Russia has only a few island possessions. The Aleutian archipelago and Alaska were sold to the United States in 1867, and the Kurile Islands ceded to Japan in 1875. The Baltic Islands with exception of those at the mouth of the Neva were ceded after the 1917 revolution. The Commander Islands off Kamchatka, the Shantar Islands near the Pacific coast and the Island of Sakhalin north of lat. 50° N. remain Russian. The chief islands off the Arctic coast belonging to Russia are Kolguev Island, Novaya Zemlya (with Vaygach Island), the Nicholas II. group north of the Taimyr peninsula, the New Siberia Islands (north of Laptev Sound) and Wrangel Island. Attempts on the part of V. Stefans-

son in 1921-22 to establish a British claim to Wrangel Island met with no official support in Britain or Canada, and in August 1924, the Russian flag was hoisted on the island. Franz Josef land is not included among Russian claims and is at present a *terra nullius*; Spitsbergen and Bear Island were recognized as being under Norwegian sovereignty in 1920.

GENERAL STRUCTURE

Russia is a very large region of vast plains characterised by climatic extremes in eastern Europe, western and northern Asia. Within its limits Europe and Asia overlap into one another in various ways and even the Ural Mountains are only an incomplete boundary between the European section, in which southward drainage (to the Black and Caspian Seas) is more important and the Asiatic section, which drains largely to the Arctic, though some rivers flow into the Aral Sea.

The fundamental feature of Russia is the great platforms, once in all probability a continuous platform, of Archaean and Palaeozoic rocks, the latter still horizontal over enormous areas though folded, for example, in the Urals. Russia, therefore, apart from the border lands of the Pacific, Mongolia, Eastern Turkestan, Afghanistan, Persia and Armenia, shows far less mountain folding than do western and southern Europe and Central Asia, though the foldings of the latter have to some extent influenced the physical geography of the Russian plains and have penetrated into them to form the Urals.

The fold mountains of central Asia on the whole become continuously younger as we proceed from the region of Lake Baikal southwestwards to the Pamirs and the Hindu Kush. Range after range runs, more or less, west to east, each successive one tending to extend farther west than that to the north of it. These ranges are discussed in the general article on Asia (*q.v.*) and it is necessary here rather to refer to their influence on the northern platform. The ranges called Sayan (with basaltic lavas in the east), Tannu-Ola and Altai belong to ancient foldings, the last being mainly Hercynian or Permo-Carboniferous, according to prevailing opinion. These old ranges are deeply dissected by what seem to be erosion-valleys with steep sides and alluvial bottoms (old lake floors) on which settlements have been made; some lakes still remain. Lake floors abound on the surface of Asiatic Russia illustrating the fact that in earlier post glacial times lakes seem to have covered vast areas in this region. To the south of the Altai mountains is the great physical feature called the Dzungarian Gate between the Altai and the Tian Shan. This is a region of very varied topography in which, in spite of local heights, relatively low land (some of it less than 1,500 ft. above sea-

level) projects from the lower western lands far to the east between the mountain ranges named. Towards the west side of the Dzungarian region lies lake Balkhash, now without outlet but still fresh.

Natural Divisions.—On the south side of the Dzungarian Gate rises sharply the immense range of the Tian Shan, far surpassing the Alps in extent and differing markedly from them in character. Their general direction is west-south-west to east-north-east and they rise sharply from the high plains along their flanks with much conspicuous faulting. Westwards they branch forming almost independent chains with some northward deflection. Suess has suggested that their structural features may be traceable ultimately through western Asia via the Turgai steppe to the Urals as well as south of Aral to the Caucasus. The Urals lie approximately along long. 60° E., and far to the east the next conspicuous feature of northern Russia is the edge of the Yenisei plateau approximately along long. 90° E. These two lines, probably related to one another in origin, help to divide north Russia into natural regions,

- (a) Northern European Russia west of the Urals.
- (b) The Urals themselves.
- (c) The great lowland of the Ob.
- (d) The plateau east of the Yenisei and west of the Lena to which may be added
- (e) The region east of the Lena dominated in the main by fold mountains belonging to the border zone of the Pacific ocean.

Northern European Russia possesses large areas of unfolded Palaeozoic rocks lying on an ancient (Archaean) floor of granites, gneisses, and syenites which emerges on the west in Finland, the Kola peninsula, and Scandinavia. Along the line from the White Sea to the Gulf of Finland (via lakes Ladoga and Onega) the ancient floor becomes covered by Palaeozoic rocks, Devonian, Carboniferous and Permian succeeding one another eastwards towards the Northern Dwina. The upper Permian beds have yielded *Glossopteris* and other plants characteristic of "Gondwana Land" and animal remains like those of the corresponding formation in S. Africa. Beyond that river the lower levels are mainly alluvials but there are glacial Pleistocene deposits between the river lines.

The basin of the Petchora is divided from the land farther west by a minor fold belt bringing up Devonian and some crystalline schist along the line of the Timan hills that may be traceable as a branching of the mid-Urals north-westward to Cape Kanin. The whole region has a very low relief and is consequently unprotected from Arctic cold. Apart from the Timan hills this region is below the 600 foot contour. Its lakes are discussed in the article on Europe (*q.v.*). Its chief rivers are the Petchora for which Strelbitsky gives a length of 915 m. and Tillo a length of 1,024 m., the Mezen for which the estimates are 496 and 507 m., and the Northern Dwina for which these authorities give a length of 358 and 447 m. respectively. These determinations vary because Strelbitsky ignored minor windings. The upper waters of Petchora and Northern Dwina interlace with those of the feeders of the Kama, a tributary of the Volga. As a consequence of the low relief the Petchora is navigable for 770 m., the Mezen for 450 m., and the Northern Dwina for 330 m., while the Vycheгда, a large tributary of this river, is navigable for 300 miles. The Onega river has rapids on it.

The Urals.—The structural relationships of the Urals have been mentioned above. Here the Palaeozoic strata are folded on the west of a longitudinal axis which exhibits crystalline rocks and is faulted on a large scale. The Devonian rocks in this area are of marine origin. Its greatest heights are chiefly in the regions of folded Palaeozoic rocks and the folds die away into the Russian platform westwards in small parallel chains known as Parma. Though there is much copper in the Permian rocks on the west the main metalliferous veins of the area are in the faulted zone of crystalline rocks to the east. The greatest height reached in the Urals is 5,533 ft in the northern Urals (at Tel-pos-iz or Murai-Chakhl). The passes are often low, that on the way from Perm to Sverdiovsk being only 1,245 ft. above sea-level. The

range is continued to the Arctic coast, Vaygach Island, and Novaya Zemlya. Details are given under articles *Ural Mts.*, *Uralsk Area*, *Novaya Zemlya*, etc. On the south the Urals finger out in a plateau region dissected by feeders of the Ural, and a few feeders of the Volga. The Ural river drains the southern Ural mountains, turns west and then south to the Caspian Sea which it reaches after a course of 1,477 m.

The Ob Basin. — Eastwards the Urals fall rapidly down to the Ob basin which is one of the largest areas of unbroken lowland on the earth. The floor material is almost entirely alluvial with a little Tertiary here and there. It rises in the westward prolongations of the Sayan mountains and is 2,260 m. long but its very large tributary the Irtysh comes from the Dzungarian Gate and adds enormously to the area of the basin, which is bounded southwards by the Turgai and the hills of Semipalatinsk, while the Tobol, another large tributary flows to the Ob from the north of the Turgai. It is widely thought that under the alluvial floor would be found a continuation of the platform of North European Russia let down through the dislocation of the east border of the Urals. The lowland extends without an appreciable break to the Yenisei, and only at some places near that river do the older rocks help to form the surface.

The **Yenisei Area.** — East of the Yenisei the character of the land changes abruptly, a sharp edge rises rapidly to more than 600, and in one place to quite 3,300 ft. above sea-level and east of this edge is a great dissected plateau of ancient rocks. Archaean rocks with granites, etc., are exposed near the Yenisei and away to the north-east, but there are larger areas of Cambrian and Silurian rocks and these are covered over a vast stretch of country by Permo-Carboniferous rocks. The plateau extends eastwards to the Lena along the valley of which is found evidence of an invasion of the sea in Cretaceous times. The plateau is an ancient block to which Suess gave the name of Angara land. Large areas on this plateau rise somewhat above the 1,600 ft. contour, and the diversities of surface are due largely to river dissection. There is evidence in the Taimyr peninsula of a fold axis with a general direction west-south-west to east-north-east but apparently no heights reaching above the 1,500 ft. contour.

The Yenisei is the collecting stream beneath the western edge of this old block and it rises in the Sayan mountains receiving nearly all its tributaries from the eastern side. Of these the upper Tunguska or Angara comes from Lake Baikal, the middle or stony Tunguska, and the lower Tunguska from the block itself. The river is some 3,000 m. long. Like the Ob, this river may be said to be formed of a pair of streams, the upper Yenisei and the Angara.

Eastern Siberia.—Beyond the Angara block eastwards stands an important series of mountain-ranges concerning which much new knowledge has recently accrued (see S. Obruchev. *Geogr. Journal*, lxx., 1927, p. 464), though it is not yet available for maps. The Stanovoi (Gidan) mountains and the Kolimski (Kolyma) mountains are more or less parallel to the coasts of the sea of Okhotsk but the former are also roughly parallel to the edge of the Angara block on the other side of the Lena, and 100 m. or so north of Okhotsk they are linked not only with the Kolimski mountains to the east but with the Verkhoyansk mountains which go westwards and northwards keeping more or less parallel to the edge of the Angara block with the Lena between them and it. Like the other great rivers mentioned above, this one is formed of a pair, the upper Lena and the Vitim. The length of the Lena is estimated at 2,860 miles. The Verkhoyansk and the Kolimski mountains thus form a great semi-circle of mountains apparently determined in the west by the Angara block and in the east by the depression of the sea of Okhotsk. Within this semi-circle most atlases show ranges stretching northward, but according to Obruchev the older surveys are very incomplete. He finds that the ranges are disposed in more or less parallel curves within the main outer one above mentioned.

The Tas Kistabit mountains come next to the western Kolimski, the Cherski mountains are a longer range parallel to the whole curve of the Verkhoyansk-Kolyma line and stretching from the east of the Yana river to the west of the Omolon river. Within

this again is a smaller range. The Cherski mountains are the newly discovered ranges named after a Russian explorer who died in this region in 1892, the river Indigirka traverses it by a winding gorge often less than a mile wide and the tributaries of this river also make gorges in this range, in which an altitude of about 3,300 m. (10,727 ft.) was observed. These high mountains are apparently almost without glaciers because of the aridity of the region. A geological traverse going northward between the Kolima and the Indigirka shows an east-west axis of igneous material alternating with Permian and Triassic rocks.

East of the mouth of the Omolon river a great axis of crystalline rock, flanked on both sides by Permian runs parallel to the coast as far as Cape Dezhnev (East Cape). The Kolimski mountains curving from the southwards come north-eastwards as the Anadir mountains and end in Cape Chukotski. This latter high line is flanked on the south-east by the Penzhina and Anadir valleys forming an almost continuous low line from the sea of Okhotsk across the base of the Kamchatka peninsula to the Gulf of Anadir north of the Bering Sea. The Kamchatka peninsula is described at some length in a special article (*q.v.*). Northward from Cape Lopatka along the east coast as far north as the curve of the Aleutian islands is a belt of volcanoes, part of the "girdle of fire" of the Pacific. The central longitudinal range of the peninsula is continued north-eastward, south of the Anadir valley to Cape Navarin. There thus seem to be three great structural lines abutting upon the neighbourhood of the Bering Strait and the north coast of the Bering Sea.

The main curve of the Stanovoi (Jurgur) mountains, supposedly fold mountains, continues westward on the south and apparently approaches the Yablonoi mountains, really the eastern edge of the Malkan horst, at an angle. To the west-north-west lies the Vitim plateau. To the south-east is found a type of topography analogous to that of Kamchatka and extreme north-east Asia. There are successive ranges more or less parallel to the coast, imbricating to some extent and separated by lines of lowland fairly parallel with their axes. The Liao-ho, Sungari and lower Amur valleys form a continuous lowland from the Gulf of Pechihli to the strait between the mainland and Sakhalin. The Ussuri and lower Amur valleys form a low line from Vladivostok northwards with the high range of the Sikhota Alin on its eastern flank. The sea of Japan and the Gulf of Tartary, narrow waters separating Sakhalin from the mainland, form still another low line with the Sikhota Alin on the west and the high axis of Sakhalin, Hokkaido, etc., on the east. As in the case of Kamchatka so also here the high axis is met on the east at a considerable angle by the Kurile islands of volcanic type and south of this junction, that is in Japan, the high axis is volcanic, just as east Kamchatka is volcanic south of its junction with the Aleutians. The great river of this eastern region is the Amur, which has a very large tributary, the Sungari, on the south; the Amur's course is governed mainly by the mountain lines of the region and its length is about 1,700 miles.

Having now, with the aid of references to other articles, briefly sketched some main features of the regions of Arctic drainage, the circum-Arctic platform and the Pacific mountains, we may turn to regions which drain elsewhere and which illustrate, though only slightly, some influences of the mountain building forces working in central Europe on blocks of ancient rock which have resisted folding and have remained almost horizontal. These regions are those which drain to the enclosed seas, the Black Sea, Caspian Sea, Aral Sea and Lake Balkhash, or looked at structurally they reveal on the west a succession of very slight undulations, anticlines and synclines, of small relief, with axes north-west to south-east from the vicinity of the Carpathians to the borders of the Arctic region, and on the east the subdued features due mainly to the great virgations of the Tian Shan range.

Considering the matter first structurally we have from the Sea of Azov west-north-westward to beyond Kiev an anticlinal zone in which appear granites and gneisses, some of which are thought to be Archaean. The Dnieper from Kiev to Dnepropetrovsk (Ekaterinoslav) follows the northern border of this zone of hard rock through which the river cuts its way below the latter town.

Next follows a syncline in which early Tertiary deposits are most widespread, whereas farther south they only capped parts of the old rocks. The syncline is named after the river Donetz which follows its axis. Towards the Sea of Azov Palaeozoic rocks are brought to the surface and the land stands somewhat higher. In this region is the Donetz coalfield, the coal belonging to upper Carboniferous strata as in western Europe. The next zone is the central anticline which is parallel with the two structural zones described and which is thought to die away towards the Caspian. The axis of this anticline is marked to some extent by the Don river where it flows south-eastward below Pavlovsk while, much further north-west, the course of the southern Dwina is clearly related to it. Along it in the Don region the Cretaceous deposits, capped interfluentially by early Tertiary here and there, form the most important outcrops but on the north-west there is a great area of Devonian (*v. inf.*).

