These basic bands become injected *lit par lit* by the granitic material and ultimately in places become so intimately intermingled with the magma as to produce a gneiss of hybrid origin. Less advanced stages of this process where injection takes place along the foliation planes of inclusions or of the country rock adjacent give rise to injection gneisses.

While gneisses are most prevalent in Archaean tracts, they are by no means absent from later formations. Some of the best known primary gneisses have been described from the Inner Hebrides (Skye and Rum). These are of Tertiary age. The banded gabbros of Druim an Eidhne, Skye, illustrate gneisses arising from imperfect differentiation, and the gneisses of central Rum, also of Tertiary age, have been produced by an intimate commingling of eucrite and granite.

The term ortho-gneiss refers strictly to igneous rocks in which a gneissic structure has been superimposed by metamorphism, but the name is loosely used by some writers to include also primary gneisses. Criteria for the distinction of ortho-gneisses from primary gneisses are sometimes difficult to establish, and are chiefly provided in the textural and structural relations of the rocks. They may be evidenced by signs of crushing (cataclastic structure), relict textures, or where the whole rock has been totally recrystallized by the textural relations of the minerals. In primary gneisses the form-development of the crystals is largely dependent on the order in which the minerals have crystallized from the magma, while in totally recrystallized ortho-gneisses the growth of the minerals has taken place in an essentially solid environment, and the form-development is dependent on the crystallizing power of the several minerals (crystalloblastic texture, *see* METAMORPHISM). Some of the best known ortho-gneisses are those of the grznulite districts of Saxony and the Austrian Waldviertel near Krems.

Many gneisses are undoubtedly sedimentary rocks brought to their present state by such agents of metamorphism as heat, movement, crushing and recrystallization. This may be demonstrated partly by their mode of occurrence; they accompany limestones, graphite-schists, quartzites and other rocks whose sedimentary origin is never in doubt. In many cases bulk chemical composition is a certain clue to their origin, since they correspond in this particular to normal sediments and not to any known igneous rocks. Structural or textural criteria, such as bedding, evidence of original pebbly or clastic character are not infrequently to be found. The chemical composition of para-gneisses is reflected in their mineralogical constitution. Gneisses derived from argillites may be rich in biotite, muscovite, cordierite, almandine-garnet, staurolite, chloritoid, kyanite and sillimanite, some of which minerals are practically unknown in metamorphosed igneous rocks, while gneisses derived from limestones or dolomites carry such characteristic minerals as grossularite, idocrase, wollastonite, scapolite or forsterite. Some para-gneisses are rich in felspar (orthoclase, microcline and plagioclase) and quartz and may show so close a resemblance to gneisses of igneous origin that by no single character, chemical or mineralogical, can their original nature be definitely established. (C. E. T.)

GNEIST, HEINRICH RUDOLF MERMANN FRIEDRICH VON (1816–1895), German jurist and politician, was born at Berlin on Aug. 13, 1816, the son of a judge attached to the "Kammergericht" (court of appeal) in that city. After receiving his school education at the gymnasium at Eisleben in Prussian Saxony, he entered the University of Berlin in 1833 as a student of jurisprudence, and became a pupil of Savigny (*q.v.*). Proceeding to the degree of *doctor juris* in 1838, young Gneist chose the judicial branch of the legal profession, and was admitted *Assessor* in 1841. He spent the next few years in Italy, France and England. On his return in 1844 he was appointed extraordinary professor of Roman law in Berlin university, and thus began a professorial connection which ended only with his death. He continued his judicial career, and became successively assistant judge of the superior court and of the supreme tribunal. But to a mind constituted like his, the want of elasticity in the procedure of the courts was galling. Feeling the necessity for fundamental reforms in legal procedure, he published, in 1849, his *Trial by Jury*.

In 1848 Gneist threw himself with ardour into the constitutional struggles of Prussia, and in 1850 resigned his judgeship Entering the National Liberal party, he began both in writing and speeches actively to champion their cause, now busying himself pre-eminently with the study of constitutional law and history. In 1853 appeared his *Adel und Ritterschaft in England,* and in 1857 the *Geschichte und heutige Gestalt der Ämter in England,* a pamphlet primarily written to combat the Prussian abuses of administration, but for which the author also claimed that it had not been without its effect in modifying certain views that had until then ruled in England itself. In 1858 Gneist was appointed ordinary professor of Roman law, and entered the Abgeordnetenhaus of the Prussian Landtag, in which assembly he sat thenceforward until 1893. He at once became one of the leading spokesmen of the Left. His chief oratorical triumphs are associated with the early period of his membership of the House; two noteworthy occasions being his violent attack (Sept. 1862) upon the Government budget in connection with the reorganization of the Prussian army, and his defence (1864) of the Polish chiefs of the (then) grand-duchy of Posen, who were accused of high treason. In 1857–63 was published *Das heutige englische Verfassungs und Verwaltungsrecht, a* work which, contrasting English and German constitutional law and administration, aimed at exercising political pressure upon the Government of the day. In 1868 Gneist became a member of the North German parliament. On the establishment of German unity his mandate was renewed for the Reichstag, and he was an active and prominent member until 1884. In the Rulturkampf he sided with the Government against the attacks of the Clericals. In 1879, together with his colleague, von Hänel, he successfully attacked the motion for the prosecution of certain Socialist members. He was parliamentary reporter for the committees on all great financial and administrative questions, and his advice was frequently sought, not only in his own but also in other countries. In Prussia he largely influenced legislation, the reform of the judicial and penal systems and the new constitution of the Evangelical Church being largely his work. He was also consulted by the Japanese Government when a constitution was being introduced into that country. In 1875–77 he was a member of the supreme administrative court (*Oberverwaltungsgericht*) of Prussia. In 1882 was published his *Englische Verfassungsgeschichte* (trans. *History of the English Constitution,* 1886), a standard work. In 1888 one of the first acts of Frederick IPI., who had always, as crown prince, shown great admiration for him, was to ennoble Gneist, and attach him as instructor in constitutional law to his son. He died in Berlin on July 22, 1895.

Gneist was a jurist of a special type. To him law was not mere theory, but living force; and this conception of its power animates all his schemes of practical reform. As a teacher he exercised a magnetic influence over his pupils. He was a man of noble bearing, religious, and imbued with a stern sense of duty. He mas proud of being a "Preussischer Junker" (a member of the Prussian squirearchy), and he clung loyally to monarchial institutions. A great admirer and a true friend of England, to which country he was attached by many personal ties, he surpassed all other Germans in his efforts to make her free institutions, in which he found his ideal, the common heritage of the two great nations of the Teutonic race.

Gneist's other works include: *Budget und Gesetz nach dem constitutionellen Staatsrecht Englands* (1867); *Freie Advocatur* (1867); *Der Rechtsstaat* (1872; 2nd ed., 1879); *Zur Verwaltungsreform in Preussen* (Leipzig, 1880); *Das englische Parlament* (1886; Eng. trans. *The English Parliament,* 1886; 3rd ed. 1889); *Die Militär-Vorlage von 1892 und der preussische Verfassungsconflikt von 1862 bis 1866* (1893); *Die nationale Rechtsidee von den Ständen und das preussische Dreiklassenwahlsystem* (1895); *Die verfassungsmässige Stellung des preussischen*

Gesammtministeriums (1895).

GNESEN (Polish, *Gniezno*), a town of Poland in the province of Poznan, on the Wrzesnia, 30 m. E N.E of Posen by rail to Thorn. Pop. (1931) 29,924. Besides the cathedral, a handsome Gothic edifice, there are eight Roman Catholic churches, a Protestant church, a synagogue, a clerical seminary and a convent of the Franciscan nuns. Among the industries are cloth and linen weaving, brewing and distilling. A great horse and cattle market is held here annually. Gnesen is one of the oldest towns in the former kingdom of Poland. Its name, Gniezno, signifies "nest," and points to early Polish traditions. The cathedral is believed to have been founded towards the close of the 9th century, and, having received the bones of St. Adalbert, it was visited in 1000 by the emperor Otto III., who made it the seat of an archbishop. Here, until 1320, the kings of Poland were crowned; and the archbishop, since 1416 primate of Poland, acted as protector pending the appointment of a new king. In 1821 the see of Posen was founded and the archbishop removed his residence thither, though its cathedral chapter still remains at Gnesen. Germany occupied Gnesen in World War II.

See S. Karwowski, Gniezno (Posen, 1892).

GNOME, AND GNOMIC POETRY. Sententious maxims, put into verse for the better aid of the memory, were known by the Greeks as gnomes, γνῶμαι, from γνώμη, an opinion. A gnome is defined by the Elizabethan critic Henry Peacham (1576?–1643?) as "a saying pertaining to the manners and common practices of men, which declareth, with an apt brevity, what in this our life ought to be done, or not done." The Gnomic Poets of Greece, who flourished in the 6th century B.C., were those who arranged series of sententious maxims in verse. These were collected in the 4th century, by Lobon of Argos, an orator, but his collection has disappeared. The chief gnomic poets were Theognis, Solon, Phocylides, Simonides of Amorgos, Demodocus, Xenophanes, and Euenus. With the exception of Theognis, whose gnomes were fortunately preserved by some schoolmaster about 300 B.C., only fragments of the Gnomic Poets have come down to us. Of the gnomic movement typified by the moral works of the poets named above, Prof. Gilbert Murray has remarked that it receives its special expression in the conception of the Seven Wise Men, to whom such proverbs as "Know thyself" and "Nothing too much" were popularly attributed. These gnomes or maxims were extended and put into literary shape by the poets. Theognis enshrines his moral precepts in his elegies, and this was probably the custom of the rest; it is improbable that there ever existed a species of poetry made up entirely of successive gnomes. But the title "gnomic" came to be given to all poetry which dealt in a sententious way with questions of ethics. It was, unquestionably, the source from which moral philosophy was directly developed, and theorists upon life and infinity, such as Pythagoras and Xenophanes, seem to have begun their career as gnomic poets. By the very nature of things, gnomes, in their literary sense, belong exclusively to the dawn of literature; their naïveté and their simplicity in moralizing betray it. But it has been observed that many of the ethical reflections of the great dramatists, and in particular of Sophocles and Euripides, are gnomic distiches expanded. It would be an error to suppose that the ancient Greek gnomes are all of a solemn character; some are voluptuous and some chivalrous; those of Demodocus of Leros had the reputation of being droll. In modern times, the gnomic spirit has occasionally been displayed by poets of a homely philosophy, such as Francis Quarles (1592–1644) in England and Gui de Pibrac (1529–1584) in France. The once-celebrated Quatrains of the latter, published in 1574, enjoyed an immense success throughout Europe; they were composed in deliberate imitation of the Greek gnomic writers of the 6th century B.C. These modern effusions are rarely literature and perhaps never poetry. With the gnomic writings of Pibrac it was long customary to bind up those of Antoine Favre (or Faber) (1557–1624) and of Pierre Mathieu (1563–1621). Gnomes are frequently to be found in the ancient literatures of Arabia, Persia and India, and in the Icelandic staves. (E. G.)

GNOMES, in folk-lore, the name given to the earth and mountain spirits, usually pictured as bearded dwarfs clad in brown garments with hoods, who are supposed to guard veins of precious metals and hidden treasures. The word "gnome" as applied to these is said to have been coined by Paracelsus.

GNOMON, a term originally used to mean an instrument for allowing one to know the time (γνώμων, *gnōmōn,* from γιγνώσκειν, *gignōskein,* to know). In its simple and primitive form it seems to have been a stick placed vertically on a plane surface, and later upon the concave surface of a hemisphere. This second form is seen in pocket sundials still used in certain parts of the world. That the term was at one time substantially synonymous with "vertical line" is seen in an expression of Oenopides of Chios (c. 465 B.C.), for Proclus (c. 460) says that he called "the perpendicular in the archaic manner 'gnomon-wise' (κατὰ γνώμονα), because the gnomon is also at right angles to the horizon." From this early use it came to represent a figure like a carpenter's square, but usually with equal arms. Seeking, as the Pythagoreans especially did, to relate number to geometric forms, the early Greek mathematicians imagined squares as built up of gnomons added to unity. For example, they saw that $1+3$, $1+3+5$, $1+3+5+7$, and so on, are squares, and that the odd numbers in a figure like this were related to the geometric gnomon. Such numbers were, therefore, themselves called gnomons. The early idea of a geometric gnomon was extended by Euclid (*q.v.;* c. 300 B.C) to include a figure consisting of two parallelograms forming an L. Four or five centuries later Heron extended the term still farther, using it to mean that which, added to any number or figure, makes the whole similar to that to which it is added. This usage is also found in the writings of Theon of Smyrna (c. 125) in connection with figurate numbers (*q.v.*). For example, the pentagonal numbers are $1+4$, $1+4+7$, $1+4+7+10$, . . ., and the gnomons in this case are 4, 7, 10, . . .; *i.e.,* they constitute an arithmetical series with a common difference of 3. In the same way gnomons are developed with respect to hexagonal and higher polygons. The gnomon with respect to the square was used by early writers in the finding of square roots, and may still be seen in various elementary arithmetics and algebras.

As to the sundial, with a gnomon as a vertical needle, this is said to have been introduced into Greece by Anaximander (*q.v.; c.* 575 B.C.), and Herodotus states that it came from the Babylonians.

BIBLIOGRAPHY.—A brief historical treatment of the subject may be found in Sir Thomas Heath, *A* History *of* Greek Mathematics, vol. i., pp. 77–83 (Oxford, 1921); Pauly-Wissowa, *Realencyclopädie* der *Classischen* Altertumswissenschaft (Stuttgart, 1894 *seq.*); D. E. Smith, History of Mathematics, vol. ii., pp. 601, 603, 669, 671 (Boston, 1925), and various other histories. (D. E. S.)

GNOSTICISM, a movement of religious syncratism (or fusion of different and previously independent beliefs), which maintained itself side by side with genuine Christianity as the latter was gradually crystallizing into the ancient Catholic Church, and which bore the strong impress of Christian influences. The movement first came into prominence in the opening years of the 2nd century; it reached its height in the 3rd quarter of that century, after which it began to wane, and from the 2nd half of the 3rd century was replaced by the closely-related and more powerful Manichaean movement. Offshoots of it, however, continued on into the 4th and 5th centuries and many of its ideas survived among later mystics.

Gnosis as Revelation.— If we wish to grasp the peculiar character of the great Gnostic movement, we must take care not to be led astray by the catchword "Gnosis." It is a mistake to regard the Gnostics as pre-eminently the representatives of intellect among Christians, and Gnosticism as an intellectual tendency chiefly concerned with philosophical speculation, the reconciliation of religion with philosophy and theology. It is true that when Gnosticism was at its height it numbered amongst its followers both theologians and men of science, but that is not its main characteristic. Among the majority of the followers of the movement "Gnosis" was understood not as meaning "knowledge" or "understanding," in our sense of the word, but "revelation."

These little Gnostic sects and groups all lived in the conviction that they possessed a secret and mysterious knowledge, in no way accessible to those outside, and not based on reflection, on scientific inquiry and proof, but on revelation. It was derived directly from the times of primitive Christianity; from the Saviour himself and his disciples and friends, with whom they claimed to be connected by a secret tradition, or else from later prophets, of whom many sects boasted. It was laid down in wonderful mystic writings, which were in the possession of the various circles (Liechtenhahn, *Die Offenbarung* im *Gnosticismus*.

In short, Gnosticism, in all its various sections, its form and its character, falls under the great category of mystic religions, which were so characteristic of the religious life of decadent antiquity, All alike boast a mystic revelation and a deeply-veiled wisdom. As in many mystical religions, so in Gnosticism, the ultimate object is individual salvation, the assurance of a fortunate destiny for the soul after death. As in the others, so in this the central object of worship is a redeemer-deity who has already trodden the difficult way which the faithful have to follow.

Symbols.—And as in all mystical religions, so here too, holy rites and formulas, acts of initiation and consecration, all those things which we call sacraments, play a very prominent part. The Gnostic religion is full of such sacraments. Indeed, sacred formulas, names and symbols are of the highest importance among the Gnostic sects. We constantly meet with the idea that the soul, on leaving the body, finds its path to the highest heaven opposed by the deities and demons of the lower realms of heaven, and only when it is in possession of the names of these demons, and can repeat the proper holy formula, or is prepared with the right symbol, or has been anointed with the holy oil, finds its way unhindered to the heavenly home. Hence the Gnostic must above all things learn the names of the demons, and equip himself with the sacred formulas and symbols, in order to be certain of a good destiny after death. The exposition of the system of the Ophites given by Celsus (in Origen vi. 25 *seq.*), and, in connection with Celsus, by Origen, is particularly instructive on this point. It was taught that even the redeemer-god, when he once descended on to this earth, to rise from it again, availed himself of these names and formulas on his descent and ascent through the world of demons. Traces of ideas of this kind are to be met with almost everywhere. They have been most carefully collected by Anz (*Ursprung des Gnosticismus, Texte und Untersuchungen* xv. 4 passim) who sees in them the central doctrine of Gnosticism.

Evil and the Emanations.—The basis of the Gnostic religion and world-philosophy lies in a decided Oriental dualism. In sharp contrast are opposed the two worlds of the good and of the evil, the divine world and the material world (ὕλη), the worlds of light and of darkness. The material world is believed to be the true seat of evil, full of active energies and hostile powers. Even when there is an attempt at reconciliation, it is still quite clear how strong was the original dualism which has to be overcome. A characteristic attempt is set forth in the so-called "system of emanations" in which it is assumed that from the supreme divinity emanated a somewhat lesser world, from this world a second, and so on, until the divine element (of life) became so far weakened and attenuated, that the genesis of a partly, or even wholly, evil world appears both possible and comprehensible. A system of emanations of this kind, in its purest form, is set forth in the expositions coming from the school of Basilides, which are handed down by Irenaeus. All these efforts at reconciliation show how clearly the problem of evil was realized in these Gnostic and half-Gnostic sects, and how deeply they meditated on the subject.

Another characteristic feature of the Gnostic conception of the universe is the rôle played in almost all Gnostic systems by the seven world-creating powers. There are indeed certain exceptions; for instance, in the systems of the Valentinian schools there is the figure of the one Demiurge who takes the place of the Seven. But how widespread was the idea of seven powers, who created this lower material world and rule over it, has been clearly proved, especially by the systematic examination of the subject by Anz (*Ursprung des Gnosticismus*). These Seven, then, are in most systems half-evil, half-hostile powers; they are frequently characterized as "angels," and are reckoned as the last and lowest emanations of the Godhead; below them—and frequently considered as derived from them—comes the world of the actually devilish powers. There can scarcely be any doubt as to the origin of these seven powers; they are the seven planetary divinities, the sun, moon and five planets. They imply a fusion of Babylonian and Persian beliefs, resulting in a degradation of the Babylonian planetary deities into half-angelic, half-demonic beings, infinitely remote from the supreme God of light.

The Way to Heaven.—With this fundamental doctrine of Gnosticism is connected, as Anz has shown, a side of their religious practices to which we have already alluded. Gnosticism is to a great extent dominated by the idea that it is in the highest degree important for the Gnostic's soul to be enabled to find its way back through the lower worlds and spheres of heaven ruled by the Seven to the kingdom of light, of the supreme deity of heaven. Hence, a principal item in their religious practice consisted in communications about the being, nature and names of the Seven (or of any other hostile daemons barring the way to heaven), the formulas with which they must be addressed, and the symbols which must be shown to them. But names, symbols and formulas are not efficacious by themselves: the Gnostic must lead a life having no part in the lower world ruled by these spirits, and by his knowledge he must raise himself above them to the God of the world of light. Throughout this mystic religious world it was above all the influence of the late Greek religion, derived from Plato, that also continued to operate; it is filled with the echo of the song, the first note of which was sounded by the Platonists, about the heavenly home of the soul and the homeward journey of the wise to the higher world of light.

The Great Mother.—We cannot here undertake to set forth and explain in detail all the complex varieties of the Gnostic systems; but it will be useful to take a nearer view of certain principal figures which have had an influence upon at least one series of Gnostic systems. In almost all systems an important part is played by the Great Mother (μήτηρ) who appears under the most varied forms.

The origin of this figure is not far to seek. It is certainly not derived from the Persian religious system, to the spirit of which it is entirely opposed. Neither would it be correct to identify her entirely with the great goddess Ishtar of the old Babylonian religion. But there can hardly be any doubt that the figure of the great mother-goddess or goddess of heaven, who was worshipped throughout Asia under various forms and names (Astarte, Beltis, Atargatis, Cybele, the Syrian Aphrodite), was the prototype of the μήτηρ of the Gnostics. The character of the great goddess of heaven is still in many places fairly exactly preserved in the Gnostic speculations. Hence we are able to understand how the Gnostic μήτηρ, the Sophia, appears as the mother of the Hebdomas. The great goddess of heaven is the mother of the stars.

Primal Man.—Another characteristic figure of Gnosticism is that of the Primal Man (πρῶτος ἄνθρωπος), the man who existed before the world, the prophet who goes through the world in various forms, and finally reveals himself in Christ. This figure can particularly be compared with that of the Gnostic Sophia. It represents that divine power which, whether simply owing to a fall, or as the hero who makes war on and is partly vanquished by darkness, descends into the darkness of the material world, and with whose descent begins the great drama of the world's development. From this power are derived those portions of light existing and held prisoner in this lower world. And as he has raised himself again out of the material world, or has been set free by higher powers, so also shall the portions of light still imprisoned in matter be set free.

A parallel myth to that of the Primal Man are the accounts to be found in most of the Gnostic systems of the creation of the first man. In all these accounts the idea is expressed that so far as his body is concerned man is the work of the beings who created the world. And as the man thus formed was unable to move, but could only crawl like a worm, the supreme Power put into him a spark of life, and man came into existence.

The Myth of Salvation.—Of the fundamental ideas of

Gnosticism of which we have so far treated, it can with some certainty be assumed that they were in existence before the rise of Christianity and the influence of Christian ideas on the development of Gnosticism. The main question with which we have now to deal is that of whether the dominant figure of the Saviour (Σωτήρ) in Gnosticism is of specifically Christian derivation, or whether this can also be explained apart from the assumption of Christian influence. And here it must be premised that, intimately as the conception of salvation is bound up with the Gnostic religion, the idea of salvation accomplished in a definite historical moment to a certain extent remained foreign to it. Indeed, nearly all the Christian Gnostic systems clearly exhibit the great difficulty with which they had to contend in order to reconcile the idea of an historical redeemer, actually occurring in the form of a definite person, with their conceptions of salvation. In Gnosticism salvation always lies at the root of all existence and all history. In fact salvation, as conceived in Gnosticism, is always a myth, a history of bygone events, an allegory or figure, but not an historical event. This explains the laborious and artificial way in which the person of Jesus is connected in many Gnostic systems with the original Gnostic conception of redemption. In this patchwork the joins are everywhere still clearly to be recognized.

Thus the essential part of most of the conceptions of what we call Gnosticism was already in existence and fully developed before the rise of Christianity. But the fundamental ideas of Gnosticism and of early Christianity had a kind of magnetic attraction for each other. What drew these two forces together was the energy exerted by the universal idea of salvation in both systems. Christian Gnosticism actually introduced only one new figure into the already existing Gnostic theories, namely that of the historical Saviour Jesus Christ. This figure afforded, as it were, a new point of crystallization for the existing Gnostic ideas, which now grouped themselves round this point in all their manifold diversity. Thus there came into the fluctuating mass a strong movement and formative impulse, and the individual systems and sects sprang up like mushrooms from this soil. Above all the Gnostics represented and developed the distinctly anti-Jewish tendency in Christianity. Paul was the apostle whom they reverenced, and his spiritual influence on them is quite unmistakable. The Gnostic Marcion has been rightly characterized as a direct disciple of Paul. Paul's battle against the law and the narrow national conception of Christianity found a willing following in a movement, the syncretic origin of which directed it towards a universal religion. St. Paul's ideas were here developed to their extremest consequences, and in an entirely one-sided fashion such as was far from his intention. In approximately all the Gnostic systems the doctrine of the seven world-creating spirits is given an anti-Jewish tendency, the god of the Jews and of the Old Testament appearing as the highest of the seven. The Demiurge of the Valentinians always clearly bears the features of the Old Testament creator-God.

The attitude of Gnosticism to the Old Testament and to the creator-God proclaimed in it had its deeper roots, as we have already seen, in the dualism by which it was dominated. With this dualism and the recognition of the worthlessness and absolutely vicious nature of the material world is combined a decided spiritualism. The conception of a resurrection of the *body*, of a further existence for *the* body after death, was unattainable by almost all of the Gnostics, with the possible exception of a few Gnostic sects dominated by Judaeo-Christian tendencies. With the dualistic philosophy is further connected an attitude of absolute indifference towards this lower and material world, and the practice of asceticism. Marriage and sexual propagation are considered either as absolute Evil or as altogether worthless, and carnal pleasure is frequently looked upon as forbidden. Then again asceticism sometimes changes into wild libertinism. Here again Gnosticism has exercised an influence on the development of the Church by way of contrast and opposition. If here a return was made to the old material view of the resurrection (the apostolic ἀνάστασις τῆς σαρκός), entirely abandoning the more spiritual conception which had been arrived at as a compromise by Paul, this is probably the result of a reaction from the views of Gnosticism. It was just at this point, too, that Gnosticism started a development which was followed later by the Catholic Church. In spite of the rejection of the ascetic attitude of the Gnostics, as a blasphemy against the Creator, a part of this ascetic principle became at a later date dominant throughout all Christendom. And it is interesting to observe how, *e.g.*, St. Augustine, though desperately combating the dualism of the Manichaeans, yet afterwards introduced a number of dualistic ideas into Christianity, which are distinguishable from those of Manichaeism only by a very keen eye, and even then with difficulty.

Gnosticism and the Church. — The Gnostic religion also anticipated other tendencies. As we have seen, it is above all things a religion of sacraments and mysteries. Through its syncretic origin Gnosticism introduced for the first time into Christianity a whole mass of sacramental, mystical ideas, which had hitherto existed in it only in its earliest phases. Gnosticism was also the pioneer of the Christian Church in the strong emphasis laid on the idea of salvation in religion.

Finally, it was Gnosticism which gave the most decided impulse to the consolidation of the Christian Church as a church. Gnosticism itself is a free, naturally-growing religion, the religion of isolated minds, of separate little circles and minute sects. The homogeneity of wide circles, the sense of responsibility engendered by it, and continuity with the past are almost entirely lacking in it. It is based upon revelation, which even at the present time is imparted to the individual, upon the more or less convincing force of the religious imagination and speculations of a few leaders, upon the voluntary and unstable grouping of the schools round the master. Its adherents feel themselves to be the isolated, the few, the free and the enlightened, as opposed to the sluggish and inert masses of mankind degraded in matter, or the initiated as opposed to the uninitiated, the Gnostics as opposed to the "Hylici" (ὑλικοί); at most in the later and more moderate schools a middle place was given to the adherents of the Church as Psychici (ψυχικοί).

This freely-growing Gnostic religiosity aroused in the Church an increasingly strong movement towards unity and a firm and inelastic organization, towards authority and tradition. An organized hierarchy, a definitive canon of the Holy Scriptures, a confession of faith and rule of faith, and unbending doctrinal discipline, these were the means employed. A part was also played in this movement by a free theology which arose within the Church itself, a kind of Gnosticism which aimed at holding fast whatever was good in the Gnostic movement, and obtaining its recognition within the limits of the Church (Clement of Alexandria, Origen).

It must be considered as an unqualified advantage for the further development of Christianity, as a universal religion, that at its very outset it prevailed against the great movement of Gnosticism. In spite of the fact that in a few of its later representatives Gnosticism assumed a more refined and spiritual aspect, and even produced blossoms of a true and beautiful piety, it is fundamentally and essentially an unstable religious syncretism, a religion in which the determining forces were a fantastic oriental imagination and a sacramentalism which degenerated into the wildest superstitions, a weak dualism fluctuating unsteadily between asceticism and libertinism.

Sects and Leaders. — For descriptions of the various sects and leaders reference must be made to the works mentioned below. Only the briefest indication can here be given. The earlier sects are not associated with the name of any personal founders or leading teachers. In the controversial writings of the Fathers we can distinguish the "Ophites," "Naasenes," "Peratae," "Sethians," "Cainites," "Archontics," "Severians," "Barbelo-gnostics," "Justinians," "Nicolaitans." and other more obscure sects. In these, the element of imaginative and fantastic mythology predominates over Christian or philosophical speculation. On the other hand, the sects or systems connected with the names of personal teachers reflect the main development of Gnosticism in its alliance with Christianity, which first appears definitely in *Cerinthus* (*q.v.*), towards the end of the first century, then in *Satornilos* and (with extreme antinomianism) in *Carpocrates*

and above all in the two great masters of Gnosticism, *Basilides* (q v) and *Valentinus* (*q.v.*). Both of these founded influential schools of followers who developed and altered their doctrines. Irenaeus connects with Valentinus the doctrines of *Ptolemaeus, Heracleon, Bardesanes,* and others. Bardcsanes, however, is an independent and original thinker and has been called the last of the great Gnostic teachers. Apart from all other Gnostics stands *Marcion.* With him, the manifold Gnostic speculations are reduced to the one problem of the contrast of justice and love, of the God of the Old Testament and the God of the Christians. Between these Marcion affirms an irreconcilable opposition which with him rests on a speculative basis. Through the noble simplicity and intensely religious character of his teaching, Marcion was able to found not only schools of followers, but a religious community which gave trouble to the Church longer than any other Gnostic movement.

BIBLIOGRAPHY.—Of the actual writings of the Gnostics, which were extraordinarily numerous, very little has survived; they were sacrificed to the destructive zeal of their ecclesiastical opponents. Numerous fragments and extracts from Gnostic wntings are to be found in the works of the Fathers who attacked Gnosticism. Most valuable of all are the long extracts in the 5th and 6th books of the *Philosophumena* of Hippolytus. The most accessible and best critical edition of the fragments which have been preserved word for word is to be found in Hilgenfeld's *Keteergeschichte des Urchristentums.* One of the most important of these fragments is the letter of Ptolemaeus to Flora, preserved in Epiphanius, *Haeres.* xxxiii. 3–7 *(see* on this point Harnack in the *Sitzungsberichte der Berliner Akademie,* 1902, pp. 507–545). Gnostic fragments are certainly also preserved for us in the *Acts of Thomas.* Here we should especially mention the beautiful and much-discussed *Song of the Pearl,* or *Song of the Soul,* which is generally, though without absolute clear proof, attributed to Bardesanes (till lately it was known only in the Syrian text; edited and translated by Bevan, *Texts and Studies,* v. 3, 1897; Hofmann, *Zeitschrift für neutestamentliche Wissenschaft,* iv.; for the newly-found Greek text see *Acta apostolorum,* ed. Bonnet, ii. 2, c. 108, p. 219). Generally also much Gnostic matter is contained in the apocryphal histories of the Apostles. We should also mention in this connection the text on which are based the pseudo-Clementine *Homilies* and *Recognitiones* (beginning of the 3rd century). It is, of course, already permeated with the Catholic spirit, but has drawn so largely upon sources of a Judaeo-Christian Gnostic character that it comes to a great extent within the category of sources for Gnosticism. Complete original Gnostic works have unfortunately survived to us only from the period of the decadence of Gnosticism. Of these we should mention the comprehensive work called the *Pistïs Sophia,* probably belonging to the 2nd half of the 3rd century, translated by C. Schmidt, *Koptisch-gnostische Schriften,* i. (1905), in the series *Die griechischen christlichen Schriftsteller der ersten drei Jahrhunderte.* The Egyptian Gnostic texts edited by C. Schmidt, *Texte* u. *Untersuchungcn,* vol. viii. (1892) and *Koptische-gnostische Schriften,* vol. i., probably represent an advanced stage in the decadence of Gnosticism (but *see* also the same writer in *Siteungsberichte der Berl. Akad.* for 1896, p. 839 ff.).

On the whole, then, for an exposition of Gnosticism we are thrown back upon the polemical writings of the Fathers in their controversy with heresy. The most ancient of these is Justin, who according to his *Apol.* i. 26 wrote a *Syntagma* against all heresies *(c.* A.D. 150), and also, .probably, a special polemic against Marcion (fragment in Irenaeus iv. 6. 2). Both these writings are lost. He was followed by Irenaeus, who, especially in the first book of his treatise *Adversus haereses* (ἐλέγχου καὶ ἀνατροπῆς τῆς ψευδωύνμου γνώσεως βιβλία ἑπτνε, *c.* A.D. 180), gives a detailed account of the Gnostic heresies. He founds his work upon that of his master Justin, but adds from his own knowledge among many other things, notably the detailed account of Valentinianism at the beginning of the book. On Irenaeus, and probably also on Justin, Hippolytus drew for his *Syntagma* (beginning of the 3rd century), a work which is also lost, but can, with great certainty, be reconstructed from three recensions of it: in the *Panarion* of Epiphanius (after 374), in Philaster of Brescia, *Adversus haereses,* and the Pseudo-Tertullian, *Liber adversus omnes haereses. A* second work of Hippolytus (Κατὰ πασῶν αἱρέσεων ἔλεγχος) is preserved in the so-called *Philosophumena* which survives under the name of Origen. Here Hippolytus gave a second exposition supplemented by fresh Gnostic original sources with which he had become acquainted in the meanwhile. These sources quoted in Hippolytus have lately met with very unfavourable criticisms. Very noteworthy references to Gnosticism are also to be found scattered up and down the *Stromateis* of Clement of Alexandria. Especially important are the *Excerpta en Theodoto,* the author of which is certainly Clement, which are verbally extracted from Gnostic writings, and have almost the value of original sources. The writings of Origen also contain a wealth of material. In the first place should be mentioned the treatise *Contra Celsum,* in which the expositions of Gnosticism by both Origen and Celsus are of interest *(see* especially v. 61 *seq.* and vi. 25 *seq.*). Of Tertullian's works should be mentioned: *De praescriptione haereticorum, Adversus Marcionem, Adversus Hermogenem,* and finally *Adversus Valentinianos* (entirely founded on Irenaeus). Here must also be mentioned the dialogue of Adamantius with the Gnostics, *De recta in deum fide* (beginning of 4th century). Among the followers of Hippolytus, Epiphanius in his *Panarion* gives much independent and valuable information from his own knowledge of contemporary Gnosticism. But Theodoret of Cyrus (d. 455) is already entirely dependent on previous works and has nothing new to add. With the 4th century both Gnosticism and the polemical literature directed against it die out. The modern literature of the subject is extensive. Here references are given to a few modern contributions where guidance to further study can be obtained. *See* E. F. Scott, articles "Gnosticism" and "Valentinianism" in Hastings, *Encyclopaedia of Religion and Etlzics,* and A. S. Peake, articles "Basilides," "Cerinthus" and "Marcion," *ibid.;* Harnack, *Dogmengeschichte,* 4th ed. (where the account of Gnosticism differs from that of the 3rd ed. from which the English translation was made); Krüger, article "Gnosticismus" in Herzog-Hauck, *Realencyklopädie;* Liechtenhan, *Die Offenbarung im Gnosticismus,* 1901; *E.* de Faye, *Introd. à l'étude du Gnosticisme,* 1903; W. Bousset, *Hauptprobleme der Gnosis,* 1911; and the works of Anz and others mentioned above.

(S. H. M.)

GNU, the large white-tailed South African antelope (*q.v.*), known to the Boers as the black wildebeest and to natmalists as *Connochaetes gnu.* A second and larger species is the brindled gnu or blue wildebeest *(Gorgon taurinus);* and there are several East African forms related to the latter.

GOA, the name of the past and present capitals of Portuguese India, and of the surrounding territory more exactly described as Goa settlement, on the western coast between 15° 44' and 14° 53' N., and between 73° 45′ and 74° 26' E. Pop. (1936) 661,100, area 1,301 sq.m.

Goa Settlement. — With Damaun and Diu (*q.v.*) Goa settlement forms a single administrative province ruled by a governor-general, and a single ecclesiastical province subject to the archbishop of Goa, who is primate of the East and patriarch of the East Indies. For judicial purposes the province includes Macao in China, and Timor in the Malay Archipelago. There are legislative and executive councils which work in collaboration with the governor. It is bounded on the north by the river Terakhul or Araundem, which divides it from the Savantwadi state, east by the Western Ghats, south by Kanara district, and west by the Arabian sea. It comprises the four districts conquered early in the 16th century and therefore known as the Velhas Conquistas (Old Conquests), seven districts acquired later and known as the Novas (New) Conquistas, and the island of Anjidiv or Anjadiva. The settlement, which has a coast-line of 62 m., is hilly, especially in the Novas Conquistas, including a portion of the Western Ghats rising nearly to 4.000 ft. The two largest rivers are the Mandavi and the Juari, which together encircle the island of Goa (Ilhas), being connected on the landward side by a creek. The island is triangular, the apex, called the *cabo* or cape, being a rocky headland separating the harbour of Goa into two anchorages—Agoada or Aguada at the mouth of the Mandavi, on the north, and Mormagao at the mouth of the Juari, on the south. The southern, sheltered by the promontory of Salsette is the more important. Its trade is mostly transit trade, manganese and cotton being exported. A breakwater and quay have recently been built. A railway, managed by the Madras and Southern Mahratta company connects Mormagao, south of the Juari estuary, with Castle Rock on the Western Ghats. Goa exports coconuts, fruit, spices, fish and salt, but its trade is small, and its manufactures few. Rice is the staple product, with fruit, salt, coconuts and betelnut. The population of the Velhas Conquistas is largely Christian, and that of the Novas Conquistas Hindu. The Christians are mostly Roman Catholics. The native population speak Konkani. Iron and manganese occur, but have been little worked recently.

Cities of **Goa.**—1. The ancient Hindu city of Goa, of which hardly a fragment survives, was built at the southernmost point of the island, and was famous in early Hindu legend and history. In the Puranas and certain inscriptions its name appears as Gove, Govapuri, Gomant, etc.; the mediaeval Arabian geographers knew it as Sindabur or Sandabur, and the Portuguese as Goa Velha. It was ruled by the Kadamba dynasty from the 2nd century A.D. to 1312, and by Mohammedan invaders of the Deccan from 1312 until about 1370. It was then annexed to the

Hindu kingdom of Vijayanagar.

2. Old Goa, founded in 1440, is, for the most part, a city of ruins. The chief surviving buildings are the cathedral, founded by Albuquerque in 1511, rebuilt in 1623, and still used for public worship; the convent of St. Francis (1517), a converted mosque rebuilt in 1661, with a portal of carved black stone, the only relic of Portuguese architecture in India dating from the first quarter of the 16th century; the chapel of St. Catherine (1551); the fine church of Bom Jesus (1594–1603), containing the shrine of St. Francis Xavier (see XAVIER, FRANCISCO DE); and the 17th century convents of St. Monica and St. Cajetan. The college of St. Paul is in ruins.

3. Panjim, Pangim or New Goa originally a suburb of Old Goa, is built like the parent city, on the left bank of the Mandavi estuary, in 15° 30′ N. and 73" 33' E. Pop. (1921) 7,388. It is a modern port, containing the Archbishop's palace, government house, barracks, etc. Panjim became the residence of the viceroy in 1759 and the capital of Portuguese India in 1843. It possesses a lyceum, commercial, medical and normal schools, and an experimental agricultural station.

Political History.— With the subdivision of the Bahmani kingdom, after 1482, Goa passed into the power of Yusuf Adil Shah, king of Bijapur, who was its ruler when the Portuguese first reached India. At this time Goa was important as the starting-point of pilgrims from India to Mecca, as a mart with no rival except Calicut on the west coast, and especially as the centre of the import trade in horses (Gulf Arabs) from Hormuz. It was easily defensible by any power with command of the sea, and was attacked on the 10th of February 1510 by the Portuguese under Albuquerque. As a Hindu ascetic had foretold its downfall and the garrison of Ottoman mercenaries was outnumbered, the city surrendered without a struggle, and Albuquerque entered it in triumph. Three months later Yusuf Adil Shah returned with 60,000 troops, forced the passage of the ford, and blockaded the Portuguese in their ships from May to August, when the cessation of the monsoon enabled them to put to sea. In November Albuquerque returned with a larger force and after overcoming a desperate resistance, recaptured the city and massacred the entire Mohammedan population.

Goa was the first territorial possession of the Portuguese in Asia. Albuquerque and his successors left almost untouched the customs and constitutions of the 30 village communities on the island, only abolishing the rite of suttee. A register of these customs (Foral de *usos* e costumes) was published in 1526, and an abstract of it is given in R. S. Whiteway's Rise of the Portuguese Empire in India (London, 1898).

Goa became the capital of the whole Portuguese empire in the East. It was granted the same civic privileges as Lisbon. In 1542 St. Francis Xavier mentions the architectural splendour of the city; but it reached the climax of its prosperity between 1575 and 162 j. The appearance of the Dutch in Indian waters was followed by the gradual ruin of Goa. In 1603 and 1639 the city was blockaded by Dutch fleets, though never captured, and in 1635 it was ravaged by an epidemic. Its trade was gradually monopolized by the Jesuits. Thevenot in 1666, Baldaeus in 1672, Fryer in 1675 describe its ever-increasing poverty and decay. In 1683 only the timely appearance of a Mogul army saved it from capture by a horde of Mahratta raiders, and in 1739 the whole territory was attacked by the same enemies, and only saved by the unexpected arrival of a new viceroy with a fleet. This peril was always imminent until 1759, when a peace with the Mahrattas was concluded. In the same year the proposal to remove the seat of government to Panjim was carried out; it had been discussed as early as 1684. Between 1695 and 1775 the population dwindled from 20,000 to 1,600, and in 1835 Goa was only inhabited by a few priests, monks and nuns.

Ecclesiastical History.— Some Dominican friars came out to Goa in 1510, but no large missionary enterprise was undertaken before the arrival of the Franciscans in 1517. From their headquarters in Goa the Franciscan preachers visited many parts of western India, and even journeyed to Ceylon, Pegu and the Malay Archipelago. For nearly twenty-five years they carried on the work of evangelization almost alone, with such success that in 1534 Pope Paul III. made Goa a bishopric, with spiritual jurisdiction over all Portuguese possessions between China and the Cape of Good Hope, though itself suffragan to the archbishopric of Funchal in Madeira. A Franciscan friar, João de Albuquerque, came to Goa as its first bishop in 1538. In 1542 St. Francis Xavier came to Goa, and took over the Franciscan college of Santa FC, for the training of native missionaries; this was renamed the College of St. Paul, and became the headquarters of all Jesuit missions in the East, where the Jesuits were commonly styled Paulistas. By a Bull dated the 4th of February 1557 Goa was made an archbishopric, with jurisdiction over the sees of Malacca and Cochin, to which were added Macao (1575), Japan (1588), Angamale or Cranganore (1600), Meliapur (Mylapur) (1606), Peking and Nanking (1610), together with the bishopric of Mozambique, which included the entire coast of East Africa. In 1606 the archbishop received the title of Primate of the East, and the king of Portugal was named Patron of the Catholic Missions in the East; his right of patronage was limited by the Concordat of 1857 to Goa, Malacca, Macao and certain parts of British India. The Inquisition was introduced into Goa in 1560: a vivid account of its proceedings is given by C. Dellon, *Relation* de *l'inquisition* de Goa (1688). Five ecclesiastical councils, which dealt with matters of discipline, were held at Goa—in 1567, 1575, 1585, 1592 and 1606; the archbishop of Goa also presided over the more important synod of Diamper (Udayamperur, about 12m. S.E. of Cochin), which in 1599 condemned as heretical the tenets and liturgy of the Indian Nestorians (*q.v.*), or Christians of St. Thomas. In 1675 Fryer described Goa as "a Rome in India, both for absoluteness and fabrics." The Jesuits were expelled in 1759, the Inquisition was abolished in 1814 and the religious orders were secularized in 1835.

GOALPARA, a town and district of British India, in the Brahmaputra valley division of Assam. The town (pop. 6,415 overlooks the Brahmaputra. It was the frontier outpost of the Mohammedan power, and has long been a flourishing seat of river trade. The civil station is built on the summit of a small hill. The town has declined in importance since the district headquarters were removed to Dhubri in 1879.

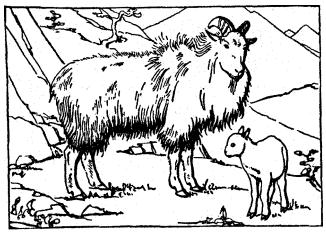
The area is 3,985 square miles. Pop. (1931) 882,748. It is situated along the Brahmaputra, at the corner where the river takes its southerly course from Assam into Bengal. Along the banks of the river grow clumps of cane and reed; farther back stretch fields of rice cultivation, broken only by the fruit trees surrounding the villages, and in the background rise the forest-clad hills overtopped by the white peaks of the Himalayas. The Brahmaputra annually inundates vast tracts of country. Extensive forests yield valuable timber; 900 sq.m. are reserved forest. Wild elephants abound in the forests. Rice forms the staple crop. Mustard and jute are also largely grown. The cultivation of tea has been introduced but is confined to 2,000 acres.

Dhubri (pop. 9,435), the administrative headquarters of the district stands on the Brahmaputra where that river takes its great bend south, and has a station on the Eastern Bengal State railway.

GOAT, the ruminant of the genus *Capra,* closely allied to the sheep. While usually easy to distinguish the two, certain hair breeds of sheep are, to the layman, only distinguishable from goats

by the direction of the tail, upward in goats, downward in sheep Domesticated goats are descended from the pasang *(Capra aegagrus).* Probably the east was its original home, the earliest records being Persian. C. *aegagrus* is probably represented in Europe by the Cretan and Cyclades races, now crossed with the common goat (*C. hircus*). For other wild goats, *see* IBEX, MARKHOR, TAHR and ROCKY MOUNTAIN GOAT.

In China, India, Egypt, Europe and North America the goat is primarily a milk-producer. By good management its limited breeding season and the consequent difficulty of maintaining a level supply throughout the year can be largely overcome. For large scale milk-production goats are inferior to cattle. The Angora and Cashmere goats produce "wool" or mohair. The flesh is edible, that from young beasts being quite tender. The goat, however, does not fatten easily. Goats are also used to keep sheep spread out and on the move.



BY COURTESY OF THE N Y. ZOOLOGICAL SOCIETY

TAHR, OR HIMALAYAN WILD GOAT (HEMITRAGUS JEMLAICUS), LIVING IN HIGH ALTITUDESAND FREQUENT. ING THE MOST INACCESSIBLE GROUND OF ALL RUMINANTS

The chalky-white milk contains a higher proportion of solids than that of the cow, and is apparently more digestible. It is also free from tuberculosis germs. In parts of Europe it is much used for cheese-making.

Distribution and Kinds.— There are many breeds of goat, which may be roughly grouped: the *prick-eared, e.g.,* Swiss goats; the *eastern* or *Nubian,* with long drooping ears; the *dwarf* and *wool* goat, *e.g.,* Angora.

Of the Swiss goats, from which many of the best modern breeds are derived, the Toggenburg and Saanen are most important. The French breeds have much Swiss blood. On the Pyrenees the goats are of very mixed origin, big but disposing of much food without corresponding milk yield. In Germany there are many varieties tracing to Swiss breeds. The Hartz Mountain goat is probably native. There are many goats of Swiss type throughout Scandinavia. Holland goats, mostly white, hornless and of Saanen type, are in high esteem.

The Maltese goat undoubtedly contains Eastern blood. Its milk is important, but is probably flavoured by the garbage feed. This goat is noteworthy as the carrier of Malta fever (*q.v.*). Many goats are found in Spain. Mauretania appears to be the home of three good types, Murcian, Grenada and La Mancha. In Italy and along the eastern Adriatic goats are fairly plentiful: a recent edict of the Italian Government against goat-keeping, owing to damage to trees, may diminish their number.

"Nubians" are eastern goats, chiefly Egyptian. They are usually large, short-haired, somewhat bony goats with large lop ears and Roman noses. Their colour, frequently black and tan, varies considerably. The goats in Palestine and Syria have long hair and large lop ears. Black, with or without white, is the commonest colour. The Mamber has the best reputation for milk. Most Indian varieties have lop ears, the best coming from the Jumna river area. They are like the Nubian. The Surti (from Surat) is another popular Indian breed, usually white and lop-eared. In proportion to the cultivated area, goats are more plentiful in Egypt than anywhere else. Their main function is milk, but the meat is also valuable. There are two distinct types, both of the lop-eared eastern variety.

The dwarf goat or Guinea goat, of central and west Africa, resembles a small English goat in appearance. It is highly resistant to trypanosomiasis. These goats are also found on the Nile and in Mauritius, Madagascar and Bourbon. In South Africa the "Boer" goat, related to the Nubian, is principally used for meat. Angora flocks are numerous; while Swiss and English milch goats have been imported.

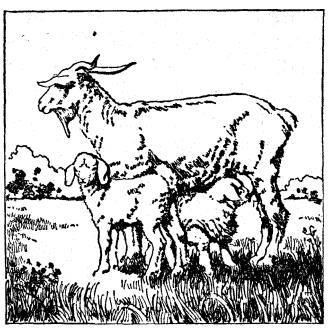
In Britain there are native goats of two types, though their purity may be questioned. The original English type usually has tapering horns, short hair and colour commonly brown or fawn, often with large white patches. The Irish goat is more thickset and has long shaggy hair. The colour is generally reddish black. They are good milkers and foragers but with a short lactation period. The Welsh and Scottish goats are of the Irish type The British Goat society (founded 1879) represents some 1,500 goat-keepers It conducts a herd-book, and by the end of 1927, had registered over 11,000 animals. The society publishes a monthly journal and a valuable *Year Book,* besides *Herd Books.* Most of the improved British goats have much imported blood, but are developing into distinct types and improving in milk-yield. The world's record (1928) for one day's milk-yield at a show is 18 lb 7 oz, from Didgemere Dream, a British Alpine, and for 365 days lactation is held by Wonderstrike, a Saanen, with a yield of 4 464 lb

In the United States and Canada, goats are valuable for wool, milk and as scrub removers. They are found principally in the Southern States, California and British Columbia. The wool type is the Angora, chiefly found in Texas, but also in California The milk goats are largely Toggenburgs, Saanens and Anglo-Nubians. The principal herd-book association is the American Milk Goat Record association of Vincennes, Indiana. The Canadian Goat society is at Victoria, B C. There are three journals published in the Cnited States; *The Goat World* (monthly), *The National Bulletin of Milk Goats* (bi-monthly) and *The International Dairy Goat Journal.*

Of the wool goats there are two main types: the *Angora* or *Mohair* and the *Cashmere* or *Shawl* goat. The Angora, owing to its likeness to the sheep, has been held by many authorities to be descended from *Capra falconeri,* not from *C. Aegagrus.* Its original home was Tibet. There are many varieties Angoras have been established in South Africa, Australia and the United States. About three-quarters of the mohair produced in the United States comes from Texas. The Angora is a poor milker. The soft, silky hair covers the whole body and most of the legs with close matted ringlets. If not shorn in spring the fleece drops off naturally as summer approaches. There is an undergrowth of short hair. The average weight of fleece is about 23 lb, though good specimens yield up to 12 lb. The Angora must have a dry climate and then stands cold well.

In the Cashmere, which is more like the common goat than the Angora, it is the undergrowth which is valuable. The longer the hair, the more abundant the fine undergrowth. These goats are rather small, with lop ears and twisted horns

Husbandry.— Goats are commonly supposed to be very hardy, but damp leads to many ills. There are three main methods of raising goats; by free range, by tether and by stall-feeding. In a civilised country, free range is disadvantageous, owing to the animal's propensity for forbidden places. Unless they get a wide range, their pasture must be frequently changed; otherwise the land gets "goat-sick," due probably to worm-infestation. Tethering is how the small man usually maintains his animals. The animals are thus always getting fresh pastures. If goats are stall-fed, they must have opportunity for exercise.



BY COURTESY OF THE U S BUREAU OF RECLAMATION

ANGORA GOATS ON A STOCK FARM NEAR ALBANY, GEORGIA

The goat demands a varied, rather than rich, diet. It is important that its food should not be soiled Pasturage of different types, with some coarse fodder and branches will keep a range or tethered goat in good condition, but the milkers are better for some additional concentrates Stall-fed animals should receive good hay and plenty of green foods, as varied as possible, besides roots. Oats are a good grain. Too much whole maize leads to inflammation of the stomach. Peas and beans are good, but wheat and barley are not properly digested. Brewers' and distillers' grains are good for milk goats Oil cakes and patent foods can be recommended Many milk goats do best if the concentrates are fed warm and wet It is important that goats should have access to clean water and to salt No goat should he given more

food than can be readily consumed and feeding should be at regular hours.

The female goat, variously called "Nanny" or "Doe," is ready for the male ("Billy" or "Buck") between October and December, during which time they come on "heat" every three weeks. The gestation period is 21–22 weeks. Goats are sexually mature at six months, but it is unwise to mate females before 18 months old and a male should be used sparingly till 12 months old.

GOATSUCKER: *see* NIGHTJAR.

GOB and **GOB FIRES.** Gob, gcaf (pl. Goaves), and waste are synonymous terms in coal mining, designating the worked out and abandoned portion of the underground workings.

In coal mining, as practised prior to the 19th century, when the pillars left for the support of the surface were very small, and only about 45½% of the coal was extracted *(see* John Buddle on *Mining Records 1838)*, the area of abandoned pillars was named the waste or goaf. Under modern conditions of coal mining all the coal is extracted, except in the case of bad coal or coal which cannot be sold at a profit, so that the goaf or gob contains little or no coal, for which reason "gob fires" are not now, perhaps, as frequent as they used to be. These fires, however, are not necessarily restricted to the goaf or gob, for they have been known to take place, though rarely, at the coal face, and they have been of frequent occurrence at the edge of shaft pillars (coal left unworked for the purpose of support in the neighbourhood of a shaft where it penetrates a coal seam).

A gob fire, or what is sometimes termed the "spontaneous heating" of coal, is due to the rapid absorption of oxygen by the coal substance which, causing heat to be generated, increases the rate of absorption until the coal bursts into flame. It was for long thought that the iron pyrites which are in coal were the supreme cause of this heating; Dr. Plott gave expression to this view in his *Natural History of Staffordshire* in 1686. It may be a contributory cause, but that it is the sole, or indeed the chief, cause was disproved by Dr. E. Richters about the year 1868 *(see* his paper published in *Dinglers Polytechniches Journal,* vol. cxc., Dec. 1868) and later by Henri Fayol in 1879 *(Etudes sur l' altération et la combustion spontanée de la houille expose' à l'air).* The two royal commissions on "Ships carrying Coals" (appointed in New South Wales, 1896 to 1900) arrived at similar conclusions.

The report of the Oberschlesische Grubenbrand commission on spontaneous combustion in coal mines, issued in 1910, contains results which may be studied with interest and value. The final report made by the British departmental committee on the subject (1921) decided "that some small amount of heat may be developed by the oxidation of pyrites in coal where it occurs as an amorphous form of marcasite; but that, as pyrites is present in coal in such small proportion as compared with the coal substance proper—which is a bad conductor of heat—the effect of this heat is negligible. The chief part played by pyrites when present in an unstable form is that of a disintegrator of the coal, so rendering the latter more permeable by air and exposing a greater area of coal substance to oxidation . . . that the chemical process is mainly one of attachment of oxygen to molecules of high carbon content, but that subsidiary to this, and playing an important part in determining the actual spontaneous ignition of coal, is a chemical interaction between the oxygen thus loosely held by carbon-like molecules and other atoms in these molecules or other portions of the coal conglomerate." (R. R.)

GOBEL, JEAN BAPTISTE JOSEPH (1724–1794), French bishop, was born at Thann, Alsace, on Sept. 1, 1727, and became suffragan bishop of the French part of the diocese of Basle. As deputy to the states-general of 1789 he took the oath of the civil constitution of the clergy, and in 1791 was consecrated archbishop of Paris. On the 17th Brumaire in the year II. (Nov. 7, 1793), he came before the bar of the Convention and resigned his episcopal functions, proclaiming that he did so for love of the people, and through respect for their wishes. The followers of Hébert, who were then pursuing their anti-Christian policy, claimed Gobel as one of themselves. Robespierre found him an obstacle to his religious schemes, and involved him in the fate of the Hébertists. Gobel was condemned to death, with Chaumette, Hébert and Anacharsis Cloots, and guillotined on April 12, 1794.

See "Episcopat de Gobel" in vol. iii. (1900) of M. Tourneux's *Bibliographie de l'histoire de Paris pendant la rév. fr.* for a bibliography of documents relating to his episcopate. *See* also G. Gautherot, *Gobel, évêque me'tropolitain constitutionnel de Paris* (1911).

GOBELIN, the name of a family of dyers, who probably came from Reims, and in the middle of the 15th century established themselves in the Faubourg Saint Marcel, Paris. The first head of the firm, named Jehan (d. 1476), discovered a scarlet dyestuff, and spent so much on his establishment that it was named *la folie Gobelin.* To the dye-works there was added in the 16th century a manufactory of tapestry (*q.v.*). In the third or fourth generation some of the family purchased titles of nobility. Balthasar Gobelin (d. 1603), who became successively treasurer general of artillery, treasurer extraordinary of war, councillor secretary of the king, chancellor of the exchequer, councillor of State and president of the chamber of accounts, in 1601 received from Henry IV. the lands and lordship of Briecomte-Robert. The name of the Gobelins as dyers cannot be found later than the end of the 17th century. In 1662 the works in the Faubourg Saint Marcel were purchased by Colbert on behalf of Louis XIV., and transformed into a general upholstery manufactory, in which designs were executed under the superintendence of the royal painter, Le Brun. The establishment, closed in 1694, was reopened in 1697 for the manufacture of tapestry, chiefly for royal use and for presentation. The industry, suspended during the Revolution, was revived by the Bourbons, and in 1826 the manufacture of carpets was added. The manufacture is still carried on under the State.

See Lacordaire, *Notice historique sur les manufactures impériales de tapisserie des Gobelin et de tapis de la Savonnerie, précédée du catalogue des tapisseries qui y sont exposés* (1853); Guiffrey, *Histoire de la tapisserie en France* (1878–85); Genspach, *Répertoire détaillé des tapisseries exécutées aux Gobelins, 1662–1892* (1893); *M.* Fénaille, *Etat général des tapisseries de la manufacture des Gobelins, 1600–1900* (5 vols., 1903–23).

GOBI (for which the alternative Chinese names are Sha-mo, "sand desert" and Han-hai, "dry sea"), a term which in its widest significance includes the stretch of desert country extending from the foot of the Pamirs eastwards to the Great Khingan mountains, and from the foothills of the Altai, the Khangai and the Yablonoi mountains on the north to the Altyn Tagh and Nan-shan on the south. The western portion of this desert belt, however, forms part of the well-defined physiographic unit of the Tarim basin and is considered separately under that head.

The Gobi proper occupies a broad, shallow depression in the wide plateau between the northern chains of the Tibetan massif and the Altai. It is approximately 600 miles from north to south and 1,000 miles from east to west. The average relief is slight. There is an alternating succession of broad gravelly plains irregularly split up by low flat-topped ranges and detached residual hills. The altitude varies from 3,000 ft. in the east to about 5,000 ft. in the south and west. The relief features are chiefly the result of warping and uplift. This sometimes gives rise to mountain structure on the borders, as in the case of the Altai, formed by a series of complex uplifted fault-blocks. The less prominent hill masses mark areas of gentler warping and smaller vertical displacement, while some are older fault-blocks which have been more completely worn down. Sometimes in the plains, the edges of the sedimentary strata are exposed to view, and these form the great fossil fields of Mongolia. There are evidences of climatic changes in the Gobi desert in remote ages. Dry river beds, and strand lines on lake shores marking former higher levels of the lake are reported. Although the central portion of the desert can hardly have been attractive to primitive man, several culture-horizons have been distinguished in the Gobi area. Finds have been made of relics representing Eolithic. Upper Palaeolithic, Azilian, Neolithic and Metallic cultures. Curiously enough, no

relics of early Mongolian civilization have, as yet, been found.

Although the name Sha-mo means "sand desert" this description by no means applies to the whole of the Gobi. The actual waterless desert of Gobi, including the Ordos country and the Ala-shan, is confined to the south-western portion of the plateau and covers barely one-quarter of its whole area. The Ordos desert, a southern extension of the Gobi plateau is enclosed within the great northward bend of the Hwang-ho. It furnishes scanty pasture to the flocks and herds of the Mongolian nomads who are scattered throughout the area.

West of the Ordos, but separated from it by the mountain peninsula of the lofty Ala-shan range, which is enclosed in a northward extension of the province of Kansu, lies the Ala-shan desert. This desert owes its existence to the interception of the rainfall by the high ranges along its southern border; the Ala-shan range rising to 10,000 and 11,000 ft. on the south-east, and the Richthofen range with peaks reaching 20,000 ft. on the south-west. There are vast expanses of absolutely waterless desert in the Ala-shan country. No oases relieve the unbroken stretches of sand which alternate with vast areas of saline clay, or, nearer the foot of the mountains; with barren gravel. The only human inhabitants of Ala-shan are the Torgod Mongols.

Trees are almost unknown in the Gobi. The vegetation comprises grass, thorns and patches of scrub in a soil varying from fine gravel and sand to coarse loam. Water in the Gobi is found only at wells or in occasional small lakes and is alkaline in taste. On the south-eastern borders of the Gobi, the desert proper gives way to steppe-land. Water can be found within fifteen or twenty-five feet of the surface and the country approximates to the type represented by the Canadian prairies. Some of the moisture from the south-east monsoon reaches these borders in the summer and this eastern part of the Gobi area offers a field for agriculture and for sheep and cattle breeding. Chinese influence is pushing out in a north-westerly direction and it is this south-eastern border-land (Inner Mongolia) which is being gradually formed into "provinces." The northern and north-western borders of the Gobi also merge into grass-land and, farther north, into forest. The wide stretch of undulating land along the northern border, which is drained by the Orkhon and its tributaries, supports many Chinese colonists who cultivate the rich soil to be found in many of the valleys. These northern borders fall within the region of cyclonic rain: the average annual rainfall at Urga being 9·7 inches.

The Gobi desert is crossed by several caravan routes, some of which have been in use for thousands of years. The most important are those from Kalgan, on the Chinese frontier, to Urga; from Su-chow, in Kansu, to Hami; and from Kwei-hwa-cheng to Barkul.

GOBHNEAU, JOSEPH ARTHUR, COMTE DE (1816–**1882).** French diplomat and man of letters, was born at Ville d'Avray, near Paris, on July **14, 1816,** son of an officer of the Royal Guard. Alexis de Tocqueville (author of *La Démocratie en Amérique*), appointed Gobineau his *chef de cabinet* during his short term of office in **1848.** Even after Tocqueville's fall, Gobineau persevered in his new profession, and, despite his legitimist convictions, served France loyally as a diplomat until **1877.** After short sojourns in Berne and Hanover he was sent to Frankfort.

In **1854** Gobineau went to Persia for four years. Here he drank in with delight the wonders of the east, exchanged views with the leaders of learning and spiritual life, and acquired valuable knowledge. After conducting a mission to Newfoundland, he returned to Teheran in **1861.** In 1864 he moved to Athens, and in **1868** to Rio de Janeiro.

During the war of **1870–71** Gobineau was in France. The last diplomatic post he held 1872–77 was Stockholm. He was forced in circumstances which wounded his pride, to retire, and left Stockholm for Rome to pass the rest of his days in writing and sculpture. He died on Oct. 13, **1882.**

Gobineau was the author of large volumes on ethnology, cuneiform writing. Persian history and literature, and also historical, political and philosophical essays, the history of his family, travel bocks, novels and short stories, a tragedy, a long epic, lyric verse, and finally *The Renaissance.*

His earliest, strongest, and, despite many weaknesses, most characteristic work was the *Essai sur l'Inégalité des races humaines* (1853–55), propounding the doctrine that the different races of human-kind are innately unequal in talent, worth and ability to absorb and create culture, and change their innate character only through crossing with alien strains. The genius of a race depends but little on conditions of climate, surroundings and period; it is therefore absurd to maintain that all men are capable of an equal degree of perfection. Only the white races are creative of culture, but are exhausted today because their racial composition is no longer pure. But Gobineau's masterpiece is his *Renaissance* (1877). This is a series of historical sketches and has been compared by the author himself to a fresco painting; it is divided into five sections, each of which is dominated by a single figure: Savonarola, Caesar Borgia. Julius II., Leo X., Michelangelo. These sketches attempt to interpret the political events of the time psychologically, and to give a living picture of the final motives and inward reality of the Renaissance by means of imaginary conversation.

BIBLIOGRAPHY.—English translations have appeared of: *The Renaissance* (1913 and 1927); the first part of the *Essai* (as *The Inequality of Human Races,* 1915); *Nouvelles Asiatiques* (as *The Dancing Girl of Shamaka, and other Tales,* 1926); *Souvenirs de Voyage* (as *The Crimson Handkerchief and other Stories,* 1927). The main works on Gobineau are: (a) French: Seillière, *Le Comte de Gobineau et l'aryanisme historique* (1903), and *Imperialismes. La conception gobinienne de la race* (1901); Dreyfus, *La vie et les prophéties du comte de Gobineau* (1905). (b) German: the many (pre-war) works by Schemann, Kretzer and Friedrich must be used with caution, owing to their patriotic bias. (c) English: Dr. Oscar Levy, "The Liie, work and influence of Count Arthur de Gobineau" (printed as foreword to *The Renaissance);* Ben Ray Redman's introduction to *The Golden Flower* (New York, 1924).

GOBLET, RENE (1828–1905), French politician, was born at Aire-sur-la-Lys, Pas de Calais, Nov. **26, 1828,** and was educated for the law. He held a minor government office in **1879.** and in **1882** became minister of the interior in the Freycinet cabinet. He was minister of education, fine arts and religion in Henri Brisson's first cabinet in **1885,** and again under Freycinet in **1886.** He sat in the Chamber on the extreme Left. All through his life he was frequently in conflict with his political associates, from Gambetta downwards. On the fall of the Freycinet cabinet in December he formed a cabinet in which he reserved for himself the portfolios of the interior and of religion. The Goblet cabinet was unpopular from the outset, and it was with difficulty that anybody could be found to accept the ministry of foreign affairs, which was finally given to M. Flourens. Then came what is known as the Schnaebele incident, the arrest on the German frontier of a French official named Schnaebele, which caused immense excitement in France. For some days Goblet took no definite decision, but left Flourens, who stood for peace, to fight it out with General Boulanger, then minister of war, who was for the dispatch of an ultimatum. Although he finally intervened on the side of Flourens, and peace was preserved, his weakness in face of the Boulangist agitation became a national danger. Defeated on the budget in May **1887,** his government resigned. In **1888** he was foreign minister in the radical administration of Charles Floquet. He was defeated at the polls by a Boulangist candidate in **1889,** and sat in the senate from **1891** to **1893,** when he returned to the popular chamber. He died in Paris on Sept. 13, 1905.

GOBLET, a large type of drinking-vessel, particularly one shaped like a cup, without handles. and mounted on a shank with a foot. (*See* **DRINKING** VESSELS.)

GOBY. The gobies (*Gobius*) are small fishes recognized by their ventral fins being united into one, forming a suctorial disc by which these fishes are enabled to attach themselves. They are essentially coastfishes, inhabiting nearly all seas but disappearing towards the Arctic and Antarctic Oceans. Many live in fresh waters, not far from the sea. Nearly 500 different kinds are known. The largest British species, *Gobius capito,* occurring in the rock-pools of Cornwall, measures 10in. None of the other British species exceeds half this length. The Californian *Gillichthys mirabilis,* which is marine, is locally known as mudfish from its habit of mak-

ing excavations in the mud at low tide. The males are usually more brilliantly coloured than the females, and guard the eggs, which are quite frequently attached to a dead bivalve's shell or to a crab's carapace, with the convexity turned upwards and covered with sand.

Close allies of the gobies are the walking fish (*Periophthalmus*) of which various species are found in great numbers on tropical mud flats, skipping about by means of the muscular, scaly base of their pectoral fins, with the head raised and bearing a pair of projecting eyes close together.

GOCH, a town of Germany, in the Prussian Rhine province, on the Niers, 8 mi. S. of Cleve. Pop. (1939) 13,403. In the middle ages it was the seat of a large trade in linen. It became a town in 1231, belonged to the dukes of Gelderland and later to the dukes of Cleves. It has manufactures of plush-goods, margarine, oil and leather.

GOD, the common Teutonic word for a personal object of religious worship. It is thus, like Gr. *θεός* and Lat. *deus,* applied to all superhuman beings of heathen mythologies who exercise power over nature and man; and also to images of supernatural beings or trees, pillars, etc., used as symbols. The word "god" on the conversion of the Teutonic races to Christianity, was applied to the one Supreme Being, and to the Persons of the Trinity.

Popular etymology has connected the word with "good." This is exemplified by the corruption of "God be wit11 you" into goodbye. In Gothic it is *Guth;* Dutch has the same form as English; Danish and Swedish have *Gud,* German *Gott.* According to the *New English Dictionary,* the original may be found in two Aryan roots, both of the form *gheu,* one of which means "to invoke," the other "to pour"; the last is used of sacrificial offerings. The word would thus mean the object either of religious invocation or of religious worship by sacrifice.

See RELIGION; HEBREW RELIGION; THEISM, etc.

GODALMING, a municipal borough in the Guildford parliamentary division of Surrey, England, 34 mi S W. of London by the S.R. Pop. (1938) 13,040. Area, 3.74 sqmi. Godalming (Godelminge) belonged to King Alfred, and was a royal manor at the time of Domesday. The manor was held by the see of Salisbury in the middle ages, but reverted to the crown in the time of Henry VIII. Godalming was incorporated by Elizabeth in 1574, when the borough originated. The charter was confirmed by James I in 1620, and a fresh charter was granted by Charles II in 1666. The bishop of Salisbury in 1300 received the grant of a weekly market which included a fair at the feast of St. Peter and St. Paul. Another fair at Candlemas was granted by Elizabeth The making of cloth, particularly Hampshire kerseys, was the staple industry of Godalming in the middle ages. Tanning, introduced in the 15th century, survives. The present manufacture of fleecy hosiery dates from the end of the 18th century. It is on the Wey, and on the high road between London and Portsmouth. The church of SS. Peter and Paul is principally Early English and Perpendicular. Charterhouse school, transferred from Charterhouse square, London, to Godalrning in 1872, has 120 ac of grounds and spacious buildings in Gothic style. *(See* CHARTERHOUSE.) Godalrning trades principally in timber, flour and oil leather, and there are corn mills and a tannery. Bargate stone, of which the parish church is built, is still quarried.

GBDARD, BENJAMIN (1849–1895), French composer, was born in Paris, on Aug. 18, 1849. He studied at the Conservatoire, and had already published many works when in 1878 his dramatic cantata *Le Tasse* won a prize in a musical competition instituted by the city of Paris. Godard was a prolific composer of operas, of which one of the best known is *La Vivandière,* left unfinished and partly scored by another hand. Among his works the "Symphonie légendaire" may be singled out as being one of the most distinctive. He wrote many charming songs, and his death, which occurred at Cannes Jan. 10, 1895, was a real loss to French art.

GODAVARI, district, British India, in the north-east of the Madras presidency. Part was transferred to Kistna district in 1908. Its present area is 6,220 sq.m., mainly east of the Godavari river, including the entire delta, with a long narrow strip extending up its valley. Inland low hills, steep and forest-clad, enclose the valley. The delta is flat, and the north-eastern part known as the Agency tract and occupied by spurs of the eastern Ghats, has recently been formed into a separate division with part of Ganjam and Vizagapatam. The coast is low, sandy and swampy, so that vessels must lie 7 m. from Cocanada, the chief port. The Sabari is the principal tributary of the Godavari within the district. The Godavari often rises in destructive floods. The population (including the Agency tract) in 1931 was 1,920,582. The chief towns are Cocanada, the administrative headquarters, and Rajahmundry, the old capital. The population is principally occupied in agriculture, the principal crops being rice, other food grains, pulse, oil seeds, tobacco and sugar. A number of rice-cleaning mills have been established. Sugar is refined, and fish is cured. The district is traversed by the main line of the East Coast railway, with a branch to Cocanada.

The Godavari district formed part of the Andhra division of Dravida, the north-west portion being subject to the Orissa kings, and the south-western belonging to the Vengi kingdom. In it various chiefs fought for independence with varying success till the beginning of the 16th century, when the whole country may be said to have passed under Mohammedan power. At the conclusion of the struggle with the French in the Carnatic, Godavari with the Northern Circars was conquered by the English, and finally ceded in 1765.

GODAVARI, a river of central and western India. It flows across the Deccan from the Western to the Eastern Ghats; its total length is 900 m. Its source is on the side of a hill behind the village of Trimbak in Nasik district, Bombay, where the water runs into a reservoir from the lips of an image. Legend brings it from the same ultimate source as the Ganges, though underground. Its course is generally south-easterly. Through much of the upper part the channel varies 1 to 2 m. in breadth, occasionally broken by alluvial islands. Below the junction of the Sabari the channel begins to contract, and the river enters a magnificent gorge only 200 yd. wide through which it flows into the delta, about 60 m. from the sea. The head of the delta is at the village of Dowlaishweram. The river has seven mouths, the largest being the Gautami Godavari. The Godavari is regarded as peculiarly sacred, and once every twelve years the great bathing festival called *Pushkaram* is held on its banks at Rajahmundry.

The upper waters of the Godavari are scarcely utilized for irrigation, but the entire delta has been turned into a garden of perennial crops by means of the anicut or dam construction at Dowlaishweram, constructed by Sir Arthur Cotton, from which three main canals are drawn off. The river channel here is $3\frac{1}{2}$ m. wide, and is spanned by a fine railway bridge. Nearly a million acres were irrigated from the system in 1920. More recent works include a large reservoir at Lake Beale on a tributary of the Godavari, and two canals, irrigating a further 50,000 acres. In 1864 water communication was opened between the Godavari and Ristna deltas. Rocky barriers and rapids obstruct navigation in the upper Godavari.

GODEFROY (GOTHOFREDUS), a French noble family, which numbered among its members several distinguished jurists and historians. The family claimed descent from Symon Godefroy, who was born at Mons about 1320 and was lord of Sapigneulx near Berry-au-bac, now in the department of Aisne.

DENIS GODEFROY (Dionysius Gothofredus) (1549–1622), jurist, son of Léon Godefroy, lord of Guignecourt, was born in Paris on Oct. 17, 1549, and died at Strasbourg on Sept. 7, 1622. He studied law in the Low Countries and in Germany, and embraced Calvinism. This change of faith led to his residence abroad, first at Geneva, where he was professor of law, and then at Heidelberg, where he was head of the faculty of law and was employed from time to time on diplomatic missions by the Elector Palatine. His most important work was the *Corpus juris civilis,* originally published at Geneva in 1583, which went through some 20 editions, the most valuable of them being that printed by the Elzevirs at Amsterdam in 1633 and the Leipzig edition of 1740.

Lists of his other learned works may he found in Senebier's *Hist. litt. de Genève.* vol. ii., and in Nicéron's *Mémoires,* vol. xvii. Some

of his correspondence with his learned friends, with his kinsman President de Thou, Isaac Casaubon, Jean jacques Grpnaeus and others, is preserved in the libraries of the British Museum, of Basle and Paris.

His eldest son, THEODORE GODEFROY (1580–1649), was born at Geneva on July 14, 1580. He abjured Calvinism, and was called to the bar in Paris. He became historiographer of France in 1613 and was employed from time to time on diplomatic missions. He was employed at the congress of Münster, where he remained after the signing of peace in 1648 as chargé d'affaires until his death on Oct. j of the next year. His most important work is *Le Cérémonial de France* . . . (1619), a work which became a classic on the subject of royal ceremonial, and was re-edited by his son in an enlarged edition in 1649.

He made vast collections of historical material, which remains in ms. and fills the greater part of the Godefroy collection of over 500 portfolios in the Library of the Institute in Paris. These were cataiogued by Ludovic Lalanne in the *Annuaire Bulletin* (1865–1866 and 1892) of the Société de l'histoire de France.

The second son of Denis, JACQUES GODEFROY (1587–1652), jurist, was born at Geneva on Sept. 13, 1587. He was educated in France but returned to Geneva, where he held various important public offices. He died on June 23, 1652. He worked for 30 years on his edition of the *Codex Theodosianus* (Lyons, 4 vols. 1665, and Leipzig, 6 vols. 1736–45). This code formed the principal, though not the only, source of the legal systems of the countries formed from the Western Empire. Godefroy's edition became a standard authority on the decadent period of the Western Empire. Of his numerous other works the most important was the reconstruction of the 12 tables of early Roman law.

See also the dictionary of Moreri, Nicéron's *Mémoires* (vol. 17) and a notice in the *Bibliothbque universelle de Genève* (Dec. 1837).

DENIS GODEFROY (1615–1681), eldest son of Théodore, succeeded his father as historiographer of France.

For iurther details see *Les Savants Godefroy* (Paris, 1873) by the marquis de Godefroy-Ménilglaise, son of Denis Joseph Godefroy.

GODESBERG, a spa in Rhenish Prussia, Germany, on the left bank of the Rhine, 4 mi. S. of Bonn, on the railway to Coblenz. Pop. (1939) 30,768.

Here on Sept. 22, 1938. Prime Minister Neville Chamberlain held another interview with Hitler, prior to the Pact of Munich a meek later, in a futile effort to satisfy German demands in regard to Czechoslovakia.

GODET, FRÉDÉRIC LOUIS (1812–1900), Swiss Protestant theologian, was born at Neuchbtel on Oct. 25, 1812. In 1873 he became one of the founders of the free Evangelical Church of Neuchbtel, and professor in its theological faculty. He died there on Oct. 29, 1900.

Godet's commentaries are on the Gospel of St. John (a vols., 1863–65; 3rd ed., 1881–88; Eng. trans. 1886, etc.); St. Luke (a vols., 1871; 3rd ed., 1888; Eng. trans. 1875, etc.); the Epistle to the Romans (2 vols., 1879–80; 2nd ed., 1883–90; Eng. trans., 1880, etc.); Corinthians (2 vols., 1886–87; Eng. trans., 1886, etc.). His other works include *Etudes bibliques* (a vols., 1873–74; 4th ed., 1889; Eng. trans., 1875 f.), and *Introduction au Nouveau Testament* (1893 f.; Eng. trans., 1894, etc.); *Lectures in Defence of the Christian Faith* (Eng. trans., 4th ed., 1900).

GODFREY, SIR EDMUND BERRY (1621–1678), English magistrate and politician, younger son of Thomas Godfrey (1586–1664), was born on Dec. 23, 1621, and educated at Westminster school and Christ Church, Oxford. After entering Gray's Inn he became a prosperous dealer in wood. He was made a justice of the peace for the city of Westminster, and in Sept. 1666 was knighted as a reward for his services during the great plague. In Sept. 1678 Titus Oates and two other men appeared before him with written information about the Popish Plot, and swore to the truth of their statements. During the excitement which followed the magistrate expressed a fear that his life was in danger, but took no precautions. On Oct. 12 he did not return home as usual, and on the 17th his body was found on Primrose Hill, Harnpstead. The evidence proved that he had been murdered, and the excited populace regarded the deed as the work of the Roman Catholics. In Dec. 1678 Miles Prance, under arrest for conspiracy, confessed to having murdered Godfrey, with the aid of Robert Green, Lawrence Hill and Henry Berry, at the instigation of Roman Catholic priests. The three men were hanged in 1679, but Prance's confession was subsequently proved false, and he pleaded guilty to perjury. The secret of Godfrey's death has never been solved.

See OATES, TITUS, also R. Tuke, *Memoirs of the Life and Death of Sir Edmondbury Godfrey* (1682); and G Burnet, *History of my Own Time; The Reign of Charles ZZ.*, ed. O. Airy (Oxford, 1900). On the question of responsibility for the murder, *see* J Pollock, *The Popish Plot* (1903); A. Marks, *Who Killed Sir E. B. Godfrey?* (1905); Sir John Hall, *Four Famous Mysteries* (1922) and *R.* W. Postgate, *Murder, Piracy and Treason* (1928).

GODFREY OF BOUILLON (*c.* 1060–1100), **a** leader in the first crusade, was the second son of Eustace **II.**, count of Boulogne, by his marriage with Ida, daughter of Duke Godfrey II. of Lower Lorraine. He was designated by Duke Godfrey as his successor; but the emperor Henry IV. gave him only the mark of Antwerp, in which the lordship of Bouillon was included (1076). He fought for Henry, however, both on the Elster and in the siege of Rome; and he was invested in 1082 with the duchy of Lower Lorraine. Lorraine had been penetrated by Cluniac influences, and Godfrey would seem to have been a man of notable piety. Accordingly, though he had himself served as an imperialist, and though the Germans in general had little sympathy with the crusaders, Godfrey, nevertheless, when the call came "to follow Christ," almost literally sold all that he had, and followed.

Along with his brothers Eustace and Baldwin (the future Baldwin **I.** of Jerusalem) Godfrey led a German contingent, some 40,000 strong, along "Charlemagne's road," through Hungary to Constantinople, starting in Aug. 1096, and arriving at Constantinople in November. He was the first of the crusading princes to arrive, and on him fell the duty of deciding what the relations of the princes to the eastern emperor Alexius were to be. Eventually he did homage to Alexius in Jan. 1097, and his example was followed by the other princes. From this time until the beginning of 1099 Godfrey appears as one of the minor princes, while men like Eohemund and Kaymund, Baldwin and Tancred were determining the course of events.

In 1099 he came once more to the front. The mass of the crusaders were weary of the political factions which divided some of their leaders; and Godfrey, who was more of a pilgrim than a politician, became the natural representative of this feeling. He was thus able to force the reluctant Raymund to march southward to Jerusalem; and he took a prominent part in the siege, his division being the first to enter when the city was captured. It was natural therefore that, when Raymund of Provence refused the offered dignity, Godfrey should be elected ruler of Jerusalem (July 22, 1099). The new dignity proved more onerous than honourable; and during his short reign of a year Godfrey had to combat the Arabs of Egypt, and the opposition of Raymund and the patriarch Dagobert. He was successful in repelling the Egyptian attack at the battle of Ascalon (Aug. 1099); but he failed, owing to Raymund's obstinacy and greed, to acquire the town of Ascalon after the battle.

Left alone, at the end of the autumn, with an army of some 2,000 men, Godfrey was yet able, in the spring of 1100, probably with the aid of new pilgrims, to exact tribute from towns like Acre, Ascalon, Arsuf and Caesarea. But already, at the end of 1099 Dagobert, archbishop of Pisa, had been substituted as patriarch for Arnulf (who had been acting as vicar) by the influence of Bohemund; and Dagobert, whose vassal Godfrey had at once piously acknowledged himself, seems to have forced him to an agreement in April 1100, by which he promised Jerusalem and Jaffa to the patriarch, in case he should acquire in their place Cairo or some other town, or should die without issue. Thus were the foundations of a theocracy laid in Jerusalem; and when Godfrey died (July 1100) he left the question to be decided, whether a theocracy or a monarchy should be the government of the Holy Land.

Because he had been the first ruler in Jerusalem Godfrey was idolized in later saga. He was depicted as the leader of the crusades, the king of Jerusalem, the legislator who laid down the assizes of Jerusalem He was none of these things Bohemund

was the leader of the crusades; Baldwin was first king; the assizes were the result of a gradual development. In reality he would seem to have been a quiet, pious, hard-fighting knight, who was chosen to rule in Jerusalem because he had no dangerous qualities, and no obvious defects.

Godfrey mas the principal hero of two French *chansons* de geste dealing with the crusade, the Chanson *d'Antioche* (ed. P. Paris, 2 vols., 1848) and the Chanson de *Jérusalem* (ed. C. Hippeau, 1568). In addition the parentage and early exploits of Godfrey were made the subject of legend. His grandfather was said to be Helias, knight of the Swan, one of the brothers whose adventures are well known, though with some variation, in the familiar fairy tale of "The Seven Swans." Helias, drawn by the swan, one day disembarked at Nijmwegen, and reconquered her territory for the duchess of Bouillon. Marrying her daughter he exacted a promise that his wife should not enquire into his origin. The tale, which is almost identical with the Lohengrin legend, belongs to the class of the Cupid and Psyche narratives. See LOHENGRIN.

See also C. Hippeau, *Le Chevalier au cygne* (2 vols., 1874–77); H. Pigeonneau, *Le Cycle de la croisade et de la famille de Bouillon* (1877). The English romance of *Helyas, Knyghte of the Swanne* was printed by W. Copland about 1550.

GODFREY OF VITERBO (c. 1120–*c.* 1196), chronicler, probably an Italian by birth, passed some of his early life at Viterbo, where also he spent his concluding days, but he was educated at Bamberg. About 1140 he became chaplain to the German king, Conrad III.; but the greater part of his life was spent as secretary (notarius) in the service of the emperor Frederick I., who employed him on many diplomatic errands. The only part of Godfrey's voluminous work which is valuable is the Gesta Friderici *I.*, verses relating events in the emperor's career from 1155 to 1180. Concerned mainly with affairs in Italy, the poem tells of the sieges of Milan, of Frederick's flight to Pavia in 1167, of the treaty with Pope Alexander III. at Venice, and of other episodes with which the author was intimately acquainted, and many of which he had witnessed. Attached to the Gesta Friderici is the Gesta *Heinrici VI.*, a shorter poem which is often attributed to Godfrey, although W. Wattenbach and other authorities think it was not written by him. His other works are *Speculum Regum,* and the popular *Memoria saeculorum,* rewritten as *Pantheon.*

Godfrey's works are found in the *Monumenta Germaniae historica,* Band xxii. (Hanover, 1872). The *Gesta Friderici I. et Heinrici VI.* is published separately with an introduction by G. Waitz (Hanover, 1872). *See* also H. Ulmann, *Gotfried von Viterbo* (Gottingen, 1863), and W. Wattenbach, *Deutschlands Geschichtsquellen,* Band ii. (Berlin, 1894).

GODHRA, a town of British India, administrative headquarters of the Panch Mahals district of Bombay, and also of the Rewa Kantha political agency; 52 m. N.E. of Baroda by rail, and on the line from Anand to Ratlam. Pop. (1931) 35,110. It has a trade in timber from the neighbouring forests, and tanneries.

GODIN, JEAN BAPTISTE ANDRÉ (1817–1888), French socialist, was born on Jan. 26, 1817 at Esquehéries (Aisne). In 1859 he made his castings manufactory at Guise into a Fourierist *familistère* or community settlement, which comprised, in addition to the workshops, buildings to house the work-people, crèches, hospital, refreshment rooms, recreation rooms, stores for the purchase of every necessity, and a large theatre. In 1880 the whole was turned into a co-operative society, and eventually became the property of the workers.

Godin was the author of *Solutions sociales* (1871); *Les Socialistes et les droits du travail* (1874); *Mutualite' sociale* (1880); *La République du travail et la réforme parlementaire* (1889). *See* Bernardot, *Le Familistère de Guise et son fondateur* (1887); Fischer, *Die Familistere Godin's* (1890); Lestelle, *Étude sur le familistère de Guise* (1904); *D.* F. P., *Le Familistère illustré, résultats de vingt ans d'association, 1880–1900* (Eng. trans., *Twenty-eight years of co-partnership at Guise. by* A. Williams, 1908).

GODIVA (1040–1080), a Saxon lady, was the wife of Leofric, earl of Mercia and lord of Coventry. The people of that city suffering grievously under the earl's oppressive taxation, Lady Godiva appealed to her husband, who refused to remit the tolls. At last, says the legend, he said he would grant her request if she would ride naked through the streets of the town. After issuing a proclamation that all persons should keep within doors or shut their windows, she rode through Coventry, clothed only in her long hair. One person disobeyed her proclamation, a tailor, ever afterwards known as Peeping Tom, who is said to have been struck blind. Her husband kept his word and abolished the obnoxious taxes.

The oldest form of the legend is given in *Flores* historiarum by Roger of Wendover, who quoted from an earlier writer. Godiva probably died a few years before the Domesday survey (1085–86), and was buried in one of the porches of the abbey church. The Godiva procession, instituted May 31, 1678, as part of Coventry fair, was celebrated at intervals until 1826. The "Peeping Tom" in Hertford street, Coventry, was perhaps an image of St. George.

GODKIN, EDWIN LAWRENCE (1831–1902), American publicist, was born in Moyne, county Wicklow, Ireland, Oct. 2, 1831. His father, James Godkin, was a Presbyterian minister and a journalist, and the son, after graduating in 1851 at Queen's college, Belfast, and studying law in London, where he was also employed by the publishing house of Cassell, was special correspondent for the London Daily News in the Crimean War. After editorial work on the Belfast Northern *Whig,* late in 1856 he went to America, writing for the London Daily News letters descriptive of a southern tour. His connection with this journal he continued while studying law in New York. He was admitted to the bar in 1858, and because of his impaired health he and his wife, Frances Elizabeth Foote, travelled in Europe 1860–62. At about this time Godkin was offered a partnership in the New York *Times* by Raymond; but although attracted by the offer, he in 186 j carried out a long-cherished dream by founding the Nation. This quickly became the foremost review in the country—as Lowell put it, because of the "ability, information and unflinching integrity" of the editor. Indeed, the periodical was so superior that Charles Dudley Warner styled it the "weekly judgment day." In 1881 Godkin sold the *Nation* to Henry Villard, owner of the New York Evening Post, of which paper the Nation became the weekly edition. Godkin himself became associate editor of the Post, succeeding Carl Schurz as editor-in-chief, 1883–99, and shaping the policy of that journal. Under his leadership the Post broke with the Republican Party in the presidential campaign of 1884, when Godkin's opposition to Blaine did much to create the so-called Mugwump party (see MUGWUMP), and his organ became completely independent. He consistently advocated currency reform, the gold basis, a tariff for revenue only, and civil service reform, rendering the greatest aid to the last cause. His attacks on Tammany Hall were so frequent and so fearless that he was several times sued for libel because of biographical sketches of certain leaders in that organization, but the cases were dismissed. His opposition to "jingoism" and to imperialism was able and forcible. He retired from his editorial duties in 1899. Although he recovered from a cerebral haemorrhage early in 1900, his health was shattered, and he died in Greenway, Devonshire, England, May 21, 1902.

BIBLIOGRAPHY.—See *Life and Letters of Edwin Lawrence Godkin,* edited *by* Rollo Ogden (1907); accounts in W. G. Bleyer's *Main Currents in the History of American Journalism* (1927); and O. G. Villard, *Some Newspapers and Newspaper-men* (1926); also Allan Nevins, *The Evening Post* (1922).

GODMANCHESTER, a town and municipal borough in Huntingdonshire, Eng., on the right bank of the Ouse, 1 mi. S.S.E. of Huntingdon, on a branch of the L.N.E. railway. Pop. (1938) 2,025. It has a beautiful Perpendicular church (St. Mary's) and an agricultural trade, with flour mills. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 7.7 sq.mi.

A Romano-British village occupied the site of Godmanchester. The town (*Gumencestre, Gomecestre*) belonged to the king before the Conquest and at the time of the Domesday survey. In 1213 King John granted the manor to the men of the town at a fee-farm of £120 yearly, and confirmation charters were granted by several succeeding kings, Richard II. in 1391–92 adding exemption from toll, pannage, etc. James I. granted an incorporation charter in 1605, but under the Municipal Reform Act of 1835 the

corporation was changed to a mayor, 4 aldermen and 12 councillors. Godmanchester was formerly included for parliamentary purposes in the borough of Huntingdon, which ceased to be separately represented in 1885. The incorporation charter of 1605 recites that the burgesses are chiefly engaged in agriculture, and grants them a fair, which still continues every year on Tuesday in Easter week. A stone bridge connecting the town with Huntingdon dates from 1295.

GÖDÖLLÖ is a growing market town in Hungary, 23 m. N.E. of Budapest, and a favourite summer resort from the capital. Its royal castle and park, the latter stocked with stags and wild boars, was presented to Francis Joseph I. in 1867 by the Hungarian nation. Near the town lies Mária-Besnyö, a famous pilgrimage centre with a Franciscan monastery. Pop. (1930), 10,756.

GODOLPHIN, SIDNEY GODOLPHIN, EARL OF (*c.* 1645–1712), English statesman was a cadet of an ancient family of Cornwall. At the Restoration he was introduced into the royal household by Charles II., with whom he had become a favourite, and at the same period he entered the House of Commons as member for Helston. Although he very seldom addressed the House, he gradually acquired a reputation as its chief financial authority. In March 1679 he was appointed a member of the privy council, and in the September following he was promoted, with Hyde (afterwards earl of Rochester) and Sunderland, to the chief management of affairs. Though he voted for the Exclusion bill in 1680, he was continued in office after the dismissal of Sunderland, and in September 1684 he was created Baron Godolphin of Rialton, and succeeded Rochester as first lord of the treasury. After the accession of James II. he was made chamberlain to the queen, and, with Rochester and Sunderland, enjoyed the king's special confidence.

In 1687 Godolphin was named commissioner of the treasury. He was one of the council of five appointed by King James to represent him in London, when he went to join the army after the landing of William, prince of Orange, in England, and was afterwards appointed a commissioner to treat with the prince. Under William III. he became first lord of the treasury in 1690, and, while holding this office he maintained, in conjunction with Marlborough, a treacherous intercourse with James II. Godolphin was not only a Tory by inheritance, but had a romantic admiration for the wife of James II. After Fenwick's confession in 1696 regarding the attempted assassination of William III., Godolphin, who was compromised, resigned; but when the Tories came into power in 1700, he was again appointed lord treasurer and retained office for about a year. Though not a favourite with Queen Anne, he was, after her accession, appointed to his old office, on the strong recommendation of Marlborough. In 1704 he was knighted, and in 1706 he received an earldom. The influence of the Marlboroughs with the queen was, however, gradually supplanted by that of Mrs. Masham and Harley, earl of Oxford, and with the fortunes of the Marlboroughs those of Godolphin were indissolubly united. After the Tory reaction which followed the impeachment of Dr. Sacheverel, the queen abruptly dismissed Godolphin from office on Aug. 7, 1710. He died on Sept. 15, 1712. He married Margaret Blagge, whose life was written by Evelyn, in 1675, and married again after her death in 1678.

See Hon. H. Elliott, *A Life of Godolphin* (1888).

GODOWSKY, LEOPOLD (1870–1938), Polish-American musician and composer, was born at Vilna on Feb. 13, 1870. He made his debut as a pianist there as a child of nine, and then toured Russia, Poland, Germany, and the United States. After 1912 most of his tours mere confined to the latter country. His compositions included 53 original studies after the études of Chopin, a sonata in E minor, and many compositions for piano and violin. He died in New York city Nov. 21, 1938.

GODOY, MANUEL DE (1767–1851), duke of Alcudia and Prince of the Peace, Spanish royal favourite and minister. Born of a noble family of Estremadura at Badajoz on May 12, 1767, he entered the Guardia de Corps in 1784. His handsome, foolish face captivated Maria Luisa of Parma, and when King Charles III. died in 1788, Godoy's fortune was soon made. By the influence of the queen, he was promoted in the army with scandalous rapidity, made duke of Alcudia, and in 1792 minister under the premiership of Aranda, whom he succeeded in displacing by the close of the year. In 1798, his unpopularity and the intrigues of the French Government led to his temporary retirement, without, however, any diminution of the king's personal favour In 1801 he returned to office, and until 1807 he was the executant of the disastrous policy of the court. In the third period of his public life (1807–08), he was desperately striving for his place between the aggressive intervention of Napoleon on the one hand, and the growing hatred of the nation, organized around Ferdinand, the prince of Asturias, on the other. A popular outbreak at Aranjuez on March 17, 1808, led to his arrest. Imprisoned by Ferdinand, he was released by order of Napoleon. He joined the royal family at Bayonne and remained with them until Charles IV. died at Rome in 1819, having survived his queen. After the death of Ferdinand VII., in 1833, Godoy returned to Madrid, and failing to secure the restoration of his property confiscated in 1808, lived on a small pension granted him by Louis Philippe. He died in Paris on Oct 4, 1851.

As a favourite Godoy is remarkable for his hold on the affection of his sovereigns. Latterly he was supported rather by the husband than by the wife. He got rid of Aranda by adopting, in order to please the king, a policy which tended to bring on war with France. When the war proved disastrous, he made the Peace of Basle, and was created Prince of the Peace for his services. Then he helped to make war with England. The disasters which followed only made him dearer to the king. The queen endured his flagrant infidelities. In his private life, Godoy was profligate, profuse and childishly ostentatious. The policy of his Government was financially ruinous, and the best that can be said for him is that he was good-natured, and tried to restrain the Inquisition and the purely reactionary parties.

See M. Godoy, *Memorias críticas y apologéticas para la historia del Reynado de Carlos IV.* (Madrid, 6 vols. 1836–42). (French and English translations); Abbé de Pradt, *Mémoires sur la Révolution d'Espagne* (1816); *Una parte de la correspondencia de Godoy con la Reyna Maria Luisa*, ed. *V. Z.* de V. (Madrid, 1813).

GODUNOV, BORIS FEDOROVICH, tsar of Muscovy (*c.* 1552–1605), the most famous member of an ancient, now extinct Russian family of Tatar origin, which migrated from the Horde to Muscovy in the 14th century. Boris's career of service began at the court of Ivan the Terrible. He is mentioned in 1570 as taking part in the Serpeisk campaign as one of the archers of the guard. In 1571 he strengthened his position at court by his marriage with Maria, the daughter of Ivan's favourite, Malyuta Skuratov. In 1580 the tsar chose Irene, the sister of Boris, to be the bride of the tsarevich Theodore, on which occasion Boris was promoted to the rank of *boyar*. On his death-bed Ivan appointed Boris one of the guardians of his son and successor, Theodore, who was of somewhat weak intellect. The reign of Theodore began with a rebellion in favour of the infant tsarevich Demetrius, the son of Ivan's fifth wife Marie Nagaya, a rebellion resulting in the banishment of Demetrius, with his mother and her relations, to their appanage at Uglich. On the occasion of the tsar's coronation (May 31 1584), Boris was loaded with honours and riches, yet he held but the second place in the regency during the lifetime of his co-guardian Nikita Romanovich, on whose death, in 1585, he was left without any serious rival. A conspiracy against him of all the other great *boyars* and the metropolitan Dionysy, which sought to break Boris's power by divorcing the tsar from Godunov's childless sister, only ended in the banishment or tonsuring of the malcontents.

Henceforth Godunov was omnipotent. The direction of affairs passed entirely into his hands, and he corresponded with foreign princes as their equal: His policy was generally pacific, but always most prudent. In 1595 he recovered from Sweden the towns lost during the former reign. Five years previously he had defeated a Tatar raid upon Moscow, for which service he received the title of *slugar*, an obsolete dignity even higher than that of *boyar*. Towards Turkey he maintained an independent attitude, supporting an anti-Turkish faction in the Crimea, and furnishing the emperor with subsidies in his war against the sultan. Godunov encouraged English merchants to trade with Russia by exempting

them from tolls. He civilized the north-eastern and south-eastern borders of Muscovy by building numerous towns and fortresses to keep the Tatar and Finn tribes in order. Samara, Saratov, and Tsaritsyn and a whole series of lesser towns owe their existence to him. He also re-colonized Siberia, which had been slipping from the grasp of Muscovy, and formed scores of new settlements, including Tobolsk and other large centres. It was during his government that the Muscovite Church received its patriarchate, which placed it on an equality with other eastern churches and emancipated it from the influence of the metropolitan of Kiev. It was Boris's internal policy to support the middle classes at the expense of the old nobility and the peasants, hence the ukase (1587) forbidding the peasantry to transfer themselves from one landowner to another, thus binding them to the soil, and leading to the institution of serfdom in its most grinding form. The sudden death of the tsarevich Demetrius at Uglich (May 1j, 1591) has commonly been attributed to Boris.

On the death of the childless tsar Theodore (Jan. 7 1598), a *Zemsky Sobor,* or national assembly, unanimously elected Boris tsar on Feb. 21. The Romanov family, who had been his chief rivals, were disgraced and banished. Boris was the first tsar to import foreign teachers on a great scale, the first to send young Russians abroad to be educated, the first to allow Lutheran churches to be built in Russia. He also felt the necessity of a Baltic seaboard, and attempted to obtain Livonia by diplomatic means. That Boris mas one of the greatest of the Muscovite tsars there can be no doubt. But his great qualities were overbalanced by an incurable suspiciousness. He encouraged informers and persecuted suspects on their unsupported statements. The Romanov family in especial suffered severely from these delations. In 1603 a pretender appeared in Poland, who claimed to be the murdered tsarevich Demetrius, and, with the support of King Sigismund of Poland, he was leading a small army, reinforced by the Don Cossacks, into south-west Russia, when Boris died suddenly (April 13 1605), leaving one son, Theodore II., who succeeded him for a few months and then was foully murdered by the enemies of the Godunovs.

See Platon Vasilievich Pavlov, *On the Historical Significance of the Reign of Boris Godunov* (Rus.), (1850); Sergyei Mikhailivich Soloviev, *History of Russia* (Rus.), (2nd ed., vols. viii.-viii., 1897).

(R. N. B.)

GODWIN, FRANCIS (1562–1633), English divine, son of Thomas Godwin, bishop of Bath and Wells, was born at Hannington, Korthamptonshire, and studied at Christ Church, Oxford. After holding two Somersetshire livings he was in 1587 appointed subdean of Exeter, bishop of Llandoif (1601) and of Hereford (1617). His *Catalogue of the Bishops of England since the first planting of the Christian Religion in this Island* (1601; and ed., 1615; Latin ed., 1616) was republished, with a continuation by William Richardson, in 1743. In 1616 Godwin produced *Rerum Anglicarum, Henrico VIII., Edwardo VI. et Maria regnantibus, Annales,* afterwards translated and published by his son Morgan under the title *Annales of England* (1630). His *The Man in the Moone, or a Discourse of a Voyage thither, by Domingo Gonsales,* written apparently between 1599 and 1603 and published posthumously in 1638, was imitated in several important particulars by Cyrano de Bergerac, from whom, if not from Godwin direct, Swift borrowed in writing of Gulliver's voyage to Laputa. Another work of Godwin's, *Nuncius inanimatus Utopiae* (1629), seems to have been the prototype of John Wilkins's *Mercury, or the Secret and Swift Messenger,* which appeared in 1641.

GODWIN, MARY WOLLSTONECRAFT (1759–1797), English miscellaneous writer, was born probably at Hoxton, London. Her family was of Irish extraction. Her father, Edward John Wollstonecraft, after dissipating the greater part of his patrimony, tried to earn a living by farming, which only plunged him into deeper difficulties, and he led a wandering, shifty life. The family roamed from Hoxton to Edmonton, to Essex, to Beverley in Yorkshire, to Lougharne, Pembrokeshire, and back to London.

After Mrs. Wollstonecraft's death in 1780, soon followed by her husband's second marriage, the three daughters, Mary, Everina and Eliza, sought to earn their own livelihood. Mary, the eldest, went in the first instance to live with her friend Fanny Blood, a girl of her own age, whose father, like Wollstonecraft, was addicted to drink. Mary helped Mrs. Blood to earn money by taking in needlework, while Fanny painted in water-colours. Everina went to live with her brother Edward, and Eliza made a hasty and, as it proved, unhappy marriage with a Mr. Bishop. A legal separation was afterwards obtained, and the sisters, together with Fanny Blood, took a house, first at Islington, afterwards at Newington Green, and opened a school, which was carried on with indifferent success for nearly two years. During their residence at Newington Green, Mary was introduced to Dr. Johnson, who, as Godwin tells us, "treated her with particular kindness and attention."

In 178j Fanny Blood married Hugh Skeys, a merchant, and went with him to Lisbon, where she died in childbed after sending for Mary to nurse her. "The loss of Fanny," as she said in a letter to Mrs. Skeys' brother, George Blood, "was sufficient of itself to have cast a cloud over my brightest days. . . . I have lost all relish for pleascre, and life seems a burden almost too heavy to be endured." Her first novel, *Mary, a Fiction* (1788), was intended to commemorate her friendship with Fanny. After closing the school at Kewington Green, Mary became governess in the family of Lord Kingsborough, in Ireland. Her pupils were much attached to her, especially Margaret King, afterwards Lady Mountcashel; and indeed, Lady Kingsborough gave the reason for dismissing her after one year's service that the children loved their governess better than their mother. Mary now resolved to devote herself to literary work, and she was encouraged by Johnson, the publisher in St. Paul's churchyard, for whom she acted as literary adviser. She also undertook translations, chiefly from the French. *Tlze Elements of Morality* (1790) from the German of Salzmann, illustrated by Blake, an old-fashioned book for children, and Lavater's *Physiognomy* were among her translations. Her *Original Stories from Real Life* were published in 1791, and, with illustrations by Blake, in 1796. In 1792 appeared *A Vindication of the Rights of Woman,* the work with which her name is always associated.

It is not among the least oddities of this book that it is dedicated to M. Talleyrand Périgord, late bishop of Autun. Mary Wollstonecraft still believed him to be sincere, and working in the same direction as herself. In the dedication she states the "main argument" of the work, "built on this simple principle that, if woman be not prepared by education to become the companion of man, she will stop the progress of knowledge, for truth must be common to all, or it will be inefficacious with respect to its influence or general practice." In carrying out this argument she used great plainness of speech, and it was this that caused all, or nearly all, the outcry. For she did not attack the institution of marriage, nor assail orthodox religion; her book was really a plea for equality of education, passing into one for State education and for the joint education of the sexes. It was a protest against the assumption that woman was only the plaything of man, and she asserted that intellectual companionship was the chief, as it is the lasting, happiness of marriage. She thus directly opposed the teaching of Rousseau, of whom she was in other respects an ardent disciple.

Mrs. Wollstonecraft, as she now styled herself, desired to watch the progress of the Revolution in France, and went to Paris in 1792. Godwin, in his memoir of his wife, considers that the change of residence may have been prompted by the discovery that she was becoming attached to Henry Fuseli, but there is little to confirm this surmise; indeed, it was first proposed that she should go to Paris with Fuseli and his wife, nor was there any subsequent breach in their friendship. She remained in Paris during the Reign of Terror, when communication with England was difficult or almost impossible. Some time in the spring or summer of 1793 Capt. Gilbert Imlay, an American, became acquainted with Mary—an acquaintance which ended in a more intimate connection. There was no legal ceremony of marriage, and it is doubtful whether such a marriage would have been valid at the time; but she passed as Imlay's wife, and Imlay himself terms her in a legal document, "Mary Imlay, my best

friend and wife." In Aug. 1793 Imlay was called to Havre on business, and was absent for some months, during which time most of the letters published after her death by Godwin were written. Towards the end of the year she joined Imlay at Havre, and there in the spring of 1794 she gave birth to a girl, who received the name of Fanny, in memory of the dear friend of her youth. In this year she published the first volume of a never completed *Historical and Moral View of the French Revolution.* Imlay became involved in a multitude of speculations, and his affection for Mary and their child was already waning. He left Mary for some months at Havre. In June 1795, after joining him in England, Mary left for Norway on business for Imlay. Her letters from Norway, divested of all personal details, were afterwards published. She returned to England late in 1795 and found letters awaiting her from Imlay, intimating his intention to separate from her, and offering to settle an annuity on her and her child. For herself she rejected this offer with scorn: "From you," she wrote, "I will not receive anything more. I am not sufficiently humbled to depend on your beneficence." They met again, and for a short time lived together, until the discovery that he was carrying on an intrigue under her own roof drove her to despair, and she attempted to drown herself by leaping from Putney bridge, but was rescued by watermen. Imlay now completely deserted her, although she continued to bear his name.

In 1796, when Mary Wollstonecraft was living in London, supporting herself and her child by working, as before, for Mr. Johnson, she met William Godwin. A friendship sprang up between them—a friendship, as he himself says, which "melted into love." Godwin states that "ideas which he is now willing to denominate prejudices, made him by no means willing to conform to the ceremony of marriage"; but these prejudices were overcome, and they were married at St. Pancras church on March 29, 1797. And now Mary had a season of real calm in her stormy existence. Godwin, for once only in his life, was stirred by passion, and his admiration for his wife equalled his affection. But their happiness was of short duration. The birth of her daughter Mary, afterwards the wife of Percy Bysshe Shelley, on Aug. 30, 1797, proved fatal, and Mrs. Godwin died on Sept. 10 following. She was buried in the churchyard of Old St. Pancras, but her remains were afterwards removed by Sir Percy Shelley to the churchyard of St. Peter's, Bournemouth.

Her principal published works are as follows:—*Thoughts on the Education of Daughters,* . . . (1787); *Mary, a Fiction (1788); The Female Reader (selections)* (1789); *An Historical and Moral View of the Origin and Progress of the French Revolution, and the effects it has produced in Europe, vol.* i. *(no more published)* (1790); *Original Stories from Real Life* (1791); *Vindication of the Rights of Woman* (1792); *Vindication of the Rights of Man* (1793); *Letters written during a Short Residence in Sweden, Norway and Denmark (1796); Posthumous Works (4 vols., 1798).* It is impossible to trace the many articles contributed by her to periodical literature.

A memoir of her life was published by Godwin in 1798. A large portion of C. Kegan Paul's work, *William Godwin, his Friends and Contemporaries,* was devoted to her, and an edition of the Letters to Imlay (1879), of which the first edition was published by Godwin, is prefaced by a somewhat fuller memoir. See also E. R. Pennell, *Mary Wollstonecraft Godwin* (1885), in the *Eminent Women Series;* E. Dowden, *The French Revolution and English Literature (1897)* pp. 82 *et seq.;* E. R. Clough, *A Study of Mary Wollstonecraft and the Rights of Woman (1898);* an edition of her *Original Stories* (1906), with William Blake's illustrations and an introduction by E. V. Lucas; the *Love Letters of Mary Wollstonecraft to Gilbert Imlay* (1908), with an introduction by Roger Ingpen; M. Linford, *Mary Wollstonecraft (1924).*

GODWIN, *WILLIAM* (1756–1836), English political and miscellaneous writer, son of a Nonconformist minister, was born on March 3, 1756, at Wisbech, Cambridgeshire. Both parents were strict Calvinists. William Godwin was educated for his father's profession at Hoxton Academy, where he was under Andrew Kippis the biographer and Dr. Abraham Rees of the Cyclopaedia, and was at first more Calvinistic than his teachers, becoming a Sandemanian, or follower of John Glas (*q.v.*), whom he describes as "a celebrated north-country apostle who, after Calvin had damned ninety-nine in a hundred of mankind, has contrived a scheme for damning ninety-nine in a hundred of the followers of Calvin." He then acted as a minister at Ware, Stowmarket and Beaconsfield. At Stowmarket the teachings of the French philosophers were brought before him by a friend, Joseph Fawcet, who held strong republican opinions. He came to London in 1782, still nominally a minister, to regenerate society with his pen—a real enthusiast, who contemplated, in theory, the complete overthrow of all existing institutions, political, social and religious. He believed, however, that calm discussion was the only thing needful to carry every change, and from the beginning to the end of his career he deprecated every approach to violence. He was a philosophic radical in the strictest sense of the term.

His first published work was an anonymous Life of Lord Chathant (1783). Under the inappropriate title Sketches of History (1784) he published under his own name six sermons on the characters of Aaron, Hazael and Jesus, in which, though writing in the character of an orthodox Calvinist, he enunciates the proposition "God Himself has no right to be a tyrant." Introduced by Andrew Kippis, he began to write in 1785 for the *Annual Register* and other periodicals, producing also three novels now forgotten. The "Slretches of English History" written for the *Annual Register* from 178j onward still deserve study. He joined a club called the "Revolutionists," and associated with Lord Stanhope, Horne Tooke and Holcroft. His clerical character was now completely dropped.

In 1793 Godwin published his great work on political science, *The Inquiry* concerrzing Political Justice, and its Influence on General Virtue and Happiness, an inquiry into the principles of society, of government and of morals. For many years Godwin had been "satisfied that monarchy was a species of government unavoidably corrupt," and from desiring a government of the simplest construction, he gradually came to consider that "government by its very nature counteracts the improvement of original mind." Believing in the perfectibility of the race, that there are no innate principles, and therefore no original propensity to evil, he considered that "our virtues and our vices may be traced to the incidents which make the history of our lives, and if these incidents could be divested of every improper tendency, vice would be extirpated from the world." All control of man by man was more or less intolerable, and the day would come when each man, doing what seems right in his own eyes, would also be doing what is in fact best for the community, because all will be guided by principles of pure reason. In a day when the penal code was still extremely severe, he argued gravely against all punishments, not only that of death. Property was to belong to him who most wanted it; accumulated property was a monstrous injustice. Hence marriage, which is law, is the worst of all laws, and as property the worst of all properties. Perhaps no one received the whole teaching of the book. But it gave cohesion and voice to philosophic radicalism. Godwin himself in after days modified his communistic views, but his strong feeling for individualism, his hatred of all restrictions on liberty, his trust in man, his faith in the power of reason remained.

In May 1794 Godwin published the novel of *Caleb Williams, or Things as they are,* dramatized by the younger Colman as *The Iron Chest.* A theorist who lived mainly in his study, Godwin yet came forward boldly to stand by prisoners arraigned of high treason in that same year—1794. The danger to persons so charged was then great, and he deliberately put himself into this same danger for his friends. But when his own trial was discussed in the privy council, Pitt sensibly held that Political Justice, the work on which the charge could best have been founded, was priced at three guineas, and could never do much harm among those who had not three shillings to spare.

In 1797, the intervening years having been spent in strenuous literary labour, Godwin married Mary Wollstonecraft (see GODWIN, MARY WOLLSTONECRAFT). Since both held the same views regarding the slavery of marriage, and since they only married at all for the sake of possible offspring, the marriage was concealed for some time, and the happiness of the avowed married life was very brief; his wife's death on Sept. 10 left Godwin prostrated by affliction, and with a charge for which he was wholly unfit—his infant daughter Mary, and her stepsister, Fanny Imlay, who from that time bore the name of Godwin. His unfitness for

the cares of a family, far more than love, led him to contract a second marriage with Mary Jane Clairmont in 1801. She was a widow with two children, one of whom, Clara Mary Jane Clairmont, became the mistress of Byron. The second Mrs. Godwin was energetic and painstaking, but a harsh stepmother; and it may be doubted whether the children were not worse off under her care than they would have been under Godwin's neglect.

Godwin's second novel, *St. Leon,* appeared in 1799. It is chiefly remarkable for the beautiful portrait of Marguerite, the heroine, drawn from the character of his own wife. His opinions underwent a change in the direction of theism, influenced, he says, by his acquaintance with Coleridge. Study of the Elizabethan dramatists led to the production in 1800 of the *Tragedy of Antonio.* Kemble brought it out at Drury Lane, but the failure of this attempt made him refuse *Abbas, King of Persia,* which Godwin offered him in the next year. He was more successful with his *Life of Chaucer,* for which he received £600.

The events of Godwin's life were few. Under the advice of the second Mrs. Godwin, and with her active co-operation, he carried on business as a bookseller under the pseudonym of Edward Baldwin, publishing several useful school books and books for children, among them Charles and Mary Lamb's *Tales from Shakespeare.* But for many years Godwin struggled with constant pecuniary difficulties, for which more than one subscription was raised by the leaders of the Liberal Party and by literary men. Me became bankrupt in 1822, but during the following years he accomplished one of his best pieces of work, *The History of the Commonwealth,* founded on pamphlets and original documents, which still retains considerable value. In 1833 the Government of Earl Grey conferred upon him the office known as yeoman usher of the exchequer, to which were attached apartments in Palace Yard, where he died on April 7, 1836.

In his own time, by his writings and by his conversation, Godwin had a great power of influencing men, and especially young men. Though his character would seem, from much which is found in his writings, and from anecdotes told by those who still remember him, to have been cold and unsympathetic, it was not so understood by enthusiastic young people, who hung on his words as those of a prophet. The most remarkable of these was Percy Bysshe Shelley, who in the glowing dawn of his genius turned to Godwin as his teacher and guide. The last of the long series of young men who sat at Godwin's feet was Edward Lytton Bulwer, afterwards Lord Lytton, whose early romances were formed after those of Godwin, and who, in *Eugene Aram,* succeeded to the story as arranged, and the plan to a considerable extent sketched out, by Godwin, whose age and failing health prevented him from completing it. Godwin's character appears in the worst light in connection with Shelley. His early correspondence with Shelley, which began in 1811, is remarkable for its genuine good sense and kindness; but when Shelley carried out the principles of the author of *Political Justice* in eloping with Mary Godwin, Godwin assumed a hostile attitude that would have been unjustifiable in any case, and was ridiculous in the light of his professions. He was not, moreover, too proud to accept £1,000 from his son-in-law, and after the reconciliation following on Shelley's marriage in 1816, he continued to demand money until Shelley's death. His character had no doubt suffered under his long embarrassments and his unhappy marriage.

BIBLIOGRAPHY.—Godwin's more important works are—The *Enquiry concerning Political Justice, and its Influence on General Virtue and Happiness* (1793); *Things as they are, or the Adventures of Caleb Williams* (1794); *The Enquirer, a series of Essays* (1797); *Memoirs of the Author of the Rights of Woman* (1798); *St. Leon, a Tale of the Sixteenth Century* (1799); *Antonio, a Tragedy* (1800); *The Life of Chaucer* (1803); *Fleetwood, a Novel* (1805); *Faulkener, a Tragedy* (1807); *Essay on Sepulchres* (1809); *Lives of Edward and John Philips, the Nephews of Milton* (1815); *Mandeville, a Tale of the Times of Cromwell* (1817); *Of Population,* an answer to Malthus (1820); *History of the Commonwealth* (1824–1828); *Cloudesly, a Tale* (1830); *Thoughts on Man, a series of Essays* (1831); *Lzves of the Necromancers* (1834). A volume of essays was also collected from his papers and published in 1873, as left for publication by his daughter Mrs. Shelley. Many other short and anonymous works proceeded from his ever busy pen, but many are irrecoverable, and all are forgotten. Godwin's life was published in 1876 in two volumes, under the title *William Godwin, his Friends and Contemporaries,* by C. Kegan Paul. The best estimate of his literary position is that given by Sir Leslie Stephen in his *English Thought in the 18th Century* (ii. 264–281, 3rd ed., 1902). *See* also the article on William Godwin in W. Hazlitt's *The Spirit of the Age* (1825), and "Godwin and Shelley" in Sir L. Stephen's *Hours in a Library* (vol. iii., ed. 1892); H. Roussin, *William Godwin* (1913); F. K. Brown, *The Life of William Godwin* (1926).

GODWIN-AUSTEN, ROBERT ALFRED CLOPNE (1808–1884), English geologist, the eldest son of Sir Henry E. Austen, was born on March 17, 1808. He was educated at Oriel College, Oxford, of which he became a fellow in 1830 He afterwards entered Lincoln's Inn. In 1855 he brought before the Geological Society of London his paper "On the possible Extension of the Coal-Measures beneath the South-Eastern part of England." In this paper he supported the theory of the freshwater origin of the Old Red Sandstone, and discussed the relations of that formation, and of the Devonian, to the Silurian and Carboniferous. He was elected F.R.S. in 1849. He died at Shalford House near Guildford on Nov. 25, 1884. Mt. Godwin-Austen (K2 or Dapsang) 28,250 ft., in the Himalayas, is named in honour of his eldest son.

GODWINE (d. 1053), earl of the West-Saxons and the leading Englishman of his day, was the son of Wulfnoth, whose identity is uncertain. Of Godwine's youth, nothing is known except that he soon became a personal favourite of Canute, who, about 1018, conferred upon him the rank of earl—probably of some one shire in Wessex. In 1019 Godwine accompanied the king on his visit to Denmark, and shortly afterwards was given in marriage Gytha, sister of Ulf, and raised (1020) to the dignity of earl of all Wessex. On Canute's death in 1035, he assisted Queen Emma in supporting the claims of her son, Hardicanute, in opposition to those of Harold Harefoot for whom the Witan at Oxford, led by Leofric, had declared *(see* HARDICANUTE). Meanwhile Xelfred, son of Emma by her former husband Aethelred II., had landed in England with the hope of gaining the crown, but, falling into Godwine's power, he was handed over to Harold and killed.

On the death of Hardicanute in 1042, after a reign of less than two years, Godwine secured an English succession to the throne by his promotion of the election of Edward the Confessor, the surviving son of Emma and Aethelred. He was now the first man in the kingdom, and though he had powerful rivals in the earl Leofric of Mercia and earl Siward of Northumbria, he secured the marriage of his daughter Eadgyth to the king (1045), an earldom in the Severn valley for his son Sweyn, one in East Anglia for his son Harold, and a third in the Chilterns for his nephew Beorn. Nevertheless, his opposition to the Norman favourites of the king, particularly to Robert, abbot of Jumièges, who in 1051 became archbishop of Canterbury, and his attempt to cover up the misdeeds of his son Sweyn (d. 1052), was bringing the earl into disfavour. The climax came with his refusal to punish the men of Dover for stirring up a riot amongst the retinue of Eustace, Count of Boulogne, who was on a visit to the king in 1051. Godwine and his sons gathered their forces in Gloucestershire, and the earls of Mercia and Northumbria hastened to the assistance of the king. Though war was averted by mediation, Godwine and his family were outlawed *(see* EDWARD THE CONFESSOR). In the following year, however, the suspicions of the English thegns having been aroused by a visit of Edward's kinsman, William, duke of Normandy, Godwine was enabled to return in triumph. Some six months later, the earl was taken ill while at the king's table. and died on April 15, 1053.

See authorities in Freeman's *Norman Conquest,* vols. i. and ii., and *Cambridge Mediaeval Hist.,* vol. iii.

GODWIT, the name of wading birds of the genus *Limosa,* much esteemed for the table. The black-tailed godwit, L. *limosa,* or yarwhelp, formerly bred in the English fens. It is now only a visitor there but breeds commonly in Holland and thence across Europe to south Russia. The bird is the size of a large pigeon but with long legs and bill, the latter slightly upturned; the winter plumage is greyish-brown but the breeding dress is marked by bright bay. The tail is white for a third of its length and then black with a white margin. As in many waders, in spring the males

circle in the air and utter a special call or song. The bar-tailed godwit breeds in Lapland and is a winter visitor and bird of passage over the rest of Europe. It is smaller than the preceding and the tail is barred with black and white throughout its length. Scientifically it is *L. lapponica*. The marbled godwit (*L. fedoa*) is very large; it is an American form, as is the smaller Hudsonian godwit (*L. hudsonica*). Both breed in the north and migrate south in winter, the second form reaching the Strait of Magellan. Two forms from Asia winter in Australia and New Zealand.

GOEBBELS, JOSEF (1897–), German politician, was born at Rheydt in the Rhineland on 29th October, 1897. He was educated locally and at various universities, receiving the degree of Doctor of Philosophy at Heidelberg in 1920. In 1922 he joined the National Socialist Party, then in its infancy, and took a leading part in organizing the student movement. In 1926 he was placed by Hitler in charge of the Party organisation for Great Berlin. In 1927 he founded the periodical "Der Angriff" and in 1929 became head of the entire party propaganda. In 1930 he entered the Reichstag. In 1933 after the advent to power of his party he received the newly-created post of Reich Minister of Enlightenment and Propaganda. Besides his important task of directing the opinions of others he is the author of several minor works of his own. (C. A. M.)

GOEBEN, AUGUST KARL VON (1816–1880), Prussian general of infantry, was born at Stade, Hanover, on Dec. 10, 1816. He first saw active service with the Carlist army in Spain, after which he re-entered the Prussian service. Transferred to the staff of the IV. army corps in 1848, he formed a lasting friendship with his immediate superior, von Moltke. In 1860 he was with the Spanish troops in Morocco, and took part in the battle of Tetuan. He became major-general commanding the 26th infantry brigade in 1863.

Von Goeben distinguished himself at Rackebiill and Sonderburg in 1864. In 1866, commanding the 13th division, he won further laurels at Dermbach, Laufach, Kissingen, Aschaffenburg, Gerchsheim, Tauber-Bischofsheim and Würzburg. In 1870 he commanded the VIII. (Rhineland) army corps, and was victorious at Spicheren (Aug. 6) and Gravelotte (Aug. 18). On Jan. 8, 1871, he succeeded Manteuffel in the command of the I. Army, and a fortnight later brought the war in northern France to a brilliant conclusion by the decisive victory of St. Quentin (Jan. 18 and 19, 1871). He commanded the VIII. corps at Coblenz until his death there on Nov. 13, 1880.

Goeben's memoirs are to be found in his works *Vier Jahre in Spanien* (Hanover, 1841), *Reise-und Lagerbriefe aus Spanien und vom spanischen Heere in Marokko* (Hanover, 1863) and in the Darmstadt *Allgemeine Militärzeitung*. The cruiser "Goeben" bore his name.

See G. Zernin, *Das Leben des Generals August von Goeben* (a vols., 1895–97) and *A. von Goeben in Seinen Briefen* (1903); H. Barth, *A. von Goeben* (1906); and for his share in the war of 1870–71; H. Kunz, *Der Feldzug im N. und N.W. Frankreichs 1870–1871* (1889), and the 14th Monograph of the Great General Staff (1891).

"GOEBEN" AND "BRESLAU." The escape of the German battle-cruiser "Goeben" and light-cruiser "Breslau" from Messina on Aug. 6, 1914; their flight to the Aegean Sea and the bold decision to make for Constantinople, turned what was for them a desperate situation into one of material advantage to Germany. Their arrival at the Sublime Porte undoubtedly had a considerable influence when Turkey was hesitating whether or no to cast in her lot with the Central Powers.

Position in Aug. 1914.—When the World War broke out, the naval forces of the powers concerned in the Mediterranean were as follows:

British forces under Vice-Admiral Sir A. Berkeley Milne:—
Battle-cruisers: "Inflexible," "Indomitable," "Indefatigable."
Armoured cruisers under Rear-Admiral E. C. Troubridge:—"Defence," "Black Prince," "Duke of Edinburgh," "Warrior." *Light-Cruisers:* "Chatham," "Dublin," "Gloucester," "Weymouth." *Destroyers:* sixteen.

French forces under Vice-Admiral de Lapeyrere:—
Battleships: One Dreadnought, fifteen older type. *Armoured Cruisers:* Six. *Destroyers:* Twenty four.

Italian forces:
Battleships: Three Dreadnoughts, three older type.

Austrian forces:
Battleships: Three Dreadnoughts, three older type.

German forces under Rear-Admiral Souchon:—
Battle-cruiser: "Goeben."
Light-cruiser: "Breslau."

The preliminary warning sent out on July 27 to Admiral Milne, then at Alexandria, directed him to return to Malta and after completing with fuel and stores, to remain there for the purpose of watching the entrance to the Adriatic. These orders were subsequently overridden by a series of telegrams from the Admiralty. The first task given to Milne was to assist the French in transporting their African army. A lack of international co-operation is here evident, as the French Commander-in-Chief knew nothing of these plans. Then followed orders to prevent the "Goeben" entering the Adriatic; to guard British trade in the East Mediterranean and to watch any Austrian ships which emerged from the Adriatic.

On July 31 the Italian Government announced its intention to remain neutral, but this important fact was not communicated to Milne until Aug. 4 when he was further instructed to observe, strictly, the neutrality and allow no British warship to approach within 6 miles of the coast of Italy. A severe handicap this to any operation in or near the Straits of Messina.

"Goeben's" Activities.—Admiral Souchon left Messina at 1 A.M. Aug. 3 and made a dash to the African coast where, on the following morning, he fired a few shots into the towns of Bona and Philippeville. He then made off to the eastward, and, by a stroke of luck, narrowly missed meeting the French 1st Squadron, but he was sighted and followed by the "Indomitable" and "Indefatigable." No hostile action could, however, be taken, as war with Germany had not then been declared by Great Britain. Superior speed, aided by hazy weather, enabled Souchon to evade the British ships, and he returned to Messina where our ships could not follow if Italian neutrality was to be strictly observed.

Declaration of War.—At 7.02 P.M. on Aug. 4, Milne was informed the ultimatum would expire at midnight. When hostilities commenced at that hour the "Indomitable" and "Indefatigable" were between Sicily and Sardinia; the "Inflexible" was in the Malta Channel steering to join her consorts; Troubridge, with the armoured cruisers, was near Cephalonia and the "Goeben" was approaching Messina, where she arrived, with the "Breslau" at 4 A.M. Aug. 5. Her presence there became known to Milne at 5.30 P.M. Aug. 5, and during that night the British battle-cruisers patrolled between Bizerta and Sardinia.

"Goeben's" Escape.—Since Austria still hesitated to declare war against Great Britain, Souchon was given permission to act as he thought best. About 6 P.M. Aug. 6, Milne decided to close the northern entrance of the Straits of Messina, and, when off the north-west point of Sicily, he received news from the "Gloucester" that the "Goeben" and "Breslau" were leaving Messina by the southern entrance. Souchon made the bold decision to run for the Dardanelles. He steered to the northward, as if for the Adriatic, until 11 P.M. and then shaped a course for Cape Matapan, being shadowed throughout the night and the next day by the "Gloucester."

Troubridge steered north to intercept the German ships, but at midnight, realizing that their first course was only a feint, turned and proceeded south at full speed. Troubridge had decided not to risk his cruisers against the "Goeben's" 11-inch guns in a daylight action, and finding it impossible to intercept her before daylight, he abandoned the chase.

Milne took his battle-cruisers to Malta, coaled, and left again at midnight, Aug. 7, for the Aegean. A false alarm of war with Austria, sent out by the Admiralty, induced Milne to alter his dispositions and wasted 24 hours. When the chase was resumed, it was too late to overtake the "Goehen" and "Breslau," which ships, having coaled at the island of Denusa, reached the Darda-

nelles at about 5 P.M. Aug. 10. (J. E. T. H.)

GOEDEKE, KARL (1814–1887), German literary historian, was born at Celle on April 15, 1814. He became professor at Gottingen in 1873, and died there on Oct. 28, 1887. His most important service to German literature was the compilation of the indispensable *Grundriss zur Geschichte der deutschen Dichtung* (3 vols., 1857–81; new ed., 10 vols., 1884–1913), a bibliography of the subject down to the death of Goethe. Goedeke published many other works, among them a critical edition of Schiller.

GOEJE, MICHAEL JAN DE (1836–1909), Dutch orientalist, was born in Friesland in 1836. He devoted himself at an early age to the study of oriental languages and became especially proficient in Arabic, under the guidance of Dozy and Juynboll, to whom he was afterwards an intimate friend and colleague. He took his degree of doctor at Leyden in 1860, and then studied for a year in Oxford, where he examined and collated the Bodleian MSS. of Idrisi (part being published in 1866, in collaboration with R. P. Dozy, as *Description de l'Afrique et de l'Espagne*). About the same time he wrote *Mémoires de l'histoire et de la géographie orientales,* and edited *Expugnatio regionum.* In 1883, on the death of Dozy, he became Arabic professor at Leyden, retiring in 1906. He died on May 17, 1909. He wielded a great influence during his long professoriate not only over his pupils, but over theologians and eastern administrators who attended his lectures, and his many editions of Arabic texts have been of the highest value to scholars, the most important being his great edition of Tabari.

Among his chief works are *Fragmenta historicorum Arabicorum* (1869–71); *Diwan of Morlim-ibn-al-Wdlid* (1875); *Bibliotheca geographorum Arabicorunz* (1870–94); *Annals of Tabari* (1879–1901); edition of Ibn Qutaiba's biographies (1904); of the travels of Ibn Jubaye (1907, 5th vol. of Gibb Memorial). He was also the chief editor of the *Encyclopaedia of Islam* (vols. i.–iii.), and contributed many articles to periodicals. He wrote for the 9th and the 11th edition of the *Encyclopædia Britannica.*

GOES, DAMIÃO DE (1502–1574), Portuguese humanist, was born of a patrician family at Alenquer. Under King John III. he was employed abroad for many years from 1523 on diplomatic and commercial missions, and he travelled over the greater part of Europe. He was intimate with the leading scholars of the time, was acquainted with Luther and Rfelanchthon, and in 1532 became the pupil and friend of Erasmus. Goes took his degree at Padua in 1538 after a four years' course. He married in Flanders a rich and noble Dutch lady D. Joanna de Hargen, and settled at Louvain, then the literary centre of the Low Countries, where he was living in 1542 when the French besieged the town. He was taken prisoner and confined for nine months in France, till he obtained his freedom by a heavy ransom. He was rewarded, however, for his services by a grant of arms from Charles V. He finally returned to Portugal in 1545, and in 1548 he was appointed chief keeper of the archives and royal chronicler.

In 1558 he was given a commission to write a history of the reign of King Manoel and the first part of this great work appeared in 1566.

Damião de Goes was a man of wide culture and genial manners, and a skilled musician. He wrote both Portuguese and Latin with classic strength and simplicity, and his style is free from affectation and rhetorical ornaments. His portrait by Albrecht Diirer shows an open, intelligent face, and the record of his life proves him to have been upright and fearless. But his historical work gave umbrage to the great families; a denunciation to the Inquisition in 1545 was taken up later and in 1571 he was arrested. He was sentenced to a term of reclusion at the monastery of Batalha. Later he was allowed to return home but died suddenly on Jan. 30, 1574.

BIBLIOGRAPHY.—His Portuguese works include *Chronica do felicissimo rei Dom Emanuel* (parts i. and ii., 1566, parts iii. and iv., 1567); other editions appeared in Lisbon in 1619 and 1749 and in Coimbra in 1790; *Chronica do principe Dom Joam* (1558), with subsequent editions in 1567 and 1724 in Lisbon and in 1790 and 1905 in Coimbra; *Livro de Marco Tullio Ciceram chamado Catam Mayor* (Venice, 1538). This is a translation of Cicero's *De senectute.* His Latin works comprise: (1) *Legatio magni imperaforis Presbiteri Joannis,* etc. (Antwerp, 1532); (2) *Legatio Davidis Ethiopiae regis,* etc. (Bologna, 1533); (3) *Commentarii rerum gestarum in India* (Louvain, 1539); (4) *Fides, religio, moresque Aethzopum* (Louvain, 1540), incorporating Nos. (1) and (2); (5) *Hispania* (Louvain, 1542); (6) *Aliquot epistolae Sadoleti Bembi et aliorum clarissimorum virorum,* etc. (Louvain, 1544); (7) *Damiani a Goes equitis Lusitani aliquot opuscula* (Louvain, 1544); (8) *Urbis Lovaniensis obsidia* (Lisbon, 1546); (9) *De bello Cambaico ultimo* (Louvain, 1549); (10) *Urbis Olisiponensis descriptio* (Evora, 1554); (11) *Epistola ad Hieronymum Cardosum* (Lisbon, 1556).

GOES, HUGO VAN DER (1440–1482), a painter of considerable celebrity at Ghent, was known to Vasari, as he is known to us, by a single picture in a Florentine monastery. At a period when the family of the Medici had not yet risen from the rank of a great mercantile firm to that of a reigning dynasty, it employed as an agent at the port of Bruges Tommaso Portinari, a lineal descendant, it was said, of Folco, the father of Dante's Beatrix. Tommaso, at that time patron of a chapel in the hospital of Santa Maria Nuova at Florence, ordered an altar-piece of Hugo van der Goes, and commanded him to illustrate the sacred theme of *Quem genuit adoravit.* In the centre of a vast triptych, comprising numerous figures of life size, Hugo represented the Virgin kneeling in adoration before the new-born Christ attended by Shepherds and Angels. On the wings he portrayed Tommaso and his two sons in prayer under the protection of Saint Anthony and St. Matthew, and Tommaso's wife and two daughters supported by St. Margaret and St. Mary Magdalen. The triptych, which has suffered much from decay and restoring, was for over 400 years at Santa Maria Nuova, and is now in the Uffizi Gallery.

There are also pieces in public galleries which claim to have been executed by Van der Goes: The "Madonna" at Frankfurt; the diptych representing the "Fall" and the "Deposition" at Vienna. These are probably early works. To a maturer period may be ascribed the precious little triptych in the Liechtenstein collection representing the "Adoration of the Magi"; the two wings of and altar-piece from the Church of the Holy Trinity at Edinburgh now at Holyrood Castle; the "Death of the Virgin" at Bruges; the "Adoration of the Shepherds" at Wilton House. To his last years are ascribed two fine pictures painted on a large scale recently acquired by the Berlin Gallery from Spain representing the "Nativity" and the "Adoration of the Magi." Van der Goes, however was not only a painter of easel pieces. He made his reputation at Bruges by producing coloured hangings in distemper. After he settled at Ghent, and became a master of his gild in 1467, he designed cartoons for glass windows. He also made decorations for the wedding of Charles the Bold and Margaret of York in 1468, for the festivals of the Rhetoricians and papal jubilees on repeated occasions, for the solemn entry of Charles the Bold into Ghent in 1470–1471 and for the funeral of Philip the Good in 1474. About the year 1475 he retired to the monastery of Rouge Cloître near Brussels, where he took the cowl. There, though he still clung to his profession, he seems to have taken to drinking, and at one time to have shown decided symptoms of insanity. But his superiors gradually cured him of his intemperance, and he died in the odour of sanctity in 1482.

GOES, a town in the province of Zeeland, Holland, on the island of South Beveland, 11½ m. by rail E. of Middelburg. Pop. (1940) 9,669. The town had its origin in the castle of Oostende, and received a charter early in the 15th century from Jacoba of Bavaria, countess of Holland, who frequently stayed at the castle. It is connected by a short canal with the East Scheldt, and has a good harbour (1819) defended by a fort. The principal

buildings are the Gothic church (1423) and the old town hall (restored 1771). It is a centre of the linen industry and a market for wheat. Germany occupied Goes in May 1940.

GOETHALS, GEORGE WASHINGTON (1858–1928), American engineerand major-general of the U S. army, was born in Brooklyn, N.Y., on June 29, 1858. He graduated from West Point military academy in 1880. From 1880–85 he served in the U.S. regular army as an engineer officer, and was at various periods an instructor at West Point. From 1891–95 he was in charge of Tennessee river improvements, the Muscle Shoals canal and the design and construction of the Colbert Shoals lock. He was assistant to the chief of engineers, U.S. army (1895–98), and after serving for a few months as chief engineer of the First Army Corps received his honourable discharge from service in the U.S. volunteers in 1898. As a major (1900–03) he was in charge of the river and harbour works from Block island to Nantucket, and of the design and construction of Narragansett bay fortifications at Yew Bedford and at Newport, R.I. From 1903 to 1907 he served on the general staff of the US. army. In 1907 he was appointed by President Roosevelt a member of the Isthmian canal commission, at which rime he became a lieutenant colonel, and afterwards became chairman and chief engineer. In 1909 he was promoted to the rank of colonel.

The work, hitherto in charge of civilian engineers, was reorganized and directed by army engineers subject to the control of the president of the United States. Several changes of plan, such as widening the canal, were inaugurated. On Aug. 15, 1914, Goethsls completed his task and the canal was declared open to world commerce *(see* PANAMA CANAL). Col. Goethals was appointed the first civil governor of the Canal Zone by President Wilson in 1914 and in the following year was made a major-general. He resigned the governorship in 1916 and at his own request was placed on the retired list of the army. He was then appointed chairman of the board constituted to report on the Adamson eight-hour law. He served for a few months as general manager of the emergency fleet corporation, U.S. shipping board, but having little faith in the plan for a wooden fleet, resigned. He returned to private practice until Dec. 11, 1917, when he was recalled to active duty as acting quartermaster-general, U S. army, becoming in 1918 chief of the division of purchase, storage and traffic. He was also a member of the war industries board. At his request he was relieved from active service in March 1919, and became engaged in the practice of consulting engineering (civil and electrical) in New York city.

After an illness of eight months, Maj.-Gen. Goethals died at his home in Sew York city, Jan. 21, 1928. (J. B. Bi.)

GOETHE, JOHANN WOLFGANG VON (1749–1832), greatest of German poets, was born at Frankfurt-on-Main. He came, on his father's side, of Thuringian stock, his great-grandfather, Hans Christian Goethe, having been a farrier at Artern-on-the-Unstrut, about the middle of the 17th century. Hans Christian's son, Georg Friedrich, was brought up to the trade of a tailor, and in this capacity settled in Frankfurt in 1687. A second marriage, however, brought him into possession of the Frankfurt inn, "Zum Weidenhof," and he ended his days as a well-to-do innkeeper. His son, Johann Kaspar, the poet's father (1710–1782), studied law at Leipzig, and subsequently travelled in Italy. He hoped, on his return to Frankfurt, to obtain an official position in the government of the free city, but he had not sufficient personal influence to attain this end. In his disappointment he resolved never again to offer his services to his native town, and retired into private life. In 1742 he acquired, as a consolation for the public career he had missed, the title of *kaiserlicher* Rat, and in 1748 married Katharina Elisabeth (1731–1808), daughter of the *Schultheiss* or *Bürgermeister* of Frankfurt, Johann Wolfgang Textor. The poet was the eldest son of this union. Of the later children only one, Cornelia (b. 1750), survived the years of childhood; she died as the wife of Goethe's friend, J. G. Schlosser, in 1777. The best elements in Goethe's genius came from his mother's side; of a lively, impulsive disposition, and gifted with remarkable imaginative power, Frau Rat, who was hardly 18 when her son was born, was the ideal mother of a poet. From his father, whose stern, somewhat pedantic nature repelled warmer feelings on the part of the children, Goethe inherited, besides an unamiable stiffness of manner which grew on him with the years. that stability of character which brought him unscathed through temptations and passions, and held the balance to his all too powerful imagination.

Unforgettable is the picture which the poet has left us of his childhood spent in the large house with its many nooks and crannies in the Grosse Hirschgraben at Frankfurt. Books, pictures, objects of art, antiquities, reminiscences of Rat Goethe's visit to Italy, above all a marionette theatre, kindled the child's quick intellect and imagination. His education was conducted in its early stages by his father, and was later supplemented by tutors. Meanwhile the varied and picturesque life of Frankfurt was in itself a liberal education. In 1759, during the Seven Years' War, the French, as Maria Theresa's allies, occupied the town, and, much to the irritation of Goethe's father, who was a stanch partisan of Frederick the Great, a French lieutenant, Count Thoranc, was quartered on the Goethe household. The foreign occupation also led to the establishment of a French troupe of actors, and to their performances the boy, through his grandfather's influence, had free access. One of Goethe's most vivid memories was the picturesque coronation of the emperor Joseph II. in the Frankfurt Romer or town hall in 1764; he also dwells at some length in his autobiography on his first love affair. The object of this passion was a certain Gretchen, who seems to have taken advantage of the boy's interest in her to further the dishonest ends of one of her friends. The discovery of the affair and the investigation that followed cooled Goethe's ardour and caused him to turn his attention seriously to the studies which were to prepare him for the university. Meanwhile his literary instinct had begun to show itself; we hear of a novel in letters—a kind of linguistic exercise, in which the characters carried on the correspondence in different languages—of a prose epic on the subject of Joseph, and various religious poems of which one, *Die Höllenfahrt Christi,* found its way in a revised form into the poet's complete works.

In Oct. 1765, Goethe, then a little over 16, left Frankfurt for Leipzig, where a wider life awaited him. He entered upon his university studies with zeal, but his education in Frankfurt had not been the best preparation for the scholastic methods which still dominated the German universities; of his professors, only Gellert seems to have wpn his interest, and that interest was soon exhausted. The literary beginnings he had made in Frankfurt now seemed to him worthless; he committed them to the flames; and, under the guidance of E. W. Behrisch, a genial, if somewhat eccentric comrade, he turned over a new leaf; he acquired the art of writing those light Anacreontic lyrics which appealed to the taste of the polite Leipzig society of the day. Artificial as this poetry is, Goethe was, nevertheless, inspired by a real passion in Leipzig, namely, for Anna Katharina Schonkopf, the daughter of a wine-merchant at whose tavern he dined. She is the "Annette" after whom the collection of lyrics discovered in 1897 was named, although it must be added that neither these lyrics nor the *Neue Lieder,* published in 1770, let us see very much of Goethe's real feelings for Kathchen Schonkopf. To his Leipzig student-days belong also two small plays in Alexandrines, *Die* Laune *des Verliebten, a* comedy in one act, which reflects the lighter side of the poet's love affair, and *Die Mitschuldigen* (published in a revised form, 1769), a more sombre production, in which comedy is incongruously mingled with tragedy. In Leipzig Goethe also had time for what remained one of the abiding interests of his life, for art; he regarded A. F. Oeser (1717–1799), the director of the academy of painting in the Pleissenburg, who gave him lessons in drawing, as the teacher by whom he was most influenced in Leipzig. His art studies were also furthered by a short visit to Dresden. His stay in Leipzig came, however, to an abrupt conclusion; the distractions of student life proved too much for his strength; a sudden haemorrhage supervened, and he lay long ill, first in Leipzig, and, after it was possible to remove him, at home in Frankfurt. These months of slow recovery were a time of serious introspection for Goethe. He still corresponded with his Leipzig friends, but the tone of his letters changed; life had become more

serious for him. He pored over books on occult philosophy; he busied himself with alchemy and astrology. A friend of his mother's, Susanne Katharina von Klettenberg, who belonged to pietist circles in Frankfurt, turned the boy's thoughts to religious mysticism.

On his recovery his father resolved that his legal studies should be completed at Strasbourg, a city, which although then outside the German empire, was, in respect of language and culture, wholly German. From the moment Goethe set foot in the narrow streets of the Alsatian capital, in April 1770, the whole current of his thought seemed to change. The Gothic architecture of the Strasbourg minster became to him the symbol of a national and German ideal, directly antagonistic to the French tastes and the classical and rationalistic atmosphere that prevailed in Leipzig. An event of the first importance in Goethe's Strasbourg period was his meeting with Herder, who spent some weeks in Strasbourg undergoing an operation. In this thinker, who was his senior by five years, Goethe found the master he sought; Herder taught him the significance of Gothic architecture, revealed to him the beauty of nature unadorned, and inspired him with enthusiasm for Shakespeare and the *Volkslied.* Meanwhile Goethe's legal studies were not neglected, and he found time to add to his knowledge in other fields, notably medicine. Another factor of importance in Goethe's Strasbourg life was his love for Friderike Brion, the daughter of an Alsatian village pastor in Sesenheim. Even more than Herder's precept and example, this passion showed Goethe how trivial and artificial had been the Anacreontic and pastoral poetry, which had occupied him in Leipzig; and the lyrics inspired by Friderike, such as *Kleine Blumen, kleine Blätter* and *Wie herrlich leuchtet mir die Natur!* mark the beginning of a new epoch in German lyric poetry. The idyll of Sesenheim, as described in *Dichtung und Wahrheit,* is one of the beautiful love-stories in the literature of the world. From the first, however, it was clear that Friderike Brion could never become the wife of the Frankfurt patrician's son; an unhappy ending to the romance was unavoidable, and, as is to be seen in passionate outpourings like *Wanderers Sturmlied,* and in the bitter self-accusations of *Cluvigo,* it left deep wounds on the poet's sensitive nature.

In Strasbourg Goethe probably planned his first important drama, *Gotz von Berlichingen.* In estimating this drama we must bear in mind Goethe's own life, and the turbulent spirit of his age, rather than the historical facts, which the poet found in an autobiography of his hero published in 1731. The latter supplied only the rough materials; the Gotz von Berlichingen whom Goethe drew, with his humane ideals of justice and his enthusiasm for freedom, is a very different personage from the unscrupulous robber-knight of the 16th century. There is no historical justification for the vacillating Weisslingen in whom Goethe executed poetic justice on himself as the lover of Friderike, or for the women of the play, the gentle Maria, the heartless Adelheid. But there is genial, creative power in all the characters, and a vigorous dramatic life in the play's action, irresistible in its appeal even to a modern audience. With *Gotz von Berlichingen* the Shakespearian form of drama was established on the German stage, and the literary movement known as *Sturm und Drang* inaugurated.

Having received his licence to practice as an advocate, Goethe returned home in Aug. 1771, and began his initiation into the routine of his profession. In the following year, in order to gain further experience in the practical side of his calling, he spent four months at Wetzlar, where the imperial law-courts were established. But Goethe's professional duties had only a small share in the eventful years which lay between his return from Strasbourg and that visit to Weimar at the end of 1775, which turned the whole course of his career, and resulted in his permanent attachment to the Weimar court. Goethe's life in Frankfurt was a round of stimulating literary intercourse; in J. H. Merck (1741–1791), an army official in the neighbouring town of Darmstadt, he found a friend and mentor, whose irony and common sense served as a corrective to his own exuberance of spirits. Wetzlar brought new friends and another passion, that for Charlotte Buff, the daughter of the *Amtmann* there—an episode which has been immortalized in *Werthers Leiden;* again the young poet was obsessed by a love which was this time strong enough to bring him to the brink of that suicide which forms the culmination of the novel. A visit to the Rhine, where new interests and the attractions of Maximiliane von Laroche, a daughter of Wieland's friend, the novelist Sophie von Laroche, brought partial healing, his intense preoccupation with literary work on his return to Frankfurt did the rest. In 1775 Goethe was attracted by still another type of woman, Lili Schönemann, whose mother was the widow of a wealthy Frankfurt banker. A formal betrothal took place, and the beauty of the lyrics which Lili inspired leaves no room for doubt that here was a passion no less genuine than that for Friderike or Charlotte. But the gay, social world in which Lili moved was not congenial to him. A visit to Switzerland in the summer of 1775 may not have weakened his affection for her, but he began to see that marriage would impose intolerable fetters upon him, and without tragic consequences on either side, the engagement was allowed to lapse. Goethe's departure for Weimar in November brought about the final break.

The period from 1771 to 1775 was, in literary respects, the most productive of the poet's life. It had been inaugurated with *Gotz von Berlichingen* and a few months later this tragedy was followed by another, *Clavigo,* peopled with equally living figures, and reflecting even more faithfully than *Gotz* the emotional experience Goethe had gone through in Strasbourg. Again poetic justice is effected on the unfortunate hero who is persuaded to choose his own personal advancement in preference to his duty to the woman he loves; more pointedly than in *Gotz* is this moral enforced; Clavigo's tragic end is due not so much to this defiance of moral laws, as to his vacillation and want of character. With *Die Leiden des jungen Werthers* (1774), the literary precipitate of the author's own experiences in Wetzlar, Goethe succeeded in attracting, as no German had done before him, the attention of Europe. Once more it was the gospel that the world belongs to the strong in will, which lay beneath the surface of this romance. This, however, was not what Goethe's contemporaries read out of it; nor did they appreciate the wide range of spiritual experience which the book contains. *Werther* was to them merely a sentimental story of a lovelorn youth whose burden becomes too great for him to bear. While *Gotz* inaugurated the manlier side of the *Sturm und Drang* literature, *Werther* was responsible for its sentimental excesses. In *Stella,* "a drama for lovers" (1776), the poet again reproduced, if with less fidelity than in *Werther,* certain aspects of his own love troubles. A lighter vein is to be observed in various dramatic satires written at this time such as *Götter, Helden und Wieland* (1774), *Hanswursts Hochzeit, Fastnachtsspiel vom Pater Brey, Satyros,* and in the *Singspiele, Erwin und Elmire* (1775) and *Claudine von Villa Bella* (1776); while to the *Frankfurter Gelehrte Anzeiger* (1772–73), Goethe contributed vigorous and provocative criticism. The exuberance of the young poet's genius is also to be seen in the many unfinished fragments of this period; at one time we find him occupied with dramas on *Caesar* and *Mahomet,* at another with an epic on *Der ewige Jude,* and again with a tragedy on *Prometheus,* of which a magnificent fragment has passed into his works. Greatest of all the torsos of this period, however, was his dramatization of the legend of *Faust.* Thanks to *a* manuscript copy of the play in its earliest form—discovered as recently as 1887, and known as the *Urfanist*—*we* now know exactly how much of *Faust* was the immediate product of the *Sturm und Drang,* and are able to understand the intentions with which the young poet began his masterpiece. Goethe's hero changed with the author's riper experience and with his new conceptions of man's place and duties in the world, but the Gretchen tragedy was taken over into the finished poem, practically unaltered, from the earliest draft of the poem. With these wonderful scenes, the most intensely tragic in German literature, Goethe's poetry in this period reaches its climax. Still another important work, however, was conceived, and in large measure written at this time, the drama of *Egmont,* which was not published until 1788. This work may, to some extent, be regarded as complementary to *Faust;* it presents the lighter, more cheerful and optimistic side of Goethe's outlook on life **is** these years; Graf Egmont, the most winning and fascinat-

ing of the poet's heroes, is endowed with that "daimonic" power over the sympathies of men and women, which Goethe himself possessed in so high a degree. But *Egmont* is but an indifferent drama: it has little plot and its interest depends almost solely on two characters, Egmont himself and Klärchen, the young girl of the people whom he loves:

In Dec. 1774 the young "hereditary prince" of Weimar, Karl August, passing through Frankfurt on his way to Paris, came into touch with Goethe, and invited the poet to visit him in Weimar. In Oct. 1775 the invitation was repeated, and on Nov. 7 Goethe arrived in the little Saxon capital which was to remain his home for the rest of his life. During the first few months in Weimar the poet gave himself up to the pleasures of the moment as unreservedly as his patron; indeed, the Weimar court even looked upon him for a time as a tempter who led the young duke astray. But the latter, although himself a mere stripling, had implicit faith in Goethe's judgment, and enlisted his services in the government of the duchy Goethe was not long in Weimar before he was entrusted with responsible state duties, and events justified the duke's confidence. Goethe displayed as minister of state, both energy and foresight. He interested himself in agriculture, horticulture and mining, which were of paramount importance to the welfare of the duchy, and these interests led to his preoccupation with the natural sciences which took up so much of his time in later years. The inevitable love-interest was also not wanting. As Friderike had fitted into the background of Goethe's Strasbourg life, Lotte into that of Wetzlar, and Lili into the gaieties of Frankfurt, so now Charlotte von Stein, the wife of a Weimar official, was the appropriate muse of Goethe's Weimar life. We possess only the poet's share of his correspondence with Frau von Stein, but it may be inferred from it that, of all Goethe's loves, she was intellectually the most worthy of him. Frau von Stein was a woman of refined literary taste and culture, seven years older than he and the mother of seven children. She dominated the poet's life for 12 years, until his journey to Italy in 1786–1788. Of other events of this period the most notable were two winter journeys, the first in 1777, to the Harz mountains, the second, two years later, to Switzerland — journeys which gave Goethe opportunity for that introspection and reflection for which his Weimar life had left him little time. On the second of these journeys he revisited Friderike in Sesenheim, saw Lili, who had married and settled in Strasbourg, and made the personal acquaintance of J. K. Lavater in Zürich.

The literary results of these years cannot be compared with those of the preceding period; they are virtually limited to a few wonderful lyrics, such as *Wanderers Nachtlied, An den Mond, Gesang der Geister über den Wassern,* ballads, such as *Der Erlkönig,* a delicate little drama, *Die Geschwister* (1776), in which the poet's relations to both Lili and Frau von Stein seem to be reflected, a dramatic satire, *Der Triumph der Empfindsamkeit* (1778), and *a* number of *Singspiele, Lila* (1777), *Die Fischerin, Scherz, List und Raclze,* and *Jery und Bately* (1780). But greater works were in preparation. A religious epic, *Die Geheimnisse,* and a tragedy *Elpenor,* did not, it is true, advance much further than plans; but in 1777, under the influence of the theatrical experiments at the Weimar court, Goethe began to write a novel of the theatre on a large scale which was to have borne the title *Wilhelm Meisters theatralische Sendung.* A manuscript copy of the novel in this early form was discovered as recently as 1910. In 1779 he himself took part in a representation before the court at Ettersburg, of his drama *Iphigenie auf Tauris.* This *Iphigenie* was, however, in prose; in the following year Goethe refashioned it in iambics, but it was not until he went to Italy that it received the form we know.

In Sept. 1786 Goethe set out from Carlsbad where he had been on holiday — secretly and stealthily, his plans known only to his servant — on that memorable journey to Italy, to which he had looked forward with such intense longing; he could not cross the Alps quickly enough, so impatient was he to set foot in Italy. He travelled by way of Munich, the Brenner and Lago di Garda to Verona and Venice, and from thence to Rome, where he arrived on Oct. 29, 1786. Here he gave himself up unreservedly to the new impressions which crowded on him, and he was soon at home in the circle of German artists there. In the spring of 1787 he extended his journey to Naples and Sicily, returning to Rome in June 1787, where he remained until his final departure for Germany on April 2, 1788. It is difficult to exaggerate the importance of Goethe's Italian journey. He himself regarded it as a kind of climax to his life; never before had he attained such complete understanding of his genius and mission as a poet; it afforded him a vantage-ground from which he could renew the past and make plans for the future. In Weimar he had already felt that he was no longer in sympathy with the *Sturm und Drang,* but it was Italy which first initiated him into that neo-classicism which superseded *Sturm und Drang* in German poetry. To the modern reader, impressed by Goethe's extraordinary sensitiveness to impressions, it may seem strange that his interests in Italy were so limited; for, after all, he had eyes for comparatively little of what Italy had to offer. He went to Rome in Winckelmann's footsteps; it was the antique he sought, and he was interested in the artists of the Renaissance only in so far as he saw in them the heirs of antiquity. The calm beauty of Greek tragedy is seen in the new iambic version of *Iphigenie auf Tauris* (1787); the classicism of the Renaissance gives the ground-tone to the drama of *Torquato Tasso* (1790), in which the conflict of poetic genius with the prosaic world is transmuted into imperishable poetry. Classic, too, in this sense, were the plans of a drama on *Iphigenie auf Delphos* and of an epic, *Nausikaa.* Most interesting of all, however, is the reflection of the classic spirit in works already begun in earlier days, such as *Egmont* and *Faust.* The former drama was finished in Italy, the latter was brought a step forward, part of it being published as a *Fragment* in 1790.

Disappointment in more senses than one awaited Goethe on his return to Weimar. He came back from Italy with a new philosophy of life, a philosophy at once classic and pagan, and with new ideals of literary beauty. But Germany had not advanced; in 1788 his countrymen were still admirers of that *Sturm und Drang* from which the poet had fled. The times seemed to him more out of joint than ever, and he withdrew into himself. Even his relations to the old friends were changed. Frau von Stein had not known of his flight to Italy until he had been several weeks there; but he looked forward to her welcome on his return. The months of absence, however, the change he had undergone, and, doubtless, lighter loves which had beguiled his leisure in Rome, weakened the Weimar ties; if he left Weimar as Frau von Stein's lover he returned only as her friend; and she naturally resented the change. Goethe, meanwhile, continuing the freer customs to which he had adapted himself in Rome, took into his household Christiane Vulpius (1765–1816), a young girl who could offer him no kind of intellectual companionship. But Christiane gradually filled a gap in the poet's life; she gave him, unobtrusively, without making demands on him, the comforts of a home. She was not accepted by court society; she was indifferent to the fact that even Goethe's intimate friends ignored her; but she, who had suited the poet's whim when he desired to shut himself off from all that might dim the recollection of Italy, became with the years an indispensable helpmate to him. On the birth in 1789 of his son, Goethe had some thought of legalizing his relations with Christiane, but this intention was not realized until 1806, when the invasion of Weimar by the French made both life and property insecure.

The period of Goethe's life which succeeded his return from Italy was restless and unsettled; relieved of his state duties, he returned in 1790 to Venice, only to be disenchanted with the Italy he had loved so intensely, a year or two before. A journey with the duke of Weimar to Breslau followed, and in 1792 he accompanied his master on that campaign against France which ended ingloriously for the German arms at Valmy. In later years Goethe published his account of this *Campagne in Frankreich* as also of the *Belagerung von Mainz,* at which he was present in 1793. His literary work naturally suffered under these distractions. *Tasso,* and the edition of the *Schriften* in which it was to appear, had still to be completed on his return from Italy; the *Römische Elegien,* perhaps the most Latin in form and content of all his works,

were published in 1795, and the *Venezianische Epigramme,* the result of the second visit to Italy, in 1796. The French Revolution, in which all Europe was engrossed, was in Goethe's eyes only another proof that the passing of the old régime meant the abrogation of law and order, and he gave voice to his antagonism to the new democratic principles in the dramas *Der Gross-Cophta* (1792), *Der Bürgergeneral* (1793), and in the unfinished fragments *Die Aufgeregten* and *Das Mädchen von Oberkirch.* The spirited translation of the epic of *Reineke Fuchs* (1794) he took up as a relief and an antidote to the perplexing state of the time. Two new interests, however, strengthened the ties between Goethe and Weimar—ties which the Italian journey had threatened to sever: his appointment in 1791 as director of the ducal theatre, a post which he occupied for 22 years, and his absorption in scientific studies. In 1790 he published his important *Versuch, die Metamorphose der Pflanzen zu erklaren,* which was even more fundamental for the new science of comparative morphology than his discovery some six years earlier of traces of a structure in the human jaw-bone analogous to the intermaxillary bone in apes; and in 1791 and 1792 appeared two parts of his *Beiträge zur Optik.*

Meanwhile, however, Goethe had again taken up the novel of the theatre which he had begun years before, with a view to its inclusion in the edition of his *Neue Schriften* (1792-1800). *Wilhelm Meisters theatralische Sendung* became *Wilhelm Meisters Lehrjahre;* the novel of purely theatrical interests was widened out to embrace the history of a young man's apprenticeship to life. The change of plan explains, although it may not exculpate, the formlessness and loose construction of the work. A hero, who was probably originally intended to demonstrate the failure of the vacillating temperament when brought face to face with the problems of the theatre, proved ill-adapted to demonstrate those precepts for the guidance of life with which the *Lehrjahre* closes; unstable of purpose, *Wilhelm Meister* is not so much an illustration of the author's life-philosophy as a lay-figure on which he demonstrates his views. *Wilhelm Mcister* is, however, a work of extraordinary variety, its scenes ranging from the commonplace realism of the troupe of strolling players to the poetic romanticism of Mignon and the harper; its pages of intuitive criticism—notably of Hamlet—add to its value as a *Bildungsroman* in the best sense of that word. Of all Goethe's works, this exerted the most immediate and lasting influence on German literature; it served as a model for the best fiction of the next 30 years.

In completing *Wilhelm Meister,* Goethe found a sympathetic critic in Schiller, to whom he owed in great measure his renewed interest in poetry. After years of tentative approach on Schiller's part, years in which that poet was not even himself clear that he desired a friendly understanding with Goethe, the favourable moment arrived. It was in June 1794, when Schiller was seeking collaborators for his new periodical *Die Horen;* and his invitation addressed to Goethe was the beginning of a friendship which continued unbroken until the younger poet's death. The friendship of Goethe and Schiller, of which their correspondence is a priceless record, had, however, its limitations; it was essentially a literary friendship, a certain barrier of personal reserve being maintained to the last. As far as actual work was concerned, Goethe went his own way as he had always been accustomed to do; but the mere fact that he devoted himself with increasing interest to literature was due to Schiller's stimulus. It was Schiller who induced him to undertake those studies on the nature of epic and dramatic poetry which resulted in the epic of *Hermann und Dorothea* and the fragment of the *Achilleis;* without the friendship there would have been no *Xenien* and no ballads, and it was again, his younger friend's encouragement which induced Goethe to betake himself once more to the "misty path" of *Faust,* and bring the first part of that drama to a conclusion.

Goethe's share in the *Xcnien* (1796) may be briefly mentioned. This collection of distichs, written in collaboration with Schiller, was prompted by the indifference and animosity of contemporary criticism, and its disregard for what the two poets regarded as the higher interests of German poetry. The *Xenien* succeeded as a retaliation on the critics, but the masterpieces with which both poets justified their attack, were in the long run a more effective antidote to the prevailing mediocrity. The collection of stories, *Unterhaltungen deutscher Ausgewanderten* (1797) was unworthy of Goethe's genius, and the translation of Benvenuto Cellini's *Life* (1796–1797) was only a translation. But in 1798 appeared *Hermann und Dorothea,* one of Goethe's most perfect poems. It is indeed remarkable—when we consider by how much theoretic discussion the composition of the poem was preceded and accompanied—that it should make upon the reader so simple and unsophisticated an impression; in this respect it is the triumph of an art that conceals art. Goethe has here taken a simple story of village life, mirrored in it the most pregnant ideas of his time, and presented it with a skill which may well be called Homeric; but he has discriminated with the insight of genius between the Homeric method of reproducing the heroic life of primitive Greece and the same method as adapted to the commonplace happenings of 18th century Germany. In this respect, he was guided by a forerunner who had depicted the life of the German people in the epic manner and in hexameters, J. H. Voss, the author of *Luise.* Hardly less imposing in their calm, placid perfection are the poems with which, in friendly rivalry, Goethe seconded the more popular ballads of his friend; *Der Zauberlehrling, Der Gott und die Bayadere, Die Braut von Korinth, Alexis und Dora, Der neue Pausias* and *Die schöne Müllerin*—the latter a cycle of poems in the style of the *Volkslied*—are among the masterpieces of Goethe's poetry. On the other hand, even the friendship with Schiller did not help him to add to his reputation as a dramatist. *Die natürliche Toclter* (1803), the first part of a trilogy, in which he proposed to embody his ideas of the Revolution on wide canvas, did not get beyond this. Goethe's abstract classic principles, when applied to the swift, direct art of the theatre, were ineffective, and *Die natürliche Tochter,* notwithstanding its good' theoretic intention, remains the most lifeless and shadowy of all his dramas. Even less in touch with the living present were the various prologues and *Festspiele,* such as *Paläophron und Neoterpe* (1800), *Was wir bringen* (1802), which in these years he composed for the Weimar theatre.

Goethe's classicism brought him into inevitable antagonism with the new Romantic movement which had been inaugurated in 1798 by the *Athenäum,* edited by the brothers Schlegel. The sharpness of the conflict was, however, blunted by the fact that, without exception, the young Romantic writers looked up to Goethe as their master; they modelled their fiction on *Wilhelm Meister;* they regarded his lyrics as the highwater mark of German poetry; Goethe, Novalis declared, was the "Statthalter of poetry on earth." With regard to painting and sculpture, however, Goethe felt that a protest was necessary, if the ideas propounded in works like Wackenroder's *Herzensergiessungen* were not to bring back the confusion of the *Sturm und Drang;* and, as a rejoinder to the Romantic theorists, Goethe, in conjunction with his Swiss friend, Heinrich Meyer (1760–1832), published from 1798 to 1800 an art review, *Die Propylaen.* In *Winckelmann und Sein Jahrhundert* (1805) Goethe defended the classical ideal of beauty in art. But in the end he himself proved the greatest enemy to the strict classical doctrine by the publication in 1808 of the completed first part of *Faust,* a work which was accepted by contemporaries as a triumph of Romantic art. *Faust* is a patchwork of many colours. With the aid of the vast body of *Faust* literature which has sprung up in recent years, and the many new documents bearing on its history—above all, the so-called *Urfaust,* to which reference has already been made—we are able now to discriminate between the various phases of the work; on the original *Sturm und Drang* hero of the opening scenes and of the Gretchen tragedy—the brother of Götz, and Clavigo—is superimposed, in the completed poem, a Faust of calmer moral and intellectual ideals, who corresponds to Hermann and Wilhelm Meister, in Goethe's work. In its first form the poem was concerned with very definite personal problems; in the years of Goethe's friendship with Schiller it was widened to embody the higher strivings of 18th-century humanism; ultimately, in the second part, it became a vast allegory of human life and activity. Thus the elements of which *Faust* is composed were even more difficult to

blend than were those of *Wilhelm Meister;* but the very want of uniformity is one source of the perennial fascination of the tragedy, and has made it in a peculiar degree the national poem of the German people, a mirror in which the national life and poetry are reflected. from the outburst of *Sturm und Drang* to the tranquil classicism of Goethe's maturity.

The third and final period of Goethe's long life may be said to have begun after Schiller's death. He never again lost touch with literature as he had done in the years which preceded his friendship with Schiller; but he stood in no active or immediate connection with the literary movement of his day. His life moved on comparatively uneventfully. Even the era of Napoleonic oppression, 1806–1813, disturbed but little his equanimity. Goethe, the cosmopolitan *Weltbürger* of the 18th century, had himself no very intense feelings of patriotism, and, having seen Germany flourish as a group of small states under enlightened despotisms, he had little confidence in the dreamers of 1813 who hoped to see the glories of Barbarossa's empire revived. Napoleon, moreover, he regarded not as the scourge of Europe, but as the defender of civilization against the barbarism of the Slavs; and in the famous interview between the two men at Erfurt the poet's admiration was reciprocated by the French conqueror. Thus Goethe had no great sympathy for the war of liberation which in 1813 kindled young hearts from one end of Germany to the other; and when the national enthusiasm rose to its highest pitch he buried himself in those optical and morphological studies, which, with increasing years, occupied more and more of his time.

The events and writings of the last 25 years of Goethe's life may be briefly summarized. In 1805, as we have seen, he suffered an irreparable loss in the death of Schiller; in 1806, Christiane became his legal wife, and to the same year belongs the magnificent tribute to his dead friend, the *Epilog zu Schillers Glocke.* Two new friendships about this time kindled in the poet something of the passion of younger days. Bettina von Arnim came into touch with Goethe in 1807, and her *Briefwechsel Goethes mit einem Kinde* (published in 1835) is, in its mingling of truth and fiction, one of the most delightful products of the Romantic mind; but the episode was of less importance in Goethe's eyes than Bettina would have us believe. On the other hand, his interest in Minna Herzlieb, foster-daughter of the publisher Frommann in Jena, was of a warmer nature, and has left its traces on the novel, *Die Wahlverwandtschaften* and on his sonnets.

In 1808, as we have seen, appeared the first part of *Faust,* which in 1809 was followed by the novel just mentioned. That novel, hardly less than the drama, effected a change in the public attitude towards the poet. Since the beginning of the century the conviction had been gaining ground that Goethe's mission was accomplished, that the day of his leadership was over; but here were two works which not merely re-established his position, but proved that the old poet was in sympathy with the movement of letters, and keenly alive to the change of ideas which the new century had brought with it. The intimate study of four minds, which forms the subject of the *Wahlverwandtschaften,* was an essay in a new type of psychological fiction and pointed out the way for developments of the German novel after the stimulus of *Wilhelm Meister* had exhausted itself. Less important than *Die Wahlverwandtschaften* was *Pandora* (1810), the final product of Goethe's classicism and the most uncompromisingly classical and allegorical of all his works. And in 1810, too, appeared his treatise *Zur Farbenlehre.* In the following year the first volume of his autobiography was published under the title *Aus meinem Leben, Dichtung und Wahrheit.* The second and third volumes of this work followed in 1812 and 1814; the fourth, bringing the story of his life up to the close of the Frankfcrt period in 1833, after his death. Goethe felt, even late in life, too intimately bound up with Weimar to discuss in detail his early life there, and he shrank from carrying his biography beyond the year 1775. But a number of other publications — descriptions of travel, such as the *Italienische Reise* (1S16–17), the materials for a continuation of *Dichtung und Wahrheit* collected in *Tag-und Jahreshefte* (1830) are important additions to the documents of his life. Meanwhile, no less valuable biographical materials were accumulating in his diaries, his voluminous correspondence and his conversations, as recorded by J. P. Eckermann. the chancellor F. von Müller and F. Soret. Several periodical publications, *Über Kunst und Altertum* (1816-32), *Zur Naturwissenschaft überhaupt* (1817-24), *Zur Morphologie* (1817-24), bear witness to the extraordinary width of Goethe's interests in these years. Art, science, literature — little escaped his ken — and that not merely in Germany: English writers, Byron, Scott and Carlyle, Italians like Manzoni, French scientists and poets, could all depend on friendly words of appreciation and encouragement from Weimar.

With *Westöstlicher Diwan* (1819), Goethe had another surprise in store for his contemporaries; this is a collection of lyrics, matchless in form and more concentrated in their apophthegmatic expression than those of earlier days; it was suggested by a German translation of the Persian poet, Hafiz. And, again, an actual passion — that for Marianne von Willemer, whom he met in 1814 and 181j — had rekindled in him the lyric fire Meanwhile the years were thinning the ranks of Weimar society: Wieland, the last of Goethe's greater literary contemporaries, died in 1813, his wife in 1816, Charlotte von Stein in 1827 and Duke Karl August in 1828. Goethe's retirement from the direction of the theatre in 1817 meant for him a break with the literary life of the day. In 1822 a passion for a young girl, Ulrike von Levetzow, whom he met at Marienbad, inspired the fine *Trilogie der Leidenschaft,* and between 1821 and 1829 appeared the long-expected and long-promised continuation of *Wilhelm Meister, Wilhelm Meisters Wanderjahre.* The latter work, however, was a disappointment: perhaps it could not have been otherwise. Goethe had lost the thread of his romance, and it was difficult for him to find it again. Problems of the relation of the individual to society and industrial questions were to have formed the theme of the *Wanderjahre;* but after the French Revolution these problems had entered on a new phase and demanded a method of treatment which it was not easy for the old poet to acquire. Thus his intentions were .only partially carried out, and the volumes were filled out by irrelevant stories, written at widely different periods.

But the crowning achievement of Goethe's literary life was the completion of *Faust.* The poem had accompanied him since early manhood and was the repository for the fullest "confession" of his life; it is the poetic epitome of his experience. The second part is far removed from the impressive realism of the *Urfaust* or even the classicism of the first part. It is a phantasmagory; a drama the actors in which are not creatures of flesh and blood, but shadows in an unreal world of allegory. The lover of Gretchen had, as far as poetic continuity is concerned, disappeared with the close of the first part. In the second part it is virtually a new Faust who, accompanied by a new Mephistopheles, goes out into a world that is not ours. Yet behind the elusive allegories of an imperial court with its financial difficulties, behind the classical *Walpurgisnacht,* the fantastic creation of the Homunculus, the noble Helena episode and the impressive mystery-scene of the close, where the centenarian Faust finally triumphs over the powers of evil, there lies a philosophy of life, a ripe wisdom born of experience, such as no other modern European poet has given us. *Faust* has been well called the "divine comedy" of 18th-century humanism.

The second part of *Faust* forms a worthy close to the life of Germany's greatest man of letters, who died in Weimar on March 22, 1832. His was the last of those universal minds which have been able to compass all domains of human activity and knowledge; for he stood on the brink of an era of rapidly expanding knowledge which has made forever impossible the universality of interest and sympathy which distinguished him. As a poet, his fame has undergone many vicissitudes since his death, ranging from the indifference of the "Young German" school to the enthusiastic appreciation of the closing decades of the 19th century — an enthusiasm to which we owe the Weimar *Goethe-Gesellschaft* (founded in 1885) and a vast literature dealing with the poet's life and work. That Goethe is Germany's greatest poet and the master of her classical literature has never been seriously questioned. The intrinsic value of his poetic work, regarded apart from his personality. may be smaller in proportion to its

bulk than is the case with some lesser German poets and with the great poets of other literatures. But Goethe was a new type of literary man; a poet whose supreme greatness lay in his subjectivity. Only a small fraction of his poetical work sprang from what might be called a purely artistic and objective impulse; by far the larger — and the better — part is the immediate precipitate of his thought, emotions, and experiences.

It is as a lyric poet that Goethe's supremacy is least likely to be challenged; he has given his nation, whose highest literary expression has in all ages been essentially lyric, its greatest songs. No other German poet has succeeded in attuning feeling, sentiment and thought so perfectly to the music of words as he; none has expressed so fully that subtle spirituality in which the strength of German lyrism lies. Goethe's dramas, on the other hand, have not, in the eyes of his nation, succeeded in holding their own beside Schiller's; but the reason is rather because Goethe refused to be bound by the conventions of the theatre, than because he was deficient in the cunning of the dramatist. For, as a creator and interpreter of human character, Goethe is without a rival among modern poets, and there is not one of his plays that does not contain scenes and characters which bear indisputable testimony to this mastery. *Faust* is Germany's most national drama, and it remains perhaps for the theatre of the future to prove itself capable of popularizing psychological masterpieces like *Tasso* and *Iphigenie*. As a novelist, Goethe has suffered most by the lapse of time. The *Sorrows of Werther* no longer maintains its hold upon us, and even *Wilhelm Meister* and *Die Wahlverwandtschaften* require more understanding for the conditions under which they were written than do *Faust* or *Egmont*. Goethe could fill his prose with rich wisdom, but he was the perfect artist only in verse.

Less attention is nowadays paid to Goethe's work in other fields, work which he himself in some cases prized more highly than his poetry. It is only as an illustration of his many-sidedness and his manifold activity that we now turn to his achievement as a statesman, as a practical political economist, as a theatre-director. His art-criticism is symptomatic of a phase of European taste to which the growing individualism of Romanticism was repugnant. His scientific studies and discoveries now possess only an historical interest. We marvel at the obstinacy with which he, with inadequate mathematical knowledge, opposed the Newtonian theory of light and colour; and at his championship of "Neptunism," the theory of aqueous origin, as opposed to "Vulcanism," that of igneous origin of the earth's crust. Of real importance was, on the other hand, his foreshadowing of the Darwinian theory in his works on the metamorphosis of plants and on biological morphology. Indeed, the deduction to be drawn from Goethe's contributions to botany and anatomy is that he, as few of his contemporaries, possessed that type of scientific mind which, in the 19th century, has made for progress; he was Darwin's predecessor by virtue of his enunciation of what has now become one of the commonplaces of natural science — organic evolution. Modern, too, was the outlook of the aging poet on the changing social conditions of the age and on its new political ideals; unexpectedly sympathetic his attitude towards modern industry, which steam was just beginning to establish on a new basis. The Europe of his later years was very different from that of the enlightened autocracies of the 18th century, in which he had spent his best years; yet Goethe was at home in it too.

From the philosophic movement, in which Schiller and the Romanticists were deeply involved, Goethe stood apart. Comparatively early in life he had found in Spinoza the philosopher who responded to his needs; and for the subtle dialectic of later thinkers he had neither liking nor understanding. As a convinced realist he took his standpoint on nature and experience, and could afford to look on with indifferenceat the battles of the metaphysicians. Of Kant's work, however, he was not ignorant, and under Schiller's stimulus he learned from him; but of the younger thinkers, only Schelling, whose mystic nature-philosophy was akin to Spinoza's thought, touched a sympathetic chord in his nature. As a moralist and a guide to the conduct of life — an aspect of Goethe's work which Carlyle, viewing him through the coloured glasses of Fichtean idealism, emphasized and interpreted not always justly — Goethe was a powerful force on German life in years of intellectual and political depression. It is difficult even still to get beyond the maxims of practical wisdom he scattered so liberally through his works and the lessons to be learned from *Meister* and *Faust;* the calm optimism which never deserted Goethe, and was so completely justified by the tenor of his life, is still an uplifting element of his thought. If the philosophy of Spinoza provided the poet with a religion which made individual creeds and dogmas seem unnecessary, Leibnitz's doctrine of predestinism supplied the foundations for his faith in the divine purpose of human life.

Goethe's many-sided activity is a tribute to the greatness of his mind and personality; we may see in him merely the embodiment of his particular age, or we may regard him as a poet "for all time"; but with one opinion all who have felt the power of Goethe's genius are in agreement — the opinion which was condensed in Napoleon's often cited words, uttered after the meeting at Erfurt: *Voilà un homme!* Of all modern men of genius, Goethe is the most universal. It is the full, rich humanity of his personality — not the art behind which the artist disappears, or the definite pronouncements of the thinker or the teacher — that constitutes his claim to a place in the front rank of men of letters. His life was his greatest work.

BIBLIOGRAPHY.—(*a*) *Collected Works, Diaries, Correspondence,* Conversations. The following editions of Goethe's writings appeared in the poet's lifetime: *Schriften* (Leipzig, 1787–90); *Neue Schriften* (1792–1800); *Werke* (13 vols., Stuttgart, 1806–10); *Werke* (26 vols., Stuttgart, 1815–22); *Werke* (Vollstandige Ausgabe letzter Hand) (40 vols., Stuttgart, 1827–30). Goethe's *Nachgelassene Werke* appeared as a continuation of this edition in 20 volumes (Stuttgart. 1832–42). These were followed by several editions of Goethe's *Sämtliche Werke,* published by Cotta of Stuttgart. The first critical edition with notes was published by Hempel, Berlin, 1868–79. The standard edition is that published at Weimar between 1887 and 1919; it is divided into four sections: I. W *ke;* II. *Naturwissenschaftliche Werke;* III. *Tagebücher;* IV. *Briefe.* Of other recent editions the most noteworthy are: *Samtliche Werke* (Jubilaums-Ausgabe), ed. *E.* von der Hellen (Stuttgart, 1902–7); *Werke,* ed. *K.* Heinemann (Leipzig, 1900 ff.), the cheap edition of the *Samtliche Werke,* ed. *L.* Geiger (Leipzig, 1901), and the "Propylaen-Ausgabe" (Munich, 1909 ff.). There are also innumerable editions of selected works; reference need only be made here to the useful collection of the early writings and letters by M. Bernays, *Der junge Goethe* (Leipzig, 1875; new ed., 1909–11). A French translation of Goethe's *Œuvres complètes,* by J. Porchat, appeared at Paris in 1860–63. There is, as yet, no uniform English edition, but Goethe's chief works have all been frequently translated and most of them will be found in Bohn's Standard Library.

The definitive edition of Goethe's diaries and letters is that forming Sections III. and IV. of the Weimar edition. Collections of selected letters based on the Weimar edition have been published by E. von der Hellen (1901–13), and by P. Stein (1901–24). Of the many separate collections of Goethe's correspondence mention may be made of the *Briefwechsel zwischen Schiller und Goethe,* edited by Goethe himself (1828–29), by H. G. Graf and A. Leitzmann (1923); Eng. trans. (1877–79); *Briefwechsel zwischen Goethe und Zelter* (1833–34); Eng. trans. (1887); *Briefwechsel mit Bettina von Arnim,* ed. R. Steig (1922); *Goethes Briefe an Frau von Stein,* ed. *A.* Scholl (1848–51); ed. J. Wahle (1899–1900); *Briefwechsel zwischen Goethe und K. F. von Reinhard* (1850); *Briefwechsel zwischen Goethe und Knebel* (1851); *Briefwechsel zwischen Goethe und Staafsrat Schultz* (1853); *Briefwechsel des Herzogs Karl August mit Goethe* (1863; ed. *H.* Wahl, 1915–18); *Briefwechsel zwischen Goethe und Kaspar Graf von Sternberg* (1866); *Briefwechsel mit Chrzstiane,* ed. H. *G.* Graf (1923); *Briefwechsel mit H. Meyer,* ed. *M.* Hecker (1920); *Goethes naturwissenschaftliche Korrespondenz,* and *Goethes Briefwechsel mit den Gebriidern von Humboldt* (ed. *F. T.* Bratranek (1874–76); *Goethes und Carlyles Briefwechsel* (1887), also in English; *Goethe und die Romantik,* ed. *C.* Schiiddekopf and O. Walzel (1898–99); *Goethe und Lavater,* ed. H. Funck (1901); *Goethe und Österreich,* ed. A. Sauer (1902–4). Besides the correspondence with Schiller and Zelter, Bohn's library contains a translation of *Early and Miscellaneous Letters,* by E. Bell (1884). The chief collections of Goethe's conversations are: J. P. Eckermann, *Gesprache mit Goethe* (1836; vol. iii., also containing conversations with Soret, 1848; ed. H. H. Houben, 1926; Eng. trans., 1850). *Cf.* J. Petersen, *Die Entstehung der Eckermannschen Gespräche* (1926). The complete conversations with Soret have been published in German translation by C. A. H. Burkhardt (1905); *Goethes Unterhaltungen mit dem Kanzler F. von Müller* (1870). Goethe's collected *Gesprache* were published by W. von Biedermann (1889–96); new ed. 1909–11.

(*b*) *Biography.*—*Goethe's* autobiography, *Aus meinem Leben: Dichtung und Wahrheit,* appeared in three parts between 1811 and 1814 part iv. in 1833 (Eng. trans., 1846); it is supplemented by other

biographical writings. as the *Italienische Reise. Tag- und Jahreshefte,* etc. The following are the more important biographies: H. Döring, *Goetlzes Leben* (1828, etc.); H. Viehoff, *Goethes Leben* (1847–54; 5th ed. 1887); J. W. Schafer, *Goethes Leben* (1851; 3rd ed., 1877); G. H. Lewes, *The Life and Works of Goethe* (1855, etc.; Ger. trans., J. Frese; a shorter biography was published by Lewes in 1873 under the title *The Story of Goethe's Life)*; W. Mézières, *W. Jahrhunderts* (1854); *F.* Kreyssig, *Vorlesungen uber Goethes Faust* (1866); the editions of *Faust* by G. von Loeper (1879; new ed., 1900); K. J. Schroer (1881; 5th ed., 1915–17); G. Witkowski (1909; 3rd ed., 1924), and R. Petsch (1925); K. Fischer, *Goethes Faust* (1878; 5th ed., 1904): O. Pniower, *Goethes Faust, Zeugnisse und Excurse zu seiner Entstehungsgeschichte* (1899); *J.* Minor, *Goethes Faust, Entstehungsgeschichte und Erklarung* (1901); E. Traumann, *Goethes Faust* (1913–14).

(d) Bibliographical Works, Goethe-Societies &c.—S. Hirzel, *Verzeichnis einer Goethe-Bibliothek* (1884), to which G. von Loeper and W. von Biederrnann have supplied supplements. Goedeke's *Grundriss zur Geschichte der deutschen Dichtung* (vol. iv., 3rd ed., 1910–13); and the bibliographies in the *Goethe-Jahrbuch* (1880–1913). Also K. Hoyer, *Zur Einführung in die Goethe-Literatur* (1904). On Goethe in England *see* E. Oswald, *Goethe in England and America* (1899; 2nd ed., 1909); J. M. Carré, *Goethe en Angleterre* (1921); W. Heinemann, *A Bibliographical List of the English Translations and Annotated Editions of Goethe's Faust* (1886).

A Goethe-Gesellschaft was founded at Weimar in 1885; its publications include the annual *Goethe-Jahrbuch* (1880–1913); now *Jahrbuch der Goethe-Gesellschaft* (1914 ff.), and a series of *Goethe-Schriften. A Goethe-Verein* has existed in Vienna since 1887, and an English Goethe society since 1886 *(Publications,* 1880–1910; new series 1924 ff.). A complete list of the literature on Goethe up to 1913 is given in Goedeke's: *Grundriss der deutschen Literaturgeschichte,* 3rd ed. vol. 4. (J. G. R.)

GOETHITE, a mineral crystallizing in the orthorhombic system and isomorphous with diaspore and manganite (*q.v.*). It consists of an iron hydroxide $Fe_2O_3.H_2O$; first noticed in 1780 and named after the poet Goethe. Crystals are prismatic, acicular or scaly in habit; they have a perfect cleavage in one direction. Reniform and stalactitic masses with a radiated fibrous structure also occur. The colour varies from yellowish or reddish to blackish-brown, and by transmitted light it is often blood-red; the streak is brownish-yellow; hardness, 5; specific gravity, 4.3. The best crystals are the brilliant, blackish-brown prisms with terminal pyramidal planes from the Restormel iron mines at Lostwithiel. and the Botallack mine at St. Just, Cornwall. A variety occurring as thin red scales at Siegen, Westphalia, is known as Rubinglimmer or pyrrhosiderite; lepidocrocite is a scaly-fibrous variety from the same locality.

GOG, a hostile Power that is to manifest itself in the world immediately before the end of things (Ezek. xxxviii. sq., Rev. xx.). Magog who is joined with Gog in the latter passage is the name of Gog's origin in the former. In Gen. x. 2 (and Ezek. xxxviii. 2) Magog appears to represent a locality in Armenia.

The legends attached to the gigantic effigies (dating from 1708 and replacing those destroyed in the Great Fire) of Gog and Magog in Guildhall, London, are of unknown date. According to the *Recuyell des histoires de Troye,* Gog and Magog were the survivors of a race of giants descended from the thirty-three wicked daughters of Diocletian; after their brethren had been slain by Brute and his companions, Gog and Magog were brought to London (Troy-novant) and compelled to officiate as porters at the gate of the royal palace. Effigies similar to the present existed in London as early as the time of Henry V.

GOGH, VINCENT VAN (1852–1890), Dutch painter of the Post-Impressionist movement. He was born on March 3, 1853, at Groot-Zundert, in Brabant, Holland, where his father was Calvinist pastor. At the age of 16 he worked in the firm of his uncle, a picture dealer at The Hague, and was later employed with Goupil and company in Paris and in London In 1876 he was art teacher in Ramsgate, and then determined to follow the religious vocation. In 1877 he returned to Holland to study theology at Amsterdam. Imbued with ideals of Christian communism, and seeking practical work, he went to live among the miners at Wasmes, in the Borinage. There he spent his free time in drawing. In 1880 he went to Brussels to take up the study of

painting, and then spent some years in his father's home in the village of Neunen, painting the simple life of the peasants, the moorland and still life. His chief work of this period is "The Potato Eaters" (1885), a group of labourers sitting round a table, under a lamp, painted in heavy brown tones and displaying the hardship and ugliness of proletarian life. Six lithographs of like subjects, of which only a few impressions are extant, were also executed at this time. He took some lessons from Mauve, who was his cousin. In 1885 he studied at the Academy at Antwerp, and a year later joined his brother, Théo, in Paris. At the studio of Cormon he met Emile Bernard, Anquetin and Toulouse-Lautrec, and joined in their revolt against slavish copying of nature. Through his brother, who was employed at Goupil, he was introduced to the Impressionist and Neo-Impressionist school, and he was persuaded to remove the browns and umbers from his palette and to paint with the clear, bright colours, and in the luminous divisionist technique of Seurat. He studied Japanese prints, and the works of Delacroix and Monticelli. "The Restaurant on Montmartre" (Luxembourg museum) was the first canvas painted in this luminous key. The portraits of the colour man, Tanguy (1887) (example at the Rodin museum), show his more developed style. But only few works of his Parisian period have survived. and of the mural decoration of the café Tambourin only fragments remain. After two years in Paris he longed to go south, and in Feb. 1888, with the financial aid of his brother, he settled at Arles, in Provence. There he painted the blossoming fruit trees, the fields bathed in sunlight, the cypresses and sunflowers, his simple room, his rustic chair, and his own portrait with Been and restless blue eyes and abnormal skull. His models were the postman and his family, the innkeeper's wife ("L'Arlésienne") and the "Berceuse." Colour seemed to him vital; he revelled in it, using it thick and pure, in long and nervous brush strokes. "I am thinking of decorating my studio with half-a-dozen sunflowers," he wrote to his brother, "it will be a decorative effect in which the glaring or broken tones of chromes will stand out vividly against a background of variegated blue, ranging from the most delicate emerald green to royal blue, enclosed in narrow strips of golden yellow. It will produce the sort of effect that Gothic church windows do." He tried to render the very texture of things. His technique was not scientific and calculated, like that of Seurat, but almost barbaric in its display of intense emotion. In October, Gauguin, whom he had befriended in Paris, arrived in response to his pressing invitation. The two worked for a while together; but soon Van Gogh's nerves gave way, undermined by privation and strain and by undue exposure to the sun. One day he threatened his friend with a knife, and then, repentant, cut off his own ear. He was brought to the hospital, and though dismissed after a fortnight, had to be interned again in Feb. 1859. The remainder of his life was passed under the shadow of insanity, though all the time he continued to paint. He was moved to St. Remy, and in May 1890 to Auvers-sur-Oise, under the care of Dr. Gachet, whose portrait he painted (Frankfurt museum). His last work was the "Mairie au 14 juillet," a picture full of sunlight. He shot himself, and died on July 29, 1890.

During his lifetime the only one who believed in his art and who helped him was his brother. Van Gogh's letters to him, dated from 1872 to his death, are moving documents describing his aims and his work.

See Maurice Denis, *De Gauguin et de van Goglz au Classicisme* (Occident XV., 1909); T. Duret, *Vincent v. Gogh* (1916); J. Meier-Graefe, *V. v. Goglz* (Eng. trans., 1928). Van Gogh's letters were first published in the *Mercure de France* (1893–95). Since then they have appeared in English translation. *Letters of a Post-Impressionist* (1912); *The Letters of V. v. Gogh to his Brother* (1872–86) *with a Memoir by his Sister-in-Law, J. v. Gogh-Bonger* (1927); *Letters of V. v Gogh to his Brother* (1929); I. Stone, *Lust for Life (fiction).* (I. A. R.)

GOGOL, NIKOLAI VASILIEVICH (1809–1852), Russian novelist and dramatist, was born at Sorochintsky, province of Poltava, on March 31, 1809, of a family of Ukrainian Cossack gentry. Educated at the Niezhin gymnasium, he there started a manuscript periodical, *The Star,* and wrote several pieces including a tragedy, *The Brigands.* In 1820 he went to St. Petersburg, where he tried the stage but failed. In 1821 he obtained a clerkship in the department of appanages, but soon resigned it. In 1829 he published anonymously a poem called *Italy,* and, under the pseudonym of V. Alof, an idyll, *Han Küchelgarten,* which was so ridiculed that Gogol bought up all the copies he could and burnt them. He was terribly disheartened, and thought of emigrating to America. Indeed, he got as far as Lübeck, but then returned to St. Petersburg, and entered the civil service. He made his way in literary circles, and was well received by Pushkin, whom he met in 1831.

In 1831 appeared *Evenings* in *a Farm near Dikanka: by Rudy Panko,* a volume of stories of Ukrainian life, which mas enthusiastically received. Gogol then planned a history of Little-Russia of the middle ages, to be completed in eight or nine volumes. This remained a plan only, but served to win for him a chair of history in the university of St. Petersburg. His lectures were a failure, and he resigned in 1835. Meanwhile he had published his *Arabesques,* a collection of essays and stories; his *Taras Bzrlba,* the best known of the *Cossack Tales* translated into English by George Tolstoi (1860) and by J. Cournos (Everyman Edition, 1906), and a number of other short stories, including *Old World Gentlefolks, a* sketch of the tranquil life led in a quiet country house, also *The Cloak,* a description of the petty miseries endured by an ill-paid clerk in a government office, the great object of whose life is to secure the "cloak" from which his story takes its name. On April 19, 1836, his famous comedy, the *Revizor* (Eng. trans. by C. Garnett, *The Government Inspector,* 1926,) was produced. The *Revizor* is the greatest of Russian comedies; it is a brilliant satire on bureaucracy, which was received with enthusiasm by the intelligentsia and with horror by the official classes. But it is an error to look on its historical and political significance as its principal claim to rank among the great European comedies. Even when played in another language (and Gogol more than any other Russian author loses in translation), it is recognised as pure and universal comedy. The plot is very simple. A traveller who arrives with an empty purse at a provincial town is taken for an inspector whose arrival is awaited with fear, and he receives all the attentions and bribes which are meant to propitiate the dreaded investigator of abuses.

After the production of the *Revisor,* Gogol went abroad, and for twelve years (1836–48) lived mainly in Rome, while paying occasional short visits to Russia. Rome left a deep impression on his mind, but during his residence there he was occupied with purely Russian subjects. There he wrote the classic novel, *Mertvuiya Dushi,* or "Dead Souls," the first part of which appeared in 1842. The hero of the story is an adventurer who goes about Russia making fictitious purchases of "dead souls," *i.e.,* serfs who have died since the last census, with the object of pledging his imaginary property to the government. His adventures provide the occasion for a series of unforgettable pictures of Russian provincial life, and of types of Russian society. These amazingly vivid pictures are a fundamental part of the experience of all Russian students of their own language. Gogol had an individual vision which presented his types with a force and truth of the kind attained by Dickens at his best. No one can fully appreciate Gogol's merits as a humorist who is not intimate with the language in which he wrote, but there are good English versions by C. Garnett (1922) and by D. J. Hogarth (Everyman Edition, 1906). To the period of his residence in Rome belong also the recasting of *Taras Bulba* and his second comedy, *Marriage.*

Dead Souls was published in 1842; Gogol lived ten years longer. He was still a young man, only 43, and it was reasonable to expect that the creator of the *Revizor* and of *Dead Souls* would produce other great imaginative works. He was a great artist and though both the comedy and the novel were "events" in the history of Russia, they are what they are because of the imaginative genius of the author. Gogol the man found himself the hero of those who would regenerate Russia, and he seems at this point to have stifled his natural genius because of his conviction that he had a mission. However that may be, he began to work on the second part of his epic of *Dead Souls,* with the idea of showing the redemption of Chichikov and his kind. He failed, and destroyed the draft, but he wrote what he conceived to be his message to Russia in his *Selected Passages from a Cor-*

respondence with Friends (1847). It called forth some bitter replies, especially from Belinsky, who accused him of "falsifying Christianity for the profit of those in power" *(see* D. Mirsky, *Hist.* of *Russ. Lit.)*. Gogol felt the rebuff deeply, and sought compensation in a religious experience that was denied to him. In vain he went on pilgrimage to the Holy Land (1848). On his return he fell under the influence of a fanatic, Father Matthew Konstantinovsky, who persuaded him that his imaginative work was sinful. He fell into melancholy and destroyed some of his mss. He died on Feb. 21, 1852.

The works of Gogol, translated by C. Garnett are available. See *Materials for the Biography* of *Gogol* (in Russian) *(1897)* by Shenrok: "Illness and Death of Gogol," by N. Bazhenov, *Russkaya Muisl* (January 1902); J. Lavrin, *Gogol* (1926); M. Theiss, *Nikolaus* W. *Gogol und seine Bühnenwerke* (1922).

GOGRA, a river of northern India. It rises in Tibet near Lake Manasarowar, not far from the sources of the Brahmaputra and the Sutlej, passes through Nepal as the Kauriala and becomes the most important waterway in the United Provinces. It joins the Ganges at Chapra after a course of 600 mi. Its tributary, the Rapti, is also commercially important. The Gogra is also called the Sarju, and in its lower course the Deoha.

GOHIER, LOUIS JEROME (1746–1830), French politician, son of a notary, was born at Semblançay (Indre-et-Loire) on Feb. 27, 1746. He practised law at Rennes. He was minister of justice (March 1793–April 1794), and in June 1799 succeeded Treilhard in the Directory. His wife was intimate with Josephine Bonaparte, and when Bonaparte returned from Egypt in Oct. 1799 he tried to gain over Gohier, who was then president of the Directory. Refusing to resign after the *coup d'état,* Gohier was detained for a time and on his release retired to Eaubonne. In 1802 Napoleon made him consul-general at Amsterdam. He died at Eaubonne on May 29, 1830.

His *Mémoires d'un vétéran irréprochable de la Révolution* was published in 1824, his report on the papers of the civil list preparatory to the trial of Louis XVI is printed in *Le Procès de Louis XVI.* (Paris, an III) and elsewhere.

GÖHRDE, a forest of Germany, in the Prussian province of Hanover, immediately W. of the Elbe, between Wittenberg and Luneburg. It has an area of about 8 j sq.mi. and is famous for its oaks, beeches and game preserves. It is memorable for the victory gained there on Sept, 16, 1813, by the allies, under Wallmoden, over the French forces commanded by Pecheur, and on account of the constitution of Gohrde promulgated there in 1719.

GOIANA or GOYANNA, a city of Brazil in the northeast angle of the state of Pernambuco, about 65 mi. N. of the city of Recife. The population (including municipal district) in 1940 was 41,309. It is built on a fertile plain between the rivers Tracunhaem and Capibaribe-mirim, near their junction to form the Goiana river, and is 15 mi. from the coast. It is surrounded by, and is the commercial centre for, one of the richest agricultural districts of the state. Goiana is one of the oldest towns of the state, and was occupied by the Dutch from 1636 to 1654. It has several old-style churches.

GOIÂNIA, capital of the state of Goiaz in Brazil, is about 120 mi. S.E. of Goiaz. Pop. of the *município* (1940) 48,884; that of the city about 30,000. Goiaz, the old capital, is a mining town on a small tributary of the Rio Araguaia. Gold was discovered there in 1682 by Bartholomeu Bueno, the first European explorer of this region, and the settlement founded by him was called Santana, which is still the name of the parish. The site of the town is a barren, rocky mountain valley, 1,900 ft. above sea level, in which the heat is most oppressive at times and the nights are unpleasantly cold. The state contains the area selected for the future federal capital on the plateau about 130 mi. N.E. of the city of Goibnia.

GOIAZ, inland state, Brazil, bounded by Maranhão on the N., by Mato Grosso and Pari on the W., Maranhão, Baia and Minas Gerais on the E., and by Minas Gerais and Mato Grosso on the south. Population (1940) 832,869, including half-civilized Indians and half-breeds. Area 2 j5,266 sq.mi. The state lies wholly within the great Brazilian plateau region, but its surface is much broken toward the N. by the deeply eroded valleys of the Araguaia and Upper Tocantins rivers and their tributaries. The general slope of the plateau is toward the N., and the drainage of the state is chiefly through the above-named rivers. A considerable part of southern Goiaz, however, slopes southward and the drainage is through numerous small streams flowing into the Paranaiba, a large tributary of the Paraná. The general elevation of the plateau is estimated to be about 2,700 ft., and the highest elevation to be the Serra dos Pireneus (5,250 ft). Crossing the state N.N.E. to S.S.W. there is a well-defined chain of rather low mountains. The surface of the plateau is generally open campo and scrubby arboreal growth called *caatingas,* but the streams are generally bordered with forest. Toward the N. the forest becomes denser and of the character of the Amazon valley. The climate of the plateau is essentially subtropical. The valley regions are tropical, and malarial fevers are common.

The cultivation of the soil is limited to local needs, except in the production of tobacco, which is exported to neighbouring states. The open campos afford good pasturage. and livestock is largely exported. Gold-mining has been carried on in a primitive manner for more than two centuries, but the output has not been large. Diamonds have been found but have been mined only to a limited extent. There is a considerable export of quartz crystal, commercially known as "Brazilian pebbles," used in optical work and high-frequency radio transmission. Although the northern and southern extremities of Goiaz lie within two great river systems — the Tocantins and Paraná — the upper courses of which are navigable, both of them are obstructed by falls. A railroad from São Paulo to Anápolis and a few hundred miles of improved roads provide the chief outlets for the state.

GOIDELIC DIALECTS: *see* CELTIC LANGUAGES.

GOITRE. Goitre or "Derbyshire neck" is a term used for abnormal enlargements, usually chronic, of the thyroid gland in the front of the neck. The enlargement may be general and uniform (parenchymatous goitre), or may be localized to one part of the gland or to the isthmus connecting the two halves or lobes. Local enlargements are either innocent, which are common, or malignant, which are rare; the innocent growths are known as adenomas (adenomatous goitre) which, at first solid, may soften down and become liquid-forming cysts; these cystic goitres or bronchoceles contain yellow, glue-like material (colloid); from bleeding into, their interior may rapidly enlarge, otherwise they grow slowly, or may exist for many years without increasing in size or causing discomfort. They often arise in parenchymatous goitres. Malignant disease commonly starts in an adenoma and is generally a carcinoma which grows slowly but has a special tendency to produce secondary deposits (metastases) in bones. The other form of malignant disease, sarcoma, is much rarer, but runs a rapid course.

Simple Goitre. — This is usually endemic, *i.e.,* occurring in special regions, such as Derbyshire, the Thames valley, the Yorkshire dales, Hampshire and Sussex, in the neighbourhood of the Great Lakes in North America, in Switzerland, the Pyrenees and some mountainous parts of Asia, and is then due to some local condition, especially the water supply. In Kashmir Col. R. McCarrison correlated it with infection of the drinking water; "goitre springs" and "uells" are known, and fish and animals may also be affected in endemic areas. The observation that boiling the water prevents the incidence of goitre and the occurrence of epidemics of acute goitre in schools is compatible with this view. But that this is the only cause is uncertain, for simple goitre can be prevented by the administration of iodine and the water in goitrous regions is hard and poor in iodine. Goitre may also occur sporadically in areas where it is rare but is seldom congenital except in endemic regions. It appears most commonly about puberty and is about seven times commoner in females than in males. Large goitres may give rise mechanically to difficulty of breathing by compressing the windpipe.

Toxic Goitre. — The adenomatous enlargement may remain latent without any symptoms for years, and then become active and produce an internal secretion which excites toxic symptoms resembling, but not exactly the same as, those of exophthalmic goitre, protrusion of the eyes being absent.

The preventive treatment of simple goitre consists in boiling the water, removal from an endemic district and the administration of iodine, or iodide of potassium, in small doses. Eut in cases of adenomatous goitre iodine is said to lead to a toxic goitre. Exposure to X-rays may reduce the size of the goitre, but by producing adhesions renders surgical removal, should it become necessary, less easy. Surgical removal is necessary for pressure symptoms, toxic manifestations, and may be desirable for cosmetic considerations.

Exophthalmic Goitre.—(Synonyms, Graves' or Basedow's disease.) This has very striking symptoms—an enlarged thyroid gland, protrusion of the eyes, rapid action of the heart and palpitation, tremor, extreme nervousness, wasting, flushing, sweating and mental irritability. It is indeed the converse of myxoedema. The skin may be pigmented, and in bad cases diarrhoea, vomiting and indigestion may be troublesome. Ninety per cent, if not more, of the patients are women. The basal metabolism (the minimal production of heat) is raised and this may be connected with the wasting and tolerance to cold. There is a structural change in the thyroid, probably due to poisons from the alimentary canal, but it may come on after mental shock or emotion. As a result of the change in the thyroid its internal secretion is altered (dysthyroidism) and causes the nervous symptoms. The disease is usually chronic; more than half the patients recover and others improve but do not become absolutely normal. Acute infections, such as influenza, are likely to prove fatal. In a few instances the morbid activity of the thyroid gland is followed by atrophy and myxoedema.

Treatment.—The patients should live a simple life in fresh, country air, avoid much protein (meaty) food, stuffy rooms and excitement. Bromides, quinine hydrobromate, belladonna, digitalis and X-rays or radium to the gland should be employed. If these measures fail, and the case is severe, operative removal of part of the gland or ligature of some of its arteries should be undertaken; the operative mortality of excision of half the gland is now about 5%. Iodine in the form of Lugol's solution improves the patient's condition so that operation can be more safely undertaken. (H. R.)

GOKAK, a town of British India, in the Belgaum district of Bombay, 8 mi. from a station on the Madras and Southern Mahratta railway. Pop. (1931) 11,866. About 4 mi. N.W. at the Gokak Falls, the Ghatprabha rushes over a precipice 170 ft. high. Close by, the water has been impounded for a large irrigation canal and as motive power for a big cotton-mill.

GOKCHA (Gok-Chai; Armen. *Sevanga;* anc. *Haosravagha*), a lake in Armenia 40° 20′ N. and 45° 35′ E., altitude 6,345 ft., triangular in shape, measures 45 mi. N.W.–S.E., max. width 25 mi., max. depth 67 fathoms, area 540 sq.mi. It is surrounded by barren mountains of volcanic origin 12,000 ft. high. Its outflow is the Zanga, a tributary of the Aras *(Araxes)*; it never freezes, and its level undergoes periodical oscillations. It contains four species of *Salmonidae*, and two of *Cyprinidae,* peculiar to the drainage area of this lake. A lava island in it is crowned by an Armenian monastery.

GOKHALE, GOPAL KRISHNA (1866–1915), Indian politician, was born at Kolhāpur. Graduating at the Elphinstone college, Bombay, in 1884, he became professor of history and political economy at the Fergusson college, Poona. He remained on the staff, finally as principal, until 1902.

He was associated with the Indian National congress from the beginning and was for some years its joint secretary. In 1902 he became a member of the Bombay legislature and was then elected to represent the nonofficial members thereof in the viceregal legislature. In 1905, although opposed by the extremist section of congress, he became president of that body. In the same year he founded at Poona his Servants of India society, whose members take vows of poverty and lifelong service to their country in a religious spirit. In the enlarged viceregal legislature set up in 1910, Gokhale was the commanding Indian figure. His quickness in debate, the attractive literary style of his speeches, his studied moderation, and the care which he took to master his subjects made him a most effective critic of the government, though he disclaimed the title of the leader of an opposition party.

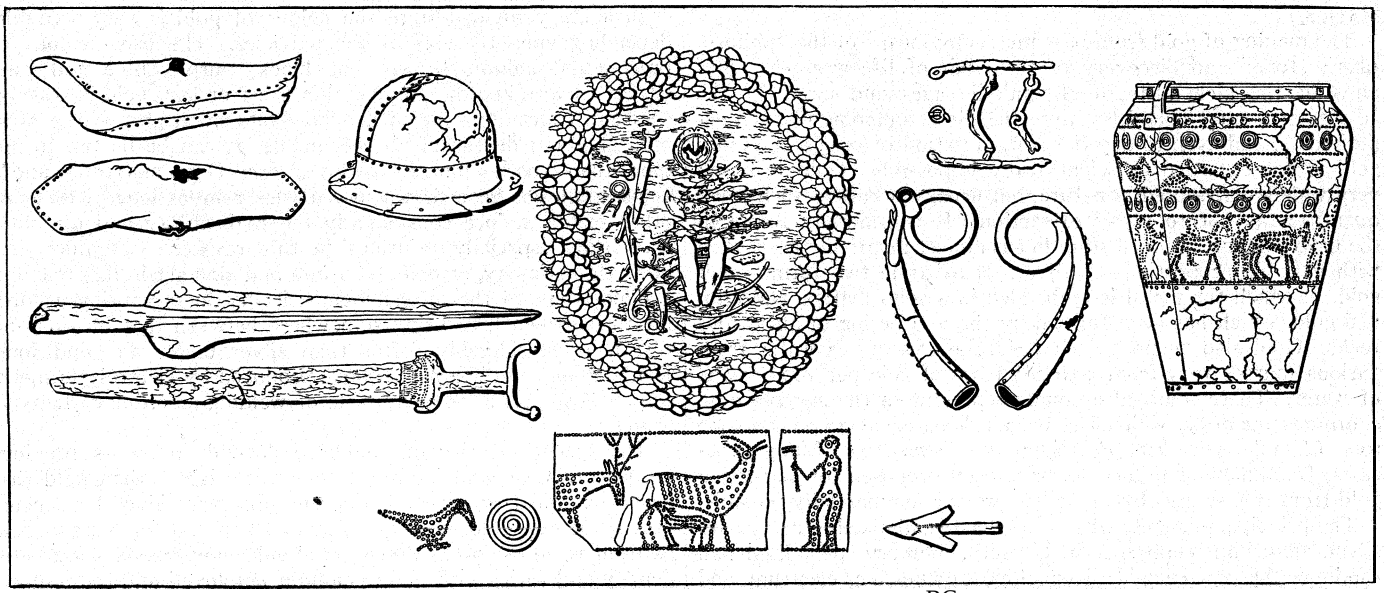
He specialized as a critic of Indian official finance and was particularly brilliant in his handling of the annual budgets. He promoted measures for compulsory education on a basis of local option but did not survive to see this principle introduced from 1918 onwards in all the large provinces. His last public duty was to serve as a member of the Indian Public Services commission 1 – 1 His death at Poona on Feb. 19, 1915, was a severe blow to the Constitutional party at a critical moment in India's political history. He was one of the last and greatest of the old school of congress politicians before the age of noncooperation.

See *Speeches of the Honourable Mr. G. K. Gokhale* (Madras 1908, 3rd ed., 1920); R. P. Parāñjpye, *Gopal Khrishna Gokhale* (1915).

GOLASECCA is a village situated on the river Ticino, a few miles below the point at which it issues from Lago Maggiore. Extensive cemeteries of the iron age have been found all over this district, and the name Golasecca has come to be applied indiscriminately to the whole series, occupying an area of nearly forty square kilometres. Some of them are situated on the left bank of the Ticino at Somma, Vergiate, Sesto Calende and Golasecca itself; others on the right bank at Castelletto Ticino and the Lazzaretto of Borgo Ticino. After the first quarter of the 19th century all these sites were despoiled by excavators, very often unauthorized, and the objects found in them were broken up or scattered over the world. The only collection of any size or importance is in the museum at the Sforza castle in Milan. There may be seen the contents of the Sesto Calende tomb illustrated in the accompanying drawing, as well as the collection formed by Castelfranco, the only archaeologist of the 20th century to make any comprehensive study of the region.

All the cemeteries of the Somma plateau were of the cremation rite. The tombs were very simple, each containing a single cinerary urn, often enclosed in the centre of a circle of rough stones. In several instances these circles were approached by a corridor of similar stones. The most perfect example of this kind is a circle 17 metres in diameter enclosing a smaller circle $4\frac{1}{2}$ metres in diameter approached by a corridor 30 metres long. One burial was found within the small circle and three more within the outer circle. Castelfranco observed traces of about 50 stone enclosures and it is probable that there had been many more. Castelfranco, whose explorations were fairly extensive and systematic, states that he invariably found a tomb in the centre of every circle that he explored, and that the tombs found within the circles contained precisely the same pottery as those which stood isolated from any enclosure. The construction of the graves, moreover, was precisely the same whether enclosed within a circle or not. There were four varieties, viz.: (1) plain round holes in which the ossuary was placed without any protection; (2) a heap of small stones surrounding the ossuary, which rested n a bed of similar stones and was sometimes covered with a rough slab; (3) rough slabs forming an oblong protection; (4) regular cists made of several slabs. These four methods of grave-making are precisely those employed by the other cremating peoples of Italy, which shows that the Golaseccans belonged to the same original family as the Comaeines, Atestines and Villanovans. The contents of the ossuaries were poor, consisting at most of one or two fibulae or weapons, or small objects of bronze, iron, amber or glass. Outside the cinerary urn itself were sometimes smaller jars and bowls.

It was principally upon a study of this pottery that Castelfranco based his division of the Golasecca antiquities into two periods. It expresses a theory which cannot be maintained. There are undoubtedly two schools of pottery-making represented at Golasecca, the one characterized by rough jars with incised ornamentation, the other by a finer ware with striped decoration obtained by double-burnishing. Examples of each class are shown in the accompanying drawing. But the two styles were sometimes found together in a single tomb and are certainly not mutually exclusive. Similarly the attempt to establish the existence of two periods by the evidence of fibulae has broken down under analysis, so that there is only one period in all the Golasecca cemeteries.



THE TOMB OF SESTO CALENDE. GOLASECCA. CIRCA 500 B.C.

Extensive cemeteries of the Iron Age have been found near Golasecca, a village on the river Ticino, near the point at which it issues from Lago Maggiore. The most important single discovery made was of the tomb of Sesto Calende, found in 1867 by a farmer when ploughing his field. The grave, in the top centre, and the principal objects contained in it are shown

As to the chronology there have been until lately great divergencies of opinion, caused chiefly by the different interpretations given to the warrior's tomb of Sesto Calende (see illustration above).

The tomb of the warrior Sesto Calende is the most important single discovery in the Golasecca area. It was found by a farmer in the process of ploughing his field in 1867, and was described by Biondelli in the same year. A sketch of the grave is shown in the plate, with the principal objects contained in it. Discussion as to the date has centred upon the situla made of plates of hammered bronze ornamented with rudely executed figures and scenes. These are not embossed or engraved as on the fine situlae of the Etruscans or Atestines but outlined by the very primitive process of pointillé, that is to say with small consecutive dots. The technique is so infantile and the execution so poor that it was natural to suppose the situla to be a very archaic work. Actually however, comparisons have shown that though childish art it is not primitive. For an attentive examination of the scenes brings out the fact that they are derivations with a good deal of travesty and misunderstanding from a well known Etruscan original. And from the date of this original it is possible to fix the date of the Sesto Calende situla, which can be very little if at all earlier than 500 B.C. The theory therefore that this is the grave of some very early Celtic warrior, with all its implications of a Gaulish invasion in the early iron age must be finally abandoned. Nor is there any reason for attributing the burial to a Celt even of the fifth century, for the weapons and accessories are not distinctively Gaulish; in fact the tomb though richer than the average is a fair representation of the usual Golasecca civilization.

The entire subject thus becomes much clearer. The Sesto Calende warrior and his famous situla find their natural place at the end of the Golasecca period. There are not two periods, as Castelfranco supposed, but only one, which ranges from 750 or 700 to 500 B.C. as the fibulae plainly show. The Golasecca period therefore is precisely conterminous with the Arnoaldi period of Bologna.

The amount of material available for a study of Golasecca, though lamentably meagre, shows that in the 7th and 6th centuries B.C. that branch of the cremating invaders which had made its way by stages from the Eastern Alps to a home on Lago Maggiore was backward in its civilization. The Golaseccans are far behind the Atestines and the Villanovans of the same period; they are distinctly poor relations, living in a remote province on the outskirts of the more progressive nations. They were not of much importance in the development of early Italy. There seems, however, to have been a trade system which extended all through the pre-Alpine region from the Ticino to Trieste, by which the products of the Adriatic filtered to this distant corner. And perhaps it is possible to detect in some of the metal work and in the individual character of the pottery the beginnings of a native local style which is independent although barbaric. The Golaseccans, however, form only a part of the early population of Lombardy with neighbours and kinsmen living round Varese and Como. In this region the records begin earlier and the material though scattered is more abundant (see COMACINES).

BIBLIOGRAPHY.—The Gaulish theory of Bertrand is given in his book written with S. Reinach in 1894 *Les Celtes dans les vallées du Po et du Danube*. D. Randall-MacIver, *The Iron Age in Italy* (1927), gives all the original references. The articles by de Mortillet and Castelfranco are now out of date, though the latter has a certain value as an original record. The old-fashioned dissertation of the Abbé Giani has been usefully summarized by Montelius ***La Civilisation primitive en Italie***, cols. 231–247, with plates, who has reproduced the best of his drawings, as well as those of Castelfranco and Biondelli. Déchelette *Manuel d'Archéologie*, vol. 11^2, pp. 730–743 is useful. Hoernes has a good discussion of the Situla in his *Urgeschichte der bildenden Kunst*.

GOLCONDA, a fortress and ruined city of India, in the Nizam's Dominions, 5 m. W. of Hyderabad city. Golconda was the capital of a large and powerful kingdom of the Deccan, ruled by the Kutb Shahi dynasty, founded in 1512 by a Turkoman adventurer on the downfall of the Bahmani dynasty, but the city mas subdued by Aurangzeb in 1687, and annexed to the Delhi empire. The fortress of Golconda, on a granite ridge, is extensive and strong, and contains many enclosures, but is commanded by the summits of the enormous and massive mausolea of the ancient kings about 600 yd. distant. These buildings form a vast group in an arid, rocky desert. Time and man have damaged them, but they have recently been repaired. Golconda has given its name in English literature to the diamonds which were found in other parts of the dominions of the Kutb Shahi dynasty, and cut at Golconda.

GOLD, an extremely heavy, very valuable, bright yellow metal, with a resplendent lustre (symbol Au, atomic number 79, atomic weight 197·2). On account of its brilliant appearance, unalterability and occurrence in the native condition, gold was almost certainly the first metal to attract the attention of man. It was known and highly valued by the earliest civilizations, Egyptian, Minoan, Assyrian and Etruscan, and from all these periods ornaments of great variety and beautiful and elaborate workmanship have survived, many of them being as perfect now as when they were first made several thousands of years ago. *(See* JEWELLERY, PLATE, EGYPT, CRETE, AEGEAN CIVILIZATION, NUMIS-

MATICS.)

The making of gold from base metals by means of the "philosopher's stone" and discovery of the elixir of life were the chief aims of the alchemists of the middle ages and many of the advances in early chemistry were the direct outcome of such experiments, and even to-day the transmutation of base metals into gold is not regarded as scientifically impossible. Gold is found very widely distributed in nature, but usually occurs in such small quantities as not to repay extraction. It is generally found in the native or uncombined state but is almost invariably associated with variable proportions of silver. It exists in two forms—reef gold, in which the metal is embedded in a solid matrix, and alluvial gold, which has been formed by the weathering of auriferous rocks. Gold also occurs in sea water; assays of sea water from various sources vary from 5 to 267 parts of gold per 100,000,000 of water. These minimal amounts represent in the aggregate an enormous quantity, which has been calculated at 10,000,000,000 tons (Mendeleyev, The Principles of Chemistry). Many processes, fraudulent or otherwise, have been proposed for extracting gold from this source, but none has proved commercially possible.

The principal elements with which gold is admixed in nature are silver, tellurium, copper, iron, bismuth, mercury, palladium and rhodium. The native gold-silver alloys are known as electrum, and have a colour range from pale yellow to pure white, depending on the amount of silver present.

Gold is found combined with tellurium in the minerals calaverite, $AuTe_2$, in which generally the gold is partly replaced by a certain amount of silver; sylvanite, $AuAgTe_4$; nagyagite, which contains lead, copper, antimony and sulphur; and other tellurium ores to which local names have frequently been given. Gold-mercury ores are known as gold amalgam. The other metals mentioned above are usually present in small amounts only and are not of great importance.

Gold is generally present to a small extent in iron pyrites, FeS_2, and much alluvial gold is regarded as having been produced by the weathering of this mineral; in addition, galena, PbS, which often contains silver, is generally found to include appreciable amounts of gold, so that the silver obtained from lead by cupellation is usually auriferous. The common occurrence of gold together with silver is well shown in the fact that, even at the present time, several of the smaller countries in North, Central, and South America possess a silver coinage which, being of the intrinsic silver value of their contents and not mere tokens, as in Great Britain, renders the extraction of gold from them an economical process. This condition existed in Germany prior to the establishment of the German Empire in 1871, when each small German State possessed its own silver currency. These coins were recalled by the Imperial Government and refined by a company specially formed for this purpose (Deutsche Gold und Silber Scheide Anstalt of Frankfurt a/M) with the result that after several years' work, gold to the value of about £3,000,000 was recovered.

PHYSICAL PROPERTIES

Gold in the massive state possesses a characteristic yellow colour which by multiple reflection becomes orange or even red This colour can be remarkably affected by alloying the gold with other metals. Small quantities of silver reduce the depth of yellow (vide *supra*), and when the amount of silver is increased to 30–40% a distinctly greenish tint results. Copper, on the other hand, deepens the yellow shade, and British standard gold coinage of 22-carat gold, or 91·67% Au to 8.33% Cu, is noticeably redder than the pure metal.

The effect of small quantities of the platinum metals on the colour of gold is very marked; thus, less than 25% platinum gives a pure white alloy—the white gold of the jeweller—which, as it can be made to contain 75% of gold, can be and is hall-marked as 18-carat gold. Palladium has a still greater whitening power than platinum and about 12% is sufficient to produce a perfectly white alloy. A remarkable colour effect is produced by alloying gold with aluminium. Roberts-Austen produced a fine purple alloy (containing about 80% Au and 20% Al), but unfortunately too brittle to be made into jewellery.

In a finely divided state the colour of gold is very variable, depending upon the size of the particles. The usual colour of precipitated gold is brown, but black, purple, blue and pink shades are also known. In very thin sheet or leaf, gold is translucent and transmits a greenish light. Gold when pure is the most malleable and ductile of all the metals; it can be beaten to not more than 0·00001 mm. in thickness (see GOLD-BEATING), and a single gram has been drawn into a wire 2 miles long. Traces of other metals reduce considerably the malleability and ductility, lead being especially injurious in this respect. Cadmium, tin, bismuth, antimony, arsenic, tellurium and zinc act in like manner.

Gold is one of the softest metals, its hardness varying according to treatment and being somewhere between that of zinc and tin; it is considerably softer than silver under all conditions. Dental gold is really a gold sponge produced by electrolytic methods; it is so soft as to be capable of welding at ordinary temperatures.

The specific gravity of gold also depends upon its previous treatment. Cast gold is always somewhat lighter than gold that has been rolled or drawn. Different observers give the specific gravity of cast gold as from 19·23 to 19·29 and for worked gold as from 19·29 to 19·34. Precipitated gold, however, has a greater density and varies with the precipitant employed and the temperature of precipitation. Ferrous sulphate appears to give the densest precipitate which has been found by G. Rose to be as high as 20·72. For practical purposes the density of pure gold may be taken as 19·3.

The melting point of gold has been determined by many observers with varying results but the mean of recent observations is 1,063° C. Gold is comparatively easily volatilized at high temperatures; at its melting point the loss is insignificant, but becomes appreciable at higher temperatures, and at 1,250° C it is 2.6 parts per thousand per hour (T. K. Rose). In all mints and gold refineries the flues are carefully swept periodically and considerable quantities of the metal are thus recovered. In the presence of other metals, volatilization is greater than with pure gold, tellurium and selenium being most active in this respect and zinc and mercury less so. Some of the recently reported transmutations of mercury into gold have been traced to the mercury containing a minute quantity of gold which had not been removed by simple distillation. The boiling point of pure gold is about 2,500° C.

The electrical conductivity of gold is greatly influenced by traces of impurities, so reported values are very variable. At ordinary temperatures the conductivity of gold is about 75% of that of pure silver, which has the greatest conductivity of any metal. The electrical resistance, which is the converse of conductivity. steadily diminishes with a lowering of the temperature, and at the boiling point of helium in *vacuo* (*i.e.*, below 5° Absolute) it has practically disappeared (H. K. Onnes), or, in other words, gold is then a perfect conductor of electricity.

The mean specific heat of gold is 0·03, a number which agrees well with the law of Dulong and Petit. Its coefficient of linear expansion is about 0·000014 for 1° C.

The spark spectrum of gold is very complicated; the most prominent lines in the visible spectrum lie at 6278 and 5957 in the orange and red, 5837 and 5656 in the yellow, 5065 in the green, 4793 and 4437 in the blue, and 4065 and 3898 in the violet.

CHEMICAL PROPERTIES

Gold is permanent in air or water under all conditions of tern. perature. It is insoluble in nitric, hydrochloric or sulphuric acids, but soluble in hot selenic acid forming gold selenatc. Hot telluric acid likewise dissolves it. The usual solvent for gold is aqua regia (*q.v.*)—a mixture of 3 volumes of strong hydrochloric acid with one volume of strong nitric acid which in practice is always diluted with a considerable volume of water. The nitric and hydrochloric acids interact producing nitrosyl chloride (NOCl) together with free chlorine, which attacks the metal. The other halogen elements, fluorine, bromine and iodine, also attack gold freely, producing the corresponding halogen compounds. Gold is also soluble in aqueous solutions of alkaline sulphides and thiosulphates. Alkali cyanides, even in very dilute solution, attack

gold readily, especially in the presence of air or oxygen (*see* below).

Gold and Oxygen.—Gold and oxygen do not combine directly under any conditions; hence all oxides and hydroxides have to be made by indirect methods. Two well-determined oxides of gold are known, namely aurous oxide, Au_2O, and auric oxide, Au_2O_3. The oxides Au_2O_2, Au_2O_4 and Au_2O_5 have been described, but their individuality is doubtful.

Aurous hydroxide, AuOH, is best prepared either by treating a neutral aqueous solution of auric chloride, $AuCl_3$, with mercurous nitrate, or by decomposing aurous chloride, AuCl, or bromide, AuBr, with cold dilute caustic potash or soda (not ammonia). It is also obtained by boiling an aqueous solution of auric chloride with the alkaline salt of an organic acid such as potassium acetate. It is a violet-black powder which, on heating to about 200° C loses water giving violet-brown aurous oxide, which at 250° C decomposes into gold and oxygen. The oxide and hydroxide have feebly basic properties and are capable of forming salts with halogen acids.

Auric hydroxide is produced by precipitating a solution of auric chloride or of aurichioric acid, $HAuCl_4$, with a iimited amount of caustic alkali. The hydroxide thus prepared cannot be entirely freed from alkali by washing, and the precipitation is preferably effected with magnesia or zinc oxide, excess of the precipitant being removed with dilute nitric acid. Auric hydroxide is a brownish-black powder which, on drying over phosphoric oxide, forms a brown powder of auryl hydroxide, AuO(OH), dehydrated at 140° C to trioxide, and this oxide on further heating to 170° is said to lose oxygen and form the oxide Au_2O_2. Auric oxide is capable either of forming salts with haloid acids or of acting as an acidic anhydride by combining with strong bases to form aurates. Potassium aurate, $KAuO_2,3H_2O$, is a yellow crystalline compound; $Ba(AuO_2)_2$ is a yellow precipitate.

Halogen Compounds.—Fluorine does not act on gold in the cold but only at a dull red heat, when a yellowish deposit is formed.

Two chlorides of gold are known with certainty, aurous chloride, AuCl, and auric chloride, $AuCl_3$. The identity of an intermediate chloride, Au_2Cl_4, is doubtful. Aurous chloride is almost always formed by heating auric chloride. The optimum temperature is about 175° C, and several days are required to complete the reaction. If a higher temperature is used complete decomposition occurs into gold and chlorine. This decomposition of auric into aurous chloride takes place to some extent even in hot aqueous solution.

Aurous chloride is a yellowish-white solid insoluble in cold water but undergoing slow decomposition into gold and soluble auric chloride.

Auric chloride can be obtained either by heating aurichloric acid to zoo° in a stream of chlorine, or by dissolving gold in chlorine water, preferably in darkness. It is obtained as a reddish-brown powder or ,as ruby-red crystals; it gives a neutral solution and can be sublimed unchanged in a stream of chlorine. The auric chloride of commerce is really aurichloric or chloroauric acid, $HAuCl_4,3H_2O$, a brown deliquescent substance very soluble in water or ether.

If gold is dissolved in aqua regia and the resulting solution freed from nitric acid by evaporation with further quantities of hydrochloric acid to near the crystallizing point, the dissolved gold compound corresponds to the formula H_2AuCl_5, but on allowing this solution to crystallize, brownish-yellow crystals of aurichloric acid are formed, having a strongly acid reaction. These crystals always contain a small amount of aurous chloride unless chlorine has been passed through the solution during evaporation. They are also frequently contaminated with small amounts of silver chloride as this substance is soluble in strong solutions of auric chloride and is only precipitated therefrom by considerable dilution with water.

Aurichloric acid forms a series of salts called aurichlorides or chloroaurates, having the general formula $MAuCl_4$. These salts may be obtained either by neutralizing the acid with the metallic base or by treating the acid with the equivalent amount of the metallic chloride. The aurichlorides of lithium, potassium and sodium are very soluble in water; those of rubidium and especially caesium are much less soluble. The sodium salt, $NaAuCl_4,2H_2O$, separating in yellowish-red prisms, is an article of commerce under the name of "sodio-gold chloride"; it has the advantage over aurichloric acid of being non-deliquescent. Aurichloric acid combines with the chlorides of many organic bases to form well-defined crystalline aurichlorides, frequently used in identifying and purifying such bases.

Two bromides of gold are known, AuBr and $AuBr_3$, corresponding with the two chforides; the tribromide, prepared by the action of bromine water on finely divided gold, forms dark brownish-red crystals and in its reactions resembles the corresponding chloride; the monobromide is obtained by heating the tribromide or $HAuBr_4$ to 105–200° C. Auric bromide forms auribromides, $MAuBr_4$, similar to the aurichlorides. These salts have been used in determining the atomic weight of gold.

On mixing aqueous solutions of potassium iodide and $AuCl_3$ or $HAuCl_4$, some auric iodide, AuI_3, is produced, but being somewhat unstable, it decomposes to a large extent into aurous iodide, AuI, and free iodine. The latter reaction is complete on warming. Although unstable by itself, yet in combination with alkali and alkaline-earth iodides auric iodide forms a stable series of complex auriodides. The potassium salt, $KAuI_4$, crystallizes in black, lustrous prisms. Iodine in aqueous, or preferably aqueous-alcoholic, solution combines with metallic gold to produce aurous iodide, AuI, a white or lemon-yellow powder insoluble in water.

Gold Cyanides.—In the presence of air gold dissolves in aqueous solutions of potassium or sodium cyanide to form potassium or sodium aurocyanide, $KAu(CN)_2$ or $NaAu(CN)_2$, and on precipitating this solution with dilute hydrochloric acid, aurous cyanide, AuCN, is deposited in yellow, insoluble, microscopic, hexagonal plates. Auric cyanide, $Au(CN)_3$, has not been isolated with certainty, but stable complex salts are known with alkali and other cyanides. Potassium auricyanide, $2KAu(CN)_4,3H_2O$, forms colourless efflorescent crystals. The silver salt, $AgAu(CN)_4$, is formed by precipitating a solution of $KAu(CN)_4$ with silver nitrate. From this salt auricyanic acid, $2HAu(CN)_4,3H_2O$, is obtained by removing the silver with hydrochloric acid and crystallizing the solution.

Fulminating Gold.—When auric oxide or a gold solution is treated with strong ammonia, a black powder is formed called fulminating gold ($AuN_2H_3,3H_2O$). When dry it is a very powerful explosive, as it detonates either by friction or on heating to about 145°; it should always be handled with great caution.

Purple of **Cassius.**—When a solution of auric chloride is precipitated with a solution of stannous chloride a reddish or purplish precipitate is produced containing both metallic gold and tin hydroxide. The composition of this precipitate is as variable as is its colour. This product is mainly used in the preparation of ruby glass.

Liquid Gold.—A preparation known as "liquid gold" (German, Glanzgold) is very largely used in the decoration of pottery and earthenware. It consists essentially of a sulpho-resinate of gold dissolved in various essential oils, together with small quantities of bismuth, rhodium and sometimes other metals. The liquid gold is applied by suitable means to the surface of the glaze of the ware: it is then allowed to dry and fired at about 700–800° C. A brilliant film of metallic gold is thus left on the surface of the ware. (F. E. M.)

GOLD: MINING AND METALLURGY. It is probable that gold was the first metal to attract the attention of prehistoric man, but it could hardly have been used even for ornaments until the art of melting had been invented in the bronze age. The earliest mining work of which traces remain was on gold ores in Egypt, and gold washing is depicted on monuments of the fourth dynasty (2900 B.C.). There are many other records of work on gold in ancient times. The legend of the Golden Fleece. stripped of its heroic dress, describes an expedition about 1200 B.C. to seize gold which was being laboriously washed out from the river sands with the aid of sheepskins by the long-suffering people of Armenia. It is interesting to note as an example of the value

of some old ideas that, in the latest development of practice in the Transvaal, blankets are used to collect the gold (see AMALGAMATION).

Occurrence and Distribution of Gold.—Gold occurs in minute quantities in almost all rocks. Igneous and metamorphic rocks contain more than sedimentary deposits which have doubtless derived it from the sea. In sea-water the amount of gold present appears to vary from 0·03 grain to 1 grain (2 to 60 mg.) per ton, but all attempts to extract it at a profit have failed. It exists in all copper and lead ores. It is everywhere, apparently even in vegetation, for there is gold in the coal of the Cambrian coalfield of Wyoming and a rich deposit in a bed of lignite in Japan.

Disseminations throughout large masses of rock, rich enough to be called ores, are unusual and gold is generally obtained from quartz lodes or veins, or from deposits derived from them by denudation, *e.g.*, river gravels and the "banket" or conglomerate of the Transvaal. The gold is not evenly distributed in the lodes but is concentrated in certain parts. Many lodes are barren, especially those which do not contain pyrites or other sulphides. The reason why gold occurs in greater quantities in lodes than in the neighbouring rocks is not known with certainty but it is considered that it has risen from below with other minerals, partly at least in solution in hot water, and has been precipitated where it is found. The mineral most commonly found with gold in lodes is iron pyrites, a yellow sulphide of iron. Others are copper pyrites, arsenical pyrites, zinc blende and stibnite—all sulphides. At the surface of the ground, where the lodes are weathered, limonite, a yellow oxide of iron, is the best indicator of gold. In alluvial deposits ("placers") magnetite ("black iron sand") usually occurs. No mineral, however, is an infallible guide to gold, except perhaps in particular localities.

The gold in ores is generally free or native, not combined with other elements to form chemical compounds except in the tellurides. Even the gold contained in iron pyrites is metallic, consisting of thin films coating the crystals or perhaps the cleavage planes of the pyrites. Gold in ore is generally invisible unless magnified, but sometimes occurs in crystalline grains or arborescent flakes which can be seen, and more rarely gold is found in considerable masses. Large crystals of an inch or more across have been found in alluvial deposits in California. They belong to the cubic system and are usually in the form of octahedra or rhombic dodecahedra. In Transylvania gold occurs in thin plates and in some other districts in wire form. Tellurides of gold are contained in rich ores in Western Australia and Colorado and occur elsewhere. The mineral calaverite, a bronze-yellow gold telluride, contains 40% of gold, and sylvanite or graphic tellurium, a steel-grey mineral, contains up to 28% of gold combined with some silver. The tellurides are often grey or blackish. Tellurium is removed from telluride ores by weathering and finely divided yellow amorphous gold or "mustard gold" is left. It resembles yellow clay, but can be made bright by burnishing. It occurs in yellow splashes at Kalgoorlie. The rocks through which auriferous veins pass are generally metamorphic, such as slates or schists, with volcanic rocks in the neighbourhood. Andesite, a volcanic rock, is often found in gold districts. Alluvial deposits or "placers" have been the most prolific sources of gold in the past, although by 1927 they had become of little importance. They are the sands, gravels and detritus of ancient or existing streams and have been derived from the disintegration of auriferous veins or rocks. The gold occurs as "gold dust," which consists of small scales and rounded grains, and "nuggets" or larger masses of a rounded or mammilated form. The largest nugget ever found was the "Welcome Stranger," 2,520 oz. in weight, which was found in 1869 in Victoria in a rut made by a cart, only a few inches below the surface of the ground.

Among the most productive goldfields in ancient times were those in Egypt, where in the deep mines the enslaved labourers were cruelly maltreated, and in Asia Minor where flows the river Pactolus, the source of the riches of Croesus. The Romans obtained their gold in great part from Transylvania, still a goldfield. After the discovery of America the main supplies to Europe came from there. In 1850–60 the gold diggings of California and Australia were at their zenith and at the end of the 19th century the "placers" of Klondike and Alaska, the last-named a beach deposit, were famous for a short time. By 1927 the Transvaal had been for many years the richest goldfield in the world but there are important goldfields in every continent and in many countries (see PHYSICAL RESOURCES, Precious Metals Group). The geological age of the deposits in which gold is found ranges from Archaean to Quaternary but is mainly very ancient or comparatively recent. The series of rocks formed between these eras contain little gold.

Placer Mining and Prospecting.—Gold sands and gravels occur in the beds of most rivers which flow for part of their course through a region composed of crystalline rocks. The gold may be dispersed through the sand or caught in the crevices of the rocky bed of the river and covered by sand. Sometimes the auriferous sands are covered by thick beds of barren detritus or even lava flows and can be reached only by sinking shafts or driving tunnels. The mining operations are usually simple. In Siberia, Alaska and the Yukon the gravels are perennially frozen and are thawed with steam jets or wood fires. The sand is tested by panning. The "dirt" is stirred and shaken with water in a pan (fig. 1.) to enable the gold to settle to the bottom, and the upper portions are gradually washed away by dipping the pan into water and pouring it off until only the gold and heavy minerals are left. Finally the gold is separated by a series of dexterous twists and tilts. The "batea" (fig. 2), a shallow wooden cone, is used instead of the pan in South America and by negro miners. If the deposit is found to be rich enough to work it is treated in pans or cradles or sluice boxes. Work with the pan is simply a repetition of the testing process already mentioned. In the Klondike a single pan of earth sometimes yielded 15 oz. of gold, but that was exceptional and work on so small a scale has seldom paid expenses. The "cradle" or "rocker" (fig. 3), which resembles a child's cradle, deals with larger quantities of earth and is more profitable. The gravel is shovelled on to the perforated iron plate, and water is poured on. The fine material drops through on to the apron, which is then carried forward over the sloping floor, rocking being continuous. The gold is caught by the "riffles," which may be strips of wood. A riffle or riffle bar is almost anything which will break the current of water and provide a protected spot where gold can settle and remain undisturbed. Mercury is often placed in riffles to amalgamate the gold (see AMALGAMATION). Thousands of improved cradles were in use at Nome in Alaska as recently as 1900. A "sluice box" (fig. 4) is an inclined wooden trough through which gravel is washed by a stream of water. The troughs are fitted together to form a sluice which may be hundreds of yards long. If gold is still being caught at the lower end of the sluice, more boxes are added, but most of the gold is caught in riffles near the upper end, where the gravel is shovelled in and mercury sprinkled. In California thick beds of gravel on hill-sides in the gulches have been worked by hydraulic mining. Powerful jets of water break down the banks of gravel and wash the material through a line of sluices without hand labour. The work was sometimes on a very large scale requiring huge reservoirs as for a great city. with many miles of pipes and flumes. The nozzle for the jet was increased to 11in. in diameter with a pressure of water given by a head of zooft. The cost of treatment was only a few cents per cubic yard and poor ground could be treated at a profit. Millions of tons of sand were washed down and delivered as "tailings" into the

Yuba and Feather rivers, and the effects on farming lower down were so marked that an injunction was obtained against the hydraulic miners in 1880 and their work thereafter was strictly limited.

In the period 1900–15 dredging became the most important branch of placer working. The chain-bucket dredger was in general use. It is similar to those used in harbours, having a number of buckets attached to an endless moving chain. The gravel is scooped up from river beds and delivered on the deck of the vessel, where it is washed. It is disintegrated in revolving screens and then flows over gold-saving tables furnished with riffles, or through short sluices. The tailings pour overboard at the stern or are deprived of the water in them by being run on to sieves and are then stacked on the river bank by a bucket elevator. Dredging originated in New Zealand and attained its greatest

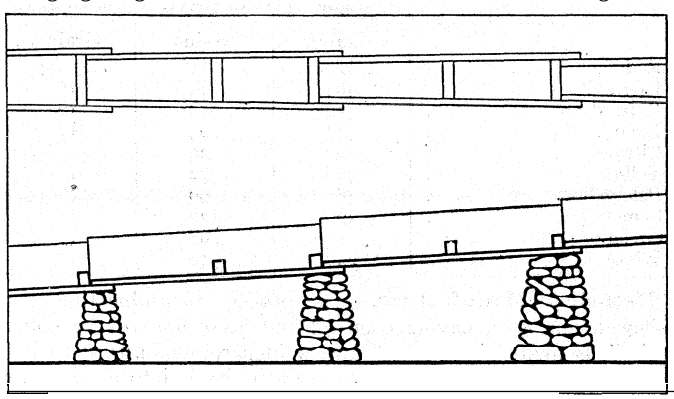

FIG. 4.— SLUICEBOXES, INCLINED WOODEN TROUGHS FOR SEPARATING GOLD FROM GRAVEL. SHOWING PLAN (TOP). GRAVEL, CONTAINING GOLD. IS CARRIED DOWN THE SLUICE BY A STREAM OF WATER. THE GOLD SINKS TO THE BOTTOM AND LODGES BEHIND THE CROSS-BARS

popularity on the rivers there, and in California. "Paddock dredging," a later development in western America, enabled all flat placer ground to be treated, even if not in or near river beds. The dredger is placed in a reservoir filled with water, the gravel is dug away from one end of the reservoir, the gold is washed out, and the tailings are stacked at the other end. In this way the dredger moves across country taking the reservoir with it. By piling gravel round the reservoir and letting in more water the dredger can be made to work its way uphill. The cost of dredging before the World War was only about ad. or 3d. per cubic yard of gravel, not counting the capital expenditure, so that poor material could be treated at a profit, but in 1926 comparatively few dredgers remained at work.

Vein Mining and Ore Treatment.— Methods of exploration and mining of veins do not greatly differ from those in use on the deposits of other metals (see MINING, METALLIFEROUS). Gold ore raised to the surface is treated by amalgamation or by the cyanide process (*q.v.*). Before the invention of the cyanide process, the tailings from amalgamation mills were often concentrated on sloping tables, or in troughs lined with blanketing or by other machines. The concentrates consisted chiefly of sulphides, especially pyrites, and often contained 2 or 3 oz. of gold per ton. They were treated by smelting and in some places by chlorination, an obsolete process. Gold ores which cannot be treated by amalgamation or cyaniding are smelted with copper or lead ores (see **COPPER** and LEAD). The gold is found in the metallic copper or lead which is tapped out from the furnaces and is recovered in the electrolytic refining of the copper and the desilverizing of the lead. The amount of gold produced in the world by smelting is comparatively small.

Refining.— Gold bars produced at the mines and gold dust and nuggets from placers are impure, containing as a rough average about 90% gold with 8–9% of silver and smaller quantities of other metals. The gold is often brittle and is refined to make it suitable for minting or for use in the industries. The ancients refined gold by "cementation." Plates of gold were stacked in an earthen pot, and were surrounded and separated by powdered porous stone or brickdust, mixed with common salt and sulphate of iron. The pot was covered and heated to redness, but the temperature was not high enough to melt the gold. The silver and other impurities in the gold were gradually converted into chlorides, which melted and oozed out of the gold and were absorbed by the brickdust, and the gold was purified. Nitric acid was in use for refining gold in the 16th century. The gold was melted with three times its weight of silver (process of "inquartation"), and granulated by pouring into water. The granules were boiled in nitric acid which dissolved the silver and left the gold unchanged. If the alloy of gold and silver contains more than 33% gold, part of the silver remains undissolved, and it is for that reason that the excess of silver is melted with the gold in inquarration. The siiver was recovered from the acid and used again. In the 19th century sulphuric acid replaced nitric acid and is cheaper to use. The chlorine process (not to be confused with chlorination, the obsolete process of treating ores) was invented in 1869 in Australia where acid was expensive, and has become the usual method of refining. The gold is melted in clay pots and a stream of chlorine gas is bubbled through it (fig. 5). The chlorine is absorbed by the silver which is present, and silver chloride is formed and rises to the surface of the molten metal whence it is skimmed off. The silver is recovered by electrolysis in another vessel. Most of the other metals are chloridized like silver; but the gold is not attacked until nearly all the silver has been removed. When the gold is about 995 fine (containing 995 parts of gold per 1,000), chlorine bubbles through to the surface freely, brown fumes appear, gold begins to be lost by volatilization and by spirting, and the work must be stopped. Platinum is not recovered by the Process and, if present, remains in the gold, but the impurities which cause brittleness in minting are always removed. The cost of the process

at Ottawa in 1916–18 when the Transvaal output was being refined was about 3 cents per oz. of gold.

In the United States mints the electrolytic process, introduced there in 1902, has since been used for refining most of the gold produced in North America. The gold is cast into thick plates which are suspended on gold or silver hooks in a porcelain cell filled with a solution of gold chloride containing some hydrochloric acid. The hooks are hung on metal rods and the whole series of plates and hooks are connected and are made the anode (fig. 6). A series of thin rolled plates of pure gold are suspended in the cell alternately with the impure plates and also connected to form

the cathode. The liquid in the cell is heated to about 60° C., and is continuously stirred, and a current of electricity is passed from the anode plates to the cathode through the liquid. The gold is dissolved from the anodes and is precipitated on the cathodes. At the end of the run it is stripped off the cathode plates and melted into bars. The silver is converted into insoluble chloride which falls to the bottom of the cell, and other metals, including platinum, dissolve in the liquid and remain in solution. The platinum is, however, subsequently recovered and sometimes pays for the whole operation. The process is somewhat slow, occupying three or four days, but the cathode gold is over 999 fine.

Alloys of Gold.—Gold alloys with silver in all proportions and the alloys are soft, malleable and ductile. The colour of gold gradually changes from yellow to white as the proportion of silver increases. When the silver is over 70% the alloys are white. "Green gold" (gold 75%, silver 25%) is used in jewellery and is of about the same composition as the *electrum* of the ancients. Gold-silver alloys are used to make trial plates, or standards of reference with which the fineness of gold wares and coins are compared. Copper hardens gold and forms alloys of reddish yellow colour at conveniently low melting points. These alloys are used for coinage. They blacken when heated, but the discolouration is removed by sulphuric acid. The triple alloys of gold, silver and copper are malleable and ductile, with a rich gold colour. They are much used for the production of gold wares. Some zinc is often present in 9 carat gold. Hot nitric acid attacks all but the richer alloys of gold with silver or copper or both, and if the proportion of gold is no more than 33%, practically the whole of the silver and copper are removed in solution. Some of the gold-palladium and gold-platinum alloys are ductile and fit for use in jewellery. The alloys containing 10–20% of palladium are nearly white. Amafgams are alloys of gold and mercury. A piece of gold rubbed with mercury is immediately penetrated by it, turning white and becoming exceedingly brittle. The ductility is not always restored on driving off the mercury by heat. Solid amalgam contains 40% or more of gold, but any excess of mercury over 60% makes the amalgam pasty. The amalgam produced in gold mills (see AMALGAMATION) is not a true amalgam but a collection of little nuggets of gold, coated and partly saturated with mercury. Lead when molten takes up gold readily, and zinc removes the gold from molten lead. The zinc and gold form a solid crust which floats on the surface of the lead. Advantage is taken of these properties in smelting.. Gold forms alloys with many other metals but most of them are brittle, and none is of metallurgical importance. Even a minute quantity (0·02%) of tellurium, bismuth or lead makes gold brittle.

GOLDBEATING. The art of goldbeating is of great antiquity, being referred to by Homer; and Pliny (N.H. 33.19) states that 1 oz. of gold was extended to 750 leaves, each leaf being four fingers (about 3in.) square; such a leaf is three times as thick as the ordinary leaf gold of the present time. In all probability the art originated among the eastern nations, where the working of gold and the use of gold ornaments have been distinguished characteristics from the most remote periods. On Egyptian mummy cases specimens of original leaf-gilding are met with, where the gold is so thin that it resembles modern gilding (*q.v.*). The minimum thickness to which gold can be beaten is not known with certainty. According to Mersenne (1621) 1 oz. was spread out over 105sq.ft.; Réaumur (1711) obtained 1464 sq.ft.; other values are 189sq.ft. and 300sq.ft. Its malleability is greatly diminished by the presence of other metals, even in very minute quantity. In practice the average degree of tenuity to which the gold is reduced is not nearly so great as the last example quoted above. A "book of gold" containing 25 leaves measuring each 3¼in., equal to an area of 264sq.in. generally weighs from four to five grains.

The gold used by the goldbeater is variously alloyed, according to the colour required. Fine gold is commonly supposed to be incapable of being reduced to thin leaves. This, however, is not the case, although its use for ordinary purposes is undesirable on account of its greater cost. It also adheres on one part of a leaf touching another, thus causing a waste of labour by the leaves being spoiled; but for work exposed to the weather it is much preferable, as it is more durable, and does not tarnish or change colour. The external gilding on many public buildings, *e.g.*, the Albert memorial in Kensington gardens, London, is done with pure gold. The following is a list of the principal classes of leaf recognized and ordinarily prepared by British beaters, with the proportions of alloy per oz. they contain.

Name of leaf.	Proportion of gold.	Proportion of silver.	Proportion of copper.
	Grains	Grains	Grains
Red	456–460		**20–24**
Pale red	**464**	..	16
Extra deep	**456**	12	12
Deep	**444**	24	12
Citron	440	30	10
Yellow	408	72	..
Pale yellow	384	96	..
Lemon	360	120	
Green or pale	312	168	..
White	240	240	..

Method of Manufacture.— The process of goldbeating is as follows: The gold, having been alloyed according to the colour desired, is melted in a crucible at a higher temperature than is necessary simply to fuse it, as its malleability is improved by exposure to a greater heat; sudden cooling does not interfere with its malleability, gold differing in this respect from some other metals. It is then cast into an ingot, and flattened, by rolling between a pair of powerful smooth steel rollers, into a ribbon of 1½in. wide and 10ft. in length to the oz. After being flattened it is annealed and cut into pieces of about 6½grs. each, or about 75 per oz., and placed between the leaves of a "cutch," which is about ½in. thick and 3½in. square, containing about 180 leaves of a tough paper. Formerly fine vellum was used for this purpose, and generally still it is interleaved in the proportion of about one of vellum to six of paper. The cutch is beaten on for about 20 minutes with a 17 lb. hammer, which rebounds by the elasticity of the skin, and saves the labour of lifting, by which the gold is spread to the size of the cutch; each leaf is then taken out and cut into four pieces and put between the skins of a "shoder," 4½in. sq. and ¾in. thick, containing about 720 skins, which have been worn out in the finishing or "mould" process. The shoder requires about two hours' beating upon with a 9-lb. hammer. As the gold will spread unequally, the shoder is beaten upon after the larger leaves have reached the edges. The effect of this is that the margins of larger leaves come out of the edges in a state of dust. This allows time for the smaller leaves to reach the full size of the shoder, thus producing a general evenness of size in the leaves. Each leaf is again cut into four pieces, and placed between the leaves of a "mould," composed of about 950 of the finest goldbeaters' skins, 5in. square and ¾in. thick, the contents of one shoder filling three moulds. The material has now reached the last and most difficult stage of the process; and on the fineness of the skin and judgment of the workman the perfection and thinness of the leaf of gold depend. During the first hour the hammer is allowed to fall principally upon the centre of the mould. This causes gaping cracks upon the edges of the leaves, the sides of which readily coalesce and unite without leaving any trace of the union after being beaten upon. At the second hour, when the gold is about 150,000th part of an inch in thickness, it for the first time permits the transmission of the rays of light. Pure gold, or gold but slightly alloyed, transmits green rays, gold highly alloyed with silver transmits pale violet rays. The mould requires in all about four hours' beating with a 7-lb. hammer, when the ordinary thinness for the gold leaf of commerce will be reached. A single ounce of gold will at this stage be extended to 75×4×4 ≈1,200 leaves, which will trim to squares of about 3¼in. each.

The dryness of the cutch, shoder, and mould is a matter of extreme delicacy. The finished leaf is taken out of the mould, and the rough edges are trimmed off by slips of the ratan fixed in parallel grooves of an instrument called a waggon, the leaf being laid upon a leathern cushion. The leaves thus prepared are placed into "books" capable of holding 25 leaves each, which have been rubbed over with red ochre to prevent the gold clinging to the paper. Dentist gold is gold leaf carried no farther than the cutch stage, and should be perfectly pure gold.

By the above process also silver is beaten, but not so thin, the inferior value of the metal not rendering it commercially desirable to bestow so much labour upon it. Copper, tin, zinc, palladium, lead, cadmium, platinum, and aluminium can be beaten into thin leaves, but not to the same extent as gold or silver.

Goldbeaters' Skin.—The fine membrane called goldbeaters' skin, used for making up the shoder and mould, is the outer coat of the caecum or blind gut of the ox. It is stripped off in lengths about 25 or o i n , and freed from fat by dipping in a solution of caustic alkali and scraping with a blunt knife. It is afterwards stretched on a frame; two membranes are glued together, treated with a solution of aromatic substances or camphor, in isinglass, and subsequently coated with white of egg. Finally it is cut into squares of 5in. or 5½in.; and to make up a mould of 950 pieces the gut of about 380 oxen is required, about 2½ skins being got from each animal. A skin will endure about 200 beatings in the mould, after which it is fit for use in the shoder alone.

GOLDBERG, a town of Germany, in the Prussian province of Silesia,[1] 14 m. by rail S W. of Liegnitz, on the Katzbach Pop (1933) 7,842. Goldberg owes its origin and name to a gold mine in the neighbourhood, abandoned since the Hussite wars. The town obtained civic rights in 1211. It suffered from the Tatars in 1241, from the plague in 1334, from the Hussites in 1428, and from various armies during the Thirty Years' War. The principal buildings are an old church dating from the beginning of the 13th century and the classical school (founded in 1524), which was famous in the 17th century and numbered Wallenstein among its pupils. The chief manufactures are woollen cloth, gloves, stockings, cigars and beer.

GOLD COAST, that portion of the Guinea Coast (West Africa) which extends from Assini upon the west to the river Volta on the east. It derives its name from the quantities of grains of gold mixed with the sand of the rivers traversing the district. The term Gold Coast is now generally identified with the British Gold Coast colony. This extends from 30° 7 W. to 1° 14′ E., the length of the coast-line being about 370 miles. It is bounded west by the Ivory Coast, east by Togoland. On the north the British possessions, including Ashanti (*q.v.*) and the Northern Territories, extend to the 11th degree of north latitude. Their combined area is given as 91,843 sq.mi., with a total population estimated in 1940 as 3,962,520. The Gold Coast colony alone has an area of 23,937 sq.mi., with a population (1931 census) of 1,825,237, including some 1,500 Europeans. For the British mandated area of Togoland, which is administered by the Gold Coast, *see* TOGOLAND.

Physical Features.— Though the lagoons common to the West African coast are found both at the western and eastern extremities of the colony (Assini in the west and Rwitta in the east) the greater part of the coast-line is of a different character. Cape Three Points (4° 44′ 40″ N 2° 5′ 45″ W) juts boldly into the sea. Thence the coast trends east by north, and is but slightly indented. The usually low, sandy beach is, however, diversified by bold, rocky headlands. The flat belt of country does not extend inland any considerable distance, the spurs of the great plateau which forms the major part of West Africa advancing in the east, in the Akwapim district, near to the coast. Here the hills reach an altitude of over 2,000 feet. Out of the level plain rise many isolated peaks, generally of conical formation. Numerous rivers descend from the hills, but bars of sand block their mouths, and the only deep water harbour the Gold Coast possesses is that of Takoradi (*q.v.*), built at great expense and dating only from 1928. Great Atlantic rollers break unceasingly upon the shore. The chief rivers are the Volta (*q.v.*) the Ankobra and the Prah. The Ankobra or Snake river traverses auriferous country, and reaches the sea some 20 m. W. of Cape Three Points. It has a course of about 150 m., and is navigable in steam launches for about 80 miles. The Prah ("Busum Prah," sacred river) is regarded as a fetish stream by the Fanti and Ashanti. The Prah rises in the north-east of the colony and flows south-west. Some 60 m. from its mouth it is joined by the Ofin, which comes from the north-west. The united stream flows south and reaches the sea in 1° 35′ W. As a waterway the river, which has a course of 400 m., is almost useless, owing to the many cataracts in its course.

Geology.— The geological structure of the country is only partially known. Igneous rocks underlie large areas and are exposed in various areas. Granites, diorites and dolerites occur. Cretaceous rocks along the coast belt are mostly hidden under superficial deposits. Basalt occurs at Axim. Inland, large tracts are covered by water-bearing sandstone and laterite. Pure sandstones, quartzite and hornstones are of wide distribution, as are clays, shales and slates, and surface deposits of limonite and pisolite cement. i n the western region are extensive beds of Longlomerate or "banket," containing gold. Here also are irregular gold bearing veins of quartz, known as the Birrimian system, usually highly inclined and traversing rocks of great age. Manganese ore is widely distributed, being found as an oxide in slate and phyllites and in highly metamorphosed rocks such as gneisses. Bauxite, formed from clay shales and phyllites, is the cap—sometimes 50 ft. thick—of several hills. Alluvial silts and gravels carry gold and diamonds.

Climate.— The climate on the coast is hot and moist, but with proper precautions, not particularly unhealthy for Europeans. The mean temperature in the coast towns is 78" to 80° F. There are two wet seasons, not very clearly defined, but the "greater rains" usually begin in March and end in July; and the "lesser rains" occur mostly in September and October. From the end of December to about the end of February the dry *harmattan* wind blows from the Sahara. In consequence of the prevalence of the sea-breeze from the south-west the western portion of the colony, up to the mouth of the Sekum river (a small stream to the west of Accra), is called the windward district, the eastward portion being known as the leeward. The rainfall at Accra, in the leeward district, averages 27 in. in the year, but at places in the windward district is much greater, varying from 55 up to 80 inches.

Flora and Fauna.— The greater part of the colony is covered with primeval forest. Here the vegetation is so luxuriant that in the struggle to reach the sunlight the forest growths are almost entirely vertical. The chief trees are silk cottons, especially the bombax, and gigantic hard-wood trees, such as the African mahogany, ebony, odum and camwood. The lowest growth in the forest consists of ferns and herbaceous plants. Of the ferns some are climbers reaching 30 ft. to 40 ft. up the stems of the trees they entwine. Flowering plants are comparatively rare; they include orchids and a beautiful white lily. The "bush" or intermediate growth is made up of smaller trees, the rubber vine and other creepers, some as thick as hawsers, bamboos and sensitive mimosa, and has a height of 30 to 60 feet. The creepers are found not only in the bush, but on the ground, and hanging from the branches of the highest trees. West of the Prah the forest comes down to the edge of the Atlantic. East of that river the coast land is covered with bushes 5 to 12 ft. high, occasional large trees and groves of oil palms. Still farther east, by Accra, are numerous arborescent Euphorbias, and immediately west of the lower Volta, forests of oil palms and grassy plains with fan palms Behind all these eastern regions is a belt of thin forest country before the denser forest is reached. In the north-east are stretches of orchard-like country, with wild plum, shea-butter and kola trees, baobabs, dwarf date and fan palms. The cotton and tobacco plants grow wild. At the mouths of the rivers and along the lagoons the mangrove is the characteristic tree. There are numerous coconut palms along the coast. The fruit trees and plants also include the orange, pineapple, mango, papaw, banana and avocado, or alligator pear.

[1] Goldberg is also the name of a small town in Mecklenburg-Schwerin, Germany. Pop. 3,082.

The fauna includes leopards, panthers, hyenas, Potto lemurs, jackals, antelopes, buffaloes, wild-hogs and many kinds of monkey, including the chimpanzee and the Colobus vellerosus whose skin with long, black, silky hair is much prized in Europe. Among the snakes are pythons, cobras, horned and puff adders and the venomous water snake. Crocodiles, and, in fewer numbers, manatees and otters frequent the rivers and lagoons, and hippopotami are found in the Volta. Lizards of brilliant hue, tortoises and great snails are common. Birds, which are not very numerous, include parrots and hornbills, kingfishers, ospreys, herons, crossbills, curlews, woodpeckers, doves, pigeons, storks, pelicans, swallows, vultures and the spur plover (the last-named rare). Shoals of herrings frequent the coast; the other fish include mackerel, sole, skate, mullet, bonito, flying fish, fighting fish and shynose. Sharks abound at the mouths of all the rivers, edible turtle are fairly common, as are the sword fish, dolphin and sting ray (with poisonous caudal spine). Oysters are numerous on rocks running into the sea and on the exposed roots of mangrove trees. Insect life is multitudinous; beetles, spiders, ants, fireflies, butterflies and jiggers abound. The earthworm is rare. The mosquitoes include the *Culex* or ordinary kind, the Anopheles, which carry malaria fever, and the Stegomyia, a striped white and black mosquito which carries yellow fever.

Inhabitants. — The natives are all of the negro race. The districts in general are named after the tribes inhabiting them. Those in the western part of the colony are mainly of Fanti stock (see FANTI); the Accra and allied tribes inhabit the eastern portion and are believed to be the aboriginal inhabitants. The Akim (Akem), who occupy the north-east portion of the colony, hdve engaged in gold-digging from time immemorial. The Akwapim (Aquapem), southern neighbours of the Akim, are extensively engaged in agriculture and in trade. The Accra, a clever race, are to be found in all the towns of the West African coast as artisans and sailors. On the right bank of the Volta, occupying the low marshy land near the sea, are the Adangme. The Krobos live in little villages in the midst of the palm tree woods which grow round about the Kroboberg, an eminence about 1,000 ft. high. Their country lies between that of the Akim and the Adangme. In the west of the colony is the country of the Ahanta, one of the finest and most intelligent of the tribes of Accra stock. The Apollonia, a kindred race, occupy the coast region nearest the Ivory Coast.

The Twi, Tshi or Chi language (the name occurs in many other forms) is that most spoken on the Gold Coast. It belongs to the great prefix-pronominal group. There are many dialects which may be reduced to two classes or types, Akan and Fanti. Akwapin, which is based on the Akim variety of the Akan type, but exhibits Fanti influences, has been made the book-language by the Basle missionaries. They had reduced it to writing before 1850. About a million people in all, it is estimated, speak dialects of the Twi. In the south-east another language, the Ga or Accra, is spoken. It comprises the Ga proper and the Adangme and Krobo dialects. Ga proper is spoken by about 40,000 people. The Adangme and Krobo dialects are spoken by about 80,000 people. They differ very considerably from Ga proper, but books printed in Ga can be used by both the Krobo and Adangme natives. Other tongues, less known, are Guan and the Obutu. East of the Volta are tribes speaking the Ewe group of languages.

Fetishism (*q.v.*) is the prevailing religion, but there are large numbers of Christians and a lesser number of converts to Islam. Belief in a God is universal, as also is a belief in a future state. A Moravian mission was started at Christiansborg about 1736; the Basle mission (Evangelical) was begun in 1828, the missionaries combining manual training and farm labour with purely religious work; the Wesleyans started a mission among the Fanti in 183j, and the Anglican and Roman Catholic Churches arc also represented.

Towns.--Owing to the multiplicity of traders of rival nations, who went to the coast in quest of gold, there are a large number of towns on the coast. There are, however, now only two ports of consequence, Takoradi (with a deep water harbour), and Accra (the capital), both separately noticed Going from west to east the first place of note is Axim (pop. 2,189), the site of an old Dutch fort built near the mouth of the Axim river, and in the pre-railway days the port of the gold region. Rounding Cape Three Points, whose vicinity is marked by a line of breakers nearly 2½ m. long, Dixcove is reached, and then Takoradi, long neglected. A few miles further on is Sekondi (*q.v.*), the first starting-point of the railway to the gold-fields and Kumasi. Elmina (*q.v.*), formerly one of the most important posts of European settlement, is some distance east of the mouth of the Prah. Eight miles east of Elmina is Cape Coast (*q.v.*), at one time the colonial capital. Anamabo, 9 m, farther east is where, in 1807, a handful of English soldiers made a successful defence against the Ashanti host. Saltpond, another 9 m. along the coast, is a well-built town (pop. 6,342), and is singular in possessing no ancient fort. Between Anamabo and Saltpond is Kormantine (Cormantyne), noted as the place whence the English first exported slaves from this coast. Hence the general name Cormantynes given in the West Indies to slaves from the Gold Coast. Winnebah (pop. 6,980), 50 m. from Cape Coast, is an old town noted for the manufacture of canoes. Next along the coast is Accra, and on the right bank of the Volta, near its mouth, is the town of Addah. Kwitta lies beyond the Volta, not far from the Togoland frontier. Of the inland towns the most populous are on the railway between Accra and Kumasi — but none has as many as 10,000 inhabitants. Akropong, in the hills north-east of Accra is 1,400 ft. above the sea and is a centre of missionary work. Yarkwa is the centre of the gold mining industry.

Communications. — Up to 1898, when the first railway was begun, internal communication was mainly by tortuous bush tracks, but there was a good main road (141 m. long) from Cape Coast to Kumasi. The first railway started from Sekondi (the terminus is now at Takoradi), and after traversing the gold-fields (with a branch line, 18 m. to Preston) was continued to Kumasi (168 m.), which was reached in Oct. 1903. In 1907–10 a railway (35 m. in length) was built from Accra to Mangoase. To meet the growing needs of trade this line was extended to Kumasi, reached in July 1923, the distance from Accra being 196 miles. An east-west line through the centre of the colony was opened in 1927. It starts from the Sekondi-Kumasi line at Huni valley and goes to Kade. It is 99 m. long. The railways are on the 3 ft. 6 in. gauge, and are State owned. Over 5,000 m. of main roads for motor traffic had been built by 1928, and as early as 1925 the railways, in which the Government had sunk over £8,000,000 capital, were complaining of road competition. The Volta is navigable in parts and there is canoe traffic on other rivers. There is an extensive system of telegraphs and telephones, and there is cable communication with Europe. Regular mail services are maintained between England and the Gold Coast, the usual time taken, Liverpool to Takoradi, being 14 or 15 days.

Agriculture, Mining and Trade. — Originally the chief exports from the coast were gold and slaves; when the slave trade was stopped palm oil and palm nuts, monkey skins, guinea grain and kola nuts took their place. To these rubber was added about 1880. In 1895 the chief exports and their value were: rubber (£332,000), gold dust (£91,000), palm oil and palm kernel (£308,000), and kola nuts (£30,000). Four years later (1899) cocoa, for the production of which the Gold Coast is now chiefly famous, figures in the exports as 714,000 lb. in weight and £16,000 in value, while the rubber exported, was worth £555,000; gold and gold dust had fallen to the value of £51,000, but palm oil and kola nuts held their place. Thereafter, the rubber trade fluctuated and finally declined, chiefly because of the competition of plantation rubber from the East. Timber was added to the exports, and with the adoption of modern methods and railway facilities, the gold mining industry revived. For a time gold and cocoa became rivals as the two chief exports (cocoa, £866,000; and gold, £790,000 in 1910) with kola nuts progressing and the palm oil exports tending to fall off. Cocoa, however, rapidly outdistanced gold, while the discovery of manganese ore in 1914 added another valuable product to the list of exports. Later (in 1919) came the discovery of diamonds and bauxite. Thus the chief exports, besides cocoa, came to be gold, manganese ore, kola nuts, lumber

and diamonds, with palm oil and kernels and copra subsidiary; and much of the cocoa and most of the gold comes from Ashanti. Imports include every variety of goods, the first in value being cotton piece goods.

The cocoa industry was started by a native of Accra, who in 1879, returning from Fernando Po, brought with him a few pods, the seeds from which he planted at his home at Mampong in the Akwapirn hills. The experiment was successful and a large demand for seeds arose. In 1890 a Government botanical station was established at Aburi, with the object of fostering agriculture, and the officials gave encouragement to the growers of cocoa. The first export of 80 lb. was made in 1891 and it fetched £4; in 1893 two tons of cocoa were exported. The natives, in whose hands the industry was, now became exceedingly keen on cocoa farms, the more so as they were easy to run, and large areas of forest were cleared. First in the eastern province and then in the central province and in Ashanti, farmer after farmer took up cocoa, so that by 1913 the output exceeded 50,000 tons and fetched nearly £2,500,000. In 1924–25 the output had grown to 220,000 tons (value £7,896,000). In 1920 an abnormal "boom" year, following the World War, a crop of 124,000 tons had fetched over £10,000,000, and the sharp fall in prices in 1921 caused a partial crisis, the farmers finding it hard to understand world economic workings. The building of roads and railways, by reducing costs—much cocoa had been planted in places where it did not pay to bring the crop to market by head loads—helped to restore normal conditions. With the aid of the Agricultural Department in seeing that farmers used the best methods, the industry was placed on a stable basis. The export of cocoa in 1926 was valued at £9,181,000. The industry was built up within a quarter of a century without the use of European capital, by the natives themselves, and mainly by a large number of illiterate farmers, each working a small area.

The cultivation of cocoa led to the neglect of the oil palm in many districts, but the Volta region continued to export palm-oil and kernels, while the Government sought to encourage the cultivation of other crops, notably sisal hemp—a plantation being started near Accra in 1921—and citrus fruits. The cultivation of Para rubber on plantation lines was also begun. In the eastern districts the cocoanut palm is abundant, and thence came the copra exports. For home consumption Indian corn, cassava and yams are largely grown. At many of the coast towns fishing is a big industry and salted and sun-dried fish from Addah and Kwitta (Keta) find a ready sale inland. While efforts to grow cotton for export were not successful, cloths are woven by the natives, partly from home-grown but mostly from imported yarn; canoes are made from the silk cotton tree; salt is prepared from the Addah and other lagoons. Native artificers in gold and other metals often show skill and taste; adum wood is used for building and cabinet work. The timber exported is largely mahogany.

The gold mines, since about 1874, have been worked by European companies though it is only since 1902 that modern methods have been used. The chief mines in the colony are at Tarkwa and Prestea; the most valuable mine is at Obuasi, in Ashanti. Alluvial gold is obtained by hydraulic sluicing. For many generations the gold exported was dust, collected by the natives from the gravel or streams—small quantities are still obtained by African women, who use the calabash—but there is evidence that the Portuguese in their day did some regular mining. The output of gold in 1927 was valued at £803,000. Between 1903 and 1927 the total value of gold produced was 6,148,192 oz., valued at £26,117,8j6. The manganese ore mined is found along the Sekondi-Kumasi railway, some 34–36 m. from Sekondi. Mining began in 1916; for the year 1926–27 over 390,000 tons of ore were railed—and the value of the total export since 1916 was about £2,500,000. The diamonds are of alluvial origin and are found chiefly in the gravel of streams in the Prah and Birim basins. Up to 1927 the value of the diamonds found, mostly stones under one carat, was over £800,000. Owing to the bauxite deposits occurring in regions distant from the railways, the mining of that metal had not begun up to 1929. The ore had, however, been proved to be of high grade,

In 1887 the total external trade of the Gold Coast was: imports, £363,000; exports, £372,000; by 1900—that is before the development of the cocoa plantation and the modern methods of gold mining—the figures had grown to: imports, £1,294,000; exports, £885,000. Twenty-five years later (1925) the figures were: imports, £9,782,000; exports £10,890,000. Two-thirds of the imports are from Great Britain, which takes only about a third of the exports. Much of the cocoa goes to the Continent of Europe; the kola nuts go mostly to Nigeria. Shipping is largely British (2,698,000 tons out of a total of 4,812,000 tons in 1926–27).

Administration, Education **and** Revenue.—At the head of the administration is a governor, who is assisted by an executive council composed of officials, and a legislative council of official and non-official members, including, since 1925, members elected by the municipalities and chiefs chosen by the council of head chiefs of each province. The provinces are three—western, central and eastern—each presided over by a commissioner. The provinces, again, are divided into districts and the district commissioner is the official in direct touch with the chiefs and people. In respect of internal affairs each tribe forms a petty, independent, and democrrtic State. Each town or village has its chiefs or headman, and these chiefs form a council of State which elects, and can depose, the omanhene (head chief). In practice the omanhene, who is the occupant of the tribal stool (throne), and formerly by Europeans was styled king, is chosen from certain selected families, and succession to the stool is normally through the female line. An omanhene is usually succeeded by a son—chosen by the council--of his eldest sister. The principal woman of the tribe, a personage of much influence, is known as the Queen Mother. She is usually an aunt or sister of the omanhene. The head chiefs had been accustomed for years to meet to discuss matters of common interest, but they had not statutory powers until 1925. They did much good work in guiding the tribes at a time when the rapid growth of commerce and the intermingling of the peoples was breaking up old tribal customs, and they were instrumental in getting for the natives a fuller share in the Central Government. There are native tribunals with a limited civil and criminal jurisdiction, and native law is administered in all the courts as far as is compatible with "natural justice" and the law of the colony—which by an ordinance of 1874 is based on the common law of England.

Education was at first wholly in the hands of missionaries, who, by grants from the administration, still provide most of the school teaching. There are also Government primary schools. Industrial instruction, mainly agricultural in character, is given in most primary schools. A Government technical school was opened at Accra in 1909 and, later, trade schools were opened in other places. These schools instruct in agriculture, carpentry, metal work and other subjects; the object being to turn out lads likely to become capable, adaptable citizens. For teachers there are the Government training college at Accra and the Presbyterian Mission seminary at Akropong. In all the institutions Africans take part in the teaching and, by an ordinance of 1927, all teachers are registered. Special care is taken to develop character, together with the preservation of all that is good in African culture, taking from Western civilization only that which is worthy. To this end a college—known as the Prince of Wales' college--was built at Achimota, near Accra, at a cost of £500,000, primarily as a Government secondary school for boys and girls, but also to afford education from kindergarten to university standards. It was opened in 1927 with a staff of 50 teachers, the principal being a European and the vice-principal an African. The Gold Coast natives, in general, showed a keen desire for education; the attendance in the elementary schools (1926) was about 30,000. All teachers must know at least one vernacular tongue. The languages taught are Twi, Fanti, Ga, Ewe and English. The "bush" schools, in which trained teachers give unsupervised instruction, are discouraged by the Government and, as far as possible, closed.

Revenue in 1887 was £122,000; it first exceeded £300,000 in 1898. Thereafter, with the growth of trade, it increased more rapidly and in 1910 exceeded £1,000,000; in 1914 £1,331,000;

and in 1924–25, which may be regarded as a normal year after the fluctuations caused by war and post-war conditions, was £3,971,000. In 1926–27 the figures were: revenue, £4,365,000; expenditure, £4,812,000.

Expenditure was regulated by receipts, which were chiefly derived from customs (£2,244,000 in 1926–27). There is a tax of one-eighth of a penny per lb. of cocoa exported. It should be noted that, as in the case of trade returns, the figures of revenue and expenditure for the Gold Coast include Ashanti, the Northern Territories and British Togoland.

HISTORY

It is claimed by some writers that English seamen made voyages to the Gold Coast in the reign of Edward I., also that a company of Norman merchants established themselves about 1364 at a place they named La Mina (Elmina), and carried on trade with the natives for nearly 50 years, when the enterprise was abandoned. There is no definite evidence to support these claims. By order of John II. of Portugal an expedition under Diogo d'Azambuja, accompanied by Bartholomew Diaz and, probably, by Christopher Columbus, took possession of (or founded) Elmina in 1481–82. By the Portuguese it was called variously São Jorge da Mina or Ora del Mina—the mouth of the (gold) mines. That besides alluvial washings they also worked the gold mines was proved by discoveries in the latter part of the 19th century. The Portuguese had no rivals on the coast for some half century, but in 1553 English ships brought back from Guinea gold to the weight of 150 lb. The fame of the Gold Coast thereafter attracted to it adventurers from almost every European nation, the most aggressive being the Dutch, who from the end of the 16th century sought to oust the Portuguese, and in whose favour the Portuguese did finally withdraw in 1642, in return for the withdrawal of the Dutch claims to Brazil. The Dutch henceforth made Elmina their headquarters on the coast. Traces of the Portuguese occupation, which lasted 160 years, are still to be found, notably in the language of the natives. Such familiar words as palaver, fetish, caboceer and dash (*i.e.*, a gift) have all a Portuguese origin.

English and Dutch Rivalry.— An English company built a fort at Kormantine previously to 1651, and some ten years later the fort or castle at Cape Coast was built. The settlements made by the English provoked the hostility of the Dutch and led to war between England and Holland, during which Admiral de Ruyter destroyed (1664–65) all the English forts save Cape Coast castle. The Treaty of Breda in 1667 confirmed the Dutch in the possession of their conquests, but the English speedily opened other trading stations. Charles II. in 1672 granted a charter to the Royal African Company, which built forts at Dixcove, Sekondi, Accra, Whydah and other places, besides repairing Cape Coast castle. At this time the trade both in slaves and gold was very great, and at the beginning of the 18th century the value of the gold exported annually was estimated by William Bosman, the chief Dutch factor at Elmina, to be over £200,000. Piracy was rife along the coast, and was not indeed finally stamped out until the middle of the 19th century.

The Royal African Company, which lost its monopoly of trade with England in 1700, was succeeded by another, the African Company of Merchants, which was constituted in 1750 by act of parliament and received an annual subsidy from government. The slave trade was then at its height and some 10,000 negroes were exported yearly. Many of the slaves were prisoners of war sold to the merchants by the Ashanti, who had become the chief native power. The abolition of the slave trade (1807) crippled the company, which was dissolved in 1821, when the Crown took possession of the forts.

Contact with the Ashanti.— Since the beginning of the 19th century the British had begun to exercise territorial rights in the towns where they held forts, and in 1817 the right of the British to control the natives living in the coast towns was recognized by the Ashanti. In 1824 the first step towards extension of British authority beyond the coast region was taken by Governor Sir Charles M'Carthy, who incited the Fanti to rise against their oppressors, the Ashanti. (The Fanti's country had been conquered by the Ashanti in 1807.) Sir Charles and the Fanti army were defeated, the governor losing his life, but in 1826 the British gained a victory over the Ashanti at Dodowah. The home government, however, disgusted with the Gold Coast because of the perpetual disturbances in the protectorate, determined to abandon the settlements, and sent instructions for the forts to be destroyed and the Europeans brought home. The merchants, backed by Major Rickets, 2nd West India regiment, the administrator, protested, and as a compromise the forts were handed over to a committee of merchants (Sept. 1828), who were given a subsidy of £4,000 a year. The merchants secured (1830) as their administrator Mr. George Maclean—a gentleman with military experience on the Gold Coast and not engaged in trade. To Maclean is due the consolidation of British interests in the interior. He concluded (1831) a treaty with the Ashanti advantageous to the Fanti, whilst with very inadequate means he contrived to extend British influence over the whole region of the present colony. In 1843 the Colonial Office resumed control of the forts, Maclean continuing to direct native affairs until his death in 1847. British jurisdiction was defined by the bond of March 6, 1844, an agreement with the native chiefs by which the Crown received the right of trying criminals, repressing human sacrifice, etc. The purchase of the Danish forts in 1850, and of the Dutch forts and territory in 1871, led to the consolidation of the British power along the coast; and the Ashanti war of 1873–74 resulted in the extension of the area of British influence.

For a considerable time the Gold Coast had been a virtual dependency of Sierra Leone. In 1874 the Gold Coast and Lagos were created a separate crown colony, this arrangement lasting until 1886 when Lagos was cut off from the Gold Coast administration.

The Struggle for Hinterland.— At this period the partition of Africa had begun, and the British endeavoured to secure, north of Ashanti, an ample hinterland for the Gold Coast. They had to meet not only the keen rivalry of the French, their neighbours on the west (in the Ivory Coast) but also on the east that of the Germans who in 1884 had secured a tiny seaboard at Togo and claimed for it a large hinterland. The Gold Coast had, in addition, further troubles with Ashanti leading finally to the annexation of that country in 1901 (see ASHANTI, History). By that time the disputes with Germany and France had been settled. The Germans, newcomers to the West Coast, had simply sought to get as much elbow room as they could. By an agreement of 1889, which defined the Gold Coast-Togoland frontier, they did very well. But the rivalry between the French and British was much more serious. Advancing from Senegal and the Ivory Coast the French tried to hem in the Gold Coast in the same manner in which they did in fact hem in the Gambia and Sierra Leone. But from 1882 onward British agents had penetrated the country north of Ashanti, prominent among them being George E. Ferguson, a native of West Africa, who had previously explored northern Ashanti. Between 1892 and 1897 Ferguson concluded several treaties guarding British interests. In 1897 Lieut. Henderson and Ferguson occupied Wa, where they were attacked by the ***sofas*** of Samory (*see* SENEGAL, History).

Henderson, who had gone to the ***sofa*** camp to parley, was held prisoner for some time, while Ferguson was killed. A period of considerable tension, arising from the proximity of British and French troops in the disputed territory, was ended by the signature of a convention in Paris (June 14, 1898), in which the western and northern boundaries were defined and the British abandoned their claim to the important town and district of Wagadugu in the Niger bend.

By the agreement with Germany and France, Britain had secured an area north of Ashanti of 30,600sq.m. In 1897 this region was organized under the name of the Northern Territories, as a dependency of the Gold Coast, and placed in the charge of a commissioner. Col. H. P. Northcott (killed in the Boer War, 1899–1902) was the first commissioner and commandant of the troops. The government was at first of a semi-military character, but in 1907 a civilian staff was appointed to carry on the administration. In these northern regions, consisting of open but well-timbered country inhabited by tribes who were both agriculturists and

stock-raisers, steady progress was made. There was considerable transport trade both with Ashanti in the south and the French colonies to the north.

An **Era of** Development.— In the Gold Coast colony a new era began about 1900, the year in which the revolt of the Ashanti was crushed. Sir Matthew Nathan who then became governor began the railway from Sekondi to Kumasi and in other ways initiated a vigorous policy of development, maintained by his successors, notable among whom were Sir John Rodger (governor 1904–10), Sir Hugh Clifford (1912–19) and Sir Gordon Guggisberg (1919–27). Progress was seen in zeal for education (technical as well as literary), sanitation, and a greatly improved standard of living generally. There was a notable increase in the converts to Christianity; and in short a social and economic revolution occurred which even the World War was powerless materially to affect. The chief agent in this transformation was cocoa. The first cocoa plantation had been started in 1879 by a native of Accra. At that time coffee was heing grown and it was not until 1898, when the cultivation of coffee became no longer profitable, that serious attention was paid to cocoa. The natives then took up its cultivation on an ever-increasing scale. By 1900 the export of cocoa had become noteworthy; 20 years later the Gold Coast produced half the world's cocoa crop. The industry is entirely in the hands of the natives, Europeans acting only as purchasers and shippers, and in a decreasing degree, as carriers. The growth of the cocoa industry created private property in real estate, contrary to local custom, under which all lands are communal. Many natives became wealthy and prosperity was general.

On the outbreak of the World War the Gold Coast regiment, under Lieut.-Col. Bryant invaded Togoland and, with some help from French troops from Dahomey, speedily conquered it (Aug. 1914). Subsequently the Gold Coast regiment served both in the Cameroons and in German East Africa where it had a distinguished record. It was regularly supplied with drafts from the colony and at the time of the armistice in 1918 had expanded into a brigade. In other ways the colony gave substantial help in the war, notably by meeting the cost of the occupation of part of Togoland, which was eventually divided into British and French spheres *(see* TOGOLAND).

The "boom" in trade which followed the war, and the depression which succeeded affected the Gold Coast but recovery came quickly. Much attention was paid to providing better communications, not only by railway, but by building roads for motor traffic, while a deep water harbour, opened in April 1928, was built at Takoradi (near Sekondi). Sir Gordon Guggisberg's governorship was notable not only for material progress but for the successful efforts made to improve the social, moral and political condition of the people. In tribal matters the chiefs and their councils already had much power and natives had been nominated to seats on the legislative council of the colony. In 1925 further measures were taken to associate the people with the government. The franchise was granted for the election of the non-official members of the council, and provincial councils of head chiefs were established. In this year the prince of Wales visited the Gold Coast and he gave his name to Achimota college, an institution providing for education up to a university standard, but aiming chiefly at character-building. The college was opened in Jan. 1927, though the buildings were not then completed. The vice-principal was Dr. Kivegyir Aggrey, a Fanti, and the greatest native authority on the education of West Africans. Dr. Aggrey's death, on July 30, 1927, was a loss to the whole of negro Africa.

A notable step had been taken in 1919 when by international agreement the importation of trade spirits into the Gold Coast and the other West African colonies was prohibited. The best authorities were at variance as to the effect of trade gin on the natives, but generally, prohibition was welcomed. As the duty on spirits had been a main source of revenue, other means had to be found to get money. and they included taxes on food. But a succession of good budgets enabled the Government to abolish the food taxes in 1928. Efforts were made to widen the basis of the country's prosperity, but, apart from cocoa, only kola nut cultivation had much attraction for the natives. In its mineral resources however the colony had another valuable asset. Besides the gold mines, manganese ores were found, and from 1921 became an important export. Diamonds and other minerals were also discovered.

BIBLIOGRAPHY.—Of early works *The Golden Coast or a description of Guinney* (1665) and *A New and Accurate Description of the Coast of Guinea,* written, in Dutch, by Willem Bosman, chief factor at Elmina (Eng. trans. 2nd ed., 1721) are the most notable; Col. A. B. Ellis, *A History of the Gold Coast* (1893); W. W. Claridge, *A History of the Gold Coast and the Ashanti* (1915); J. Maxwell, *Gold Coast Handbook* (1923); A. W. Cardinall, *A Gold Coast Library* (1924, bibl.). *See* also the annual reports on the colony published by the Colonial Office. London, and the authorities under ASHANTI.

(F. R. C.)

GOLDCREST or **GOLDEN CRESTED WREN** is the type of a small group placed among the *Sylviidae,* Old World warblers. The goldcrest *(Regulus cristatus)* is the smallest of British birds, its whole length being about $3\frac{1}{2}$ in., and its weight some 5 grams. Generally of an olive-green colour, the top of its head is bright yellow, deepening into orange, and bounded on either side hy a black line The wing coverts are dull black with a whitish bar. The cock has a pleasant but weak song, which has been compared to the squeaking of young mice. The nest is of moss, wool and spiders' webs, lined with feathers, and usually built under and near the end of the branch of a yew, fir or cedar, supported by the interweaving of two or three twigs. The six to ten eggs are dull white, sometimes freckled with reddish-brown. The species lives most of the year in family parties often in company with titmice. Though to be met with in Britain at all seasons, in the autumn large numbers of migrants from northern Europe visit the east coast. A more local European species is the fire-crest *(R. ignicapillus)* recognizable by the black streak on each side of the head, as well as by the deeper colour of its crown. A third species, R. *maderensis,* inhabits the Madeiras. Examples from the Himalayas and Japan are R. *himalayensis* and *R. japonicus.* North America has two species, R. *satrapa,* very like the European *R. ignicapillus,* and the ruby-crowned wren, *R. calendula,* which has a loud and very melodious song.

GOLDEN, a city of Colorado, U.S.A., 14m. W. by N. of Denver, at an altitude of 5,700ft.; the county seat of Jefferson county. It is served by the Colorado and Southern and the Denver and Intermountain (electric) railways. The population in 1940 was 3,175. The Colorado School of Mines (1874) is situated at Golden, and one mi. S. is the State industrial school for boys. The manufactures include china, pottery, drain pipe, bricks, flour and malted milk. There are extensive clay and coal deposits near by. Golden is at the entrance to Denver's system of mountain parks. The city was named after Tom Golden, one of the pioneer prospectors who established a mining camp at this point in 1859. It was incorporated as a town in 1865 and as a city in 1870. From 1862 to 1868 it was the capital of Colorado Territory.

GOLDEN BULL, the general designation of any charter decorated with a golden seal or *bulla.* The name, however, has become practically restricted to a few documents of unusual political importance, the golden bull of the empire, the golden bull of Brabant, the golden bull of Hungary, and the golden bull of Milan—and of these the first is undoubtedly *the* golden bull *par excellence.* The main object of the golden bull was to provide a set of rules for the election of the German kings, or kings of the Romans, as they are called in this document. Since the informal establishment of the electoral college about a century before *(see* ELECTORS), various disputes had taken place about the right of certain princes to vote at the elections, these and other difficulties having arisen owing to the absence of any authoritative ruling. Under these circumstances the emperor Charles IV. determined by an authoritative pronouncement to make such uncertainty impossible in the future, and at the same time to add to his own power and prestige, especially in his capacity as king of Bohemia. In its first form the bull was promulgated at the diet of Nuremberg on Jan. 10, 1356, but it was not accepted by the princes until some modifications had been introduced, and in its final form it was issued at the diet of Metz on Dec. 25 following.

The text of the golden bull consists of a prologue and of 31 chapters. The early chapters are mainly concerned with details

of the elaborate ceremonies which are to be observed on the occasion of an election. The number of electors is fixed at seven, the duke of Saxe-Wittenberg, not the duke of Saxe-Lauenburg, receiving the Saxon vote, and the count palatine, not the duke of Bavaria, obtaining the vote of the Wittelsbachs. The electors were arranged in order of precedence thus: the archbishops of Mainz, of Trier and of Cologne, the king of Bohemia, the count palatine of the Rhine, the duke of Saxony and the margrave of Brandenburg. The work of summoning the electors and of presiding over their deliberations fell to the archbishop of Mainz, but if he failed to discharge this duty the electors were to assemble without summons within three months of the death of a king. Elections were to be held at Frankfort; they were to be decided by a majority of votes, and the subsequent coronation at Aix-la-Chapelle was to be performed by the archbishop of Cologne. During a vacancy in the empire the work of administering the greater part of Germany was entrusted to the count palatine of the Rhine, the duke of Saxony being responsible, however, for the government of Saxony, or rather for the districts ubi Saxonica *jura* servantur.

The chief result of the bull was to add greatly to the power of the electors. To these princes were given sovereign rights in their dominions, which were declared indivisible and were to pass according to the rule of primogeniture. Except in extreme cases, there was to be no appeal from the sentences of their tribunals, and they were confirmed in the right of coining money, of taking tolls, and in other privileges, while conspirators against their lives were to suffer the penalties of treason. One clause gave special rights and immunities to the king of Bohemia, who, it must be remembered, at this time was Charles himself, and others enjoined the observance of the public peace. Provision was made for an annual meeting of the electors, to be held at Metz four weeks after Easter. This arrangement, however, was not carried out, although the electors met occasionally. Another clause forbade the cities to receive *Pfahlbürger, i.e.,* forbade them to take men dwelling outside their walls under their protection. It may be noted that there is no admission whatever that the election of a king needs confirmation from the pope.

GOLDEN CLUB (*Orontium* aquaticum), a North American aquatic plant of the arum family (Araceae), found in shallow ponds and less frequently in swamps from Massachusetts to Florida, chiefly near the coast. It is a somewhat fleshy perennial, with thick oblong, ascending, or floating leaves, 5 to 10 in. long, and bearing in early spring a narrow but dense cluster (spike) of small bright yellow flowers, terminating a flattened stalk, ½ ft. to 2 ft. long, which rises above the water. This handsome aroid, the only species of the genus, is sometimes transplanted in water gardens (see ARACEAE).

GOLDEN-EYE, a name given to a diving duck (Glaucion, or Clangula), breeding in far northern regions, whence it migrates south in winter. It nests in hollow trees. In Scandinavia the people set up artificial nesting-boxes, whence they take toll of the bird's eggs and down. The adult male is mainly black above, with a white eye-patch and scapulars; the lower parts are white; in the female, dark brown replaces black. An elaborate courtship during which the drake may dive and bob up just in front of the female, occurs in the early spring.

Two species inhabit North America. These are Barrow's golden-eye (C. islandica), with a high northern breeding range, and the American golden-eye (C. *c. americana*).

GOLDEN FLEECE, in Greek mythology, the fleece of the ram on which Phrixus and Helle escaped, for which see ARGONAUTS; see also KNIGHTHOOD AND CHIVALRY, section Orders of Knighthood.

GOLDEN GATE, THE, a strait in California, U.S.A., located N. of the city of San Francisco and separating San Francisco bay from the Pacific ocean. The Gate varies in width from a mile to two miles and is about five miles long.' Over it passes the Golden Gate bridge, a suspension bridge with a central span of 4,200 ft., the longest single span in the world at the time of its completion in 1937.

It is possible that the first white man to see the Golden Gate was Sir Francis Drake in 1579, but the more common theory is that Sergeant José Francisco Ortega, a member of an expedition under Don Gaspar de Portola, governor of Lower California, first saw it nearly 200 years later, in 1769. The evidence for even this view is largely circumstantial, however, and there is no definite proof that the strait was discovered before 1772, when a small group of soldiers led by Pedro Fages, who was also serving under Portola, must certainly have seen the Gate.

The name Golden Gate was given to the strait by John Charles Frémont in 1846.

GOLDEN-GLOW, a double-flowered cultivated variety (Rudbeckia laciniata *hortensia*) of the tall cone-flower, native to North America, widely grown in the United States and Canada as an ornamental plant. It is a showy summer bloomer, usually 4 ft. to 7 ft. high, with smooth, much-branched stems, more or less divided leaves and numerous flowering heads 2½ to 3½ in. across, crowded with brilliant golden yellow ray flowers. (See BLACK-EYED SUSAN; CONE-FLOWER.)

GOLDEN HORDE, a body of Tatars who in the middle of the 13th century overran a great portion of eastern Europe and founded in Russia the Tatar khanate, known as the Empire of the Golden Horde or Western Kipchaks.

They invaded Europe about 1237 under the leadership of Bātū Khan, a grandson of Jenghiz Khan, passed over Russia with slaughter and destruction, and penetrated into Silesia, Poland and Hungary, finally defeating Henry II, duke of Silesia, at Liegnitz in the battle known as the Wahlstatt on April 9, 1241. So costly was this victory, however, that Bātū, finding he could not reduce Neustadt, retraced his steps and established himself in his magnificent tent (whence the name "golden") on the Volga. The new settlement was known as Sir Orda ("Golden Camp," whence "Golden Horde"). Very rapidly the powers of Bātū extended over the Russian princes, and so long as the khanate remained in the direct descent from Bāṭū nothing occurred to check the growth of the empire. But the death of Jiini-Beg, in 1357, threw everything into confusion until in 1378 Tōkṭāmish, of the Eastern Kipchaks, succeeded in ousting all rivals. For a short time the glory of the Golden Horde was renewed, but it was finally crushed by Timur in 1395. (See MONGOLS.)

GOLDEN MOLE, the name given to species of the south African family Chrysochloridae of the order Insectivora (*q.v.*) from the bright lustre of their fur. They resemble the true moles (*q.v.*) in habits and, to some extent, in appearance, but dig by means of the enormous claws on the two middle digits of the forelimbs, an adaptation to the hard soil. For their structure and relationships, see INSECTIVORA.

GOLDEN RAGWORT (Senecio aureus), a North American plant of the composite family (Compositae), called also squaw-weed, life-weed and false valerian, found in wet places from Newfoundland to Ontario and Wisconsin and southward to Florida and Texas. It is a slender perennial with strongly scented roots and a smooth stem, 1 to 2 ft. high, bearing large, rounded, heart-shaped, basal leaves on slender stalks and a few narrow, toothed or divided, somewhat clasping stem leaves. The conspicuous golden-yellow flower heads, about ¾ in. across, are borne in a long-stalked, terminal, more or less flat-topped cluster. The plant is a common late spring and early summer wild flower throughout most parts of its range (see SENECIO).

GOLDEN ROD, the popular name for plants of the botanical genus Solidago, of the family Compositae, comprising about 125 species, natives chiefly of North America, a few, however, occurring in the old world and in South America. They are erect perennial herbs, mostly from 2 to 8 ft. high, usually unbranched or slightly branched, with undivided, toothed or entire leaves and very numerous small heads of brilliant yellow (rarely white) flowers arranged in conspicuous terminal or axillary clusters. The European golden rod (S. virgaurea), the only British species, with a stem, usually 1 to 3 ft. high, bearing a long cluster of showy flower heads, is found in woods and thickets. It is one of the best garden plants of the genus, several other species of which are sparingly cultivated for ornament. The golden rods are characteristic plants in eastern North America, where about 60

species occur, many of which are widely distributed and of great abundance. They are found almost everywhere,—in woodlands swamps, on mountains, in fields and along roadsides. With the asters, whose bright colours they complement, the golden rods form one of the chief floral glories of autumn from the great plains eastward to the Atlantic. While numerous handsome species occur in the Rocky mountain region and on the Pacific coast they are less abundant and conspicuous than in the eastern states. Among the best-known eastern species are the early golden rod (S. *juncea*), the late golden rod (S. *serotina*), the tall golden rod (S. altissima), the Canada golden rod (S. canadensis), the dwarf golden rod (*S. nemoralis*), the wreath golden rod (S. caesia), the pale golden rod or white rod (S. bicolor), the sweet golden rod (S. odorata) and the showy golden rod (S. *speciosa*). Among the western species are the western golden rod (*S.* occidentalis), found from the Rocky mountains westward; the California golden rod (S. californica), the *oreja* de *liebre* of the Spanish Californians: and the coast golden rod (S. *spathulata*), of central Californian shores. Some of the species have been demonstrated to be a source of rubber. (See ASTER.)

GOLDEN **ROSE,** an ornament made of wrought gold and set with gems, generally sapphires, which is blessed by the pope on the fourth (Laetare) Sunday of Lent, and usually afterwards sent as a mark of special favour to some distinguished individual, to a church, or a civil community. Formerly it was a single rose of wrought gold, coloured red, but the form finally adopted is a thorny branch with leaves and flowers, the petals of which are decked with gems, surmounted by one principal rose. The origin of the custom is obscure. From very early times popes have given away a rose on the fourth Sunday of Lent, whence the name Dominica Rosae, sometimes given to this feast. The practice of blessing and sending some such symbol (*e.g., eulogiae*) goes back to the earliest Christian antiquity, but the use of the rose itself does not seem to go farther back than the 11th century. Beginning with the 16th century, a letter was sent with the rose, giving the reasons for sending it and recounting the merits and virtues of the receiver. When the change was made from the form of the simple rose to the branch is uncertain. The rose sent by Innocent IV in 1244 to Count Raymond Eerengar IV of Provence was a simple flower without any accessory ornamentation, while the one given by Benedict XI in 1303 or 1304 to the church of St. Stephen at Perugia consisted of a branch garnished with five open and two closed roses enriched with a sapphire, the whole having a value of seventy ducats. The value of the gift varied according to the character or rank of the recipient. Many kings and queens have received this honour at the hands of the pope; and if, in any year, there is deemed to be no worthy recipient the rose is laid up in the Vatican.

Some of the most famous Italian goldsmiths have been employed in making the earlier roses; and such intrinsically valuable objects have, in common with other priceless historical examples of the goldsmith's art, found their way to the melting pot, therefore few specimens are extant. There is one of the 14th century in the Cluny Museum, Paris, believed to have been sent by Clement V to the prince-bishop of Basel; one conferred in 1458 on his native city of Siena by Pope Pius II; and the rose bestowed upon Siena by Alexander VII, a son of that city, is depicted in a procession in a fresco in the Palazzo Pubblico at Siena.

GOLD FERN, a handsome American fern (*Pityrogramma triangularis*), native to the Pacific coast region from Alaska to Lower California, so called because the leaves (fronds) are coated beneath with a bright orange-coloured powder, varying to white. The dark-brown, glossy leaf-stalks (stipes), 6 in. to 12 in. high, rise from the rootstock in tufts, and hear triangular-shaped, somewhat leathery leaves, 3 in. to 4 in. long and broad, more or less deeply cut into rounded lobes. A tropical American species, P. *chrysophylla,* popular in greenhouse cultivation, with golden yellow powder on the under surface of the fronds, is also called gold fern.

GOLDFIELD, a mining town in the desert in south-western Nevada, U.S.A., served by the Tonopah and Goldfield and the Tonopah and Tidewater railways; the county seat of Esmeralda county. The population in 1940 was 554. Gold was discovered there in 1902, two or three years after the lucky strike at Tonopah, 26 mi. north, and Goldfield soon became the largest town in the State. Production was at its peak in 1910–11, with an annual output of about $10,000,000. After 1918 it declined until in 1927 only about 500 tons of ore was mined. Much of the ground has not yet been explored, and in 1941 active prospecting operations were in progress by lessees of the principal mining property.

The Goldfield mines were the scene of a bitter labour struggle. Conflict between the miners (organized as a branch of the Western Federation of Miners) and the operators began early, and there were several set strikes in the year beginning Dec. 1906. From Dec. 6, 1907, to March 7, 1908, Federal troops under Zen. Frederick Funston, sent by President Roosevelt on an appeal from Gov. Sparks, were stationed in the town to maintain order. On their arrival the mine-owners reduced wages and announced that no members of the Western Federation of Miners would be employed. After their withdrawal work was gradually resumed, on the operators' terms, and there has been no union organization since.

GOLDFINCH, Carduelis carduelis, a well-known and beautiful bird found over the greater part of Europe and north Africa, and eastwards to Persia and Turkistan. It is a favourite cage-bird. As a songster it is surpassed by other species, but its docility and attachment to its master or mistress make up for any defect in its vocal powers. In some parts of England the trade in goldfinches is very considerable. The goldfinch decreased markedly in Britain during the later part of the 19th century, but is now becoming more common. Though goldfinches may be observed in the coldest weather, most leave Britain in autumn, returning in spring, and resorting to gardens and orchards to breed. The nest is beautifully neat, generally well hidden by the leafy bough on which it is built. When the broods leave the nest they frequent pastures, commons, heaths and downs in flocks. The goldfinch is very fond of the seeds of thistles and other weeds. It has been introduced into New Zealand, where it has firmly established itself (see Thomson, *Naturalisation* of Animals and *Plants* in New Zealand). Eastward of the range of the present species its place is taken by C. *caniceps,* wanting the black hood and white ear-cdverts of the British bird. Its home seems to be in Central Asia, but it moves southward in winter, being common at that season in Cashmere, In America the term "goldfinch" is applied to *Astragalinus* tristis, a yellow bird with black wings, tail and crown. This bird has a wild yet canary-like love song. (See FINCH.)

GOLDFISH (*Carassius auratus*), a cyprinid fish, like the carp, a native of eastern Asia, but introduced into many other parts of the world. It is closely related to the crucian carp of Europe and northern Asia; both species resemble the common carp in having a long dorsal fin, but differ from it in having no barbels. The goldfish flourishes in ponds and feeds on weeds and small invertebrates. In a wild state the coloration is generally greenish-brown, but specimens may occur with the brown or black pigment absent or restricted to some spots and patches, and bright orange in colour. These golden fish have been bred by the Chinese for centuries, and many strange and even monstrous types have been produced. Fish with silvery patches, or even pure white, are not uncommon; the telescope-fish, with protruding eyes, no dorsal fin and a large trilobed tail-fin, is one of the most extraordinary forms. Goldfish were introduced from China into Japan, and for hundreds of years they have been cultivated in ponds by the Japanese, who have produced new types by cross-breeding; many of these have a long double tail-fin. The most prized variety has a short rounded body, a broad head

covered with protuberances, no dorsal fin and a short double tail-fin; as much as £20–£25 may be given for an exceptional pair. Annual exhibits of this breed are held in Tokyo; fish which are entirely bright red are considered best, but white fish with red fins are much admired.

Escaping from ornamental pools in parks and gardens the goldfish has become naturalized in many ponds and streams of the eastern United States, notably in the Potomac river. In some localities it occurs in sufficient abundance to be marketed as a food fish. Upon resuming life under natural conditions it reverts to its original greenish-brown color, and usually attains a length of from 6 to 12 inches.

See S. Matsubara, "Goldfish and their Culture in Japan," *Bull. U.S. Fish Bureau* (1908); H. M. Smith *Japanese Goldfish* (Washington, 1909).

GOLDIE, SIR GEORGE DASHWOOD TAUBMAN (1846–1925), English administrator, the founder of Nigeria, was born on May 26, 1846, at the Nunnery, Isle of Man, being the youngest son of Lieut.-Colonel John Taubman Goldie-Taubman, speaker of the House of Keys. Sir George resumed his paternal name, Goldie, by royal licence in 1887. He was educated at the Royal Military academy, Woolwich, and for about two years held a commission in the Royal Engineers. He travelled in all parts of Africa, gaining an extensive knowledge of the continent, and first visited the country of the Niger in 1877. He conceived the idea of adding to the British empire the then little known regions of the lower and middle Niger, and for over zo years his efforts were devoted to the realization of this conception. The method by which he determined to work was the revival of government by chartered companies within the empire—a method supposed to be buried with the East India company. The first step was to combine all British commercial interests in the Niger, and this he accomplished in 1879 when the United African company was formed. In 1881 Goldie sought a charter from the imperial government (the 2nd Gladstone ministry). Objections of various kinds were raised. To meet them the capital of the company (renamed the National African company) was increased from £125,000 to £1,000,000, stations were founded on the Niger and the French traders established on the lower river were bought out in 1884. Meantime the Niger coast line had been placed under British protection, and over 400 political treaties—drawn up by Goldie—were made with the chiefs of the lower Niger and the Hausa states. The scruples of the British Government being overcome, a charter was at length granted (July 1886), the National African company becoming the Royal Niger company, with Lord Aberdare as governor and Goldie as vice-governor. In 1895, on Lord Aberdare's death, Goldie became governor of the company, whose destinies he had guided from the time of its foundation under its former name.

The building up of Nigeria as a British state had to be carried on in face of further difficulties raised by French travellers with political missions, and also in face of German opposition. From 1884 to 1890, Prince Bismarck was a persistent antagonist, and the strenuous efforts he made to secure for Germany the basin of the lower Niger and Lake Chad were even more dangerous to Goldie's schemes of empire than the ambitions of France. E. R. Flegel, who had travelled in Nigeria during 1882–84 under the auspices of the British company, was sent out in 1885 by the newly-formed German Colonial society to secure treaties for Germany, which had established itself at Cameroon. After Flegel's death in 1886 his work was continued by his companion Staudinger, while Hoenigsberg was despatched to stir up trouble in the occupied portions of the company's territory,—or, as he expressed it, "to burst up the charter." He was finally arrested at Onitsha, and, after trial by the company's supreme court at Asaba, was expelled from the country. Bismarck then sent out his nephew, von Puttkamer, as German consul-general to Nigeria, with orders to report on this affair, and when this report was published in a White Book, Bismarck demanded heavy damages from the company. Meanwhile Bismarck maintained constant pressure on the British government to compel the Royal Niger company to a division of spheres of influence, whereby Great Britain would have lost a third, and the most valuable part, of the company's territory. But he fell from power in March 1890, and in July following Lord Salisbury concluded the famous "Heligoland" agreement with Germany. After this event the aggressive action of Germany in Nigeria entirely ceased, and the door was opened for a final settlement of the Nigeria-Cameroon frontiers. These negotiatidns, which resulted in an agreement in 1893, were initiated by Goldie as a means of arresting the advance of France into Nigeria from the direction of the Congo. By conceding to Germany a long but narrow strip of territory between Adamawa and Lake Chad, to which she had no treaty claims, a barrier was raised against French expeditions, semi-military and semi-exploratory, which sought to enter Nigeria from the east. Later French efforts at aggression were made from the western or Dahomeyan side, despite an agreement concluded with France in 1890 respecting the northern frontier.

The hostility of certain Fula princes led the company to despatch, in 1897, an expedition against the Mohammedan States of Nupé and Illorin. This expedition was organized and personally directed by Goldie and was completely successful. Internal peace was thus secured, but in the following year the differences with France in regard to the frontier line became acute, and compelled the intervention of the British government. In the negotiations which ensued Goldie preserved for Great Britain the whole of the navigable stretch of the lower Niger. It was, however, evidently impossible for a chartered company to hold its own against the state-supported protectorates of France and Germany, and in consequence, on Jan. 1, 1900, the Royal Niger company transferred its territories to the British government for the sum of £865,000. The ceded territory together with the small Niger Coast Protectorate, already under imperial control, was formed into the two protectorates of northern and southern Nigeria *(see* further NIGERIA).

In 1903–04, at the request of the Chartered company of South Africa, Goldie visited Rhodesia and examined the situation in connection with the agitation for self-government by the Rhodesians. In 1902–03 he was one of the royal commissioners who inquired into the military preparations for the war in South Africa (1899–1902) and into the operations up to the occupation of Pretoria, and in 1905–06 was a member of the royal commission which investigated the methods of disposal of war stores after peace had been made. In 1905 he was elected president of the Royal Geographical society and held that office for three years. From 1908 to 1919 he was an alderman of the London County Council, on which he served as chairman of the finance committee. Goldie was created K.C.M.G. in 1887, and a privy councillor in 1898. From 1905 to 1914, and from 1915 to 1920 he was president of the National Defence Association. He died in London on Aug. 22, 1925.

GOLDING, ARTHUR (c. 1536–*c.* 1605), English translator, son of John Golding of Belchamp St. Paul and Halsted, Essex, one of the auditors of the exchequer, was born probably in London about 1536. In 1549 he was already in the service of Protector Somerset. He seems to have resided for some time in the house of Sir William Cecil, in the Strand, with his nephew, the poet, the 17th earl of Oxford, whose receiver he was, for two of his dedications are dated from Cecil House. His chief work is his translation of Ovid. *The Fyrst Fower Bookes of P. Ovidius Nasos worke, entitled Metamorphosis, translation oute of Latin into Englishe meter* (1565), was supplemented in 1567 by a translation of the 1j books. Strangely enough the translator of Ovid was a man of strong Puritan sympathies, and he translated many of the works of Calvin. Golding translated also the *Commentaries* of Caesar (1565), Theodore Beza's *Tragedie of Abraham's Sacrifice* (1577) and the *De Beneficiis* of Seneca (1578). He completed a translation begun by Sidney from Philippe de Mornay, *A Worke concerning the Trewnesse of the Christian Religion* (1587, 3rd ed., 1604).

See the reissue of Golding's translation of Theodore Beza's *Tragedie of Abraham's Sacrifice* in the University of Toronto Studies, Philological Series (1906), which contains a biographical notice and complete bibliography.

GOLDINGEN (Lettish, *Kuldiga*), a town of western Courland in Latvia, 55 mi. by rail N.E. of Libau, and on Windau river, in 56° 58' N. and 22° E. Population 6,921. It has several small industries including leather, woollen goods, food products, needles and other metal industries, matches and other products of wood. There are glass works and lime kilns in the neighbourhood, and ruins of a castle of the Teutonic Knights, built in 1248.

GOLDMAN, EMMA (1869–1940), international anarchist, was born in Kovno. Lithuania, on June 27, 1869, daughter of the manager of the subsidized theatre there. Her youth was spent in Konigsberg and St. Petersburg. When she was 17 years old she went to the U.S. and worked in a factory in Rochester, N.Y., and later in New Haven, Conn., where she first became associated with anarchists and espoused their views. In 1889 she went to New York city, where she met Alexander Berkman, who attempted to assassinate Henry C. Frick in Pittsburgh during the Homestead steel strike in 1892.

She resumed the association after Berkman completed a 14-year sentence in prison. She was sent to prison herself in 1893 for inciting a riot. During World War I she and Berkman were convicted of interfering with war preparations and mere sentenced to prison. Both were deported from the United States Dec. 1, 1919. They went to Russia but disapproved of the soviet regime and travelled to England and thence to Canada. She edited anarchist periodicals and was the author of two books on the U.S.S.R. She died in Toronto, May 14, 1940.

GOLDMARK, KARL (1832–1915), Hungarian composer, was born at Keszthely-am-Plattensee, Hungary, on May 18, 1832, the son of a poor cantor in the local Jewish synagogue. On a cheap violin and home-made flute, the future composer first gave rein to his musical ideas. After the revolution of 1848 he was to have been shot for a spy, and was only saved at the eleventh hour by the happy arrival of a former colleague. There followed the *Sakuntala* and Penthesilea overtures, showing the influence of Wagner, and the delightful Landliche Hochzeit symphony, which carried his fame abroad. His first and best opera, Die *Königin von* Saba (Vienna, 1873), was followed in Nov. 1886, also at Vienna, by Merlin, much of which was afterwards rewritten. A third opera, a version of Dickens' Cricket on the Hearth, was given by the Royal Carl Rosa company in London in 1900. He died at Vienna on Jan. 2, 1915.

See *Erinnerungen* aus *meinen* Leben (Vienna, 1923).

GOLDONP, CARLO (1707–1793), Italian dramatist, the real founder of modern Italian comedy, was born at Venice, on Feb. 25, 1707. His father, Giulio, was a native of Modena. The young Goldoni ran away with a Venetian company of players. He began to study law at Venice, then went to continue the same pursuit at Pavia, but at that time he was studying the Greek and Latin comic poets much more and much better than books about law. For a satire entitled *Il* Colosso, which attacked the honour of several families of Pavia, he was driven from that town.

The wish to write for the stage was always strong in him, and he tried to do so; he made, however, a mistake in his choice, and began with a tragedy, *Amalasunta,* which was represented at Milan and proved a failure. In 1734 he wrote another tragedy, *Belisario,* which, though not much better, chanced nevertheless to please the public. This first success encouraged him to write other tragedies, some of which were well received; but the author himself saw clearly that he had not yet found his proper sphere, and that a radical dramatic reform was absolutely necessary for the stage. He wished to create comedy of character in Italy, to follow the example of Molière, and to delineate the realities of social life in as natural a manner as possible. His first essay of this kind was *Momolo Cortesan* (Momolo the Courtier), written in the Venetian dialect, and based on his own experience. Other plays followed—some interesting from their subject, others from the characters; the best of that period are: Le Trentadue *Disgrazie d' Arlecchino,* La Notte *critica,* La *Bancarotta,* La Donna *di* Garbo. While consul of Genoa at Venice, he was cheated by a captain of Ragusa, and founded on this incident a play, *L'Impostore.* At Leghorn he made the acquaintance of the comedian Medebac, and followed him to Venice, with his company, for which he began to write his best plays. The whole social life of Venice is to be found in Goldoni's plays. Once he promised to write 16 comedies in a year, and kept his word; among the 16 are some of his very best, such as *Il Caffè, Il* Bugiardo, La Pamela. When he left the company of Medebac, he passed over to that maintained by the patrician Vendramin, continuing to write with the greatest facility. But Vendramin was tyrannical, and the purists of the day were constantly attacking Goldoni's work (see Gozzi). Goldoni accepted the post of manager of the Italian theatre in Paris in 1761. Before leaving Venice he wrote *Una* delle *ultime* sere di *Carnevale* (One of the Last Nights of Carnival), an allegorical comedy in which he said good-bye to his country. At the end of the representation of this play, the theatre resounded with applause, and with shouts expressive of good wishes. Goldoni, at this proof of public sympathy, wept like a child.

At Paris, during two years, he wrote comedies for the Italian actors; then he taught Italian to the royal princesses; and for the wedding of Louis XVI and of Marie Antoinette he wrote in French one of his best comedies, Le *Bourru* bienfaisant, which was a great success. When he retired from Paris to Versailles, the king made him a gift of 6,000 francs, and fixed on him an annual pension of 1,200 francs. It was at Versailles he wrote his Memoirs, which occupied him till he reached his 80th year. The Revolution deprived him all at once of his modest pension and reduced him to extreme misery; he dragged on his unfortunate existence till Feb. 6, 1793. The day after, on the proposal of André Chenier, the Convention agreed to give the pension back to the poet, and as it was too late, a reduced allowance was granted to his widow.

The best comedies of Goldoni are: La Donna di *Garbo,* La *Bottega di Caffè,* Pamela nubile, Le *Baruffe* chiozzotte, I Rusteghi, Todero Brontolon, *Gli* Innamorati, *Il* Ventaglio, *Il* Bugiardo, Lo Casa nova, *Il Burbero benefico,* La Locandiera.

A collected edition of the plays (44 vols., Venice, 1788) was republished at Florence in 1827. The standard edition is that arranged by the city of Venice, *Opere* complete (20 vols., Venice, 1907–17). The Memoirs (best ed. by Mazzoni, 1907) were translated into English by John Black (Boston, 1877), with preface by W. D. Howells. See A. de Gubernatis, *Carlo Goldoni* (Florence, 1911), a course of lectures delivered at Rome in 1901–11; H. C. Chatfield-Taylor, Goldoni (1914).

GOLD PRODUCTION: see PHYSICAL RESOURCES: Precious *Metals Group:* Gold.

GOLD RESERVES. By tradition, currency is metallic, gold, silver, copper or an alloy. The basic coin in most western countries has been gold. Banks issued notes which were a promise to pay gold on demand. Also they accepted deposits withdrawable in gold. For this purpose they held a reserve of gold available at any time for the discharge of these obligations. The reserve was not as large as the corresponding liabilities to pay, for the assumption was that all holders of notes and all depositors would not apply for gold at the same time. A run on a bank meant that such customers, moved by misgivings, applied for payment simultaneously.

National treasuries have issued, or permitted banks to issue, paper money which is valued in terms of gold. As in the case of banks, the assumption was that holders of this money could obtain gold for it at any time by applying in the proper quarter; and gold up to a percentage of currency was held by the treasury or its agents. During and after World War I many governments, financially hard pressed, withheld gold from their own people, who were therefore compelled to use paper as the only alternative. In Great Britain the price of gold rose, and large accumulations of domestic ornaments were brought into the market. Italy (1936) went so far as to help finance her Ethiopian War by appealing to wives to surrender their wedding rings.

As a result of the depression and of the banking crisis, the United States congress passed a law in 1933 enabling the president to devalue the dollar by not over 50%. By presidential action all gold certificates were called in and the dollar devalued by approximately 40%. The gold reserve of the government, then about $2,500,000,000, rose until in Oct. 1939 it was over $16,970,000,000, well over half the world's gold reserves, and much more than the total outstanding currency in the United States.

GOLDS: *see* TUNGUSES.

GOLDSBORO, a city of North Carolina, U.S.A., on the Neuse river, 50 mi. S.E of Raleigh; the county seat of Wayne county. It is on federal highways 70 and 117, and is served by the Atlantic Coast Line, the Atlantic and East Carolina and the Southern railways. The population was 11,296 in 1920 (43% Negroes) and 17,274 in 1940. It is an important market and shipping point for bright-leaf tobacco, cotton and early vegetables, and has over 30 substantial manufacturing establishments, with an output in 1940 valued at $8,500,000. The state Oddfellows' orphan home and a state hospital for insane Negroes are situated there. Goldsboro was settled in 1838 and incorporated in 1841. Between 1910 and 1920 the population almost doubled. Since 1920 it has had a commission-manager form of government. In the campaign of 1865 the Union armies under Sherman and Schofield united there before the final advance to Greensboro.

GOLBSCHMIDT, HENRIETTE BENAS (1825–1920), German feminist educator, was born at Krotoschin, in the Prussian province of Posen, the daughter of a well-to-do merchant. From her stepmother she derived little encouragement for learning, and her formal education was meagre, but she and a gifted sister had serious dispositions and enlarged their minds by reading. Henriette acted as guardian to her sister's orphans and then married her uncle, a rabbi of Leipzig. After she became acquainted with Louise Otto-Peters, promoter of the *Allgemeine Deutsche Frauenverein,* she served on its first board, in 1865. In 1867 she drafted its petition for the admission of girls to higher schools, and in her long association with the *Allgemeine Deutsche Frauenverein* she framed most of its petitions. A disciple of Froebel, she founded a society in 1871 which eventually established public kindergartens, training schools for kindergarten teachers, and vocational schools for girls. In 1872 she began teaching advanced courses in training schools for kindergarten teachers. An "archdemocrat," she played a prominent role in the liberalization of education in Leipzig. Her last years were spent in an apartment within the first public vocational school for girls which had come into existence by her pressure. She published treatises on pedagogical problems, imbued with her own teaching experiences, and her forceful, apt maxims have been widely quoted in German publications dealing with education. On her 80th birthday she was awarded the *Carola Medaille* in honour of her contributions to the cause of education. Though Louise Otto-Peters and Auguste Schmidt are better remembered as fellow feminists, Henriette Goldschmidt had a powerful influence no less than they.

GOLDSCHMIDT, HERMANN (1802–1866), German painter and astronomer, was the son of a Jewish merchant, and was born at Frankfurt on June 17, 1802. He settled in Paris, where he painted a number of pictures. Between 1852 and 1861 he discovered 14 asteroids between Mars and Jupiter. His solar observations, made during the total eclipse on July 10, 1860, are included in the work of Madler on the eclipse, published in 1861. Goldschmidt died at Fontainebleau on Aug. 26, 1866.

GOLDSMID, the name of a family of Anglo-Jewish bankers sprung from Aaron Goldsmid (d. 1782), a Dutch merchant who settled in England about 1763. Two of his sons, Benjamin Goldsmid (c. 1753–1808) and Abraham Goldsmid (c. 1756–1810), set up as bill-brokers in London in 1777 and became great powers in the money market, during the Napoleonic war, through their dealings with the government. Abraham Goldsmid was in 1810 joint contractor with the Barings for a government loan, but owing to a depreciation of the scrip he was forced into bankruptcy and committed suicide, as his brother had done.

Their nephew, Sir Isaac Lyon Goldsmid, Bart. (1778–1859), connected with a firm of bullion brokers to the Bank of England and the East India company, was made Baron da Palmeira by the Portuguese government in 1846 for services rendered in settling a monetary dispute between Portugal and Brazil, but he is chiefly known for his efforts to obtain the emancipation of the Jews in England and for his part in founding University college, London. The Jewish Disabilities bill owed its final passage to Goldsmid's energetic work. He helped to establish the University College hospital in 1834, aided in the efforts to obtain reform in the English penal code, and financially assisted the building of the English southern railways and the London docks. In 1841 he became the first Jewish baronet. His second son, Sir Francis Henry Goldsmid, Bart. (1808–1878), born in London, and the first Jew to become an English barrister, entered parliament in 1860 as member for Reading. He was succeeded in the baronetcy by his nephew, Sir Julian Goldsmid, Bart. (1838–1896).

Another distinguished member of the same family, Sir Frederic John Goldsmid (1818–1908), grandson of Benjamin Goldsmid (*see* above), was educated at King's college, London, and entering the Madras army in 1839 served in the China War of 1840–41, with the Turkish troops in eastern Crimea in 1855–56, and during the Egyptian campaign. From 1865 to 1870 he was director-general of the Indo-European telegraph, and carried through the telegraph convention with Persia; and between 1870 and 1872, as commissioner, he settled with Persia the difficult questions of the Perso-Baluch and Perso-Afghan boundaries. In 1881–82 he was in Egypt, as controller of the Daira Sanieh, and in 1883 he went to the Congo, on behalf of the king of the Belgians.

GOLDSMITH, OLIVER (1728–1774), English poet, playwright, novelist and man of letters, came of a Protestant and Saxon family which had long been settled in Ireland. He is usually said to have been born at Pallas or Pallasmore, County Longford; but recent investigators have contended, with much probability, that his true birthplace was Smith-Hill house, Elphin, Roscommon, the residence of his mother's father, the Rev. Oliver Jones. His father, Charles Goldsmith, lived at Pallas, supporting with difficulty his wife and children on what he could earn, partly as a curate and partly as a farmer.

Youth.—While Oliver was still a child his father was presented to the living of Kilkenny West, in the county of West Meath. This was worth about £200 a year. The family accordingly quitted their cottage at Pallas for a spacious house on a frequented road, near the village of Lissoy. Here the boy was taught his letters by a relative and dependent, Elizabeth Delap, and was sent in his seventh year to a village school kept by an old quartermaster on half-pay, who professed to teach nothing but reading, writing and arithmetic, but who had an inexhaustible fund of stories about ghosts, banshees and fairies, about the great Rapparee chiefs, Baldearg O'Donnell and Galloping Hogan, and about the exploits of Peterborough and Stanhope, the surprise of Monjuich and the glorious disaster of Brihuega. This man must have been of the Protestant religion; but he was of the aboriginal race, and not only spoke the Irish language, but could pour forth unpremeditated Irish verses. Oliver early became, and through life continued to be, a passionate admirer of the Irish music, and especially of the compositions of Carolan, some of the last notes of whose harp he heard. It ought to be added that Oliver, though by birth one of the Englishry, and though connected by numerous ties with the Established Church, never showed the least sign of that contemptuous antipathy with which, in his days, the ruling minority in Ireland too generally regarded the subject majority. So far indeed was he from sharing in the opinions and feelings of the caste to which he belonged that he conceived an aversion to the Glorious and Immortal Memory, and, even when George III was on the throne, maintained that nothing but the restoration of the banished dynasty could save the country.

From the humble academy kept by the old soldier, Goldsmith was removed in his ninth year. He went to several grammar-schools, and acquired some knowledge of the ancient languages. His life at this time seems to have been far from happy. He had, as appears from the admirable portrait of him by Reynolds at Knole, features harsh even to ugliness. The smallpox had set its mark on him with more than usual severity. His stature was small, and his limbs ill put together. Among boys little tenderness is shown to personal defects; and the ridicule excited by poor Oliver's appearance was heightened by a peculiar simplicity and a disposition to blunder which he retained to the last. He became the common butt of boys and masters, was pointed at as

a fright in the playground, and flogged as a dunce in the schoolroom. When he had risen to eminence, those who had once derided him ransacked their memory for the events of his early years, and recited repartees and couplets which had dropped from him, and which, though little noticed at the time, were supposed, a quarter of a century later, to indicate the powers which produced the *Vzcar of Wakefield* and the *Deserted Village.*

On June 11, 1744, being then in his 16th year, Oliver went up to Trinity college, Dublin, as a sizar. The sizars paid nothing for food and tuition, and very little for lodging; but they had to perform some menial services from which they have long been relieved. Goldsmith was quartered, not alone, in a garret of what was then No. 35 in a range of buildings which has long since disappeared. His name, scrawled by himself on one of its window-panes, is still preserved in the college library. From such garrets many men of less parts than his have made their way to the woolsack or to the episcopal bench. But Goldsmith, while he suffered all the humiliations, threw away all the advantages of his situation. He neglected the studies of the place, stood low at the examinations, was turned down to the bottom of his class for playing the buffoon in the lecture room, was severely reprinianded for pumping on a constable, and was caned by a brutal tutor for giving a ball in the attic story of the college to some gay youths and damsels from the city.

The **Continent.**—While Oliver was leading at Dublin a life divided between squalid distress and squalid dissipation, his father died, leaving a mere pittance. In Feb. 1749 the youth obtained his bachelor's degree and left the university. During some time the humble dwelling to which his widowed mother had retired was his home. He mas now in his 21st year; it was necessary that he should do something; and his education seemed to have fitted him to do nothing but to dress himself in gaudy colours, of which he was as fond as a magpie, to take a hand at cards, to sing Irish airs, to play the flute, to angle in summer and to tell ghost stories by the fire in winter. He tried five or six professions in turn without success. He applied for ordination; but, as he applied in scarlet clothes, he was speedily turned out of the episcopal palace. He then became tutor in an opulent family, but soon quitted his situation in consequence of a dispute about pay. Then he determined to emigrate to America. His relations, with much satisfaction, saw him set out for Cork on a good horse, with £30 in his pocket. But in six weeks he came back on a miserable hack, without a penny, and informed his mother that the ship in which he had taken his passage, having got a fair wind while he was at a party of pleasure, had sailed without him. Then he resolved to study the law. A generous uncle, Mr. Contarine, advanced £50. With this sum Goldsmith went to Dublin, was enticed into a gaming house and lost every shilling. He then thought of medicine. A small purse was made up; and in his 24th year he was sent to Edinburgh. At Edinburgh he passed 18 months in nominal attendance on lectures, and picked up some superficial information about chemistry and natural history. Thence he went to Leyden, still pretending to study physic. He left that celebrated university, the third at which he had resided, in his 27th year, without a degree, with the merest smattering of medical knowledge, and with no property but his clothes and his flute. His flute, however, proved a useful friend. He rambled on foot through Flanders, France and Switzerland, playing tunes which everywhere set the peasantry dancing, and which often procured for him a supper and a bed. He wandered as far as Italy. His musical performances, indeed, were not to the taste of the Italians; hut he contrived to live on the alms which he obtained at the gates of convents. It should, however, be observed that the stories which he told about this part of his life ought to be received with great caution; for strict veracity was never one of his virtues; and a man who is ordinarily inaccurate in narration is likely to be more than ordinarily inaccurate when he talks about his own travels. Goldsmith, indeed, was so regardless of truth as to assert in print that he was present at a most interesting conversation between Voltaire and Fontenelle, and that this conversation took place at Paris. Now it is certain that Voltaire never was within 100 leagues of Paris during the whole time which Goldsmith passed on the continent.

In London.—In Feb. 1756 the wanderer landed at Dover, without a shilling, without a friend and without a calling. He had indeed, if his own unsupported evidence may be trusted, obtained a doctor's degree on the continent; but this dignity proved utterly useless to him. In England his flute was not in request; there were no convents; and he was forced to have recourse to a series of desperate expedients. There is a tradition that he turned strolling player. He pounded drugs and ran about London with phials for charitable chemists. He asserted, upon one occasion, that he had lived "among the beggars in Axe Lane." He was for a time usher of a school, and felt the miseries and humiliations of this situation so keenly that he thought it a promotion to be permitted to earn his bread as a bookseller's hack; but he soon found the new yoke more galling than the old one, and was glad to become an usher again. He obtained a medical appointment in the service of the East India company; but the appointment was speedily revoked. Why it was revoked we are not told. The subject was one on which he never liked to talk. It is probable that he was incompetent to perform the duties of the place. Then he prcscntcd himself at Surgeons' hall for cxaniination, as "mate to an hospital." Even to so humble a post he was found unequal. Nothing remained but to return to the lowest drudgery of literature. Goldsmith took a room in a tiny square off Ludgate hill, to which he had to climb from Sea-coal lane by a dizzy ladder of flagstones called Breakneck Steps. Green Arbour court and the ascent have long disappeared. Here, at 30, the unlucky adventurer sat down to toil like a galley slave. Already, in 1758, during his first bondage to letterg, he had translated Marteilhe's remarkable *Memoirs of a Protestant, Condemned to the Galleys of France for his Religion.* In the years that now succeeded he sent to the press some things which have survived, and many which have perished. He produced articles for reviews, magazines and newspapers; children's books, which, bound in gilt paper and adorned with hideous woodcuts, appeared in the window of Newbery's once far-famed shop at the corner of Saint Paul's churchyard; *An Inquiry info the State of Polite Learning in Europe,* which, though of little or no value, is still reprinted among his works; a volume of essays entitled *The Bee;* a *Life of Beau Nash;* a superficial and incorrect, but very readable. *History of England,* in a series of letters purporting to be addressed by a nobleman to his son; and some very lively and amusing sketches of London society in another series of letters purporting to be addressed by a Chinese traveller to his friends.

All these works were anonymous; but some of them mere well known to be Goldsmith's; and he gradually rose in the estimation of the booksellers for whom he drudged. He was, indeed, emphatically a popular writer. For accurate research or grave disquisition he was not well qualified by nature or by education. He knew nothing accurately; his reading had been desultory; nor had he meditated deeply on what he had read. He had seen much of the world; but he had noticed and retained little more of what he had seen than some grotesque incidents and characters which had happened to strike his fancy. But, though his mind was very scantily stored with materials, he used what materials he had in such a way as to produce a wonderful effect. There have been many greater writers; but perhaps no writer was ever more uniformly agreeable. His style was always pure and easy, and, on proper occasions, pointed and energetic. His narratives were always amusing, his descriptions always picturesque, his humour rich and joyous, yet not without an occasional tinge of amiable sadness. About everything that he wrote, serious or sportive, there was a certain natural grace and decorum, hardly to be expected from a man a great part of whose life had been passed among thieves and beggars, streetwalkers and merry-andrews, in those squalid dens which are the reproach of great capitals.

The Man **of** Letters.—As his name gradually became known, the circle of his acquaintance widened. He was introduced to Johnson, who was then considered as the first of living English writers; to Reynolds, the first of English painters; and to Burke who had not yet entered parliament, but had distinguished himself greatly by his writings and by the eloquence of his con-

versation. With these eminent men Goldsmith became intimate. In 1763 he was one of the nine original members of that celebrated fraternity which has sometimes been called the Literary club, but which always disclaimed that epithet, and gloried in the simple name of the Club.

By this date Goldsmith had quitted his miserable dwelling at the top of Breakneck Steps, and, after living for some time at No. 6 Wine Office court, Fleet street, had moved into the Temple. But he was still often reduced to pitiable shifts, the most popular of which is connected with the sale of his solitary novel, the *Vicar of Wakefield*. Toward the close of 1764(?) his rent is alleged to have been so long in arrear that his landlady one morning called in the help of a sheriff's officer. The debtor, in great perplexity, dispatched a messenger to Johnson; and Johnson, always friendly, though often surly, sent back the messenger with a guinea, and promised to follow speedily. He came, and found that Goldsmith had changed the guinea and was railing at the landlady over a bottle of Madeira. Johnson put the cork into the bottle and entreated his friend to consider calmly how money was to be procured. Goldsmith said that he had a novel ready for the press. Johnson glanced at the manuscript, saw that there were good things in it, took it to a bookseller, sold it for £60 and soon returned with the money. The rent was paid, and the sheriff's officer withdrew. (Unfortunately, however, for this time-honoured version of the circumstances, it was later discovered that as early as Oct. 1762 Goldsmith had already sold a third of the *Vicar* to one Benjamin Collins of Salisbury, a printer, by whom it was eventually printed for F. Newbery, and it is difficult to reconcile this fact with Johnson's narrative.)

Traveller and Vicar of Wakefield. — But before the *Vicar of Wakefield* appeared in 1766, came the great crisis of Goldsmith's literary life. In Christmas week 1764 he published a poem, entitled the *Traveller*. It was the first work to which he had put his name, and it at once raised him to the rank of a legitimate English classic. The opinion of the most skilful critics was that nothing finer had appeared in verse since the fourth book of the *Dunciad*. In one respect the *Traveller* differs from all Goldsmith's other writings. In general his designs were bad and his execution good. In the *Traveller* the execution, though deserving of much praise, is far inferior to the design. No philosophical poem, ancient or modern, has a plan so noble, and at the same time so simple. An English wanderer, seated on a crag among the Alps, near the point where three great countries meet, looks down on the boundless prospect, reviews his long pilgrimage, recalls the varieties of scenery, of climate, of government, of religion, of national character, which he has observed, and comes to the conclusion, just or unjust, that our happiness depends little on political institutions, and much on the temper and regulation of our own minds.

While the fourth edition of the *Traveller* was on the counters of the booksellers, the *Vicar of Wakefield* appeared, and rapidly obtained a popularity which has lasted down to our own time, and which is likely to last as long as the English language. The fable is indeed one of the worst that ever was constructed. It wants, not merely that probability which ought to be found in a tale of common English life, but that consistency which ought to be found even in the wildest fiction about witches, giants and fairies. But the earlier chapters have all the sweetness of pastoral poetry, together with all the vivacity of comedy. Moses and his spectacles, the vicar and his monogamy, the sharper and his cosmogony, the squire proving from Aristotle that relatives are related, Olivia preparing herself for the arduous task of converting a rakish lover by studying the controversy between Robinson Crusoe and Friday, the great ladies with their scandal about Sir Tomkyn's amours and Dr. Burdock's verses, and Mr. Burchell with his "Fudge," have caused as much harmless mirth as has ever been caused by matter packed into so small a number of pages. The latter part of the tale is unworthy of the beginning. As we approach the catastrophe, the absurdities lie thicker and thicker, and the gleams of pleasantry become rarer and rarer.

The success which had attended Goldsmith as a novelist emboldened him to try his fortune as a dramatist. He wrote the *Good Natur'd Man*, a piece which had a worse fate than it deserved. Garrick refused to produce it at Drury Lane. It was acted at Covent Garden in Jan. 1768, but was coldly received. The author, however, cleared, by his benefit nights. and by the sale of the copyright, no less than £500, five times as much as he had made by the *Traveller* and the *Vicar of Wakefield* together. The plot of the *Good Natur'd Man* is, like almost all Goldsmith's plots, very ill constructed. But some passages are exquisitely ludicrous — much more ludicrous indeed than suited the taste of the town at that time. A canting, mawkish play. entitled *False Delicacy*, had just been produced, and sentimentality was all the mode. During some years more tears were shed at comedies than at tragedies; and a pleasantry which moved the audience to anything more than a grave smile was reprobated as low. It is not strange, therefore, that the very best scene in the *Good Natur'd Man*, that in which Miss Richland finds her lover attended by the bailiff and the bailiff's follower in full court dresses, should have been mercilessly hissed, and should have been omitted after the first night, not to be restored for several years.

The Deserted Village. — In May 1770 appeared the *Deserted Village*. In mere diction and versification this celebrated poem is fully equal, perhaps superior, to the *Traveller;* and it is generally preferred to the *Traveller* by that large class of readers who think, with Bayes in the *Rehearsal*, that the only use of a plot is to bring in fine things. More discerning judges, however, while they admire the beauty of the details, are shocked by one unpardonable fault which pervades the whole. The fault which we mean is not that theory about wealth and luxury which has so often been censured by political economists. The theory is indeed false; but the poem, considered merely as a poem, is not necessarily the worse on that account. The finest poem in the Latin language — indeed, the finest didactic poem in any language — was written in defense of the silliest and meanest of all systems of natural and moral philosophy. A poet may easily be pardoned for reasoning ill; but he cannot be pardoned for describing ill, for observing the world in which he lives so carelessly that his portraits bear no resemblance to the originals, for exhibiting as copies from real life monstrous combinations of things which never were and never could be found together. What would be thought of a painter who should mix August and January in one landscape, who should introduce a frozen river into a harvest scene? Would it be a sufficient defense of such a picture to say that every part was exquisitely coloured, that the green hedges, the apple trees loaded with fruit, the wagons reeling under the yellow sheaves, and the sunburned reapers wiping their foreheads were very fine, and that the ice and the boys sliding were also very fine? To such a picture the *Deserted Village* bears a great resemblance. It is made up of incongruous parts. The village in its happy days is a true English village. The village in its decay is an Irish village. The felicity and the misery which Goldsmith has brought close together belong to two different countries and to two different stages in the progress of society. He had assuredly never seen in his native island such a rural paradise, such a seat of plenty, content and tranquillity, as his Auburn. He had assuredly never seen in England all the inhabitants of such a paradise turned out of their homes in one day and forced to emigrate in a body to America. The hamlet he had probably seen in Kent; the ejectment he had probably seen in Munster; but by joining the two, he has produced something which never was and never will be seen in any part of the world.

She Stoops to Conquer. — In 1773 Goldsmith tried his chance at Covent Garden with a second play. *She Stoops to Conquer*. The manager was, not without great difficulty, induced to bring this piece out. The sentimental comedy still reigned, and Goldsmith's comedies were not sentimental. The *Good Natur'd Man* had been too funny to succeed; yet the mirth of the *Good Natur'd Man* was sober when compared with the rich drollery of *She Stoops to Conquer*, which is, in truth, an incomparable farce in five acts On this occasion, however, genius triumphed. Pit, boxes and galleries were in a constant roar of laughter. If any bigoted admirer of Kelly and Cumberland ventured to hiss or groan. hc was speedily silenced by a general cry of "turn him out,"

or "throw him over." Later generations have confirmed the verdict which was pronounced on that night.

While Goldsmith was writing the *Deserted Village* and *She Stoops to Conquer*, he was employed on works of a very different kind — works from which he derived little reputation but much profit. He compiled for the use of schools a *History of Rome*, by which he made £250; a *History of England*, by which he made £500; a *History of Greece*, for which he received £250; a *Natural History*, for which the booksellers covenanted to pay him 800 guineas. These works he produced without any elaborate research, by merely selecting, abridging and translating into his own clear, pure and flowing language what he found in books well known to the world, but too bulky or too dry for boys and girls. He committed some strange blunders, for he knew nothing with accuracy. Thus, in his *History of England*, he tells us that Naseby is in Yorkshire; nor did he correct this mistake when the book was reprinted. He was very nearly hoaxed into putting into the *History* of *Greece* an account of a battle between Alexander the Great and Montezuma. In his *Animated Nature* he relates, with faith and with perfect gravity, all the most absurd lies which he could find in books of traveis about gigantic Patagonians, monkeys that preach sermons, nightingales that repeat long conversations. "If he can tell a horse from a cow," said Johnson, "that is the extent of his knowledge of zoology." How little Goldsmith was qualified to write about the physical sciences is sufficiently proved by two anecdotes. He on one occasion denied that the sun is longer in the northern than in the southern signs. It was vain to cite the authority of Maupertuis. "Maupertuis!" he cried, "I understand those matters better than Maupertuis." On another occasion he, in defiance of the evidence of his own senses, maintained obstinately, and even angrily, that he chewed his dinner by moving his upper jaw.

Yet, ignorant as Goldsmith was, few writers have done more to make the first steps in the laborious road to knowledge easy and pleasant His compilations are widely distinguished from the compilations of ordinary bookmakers. He was a great, perhaps an unequalled, master of the arts of selection and condensation. In these respects his histories of Rome and of England, and still more his own abridgments of these histories, well deserved to be studied. In general nothing is less attractive than an epitome; but the epitomes of Goldsmith, even when most concise, are always amusing; and to read them is considered by intelligent children not as a task but as a pleasure.

Personality. — Goldsmith might now be considered as a prosperous man. He had the means of living in comfort, and even in what to one who had so often slept in barns and on bulks must have been luxury. His fame was great and was constantly rising. He lived in what was intellectually far the best society of the kingdom, in a society in which no talent or accomplishment was wanting, and in which the art of conversation was cultivated with splendid success There probably were never four talkers more admirable in four different ways than Johnson, Burke, Beauclerk and Garrick; and Goldsmith was on terms of intimacy with all the four. He aspired to share in their colloquial renown, but never was ambition more unfortunate. It may seem strange that a man who wrote with so much perspicuity, vivacity and grace should have been, whenever he took a part in conversation, an empty, noisy, blundering rattle. But on this point the evidence is overwhelming. So extraordinary was the contrast between Goldsmith's published works and the silly things which he said, that Horace Walpole described him as an inspired idiot. "Noll," said Garrick, "wrote like an angel, and talked like poor Poll." Chamier declared that it was a hard exercise of faith to believe that so foolish a chatterer could have really written the *Travellev*. Even Boswell could Say, with contemptuous compassion, that he liked very well to hear honest Goldsmith run on. "Yes, sir," said Johnson, "but he should not like to hear himself." Minds differ as rivers differ. There are transparent and sparkling rivers from which it is delightful to drink as they flow; to such rivers the minds of such men as Burke and Johnson may be compared. But there are rivers of which the water when first drann is turbid and noisome, but becomes pellucid as crystal and delicious to the taste, if it he suffered to stand till it has deposited a sediment; and such a river is a type of the mind of Goldsmith. His first thoughts on every subject were confused even to absurdity, but they required only a little time to work themselves clear. When he wrote they had that time, and therefore his readers pronounced him a man of genius; but when he talked he talked nonsense and made himself the laughingstock of his hearers. He was painfully conscious of his inferiority in conversation; he felt every failure keenly; yet he had not sufficient judgment and self-command to hold his tongue. His animal spirits and vanity were always impelling him to try to do the one thing which he could not do. After every attempt he felt that he had exposed himself, and writhed with shame and vexation; yet the next moment he began again.

His associates seem to have regarded him with kindness, which, in spite of their admiration of his writings, was not unmixed with contempt. In truth, there was in his character much to love, but very little to respect. His heart was soft even to weakness: he was so generous that he quite forgot to be just; he forgave injuries so readily that he might be said to invite them, and was so liberal to beggars that he had nothing left for his tailor and his butcher. He nas vain, sensual, frivolous, profuse, improvident. One vice of a darker shade was imputed to him, envy. But there is not the least reason to believe that this bad passion, though it sometimes made him wince and utter fretful exclamations, ever impelled him to injure by wicked arts the reputation of any of his rivals. The truth probably is that he was not more envious. but merely less prudent, than his neighbours His heart was on his lips. All those small jealousies, which are but too common among men of letters, but which a man of letters who is also a man of the world does his best to conceal, Goldsmith avowed with the simplicity of a child. When he was envious, instead of affecting indifference, instead of damning with faint praise, instead of doing injuries slyly and in the dark, he told everybody that he was envious. "Do not, pray, do not, talk of Johnson in such terms," he said to Boswell; "you harrow up my very soul." George Steevens and Cumberland were men far too cunning to say such a thing. They would have echoed the praises of the man whom they envied. and then have sent to the newspapers anonymous libels upon him. Both what was good and what was bad in Goldsmith's character was to his associates a perfect security that he would never commit such villainy. He was neither ill-natured enough, nor long-headed enough, to be guilty of any malicious act which required contrivance and disguise.

The Spendthrift. — Goldsmith has sometimes been represented as a man of genius, cruelly treated by the world, and doomed to struggle with difficulties, which at last broke his heart. But no representation can be more remote from the truth He did, indeed. go through much sharp misery before he had done anything considerable in literature. But after his name had appeared on the title page of the *Traveller*, he had none but himself to blame for his distresses. His average income during the last seven years of his life certainly exceeded fqoo a year, and £400 a year ranked, among the incomes of that day, at least as high as £800 a year would rank a century later. A single man living in the Temple, with £400 a year, might then be called opulent. Not one in ten of the young gentlemen of good families who were studying the law there had so much. But all the wealth which Lord Clive had brought from Bengal and Sir Lawrence Dundas from Germany, joined together, would not have sufficed for Goldsmith. He spent twice as much as he had. Re wore fine clothes, gave dinners of several courses, paid court to venal beauties. He had also, it should be remembered, to the honour of his heart, though not of his head, a guinea, or five, or ten, according to the state of his purse, ready for any tale of distress, true or false. But it was not in dress or feasting, in promiscuous amours or promiscuous charities that his chief expense lay. He had been from boyhood a gambler, and at once the most sanguine and the most unskilful of gamblers. For a time he put off the day of inevitable ruin by temporary expedients. He obtained advances from booksellers by promising to execute works nhich he never began. But at length this source of supply failed. He owed more than £2,000, and he

saw no hope of extrication from his embarrassments. His spirits and health gave way. He was attacked by a nervous fever, which he thought himself competent to treat. It would have been happy for him if his medical skill had been appreciated as justly by himself as by others. Notwithstanding the degree which he pretended to have received on the continent, he could procure no patients. "I do not practise," he once said, "I make it a rule to prescribe only for my friends." "Pray, dear Doctor," said Beauclerk, "alter your rule; and prescribe only for your enemies." Goldsmith, now, in spite of this excellent advice, prescribed for himself. The remedy aggravated the malady. The sick man was induced to call in real physicians; and they at one time imagined that they had cured the disease. Still his weakness and restlessness continued. He could get no sleep. He could take no food. "You are worse," said one of his medical attendants, "than you should be from the degree of fever which you have. Is your mind at ease?" "No; it is not," were the last recorded words of Oliver Goldsmith. He died on April 4, 1774, in his 46th year. He was laid in the churchyard of the Temple; the actual spot is unknown, but a stone with a Latin inscription, erected nearby in 1856, notes the fact. The coffin was followed by Burke and Reynolds. Both these great men were sincere mourners. Burke, when he heard of Goldsmith's death, had burst into a flood of tears. Reynolds had been so much moved by the news that he had flung aside his brush and palette for the day.

A short time after Goldsmith's death, a little poem appeared, which will, as long as the language lasts, associate the names of his two illustrious friends with his own. It has already been mentioned that he sometimes felt keenly the sarcasm which his wild blundering talk brought upon him. He was, not long before his last illness, provoked into retaliating. He wisely betook himself to his pen; and at that weapon he proved himself a match for all his assailants together. Within a small compass he drew with a singularly easy and vigorous pencil the characters of nine or ten of his intimate associates. Though this little work did not receive his last touches, it must always be regarded as a masterpiece. It is impossible, however, not to wish that four or five likenesses which have no interest for posterity were wanting to that noble gallery, and that their places were supplied by sketches of Johnson and Gibbon, as happy and vivid as the sketches of Burke and Garrick.

Some of Goldsmith's friends and admirers honoured him with a cenotaph in Westminster abbey. Nollekens was the sculptor, and Johnson wrote the inscription. It is much to be lamented that Johnson did not leave to posterity a more durable and a more valuable memorial of his friend. A life of Goldsmith would have been an inestimable addition to the *Lives of the Poets*. No man appreciated Goldsmith's writings more justly than Johnson; no man was better acquainted with Goldsmith's character and habits; and no man was more competent to delineate with truth and spirit the peculiarities of a mind in which great powers were found in company with great weaknesses. But the list of poets to whose works Johnson was requested by the booksellers to furnish prefaces ended with Lyttelton, who died in 1773. The line seems to have been drawn expressly for the purpose of excluding the person whose portrait would have most fitly closed the series. Goldsmith, however, has been fortunate in his biographers. (M.)

BIBLIOGRAPHY.—Goldsmith's *Miscellaneous Works* were first published by W. Osborne and T. Griffin (1775). Bishop Percy wrote a memoir for S. Rose's edition of Goldsmith's *Miscellaneous Works* (4 vols., 1806). For other editions *see* I. A. Williams, *Seven XVIII Century Bibliographirs* (1924). The Oxford edition of Goldsmith's plays and *The Vicar of Wakefield* was issued in 1909. Some *New Essays* by him were edited by R. S. Crane (Chicago, 1927). Goldsmith's life has been written by Prior (1837), by Washington Irving (1844–49) and by John Forster (1848, 2nd ed. 1854). The diligence of Prior deserves great praise; the style of Washington Irving is always pleasing; but the highest place must, in justice, be assigned to the eminently interesting work of Forster. Subsequent biographies are by William Black (1878); Austin Dobson (1888, American ed. 1899); R. A. King (1910); F. F. Moore (1910); S. L. Gwynn (1935); *see* also *K. C.* Balderston, The *History and Sources of Percy's Memoir of Goldsmith* (1926). The above article by Lord Macaulay was slightly revised by Austin Dobson, as regards questions of fact for which there has been new evidence.

GOLDSMITH BEETLE, a name applied to species of the subfamily Rutelinae, from their brilliant metallic lustre, and especially to *Cotalpa lanigera* of the eastern United States, a large hairy form, nocturnal in habit, concealed often in willow trees, by day. It is allied to the common dung and burying beetles.

GOLDSMITHS' AND SILVERSMITHS' WORK: *see* SILVERSMITHS' AND GOLDSMITHS' WORK.

GOLD STANDARD. A country is on the gold standard when its money — paper bills, silver coins, etc.—is redeemable on demand at a fixed weight of fine gold for each monetary unit. For example, in the United States previous to March 1933, a five-dollar bill was convertible into 129 grains of fine gold on demand. Accordingly its value in terms of other goods or services changed only in so far as the amount of goods or services purchasable by 129 grains of gold changed. Under normal conditions, this insured a fairly stable medium of exchange, which is a basic requirement for the efficient operation of any advanced economic system.

To maintain the gold standard two things are necessary. The currency authority — usually a government — must purchase at a fixed price and coin free of charge all gold brought to it. It must also sell at the same price all gold demanded of it. Gold therefore remains the one commodity in a gold standard country which registers no change in price, measured by monetary units.

The government can easily fulfil its pledge to purchase gold at a fixed price, as it can print paper money for this purpose. The main difficulty in the operation of the gold standard arises when the banks, as agents of the government, are called upon to redeem in gold large amounts of paper currency or other kinds of money. As the gold held in reserve for such emergencies is normally only a small part of the face value of the paper and other nongold currency in circulation, a sustained "run" on gold will eventually force the suspension of the gold standard.

The gold standard was first legally introduced in Great Britain in 1816 The United States adopted the gold standard in 1873.

GOLD STICK IN WAITING, an officer of the British royal household who waits in close attendance upon the sovereign and whose emblem of office is an ebony staff or stick with a gold head, engraved with the sovereign's cipher and crown. The office was instituted in 1678 and was held exclusively by "Colonels of the Regiment" of regiments of life guards until 1820 when the honour was extended to officers holding similar appointments in the royal horse guards. *Silver Stick in Waiting* is the officer who stands near the *Gold Stick* "ready to relieve him."

See Sir George Arthur, *The Story of the Household Cavalry* (1909).

GOLDSTÜCKER, THEODOR (1821–1872), German Sanskrit scholar. was born of Jewish parents at Konigsberg on Jan. 18, 1821. From 1847 to 1850 he resided at Berlin, but his advanced political views caused the authorities to regard him with suspicion. In the latter year he removed to London, in 1852 he became professor of Sanskrit in University college. He was one of the founders and chief promoters of the Sanskrit Text society. He died in London on March 6, 1872.

GOLDWELL, THOMAS (d. 1585), English ecclesiastic, began his career as vicar of Cheriton in 1531. As chaplain to Cardinal Pole he lived at Rome, was attainted in 1539, but returned to England on Mary's accession, and in 1555 became bishop of St. Asaph. On the death of Mary, Goldwell escaped from England and in 1561 became superior of the Theatines at Naples. In 1563 he was appointed vicar-general to Carlo Borromeo, archbishop of Milan. He died in Rome in 1585.

GOLDZIHER, IGNAZ (1850–1921), Jewish Hungarian orientalist, was born in Stuhlweissenburg on June 22, 1850. He was educated at the universities of Budapest, Berlin, Leipzig and Leyden, and was the first Jewish scholar to become professor in the Budapest university (1894), and represented the Hungarian government and the Academy of Sciences at numerous international congresses. He received many foreign academic honours. Goldziher investigated pre-Mohammedan and Mohammedan law, iradition, religion and poetry. Among his chief works are: *Beiträge zur Literaturgeschichte der Schi'u* (1874); *Beiträge zur Ceschichte der Sprachgelehrsamkeit bei den Arabern* (1871–73); *Der Mythos bei den Hebräern und seine geschichtliche Entwickelung* (Leipzig, 1876; Eng. trans., R. Martineau, 1877); *Muhammedanische Stu-*

dien (Halle, 1889–90, 2 vols).

GOLETTA, a town on the Gulf of Tunis in 36° 50′ N., 10° 19′ E., a little south of the ruins of Carthage, and on the north side of the ship canal which traverses the shallow Lake of Tunis and leads to the city of that name. Built on the narrow strip of sand which separates the lake from the gulf, Goletta is defended by a fort and battery. The town contains a summer palace of the bey, the old seraglio, arsenal and custom-house, and many villas, gardens and pleasure resorts. A short canal, 40 ft broad and 8½ ft deep, divides the town and affords communication between the ship canal and a dock or basin, 1,082 ft. long and 541 ft. broad. An electric tramway which runs along the north bank of the ship canal connects Goletta with the city of Tunis (*q.v*). Pop. 7,407, mostly Jews and Italian fishermen Beyond Cape Carthage, 5 mi N. of Goletta, is La Marsa, a summer resort.

GOLF (in its older forms GOFF, GOUFF or GOWFF, the last of which gives the genuine old pronunciation), a game which probably derives its name from the German *kolbe,* a club—in Dutch, *kolf*—which last is nearly identical in sound.

EARLY HISTORY

The origin of golf is lost in antiquity. Historians are inclined to credit the game as we know it today to Scotland, although there is evidence that the basic principle of the game may have been brought there from Holland, where the Dutch played a game employing a club and ball on ice, the putting being at a stake. An exception, in the British museum, is a picture which served as the tailpiece to an illuminated Book of Hours, made in Bruges at the start of the 16th century It depicts three players, each with a ball and what appears to be an iron-headed club. They are putting at a hole in the turf.

The earliest Scotch reference to golf is found in a decree of parliament dated March 1457, when it appears the people had become so interested in golf that the more important pursuit of archery was being neglected The decree, in the interest of defense of the realm, read. "Parliament decreted and ordained that *wapinshawingis* be halden be the lordis and baronis spirituale and temporale, four times in the zeir; and that the futeball and golf be utterly *cryit doun,* and nocht *usit;* and that the bowe-merkis be maid at ilk paroche kirk a pair of buttis, and *schuttin* be *usit* ilk *Sunday.*" Fourteen years later, in 1471, it was judged necessary to pass another act "anent wapenshawings" because "futeball and golfe be abusit in tyme cuming" In 1491 a final and apparently angry fulmination was issued on the general subject, with pains and penalties annexed. It runs thus: "Futeball and Golfe forbidden Item, it is statut and ordainit that in na place of the realme there be usit futeball, golfe or *uther* sik *unprofitabill sportis,*" etc. Curiously, this was an edict of James IV, who a few years later set his commons an ill example by practice of the "unprofitabill sportis." as is shown by various entries for golf balls and such in the accounts of the lord high treasurer of Scotland (1503–06).

About a century later the game again appears on the surface of history, and it is quite as popular as before. In the year 1592 the town council of Edinburgh 'ordanis proclamation to be made threw this burgh, that na inhabitants of the samyn be seen at ony pastymes within or without the toun, upoun the Sabboth day, sic as golfe, etc." The following year the edict was reannounced, but with the modification that the prohibition was "in tyme of sermons."

In 1603 James VI (afterwards James I of England) appointed one "William Mayme, bower burges of Edinburgh, during all the dayes of his lyif-tyme, club-maker to his Hienes." As for golf balls, it appears that the Scottish product was not the equal of balls imported from Holland, because in 1618 James (now in England) stated in a letter that "whereas na small quantitie of gold and silver is transported zeirly out of his Hienes' kingdome of Scoteland for buying golfe ballis," therefore to stop this iniquity his majesty conferred a monopoly of ball manufacture on one James Melvill "for the spaice of tuenti-ane yeiris," but lest the said Melvill should become an extortioner, it was provided that the cost of each ball "exceid not the price of four schillings. monie of this realm" and that Melvill should have "ane a stamp of awin" and that "all ballis maid be stampet."

Golf has been known since old times as the "royal and ancient" game. James IV is the first who figures formally in the golfing record, followed by James V and by his daughter, Mary Stuart, who was "seen playing golf and pallmall in the fields beside Seton" a few days after the murder of her husband. The interest of her son, James VI, in golf has already been alluded to. Charles I was a devotee; he was engaged in golf on the links at Leith in 1642 when news of the Irish Rebellion reached him. Afterward. while prisoner of the Scots army at Newcastle, it is recorded that he was permitted to "go abroad and play at goff in the Shield Field, without the walls." His son, Charles II, did not play the game, but James II did After the Restoration. James (then duke of York) was sent to Edinburgh in 1681–82 as commissioner of the king to parliament. While there, challenged by two noblemen of his suite to play a match against them, along with any Scotch ally he might select, the duke chose as his partner one "Johne Patersone," a shoemaker. The duke and his humble coadjutor won easily, and the duke made over half of the large stake to the said Johne, who therewith built himself a house at 77 Canongate, known as "Golfer's Land."

Golf clubs, some of which have existed down to the present, began to be founded in the 18th century. Indeed, Royal Blackheath is said to have been in operation in 1608, but modern searchers among golf records set the correct date as about 1787. Written evidence shows six clubs were founded earlier—the Honourable Company of Edinburgh Golfers in 1744, the Royal and Ancient Golf Club of St. Andrews (known until 1834 as the St Andrews Golf club) in 1754, the Bruntsfield links (Edinburgh) in 1761, the Royal Burgess Golfing society (Edinburgh) in 1773, the Royal Musselburgh Golf club in 1774, and the Royal Aberdeen Golf club in 1780. By the start of the 19th century, at least a score of clubs were in existence in Scotland and England, many of these have continued to the present.

The most famous golf club in the world is the Royal and Ancient Golf Club of St. Andrews, which, as just mentioned, was known until 1834 as the St Andrews Golf club. In 1840 the present clubhouse was erected; it was largely extended in the early years of the 20th century. The pre-eminence of the club in the golfing world is due to its historical associations, and the influential and widely representative character of its membership. The following royal personages have been captains of the club: Edward VII (then prince of Wales) in 1863, Prince Leopold in 1876, the duke of Windsor (then prince of Wales) in 1922, George VI (then duke of York) in 1930, and the duke of Kent in 1937

The Royal and Ancient is the governing club in golf. It frames the rules of the game and, in response to questions and disputes on the rules, gives decisions which are accepted by golf clubs throughout the world, with the exception of the United States, where the U.S. Golf association is the ruling body and at times promulgates rules which are at variance with St. Andrews pronouncements. On the whole, however, the two bodies are in agreement The British Open and Amateur championships and such international events as the Ryder Cup and Walker Cup matches (when played on British soil) are also under the jurisdiction of the Royal and Ancient.

Early British Professionals.—As golf gained in popularity, it was natural that a professional class should be formed—men who made golf their life work. In addition to great playing skill, they lent their talents to the fashioning of wood and iron clubs, to the stuffing of feather balls (and later to the moulding of "gutties") and to instructing golfers in the art of the game.

Most famous of the early professionals was "Old Tom" Morris, a kindly man with a keen insight into the science, ethics and future of golf. Around the middle of the 19th century, Old Tom worked at St Andrews, Scotland, as assistant in the shop of Allan Robertson, another famous pro, of whom it is said that he was never beaten in a match. Morris and Robertson were inseparable on the links and off, and wielded much influence in the golfing world. But in 1848, when the guttie ball was intro-

WINNERS OF BRITISH CHAMPIOXSHIPS FROM 1907
(Winners from the United States are listed in italics)

Year	Open	Amateur	Ladies'
1907	A. Massy	John Ball	Bliss M. Hezlet
1908	J. Braid	E. A. Lassen	Miss M. Titterton
1909	J. H. Taylor	R. Maxwell	Miss D. Campbell
1910	J. Braid	John Ball	Miss Grant Suttie
1911	H. Vardon*	H. H. Hilton	Miss D. Campbell
1912	E. Ray	John Ball	Miss G. Ravenscroft
1913	J. H. Taylor	H. H. Hilton	Miss M. Dodd
1914	H. Vardon	J. L. C. Jenkins	Miss C. Leitch
1915–1919		No competitions	
1920	G. Duncan	C. J. H. Tolley	Miss C. Leitch
1921	*J. Hutchison*†	*W. I.* Hunter	Miss C. Leitch
1922	*W. Hagen*	E. Holderness	Miss J. Wethered
1923	A. G. Havers	R. H. Wethered	Miss D. Chambers
1924	*W. Hagen*	E. Holderness	Miss J. Wethered
1925	*J. M. Barnes*	*R.* Harris	Miss J. Wethered
1926	*Robert* T. ("Robby") *Jones. Jr.*	*Jesse Sweetser*	Miss C. Leitch
1927	R. *Jones,* Jr.	W. Tweddell	hllle. Simone de la Chaume
1928	*W. Hagen*	T. P. Perkins	Mlle. Manet Leblanc
1929	W. *Hagen*	C. J. H. Tolley	Miss J. Wethered
1930	R. *Jones, Jr.*	*R. Jones, Jr*	Miss D. Wallock
1931	*T. Armour*	E. Martin Smith	Miss E. Wilson
1932	*G. Sarazen*	J. de Forest	Miss E. Wilson
1933	D. *Shute*‡	Hon. Michael Scott	Miss E. Wilson
1934	H. Cotton	*Lawson Little, Jr.*	Mrs. Holm
1935	A. Perry	*Lawson Little, Jr.*	Miss Wanda Morgan
1936	A. H. Padgham	H. Thomson	Miss P. Barton
1937	H. Cotton	R. Sweeny	Miss J. Anderson
1938	R. Whitcombe	*C. Yates*	Mrs. H. Holm
1939	R. Burton	Alex Kyle	Miss P. Barton
1940–1942		No competitions	

After tie with:—*A. Massy; †R. H. Wethered; ‡Craig Wood.

duced, their long friendship was broken—Robertson refusing to have anything to do with this innovation (perhaps because he saw the new ball would ruin his prosperous business in "feather-ies"), while Morris espoused the cause of the guttie. Following a business quarrel in 1851, Old Tom left Robertson's employ and set up for himself at Prestwick, where in the course of time he became the largest and most important golf-shop proprietor in Scotland.