North-east of this anticlinal zone is the immense "Moscow basin" floored mainly by Palaeozoic rocks mainly still horizontal, with some Triassic deposits, but there are patches of Jurassic and Cretaceous strata as for example around Moscow and in the great bend of the Volga, and also farther north from Kostroma to Ust-Sysolsk on a tributary of the Vychevga. There was an intrusion of the sea in Jurassic times which became much more extensive in the Cretaceous period; no upper Cretaceous is known, however, in northern Russia. Around the Moscow basin in the south-west and west the lower Carboniferous system (with poor coal at Tula, etc.), outcrops in a great curved belt from the region of Tula almost to the White Sea. Beyond this belt north-westward is the area of Devonian rocks towards Latvia and Estonia and across to the White Sea. They rest unconformably on Silurian rocks which outcrop along the southern shore of the Gulf of Finland and of lake Ladoga. The Devonian rocks are partly lacustrine (old red sandstone) and partly marine in origin, and the two types are often interstratified; a basal red sandstone is covered by a dolomitic limestone which in turn has a sandstone over it.

The Timan hills (p. 684) on the north-east may be said to be an upfold bordering the Moscow basin. The main axis of the basin is parallel to the course of the Volga above Nizhniy-Novgorod, continued north-westward by the Mologa, *i.e.*, rivers running broadly parallel to the sections of the Dnieper, Donetz and Don already noted. Permian rocks outcrop over large areas on the north. The dips of the strata are small and anticlines and synclines are here really slight undulations which might be followed right across Russia from the Dniester to the Timan hills always with lines roughly north-west to south-east (or west-north-west to east-south-east) well marked in geology and drainage, though not much indicated in relief save that there is a marked low line of the Dnieper valley above Dnepropetrovsk, the Pripet marshes or Rokitno swamps and the upper Bug, where it continues the line of the Dnieper and Pripet in Poland. This belt of lowlands is of special importance because of the great marshes just named; they form the effective barrier between Russia and peninsular Europe. (See EUROPE: Geography.)

Turning now to the east one notes the virgations of the Tian Shan, orographically very subdued in the Aralo-Caspian lowland. One stretches north-westward parallel to and north of the Syr Darya river and apparently re-emerges from the lowland in one of the southern branches of the Urals which are at first a plateau and only rise to any considerable height north of lat. 52° N. Another virgation stretches parallel to the first, this time just north-north-east of the Amu-Darya or Oxus river, and is continued into the Mangishlak peninsula that projects into the north-east of the Caspian Sea. Farther south still are the hills of the Persian border reaching the Caspian Sea between the Gulf of Kara Boghaz and the town of Krasnovodsk, and continued on the west of that sea by the mighty Caucasus. In the Aralo-Caspian lowland the rocks of these virgations are masked by a quaternary covering with Tertiary deposits south of the lower Oxus and on the Ust Urt plateau between Aral and Caspian. Between the Aralo-Caspian-Balkhash area and the Arctic drainage area of the Ob and its feeders, is the higher land of Semipalatinsk related

structurally to the Altai and floored by Palaeozoic and igneous rocks. West of this the land continues to be somewhat above the level of the lowlands on either side and is floored by Tertiary deposits, but the higher land narrows down in the Turgai region which according to general opinion until Oligocene times had a sea-communication right away to the Arctic on the north. The two great rivers of the region are the Amu-Darya (Oxus), 1,500 m. long, and the Syr Darya, 1,500 m. long, both reaching the Aral Sea.

Structural geologists have spread familiarity with the idea of a great sea called Tethys reaching in Mesozoic and Eocene times from the present Mediterranean area eastwards through the region occupied later by the young folded ranges of Asia Minor, Armenia, the Hindu-Kush and Himalaya, etc., out to the Malaya. Without venturing into details of advances and retreats of the sea it may be said that the uprise of the fold mountains of Asia Minor, Armenia, the Elburz Range and the Hindu-Kush left the part of that sea to the north of this more or less isolated as the Pontic brackish lake, losing its former connection via the Turgai low-line with the Arctic Ocean probably in Oligocene times and becoming much modified by the sinking of the southern parts of the Black and Caspian Seas (*q.v.*) which are both deep. Apart from these two depressions the land shelves easily from land to sea around the northern parts of the Black and Caspian Seas while the shallow Aral Sea is a part of the Pontic lake, now cut off by lowland from the north-east of the Caspian Sea. Balkhash is a freshwater lake on higher land farther east now, at any rate, without outlet, whatever may have been the condition of things in the past.

We thus have a series of enclosed seas and lakes (*q.v.*) of which Balkhash, the Aral and the Caspian have no outlet, and the two latter are salt, while the Sea of Azov communicates with the Black Sea through a break in the mountain line between the Caucasus and the Yalta mountains of the Crimea, and the Black Sea has communicated with the Egean and the Mediterranean since the sinking of the former. The rivers Dnieper (strictly 1,064 m. or with minor windings 1,328 m.), and Don (strictly 980 m. or with minor windings 1,123 m.), both flow south-eastwards for a considerable distance and then turn sharply south-westward to the Black Sea, probably as a consequence of the recent dominance of flow towards the Egean following the sinking of the latter. Prior to that sinking it is thought that the Danube for a time made its way eastward across the lowland to the Caspian Area which it may have reached via the curious Manych depression. The Volga (1,977 m. or with minor windings 2,107 m.), is the longest river of Europe flowing broadly east-south-east parallel to the axis of the Moscow basin and meeting the Kama as it turns south below Kazan. On its course southward it has a sharp eastward loop with Samara at the head opposite the southward bend of the Don, and quite near it, the Volga bends south-east, thus continuing the previous line of the Don, and so it reaches its delta on the Caspian Sea. The great rivers of the Aral basin, the Amu-Darya or Oxus and the Syr Darya have already been mentioned and the relation of their courses to structural lines has been indicated.

Apart from the borders of the Pacific Ocean, Mongolia, Sinkiang, Afghanistan, Persia and the Caucasus, the Russian Area is really great lowland broken only by the Ural mountains and the residual heights on the Angara block. It is a region of great lakes and inland seas, of which the north-west European group is discussed in the article Europe, while the Caspian, Aral, Balkhash and Baikal are subjects of separate articles. As there are immense tracts covered by glacial clays, there are areas, for example, in the south-east of the Ob basin, with myriads of small lakes in the hollows.

The Caucasus (*q.v.*) and Transcaucasia form very distinct regions structurally and physically, the Armenian mountain-knot being separated from the Caucasus by a relatively low narrow line occupied by the river Rion on the west and the river Kur on the east, but a long stretch of this "low line" is well over 1,500 ft. above sea. This line has to the east the deep basin of the southern Caspian and westward the deep basin of the southern Black Sea.

GLACIATION

The Pleistocene Ice Age affected Russia profoundly and its effects have been studied more particularly in European Russia. In north Russia river-drainage has re-established itself post-glacially to a greater extent than in Finland, which lay near the Scandinavian ice centre of the time. A great morainic belt may be traced between the Petchora-Vycheгда-Northern Dwina basin and the Kama-Vyatka basin, and this belt continues south-westward past Kostroma, Moscow and the northern watershed of the Dnieper and Pripet system into Poland. North-west of this great belt, in the west, are many great remnants of moraines enclosing lake or swamp areas. To the south of it are swamp-areas such as the Pripet basin, the Riazan district and the tongue between Volga and Oka before they join. Boulder clay stretches some way south of the great morainic belt above mentioned, and this extension is enormously increased by the occurrence of great tongues of boulder clay in the basins of the Don and Dnieper on the left banks of their long north-west-south-east sections. In each case these boulder-clay extensions are much dissected by streams as would be expected on an area with impervious floor. The main morainic belt and the more southerly morainic limit above described are sometimes held to represent two separate glacial advances, the former being the more recent.

There seems little doubt that the Caucasus and the great highlands of Central and north-east Asia (including the Verkhoyansk arc and the Stanovoi range, as well as part of the Angara plateau) were centres of Pleistocene glaciation, but towards the north-east the low precipitation probably limited the extent of the glaciers. Beyond the boulder-clay zone follows the loess, an aeolian deposit due to the outblowing winds from an ice sheet or other cold centre. They pick up fine-grained material from terminal moraines across which they blow out and deposit this over a wide zone as a porous deposit in which, frequently, grasses have grown and decayed, leaving vertical tubes up which water may be brought, and depositing organic matter which has promoted the fertility of loess when it is exploited by man. Loess occupies practically the whole of South Russia and interlocks with the two tongues of boulder clay, sending north a broad tongue between the Don and the left bank feeders of the Dnieper to Orel, forming a region much poorer in streams than the boulder-clay tongues on its two flanks. East of the boulder-clay tongue of the Don basin, the loess reaches as far north as the Vyatka river and eastward into Turkestan. In Asiatic Russia the loess seems to occur mainly along the foot of the western highlands and across Turkestan towards the Caspian.

CLIMATE

The essential feature of the climate of the U.S.S.R. is its continental character; the regions of somewhat more temperate type became independent states after 1917. From the western border to the mountains fringing the Pacific and from the Arctic to the mountain zone of Central Asia, this great stretch of land lies open to the winds, the Urals being too low to form an effective climatic barrier, though they have some influence on isotherms and especially on isohyets. Oceanic influences play some part in the west, but the Arctic Ocean to the north has practically no moderating effect. Even if eastern Russia were not cut off from the ocean by a mountain fringe, moderating influences would hardly be felt, since the winds blow off shore most of the year and moreover the Sea of Okhotsk is under the influence of a cold Polar drift and is a region of floating ice and fog. During the long winter the land mass of Asiatic Russia becomes extremely cold especially towards the north-east, and the cold, dry, heavy air which settles above it so intensifies the high pressure belt of Central Asia that it is attracted northwards. Lake Baikal and the region to the east of it have a January pressure of 30.5". The north-east coast of the Arctic lies north of the 30.1" isobar and a belt of high pressure extends from Asiatic Russia in a south-west direction. The most intense tongue of January high pressure stretches west along lat. 50° N. and forms a vortex of variable winds. To the north of it the prevailing winds are south and west, while to the south of it in the steppes and steppe-deserts of European South Russia and of Turkestan the winds

are north, north-east and east, so that severe winter cold is carried far to the south. The region west of the Ob river is under the influence of the Icelandic low-pressure system of western Europe.

The general high pressure relations which are outlined above last from August to April. Thus about half of Russia has a winter of six months' duration, while from Yenisei eastwards there stretches a vast area of permanently frozen ground extending from the Arctic to the south of lat. 50° N. only southern Kamchatka and the Maritime provinces of the Far Eastern Area lying outside this zone, which extends westwards from the south of the Gulf of Taz to the open Murmansk coast. In this permanently frozen zone winter lasts 6 to 9 months or more and summer is too short to thaw the ground to any depth. Forest and tundra cover much of it, and in a few places, notably in the Yakutsk area there is some cultivation of potatoes and hardier cereals on the upper, temporarily thawed soil above the permanently frozen subsoil. The line marking the southern limit of the duration of winter for a period varying from 3 to 6 months extends westwards from the Tian Shan, passing well to the south of the Sea of Aral and crossing the Caspian and the Sea of Azov, so that their northern portions lie within it, and just skirting the north of the Black Sea. The effect of this prolonged winter on the life of the people is profound; agricultural and outdoor occupations (*e.g.*, building) are impossible, river navigation ceases and sledge transport takes its place. Terrible wind and snow storms occasionally sweep with great violence across the plains even in the southern steppe and the Ukraine, and cattle and sheep perish in great numbers.

In a great country depending mainly on agriculture this prolonged annual pause constitutes a very serious drawback. Its complex psychological and physical effects on the individual are also profound, especially when monotonous diet and insufficient vitamin supply accompany it. For an interesting account of the effects of severe climate on human personality see Czaplicka, *Aboriginal Siberia*, 1914. The deterioration of the tribes pushed to the north-east and of the Russian settlers in Kamchatka are patent and extreme cases and the slow cultural development of the Russian race must be in part attributed to climatic causes. The only regions with a winter frost of one month or less are the south-east coast of the Crimea, the malarial east coast strip of the Black Sea and the arid coastal regions of the eastern and western shores of the South Caspian. The Lenkoran district of the south-west Caspian shore, with an annual rainfall averaging 40 inches is an interesting example of micro-climate due to local relief. The warm Atlantic drift influences the winter of European Russia and her only all the year round open port is the recently built Murmansk on the Arctic coast. The prevailing westerly winds modify winter conditions in north and central European Russia, so that winter isotherms have a general north-west to south-east trend. The coldest winter in the world (as yet recorded) is experienced at Verkhoyansk in lat. $67^{\circ} 30' N.$, $134^{\circ} E.$, 3,900 miles east from the Atlantic, where the average January temperature is $-59^{\circ} F.$, and where it dropped to $-94^{\circ} F.$ in February 1892, the lowest temperature ever observed.

There is no direct insolation in winter, since it lies within the Arctic circle, night radiation from the snow covered earth is intense in the clear, dry atmosphere and, as Verkhoyansk lies in a valley bottom, inversion of temperature intensifies the cold. Woeikof attributes the fact that Sagastyr on the Arctic Ocean, in $73^{\circ} 32' N.$ has an av. Jan. temp. $25^{\circ} F.$ warmer than that of Verkhoyansk to the stronger winds on the flat and treeless tundra and to the absence of temperature inversion. S. Obruchev ("Discovery of a Great Range in North-Eastern Siberia," *Geographical Journal*, 1927, vol. 10) suggests that the Pole of Cold may extend over the Upper Indigirka. Another local relief effect is the cold temperature experienced immediately east of the Scandinavian mountains. A general feature of the Russian winter south of the Arctic circle is the clear bright sunshine and the absence of cloud, the maximum of cloudiness being experienced in autumn, except in the Far Eastern Area, where summer is the season of maximum cloud, and in the south of the Ukraine, the

Kazakstan steppe and the Central Asiatic Republics where winter, though not very cloudy, is the season of greatest nebulosity. In three regions, the western Caucasus and west trans-Caucasia, the district between Lake Balkhash and the Tian Shan and in a belt on the left bank of the Amur from Blagovyeschensk to its mouth, spring is the cloudiest season. The general prevalence of clear skies in spring is a noticeable feature.