Robertson remained at St. Andrews, dying in 1858; a memorial to him stands in St. Andrews churchyard.

About the time Old Tom moved to Prestwick, his son "Young Tom," was born. The lad, bred to golf, early exhibited remarkable ability as a player. He entered his first tournament against a professional field when 13, and at the age of 16 won the Open Professional tournament at Montrose against the best players in the country. Old Tom was an excellent golfer and won the British Open in 1861, 1862, 1864 and 1867, but in 1868 he relinquished the title to Young Tom. Scotland marvelled that the world's championship of golf should be won by a lad only 17 years of age, and had still more at which to marvel in the next two years, when Young Tom repeated his victories to gain permanent possession of the "Challenge Belt," an exquisite piece of workmanship put up in 1860 by the Prestwick club, who felt safe in stipulating that it must be won three successive years to become the property of any one player. After the lapse of a year, the British Open cup was substituted, and Young Tom proved his continued golfing skill by being the first to win the right to have his name inscribed on the cup by winning again in 1872, his fourth successive victory. There is no doubt that Young Tom was the finest golfer of his time, but his career came to a tragic end in 1875, when he failed to waken from his sleep on Christmas morning.

Old Tom lived until 1908. His portrait hangs in the Royal and Ancient clubhouse, and the home green at St. Andrews is named in his honour.

A sculptured figure of Young Tom in golfing pose was erected by public subscription in St. Andrews Cathedral churchyard.

Among other professional golfers of the old Scottish school who left their mark in the golfing world were: Willie Park, who won the British Open in 1860, the first year it was played, and won again in 1863, 1866 and 1875; Jamie Anderson, winner of three championships in consecutive years (1877–79); Willie Campbell, a tall, strapping fellow with remarkable courage in golfing matches around Musselburgh and Prestwick, where he was professional in 1887; Andrew Kirkaldy, who served most of his life (1860–1934) as a playing pro at St. Andrews; and Bob Ferguson (1848–1915), who held the British Open title in 1880, 1881 and 1882 and tied for it in 1883, but lost in the play-off to Willie Fernie (1851–1924), long-time professional at Troon.

With the decline of these famous mentors, others of course rose to carry on the traditions of the game. At the turn of the 20th century, golf had taken hold in the United States, and many of the Scottish-born professionals came to America, where wages were high and opportunities abounded. Their influence is still felt in America, although by 1915 the United States began to breed its own professionals, and the light of the Scottish pros and their descendants became overshadowed by the brilliance of such U.S.-born golfing masters as Walter Hagen, Gene Sarazen and a host of others.

THE UNITED STATES

Golf was played in the United States as early as 1779; in that year an advertisement appeared in the April 21 issue of *Rivington's Royal Gazette* (New York), reading: "To the Golf Players. The season for this pleasant and healthy Exercise now advancing. Gentlemen may be furnished with excellent CLUBS and the veritable Caledonian BALLS, by enquiring at the Printers." There is also evidence of golf at Charleston (S.C.) in 1786 and at Savannah (Ga.) in 1796.

But whatever seeds of the game may have been sown at these early dates did not take permanent root; golf does not appear in U.S. records for another century.

Historians are satisfied that golf has been in continuous play in the United States only from 1887, when Robert Lockhart, a resident of Yonkers, just north of New York city, and a Scotchman by birth, brought a small supply of clubs and balls back with him from one of his frequent trips to Scotland as a linen buyer. Before long, he had interested his friend and neighbour, John Reid, in the game. The pair laid out a crude, course on some pastureland and played the game through the summer of 1888. Several other residents of Yonkers became interested and, on Nov. 14, 1888, Reid invited them to his home for dinner; afterwards, he proposed some form of organization to provide what small funds were necessary to continue play for another year. Thus the first golf club in the United States was formed. At Reid's suggestion, it was named St. Andrews Golf club, after the cradle of golf in Scotland. St. Andrews is still in existence, although the site of the course was shifted to Mt. Hope, N.Y., in 1897.

Apparently the United States was "ready" for golf. Within the next five years more than 20 clubs were organized. Among them

WINNERS OF UNITED STATES CHAMPIONSHIPS FROM 1907
(Winners from Great Britain are listed in italics)

Year	Amateur	Open	Professional	Women's
1908	J. Travers	A. Ross	..	Miss M. Curtis
1909	R. Gardner	F. McLeod[1]	..	Miss K. Harley
		G. Sargent	..	*Miss D. Campbell*
1910	W. Fownes, Jr.	A. Smith[2]	..	*Miss D. Campbell*
1911	*H. Hilton*	J. McDermott[3]	..	Miss M. Curtis
1912	J. Travers	J. McDermott	..	Miss M. Curtis
1913	F. Ouimet	F. Ouimet[4]	..	*Miss G. Ravenscroft*
	R. Gardner	W. Hagen	..	Mrs. H. Jackson
1916	C. Evans, Jr.	C. Evans, Jr.	J. Barnes	Mrs. C. Vanderbeck
1917–18		No competitions		Miss A. Sterling
1919	S. Herron	W. Hagen[5]	J. Barnes	Miss A. Sterling
1920	C. Evans, Jr.	*E. Ray*	J. Hutchison	Miss A. Sterling
1921	J. Guilford	J. Barnes	W. Hagen	Miss M. Hollins
		G. Sarazen	G. Sarazen	Miss G. Collett
1922	J. Sweetzer			Miss
1923	M. Marston	R. Jones, Jr.[6]	G. Sarazen	E. Cummings
1924	R. Jones, Jr.	C. Walker	W. Hagen	Mrs. D. Hurd
1925	R. Jones, Jr.	W. Macfarlane[7]	W. Hagen	Miss G. Collett
1926	G. Von Elm	R. Jones, Jr.	W. Hagen	Mrs. G. Stetson
		T. Armour[8]		
1927	R. Jones, Jr.		W. Hagen	Miss M. Gulett
1928	R. Jones, Jr.	J. Farrell[9]	L. Diegel	Miss G. Collett
1929	R. Jones, Jr.	R. Jones, Jr.[10]	T. Armour	Miss G. Collett
	F. Ouimet	B. Burke[11]	T. Creavy	bliss H. Hicks
1933	G. Dunlap, Jr.	J. Goodman	O. Dutra	Miss V. Van Wie
1934	L. Little, Jr.		G. Sarazen	Miss V. Van Wie
1935	L. Little, Jr.	O. Dutra	P. Runyan	Miss V. Van Wie
1936	J. Fischer	S. Parks	J. Revolta	Mrs. E. Vare, Jr.
1937	W. Turnesa	T. Manero	D. Shute	*Miss P. Barton*
1938	M. Ward	R. Guldahl	D. Shute	Mrs. J. Page, Jr.
1939		R. Guldahl	P. Runyan	Miss P. Berg
1940	R. Chapman	B. Nelson[12]	H. Picard	Miss B. Jameson
1941	M. Ward	L. Little, Jr.[13]	B. Nelson	Miss B. Jameson
1942		C. Wood	V. Ghezzi	Mrs. F. Newell

After tie with:—[1]W. Smith [2]J. McDermott and McD. Smith, [3]M. Brady and G. Simpson; [4]H. Vardon and T. Ray; [5]M. Brady; [6]R. Cruickshank; [7]R. Jones, Jr.; [8]H. Cooper; [9]R. Jones, Jr.; [10]A. Espinosa; [11]G. Von Elm; [12]C. Wood and D. Shute; [13]G. Sarazen.

were the Country club of Buffalo (N.Y.) and Pomonok Country club (Flushing, N.Y.) in 1889; the Country club (Brookline, near Boston, Mass.), the Philadelphia (Penna.) Country club and the Newport (R.I.) Country club in 1890; Shinnecock Hills Golf club (Southampton, Long Island), Myopia Hunt club (Boston) and Kebo Valley Golf club (Bar Harbor, Me.) in 1891; and the Chicago (Ill.) Golf club, the Chevy Chase club (Washington, D.C.) and the Apawamis club (Rye, N.Y.) in 1893. Shinnecock Hills was the first U.S. club to incorporate; Chicago Golf club was the first to have an 18-hole course.

By 1895 not less than 50 clubs were operating, and by the summer of 1900 golf had become general throughout the United States. *Harper's Official Golf Guide, 1901*, lists 982 courses, 66 of which were six-hole layouts, 71 j nine-hole and 92 of full 18-hole length; the length of 109 courses mas not given. The list did not represent all courses that had been constructed, but it showed at least one layout in every state of the union; New York, as was to he expected, led with 154 courses, followed by Massachusetts with 139 and New Jersey and Pennsylvania with 62 each.

During the next two decades (1900–1920), golf continued to grow in popularity, though at a rate somewhat less rapid than in the period 1895–1900. This was a healthy sign; fewer clubs were being organized on an experimental basis and most of them continued to exist for many years. In 1910 there were some 1,700 courses, and in 1920, despite the deterrent of World War I, the number had grown to 2,800.

Then followed an unprecedented blossoming of golf's popularity; where even as late as 1915 a man seen carrying a golf bag on the streets tempted jeers from urchins, an abrupt change in public opinion occurred and golf became the "thing to do" socially. As a result of this nation-wide interest in the game, the number of courses by 1930 had grown to 5,691, with an estimated property value of $830,000,000. Not less than 2,225,000 persons were playing the game, approximately 87,000 men and women were employed by the golf clubs, and some 800,000 boys acted as caddies on fairly regular schedules.

This prosperous character of golf was due for a setback. The structure of club organization had grown more complex with the seasons. The average layout, especially in the larger metropolitan communities where competition for members was keen, was likely to lose prestige unless it offered all manner of attractions in addition to golf—tennis, trapshooting, lawn bowling, swimming, horseback riding, dances and card parties, and in winter such sports as skiing, tobogganing, skating and curling. Emphasis was on the social side of club life; money was being broadcast with little regard to the financial future. No expenditure was too great; no promoter's dream too fantastic to accept. Tracts of woodland once deemed impossible as sites for courses were hacked and dynamited into shape. On Long Island, because a suitable tract of rolling terrain was lacking, sand was sucked up from the sea by giant dredges and spread over a flat marsh in picturesque hills and valleys to form one of America's most famous courses, the Lido Golf club. In Florida, the site for the Boca Raton course was too sandy to support a stand of grass, so swamp-muck was transported from near by and spread over approximately 100 ac.; at Miami Beach, the Indian Creek club was constructed on land made in Biscayne bay by sandsuckers. In Chicago, the park commission reclaimed 70 ac. from Lake Michigan by similar means for the Waveland municipal course. And to the south of the city some 26 mi., the world's largest private golf club, Olympia Fields, completed construction of a clubhouse costing $1,800,000 as a fitting headquarters for its 1,100 members who had their choice of four 18-hole courses of championship calibre maintained on the club's 840-ac. property.

The financial depression which started in 1929 hit golf in 1932. There was an alarming drop in members and a consequent falling-off in receipts from various departments of the clubs. Retrenchments were necessary; employees were eliminated where they could be spared, salaries were cut, the extent and expense of non-revenue-producing activities were reduced and capital improvements not essential to the immediate future were postponed until more auspicious times.

But by 1935 golf had put its financial house in order. Those clubs woefully overfinanced during the boom years became bankrupt; the rest managed to place themselves on a sound operating basis. In all, fewer than 500 of the nation's golf courses were abandoned during the depression, and most of those were in the smaller communities.

There had, however, been a marked change in the character of golf facilities. Broadly speaking, there are three types of golf courses—the private club, owned by its members, operated not for profit and open to play only to its members and their guests; the daily-fee course, owned by an individual or group, operated for profit and open to any golfer on payment of a stipulated daily fee; and the municipal course, owned and operated by a city and open to play by anyone either free or, more generally, on payment of a nominal fee of a few cents. In 1930 there were 4,448 *private* courses in the U.S. By 1941 the number had shrunk 26% to 3,288 In contrast, daily-fee courses had grown from 700 in 1930 to 1,210 in 1941, an increase of 71%. Meanwhile, municipal courses grew from 543 in 1930 to 711 in 1941, an increase of 31%. Little of this expansion in daily-fee and municipal golf was due to new construction; nearly all of it resulted from taking over existing private clubs that were in financial difficulties. It was no longer necessary to be wealthy to afford golf.

A more complete breakdown of 1941 statistics shows that of the nation's 3,288 private clubs, 2,080 were nine-hole and 1.208 were eighteen-hole. The daily-fee totals were 715 and 495; municipal, 407 and 304. Taking all types of courses together, there were 3,202 nine-hole courses and 2,003 eighteen-hole courses; the latter figure includes 134 cases where a club had more than one course on its property. As from the beginning of golf in the U.S., New York state led with 431 courses; Illinois was second with 329; followed by Pennsylvania with 280, Ohio with 277, Michigan with 270, Texas with 242, Massachusetts and California with 198 each and Wisconsin with 194. The total value of the lands, courses, clubhouses, equipment and furnishings of the nation's golf facilities was $726,000,000.

Number of Golfers and Volume of Play.—Accurate records had not, by the end of 1942, been compiled on the number of golfers in the U.S., but best estimates, based on reasonably complete surveys, indicate there were in 1941 some 2,351,000 golfers, a golfer being defined as a person playing at least ten rounds during a season. Not included were perhaps 250,000 individuals who played one to nine times that season, nor the thousands of caddies and golf course employees, most of whom follow the sport in their leisure time. Rounds of golf for the year, again strictly on an estimated basis, because on the same day some golfers play but nine holes, others play 18, others 36 and still others even more, totalled 63,406,000.

The United States Golf Association.—Golf is governed in the United States by the United States Golf association, organized Dec. 22, 1894, by representatives of the St. Andrews, Brookline, Newport, Chicago and Shinnecock Hills clubs, to assume orderly control of the game. In the previous summer, great confusion had arisen over which of two amateur championships was official—St. Andrews had sponsored one championship at 18-hole match play, while Newport had held another at 36 holes of medal play. At first the association was called the Amateur Golf association, but the name was unsuitable, because the organization contemplated looking after professional as well as amateur interests. Accordingly, the name was changed to the American Golf association, but this in turn was criticized because Canadian clubs were not eligible for membership. The final selection—the United States Golf association—correctly defined the aims and scope of the body.

The U.S.G.A. is the "watchdog" of golf. It promotes the best interests of the game, preserves its traditions, adopts and enforces the rules, conducts each year the national Amateur, Open, Women's and Public Links championships, and maintains a turf research bureau, known as the Green Section, which advises member clubs on course maintenance problems. Membership in the association is open to any regularly organized golf club on payment of an annual fee.

While the U.S.G.A. has at times been subject to criticism for its acts, its record through the years is one of strict adherence to its prime function of preserving the best traditions of the game. At no time has the U.S.G.A. roster exceeded the 1,160 of 1932 when the national total of courses was around 5,700. In 1942 the membership roster was only 758 of the nation's 5,200 courses.

U.S. Players.—If one were asked to name the half-dozen finest amateur golfers the United States had produced by the end of 1942, the following would most probably be selected:

Walter J. Travis (1862–1927) was the first great U.S. golfer. He was born in Australia, but his golf was wholly learned in the United States; hence in golfing matters, Australia can hardly claim him. Of striking appearance, with jet black beard and impeccable garb, he was quite unpopular with fellow golfers because of his austere, taciturn demeanour. To him, golf was serious business; he observed the rules and etiquette of the game to the letter and insisted that his opponents do likewise. Playing against him was therefore too formal to be a pleasure. But he proved his ability as a golfer by winning the Amateur in 1900, 1901 and 1903, by reaching the semifinals in five other years, and by winning the qualifying medal in 1900, 1901, 1902, 1906, 1908 and 1914. He won the British Amateur title the only year he entered this event—1904.

Jerome D. Travers (1887–) learned his golf at Nassau Country club (Long Island) under the tutelage of Alec Smith, famous Scotch professional who went to the U.S. in 1898. Travers was a player with indomitable courage, an ability to outgame an opponent at match play, and nerve that rarely failed him in a crisis. He won the Amateur championship in 1907, 1908, 1912 and 1913, and was finalist in 1914; he won the Open title in 1915; and he won a long list of sectional championships.

Francis D. Ouimet (1893–) became a national hero in 1913 when, unknown as a golfer except around Boston, he tied Harry Vardon and Ted Ray, two of the best British professionals, at 304 strokes for 72 holes in the National Open, held at Brookline. The two pros were touring America and were confident they would take back to England the U.S. title. Instead, on the following day, Ouimet played nerveless golf to score 72 against Vardon's 77 and Ray's 78; the title remained in America. The following year, Ouimet won the National Amateur, and he repeated 17 years later, in 1931. He was a semifinalist in 1923, 1924, 1926 and 1927; and was runner-up in 1920. He was a member of the United States team against Great Britain for the Walker Cup from the first of these international matches in 1921 to the latest before World War II, held in 1938, serving as captain the last four times the event was held.

Charles Evans, Jr. (1890–), first showed promise as a golfer around Chicago in the period 1906–10, winning in those five years the Western Interscholastic and the Western Junior three times each, the Chicago City championship twice and the Western Amateur and Western Open once each. He placed second in the National Amateur of 1912 and the National Open of 1914, winning the Western Amateur title in both those years and also in 1915. In 1916 he became the first golfer to win both the National Amateur and National Open in the same year; his score of 286 in the Open stood as the record low for 20 years, until Tony Manero scored 284 in the 1936 Open. In 1942, at the age of 52, Evans fought his way against excellent competition to the final of the Chicago City championship, where he was defeated by a youthful opponent.

Robert T. Jones, Jr. (1902–), is regarded as perhaps the greatest golfer, certainly the greatest amateur golfer of modern times. His career was brilliant from his first debut in national competition in the National Amateur of 1916 until his unparalleled performance in 1930 of winning all four of the world's most difficult titles—the British Amateur, the British Open, the U.S. Amateur and the U.S. Open. This feat became known as Jones's "Grand Slam." During his golfing career Jones won the British Open three times, the British Amateur once, the U.S. Open four times and the U.S. Amateur five times. He played for the U.S. against Britain in the Walker Cup team matches in 1921, 1922, 1924, 1926, 1928 and 1930.

W. Lawson Little, Jr. (1910–), learned his golf around San Francisco, Calif., became a golfer of promise during his undergraduate days at Stanford university, and first appeared in national competition in the 1929 National Amateur, where he was defeated in the semifinal round by Francis Ouimet. He entered the event annually thereafter, but did not succeed in bettering his 1929 record until 1934, when he won not only this event, but the British Amateur as well. The following year he repeated his victories in both events. Little turned professional in 1936, won the Canadian Open that year and, in 1940, won the National Open.

Professional golfers contributed richly to the history of the game in the United States, and while it was well into the 20th century before the U.S. could breed a native-born champion among them, the over-all record of the pros was remarkable. No other country produced so many able players; in the long list, Walter Hagen and Gene Sarazen are particularly outstanding.

Walter Hagen (1892–) first appeared on the national scene for the 1913 National Open at Brookline, where he gave an excellent account of himself, considering his competitive inexperience, and placed fourth against an expert field. The following year at Chicago he won the event, but the win was purely incidental to the parade of titles that came his way throughout his career. His golf, entirely self-taught, was unorthodox; he had no desire to copy the smoother swings of his fellow professionals. He scorned to practise by the hour, as was the wont of other pros. And to Hagen, more than to any other golfer, goes the credit for breaking down the false barriers society had raised between amateurs and professionals. Between 1914 and 1936 Hagen won the U.S. Open twice, the British Open four times, the Professional Golfers' Association championship five times (including four in a row—1924, 1925, 1926, 1927), the Canadian, French and Belgian Opens once each, and at least 45 other events of lesser importance. In all, he participated in not less than 200 open tournaments and was rarely "out of the money." In addition, he played in some 1,500 exhibition matches in the U.S. and other countries, many of them for high fees or stakes. He is said to have earned around $1,000,000 during the 22 years he was rated as a top-flight golfer. .

Gene Sarazen (1902–) reached golfing fame in 1922 by winning the National Open at Chicago and proved he was a golfer of more than passing ability by adding the Professional title that same year at Oakmont (Pittsburgh) and the following year at Pelham (New York). No further titles of importance came his way for ten years, but during this period he was a constant competitive threat. In 1932 he reappeared as a champion, winning the British Open with a brilliant 283, lowest score ever recorded in that event, and the U.S. National Open with an equally brilliant 286, which tied the then low-scoring record established in 1916 by Chick Evans. Such "tight" golf under the pressure of championship play had never before been exceeded. In 1933 he won the P.G.A. title for the third time and came within one stroke of winning the British Open. In 1940 he tied Lawson Little for the National Open championship with a score of 287, but lost the playoff with a score of 73 to Little's 70. His near-win at the old (in golfing eyes) age of 38 was a fitting climax to a creditable career.

As Hagen and Sarazen passed their golfing primes, other U.S.-born professionals took their places. Outstanding among them were: Sam Snead, who won a total of $19,500 in tournament prize money in 1938; Ben Hogan, whose competitive golf was sufficiently good to finish "in the money" in 56 consecutive events he entered during 1938–40; Byron Nelson, credited with the finest golfing form among later golfers, winner of the 1939 National Open and the 1940 P.G.A. championships, and a consistent performer in less important events; Ralph Guldahl, whose 281 in the 1937 National Open was an all-time low record for that event; and Henry Picard, whose ability is best made clear by his achievement of scoring par or better in 49 of 54 tournaments he entered between Aug. 1934 and April 1935.

GOLF FOR WOMEN

The game of golf is admirably suited for women; they have followed the sport with enthusiasm from the very earliest times.

It has already been mentioned that Mary, Queen of Scots, was playing the game when word was brought to her of Darnley's fate. In Britain, prior to 1885, women were using the short links at St. Andrews, North Berwick and elsewhere, but they did not venture onto the longer courses, which were presumed to be the undisputed possessions of the men. In the United States, early records indicate that women were responsible for the formation of clubs in Boston, Mass., Montclair and Glen Ridge, N.J., and Philadelphia in the 1890s. It was not long, either in Britain or the United States, before women were playing the longer courses too.

While the best women players have never been able to equal the best men players in scoring, they have at times come very close, especially in the United States, where 18-hole rounds in the 70s over full-length courses have become commonplace in championships. Men obtain longer yardage from the tees, but this is offset to a great extent by the women's finer sense of timing and accuracy in the shorter shots.

One of the first truly outstanding woman golfers was Dorothy Campbell (1883–), who won the British Ladies' championship in 1909 and 1911, was runner-up in 1908 and semifinalist in 1904, 1905 and 1906; she won the U S. championship in 1909, 1910 and 1924; and won the Canadian championship in 1910, 1911 and 1912. Twice married, she was first known as Mrs. Edward Howe and later registered as Mrs. Dorothy Campbell Hurd; she became a resident of the U.S. early in the century. She won more than 750 prizes in golf.

Another British woman, Joyce Wethered (1901–), won the Ladies' Open championship in 1922, 1924, 1925 and 1929, the English Ladies' title five years in a row, 1920–24 and represented Britain in numerous international matches. In 193j she toured the United States as a professional, representing a London store, and competed most creditably against the best men and women golfers. She is now Lady Heathcoat-Amory.

Other British women golfers of note were Lady Margaret Scott, winner of the Ladies' championships of 1893, 1894 and 1895; Miss Enid Wilson (1910–), who won the event in 1931, 1932 and 1933, and Miss Pamela Barton (1917–), who was titlist in 1936 and 1939 and who won the U.S. title in 1936.

In the United States in the first three decades of the 20th century, four women golfers reigned supreme. First of these was Margaret Curtis, who won the Women's National in 1907, 1911 and 1912 and who was a constant threat in national and sectional events during the seasons (1900–12) she was active in the game. The next outstanding champion among the women was Alexa Stirling of Atlanta, Ga., who won her first national title while quite young in 1916 and repeated in 1919 and 1920. She was runner-up to the women's title in 1921 and 1923, and won the Canadian championship in 1921 and 1934.

Perhaps the finest woman golfer the United States has produced is Mrs. Glenna Collett Vare (1903–), who learned her golf around Providence, R I., won her first Women's title in 1922 and repeated on five occasions — 1925, 1928, 1929, 1930 and 1935. She made four attempts at the British crown, but was turned back twice in the final round, earlier on the other two occasions. Mrs. Vare's extended hold on women's golf was broken when Virginia Van Wie of Chicago, a player of brilliant ability, replaced her as champion during the three seasons of 1932, 1933 and 1934. Physical inability to continue in tournament play forced Miss Van Wie to forfeit her title without contest in 1935.

THE GAME

The game of golf consists in hitting a ball over a stretch of country with clubs which have been designed to suit the different positions in which the ball may be found (see Clubs, below). The regulation golf course has 18 "holes" or units, which begin at a "teeing ground" and extend for varying distances to a "green," an area of closely mowed and carefully cultivated turf in which is sunk a "cup" or "hole" $4\frac{1}{4}$ in. in diameter. The holes are played in stipulated succession, as the links of a chain, the teeing ground for a succeeding hole always being adjacent to the green just quitted, so that the golfer in his "round" plays each hole once.

On the teeing ground, the ball may be elevated on a small wooden peg or pinch of sand in order to make the starting stroke easier, but thereafter the golfer is not permitted to touch his ball, except with the club, until he has "holed out" in the cup. Each player competes without interference from his opponent, and the object of the game is to hit the ball from tee to cup in the fewest possible strokes. The charm of the game lies in the wide variety of demands placed on the golfer as his ball progresses. One time it may be well perched on a tuft of grass and the next time half buried in loose sand; it may be found behind a tree or in long grass. The player's shot may be uphill or down, over a hummock or across a gully. Nearly every golf course manages to have one or more "water hazards," which must be carried. A player rarely has exactly the same shot facing him in the course of a round.

There are two types of play — "match play," in which each hole is a separate contest and the victor in a match is the player who wins more holes from his opponent than his opponent has won from him, plus the number of holes remaining to be played; and "stroke play," in which the total number of strokes a player takes for the complete round (or rounds) determines the winner. Both types of play are popular with golfers, and in their informal rounds both match and stroke are often played simultaneously — a practice frowned on by golf rule purists because situations may arise in the course of a round that are met one way under match-play rules and another way under stroke-play rules. (See Rules of *Golf* below for examples.)

Generally speaking, amateur events of national or sectional importance are played at match, although they are generally preceded by a round or two of stroke play to reduce the field of entrants to a required 64 or 32 contestants. These players are paired, and the winner of each match is then paired with the winner of another match, until eventually a single victor emerges. Losers in all matches drop out of the contest as it progresses. Typical match-play events of national scope in Britain are the Amateur championship and the Women's championship; in the United States, such events as the National Amateur, the Women's National, the National Intercollegiate and (an exception since professionals make up the field) the annual championship of the Professional Golfers' association.

On the other hand, nearly all events in which professional golfers compete are at stroke play, usually for 72 holes or four rounds over the course. Among well-known stroke-play events are the British, Canadian and U.S. Opens and the chain of "winter circuit" tourneys in which both pros and amateurs in the U.S. play annually.

CLUBS

As is to be expected, golf club design has changed through the years. Early implements tended to have thick wooden shafts and long, narrow heads. The modern club is steel shafted with a short compact head, in order to mass the weight behind the point on which the ball is struck. Persimmon has been found the best for

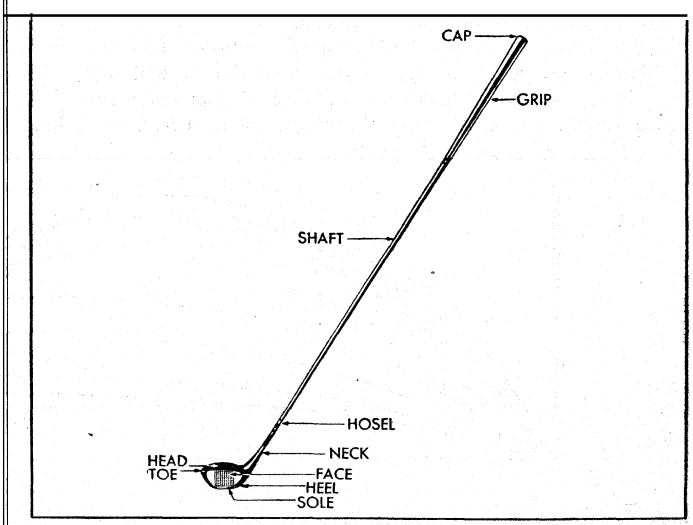

FIG. 1.—PARTS OF A GOLF CLUB

wooden heads, and forged steel, generally chromium plated, is used for irons. There is considerable variation, however, in putters; such materials as aluminum, brass, steel, plastic and wood have been found satisfactory.

Under the old conditions, golf clubs were hand-made by the artisans at the few golf courses then in existence, but with the spread of golf a large industry sprang up both in the United Kingdom and the United States, employing thousands of workers. The invention of the steel shaft and its sanction for use by the Royal and Ancient and the U.S.G.A. in 1929 further divorced the local craftsman from the industry; factory equipment was needed to attach the shafts to the heads.

Around 1920 the "matched set" was introduced to the golfing public. This consisted of as many clubs as the golfer cared to purchase, scientifically graduated in length, weight and shaft stiffness to make all clubs "feel" the same when swung. Previously, golfers were in the habit of acquiring their sets a club or two at a time, and there was wide variation in the feel of the set. Matched sets have greatly simplified the game for the ordinary golfer; he is able to stroke the ball uniformly with each club and does not have to vary his swing to compensate for variations in club design.

In the average good player's set, there are either three or four wood clubs and nine or ten irons. No two clubs in a set are the same. There are differences in length and suppleness of shaft, weight, size and shape of head, the angle at which the shaft ends and the head begins (the lie), and the angle of the face of the club from the vertical (the loft). For best results, a player should be "measured" for his set of clubs, so that he gets implements of the weight, length, lie and suppleness best suited to his strength, build and swing characteristics. Golf professionals, because of their experience in fitting players with the right clubs, should be consulted uhenever golf clubs are purchased.

The various clubs are known both by number and name. The names have come down from the early days of golf; the numbers are an American innovation dating from the early 1920s, when matched sets came in and it was found more practical to indicate club gradations by consecutive numbering than to stamp the name on the club's sole.

The Wood Clubs.—Number One (Driver).—Used from the tee for maximum distance; has a large head and a deep, almost vertical face. For the average player, the driver is 42 to 43 in. long and weighs between 13 and 14 oz.

Number Two (*Brassie*).—So called because the sole of the club is generally covered with a brass plate. Used mostly for long shots from good fairway lies, the club has a slightly smaller and shallower face than a driver but with more loft.

Number Three (Spoon).—Shorter shaft and shallower face than driver or brassie, but face has considerably more loft. The club is used to play the ball from lies too poor for a brassie, and also for short holes when the use of a driver from the tee would send the ball beyond the green.

Number Four (*Baffy*).—Smaller head, shallower face and more loft than a spoon. Used from a very bad lie. It will hit a ball about as far as a No. 1 iron; many players do not carry this club.

The Irons.—Number One (Driving Iron or *Cleek*.)—A long shaft and very little loft to the club face. Used for full shots of 190 to 205 yd. from lies too "heavy" for a brassie. A difficult club to use, it produces a long, low shot.

Number Two (Midiron).—Slightly more loft, for shots from 180 to 190 yd.

Number Three (Mid Mashie).—For shots between 165 and 175 yd.

Number Four (Mashie Iron).—For shots between 150 and 160 yd.

Number Five (Mashie).—A popular and relatively easy club to use. For shots between 140 and 150 yd. Ball pitches high and stops quickly after hitting ground. This club is also used for "pitch-and-run" shots from 30 to 50 yd. of the green; the ball travels part way through the air, then rolls the rest of the way.

Number Six (Spade *Mashie*).—Used for playing the ball from high grass or difficult lies, when "getting out" is more important than distance. From a clean lie, the club will hit the ball 130 to 140 yd., and is useful for distance from a sand trap when the ball lies well perched up.

Number Seven (Mashie Niblick).—Resembles the spade mashie, but has still more loft and head weight. Used for shots between 125 and 135 yd.; puts plenty of backspin on the ball.

Number Eight (Pitching Niblick).—Still more loft, for shots of from 120 to 130 yd.

Number Nine (Niblick).—Face has a great deal of loft and the head is heavy, to carry it through long tough grass or heavy sand. A ball, properly hit, rises almost vertically and upon hitting the ground may jump backward as a result of the backspin this club imparts.

The Putter.—A club with a short stiff shaft and a straight or nearly straight face, for rolling the ball on the green. There are many styles of putters.

Some players omit one or more of the above-named clubs and carry instead a jigger or chipper, which is an iron with a head quite similar to a Number One in weight and loft, but with a very short shaft. The club is used for run-up shots from fairly near the clipped margins of a green.

Another club is the sand iron or blaster. It resembles a niblick, but has a much heavier head and a face so deep it is almost disk shaped. The club is used for pitching the ball onto the green from adjacent sand and can be used by an expert player with great accuracy.

THE BALL

Prior to 1848, golf balls were of leather, stuffed by means of a special tool with "as many feathers as a hat will hold." They were not particularly satisfactory, however, since they were expensive, became easily out of round and were useless when wet. Golfers therefore welcomed the invention in 1848 of the "guttie." a ball of solid gutta percha. At first these balls had smooth covers and when hit would duck and twist erratically. It was soon noticed that an old guttie, scarred and nicked, travelled straight; so golfers began hammering dents into the gutties before playing with them. Later, moulds were made which put the dimpled or recessed markings on the balls. The guttie was cheap, held its shape and was unaffected by moisture. Its main defect

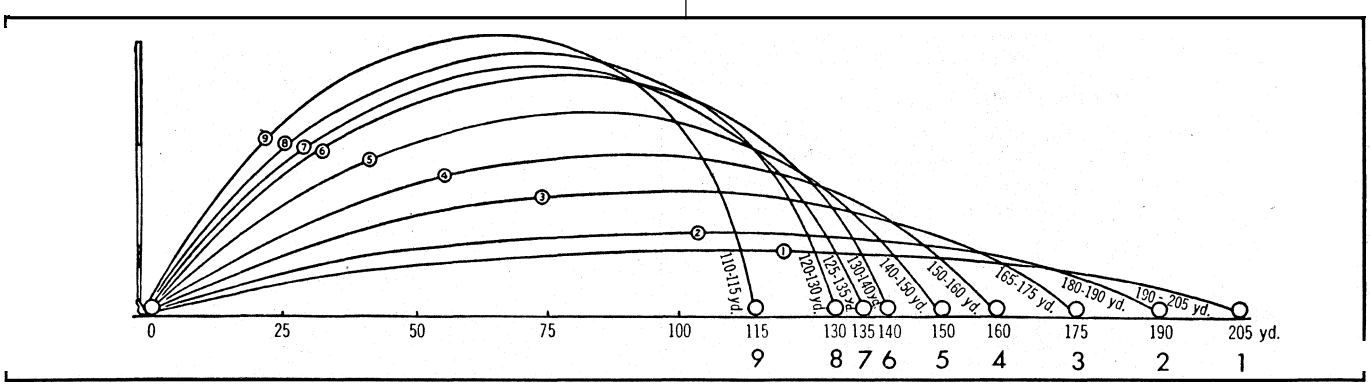

FIG. 2.— DISTANCES AN EXPERT PLAYER GETS WITH VARIOUS IRONS

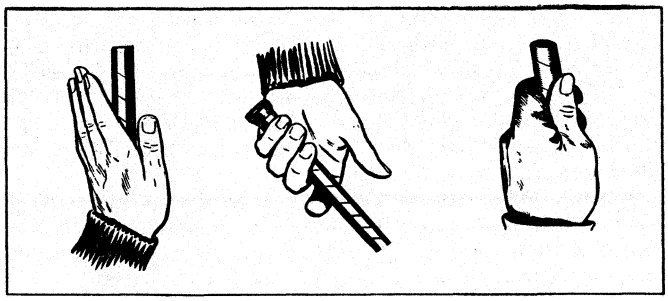


COURTESY, NATIONAL GOLF FOUNDATION
FIG. 3.—FIRSTSTEPS IN GETTING "OVERLAPPING" GRIP OF GOLF CLUB

was a tendency to break into several pieces, but because the ball could be melted and remade, this fault was not regarded as serious.

In 1898 the rubber-cored ball, not greatly different from the ball in use today, was invented by an American, Dr. Coburn Haskell. Some of these were tried in the British Amateur championship at Hoylake in 1902, but they were not satisfactory. A few weeks later, however, at the British Open, also held at Hoylake, better balls were available and Alex Herd won the event using one of them. Thereafter the rubber-cored ball swiftly replaced the guttie, just as the guttie had replaced the feather ball.

Scoring improved markedly after the introduction of the modern ball. For example, from 1892 to 1901, when the guttie was in use, the average score per round for winners of the British Open championship was 78.5 strokes; from 1902 to 1926 the average was 75.1, while from 1927 to 1939 it was 72.2. Indeed, such relatively tremendous distances became possible with the new ball that greens designed to be reached in two solid strokes became little more than a drive plus a short approach, and much of the pleasure of golf was dissipated. Considerable agitation arose as a consequence to limit the flight of the ball through legislation, and the Royal and Ancient club in 1920 decreed that after May 1, 1921, the weight of the ball should not be greater than 1.62 oz. avoirdupois, and the size not less than 1.62 in. in diameter.

These limitations held also for the United States until 1931, when the United States Golf association, searching for "an easier and pleasanter ball for the average golfer," resolved that the ball should thereafter be not less than 1.68 in. in diameter and not greater than 1.55 oz. in weight. In Jan. 1932 another alteration was made, the weight being increased to 1.62 oz.; the diameter remained the same, viz., not less than 1.68 in.

In 1941 the U.S.G.A. further limited the ingenuity of the golf-ball manufacturers by perfecting a machine, in co-operation with the Illinois Institute of Technology, to measure the velocity of the ball. Effective in 1942, a ball to be legal could not have a velocity greater than 250 ft. per sec. when tested on the U.S.G.A.'s apparatus at 75° F.

The effect of this difference between the legislation of the R. & A. and the U.S.G.A. is that golfers competing in the United States must use a ball larger than is legal in other parts of the world.

THE GRIP

While a golf club may be gripped in various ways, and satisfactory shots result, the so-called "overlapping" grip seems to be the most commonly used among expert players and the most frequently taught by golf instructors. Figs. 3 and 4 show the progressive stages of the hands of a right-handed player in assuming this grip, which is used for all clubs except the putter. (For recommended putting grip, see later under Putting.)

With the club on the ground in normal golfing position, place the extended left hand, with thumb close to fingers, slightly over the top of the shaft. The fingers wrap under the shaft, so that it lies diagonally across the base of the first and middle fingers and across the palm below the ring finger and little finger. Note that the shaft is not deep in the palm of the hand. Greatest pressure is exerted by the middle, ring and little fingers.

The thumb is now placed slightly to the right of the top of the shaft, so that the V formed at the bases of the thumb and forefinger points in the general direction of the right shoulder.

The right hand is now brought up to the shaft in such position that the palm is vertical and parallel with the shaft. It is then placed over the left hand so that the "life line" of the right palm covers the left thumb. The index, middle and ring fingers wrap around the shaft as close as possible to the left forefinger. The left forefinger is overlapped by the right little finger, and the right thumb comes down flat on top of the shaft (or very slightly to the left) to give a feeling of snug control between the ball of the thumb and the crooked forefinger. As with the left hand, the V formed by thumb and forefinger points toward the right shoulder. Both hands should be pulled snugly together to assure harmonious control and power. The beginning golfer will find this grip awkuard but with practice this feeling will disappear.

While the overlapping grip is most universally used among golfers, the "interlocking" grip has its advocates. This grip differs from the overlapping in only one particular—the little finger of the right hand does not overlap the left forefinger, but instead fits down between the left fore and middle fingers.

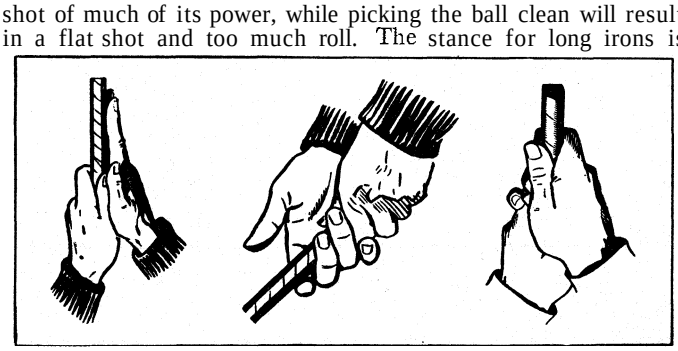
TYPES OF SHOTS

Descriptions are for right-handed players

The **Wood** Shot.—With the wood clubs, the player assumes a square stance in correct relation to the intended line of flight. He should feel comfortable and well balanced. The club head is placed on the turf directly back of the ball, with the face at right angles to the flight line. Keeping his eye on the ball, the player starts the club back slowly along the ground until the extended arms naturally lift it. This action continues to the top of the swing, at which point the club shaft is approximately horizontal, with both wrists underneath it. The left arm is fairly straight but not rigid, with just enough elbow bend to permit freedom. The right elbow is kept close to the body. It is important that the backswing be unhurried; a fast, jerky backswing will destroy timing.

The downswing is started by a co-ordinated "pull" of the left hip, shoulder, arm and hand, slowly at first, then accelerated as the ball is neared. Care must be taken not to "hit too soon"; greatest acceleration should be achieved at the moment of impact with the ball. At impact the left arm and club shaft are in alignment and the club follows through along the line of flight until the arms naturally bring it up and around to the rear. The stroke with a wood club is a sweeping swing, rather than the hit which characterizes play with irons.

The Iron Shot.—The technique employed in hitting an iron shot is somewhat different from that used with the woods. Iron shots are hit very crisply and downward; the club head comes in contact with the ball and continues down and through, taking some turf (called a "divot"). This aids in control and imparts backspin to the ball so that it rises readily and comes to rest without much roll—a desirable feature, since irons are rarely used for distance but rather for shots of medium to short length. It is easier for the golfer to gauge the travel of a quick-stopping ball. Actually, contact with the ball and the turf must be almost simultaneous, since to hit the turf back of the ball will rob the shot of much of its power, while picking the ball clean will result in a flat shot and too much roll. The stance for long irons is



COURTESY, NATIONAL GOLF FOUNDATION
FIG. 4.—FINAL STAGES IN ASSUMING "OVERLAPPING" GRIP

not greatly different from that employed with a wood, with the ball off the left heel, but as the iron selected for a shot becomes progressively "shorter" (that is, a shorter shaft and a face more laid back) the ball is played more and more from a spot toward the centre or even the right foot. The swing is inclined to be more upright and, especially on the shorter shots, the backswing and follow-through are less full.

Approaching. — When the player has come within close range of the green, two methods of play are open to him—he may pitch the ball all the way and depend on backspin to stop his ball near the pin, or he may play a "chip-shot" in which the ball flies part way through the air, as to the edge of the close-clipped green surface, and then rolls the remaining distance. For the pitch shot, a divot is taken; for a chip-shot, the ball is picked cleanly, since backspin is not desired.

Shots from Sand. — Even the most expert player will rarely complete his round without having to play his ball from the loose sand in a bunker (or sand trap) adjacent to a green. For this purpose he uses his niblick or a special sand iron, if he carries the latter club. An open stance is used—that is, the left foot is considerably withdrawn from the line to the cup. Care is taken to "worm" the feet well into the sand to assure a firm footing through the stroke. The club is carried up more vertically than in other shots and then sent down at a spot about an inch behind the ball, following a path that cuts across the line to the hole. This places a layer of sand between the ball and the club head; the ball thus is "blasted" from the trap without actually being touched with the club. It rises very slowly and vertically and settles on the adjacent green with backspin enough in many cases to make it hop a few inches back toward the player.

When the player's ball is in a sand trap at a distance from the green and lies well perched on the sand, it is possible to play an ordinary iron shot and get considerable distance. However, unless the stroke is perfectly executed, the loose sand is likely to thwart the intentions of the player; hence the wise golfer is generally content to get his bali out as best he can on his first try and depend on the succeeding shot to recover any distance he may have lost.

Wood Shots from Uneven Lies. — The golfer is often required to play his ball uphill, downhill or from a sidehill slope. For best results, certain modifications of the stance and swing are needed. When playing from an uphill lie, the stance of the right-handed player should be taken so the ball is off the right heel and the weight of the body over the right foot. Keep the club head low on the backswing and hit up the slope. The result of the shot will be a hook, so play to the right of the objective. In a downhill lie, the stance is somewhat open, with the ball off the left heel and the weight toward the left leg. The shot will almost always be a slice, so aim to the left of the objective. From a sidehill lie, with the ball at a higher level than the feet, bring the feet closer together than in the usual stance and grip the club somewhat farther down the shaft to compensate for the high position of the ball with relation to the feet; conversely, for a sidehill lie with the ball at a lower level than the feet, take a wide stance and grip the club as near the end of the shaft as is practical. Keep the weight well back on the heels, to prevent falling forward during the swing.

Putting. — The putt, once the ball is on the green, is perhaps the most delicate shot in golf. The player must hit the ball along a line that allows for very little margin of error, and with enough force to roll the ball to the hole but not too far beyond, in case the hole is missed, to make the return putt difficult. And since most greens are not level, but have numerous minor pitches and slopes, great care must be taken to select the proper line, which may be quite far to one side or the other of the cup.

The grip for putting differs from the grip for other clubs. The hands are placed on the shaft so the palms are opposed and parallel to the putter blade. This is for the purpose of relieving all muscular strain in the wrists during the stroke. The player stands quite erect (see fig. 7), with his head directly over the ball and his feet close together and square to the line of putt. The ball is generally played off the left foot, in which case the player's weight is rather more over the left leg than the right, for the sake of balance. Knees are slightly bent, to avoid tenseness. Hands are kept close to the body, with the left elbow moved out to point along the line of putt. Head and body are not allowed to move during the stroke. The putter is soled square across the line of putt, then brought back low along the ground—a matter of hand action rather than arm action, although the arms must not be too rigid. On the downstroke, the putter still maintains its position square to the line of putt, hits the ball crisply in dead centre, then follows through straight toward the hole.

THE RULES OF GOLF

In view of the simplicity of golf's purpose—to hit a ball from tee to cup in the fewest possible strokes, it would seem that a very short set of playing rules would suffice for the game. Actually, however, a thousand and one situations may develop between tee and cup. To cover these irregularities, the rules of golf are long and complicated. But the finer points of the rules need not concern the beginner; if he familiarizes himself with the more important rules, as outlined here, he will have no difficulty in playing the game intelligently.

First of all, there are two types of golf competition—match play and stroke play (often called medal play). Under match play, the winner is the player who wins the most holes from his opponent. Each hole is figured separately and is either won, lost or tied by the player. Under stroke play, the competitor who completes the round in the fewest total strokes is the winner.

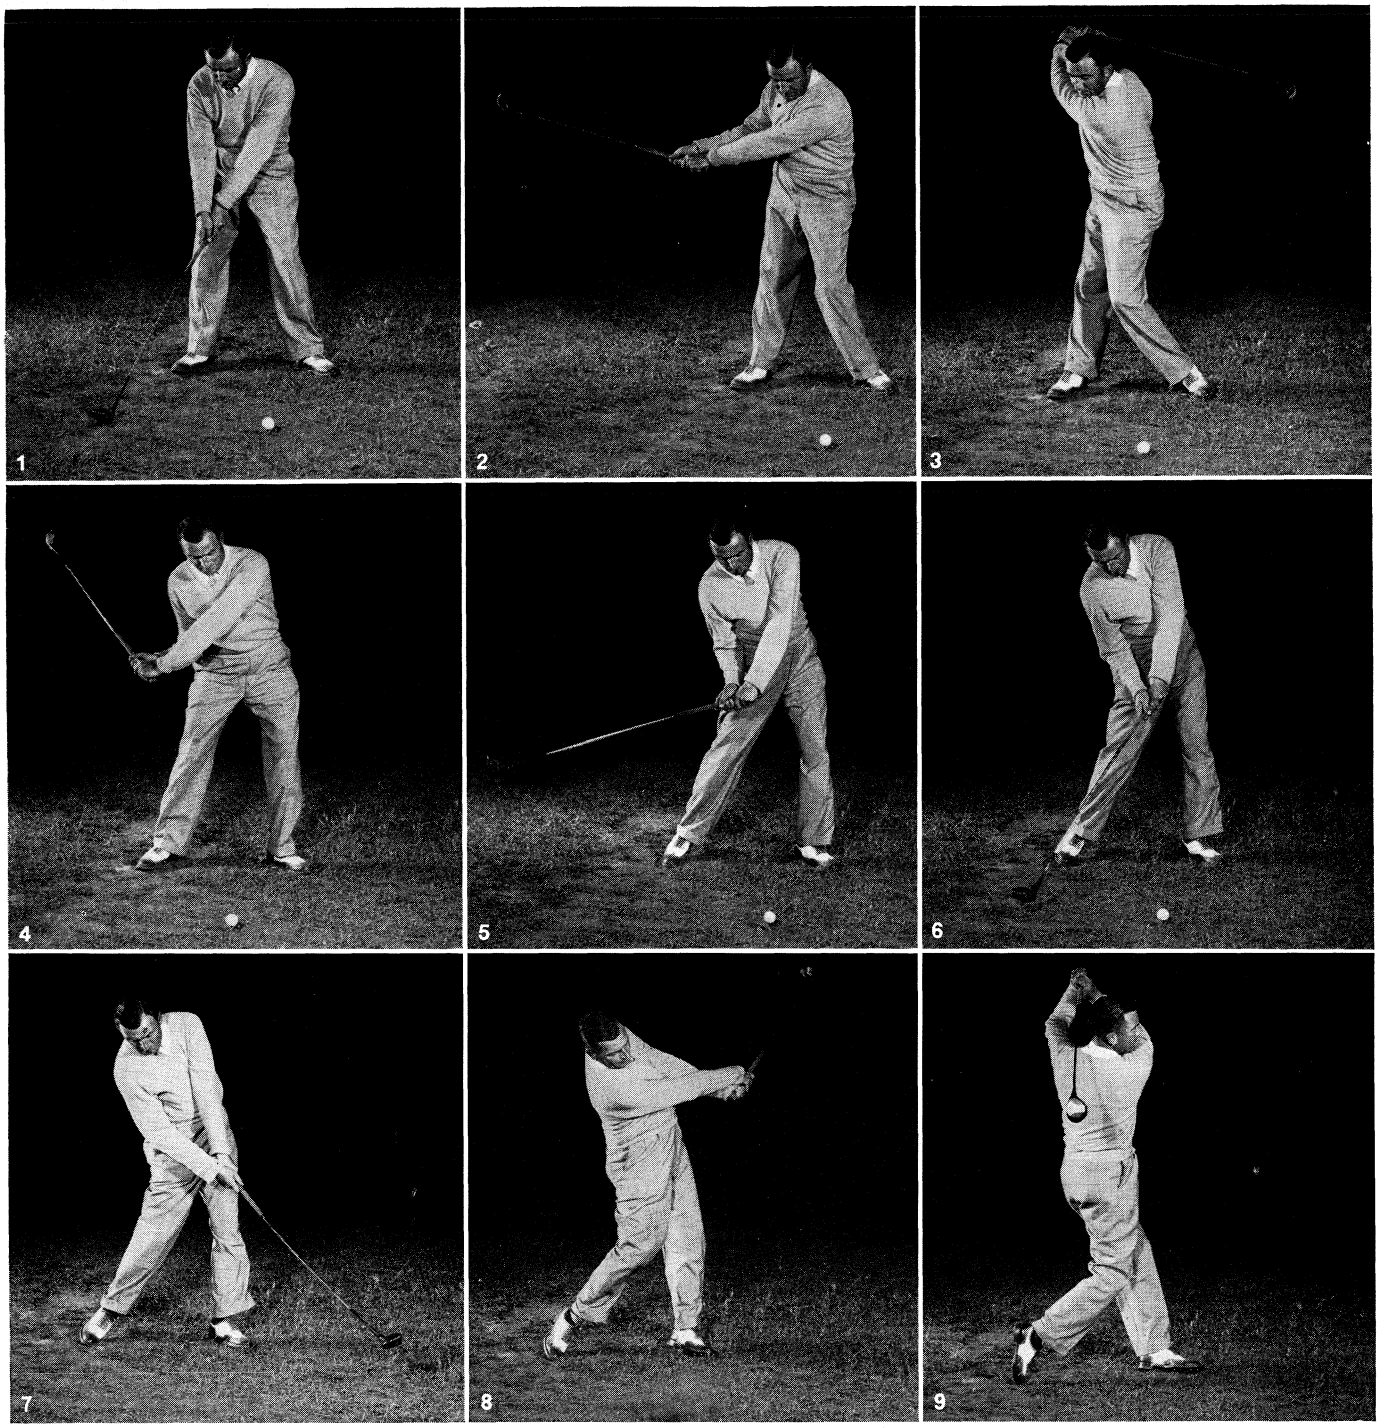
FIG. 5. — VARIOUS STANCES. LEFT TO RIGHT: CHIP-SHOT, MASHIE SHOT, LONG-IRON SHOT, WOOD-CLUB SHOT



PHOTOGRAPHS, FRANK J. SCHERSCHEL

STROBO-FLASH PHOTOGRAPHS OF A WELL-EXECUTED FULL TEE-SHOT

1. The initial movement of the backswing is a turn of the left hip to the right. As the body "winds up," the shoulders, arms, hands and club follow in one co-ordinated movement, with the club-shaft kept in line with a straight (but not tense) left arm. The club-head starts low along the ground and follows the body-turn
2. The wrists do not enter the swing in any way until this stage, at which point they begin to "cock," are fully cocked at the top of the swing, and remain so until just before the ball is hit. The greater part of the player's weight has shifted onto his braced right leg, the left side is relaxed, and the left heel has eased very slightly from the ground
3. At the top of the swing, there is a full body-turn, essential for power. The club-shaft has reached the horizontal, with both hands well under the shaft and fully cocked. A full grip is maintained with the left hand, and the left arm is held as straight as possible without tenseness
4. The left hip starts the downswing. As the body uncoils, it pulls the left arm down into the hitting area. The left arm continues to be held straight, with the cock of the wrists preserved. Observe in this and figs. 5 and 6 how the player's weight gradually shifts off the right leg
5. The left hip has turned well out of the way of the shot, clearing the path for the straight left arm. Wrists are uncocking to bring the club again into alignment with the left arm, thus delivering a powerful blow to the ball
6. As the club approaches impact with the ball, the wrists have straightened; so have the legs. There is a feeling of hitting against a firm left side. The whole right hand hits hard, as though slapping a flat object. Left hand grip must be firm enough to support this hit
7. The club-head, after impact, follows the line of flight until the wrists naturally begin to turn. The action is that of centrifugal force, applied from a solidly-grounded triangular foundation composed of the two feet and the head
8. Note that, until this view, the head has been held steady throughout the swing. This position is important in preserving balance. Observe also that, until now, the right elbow has been kept comfortably close to the right hip, to give the swing compactness
9. At the finish of the swing, the body has turned to face the line of flight. The head is not raised, but waits until it is pushed up by contact of the right shoulder on the chin. The player's balance continues to be retained, with most of his weight on his left heel

There are certain differences in the rules governing these two types of play; hence, in applying the rules given below, the player should take into account whether he is playing "match" or "stroke." When no difference is pointed out, the rule is the same for either type of play.

A fundamental rule of golf is this: Hit the ball from the tee and do not touch it again, except by striking at it with the club, until it has been holed out in the cup. There are situations, true enough, where the rules permit the player to lift his ball, sometimes without penalty and sometimes under penalty of an added stroke or two to the score. But 99% of the time, the player is expected to play the ball where it lies.

Another fundamental rule is: Always allow the player farthest from the hole to play first. This is called the "honour." On the teeing ground, the honour belongs to the player who won the last previous hole or, in case of a tie, the last hole that was not tied. The honour on the first teeing ground is decided by lot.

On each teeing ground of the course are two "tee markers," a few yards apart and at right angles to the direction of the hole. A player may tee his ball anywhere between the markers and not over two club lengths (about 7 ft.) behind them. If a bali is put in play from outside this teeing area, an opponent in match play may (but is not obliged to) recall the shot and require the erring player to replay properly from within the area; no penalty attaches and the illegal shot is not counted. In stroke play, the ball *must* be recalled; the player must count the illegal stroke, shoot again and, in addition, take one stroke penalty for his carelessness.

Every intentional stroke at the ball must be counted, even if the player completely "fans" the ball. On the teeing ground, however, a ball accidentally knocked off the wooden-peg tee in the act of addressing it may be replaced without penalty.

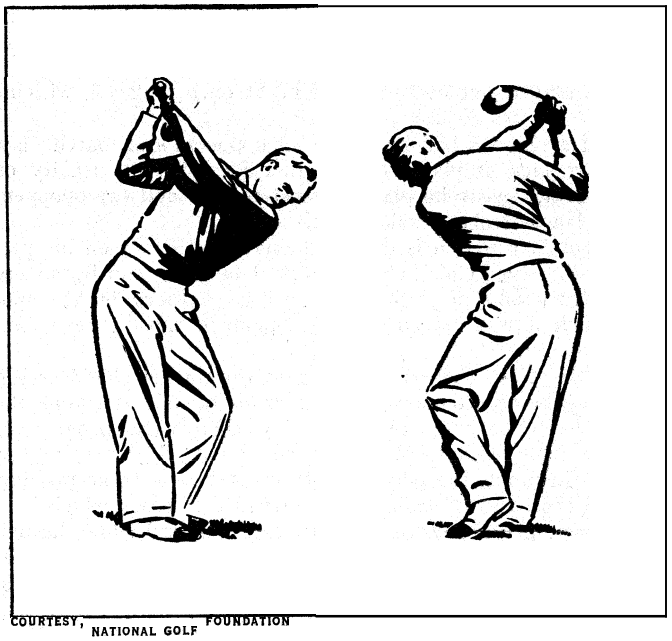
The player is not permitted to remove or press down any irregularities of the ground which could in any way affect his stroke, and he must not move, bend or break anything fixed or growing except as is necessary in taking his stance or in making his swing. He must play around trees, bushes, fence posts and immovable natural objects, such as large boulders, as best he can. But the rules permit him to remove any natural impediments to play which can be lifted, such as pebbles, twigs or fallen leaves and man-made impediments such as paper, bottles and boxes. In addition, any greenkeeping tools or equipment may be lifted out of the way or, if too heavy to lift, may be avoided by lifting the ball and dropping it to one side, within two club lengths and not nearer the hole. Similar relief is granted from water pipes, drains and the like.

An exception is when the ball lies in a hazard, such as a creek bank or sand trap. There, the player may not lift, or lift away from, any natural obstruction which may be in the hazard, although he is permitted to remove man-made impediments.

The following are hazards: the exposed soil or sand in a bunker, permanent water areas and the banks thereof, ditches, sandy areas and roads. Paths, bare patches of ground and temporary accumulations of water (called "casual" water) are not hazards. There are certain restrictions to freedom of play when a ball lies in a hazard. Except unavoidably while taking his stance, a player must not touch the ground or move anything except growing vegetation prior to his downward swing. Nothing may be smoothed out, the surface of a hazard must be taken as it is found. Anywhere on the course, if a ball moves after the player has addressed it, or is accidentally moved by the player or his caddie, one penalty stroke must be added to the player's score for the hole. Under no circumstances except when in water may a moving ball be struck.

Some rules immediately following do not apply to greens, so read *Rules for Greens* below for proper procedure when the ball lies on a putting green.

There is no penalty if a player's ball hits an opponent's ball; play the ball where it comes to rest; the opponent may, if he chooses, replace his ball in its original spot. In match play, a player loses the hole if his ball hits him, his caddie or his clubs; in stroke play there is a penalty of two strokes for such a mishap.



COURTESY, NATIONAL GOLF FOUNDATION

FIG. 6.— PROPER POSITION AT TOP OF THE SWING

Ball hitting opponent, his caddie or clubs: Opponent loses hole at match play; no penalty, stroke play. *Ball hitting person not engaged in the match:* Play the ball where it lies, no penalty. *Ball lodging in anything moving:* Drop a ball where ball first entered the moving object; no penalty. *Ball at rest moved by any agency outside the match:* Drop the ball where it lay before it was moved.

When two balls come to rest within a club length of each other, the ball nearer the hole must be lifted on request of the farther player until his ball is played, then replaced. When balls are on the green, however, different regulations apply; see *Rules for Greens*, below.

Playing the opponent's ball by mistake entails loss of hole at match play unless the opponent then plays the player's ball, in which case the hole is played out with the balls exchanged.

Playing the ball of someone not in the match loses the hole for a player, unless he discovers the fact and informs his opponent before the opponent plays his next stroke, in which case the player then plays his correct ball, without penalty. In stroke play, the penalty is two strokes for playing any ball but the player's own.

When a ball is lost, out of bounds or unplayable, the player drops a ball at the spot from which the first ball, was hit, adding a penalty stroke to his score. The player is the sole judge of when his ball is unplayable.

When a ball ends up in a water hazard, the player may (a) play the ball as it lies without penalty; *(b)* drop a ball under penalty of one stroke as far as he pleases behind the hazard, keeping the spot the ball crossed the margin of the hazard between him and the hole; or (c) drop a ball under penalty of one stroke on a dry spot in the hazard, in this case keeping the spot the ball entered the water between him and the hole.

There is no penalty, however, for lifting from "casual" water (as after a heavy rain). Drop a ball on the nearest dry spot not nearer the hole. On the green, the ball may be placed instead of dropped.

Rules **for** Greens.— Should the ball move after the player has removed a loose impediment (as a fallen leaf) within 6 in. of the ball, a penalty stroke must be added to the score for the hole.

The line of putt must not be touched, except immediately in front of the ball in addressing it. A caddie or partner may point out the direction for putting, but must not touch the ground on the proposed line or place any marks to guide the player.

In match play, when an opponent's ball wholly or partially blocks a player's line of putt, the player must play around the blocking ball as best he can, unless the opponent's ball is within 6 in. of the player's, or (U.S. only) within 6 in. of the cup, in which case the opponent's ball must be lifted and replaced after

the player has putted. In stroke play, the nearer ball must be lifted or played (as its owner chooses) whenever the farther player requests and whether or not it is in the line of putt.

A ball played out of turn must be at once replaced, with no penalty.

Should a player's ball be hit by an opponent's in match play, he may replace or play from his new location; no penalty on either player. In stroke play, he must replace and the opponent must add a a-stroke penaltv to his score.

A player in a match is deemed to have holed out on his previous stroke should his ball be knocked into the cup by an opponent. In stroke play, the ball must be replaced on the spot from which it was moved, and the opponent must take a two-stroke penalty.

In match play, there is no penalty for hitting the flagstick, unless it is being attended, in which case the side attending the flagstick loses the hole. In stroke play, there is no penalty for striking the flagstick from more than 20 yd.; if hit from less than that distance, the player must accept a two-stroke penalty.

Should the ball rest against an unattended flagstick which is in the hole, the player is entitled to lift the stick and allow the ball to fall into the cup. He is considered to have holed out on his previous stroke. In stroke play, this same procedure is followed, but the player is subject to the two-stroke penalty for hitting the pin if his shot was played from within 20 yd.

Glossary *of* Technical *Terms* Used in the *Game*

Ace.—A hole scored in one stroke.

Addressing the Ball.—Putting oneself in position to strike the ball.

All Square.—Term used to express that the score stands level, neither side being a hole up

Approaching.—Playing or attempting to play a ball onto the putting green.

Apron.—The last few yards of fairway in front of the green

Away.—The player whose ball lies farthest from the hole is said to be away.

Backspin.—Rotation of the ball in flight backward, imparted by causing the club head to strike the ball a descending blow, as in a draw shot in billiards.

Bent.—Rushes. Also a certain species of grass of fine texture used for putting greens.

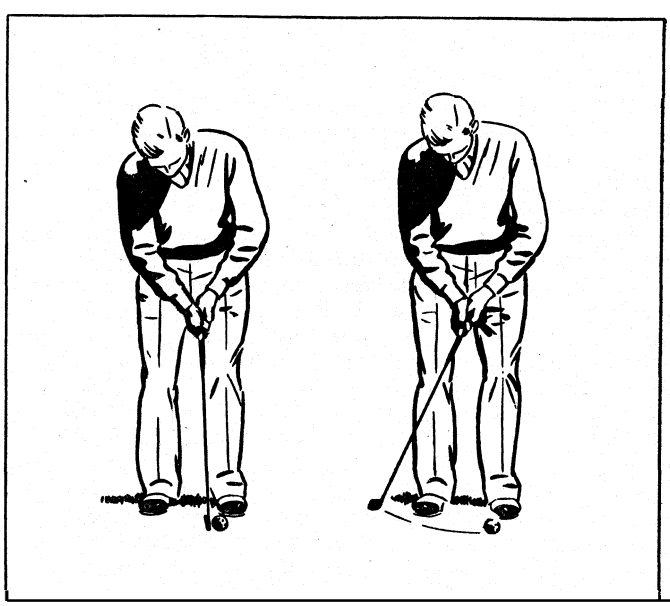
Best-Ball Match.—A match in which a single player competes against the best ball of two or more.

Birdie.—A score one stroke less than the par of a hole.

Bisque.—A handicap stroke given under the condition that the player may use it at his option on any hole, but with the provision that he must announce his choice to do so on any hole, before striking off from the tee for the next hole.

Blind.—Said of a green that cannot be seen when approaching it.

Bogey.—The number of strokes which a good average player should take to each hole. This imaginary player is usually known as "Colonel Bogey" and plays a fine game.



COURTESY, NATIONAL GOLF FOUNDATION

FIG. 7.—THE PUTTING STANCE AND THE BACKSTROKE

Borrow.—In putting to play to the right or left of the direct line from ball to the hole in order to compensate for roll or slant in the putting green.

Bulger—A driver in which the face "bulges" into a convex shape.

Bunker.—A depression in the ground, either natural or artificial, where the soil is exposed or covered with a layer of sand.

Bye.—The holes remaining after one side has become more holes up than remain for play.

Caddie.—The person who carries the clubs. Diminutive of "cad" (from Fr. cadet, cf. laddie).

Carry.—The distance between where a ball is hit and where it first strikes the ground.

Casual Water.—Water that is temporary, as after a rain.

Chip-Shot.—A short approach, mostly through the air.

Club.—The implement with which the ball is struck.

Competitor.—A player in a stroke-play event.

Concede.—To grant that an opponent will hole out in one more stroke; also to admit an opponent has won a hole before play is completed.

Cop.—The top or parapet of a bunker.

Course.—The terrain over which the game is played. All ground on which play is permitted, including fairway, rough, hazards and putting greens. (See also Links.)

Cup.—The hole into which the ball is played at each green. It is 4¼ in. in diameter and at least 4 in. deep.

Dead.—A ball is said to be "dead" when so near the hole that the putting it in in the next stroke is a "dead" certainty. A ball is said to "fall dead" when it pitches with hardly any run.

Default.—To concede a match to an opponent without playing against him.

Divot.—A piece of turf cut out in the act of playing, which, be it noted, should always be replaced before the player moves on.

Dog-Leg.—Said of a hole that bends markedly left or right between tee and green.

Dormie.—One side is said to be "dormie" when it is as many holes to the good as remain to be played—so that it cannot be beaten.

Dub.—An unskilful player; also, to hit the ball poorly.

Eagle.—A score two less than the par of a hole.

Face.—The surface of the club with which the ball is struck.

Fairway.—The expanse of ground, extending in whole or in part from the tee to the putting green, especially prepared for play with excellent turf on which the grass is kept cut.

Follow Through.—The continuation of the sweep of the club after the ball has been struck.

"Fore!"—A cry of warning to people in front.

Forecaddie.—A caddie who stays ahead of a player to watch the ball.

Four-Ball Match.—A match in which two players to a side are engaged, each playing his own ball.

Foursome.—A match in which four persons engage with two balls, two on each side playing alternately with the same ball and alternately from succeeding tees.

Gobble.—Said of a boldly hit putt, which finds the hole, but which must have gone considerably beyond the hole, had it failed to go in.

Green.—The "putting-greens" around the holes.

Grip.—(a) The part of the club shaft which is held in the hands while playing; (b) the grasp itself—*e.g.*, "a firm grip," "a loose grip" are common expressions.

Gross.—A player's score before deducting his handicap.

Ground.—To sole or rest the club head on the ground back of the ball.

Half-Shot.—A shot played with something less than a full swing.

Halved.—A hole is "halved" when both sides have played it in the same number of strokes. A round is "halved" when each side has won and lost the same number of holes.

Handicap.—The strokes which a player received either in match play or stroke play to equalize the playing ability of all contestants.

Hanging.—Said of a ball that lies on a slope inclining downward in regard to the direction in which it is to be struck.

Hazard.—Area in which the privileges of play are restricted, including bunkers, water (except "casual water"), ditches, sand or roads.

Head.—The knob or crook part of the club as distinguished from the shaft or handle. Heads are made of wood, steel and sometimes metallic compounds.

Heel.—To hit the ball on the "heel" of the club; *i.e.*, the part of the face nearest the shaft, and so send the ball to the right, with the same result as from a slice.

Hole.—The circular opening in the ground into which the ball is played, being 4¼ in. in diameter and at least 4 in. deep; also a unit of play including teeing ground, putting green and all intermediate ground.

Hole-high.—Said of the ball when it lies even with the hole but to one side or the other.

Hole-out.—To make the final stroke in playing the ball into the hole.

Honour.—The privilege (which its holder is not at liberty to decline) of striking off first from the lee.

Hook.—A right-handed player's shot which curves to the left in flight; the opposite for a left-handed player.

Hosel.—The socket on iron clubs into which the shaft is fitted.

Iron.—A club with a metal head, generally steel, as opposed to a "wood."

Lie.—(*a*) The angle of the club head with the shaft (*e.g.*, a "flat lie," "an upright lie"); (b) the position of the ball on the ground (*e.g.*, a "good lie," "a bad lie").

Like, The.—The stroke which makes the player's score equal to his opponent's in the course of playing a hole.

Line.—The direction in which a player desires his ball to travel.

Links.—Ground on which golf is played; more properly used only of a seaside course.

Loft.—The angle of declination from 90° on the face of a club; also to hit the ball on a high short trajectory, usually over some intervening obstacle.

Long Game.—The strokes where distance is an important factor, as distinguished from play where control of distance is a problem.

Loose *Impediments.*—Any object lying in the immediate vicinity of the ball, not fixed in the earth or growing.

Match Play.—Play in which score is reckoned by holes won and lost.

Medal Play.—Play in which the score is reckoned by the total of strokes taken on the round. Officially termed stroke play.

Mixed *Foursome.*—Foursome in which a man and woman play as partners.

Nassau.—A basis of scoring, in which three points are involved, one on the first 9 holes, one on the second 9, and one on the full 18. Play may be at either match or stroke play.

Neck.—The bent or crooked part of the club where the shaft joins onto the head.

Net.—A player's score after subtracting his handicap from his gross.

Nose.—The outward point of the club face; called also the toe.

Odd, The.—A stroke more than the opponent has played.

Par.—Theoretically perfect play, calculated on the number of strokes required to reach the green, plus two putts. Distance is the chief factor in determining the par for a hole. Following are the divisions: all distances up to 250 yd., par 3; 251 to 445, par 4; 446 to 600, par 5; over 600, par-6.

Pin.—Rod or pole to which flag is attached.

Pitch.—To lob or loft a ball into the air.

Pitch-and-run.—To so play the ball that a part of the desired distance is to be covered by the roll of the ball after it strikes the ground.

Pivot.—The turn of the body as a stroke is played.

Press.—To strive to hit harder than you can hit with accuracy.

Pull.—To hit the ball so as to make it curve to the left.

Putt.—The stroke used on the putting green to roll the ball toward the hole.

Rough.—Ground to left and right of the fairway; also at times intervening between the tee and fairway, on which vegetation is allowed to grow without frequent cutting; long grass and weeds.

Rub-of-the-Green.—Any deflection or stoppage of the ball by an agency outside the match.

Run.—The distance the ball rolls after striking the ground.

Runner-up.—The player finishing second in an event.

Run up.—To send the ball low and close to the ground in approaching the hole—opposite to lofting it up.

Sand Trap.—See Bunker, above.

Sclaff.—To strike the ground back of the ball before striking the ball itself.

Scratch Player.—Player who receives no odds in handicap competitions.

Shaft.—The handle of the club, as distinguished from the head.

Short Game.—Approach shots and putts.

Single.—A match between two players.

Slice.—A right-handed player's shot which curves to the right in flight; the opposite for a left-handed player.

Socket.—The opening in the neck of an iron club into which the shaft is fitted; also to hit the ball back on this part of the club, or the heel.

Sole.—The bottom of the club on which it rests when set in position on the ground.

Spring.—The resilience in the shaft of a club.

Square.—Said of a match, when the players are even.

Stance.—The position of the player's feet in hitting the ball. Stances are designated as open, square and closed. In the square stance, the toes of the feet are in a line parallel with the proposed line of play. In the open stance, the left foot is drawn back from the line. In the closed stance, the right foot is drawn back from the line.

Stroke.—A forward movement of the club made with the intent to hit the ball, even though the ball is not struck, constitutes a stroke.

Stroke Play.—Play in ,which the total strokes for the round determine the winner. Same as medal play.

Stymie—When the path of a ball to the hole is blocked by an opponent's ball which is more than 6 in. away (and in the U.S., more than 6 in. from the cup),

Swing.—The sweep of the club in the operation of hitting the ball.

Tee.—A wooden peg or pinch of sand on which the ball may be placed for the first drive to each hole.

Teeing Ground.—The place marked as the limit, outside of which it is not permitted to drive the ball off. This marked-out ground is also sometimes called "the tee"

Three-Ball *Match*—A match in which three players compete against one another, each playing his own ball.

Threesome.—A match in which one player competes against two others of a side, the two playing alternate strokes with the same ball.

Through-the-Green.—Conditions governing play from the time the ball is played from the tee until it reaches the green, except in hazards.

Toe.—The outward point of the head of the club; also called nose.

Top.—To hit the ball above the centre, so that it does not rise much from the ground.

Undercut.—Also called "cut"; same as Backspin.

Up.—A player is said to be "one up," "two up," etc., when he is so many holes to the good of his opponent.

Upright.—Referring to the lie of clubs, means that the angle between the head of the club and the shaft is less obtuse than in a flat lie.

Whipping.—The thread or twine used in wrapping the space where the head and shaft of the club are joined together.

GOLGOTHA, a skull, from the Aramaic Gulgulta (גולגולתא Targ. Onqelos of Ex. xvi. 16, with the second "l" omitted for euphony to Greek ears). The name of the spot where Christ was crucified (Matt. xxvii. 33; Mk. xv. 22: John xix. 17). outside Jerusalem. Perhaps so called from a' knoll on thk' north of the city, not far from the Damascus gate, which now resembles a skull, cavities in its face forming eyes. nose, and mouth, if we may assume that the form of this has not changed since those days. But this is very doubtful; see F. L. N. Bower in *Ch. Qu.* Review xci. (1920) p. 125. See further *Dict.* of *Christ* and the Gospels, *s.v.*

(A. L. W.)

GOLIAD, an incorporated village of south-eastern Texas, on the San Antonio river and the Southern Pacific railway. 85 mi S.E. of San Antonio; the county seat of Goliad county. The population in 1940 was 1,446. Goliad is surrounded by a very rich farming and grazing country. In nearby Goliad state park are a restored Spanish mission and the well-preserved ruins of a presidio, moved there in 1749. The name Goliad, in use since 1829, is probably an anagram of the name of the Mexican patriot Hidalgo (1757–1811). During the struggle between Mexico and Spain the Mexican leader Bernardo Gutierrez was besieged here. On the outbreak of the Texan War of Liberation Goliad was garrisoned by a small force of Mexicans. who were soon forced to surrender. and on Dec. 20. 1835. a preliminary "declaration of independence" was published here. In 1836, when Santa Anna began his advance. Goliad was occupied by 3jo American troops under Col. James W. Fannin. In obeying orders to withdraw and join Gen. Houston, they were overtaken on Coletto Creek, and after a sharp fight (March 19–20) were obliged to surrender, whereupon they were marched back to Goliad, and were shot down (March 27) by Santa Anna's command.

GOLIARD, a name applied to those wandering students (*vagantes*) and clerks in England, France and Germany, during the 12th and 13th centuries, who mere better known for their rioting, gambling and intemperance than for their scholarship. The derivation of the word is uncertain, but it was connected by them with a mythical "Bishop Golias," also called *"archipoëta"*

and "primas"—especially in Germany—in whose name their satirical poems were mostly written. The jocular references to the rules of the "gild" of goliards should not be taken too seriously, though their aping of the "orders" of the Church, especially their contrasting them with the mendicants, was denounced by Church synods. Their satires were almost uniformly directed against the Church, attacking even the pope. In 1227 the Council of Trèves forbade priests to permit the goliards to take part in chanting the service. In 1229 they played a conspicuous part in the disturbances at the University of Paris, in connection with the intrigues of the papal legate. During the century which followed they formed a subject for the deliberations of several Church councils, notably in 1289, when it was ordered that "no clerks shall be jongleurs, goliards or buffoons," and in 1300 (at Cologne) when they were forbidden to preach or engage in the indulgence traffic. This legislation only became effective when the "privileges of clergy" were withdrawn from the goliards.

Along with their satires went many poems in praise of wine and riotous living. A remarkable collection of them, now at Munich, from the monastery at Benedictbeuren in Bavaria, was published by Schmeller (3rd ed., 1895) under the title *Carmina Burana.* Many of these, which form the main part of song-books of German students today, have been delicately translated by John Addington Symonds in a small volume, Wine, *Women* and Song (1884).

The word "goliard" itself outlived these turbulent bands which had given it birth, and passed over into French and English literature of the 14th century in the general meaning of jongleur or minstrel, quite apart from any clerical association. It is thus used in Piers *Plowman,* where, however, the goliard still rhymes in Latin, and in Chaucer.

See O. Hubatsch, Die *lateinischen* Vagantenlieder des Mittelalters (Gorlitz, 1870); B. Spiegel, Die Vaganten und ihr *Orden* (Spires, 1892); M. Haezner, Goliardendichtung und die Satire *im 13ten Jahrhundert* in England (Leipzig, 1905); the article in La grande *Encyclopédie;* Helen Waddell, The Wandering *Scholars* (1927); also K. Breul, The Cambridge Songs (1915).

GOLIATH, the name of the giant by slaying whom David achieved renown (1 Sam. xvii.). The Philistines had come up to make war against Saul and this warrior came forth day by day to challenge to single combat. Only David ventured to respond, and armed with a sling and pebbles he overcame Goliath. The Philistines, seeing their champion killed, lost heart and were easily put to flight. The giant's arms were placed in the sanctuary, and it was his famous sword which David took with him in his flight from Saul (1 Sam. xxi. 1–9). From another passage we learn that Goliath of Gath was slain by a certain Elhanan of Bethlehem in one of David's conflicts with the Philistines (2 Sam. xxi. 18–22)—the parallel 1 Chron. xx. 5, avoids the contradiction by reading the "brother of Goliath." But this old popular story has probably preserved the more original tradition, and if Elhanan is the son of Dodo in the list of David's mighty men (2 Sam. xxiii. 9, 24) the resemblance between the two names may have led to the transference.

GOLITSYN, BORIS ALEKSEYEVICH (1641–1713), Russian statesman, came of a princely family, claiming descent from Prince Gedymin of Lithuania. Boris became court chamberlain in 1676. He was the young tsar Peter's chief supporter when, in 1689, Peter resisted the usurpations of his sister Sophia, and the head of the loyal council which took refuge in the Troitsa monastery and won over the boyars of the opposite party. In 1690 he was created a boyar and shared with Naryshkin, Peter's uncle, the conduct of home affairs. After the death of the tsaritsa Natalia, Peter's mother, in 1694, his influence increased further. He accompanied Peter to the White Sea (1694–95); took part in the Azov campaign (1695); and was one of the triumvirate who ruled Russia during Peter's first foreign tour (1697–98). The Astrakhan rebellion (1706), which affected all the districts under his Government, shook Peter's confidence in him, and seriously impaired his position. In 1707 he was superseded in the Volgan provinces by Andrei Matveyev, and in 1713 entered a monastery. He was a typical representative of Russian society of the end of the 17th century in its transition from barbarism to civilization. In many respects he was far in advance of his age. He was highly educated, spoke Latin fluently, frequented the society of scholars and had his children carefully educated. Yet he was an habitual drunkard; it was his drunkenness which ruined him in the estimation of Peter the Great, despite his previous services.

See S. Soloviev, History of Russia. (Rus.), vol. xiv. (Moscow, 1858); R. N. Bain, The First Romanovs (1905).

GOLITSYN, BORIS BORISOVICH, PRINCE (1862–1916), Russian physicist, was born on Feb. 18 (old style) 1862 in St. Petersburg (Leningrad). He was educated in the naval school and naval academy. In 1887 he left the active service for scientific studies and went to Strassburg. In 1891 he was appointed *privat*-docent at the University of Moscow and in 1893 professor of physics at Dorpat. The same year he was elected fellow of the Academy of Sciences in St. Petersburg and in 1908 a member of the same. His early research was in spectroscopy, but his world-known work is on the methods of earthquake observations and on the construction of seismographs, which are used in all Russian and in many foreign observatories. His valuable book, Lectures on *Seismometry,* was published in 1912 and translated into German in 1914. He received the degree of D.Sc. from the University of Manchester in 1910. In 1911 he was elected president of the International Seismological association. In 1913 he was appointed director of the Central Physical (now Geophysical) observatory at St. Petersburg and achieved good results in the organization of the meteorological service throughout Russia, especially during the World War, but his work was cut short by his death from pneumonia on May 4, 1916, at New Peterhof, near St. Petersburg.

(A. FOE.)

GOLITSYN, DMITRY MIKHAILOVICH (1665–1737), Russian statesman, was sent in 1697 to Italy to learn "military affairs"; in 1704 he was appointed to the command of an auxiliary corps in Poland against Charles XII.; from 1711 to 1718 he was governor of Byelogorod. In 1718 he was appointed president of the newly erected *Kammer Kollegium* and a senator. In May 1723 he was implicated in the disgrace of the vice-chancellor Shafirov and was deprived of all his offices and dignities, which he only recovered through the mediation of the empress Catherine I. Golitsyn remained in the background till the fall of Menshikov, 1727. During the last years of Peter II. (1728–30) his high aristocratic theories had full play. On the death of Peter II. he conceived the idea of limiting the autocracy by subordinating it to the authority of the supreme privy council, of which he was president. He drew up a form of constitution which the empress Anne was forced to sign at Mittau before leaving for St. Petersburg. Anne lost no time in repudiating this constitution, and never forgave its authors. Golitsyn lived in retirement till 1736, when he was arrested on suspicion of being concerned in the conspiracy of his son-in-law Prince Constantine Cantimir. He was really prosecuted for his anti-monarchical sentiments. A court, largely composed of his antagonists, condemned him to death, but the empress commuted the sentence to lifelong imprisonment in Schlüsselburg and confiscation of all his estates. He died in prison on April 14, 1737, after three months of confinement.

See R. N. Bain, The Pupils of Peter the Great (1897).

GOLITSYN, VASILY VASILEVICH (1643–1714), Russian statesman, spent his early days at the court of Tsar Alexius where he gradually rose to the rank of boyar. In 1676 he was sent to the Ukraine to keep in order the Crimean Tatars and took part in the Chigirin campaign. The revolution of May 1682 placed Golitsyn at the head of the Posolsky Prikaz, or Ministry of Foreign Affairs, and during the regency of Sophia, sister of Peter the Great, whose lover he became, he was the principal minister of State (1682–1689) and "keeper of the great seal." His foreign policy was distinguished by the peace with Poland in 1683, whereby Russia recovered Kiev. By the terms of the same treaty, he acceded to the grand league against the Porte, but his two expeditions against the Crimea (1687 and 1689), "the First Crimean War," were unsuccessful and made him extremely unpopular. In the civil war between Sophia and

Peter (Aug.–Sept. 1689), Golitsyn half-heartedly supported his mistress, and shared her ruin. He was banished successively to Kargopol, Mezen and Kologora. where he died on Apr. 21, 1714. Golitsyn was unusually well educated. He understood German and Greek, and could express himself fluently in Latin. He was a great friend of foreigners, who generally alluded to him as "the great Golitsyn."

See R. N. Bain, *The First Romanovs* (1905); *A.* Brückner, *Fürst Golizin* (Leipzig, 1887); S. Soloveiv, *History of Russia* (Rus.), vols. xiii.–xiv. (Moscow, 1858, etc.).

GOLIUS or **GOHL, JACOBUS** (1596–1667), Dutch orientalist, born at The Hague, studied at the University of Leyden, where in Arabic and other Eastern languages he was a pupil of Erpenius. In 1622 he accompanied the Dutch embassy to Morocco, and on his return he was chosen to succeed Erpenius (1624). He then spent five years travelling in Syria and Arabia. The remainder of his life was spent at Leyden where he held the chair of mathematics as well as that of Arabic. He died on Sept. 28, 1667. His most important work is the *Lexicon Arabico-Latinum* (Leyden, 1653), which, based on the *Sihah* of Al-Jauhari, was only superseded by the corresponding work of Freytag. In 1656 he published a new edition, with considerable additions, of the *Grammatica Arabica* of Erpenius. After his death, there was found among his papers a *Dictionarium Persico-Latinum* which was published, with additions, by Edmund Castell in his *Lexicon heptaglotton* (1669).

GOLLANCZ, SIR HERMANN (1852–1930), Jewish rabbi, son of the Rev. S. M. Gollancz, studied at University college, London. He became an authority on the Hebrew language and literature, and in 1897 the Chief Rabbis in Galicia conferred on him the highest Rabbinical diplomas, "Hatarath Koraah." He was for 21 years Goldsmid professor of Hebrew at University college, and presented his library to the college at the end of this period (1902–24). From 1892 to 1923 he was preacher at the Bayswater synagogue, and was then appointed emeritus minister for his record service of 51 years. In that year he received a knighthood. He interested himself in many philanthropic works, and founded several synagogues for the working classes. He was a member of the commission on the birth-rate (1913–16), and other Government inquiries.

His publications include many translations from Hebrew and Aramaic and articles contributed to learned reviews.

GOLLANCZ, SIR ISRAEL (1863–1930), British scholar, was born in London July 13, 1863. He was educated at the City of London school and at University college, London and Christ's college, Cambridge. From 1892 to 1895 he was Quain student and lecturer in English at University college, London and in 1896 was appointed university lecturer in English at Cambridge, becoming in 1906 university professor of English language and literature at King's college, London. He became secretary of the British Academy on its foundation in 1903 and was knighted in 1919. He was general editor of the *Temple Classics* and *King's Library* series and of the *Book of Homage to Shakespeare* which appeared in 1916. He died June 23, 1930. His published works include *Cynewulf's Christ* (1892); an edition of C. Lamb's *Specimens of Elizabethan Dramatists* (1893); *Exeter Book of Anglo-Saxon Poetry* (1895); *Hamlet in Iceland* (1898); and *The Caedmon Manuscript of Anglo-Saxon Biblical Poetry* (1927).

GOLLNOW, a town in the Prussian province of Pomerania, Germany, on the Ihna, 14 mi. N.N.E. of Stettin, with which it has communication by rail and steamer. Pop. (1939) 13,433. Gollnow was founded in 1190, and was raised to the rank of a town in 1268. It was for a time a Hanse town, and came into the possession of Prussia in 1720, having belonged to Sweden since 1648. It manufactures chairs and cement.

GOLOVIN, FEDOR ALEKSEYEVICH, COUNT (d. 1706), Russian statesman. During the regency of Sophia, sister of Peter the Great, he was sent to the Amur to defend the new Muscovite fortress of Albazin against the Chinese. In 1689 he concluded with the Celestial empire the Treaty of Nerchinsk, by which the line of the Amur, as far as its tributary the Gorbitsa, was retroceded to China. In Peter's grand embassy to the West in 1697 Golovin occupied the second place immediately after Lefort. It was his chief duty to hire foreign sailors and obtain everything necessary for the construction and complete equipment of a fleet. On Lefort's death, in March 1699, he succeeded him as admiral-general. The same year he was created the first Russian count, and was also the first to be decorated with the newly-instituted Russian order of St. Andrew. The conduct of foreign affairs was at the same time entrusted to him, and from 1699 to his death he was "the premier minister of the tsar." Golovin supplemented the Treaty of Carlowitz, by which peace with Turkey had only been secured for three years, by concluding with the Porte a new treaty at Constantinople (June 13, 1700), by which the term of the peace was extended to 30 years and, besides other concessions, the Azov district and a strip of territory extending thence to Kuban were ceded to Russia.

See R. N. Bain, *The First Romanovs* (1905). (R. N. **B.**)

GOLOVKIN, GAVRIIL IVANOVICH, COUNT (1660–1734), Russian statesman, was attached (1677), while still a lad. to the court of the tsarevitch Peter, afterwards Peter the Great, with whose mother Natalia he was connected, and vigilantly guarded him during the regency of Sophia. He accompanied the young tsar abroad on his first foreign tour, and worked by his side in the dockyards of Saardam. In 1706 he took over the direction of foreign affairs, and was created the first Russian grand-chancellor on the field of Poltava (1 jog). Golovkin held this office for 25 years. Under Catherine I. he became a member of the supreme privy council; the empress also entrusted him with her last will whereby she appointed the young Peter II. her successor and Golovkin one of his guardians. On the death of Peter II. in 1730 he declared in favour of Anne, duchess of Courland, in opposition to the aristocratic Dolgorukis and Golitsyns, and his determined support of the autocracy wrecked the proposed constitution, which would have converted Russia into a limited monarchy. Under Anne he was a member of the first cabinet formed in Russia. He was one of the wealthiest, and at the same time one of the stingiest, magnates of his day. His ignorance of any language but his own made his intercourse with foreign ministers very inconvenient.

See R. N Bain, ***The Pupils*** of *Peter* ***the*** *Great (1897).*

GOLOVNIN, VASILY MIKHAILOVICH (1776–1831), Russian vice-admiral, born on April 8 (new style April 20), 1776 in the province of Ryazan, received his education at the Cronstadt naval school and from 1801 to 1806 served as a volunteer in the English navy. In 1807 he was commissioned by the Russian Government to survey the coasts of Kamchatka and of Russian America, including also the Kurile islands. Golovnin sailed round the Cape of Good Hope, and on Oct. 5, 1809, arrived in Kamchatka. In 1810, whilst attempting to survey the coast of the island of Kunashiri, he was seized by the Japanese, and was kept prisoner until Oct. 13, 1813. Golovnin was presently appointed to the command of a voyage of circumnavigation. He started from St. Petersburg on Sept. 7, 1817, sailed round Cape Horn, and arrived in Kamchatka in the following May. He returned to Europe by way of the Cape of Good Hope, landing at St. Petersburg on Sept. 17, 1819. He died on July 12, 1831. Golovnin's works include: *Journey to Kamchatka* (2 vols., 1819); *Journey Round the World* (2 vols., 1822); and *Narrative of my Captivity in Japan, 1811–1813* (2 vols., 1816). The last has been translated into French, German and English (1824).

A complete edition of his works was published at St. Petersburg in five volumes in 1864, with maps and charts, and a biography of the author by N. Grech.

GOLTZ, BOGUMIL (1801–1870), German humorist and satirist, was born at Warsaw on March 20, 1801, and died at Thorn on Nov. 12, 1870. Goltz wrote *Buch der Kindheit* (Frankfort, 1847; 4th ed., Berlin, 1877), in which he gives a charming and idyllic description of the impressions of his own childhood. Among his other works must be noted *Ein Jugendleben* (1852); *Der Mensch und die Leute* (1858); *Zur Charakteristik und Naturgeschichte der Frauen* (1859); *Zur Geschichte und Charakteristik des deutschen Genius* (1864), and *Die Weltklugheit und die Lebensweisheit* (1869). Goltz was a follower, in some respects,

of Rousseau. He desired to see a freer, more natural system of education which should develop a robuster type of manhood.

See T. Kuttenkeuler, *Bogumil Goltz . . .* (1913).

GOLTZ, COLMAR, FREIHERR VON DER (1843–1916), Prussian soldier and military writer, was born at Bielkenfeld, East Prussia, on Aug. 12, 1843, and entered the Prussian infantry in 1861. In 1864 he entered the Berlin military academy, but was temporarily withdrawn in 1866 to serve in the Austrian war, in which he was wounded at Trautenau. In 1867 he joined the topographical section of the general staff, and at the beginning of the Franco-German War of 1870–71 was attached to the staff of Prince Frederick Charles. He took part in the battles of Vionville and Gravelotte and in the siege of Metz. After its fall he served under the Red Prince in the campaign of the Loire, including the battles of Orleans and Le Mans. He was appointed in 1871 professor at the military school at Potsdam, and the same year was promoted captain and placed in the historical section of the general staff. He then wrote *Die Operationen der II. Armee bis zur Capitulation von Metz* and *Die Sieben Tage von Le Mans,* both published in 1873. In 1874 he was appointed to the staff of the 6th division, and while so employed wrote *Die Operationen der II. Armee an der Loire* and *Léon Gambetta und seine Armeen,* published in 1875 and 1877 respectively. Both are impartially written, and the latter was translated into French the same year. The views expressed in it led to his being sent back to regimental duty for a time, but he soon returned to the military history section. In 1878 von der Goltz was appointed lecturer in military history at the military academy at Berlin, where he remained for five years and attained the rank of major. He published, in 1883, *Rossbach und Jena* (new and revised ed., *Von Rossbach bis Jena und Auerstädt,* 1906), *Das Volk in Waffen* (Eng. trans. *The Nation in Arms),* both of which quickly became military classics, and during his residence in Berlin contributed many articles to the military journals. In June 1883 his services were lent to Turkey to reorganize the military establishments of the country. He spent 12 years in this work, the result of which appeared in the Greco-Turkish War of 1897, and he was made a pasha and in 1895 a *mushir* or field-marshal. On his return to Germany in 1896 he became a lieutenant-general and commander of the 5th division, and in 1898, head of the Engineer and Pioneer Corps and inspector-general of fortifications. In 1900 he was made general of infantry and in 1902 commander of the I. Army Corps. In 1907 he was made inspector-general of the newly created sixth army inspection at Berlin, in 1908 colonel-general, and in 1911 field-marshal. He retired in 1913.

In Aug. 1914 he was appointed governor-general of Belgium, then occupied by German forces. In November of the same year he was attached to the Turkish headquarters as aide-de-camp-general to the Sultan. In April 1915 he was placed in the chief command of the I. Turkish army in Mesopotamia, and succeeded in investing General Townshend's British forces at Kūt-el-Amāra in Dec. 1915. He died on April 19, 1916, at Baghdad and was said to have been poisoned by the Young Turks. His latest work was *Kriegsgeschichte Deutschlands im 19ten Jahrhundert* (2 vol., 1910–14).

In addition to the works already named and frequent contributions to military periodical literature, he wrote *Kriegführung* (1895, later ed. *Rrieg- und Heerführung,* 1901; Eng. trans. *The Conduct of War*); *Der tlzessalische Krieg* (1898); *Ein Ausflug nach Macedonien* (1894); *Anatolische Ausflüge* (1896); a map and description of the environs of Constantinople; *Von Jena bis Pr. Eylau* (1907), *a* most important historical work, carrying on the story of *Rossbach und Jena* to the peace of Tilsit, etc.

See v. Schmiterlow, *Gen.-Feldm. Freiherr Colmar von der Goltz Pasha, Leben und Briefe* (1926).

GOLTZ, RUDIGER, COUNT VON DER (1865–1930), German lieutenant-general, was born at Züllichau on June 28, 1864. He commanded a division of the *Landwehr* at the battle of the Masurian Lakes in Feb. 1915. In the spring of 1918 he led the Baltic Division into Finland and was appointed chief-in-command in the Baltic countries in Nov. 1918. In 1919 he was leading a volunteer army professedly against the Bolshevists, but he was suspected of scheming to use his Baltic volunteers as an instrument for the royalist and reactionary movement and his recall was demanded. Sections of these troops *(Das Baltikum)* actually took part in the military occupation of Berlin which attended the Kapp *coup* in March 1920, and were with difficulty disbanded. He then took part in the youth movement, and in 1924 became president of the United Patriotic Associations. Count von der Goltz wrote *Meine Sendung in Finnland und im Baltikum* (1920).

GOLTZIUS, HENDRIK (1558–1617), Dutch painter and engraver, was born in 1558 at Mulebrecht, in the duchy of Julich. After studying painting on glass for some years under his father, he was taught the use of the burin by Dirk Volkertsz Coornlert, a Dutch engraver. He was employed by Philip Galle to engrave a set of prints of the history of Lucretia. Marriage with a rich widow at the age of 21 enabled him to set up in independent business at Haarlem, where he spent the rest of his life, except for a tour in Germany and Italy in 1590. He died at Haarlem on Jan. 1, 1617.

His portraits, mostly miniatures, are masterpieces of their kind, both on account of their exquisite finish, and as fine studies of individual character. Of his larger heads, the life-size portrait of himself is probably the most striking example. Six scenes from the life of the Virgin are called his "master-pieces," from their being attempts to imitate the style of the old masters. In his command of the burin Goltzius is not surpassed even by Durer; his eccentricities and extravagances are counterbalanced by the beauty and freedom of his execution. He began painting at the age of 42, but none of his works in this branch of art display any special excellences.

His prints amount to more than 300 plates, and are fully described in Bartsch's *Peintre-graveur,* and Weigel's supplement to the same work. *See* Karel van Mander, *Schilderboeck* (1604).

GOLUCHOWSKI, the name of an ancient family of Polish aristocracy, two members of which played an important part in Austrian politics. Count AGENOR GOLUCHOWSKI, the elder (1812–7j), studied at Lemberg, served in the Galician *Statthalterei* under Stadion, and did excellent work on the Galician agrarian reform of 1847. In Nov. 1848 he became a member of Schwarzenberg's cabinet and was governor of Galicia, 1848–59, 1866–68 and 1871–75. From 1859–61 he was Austrian minister of the interior, during which period he secured for Galicia a degree of autonomy not enjoyed by any other Austrian crownland, while as governor of Galicia he secured the introduction of Polish as official language. He was the principal author of the federalist "October Diploma" of 1860 (*see* AUSTRIA). An excellent administrator, Goluchowski transformed the policy of the Austrian Poles from romantic revolutionism to their eminently successful later policy of co-operation with the Austrian Government in return for national concessions in Galicia, and was thus one of the true forerunners of Polish independence.

His son AGENOR GOLUCHOWSKI, the younger (1849–1921) was born on March 25, 1849, entered the Austro-Hungarian diplomatic service, served in Berlin, Paris and Budapest (1887–93) and became Austro-Hungarian minister of foreign affairs in May 1895. The appointment caused surprise, but Goluchowski enjoyed Francis Joseph's personal confidence, and his policy was peaceable and practical, and generally conducted with an eye on economic necessities. In particular he showed a conciliatory spirit towards Russia for which he was often blamed by more bellicose spirits. He was author of the Austro-Russian agreement of 1897, which temporarily ended the two Powers' rivalry in the Balkans and of the Macedonian reform plans of 1902 and 1903 (Miirzsteg programme). At the same time, he contrived to pacify Italy's fears by guaranteeing the *status* quo (1898) and stood loyally by the German alliance. It was to Goluchowski that the German emperor William II. addressed the famous telegram after Algeciras, saying that he had proved a "brilliant second" and could rely on the Imperial gratitude—a promise redeemed to Goluchowski's more aggressive successor, Aerenthal, in 1908. As a Pole and a Slav, Goluchowski was unpopular with the Magyars who believed him to be inspiring Francis Joseph's opposition to the use of Magyar in the army. He resigned office on Oct. 11, 1906, to

ease the crisis in Hungary and did not return to office. He died in Lemberg on March 29, 1921. (C. A. M.)

GOMAL or GUMAL, the name of a river of Afghanistan, and of a mountain pass on the Dera Ismail Khan border of the North West Frontier Province of British India. The Gomal river rises in the unexplored regions to the south-east of Ghazni and runs to the Indus. Its chief tributary is the Zhob. Within British territory the Gomal bounds the North West Frontier Province and Baluchistan, and more or less the Pathan and Baluch races. The Gomal pass is the most important pass on the Indian frontier between the Khyber and the Bolan. It connects Dera Ismail Khan with the Gomal valley in Afghanistan, and has formed for centuries the outlet for the *povindah* trade. In 1889 the Government of India decided that the Zhob valley should, like the Bori valley, be brought under British protection and control, and the Gomal pass should be opened. After the Waziristan expedition of 1894 Wana was occupied by British troops in order to dominate the Gomal and Waziristan; but on the formation of the North West Frontier Province in 1901 it was occupied by the South Waziristan militia.

Since the Waziri rising during the third Afghan War in 1919 Wana has been abandoned, but the Gomal route is still protected.

GOMARUS, FRANZ (1563–1641), Dutch theologian, was born at Bruges on Jan. 30, 1563. He studied at Strasbourg, Neustadt, Oxford and Cambridge. He was pastor of a Reformed Dutch church in Frankfort from 1587 till 1593, when the congregation was dispersed by persecution. From 1594 to 1611 he was professor of theology at Leiden. There he became the leader of the opponents of Arminius, who from that circumstance came to be known as Gomarists. He disputed with Arminius before the assembly of the estates of Holland in 1608, and was one of five Gomarists who met five Arminians or Remonstrants in the same assembly of 1609. On the death of Arminius, Konrad Vorstius (1559–1622), who sympathized with his views, was appointed to succeed him; and Gomarus left Leiden for Middleburg, where he became preacher at the Reformed church, and taught theology and Hebrew in the newly founded *Illustre Schule*. Later he was professor at Saumur, then at Groningen, where he died on Jan. 11, 1641. He took a leading part in the synod of Dort (1618). His works were collected and published in one volume folio, in Amsterdam in 1645. He was succeeded at Groningen in 1643 by his pupil Samuel Maresius (1599–1673).

GOMEL (Homel), town in White Russian S.S.R.; lat. 52° 25′ N., long. 31° 0′ E., on the Sozh river, a tributary of the Dnieper. Pop. (1939) 144.169. It is situated on the great north road from Kiev, and is an important railway junction from which five lines radiate, one linking westward with Warsaw. It also has steamer routes to Kiev and hlogilev. Its industries include iron founding, the making of agricultural machinery, saw-milling, the preparation of bristles, brewing and confectionery. It is situated in a forest and marsh-dotted county of the same name, drained by numerous tributaries of the Dnieper. Its western position gives it a less extreme climate, average January temperature −6.5° C, average July temperature 18.5° C. The rivers are frozen for 130 to 140 days.

The town is first mentioned in 1142, when it belonged to the Prince of Chernigov. It was alternately in the occupation of Poland and Russia until 1772, when it was finally annexed by Russia. In 1648 it was captured by the Cossack chieftain Bogdan Chmielnicki (*q.v.*)

GOMER, in the table of nations, Gen. x., the eldest "son" of Japheth, and in Ezek. xxxviii. 6 a part of Gog's army, represents the people known to the Greeks as Cimmerians, and in the cuneiform inscriptions called Gi-mi-ra-a-a. Their earliest known home is the district north of the Black Sea. They appeared on the Assyrian horizon first in the reign of Sargon, when they overthrew the kingdom of Urartu and settled there. About 700 B.C. they migrated into Asia Minor, subduing the kingdom of Phrygia under Midas, and that of Lydia under Gyges.

GOMER, wife of Hosea. See HOSEA.

GOMERA, an island forming part of the Spanish archipelago of the Canary islands (*q.v.*). Pop. (1930) 25,405; area, 144 sq.m. Gomera lies 20 m. W.S.W. of Teneriffe. Its greatest length is about 23 m. Dromedaries are bred on Gomera in large numbers. San Sebastian (5,868) is the chief town and a port. It was visited by Columbus on his first voyage of discovery in 1492.

GOMES, MANUEL TEIXEIRA (1862–), Portuguese politician, was born at Portimão, in the province of Algarve, in 1862, and educated at the University of Coimbra. From 1910–23 he was Portuguese minister to Great Britain, and in 1923 he became president of the Portuguese republic. This office he resigned on Dec. 10, 1925, on grounds of health, being succeeded by Dr. Bernadino Machado.

GOMEZ, DIOGO (*fl.* 1440–1482), Portuguese explorer and writer, is known to have been receiver of the royal customs in 1440. Sixteen years later, Prince Henry the Navigator sent him in command of three vessels along the west African coast with the commission to explore and to reach the Indies. Strong currents beyond the Rio Grande obliged Gomez to put back to the Gambia, which he ascended to the negro town of "Cantor," where he established profitable commercial relations with negro chiefs. In 1462 another African voyage resulted in a fresh discovery of the Cape Verde islands, already found by Cadamosto (*q.v.*). Four years later Gomez was appointed judge at Cintra.

His chronicle, which deals with the life and exploring ventures of Prince Henry and gives an elaborate account of negro life and trade along the Gambia, exists only in one ms., viz., *Cod. Hisp.* 27 in the Staats-Bibliothek, Munich. The original Latin text was printed by Schmeller, "Über Valentim Fernandez Alemão," in the *Abhandlungen der philosoph.-philolog. Kl. der bayerisch. Akademie der Wissenschaften,* vol. iv. (Munich, 1847): *see* also J. Mees, *Histoire de la découverte des îles Açores* (Ghent, 1901); R. H. Major, *Life of Prince Henry the Navigator* (1868); C. R. Beazley, *Prince Henry the Navigator* (1895) and Introduction to Azurara's *Discovery and Conquest of Guinea* (1899).

GOMM, SIR WILLIAM MAYNARD (1784–1875), British soldier, was gazetted to the 9th Foot at the age of ten, in recognition of the services of his father, Lieut.-Colonel William Gomm, who was killed in the attack on Guadaloupe (1794). He joined his regiment in 1799, and fought in Holland under the duke of York, and subsequently was with Pulteney's Ferrol expedition. On the general staff he was with Cathcart at Copenhagen, with Wellington in the Peninsula, and on Moore's staff at Corunna. He was also on Chatham's staff in the disastrous Walcheren expedition of 1809. In 1810 he rejoined the Peninsular army as Leith's staff officer, and took part in all the battles of 1810, 1811 and 1812, winning his majority after Fuentes d'Onor and his lieutenant-colonelcy at Salamanca. His careful reconnaissances and skilful leading were invaluable to Wellington in the Vittoria campaign, and to the end of the war he was one of the most trusted men of his staff. His reward was a transfer to the Coldstream Guards and the K.C.B. In the Waterloo campaign he served on the staff of the 5th British Division. From 1839 to 1842 he commanded the troops in Jamaica. He was sent out to be commander-in-chief in India in 1846, arriving only to find that his appointment had been cancelled in favour of Sir Charles Napier, whom, however, he eventually succeeded (1850–55). In 1854 he became general and in 1868 field marshal. In 1872 he was appointed constable of the Tower, and he died in 1875. Five "Field Marshal Gomm" scholarships were afterwards founded in his memory at Keble college, Oxford.

See his *Letters and Journals* (ed. *F.* C. Carr-Gomm, 1881).

GOMME, SIR GEORGE LAURENCE (1853–1916), knighted 1911, English archaeologist, was born in London on Dec. 17, 1853, and educated at the City of London school. As a boy he entered the service of the Metropolitan Board of Works; but in 1891 he was appointed statistical officer to the London County Council, becoming in 1900 clerk to the council. Few men have possessed a more profound knowledge of the past and present history of London, and his book *The Making* of *London* (1912) is a classic on the subject. He died at Long Crendon, Bucks., on Feb. 25, 1916.

GOMPERS, SAMUEL (1850–1924), American labour leader, was born in London on Jan. 27, 1850. He emigrated to New York in 1863 and became a prominent member of the Cigar-

makers' International Union, which he represented at the conventions of the American Federation of Labor, of which he became president in 1882. He served intermittently in this capacity until 1894, when the opposition of the Socialists secured his defeat; he was re-elected in the following year and thereafter was re-elected every year till his death. His power within the organization increased yearly and he was largely responsible not only for its victory over the Knights of Labor but also for the general adoption of the "craft" principle in U.S. trade unionism. In 1894 he became editor of the Federation's organ, The *American* Federationist, and in 1907 was sentenced to 12 months' imprisonment for contempt of court in disobeying an injunction prohibiting The Federationist from blacklisting the Buck Stove and Range Co. of St. Louis, a sentence eventually set aside by the U.S. Supreme Court. Although in theory opposed to all war, after the outbreak of the World War he resisted any pacifist tendency in the trade unions. He was appointed a member of the advisory commission of the U.S Council of National Defence in 1917. Gompers represented the American Federation of Labor at the Peace Conference in Paris 1918–19, and was appointed chairman of the Peace Conference Commission on Labour Legislation. He was also actively concerned in the organization of the Pan-American Federation of Labor, and was largely responsible for the decision of the A.F. to hold aloof from the International Federation of Trade Unions, 1919. He consistently opposed socialistic movements among the unions, fought the I.W.W. and chartered craft unions (as opposed to industrial unions) wherever possible. He opposed compulsory arbitration in labour disputes. For many years he was the most prominent figure in U.S. labour and had a worldwide reputation as a conservative labour leader. This policy excited the bitterest opposition in certain circles, but it cannot be denied that he was the most powerful influence in American trade unionism. He died at San Antonio, Texas, on Dec. 13, 1924.

See J. R. Commons and others, *History of Labour in the United States* (1918), and Samuel Gompers, *Seventy Years of Life and Labour* (1925).

GOMPERZ, THEODOR (1832–1912), German philosopher and classical scholar, was born at Briinn on March 29, 1832. He studied at Briinn and at Vienna under Herman Bonitz. He became professor of classical philology in 1873. In 1882 he was elected a member of the Academy of Science. He received the D. Ph. *honoris* causa from Konigsberg, and the D. Litt. from Dublin and Cambridge, and became correspondent for several learned societies. He died Aug. 29, 1912, at Baden, Austria.

His principal works are: *Demosthenes der Staatsmann* (1864), *Philodemi de ira liber* (1864), *Traumdeutung und Zauberei* (1866), *Herkulanische Studien* (1865–1866), *Beiträge zur Kritik und Erklärung griech. Schriftsteller* (7 vols., 1875–1900), *Neue Bruchstucke Epikurs* (1876), *Die Bruchstücke der griech. Tragiker und Cobets neueste kritische Manier* (1878), *Herodotezsche Studien* (1883), *Ein bisher unbekanntes griech. Schriftsystem* (1884), *Zu Philodems Büchern von der Musik* (1885), *Über den Abschluss des herodoteischen Geschichtswerkes* (1886), *Platonische Aufsatze* (3 vols., 1887–1905), *Zu Heraklits Lehre und den Überresten seines Werkes* (1887), *Zu Aristoteles' Poëtik* (2 parts, 1888–96), *Über die Charaktere Theophrasts* (1888), *Nachlese zu den Bruchstücken der griech. Tragiker* (1888), *Die Apologie der Heilkunst* (1890), *Philodem und die ästhetischen Schriften der herculanischen Bibliothek* (1891), *Die Srhrift vom Staatswesen der Athener* (1891), *Die jüngst entdeckten Bberreste einer den Ptatonischen Phädon enthaltenden Papyrusrolle* (1892), *Ans der Hekale des Kallimachos* (1893), *Essays und Erinnerungen* (1905). He supervised a translation of J. S. Mill's complete works (12 vols., Leipzig, 1869–80), and wrote a life (Vienna, 1889) of Mill. His *Griechische Denker: Geschichte der antiken Philosophie* (vols. i. and ii., Leipzig, 1893 and 1902) was translated into English by L. Magnus and G. G. Berry (1901–12).

GONAGUAS ("borderers"), descendants of a cross between the Hottentots and the Kafirs, before the arrival of the whites in South Africa, and in some districts scarcely distinguishable from other natives but for their broken speech.

GONCALVES DIAS, ANTONIO (1823–1864), Brazilian lyric poet, was born near the town of Caxias, in Maranhão. He studied law at the university at Coimbra, in Portugal, and in 184j decided to try his fortune as an author at Rio de Janeiro. Here he wrote for the newspaper press, ventured to appear as a dramatist, and in 1846 established his reputation by a volume of poems—Printeiros Cantos—which were remarkable for their autobiographic impress, and placed their author at the head of the lyric poets of his country. In 1848 he followed up his success by *Segundos Cantos* e *sextilhas* de Frei *Antão,* and in the following year, in fulfilment of the duties of his new post as professor of Brazilian history in the Imperial College of Pedro II. at Rio de Janeiro, he published an edition of Berredo's Annaes historicos do *Maranhão* and added a sketch of the migrations of the Indian tribes. A third volume of poems, *Ultimos* Cantos, published in 1851, was practically the poet's farewell to the service of the muse, for he spent the next eight years engaged under Government patronage in studying public instruction in the north and the educational institutions of Europe. On his return to Brazil in 1860 he joined an exploring expedition but was forced in 1862 by the state of his health to try the effects of another visit to Europe. He died in Sept. 1864. While in Germany he published at Leipzig a complete collection of his lyrical poems, which went through several editions, the four first cantos of an epic poem called *Os* Tymbiras (1857) and a Diccionario da lingua Tupy (1858).

A complete edition of the works of Dias has been published in Rio de Janeiro. *See* Wolf, *Brésil littéraire* (Berlin, 1863); Innocencio de Silva, *Diccionario bibliographico portuguez,* viii. 157; Sotero dos Reis, *Curso de litteratura portugueza e brazileira,* iv. (Maranhão, 1868); José Verissimo, *Estudos de literatura braeileira, segunda serie* (Rio, 1901).

GQNCHARQV, IVAN ALEXANDROVICH (1812–1891), Russian novelist, was the son of a rich merchant in the town of Simbirsk. At the age of ten he was placed in one of the gymnasiums at Moscow, from which he passed into the Moscow university. He then entered the civil service, being first employed as secretary to the governor of Simbirsk, and afterwards in the ministry of finance at St. Petersburg (Leningrad). Absorbed in bureaucratic work, Goncharov paid no attention to the social questions then ardently discussed by his contemporaries, Herzen, Aksakov and Bielinsky. His first original work was *Obyknovennaya Istoria,* "A Common Story" (1847, Eng. trans. by C. Garnett, 1890, 2nd ed. 1917). In 1856 he sailed to Japan as secretary to Admiral Putiatin, returning by the then tedious land route through Siberia. He published a description of the voyage under the title of "The Frigate Pallada." In 1857 appeared his masterpiece, *Oblomov* (Eng. trans. by C. J. Hogarth, 1915), which was immediately recognized as a classic. He had been at work on it for ten years. What Prince Mirsky has called the "indolent and impotent determinism of the hero" was recognized as of general significance in Russian life, especially in the life of the country gentry. Dobrolubov said of it, "Oblomovka (the country-seat of the Oblomovs) is our fatherland: something of Oblomov is to be found in every one of us." Pisarev, another celebrated critic, declared that "Oblomovism," as Goncharov called the sum total of qualities with which he invested the hero of his story, "is an illness fostered by the nature of the Slavonic character and the life of Russian society." In 1858 Goncharov was appointed a censor, and in 1868 he published another novel called Obryv (Eng. trans., The Precipice, 1915), on which he had worked for 20 years. This contains a charming picture of a great Russian household, ruled by a despotic and benevolent grandmother, but aroused great hostility among the intelligentsia by the unsympathetic portrait of the nihilist. Goncharov was convinced that Turgenev borrowed from The Precipice, and wrote an account of his wrongs. He died on Sept. 15–27, 1891.

See A. A. Mazon, *Un Maître du roman russe: Ivan Gontcharov* (1914). *A* new translation of *Oblomov,* by Natalie *A.* Duddington, appeared in 1929.

GONCOURT, DE, a name famous in French literary history. EDMOND LOUIS ANTOINE HUOT DE GONCOURT was born at Nancy on May 26, 1822, and died at Champrosay on July 16, 1896. JULES ALFRED HUOT DE GONCOURT, his brother, was born in Paris on Dec. 17, 1830, and died in Paris on June 20, 1870.

Writing always in collaboration, until the death of the younger, it was their ambition to be not merely novelists, inventing a new kind of novel, but historians; not merely historians, but the historians of a particular century, and of what was intimate and what

is unknown in it; to be also discriminating, indeed innovating, critics of art, but of a certain section of art, the 18th century, in France and Japan; and also to collect pictures and bibelots, always of the French and Japanese 18th century. Their histories *(Portraits intimes du XVIIIe sikcle* [1857], *La Femme au XVIIIe siècle* [1862], *La du Barry* [1878], etc.) are made entirely out of documents, autograph letters, scraps of costume, engravings, songs, the unconscious self-revelations of the time; their three volumes on *L'Art du XVIIIe siècle* (1859–7j) deal with Watteau and his followers in the same scrupulous, minutely enlightening way, with all the detail of unpublished documents; and when they came to write novels, it was with a similar attempt to give the inner, undiscovered, minute truths of contemporary existence, the *inédit* of life. The same morbidly sensitive noting of the *inédit,* of whatever came to them from their own sensations of things and people around them, gives its curious quality to the nine volumes of the *Journal,* 1887–96, which will remain, perhaps, the truest and most poignant chapter of human history that they have written. Their novels, *Soeur Philomkne* (1861), *Rene'e Mauperin* (1864), *Germinie Lacerteux* (1865), *Manette Salomon* (1865), *Madame Gervaisais* (1869), and, by Edmond alone, *La Fille Elisa* (1878), *Les Frkres Zemganno* (1879), *La Faustin* (1882), *Chérie* (1884), are, however, the work by which they will live as artists. Learning something from Flaubert, and teaching almost everything to Zola, they invented a new kind of novel, and their novels are the result of a new vision of the world, in which the very element of sight is decomposed, as in a picture of Monet. Seen through the nerves, in this conscious abandonment to the tricks of the eyesight, the world becomes a thing of broken patterns and conflicting colours, and uneasy movement. A novel of the Goncourts is made up of an infinite number of details, set side by side, every detail equally prominent. While a novel of Flaubert, for all its detail, gives above all things an impression of unity, a novel of the Goncourts deliberately dispenses with unity in order to give the sense of the passing of life, the heat and form of its moments as they pass. It is written in little chapters, sometimes no longer than a page, and each chapter is a separate notation of some significant event, some emotion or sensation which seems to throw sudden light on the picture of a soul. To the Goncourts humanity is as pictorial a thing as the world it moves in; they do not search further than "the physical basis of life," and they find everything that can be known of that unknawn force written visibly upon the sudden faces of little incidents, little expressive moments. The soul, to them, is a series of moods, which succeed one another, certainly without any of the too arbitrary logic of the novelist who has conceived of character as a solid or consistent thing. Their novels are hardly stories at all, but picture-galleries, hung with pictures of the momentary aspects of the world. French critics have complained that the language of the Goncourts is no longer French, no longer the French of the past; and this is true. It is their distinction—the finest of their inventions—that, in order to render new sensations, a new vision of things, they invented a new language.

(A. SY.)

In his will Edmond de Goncourt left his estate for the endowment of an academy, the formation of which was entrusted to Alphonse Daudet and LCon Hennique. The society was to consist of ten members, each of whom was to receive an annuity of 6,000 francs, and a yearly prize of 5,000 francs was to be awarded to the author of some work of fiction. Nine of the members of the new academy were nominated in the will. They were: Alphonse Daudet, J. K. Huysmans, LCon Hennique, Octave Mirbeau, the two brothers, "J. H." Rosny, Gustave Geffroy and Paul Margueritte. On Jan. 19, 1903, after much litigation, the academy was constituted, with Elémir Bourges, Lucien Descaves and LCon Daudet as members in addition to those mentioned in de Goncourt's will, the place of Alphonse Daudet having been left vacant by his death in 1897.

On the brothers de Goncourt *see* the *Journal des Goncourt* already cited; *M.* A. Belloc (afterwards Lowndes) and M. L. Shedlock, *Edmond and Jules de Goncourt, with Letters and Leaves from their journals* (1895); Alidor Delzant. *Les Goncourt* (1889) which contains a valuable bibliography; *Lettres de Jules de Goncourt* (1888), preface by H. Céard; R. Doumic, *Portraits d'écrivains* (1892); Paul Bourget. *Nouveaux Essais de psychologie contemporaine (1886)*; Émile Zola, *Les Romanczers naturalistes* (1881).

GONDA, a town and district of British India, in the Fyzabad division of the United Provinces. Pop. (1931) 17,450. The district of Gonda has an area of 2,842 sq.m. It consists of an alluvial plain with very slight undulations, studded with groves of mango trees, and divided into three belts known as the *tarai* or swampy tract, the *uparhar* or uplands, and the *tarhar* or wet lowlands, all three being fertile and closely tilled. Several rivers flow through the district, but; only two, the Gogra and Rapti, are of any importance. On the outbreak of the Mutiny, the raja of Gonda, after honourably escorting the government treasure to Fyzabad, joined the rebels. His estates, along with those of the rani of Tulsipur, were confiscated, and conferred as rewards upon the maharajas of Balrampur and Ajodhya, who had remained loyal. In 1931 the population was 1,576,003.

GONDAL, a town and native State of India, in the western Indian States agency of Bombay, in the centre of the peninsula of Kathiawar. The area of the State is 1,024 sq.m.; pop. (1931) 205,846 The tribute is £7,000. Grain and cotton are the chief products, and cotton and wool stuffs and gold embroidery are made. The chief, whose title is Thakur Sahib, is a Jadeja Rajput. The State has long had progressive administration and compulsory female education has recently been introduced. It is traversed by a railway connecting it with Bhanagar, Rajkot and the sea-board. The town of Gondal, the state capital and residence of the chief, is 23 m. by rail S. of Rajkot; pop. (1931) 24,573. It contains a fine college, an orphanage, a high school for girls, and an asylum.

GONDAR, one of the former capitals of Abyssinia, situated on a basaltic ridge some 7,500 ft. above the sea, about 21 m. N.E. of Lake Tana, a splendid view of which is obtained from the castle. Two streams, the Angreb on the east side and the Gaha or Kaha on the west, flow from the ridge, and meeting below the town, pass onwards to the lake. Gondar was a small village when at the beginning of the 16th century it was chosen by the Negus Sysenius (Seged I.) as the capital of his kingdom. His. son Fasilidas, or A'lem-Seged (1633–1667), was the builder of the castle which bears his name. Later emperors built other castles and palaces, the latest in date being that of the Negus Yasu II., erected about 1736, at which time Gondar appears to have been at the height of its prosperity. Thereafter it suffered greatly from the civil wars which raged in Abyssinia, and was more than once sacked, most recently in 1868 by the emperor Theodore, and in 1887 by the dervishes under Abu Anga, who inflicted very great injury, destroying many churches, damaging the castles and carrying off much treasure. The population, estimated by James Bruce in 1770 at 10,000 families, had dwindled in 1935 to about 3,000 persons. Since the pacification of the Sudan by the British (1886–1889) there has been some revival of trade between Gondar and the regions of the Blue Nile. Among the inhabitants are numbers of Mohammedans, and there is a settlement of Falashas. Cotton, cloth, gold and silver ornaments, copper wares, fancy articles in bone and ivory, excellent saddles and shoes are among the products of the local industry.

Unlike any other buildings in Abyssinia, the castles and palaces of Gondar resemble, with some modifications, the mediaeval fortresses of Europe, the style of architecture being the result of the presence in the country of numbers of Portuguese. Fasilidas's castle was built by Indian workmen, under the superintendence of Abyssinians who had learned something of architecture from the Portuguese adventurers. The castle has two storeys, is 90 ft. by 84 ft., has a square tower and circular domed towers at the corners. The most extensive ruins are a group of royal buildings enclosed in a wall. These ruins include the palace of Yasu II., which has several fine chambers. Christian Levantines were employed in its construction and it was decorated in part with Venetian mirrors, etc. In the same enclosure is a small castle attributed to Yasu I. The exterior walls of the castles and palaces named are little damaged and give to Gondar a unique character among African towns. Of the 44 churches, all in the circular

Abyssinian style, which are said to have formerly existed in Gondar or its immediate neighbourhood, Major Powell-Cotton found only one intact in 1900.

See E. Rüppell, *Reise in Abyssinien* (Frankfort-on-the-Main, 1838–1840); T. von Heuglin, *Reise nach Abessinien* (Jena, 1868); G. Lejean, *Voyage en Abyssinie* (Paris, 1872); Achille Raffray, *Afrique orientale: Abyssinie* (Paris, 1876); P. H. G. Powell-Cotton, *A Sporting Trip through Abyssinia,* chaps. 27–30 (London, 1902); and Rosita Forbes, *From Red Sea to Blue Nile* (1925). Views of the castle are given by Heuglin, Raffray, Powell-Cotton and Rosita Forbes.

GONDJA, a people greatly resembling the Dagomba (to whom they were formerly subject), living in the Salaga and Bole districts of the Northern Territories, Gold Coast.

GONDOKORO, a stopping place for steamers on the east bank of the upper Nile, in 4° 54' N., 31° 43' E. 1,077 m. by river south of Khartum and 13 miles below Rejef where, up stream from Khartum, the Nile ceases to be navigable. The station, which is very unhealthy, is at the top of a cliff 25 ft. above the river-level.

Gondokoro was first visited by Europeans in 1841–1842, when expeditions sent out by Mohammed Ali, pasha of Egypt, ascended the Nile as far as the foot of the rapids above Gondokoro. It soon became an ivory and slave-trading centre. In 1851 an Austrian Roman Catholic mission was established here, but it was abandoned in 1859. It was at Gondokoro that J. H. Speke and J. A. Grant, descending the Nile after their discovery of its source, met, on Feb. 1j, 1863, Samuel Baker and his wife who were journeying up the river. In 1871 Baker, then governor-general of the equatorial provinces of Egypt, established a military post at Gondokoro, which he named Ismailia, after the then khedive. Baker made this post his headquarters, but Colonel (afterwards General) C. G. Gordon, who succeeded him in 1874, abandoned the station on account of its unhealthy site, removing to Lado, 11 miles down stream. Gondokoro fell into the hands of the Mahdists in 1885. After the destruction of the Mahdist power in 1898 it was occupied by British troops and formed the northernmost post on the Nile of the Uganda protectorate. In 1914 however the administration was transferred to the Sudan Government which gained control of the whole stretch of the Nile navigable from Khartum.

GONDOMAR, DIEGO SARMIENTO DE ACUÑA, COUNT OF (1567–1626), Spanish diplomatist, born in Gondomar, Galicia, on Nov. 1, 1j67. He inherited wide estates in Galicia and in Old Castile from his father, corregidor of Granada and governor of the Canary islands. In 1583 Philip II. gave him military command of the Portuguese frontier and coast of Galicia. Corregidor of Toro in 1593, he was sent in 1603 to superintend the distribution of the treasure brought from America by two galleons driven to take refuge at Vigo, and on his return was appointed on the board of finance. In 1609 he repelled a naval attack on Galicia made by the Dutch. In the Casa del Sol at Valladolid, where he resided, he collected a library which the marquis of Malpica, his descendant, ceded to Charles III.; it is now in the royal library at Madrid.

His reputation as a diplomatist rests on his two periods of service as ambassador in England (1613–18 and 1619–22). The excellence of his latinity pleased the literary tastes of James I., whose character he judged with remarkable insight. He flattered the king's love of books and of peace, and he made skilful use of his desire for an alliance between the prince of Wales and a Spanish infanta. Sarmiento's aim was to keep James from aiding the Protestant States against Spain and the house of Austria, and to avert English attacks on Spanish possessions in America. His success made him odious to the anti-Spanish and Puritan parties. The active part he took in promoting the execution of Sir Walter Raleigh aroused particular animosity. He was attacked in pamphlets and figured as the principal person in Thomas Middleton's *A* Game *at Chess,* a political play suppressed by order of the council. Count of Gondomar in 1617, he returned home on leave for his health, through Flanders and France, on a diplomatic mission in 1618. He resumed office in London in 1619; on his retirement in 1622 he was appointed on the royal council and sent on a complimentary mission to Vienna. He died near Haro in the Rioja on Oct. 2, 1626.

See S. R. Gardiner, *History of England* (London, 1883–84); P. de Gayangos, introduction to *Cinco Cartas politico-literarias de Don Diego Sarmiento de Acuña, Conde de Gondomar . . .* (Madrid, 1869, Soc. de Bibliófilos Españoles); R. H. Lyon, *Gondomar* (Oxford, 1910).

GONDWANA, the historical name for a large tract of hilly country in India which roughly corresponds with the greater part of the present Central Provinces. The name is derived from the aboriginal tribe of Gonds, who ruled the country from the 12th to the beginning of the 18th century in three or four separate kingdoms. They maintained a barbaric civilization and though nominally subject to the Moguls they were not much disturbed, but when the Mahratta invaders appeared in the 18th century the Gond kingdoms succumbed and the aboriginal population fled for safety to the hills. Gondwana was included in the dominions of the Bhonsla Raja of Nagpur which passed to the British between 1818 and 1853.

FROM RUSSEL, "TRIBES AND CASTES OF CENTRAL INDIA"

MÄRIA GOND IN DANCING COSTUME
The Gonds are an aboriginal hill race of Central India

The Gonds, who call themselves Koitur or "highlanders," are the most numerous tribe of Dravidian race in India. In 1931 they numbered 2,261,138. Their language, akin to the Southern languages of India, is unwritten and, except for missionary productions, there is no literature, but it is still the spoken language of 7% of the population of the Central Provinces. The Rajgonds, claiming to have Rajput blood. are on the skirts of Hinduism, but most of the Gonds are animistic in belief. They are a courageous race, and, when unspoilt by contact with civilization, extremely honest.

The term "Gondwana" is likewise used by geologists as a name for certain rock formations.

GONDWANALAND. This name, derived from Gondwana, a district of Central India, was given by Süss to the inferred Palaeozoic continent, that at its greatest extension spanned the South Atlantic and Indian oceans—incidentally including Sclater's *Lemuria* linking India, Madagascar, and Africa, and Ihering's *Arch-hellenis* uniting Africa with Brazil. It embraced all (except north-west) Africa, Madagascar, peninsular India, Australia, Tasmania, Antarctica, Falklands, and all South America except the extreme west and north-west. Its unstable margins were between the Devonian and Jurassic, intermittently and widely transgressed by the oceans; the sea bounding it on the north, wherein deposition went on continuously down to the Tertiary, being called the "Tethys"—with the Mediterranean as a remnant.

Sedimentation upon Gondwanaland itself was predominantly of "continental" type, the widespread strata—Gondwana beds—being often coal-bearing and frequently still horizontal. Highly folded banded ironstones and jaspilites characterise the Proterozoic. Noteworthy are those deposits betraying glacial conditions during several epochs—in the late pre-Cambrian, early Devonian and especially late Carboniferous (so-called Permian or Permocarboniferous), the last-named occupying enormous stretches within the west and south-east of Australia, Tasmania, (possibly New Zealand), peninsular India (and the Salt Range), southern Madagascar, South Africa (possibly the Congo), Falklands, south-eastern Brazil, Uruguay, Paraguay, and central and western Argentina. Those morainic deposits are regarded as the products of continental ice-caps of vast extent and huge thickness, that developed over relatively low-lying ground, moving outwards over distances measurable in hundreds of miles and passing into the ocean in places, as indicated by beds with marine fossils. This intense refrigeration (with milder inter-glacial periods) began in the mid-Carboniferous in New South Wales and only ended there in the Permian, attaining its maximum throughout the regions cited towards the

close of the Carboniferous.

The causes are obscure and much debated. The boulder-beds with striated erratics and underlying grooved rock-surfaces disclose the ice-movement, which was away from the South Pole except in Africa. The succeeding Permian sediments contain the workable coals of the Southern hemisphere. The Triassic is signalled by diastrophism and transgression; and later by widespread aridity, as in Europe. In the early Jurassic, floods of basalt (sometimes rhyolite) terminated sedimentation and the strata beneath were riddled with intrusive dolerite in South Africa, Tasmania, Antarctica, and Brazil.

The breaking up of Gondwanaland dates from that time, though not accomplished until late in the Cretaceous—a process currently ascribed to the foundering of segments of the continent or of narrow "land bridges." Under Wegener's "Displacement Hypothesis," however, the continent is supposed to have fractured and the crustal blocks, floating on a liquefied basic substratum (basalt), to have drifted apart, pushing up before them the marine sediments bordering Gondwanaland, and elevating them as the Tertiary folded chains of the Andes, Morocco, Alps, Iranian chains, Himalayas, New Zealand, which encircle its reiics. Magma was squeezed into or erupted through the rising arches, as in the Andes. The Great Rift Valley of Africa with its prolonged volcanicity and the lavas of the Deccan (India) and Abyssinia bespeak zones of tension in the crust.

Distinctive of the Gondwana beds is the "Southern" or *Glossopteris Flora—with* its few "Northern" Carboniferous elements in South America and South Africa that survived the intense glaciation—ousted in late Triassic times by the *Thinnfeldia Flora,* with return to floral uniformity throughout the globe in the Jurassic. Reptilia and amphibia belonging to the orders Anomodontia, Therocephalia, Therodontia, and Saurischia characterise the Permo-Triassic, especially that of the Karroo (spreading partly into Russia), the Triassic Cynodontia being apparently ancestral to the Mammalia. Post-Cretaceous vertebrate evolution followed diverging lines in the fragments of Gondwanaland, producing the Edentata of Patagonia, Proboscidea of Africa and Asia, and Monotremata of Australasia. As noted by Blanford, the distribution and affinities of their existing faunas point to the former continental unity of these areas. For example the lemurs of Africa, Madagascar and India, manati of West Africa and the Amazon, freshwater fishes, birds of *Struthio-type,* blind snakes, geckos, scorpions, decapod Crustacea, *Helicidae,* isopod *Phreatoicus* and oligochete *Phreodrillidae*, could not have crossed the oceans. Similar evidence is obtainable from the present floras and the actuality of this former continent appears unquestionable. (A. L. DU T.)

GONFALON, a banner or standard of the middle ages (the late French and Italian form, also found in other Romanic languages, of *gonfanon,* which is derived from the O.H. Ger. *gundfano, gund,* war, and *fano,* flag, *cf.* Mod. Ger. *Fahne,* and English "vane"). It took the form of a rectangular ensign, often slit into streamers at the foot, and swinging from a cross-bar attached to a pole. This is the most frequent use of the word. The title of "gonfalonier," the bearer of the gonfalon, was in the middle ages both military and civil. It was borne by the counts of Vexin, as leaders of the men of St. Denis, and when the Vexin was incorporated in the kingdom of France the title of *Gonfalonier de Saint Denis* passed to the kings of France, who thus became the bearers of the "oriflamme," as the banner of St. Denis was called. Gonfalonier was the title of civic magistrates of various degrees of authority in many of the city republics of Italy, notably of Florence, Siena and Lucca. At Florence the functions of the office varied. At first the gonfaloniers were the leaders of the various military divisions of the inhabitants. In 1293 was created the office of gonfalonier of justice, who carried out the orders of the signiory. By the end of the 14th century the gonfalonier was the chief of the signiory. At Lucca he was the chief magistrate of the republic. At Rome two gonfaloniers must be distinguished, that of the church and that of the Roman people; both offices were conferred by the pope. The first was usually granted to sovereigns, who were bound to defend the church and lead her armies. The second bore a standard with the letters S.P.Q.R. on any enterprise undertaken in the name of the church and the people of Rome, and also at ceremonies, processions, etc. This was granted by the pope to distinguished families.

GÓNGORA Y ARGOTE, LUIS DE (1561–1627), Spanish lyric poet, was born at Cordova. His father, Francisco de Argote, was *corregidor* of that city, but the poet early adopted the surname of his mother, Leonora de Góngora, who was descended from an ancient family. He was educated at the university of Salamanca, and was already known as a poet in 1585, when Cervantes praised him in the Galatea. Ordained priest in 1599, he settled from 1612 onwards at Madrid, where, as a contemporary remarks, he "noted and stabbed at everything with his satirical pen." In 1626 a severe illness, which impaired his memory, compelled his retirement to Cordova, where he died (1627). The collection of his poems consists of numerous sonnets, odes, ballads, songs for the guitar and of certain larger poems, such as the *Soledades* and the *Polifemo.* Too many of them exhibit that tortuous elaboration of style (*estilo culto*) with which the name of Góngŏra is inseparably associated; but though Góngora has been justly censured for affected Latinisms, unnatural transpositions, strained metaphors and frequent obscurity, it must be admitted that he was a man of rare genius—a fact cordially acknowledged by those of his contemporaries who were most capable of judging. It was only in the hands of those who imitated Góngora's style without inheriting his genius that *culteranismo* became absurd. Besides his lyrical poems, Góngora is the author of a play entitled *Las Firmezas de Isabel* and of two incomplete dramas, the *Comedia venatoria* and *El Doctor Carlino.*

See E. Churton, *Gdngora* (1862); L. **P.** Thomas, *Gdngora et le gongorisme considérés dans leurs rapports avec le marinisme* (1911); *M.* Artigas, "D. Luis de Góngora and Argote," *Biografia* y *estudio crítico* (1925).

GONIOMETER, an instrument for measuring the angles of crystals; there are two kinds—the contact goniometer and the reflecting goniometer.

The Contact **Goniometer** (or Hand-goniometer).—This consists of two metal rules pivoted together at the centre of a graduated semicircle (fig. 1). The instrument is placed with its plane perpendicular to an edge between two faces of the crystal to be measured, and the rules are brought into contact with the faces; this is best done by holding the crystal up against the light with the edge in the line of sight. The angle between the rules,

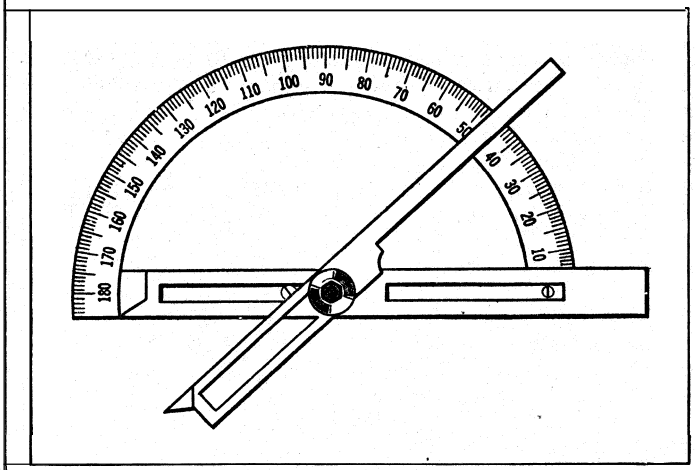

FIG. 1.—CONTACT GONIOMETER

as read on the graduated semicircle, then gives the angle between the two faces. The rules are slotted, so that they may be shortened and their tips applied to a crystal partly embedded in its matrix. The instrument represented in fig. 1 is einployed for the approximate measurement of large crystals with dull and rough faces.

The Reflecting **Goniometer.**—This is an instrument of far greater precision, and is always used for the accurate measurement of the angles when small crystals with bright faces are available. As a rule, the smaller the crystal the more even are its faces, and

when these are smooth and bright they reflect sharply defined images of a bright object. By turning the crystal about an axis parallel to the edge between two faces, the image reflected from a second face may be brought into the same position as that formerly occupied by the image reflected from the first face; the angle through which the crystal has been rotated, as determined by a graduated circle to which the crystal is fixed, is the angle between the normals to the two faces.

Several forms of instruments depending on this principle have been devised. One consists of a graduated circle reading degrees and minutes, which turns with a milled head about a horizontal axis. The crystal is attached with a mixture of beeswax and pitch to a holder and by means of pivoted arcs is adjusted so that the edge between two faces (a zone-axis) is parallel to, and coincident with, the axis of the instrument. The crystal-holder and adjustment-arcs, together with the milled head are carried on an axis which passes through the hollow axis of the graduated circle, and may thus be rotated independently of the circle. In use, the goniometer is placed directly opposite to a window, with its axis parallel to the horizontal window-bars, and as far distant as possible. The eye is placed quite close to the crystal, and the image of a slit in a dark screen as seen in the crystal-face is made to coincide with a chalk mark on the floor as seen directly; this is done by turning the milled head, the reading of the graduated circle having previously been observed. Without moving the eye, the crystal is then rotated until the image from a second face is brought into the same position; the difference between the first and second readings of the graduated circle will then give the angle between the normals of the two faces.

Several improvements have been made on this goniometer. The adjustment-arcs have been modified; a mirror of black glass fixed to the stand beneath the crystal gives a reflected image of the signal, with which the reflection from the crystal can be more conveniently made to coincide; a telescope provided with cross-wires gives greater precision to the direction of the reflected rays of light; and with the telescope a collimator has sometimes been used. A still greater improvement was effected by placing the graduated circle in a horizontal position. Many forms of the horizontal-circle goniometer have been constructed; they are provided with a telescope and collimator, and in construction are essentially the same as a spectrometer, with the addition of arrangements for adjusting and centring the crystal. The instrument shown in fig. 2 has four concentric axes, which enable the crystal-holder A, together with the adjustment-arcs B and centring-slides D, to be raised or lowered, or to be rotated independently of the circle H; further, either the crystal-holder or the telescope T may be rotated with the circle, while the other remains fixed. The crystal is placed on the holder and adjusted so that the edge (zone-axis) between two faces is coincident with the axis of the instrument. Light from an incandescent gas-burner passes through the slit of the collimator C, and the image of the slit (signal) reflected from the crystal face is then viewed in the telescope. The clamp and the slow-motion screw F enable the image to be brought exactly on the cross-wires of the telescope, and the position of the circle with respect to the vernier is read through the lens. The crystal and the circle are then rotated together until the image from a second face is brought on the cross-wires of the telescope, and the angle through which they have been turned is the angle between the normals to the two faces. While measuring the angles between the faces of crystals the telescope remains fixed by the clamp β, but when this is released the instrument may be used as a spectrometer or refractometer for determining, by the method of minimum deviation, the indices of refraction of an artificially cut prism or of a transparent crystal when the faces are suitably inclined to one another.

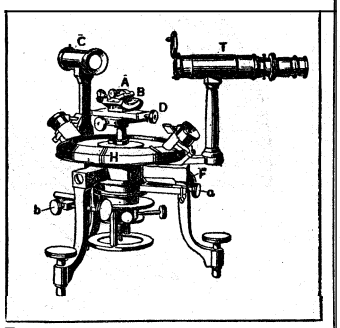

FIG. 2— HORIZONTAL-CIRCLE GONIOMETER

With a one-circle goniometer, such as is described above, it is necessary to mount and re-adjust the crystal afresh for the measurement of each zone of faces (*i.e.*, each set of faces intersecting in parallel edges); with very small crystals this operation takes a considerable time, and the minute faces are not readily identified again. Further, in certain cases, it is not possible to measure the angles between zones, nor to determine the position of small faces which do not lie in prominent zones on the crystal. These difficulties have been overcome by the use of a two-circle goniometer or theodolite-goniometer, which is a combination of a vertical-circle goniometer. In these instruments the crystal is set up and adjusted with the axis of a prominent zone parallel to the axis of either the horizontal or the vertical circle. As a rule, only in this zone can the angles between the faces be measured directly; the positions of all the other faces, which need be observed only once, are fixed by the simultaneous readings of the two circles. These readings, corresponding to the polar distance and azimuth, or latitude and longitude readings of astronomical telescopes, must be plotted on a projection before the symmetry of the crystal is apparent; and laborious calculations are necessary in order to determine the indices of the faces and the angles between them, and the other constants of the crystal; or to test whether any three faces are accurately in a zone.

These disadvantages are overcome by adding still another graduated circle to the instrument, with its axis perpendicular to the axis of the vertical circle, thus forming a three-circle goniometer. With such an instrument measurements may be made in any zone or between any two faces without re-adjusting the crystal; further the troublesome calculations are avoided, and, indeed, the instrument may be used for solving spherical triangles.

Goniometers of special construction have been devised for measuring crystals during their growth in the mother-liquid; for cutting section-plates and prisms from crystals (precious stones) accurately in any desired direction. The instrument commonly employed for measuring the optic axial angle of biaxial crystals is really a combination of a goniometer with a polariscope. For the optical investigation of minute crystals under the microscope, various forms of stage-goniometer with one, two or three graduated circles have been constructed. An ordinary microscope fitted with cross-wires and a rotating graduated stage serves the purpose of a goniometer for measuring the plane angles of a crystal face or section, being the same in principle as the contact goniometer.

For fuller descriptions of goniometers see text-books of Crystallography and Mineralogy, especially P. H. Groth, *Physikalische Krystallographie* (4th ed., Leipzig, 1905). See also C. Leiss, *Die optischen Instrumente der Firma R. Fuess, deren Beschreibung, Justierung und Anwendung* (Leipzig, 1899). (*L. J. S.*)

GONTAUT, MARIE JOSEPHINE LOUISE, DUCHESSE DE (1773–1857), was born in Paris on Aug. 3, 1773, daughter of Augustin François, comte de Montaut-Navailles, who had been governor of Louis XVI. and his two brothers when children. Joséphine de Gontaut shared the lessons given by Madame de Genlis to the Orleans family, with whom her mother broke off relations after the outbreak of the Revolution. Mother and daughter emigrated to Coblenz in 1792; thence they went to Rotterdam, and finally to England, where Joséphine married the marquis Charles Michel de Gontaut-Saint-Blacard (d. 1822). They returned to France at the Restoration, and resumed their place at court. Madame de Gontaut became lady-in-waiting to Caroline, duchess of Berry, and later governess to the children of France. She remained faithful to the Bourbon cause all her life. In 1827 she was created duchesse de Gontaut. She followed the exiled royal family to Prague, but in 1834 Pierre Louis, duc de Blacas, thought her comparatively liberal views dangerous for the prince and princess and she received a brusque congé from Charles X. Her twin daughters, Joséphine (1796–1844) and Charlotte (1796–1818), married respectively Ferdinand de Chabot, prince de Léon and afterwards duc de Rohan, and François, comte de Bourbon-Busset. She wrote in her old age some naïve memoirs. She died in Paris in 1857.

See her *Memoirs* (Eng ed.. 2 vols, 1894), and *Lettres inédites* (1895).

GONVILLE, EDMUND (d. 1351), founder of Gonville Hall, now Gonville and Caius College, at Cambridge, England, is thought to have been the son of William de Gonvile, and the brother of Sir Nicholas Gonvile. The foundation of Gonville Hall at Cambridge was effected by a charter granted by Edward III. in 1348 It was called, officially, the Hall of the Annunciation of the Blessed Virgin, but was usually known as Gunnell or Gonville Hall. Its original site was in Free-school Lane, where Corpus Christi college now stands. Gonvile apparently wished it to be devoted to training for theological study, but after his death the foundation was completed by William Bateman, bishop of Norwich and founder of Trinity Hall, on a different site and with considerably altered statutes. (*See* also CAIUS, JOHN.)

GONZAGA, an Italian princely family named after the town where it probably had its origin. Its known history begins with Luigi I. (1267–1360), who, after fierce struggles, supplanted his brother-in-law Rinaldo Bonacolsi as lord of Mantua in 1328, with the title of captain-general, and afterwards of vicar-general of the empire, adding the designation of count of Mirandoia and Concordia, which fief the Gonzagas held from 1328 to 1354. In 1335 his son Guido wrested Reggio from the Scaligeri and held it until 1371. Luigi was succeeded by Guido (d. 1369); the latter's son Luigi II. came next in succession (d. 1382), then Giovan Francesco I. (d. 1407), then Giovan Francesco II. (d. 1444) who received for his military services to the emperor Sigismund the title of marquess of Mantua (1432), an investiture which legitimatized the usurpations of the house of Gonzaga. His grandson, Federigo 1. (d. 1484), served under various foreign sovereigns, including Bona of Savoy and Lorenzo de' Medici; subsequently he upheld the rights of the house of Este against Pope Sixtus IV. and the Venetians, whose claims were a menace to his own dominions of Ferrara and Mantova. His son Giovan Francesco III. (d. 1519) commanded the allied Italian forces against Charles VIII. at the battle of Fornovo; he afterwards fought in the kingdom of Naples and in Tuscany, until captured by the Venetians in 1509. With the help of his wife, the famous Isabella d'Este, he promoted the fine arts and letters.

He was succeeded by his son Federigo II. (d. 1540), captain-general of the papal forces. After the peace of Cambrai (1529) his ally and protector, the emperor Charles V., raised his title to that of duke of Mantua in 1530; in 1536 the emperor decided the controversy for the succession of Monferrato between Federigo and the house of Savoy in favour of the former. His son Guglielmo subdued a revolt in Monferrato and was presented with that territory by the emperor Maximilian II. His grandson Vincenzo II. (d. 1627) appointed as his successor Charles, the son of Henriette, the heiress of the French family of Nevers-Rethel, who was only able to take possession of the ducal throne after a bloody struggle; his dominions were invaded and he himself reduced to the sorest straits. His great grandson, Ferdinand Charles, acquired Guastalla by marriage in 1678, but lost it soon afterwards; he involved his country in useless warfare. with the result that in 1708 Austria annexed the duchy. On July 5, 1708, he died in Venice, and with him the Gonzagas of Mantua came to an end.

GONZAGA, THOMAZ ANTONIO (1744–*c.* 1809), Portuguese poet, was born at Oporto, and brought up at Bahia, Brazil, where his father was *disembargador* of the appeal court. After completing his legal studies at Coimbra he remained there for some time, and compiled a treatise on natural law. In 1782 he was made *disembargador* of the appeal court at Bahia; in 1785, on the eve of his marriage with the "Marilia" of his verses, he was arrested on a charge of complicity in the conspiracy of Tiradentes, and after three years' imprisonment was exiled to Mozambique. His last years were darkened by melancholia, deepening into madness, and he died in exile. His reputation as a poet rests on a little volume of bucolics entitled *A Marilia de Dirceo* (Dirceo being his Arcadian pen name), which includes all his published verses and is divided into two parts, corresponding with those of his life. The first extends to his imprisonment and breathes only love and pleasure, while the main theme of the second part, written in prison, is his *saudude* for *Marilia* and past happiness. Gonzaga borrowed his forms from Anacreon and Theocritus, but the matter, except for an occasional imitation of Petrarch, the natural, elegant style and the harmonious metrification, are all his own. *Marilia* is the most celebrated collection of erotic poetry dedicated to a single person in the Portuguese tongue.

BIBLIOGRAPHY.—The Paris edition of 1862 in 2 vols. is in every way the best, although the authenticity of the verses in its 3rd part, which do not relate to *Marilia*, is doubtful. A popular edition of the first two parts was published in 1888. A French version of *Marilia* by Mongiave and Chalas appeared in Paris in 1825, an Italian by Vegezzi Ruscalla at Turin in 1844, a Latin by Dr. Castro Lopes at Rio in 1868, and there is a Spanish one by Vedia. *See* Innocencio da Silva, *Diccionario Bibliographico Portuguez* vol. vii., p. 320; also Dr. T. Braga, *Filinto Elysio e os Dissidentas da Arcadza* (Oporto, 1901).

GONZALEZ-CARVAJAL, TOMAS JOSE (1753–1834), Spanish poet and statesman. Intendant (1795) of the colonies recently founded in Sierra Morena and Andalusia, and director (1813) of the University of San Isidro, he was imprisoned (1815–20) for establishing a chair of international law. Reinstated by the revolution of 1820, he was exiled by the counter-revolution of 1823–27. He died a member of the supreme council of war. As an author, he is known for his metrical translations of the poetical works of the Bible after the model of Luis de Leon.

GOOCH, SIR DANIEL, BART. (1816–1889), English mechanical engineer, was born at Bedlington, Northumberland, on Aug. 16, 1816. In 1837 he became the locomotive superintendent of the Great Western Railway, and gradually replaced the unsatisfactory locomotives employed by a new and efficient eight-wheeled class. One of these broad gauge locomotives, the "Lord of the Isles" gained a gold medal at the Great Exhibition of 1851, and ran 789,300 miles, with its original boiler, before withdrawal in 1881. Gooch left the railway in 1864, and as a director of the Telegraph Construction Companv personally superintended the laying of the first two Atlantic Cables by the steamship "Great Eastern" in 1865–6. He returned to the Great Western Railway as chairman in 1866 and carried out many improvements before his death at Clewer Park, near Windsor, on Oct. 15, 1889. He was an advocate of the "broad," or 7 ft., gauge for railways, but his death only preceded by three years the complete conversion of the Great Western Railway to standard gauge.

GOOCH, GEORGE PEABODY (1873–), English historian, was educated at King's college, London, and Trinity college, Cambridge, and continued his studies in Berlin and Paris. He was Liberal M.P. for Bath (1906–10), and for Reading (1913). He was joint editor of the *Contemporary Review* (1911 onwards); president of the Historical Association (1922–25); joint editor of the *British Documents on the Origins of the War, 1898–1914* (1926, etc.), and president of the National Peace Council (1933–36). Gooch has made a special study of modern German history, and is one of the first English authorities on the subject.

His more important works include: *Germany and the French Revolution* (1920); *History of Modern Europe, 1878–1918* (1923); *Franco-German Relations, 1871–1914* (1923); *Recent Revelations of European Diplomacy* (1927).

GOOD, JOHN MASON (1764–1827), English writer on medical, religious and classical subjects, mas born on May 25, 1764, at Epping, Essex, the son of a Nonconformist minister. In 1794 he became a member of the British Pharmaceutical Society, and in that connection, and especially by the publication of *A History* of *Medicine* (1795), he effected a greatly needed reform in the profession of the apothecary. In 1820 he took the diploma of M.D. at Marischal college, Aberdeen. He died at Shepperton, Middlesex, on Jan. 2, 1827. Good was acquainted with the principal European languages, and also with Persian, Arabic and Hebrew.

GOOD CONDUCT BADGES: *see* STRIPE.

GOODE, GEORGE BROWN (1851–1896), American zoologist, was born in New Albany, Ind., on Feb. 13, 1851. He graduated from Wesleyan University at Middletown, Conn., and spent a year at Harvard studying natural history under Agassiz. In 1874 he became chief of the division of fisheries at the National Museum, Washington, D.C., and in 1887 assistant secretary of the Smithsonian Institution in charge of the National Museum, which position he held until his death at Washington, on Sept. 6, 1896. Under his direction the collections at the museum were entirely reorganized and recatalogued in a scientific manner and displayed with an educational aim in view. His ideas of museum administration and display as expressed in his papers "Museums of the Future" and "Principles of Museum Administration" (U.S. National Museum *Report*, pt. ii., 1897) influenced nearly every important museum of the period. They were also spread by the remarkable Government exhibits prepared by Goode for the Centennial Exhibition of 1876, The World's Columbian Exposition of 1893, exhibitions at Berlin (1880), London (1883) and Madrid (1892–93) and many others. Goode directed the fisheries division of the 10th census (1880) and prepared the report in seven quarto volumes *The Fisheries and Fishing Industries of the United States* (1884–87). He wrote *American Fishes* (1888) and in 1896 published his most important scientific work, *Ocean Iclzthyology*. He was prominent in the organization and conduct of scientific societies, interested in the history of science, in which field he prepared many papers, and an indefatigable bibliographer of the writings of naturalists. The *Annual Report* of the U.S. Nat. Museum for 1897 contains a bibliography of Goode's publications together with memoirs by S. P. Langley and others.

See also *D. S.* Jordan, ed., *Leading Men* **of** *Science* (1910).

GOOD FRIDAY, the English name for the Friday before Easter, kept as the anniversary of the Crucifixion. The term is probably a corruption of "God's Friday." It was called Long Friday by the Anglo-Saxons and Danes, possibly in allusion to the length of the services which marked the day.

The origin of the custom of a yearly commemoration of the Crucifixion is somewhat obscure. It may be regarded as certain that among Jewish Christians it almost imperceptibly grew out of the old habit of annually celebrating the Passover on the 14th of Nisan, and of observing the "days of unleavened bread" from the 15th to the 21st of that month. In the Gentile churches, on the other hand, it seems to be well established that originally no yearly cycle of festivals was known at all. *(See* EASTER.)

From iis earliest observance, the day was marked by a specially rigorous fast, and also, on the whole, by a tendency to greater simplicity in the services of the church. Prior to the 4th century there is no evidence of non-celebration of the eucharist on Good Friday; but after that date the prohibition of communion became common. In Spain, indeed, it became customary to close the churches altogether as a sign of mourning; but this practice was condemned by the council of Toledo (633). In the Roman Catholic Church the Good Friday ritual at present observed is marked by many special features, most of which can be traced back to a date at least prior to the close of the 8th century *(see* the Ordo Romanus in Muratori's *Liturg. Rom. Vet.)*. The altar and the officiating clergy are draped in black and the gospel for the day consists of the history of the Passion as recorded by St. John. This is often sung in plain-chant by three priests, one representing the "narrator," the other two the various characters of the story. The singing of this is followed by bidding prayers for the peace and unity of the church, for the pope, the clergy, all ranks and conditions of men, the sovereign, for catechumens, the sick and afflicted, heretics and schismatics, Jews and heathen. Then follows the "adoration of the cross." In the Church of England the history of the Passion from the gospel according to John is also read; the collects for the day are based upon the bidding prayers which are found in the Ordo Romanus. The "three hours" service, borrowed from Roman Catholic usage and consisting of prayers, addresses on the "seven last words from the cross" and intervals for meditation and silent prayer, has become very popular in the Anglican Church, and the observance of the day is more marked than formerly among Nonconformist bodies even in Scotland.

GOODHUE, BERTRAM GROSVENOR (1869–1924), American architect, was born at Pomfret Hill (Conn.), April 28, 1869. He studied architecture in New York city with James Renwick, and in 1891 entered the office of R. A. Cram in Boston (Mass.), later becoming a partner. In 1903 the firm opened an office in New York city, of which Goodhue took charge. After 1914 he practised alone. He designed churches and cathedrals which were thoroughly modern, yet Gothic in inspiration. At the same time he was one of the most prominent exponents of the sky-scraper building.

Among the structures designed by him are St. Thomas's Church, the Chapel of the Intercession, and the Church of St. Vincent Ferrer, New York city; the Nebraska State capitol, Lincoln (Neb.); St. Mark's Church, Mount Kisco (N.Y.); St. Thomas's College, and the National Academy of Sciences and National Research Council in Washington; University Chapel at the University of Chicago; the California Institute of Technology, Pasadena (Calif.); and the Exposition buildings for San Diego (Calif.). He was also the architect for the Cathedral of Maryland (Balt.). He died in New York city, April 24, 1924.

GOOD-KING-HENRY (*Chenopodium Bonus-Henricus*), a rank-growing perennial herb of the family Chenopodiaceae, found in Great Britain and naturalized in North America from Nova Scotia to Ontario and southward. It is a smooth, dark green, little-branched plant, about 2 ft. high, with usually entire halberd-shaped leaves. The plant is sometimes cultivated as a pot-herb under the name mercury or all-good. *(See* CHENOPODIUM.)

GOODMAN, GODFREY (1583–1656), bishop of Gloucester, was born at Ruthin, Denbighshire, and educated at Westminster and Cambridge. He took orders in 1603, and, after holding various preferments; became bishop of Gloucester in 1625. From this time his tendencies towards Roman Catholicism constantly got him into trouble. In 1633 he secured the see of Hereford by bribery, but Archbishop Laud persuaded the king to refuse his consent. In 1640 he was imprisoned for refusing to sign the new canons denouncing popery and affirming the divine right of kings. He afterwards signed and was released on bail, but next year the bishops who had signed were all imprisoned in the Tower, by order of parliament, on the charge of treason. After 18 weeks' imprisonment Goodman was allowed to return to his diocese. About 1650 he settled in London, where he died a confessed Roman Catholic. His best known book is *The Fall of Man* (1616).

GOODNOW, FRANK JOHNSON (1859–1939), American educationalist, was born in Brooklyn (N.Y.), on Jan. 18, 1859. Educated at Amherst college (Mass.), he graduated in law at Columbia (1882), subsequently proceeding to the École Libre des Sciences Politiques, Paris, and the University of Berlin. He was appointed instructor in history and lecturer in U.S. administrative law at Columbia university in 1883, becoming professor in 1891, and Eaton professor of administrative law and municipal science in 1903. During 1906–7 he was acting dean of political science. He was legal adviser to the Chinese Government, stationed at Peking, during the years 1913 and 1914, and from 1914 to 1928 was president of Johns Hopkins university. Among his published works are *Comparative Administrative Law* (1893); *Municipal Home Rule* (1895); *Municipal Problems* (1897); *Politics and Administration* (1900); *City Government in the United*

States (1904); *The Principles of the Administrative Law of the United States* (1905); *Municipal Government* (1909); *Social Reform and the Constitution* (1911); *Principles of Constitutional Government* (1916); and *China; an Analysis* (1926).

GOODRICH, ANNIE WARBURTON (1866–), American nurse educator, was born at New Brunswick, N.J., on Feb. 6, 1866. She was educated at private schools in Connecticut, England and France and in 1892 graduated from the New York hospital training school for nurses. In 1900–14 she was superintendent of nurses at St. Luke's, New York and Bellevue and Allied hospitals, inspector of nurses' training schools under the New York department of education, also lecturer at Teachers college, Columbia university, 1904–13. In 1914 she became assistant professor of the department of nursing and health at Teachers college, and in 1917 director of nurses, Henry St. Settlement. Her services to nursing during the World War led to her appointment in 1918 as dean of the army school of nursing. At the invitation of Yale university she became dean of its schoo! of nursing in 1923 when it was established with the aid of the Rockefeller Foundation. In 1928 it was the only school of nursing awarding the degree of "Bachelor of Nursing."

GOODRICH, SAMUEL GRISWOLD (1793–1860), an American author, better known under the pseudonym of "Peter Parley," was born, the son of a Congregational minister, at Ridgefield, Connecticut, Aug. 19, 1793. He was largely self-educated, but after general mercantile experience became a bookseller and publisher at Hartford and later in Boston. There, beginning in 1828, he published for fifteen years an illustrated annual, the *Token,* to which he was a frequent contributor both in prose and verse. The *Token* contained some of the earliest work of Nathaniel Hawthorne, N. P. Willis, Henry W. Longfellow and Lydia Maria Child. In 1841 he established *Merry's Museum,* which he continued to edit till 1854 In 1827 he began, under the name of "Peter Parley," his series of books for the young, which embraced geography, biography, history, science and miscellaneous tales. Of these he was the sole composer of comparatively few, but in his *Recollections of a Lifetime* (2 vols., 1856) he wrote that he was "the author and editor of about 170 volumes," of which about seven million copies had been sold, and gave a list both of the works of which he was the author or editor and of the spurious works published under his name. He was chosen a member of the Massachusetts House of Representatives in 1836, and of the state senate in 1837, and in 1851–53 he was consul at Paris, where he remained till 185j. He died in New York May 9, 1860.

GOODRICH or **GOODRICKE, THOMAS** (d. 1554), English ecclesiastic, son of Edward Goodrich of East Kirkby, Lincolnshire, was educated at Corpus Christi college, Cambridge, afterwards becoming a fellow of Jesus college in 1510. He was consulted about the legality of Henry VIII.'s marriage with Catherine of Aragon, became royal chaplain about 1530, and bishop of Ely in 1534. He was zealous for the Reformation, helped in 1537 to draw up the *Institution of a Christian Man* (known as the *Bishops' Book),* and translated the Gospel of St. John for the revised New Testament. On the accession of Edward VI. in 1547 the bishop was made a privy councillor. He assisted to compile the First Prayer Book of Edward VI., and he was one of the commissioners for the trial of Bishop Gardiner. In January 1551 he succeeded Rich as chancellor and held this office during the nine days' reign of Lady Jane Grey; but he made his peace with Queen Mary by associating himself with the order commanding the duke of Northumberland to disarm. He conformed to the restored religion, and, though deprived of the chancellorship, kept his bishopric until his death on May 10, 1554.

See the *Dict. Nat. Biog.,* where further authorities are cited.

GOODSIR, JOHN (1814–1867), Scottish anatomist, was born at Anstruther, Fife, on March 20, 1814. He was educated at St. Andrews, and at Edinburgh, and in 1835 joined his father in practice at Anstruther. Three years later he communicated to the British Association a paper on the pulps and sacs of the human teeth, and about the same date, on the nomination of Edward Forbes, he was elected to the famous coterie called the "Universal Brotherhood of the Friends of Truth," which comprised artists, scholars, naturalists and others, whose relationship became a potent influence in science. With Forbes he worked at marine zoology, but human anatomy, pathology and morphology formed his chief study. In 1840 he moved to Edinburgh, where he was appointed conservator of the museum of the College of Surgeons, in succession to William Macgillivray. In his lectures in the theatre of the college in 1842–43 he insisted on the importance of the cell as a centre of nutrition, and pointed out that the organism is subdivided into a number of departments. R. Virchow recognized his indebtedness to these discoveries by dedicating his *Cellular Pathologie* to Goodsir, as "one of the earliest and most acute observers of cell-life." In 1843 Goodsir became curator in the University of Edinburgh; then demonstrator of anatomy, and in 1845 curator of the entire museum. A year later he was elected to the chair of anatomy in the university. He died at Wardie near Edinburgh, on March 6, 1867.

See *Anatomical Memoirs of John Goodsir, F.R.S., edited by W. Turner, with Memoir by H. Lonsdale* (Edinburgh, 1868); *Proc. Roy. Soc.,* vol. iv. (1868); *Trans. Bot. Soc. Edin.,* vol. ix. (1868).

GOODWILL. In accounting, goodwill appears as an asset upon the balance sheet at the amount it originally cost, or at such lesser amount as it may have been written down out of profits. No attempt is ever made to re-value the goodwill of a business from year to year for balance sheet purposes. When, however, a change takes place in the owners of a business, the price to be paid for goodwill has necessarily to be agreed upon by the incoming and outgoing parties. This price is a matter of bargaining, and has nothing to do with the figure that goodwill may appear at in the books of the business changing hands.

Goodwill represents the difference between an established successful business and one that has yet to establish itself and achieve success. The price that a purchaser is willing to pay for goodwill is the price he is prepared to pay for the right to stand in the shoes of his predecessor, and to represent himself as his successor in business. The price that the vendor of a goodwill is content to receive is the compensation that he is content to regard as adequate for his surrender of an income equal to the future profits of the business. The future profits of any business are, in the nature of things, incalculable.

The Result of Fair Dealing.—At one time it used to be thought that the goodwill of a business consisted solely of the goodwill of its customers, and represented the reputation that the business had acquired in their minds as a result of fair dealing over a reasonably extended period of time. Modern thought recognizes that, second only to the esteem of customers, is the esteem of supplying houses and employees.

Writing down Goodwill.—Many persons take the view that goodwill is an unsatisfactory item to appear in a balance sheet. The earning power of every business fluctuates from year to year; thus, the actual value of goodwill also fluctuates. No attempt would ever be made to record these fluctuations in successive balance sheets, as that would give rise to confusion and serve no useful purpose; but goodwill is very commonly written down year by year when the profits are sufficiently large to make that practice possible, and many persons confuse this with the writing down of such wasting assets as plant and machinery to provide for depreciation. As a matter of fact, the goodwill of a business does not "depreciate" unless the business is a temporary one. Paradoxical as it may seem, goodwill is in practice written down only when in fact its value is increasing.

BIBLIOGRAPHY.—L. R. Dicksee and F. Tillyard's *Goodwill and its Treatment in Accounts* (4th ed. 1920). (L. R. D.)

GOODWIN, JOHN (*c.* 1594–1665), English Nonconformist divine, was born in Norfolk and educated at Queens' college, Cambridge, where he was elected fellow in 1617. He was vicar of St. Stephen's, Coleman street, London, from 1633 to 1645, when he was ejected by parliament for his attacks on Presbyterianism, especially in his Θεομαχία (1644). He established an independent congregation, and put his literary gifts at Oliver Cromwell's service. In 1648 he justified the proceedings of the army against the parliament ("Pride's Purge") in a pamphlet *Might and Right*

Well Met, and in 1649 defended the proceedings against Charles I. (to whom he had offered spiritual advice) in 'Υβριστοδίκαι. At the Restoration this tract, with some that Milton had written to Monk in favour of a republic, was publicly burnt, and Goodwin was ordered into custody, though finally indemnified. He died in 1665.

Among his other writings are *Anti-Cavalierisnze* (1642), *a* translation of the *Stratagemata Satanae* of Giacomo Aconcio, the Elizabethan advocate of toleration; *Redemption Redeemed, contaitzing a thorough discussion of . . . election, reprobation and the perseverance of the saints* (1651, reprinted 1840). John Wesley published an abridged edition of his *Imputatio fidei*. See *Life* by T. Jackson (1839).

GOODWIN, THOMAS (1600--1680), English Nonconformist divine, was born at Rollesby, Norfolk, on Oct. 5, 1600, and was educated at Christ's college, Cambridge, and became a fellow of Catharine Hall. In 1625 he was licensed a preacher of the university; he became lecturer and then vicar (1632) of Trinity church, Cambridge. Worried by his bishop, who was a zealous adherent of Laud, he resigned all his preferments and left the university in 1634. He lived for some time in London; but in 1639 he withdrew to Holland. Returning to London soon after Laud's impeachment by the Long Parliament, he became minister of an independent congregation in Lime St., East London. In 1643 he was chosen a member of the Westminster Assembly, and at once identified himself with the Congregational party. In 1650 he became president of Magdalen college, Oxford, a post which he held until the Restoration. He was one of Cromwell's intimate advisers, attending him on his death-bed. He was also a commissioner for the inventory of the Westminster Assembly, 1650, and for the approbation of preachers, 1653, and together with John Owen (*q.v.*) drew up an amended Westminster Confession in 1658. From 1660 until his death on Feb. 23, 1680 he lived in London as pastor of the Fetter Lane Independent church.

See his *Works* (5 vols., 1681–1704; reprinted 12 vols., Edin., 1861–66); a memm. prefixed to vol. v. of his *Works;* and a sketch by Addison in No. 494 of the *Spectator*.

GOODWIN, WILLIAM WATSON (1831–1912), American classical scholar, was born in Concord, Mass., on May 9, 1831. He graduated at Harvard in 1851, studied at Bonn, Berlin and Gottingen, receiving his Ph.D. degree from there in 1855; was tutor in Greek at Harvard in 1856–60, and Eliot professor of Greek thereafter until his retirement in 1901. He became an overseer of Harvard in 1903. In 1882–83 he was the first director of the American School of Classical Studies at Athens. Goodwin edited the *Panegyricus* of Isocrates (1864) and Demosthenes' *De Corona* (1901), and assisted in preparing the 7th edition of Liddell and Scott's *Greek-Englislz Lexicon*. He revised an English version by several writers of *Plutarch's Morals* (5 vol., 1871), and published the Greek text with literal English version of Aeschylus' *Agamemnon* for the Harvard production of that play in June 1906. As a teacher he did much to raise the tone of classical reading from that of a mechanical exercise to literary study. But his most important work was his *Syntax of the Moods and Tenses of the Greek Verb* (1860, enlarged ed. 1890). Besides making accessible to American students the works of Madvig and Kriiger, it presented original matter, including a "radical innovation in the classification of conditional sentences," notably the "distinction between particular and general suppositions." Both this and his *Greek Grammar* (1870) in later editions are largely dependent on the theories of Gildersleeve for additions and changes. He died in Cambridge, Mass., on June 16, 1912.

GOODWIN SANDS, a dangerous line of shoals at the entrance to the Strait of Dover from the North sea, about 6 m. from the Kent coast of England, from which they are separated by and form shelter for, the anchorage of the Downs. The shifting sands are partly exposed at low water and in spite of lights and bell-buoys, are frequently the scene of wrecks, while attempts to erect a lighthouse have failed. Tradition finds in the Goodwins the remnant of an island called Lomea, which belonged to Earl Godwine (11th century) and was afterwards submerged. Four lightships mark the limits of the sands, and also signal to the lifeboat stations on the coast when any vessel is in distress on the sands.

GOODYEAR, CHARLES (1800–1860), American inventor, was born at New Haven (Conn.), Dec. 29, 1800, the son of Amasa Goodyear, an inventor (especially of farming implements) and a pioneer in the manufacture of hardware in America. In 1821 he entered into a partnership with his father at Naugatuck, which continued till 1830. Already he was interested in an attempt to discover a method of treatment by which india-rubber could be made into articles that would stand extremes of heat and cold. To the solution of this problem the next ten years of his life were devoted. For a time he seemed to have succeeded with a treatment of the rubber with *aqua fortis*. In 1836 he secured a contract for the manufacture by this process of mail bags for the U.S. Government, but the rubber fabric was useless at high temperatures. In 1837 he worked with Nathaniel Hayward (1808–65), who had been an employee of a rubber factory in Roxbury and had made experiments with sulphur mixed with rubber. Goodyear bought from Hayward the right to use this imperfect process. In 1839, by dropping on a hot stove some india-rubber mixed with sulphur, he discovered accidentally the process for the vulcanization of rubber. In 1844 his first patent was granted. Numerous infringements had to be fought in the courts, the decisive victory coming in 1852. In the same year he went to England, where articles made under his patents had been displayed at the International Exhibition of 1851, but he was unable to establish factories there. In France a company for the manufacture of vulcanized rubber by his process failed, and in Dec. 1855 he was arrested and imprisoned for debt in Paris. He died in New York city July 1, 1860. He wrote an account of his discovery entitled *Gum-Elastic and Its Varieties* (2 vols., New Haven, 1853–55).

See also B. *K*. Peirce, *Trials of an Inventor, Life and Discoveries of Charles Goodyear* (New Yorii, 1866); James Parton, *Famous Americans of Recent Times* (Boston, 1867); and Herbert L. Terry, *India Rubber and Its Manufacture* (New York, 1907).

GOODYEAR TIRE & RUBBER COMPANY, THE, founded in 1898 at Akron, O., began as a manufacturer of bicycle and carriage tires. It soon entered the field of automobile tire manufacture, research and development, and by 1916 had become the largest tire company in existence, and in 1926 the largest manufacturer of rubber products.

It is the principal American manufacturer of lighter-than-air craft.

The company has subsidiary mechanical goods plants at Bowmanville, Canada, and Windsor, *Vt.;* also subsidiary tire factories at New Toronto, Canada; Los Angeles, Calif.; Gadsden, Ala.; Cumberland, Md., and Jackson, Mich.; and in England, Australia, Argentina, Java, Sweden and Brazil; textile mills are making tire fabric in Cedartown, Cartersville and Rockmart, Ga.; Decatur, Ala., and St. Hyacinthe, Que.; a 32,000ac. cotton plantation in southern Arizona; 91,000ac. of rubber lands in Sumatra (55,000ac. producing plantations), 2,500ac. in the Philippines (2,400ac. producing), and is developing 1,000ac. in Costa Rica and 1,500ac. in Panama. The company also has its own coal mines in southern Ohio.

It has branches and sales representation throughout the world, including 100,000 retail dealers. Goodyear had produced a total of 298,000,000 tires from 1898 up to July 1, 1939.

GOOGE, BARNABE (1540–1594), English poet, son of Robert Googe, recorder of Lincoln, was born at Alvingham, Lincolnshire. He studied at Christ's college, Cambridge, and at New college, Oxford. He was attached to the household of his kinsman, Sir William Cecil, and in 1563 became a gentleman pensioner to Queen Elizabeth. His poems appeared in 1563 as *Eglogs, Epytaphes and Sonettes*. Googe was provost-marshal of the court of Connaught, and some 20 letters of his in this capacity are preserved in the record office. He was an ardent Protestant, and his poetry is coloured by his religious and political views.

His other works include a translation from Marcellus Palingenius (said to be an anagram for Pietro Angelo Manzolli) of a satirical Latin poem, *Zodiacus vitae* (Venice, 1531?), in 12 books, under the title of *The Zodyake of Life* (1560); *The Popish Kingdome, or Reign of Antichrist* (1s;~), translated from Thomas Kirchmayer or Naogeorgus; *The Spiritual Husbandrie* from the

same author, printed with the last; *Foure Bookes of Husbandrie* (1577), collected by Conradus Heresbachius; and *The Proverbs of . . . Lopes de Mendoza* (1579).

GOOKIN, *DANIEL* (*c. 1612–1687*), American colonial soldier and magistrate, was born in the British Isles but accompanied his father to Virginia at an early age and remained in the colonies for the greater part of his life. He lived in Virginia, except for a few years in England, until *1643*, when he moved to Maryland and thence to Massachusetts because of his sympathy with Puritan teachings. He was a founder of the Roxbury public grammar school, was made captain of the militia in Cambridge, where he next settled, and in *1649* was elected to the Massachusetts house of representatives, becoming speaker of the house in *1651*. In *1652* he was elected an assistant, the title given to members of the governor's council in Massachusetts, and held the position uninterruptedly until *1686* except for the year *1676* when he failed to be elected because he had befriended the Indians during King Philip's War. In 1655 Cromwell placed him in charge of the attempt to settle Jamaica, which England had recently acquired, with New Englanders, but the venture was not successful. The following year he was chosen superintendent of all Indians ruled by the Massachusetts government, a post he held, after his re-election in *1661*, until his death. His attempts to protect the Indians from mistreatment at the hands of the whites made him widely unpopular with the citizens of Massachusetts. He helped John Eliot found several towns which were to be settled by natives converted to Christianity, the so-called "Praying Indians." He was made major-general of Massachusetts in *1681*. Gookin was the author of *Historical Collections of the Indians of Massachusetts (1674); Historical Account of the Doings and Sufferings of the Christian Indians in New England;* and a history of New England which he never finished.

GOOLE, municipal borough, market town and river-port, in the Pontefract parliamentary division of the West Riding of Yorkshire, England, at the confluence of the Don and the Ouse, *24* mi. S.W. from Hull, and served by the L.M.S. and L.N.E. railways. Pop. (1938), *19.560*. Area, *1.98* sq.mi.

It is situated on very low-lying land, on the right bank of the Ouse, at its last bridging place. The river later widens to the broad channel of the Humber. The town owes its existence to the construction of the Knottingley canal, in *1826*, by the Aire and Calder Navigation company, after which, in *1829*, Goole was created a landing port. The port was administratively combined with that of Hull in *1885*. It is *47* mi. from the North sea (mouth of the Humber), and a wide system of inland navigation opens from it. There are nine docks supplied with timber ponds, quays, warehouses, etc. The depth of water is *21* or *22* ft. at high water, spring tides. Chief exports are coal, coke, pitch, cotton, linen and woollen goods, earthenware, iron and steel manufactures and machinery. Imports include bricks, tiles, cement, dyes and dyestuffs, paper, sugar, bacon, butter and fuel oil. Iron founding and the manufacture of alum, sugar, rope and agricultural implements form the principal industries. Shipbuilding and repairing are also carried on. Passenger steamship services are ordinarily worked in connection with the L.N.E. railway to Amsterdam, Antwerp, Bruges, Copenhagen, Rotterdam and other north European ports. The handsome church of St. John the Evangelist, with a lofty toner and spire, dates from *1844*. Goole was incorporated in 1933.

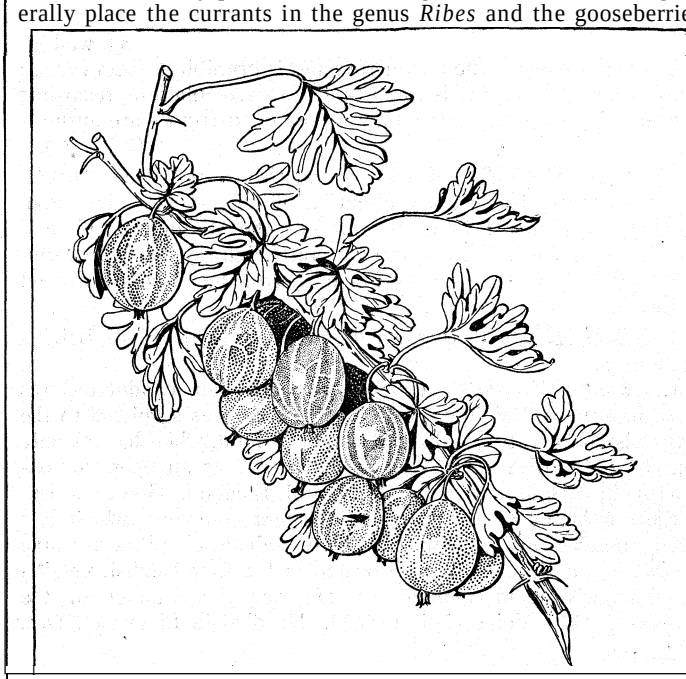
GOOSE, the common name for birds forming the sub-family *Anserinae* of the *Anatidae*. Technically "goose" is the female, the male being "gander." Geese differ from ducks in that the sexes are alike and that the male assists the female in the duties of rearing the young. At the close of the breeding season they moult their wing quills and may then be easily approached. When in company, geese usually fly in a V-shaped formation.