Seasonal Contrasts.—Summer is everywhere hot, and there is no place in European Russia, from Astrakhan to Archangel where the summer temperature does not reach $86^{\circ} F.$ In Asiatic Russia the summer isotherm of $68^{\circ} F.$ goes through Omsk, Krasnoyarsk and Irkutsk, turns north to Yakutsk and then bends south to Vladivostok. Even the mouths of the Ob, Yenisei, Lena and Kolyma, in $70^{\circ} N.$ lat. have an av. July temp. of 40° to $50^{\circ} F.$ Verkhoyansk has an av. July temp. of $60^{\circ} F.$ and a maximum of $93^{\circ} F.$ has been recorded. The highest July averages and also the highest maxima are experienced in Turkestan, where $105^{\circ} F.$ and even higher temperatures have been observed. The av. July temp. for Southern Turkestan is over $86^{\circ} F.$ Thus the range of temperature between winter and summer is great, the maximum, $118.6^{\circ} F.$ being near the pole of cold, from which it diminishes in a series of concentric rings. The line of the range of $79^{\circ} F.$ passes along the Arctic coast westwards roughly from Chaun Bay, cuts off the Taimyr peninsula and bends southwards along the course of the Yenisei, crosses the Upper Tunguska in an easterly loop and then curves westward to the Upper Yenisei. It makes a sharp bend north-eastwards round Lake Baikal, passes south again and then east to the mouth of the Sungari. The lines of equal range to the west of this have a general north-south trend, each having wide curves first to the east and then to the west as far as the Urals. West of the Urals the lines are less sinuous. The range at Moscow is $54^{\circ} F.$ and at Petrograd $48.6^{\circ} F.$ The range at Batum on the west coast of the Black Sea drops to $30.8^{\circ} F.$ The geographical distribution of great temperature ranges in Russia indicates that the determining factor of range is the intensity of winter.

These figures, showing a great range of temperature in regions of prolonged winter, indicate what a dislocation the brief spring brings to the life of Russia and how great is the strain on plant, animal and human life to secure adaptability. In European Russia the last days of frost are experienced for the most part in April, but north of lat. $55^{\circ} N.$ in May and progressively later towards the north. In Asiatic Russia spring sets in at the end of April in the south and progressively later towards the north. Thus on a line from Yakutsk, passing north of Beresov on the Ob, south of Mezen and through Kola the average date of thawing on the rivers is May 21st. On a line extending from Sredne Kolimsk through the confluence of the Butyntai and Yana rivers, bending south over the plateau and turning north to Obdorsk the date is May 31st; on the upper Lena and its delta and at the mouth of the Yenisei, the thaw does not set in until the second week in June. The date of freezing of rivers in Russia varies from December near the north coast of the Black Sea, and for the northern part of the Caspian and the Sea of Aral to November on the northern coast.

In Asiatic Russia the date of freezing varies from November in the south to September for the Taimyr peninsula and the region east of Yana Bay. We thus have a picture of an unlocking of the winter grip setting in about April in the south and at dates varying from early May in the west to late June in the north-east, with a period of possible vegetation activity at its maximum in the south-west and rapidly diminishing towards the north-east. The melting of the snows and the consequent flooding of the roads and river banks and the coming of the spring rains, slight though their quantity may be, disorganise traffic. The badly constructed roads become seas of mud, the frozen marshes turn to quaking bogs and the rivers are at first obstructed by blocks of ice. On the lower courses of the rivers flowing to the Arctic blocks of ice brought by the warmer water from the earlier thawing upper courses are heaped upon the still frozen river, and as this latter melts and begins to flow the banks are flooded and ice blocks are carried on to the land to the accompaniment of deafening

crashes of the great blocks as they are hurled against one another.

A set-back to spring occurs in the second half of May, most sharply felt in Siberia, where the "icy saints' days," as they are called, are so blighting that it is impossible to cultivate the apple and the pear. This return of frost is experienced frequently in the Ukraine in a belt lying south of the extension of high pressure. Northerly and easterly winds may bring such biting frost that the leaves of the oak are shrivelled in an hour or two. It is significant to note that the maximum pressure conditions of April in the Polar region are succeeded by minimum pressure conditions in June. (This phenomenon of late spring frosts is by no means confined to Russia.)

Precipitation.—Evaporation from melting snows and drying surfaces keeps the spring temperature lower than the autumn temperature except in Turkestan and the steppes to the north of it, where snow does not lie because of the exposure of this treeless region to violent winter winds. In these regions, therefore, in accordance with the greater spring altitude of the sun, spring is warmer than autumn. The snow covering is thickest in the taiga belt (often 3 ft.) and in the west, under the influence of occasional cyclones, may form drifts of very great depth. The thin snow covering of Asiatic Russia melts in spring. Except in the extreme north of European Russia, in the deserts and steppes east of the Caspian roughly south of lat. 48° N., and in trans-Caucasia and the east coast strip of the Black Sea, summer is the season of maximum precipitation. The Pacific coastal strip, under the influence of the south-east monsoon has a particularly wet, stormy, cool summer unfavourable to agriculture, the maximum fall being in August. In Asiatic Russia east of the Yenisei and in the northern part from the west of the lower Yenisei to the Urals July and August are the rainiest months, a condition unfavourable to grain crops.

In a belt lying north of the steppe-desert and of the Caspian, east of a line curving through Astrakhan, Kazan and Bogoslovsk, and stretching west to the Altai, June and July are the wettest months. This belt terminates south of lat. 60° N. in the west and north of it in the east. To the west of it June is the wettest month in the south and August in the north, while in the central and western zone beyond, July is the month of greatest rainfall. To the north of this region July and August are the wettest months. Thus in many regions a wet August follows a severe winter. Winter rainfall is kept at a minimum by the prevalence of outblowing winds from the dry high pressure area, but in summer pressure conditions are reversed. Autumn, with its transition to the frost régime, is, like spring, a season of interruption of communications both by road and river, sometimes involving interruption of telegraphic communication because of the impossibility of getting over the roads to carry out repairs. Precipitation except near the Caucasus range and the coastal range of the east against which the south-east monsoon impinges, is fairly uniform, averaging about 20 inches in the central belt west of the Urals and 15 inches in that belt east of the Urals extending to the Pacific coastal ranges. Regions with such a rainfall may be humid in conditions of minimum evaporation, especially if the soil is clayey or icebound; they are arid in conditions favouring evaporation and dispersion of soil moisture.

In the tundra region of the north it sinks to 8 inches, while south of the central belt, in a region which includes the south of European Russia and the Central Asiatic Republics and the steppes and semi-deserts to the north of them, the prevailing winds throughout the year are from the dry north-east and rainfall therefore is scanty, in some places as low as 4 inches per annum, and agriculture depends on irrigation. A special problem of Russian agriculture is the irregularity of the amount of spring rainfall, complicated by the fact that this irregularity occurs in regions where the length of the snow covering varies from year to year in dependence on violent winds. A combination of poor snow covering and deficient spring rains leads to the terrible famines which are a recurrent scourge of south-east Russia. Related to this irregularity are such problems as the increasing desiccation of Turkestan, the present shallowness of streams which

were navigable within recent historic times, and the drainage of marshes in the north by the slow elevation of the land. A general feature of the summer rainfall and of the May and June rainfall of the steppe is its liability to fall in sudden heavy showers, often accompanied by thunderstorms. This results in a quick run off of the water so that the effective moisture is small. In 1882 in Kursk province a heavy storm in July deposited within half an hour an amount of rain equal to 25% of the normal annual rainfall. Forest cutting in the upper courses of streams has greatly increased the denuding action of streams.

Certain regions form distinct climatic units. In this group, of course, fall the valley regions of the mountain zones, each valley often having a different exposure and different altitude. The east coast of the Black sea under the lee of the Caucasus has a milder climate and its rainfall (60 inches per annum) is of the same type as that of the west coasts of the Mediterranean, in dependence on the special pressure systems over the Black Sea. The region round Lake Baikal is much influenced by the presence of that body of water, especially in December before freezing sets in, when the combined influences of open water and of the liberation of latent heat during freezing cause the isotherms to loop north-eastwards around the lake. The special features of the eastern coastal region are discussed under Far Eastern Area (*q.v.*) and for those of the Arctic fringe see ARCTIC REGIONS.

SOILS AND THEIR INFLUENCE

Soil study or Pedology as a scientific discipline owes its present position largely to Russian research, which has demonstrated that the soil is a distinct entity dependent on regional and climatic factors for its evolution and type. The vast extent of the Russian empire and the importance to its life of the chernozem (chernozom) or black earth, gave special opportunities for studying the characteristics of soil under widely differing climatic, geological, topographical and biological conditions. Foremost among these workers was V. V. Dokuchaiev (1846-1903) whose researches, published 1879-1883, included a cartography of Russian soils. The Dokuchaiev Institute of Soils in Leningrad published in 1926 a detailed map in colour of the soils of Russia compiled under the direction of K. D. Glinka and L. I. Prasolov, with the assistance of S. S. Neustruev, B. B. Polynov and N. I. Prochorov. Glinka's work on soils is of world-wide importance and the publication in 1928 by the Department of Agriculture of the United States of America of an English translation of his classic "The Great Soil Groups of the World and their Development" makes his results available for the first time to English speaking peoples.

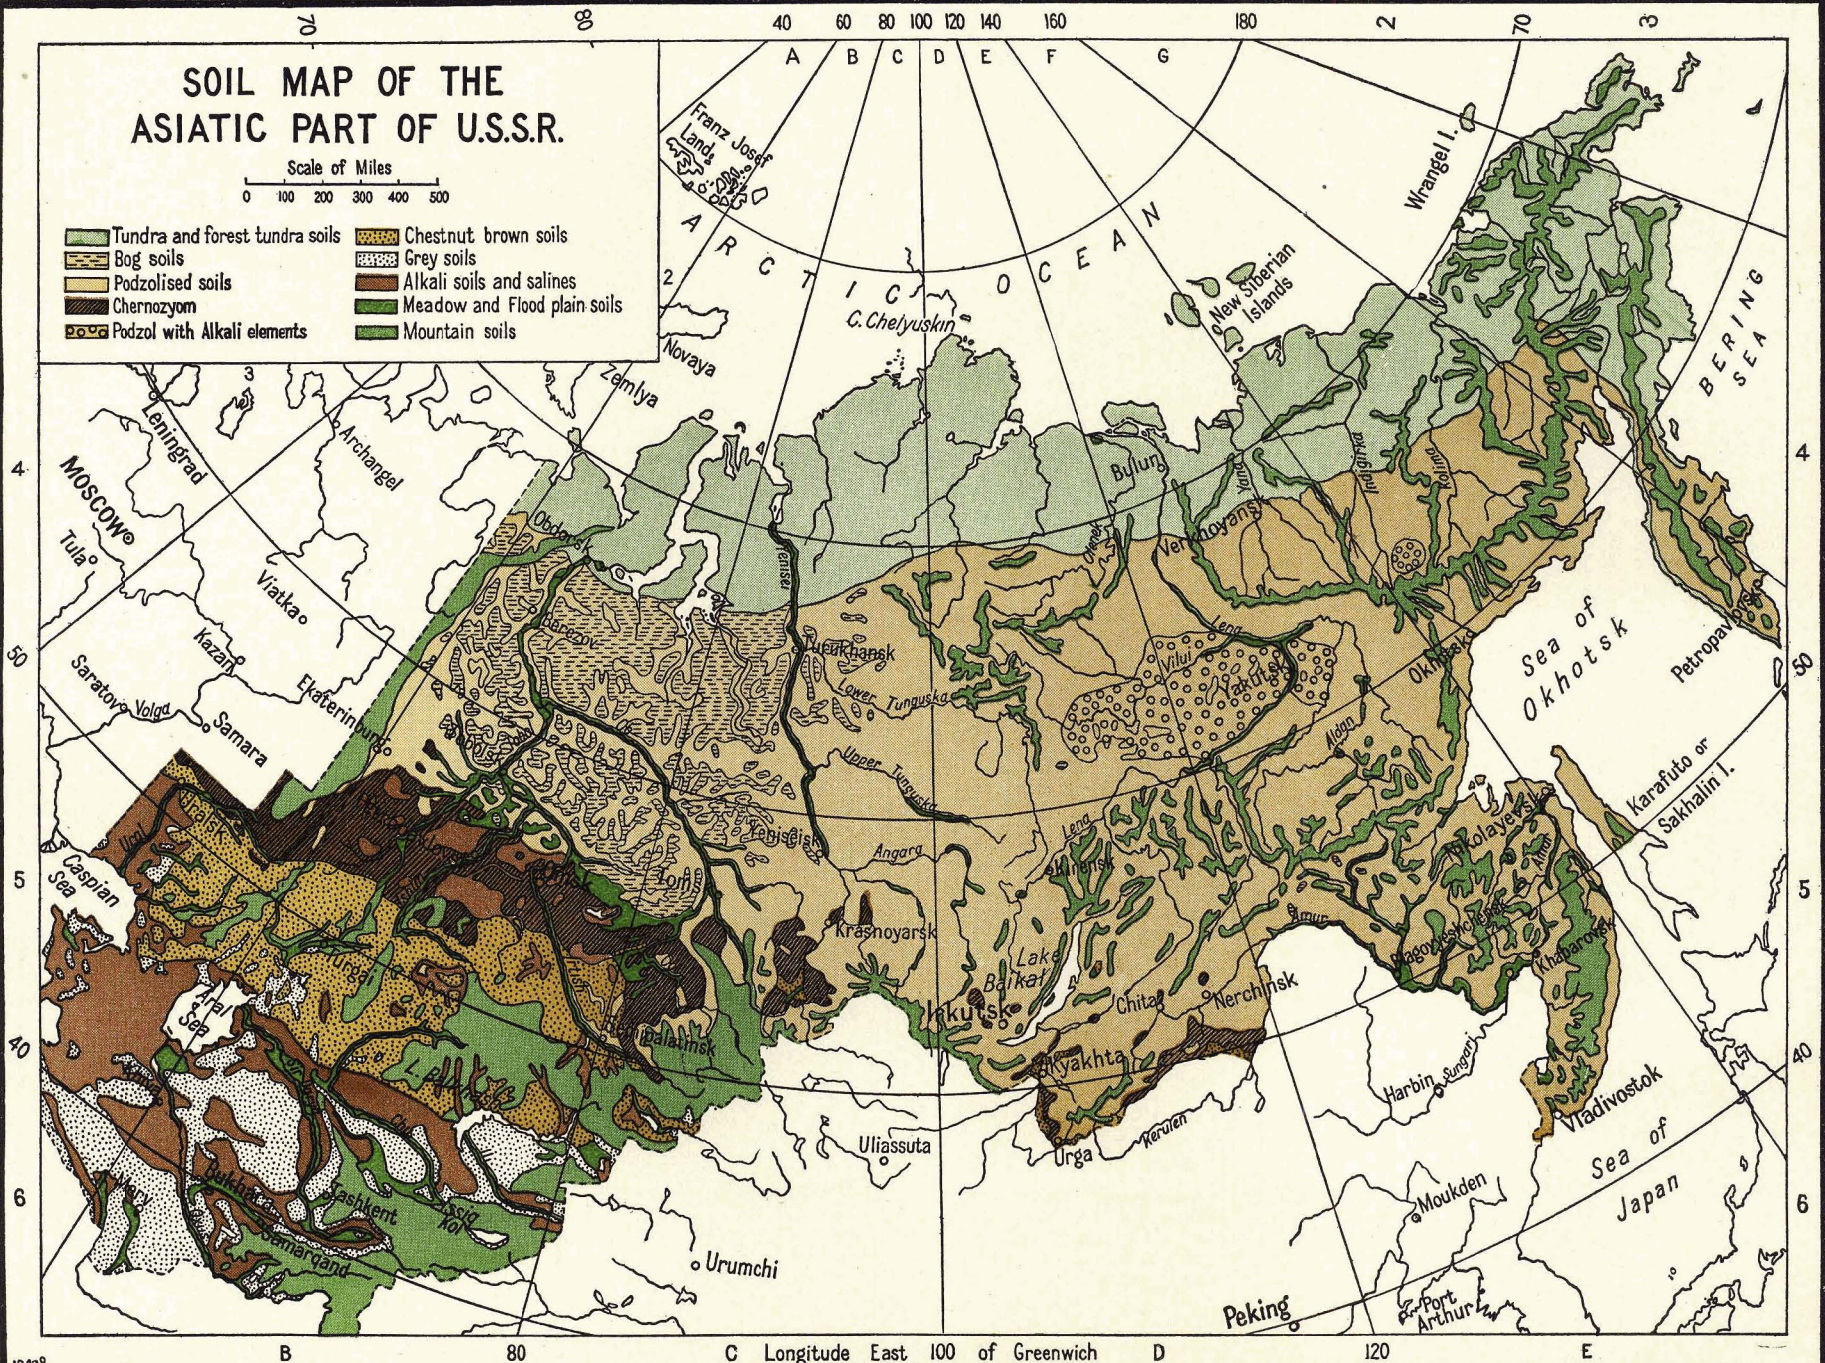

An important series was published in English in 1927 by the Russian Academy of Sciences and includes thirteen pamphlets by different Russian soil scientists on various aspects of pedology affecting Russia. Fallou and Richtofen had previously recognized the importance of the study of the regional distribution of soils, but the definite connection of present climatic conditions with the geography of soil distribution was first laid down by Dokuchaiev and afterwards developed by N. Sibirtsev and K. D. Glinka. Russian scientists were pioneers in the detailed study of vertical sections of soils, which reveals important morphological characters of the various layers dependent to a large extent on climate. This study of soil horizons owes much also to Japanese and American investigators, while later the work of microbiologists (*e.g.*, S. N. Vinogradski and V. L. Omelianski) and of students of colloidal action (*e.g.*, K. K. Gedroiz) much widened the scope of study. The accompanying soil maps of Russia are based on the maps prepared by Glinka and Prasolov.

The Tundra.—The first main group is the tundra zone stretching across the whole of northern Russia. The name tundra implies treeless as opposed to forest lands, and two main zones can be noted. As one goes north-eastwards in Asiatic Russia, the climatic conditions become increasingly dry and precipitation ultimately reaches a minimum and there is much arid clayey and stony dry tundra, but in the remainder of the northern tundra zone there is

greater annual precipitation. Scanty though it may be, this precipitation is often sufficient to cause the soils to be classed as humid, owing to low temperatures, slight evaporation and the permanent freezing of the sub-soil which seriously limits the draining off of surface water. The excessively moistened horizon above the frozen sub-soil, which thaws during the brief summer and turns the region into an impassable quaking bog, is called "talik"; it is coloured by ferric rusty spots and wedges of humus. This "glei" horizon of tundra soils retains its motley colouring when dried. The vegetative mass of moss, lichen and dwarf shrub tends to form peat, and "hillock tundra" is apparently due to the formation of a frozen core which cuts off the moisture supply of the surface moss, thus causing it to die. The decomposition of vegetation causes denudation and cracking, with ultimate gradual disintegration of the hillocks, between which the surface water collects and runs off.

Remarkable features of tundra soil are the "polygon" or "medallion" type and the "spot" type. The former, tessellated soils, are due to cracking of the surface layer during drying with consequent drainage of water along the cracks, removing fine particles and sometimes depositing stones, so that sandy and occasionally stony streaks separate the polygons. "Spotty" tundra may be due to compression of the semi-liquid mass of earth between the frozen sub-soil and the newly freezing surface; this semi-liquid mass breaks through to the surface and forms spots deprived of vegetation; in other places it is apparently due to the action of wind. Peat formation is observed at the highest latitudes in the Arctic regions; except where the ice and snow cover is permanent. The frozen sub-soil and the severe climate make agriculture impossible here and the tundra is the land of the wild reindeer and the nomad reindeer breeder, who takes his herds to the south during summer and to the north during winter and supplements his dependence on the reindeer for food, transport and clothing by a little fishing in the summer and by occasional hunting. Huts erected on this frozen sub-soil sometimes cause thawing with a development of a consequent upward fountain, the water of which may freeze into solid ice. Remains of birches and spruces have been found beneath peat hillocks on the tundra.

The forest stretched much further northwards at some post-glacial stage (the "Atlantic" phase in western Europe), when the climate was warmer than it is now, but the advance of tundra on forest has been encouraged by human destruction of the thinner fringe of "island" forest to the north, which helped Sphagnum bog to swamp the forest fringe. Towards the west, under the influence of the Atlantic, the tundra belt is narrow; it increases in width towards the east under the influence of the continental Asiatic winter, and thrusts much farther south in Kamchatka, partly because of the height of the land and partly under the influence of cold ocean currents from the north; oceanic influences thus playing an entirely different rôle in the east. South of the tundra bog begins a zone of scattered dwarf spruce and birch trees, transitional forms to the trees of the taiga zone. In Asiatic Russia a belt of vast marshy plain covered with dwarf birch lies south of the tundra belt. Along the river valleys, better protected from the wind, which induces winter evaporation and thus hinders their growth, and also better drained so that sub-soil ice is not so near the surface, the forest pushes northward. In the immediate vicinity of the streams, forest is denuded by the blocks of ice brought down in spring.

THE FOREST ZONES

Podzol.—The coniferous forest (taiga) belt and much of the mixed coniferous and deciduous belt are characterised by podzolised soils. Podzol or ash-coloured soils are developed in conditions where the moistening of the upper soil horizons is sufficient to ensure the percolation of water into deeper horizons, and where there is sufficient, but not excessive evaporation so that the percolating solutions are drawn upwards. Forest conditions, which prevent rapid or excessive evaporation and which at the same time ensure moistening of the soil are peculiarly favourable to podzol formation, though this type of soil has also been found in meadow and meadow-moor regions. Owing to strong transpiration,

the sub-soil under forest is drier than that under herbaceous vegetation, and the level of sub-soil water is therefore lower under forest. At the same time the upper horizon under forests is moistened by better preservation of the snow covering and by lower evaporation under the shade of leaves and forest bedding.

The main morphological characteristic of podzol is the presence of two horizons, an eluvial upper horizon **A**, which is comparatively deprived of colour and leached, with sandy particles, and an underlying eluvial horizon **B**, more intensely coloured, having an increased clayey content and chemically enriched with hydrates of sesqui-oxides and with humus. The upper horizon may be divided into a layer containing undecomposed organic matter (*e.g.*, hyphae of fungi), a greyish humus layer and a whitish horizon almost deprived of humus and enriched with silicic acid. The **B** horizon may have an upper coffee-coloured layer, with precipitated humus substances and a lower more yellow or rust-coloured layer with precipitation of iron hydroxide. This horizon may sometimes consist of *ortstein*, a compact indurated ferro-humus layer. The process of leaching to which the upper horizon of the soil is subjected is known as podzolisation and varies in degree, sometimes being indicated by almost imperceptible spots and at the other extreme by a compact whitish streak of a schistose character. The colloidal nature of humus plays an important part in the development of podzolisation. The type of parent rock is also important, the morphology of clayey, sandy-loamy and sandy podzolised soils varying greatly. The exact processes of podzol formation are still a subject of dispute; for an account of various theories see S. S. Neustruv, "Genesis of Soils" 1927, Pt. III. of Russian Pedological Investigations. This podzol zone is very extensive and broadens out in Asiatic Russia so that it reaches from the tundra in the north to the plateau region in the south.

The term *Rendzina* is applied to soils derived from the weathering of calcareous rocks.

Bog Soils.—There are vast regions that are intercalated among the forests covered by bog, especially in the west. Bog soils are formed where the pores of the soil are filled with moisture for a prolonged period, in regions of slight evaporation and marked atmospheric precipitation. The organic matter, paludinous herbaceous growths (*Carex*, etc.) and paludinous moss (*Sphagnum*, etc.) and sometimes the remains of alder, dwarf-birch, etc., instead of decomposing into humus, becomes enriched with carbon and transformed into peat. Micro-organisms play a large part in this carbonisation process, which penetrates to varying depths and which, where moisture rich in oxygen exists in deeper layers, may be superimposed on a humus layer. As a result of evaporation on the surface of the swamped soil, iron is precipitated in the upper soil-horizon directly beneath the peaty layer in the form of nodules of bog-iron ore. Bog-iron ore has been worked in a primitive way from very early times in Russia. The swamps and marshes have played a twofold part in history; they hindered the development of communications, but they frequently formed retreats for the Slavs and the Finns in early times. Novgorod escaped destruction by the Tatar horde in the 13th century because the Tatars could not cross the marsh in the rainy summer, and the strategic importance of the Pripet marshes has been evident from early days. Today the peat bogs have great commercial importance, for Russian scientists have invented a method of using peat fuel in the production of electricity.

The forest and marsh zone of European Russia is of peculiar interest historically, for it was in this less attractive region that the Slavs settled after the devastation of the fertile steppe by nomad Turkic hordes, and it was in this region that the Great Russian race consolidated the kingdom of Moscow, which afterwards re-absorbed the steppe. Here, too, various small minorities, Finnish and Turkic, were able to retain their national individuality even to the west of the Urals, and are now separate cultural units within the Russian state. The forests of this belt are subject to two forms of climatic zoning, a north to south zone related to temperature and a west to east zone related to decreasing humidity. The beech just makes an appearance in the Podolian bend of the Ukraine, but penetrates no further east, except in the moister regions of the Crimea and the Caucasus. The oak approaches, but

does not cross, the Urals, while the Siberian pine, larch and cedar penetrate from Asiatic Russia into the extreme north-east of European Russia.

Concerning north to south distributions, one notes that the oak appears south of a line drawn through Pskov, Kostroma, Kazan and Ufa, though islands of oak penetrate further to the north. Profitable production of apple, pear and cherry is roughly coincident with the oak belt. Hornbeam does not penetrate much beyond the northern boundary of the Ukraine, though maple and ash accompany the oak almost to its northern limit. The lime tree combines the two zones, preferring the east and not as a rule extending further north than lat. 62° – 64° N. Apricots and walnuts, on the other hand, prefer the west, reaching 50° N. lat. in eastern Ukraine and spreading further north to the west.

Coniferous Deciduous Zones.—The Siberian coniferous zone is characterised by its wider north to south extent, by the great fringe of stunted birch to the north, where trees a hundred years old may be but a few feet high and are thickly encrusted with lichens, and by certain distinct varieties of conifers, *e.g.*, the silver fir, stone pine and the Siberian larch. In the virgin forests of the valleys and lowlands of Western Siberia are larches, pines and silver firs, mingled with birch and aspen, while poplar and willow fringe the streams. In this region are the *urmans*, dense thickets of trees often rising from a treacherous carpet of thickly interlaced grasses, concealing deep marshes, impassable except in winter. In the south-eastern trans-Baikal region, under the influence of the drought of the Gobi steppe, the forest thins out. The distribution of spruce and Scotch pine, the chief trees of the coniferous forest, depends largely on the parent rock. Spruce grows best on clayey, but not boggy, soil and is therefore closely related to the distribution of glacial boulder clay, while Scotch pine spreads best on sand and peat.

In the Bryansk district, on the cretaceous marl and phosphorite sand, near the southern limit of the coniferous forest, spruce is found with an admixture of oak, Norway maple, poplar, birch and elm. Along the river valleys of the steppe are interesting southward-extending strips of forest, oak growing on the high right bank and Scotch pine on the low sandy left bank. On some soils where sand lies above clay, the spruce, which is tolerant of shade, grows among the taller pines. Pine forests occur on loess covered chalk on the right bank of the Volga and in Voronezh, Kursk and Kharkov, and with them are certain rare plants, possibly relics of the Ice Age. A general characteristic of the oak is that it does not tolerate complete podzolisation and requires greater warmth than spruce, thus it penetrates north into the coniferous zone along river valleys where the soil is warmer and less podzolised and gives way to spruce on the interfluvial clay-lands. The earliest agricultural development in Russia took place in the region of the heavy clay soil of Moscow, as the first period of relying on forest wealth for trade gave way to dependence on local cultivation of crops in view of the closing of the trade channel to the Black Sea and Caspian by Mongol invaders. Agriculture involved forest clearing by cutting or burning, more frequently the latter because the charcoal helped to make the soil productive. Before a good yield could be obtained, many years of careful cultivation and manuring were necessary, and the population constantly tended to drift to the more fertile black earth region, while of late years the population on the clay soils (podzol) has been more and more diverted from agriculture to industry.