The type of the sub-family is the gray-lag goose (*Anser anser*), from which the domestic goose has been derived. It breeds in suitable localities from Lapland to Spain, and from Scotland to China. The nest is placed in heather or grass and five or six eggs form a clutch. The genus *Anser* constitutes the "gray" geese, and includes, besides the gray-lag, the bean-goose (*A. fabalis*), the pink-footed goose (*A. brachyrhynchus*) and the white-fronted goose (*A. albifrons*), all breeding in the northern part of the old world and migrating south in winter. American members of the genus are *A. gambeli* and, in its northern portions, the snow-geese, of which the commonest is *A. hyperboreus*, the snow goose proper, white with black primaries, and *A. canagica*, the emperor goose of the Aleutian Islands. South America possesses the genus *Chloephaga*, which includes the kelpgoose, *C. antarctica*, and the upland goose, *C. magellanica*.

The "black" geese include the barnacle-goose (*Branta leucopsis*), breeding in Spitsbergen, northeast Greenland and northwest Siberia, supposed of old to be produced from barnacles (*Lepadidae*), and the brent-goose, B. *bernicla*, with a circumpolar breeding range. To this group also belongs the well-known Canada goose (B. *canadensis*) of America. Other species occur in North America, Asia and the Hawaiian archipelago.

The largest living goose is the Chinese goose, *Cygnopsis cygnoides*, the origin of the eastern domestic races. *Cnemiornis calcitrans* is a fossil goose from New Zealand, remarkable for its extraordinary *patella*, and its loss of flight. The Egyptian and Orinoco geese (*Chenalopex*) are of doubtful affinities and possess an enlargement of the junction of the bronchial tubes and trachea —a characteristic of the ducks (*Anatinae*).

GOOSEBERRY, a well-known fruit-bush of the northern hemisphere of which there are about 50 species, mostly natives of western North America. They are closely related to the currants and were formerly placed in the same genus. Now botanists generally place the currants in the genus *Ribes* and the gooseberries in the genus *Grossularia*. Currants are non-spiny and the flowers are borne in racemes, while gooseberries are spiny and produce their flowers singly or in twos or threes.



GOLDEN DROP GOOSEBERRY (GROSSULARIA RECLINATA), A SPINY EUROPEAN VARIETY DIFFICULT TO GROW IN AMERICA BECAUSE OF THE CLIMATE

The gooseberry is far more important in Great Britain and northern Europe than in North America. The acreage for the United States in 1939 was *926* acres and for England 13,200 acres in 1934. European gooseberries are derived from the species *G. reclinata*, native in northern Africa and from Spain to the Caucasus north to Scandinavia. It was cultivated in English gardens as early as *1600*. Hundreds of varieties are known and are classed as early, midseason or maincrop, and dessert kinds. May Duke is the chief early variety; Keepsake is also grown. Both are chiefly raised in the south of England. Picking may begin as early as April 15, usually by May *1*, when the berries are young. The midseason varieties are mostly Industry and Careless and are grown in Kent and the eastern counties. In-

dustry is thinned but little, while Careless is cut severely. The dessert varieties are grown mostly about East Grinsted in Sussex. Leveller is the principal variety and by especial care berries 1 oz. in weight are obtained. Shiner, Lord Derby, Gunner, Leader, Careless, White Lion and Consens Seedling are other dessert varieties. They are picked from July 1 to about Aug. 1j and are marketed ripe. Most gooseberries are interplanted in fruit orchards, the early 3 by 6 ft., the midseason 6 by 6 ft., and the late 4 by 4 ft. Stable manure (15 tons) plus potash (200 lb.) are used as fertilizer. The bushes are propagated by cuttings taken in the fall and disbudded at the base to form a tree-shaped plant.

In the United States the European gooseberries are attacked by mildew. Hybridizing the European varieties with American species produced resistant varieties. Houghton and Downing were the chief varieties till after 1900. Now Oregon, Poorman, Pixwell, Como, Glenndale, Pearl and Red Jacket are also raised as well as Industry and Columbus of the English type. Pixwell and Glenndale are both hybrids of the native wild gooseberry, G. *missouriense,* with cultivated varieties. Poorman is large-fruited, bright red, and high-flavoured when eaten as a dessert sort. At the Canadian experiment station thornless varieties have been originated.

Powdery mildew is especially serious on European varieties but may be controlled by spraying with commercial lime-sulphur. 1½ gal. to 50 gal. of water. Anthracnose and leaf spot may defoliate the plants unless they are controlled by spraying with bordeaux mixture. The chief insect is the "imported" currant worm which quickly strips the plants of leaves. They are readily controlled by powdered hellebore. The gooseberry, as well as the currant, spreads the blister rust and is prohibited from certain areas where white pine is important. State regulations regarding the planting of gooseberries may be obtained from state authorities. (G. M. D.)

GOOSE CREEK, a city of southeastern Texas, U.S.A., located near Galveston bay about 32 mi. E. of Houston. Pop. (1940) 6,929. Goose Creek is served by the Missouri Pacific and Southern Pacific railroads and by state highway 146. Its principal industry is the distribution of petroleum from nearby oil fields.

GOOSSENS, a distinguished family of English and Belgian musicians.

1. EUGENE GOOSSENS (1845–1906), Belgian conductor, was born in Bruges, Belgium, Feb. 25, 1845. He was admitted to the Brussels conservatory, where he studied violin, when he was only 14. In 1882, after several years' experience as an operatic conductor in Belgium, France, Italy and England, Goossens was made conductor of the Carl Rosa Opera company, which had been founded in 1875 to travel through England performing operas in English. He led the group in the first English version of Wagner's opera *Tannhäuser*. He was the founder of the Goossens Male Voice choir (1894). He died in Liverpool, Dec. 30, 1906.

2. EUGENE GOOSSENS (1867–), son of the above, was also a conductor. He was born in Bordeaux, France, Jan. 28, 1867, and was educated in Bruges, the Brussels conservatory and the Royal Academy of Music in London. He played the violin with the Carl Rosa Opera company and was a member of the orchestra of the Royal opera, after which he conducted opera, becoming in 1899 conductor of the Carl Rosa company, a position he held until 1915. He was made conductor of the British National Opera company in 1926 and aiter his retirement taught music.

3. EUGENE GOOSSENS (1893–), English composer and conductor and son of the Eugene Goossens immediately above, was born in London, May 26, 1893. He received his musical training at Bruges conservatoire, the Liverpool School of Music and the Royal College of Music, London. In 1921, after he had for some years been associated with Sir Thomas Beecham, he organized an orchestra of his own and gave some concerts of modern chamber music. He was made conductor of the Rochester (N.Y.) Philharmonic orchestra in 1923 and remained in Rochester until 1931, when he became director of the Cincinnati Symphony orchestra. He also conducted the London Symphony orchestra, the Russian ballet, and the Beechani National and Carl Rosa opera companies.

In composition Goossens' output was considerable. Of particular interest is his chamber music which includes: Suite for flute, violin and harp op. 6; Five *Impressions* of a *Holiday* for piano, flute or violin, and 'cello; Fantasy for string quartet; string quartet op. 14; a quintet and a sextet for strings; Pastoral and *Harlequinade* for flute, oboe and piano op. 39; Fantasy for wind instruments op. 40. He also wrote two operas, Judith (1925) and Don Juan de *Mañara* (1937), both with librettos by the English novelist Arnold Bennett; a ballet, *L'École* en Crinoline (1921); a symphony op. 58; songs; piano, 'cello and violin pieces; and works for orchestra.

4. LEON GOOSSENS (1896–), English oboist, son of Eugene Goossens (2, above) was born in Liverpool. He was first oboist of the Royal Opera House orchestra and of the London Philharmonic orchestra after it was founded in 1932.

GOOTY, a town and hill fortress of souther? India, in the Anantapur district of Madras, 48 mi. E. of Bellary, with a station on the Madras and Southern Mahratta railway. Pop. (1931) 9,712.

The town is surrounded by a circle of rocky hills, connected by a wall. On the highest stands the citadel, 2,100 ft. above sea-level. Here was the stronghold of Morari Rao Ghorpade, a famous Mahratta warrior and ally of the English, who was ultimately starved into surrender by Hyder Ali in 1775.

GOPHER, the name applied in North America to certain burrowing, squirrel-like rodents. as the pocket gopher (Geomys bursarius), of the Mississippi valley, and the northern pocket gopher (*Thomomys talpoides*), common west of the Rocky Mountains, both exceedingly destructive to crops.

The gopher turtle (Gopherus *polyphemus*), native to the southern states, likewise lives in burrows and often does great damage to crops.

GOPPERT, HEINRICH ROBERT (1800–1884), German botanist and palaeontologist, was born at Sprottau, July 25, 1800. He was educated at the universities of Berlin and Breslau and by 1839 had become professor of medicine and botany at the latter. He helped to found the Breslau botanical gardens. Göppert was interested chiefly in fossilized plants, particularly Coniferae. He compiled an important classification of fossil plants and wrote a number of books on palaeobotany and plant physiology. He died in Breslau, May 18, 1884.

GÖPPINGEN, a town of Germany, in the Land of Württemberg, on the Fils, 22 mi. E.S.E. of Stuttgart on the railway to Friedrichshafen. Pop. (1939) 30,431. Goppingen originally belonged to the Hohenstaufen, and in 1270 came into possession of the counts of Wurttemberg. It was surrounded by walls in 1129, and was rebuilt after a fire in 1782. It possesses a castle built partly with stones from the ruined castle of Hohenstaufen which stands 3 mi. N. of the town, by Duke Christopher of Württemberg in the 16th century and now used as public offices. The manufactures include linen and woollen cloth, electric motors. leather, glue, paper and toys. There are machine shops and tanneries in the town. It has a chalybeate spring.

GORAKHPUR, a city, district and division of the United Provinces of British India. The city is situated on the left bank of the river Rapti. Pop. (1931) 59.369. It is believed to have been founded about A.D. 1400. It is the civil headquarters of the district and an important depot for recruits coming from Nepal to join the Gurkha regiments of the Indian army. It is also the headquarters of the Bengal and North-western railway, with its workshops and a large settlement of European employees. The town itself is little better than a collection of adjacent village sites, sometimes separated by cultivated land, and most of the inhabitants are agriculturists.

The DISTRICT OF GORAKHPUR has an area of 4,534 sq.mi. It lies immediately south of the lower Himalayan slopes, but itself forms a portion of the great alluvial plain. Only a few sandhills break the monotony of its level surface, which is, however, intersected by numerous rivers (Gōgra, Gandak, Rapti and others) studded with lakes and marshes. In the north and centre dense

forests abound, and the district is not subject to very intense heat, from which it is secured by its vicinity to the hills and the moisture of its soil

Gautama Buddha was born, and died near the boundaries of the district; and near Kasia are remains which were long (but probably erroneously) believed to mark his burial-place. From the beginning of the 6th century the country was the scene of a continuous struggle between the Bhars and their Rajput antagonists, the Rathors. Towards the end of the 16th century the Mohammedans occupied Gorakhpur town, but they interfered very little with the district, and allowed it to be controlled by the local rajas. In the middle of the 18th century a formidable foe, the Banjaras from the west, so weakened the power of the rajas that they could not resist the fiscal exactions of the Oudh officials, who plundered the country to a great extent. The district formed part of the territory ceded by Oudh to rhe British under the treaty of 1801. The population in 1931 was 3,567,561.

FROM RUSSEL "TRIBES AND CASTES OF CENTRAL INDIA"

BANJARA WOMAN WITH THE SINGH OR HORN

The Division comprises the three districts of Gorakhpur, Basti and Azamgarh, and has an area of 9,565 sq.m. The population in 1931 was 7,217,162, giving an average density of 754 persons per sq.m., the highest for any large tract in India.

GORAL (Urotragus goral), a small Himalayan rough-haired cylindrical-horned ruminant related to the chamois. The native name is often extended to all the members of the genus. In addition to peculiarities in the form of the skull, gorals are chiefly distinguished from serows (*q.v.*) by not possessing a gland below the eye. Several species are known, ranging from the Himalaya to Burma and through Tibet to North China.

GORAMY or **GOURAMY** (*Osphromenus olfax*), one of the best-flavoured freshwater fishes in the East Indian archipelago. Being omnivorous and tenacious of life, it is to be recommended for acclimatization in other tropical countries. It attains the size of a large turbot. Its shape is flat and short, the body covered with large scales; the dorsal and anal fins are provided with numerous spines, and the ventral fins are produced into long filaments. It possesses an accessory respiratory organ above the gills, enabling it to live for some time out of water.

GÖRBERSDORF, a health resort in the Prussian province of Silesia, Germany, in a valley of the Waldenburg range, 1 900 ft. above the sea, 60 mi. S.W of Breslau by the railway to Friedland. Pop. (1933) 625. It has large sanatoria for consumptives.

GORBODUC, a mythical king of Britain. He gave his kingdom away during his lifetime to his sons, Ferrex and Porrex. The two quarrelled and the younger stabbed the elder. Their mother, loving the latter most, avenged his death by murdering the other, and the people, horrified at her act, revolted and slew both her and King Gorboduc. This legend was the subject of the earliest regular English tragedy written by Thomas Sackville, Lord Buckhurst and Thomas Norton in collaboration. Produced in 1561, it was first published very corruptly in 1565, and in better form as *The* Tragedy of *Ferrex* and *Porrex* in 1570.

GORCHAKOV or GORTCHAKOFF, a noble Russian family, descended from Michael Vsevolodovich, prince of Chernigov, who, in 1246, was assassinated by the Mongols. PRINCE ANDREY IVANOVICH (1768–1855), general in the Russian army, took a conspicuous part in the final campaigns against Napoleon. ALEXANDER IVANOVICH (1769–1825) served with distinction under his relative Suvorov in the Turkish Wars, and took part as a general officer in the Italian and Swiss operations of 1799, and in the war against Napoleon in Poland in 1806–1807 (battle of Heilsberg) PETR DMITRIEVICH (1790–1868) served under Kamenski and Kutusov in the campaign against Turkey, and afterwards against France in 1813–14. In 1820 he suppressed an insurrection in the Caucasus, for which service he was raised to the rank of major-general In 1828–29 he fought under Wittgenstein against the Turks, won an action at Aidos, and signed the treaty of peace at Adrianople. In 1839 he was made governor of Eastern Siberia, and in 1851 retired into private life. When the Crimean War broke out he offered his services to the emperor Nicholas, by whom he was appointed general of the VI. army corps in the Crimea. He commanded the corps in the battles of Alma and Inkerman. He retired in 1855 and died at Moscow, on March 18, 1868. Other members of the family are separately noted.

GORCHAKOV, PRINCE ALEXANDER MIKHAILOVICH (1798–1883), Russian statesman, cousin of Princes Petr and Mikhail Gorchakov, was born on July 16, 1798, and was educated at the lyceum of Tsarskoye Selo On leaving the lyceum Gorchakov entered the foreign office under Count Nesselrode When the German confederation was re-established in 1850 in place of the parliament of Frankfort, Gorchakov was appointed Russian minister to the diet, and formed with Bismarck a friendship which was afterwards renewed at St. Petersburg. Gorchakov was then transferred to Vienna, where he remained through the critical period of the Crimean War. Although he attended the Paris conference *of* 1856, he abstained from signing the treaty *of* peace. Alexander II. then appointed him minister of foreign affairs in place of Count Nesselrode. Gorchakov was appointed chancellor, and was, for a time, the most powerful minister in Europe.

When the conflict arose between Austria and Prussia in 1866, Russia remained neutral, and when the Franco-German war of 1870–71 broke out Russia answered for the neutrality of Austria. In 1875 Bismarck was suspected of a design of again attacking France, and Gorchakov let it be known that Russia would oppose any such scheme Slavophil agitation produced the Russo-Turkish campaign of 1877–78. At the congress of Berlin (June 13 to July 13, 1878) the aged chancellor held nominally the post of first plenipotentiary, but left to Count Shuvalov the odium for the concessions which Russia had to make to Great Britain and Austria He died at Baden-Baden on March 11, 1883.

See Charles-Roux, *Alexandre II.,* Gorchakov et Napoleon *III.* (1913).

GORCHAKOV, PRINCE MIKHAIL DMITRIEVICH (1795–1861), served in the campaigns against Persia in 1810, and in 1812–15 against France. During the Russo-Turkish War of 1828–29 he was present at the sieges of Silistria and Shumla. After being appointed, in 1830, a general officer, he was present in the campaign in Poland, and was wounded at the battle of Grochow Feb. 25 (1831). He also distinguished himself at the battle of Ostrolenka and at' the taking of Warsaw. In 1846 he was nominated military governor of Warsaw. In 1849 he commanded the Russian artillery in the war against the Hungarians, and in 1852 he visited London as the representative of the Russian army at the funeral of the duke of Wellington. At this time he was chief of the staff of the Russian army and adjutant-general to the tsar. Upon Russia declaring war against Turkey in 1853, he was appointed commander-in-chief of the troops which occupied Moldavia and Wallachia. In 1854 he crossed the Danube and besieged Silistria, but was superseded in April by Prince Paskevich, who, however, resigned on June 8, when Gorchakov resumed the command. In July the siege of Silistria was raised, and the Russian armies recrossed the Danube; in August they withdrew to Russia. In 1855 he was appointed commander-in-chief of the Russian forces in the Crimea in place of Prince Menshikov. Gorchakov's defence of Sevastopol, and final retreat to the northern part of the town, which he continued to defend till peace was signed in Paris, were conducted with skill and energy. In 1856 he was appointed governor-general of Poland in succession to Prince Paskevich. He died at Warsaw on May 30, 1861, and was buried, in accordance with his own wish, at Sevastopol

GORDIAN or **GORDIANUS,** the name of three Roman emperors The first, Marcus Antonius Gordianus Sempronianus Romanus Africanus (A.D 159–238), an extremely wealthy man, was descended from the Gracchi and Trajan Alexander Severus made him governor of Africa, and during his proconsulship occurred the usurpation of Maximin. The universal discontent under

Maximin ended in a revolt in Africa in 238, and Gordian reluctantly yielded to the popular clamour and assumed the purple. His son, Marcus Antonius Gordianus (192–238), was associated with him. The Senate and most of the provinces supported them. But after a siege of 36 days they fell before Cappellianus, a supporter of Maximin. The Senate continued the revolt against Maximin and elected M. Antonius Gordianus Pius (224–244), grandson of the elder Gordian, joint emperor with two Senators. The death of Maximin and the murder of Gordian's colleagues by the praetorians left Gordian sole emperor. For some time he was under the control of his mother's eunuchs, till Timesitheus, his father-in-law and praefect of the praetorian guard, persuaded him to assert his independence. When the Persians under Shapur (Sapor) I. (*q.v.*) invaded Mesopotamia, the young emperor opened the temple of Janus for the last time recorded in history, and marched in person to the East. The Persians were driven back over the Euphrates and defeated in the battle of Resaena (243), and only the death of Timesitheus (under suspicious circumstances) prevented an advance into the enemy's territory. Philip the Arabian, who succeeded Timesitheus, stirred up discontent in the army, and Gordian was murdered by the mutinous soldiers in Mesopotamia.

GORDIAN KNOT: see GORDIUM.

GORDIUM, an ancient city of Phrygia on the road from Pessinus to Ancyra, and not far from the Sangarius. Its site lies opposite the village Pebi, a little north of the point where the Constantinople-Angora railway crosses the Sangarius. According to the legend, Gordium was founded by Gordius, a Phrygian peasant who had been called to the throne by his countrymen in obedience to an oracle of Zeus commanding them to select the first person that rode up to the temple of the god in a wagon. The king afterwards dedicated his car to the god, and another oracle declared that whoever succeeded in untying the strangely entwined knot of cornel bark which bound the yoke to the pole should reign over all Asia. Alexander the Great, according to the story, cut the knot by a stroke of his sword. Gordium was captured and destroyed by the Gauls soon after 189 B.C. and disappeared from history. In imperial times only a small village existed on the site.

See *Jahrbuch des Instituts,* Ergänzungsheft v. (1904).

GORDON, the name of a Scottish family, no fewer than 157 main branches of which are traced by the family historians. A laird of Gorden, in Berwickshire, near the English border, is said to have fallen in the battle of the Standard (1138). The families of the two sons ascribed to him by tradition, Richard Gordon of Gordon and Adam Gordon of Huntly, were united by the marriage of their great-grandchildren Alicia and Sir Adam, whose grandson Sir Adam (killed at Halidon Hill, 1333) at first took the English side in the Scottish struggle for independence, and is the first member of the family definitely to emerge into history. He was justiciar of Scotland in 1310, but after Bannockburn he attached himself to Robert Bruce, who granted him in 1318 the lordship of Strathbogie in Aberdeenshire, to which Gordon gave the name of Huntly from a village on the Gordon estate in Berwickshire. He had two sons, Adam and William. The younger son, laird of Stitchel in Roxburghshire, was the ancestor of William de Gordon of Stitchel and Lochinvar, founder of the Galloway branch of the family represented in the Scottish peerage by the dormant viscounty of Kenmure (*q.v.*), created in 1633; most of the Irish and Virginian Gordons are offshoots of this stock. The elder son, Adam, inherited the Gordon-Huntly estates. He had two grandsons, Sir John (d. 1394) and Sir Adam (slain at Homildon Hill, 1403). Sir John had two illegitimate sons, Jock of Scurdargue, the ancestor of the earls of Aberdeen, and Tam of Ruthven. From these two stocks most of the northern Gordon families are derived. Sir Adam's daughter and heiress, Elizabeth, married Sir Alexander Seton, and with her husband was confirmed in 1408 in the possession of the barony of Gordon and Huntly in Berwickshire and of the Gordon lands in Aberdeen. The Seton-Gordons are their descendants. Their son Alexander was created earl of Huntly (see HUNTLY, EARLS AND MARQUESSES OF), probably in 1445; and his heirs became dukes of Gordon, George Gordon (c. 1650–1716), 4th marquess of Huntly, being created duke of Gordon in 1684. His son Alexander, 2nd duke of Gordon (c. 1678–1728), joined the Old Pretender, but gained the royal pardon after the surrender of Gordon castle in 1716. Of his children by his wife Henrietta Mordaunt, second daughter of Charles Mordaunt, earl of Peterborough, Cosmo George (c. 1720–1752) succeeded as 3rd duke; Lord Lewis Gordon (d. 1754) took an active part in the Jacobite rising of 1745; and General Lord Adam Gordon (c. 1726–1801) became commander of the forces in Scotland in 1782, and governor of Edinburgh Castle in 1786. Lord George Gordon (*q.v.*) was a younger son of the 3rd duke.

A PIPER OF THE GORDON HIGHLANDERS. A SCOTTISH REGIMENT ORGANIZED IN 1796

The title, with the earldom of Norwich and the barony of Gordon Huntly, became extinct on the death of George, 5th duke (1770–1836), a distinguished soldier who raised the corps now known as the and battalion of the Gordon Highlanders. The marquessate of Huntly passed to his cousin and heir-male, George, 5th earl of Aboyne. Lady Charlotte Gordon, sister of and co-heiress with the 5th duke, married Charles Lennox, 4th duke of Richmond, whose son took the name of Gordon-Lennox. The dukedom of Gordon was revived in 1876 in favour of the 6th duke of Richmond, who thenceforward was styled duke of Richmond and Gordon. Adam Gordon of Aboyne (d. 1537) took the courtesy title of earl of Sutherland in right of his wife Elizabeth, countess of Sutherland in her own right, sister of the 9th earl. The lawless and turbulent Gordons of Gight were the maternal ancestors of Lord Byron.

Among the many soldiers of fortune bearing the name of Gordon was Colonel John Gordon, one of the murderers of Wallenstein. Patrick Gordon (1635–99) was born at Auchleuchries in Aberdeenshire, entered the service of Charles X. of Sweden in 1651 and served against the Poles. He changed sides more than once before he found his way to Moscow in 1661 and took service under the tsar Alexis. He became general in 1687; in 1688 he helped to secure Peter the Great's ascendancy; and later he crushed the revolt of the Streltzi. His diary was published in German (3 vols., 1849–53, Moscow and St. Petersburg), and selections from the English original by the Spalding Club (Aberdeen, 1859).

The Gordons fill a considerable place in Scottish legend and ballad. "Captain Car," or "Edom (Adam) of Gordon" describes an incident in the struggle between the Forbeses, and Gordons in Aberdeenshire in 1571; "The Duke of Gordon's Daughter" has apparently no foundation in fact, though "Geordie" of the ballad is sometimes said to have been George, 4th earl of Huntly; "The Fire of Frendraught" goes back to a feud (1630) between James Crichton of Frendraught and William Gordon of Rothiemay; the "Gallant Gordons Gay" figure in "Chevy Chase"; William Gordon of Earlston, the Covenanter, appears in "Bothwell Bridge," etc.

See William Gordon (of old Aberdeen), *The History of the Ancient, Noble, and Illustrious House of Gordon* (2 vols., Edinburgh, 1726–27), of which *A Concise History of the . . . House of Gordon,* by C. A. Gordon (Aberdeen, 1754) is little more than an abridgment; *The Records of Aboyne, 1230–1681,* edited by Charles, 11th marquess of Huntly (New Spalding Club, Aberdeen, 1894); *The Gordon Book,* ed. J. M. Bulloch (1902); *The House of Gordon,* ed. J. M. Bulloch (Aberdeen, vol. i., 1903); and J. M. Bulloch, *The First Duke of Gordon* (1909).

GORDON, ADAM LINDSAY (1833–1870), Australian poet, was born at Fayal, in the Azores, in 1833, the son of a retired Indian officer who taught Hindustani at Cheltenham college. Young Gordon was educated there and at Merton college, Oxford,

but a youthful indiscretion led to his being sent in 1853 to South Australia, where he joined the mounted police. He then became a horsebreaker, but on his father's death he inherited a fortune and obtained a seat in the House of Assembly. At this time he had the reputation of being the best non-professional steeplechase rider in the colony. In 1867 he moved to Victoria and set up a livery stable at Ballarat. Two volumes of poems, *Sea Spray and Smoke Drift* and *Ashtaroth,* were published in this year, and two years later he gave up his business and settled at New Brighton, near Melbourne. A second volume of poetry, *Bush Ballads and Galloping Rhymes,* appeared in 1870. It brought him more praise than money, and, discouraged by his failure to make good his claim to some property in Scotland to which he believed himself entitled, he committed suicide on June 24, 1870. Much of Gordon's poetry might have been written in England; when, however, it is really local, it is vividly so; his genuine feeling frequently kindles into passion; his versification is always elastic and sonorous. but sometimes too reminiscent of Swinburne.

Gordon's *Poems* were edited by F. M. Robb (1912), with a biographical introduction. See also J. Howlett-Ross, *The Laureate of the centaurs,* etc. (1888); E. Humphries and D. Sladen, *Adam Lindsay Gordon (1912).*

GORDON, ALEXANDER (*c.* 1692–*c.* 1754), Scottish antiquary, the "Sandy Gordon" of Scott's *Antiquary.* When still young he travelled abroad, probably in the capacity of tutor. He returned to Scotland previous to 1726, and devoted himself to antiquarian work. In 1726 appeared the *Itinerarium Septentrionale,* his greatest and best-known work. In 1741 he accompanied James Glen (afterwards governor) to South Carolina. Through his influence Gordon, besides receiving a grant of land in South Carolina, became registrar of the province and justice of the peace, and filled several other offices

See Sir Daniel Wilson, *Alexander Gordon, the Antiquary;* and his Papers in the *Proceedings of the Society of Antiquaries of Scotland,* with Additional Notes and an Appendix of Original Letters by Dr. David Laing *(Proc. Soc. of Antiq. of Scot.* x. 363–382).

GORDON, CHARLES GEORGE (1833–1885), British soldier and administrator, fourth son of Gen. H. W. Gordon, Royal Artillery, was born at Woolwich on Jan. 28, 1833. He received his early education at Taunton school, and was given a cadetship in the Royal Military Academy, Woolwich, in 1848. He was commissioned as second lieutenant in the corps of Royal Engineers on June 23, 1852. In 1854 he was sent to Pembroke dock to assist in the construction of the fortifications then being erected for the defence of Milford Haven. Gordon served in the Crimean War, and took part in the siege of Sevastopol. He was attached to one of the British columns which assaulted the Redan on June 18, 1855, and was present at the capture of that work on Sept. 8. After the peace Gordon was attached to an international commission appointed to delimit the treaty boundary between Russia and Turkey in Bessarabia, and on the conclusion of this work was ordered to Asia Minor on similar duty on the eastern boundary. While so employed Gordon studied the geography and people of Armenia, and the knowledge of dealing with eastern nations then gained was of great use to him in after life.

In China. — He returned to England towards the end of 1858, and was made instructor at the Royal Engineers' establishment, but in 1860 was ordered out to China. He was too late for the attack on the Taku forts, but was present at the occupation of Peking and destruction of the Summer palace. He remained with the British force of occupation in northern China until April 1862, when the British troops, under the command of Gen. Staveley, proceeded to Shanghai, in order to protect the European settlement at that place from the Taiping rebels. The Taiping revolt, which had some remarkable points of similarity with the Mahdist rebellion in the Sudan, had commenced in 1850 in the province of Kwangsi. The leader, Hung Sin Tsuan, a semi-political, semi-religious enthusiast, assumed the title of Tien Wang, or Heavenly King. The imperialist troops sent against him were defeated The area of revolt extended northwards through the provinces of Hunan and Hupeh, and down the valley of the Yangtsze-kiang as far as Nanking, which was captured by the rebels in 1853. Here the Tien Wang established his court, and sent the assistant Wangs on warlike expeditions through the adjacent provinces.

The Taipings gradually advanced eastwards, and approaching Shanghai, alarmed the European inhabitants, who subscribed to raise a mixed force of Europeans and Manila men for the defence of the town. This force was placed under the command of an American, Frederick Townsend Ward (1831–62). Ward's force was not altogether successful, and when Gen. Staveley arrived from Tientsin he decided to clear the district of rebels within a radius of 30 m. from Shanghai, and Gordon was attached to his staff as engineer officer. A French force, under the command of Admiral Prôtet, co-operated with Staveley and Ward, with his little army, also assisted. The country was fairly cleared of rebels by the end of 1862.

Ward was, unfortunately, killed in the assault of Tseki, and Li Hung Chang, 'the governor of the Kiang-su province, asked for a British officer to command the contingent. Staveley selected Gordon who, in March, 1863, proceeded to Sungkiang to take command of "The Ever-Victorious Army." He marched at once to the relief of Chansu, a town 40 m. north-west of Shanghai. The relief was successfully accomplished, and the operation established Gordon in the confidence of his troops. Gordon then marched through the country, seizing town after town.

Suchow was taken on Nov. 29, and after its capture Gordon had a serious dispute with Li Hung Chang, who had beheaded certain rebel leaders whose lives Gordon had promised to spare if they surrendered. This action, though not opposed to Chinese ethics, was so opposed to Gordon's ideas of honour that he withdrew his force from Suchow and remained inactive at Quinsan until Feb. 1864. He then came to an arrangement with Li, no allusion being made to the death of the Wangs. Chanchufu, the principal military position of the Taipings, fell in May, when Gordon returned to Quinsan and disbanded his force. In June the Tien Wang, seeing his cause was hopeless, committed suicide, and the capture of Nanking by the imperialist troops shortly afterwards brought the Taiping revolt to a conclusion. The suppression of this serious movement was undoubtedly due in great part to the skill and energy of Gordon, who had shown remarkable qualities as a leader of men. The emperor promoted him to the rank of Titu, the highest grade in the Chinese army, and also gave him the Yellow Jacket, the most important decoration in China. He wished to give him a large sum of money, but this Gordon refused. Henceforth he was "Chinese" Gordon.

Gordon was appointed on his return to England Commanding Royal Engineer at Gravesend, where he was employed in superintending the erection of forts for the defence of the Thames. He devoted himself with energy to his official duties, and his leisure hours to practical philanthropy. In Oct. 1871 he was appointed British representative on the international Danube Commission, with headquarters at Galatz. In a visit to Constantinople in 1872 he met Nubar Pasha, prime minister of Egypt, who sounded him as to whether he would take service under the khedive. In 1873 he received a definite offer from the khedive, which he accepted with the consent of the British Government. and proceeded to Egypt early in 1874. He was then a colonel in the army, though still only a captain in the corps of Royal Engineers,

First Visit to Egypt. — In 1820–22 Nubia, Sennar and Kordofan had been conquered by Egypt, and the authority of the Egyptians was subsequently extended southward, eastward to the Red Sea and westward over Darfur (conquered by Zobeir Pasha in 1874). The Egyptian occupation of the country led to the development of the slave trade, especially in the White Nile and Bahr-el-Ghazal districts. Public opinion was moved by the accounts brought back by travellers and in 1869 the khedive Ismail decided to send an expedition up the White Nile, with the double object of limiting the evils of the slave trade and opening up the district to commerce. The command of the expedition was given to Sir Samuel Baker, who reached Khartum in Feb 1870, but did not reach Gondokoro, the centre of his province. for 14 months. He established a few posts along the Nile and placed some

steamers on the river. The khedive asked for Gordon's services, as governor of the equatorial regions in succession to Baker. After a short stay in Cairo, Gordon proceeded to Khartum by way of Suakin and Berber, a route which he ever afterwards regarded as the best mode of access to the Sudan. From Khartum he proceeded up the White Nile to Condokoro, where he arrived in 24 days, the sudd, which had proved such an obstacle to Baker, having' been removed Gordon remained in the equatorial provinces until Oct. 1876, and then returned to Cairo. The 2½ years thus spent in Central Africa was a time of incessant toil. A line of stations was established from the Sobat confluence on the White Nile to the frontier of Uganda—to which country he proposed to open a route from Mombasa—and the slave trade was repressed. The river and lake Albert were mapped by Gordon and his staff, and he sought to improve the condition of the people. But Khartum and the whole of the Sudan north of the Sobat were in the hands of an Egyptian governor, independent of Gordon, and not too eager to diminish the slave trade. On arriving in Cairo Gordon informed the khedive of his reasons for not wishing to return to the Sudan, but did not definitely resign the appointment of governor of the equatorial provinces; but on reaching London he telegraphed to the British consul-general in Cairo, asking him to let the khedive know that he would not go back to Egypt. Ismail Pasha wrote to him saying that he had promised to return, and that he expected him to keep his word. Upon this Gordon returned to Cairo, and the Khedive appointed him governor-general of the Sudan, inclusive of Darfur and the equatorial provinces.

Governor-General of the Sudan.—Gordon had now to consider the political relations between Egypt and Abyssinia, which were embittered by a dispute over the district of Bogos, claimed by both parties. In March 1877 he proceeded to Massawa to endeavour to make peace with King John of Abyssinia. He went up to Bogos, and had an interview with Walad Michael, an Abyssinian chief and the hereditary ruler of Bogos, who had joined the Egyptians with a view to raiding on his own account. Gordon persuaded Michael to remain quiet, and wrote to the king proposing terms of peace. But John, feeling pretty secure on the Egyptian frontier after his two successful actions against the khedive's troops, had gone south to fight with Menelek, king of Shoa. Gordon then proceeded to Khartum. Here he took up the slavery question, and proposed to issue regulations making the registration of slaves compulsory, but his proposals were not approved by the Cairo government.

In the meantime an insurrection had broken out in Darfur, and Gordon had to relieve the Egyptian garrisons. On coming up with the main body of rebels he saw that diplomacy gave a better chance of success than fighting, and, accompanied only by an interpreter, rode into the enemy's camp to discuss the situation. This bold move proved successful, as part of the insurgents joined him, and the remainder retreated to the south. The relief of the Egyptian garrisons was successfully accomplished, and Gordon visited the provinces of Berber and Dongola, whence he had again to return to the Abyssinian frontier to treat with King John. No satisfactory settlement was reached and Gordon returned to Khartum in Jan. 1878. The khedive then summoned him to Cairo to assist in settling the financial affairs of Egypt. He reached Cairo in March, and was appointed by Ismail as president of a commission of inquiry into the finances, on the understanding that the European commissioners of the debt should not be members of the commission. Gordon accepted the post on these terms, but the consuls-general of the different powers protested against the constitution of the commission, and the khedive had to abandon the scheme. The attempt to utilize Gordon as a counterpoise to the European financiers having failed, Ismail fell into the hands of his creditors, and was deposed by the sultan in the following year in favour of his son Tewfik. Gordon returned to the Sudan and proceeded to the province of Harrar, south of Abyssinia.

He dismissed Raouf Pasha, the governor, who had allowed the administration to fall into disorder; then returned to Khartum, and in 1879 went again into Darfur to pursue the slave traders. while his subordinate, Gessi Pasha, fought them in the Bahr-el-Ghazal district and killed Suleiman, their leader and a son of Zobeir. This put an end to the revolt, and Gordon went back to Khartum. Shortly afterwards he went down to Cairo and was requested by the new khedive to pay a visit to King John and make a definite treaty of peace with Abyssinia. Gordon was not able to do much, as the king wanted great concessions from Egypt, and the khedive's instructions were that nothing material was to be conceded. The matter ended by Gordon being made a prisoner and sent back to Massawa. Thence he returned to Cairo and resigned his Sudan appointment. He was exhausted by the three years' incessant work, during which he had ridden no fewer than 8,500 m. on camels and mules, and was constantly engaged in the task of trying to reform a vicious system of administration.

1880–1884.—In March 1880 Gordon visited Brussels, and King Leopold suggested that he should at some future date take charge of the Congo Free State. In April the Government of Cape Colony telegraphed to him offering the position of commandant of the local forces, but he declined the appointment. In May the marquess of Ripon, governor-general of India, asked Gordon to go with him as private secretary. Gordon accompanied him to India, but definitely resigned his post on Lord Ripon's staff shortly afterwards. Hardly had he resigned when he received a telegram from Sir Robert Hart, inspector-general of customs in China, inviting him to Peking. He started at once and arrived at Tientsin in July, where he met Li Hung Chang, and learnt that affairs were in a critical condition, and that there was risk of war with Russia. Gordon proceeded to Peking and used all his influence in favour of peace. His arguments, which were given with much plainness of speech, appear to have convinced the Chinese government, and war was avoided. Gordon returned to England, and in April 1881 exchanged with a brother officer, who had been ordered to Mauritius as Commanding Royal Engineer, but who for family reasons was unable to accept the appointment. He remained in Mauritius until the following March, when, on promotion to the rank of major-general, he had to vacate the position.

The Cape ministry now asked his advice on affairs in Basutoland. Gordon sailed at once for the Cape, and saw the governor, Hercules Robinson, Thos. Scanlen, the premier, and J. X. Merriman, who, for political reasons, asked him not to go to Basutoland, but to take the appointment of commandant of the colonial forces at King William's Town. After a few months spent in reorganizing the colonial forces Gordon was requested to go up to Basutoland to try to arrange a settlement with the Basuto chief Masupha. Greatly to his surprise, at the very time he was with Masupha, J. W. Sauer, a member of the Cape Government, was taking steps to induce Lerethodi, another chief, to advance against Masupha. This was regarded by Gordon as an act of treachery. He advised Masupha not to deal with the Cape Government until the hostile force was withdrawn, and resigned his appointment. He considered that the Basuto difficulty was due to the bad system of administration by the Cape Government. A few years later Gordon's view was endorsed, when Basutoland was separated from Cape Colony and placed directly under the imperial government.

After his return to England Gordon went to Palestine, where he devoted a year to the study of Biblical history and the antiquities of Jerusalem. He then accepted a mission from the king of the Belgians to take charge of the Congo Free State, and returned to London to make the necessary preparations. But a few days after his arrival he was requested by the British Government to proceed immediately to the Sudan to cope with the revolt headed by the Mahdi (Mohammed Ahmed).

The Revolt of the Mahdi.—The Egyptian government was too busily engaged in suppressing Arabi's revolt to be able to send any help to the governor of the Sudan, Abdel Kader, and in Sept. 1882, when the British troops entered Cairo, the position in the Sudan was very perilous. Had the British Government listened to the representations then made to them, that, having conquered Egypt, it was imperative at once to suppress the revolt in the Sudan, the rebellion could have been crushed, but unfortunately Great Britain would do nothing herself, while the steps she allowed Egypt to take ended in the disaster to Hicks Pasha's expe-

dition. In Dec. 1883, the Government ordered Egypt to abandon the Sudan. But abandonment involved the withdrawal of thousands of Egyptian soldiers, civilian employees and their families. Abdel Kader Pasha was asked to undertake the work, and he agreed on the understanding that he would be supported, and that the policy of abandonment was not to be announced. But the latter condition was refused, and he declined the task. The British Government then asked Gen. Gordon to proceed to Khartum to report on the best method of carrying out the evacuation. Sir Evelyn Baring (Lord Cromer), was, however, at first opposed to Gordon's appointment. His objections were overcome and Gordon received his instructions in London on Jan. 18, 1884, and started at once for Cairo, accompanied by Lt.-Col. J. D. H. Stewart.

At **Khartum.**—At Cairo Gordon received further instructions from Baring, and was appointed by the khedive as governor-general, with executive powers. Travelling by Korosko and Berber, he arrived at Khartum on Feb 18, and at once commenced the task of sending the women and children and the sick and wounded to Egypt: about two thousand five hundred had been removed before the mahdi's forces closed upon Khartum. **At** the same time he saw the necessity of making some arrangement for the future government of the country, and asked for the help of Zobeir (*q.v.*), who had great influence in the Sudan, and had been detained in Cairo for some years. This request had been made at Cairo, and was repeated on the day Gordon reached Khartum. The British Government refused (March 13) to sanction the appointment, because Zobeir had been a notorious slave-hunter. With this refusal vanished all hope of a peaceful retreat of the Egyptian garrisons. Wavering tribes went over to the Mahdi. The advance of the rebels against Khartum was combined with a revolt in the eastern Sudan, and the Egyptian troops in the vicinity of Suakin met with constant defeat. At length a British force was sent to Suakin under the command of Gen. Sir Gerald Graham, and routed the rebels in several hard-fought actions. Gordon telegraphed to Baring urging that the road from Suakin to Berber should be opened by a small force. But this request, though strongly supported by Baring and the British military authorities in Cairo, was refused by the Government in London. In April Gen. Graham and his forces were withdrawn from Suakin. The garrison of Berber, seeing that there was no chance of relief, surrendered a month later, and Khartum was completely isolated.

With an energy and skill that were almost miraculous, Gordon held Khartum until Jan. 1885. He had only one British officer to assist him, and the town was badly fortified and insufficiently provided with food. The siege commenced on March 18, but it was not until August that the British Government under the pressure of public opinion decided to take steps to relieve Gordon. Gen. Stephenson, who was in command of the British troops in Egypt, wished to send a brigade at once to Dongola, but was overruled; and it was not until the beginning of Nov. that the British relief force was ready to start from Wadi Halfa under the command of Wolseley. The force reached Korti towards the end of Dec., and from that place a column was despatched across the Bayuda desert to Metemmeh on the Nile. After severe fighting in which the leader of the column, Sir Herbert Stewart, was mortally wounded, the force reached the river on Jan. 20, and the following day four steamers, which had been sent down by Gordon to meet the British advance, and which had been waiting for them for four months, reported to Sir Charles Wilson, who had taken command after Stewart was wounded.

Death.--On the 24th Wilson started with two of the steamers for Khartum, but on arriving there on the 28th he found that the place had been captured by the rebels and Gordon killed two days before. The attack was made at a point in the fortifications where the rampart and ditch had been destroyed by the rising of the Nile, and when the mahdi's troops entered the soldiers were too weak to make any effectual resistance. Gordon himself expected the town to fall before the end of December, and it is difficult to understand how he succeeded in holding out until Jan. 26. Writing on Dec. 14, he said, "Now, mark this, if the expeditionary force—and I ask for no more than 200 men—does not come in ten days, the town may fall. and I have done my best for the honour of my country." He had indeed done his best, and far more than could have been regarded as possible. Part of his journal (Sept. 10–Dec. 14) was fortunately preserved and published.

Gordon's power to command men of non-European races has rarely—if ever—been exceeded. He had no fear of death, and cared but little for the opinion of others, adhering tenaciously to the course he believed to be right in the face of all opposition. He was a religious man in the highest sense of the word, and was a constant student of the Bible. To serve God and to do his duty were the great objects of his life, and he died as he had lived, carrying out the work that lay before him to the best of his ability. The last words of his last letter to his sister, written when he knew that death was very near, sum up his character: "I am quite happy, thank God, and, like Lawrence, I have tried to do my duty."[1]

[1] With this estimate of Gordon's character may be contrasted those of Lord Cromer (one of the most severe of Gordon's critics), Lord Morley and—in more recent times—Lytton Strachey. In their strictures as in their praise they help to explain both the causes of the extraordinary influence wielded by Gordon and also his difficulties. Cromer's criticism deals solely with Gordon's last mission to the Sudan; Morley's is a more general judgment; while Lytton Strachey's essay in *Eminent Victorians* is impressionistic and has a tendency to throw the high lights on the weaker points in Gordon's character.

Lord Cromer (*Modern* Egypt, I., xxvii., p. 565–571) says: "We may admire, and for my own part I do very much admire General Gordon's personal courage, his disinterestedness and his chivalrous feeling in favour of the beleaguered garrisons, but admiration of these qualities is no sufficient plea against a condemnation of his conduct on the ground that it was quixotic. In his last letter to his sister, dated December **14, 1884,** he wrote: 'I am quite happy, thank God, and, like Lawrence, I have tried to do my duty' . . . I am not now dealing with General Gordon's character which was in many respects noble, or with his military defence of Khartoum, which was heroic, but with the political conduct of his mission, and from this point of view I have no hesitation in saying that General Gordon cannot be considered to have tried to do his duty unless a very strained and mistaken view be taken of what his duty was. . . . As a matter of public morality I cannot think that General Gordon's process of reasoning is defensible. . . . I do not think that it can be held that General Gordon made any serious effort to carry out the main ends of British and Egyptian policy in the Sudan. He thought more of his personal opinions than of the interests of the state. . . . In fact, except personal courage, great fertility in military resource, a lively though sometimes ill-directed repugnance to injustice, oppression and meanness of every description, and a considerable power of acquiring influence over those, necessarily limited in numbers, with whom he was brought into personal contact, General Gordon does not appear to have possessed any of the qualities which would have fitted him to undertake the difficult task he had in hand."

Lord Morley (*Life of Gladstone*, III., ix., p. 151) says: "Gordon, as Mr. Gladstone said, was a hero of heroes. He was a soldier of infinite personal courage and daring, of striking military energy, initiative and resource; a high, pure and single character, dwelling much in the region of the unseen. But as all who knew him admit, and as his own records testify, notwithstanding an undercurrent of shrewd common sense, he was the creature, almost the sport, of impulse; his impressions and purposes changed with the speed of lightning; anger often mastered him; he went very often by intuitions and inspirations rather than by cool inference from carefully surveyed fact; with many variations of mood he mixed, as we often see in people less famous, an invincible faith in his own rapid prepossessions while they lasted. Everybody now discerns that to despatch a soldier of this temperament on a piece of business [the mission to the Sudan in 1884] that was not only difficult and dangerous, as Sir E. Baring said, but profoundly obscure, and needing vigilant sanity and self-control, was little better than to call in a wizard with his magic. Mr. Gladstone always professed perplexity in understanding why the violent end of the gallant Cavagnari in Afghanistan stirred the world so little in comparison with the fate of Gordon. The answer is that Gordon seized the imagination of England, and seized it on its higher side, His religion was eccentric, but it was religion; the Bible was the rock on which he founded himself, both old dispensation and new; he was known to hate forms, ceremonies and all the 'solemn plausibilities': his speech was sharp, pithy, rapid and ironic; above all, he knew the ways of mar and would not bear the sword for nought."

GORDON, LORD GEORGE (1751–93), third and youngest son of Cosmo George, duke of Gordon, was born in London on Dec. 26, 1751. He was educated at Eton and entered the navy, rising to the rank of lieutenant in 1772; but Lord Sandwich, then at the head of the Admiralty, would not promise him a command, and he resigned his commission shortly before the beginning of the American War. In 1774 the pocket borough of Ludgershall was bought for him by Gen. Fraser, whom he was opposing in Inverness-shire, in order to bribe him not to contest the county. He was considered flighty, and of little importance. In 1779 he organized, and made himself head of the Protestant associations, formed to secure the repeal of the Catholic Relief act of 1778. On June 2, 1780, he headed the mob which marched in procession from St. George's Fields to the Houses of Parliament in order to present the monster petition against the acts. A terrific riot ensued, which continued several days, during which the city was virtually at their mercy. At first indeed they dispersed after threatening to make a forcible entry into the House of Commons, but reassembled soon afterwards and destroyed several Roman Catholic chapels, pillaged the private dwellings of many Roman Catholics, set fire to Newgate and broke open all the other prisons, attacked the Bank of England and several other public buildings, and continued the work of violence and conflagration until the interference of the military, by whom no fewer than 450 persons were killed and wounded before the riots were quelled. For his share in instigating the riots Lord Gordon was apprehended on a charge of high treason; but, mainly through the skilful and eloquent defence of Erskine, he was acquitted on the ground that he had no treasonable intentions. His life was henceforth full of crack-brained schemes, political and financial. In 1786 he was excommunicated by the archbishop of Canterbury for refusing to bear witness in an ecclesiastical suit; and in 1787 he was convicted of libelling the queen of France, the French ambassador and the administration of justice in England. He was, however, permitted to withdraw from the court without bail, and made his escape to Holland; but on account of representations from the court of Versailles he was commanded to quit that country, and, returning to England, was apprehended, and in January 1788 was sentenced to five years' imprisonment in Newgate, where he lived at his ease, giving dinners and dances. As he could not obtain securities for his good behaviour on the termination of his term of imprisonment, he was not allowed to leave Newgate, and there he died of delirious fever on Nov. 1, 1793. Some time before his apprehension he had become a convert to Judaism, and had undergone the initiatory rite.

A serious defence of most of his eccentricities is undertaken in *The Life of Lord George Gordon, with a Philosophical Review of his Political Conduct, by* Robert Watson, M.D. (1795). The best accounts of Lord George Gordon are to be found in the *Annual Registers* from 1780 to the year of his death.

GORDON, JOHN BROWN (1832–1904), American soldier and statesman, born Feb 6, 1832, in Upson county, Georgia. He was graduated from the University of Georgia (1852) and later practised law in Atlanta. At the outbreak of the Civil War he joined the Confederate army as captain of volunteers (1861) and passed successfully through the grades to lieutenant general. In the course of the war he was wounded in battle eight times. He commanded an infantry division at Gettysburg and led the attack on July 1. 1863. He held the last lines at Petersburg, guarding the Confederate retreat from that city. At Appomattox he commanded one wing of Lee's army with the instructions to cut through Grant's line. He made the last charge, and was taking the Federal breastworks, when news of his chief's surrender ended his action. Following the war he settled in Atlanta, Ga.. and was a member of the Democratic national conventions of 1868 and 1872. He was elected to the U.S. Senate in 1873 and re-elected in 1879 and 1890. He was governor of Georgia (1886–go), and elected commander-in-chief of the United Confederate Veterans (1900). He died in Miami, Fla., Jan. 9, 1904. He wrote *The* Old *South* (1887) and *Reminiscences of the Civil War* (1903).

GORDON, SIR JOHN WATSON (1788–1864), Scottish portrait painter, born in Edinburgh, was the son of Captain Watson R.N.; he began to exhibit in 1808. After the death of Sir Henry Raeburn in 1823, he succeeded to much of his practice. He assumed in 1826 the name of Gordon. One of the earliest of his famous sitters was Sir Walter Scott, who sat for a first portrait in 1820.

Among his works may be mentioned the earl of Dalhousie (1833), in the Archers' Hall, Edinburgh; Sir Alexander Hope (1835), in the county buildings, Linlithgow; Lord President Hope, in the Parliament House; and Dr. Chalmers. These, unlike his later works, are generally rich in colour. The full length of Dr. Brunton (1844), and Dr. Lee, the principal of the university (1846), both on the staircase of the college library, mark a modification of his style, which ultimately resolved itself into extreme simplicity, both of colour and treatment. Among the portraits painted during the last 20 years of his life, in what may be termed his third style, are De Quincey, in the National Portrait Gallery, London; the prince of Wales, Lord Macaulay, Lord Murray, Lord Cockburn, Lord Rutherford and Sir John Shaw Lefevre, in the Scottish National Gallery. These latter pictures are mostly clear and grey, sometimes showing little or no positive colour, the flesh itself being very grey, and the handling extremely masterly.

John Watson Gordon was one of the earlier members of the Royal Scottish Academy, and was elected its president in 1850; he became R A. in 1851. He died on June 1, 1864.

GORDON, LEON, originally JUDAH LOEB **BEN** ASHER (1831–1892), Russian-Jewish poet and novelist (Hebrew), was born at Wilna in 1831 and died at St. Petersburg in 1892. He took a leading part in the modern revival of the Hebrew language and culture. His satires did much to rouse the Russian Jews to a new sense of the reality of life, and Gordon was the apostle of enlightenment in the Ghettos. His Hebrew style is classical and pure. His poems were collected in four volumes, *Kol Shire Yehuda* (St. Petersburg, 1883–1884); his novels in *Kol Kithbe Yehuda* (Odessa, 1889).

For his works see *Jewish Quarterly Review,* xviii. *437 seq.*

GORDON, PATRICK (1635–1699), Russian general, descended from a Scottish family, was brought up in Aberdeenshire, but entered, in his 15th year, the Jesuit college at Braunsberg, Prussia. In 1655 he enlisted at Hamburg in the Sweuish service. In the course of the next five years he served alternately with the Poles and Swedes as he was taken prisoner by either. In 1661 he took service in the Russian army under Alexis I., and in 1665 he was sent on a special mission to England. After his return he fought against the Tu s and Tatars in southern Russia. In 1678 he was made major-general, in 1679 was appointed to the chief command at Kiev, and in 1683 was made lieutenant-general. He visited England in 1686, and in 1687 and 1689 took part as quartermaster-general in expeditions against the Crim Tatars in the Crimea. On the outbreak of the revolution in Moscow in 1689, Gordon with the troops he commanded virtually decided events in favour of the tsar Peter I., and against the tsaritsa Sophia. The tsar confided to him the command of his capital during his absence from Russia, employed him in organizing his army according to the European system, and raised him to the rank of general-in-chief. He died on Nov. 29, 1699. The tsar was with him when he died, and with his own hands closed his eyes.

Gordon left a diary of his life (in English), the ms. of which is in the archives of the Russian Foreign Office. It was translated into German (Moscow and St Petersburp, 1849, 1853 and 1855). *Passages from the Diary of General Patrick Gordon of Auchleuchries* (1635–1699) was printed in 1859.

GORDON-CUMMING, ROUALEYN GEORGE (1820–1866), Scottish traveller and sportsman, known as the "lion-hunter," was born on March 15, 1820, the second son of Sir William G. Gordon-Cumming, second baronet of Altyre and Gordonstown. He was educated at Eton, and served in the Madras Light Cavalry and later in the Cape Mounted Rifles. At the end of 1843 he sold out, and with a few native followers set out for the interior, hunting in Bechuanaland and the Limpopo valley. In 1848 he returned to England and published his book, *Five Years of a Hunter's Life in the Far Interior of South Africa* (1850, 3rd ed. 1851). His collection of hunting trophies was shown at the Great Exhibition of 1851, and afterwards exhibited in various parts of the country. He died at Fort Augustus, Scotland, on March 24, 1866.

An abridgment of his book, *The Lion Hunter of South Africa* (1856), has been frequently reprinted.

GORE, CATHERINE GRACE FRANCES (1799–1861), English novelist and dramatist, the daughter of Charles Moody, a wine merchant, was born at East Retford, Nottinghamshire. In 1823 she was married to Captain Charles Gore; and, in the next year, she published her first work, *Theresa Marchmont, or the Maid of Honour.* Mrs. Gore continued to write, with unfailing fertility of invention, one or more novels year by year till her death. She also wrote some dramas, of which the most successful was the *School for Coquettes,* produced at the Haymarket (1831).

Mrs. Gore's novels had an immense temporary popularity; they were parodied by Thackeray in *Punch,* in his "Lords and Liveries by the author of *Dukes and Déjeuners.*" Some of them deserve to be revived; her *Cecil* was reprinted with success in 1927.

GORE, CHARLES (1853–1932), English bishop, was born in 1853, the 3rd son of the Hon. Charles Alexander Gore, brother of the 4th earl of Arran. His mother was a daughter of the 4th earl of Bessborough. He was educated at Harrow and at Balliol college, Oxford, and was elected fellow of Trinity college in 1875. He was vice-principal (1880–83) of the theological college at Cuddesdon, and librarian of Pusey Library (1884–93). Gore exercised a wide influence over undergraduates and the younger clergy, and under his influence the "Oxford Movement" underwent a change which to the survivors of the old school of Tractarians seemed to involve a break with its basic principles. "Puseyism" had based itself on authority and tradition, and repudiated any compromise with the modern critical and liberalizing spirit. Gore, starting from the same basis of faith and authority, set himself the task of reconciling the principle of authority in religion with that of scientific authority by attempting to define their respective spheres of influence. In 1889 he published two works, *The Church and the Ministry,* a vindication of the principle of Apostolic Succession in the episcopate against the Presbyterians and other Protestant bodies; and *Roman Catholic Claims,* a defence of the Anglican Church and Anglican orders against the Roman Catholics.

So far his published views had been in consonance with those of the older Tractarians. But in 1890 there appeared under his editorship *Lux Mundi,* a series of essays by different writers, being an attempt "to succour a distressed faith by endeavouring to bring the Christian Creed into its right relation to the modern growth of knowledge, scientific, historic, critical; and to modern problems of politics and ethics." Gore himself contributed an essay on "The Holy Spirit and Inspiration." The book produced a profound effect far beyond the borders of the English Church, and the High Church movement developed thenceforth on "Modernist" rather than Tractarian lines.

In 1891 Gore delivered the Bampton lectures before the university. He chose for his subject the Incarnation. developing the doctrine, the enunciation of which in *Lux Mundi* had caused so much heart-searching. This is an attempt to explain how it came that Christ, though incarnate God, could be in error, *e.g.,* in his citations from the Old Testament. He interpreted St. Paul's saying (2 Phil. ii. 7) that Christ "emptied himself and took upon him the form of a servant" (ἑαυτὸν ἐκένωσεν μορφὴν δούλου λαβών) as meaning that Christ, on his incarnation, became subject to all human limitations, and had, so far as his life on earth was concerned, stripped himself of all the attributes of the Godhead, including the Divine omniscience, the Divine nature being, as it were, hidden under the human.[1]

In 1893 Dr. Gore resigned his principalship and became vicar of Radley, a small parish near Oxford. In 1894 he became canon of Restminster. Here he gained commanding influence as a preacher and in 1898 was appointed one of the court chaplains. In 1902 he became bishop of Worcester and in 1905 was installed bishop of Birmingham, a new see, the creation of which had been mainly due to his efforts. While adhering rigidly to his views on the divine institution of episcopacy, Dr. Gore cultivated friendly relations with the ministers of other denominations, and advocated co-operation with them in all matters when agreement was possible. In social questions he became one of the leaders of the group of High Churchmen known, somewhat loosely, as Christian Socialists. He worked actively against the sweating system, pleaded for European intervention in Macedonia, and was a keen supporter of the Licensing Bill of 1908. In 1892 he founded the clerical fraternity known as the Community of the Resurrection. Its members are priests, who are bound by the obligarion of celibacy, live under a common rule and with a common purse. Their work is pastoral, evangelistic, literary and educational., In 1898 the House of the Resurrection at Mirfield, near Huddersfield, became the centre of the community; in 1903 a college for training candidates for orders was established there, and in the same year a branch house, for missionary work, was set up in Johannesburg in South Africa.

From 1911 to 1919 Dr. Gore was bishop of Oxford; he then resigned and settled in London. Dr. Gore's works include *The Incarnation* (Bampton Lectures, 1891); *The Creed of the Christian* (189;); *The Body of Christ* (1901); *The New Theology and the Old Religion* (1908); *Orders and Unity* (1910); *The Question of Divorce* (1911); *The Religion of the Church* (1916); *Belief in God* (1921); *The Holy Spirit and the Church* (1924); *Can We Then Believe?* (1926); and expositions of *The Sermon on the Mount* (1896), *Ephesians* (1898), *Romans* (1899) *The Epistles of St. John* (1920). Dr. Gore died Jan. 17, 1932.

GOREE, an island off the west coast of Africa, forming part of the autonomous district of Dakar. It lies at the entrance of the large natural harbour formed by the peninsula of Cape Verde. The island, some 900 yd. long by 330 broad, and 3 m. distant from the nearest point of the mainland, is mostly barren rock. The greater part of its surface is occupied by a town, formerly a thriving commercial entrepôt and a strong military post. With the rise of Dakar (*q.v.*), *c.* 1860, on the adjacent coast, Goree lost its trade and its inhabitants, mostly Jolofs, had dwindled in 1905 to about 1,500. Its healthy climate, however, makes it useful as a sanatorium. Goree was first occupied by the Dutch, who took possession of it early in the 17th century. It was captured by the English under Commodore Holmes in 1663, but retaken in the following year by de Ruyter. The Dutch were finally expelled in 1677 by the French under Admiral d'Estrées. Goree subsequently fell again into the hands of the English, but was definitively occupied by France in 1817 *(see* SENEGAL: *History).*

GORELL, JOHN GORELL BARNES, 1ST BARON (1848–1913), English judge, was born at Liverpool on May 16, 1848, the son of Henry Barnes, a shipowner. He was educated at Peterhouse, Cambridge. He began as a solicitor, but was called to the bar in 1876 becoming Q.C. in 1888. He was an expert in Admiralty cases, and in 1892 was made a judge of the Probate, Divorce and Admiralty division, becoming its president in 1905. He was made privy councillor in 1905, and in 1909 raised to the peerage. In 1909 he became chairman of the royal commission on divorce. Lord Gorell, who married in 1881 Mary, daughter of Thomas Mitchell, died at Mentone on April 22, 1913.

[1] *Cf.* the Lutheran theologian Ernst Sartorius in his *Lehre von der heiligen Liebe* (1844), *Lehre* ii. pp. 21 et *seq.:* "the Son of God veils his all-seeing eye and descends into human darkness and as child of man opens his eye as the gradually growing light of the world of humanity, until at the right hand of the Father he allows it to shine forth in all its glory." *See* Loofs, Art. "Kenosis" in Herzog-Hauck, *Realencyklopädie* (ed. 1901), *x.* 247.

See J. E. G. de Montmorency, *John Gorell Barnes, first Lord Gorell* (1920).

GORGAS, WILLIAM CRAWFORD (1854–1920), American army surgeon, was born at Mobile (Ala.), on Oct. 3, 1854. He was educated at the University of the South, Sewanee (Tenn.), and Bellevue hospital medical college, New York, taking his M.D. in 1879. In 1880 he entered the Medical Corps of the U.S. Army. During the Spanish-American War he served as major in the Medical Corps, and was sent, after the Santiago expedition, to Havana, where he was in charge of yellow fever patients. From 1898 to 1902 he was chief officer in charge of sanitation measures in Havana, and there conducted many experiments in connection with the discovery that yellow fever was transmitted by the mosquito. Because of his success in eliminating yellow fever there he was made assistant surgeon general, U.S. Army, with the rank of colonel, by special act of Congress in 1903.

In 1904 Gorgas was sent as chief sanitary officer to Panama, where two of the main obstacles to building the canal were yellow fever and malaria. Here again his methods were so effective that in two years he eliminated yellow fever from the Canal region. Malaria also was brought under control. In 1907 he was appointed a member of the Isthmian Canal commission by President Roosevelt, and the following year was U.S. delegate to the first Pan-American Medical Congress, held at Santiago, Chile. He was president of the American Medical Association, 1908–09. In 1913 he was called to the Rand gold mines in South Africa to suggest means for combating the frequent epidemics of influenza. This he found was largely due to crowding the labourers together in barracks.

In 1914 he was made surgeon general, U.S. Army, with the rank of brigadier general, becoming major general in 1916. In 1918 he was retired. He then became the permanent director of the yellow-fever work of the international health board of the Rockefeller Foundation. He went to Central America, and under his direction investigations of yellow fever were made in Guayaquil, Ecuador and Guatemala. In 1919 he accepted a contract with the Government of Peru to carry out a sanitary programme in that country. He died in London, July 3, 1920, and was buried in the Arlington National Cemetery, Washington (D.C.).

In his honour were established the Gorgas Memorial Institute of Tropical and Preventive Medicine. Inc., Washington, D. C., and the Gorgas Memorial Laboratory of Tropical Research, Panama.

GORGEI, ARTHUR (1818–1916), Hungarian soldier, was born at Toporcz, in Upper Hungary, on Jan. 30, 1818, of a Saxon family. In 1837 he entered the Hungarian bodyguard, transferring in 1842 to the Palatine Hussars. In the revolutionary war of 1848, Gorgei offered his sword to the Hungarian Government. Entering the Honvéd army with the rank of captain, he was employed in the purchase of arms, and soon became major and commandant of the national guards north of the Thciss. After various successes over the Croatian forces, notably at Ozora, where 10,000 prisoners fell into his hands, Gorgei was appointed commander of the army of the Upper Danube, but when Windischgrätz advanced across the Leitha (Dec. 1j), he retreated, despite the remonstrances of Kossuth, whom he disliked; and on Jan. 5, 1849 he issued a public manifesto, blaming the Government for Hungary's recent failures. After conducting operations independently and with Klapka, he was appointed Hungarian commander-in-chief after the battle of Kapolna (Feb. 1849) and won a series of brilliant victories. The relief of Komoru (April 22) forced the Austrian troops to evacuate Hungarv. and on May 21 Görgei took Buda.

Meanwhile Kossuth at Debreczen had proclaimed Hungary a republic. Gorgei, who had, strangely enough, a strong dislike of Magyars, refused a field-marshal's baton but consented to become minister of war, while retaining the command of the troops in the field. The Russians had now intervened in the struggle, the allies were advancing into Hungary on all sides, and Görgei was defeated by Haynau at Pered (June 20–21). Kossuth resigned his position as dictator. Gorgei took his place, and finding the military position hopeless, surrendered at Világós to the Russian commander (Aug. 13). Alone of the ex-Austrian officers in his force, Gorgei escaped court-martial, at the tsar's personal intervention. He was interned at Klagenfurt till 1867, when he was pardoned and returned to Hungary, but took no part in public life, as his surrender and the personal pardon granted him led the Hungarians to accuse him of treason. After some years work as a railway engineer he retired to Visegrád, where he lived in retreat until his death on May 21, 1916.

Görgei wrote a justification of his operations (*Mein Leben und Wirken in Ungarn 1848–1859* (Leipzig, 1852), an anonymous paper under the title *Was verdanken wir der Revolution?* (1875), and a reply to Kossuth's charges (signed "Joh. Demár") in *Budapesti Szemle,* 1881, 25–26. *See* also A. G. Horn, *Gorgei, Oberkommandant d. ung. Armee* (Leipzig, 1850); Kinety, *Gorgei's Life and Work in Hungary* (1853); and HUNGARY: *History.*

GORGES, SIR FERDINANDO (*c.* 1566–1647), English colonial pioneer in America and the founder of Maine, was born in Somersetshire, England, probably in 1566. From youth both a soldier and a sailor, he was a prisoner in Spain a+ the age of 21, having been captured by a ship of the Spanish Armada. In 1589 he was in command of a small body of troops fighting for Henry IV. of France, and after distinguishing himself at the siege of Rouen was knighted there in 1591. In 1596 he was commissioned captain and keeper of the castle and fort at Plymouth and captain of St. Nicholas Isle; in 1597 he accompanied Essex on the expedition to the Azores; in 1599 assisted him in the attempt to suppress the Tyrone rebellion in Ireland, and in 1600 was implicated in Essex's own attempt at rebellion in London. In 1603, on the accession of James I., he was suspended from his post at Plymouth, but was restored in the same year and continued to serve as "governor of the forts and island of Plymouth" until 1629, when, his garrison having been without pay for three and a half years, his fort a ruin, and all his applications for aid having been ignored, he resigned. About 1605 he began to be greatly interested in the New World; in 1606 he became a member of the Plymouth Company, and he laboured zealously for the founding of the Popham colony at the mouth of the Sagadahoc (now the Kennebec) river in 1607. For several years following the failure of that enterprise in 1608 he continued to fit out ships for fishing, trading and exploring, with colonization as the chief end in view. He was largely instrumental in procuring the new charter of 1620 for the Plymouth Company, and was at all times of its existence perhaps the most influential member of that body. He was the recipient, either solely or jointly, of several grants of territory from it, for one of which he received in 1639 the royal charter of Maine (*see* MAINE). In 1635 he sought to be appointed governor-general of all New England, but the English Civil War—in which he espoused the royal cause—prevented him from ever actually holding that office. A short time before his death at Long Ashton in 1647 he wrote his *Briefe Narration of the Originall Undertakings of the Advancement of Plantations into the Parts of America.* He was an advocate, especially late in life, of the feudal type of colony.

See J. P. Baxter (ed.), *Sir Ferdinando Gorges and his Province of Maine* (Boston, 1890, in the Prince Society Publications), the first volume of which is a memoir of Gorges, and the other volumes contain a reprint of the *Briefe Narration,* Gorges's letters, and other documentary material. Also Henry Sweetser Burrage, *Gorges and the Grant of the Province of Maine, 1622* (1923); and Raymond Gorges, "Sir Frederick Gorges and His Connection with the Essex Rebellion," *Soc. of Colonial Wars, Publication No.* 37 (1926).

GORGET, the name applied after about 1480 to the collar-piece of a suit of armour (O.Fr. *gorgete,* dim. of *gorge,* throat). It was generally formed of small overlapping rings of plate and attached either to the body armour or to the armet. It was worn in the 16th and 17th centuries with the half-armour, with the plain cuirass, and even occasionally without any body armour at all. During these times it gradually became a distinctive badge for officers, and as such it survived in several armies—in the form of a small metal plate affixed to the front of the collar of the uniform coat—until after the Napoleonic wars.

GORGIAS (*c.* 483–375 B.C.), Greek sophist and rhetorician, was a native of Leontini, Sicily. In 427 he headed an embassy to ask Athenian protection against the Syracusans. He subsequently

settled in Athens, and supported himself by oratory and by teaching rhetoric. He died at Larissa, Thessaly. His chief claim to recognition consists in the fact that he transplanted rhetoric to Greece, and contributed to the diffusion of the Attic dialect as the language of literary prose. He was the author of a lost work On Nature or *the* Non-existent Περί τοῦ μὴ ὄντος ἢ περι φύσεως (fragments ed. by M. C. Valeton, 1876), the substance of which may be gathered from the writings of Sextus Empiricus, and also from the treatise (ascribed to Theophrastus) *De Melisso, Xenophane,* Gorgia. Gorgias is the central figure in Plato's Gorgias. The genuineness of two rhetorical exercises (The Encomium of Helen and The Defence of Palamedes, ed. with Antiphon by F. Blass 1881) is disputed.

For his philosophy see SOPHISTS and SCEPTICISM. See also Gomperz, Greek Thinkers, Eng. trans. vol. i.; Jebb's Attic Orators, introd. to vol. i. (1893); F. Blass, Die attische Beredsamkeit, i. (1887); and article RHETORIC.

GORGON, GORGONS, a figure or figures in Greek mythology. Homer speaks of only one Gorgon, whose head is represented in the Iliad (v. 741) as fixed in the centre of the aegis of Zeus. In the Odyssey (xi. 633) she is a monster of the underworld. Hesiod increases the number of Gorgons to three—Stheno (the mighty), Euryale (the far-springer) and Medusa (the queen), and makes them the daughters of the sea-god Phorcys and of Keto. Their home is on the extreme west; according to later authorities, in Libya (Hesiod, Theog. 274; Herodatus II. 91; Pausanias II. 21). The Attic tradition, reproduced in Euripides (*Ion,* 1002), regarded the Gorgon as a monster, produced by Ge to aid her sons the giants against the gods and slain by Athena.

The Gorgons are represented as winged female creatures; their hair consists of snakes; they are round faced, flat nosed, with tongues lolling out and with large projecting teeth. Medusa was the only one of the three who was mortal; hence Perseus was able to kill her by cutting off her head. From the blood that spurted from her neck sprang Chrysaor and Pegasus, her two sons by Poseidon. The head, which had the power of turning all who looked upon it into stone, was given to Athena, or buried in the market-place of Argos. The hideously grotesque original type of the Gorgoneion, as the Gorgon's head was called, was used generally as an amulet, a protection against the evil eye. Heracles is said to have obtained a lock of Medusa's hair from Athena and given it to Sterope, the daughter of Cepheus, as a protection for the town of Tegea against attack (Apollodorus II. 144). Later classical art showed Medusa as coldly beautiful; the realists of Hellenistic times gave her face an agonized expression. Various silly rationalistic accounts are given by late authors. More reasonable is the explanation of anthropologists that Medusa, whose virtue is really in her head, was originally a ritual mask. It also is possible that the staring or pursuing faces, common in nightmares, have a good deal to do with her.

BIBLIOGRAPHY.—N. G. Polites (Ὁ περί τῶν Γοργόνων μῦθος παρὰ τῷ Ἑλληνικῷ λαῷ, 1878) gives an account of the Gorgons, and of the various superstitions connected with them, from the modern Greek point of view, which regards them as malevolent spirits of the sea. W. H. Roscher, Die *Gorgonen und Verwandtes* (1870); J. Six, De Gorgone (1885), on the types of the Gorgon's head; articles by Roscher and Furtwangler in Roscher's Lexikon der Mythologie, by G. Glotz in Daremberg and Saglio's *Dictionnaire* des *antiquités;* Jane E. Harrison, *Prolegomena* to the Study of Greek Religion (1903).

GORGONZOLA, a town of Lombardy, Italy, province of Milan, from which it is 11 m. E.N.E. by steam tramway. Pop. (1936) 4,754 (town); 6,093 (commune). It produces the well-known Gorgonzola cheese.

GORI, a town in the Georgian S.S.R. north-west of Tiflis, on the river Kura; altitude, 2,010 ft., lat. 42° 0′ N., long. 44° 7′ E. Population 12,000. It is the centre of a corn and wine district. The climate is delightfully cool in summer, owing to refreshing mountain breezes, though these are disagreeable in winter. It has timber mills and manufactures railway sleepers, and a jam industry is being established. Gori was founded (1123) by the Georgian king David II., the Renovator, for the Armenians who fled their country on the Persian invasion. The earliest remains of the fortress are Byzantine; it was thoroughly restored in 1634–1658, but destroyed by Nadir Shah of Persia in the 18th century. There is a church constructed in the 17th century by Capuchin missionaries from Rome. Five miles east of Gori is the remarkable rock-cut town of Uplis-tsykhe, which was a fortress in the time of Alexander the Great of Macedon, and an inhabited city in the reign of the Georgian king Bagrat III. (980–1014).

GORILLA, the largest of the anthropoid (manlike) apes, inhabiting forest regions of West Africa from the Cameroons to the Congo river and represented by a somewhat different form in mountainous regions of the eastern Belgian Congo. The popular reputation of the giant ape (Gorilla gorilla) is largely due to the writings of the explorer Paul B. du Chaillu in 1861 and later. In 1903 a somewhat different type of gorilla was discovered in high mountains of the eastern Belgian Congo, where it thrives at an altitude of 10.000ft. and is protected from the cold by much longer and thicker fur than the western form. This mountain species is known as Gorilla beringei.

Though nearly related to the chimpanzee, the gorilla is a far larger and heavier animal, the males attaining a weight of 400 lb. or more, and a standing height of 53 feet. The naked skin of the face is black and wrinkled; the hair in general black, commonly with a reddish tinge on the crown and tending to become grey on the back in adult males. The animals inhabit dense forests, commonly in small family groups, feeding on fruits and tender shoots and occasionally raiding plantations. The West African gorillas construct sleeping nests in the branches of trees, which seem to be used chiefly by the females and young. These beds, commonly used only for a single night, are also sometimes constructed on the ground; the American explorer Carl Akeley always found them thus placed by the mountain gorilla. Adult males, owing probably to their great weight, generally remain on the ground. The gorilla is shy and not usually inclined to attack man unless provoked, in which case the males are extremely dangerous. A peculiar habit, mentioned by du Chaillu, and observed in all captive gorillas, is a rapid drumming on the chest with both hands. Comparatively few gorillas have been kept in captivity and most of these have survived for only a short time. They seem to react far less favourably to captivity than the chimpanzee, lacking the friendly curiosity, imitativeness and general social adaptability of that animal, and exhibiting in contrast a self-centred repression and lack of interest in their surroundings. A few examples, however, captured when quite young have remained fairly tractable up to the age of five or six years.

The American psychologist R. M. Yerkes, as a result of extensive observations and experiments on the mentality of a young female mountain gorilla, found that this animal showed considerable ability in the solution of problems involving the use of sticks as tools, stacking boxes to secure suspended food, and in experiments involving multiple choice and delayed response. Some insight, memory and anticipation of experience were clearly demonstrated. Though he cautiously avoids generalizing from a single case, Yerkes finds this gorilla, as "compared with chimpanzees and orang-utans of like age . . . remarkably slow in adaptation and limited in initiative, originality and insight." (See CHIMPANZEE and PRIMATES.) (J. H. McG.)

GORINCHEM or GORCUM, a town of Holland in the province of south Holland, on the right bank of the Merwede at the confluence of the Linge, 16 mi. by rail E. of Dordrecht. It is connected by the Zederik and Merwede canals with Amsterdam. Pop. (1940) 14,433. Gorinchem possesses several old houses, and overlooking the river are some fortified gateways of the 17th century. It has an old church dedicated to St. Vincent. Gorinchem possesses a good harbour, and a considerable trade in grain, hemp, cheese, potatoes, cattle and fish, the salmon fishery being noted. At three miles distance is the mediaeval castle of Loevestein, where Hugo Grotius was kept a prisoner until he escaped in 1619, hidden in a carton loaded with books.

GORING, GEORGE GORING, LORD (1608–1657), English Royalist, soldier, son of George Goring, earl of Norwich, was

born-on July 14, 1608. He served in the Dutch army, and was lamed at Breda in 1637. Returning in 1639 he became governor of Portsmouth, and won favour with parliament by betraying the "First Army Plot." He then became a Royalist, and obtained Dutch recruits in Dec. 1642. In March 1643 he defeated Fairfax at Seacroft Moor, but was taken prisoner in May. In April 1644 he effected an exchange, and commanded the Royalist left at Marston Moor, being routed by Cromwell. Later, as lieutenant-general of the Royalist horse, his excesses gave the Royalist cause a bad name. In 1645 he went to relieve Oxford, was engaged in the operations round Taunton, and on July 10 was defeated by Fairfax at Langport. He retired in November. Later he commanded some English regiments in the Spanish service.

GÖRING, HERMANN (1893–), German politician, was born on 12th January, 1893, and joined the army in 1912 as lieutenant of infantry. In 1914 he went to the front with his regiment, but soon transferred to the air arm, in which he won the highest honour "pour le mérite," and commanding the Richthofen squadron in 1918. He was promoted to General some years after the war. After serving two years in Swedish civil aviation, he returned to Germany, associated himself with Adolf Hitler (*q.v.*) and became organiser and leader of the S. A. Wounded in the Munich *Putsch* (November, 1923) he took refuge in Italy, returning in 1927. He was one of the first Nazi members of the Reichstag and quickly became the best known member of the Party, after Hitler himself. In August, 1932, he became President of the Reichstag; and when Hitler became Chancellor in January, 1933, Goring was promoted to Reich Minister for Air and Prussian Minister President and Minister of the Interior.

(C. A. M.)

GORIZIA (German *Görz;* Slovene *Gorica*), the capital of a province in Venetia Giulia, Italy, 25 mi. east of Udine by rail. Pop. (1936) 30,265 (town); 46,640 (commune). It lies on the left bank of the Isonzo in a valley almost surrounded by hills. It is the seat of an archbishopric. The richly decorated 17th century church of St. Ignatius was built by the Jesuits. The old castle, formerly the seat of the counts of Gorizia, dominates the town. Owing to its mild climate, Gorizia was called the Nice of Austria.

Its topographical position made Gorizia the centre of important battles in World War I. On the right bank of the river the village of Podgora, opposite Gorizia, with the hill of the same name dominating, constituted one of the most formidable bulwarks of the Austrian bridgehead, and the Sabotino, farther north, with its vast network of dug-outs and caverns, capable of sheltering many regiments, was the other. Repeated attacks on the two hills from June 1915 onward were repulsed with heavy loss, and the attempts to capture the Oslavia saddle between them resulted in desperate engagements at various points which were captured and lost many times. In the general offensive against Gorizia of Aug. 1916, after elaborate preparations conducted by Colonel (later Field Marshal) Badoglio, Hill 188, Oslavia, the Sabotino and Podgora were finally captured with comparatively small loss, and the operations on San Michele having been equally successful, the Italians were able to occupy Gorizia on the 8th. The positions north and east were never completely held, owing to heavy enemy fire, while those to the east remained for the most part in Austrian hands. After Caporetto (Oct. 1917) Gorizia itself had to be evacuated together with all the positions on both banks of the Isonzo. It was reoccupied after Vittorio Veneto (Oct. 1918). The town, which suffered great damage, was almost entirely reconstructed.

GORKI, MAXIM (1868–1936), pen-name of the Russian author Alexey Maximovich Peshkov, born at Nizhni-Novgorod. His father, an upholsterer, died when the boy was five; his mother married again, and he grew up in the family of his maternal grandfather, a dyer, whose affairs went from bad to worse. At nine, the boy was made to earn his own bread. In the following 15 years he changed many trades, and covered in search of work all east and south Russia from Nizhni to the Danube and to Georgia. At the same time he contrived to give himself an education, read voraciously and early began to write. While at Tiflis, where he was working in the railway workshops, he succeeded in getting published a story in a local daily, over the signature that has become famous. He now became a provincial journalist, and in 1895 a tale of his (*Chelkash,* first Eng, trans. 1902) was accepted by a leading St. Petersburg review. Two years later his stories appeared in book form. The success was unprecedented Gorki found himself placed in public opinion by the side of Tolstoy Before long his fame crossed the frontier and he became one of the foremost world-celebrities. His play *The Lower Depths* (*Na Dne,* 1903, Eng. trans. 1912) had a run of almost two years at Berlin. His association (from 1899) with the Social-Democrats brought on him police persecution, but this only increased his popularity at home. In 1905 he took an active part in revolutionary activities, and in 1906 left Russia for an anti-tsarist campaign abroad. In 1907 he settled in Capri. About the same time he contracted a friendship with Lenin. In 1913 he returned to St. Petersburg and started a review *(Letopis).* During the World War he took a pacifist attitude, and in 1917 he gave his, not always unqualified, support to the Bolsheviks. After their victory he became the official spokesman for culture before the new Government, and did much to alleviate the hardships of the intellectual classes, as well as to preserve cultural treasures. In 1922 his health compelled him to go abroad. After a stay in Germany, he settled at Sorrento. In 1928 he visited the U.S.S.R., where he was given an enthusiastic reception.

Gorki's literary work falls distinctly into three periods. In the '90s he wrote the short stories that first made him famous. Their subject-matter is taken mainly from the lives of tramps and social outcasts. whom he represents with a mixture of outspoken realism and romantic gusto. It was the latter quality that most endeared them to the Russian public. The romantic colouring he gave his tramps and thieves has become somewhat the worse for wear, but the best of these early stories *(My Fellow-traveller* and *Twenty-Six Men and a Girl,* Eng. trans. 1902) fall little short of being masterpieces. After 1899 Gorki wrote longer and more ambitious novels and plays, which aimed at presenting a broad and comprehensive picture of Russian life and at finding the solution of burning social problems. Most of them lack constructive unity, and are disfigured by interminable conversations on "the meaning of life." The plays especially are hopelessly formless. Towards 1906 Gorki's popularity with the intelligentsia began to decline, but it increased among the working-class, who came to regard him as their literary spokesman. His proletarian novel *Mother* (1907, Eng. trans. 1921, publ. in U.S.A.) which has been turned into a splendid film by the great film-producer Eisenstein, is not, however, by itself a work of great value Gorki's third period begins with the publication in 1913 of *Childhood* (Eng. trans. 1915), the first part of an autobiographical trilogy, of which the other parts are In *the World (V Lyudyakh,* 1915, Eng. trans. 1917) and My *Universities* (1923, Eng. trans. *Reminiscences of my Youth,* 1924). Together with a volume of *Recollections* (it includes the famous *Recollections of Tolstoy,* Eng. trans. 1920, a document of quite exceptional value), and *Fragments from my Diary* (1924, Eng. trans. 1924) these works are the best Gorki has written. The penetrating and plastic realism with which he presents a vast gallery of Russian characters is unrivalled. After 1926 Gorki turned to fiction dealing with social problems: *The Artamonov's Business,* (trans. *Decadence,* 1927); *The Bystander* (trans., B. G. Guerney, 1930). (D. S. M.)

GÖRLITZ, a town in the Prussian province of Silesia, Germany, on the Neisse, 62 mi. E. from Dresden on the railway to Breslau, and at the junction of lines to Berlin, Zittau and Halle. Pop. (1939) 93,669. Gorlitz is an ancient village, which, as Drebenau, received civic rights at the beginning of the 12th century. After a fire in 1131, it was rebuilt and called Zgorzelice. About the end of the 12th century it was strongly fortified, and for a short time it was the capital of a duchy of Gorlitz. It also suffered considerably in the Thirty Years' War and the Seven Years' War. In 1815 the town, with the greater part of Upper Lusatia, came into the possession of Prussia. Gorlitz is wealthy, owing to the extensive municipal forests of 70,000 acres. The fine Gothic church of St. Peter and St. Paul dates from the 15th century; the Frauen Kirche (end 15th cent.) possesses a fine

portal and choir in pierced work; the Kloster Kirche, restored in 1868, has handsome choir stalls and a carved altar dating from 1383. The old bastion, named Kaisertrutz, has been used as a guardhouse and armoury. Near the town is the chapel of the Holy Cross, where there is a model of the Holy Sepulchre at Jerusalem made during the 15th century. In the public park there is a bust of Schiller and a monument to Alexander von Humboldt, also a statue of the mystic Jakob Bohme (1575–1624). There is a large library and a rich collection of antiquities, coins and articles of virtu. Görlitz, next to Breslau, is the largest and most flourishing commercial town of Silesia, and is classic for study of German Renaissance architecture. Cloth is manufactured, also various linen and woollen wares, machines, railway wagons, glass, sago, tobacco, leather, chemicals and tiles.

GÖRRES, JOSEPH VON (1776–1848), German writer, was born on Jan. 25, 1776, at Coblenz, and educated at a Latin college under clerical direction. Young Gorres sympathized with the French Revolution, harangued the revolutionary clubs in the Rhineland, and insisted on the unity of interests which should ally all civilized States. He then began a Republican journal called *Das* rote *Blatt* (afterwards *Rübezahl*), in which he eloquently defended French principles.

After the peace of Campo Formio (1797) there was some hope that the Rhenish provinces would be constituted into an independent Republic. In 1799 the provinces sent to Paris an embassy of which Görres was a member; it arrived two days after Napoleon had assumed the supreme direction of affairs. After much delay he received the embassy; but the only answer they obtained was "that they might rely on perfect justice, and that the French Government would never lose sight of their wants." Gorres on his return published a tract called Resultate meiner *Sendung nach* Paris, in which he reviewed the history of the French Revolution. He was thoroughly disillusioned. During the 13 years of Napoleon's dominion Gorres lived a retired life. In 1801 he married Catherine de Lasaulx; from 1806 to 1808 he lectured at Heidelberg. With K. Brentano and L. von Arnim he edited the famous *Zeitung für Einsiedler* (subsequently re-named Trost-Einsamkeit), and in 1807 he published Die deutschen Volksbucher.

He loved the German folk-tale, not as a vehicle for romantic ideas, but in its stark realism. His versions have none of the fanciful adornments given to the folk-taie by Novalis and Tieck, but are more akin to those of the brothers Grimm. He returned to Coblenz in 1808. He now studied Persian, and published a Mythengeschichte der asiatischen Welt (2 vols., 1810) and Das *Heldenbuch* von Iran (1816), a translation of part of the *Shahnama,* the epic of Firdousi. In 1813 he was drawn into the movement for national independence and in 1814 founded the *Rheinische* Merkur. The intense earnestness of the paper, its hostility to Napoleon, and its fiery eloquence secured for it a position unique in the history of German newspapers. Napoleon himself called it la cinquikme *puissance.* It advocated a united Germany, with representative government, but under an emperor after the fashion of other days—for Görres now abandoned his early revolutionary ideas. He inveighed most bitterly against the second peace of Paris (1815), declaring that the territory comprising Alsace and Lorraine should have been demanded back from France.

Stein was glad enough to make use of the *Merkur* at the time of the meeting of the congress of Vienna, but Hardenberg in May 1815 warned Gorres to remember that he was not to attack France but only Bonaparte. The Merkur evinced an antipathy to Prussia, a desire for an Austrian emperor, and also a tendency to pronounced liberalism—which made it most distasteful to Hardenberg and Frederick William III. Gorres disregarded the warnings of censorship, and accordingly his paper was suppressed early in 1816 at the instance of the Prussian Government; soon afterwards Görres was dismissed from his post as teacher at Coblenz. In the wild excitement which followed Kotzebue's assassination the reactionary decrees of Carlsbad were framed, and these were attacked by Görres in his pamphlet *Deutschland und* die *Revolution* (1820). He reviewed the circumstances which had led to the murder of Kotzebue, and, while expressing horror at the deed itself, he urged the danger of repressing the free utterance of public opinion by reactionary measures. The pamphlet was suppressed by the Prussian Government, and orders were immediately issued for the arrest of Gorres and the seizure of his papers. He escaped to Strasbourg, and thence went to Switzerland. Gorres later became a vehement Ultramontane. King Ludwig of Bavaria gave him the chair of history at Munich. His *Christliche Mystik* (1836–42) was an exposition of Roman Catholic mysticism. Gorres died on Jan. 29, 1848.

Gorres's *Gesammelte* Schriftrn (only his political writings) appeared in six volumes (1854–60), to which three volumes of *Gesammelte* Briefe were subsequently added (1858–74). See J. Galland, *Joseph von Görres* (1876, and ed. 1877); J. N. Sepp, *Görres und* seine *Zeitgenossen* (1877) and by the same author, *Görres,* in the series *Geisteshelden* (1896); J. G. Uhlmann, Joseph Gorres und die deutsche *Einheits und Verfassungsfrage* (1912); M. Berger, *Görres als politischer Publizist* (1921). A *Görres-Gesellschaft* was founded in 1876 to encourage the Catholic aspect in culture.

GORRIE, JOHN (1802?–1855), U.S. physician and inventor. His parentage and place and date of birth are uncertain, but there is reason to believe that he was born on the island of Nevis in the West Indies and was taken to Charleston, S.C. by his parents in Oct. 1803. He was educated in the schools of Charleston and was graduated from the Western College of Physicians and Surgeons at Fairfield, N.Y. in 1829. After four years in Abbeville, S.C., he set up practice at Apalachicola, Fla. in 1833, soon becoming one of the town's leading citizens. He was elected mayor in 1836 or 1837, but retired to give more time to his profession. Much of his time was taken with the treatment of malaria and other fevers. He foresaw that if sleeping rooms could be cooled, much could be done to prevent or relieve fevers, and thus was led to the invention of the first cool-air machine on record. He received little recognition for this work during his lifetime, but in 1914 he was designated as one of Florida's representatives in Statuary Hall. Dr. Gorrie died June 16 (or June 29), 1855.

GORSAS, ANTOINE JOSEPH (1752–1793), French publicist and politician, son of a shoemaker, was born at Limoges (Haute-Vienne) on March 24, 1752. He set up an army school at Versailles. In 1781 he was imprisoned in the Bicêtre on an accusation of corrupting the morals of his pupils, his real offence being the writing of satirical verse. On Sept. 10, 1792 he was elected to the Convention (Seine-et-Oise). He sat at first with the Mountain, but his agreement with the Girondists became gradually more pronounced; during the trial of Louis XVI. he voted for the king's detention during the war and subsequent banishment. An attack on Marat in the Courrierled to a raid on his printing establishment on March g, 1793, but he escaped to Normandy to join Buzot, and after the defeat of the Girondists at Pacy-sur-Eure he found shelter in Brittany. The Convention passed a resolution forbidding representatives to engage in journalism. On June 2 he was ordered by the Convention to hold himself under arrest. He was imprudent enough to return to Paris in the autumn, where he was arrested on Oct. 6, and guillotined the next day.

See the Moniteur, No. 268 (1792), Nos. 20, 70 new series 18 (1793); M. Tourneux, *Bibl.* de l'hist. de Paris, 10,291 seq. (1894).

GORSE: see FURZE.

GORST, SIR JOHN ELDON (1835–1916), English statesman, was born at Preston, the son of Edward Chaddock Gorst, who took the name of Lowndes on succeeding to the family estate in 1853. He graduated third wrangler from St. John's College, Cambridge, in 1857, and was admitted to a fellowship. After beginning to read for the bar in London, he sailed for New Zealand, where he married in 1860 Mary Elizabeth Moore. The Maoris had at that time set up a king of their own in the Waikato district and Gorst, who had made friends with the chief Tamihana (William Thomson), acted as an intermediary between the Maoris and the Government. Sir George Grey made him inspector of schools, then resident magistrate, and eventually civil commissioner in Upper Waikato. Tamihana's influence secured his safety in the Maori outbreak of 1863. In 1908 he published a volume of recollections, under the title of New *Zealand Revisited*: Recollections of the *Days* of my *Youth.* He returned to England and was called to the bar at the Inner Temple in 1865,

becoming Q.C. in 187. He sat in parliament for Cambridge from 186j to 1868. After the Conservative defeat of that year he was entrusted by Disraeli with the reorganization of the party machinery, and in five years of hard work he paved the way for the Conservative success at the general election of 1874. At a bye-election in 1875 he re-entered parliament as member for Chatham, which he continued to represent until 1892. He joined Henry Drummond-Wolff, Randolph Churchill and Arthur Balfour in the "Fourth Party," and he became solicitor-general in the administration of 1885–86 and was knighted. On the formation of the second Salisbury administration (1886) he became under-secretary for India and in 1891 financial secretary to the Treasury. At the general election of 1892 he became member for Cambridge university. He was deputy chairman of committees in the House of Commons from 1888 to 1891, and on the formation of the third Salisbury administration in 1895 he became vice-president of the committee of the council on education (until 1902). Sir John Gorst adhered to the principles of Tory democracy which he had advocated in the days of the fourth party, and took an active interest in the housing of the poor, the education and care of their children, and in social questions generally, both in parliament and in the press. But he was always "independent" in his political action. He objected to Chamberlain's proposals for tariff reform, and lost his seat at Cambridge at the general election of 1906 to a tariff reformer. He then withdrew from the vice-chancellorship of the Primrose League, of which he had been one of the founders, on the ground that it no longer represented the policy of Lord Beaconsfieid. In 1910 he contested Preston as a Liberal, but failed to secure election. He died in London on April 4, 1916.

His elder son, SIR J. ELDON GORST (1861–1911), was financial adviser to the Egyptian government from 1898 to 1904, when he became assistant under-secretary of state for foreign affairs. In 1907 he succeeded Lord Cromer as British agent and consul-general in Egypt. He died at Castle Combe, Wiltshire, on July 12, 1911.

An account of Sir John Gorst's connection with Lord Randolph Churchill will be found in the *Fourth Party* (1906), by his younger son, Harold E. Gorst.

GORTER, HERMAN (1864–1933), Dutch poet, was born on Nov. 26, 1864, at Wormerveer. He taught for some time in the gymnasium at Amersfoort, and then settled at Bussum. His strong impressionistic tendencies colour his three chief publications—Mei, *een Gedichte* (1893), *De School der Poëzie* (1897) and *Pan, een Gedichte* (1912). His translation of Spinoza's *Ethics* appeared in 1895.

See Hauser, *Die niederländische Lyrik von 1875–1900* (1901).

GORTON, SAMUEL (1592–1677), colonial fighter for religious and civil liberty, was born in Gorton, England, in 1592. For a time a clothier in London, he sailed for Boston, Mass., "to enjoy liberty of conscience." Failing to find it there and being involved in religious, political and property disputes at Plymouth, Aquidneck, Providence and Shawomet successively, he went to England, where he published in 1646 *Simplicities Defence against Seven Headed Policie* (reprinted in the R. I. Hist. Soc. *Collections*, vol. ii.), giving an account of his grievances against the Massachusetts Government. He returned to Shawomet in 1648 with a letter from the earl of Warwick, after whom he renamed the settlement, and lived there in peace and honour until his death on or before Dec. 10, 1677 He left several religious treatises, both in print and manuscript, some of them surprisingly modern in concept in spite of their quaint phraseology. As a result estimates of him have shifted from his contemporaries' denunciations as "a most prodigious minter of exorbitant novelties" and "a man whose spirit was stark drunk with blasphemies and insolences," to his later biographers' tributes as "a forgotten founder of our liberties," "the premature John the Baptist of New England Transcendentalism."

Edward Winslow's attack on Gorton, *Hypocrisie Unmasked* (1646) was issued by the Club for Colonial Reprints (Providence, 1916). Among his biographers are J. M. Mackie in J. Sparks's, *Library of American Biography* (2nd ser., vol. v., 1845); L. G. Janes (1896), and Adelos Gorton (1907).

GORTON, Gorton parliamentary division, Manchester borough, Lancashire, England. Pop. (1931), 49,127. It is a large manufacturing district, with cotton mills, engineering, motor, iron and chemical works, and contains two reservoirs (capacity 223 million gallons) for Manchester water supply.

GORTYNA or GORTYN, an important ancient city of Crete on the small river Lethaeus (Mitropolipotamo), about three hours distant from the south coast with which it communicated by two harbours, Metallum and Lebena. Near the town was the spring, overhung by an evergreen plane tree which in popular belief marked the scene of the amours of Zeus and Europa. Gortyna was, next to Cnossus, the largest and most powerful city of Crete, but neither plays a conspicuous part in the history of Greece. Under the Romans Gortyna became the metropolis of the island. Extensive ruins may be seen at the village of Hagii Deka, and the great inscription containing many of the ancient laws. The ruinous church of St. Titus dates from about the 4th century.

See also CRETE, and for a full account of the laws *see* GREEK LAW.

(J. L. MY.)

GÖRTZ, GEORG HEINRICH VON, BARON VON SCHLITZ (1668–1719), Swedish statesman, entered the Holstein-Gottorp service, and after the death of the duchess Hedwig Sophia, Charles XII.'s sister, became influential during the minority of her son, Duke Charles Frederick. His earlier policy aimed at strengthening Holstein-Gottorp at the expense of Denmark. With this object, during Charles XII.'s stay at Altranstadt (1706–1707), he tried to divert the king's attention to the Holstein question, and six years later, when the Swedish commander, Magnus Stenbock, crossed the Elbe, Gortz surrendered the fortress of Tonning to the Swedes. He next attempted to undermine the grand alliance against Sweden by negotiating with Russia, Prussia and Saxony for the purpose of isolating Denmark, or even of turning the arms of the allies against her. The plan foundered on the refusal of Charles XII. to save the rest of his German domains by ceding Stettin to Prussia. Another simultaneous plan of procuring the Swedish crown for Duke Charles Frederick failed. Gortz first suggested the marriage between the duke of Holstein and the tsarevna Anne of Russia.

On the arrival of Charles XII. from Turkey at Stralsund, Gortz was the first to visit him, and emerged from his presence virtually chief minister. Gortz owed his extraordinary influence to the fact that he was the only one of Charles's advisers who believed, or pretended to believe, that Sweden was still far from exhaustion, or at any rate had a sufficient reserve of power to give support to an energetic diplomacy. Ostensibly, Gortz was only the Holstein minister at Charles's court, in reality he was everything in Sweden except a Swedish subject—finance minister, plenipotentiary to foreign powers, factotum, and responsible to the king alone, though he had not a line of instructions. His chief financial expedient was to debase, or rather ruin, the currency by issuing copper tokens redeemable in better times; but it was no fault of his that Charles XII., during his absence, flung upon the market too enormous an amount of this copper money for Gortz to deal with. By the end of 1718 the hatred of the Swedes towards him was so intense and universal that they blamed him for Charles XII.'s tyranny as well as for his own.

Gortz hoped to conclude peace with at least some of Sweden's numerous enemies before the crash came and then, by means of fresh combinations, to restore Sweden to her rank as a great power. In pursuance of his "system," Gortz displayed a genius for diplomacy which would have done honour to a Metternich or a Talleyrand. He desired peace with Russia first of all, and at the congress of Aland even obtained relatively favourable terms, only to have them rejected by his obstinately optimistic master. Simultaneously, Gortz was negotiating with Cardinal Alberoni and with the whigs in England. On the sudden death of Charles XII. the whole fury of the Swedish nation fell upon Gortz. After a trial before a special commission which was a parody of justice—the accused was not permitted to have any legal assistance or the use of writing materials—he was condemned to be beheaded,

and promptly executed. His death was certainly a judicial murder, and some historians even regard him as a political martyr.

See R. N. Bain, *Charles XII.* (1895), and *Scandinavia*, chap. 12 (Cambridge, 1905); B. von Beskow, *Frciherre Georg Heinrich von Görtz* (Stockholm, 1868).

GORZ: *see* GORIZIA.

GOSCHEN, GEORGE JOACHIM GOSCHEN, 1st VISCOUNT (1831–1907), British statesman, son of William Henry Goschen, a London merchant of German extraction, was born in London on Aug. 10, 1831. He was educated at Rugby under Dr. Tait, and at Oriel college, Oxford, where he took a first-class in classics. He entered his father's firm of Friihling and Goschen, of Austin Friars, in 1853, and three years later became a director of the Bank of England. In 1863 he was returned without opposition as member for the city of London in the Liberal interest, and this was followed by his re-election, at the head of the poll, in the general election of 1865. In November he was appointed vice-president of the Board of Trade and paymaster-general, and in Jan. 1866 he was made chancellor of the duchy of Lancaster, with a seat in the cabinet. Goschen joined Gladstone's cabinet in 1868 as president of the Poor Law Board, and continued to hold that office until March 1871, when he succeeded Childers as first lord of the admiralty. In 1874 he was elected lord rector of the University of Aberdeen. Sent to Cairo in 1876 as delegate for the British holders of Egyptian bonds, to arrange for the conversion of the debt, he effected an agreement with the Khedive.

In 1880 he was elected for Ripon, and continued to represent that constituency until the general election of 1885, when he was returned for the eastern division of Edinburgh. Being opposed to the extension of the franchise, he was unable to join Gladstone's Government in 1880; declining the post of viceroy of India, he accepted that of special ambassador to the Porte, and was successful in settling the Montenegrin and Greek frontier questions in 1880 and 1881. In 1884 he declined the speakership of the House of Commons. During the parliament of 1880–85 he frequently found himself at variance with his party; and when Gladstone adopted the policy of Home Rule for Ireland, Goschen followed Hartington and became one of the most active of the Liberal Unionists. He lost his seat in the election of July 1886. On the resignation of Randolph Churchill in Dec. 1886, Goschen though a Liberal Unionist, became chancellor of the exchequer. Being defeated at Liverpool (Jan. 26, 1887), by seven votes, he was elected for St. George's, Hanover Square (Feb. 9).

His chancellorship of the exchequer (1886–92) was rendered memorable by his successful conversion of the National Debt in 1888 *(see* NATIONAL DEBT). With that financial operation, under which the new $2\frac{3}{4}\%$ Consols became known as "Goschens," his name will long be connected. From 1895 to 1900 Goschen was first lord of the admiralty. He retired in 1900, and was raised to the peerage by the title of Viscount Goschen of Hawkhurst, Kent. He continued to take a great interest in public affairs; and when Mr. Chamberlain started his tariff reform movement in 1903, Lord Goschen was one of the weightiest champions of free trade on the Unionist side. He died on Feb. 7, 1907, being succeeded in the title by his son George Joachim (b. 1866), who was Conservative M P. for East Grinstend from 1895 to 1900, and married a daughter of the 1st earl of Cranbrook.

In educational subjects Goschen had always taken the greatest interest. He was a pioneer of the University Extension movement; and his first efforts in parliament were devoted to advocating the abolition of religious tests and the admission of Dissenters to the universities. In addition to his well-known work on *The Theory of the Foreign Exchanges* (1861, 5th ed. 1864) he published several financial and political pamphlets and addresses on educational and social subjects, among them being that on *Cultivation of the Imagination* (Liverpool, 1877), and that on *Intellectual Interest* (Aberdeen, 1888). He also wrote *The Life and Times of Georg Joachirn Göschen, publisher and printer of Leipzig* (1903).

See A. D. Elliot, *Life* of *Lord Goschen* (2 vols. 1911).

GOSHAWK, *i.e.*, goose-hawk (*Accipiter gentilis*), the largest short-winged hawk used in falconry. The genus *Accipiter* may be distinguished from *Falco* by the smooth edges of its beak, its short wings, and its long legs and toes. In plumage the goshawk has a general resemblance to the peregrine falcon, and it undergoes a corresponding change as it develops—the young being longitudinally streaked beneath, while the adults are transversely barred. The irides, however, are always yellow, or in old birds orange, while those of the falcons are dark brown. The sexes differ greatly in size. The goshawk, nowadays rare in England, was once common. In many parts of Europe it still abounds. It ranges eastward to China and thence to North America. It feeds on small mammals, especially squirrels, and birds of all kinds, including gamebirds and domestic pigeons and poultry.

GOSHEN, a region of Egypt (? by the Wadi Tumilāt) settled by the Israelite shepherds between Jacob's immigration and the Exodus. The region has not been finally identified. The name may possibly be of Semitic, or at least non-Egyptian origin, as in Palestine we meet with a district (Josh. x. 41; xi. 16) and a city (*ib.* xv. 51) of the same name. The Septuagint reads Γέσεμ Ἀραβίας in Gen xlv. 10, and xlvi. 34, elsewhere simply Γέσεμ. In xlvi. 28 "Goshen . . . the land of Goshen" are translated respectively "Heroopolis . . . the land of Rameses." This represents a late Jewish identification. The extent of Goshen, according to the book of Judith (i. 9, 10), included Tanis and Memphis; this is probably an overstatement. Goshen was a place of good pasture and fruitful in edible vegetables and in fish (Numbers xi. 5).

GOSHEN, a city of northern Indiana, U.S.A., on the Elkhart river, at an altitude of 800 ft.; the county seat of Eikhart county, It is on federal highway 33 and is served by the Big Four and the New York Central railways. The population in 1920 was 9,525; 1930 it was 10,397; 1940, 11,375, federal census Goshen is in the fertile St. Joseph River valley, and is within 20 mi. of two popular lake resorts. Its residential streets are beautifully shaded uith maple trees. Since 1903 it has been the seat of Goshen college (Mennonite), chartered as Elkhart institute (in Elkhart) in 1895. Ample electric power is available from a super-power system, and there are over 40 manufacturing establishments, making maps, flour, condensed milk, knitted underwear and diversified products of wood, metal and rubber. Goshen was settled in 1828 and was chartered as a city in 1868.

GOSLAR, a town in the Prussian province of Hanover, Germany, on the Gose, at the north foot of the Harz, 24 mi. S.E. of Hildesheim and 31 mi. S.S.W. of Brunswick Pop. (1939) 27,693

Goslar, probably founded under Henry the Fowler (920) became important under Otto the Great when minerals were discovered here: It was often the meeting-place of German diets, and about 1350 it joined the Hanseatic League. In the middle of the 14th century the famous *Goslar statutes,* a code of laws, adopted by many other towns, was published. Fires in 1632, in 1728 and 1780 damaged its prosperity. In 1802 it came into the possession of Prussia, in 1807 was joined to Westphalia, and in 1866 it was, along with Hanover, re-united with Prussia. It is surrounded by walls. Among the noteworthy buildings are the "Zwinger," a tower with walls 23 ft. thick; the market church, in Romanesque style, restored since its partial destruction by fire in 1844, containing a library in which are some of Luther's manuscripts; the old town hall (Rathaus) has interesting antiquities, and the Kaiserhaus is the oldest secular building in Germany, built by the emperor Henry III. before 1050. A small chapel is all that remains since 1820 of the cathedral of St. Simon and St. Jude founded by Henry III. about 1040; it contains an old altar supposed to be that of the idol Krodo which formerly stood on the Burgberg near Neustadt-Harzburg; the church of the former Benedictine monastery of St. Mary, or Neuwerk, is Romanesque of the 12th century; the house of the bakers' gild is now an hotel, the birthplace of Marshal Saxe; a natural science museum, contains a collection of Harz minerals, and there is a museum of antiquities. Sulphur, copper, silver and other mines are important. The town has been long noted for beer, possesses small manufactures and trades in fruit.

GOSLICKI, WAWRZYNIEC (?1533–1607), Polish bishop, better known under his Latinized name of Laurentius Grimalius

Goslicius, was born about 1533. After having studied at Cracow and Padua, he entered the church, and was successively appointed bishop of Kaminietz and of Posen. It was chiefly through Goslicki's influence that the Jesuits were prevented from establishing their schools at Cracow. He died on Oct. 31, 1607. His principal work is De *optimo* senatore, etc. (Venice, 1568). There are two English translations published respectively under the titles A *commonwealth of good counsaile,* etc. (1607), and The *Accomplished* Senator, done into English by Mr. Oldisworth (1733).

GOSLIN or **GAUZLINUS** (d. *c.* 886), bishop of Paris and defender of the city against the Northmen (885), is variously described as the son of Roricon II., count of Maine and the natural son of the emperor Louis I. In 848 he entered a monastery at Reims; later he became abbot of St. Denis. He took a prominent part in the struggle against the Northmen, by whom he and his brother Louis were taken prisoners (858), and he was released only after paying a heavy ransom (Prudentii *Trecensis episcopi* Annales, ann. 858). From 855 to 867 he held intermittently, and from 867 to 881 regularly, the office of chancellor to Charles the Bald and his successors. In 883 or 884 he was elected bishop of Paris, and foreseeing the dangers to which the city was to be exposed from the attacks of the Northmen, he strengthened the defences, though he also relied for security on the merits of the relics of St. Germain and St. Geneviève. The city was attacked on Nov. 26, 885, and the struggle for the possession of the bridge (now the Pont-au-Change) lasted for two days; but Goslin repaired the destruction of the wooden tower overnight, and the Normans were obliged to give up the attempt to take the city by storm. The siege lasted for about a year longer, while the emperor Charles the Fat was in Italy. Goslin died soon after the preliminaries of the peace had been agreed on, worn out by his exertions, or killed by a pestilence which raged in the city.

See Amaury Duval, *L'Evêque Gozlin ou le siège de Paris par les Normands, chronique du IXe siècle* (2 vols., 1832, 3rd ed. ib., 1835).

GOSNOLD, BARTHOLOMEW (d. 1607), English navigator. In 1602, in command of the "Concord," chartered by Sir Walter Raleigh and others, he crossed the Atlantic; coasted from what is now Maine to Martha's Vineyard, landing at and naming Cape Cod and Elizabeth island (now Cuttyhunk) and giving the name Martha's Vineyard to the island now called No Man's Land; and returned to England with a cargo of furs, sassafras and other commodities obtained in trade with the Indians about Buzzard's bay. In London he actively promoted the colonization of the regions he had visited and, by arousing the interest of Sir Ferdinando Gorges and other influential persons, contributed toward securing the grants of the charters to the London and Plymouth companies in 1606. In 1606–07 he was associated with Christopher Newport in command of the three vessels by which the first Jamestown colonists were carried to Virginia. As a member of the council he took an active share in the affairs of the colony, seconding the efforts of John Smith to introduce order, industry and system in the colony. He died from swamp fever on Aug. 22, 1607.

See *The Works of John Smith* (Arber's Edition, 1884); and J. M. Brereton, *Brief and True Relation of the North Part of Virginia* (reprinted *by B.* F. Stevens, 1901), an account of Gosnold's voyage of 1602.

GOSPATRIC or **COSPATRIC** (*fl.* 1067), earl of Northumberland, belonged to a family which had connections with the royal houses both of Wessex and Scotland. Before the Conquest he is said to have accompanied Tostig on a pilgrimage to Rome (1061). About 1067 he bought the earldom of Northumberland from William the Conqueror; but, repenting of his submission, fled with other Englishmen to the court of Scotland (1068). He joined the Danish army of invasion in 1069, but was afterwards able, from his possession of Bamburgh castle, to make terms with the conqueror. The peace concluded with Scotland in 1072 left him at William's mercy. He lost his earldom and took refuge in Scotland, where Malcolm seems to have provided for him.

See E. A. Freeman, *Norman Conquest,* vol. i. (Oxford, 1877), and the *English Hist. Review,* vol. xix. (London, 1904).

GOSPEL denotes primarily the "good news" of Christianity (O. Eng. *godspel,* ie., good news, corresponding to Lat. *evangelium,* Gr. *εὐαγγέλιον*). See CHRISTIANITY. In the Greek New Testament "evangel" and "evangelize" are used especially in the Pauline and Lucan writings ("evangel" also in certain passages in Mark) to denote the preaching or the message of Christianity, and would seem therefore at a very early date to have become technical terms in the vocabulary of the Gentile Christian Mission. An inscription of the year 9 B.C. found at Priene describes the birthday of the Emperor Augustus as having been "for the world the beginning of things which owing to him are glad tidings." The Christian use of such language probably goes back, however, to the LXX. version of Is. lxi. 1, in which the Gr. verb "evangelize" is used to translate a corresponding Hebrew expression. In Mk. i. 14, 15 Jesus' own preaching is described as a "gospel." It is possible that He may have used some Aramaic phrase for "glad tidings," or quoted Is. lxi. 1 (cf. Mt. xi. 5, Lk. iv. 18, vii. 22).

The use of the term "gospel" to denote a written work setting forth the story of Jesus is derived probably from the fact that the word happened to occur in the opening sentence of the Gospel according to St. Mark, which appears to have been the earliest work of the kind. Christian usage was influenced by Jewish, and among the Jews it was a common practice to refer to books by their opening words. "Gospel" became consequently a kind of title, and when other similar works came to be compiled, the same title was extended to them by analogy. When it became necessary, later still, to distinguish the different "Gospels" from one another, they were described as the Gospels according to Mark, according to Luke, etc. The four "Gospels" recognised by the Church were not regarded as rivals, but as parallel versions of the same fundamental message—the "good news" about Jesus. The heretic Marcion, early in the second century A.D., described St. Luke's Gospel (edited with modifications by himself) as "the Gospel," in contradistinction to "the *Apostolicon*" (a collection of Pauline Epistles); and Justin Martyr (c. A.D. 145–160) speaks of "memoirs" of the Apostles, "which are called Gospels" (Justin, *Apol.* I. 66). The use of the term by Ignatius of Antioch (c. A.D. 110; see Ignat. ad *Philad.* viii. 2) in the sense of a written Gospel is less certain. A number of more or less imaginative lives of our Lord, not accepted by the Church as canonical, are known as the "apocryphal gospels" (see APOCRYPHAL LITERATURE). The Syriac writer Tatian, not long after the death of Justin, produced a harmony of the four Gospels, known as the *Diatessaron* ("through four"); and in the treatise of Irenaeus Against Heresies (c. A.D. 180; see esp. III. i. 1 sq., and x., xi.) the four Gospels since recognised as canonical are clearly regarded as being uniquely authoritative. For further information as regards the diffusion and reception of the Gospels in Christian antiquity see BIBLE, N.T., § 1, CANON; and for individual accounts of the Gospels see the articles MATTHEW, MARK, LUKE and JOHN. The present article deals only in general terms with the beginnings of Gospel-literature, and with the mutual relations of the four Gospels received by the Church.

The Beginnings **of** Gospel Literature.— The Church did not depend originally upon written accounts of our Lord. Christianity was proclaimed as a "Gospel" before any Christian literature existed at all, and the first Christian writings are not "Gospels"; they are the Epistles of St. Paul. From the date of the Crucifixion to the date at which the earliest of our Gospels was written (see MARK, GOSPEL OF) appears to have been almost exactly a generation. The substance of the narratives and sayings which eventually went to make up the contents of the Gospels circulated originally in the form of oral tradition.

The attempt has been made by recent New Testament criticism to infer back, behind the present literary forms of "the Gospel," to thewe-literary stage of the tradition. According to Paul, the "Gospel" received by him and handed on to his converts included "first of all" the assertions that "Christ died for our sins according to the Scriptures; and that he was buried, and that he hath been raised on the third day according to the Scriptures; and that he appeared to Cephas: then to the twelve" (I Cor. xv.

1–5) The story of the Passion and Resurrection w a regarded therefore from the first as being of primary import; a fact which accounts at once for the connected and continuous character of the Passion-narratives in the existing four Gospels, for the elaboration of detail which they display, and for the large proportion of space which they occupy in relation to the contents of the Gospels as a whole.

The interest, however, of the Christian Church in the story of Jesus was not confined to the fundamental story of the Passion and Resurrection. Apart from the theological interest in Christ the Redeemer from sin, there was a purely human interest—those who had been personally in contact with Jesus could never allow His memory to fade. There was further a moral and spiritual interest—the sayings and deeds of the Lord were regarded as supplying the key to the solution of the moral and practical problems confronting the Church. The ideal of life which was everywhere set before converts was that of "living in accordance with the words of the Lord"; and the experiences which befell the Church, whether of success or of failure, the sharp onset of persecution and the call to face martyrdom, the problems of early Church discipline, the necessities of early apologetic and polemic against the Jews—all these were illuminated and dealt with. as far as possible, by reference to the remembered words and example of Jesus. The church was interested further to know the story of its own beginnings and of the origin of its characteristic institutions—the Apostolate, Baptism, the Eucharist. Stories moreover appear to have been preserved which exhibited Jesus more particularly in the characters of Wonder-worker, Teacher and Prophet.

With all these considerations in view, the new school of "form-criticism" attempts to throw light upon the pre-literary history of the Gospel-material by means of an analysis and classification of its "forms." The material can. as a matter of fact, without difficulty be classified or grouped under such headings as (1) dialogues, (2) stories of miracles, (3) parables, (4) narrative paragraphs, (5) poem stanzas, and (6) groups of short sayings. It is noticeable that all these represent "forms" of which the contents would be easy to memorize; and it may be presumed that it was in these "forms" that the material of the Church's tradition about Jesus was in circulation before it came to be written down.

Precisely how early the material, or any part of it, was committed to writing is a matter of dispute among scholars. The Greek of St. Mark, and to a large extent also the Greek in which the sayings of Jesus contained in the non-Marcan Gospels are expressed, is strongly Semitic in colouring, and bears all the marks of what is described as "translation Greek." The story of Jesus must of course have been originally told, and His sayings reported, in the vernacular Aramaic language of Palestine. Was the Aramaic stage of the tradition a purely oral one? Or are there Aramaic *documentary* sources behind our Greek Gospels?

On the whole it appears to be the more probable view that the literary stage in the transmission of the Gospel materials belongs, in the main, to Greek-speaking Christianity, the evidences of "translation Greek" being due not to actual translation from documents, but to the originally Semitic character of the tradition, and to the fact that it was in the first instance "done into Greek" by interpreters whose native speech was Semitic. The Aramaic-speaking Church of Jerusalem, the original fountain-head of the tradition, was in all probability for a considerable period of the same mind as the early second century writer Papias, who believed that he "would not be so much profited" by "what came from books" as by "the living and abiding voice" (Papias *ap.* Euseb. H.E. III. 39, 4).

On the other hand, it is probable that in Greek-speaking circles the work of Christian teachers and catechists was at a very early stage helped by the use of written materials as an aid to the memory. Collections of the sayings and parables of Jesus were probably made, and perhaps collections of short narratives also. There were therefore written materials available when the Gospels came to be compiled (*cf* Lk. i. 1 *sq.*), for the most part probably in the form rather of catechists' notes than of "books" in any literary sense The later Gospels of Matthew and Luke are dependent on Mark *(see* below), but on other documents also. A specific tradition with regard to the words and deeds of our Lord probably tended to crystallize in each of the main centres of early Church missionary work—Jerusalem, Caesarea, Antioch, and eventually Rome. St. Mark's Gospel represents the tradition of Rome *(see* MARK, GOSPEL OF). It has been suggested of late that a great part of the special material peculiar to Luke may have been derived from the tradition of the Church at Caesarea; that the document "Q," used in common by Matthew and Luke *(see* below), represents the tradition of Antioch; and that the matter peculiar to Matthew is derived, in the main, from the tradition of the Church at Jerusalem. (B. H. Streeter, *The Four Gospels*, pp. 230 *sqq*) The conjecture is not without probability, but it does not follow that we can to-day reconstruct these supposed sources with any exactness, since it is likely that in respect of their contents all or most of the documents to a certain extent overlapped.

The Synoptic Problem.—It has been already, remarked that the Gospels of Matthew and Luke are dependent on Mark. If the first three canonical Gospels are arranged in parallel columns, so as to provide a "synoptic" view of their contents, it becomes manifest at once that there are literary relationships between them, and the literary problem thus constituted—the *Synoptic* Problem, as it is called—has been elaborately studied in modern times, and to a large extent solved.

(1) Of the 661 verses contained in the authentic text of Mark, it has been calculated that more than 600 are reproduced or represented in substance in Matthew, and about 350 in Luke, while the material contained in Mark which is wholly unrepresented in *either* Matthew *or* Luke amounts to only *31* verses in all. The agreements are largely *verbatim*, sometimes in all three Synoptists, more often either between Matthew and Mark or between Luke and Mark, only rarely between Matthew and Luke against Mark; and it is to be observed that this latter type of agreement (Mt. and Lk. against Mk.) tends either to disappear. when the true text of the Gospels has been critically determined in the light of the most recent discoveries of textual criticism (*i.e.*, the supposed "agreements" are the result merely of the erroneous assimilation of the texts to one another in the course of scribal transmission), or to be fairly easily explicable (*e.g.*, Mt. and Lk. have concurred in correcting in the most obvious way the defective grammar of Mk., or in the substitution of the most obvious Greek word for a rare or unsuitable word used by Mk.). It is to be observed, further, that the actual *order* of the materials in Mk. tends to be reproduced *either* in Mt. *or* in Lk., and sometimes in *both* Mt. and Lk. It is true that the two non-Marcan writers both in different ways alter the order at times, and that they both modify and edit, transpose, change and abridge the material contained in Mk. very freely. The conclusion nevertheless follows from the facts summarized above that *they both employed Mark as a source.*

(2) Apart from the Marcan material, the Synoptic tradition includes also a considerable amount of material—chiefly though not exclusively consisting of sayings of Jesus—which is common to both Mt. and Lk. The agreements here also extend not infrequently to the actual wording of the sayings in Greek, and are of such a kind as to suggest literary dependence, though not directly the dependence either of Mt. upon Lk. or of Lk. upon Mt. *Scholars therefore assume the existence at one time of a second source, no longer extant, which was used in common by Mt. and Lk., and which is conventionally designated "Q" (from the German "Quelle"="source").* Attempts to reconstruct "Q" have been numerous, but the procedure is necessarily speculative, and the results are not valuable. The "Q" material which is common to Mt. and Lk. cannot safely be taken to represent the whole contents of the document, but we cannot tell what more it may have contained. The attempt based on the statement. ascribed by Eusebius to Papias (Euseb H.E. III. 39, 16), that "Matthew wrote" (or "compiled") "the oracles in the Hebrew language, and every man translated them as he was able" to identify "Q" with a document supposed to have been written by the

Apostle Matthew in Aramaic, is more unfortunate still. By the *logia* or "oracles" it is probable that Papias meant the canonical Gospel of Matthew, of which he gives an erroneous account. The supposed source "Q" was a *Greek* document, and it is extremely unlikely that Matthew was the author. It has been suggested of late (*see* above) that the "Q" material in our Gospels may represent more particularly the tradition of Antioch. It is in any case wiser to regard "Q" as a mere symbol, a convenient designation for the non-Marcan material which is common to Mt. and Lk.

(3) The compilers of Mt. and Lk. clearly drew also upon other sources, oral or written, for at least some proportion of their material. The two infancy-narratives (Mt. i.–ii., Lk. i.–ii.) are independent; and apart from these, there is a good deal of material which is peculiar to one or other of the Gospels. For the view that the compiler of Mt. may have had access to materials derived from the tradition of Jerusalem, and for the possible connection of the specific Lucan material with Caesarea, *see* above. On the "special source" of Luke and the recent "proto-Luke" theory *see* further LUKE, GOSPEL OF.

The Fourth Gospel.—The Gospel according to St. John stands apart by itself. The author perhaps knew Mk. and Lk., and less probably Mt., but he writes throughout in a characteristic style of his own, and is in the main independent. His book presents many problems, which criticism cannot be said to have solved. His work is certainly not meant as an allegory—he insists strongly on the historical fact that the "Word became flesh." He is at the same time more meditative, more interpretative, and more explicitly doctrinal than the Synoptic Evangelists, and his work (which for these very reasons is of supreme *spiritual* value) is best regarded as an "inspired meditation" upon the life of our Lord and upon the significance of the Incarnation—the maturest expression of the Christianity of Ephesus at the close of the first Christian century. For a more detailed consideration *see* JOHN, GOSPEL OF.

The Historical Value of the **Gospels.**—The Gospels were not written primarily in the interests of history in the modern scientific sense of that word. They were written in a religious interest, to evoke, deepen and foster the faith of Christians in Christ. They are not biographical; they afford the materials for a vividly realistic historical *picture*, but not for a "life" (in the modern sense), of our Lord. They are the literary products of what was in the first century a living tradition, and they are in a broad sense based upon facts, but they are written from the standpoint of "faith." On the other hand, "the scientific historian could not trust as reliable an account of Jesus which did not show how men came to believe in Him"; the Jesus whom the Gospels present to us is an uninventable Figure; and the rise of Christianity implies the historical existence of some such Person as its source. The creative fact behind Christianity is the action of God in and through Jesus—a Jesus such as the Gospels portray. The historical tradition was not merely overlaid; and it is worth noticing that—despite the fact that the Gospels are written in Greek, and that Christianity very quickly moved out beyond Palestine into Greek-speaking areas—the perspective and atmosphere of the Synoptic tradition (and indeed even to a certain extent also of the Johannine tradition) is still strongly Palestinian. The antithesis sometimes set up between the "Christ of faith" and the "Jesus of history" is (in the form in which it is commonly stated) misleading.

GOSPORT, a seaport and municipal borough of Southampton, England, on a peninsula on the west side of Portsmouth harbour, 86 mi. S.W. from London by the S.R. Pop. (1938) 45,910. Area, 10.6 sq.mi. A floating bridge connects it with Portsmouth.

Gosport (Goseporte, Gozeport, Gosberg, Godsport) was originally included in Alverstoke manor, held in 1086 by the bishop of Winchester for the monks of St. Swithun's priory, but in 1284 it was transferred to the bishop. In 1648 it was sold by the state to George Withers, but at the Restoration returned to the see of Winchester, which retained the manor until it mas taken over by the ecclesiastical commissioners. In 1086 the villeins of the manor were "farming" the land themselves. The earliest reference to Gosport as a borough is in 1462, when a bailiff was chosen. In the 16th century it was "a little village of fishermen," and in 1682 it was incorporated into Portsmouth. Six years later it was separated from Portsmouth, when Charles II's charter was annulled, but the election of a bailiff was not revived, and by 1749 all traces of burgage tenure had disappeared. Gosport increased in importance in the 16th and 17th centuries owing to its convenience as a victualling station, and for this reason was particularly prosperous during the American and Peninsular wars. The town's later rise came with the development of the naval depot. It was made an urban district in 1894 and was incorporated in 1922. The boundaries were extended in 1939.

GOSS, SIR JOHN (1800–1880), English composer, was born at Fareham, on Dec. 27, 1800. His church music includes some admirable compositions, such as the anthems "O taste and see," "O Saviour of the world," and others; and in the history of the glee he has also an honoured place. He died in London, on May 10, 1880.

GOSSAMER, a fine, thread-like, filmy substance spun by small spiders, covering stubble fields and floating in the air in clear weather, especially in the autumn; figuratively, anything light and unsubstantial. A gauzy material used for trimming, resembling the "chiffon" of to-day, was formerly known as gossamer; and in the early Victorian period it was a term used in the hat trade, for silk hats of very light weight. It is suggested that the word is a corruption of *gaze à Marie* (gauze of Mary) through the legend that gossamer was originally the threads which fell away from the Virgin's shroud on her assumption.

GOSSAU, a town (alt. 2,090 ft.) in the canton of St. Gall, Switzerland, at the junction of the railway lines St. Gall–Winterthour and Sulgen–Herisau–Appenzell. Lace and embroidery are made in the district, which had a pop. (1930) of 7,914, the majority German-speaking Roman Catholics.

GOSSE, SIR EDMUND (1849–1928), English poet and critic, born in London Sept. 21, 1849, son of the zoologist P. H. Gosse. In 1867 he became an assistant in the department of printed books in the British Museum, where he remained until he became in 1875 translator to the Board of Trade. In 1904 he was appointed librarian to the House of Lords and retired in 1914. In 1884–90 he was Clark Lecturer in English literature at Trinity College, Cambridge. Himself a writer of literary verse of much grace, and master of a prose style admirably expressive of wide and appreciative culture, he was conspicuous for his valuable work in bringing foreign literature home to English readers. *Northern Studies* (1879), a collection of essays on the literature of Holland and Scandinavia, was followed by later work in the same direction. He translated Ibsen's *Hedda Gabler* (1891), and, with W. Archer, *The Master-Builder* (1893), and in 1907 he wrote a life of Ibsen for the "Literary Lives" series. He

also edited the English translation of the works of Björnson.

Gosse's published volumes of verse include *On Viol and Flute* (1873), *King Erik* (1876), *New Poems* (1879), *Firdausi in Exile* (1885), *In Russet and Silver* (1894), *Collected Poems* (1896), and *Hypolympia, or the Gods on the Island* (1901). His *Seventeenth Century Studies* (1883), *Life of William Congreve* (1888), *The Jacobean Poets* (1894), *Life and Letters of Dr. John Donne, Dean of St. Paul's* (1899), *Jeremy Taylor* (1904, "English Men of Letters"), and *Life of Sir Thomas Browne* (1905) form a very considerable body of critical work on the English 17th-century writers. He also wrote a life of Thomas Gray, whose works he edited (4 vols., 1884); *A History of Eighteenth Cenfury Literature* (1889); *A History of Modern English Literature* (1897), and vols. iii. and iv. of an *Illustrated Record of English Literature* (1903–04) undertaken in connection with Dr. Richard Garnett. Gosse was always a sympathetic student of the younger school of French and Belgian writers, some of his papers on the subject being collected as *French Profiles* (1905). *Critical Kit-Kats* (1896) contains an admirable criticism of J. M. de Heredia, reminiscences of Lord de Tabley and others. To the 9th edition of the *Encyclopædia Britannica* he contributed numerous articles, and acted as chief literary adviser in the preparation of the 10th and 11th editions. In 1903 he was entertained in Paris by the leading *littérateurs* as a representative of English literary culture. In 1907 he published anoriymously *Father and Son*, an intimate study of his own early life, which was crowned by the *Acade'mie Française* in 1913. In 1917 he published his *Life of Algernon Charles Swinburne*. He received numerous honours from universities and governments, British and foreign, and was knighted in 1925. He continued to write weekly critical articles in *The Sunday Times*, and selections from these were reprinted in *Books on the Table* (1921) and *More Books on the Table* (1923). He published *Silhouettes* in 1925 and *Leaves and Fruit* in 1927. Edmund Gosse died in London on May 16, 1928.

GOSSE, PHILIP HENRY (1810–1888), English naturalist, was born at Worcester on April 6, 1810. In 1827 he became a clerk in a whaler's office at Carbonear, Newfoundland, where he beguiled the tedium of his life by investigations into natural history. After an unsuccessful interlude of farming in Canada he travelled in the United States, taught for some time in Alabama, and returned to England in 1839. He published many popular books on zoology, and was elected F. R. S. in 1856. He died at St. Marychurch, Devon, on Aug. 23, 1888.

See *The Life of P. H. Gosse* by his son, Edmund Gosse (1890), and the intimate biography, *Father and Son*, by the same writer.

GOSSEC, FRANÇOIS JOSEPH (1734–1829), French musical composer, son of a small farmer, was born at the village of Vergnics, in Belgian Hainaut, and became a choir-boy at Antwerp. He went to Paris in 1751 and was introduced by Rameau to La Popelinière, a wealthy amateur, who made him conductor of his private band. His first symphony was performed in 1754, and as conductor to the Prince de Condé's orchestra he produced several operas and some 30 symphonies. Gossec gave enormous stimulus to the development of orchestral and chamber music in France. He died at Passy on Feb. 16, 1829.

See the *Lives* by P. Hédouin (1852) and E. G. J. Gregoir (1878); also **F.** Hellouin, *Gossec et la musique française à la fin du XVIIIe siècle* (1903).

GOSSIP, originally a god-parent (from the O.E. *godsibb, i.e.*, God, and *sib*, akin, standing in relation to). "Gossip" soon came to mean a friend or acquaintance, either of the parents of the child baptized or of the other god-parents, and hence women friends of the mother, present at a birth; the transition of meaning to an idle chatterer is easy.

GOSSON, STEPHEN (1554–1624), English satirist, was baptized at St. George's, Canterbury, on April 17, 1554. He entered Corpus Christi college, Oxford, 1572, and on leaving the university in 1576 he went to London. In 1598 Francis Meres in his *Palladis Tamia* mentions him with Sidney, Spenser, Abraham Fraunce and others among the "best for pastorall," but no pastorals of his are extant. He is said to have been an actor, and by his own confession he wrote plays, for he speaks of *Catiline's Conspiracies* a5 *a* "Pig of mine own Sowe." To this play and some others, on account of their moral intention, he extends indulgence in the general condemnation of stage plays contained in his *Schoole of Abuse, containing a pleasaunt invective against Poets, Pipers, Plaiers, Jesters and such like Caterpillers of a Commonwelth* (1579). Gosson justified his attack by consideration of the disorder which the love of melodrama and of vulgar comedy was introducing into the social life of London. The tract was dedicated to Sir Philip Sidney, and Spenser, writing to Gabriel Harvey (Oct. 16, 1579) of the dedication, says the author "was for hys labor scorned." He dedicated, however, a second tract, *The Ephemerides of Phialo . . . and A Short Apologie of the Schoole of Abuse*, to Sidney on Oct. 28, 1579. Gosson's abuse of poets seems to have had a large share in inducing Sidney to write his *Apologie for Poetrie*, which probably dates from 1581. The publication of Gosson's polemic provoked many retorts, the most formidable of which was Thomas Lodge's *Defence of Playes* (1580). The players themselves reialiaied by reviving Gosson's own plays. Gosson replied to his various opponents in 1582 by his *Playes Confuted in Five Actions*, dedicated to Sir Francis Walsingham. Meanwhile he had taken orders, was made lecturer of the parish church at Stepney (1585), and was presented by the queen to the rectory of Great Wigborough, Essex, which he exchanged in 1600 for St. Botolph's, Bishopgate. He died on Feb. 13, 1624. *Pleasaunt Quippes for Upstart New-fangled Gentlewomen* (1595), a coarse satiric poem, is also ascribed to Gosson.

GOT, FRANCOIS JULES EDMOND (1822–1901), French actor, was born at Lignerolles on Oct. 1, 1822, and entered the Conservatoire in 1841, winning the second prize for comedy that year and the first in 1842. After a year of military service he made his début at the Comédie Franqaise on July 17, 1844, as Alexis in *Les Héritiers* and Mascarelles in *Les Précieuses ridicules*. He was immediately admitted *pensionnaire*, and became *sociétaire* in 1850. His golden jubilee at the Théâtre Franqais was celebrated in 1894. He made his final appearance in 1895. Got was a fine representative of the grand style of French acting, and was much admired in England as well as in Paris. He wrote the libretto of the opera *François Villon* (1857) and also of *L'Esclave* (1874).

GOTA, a river of Sweden, draining the great Lake Vener. The name is also applied to the canal which leads from Gothenburg to Stockholm. The river flows out of the southern extremity of the lake almost due south to the Cattegat, which it enters by two arms enclosing the island of Hisingen, the eastern forming the harbour of the port of Gothenburg. The Gota river is 50 m. long and is navigable for large vessels, a series of locks surmounting the falls of Trollhattan (*q.v.*). Passing the wooded Halleberg and Hunneberg (royal shooting preserves) Lake Vener is reached at Venersborg. From Sjotorp, midway on the eastern shore, the western Gota canal leads south-east to Karlsborg. Over 20 locks raise it from the Vener level (144 ft.) to its extreme height of 300 ft., and lower it over the subsequent fall through the small lakes Viken and Botten to Lake Vetter (289 ft.), which the route crosses to Motala. The eastern canal then descends through five locks to Lake Boren, after which the canal crosses a rich plain. Lake Rox with its ruined castle of Stjernarp is next traversed.

At Norsholm a branch canal connects Lake Glan to the north, giving access to the manufacturing centre of Norrkoping. Passing Lake Asplången, the canal follows a cutting, and then resumes an elevated course to Söderköping, after which the Baltic is reached at Mem. The whole distance from Gothenburg to Stockholm is about 360 m., and the voyage takes about two and one-half days. The length of artificial work on the Gota canal proper is 54 m., and there are 58 locks. The idea of a canal dates from 1516, but the construction was organized by Baron von Platten and engineered by Thomas Telford in 1810–32.

GOTARZES or **GOTERZES,** king of Parthia (*c.* A.D. 42–51). In an inscription on the rock of Behistun he is called Γωτάρζης Γεόποθρος, *i.e.*, "son of Gēw," and seems to be designated as "satrap of satrap." When the troublesome reign of Artabanus II. ended in A.D. 39 or 40, he was succeeded by Vardanes, probably his son; but against him in 41 rose Gotarzes, who also belonged to the king's family. He soon made himself

detested by his cruelty—among many other murders he even slew his brother Artabanus and his whole family (Tac., ***Ann.,*** xi, 8)—and Vardanes regained the throne in 42; Gotarzes fled to Hyrcania and gathered an army from the Dahan nomads. but the war was ended by a treaty, as both kings were afraid of the conspiracies of their nobles. When Vardanes was assassinated in 45, Gotarzes was acknowledged in the whole empire. He now takes on his coins the usual Parthian titles, "king of kings Arsaces the benefactor, the just, the illustrious (*Epiphanes*), the friend of the Greeks (*Philhellen*)," without mentioning his proper name. The hostile party brought from Rome an Arsacid prince, Meherdates (*i.e.*, Mithradates), who lived there as hostage, but he was taken prisoner by Gotarzes, who died soon afterwards. According to Tacitus, Gotarzes died of an illness; but Josephus says he was murdered. His last coin is dated from June 51.

An earlier "Arsakes with the name Gotarzes," mentioned on some astronomical tablets from Babylon (Strassmaier in Zeitschr. fur Assyriologie, vi; Mahler in Wiener Zeitschr. fur Kunde des *Morgenlands,* xv), appears to have reigned in Babylonia *c.* 87 B.C.

GOTHA, a town of Germany, in the Land of Thuringia. alternately with Coburg the former residence of the dukes of Saxe-Coburg-Gotha, on the Leine canal, 6 mi. N. of the slope of the Thuringian forest, 17 mi. W. from Erfurt, on the railway to Cassel. Pop. (1939) 54,915.

Gotha (in old chronicles called Gotegewe and later Gotaha) existed as a village in the time of Charlemagne. In 930 its lord, the abbot of Hersfeld, surrounded it with walls. It was a town as early as 1200, when it came into the possession of the landgraves of Thuringia.

On the extinction of that line it fell to the electors of Saxony, and later to the Ernestine line of dukes. After the battle of Mühlberg in 1547 the castle of Grimmenstein was partly destroyed, but it was again restored in 1554. At the end of the 16th century it came into the possession of Ernest the Pious, founder of the line of the dukes of Gotha. In 1835 it was united to the dukedom of Coburg.

The old inner town is encircled by suburbs, and is dominated by the castle of Friedenstein, begun by Duke Ernest the Pious in 1643, lying on the Schlossberg, the site of the old fortress of Grimmenstein, at an elevation of 1,100 ft.

The new museum, south of the castle, contains the picture gallery, cabinet of engravings, natural history museum, Chinese museum and a collection of Egyptian, Etruscan, Roman and German antiquities.

The church of St. Margaret has a beautiful portal and a lofty tower (12th cent.), twice burnt down, and rebuilt in its present form in 1652; the church of the Augustinian convent has an altarpiece by the painter Simon Jacobs; and the old town hall dates from the 11th century. The schools include a gymnasium founded in 1524.

Gotha is most active commercially, making sausages, porcelain, tobacco, rubber, machinery, mechanical instruments, musical instruments, shoes, furniture and toys. There are also a number of nurseries and market gardens. The book trade is represented by about a dozen firms, including that of the great geographical house of Justus Perthes, founded in 1785. Gotha is also noted for its insurance societies.

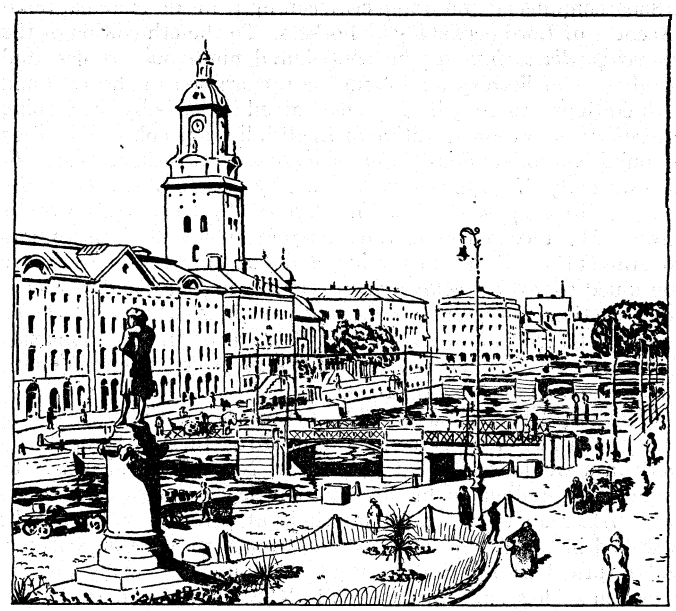
GOTHAM, WISE MEN OF, the early name given to the people of the village of Gotham, Nottingham, in allusion to their reputed simplicity. But if tradition is to be believed the Gothamites were not so very simple. The story is that King John intended to live in the neighbourhood, but that the villagers, foreseeing ruin as the cost of supporting the court, feigned imbecility when the royal messengers arrived. Wherever the latter went they saw the rustics engaged in some absurd task. John, on this report, determined to have his hunting lodge elsewhere, and the "wise men" boasted, "We ween there are more fools pass through Gotham than remain in it." The "foles of Gotham" are mentioned as early as the 15th century in the *Towneley Mysteries;* and a collection of their "jests" was published in the 16th century under the title *Merrie* Tales of *the* Mad *Men* of *Gotham,* gathered togethev by A B., of *Phisicke Doctour.* As typical of the Gothamite folly is usually quoted the story of the villagers joining hands round a thornbush to shut in a cuckoo so that it would sing all the year. The localizing of fools is common to most countries.

Among the ancient Greeks, Boeotia was the home of fools; among the Thracians, Abdera; among the ancient Jews, Nazareth.

See W. A. Clouston. *Book of Noodles* (1888); *R. H.* Cunningham, *Amusing Prose Chap-books (1889).*

GOTHENBURG (Swed. *Göteborg*), a seaport of Sweden, on the river Gota, 5 mi. above its mouth in the Kattegat, 285 mi. S.W. of Stockholm by rail, and 360 by the Gota canal route. Pop. (1943) 285,732.

Founded by Gustavus Adolphus in 1619, Gothenburg was from the first designed to be fortified, a town of the same name, founded on Hisingen, in 1603, having been destroyed by the Danes during the Kalmar war. The great development of its herring fishery in the latter part of the 18th century gave a new impulse to the city's trade, which was kept up by the influence of the "continental system," under which Gothenburg became a



BY COURTESY OF THE SWEDISH TRAVEL BUREAU

GREAT HARBOUR CANAL AT GOTHENBURG

depot for the colonial merchandise of England. In 1807 its walls were demolished. Its close connection with the interior of the country by the Gota canal (opened 1832) and Western railway rapidly advanced both its population and trade.

The inner city is contained almost entirely between the river and the Rosenlunds canal, continued in the Vallgraf, the moat of the old fortifications; and is crossed by canals. The old East India company's house is now a museum and art gallery. Gustaf-Adolfs-Torg is the business centre, and contains the town hall (1670).

Among several churches in this quarter of the city is the cathedral. (*Gustavii* Domkyrka), of 1633, rebuilt after fires in 1742 and 1815. At the west end of Vasa street is the city library, the most important in the country except the royal library at Stockholm and the university libraries at Uppsala and Lund. The university (Hogskola) was a private foundation (1891), but is governed by a board, the members of which are nominated by the state, the town council, Royal Society of Science and Literature and others.

The navigation school was rebuilt in 1916 and a marine museum was opened in 1913. The principal railway lines run to Trollhättan, and into Norway (Oslo); Stockholm, Falun and the north; Borås and beyond, and Helsingborg, etc.

Gothenburg is the first port in Sweden and the chief centre of the shipbuilding industry. The harbour has been enlarged and was made a free port in 1922. Its principal industrial establishments are mechanical works. sawmills, dealing with the timber which is brought down the Gota, flour mills, margarine factories,

breweries and distilleries, tobacco works, cotton mills, dyeing and bleaching works (at Levanten in the vicinity), furniture factories, paper and leather works.

Normal shipping in and out is some 14,000,000 tons per year. Gothenburg has been the chief port of embarkation for Swedish emigrants to America.

"GOTHENBURG" LICENSING SYSTEM. The distinctive and basic principle of this system is the elimination of private profit interest in the sale of spirituous liquors. The system takes its name from Gothenburg, the second largest city and principal seaport of Sweden, where the system was first established on a statutory basis.

The Swedish Licensing law of 1855, which reorganized and greatly extended drink control, gave to urban municipalities the right to transfer the whole of the retail spirit licences (on and off) in their areas to a specially constituted "bolag" (controlling company), subject to the condition that the whole of the profits (after payment of the current rate of interest on the capital subscribed) should be devoted to public purposes. The precise use of the profits was not prescribed.

This optionai right was destined in a comparatively short time to revolutionize licensing in Sweden, Norway and Finland, and later it was to have a powerful effect upon licensing policy generally.

In 1865 the Gothenburg municipal authorities decided to hand over to the control of a company the whole of the "on" spirit licences in the city as and when they expired. The licences were granted to the company for the usual period of three years. The retail "off" trade in spirits, which in Sweden is kept entirely distinct from the "on" trade and is carried on in separate premises under a different licence, was not transferred to the company until 1874.

Discouragement of Drinking. — The chief features of the "Gothenburg" system, apart from restrictiop and reduction of licences, have been the encouragement of the sale of food with drink; restriction of the amount of spirits sold, restriction of the hours of sale, and improvement of the premises and service. While the companies are subject to the ordinary licensing statutes. and are also subject to close supervision by local and central authorities, they have had from the first considerable liberty of experimental action which has led to great improvements both in the scheme of control and in national law. The Gothenburg company, for example, was able in its early years voluntarily to raise the age limit at which young persons could be served with spirits from 15 (the then legal age) to 18; to reduce the alcoholic strength of the spirits sold; to provide eating houses for workingmen in which the purchase of spirits, although permitted (under compulsion of the law as it then stood), was not encouraged, and ultimately, in advance of the law, to make the separate purchase of food of a specified value a necessary condition of the purchase of spirits.

The "Gothenburg" system (now usually referred to as the "Bratt" system, in acknowledgment of the great contribution to its development made by Dr. Ivan Bratt), as it exists today, is greatly different in scope and character from the original form of the system. Control has been centralized and improved, and the application of the basic principle of the system has been extended. It is no longer an optional system but obligatory in all areas where spirit (and wine) licences are granted. The profits of the controlling companies, which formerly were assigned to the municipal treasury and to certain county and provincial funds, now go to the state. The subleasing of licences to private traders (a necessary arrangement at first) has been wholly abolished in the case of "off" sale licences, but is still permitted, under stringent regulations, in the case of hotels, restaurants and clubs.

The Mot-Bok System. — The most striking development of the system in recent years is, however, the introduction, and subsequent statutory enforcement, of the mot-bok (pass-book) method of regulating "off" sales of spirits (which represent 90% of the total spirit sales in Sweden), under what is known as the "Bratt" system. These mot-boks are granted only to adults of a specified age which can be, and in fact often is, raised at the option of the control authority in tach district; and spirits can only be purchased for "off" consumption (subject to a maximum quantity limit per month) on production of the mot-bok. Mot-boks are valid for use only by the actual owner.

The mot-bok method of sale was suggested and introduced by Dr. Ivan Bratt, a Stockholm physician, the chairman and creator of the *Vin* och *Sprit Centralen*, a semistate monopoly (with a restricted share interest) which controls the entire wholesale trade in wine and spirits (including importation and manufacture) in Sweden. In 1913 he successfully applied the mot-bok method of "off" sale to the Stockholm scheme of "bolag" management, of which he is also the head.

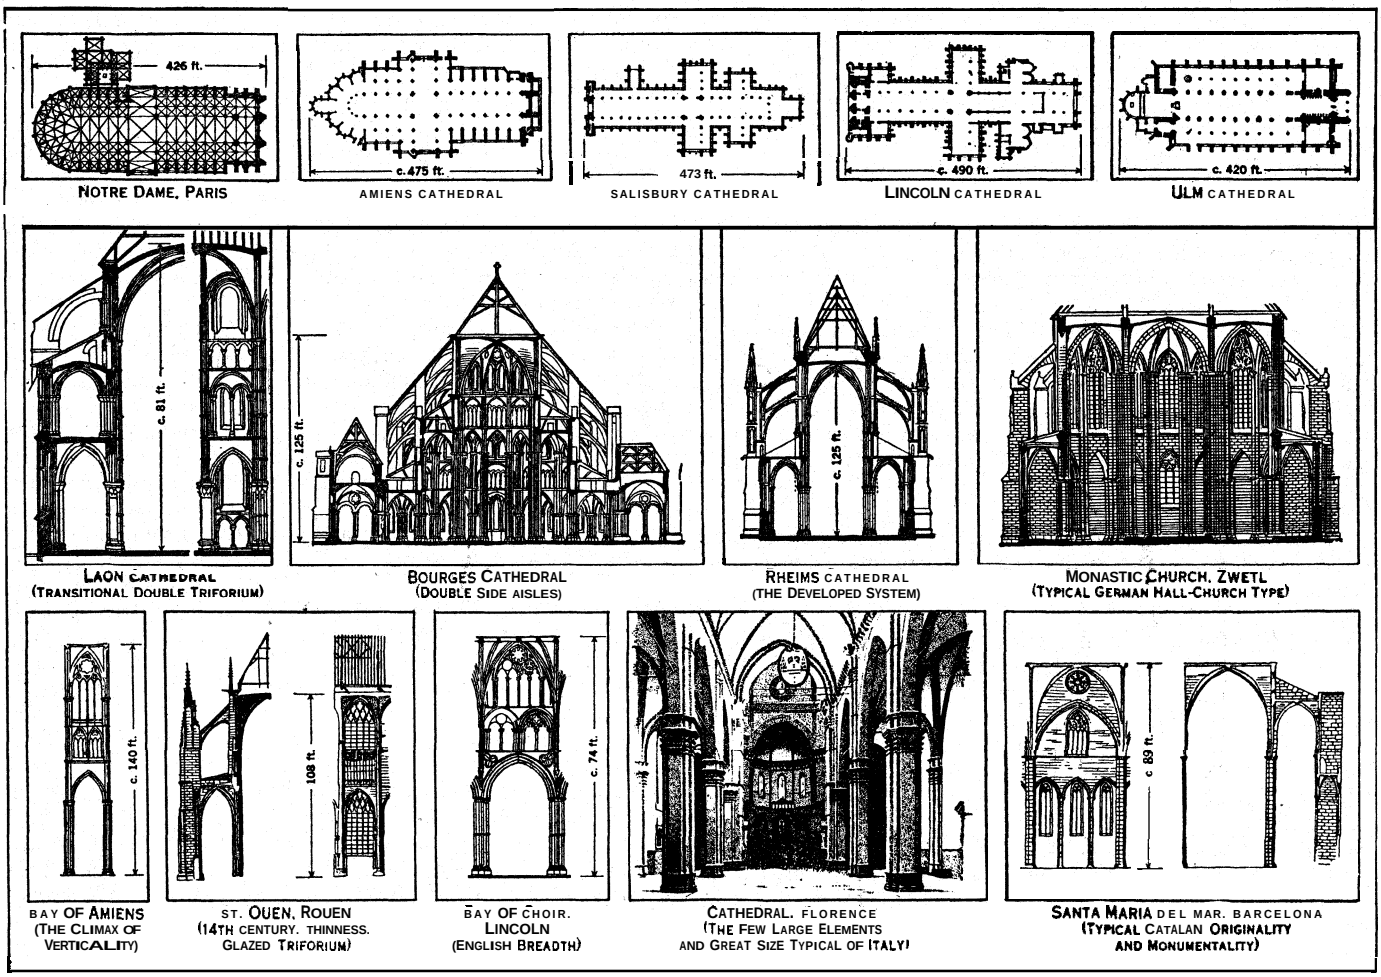
The new method made a wide appeal. It was adopted in town after town, and in 1915 was standardized by statute and made obligatory for all "off" sale of spirits in Sweden as from Jan. 1, 1916.

The underlying legislation with respect to both the "Gothenburg" and "Bratt" systems, both of which are still in force, the latter resting on the basic principle of the former but developing and applying it in wider areas of liquor control, was drastically revised and strengthened in 1917 and 1937. (See LIQUOR LAWS AND LIQUOR CONTROL; PROHIBITION; TEMPERANCE.) (A. SH.; X.)

GOTHIC ARCHITECTURE is a loose term used variously, but in general it is that type which developed from Romanesque (see BYZANTINE AND ROMANESQUE ARCHITECTURE) during the latter half of the 12th century, and became general in Europe, except in Italy, by the middle of the 13th century. Its structural forms originated in the effort to build, simply and beautifully, churches completely vaulted in stone with ribbed vaults, with nave, clerestory windows and side aisles, and with large areas for stained glass; its decorative details developed in the striving to find the loveliest and most appropriate ornament for such structural forms. Its basis is thus structural, and some authorities limit the use of the word Gothic to the architecture of such structurally vaulted churches (Chas. H. Moore, Gothic Architecture). Although the forms known as Gothic were originally developed in church architecture they soon spread to halls, houses and barns and even affected all industrial ornament. These latter are as "Gothic" as the churchrs, and this general usage of the word is too wide and too descriptive to be gainsaid.

Gothic architecture, thus broadly'defined, has in all its phases and in almost all its local expressions certain constant characteristics. These are: (1) the use and careful decorative development of ribbed vaults; (2) the general use of the pointed arch; (3) the decorative subdivision of large window areas into smaller elements easier to glaze, by means of tracery (*q.v.*); (4) decorative importance given to structural features such as buttresses, piers, vaulting ribs, vaulting shafts, gables, flying buttresses, etc., achieved not only by careful design of the elements themselves, but also by accenting them by means of mouldings, carving and crockets; (5) the use of forms originally structural for ornamental purposes. Thus buttress forms are frequent in the ornament of doors, choir screens, furniture, etc.; gables, purely decorative and often pierced or traceried are common and arcades occur solely as ornament; (6) in carving and other decorating, a general tendency towards naturalism; (7) a frequent, but by no means universal, emphasis on vertical rather than horizontal lines and on the impression of height.

Gothic architecture, because it never became bound by the canons which, in general, fixed classic details, and because it required and commanded a higher level of craftsmanship than Romanesque, was a style of continuous growth and freedom. In its origin essentially ecclesiastic, it has always been bound up with the church; even now it seems, in modified forms, particularly applicable to church design, by reason of its sincerity, its directness and its devotional atmosphere attained through height. mystery and the opportunity for rich colour that stained glass can give. Successful modern adaptation of the style must be a matter, first and foremost, of the recognition of its guiding spirit--design through structural form, and sincere expression of material. No dependence on mere details can do; the sterility of the Gothic revival work of the 19th century (see MODERN



NOTRE DAME, ULM, ZWETL, ST. OUEN, SANTA MARIA DEL MAR, FROM STURGIS AND FROTHINGHAM, "HISTORY OF ARCHITECTURE" (DOUBLEDAY-PAGE); SALISBURY. LINCOLN. FIG. 1.—TYPICAL GOTHIC CATHEDRALS. SHOWING THEIR PROPORTIONS AND GENERAL PLAN

ARCHITECTURE, *18th and 19th Centuries)* resulted from the fact that the revivalists took the form for the substance and forgot the essential Gothic qualities of growth, freedom and sincerity.

It is the freedom of the Gothic spirit that has enabled it to be widely applied. Particularly in its later phases it was fecund in developing secular types. Town halls, city houses, barns, court houses, manors, hospitals, castles in all the countries of Europe bear witness to this vitality. Wherever the problem demands free composition, the grouping of many windows into one large element, high roofs or an emphasis on verticality, the Gothic style can furnish inspiration. It is thus much used in modern educational work and occasionally, in America, in high commercial buildings. Historical Gothic architecture is, however, a style requiring rich carved ornament and sculpture, and the effect of mediaeval Gothic buildings is largely dependent upon exquisiteness of craftsmanship and that variety and personality in details which can only be produced by masons who are artists as well. For this reason it is, under modern conditions, a style extremely expensive in any but a much modified form, and as the mechanization of the building trades progresses, it is more and more a style out of harmony with the 20th century.

GENERAL DEVELOPMENT

On the continent of Europe the last half of the 12th century was everywhere a time of cultural rebirth. The dry hand of scholasticism was slowly lifting from contemporary thought. Feudalism was beginning to yield before the growth of towns and the gradual birth of a national feeling non-feudal in spirit. In the ecclesiastical world the dominance of feudal monasteries was passing and the importance of bishops and the secular clergy growing apace. Most important of all, a more settled civilization allowed and encouraged the secularization of culture. It is significant that from this time on the designers, sculptors and masons at work on the great churches were increasingly laymen.

Structural Changes. — Many solutions for difficult problems in church design, never thoroughly solved in the Romanesque style, were almost suddenly discovered. These problems largely concerned the vaulting of churches *(see* BYZANTINE AND ROMANESQUE ARCHITECTURE). In the first place, the oblong bay of a church nave created many difficulties in designing the ribs of rib vaulting. If semi-circular arches were used, springing from the same piers, the different lengths of wall, cross and groin ribs would bring their apexes to awkwardly different levels. Moreover, if a clerestory was desired, the nave vaults were so high that it was hard to counteract their outward thrust. In the second place, the ambulatories round the apses presented awkward shapes. Although the old annular or ring shaped vault was simple, when it was desired to intersect this with cross vaults radiating from the apse, and constructed with ribs, the different widths of the resulting arches and the strange lines of the intersections created forms that were ugly and structurally false. In the solution of these two problems lay the origin of Gothic architecture.

The pointed arch was a form well known in many of the Romanesque styles and especially common in the domed churches of Aquitania. Its application to the design of ribbed vaults was epoch making. In the oblong nave bay, by building the diagonal ribs as semi-circles, and pointing the shorter cross and wall ribs, the apexes could be brought to approximately the same level. Moreover, the pointed arch is, in essence, two sections of a circular arch, each half of which is rigid and structurally safe if its ends are properly abutted. Thus in the ambulatory vault, not only could the arches be more or less pointed to regu-

PHOTOGRAPH, LEVY AND NEURDEIN

INTERIOR OF SAINTE CHAPELLE, PARIS

This building, built 1246–48 by Pierre de Montereau for Louis IX. (Saint Louis), to enshrine the Crown of Thorns, reveals in its entirety the ideal for which Gothic Architecture was striving—a stone vaulted church with large window areas for stained glass, great height, and decorative richness based on the structural forms. The glass is largely red and blue, and the purple light through the slim jewelled windows gives a strange and magic beauty to the whole interior. Note that the wall surface is reduced to a minimum

ENGLISH GOTHIC CHURCH EXTERIORS

1. Salisbury Cathedral (1220–60). A typical early English Cathedral; the great central tower, the informal and scattered richness, and the small entrance doors are characteristic

2. York Minster (west front, 14th century: towers, 15th century). Equally typical of the richer and later Decorated and Perpendicular styles is the lavish front of York, with its pinnacled towers and its great nave window

late their height, but also the groin ribs, rising from the four supports of the wedge-shaped radiating bay could be built independently and brought together to any desired point near the centre. This enabled the ridges of the ambulatory vault not only to be kept almost level, but also to follow graceful and simple lines, without the queer distortions produced by the round arches.

The problem of abutting the thrust of nave vaults still remained. Its solution was the flying buttress by which the thrust of the vault was carried over the side aisles with struts formed of half arches to heavy buttress masses built upon the outside of the side aisles (see BUTTRESS). Elementary approximations of the flying buttress idea are found in certain Romanesque churches in Normandy such as the Abbaye aux Dames, Caen, *c.* 1140 (date much questioned, perhaps earlier). But the acceptance of this form and its structural and decorative development was a distinctly Gothic movement.

The adoption of the pointed arch for structural purposes led almost immediately to its use as the controlling arch form. The 20 years from 1140 to 1160 saw the beginning of many French cathedrals in the design of which the pointed arch dominates, although round arches still spasmodically occurred, and by the last quarter of the century its use was common in England.

Ornament.—A change in carved ornament accompanied this change in structural forms. The dying Romanesque traditions were being replaced by a growing naturalism. Occasionally the designers turned direct to ancient Roman forms for inspiration, but this tentative attempt yielded to the universal use of naturalistic plant forms. The grotesque feeling of Romanesque work almost completely disappeared and was replaced by works of a fantastic imagination in which there is little trace of the earlier neurotic cruelty. A fresh and spring-like spirit shows in the ornament of the early Gothic period like the spirit of small leaves just broken from the bud, which are its favourite forms; the crocket (*q.v.*) form with its uncurling, vivid movement became common on capitals and corbels.

Towards the beginning of the 13th century another element of great importance was introduced. Romanesque architecture had made common use of double or triple arches under a single enclosing arch; it had occasionally used the cusp (pointed intersection between two curves). When the space between the outer enclosing arch and the smaller paired arches below is pierced, elementary tracery (*q.v.*) results. The earlier forms, known as plate tracery, consist merely of the piercing of such an area by many large and small holes which usually approximate a circle in form and are often cusped. Such openings could be glazed as well as the arched openings below them. The clerestory windows of Chartres cathedral (between 1194 and 1212) show the richness possible by the use of such plate tracery. From work like this it is but a small step to bar tracery, in which the openings are not pierced in a section of a wall or a slab, but are bounded by thin bars of stone separating them. As the desire for large areas of stained glass increased, the size and complexity of windows with bar tracery increased as well; wall surfaces tended to become smaller and vaults higher, until the church approximated a cage.

From this point, Gothic development was towards a greater freedom in the combination of these elements. Perfect technical mastery having been obtained, experimentation in the details was universal. Complexity of geometrical form, rectangularity, flowing curves of reverse curvature, elaboration of cusping, all appeared, and in the late Gothic there was a continual see-saw between a love of lavish and over-luxurious ornament and a tendensy towards the elimination of superfluous ornament and unnecessary wall. Even though thus striving after conflicting ideals, the style retained its vitality late into the 15th century and into the 16th also, and outside of Italy profoundly affected the early Renaissance architecture that gradually succeeded it.

GOTHIC ARCHITECTURE IN FRANCE

As it was in France that the basis of Gothic was first developed, so it is there that the greatest number of transitional buildings are found. Of these the earliest is the great abbey church of St. Denis, 1140–44, in which Abbot Suger attempted to create the most beautiful church of his time in France. All the greatest painters, sculptors, metal workers and builders were called in, and the result had a profound influence, not only upon architecture, but also on the industrial arts (see Mâle, L'art *religieux du XIIIe Siècle*). The remaining parts of this church, the choir aisles and chapels, and the west end, show a use of both round and pointed arches, ribbed vaults and a completely developed east end plan, or chevet (*q.v.*). The whole system is Gothic in structural idea and in the delicacy and refinement of its effect.

Shortly afterwards the three great cathedrals of Sens, Senlis and Noyon (all three begun *c.* 1150), and the cathedrals of Notre Dame at Paris (begun 1163), and Laon (1160–1205), all show transitional work in a highly developed form. In all, the nave vaulting was originally in six parts, as the arch rib lengths resulting from this vault type, combining two nave bays into one composition, did not require excessively pointed arches in order to bring the ridges approximately level. It was a tentative form, but one which admitted of greater height, greater delicacy and a more powerful effect than earlier Romanesque methods. The internal composition of these churches is also tentative. The tendency was at first towards developing the old Romanesque triforium into a full vaulted gallery, and the roof over this created a space between the top of the gallery arches and the bottom of the clerestorey windows. This at once suggested a second triforium which appears as a fully developed arcade in Laon and as a series of round openings with primitive tracery in the earlier design of Paris. Nevertheless, even with the greater height of these early Gothic naves, the four-fold division thus resulting—pier arcade, gallery arcade, triforium and clerestorey—was too complicated and except in rare instances disappeared by the end of the century. In Paris, for instance, after a fire in 1200, the upper part of the bay was reconstructed by flattening the roof over the gallery and replacing the early clerestorey window and the triforium round opening below, by a single large window divided by simple bar tracery.

The advances over Romanesque usage shown by these early cathedrals are enormous. In the first place, the whole building was clearly articulated, with each pier, arch, buttress and vault rib designed for its particular purpose. In the second place, flying buttresses allowed enormously increased heights, the nave vault of Notre Dame, for instance, rising roughly 110 ft. above the floor. A growing knowledge of the strength of stone masonry, and an increased skill in stone cutting allowed more and more slender supports, so that the sense of height and of aspiration, was vastly increased.

In exterior design, the changes were even more profound. The increase in buttress depths accented vertical lines, and the half-arched flying buttresses, with their sloping tops, served to carry the eye inevitably upwards to the top of the building. Around the apse, the flying buttresses, in naturally radiating lines, combined with the projecting chapels to form a type of composition new and magnificent. In the west fronts, of which that at Laon is an excellent example, new effects were obtained by the emphasis of the buttresses of the two towers that were almost universal, the use of a great rose window at the end of the nave and the development of three monumental portals. The whole front was tied together by bands of arcading and heavy cornices; the power and richness of this balance of vertical and horizontal lines is well shown in the front of Notre Dame at Paris.

In decorative detail, the development was towards finer and more delicate mouldings, the use of naturalistic and crocket forms in place of Romanesque foliage and a new skill in figure sculpture. The west portals of Chartres cathedral (*c.* 1145) show the richness and facility of the best sculpture of the time. This is Romanesque in its conventionality and occasional awkwardness, but the powerful individualization of the figures, the blending of sculpture with architectural lines and the genera1 composition were all prophetic of the Gothic portals to come.

The Second Phase, **Rayonnant.**—With the beginning of the nave and choir of Ghartres cathedral in 1194, French Gothic architecture entered its second phase. Mastery replaced experi-

mentation. From that time, the problems were how gradually to refine detail, but to increase height and lightness, and how to find the best possible relationship for the natural church forms. The six-part vault gave way to the more simple and more direct four-part vault. The loss of the rhythmical alternation of the heavy and light supports of the six-part vault was more than compensated by the direct power of the parade of similar bays and similar piers down the length of the church nave. The effect of height was sought by increasing clerestoreys and pier arcades and diminishing the triforium. In the cathedral at Bourges (early 13th century) transepts are omitted; there are five aisles; and the side aisles run continuously around the apse. Moreover, the inner aisle is 70 ft. high, much higher than the outer aisle. There is a complete triforium and a clerestorey on the outer side of the inner aisle, above the arches. The nave has a similar triforium and clerestory which, with the tall, slim arches leading into the outer aisles, give an impression of height greater than the actual dimensions indicate. The whole scheme is daring, impressive and produces a sense of great openness.

Nevertheless, the general tendency of this period was towards the greater emphasis that a simpler plan produces, and the cathedrals of Rheims (c. 1210–50) and Amiens (c. 1220–70), which represent the apogee of the style, have in the naves but three aisles, and gain their effect from great height, refinement and the repetition of exquisitely proportioned bays. In both, the size of supports is reduced to a minimum and freely developed geometrical bar tracery is used for windows throughout. In Amiens, particularly, the construction seems almost foolhardy; perfection in technique has allowed that display of knowledge and skill for their own sake which sometimes detracts from pure beauty. The summit of this development came in the choir of Beauvais cathedral (begun 1247). Here the architect strove to place a vault higher than any other, on slimmer piers. Rheims and Amiens had both had ceiling heights of approximately 140 ft., with naves about 46 ft. wide; in Beauvais, the vault rose to 154 feet. The result was disastrous — the vault fell; it was rebuilt in 1274 only to fall again ten years later. In 1320, the number of bays was doubled by building intermediate piers between those of the earlier scheme, and the vault on this doubled support has remained stable. The stupendous impression of height given by these narrow bays was gained at a sacrifice and the whole seems cramped and thin.

The qualities of the developed Rayonnant are even better shown in the little St. Chapelle, Paris, built by St. Louis (1247–50). In the upper chapel the wall has almost disappeared. Instead there is a series of slim, heavily buttressed piers supporting a soaring vault. The entire area of the spaces, between the under side of the vault and the piers, down to a point only slightly above the chapel floor, is glazed. The effect of these high traceried windows with rich blue, red and purple glass is incredibly warm and light.

Such windows as these necessitate the greatest perfection in the design and execution of window tracery. It is, in fact, window tracery, and especially the radiating tracery of the great rose windows, which gives the period its French name of Rayonnant. All the tracery is geometrical in pattern, consisting generally of pointed arches, cusps, cusped circles and curved sided triangles. The tracery bars are slender and delicate, usually with a roll moulding on the edges. In mullions these were frequently treated like colonnettes. The rose windows of Notre Dame and the clerestorey and choir windows at Amiens and Rheims are notable examples of this type of tracery. To display such a magnificent decorative element, the French architects of the later 13th and early 14th centuries, did everything to increase window areas. By making aisle roofs flat, it was possible to glaze the triforium, as in the choir of Amiens. And in the church of St. Urbain at Troyes (begun 1262), the triforium disappears.

In exterior design, Rayonnant churches merely elaborate the earlier ideas. Portals are deeper, with gables above them as in Amiens and Rheims. Buttresses are decorated with tracery and crowned with pinnacles. Foliage decoration in arches and bands increases in extent and plain walls tend to disappear behind arcades, tracery and sculpture. More and more, structural details are purely decorative, as in the magnificent pierced and traceried gable of the Gate of the Libraries in the cathedral of Rouen (end of the 13th century). Crockets appear on every gable, pinnacle and spire edge, and frequently in the hollows of mouldings. Gargoyles and grotesque animals are common. In figure sculpture realism and technical skill are growing. Despite this lavishness, however, late Rayonnant work of the early 14th century shows a tendency towards mechanical perfection, thinness and coldness.

Third Phase, Flamboyant. — The 14th century in France was a discouraging period of foreign dominion and internal stress. Little great work remains. But at the end of the century there came a recrudescence of building activity. In it the influence of England was marked by the introduction of the ogee or double curve and the consequent development of flamboyant, or flame-like, forms. Flamboyant work is characterized by structural simplicity and lavish ornament. Flowing tracery is used for wall surfaces, balustrades and gables as well as for windows. Towards the end of the period, elliptical arches came into use over doors, and openings were crowned by sweeping up the enclosing, or hood, mould into a tall finial. In church interiors the triforium was frequently omitted. Vaulting ribs and pier arch mouldings of many small members were often carried unbroken down the piers to the floor, or else were allowed to die on the surface of simple cylindrical piers. Mouldings were made to intersect in all sorts of curious ways, and double or triple bases are common. Figure sculpture was much used, but on a small scale, and individualization and the expression of emotion were carried to the point of exaggeration. The church of Notre Dame at Alençon and those of St. Maclou at Rouen, St. Gervais at Paris, St. Jacques at Dieppe and St. Wulfram at Abbéville, are beautiful examples of the developed flamboyant church of the 15th and early 16th centuries. So vital was this flamboyant style, that, in ecclesiastical work, it remained in vogue until long after the Renaissance dominated secular building, and its structural ideas, even longer, as shown in the large church of St. Eustache in Paris, which is structurally late Gothic.

GOTHIC ARCHITECTURE IN ENGLAND

Although pointed arches occur spasmodically in England in various buildings dating from the last half of the 12th century, English Gothic first appears in a complete form in the choir of Canterbury cathedral, built by the French architect William of Sens (1175–78). This was designed according to a predominantly French scheme, with a six-part vault, a developed chevet and crocketed capitals. Nevertheless, certain English characteristics appear in the generally low proportions and the amount of wall surface. Similarly, in Westminster Abbey (begun 1245), although the high vault and some of the tracery details are French in type, the ornament and arch shapes are purely English. Two main influences caused the difference between English and French work. The first was that in England no break or rivalry between the regular and secular clergy occurred such as that which had taken place in France. The monasteries were everywhere powerful. Especially important architecturally was the influence of the Cistercian order, with its insistence upon simplicity and restraint, to which was due, in no small part, the English abandonment of the chevet plan in favour of the square east end, as well as the development of the moulded capital without foliage, and the English skill in the invention of varied moulding profiles. The tradition of Norman church building strengthened the English Gothic love of simple wall and textured surface in place of the rigid French articulation. Thus the English never sought the soaring heights of the French churches, or the lavish use of carved ornament and sculpture.

Early English. — The first of the national English styles thus developed is known as the Early English, embracing, roughly, all the English Gothic up to the middle of the 13th century. In this period, the complete English church plan was developed. This is characterized by great length, a square east end, sometimes with an additional square-ended eastern chapel, as in Salisbury cathedral (1220–66), the placing of the main transept almost in the centre of the length, and the addition of a second eastern transept of small size. Except for the length, 473 ft., the dimensions of Salisbury are comparatively modest, the width across nave and aisles

FRENCH, ENGLISH AND ITALIAN GOTHIC

1. The Nave of Amiens Cathedral, built for the most part between **1218** and **1269,** by Robert de Luzarches, and Thomas and Regnault de Cormont, rep. resents almost the highest point in the development of Rayonnant French Gothic church architecture. The construction is daringly light, yet sound; the upward sweep of the shafts most effective; the resulting effect of lightness, delicacy and aspiring height is superb. Decorative detail is restrained, and carefully limited to such important places as the column and shaft capitals, and the window tracery; everything is designed to emphasize the soaring ribbed vault. **2.** The interior of Exeter Cathedral. By contrast with Amiens, the nave of Exeter Cathedral, built between **1280** and **1370** seems long, low, quiet. Typically English is the search for richness of light and shade as manifested in the clustered nave piers, the rich arch mouldings, the multiple vaulting ribs. As is usual in English works, height is sacrificed to length; structural expressiveness to surface richness; monumentality to intimate charm. 3. The West Portals, Amiens Cathedral. The French Gothic designers sought to obtain large, welcoming, impressive church entrances. Thus they developed the great western portals, of which these are typical; row on row of angels under delicate canopies ring the deeply recessed arches and saints are ranked below. Architecture and sculpture are merged into one unified expression of worship and beauty; each art would be incomplete without the other. The three doors are deeply recessed between the base of the towers and the buttresses that mark the end of the nave and aisles; thus structural essence is expressed; and the richness of the porches only makes more plain the simple basis of the whole. 4. The Presbytery or Rectro-choir of Lincoln Cathedral. Like Exeter, Lincoln Cathedral is impressive for its length, its richness, its intimate beauty. Built **1255–80,** this the east end of Lincoln is usually known as the Angel Choir, from the angels carved above the arches of the triforium arcade (the gallery between the pier arches below and the clerestory windows above). Horizontal lines are strongly accented, mouldings intricate, carving everywhere luxuriant. The Angel Choir is thus almost completely expressive of the Decorated Period of English Gothic. 5. Santa Croce, Florence. This 14th century Italian interior shows the great difference between the Gothic of Italy and that of the countries farther North. The simple octagonal piers, the great plain surfaces, the unmoulded arches, the bracketted cornice above, and the open timber ceiling are typical of many Italian churches; the wide spacing of the piers tends to make the whole appear smaller than a French or English church of equal size

being 82 ft. and the height 84 ft. Salisbury also illustrates the great difference of interior effect between the French and the English cathedral. The vaulting shafts continue only down to the spandrels of the triforium arches. The clerestory has a group of three slim lights, known as lancets, in each bay. Triforium arches are segmental and the band course above the pier arcade runs through continuously so that the horizontal elements predominate. Tracery exists only in a rudimentary form in the triforium. Capitals are simply moulded, without carving and the abacus is circular. Yet quiet richness is obtained by the slim black marble shafts clustered around the nave piers and the complexity of pier arch mouldings consisting of a series of small rounds and deeply cut hollows. In the Lady Chapel the vault is supported entirely on black marble shafts so slim that they seem tenuous and hardly adequate for their work. In the choir and nave of Lincoln cathedral (1192–1250) there is the same use of marble shafts and lancet windows. The design, however, is more advanced; the English richness appears in the interlaced wall arcades at the base of the side aisle walls, in the introduction of carved capitals and especially in the vault. This shows an early example of a characteristic love for experiment in vaulting. Additional ribs running from pier to crown, known as tiercerons, and a favourite means of obtaining rich interior decorative effect, are combined in a most original manner so that the cross ridges of the vault are oblique.

In exterior effect even greater divergences from French usage are present. Flying buttresses are rudimentary and frequently covered by the aisle roof. Buttress pinnacles, except at corners, are rare, and the west fronts become more and more mere decorative screens, often of great richness, but with little organic relation to the building behind. Entrance doors are usually extremely small, though occasionally, as in Lincoln cathedral and in Peterborough (west front 1200–14), composed in enormous arched recesses. The comprehensive effect is usually long, low, rambling and picturesque, building up gradually to the central tower over the crossing, which was becoming almost universal. Other important examples are Wells (1170–90), especially noted for its west front (1220–39); and the choir of Worcester cathedral (1222).

Decorated.— By the middle of the 13th century the use of rich tracery had become common, and the decorative lavishness that was general, gave rise to the second type of English Gothic, known as *decorated*. In its earlier phase, known as geometric, which includes the last half of the 13th century, there is a consistent development of geometrical bar tracery. It first followed the French general idea of double or triple lights combined with one or three cusped circles, but soon broke away from this precedent and every conceivable combination of simple geometrical curves is found. The arches over the lights were made interlacing. Curved sided triangles are common, and frequently gables with finials were placed under the arched heads of the lights. Trefoil, quatre-foil and sexfoil were used without enclosing circles. At the same time the richness and complexity of mouldings, and the use of sculpture and ornament increased greatly. The earlier stiff leaves gave place to naturalistic treatment and decorative figure sculpture of a high order is frequent, as in the Angel choir of Lincoln (1255–80) and the west front of Wells cathedral.

Yet even such decorative enrichment as that of the Angel Choir of Lincoln did not give sufficient scope for the English imagination, and about the beginning of the 14th century the introduction of reversed curves and flowing lines in tracery brought about the second phase of English decorated Gothic, known as *cur-*

vilinear. Although at first merely developing varieties of geometric forms, like the reticulated windows in which, as in the early 14th century church of New Romney, the whole arched head is filled with a regularly arranged network of flowing bars, in later examples, the geometric basis was forgotten, and the tracery patterns often simulate leaf, tree or branch forms. The great west window of York cathedral (1338), and the rose window of Lincoln, known as the "bishop's eye" (1350), show beautifully this freer type of curvilinear work. There was too, an immense development of vaulting by the introduction of many tiercerons, and a growing enrichment of carving throughout. Moulding profiles are, however, simplified. The effect can best be seen in the cathedral at Exeter, which was built in the curvilinear style (1290–1367). Here the ranked colonnettes of the clustered piers, the richly simple pier arches, the vaulting shafts resting on carved corbels, the tiny triforium and the forest of branching vaulting ribs combine to produce an effect of warmth, richness, invitation and mystery. The choir, Lady Chapel and octagon of Ely cathedral (1321–49), form another combination with the same characteristics, and the octagon, with its wooden vault, is remarkable as an example of the inventiveness of the curvilinear architects, in this case Alan of Walsingham. There was an accompanying lavishness in all types of church furniture and minor work, such as tombs, chantries, screens and choir stalls. In these, the richest use was made of gablets, false gables, finials, foliated cusping, crockets and foliage. The choir stalls at Ely, the choir screen of Southwell minster and the Percy tomb at Beverly (1365) are examples.

The decorated period also saw the development of the characteristic English simple, slim, stone spires. That of Salisbury (1329–75), rising in simple lines 406 ft. high, is only one of many instances which show how felicitously the English combined the octagonal spire with a square tower.