Cereals, chiefly barley, rye and oats, with flax and hemp, potatoes and cabbages and recently grass and lucerne are the chief crops. Some wheat is grown, but not so successfully as farther south. Intensity of cultivation thins out markedly to the north and in Siberia hardly exists, the long severe winter and the liability to recurrent frost in spring being unfavourable. Timber exploitation and hunting of fur-bearing animals are of ancient importance. Cattle breeding and dairying are developed in many parts. Human settlement in the northern hunting, fishing and forest-products belt is usually along the river valleys and the shores of lakes and seas, the peat bog watersheds being uninhabited. On the glacial soils of the central watershed the valleys are humid and cold and settlement is on the warmer, drier morainic hills, where the season for

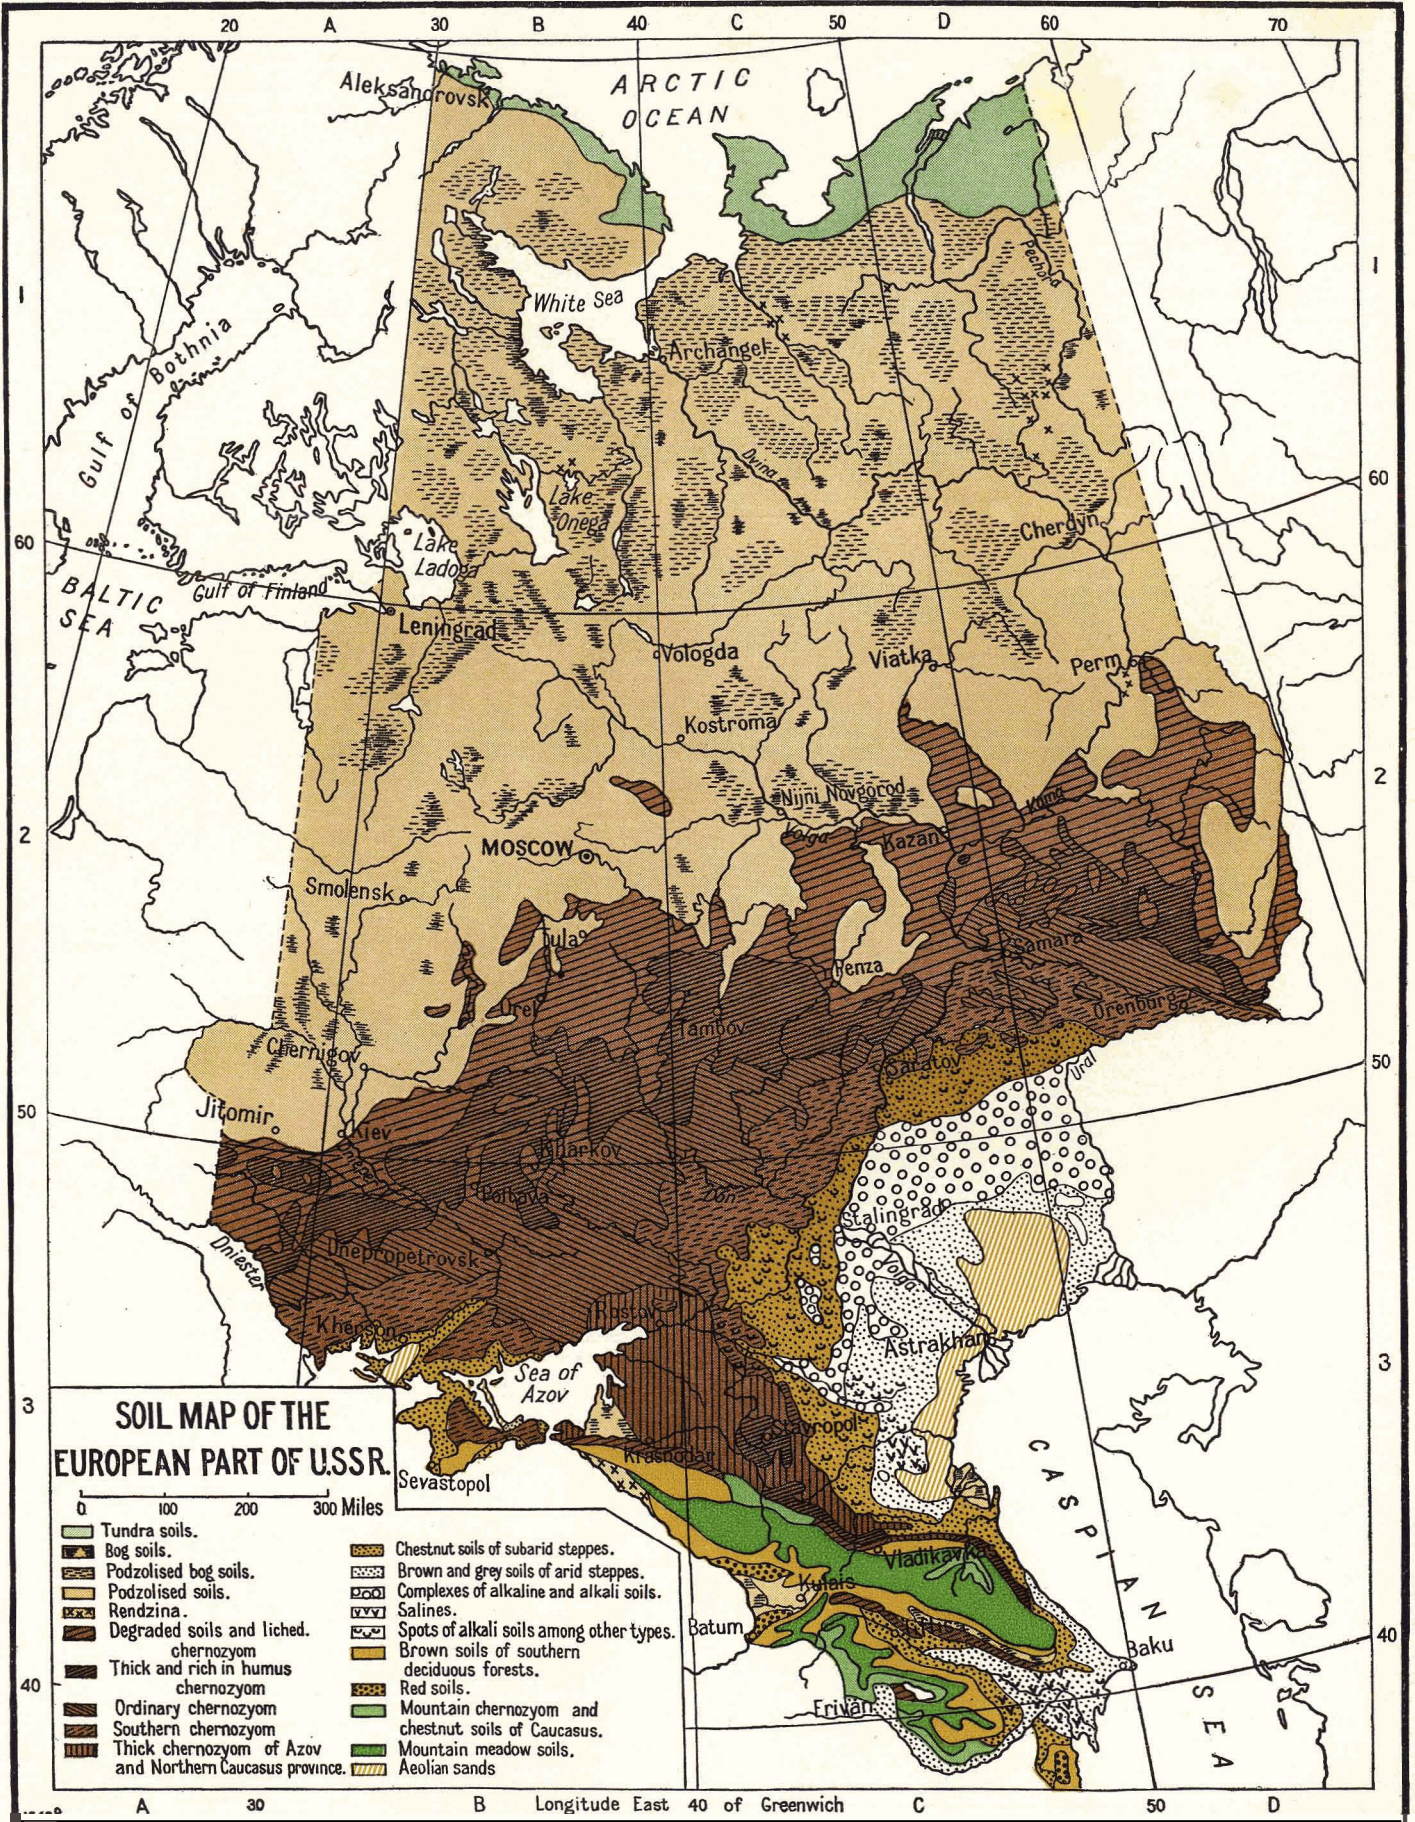

ripening crops is 10 days longer than in the valley bottoms. The podzol zone of Asiatic Russia is sparsely peopled in view of the severity of climatic conditions, and averages one inhabitant per square kilometer. This is a misleading way to put it since settlement is usually concentrated on the alluvial river strips and vast expanses of virgin forest have no settlements. Hunting and fishing are the main occupations, with cattle-breeding in the bog meadow belt lying east and west of the great bend of the Lena, on the alkaline podzol. Berry-bearing plants are found everywhere in this zone, whortleberry and arctic bramble spreading far into the north, while raspberries and currants form a luxurious undergrowth in many coniferous forest regions.

Black Earth.—The chernozem (black earth) formations lie south of the podzol forest zone. Their origin was a subject of much discussion in the early days of soil study, though Glinka states that the Russian peasant had long ago arrived at the conclusion now generally held that chernozem has been developed through the modification of an original material by the decay of animal and vegetable remains. Dokuchaiev in *The Russian Chernozym* (1883) enunciated the view now generally accepted. Owing to the wide extent of chernozem on loess, loess-like loams and loess-like clays it was once thought that chernozem was a humus-coloured loess. But chernozem is now known to occur on granites and andesites, on chalk, on Permian, Jurassic and other limestones, on Upper Permian marls, on Tertiary siliceous clays, and even on sands and sandstones, provided that the latter are rich in complex minerals.

The essentials for the formation of chernozem are high evaporation with consequent desiccation of the soil during summer (high temperature with a high saturation-deficit) and long freezing of the soil in winter. During winter, water accumulates in the soil and provides for luxuriant spring vegetation, this moisture being exhausted by the end of May or the middle of June. The resulting drought retards the decay of the steppe grass (*stipa*), whose strongly developed root-systems provide abundant humus. The essential characteristic of chernozem is its rich humus content, thick and rich chernozem yielding 10 to 13% or more in southern latitudes, and 6 to 10% in northern latitudes, 6 to 10% is also the average content of ordinary chernozem, while northern and southern chernozems yield 4 to 6%. The map shows that the central belt has the greatest humus content and that there is a decrease to north and south. During the intense summer evaporation there is a powerful ascending current of water in the soil, gypsum and calcium carbonates being deposited in separate horizons.

Morphologically a chernozem profile consists of an upper humus horizon and a horizon of carbonate accumulation. "Thick" when applied to chernozem denotes thickness of the humus horizon, though the limit of the underlying horizon is sometimes hardly distinguishable owing to its containing wedges, spots and veins of humus. It should be noted that chernozem is found on mountain slopes (*e.g.*, in Turkestan and Trans-Caucasia), the height at which it will occur being determined by the climatic conditions at the foot of the mountain. If forested podzol occurs in this region, no black earth will exist on the mountain, but if the mountain rises from desert or desert steppe, chernozem will occur on the mountain provided the altitude is sufficient.

Loess.—Loess, a fine grained porous deposit of material accumulated under the influence of winds blowing out from an ice-sheet across its marginal moraines, is widespread in South Russia and Turkestan. It gives rise to different soil types, the chernozem being carried farther into moist conditions on loess because the porosity of loess drains off the superfluous water. Under arid conditions grey semi-desert and desert soils are formed on loess. When moister and milder conditions of climate supervened during the "Atlantic" phase of climate after the great retreat of the glaciers, forests sprang up in the regions affected, though apparently less on loess than elsewhere. Under forest the humus was removed by displacement of sesqui-oxides and colloidal clay from upper to deeper horizons, the resulting soil being termed degraded or lichen (leached) chernozem. The map shows this belt stretching in a south-west to north-east direction in European Russia and

extending into Asiatic Russia as far as the Altai mountains, with a few patches further to the east as far as the trans-Baikal region. A tongue of it extends as far north as Perm and another tongue extends northwards on the left bank of the Vyatka. The oak forest is characteristic of the northern belt of degraded chernozem in European Russia and there are three stages of development, the belt where the forest spread at the expense of the steppe and was continuous until man interfered, the belt of island-like clumps of oak near the rivers, and the steppe belt, where forest is found in the ravines only and the plateau is left to steppe vegetation. This latter belt has had interesting historic relations; the Slavs took to the forested ravines and left the plateaux to the nomad grazers, and to the present day village settlements run continuously along the ravines. The proximity to river water was an attraction, though ravine streams often disappear in summer except after heavy showers.

On plateau land enclosed in the angle between two rivers, upland oak occurs (e.g., the Voronezh province oak used by Peter the Great for ship-building). Associated with the plateau oak forest are ash, lime, maple and elm. The fertility of the rich black earth is such that many years of continuous cropping hardly affects it and it is this zone which made Russia a famous grain-exporting region even in the time of Greek and Roman dominion. The islands and ravine strips of oak cease south of lat. 48° N., and of the line from the Stalingrad (Tsaritsyn) bend of the Volga to the Urals south of lat. 52° N. Patches of oak occur near the left bank of the Volga from the bend to 52° N. Thus the Pontic steppe was left free from forest and was a highway for nomad invaders. For types of agriculture, difficulties and history of the region see Ukraine and Black Earth Region (Central). In Asiatic Russia the railway runs through the chernozem belt where Russian settlement has been intense since the latter part of the 19th century. The more easterly extensions of the steppe black earth lie in the zone of recurrent droughts and terrible famines, and under stress of famine conditions the ancient tradition of persistent wheat sowing on the three-field system is giving way to cultivation of maize and potato and to many-field systems; irrigation schemes are also being developed.

Drought Soils.—Chestnut-colour, brown-desert and grey-desert soils are developed under conditions of insufficient moisture. The chestnut-coloured soil fringes the black earth zone on the south, and, since its humus content may be 3 to 5%, it is very productive if sufficient moisture is available, and is specially favourable to the production of the harder wheats. It demands careful working and much forethought, however, in view of its position in a sub-arid zone liable to irregular recurrence of drought. With increasing aridity alkaline and saline soils occur. Capillary rising of water to the surface and subsequent evaporation and deposition of salt cause the development of saline soils. Snow-white salt efflorescences of sulphates and chlorides frequently cover a soft friable "puffed" layer containing separate salt crystals. Irrigation of the *tugai* or flood plains of Turkestan has resulted in a distribution of salt on the surface and an evolution through puffed layers to a hard, grey, porous, loamy crust (*takyr*). The micro-relief of the saline soils in the Aralo-Caspian basin and in Turkestan has encouraged salt accumulation, salt collects in hollows containing brackish ground-water. Alkaline soils appear to be derived from saline soils through the diminution of salt content. This has an important bearing on palaeogeography, though Vilenski's suggestion that all alkali soils were saline before the post-glacial period seems to need modification.

Mountain Soils.—Mountain soils are of much interest since they show a vertical distribution bearing somewhat the same relation to zonal soil distribution on the plains as vertical climatic zones bear to latitudinal ones. The relation is complicated by rain and river denudation and by glacial erosion. For the forest and other zones associated with the Caucasus, see CAUCASIAN AREA, NORTH; GEORGIA; ARMENIA; AZERBAIJAN and DAGHESTAN. In the trans-Baikal and southern regions of the Far Eastern Area the mountain forest is linked in type with that of Manchuria. (See FAR EASTERN AREA.) In the Altai forest there is a relict oasis of the Tertiary deciduous forest.

Brown Soils.—The brown soils of deciduous forests differ from those of the arid steppes, which have a greyish tinge. Forest brown earths are formed under the influence of a temperate climate with fluctuations from year to year in the amount of rainfall so that the leaching of the soil, and consequently the humus content, varies. They have a neutral or slightly alkaline reaction and therefore readily dispersible humus bodies do not occur. Glinka and Ramann hold different views on the question of these brown earths, the former being doubtful as to the advisability of classifying them as independent soil types.

Red Soils.—The exact systematic position of the red soils in the Batum area is not definitely decided; they are not true laterite, though they may belong to the laterite type. In most cases the profile consists of a red and yellow coloured lower horizon and a brownish upper humus horizon. Glinka considers that the red-coloured and motley-coloured horizons of the Batum and Chavka soils are relict red soils from the Tertiary epoch, while the overlying more or less humus-coloured layers may be slightly podzolised soils. The probability of this hypothesis has been strengthened by the finding of similar relict soils in the Far Eastern Area, in the eastern Ural region, in the Kirghiz steppe and even in the centre of European Russia. These relict soils are partly subtropical red soils and partly kaolin-laterite, kaolin-bauxite and bauxite-laterite. Bauxite regions are important for the development of the aluminium industry. The red soils of the Batum region are very fertile and are specially suitable for tea plantations.

In conclusion it should be noted that Russian soil scientists, while regarding climatic zoning as a predominant factor in the formation of soil types emphasise the complicated interplay of other factors, parent rock, relief and its evolution, geological history, biological factors, and so on.

Dokuchaiev also considered that the age of the parent rock and the length of time during which soil formation in particular conditions had been in progress were both important factors, thus podzolisation tends to end in the production of podzol from chernozem, while saline soils represent the youthful stage of alkaline soils. The concept of finality is, however, very rarely tenable in the complex and interdependent relations of organism and environment.

POPULATION

The population of Russia, huge though it is, is small in comparison with the vast area over which it is spread, averaging about 18 per sq.m. This is partly due to the vast extent of land unsuitable for settlement, the great tundra expanse fringing the north, with the taiga belt south of it, and the huge deserts of Central Asia, and partly to the fact that Russia is an agricultural and not a manufacturing country. Dense agricultural populations exist in the monsoon lands of south-east Asia, but Russia lies too far north and is too much exposed towards the north to permit of all-the-year-round agricultural production, and therefore the possible density of her agricultural population is strictly limited by climatic conditions. The saturation point of agricultural population is, however, very far from having been reached. Many areas of land which could be cultivated are empty, and in the cultivated areas production is hindered by poor methods of farming the land, by the illiteracy of the peasant and by lack of transport facilities. Lack of transport facilities is perhaps the greatest drawback to agriculture: the effects of the construction of the trans-Siberian railway on grain-production and dairying were marked. Weak development of industry also limits agricultural progress, since large towns encourage a meat and dairy industry and intensive market-gardening. Russia has great mineral wealth and the construction of railways is increasing year by year so that her potential industrial development is great. The reasons for its retardation and for the poor stage of cultural development in the country and possibly even for the misgovernment and crises through which she has passed are partly historical.

It is to the Slav colonisation of the Russian plains and to the long Slav struggle with nomadic invasions from Asia that Western Europe owes her comparative freedom to develop a certain cultural unity. The rôle of buffer state was not voluntary, but the debt is none the less great, and the heroic struggle of the Slav races against repeated plunder and invasion, in hard climatic conditions, should command the respect and admiration of the world. Many times in the long history of recurrent plunderings and invasions, of terrible famines, of misgovernment, of enslavement at home and by Eastern races (serfdom existed till 1861 and even in the 19th century Russian slaves were sold in Oriental markets) the inhabitants of Russia must have felt what the 12th century historian records of the men of the Kiev steppe: "Men began to ask themselves whether life was possible under such conditions."

Vital Statistics.—The first Russian census, taken in 1897, recorded a population of 129,200,200. In 1926, in spite of the loss of some of its most densely peopled areas on the west, and of the deaths resulting from war and famine and the epidemics which followed in their wake, it numbered 146,989,460, and in Jan. 1939 it was estimated at 170,467,186. The birth rate is high, about 47 per 1,000, and the death rate, 30 per 1,000, is also high. Infant mortality is specially high, and it is calculated that 450 out of every 1,000 children born die within the first five years of life. The mortality of women in the prime of life has been high since the revolution. According to the 1897 census, the proportion of men and women was fairly even. In the 1920 census the ratio of men to women was 100:115.5, the excess of women being largely due to war deaths among men. In 1926, though there was much fighting in the period 1920-22, the ratio was 100:108. Professor Semenov-Tian-Shansky in an article "Russia: Territory and Population" in the *American Geographical Review* of October, 1928, attributes this to the loss of man power, which has resulted in burdening women beyond their strength. It may, however, be also connected with the prolonged food shortage, for nutrition is of vital importance to the expectant and nursing mother. An interesting phenomenon, possibly due to the greater liability of male infants to catarrhal disorders in a cold and damp climate, is that the numerical predominance of women in the 1897 census in European Russia was chiefly to the north of the line of the annual isotherm of 7° C.

The high mortality in Russia results from complex factors, amongst which are the general poverty, resulting in insufficient and monotonous diet, peculiarly unfortunate in a country where

resistance to climatic conditions demands food of high nutritive value, the lack of any medical help for large sections of the population, unhygienic conditions, including overcrowding in the cities and lack of sanitation and pure water supply in the country, and in many towns, and the general illiteracy of the population. This latter factor makes it impossible to instruct the population in methods of preserving health and avoiding the spread of the epidemic diseases so common in Russia. The complete absence of isolation hospitals in most rural districts and the custom of admitting animals into the huts for the sake of warmth in winter add to the difficulties of prevention.

In some districts, especially in the administrative unit known as the Central Black Earth Area, verminous conditions are rampant in the crowded peasants' huts and though the peasants consider their weekly steam bath a necessity, poverty compels them to resume their verminous garments. The Soviet government has achieved much in city centres in its struggle against child mortality: in Moscow the death rate fell from 23 per 1,000 in 1913 to 13 per 1,000 in 1925, this figure has declined chiefly since 1922 having naturally been high during the war and revolution. The mortality of children in their first year of life fell from 177 per 1,000 in 1924 to 135 per 1,000 in 1925. This has been achieved, in spite of wretched housing conditions, mainly through the establishment of crèches and maternity hospitals and through a campaign of pictorial as well as written instruction in hygiene. A darker side of the picture is the suicide record; between 1923 and 1926 the number of suicides in the U.S.S.R. increased by 50%. Progress in rural districts and in the autonomous areas and republics is necessarily slow and in some regions there are fewer medical facilities than previously. An interesting experiment is the recent establishment of a centre in Leningrad where men and women from remote areas receive instruction in the rules of hygiene and first aid so that they may return to their villages and thus act as pioneers. The gathering in Moscow of representatives from all parts of the U.S.S.R. every year for congresses must help to spread hygienic and cultural ideas.

Ethnic Groups.—In ethnographic character the population of Russia is remarkably varied. The Russian Academy of Sciences calculates that Russia is inhabited by 169 ethnic groups, divided into 10 major divisions as follows:—Indo-Europeans 36 groups, Caucasian (now classified as Japhetic) 40, Semites 6, Finns 16, Samoyedes 1, Turks 48, Mongols 3, Tungus-Manchurian tribes 6, Palaeo-Asiatics 9, and groups of tribes from the Far East, with an ancient culture 4. Of these one quarter have a yellowish tinge in the skin, the rest may be considered white, thus racially as well as geographically Russia is Euro-Asiatic rather than European.

Numerically Russians form 58.4% of the population, Ukrainians 16.6%, White Russians 3.1%, Uzbeks 2.9%, Tatars 2.5%, Kazaks 1.8%, Jews 1.8%, Azerbaijanis 1.34%, Georgians 1.33%, and Armenians 1.27%. No other nationality numbers 1%. Thus the three branches of the Slavs form 78.1% of the population, while no other nationality reaches 4%. On the whole Turkic tribes occupy the most important rôle after the Slavs. These ratios vary very much in different districts. The Slav population is most dense in European Russia, in Asiatic Russia it has spread in a dense belt along the cultivable prairie land lying south of lat. 50° N. as far as the Yenisei river, along which a ribbon of Slav penetration has reached the Arctic, following the same line as Ugro-Samoyede peoples of long ago; in the same way a ribbon of Slav settlements accompanies the Ural river to the Caspian. East of the Yenisei Slav colonisation is mainly in ribbons along the rivers, or in islands in mining districts or on patches of fertile soil. Similarly south of the main wedge of colonisation, islands of Slav settlement exist among the Turkic peoples. These Turkic peoples, Uzbeks, Turkmen, Kirghiz, etc., are most continuous in the Central Asiatic Republics, *i.e.*, in the region lying west of the Dzungarian Gate from Mongolia to Eurasia and thus being the first to receive the impact of Turkish invasions under the stress of Mongolian attack. The Tatar Republic of the Volga with Bashkiria to the south-east, represents the most north-westerly extension of a solid wedge of Turkic settlement. The Mongol

peoples are mainly to be found south and east of Lake Baikal; the Kalmuck region (*q.v.*) on the Lower Volga is a Mongol intrusion far to the west, separated from its original base by a wedge of Turkic settlement. The Yakuts of the Lena represent a north-eastern spread of the Turkic element, now much intermingled with Slavic blood.

The Finnic aboriginal population, Karelians, Mordva, Marii, Votyak, Permyak, Komi, and the allied Samoyedes, were increasingly pushed outward by Slav settlement. Finns are to be found mainly in the north and west, and also in a belt of Finnish settlement in Asiatic Russia, lying north of the main Slav belt and extending to the Yenisei, again much intermingled with the incoming Slav population. East of the Yenisei the Finns form an insignificant element in the population. The Finns have preserved their distinctive culture best among the forests and marshes lying south of the tundra zone, and along the central course of the Volga. East of the Yenisei, in the Yakutsk A.S.S.R. and in the Far Eastern Area are scattered groups of Palaeo-Asiatics and of Tungus, while a wedge of Korean and Chinese colonisation has extended northwards into the south-east of the Far Eastern Area. Remnants of early Iranian peoples exist in the Central Asiatic Republics. Scattered Cossack and trading settlements exist even in the tundra zone, and in Kamchatka. These Russian settlers have tended to amalgamate to a marked degree with the natives in a region where the difficulties of the environment made unity of human effort essential. An interesting feature of Russian settlement is the greater density of population in high latitudes in comparison with other parts of the world. This movement towards high latitudes has been given a recent impetus by the construction of the Murmansk railway.

Colonisation of Siberia.—The first attraction of northern Asiatic Russia was its wealth of furs. Fur merchants from Novgorod penetrated as far as Tobolsk and had, in the 14th century, established settlements on the Taz; they called the country Ugra. As Novgorod decayed, the Ostyaks destroyed the settlements. From the time when the Cossack Yermak, towards the end of the 16th century, captured Sibir or Isker on the Irtysh, the chief settlement of the Tatar Khan Kuchum, Russian hunters have exploited the fur bearing animals of its forests, partly directly and partly through barter with native hunters. The term *Cossack* under the Imperialist régime indicated a section of the Russian people liable to military service and receiving a monetary grant and arms from the government. Large stretches of land, usually on the frontiers, were reserved for them and they had a certain amount of autonomy. As an example of their formation it may be noted that Count Muraviev during his conquest of the Amur converted the Nerchinsk peasants into Cossacks in 1851. Government colonisation in early days consisted of sending parties of Cossacks to settle on the distant frontiers, of imperial guards (*stryeltsy*) to garrison the forts, and of *Yamschiks*, a special organisation of old Russia which arranged for the maintenance of horses at stations along the posting routes. The Cossack settlers did not form good colonising material, their interests being military and not agricultural. Cossack *ostrogs* or forts could hold sway over scattered native peoples, but could not at first conquer the settled Turkic regions of the south, so that the first colonisation was to the north and east where also furs were most readily obtainable.