Perpendicular. — Meanwhile, a new style, the perpendicular, was developing. It started at Gloucester abbey where, between 1327 and 1377, the entire Norman choir interior was altered, refaced and vaulted. In this alteration curvilinear lines are forgotten. Wall surfaces are covered with rectangular, arched headed panels, and the lines of the tracery carried vertically down to the floor. In the south transept window (1337), the main divisions are vertical, although reminiscences of curvilinear tracery exist, but in the great east window (1377) the fully developed perpendicular scheme is apparent, with its light and heavy mullions, its horizontal ranges of arched lights capped by a cornice, and the smaller subdivisions of the upper portion. Moreover, in the vault (*q.v.*), the additions of liernes (small connecting ribs between the tiercerons), and the elaboration of carved bosses, produced a veritable network of lacy richness. At the same time, mouldings were flattened and carved ornament reduced. At Winchester, between 1345 and 1394, a similar alteration using the same forms was made in a Norman fabric. Furthermore, the use of the four-centred arch appeared in pier arches. At Gloucester, in the cloister (begun 1351), fan vaulting appeared in an entirely developed form. Thus the final step in the decorative development of vaulting was achieved; ribs, at first structural, had become so numerous and complicated, that their decorative function overbalanced the structural, and in fan vaulting they are only decorative, being carved in the form of tracery on the lower side of a completely cut stone vault. The climax of fan vaulting development was reached in Rings college chapel at Cambridge and the Henry II. chapel at Westminster abbey. (See FAN VAULT.)

The perpendicular period is also notable for the tremendous number of lavish parish churches, such as St. Mary Redcliffe, Eristol and Lavenham church in Suffolk. Many of these are extremely rich on the outside and distinguished by the use of polychrome masonry of flint and free-stone and the exquisite square towers which are so characteristic of the period and were so frequently added to earlier churches. In decorative detail the same love of rectangularity seen in the tracery finds complete expression. The four-centred arch is almost universal. When used for doors and windows it is enclosed within a rectangular frame and the spandrils filled with tracery or carving. Battlemented parapets, frequently pierced with tracery, are found, sometimes even on interior work. The capital almost disappears and takes the form of the simple band of mouldings with occasional rudimentary foliage. Moulding profiles are flat, delicate rather than strong, and sometimes decorated with rosettes repeated at intervals. This style was reaching its highest development just when Renaissance architecture (*q.v.*) was being gradually introduced, and its influence was strong.

GOTHIC ARCHITECTURE IN GERMANY

The Gothic in Germany was largely an imported style. Little transitional work occurred, and in most of the 13th century Gothic buildings, such as Cologne and Strasbourg cathedrals, the French touch is obvious. It was not long, however, before national taste exerted a change in the direction of increased picturesqueness and the emphasis on vertical lines, as in the west front of Strasbourg cathedral (1298), by Erwin of Steinbach, with its lacy free-standing mullions and tracery and its exquisite sculpture. The Cathedral of Regensburg (1275–1309, façade 1500) is equally impressive, and in its choir illustrates another German characteristic, the omission of ambulatory and chapels around the apse, so that continuous windows from floor to vault on the same plane are possible. Here these are divided into two storeys, but in the western apse of St. Sebald's church, Nuremberg (1361–77), and in the magnificent choir of Erfurt cathedral (1349–70), the logical step has been taken and the windows are continuous slim openings, of enormous height, producing an impression of incredible lightness.

The same love for high windows is perhaps responsible for another German peculiarity, the popularity of the so-called hall type church, in which nave and aisles are of the same height. Examples occurred throughout Germany and Austria during the 14th century and its frequency would indicate an independent invention. The monastic church at Zwetl (1343) and St. Stephen's cathedral at Vienna (1340–1433), that of the Holy Cross at Gmiind in Swabia (1351–1414) and the Frauenkirche at Nuremberg (1355–61) show, both outside and inside, the impression of slim height that long windows and high, narrow supports produce. In the Nuremberg example another German peculiarity is present, for the west front has a porch with stepped, traceried gable, and turret above, distinguished by the combination of rich carving and fantastic shapes. This fantastic quality ran riot in the German Gothic of the 15th and 16th centuries. The vaults of the double side aisles of Ulm cathedral (1478) have an intricacy of vault ribbing unknown outside Germany. Similar complex patterns occur at St. George in Dinkelsbiihl and in the throne room of the castle at Prague in Czechoslovakia (1502). But it is in tracery, and other decorative details that this quality is most evident. Both geometric and flamboyant or curvilinear types are used, composed with an unbridled imagination and a great complexity of cusping and intersecting lines, particularly in some of the later secular work. The most bizarre forms are found in balconies, corbels, etc. At times tracery bars are carved like tree branches with twigs and knots and bark.

In north Germany, especially in the Hanseatic towns, an interesting Gothic of entirely different type, based upon the use of brick instead of stone, was developed. The Marienkirche at Lübeck (1270–1310) and St. Mary's at Wismar, slightly later, have a simple nave and lower side aisles, but it is the hall church which is most characteristic. The Marienkirche at Danzig (begun 1403) is especially interesting in its elaborate and frank brick treatment. Even more remarkabie use of brick and terra-cotta appears in some of the secular work of this locality, as for instance, city gates in Neu-Brandenburg (14th century) and Stendal (*c.* 1300) and in the monumental town hall at Tangermunde (*c.* 1460), remarkable for its great screen façade.

Typical of the German fondness for picturesqueness and height are the numerous rich stone spires, almost all of them dating from the 15th century. That of Strasbourg is notable for the daring slimness of the stone supports which form the receding stages of the pinnacles of the spire top. In Regensburg (spires late 15th century) and Cologne, built in the 19th century from

THE FACADE OF THE CATHEDRAL AT ROUEN

From an etching, "Lace in Stone" by John Taylor Arms, of tne west front (late 15th century) of the Cathedral at Rouen, showing the fragile and delicate elaboration of stone carving, characteristic of the Flamboyant style of later Gothio architecture

original Gothic drawings. a different treatment appears: the spires are pyramidal, with crockets up the edges, and the sides are filled with open work tracery. At Ulm, also, as in Cologne, the spire was built in modern times from 15th century drawings. It is the culmination of the type and rises with a remarkable air of lift and power for more than 500 feet.

GOTHIC ARCHITECTURE IN THE LOW COUNTRIES

Gothic design throughout Belgium and Holland is a mixture of influences from France and Germany. Little transitional work exists, but, especially in Belgium, there are many delightful 13th and 14th century examples which show the dominance of French forms. It is noticeable that a circular column in place of the clustered pier is retained much later than elsewhere in Europe.

The cathedral at Brussels (choir 13th, nave 14th century) and the beautiful church of St. Martin at Ypres, of the same period, are typical. In the flamboyant period of the 15th century German influence became stronger. The cathedral at Antwerp (begun 1352, completed 1474, spire 1518) is remarkable for being a seven aisle church and for its rich, late Gothic spire, obviously indebted to German precedent. The richest of all the flamboyant work is St. Jaques at Liège (1513–38), in which Renaissance elements appear, but without modifying the delicate Gothic structure or harming the lacy intricacy of detail. In Holland, the cathedral at Utrecht (middle 13th century) is a typical French design; much more characteristic are the brick churches of the 15th century, frequently with wooden vaults, such as the new church at Amsterdam and the Great church in Haarlem.

Throughout the Low Countries, however, civic buildings are universally more interesting than ecclesiastical. The great Cloth Hall at Ypres (1200–1304, destroyed during World War I), with its simple range of traceried arcades, and its great central tower, was the largest and most monumental. Others, of the 14th and 15th centuries, though smaller, show greater richness. The town-halls of Brussels, Gouda and Middleburg show the lavish use of pinnacles, tracery and niches that was common. This ornateness of the late Gothic reached a climax in the town-halls of Louvain (1448–63) (now destroyed), and Ghent (1518–35). Certain brick houses at Bruges and other places, in which simple window arrangements are decorated with brick piers and flamboyant wall tracery, and in which stepped gables top the façade, are also interesting.

GOTHIC ARCHITECTURE IN SPAIN

Although Gothic seems to have been introduced into Spain from the south of France by Cistercian monks whose work is shown in the monastery of Poblet (early 13th century), national characteristics were swift in their development. These consist of a tendency toward reducing window sizes, increasing the height of the pier arcades and omitting the triforium, and a love of large scale and lavish ornament, in the use of which Moorish ideas are obvious (as in the contrasting of plain wall surface with rich, concentrated decoration and the tendency to elaborate door compositions until they fill large areas). The cathedrals of Burgos (begun 1221), León (1204–1303) and Toledo (begun 1227) all adhere faithfully to French detail, yet the effect both inside and out, except in the case of León, is non-French. Flat roofs, rugged masonry and large wall surfaces change the exterior effect, and on the interior, the relatively small size of windows, the great widths of bays and the lowness of the nave vault give characteristically Spanish effects. Even the spires of Burgos (1442), though designed by a German architect (Juan de Colonia) in a strictly German style have this Spanish feeling. It was in Catalonia that this feeling achieved its most congenial expression, as in the cathedral of Barcelona (1298) by Jaime Fabre, an architect of great genius from Majorca, Sta. María del Mar, Barcelona (1329), and the nave of Gerona cathedral (begun 1417). All of these are distinguished by tremendous scale and the subdivision of one bay of nave and aisles into two or more chapels at the sides. The two first examples are modified hall type churches. The nave of Gerona cathedral spans in one great sweep (73 ft.) the entire width of the earlier nave and aisles of the choir: it is thus the widest Gothic vault in Europe, and its great size and simple wall surfaces give an effect of striking grandeur.

In the flamboyant work further south, the Moorish influence of the many columned mosques is obvious. The effect of such a plan as that of the old cathedral at Saragossa (15th century), or of Seville (begun 1412) is not of the simple cross plan of north Europe, but rather that of a great rectangular hall with a bewildering succession of piers. Again the love of great scale is evident; Seville is the largest Gothic church in the world. It is in exterior detail that the Moorish influence showed most strongly and developed that peculiar blend of Moorish and Christian forms known as Mudejar, in which Moorish brick panels simulate Gothic forms, as in the tower at Saragossa (1504). The exuberant character of the flamboyant work in the Iberian peninsula achieved an amazing climax in the two monasteries of Batalha and Belem in Portugal. At Batalha a tomb chapel, never completed, was added in 1500 to the early 15th century monastery. In this there occurs a unique lavishness of massy ornament. Some find in it the influence of Indian forms (see INDIAN ARCHITECTURE; and INDONESIAN AND FURTHER INDIAN ARCHITECTURE). The monastery at Belem (1517) shows the same extravagance with interlacing and intersecting cusps, twisted piers and fantastic tracery, but here Renaissance details are already present.

GOTHIC ARCHITECTURE IN ITALY

The persistence of classic detail throughout the middle ages and the vitality of Romanesque construction traditions rendered impossible in Italy any adoption of true Gothic architecture. The Italians never understood the structural basis of northern Gothic. Pointed arches, crockets, pinnacles, tracery, were all considered merely as convenient adjuncts for buildings otherwise Romanesque or basilican. Yet the Italian genius for grand scale and polychrome decoration makes such works as Siena (1260–67) and Orvieto (1290–1330) cathedrals of distinguished and living beauty. The brilliant fronts of Siena and Orvieto, with their coloured marble mosaics and paintings, are mere screens, without relation to the roof lines behind, and the banded interior of Siena, although it uses tracery and pointed arches, is as little Gothic as can be imagined. Everywhere the acanthus leaf, classic moulding decoration and other Roman details are used for ornament, and the richness of inlaid marble floors, of black and white marble banding and of painted vaults and walls makes the effect one of colour rather than of line. The structural basis of tracery disappeared entirely; tracery became a free pattern, often of fantastic richness, in pierced stone. Buttresses and gables are mere surface decorations, as in the cathedral at Florence (14th century). The climax of this development is shown in the exquisite Campanile at Florence (begun 1334), designed, characteristically enough, by Giotto and his pupils (see illustration under CAMPANILE).

Italian fondness for large dimensions is responsible for one of the greatest defects in Italian Gothic churches—the lack of an adequate sense of scale. The piers are so few, the arches so simple, the bays so wide that judgment of size is impossible. For instance, the cathedral at Florence, designed by Arnolfo (begun 1298), the nave vault of which is 150 ft. high, and the pier arches almost 55 ft. wide, gives an impression of barren smallness.

In Venice a local school of great interest and vitality was developed, especially in connection with palace architecture, by treating a Byzantine-like surface decoration of coloured marble with pointed arches and tracery. Walls mere covered with large sheets of veined marble and the Gothic detail applied only to the openings. The result is an impression of great delicacy and richness as in the famous Ca' d' Oro (1430) by Giovani and Bartolommeo Bon; the Doge's Palace (begun 1340) by Pietro Baseggio, is more severe, but its Porta della Charta (15th century), by the Bons, is one of the most lavish examples of the style, interesting in its fantastic crockets combined with human figures.

SECULAR GOTHIC ARCHITECTURE

The 12th century left Europe fundamentally ecclesiastic and feudal. The 16th century found it essentially secular. This development is expressed architecturally by the growing importance in

the design, not only of town and country houses, but also in such civic buildings as town halls and court houses. In secular buildings where floors and roofs are more usually beamed than vaulted, no such structural articulation as that which gave character to Gothic churches was possible, and no imitation was attempted. As a rule, simple wall surfaces predominate; Gothic detail was reserved for doors, windows and occasionally gables. Nevertheless, by the frank treatment of the materials and construction, great beauty was often achieved. Interiors were generally simple, yith exposed masonry walls, originally hung with tapestries; ceiling beams were moulded and polychromed and where the hall went into the peaked roof, an interesting carpentry treatment was developed. In France, the tendency in such halls was toward the use of barrel vault forms; in England, toward separate, strong roof trusses. The council hall of the Palais de Justice, Rouen (c. 1500), and Westminster Hall, London (1394–98) show these two trends. The development of that method of construction known as half timber work (*q.v.*) was also important. In its frank expression of structural elements, it is essentially Gothic, although only occasionally admitting Gothic ornamental forms. While the fortified castle (*q.v.*) was developing into the palatial manor house (*q.v.*), town houses were becoming richer and more complicated, reaching their climax in such exquisite examples as the house of Jacques Coeur at Bourges (early 15th century) and the Hotel de Cluny, Paris, slightly later. (T. F. H.)

GOTHIC ART. Giorgio Vasari, a pupil of Michelangelo, in writing in the 16th century on the arts of architecture and sculpture, speaks of the monuments of the middle ages as being built in a style originated by the Goths, those Germanic races untutored in the classics, and describes the "Gothic" style as being a fantastic heap of spires, pinnacles and grotesque decoration lacking in all the simple beauty of the classical orders. It was not until the middle of the 19th century that this statement was widely discounted.

At the present time the term "Gothic art" is everywhere accepted, though many other names have been suggested. The Gothic period commenced in the 12th century in Middle France and spread through Europe during the 13th, 14th and 15th centuries when it was at length superseded first in Italy and later in the other countries by that huge revival of the classic known as the Renaissance.

Architecturally, the style is primarily perpendicular, consisting of tall slender pillars supporting graceful pointed arches which often spread like the fronds of a palm tree and which are groined similar to those of the Romanesque period. The thrust of these arches was taken up on the outside of the building by the use of buttresses, sometimes solid but often hollowed out to form ogival flying buttresses which act as props against it, and thus we have a style, when brought into use in cathedrals, not unlike the inverted hull of a ship, supported, as is notably the case in the cathedral of Notre Dame of Paris, with widely set props. Upon this general form, often complicated by the addition of various other abutting structures, is erected point upon point and colonnade upon colonnade, a series of spires or pinnacles, the entire formation presenting a structurally beautiful framework. (*See* GOTHIC ARCHITECTURE.)

Ornamentation.—The ornamentation became, as the style advanced, more and more widely different from that of the Romanesque, more and more detailed and ornate. Yet this tremendous amount of detail as is seen in some of the 15th century examples was always well-related and took its proper place in the structural ensemble. (*See* illustrations, GOTHIC ARCHITECTURE.) It consisted of a combination of geometrical designs based upon the circle inherited from the Romanesque period and upon similar curvilinear treatments of the triangular spaces left between the circle and the point of the arch. These shapes can best be likened to motives of the three- or four-leaved clovers or rose designs. On a structure of design so developed added ornamentation of two sorts was employed: first, naturalistic forms or very slightly conventionalized forms of foliage, flowers and birds, with perhaps a more general use of ivy leaves than other leaves; second, grotesque forms of almost unbelievably dreadful and imaginative monsters seeming to spring suddenly from their beautiful surroundings like legendary gnomes, goblins and dwarfs from the forest.

Stained Glass.—Like jewels mounted in these delicately ornate settings of stone, the stained glass windows in all their variety of rich colours cast a burning glow of mysterious and ever-changing light throughout the interiors of the cathedrals in which they were used and incorporate in the design not only the architectural motives with which they were related but many subjects derived from the paintings of the time, including human figures and illustrating various biblical and historical texts. (See STAINED GLASS; SCULPTURE; and PAINTING.) These illustrative figures also were derived from the wealth of sculpture which was added to the exteriors and interiors of buildings and which, though during the 12th century they were treated with severely straight and often stiff and highly conventionalized draperies, soon developed in the 13th and 14th centuries into a beauty which has seldom been surpassed, incorporating what seemed to be living beings in carefully imposed restrictions which make them fall naturally into the spirit of the design.

The paintings followed this same development and were executed either for the illustrations of books of missals or for architectural application in fresco or altar adornment, often for the enhancement of the reredos. There was not much mural treatment as there was little wall space upon which to execute it. Painting and sculpture alike were often treated with the richest of colours and enhanced by the application of gold or jewels. Much of the sculpture which was not primarily architectural was executed in wood, ivory and similar mediums, but the element which marks it all is its beautiful suitability in which never for one instant was the sense of structure forgotten.

Applied Arts.—It veritably seems that during this period every carver of stone or wood or every metal-worker and every carpenter was an artist, for in the making of the simplest furnishings, ornaments or objects of art, it seemed to be natural for them to use structural ornamentation. A simple casket was beautifully decorated by the enhancement of the hinges and lock; the metal studs of a door were made to reflect the feeling of the whole building in design and proportion; the latch became an ornament of rare beauty.

It is evident that a comparatively small amount of pottery and glass was executed aside from the glass used in archi-

tectural ornamentation, but in the carving of wood and stone and in the designing of furniture, such as beds, chairs, chests, etc., the greatest of artistry found its place. Among the most beautiful examples of this art are the choir stalls of which a number of perfect examples exist. Notable among the crafts was the work of the great goldsmiths who in their execution of chalices, reliquaries. monstrances, caskets and jewellery helped to enhance the glory of this period. *(See* SILVERSMITHS' AND GOLDSMITHS' WORK; IRON IN ART; ENAMEL; JEWELLERY; WOOD-CARVING; IVORY CARVING; POTTERIES AND PORCELAINS; STONE CARVING; INTERIOR DECORATION.)

Textiles and Tapestries.--Only a comparatively few textiles have come down to us through the ages but in the paintings and illuminations, superbly beautiful brocades and velvets are shown as they were worn by the personages portrayed. Many of these textiles were executed in Italy, more especially in Venice, and in the 15th century we find a distinct tendency toward the feeling of the Renaissance rather than an upholding of the traditions of the Gothic.

Tapestry weaving, however, became one of the chief arts and in the very ciosely and finely woven wall-hangings which were executed a new expression of art took place. The treatment of the "verdure" types favoured foliage designed to include beautifully related curves forming concavities terminated by sharp points. This design enhanced by the rich colours at that time obtainable developed possibilities of all-over treatment which were exceptionally happy. The *mille fleur* examples, depending upon a dark background sprinkled with beautifully related and delicately executed little plants or flowers with their sensitive curling foliage, were even more exquisite and this type often incorporated figures of animals beautifully drawn and wonderfully executed.

The human figure was also often employed in tapestry weaving and developed all of the life and structural beauty which has been noted in the sculpture of the period. *(See* TAPESTRY; WEAVING.)

Even though the great wave of the Renaissance engulfed much that was Gothic during its development, yet so fundamentally true and beautiful was this style that through all following periods it has from time to time been employed.

Most Christian churches reflect its influence in their architecture and many of the most recent sky-scrapers of the New World will be found upon examination to incorporate certain of its elements. (W. E. Cx.)

GOTHS, a Teutonic people who in the 1st century A.D appear to have inhabited the middle part of the basin of the Vistula. They were probably the easternmost of the Teutonic peoples. According to their own traditions they had come originally from the island Scandza, *i.e.* Skåne or Sweden and landed first in a region called Gothiscandza. Thence they invaded the territories of the Ulmerugi (the Holmryge of Anglo-Saxon tradition), which were probably in the neighbourhood of Riigenwalde in eastern Pomerania, and conquered both them and the neighbouring Vandals.

Early History.— Under their sixth king Filimer they migrated into Scythia and settled in a district which they called Oium. The rest of their early history, as it is given by their historian Jordanes, is due to an erroneous identification of the Goths with the Getae, an ancient Thracian people. The credibility of the story of the migration from Sweden has been much discussed by modern authors. The legend was not peculiar to the Goths, similar traditions being current among the Langobardi, the Burgundians and apparently several other Teutonic nations. Although so many populous nations can hardly have sprung from the Scandinavian peninsula the existence of these traditions certainly requires some explanation. In part, at least, they are probably due to a Scandinavian element in the royal families of the various nations which participated in them. It is also probable that a portion of the Gothic nation came from the isiand of Gotland in the Bairic, for it is clear from archaeological evidence that this island had an extensive trade with the coasts about the mouth of the Vistula.

The first certain references to the Goths in ancient literature go back to the first years of the Christian era, when they seem to have been subject to the Marcomannic king Maroboduus. They do not enter into Roman history until the 3rd century, when their frontier seems to have been advanced considerably farther south, and the whole country as far as the lower Danube was frequently ravaged by them. The emperor Gordian is called "victor Gothorum" by Capitolinus, and further conflicts are recorded with his successors, one of whom, Decius, was slain by the Goths in Moesia. The emperor Gallus was forced to pay tribute to them. and during the next twenty years they frequently ravaged the maritime regions of Asia Minor and Greece. Aurelian is said to have won a victory over them, but the province of Dacia had to be given up. In the time of Constantine the Great, Thrace and Moesia were again plundered by the Goths, A.D. 321. Constantine drove them back and then concluded peace with their king Ariaric.

Though by this time the Goths had extended their territories far to the south and east, it must not be assumed that they had evacuated their old lands on the Vistula. Jordanes records several traditions of their conflicts with other Teutonic tribes, in particular a victory won by Ostrogotha over Fastida, king of the Gepidae, and another by Geberic over Visimar, king of the Vandals, about the end of Constantine's reign, in consequence of which the Vandals sought and obtained permission to settle in Pannonia. Geberic was succeeded by the most famous of the Gothic kings, Hermanaric (Eormenric, Iormunrekr), one of the greatest figures of Germanic saga, whose deeds are recorded in the traditions of all Teutonic nations. According to Jordanes he conquered the Heruli, the Aestii, the Venedi and a number of other tribes who seem to have been settled in the southern part of Russia. From Anglo-Saxon sources it seems probable that his supremacy reached westwards as far as Holstein. To his time belong a number of other heroes whose exploits are recorded in English and Northern tradition, amongst whom we may mention Wudga (Vidigoia), Hama and several others, who in *Widsith* are represented as defending their country against the Huns in the forest of the Vistula. Hermanaric committed suicide in his distress because of an invasion of the Huns about A.D. 370, and the portion of the nation called Ostrogoths then came under Hunnish supremacy.

(F. G. M. B.)

Later History.—From about this time the history of the East and West Goths parts asunder. The East Goths do not at first enter into the history of the Empire. In 376 a great part of the West Gothic people, under their chief, Frithigern, crossed the Danube into the Roman province of Moesia with the approval of the imperial government. Disputes between the new settlers and the Roman officials soon led to a war, marked by the great Gothic

victory at Adrianople in 378, when the emperor Valens was killed. His successor Theodosius the Great made terms with the Goths in 381 and the mass of the Gothic warriors entered the Roman service as *foederati*. Athanaric, the Gothic leader, came to Constantinople in 381; he was received with high honours, and had a solemn funeral when he died.

The death of Theodosius in 395 broke up the union between the West Goths and the Empire. The Goths threw off their allegiance, and chose Alaric as their king. Under him, the Goths are an independent people under a national king; their independence is in no way interfered with if the Gothic king, in a moment of peace, accepts the office and titles of a Roman general. But under Alaric the Goths make no lasting settlement. Cessions of territory are offered to them, provinces are occupied by them, but as yet they do not take root anywhere; no Western land becomes *Gothia*.

Greece was the scene of Alaric's first great campaign, in 395–6. His Italian campaigns fall into two great divisions, that of 402–3, when he was driven back by Stilicho, and that of 408–10, after Stilicho's death. In this second war he thrice besieged Rome (408, 409, 410). The second time it suited a momentary policy to set up a puppet emperor of his own, and even to accept a military commission from him. The third time he sacked the city. The intricate political and military details of these campaigns are of less importance in the history of the Gothic nation than the stage which Alaric's reign marks in the history of that nation. It stands between two periods of settlement within the Empire and of service under the Empire. Under Alaric there is no settlement, and service is quite secondary and precarious; after his death in 410 the two begin again in new shapes.

Under Ataulf, the brother-in-law and successor of Alaric, another era opens, the beginning of enterprises which did in the end lead to the establishment of a settled Gothic monarchy in the West. His position is well marked by the speech put into his mouth by the Roman historian Orosius. He had at one time dreamed of destroying the Roman power, of turning Romania into Gothia, and putting himself in the place of Augustus; but he had learned that the world could be governed only by the laws of Rome and he determined to use the Gothic arms for the support of the Roman power. In many shiftings of allegiance, Ataulf seems never to have wholly given up the position of an ally of the Empire. His marriage with Placidia, the daughter of the great Theodosius, was taken as the seal of the union between Goth and Roman, and, had their son Theodosius lived, a dynasty might have arisen uniting both claims. But the career of Ataulf was cut short by his murder at Barcelona in 415. Under Wallia, who became king in that year, a more settled state of things was established. The Empire received again, as the prize of Gothic victories, the Tarraconensis in Spain, and Novempopulana and the Narbonensis in Gaul. The Roman "Aquitania Secunda" became the West Gothic kingdom of Toulouse. The dominion of the Goths was strictly Gaulish; their lasting Spanish dominion had not begun.

Under Wallia's successor Theodoric I. (419–451) Goths and Romans became for a time united against their common enemy Attila King of the Huns. But they met Gothic warriors in his army. By the terms of their subjection to the Huns, the East Goths came to fight for Attila against Christendom at Châlons, just as the Serbs came to fight for Bajazet against Christendom at Nicopolis. Theodoric fell in the battle (451). After this momentary meeting, the history of the East and West Goths again separates for a while. The West Gothic kingdom of Toulouse grew within Gaul at the expense of the Empire, and in Spain at the expense of the Suevi. Under Euric (466–485) the West Gothic power again became largely a Spanish power. The kingdom of Toulouse took in nearly all Gaul south of the Loire and west of the Rhone, with all Spain, except the north-west corner, which was still held by the Suevi. Provence alone remained to the Empire. The West Gothic kings largely adopted Roman manners and culture; but, as they still kept to their original Arian creed, their rule never became thoroughly acceptable to their Catholic subjects. They stood, therefore, at a great disadvantage when a new and aggressive Catholic power appeared in Gaul through the conversion of the Frank Clovis. In 507 the West Gothic king Alaric II. fell before the Frankish arms at Campus Vogladensis, near Poitiers, and his kingdom, as a great power north of the Alps, fell with him. That Spain and a fragment of Gaul still remained to form a West Gothic kingdom was owing to the intervention of the East Goths under the rule of the greatest man in Gothic history.

When the Hunnish power broke in pieces on the death of Attila, the East Goths recovered their full independence. Even before this time, in 406, a large body of Goths, apparently belonging to the eastern branch of their race, had invaded Italy under their king Radagais. Later in the century, the East Goths entered into relations with the Empire and obtained a settlement in Pannonia. Subsequently, they play in south-eastern Europe nearly the same part which the West Goths played in the century before. Towards the close of the 5th century their royal house produced a great figure, famous alike in history and in romance, in the person of Theodoric, son of Theodemir. Theodoric the Great is sometimes the friend, sometimes the enemy, of the Empire, but in all cases alike he remains the national East Gothic king. It was both as Gothic leader and as ally of the Empire that he set out in 488, by commission from the emperor Zeno, to recover Italy from Odoacer. By 493 the East Gothic power was fully established over Italy, Sicily, Dalmatia and the lands to the north of Italy. Under Theodoric the history of the East and West Goths converges again, through the marriage of a daughter of Theodoric to the Visigothic king Alaric II. After Alaric's fall in 507 his heir was protected by Theodoric, in whose later years the kingdoms of the East and West Goths were in effect united.

The East Gothic dominion was now again as great in extent and far more splendid than it could have been in the time of Hermanaric. But it was now of a wholly different character. The dominion of Theodoric was not a barbarian but a civilized power. His twofold position ran through everything. He was at once national king of the Goths, and successor, though without any imperial titles, of the Roman emperors of the West. The two nations, differing in manners, language and religion, lived side by side on the soil of Italy; each was ruled according to its own law, by the prince who was, in his two separate characters, the common sovereign of both. The Goths seem to have been thick on the ground in northern Italy; in the south they formed little more than garrisons. In Theodoric's theory the Goth was the armed protector of the peaceful Roman; the Gothic king had the toil of government, while the Roman consul had the honour. All the forms of the Roman administration went on, and the Roman polity and culture had great influence on the Goths themselves.

Such a system as that which Theodoric established needed a Theodoric to carry it on. On his death (526) the East and West Goths were again separated. Amalaric, son of Alaric II., succeeded to the West Gothic kingdom in Spain and Septimania. Provence was added to the dominion of the new East Gothic king Athalaric, the grandson of Theodoric through his daughter Amalaswintha. But the essential weakness of the East Gothic position in Italy now showed itself. The long wars of Justinian's reign (535–555) recovered Italy for the Empire, and the Gothic name died out.

The West Gothic kingdom lasted much longer, and came much nearer to establishing itself as a national power in the lands which it took in. But its history was long influenced by the difference of race and faith between the Arian Goths and the Catholic Romans of Gaul and Spain. The Arian Goths ruled over Catholic subjects, and were surrounded by Catholic neighbours. The Catholics everywhere preferred either Roman, Suevian or Frankish rule to that of the heretical Goths; even the unconquerable mountaineers of Cantabria seem for a while to have received a Frankish governor. In some other mountain districts the Roman inhabitants long maintained their independence, and in 534 a large part of the south of Spain, including the great cities of Cadiz, Cordova, Seville and New Carthage, was, with the good will of its Roman inhabitants, reunited to the Empire, which kept some points on the coast as late as 624. That is to say, the same work which the Empire was carrying on in Italy against the East Goths was at the same moment carried on in Spain against the West Goths. But in Italy the whole land was for a while won back, and

the Gothic power passed away for ever. In Spain the Gothic power outlived the Roman power, but it outlived it only by itself becoming in some measure Roman. The greatest period of the Gothic power as such was in the reign of Leovigild (568–586). He reunited the Gaulish and Spanish parts of the kingdom which had been parted for a moment; he united the Suevian dominion to his own; he overcame some of the independent districts, and won back part of the recovered Roman province in southern Spain. He further established the power of the crown over the Gothic nobles, who were beginning to grow into territorial lords. The next reign. that of his son Reccared (586–601), was marked by a change which took away the great hindrance which had thus far stood in the way of any national union between Goths and Romans. The king and the greater part of the Gothic people embraced the Catholic faith. A vast degree of influence now fell into the hands of the Catholic bishops; the two nations began to unite; the Goths were gradually romanized and the Gothic language began to go out of use. In short, the Romance nation and the Romance speech of Spain began to be formed. The kingdom, however, still remained a Gothic kingdom. "Gothic," not "Roman" or "Spanish," is its formal title; only a single late instance of the use of the formula "regnum Hispaniae" is known. In the first half of the 7th century that name became for the first time geographically applicable by the conquest of the still Roman coast of southern Spain. The Empire was then engaged in the great struggle with the Avars and Persians, and, now that the Gothic kings were Catholic, the great objection to their rule on the part of the Roman inhabitants was taken away. The modern Spanish nation is the growth of the long struggle with the Mussulmans, which followed the overthrow of the Visigothic kingdom in 711. Nevertheless, the Goths hold altogether a different place in Spanish memory from that which they hold in Italian memory. In Italy the Goth was but a momentary invader and ruler. In Spain the Goth supplies an important element in the modern nation. And that element has been neither forgotten nor despised. Part of the unconquered region of northern Spain, the land of Asturia, kept for a while the name of Gothia, as did the Gothic possessions in Gaul and in the Crimea. The name of the people who played so great a part in all southern Europe, and who actually ruled over so large a part of it has now wholly passed away; but it is in Spain that its historical impress is to be looked for.

Among the West Goths written laws had already been put forth by Euric. Alaric II. (484–507) put forth a Breviarium of Roman law for his Roman subjects; but the great collection of West Gothic laws dates from the later days of the monarchy, being issued by King Recceswinth about 654. Of special Gothic histories, besides that of Jordanes, already so often quoted, there is the Gothic history of Isidore, archbishop of Seville, a special source of the history of the West Gothic kings down to Svinthala (621–631). Not for special facts, but for a general estimate, no writer is more instructive than Salvian of Marseilles in the 5th century, whose work De Gubernatione **Dei** is full of passages contrasting the vices of the Romans with the virtues of the barbarians, especially of the Goths. In all such pictures we must allow a good deal for exaggeration both ways, but there' must be a ground-work of truth. The chief virtues which the Catholic presbyter praises in the Arian Goths are their chastity, their piety according to their own creed, their tolerance towards the Catholics under their rule, and their general good treatment of their Roman subjects. He even ventures to hope that such good people may be saved, notwithstanding their heresy. For the Gothic language see below. (E. A. F.)

There is now an extensive literature on the Goths, and among the principal works may be mentioned: *T.* Hodgkin, *Italy and her Invaders* (Oxford, 1880–99); F. Dahn, *Die Könige der Germanen* (1861–99); *E.* von Wietersheim, *Geschichte der Volkerwanderung* (1880–81); R. Pallmann, *Dze Geschichte der Völkerwanderung* (Gotha, 1863–64); B. Rappaport, *Die Einfalle der Goten in das romische Reich* (Leipzig, 1899), and K. Zeuss, *Die Deutschen und die Nachbarstämme* (Munich, 1837). Other works which may be consulted are: E. Gibbon, *Decline and Fall of the Roman Empire*, edited *by J.* B. Bury (1896–1900); J. B. Bury, *History of the Later Roman Empire* (1889); P. Villari, *Le Invasioni barbariche in Italia* (Milan, 1901); and F. Martroye, *L'Occident à l'époque byzantine: Goths et Vandales* (Paris. 1903). There is a popular history of the Goths by H. Bradley in the "Story of the Nations" series (London, 1888). For the laws *see* the *Leges* in Band *I.* of the *Monumenta Germaniae historica, Leges* (1902); *A.* Helfferich, *Entstehung und Geschichte des Westgotenrechts* (Berlin, 1858); F. Bluhme, *Zur Textkritik des Westgotenrechts* (1872); F. Dahn, *Lex Visigothorum. Westgotische Studien* (Würzburg, 1874); C. Rinaudo, *Leggi dei Visigote, studio* (Turin, 1878); and K. Zeumer, "Geschichte der westgotischen Gesetzgebung" in the *Neues Archiv der Gesellschaft fur ältere deutsche Geschichtskunde. See* also THEODORIC.

Gothic Language. — Our knowledge of the Gothic language is derived almost entirely from the fragments of a translation of the Bible which is believed to have been made by the Arian bishop Wulfila or Ulfilas (d. 383) for the Goths who dwelt on the lower Danube. The mss. which have come down to us and which date from the period of Ostrogothic rule in Italy (489–555) contain the Second Epistle to the Corinthians complete, together with more or less considerable fragments of the four Gospels and of all the other Pauline Epistles. The only remains of the Old Testament are three short fragments of Ezra and Nehemiah. There is also an incomplete commentary on St. John's Gospel, a fragment of a caiendar, and two charters (from Naples and Arezzo, the latter now lost) which contain some Gothic sentences. All these texts are written in a special character, which is said to have been invented by Wulfila. It is based chiefly on the uncial Greek alphabet, from which indeed most of the letters are obviously derived, and several orthographical peculiarities, *e.g.*, the use of *ai* for e and ei for *ī* reflect the Greek pronunciation of the period. Other letters, however, have been taken over from the Runic and Latin alphabets. Apart from the texts mentioned above, the only remains of the Gothic language are the proper names and occasional words which occur in Greek and Latin writings, together with some notes, including the Gothic alphabet, in a Salzburg ms. of the 10th century, and two short inscriptions on a torque and a spear-head, discovered at Buzeo (Walachia) and Kovel (Volhynia) respectively. The language itself, as might be expected from the date of Wulfila's translation, is of a much more archaic type than that of any other Teutonic writings which we possess, except a few of the earliest Northern inscriptions. This may be seen, *e.g.*, in the better preservation of final and unaccented syllables and in the retention of the dual and the middle (passive) voice in verbs. It would be quite erroneous, however, to regard the Gothic fragments as representing a type of language common to all Teutonic nations in the 4th century. Indeed the distinctive characteristics of the language are very marked, and there is good reason for believing that it differed considerably from the various northern and western languages, whereas the differences among the latter at this time were probably comparatively slight (see TEUTONIC LANGUAGES). On the other hand, it must not be supposed that the language of the Goths stood quite isolated. Procopius (Vand. i. 2) states distinctly that the Gothic language was spoken not only by the Ostrogoths and Visigoths but also by the Vandals and the Gepidae; and in the former case there is sufficient evidence, chiefly from proper names, to prove that his statement is not far from the truth. With regard to the Gepidae we have less information; but since the Goths, according to Jordanes (cap. 17), believed them to have been originally a branch of their own nation, it is highly probable that the two languages were at least closely related. Procopius elsewhere (*Vand.* i. 3; Goth. i. 1, iii. 2) speaks of the Rugii, Sciri and Alani as Gothic nations. The fact that the two former were sprung from the north-east of Germany renders it probable that they had Gothic affinities, while the Alani, though non-Teutonic in origin, may have become gothicized in the course of the migration period.

In the 4th and 5th centuries the Gothic language — using the term in its widest sense — must have spread over the greater part of Europe together with the north coast of Africa. It disappeared, however, with surprising rapidity. There is no evidence for its survival in Italy or Africa after the fall of the Ostrogothic and Vandal kingdoms, while in Spain it is doubtful whether the Visigoths retained their language until the Arabic conquest. In central Europe it may have lingered somewhat longer in view of the evidence of the Salzburg ms. mentioned above. Possibly the in-

formation there given was derived from southern Hungary or Transylvania where remains of the Gepidae were to be found shortly before the Magyar invasion (889). According to Walafridus Straba (de Reb. Eccles. cap. 7) also, Gothic was still used in his time (the 9th century) in some churches in the region of the lower Danube. Thenceforth the language seems to have survived only among the Goths (*Goti* Tetraxitae) of the Crimea, who are mentioned for the last time by Ogier Ghislain de Busbecq, an imperial envoy at Constantinople about the middle of the 16th century. He collected a number of words and phrases in use among them which show clearly that their language was still essentially a form of Gothic. (H. M. C.)

The more important phonetic changes are:—

(1) *e* became i always; e.g., *wigs* (road). But *i* later became e (written *ai* in Ulfilas' orthography) before *r, h;* e.g., *hairdeis* (herdsman).

(2) *u* became o (written au) before *r, h;* e.g., *baurgs.* (In Ulfilas' orthography the letters transcribed e, o are used for long vowels only.)

(3) *ai,* au became *ē,* 6; but the digraphs were still written.

(4) short vowels (except u) in final syllables were lost; e.g., *dags, gasts: dazaz, -gastiz.*

(5) final nasals and explosives were lost; e.g., sunu (Acc. sing.): Skr. *sūnum.*

(6) final long vowels (including those which had become final through the last change) were (in general) shortened (*ī>i, ō>a, ē>a*); e.g., waurhta (1 sing. pret.): (N. inscr.) *worahtō; liuba* (N. sing. fem.): (N. inscr.) *liubu.*

(7) voiced spirants when final (also before s) became voiceless; e.g., bap (3 sing. pret. of bidjan).

All these changes which occurred before or during the 4th century rendered the Gothic language hardly intelligible to a person who spoke a northern or western language. At a later date Gothic underwent further changes which do not appear in Ulfilas' version (c. 370 A.D.), or only to a slight extent.

(1) *i* became a close e- sound; e.g., Venethae (Jordanes), for *Winid-.*

(2) *u* became a close *o* sound: *e.g.,* Πόγοι (Procopius): Rugii; later o became a in unaccented syllables, e.g., *ūraz* (for -us).

(3) *ē* became i; e.g., leikeis for *lekeis* (not infrequently in the MSS.).

(4) *ō* became *ū;* e.g., *sunjus* for sunjos.

The Gothic and Scandinavian (*q.v.*), languages have one or two characteristics in common, the most important of which is the treatment of intervocalic j and *w* in a number of words. In the former case we find Goth. *-ddj-* and O.N. *-ggi-,* whereas in German a diphthong developed; *e.g.,* Goth. *twaddje* (Gen. of twai, "two"). In the latter case both Goth. and Scand. had *ggw* while a diphthong appears both in English and German, *e.g.,* Goth. *triggws* ("true"), Anglo-Saxon *getrīowe, getrīewe,* Old High German *gitriuwi.* Gothic and Scandinavian preserved the ending *-t* in the 2 singular of the strong Preterite, while English and German had a different form with the stem of the plural. By the 4th or 5th century the Scandinavian languages had far more resemblance to English and German than to Gothic.

GOTLAND, an island in the Baltic sea belonging to Sweden, lying between 57° and 58° N., and having a length from S.S.W. to N N.E. of 75 mi., a breadth not exceeding 30 mi. and an area of 1,220 sq.mi. The nearest point on the mainland is 50 mi. from the westernmost point of the island. With the island Fårö, off the northern extremity, the Karlsoe, off the west coast, and Gotska Sando, 25 mi. N. by E., Gotland forms the administrative district (lan) of Gotland. The island is a level plateau of Silurian limestone, rising gently eastward, with a few low isolated hills inland, and with steep coasts fringed with free-standing columns of limestone (raukar). The climate is temperate, and the soil, although in parts dry and sterile, is mostly fertile. Rye, wheat and oats are grown, and especially barley, which is exported to the breweries on the mainland. The sugar beet is also produced and exported, and there are beet-sugar works on the island. Sheep and cattle are kept; there is a government sheep farm at Roma, and the cattle may be noted as belonging principally to an old native breed, yellow and horned. Some lime-burning, cement-making and sea-fishing are carried on. The capital of the island is Visby, on the west coast. The shrunken walled town of Visby was one of the richest commercial centres of the Baltic from the 11th to the 14th century, and its prosperity was shared by the whole island. It retains ten churches besides the cathedral. The massive towers of the village churches are often detached, and doubtless served purposes of defense. The churches of Roma, Hemse, with remarkable mural paintings, Othen and Larbo may be specially noted. Some contain fine stained glass, as at Dalhem near Visby. The natives of Gotland speak a dialect distinguished from that of any part of the Swedish mainland. Pop. of *län* (est. 1940) 58,444. Density per sq.mi. 48.

HISTORY

Gotland has a remarkable history, the most important part of which goes back to mediaeval times. Already in the early period of the Stone Age the island was a centre of trade and shipping in the Baltic, and its commercial importance increased during the Bronze and Iron Ages. Out of the 7,000 Roman coins dating from the two first centuries after Christ which have been found in Scandinavia more than 5,000 have come from Gotland, while most of the Byzantine *solidi* and of those from the Western empire were dug up on the islands of Gotland, Öland and Bornholm. About 30,000 Arabic coins have been found in Scandinavia, more than half of them in Gotland. Hence it is deduced that the island was a commercial centre for Sweden, Denmark, Germany and eastern Europe with connections extending far beyond this region. After the Scandinavian countries had been converted to Christianity, pilgrims from Norway and Sweden often travelled to the Holy Land by way of Gotland.

During the 9th century Gotland ranked as part of Sweden although in administration and government it was largely autonomous. The peasants of the island were also traders and their wealth was famous far and wide. Nearly 100 churches were built or restored during the island's great days. A town came into existence at Visby and German merchants took up their abode there. The peasant-traders found their competition injurious and. open strife broke out between the townsfolk and the countryfolk. About A.D. 1280 the Swedish king, Magnus Ladulås, bound the island closer to Sweden and levied taxes as a punishment for these disturbances. During the 14th century Visby continued to be talked about as the richest city in Scandinavia. Covetous neighbours were tempted by this and the Danish king, Valdemar Atterdag, invaded the island in the year 1361 and defeated an army of peasants outside Visby, which became his prey. Visby was a member at this period of the Hanseatic league which now united with Sweden and Norway against Denmark, but owing to dissensions among the allies the Danish king went unscathed. During the later portion of the middle ages Visby and the whole island of Gotland were a resort for pirates and for foreign invaders such as the *Vitelianerna* (from Mecklenburg), the Teutonic knights, the Danes, and Erik of Pomerania who from the vantage point of the newly-built castle of Visborg spread terror over this part of the Baltic during the years 1437–49. The Danish country nobles, the brothers Tott, exercised the lofty calling of Sea-rovers from the island during the years 1449–87. The island belonged de *facto* to Denmark and was formally transferred to the Danish throne

by Sweden by the Peace of Stettin in 1570. Through the Peace of Bromsebro, in 1645, Sweden regained the island, which has since continued to belong to her except during the years 1676–79, when the Danes occupied it and for some weeks in 1808.

During the middle ages the special laws of Gotland were kept on the island. The importance of Visby in the sea-trade of the world is conclusively attested by the famous code of maritime law which bears its name. This "sea law which the merchants and seamen have made at Visby" (*"Waterrecht dat de Kooplüde en de Schippers gemakt hebben to Visby"*) was a compilation based upon the Liibeck code and was first printed in Low German in 1505 but probably dated back to about 1240 *(see* SEA LAWS).

Visby boasts a number of fine ruins of churches and a large portion of its walls dates from mediaeval times. It has become in consequence one of Sweden's principal tourist resorts.

GOTO, SHIMPEI, VISCOUNT (1856–1929), Japanese politician, was born in Iwate-Ken and studied medicine in Germany. As the first civil administrator of Taiwan (Formosa) under Gen Kodama in 1898, and as the first president of the South Manchuria railway in 1906, he laid the groundwork of Japan's colonial enterprises. He was minister of communications in 1908 and 1912; of home affairs in 1916; foreign affairs in 1918; and mayor of Tokyo (1921–22). He exchanged conversations with M. Joffe regarding the reopening of Russo-Japanese relations upon his own initiative and personal responsibility in 1922. After the great Japanese earthquake in 1923 he became again minister of home affairs. He died at Kyoto on April 13, 1929.

GOTO RETTO, a group of islands belonging to Japan, lying west of Kyushu, in 33° N., 129° E. The southern of the two principal islands, Fukae-shima, measures 17 mi. by 13½; the northern Nakaori-shima, measures 23 mi. by 7½. The islands are distant some 50 mi. from Nagasaki and are highly cultivated.

GOTTER, FRIEDRICH WILHELM (1746–1797), German poet and dramatist, was born on Sept. 3, 1746, at Gotha. After the completion of his university career at Gottingen, he was appointed second director of the Archive of his native town, and subsequently went to Wetzlar, the seat of the imperial law courts, as secretary to the Saxe-Coburg-Gotha legation. In 1768 he returned to Gotha as tutor to two young noblemen, and here, together with H. C. Boie, he founded the famous *Göttinger Musenalmanach.* In 1770 he was once more in Wetzlar, where he belonged to Goethe's circle of acquaintances. Four years later he settled in Gotha, where he died on March 18, 1797. Gotter was the chief representative of French taste in the German literary life of his time. His own poetry is elegant and polished, and in great measure free from the trivialities of the Anacreontic lyric of the earlier generation of imitators of French literature; but he was lacking in imaginative depth. His plays were mostly based on French originals.

Gotter's collected *Gedichte* appeared in 2 vols. in 1787 and 1788; a third volume (1802) contains his *Literarischer Nachlass. See* B. Litzmann, *Schroder und Gotter* (1887), and R. Schlosser, F. W. *Gotter, sein Leben und seine Werke* (1894).

GOTTFRIED VON STRASSBURG (*fl.* 1210), one of the chief German mediaeval poets. The dates of his birth and death are unknown, but he was the contemporary of Hartmann von Aue, Wolfram von Eschenbach and Walther von der Vogelweide, and his epic *Tristan,* which bears witness to his education, was written about 1210. The story of *Tristan* had been evolved from its shadowy Celtic origins by the French *trouvkres* of the early 12th century, and had already found its way into Germany before the close of that century, in the unpolished version of Eilhart von Oberge. It was Gottfried who gave it its final form, his version being based on that of a *trouvkre* Thomas, of which only fragments remain. The story centres in the fatal voyage which Tristan, a vassal to the court of his uncle King Marke of Kurnewal (Cornwall), makes to Ireland to bring back Isolde as the king's bride. On the return voyage Tristan and Isolde drink by mistake a love potion, which binds them irrevocably to each other. The epic resolves itself into a series of love intrigues in which the two lovers ingeniously outwit the trusting king. They are ultimately discovered, and Tristan flees to Normandy where he marries another Isolde—"Isolde with the white hands"—without being able to forget the blond Isolde of Ireland. At this point Gottfried's narrative breaks off and the conclusion is supplied by Ulrich von Tiirheim and Heinrich von Freiberg. After further love adventures Tristan is fatally wounded by a poisoned spear in Normandy; the "blond Isolde," as the only person who has power to cure him, is summoned from Cornwall. The ship that brings her is to bear a white sail if she is on board, a black one if not. Tristan's wife, however, deceives him, announcing that the sail is black, and when Isolde arrives, she finds him dead.

Though following closely the narrative of events found in Thomas, Gottfried has introduced into the story an astounding fineness of psychological motive, which, to judge from a general comparison of the Arthurian epic in both lands, is German rather than French; he has spiritualized and deepened the narrative; he has, above all, depicted with a variety and insight, unusual in mediaeval literature, the effects of an overpowering passion. Yet, glowing and seductive as Gottfried's love scenes are, they are never disfigured by frivolous hints; the tragedy is unrolled with an earnestness that admits of no touch of humour, and also with a freedom from moralizing. The mastery of style is no less conspicuous. Gottfried had learned his best lessons from Hartmann von Aue, but he was a more original and daring artificer of rhymes and rhythms than that master; he delighted in the sheer music of words, and indulged in antitheses and allegorical conceits to an extent that proved fatal to his imitators. As far as beauty of expression is concerned, Gottfried's *Tristan* is the masterpiece of the German court epic.

Gottfried's *Tristan* has been frequently edited. by H. F. Massman (Leipzig, 1843); by R. Bechstein (2 vols., 3rd ed., Leipzig, 1890–91); by W. Golther (2 vols., Stuttgart, 1889); by K. Marold (1906). There is a good German trans. by W. Hertz (Stuttgart, 1877), and an abbreviated English trans. by J. L. Weston (1899). The continuation of Ulrich von Turheim will be found in Massman's edition; that by Heinrich von Freiberg has been separately edited by R. Bechstein (Leipzig, 1877). *See* also R. Heinzel, "Gottfrieds von Strassburg Tristan und seine Quelle" in the *Zeit. für deut. Alt* xiv (1869); W. Golther, *Die Sage von Tristan und Isolde* (Munich, 1887); F. Piquet, *L'Originalité de Gottfried de Strasbourg dans son poème de Tristan et Isolde* (Lille, 1905); K. Immermann (*q.v.*) has written an epic of *Tristan und Isolde* (1840), R. Wagner (*q.v.*) a musical drama (1865). *See* R. Bechstein, *Tristan und Isolde in der deutschen Dichtung der Neuzeit* (Leipzig, 1877); B. Dittrich, *Die Darstellung der Gestalten in Gottfrieds "Tristan"* (Greifswald, 1914); L. L. Wolff, *Der Gottfried von Strassburg Zugeschriebene Marienpreis und Lobgesang auf Christus,* text and comment (Jena, 1924).

GOTTHELF, JEREMIAS: *see* BITZIUS, ALBRECHT.

GÖTTINGEN, a town in the Prussian province of Hanover, Germany, at the west foot of the Hainberg, in the valley of the Leine, 67 mi. S. from Hanover. Pop. (1939) 54,199. A village of Goding or Gutingi is named in documents of about A.D. 950. The place received municipal rights from the German king Otto IV about 1210, and during the 14th century it held a high place in the Hanseatic League. In 1531 it joined the Reformation movement, and in the following century it suffered considerably in the Thirty Years' War. After a century of decay, it was anew brought into importance by the establishment of its university; and a marked increase in its industrial and commercial prosperity has again taken place in recent years. Towards the end of the 18th century Gottingen was the centre of a society of young poets of the *Sturm und Drang* period of German literature, known as the *Gottingen Dichterbund* or *Hainbund (see* GERMAN LITERATURE).

The town is traversed by the Leine canal, which separates the Altstadt from the Neustadt and from Masch, and is surrounded by ramparts. The old streets are crooked and narrow. Gottingen possesses a mediaeval town hall, built in the 14th century and restored in 1880. Industries include branches of the publishing trade, manufacture of cloth and woollens and of scientific instruments. The university, founded by George II in 1734 and opened in 1737, rapidly attained fame. Political disturbances, in which

both professors and students were implicated, and the expulsion in 1837 of seven professors—Die *Göttinger Sieben*—for protesting against the revocation by King Ernest Augustus of Hanover of the liberal constitution of 1833, reduced the prosperity of the university. The events of 1848, on the other hand, told somewhat in its favour; and, after the annexation of Hanover in 1866, it was carefully fostered by the Prussian government. The main university building lies on the Wilhelmsplatz, and, adjoining, is the library with the richest collection of modern literature in Germany. There are zoological. ethnographical and mineralogical collections, the most remarkable being Blumenbach's collection of skulls. The Society of Sciences (Sozietat der *Wissenschaften*) is well known and publishes the *Göttingische gelehrte Anzeigen.*

GÖTTLING, CARL WILHELM (1793–1869), German classical scholar, was born at Jena, where he was professor from 1822 till his death. In his early years Gottling devoted himself to German literature and published two works on the Nibelungen; Uber das *Geschichtliche im Nibelungenliede* (1814) and *Nibelungen und* Gibelinen (1817). The greater part of his life, however, was devoted to the study of classical literature. The contents of his *Gesammelte Abhandlungen* aus dem *klassischen Altertum* (1851–63) and *Opuscula Academica* (published in 1869 after his death) show the varied nature of his studies.

See memoirs by C. Nipperdey, his colleague at Jena (1869), and G. Lothholz (Stargard, 1876).

GOTTSCHALK [GODESCALUS, GOTTESCALE] (*c.* 808–867?), German theologian, was born near Mainz, the son of a Saxon noble who obliged him to enter the Benedictine monastery of Fulda, then under the abbot Hrabanus Maurus. In 829, at the synod of Mainz, on the pretext that he had been unduly constrained by his abbot, he obtained his liberty, withdrew first to Corbie and then to Orbais where his study of St. Augustine led him to support the doctrine of absolute predestination and the denial of liberty and responsibility. Between 835 and 840 Gottschalk was ordained priest, and went to Italy. Driven out through the influence of Hrabanus Maurus, now archbishop of Mainz, he travelled through Dalmatia, Pannonia and Norica, preaching and writing. In 848 he presented to the synod at Mainz a profession of faith and a refutation of the accusations by Hrabanus Maurus. He was convicted of heresy however, obliged to swear that he would never enter the territory of Louis the German, and handed over to Hincmar, archbishop of Reims.

The next year at a provincial council at Quierzy, presided over by Charles the Bald, Gottschalk attempted to justify his ideas, but was again condemned, was degraded from the priesthood, and shut up in the monastery of Hautvilliers. There Hincmar tried again to induce him to retract, but he continued to defend his doctrine, and a great controversy resulted. Prudentius, bishop of Troyes, Wenilo of Sens, Ratramnus of Corbie, Loup of Ferrières and Florus of Lyons wrote in his favour. Hincmar wrote De *praedestinatione* and De una non trina deitate against his views, and called in Erigena. The question was discussed at the councils of Kiersy (853), of Valence (855) and of Savonnières (859). Finally Pope Nicolas I. took up the case, and summoned Hincmar to the council of Metz (863). Hincmar declared that Gottschalk might defend himself before the pope. Nothing came of this, and Gottschalk died without recanting. Of his many works we have only the two professions of faith (cf. Migne, Patrol. Lat., cxxi.), and some poems, ed. L. Traube in *Mon.* Germ. *hist.:* Poetae *Latini aevi Carolini* (t. iii., 1896). Fragments of his theological treatises have been preserved in the writings of Hincmar, Erigena, Ratramnus and Loup of Ferrikres.

From the 17th century, when the Jahsenists exalted Gottschalk, much has been written on him. Mention may be made of F. Picavet's "Les Discussions sur la liberté au temps de Gottschalk, de Raban Maur, d'Hincmar, et de Jean Scot," in Comptes *rendus* de l'acad. des sciences morales et *politiques* (1896); and A. Freystedt's "Studien zu Gottschalks Leben und Lehre," in Zeitschrift fur Kirchengeschichte (1897). Further bibliography in Uberweg's Gesch. der Philosophie.

GOTTSCHALL, RUDOLF VON (1823–1909), German man of letters, was born at Breslau on Sept. 30, 1823, the son of a Prussian artillery officer. He studied law at Konigsberg, but was expelled on account of his Liberalism. Breslau and Leipzig proved equally intolerant, and he completed his studies in Berlin. During this period he wrote Lieder der *Gegenwart* (1842) and *Zensurflüchtlinge* (1843)—the poetical fruits of his political enthusiasm. In 1852 he married Marie, baroness von Seherr-Thoss, and for the next few years lived in Silesia. In 1864 he settled in Leipzig. Down to 1887 Gottschall edited the *Brockhaus'sche* Blatter *für litterarische Unterhaltung* and the monthly periodical Unsere Zeit.

Among Gottschall's volumes of lyric poetry are *Sebastopol* (1856). Janus (1873), Bunte *Blüten* (1891); among his epics, *Carlo* Zeno (1854), *Maja* (1864), dealing with an episode in the Indian Mutiny, and *Merlins Wanderungen* (1887). Pitt *und* Fox (1854) was his best comedy. The tragedies, *Mazeppa,* Catharine Howard, Amy Robsart and Der *Götze* von *Venedig,* were written in imitation of Schiller. His historical novels, *Im* Banne des *schwarzen Adlers* (1875; 4th ed., 1884), Die Erbschaft des *Blutes* (1881), Die Tochter *Rübezahls* (1889), and Verkummerte *Existenzen* (1892), enjoyed great popularity. His critical work includes Die deutsche *Nationalliteratur* des *19. Jahrhunderts* (1855; 7th ed., 1901–02), and Poetik (1858; 6th ed., 1903). See his autobiography, *Aus* meiner *Jugend* (1898).

GOTTSCHED, JOHANN CHRISTOPH (1700–1766), German author and critic, was born on Feb. 2, 1700, at Judithenkirch near Konigsberg, the son of a Lutheran clergyman. He studied at Konigsberg, and in 1723, on taking his degree, fled to Leipzig in order to evade Prussian military service. In 1730 he was appointed extraordinary professor of poetry, and, in 1734, ordinary professor of logic and metaphysics in the university. He died at Leipzig on Dec. 12, 1766.

Gottsched's chief work was his *Versuch* einer kritischen *Dichtkunst* fur die *Deutschen* (1730), the first systematic treatise in German on the art of poetry from the standpoint of Boileau. His *Ausführliche Redekunst* (1728) and his *Grundlegung einer* deutschen *Sprachkunst* (1748) were of importance for the development of German style and the purification of the language. He wrote several plays, including Der *sterbende* Cato (1732), an adaptation of Addison's tragedy. In his *Deutsche* Schaubiihne (6 vols., 1740–45), which contained mainly translations from the French, he provided the German stage with a classical repertory, and prepared a bibliography of the German drama, *Nötiger* Vorrat *zur Geschichte* der *deutschen dramatischen Dichtkunst* (1757-6 j). He was also the editor of several literary journals. As a critic, Gottsched insisted on German literature being subordinated to the laws of French classicism. In 1740 he came into conflict with the Swiss writers Johann Jakob Bodmer (*q.v.*) and Johann Jakob Breitinger (1701–76), who, under the influence of Addison and contemporary Italian critics, demanded that the poetic imagination should not be hampered by artificial rules; they pointed to the great English poets, and especially to Milton. Gottsched clung the more tenaciously to his pseudo-classicism, and, in the fierce controversy which for a time raged between Leipzig and Zurich, he was inevitably defeated.

His wife, Luise Adelgunde Victorie, *née* Kulmus (1713–62), wrote several popular comedies, of which Das Testament is the best, and translated the Spectator (9 vols., 1739–43), Pope's Rape of *the* Lock (1744) and other English and French works. After her death her husband edited her *Sämtliche kleinere* Gedichte.

See T. W. Danzel, Gottsched und seine Zeit (Leipzig, 1848); J. Cruger, Gottsched, Bodmer, und Breitinger (with selections from their writings) (Stuttgart, 1884); F. Servaes, Die Poetik Gottscheds und der Schweizer (Strasbourg, 1887); E. Wolff, Gottscheds *Stellung im deutschen Bildungsleben* (2 vols., Kiel, 1895–97), and G. Waniek, Gottsched und die deutsche Literatur seiner Zeit (Leipzig, 1897). A movement for the rehabilitation of Gottsched, whose real merits were derided after the victory of romanticism, was undertaken by E. Reichel in a series of works on Gottsched from 1900 onward, and by a new edition (1902–06) of his Gesammelte Schriften. On Frau Gottsched, see P. Schlenther, Frau Gottsched und die *bürgerliche* Komodie (1886).

GOTZ, JOHANN NIKOLAUS (1721–1781), German poet, was born at Worms on July 9, 1721. He studied theology at Halle (1739–42), where he became intimate with the poets J. W. L. Gleim and J. P. Uz, acted for some years as military chaplain, and afterwards filled various other ecclesiastical offices. He died at Winterburg on Nov. 4, 1781. Gotz wrote short lyrics and several translations, of which the best is a rendering of Anacreon. The best known of his poems is the elegy Die *Mädcheninsel.*

Gotz's *Vermischte Gediclzte* were published with biography by K. W. Ramler (Mannheim, 1785; new ed., 1807). *See* also *Briefe von und an J. N. Gotz,* ed. by C. Schiiddekopf (1893).

GOUACHE, a French word adapted from the Ital. *guazzo* (probably in origin connected with "wash"), meaning literally a "ford," but used also for a method of painting in opaque water-colour. The colours are mixed with or painted in a vehicle of gum or honey. High lights are obtained by white or other light colour. "Gouache" is frequently used in miniature painting. (See also WATER-COLOUR PAINTING.)

GOUDA, a town of Holland, in the province of South Holland, on the Gouwe at its confluence with the Ysel, and a junction station 12½ mi. by rail N.E. of Rotterdam. Pop. (1940) 32,703. Tramways connect it with Bodegraven on the old Rhine and with Oudewater on the Ysel; and there is a regular steamboat service along canals in various directions. The Groote Markt is the largest market-square in Holland. Among the numerous churches belonging to various denominations, the first place must be given to the Groote Kerk of St. John. It was founded in 1485, but rebuilt after a fire in 1352, and is remarkable for a celebrated organ, and a series of 40 stained-glass windows, mostly from the hand of Crabeth. Other buildings are the Gothic town hall, founded in 1449 and rebuilt in 1690, and the weigh-house, built in the 17th century and adorned with a fine relief.

In the time of the counts Gouda was busy with brewing and cloth-weaving; but at a later date the making of clay tobacco pipes became the staple trade, and, although this industry somewhat declined, the churchwarden pipes of Gouda are well known, while it also manufactures candles. The transit and shipping trade is considerable, and as one of the principal markets of South Holland, the round, white Gouda cheeses are known throughout Europe. Boskoop, 5 mi. N. by W. of Gouda on the Gouwe, is famous for its nursery gardens; and the little town of Oudewater as the birthplace of the famous theologian Arminius in 1560. In World War II Gouda was occupied by Germany.

GOUDIMEL, CLAUDE (c. 1510–1572), musical composer of the 16th century, born about 1510. Both French and Belgians claim him as their countryman. In all probability he was born at Besançon, for in his edition of the songs of Arcadelt, as well as in the mass of 1554, he calls himself "natif de Besançon" and "Claudius Godimellus Vescontinus." The excellent Latin in which his letters were written proves that, in addition to his musical knowledge, he had a good classical training. In 1jjj he published, with Nicolas Duchemin, a musical setting, now lost, some odes of Horace, and in 1357 and 1558 a Magnificat and two Masses. He was living in Metz in 1357, and at about this time, probably, joined the Huguenots. For them he composed a setting of the celebrated French version (1565) of the Psalms by Marot and Beza. The French version of the Psalms was at first used by Catholics as well as Protestants, until their use was forbidden in Catholic churches. Goudimel moved to Lyons, where he perished during the St. Bartholomew massacres of August 27–28, 1572.

Among modern books containing examples of Goudimel's work *see* especially O. Douen, *Clément Marot et le psautier huguenot* (2 vols., 1878), and *Choix de Psaumes* (1879); *H.* Expert, *Le Psautier huguenot du XVIe siècle* (1902); J. Tiersot, *Ronsard et la musique de son temps* (Leipzig, 1903); and T. Gerold, *Clément Marot, Psaumes avec les mélodies* (Bibliotheca Romanica. Strasbourg, 1919).

GOUGE, a tool of the chisel type with a curved blade, used for scooping a groove or channel in wood, stone, etc. (see TOOL). A similar instrument is used in surgery for operations involving the excision of portions of bone. "Gouge" is also used as the name of a bookbinder's tool, for impressing a curved line on the leather, and for the line so impressed. In mining, a "gouge" is the layer of soft rock or earth sometimes found in each side of a vein of coal or ore, which the miner can scoop out with his pick, and thus attack the vein more easily from the side.

GOUGH, SIR HUBERT DE LA POER (1870–), British soldier, was born on Aug. 12, 1870, a son of Gen. Sir C. Gough, V.C., and joined the 16th Lancers in 1889. In 1911 he became brigadier-general commanding the III. Cavalry Brigade at the Curragh, where his attitude with regard to Ulster and the use of the troops in 1914 caused a grave political crisis (see ENGLISH HISTORY). He took his brigade to France in August of that year, and after successive promotions, was given command of the newly constituted V. Army; with this he played an important part in the battle of the Somme. In 1917 he was for some time in charge of the Ypres offensive, where his conduct of the operations received considerable criticism. The brunt of the great German offensive of March 1918 fell on his troopr, who were unable to withstand the pressure and fell back with heavy loss in personnel and material. Gough's dispositions under circumstances of the utmost difficulty were appropriate, but he was deprived of his command. In 1919 he was head of the British Mission to the Baltic States. He retired in 1922, with the rank of general. He then became a director of Siemens Bros. Gough received K.C.B. (1916), K.C.V.O. (1917), and G.C.B. (1937).

GOUGH, HUGH GOUGH, VISCOUNT (1779–1869), Irish field-marshal, a descendant of Francis Gough who was made bishop of Limerick in 1626. was born at Woodstown, Limerick, on Nov. 3, 1779. Having entered the army in August 1794, he served with the 78 Highlanders at the Cape of Good Hope, taking part in the capture of Cape Town and of the Dutch fleet in Saldanha Bay in 1796. His next service was in the West Indies, where, with the 87th (Royal Irish Fusiliers), he shared in the attack on Porto Rico, the capture of Surinam, and the brigand war in St. Lucia. In 1809 joining the army in Portugal under Wellington, he commanded his regiment as major in the operations before Oporto, by which the town was taken from the French. At Talavera he was severely wounded, and had his horse shot under him. For his conduct on this occasion he was afterwards promoted lieutenant-colonel, his commission, on the recommendation of Weliington, being antedated from the day of the duke's despatch. He was thus the first officer who ever received brevet rank for services performed in the field at the head of a regiment. He was next engaged at the battle of Barrosa, at which his regiment captured a French eagle. At the defence of Tarifa the post of danger was assigned to him, and he compelled the enemy to raise the siege. At Vittoria, where Gough again distinguished himself, his regiment captured the baton of Marshal Jourdan. He was again severely wounded at the battle of Nivelle, and was soon after created a knight of St. Charles by the king of Spain.

After a short respite from active service he served in southern Ireland. In 1837 he took command in Mysore, and was sent from there to China during the first Chinese war (1841–42). After the conclusion of the treaty of Nanking in August 1842 the British forces were withdrawn. Gough was created a baronet. In August 1843 he was appointed commander-in-chief of the British forces in India, and in December he took the command in person against the Mahrattas, and defeated them at Maharajpur, capturing more than fifty guns. In 1845 occurred the rupture with the Sikhs, who crossed the Sutlej in large numbers. Gough conducted the operations. Successes in the hard-fought battles of Mudki and Ferozeshah were succeeded by the victory of Sobraon, and shortly afterwards the Sikhs sued for peace at Lahore. Gough was now raised to the peerage as Baron Gough (April 1846). The war broke out again in 1848, and again Lord Gough took the field; but the result of the battle of Chillianwalla being equivocal, he was superseded bv the home authorities in favour of Sir Charles Napier; before the news of the supersession arrived Gough had finally crushed the Sikhs in the battle of Gujarat (February 1849). His tactics during the Sikh wars were the subject of an embittered controversy *(see* SIKH WARS). Lord Gough now returned to England, was raised to a viscountcy, and for the third time received the thanks of both Houses of Parliament. A pension of £2,000 per annum was granted to him by parliament, and an equal pension by the East India Company. In November 1862, he was made field-marshal. He died on March 2, 1869.

See R. S. Rait, *Lord Gough* (1903); and Sir W. Lee Warner, *Lord Dalhousie* (1904).

GOUGH, RICHARD (1735–1809), English antiquary, was born in London on Oct. 21, 1753, the son of a director of the East India company. In 1756, he began antiquarian excursions in

various parts of Great Britain. In 1773 he began an edition in English of Camden's *Britannia,* which appeared in 1789. His great work is *Sepulchral Monuments of Great Britain . . . from the Norman Conquest to the Seventeenth Century* (2 vols., 1786–96). Gough was director of the Society of Antiquaries from 1771 to 1791. He was elected F.R.S. in 1775. He died at Enfield on Feb. 20, 1809.

GOUIN, SIR LOMER, KT. 1908, K.C.M.G., 1913 (1861–1929), Canadian politician, was born at Grondines, Quebec, on March 19, 1861. Educated at Laval and McGill universities, he was called to the bar in 1884, and became Q.C. in 1900. In 1897 he was elected to the Quebec Legislature and from 1905 to 1920 was Prime Minister and Attorney-General of the province. He declined to join Sir Robert Borden's coalition Ministry, subsequently declaring his allegiance to the Liberal opposition. Gouin was included in the King cabinet of 1921 as minister of justice. He was a Canadian representative at the fourth assembly of the League of Nations at Geneva. In 1924 he attended the Imperial and Economic Councils in London as one of Canada's representatives. He died at Quebec on March 28, 1929.

GOUJON, JEAN (c. 1520–*c.* 1566), the greatest French sculptor of the French Renaissance. In 1541 he was employed at the cathedral of Rouen where he added to the tomb of Cardinal d'Amboise a statue of his nephew Georges, afterwards removed, and possibly carved portions of the tomb of Louis de Brézé, executed some time after 1545. On leaving Rouen, Goujon was employed by Pierre Lescot, the celebrated architect of the Louvre, on the restorations of St. Germain l'Auxerrois; the building accounts—some of which for the years 1542–1544 were discovered by M. de Laborde on a piece of parchment binding—specify as his work, not only the carvings of the pulpit (Louvre), but also a Notre Dame de Piété, now lost. In 1547 appeared Martin's French translation of Vitruvius, the illustrations of which were due, the translator tells us in his "Dedication to the King," to Goujon, *naguères architecte de Monseigneur le Connétable, et maintenant un des vôtres.* This statement shows not only that Goujon had been taken into the royal service on the accession of Henry II., but also that he had been previously employed under Bullant on the château of Écouen. Between 1547 and 1549 he was employed in the decoration of the Loggia ordered from Lescot for the entry of Henry II. into Paris, which took place on June 16, 1549. At the Louvre, Goujon, under the direction of Lescot, executed the carvings of the south-west angle of the court, the reliefs of the Escalier Henry II., and the Tribune des Cariatides, for which he received 737 livres on Sept. 5, 1550. Between 1548 and 1554 rose the château d'Anet, in the embellishment of which Goujon was associated with Philibert Delorme in the service of Diana of Poitiers. We should probably ascribe the work attributed to him in the Hôtel Carnavalet *(in situ),* together with much else executed in various parts of Paris—but now dispersed or destroyed—to a period intervening between the date of his dismissal from the Louvre and his death.

See A. A. Pottier, *Oeuvres de Goujon* (1844); Reginald Lister, *Jean Goujon* (London, 1903).

GBUJON, JEAN MARIE CLAUDE ALEXANDRE (1766–1795), French publicist and statesman, was born at Bourg on April 13, 1766. After a number of years at sea, he became procureur-général-syndic of the department of Seine-et-Oise (1792), and subsequently took his seat with the Mountain in the Convention. After the revolution of the 9th Thermidor (July 27, 1794) he denounced the Jacobin Club, and on the 1st Prairial (May 20, 1795) supported the demands of the populace who invaded the legislature. The failure of the insurrection brought about his arrest, and he committed suicide after his trial.

See J. Claretie, *Les Derniers Montagnards, histoire de l'insurrection de Prairial an III. d'après les documents* (1867); *Défense du représentant du peuple Goujon* (Paris, no date). *See* also Maurice Tourneux (1890, vol. i., pp. 422–425).

GOULBURN, HENRY (1784–1856), English statesman, was born in London on March 19, 1784, and educated at Trinity college, Cambridge. Member of parliament for Horsham in 1808, he was appointed under-secretary for home affairs in 1810, and under-secretary for war and the colonies in 1812; he became a privy councillor in 1821, and soon after was appointed chief secretary to the lord-lieutenant of Ireland, a position which he held until April 1827. Although frequently denounced as an Orangeman, his period of office was on the whole a successful one, and in 1823 he managed to pass the Irish Tithe Composition bill. In January, 1828, he was made chancellor of the exchequer under Wellington. Goulburn was home secretary under Peel for four months in 1835, and in September, 1841, he became chancellor of the exchequer for the second time. Although Peel himself did some of the chancellor's work, Goulburn was responsible for a further reduction in the rate of interest on the national debt, and he aided his chief in the struggle which ended in the repeal of the corn laws. He left office in June, 1846. After representing Horsham in the House of Commons for over four years Goulburn was successively member for St. Germans, for West Looe, and for the city of Armagh. In May, 1831, he was elected for Cambridge university. He died on Jan. 12, 1856, at Dorking.

See S. Walpole, *History of England* (1878–86).

GOULBURN, a city of Argyle county, New South Wales, Australia, 134 m. S.W. of Sydney by the Great Southern railway. Pop. (1933) 14,851. The municipality was created in 1859; and Goulburn became a city in 1864. It lies in a productive agricultural district, at an altitude of 2,129 ft., and is a depot of the inland trade. There are Anglican and Roman Catholic cathedrals.

GOULD, AUGUSTUS ADDISON (1805–1866), American conchologist, was born in New Ipswich, N.H., on April 23, 1805, and graduated at Harvard in medicine in 1830.

As a conchologist his reputation was world-wide. His writings fill many pages of the publications of the Boston Society of Natural History. He published: with L. Agassiz the *Principles of Zoology* (2nd ed., 1851); he edited the *Terrestrial and Air-breathing Mollusks* (1851–55) of Amos Binney (1803–47). The two most important monuments to his scientific work, however, are *Mollusca and Shells* (vol. xii., 1852) of the U.S. exploring expedition (1838–42) under Lieut. Charles Wilkes (1833), published by the Government, and the *Report on the Invertebrata of Massachusetts* (1841). He died in Boston on Sept. 15, 1866.

Among his other writings are: *The Study of Botany in Connection with Medicine* (1835); *Description of Shells* (1848); *The Naturalists' Library* (1849); *Animal Life in the Ocean at Great Depths* (1862); *Otia Conchologica* (1863); *Search out the Secrets of Nature* (1885).

See National Academy of Science, *Biographical Memoirs,* vol. v., pp. 91–113, and *Bibliography,* pp. 106–113.

GOULD, BENJAMIN APTHORP (1824–1896), American astronomer, was born at Boston (Mass.), Sept. 27, 1824. He graduated from Harvard college in 1844, studied mathematics and astronomy under C. F. Gauss at Gottingen, and returned to America in 1848. From 1852 to 1867 he was in charge of the longitude department of the U.S. coast survey; he developed and organized the service, was one of the first to determine longitudes by telegraphic means, and employed the Atlantic cable in 1866 to establish longitude relations between Europe and America. The *Astronomical Journal* was founded by Gould in 1849; and its publication, suspended in 1861, was resumed by him in 1885. From 1855 to 1859 he was director of the Dudley observatory at Albany (N.Y.); and published in 1859 a discussion of the places and proper motions of circumpolar stars to be used as standards by the U.S. coast survey. He undertook (1868), on behalf of the Argentine republic, to organize a national observatory at Córdoba; began to observe there with four assistants in 1870, and completed in 1874 his *Uranometria Argentina* (published 1879). He then made a zone-catalogue of 73,160 stars (1884), and a general catalogue (1885) compiled from meridian observations of 32,448 stars. He died in Cambridge (Mass.), Nov. 26, 1896.

See *Astronomical Journal,* No. 389; *Observatory,* xx. 70 (same notice abridged); *Science* (Dec. 18, 1896, S. C. Chandler); *Astrophysical Journal,* vol. I.; *Monthly Notices Roy. Astr. Society,* lvii. 218.

GOULD, SIR FRANCIS CARRUTHERS (1844–1925), English caricaturist and politician, was born in Barnstaple on Dec. 2, 1844. He joined the London Stock Exchange, where he constantly sketched the members and illustrated important events in the financial world; many of these drawings were reproduced

by lithography and published for private circulation. In 1879 he began the regular illustration of the Christmas numbers of *Truth*, and in 1887 he became a contributor to the *Pall Mall Gazette*, transferring his allegiance to the *Westminster Gazette* on its foundation and subsequently acting as assistant editor. Among his independent publications are *Who killed Cock Robin?* (1897), *Tales told in the Zoo* (1900), two volumes of *Froissart's Modern Chronicles, told artd pictured by F. C. Gould* (1902 and 1903), and *Picture Politics—a* reprint of his *Westminster Gazette* cartoons. He was knighted in 1906. He died on Jan. 1, 1925.

GOULD, JAY (1836–1892), American financier, was born in Roxbury, Delaware county (N.Y.), on May 27, 1836. Though he left school in his 16th year, he devoted himself assiduously thereafter to private study, chiefly of mathematics and surveying. In 1852–56 he worked as a surveyor in preparing maps of Ulster, Albany and Delaware counties in New York, of Lake and Geauga counties in Ohio, and of Oakland county in Michigan, and of a projected railway line between Newburgh and Syracuse, in New York state. In 1863 he was appointed manager of the Rensselaer and Saratoga railway. He bought and reorganized the Rutland and Washington railway.

In 1859 he removed to New York city, where he became a broker in railway stocks, and in 1868 he was elected president of the Erie railway, of which he and James Fisk, Jr., (*q.v.*), had gained control. The management of the road under his control, and especially the sale of $5,000,000 of fraudulent stock in 1868–70, led to litigation, and Gould was forced out of the company in March 1872 and compelled to .make restitution. It was during his control of the Erie that he and Fisk admitted Tweed to the directorate of the Erie, and Tweed in turn arranged favourable legislation for them at Albany. With Fisk in Aug. 1869 he began to buy gold, his hope being that, with the advance in price of gold, wheat would advance to such a price that western farmers would sell, and there would be a consequent great movement of bread-stuffs from west to east, which would result in increased freight business for the Erie road. His speculations in gold culminated in the panic of "Black Friday," on Sept. 24, 1869, when the price of gold fell from 162 to 135.

Gould gained control of the Union Pacific, from which in 1883 he withdrew after realizing a large profit. Buying up the stock of the Missouri Pacific, he built up the "Gould System" of railways in the South-western States. In 1880 he was in virtual control of 10,000m. of railway. He obtained a controlling interest in the Western Union Telegraph Company, and after 1881, in the elevated railways in New York city. He died on Dec. 2, 1892.

His eldest son, GEORGE JAY GOULD (born 1864), was prominent also as an owner and manager of railways, and became president of the Little Rock and Fort Smith railway (1888), the St. Louis, Iron Mountain and Southern railway (1893), the International and Great Northern railway (1893), the Missouri Pacific railway (1893), The Texas and Pacific railway (1893), and the Manhattan Railway Company (1892); he was also vice president and director of the Western Union Telegraph Company. It was under his control that the Wabash system became transcontinental.

The eldest daughter, HELEN MILLER GOULD SHEPARD (1868–1938), became widely known as a philanthropist, and for her gifts to American Army hospitals in the war with Spain.

GOUNOD, CHARLES FRANÇOIS (1818–1893), French composer, was born in Paris on June 17th, 1818, the son of F. L. Gounod, a talented painter. He studied at the Paris Conservatoire under Reicha, Halévy and Lesueur, and won the "Grand Prix de Rome" in 1839. In Rome he devoted much of his time to the study of the works of Palestrina and Bach. In 1843 he went to Vienna, where a "requiem" of his composition was performed. On his return to Paris he tried in vain to find a publisher for some songs which he had written in Rome. He became organist to the chapel of the "Missions Étrangères," and seems to have contemplated entering holy orders. Through the intervention however of Madame Viardot, the celebrated singer, he was commissioned (1851) to compose an opera on *Sapho,* a text by Émile Augier, for the Académie Nationale de Musique. Its success was not very great but it brought its composer's name to the fore, though for a time not to any great purpose, since neither his second dramatic attempt consisting of some choruses written for *Ulysse,* a tragedy by Ponsard, played at the Théâtre Français in 1852, conducted by Offenbach, nor his third *La Nonne sanglante,* given at the Paris Opéra in 1854, advanced his reputation.

Goethe's *Faust* had for years exercised a strong fascination over Gounod, and he at last determined to turn it to operatic account. The performance at a Paris theatre of a drama on the same subject delayed the production of his opera for a time. In the meanwhile he prepared a pleasing operatic version of Molière's comedy, *Le Médecin malgré lui* (Théâtre Lyrique, 1858). The first performance of *Faust* took place at the Théâtre Lyrique on March 19, 1859. The subject had already inspired in various ways Spohr, Schumann, Berlioz, Liszt and Wagner among others. *Faust* was given in London in 1863, when its success at first doubtful, became enormous, so that it was heard concurrently at Covent Garden and Her Majesty's theatres.

Gounod's next opera was *Philémon et Baucis* a charming setting of the mythological tale (Théâtre Lyrique, 1860) in which the composer followed the traditions of the Opéra Comique, employing spoken dialogue, though without abandoning the individuality of his own style. *La Reine de Saba* (Grand Opéra, Feb. 28, 1862) a four-act opera, was a more ambitious work, but had little success, although the score contains some of the composer's happiest inspirations. *La Reine de Saba* was adapted for the English stage under the name of *Irene. Mireille,* which followed (Théâtre Lyrique, March 19, 1864), founded upon the *Mireio* of the Provencal poet Mistral, contains much charming and characteristic music, but again the public was unresponsive; nor did *La Colontbe,* heard at Baden in 1860, and at the Opéra Comique, succeed.

Gounod next sought inspiration in Shakespeare, and in the result *Roméo et Juliette* (Théâtre Lyrique, April 27, 1867) had a success second only to that of *Faust.* Some have even preferred it to the latter. Gounod expressed his own opinion of the relative value of the two operas enigmatically by saying, "*Faust* is the oldest, but I was younger; *Rome'o* is the youngest, but I was older." The success of *Roméo et Juliette* in Paris was great from the outset. In London it was not until the part of Romeo was sung by Jean de Reszke that the work was fully recognized.

Corneille's *Polyeucte* provided the 'subject of Gounod's next opera, but its production was delayed by the Franco-German war, during which Gounod visited London. There he composed the "biblical elegy" *Gallia* for the inauguration of the Royal Albert Hall, and a number of songs to English words, many of which have attained an enduring popularity, such as "Maid of Athens," "There is a green hill far away." On his return to Paris he hurriedly set to music an operatic version of Alfred de Vigny's *Cinq-Mars* (Opéra Comique, April 5, 1877), which found little favour. *Polyeucte,* which appeared at the Grand Opéra on Oct. 7, 1878 was no better received; nor was *Le Tribut de Zamora* (1881).

But Gounod had other strings to his bow besides the theatre. As Saint-Saens put it in his *Portraits et Souvenirs:*

> Gounod did not cease all his life to write for the church, to accumulate masses and motets; but it was at the commencement of his career, in the *Messe de Sainte Cécile,* and at the end, in the oratorios *The Redemption* and *Mors et vita,* that he rose highest.

Saint-Saëns held that the three works mentioned will survive all the master's operas and however this may be they certainly contain many beautiful pages which have won them warm admirers along with the *Messe d~ Sacré Coeur* (1876) and the *Messe à la mémoire de Jeanne d'Arc* (1887). *The Redemption,* a "sacred triology," dedicated to Queen Victoria, and produced at the Birmingham Festival of 1882 bears the unmistakable imprint of the composer's hand, but the work in its entirety is not exempt from monotony. *Mors et vita,* dedicated to Pope Leo XIII., was first produced in Birmingham, at the Festival of 1885.

Gounod was a great worker. Besides the works already mentioned may be named two symphonies which were played during the '50s, but have long since fallen into neglect. He also attempted to set Molière's comedy, *Georges Dandin,* to music, keeping to the original prose, but this work was never performed. Gounod died at St. Cloud on Oct. 18, 1893.

See his own posthumous *Mtmoires d'un artiste* **(1896)** ; **C.** Saint-Saens, *Charles Gounod et le Don Juan de Mozart* **(1893)** and *Le Livret de Faust (Monde Musicale,* 1914–19). *See* also P. *L.* Hillemacher **(1906)** ; C. Bellaigue (1910), and Prod'homme and Daudelot (1911).

GOURAUD, HENRI JOSEPH ÉTIENNE (1867–), French general, was born at Paris on Nov. 17, 1867. He entered St. Cyr in 1888, and was commissioned to the infantry in 1890. In 1894 he was seconded for duty under the colonial administration; and thereafter he served in the French Sudan for two years. He was serving in Morocco at the outbreak of the World War.

On Sept. 17, 1914, Gouraud was promoted temporary general of division, and the following Jan. was appointed commander of the Colonial Army Corps. On Feb. 15, 1915, he was made a substantive general of division. In May he replaced D'Amade as commander of the force in Gallipoli, where he was so badly wounded that his right arm had to be amputated. He was awarded the *médaille militaire* on July 10, 1915. On recovering from his wound he went to Italy in charge of a mission, and then in Dec. 1915 he was appointed to command the IV. Army. A year later he was sent temporarily, as commissioner general, to Morocco; but he again took command of the IV. Army in June 1917. From 1917 to the summer of 1918 the sector of the IV. Army was relatively quiet, save for one moment in the spring of 1917 in which it was drawn into the ambit of Nivelle's offensive on the Aisne, and at that time Gouraud was in Morocco. Thus, when on July 15, 1918, the Germans launched their last offensive cn the Champagne front, Pétain had difficulty in winning him to the necessity of a "coil spring" defence. But when the time came Gouraud carried out its principles admirably, and brought the Germans' last effort to a standstill in his battle zone. In Oct. 1919 he became high commissioner in Syria and commander-in-chief in the Levant. He was appointed military governor of Paris in 1924, and visited the United States in July, 1929.

GOURD, a name given to various plants of the family *Cucurbitaceae,* especially those belonging to the genus *Cucurbita,* trailing herbs of annual duration. with long succulent stems furnished with tendrils, and large, rough, palmately-lobed leaves; the flowers are generally large and of a bright yellow or orange colour, the barren ones with the stamens united; the fertile are followed by the large succulent fruit that gives the gourds their economic value. The most important of the gourds, from an economic point of view; is perhaps *C. maxima,* the red and yellow gourd of British gardeners. It is grown everywhere in hot climates, and in Turkey and Asia Minor it yields, at some periods of the year, an important article of diet especially near Istanbul. The yellow kind attains occasionally a weight of upwards of 240 lb. It grows well in central Europe and the United States, while in the south of England it will produce its gigantic fruit to perfection in hot summers. In France and in the east it is used in soups and ragouts, while simply boiled it replaces other table vegetables. In some countries the larger kinds are employed as cattle food. The seeds yield by expression a large quantity of a bland oil, which is used for the same purposes as that of the poppy and olive. The "mammoth" gourds of English and American gardeners (known in America as squashes) belong to this species. The pumpkin (summer squash of America) is *Cucurbita Pepo.* Some of the varieties of *C. maxima* and *Pepo* contain a considerable quantity of sugar, amounting in the sweetest kinds to 4 or 5%, and in the hot plains of Hungary efforts have been made to use them commercially. The vegetable marrow is a variety (*melopepo*) of *C. Pepo.* Many smaller gourds are cultivated in India and other hot climates.

The bottle- or calabash-gourds are placed in a separate genus, *Lagenaria,* chiefly differing from *Cucurbita* in the anthers being free instead of adherent. The only species, L. *vulgaris,* is *a* climbing plant with heart-shaped leaves and beautiful white flowers; the fruit of which first begins to grow in the form of an elongated cylinder, but gradually widens towards the extremity, until, when ripe, it resembles a flask with a narrow neck and large rounded bulb. When ripe, the pulp is removed from the neck, and the interior cleared by leaving water standing in it: the woody rind that remains is used as a bottle, and to make calabash pipes. The ripe fruit is bitter and cathartic, but while immature it is eaten by the Arabs and Turks.

The snake-gourds of India and China (*Trichosanthes*) are there used in curries and stews but chiefly grown in Europe and America as ornamental oddities.

All the true gourds have a tendency to secrete the cathartic principle *colocynthin,* and in many varieties of *Cucurbita* and allied genera it is often elaborated to such an extent as to render them unwholesome, or even poisonous. The seeds of some species possess anthelmintic properties, while salted pumpkin seeds are sold as a confection in the U.S. and Mexico.

The abundance of varieties found in India would seem to indicate that part of Asia as the birthplace of the present edible and ornamental forms; but some appear to have been cultivated in all the hotter regions in North Africa, from the earliest ages, while the Romans were familiar with at least certain kinds of *Cucurbita,* and with the bottle-gourd. *Cucurbita Pepo* is of unknown origin.

GOURGAUD, GASPAR, BARON (1783–1852), French soldier, was born at Versailles on Sept. 14, 1783. He served in the campaigns of 1803–5, at Saragossa, and in the Danubian campaign of 1809. He acted as ordnance officer to Napoleon throughout the Russian campaign of 1812, served in the campaign in Saxony, and saved the emperor's life at Brienne. Though one of the royal guards of Louis XVIII. in 1814, he joined Napoleon in the Hundred Days (1815), was named general and aide-de-camp, and fought at Waterloo. He shared Napoleon's exile at St. Helena, but tired of the life at Longwood and the friction with Montholon, and went to England, where he published his *Campagne de 1815.* He returned to the army in 1830, became a deputy to the Legislative Assembly in 1849, and died in Paris in 1852.

His works include: *La Campagne de 1815* (London and Paris **1818)**; *Napoléon et la Grande Armée en Russie; examen critique de l'ouvrage de M. le comte P. de Ségur* (1824); *Réfutation de la vie de Napoléon par Sir Walter Scott* (1827); *Mémoires pour servir a l'histoire de France sous Napoléon* (with Montholon, 1822–23); *Bourrienne et ses erreurs* (with Belliard and others, 2 vols. **1830)**; his most important work is the *Journal inédit de Ste-Hélène* (2 vols. **1899)**.

See B. Jackson, *Notes and Reminiscences of a Staff Officer* (1904), and the bibliography to the article LOWE, SIR HUDSON.

GOURKO, JOSEPH VLADIMIROVICH, COUNT (1828–1901), Russian general, of Lithuanian extraction, was born on Nov. 15, 1828. He entered the imperial bodyguard, rose rapidly in the service, and at the outbreak of the Russo-Turkish war of 1877 he was placed in command of the van of the Russian invasion. He took Trnovo on July 7, crossed the Balkans by the Hain Bogaz pass, debouching near Hainkioi, and, notwithstanding considerable resistance, captured Uflani, Maglish and Kazanlyk; on July 18 he attacked Shipka, which was evacuated by the Turks on the following day. Thus within sixteen days of crossing the Danube Gourko had secured three Balkan passes and created a panic at Constantinople. He then made a series of successful reconnaissances of the Tunja valley, cut the railway in two places, occupied Stara Zagora (Turkish, Eski Zagra) and Nova Zagora (Yeni Zagra), checked the advance of Suleiman's army, and returned again over the Balkans. In October he was appointed commander of the allied cavalry, and attacked the Plevna line of communication to Orkhanie with a large mixed force, captured Gorni-Dubnik, Telische and Vratza, and, in the middle of November, Orkhanie itself. Plevna was isolated, and after its fall in December Gourko crossed the Balkans, totally defeated Suleiman, and occupied Sophia, Philippopolis and Adrianople, the armistice at the end of January 1878 stopping further operations *(see* Russo-TURKISH WARS). Gourko was made a count, and decorated with the 2nd class of St. George and other orders. In 1879–1880 he was governor of St. Petersburg, and from 1883 to 1894 governor-general of Poland. He died on Jan. 29, 1901.

GOURMANCHE, an agricultural, cattle-raising people closely related to the Mossi, whom they resemble in social characteristics, in the Gourma province of the Upper Volta, Africa. They are organized in territorial groups under a paramount chief descended from the conqueror of the hfossi. (See Delafosse, *Haut Sénégal Niger* [1912]).

GOURMET, a French term for one who takes a refined and critical pleasure in good cooking and the delights of the table.

GOURMONT, REMY DE (1858–1915), French critic, essayist and novelist, was born on April 4, 1858, at the Chbteau de la Motte, Bazoches-en-Houlme (Orne). He went to Paris in 1883, after having studied at Caen and entered the Bibliothèque Nationale, where he remained for eight years; he was obliged to leave in 1891 in consequence of having published an article which was considered anti-patriotic. In 1890 he founded, with several friends — including J. Renard and others—the *Mercure de France,* of which he was one of the chief collaborators for about 20 years. In his critical works, a distinction must be made between (1) notes on contemporary life published in the *Mercure* under the title of *Epilogues* (1903–13); (2) the series of *Promenades Littéraires* and *Promenades Philosophiques* (1904–13) which are sometimes comparable with the *Causeries du Lundi* of St.-Beuve; (3) the series of studies dealing with pure literature, style and versification (*Le Latin Mystique,* 1892; *L'Esthétique de la Langue Française,* 1899; *La Culture des Idées,* 1900; *Le Chemin de Velours,* 1902; *Le Problème du Style,* 1907). As a critic, he had the great merit of drawing attention to the intellectual importance of Villiers de l'Isle Adam, Huysmans, Mallarmé, Nietzsche, etc., when the work of these authors was still little known.

He also had an original and precise conception of style. He was always on the alert to break up ideas or images associated by tradition or custom and to analyse them separately in order to set up new associations which, in their turn, might eventually be broken. From the philosophical point of view, Remy de Gourmont agreed, in principle, with the symbolists, in admitting that there exist other realities than those of the mind; but this idealism tended in his case to be sceptical and, at times, even cynical.

Like Schopenhauer and Nietzsche, with whose works he was so fully conversant, he owed much to the French moralists of the 18th century, and to Montaigne. This quality of cynicism is clearly apparent in his *Physique de l'Amour* (1903), in which he attempts to eliminate from the philosophy of love all mystical and romantic elements and to bring it into line with biology.

Remy de Gourmont was also the author of plays and symbolist poems which are no longer interesting except to the student, and various novels, of which the most important are *Sixtine,* a *roman de la vie cérébrale* (1890); *Les Chevaux de Diomkde* (1897); *Le Songe d'une Femme* (1899); *Une Nuit au Luxembourg* (1906) and *Un Coeur Virginal* (1907). His gift for creating living characters is lacking in these books, but those of his works inspired by the philosophical romances of the 18th century, especially Diderot, are noteworthy for their lucidity, and are marked by a fantastic and alert individuality. Remy de Gourmont wrote on many subjects, and with Anatole France was one of the last representatives of the "grande culture générale" in France.

JEAN WE GOURMONT (1877–1928), brother of the above, also contributed largely to the *Mercure de France.* He wrote some poems, and a novel *Le Toison d'Or* (1908).

GOUROCK, police burgh, burgh of barony and watering-place, Renfrewshire, Scotland, on the south of the Firth of Clyde. 3¼ m. W. by N. of Greenock by the L.M.S R., which passes through long tunnels between the two places. Pop. (1938) 9,170. It is partly situated on a fine bay affording good anchorage, largely used by yacht clubs of the Clyde, and the quay is an important centre for passenger steamers. Barrhill (480 ft. high) divides the town into two parts, the eastern is Kempoch, the western Ashton. Gourock became a burgh of barony in 1694.

GOURVILLE, JEAN HERAULD (1625–1703), French adventurer, was born at La Rochefoucauld, and in 1646 became secretary to François de la Rochefoucauld, author of the *Maximes,* whom he served during the Fronde, in his intrigues with the parliament, the court and the princes. In these negotiations he came into contact with Condé, Mazarin and Nicolas Fouquet. In 1658 he farmed the *taille* in Guienne. He bought depreciated *rentes* and had them raised to their nominal value by the treasury; he extorted gifts from the financiers for his protection, being Fouquet's confidant in many operations of which he shared the profits. In three years he accumulated an enormous fortune. increased by his luck at cards. He was involved in the trial of Fouquet, and in April 1663 was condemned to death for peculation and embezzlement of public funds; but, escaping, was executed in effigy. He sent a valet to take the effigy down from thegallows in the court of the Palais de Justice, and then fled the country. After five years' absence he returned, entered the service of Condé, and received diplomatic missions in Germany, Holland and Spain. In 1694 he was legally rehabilitated.

See his *Mkmoires* (1724), of which there is a modern edition, with notes, an introduction and appendix, by Lecestre (1894–95, 4 vols.). They are a useful source for certain transactions of the time.

GOUT, the name rather vaguely given, in medicine, to a constitutional disorder which manifests itself by inflammation of the joints, sometimes with deposition of sodium biurate, and also by morbid changes in various important organs.

In all times this disease has engaged the attention of physicians, from its wide prevalence and the amount of suffering which it entails. Sydenham. the famous English physician of the 17th century, wrote an important treatise on the subject, and his description of the gouty paroxysm, all the more vivid from his having himself suffered for 34 years, is still quoted by writers as the most graphic and exhaustive account of the symptomatology of gout. Garrod. the most eminent authority on gout of recent times, distinguished *regular gout,* which affects the joints alone, and is either acute or chronic, from *irregular gout,* affecting non-articular tissues, or disturbing the functions of various organs.

An attack of gout may come on without previous warning; but premonitory symptoms, especially in those who have previously suffered from the disease, are common. Among the more frequent of these are disorders of the digestive organs, feeble and capricious appetite, flatulence and pain, discomfort in the region of the liver and frequent micturition. These are accompanied by extreme irritability of temper, and various perverted sensations, such as that of numbness and coldness in the limbs. These symptoms may persist for many days and then undergo amelioration immediately before the impending paroxysm. On the night of the attack the patient retires to rest apparently well, but about two or three o'clock in the morning awakes with a painful feeling in the foot, most commonly in the ball of the great toe, but it may be in the instep or heel, or in the thumb.

The affected part is swollen and deep red. The overlying skin is tense and glistening, and the surrounding veins are distended. After a few hours there is a remission of the pain, slight perspiration takes place, and the patient may fall asleep. The pain may continue moderate during the day but returns towards night. These nocturnal exacerbations occur with greater or less severity during the continuance of the attack, which generally lasts for a week or ten days. As the symptoms decline the swelling and tenderness of the affected joint abate, but the skin over it pits on pressure for a time, and with this there is often associated slight desquamation of the cuticle. During the attacks the patient is restless and extremely irritable, and suffers from cramp in the limbs, dyspepsia, thirst and constipation. The urine is scanty and high-coloured, with a copious deposit, consisting chiefly of urates. During the attack the inflammation may leave one foot and affect the other, or both may suffer at the same time. After the attack is over the patient feels quite well, but it is rare that the first is the only attack of gout; symptoms recur at ever-shortening intervals. In the earlier recurrences the same joints suffer again, but in time others become implicated, until in advanced cases scarcely any articulation escapes. When gout assumes this form the attacks are usually less painful, but their effects are shown by disturbance of important organs, especially the stomach, liver, kidneys and heart, and by changes in the joints arising from the formation of so-called chalk-stones or tophi. These deposits, characteristic of gout, appear at first as a semi-fluid material containing sodium biurate, which ultimately becomes hard and restricts movement of the joint. Any of the joints may be thus affected, but most commonly those of the hands and feet. The material is also deposited in tendon sheaths underneath the skin and periosteum, in the sclerotic coat of the eye, and especially on the cartilages of the external ear.

The recognition of what is termed irregular gout is less easy. In general the manifestations are those of lithiasis (see METABOLIC DISEASES). When chronic, gout is often associated with degenerative changes in the heart and large arteries and with chronic granular kidney. Less commonly the kidney is found to contain uric acid calculi; the association of gout with gravel is well recognised.

Gout is a familial disease, but luxurious living and strong sweet wines on the one hand, and chronic lead poisoning on the other, are predisposing causes. Lack of adequate exercise also plays a part, and an attack sometimes may be warded off by a sharp walk.

Gout may also affect persons who observe the strictest temperance in living, and whose only excesses are in the direction of over-work, either physical or intellectual. It is more common in mature age than in the earlier years of life, the greatest number of cases in one decennial period being between the ages of 30 and 40, next between 20 and 30, and thirdly between 40 and 50. After middle life gout rarely appears for the first time. Women are less subject than men, and it most frequently appears after the menopause. Persons exposed to the influence of lead poisoning, such as plumbers, painters, etc., are apt to suffer from gout.

Attacks of gout are readily excited in those predisposed to the disease. Exposure to cold, disorders of digestion, fatigue, and injuries of particular joints will often precipitate the paroxysm.

Treatment. — During an attack rest, restriction of protein and starchy foods, alkaline diuretics, purgatives, and for the relief of pain, colchicum, are usually relied upon. In the intervals attention to diet, avoidance of constipation, and certain mineral waters and baths (see MINERAL WATERS) are useful.

GOUTHIERE, PIERRE (1740–1806), French metal worker, was born at Troyes and went to Paris at an early age as the pupil of Martin Cour. He executed a vast quantity of metal work of the utmost variety, the best of which was unsurpassed by any of his rivals. His great patrons were the duc d'Aumont, the duchesse de Mazarin and Madame du Barry, for whom he produced much splendid work. The custom of the latter, indeed, brought about his financial ruin. When the collection of the duc d'Aumont was sold by auction in Paris in 1782 many objects mounted by Gouthière were bought for Louis XVI. and Marie Antoinette, which gave rise to the belief that he had worked for the court. The sale catalogue is in existence, with the names of the purchasers and the prices realized; nearly all the lacquer cabinets, chandeliers, candelabra, columns and vases in porphyry, Chinese and Japanese porcelains were mounted in bronze by Gouthière, and about 50 pieces bore his signature. The great prices paid at this sale are the criterion of the contemporary value set upon his achievement. Thus Marie Antoinette paid 12,000 livres for a red jasper bowl or *brûle-parfums* mounted by him, which was then already famous. In 1865 the marquis of Hertford bought it at the prince of Beauvais's sale for 31,900 francs. It is now in the Wallace Collection. In the Louvre is a smaller cup and a bronze clock signed and dated 1771. When Madame du Barry's property was seized at the Revolution she owed Gouthière 756,000 livres, of which he never received a penny, and his sons stated that he died in destitution.

See H. Vial, "La faillite de Gouthière," in *La Correspondance historique et archéologique,* viii., 131 (1901).

GOUVERNEUR, a village of St. Lawrence county, New York, U.S.A., on the Oswegatchie, 25 mi. from the St. Lawrence at Ogdensburg. It is on federal highway 11, and is served by the New York Central railroad. The population was 4,478 in 1940 It is in a fertile agricultural and dairying region, which is also rich in minerals. The village has zinc refineries, marble and talc mills, and factories making lace curtains, silk and paper. It was founded as Cambray in 1805, and was renamed in honour of Gouverneur Morris. The village was incorporated in 1850.

GOUVION SAINT-CYR, LAURENT, MARQUIS DE (1764–1830), French marshal, was born at Toul on April 13, 1764. He studied painting in Rome, but never adopted the profession of a painter. He entered the army in 1792 and from 1796 to 1800 held commands in the Rhine campaign (1796), Italy (1798), Germany, Italy, and again (1800) on the Rhine. In 1801 he was sent to Spain for the intended invasion of Portugal, and when a treaty of peace was concluded with Portugal he succeeded Lucien Bonaparte as ambassador at Madrid. From 1803 he again served in the army, in Italy, Prussia, Poland and Catalonia, but eventually resigned his command in protest against orders received from Paris, and remained in disgrace until 1811. He was excluded from the first list of marshals owing to his refusal to influence the troops in favour of the Empire. On the opening of the Russian campaign in command of an army corps, on Aug. 18, 1812, he defeated the Russians at Polotsk and was created a marshal of France. On the fall of Napoleon he was created a peer of France, and became war minister (July–Nov. 1815). In June 1817 he was appointed minister of marine, and in September again war minister, until November 1819 He was made a marquis in 1817. He died at Hyères (Var) March 17, 1830.

He was the author of the following valuable works: *Journal des opérations de l'armée de Catalogne en 1808 et 1809* (1821); *Mémoires sur les campagnes des armées de Rhin et de Rhin-et-Moselle de 1794 à 1797* (1829); and *Mémoires pour servir à Phistoire militaire sous le Directoire, le Consulat, et l'Empire* (1831).

See Gay de Vernon, *Vie de Gouvion Saint-Cyr* (1857).

GOVAN, a parish of Glasgow, Scotland. Pop. (1931), 364,780 (ecclesiastical parish of Govan, 1921, 58,861). There are stations on the L.M.S.R. and Glasgow subway. (*See* GLASGOW.)

GOVERNMENT. Government in the ancient world presents three main types — the great despotic empires of Sumeria, Egypt, Assyria, Persia, Macedon; the city-states of Asia Minor, Greece and Italy; and the unique example in Rome of a city-state gradually becoming the centre of an empire, and, in the process, changing its republican system into an autocracy, limited only by the survival of some republican institutions and traditions.

The early despotic empires have exerted no direct influence upon the development of forms of government and for information on them readers are referred to the separate articles in which they are described. The city-state Governments of the Mediterranean cannot be thus dismissed. It is true that, in a narrow sense, their direct influence upon the history of governmental institutions has been small. The disparity in size between the territory of the Athenian or Spartan State and any modern nation-state; the difference in social structure involved in the existence of slavery in the ancient world; and the relation of the political structure to a social organization unrelated to modern conditions are sufficient in themselves, to say nothing of the long interval of time which elapsed between the downfall of the Roman empire and the emergence of the modern nation-state, to account for this. Yet both Greece and Rome, through the effect of the political ideas of the one, and the legal system of the other, have exerted a profound influence upon the development of government.

The appearance of a number of small independent city-states in Greece and the Greek-speaking belt of Asia Minor, and later in the Greek colonies of Sicily and Southern Italy, led to the first great outburst of political speculation. The fundamental questions of political theory were discussed — the nature and end of the State, the meaning of justice, the ideal polity, its aims and structure — whilst speculation was combined with an inductive method by Aristotle and led to the classification of States into good and bad, according as the Government aimed at the good of the whole or at the satisfaction of its own interest and, from another point of view, into three types under each head — monarchy, aristocracy, polity, with their corresponding perversions tyranny, oligarchy, democracy — according as the governmental power was in the hands of one, a few, or the many in each State. To the political thought of the Greeks, and above all to that of Plato and Aristotle, modern political theorists have constantly returned; whilst to the Greek city-state, and especially to Athens, the modern world owes the idea of the self-governing community in which the rule of law is paramount, the citizen shares in political power and controls the destinies of the State, and the executive officers of the State are responsible to the citizen body for the exercise of the functions entrusted to them. (*See* PLATO, ARISTOTLE, ATHENS.)

The influence of Rome has been of another kind. Though its legal writers and its legal system preserved some of the ideas of the Greeks — more especially the conception of a law of nature

transcending the positive law of a given state—the strength of the Romans lay in legal construction rather than in political speculation. The idea of the sovereignty of the State as in its nature final and unchallengeable to all its citizens, though implicit in the Greek view of the State, has indeed most clearly passed into modern political thought through Roman channels (see SOVEREIGNTY). Yet the direct influence of Rome is to be seen more in the influence exercised by the conception of a universal empire on the mediaeval mind, and what is still more important, in the influence of the great fabric of Roman law upon the legal systems of the modern world. The private law of France, Germany, Italy, Spain, Holland, Belgium and the Spanish American republics rests upon Roman foundations, and its only great rival, the English Common law, which was retained by the United States and has spread to some, though not all, of the Dominions and dependencies, itself owes not a little to the Roman law.

The Mediaeval Period.—The barbarian invasions of the West from the 5th to the 10th centuries inaugurated a new and confused period in the history of Government from which the modern State has gradually emerged. On the one hand the new barbarian kingdoms were tribal and spread over a wide territory: their character was for long "rural" rather than "civic," and even when town life became important in the later middle age the towns were no longer, for the most part, independent centres of political life but were incorporated within large territorial areas of government. On the other hand the Roman theory of universal dominion lasted on throughout the Middle Ages and, through the titular supremacy of the Holy Roman empire, delayed the emergence of national territorial states with a clear title to independence. This delay was assisted by the equally universal claim of the popes to human obedience, and by the effective organization of the Church's system of Government through the canon law, and the courts which administered it, throughout the Christian world. Further, within each territorial kingdom, the authority of the monarch was checked by the local authority of the feudal baron and the contractual organization of feudal tenure. (See FEUDALISM.)

But by the end of the 13th century the empire had begun to take on the character of a title appended to a German princedom, without authority over or danger to the other princes of Europe: whilst in the first years of the 14th century the papacy itself fell a victim to the attack of a national king, Philip the Fair, and entered upon its "Babylonish captivity" at Avignon. At the same period the force of nationality began to make itself felt both in England and France, and the development in both countries in the later middle ages of a middle class, engaged in trade, gave the kings a new source of strength upon which to rely in their struggle with the feudal nobility. The great religious revolt of the 16th century carried the emergence of the national state yet a stage further. In the Protestant kingdoms—England, Sweden, Denmark for example—the universal claims of the pope were finally repudiated. And even in those States which adhered to Roman Catholicism the secular power gained greatly in authority.

The greatest contribution of the later middle age to the development of modern government was the establishment of a representative system in the countries of Europe. The conditions of the feudal contract always made it necessary for the king to obtain consent from his vassals for any military effort that would demand more from them in service than they were liable to perform. The summoning of the great tenants-in-chief to assemblies at which such consent was asked was natural enough. With the growth of the towns, many of which owed their charters to and held their immunities directly from the Crown the consent of these communities—early regarded as "persons"—became advisable and necessary, more especially as military service became commuted into money contributions. The device of representation of the "estates" of the realm—nobility, clergy, commons—was adopted in the 13th century and spread rapidly over Europe. Its value as a means of solving the problem of consent in a State spread over a wide territorial area cannot be over-estimated, and though its early triumphs were not always permanent it remained the basis upon which a system of representative government could be built. The specifically feudal character implied in the term "estates" gradually gave way in England before the growing power of the Commons who, partly through the happy absence of any permanent barrier of nobility or privilege between the upper and lower classes, came to regard themselves as representative of the nation as a whole.

Modern Times.—If the modern nation-state clearly emerges in the 16th century the history of modern government falls equally clearly into two main periods since that date, the period before and the period since the French Revolution.

1. In its earlier form the nation-state was almost universally autocratic and dynastic. From 1600 down to 1789 the will of each State was the will of its monarch, or of advisers chosen by himself. In France, Spain, Austria, Prussia, Russia, as in most of the minor states of Europe, the will of the governed had hardly any means of constitutional expression and none of effective enforcement upon the governments. The estates were either no longer summoned—1614 was the last meeting of the French States General till 1789—or were deprived of all effective power. England and Holland stood almost alone in Europe as representative of a political system in which government was in constant and organized relationship with the will of the citizens as a whole, and even in these two countries the number of citizens legally entitled to express a political opinion was severely restricted.

2. The American and French Revolutions form the watershed which divides the world of the autocratic from that of the modern democratic nation-state. Regarded broadly the history of government in the 19th and 20th centuries has been the history of the steady widening of the basis of political power. That movement has been more gradual than is often recognized. In England the Reform Act of 1832 created no more than a middle class oligarchy: 35 years elapsed before another Reform Act gave political rights to a section of the artisan class, and almost a century has been needed, together with the profound shock of the greatest war in history, to include women in the democratic structure of the State. France became a democracy in 1871, though it has shown as yet no sign of extending political rights to women. Germany, when it became united, nullified its extended franchise by a constitution which preserved the autocratic principle and has only joined the ranks of democratic states since 1918. Moreover there have been reactions against the liberal democratic system—most notably in Italy and Spain, if indeed the latter state can ever be said to have possessed a democratic organization. Nevertheless it is true that since the World War the democratic system of representative government, based on an adult franchise (with the notable exception of women in many cases) has become the predominant system of government in the world. For the system has captured the New World as well as the Old. Under the aegis of the British empire, Canada, Australia and New Zealand have become great democratic nation-States, whilst the Latin American States, if unstable in practice, are theoretically wedded to the same system: and in Asia Japan has followed the same path, China has attempted to set up a parliamentary republic, and the Government of India Act of 1918 was intended to prepare the way for representative democracy. Of the great States of the modern world Russia and Italy (*qq.v.*; see also FASCISM and COMMUNISM) present definitely antagonistic systems (see below).

CLASSIFICATION OF MODERN GOVERNMENTS

Modern democracies show great variations in their governmental organization and the following criteria of differentiation have become usual.

Flexible and Rigid States—States may be classified as "flexible" or "rigid" (as by the late Lord Bryce: see Studies in History *and* Jurisprudence Essay III.) according as their constitutions—the forms of their government—can be changed by the ordinary process of legislation or only by a specially difficult method of making changes of this kind. Thus in England the successive extensions of the franchise which have changed the basis of government from aristocracy to democracy (and the still more radical change made by the Parliament Act of 1911 in limiting the veto of the House of Lords) have required only the authority of an act of parliament passed by the same procedure

as any other measure. In most other countries any change in the constitution requires a special procedure attended with much greater formal difficulty than that of the ordinary mode of legislation. Thus in the United States of America "the constitution cannot be amended without the consent of two-thirds of Congress and three-fourths of the States" (Wilson, *The State* p. 524); in Australia a constitutional amendment requires an absolute majority of each house of parliament, together with, by a referendum "in a majority of the States a majority of the electors voting . . . and a majority of all the electors voting"; and it was laid down by the Weimar constitution of Germany that "constitutional amendments by the *Reichstag* are only valid if two-thirds of the members are present and at least two-thirds of those present are in favour" whilst, in addition, unless the consent of two-thirds of the *Reichsrat* was also obtained, that body might demand a referendum to the electorate, of which a majority must then support the amendment to secure its passage into law.

The degree of "rigidity" varies considerably in different modern States. In France, for example, an absolute majority of the two chambers sitting together as the national assembly is sufficient to secure amendment of the constitution. It should, however, be added that the test of rigidity or flexibility cannot be allowed to rest simply on the provision of formal difficulties in the way of constitutional amendment. The whole balance of a constitution is involved as well as the temper and attitude of both its legislators and citizens.

Unitary and Federal States.—Of much more fundamental importance is the classification of States into unitary and federal.

The unitary State has one legislature, capable of making laws of universal validity for all its citizens and subjects, one executive to apply and a unified judicial system to interpret these laws. To this type belong amongst others the British, French, Belgian, Italian Governments. The federal State, on the other hand, is "made up of several individual states, each of which preserves in principle its internal sovereignty, its own laws and government. But the nation as a whole, comprising the total population of the individual States and leaving these States as such out of account, forms a united or federal State which also possesses a complete government and of which the citizens of the individual States are all also -citizens[v] (Esmein, *Eléments de Droit Constitutionnel Français et Compare'*. Vol. I. p. 6 [1927]). The difference between a federal and a unitary State may be put in another way by saying that whereas in a unitary state all law-making bodies, other than the central legislature, have their powers of law-making defined for them by the central legislature which gives them juridical existence, in a federal State the law-making powers of the central federal government are defined by the constitutional agreement between the several States of the federal union, by which it was created, whilst all such legislative or executive powers as were not by that act expressly attributed to the federal government are retained by the States themselves. In practice this is the arrangement in the United States and in the Swiss Federation and it was followed in the Commonwealth of Australia Act 1900. But in the British North America Act of 1867, which gave Canada its constitution, an attempt was made to define not only the powers of the Federal government but also those of the provincial government. The attempt was unfortunate in view of the non-exclusive character of the powers so granted and has resulted in much litigation which might have been avoided.

It follows from the existence of such a division of legislative power that the question must arise whether the federal or a state government has acted *ultra vires* in a given instance. One characteristic of federal government, therefore, is the lack of finality in the legislation of either the federal or a State government. All legislation is subject to the terms of the constitution, itself a result of the fact that the federal structure arises from an agreement between hitherto sovereign States, and the interpretation of the constitution belongs by its terms usually to the courts. Thus in the United States the supreme court, in Australia the high court, and in the case of Canada the judicial committee of the privy council, is constituted the interpreter of the constitution with the ultimate right to pass upon the validity of the legislation either of the federal government or of a State or province. In Switzerland alone amongst federations has this question been reserved for the decision of the federal legislature itself, thus exposing it to the charge of being a judge in its own cause, But even here the use of the referendum provides another, though a different, court of appeal. (*See* also FEDERAL GOVERNMENT.)

The Parliamentary Executive.—Still another mode of classifying modern democratic governments, which cuts across that last discussed, is to divide them into those with a parliamentary and those with a non-parliamentary executive. England is the home and the source of the parliamentary executive, by which is meant that the body of ministers of State, in charge of the executive offices, is chosen from and is responsible to the members of the legislature. This choice of the executive from the members of the legislature is not, however, a formal act of the legislature itself. It is the result of the growth of a party system as a consequence of which the popularly elected house was always divided into a majority and a minority, with the result that the party enjoying a majority for the time being selected a leader who, on the victory of his party at the polls, became prime minister and himself selected his colleagues and offered them the vacant ministerial posts. The responsibility of this body of ministers to the elected house is, in effect, a responsibility primarily to the party majority of which they are themselves members, and their continuance in power depends upon their ability to command the votes of this majority for their policy. Further, in the English system, the body of ministers, or cabinet, are regarded as having a joint responsibility to each other as well as to the House of Commons as a whole. All important matters of policy are considered by the cabinet as a body, and a vote of censure upon any one minister on a matter of importance is in ordinary cases a vote of censure upon the government and would be followed by its resignation. (*See* also CABINET.)

The advantages claimed for this system of government are those of close co-operation between executive, legislature and people and the co-ordination of policy in all the great departments of State. Further the cabinet and its supporters in the House are under day to day criticism from the opposition—a criticism which is rendered both more responsible and more effective by the consideration that defeat of the government in the House, followed by success at the polls will place upon the critics the duty of carrying on the government and of giving legislative effect to the policy on which their criticisms of their opponents are based.

In its broad lines this English system of the parliamentary executive has been adopted not only in the self-governing dominions of the British empire but also in a majority of modern democratic states, including now both France and Germany.

The Non-parliamentary Executive.—In sharp contrast with the system of a parliamentary executive is that of the United States of America. Here the supreme executive, the president, is elected by a different procedure and for a different term from the legislature in either branch. He chooses his own ministers, with the consent of the Senate—a consent very rarely refused—and these must not be members of either branch of Congress. The president is not responsible to Congress in the sense that an adverse vote in either or both Houses will either cause his resignation or even lead to a change in the policy of his administration. His ministers are in no other sense responsible to the legislature than that they are, like the president, impeachable. They are responsible to the president himself whose right it is to dismiss them at his pleasure. Nor do the president and his ministers form a "cabinet" in the English sense, though the word is current in the United States. There is no joint responsibility for policy: each minister is responsible directly to the president for the conduct of his own department, and in the last resort the president is responsible alone for at least all acts of the administration authorized by himself. "In America," wrote Lord Bryce in *The American Commonwealth*, "the administration does not work as a whole. It is not a whole. It is a group of persons, each individually dependent on and answerable to the president, but with no joint policy, no collective responsibility." (Vol. I. p. 91.)

There can be little doubt that the adherence of the framers of the United States constitution to the principle of the "separation of powers" enunciated by Montesquieu has not made the process of government as efficient, as smooth-working, or as free from corruption as it might have been. Congress, divorced from the practical problems of administration—at least in the House of Representatives, for the Senate has a definite responsibility in foreign policy—tends to become a talking-house and to fall too much under the control of party and financial interests which engage it in the task of "log-rolling" with an eye to the next election or to the furtherance of sectional economic ends. It is hardly too much to say with Professor Laski *(Grammar of Politics* p. 344) that "the American system maximises all the difficulties of law-making," and, it may be added, taking into consideration the presidential veto and the control exercised by the senate in foreign affairs and by Congress as a whole over finance, the difficulties of carrying on the executive government as well.

Switzerland.— The Swiss system is intermediate between the English and the American types. The executive (federal council) is parliamentary in that it is elected by and its members are responsible to the legislature. But it is non-party in character, it has no collective responsibility, its members do not resign as individuals—still less do they resign as a body—if their policy is not approved by the legislature. Each executive minister is responsible to the legislature for the conduct of his department but "policy. . . belongs to the assembly" and the minister stands to it somewhat in the relation of a permanent under-secretary to his political chief in England. At the same time ministers may and do address either house of the federal assembly in explanation of their administrative actions or of legislation which affects their departments. Members of the federal council, though only elected for the term of each new assembly, are almost invariably re-elected and in this continuity of tenure again approach to the position of permanent under-secretaries in the English system.

This system, which works well in Switzerland, has some clear advantages over the English type of parliamentary government. It secures expert and continuous administration of the departments of State: it eliminates much of the atmosphere of personal combat which is inevitable in the English system and therefore directs attention more to "measures" and less to "men." It is, moreover, compatible with the existence of more than two parties in the State. This last consideration is of the first importance to all States which possess a parliamentary executive in view of the challenge to the whole basis of that system made by the appearance of more than two political parties. In France the parliamentary executive has been hampered partly by the fact that the executive has not the right of dissolution, still more by the existence of numerous groups within the Chamber of Deputies. In recent years the second difficulty has been to some extent overcome by the formation of the *Bloc National* and the *Bloc des Gauches.* But in England the situation in which no party can command a solid majority in the House of Commons has already occurred once in recent years (1924). Should this become a frequent situation the conventions of parliamentary government, in the English sense, must be viewed in the light of new facts.

Italy, Germany and Russia.—A new and seemingly revolutionary form of government has since the war appeared in Italy, Germany, and Russia. It should perhaps be classed under the Aristotelian heads of aristocracy or oligarchy, though political prejudice is likely to be at present the deciding factor in the decision between these alternatives. At any rate both Fascism and Bolshevism exhibit certain common characteristics. Both explicitly repudiate the claim of right made for the rule of a majority obtained by the ordinary method of party organization. "It is our proud prophecy" writes Signor Mussolini in a preface to J. S. Barnes' *Universal Aspects of Fascism* "that Fascism will come to fill the present century with itself even as Liberalism filled the 19th century." And in *The State and Revolution* Lenin wrote "To decide once every few years which member of the ruling class is to repress and oppress the people through parliament—this is the real essence of middle-class parliamentarism, not only in parliamentary and constitutional monarchies, but also in the most democratic republics." In place of Liberalism and parliamentary representation both doctrines propose and have put into practice the dictatorship of a minority—in Italy the Fascist, in Russia the Bolshevik Party. This characteristic of minority rule is, however, regarded in both cases as accidental. The Bolshevik looks to see the whole mass of the proletariat, easily outnumbering all other classes combined, converted to the theory of communism: the Fascist equally hopes to convert to his doctrine of national functionalism the main body of the Italian people. Whilst, therefore, both doctrines justify the dictatorship of a minority as a necessary stage in effecting the revolution against parliamentary liberalism they cannot justly be accused of an admiration for oligarchy *per se.*

The more essential similarity between the two systems is in their attempt to organise government on the basis of integral relationship between the social function of the individual and his political representation. In this sense both are "syndicalist," and the industrial unit which from the beginning of the Soviet regime has been the basis of its governmental hierarchy is at present being worked into the fabric of the Italian state which will become the "corporative State" when, in the judgment of its present leaders, the revolutionary stage has been passed.

It must be added that there is a profound difference between the Russian and Italian solutions in one respect. The Communist functional organization of the State on an occupational basis has definitely aimed at eliminating the individual capitalist employer, who has in fact been largely replaced by the State itself. The Fascist Corporative State (cf. *La Carta del Lavoro,* 1927) whilst clearly placing the interest of the State above those of the individual employer or employee ("the whole body of production must be considered as a united effort from the national point of view") proposes to recognise professional associations of employers alongside the similar associations of employees; and, it should be added, restricts membership of both to adherents of Fascism.

These two experiments, whether they prove lasting or ephemeral, are at least of great importance as attempts to solve the fundamental difficulty of representative government, *i.e.,* how one man can adequately "represent" the views, desires, opinions, interests, of an electorate numbering anything up to 50,000, divided into different social strata, and of whom under the party systems of parliamentary democracy it may be possible for actually more than half to be opposed to him in politics. The German economic council set up under the republican constitution was, though it would be regarded with derision for its powerlessness by either Fascists of Bolsheviks, a concession to the same current of opinion, and even in England after the war a National Council of Employers and Employed was convened to consider the problems of industry, for the solution of which the organisation and available time of parliament were felt to be inadequate. Moreover, radical reconstruction of our parliamentary system on "functional" lines has been advocated by the Guild Socialists *(see* G. D. H. Cole *Guild Socialism Re-stated)* and to a less complete degree by Mr. and Mrs. Sidney Webb in their *Constitution for a Socialist Commonwealth (see* also FASCISM; COMMUNISM; GUILD SOCIALISM; SYNDICALISM).

Bicameral and Unicameral States— The form of the legislature in one or two chambers provides a further distinction between States. In a federal State the second chamber is primarily representative of the component States of the union, each State of whatever size receiving equal representation with all the rest: whilst the principle of popular sovereignty is embodied in the "other" house, each member of which represents an approximately equal number of citizens regardless of State boundaries. The primary duty of a second chamber in a federal state, from this point of view, is to protect the interests of the States as such against the encroachments of the federal government (though with the growth of national sentiment in federal states, this function steadily decreases in importance). In unitary States, on the other hand, the case for a second chamber is usually rested upon the need for a differentiation within the legislature by which the work of a popularly elected house, directly under the pressure of

public opinion, liable to gusts of passion, and, under modern conditions, usually grossly over-worked, may be reconsidered and if necessary revised in a calmer atmosphere: whilst in certain cases the period of delay involved in the process of revision may provide an appeal from "Philip drunk to Philip sober," an argument applicable to the second chambers of Federal States.

Opponents of the bicameral system contend that the need for delay and revision is either sufficiently provided by the formal stages of legislation or would be better met by a provision requiring the submission of certain measures to a referendum (*q.v.*). They contend further that a second chamber cannot be reconciled with the theory of democracy and they pose the dilemma "either it resembles the elected house and represents the people's will, in which case it is useless: or it opposes that will, in which case it is mischievous." The vast majority however of modern democratic states, unitary as well as federal, have bicameral constitutions. In Europe only Yugoslavia and one or two of the new Baltic States possess single chamber governments.

British Empire.—A word must be added on the two great unions of States which are the most unique features of modern governmental organisation, the British empire and the League of Nations (*qq.v.*) The extension of a unitary state to cover the great aggregate of territories subject to the British Crown is a remarkable commentary on the flexibility of the British constitution. Within the territories subject to the Crown there is every variety of government, from the virtually complete autonomy of the dominions, to the direct government of backward territories by a civil service appointed by the British Government. Moreover the autonomy of the self-governing dominions has since the imperial conference of 1926 been recognised as so complete that the several governments of the dominions now stand on an equal footing with the British Government itself and in matters concerning any dominion the Crown is constitutionally bound to be advised by the ministers of the dominion, as in other matters by the British cabinet. This new situation in which the Crown is apart from the appellate jurisdiction of the privy council the single legal link binding the Dominions to the mother country is the result of the growth of national consciousness in the dominions themselves, and is strikingly illustrated by their position in the League of Nations where each takes its place as a sovereign state side by side with the representatives of Great Britain, and the other States of the world.

League of Nations.—The League of Nations can only be noticed here as the first effective attempt to organise on a world-wide scale the external relations of sovereign states with each other. That it does not include the Cnited States, Germany, and Japan—as well as some minor states—seriously impairs its world-wide character. But that it should have come into existence at all, and should have maintained itself during a period of ten years of post-war weariness, is a sufficient proof of the need for some solution of the problem of a world of armed sovereign states, each jealous of its independence.

THE FUNCTION OF THE STATE

The fundamental difference of opinion in this matter lies between those who, on the one hand, preserve the Greek conception of the State as an all-inclusive association in which every member should find opportunity of complete self-expression and those, on the other hand, who regard the State as an instrument created by men, in society for certain limited and specified purposes. The one conception leads to a "panarchist" position, in which all the activities of individuals and groups are correlated and co-ordinated within a great scheme of social life of which the State is the supreme and all-embracing expression; the other conception is individualist in trend, seeks to limit the functions of the State to a definite sphere beyond which its "interference" is resented, regards law with Bentham as "a necessary evil," and is in its logical ideal "anarchistic," since it would conceive a society of enlightened individuals working harmoniously together without coercive rules as its utopia. Political theory moves between these two poles, and representatives of almost every possible intermediate position could be named.

Panarchism.—In modern times the "panarchist" position was that upon which the nation-states began to operate. The revolt against Rome in the Protestant states is in part evidence of this. In England the king in the act of throwing off the Roman allegiance, declared "that this realm of England is an empire . . . governed by one supreme head and king . . . he being also institute and furnished . . . with plenary whole and entire power . . . to render and yield justice and final determination . . . in all causes . . . without restraint or provocation to any foreign princes or potentates of the world" (Act of Appeals 1533). Nor did any doubt cross the mind of Tudor Englishmen of the right of the State to control and direct commerce and industry. The unity of national life—political, religious, economic—was more completely realized than ever before or since. Not less, but more completely, was the panarchic ideal pursued upon the continent—at least in the kingdoms of France and Spain. If these Catholic monarchs could not extrude the pope from all jurisdiction in their realms they could and did put the papal power in leading strings, as far as their own realms were concerned, and control its exercise: and with less deeply-rooted organized opposition to face than their English rivals they carried the control of commerce and industry, of religion and education, even of art and literature far beyond the limits possible for an English king. In particular religious unity was insisted on, and the expulsion of the Moriscoes from Spain under Philip III., and of the Huguenots from France under Louis XIV. is sufficient testimony of the price these monarchs were prepared to pay for unity.

Yet the religious dissensions of the 16th and 17th centuries brought to the birth a new and powerful trend of opinion which has not yet spent its force. The exercise of private judgment in the interpretation of the scriptures led to an increasing number of differences of opinion with the consequent formation of new sects. For long the "panarchistic" Protestant States would suffer, no more easily than their Catholic neighbours, any challenge to their internal unity. So Calvin burned Servetus, as the French king would gladly have burned Calvin; so Henry VIII. beheaded Thomas More as his daughter Mary burned Cranmer. Those to whom the situation seemed intolerable at first proposed in fuller and more philosophical terms the doctrine of the Compromise of Augsburg "*Cuius* regio, eius religio," and Bodin writing during the French religious wars, Hobbes during the Great Rebellion would seek to quiet religious strife by insisting that the sovereign power in each state must be left to settle the religious problem in its own way: the individual's right being limited to that of thinking, though not of acting, speaking or writing, as he wished. Not so easily could the desire of men to worship after their own fashion, to prophesy freely, to propagate their opinions, be controlled, and this reassertion of the panarchistic idea was doomed to failure. It was succeeded, through the practical necessities of the situation, by a gradual movement towards toleration which gained momentum as experience showed that a dissident from the State church might yet be a good and loyal citizen. How slow the movement was, how reluctant the abandonment of the idea of the State as a "partnership in all science, a partnership in all art: a partnership in every virtue and in all perfection" (Burke Reflections on the Revolution in France) an Englishman realizes on reflecting that Burke wrote those words in 1790, that the major civil disabilities on Roman Catholics were not removed from the Statute Book till 1829, that Jews could not sit in the House of Commons till 1859, and that the late Lord Acton (1834–1902) was, because of his Catholicism, unable as a young man to enter the university of which in his old age he became professor of Modern History.

Toleration and Individualism.—The admission of the principle of toleration is of profound importance in the development of the individualist view of the function of the State, nor is it any accident that Locke, who wrote the essay on Toleration also fathered political individualism in his second Treatise on Civil Government. Moreover once it was agreed that men might think as they pleased—and act in worship and in teaching as they pleased—in their relation to God, other spheres of activity were certain soon to be claimed from State control for the free occupation of

the individual. Freedom of the press was tacitly admitted in England before the close of the 17th century by the lapse and non-renewal of the Licensing Act in 1695. Freedom of trade was the next stage. Here the development of capitalist enterprise which culminated in the Industrial Revolution (*q.v.*), and which was itself the product of the critical and constructive spirit of the 17th and 18th century played a decisive part. Action and theory went hand in hand, and by the end of the 18th century state control of industry was beginning to be relaxed, whilst the doctrine embodied in the phrase popularized by the Physiocrats *laissez faire, laissez passer* had been worked out into a system of political economy by Adam Smith, had been developed by Bentham in politics and was soon to be applied in legislation by his followers. The idea of free contract dominated politics as well as economics and the state was regarded widely as a limited company formed for certain defined and restricted ends. Witness the prominence of the Social Contract in political philosophy in the works of Hobbes, Locke and Rousseau.

The 19th century opened, therefore, with a new conception of the function of the State. This was conceived as properly confined to the maintenance of urder—a term which emphatically included the enforcement of the laws of property—so that the organization of the army and navy and the enforcement of a minimum of law by the police and the courts summed up the main duties of government. Taxation was, in this view, admitted as necessary for the maintenance of the armed forces and the police and judicial systems, but the machinery of government needed hardly more than an admiralty, a ministry of war, and a home office, together with a treasury to supply the other services with money. For the rest the life of the citizen was to be left to his own unaided activities. His religion, his family life, his education, his business, his amusements, were his own affair.

This individualist movement was greatly assisted in the middle of the century by the application, or misapplication, of a crude version of Darwinian biological theory to the political sphere. As the "survival of the fittest" was the law of nature in the realm of physical evolution, so it was held to be in the struggle of man with man in social life. Not quite logically, such writers as Herbert Spencer eagerly adopted an apparently "scientific" view which supported their resistance to every form of State "interference"; whilst the view naturally gained much currency amongst those favourably placed in the economic struggle who could feel an almost moral indignation at any attempt on the part of the State to interfere with the beneficent operation of the competitive principle in economic life.

Reaction against the more extreme individualism began early in the ranks of individualists themselves. J. S. Mill made considerable modifications in the system which he had received from Bentham and his father, James Mill. In particular, in his *Political Economy,* he was prepared to support, in the name of individual liberty, laws (*e.g.,* limiting hours of work or providing money for education) which would redress the inequality of fortune and give opportunities of self-development to the less fortunate individuals in the State which they could not hope to obtain either by their separate or combined efforts. Henry Sidgwick at Cambridge continued the modification of Utilitarian Individualism and brought ethics, even if a hedonistic ethics, again into relation with politics. Yet both these writers are nearer the anarchistic than the panarchistic "pole," in principle, individualists to the end.

"Panarchistic" theory of the function of the State has a continuous history in modern times and, during the last fifty years, has had the current of political experience in its favour. Rousseau, in a certain sense truly regarded as an arch-individualist, is yet to be regarded as the "father of modern idealism" in that, in the *Contrat Social* he is prepared to recognize that the State is a moral being, with a life and will of its own, and that the individual may find his true liberty in being compelled to obey a law which he is neither sufficiently morally elevated to desire nor rationally enlightened to understand. Still more profoundiy and far more subtly was the panarchistic idea of the State worked out by Hegel, the influence of whose philosophy upon modern political thought it would be difficult to overestimate.

It has been said that panarchism has had experience on its side. The individualism of the early 19th century, coincident with the great industrial developments of the time, brought not only much prosperity but also deep misery in its train. Unregulated competition produced the horrors which shocked even the complacency of mid-Victorian England into the State "interference" embodied in the Factory Acts. Further the development of the spirit of nationalism, combined with the increasing acceptance of democratic principle, made the existence of the "two nations" rich and poor within the confines of each State of which Disraeli wrote, increasingly intolerable for the sensitive of both sections. Tory paternalist democracy in England finds its counterpart in the Liberal Empire of Napoleon III., in the social reforms of Bismarck in Germany: and in all three countries the attempts of authority to adapt itself to the demands of the masses were by those masses condemned as insufficient and they turned to socialism to supply their demands. In time, under the pressure of socialism, united in its many divergent forms at least in condemning *"laissez faire,"* the modern State has developed new governmental institutions to deal with the complex conditions of modern life. It has, on the whole reluctantly, accepted a moral responsibility for the welfare of its citizens, and has gradually been re-assuming, the more easily as its response to demands for assistance brought it new loyalty and support, the character of moral controller and co-ordinator of effort for the good life which, in the Greek conception of politics, properly belonged to it.

The Development of the Functions of Government in the Modern State.—Neither in France nor in the federal legislation of America has the extension of governmental activity been so great as in England *(see* GOVERNMENT DEPARTMENTS), in the one case because of the conservatism of the senate and the distraction from social legislation caused by the struggle between Church and State, in the other case because of the individualist interpretation of the constitution by the supreme court and the fact that, for the most part, the province of social legislation falls within the reserved legislative sphere of the individual states of the union. Yet the Prohibition Amendment is enough to show that Americans do not, in certain cases, shrink from the use of governmental action for attempting to secure a moral end, and in some of the individual states social legislation has been varied and wide in scope. In Germany the same tendency showed itself during the "paternalist" rule of Bismarck, and the establishment of the republic, with the greatly increased political influence of the Socialist Parties, is a guarantee of its continuance. Finally the integral unity of the State, and the omnicompetence of government, is, though in different ways, most clearly and completely worked out in the governmental systems of Russia and Italy.

The reaction against State interference in industry which followed upon the extension of State activity during the War seems (1928) to have spent its force, whilst on the other hand, the demand for direct state control of industrial organisation embodied in the demand for nationalisation of, *e.g.,* railways or coal-mines no longer implies a bureaucratic organisation of such industries by a civil service. The general tendency is to admit that some measure of legal control over industrial and commercial activities is frequently necessary in the interests of the citizen as consumer as well as in his capacity as producer, but that such control should be directed rather to the establishment of reasonable conditions of work and wages, and to the protection of the consumer from unreasonable prices, than to any direct conduct of business enterprises by officials appointed by the State.

No general bibliography of so wide a subject is possible, and readers are referred to the separate bibliographies at the end of the various articles mentioned. The three most important recent works of a general kind on the subject of modern government are: Viscount Bryce, *Modern Democracies* (1921); A. Eómein, *Eléments de droit constitutionnel français et comparé (1927)*; and G. Jellinek, *Allgemeine Staatslehre* (1922). (E. J. P.)

GOVERNMENTAL ARCHITECTURE, as discussed in this article, comprises those buildings whose function has definite relation to governmental purposes, such as town halls, State or provincial capitols, court-houses and parliament buildings.

The ancestry of governmental buildings can be traced back to

three different sources—the temple, the royal residence and the communistic dwelling—according as the governmental structure was theocratic, autocratic or democratic and communistic. At times, where the king was also priest, or the primitive communism hedged around with religious taboos, the three types overlap. Thus, among some savage peoples, notably in the Melanesian islands, there are houses reserved for the use of the men, which are combined temples and meeting-houses, and without doubt, served the purpose of council chambers. In such autocratic civilizations as that of Egypt, on the other hand, governmental functions were centred in the royal palace, which had halls of audience and courts where the king and his councillors could meet, and where executive orders and judicial decisions could be rendered. The great columned halls of the Persian palaces at Susa and Persepolis (6th and 5th centuries B.C.), and the palace of Solomon at Jerusalem, especially the "House of the forest of Lebanon" (I Kings vii. 2) were built, obviously, for official rather than residential use.

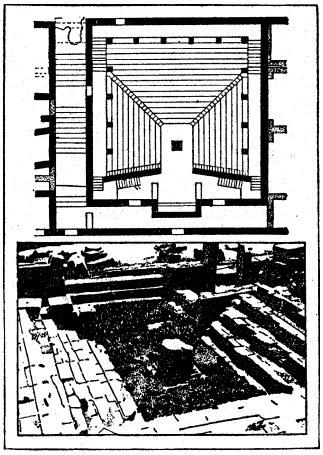

FIG. I.—GREEK BOULEUTERION; ABOVE, GENERAL GROUND PLAN; BELOW, PORTION OF RUINS

Primitive developments of the communistic idea are found amcng the tribes of the American Indians. Thus according to John Bartram *(Observations on his Travels . . . in 1743,* 1751) the Onandaga council house was 80 ft. long and 17 ft. wide. Among the town-dwelling Indians of the south-west, the relation between religion and government seems more strong, as those Pueblo and pre-Pueblo round rooms known as *kicas* or *estufas,* occasionally built under ground, were used both for secret rites and for council meetings. These *estufas* vary in diameter from 18 to 60 ft.; they had flat roofs and were entered only from above.

Greece.—In prehistoric Greece a combination of the autocratic and democratic types first appears. The great flights of steps which bordered the side courts of the palaces of Cnossus and Phaestus *(c.* 1800–1200 B.C.), sometimes termed theatres, were probably used as well for the meetings of large numbers of the heads of families. On the mainland, during this period the autocratic element was more emphasized. The result was the more purely residential type as represented by the palace at Tiryns *(c.* 1200 B.C.).

The growing complexity of governmental systems in the independent cities of historic Greece necessitated special governmental buildings. At first, merely subdivisions of an open space or agora *(q.v.),* these later became well-articulated structures, usually placed near the agora. The most important was the *bouleuterion (q.v.)* or council hall, in which were centred the legislative and executive functions. Near by stood the *prytaneum (q.v.)* which has no modern analogue. It was the official centre of the State as a unit; there the city hearth fire continually burned, banquets were held, and the commanding general had his official residence. Courts, usually held in colonnades or *stoas,* were occasionally convened in open areas reserved for them, such as the Areopagos at Athens. At Priene and Miletus extensive remains of the bouleuterion exist, which show a building nearly square with seats rising up in stages on three sides. In that at Miletus they are curved like the seats of an ancient theatre. At Megalopolis there is a much larger hall (late 4th century B.C.) known as the Thersilion, built for the meeting of a large governmental council. This building, a rectangle 220 ft. long, by 172 ft. wide, had a roof supported on columns placed behind each other in radiating lines, so as to give the widest possible view of the centre of the hall where the speakers stood. In Olympia, the bouleuterion is a more complex structure consisting of a square central hall, the council chamber proper, with an apse-ended building on each side, divided by ranges of columns down the centre.

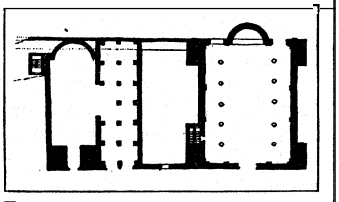

FIG. 2.—GENERAL GROUND PLAN OF A ROMAN CURIA IN THE 16TH CENTURY

Two forms of pyrtaneum existed. The primitive form was circular in plan, and of tholos or bee-hive shape, thus long preserving the tradition of old hut forms. Existing remains of prytanea are, however, of a more developed sort, in which the tradition of the megaron or great hall of the Mycenean palace is recognizable. In Priene, the resemblance to the typical Greek house is particularly strong; at Olympia, the hearth fire is in a hall at the front with a large court at the rear, smaller courts at each side, and halls for banquets. *(See* GREEK ARCHITECTURE.)

FIG. 3.—TOWN HALL OF ST. ANTONIN, FRANCE; BELOW, GROUND PLAN

Rome.—The development of governmental life under the Roman empire is reflected in its mature types of governmental architecture. The group of government buildings surrounding the Roman Forum formed, in fact, the earliest prototype of the modern national capitol; its buildings nevertheless, are merely high developments of those of a small city such as Pompeii. There one end of the forum was filled by three buildings with a common façade, the central being the curia or town council chamber, and those at the sides the offices of the duumvirs and the aediles. The purpose of the central building was thus legislative and that of the side units executive. All three are rectangular halls with recesses or apses at the end. Moreover, close to this group there is, on one side, an enclosed court which is supposed to have been the comitium or voting place for the citizens. On the other side stood the basilica *(q.v.),* so that all the functions of government were housed in buildings designed for governmental purposes.

In Rome the details are different and additional elements appear, yet the basic idea is the same. The senate house or Curia, whose walls still stand as the church of S. Adriano (rebuilt by Julius Caesar and Augustus after a fire, rebuilt again by Diocletian after the great fire of A.D. 283), was a rectangle 75 ft. wide and 85 ft. long, probably with columns dividing it in three aisles, and an apsidal tribune at the end, containing a statue of Victory. This senate house was at one end of a large structure; at the other was a smaller apsidal hall, now the church of S. Martina, and originally the *secratarium senatus;* between the two were two other halls for archives and executive offices. Stairs indicate the presence of a second floor. The whole formed a richly decorated and magnificent government building. Close by on the slope of the Capitol hill was the great national archives building known as the Tabularium, built by Sulla, whose powerful masonry and monumental arcades still overlook the Forum. Across the Forum from the Curia was the Roman treasury, incorporated into the temple of Saturn. The crowded judicial functions were housed in numerous basilicae, especially the Basilica Aemilia and the Basilica Julia.

At the other end of the Forum stood the Regia, the Roman form of the Greek prytaneum, the ritual centre of Roman life and government, and the official residence of the pontifix maximus, closely related to the Atrium Vestae and the temple of Vesta with the never-dying city fire. Thus even in the sophisticated civilization of Rome, government still retained its ancient connection with religious rites, and on ceremonial occasions, even the senate

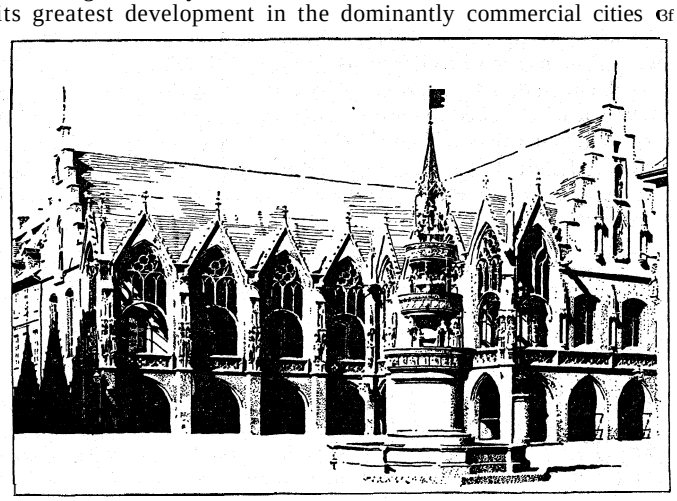
itself was convoked, not in the Curia, but in temples or sacred buildings as in the famous Area Apollonis of Augustus on the Palatine hill. (See ROMAN ARCHITECTURE.)

Middle Ages.—The autocracy of the later emperors and the feudal system which followed were not conducive to the development of governmental buildings. It was only with the development of the powerful municipalities of the 12th century that the modern tradition of governmental architecture began. Throughout Europe the reaction against feudalism found expression in the building of town halls in which were centred more and more of the functions that had been scattered through monasteries and feudal castles. At first the town hall was merely a meeting place for citizens, sometimes nothing more than a belfry whose bell was used to call meetings in a public square; but other rooms for offices and storage were soon added, and by the middle of the 12th century, at least in France and Italy, types had become definite.

In Italy the *palazzo pubblico* resembled the town houses of the wealthy in usually being built around a court and having high, castellated walls. It might serve both as an official building, with meeting halls for governing bodies, and also as a residence for the commanding general Sometimes, as in Florence, two separate buildings, the Palazzo Vecchio (1298) and the Bargello (1256) were used, the former a town hall, the second the residence of the chief magistrate and the prison. Both of these, like all early Italian town halls, have campaniles or belfries attached. There are other characteristic town halls of the period at Siena (1293–1309), and the remarkable Palazzo della Ragione at Padua (1172–1219), whose upper hall was made into one room (1420) said to be the largest undivided hall in Europe, 89 ft. wide, 267 ft. long.

The French type usually combined an arcaded market hall on the ground floor with the governmental portion above and a belfry at one side. At S. Antonin there is a town hall of the 12th century in almost perfect preservation. Another 12th century example is that at La Réole. As the power of the municipalities increased, the richness of the town hall grew also, and those at S. Omer, 14th century, and S. Quentin, 16th century, with an elaborate late Gothic façade, show the development. The market hall has been completely forced out and the entire building is devoted to governmental purposes, and instead of one or two large chambers with a chapel, there now appears a more articulated plan with meeting halls, offices and storage facilities carefully differentiated.

During the 200 years from 1400 to 1600, the town hall received its greatest development in the dominantly commercial cities of



BY COURTESY OF GERMAN TOURIST INFORMATION BUREAU

FIG. 4.—TOWN HALL OF BRUNSWICK, GERMANY

the north. In these a new influence was operative, that of the gild-hall, for the merchants gilds had become closely related to municipal government; in some cases the governing body of a city was itself termed a gild. Thus the hall of the corporation of the city of London is known as the Gildhall. In some towns of the Low Countries, the town hall and a gild-hall were combined. Thus at Ypres the town hall is also known as the Cloth Hall. This magnificent building (1200–1304), is a vast rectangle 50 ft. wide and 462 ft. long. Its arcaded ground floor served as a cloth market, its upper floor contained meeting halls. law courts. banquet halls and municipal offices. The whole formed one of the most monumental examples of secular Gothic in Europe until it was destroyed in the World War. Other remarkable Flemish examples are those of Arras (finished 1494, belfry 1554), Louvain (1448–63), Brussels (1380–1442) and Ghent (completed 1533). In Germany the most beautiful town halls are those of Lubeck (13th century), Tangermunde (1373–78) with remarkable brick Gothic detail, the complex town hall of Brunswick (14th century) and the simpler 15th century example at Goslar. (See GOTHIC ARCHITECTURE.)

Renaissance.—This general type of town hall design continued in use throughout the Renaissance period except in Italy. There

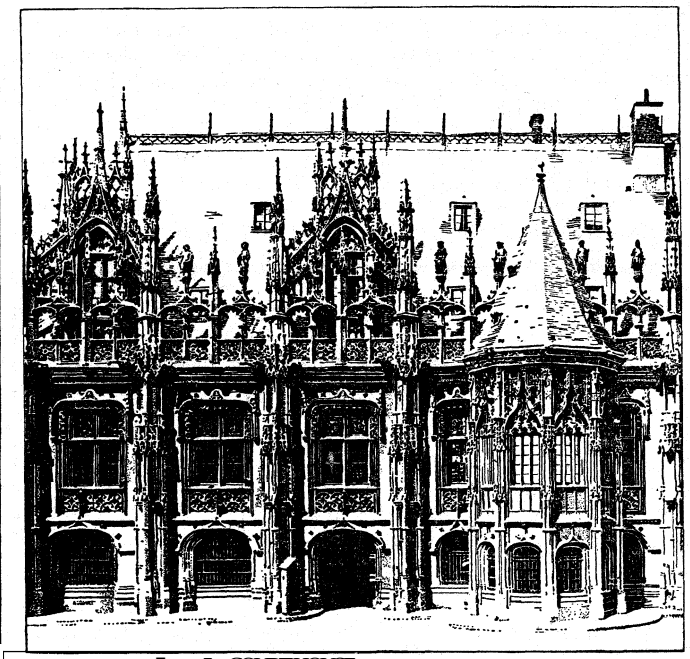


FIG. 5.—COURTHOUSE AT ROUEN, FRANCE

the desire for classicism led to the erection of smaller and more elegant single buildings such as the beautiful Palazzo del Consiglio at Verona (c. 1500 by Fra Giocondo), whose exquisite early Renaissance polychrome façade was adapted by McKim, Mead and White for the old Herald building in New York, and the equally rich and somewhat similar Municipio of Brescia (c. 1500). Michelangelo's Palazzo del Senatore (1592–98) on the Capitoline hill at Rome is significant in its attempt to give to such an official building an architectural form dominant and monumental, and differing alike from the castellated halls of the middle ages and the delicate early Renaissance of north Italy.

Outside of Italy, where the mediaeval tradition held true, the Renaissance town halls merely clothed in classic dress such building types as had been developed before; *e.g.*, the town hall of Bremen (15th century, reconstructed 1609) and the old city hall of Paris (originally built under Francis I. and destroyed in the civil war, 1871). In rebuilding the latter, the old plan was merely enlarged and the old style preserved; the modern tradition of municipal building is thus founded on the mediaeval town hall.

The second important type of governmental building that took form during the middle ages was the court-house or *palais* de justice. Most mediaeval examples are of the late Gothic period because only then had judicial processes become sufficiently divorced from royal, monastic or feudal domination to necessitate separate buildings. The earliest existing examples are the Maison de Pierre at Chartres and the Salle le Roi at Montdidier (both of the 14th century). By far the most famous is the lavish Palais de Justice at Rouen (begun before 1474, completed before 1509). This magnificent building stands on three sides of a court and contains, not only the smaller court rooms, but two vast halls and a beautiful chapel. It is in this use of large halls that originated the tradition of having as an integral part of every court-house a great lobby where lawyers could confer with their clients.

No such development of national governmental buildings can be found during this period. Whatever national unity existed was centred in the residence of the sovereign, and when national councils or legislative bodies arose they were housed either in a royal palace or in religious buildings. To this day the French senate sits in the palace of the Luxembourg. In England, the king's council met wherever he happened to be, as at St. Albans, Oxford or Winchester, and the English parliament convened at the nearest convenient spot to the royal palace at Westminster, which was the chapter house of Westminster Abbey, until 1547 when it moved to St. Stephen's chapel within the palace itself. This remained the meeting place of the House of Commons until 1834 when the palace was burned.

It was only with the development of the government of the United States that a national capitol building, built solely for the housing of a National Government, was first projected. The competition for the capitol at Washington, D.C., was advertised in March 1792 and awarded to Dr. William Thornton. A carefully articulated plan, in which large halls for the meetings of a higher and a lower legislative body flank a central rotunda, appeared for the first time. The capitol, in its original form, was not completed until the early '30s, and its form was then due not only to Thornton but to Stephen Hallet, B. H. Latrobe and Charles Bulfinch as well, all successively its architects. The old House of Representatives is now Statuary hall, and the old Senate is used for the Supreme Court; the original rotunda was roofed with a low dome. By the '50s this plan had become inadequate and two new wings were added by T. U. Walter, together with the enormous colonnaded dome that now crowns the building; one wing was designed for each of the houses. In its present condition, as completed in 1865, it is one of the largest and most monumental of national buildings, and it has furnished a basic plan idea of profound influence on almost all modern governmental architecture. (See RENAISSANCE ARCHITECTURE; MODERN ARCHITECTURE, 18th and *19th* Centuries.)

MODERN PRACTICE

The controlling elements of all governmental architecture are simple. Most important is the convenient relationship of the necessary working units; second in importance is the means of communication between them, and from them to the outside. By virtue of its public and official function, a government building must have the means of communication highly developed and designed for convenience, directness and to give the most beautiful effect possible. As a result, there are many public spaces, such as lobbies, rotundas or *salles* des pas *perdus,* and the halls and corridors are made as monumental as possible. Axial symmetry is an almost inevitable result, as the existence of an axis is not only expressive of direct communication, but also of direct view.

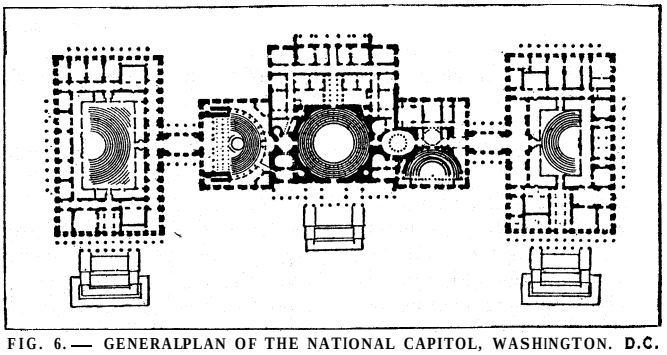

FIG. 6.— GENERALPLAN OF THE NATIONAL CAPITOL, WASHINGTON. D.C.

Owing to the complexity of modern government, governmental buildings can be divided into several classes, each of which must be treated separately. These classes are: (1) Municipal; (2) judicial; (3) legislative, either State, provincial or national; (4) administrati've and executive.

Modern Municipal Buildings.— The requirements governing the design of a modern town hall are as follows: First, a hall or halls for the town council meetings; second, offices for the mayor or the councillors and their secretaries; third, offices for the financial and administrative sections of the town government, such as the tax board, building department, etc. In addition, particularly in European town halls, there are frequently great suites of State rooms for receptions and official banquets (cf. the ancient Greek prytaneum). In America, the typical smaller building frequently also contains an auditorium for popular meetings or entertainments, and may also house the police department and the gaol. The most monumental example of the continental city hall is the great Paris Hôtel de Ville, rebuilt, after the commune, by Ballu and Deperthes (1874–82). Following the original Francis I. style on the exterior, it was elaborated inside with all the decorative lavishness then characteristic, and its great Salles des Fêtes and magnificent stairways, with decorations by Puvis de Chavannes and others, form one of the most gorgeous and effective official suites in the world. This precedent has affected French municipal building ever since. Characteristic examples of later mairies and hôtels de ville that show a similar type of Renaissance classicism, lavish decoration and monumental plan are those of Neuilly-sur-Seine, by Dutocq and Simonet (1885); Versailles, by le Grand (1897); Tours, by Laloux (1896–1904).

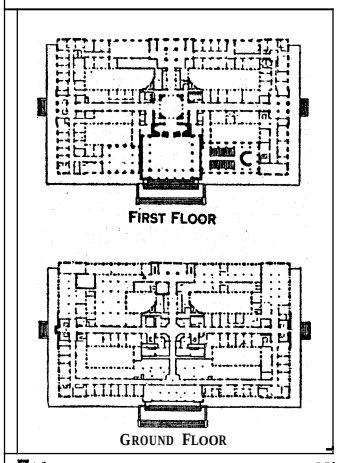

FIG. 7.— PLAN OF CITY HALL AT LOS ANGELES, CAL.; AUSTIN, PARKINSON & MARTIN, ARCHITECTS

In England, the dominance of the Gothic revival movement of the middle 19th century affected much municipal building. The town hall of Manchester, by Waterhouse (1868–77), is the largest example of this, and its picturesque outline and original detail are typical of the best in Gothic revival work. The town hall of Halifax, by Sir Charles Barry, completed by his son after his death in 1860, is a daring and unsuccessful attempt to treat a picturesque Victorian outline, essentially Gothic, in an elaborate Renaissance style. In more recent examples there is greater simplicity of composition and freedom of style. That of Sheffield, by Mountford (1897), in a free early Renaissance style, is typical of the larger examples; that of Oxford, by Hare (1897), in modified Jacobean, is characteristic of the smaller.

Growing complexity of the administrative branches of city government has led inevitably to a type of building in which the council chamber and mayor's offices are subsidiary to the vast amount of office space required. This movement is best expressed in the London County Council Hall, won in competition in 1908 by Ralph Knott, but only completed in 1922. This vast building, in a severely classic, late English Renaissance style, forms an impressive decoration to the south bank of the Thames.

In Germany, the most interesting recent municipal buildings are those in which modernistic expression is consciously sought. In that at Miilheim, by Pfeiler and Grosymann and the *Verwal*tungsgebaude at Berlin, by Ludwig Hoffman, the style is a modernistic neo-classic, freely traditional, and the effect one of restrained and harmonious monumentality. The famous stadhalle at Hanover, by F. Scholer and Bonatz (1914), contains a vast circular hall, and the whole is treated in a much more bizarre and fantastic manner. This is, however, more properly a municipal auditorium similar to a common American type, of which that at San Antonio, Texas, by Ayers, Willis and Jackson, is a good example. All three show the vitality of this movement in Germany. A similar imaginative quality distinguishes the exquisitely restrained town hall at Joensuu, Finland, by Eliel Saarinen.

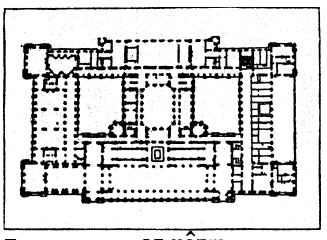

FIG. 8.—PLAN OF HÔTEL DE VILLE, PARIS

The most remarkable of the modernistic city halls is that at

Stockholm, Sweden, by Ragnar Ostberg (completed 1924). This forms a dignified mass capped with a well designed tower and embodying in its base an arcade of great beauty. Inside, it is chiefly noteworthy for the brilliant colour decoration, especially the mosaics of the great official reception hall. (See MOSAIC.)

American Town and City Halls.—Town and city halls in the United States can be divided into three classes. The first consists of the town halls of the small towns and villages, whose needs are simple and whose buildings, therefore, are comparatively small. Faithfulness to the traditional style of the locality is general. In the East, colonial types predominate; in the far West, Spanish colonial; in the spaces between, there is more freedom. The town hall of Weston, Mass., by Bigelow and Wadsworth, in a charming brick colonial, and the Plattsburg, N.Y., city hall, by John Russell Pope, in an austere Greek revival style, are characteristic of these smaller halls. Other notable examples are those at Athol, Mass., by Brainerd, Leeds and Thayer, at Huntington, N.Y., by Peabody, Wilson and Brown and the village hall, Winnetka, Ill., by Edwin Clark. The second type, that of the small city, is necessarily larger and more articulated, with greater office areas. This class owes much to the beautiful city hall of New York, then a small city, by Mangin and McComb (1802–09), which Lafayette's secretary, A. Lavasseur, said was the only building worth looking at in New York (Lafayette en *Amérique,* 1824, trans. 1829). This building is characterized by an unusual delicacy of detail that owes much to Louis XVI. inspiration. Its dome, rotunda and monumental staircase, council chamber, and the suite of offices and reception rooms over the entrance, are particularly noteworthy. Characteristic modern examples are those of Portland, Me., by Carrère and Hastings, with a colonial flavour, and the group at Springfield, Mass., by Pell and Corbeft, in which two colonnaded buildings flank a municipal-clock tower.

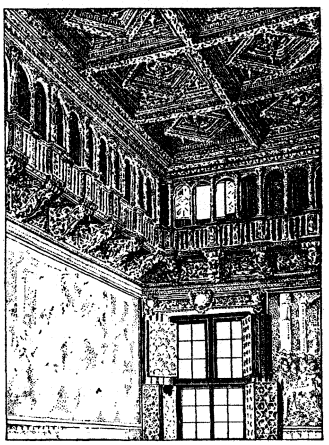

FIG. 9.—VALENCIA COURT ROOM
FROM BYRNE & STAPLEY "SPANISH INTERIORS AND FURNITURE" (WILLIAM HELBURN)

The great city hall of San Francisco, California, by Bakewell and Brown, reaches the dimensions of an important State capitol. It is, nevertheless, a compromise, lacking the intimacy of the small type, and due to its necessary small subdivisions, missing the simplicity of a great legislative building. To meet the same problem, New York was compelled to erect a great municipal office building to supplement its century old city hall. This, by McKim, Mead and White, is essentially a sky-scraper officebuilding. Only the lavish classicism and dignity of its exterior distinguish it from its commercial neighbours. Thus far, the most successful American solution of the problem is the Los Angeles, Calif., city hall, by Austin, Parkinson and Martin, completed 1928. Here, for the first time, the two elements of town hall and municipal office building are combined in the same structure and given adequate architectural expression.

Modern Judicial Buildings.—Just as the modern court system has remained close to its traditional ancestry, so the modern court-house in its essential elements has changed little. Such a Renaissance court room as that in the Ayuntamiento of Valencia, which dates from 1535, could be used, even to its furniture, without change, by almost any modern court. The *salle* des pas *perdus,* or monumental lobby, the court rooms and rooms for judges, lawyers, witnesses and archives, all appeared in court-houses of the 1jth century, so that between such a building as the picturesque Law Courts of London, by G. E. Street (completed 1882), and the Palais de Justice of Rouen, 400 years earlier, the difference is only one of detail. The Palais de Justice at Paris is typical of the 19th century continental court-house. It is of many dates, as it is on the site of and incorporates portions of a 13th century royal palace. Other portions were rebuilt after a fire in 1618, and its present form was completed by large rebuilding: after the commune, and a new west front by J. L. Duc. Thus its plan represents a continual compromise between old and new.

Nevertheless, two of the most remarkable modern public buildings of Europe are court-houses. The Palazzo di Giustizia at Rome, by Calderini (1889–1910), is a vast agglomeration of pseudo-classic detail, monumental and powerful in composition, but with too much meaningless small scale ornament which detracts from the unmistakable vitality. A somewhat similar type of imagination characterizes the much more interesting Palais de Justice at Brussels, by Poelaert (1866–83). Here everything is subservient to a vast and craggy grandeur.

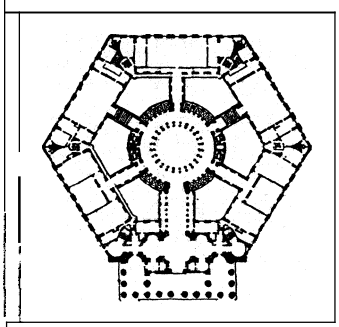

FIG. 10.—PLAN OF NEW YORK COUNTY COURT HOUSE: GUY LOWELL, ARCHITECT

American Court-houses.—It is in America that the court-house has received a definitive form; as early as 1724 the germs of it ate seen in the charming porticoed Court House at Chester, Va. The traditional elements have remained the same, and the classic tradition for governmental buildings, dating back to the beginning of the 19th century, has almost completely dominated. The wide use of elevators, and the demand for economy in land usage, have produced a compact plan, generally in several storeys. The wide development of the jury system has also necessitated careful planning to give adequate jury rooms with the necessary services. The basic unit, therefore, consists of the court room proper, with its space for the public, witnesses, jury box, judge's bench and areas for counsel, clerks and stenographers and the press; the judge's office or chambers, and the jury room.

Since the time of the Gothic revival, classic treatment and an attempt to emphasize the dignity of the law are almost universal. This tendency is as strong within the building as without and it is sometimes only in his court room experience that an American is brought in close contact with a dignified and beautiful room, austere in form but lavish in fittings and decoration. The Shelby county court-house at Memphis, Tenn., by Hale and Rogers, with its dignified Ionic portico, and its pedimented end pavilions is characteristic of the classic grandeur obtained in many recent court-houses even in the smaller cities. The Hamilton county court-house at Cincinnati, O., shows the same tradition, applied to a much larger building. All of these modern trends in court-house design reached a conclusion in the court-house of New York county, at New York city, by Guy Lowell, completed in 1927, after his death. In this, a plan of striking originality, a central rotunda gives access to elevators surrounding it, which, in turn, communicate simply with the court rooms on each floor.

Modern Administrative Buildings.—Administrative buildings are of two broad classes, one consisting of those primarily for a public service, such as post offices and custom houses, and one of those devoted to purely administrative services, such as ministries. Owing t~ the gradual growth of public services of the first type their housing in many European countries has until recently been neglected; they have frequently been forced into altered buildings, usually palaces, but in Rome and in Havana, Cuba, the post offices occupy former monastery buildings. Only in the largest cities are there exceptions, such as the rather undistinguished general post office of Paris (1884) by Guadet, or the great late Renaissance piles in London of the general post office proper (1910) and the general post office north (1905), both by Henry Tanner. Recent years have seen greater attention paid to post office design, especially in Germany, but it is in the little Dutch city of Utrecht that the most beautiful of modern European post offices is to be found, designed by Crouwel.

Custom houses similarly are seldom of architectural import in Europe. Almost the only one that has adequate dignity and convenience, is the great custom house in London. by David Lang (1817), partially rebuilt by Robert Smirke. Its vast length forms

one of the most distinguished decorations of that portion of the Thames bank, and it is remarkable for its "Long Room" over 200 ft. long, where most of the business is transacted.

The lack of any adequate buildings into which these services could be placed in America was, from the beginning, a great incentive to the development of new types of building. As early as 1832 New York possessed a monumental custom house, designed by Town and Davis, in the Greek revival style, which is still (1928) standing at the corner of Nassau and Wall Sts. used for a passport office. The present New York custom house is a lavish building of Renaissance character, by Cass Gilbert. Of the smaller towns that at Wooster, O., by Wetmore, and New Haven, Conn., by J. G. Rogers, are typical; a notable combined Federal Court House and Post Office building is that at Denver, Colo., by Tracy, Swartwout and Litchfield. The New York post office, by McKim, Mead and White, is interesting for its Corinthian colonnade.

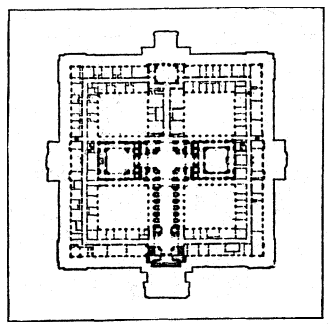

FIG. 11.— PLAN OF THE STATE CAPITOL OF NEBRASKA: BERTRAM GROSVENOR GOODHUE, ARCHITECT

Ministries and similar administrative buildings suffer from having a programme exactly like that of a modern office building; in general, the result is not distinguished. In European capitals, ministries are frequently housed in altered palaces, as in Paris and Vienna. In London, where they are concentrated along Whitehall and Parliament street they form a group, impressive in general effect, but without individual distinction, except in the case of the Admiralty, by Ripley (1726), with an exquisite screen by Robert Adam (1760). The Renaissance group by Scott (1873), and Brydon (1900–20), containing many ministries is noteworthy.

In America, the classic tradition, under which the city of Washington, D.C., was started, has led to the imposing colonnade of the Treasury building, and within the 20th century to the restrained Senate and House office buildings, by Carrbre and Hastings.

Modern Buildings. — With the addition to the old Palais Bourbon (1722, by Girardini and Gabriel) of the great 12 columned pedimented front, in 1807, by Poyet, to express the dignity of the buildings used by the Chambre des Députés, modern legislative architecture began. The classic tradition, there set, remained almost unbroken for 100 years all over the Western world; to this precedent was added the influence of the U.S. Capitol at Washington, D.C , with its clear expression of two chambers, one on each side of a central public rotunda. The French Chambre des Députés, reconstructed (1822–33) by de Joly, and the Senate, in the Luxembourg palace (1836–41), by de Gisors, are characteristic lavish developments of a classic amphitheatre plan already adopted in the Washington Capitol. The simplicity and directness of the U.S. Capitol plan have inspired many modern legislative buildings of two chambers. It is almost universal in American State capitols, from such early examples as the Massachusetts State house at Boston, completed 1798, by Charles Bulfinch. To such 20th century examples as that at Jefferson City, Mo.. by Tracy, Swartwout and Litchfield, that of Minnesota, at St. Paul, by Cass Gilbert, the Wisconsin capitol at Madison, by George B. Post and Sons, and the Territorial Capitol of Porto Rico at San Juan, by Carmaega and Nichols. In Hungary, the same type appears in the parliament building at Budapest, by Steindl (1883–1902), although the style is flamboyant Gothic. In Vienna, the parliament building by Hansen (1874–83), has a similar plan.

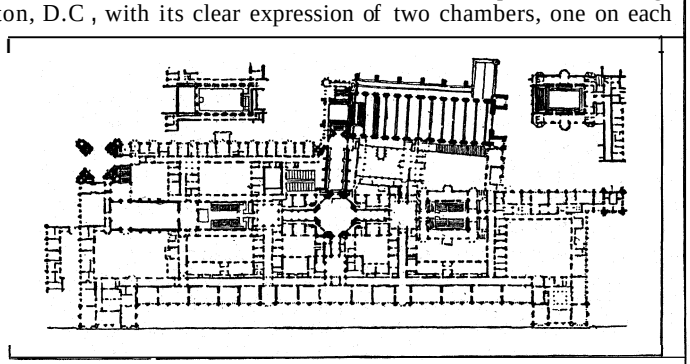

FIG. 12.— PLAN OF PRINCIPAL FLOOR, HOUSES OF PARLIAMENT. WESTMINSTER

In the Wisconsin capitol the architects were forced to have four wings, forming a cross, instead of the usual two. This was at best a compromise. Finally, in the masterly Nebraska State capitol, at Lincoln, the late Bertram Grosvenor Goodhue accepted the problem and solved it. In place of the usual two-winged building with a dome, there is a vast rectangle, divided by a cross into four courts. One arm of the cross contains the monumental corridor, with a central rotunda. The cross arm holds the two legislative houses. Above the rotunda rises a tower of many storeys, and the administrative offices ring the courts and occupy the tower as well.

The Houses of Parliament in London, by Sir Charles Barry (1840–50) is an interesting and remarkable exception to the general rule in both plan and style. Here, the House of Lords and the House of Commons are but incidents in a vast composition in which are placed the members' offices, dining-rooms andlibraries, the speaker's residence and all the rooms required for the traditional and picturesque ritual. In style, the whole is treated in lavish Perpendicular Gothic, and the exterior aim has been to achieve picturesque massing, with the Victoria tower at one end and the clock tower at the other, rather than any expression of interior function.

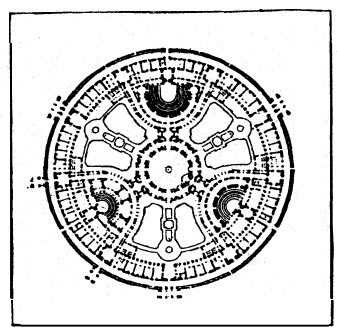

FIG. 13.— LEGISLATIVE BUILDING, DELHI: SIR HERBERT BAKER AND SIR EDWIN LUTYENS, ARCHITECTS

The foundation of new provincial capitals, in Australia, 1911, and in India, 1919, furnished a new opportunity for the adequate housing of complete dominion governments. In Australia, the competition for the lay-out of the city of Canberra was won by Walter Griffin of Chicago, with a most comprehensive plan. The first of the buildings, in connection with this, was formally opened in the summer of 1928. The eventual scheme consists of a rectangular plaza with the departmental administrative buildings flanking it on each side, and at its head, a great structure containing the parliament and a library. Behind is a circular plaza flanked by the residences of the premier and the governor-general.

In Delhi, a much more lavish scheme is under construction. It consists of an enormous avenue, or plaza, flanked by two groups of administrative offices known as the secretariat buildings, by Sir Herbert Baker, and headed by the picturesque mass of the Government house, the official residence of the viceroy, by Sir Edward Lutyens. At one side is the legislative building, by Baker, an enormous circle, with three interior courts, between which are the three houses, the council of princes, the assembly, and the council of State, with a circular library joining them in the centre. Lower down on the main axis is a great memorial arch, by Lutyens; smaller buildings are to flank the avenue, one of them, the record office, by Lutyens, being now (1928) under construction. All the buildings of this tremendous group are designed with great lavishness of plan and interior arrangement, and exteriors in which classic Renaissance and Indian detail are daringly combined and powerfully massed.

An even greater opportunity is offered in the proposed group of buildings for the League of Nations at Geneva. The opening created by the site on the shore of the lake, and by the programme, is one to stimulate the best efforts of modern architects.

LEGISLATIVE AND JUDICIAL BUILDINGS

1. Parliament House, Budapest, Hungary; Steindl, architect (1883–1902). An interesting attempt is made in this building to take a plan of the type set by the Capitol at Washington (fig. 3) — two wings, one on each side of a central rotunda — but to treat the whole in a picturesque and romantic Gothic style. The result is impressive, although the detail is sometimes crowded. 2. Houses of Parliament, London, England; Sir Charles Barry, architect (1840–50). The first great modern legislative building in an adapted Gothic style was that in London. It forms one of the most convincing examples of Modern Gothic. There is no attempt to express the plan or arrangement of the building on its exterior; on the other hand there is no attempt at false or forced picturesqueness. In addition to the legislative chambers and their offices, the building contains the Speaker's residence, and many robing rooms and other quarters required for royal ceremonials. 3. The United States Capitol, Washington, D.C. Begun in the last decade of the 18th century with Dr. William Thornton as architect, it was carried on through the early 19th century by Stephen Hallet, B. H. Latrobe, and Charles Bulfinch. In its earlier form it had the central rotunda (then with a low dome) and a wing on either side, one for the Senate, and one for the House of Representatives. In 1853 these old rooms were found too small, and a great wing was added at each end, from the designs of Thomas U. Walter. At the same time the present great dome with its column-circled drum was added. 4. The former Parliament buildings, Vienna; Hansen, architect (1874–83). One of the most monumental in plan, and most gracious in its classic detail of any of the national parliament buildings, this simple Composition is one of the distinguished decorations of its city. 5. Hôtel de Ville, Ypres, Belgium. 13th–15th centuries. Sometimes called the "Cloth Hall," this building (destroyed during the World War) was an expression of the close relationship of merchants' guilds and city government which was usual in Flanders.. It contained the hall of the Cloth Merchants' Guild, a market hall beneath, and the offices of the city government as well as a great banqueting hall. 6. The Palais de Justice, Brussels, Belgium; Polaert, architect (1866–83). The enormous bulk of this craggy and powerful building set on a hill top dominates the city: although lavish and in questionable taste, it conveys, nevertheless, by virtue of simple conception, monumental arrangement, and stark strength of design, a compelling impression of the dignity of government, and the power of law

GOVERNMENT DEPARTMENTS. While differences of internal organization and of cultural development between countries have produced inevitable differences — superficial or profound — in their governmental machinery, it will be found under modern conditions that common political, social and economic needs tend to give the same functions to Government departments in one country as another, however diverse their theory of the proper arrangement and scope of governmental organs.

In comparing different countries, homogeneity is suggested by the nomenclature of their Government departments, but this is apt to be deceptive. For example, the English Home Office may reasonably be thought to correspond to the Ministry of the Interior in nearly every other country. This is largely true, but the Home Office has many functions which elsewhere are commonly assigned to a Ministry of Justice, and the control of local government, which in France (for example) has been said to be the main function of the Minister of the Interior, is in England (so far as control exists in England) at least as much for the Ministry of Health, as successor of the Local Government Board. Again the Ministry of Public Works is in France responsible for railways, with which the English Office of Works has no concern.

In England, the normal mode of creating a new department in modern times has been by statute, *e.g.,* the Local Government Board Act, 1871, and the acts creating Ministries of Transport and Agriculture in 1919, but the constitutional necessity for this arises — so long as existing statutory functions are not touched — only from the need of a parliamentary grant for the resulting expenditure. Indeed, in the drafting of statutes care is usually taken, if the department of a secretary of State is involved, to preserve the position that the King can appoint a fresh secretary of State without parliamentary authority. A good example is the Secretaries of State Act, 1926, turning the secretaryship for Scotland into a secretaryship of State: the act is expressed to operate as from the date when His Majesty shall first appoint another secretary of State after the act passes, if he shall be pleased to do so. With two or three exceptions all statutory functions of a secretary of State in England are assigned to a (or the) secretary of State simply, without distinction between one department and another, on the constitutional view that the King's secretariat is one, although in practice the work is divided by administrative arrangements periodically varied. So in France. although jurists differ concerning the basis of the practice, it is recognized that the Government of the day can increase or reduce the number of departments and redistribute their functions at will, subject to parliamentary control of the necessary funds. Transfers of duty from one department to another are made, in modern English practice, by statute or (perhaps more often) by order in council authorized by statute, but some transfers, *e.g.,* from one secretary of State to another, can in principle be made without formality.

If functions are distributed on a theoretical basis, between various departments, this must be either according to the persons affected by performance of a function or according to the purpose for which it is performed. For example, assuming Ministries of Shipping and of Health, which should be responsible for the health of seamen? Questions like this closely bear on the efficiency of Government, but they have small interest for the public — except those members of it affected personally by some fault in distribution — and no nation popularly governed has made a serious effort towards embodying a scientific answer in its legislation. A re-grouping on practical lines, halving the number of departments, has been effected in Italy between 1923 and 1927. Lord Haldane's committee on the machinery of Government, reporting in 1918, suggested a re-grouping of functions for England, but this has not been carried out — and whether the particular suggestions made were sound remains a matter of opinion The central recommendation was re-grouping according to the services performed, not according to the persons affected, but exceptions were perforce admitted. Thus — to take the instance already used — if shipping be nationalized the department managing it (and not a separate Ministry of Health) must be responsible for the health of its employees: this applies to any nationalized service, as is seen with the army and the post office.

Practical exigencies, constitutional accretion, statute, order in council, tradition and convention have played their part in making the English distribution more haphazard than that of most other countries, but in this article an attenipt is made to use the English departments as a key (since their names at least will be familiar to English speaking readers), mentioning under each any points of special interest relating to the Government departments of European countries.