The method of progression was by portages from one river to another. The Berezovo ostrog, famous later for its princely exiles, was founded in 1593, Tomsk in 1604, Yeniseisk in 1618 and Yakutsk in 1637. The most effective native resistance was offered by the Tungus who were only subdued in 1623, and who are now demanding autonomy. In the Yenisei valley and throughout south-west Siberia the settlers found traces of a former civilisation, usually called Ugro-Samoyed, the Uighurs being a Turkish race supposed to have over-run the country during the wanderings of the Huns. Tumuli with monoliths and containing iron and bronze implements are numerous, especially in the Minusinsk district and traces of former irrigation canals exist and are often utilised by modern settlers. A long line of Cossack forts extended along the Irtysh river from Omsk in a south-easterly direction as a

protection for settlers against Kirghiz tribes throughout the eighteenth century. Another government means of colonisation was exile, which is first mentioned in 1648, the first exiles being mainly criminals, often mutilated as a punishment. By the end of the 17th century a policy of exile as a means of colonisation had set in and men were sent to Siberia for the most trifling offences, especially after the introduction of convict labour into the mines. In 1753 capital punishment was abolished and perpetual exile to hard labour in Siberian mines took its place.

Raskolniks (religious dissenters from the reforms of Nikon), rebel *stryeltsy* under Peter the Great, courtiers of rank during the reigns of the empresses, Polish confederates under Catherine II., the "Decembrists" under Nicholas I., nearly 50,000 Poles after the insurrection of 1863, and whole generations of socialists, including 45,000 political exiles after the 1905 rebellion, were sent to Siberia. In early days they were driven in herds from one village to another and often starved by the way, but in the 19th century somewhat less brutal conditions were organised. Between 1823 and 1898, no fewer than 700,000 exiles with 216,000 voluntary followers entered Siberia. In 1900 exile as a means of political persecution was abolished but was restored in 1904 and is still used. Some political exiles added to the cultural development of the country. The brother of Prince Kropotkin, whose researches in Siberia are well-known, arranged the remarkable archaeological museum at Minusinsk. Bogoras conducted research in the Chukchee country and the Decembrists built the town of Chita, but others either died of the hardships to which they were exposed or developed melancholia, and suicides were common. The *raskolniki* as a rule made good settlers being ascetic, industrious and abstemious. The *skoptsy* sect introduced agriculture and better standards of living into Yakutsk. *Brodyagi*, or escaped convicts, were a menace to settlers and natives alike.

Free Settlers.—The free settlers, however, have played the most important part in colonisation. In the first instance, they were runaway serfs, or fugitives from religious persecution and conscription, and thus they went into more remote parts to avoid re-capture. Many intermarried with the Buriats or Yakuts, and often adopted the language of the natives. Their descendants are called *Siberiaks*. The Russian government did not support voluntary emigration until after the abolition of serfdom in 1861; till that year it was a crime for a peasant to leave his native soil.

After the Russo-Japanese war, emigration set in intensively, and 350,000 families were settled between 1909 and 1913, while in 1913 the number of settlers was 234,877. There has been a marked decrease in the number of immigrants who return, with the exception of those going to Yeniseisk and Irkutsk, where climatic conditions reduced the colonists to destitution. During the general disorders of 1917 to 1922 colonisation ceased, but is reviving now. In 1925 a special commission of the Soviet government drew out a five year plan for settling 1,200,000 colonists in Siberia, and rebates from taxation and exemption from conscription are offered to suitable settlers. Many fishermen from the declining Caspian fisheries have been settled in the Far Eastern Area and encouraged to develop a winter lumbering and a summer fishing industry. But colonisation now is of a different order; the more accessible lands have been settled and the rate of further colonisation will depend upon the development of road construction. Much of the vast forest wealth is at present locked up through lack of transport facilities.

The town population in the colonized areas has grown with the rapidity characteristic of American development, *e.g.*, Novo-Sibirsk (formerly Novo-Nikolaevsk) had a population of 5,000 in 1897 and of 278,000 in 1933; Omsk had increased from 37,470 to 281,000 (1939) and Vladivostok from 28,896 to 206,000 (1939).

Towns and Settlements.—According to the 1926 census, thirty towns had populations of over 100,000, and these all showed marked increases on the 1897 population with the exception of Odessa, which has been adversely affected by the diminished trade in the Black Sea and by the severance of Bessarabia.

Two, Moscow 2,018,286 and Leningrad (Petrograd) 1,611,103, were over a million according to the official census of 1926. Kiev,

Baku, Odessa and Kharkov had more than 400,000 inhabitants, Tashkent and Rostov-on-Don had more than 200,000.

According to the census reported on Jan. 17, 1939, 11 cities had a population of more than 500,000: Moscow (4,137,020), Leningrad (3,191,306), Kiev (846,295), Kharkov (833,434), Baku (809,349), Nijni-Novgorod (Gorki) (644,118), Odessa (604,225), Tashkent (585,007), Tiflis (519,175), Rostov-on-Don (510,255), Dnepropetrovsk (500,255). The long struggle against the nomads is reflected in the type of Russian towns; the most ancient military settlements having been surrounded by wooden turreted walls; later the centre of the town was built of stone and has often retained its name of *kreml*, kremlin or keep.

These ancient military centres and the later Cossack *ostrogs* to the south and east still retain their concentric forms and radiating streets.

A few towns of the west while under Polish-Lithuanian rule obtained the Magdeburg rights, notably Kiev in 1499, and traces of Germanic influence, such as tiled roofs, still remain. No chartered towns arose in Muscovite Russia. At the beginning of the 19th century, town formation began to be of an economic character, either factory or railway centres. An interesting illustration of the importance of the present Soviet All-Union Congresses in Moscow is the fact that the towns of Eastern Siberia have a higher cultural level than those of Western Siberia, because the merchants from the east traded in small bulk, but valuable goods, e.g., gold, fur and tea, and therefore visited Leningrad, Moscow and Nijni-Novgorod, while those of the west, trading in heavy bulk and cheaper goods did not travel further than Irbit, and thus missed higher cultural influences. Most of the ancient towns of European Russia bear strong traces of Byzantine influence in their architecture; the Ukrainian stone tracery is distinctive. A marked feature of Russian towns is the appearance, on the outskirts, of the low wooden house of the same type as the peasant *izba*. The smaller towns are distinguished by the great width of the main street, which in spring and autumn is often a sea of mud. The ancient oasis towns of Turkestan now usually consist of a new Russian garden city and the ancient city with its winding narrow lanes and ruins of Mohammedan palaces and *madrasas*.

Samarkand, since it has become the administrative centre of Uzbekistan, is regaining some of its former importance. An interesting effect of the 1917 revolution has been to give an impetus to those towns which became the centres of administrative units with local autonomy. The housing shortage in Russian towns is acute: many towns suffered war damage and in addition wooden houses were torn down for fuel during the disastrous 1920-1922 period. Climatic conditions sharply limit the building season and add to the difficulties caused by lack of capital and shortage of building materials. In the case of areas where no town settlement existed e.g., the Karachaev, the Central Government provided funds for building a town. Modern sanitation and good water supply are still lacking in most Russian towns and in some of the smaller towns the streets are not even swept. Many small villages remote from the railway, and on such bad roads that communication is difficult, remain in a very primitive condition and are popularly known as "bear corners." Incidentally bears and wolves are still a menace in districts not far removed from Leningrad, and their numbers increased during the war and famine. Semenov divides rural settlements into three main groups. Those in the northern zone stretch in ribbons

and the lakes and seas, and leave the peat-bog watersheds uninhabited. On glacial soils settlement tends to be on the clayey morainic hills, since the valleys are damp and frosty because of inversion of temperature. In the steppe black earth zone settlements strongly reflect historic conditions; nomad raiders grazed their flocks on the watershed and the Slavs took to the wooded valleys. These settlements are large and stretch in almost continuous belts along the higher banks of the streams; another factor in this valley settlement was the difficulty of sinking wells on the watershed. Though settlements in the north-west are smaller and the region is less densely peopled, yet they are always compact, partly because of the necessity for warmth and partly

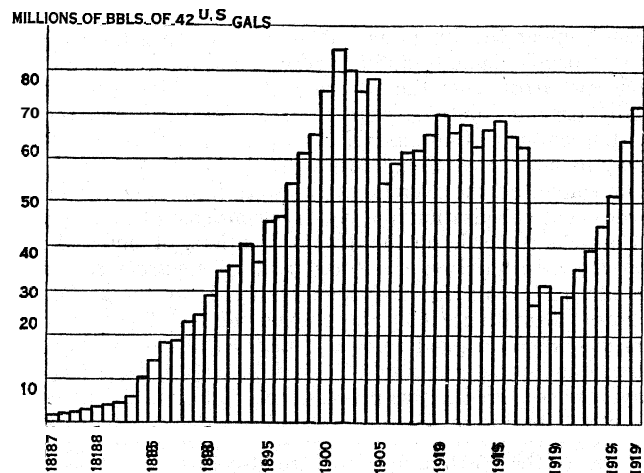

through the need of co-operation against wild beasts.

AGRICULTURE AND INDUSTRIES

Russia is essentially an agricultural country, about 83% of the population being non-urban, and about 7.5% being engaged in large-scale factory industry. Cattle-breeding and dairying are poorly developed, though the growth of the dairy industry since its introduction into Siberia in 1893 has been phenomenal. With better transport facilities many meadow land areas could develop into dairying regions. Improvement of communications, increasing social and economic exchanges, have been a condition precedent to most of the greater developments of social and economic life in the past and is now of more importance than ever. Owing to poor transport conditions lumbering is little developed in spite of Russia's great forest wealth in the taiga belt and the mixed deciduous region to the south of it, in the Caucasus and in the Far Eastern Area. Many stretches of forest have been wasted through forest fires and through neglect, leading to disease and decay. Since 1921 active policies of railway repair and construction, of improvement of waterways, of re-forestation, especially in belts round the drought areas and in the upper courses of streams have been carried out. Legislation for the prevention of forest fires has been introduced and the great development of electrification and of the use of peat fuel has lessened the use of wood fuel and so freed timber for export. In 1926-7 the income from timber export had reached five times that of 1913, in spite of the loss of some valuable timber-bearing regions in the west.

Hunting.—Closely linked with the lumbering industry is the hunting of fur-bearing animals, originally almost entirely in the hands of native tribes exploited by Russian merchants. To-day much hunting and trapping is carried on by the Russians themselves, though the natives still take their share and in 1925 a congress of native hunters in the Far East met to discuss better methods of hunting and of barter. In some regions hunting is a

GRAPH SHOWING PRODUCTION OF CRUDE PETROLEUM IN RUSSIA, 1876-1927

The production in 1927 (72,400,000 bbl.s.) was 5.86% of the total world production, ranking Russia second to the United States among the oil-producing countries

supplementary winter occupation for the peasant cultivator, e.g., Cherepovetz and Tomsk; in others it is the main support of the Russian settler, e.g., Tobolsk. The furs of greatest trade importance, in order of total value, are squirrel, wolf, ermine, hare, fox, skunk, bear, marten, Siberian skunk, lynx, wild cat and sable. Beavers and seals are also hunted. It will be noted that the sable, once so numerous, has been almost exterminated by ruthless exploitation. Closed seasons are now enforced and a farm for fur-bearing animals has been established in the Far Eastern Area on American lines. Wild birds are numerous in the marshes and round

the lakes and form a supplementary article of diet, as do the fish in the lakes and streams.

Fishing.—The Caspian fishing industry is still important, caviare forming an export article, but it has much declined owing to ruthless capture of young fish and destruction of roe for caviare. Many unemployed fishermen from the Caspian have been settled in the Far East and are combining winter lumbering with summer fishing. The Pacific fisheries suffer from lack of refrigerators and ice trains. The North Sea cod and cod-liver oil export is developing, and since the construction in 1917 of the railway to Murmansk the difficulties of migration northwards for seasonal fishing have been diminished and it is hoped that here too lumbering may develop as a winter occupation for the fishermen. The fact that 88% of the fish is salted or dried, 2% canned and only 10% frozen militates against its export value.

Bees-keeping, like hunting and fishing, is an ancient occupation and, recently, Russian settlers have introduced it into the Far Eastern Area. About two-thirds of the honey and bees-wax produced reach the market, the rest being consumed by the producers.

ECONOMIC DIVISIONS

The Soviet government has classified the regions of Russia on an economic basis.

(1) In the North-West Area of Russia, which includes Murmansk, the Karelian Republic, Leningrad, Cherepovetz, Novgorod and Pskov provinces, there is little agriculture owing to unsuitable soil and climate; and the population relies mainly on lumbering, saw-milling, hunting and fishing. But these are not sufficient to maintain the peasants all the year round, and many migrate southwards seasonally to work at the river ports as freight hinds during the open navigation season. Peasant industries supply local needs of homespun, leather and wooden articles, and pitch and tar are extracted in a primitive way. Agriculture is poorly developed and relies mainly on the old three field system, rye, oats, barley, potatoes and flax being the chief crops. Cattle, horses, sheep and pigs are bred. Bog-iron ore is worked and bauxite for aluminium near Tikhvin, but otherwise no mineral wealth is exploited. Flax production is specially developed in Pskov and cabbages and root crops are everywhere grown, cabbage soup forming a staple article of peasant diet. Experiments at the Murmansk Institute of Applied Botany show that potatoes and turnips thrive well north of the Arctic circle. The diminishing yield is inducing peasants to take to manuring and more intensive agricultural systems. Near the town of Leningrad vegetable growing and cattle breeding to supply the town meat market have developed. Factory industry is confined to the town of Leningrad (*q.v.*). Flax production, which demands heavy labour, is not developed near the town, since surplus labour is attracted to the factories.

(2) In the North-Eastern Area, which includes Archangel, Vologda, the North Dwina province and the Autonomous Komi or Zirian Area, there is much tundra with nomad reindeer breeding by native tribes. The timber wealth is great, especially in the basin of the Pechora and huts are everywhere built of wood; lumbering is the chief occupation of the people, with hunting and fishing as a supplementary source of income. In Kholinogory cattle breeding has been important since Peter the Great started the industry by importing breeds of cattle from Holland, and Kholmogory supplies Leningrad with veal. Dairying is important in Vologda and is of an export character, though it is hampered by lack of transport facilities. In consequence of the severe winter, cultivation is little developed, flax growing is of an export character and rye, oats and barley are sown, but grain has to be imported. Forest clearing by burning and subsequent sowing of crops still goes on here as in very ancient times, especially among the Finnish tribes. When the area thus cleared loses its fertility it is left to grow wild again and a fresh patch is cleared. Peasant industries include the preparation of pitch and tar for export through Archangel and the making of homespun linen and of every variety of wooden article. During the summer many peasants migrate to Archangel to work as dock hands, and to the North Sea fisheries. The coal, graphite, salt, naphtha and lead of

the region are as yet unexploited.