The Treasury or Ministry of Finance. — Among English Government departments the first place is taken by the Treasury. This is the office responsible for the management of the national revenue — although the actual collection of revenue is made (apart from that which is earned, *e.g.,* by the post office) through the commissioners of inland revenue and the commissioners of customs and excise — two departments which, while closely connected with the Treasury, are formally distinct. The Treasury has an exceptional relation to the House of Commons, and the position has come to be recognized that no expenditure can be incurred by any department of Government (with certain exceptions not affecting the general proposition) without previous Treasury sanction. Moreover, when money is voted by parliament, the department to which it has been granted does not get it automatically. The money has still to be collected from the taxpayer, and meantime the department and all others — in short the business of Government as a whole — must be financed. This involves extensive borrowing, to be repaid as taxes are forthcoming, and this borrowing in the money market is a specific function of the Treasury Similarly, the negotiating of long term loans, at as favourable a rate as the national credit will secure, is a function of the Treasury, which is thus in close and necessary touch with the city as well as with parliament. Historically, the Treasury sprang from the accounts department of the Plantagenet kings, the early "exchequer," which was associated with the court of exchequer in dealing with the revenue. In later days, a lord high treasurer was appointed, whose office was placed in commission in the 17th century The Treasury has since been controlled in name by a board of lords commissioners, of whom the prime minister is usually (though not of necessity) first lord, but the commissioners have formal duties merely. The chancellor of the exchequer, assisted by the financial secretary of the Treasury, is the minister in charge of the Treasury's daily work, which is divided under three main heads. These are supply — that is, that side of its work which relates to public expenditure; finance — that side which is related to the raising of loans, to currency, banking and the like, including since 1918 the important and complicated question of international debts; and establishments — that side which deals specifically with the problems of "management" of Government departments, salaries and wages, accommodation, and the like. The field of action of the Treasury covers Scotland as well as England, but the constitution of separate parliaments for Northern Ireland and the Irish Free State has naturally led to the establishment of separate Finance Ministries. The title "Ministry of Finance" is used in all countries of the British empire except Australia, and is the accepted English translation of the titles given in all European countries to the

department having functions generally similar to those of the British Treasury.

DEPARTMENTS OF A SECRETARY OF STATE

Although there is no formal order of precedence among English Government departments a certain priority, after the Treasury, may be said to attach to those whose head is one of the secretaries of State. These are eight in number under seven Ministers (that of the colonies and the dominions being held together), namely—Home Affairs, Foreign Affairs, War, the Colonies, India, Air, the Dominions, and Scotland. The Board of Trade, the Board of Education, the Ministries of Agriculture and Fisheries, of Health, of Transport and of Pensions, and the General Post Office are other departments usually recognized as suitable to be placed in charge of a minister of cabinet rank, though not of a secretary of State.

The Home Office.—The Home Office in its present form dates from 1801, when colonial business was transferred to a separate secretary of State. The supervision (other than judicial) of the administration of justice, advice to the King upon the exercise of the prerogative of mercy, the supervision of police, prisons, reformatories, the liquor trade and factories, and the making of arrangements for national and local elections and for electoral registration, are among the specific duties of the home secretary. He is, moreover, the primary constitutional channel of communication between the sovereign and the subject, and in this capacity no limit to his duties can be set. A duty of particular interest is to serve as intermediary between the Imperial Government and the Channel islands, which are not colonies but part of the ancient dominions of the Crown. It is his duty also to receive petitions addressed to the Crown (and refer them to other departments if necessary), to issue warrants and appoint royal commissions (even in matters not affecting his own specific duties), to settle precedence and titles of honour (for example, in 1927, a pronouncement was made that lord mayors are not entitled to be called "Right Honourable" without a grant from the Crown) and generally to deal with business involving the prerogative, or any business not definitely assigned to some other department of Government. The jurisdiction of the Home Office does not extend to Scotland, which has its own secretary of State. The Home Office, though new duties, *e.g.,* the supervision of factories, have been engrafted on it by statute, is fundamentally a peculiar product of British constitutional growth, and its position has no exact parallel elsewhere. In many countries of the British empire and of Europe its duties are divided between the Ministries of Justice and of the Interior (some also being appropriate to a Ministry of Labour)—although in many countries, as is mentioned above, the Minister of the Interior is largely engaged in controlling local administration through the prefect, a functionary for whom no English parallel exists.

The **Colonial and Dominions** Offices.—The Colonial Office is the department which deals with questions affecting the various colonial possessions of the British Crown other than the self-governing dominions. At the Restoration, a committee of the privy council was formed to deal with colonial business, and in 1695 a Board of Trade and Plantations was created for collecting information and giving advice, the executive work being performed by the secretary of State for the southern department. A separate secretary of State was appointed, abolished and reappointed in the 18th century, and in 1801 this secretary was designated as secretary of State for war and the colonies. In 1854 a distinct office of secretary of State for the colonies was created. In 1925 a secretaryship of State for the dominions was created. This is a good example of the constitutional process by which a secretaryship of State comes into existence, for there was no statute: an order was given to the king's engraver to make a new seal and this was conferred on L. S. Amery, to be held with the seal appertaining to the secretaryship of State for the colonies. The business relating to the self-governing dominions was assigned to a separate Dominions Office, though certain services, *e.g.,* legal, financial, and other general business, continued common. Since the Colonial and Dominions Offices exist as the vehicle of communication between the Imperial Government and the rest of the empire, there is, in the nature of things, no counterpart in other countries of the empire. Similarly, no other State has an exact parallel to the Dominions Office, because no imperial constitution resembles the British, but France and Italy among the Great Powers have Colonial Offices, under ministers of the first rank, as had Germany before the war.

The India Office.—The India Office is another department of the British Government which is without parallel elsewhere. being the link between the imperial cabinet and parliament and the Government of India. Created in 1858, it took over the duties of the Board of Control (which Pitt's act of 1784 had set up for such supervision of Indian affairs as parliament and the home Government then desired to exercise) and of the head office of the East India company in the city. The office was in part reorganized in 1919, in connection with the reform of the Indian Government, but retains certain special features due to its origin, which are not found in other departments. Thus the secretary of State, who is the head of the department, exercises in part the same class of jurisdiction as any other member of the Government, but in certain matters he is bound by statute to obtain consent of, and in other matters to consult, the "Council of India." This is an advisory body, of whom half at least must have Indian experience, and is historically descended from the 18th century Board of Control on the one hand and from the board of directors of the East India company on the other. It works in close touch with the several divisions of the India Office, but administratively does not control them. A second peculiarity of the India Office lies in the fact that its cost is in part not charged upon British revenues: the British parliament pays (since 1919) the salary of the secretary of State and a proportion of the office charges, and the rest, calculated to represent the value of business done in England for India, falls on Indian revenues.

For the departments of other secretaries of State, *see* FOREIGN OFFICE; WAR OFFICE; see also ADMIRALTY.

OTHER DEPARTMENTS

After the departments headed by secretaries of State come a number of ministries and boards, the most important of which are here noticed in alphabetical order—their relative standing not being authoritatively defined—and the others collectively at the end of this article. It will be seen that the title of "ministry" is borne by those created since the war, some of which absorbed or were mere reincarnations of "boards" with the same functions. There is, it seems, a fashion in the naming of Government departments—the English tradition in the 18th century, *e.g.,* Board of Trade, and until the zoth, *e.g.,* the Insurance Commission created in 1911, being in favour of boards of commissioners, their theoretical constitution being often more or less a legal fiction. The Continental titles of "minister" and "ministry" do not occur in a single English department before the war: they sprang into use with the Ministry of Munitions in 191j, and—for some inexplicable reason—wholly replaced the native usage after the war. A bill was introduced into parliament in March 1928 to remodel the Scottish departments (most of which existed previously in the form of boards of active members, with the secretary of State for Scotland as their president) under the name of ministries.

The Ministry **of** Agriculture.—The Ministry of Agriculture and Fisheries, created in 1919, took over the duties of the Board of Agriculture and Fisheries, which itself sprang from the "veterinary department" of the privy council, formed in 1865 when the country was ravaged by cattle plague and renamed the "agricultural department" in 1883.

Among the statutes executed by the ministry may be mentioned those relating to the diseases of animals, the weighing of cattle, the redemption of tithe, the enclosure of commons, the provision of small holdings and the drainage and improvement of land.

In 1903 the powers and duties of the Board of Trade under various acts relating to fishing were transferred to the Board of Agriculture. The department carries out much agricultural research, and publishes numerous pamphlets and other papers at popular prices for the assistance of farmers, small holders, poultry

keepers, horticulturalists, etc. Similar departments exist in Scotland, in Northern and Southern Ireland and in most of the British dominions. Among European countries many have separate Ministries of Agriculture, but the Italian reforms of 1923–27 placed agricultural affairs in a general "Ministry of National Economy" which is responsible for co-ordinating agricultural and industrial policy.

The Board of Education. — The Board of Education succeeded a committee of the privy council, formed in 1839 to administer parliamentary grants in aid of education which had then recently been introduced. The board consists of a president, the lord president of the council, the first lord of the treasury, the chancellor of the exchequer and the secretaries of State — the responsibility resting with the president. Its jurisdiction extends to Wales, for which, however, there is a separate department in its office. As at present constituted, after education in England and Wales was put on its present footing by the Education Act, 1902, this office is one of the largest of Government departments. The board, through its headquarters staff and a large inspectorate, supervises the educational work carried on by local education authorities in counties and boroughs, and through parliamentary grants has considerable influence over the work of universities and other educational organizations which are not subject to direct governmental control. In addition, the Board controls several (not all) of the national museums.

In Scotland and Northern Ireland, there are separate education departments, as there are in Southern Ireland and the dominions overseas. Indeed, education is one of the national services which is almost everywhere increasingly costly and considered to require governmental organization. This is usually by a separate ministry, which may, however, be combined with "fine arts" as in France and Italy, or with "public worship" or some other subject as in some States of Germany. The commissariat for education in Russia, in addition to educational duties of the usual type, manages a large publishing business, producing not merely text-books but some 40 scientific journals.

The Ministry of Health. — The Ministry of Health was set up by statute in 1919, primarily to concentrate health services previously exercised by the Local Government Board, the National Health Insurance Commission, the privy council, the Home Office and the Board of Education. The insurance commission had been responsible for collecting contributions to a national scheme of health insurance established in 1911, and for providing the benefits for which the insured population had paid, with certain ancillary functions in the way (especially) of research. The Local Government Board had much wider scope. Established by act of parliament in 1871, with the same purpose as the new ministry — that of concentrating services which previously had been divided — it was responsible for the central supervision of most services carried out by locally elected authorities, and for much besides. In matters of health, these services covered the suppression of nuisances, closing of unhealthy dwellings, prevention of iniectious disease and of the sale of contaminated food, maintenance of sewers and (increasingly under the legislation of the 20th century) the provision of clinics and public medical assistance, largely aided by parliamentary grants. The board took over the central administration of the poor law from the Poor Law board in 1871. It supervised highways, the registration of electors, town planning, the provision of houses for the working classes, motor cars and local finance (sanctioning loans and auditing through district auditors the accounts of most local authorities). It confirmed by-laws on most subjects on which local authorities could make them. It decided between the Crown and the subject on claims for old age pensions, between local authorities in various disputes, and between them and individuals on numerous matters affecting proprietary rights. Of the subjects here enumerated, highways (in part) and motor cars have, by the Ministry of Transport Act, 1919, passed to the Ministry of Transport, and electoral registration has by order in council passed to the Home Office.

The Ministry of Health Act gave power, by order in council, to transfer functions from or to the minister, and a few small changes, additional to those mentioned, have been made, but substantially the functions of the ministry remain as now enumerated (that is, as they were in 1919), with the addition of extensive new duties, affecting many matters besides health, under later legislation. To a great extent, therefore, the Ministry of Health in England has functions assigned in most European countries to the Ministry of the Interior. The minister's jurisdiction extends to Wales, where work in matters of "health" (not including "housing") is done through the Welsh Board of Health, but the "local government" work of the ministry direct from London. In Scotland the Scottish Board of Health performs duties almost identical with those of the Ministry of Health in England. It is derived similarly from the Scottish Local Government Board and the Scottish Insurance Commission. In Northern Ireland, most of the duties of a Ministry of Health are performed by the Ministry of Home Affairs. So in the Free State, and in the dominions overseas, there is no separately organized Ministry of Health, but duties analogous to those of the English ministry are performed by other departments. Except in France, where "health" and "labour" are combined, the same is true of European countries.

The Ministry of Labour. — The Ministry of Labour was set up in 1916 and took over certain duties (mainly from the Board of Trade) in relation to problems of labour. It does not deal with all such problems; in particular the inspection of factories and workshops remains under the Home Office, and that of mines falls to the mines department of the Board of Trade.

The ministry is responsible for unemployment insurance and for the national system of employment exchanges. It is also the authority for dealing with industrial disputes and the medium by which those capable of settlement in a judicial manner are brought before the industrial court or special tribunals of enquiry.

Among European States, France, Germany and Russia have Ministries of Labour (the first named combining it with "health") and it will probably be found that the Italian "Ministry of Corporations" when fully constituted performs a great many of the same functions.

The Ministry of Pensions. — The Ministry of Pensions was set up by act of parliament in Dec. 1916, to deal with pensions arising out of services during the war, but the department does not deal with the "service pensions" of the army, navy and air force, which are left with the departments responsible for the general administration of those services. That is, the business of the ministry is the assessment and payment of pensions to widows and dependents, and for disability — the latter involving maintenance of hospitals and a large staff of medical men.

The Board of Trade. — The "committee of the privy council for trade" or, as it is usually called, the Board of Trade, dates in its present form from 1786, when (after the constitution and dissolution of several earlier bodies) a permanent committee was formed by an order in council, which with one or two small exceptions still regulates the legal constitution of the board. Under it all the principal officers of State, including the first lords of the Treasury and Admiralty, the secretaries of State, and certain members of the privy council, among whom was the archbishop of Canterbury, obtained seats at the board *ex officio*. The growth of commerce, however, necessarily threw new duties upon the Board of Trade, and its technical constitution has now merely an historical importance, the president acting alone as the responsible minister. Described by Lord Haldane's committee on the machinery of Government in 1918, as "the department dealing with private enterprise as such," the Board of Trade has since lost some of its functions, to the Ministry of Transport and Ministry of Labour in particular. It retains, however, the control of patents, weights and measures, and of foreshores belonging to the Crown, the administration of the law relating to wrecks, to copyright, to companies and bankruptcy, to gas undertakings and to merchant shipping, and it publishes statistical and other information on commercial subjects, relating to Great Britain and other countries. A sub-department under a parliamentary secretary is charged with administration of the law relating to mines, and another organization of general interest was attached to the Board of Trade in 1925, when a food council was established, without executive

functions but intended to collect and publish information on food prices and supplies. The Board of Trade is one of the few departments which exercises jurisdiction in Scotland as well as England.

Departments of trade, or commerce, or bearing similar titles, exist in Northern Ireland and the Irish Free State, and in all the self-governing dominions, with functions similar to the central functions of the Board of Trade in Great Britain. In European countries the same is generally true, but in Italy the interests of industry and the supervision of mining, of insurance, of "intellectual property," and the preparation of statistics on all subjects, are among the duties of sub-departments of the Ministry of National Economy, which also embraces agriculture, fisheries and the exploitation of forests and national domains.

The Ministry of Transport.— The Ministry of Transport was formed by statute in 1919, to take over from other Government departments their duties concerning transport by road and rail throughout Great Britain.

In effecting the transfer of existing powers to the ministry, the problem already mentioned, of allocating governmental functions, arose and it was found expedient to leave some, *e.g.*, the sanctioning of loans for road works proposed by local authorities, and the approval of by-laws for the width of streets and for vehicles on the roads, with the Ministry of Health, as the department generally responsible for local government.

In 1927 the Government announced an intention to abolish the Ministry of Transport as a separate entity, but this intention was abandoned, and the functions of the department continued as before. These fall under three main headings: railways, roads and road vehicles. The minister orders public enquiry into railway accidents and confirms by-laws of the railway companies. He sees to the enforcement of the regulative acts of parliament for railways, and himself makes orders, having statutory force, for trams and mechanically propelled road vehicles. He also administers the road fund, a fund kept separate from the country's main revenues, fed by the proceeds of taxation on motor cars, and devoted to the upkeep of the roads. The minister is also responsible to parliament for the work of the electricity commission, a sub-department charged with the duty (under the supervision of a central board created in 1927) of developing electrical supplies.

Among European countries, Russia has a Ministry of Transport whose jurisdiction covers the whole U.S.S.R. In Germany a Ministry of Transport works the State railways and supervises others, as does the Ministry of Public Works in France, though many of the supervisory duties in regard to private enterprise appertain to the Ministry of the Interior. In Italy, the State railways are worked by an autonomous department of the Ministry of Communications, which ministry also controls posts and telegraphs and the mercantile marine, while supervision over privately owned railways, trams and automobile services is exercised by the Ministry of Public Works. The latter is also responsible, like the English Ministry of Transport, for the development of electric power, and, like that ministry and the French Ministry of Public Works, for the development of roads.

Office of Works.— The Office of His Majesty's Works and Public Buildings is another department of the British Government which is under the control of a board: this consists of the first commissioner and (nominally) all the secretaries of State and the president of the Board of Trade. As with other boards already mentioned, the practical responsibility rests with the first commissioner. The board's primary duty is the maintenance of the royal palaces and governmental buildings: this includes palaces (like Hampton Court) and parks (like Hyde Park) which are open to the public. Another duty of popular interest is the control of ancient monuments, the commissioners having power to purchase or to accept the guardianship of monuments. They can also, upon its being represented to them that a monument is in danger of destruction or removal, make a preservation order, the effect of which is to prohibit demolition or removal.

Other European countries necessarily maintain departments charged with the supervision of the buildings of Government, but it is not usual for the same department to be charged with responsibility for the preservation of ancient monuments. Thus in France and Italy this power is entrusted to the Ministry of Public Instruction and Fine Art.

Among other departments of the British Government which need not be treated at length are the Charity Commission, which supervises the administration of charitable funds; the Civil Service Commission, which manages the examinations, and otherwise arranges, for recruitment to the Government services (including many branches of the armed forces); the Commissioners of Crown Lands, formerly the Commissioners of His Majesty's Woods, Forests and Land Revenues, who manage those hereditary estates of the Crown which have been surrendered in return for a fixed parliamentary revenue; the Development Commission, which dispenses parliamentary grants for various public improvements; the Exchequer and Audit Department, whose head, the comptroller and auditor-general, is responsible for the audit of all moneys under parliamentary control; the Forestry Commission, which is charged with the management of existing state-owned forest lands and reafforestation; the Friendly Societies Registry; the Royal Mint; the Department of Overseas Trade, formed jointly by the Foreign Office and the Board of Trade to foster foreign commerce; the Public Works Loan Board, which advances money for work of public utility; the Department of the Paymaster-General, who acts as a banker, by drafts on whom most governmental payments are made; the office of the privy council, which provides staff also for the cabinet and the committee of imperial defence; the Public Record Office, of which the titular head is the Master of the Rolls, and in which all governmental papers (except those destroyed under his authority) are destined to be stored for the information of posterity; the Department of Scientific and Industrial Research, which maintains laboratories and issues reports on a variety of scientific topics, especially those with a practical bearing; and His Majesty's Stationery Office, which not only supplies the paper and similar stores needed in Government offices but carries on a considerable publishing business.

(A. N. C. S.)

UNITED STATES

The executive department of the United States began to function (1789) with only three Government departments (State, Treasury and War) and two offices (attorney general and postmaster general), but as the nation expanded and new functions were undertaken, new departments, bureaux, commissions and other agencies were created by Congress to carry on the administrative work. As a result of this expansion, there existed in 1929 ten co-ordinate executive departments, each with numerous bureaux and divisions, and about a score of agencies and commissions which have been erected outside the great departments. At first, excepting the Navy Department which was created in 1798, the new agencies were established within the existing departments without any special regard to the functions they were to perform. As bureaux and agencies of a similar nature accumulated they were grouped into one organization and collectively transferred into a department and its administrative head became a member of the president's cabinet. (See CABINET: *United* States.) In this manner the Department of the Interior was created in 1849, the Department of Agriculture in 1862, the Department of Commerce and Labor in 1903; however, the latter department was divided in 1913 into two separate depart-

ments, that of Commerce and that of Labour, each with a separate head. As is pointed out in the article CABINET, the heads of the Federal departments are appointed by the president (with the consent of the Senate) and serve at his pleasure rather than that of a majority of the legislative body; they do not hold seats in Congress, nor are they given the privilege of speaking from the floor. It must be observed, however, that the various departments and agencies are created by Congress and that it may impose or take away duties, or may prescribe such minute details as to amount to a practical direction of the officials. The ten U.S. Government departments, their chief divisions and functions, are indicated below. (X.)

The Department of State.—The Department of State was created by two acts of the first Congress, July 27 and Sept. 1 j, 1789. By the former act the department was designated as the Department of Foreign Affairs, but that designation was changed by the second act, Congress having decided not to carry out the project for a corresponding Department of Home Affairs The functions of the latter office were imposed upon the department already created and the name changed to be more descriptive. Many of the functions now performed by other offices of the Government were first embraced within the Department of State, and there still remain vestiges of the earlier time. Among these latter functions are the custody of the great seal and the original laws, and the duty of carrying on the correspondence with the State Governments with reference to amendments to the Constitution and the election each four years of electors for president and vice president. But the Department of State is primarily the "foreign office" of the nation and under the supervision of the president, it exclusively directs the foreign relations of the United States. The secretary of State is the ranking member of the president's cabinet. Under him, in the department, there is the under-secretary of State, the counsellor, three assistant secretaries, the legal adviser, one special assistant, two advisers on political relations, the adviser on international economic affairs, the chiefs of various divisions. some of which are political and some administrative in function, and a total staff of about 900 officers and employees. The Department of State, which is the smallest of the executive departments of the United States Government, costs the taxpayer less than any other department and less even than many of the independent agencies of the Government. The secretary of State is appointed directly by the president, by and with the consent of the Senate, as are also the under-secretary, the counsellor, the assistant secretaries and the legal adviser. The lower positions in the department are, for the most part, filled on the basis of examinations given by the Civil Service Commission.

Under the secretary of State is the Foreign Service of the United States. The United States maintains abroad (1939) 20 embassies and 36 legations, 25 of which perform consular as well as diplomatic duties. There are 253 American consular offices and consular agencies located in important foreign commercial centres. The total foreign service staff includes 4.086 persons, among whom are 828 foreign service officers and 1,909 clerks. Ambassadors and ministers are appointed by the president, by and with the advice of the Senate, as well as all commissioned Foreign Service officers of lower rank; the latter are appointed after examination and are promoted on the basis of efficiency.

The duties of the Department of State as a foreign office are for the most part those which the president, in his capacity as director of the foreign relations of the nation, may direct. The function of the Department of State is to transact. the foreign business of the United States. Its methods are those of negotiation and discussion with a view to securing by peaceful means the preservation of American rights under the treaties and under international law. Most of the functions are not defined by municipal law but by international law and the established usages of nations. The president has the power to negotiate a treaty but such a treaty becomes effective only with the advice and consent of the Senate. The practice is almost universal for the president first to negotiate and sign a treaty and then submit it to the Senate for its advice and consent to ratification. However. it frequently occurs that the secretary of State confers with proper committees of the Senate before a treaty is made. International agreements of less importance than treaties and the reciprocal trade agreements, which are negotiated under the authority of an act of Congress passed in 1934 and extended in 1937, are concluded without the advice and consent of the Senate.

The Department of State has important functions as the agent or representative of other executive departments in the discharge of functions which are both domestic and foreign in character. Thus the department, through its Foreign Service, has a share in the execution of the immigration, narcotic and quarantine laws, and it gathers much of the financial, agricultural and commercial information upon which the departments of the Treasury, Agriculture and Commerce depend. Where representatives of other departments transact official business abroad they function under the supervision of, or in close co-operation with, the diplomatic and consular representatives of the United States.

(G. S. ME.)

The Treasury Department was established by the act of Congress of Sept. 2, 1789. The secretary, who is a member of the President's cabinet, is also member of the Board of Trustees, Postal Savings System; member, of the Board of Trustees, Smithsonian Institution; member, National Archives Council; Chairman, Board of Trustees, Endowment Fund, American Red Cross; member, National Park Trust Fund Board; Chairman, Library of Congress Trust Fund Board; member, Board of Trustees of the National Gallery of Art; Managing Trustee. Board of Trustees of the Federal Old-Age and Survivors Insurance Trust Fund; member, Foreign Service Buildings Commission; and, member, National Munitions Control Board. He is assisted by an undersecretary and by three assistant secretaries. He is charged with the management of the national finances; superintends the collection of the revenue and is responsible for public debt operations; grants warrants for money drawn from the Treasury in pursuance of appropriations made by law, and for the payment of moneys into the Treasury; studies plans for the improvement of the revenue laws and for the support of the public credit; and submits a report annually to Congress on the condition of the public finances.

The receipts of the Government come chiefly from internal revenue collections and customs duties. The Bureau of Internal Revenue of the Treasury Department, under the supervision of the commissioner of internal revenue, administers and enforces the internal revenue laws and collects all internal revenue taxes. For administrative purposes, the duties of the bureau are assigned to five divisions or units in Washington, D.C. There are four divisions of the Internal Revenue field service, namely: Collection Service, consisting of 64 collection districts under supervision of collectors of internal revenue; the Field Audit Service consisting of 38 divisions under the supervision of internal revenue agents; the supervisory field service of Alcohol Tax unit; and the field division of the Technical Staff. The principal function of the Customs Service is the collection of import duties; incident to this is the prevention of smuggling.

Except where otherwise provided by law, all receipts of the U.S. Government are covered into the Treasury by warrant of the secretary, and expenditures therefrcm are made only upon authorization of Congress. The major part of the Government's expenditures are made by disbursing officers' checks from funds placed to their credit with the treasurer of the U.S. upon warrants of the secretary of the Treasury, countersigned by the controller general of the U.S. To some extent payments are made to public creditors upon Treasury warrants. The U.S. treasurer is charged with the receipt and disbursement of all public moneys that may be deposited in the U.S. Treasury and in all other depositaries authorized by the secretary of the Treasury. He has also many other fiscal duties.

The commissioner of accounts and deposits has administrative supervision over the Division of Bookkeeping and Warrants, which is by law the official book-keeping organization of the Government, in regard to the receipt, appropriation and expenditure of public moneys covering all departments and establishments of the Government; he also supervises the Division of Disbursement,

which pays the current bills of the Government (except Army and Navy); the Division of Deposits, which is charged with the administration of matters pertaining to the designation of Government depositaries and the deposit of Government funds in such depositaries. In addition he has control of the investmrnt accounts of the Government and is responsible for the proper custody of investments and securities held by the treasurer and the Federal Reserve banks for which the secretary is responsible, other than those related to public debt operation.

The Public Debt Service is under the general supervision of the commissioner of the public debt, who is in charge of transactions in the public debt and the paper currency issues of the Treasury. As agent, the Public Debt Service conducts transactions in interest-bearing issues of governmental corporations and credit agencies, and of the Philippine and Puerro Rican Governments.

One of the important functions of the Treasury is to supply money which is the circulating medium of this country. It maintains mints at Philadelphia, San Francisco and Denver for the coinage of money and the Bureau of Engraving and Printing at Washington for the production of notes, bonds, securities and postage stamps. The controller of the currency is charged under the law with the organization and supervision of all solvent national banks and the administration, through a receiver, of those which have become insolvent.

The Coast Guard is responsible for enforcement in navigable waters and on the high seas of laws and regulations relating to customs, navigation, neutrality, immigration, and quarantine. It assists vessels and aeroplanes in distress, protects game, seal, and otter fisheries in Alaska, and maintains the international ice patrol in the North Atlantic. The Coast Guard also maintains lighthouses, light-ships, beacons, and other aids to navigation, and removes wrecks and other floating dangers to navigation.

The Secret Service Division is charged with suppression of counterfeiting, the protection of the President and his family and the president elect, the investigation of violations of the Farm Loan Act and such other matters relating to the Treasury Department as are directed by the secretary. The Bureau of Narcotics enforces Federal narcotic laws; co-operates with the Department of State in discharge of the international obligations of the United States concerning the traffic in narcotic drugs; co-operates with the States in suppression of abuse of narcotic drugs; and with the Public Health Service of the Federal Security Agency in determining quantities of narcotics allowed to be imported for legitimate use. Certain Federal liquor laws are administered and restrictive regulations relating to importing, distilling, and resale of liquors are enforced by the Federal Alcohol Administration. The Procurement Division acts as the central Government purchasing agent except for regular purchases of supplies and equipment by the War and Navy departments. Legal activities of the Treasury are in charge of the general counsel. Research activities are centred in the divisions of Research and Statistics, Monetary Research, and Tax Research, all in the office of the secretary. Primary statistical data are compiled by statistical units in the Bureau of Internal Revenue, Bureau of Customs. Bureau of Narcotics, and Office of the Comptroller of the Currency.

Administrative duties are carried out by the Chief Clerk, the Division of Appointments, the Division of Printing, the Secretary's Correspondence Division, and the Superintendent of Treasury buildings. (X.)

The War Department. — The War Department dates from 1789, although there was a similar department during the period of the Confederation and Washington reappointed its head, Gen. Henry Rnox, secretary of the new department established under the Constitution. The department has important non-military as well as military functions.

In general, the secretary of War concerns himself with the major aspects of the defence problems and administrative functions of the department. Under him in the department is an assistant secretary of War who is charged with supervision of the procurement of all military supplies in peacetime and the assurance of adequate provision for the mobilization of material and industrial organizations essential to wartime needs. The assistant secretary also represents the War Department in transactions with other departments of the Government relating to the procurement of supplies when they concern joint programs.

The chief of staff is the senior military adviser to the secretary of War. Subordinate to him, and assisting him, are the deputy chief of staff and five assistant chiefs of staff, who head the divisions of what is known as the War Department general staff, which acts in an advisory and planning capacity. The routine activities of the War Department are cleared through the office of the adjutant general. The combatant branches or the line of the army comprise the infantry, cavalry, field artillery, coast artillery, air corps, corps of engineers and signal corps. Other branches are the judge advocate general's department, inspector general's department, quartermaster corps, finance department, the ordnance department, chemical warfare service, chaplains and the medical department, the latter including the medical corps, the dental corps, the veterinary corps, the medical administrative corps and the army nurse corps.

Agencies for the transmission and co-ordination of War Department business include the war council and the general council. The former meets from time to time at the call of the secretary of War, to consider policies relating to the military and munitions problems of the department.

The territorial administration of the army is conducted through nine corps areas — into which the United States, including Alaska, are divided — and the Hawaiian department, Philippine department, Panama canal department and the Puerto Rican department. Under the commanding general of each corps area is a chief of staff with general and administrative staffs.

The military activities of the War Department include responsibility for the clothing, feeding, equipping, transportation and instruction of troops in the Regular Army, who garrison over 250 military posts in all parts of the United States, Puerto Rico, Panama Canal Zone, Hawaii, Alaska, and Philippine Islands. Among the varied military installations administered by the War Department are: proving grounds and arsenals; ordnance, quartermaster and engineer depots; hospitals and medical centres; remount stations; motor repair centres; flying fields; ferry and transport systems; railroads; and service schools. The department is also charged with many non-military functions. The most important civil task is the river and harbour work of the corps of engineers. This may be regarded as "maintenance of way" work for practically all the water-borne commerce of the United States. For the improvement of rivers and harbours the Federal Government has expended, through the War Department, over $2,500,000,000, including both first cost and maintenance. To the War Department is also delegated the supervision of projects for the control of floods on river systems. This responsibility has assumed increasing importance during the past decade and $700,000,000 have been expended by the department for the prosecution of flood control projects. Other non-military War Department activities relate to such varied projects as national parks, national cemeteries, homes for disabled soldiers. roads, trails and bridges in Alaska; and cable, radio and telegraph systems. The War Department has also been charged, since 1933, with administrative functions pertaining to the Civilian Conservation Corps, including the physical examination and enrolment of new members, the furnishing of food, clothing and other supplies, the construction and maintenance of camps, and provision for the medical care of enrollees. The Civilian Conservation Corps provides employment and vocational training for youthful citizens of the U.S. and, to a limited extent, to war veterans and Indians through performance of useful public work in connection with the conservation and development of the natural resources of the United States. Military training is not conducted for members of the corps. By June 30, 1938. 2,210,730 Civilian Conservation Corps members had been administered to by War Department agents. The secretary of War is the representative of the president directly charged with the general supervision of the government of the Panama Canal Zone and the administration of the Panama canal. He is also chairman of the National Forest Reservation Commission. (X.)

The Department of Justice.——The Department of Justice is that executive department of the U.S. Government which is charged with the conduct of its legal business The head of the department is the attorney general, appointed by the president, and confirmed by the Senate. As a member of the cabinet he ranks fourth in the line of succession to the Presidency in the event of a vacancy in the offices of president and vice president.

The office of the attorney general was created by the Judiciary Act of 1789. Its growth, both in its functions and personnel, during the first 80 years of the existence of the Federal Government, was such that in 1870 Congress enacted the law entitled "An Act to establish the Department of Justice." This law provided that the attorney general should be the head of the Department of Justice, created the office of solicitor general, provided for assistant attorneys general; placed under the supervision of the attorney general the law officers of the other departments, and the supervision and control of U.S. district attorneys and all other counsel employed on behalf of the United States and vested him with supervisory powers over the accounts of district attorneys, marshals clerks and other officers of the Federal courts.

As the head of the Department of Justice the attorney-general is the chief law officer of the Government, representing it in all legal cases to which it may be a party, and appears in person in the U.S. Supreme Court in cases of exceptional gravity and importance; is the legal adviser of the president, to whom, and the heads of the executive departments, he is required by statute to give his advice and opinion on any questions of law arising in the conduct of administrative affairs. The major activities of the department include the investigation and prosecutions of violations of the Federal laws; the approval of titles to lands or other property acquired by purchase or condemnation; the acting as counsel for the Government in all civil litigation; the management of the penal and reformatory institutions of the Federal Government. The department is the chief law office of the Federal Government, under the general supervision of the attorney general and the immediate supervision of his assistants, exercising direction and control over the 92 district attorneys and marshals in the various U.S. judicial districts. The solicitor general is responsible for the conduct of all Government cases before the U.S. Supreme Court; the assistant to the attorney general has special charge of administrative matters, such as appointments, personnel, accounts, budget, and general administrative supervision of the department and its field force. Six assistant attorneys general are charged with the conduct of the work of the respective divisions of the department, as indicated: (1) Anti-trust Division, in charge of all matters under the antitrust laws and other acts relating to commerce, as well as acts relating to agriculture; (2) Tax Division, in charge of the general conduct of cases involving taxation; (3) Claims Division, in charge of the defence of claims against the U.S. in the court of claims and in the district courts, and patent litigation, as well as civil suits against Government officers and civil cases in which the Government is plaintiff, and alien property matters. In addition, the office of the assistant solicitor general has charge of drafting opinions of the attorney general and similar matters; (4) Lands Division, in charge of cases involving the public lands and Indian litigation; (5) Criminal Division, in charge of criminal cases generally, and matters involving criminal practice and procedure. (6) Customs Division (New York city), in charge of protecting the interests of the Government in customs matters. The organization of the Department of Justice includes the Federal Bureau of Investigation in charge of the director of the bureau, directing the investigation of alleged offences against U.S.: interstate transportation of kidnapped persons and stolen automobiles, bank robbery, espionage, sending extortion letters. The bureau also carries on civil investigations for the department. The department also comprises the Bureau of Prisons which is in charge of all Federal penal and correctional institutions and also supervises the administration of Federal probation and parole laws.

(F. MU.)

The **Post** Office **Department.**—The Post Office Department is the outgrowth of the office of postmaster general created in 1789 and attached to the Treasury Department as a bureau in 1791. To all intents and purposes the post office organization has been an independent department since 1825, when the term "post office department" was first used in the title of an act of Congress, and even more clearly from 1829, when President Jackson made the postmaster general a member of the cabinet. The Department was fully recognized by statute in 1874.

The postal system, described as the "biggest single business in the world," handles nearly 27,000,000,000 pieces of mail yearly of which 15,000,000,000 are letters. Nearly 370,000 employees are required to handle this mail. Approximately 56,000 of them are city letter carriers, 33,000 rural carriers, nearly 76,000 clerks and 20.000 railway mail clerks. There are 44,400 post offices with a postmaster presiding over each. Every type of transportation suitable to local conditions is utilized. This includes railroads, steamships, motor vehicles, aeroplanes, motor boats, wagons, horses, pneumatic tubes, belt conveyors, motor cycles, bicycles and the dog sled of Alaska. (*See* POST AND POSTAL SERVICES. *American Postal Service.)*

The postal service is administered by a postmaster general and four assistant postmasters general. The executive head appoints all officers and employees of the department, except the four assistant postmasters general, the purchasing agent and the comptroller, who are presidential appointees. With the exception of postmasters of the first, second and third classes, who are likewise presidential appointees, he appoints all postmasters and all other officers and employees of the service at large. Subject to the approval of the president, he makes postal treaties with foreign Governments. He awards and executes contracts and directs the management of the foreign mail service. The first assistant postmaster general administers the organization and management of post offices of the first, second, third and fourth classes; the division of postmasters' appointments. the division of post office service, the division of air mail service, and the division of dead letters and dead parcel post. The second assistant postmaster general has charge of transportation facilities: railway mail service, railway adjustments, international postal service, and the rural mail service. The third assistant has charge of financial operations: collection of postal revenues, money orders, stamps, registered mails and postal savings, and controls the classification of mails. The fourth assistant postmaster general has charge of the divisions of engineering and research, traffic, post office quarters, motor vehicle service, topography, and building operations and supplies. (J. A. FY.)

The **Navy** Department.— Naval affairs were administered by the War Department until 1798, when a threatened war with France caused Congress to create a separate and independent Navy Department. The president is, by the Constitution, the commander-in-chief of the navy. Through the secretary of the Navy he participates in naval activities, the secretary being in direct charge of every matter relating to the navy.

The Navy Department is subdivided into offices and bureaux, each charged with specific duties. The heads of these subdivisions are the technical advisers of the secretary of the Navy and through them the secretary controls all naval work. In the Navy Department in Washington, besides the offices of the secretary, the assistant secretary, the assistant secretary for aeronautics and the chief of Naval operations, there are eight chiefs of bureaux, *viz.*, the chiefs of the bureaux of Navigation, Ordnance, Engineering, Aeronautics, Construction and Repair. Yards and Docks, Supplies and Accounts and Medicine and Surgery; and in addition the major general commandant of the marine corps and the judge advocate general of the Navy.

During the temporary absence of the secretary and the assistant secretaries, the chief of naval operations acts as secretary of the Navy. The chief of naval operations is the senior officer of the navy while so serving and has the temporary rank of Admiral. Under the direction of the secretary of the Navy he is charged with the operations of the fleet and of aircraft and with the preparation and readiness of plans for its use in war.

The Bureau of Navigation is charged with the personnel of the navy. The Bureau of Ordnance has cognizance over the upkeep and operation of the gun factory, ordnance plants, torpedo stations, proving grounds, ammunition and mine depots and magazines on shore. The Bureau of Engineering has charge of designing, building, fitting out and repairing machinery used for the propulsion of naval ships. The duties of the Bureau of Aeronautics comprise all that relates to the design and procurement of aircraft and the maintenance of active aviation units and air stations. The Bureau of Construction and Repair is charged with designing, building, fitting and repairing the vessels of the navy, except the machinery. The Bureau of Yards and Docks is charged with the design and construction of public works and all buildings under the navy and marine corps. The duties of the Bureau of Supplies and Accounts comprise all that relates to the purchase. reception. storage, care. custody, transfer, shipment, issue of and accountability for all supplies and property of the navy. The Bureau of Medicine and Surgery has charge of the upkeep and operation of all naval hospitals and the health of personnel.

The major general commandant of the marine corps is responsible to the secretary of the Navy for the general efficiency and discipline

of the corps. He has charge of the operation of marine units and makes all assignments to vessels and shore stations. The judge advocate general of the Navy has cognizance of all matters of law arising in the Navy Department. (CH. ED.)

The Department of the Interior.—The Department of the Interior is the Federal agency chiefly responsible for the care of the nation's natural resources. It was established March 3, 1849, as the "Home Department" for the purpose of administering internal affairs and handling problems arising within the nation. It was given jurisdiction over the General Land Office, the Patent Office, Indian Affairs, and the Pension Office. From this beginning, it developed into one of the major arms of the Federal Government, many of its bureaus and programs subsequently being expanded themselves into Federal departments. The activities of the department extend further geographically than any other Federal agency, with the exception of the nation's armed forces. Its jurisdiction reaches from the Arctic circle to Puerto Rico; from Canton island in the South Pacific to the Maine coast; from the welfare of natives on the Aleutian islands to helium plants in Texas; from the improvement of the Middle Atlantic States fishery to the administration of national areas in Hawaii.

Because of its administration of the public lands, the department early became identified with the exploitation of the public domain. Today, its activities have completed a transition from exploitation of resources to their conservation. During recent years Federal conservation activities have concentrated more and more within the department.

The department functions through 12 main bureaus and eight smaller units. The General Land Office (est. 1812) has control of the public lands and their mineral resources in the United States and the Territory of Alaska. It is responsible for the survey and administration of the public lands under sound conservation principles. It has jurisdiction over the granting of easements or rights of way over public lands, and adjusting land grants. Its tract books contain the base title record or status of every 40-acre tract in 76% of the United States.

The Office of Indian Affairs (est. 1832) handles all relations between the Federal Government and the Indians; directs the administration of Indian tribal resources; reclaims and conserves their lands; supervises their "trust" property; and promotes the health and physical welfare of Indians. It provides for their education; encourages their native arts and crafts; and guides their activities toward the attainment of economic self-sufficiency, self-government, and the preservation of Indian cultural values.

The work of the Bureau of Fisheries (est. 1871) comprises the propagation, salvaging, and distribution of food fishes to suitable waters; the inquiry into causes of fluctuations in abundance of food fishes in coastal and inland waters; the study of the methods of the fisheries and utilization of fishery products; the collection and compilation of statistics of the fisheries; the administration of the fisheries of Alaska, the black bass and whaling treaty acts; the act authorizing fishery co-operatives, and the conduct of a market news service. The bureau advises and co-operates with the States in fishery problems.

The Geological Survey (est. 1879) makes topographic and geological maps of the United States and Alaska; studies the surface and underground water resources; prepares and distributes reports on mineral deposits; and, through a conservation branch, classifies public lands and supervises engineering phases of mineral leasing.

The Bureau of Biological Survey (est. 1885) studies all forms of vertebrate wild life except fishes. The bureau's activities include surveys of the major biological regions of North America; studies of wild life food habits; observations on the distribution and migration of birds; propagation experiments with fur and game species; wild life-disease investigations; acquisition and maintenance of national wild life refuges; wild life management, including restoration and control, and administration of wild life conservation laws. See BIOLOGICAL SURVEY.

The United States Board on Geographical Names (est. 1890) provides for uniformity in the use of geographic names on maps and in publications issued by the Federal Government.

The Bureau of Reclamation (est. 1902) constructs and operates irrigation works; collects annual payments from water users for cost of irrigation; promotes knowledge of irrigation methods; suitability of markets, and improvement of farm homes.

The Bureau of Mines (est. 1910) is a bureau of mining, metallurgy, mineral technology, and mineral economics. It conducts investigations concerning mining, preparation, treatment, and utilization of mineral substances with a view to improving health conditions, increasing safety, efficiency, and economic development, and preventing waste in the mineral industries. It studies the production, consumption, distribution, and marketing of mineral commodities. It investigates mineral fuels with a view to their most efficient mining, preparation, and use. The bureau studies the use of explosives, electricity, safety methods, and appliances in mines, and the causes and prevention of mine accidents, explosions, and fires. It trains annually more than 100,000 mineral workers in first-aid and mine-rescue methods.

The National Park Service (est. 1916) conserves and operates all the Federal Parks—national parks, national monuments, national historical parks, national military parks, and allied areas—for the benefit and enjoyment of the people. (See NATIONAL PARKS AND MONUMENTS.) The Division of Grazing (est. 1934) administers the Taylor Grazing Act of 1934. This act provided for a conservation program covering the forage, soil, and aiid life resources on public domain lands. 142,000,000 acres of this land are under the jurisdiction of the Grazing Service. The Division of Territories and Island Possessions (est. 1934) co-ordinates the activities of the various Federal departments pertaining to the U.S. islands and territories of Alaska, Hawaii, the Philippine islands, Puerto Rico, and the Virgin islands. Canton, Enderbury, Howland, Jarvis and Baker islands in the South Pacific have been colonized for the United States under the direction of this division, Canton island to be used as a commercial air base.

The Petroleum Conservation Division (est. 1936) assists the secretary of the Interior in administering the Connally Law, which prohibits the interstate and foreign commerce of oil produced in violation of State law. It co-operates with the oil and gas producing States in an endeavour to prevent avoidable waste in oil and gas production and in working toward uniform oil and gas conservation laws. The Bonneville Project (est. 1937) makes available for use and sale the electric energy generated by Bonneville dam and power plant on the Columbia river at Bonneville, Oregon. The Office of the Director of Forests (est. 1938) promotes a unified policy of forest conservation on all lands under the jurisdiction of the department.

The Bituminous Coal Division (est. 1939) administers the Bituminous Coal Act of 1937. The division superseded the National Bituminous Coal Commission, the original administrative agency. Through administration of the Bituminous Coal Act, which expires April 26, 1941, the division is charged with responsibility for stabilizing bituminous coal markets and conserving bituminous coal resources by establishing minimum prices and marketing rules and regulations.

There are also assigned to the Department of the Interior additional functions, including the operation and maintenance of a Government-owned railroad into the interior of Alaska; the exercise of certain powers and duties in the administration of the affairs of the Territories of Alaska and Hawaii; the maintenance of Saint Elizabeth's hospital, an institution for the treatment of mental diseases of the army, navy, public health service, and the insane of the District of Columbia; also the maintenance of The Freedmen's hospital, an institution providing medical and surgical treatment for the coloured race of the District of Columbia and residents of the several States. Howard university, an institution for the education of the coloured youth in the liberal arts and sciences, supported partly by congressional appropriations, is also under the general supervision of the department as is the Columbia Institution for the Deaf. (See DEAF AND DUMB: *United States.*) (H. L. Is.)

The Department of Agriculture.— The Department of Agriculture was established by the Act of Congress of May 15, 1862, assigning the duties of acquiring and diffusing information on subjects concerned with agriculture. Subsequent legislation has given the department responsibilities in all phases of agricultural welfare and in many fields related to the general welfare.

The department is organized in 12 staff offices and 26 operating bureaus and offices. Staff offices include budget and finance, personnel plant and operations, extension service, library, foreign agricultural relations, office of land use co-ordination, office of Civilian Conservation Corps activities, office of marketing and regulatory work, office of the solicitor, office of experiment stations, and office of information.

Agencies with major responsibilities in the field of research include Agricultural Marketing Service, Bureau of Plant Industry, Bureau of Agricultural Chemistry and Engineering, Bureau of Dairy Industry, and Bureau of Home Economics. Functions of the Bureau of Agricultural Economics combine economic research and general planning. Regulatory duties are administered by the Food and Drug Administration, Commodity Exchange Administration, and Agricultural Marketing Service. The Bureau of Entomology and Plant Quarantine conducts research and regulatory activities and programs to control insect pests and diseases. The Bureau of Animal Industry conducts both research and regulatory work. The Farm Credit Administration assists associations of farmers to obtain adequate credit and reasonable rates to finance co-operative services, land mortgages, and production operations. The Rural Electrification Administration assists groups of farmers to obtain electric service. The Farm Security Administration administers emergency rural relief, rehabilitation loans and guidance, assistance for migratory farm families, and loans to assist tenants to become farm owners. The Commodity Credit Corporation makes loans to producers on stored agricultural commodities to finance carrying and orderly marketing.

The Soil Conservation Service conducts erosion control research and demonstration and co-operates with individuals and groups of farmers in applying good land-use practices, purchases and develops submarginal land for constructive uses, encourages development of farm woodlands and water facilities and treatment of land for flood control. The Forest Service is responsible for the care of public forest lands and assists owners of private lands on problems of reforestation and forest management. The Agricultural Adjustment Administration administers the national conservation and adjustment program, providing for conservation practices, production and marketing adjustments, the Ever-Normal Granary, and farm income maintenance including payments. The department co-operates with State agricul-

tural colleges and experiment stations to promote and co-ordinate research and the system of agricultural extension which provides information for farmers through county agents and agricultural and home economics specialists. The Division of Marketing and Marketing Agreements administers marketing agreement programs and determines needs for diversion of price-depressing farm surpluses. The Federal Surplus Commodities Corporation purchases farm surpluses for distribution to needy low-income families. The Sugar Division is responsible for administration of programs for sugar cane and sugar beet producers as authorized by Congress. The Federal Crop Insurance Corporation administers the program to insure wheat crops against natural hazards. The Weather Bureau provides daily reports, forecasts, and general advice on weather and climate. (H. A. WAL.)

The Department of Commerce.—The Department of Commerce succeeded the earlier Department of Commerce and Labor by the act of Congress approved on March 4, 1913, which also created a separate and independent Department of Labor. The secretary of Commerce is a member of the president's cabinet, but is not in line of succession to the Presidency. It is his duty to promote and develop the foreign and domestic commerce, the mining, manufacturing, shipping and fishery industries and the transportation facilities of the United States. There are an under-secretary and an assistant secretary assisting the secretary of Commerce in supervising the functions of the department.

The department is composed of 8 branches, as foilows: the office of the secretary, which supervises the work of the department as a whole; the Bureau of the Census, for the publication of statistics relating to population, agriculture, manufactures, mining, etc.; the Bureau of Foreign and Domestic Commerce, charged with the collection and dissemination of trade information for the benefit of manufacturers and exporters; the Coast and Geodetic Survey, for surveying the coastal waters and the publication of nautical charts; the Bureau of Marine Inspection and Navigation, for the enforcement of the navigation laws, the inspection of steam vessels. and the licensing of their officers and crews; the Bureau of Standards, the custodian of the official prototype standards of measurement, which carries on industrial experimentation and research; the Patent Office, through which the Government issues letters patent to inventors, and registers trade-marks, prints, and labels; and the Inland Waterways Corporation for the development of inland waterway transportation and the operation of Government-owned barge lines. (H. L. H.)

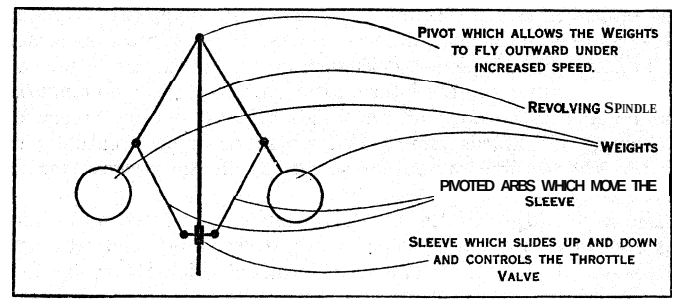
The Department of Labor.—The Department of Labor is the outgrowth of an agitation that began after the Civil War (1861–65), when recognition in the Federal Government for the great group of wage-earners of the country was first sought. This resulted in the creation of the Bureau of Labor in the Department of the Interior in 1884. In 1888 the bureau was made an independent establishment and in 1903 the Department of Commerce and Labor was created, and the Bureau of Labor was transferred to it. A law approved by President Tait on March 4, 1913, created the Department of Labor and transferred to it the Bureau of Labor (now the Bureau of Labor Statistics), the Children's Bureau and the bureaus of Immigration and Naturalization. The law also gave the secretary authority to conciliate industrial disputes.

The department, through its bureaus, pursues a clear-cut service in fostering the welfare of the wage-earner. The Bureau of Immigration and Naturalization guards the gates of the nation, and protects the American workman from injurious competition from abroad. The Bureau of Labor Statistics keeps the wage-earner and the public informed as to employment, wage, working conditions and cost of living. The Conciliation Service seeks to avert and settle industrial disputes, and to foster the spirit of co-operation in industry. The Women's Bureau and the Children's Bureau work for the betterment of women and children in industry and in home life. The Division of Labor Standards is authorized to develop desirable labour standards in industrial practice, labour law administration and labour legislation. The Public Contracts Division administers the Walsh-Healey Act which requires Government contracts to contain maximum hours, minimum wage, child labour, safety and health stipulations. The Wage and Hour Division enforces the provisions of the Fair Labor Standards Act. Its duties are to see that employers engaged in interstate commerce and producing goods for interstate commerce conform to the wage and hour standards. (F. PE.)

GOVERNOR, in general, one who governs or exercises authority; specifically, an official appointed to govern a district, province, town, etc. In British colonies or dependencies the representative of the Crown is termed a governor. Colonial governors are classed as governors-general, governors and lieutenant-governors, according to the status of the colony or group of colonies over which they preside.

In the United States the official head of every State Government is a governor.

GOVERNOR is an automatic device which regulates the speed of a prime mover so as to keep it within certain limits notwithstanding variations in the load or the pressure. The centrifugal governor is the principal type. It is made in numerous forms, all having two or more weights arranged so that they can freely move outwards upon increase of speed, or fall as speed falls. Any change of speed is communicated to the governor, which automatically varies the intake of power. In steam engines the flow of steam is thus controlled, or expansion gear is actuated. In gas engines the full charge is admitted, but the governor shuts it off at excess speed, this system being termed the hit-and-miss. Or the volume of air and gas is varied, or the proportion of air to the gas, without, however, missing a charge. Oil and Diesel engines (*q.v.*) are governed by varying the quantity of fuel injected into the cylinders as the speed varies and affects the governor. Water turbines receive their governing from a curtailment of the supply by a movable sluice device or by a spear-head entering more or less deeply into an inlet cone. Elaborate governors are fitted to some steam turbines, with a system of oil pressure to control the steam throttle-valve. Governors for engines driving mine hoists operate a control unit arranged so that if the cage travels too fast the governor shuts off steam and applies the brakes automatically. It usually is necessary to arrange the governor mechanism so as to offer resistance to rapid movement or "hunting" may result.



DIAGRAMMATICAL SKETCH SHOWING THE PRINCIPLE OF THE GOVERNOR
To keep the speed of an engine or turbine within prescribed limits, under varying loads, centrifugal action of the balls affects the throttle, opening it wider as speed drops, or partially closing it if the speed is too high

A gas governor is used to regulate the pressure of gas supply, either at the works or on a small scale for gas cookers or gas fires. In the latter type of governor, weights on a spindle are regulated to suit the desired adjustment. (F. H.; X.)

GOW, NIEL (1727–1807), Scottish musician of humble parentage, famous as a violinist and player of reels, but more so for the part he played in preserving the old melodies of Scotland. His compositions, and those of his four sons. Nathaniel, the most famous (1763–1831), William (1751–1791), Andrew (1760–1803), and John (1764–1826), formed the "Gow Collection," comprising various volumes edited by Niel and his sons, a valuable repository of Scottish traditional airs. The "Gow Collection" includes *A Collection of Strathspey Reels* (Dunkeld, 1784); *Second, Third, Fourth* and *Fifth Collections* (1788, 1792, 1800, 1809, 1822).

GOWER, JOHN (d. 1408), English poet, died at an advanced age in 1408, so that he may be presumed to have been born about 1330. He belonged to a good Kentish family and owned the manors of Feltwell in Suffolk and Moulton in Norfolk. In a document of 1382 he is called an "Esquier de Kent," and he was certainly not in holy orders. That he was acquainted with Chaucer we know, first because Chaucer in leaving England for Italy in 1378 appointed Gower and another to represent him in his absence, secondly because Chaucer addressed his *Troilus and Criseide* to Gower and Strode (whom he addresses as "moral Gower" and "philosophical Strode") for criticisin and correction, and thirdly because of the lines in the first edition of Gower's *Confessio amantis*, "And gret wel Chaucer whan ye mete," etc. There is no sufficient ground for the suggestion, based partly on the subsequent omission of these lines and partly on the humorous reference of Chaucer to Gower's *Confessio amantis* in the introduction to the *Man* of *Law's Tale*, that the friendship was

broken by a quarrel. From his Latin poem Vox *clamantis* we know that he was deeply and painfully interested in the peasants' rising of 1381; and by the alterations which the author made in successive revisions of this work we can trace a gradually increasing sense of disappointment in the youthful king, whom he at first acquits of all responsibility for the state of the kingdom on account of his tender age. That he became personally known to the king we learn from his own statement in the first edition of the Gonfessio *amantis,* where he says that he met the king upon the river, was invited to enter the royal barge, and in the conversation which followed received the suggestion which led him to write his principal English poem. At the same time we know, especially from the later revisions of the Confessio *amantis,* that he was an admirer of the king's brilliant cousin, Henry of Lancaster, afterwards Henry IV., whom he came eventually to regard as a possible saviour of society from the misgovernment of Richard II.

The first edition of the Confessio *amantis* is dated 1390, and this contains, at least in some copies, a secondary dedication to the then earl of Derby. The later form, in which Henry became the sole object of the dedication, is of the year 1393. Gower's political opinions are further embodied in the Cronica *tripartita.*

In 1398 he was married to Agnes Groundolf, and from the special licence granted by the bishop of Winchester for the celebration of this marriage in John Gower's private oratory we gather that he was then living in lodgings assigned to him within the priory of St. Mary Overy, and perhaps also that he was too infirm to be married in the parish church. It is probable that this was not his first marriage, for there are indications in his early French poem that he had a wife at the time when that was written. His will is dated Aug. 15, 1408, and his death took place very soon after this. He had been blind for some years before his death. A magnificent tomb with a recumbent effigy was erected over his grave in the chapel of St. John the Baptist within the church of the priory, now St. Saviour's, Southwark.

The effigy on Gower's tomb rests its head upon a pile of three folio volumes entitled Speculum *meditantis,* Vox clamantis and Confessio *amantis.* These are his three principal works. The first of these was long supposed to have perished, but a copy of it was discovered in the year 1895 under the title *Mirour* de *l'omme.* It is a French poem of about 30,000 lines in 12-line stanzas, and under the form of an allegory of the human soul describes the seven deadly sins and their opposing virtues.

Gower's next work was the *Vox* clamantis in Latin elegiac verse, in which the author takes occasion from the peasants' insurrection of 1381 to deal again with the faults of the various classes of society. In the earlier portion the insurrection itself is described in a rather vivid manner.

Gower's chief claim, however, to reputation as a poet rests upon his English work, the Confessio *amantis,* in which he displays in his native language a real gift as a story-teller. He is himself the lover of his poem, in spite of his advancing years, and he makes his confession to Genius, the priest of Venus, under the usual headings supplied by the seven deadly sins. These with their several branches are successively described, and the nature of them illustrated by tales drawn from very various sources and often extremely well told. The metre is the short couplet, and it is very smooth and regular. The great fault of the Confessio *amantis* is the extent of its digressions.

Gower also wrote in 1397 a short series of French ballades on the virtue of the married state (*Traitié* pour *essampler les amantz mariés*), and after the accession of Henry IV. he produced the Cronica tripartita, a partisan account in Latin leonine hexameters of the events of the last 12 years of the reign of Richard II. About the same time he addressed an English poem in seven-line stanzas to Henry IV. (In Praise of Peace), and dedicated to the king a series of French ballades (*Cinkante* Balades), graceful and even poetical in expression. Several occasional Latin pieces also belong to the later years of his life

On the whole Gower must be admitted to have had considerable literary powers; and though not a man of genius, and by no means to be compared with Chaucer, yet he did good service in helping to establish the standard literary language, which at the end of the 14th century took the place of the Middle English dialects. The *Confessio amantis* was long regarded as a classic of the language, and Gower and Chaucer were often mentioned side by side as the fathers of English poetry.

A complete edition of Gower's works in four volumes, edited by G. C. Macaulay, was published in 1899–1902, the first volume containing the French works, the second and third the English, and the fourth the Latin, with a biography. Before this the Confessio *amantis* had been published in the following editions: Caxton (1483); Berthelette (1532 and 1554); Chalmers, British Poets (1810); Reinhold Pauli (1857); H. Morley (1889, incomplete). The two series of French ballades and the Praise of Peace were printed for the Roxburghe Club in 1818, and the Vox clamantis and Cronica tripartita were edited by H. O. Coxe for the Roxburghe Club in 1850. The Cronica tripartita, the Praise of Peace and some of the minor Latin poems were printed in Wright's Political *Poems* (Rolls series, 14). The Praise of Peace appeared in the early folio editions of Chaucer, and has been edited also by Dr. Skeat in his Chaucerian and other Pieces. Reference may be made to H. J. Todd, *Illustrations* of the Lives and Writings of Gower *and* Chaucer (1810); the article (by Sir H. Nicolas) in the Retrospective Review for 1828; F. J. Child, "Memoirs on the Language of Chaucer and Gower," in Early English *Pronunciation* (1869 etc.); H. Morley, English Writers (1887 etc.), vol. iv.; B. ten Brink, History of Early English Literature (Eng. trans., 1883, etc.), vol. ii.; and W. J. Courthope, History of English Poetry (1895), vol. i. (G. C. M.)

GOWER, a Welsh seigniory and district in the county of Glamorganshire (*q.v.*), lying between the rivers Tawe and Loughor and between Breconshire and the sea, its length from the Breconshire border to Worm's Head being 28 m., and its breadth about 8 m. It corresponds to the ancient commote of Gower (in Welsh Gwyr) which in early Welsh times was grouped with two other commotes stretching westwards to the Towy and so fdrmed part of the principality of Ystrad Tywi. Its western associations were shown by its inclusion until the formation of the diocese of Swansea and Bacon (1923) within the diocese of St. David. What is meant by Gower in modern popular usage, however, is only the peninsular part or "English Gower," lying mainly to the south of a line drawn from Swansea to Loughor.

The numerous limestone caves of the coast are noted for their animal remains, and finds of palaeolithic flints and a skeleton of palaeolithic date have been made (see W. J. Sollas, "Paviland Cave: An Aurignacian Station in Wales," *Journ.* Roy. Auth. *Inst.,* 1913). The high ground of the centre of the peninsula has megaliths and tumuli. The south coast has evidences of a Bronze Age culture, while hill-top camps seem to have been occupied by different groups up to the time of the Viking raids. In the Arthurian romances Gower appears in the form of Goire, as the island home of the dead. It is also surmised by Sir John Rhys that Malory's Brandegore (*i.e.,* Brbn of Gower) represents the Celtic god of the other world (Rhys, Arthurian Legend, 160, 329 et seq.). Traces of the more or less temporary Scandinavian occupation are found in such place-names as Burry Holms, Worms Head and Swansea, and probably also in some cliff earthworks. About 1100 Gower was conquered by Henry de Newburgh, earl of Warwick. His followers settled for the most part on the southern side of the peninsula, leaving the Welsh inhabitants of the northern half of Gower practically undisturbed. These invaders were probably reinforced later by Flemings from south Pembrokeshire. Moated mounds, which in some cases developed into castles, were built for the protection of the various manors. The castles included those of Swansea, Loughor and Oystermouth. These were repeatedly attacked and burnt by the Welsh during the 12th and 13th centuries. A large section of Gower is still unenclosed common land.

About 1189 the lordship passed from the Warwick family to the crown and then to the de Braoses, in whose family it remained practically continuously for over 120 years. In 1208 the Welsh and English inhabitants received each a charter from King John. Later the king's officers of the newly organized county of Carmarthen repeatedly claimed jurisdiction over Gower. De Braose resisted the claim and organized the English part of his lordship on the lines of a county palatine. Troubles befell the de Braose family and the region passed to John de Mowbray.

It frequently changed hands between them and the Beauchamps, representatives of the original owners (earl of Warwick). The 4th duke of Norfolk (the Mowbrays) exchanged it in 1489, for lands in England, with William Herbert, earl of Pembroke. It passed through Charles Somerset to the present owner, the duke of Beaufort. Gower was included in 1535 in Glamorgan.

The characteristically English part of Gower lies to the south and south-west of its central ridge of Cefn y Bryn. The present line of demarcation between English and Welsh is one drawn from Swansea in a west-north-west direction to Llanrhidian on the north coast. The boundary very nearly coincides with the outcrop of the coal measures, the industrial population to the north being Welsh-speaking, the agriculturists to the south English.

See J. D. Davies, *A History of West Gower* (4 vols., 1877–94); W. Ll-Morgan, *An Antiquarian Survey of East Gower* (1899); an article (probably by Prof. Freeman) entitled "Anglia Trans-Walliana" in the *Saturday Review* for May 20, 1876; G. T. Clark, "The Signory of Gower" *Archaeologia Cambrensis* (1893–94); *The Surveys of Gower and Kilvey,* ed. by Baker and Grant-Francis (1861–70).

GOWN, formerly the term for a loose outer garment worn by either sex but now generally for that worn by women. It is also the name for the distinctive robes worn by holders of particular offices or by members of particular professions or universities, etc. *(see* ROBES).

GOWRIE, JOHN RUTHVEN, THIRD EARL OF (*c.* 1577–1600), Scottish conspirator, was the second son of William, 4th Lord Ruthven and first earl of Gowrie (?1541–1584), by his wife Dorothea, daughter of Henry Stewart, second Lord Methven. The Ruthven family was of ancient Scottish descent; the earldom dated from 1581. The first earl of Gowrie and his father Patrick, third Lord Ruthven (c. 1520–1566), had both been concerned in the murder of Rizzio in 1566; and both took an active part on the side of the Kirk in the constant intrigues of the period. Gowrie had been custodian of Mary, queen of Scots, during her imprisonment in Loch Leven, and had also been the chief actor in the "raid cf Ruthven" in 1582 when King James VI. was seized while a guest and kept prisoner. Though pardoned, he continued to plot, and was executed for high treason in 1584.

When, therefore, on the death of his elder brother the second earl in 1588 John Ruthven succeeded to the earldom, he inherited family traditions of treason and intrigue. He received an excellent education at the grammar school of Perth and at the University of Edinburgh, after which he joined with Atholl and Montrose in offering to serve Queen Elizabeth, and had thus already been engaged in conspiracy when, in 1594, he went to study at Padua. On his way home in 1599, moreover, it is probable that he communicated at Paris with the exiled Bothwell.

In 1600 the earl and his brother, Alexander Ruthven, were murdered at Gowrie house in mysterious circumstances. Three solutions of the mystery of this "Gowrie conspiracy" have been suggested: first, that Gowrie and his brother had plotted to murder or to kidnap King James at Gowrie house; second, that James visited Gowrie house with the intention of murdering the two Ruthvens; third, that the tragedy sprang from a brawl.

According to James the facts were as follows: on Aug. 5, 1600, James was asked while hunting near Falkland to go to Gowrie house to examine a prisoner with a quantity of foreign gold there. When he arrived with a small retinue, he was taken alone into a small turret by Alexander Ruthven. Here, instead of the prisoner with the foreign gold, he found an armed man. His retainers, who had been told that the king had left, were setting out to overtake him when they saw him struggling at a window, and heard his cry for help. They thereupon forced an entrance to the turret, and in the struggle Ruthven and Gowrie were killed.

The tragedy caused intense excitement throughout Scotland and the investigation of the circumstances was followed with much interest in England also. The preachers of the Kirk, whose influence in Scotland was too extensive for the king to neglect, were only with the greatest difficulty persuaded to accept James's account of the occurrence. Their belief was that the king had invented the story to cover his own design to extirpate the Ruthven family and James gave some colour to this belief by the severity with which he pursued the two younger, and unquestionably innocent, brothers of the earl.

One of Gowrie's younger brothers, William, fled abroad, while the other, Patrick, was imprisoned in the Tower. He was released in 1622, married Elizabeth Woodford, widow of the 1st Lord Gerrard; he died in poverty. Their daughter Mary married the famous painter Van Dyck.

See Andrew Lang, *James VI and the Gowrie Mystery* (1902), and the authorities there cited; Robert Pitcairn, *Criminal Trials in Scotland* (3 vols., Edinburgh, 1833); David Moysie, *Memoirs of the Affairs of Scotland 1577–1603* (Edinburgh, 1830); Louis A. Barbe, *The Tragedy of Gowrie House* (1887); Andrew Bisset, *Essays on Historical Truth* (1871); David Calderwood, *History of the Kirk of Scotland (8* vols., Edinburgh, 1842–1849). W. A. Craigie has edited as *Skotlands Rimur* some Icelandic ballads relating to the Gowrie conspiracy.

GOWRIE, a belt of fertile alluvial land (Scotice, "carse"), in Perthshire, Scotland. Occupying the north shore of the Firth of Tay, the Carse of Gowrie extends east of Perth city to the confines of Dundee. It measures 15 mi. in length, and is one of the richest tracts in Perthshire. The district is noteworthy for the number of its castles and mansions, among which may be mentioned Kinfauns castle, Inchyra house, Pitfour castle, Errol park. Megginch castle, dating from 1575; Fingask castle, Kinnaird castle, erected in the 15th century and occupied by James VI in 1617; Rossie priory, the seat of Lord Kinnaird; and Huntly castle.

GOYA, a town and port of the Province of Corrientes, Argentina, on the Paraná river, 618 mi. N. of Buenos Aires and 147 mi. S. of the town of Corrientes. Population 18.000. It is served by the Central, Entre Rios and North-eastern railways, and is 34 hours from Buenos Aires by rail. Goya is a distributing centre for agricultural products and timber. It dates from 1807.

GOYATACAN, an independent linguistic stock of South American Indians, so called from the Goyatacas, one of its important tribes. The Goyatacas (so named from the Brazilian state of Goyaz, in which, however, few of these Indians appear to have lived) occupied a large part of the state of Minas Geraeas and the southern edge of the state of Bahia, in the highlands of eastern Brazil. In early times tribes of this stock probably occupied the Atlantic coast in this region, but at the time of arrival of the Portuguese, the coastal strip was in the hands of Tupian (*q.v.*) tribes. The bow and throwing-club were their chief weapons.

See Maximilian, Prince of Wied-Neuroeid, *Travels in Braszl in the Years 1815, 1816, 1817* (London, 1820); K. von den Steinen, *Durch Zentral Beasilien* (Leipzig, 1886).

GOYA Y LUCIENTES, FRANCISCO (1746–1828), Spanish painter, was born on March 30, 1746, at Fuendetodos, near Saragossa. He began his art studies in the studio of José Luzan Martinez at Saragossa, where he made the acquaintance of Francisco Bayeu, the future court painter, and of Zapater, his life-long friend and correspondent. Goya was a true son of Aragon; he took part in street scuffles between the youths of rival parishes; after one of these fights, in which three combatants were killed, he was compelled, at the age of 19, to flee to Madrid.

In consequence of his riotous and dissolute life he found it convenient to leave Madrid also, and he made his way to the coast as one of a travelling troupe of bull-fighters, and finally reached Rome, broken in health and destitute. Here he continued his studies. In 1771 he was awarded the second prize in a competition initiated by the academy of Parma. He returned to Saragossa in the autumn of the same year. There he painted frescoes in the famous cathedral El Pilar, and in the Carthusian church Aula Dei. The influence of Tiepolo is evident. He married Bayeu's sister and returned to Madrid in 1775.

The Court Painter. — Raphael Mengs was at that time decorating the royal palace with classicist pictures of Olympian gods, and Bayeu, who was working under Mengs, may have put in a good word for his brother-in-law. Goya was commissioned to paint cartoons for tapestries in the Pardo, the crown prince's residence. He was free to choose his own subjects, and between 1776 and 1780 he supplied some 20 cartoons to the factory of Santa Barbara representing *genre* scenes from the life of the fields, the village and the street. These cartoons opened a new chapter in the history of decorative art. His originality was

recognized by Mengs; and royal favour naturally followed.

He was director of the Academy of Arts in 1785, and a court painter in 1786. His work now became intimately connected with the court life. He painted the portraits of four successive sovereigns of Spain and their families. The "Family of Charles IV.," the "Queen in a Mantilla," the "King in Uniform," and the great equestrian portraits of the king and queen are among his best work in the Prado. These portraits, with their searching and sometimes cruel analysis of character, reveal him as a cynical onlooker at a decadent court. He disdained flattery, and his interpretation was lifelike, brilliant and strong.

He viewed the world as a drama—almost as a farce; and he expressed now in grim satire, now in delightful simplicity, the contemporary life of Spain at the time of the French Revolution. He was versatile and his facility was marvellous; it often took him but one or two hours to paint a portrait, and he left a gallery of the most famous men and women of his age and country. The Duchess of Osuna favoured him with commissions. The splendid portrait of the Duchess of Alva, with the dedication "by her friend Goya," is dated 1795. The portrait of Guillemardet, then ambassador of the Directory and later one of Napoleon's prefects, belongs to the same time. "No portrait succeeded with me better," wrote Goya. It is a triumph of realism. Of a later date are his portraits of the duke of Wellington, one in the possession of the present duke, the other in the Havermeyer collection at New York. The British Museum has a sketch of the duke in red chalk. Among Goya's religious paintings are the "Crucifixion" for Francisco el Grande, and the decoration of the cupola of San Antonio de la Florida, painted in 1798.

With the French invasion, Goya joined the Josefinos and worked for Joseph Bonaparte. He had to hide for three months from the fury of the people, when the French fled from Madrid. That his feelings were for his own people all the time is shown in his painfully realistic picture of the massacre of the "Dos de Mayo" (1808), and by his set of etchings, "Disasters of the War," a record of French atrocities, drawn while he was King Joseph's court painter, and, perhaps, not meant for publication. Of this time are the weird and terrifying paintings which decorated the walls of his home, and which are now in the Prado.

Bordeaux.—With age, Goya's health began to fail; he became almost totally deaf. At 78 he crossed the Pyrenees alone and went to Bordeaux, where he was welcomed by the colony of Spanish refugees. He set to work and painted his friends; he painted the "Water Carrier," the "Knife Grinder," and the "Milkmaid," working with colour and without line. From Bordeaux he visited Paris, and in 1827 returned to Madrid for a short stay. His portrait was then painted, by order of King Ferdinand, by Vincente Lopez (now in the Prado). Goya died at Bordeaux on April 16, 1828. His remains were transferred in 1919 to S. Antonio de la Florida at Madrid.

Most of Goya's paintings are in Spain, in the Prado, in the Academia de San Fernando and in private collections; until the Osuna sale of 1896, very few of his pictures were to be seen outside his own country. The National Gallery, London, has two fine portraits. Goya was also an etcher and a lithographer. The set of etchings known as "Los Caprichos" (*c.* 1797) exposed the vices of degraded society with savage satire; "Los Proverbios" (1805) were executed in the same vein. Then followed the terrible "Los Desastres de la Guerra" (1810) mentioned above, and the "Tauromaquia" (1815) with scenes of the bull-fight. Of great interest are his etchings after pictures by Velasquez. At Bordeaux, in 1825, he executed four lithographs. Of the four sets of etchings only the first was issued in his life-time; the others were not published until the middle of the last century. Although Goya founded no school and had no direct followers, his strongly personal and spontaneous art greatly influenced the development of modern painting. Delacroix and the French romanticists admired him. He was studied by Manet, by Daumier, and more recently by Sargent and by Zuloaga.

The most important documents for the *Life* of Goya are contained in his correspondence with his friend, Martin Zapater. Of these letters 135 were published in 1868. Monographs on Goya were written by Ch. Yriarte (1867); Paul Lefort (1877); W. Rothenstein (1900); P. Lafond (1902); Val von Loja (1903); A. F. Calvert (1908); Hugh Stokes (1914); J. Tild (1920); A. L. Mayer (1923); R. Gomez de la Serina (1928). Three separate books on Goya, the portraitist, the painter, and the engraver were written by A. de Eeruete y Moret. The first of these was translated into English by S. Brinton. For Goya's centenary these three books were condensed into one volume by Sanchez Canton. *See* also Cruzado Villaarnil, *Los Tapices* de Goya (1870).

GOYAZ: see GOIAZ.

GOYEN, JAN JOSEPHSZOON VAN (1596–1656), Dutch painter, was born at Leyden on Jan. 13, 1596, learned painting under several masters at Leyden and Haarlem, married in 1618 and settled at The Hague about 1631, where he rose to the presidency of his guild in 1640. He was one of the first to emancipate himself from the traditions of minute painting of detail embodied in the works of Breughel and Savery. Though he preserved the dun scale of tone peculiar to those painters, he studied atmospheric effects in black and white with considerable skill. He had much influence on Dutch art. He formed Solomon Ruysdael and Pieter Potter, forced attention from Rembrandt, and bequeathed some of his precepts to Pieter de Molyn, Coelenbier, Saftleven, van der Kabel and Berghem. A friend of van Dyck and Bartholomew van der Helst, he sat to both these artists for his likeness. His daughter Margaret married Jan Steen, and he had steady patrons in the stadtholder Frederick Henry and the chiefs of the municipality of The Hague. He died at The Hague on April 27, 1656.

Between 1610 and 1616 van Goyen wandered from one school to the other. He was apprenticed to Isaak Smanenburgh, de Man, Klok and de Hoorn. In 1616 he joined Esaias van der Velde; among his earlier pictures, some of 1621 (Berlin Museum) and 1623 (Brunswick Gallery) show the influence of Esaias very perceptibly. The landscape is minute. Details of branching and foliage are given. and the landscape serves as a stage for genre scenes. After 1625 these peculiarities gradually disappear. Atmospheric effect in landscapes of cool tints is the principal object which van Goyen holds in view. In buildings and water, with shipping near the banks, he sometimes has the strength if not the colour of Albert Cuyp.

Van Goyen's work is seen to advantage at the Louvre, and in Berlin, Gotha, Vienna, Munich and Augsburg. The National Gallery in London has seven of his works. Though he visited France once or twice, van Goyen chiefly confined himself to the scenery of Holland. One of his largest pieces is a view of The Hague, executed in 1651 for the municipality, and now in the town collection of that city. Most of his panels represent reaches of the Rhine, the Waal and the Maese. But he sometimes sketched the donns of Scheveningen, or the sea at the mouth of the Rhine and Scheldt; and he liked to depict the calm inshore and rarely ventured upon seas stirred by more than a cooling breeze. He painted winter scenes, with ice and skaters and sledges. He produced little in partnership: we can only instance the "Wateringplace" in the gallery of Vienna, where the landscape is enlivened with horses and cattle by Philip Wouvermans. More than 1,000 of van Goyen's pictures are catalogued by Hofstede de Groot. As an etcher, van Goyen has bequeathed to us two rare plates.

GOYENECHE, JOSÉ MANUEL (1775–1846), South American royalist soldier, was born in Arequipa, Peru, June 13. 1775. In 1795 he left South America for Spain, where he remained until 1808. In that year he returned to South America as the agent of the junta of Seville. It is thought that he had been instructed by the French, whose armies had recently invaded Spain, to promote the French cause in South America, but in Seville he transferred his affiliation to Ferdinand VII and when he arrived in America devoted himself to winning loyalty to the Spanish king. At that time, several South American countries were beginning to break away from Spanish rule and Goyeneche became a leader of the anti-revolutionary army. He was responsible for a number of victories in Argentina, but the defeat of one of his subordinates forced him to abandon much of the territory he had captured. He therefore returned to Spain (1813), where he served against the French. At his death in Madrid, Oct. 15, 1846, he

was count of Guaqui and held the rank of lieutenant general.

GOZLAN, LEON (1803?–1866), French author, was born at Marseilles. His father had been a wealthy man but lost his money during Gozlan's youth, forcing the latter to leave school and ship as an apprentice on a coastal trading vessel. His experiences in Senegal during this period of his life later forined the basis for several of his novels and short stories. After his return to France, he became a clerk in a Paris bookstore, but in a short time his stories began to be published in various French magazines and thereafter he was able to devote himself to writing. Gozlan was a prolific writer, and his work was characterized by a great deal of spirit and charm. His most successful works were his novels, which included *Le Notaire de Chantilly* (1836), *Washington Levert et Socrate Leblanc* (1838), *Le Médecin du Pecq* (1839), *Aristide Froissart* (1843) and *Les Émotions de Polydore Marasquin* (1857). He also wrote *Balzac en pantoufles* (1865), a light biography of the French writer; *Les Tourelles,* a history of French châteaux, later reprinted under the title of *Les Châteaux de France,* a moderately valuable historical study; and numerous short stories and plays Two of his plays, La *Pluie et le Beau Temps* and *Une Tempête dans un verre d'eau* became part of the repertory of the Comédie Française and achieved some success, but most of the rest were insignificant, even during Gozlan's lifetime. Gozlan died in Paris, Sept. 14, 1866.

GOZO or **GOZZO,** an island of the Maltese group in the Mediterranean sea, second in size to Malta and similar in physique. It lies N.W. and $3\frac{1}{4}$ mi. from the nearest point of Malta, is of oval form, $8\frac{3}{4}$ mi. in length and $4\frac{1}{2}$ mi. in extreme breadth, and has an area of nearly 26 sq.mi. Its chief town, Victoria, formerly called Rabat (pop. 1937, *c.* 6,000), stands near the middle of the island on one of a cluster of steep conical hills. The prehistoric temple "Gigantia" is of the same type as Hagiar Kim in Malta but larger. The estimated population in 1937 was 25,693.

GOZZI, CARLO, COUNT (1720–1806), Italian dramatist, was born at Venice on Dec. 13, 1720. At the age of sixteen he joined the army in Dalmatia; three years afterward he returned to Venice, where he was reputed the wittiest member of the Granelleschi society, to which his satirical pieces had gained him admission. This society aimed at preserving Tuscan literature pure and untainted by foreign influences. Gozzi flouted the innovations of Pietro Chiari, but he also turned his wit against Goldoni and wagered that he could attract audiences by plays on the most puerile subjects. His comedy *Fiaba dell' amore delle tre melarancie* was one of several slight and witty pieces based on fairy tales. These pieces were praised by Goethe, Schlegel, Madame de Stael and Sismondi; and one of them, Re *Turandote,* was translated by Schiller and later made the subject of operas by Weber, Busoni and Puccini. In his later years Gozzi wrote tragedies in which the comic element was introduced; he also copied Spanish models. He died on April 4, 1806.

His collected works were published under his own superintendence, at Venice, in 1792, in 10 volumes. *See* Gozzi's own work, *Memorie inutili della vita di Carlo Gozzi* (3 vols., Venice, 1797; new ed., 2 vols., 1910), translated into French by Paul de Musset (1848), and into English by J. A. Symonds (1889); and Magrini, I *tempi,* Is *vita e gli scritti di Carlo Gozzi* (Eenevento, 1883).

GOZZI, GASPARO, COUNT (1713–1786), brother of Carlo Gozzi, was born at Venice on Dec. 4, 1713. He married Luise Bergalli, who undertook the management of the theatre of Sant' Angelo, Venice, for which he provided the plays, chiefly adaptations from the French. He published the *Gazzetta Veneta* and the *Osservafore Veneto* (1761, *seq.),* modelled on Addison's *Spectator* and written in pure and graceful Italian. His *Difesa di Dante* (1755), marked the beginning of the revival of the study of Dante. He died at Venice on Dec. 26, 1786.

BIBLIOGRAPHY.—Among his other works are: *Lettere famigliari* (1755); *Sermoni,* in blank verse. His collected works were published at Venice, 1794–1798. *See* M. A. Viglio, *Gasparo Gozzi* (1916).

GOZZOLI, BENOZZO (more properly BENOZZO DI LESE DI SANDRO, called "Gozzoli" by Vasari) (1420–1497), Italian painter, born in Florence 1420, in the early part of his career assisted Fra Angelico, whom he followed to Rome and worked with at Orvieto. In Rome he executed in Santa Maria in Aracoeli a fresco of "St. Anthony and Two Angels." In 1449 he left Angelico, and went to Montefalco, near Foligno in Umbria. In S. Fortunato, near Montefalco, he painted a "Madonna and Child with Saints and Angels" and three other works. One of these, the altarpiece, representing "St. Thomas receiving the Girdle of the Virgin," is now in the Vatican gallery, and shows the affinity of Gozzoli's early style to Angelico's. He next painted in the monastery of S. Francesco, Montefalco, filling the choir with a triple course of subjects from the life of the saint, with various accessories, including heads of Dante, Petrarch and Giotto. This work was completed in 1452 and is still marked by the style of Angelico, crossed here and there with a more distinctly Giottesque influence. In the same church, in the chapel of St. Jerome, is a fresco by Gozzoli of the Virgin and Saints, the Crucifixion and other subjects. He remained at Montefalco (with an interval at Viterbo) probably till 14j6, employing Mesastris as assistant. Thence he went to Perugia, and painted in a church a "Virgin and Saints." now in the local academy, and soon afterward to his native Florence, the headquarters of art. By the end of 1459 he had nearly finished his important labour in the chapel of the Palazzo Riccardi, the "Journey of the Magi to Bethlehem," and, in the tribune of this chapel, a composition of "Angels in a Paradise." His picture in the National Gallery. London, a "Virgin and Child with Saints." 1461, belongs also to the period of his Florentine sojourn. In 1464 Gozzoli left Florence for S. Gimignano, where he executed some extensive works: in the church of S. Agostino, a composition of St. Sebastian protecting the city from the plague of this same year, 1464; over the entire choir of the church, a triple course of scenes from the legends of St. Augustine, from the time of his entering the school of Tagaste on to his burial, 17 chief subjects, with some accessories in the Pieve di S. Gimignano, the "Martyrdom of Sebastian," and other subjects; and some further works in the city and its vicinity. Here he received undoubted co-operation from Giusto d'Andrea. He stayed in this city till 1467, and from 1469 began, in the Campo Santo of Pisa, the vast series of mural paintings with which his name is specially identified. He died in Pistoia on Oct. 4, 1497, and was buried in San Domenico.

The art of Gozzoli is pre-eminently attractive by its sense of what is rich, winning, lively and abundant; his colour is bright, vivacious and gay.

GRAAF, REGNIER DE (1641–1673), Dutch physician. was born July 30, 1641, at Schoonhoven, Holland. He was educated at Louvain, Utrecht, Leyden and Angers and for a short time practised medicine in Paris but returned to Delft in 1667 and remained there until his death, Aug. 17, 1673.

Graaf is known for his studies on the pancreas and on the reproductive organs of mammals, particularly the latter. He was the discoverer of the ovarian follicles, which are still known as Graafian follicles *(see* REPRODUCTION, PHYSIOLOGY OF). His writings include *Disputatio medica de natura et usu succi pancreati* (1663); *Epistula de nonnullis circa partes genitales inventis novis* (1668); *Tractatus de virorum organis generationi inservientibus* (1668); *De mulierum organis in generatione inservientibus* (1672); *Partium genitalium defensio adversus J. Swammerdam* (1673); and an edition of his complete works, *Opera omnia* (1677).

GRAAFF REENET, a town in the Cape Province of the Union of South Africa 32° 15′ S., 24° 32′ E. Alt. 2,463 ft. Population 4,498 whites, 4,724 coloured. It was founded by the Dutch in 1786, and named after the then governor of the Cape, C. J. van de Graaff, and his wife. The town was built near the Sunday river, from which water is led to irrigate the gardens, and across which a large dam has been constructed just above the town to create a reservoir, capable of irrigating 17,000 ac. of adjacent land, The average annual rainfall is about 17 in. The surrounding country is Karroo Veld. in the midst of which the town stands as an oasis. Most of the houses have their gardens, in which large quantities of fruit arid vines and vegetables are grown. Water is

led along the streets in open furrows. The botanical gardens are well laid out. Graaff Reinet is lighted by electricity. The district produces considerable quantities of mohair and merino wool.

(R. U. S.)

GRABAU, AMADEUS WILLIAM (1870–), American palaeontologist, was born at Cedarburg, Wis., on Jan. 9, 1870, educated at the Massachusetts Institute of Technology (Sc.B., 1896) and Harvard (Sc.D., 1900). He served as assistant and instructor in palaeontology at the Massachusetts institute, 1892–97, was professor of geology at Rensselaer Polytechnic institute, Troy, N.Y., 1899–1901 and then entered the faculty of Columbia university as lecturer, 1901–02, adjunct professor, 1902–05 and professor, 1905–19, of palaeontology. In 1919 he became professor of palaeontology at the National university in Peking, China, and also chief palaeontologist of the Chinese geological survey. He accompanied the Third Asiatic Expedition of the American Museum of Natural History as research associate in palaeontology. The subjects of his special researches include *North American Index Fossils* (with H. W. Shimer, 1909–10); *Palaeozoic Corals of China* (1921); *Ordovician Fossils of North China* (1921); *Stratigraphy of China*, vol. 1 (1924–25); *Silurian Fossils of Yunnan* (1926).

GRABBE, CHRISTIAN DIETRICH (1801–1836), German dramatist, was born at Detmold on Dec. 11, 1801. He lived an extremely irregular life, and though both Tieck and Immermann tried to reform him, he died prematurely as a result of his excesses on Sept. 12, 1836. His tragic life provided the matter of a play by E. Johst, *Der Einsame* (1917) and a novel by P. Friedrich (1925). Many of Grabbe's dramas contain fine passages and a wealth of original ideas, though they are little suited to the requirements of the stage. The boldly conceived *Don Juan und Faust* (1829) and the historical dramas *Friedrich Barbarossa* (1829), *Heinrich VI.* (1830), and *Napoleon oder die Hundert Tage* (1831), the last of which places the battle of Waterloo upon the stage, are his best works.

Grabbe's works have been edited by O. Blumenthal (4 vols., 1875), E. Grisebach (4 vols., 1902) and by P. Zaunert (3 vols., 1910). *See* also K. Ziegler, *Grabbes Leben und Charakter* (1855); O. Blumenthal, *Beiträge zur Kenntniss Grabbes* (1875); C. A. Piper, *Grabbe* (1898).

GRACCHUS, in ancient Rome, the name of a plebeian family of the Sempronian *gens*. Its most distinguished representatives were the famous tribunes of the people, Tiberius and Gaius Sempronius Gracchus, mentioned below, usually called "the Gracchi."

GRACCHUS, GAIUS SEMPRONIUS (153–121 B.C.), younger brother of Tiberius, was a man of greater abilities, bolder and more passionate, although possessed of considerable powers of self-control, and a vigorous and impressive orator. When 20 years of age he was appointed one of the commissioners to carry out the distribution of land under the provisions of his brother's agrarian law. At the time of Tiberius's death, Gaius was serving under his brother-in-law Scipio in Spain, but probably returned to Rome in the following year (132). In 131 he supported the bill of G. Papirius Carbo, the object of which was to make it legal for a tribune to offer himself as candidate for the office in two consecutive years, and thus to remove one of the chief obstacles that had hampered Tiberius. The bill was then rejected, but appears to have subsequently passed in a modified form, as Gaius himself was re-elected without any disturbance. Possibly, however, his re-election was illegal, and he had only succeeded where his brother had failed. For the next few years nothing is heard of Gaius. Public opinion pointed him out as the man to avenge his brother's death and carry out his plans, and the aristocratic party, warned by the example of Tiberius, were anxious to keep him away from Rome. In 126 Gaius accompanied the consul L. Aurelius Orestes as quaestor to Sardinia, then in a state of revolt. Here he made himself so popular that the senate in alarm prolonged the command of Orestes, in order that Gaius might be obliged to remain there in his capacity of quaestor. But he returned to Rome without the permission of the senate. and, when called to account by the censors. defended himself so successfully that he was acquitted of having acted illegally. The disappointed aristocrats then brought him to trial on the charge of being implicated in the revolt of Fregellae, and in other ways unsuccessfully endeavoured to undermine his influence. Gaius then decided to act; against the wishes of his mother he became a candidate for the tribuneship, and was elected for the year 123.

Legislative Work.—The following is a summary of his legislation, apart from special measures aimed at his brother's opponents. He revived his brother's agrarian law, which, although it had not been repealed, had fallen into abeyance, and stabilised the price of corn in Rome. He founded the first over-sea colony at Iunonia, on the site of Carthage, with a citizen status. He also remodelled the voting system of the comitia centuriata in such a way as to reduce the influence of the aristocrats. A further group of laws aimed at strengthening the hands of the equites, to whom he gave the right to farm the taxes of Asia, and at the same time he provided that the members of the *quaestiones perpetuae*, which included the court that dealt with extortion in the provinces, should be drawn from the equites. These measures raised Gaius to the height of his popularity, and during the year of his first tribuneship he may be considered the absolute ruler of Rome. His legislation also involved him in an immense amount of administrative work, at which according to Plutarch he was very successful. Store-houses were built for the state-controlled corn (*Horrea Sempronianа*), roads built and improved in the country districts to facilitate transport, and so on. He was chosen tribune for the second time for the year 122. To this period is probably to be assigned his proposal that the franchise should be given to all the Latin communities, and that the status of the Latins should be conferred upon the Italian allies. This proposal would have saved the Social War, but of course lost him favour with his own supporters, and the senate put up Livius Drusus to outbid him with proposals never meant to be carried out. On his return from superintending the organisation of his new colony he failed to secure the tribunate again, and the new consul, L. Opimius, at once proposed the abandonment of Iunonia. A riot during the voting resulted in Gaius being proclaimed a public enemy—the consuls were given plenary powers, and Gaius, who escaped over the Tiber, was found dead next day.

GRACCHUS, TIBERIUS SEMPRONIUS, consul in 238 B.C., defeated the Ligurians, and, at the conclusion of the Carthaginian mercenary war, was in command of the fleet which took possession of Sardinia.

GRACCHUS, TIBERIUS SEMPRONIUS, probably the son of the preceding. Consul in 215, during the second Punic War, he defeated the Capuans, and in 214 beat Hanno near Beneventum with the help of slave volunteers, fighting under promise of freedom. In 213 Gracchus was consul a second time and carried on the war in Lucania; in the following year, while advancing on Capua, he was betrayed by a Lucanian and trapped and killed by Mago.

GRACCHUS, TIBERIUS SEMPRONIUS (c. 210–151 B.C.), father of the tribunes, and husband of Cornelia. Although an opponent of the two Scipios (Asiaticus and Africanus), as tribune in 185 he was a member of the commission sent to Macedonia to investigate the complaints made by Eumenes II. of Pergamum against Philip V. of Macedon. In 181 he went as praetor to Hither Spain, where he was successful both as a soldier and administrator. Censor in 169, he was associated with the somewhat reactionary policy of his colleague Claudius Pulcher. They tried to curb the growing power of the capitalists (the equites), and restricted the political influence of the freedmen by confining them to the city tribes. He visited Asia as an ambassador in 165 and 161, and was consul again in 163.

GRACCHUS, TIBERIUS SEMPRONIUS (163–133 B.C.), son of the preceding, was the elder of the two great reformers. He and his brother were brought up by their mother Cornelia, assisted by the rhetorician Diophanes of Mytilene and the Stoic Blossius of Cumae. In 147 he served under his brother-in-law the younger Scipio in Africa during the last Punic War, and was the first to mount the walls in the attack on Carthage. Quaestor in 137, he served in the Numantine wars in Spain, and saved the army by concluding an agreement with the enemy, who consented to treat with him out of respect for his father's memory. This agreement was repudiated by the senate.

In 133 he was tribune, and championed the impoverished farmer class and the lower orders. His proposals (see AGRARIAN LAWS) were, briefly, to recover all the State lands which had been acquired by prescription in excess of the amount allowed by the Licinian laws (500 jugera a head) and distribute them in inalienable allotments. They met with violent opposition, and were not carried until he had, illegally and unconstitutionally. secured the deposition of his fellow-tribune, M. Octavius, who had been persuaded by the *optimates* to veto them. The senate put every obstacle in the way of the three commissioners appointed to carry out the provisions of the law, and Tiberius, in view of the bitter enmity he had aroused, saw that it was necessary to strengthen his hold on the popular favour. The legacy to the Roman people of the kingdom and treasures of Attalus III. of Pergamum gave him an opportunity. He proposed that the money realized by the sale of the treasures should be divided, for the purchase of implements and stock, amongst those to whom assignments of land had been made under the new law.

To strengthen his position further, Tiberius offered himself for re-election as tribune for the following year. The senate declared that it was illegal to hold this office for two consecutive years; but Tiberius treated this objection with contempt. To win the sympathy of the people, he appeared in mourning, and appealed for protection for his wife and children, and whenever he left his house he was accompanied by a bodyguard of 3,000 men, chiefly consisting of the city rabble. The meeting of the tribes for the election of tribunes broke up in disorder on two successive days, without any result being attained, although on both occasions the first divisions voted in favour of Tiberius. A rumour reached the senate that he was aiming at supreme power. An appeal to the consul P. Mucius Scaevola to order him to be put to death at once having failed, P. Scipio Nasica exclaimed that Scaevola was acting treacherously towards the state, and called upon those who agreed with him to take up arms and follow him. During the riat that followed, Tiberius was killed, and his body was thrown into the Tiber that night with 300 others. A commission was appointed for the trial of his followers.

GRACE, EDWARD MILLS (1841–1911), English cricketer, was born at Downend, near Bristol on Nov. 28, 1841, and was an elder brother of William Gilbert Grace (*q.v.*). He was educated at Long Ashton, and studied medicine at the Bristol Medical School, and in Edinburgh. In 1869 he settled at Thornbury, and practised there until his death on May 20, 1911.

He was an enthusiastic cricketer, and was the first member of the family to become famous for his play. He played first at Lord's in July 1861, for South Wales v. M.C.C., and by 1862 his reputation was established. He played 12 times for the Gentlemen v. Players from 1863 to 1869, and for the last time in 1886. From 1865 onwards, his two brothers W. G. and George Frederick (1850–80) became even more famous as cricketers, and in 1880 (Sept. 6–8) the three brothers played together for England against Australia.

GRACE, WILLIAM GILBERT (1848–1915), English cricketer, was born at Downend, Gloucestershire, on July 18, 1848. His father (Henry Mills Grace), his uncle (Alfred Pocock) and his elder brothers, Henry, Alfred and Edward Mills were enthusiastic cricketers; indeed, in E. M. Grace the family name first became famous. A younger brother, George Frederick, also added to the cricket reputation of the family. "W. G." was endowed with a splendid physique as well as with powers of self-restraint and determination. At the acme of his career he stood full 6 ft. 2 in., being powerfully proportioned, loose yet strong of limb. He kept himself in condition all the year round, shooting, hunting or running with the beagles as soon as the cricket season was over. He was also a fine runner, 440 yd. over 20 hurdles being his best distance; and it may be quoted as proof of his stamina that on July 30, 1866, he scored 224 not out for England v. Surrey, and two days later won a race in the National and Olympian Association meeting at the Crystal Palace. The title of "champion" was well earned by one who for 36 years (1865–1900 inclusive) was actively engaged in first-class cricket. In each of these years he was invited to represent the Gentlemen in their matches against the Players, and, when an Australian eleven visited England, to play for the mother country. As late as 1899 he played in one of the five international contests; in 1900 he played against the Players at the Oval. He held most "records" connected with the game, scoring over 100 runs on 121 occasions, and in seven seasons scoring over 1,000 runs and taking over 100 wickets. Grace was one of the finest fieldsmen in England, and, at his best, a fine thrower, fast runner and safe "catch." By profession he was a medical man. In later years he became secretary and manager of the London County Cricket club. He was married in 1873 to Miss Agnes Day, and one of his sons played for two years in the Cambridge eleven. He was the recipient of two national testimonials: the first, amounting to £1,500, being presented to him in the form of a clock and a cheque at Lord's ground by Lord Charles Russell on July 22, 1879; the second, collected by the M.C.C., the county of Gloucestershire, the *Daily* Telegraph and the Sportsman, amounted to about £10,000, and was presented to him in 1896. He visited Australia in 1873–74 (captain), and in 1891–92 with Lord Sheffield's eleven (captain); the United States and Canada in 1872, with R. A. Fitzgerald's team. He died at Eltham, Kent, on Oct. 23, 1915.

See F. S. A. Cooper, W. G. ***Grace, Cricketer*** (1916); Lord Hawke and others, ***The Memorial Biography*** of ***Dr. W. G. Grace*** (1919).

GRACE, a word of many shades of meaning, but in general connoting the idea of favour, whether that in which one stands to others or that which one shows to others. The New *English* Dictionary groups the meanings of the words under three main heads: (1) Pleasing quality, gracefulness, (2) favour, goodwill, (3) gratitude, thanks (Fr. "grâce," Lat. "gratia" from "gratus," beloved, pleasing; formed from the root "ça-," Gr. χαρ-, *cf.* χαίρω, χάρμα, χάρις).

In religion "grace" is a term describing an experience the basis of which is the sense of givenness in human life. From one aspect this may be described as inspiration, from another as favour, from another as power, and from yet another as pity; but in all these cases the fundamental feature of the experience is man's perception that he is in touch with a wider Self from which there flow into him streams of rich, full energy. Some of his greatest achievements seem to have come to him from outside himself, and he feels that, acting merely as a small self-dependent nucleus of consciousness, he could never have attained to them.

Man has naturally tried to find a suitable word to describe this divine influx of energy. Primitive peoples recognized its existence. In Melanesia it is called *mana* (*q.v.*), and among some Indian tribes *manitou, orenda* and wakonda. The Greeks called it sometimes ἀρετή, sometimes χάρις, and in the LXX. and N.T. when pity is implied the word ἔλεος is used. The Hebrews generally used חֵן as the equivalent of χάρις and חֶסֶד or "loving kindness', as the equivalent of ἔλεος.

The distribution of this power has also to be explained. The primitives regarded it as a quality or potency hovering between the personal and the impersonal, but more psychical than physical in character, permeating all things, but often concentrated in individual persons or things. It is an indefinite reservoir of energy in the universe, on which man can draw for good or ill.

All men, however, have not seemed to be equally under the influence of grace, and an explanation of this indisputable fact has had to be sought. Some found it in the inscrutable character of the deity, who was held by them to bestow grace sportively or

capriciously, just like an oriental despot. But this conflicted with the gradually developing human conviction that any deity worthy of the name must be at least as good as the best human being; and so an explanation was found in the experience of the freedom of the will. All, it was held, were given sufficiency of grace, but only those who freely appropriated it showed its full effects.

Alongside of this conception of grace developed that of sin. This article is limited in scope by its title, but we are bound to consider the fact that in proportion as man's sense of guilt and failure increases (ἁμαρτία the N.T. word translated "sin" = "missing of the mark") so there also increase his sense of helplessness and dire need of divine aid and his sense of his unworthiness and so of his inability to merit the loving self-outpourings of the Divine Being. The conception of "grace" is therefore an inevitable concomitant of moral theism. The positivist and determinist find with difficulty a place in their programme for grace and free will. But the common-sense of the ordinary man revolts against the rigid conclusions of the determinist, and insists upon the reality of free will, and so upon the reality of grace.

In Christianity the conception of grace has developed proportionately to the richness of the experiences of Christian believers. As the influence of the energising personality of God exercised on man, its definition has depended upon the nature of the beliefs held about God's personality and Character. Hence the wonderful richness and variety of the χαρισματα imparted to the Christian, believing himself, as he has always done, to be in touch with a deity whose character and influence are equivalent to those of the historical Jesus. It must be admitted that the interpretation of Christian experience has been the subject of some controversy. Thus it was debated whether after a single fall from grace a Christian could be reinstated (Novatianism, A.D. 251). It was also debated as to whether saving grace could be obtained outside the membership of the Church. The largest single contribution to the answer of these questions was made by Augustine the Great (A.D. 354–430), Bishop of Hippo in Africa. (*See* AUGUSTINE, SAINT.) The experiences of his stormy youth and impressive conversion led him to lay tremendous stress on the irresistible power of God, and he therefore undervalued the importance of the co-operation of the free human will. But he was led to do this by the sense of his own past wickedness, interpreted as evidence of the correctness of the meaning of the early chapters of the book of Genesis, *i.e.*, that the nature of every man is corrupted because of the original fall of Adam, so that man is not only of his own nature inclined to evil, but is now in such a condition that he cannot by his own natural strength and good works carry out the will of God. The dependence of the soul upon God seems to be a natural consequence of its origin, and the teaching of the Roman Catholic catechism is that we can do no good work of ourselves, but that we need the help of God's Grace. This is also taught by the Church of England catechism.

Pelagius, a native of Britain, a learned layman and a monk (a contemporary of Augustine), saw no safeguard for righteousness unless men recognised the complete freedom of the will and realised that they were accountable for their actions. Augustine in 417 secured the condemnation of Pelagius by means of an imperial decree, and this decision was afterwards confirmed in 431 at the Council of Ephesus. The influence of Augustine, with his tendency to attribute arbitrary action to the deity, runs through the subsequent history of the Church. In the 16th century Erasmus tended to take the side of Pelagius, Luther and to an even greater extent Calvin the side of Augustine. Calvin in fact has seemed to insist that God predestines some to blessedness and some to damnation, and that man himself is so helpless and corrupt that all he can do is to take thankfully whatever grace and mercy may be dealt out to him. The so-called Arminian controversy was due to a reaction against this (A.D. 1608) and an attempt was made to settle the dispute at the famous Synod of Dort 1618–19, the decrees of which decided that predestination only came in after the fall, and was not included in the eternal counsels of God.

Another difference of opinion arose as to the relation of grace to the sacraments. The Catholic view is that the sacraments are means by which grace is given, and its appropriation is held to depend on having the right disposition when receiving the sacraments. The Protestant view, aiming at the rejection of magic, has tended to regard the sacraments rather as symbols and pledges of grace already given, and the teaching and experience of Luther, that faith alone was needed in order to receive grace, was an immense simplification of life, though it was not carried to its logical conclusion by the earlier Protestants (except perhaps the Quakers) but was still linked up to the church system and its ordinances.

In modern times the study of psychology has led to a clearer apprehension of the reality of grace, and of the lines along which the divine gift appears to operate. The notion that behind consciousness lies a large realm, to which various titles have been given, has suggested to some that grace is the inflow into consciousness (as it were through a mental sluice) of spiritual power which exists in the realm of the subconscious or super-conscious. The extension of Protestant principles has led many totally to discard sacraments, services and institutions as means of attaining grace, and to assert that the individual can find the power he needs ready to hand at all points in ordinary daily life. On the other hand the last forty years have seen a considerable revival of Catholic sacramentalism, based often upon a pragmatic appeal.

A final change in the conception of grace has resulted from the effect upon the belief in an original fall from righteousness produced by an independent study of the origin and development of the human species. Those who totally discard the traditional belief are led sometimes to an exaggerated denial of the necessity of grace. But the acceptance of its absolute necessity is independent of folk-lore. The facts of past and present sin and corruption, and the humiliating spectacles of individual, national and racial deterioration, must prevent sober thinkers from indulging in the rash assumption that man is capable by himself, and without any aid from the Divine Spirit, either of developing or of regenerating his character.

GRACES, THE, Greek goddesses of fertility. The name (*cf.* Venus) refers to the "pleasing" or "charming" appearance of a fertile field or garden. (Gr. Χάριτες, Lat. *Gratiae.)* The number varies; sometimes only one Charis is mentioned, but usually they are three, Aglaia (brightness), Euphrosyne (joyfulness), Thalia (bloom)—daughters of Zeus and Hera (or Eurynome, daughter of Oceanus), or of Helios and Aegle. At Sparta there were two, Kleta and Phaenna; at Athens two, Auxo and Hegemone, associated with Agraulos in the ephetic oath. Frequently they are taken as goddesses of charm or beauty in general, hence as associated with Aphrodite, Peitho, Hermes; the union of Hephaestus with Charis in the *Iliad* is probably *a* mere allegory (Craftsmanship weds Beauty). In works of art they were represented in early times draped, later as nude female figures. In Latin the name was translated Gratiae (Graces).

See the articles in Roscher's *Lexikon der Mythologie,* and *in* Daremberg and Saglio's *Dictionnaire des antiquités* (with useful bibliography).

GRACIÁN Y MORALES, BALTASAR (1601–1658), Spanish prose writer and Jesuit. His principal works are *El Héroe* (1637); the *Arte de ingenio, tratado de Agudeza* (1642), a system of rhetoric in which the principles of *conceptismo* as opposed to *culteranismo* are inculcated; *El Discreto* (1646), *a* delineation of the typical courtier; El *Oráculo manual y arte de prudencia* (1647); and *El Criticdn* (1651–53–57), an ingenious philosophical allegory of human existence.

GRACKLE, a word applied to certain birds of the family *Sturnidae* in the Old World and of the *Icteridae* in the New. The former include the mynas of India and adjacent countries, es-

pecially Gracula *religiosa,* which is some 10in. long and has a black iridescent plumage, a white patch on the wing and yellow wattles behind the eyes, the bill is orange, the legs yellow, and the bird, which inhabits southern India, is frugivorous. It can be taught to talk. Allied species occupy Ceylon, Burma and Malay.

The American grackles belong to the genera *Euphagus, Megaquiscalus* and *Quiscalus.* The best known are the rusty blackbird or rusty grackle, E. *carolinus,* found all over North America, and Q. *quiscula,* the purple grackle east of the Rocky mountains.

THE AMERICAN GRACKLE, COLOURED PURPLE AND BRONZE, WITH METALLIC TOUCHES OF GREEN AND BLUE

GRADO, an island of the province of Trieste, Italy, 4 mi. from Belvedere. Pop. (1936) 5,831 (town); 6,005 (commune). The inhabitants of Aquileia took shelter there in 452 and 568 and the patriarchate of Grado began in 557–569 and continued till 1451 when it passed to Venice. The cathedral mas rebuilt in 571–586.

GRADUAL, advancing or taking place by degrees or step by step; hence used of a slow progress or a gentle declivity or slope, opposed to steep or precipitous. As a substantive, "gradual" is used of a service book of the Roman Catholic Church containing certain chants, called "graduals," sung at the service of the Mass after the reading or singing of the Epistle. For the so-called Gradual Psalms, cxx.–cxxxiv., the "songs of degrees," LXX., ὠδαὶ τῶν ἀναβαθμῶν.

GRADUATE (Med. Lat. graduare, to admit to an academical degree, *gradus*), in Great Britain a verb now only used in the academical sense intransitively, *i.e.,* "to take or proceed to a university degree," and figuratively of acquiring knowledge of, or proficiency in, anything. The original transitive sense of "to confer or admit to a degree" is, however, still preserved in America, where the word is, moreover, not strictly confined to university degrees, but is used also of those successfully completing a course of study at any educational establishment. As a substantive, a "graduate" (Med. Lat. *graduatus*) is one who has taken a degree in a university. Those who have matriculated at a university, but not yet taken a degree, are known as "undergraduates." The word "student," used of undergraduates, e g., in Scottish universities, is never applied generally to those of the English and Irish universities. At Oxford the only "students" are the "senior students" (*i.e.,* fellows) and "junior students" (*i.e.,* undergraduates on the foundation, or "scholars") of Christ Church. The verb "to graduate" is also used of dividing anything into degrees or parts in accordance with a given scale. For the scientific application see GRADUATION below. It may also mean "to arrange in gradations" or "to adjust or apportion according to a given scale." Thus by "a graduated income-tax" is meant the system by which the percentage paid differs according to the amount of income on a pre-arranged scale.

GRADUATION. There are few advances or refinements in the exact sciences which have not depended considerably on corresponding refinement in linear or angular measurement.

Graduation, or "dividing," as it is usually called, is the art of dividing straight lines, circular arcs, or whole circumferences into any required number of equal parts. It is the most important and difficult part of the work of the mathematical instrument maker.

According to Shuckburgh, from the time of Hipparchus and Ptolemy to that of Copernicus in the beginning of the 16th century, few astronomical observations can be depended on to within less than 5 to 10 minutes of arc, those of Tycho Brahé (1546–1601) being reliable to within one minute. The errors of Hevelius's 6-foot sextant (middle 17th century) might amount to 15 or 20 seconds of arc, Flamsteed's sextant to 10 or 12 seconds, and Graham's 8-foot mural quadrant, used by Bradley from 1742, to 7 or 8 seconds.

There is still no such thing as a perfectly graduated circle in existence. A fair indication of the present state of progress towards this ideal may be found in the fact that it is possible to produce circles of 12 inches diameter divided into very many nearly equal parts by divisions none of which is out of its true position by more than two seconds of arc. Graduation may be considered under three heads, viz., original graduation, hand copying, and machine graduation performed by a dividing engine.

Original Graduation. — The original graduation of a straight line may he performed either by continual bisection or by stepping. In continual bisection the entire length of the line is first laid down. Then, as nearly as possible, half that distance is taken in the beam-compass and marked off by faint arcs from each end of the line. Should these marks coincide the exact middle of the line is obtained. If not, as will almost always be the case, the distance between the marks is carefully bisected by hand with the aid of a magnifying glass. The same process is again applied to the halves thus obtained, and so on in succession, till the desired divisions are reached. In stepping, the smallest division required is first taken as accurately as possible by spring dividers. and that distance is then laid off by successive steps from one end of the line. The division of circular arcs is essentially the same in principle as the graduation of straight lines.

The foundation of the Royal Observatory at Greenwich, and the increasing demand for more accurate determination of the positions of the heavenly bodies, induced great advances in the art of graduation In England, outstanding amongst those who made definite contributions to these advances from the late 17th to the early 19th century, are Abraham Sharp (1651–1742), Thomas Tompion (1639–1713), George Graham (1673–1751), Jonathan Sisson (c. 1690–1747), Jeremiah Sisson (c. 1715–*c.* 1780), John Bird (1709–1776), John Smeaton (1724–1792), Jesse Ramsden (1735–1800), John Troughton (c. 1747–*c.* 1790), Edward Troughton (1753–1835), Thomas Jones (c. 1780–*c.* 1840), and William Simms (1793–1860).

The first example in which the method of performing the graduation is described in detail is the 8-ft. mural circle graduated by George Graham for Greenwich Observatory in 1725. In this two concentric arcs of radii 96·85 and 95.8 in. respectively were first described by the beam-compass. On the inner of these the arc of 90° was to be divided into degrees and 12th parts of a degree, while the same on the outer was to be divided into 96 equal parts and these again into 16th parts. The reason for adopting the latter was that 96 and 16 being both powers of 2, the divisions could be obtained by continual bisection alone (which in Graham's opinion was the only accurate method), and would thus serve as a check upon the accuracy of the divisions of the inner arc. With the same distance on the beam-compass as was used to describe the inner arc, laid off from 0°, the point 60° was determined. With the points 0° and 60° as centres successively, and a distance on the beam-compass very nearly bisecting the arc 60°, two slight marks were made on the arc; the distance between these marks was divided by the hand aided by a lens, and this gave the point 30°. The chord of 60° laid off from the point 30° gave the point 90°, and the quadrant was now divided into three equal parts. Each of these parts was similarly bisected, and the resulting divisions again trisected, giving 18 parts of 5° each. Each of these quinquesected gave degrees, the 12th parts of which were arrived at by bisecting and trisecting as before. The outer arc was divided by continual bisection, and a table was constructed by which readings of the one could be convertedinto those of the other

After the dots indicating the required divisions were obtained small arcs were drawn through them by the beam-compass having its fixed point somewhere on the line which was tangent to the quadrantal arc at the point where a division was to be marked.

The next important example of graduation was performed by Bird in 1767 His quadrant, which was also of 8-ft. radius, was divided into degrees and 12th parts of a degree. Bird computed the chords of certain arcs, so that when taken from an accurate scale of equal parts (previously constructed by him, employing continual bisection), and marked on the quadrant in their proper order, he obtained the point $85° 20' = 1{,}024 \times 5'$. As 1,024 is equal to the tenth power of 2, he was able to obtain 5′ by continual bisection of this arc.

The Duc de Chaulnes published in 1768 a method of dividing in which greater accuracy was obtainable by replacing the points of a pair of beam compasses by two micrometer microscopes. These microscopes, having cross wires in the foci of their eye-glasses were fixed to a frame, and several pieces of brass with divisions on them could be temporarily secured by wax as required, to the circle to be divided; these were used as trial divisions. The microscopes were first fixed as nearly as possible at opposite ends of a diameter of the circle to be divided, and a trial division placed under each, so that the intersection of the cross wires in each case was coincident with the middle of the division when viewed through the microscope. By repeatedly turning the circle half round, and by slight adjustment of the position of one microscope and one trial division, positions were obtained which were exactly diametrically opposite. A cutting point was then placed over one division and a fixed microscope over the other, so that when any division was brought to bisect the cross wires in the microscope, the cutting point made one diametrically opposite. By a process of trial and adjustment with bisections and trisections, the circle was divided into spaces of 10°, then by obtaining the arc of 9°, by trial on the arc of 180°, the circle could be divided into spaces of 1°, or by similar means into smaller spaces.

In the first stages of an original graduation, Ramsden used beam compasses as employed by Bird. Micrometer microscopes were then used as in the method of the Duc de Chaulnes to measure the errors in the positions of the dots. Corrections were made by pressing the dots backwards or forwards by hand, with a fine conical point. This method, known as "coaxing," is capable of a great degree of accuracy, but is extremely tedious.

Ramsden's original graduation of the wheel of his dividing engine (described later) was as follows:—It was divided with the greatest exactness of which he was capable, first into 5 parts, and each of these into 3; these parts were then bisected 4 times. Supposing the whole circumference of the wheel to contain 2,160 teeth, this gave successively spaces corresponding to 432, 144, 72, 36, 18 and 9 teeth. To check the accuracy of these, he divided another circle (one-tenth of an inch within the first one), by continual bisections, giving 1,080, 540, 270, 135, $67\frac{1}{2}$ and $33\frac{3}{4}$. Not finding any sensible differences as observed by means of a fixed radial thin silver wire and magnifying lens, he used the former set of divisions for reference in ratching the edge of the wheel.

The method of original graduation adopted by Edward Troughton is fully described in the Philosophical Transactions for 1809, as employed by himself to divide a meridian circle of 4 ft. diameter, made for Stephen Groombridge, and now preserved in the Science Museum. The circle was first accurately turned both on its face and its inner and outer edges. A roller was next provided, of such diameter that it revolved 16 times on its own axis while made to roll once round the outer edge of the circle. The roller, after having been properly adjusted as to size, was divided as accurately as possible into 16 equal parts by radial lines near the edge. While the frame carrying the roller was moved once round along the circle, the points of coincidence of the roller-divisions with the circle were accurately observed by two microscopes attached to the frame, one of which commanded the ring on the circle near its edge, which was to receive the divisions, and the other viewed the roller-divisions. The points of contact thus ascertained were marked with faint dots, and the circle thereby divided into 256 very nearly equal parts.

From observations by means of two microscopes a table of errors in the positions of these dots was prepared. The last part of Troughton's process was to employ them in cutting the final divisions of the circle, which were to be spaces of 5′ each. The mean interval between any two dots is $360°/256 = 5' \times 16\frac{7}{8}$, and in the final division, this interval must be divided into $16\frac{7}{8}$ parts. This was accomplished by means of an instrument called a sub-dividing sector.

Troughton estimated (1809 paper) that 13 days of eight hours each would be well employed in dividing a 4-ft. circle by his own method, and 52 days by Bird's method; whereas the method by adjustment supposing every dot to be tried, and that two-thirds of them wanted adjusting, would require approximately 150 days. .

Copying.—In copying a linear scale the pattern and scale to be divided are first fixed side by side, with their upper faces in the same plane. The dividing square, resembling an ordinary joiner's square, is then laid across both, and the point of the dividing knife dropped into the division of the pattern. The square is now moved up close to the point of the knife; and, while it is held firmly in this position by the left hand, the corresponding division on the work is made by drawing the knife along the edge of the square with the right hand.

In copying circles use is made of the dividing plate. This is a circular plate of brass, three feet or more in diameter, carefully graduated near its outer edge. The work to be graduated is centred and clamped to the dividing plate, and by setting a radial straight-edge to any required division on the dividing plate, the corresponding division on the work is cut by drawing the dividing knife along the straight-edge.

Machine Graduation.—Henry Hindley of York, about 1739, constructed a small engine for cutting the teeth in clock wheels, and for dividing instruments. In this he used the roller method for the original division of the dividing plate, which was actuated by an endless screw.

In 1766 Jesse Ramsden had made his first dividing engine, with a dividing plate 30 inches in diameter. Though this engine gave more accurate results than the ordinary dividing plate method, and was good enough for dividing the circle of the common surveying instruments, it was not sufficiently accurate for nautical instruments used in the determination of position. In 1775 Ramsden had completed his second and very much better engine. A sextant divided by it was examined by Bird, who reported favourably on it. For his invention Ramsden received £615 from the Commissioners of Longitude on condition that he would divide sextants and octants for the trade at the rate of 6s. per sextant and 3s. per octant, also that he should instruct a certain number of persons (not exceeding ten) in the method of making and using the engine, during the period 28th October 1775 to 28th October 1777, the engine to become the property of the Commissioners.

Jesse Ramsden's engine consists of a horizontal wheel or plate 45 inches in diameter, which turns on a vertical axis; its outer edge is ratched or cut into 2,160 teeth, into which an endless screw gears. The downward stroke of a treadle turns the screw through any portion of a revolution as fixed by the setting of suitable mechanism. By means of a free wheel on the worm axis, the upward stroke of the treadle leaves the worm stationary. The circle to be divided is centred and fixed securely to the horizontal plate of the engine, and after each downward stroke of the treadle a division is cut by hand, the cutting point being carried in a frame (invented by Hindley) which allows only a radial to-and-fro motion of the point. One forward revolution of the screw advances the wheel through 10 minutes of arc. A brass plate on the screw arbor is divided into 60 parts, so that one division of this corresponds to 10 seconds of arc on the wheel. In cutting the teeth on the wheel, the first light marks were made for the whole circle by a series of 240 operations, in each of which the space corresponding to 9 teeth was dealt with by 9 turns of the endless screw, the divided circle being referred to at the commencement of each operation so as to eliminate any slight errors which may have occurred during the previous operation. The whole series of operations was repeated three times round, to make the impression of the screw deeper. The wheel was then ratched round continuously about 300 times, until the teeth were finished. As the screw in ratching had continually hold of several teeth at the same time, and these continually changing, the inequalities of the teeth soon corrected themselves, and the teeth were reduced to what Ramsden described as "a perfect equality."

This engine was used continuously by Ramsden until his death in 1800. Since that time it has been in the possession of several dividers, and is now in the U.S National Museum at Washington, together with his original machine by which the endless screw of the dividing engine was cut. Ramsden also constructed a linear

dividing engine on essentially the same principle, a straight rack taking the place of the notched rim of the circular plate.

In 1778 John Troughton completed an engine which had occupied him three years. It was in general construction like that of Ramsden, but according to Edward Troughton it was thought to be superior in point of accuracy. Writing in 1830, he states: "The excellent engine of my late brother being fully four feet in diameter gave the operator, when at work near the centre, a position so painful, that it had done no good to either his health or my own, and has materially injured that of a worthy young man then my assistant; it was evident that, by making one of smaller dimensions, this evil would in a great measure be removed, and I foresaw that by employing my own method of original dividing from which to rack the plate, a considerable reduction might be effected without any sacrifice to accuracy. I also perceived, that by contriving the parts with more simplicity than Ramsden had done, I could get through the work at less than two-thirds of the labour and expense. Such were my motives for making an engine and the work was accomplished in the year 1793." The description of the engine was published only in 1830. The engine was driven by a treadle and the divisions were cut by hand, as in Ramsden's engine. The circle is 34 inches in diameter, the worm has 20 threads to the inch, and the edge of the plate is ratched into 2,160 teeth.

In Troughton's dividing engine and those of Ramsden's construction the operator could cut about 24 divisions per minute and could continue at this rate for hours, allowing for slight interruptions. In one minute as many as 30 divisions could be cut, but this rate could not be maintained.

In 1826 William Simms went into partnership with Troughton, who retired from business in 1831 and died in 1835, In 1843 Simms had completed his own dividing engine, which he described before the Royal Astronomical Society in 1843. The plate was 46 inches in diameter and divided with extreme care on a ring of silver into 4,320 divisions, adopting Troughton's method with some modifications. A single cutter, mounted in the endless screw frame, was used for ratching the edge of the plate, and as each of the 4,320 divisions in order was brought to coincide with the wires of a powerful microscope, the cutter was entered, and three circulations of the engine plate completed the work. Mr. Simms, in his paper, states: — "I was not without hope that the teeth on the edge would by this means be cut as truly as the original divisions themselves, and this expectation has, I believe, been fully realised."

A new, important feature in this engine was the mechanism by which the engine became self-acting. When first used, it was driven by means of a descending weight in an open court adjoining the room in which the engine was placed; later on, it was driven from an overhead shaft by a belt in the usual way.

The original Troughton engine of 1793 with self-acting mechanism added by William Simms, appeared probably not long after Simms' larger engine had been made. The wooden stand, the worm mechanism, and the large circle were made by Troughton in 1793. The casting seen on the left, with its wheelwork, the tracelet frame, and cam mechanism for moving the cutting knife up and down, and for regulating the length of cut, are due to Simms. This engine was in use almost continuously from 1793 until recent years, though it has been superseded for more accurate division by later and better engines constructed by Troughton and Simms. During the latter part of its existence it has not been used for graduating instruments reading to a greater accuracy than one minute of arc.

The re-graduation by hand of the two circles 30 and 24 inches in diameter of the Westbury altitude and azimuth circle made by Edward Troughton, which was performed by Simms in 1823, occupied nearly twelve weeks of six eight-hour days a week. By means of his automatic dividing engine (1843), after some five hours necessary for setting up the circles on the engine, the actual graduation would have been performed in about five hours.

Modern Dividing Engines. — In fundamental design and principle of action the automatic dividing engine constructed by George W. Watts in 1905 resembles the engine of William Simms There are two sets of teeth on the edge of the wheel, one having 4,320 teeth and the other 2,160.

After the circle to be graduated has been exactly centred and clamped upon the revolving wheel, the action of the engine is entirely automatic. The main frame, in which the revolving table moves, is of cast iron; the revolving table and its spindle are of phosphor bronze, and weigh about 5 cwt., the whole engine weighing about 2 tons. The original graduation into 4,320 equal divisions, which occupied five months, was made on three rings of silver inlaid on the top face near its outer edge. The graduations, successively made on circular lines cut on these silver rings, were re-cut from tables of errors many times, until the maximum error of any one division did not exceed 0·6 of a second. From the final graduations the teeth on the edge of the revolving table were cut one by one. To avoid undue stress of the metal, and to maintain the keen edge of the V cutter, several cuts were taken, and the accuracy was checked by taking the mean of seven micrometer readings before each tooth was cut The whole process of cutting the teeth occupied five weeks, care being taken to keep the temperature constant and uniform throughout the specially constructed room in which the operations were carried out. The machine is capable of graduating circles from 3 inches to 4 ft. 6 in. in diameter.

Dividing engines of different designs for both circular and linear graduation are manufactured in considerable numbers at Geneva by the Société Genevoise d'Instruments de Physique. The machines designed and made for laboratory use can engrave lines either *fine* grade, 0·05 to 0·15 mm. (0·002″ to 0·006″) in thickness, or microscopic grade, 0·002 to 0·005 mm. (0·0001″ to 0·0006″) in thickness to a guaranteed accuracy of 0.002 mm. (0·0001″) for linear machines and ±1 second of arc for circular machines. The largest and most accurate of the circular dividing engines are 1 metre in diameter and the guaranteed accuracy is ±1 second of arc. An automatic correcting device is provided to compensate the slight errors existing in the spacing of the teeth on the periphery of the dividing wheel. In a larger machine, 2 metres in diameter, specially designed for use in gun factories, the accuracy is ±15 seconds.

In the automatic machines for workshop use, lines may be ruled either of medium or coarse grade, 0·1 to 0·2 mm. (0·004″ to 0·008″) in thickness to a guaranteed accuracy of ±0·010 mm. (0·0004″) for linear machines, and ±15 to ±30 seconds of arc for circular machines, at a rate of 80 to 200 lines per minute

The high precision linear dividing engines are provided with a temperature compensation device which produces the same effect as if the pitch of the leading screw were varied by the small amount necessary to produce the correct compensation.

GRADUS, or GRADUS AD PARNASSUM (a step to Parnassus), a Latin (or Greek) dictionary, in which the quantities of the vowels of the words are marked. Synonyms, epithets and poetical expressions and extracts are also included under the more important headings, the whole being intended as an aid for students in Greek and Latin verse composition. The first Latin gradus was compiled in 1702 by the Jesuit Paul Aler (1656–1727), a famous schoolmaster. There is a Latin gradus by C. D. Yonge (1850); English-Latin by A. C. Ainger and H. G. Wintle (1890); Greek by J. Erasse (1828) and E. Maltby (1815), bishop of Durham.

GRAECO-PERSIAN WARS, 546–466 B.C. The great Assyrian kingdom which had ruled and terrorized Asia for centuries came to an end with the fall of Nineveh in 612 B.C. Of it the Greeks knew little or nothing. Only the Greeks of Cyprus had come into contact with it, and that only on one brief occasion. It had never ruled within the peninsula of Asia Minor.

For half a century after the fall of Nineveh the old dominions of Assyria were divided between two Powers, the Median and Babylonian kingdoms. The Median monarchy conceived ambitions beyond the Taurus, so that a war arose between it and Lydia, which was brought to a practical, though not formal, conclusion by that strange incident on the Walys in 585, when the armies, prepared for battle, withdrew from the unfought fight in consequence of an eclipse of the sun. Freed from danger from the east, Lydia turned her attention westwards, and in the next 40 years brought into subjection those Greek cities of the Asiatic coast of the Aegean on whose liberties the Lydian kings had been making desultory attacks for more than a century past.

Rise of **Cyrus.**—The independent kingdom of Media had lasted little more than half a century when there came a change of dynasty within it, a change which seems, judging from the contemporary records of Nabonidus, king of Babylon, to have been little more than a domestic matter. The history of the next two centuries makes it almost certain that the Persians in the southwest of modern Persia were either a Median tribe or of a race near akin to the Medes. In 532 Cyrus the Persian king of Anshan, a part of Elam, revolted and set himself up as ruler of the Median kingdom. Lydia and Babylonia got alarmed at his vigour and success, and concluded an alliance which aimed at checking, or even suppressing, Cyrus. Of that alliance he got wind; so about 546 he made an attack on Croesus of Lydia which ended in the capture of Sardes, the fall of the Lydian kingdom, and the passing of the continental Greeks of the Asiatic coast under Persian dominion.

The fall of Lydia made a great impression on the Greek world, for it had loomed large as an oriental empire in contrast to the small and comparatively poor States of Greece.

Of the relations between the Persians and the Greeks during the later part of the reign of Cyrus and during the reign of his successor Cambyses but little is known. The islands of the eastern Aegean, with the exception of Samos, seem to have fallen early under Persian rule.

A certain Polycrates ruled at Samos as tyrant for some years, and used the wealth he acquired in trade in carrying out some great architectural and engineering works. But about 424 he fell into the hands of the Persians and was put to death. In 516 a Persian force captured the island. Thus Persian rule now extended to a line drawn north and south through the middle of the Aegean. Cambyses had died in 522, and had been succeeded by a pretender who was slain by certain Persian nobles, of whom the leader, Darius succeeded to the throne.

Reign of **Darius.**—Everything that is known of him suggests that Darius was one of the greatest men that the ancient world produced, at least capable—perhaps great—as a commander in war, and in peace a ruler and organizer such as the world was never to see till the days of Augustus. The system of government which he established is all the more remarkable because it is in strong contrast with the crude and often barbarous methods of government which races ruling before him in the East had applied to the peoples which they had brought into subjection; for it was a system which recognized the wisdom, if not the justice, of respecting the rights of subjects of various races, and of allowing them as much local freedom as was consistent with the calls which the interests of the empire as a whole made upon them. The Greek cities were left with considerable local autonomy under tyrants of their own race, who were indeed agents of Persia, but do not seem to have been harsh in their rule. Tribute had to be paid; but not even the Greeks themselves ever alleged that it was a crushing burden. They had also in time of war to provide military and naval contingents for the Persian forces. But, however lightly the hand of Persia lay upon them, the Greeks of Asia, being Greeks, resented any form of subjection which circumscribed their political freedom.

Scythian Expedition.—Either before or after Darius' accession the Persians had acquired two *têtes-du-pont* in Europe, the Thracian Chersonese (Gallipoli peninsula), and Byzantium. This may have signified nothing more than a desire to control the narrow passages of the Hellespont and Bosporus. But somewhere about 512 Darius took a step which has seemed to some writers, ancient and modern, to have signified a deliberate policy of extending the empire into Europe. This is what is known as the Scythian expedition. For this incident Herodotus is the chief authority among ancient writers, though Ctesias and Strabo contribute matter of importance. The outstanding element in the ancient tradition is that the expedition was directed against the Scyths. Darius may have wished to teach that people the lesson that they must keep their hands off Asia and Asiatic kingdoms. It was much easier to attack the Scyths through Thrace than through the twofold barrier of the Armenian mountains and the Caucasus.

Misled, it would seem, by exaggerated reports of some disaster having overtaken the Persians in Scythia, the Greek cities of the Propontis region, which had submitted to Darius on his march northwards, revolted; so, when Darius himself returned to Asia, he left Megabazus in Europe to deal with those towns. Herodotus represents him as having subdued all Thrace, a statement inconsistent with the story of some years later; nor is the story of Macedonia having given the earth and water of submission at this time quite free from suspicion. The only element in the story of this aftermath of the Scythian expedition which lends colouring to the Greek conception of its having been preparatory to a future advance into Europe, that is to say, against Greece, is the tale of what happened at Myrcinus. That leads to the next act in the Perso-Greek tragedy—the Ionian revolt.

A certain Histiaeus, tyrant of Miletus, had been rewarded for his services in the Scythian expedition by the grant of Myrcinus, a town which commanded the narrow route along the north Aegean coast which was practically the only line of communication from the Hellespont region westwards. When he proceeded to fortify this place the suspicions of Megabazus were aroused. Representations made by him to Darius caused the latter to recall Histiaeus and to take him with him to Susa, where he would be out of mischief. Histiaeus did not like detention at Susa, and was anxious to get back to his own people. But, before he took any measures to bring about his return, certain other events of great significance in the relations between Persia and Greece took place.

Political Movements at Athens.—In 510 the Athenians, aided by the Spartans, had expelled the tyrant Hippias, who had alienated the sympathies of Sparta by making an alliance with its sworn foe Argos. The expulsion of the tyrant Hippias was followed by a struggle at Athens between the oligarchs, or, more probably, the conservative[1] element and the extreme democrats, in

[1]The term "conservative" in relation to Athenian politics will be used hereafter to denominate the moderate democrats at Athens together with the oligarchs, who voted with the moderates because the oligarchical vote was too small to carry any policy.

which Sparta intervened in a half-hearted and ineffective way on behalf of the former, a half-heartedness due to the fact that a strong party at Sparta was opposed to incurring obligations abroad which might keep Spartan troops away from home; and events at Athens had shown that an oligarchy could only be maintained by something like permanent military support from Sparta. But to the democrats it seemed as if they had to face political foes who were backed by the strongest military power in Greece, against which no alliance with any other Greek State would be of effective value. Thus they turned to Persia for support, having no suspicion that Persia had any designs on the Greeks in Europe. An embassy was sent to Artaphernes, the satrap of Sardis, asking for an alliance. He demanded earth and water from the envoys, which they gave, evidently under the impression that it was part of the contract of alliance. Artaphernes did not regard it in that light; but assumed that the Athenians had accepted subjection to the Great King. Not till the time of Marathon were the Athenians undeceived on this point. The date of this embassy is not known; but it must have been about 507. Matters became complicated a year or two later when Artaphernes took up the cause of the exiled Hippias, and demanded of the Athenians that they should receive him back as tyrant. The Athenian democrats who had expelled him had to swallow that bitter pill as the price of the continuance of the supposed alliance, for politics at Athens were finely balanced.

The **Ionian** Revolt.— Such was the position when Histiaeus at Susa found means of intervening in the affairs of the Greek cities of the Asiatic coast. His hope was that if Persia had trouble in those parts he might be sent down to settle it. It is evident, however, from incidental references in Herodotus' account of the preliminaries to the Ionian revolt that, before Histiaeus moved, a conspiracy had been formed. The prime mover in the matter was a certain Aristagoras, a cousin and son-in-law of Histiaeus, and his successor in the tyranny of Miletus. Certain exiles from Naxos applied to him for help against political opponents. The main difficulty of the conspirators would be the question of getting together at the outset of the revolt such a force as could cope successfully with the Persian fleet. To the astute Aristagoras the affair of Naxos afforded such an opportunity, for, if Artaphernes could be induced to take up the matter, he would almost certainly mobilize an Ionian Greek fleet. Artaphernes was quite ready to add Naxos to the empire of the Great King, and did mobilize the Greek fleet, whereon someone — almost certainly Aristagoras — warned the Naxians of what was impending and they, being prepared, beat off the attack, Aristagoras came back with the fleet, apparently a disgraced man, but, in fact, a man who had got what he wanted. Just about that time, says Herodotus, he received from Histiaeus at Susa a message tattooed on the head of a slave urging revolt. The first act of Aristagoras and the conspirators was to seize certain tyrants who were on the fleet and to depose the rest. This must have taken place in the autumn of 499. Then Aristagoras went off to Greece to get help. Sparta refused assistance; but at Athens, where the conservatives were for the moment controlling affairs, he was offered help. The story of the revolt, as told by Herodotus, shows that it was a brave venture bravely carried out; it took all the power of Persia six years to suppress the effort.

In the spring of 498 twenty ships from Athens and five from Eretria in Euboea arrived on the Asiatic coast. The hoplites which they brought over seem to have taken part in a march on Sardes, which was partly taken. The danger to Sardes, so Plutarch says, forced Artaphernes to raise the siege of Miletus and come to the rescue of his capital. The Greeks had to fall back to the sea, and were, according to Herodotus, badly defeated near Ephesus. Subsequent events suggest that he exaggerated the disaster. Be that as it may, the Athenian fleet sailed home shortly afterwards, recalled, it may be presumed, by the democrats who had once more got control of affairs. So the year closed for the rebels. They opened the next year 497 by sending their fleet to Byzantium and winning it and the cities of the Propontis over to their side. The absence of the Persian fleet from Herodotus' story of the revolt up to this time is perhaps to be explained by a story preserved by Plutarch to the effect that the Ionians had defeated that fleet in a battle off the Pamphylian coast. This had probably taken place in the summer or autumn of 498, and it would account for the unimpeded action of the Ionian fleet in 497.

The news of the revolt of Ionia had stirred the Cypriote Greeks to action. The Greeks proceeded to attack Amathus, the stronghold of the Phoenician minority in the island. Onesilus, the leader of the revolt, sent urgent messages to the Ionians for help. Before coming to the aid of the Cypriote Greeks the Ionian fleet brought about the revolt of Caria, a formidable addition to the resources of the rebels. The Hellespontine and Carian ventures must have taken some time, so that it is not possible to put the arrival of the Ionian fleet at Cyprus earlier than the late summer of 497. In a sense it arrived too late, for a Phoenician fleet had shipped a Persian force over to the island, and, though the fleet gained another naval victory over the Phoenicians, treachery in the Greek land force led to disaster, and by the beginning of 496 the island was again in the hands of the Persians.

After the recapture of Cyprus by the Persians the chronology of the revolt, always shadowy, vanishes for some years into thin air. One thing seems certain — that the spread of the revolt in 497 must have called for great efforts on the part of Persia. It was not till 496 that Persia was ready. In the earlier half of that year Daurises seems to have subdued the Asiatic side of the Propontis. The Greeks on the European side and the Thracians behind them seem to have thrown off whatever allegiance they had had to Persia at the time when north-west Asia Minor revolted. Caria, with a population which had apparently for some centuries past made a living by fighting the battles of others, was a much more serious problem for Persia. Three great battles took place there, the first on the Marsyas river, in which the Carians were defeated; the second shortly afterwards at Labraunda, in which they were again defeated, and a third near Pedasus, in which they inflicted a terrible defeat on the Persians. These three battles took place, it would seem, in the campaigning season of 496. It was probably after the two defeats in Caria that Aristagoras proposed and carried out the plan of establishing, in case of the failure of the revolt, a refuge for the surviving rebels at that Myrcinus on the Strymon which had been granted to Histiaeus. But there he and all his company perished in battle with the Thracians.

Just about the time of Aristagoras' death Histiaeus arrived at Sardes. His own plan had so far worked excellently, in that he had won his escape from Susa by persuading Darius to let him go down to the coast and settle the revolt; but on his arrival there he found that nobody trusted him. At last the Mytilenians gave him eight ships with which he set himself up as a pirate in the Propontis in the rebel interests, making things unpleasant for the merchant ships of any city which showed a tendency to weaken in its enthusiasm for the continuation of the revolt. These doings of Histiaeus form probably the sum of all that Herodotus has to tell of the events of the revolt in 495. In 494 the Persians began to besiege Miletus as being the true centre of the revolt. Nothing further is told of the fate of Caria, save that after the fall of Miletus some of its cities submitted, while some were subdued by the Persians. To aid in the attack on Miletus the Persians brought up a large fleet composed of Phoenician, Cilician, Cypriote and Egyptian contingent?, numbering in all 600 vessels. Against this the rebels put to sea with 353 ships, Miletus, Chios, Lesbos and Samos furnishing the largest contingents. The fight took place at Ladé off Miletus. The story of it as told by Herodotus is much distorted by anti-Ionian bias; but the battle ended in a great defeat of the Greeks. This defeat was practically the end of the revolt. Miletus fell late in 494. Histiaeus was finally caught and executed by Artaphernes. After that the Persians spent part of 493 in extinguishing the dying embers of the rising.

Even from Herodotus' account it is clear that the revolt was one of the most glorious incidents in the story of the Greek race. It took the Persians six years to suppress it, and taxed severely the resources of the greatest empire of the time.

Very little is known of the history of Athens during these years; but what is known suggests that a lively and varying struggle for supremacy was going on between the ultra-democrats and

the conservatives. The end of the revolt in 493 brought it indirectly to a climax. Phrynichus, in his play, *The Capture of Miletus,* attacked the democrats who five years before had withdrawn Athenian aid from the rebels, and was prosecuted and fined for so doing. Also Miltiades returned a fugitive from his tyranny in the Thracian Chersonese and was prosecuted by the democrats for tyranny, but acquitted. This acquittal was a conservative victory of such a decisive character that that party seems under the leadership of Miltiades to have controlled Athenian affairs up to the time of Marathon three years later.

Mardonius in **Thrace.**—After sweeping up the mess in Asia in 493 the Persians proceeded in the next year to bring Thrace and Macedonia once more under their control; but the expedition of 492 was not confined to these limited aims. It was commanded by Mardonius who had been appointed to supreme authority in the control of this extreme western part of the empire. He seems also to have received at Susa orders for the settlement of affairs in the Asiatic Greek cities, a settlement showing a policy which aimed at the abolition of the recent discontents. But when it comes to the expedition into Europe it is clear that its object was larger than the mere re-establishment of Persian authority in Thrace and Macedonia. Herodotus says that it was aimed at Athens and Eretria in punishment for the aid they had sent to the Ionian rebels. That it was intended to advance beyond Macedonia is shown by the fact that the disaster which stopped its further progress took place after Macedonia had been pacified. That it was an expedition of great magnitude and importance is shown by the employment of the fleet to co-operate with the land army. The expedition of 492 seems to have aimed at a large, perhaps complete, conquest of Greece. It was brought to an end by a great disaster to the fleet in a storm off Mt. Athos.

But Darius did not forget Athens and Eretria. They at least must be taught the lesson that it did not pay to interfere with Persian rule on the east side of the Aegean. The year 491 passed without movement on the part of Persia; but in 490 came the famous Marathonian expedition.

The Marathon Expedition.— The story of Marathon soon became a legend, a legend in which the truth was both exaggerated and suppressed. The most important suppression was the successful elimination from the tale of the part which the Athenian ultra-democrats had played in the matter. On the side of exaggeration the magnitude of the Persian numbers was multiplied many times. As far as numbers are concerned the only trustworthy element in the legend is that the army was transported across the Aegean in 600 ships. That may be an overstatement; but it is not likely to be an understatement. It would imply that the land force cannot have been more than 60,000, and possibly not more than 40,000.

Since the return of Miltiades in 493 the Athenian ultra-democrats had been viewing with apprehension the possibility of an oligarchical reaction. Now, if ever, was that alliance [sic] with Persia, which had been made with a view to provide against such a contingency, to bear fruit. Therefore they regarded the expedition as in their interest, and were quite ready to co-operate with it. Even Herodotus cannot disguise the fact, though he tries to tone it down in the interests of the democracy of 30 or 40 years later. Pindar and Aristophanes, however. backed by the evidence of the 20 years preceding Marathon, make the situation clear.

In the course of its passage across the Aegean the expedition attacked Naxos and did damage there; but the inhabitants escaped to the hills. Delos was treated with respect, for the Persians did not wish to arouse the whole Greek world against them. Then, after visiting some other islands, they came to Eretria. In answer to an appeal for help the Athenians ordered the 4,000 Athenian κληροῦχοι (allotment holders) who had been settled in Chalcis after its capture in 506 to go to the assistance of Eretria. This they did not do, urging, so Herodotus relates, certain excuses which are not very credible. The siege of Eretria only lasted six days. The resistance was brave; but then the Persians got into the town—through treachery, so Herodotus says. It was destroyed, and the inhabitants were carried away to be eventually settled at Ardericca near the mouth of the Euphrates. After capturing the place the Persians took ship across the Euripus and landed on the plain of Marathon 24m. north-east of Athens.

There can be little doubt that the strategy of the Persians in the brief campaign which ensued in Attica was dictated by the assumption that they would receive considerable aid from their ultra-democratic sympathizers. The country party, the moderate democrats, from which the hoplite force was mainly drawn, seem to have been aware that the ultra-democrats were prepared to support the invaders. The latter were probably hampered by the presence of the hoplite force in Athens, and the suggestion of the landing at Marathon, at the extreme end of Attica, may have come from them. When the news of the landing reached Athens a council of war was held. A message had already been sent to Sparta for assistance, a natural measure on the part of those conservatives who had looked for, and to a certain extent obtained aid from Sparta in the internal political struggles of the last 20 years.

The council of war was composed of the polemarch and the ten generals, the commanders of the regiments of the ten tribes. Herodotus reads into the Athenian army organization of 490 that of the time at which he wrote, some 30 or 40 years later. The application in 487 of the lot to the election of archons rendered it thenceforth impossible to entrust the supreme military command to the polemarch; and thereafter the direction of military and naval affairs passed to the board of ten generals, and the command on active service to one or more appointed for the expedition or campaign. But at the time of Marathon the polemarch still had the supreme command in battle, though the strategy of a campaign was decided by a council of war in which the generals had each an equal vote with the polemarch. It is evident from the story that the council was at first very nervous about leaving Athens for Marathon. But this nervousness seems to have vanished; and the army marched out. Moreover, no movement of the ultra-democrats took place, though their leaders, the Alcmaeonid family, did not renounce their connection with Persia.

Battle of Marathon.— Miltiades was not commander-in-chief of the Athenian forces, though the council of war adopted his advice and design. He may have advised the march of the Athenians from Athens to Marathon. He was almost certainly the conceiver of the strategy they adopted when they got there. The council of war decided that it was safe for the hoplite force to leave Athens for Marathon, and thither it went. The Persians, who did not as yet know the change of feeling among their quondam friends at Athens, regarded the Athenians as having fallen into the trap set for them—as having left Athens exposed to a surprise attack which would be supported by sympathizers within the city. It may be assumed that Miltiades' idea was that, as the Persian army had landed at Marathon, it could not, if the Athenians were there, either re-embark the army without exposing a covering force to attack and possible destruction, or advance on Athens without fighting its way through one or other of the narrow passages which led from the plain to Athens. That is why, in accordance with his advice, the Athenian army remained inactive at Marathon until the Persians developed one of these two designs. On arriving at Marathon the Athenians took up a position at the Heracleum, a sanctuary and precinct the remains of which have been discovered high up the valley now called the valley of Vrana, but called in old times the Aulon or Funnel. Here they were amid rugged hills on the actual upper road to Athens, and within striking distance—about two miles—of any force which either tried to cover an embarkment or attempted to use the lower road. Either here or at Athens 1,000 Plataeans had joined them, assistance sent in gratitude for the protection which Athens had given to Plataea against Thebes for some 29 years past. Then ensued some days of inactivity, the Athenians waiting for the Persians to move, and for the arrival of the promised Spartan assistance, the Persians for a signal that their partisans in Athens were ready. But the Persians moved before the signal came, anxious to decide the matter before the Spartans arrived. The Persian plan was to re-embark a part of their army under the protection of a covering force, and, while the latter held the Athenians at Marathon, to land at Phalerum and make a dash on Athens. So soon as the design developed its general nature must have become clear to the Athenian command;

also it was quite evident that the Athenian army must be back at Athens before the Persians landed at Phalerum.

That being so, the Athenians attacked the Persian covering force without delay. The remains of the mound which was raised over the Athenian dead after the battle show that the covering force was drawn up between the lower end of the Aulon and the sea with its back to the latter. Down the Aulon the Athenians advanced and took up battle formation at the mouth of the valley, probably about three quarters of a mile from the Persian front. For the actual tactics in the battle the polemarch Callimachus, who took the unusual step of strengthening both wings and. weakening the centre, with the idea, actually realized in the course of the battle, that the enemy's centre would force back the Athenian centre, follow it up, and so expose both its flanks to attack by the troops massed on the Athenian wings.

As has been said, the battle developed as Callimachus had foreseen. The enemy drove in the Athenian centre with their own centre which, advancing in pursuit, was defeated and apparently wiped out by the Athenian wings. The rest of the army fled to the ships, on which, after a struggle, most of them managed to escape. That the battle was not by any means a walk-over for the Athenians is clear from their own account of it. Later tradition represented the numbers of the Athenians as 10,000, which was probably the truth. The number of the Persians was exaggerated at discretion. The Persian losses are said to have amounted to 6,400, a loss which must have fallen mainly on the centre, and perhaps included nearly the whole of it. If this number be accepted, and be taken as about one-third of the Persian troops in the battle, then their total number was about 20,000.

From Marathon the Athenians marched with all speed to Athens in order to anticipate the arrival of the Persian fleet and the rest of the Persian army at Phalerum. The latter did not attempt a landing. The rapid movements of the Athenian army had rendered their plan hopeless, and so they sailed back to Asia. The expected signal came late — probably after the battle was already engaged. After the Athenian army arrived in Athens the promised force from Sparta, 2,000 strong, arrived at the city. The battle made an enormous, indeed an exaggerated, impression on the Greek mind. This great Persia, which to the Greek stood for all that was great in the contemporary world, had been defeated in battle by a Greek State which was at the time hardly a first-class Power in contemporary Greece. The Athenian State had suddenly emerged from a position of second-rate obscurity into a blaze of reputation. Exaggerated or not, Marathon was a great victory, and in one sense epoch-making in the history of warfare. It demonstrated the superiority of the Greek hoplite over any form of soldiery that Persia could put into the field. Nevertheless, the glory of Marathon nearly proved the undoing of Greece, in that it made the Greek world incredulous as to the reality and the extent of the danger which threatened it from Persia ten years later, so that it was caught only half prepared to meet it.

The Ten Years After Marathon.--Of the history of Greece in the decade following Marathon very little is known, and of that little less still has a bearing on the relations between the Greek and the Persian. Aegina, jealous of the growth of Athenian rivalry in trade, renews a war with Athens which the events of 490 had interrupted. Miltiades comes to political ruin the year after Marathon; and a miscellaneous list of prominent Athenian politicians are ostracized in the years which follow. The legislation of 487, to which reference has been made already, brings about a change in the Athenian military and naval organization. Then comes the great increase of the Athenian fleet — of which more later. That Darius intended to take vengeance for Marathon is undoubtedly the case. He lost no time in beginning preparations with that end in view. Their magnitude prolonged them, and Greece was saved by a revolt in Egypt which broke out in 486. It was not suppressed till 484, and Darius had died the previous year.

During these years there had been coming to the front in the ultra-democratic party a new leader not of the Alcmaeonid family. Themistocles had been archon in 493; but his name does not come into prominence until the second half of this decade, when he comes to the front as the advocate of the increase of the Athenian fleet. The silver mines at Laurium were bringing in a much larger income than aforetime to the State, an income which Themistocles proposed to use in the building of a great fleet instead of distributing it in doles among the citizens.

There were political circumstances which were probably the real efficient cause of the support given by democracy to his naval policy. If the democratic position had been an anxious one before Marathon, it was certainly still more anxious afterwards, even allowing for the fact that Miltiades had in 489 prejudiced conservative supremacy by his failure at Paros. Sparta was still to all appearance ready to support the conservatives, and the democrats had lost the support of Persia. There was nothing in Greece to substitute for it. A great fleet would give security for the vital import of foreign corn; but it could also be used to cut off the supply: in other words the crews of the fleet would have the last say on the fate of Attica, and any oligarchy which might be set up there could be starved to death. During those years, there came to Greece reports of great preparations being made in Asia for a repeated attack on the Greeks of Europe.

Preparations of **Xerxes.**—Xerxes had inherited the policy of Darius, and from the time when in 484 the revolt of Egypt was suppressed, he began preparations for a grand attack on the Greeks of Europe. By the autumn of 481 all was ready for an advance. Athens had no delusions on the object of the expedition. Corinth and Aegina with their trade connections with Asia would be in a position to ascertain the truth, and it was perhaps Corinth that convinced Sparta of it. The Peloponnese, with the exception of Argos, took the patriotic side. Boeotia, so Herodotus says, medized outright, a statement which Plutarch *(De Herodoti Malignitate 31)* indignantly denies. Phocis took the patriotic side because, so Herodotus says, the Thessalians took the other. In Thessaly the feudal barons, led by the Aleuadae of Larissa, medized; but the mass of the population took the other side. Corcyra was inclined to be neutral. The Sicilian cities had their hands full with a Carthaginian attack arranged by Persia.

Meanwhile Xerxes had marched from Sardes to the Hellespont, where he had caused two bridges to be constructed, a considerable engineering feat across a wide strait with a strong current; also a canal had been cut across the peninsula of Mt. Athos to avoid the stormy and ill-omened passage round the cape. Its line is traceable at the present day.

Greek Plans of Defence.- he Greek council of war now knew that no help was to be expected from outside Greece; so it planned the defence on that assumption. As in the expedition of 492 the Persian strategy centred on the co-operation between army and fleet. The plan's one drawback was that it limited the mobility of the fleet, since it had to keep in close touch with the army. That the Greeks recognized this is apparent from their designs, even if they were not unanimous as to how and where they should be carried out. That lack of unanimity came nigh to bringing the cause of the Greeks to ruin. There was only one State north of the isthmus, Athens, which really counted in the defence. The minor Peloponnesian States were therefore anxious to concentrate the defence at the isthmus, and there can be little doubt that Sparta and Corinth were in sympathy with them. According to this design Athens was to sacrifice her territory for the time being, and her population was to take refuge in Peloponnese. With this intent the Peloponnesians set about fortifying in feverish haste the four and a half miles breadth of isthmus. It is plain that the Athenians refused to assent to a plan which involved at least the temporary sacrifice and devastation of their territory. It is also plain that the Peloponnesians or, at any rate, the Spartans, knowing that the Athenian fleet was necessary even for a defence of the isthmus, made a show of falling in with the Athenian designs.

The co-operation of fleet and army in the Persian attack rendered a similar co-operation necessary on the part of the defence. But it is possible that the question arose whether the main effort of the Greeks should be on land or on sea. Physiography decided the question. The passage from the north frontier of Thessaly to the isthmus is, owing to the difficult nature of the country, a well-defined line, which offers no alternatives save in Thessaly

itself. There it is possible, in passing from Larissa to Thermopylae to go either via Halos and Larissa Cremaste to Lamia, or to take a more inland route over the pass of Thaumacium. South of Thermopylae the line is single, through Thermopylae and a low passage through the Oeta range near Abae; then by the narrow passage between the foot of Helicon and Lake Copais, and so by one of the passes of Mt. Cithaeron — preferably the Dryoscephalae — into the Megarid and Attica. There were various defensible points on this route: at Tempe, where, however, the very narrow passage through that valley could be turned; at Thermopylae, where a turning movement involved great difficulty and danger; and at the narrow strip of traversable ground in Boeotia on the route-between Coronea and Haliartus. By sea, on the other hand, there was no place where the passage of the Persians could be blocked. The Euripus could be turned by passing outside Euboea. The Athenian plan of campaign assumed rightly that, if either arm of the invaders' force could be brought to a stand, the other would be brought to a stand also. Physiography determined that this could only be done in the case of the army. At the same time the Greek fleet would have to cooperate with the Greek army to prevent the landing of troops in the rear of any position the latter might take up. Had this design been carried out it is probable that the invaders would never have got south of Thermopylae. That it was not carried out was due to the Peloponnesian dislike of any defence north of the isthmus, and to the further fact that, when forced into compliance with the Athenian designs, their compliance was at best half-hearted.

The first attempt at land defence was made at Tempe, where the Peneius river breaks through the mountains between Ossa and Olympus. The available passage is very narrow indeed. To this place they despatched 10,000 hoplites. This must have been in the spring of 480. The Thessalian commons had begged them to come thither. But, says Herodotus, the Greeks found that the pass could be turned by a route through Gonnos, and so gave up the idea of defending it, and so the Greek army and fleet went back to Attica and the isthmus.

Battle of **Thermopylae.**—There must have been much controversy as to the next line of defence to be adopted; but the views of the Athenians again prevailed, and it was determined to send a force to Thermopylae, and the fleet to the north Euripus to cover the rear of the defenders of the pass. The tale of this episode of the war as told by Herodotus, a Spartan version of a story of which there was much that the Spartan Government would be glad to conceal, is one of the strangest in literature. So far as it goes it is true. Only 7,300 men, nearly all hoplites, were sent to defend the pass. About 4,000 came from the Peloponnese, and the rest from Phocis and Boeotia. No Athenians could be spared, for, now that the 200 vessels of the fleet were mobilized, all the Athenian hoplites would be serving as marines aboard the fleet. This land force was but a fraction of what the Peloponnesians could put into the field. This force, says Herodotus, was represented by Leonidas, the Spartan king, as a sort of vanguard of a larger army; but no other troops were ever sent, not even when Leonidas sent an urgent message asking for reinforcements.

Leonidas was, however, prepared to make a desperate defence of the pass; and it might have succeeded had not the Phocians who guarded the very narrow path of the Anopaea been taken unawares. The Middle Gate of Thermopylae was at that day of such a nature that the front of an attacking force could only be a few men wide. The light-armed Persian or the Persian bowmen could not make any impression on a Greek hoplite force in such a strong position. The path of the Anopaea was a mere forest track on which a small force could have stopped an army. The defence of Thermopylae showed the grandeur of the Spartan nature at its best; but for the Spartan Government it was fortunate that the circumstances of the battle made it possible for it to give its own version of a very embarrassing story. The Greek world all but accepted in full a tale which redounded to the glory of the Greek race as a whole; but there were those who, in moments of irritation and candour, were inclined to remind Sparta of the truth: "the Mede had time to come from the ends of the earth to Peloponnese ere any force of yours worthy of the name went out to meet him," said a speaker to the Spartans some 50 years later (Thuc. i. 69).

While these things had been going on at Thermopylae the Greek fleet in the north Euripus had successfully prevented the Persian fleet from landing troops behind the pass, and had, generally speaking, tried conclusions with the enemy. The Persian fleet had suffered greatly in a storm near Cape Sepias off the mouth of the Euripus, and in a later storm a Persian detachment of 200 vessels had been wrecked in the Hollows of Euboea. After the disaster at Thermopylae the Greek fleet withdrew southwards to the strait of Salamis on the Attic coast.

Athenian Retirement to Salamis.— That the Athenians had expected the defence of the pass to be a real effort on the part of the land army is evident from the fact that they did not until after the disaster take any measures to secure the safety of their people. Moreover, Herodotus says that, even after the disaster, they had expected a Greek army to oppose the Persians in Boeotia. The miscalculation was such that, though some of the Attic population could be shipped over the Saronic gulf to Troezen, a large number could only, owing to lack of time, be transferred to the island of Salamis, less than a mile from the Attic coast. That was why the fleet went to the Salamis strait. The refugees in the island had to be protected. The fleet in the strait did not in any sense cover the fortifications at the isthmus 30 miles away. The Persian fleet might have ignored it, and sailed on to land troops south of the fortifications, in which case the Greek fleet would have been forced to give battle in open waters, which was what the Persians wished to force it to do, and exactly what the more intelligent of the commanders of the Greek fleet wished to avoid. That the subsequent battle in the strait was brought about by Themistocles is doubtless a fact; but Eurybiades, the Spartan commander-in-chief of the Greeks, seems to have shared his views. The enemy's fleet was not merely superior in numbers to that of the Greeks, but some of its contingents, especially the Phoenician, must have been superior to it in manoeuvring power. The great Athenian contingent of 200 ships, more than half of the 366 triremes in the fleet, was manned by imperfectly trained crews. Even after the disasters at the Sepiad strand and in the Hollows of Euboea, the Persian probably outnumbered the Greek fleet by two to one. With regard to the army, calculations of a more convincing kind may be made which reckon the total numbers at this period of the war at about 400,000 fighting men. The passage of the Persian army from Thermopylae to Attica was marked by a raid on Delphi. A considerable interval must have intervened between its departure from Artemisium and its arrival at the bay of Phalerum on the Attic coast, a few miles outside the eastern end of Salamis strait. It put in there, not apparently with any intent of attacking the Greeks, but to afford supplies to the Persian army in Attica.

Battle of Salamis.— The extant evidence as to what occurred at Salamis is contained in Herodotus and Diodorus together with a few but important details which may be gathered from the Persae of Aeschylus. Diodorus' version is plagiarized from Ephorus, whose story, though not so dramatic as that of Herodotus, gives what is probably a more correct account of the course of events in and before the great fight. The transhipment of the population to Troezen or Salamis seems to have been all but complete. A few, indeed, seem to have deliberately remained behind on the Acropolis The Greeks inside the strait of Salamis were in a very divided state of mind. The Peloponnesian contingents in the fleet wanted naturally to sail to the isthmus; but any move thither without the Athenian contingent would have been suicidal. As far as the Athenians were concerned it was plain that they could not desert the refugees on the island of Salamis. At the same time if the fleet remained in the strait the Persians would be able to land troops behind the isthmus defence, which would have been a capital disaster to the Greek cause. Strategically the position of the Greeks before the battle of Salamis was a very desperate one. There was only one way out, and Themistocles saw it—to induce the Persians to attack the Greek fleet in the

strait. The less experienced seamen had to make up for inferior skill by resorting to boarding tactics, which could only be really effective in narrow waters. Moreover, the Persian superiority in numbers would be discounted if the battle were fought on a necessarily narrow front.

In view of these considerations, Themistocles took what was the desperate measure of simulating treachery by sending a message to Xerxes saying that the Greek fleet was ready to betray the Greek cause. This message reached Xerxes in the late afternoon of the day preceding the battle. Unfortunately for the Persian he had had too many experiences of treachery within the ranks of Greek opponents to suspect the genuineness of the message; and so, early in the night, Xerxes moved the main part of his fleet from Phalerum bay to the eastern entrance of Salamis strait, to a line of which the small island of Psyttaleia formed more or less the centre. To prevent any escape of the Greeks through the western strait of Salamis he sent the Egyptian squadron of 200 vessels to block its passage. What actually took place on the day of battle may be deduced from the *Persae*. The Persian fleet had to advance into the strait. Up to that time it had been hidden from the Greeks by the promontory of Cynosura; but the latter were aware that they were shut in, since Aristides had arrived at Salamis from Aegina during the night, and had informed them of the Persian movement.

North of Psyttaleia the strait of Salamis turns at right angles from north to west, and thus the Persian fleet, advancing on both sides of Psyttaleia, had to execute a wheeling movement. The strait after turning becomes somewhat narrower, a fact for which the Persians do not seem to have allowed, so that when they tried to advance into the inner strait with as broad a front as they had had when south of Psyttaleia a certain amount of confusion arose. It was during this confusion that the Greeks, who had advanced eastwards down the inner strait, attacked. Everything must have been in favour of the Greeks. The two fleets must have become almost literally jammed in the strait to the north of Cynosura, and that would favour the boarding tactics of the Greeks who had on their vessels hoplites serving as marines. Of the details of the fight a few are related by Herodotus, but they are rather picturesque stories than real contributions to its history. Before the day was done the Persians had been either driven, or forced to retire, from the strait.

The Greeks themselves seem not to have realized the extent of their victory until, shortly afterwards, the Persian fleet retired altogether from European waters and their army fell back northwards, part of it to winter in Thessaly with a view to further attack next year, part of it to Asia. Though Salamis was not decisive of the war, for the attack of Mardonius in 479 was very formidable, yet it is one of the decisive battles of the world in that, had it turned out otherwise, Greece would have fallen under the dominion of Persia. When the Greeks discovered that the Persian fleet had retreated they sailed as far as Andros. Proposals were made to break down the Hellespont bridges; but these were overruled.

In this same year Gelon of Syracuse inflicted on the Carthaginian invaders of Sicily such a defeat that, had he followed it up on the African coast, the career of Carthage might have come to an end. Thus the great scheme of Persia had failed in both east and west. When the year 479 opened, the Persian fleet seems to have been on the Ionian coast with a view to preventing any movement of revolt in the Ionian cities. Mardonius was in Thessaly with an army which Greek authors reckoned at 400,000 men. Half that number would probably be nearer the truth. In the campaign of 480 Themistocles had held supreme command of the Athenian contingents, both naval and military; but in 479 he vanishes from the picture. No Greek author gives any explanation of his disappearance.

Battle of **Plataea.**—In the spring the Persians seem to have made, through a certain Alexander of Macedon, an attempt to detach Athens from the Greek cause. Sparta intervened, perhaps superfluously, and the attempt came to nothing. Then Mardonius started from Thessaly on his march south. It is evident that at the back of what follows is a resuscitation of the Peloponnesian design to concentrate the land defence at the isthmus. Sparta was reluctant to move northwards, but fearing that Athens might desert the Greek cause, the Spartans, whose army was mobilized, made a surprise march northwards at the very time that an Athenian embassy was at Sparta imploring them to act. But meanwhile Mardonius had overrun Attica. When, however, he heard that the Greek army was marching north he retreated to Boeotia with a base at Thebes. The Peloponnesian contingents of the Greek army now moved north from the isthmus, advancing to Eleusis, where the Athenian army met them. Then the whole force marched through the Dryoscephalae pass into Boeotia, and took up a position low down on the north side of the pass. Here the position was across a valley, the Greek centre being on low ground, and the wings on higher ground on either side. The position was close to the little town of Erythrae. The Persians were encamped on the Asopus river about three miles north of this point. The Persian cavalry assailed the Megarians in the Greek centre but the Athenians went to their help, and the cavalry attack was driven off. During the night the Greeks moved in a north-north-westerly direction to a hollow on the north side of which rose a ridge, the Asopus ridge. The Persians got wind of the movement, and moved up the Asopus to a position fronting the Greeks. About this time reinforcements were coming in which raised the numbers of the Greek army to a total of 108,200. The number of hoplites, the real fighting force, was about 39,000. The Persians numbered about 200,000. With them, however, were some Phocians and a large force of Thebans.

A position of stalemate then supervened, neither side attempting anything for eight days. Then, as the Greeks were some two miles from the passes which debouch on to the field, the Persians began to send cavalry round their flanks, which attacked and interfered with the Greek provision trains. Then came a grand attack by the Persian cavalry which harassed the Greeks with long-range missiles, and destroyed the spring of Gargaphia on which the Greeks were dependent for water. It lay in a hollow behind the Greek line. The Greek position on the Asopus ridge became untenable, and a retreat was necessary. The new position which was to be taken up was at the "island," which is a mound on a ridge at the foot of Cithaeron about a mile east of the town of Plataea, and almost surrounded by two branches of the Oeroë river. But, though the army generally was to make for this position, it is evident from what followed that the Spartans were to go in the first place to the relief of the Greek baggage trains in the passes. As the retreat was to be made at night there was every possibility of confusion. The Greek centre started first, but missed the "island" and arrived at the town of Plataea. The Spartans started later south-south-east towards the pass of Dryoscephalae. The Athenians, who had waited for the Spartans to move, then started for the "island." Neither the Spartans nor the Athenians reached their objectives, for the Spartans, after they had gone a little more than a mile from the summit of the Asopus ridge, were assailed by the Persian cavalry and brought to a standstill at a point near a temple of Eleusinian Demeter, which stood on the ridge next east of the Asopus ridge. Mardonius seems to have thought that the Greek retirement meant defeat, and to have determined to make the rout complete. So long as the Persian cavalry employed missiles the Spartans suffered considerable loss. Then the Persian infantry came up. The battle was an unequal one, for the light-armed Persian had no chance against the hoplite. In the mêlée Mardonius himself perished, and eventually the Persians were driven back in rout and tried to take refuge in their camp. Meanwhile the Athenians on the Greek left had started for the "island." They had only reached the plain south-west of the Asopus ridge when they received a message from the Spartans asking for assistance, and seem to have started off in their direction. But in the hollow south of the Asopus ridge they were assailed by the Greeks who were fighting on the Persian side. They defeated the Thebans after an obstinate fight. The Greek centre at Plataea had by this time received news of the two battles, and part of it seems to have hurried to aid the Spartans, while the other part went to help the Athenians. The latter were badly cut up by the

Theban cavalry, and so never reached the Athenians, while the former may possibly have taken part in the last stages of the fight beneath the temple of Demeter. The last phase of the battle was a combined assault by the Greeks on the Persian camp and a general massacre of the enemy, 30,000 of whom are said to have perished. The Greeks celebrated their victory by dedicating to Delphi a tenth of the spoils and setting up the famous serpent column surmounted by a bowl, the remains of which still survive at Constantinople. The leaders of the medizing party at Thebes they captured and executed. Plataea set the seal on Salamis. The two battles saved Hellenism in Europe from becoming orientalized, and thus modified the history of the world.

Naval Operations in the Aegean: **Mycalé.**—While these things were taking place in European Greece, a Greek fleet was operating on the Asiatic coast of the Aegean. The Ionians had appealed for help. The fleet was commanded by the Spartan Leutychides. For some unknown reason the Phoenician contingent of the Persian fleet had been sent home, and therefore the weakened remnant dared not try conclusions with the Greeks on the open sea. They sought refuge at Mycalé where was a strong land army which had been overawing the Greek cities. As the Persians declined a naval battle, Leutychides disembarked his troops and attacked them on land. The result was an obstinate battle but a great Greek victory to which the Ionian contingent on the Persian side contributed by turning against their masters. From that time forward the fate of the Greek cities of Asia became a factor in the relations between Persia and the European Greeks. The year 478 was spent partly in the reconstitution of Attica and in that rebuilding of the walls of Athens which the Spartans would have prevented had they not been tricked by Themistocles.

The **Delian** Confederacy.—As far as the patriotic Greeks were concerned the action of the Ionians at Mycalé had practically committed them to the liberation of the Greek cities of Asia from Persian rule, and so the war had to be carried on in the form of an attack on the Persian hold on the Greek cities of the Aegean, the Propontis and Cyprus. Pausanias the Spartan who had commanded at Plataea led in 478 what was probably a very miscellaneous fleet drawn from the Greek mainland and islands in an attack on the Persian possessions. Under his command Cyprus and Byzantium were taken, the former a base for Persian attack on the Aegean, the latter the key to the corn route from the Euxine. At Byzantium Pausanias developed certain strange habits which the Greek patriots interpreted as medism. Sparta recalled him, and sent out a successor whom the Greeks refused to accept as commander; and so the leadership passed to Athens. Sparta withdrew from the war, and it is probable that all the other States of the mainland save Athens withdrew at this time. With the new league came the tribute from those States which paid Athens to furnish ships and crews on their behalf, an ever-increasing number as time went on. How long it took to set free the Greek cities of the Asiatic coast is not known. It is probable that one of the main motives of the campaigning was the complete restoration of the passage through the Hellespont and Bosporus to the Euxine corn region. The restiveness of the allies culminating in the revolt of Naxos in 467, shows that there were many of them who thought that the danger from Persia was over by that time. Whatever may have been the case before 466 the battle of the Eurymedon in that year put Persia completely out of action as far as the Aegean was concerned. That great victory by land and sea was less dramatic and less decisive of the future than Salamis had been; but for 50 years after the battle Persia left Greece alone. Still the experience of 50 years later was to show that those members of the league who supposed that the danger from Persia was over for ever were mistaken. It was the continued existence of the great Athenian fleet which kept the Persians from interfering in Greek affairs. Within a brief period after its destruction at Syracuse the interference began again, and within 30 years of that time Persia had become arbiter even in the internal politics of Greece.

GRAECO-TURKISH WAR, 1897. This war between Greece and Turkey (*see* GREECE: *Modern History*) involved two practically distinct campaigns, in Thessaly and in Epirus. Upon the Thessalian frontier the Turks, early in March, had concentrated six divisions (about 58,000 men), 1,500 cavalry and 136 guns, under Edhem Pasha. A seventh division was rendered available a little later. The Greeks numbered about 45,000 infantry, 800 cavalry and 96 guns, under the crown prince. On both sides there was a considerable dispersion of forces along the frontier. The Turkish navy, an important factor in the war of 1877–78, had became paralytic ten years later, and the Greek squadron held complete command of the sea. Expeditionary forces directed against the Turkish line of communications might have influenced the course of the campaign; but for such work the Greeks were quite unprepared, and beyond bombarding one or two insignificant ports on the coast-line, and aiding the transport of troops from Athens to Volo, the navy accomplished nothing. On April 9 and 10 Greek irregulars crossed the frontier, either with a view to provoke hostilities or in the hope of fomenting a rising in Macedonia. On the 16th and 17th some fighting occurred, in which Greek regulars took part; and on the 18th Edhem Pasha, whose headquarters had for some time been established at Elassona, ordered a general advance. The Turkish plan was to turn the Greek left and to bring on a decisive action, but this was not carried out. In the centre the Turks occupied the Meluna pass on the 19th, and the way was practically open to Larissa. The Turkish right wing, however, moving on Damani and the Reveni pass, encountered resistance, and the left wing was temporarily checked by the Greeks among the mountains near Nezeros. At Mati, covering the road to Tyrnavo, the Greeks entrenched themselves. Here sharp fighting occurred on the 21st and 22nd, during which the Greeks sought to turn the right flank of the superior Turkish central column. By the 23rd the Turkish forces had drawn together, and the Greeks were threatened on both flanks. In the evening a general retreat was ordered, and the loose discipline of the Greek army was at once manifested. Rumours of disaster spread among the ranks, and wild panic supervened. There was nothing to prevent an orderly retirement upon Larissa, which had been fortified and provisioned, and which offered a good defensive position. The general *débâcle* could not, however, be arrested, and the mass of the Greek army fled southwards to Pharsala. There was no pursuit, and the Turkish commander-in-chief did not reach Larissa till the 27th. Thus ended the first phase of the war, in which the Greeks showed tenacity in defence, which proved fruitless by reason of initially bad strategic dispositions entailing far too great dispersion, and also because there was no plan of action beyond a general desire to avoid risking a defeat which might prevent the expected risings in Macedonia and elsewhere. The handling of the Turkish army showed little skill or enterprise.

Larissa being abandoned, Velestino, the junction of the Thessalian railways, where there was a strong position covering Volo, seemed to be the natural rallying point for the Greek army. Here the support of the fleet would have been secured, and a Turkish advance across the Othrys range upon Athens could not have taken place until the flanking position had been captured. Whether by direction or by natural impulse, however, the mass of the Greek troops made for Pharsala, where some order was reestablished. The importance of Velestino was recognized by sending a brigade thither by railway from Pharsala, and the inferior Greek army was thus split into two portions, separated by nearly 40m. A Turkish reconnaissance on Velestino was repulsed, but on May 5 the Greeks were driven from their positions in front of Pharsala by three divisions. Further fighting followed on the 6th, and in the evening the Greek army retired in fair order upon

Domokos. It was intended to turn the Greek left with the first division under Hairi Pasha, but the flanking force did not arrive in time to bring about a decisive result. The abandonment of Pharsala involved that of Velestino. Again delaying, Edhem Pasha did not attack Domokos till the 17th, giving the Greeks time to entrench their positions. The attack was delivered in three columns, of which the right was checked and the centre failed to take the Greek trenches and suffered much loss. The left column, however, menaced the line of retreat, and the Greek army abandoned the whole position during the night. No effective stand was made at the Furka pass, which was evacuated on the following night Col Smolenski, who arrived on the 18th from Velestino, was directed to hold the pass of Thermopylae. The Greek forces being much demoralized, the intervention of the tsar was invoked by telegraph; and the latter sent a personal appeal to the sultan, who directed a suspension of hostilities. On the 20th an armistice was arranged.

In Epirus at the outbreak of war about 15,000 Greeks under Col. Manos occupied a line of defence from Arta to Peta. The Turks. about 28,000 strong, under Achmet Hifsi Pasha, were distributed mainly at Iannina, Pentepagadia, and in front of Arta. On April 18 the Turks commenced a three days' bombardment of Arta; but successive attempts to take the bridge were repulsed, and during the night of the 21st they retired on Philippiada, 26m. distant, which was attacked and occupied by Col. Manos on the 23rd The Greeks then advanced to Pentepagadia, but the position held by their advanced force near Homopulos was attacked on the 28th and 29th, and no Greek reinforcements were forthcoming when needed. The Evzones made a good defence, but were driven back by superior force, and a retreat was ordered, which quickly degenerated into panic-stricken flight to and across the Arta Reinforcements were sent to Arta from Athens, and on May 12 another incursion into Turkish territory began, the apparent object being to occupy a portion of the country in view of the breakdown in Thessaly and the probability that hostilities would shortly end. The advance was made in three columns, while 2,500 Epirote volunteers were landed near the mouth of the Luro river with the idea of cutting off the Turkish garrison of Prevesa. The centre column attacked the Turks near Strevina on the 13th, but although the Greeks fought well, they ultimately had to retreat. The volunteers landed at the mouth of the Luro, were attacked and routed with heavy loss.

The campaign in Epirus thus failed as completely as that in Thessaly. Under the terms of the treaty of peace, signed on Sept 20, and arranged by the European Powers, Turkey obtained an indemnity of £T4,000,000 and a rectification of the Thessalian frontier, carrying with it some strategic advantage. History records few more unjustifiable wars than that which Greece gratuitously provoked. The Greek troops on several occasions showed tenacity and endurance, but discipline and cohesion were manifestly wanting. Many of the officers were incapable; the campaign was gravely mismanaged; and politics, which led to the war, impeded its operations. On the other hand, the fruits of the German tuition, which began in 1880, and received a powerful stimulus by the appointment of Gen. von der Goltz in 1883, were shown in the Turkish army. The mobilization and concentration was on the whole smoothly carried out, the young school of German-trained officers displayed ability, and the artillery at Pharsala and Domokos was well handled. The superior leading was, however, not conspicuously successful; and while the rank and file again showed excellent military qualities, political conditions and the Oriental predilection for half-measures and for denying full responsibility and full powers to commanders in the field enfeebled the conduct of the campaign. (G. S. C.)

GRAEVIUS (properly GRAEVE or GREFFE), **JOHANN GEQRG** (1632–1703), German classical scholar and critic, was born at Naumburg, Saxony, on Jan. 29, 1632. After holding other appointments, he became, in 1662, professor at Utrecht, where he died Jan. 11. 1703. Graevius had a high reputation as a teacher He was honoured with special recognition by Louis XIV., and was a particular favourite of William III. of England, who made him historiographer royal.

His two most important works are the *Thesaurus antiquitatum Romanarum* (1694–99), and the *Thesaurus antiquztatum et historiarum Italiae* published after his death, and continued by the elder Burmann (1704–25). His editions of the classics, although they marked a distinct advance in scholarship, are now for the most part superseded.

GRAF, ARTURO (1848–1913), Italian poet, of German extraction, was born at Athens. He was educated at Naples university and lectured on Italian literature in Rome, till in 1882 he was appointed professor at Turin. His volumes of verse—*Medusa* (1880), *Poesie e novelle* (1874), *Dopo il tramonto* (1893), *Morgana* (1901), *Le Danaidi* (1897; enlarged ed 1905), *Rime della selva* (1906)—give him a high place among the lyrical poets of his century. A good selection, *Poesie,* appeared in 1915. Of his numerous prose works may be mentioned *Roma nella memoria e nelle immaginazioni del medio evo* (2 vols., 1882–83). Graf was possessed by a pessimism deeper than that of Leopardi, on whom some of his best critical work was done in his *Foscolo, Manzoni, Leopardi* (1898). He died at Turin on May 29, 1913.

See Sartori Treves, *Arturo Graf, romanziere e poeta* (1904); *M.* Morandi, *Arturo Graf* (Rome, 1921); R. Rizzo, *Pessimismo e spiritualismo nell' opera poetica di Arturo Graf* (Catania, 1921).

GRAF, KARL HEINRICH (1815–1869), German Old Testament scholar and orientalist, was born at Mülhausen in Alsace on Feb. 28, 1815, and was educated at Strasbourg After holding various teaching posts, he was made instructor in French and Hebrew at the Landesschule of Meissen, and in 1852 professor. He died on July 16, 1869. Graf was one of the chief founders of Old Testament criticism.

See T. K. Cheyne, *Founders of* Old *Testament Criticism* (1893); and O. Pfleiderer, *Development of Theology* (1890).

GRAF or **GRAFF, URS** (c. 1485–1527), Swiss draughtsman, engraver and goldsmith. He was born at Solothurn, the son of the goldsmith Hugo Graf, and probably studied under his father and then at Basle. His art is inspired by that of Diirer and of Baldung Griin. After a period of travel he settled in Basle in 1509. In 1514 he executed a reliquary of St. Bernard for the monastery of St. Urban. This, his chief work as a goldsmith, was sold by the city of Lucerne in 1850 and has since disappeared. Graf is best known for his drawings, executed in sure and bold line work. A hundred woodcuts for which he made the drawings; a number of engravings, etchings and niellos, and some 200 drawings by his hand are extant. Most of his work is dated and signed by his monogram.

GRAFE, ALBRECHT VON (1828–1870), German oculist, was born on May 22, 1828. He studied medicine in Berlin, Vienna, Prague, Paris, London, Dublin and Edinburgh, specializing in ophthalmology, and soon became one of the greatest of eye surgeons. After practising from 1850 in his private institution for the treatment of the eye, he was appointed teacher of ophthalmology in Berlin university in 1853 and professor in 1858. Von Grafe began in 1855 to issue the *Archiv für Ophthalmologie,* which contains most of his important discoveries including his introduction of the operation of iridectomy in the treatment of iritis, iridochoroiditis and glaucoma (1855–62), his improvement of the treatment of cataract (1865–68) and his demonstration that often blindness and visual defects connected with cerebral disorders are traceable to optic neuritis (1860). Grafe was also an authority on diseases of the nerves and brain.

See Alfred Gräfe, *Ein Wort der Erinnerung an Albrecht von* **Grafe** (Halle, 1870), and E. Michaelis, *Albrecht von Grafe* (1877).

GRAFE, KARL FERDINAND VON (1787–1840), German surgeon, was born at Warsaw on Mar. 8, 1787. He studied medicine at Halle and Leipzig, and in 1810 became professor of surgery at Berlin, and during the war with Napoleon, superintendent of the military hospitals. He died at Hanover on July 4, 1840. Grafe did much to reform army hospitals and improve the treatment of wounds, but he is chiefly noted as being the founder of modern plastic surgery.

See E. Michaelis, *K. F. von Gräfe* (1840).

GRAFFITO, plural *graffiti,* the Italian word meaning "scribbling" or "scratching" *(graffiare,* to scribble, Gr. γράφειν), adopted by archaeologists as a general term for the casual writings, rude drawings and markings on ancient buildings, in distinction

from the deliberate writings known as "inscriptions." These "graffiti," either scratched on stone or plaster by a sharp instrument or, more rarely, written in red chalk or black charcoal, are found in great abundance, *e.g.*, on the monuments of ancient Egypt. The best-known "graffiti" have been collected by R. Garrucci (*Graffiti di Pompei,* Paris, 1856), and L. Correra ("Graffiti di Roma" in *Bolletino della commissione municipale archaeologica* Rome, *1893; see* also *Corp. Ins. Lat.* iv., Berlin, *1871).* The subject matter of these scribblings includes scrawls by boys, street idlers and the casual "tripper," of rude caricatures, election addresses and lines of poetry. Apparently private owners of property felt the nuisance of the defacement of their walls; at Rome near the *Porta Portuensis* was found an inscription begging people not to scribble *(scariphare)* on the walls.

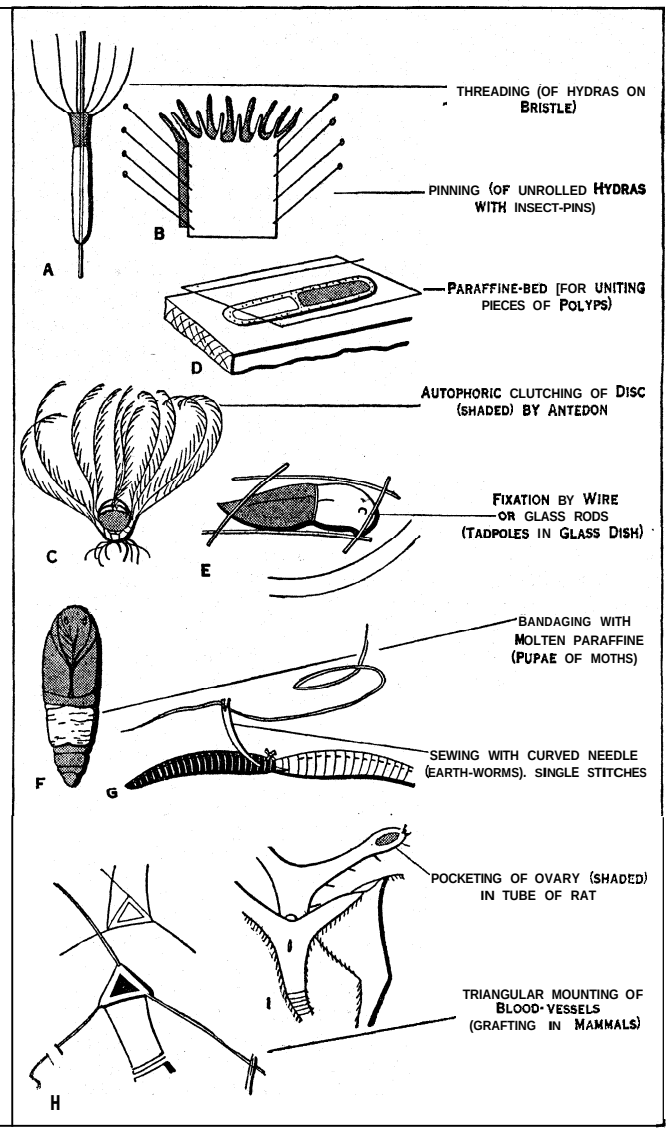
Graffiti are important to the palaeographer and the philologist as illustrating the forms and corruptions of the various alphabets and languages used by the people, and may guide the archaeologist to the date of the building; but they are chiefly valuable for the light they throw on the everyday life of the "man in the street" of the period, and for the intimate details of customs and institutions. The graffiti dealing with the gladiatorial shows at Pompeii are in this respect particularly noteworthy *(see* Garrucci, *op. cit.,* Pls. x.–xiv.; A. Mau, *Pompeii in Leben und Kunst,* 2nd ed., 1908, ch. xxx.). In 1866 in the Trastevere quarter of Rome was discovered the guard-house *(excubitorium)* of the seventh cohort of the city police (*vigiles*), the walls being covered by the scribblings of the guards (W. Henzen, "L' Escubitorio della Settima coorte dei Vigili" in *Boll. Inst., 1867,* and *Annali Inst., 1874; see* also R. Lanciani, *Ancient Rome in the Light of Recent Discoveries,* 230, and *Ruins and Excavations of Ancient Rome, 1897,* 548). The most famous graffito is that generally accepted as representing a caricature of Christ upon the cross, found on the walls of the Domus Gelotiana on the Palatine in *1857,* and now preserved in the Kircherian Museum of the Collegio Romano. *(See* Ferd. Becker, *Das Spottcrucifix der romischen Kaiserpaläste,* Breslau, *1866;* F. X. Kraus, *Das Spottcrucifix vom Palatin,* Freiburg in Breisgau, 1872; and Visconti and Lanciani, *Guida del Palatino.*)

GRAFLY, CHARLES (1862–1929), American sculptor, was born at Philadelphia, Pa., on Dec. *3, 1862.* He was a pupil of the schools of the Pennsylvania Academy of the Fine Arts. Philadelphia, and of Henri M. Chapu and Jean Dampt, and the École des Beaux-Arts, Paris. He received an honourable mention in the Paris salon of *1891* for his "Mauvais Présage," now at the Detroit Museum of Fine Arts, a gold medal at the Paris Exposition in 1900, and medals at Chicago *(1893).* Atlanta. *(1895)* and Philadelphia (the gold medal of honour, Pennsylvania Academy of the Fine Arts) in *1899.* In *1892* he became instructor in sculpture at the Pennsylvania Academy of the Fine Arts, also filling the same chair at the Drexel Institute, Philadelphia. He was elected a full member of the National Academy of Design in 1905. He has received a number of gold medals at various exhibits. His better-known works include: "General Reynolds," Fairmount park, Philadelphia; "Fountain of Man"; "From Generation to Generation"; "Symbol of Life"; "Vulture of War"; "England" and "France" for the New York custom house; "Pioneer Mother Monument," San Francisco; "Meade Memorial," Washington, D.C.; and many portrait busts. He died on May 5, 1929.

GRÄFRATH, a former town in Rhenish Prussia, Germany, on the Itterbach, *14* mi. E. of Diisseldorf. Pop 10,585. In 1929 Grafrath was incorporated with Solingen. The chief industries were iron and steel, and weaving was carried on.

GRAFT HYBRIDS: *see* CHIMAERA.

GRAFTING IN ANIMALS. Every gardener is well acquainted with grafting in plants. But it is less well-known that pieces of animals too may be joined in permanent union. Grafting in animals is practised mainly for scientific purposes or for the restoration of weakened or lost parts. Therefore graft and stock are not always taken from different species (*heteroplastic* transplantation) or races *(alleloplastic),* but may belong to samples of the same species and race *(homoplastic)* or even to one individual (*autoplastic*). It is as a rule easier to join pieces of the same species than pieces belonging to different species. In the warm-blooded animals difficulties may arise even when two individuals of the same species are united by grafting, owing to blood incompatibility. With adult specimens of cold-blooded vertebrates this difficulty is less, and in their earlier stages and in invertebrate animals there seems to be little inconvenience from this source. In some types it is possible to join species belonging to different



THE TECHNIQUE OF GRAFTING AS PRACTISED ON ANIMALS

classes *(dysplastic* transplantation), *e.g.*, amphibians and fish. The degree to which grafting may be carried on depends, too, on the injury a given animal can endure. Developed vertebrates will not stand the stoppage of their circulation and breathing inevitable with the removal of the head. But in embryos of frogs, before the circulation of blood has started, the head-region may be grafted on to the body even of another species, and such compound monsters may even pass metamorphosis. As insects do not need their heads for breathing, and circulation continues without the head being present, grafting of the head is possible even in the imaginal instar, but it is not yet clear whether function is restored. There is no doubt that in lower organisms, such as worms, the head or other body-region can be grafted with functional success. Lengthened individuals may be obtained in embryos of amphibians, tadpoles of abnormal length resulting. Two warm-blooded animals may be joined by bridges of tissue containing blood-vessels and nerves. Side-to-side *"Parabiosis"* of this kind has been effected in rats, and reminds one of the "Siamese twins." Parabiotic grafts have also been effected in frogs, newts, butterfly pupae, earthworms and hydrae.

In certain cases the technique of grafting is even simpler in animals than in plants; when the opportunity is given for the stock to grip the graft by its own means, not even tying or gluing is required (autophoric method). Thus the sea-lily *Antedon,* a relative of the starfish, bears a central disc easily detached. If another disc taken, let us say, from a specimen of different colour, be inserted into the groove left after the removal of the central disc, it will be clutched and kept in place by the tentacles surrounding this spot. There is nothing mysterious about this reaction as the tentacles also fold over the disc in the normal animal. In the case of the vertebrate eye an implanted eye-ball will keep in place by friction and the closing of the eyelids. To prevent these from opening prematurely, a fine pin or a silk stitch can be applied. Eyes can also be grafted in forms (*e.g.,* fish and tadpoles), which have no eyelids and have no means of pawing at the replanted eyes. Replantation of eyes has been successfully achieved in several species of fresh-water fish, newts, salamanders, frogs, toads, rats and in a rabbit. But only in very rare cases does sight return. Endeavours to apply grafting of eyes to restore vision to domestic animals have hitherto been unsuccessful. The lens alone may he grafted autophorically. The lens is extracted as in the operation for cataract. In fish, with cataract, the damaged lens, easily recognized by its opacity, is removed and a transparent lens from the eye of a healthy fish is slipped through the slit made by the operator's knife and is retained by the cornea. Transplantation of the lens in warm-blooded animals has not yet been recorded. Grafting of limbs, arm or leg, may be done in young tailed amphibians by inserting freshly detached limbs between the muscles of the shoulder pit or inguinal region, the contraction of the muscles holding them in place. In warm-blooded animals, however, this method is not practicable and one has to resort to uniting every blood-vessel and nerve-trunk by stitching with catgut or silk. A special technique has been devised for this purpose. The suturing of nerves, however, in transplanting mammals' limbs has not proved satisfactory; no return of motility being secured. In cold-blooded animals sewing is widely used. Chrysalids of butterflies and moths have been united by girdles of paraffin after cutting on ice. Small sea or fresh-water animals can be fixed in grooves of wax and covered by slips of glass or metal (silver, lead) so that the two cut ends touch each other; they then become united by the pressure. In this manner tadpoles, planarians and hydras may be dealt with. A convenient method of joining two or more pieces of hydra has been found by threading them on fine bristle. When the thread is taken out of the water, a drop of water remains on the grafts and draws them together by surface-tension.

Influence of Host.—Diverse scientific problems may be attacked by animal grafting. One (which has also occupied the minds of many laymen), is the question as to the influence of a foster-mother on the characteristics of her nurslings. Ovaries of one female mammal may be grafted into another previously spayed female, and their eggs then fertilized by a chosen male. Then one can decide if the young show the characteristics one would predict from the crossing of this male with the female that has provided the ovary, or whether traits of the foster mother also appear. These experiments have furnished no sure evidence of the latter ever taking place. In some series apparent exceptions to this law have been observed, but it could be shown that in these cases either the races employed were not pure, or that regeneration of ovarian tissue had occurred in the foster-mother, the eggs fertilized by the male being derived from this source. This latter error is avoided by grafting ovaries inside the uterine horn and closing its end by a stitch. Thus eggs of the regenerating ovaries are prevented from passing into the tube. Much the same problem confronts us when parts of the body of an animal are grafted on to individuals of another race or species. Can the specific characters in the graft be changed by the influence of the host? Such an influence has been observed in a few special cases, but it is only colour that has spread from the stock into the graft, *e.g* , from a black axolotl to a pink eye grafted into its back from an albino of the same species. Here merely chemicals have diffused without altering the faculty of the graft to produce colour. But no sign has ever been observed of the host being able to change the tissues of the graft so as to assume a new specificity. The inability of the stock to change inherent differences applies also to merely individual characters. Newts or frogs of the same species differ in the rate of heart-beat. If the heart be extracted from one individual and grafted into the intestine of another, it retains its original rhythm of beating. When different stages of animals undergoing metamorphosis are used as stock and graft, an interesting point occurs: the eye of a caterpillar grafted on to the abdomen of the same species will develop at metamorphosis into the eye of the butterfly; the eye of a newt or salamander larva, grafted to the back of its neck will metamorphosize into the eye of the adult form. This happens not only when stock and graft have been taken from individuals of equal size, stage and age, but also from those differing in these aspects to a wide degree. The explanation in amphibians is that metamorphosis is produced by the internal secretion of a gland, the thyroid; this secretion passes not only to the host but also to the graft. Metamorphosis sets in, not because the stage of the grafted eye has been suited to the stage of the host, but because the graft receives the same agency as the host at the same time. In insects some similar but as yet unknown agency is presumably at work.

Functioning of Grafts.—As the host may in this manner modify the graft, so, too, the graft can by internal secretion mod-

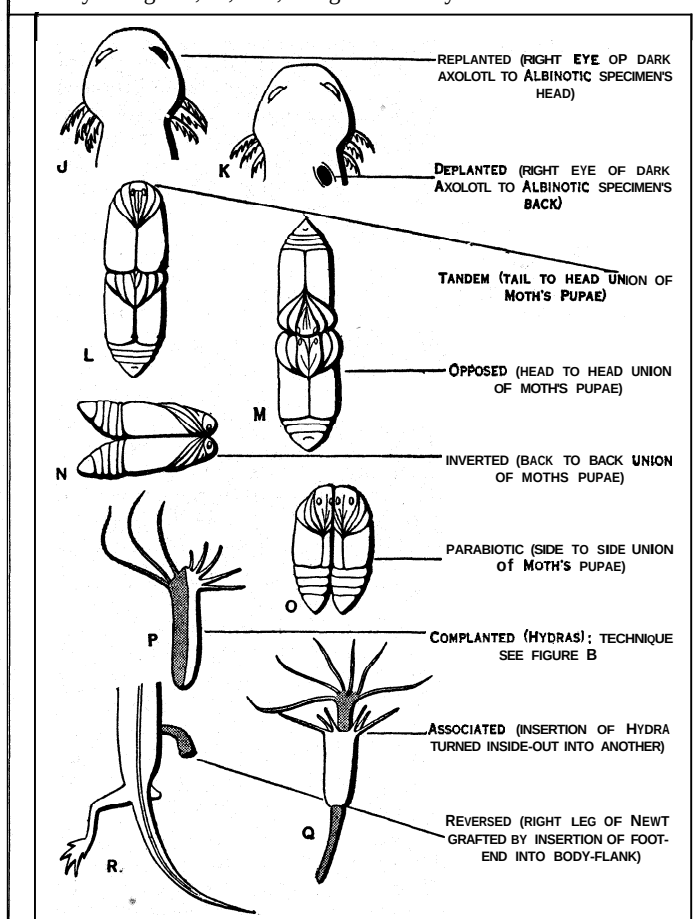


FIG. 2.—THE POSITIONS AND ORIENTATION OF GRAFTS IN ANIMALS

ify the host. In recent years numerous experiments have been performed in grafting ovaries or testes into castrated vertebrates, females or males: the engrafted individuals displayed more or less distinctly the characters of the sex from which they had received the germinal glands by transplantation *(see* SEX). By joining embryos of amphibians the sex of one partner, usually the female, is changed. An analogous case is found, when the posterior half of a male Hydra with functional testes is grafted on to the anterior half of a female. In all these cases the function of the graft is presumably established by diffusion of hormones. It

is the same with grafts of other glands of internal secretion. If, on the contrary, such parts of the body as require nervous connection for their normal function, are to be used in grafting, their function will only be completely restored, if the nerves of graft and stock unite. When the head of one earthworm, for instance, has been joined to the body of another, the movements of this compound will at first be irregular, the ingestion of food impossible. But later co-ordinate movements reappear, and food is taken in. Microscopical examination then reveals continuity of nerve-cord between the grafted head and the stock. In amphibian larvae limbs grafted by the autophoric method may regain motility. Curiously enough, it seems as if the connection of one nerve-trunk of the host's limb with the graft is enough for restoring all kinds of motility to the transplanted limb, although several nerve-trunks normally run to different parts of the limb. As with motility, the return of sensation also depends on the regeneration of nerves. Special tests must be applied to prove return of eyesight after replantation of the eye described above. In fish and newts return of vision can be demonstrated by holding a wriggling worm behind the glass aquarium. If the animal can see, it will strike at the glass trying to catch the prey; a blind one will take no notice. In rats, jumping tests may be resorted to, as blind ones will not jump from a height. This evidence of return of vision has been corroborated by microscopical examination of the retina and optic nerve in the grafted eyes.

Antagonism of Graft and Re-growth. — Although a certain amount of regenerative capacity must reside in the tissues of stock and graft, if they are to unite, the possibility of grafting in a given species or stage is by no means parallel to its regenerative potentialities. Forms with a high regenerative capacity are often very difficult to unite permanently by grafting because a bud of regenerating tissue may appear on the host's cut surface, before the graft has become firmly attached. This often happens when two headless Hydrae are grafted together. Each forms a new head at the line of union and the animals separate again as two complete beings. It is not necessary for permanent union, chat the stock should be able to regenerate the organ which the graft represents. As examples of this we may take the eyes of frogs or rats, which cannot of course be regenerated by these animals. On the other hand structures may be difficult to graft, although easily regenerated in the same species: the legs of the crayfish furnish an instance of this kind. Neither is the regenerative capacity of the graft essential for its permanent fixation. Pieces of young stages transplanted on older animals of the same kind will be resorbed, whilst the same part taken from an older stage will keep permanently attached, although its regenerative faculty is less. It has, indeed, recently been established that a graft will usually hold better on a weakened stock. Probably the latter cannot resorb or destroy the intruder as quickly as a vigorous host, thus giving the graft a better chance to "take." The different regions of a developing embryo or animal body exert an influence on such parts as have not yet reached the same stage of differentiation. (See DEDIFFERENTIATION, EXPERIMENTAL EMBRYOLOGY). If a hydra is deprived of its tentacular ring and inserted with this cut surface into the side of another hydra, nearly all the trunk of the former can be removed, without preventing the inserted head region from drawing material from the side of the larger component, the head "dominating" the flank. In planarians, newts and tadpoles, regeneration-buds in a sufficiently early stage will develop into any structure. in place of which they have been grafted. Such a regenerating "blastema" derived from the tail of a newt will develop into a limb if grafted on the cut stump of the latter. But in the lizard the regenerating tail blastema is not changed, even if grafted in place of a fore-leg *(see* HETEROMORPHOSIS and REGENERATION IN ANIMALS).

As soon as differentiation sets in, the regenerating tissues will no longer be influenced by the site on which they are grafted. They then conform to the general rule, that the form of a body-region or organ will not be changed by transplantation. Eyes may not only be grafted into eyesockets, but also to the neck or back of salamanders; the main difference being, that in the case of "replantation" function may be restored, whereas "deplantation" to an abnormal situation makes restoration of sight impossible. The orientation in which the components meet is only of consequence for function, not for morphology. When the posterior half of a tadpole is joined to the anterior of another in normal orientation, all parts will be able to function. If, on the contrary, two posterior halves are joined with their anterior cut surfaces together, the compound will not be able to take in food, as a mouth is lacking and will not be formed. If anterior halves are joined by their posterior cut surface, the two heads will pull in opposite directions and often tear asunder. The orientation of the grafted parts towards each other need not only be "normal" or "opposite," as in our last mentioned examples. Two animals, grafted on to each other with their backs or bellies united, are termed "inverted" grafts. If a limb be cut off and, after removal of its distal tip, grafted with the latter end directed towards the body, we have an instance of "reversed" transplantation. In hydras other possibilities of grafting have been invented: if the body be slit lengthwise, the animal can be unrolled completely. By putting one unrolled hydra on the other with their interior sides towards each other, and pinning the edges together for a short time, the two hydras will be united lengthwise by this "conplantation." By turning one hydra inside out and inserting it into the body-channel of a second polyp an "association" is effected. Finally by pressing hydras through a cloth and mixing the dissociated parts complex hydras of "mosaic" character were obtained.

When two different kinds or species of fresh-water polyp have been grafted, the behaviour of the compound as regards asexual reproduction by budding can be studied. Although both kinds used may enter into a bud, in time the specific tissues will separate and no permanent "chimera" can be created. Such experiments are especially striking when the two species differ in colour.

In higher animals without asexual reproduction, buds of chimerical character may be obtained by grafting regenerating tissue, for instance from the member of a black axolotl on to the regenerating member of a white specimen. If in this way half of the regenerating bud has been changed, the leg will show a "sectorial chimera." When the bud of one type is overgrown by the skin of the host, a "periclinal chimera" results. In any case each cell only produces cells with the character of the species or race it has been taken from, as in "mosaic chimeras" with irregular mixture.

GRAFTON, DUKES OF. The English dukes of Grafton are descended from HENRY FITZROY (1663–1690), the natural son of Charles II. by Barbara Villiers (countess of Castlemaine and duchess of Cleveland). In 1672 Henry was married to the daughter and heiress of the earl of Arlington and created earl of Euston; in 1675 he was created duke of Grafton. At James II.'s coronation he was lord high constable. In the Monmouth rebellion he commanded the royal troops in Somersetshire; but in 1688, with Churchill (duke of Marlborough), he seceded to William of Orange. He died of a wound received at the storming of Cork.

AUGUSTUS HENRY FITZROY, 3rd duke of Grafton (1735–1811), grandson of the preceding, was educated at Westminster and Cambridge. In 1765 he was secretary of State under the marquis of Rockingham; but he retired next year, and Pitt (becoming earl of Chatham) formed a ministry in which Grafton was first lord of the treasury (1766) but only nominally prime minister, until Chatham's illness at the end of 1767. Political differences and the attacks of "Junius" led to his resignation in Jan. 1770. He was lord privy seal in Lord North's ministry (1771), but resigned in 1775, being in favour of conciliatory action towards the American colonists. In the Rockingham ministry of 1782 he was again lord privy seal. In later years he was a prominent Unitarian.

BIBLIOGRAPHY.—The 3rd duke left in manuscript a *Memoir* of hie public career, of which extracts have been printed in P. H. Stanhope, 5th Earl, *History of England* (1836–54); *H.* Walpole. *Memoirs* of

George III. (Appendix, vol. iv., 1845); J. Campbell, *Lives of the Chancellors* (1845–69).

GRAFTON, RICHARD (d. 1572), English printer and chronicler, was born probably about 1513. He received the freedom of the Grocers' Company in 1534. In 1537 Grafton undertook, in conjunction with Edward Whitchurch, to produce a modified version of Coverdale's bible, generally known as Matthew's Bible (Antwerp, 1537). He went to Paris to reprint Coverdale's revised edition (1538). There Whitchurch and he began to print the folio known as the Great Bible by special licence obtained by Henry VIII. from the French Government. Suddenly, however, the work was officially stopped and the presses seized. Grafton fled, but Thomas Cromwell eventually bought the presses and type, and the printing was completed in England, The Great Bible was reprinted several times under his direction, the last occasion being 1553. In 1544 Grafton and Whitchurch secured the exclusive right of printing church service books, and on the accession of Edward VI., he was appointed king's printer. In this capacity he produced *The Booke of the Common Praier and Administracion of the Sacramentes, and other Rites and Ceremonies of the Churche: after the Use of the Churche of Engiande* (1549 *seq.),* and *Acfes of Parliament* (1552 and 1553). In 1553 he printed Lady Jane Grey's proclamation and signed himself the queen's printer. For this he was imprisoned for a short time, and he seems thereafter to have retired from active business. His historical works include a continuation (1543) of Hardyng's *Chronicle* from the beginning of the reign of Edward IV. down to Grafton's own times. He seems to have taken liberties with the original. After he retired from the printing business he published *An Abridgement of the Chronicles of England* (1562), *Manuell of the Chronicles of England* (1565), *Chronicle at large and meere Historye of the Affayres* of *England* (1568). In 1553–54 and 1556–57 he represented the City in parliament, and in 1562–63 he sat for Coventry.

See J. A. Kingdon, *Richard Grafton, Citizen and Grocer of London,* etc. (1901), in continiuation of *Incidents* in *the Lives of T. Poyntz and R. Grafton* (1895).

GRAFTON, a city of Clarence county, New South Wales, lying on the Clarence river, at a distance of 45 m. from its mouth, 342 m. N.E. of Sydney. Pop. (1933) 6,412. The city became a municipality in 1850. The river is navigable from the sea to the town for ships of moderate burden, and for small vessels to a point 35 m. beyond it. The entrance to the river has been artificially improved. Grafton is the seat of the Anglican joint-bishopric of Grafton and Armidale, and of a Roman Catholic bishopric created in 1888, both of which have cathedrals. Dairy-farming and sugar-growing are important industries, and there are several sugar-mills in the neighbourhood. Tobacco, cereals and fruits are also grown. There is rail-connection with Brisbane, etc.

GRAFTON, a town of Worcester county, Massachusetts, U.S.A., 8m. S.E. of Worcester; served by the Boston and Albany and the New York, New Haven and Hartford railways. The population (about 12% foreign-born white) was 7,457 in 1940. The several villages are residential suburbs of Worcester, and there are cotton and woollen mills, a shoe factory and other manufacturing industries. Within the present limits of the town was an Indian village uhere John Eliot soon after 1651 organized the third of his bands of "praying Indians." The Massachusetts general court granted to the Indians (1654) 4 sq.mi. for their exclusive use. In 1718 they sold a small farm to the first white settler, and in 1728 a large tract to a group of colonists. The town was incorporated in 1735 and named after the second duke of Grafton. The last of the pure-blooded Indians died about 1825.

GRAFTON, a city of northern West Virginia, U.S.A., 85 mi. S. of Pittsburgh, on the Tygart river, at an altitude of 1.000 ft.; the county seat of Taylor county. It is on federal highways 50, 119 and 250 and is served by the Baltimore and Ohio railroad. The population was 7,431 in 1940 by the federal census. It is in a coal-mining and lumbering region, and has large railroad shops, saw-mills, glass and pottery works and other factories The only national cemetery in the state is there. The West Virginia reform school is 4 mi. west: Grafton was settled about 1852, incorporated in 1856 and chartered as a city in 1899. Grafton is the site of the Tygart's dam, a federal flood control project.

GRAHAM, SIR GERALD (1831–1899), British general, uas born on June 27, 1831, at Acton, Middlesex, and educated at Dresden and Woolwich academy. He entered the Royal Engineers in 1850, and served through the Russian War of 1854, being awarded the V.C. He fought in the China War of 1860, and was promoted brevet lieutenant-colonel and given the C.B. for his part in the storming of the Taku forts and the entry into Peking. He was promoted major-general in 1881, and commanded the advanced force in Egypt in 1882. In 1884 he commanded the expedition to the eastern Sudan. In 1885 he commanded the Suakin expedition, advancing the railway from Suakin to Otao, uhen the expedition was withdrawn. He three times received the thanks of parliament, and was given the G.C.M.G. and the G.C.B. He died on Dec. 17, 1899. He published a translation of Goetze's *Operations of the German Engineers in 1870–71* (1875) and *Last Words with Gordon* (1887).

GRAHAM, SIR JAMES ROBERT GEORGE, BART. (1792–1861), British statesman, son of Sir James Graham and Lady Catherine Stewart, daughter of John, 7th earl of Gailoway, was born on June 1, 1792 at Naworth, Cumberland. He was educated at Dalston, Westminster school and Christ Church, Oxford (1810–12). He sat in parliament from 1818 to 1820, but made no serious mark in politics until 1826, when his pamphlet *Corn. and Currency* foreshadowed his career as an advanced liberal. He was returned in 1826 as Liberal M.P. for Carlisle, a seat which he exchanged in 1827 for the county of Cumberland. In 1830 he moved for the reduction of official salaries. In Earl Grey's administration of Nov. 1830, he was made first lord of the Admiralty, with a seat in the cabinet, and introduced many financial reforms in his department. Graham served on the Committee of four which prepared the first Reform Bill. From 1832–37 he sat again for the county of Cumberland.

In 1834 dissensions on the Irish church question led to his withdrawal, with Lord Stanley, from the ministry. He was again returned for Cumberland in 1835, but in 1837 lost his seat on account of his growing sympathy with the Conservatives. In 1838 he was elected for Pembroke, and in 1841 for Dorchester. He held office as home secretary under Peel (1841–46), but his character hardly fitted him for a post requiring tact and an equable temperament. His treatment of the representatives from Scotland was partly responsible for the dissatisfaction which resulted in the secession of the Free Kirk. During his term of office he became increasingly unpopular, and failed to carry through several reforms which he attempted. In 1844 the detention and opening of letters at the post-office on his warrant raised a storm of public indignation against Graham, though this action was taken at the request of Lord Aberdeen, then foreign secretary. An unsuccessful attempt was made to abolish the home secretary's power in this respect. In 1846 famine threatened Ireland as the result of a potato disease, and Graham's agreement with Peel that the duty on imported corn could not be maintained alienated the Tories. Graham was out of office from Peel's resignation in 1846 to 1852, and on Peel's death in 1850 he became prominent among the Peelites. In 1852 Graham again represented Carlisle, and was again given his post at the admiralty in Lord Aberdeen's coalition Government. Graham took office again under Lord Palmerston, but resigned when he found that there was a cabinet majority in favour of the establishment of a committee of inquiry, to which he was opposed in principle in time of war. Graham successfully resisted an attempt to oppose his election in 1857, but took little active part in politics from that time until his retirement in 1861. He died on Oct. 25, 1861.

See W. MacCullagh Torrens, *Life and Times of Sir James Graham* (1863); *H.* Lonsdale, *Worthies of Cumberland (6* vols., 1867–75); C. S. Parker, *Life of* Sir *James Graham* (1907).

GRAHAM, afterwards **CUNNINGHAME-GRAHAM, ROBERT** (d. 1797?), Scottish poet, was the son of Nicholas Graham of Gartmore apd Lady Margaret Cunninghame. He started life as a planter in Jamaica, where he was for a time receiver-general. In 1784 he was elected rector of Glasgow uni-

versity, and from 1794 to 1796 he was M.P. for Stirlingshire. Politically he is remembered as the mover of a Bill of Rights, in which the Reform bill of 1832 was foreshadowed, and as an ardent advocate of the ideals of the French Revolution; but it is for his lyrics, the best known of which is "If Doughty Deeds My Lady Please," that he has remained famous.

GRAHAM, THOMAS (1805–1869), British chemist, born at Glasgow, was educated at Glasgow University. He was professor of chemistry in the Anderson Institution, Edinburgh (1830–37), then at University College, London (1837–55), and master of the Mint (1855–69). He was F.R.S. (1836), and one of the founders of the London Chemical and the Cavendish Societies.

His first paper, published in 1826, dealt with the absorption of gases by liquids, and the first of his important memoirs on gaseous diffusion appeared in 1829. By measuring the rate at which gases diffuse through a plug of plaster of Paris, Graham developed the law, known by his name, "that the diffusion rate of gases is inversely as the square root of their density." *(See* DIFFUSION.) He further studied the flow of gases through fine tubes, and by effusion through a minute hole in a platinum disc; he found that the relative rates of effusion of gases are, like their rates of diffusion, inversely proportional to the square roots of the densities.

His early work led him to examine the diffusion of one liquid into another, and as a result of the experiments he divided bodies into two classes—crystalloids, such as common salt, and colloids, of which gum arabic is a type—the former having high and the latter low diffusibility; this division has since been modified. Graham observed that in the passage through a parchment membrane these differences still held, and so was led to devise a method —"dialysis"—for the separation of colloids from crystalloids. He also proved that the process of liquid diffusion causes partial decomposition of certain chemical compounds, the potassium sulphate, for instance, being separated from the aluminium sulphate in alum by the higher diffusibility of the former salt.

In 1833 Graham studied the three forms of phosphoric acid (ortho, pyro and meta); the differences between them were attributed to the fact that they contained different amounts of basic water, replaceable by metallic oxides, united with a given quantity of phosphoric anhydride. From this work the important concept of polybasic acids developed *(see* ACID). In 1835 he published the results of an examination of the properties of water of crystallization as a constituent of salts; definite compounds of salts and alcohol, analogous to hydrates, can be obtained, and these were called "alcoholates."

BIBLIOGRAPHY.—Graham's *Elements of Chemistry*, first published in 1833, went through several editions, and also appeared in German, remodelled under J. Otto's direction. His *Chemical and Physical Researches* were collected by Dr. James Young and Dr. Angus Smith and printed "for presentation only" at Edinburgh in 1876, Dr. Smith contributing a valuable preface and analysis of its contents. *See* also T. E. Thorpe, *Essays in Historical Chemistry* (1902).

GRAHAME-WHITE, CLAUDE (1879–), English aviator and engineer, was born on Aug. 21, 1879 He was educated at Bedford and studied engineering. He owned one of the first petrol-driven motor cars in England, and worked at a motor engineering business in London until he became interested in aeronautics in 1909. In that year he gained an aviator's certificate of proficiency, being the first Englishman to do so, and in the following year he entered for many flying races both in Europe and in America, where he won the Gordon Bennett Cup. He founded the first British flying school at Pau, in France, in 1909, and in the following year joined a company to run the Hendon aerodrome of London. At the outbreak of war in 1914 he resigned from his position of flight commander, and superintended the construction of Government aeroplanes. He wrote many treatises on aircraft, dealing with its history, its technical development, and its use in warfare. Among the most important are: *The Aeroplane; Past, Present and Future* (1911); *The Aeroplane in War* (1912); *Our First Airways, their Organization, Equipment and Finance* (1918).

GRAHAMSTOWN, a town in South Africa, 33° 19′ S., 26° 31′ E.; alt. 1,769. White pop. (1926), 7,648; coloured, 7,860. It is 106 m. from Port Elizabeth and is reached by a branch line from Alice Dale, on the main Port Elizabeth-Pretoria line. The first settlement, established here in 1812, near the headwater of the Kowie river, and on the slopes of the Zuurberg, was a military post, founded by Col. John Graham, to hold in check the Kafir tribes, who were pushing south-westward. The town is named after its founder. After the arrival of the 1820 settlers, the site was chosen as a central rallying-point in case of need. Since that time, in spite of its present somewhat isolated position, Grahamstown has retained its importance. It is the capital of the Eastern Province of Cape Colony, and here the Eastern Province law courts are placed. It is also the seat of Anglican and Roman Catholic bishops. The town is pleasantly laid out with broad, straight streets, often lined with trees. It is often regarded as the most English town in Cape Colony. The slopes of the neighbouring ridge are planted with trees, and from the top a magnificent view of the surrounding country can be obtained, a view of much geological interest. The town is also an important educational centre. It has several good schools, and a training college. The Rhodes university college, a constituent college of the University of South Africa, stands in its own grounds, and is equipped with fine hostels, college buildings and playing fields. Among the public buildings mention may be made of St. George's cathedral (Anglican), built from designs by Sir Gilbert Scott, St. Patrick's cathedral (R.C.), and the commemoration chapel (Wesleyan), erected in 1845 by the British 1820 settlers. The Albany museum ranks high in South Africa for its examples of South African fauna and its collection representing early African cultures.

(R. U. S.)

GRAIL, THE HOLY, the famous talisman of Arthurinn romance, the object of quest on the part of the knights of the Round Table. It is mainly, if not wholly, known to English readers through the medium of Malory's translation of the French *Quête del Saint Graal,* where it is the cup or chalice of the Last Supper, in which the blood which flowed from the wounds of the crucified Saviour has been miraculously preserved. Students of the original romances are aware that there is in these texts an extraordinary diversity of statement as to the origin and nature of the Grail, and that it is extremely difficult to determine the precise value of the differing versions.

The word *grail* undoubtedly originally signified *dish;* we read in an early French text of "boars' heads on grails of silver," and Robert de Borron, the author of the first Christian Grail romance, represents it as the dish on which, at the Last Supper, the Paschal Lamb was served. Helinandus describes it as a "wide and somewhat shallow dish." This is certainly the primary sense of the word, which later on became attached to the varying manifestations of this mysterious object. Thus it may be a direct food-providing talisman, as in the version attributed to the Welshman, Bleheris (probably identical with the Bledhericus to whom Giraldus Cambrensis refers as *"famosus ille fabulator").* Here the king and his guests are fed by the "rich" Grail, which acts automatically, *"sans serjant et sans seneschal,"* the butlers providing the wine. Or it may be indirectly such a talisman, as in the *Perceval* romances and the Galahad *Queste,* where its appearance synchronizes with the feast provided, but we are not told that it is, as in the first case, the actual source of the food. It may be a crystal vase, filled with blood, from which the Fisher king drinks, through a golden reed (*Diu Crône,* first visit) or a reliquary containing the Host (*ibid.,* second visit). It may be a cup or dish, accompanied by a lance, which bleeds into it (Bleheris and *Perlesvaus*); the dish of the Last Supper (Borron's *Joseph),* or the cup *(Queste).* It may be a stone, as in the *Parzival;* or its place in procession may be taken, as in the Welsh *Peredur,* by a bleeding head on a dish. The task of the critic is to discover a solution which shall admit of all these diverse objects being one and the same, all equally "the Grail." Modern criticism is gradually arriving at the conclusion that there is only one solution which will meet these apparently contradictory demands: that which lies in the direction of what is now termed the "ritual" origin, rather than in that of purely Christian legend or modified folk-tale. The theory of a Christian origin, once very

generally accepted, has now been practically abandoned in face of the fact that no story of Joseph of Arimathea and the Grail exists in any legendary; it makes its first appearance in the romance of *Joseph of Arimathea* by Robert de Borron, composed in the closing years of the 12th century, and by no means the earliest Grail romance. The connection of Joseph with Glastonbury, still credited in some circles, is even later, and is obviously imitated from the much earlier "Saint Sang" legend of Fescamp, of which Nicodemus is the protagonist. Glastonbury and Fescamp were alike Benedictine foundations, both enjoyed royal patronage, and their abbots were closely connected by family ties both with each other and with the royal family of England. The *Joseph-Glastonbury* story, which in its earliest form knows nothing of the Grail, is thus easily to be accounted for. The folk-tale theory has more in its favour, as there are undoubted folklore features in some of the romances, such as, *e.g.,* the food-providing powers of the Grail, but we have no popular tale, even fragmentary, which provides us with the requisite *mise-en-scine.*

On the other hand, it is now very generally recognized that the machinery of the earlier romances—the Fisher king, sick, wounded or in extreme old age, whose incapacity entails disastrous consequences upon his land and folk, both alike ceasing to be fruitful; the quester, whose task is to heal the king, and restore fruitfulness to the land—bear a striking resemblance to the cults associated with such deities as Tammuz, Adonis and Attis, the object of which was the renewal of vegetation and the preservation of life. Further, we now know that a certain early Christian sect, the Naassenes, identified the Logos of the Christian worship with these earlier deities, practised a triple initiation into the sources of life, physical and spiritual, and boldly proclaimed themselves to be "alone the true Christians, accomplishing the mystery at the Third Gate." The evidence for the connection between Christianity and the Attis cult in particular is clear, and has been commented upon by A. B. Cook in the second volume of his monumental work on *Zeus.* Scholarly opinion is steadily coming round to the view that the only interpretation of the obscurities and apparent contradictions of the Grail story is to regard it as the confused record of a form of worship, semi-Christian, semi-pagan, at one time practised in these islands, the central object of which was initiation into the sources of life, physical and spiritual. This, and this alone, will account for the diverse forms assumed by the Grail, the symbol of that source. Thus is may be the dish from which the worshippers partook of the communal feast; it may be the cup in juxtaposition with the lance, symbols of the male and female energies, source of physical life, and well known phallic emblems. It may be the "Holy" Grail, source of spiritual life, the form of which is not defined, and which is wrought of no material substance—"'twas not of wood, nor of any manner of metal, nor was it in any wise of stone, nor of horn, nor of bone"; it is a spiritual object, to be spiritually discerned, but always, and under any form, a source of life. Thus Wolfram's stone, the mere sight of which preserves all inhabitants of the Grail castle, not only in life, but in youth, is what is popularly known as "the philosopher's stone," that stone of the alchemist which was the source of all life. Even the bleeding head of *Peredur* may be interpreted on the same lines. A passage in the York Breviary, for the Feast of the Beheading of St. John the Baptist, states *"Caput Jolzannis in disco signat Corpus Christi quo pascimur in sancto altari."* When the Grail had once been elevated to the purely Christian orthodox plane, as was done by Borron, and became the source, no longer of physical, but of spiritual life, such a substitution, by one familiar with the York Breviary, was possible, even as the author of Wolfram's source, or one before him, had introduced the alchemical stone. As the record of the perennial, too often unsuccessful, quest for the source of life, all the puzzling features of the Grail story are capable of satisfactory explanation. There is no other clue to the maze.

The versions of the Grail Quest which have come down to us are (*a*) those of which Gawain is the hero: the version by Bleheris, incorporated in the first continuation of Chrétien de Troyes' *Perceval,* and *Diu Crône,* a long and rambling series of *Gawain* adventures, the source of which is unknown. (*b*) The important group of which Perceval is the central figure: the *Conte del Grual* or *Perceval* of Chrétien, with its three continuations, respectively due to Wauchier de Denain, Gerbert (probably Gerbert de Montreuil, author of *Le Roman de la Violette),* and Manessier; the *Perceval* of Robert de Borron; *Perlesvaus,* by an unknown writer, and *Parzival,* by Wolfram von Eschenbach, the finest romance of the cycle. Of the three continuations of Chrétien's poem that of Gerbert is the most interesting, as it witnesses to the existence of a tradition connecting the Swan Knight with the Grail hero, a tradition known also to Wolfram and to the author of *Sone de Nausai,* and familiar to the present generation through the medium of Wagner's *Lohengrin.* (*c*) The latest of the Grail romances is the *Queste,* or *Quête del Saint Graal,* a section of the prose *Lancelot,* known to English readers through the medium of Malory's translation. Thus we have two romances of which Gawain is the hero; seven, if we include the three continuations of Chrétien, connected with Perceval; one only which knows Galahad, with Perceval as a good second. To treat Galahad as Grail hero *par excellence,* as is too often done, is a grave mistake.

BIBLIOGRAPHY.—The great bulk of the Graii literature still awaits adequate editing. The *Conte del Graal* or *Perceval* of Chrétien is still only available in Potvin's edition (6 vols. 1866–71). This is not a critical edition, and the ms. selected, that of Mons, is unfortunately the least reliable of the extant texts. The Gerbert continuation, which exists in only two mss., has been edited by Dr. Mary Williams for *Les Classiques Français du Moyen Age.* So far only two of the three volumes announced have appeared. The same series includes an edition of *La Quête del Saint Graal* (Galahad Quest) by A. Pauphilet, and an edition of Borron's *Joseph* by W. *A.* Nitze. A critical edition of the *Perlesvaus,* under the direction of W. A. Nitze, is about to be published by the Carnegie trustees. The text of the Modena ms. of Borron's *Perceval* (a superior text to the Didot) was published by J. L. Weston, in vol. ii. of *The Legend of Sir Perceval* (1909). *Diu Crône* is still only available in Scholl's edition (Stuttgart, 1852). Three of the *Gawain* Grail visits (Bleheris, prose *Lancelot,* and *Diu Crône* second visit) have been translated by J. L. Weston, in vol. vi. of *Arthurian Romances.* The *Parzival* is that one of the Grail texts which has been most thoroughly studied. The most available version for popular use is that by Bartsch *(Deutsche Classiker des Mittelalters),* which has recently been revised; other editions are by Lachmann (1891) and E. Martin (1903). There is an English translation by J. L. Weston, *Parzival, a Knightly Epic* (1894). The *Perlesvaus,* has been translated by Dr. Sebastian Evans, *The High History of the Holy Grail* (1898). *A* translation of the Galahad *Queste* will be found in Malory (Books XIII.–XVIII.). For general treatment of the subject *see* J. L. Weston, *From Ritual to Romance* (1920); *J.* D. Bruce, *The Evolution of Arthurian Romance* (1923); *J.* Armitage Robinson, *Two Glastonbury Legends* (1926); *R.* S. Loomis, *Celtic Myth and Arthurian Romance* (Columbia University Press, 1927). (J. L. W.)

GRAIN, the fruit or caryopsis of cereals, and hence cereal plants generally (from Lat. *granum,* seed). (*See* GRAIN PRODUCTION.) The word is also used of the malt refuse of brewing and distilling, and of many hard rounded small particles, such as "grains" of sand, salt, gold, gunpowder, etc. A "grain" is also the smallest unit of weight, both in Great Britain and the United States of America. Its origin is supposed to be the weight of a grain of wheat. The troy grain= $\frac{1}{5,760}$ of a lb., the avoirdupois grain = $\frac{1}{7,000}$ of a lb. In diamond weighing the grain = $\frac{1}{4}$ of the carat = ·7925 of the troy grain. The word "grains" was early used of the small seed-like insects supposed formerly to be the berries of trees, from which a scarlet dye was extracted *(see* COCHINEAL and KERMES). The imitating in paint of the grain of wood is called "graining" *(see* INTERIOR DECORATION).

GRAIN ELEVATORS: *see* GRANARIES.

GRAINGER, PERCY ALDRIDGE (1882–), Australian pianist and composer, was born at Brighton, Melbourne, on July 8, 1882. He studied with Louis Pabst in Melbourne, with Kwast at Dr. Hoch's conservatorium, Frankfurt, and later with Busoni. From 1900 to 1915 he lived in London, during which period he made extensive concert tours and also collected the folk-tunes of which his very effective arrangements are widely known. In 1915 he settled in the United States. His compositions include: *Molly on the Shore* for orch., small orch, strings; *Shepherd's Hey* for orch., also for 12 voices; *Mock Morris,* sm. orch., strings; *Irish Tune from County Derry,* strings and horns, strings only; Clog Dance: *Handel in the Strand,* piano and

strings; paraphrase on the "Flower Waltz" from *Cassenoisette*, Tschaikovsky, for piano; choruses with instruments; ***Brigg*** Fair, tenor solo and mixed chorus.

GRAINING: see INTERIOR DECORATION.

GRAIN PRODUCTION AND TRADE. No one can study the international trade in grain without noticing the great changes that have occurred in modern times and that are still occurring. Since the closing years of the last century there have been developments which may affect the dietary and economic conditions of the various races of mankind; these later developments will be discussed and illustrated in subsequent sections of this article. If we take a longer survey of the position, we find that one of the most striking features is the gradual displacement of rye by wheat in the dietary of the European races. The displacement is still only partial, but it is progressing steadily, and it would seem as if wheat would become the staple bread-stuff of the Caucasian peoples and perhaps of some at least of the races of the Orient. In a somewhat similar way maize appears to be taking the place of oats and barley as a cattle-food, but here too the displacement is only partial. Development in the growing of grain is certainly not standing still, the world's average yield per acre having increased appreciably in recent years. In most countries of Europe, governments are giving more attention to scientific plant breeding than ever before. In North America, recent research has been focussed on the rust resistant varieties of wheat, "Thatcher," evolved in Minnesota, being probably the best known of these. Plant breeders the world over are aiming to provide growers with better yielding seed and hardier species of grain, but their work is necessarily slow. We may be sure, however, that the last word in the breeding of new plants has not yet been said, and it would be venturesome to say it is outside the bounds of possibility for some new plant to be evolved which may even displace wheat as the chief bread-grain of civilized man. In another direction too there have been developments; synthetic commodities are being manufactured on a large scale. The French chemist Berthelof held the opinion that synthetic wheat and flour are within the bounds of possibility and put his belief on record in the following words:—"The day is perhaps near when the progress of chemistry will make it possible to manufacture foodstuffs economically. When that day arrives the cultivation of wheat and the raising of cattle mill meet with the fate that we have seen fall upon the cultivation of madder. There will be immense shifting of interests, but the masses will profit by the change."

The World's Wheat.—The statistics of wheat production are of deep interest:

Wheat Crops of the World
(in thousands of quarters of 480lb.)

	1890	1900	1913	1927	1938
Europe (without Russia)	137,400	138,870	153,700	157,800	229,800
North America	56,700	80,500	124,300	164,500	160,100
South America	6,400	9,100	18,000	34,200	46,100
Australasia	4,900	6,900	13,600	14,600	19,700
India and Japan	30,000	33,800	48,300	45,400	56,000
Africa	6,200	7,860	13,400	13,300	16,600
Total (without Russia)	241,600	277,030	371,300	429,800	528,300

Wheat can truly be described as the most important of all crops, for it provides the staff of life for all the more advanced and progressive people of the world. It has certainly been known to man for 5,000 years and has always accompanied him in his forward march. The crop responds readily to generous and careful treatment and herein lies the main reason for the great plethora of supplies grown during the present era. Enormous areas which, before the war of 1914–18, were growing 8 to 12 bushels an acre, are now producing 14 to 15 bushels, and, in some instances, even more. Seemingly, the world has been relieved for many decades of all anxiety concerning its supply of bread. As an instance of what can be produced on good land under favourable conditions, there is on record the sworn statement of a Canadian farmer of the Peace River district, that in 1927 he harvested 8j bushels per acre from twenty acres of summer fallow land. On the other hand, without man's care and cultivation wheat dies out completely.

In addition to the crops given in the table, there are others concerning which no reliable statistics are available. These include those of Mexico (about 1,500,000qrs.), Turkey (about 20,000,000qrs.), Manchoukuo (about 4,000,000qrs.), China (80,000,000qrs.), Iran (2,000,000qrs.). The figures given in brackets are unauthoritative estimates of outturn which have been issued from time to time. There are also crops such as those of Kenya, Brazil and Peru, which may increase, but are at present quite unimportant.

Adjustment of **Supply** to Demand.—It was said of old that while the earth remained seed time and harvest should not cease, and the experience of mankind proves how well the promise has been fulfilled. In a majority of years during the decade 1928–38, the world grew a greater quantity of wheat than it was possible to market economically in the season of its production. Owing to a constant threat of war, the group of countries in Europe which constitute the importing bloc, were so concerned to increase the native production of wheat, that imports were considerably reduced. The reduction, however, was not accompanied by a corresponding curtailment of output in the exporting countries, and in the season 1939–40 the surplus of world supply over demand was the largest on record.

The consumption of any importing country can be ascertained approximately by adding the imports to the home crop; in the case of exporting countries, the home consumption is found by deducting the exports from the quantity grown.

The World's **Maize.**—We pass to the statistics of the crops of maize or Indian corn, commonly called "corn" in America.

The Maize Crop of the World
(in thousands of quarters of 480lb.)

	1890	1900	1913	1927	1938
Europe (including Russia)	39,000	54,300	79,400	73,500	82,400
United States	172,000	255,000	285,000	325,000	296,600
Argentina	5,500	7,000	25,700	37,400	20,300
Africa	4,700	5,000	11,300	18,000	16,600
British India	8,000	6,700	9,500	10,000	10,000
Total	229,200	328,000	410,900	463,900	425,900

This cereal is also grown in a number of countries which do not publish regular information about production, or for which it is not possible to obtain comparable statistics. The most important are: Dutch East Indies about 9,500,000qrs., Philippine Islands about 1,500,000qrs., Mexico 7,000,000qrs., Manchoukuo about 10,000,000qrs. Australia grows a small crop and other small crops are those of Peru, Brazil, New Zealand and Uruguay.

Maize is usually considered a secondary or coarse grain and rated as feeding-stuff, but it is used as human food by many millions of people in tropical climates and in the southeast of Europe; it is also much used for food in Italy and the United States. Dari or Kaffirkorn is used with maize in tropical climates and largely grown in countries which do not compile statistics of production, such as the Sudan, Syria and Iran, but there are crops, such as those of South Africa and the United States, of which the outturns are definitely known. Maize is not a bread grain and therefore cannot rank with wheat as human food but it is a crop of the greatest importance to the human race. Like wheat, it emerged with man from unrecorded history and depends on man's care for its continued existence. There is no known wild maize, although it was reported that a kind of grass with large seeds was discovered in America some time ago, which might have been the parent of maize.

The yield of maize in America is 213bushels per acre compared

with 14 bushels of wheat and 17 of barley; in Argentina 28 bushels per acre against 13½ of wheat, while good European crops will give 32 bushels of maize against 20 of wheat from adjoining lands. (All comparisons are made in bushels of 60lb. weight.) It is safe to predict that maize will continue to be grown as long as meat, milk and eggs are popular articles of diet.

The World's Barley.—The available statistics of barley production are as follow:

Barley Crops of the World
(in thousands of quarters of 400lb.)

	1890	1900	1913	1927	1938
Europe (without Russia)	48,700	62,600	70,000	80,700	92,800
North America	10,700	9,600	27,200	42,700	42,500
North Africa	8,500	9,000	12,400	9,700	9,400
India, Japan and Korea	25,300	24,500	33,500	27,600	27,300
Southern Hemisphere	1,100	1,200	2,400	3,000	5,200
Total (without Russia)	94,300	106,900	145,500	163,700	177,200

This table does not give a full list of the world's barley crops, the chief omissions being those of Russia, Asia Minor, and 'Iraq, all of which are important in the international trade. In 1938–39 the United Kingdom imported 1,137,000qrs. from Russia and nearly a million quarters from 'Iraq.

Barley is of ancient lineage, probably the equal of wheat in this respect; it is of the greatest importance to agriculture and cattle raising.

Barley is a dual purpose grain; it is used for malting and distilling and also for animal food, being especially valuable for fattening pigs. The best qualities are bought for malting purposes, the lower ones go to the distillers, and the poorest sorts are ground up for meal. The average barley yield in England and Wales expressed in bushels of 60lb. is 30½; in the United States 17½; in Germany 14.

The World's Oats.—The following table gives the available figures for oats:

The Oat Crops of the World
(in thousands of quarters of 320lb.)

	1890	1900	1913	1927	1938
Europe (without Russia)	128,500	134,600	191,600	184,200	185,100
North America	59,400	93,000	155,000	164,000	144,800
Southern Hemisphere	2,200	4,200	9,800	7,100	9,000
Total (without Russia)	190,100	231,800	356,400	355,300	338,900

In addition to the crops included in the above table there are a few others but these, apart from Russia, are not important.

The oats crop can be described as the friend of the poor man and the good servant of his richer neighbour. It grows and flourishes where sunshine is scanty and the land not very fertile, but at the same time it well repays the care of the good farmer and brings forth heavier yields on the better soils. Speaking generally, the best oats grow towards the north, or south of the equator towards the south.

English farmers have been very dissatisfied with the prices they have received for oats in recent years and the government has at length introduced a bonus system, whereby a subsidy is paid to growers on an acreage basis when the price of the article falls below a certain level.

Although oats are still extensively grown, production has long passed its peak. The displacement of horse traction by the machine has affected the consumption of feed oats more than any other single commodity.

Expressed in units of 60lb., oats do not always yield so well as wheat, the figures for Great Britain being 29½ of oats against 33 of wheat. In France the yields are 21 units of 60lb for both wheat and oats; but in the United States oats make a much better relative showing with 14½ units against 12¾ units of wheat.

The World's Rye.—The statistics of rye production here follow:

Rye Crops of the World
(in thousands of quarters of 480lb.)

	1890	1900	1913	1927	1938
Europe (without Russia)	64,600	74,700	95,600	92,600	113,900
North America	3,300	3,300			
Argentina	..	100	5,100	9,100	7,700
			400	860	1,260
Total (without Russia)	67,900	78,100	101,100	102,560	122,860
Russia	*87,500	†117,000	§116,000	‡100,000	†90,000
Grand total	155,400	195,100	217,100	202,560	212,860

*60 governments; †70 governments; $73 governments; ‡Soviet Russia.

Rye is a very valuable bread grain, but its cultivation has increased very gradually since the war of 1914–18, and even yet has not attained the volume of 1913 Argentina has made a *small* extension of her rye acreage, but Europe is not growing more rye, or if there is any increase it is not important. The European crop. exclusive of Russia, shows a bigger total than in the former years, but previous to 1914 Poland and the small Baltic States (Estonia, Lithuania, Latvia) were all included in Russia. It cannot be doubted that rye will continue to be cultivated in northerly regions, but gradually it is giving place to mheat.

Rye is not a heavy yielding grain, the outturn in Germany averaging 26 bushels per acre compared with 33 bushels of wheat; in the United States the yield is 11 bushels compared with 12¾ bushels of wheat; the comparisons are made in bushels of 60 lb.

THE GRAIN MARKET

Recent developments in grain trading have tended to reduce the volume of business transacted on the large exchanges of London and Liverpool. At Liverpool, "futures" trade in wheat is still active, but efforts to develop a similar market in London have met with only a modified degree of success. London was formerly pre-eminent, in the c.i.f. business by reason of the large surplus supplies which the United Kingdom imported, the financial facilities available in London, together with well-placed ports of call in the South of England and Ireland to which laden ships could be sent to await orders. Among the causes of reduction are the smaller imports made by continental countries and the efforts of exporters to sell direct to the importers; the formation of pools and official selling agencies in Canada, Australia, Argentina and the United States which seek to obtain high prices for growers by cutting out merchants and brokers—where possible the pools sell full cargoes direct to millers; the formation of millers' combines with the object of buying large quantities direct from shippers, both brokers and merchants being ignored in these operations.

Movements of Wheat.—The statistics in the tables on the next page show the world's commerce in wheat.

World exports of wheat nearly doubled between 1900 and 1928 but with the inauguration of the self-sufficiency era, trade subsequently contracted. The period 1929–39, in fact, makes depressing reading. It was a period of low prices, world over-production and general economic deterioration. The importing countries of Europe, without exception, brought into operation measures to reduce the inflow of foreign wheat or to exclude it entirely. National development of mheat growing in Europe cut down the world trade in wheat and flour by some 20 to 30 million qrs. per annum. In the seasons 1936–39, not one country in Europe imported as much foreign wheat or flour as in the peak or "pre-depression" period of 1925–29. However, most authorities believe that, with the return of more stable political conditions, Europe will reverse its policy and call a halt to uneconomic production at home. There is an abundance of additional land in Canada, Argentina and Australia to enable shippers to sell still larger quantities, and there are millions of potential buyers and consumers in Asia and Africa, but they have yet to acquire a

Wet Exports of Wheat & Flour (Reckoned as Wheat)
(in thousands of quarters of 480lb.)

The figures for the war years are necessarily incomplete for some countries.

taste for wheaten bread and sufficient money to pay for it. Alterations in the sources of supply have been many and varied within the memory of the oldest traders. Baltic ports were once important shippers, but they were pushed out of the trade by South Russia and the Eastern states of America, then came California and India, and finally the great inland States of America, the vast prairies of Canada, the fertile plains of Argentina and the vast spaces of Australia, measured in millions of square miles.

London Corn Trade Association. — The usages and terms of the London market are matters within the competence of the London Corn Trade Association, a corporate body including members of all grain trade firms of consequence in Great Britain, on the Continent of Europe. and among exporters of North and South America, of India, Australia and Africa. Brokers and traders in all the principal ports of Britain find it advantageous to belong to this Association. Most of those not strictly connected with London are members of their own local associations, of which the Liverpool Corn Trade Association is the most important, followed by those of Hull, Bristol, Leith, Antwerp, Rotterdam, etc. The main object of these associations is the protection of the common interests, by defining terms of contract, by providing for arbitration in cases of dispute, and by taking mkasures to uphold the rights of traders against infringement.

The predominance of North America in the grain markets of the world is an outstanding fact, and it is not too much to say that the wheat quotations of Chicago and Winnipeg are those most regarded as deciding the course of the world's grain trade from day to day; the importance of Buenos Aires quotations has also steadily increased as Argentine crops have become greater and trade in River Plate produce has steadily expanded.

United States and Canadian Trading. — In the United States and in Canada the system of Government inspection of grain for settling grades is very efficient, and the certificate of the Government inspector is accepted as final. By far the greater part of the grain business in the United States is in connection with produce intended for national consumption or manufacture, although recently the Government has helped to keep export business alive through subsidies. In Canada the relative size of overseas trade is much greater, but the system of inspection and grading is even more precise than in the United States and is frankly accepted by importers. In dealing with Argentina, whence the tropical passage may cause the grain to deteriorate on the voyage, the contract's basis throws this risk on the shoulders of the exporter and wheat is sold with a guarantee of natural weight and good condition to be verified at discharge of the grain. Wheat from Australia is sold as average at time of shipment, about equal to the official standard, and somewhat similar stipulations are made in the special contract form for Indian wheat, with a guarantee in case of damage by weevil, or deterioration by the excessive mixture of barley or any other extraneous matter. Russian wheat is now sold on sample.

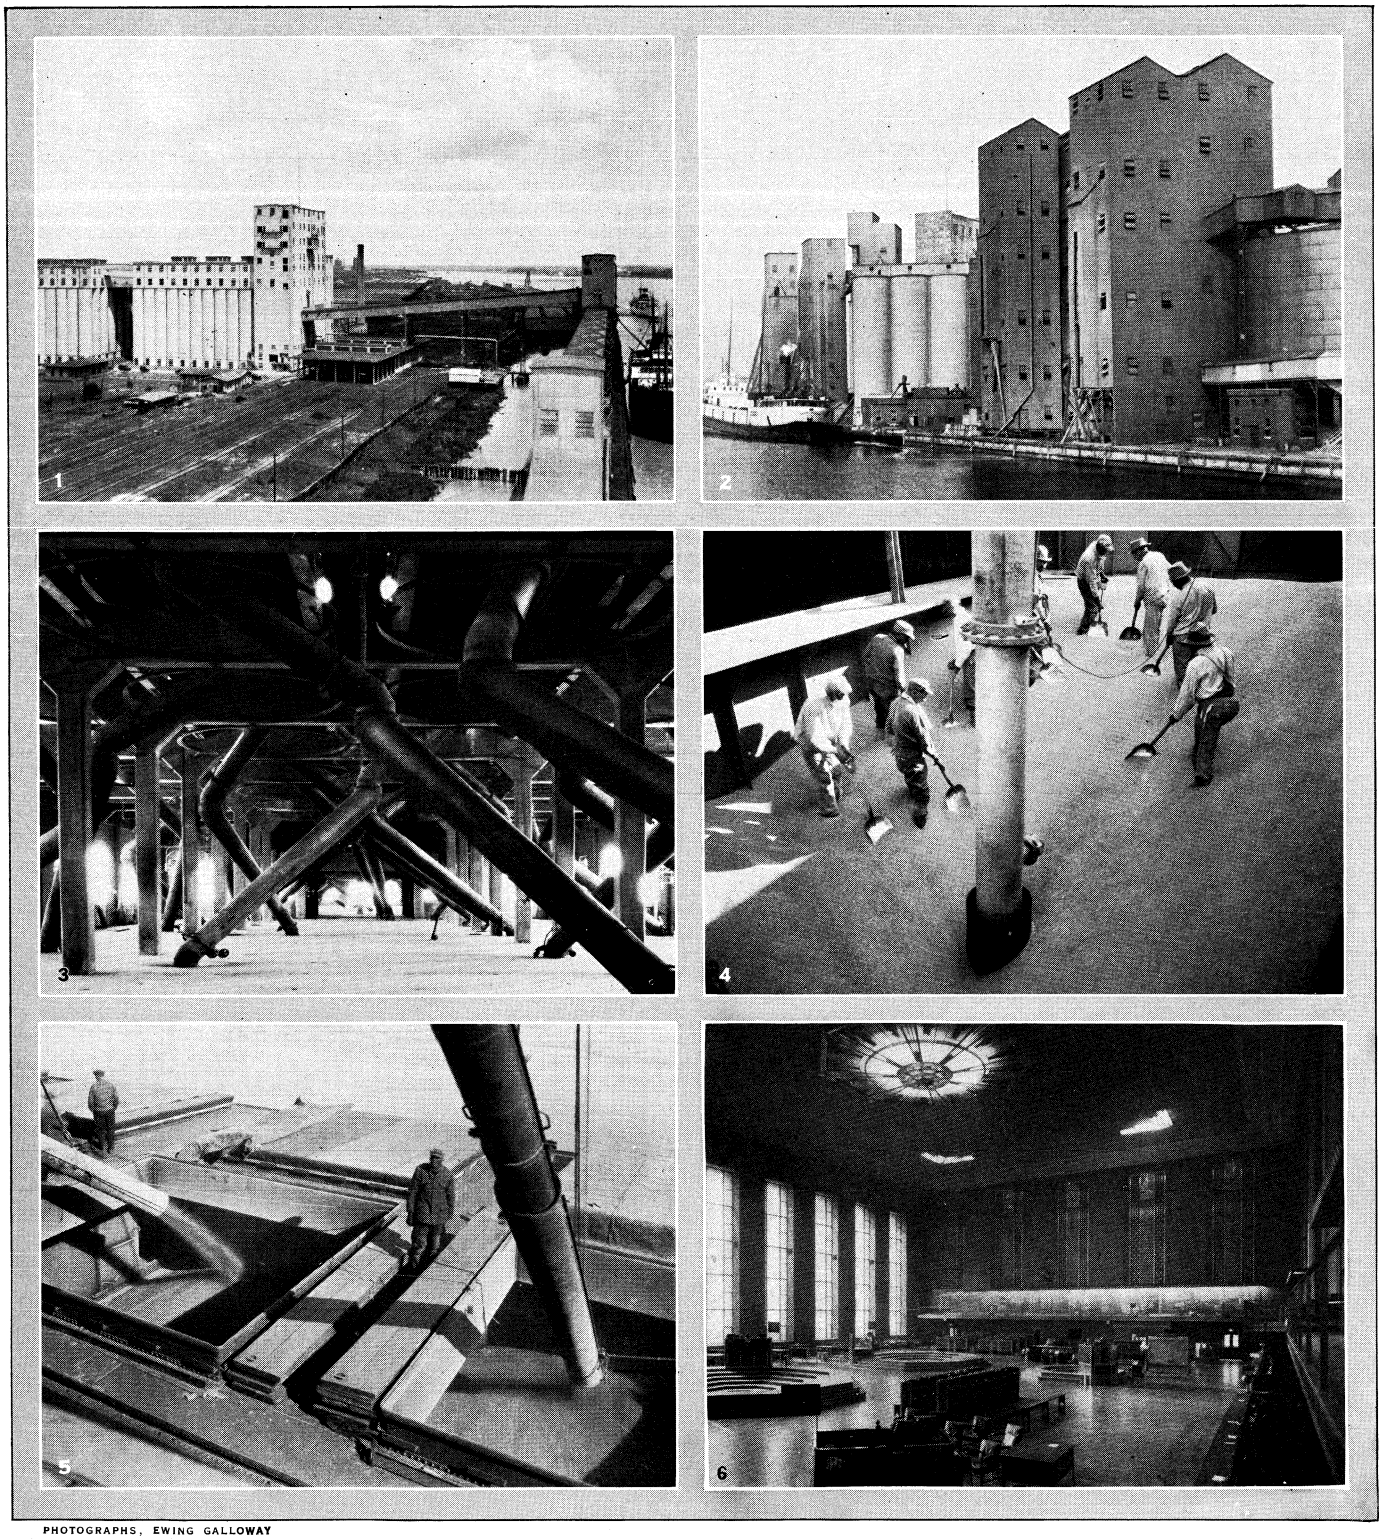
The practice of grading wheat and other grain has spread from North America to other countries, but lacking the complete elevator systems, these cannot deal with all their crops on the basis of grades. Argentina will probably be the next country to adopt the grading certificate.

Millers' Purchases. — By far the larger portion of the world's wheat crop finds its way to the flour mill although some considerable quantity is used for cattle or poultry food. The miller is in most cases the original buyer of grain for British ports, to be discharged direct from the ship into his warehouse communicating with the mill by grain elevators and conveyors. In the British grain trade today there is very little scope for the merchant who formerly purchased a wheat cargo for apportionment in suitable quantities amongst the smaller mills.

Futures. — Apart from direct sales of overseas wheat to millers, considerable business is done by traders who buy wheat for shipment and, either immediately or later, sell a similar quantity for delivery at a future period. This future delivery trading, known also as *marché à terme* or *mercado á término,* originated in the United States and has been established at Liverpool for over half a century. It was adopted at Buenos Aires in 1908 and at Winnipeg in 1904. There are future delivery exchanges, including grain contracts, at several other American markets, also at Paris, Rotterdam, etc.; formerly grain futures trading was practised at Berlin, Hamburg, Genoa, and Milan, but it was no longer permitted under the authoritarian régimes. At Chicago futures trading is established for wheat, maize, oats, barley, and rye; at Winnipeg for wheat, oats, barley, and rye; at Buenos Aires for wheat, maize, and oats; in Liverpool wheat absorbs the chief attention and this is also the case in other big markets. It may be considered as essential that, to avoid cornering, a future delivery exchange should have an ample available supply of such qualities of wheat as are in favour with millers; in other words, the exchange should be located on a main route of transit between the grower and the consumer. Unless this condition is fulfilled the business organization seldom succeeds.

By means of one or other of these exchanges the farmer can, if he chooses to do so, sell his crop of wheat whenever the price suits him, months before it is ready for the reaper, and thus practically eliminate any risk of falling prices. The miller who has purchased a cargo of wheat can sell an equal quantity in the form of contracts for future delivery. Naturally he will not find this course desirable unless there is an apparent profit between the price paid for his cargo, and that obtainable for future delivery of wheat. The miller has to buy wheat for his mill, and if he makes contracts for future delivery his next enterprise is to sell the flour to be manufactured later, and, as he achieves this, to buy in his wheat contracts. He thus makes four transactions in place of the simple purchase of wheat abroad and the sale of flour at home.

Settlement of Price Differences. — Future trading involves, in effect, a daily settlement by seller and buyer alike of the difference in price arising from market fluctuations, and a payment



PHOTOGRAPHS, EWING GALLOWAY

STORING, SHIPPING AND TRADING GRAIN IN THE UNITED STATES

1. Modern grain elevator built by the State of Louisiana at New Orleans. Its storage capacity is over 2,500,000bu., and its sacking capacity 7,200bu. per hour. Elevator (left) consists of tubular concrete bins, open at the top and filled through chutes (fig. 3). Grain is unloaded from barges or railroad cars by suction tubes, stored in elevator, then loaded into ocean steamers for shipment to foreign markets
2. Grain elevator along the Lake Erie water-front at Buffalo, to which wheat is shipped by steamer from Duluth and other Great Lakes ports, for transport by the barge canal to Atlantic ports. The illustration shows (centre) concrete bins and (right) covered elevators
3. Interior of upper structure of the elevator in fig. 1, showing chutes which distribute grain into the round bins. The chutes are jointed and can be turned to reach several bins in their radius
4. Suction unloader removing grain from a steel barge for storage in water-front elevator. A barge can be emptied in a few minutes by this method
5. Filling a barge with wheat in St. Louis, for shipment via the Mississippi river to New Orleans. Covered bins, fitted with weather-proof hatches, keep the wheat in prime condition during shipment
6. The famous wheat pit of the Chicago Board of Trade, the grain-trading centre of North America. In the background is the panel on which price changes are recorded

by both parties at the time of making the contracts of a cash margin according to the regulations which form part of the contract stipulations. The penalty for non-payment of difference at the appointed time is the immediate sale or purchase. as the case may be, of all contracts standing in the name of the defaulting member in the clearing house registry.

The wheats tenderable against the Liverpool future delivery (Graded Wheat) contract are Canadian Spring wheat; American Red wheat and Spring wheat; Soft Winter wheat and Hard Winter wheat, Argentine wheat (northern type and southern type) and Australian wheat; but no wheat is tenderable which is unsuitable for general milling purposes.

Movements of Maize.—There have been great changes in the sources of supply of this cereal, but on the whole the trade has flourished.

Maize growers have grumbled at the prices obtained but they have continued to ship. In the case of Argentina the quantities exported have steadily grown until the trade is now on a vast scale, and moreover it appears likely to increase. Argentina indeed, is regarded as the main source of supply, but in years of poor crops, the higher international price invariably encourages the United States to export. There is no country in the world that grows as much maize as the United States. The British Empire does not figure prominently as a maize exporter. The African supplies are uncertain, the Canadian climate is not suitable, and Australia finds the international price too low. India can consume all the home crop in a normal year. As maize contains a larger percentage of moisture than wheat, it is more likely to spoil if shipped soon after harvest, or during the germinating season.

The units for maize sales on the international market are a quarter of 480lb. or a metric ton of 1.000 kilos (2,204·6lb.). American maize is sold on grade, the certificate of the U.S. grader being final. Argentine maize is sold as fair average quality and shippers guarantee full outturn on arrival; of course, the quality and condition must be right to conform to the description "fair average." South African and Kenya maize are also graded by the Government and sales are made on the basis of the official inspection certificate. The unit for "futures" (forward deliveries) and spot sales in Liverpool is 100lb.; in America the bushel of 56lb. is the legal unit. In South Africa and East Africa the bag of 200lb. is always employed for statistics and sales.

Barley Movements.—The statistics of the commerce in barley since 1900 are shown in the following tables:

Exports of Barley
(in thousands of quarters of 400lb.)

United Kingdom and Eire	5,100	4,400	3,300	4,500	3,600	5,600
Holland	300	200	50	1,900	2,100	1,400
Belgium	1,100	300	100	1,600	1,400	2,400
France.	600	3,200	1,200	300	300	500

The moderate exports in 1900–01 were below the average of that period, for Russia and Balkan countries alone were then averaging shipments of about 10,000,000qrs. yearly. By 1910–11 the Russian trade had reached its highest point and a very active shipping business was being done. The great bulk of the Russian barley went to Germany, to feed the herds of pigs on which the Germans relied to provide the fats and meats which formed such a large part of their dietary. But the war cut off the Russian supply almost as completely as if it did not exist, and the blank shown for the period 1916–20 testifies to a complete stagnation of the trade. After the dislocation caused by the World War of 1914–18 the former volume of business in feeding barley was never recovered. Maize came increasingly into favour, while the former big importing countries, especially Germany, concentrated more and more on either home-grown feeding barley or substitute feedingstuffs. Malting barley is furnished by other and widely separated lands, chiefly California and Chile, but smaller quantities are obtained from Asia Minor and Australia, and lower qualities from India, Canada, and North Africa.

On the British markets the supplies of home grown and foreign barley used to be about equal in quantity, so that brewers and maltsters could select' the desired quality from either source, but times have changed, and in more recent years native types have predominared. Agricultural legislation has favoured the barley grower who, commencing with the season 1939–40, is entitled to a guaranteed average price, the difference between the guaranteed and the open market price being made good by payments obtained by a levy on home-brewed beer, malt, etc. The suitability of barley for malting is one of the technical studies of the grain trade and a really accurate judgment on a particular sample is not an easy matter. Of the feeding barley trade in Great Britain, Bristol is the chief centre. Sales are always made per 400lb. and the contracts expressly stipulate that imported barley shall not contain more than a fixed percentage of foreign matter, *e.g.*, 3% or 5%. It was found necessary many years ago to fix definitely the amount of foreign matter tolerated, because it seemed the Russian peasant was trying to ship the family acres to importing countries and charge them as barley.

The higher qualities of malting and distilling barleys are mostly sold per 448lb, the lower qualities per 400lb., but this rule is not adhered to strictly, for so-called Chilian Forage is sold per 448lb. and on the other hand some good Asia Minor sorts are sold per 400lb.

Movements of Oats.—The world's commerce in oats is shown in the following tables:

Exports of Oats
(in thousands of quarters of 320lb.)

	1900–1	1910–11	Average 1916–20	1925–6	1926–7	1937–8
Argentina		3,100	3,300	3,500	4,000	2,800
North America	5,600	900	9,500	6,200	1,600	1,800
Russia	9,200	10,800	..	100	100	..
Poland			..	700	800	100
Balkan countries	200	1,200	..	300	..	100
Other countries	2,000	1,500	1,000	1,600	1,000	1,200
Total	17,000	17,500	13,900	12,400	7,500	6,000

Imports of Oats by Chief Receiving Countries
(in thousands of quarters of 320lb.)

	1900–1	1910–11	Average 1916–20	1925–6	1926–7	1937–8
United Kingdom and Eire	8,200	5,700	3,400	3,100	1,700	100
Germany	2,900	2,500	..	2,100	1,100	1,000
Holland	900	500	200	700	700	500
Belgium	400	800	200	1,000	600	400
France	2,300	4,000	4,000	1,300	100	200
Italy	200	1,100	2,100	800	800	100

The international trade in oats has decreased in recent years and the figures of exports and imports in the table show that the quantities exchanged on the market are only one-third of those handled formerly.

The contract terms for the sale of Argentine and North American oats are the same as for other grain.

Sales on the international market are now all made per quarter of 320lb., or metric tons of 2,204·61lb.; previous to the war of 1914–18 the size of the quarter varied, some qualities being always sold at 304lb. and some at 320lb. British oats are sold per cwt. of 112lb. or per quarter of 3cwt., the former being the only legal unit. The unit in North America is a bushel of 32lb., so that 10 bushels make one quarter of 320lb.

The British trade in oats is chiefly in home grown grain; of the country's ordinary requirements over 80% is produced in the British Isles, and a very large proportion is used locally for dairying or other cattle food and horse provender. British oats growers are subsidized, and a prohibitive tariff has been placed on foreign grown oats.

Movements of Rye.—Next follow the figures for the world's commerce in rye:

Exports of Rye
(in thousands of quarters of 480lb.)

	1900–1	1910–11	Average 1916–20	1925–6	1926–7	1937–8
North America	400	..	3,100	2,000	3,200	800
Russia	6,100	4,800	..	800	1,900	1,700
Poland			..	1,500	400	100
Balkan States	400	700	100	100	300	900
Argentina	..	..	..	300	700	..
Hungary	..	1,400	..	700	1,100	700
Other countries	..	200	..	600	..	700
Total	6,900	7,100	3,200	6,000	7,600	4,900

Imports of Rye by Chief Receiving Countries
(in thousands of quarters of 480lb.)

	1900–1	1910–11	Average 1915–20	1925–6	1926–7	1937–8
Germany	4,100	+ ..	..	+ ..	2,200	300
Holland	1,000	1,400	100	700	300	300
Scandinavia	1,300	1,100	600	1,100	900	600
Denmark	400	800	200	1,000	800	600
Finland	..	..	100	700	600	200
France	..	600	300	100	400	..
Czechoslovakia	..	..	..	800	500	900

+Small exports in these years.

The international trade was never greatly interested in the rye business. In former times Russia was the chief source of supply and Germany the chief buyer, but when the latter had a good harvest her exports exceeded her imports. A good deal of the rye was exported across Russia's land frontiers and the bulk of the trade was done direct between shippers in Russian ports and trading centres and German importing houses. Russia, Argentina, and the United States can ship liberally when conditions are favourable, and prior to her annexation by Germany and Russia, Poland was also an exporter of this grain. The trade, however, does not expand nor is there any expectation that it will grow in the coming years. It may perhaps remain as at present, on the other hand there is no indication of any appreciable use of rye as a bread grain amongst people who hitherto have used other food. It is fairly common for France, Italy and some other countries to decree the admixture of a percentage of rye flour with wheaten flour, but this is increase by compulsion, for the millers stop the practice immediately they are free to do so. Belgium, Holland, and Scandinavia import fair quantities.

Rye is sold on British markets per quarter of 480lb. and on the Continent the units are the quintal (220·46lb.) and the metric ton of ten quintals. In North America rye is graded officially in the same way as other grain and is sold per bushel of 56 pounds.

British Sources **of** Grain Supply.—In the following tabular statements are shown the countries which furnished the grain and flour imported by Great Britain and Ireland in 1901–02 and 1938–39 with the quantities received from each source of supply. It will be noted that the import trade in oats has practically disappeared and that imports of barley and flour have also dwindled. On the other hand, British imports of wheat have increased more than 50 per cent, and maize by about 20 per cent.

Imports from Various Countries into Great Britain and Ireland

The Flour Trade.—The British trade in imported flour was at one time important and represented as much as 25% of the total British supplies, but now it is only 7·4%, and the reduced trade is maintained with difficulty owing to the fierce competition of British millers. Canada and Australia are the main sources of supply.

The United States and Canada ship to Holland and a few other Continental countries, but foreign flour is mostly barredout by high import tariffs. Practically every civilized country being overmilled, all, or nearly all, protect their home markets and at the same time try to export. A good trade is done by the big exporters with Africa, the Orient. East and West Indies, Central and South America.

PRICES OF GRAIN

The comparative prices of wheat and feeding grain given in the table on the next page are those current on Nov. 15. This date is selected because at that time all the important crops of the world have been harvested and their outturns officially estimated; in the case of the southern hemisphere, the crops are hardly sufficiently advanced to permit of reasonably accurate forecasts of outturn. The new supplies are exerting their influence on the leading markets, although not their full influence, which is felt later on when the movement from the Southern Hemisphere is in full swing.

English Wheat Prices.—There are records of the prices of English wheat dating back to 1656, the figures for the more distant years having been originally published by Mr. T. Smith, Melford. The records start with 38/2 in 1656; in the fifty years 1678 to 1727 the average was 40/8; 1728 to 1777, 37/9; 1778 to 1827, 66/9; 1828 to 1877, 54/6; 1878 to 1927, 39/9,—all per quarter of 480 pounds. The highest point in recent times was 81/1, the average for the year 1920, and the lowest point was 17/7 in the year 1939.

GRAIN FREIGHTS

Many years ago the beiief was held rather widely that ocean transport costs gave British farmers an effective protection of about 10/– per quarter. Sir J. Caird writing in 1880 put the figure lower than this, however, and reckoned 30/– per ton or about 6/6 per quarter. But events proved that even the latter figure was much too high for by 1900 the average freight on the wheat imports of the British Isles was no more than 3/6 per quarter. It was higher in 1927, namely 4/7 per qr., but this must be considered a modest advance, especially as much greater quantities are now coming on long voyages from Vancouver and Australia. In 1938, the average freight had again fallen 3/7 a unit. The following tabular statements illustrate the points mentioned:—

Quantity of Wheat and Wheaten flour (as wheat) imported into the United Kingdom from various sources during the calendar year 1938, together with the average rate of freight

Countries of origin	Quantities qrs.480lb.	Ocean freight to United Kingdom per 480lb. s.	d.	Total cost of ocean carriage £
Atlantic America	3,048,000	2	9	419,000
Pacific America	770,000	5	4½	206,700
Pacific Canada	1,629,000	5	4⅝	437,300
Russia	2,226,000	2	6	278,200
Atlantic Canada	6,322,000	3	3	1,027,000
Argentina and Uruguay	1,515,500	5	0	378,900
Belgium	235,000	1	6	17,600
India	1,027,500	5	9	290,400
Holland	53,000	1	0	2,600
Rumania	842,000	3	9	157,800
France	347,500	1	0	17,800
Australia	8,213,500	7	3	2,977,300
Other countries	5,000	2	0	5,100
Total	26,280,000	Average 3s	7d	£6,215,700

A comparison of the figures for 1938 with those of 1900 shows how greatly British Empire supplies have increased since the beginning of the twentieth century, a result largely due to the modern development of transportation.

Between the years 1872 and 1900 freights declined about 2/11 per qr. (480lb.) but this was a mere trifle compared with the fall of wheat prices.

From 1900 to 1927 freights rose about 1/1 per qr. but wheat in Liverpool rose no less than 21/– per quarter. It is an indisputable fact that freights influence grain prices, but the latter are affected so strongly by supply and demand that usually the resulting price movements quite overshadow any fluctuations caused by variations in freight rates.

The following data bearing on the subject are partly taken from

American Interior **Freights.**—As Great Britain and Ireland still draw supplies from the United States, transport charges from Chicago to New York and thence to Liverpool have a direct bearing on prices at which exporting firms can offer to sell to importers. The following data give the price of the grain and the transport charges to Liverpool from Chicago.

As Canada is, 1939, the leading grain exporter, it is of interest to compare her transport rates with those of the United States. The cost of transporting 1,000 bushels of wheat from the producer in Canada to Liverpool are also shown.

The rate of 6·3 cents per bushel for water carriage, that is

Annual Average Freight Rates on Wheat from Chicago via New York to Liverpool: 1881 to 1937
(average rates per bushel)

Calendar year	Price per bushel	By lake and canal	By lake and rail	All rail	New York to Liverpool steamer
	$	cents	cents	cents	pence
1881	1·11	8·19	10·4	14·4	4⅛
1901	·72	5·14	5'57	9·02	1¼
1911	'99	5·31	5·23	7·80	2
1914	1·02		6·54	7·80	3
1921	1·47	10'29	10·91	17·16	7⅜
1922	1·32	11·63	11·93	16·15	3¾
1923	1·17	10·94	12·43	13·15	3
1924	1·29	8.67	10·92	13·15	4
1937	1·23	8·50	9·30	10·5	4⅛

It may be noted that the rates in 1937 differed very little from those of 1881.

Transport Costs of Wheat from Canada to Liverpool

Items	Dollars per 1,000 bushels	Centsper bushel	Per cent of total
Handling at country elevator	40·00	4·00	11
Freight by rail	138·00	13·80	39
Handling at terminal elevators	15·00	1·50	4
Lake freights	63·00	6·30	18
Ocean Insurance & freight	96·50	9·65	28
Total	352·50	35·25	100

from the head of the Lakes to Montreal, compares with 10·5 cents in the United States for transporting the same unit from Chicago to New York, the distance for each voyage being practically the same. Comparative figures published in 1925 gave more definite information on the point of land carriage. The charge for hauling 100 pounds for 6jo miles in Canada was 22½c. compared with 32c. in the United States. The average cost in 1937 of transporting a bushel of wheat from the farm in Canada to Liverpool was 38½ cents via the Montreal or Vancouver route, or 35 cents via Churchill. From Central Kansas to Liverpool the aggregate cost reckoned for the year 1937 worked out at approximately 35 cents a bushel.

GRAINS OF PARADISE, the seeds of Aframomum *melegueta,* a reed-like plant of the Zingiberaceae family, also called guinea grains and Melegueta pepper. It is a native of tropical western Africa, and of Prince's and St. Thomas's islands in the Gulf of Guinea, and is cuitivated in other tropical countries. The seeds are contained in the acid pulp of the fruit and have a glossy dark-brown husk, with a conical light-coioured membranous caruncle at the base and a white kernel. They contain a neutral essential oil, having an aromatic, not acrid taste and an intensely pungent, viscid, brown resin.

Grains of paradise were formerly officinal in British pharmacopoeias, and in the 13th and succeeding centuries were used as a drug and a spice, the wine known as hippocras being flavoured uith them and with ginger and cinnamon. They are exported almost exclusively from the Gold Coast.

GRAM or **GRAMME,** the unit of weight in the metric system, equivalent to 15·43235564 grains avoirdupois or to 0·2572 drachms (drams) or to 0.7716 scruples. This metric unit is very nearly equal (it was intended to be exactly equal) to the weight in a vacuum of one cubic centimetre of pure water at maximum density. See MEASURES AND WEIGHTS.

GRAM or CHICK-PEA, called also Egyptian pea or Bengal gram, Cicer arietinum, so named from the resemblance of its seed to a ram's head. It is a member of the family Leguminosae, largely cultivated as a pulse-food in the south of Europe, Egypt and western Asia as far as India, but is not known undoubtedly wild. The plant is an annual herb with flexuose branches, and alternately arranged pinnately compound leaves, with small, oval leaflets. The flowers are borne singly in the leaf-axils on a stalk about half the length of the leaf and jointed and bent in the middle; the corolla is blue-purple. The inflated pod, 1 to 1½ in. long, contains two roundish seeds. It was cultivated by the Greeks in Homer's time under the name erebinthos. Alphonse de Candolle (*Origin* of Cultivated Plants) suggests that the plant originally grew wild in the countries to the south of the Caucasus and to the north of Persia. In the East the seeds are eaten raw or cooked in various ways, both ripe and unripe, and when roasted and ground serve the same purposes as ordinary flour. In Europe the seeds are used as an ingredient in soups.

The seed of Phaseolus Mungo, or green gram, a form of which plant with black seeds is termed black gram, is an important article of diet among the labouring classes in India. A variety, *var* radiatus, also known as green gram, is perhaps the most esteemed of the leguminous plants of India, where the meal of its seed enters into the composition of the more delicate cakes and dishes. Horse gram, *Dolichos biflorus,* which supplies in Madras the place of the chick-pea, affords seed which, when boiled, is extensively employed as a food for horses and cattle in south India, where also it is eaten in curries.

See H. Drury, *The Useful Plants of India* (1873); U. C. Dutt, *Materia Medica of the Hindus* (Calcutta, 1877); G. Watt, *Dictionary of the Economic Products of India* (1890).

GRAMINEAE, the grass family (see GRASSES), comprising about 450 genera and 4,500 species.

GRAMMAR. According to the definition of the late Dr. Henry Sweet a grammar gives the general facts of language, while a dictionary deals with the special facts of language. But the two domains frequently overlap, so that one and the same fact finds its place in the grammar as well as in the dictionary; this is because in order to state a rule correctly we must also state its limitations, *i.e.,* the special cases in which it does not hold good. If we give the rule that English substantives form their plurals in *-s,* we must add that besides this regular formation we have the irregular plurals men, *women,* oxen, etc. And as languages are not constructed after ideal patterns, such exceptions to the rules must necessarily take up much space in all books on grammar.

To the ordinary man, grammar means a set of more or less arbitrary rules which he has to observe if he wants to speak or write correctly. This is especially the case if he is engaged in the study of a foreign language, but he is often led to the same point of view by the grammar of his own native language, as taught in schools. Grammar treated in this way may be called normative or prescriptive grammar.

But to the scientific grammarian the subject has a different aspect: to him the rules are not what he has to observe but what he observes (in a different sense) when he examines the way in which speakers and writers belonging to a particular community or nation actually use their mother-tongue. His attitude towards linguistic phenomena is therefore much more that of a naturalist observing the facts of nature; he stands more objectively outside the language he is studying, and perhaps never has to form one single sentence in it for himself. This we term descriptive grammar.

The grammatical observer, like the observer in other fields, seeks, wherever possible, to go beyond the mere facts in order to find their explanation. This is the function of comparative historical grammar, a creation of the 19th century (see PHILOLOGY). Many things which seem strange from the point of view of merely descriptive grammar find their natural explanation when viewed in the light of earlier periods of the same language or of related languages. Take such an abnormal plural as feet from foot: the historian finds that its long vowel goes back through a regular phonetic development to an earlier *ōē* which, wherever it was found, was treated in the same way (thus in feed, *green,* sweet) and like other *ōē's* was a mutated form of a still earlier *ō*—the vowel that is better preserved in the singular foot, where, however, it has now been shortened and raised. The mutation was here, as elsewhere, due to the existence of an earlier *i* in the final syllable, which was dropped in all analogous cases. Now we know that the ending in the plural in the earliest Germanic was very often *-iz,* which corresponds to a still earlier *-es,* preserved in Latin and Greek; the form feet, which from the one-sided Modern English point of view was an isolated fact, is thus seen to correspond to the Greek plural πόδες and to be connected with that form through a long series of perfectly normal historical changes, which do not only affect such plural forms but find parallels in other words as well. The historical and comparative method of explaining grammatical facts has been carried to a rare degree of perfection, but it is clear that it can only be employed to the full where we have early linguistic documents of the same language or of nearly related languages to refer to. The great majority of languages are only known to us in quite recent stages; here, however, a similar method of explanation may be used if there are other now existing languages that are akin to that we are examining, and the comparative method then sometimes allows us within certain limits to reconstruct a common basis from which the several languages have started, as with the numerous African languages known as Bantu.

Grammatical reconstructions should always be made with great caution, for the ways in which languages develop are not always easy to calculate. We may take the Romanic languages (Italian, French, Spanish, etc.) as a test case: all these languages have been known to us for several centuries; now in some cases it would be possible from existing forms in them to infer what the common basis must have been, and the forms thus reconstructed would agree pretty closely with the forms of what we know to have been the basis, namely Latin; but the method fails utterly,

as has been well remarked, with regard to many other forms: no one would be able, for instance, to conclude from the forms of Romanic substantives that Latin had ever had an accusative in *-m,* for the only remnant is French *rien* from Latin *rem* "a thing" —and that now means "nothing" and can no longer be called an accusative.

The method of comparative grammar was especially developed in the study of our own family of languages, the Aryan or Indo-European family (*q.v.*), and at a certain stage of its development scholars were naturally tempted to dwell on and to a certain extent exaggerate those features that were common to these languages, and to take less account of features which were peculiar to one or a few of them. There was always a tendency to think that these were survivals of primitive common phenomena which were lost in the other languages of the group. This may be true in some cases, but more often we see that something found in one language only is a recent development that has really nothing to do with the rest of the family and may constitute a new grammatical type or phenomenon. Comparative grammar should therefore always be supplemented by *separative* grammar which does full justice to what is peculiar to each separate language and treats each on its own merits.

Differences of Structure.— Languages differ very considerably in their grammatical structure; subtle nuances which in one language are considered absolutely necessary are utterly disregarded in others. Things which we should naturally look upon as belonging necessarily to the grammar of any language, are in other languages either not expressed at all or expressed by means that are utterly different from ours. We have separate forms for the superlative, but French simply uses the comparative form with a defining word: *mon meilleur ami,* "my best friend," *la chose la plus nécessaire,* "the most necessary thing." Semitic verbs originally had no indications of the three time distinctions, past, present and future, but possessed two forms that showed whether an action was completed or not, no matter whether it was in the past, present or future time---distinctions which were later partly utilized to show time relations as well. Chinese substantives have no separate forms for singular and plural, and their verbs none for different tenses. Inversely, where we have only one "third person," American Indian languages very carefully distinguish between the first and second "third person" mentioned; the English sentence "John told Robert's son that he must help him" is capable of six different meanings which in Chippeway would be carefully distinguished by different forms of the pronouns for "he" and "him." Many languages have separate reflexive pronouns, like Latin *se,* himself, herself, themselves, *suus* his, her, their (own); these indicate identity with the subject of the sentence, but their sphere of application varies very considerably from one language to another; sometimes they refer to all three persons, sometimes only to the third, sometimes only to the singular, not to the plural, etc. In the oldest English we find *sin* as a reflexive possessive pronoun, but afterwards this solitary survival of the reflexive pronouns beginning with *s* disappeared from English, while such forms are still found in German, Scandinavian, etc.

Thus not only separate grammatical forms, but whole grammatical categories may be dropped in course of time. Generally this does not take place all at once but gradually, those forms which are in constant use being sometimes preserved for a long time after the others have been given up. The old Aryan (Indo-European) languages had separate forms for the dual number, distinct from the plural, but that distinction has been nearly universally lost. In Greek the dual was an archaism in Homer, though it lived on as a colloquialism in Attic till finally it disappeared there too. In the oldest English a few pronominal forms such as *unc* us two, *inc* you two, are the only survivals of a separate dual, and from about 1250 they go completely out of use. In Russian the dual, which ended in *-a,* has left some curious traces which are no longer felt as a separate number: some words denoting parts of the body which are found in pairs, form their plural in *-a: glaza* eyes, *roga* horns, etc.; after the numerals 2, 3, 4 a form that looks like a genitive singular is used instead of the usual plural form: it is the old dual in *-a,* which is extended to three and four.

In dealing with any definite period of a language it is important to state exactly which categories are found and which not. Old English had, but Modern English has not, a dative case. When the old forms were given up in the Middle English period, traces of them were still preserved in some survivals, *e.g.,* in Chaucer *of towne* (with *e* pronounced as a separate syllable), *yeer by yere, by weste;* a few isolated remnants exist still, though no longer felt as separate case-forms: *alive*="on life" (dat.), *Atterbury*= "at the (dat.) borough." In a sentence like "he gave his children food" or a phrase like "from his children," Old English used the form *cildrum,* while the form was *cildru* in the nominative and accusative plural. Now the distinction has disappeared. To say that English still uses a dative case in these combinations is just as unhistorical as to say that Normandy and Massachusetts still form parts of the British Empire. This does not, of course, amount to denying that *children* in the sentence above is an indirect object, to be distinguished from the direct object *(food).* If we were to speak of a dative case here we might just as well say that in "Tom and Mary are children" the last word is grammatically in the dual number, but who would say this?

A word or form belonging to one grammatical category may in course of time be shifted insensibly into another one. Thus *near* at first was the comparative of *nigh,* with a superlative *next;* but in such a sentence as "Come near!" the meaning might be equally well taken as "closer" or "close," and thus the word passed into its modern use as a "positive" and it became possible to form a new comparative and superlative *nearer, nearest,* while the old superlative *next* was specialized in its use, and *nigh* became obsolete.

New grammatical categories may develop; examples are the English "expanded" or "progressive" tenses: *he is running, was running, has been running,* etc., as distinct from *he runs, ran, has run.* The distinction between "absolute" (primary) and "conjoint" (adjunctive) possessive pronouns, e.g., *mine! yours* as distinct from *my, your,* is another case in point. There is in some languages a tendency in regard to personal pronouns to merge the distinction of nominative and objective in that of conjoint and absolute, the old nominative being used only when it stands in immediate connection with a verb as subject, and the old objective in all other positions. This has become the rule in French, where *je* is used only in combinations like *je dis, dis-je* (I say, say I) and *moi,* which is the stressed form of the accusative *me,* is found in *c'est moi* and *Qui l'a dit? Moi* (Who said it? I). In Italian we see similar tendencies, and in modern colloquial English *me* tends to supersede the literary *I* in *It is me* and *Who's there? Me.*

As languages are thus seen to be in constant flux, and as grammatical categories may to a certain extent change from language to language and even from one period to another—and as exotic and "savage" languages possess many categories unknown to our European languages, it will easily be understood how injurious it is to a scientific conception of grammar to measure it always and everywhere by the same standard. But that is what grammarians of former centuries and even recent writers have been and are in the habit of doing; for Latin was for centuries the only language studied grammatically, and its privileged position made people think it a pattern by which to measure all other languages. Not only those languages that were similar in structure to Latin, but even the most heterogeneous languages were indiscriminately saddled with the elaborate Latin system of tenses and moods, and by means of such Procrustean methods the actual facts of many languages were distorted and misrepresented. Discriminations which had no foundation in reality were nevertheless insisted on, while discriminations that happened to be non-existent in Latin were apt to be overlooked. As **A. H.** Sayce writes in the 9th edition of the *Encyclopædia Britannica,* "The endeavour to find the distinctions of Latin grammar in that of English has only resulted in grotesque errors, and a total misapprehension of the usage of the English language." Happily things are improving very considerably in this respect.

Spoken and Written Language. — A modern philologist always looks upon the spoken language as the essential thing to study; in languages with a traditional spelling he must constantly be on his guard against misconceptions arising from that source. To the uniform English plural ending in the written words *kings, dukes, princes* 'correspond three different forms in the spoken language; on the other hand the French forms *(je) donne, (tu) donnes, (ils) donnent,* though differently spelt, are the same in sound, and thus in numerous cases. Many things of great grammatical importance, like intonation, stress, etc., are not shown in our traditional spellings. Grammars of spoken as distinct from written English have been written by Henry Sweet and Harold Palmer. Dialect grammars and grammars of the languages of uncivilized races deal of necessity only with spoken words.

THE SYSTEM OF GRAMMAR

Most grammars, at any rate most of those dealing with our own family of speech, are built up in the traditional way with the following main divisions:—

I. Phonology. This treats of the general theory of the sounds and sound-combinations of the language concerned, and expounds the orthography, where there is occasion.

II. Accidence or Morphology, the theory of forms (German *Formenlehre* is a better term than those used in English). This generally treats of the traditional "parts of speech" in their usual order, substantives, adjectives, etc. The main subject is the changes words undergo in flexion, paradigms being given which show all the forms of one and the same typical word; but the point of view is not pursued consistently, for under "numerals" we generally find an enumeration of all these words in their natural order, though most of them are subject to no formal changes.

III. Word-formation, dealing with prefixes, suffixes and other means of forming one word from another.

IV. Syntax, generally in its first part taking the parts of speech separately as in II. and stating the rules for the use of each case, tense, mood, etc. A second part then deals with word-order, etc.

This system, which varies a good deal in details, has been repeatedly criticized (by J. Ries, Noreen, Jespersen), but no other system has been universally accepted. In France, F. Brunot has proposed basing the teaching of grammar not, as is usually done, on the forms from which the pupils proceed to their syntactical use, but on the inner meanings expressed by grammatical phenomena, stating in each case secondarily the external forms, etc., which are used to express them.

As a matter of fact, grammatical phenomena can be viewed from two different angles: one that of the hearer (reader), to whom a certain series of sounds (letters) is presented, the inner meaning of which it is his task to understand: he begins from the outside and moves inwards; the other that of the speaker (writer): he has certain ideas which he wants to communicate to others; he therefore has to choose the forms (sounds, etc.) that serve best to express these ideas: he moves from within to without.

We are thus led to the following two main divisions of grammar: I. The theory of Forms. II. The theory of Notions. Both deal with the same grammatical facts but from opposite points of view.

I. The Theory of Forms. — The following is a systematic survey of the external means used in languages for grammatical purposes.

(1) A simple sequence of words. This is seen, for instance, in compound substantives like *post-ofice.* The importance of the order in which words are arranged, is seen in cases like *garden-flower* and *flower-garden,* where the first element limits and defines the meaning of the second, and in the distinction between *Paul loves Ann* and *Ann loves Paul,* where word-order shows which is subject and which object.

(2) "Empty words," *i.e.,* words which have no proper meaning of their own, but merely serve to indicate the relations of other words. Examples: *of* in "the father of the boy" (=the boy's father), "the City of Rome," "that scoundrel of a servant"; *to* in "I want to hear," "he refused food to the poor"; *that* in "I saw that he came," etc. There is no hard-and-fast distinction between full and empty words; *to* in "I give food to the poor" has still something of its local meaning found in "go to London," etc.

(3) Prefixes, e.g., *for-* in *forbid, be-* in *besiege.*

(4) Infixes, e.g., *n* in Latin *vinco,* cf. the perfect *vici,* English *stand,* cf. *stood, messenger,* cf. *message.*

(5) Suffixes, e.g., *-ness* in *goodness, -en* in *blacken;* these cannot be separated from such "inflexional endings" as *-s* in *kings, -en* in *oxen.*

(3) (4) (5) together may be termed affixes. The origin of some of these is quite obvious: they were at one time independent words joined to other words like those in (1). A word may easily be accentually subordinated to another with which it is continually combined, especially if the combination acquires a meaning of its own, independent of that of each element, as in *blackbird;* in *postman,* the vowel of the second element is obscured, and in other cases further phonetic changes take place; *gentlemanlike* and *gentlemanly* show two stages in the development of a suffix from what was originally an independent word; *for-* in *forgive* is an old preposition, though perhaps not exactiy identicai with the ordinary *for; be-* is a weakened form of by. But it is not all affixes that originate in this manner from independent words: *-en* in *oxen* originally belonged to the stem of the word in all its forms, and it was only through the accident of this syllable having been lost in the singular, but not in the plural, that it came to be felt as an affix to denote the plural number. The origin of most of our affixes is hopelessly obscure.

(6) Change in intonation, stress or quantity, e.g., *Yes?* with a rising tone in a question, *Yes* with a falling tone as an affirmative answer; *object* with varying stress according as it is a substantive or a verb.

(7) Consonantal changes, e.g., *send, sent; half, halve; use* as a substantive with unvoiced, as a verb with voiced consonant.

(8) Vocalic changes, e.g., *feed, fed; see, saw; man, men; drink, drank, drunk.*

(6) (7) (8) are phonetic changes, which may be due to the most different causes; some are recent, others go back to the most remote times; some have only in various circuitous ways acquired significative grammatical importance.

(9) Combined changes, affixes like those in (3) (4) (5) being joined to phonetic changes like those in (6) (7) (8). Examples: *forgot* (3) (8), *forgotten* (3) (8) (5), *drunken* (5) (8), *halves* (5) (7), *men's* (5) (8), *won't* (5) (7) (8).

(10) Supplementing with different stems: *I, me, we, us; am, is, was, been; good, better.*

Some languages make a more extensive use of some of these grammatical means than of others. Chinese uses scarcely anything but word order and empty words; some languages are predominantly prefix-languages, as for instance, the Bantu family; others predominantly suffix-languages, *e.g.,* Eskimo and Turkish. As will be seen from the examples, English uses all these means freely, though there are few examples of infixes.

We must here mention a classification of all the languages of the world according to their morphological system, which played a great rôle in the discussions of the 19th century, but has now been given up as superficial, namely, into (1) isolating languages or root-languages like Chinese, (2) agglutinative languages like Finnish and Turkish, which use affixes, but have no internal changes in the roots, (3) flexional languages like those of the Aryan and Semitic families. The last were also supposed to have gone through the isolating and agglutinative stages in their prehistorical development, while Chinese was thought to represent the earliest childlike linguistic structure. The latter supposition has been shown to be wrong, as the earliest Chinese in some respects was "flexional," and those hundreds of languages that were formerly classed together as "agglutinative" represent the most diverse types of morphological structure. The world is more complex than our ancestors imagined.

II. The Theory of Notions. — A comprehensive system of all the notions that find expression in language would be impracticable on account of the infinite complexity of mental and physi-

cal phenomena. But we are here concerned with those notions only that have found grammatical expression, and this makes our task somewhat less difficult, though far from easy. The following necessarily very brief survey does not claim to be either complete or final.

(1) Parts of speech. It is usual to divide words grammatically into the following classes and to define them somewhat as is here (very succinctly) indicated:—

(a) Substantives — denoting "persons" and "things."

(b) Adjectives — showing qualities.

Substantives and adjectives are often classed together as "nouns," but many grammarians make the term "noun" equivalent to "substantives," and do not comprise under it adjectives.

(c) Pronouns — used instead of nouns "to designate a person or thing already mentioned or known or forming the subject of inquiry." Various well-known subclasses: personal, demonstrative, relative, interrogative, indefinite. The so-called articles, as well as numerals, are best treated as subdivisions of pronouns.

(d) Verbs — denoting actions, states or happenings.

(e) Adverbs — serving to modify adjectives or verbs.

(f) Prepositions — marking relations between words.

(g) Conjunctions — used to connect clauses or to coordinate words in the same clause.

(*h*) Interjections — ejaculations, standing outside ordinary sentences.

This division and the definitions usually given have, however, been subjected to severe criticism and should not be taken at their face value. One of the chief difficulties with substantives is the existence of such words as arrival and kindness, which are undoubtedly substantives and are treated grammatically as such, but cannot be termed names of "things"; they represent "nexus" (see p. 615). Adverbs, prepositions and conjunctions are best classed together as "particles."

(2) Rank. While the division under (1) concerns words separately, we here have a distinction that has regard to words or word-groups in combinations, namely into:

(a) Primary

(b) Secondary

(c) Tertiary — words or word-groups.

The three ranks to some extent, but only to some extent, correspond to substantives, adjectives and adverbs respectively. Secondary elements serve to modify or delimit primaries, tertiary elements to modify or delimit secondaries, as will be seen from the following examples in which those words or groups are italicized which belong to the rank under which they are classed:—

(a) The King's palace. The *King* arrived. I know *when* he arrived.

(b) The King's palace. *A* big palace. The palace that he built.

(*c*) A really big palace. I was present *when he* arrived.

The combination of a primary and a secondary element in the way exemplified under (b) is termed junction; the adjective or (relative) clause standing as secondary is called an adjunct. Tertiaries are also termed subjuncts.

(3) Other classifications. Many languages classify words in such a way that a class is indicated either in the word itself or in the form required in those adjuncts, etc., which belong to it. Sometimes the distinction is into animate and inanimate, sometimes into big and small things, sometimes into male, female and sexless; but such distinctions are rarely indicated with what we should call consistency; some languages, for instance, that have the main distinction "animate: inanimate," reckon certain parts of the human body as animate, others as inanimate. Sometimes it is impossible to see what is really the notional basis of a classification. When the distinction is connected with sex, as in most of the Aryan languages, we speak of gender; but the actual distinction between masculine, feminine and neuter gender does not correspond at all exactly with that between male and female beings and sexless things; very often it is impossible to discern why one word belongs to one gender rather than to another. In Old English, for instance, *stan* stone, daeg day, finger, *wifmann* woman were masculine; niht night, ecg edge, hand feminine; and treow tree, gear year, *blod* blood, *wif* wife neuter. This word-gender, which is still found in German, and which influenced the flexion of the words and the form of the article and adjective belonging to them, disappeared gradually from English in the Middle English period. In Semitic languages, the sex of the subject influences the form of the verb.

(4) Number. On the dual number see above. The distinction between "one" and "more than one" is very easy from a notional point of view, but not always so easy grammatically, partly because some things may be looked upon either as units (as German *brille*) or as composite (Engl. spectacles), partly from other causes. A collective is a word which though singular in form denotes a plurality, hence such anomalies as twenty police; cf. also "my family is an old one" and "my family are early risers." Number properly belongs to primaries only, but many languages require secondaries to agree in number with their primaries, e g., those trees, and German die *hohen bäume* the big trees, where in English the article and adjective are invariable. In English verbs the distinction has been given up in all past tenses, e.g., he went, tlzey *went* (except *he* was, *they* were), in the present tense it is preserved in the third person only: *I* go, we go; *he* goes, they go.

(5) Person, *i.e.*, the distinction between the speaker, the person (or persons) addressed, and what is neither speaker nor spoken to. The distinction is shown in pronouns and in many languages also in the verb. The plural "we" does not mean two or more "first persons," but "14–you" or "I + some one or more persons besides," and some languages make a distinction according as the second person is included or not. Such a pronoun as French on, Engl. *one,* may be considered a "common person." (On reflexive pronouns, see above.)

(6) Space. Some languages have different forms according to distance from the speaker, etc. Case-forms denoting existence in or at a place and movement to, towards or from a place are very frequent. In our languages, with a view to greater precision, such case-forms were frequently supplemented by adverbs, and these in time became prepositions governing the cases which at first were sufficient in themselves to denote the spatial relation; eventually the case-endings were often dropped as superfluous.

(7) Time. With substantives the same means (case-forms, adverbs, prepositions) as are used to indicate spatial relations are as a rule also used to denote time relations. But with verbs many, or perhaps most, languages have separate means of denoting time-relations, which cannot surprise us, as the idea of time is naturally associated with that of action or happening. But while the notional division of time into past, present and future is quite simple, mankind has not, as a rule, found correspondingly simple grammatical expressions for time and its subdivisions, such distinctions as that between permanent and transitory, or between finished and unfinished, or between once and repeatedly, or between stability and change, or between resultative and non-resultative action being often inextricably connected with real time-indications in the "tenses" of verbs. Expressions for the future are often much more vague than those for the past, and frequently expressions which at first had and still to some extent have the meaning of volition or obligation or motion are made to do duty as a kind of future tense, as in "he will come," "I shall come," "they are going to start" (French "on va partir"), etc. Some languages have very elaborate tense systems with separate forms for imperfect, aorist, perfect, pluperfect, future in the past, etc., others rely more on the context or on adverbs for such nuances, if they are conceived at all.

(8) Comparison. The superlative ("strongest," etc.) is really a kind of comparative: "he is the strongest of the boys" means the same thing as "he is stronger than the other boys," the difference being only that the result in the former sentence is stated with regard to all boys, himself included, while in the latter he is excluded. A comparison results in expression of inequality or equality, as in "he is stronger than X" (a), "he is as strong as X" (b), "he is less strong than X" (c); of these (a)

and (c) are closely connected as they both denote inequality and therefore use the comparative. Many languages even for this sense use the positive form and say "strong from X" or the like.

(9) Nexus. This is a comprehensive term for the combination of two words (or word-groups) which stand to another in the relation of subject to predicate. The simplest case is a sentence with a subject and a verb, as "the doctor arrived" or with a subject, an "empty" verb ("copula") and a predicative, as "the doctor is clever." Compare also sentences without a verb like "Happy the man who. . . ." and "He a doctor!" There are other cases of nexus, in which the nexus does not in the same way as here form a whole sentence, but only part of one, as in "the doctor's arrival," "the doctor's cleverness," "(I saw) the doctor arrive," "(we thought) the doctor clever," "(we count on) the doctor to arrive," "(he slept with) the window open," "every thing considered (he must be clever)."

A nexus of a different kind exists between a verb and its object, as in "we saw the doctor," or its two objects, as in "we offeredthe doctor money." Further, the theory of nexus leads to a contemplation of the relation between the active and the passive expression for one and the same thought. what in the active turn is an object, is made into a subject in the passive turn: "the doctor was seen (by us)," "money was offered (to) the doctor," "the doctor was offered money."

(10) Affirmation and negation. In some languages the verb has special forms for negation: this is to a certain extent true of English, especially in its colloquial form: won't, cf. *will*, shan't, cf. shall; note also the use of the auxiliary do in most negative sentences which contain no other auxiliary: "The doctor did not arrive."

(11) Subjective attitude of the speaker. By the side of simple ("flat") assertions we find others in which the speaker does not want to commit himself, but speaks with a certain hesitation, doubt, hope or fear, and such emotional repressions often manifest themselves grammatically, either in particles like Greek ἄν or in special forms of the verb (chiefly the subjunctive mood). The same means are frequently applied in conditioned clauses, which range from those in which doubt is not expressed at all or slightly hinted at, to those in which unreality is expressly indicated. In the latter kind some languages use a special conjunction, while others show that "the condition is rejected" by shifting the mood into the subjunctive and the tense into the preterite or by the latter means alone. In connection with this must be mentioned the expression of diffidence or modesty in questions like "Could you (Would you) lend me a pound?" as against the simple and direct "Can you (Will you) . . .?" and the difference between the unrealizable wish in "Would he were still alive!" and the realizable wish in "May he be still alive!"

(12) Relation to the will of the hearer. In one class of utterances (ordinary statements and exclamations, for example) the speaker does not want to influence the will of the hearer. The aim of another class is to influence the will of the hearer, that is, to make him do something. This may be effected by requests, which range from brutal commands or orders through demands, implorations, invitations, etc., to the most humble entreaty or supplication. One of the linguistic forms for requests is the imperative, other forms are seen in "One minute!" and "Hands off!" Questions belong to requests, as they imply a request (command prayer, etc.) to give the original speaker a piece of information They are of two distinct kinds according to the existence or non existence of an "unknown quantity" expressed by means of an interrogative pronoun or adverb: "Who said that?" "What did he say?" and "When did he say that?" are examples of one kind, "Did he say that?" of the other kind. Questions, and requests generally, are naturally liable to those influences which were dealt with under (11); questions are likewise notionally related to negations, whence they often employ similar grammatical means this is seen, for instance, in the English use of the auxiliary *d* in both kinds of sentences

The system here given shows how a notional arrangement leads to the separation of things which in the ordinary grammatical system are placed together. Under case, accordingly, we have things which have relation to junction (the chief use of the genitive is to make a word the adjunct of another word), to space (the so-called locative cases) and to nexus (nominative to denote the subject, accusative and dative, for various kinds of objects). Here, as elsewhere, we see that linguistic phenomena are capable of being viewed from different angles and that they present all kinds of intersections and overlappings.

In the treatment of each particular language we meet with units which are units neither from the purely formal nor from the purely notional point of view, but which nevertheless must be taken together as what might be called functional units. Take the English preterite: it is not a formal unit, because it is formed in different ways: ended from *end, sent* from send, *thought* from *think,* put from *put,* saw from see, was from *be,* etc. Neither is it a notional unit, for sometimes it indicates the past time pure and simple, sometimes unreality ("if he came"), or modesty ("Could you . . .?") or even future time ("it is time you went to bed"), and it has even more spheres of application. Yet all these formal and notional things go together and form one separate unit in English grammar, which is different from such units in any foreign grammar as in some ways correspond to it: in French, for instance, we have two or three tenses (je *finissais* and je finis or colloquially *j'ai fini* corresponding to *I* ended), each of which is a unit in the same way as the English preterite is. But all the units we arrive at through our analysis of grammatical phenomena are at best symbols or shadowings of the innermost notional categories.

GRAMME: see GRAM.

GRAMMICHELE, a town of Sicily, province of Catania, 55 mi. S.W. of it by rail and 31 mi direct. Pop. (1936) 13,772 (town), 14,014 (commune). It was built in 1693, after the destruction by an earthquake of the old town of Occhialà to the north; the latter, on account of the similarity of name, is generally identified with Echetla, a frontier city in the time of Hieron II.

GRAMONT, ANTOINE AGENOR ALFRED, DUC DE, DUC DE GUICHE, PRINCE DE BIDACHE (1819–1880), French diplomatist and statesman, was born in Paris on Aug. 14, 1819, of a family originally royalist, though the younger members were Bonapartist. Antoine was educated at the École Polytechnique, but entered the diplomatic service. His promotion began with the accession of Louis Napoleon to the supreme power. He was successively minister plenipotentiary at Cassel and Stuttgart (1852), at Turin (1853), ambassador at Rome (1857) and at Vienna (1861). On May 15, 1870 he was appointed minister of foreign affairs in the Ollivier cabinet, and was thus concerned in the bungling of the negotiations between France and Prussia arising out of the candidature of Prince Leopold of Hohenzollern for the throne of Spain, which led to the disastrous war of 1870–71. The famous declaration read by Gramont in the Chamber on July 6, the "threat with the hand on the sword-hilt," as Bismarck called it, was the joint work of the whole cabinet; the original draft presented by Gramont was judged to be too "elliptical" in its conclusion and not sufficiently vigorous. The history of the affair is given in detail by Emile Ollivier himself in his Empire *libéral* (vol. xii, 1909). It was Gramont who pointed out to the emperor, on the evening of the 12th, the dubious circumstances of the act of renunciation of the prince of Hohenlohe-Sigmaringen on behalf of his son, and on the same night, without informing Ollivier, he despatched to Benedetti at Ems the fatal telegram demanding the king of Prussia's guarantee that the candidature would not be revived. The supreme responsibility for this act must rest with the emperor, "who imposed it by an exercise of personal power on the only one of his ministers who could have lent himself to such a forgetfulness of the safeguards of a parliamentary régime." says Ollivier.

Gramont resigned office with the rest of the Ollivier ministry (Aug. g), and after the revolution of September he went to Eng-

land, returning after the war to Paris, where he died on Jan. 18, 1880. He published various apologies for his policy in 1870, notably *La France et la Prusse avant la guerre* (1872).

GRAMONT, PHILIBERT, COMTE DE (1621–1707), the subject of the famous *Memoirs,* came of a noble Gascon family, said to have been of Basque origin. His grandmother, Diane d'Andouins, comtesse de Gramont, was "la belle Corisande," a mistress of Henry IV. The grandson assumed that his father Antoine II. de Gramont, viceroy of Navarre, was the son of Henry IV. Philibert was educated for the church at the *collège* of Pau, in Béarn, but he joined the army of Prince Thomas of Savoy, then besieging Trino in Piedmont. He afterwards served under his elder half-brother, Antoine, marshal de Gramont, and the prince of Condé. He favoured Condé's party at the beginning of the Fronde, but changed sides before he was too severely compromised. During the Commonwealth he visited England, and in 1662 was exiled from Paris for paying court to Mademoiselle de la Motte Houdancourt, one of the king's mistresses. He found a congenial atmosphere at the court of Charles II., and married in London, under pressure from her two brothers, Elizabeth Hamilton, the sister of his future biographer and one of the great beauties of the English court. In 1664 he was allowed to return to France. He revisited England in 1670 in connection with the sale of Dunkirk, and again in 1671 and 1676. In 1688 he was sent by Louis XIV. to congratulate James II. on the birth of an heir. In 1696 he had a dangerous illness, during which he became reconciled to the church. He was 80 years old when he supplied his brother-in-law, Anthony Hamilton, with the materials for his *Mémoires.* He died on Jan. 10, 1707, and the *Mémoires* appeared six years later.

Hamilton's portrait of Gramont is drawn with such skill that the count, in spite of his biographer's candour, imposes by his grand air on the reader much as he did on his contemporaries. The book is the most entertaining of contemporary memoirs, and gives a vivid, truthful, and graceful description of the licentious court of Charles II. His scandalous tongue knew no restraint, and he was a privileged person who was allowed to state even the most unpleasing truths to Louis XIV. Saint-Simon in his memoirs describes the relief felt at court when the old man's death was announced. *See* also HAMILTON, ANTHONY.

Mémoires de la vie du comte de Grammont were printed in Holland with the inscription Cologne, 1713. Other editions followed in 1715 and 1716. An Eng. trs. *by Mr. [Abel] Boyer* (1714) was supplemented by a "compleat key" in 1719. The *Mémoires* "augmentées de notes et d'éclaircissemens" were edited by Horace Walpole in 1772. Among more modern editions are those by Sir Walter Scott (1846), frequently reprinted; by H. Vizetelly (1889), and G. G. Goodwin (1903). *See* also R. Clark, *Anthony Hamilton, Author of Memoirs of Count Gramont* (1921).

GRAMOPHONE. An instrument for reproducing sound (Gr. γράμμα, letter, φωνή, sound), by transmitting to the air the mechanical vibrations of a stylus in contact with a sinuous groove in a moving record. In a wider sense the term might be applied to any instrument for the recording or subsequent reproduction of sound. As long ago as in 1857 Leon Scott had, by the invention of the "Phonautograph," provided means whereby *visual* records could be made of the vibrations of a diaphragm, but it was not until 1877 that the first "Talking Machine" was patented. Scott's Phonautograph consisted of a thin membrane, to which a delicate lever was attached. The membrane was stretched over the narrow end of a parabaloidal funnel, while the end of the lever was brought against the surface of a cylinder covered with paper on which soot had been deposited. The cylinder was fixed on a fine screw which moved horizontally when the cylinder was rotated. The marker thus described a spiral line on the blackened surface. When sounds were transmitted to the membrane and the cylinder was rotated the oscillations of the marker were recorded. Thus tracings of the vibrations were obtained (Comptes Rendus 53 p. 108). The actual *audible* reproduction of recorded sound was first accomplished by T. A. Edison in 1876, the first patent specification being dated January 1877. In this instrument a spiral groove was cut on a brass drum fixed on a horizontal screw, so that when the drum was rotated it moved from right to left, as in the Phonautograph. The recorder consisted of a membrane of parchment or gold-beater's skin stretched over the end of a short brass cylinder about two inches in diameter. In the centre of the membrane there was a steel needle having a chisel-edge, and a stiff piece of spring steel was soldered to the needle near its point, the other end of the spring being clamped to the edge of the brass cylinder. The recorder was then so placed beside the large cylinder that the sharp edge of the needle ran in the middle of the spiral groove when the cylinder was rotated. The cylinder was covered with a sheet of tin-foil. During rotation of the cylinder, the sharp edge of the marker indented the tin-foil into the spiral groove, and when the membrane was caused to vibrate by sounds being thrown into the short cylinder by a funnel-shaped opening, the variations of pressure corresponding to each vibration caused the marker to make indentations of varying depth on the tin-foil in the bottom of the groove. These indentations corresponded to the sound-waves. To reproduce the sounds a second marker was caused to pass over the grooves of the cylinder, the marker being alternately elevated or depressed according to the nature of the indentations, and so transmitting to its membrane vibrations corresponding after a fashion to those which it was originally made to execute. These were then communicated to the air, so that the sound previously given to the "phonograph" (as Edison termed hisinvention) wasreproduced in a crude but unmistakable manner.

Many improvements were attempted. In Edison's wax-cylinder phonograph, and in the "graphophone" of Graham Bell and C. S. Tainter, the sound record was produced by *cutting* instead of *indenting* an up-and-down line in the record material. Reproductions were made by an electro-deposition process similar to that used later for disc records. Machines employing cylindrical records of the phonograph type enjoyed a wide popularity for many years. But the non-linear relation between the driving force and the amplitude of the cut, inherent in this method, led to the adoption of means whereby the resistance of the record material to the motion of the cutting stylus was made more uniform, while the movement of the diaphragm in reproductiop was positively controlled by the record, and was not at times wholly dependent on the elasticity of the diaphragm, as in the phonograph. These improvements were introduced in 1887 by Emile Berliner. Berliner named his instrument the "gramophone." In the first drawing of his original patent specification, a cylindrical record, consisting of a strip of paper, coated with a layer of lamp-black and stretched round a drum, is used. Movement of the recording stylus is horizontal and causes the removal of the lamp-black from the surface in a sinuous, spiral line. For purposes of reproduction he copied the record in a resisting material, either mechanically, or by engraving or etching, and this gave him a permanent record, con-

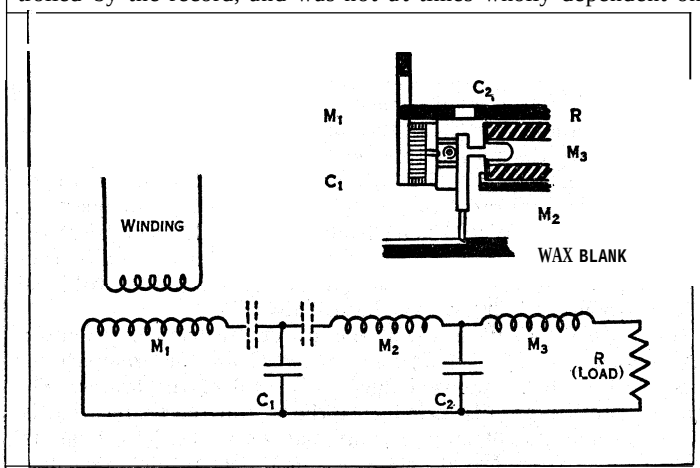

FIG. 1.—DIAGRAM SHOWING A GRAMOPHONE OF THE EQUIVALENT ELECTRICAL CIRCUIT

The Inductance (m_1) represents the mass of the armature, which, when acted on by the magnetic field, forms the driving portion of the mechanical system. (c_1) Condenser showing the compliance of the shaft connecting the armature to the stylus holder. (m_2) Mass of the stylus and its holder. (c_2) Compliance of the shaft connecting the stylus holder with the metal piece which fits into the rubber damping element. (m_3) Mass of this metal piece. (R) Damping element. sisting of a wavy grooved line in a strip of copper, nickel or other material. To reproduce the sounds recorded, this strip was in turn stretched round a drum, the point of the stylus placed in the groove, and the drum rotated. Thus the first of Berliner's inventions was virtually to provide means whereby Scott Phonautograph records could be reproduced. In this connection it is to be noted that eleven years previously Charles Cros, a Frenchman, had deposited with the Academie des Sciences, Paris, a sealed packet

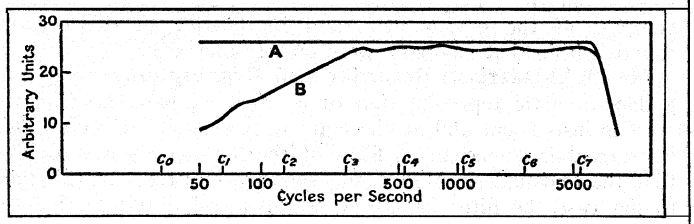

FIG. 2.— CURVE A SHOWS CURRENT IN THE SERIES BRANCHES OF A LOW-PASS FILTER AS A FUNCTION OF PITCH. CURVE B, CALIBRATION OF A RECORD INSTRUMENT

containing a suggestion for doing this very same thing, though he cannot be said to have carried his ideas very far.

In the second or improved form of gramophone described in Berliner's patent specification, a flat record is used which, he says, offers advantage for copying purposes. A glass disc is covered with a semi-fluid coating of ink or paint, in which the stylus cuts a sinuous spiral running from the outer edge of the record to the centre, or vice versa. A turntable carries the record disc, and is rotated by any suitable means.

Berliner's next step was to make a record in a solid material by direct etching. To this end he coated a disc or cylinder of zinc or glass with some substance which, while offering little resistance to the movements of the recording stylus, resisted the chemical action of acids. The coating he preferred consisted of beeswax dissolved in benzine. When the recording stylus had traced out its line on the record, and exposed the solid disc below, the latter was etched, and a permanent record produced. Copies could be made by the galvano-plastic process, by making a matrix, and impressing discs of hard rubber or the like. Owing to the undercutting of the protective coating by the acid a very rough record resulted, and it was not until the end of 1897 that the manufacture of disc records became a commercial success. The technique of record-making was now briefly as follows:—

Early Methods of Recording.—The players or singers were placed immediately before the mouth of a horn, which was used to concentrate the sound energy on the recording diaphragm. Singers were instructed to draw away from the horn at the moment of singing loud notes, in order to prevent "blasting." Orchestras were small; the players were crowded together and in some cases were given instruments of special construction to make up for the deficiencies in their number. The horn (or horns, for sometimes there were several) protruded through a screen, on the opposite side of which was the recording machine, carrying a disc-shaped blank of wax-like material, on which the recording stylus traced its spiral. From this disc, a solid metal negative or matrix was obtained by electro-deposition. Copies of the original record were then pressed from this matrix in a material which, while normally hard, became plastic under heat.

About this time a number of inventors began to turn their attention to the improvement of the reproducing machine. Successive stages of development are well illustrated by an interesting series of machines exhibited at the Science Museum of London, beginning with an early Berliner disc machine with metal diaphragm sound-box and hand-drive. Mechanical governing was introduced in 1896 and by the end of the century a clockwork machine, intended solely for reproduction, was made. This was provided with a celluloid diaphragm, but two years later mica was being used. By 1905, a type of sound-box had been evolved, the use of which persisted without radical change for twenty years. A mica diaphragm was held lightly at its edges by hollow rubber gaskets, the fulcrum of the lever connecting the centre of the diaphragm to the needle-point being formed by knife-edges, and its movements controlled by delicate springs. It was found that better reproduction resulted from the use of larger horns, and when these became too heavy for their weight to be carried by the record they were removed from the sound-box and fixed to a bracket on the machine cabinet, the sound-box being connected to the small end of the horn by a piece of straight tubing known as a "tone-arm." This arrangement gave rise to increased distortion of the sound-waves, until steps were taken to design the tone-arm as a tapering continuation of the horn. The appearance of the horn being looked upon by the public with disfavour, it became inverted and was placed inside the cabinet. From 1910 onwards this type of construction was generally preferred for domestic use.

Position of the Gramophone in 1925.—Such, then, was the typical reproducing instrument of 1925. Much painstaking work had enabled machines and records to be produced which were capable of yielding results acceptable to music-lovers. But knowledge of the fundamental principles was so imperfect that there was nothing in the nature of a standardized basis of recording to give results of uniform quality. It was necessary to introduce deliberate errors into one part of the system to compensate for errors in another part, and progress was naturally slow and unsatisfactory. The neglect of the industry to institute proper scientific research into the all-important problems of acoustics and vibrational mechanics might have indefinitely retarded its growth, for it cannot be said that any obvious improvement had been overlooked. When help came, it was from another quarter.

The problems of electrical communication by line and radio had been intensively studied for many years by experts equipped with measuring instruments of a sensitivity and accuracy then unknown in acoustic research. Microphones (*q.v.*) and *amplifiers* (*q.v.*) of high quality were developed in connection with telephony and broadcasting, and were now available for the gramophone. It was therefore no longer necessary for the recording stylus to be actuated directly by the acoustic output of the performers themselves, grouped closely round the mouth of a horn. The performers could now be permitted to carry on their work in front of the microphone in commodious studios resembling more nearly the normal conditions of musical performance or even in the actual concert-hall. The existence of amplifiers also made possible the use of quality-correcting devices which, even if it had been feasible to apply them in the acoustic recording process, would have unduly attenuated a motive energy already far too weak for many requirements. On the reproducing side, the proper function of a horn in communicating to the air the vibrations of a diaphragm had been investigated by A. G. Webster, who, in an important paper[1], outlined the properties of a logarithmic horn and also drew attention to the advantages to be derived by applying the conception of electrical impedance to acoustic and mechanical systems. The logarithmic horn was studied in detail by Hanna and Slepian, by P. B. Flanders, and by H. C. Harrison'. What remained to be done was to devise a systematic linkage between the microphone and the recording stylus, and between the reproducing point and the mouth of the horn, of such a kind as take the fullest advantage of these new components.

Theory of Modern Gramophone Design. *Electro-mechanical* Analogy.—A mathematical statement of the behaviour of mechanical and electrical systems discloses the existence of a remarkable analogy between such quantities as mass and compliance (*i.e.*, reciprocal stiffness) on the one hand, and inductance and capacity on the other. For example, the kinetic energy of a particle of mass M moving with velocity V is $\frac{1}{2}MV^2$, while the electrical energy in an inductance L carrying a current I is $\frac{1}{2}LI^2$. Again, the potential energy of a compliance C exerting a force F is $\frac{1}{2}CF^2$; that of a condenser of capacity C charged to a potential V is $\frac{1}{2}CV^2$. The logical necessity for the existence of such an analogy can be deduced from the observed phenomena of wave motion in mechanical and electrical systems: A highly important feature of the development of some of the later recording and reproducing instruments has been their quantitative design as imitations of electrical circuits, it having so happened that the science of electrical wave transmission had by this time outstripped the

[1] *See* bibliography.

knowledge of oscillation mechanics.

As previously mentioned, A. G. Webster had in 1919 already suggested the conception of mechanical and acoustic impedance as an aid to correct design. In 1926 J. P. Maxfield and H. C. Harrison published an account of their work in designing complete recording and reproducing systems as analogues of the electric wave filters invented by G. A. Campbell in 1917[1]. Such filters are ideally composed of infinitely repeated similar sections, each section comprising one or more series and shunt elements. Structures of this type have in general one or more transmission bands of zero attenuation and one or more bands having infinite attenuation; in gramophone technique single band-pass filters are of chief interest, as will be seen later. Suppression of all but the first few sections of such an ideal structure does not seriously affect its properties so long as a suitable terminating resistance is applied. Without this termination the structure reduces to an assembly of n similar tuned circuits having collectively n different natural frequencies. Multi-resonant mechanical systems can, by the employment of damping and at the expense of efficiency, be designed to have excellent frequency characteristics, but the behaviour of such systems is best considered after that of a true mechanical band-pass filter has been thoroughly grasped.

Frequency Requirements of a Recording System.— The efficiency with which a sound of any given pitch is radiated from a horn is independent of the intensity of the sound. This relation may be expressed in the form

$$P = kV^2$$

where P is the power radiated, V the R.M.S. velocity of the air particles, and k a constant which may be defined as the radiation resistance of the horn at a particular frequency. When making records intended for mechanical reproduction, therefore, it is seen that, for correct balance, the recording tool should be made to move at constant maximum velocity at all frequencies. Under these conditions, for a given sound intensity, the amplitude of the cut is inversely proportional to the frequency. Whatever may be the degree of coarseness of the spiral record trace, therefore, there must be some limit of frequency below which it is impossible to maintain a constant velocity without encroaching on the adjacent groove. Also, an upper frequency limit is imposed by the physical dimensions of the reproducing point, which is unable to follow the grooves when, at very high frequencies, their radius of curvature becomes extremely small. Maxfield and Harrison considered this matter and adopted a frequency characteristic of the uniform velocity type between the frequencies of 200 and about 4,000 cycles per second. Below 200 the system was modified to operate at approximately constant amplitude and above 4,000 at approximately constant acceleration. In this manner they were able to extend the range of frequencies recorded to 30 and to 10,000 cycles, with some falling off towards these two opposite extremes.

Applications of the Theory.— In the design of their recording and reproducing systems, Maxfield and Harrison made use of the following table of corresponding mechanical and electrical quantities:

Mechanical.	*Electrical.*
Force (dynes)	Electromotive Force (volts)
Velocity (cm/sec)	Current (amperes)
Displacement (cm)	Charge (coulombs)
Impedance (dyne sec/cm)	Impedance (ohms)
Resistance (dyne sec/cm) (or mechanical ohms)	Resistance (ohms)
Reactance (dyne sec/cm) (or mechanical ohms)	Reactance (ohms)
Mass (gms)	Inductance (henries)
Compliance (cm/dyne)	Capacity (farads)

In deriving the equivalent circuit of any mechanical device, a compliance between two consecutive moving members is represented by a shunt capacity, and between a moving member and a rigid support by a series capacity. By proportioning the parts of a mechanical system it can be made to behave as an equivalent electrical network, and hence the peculiar properties of electrical filter circuits can be simulated.

[1] *See* bibliography.

The matter may be put somewhat differently as follows. In the older recording and reproducing systems there were numerous abrupt changes in the nature of the path along which the vibrations were conducted from the mouth of the recording horn to the record and back again to the listener. This had the effect of introducing numerous resonances and greatly limited the range of musical tones which could be covered. By properly proportioning the parts of each system, Maxfield and Harrison were able to smooth out these irregularities, with the result that the musical compass of the gramophone, and its fidelity to the original sounds within that compass, were greatly increased.

Maxfield-Harrison Recorder and Gramophone.— Fig, 1 is a diagrammatic representation of a Maxfield and Harrison recording instrument and of the equivalent electrical circuit. This instrument is a mechanical filter of the low-pass type, provided that the two undesignated condensers are omitted. In this particular case the filter has three sections and a terminating resistance. In designing mechanical analogues of such a system, the problem is threefold; first, that of arranging the parts so that they form repeated filter sections; second, determining the magnitude of these parts so that the separate sections all have the same characteristics; third, providing the proper resistance termination. This last requirement was found specially difficult to meet owing to the lack of satisfactory non-reactive mechanical resistances. In the recorder illustrated, Maxfield and Harrison made use of a rubber rod along which the vibrations travel torsionally with heavy attenuation. A correctly designed three-section filter would secure a sensitiveness at the various pitches as represented by curve A in fig. 2. The actual recorder, however, owing to the presence of the two undesignated condensers shown in fig. 1 has a loss of response at the low pitch end as indicated by curve B (fig. 2). This loss is deliberately introduced in order to limit the amplitude, as previously explained. The power required to actuate this recorder is only a fraction of a watt, whereas a damped resonant system may therefore require a power of several watts.

Maxfield-Harrison Gramophone.— The analogy between the mechanical and electrical filter is more perfectly shown in the reproducing equipment. The principle of "matched impedance" is of fundamental importance in the design of machines for mechanical reproduction, for here there are no amplifiers to make good the losses incurred in suppressing resonances. In applying the principle it was necessary to take into consideration the behaviour of an air-chamber behind the diaphragm and to determine its equivalent electrical elements before formulating the design. Fig. 3 shows a section of the Maxfield-Harrison sound

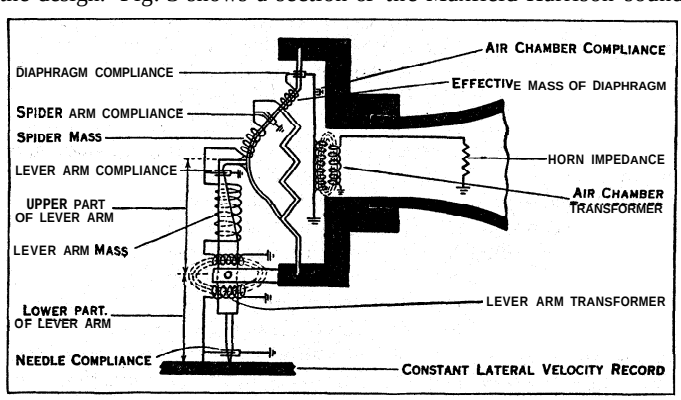

FIG. 3.— SECTIONAL DRAWING OF A SOUND BOX

box. Superimposed on each component the equivalent electrical component is shown, while in fig. 4 the mechanical elements are arranged diagrammatically for comparison with a simple form of electrical filter, combining two sections of low pass construction with a single band-pass element. As the series (diaphragm) compliance is so large that the low frequency cut-off which it causes lies well below that created by the horn, an inappreciable error is introduced in using for design purposes formulae of low pass filters. In an ordinary electrical filter, any section through the centre of the series impedances divides the filter into two

parts, the impedances of which, looking forward and backward from the line of section, are matched. In this sound box two transformers are used, the needle arm with its lever action and the ratio of the areas of diaphragm to horn opening. Each of these steps up the velocity and hence in usual nomenclature would be described as a step-down transformer. The matching of impedances by equivalent transformers is one of the chief points in the design of this sound box. In fig. 4 the record is to be regarded as the approximate equivalent of a constant current electrical generator, whose impedance is infinite. That this is not strictly true is evident from the fact that some record wear still occurs, but in spite of the increased amplitude of cut in records made by the electrical processes, less wear occurs with this type of sound box than with the earlier records and instruments.

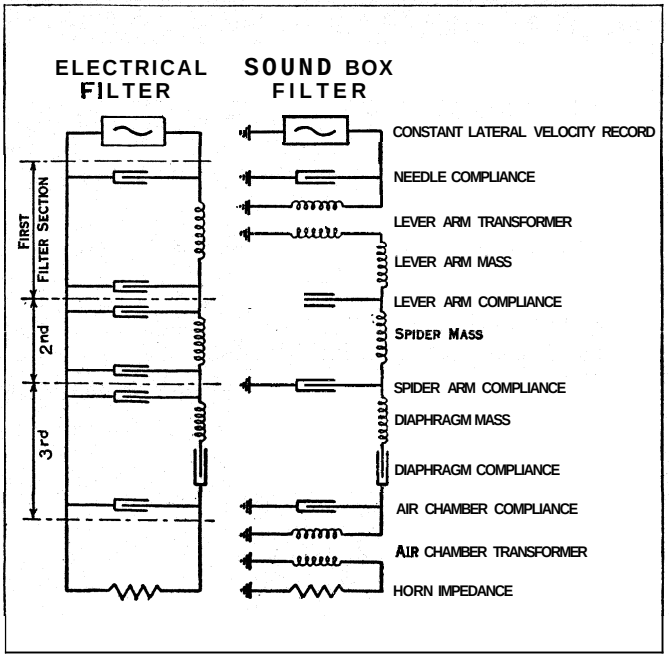

FIG. 4. — ELECTRICAL EQUIVALENT OF THE SOUND BOX COMPARED WITH THE COMPONENTS OF A SIMPLE FORM OF ELECTRICAL FILTER. COMBINING TWO SECTIONS OF LOW-PASS CONSTRUCTION WITH A SINGLE BAND-PASS ELEMENT

The two formulae on which the design is based are as follows:

$$f_c = \frac{1}{\pi}\sqrt{\frac{1}{MC}} \qquad (1)$$

$$z_0 = \sqrt{\frac{M}{C}} \qquad (2)$$

whence

$$C = \frac{1}{\pi^2 f_c^2 M} \qquad (3)$$

where f_c = the cut-off frequency of a transmission system in cycles per second; C = the shunt compliance per section in centimetres per dynes; M = the series mass per section in grams; z_0 = the value of the characteristic impedance over the greater part of the band range.

It was found possible to make a satisfactory diaphragm of effective area 13 sq.cm. with a mass of 0·186 grams; this value was therefore taken for M. The cut-off frequency was chosen as 5,000, a compromise between the highest frequency occurring in the record and the increase in surface-noise when the cut-off frequency is raised. Using these arbitrary values for two of the variables, equation (3) above shows that the values of all the equal shunt compliances and series masses in fig. 4 are determined; while by substituting these values in equation (2) the characteristic impedance of the system can be computed. For this particular design it is 2,920 mechanical ohms. Maxfield and Harrison made experiments from which it was calculated that for the reproduction to be sufficiently loud the radiation resistance of the entire system (*i.e.*, the impedance as viewed from the record) should be approximately 4,500 mechanical ohms. A lever-arm transformer ratio of — was therefore incorporated to produce the necessary resistance.

The terminating resistance of the filter is provided by the horn, which is of the logarithmic type. There are two fundamental constants of such a horn. The first is the area of the large end and the second is the rate of taper. The area of the mouth determines the lowest frequency which is radiated satisfactorily. The energy of the frequencies below this is largely reflected if it is permitted to reach the mouth. From the equations given by Webster it can be shown that all logarithmic horns have a low-frequency cut-off which is determined by the rate of taper. It is, therefore, possible to build a horn in which the lowest frequencies are prevented from reaching the mouth and so undergoing reflection, while all frequencies above the cut-off value are radiated. Such a horn will have no marked fundamental resonance and will behave substantially as a pure acoustic resistance as required by the theory. Since the characteristics of the horn are determined by the area of its mouth and by its rate of taper, the length of the horn is determined by the area of the small end. This in turn is determined by the mechanical impedance and effective area of the system which it is terminating. It is seen, therefore, that the length of the horn should not be considered as a fundamental constant. Where it has been necessary to make a folded horn, difficulties have been encountered in settling the proper shape that this should take in order that its performance may approximate to that of a straight exponential horn. In practice a number of assumptions have been made which although not rigorously correct, have permitted the construction of compact horns having approximately the same properties as a straight logarithmic horn.

Outline of Modern Record Manufacture. — Some of the details of record manufacture are known only to the trade, but the following is a general description of the procedure. The dispositions of the performers, microphones, etc. are similar to those used in Broadcasting, *i.e.*, they may be located in a public auditorium or in special studios. In the latter case, such reverberation or echo effecl as is desired is obtained by adjusting the amount of acoustic damping material in the studio, or by the use of an auxiliary microphone, placed in a separate "Echo room" containing a loud-speaker coupled through an amplifier to the microphone in the main studio.

The output from the microphone or microphones is in most cases passed through a series of distortionless amplifying stages direct to the recorder, which is provided with a V-shaped cutting tool. The record blank is a tablet of a soapy wax, carried on a horizontal table which is rotated with uniform angular velocity by a weight-driven motor. As the table rotates it also travels laterally at a uniform speed, being carried on a revolving threaded spindle. The cutting point is lowered so as to enter the surface of the blank to a depth of a few mils, and as the machine runs it cuts a fine spiral groove of uniform depth, running from the circumference of the blank to within 2 or 3 inches of the centre. The lateral travel of the turntable is such that a record having about 100 grooves to the inch is made.

The record so prepared is dusted with graphite to make it electrically conductive, and is then slowly rotated in a copper-plating bath. A homogeneous deposit of copper having thus been grown, it was at one time usual to take "dubs" or impresses in wax from the resulting negative. From this in turn one or more working matrices were made, from which the records were pressed. More recently, however, it has become standard practice to grow a whole series of negatives upon the original record, thereby obviating any necessity for a second wax impression.

Two classes of materials are used in the manufacture of the common breakable type of record, viz.,—resins and gums (of which the principal example is shellac); and various mineral fillers, which are used to lower the cost of production and to give increased resistance. From this material, records are pressed from the matrices in steam-heated hydraulic presses.

Flexible records, composed principally of celluloid, are also made. They are exceptionally free from surface noise but have hitherto proved inferior to wax in wear-resisting qualities.

Methods of Measurement. — Side by side with the introduc-

tion of electrical recording methods, and of reproducing mechanisms based on electrical theory, there have also been developed electrical methods for the measurement of mechanical impedance and for determining the acoustic output of a gramophone at any given frequency. The masses and compliances of the various members of a recorder or sound-box assembly are seldom separately located but are usually distributed in a complex manner.

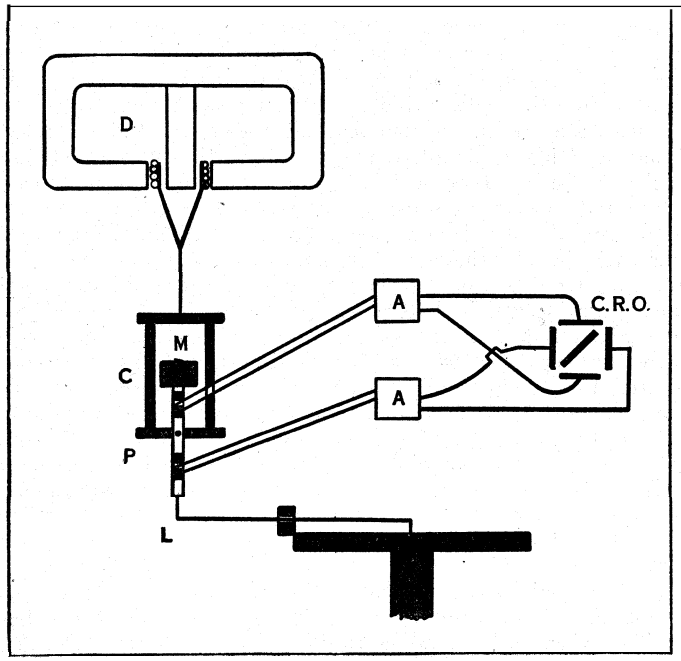

FIG. 5.—IMPEDOMETER, FOR THE MEASUREMENT OF MECHANICAL IMPEDANCE

Cage C is driven by the coil and magnet system D. If the auartz strip is fixed to the cage at P, and the forces at each end of the strip are dependent upon the known mass M and the unknown impedance L, piezo-electric changes are liberated on the silvered electrodes and conveyed to separate amplifiers A, A. From the figure obtained in the cathode-ray oscillograph C,R,O, the unknown impedance may be determined

Moreover, they cannot at once be determined by static measurements alone. It is necessary to have some means for measuring the mechanical impedance of the parts in the degrees of freedom in which it is desired that they shall operate, as well as in those directions in which they should not be permitted to vibrate.

Fig. 5 shows diagrammatically a method of making such measurements. A known mass M is attached to one end of a quartz strip, the other end of which is fixed to the driving point of the impedance *L* under examination. The strip is rigidly fastened at its centre P to a cage C which can be driven at any desired frequency by an electro-magnetic coil and magnet system D. Near each end of the strip the two faces are silvered and connected through an amplifier *A* to one pair of plates of a cathode-ray oscillograph (see INSTRUMENTS, ELECTRICAL). The natural frequency of the strip being made high in comparison with the frequencies of operation, the piezo-electric effect (see ELECTRICITY) liberates on the electrodes at each end instantaneous charges whose magnitudes are proportional to those of the mechanical forces set up by the known mass and the unknown impedance respectively. The cathode beam is acted upon by these two forces at right angles to each other. From the resultant figure it is therefore possible to determine the relative phase and magnitude of the force exerted by the impedance under measurement. For example, if the impedance is purely reactive a straight line figure is produced; if resistive, the combination of forces due to the mass and to this resistance will give rise to an elliptical figure. The instrument, which is termed an "Impedometer," is likely to be of value in the further practical applications of Maxfield and Harrison's ideas, especially in the search for suitable non-reactive mechanical resistances. A method which is used for obtaining the curve of response of a gramophone is as follows:—

A number of records are made on a constant-velocity basis, of pure tones of given intensity. These are played on the machine under test, which is placed in a special room with heavy acoustic damping. The sound from the machine is picked up by a calibrated microphone which is swung from side to side during the test in order to nullify any effects due to standing waves in the room. The microphone is connected to an amplifier of which the performance is known, and the output from this is taken through a low-pass filter and a variable resistive network to a thermionic voltmeter. The acoustic output of the gramophone at any frequency is measured by the amount of attenuation it is necessary to introduce into the resistive network in order to obtain a standard reading on the voltmeter. A low-pass filter is necessary in order to eliminate from the measurement the effect of any harmonic frequencies which may be accidentally present in the record and radiated by the machine. The voltmeter is given a very slow natural period in order to obtain a mean value of the output from the swinging microphone.

Fig. 6 shows the frequency response curves for two gramophones. The dotted curve is of a machine of 1897, with massive moving parts and short conical horn. The full line curve is of a 1928 cabinet model, designed according to electrical analogies as the equivalent of a band pass filter. In this diagram the abscissae are frequencies plotted on a logarithmic scale and the ordinates represent the gain or amplification required to bring the output up to an arbitrary energy level. These are plotted in transmission units, which are defined as $10 \log_{10} E/E'$, where E is the energy output and E' is a standard energy level. The transmission unit scale is roughly proportional to the audible value of the sound. Three units represent a noticeable change in intensity.

Electrical Reproduction. — If the sound-box of a gramophone is removed and replaced by a device which generates a fluctuating voltage, the instantaneous values of which are proportional to those of the air pressures originally impressed on the recording microphone, it is possible to obtain a telephonic version of the

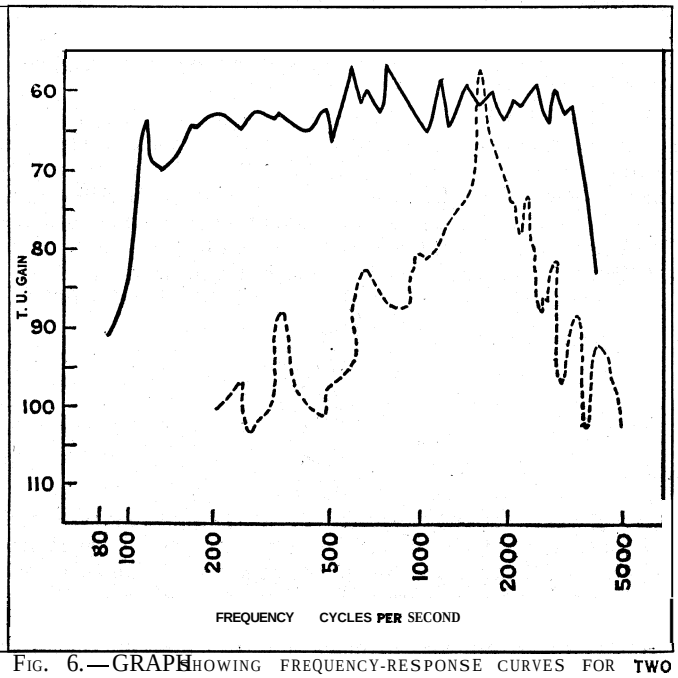

FIG. 6.—GRAPH SHOWING FREQUENCY-RESPONSE CURVES FOR TWO GRAMOPHONES

original performance. The output from the pick-up device may be passed through an amplifier to one or more loud-speakers; hence, almost any desired volume may be obtained, and electrical correction circuits introduced if required for any purpose.

A variety of pick-up devices have been utilised, but whether they comprise a moving-iron or a moving-coil system, an electrostatic arrangement or a piezo-electric crystal, there is in every case a reactive load due to the mass and compliance of the moving parts, so that it is generally necessary to apply some form of damping.

The lateral forces which act on the needle during reproduction (apart from that which urges it towards the centre of the record)

are, first, a steady force, due to the fact that a line passing through the needle-point and the axis of rotation of the tone-arm cannot be exactly tangential to the record groove; and second, a force due to the vibratory motion of the needle-point. The first of these can easily be kept within reasonable limits by careful design. The second may be regarded as the mechanical equivalent of an alternating voltage applied to a network—*i.e.*, there can be any phase-relation with the current, which is here analogous to velocity. If the force and velocity are go deg. out of phase, no useful work is done, and the load is then purely reactive. Such a load would be furnished in electrical parlance by a pure inductance or pure capacity; mechanically, by a pure mass or compliance. In the older gramophones the load on the needle-point was extremely destructive to the record. There were numerous resonances, and the load, which was purely resistive only at the peaks, was elsewhere almost wholly reactive. Under such conditions a large proportion of the energy is reflected back into the record groove with a difference of phase which in some cases may even result in the needle leaving the grooves altogether and cutting across them, with disastrous effects on the life and reproduction of the record. it is, as a matter of fact, only possible to construct a mechanical system which shall not be harmful to records if it is substantially resistive over a wide frequency range, *i.e.*, if it is a network correctly terminated by a resistance equal to its characteristic impedance. We have seen in the case of a sound-box that this resistance is provided by the horn. In the case of an electrical reproducer a difficulty arises owing to the fact that it is not required to do work, but only to generate variations of electric potential. It has been stated that the provision of a pure mechanical resistance is not a simple matter. The use of rubber, for example, introduces a reactive component which is large compared with its resistance, and may lead to very heavy record wear if other compliances are added.

Long-playing Records.--There are several ways in which the playing time of a disc record of given diameter may be increased. In one method the principle of recording and reproducing with the turntables rotating at constant angular velocity is abandoned in favour of some other type of motion; for example, a constant linear velocity of the record relative to the needle. Using the former method, it is necessary to make the minimum linear velocity (when the needle is near the centre) great enough to ensure proper recording of the high frequencies. In all other parts of the record the velocity is then unnecessarily high. If the record is made with varying angular velocity, some form of go ernor or variable gear must be linked with the tone-arm of the reproducing machine to control the speed of the turntable, and care must be taken to ensure that the power is adequate to drive the record under all conditions.

A second method of increasing the playing time, which could be combined with the above, consists in cutting the record with uniform amplitude instead of with uniform velocity, and correcting for the error by a suitable reproducing system. In the case of electrical reproduction this can easily be arranged; moreover it is permissible to reduce the amplitude down to any point where the ratio of surface noise to music is still reasonably small. In this way a much larger number of grooves may be included in the record. But records so made would be unsuitable for use with mechanical instruments of the type described in this article.

Light Recording.— Recently a number of sound-reproducing systems have been devised for use in conjunction with synchronised motion-pictures. In some cases a disc record with electrical reproducing equipment has been used, while in others the sound is recorded on a moving photographic film, either on a narrow strip beside the picture or else on a separate film. These records may be of constant density and variable width, or the density of the photographic image may vary in accordance with the sound pressure. They are made by means of a beam of light which is deflected (*e.g.*, by a galvanometer) or caused to fluctuate in intensity before reaching the film. Among other methods of producing a fluctuating beam, use may be made of mechanically or electrically operated shutters, microphone-controlled gas glow lamps, or the Kerr or Faraday effects in liquids. In the latter case the microphone is caused to produce a varying magnetic field, which rotates the plane of polarisation of a beam of light after passing through a Nicol prism. Hence the amount of light which will pass through a second Nicol prism or analyser to the photographic film is controlled. The record may be reproduced by passing it between a light source and some form of light sensitive cell, from which, after amplification, a powerful audio-frequency current is obtained. This current may in turn be used to operate one or more loud-speakers, or alternatively, using an electromagnetic recorder, an ordinary wax disc record may be cut in which case the speed may be lowered with a corresponding reduction of some of the difficulties in mechanical recording. By so transferring the film record, however, many of the potential advantages of light recording, such as freedom from noise and ability to deal with the highest frequencies, are sacrificed.

GRAMOPHONE MUSIC

Gramophone music as a thing to be taken seriously by cultivated musicians has been a matter of slow growth and development. Invented as a by-product of telephone research, reared in the atmosphere of booths, side-shows and acrimonious litigation, a horror to eye and ear, this crazy, ridiculous machine, that contained none the less such remarkable potentialities, won its way to the recognition of the astute and the respectable through even longer years of ignominy and disrepute than the, at first, equally crude and grotesque motor car.

Even now, in 1939, the gramophone suffers from two major disadvantages which have dogged it from the start. It still cannot reproduce sounds quite faithfully; and the standard 12″ record only lasts about five minutes, so that longer pieces of music have to be reproduced with either cuts or intermittent pauses for record-changing.

Automatic record-changing contrivances are now available but they only serve to eliminate the need for manual attention; the pause between records still remains and still causes discomfort to the musician.

The three outstanding landmarks in the past have been, first,

the records made by Caruso, and the other "celebrities" of the early catalogues of the Gramophone Company (H.M.V); secondly, the adoption of the Columbia "silent surface" in 1922, which converted the music-loving public; and thirdly, the use of the microphone, which superseded the "acoustic" system of recording in 1925. It is probably just to count as a fourth landmark the advent of electrical reproduction through a "pickup" in place of the earlier tone-arm and sound-box.

If the handicap of surface noise is ignored, it would be idle to suggest that the music lover in 1923 or even earlier could not collect a very substantial nucleus of good music on gramophone records. Most of the celebrated conductors — Toscanini, Nikisch, Wood, Coates, Ronald — with singers such as Melba, Patti, Destinn, Bispham, Elwes, Caruso, Battistini, Santley and Edward Lloyd, and instrumentalists such as Kreisler, Kubelik, Casals, Paderewski, Busoni, Joachim, Ysaye, had made records; it was possible to procure at least fifteen more or less complete chamber music works played by such distinguished bodies as the Flonzaley, Léner and London String Quartets; and records of still wider scope, such as complete operas and oratorios (*Elijah* for example) were available.

It was about this period that the late Arthur Clutton Brock wrote one of his last essays entitled "The Psychology of the Gramophone," in which he confessed that "always with the Gramophone we have to make allowances; and these are most easily made when others help us to make them unconsciously. . . . There are qualities of the orchestra," he added, "that never survive on the gramophone, the sharpness of attack on the strings, the clearness of their different parts, and the full distinction between strings and wood wind; pizzicato is usually unpleasant, seeming to intrude between you and the rest of the music; while all the bass parts are apt to be a mere rumble." Clutton Brock also added that sometimes by playing an orchestral record with the thinnest possible needle he could persuade himself that he had produced "a delicate, distant kind of fairy music, something not at all like the actual orchestra, but with an original quality of its own."

From these quotations it is possible to perceive a kind of romantic despair, acquiescing in the limitations of the gramophone and attempting to find a new quality of pleasure in its very imperfections. Against this tendency the "realists" opposed a feverish energy in experiments with soundboxes and gramophone design in general, coupled with a constant demand for the recording of classical masterpieces without "cuts"; but it was not till the benefits of the research work done in radio laboratories were felt that the gramophone and the record as we know them today were developed by anything but the most empirical methods.

No one in his senses would claim that he no longer had to "make allowances" for the gramophone; but musical critics of high standing have been astounded by the rapid progress made.

At present the library of gramophone records has reached vast proportions. At least two hundred albums of symphonies and concertos and of chamber music are now available, and it is not uncommon to hear of private libraries containing from four to seven thousand discs of good music.

The B.B.C. has probably the largest record library in Great Britain at Broadcasting House and the daily broadcasting of record programs has done much to familiarize the public with the scope and quality of recorded entertainment. Nor should the rapid growth in the appreciation of the gramophone for educational purposes be overlooked. Educational authorities give it their support with increasing confidence and the recording companies have their education departments; "courses" in foreign languages have a large and eager public; research work in phonetics and anthropology is carried on with recording apparatus in many countries; enthusiasts form Gramophone Societies and in several instances the private recording of unusual works for distribution to members has been further evidence of the part which the gramophone is able to play in the musical culture of communities and of the individual.

The only dangers that threaten are that the listener may insensibly be trained to accept distortions for facts and that he may regard some particular interpretation and performance of the great classical works as a standard of perfection which by constant repetition becomes ineradicable from his mind. The limitations of recording hitherto have often led to faulty tempi, to the distortion of orchestral balance, and the like, with the result that the bottled fruit may sometimes have, not so much lost flavour, as acquired an exaggerated flavour. None the less it may be said that the stage of commercial barbarism and academic snobbishness has now been passed, and that the inherent disadvantages of the gramophone have been to a great extent surmounted. It is now possible to obtain satisfactory records of Wagner's works made actually at Bayreuth; of symphonies played by full-sized orchestras under the world's leading conductors; of the famous organists playing in their own cathedrals; of stage performances of opera or oratorio, and even of important open-air events. Where a microphone can be installed a record can be made. (C. MAC.; *C. STO.*)

GRAMPIANS, THE, a mass of mountains in central Scotland, occupying the area between a line drawn from Dumbartonshire to the North sea at Stonehaven, and the valley of the Spey or even Glenmore (the Caledonian canal). Their trend is from south-west to north-east, the southern face forming the natural division between the Lowlands and Highlands. They lie in the shires of Argyll, Dumbarton, Stirling, Perth, Forfar, Kincardine, Aberdeen, Banff and Inverness. Among the highest summits are Ben Nevis, Ben Macdhui and Cairngorm, Ben Lawers, Ben More, Ben Alder, Ben Cruachan and Ben Lomond. The principal rivers flowing from the watershed northward are the Findhorn, Spey, Don, Dee and their tributaries, and southward the South Esk, Tay and Forth with their affluents. On the north the mass is wild and rugged; on the south the slope is often gentle, affording excellent pasture in many places. Both sections contain some of the finest deer-forests in Scotland. The rocks consist chiefly of granite, gneiss, schists, quartzite, porphyry and diorite. Their fastnesses were inhabited by the northern Picts, the Caledonians who, under Galgacus, were defeated by Agricola in A.D. 84 at Mons Graupius — the false reading of which, Grampius, has been perpetuated in the name of the mountains. This site has not been ascertained.

GRAMPOUND, a small market town, Cornmall, England, 8 mi. E.N.E. of Truro. and 2 mi. from its station (Grampound Road) on the G.W. railway. Pop. (1931) 388. On the river Fal, it retains an ancient town hall; there is a good market cross; and in the neighbourhood, along the Fal, are several early earthworks. Grampound (Ponsmure, Graundpont, Grauntpount, Graundpond) and the hundred, manor and vill of Tibeste were formerly closely associated. At the time of the Domesday Tibeste was granted to the count of Mortain. The burgensic character of Ponsmure first appears in 1299. John of Eltham (1334) granted to the burgesses the whole town of Grauntpount. This grant was confirmed in 1378 as well as two fairs at the feasts of St. Peter in Cathedra and St. Barnabas, both of which are still held, and a Tuesday market (now held on Friday). Two members were summoned to parliament by Edward VI. in 1553. The venality of the electors (about 50) became notorious. In 1821 the borough was disfranchised.

GRAMPUS (*Orcinus orca*), a cetacean belonging to the *Delphinidae* or dolphin family, characterized by its rounded head without distinct beak, high dorsal fin and large conical teeth. The upper parts are nearly uniform glossy black, with a white eye-stripe and the under parts white. The animal is also known as the "killer," in allusion to its ferocity in attacking its prey, which consists of fishes, seals, porpoises, and the smaller dolphins. It is very voracious. In the Antarctic several will combine to break the ice in order to throw their prey (and, it is said, even men) into the water where they can kill it. These cetaceans sometimes hunt in packs and commit great havoc among the belugas (*q.v.*) and other whales. The grampus inhabits both northern and southern regions, and is by no means uncommon in British waters. The number of species is doubtful, but only one is usually recognized. *Grampus* is used as the generic name of Risso's dolphin. (See CETACEA.)

GRANADA, LUIS DE (1504–1588), Spanish preacher and ascetic writer, was born of poor parents at Granada. He became a Dominican and after studying at Valladolid, was appointed procurator at Granada. Seven years later he was elected prior of the convent of Scala Caeli in the mountains of Cordova, where he became one of the most famous of Spanish preachers. He went to Portugal in 1555 and became provincial of his order, declining the offer of the archbishopric of Braga but accepting the position of confessor and counsellor to Catherine, the queen regent. At the expiration of his provincialship, he retired to the Dominican convent at Lisbon, where he died. His mystical teaching was said to be heretical, and his famous *Guia de Peccadores*, which has been translated into nearly every European tongue, was put on the Index together with his book on prayer, in 1559. In 1576 the prohibition was removed and his works became much prized by St. Francis de Sales, St. Teresa and St. Peter of Alcantara.

The collected works appeared in 9 vols. at Antwerp in 1578. *See* *L.* Monoz, *La Vida y virtudes de Luis de Granada (1639)*; *P.* Rousselot, *Mystiques espagnoles* (1867); Fitzmaurice Kelly, *Hist.* of *Spanish Lit* (1926).

GRANADA, one of the chief cities of Nicaragua, Central America, capital of the province of the same name, and the terminus of the Pacific railroad. It is 36 m. S.E. of Managua, the national capital, and 118 m. from Corinto, the chief Pacific port and the northern terminus of the railroad. Granada's population was 24.843 in 1940, and it lies at an altitude of 180 ft. above sea level, on the shores of Lake Nicaragua where steamers and launches connect it with the lake towns. It is remarkable for the considerable number of Roman Catholic churches, schools and institutions, including the pretentious Colegio de Centro-América, on the shores of the lake; is the seat of a bishop, and as the headquarters of the Conservative party in Nicaraguan politics is closely linked with the religious interests of the country. The city itself is laid out like most Spanish towns, on a rectangular "grid-iron" style: the houses are mostly one story, but include many fine old mansions dating from colonial times; the churches are massive and some of them ornate. The city lies back from the shore of the lake, whose clustered islands near Granada (called *"Los Diamantes"* or "the Diamonds") are the recreational resort of the city. Granada is an important trading centre and most of the old families there are engaged in commerce. The products of the locality are cattle and hides, cacao, sugar, cotton, indigo. alcohol and coffee.

Granada was founded in 1524 by Francisco Hernández de Córdoba, early became the centre of the Conservative life and trade of the region, and from earliest times has been a keen political and trade rival of León (*q.v.*), further north, the centre of the Liberal party, and now a more populous and prosperous business rival of Granada. The present capital, Managua (*q.v.*) was founded between the two older cities as a political compromise. Granada was raided by pirates from the Caribbean many times in the 17th century and in 1606 it was sacked and burned. William Walker (*q.v.*), the American filibuster, made Granada the centre of his attacks and his headquarters during the period (1855–59) when he was active in Nicaragua, and as leader of the Liberals sacked and partially burned Granada in 1855.

GRANADA, a maritime province of southern Spain, formed in 1833 of districts belonging to Andalusia, and formerly centre of the ancient kingdom of Granada. Pop. (1939) 709,939; area, 4 928 sq. miles. Granada is bounded on the north by Cordova, Jaén and Albacete, east by Murcia and Almeria, south by the Mediterranean sea, and west by Málaga. It includes the western and loftier portion of the Sierra Nevada (*q.v.*), a vast ridge rising parallel to the sea and attaining its greatest altitudes in the Cerro de Mulhacén (11,427 ft.) and Picacho de la Veleta (11.338 ft.), which overlook the city of Granada. Lesser ranges, such as the Sierras of Parapanda, Alhama, Almijara, Harana or Baeza, adjoin the main ridge. In this central watershed rise the three principal rivers of the province. Southward flows the Guadalféo to the Mediterranean, westward the Genil, and northward the Guadiana Menor and its many tributaries draining the north-eastern districts Both the Genil and the Guadiana join the Guadalquivir outside the province. Summer drought predominates and only the mountain slopes are forested, mainly with pine trees. The soil of the high basins north of the Sierra is, however, fertile, that of the Vega of Granada being considered the richest in the whole peninsula, and from the days of the Moors it has been systematically irrigated. Sheep and goats are reared in the Sierra and esparto grass is obtained from the upland areas. Fine alabaster, jasper and other precious stones occur in the mountains behind Granada, but are little worked. The only important industry is sugar refining. This developed rapidly after the loss of the Spanish West Indies and the Philippine Islands in 1898, with the consequent decrease in competition, and there are now factories in many towns, especially in the Vega and along the coast. Apart from the great highways traversing the province, which are excellent, the roads are few and ill-kept. The main Madrid–Málaga–Algeciras railway passes through the capital. At Moreda a line branches south-east to Almeria, passing through Guadix, junction for Murcia, and through La Calahorra, where a short line runs out to Alquife. A line connects Granada with Motril on the coast, and an electric railway runs from the capital up into the Sierra Nevada. The capital is Granada (pop. 1940, 125,256); other towns are Loja (pop 1930, 21,021), Motril (18,797), Guadix (21,949), Baza (15,935), Montefrío (14,380). Alhama de Granada (8,204), Illora (11,000), Huéscar (10,012), Pinos-Puente (11.257) and Almuñécar (9,149). Although the city of Granada was captured by Nationalists during the civil war of 1936–39, most of the province remained in Loyalist hands until the end of the war. (*See* also ANDALUSIA and, for the history of the ancient kingdom, the city of GRANADA below.)

GRANADA, the capital of the province, and formerly of the kingdom of Granada, in southern Spain; on the Madrid-Granada-Algeciras railway. Pop. (1940), 125,256. Granada is well situated, 2,191 ft. above the sea, on the north-western slope of the Sierra Nevada, overlooking the fertile lowlands known as the Vega de Granada on the west and overshadowed by the peaks of Veleta (11,338 ft.) and Mulhacén (11,427 ft.) on the south-east. The southern limit of the city is the river Genil, the Roman *Singilis* and Moorish *Shenil,* a swift stream flowing westward from the Sierra Nevada, with a considerable volume of water in summer, when the snows have thawed. Its tributary the Darro, the Roman *Salon* and Moorish *Hadarro,* enters Granada on the east, flows for upwards of a mile from east to west, and then turns sharply southward to join the main river, which is spanned by a bridge just above the point of confluence. The waters of the Darro are much reduced by irrigation works along its lower course, and within the city it has been canalized and partly covered with a roof.

Granada comprises three main divisions, the Antequeruela, the Albaicin and Granada properly so-called. The first division, founded by refugees from Antequera in 1410, consists of the districts enclosed by the Darro, besides a small area on its right, or western bank. It is bounded on the east by the gardens and hill of the Alhambra (*q.v.*), the most celebrated of all the monuments left by the Moors. The Albaicin (Moorish *Rabad al Bayazin,* "Falconers' Quarter") lies north-west of the Antequeruela. Granada, properly so-called, is north of the Antequeruela, and west of the Albaicin. The origin of its name is obscure; it has been sometimes derived from *granada,* a pomegranate, in allusion to the abundance of pomegranate trees in the neighbourhood. A pomegranate appears on the city arms. The hloors, however, called Granada *Karnattah* or *Karnattah-al-Yahud,* and possibly the name is composed of the Arabic words *kurn,* "a hill," and *nattah,* "stranger"—the "city" or "hill of strangers."

Granada is the see of an archbishop. Its cathedral, begun in 1529 by Diego de Siloe, and finished only in 1703, is profusely ornamented with jasper and coloured marbles, and surmounted by a dome. The interior contains many paintings and sculptures by Alonso Cano (1601–1667), the architect of the fine west façade, and other artists. In one of the numerous chapels, known as the Chapel Royal (*Capilla Real),* is the tomb of Ferdinand and Isabella, the first rulers of united Spain. The Cartuja, or

Carthusian monastery north of the city, was built in 1516 in memory of the Great Captain, Gonzalo de Córdoba (1453–1515), whose tomb is in the convent of San Jerónimo.

After the Alhambra, and such adjacent buildings as the Generalife and Torres Bermejas, which are more fitly described in connection with it, the principal Moorish antiquities of Granada are the 13th-century villa known as the Cuarto Real de San Domingo, admirably preserved, and surrounded by beautiful gardens; the Alcazar de Genil, built in the middle of the 14th century as a palace for the Moorish queens; and the Casa del Cabildo, a university of the same period, converted into a warehouse in the 19th century. Granada has an active trade in the agricultural produce of the Vega, and manufactures liqueurs, soap, paper and coarse linen and woollen fabrics.

History.—The identity of Granada with the Iberian city of *Iliberris* or *Iliberri,* which afterwards became a flourishing Roman colony, has never been fully established; but Roman tombs, coins, inscriptions, etc., have been discovered in the neighbourhood. Under the caliphs of Cordova the family of the Zeri, Ziri or Zeiri maintained itself as the ruling dynasty until 1090; it was then displaced by the Almohades, who were in turn overthrown by the Almoravides, in 1154. The dominion of the Almoravides continued unbroken, save for an interval of one year (1160–61), until 1229. From 1229 to 1238 Granada formed part of the kingdom of Murcia; but in the last-named year it passed into the hands of Abu Abdullah Mohammed Ibn Al Ahmar, prince of Jaen and founder of the dynasty of the Nasrides. Al Ahmar was deprived of Jaen in 1246, but united Granada, Almeria and Malaga under his sceptre, and made peace with Castile. Al Ahmar and his successors ruled over Granada until 1492, in an unbroken line of 25 sovereigns. Their encouragement of commerce—notably the silk trade with Italy—rendered Granada the wealthiest of Spanish cities; their patronage of art, literature and science attracted many learned Muslims such as the historian Ibn Khaldun and the geographer Ibn Batuta, to their court. and resulted in a brilliant civilization, of which the Xlhambra is the supreme monument.

The two noble families of the Zegri and the Beni Serraj, better known in history and legend as the Abencerrages (*q.v.*), encroached greatly upon the royal prerogatives during the middle years of the 15th century. **A** crisis arose in 1462, resulting in the dethronement of Abu Nasr Saad, and the accession of his son, Muley Abu'l Hassan, whose name is preserved in that of Mulhacen, the loftiest peak of the Sierra Nevada. Muley Hassan weakened his position by resigning Malaga to his brother Ez Zagal, and incurred the enmity of his first wife, Aisha, by marrying a beautiful Spanish slave, Isabella de Solis, who had adopted the creed of Islam and taken the name of Zorayah, "morning star." Aisha or Ayesha, who thus saw her sons Abu Abdullah Mohammed (Boabdil) and Yusuf in danger of being supplanted, appealed to the Abencerrages. (See ALHAMBRA) In 1482 Boabdil deposed his father, who fled to Malaga, but the Christians under Ferdinand and Isabella forced him to resign the task of defense into the more warlike hands of Muley Hassan and Ez Zagal (1483–86). In 1491 Boabdil signed away his kingdom; and on Jan. 2, 1492, the Spanish army entered Granada, and Moorish power in Spain ended. Nationalists captured Granada during the civil war of 1936–39.

GRANADOS GAMPINA, ENRIQUE (1867–1916), Spanish pianist and composer, was born at Lerida on July 29, 1867. After studying in Barcelona under Pujol and Pedrell he went to Paris, where he worked chiefly under de Bériot. In 1898 his first opera, Maria del Carmen, was produced in Madrid. Two years later he founded the Sociedad de Conciertos Clbsicos and, in 1901, the Academia Granados. He had a brilliant career as a pianist, playing chiefly in France and Spain but visiting America in 1915 and in 1916, when his opera Goyescas was performed in New York. On his return home he met his death on the "Sussex," which was sunk in the Channel by a German submarine on March 24. His most characteristic writing is to be found in his piano music, which is full of the colour and rhythm of Spanish folk-tunes. Especially in the *Goyescas*—two sets of pieces from which he took the material for his opera of that name—he produced melodies of great beauty, drawing his inspiration from Goya's paintings and tapestries and the life of the period in Madrid. Among his other piano compositions are: 12 Spanish dances; children's pieces; six pieces based on Spanish popular songs; romantic scenes; poetic scenes; book of hours and impromptus. His operas include: *Picarol, Gaziel, Liliana,* Petrarca and Follet. He also wrote a symphonic poem: *Nit* del Mort and several orchestral suites; an "Oriental" for oboe and strings; a collection of canciones amatorias and another of seven Tonadillas for the voice.

GRANARIES AND GRAIN ELEVATORS. With the disappearance of the old type of granary, the term grain elevator has in the United States and Canada almost wholly ousted the older term. **A** modern granary, with its elaborate organizations, may be likened to a scientific development of the fundamental theory laid down by Joseph of Old in Egypt. In modern civilization granaries play probably the most important part in the world's economy, since they are instrumental in distributing the daily bread from the sparsely populated new countries where production, on the virgin soil, is greater than the consumption, to the densely populated old countries, where conditions are reversed. Beyond the obvious purpose of providing safe storage, modern granaries provide automatic handling for the grain to and from storage with a maximum of speed and a minimum of cost. An outstanding advantage of the system is that a farmer can store his wheat or maize at a moderate rate and can get an advance on his warrant if he is in want of money. Moreover, a holder of grain in a Chicago terminal elevator can arrange to withdraw or exchange grain of similar grade in another terminal with proper adjustments for freight rates and other costs. America is the home of great granaries, which are called "elevators" in that country. However, a certain Robert Dunbar, a native of Carabee, Fifeshire, Scotland, designed the first modern type of granary at Buffalo, where he had settled in 1834.

Granary **Building** Materials—Until within a few years of the close of the 19th century silo granaries were in vogue, built of timber on the crib system, somewhat after the fashion of block. houses; the silos, however, were of sawn timber, generally about 12ft. square, and the planks were nailed one on top of the other overlapping at the corners, beginning at the base with those of 6 to 10in. width, and finishing at the top with those of 4 inches. This construction was quite satisfactory, but the high cost and growing scarcity of timber necessitated the use of other materials.

During the opening years of the 20th century cylindrical steel silos were built with conical or flat bases, the former being constructed of steel and the latter of concrete. This type of granary is comparatively cheap and the weight of the structure is light relative to the amount of grain stored. Formerly all steel silos were built with riveted joints, but bolts are now largely used, the cost of erection being thereby considerably reduced, since skilled riveters are no longer required to put the tanks together on the site. Steel was soon ousted by tiles reinforced by steel rods for square silos and rings for circular ones. The concrete type of granary is the most recent and by far the most satisfactory form of construction, and the majority of large granaries built of late years are of this type. They are proof against both fire and vermin and have the advantages of utility, longevity and economy.

Granaries are built with what is known as a cupola which is erected above the silos; in the early days this, too, was built of timber. It consists of one or more working floors where the elevator tops and the band conveyors are located and manipulated. Nowadays these cupolas are also built of ferro-concrete.

The development in the mechanical equipment since 1896 must be likewise recorded. This is in keeping with the general progress in engineering practice by which all industries have more or less benefited during the period in question. It is now customary, with the advent of the individual motor, to drive each conveyor or elevator unit by a separate motor through silent chain and double helical speed reduction gear instead of, as formerly, all machines being driven by means of ropes and countershafts from one prime mover on the ground floor. This means great saving of space, increase of storage room, altogether greater compactness, convenience of operation with a minimum of manual attention

and better facilities for dust elimination. The very latest improvement noted is the employment of roller bearings on all of the machinery.

At the No. 3 Montreal Granary, where all these mechanical improvements are in use, a saving of one-third in driving power has been effected over all of the earlier and the more cumbersome methods.

Risk of Explosion.— One phase of the granary and terminal elevator problem is the matter of safeguarding against explosions. Extensive losses have occurred in every section of United States from dust explosions and fires in connection with the storing, handling, milling and processing of agricultural products. In the last twenty years, preceding 1940, about four hundred dust explosions have occurred in industrial plants in the United States in which more than three hundred persons have been killed, nearly seven hundred others injured and the property loss (insurance paid) amounting to more than twenty eight million dollars. Due to the constant study of the problem by insurance companies and others, losses have been somewhat reduced. For example, an explosion in the public grain elevator at New Orleans, Louisiana in March 1938, was limited in extent due to the adoption of precautionary measures recommended in the safety code for terminal grain elevators.

The risk of explosion can never be entirely eliminated because grain cannot be handled without the creation of dust and dust when mixed with air in a certain proportion may constitute an explosive mixture, which, upon being brought into contact with some external source of heat, equal to the ignition temperature, such as a broken electric light bulb, or even a static spark, may cause a catastrophe.

It has only recently been fully recognized that granary engineers should take measures to reduce the risk of explosion when designing a granary. The John S. Metcalf Co. Ltd., of Montreal, have realized that though an initial explosion is often only a small affair, it may give rise to a second, and even to a third, each one increasing in extent and violence. They have therefore in the construction of the Port of Montreal granary, concentrated on the prevention or localization of the initial explosion. To this end they have segregated the granary into smaller units, thereby reducing the danger to a possible minimum, as will be seen later.

Fortunately, Great Britain has not suffered from any serious explosion, probably on account of the fact that about 75% of imported wheat is used, which has already passed through granaries in the countries where it has been grown, so that a goodly percentage of dust has already been eliminated. Another reason for this immunity from explosions is probably that the British granaries are smaller. In Great Britain there are climatic difficulties in the way of storing the native grain on a large scale. To preserve newly harvested grain in good condition it should be kept as far as possible from moisture and heat, because it has a tendency to sweat when brought into a warehouse, and in this condition will easily heat, such heating, if allowed to continue, impairing the quality of the grain. These difficulties have been largely overcome by frequently transferring it from one silo to another.

Modern granaries are all built on the same fundamental plan and the mechanical equipment for receiving and discharging grain is similar in all of them. For taking in rail-borne grain the mechanical handling equipment consists essentially of truck-unloading devices, bucket elevators and band conveyors; while in addition to these both barge elevators and pneumatic grain-handling plant are employed, principally for transferring grain from vessels to granaries. In most cases it is necessary to receive and distribute grain by both rail and waterways, and since the railway system is the more flexible, most of the important granaries are located on the waterside, where large vessels may be berthed for the discharging and receiving of the grain, while the railway sidings on the land side connect the granaries with the chief lines in the district. The Montreal granaries, for instance, are connected with the lines which traverse the Canadian wheat belt— Manitoba, Saskatchewan and Alberta.

Granaries as a rule are enormously heavy and the soil on which they are constructed is in many cases alluvial, consequently the question of foundations is at all times of the greatest importance.

Harbour Commissioners of Montreal Granary No. 3.— This granary is of concrete construction and it has a total capacity of 2,000,000 bushels; it has been specially designed with the view of guarding against explosions. Each department of the plant is segregated to form an isolated unit. The receiving-house, for instance, which is perhaps the dustiest section, and therefore the place where explosions would be most likely to occur, stands quite apart from the granary proper. The unloading of the grain cars on their arrival at the granary is accomplished by a dumping process in which the car is first lifted and simultaneously tilted forward, then rocked endwise. With this, the unloading of a 60-ton car takes only seven minutes, and one such car dumper can unload from seven to ten 2,000-bushel cars per hour.

The granary itself is divided into two units, each having a storage capacity of one million bushels, and separated from the working house, which is located between them, by substantial concrete walls. The only apertures in these wails are small openings for the belt conveyors to pass through, and those for the necessary iron doors. Moreover, the lowest floor of the working house is on a level with the floor above the silo cells. while the space between the working house and ground level (about 100ft.) is entirely open, allowing the elevator legs to pass through. In these circumstances, should an explosion occur in the receiving house it would spend itself locally, since the only connections between it and the working floors are the elevator legs which are in the vast open space between the working floors and the ground. The casings, of light steel sheets, are carried up to a considerable height in the open, so that an explosion would blow them out and escape before it reached the building above. An explosion on either of the working floors would be kept from spreading to the adjacent granaries by the concrete walls, which would, at the same time, protect the working house if an explosion occurred in either of the two granaries. As an additional precaution, every bucket elevator and every silo cell has a separate vent through the roof to the open. The numerous windows are all hinged from the top and swing outwards with the least pressure from the inside. Practically speaking, all avenues through which an explosion can spread are closed. The risk of explosion is further reduced by the provision of roller bearings on all the machines, for the true rolling motion reduces friction to a minimum and prevents heating of the journals. Lubricating difficulties are likewise overcome, since roller bearings require very little lubricant and that only periodically. As a matter of fact there are over 53,000 Hyatt roller bearings in this plant, and the motors installed for the conveyors are of one-third less power than those formerly employed when bearings of solid type were used. Moreover, reduction of strain permits the use of lighter and less costly conveyor belts.

Durban Terminal Granary.— This large granary installation is an enterprise of the Government of the Union of South Africa; it has a storage capacity of 42,000 short tons of maize, but provision has been made to increase the capacity to a total of 78,000 tons. The building is of ferro-concrete and structural steel and comprises a main working house and several annexes. The working house block is 194ft. long by 70ft. wide and is divided into 89 rectangular storage silos with a total capacity of 15,000 tons. A basement working floor beneath the silos, and likewise one immediately above them, accommodate the band conveyors for distributing and withdrawing grain to and from the silos. Above the silos is a cupola, to the highest point of which the four main intake elevators reach. Accommodation is provided in this cupola for the weighing machines with their receiving and delivery hoppers, from the latter of which maize is spouted on to the distributing band conveyors as well as on to the transverse conveyors, which communicate with the storage annexe. This consists of 50 hoppered cylindrical silos, each 18ft. in diameter, and 36 interspace bins with a total capacity of 27,000 tons. These are of the same depth as the others, just over 90ft., and are constructed of ferro-concrete 7in. thick. Their tops, like those of the silos in

the working house, are covered by a reinforced concrete floor. The structure above the annexe is of steel, with brickwork between the steel uprights. Galleries of reinforced concrete connect the annexe at the top with the working house, while in the basement connection is afforded by underground tunnels. Alongside the working house is a track shed, 188ft. long by 70ft. wide, which extends over four rail tracks and in which the operation of unloading the wagons takes place.

Since damp or dirty grain has occasionally to be stored, means have been provided for drying and cleaning it. These operations are carried out in a ferro-concrete annexe, 55ft. long by 15ft. wide. The drying plant is capable of evaporating from 4% to 5% of moisture from the grain at the rate of 600 bushels per hour. The cleaning machinery has a combined capacity of 3,600 bushels per hour.

***The United States of* America *and Canadian* Elevators.**—The United States of America and the Dominion of Canada, both being large surplus grain producing territories, have found it necessary as a part of their grain producing and merchandising problems to use very extensively both at local and country points and at large terminal centres, granaries and/or elevators for the purpose, not only of storing but of receiving and shipping out grain. The estimated capacity of elevators at leading grain storage centres in the United States, as well as a few in Canada for the purpose of comparison and as of record Jan. 1, 1938, are as follows:

Minneapolis, Minn., 93,135,050bu.; Fort William and Port Arthur, Ont., 91,487,210bu.; Kansas City, Mo., 62,282,000bu.; Chicago, Ill., 54,226,000bu.; Buffalo, N.Y., 51,378,000bu.; Duluth, Minn., 46,925,000bu.; Milwaukee, Wis., 27,835,000bu.; Omaha, Neb., 26,710,000bu.; Vancouver, B.C., 18,582,000bu ; Montreal, Que., 16,537,000bu.; Fort Worth, Tex., 15,825,000bu.; St. Louis, Mo., 15,124,500 bushels.

Capacity of a few large individual elevators are as follows: Delmar-Archer Daniels Midland Company at Minneapolis, 12,775,700bu.; Chicago and North Western Terminal and Annex at Chicago, 10,564,000bu.; Elevator "A," Davis, Nolan, Merrill Grain Company at Kansas City, 10,000,000bu.; Elevator "B" at Galveston Wharf Company at Galveston, 5,865,000 bushels.

The Canadian Upper Lake Terminal at Fort William has 16 elevators with a total capacity of 40,420,000bu. and one elevator of this group, namely Northland Elevator Company, Ltd., "D" has a capacity of 7,500,000 bushels.

At Port Arthur, on the water front. there are 14 elevators with a total capacity of 51,067,210bu.; one elevator of this group, namely, Saskatchewan Pool Terminals, Ltd., No. 6, has a capacity of 7,398,800 bushels. The Alberta Pool Elevator Ltd., No. 1 Elevator at Vancouver, B.C., has a capacity of 5,150,000 bushels.

An interesting and unusual feature in connection with the subject of granaries and elevators was that of the purchase in 1939 by the United States Department of Agriculture of 25.500 grain bins (granaries) to be used in connection with the "ever-normal granary" plan as advocated at that time.

This number of granaries cost $3,611,520 and had a total capacity of 43,000,000 bushels of corn (maize). They were used in storing grain at the local country station instead of at the terminal grain centres.

No.* 2 *Granary, Manchester Ship Canal.*—*It is of reinforced concrete and has a storage capacity of 40.000 tons. It comprises 260 storage bins and 81 shipping silos, as well as distributing, weighing and loading-out floors. The building block is 295ft. long and 165ft. wide, the total height from the quay level to the top of the cupola being 168 feet. The cupola is 238ft. long and 37ft. wide and rises, with its four floors, to a height of 70ft. above the silos.

General cargo, as well as grain, can be simultaneously discharged from ships in No. 9 dock. Grain is conveyed from the ships to the granary on belt conveyors in subways on both north and south quays. That below the north quay extends about 950ft. along the dock from the granary, so that two full cargoes of grain can be unloaded simultaneously. The south subway extends the full length of five berths and is about half-a-mile long. On this side of the dock grain can be taken from ships while general cargo is being discharged. The conveyors in these subways can be fed from numerous points along the quay. With the layout of these conveyors six separate streams of grain can be carried to the granary at the same time, and as each conveyor can handle 200 tons per hour, the plant has an hourly intake capacity of 1,200 tons. The subway conveyors feed cross conveyors in the basement of the granary, these, in turn, feeding the six receiving elevators. The grain is conveyed to the top of the cupola by these elevators and delivered into automatic weighing machines, whence it passes into a steel hopper below. From this the grain is led by an elaborate system of spouts to the distributing conveyors over the silos, or, as an alternative, to a conveyor on the floor above the bins, which in turn feeds to the sacking and shipping bins on the west side.

The silos round the four sides of the building, 81 in number, are divided into upper and lower parts by a sloping cross division inserted at a sufficient height to afford delivery by gravity from the upper part to the sacking sheds, and from the lower for shipping the grain. Sacking sheds are provided on all four sides of the granary, and are so built that wheat may be sacked off from any number of points at the same time. Railway wagons can be brought in and loaded on three sides of the granary under the sacking shed floors. A very complete dust collecting system is provided, which includes exhausters from the garners above the weighers, while "sweep-ups" are provided on all floors. The installation is electrically driven throughout. (G. F. Z.; H. FA.)

GRANBY, JOHN MANNERS, MARQUESS OF (1721–1770), British soldier, the eldest son of the third duke of Rutland, was born in 1721, educated at Eton and Trinity college, Cambridge, and elected M P. for Grantham in 1741. Four years later he received a commission as colonel of a regiment raised to assist in quelling the Highland revolt of 1745. This corps never got beyond Newcastle, but as a volunteer on the duke of Cumberland's staff, Granby saw active service in the last stages of the insurrection. He was in the Flanders campaign of 1747, was promoted major-general in 1755, and three years later was appointed colonel of the Royal Horse Guards (Blues). He had married the daughter of the duke of Somerset, and in 1754 had begun his parliamentary connection with Cambridgeshire, for which county he sat until his death. Dispatched to Germany in 1758, he was present at the battle of Minden, and later succeeded to the command of the British contingent after Lord Sackville's disgrace. On July 31, 1760, Granby stormed Warburg at the head of the British cavalry, capturing 1,500 men and ten pieces of artillery. A year later (July 15, 1761) the British' defended the heights of Vellinghausen with great bravery, and in the last campaign, at Gravenstein and Wilhelmsthal, Homburg and Cassel, Granby's men bore the brunt of the fighting and earned the greatest share of the glory.

Returning to England in 1763 the marquess found himself the popular hero of the war. He was appointed to the Ordnance on July 1, 1763, and three years later he became commander-in-chief. In this position he was attacked by "Junius." He died at Scarborough on Oct. 18, 1770.

Two portraits of Granby were painted by Sir Joshua Reynolds, one of which is now in the National Gallery. His contemporary popularity is indicated by the number of inns and public-houses which took his name and had his portrait as sign-board.

GRAN CHACO, an extensive region in the heart of South America belonging to the La Plata basin, stretching from 20° to 29° S. lat. Its area is estimated at 300,000 sq. miles. The greater part is covered with marshes, lagoons and dense tropical jungle and forest, and is still unexplored. On its southern and western borders there are extensive tracts of open woodland, intermingled with grassy plains, while on the northern side in Bolivia are large areas of open country subject to inundations in the rainy season. It is traversed by two great rivers; the Pilcomayo and Bermejo, whose sluggish courses are not navigable. The greater part of its territory is occupied by nomadic tribes of Indians, some of whom are still unsubdued, while others like the Matacos, are sometimes to be found on neighbouring sugar estates and *estancias* as labour-

ers during the busy season. The forest wealth of the Chaco region is incalculable, consisting of a great variety of palms and valuable cabinet woods, building timber, etc. Its extensive tracts of *quebracho colorado* (Loxopterygium *Lorentzii*) are of very great value because of its use in tanning leather. Both the wood and its extract are largely exported. Its possession was the cause of serious dispute and armed conflict between Bolivia and Paraguay commencing in the winter of 1928. (*See* CHACO.)

GRAND ALLIANCE, WAR OF THE (alternatively called the War of the League of Augsburg), the third[1] of the great aggressive wars waged by Louis XIV. of France against Spain, the Empire, Great Britain, Holland and other states. The two earlier wars, which are redeemed from oblivion by the fact that in them three great captains, Turenne, Conde and Montecucculi, played leading parts, are described in the article DUTCH WARS. In the third war the leading figures are: Henri de Montmorency-Boutteville, duke of Luxemburg, the former aide-de-camp of Condé and heir to his daring method of warfare; William of Orange, who had fought against both Condé and Luxemburg in the earlier wars, and was now king of England; Vaaban, the founder of the sciences of fortification acd siegecraft, and Catinat, the follower of Turenne's cautious and systematic strategy, who was the first commoner to receive high command in the army of Louis XIV. But as soldiers, these men — except Vauban — are overshadowed by the great figures of the preceding generation, and except for a half-dozen outstanding episodes, the war of 1689–97 was an affair of positions and chess-board manoeuvres.

It was within these years that the art and practice of war began to crystallize into the form called "linear" in its strategic and tactical aspect, and "cabinet-war" in its political and moral aspect. In the Dutch wars, and in the minor wars that preceded the formation of the League of Augsburg, there were still survivals of the loose organization, violence and wasteful barbarity typical of the Thirty Years' War; and even in the War of the Grand Alliance (in its earlier years) occasional brutalities and devastations showed that the old spirit died hard. But outrages that mould have been borne in dumb misery in the old days now provoked loud indignation, and when the fierce Louvois disappeared from the scene it became generally understood that barbarity was impolitic, not only as alienating popular sympathies, but also as rendering operations a physical impossibility for want of supplies.

Character of the War. — Thus in 1700, so far from terrorizing the country people into submission, armies systematically conciliated them by paying cash and bringing trade into the country. Formerly, wars had been fought to compel a people to abjure their faith or to change sides in some personal or dynastic quarrel. But since 1648 this had no longer been the case. The Peace of Westphalia established the general relationship of kings, priests and peoples on a basis that was not really shaken until the French Revolution, and in the intervening 140 years the peoples at large, except at the highest and gravest moments (as in Germany in 1689, France in 1709 and Prussia in 1757) held aloof from active participation in politics and war. This was the beginning of the theory that war was an affair of the regular forces only, and that intervention in it by the civil population was a punishable offence. Thus wars became the business of the professional soldiers in the king's own service, and the scarcity and costliness of these soldiers combined with the purely political character of the quarrels that arose to reduce a campaign from an "intense and passionate drama" to a humdrum affair, to which only rarely a few men of genius imparted some degree of vigour, and which in the main was an attempt to gain small ends by a small expenditure of force and with the minimum of risk. As between a prince and his subjects there were still quarrels that stirred the average man — the Dragonnades, for instance, or the English Revolution — but foreign wars were "a stronger form of diplomatic notes," as Clausewitz called them, and were waged with the object of adding a codicil to the treaty of peace that had closed the last incident.

Other causes contributed to stifle the former vigour of war. Campaigns were no longer conducted by armies of ten to thirty thousand men. Large regular armies had come into fashion, and, as Guibert points out, instead of small armies charged with grand operations we find grand armies charged with small operations. The average general, under the prevailing conditions of supply and armament, was not equal to the task of commanding such armies. Any real concentration of the great forces that Louis XIV. had created was therefore out of the question, and the field armies split into six or eight independent fractions, each charged with operations on a particular theatre of war. From such a policy nothing remotely resembling the overthrow of a great power could be expected to be gained. The one tangible asset, in view of future peace negotiations, was therefore a fortress, and it was on the preservation or capture of fortresses that operations in all these wars chiefly turned. The idea of the decisive battle for its own sake, as a settlement of the quarrel, was far distant; for, strictly speaking, there was no quarrel, and to use up highly trained and exceedingly expensive soldiers in gaining hy brute force an advantage that might equally well be obtained by chicanery was regarded as foolish.

The fortress was, moreover, of immediate as well as contingent value to a state at war. A century of constant warfare had impoverished middle Europe, and armies had to spread over a large area if they desired to "live on the country." This was dangerous in the face of the enemy (cf. the Peninsular War), and it was also uneconomical. The only way to prevent the country people from sending their produce into the fortresses for safety was to announce beforehand that cash would be paid, at a high rate, for whatever the army needed. But even promises rarely brought this about, and to live at all, whether on supplies brought up from the home country and stored in magazines (which had to be guarded) or on local resources, an army had as a rule to maintain or to capture a large fortress. Sieges, therefore, and limited manoeuvres are the features of this form of war, wherein armies progressed not with the giant strides of Napoleonic war, but in a succession of short hops from one foothold to the next. The general character of the war being borne in mind, nine-tenths of its marches and manoeuvres can be almost "taken as read"; the remaining tenth, the exceptional and abnormal part of it, alone possesses an interest for modern readers.

In pursuance of a new aggressive policy in Germany, Louis XIV. sent his troops, as a diplomatic menace rather than for conquest, into that country in the autumn of 1688. Some of their raiding parties plundered the country as far south as Augsburg, for the political intent of their advance suggested terrorism rather than conciliation as the best method. The League of Augsburg at once took up the challenge, and the addition of new members (Treaty of Vienna, May 1689) converted it into the "Grand Alliance" of Spain, Holland, Sweden, Savoy and certain Italian states, Great Britain, the emperor, the elector of Brandenburg, etc.

"Those who condemned the king for raising up so many enemies, admired him for having so fully prepared to defend himself and even to forestall them," says Voltaire. Louvois had in fact completed the work of organizing the French army on a regular and permanent basis, and had made it not merely the best, but also by far the most numerous in Europe, for Louis disposed in 1688 of no fewer than 375,000 soldiers and 60,000 sailors. The infantry was uniformed and drilled, and the socket bayonet and the flint-lock musket had been introduced. The only relic of the old armament was the pike, which was retained for one-quarter of the foot, though it had been discarded by the Imperialists in the course of the Turkish wars described below. The first artillery regiment was created in 1684, to replace the former semi-civilian organization by a body of artillerymen susceptible of uniform training and amenable to discipline and orders.

Devastation of the Palatinate, 1689. — In 1689 Louis had six armies on foot. That in Germany, which had executed the raid of the previous autumn, was not in a position to resist the principal army of the coalition so far from support. Louvois therefore

[1] The name "Grand Alliance" is applied to the coalition against Louis XIV. begun by the League of Augsburg. This coalition not only waged the war dealt with in the present article, but (with only slight modifications and with practically unbroken continuity) the war of the SPANISH SUCCESSION (*q.v.*) that followed.

ordered it to lay waste the Palatinate, and the devastation of the country around Heidelberg, Mannheim, Spires, Oppenheim and Worms was pitilessly and methodically carried into effect in January and February. There had been devastations in previous wars, even the high-minded Turenne had used the argument of fire and sword to terrify a population or a prince, while the whole story of the last ten years of the great war had been one of incendiary armies leaving traces of their passage that it took a century to remove. But here the devastation was a purely military measure, executed systematically over a given strategic front for no other purpose than to delay the advance of the enemy's army. It differed from the method of Turenne or Cromwell in that the sufferers were not those people whom it was the purpose of the war to reduce to submission, but others who had no interest in the quarrel. It differed from Wellington's laying waste of Portugal in 1810 in that it was not done for the defence of the Palatinate against a national enemy, but because the Palatinate was where it was. The feudal theory that every subject of a prince at war was an armed vassal, and therefore an enemy of the prince's enemy, had in practice been obsolete for two centuries past; by 1690 the organization of war, its causes, its methods and its instruments had passed out of touch with the people at large, and it had become thoroughly understood that the army alone was concerned with the army's business. Thus it was that this devastation excited universal reprobation, and that in the words of a modern French writer, the "idea of Germany came to birth in the flames of the Palatinate."

As a military measure even, it was unprofitable; for it became impossible for Marshal Duras, the French commander, to hold out on the east side of the middle Rhine, and he could think of nothing better to do than to go farther south and to ravage Baden and the Breisgau, which was not even a military necessity. The grand army of the Allies, coming farther north, was practically unopposed. Charles of Lorraine and the elector of Bavaria—lately comrades in the Turkish war (see below)—invested Mainz, the elector of Brandenburg, Bonn. Mainz, valiantly defended by Nicolas du Blé, marquis d'Uxelles, had to surrender on Sept. 8. The governor of Bonn, baron d'Asfeld, not in the least intimidated by the bombardment, held out till the army that had taken Mainz reinforced the elector of Brandenburg, and then, rejecting the hard terms of surrender offered him by the latter, he fell in resisting a last assault on Oct. 12. Only 850 men out of his 6,000 were left to surrender on the 16th, and the duke of Lorraine, less truculent than the elector, escorted them safely to Thionville. Boufflers, with another of Louis's armies, operated from Luxemburg (captured by the French in 1684 and since held) towards the Rhine, but was unable to relieve either Mainz or Bonn.

In the Low Countries the French marshal d'Humières, being in superior force, had obtained special permission to offer battle to the Allies. Leaving the garrison of Lille and Tournay to amuse the Spaniards, he hurried from Maubeuge to oppose the Dutch. Coming upon their army (commanded by the prince of Waldeck) in position behind the river Heure, with an advanced post in the little walled town of Walcourt, he flung his advanced guard against the bridge and fortifications of this place to clear the way for his deployment beyond the river Heure (Aug. 27). After wasting a thousand brave men in this attempt, to whose repulse a British regiment, the Coldstream Guards, contributed, he drew back. For a few days the two armies remained face to face, cannonading one another at intervals, but no further fighting occurred. Humibres returned to the region of the Scheldt fortresses, and Waldeck to Brussels. For the others of Louis's six armies the year's campaign passed off quite uneventfully.

The War in Ireland, 1689–1691.—Simultaneously with these operations, the Jacobite cause was being fought to an issue in Ireland. War began early in 1689 with desultory engagements between the Orangemen of the north and the Irish regular army, most of which the earl of Tyrconnel had induced to declare for King James. The northern struggle after a time condensed itself into the defence of Derry and Enniskillen. The siege of the former place, begun by James himself and carried on by the French general Rosen, lasted 105 days. In marked contrast to the sieges of the continent, this was resisted by the townsmen themselves, under the leadership of the clergyman George Walker. But the relieving force (consisting of two frigates, a supply ship and a force under Major-general Percy Kirke) was dilatory, and it was not until the defenders were in the last extremity that Kirke actually broke through the blockade (July 31). Enniskillen was less closely invested, and its inhabitants, organized by Col. Wolseley and other officers sent by Kirke, actually kept the open field and defeated the Jacobites at Newton Butler (July 31). A few days later the Jacobite army withdrew from the north. But it was long before an adequate army could be sent over from England to deal with it. Marshal Schomberg (q *v*), one of the most distinguished soldiers of the time, who had been expelled from the French service as a Huguenot, was indeed sent over in August, but the army he brought, some 10,000 strong, was composed of raw recruits, and when it was assembled in camp at Dundalk to be trained for its work, it was quickly ruined by an epidemic of fever. But James failed to take advantage of his opportunity to renew the war in the north, and the relics of Schomberg's army wintered in security, covered by the Enniskillen troops. In the spring of 1690, however, more troops, this time experienced regiments from Holland, Denmark and Brandenburg, were sent, and in June, Schomberg in Ireland and Major-general Scravemore in Chester having thoroughly organized and equipped the field army, King William assumed the command himself. Five days after his arrival he began his advance from Loughbrickland near Newry, and on July 1 he engaged James's main army on the river Boyne, close to Drogheda. Schomberg was killed and William himself wounded, but the Irish army was routed.

No stand was made by the defeated party either in the Dublin or in the Waterford district. Lauzun, the commander of the French auxiliary corps in James's army, and Tyrconnel both discountenanced any attempt to defend Limerick, where the Jacobite forces had reassembled; but Patrick Sarsfield (earl of Lucan), as the spolresman of the younger and more ardent of the Irish officers, pleaded for its retention. He was left, therefore, to hold Limerick, while Tyrconnel and Lauzun moved northward into Galway. Here, as in the north, the quarrel enlisted the active sympathies of the people against the invader, and Sarsfield not only surprised and destroyed the artillery train of William's army, but repulsed every assault made on the walls that Lauzun had said "could be battered down by rotten apples." William gave up the siege on Aug. 30. The failure was, however, compensated in a measure by the arrival in Ireland of an expedition under Lord Marlborough, which captured Cork and Kinsale, and next year (1691) the Jacobite cause was finally crushed by William's general Ginckell in the battle of Aughrim in Galway (July 12), in which St. Ruth, the French commander, was killed and the Jacobite army dissipated. Ginckell, following up his victory, besieged Limerick afresh. Tyrconnel died of apoplexy while organizing the defence, and this time the town was invested by sea as well as by land. After six weeks' resistance the defenders offered to capitulate, and with the signing of the treaty of Limerick on Oct. 1, the Irish war came to an end. Sarsfield and the most energetic of King James's supporters retired to France and were there formed into the famous "Irish brigade."

Fleurus, 1690.—The campaign of 1690 on the continent of Europe is marked by two battles, one of which, Luxemburg's victory of Fleurus (*q.v.*) belongs to the category of the world's great battles. The conditions in which it was fought, however, were in closer accord with the general spirit of the war than was the decision that arose out of them. Luxemburg had a powerful enemy in Louvois, and he had consequently been allotted only an insignificant part in the first campaign. But after the disasters of 1689 Louis re-arranged the commands on the north-east frontier so as to allow Humibres, Luxemburg and Boufflers to combine for united action. "I will take care that Louvois plays fair," Louis said to the duke when he gave him his letters of service. Though apparently Luxemburg was not authorized to order such a combination himself, as senior officer he would automatically take command if it came about. The whole force available was

probably close or? 100,000, hut not half of these were present at the decisive battle, though Luxemburg certainly practised the utmost "economy of force" as this was understood in those days (*see* also NEERWINDEN). On the remaining theatres of war, the dauphin, assisted by the duc de Lorge, held the middle Rhine, and Catinat the Alps, while other forces were in Roussillon, etc., as before. Catinat's operations are briefly described below. Those of the others need no description, for though the Allies formed a plan for a grand concentric advance on Paris, the preliminaries to this advance were so numerous and so closely interdependent that on the most favourable estimate the winter would necessarily find the Allied armies many leagues short of Paris. In fact, the Rhine offensive collapsed when Charles of Lorraine died (April 17), and the reconquest of his lost duchy ceased to be a direct object of the war.

Luxemburg began operations by drawing in from the Sambre country, where he had hitherto been stationed, to the Scheldt and "eating up" the country between Oudenarde and Ghent in the face of a Spanish army concentrated at the latter place (May 15–June 12). He then left Humières with a containing force in the Scheldt region and hurried back to the Sambre to interpose between the Allied army under Waldeck and the fortress of Dinant which Waldeck was credited with the intention of besieging. His march from Tournay to Gerpinnes was counted a model of skill—the *locus classicus* for the maxim that ruled till the advent of Napoleon—"march always in the order in which you encamp, or purpose to encamp, or fight." For four days the army marched across country in close order, covered in all directions by reconnoitring cavalry and advanced, flank and rear guards. Under these conditions eleven miles a day was practically forced marching, and on arriving at Jeumont-sur-Sambre the army was given three days' rest. Then followed a few leisurely marches in the direction of Charleroi, during which a detachment of Boufflers's army came in, and the cavalry explored the country to the north. On news of the enemy's army being at Trazegnies, Luxemburg hurried across a ford of the Sambre above Charleroi, but this proved to be a detachment only, and soon information came in that Waldeck was encamped near Fleurus. Luxemburg knew that the enemy was marking time till the troops of Liège and the Brandenburgers from the Rhine were near enough to cooperate in the Dinant enterprise, and he determined to fight a battle at once. He moved to Velaine, and thence, on July 1, forward to Fleurus, there winning one of the most brilliant victories in the history of the Royal army. But Luxemburg was not allowed to pursue his advantage. Thus Waldeck reformed his army in peace at Brussels, where William III. of England soon afterwards assumed command of the Allied forces in the Netherlands, and Luxemburg and the other marshals stood fast for the rest of the campaign, being forbidden to advance until Catinat—in Italy—should have won a battle.

Staffarda.—In this quarter the armed neutrality of the duke of Savoy had long disquieted the French court. In consequence, a French army under Catinat had for some time been maintained on the Alpine frontier, and in the summer of 1690 Louis XIV. sent an ultimatum to Victor Amadeus to compel him to take one side or the other actively and openly. The result was that Victor Emmanuel threw in his lot with the Allies and obtained help from the Spaniards and Austrians in the Milanese. Catinat thereupon advanced into Piedmont, and won, principally by virtue of his own watchfulness and the high efficiency of his troops, the important victory of Staffarda (Aug. 18, 1690). This did not, however, enable him to overrun Piedmont, and as the duke was soon reinforced, he had to be content with the methodical conquest of a few frontier districts. On the side of Spain, a small French army under the duc de Noailles passed into Catalonia and there lived at the enemy's expense for the duration of the campaign.

In these theatres of war, and on the Rhine, where the disunion of the German princes prevented vigorous action, the following year, 1691, was uneventful. But in the Netherlands there were a siege, a war of manoeuvres, and a cavalry combat, each in its way somewhat remarkable. The siege was that of Mons, which, like many sieges in the previous wars, was conducted with much pomp by Louis XIV. himself, with Boufflers and Vauban under him. On its surrender (April 8), Louis returned to Versailles and divided his army between Boufflers and Luxemburg, the former of whom departed to the Meuse. There he attempted by bombardment to enforce the surrender of Liége, but had to desist when the elector of Brandenburg threatened Dinant. The principal armies on either side faced one another under the command respectively of William III. and of Luxemburg. The Allies were first concentrated to the south of Namur, and Luxemburg hurried thither, but neither party found any tempting opportunity for battle, and when the cavalry had consumed all the forage available in the district, the two armies edged away gradually towards Flanders. The war of manoeuvre continued, with a slight advantage on Luxemburg's side, until September, when William returned to England, leaving Waldeck in command of the Allied army, with orders to distribute it in winter quarters amongst the garrison towns. This gave the momentary opportunity for which Luxemburg had been watching, and at Leuze (Sept. 20) he fell upon the cavalry of Waldeck's rearguard and drove it back in disorder with heavy losses until the pursuit was checked by the Allied infantry.

In 1692[1] the Rhine campaign was no more decisive than before, although Lorge made a successful raid into Wiirttemberg in September and foraged his cavalry in German territory till the approach of winter. The Spanish campaign was unimportant, but on the Alpine side the Allies under the duke of Savoy drove back Catinat into Dauphiné, which they ravaged with fire and sword. But the French peasantry were quicker to take arms than the Germans, and, inspired by the local gentry—amongst whom figured the heroine, Philis de la Tour du Pin (1645–1708), daughter of the marquis de la Charce—they beset every road with such success that the small regular army of the invaders was powerless. Brought practically to a standstill, the Allies soon consumed the provisions that could be gathered in, and then, fearing lest the snow should close the passes behind them, retreated.

Siege of Namur, 1692.—In the Low Countries the campaign as before began with a great siege. Louis and Vauban invested Namur on May 26. The place was defended by the prince de Brabançon and Coehoorn (*q.v.*), Vauban's rival in the science of fortification. Luxemburg, with a small army, manoeuvred to cover the siege against William III.'s army at Louvain. The place fell on June 5,[2] after a very few days of Vauban's "regular" attack, but the citadel held out until the 23rd. Then, as before, Louis returned to Versailles, giving injunctions to Luxemburg to "preserve the strong places and the country, while opposing the enemy's enterprises and subsisting the army at his expense." This negative policy, contrary to expectation, led to a hard-fought battle. William, as a ruse, announced his intention of retaking Namur, but set his army in motion for Flanders and the sea-coast fortresses held by the French. Luxemburg, warned in time, hurried towards the Scheldt, and the two armies were soon face to face again, Luxemburg about Steenkirk, William in front of Hal. William then formed the plan of surprising Luxemburg's right wing before it could be supported by the rest of his army, relying chiefly on false information that a detected spy at his headquarters was forced to send, to mislead the French. But Luxemburg, although ill in bed when William's advance was reported, shook off his initial apathy, and, enabled by his outpost reports to divine his opponent's plan, met it (Aug. 3) by a swift concentration of his army, against which the Allies, whose advance and deployment had been mismanaged, were powerless (see STEENKIRK). In this almost accidental battle both sides suffered enormous losses, and neither attempted to bring about, or even to risk, a second resultless trial of strength. Only after the armies had broken up into their winter quarters was an abortive attempt on Charleroi made, by Boufflers, at Louis' orders.

In 1693, the culminating point of the war was reached. It began with a winter enterprise that at least indicated the

[1] Louvois died in July 1691.

[2] A few days before this the great naval reverse of La Hogue put an end to the projects of invading England hitherto entertained at Versailles.

aggressive spirit of the French generals. The grand army in the Netherlands this year numbered 120,000, to oppose whom William III. had only some 40,000 at hand. But after reviewing this large force at Gembloux, Louis was driven to break it up, in order to send 30.000 under the dauphin to Germany, where Lorge had captured Heidelberg and seemed able, if reinforced, to overrun south Germany. But the imperial general Prince Louis of Baden took up a position near Heilbronn so strong that the dauphin and Lorge did not venture to attack him. Thus King Louis sacrificed a reality to a dream, and for the third time lost the opportunity, for which he always longed, of commanding in chief in a great battle. He himself, to judge by his letter to Monsieur on June 8, regarded his action as a sacrifice of personal dreams to tangible realities. And, before the event falsified predictions, there was much to be said for the course he took, which accorded better with the prevailing system of war than a Fleurus or a Neerwinden. In this system of war the rival armies, as armies, were almost in a state of equilibrium, and more was to be expected from an army dealing with something dissimilar to itself—a fortress or a patch of land or a convoy—than from its collision with another army of equal force.

Neerwinden and **Marsaglia.**—Thus Luxemburg obtained his last and greatest opportunity. He was still superior in numbers, but William at Louvain had the advantage of position. The former, given more latitude by his master this year, threatened Liége, drew William over to its defence and then advanced to attack him. The Allies, however, retired to a strongly entrenched position around Neerwinden in which they were attacked by Luxemburg on July 29. The long and doubtful battle ended in a brilliant victory for Luxemburg, but his exhausted army could not pursue far; William was as unshaken and determined as ever; and the campaign closed, not with a treaty of peace, but with a few manoeuvres which, by inducing William to believe in an attack on Ath, enabled Luxemburg to besiege and capture Charleroi (October).

Neerwinden was not the only French victory of the year. Catinat, advancing to the relief of Pinerolo (Pignerol), which the duke of Savoy was besieging, took up a position north of the village of Marsaglia (*q.v.*). Here on Oct. 4 the duke of Savoy attacked him front to front. But the greatly superior regimental efficiency of the French, and Catinat's minute attention to details in arraying them, gave the newly created marshal a victory that was a not unworthy pendant to Neerwinden. The Piedmontese and their allies lost, it is said, 10.000 killed, wounded and prisoners, as against Catinat's 1,800. But here, too, the results were trifling, and this year of victory is remembered chiefly as the year in which "people perished of want to the accompaniment of Te *Deums.*"

In 1694 (late in the season owing to the prevailing distress and famine) Louis opened a fresh campaign in the Netherlands. The armies were larger and more ineffective than ever, and William offered no further opportunities to his formidable opponent. In September, after inducing William to desist from his intention of besieging Dunkirk by appearing on his flank with a mass of cavalry, which had ridden from the Meuse, 100m., in four days, Luxemburg gave up his command. He died on Jan. 4, and with him the tradition of the Condé school of warfare disappeared from Europe. In Catalonia de Noailles gained some success.

In 169j William found Marshal Villeroi a far less formidable opponent than Luxemburg had been, and easily succeeded in keeping him in Flanders while a corps of the Allies invested Namur. Coehoorn directed the siege-works, and, as in 1692, but with sides reversed, the defenders were progressively dislodged, the citadel itself being stormed by the "British grenadiers," as the song commemorates, on Aug. 30.

By 1696 necessity had compelled Louis to renounce his vague and indefinite offensive policy, and he now frankly restricted his efforts to the maintenance of what he had won in the preceding campaigns. In this new policy he met with much success. His marshals held their various spheres of operations without allowing the Allies to inflict any material injury, and also preserved French soil from the burden of their own maintenance. In this, as before, they were powerfully assisted by the disunion and divided counsels of their heterogeneous enemies. In Piedmont, Catinat crowned his work by making peace and alliance with the duke of Savoy. The last campaign was in 1697. Catinat and Vauban besieged Ath. This siege was perhaps the most regular and methodical of the great engineer's career. It lasted 23 days and cost the assailants only 50 men. King William did not stir from his entrenched position at Brussels. Lastly, in Aug. 1697, Vendôme, Noailles' successor, captured Barcelona. The peace of Ryswick, signed on Oct. 30, closed this war by practically restoring the *status quo ante;* but neither the ambitions of Louis nor the Grand Alliance that opposed them ceased to have force, and three years later the struggle began anew (see SPANISH SUCCESSION, WAR OF THE).

Austro-Turkish **Wars,** 1682–99.—Concurrently with these campaigns, the emperor had been engaged in a much more serious war on his eastern marches against the old enemy, the Turks. This war arose in 1682 out of internal disturbances in Hungary. The campaign of the following year is memorable for all time as the last great wave of Turkish invasion. Mohammed IV. advanced from Belgrade in May, with 200,000 men, drove back the small imperial army of Prince Charles of Lorraine, and early in July invested Vienna itself. The two months' defence of Vienna and the brilliant victory of the relieving army led by John Sobieski, king of Poland, and Prince Charles on Sept. 12, 1683, were events which, besides their intrinsic importance, possess the romantic interest of an old knightly crusade against the heathen. But the course of the war, after the tide of invasion had ebbed, differed little from the wars of contemporary western Europe. Turkey figured rather as a factor in the balance of power than as the "infidel," and although the battles and sieges in Hungary were characterized by the bitter personal hostility of Christian to Turk which had no counterpart in the West, the war as a whole was as methodical and tedious as any Rhine or Low Countries campaign.

After gradually advancing his position in 1684–85, in 1686 Charles, assisted by the elector Max Emanuel of Bavaria, besieged and stormed Budapest (Sept. 2). In 1687 they followed up their success by a great victory at Mohács (Aug. 12). In 1688 the Austrians advanced still further, took Belgrade and entered Bosnia. Next year, in spite of the outbreak of a general European war, the margrave Louis of Baden, who afterward became one of the most celebrated of the methodical generals of the day, managed to win a battle at Nisch (Sept. 24), to capture Widin (Oct. 14) and to advance to the Balkans, but in 1690, more troops having to be withdrawn for the European war, the imperialist generals lost Nisch, Widin and Belgrade one after the other. The new tide, however, was stopped, and several years of desultory war followed, until in 1697 the young Prince Eugene was appointed to command the imperialists and won a great and decisive victory at Zenta on the Theiss (Sept. 11). This induced a last general advance of the Germans eastward, which was definitely successful and brought about the peace of Carlowitz (Jan. 1699).

(C. **F. A.**)

NAVAL OPERATIONS

The naval mar opened with desultory fighting early in 1688. but nothing of importance happened till after William of Orange's successful expedition to England in November, which gave him strategic control of the English fleet and the whole anti-French alliance.

In March 1689, Louis XIV. sent the exiled King James II. of England over to Ireland, to conduct guerrilla operations against the Protestant forces of the new government. Admiral Arthur Herbert was unable to put to sea in time to stop him, and also failed to intercept reinforcements of 6,000 troops protected by a French fleet under Châteaurenault. He found them, however, in Bantry Bay on May 1, 1689, but in the action which followed he made little impression, chiefly owing to the reaction of internal politics on the morale and administration of his fleet. The French. however, did not press the Irish campaign; and after the relief of Londonderry on June 28 by Leake's ships, James' position deteriorated and English troops were able to cross from Chester unopposed. Early in 1690 Louis XIV. ordered the Toulon fleet

to Brest, where it arrived after eluding an Anglo-Dutch squadron. The whole French fleet of 70 of the line then came up Channel under the Comte de Tourville and met the main Anglo-Dutch fleet off the Isle of Wight under Herbert, now Lord Torrington, who had only 55 of the line. Torrington at once retired, not wishing to engage unless very favourably placed, and all the time seeking an opportunity to slip round to westward of the French and so cut them off from home. However, in deference to the wishes of the Council of Regency, he forced an action on June 30 off Beachy Head and fought for many hours against his superior and well-ordered enemy, but was prevented from obtaining any definite successes by the impetuous conduct of his Dutch allies. Meanwhile, with naval assistance, William III. completely routed the Franco-Irish forces in the Boyne campaign.

During 1691 Tourville contented himself with operations against English and Dutch commerce, and it was not till 1692 that he was ordered to attack the English fleet with the idea of covering the transport of an invading army across the Channel. This time he had only 44 of the line against the Anglo-Dutch fleet of 99 under Admiral Edward Russell, but on finding them off Cape Barfleur on May 19, he engaged without the least hesitation. Fickle winds and occasional fog assisted him, and after fighting for seven hours, without losing a ship, he began to withdraw. The allies pursued and his fleet was completely dispersed and routed, 12 of the line, which had taken refuge in the bay of La Hogue, being destroyed on the nights of May 23 and 24 by a light squadron under Admiral Rooke (see LA HOGUE, BATTLE OF, for account of the Barfleur campaign).

The French now entirely abandoned fleet operations, and again turned their attention to commerce destruction. In this they were very successful, for the allies failed to exercise their undoubted command of the sea, and in June 1693 the outward-bound Smyrna convoy of some 400 ships, under a weak escort, was attacked by Tourville off Lagos, and So ships were lost. Raids were, therefore, attempted on French bases, of which those on Brest in 1694 and Dunkirk in 169; were the most important, but in most cases the French were well prepared and the attempts failed. French stations in the West Indies, Nova Scotia and on the West African coast were also attacked from 1690–93.

In the concluding stages of the war, William III. initiated a concentration of Anglo-Dutch forces in the Mediterranean under Russell, who in 1694 drove the French from Barcelona, Spain having joined the allies. William now ordered Russell to winter his fleet at Cadiz, and though in the spring of 1695 it failed to attack Toulon owing to the defection of Savoy, French Mediterranean trade was temporarily ruined. Rooke was now left in command and again wintered at Cadiz, but early in 1696, Louis XIV. feinted with another invasion scheme and got Châteaurenault's Toulon fleet safely into Brest. All English forces were therefore concentrated in the Channel, and Rooke was recalled, ending the new Mediterranean fleet. (G. A. R. C.; W. C. B. T.)

GRAND BANKS, probably the top of a submerged mountain range in the Atlantic Ocean, about 300 miles long running southeastward from Newfoundland. Its depth varies from 80 to 100 fathoms. The banks are frequented by hordes of valuable fish, especially cod; and thousands of British, French, and American fishermen annually resort there. (See NEWFOUNDLAND.)

GRAND CANARY (Gran Canaria), an island forming part of the Spanish archipelago of the Canary islands (*q.v.*). Pop. (1930) 216,853; area, 523 sq.m. Grand Canary, the most fertile island of the group, is nearly circular in shape, with a diameter of 24 m. and a circumference of 7j m. The highest peak, Los Pexos, is 6,400 ft. Large tracts are covered with native pine. Las Palmas (pop. 1940, 115,033), the capital, is described in a separate article.

GRAND CANYON, THE, an immense gorge cut by the Colorado river into the high plateau in the northern part of Arizona, U.S.A. It is a broad, intricately sculptured chasm that contains between its outer walls a multitude of imposing peaks and buttes, of canyons within a canyon and of complex ramifying gulches and ravines. It ranges in width from 4 to 18 m., its greatest depths lie more than a mile below its rim and it extends in a winding course from the head of Marble Gorge, near the northern boundary of Arizona, to Grand Wash Cliffs, near the Nevada line, a distance of about 280 miles. Its most impressively beautiful part, 56 m. long, lies within the Grand Canyon National Park. Through it the river winds for 105 miles.

In its general colour the canyon is a dull red that glows when lit by the sun, but it displays the parallel edges of beds of many-coloured rocks, whose varied tints give it wonderful diversity—pale buff and grey, delicate green and pink, and, in its depths, chocolate-brown, slate-grey and other sombre hues. Its distances are often suffused with a transparent blue-purple haze that contrasts with the deep green of the pine trees on its rim and the intense blue of the sky.

The first white man to behold the Grand Canyon was Garcia López de Cárdenas, who had been sent from Zuñi, New Mexico, to find a river far to the west, the existence of which had been learned from the natives. In 1854 Lieut. A. W. Whipple followed the lower course of the Colorado river as far up as the mouth of Diamond creek. In 1857 Lieut. J. C. Ives travelled through the gorge of Diamond creek and eastward to Havasu canyon, the San Francisco mountains, the Little Colorado and the country of the Hopi Indians.

The first graphic and geological description of the Grand Canyon was given by Prof. John S. Newberry. It remained for Maj. John W. Powell to make the first voyage through the depths of the canyon. He embarked in May 1869 at the bridge of the Union Pacific railroad over the Green river, in Wyoming, with nine companions, in four small rowboats. After a perilous trip through turbulent rapids, covering three months, during which four of his men deserted, he emerged safely from the lower end of the canyon. He put an end to many myths, including one about an underground "lost course" of the river.

In 1870, under the auspices of the Smithsonian Institution, Powell set out to explore the Colorado more thoroughly. For several years he carried on geographic, geologic and ethnologic studies in the region, and supervised the preparation of the first map of it. In 1923 a Government expedition led by Col. C. H. Birdseye, descended the Colorado in boats from Lee's Ferry to the mouth of the canyon to find sites for dams and to complete the survey of the profile of the river. Accurate maps have now been prepared.

The Grand Canyon is cut in a plateau that stands 5,000 to 9,000 ft. above sea-level, a region of mesas and buttes diversified by lava flows, masses of intrusive rocks and hills composed of volcanic ash. The plateau slopes in general south-westward, but the continuity of its surface is broken by terraces that represent either folds or faults in the beds of rock. Only the upper plateaus are covered with forests, but even here are no perennial streams. The rock slopes are generally bare of soil or of vegetation. In the bottom of the canyon the heat is intense in summer and frost is rare in winter. Here is a sparse growth of desert bushes and cacti, of Spanish bayonet and of agave or "the century plant."

Parts of upper terraces bear clumps of juniper and gnarled piñon. The Coconino plateau, which borders the canyon on the south at altitudes ranging from 6,000 to 7,000 ft. above sea-level, receives enough precipitation in snow and showers to sustain an open forest of juniper and piñon, and on its higher parts there are groves of tall, straight yellow pines. The Kaibab plateau, which stands on the north side of the canyon, at altitudes ranging from 8,000 to 9,000 ft. above sea-level, has a mountain climate, snowy and severe in winter, agreeably cool in summer. It bears majestic forests of yellow pine, with which is mixed some Englemann spruce. Scrub oak and cottonwood grow in the bottoms of the shallow dry washes on the plateau and clumps of aspen line the grassy glades and natural "parks" in the valleys, where thousands of deer and, outside of the national park, herds of cattle find grazing ground.

The Grand Canyon was formed by the ceaseless cutting of the silt-laden Colorado river, accelerated by storm waters that occasionally fall into the Canyon, and by "weathering" processes. The most effective of these agencies has been the river.

Although the Colorado river has been the principal agent that

formed the Grand Canyon, it has not directly carved the canyon to its full width; neither has it cut the embayments that scallop the rims of the plateaux. It has cut its way vertically downward, maintaining its course almost without change. Meanwhile the rocky walls of the canyon have been exposed to destruction by the action of rain and rill, of frost and landslide, of wind and chemical action.

The south rim of the canyon is nearer to the river than the north rim, and the erosion on the north side of the river is much greater than on the south side. This difference is due to several causes, which, named in the inverse order of their effectiveness, are as follow: (1) As the land in the plateau region slopes southwestward, at a right angle to the general course of the river, the streams of the Kaibab plateau, on the north, drain into the canyon, whereas those of the Coconino plateau, on the south, drain away from it; (2) the beds of rock in the region also slope toward the south-west, so that the underground water coming from the north, beneath the Kaibab plateau, flows into the canyon, whereas that going southward, beneath the Coconino plateau, flows away from it; (3) the north rim of the canyon is 1000 ft. higher than south rim, and the streams that flow down it and the rainwater that falls on it make a longer descent and do correspondingly more erosional work; (4) fractures and faults by which the beds of rock have been so greatly broken that pieces of them have been easily removed by erosion are more numerous on the north side than on the south side. These fractures and faults have determined the course of some of the streams in the canyon. The intricate sculpture of the broad north side of the canyon, which is its most spectacular part, was thus determined in part by the network of fractures and faults in its rocks.

While the river has been cutting its way downward the land in the plateau region has been gradually rising, and both the uplift of the land and the carving of the canyon are events of recent geologic history. The Grand Canyon is a relatively new geologic feature, even though the work of making it has been carried on for more than a million years. Although the canyon is new, the beds of rock exposed in it are old; they tell a story that began many millions of years ago. Most of the geologic formations in the canyon are sedimentary — that is, were laid down in water — but the Coconino sandstone, which underlies the Kaibab limestone, the uppermost formation exposed in the walls of the canyon, appears to be in part, at least, a deposit of wind-blown sand, a sort of fossil desert. At some places volcanic rock is seen The rock that lies below the sedimentary series is the Vishnu schist, which is greatly squeezed and crumpled and into which were injected, at some places, molten masses of igneous rock that formed dikes and sills. The red Supai formation, which underlies the Coconino sandstone and which forms the wall of the part of the canyon in which the Supai Indians live, imparts the colouring matter of its shaly beds to the underlying Redwall limestone, a hard rock which is in itself pale blue and which forms steep cliffs that can be easily traced through the canyon. At the foot of the Redwall begin the slopes of the light-buff Muav limestone and the greenish Bright Angel shale, which lead down for 700 ft. to the broadest and lowest terrace of all, the Tonto platform.

The Grand Canyon National Park, which was created by the United States Congress in 1919, embraces 1,009 sq.m. The most prominent of the rock masses within the canyon have been called "temples," because of their resemblance to Oriental temples of worship — the pagodas of Asia. These temples are carved from blocks of essentially horizontal strata, and some of them rise more than a mile above the level of the river and carry at their tops remnants of the bed that forms the surface of the plateau. The great chasm contains towers, buttes, terraces, platforms, amphitheatres and other striking features to which distinctive names have been given. Some of the formations contain traces of ancient life — impressions of seaweeds and of other plants long extinct, the remains of corals and marine shells and of extinct forms of fishes, as well as tracks of animals. The Grand Canyon is therefore not only a remarkable example of earth sculpture produced by erosion but is of immense scientific interest because it discloses a great perspective of the geologic past.

By motor car the south rim of the Grand Canyon may be reached via U. S. Highway 66, about 60 miles south. From Williams, Arizona, State Highway 64 leads directly to the south rim. Motorists may leave U. S. Highway 66 at Flagstaff, proceed north until near Cameron, and then go west to Desert View on the south rim By rail the south rim may be reached on a branch line of the Santa Fe System from Williams. Arizona. From Cedar City, Utah on U. S. Highway 91, motorists for the north rim continue to the town of Mount Carmel, where connection is made with U. S. Highway 89 for the trip south. By rail the approach is via the Union Pacific System from Lund, Utah; from there in buses. A pack horse route down the Bright Angel trail across the river on a suspension bridge and up Bright Angel canyon connects the southern and northern rims.

Geological Survey, and also a large map of the Grand Canyon National Park, in two parts, prepared by Mr. Matthes; see R. Tillotson and T. J. Taylor, *Grand Canyon Country* (1929). (G. McL. Wo)

GRAND-DUKE, a title borne by princes ranking between king and duke (Fr. *grand-duc,* Ital. *granduca,* Ger. *Gross-herzog*). The dignity was first bestowed in 1567 by Pope Pius V. on Duke Cosimo I. of Florence, his son Francis obtaining the emperor's confirmation in 1576; and the predicate "Royal Highness" was added in 1699. In 1806 Napoleon created his brother-in-law Joachim Murat, grand-duke of Berg, and in the same year the title was assumed by the landgrave of Hesse-Darmstadt, the elector of Baden, and the new ruler of the secularized bishopric of Würzburg (formerly Ferdinand III., grand-duke of Tuscany) on joining the Confederation of the Rhine. According to the decision of the Congress of Vienna, the title was borne by the sovereigns of Luxemburg, Saxe-Weimar (grand-duke of Saxony), Mecklenburg-Schwerin, Mecklenburg-Strelitz, and Oldenburg (since 1829), as well as by those of Hesse-Darmstadt and Baden. The emperor of Austria included among his titles those of grand-duke of Cracow and Tuscany, and the king of Prussia those of grand-duke of the Lower Rhine and Posen. The title is also retained by the dispossessed Habsburg-Lorraine dynasty of Tuscany.

Grand-duke is also the conventional English equivalent of the Russian *velikiy knyaz,* more properly "grand-prince" (Ger. Grossfürst), at one time the title of the rulers of Russia, who, as the eldest born of the house of Rurik, exercised overlordship over the *udyelniye knyazi* or local princes. On the partition of the inheritance of Rurik, the eldest of each branch assumed the title of grand-prince. Until 1886 this title grand-duke or grand-duchess, with the style "Imperial Highness," was borne by all descendants of the imperial house. It was then confined to the sons and daughters, brothers and sisters and male grandchildren of the emperor. The other members of the imperial house bore the title

of prince (knyaz) and princess (*knyaginya* if married, *knyazhna* if unmarried) with the style of "highness." The emperor of Austria, as king of Hungary, also bore this title as "grand duke" of Transylvania, which was erected into a "grand princedom" (Grossfurstentum) in 1765 by Maria Theresa.

GRANDEE, a title of honour borne by the highest class of the Spanish nobility (Span. Grande). It would appear to have been originally assumed by the most important nobles to distinguish them from the mass of the ricos hombres, or great barons of the realm. It was thus, as Selden points out, not a general term denoting a class, but "an additional dignity not only to all dukes, but to some marquesses and condes also" (Titles of Honor, ed. 1672, p. 478). It formerly implied certain privileges; notably that of sitting covered in the royal presence. Until the time of Ferdinand and Isabella, when the power of the territorial nobles was broken, the grandees had also certain more important rights; *e.g.,* freedom from taxation, immunity from arrest save at the king's express command, and even—in certain cases—the right to renounce their allegiance and make war on the king. Their number and privileges were further restricted by Charles I (the emperor Charles V), who reserved to the crown the right to bestow the title. The grandees of Spain were further divided into three classes: (1) those who spoke to the king and received his reply with their heads covered; (2) those who addressed him uncovered, but put on their hats to hear his answer; (3) those who awaited the permission of the king before covering themselves. All grandees were addressed by the king as "my cousin" (mi *primo*), whereas ordinary nobles were only qualified as "my kinsman" (mi *pariente*). The title of "grandee," abolished under King Joseph Bonaparte, was revived in 1834, when, by the Estatudo real, grandees were given precedence in the chamber of peers. The designation later, honever, became purely titular, and implied neither privilege nor power.

GRAND FORKS, a town in the boundary district of British Columbia; at the junction of the north and south forks of the Kettle river, 2 mi. N. of the international boundary, on the Canadian Pacific and (for freight) Great Northern railways. Pop. (1941) 1,259. It is in a good agricultural district, but owes its importance largely to works for smelting gold, copper and silver ores from the boundary country. It is a trade centre, with sawmills, wood and iron works, machine shops, etc.

GRAND FORKS, a city of North Dakota, U.S.A., at the confluence of the Red river of the North and the Red Lake river, 78 mi. N. of Fargo; the second city of the state in size, and the county seat of Grand Forks county. It is on federal highways 2 and 81; is served by the Great Northern and the Northern Pacific railways; and has an airport and bus lines The population in 1940 federal census was 20,228. About 15% are of foreign birth, chiefly Scandinavian and Canadian.

Grand Forks is in the heart of the spring wheat country, where modern methods of cultivation have added large acreages of other crops (notably potatoes, sugar beets, legumes and feed crops) and increased the livestock and poultry. The All-American turkey show is an annual event, and the state fair is also held there.

The city has a large wholesale and retail trade. Among the industries are flour mills, including the large state-owned terminal elevator and mill; a beet sugar factory; a meat packing plant; creameries; a candy factory; fur clothing manufacture; baking and printing plants, fox fur farms and apiaries.

The park system totals over 200 ac. in four parks with all facilities such as swimming pool, tennis courts, ball diamonds and picnic grounds.

There are three golf courses On the outskirts of the city is the University of North Dakota, founded by the territorial assembly in 1883 and opened in 1884. The enrolment is about 2,000. Connected with it are the state geologica! survey, the state public health laboratories, and a special meteorological station of the United States weather bureau. The university maintains a substation of the School of Mines at Hebron, and a biological station on the shores of Devils lake. Affiliated with the university is Wesley college, and a Lutheran Bible college is situated there.

A trading post of the North-West Fur company was established on the site of Grand Forks in 1801 by John Cameron (d 1804), and later it passed to the Hudson's Bay company. Permanent settlement began in 1871, and the city was chartered in 1881, the year when the Northern Pacific reached it. In 1900 the population was 7,652; in 1910, 12,478; in 1920, 14,010.

GRAND HAVEN, city of Michigan, U.S.A., on Lake Michigan, at mouth of the Grand river, is a port of entry and the county seat of Ottawa county. It is on federal highways 16 and 31 and on state highways 50 and 104. It is served by the Grand Trunk and Pere Marquette railroads, has boat service to Milwaukee and trucking lines. The population was 8,799 by the 1940 federal census.

The resident population is more than doubled in summer by visitors to the city and to Grand Haven state park. The traffic of the port amounted in 1940 to 2,034,979 tons. It has 35 diversified manufacturing plants, and a municipally owned power plant, water works and sewage disposal plant. It is the base for the U.S. coast guard cutter "Escanaba."

A trading post was established there about 1821 by the American Fur company. Permanent settlement began in 1834, and a town was laid out in 1836.

The city was chartered in 1867. Since 1916 it has had a city-manager form of government.

GRANDIER, URBAIN (1590–1634), priest of Loudun (Vienne, France), mas accused of witchcraft in 1632, found guilty and burnt alive on Aug. 18, 1634. The accusation was due to a prevailing hysteria and the condemnation obtained through the influence of Cardinal Richelieu.

See G. Legué, *Urbain* Grandier *et les possédées de* Loudun (1880).

GRAND ISLAND, a city of Nebraska, U.S.A., near the Platte river, on the Lincoln highway, at an altitude of 1.861 ft, 85 mi. W. of Lincoln; the county seat of Hall county. It is served by the Burlington, the St. Joseph and Grand Island, and the Union Pacific railways, and has an airport. Pop. was 13,947 in 1920 (87% native white); 18,041 in 1930; and 19,130 in 1940 by the federal census.

The city lies on a slope rising from the broad bottomlands, opposite a narrow strip of land 42 mi. long between two channels of the Platte river ("la grande île" of the early French Canadian trappers).

Sheep feeding and the raising of sugar beets are specialties of the region. The city is an important horse and mule market and has large stockyards. Auction sales of livestock total about $6,000,000 annually.

Over 10,000,000 lb. of beet-sugar are manufactured annually, and there are large packing plants, flour mills, vegetable canneries and creameries. The Union Pacific maintains extensive shops there.

Grand Island is the seat of the State soldiers' and sailors' home (established 1888), and the U.S. Monitor station for checking the nation's radio broadcasting stations is located there. The city was laid out when the Union Pacific reached it in 1866, and was incorporated in 1873. It is in the midst of what was the great buffalo range. Buffaloes were still numerous in this region as late as 1866.

GRAND JUNCTION, a city of western Colorado, U.S.A., 4,600 ft. elevation, at the confluence of the Gunnison and Colorado rivers, from which the city derives its name; county seat of Mesa county. It is on federal highways 6, 24 and 50; is served by the Denver and Rio Grande Western railroad and Rio Grande motorway. It has a municipal airport. Population was 3,503 in 1900; 10,247 in 1930; and 12,479 in 1940. It is the metropolis of an extensive irrigated region (fruit, truck gardening, general farming) and industrial and jobbing centre of an area of 50,000 sq mi. Thirty miles to the east is the Grand Mesa (Grand Mesa national forest), world's largest flat-topped mountain; it is the leading scenic and recreational area of the Rocky mountain region. Its wintertime skiing is among the finest in the United States. Colorado national monument, 8 mi. to the west, contains 18,000 ac. of spectacular specimens of erosion. Its famed Rim-

rock drive is open throughout the year. The city was settled in 1881 and incorporated in 1882.

GRAND'MERE, an industrial city in Laviolette (formerly part of Champlain) county, Quebec, Canada, on the St. Maurice river, 21 mi. N. of Three Rivers, and on the Canadian National and Canadian Pacific railways. It is situated in a good farming district with excellent water-power facilities, which operate pulp and paper mills. Its industries also include the manufacture of stoves. Population (1941) 8,608.

GRANDMONTINES, a religious order founded by St. Stephen of Thiers in Auvergne towards the end of the 11th century. St. Stephen was so impressed by the lives of the hermits whom he saw in Calabria that he desired to introduce the same manner of life into his native country. A few disciples gathered round him, and a community was formed. The rule was not reduced to writing until after Stephen's death, 1124. The life was eremitical and very severe in regard to silence, diet and bodily austerities. About 1150 the hermits, being compelled to leave Muret, settled in the neighbouring desert of Grandmont, whence the order derived its name. Louis VII founded a house at Vincennes near Paris, and the order had a great vogue in France, as many as sixty houses being established by 1170, but it seems never to have found favour out of France. Later centuries witnessed mitigations and reforms in the life, and at last the order came to an end just before the French Revolution.

See art. "Grandmont, order of" in the *Catholic Encyclopaedia;* Max Heimbucher, *Orden und Kongregationen* (1896), i, §31; and the art. in Wetzer and Welte, *Kirchenlexicon* (ed. 2), and in Herzog-Hauck, *Realencyklopadie.*

GRAND NATIONAL: see HORSE RACING AND BREEDING.

GRAND PRIX: see HORSE RACING AND BREEDING.

GRAND RAPIDS, a city of western Michigan, 30 mi. from Lake Michigan; a port of entry, the county seat of Kent county, the second city of the state in size, and "the furniture capital of America."

It is on federal highways 16 and 131; has a county airport; and is served by the Grand Trunk, the New York Central, the Pennsylvania, and the Pere Marquette railways, and by interurban motor coach and truck lines. The population was 168,592 in 1930 and 164,292 in 1940 by the federal census. More than one-third of the foreign-born are from Holland, the largest colony of Dutch in the U.S.A. The city has an area of 22.5 sq.mi.; the metropolitan area is 136.35 sq.mi. The valley there is about 2 mi. wide, with a range of hills on either side about equally distant from the river, which falls 18 ft. within a mile. A comprehensive city plan was adopted in 1922. A zoning ordinance became operative in 1923.

Progress has been made in eliminating grade crossings by viaducts and depressed roadways, widening major streets, rerouting transit lines. A system of large parks and pleasure drives encircles the city. The public parks and playgrounds cover 1,246 ac., and are so distributed that there is one within 15 min. walk of every home in the city and a supervised playground within half a mile of every child. The public-school system includes a junior college and classes for children needing special consideration.

Grand Rapids ranked third among the large cities of the country in percentage of home ownership. It has a high proportion of children in school, a small amount of child labour, a low percentage of illiteracy, a low death rate and a low infant mortality. Since 1916 it has had a commission-manager form of government. The assessed valuation of property in 1939 was $191,985,310. The city's water supply is obtained from Lake Michigan by pipe line.

On the outskirts of the city, overlooking the river, is the Michigan soldiers' home.

The furniture industry dates from 1847 and is important in the city's economic life, although Grand Rapids has a diversification of industry second only to Detroit in Michigan. The city has 516 manufacturing plants

Of its 63.000 persons gainfully employed, 28.000 are employed in industry. One-fourth of its industrial employment is in huge plants within the environs of the city; metal-working plants account for over 35% of the industrial employment. Large makers of metal stampings and sheet-metal products, machinery, brass goods and miscellaneous hardware are located there. Industries include chemicals, foods, paper products, textiles, gypsum mining, graphic arts and automotive products. The city is the western Michigan centre of petroleum refining and production and of motor freight transport. Grand Rapids' factories manufacturing carpet sweepers, school seats, church pews, opera chairs, flypaper, showcases, refrigerator cabinets, gypsum products and boxboard products are the largest or among the largest in the world.

Grand Rapids is in the heart of the Michigan fruit belt, and truck farming is carried on extensively near the city limits. The city's wholesale and jobbing trade amounted to $140,021,863 in 1940; volume of retail business in the city proper was $80,751,000 in 1939. Bank debits to individual accounts in 1940 totalled $721,368,000.

In the early 1800s, there was a large Ottawa Indian village on the site of Grand Rapids, and there a Baptist mission was established in 1824; a trading post was established in 1826 (by Louis Campau).

The first sawmill was built in 1833; in 1838 the village was incorporated. In 1850, when the population was 2.686, it was chartered as a city. By 1860 the city had grown to 8.085, and in the next 30 years the population practically doubled in each decade.

The prosperity of the city in the early days was built on lumbering. When the great stands of softwoods were nearing depletion, attention was given to utilizing the maple, oak, birch, walnut and other hardwoods that were left. The steady industrial growth since the introduction of furniture making and the increasing importance of the metal-working industry have been natural developments.

GRANDSON (Ger. Grandsee), a town in the Swiss canton of Vaud, near the southwestern end of the Lake of Neuchbtel, and by rail 20 mi. S.W. of Neuchâtel and 3 mi. N. of Yverdon. Its population in 1930 was 1,663, mainly French speaking and Protestant. The old church (once of a Benedictine monastery) contains Roman columns, etc., from Avenches and Yverdon. It has now a tobacco factory. Its lords were vassals of Savoy, till in 1475 the castle was taken by the Swiss at the beginning of their war with Charles the Bold, duke of Burgundy, whose ally was the duchess of Savoy. It was retaken by Charles in Feb. 1476, and the garrison put to death. The Swiss avenged this deed in a famous battle (March 2, 1476), defeating Charles with great loss. The battle was between Concise and Corcelles, at a place marked by several columns. (See SWISS WARS.)

GRAND TETON NATIONAL PARK, established in 1929, a picturesque district in northwestern Wyoming. U.S.A., with an area of 150 sq.mi., situated about 25 mi. S. of Yellowstone park. It embraces a region of unusual scenic grandeur, including the Teton range, which is a remarkable granitic uplift, with glaciers in the cirques and gorges. On the west it borders the Jackson Hole country. Grand Teton (13,671 ft.) is one of the most difficult peaks to climb in the United States.

GRANET, FRANÇOIS MARIUS (1775–1849), French painter, was born at Aix in Provence, on Dec. 17, 1775; his father was a builder. The boy's strong desires led his parents to place him in a school of art directed by Gonstantin, a landscape painter. In 1793 Granet followed the volunteers of Aix to the siege of Toulon, at the close of which he obtained employment as a decorator in the arsenal. Whilst at Aix he made the acquaintance of the young comte de Forbin, and upon his invitation Granet, in the year 1797, went to Paris. De Forbin was one of the pupils of David, and Granet entered the same studio. Later he got possession of a cell in the convent of Capuchins, which, having served for a manufactory of assignats during the Revolution, nas afterwards inhabited almost exclusively by artists. In the changing lights and shadows of the corridors of the Capuchins, Granet found the materials for the one subject to the painting of which he devoted his life. In 1802 he left for Rome, where he remained until 1819, when he returned to Paris, bringing with

him besides various other works one of 14 repetitions of his celebrated Choeur des Capucins, executed in 1811. "Stella painting a Madonna on his Prison Wall," 1810 (Leuchtenberg collection); "Sodoma à l'hôpital," 1815 (Louvre); "Basilique basse de St. François d'Assise," 1823 (Louvre); "Rachat de prisonniers," 1831 (Louvre); "Mort de Poussin," 1834 (Villa Demidoff, Florence), are among his principal works. In 1819 Louis Philippe decorated Granet, and afterwards named him Chevalier de l'Ordre St. Michel, and Conservateur des tableaux de Versailles (1826). He became member of the institute in 1830. After 1848 he retired to Aix and died on Nov. 21, 1849. He bequeathed to his native town the greater part of his fortune and his collections, now exhibited in the local Musée, together with a fine portrait of the donor painted by Ingres in 1811.

GRANGE, THE, known officially as the Patrons of Husbandry, is a national secret organization of farmers founded in Washington, D.C., in 1867 by Oliver Hudson Kelley and six associates. Growing slowly at first, the organization advanced rapidly in the early '70s. This was a period of agrarian discontent, and the Grange, together with other societies of farmers, purposed to accomplish agricultural regeneration through education, legislation and other means. What was known as "the Granger movement" resulted. An impetus was given to regulation of railroads, agricultural investigation and education, more equitable taxation and more satisfactory rural life. A number of the western State granges established extensive co-operative business enterprises. Developing too rapidly, these proved generally unsuccessful. Their failure, coupled with internal dissensions, caused a heavy decline in membership of the Grange between 1875 and 1880, though the society retained a strong influence. From 1880 on the society has gradually increased in membership. Social and educational features are now emphasized. The society's political and agricultural pronouncements tend to the conservative side. The Grange is open to both men and women. There are seven degrees, and the names of these, as well as the ritual of the order, carry agricultural connotations. It is ihe only farmers' organization in the U.S. to extend to a foreign country. In 1872 it was organized in Canada, where, however, it never attained a dominant place.

GRANGEMOUTH, police burgh, seaport and parish, Stirlingshire, Scotland. Pop. (1931) 11,798. It is situated on the south shore of the estuary of the Forth, at the mouth of the Carron and also of Grange Burn, a right-hand tributary of the Carron, 3 m. N.E. of Falkirk by the L.M.S.R. and L.N.E.R. It is the terminus of the Forth and Clyde Canal, from the opening of which (1789) its history may be dated, and is now the chief port of the Firth W. of Leith. With Stirling and Falkirk, Grangemouth returns one member to parliament. The growth of the docks, which cover an area of 58 acres, rendered it necessary to divert the influx of the Grange from the Carron to the Forth. Timber, iron and oil are the leading imports, and coal and oil the chief exports. The industries include shipbuilding and rope and sail making. There is regular steamer communication with London, Antwerp, Christiania, Hamburg, Rotterdam, Stockholm, etc. Experiments in steam navigation were carried out in 1802 with the "Charlotte Dundas" on the Forth and Clyde Canal at Grangemouth.

GRANGER, JAMES (1723–1776), English clergyman and print-collector, published a *Biographical History of England* (1769) "consisting of characters dispersed in different classes, and adapted to a methodical catalogue of engraved British heads." The work was supplemented in later editions by Granger, and still further editions were brought out by the Rev. Mark Noble, with additions from Granger's materials. Blank leaves were left for the filling in of engraved portraits for extra illustration of the text, and it became a favourite pursuit to discover such illustrations and insert them in a *Granger*, so that "grangerizing" became a term for such an extra-illustration of any work, especially with cuts taken from other books.

GRANICUS, BATTLE OF THE (May–June, 334 B.C.). In the spring of 334 Alexander, having by various campaigns established a secure base of operations in Greece, set sail from Sestos to Abydos to carry out the invasion of Persia. His army consisted of about 30,000 foot and 5,000 horse, and it was accompanied by a siege train, a baggage train and a corps of engineers. Having visited Ilium to crown the tomb of his traditional ancestor

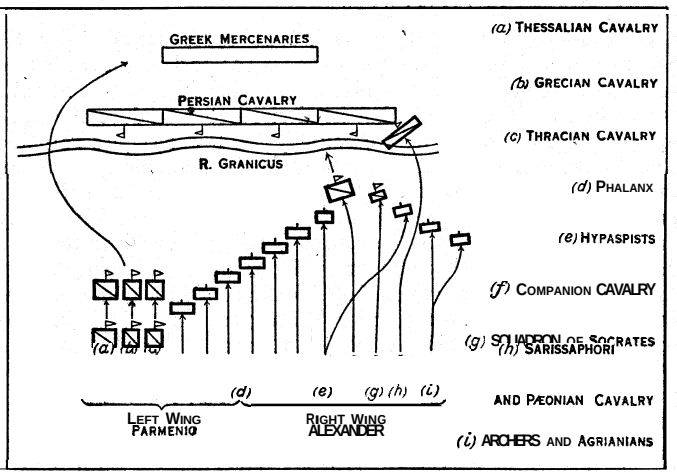

DIAGRAM SHOWING FORMATION OF TROOPS IN THE BATTLE OF THE GRANICUS. 334 B.C.
This, the first battle fought by Alexander the Great in his conquest of Asia, ended in victory for the Greeks. Alexander displayed the highest courage, first leading cavalry and then phalanx across the river in face of stubborn Persian resistance, and with his own hand slaying two Persian grandees

Achilles, he moved northwards through Lampsacus and came upon the Persian army on the river Granicus (Bigha-Chai), an army which, according to Arrian, numbered 20,000 Persian cavalry and 20,000 Greek mercenaries under Memnon. Memnon, an able general, had suggested to Arsites and Spithridates, who were in joint command, that they should retire and lay waste the country, and then land an army in Macedonia and attack Alexander's base. This they refused to do, and in place drew up their cavalry on the northern bank of the river with Memnon's infantry in rear. Alexander, seeing this faulty distribution, determined on immediate attack, and deployed his army as shown in the diagram. From the accounts of this battle as given by the classical historians, it is obvious that Alexander's intention was to refuse his left wing, pivot his right wing on the phalanx, and rapidly moving this wing forward concentrate his main blow against the Persian left. In brief the action was as follows:—

The Battle.—The battle opened by a charge on the Persian left by the right wing light cavalry, who, after a severe engagement, were driven back. Under cover of this attack Alexander advanced at the head of the Companion cavalry and charged the left centre of the Persian horse, for it was here that their leaders had posted themselves. Little by little the Persians were pushed back until their left centre broke, whereupon both wings dispersed in flight. Alexander did not pursue them far, instead, he turned on the Greek mercenaries, and as Arrian says: "leading the phalanx against these, and ordering the cavalry to fall upon them from all sides," he soon completely surrounded them and cut them up. According to Diodorus, the Persians lost 12,000 in killed, and 20,000 were made prisoners. Alexander is said to have lost less than 150 killed; this figure is probably an understatement.

Tactics.—Though this battle was purely a cavalry action, it was not a blind charge of the Prince Rupert type, bat an operation rendered only possible by the scientific organization of the Macedonian army which was the master-work of Philip, Alexander's father. In the centre was the phalanx which possessed immense protective power, and on its flanks were two wings which could, like the fists of a pugilist, punch out from it. Holding his left wing back, Alexander, under protection of the phalanx, which stood like a wall on the left of his right wing, first sent forward his light cavalry, protected on their outer flank by light infantry, to hold the Persian left wing by engaging their cavalry and simultane-

ously disorganize them. Next he rapidly advanced the companion cavairy (the decisive attack) which advance drew the phalanx into an oblique order. This decisive attack was not directed on the Persian left flank, that is, it did not strike where the light cavalry had struck, but, in place, at the centre of the Persian left, for here the brains of the army (the generals) were assembled. This decisive attack moved down a protective funnel of men, for on its right were the light cavalry and light infantry, and on its left the hypaspists and the phalanx, both echeloned backwards. Whilst the Persian left flank was being pushed in confusion towards the centre, this centre was suddenly struck a terrific blow by a wedge of heavy cavalry followed closely by armoured infantry (the hypaspists) who worked into the enemy's shattered front and "ate" it away.

GRANITE, in petrology, the group name for a family of plutonic or deep-seated acidic igneous rocks characterized essentially by the presence of the minerals, quartz, felspar (orthoclase, microcline, perthite, anorthoclase [rarely], acid plagioclase) and some ferromagnesian mineral (mica, amphibole or pyroxene). Granites are wholly crystalline and possess a typical hypidiomorphic or irregular granular (granitoid) texture—whence the name from Lat. "granum," a grain. When, however, they are porphyritic, the phenocrysts may possess well defined crystallographic outlines. In popular usage the term granite is applied to almost any crystalline rock, irrespective of its composition or origin.

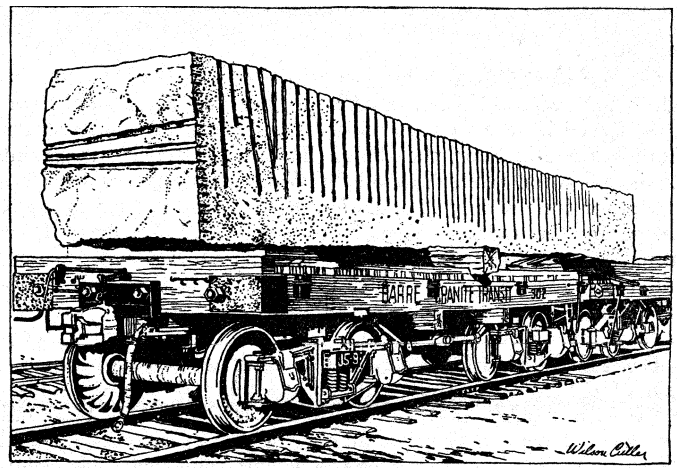
According to their mineralogical composition, the granites may be subdivided broadly into three groups: (a) alkali-granites (b) calc-alkali granites and the intermediate *(c)* adamellite granites. This subdivision is based on the nature and quantitative proportions of the contained felspar; alkali granites possess a predominance of alkali felspar, calc-alkali granites a predominance of lime-bearing plagioclase, and the adamellite granites have alkali felspar and lime-bearing plagioclase in approximately equal proportions. The alkali-granites are again subdivided into potash granites (dominant potash felspar) and soda granites (dominant albite felspar). The chief ferro-magnesian mineral of the former is biotite (lepidomelane, zinnwaldite) and may be accompanied by muscovite. The rarer soda granites have as dark constituents soda-amphiboles (arfvedsonite, hastingsite or riebeckite) or soda-pyroxenes (acmite, aegirine or aegerine-augite).

The calc-alkali granites are typically represented by the great group of granodiorites, in which there is a great predominance of lime-plagioclase (oligoclase to andesine). The ferro-magnesian minerals are biotite, green hornblende or an alumina-poor pyroxene near diopside in composition. These ferro-magnesian minerals also characterize the adamellite group of granites. Different varieties are usually distinguished by prefixing the name of the dominant ferro-magnesian mineral, *e.g.,* hornblende-granite, aegirine granite, etc.

The distinctive type carrying rhombic pyroxene (hypersthene) is usually referred to under the name charnockite (*q.v.*). Amphibole- and pyroxene-bearing granites never carry muscovite, which occurs only in association with biotite or alone, as in muscovite granite. The granites usually carry minor amounts of other minerals, the principal being apatite, zircon (often enclosed in biotite and yielding pleochroic haloes due to their content of uranium or thorium), titanite, magnetite and ilmenite. Less frequently monazite, spessartine-rich garnet orthite, topaz, fluorite and cassiterite occur. Tourmaline may appear as a primary accessory, but it is most often of pneumatolytic origin (see PNEUMATOLYSIS). Cordierite and andalusite only occur in those granites which have assimilated the country rock into which they are intruded. These two minerals are well known in the granites of Cornwall and Devon.

In hand specimens granites show a great variety of colour, dependent on the abundance of the dark constituents or the state of preservation of the contained felspar. Many potash granites are pink or red, due to the colour of the orthoclase felspar. Calc-alkali granites are more usually grey or white. Porphyritic granites are common, the phenocrysts being felspars, some of the best known examples being those of Cornwall.

In the field. granite usually occurs in great masses covering wide areas. They form the rocks of many batholiths, laccoliths



BY COURTESY OF THE ROCK OF AGES CORPORATION

A BLOCK OF VERMONT GRANITE ON ITS WAY FROM QUARRY TO PLANT

Blocks of granite weighing many tons are lifted from the ground by electric hoists and sent on flat cars to the manufacturing plant, where they are sawed into sizes convenient for building purposes and then polished

and stocks, and frequently appear in the core of mountain ranges. Granites are by far the most abundant of the plutonic intrusive rocks visible on the earth's surface, and appear in batholiths of great dimensions as in British Columbia and Patagonia. It is probable that many apparently homogeneous granite laccoliths, etc., are not single intrusive masses but multiple intrusions in the form of sheets successively injected, as is the case for the granite laccolite of Dartmoor.

Evidence of the intrusive character of granite is principally provided by the occurrence of transgressive dikes and veins proceeding from it into the surrounding strata, and by the alteration which the granite produces in the country rock through a zone varying from a few yards to a mile or more in breadth around it (see METAMORPHISM). Seen in natural sections, many granites have a rudely columnar appearance. Others weather into large cuboidal blocks which may produce structures resembling cyclopean masonry. The tors of the west of England are of this nature. These differences depend on the disposition of the joint cracks which traverse the rock and are opened up by the action of frost and weathering.

As a group the granites are of very great economic importance. They form the country rock of a vast number of metalliferous deposits in many parts of the world. Gold, tin, tungsten and bismuth may be especially mentioned. The chinastone used in pottery is frequently derived by the pneumatolytic action of residual vapours upon the solidified granite. As a building stone, granite is of great importance, particularly for works of some magnitude.

The chemical composition of a few granites from different parts of the world is given below:—

	SiO_2	Al_2O_3	Fe_2O_3	FeO	MgO	CaO	Na_2O	K_2O
1	73·66	13·81	0·21	1·51	0·45	0·67	2·89	5·02
2	70·40	7·85	6·98	2.98	0·52	0·26	4·05	4·45
3	71·24	13·78	1·30	2.83	tr.	0·38	5·32	5·10
4	66·65	16·15	1·52	2·36	1·74	4.53	3·40	2·65
5	68·55	16·21	2·26	..	1·04	2'40	4·08	4·14

1. Biotite granite, Haytor, Dartmoor.
2. Aegirine—Riebeckite granite, Ampasibitika, Madagascar.
3. Katophorite granite, Iviangusat, Greenland.
4. Granodiorite, Nevada City, California.
5. Adamellite, Shap, Cumberland.

Only the most important constituents are shown in the table, but all granites contain also small amounts of MnO, P_2O_5, TiO_2, ZrO_2, BaO and water. These aggregate usually less than 1%, except water, which may rise to 2 or more per cent in weathered rocks. From the chemical composition it may be computed that granites contain 20% to 50% of quartz, the total silica content varying from 66% to 80%. The shap granite, *e.g.* (see analysis 5) by micrometric analysis is shown to contain quartz 24·4%, orthoclase 36·2%, plagioclase 33.6% and biotite 5·8%. (See also PETROLOGY.) (C. E. T.)

GRANITE CITY, a busy industrial city of Madison county, Ill., U.S.A., 10 mi. N.E. of Saint Louis, near the Mississippi river. It is served by the Chicago and Alton, the Chicago and Eastern Illinois, the Big Four, the Illinois Traction (electric), the Saint Louis and Alton (electric), and the Wabash railways, and by five others for freight only. Population in 1930 was 25,130; in 1940, 22,974 by the federal census. There are steel foundries, blast furnaces, coke factories, rolling mills, car factories, syrup plants, and a graniteware factory, which is the largest in the U.S. Aggregate annual manufacturing output is from $50,000,000 to $75,000,000. The city was founded in 1893 and incorporated in 1896.

GRAN SASSO D'ITALIA ("Great Rock of Italy"), mountain of the Abruzzi, Italy, culminating point of the Apennines, 9,560 ft. in height. It resembles the limestone Alps of Tirol and its elevated plateaux have a number of *doline* or funnel-shaped depressions into which melted snow and rain sink. The summit is covered with snow for the greater part of the year. The Alpine region beneath its summit is still the home of the wild boar, and here and there are dense woods of beech and pine. The group has other lofty peaks, the Pizzo d'Intermesole (8,680 ft.), the Corno Piccolo (8,650 ft.), the Pizzo Cefalone (8,307 ft.) and the Monte della Portella (7,835 ft.). The most convenient starting-point for the ascent is Assergi, 10 m. N.E. of Aquila, at the south foot of the Gran Sasso with its interesting Romanesque church (Sta Maria Assunta).

GRANT, SIR ALEXANDER, 8TH BART. (1826–1884), British scholar and educationalist, was born in New York on Sept. 13, 1826. After a childhood spent in the West Indies, he was educated at Harrow and Oxford. He entered Oxford as scholar of Balliol, and subsequently held a fellowship at Oriel from 1849 to 1860. He made a special study of the Aristotelian philosophy, and in 1857 published an edition of the Ethics which became a standard text-book at Oxford. He spent nine years in India, filling various important educational positions in Bombay. From 1868 until his death (which occurred in Edinburgh on Nov. 30, 1884) he was principal of Edinburgh University. The institution of the medical school in the University was almost solely due to his initiative.

GRANT, DUNCAN (1885–), British painter, was born at Rothiemurchus, Inverness-shire, son of Major Bartle Grant, and was educated at St. Paul's school, London. He early showed his remarkable decorative sense, working with Roger Fry at the Omega Workshops, London, and at the same time produced some highly individual painting. His early work included "The Lemon Gatherers" (1911), now in the Tate Gallery, and the "Seated Woman" (1912). Modern French influences, particularly those of Cézanne, made themselves strongly felt in his design and brushwork, as may be seen in the "Tight-rope Walker" (1918), "Snow Scene" (1921), "The Hammock" (1923) and many still-life pictures of this period. Grant, who became a member of the London Group, also carried out interesting domestic and scenic decorations and designs for embroideries.

See Duncan Grant, *A Collection of Plates,* with introduction by Roger Fry (1923).

GRANT, SIR FRANCIS (1803–78), Scottish portrait-painter, fourth son of Francis Grant of Kilgraston, Perthshire, born at Edinburgh, was educated for the bar, but at the age of 24 turned to art. He began to exhibit at the Royal Academy, London, in 1843. He became a fashionable portrait-painter, among his society sitters being Lady Glenlyon, the marchioness of Waterford, Lady Rodney and Mrs. Beauclerk. He painted many of the celebrities of the time, including Scott, Macaulay, Lockhart, Disraeli, Hardinge, Gough, Derby, Palmerston and Russell, his brother Sir J. Hope Grant and his friend Sir Edwin Landseer. In 1842 he was elected A.R.A., and in 1851 R.A.; in 1866 he was chosen to succeed Sir C. Eastlake as P.R.A. Shortly after his election as president he was knighted. He died on Oct. 5, 1878.

GRANT, GEORGE MONRO (1835–1902), principal of Queen's university, Kingston, Ontario, was born in Nova Scotia in 1835 and educated at Glasgow university, where he had a brilliant academic career; and having entered the ministry of the Presbyterian Church, he obtained a pastoral charge in Halifax, Nova Scotia, which he held from 1863 to 1877. When Canada was federated in 1867 Nova Scotia was strongly opposed to federal union. Grant threw his influence in the federal scale, and his oratory played an important part in securing the success of the movement. When the consolidation of the Dominion by means of railway construction was under discussion in 1872, Grant travelled from the Atlantic to the Pacific with the engineers who surveyed the route of the Canadian Pacific railway, and his book Ocean to Ocean (1873) helped to show Canadians the value of the heritage they enjoyed. In 1877 Grant was appointed principal of Queen's university, Kingston, Ontario. A tour in 1888 to Australia, New Zealand and South Africa strengthened the Imperialism which was the guiding principle of his political opinions. He died at Kingston on May 10, 1902.

GRANT, JAMES (1822–1887), Scottish novelist, was born in Edinburgh, the son of a captain in the 92nd Gordon Highlanders. He entered the 62nd Foot as an ensign, but in 1843 he resigned his commission and devoted himself to writing novels, full of vivacity and incident, and dealing mainly with military scenes and characters. His best work, however, is Old *and* New Edinburgh (3 vols., 1880).

GRANT, JAMES AUGUSTUS (1827–1892), Scottish explorer of eastern equatorial Africa, was born at Nairn, where his father was the parish minister, on April 11, 1827. He was educated at the grammar school and Marischal college, Aberdeen, and in 1846 joined the Indian army. He saw active service in the Sikh War (1848–49), served throughout the mutiny of 1857, and was wounded in the operations for the relief of Lucknow. He returned to England in 1858, and in 1860 joined J. H. Speke (*q.v.*) in the expedition which solved the problem of the Nile sources. Grant served in the intelligence department of the Abyssinian expedition of 1868; he then retired from the army with the rank of lieutenant-colonel. He died at Nairn on Feb. 11, 1892. He wrote A *Walk* Across Africa (1864) and, among other papers, "Botany of the Speke and Grant Expedition" in vol. xxix. of the Transactions of the Linnaean Society.

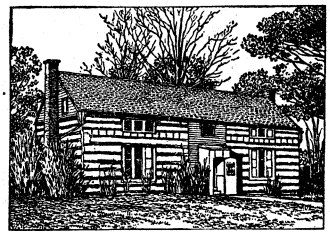
GRANT, SIR JAMES HOPE (1808–1875), English general, son of Francis Grant of Kilgraston, Perthshire, and brother of Sir Francis Grant, P.R.A., was born on July 22, 1808. He entered the army in 1826, becoming captain in 1835. In 1842 he was brigade-major to Lord Saltoun in the Chinese War, and received the rank of major and the C.B. for his services at the capture of Chin-Kiang. He fought in the first Sikh War of 1845–46 and in the Punjab campaign, winning further promotion. He took a leading part in the suppression of the Indian mutiny of 1857. After the recapture of Lucknow he was appointed to the command of the force employed for the final pacification of India. Before this task was quite completed he was created K.C.B. In 1859, in command of the British land forces in the French and British expedition against China, he accomplished the object of the campaign within three months of the landing at Pei-tang (Aug. 1, 1860), occupying Peking. For his conduct in this, which has been called the "most successful and the best carried out of England's little wars," he received the thanks of parliament and was gazetted G.C.B. In 1861, as lieutenant general, he was appointed commander-in-chief of the army of Madras; on his return to England in 1865 he was made quartermaster general at headquarters, and in 1870 was transferred to the command of the camp at Aldershot. He took part in the reform of educational and training plans of the forces after the Franco-German war, and was largely responsible for the introduction of annual army manoeuvres. In 1872 he was gazetted general. He died in London on March 7, 1875.

Incidents in the Sepoy War of 1857–58, compiled from the Private Journal of General Sir Hope Grant, K.C.B., together with some explanatory chapters by Capt. H. Knollys, Royal Artillery, was published *in* 1873, and *Incidents in the China War of 1860* appeared posthumously under the same editorship in 1875.

GRANT, SIR PATRICK (1804–1895), British field marshal, second son of Major John Grant, was born on Sept. 11, 1804, at Auchterblair, Inverness-shire. He entered the Bengal native infantry in 1820 and became captain in 1832. He served in Oudh from 1834–38 and raised the Hariana Light Infantry. He became adjutant-general in 1846. He served under Sir Hugh Gough and was present at the battles of Maharajpur (1843), Moodkee (1845), Ferozshah (1846), and Sobraon (1846), receiving the C.B. and the brevet rank of lieutenant-colonel. He was appointed aide-de-camp to the queen, and served in Kohat in 1851. From 1856 to 1861 he was commander-in-chief of the Madras army, was made K.C.B. in 1857, and succeeded General Anson in command of the army in India. He directed operations from Calcutta until the arrival of Sir Colin Campbell. He left India in 1861, was promoted lieutenant-general in 1862, and was governor of Malta from 1867 to 1872. He was promoted general in 1870, held marshal in 1883, and colonel of the Royal Horse Guards and gold-stick-in-waiting to the queen in 1885. From 1874 he was governor of the Royal Hospital, Chelsea, until his death there on March 28, 1895.

GRANT, ROBERT (1814–1892), British astronomer, was born at Grantown, Scotland, on June 17, 1814. He became interested in astronomy at an early age and after working in a counting house In London he conceived the idea of writing a history of physical astronomy. *The History* of *Physical Astronomy from the Earliest Ages to the Middle of the Nineteenth Century* was published as a whole in 1852. The book at once took a leading place in astronomical literature. In 1859 Grant succeeded J. P. Nichol as professor of astronomy in the university of Glasgow. His principal work at Glasgow consisted in determining the places of a large number of stars with the Ertel transit-circle of the observatory. The results, extending over 21 years, are contained in the *Glasgow Catalogue of 6,415 Stars,* published in 1883. This was followed in 1892 by the *Second Glasgow Catalogue of 2,156 Stars,* published only a few weeks after his death (Oct. 24, 1892).

GRANT, ULYSSES SIMPSON (1822–1885), American soldier and 18th president of the United States, was born at Point Pleasant (Ohio), on April 27, 1822. He was a descendant of Matthew Grant, a Scotsman, who settled in Dorchester (Mass.) in 1630. His earlier years were spent in helping his father, Jesse R. Grant, upon his farm in Ohio. In 1839 he was appointed to the military academy at West Point, and it was then that his name assumed the form by which it is generally known. He was christened Hiram, with Ulysses for a middle name. As he was usually called by his middle name, the congressman who recommended him for West Point supposed it to be his first name, and added thereto the name of his mother's family, Simpson. Grant was the best horseman of his class, and took a respectable place in mathematics, but at his graduation in 1843 he ranked only 21st in a class of 39. In Sept. 1845 he went with his regiment to join the forces of Gen. Taylor in Mexico; there he took part in the battles of Palo Alto, Resaca de la Palma, and Monterey, and, after his transfer to Gen. Scott's army, which he joined in March 1847, served at Vera Cruz, Cerro Gordo, Churubusco, Molino del Rey, and at the storming of Chapultepec. He was breveted 1st lieutenant for gallantry at Molino del Rey and captain for gallantry at Chapultepec. In Aug. 1848, after the ciose of the war, he married Julia T. Dent (1826–1902), and was for a while stationed in California and Oregon, but in 1854 he resigned his commission. His reputation had suffered from allegations of intemperate drinking which, whether well founded or not, certainly impaired his usefulness as a soldier. For the next six years he lived in St. Louis (Mo.), earning a scanty subsistence by farming and dealings in real estate. In 1860 he removed to Galena (Ill.) and became *a* clerk in his father's leather store. At that time his earning capacity seems not to have exceeded $800 a year, and he was regarded by his friends as a broken and disappointed man. He was living at Galena at the outbreak of hostilities between the North and South. (J. F.)



BY COURTESY OF THE ST. LOUIS CHAMBER OF COMMERCE

THE GRANT CABIN NEAR ST. LOUIS

Grant's Civil War Career—To the "call to arms" of 1861 Grant promptly responded. After some delay he was commissioned colonel of the 21st Illinois regiment and soon afterwards brigadier-general. He was assigned to a territorial command on the Mississippi, and first won distinction by his energy in seizing, on his own responsibility, the important point of Paducah (Ky.), situated at the confluence of the two great waterways of the Tennessee and the Ohio (Sept. 6, 1861). On Nov. 7 he fought his first battle as a commander, that of Belmont (Mo.), which, though failing any material result, certainly showed him to be a capable and skilful leader. Early in 1862 he was entrusted by Gen. H. W. Halleck with the command of a large force to clear the iower reaches of the Cumberland and the Tennessee, and, whatever criticism may be passed on the general strategy of the campaign, Grant himself, by his able and energetic work, thoroughly deserved the credit of his brilliant success of Fort Donelson, where 15,000 Confederates were forced to capitulate. Grant and his division commanders were promoted to the rank of major-general U.S. Volunteers soon afterwards, but Grant's own fortunes suffered a temporary eclipse owing to a disagreement with Halleck. When, after being virtually under arrest, he rejoined his army, it was concentrated about Savannah on the Tennessee, preparing for a campaign towards Corinth (Miss.). On April 6, 1862, a furious assault on Grant's camps brought on the battle of Shiloh (*q.v.*). After two days' desperate fighting the Confederates withdrew before the combined attack of the army of the Tennessee under Grant and the army of the Ohio under Buell. But the army of the Tennessee had been on the verge of annihilation on the evening of the first day, and Grant's leadership throughout was by no means equal to the emergency, though he displayed his usual personal bravery and resolution. In the grand advance of Halleck's armies which followed Shiloh, Grant was relieved of all important duties by his assignment as second in command of the whole force, and was thought by the army at large to be in disgrace. But Halleck soon went to Washington as general-in-chief, and Grant took command of his old army and of Rosecrans' army of the Mississippi. Two victories (Iuka and Corinth) were won in the autumn of 1862, but the credit of both fell to Rosecrans, who commanded in the field, and the nadir of Grant's military fortunes was reached when the first advance on Vicksburg (*q.v.*), planned on an unsound basis, and complicated by a series of political intrigues (which had also caused the adoption of the original scheme), collapsed after the minor reverses of Holly Springs and Chickasaw Bayou (Dec. 1862).

It is fair to assume that Grant would have followed other unsuccessful generals into retirement, had he not shown that, whatever his mistakes or failures, and whether he was or was not temperate in his habits, he possessed the iron determination and energy which in the eyes of Lincoln and Stanton and of the whole northern people, was the first requisite of their generals. (President Lincoln was Grant's most unwavering supporter. Many amusing stories are told of his replies to various deputations which waited upon him to ask for Grant's removal. On one occasion he asked the critics to ascertain the brand of whisky favoured by Grant, so that he could send kegs of it to the other generals.) He remained then with his army near Vicksburg, trying one vain plan after another, until after months of almost hopeless work his perseverance was rewarded—a success directly consequent upon a strange and bizarre campaign of ten weeks, in which his daring and vigour were more conspicuous than ever before. On July 4, 1863, the great fortress surrendered with 29,491 men, this being one of the most important victories won by the Union arms in the whole war. Grant was at once made a major-general in the regular army. A few months later the great reverse of

Chickamauga created an alarm in the North commensurate with the elation that had been felt at the double victory of Vicksburg and Gettysburg, and Grant was at once ordered to Chattanooga, to decide the fate of the army of the Cumberland in a second battle. Four armies were placed under his command, and three of these concentrated at Chattanooga. On Nov. 25, 1863, a great three-days' battle ended with the crushing defeat of the Confederates, who from this day had no foothold in the centre and west.

After this, in preparation for a grand combined effort of all the Union forces, Grant was placed in supreme command and the rank of lieutenant-general revived for him (March 1864). Grant's headquarters henceforth accompanied the army of the Potomac, and the lieutenant-general directed the campaign in Virginia. This, with Grant's driving energy infused into the best army that the Union possessed, resolved itself into a series, almost uninterrupted, of terrible battles. Tactically the Confederates were almost always victorious, strategically, Grant, disposing of greatly superior forces, pressed back Lee and the army of northern Virginia to the lines of Richmond and Petersburg, while above all, in pursuance of his explicit policy of "attrition," the Federal leader used his men with a merciless energy that has few, if any, parallels in modern history. At Cold Harbor 6,000 men fell in one useless assault lasting an hour, and after two months the Union armies lay before Richmond and Petersburg indeed, but had lost no fewer than 72,000 men. But Grant was unshaken in his determination. "I purpose to fight it out on this line, if it takes all summer," was his message from the battlefield of Spottsylvania to the chief of staff at Washington. Through many weary months he never relaxed his hold on Lee's army, and, in spite of repeated partial reverses, that would have been defeats for his predecessors, he gradually wore down his gallant adversary. The terrible cost of these operations did not check him; only on one occasion of grave peril were any troops sent from his lines to serve elsewhere, and he drew to himself the bulk of the men whom the Union government was recruiting by thousands for the final effort. Meanwhile, all the other campaigns had been closely supervised by Grant, preoccupied though he was with the operations against his own adversary. At a critical moment he actually left the Virginian armies to their own commanders, and started to take personal command in a threatened quarter, and throughout he was in close touch with Sherman and Thomas, who conducted the campaigns on the south-east and the centre. That he succeeded in the efficient exercise of the chief command of armies of a total strength of over one million men, operating many hundreds of miles apart from each other, while at the same time he watched and manoeuvred against a great captain and a veteran army in one field of the war, must be the greatest proof of Grant's powers as a general. In the end complete success rewarded the sacrifices and efforts of the Federals in every theatre of war; in Virginia, where Grant was in personal control, the merciless policy of attrition wore down Lee's army until a mere remnant was left for the final surrender.

Grant had thus brought the great struggle to an end, and was universally regarded as the saviour of the Union. A careful study of the history of the war bears out the popular view. There were soldiers more accomplished, as was McClellan; more brilliant, as was Rosecrans; and more exact, as was Buell; but it would be difficult to prove that these generals, or indeed any others in the service, could have accomplished the task which Grant brought to complete success. Nor must it be supposed that Grant learned little from three years' campaigning in high command. There is less in common than is often supposed between the buoyant energy that led Grant to Shiloh and the grim plodding determination that led him to Vicksburg and to Appomattox. Shiloh revealed to Grant the intensity of the struggle, and after that battle, appreciating to the full the material and moral factors with which he had to deal, he gradually trained his military character on those lines which alone could conduce to ultimate success. Singleness of purpose, and relentless vigour in the execution of the purpose, were the qualities necessary to the conduct of the vast enterprise of subduing the Confederacy. Grant possessed or acquired both to such a degree that he proved fully equal to the emergency. If in technical finesse he was surpassed by many of his predecessors and his subordinates, he had the most important qualities of a great captain, courage that rose higher with each obstacle, and the clear judgment to distinguish the essential from the minor issues in war.

For a fuller account see AMERICAN CIVIL WAR. (C. F. A.)

Grant's Presidency.—After the assassination of President Lincoln a disposition was shown by his successor, Andrew Johnson, to deal severely with the Confederate leaders, and it was understood that indictments for treason were to be brought against Gen. Lee and others. Grant, however, insisted that the U.S. Government was bound by the terms accorded to Lee and his army at Appomattox. He went so far as to threaten to resign his commission if the President disregarded his protest. This energetic action on Grant's part saved the United States from a foul stain upon its escutcheon. In July 1866 the grade of general was created, for the first time since the organization of the government, and Grant was promoted to that position. In the following year he became involved in the deadly quarrel between President Johnson and Congress. To tie the President's hands Congress had passed the Tenure of Office Act, forbidding the President to remove any cabinet officer without the consent of the Senate; but in Aug. 1867 President Johnson suspended Secretary Stanton and appointed Grant secretary of war ad *interim* until the pleasure of the Senate should be ascertained. Grant accepted the appointment under protest, and held it until the following January, when the Senate refused to confirm the President's action, and Secretary Stanton resumed his office. President Johnson was much disgusted at the readiness with which Grant turned over the office to Stanton, and a bitter controversy ensued between Johnson and Grant. Hitherto Grant had taken little part in politics. The only vote which he had ever cast for a presidential candidate was in 1856 for James Buchanan; and leading Democrats, so late as the beginning of 1868, hoped to make him their candidate in the election of that year; but the effect of the controversy with President Johnson was to bring Grant forward as the candidate of the Republican Party. At the convention in Chicago on May 20, 1868, he was unanimously nominated on the first ballot. The Democratic Party nominated the one available Democrat who had the smallest chance of beating him—Horatio Seymour, lately governor of New York, an excellent statesman, but at that time hopeless as a candidate because of his attitude during the war. The result of the contest was at no time in doubt; Grant received 214 electoral votes and Seymour 80.

The most important domestic event of Grant's first term as President was the adoption of the 15th amendment to the Constitution on March 30, 1870, providing that suffrage throughout the United States should not be restricted on account of race, colour, or previous condition of servitude. The most important event in foreign policy was the treaty with Great Britain of May 8, 1871, commonly known as the Treaty of Washington, whereby several controversies between the United States and Great Britain, including the bitter questions as to damage inflicted upon the United States by the "Alabama" and other Confederate cruisers built and equipped in England, were referred to arbitration. In 1869 the government of Santo Domingo (or the Dominican republic) expressed a wish for annexation by the United States, and such a step was favoured by Grant, but a treaty negotiated with this end in view failed to obtain the requisite two-thirds vote in the Senate. In May 1872 something was done towards alleviating the odious reconstruction laws for dragooning the South, which had been passed by Congress in spite of the vetoes of President Johnson. The Amnesty Bill restored civil rights to all persons in the South, save from 300 to 500 who had held high positions under the Confederacy. As early as 1870 President Grant recommended measures of civil service reform, and succeeded in obtaining an act authorizing him to appoint a civil service commission. A commission was created, but owing to the hostility of the politicians in Congress it accomplished little. During the 50 years since Crawford's Tenure of Office Act was passed in 1820, the country had been growing more and more familiar with the spec-

tacle of corruption in high places. The evil rose to alarming proportions during Grant's presidency, partly because of the immense extension of the civil service, partly because of the growing tendency to alliance between spoilsmen and the persons benefited by protective tariffs, and partly because public attention was still so much absorbed in Southern affairs that little energy was left for curbing rascality in the North. The scandals, indeed, were rife in Washington and affected persons in close relations with the President. Grant was ill-fitted for coping with the difficulties of such a situation. Along with certain high intellectual powers he had a simplicity of nature charming in itself but often calculated to render him the easy prey of sharpers. He found it almost impossible to believe that anything could be wrong in persons to whom he had given his friendship, and on several occasions such friends proved themselves unworthy of him. The feeling was widely prevalent in the spring of 1872 that the interests of pure government in the United States demanded that President Grant should not be elected to a second term. This feeling led a number of high-minded gentlemen to form themselves into an organization under the name of Liberal Republicans. They held a convention at Cincinnati in May with the intention of nominating for the presidency Charles Francis Adams, who had ably represented the United States at the court of St. James during the Civil War. The convention was, however, captured by politicians who converted it into a farce by nominating Horace Greeley, editor of the New York Tribune, who represented almost anything rather than the object for which the convention had been called. The Democrats had despaired of electing a candidate and hoped to achieve success by adopting the Cincinnati nominee, should he prove to be an eligible person. The event showed that while their defeat in 1868 had taught them despondency, it had not taught them wisdom; it was still in their power to make a gallant fight by nominating a person for whom Republican reformers could vote. But with almost incredible fatuity, they adopted Greeley as their candidate. As a result Grant was re-elected by an overwhelming majority.

The most important event of his second term was his veto of the Inflation Bill in 1874 followed by the passage of the Resumption Act in the following year. The country was still labouring under the curse of an inconvertible paper currency originating with the Legal Tender Act of 1862. There was a considerable party in favour of debasing the currency indefinitely by inflation, and a bill with that object was passed by Congress in April 1874. It was promptly vetoed by President Grant, and two months later he wrote a very sensible letter to Senator J. P. Jones of Nevada advocating a speedy return to specie payments. The passage of the Resumption Act in Jan. 1875 was largely due to his consistent advocacy, and for these measures he deserves as high credit as for his victories in the field. In spite of these great services, popular dissatisfaction with the Republican Party rapidly increased during the years 1874–76. The causes were twofold: firstly, there was great dissatisfaction with the troubles in the Southern states, owing to the harsh reconstruction laws and the robberies committed by the carpet-bag governments which those laws kept in power; secondly, the scandals at Washington, comprising wholesale frauds on the public revenue, awakened lively disgust. In some cases the culprits were so near to President Grant that many persons found it difficult to avoid the suspicion that he was himself implicated, and never perhaps was his hold upon popular favour so slight as in the summer and autumn of 1876.

Later Life.—After the close of his presidency in the spring of 1877 Grant started on a journey round the world, accompanied by his wife and one son. He was received with distinguished honours in England and on the continent, whence he made his way to India, China and Japan. After his return in Sept. 1880 he went back to his old home in Galena (Ill.). A faction among the managers of the Republican Party attempted to secure his nomination for a third term as president, and in the convention at Chicago in June 1880 he received a vote exceeding 300 during 36 consecutive ballots. Nevertheless, his opponents made such effective use of the popular prejudice against third terms that the scheme was defeated and Garfield was named in his stead In Aug. 1881 Gen. Grant bought a house in the city of New York. His income was insufficient for the proper support of his family, and accordingly he had become partner in a banking house in which one of his sons was interested. The name of the firm was Grant and Ward. The ex-president invested in it all his available property, but paid no attention to the management of the business. His facility in giving his confidence to unworthy people was now to be visited with dire calamity. In 1884 the firm became bankrupt, and it was discovered that two of the partners had been perpetrating systematic and gigantic frauds. This blow left Gen. Grant penniless, just at the time when he was beginning to suffer acutely from the disease which finally caused his death. Down to this time he had never made any pretensions to literary talent, but on being approached by the *Century Magazine* with a request for some articles he undertook the work in order to keep the wolf from the door. It proved a congenial task, and led to the writing of his *Personal Memoirs,* a frank, modest, and charming book, which ranks among the best military biographies. The sales earned for the general and his family something like half a million dollars. The circumstances in which it was written made ii an act of heroism comparable with any that Grant ever showed as a soldier. During most of the time he was suffering tortures from cancer in the throat, and it was only four days before his death that he finished the manuscript. In the spring of 1885 Congress passed a bill creating him a general on the retired list; and in the summer he was removed to a cottage at Mt. M'Gregor, near Saratoga, where he passed the last five weeks of his life, and where he died on July 23, 1885. His body was placed in a tomb monument in Riverside drive, in New York city, overlooking the Hudson river.

Grant showed many admirable and lovable traits. There was a charming side to his trustful simplicity. He abounded in kindliness and generosity, and if there was anything especially difficult for him to endure, it was the sight of human suffering, as was shown on the night at Shiloh, where he lay out of doors in the icy rain rather than stay in a comfortable room where the surgeons were at work. His good sense was strong, as well as his sense of justice, and these qualities stood him in good service as president, especially in his triumphant fight against the greenback monster. Altogether, in spite of some shortcomings, Grant was a massive, noble and lovable personality, well fit to be remembered as one of the heroes of a great nation. (J. F.)

BIBLIOGRAPHY.—Adam Badeau's *Military History* of *U. S. Grant* (1867–81) and *Grant in Peace* (Hartford, 1887) are appreciative but lacking in discrimination; William Conant Church's *Ulysses S. Grant and the Period of National Preservation and Reconstruction* (1897) is a good succinct account; Hamlin Garland's *Ulysses S. Grant, His Life and Character* (1898) gives especial attention to the personal traits of Grant and abounds in anecdote. *See* also Grant's *Personal Memoirs* (1885–86); J. R. Young, *Around the World with General Grant* (1880); J. G. Wilson, *Life and Public Services of U. S. Grant* (1886); James Ford Rhodes, *History of the United States,* vols. iii.–vii. (1896–1906); Horace Porter, *Campaigning with Grant* (1897); James K. Hosmer, *Appeal to Arms and Outcome of the Civil War* (1907); John Eaton, *Grant, Lincoln, and the Freedmen* (1907); J. F. C. Fuller, *The Generalship of Ulysses S. Grant* (1929); and works mentioned in the articles AMERICAS CIVIL WAR, WILDERNESS, etc.

GRANT, in law, the transfer of property by an instrument in writing, termed a deed of grant. According to the old rule of common law, the immediate freehold in corporeal hereditaments lay in livery *(see* FEOFFMENT), whereas incorporeal hereditaments, such as a reversion, remainder, advowson, etc., lay in grant, that is, passed by the delivery of the deed of conveyance or grant without further ceremony. The distinction between property lying in livery and in grant is now abolished, the Real Property Act 184j providing that all corporeal tenements and hereditaments shall be transferable as well by grant as by livery. What in many other countries is termed a "concession" is in England usually called a "grant."

GRANTH, the sacred "book" of the Sikhs (*q.v.*). It is a notable compilation of later Indian protestant writings, inculcating monotheism, yet not excluding praise of the goddess Durga (*q.v.*), denouncing caste privileges. concremation of widows and female infanticide, the use of hemp and alcohol (though the lat-

ter prohibition is disregarded), and any indulgence in tobacco. It consists of two parts, the Adi Granth or "Original Book," and the Dasam Pādshāhī dā Granth, or "Book of the Tenth Reign," *i.e.*, of the 10th Gurū, Govind Singh. This latter is accepted by all Sikhs. Its difficulties of interpretation have hindered Sikh progress and expansion. Written in a special Sikh script (*Gurmukhi*) without separation of words in various dialects and even partly in Persian its earliest manuscripts have perished. It still awaits definitive exegesis.

See M. A. Macauliffe, ***The Sikh Religion; its Gurus, Sacred Writings and Authors,*** *6* vols. (Oxford, 1909); Ernst Trumpp, ***The*** Adi ***Granth or Holy Scriptures of the Sikhs*** (London, **1877).**

GRANTHAM, municipal borough in the Grantham parliamentary division and the parts of Kesteven, Lincolnshire, England; situated on the river Witham. Pop. (est. 1938) 19,890. Area 6.04 sq.mi. It is an important junction of the L.N.E. railway, 105 mi. N.N.W. from London, with branch lines to Nottingham, Lincoln and Boston, while there is communication with Nottingham and the Trent by the Grantham canal. Although there is no authentic evidence of Roman occupation, Grantham (Graham, Granham in Domesday Book) from its situation on Ermine Street, is supposed to have been a Roman station. It was possibly a borough in the Saxon period, and by the time of the Domesday survey it was a royal borough with 111 burgesses. Charters of liberties, existing now only in the confirmation charter of 1377, were granted by various kings. From the first the town was governed by a bailiff appointed by the lord of the manor, but by the end of the 14th century the office of alderman had come into existence. Finally government under a mayor and alderman was granted by Edward IV in 1463, and Grantham became a corporate town. Among later charters, that of James II, given in 1685, changed the title to that of government by a mayor and six aldermen, but this was afterward reversed and the old order resumed. With some exceptions Grantham returned two members to parliament from 1467 to 1885, and one member from then until 1918. Richard III in 1483 granted a Wednesday market and two fairs yearly, namely, on the feast of St. Nicholas the Bishop and the two following days and on Passion Sunday and the day following. The market is held on Saturday, and fairs are held on the Monday, Tuesday and Wednesday following the fifth Sunday in Lent; and two stock fairs, on Oct. 26 and Dec. 17. The parish church of St. Wulfram exhibits all the Gothic styles but is mainly Early English and Decorated. The western tower and spire, about 280 ft. in height, are of early Decorated workmanship. There is a double Decorated crypt beneath the Lady chapel. Two libraries, respectively of the 16th and 17th centuries, are preserved in the church. King's school, refounded in 1528 by Richard Fox, bishop of Winchester, is a late Perpendicular building. The Angel hotel is a hostelry of the 15th century, with a gateway of earlier date. A conduit dating from 1579 stands in the wide market-place. The chief industries are malting and the manufacture of agricultural implements. It also has iron foundries.

Grantham was created a bishopric suffragan in the diocese of Lincoln in 1905.

GRANTIA, a genus of the Iesser calcareous sponges. It contains several species, of comparatively small size, including *compressa,* the purse sponge, native to the coast of Great Britain. See SPONGES.

GRANTOWN-ON-SPEY, police burgh, Moray, Scotland. Pop. (1938) 1,442. It lies on the left bank of the. Spey, 23$ mi. south of Forres by the L.N.E.R., with a station on the L.M.S.R. Speyside line connecting Craigellachie with Boat of Garten. It was founded in 1776 by Sir James Grant of Grant, and became the chief seat of that ancient family, who had lived on their adjoining estate of Freuchie (Gaelic, *fraochach,* "heathery") since the beginning of the 15th century, and hence were usually described as the lairds of Freuchie. The town, built of grey granite, and delightfully situated in the midst of beautiful woods, is a holiday resort.

GRANULITE (Lat. *granulum,* a little grain), a name used by petrographers to designate two distinct classes of rocks. According to the terminology of the French school it signifies a granite in which both kinds of mica (muscovite and biotite) occur, and corresponds to the German Granit, or to the English "muscovite-biotite-granite." This application has not been accepted generally. To the German petrologists "granulite" means a more or less banded fine-grained metamorphic rock, consisting mainly of quartz and felspar in very small irregular crystals, and containing usually also a fair number of minute rounded pale-red garnets. Among English and American geologists the term is generally employed in this sense. The granulites are very closely allied to the gncisses, as they consist of nearly the same minerals, but they are finer grained, have usually less perfect foliation, are more frequently garnetiferous, and have some special features of microscopic structure. In the rocks of this group the minerals, as seen in a microscopic slide, occur as small rounded grains forming a mosaic closely fitted together. The individual crystals have never perfect form, and indeed rarely any traces of it. In some granulites they interlock, with irregular borders; in others they have been drawn out and flattened into tapering lenticles by crushing. In most cases they are somewhat rounded with smaller grains between the larger. This is especially true of the quartz and felspar which are the predominant minerals. Both muscovite and biotite may be present and vary considerably in abundance; very commonly they have their flat sides parallel and give the rock a rudimentary schistosity, and they may be aggregated into bands—in which case the granulites are indistinguishable from certain varieties of gneiss. The garnets are very generally larger than the above-mentioned ingredients and easily visible as pink spots on the broken surfaces of the rock. They usually are filled with enclosed grains of the other minerals.

The felspar of the granulites is mostly orthoclase or microperthite; microcline, oligoclase and albite are also common. Basic felspars occur only rarely. Among accessory minerals, in addition to apatite, zircon and iron oxides, the foilowing may be mentioned: hornblende (not common), riebeckite (rare), epidote and zoisite, calcite, sphene, andalusite, sillimanite, kyanite, hercynite (a green spinel), rutile, orthite and tourmaline.

On account of the minuteness with uhich it has been described and the important controversies on points of theoretical geology which have arisen regarding it, the granulite district of Saxony (around Rosswein, Penig, etc.) may be considered the typical region for rocks of this group. Very similar granulites occur in Austria near Krems (in the Wald-Viertel). J. G. Lehmann propounded the hypothesis that the present state of the Saxon granulites was due principally to crushing acting on them in a solid condition, grinding them down and breaking up their minerals, while the pressure to which they were subjected welded them together into coherent rock. It is now believed, however, that they are comparatively recent and include sedimentary rocks, partly of Palaeozoic age, and intrusive masses which may be nearly massive or may have gneissose, veined or granulitic structures. These have been developed largely by the injection of semi-consolidated, highly viscous intrusions, and the varieties of texture are original or were produced very shortly after the crystallization of the rocks.

The Saxon and Austrian granulites are apparently for the most part igneous and correspond in composition to granites acd porphyries. There are, however, many granulites uhich undoubtedly were originally sediments (arkoses, grits and sandstones). A large part of the highlands of Scotland consists of paragranulites of this kind, which have received the group name of "Moine gneisses."

Along with the typical acid granulites above described, in Saxony, India, Scotland and other countries there occur dark-coloured basic granulites ("trap granulites"). These are fine-grained rocks, not usually banded, nearly black in colour with small red spots of garnet. Their essential minerals are pyroxene, plagioclase and garnet; chemically they resemble the gabbros. Green augite and hypersthene form a considerable part of these rocks; they may contain also biotite, hornblende and quartz. Around the garnets there is often a radial grouping of small grains of pyroxene and hornblende in a clear matrix of felspar; these "centric" structures are frequent in granulites.

GRANVELLA, ANTOINE PERRENOT, CARDINAL DE (1517–1586), one of the ablest and most influential of the princes of the Church during the great political and ecclesiastical movements which immediately followed the appearance of Protestantism in Europe, was born on Aug. 20, 1517, at Besançon. After studying at Padua and at Louvain. he held a canonry at Besançon and in 1540 was promoted to the bishopric of Arras. Through the

influence of his father, Nicolas Perrenot de Granvella (1484–1550), chancellor of the empire under Charles V, he was entrusted with many delicate pieces of public business, in the execution of which he developed a rare talent for diplomacy and at the same time acquired an intimate acquaintance with the currents of European politics. Specially noteworthy was his settlement of the peace terms after the defeat of the league of Schmalkalden at Mühlberg in 1547. As secretary of state (1550) he attended Charles in the war with Maurice, elector of Saxony, accompanied him in the flight from Innsbruck and afterward drew up the Treaty of Passau (Aug. 1552). In 1553 he conducted the negotiations for the marriage of Mary of England and Philip II of Spain, to whom in 1555, he transferred his services. One of the Spanish commissioners at the peace of Cateau Cambrésis (1559), on Philip's withdrawal from the Netherlands, he was appointed prime minister to the regent, Margaret of Parma.

In 1560 Granvella was made archbishop of Malines and in 1561 cardinal, but his policy of repression aroused the hostility of the people and by the advice of Philip he retired to Franche Comté in 1564. Recalled in 1570 to Rome, he helped to arrange the alliance between the papacy, Venice and Spain against the Turks and in the same year became viceroy of Naples. In 1575 Philip II appointed him president of the council for Italian affairs. Among the more delicate negotiations of his later years were those of 1580, whose object was the union of the crowns of Spain and Portugal, and those of 1584, which proved a check to France by the marriage of the Spanish infanta Catherine to Charles Emmanuel, duke of Savoy. He died of a lingering disease at Madrid on Sept. 21, 1586.

Philippson, *Ein Ministerium unter Philipp II.* . . . (Berlin, 1895).

GRANVILLE, GRANVILLE GEORGE LEVESON-GOWER, 2ND EARL (1815–1891), English statesman, eldest son of the 1st Earl Granville (1773–1846), by his marriage with Lady Harriet, daughter of the duke of Devonshire, was born in London on May 11, 1815. On leaving Oxford young Lord Leveson went to Paris for a short time under his father and in 1836 was returned to parliament in the Whig interest for Morpeth. For a short time he was undersecretary for foreign affairs in Lord Melbourne's ministry. In 1840 he married Lady Acton. From 1841 till his father's death in 1846, when he succeeded to the title, he sat for Lichfield. In the house of lords he signalized himself as a Free Trader, and Lord John Russell made him master of the buckhounds (1846). He became vice-president of the board of trade in 1848, and was one of the promoters of the great exhibition of 1851. In that year, having already been admitted to the cabinet, he succeeded Palmerston at the foreign office until Lord John Russell's defeat in 1852; and when Lord Aberdeen formed his government at the end of the year, he became first president of the council, and then chancellor of the duchy of Lancaster (1854). Under Lord Palmerston (1855) he was president of the council. He was chancellor of the London university for 35 years; he advocated the admission of women, and also the teaching of modern languages. From 1855 Lord Granville led the Liberals in the upper house, both in office and, after Palmerston's resignation in 1858, in opposition. He went in 1856 as head of the British mission to the tsar's coronation in Moscow. In June 1859 the queen, embarrassed by the rival ambitions of Palmerston and Russell, sent for him to form a ministry, but he was unable to do so, and Palmerston again became prime minister, with Lord John as foreign secretary and Granville as president of the council.

From 1866 to 1868 he was in opposition, but in Dec. 1868 he became colonial secretary in Gladstone's first ministry. His tact was invaluable to the government in carrying the Irish Church and Land bills through the house of lords. On June 27, 1870, on Lord Clarendon's death, he was transferred to the foreign office. Lord Granville's name is mainly associated with his career as foreign secretary (1870–74 and 1880–85). Personally he was patient and polite, but his courteous and pacific methods were somewhat inadequate in dealing with the new situation then arising in Europe and outside it; and foreign governments had little scruple in creating embarrassments for Great Britain and relying on the disinclination of the Liberal leaders to take strong measures. The Franco-German War of 1870 broke out within a few days of Lord Granville's quoting in the house of lords (July 11) the curiously unprophetic opinion of the permanent undersecretary (Hammond) that "he had never known so great a lull in foreign affairs." Russia took advantage of the situation to denounce the Black sea clauses of the Treaty of Paris, and Lord Granville's protest was ineffectual. In 1871 an intermediate zone between Asiatic Russia and Afghanistan was agreed on between him and Shuvalov; but in 1873 Russia took possession of Khiva, within the neutral zone, and Lord Granville had to accept the aggression.

When the Conservatives came into power in 1874, his part for the next six years was to criticize Disraeli's "spirited" foreign policy and to defend his own more pliant methods. He returned to the foreign office in 1880, only to find an anti-British spirit developing in German policy which the temporizing methods of the Liberal leaders were generally powerless to deal with. Lord Granville failed to realize in time the importance of the Angra Pequeña question in 1883–84, and he was forced to yield to Bismarck over it. Whether in Egypt, Afghanistan or equatorial and southwest Africa, British foreign policy was dominated by suavity rather than by the strength which commands respect. Granville was a faithful supporter of Gladstone all through his life, and during the troubled period (1880–85) the prime minister constantly turned to him. When Gladstone took and gave way to Lord Rosebery when the latter was preferred to the foreign office. He went to the colonial office for six months and in July 1886 retired from public life. He died in London on March 31, 1891, being succeeded in the title by his son (1872–1939).

See Lord E. Fitzmaurice, *Life of Lord Granville* (1905); also other memoirs of the time, notably Morley's *Life of Gladstone*.

GRANVILLE, JOHN CARTERET, EARL (1690–1763), English statesman, known as Lord Carteret, was born on April 22, 1690, the son of George, 1st Lord Carteret, and great grandson of the Elizabethan admiral, Sir Richard Grenville. He succeeded his father in 1695 as 2nd baron Carteret. He was educated at Westminster, and at Christ Church, Oxford, and acquired a wide knowledge of modern languages and literatures, being almost the only Englishman of his time who knew German. He took his seat in the house of lords on May 25, 1711. An adherent of the Hanoverian dynasty, the friend of Stanhope and Sunderland, he took a share in defeating the Jacobite conspiracy of Bolingbroke on the death of Queen Anne and supported the Septennial act. His interests were, however, rather in foreign than in domestic policy. Early in 1719 he was appointed ambassador to Sweden, a post which he held for two years with great success. He gained an exceptional knowledge of European and, in particular, of German affairs.

Named secretary of state for the southern department on his return to London, he came into conflict with Townshend and Sir Robert Walpole. Walpole, who resented his ability to speak German with the king, arranged for him to succeed the duke of Grafton as lord lieutenant of Ireland, when the violent agitation in Ireland against Wood's halfpence (*see* SWIFT, JONATHAN) made a new appointment necessary. He was in Dublin from Oct. 23, 1724 until 1730. He had to deal with the opposition to Wood's halfpence, and to counteract the effect of Swift's *Drapier's* Letters. It is doubtful whether he could have reconciled his private friendship with Swift with his duty to the crown if Wood's patent had not been withdrawn. When he returned to London in 1730 Walpole was firmly established as master of the house of commons, and as the trusted minister of George II and he took no share in public affairs until the fall of Walpole in 1742. Carteret is credited with having paid the expenses of the first edition of *Don Quixote* to please Queen Caroline, but he lost her favour through becoming entangled in the scandalous family quarrel between Frederick, prince of Wales, and his parents. His sympathies were with Maria Theresa in the War of the Austrian Succession, on the ground that the fall of the house of Austria would increase the power of France.

George II welcomed these views, and made him secretary of state in 1742, a post which he held until 1744, accompanying the king to Germany in 1743. He succeeded in promoting an agreement between Maria Theresa and Frederick. His support of the king's policy was denounced as subservient to Hanover, but a few years later Pitt adopted an identical policy and confessed that whatever he knew he had learned from Carteret. In 1751 he became president of the council and was still liked and trusted by the king but had little active share in the government.

In 1756 Newcastle asked him to become prime minister as the alternative to Pitt, but Granville, understanding why the offer was made, declined and supported Pitt. When in Oct 1761 Pitt threatened to resign unless his advice to declare mar on Spain was accepted, Granville replied that "the opinion of the majority (of the cabinet) must

decide." He resisted Pitt's claim to be considered as a "sole minister," or in the modern phrase, "prime minister." Granville remained in office as president until his death in London on Jan. 22, 1763. The title descended to his son Robert, who died without issue in 1776, when the earldom became extinct.

A somewhat partisan life of Granville was published by A. Ballantyne, Lord Carteret, a Political Biography (1887). His correspondence is in the British Museum.

GRANVILLE, a town of Cumberland county, New South Wales, 13 mi. by rail W. of Sydney. It became a municipality in 1885. Pop. (1933) 19,717. It is an important railway junction and manufacturing town, producing agricultural implements, tweed, pipes, tiles and bricks; there are also tanneries, flour mills, and kerosene and meat export works.

GRANVILLE, a fortified seaport and bathing-resort of northwestern France, in the department of Manche, at the mouth of the Bosq, 85 mi. S.W. of Cherbourg by rail. Pop. (1936) 10,247. The upper town stands on a promontory and is surrounded by ramparts; the lower town and harbour lie below it. The barracks and the church of Notre Dame are in the upper town. The port consists of a large tidal harbour, two floating basins and a dry dock. Deep sea fishing, including the cod-fishing off Newfoundland, and oyster-fishing are carried on. Before World War 11 it had much trade with St. Pierre and Miquelon, and was the port of Normandy for British goods. The principal exports are eggs, vegetables and fish, armaments to the colonies, salted fish, lard, butter. Coal, timber and chemical manures are imported. The industries include ship-building, fish-salting, the manufacture of cod-liver oil, the preserving of vegetables, dyeing, metal-founding, rope-making and the manufacture of chemical manures.

GRANVILLE, a village of Licking county, O., U.S.A., 27 mi. N.E. of Columbus; served by the New York Central railway. The population in 1940 was 1,502. The village, settled in 1805, has a setting of great natural beauty, in a fertile valley, surrounded by hills, and has many aspects of a New England college town. It is the seat of Denison university, founded in 1831 by the Ohio Baptist Education society.

GRANVILLE-BARKER, HARLEY GRANVILLE (1877–), British playwright, was born in London on Nov. 25, 1877. At the age of 13 he was sent to the Theatre Royal, Margate, then a combination of stock company, theatre and dramatic school. He first appeared in London in the following year, at the Comedy theatre, under Charles Hawtrey. His first play, written in 1893, was produced by amateurs. From 1895 onward he acted in a variety of plays, in Shakespeare with Ben Greet, and with William Poel in *Richard II* and Marlowe's Edward *II*. In 1899, his play The Weather-hen (written in collaboration with Herbert Thomas) was produced in London. In 1900 he became interested in the newly formed Stage society, first as actor, then as producer, and his own play, The *Marrying* of Ann Leete, was produced by the society in 1901. In 1903 he collaborated with William Archer in the framing of *A Scheme* and Estimates for a *National* Theatre. In 1904 he joined J. E. Vedrenne in the management of the Court theatre, London. There, during three years he produced, and at first acted in, a variety of plays by Ibsen, Bernard Shaw, St. John Hankin, John Galsworthy, John Masefield, Maurice Hewlett, Gilbert Murray (translations from Euripides) and his own The Voysey Inheritance (1905). His management at the court may be said to have been the beginning of the great vogue of the plays of Bernard Shaw. His services to the English theatre in producing many other plays which would have had little chance of production by the commercial stage of that day were very great. In 1906 he wrote the charming Pierrot play, Prunella, in collaboration with Laurence Housman. A later play, *Waste* (1906), was banned by the censor but was privately performed by the Stage society. *The* Madras House (1909) was produced by the Frohman Repertory company at the Duke of York's theatre in 1910, and a revised version of it was revived in 1925.

By 1910 he had given up acting but until 1914 produced plays in London, including two by Shakespeare upon a platform stage with "conventional" decoration. He was as great an innovator in stage décor as he had been in the production of new plays. Again his experiments were the forerunners of a movement which later had greater developments. After World War I he prepared a series of translations, in collaboration with his wife, Helen Granville-Barker, of Spanish plays, the most successful of which on the English stage was The Kingdom of God, by G. Martinez Sierra. He published various other works, including The *Exemplary* Theatre (1922), dramatic criticism, also translations of several foreign authors.

GRAPE, the fruit of the vine: see VINE.

GRAPEFRUIT, also known as pomelo, is the fruit of Citrus *paradisi,* considered by W. T. Swingle (1943) as a "satellite" species of C. *grandis,* the pummelo, or shaddock. Certainly the grapefruit and pummelo are closely related, and some students consider it probable that the grapefruit originated from the pummelo as a mutation. Such mutations among Citrus species are not uncommon. In 1814, John Lunan in his *Hortus* Jamaicensis mentioned that there was a variety of the shaddock "known by the name of 'grapefruit' on account of its resemblance in flavour to the grape" and stated that this fruit was not nearly so large as the shaddock (H. J. Webber, 1943). The place of origin of the grapefruit is not certain, but it probably originated in Jamaica, for, in spite of careful search, it has not been found native in southeastern Asia or in the East Indian archipelago, where the parent species, C. *grandis,* is widely grown, or in any other region where any other Citrus species is native. There is evidence of a morphological character both for and against the theory that the grapefruit may be an intrageneric hybrid of the pummelo (C. *grandis*) and the sweet orange (C. *sinensis*) (Swingle, 1943).

The grapefruit tree grows to be as large and vigorous as a vigorous orange tree; a mature tree may be from 15 to 20 ft. high. The foliage is very dense, leaves dark shiny green, larger than those of sweet orange but smaller than those of the pummelo, nearly glabrous, petioles broadly winged. Flowers are large, uhite, borne singly, or in clusters in the axils of the leaves; petals similar to those of sweet orange but usually larger. The fruit, which is lemon yellow when ripe, ranges from 9 to 12 cm. in diameter and averages twice as large as a medium-sized orange, the size depending upon the variety and upon cultural conditions; pulp usually of a light yellowish colour, somewhat intermediate between that of the orange and that of the lemon, tender and usually very full of juice, with a distinctive, mildly acid, very pleasing flavour. Several varieties, originated by bud mutations, have pink or red pulp of varying intensity of colour; some of these varieties have a slightly pinkish cheek overlying the normal yellow colour of the peel.

H. J. Webber (1943) describes 23 varieties of grapefruit with normal-coloured pulp and 4 varieties with pink or reddish pulp, all of which have been propagated in the United States. Most of the fruit produced in the U.S. is of either the Marsh or Duncan, yellowish-pulp varieties. The Ruby and Webb are the principal varieties having red pulp; the actual quality of these varieties is comparable to that of the normal-coloured varieties, and they have become very popular, because of their attractive appearance, for use at banquets and other social functions.

The grapefruit hybridizes readily with other species of Citrus. The tangelo, an intrageneric hybrid, is the result of a cross between the mandarin orange (some varieties of which are known as tangerines) and the grapefruit (also known as pomelo). One of the most promising of these hybrids, the Sampson tangelo, was produced in 1897, in Forida, by W. T. Swingle, an investigator employed at the time by the United States department of agriculture. This fruit has considerable merit as a juice fruit and as a source of seed for rootstock purposes.

As a fruit for home consumption, grapefruit became well established in the islands of the West Indies before its culture spread to the mainland. The commercial culture of the grapefruit in the U.S. began in Florida in the early '80s, and from then on production persistently increased, owing to the public demand for it, as a breakfast fruit or served as juice. In the period from 1889 to 1940, production in Florida increased from 10,000 boxes (80 lb. each) to over 24,000,000 boxes. Meanwhile, the grapefruit became the basis of a large citrus industry in Texas and Arizona, with a production, in 1940, of 14,000,000 boxes and nearly 3,000,000 boxes, respectively. Although production of grapefruit in California is secondary to that of either oranges or lemons, the annual production in this state during the five-year period 1936 to 1940, inclusive, averaged nearly 2,000,000 boxes. Grapefruit has become popular as a breakfast fruit in various parts of the world and production has expanded to other citrus-growing countries, notably Palestine, South Africa and Brazil.

Grapefruit trees thrive and produce the best quality fruit on sandy but relatively fertile soils. Supplementary fertilization is necessary in practically all the producing areas in the U.S. The trees come into bearing early and may be expected to produce commercially profitable crops by the fourth to sixth year after being planted in the orchard. Mature trees may produce remarkably large crops—1,300 to 1,500 lb.

of fruit per tree. Culture and pest-control problems of grapefruit are comparable to those of other citrus crops (see LEMON and ORANGE).

The rapid expansion of grapefruit acreage in the U.S. during the two decades 1920–1940 to an estimated total of 128,000 acres in 1940 caused serious problems in the sale and distribution of the fruit. Fresh fruit from Florida and Texas is not available throughout the entire year. The season of shipment is primarily from late fall to early spring, with the peak of the marketing season in midwinter. To avoid an overproduction at one period, and a shortage of grapefruit at another, the preservation of the fruit by canning developed into an important industry. The two products which have taken most of the fruit off the fresh-fruit market are the juice and the prepared segments. The latter product is very frequently used as a basis for salad-making. The segments may be packed in a 40° Brix sugar syrup. The increase in these two methods of processing grapefruit has been very rapid during the decade from 1930 to 1940; in 1929–30, the number of cases produced was 1,509,000 (24 cans of 20 oz. each), whereas during the 1939–40 season 10,933,000 cases of juice and 4,191,000 cases of segments were processed. This makes grapefruit available to the general public the year round and is an important service to both the consumer and the producer of this popular fruit. The processing of grapefruit juice is comparable to that of orange juice. (See ORANGE.) It is sometimes advisable to add cane or beet sugar to grapefruit juice as it is canned, especially if the fruit is subnormal in sugar content and lacking in character. The yield of grapefruit juice under factory conditions will approximate 70 to 90 gal. per 2,000 lb. of fruit.

The ratio of total soluble solids to acids in edible grapefruit depends upon the relative maturity of the fruit and ranges from 6.1 to 10:1. The concentration of total soluble solids is slightly less in grapefruit juice than in orange juice, and the acid is 50% greater; therefore, the grapefruit is more decidedly acid in taste than the orange. Of the total soluble solids in grapefruit, 73% may be sugars. The grapefruit is richer as a source of vitamin C than most of the fruits and vegetables normally consumed by man; it is exceeded only by the orange and the lemon. The vitamin C content of grapefruit juice depends upon the variety, soil fertility and the season of the year when the fruit is picked; it may average from 39 to 47 mg. per 100 gr. Early in the season of maturity, the vitamin C content is higher than it is later.

GRAPE-HYACINTH, the name given to any species of *Muscari,* a genus of the lily family (Liliaceae), comprising about 45 species, natives chiefly of the Mediterranean region. They are small bulbous plants with narrow fleshy basal leaves and small usually blue urn-shaped or globose flowers, nodding or pendulous, in a more or less dense cluster terminating a single flowering stalk. The common grape-hyacinth (M. botryoides), called also grape-flower, baby's-breath and blue-bells, widely cultivated in gardens, is native to southern Europe and western Asia and has run wild in meadows and thickets in the eastern United States. It has narrow erect leaves, about as long as the flower-stalk, which usually grows from 4 in. to 12 in. high, bearing at the top about 12 globose blue, or in some varieties white, faintly scented flowers, about ⅛ in. long, crowded in a cluster. The starch grape-hyacinth (M. *racemosum*), native to Europe and found in sandy fields in England and Scotland, has become naturalized in the eastern United States. It grows about a foot high, and bears very narrow, almost cylindrical, recurved leaves and numerous starchy-scented, urn-shaped blue flowers in a dense raceme. Various other species are more or less cultivated.

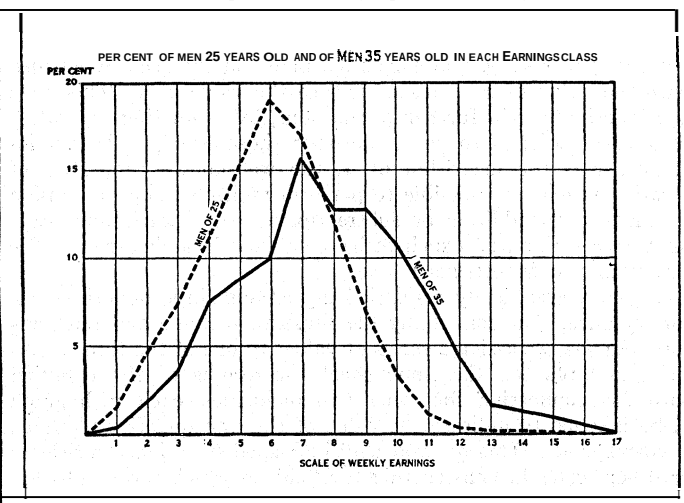
GRAPHIC METHODS IN MATHEMATICS. It is often found helpful to devise some scheme to show to the eye the relations between the different quantities involved in certain mathematical and statistical problems. In the simplest cases, the purpose of such "graphic methods" is merely to present the results of mathematical or statistical analysis. For instance, in the *Statistical Atlas* of *the United States,* the census statisticians use various graphic devices to make readily available to others important results such as the average number of persons per square mile in various States or counties.

The selection from a mass of statistical work of the results that are to be shown graphically, and the determination of the best statistical device for each case, are tasks which require both close familiarity with the details of the work and a broad view of the problems in which the results may be significant and of the mental attitude of those who will use the results. Graphic presentation, if it is attempted at all, should be regarded as the culmination of a statistical study and not as an incidental diversion.

Graphic Methods As an Aid to Thinking.— In some cases graphic methods are much more than a vehicle for conveying information. Without their aid it is difficult to formulate the ideas which underlie many investigations of complicated quantitative relations, or to carry through the various steps of the investigation. The ordinary graph, obtained by plotting on coordinate paper various values of one quantity against corresponding values of another quantity, has become so familiar that we sometimes use it without realizing it. For instance, consider the following (hypothetical) description of the relation between average wages and term of service in a certain company:

"On the average, wages rise, though at a decreasing rate, until about the tenth or twelfth year of service, and then flatten out, except for workmen appointed to supervisory positions. Salaries, on the other hand, continue to rise at a pretty uniform rate until the twentieth or twenty-fifth year of service, after which the averages are based on too few cases to establish a trend."

While no graph is mentioned specifically, this statement would hardly be made except with the graph of earnings as a function



AN EXAMPLE OF GRAPHICAL METHODS SHOWING HOW STATISTICAL DATA ARE SO REPRESENTED THAT THE COMPARISON BETWEEN TWO RELATED VALUES CAN BE SEEN AT A GLANCE

PERCENTAGE DISTRIBUTION

Earnings scale	Men of 25	Men of 35	Earnings scale	Men of 25	Men of 35
1	1.5	0.4	9	6.9	12.7
2	4.6	1.8	10	3.2	10.7
3	7.4	3.6	11	1.1	7.7
4	11.1	7.5	12	0.3	4.3
5	15.3	8.8	13	0.2	1.6
6	19.0	10.0	14	0.2	1.2
7	17.0	15.6	15	0.1	0.9
8	12.1	12.7	16		0.5

of years of service definitely pictured in the mind of the writer, and would not be understood except with the same graph pictured in the mind of the reader.

As a second illustration of the use of graphic devices as an aid to thought, consider the graphs of frequency distributions, as constructed by statisticians. The accompanying diagram, for instance, compares the percentage distribution according to weekly earnings of male wage-earners 25 years old and of those 35 years old, in a certain factory. After inspection of these two frequency polygons, statements like the following may be made:

(1) The earnings of different individuals of the same age differ considerably; therefore an average for any group is of little value

as an indication of the number below any particular standard of pecuniary well-being.

(2) Relatively high earnings are more common among men of 35 than among men of 25; therefore a single distribution by earnings of men of all ages is inadequate to measure the extent to which earnings are large enough for needs, which obviously vary with age.

(3) The earnings of men of 35 more frequently vary considerably from the most typical amount than do those of men of 25. There is no point on the scale at which as large a percentage of 35 year old men are concentrated as of 25 year old men at "6" or "7" on the scale.

As these statements show, a diagram of this type provides a basis for beginning to think about the problems of variation which are the subject matter of statistical science. In such cases the graph is an instrument whereby a real idea can be definitely formulated, made clear to others, and used for guidance in the solution of problems.

Securing Approximate **Numerical Results** Rapidly.--On the basis of a limited number of paired values of the quantities x and *y*, obtained either by substitution in a formula or by observation of phenomena, a graph may be constructed by drawing a smooth curve through the points representing these paired values. From the graph we may then read other pairs of values, thus avoiding additional observations or substitutions in the formula. In many cases this process of graphic interpolation is much shorter than the processes which it replaces, though usually not as accurate.

A variation of this scheme is to construct a scale on the basis of the given pairs of values. Distances on this scale from an indicated starting-point are measured off proportional to the various values of *y*, and each such point on the scale is labelled with the value of x corresponding to the value of *y*. This scale can then be used in further calculations, by estimating the values of x corresponding to points between those labelled. If, for instance, *y* is the logarithm of x, the well-known properties of logarithms make it possible to perform multiplication or division by mechanical addition or subtraction on the logarithmic scale, or, better still, on two such scales combined in a slide rule. (See CALCULATING MACHINES.)

To show graphically a relationship among three quantities, as, for instance, that connecting the pressure, volume and temperature of a gas, we assign a series of values to one of the three quantities and plot on the same sheet the graphs of the resulting formulas connecting the other two quantities, each such graph being labelled to indicate the value of the first quantity to which it corresponds. This method may be varied by using logarithmic or other scales in constructing the field on which the graphs are plotted. The purpose in such cases is to facilitate plotting by reducing the graphs to straight lines or at least to simple curves.

When a three-variable relationship has thus been plotted in a series of "contour lines," it is a simple and rapid process to read off approximately the value of one quantity corresponding to any specified values of the other two. The process is often more simple and rapid if a nomographic or alinement chart is constructed (see NOMOGRAPHY) and that method can also take care of relationships involving four or more variables.

While in general the aim of graphic methods of this type is merely to do simply and rapidly what could otherwise be done at the cost of more time and labour by arithmetic, algebra or measurement, in some cases the alternatives are so laborious as to be prohibitive. For instance, graphic analysis makes clear the nature of the solution of certain differential equations which cannot be solved in terms of elementary functions. In certain cases, moreover, mechanical methods whose basis is mainly graphic provide many of the numerical results which are the real reason for desiring to solve the differential equation.

Limitations of Graphic Methods.—The unquestionable value of graphic methods if properly handled has been sometimes obscured by cases in which they have not accomplished the purpose intended as well as other methods, or more skilful use of graphic methods, would have done. If a proposed method of presenting the results of a statistical investigation does not make the results clearer to the audience than if the results had been presented merely in words or in a table, the method should be discarded or improved. If a proposed scheme for graphic computation is less accurate than is necessary or less rapid in actual use than other methods, the true friend of graphic methods will be the first to turn to some other mode of computation.

A serious difficulty with graphic computations is the existence in most charts of regions in which the results have a larger margin of error than is acceptable. If, for instance, a point is to be located by the intersection of two arcs, the location is accurate if the arcs are nearly perpendicular, but if they run in about the same direction, a slight error in one of the radii or one of the centres will shift the point of intersection to a much greater extent. This difficulty can sometimes be avoided by using a second chart modified by change of scale or otherwise so as to shift the region of inaccuracy. The careful maker and user of charts always bears in mind this possibility of serious error, and determines the probable size of such errors, either by experiment or by analysis of his methods and formulas. (See PROBABILITY AND ERROR; STATISTICS.)

See J. **Lipka,** *Graphical and Mechanical Computation* (New York, 1918); R. W. Burgess, *Introduction to the Mathematics of Statistics* (Boston, 1927). (*R.* W. B.)

GRAPHITE, a mineral species consisting of the element carbon crystallized in the rhombohedral system. Chemically, it is thus identical with the cubic mineral diamond, but between the two there are very wide differences in physical characters. Graphite is black and opaque, whilst diamond is colourless and transparent; it is one of the softest (H.=1) of minerals, and diamond the hardest of all; it is a good conductor of electricity, whilst diamond is a bad conductor. The specific gravity is 2·2, that of diamond is 3·5. Further, unlike diamond, it never occurs as distinctly developed crystals, but only as imperfect six-sided plates and scales. There is a perfect cleavage parallel to the surface of the scales, and the cleavage flakes are flexible but not elastic. The material is greasy to the touch, and soils everything with which it comes into contact. The lustre is bright and metallic. In its external characters graphite is thus strikingly similar to molybdenite.

The name graphite, given by A. G. Werner in 1789, is from the Greek γράφειν, "to write," because the mineral is used for making pencils. Earlier names, still in common use, are plumbago and black-lead, but since the mineral contains no lead these names are singularly inappropriate. Plumbago (Lat. *plumbum,* lead) was originally used for an artificial product obtained from lead ore, and afterwards for the ore (galena) itself; it was confused both with graphite and with molybdenite. The true chemical nature of graphite was determined by K. W. Scheele in 1779.

Graphite occurs mainly in the older crystalline rocks—gneiss, granulite, schist and crystalline limestone—and also sometimes in granite; it is found as isolated scales embedded in these rocks, or as large irregular masses or filling veins. It has also been observed as a product of contact-metamorphism in carbonaceous clay-slates near their contact with granite, and where igneous rocks have been intruded into beds of coal; in these cases the mineral has clearly been derived from organic matter. The graphite found in granite and in veins in gneiss, as well as that contained in meteoric irons, cannot have had such an origin. As an artificial product, graphite is well known as dark lustrous scales in grey pig-iron, and in the "kish" of iron furnaces; it is also produced artificially on a large scale, together with carborundum, in the electric furnace (see below). The graphite veins in the older crystalline rocks are probably akin to metalliferous veins and the material derived from deep-seated sources; the decomposition of metallic carbides by water and the reduction of hydrocarbon vapours have been suggested as possible modes of origin. Such veins often attain a thickness of several feet, and sometimes possess a columnar structure perpendicular to the enclosing walls; they are met with in the crystalline limestones and other Laurentian rocks of New York and Canada, in the gneisses of the Austrian Alps and the granulites of Ceylon. Other localities which have yielded the mineral in large amount are the Alibert mine in

Irkutsk, Siberia, the Borrowdale mine in Cumberland and the Santa Maria mines of Sonora, Mexico.

Graphite is used for the manufacture of pencils, dry lubricants, grate polish, paints, crucibles and for foundry facings. The material as mined usually does not contain more than 20 to 50% of graphite: the ore has therefore to be crushed and the graphite floated off in water from the heavier impurities. Even the purest forms contain a small percentage of volatile matter and ash. The Cumberland graphite, which is especially suitable for pencils, contains about 12% of impurities. (L. J. S.)

Artificial Manufacture.— The alteration of carbon at high temperatures into a material resembling graphite has long been known. In 1893 Girard and Street patented a furnace and a process by which this transformation could be effected. Carbon powder compressed into a rod was slowly passed through a tube in which it was subjected to the action of one or more electric arcs. E. G. Acheson, in 1896, patented an application of his carborundum process to graphite manufacture, and in 1899 the International Acheson Graphite Co. was formed, employing electric current from the Niagara Falis. Two procedures are adopted: (1) graphitization of moulded carbons, (2) graphitization of anthracite *en masse*. The former includes electrodes, lamp carbons, et~.Coke, or some other form of amorphous carbon. is mixed with a little tar, and the required article moulded in a press or by a die. The articles are stacked transversely in a furnace, each being packed in granular coke and covered with carborundum. At first the current is 3,000 amperes at 220 volts, increasing to 9,000 amperes at 20 volts after 20 hours. In graphitizing en masse large lumps of anthracite are treated in the electric furnace. A soft, unctuous form results on treating carbon with ash or silica in special furnaces, and this gives the so-called "deflocculated" variety when treated with gallotannic acid. These two modifications are valuable lubricants. The massive graphite is very easily machined and is widely used for electrodes, dynamo brushes, lead pencils and the like.

GRAPHS: see STATISTICS: *Graphs*.

GRAPPA, MONTE, a mountain or rather mountainous group between the rivers Brenta and Piave (Italy), which was the scene of extremely heavy fighting during World War I (*q.v.*) between November 1917 and October 1918.

GRAPTOLITES, a group of organisms now extinct, from the fossil remains of which it is impossible to state with certainty what they were, though it is usually considered that they were Coelenterata (*q.v.*). The remains are found, often in great abundance, in Palaeozoic rocks. They begin in the Cambrian strata and die out in the Devonian. They occur for the most part as flattened carbonized films in shales or mudstones which were deposited in the Palaeozoic seas; but sometimes they occur in limestone, in which case the skeleton may retain its original nature. This was composed of chitinous (horny) material, and in the case of specimens embedded in limestone the matrix can be dissolved away, leaving it in a suitable condition for examination.

The general appearance of graptolites is that of rods or twigs which may be branched or simple, or of leaf-like or cone-like structures. One or both margins of each twig are regularly toothed or serrate. These remains represent the common skeleton of a colony of small animals which were linked together by a stalk; and each tooth along the notched edge of the skeleton marks the site of a small skeletal cup which during life contained one individual of the colony. The general effect of a graptolite skeleton is similar to that of some of the modern hydroids (see HYDROZOA), but the two structures are not fully comparable and there is no conclusive reason for supposing that the graptolites were hydroids.

In a graptolite such as *Dimorphograptus* (fig. 1, A) the skeleton consists of a small helmet-like structure (the *sicula*), from the apex of which there extends a long hollow thread (the nema). On either side of this thread. and enclosing it, lies the main part of the skeleton, consisting of a row of cups (thecae) on each side, linked up by a common canal In the part nearest to the sicula, however, there is only one row of cups. The sicula is the skeleton of the individual which originally founded the colony, and the later individuals inhabiting the thecae were produced from this by budding; it is a hollow cone consisting of a delicate apical portion continuous with the nema, and of a stronger proximal part which is prolonged into a spine pointing in the opposite direction from the nema. A sicula with the first few thecae of the colony of a similar form is shown enlarged in fig. 1, B.

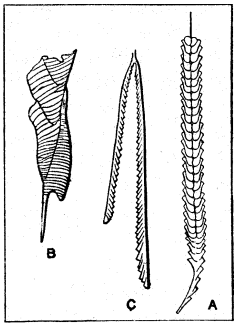

FIG. 1.— THE STRUCTURE OF GRAPTOLITES AS DEDUCED FROM SKELETAL REMAINS FOUND IN THE PALAEOZOIC ROCKS
A. Portion of a graptolite with a double row of thecae (*Dimorphograptus*); the sicula here is at the lower end of the figure. B. A much enlarged sicula of *Monograptus*. C. *Didymograptus;* the sicula is at the upper end of the figure, where the two branches meet

Other graptolites differ from *Dimorphograptus* in a variety of ways. The general form of the colony may be quiteunlikethat of the one illustrated. The degree and mode of branching also varies, as well as the shape and arrangement of the thecae and the manner in which they are related to the sicula. In *Didymograptus,* for instance (fig. 1, C), there are two branches united at the sicula-end, with a single row of thecae on each; and the mouth of the sicula points in the same direction as do those of the thecae. Certain graptolites have been found in which a number of stems bearing siculae and thecae radiate from a central body to which they are attached. A complex system such as this was founded by a single sicula from which at first grew a single theca-bearing stem; this was attached at the end farther from the sicula to a little square plate which after a time became a vesicle and probably served as a float for the colony (fig. 2, A). Round the end of the first stem, where it was attached to the float, grew short stalks, each of which was enclosed in a protective capsule and which produced a number of siculae; some of these became free from the stalk and went away to found new colonies; others grew *in situ* into theca-bearing stems and in this manner gave the parent system its radial structure (fig. 2).

FIG. 2.—TWO STAGES IN FORMATION OF COMPLEX GRAPTOLITE SYSTEM
F, float; N¹, stem of first sicula; S¹, first sicula; S², S³, siculae of successive generations

It is impossible to deal in so short an article with the evolution of the graptolites, but it may be stated that a good deal is known about the main changes which took place during the history of the group. From branched forms there arose by reduction unbranched kinds; the direction of the outgrowth of thecae from the sicula was originally that of *Didymograptus,* and became converted by degrees into the state of affairs found in *Dimorphograptus;* the shape and relation to one another of the thecae showed progressive changes in various stocks; and so on. The knowledge which has been gained of the direction of evolution in graptolites collected from series of strata of known succession has proved extremely useful in determining the succession of deposits which contain a similar series of graptolites whose succession was not known.

We do not know what habit of life was adopted by the graptolites; many of them appear to have been pelagic organisms but others may have been attached to foreign surfaces in one way or another.

GRASLITZ: see KRASLICE.

GRASMERE, village, parish and lake of Westmorland, in the heart of the English Lake District. Population (1931) 988. The village lies near the head of the lake, on the river Rothay and the Keswick-Ambleside road, 12½ mi. from Keswick

and 4 from Ambleside. The scenery is very beautiful; the valley of Grasmere and Rydal Water is well wooded, while on its eastern flank there rises boldly the range of hills which includes Rydal Fell, Fairfield and Seat Sandal, and, farther north, Helvellyn. On the west side are Loughrigg Fell and Silver How. The village has become a favourite centre for tourists, but preserves its picturesque and sequestered appearance. In a house still standing, William Wordsworth lived from 1799 to 1808, and it was subsequently occupied by Thomas de Quincey.

Wordsworth's tomb, and that of Coleridge, are in the churchyard of the ancient church of St. Oswald, which contains a memorial to Wordsworth with an inscription by John Keble. A festival, procession and general holiday are held on Aug. 5. This festival of the Rushbearing is of ancient origin. From 1894 to 1934 Grasmere was an urban district.

The lake of Grasmere is just under 1 m. in length, and has an extreme breadth of 766 yards. A ridge divides the basin from north to south, and forms an island about the middle.

GRASS AND GRASSLAND. Since the grasses (*q.v.*) constitute one of the most widespread of flowering plants on most farms, the land not actually cultivated will either be in grass or will revert naturally to grass in time if left alone. This pasture land has always been an important part of the economy of the farm; but with the advent of "cheap corn" its importance has been increased, and much more attention has been given to the study of the different species of grass, together with their characteristics and the improvement of a pasture generally, as well as to the "laying down" of arable land to grass where tillage farming has not paid. Since the World War many of the scientific institutions connected with agricultural research (*q.v.*) have therefore been engaged in experimenting with, and developing, individual pasture plants or pastures as a whole. The improvement of pasture lands has been followed by a corresponding increase of live stock of all kinds, coupled with a reduction in the working expenses as compared with arable farming.

GREAT BRITAIN

Even on wholly arable farms there are usually certain courses in the rotation of crops devoted to grass (or a corresponding leguminous crop, such as clover). Thus the Norfolk four-course rotation is corn, roots, corn, clover; the Berwick five-course is corn, roots, corn, grass, grass; the Ulster eight-course, corn, flax, roots, corn, flax, grass, grass, grass; and so on, to the point where the grass remains down for five years, or is left indefinitely.

Permanent grass may be grazed by live stock and classed as pasture pure and simple, or it may be cut for hay. In the latter case it is usually classed as "meadow" land, and often forms an alluvial tract alongside a stream, but as grass is often grazed and hayed in alternate years, the distinction is not a hard and fast one. Two classes of pasturage, however, temporary and permanent, may be distinguished. But the latter again consists of two kinds, the permanent grass natural to land that has never been cultivated, and the pasture that has been laid down artificially on land previously arable and allowed to remain and improve itself in the course of time. Thus, the existence of ridge and furrow on many old pastures in Great Britain shows that they were cultivated at one time.

Often a newly laid down pasture will decline markedly in thickness and quality about the fifth and sixth year, and then begin to thicken and improve year by year afterwards. This is usually attributed to the fact that the unsuitable varieties die out, and the "naturally" suitable varieties only come in gradually. This trouble can be largely prevented, however, by a judicious selection of seed, and by subsequently manuring with phosphatic manures, with farmyard or other bulky "topdressings," or by feeding sheep with cake and corn over the field.

Grasses and Clovers.—All the grasses proper belong to the natural order *Gramineae,* to which order also belong all the "corn" plants cultivated throughout the world, also many others, such as bamboo, sugar-cane, millet, rice, etc., etc., which yield food for mankind. Of the grasses which constitute pastures and hayfields, over 100 species are classified by botanists, with many varieties in addition, but the majority of these, though often forming a part of natural pastures, are worthless or inferior for farming purposes. The grasses of good quality which should form a "sole" in an old pasture and provide the bulk of the forage on a newly laid down piece of grass are only about a dozen in number (see below), and of these there are only some six species of the very first importance and indispensable in a "prescription" of grass seeds intended for laying away land in temporary or permanent pasture. Dr. W. Fream caused a botanical examination to be made of several of the most celebrated pastures of England, and, contrary to expectation, found that their chief constituents were ordinary perennial rye-grass and white clover. Many other grasses and legumes were present, but these two formed an overwhelming proportion of the plants.

In ordinary usage the term grass, pasturage, hay, etc., includes many varieties of clover and other members of the natural order *Leguminosae* (*q.v.*) as well as other "herbs of the field," which, though not strictly "grasses," are always found in a grass field, and are included in mixtures of seeds for pasture and meadows. The following is a list of the most desirable or valuable agricultural grasses and clovers, which are either actually sown or, in the case of old pastures, encouraged to grow by draining, liming, manuring and so on:—

Grasses

Alopecurus pratensis	Meadow foxtail.
Anthoxanthum odoratum	Sweet vernal grass.
Arrhenatherum avenaceum	Tall oat-grass.
Avena flavescens	Golden oat-grass.
Cynosurus cristatus	Crested dogstail.
Dactylis glomerata	Cocksfoot.
Festuca duriuscula	Hard fescue.
Festuca elatior	Tall fescue.
Festuca ovina	Sheep's fescue.
Festuca pratensis	Meadow fescue.
Lolium italicum	Italian rye-grass.
Phleum pratense	Timothy or catstail.
Poa pratensis	Smooth meadow-grass.
Poa trivialis	Rough meadow-grass.

Clovers, etc.

Medicago lupulina	Trefoil or "Nonsuch."
Medicago sativa	Lucerne (Alfalfa).
Trifolium hybridum	Alsike clover.
„ pratense	Broad red clover.
„ pratense, perenne	Perennial clover.
„ incarnatum	Crimson clover or "Trifolium."
„ procumbens	Yellow Hop-trefoil.
„ repens	White or Dutch clover.
Achillea millefolium	Yarrow or Milfoil.
Anthyllis vulneraria	Kidney vetch.
Lotus major	Greater Birdsfoot Trefoil.
Lotus corniculatus	Lesser „ „
Carum petroselinum	Field parsley.
Plantago lanceolata	Plantain.
Cichorium intybus	Chicory.
Poterium officinale	Burnet.

The predominance of any particular species is largely determined by climatic circumstances, the nature of the soil and the treatment it receives. In Great Britain, in limestone regions sheep's fescue has been found to predominate; on wet clay soil the dog's bent (*Agrostis canina*) is common; continuous manuring with nitrogenous manures kills out the leguminous plants and stimulates such grasses as cocksfoot; manuring with phosphates stimulates the clovers and other legumes; and so on.

The Best Grasses.—As to the best kinds of grasses to sow in making a pasture out of arable land, experiments at Cambridge, England, have demonstrated that of the many varieties offered by seedsmen only a very few are of any permanent value. A complex mixture of tested seeds was sown, and after five years an examination of the pasture showed that only a few varieties survived and made the "sole" for either grazing or forage. These varieties in the order of their importance were:—

Cocksfoot	26
Perennial rye-grass	16
Meadow fescue	13
Hard fescue	9
Crested dogstail	8

Timothy	6
White clover	4
Meadow foxtail	2

The figures represent approximate percentages

Before laying down grass it is well to examine the species already growing round the hedges and adjacent fields. An inspection of this sort will show that the Cambridge experiments are very conclusive, and that the above species are the only ones to be depended on. Occasionally some other variety will be prominent, but if so there will be a special local reason for this On the other hand, many farmers when sowing down to grass like to have a good bulk of forage for the first year or two, and therefore include several of the clovers, lucerne, Italian rye-grass, evergreen rye-grass, etc., knowing that these will die out in the course of years and leave the ground to the more permanent species.

There are also several mixtures of "seeds" (the name given in agriculture to grass seed mixtures) which have been adopted with success in laying down permanent pastures in some localities.

Total lb. per acre	30	40	17	40	30	40

Arthur Young more than 100 years ago made out a mixture to suit chalky hillsides; Faunce de Laune (Sussex) in more recent times was the first to study grasses and advocated leaving out rye-grass of all kinds; Lord Leicester adopted a cheap mixture suitable for poor land with success; Mr. Elliot (Kelso) introduced many deep-rooted "herbs" in his mixture with good results. Typical examples of such mixtures are given above.

Temporary Pastures.— These are commonly resorted to for rotation purposes, and in these the bulky fast-growing and short-lived grasses and clovers are given the preference. Three examples of temporary mixtures are given below.—

	One year	Two years	Three or four years
Italian rye-grass . . .	14	10	6
Cocksfoot	2	4	6
Timothy . . .		2	3
Broad red clover . .	8	5	
Alsike . .	3	2	
Trefoil . . .	3	2	2
Perennial rye-grass . . .		5	10
Meadow fescue		2	2
Perennial red clover .		2	
White clover		1	
Meadow foxtail		1	2
Total lb. per acre	30	36	40

Where only a one-year hay is required, broad red clover is often grown, either alone or mixed with a little Italian rye-grass, while other forage crops, like trefoil and trefolium, are often grown alone.

In recent investigations wild White clover—botanically similar to ordinary White Dutch clover (which is usually included in grass seed mixtures)—has come very much to the front, and now a small amount (from half to a whole pound) of seed per acre is often included in those mixtures intended to remain down for several years. It improves the feeding "quality" of pastures very much, does not die out in a year or two, and enriches the soil with nitrogenous compounds, so that if and when the grass land is ploughed up for corn growing again after a few years, the fertility is greatly improved. Several other varieties of clover are also being experimented with besides those mentioned in the above prescriptions, such as Montgomeryshire late flowering red clover, Cornish "marl-grass," subterranean clover and so on, while many grasses are also being further developed.

Fertilizers.— Apart from the selection and improvement of the individual plants which compose a pasture or hay field there is the general treatment by manuring. The grazing of land for generations by live stock, and the continuous selling off of beef, mutton, wool, milk, etc., reduces the fertility of the soil, and so in most cases a return in the shape of manure is desirable. The older and more usual way of renovating the fertility of grasslands was to feed the cattle or sheep thereon with an allowance of feeding cakes or corn of some sort. This enriched their manure and so helped to keep up the fertility of the land; but it has now been repeatedly demonstrated that judicious chemical manuring of either an old or a new grass field can increase the crop yield immensely. (*See* FERTILIZERS and FEEDING STUFFS.)

The most suitable chemicals are those of a phosphatic nature such as basic slag, North African phosphate, bone superphosphate, etc. The effect of these has been most satisfactory in the great majority of cases, when applied at the rate of from four to ten cwt. per acre, and repeated at intervals of, say, five years. On the lighter class of soils an addition of a potassic manure has often helped to get good results. In the Rothamsted experiments continuous manuring with "mineral manures" (no nitrogen) on an old meadow has reduced the grasses from 71 to 64% of the whole, while at the same time it has increased the Leguminosae from 7% to 24%. On the other hand, continuous use of nitrogenous manure in addition to "minerals" has raised the grasses to 94% of the total and reduced the legumes to less than 1%.

Besides manuring so as to increase the yield of food, and thus enable more live stock to be carried, there have been introduced better methods of grazing. It has been found that if a pasture is allowed to run to seed there is a loss in food economy, the stalks and seeds being of inferior value; to prevent the development of these the land should be heavily stocked so as to keep the grass grazed well down, and thus fresh leafy growth is encouraged instead of seed stalks. An old pasture is liable to show rough growth in spots which the animals do not readily eat over; such parts are improved by cutting over with a mowing machine, while extra phosphatic top-dressing should be applied thereto.

Rotation Grazing.—A rotation of grazing is also an improved method, whereby the stock is moved from field to field, so that each field is hard grazed in turn and then shut up till a fresh lot of leaves spring up. Some investigators in this line have divided up their fields into small paddocks to be grazed in rotation, while an intensive, form of this principle has long been practised in the Channel islands, Denmark, and to a less extent in some other European countries. This consists in tethering the animals to be grazed singly to pegs or corkscrew pins fixed in the ground, with an allowance to each of several yards of rope or chain attached to a neck-band Each animal eats off a circular patch of grass very closely, and is then moved on to a fresh spot. It involves a large amount of personal attention on the part of attendants as compared with ordinary grazing, but on the other hand the growth of the grass is controlled and made the most of

In Great Britain a heavy clay soil is usually preferred for

pasture, both because it takes most kindly to grass and because the expense of cultivating it makes it unprofitable as arable land when the price of corn is low. On light soil the plant frequently suffers from drought in summer, the want of moisture preventing it from obtaining proper root-hold. On such soil the use of a heavy roller is advantageous, and indeed on any soil except heavy clay frequent rolling is beneficial to the grass, as it promotes the capillary action of the soil-particles and the consequent ascension of ground water. In addition the grass on the surface helps to keep the moisture from being wasted by the sun's heat. Frequent harrowing on heavy clay soil is also beneficial.

The graminaceous crops of western Europe generally are similar to those enumerated. Elsewhere in Europe are found certain grasses, such as Hungarian brome, which are suitable for introduction into the British Isles. The grasses of the American prairies also include many plants not met with in Great Britain. Some half-dozen species are common to both countries: Kentucky "blue-grass" is the British Poa *pratensis;* couch grass (*Triticum repens*) grows plentifully without its underground runners; bent (Agrostis vulgaris) forms the famous "red-top," and so on. But the American buffalo-grass, the Canadian buffalo-grass, the "bunch" grasses, "squirrel-tail" and many others which have no equivalents in the British Isles, form a large part of the prairie pasturage. There is not a single species of true clover found on the prairies, though cultivated varieties can be introduced.

The separate articles on HAY; LUCERNE (Alfalfa); CLOVER and the like, may be consulted as well as the articles on ROTATION OF CROPS; CULTIVATION; WEED DESTRUCTION, etc. For grass cultivation of lawns and playing greens, see GREEKS.

BIBLIOGRAPHY.—J. F. Armstrong, British Grasses and their Employment in Agriculture (Cambridge, 1917); R. G. Stapledon and J. A. Hanley, Grass Land: Its Management and Improvement (Oxford, 1927), contains a full, selected bibliography; W. J. Malden, Grassland Farming (1924). All three works are illustrated.

UNITED STATES

In the United States, the region from 95° W. to the foothills of the Rocky mountains was originally occupied by native grasses. This almost treeless area which extends northward to Saskatchewan and Alberta is still occupied by native grasses, except where it has been placed under cultivation. The eastern part of this belt, including Iowa and Illinois, has an annual rainfall of 20 to 30 in. and is largely cultivated; tall native grasses are replaced by others, mostly European. The most extensive of the smaller areas of natural grassland are between the Rocky mountains and Pacific coast ranges. In arctic northern Canada and Alaska the grazing lands or tundra, mostly of mosses and lichens, with a few hardy summer grasses and woody plants, are useful only for reindeer and wild animals.

In South America are several well defined, extensive grass areas. In the central plateau are two large natural grasslands, the Orinoco llanos (Venezuela) and the Argentine pampas. In the higher sections of eastern and southern Brazil is considerable grassland between forests. Many introduced species have somewhat replaced the native grasses.

Mexico and Central America have no well defined extensive grasslands.

Meadows and Hay Plants.—In humid regions the meadows or hay fields are largely seeded to tame grasses or mixtures of grasses and legumes. Mixtures ordinarily yield better and more palatable hay than pure cultures and they are preferred because: production is more uniform and permanent with both short and long lived plants; loss through insects, disease and climate is less; inclusion of some low-growing, turf-forming grasses with the taller species results in much better pasture if the aftermath is grazed or if the meadow is converted into a pasture; legumes stimulate growth and probably increase the protein content of the grasses.

The number of seed mixtures for meadows is legion. Generally, however, complex mixtures are not popular in America and consequently there is less justification for complexity in mixtures for meadows than for pastures. Where hay is the crop and plants of varying habits are represented in the mixture they must mature at approximately the same time. Reliable mixtures (1) the standard for north-east United States and south-east Canada, timothy and red clover, sometimes with alsike clover and redtop added. For low, wet lands, redtop and alsike alone; (2) in the southern part of the above region where timothy does not succeed, particularly on dry uplands, orchard grass, tall oat grass and alsike are best; (3) in the semiarid or subhumid regions farther west, brome grass (Bromus *inermis*) and slender wheat grass (*Agropyron tenerum*) are most reliable, and where alfalfa thrives it should be included.

Hay Plants.—Timothy is a good hay plant, but nearly all timothy and clover hay are from rotations. The most common of these is corn, oats, wheat, followed by two years of timothy and clover, these being sown in the wheat. The usual rate of seeding is timothy, 12 lb.; red clover, 8 pounds. When alsike and redtop are added the quantities are 2 and 4 lb., respectively.

In the Gulf States the principal hay is Johnson grass (Sorghum *halepense*). On rich, black soils it usually grows spontaneously, excluding other plants. Because of the difficulty of eradicating it, it is rarely seeded intentionally. Mixtures of Johnson grass and clover or other legumes are impractical except when the meadow is plowed up to stimulate a renewed growth.

In the central West and on irrigated lands in the more arid western States, alfalfa is the chief and often the only hay crop. It is also the main one in Argentine. Where alfalfa succeeds well there is no other hay plant so productive and generally desirable. It is very palatable and nutritious and several cuttings may be made yearly. Seeding should be on well prepared soil at 15 to 25 lb. per acre.

On the Pacific coast and in some interior localities cereal crops (wheat, oats, barley and rye) are often cut for hay. Certain annual grasses and legumes are also important. Among these are millets, sorghum, Sudan grass, cowpeas, soybeans, vetches and field peas. Of the hay harvested in the United States in 1919, 26% was timothy; 19% alfalfa; 17% clovers; 16% native or wild plants; 5% sorghums and Sudan grass; all other hay plants produced 17%. Since 1919 timothy has declined and alfalfa has increased in importance.

Fertilizers.—The use of fertilizers on meadows in the humid region is undoubtedly warranted, although where hay is part of a general rotation the grain crops are usually fertilized. In this way the grass benefits only from the residual effect. The average yield of meadows in north-east United States and south-east Canada is about 1.3 tons per acre. With fertilizers, yields of 2.5 to 4 tons per acre have been maintained for years. Nitrogen fertilizers alone encourage grasses at the expense of legumes and should rarely be used indefinitely on a mixed meadow without phosphate and potash. Brooks recommends for hay meadows: nitrate of soda, 150 to 250 lb.; basic slag meal, 300 to 400 lb.; high grade sulphate of potash, 75 to 100 pounds. On peat and certain sandy soils potash is particularly effective. On clay or loam of moderate fertility where clover is in the mixture, phosphate of some kind is almost essential. For alfalfa, soil acidity is corrected by lime.

Pastures and Pasture Plants.—Pastures are land areas covered with grass and other plants for grazing. Until the last decade American agricultural agencies devoted little study to them. In the United States about 55% of all land is used for grazing. Of this 1,055,000,000 ac., only a little less than one-tenth is arable land in rotation or permanent pastures like those of the British Isles and western Europe. The remainder is arid grassland and desert shrub-land too dry for cultivation, or forest and cut-over or burned-over land not suited for pastures until improved. Probably 50% of the sustenance of American live stock is obtained from pastures. Generally American pasture feed costs approximately one-eighth as much as that from harvested crops. Pastures are valuable also on hillside lands in preventing soil erosion. True grasslands comprise improved and natural pastures (called ranges when extensive). The acreage of natural pastures is about ten times that of the tame, but their unit carrying capacity is only one-fifth as great. They are mostly in the western half of the United States, excluding, however, the Pacific slope. In the

semiarid or Great Plains region are the "short grasses," the most important of which are buffalo (Buchloe dactyloides), and grama grasses (*Bouteloua sp.*) in the north and the grama grasses and mesquite (*Hilaria* sp.) in the south. Mixed with these are taller needle grasses (*Aristida sp.*), and some bluestem (Andropogon sp.), and wheat-grass (*Agropyron* sp.). Farther west in the more arid sections are bunch grasses, mostly wheat-grass, fescue and brome with some salt grasses in alkaline areas. Humid south-eastern States still have native grasses, although practically all grassland in the eastern or humid section is made up of introduced grasses. These natural pastures in the south-eastern States are mostly cut-over or burned-over forest lands now carpeted with the broom sedges (*Andropogon* sp.) and panic and wire grasses.

In 1925 about one-third of the arable land was in permanent pasture. Probably $\frac{1}{4}$ to $\frac{1}{3}$ of a farm of average size favourable to live stock could be profitably devoted to permanent pasture.

Grasses. — The following discussion of pasture plants and seed mixtures applies to the humid regions. Natural pastures in arid and semi-arid regions remain practically unimproved. Probably 75% of pasture herbage is grasses. (In common usage any fine-stemmed hay or pasturage plant such as clover, alfalfa, lespedeza and vetch, is called grass. This, however, cannot be justified.) In America north of Mexico there are some 1,500 species of true grasses. Many of these are in natural pastures, but only a few are important, and in the improved pastures less than a dozen grasses are generally found. These are in the order of their importance: Kentucky bluegrass, Bermuda grass, timothy, redtop, Rhode Island bent, carpet grass, Canada bluegrass, orchard grass, Johnson grass and crab grass. On well drained, fertile Northern soils, Kentucky bluegrass and white clover are predominant. On wet soils in the interior, redtop and alsike clover are preferred to bluegrass and white clover. Redtop and the other species of Agrostis, such as Rhode Island bent and creeping bent are also prominent on less fertile New England coastal soils. Orchard grass thrives on drier and shaded soils, and in parts of Virginia is valued above Kentucky bluegrass and redtop. South of Virginia, Bermuda grass is the premier pasture grass on uplands and on silt and clay coastal soils, while carpet grass is the best for moist sandy soils. Both usually grow with lespedeza, or Japan clover. Canada bluegrass grows mostly in southern Canada and northern United States on poorer soils. Kentucky bluegrass is valued most on limestone soils which are also rich in phosphates, as in Kentucky.

Legumes. — Include clovers, alfalfa, melilot, lespedeza, yellow trefoil, etc. The most important of these for pasture are white, red and alsike clover and lespedeza. These are almost always mixed with one or more grasses for grazing. The first three are largely confined to the northern half of the region, although white clover thrives on better soil types even near the Gulf of Mexico. Lespedeza (Lespedeza striata) is an annual which, however, reseeds itself and thus serves as a perennial. Although introduced, it is abundant in uncultivated fields of all the southern States west to Texas and adds immeasurably to the summer pastures. Bur clover and yellow trefoil, both species of Medicago, are useful southern winter legumes. Alfalfa in pure stands is often pastured, especially with hogs; but it is not good for cattle and horses as it often causes bloat (hoven). Melilot or sweet clover is gaining favour as temporary pasture.

Piper roughly estimates the relative value of the various pasture grasses and legumes as follows: — Kentucky bluegrass, 35; while clover, 10; Bermuda grass, 8; timothy, 7; redtop, 7; red clover, 4; alfalfa, 4; Rhode Island bent, 4; carpet grass, 3; Alsike clover, 3; Canada bluegrass, 3; orchard grass, 2; Johnson grass, 2; Lespedeza, 2; crab grass, 2; all others, 2. While most of these are European there are several grasses considered of first importance in English pastures, such as Italian and perennial rye grasses which are seldom found in America.

Pasture Mixtures. — Quick growing but less permanent grasses are often added to furnish pasturage while slower growing grasses are forming a turf. The complex mixtures often recommended in England are not profitable in America. Some mixtures that have been found satisfactory under various climatic and soil conditions for humid grasslands are as follows (the northern section includes that part of the United States north of the south boundaries of Virginia and Tennessee) :—

	Northern section				Southern section	
	Well drained, fertile soils	Poor, upland soils	Heavy wet soils in the interior	Sandy soils of the coast	Clay and silt soils	Moist, sandy or sandy loam soils
	Lb.	Lb.	Lb.	Lb.	Lb.	Lb.
Kentucky bluegrass	10	..	..	..	..	..
Redtop	4	5	8	6	..	..
Timothy	6	..	6	..	..	..
Orchard grass (cocksfoot)	4	6	..	..	..	..