(3) The Western Area includes Smolensk, Briansk, White Russia and part of Pskov, Tver and Raluga. Cultivation is the main source of livelihood, flax, potatoes and grass crops are increasing and in several regions the three field system has died out, though in others it still prevails. Winter rye and oats are the chief grain crops, but grain has to be imported, and agriculture is insufficient for the needs of the people, so that in some areas 35% of the peasants are unemployed and wander seasonally in search of work. Drainage of the marshes is being undertaken on a large scale as a relief measure. Cattle breeding and dairying is important and Yorkshire breeds of pigs have been imported with a view to developing a bacon industry. Lumbering and industries dependent on it are important; there are cardboard and paper factories and a match industry depending on the ash forest. Glass and pottery manufactures are developing and in the south-east iron ore and coal are mined and there are smelting works. Phosphorite beds exist, but are little worked at present. Huge peat resources exist, and electrification dependent on them has recently been developed. Peasant-made wooden articles, including sleighs, carts, boats, plates, etc., are exported to other regions.

(4) The Central Productive Area includes Moscow, Vladimir, Ivanovo-Voznesensk, Tver, Yaroslavl, Kostroma, Ryazan, Kaluga and part of the provinces of Nizhegorod and Tula. This is the region of the great textile industries, cotton, wool, linen and silk, and factory life is more strongly developed here than anywhere else in Russia. The manufacture of food stuffs, metal and metal wares, the preparation of furs and sheepskins and of leather goods are other industries of the region. The chief cities are Moscow, Tula, Yaroslavl, Ivanovo-Voznesensk, and Tver, all with populations of over 100,000, and there are numerous smaller factory towns. Coal is worked in the south, iron in the south and south-east and phosphorite from the beds lying to the north-east of the coal field. A difficulty of the region was the inadequate fuel supply, but the Soviet government has erected several electric power stations working on peat and local coal which cheapen production by lessening the freightage cost of fuel.

A great part of the region is purely agricultural, and in the northern area agriculture has developed recently on modern lines, with a many field system, efficient manuring and up-to-date implements, but in the south it is still in a backward condition. The proximity of Moscow, which makes it easy for agronomical experts to help the peasants, has led to this more intensive development. The chief crops are winter rye, oats, potatoes, flax, barley, millet, buckwheat, hemp and summer wheat. Horses, cattle, sheep and pigs are bred. The grain supply is insufficient for the needs of the towns. Vegetables, pears, apples and currants and berries are grown to supply the town markets and meat, milk and dairy produce also depend on town demand. It was on the morainic boulder clay soil of this region that agriculture first developed among the Great Russian settlers, and it is interesting to note that manufactures are now replacing agriculture, in much the same way as agriculture formerly replaced reliance on trade in furs, honey, wax and slaves. Forest still covers 40% of the area, which is a transition zone from coniferous to mixed deciduous, which thins out in the south. Lumbering and industries dependent on timber occupy part of the population. Peasant industries, mainly conducted in *artels*, or co-operative groups, are very strongly developed and the factory textile industry has its origin in the early skill of the peasants in making homespun.

Millions of people are thus occupied and their products are sold at the Nijni-Novgorod fair; each district has its speciality. Footwear is made in Tver province, homespun linen in Yaroslavl and Kostroma. The latter province is also famous for its wooden spoons and its bast work (especially the bast shoes worn by peasants), small wooden articles, and for small silver, pewter and brass articles. In Nizhegorod wooden goods and felt boots and caps are the chief products. The Pavlov district is famous for its locks and the Vorsm district for knives. In Moscow province the peasants are noted for their skill in making furniture, pottery and toys, and Tula samovars (tea urns) are famous all over Russia. The development of peasant handicraft, called *koustar*, is very

strong here and is attributable partly to the six months' winter, when the peasant naturally found some other outlet for his energies since outdoor work was impossible, and partly to his need to supplement his scanty income from agriculture. Moreover the weak development of factory industry and the poor transport conditions made the peasant dependent on his own resources for clothing, utensils and other necessities. The Tsarist government encouraged peasant industry and established training schools for craftsmen. The industry declined sharply after the recent war and famine years, owing to lack of raw materials and to the peasants' lowered stamina. The Soviet government has organized peasant co-operatives, unions and artels, and is now developing these industries, as their importance for the peasants' life in view of the present small factory output is very great. Many peasants migrate to the Volga as boatmen and dock hands during the navigation season.

Lumbering and Peasant Industries. — (5) The Vyatka-Vetluga Area includes Vyatka, the autonomous Votyak and Marii areas and part of Nizhegorod and the neighbouring provinces. Much of it is covered by continuous coniferous forest, with Siberian larch, cedar and silver fir in the east, and there are vast expanses of moss covered bog. Flax, winter rye, oats, barley, buckwheat and potatoes are grown in the small area cleared of forest. Homespun linen of a coarse kind is made into flour sacks for the Nijni-Novgorod fair, but most peasant industries supply local needs only in view of the poor transport conditions and the distance from markets. Iron and silver are mined in the east and the working of the phosphorite beds on the upper Vetluga has developed markedly in the last few years. Sheep are reared, especially in Vyatka, where pig breeding and bristle export is developing, and there are some horses and cattle.

(6) The Uralsk Area is described in a separate article. According to the State plan the Bashkir republic and the south-east of the Votyak Area are included in (6). Hunting and lumbering are the chief occupations in the north, where the climate is too severe to admit of agriculture. Among the Finnish Voguls of the forest fringe the primitive system of sowing crops in a clearing till it is exhausted and then migrating still goes on. In the south on the clayey and sandy chernozom, agriculture is the chief occupation, though years of drought bring terrible famines, as in 1921. Winter rye, summer wheat, oats, buckwheat, millet, potatoes, barley and flax are the chief crops. Bee-keeping is everywhere an important supplement to agriculture. Mining and metal working are strongly developed in the central region and in some parts of Bashkiria. (See Uralsk Area and Bashkir Republic.)

(7) The Central Volga Area includes Ulianovsk (Simbirsk), Penza, part of Nizhegorod and Saratov, the Tatar republic, and the Chuvash republic. Most of the region lies in the fertile chernozom belt, though podzol is found in the north, and in the drought area of the south-east the soil is chestnut coloured, fertile if a sufficient water supply is available. Agriculture is the main occupation. Methods and implements of the peasants in many places are extremely primitive, but the shortage of horses and working cattle after the famine has led to the introduction of tractors in some places. Some model farms have been established and efforts are made to spread new methods and the use of drought-resisting seeds; progress in this respect is slow among the illiterate peasants, though the terrible lesson of the famine has somewhat quickened the change. In good years the region produces a surplus for export. The chief crops are rye, wheat, oats, millet, potatoes, hemp, flax and sunflower seed. The latter is used mainly in oil pressing factories, but the chewing of sunflower seeds is a widespread custom among the peasants. The area under potato and sunflower seed has markedly increased since 1921; the potato stands the spring drought well. Apples, cherries, berries and currants are cultivated on the high right bank of the Volga, and melons, watermelons and cucumbers are grown. Sheep and pigs are bred and have reached pre-war numbers. Factory industry consists exclusively of the making of food products, e.g. flour-milling, distilling, preserve and fruit syrup manufacture, etc., and of products depending on stock raising, leather goods, soap, tallow, etc. Combustible slates are found near Zhigulyakh and asphalt is prepared. The electric

station at Syzran works on combustible slate. In summer the peasants are employed on the Volga steamers and as dock hands and fishing then supplements their diet. Poultry breeding is well developed in some parts. Peasant industries include the preparation of foodstuffs and leather goods and the making of homespun, especially woollen goods. There is some forest, but lumbering is a minor industry, though the making of wooden goods, partly dependent on imported timber, is a peasant industry to supply local needs. The phosphorite beds of the south and west are beginning to be exploited to supply the need for manure emphasized by the cattle and horse shortage since 1921.

(8) The Ukraine (*q.v.*) with the Moldavian A.S.S.R. forms a separate region.

Mining. — (9) The Southern Mining Area includes the eastern half of the Ukraine, the Crimean republic and the Rostov-on-Don district of the North Caucasian Area. The mineral wealth of the region is increasingly exploited and includes the Donetz coal and anthracite beds, the famous Krivoi Rog iron district, and that of Kertch, the rock salt of Artemovsk (Bakmut), the manganese beds of the right bank of the Dnieper, with some graphite on the Dnieper and mercury at Nikitovka. Smelting and manufactures of metal goods and machinery have developed and there is a large industrial population. Electrification dependent on the falls of the Dnieper is nearing completion, and other electric plants are working on anthracite dust, peat, fuel, etc. But even in this region the majority of the people are engaged in agriculture on the fertile chernozom and the less fertile, but still productive chestnut-coloured soils of the south. Large scale agriculture with motor-driven tractors and up-to-date implements and methods is a feature of the region. The chief crops are wheat, barley, rye, oats, buckwheat, potatoes, maize, millet and sunflower-seed and sugar beet. Fruits, especially the vine, and apricot and peach in the south grow well, the chalk soil of the Crimea is specially favourable to vineyards. Flour-milling, wine-making, drying and preserving of fruits, macaroni and tobacco manufacture are extensively carried on, and there is some sugar-refining. Fishing and the preparation of salt from the *limans* are carried on in the coastal areas. Most of the steppe has been ploughed, but in the region between Rheron and Perekop the virgin steppe, with its wealth of flora and fauna, remains untouched. Ostriches are bred here. The natural steppe vegetation of much of the area provides grazing for vast flocks of sheep and herds of cattle, and wool, leather and meat are produced in quantity.

Peasant industries are less developed here in view of the shorter winter and the better agricultural guarantee for the peasant. Health resorts dot the *limans* of the Black Sea coast with their curative muds and the southern shores of the Crimea, where the climate is mild and the beech and pine forests fringe the mountain slopes. The seasonal nature of the grain crop and the variable quantity of the amount for export, depending on recurrent spring drought, have created a class of unemployed dock hands in the seaport towns.

(10) The Lower Volga Area consists of the Saratov province, the German-Volga republic, Stalingrad and Astrakhan provinces and a small part of the east of the North Caucasian Area. The area is sub-arid, and the soils vary from chernozom in the north to the salted light brown clays and sands of the semi-desert and to the desert near the Caspian Sea. Steppe prevails in the region except for a little forest in the north on the right bank of the Volga.

The population diminishes markedly from north-west to south-east, in dependence on increasing aridity. The only mineral wealth of the region is the salt of the Elton and Baskunchak lakes. Factory industry consists of the steam flour-mills of Saratov, the metal works, including manufacture of agricultural machinery, at Stalingrad (Tsaritsyn) and numerous sawmills working on timber floated down the Volga from the north. Agriculture is severely hampered by drought and by the prevalence of weeds due to the primitive fallow system. Moreover the lack of transport makes it impossible to export the surplus of wheat in good years and difficult to help the scattered population in years of drought and famine. Since 1921 efforts have been made to encourage the sowing and use of maize, which is drought resisting and which would

provide winter fodder for cattle and sheep. Wheat and rye are the chief crops, and oats, millet, barley, sunflower seed and potatoes are grown. The vine, apricot and other fruits are grown on the alluvial well watered banks of the Volga, and melons, water-melons, cucumbers and vegetables are also cultivated. Mustard resists drought well and is increasingly sown, especially in the German Volga republic, where agricultural methods are better and where irrigation works are being extensively constructed. The Kalmucks of the right bank steppe of the Volga are still in a nomadic stage. Sheep-rearing is their main occupation, but they make no provision of winter food or shelter for their flocks and many die of hunger in that season or perish in the terrible wind and snowstorms (*burans*) to which the steppe is liable. The fishing industry of the lower Volga and the Caspian provides seasonal occupation for the peasants, but has diminished markedly as a result of careless exploitation. Many peasants are seasonally employed on the Volga steamers and as dock labourers. The making of homespun woollen and felt goods, and of articles of household necessity is a peasant industry to supply local needs, but the peasant cotton weaving of the German Volga republic has an export character.

(11) The Central Black Earth Area. (See BLACK EARTH.)

The above regions cover European Russia and the Ural and pre-Ural Area of Western Asiatic Russia. The North Caucasian Area is described in a separate article. The varied nature of the occupations of trans-Caucasia is described under the separate republics of Armenia, Azerbaijan, Daghestan and Georgia, with their dependencies. In Asiatic Russia there extends north and south of the railway as far as the Altai a belt of grain cultivation and intensive dairying. (See SIBERIAN AREA.) Kazakstan (*q.v.*) is a region of mixed agricultural and semi-nomad stock-raising. In the Central Asiatic Republics, especially in Uzbekistan and Turkmenistan, cotton, grain and fruit growing, dependent on irrigation from glacier fed streams are the main occupations, with craftsmanship in metal, and in textiles such as silk and carpet weaving, as subsidiary occupations. To the south-west of them are the thinly peopled mountain republics and autonomous areas of the nomad and semi-nomad hill tribes. The Buriat-Mongol republic (*q.v.*) shows an interesting combination of mining, semi-nomad cattle-breeding and settled agriculture along the sheltered river valleys. The north of the Siberian Area (*q.v.*) and the whole of the Yakutsk republic (*q.v.*) lie in the tundra and taiga regions and have sparse native populations depending on fishing and hunting, many being reduced to an exclusive fish diet, often none too well preserved, for the winter months. Russian traders and hunters are scattered in small settlements, and in Yakutsk there is some cattle breeding on the podzol-alkali patch east and west of the town of Yakutsk. The Skoptsi, religious refugees, settled in and near Yakutsk and have succeeded in growing vegetables and scanty grain crops. There are also Russian mining settlements in Yakutsk and in the Far Eastern Area. For the complex life of the latter see FAR EASTERN AREA and KAMCHATKA.

COMMUNICATIONS

The development of Russia is severely handicapped by poor transport conditions internally and by the lack of ice-free ports. Batum on the Black Sea is open all the year round but is far removed from the main centres of activity, and the Black Sea is limited commercially by its semi-inland character. Murmansk on the Arctic is open all the year round and efforts have been made to develop it since 1917, when a railway was constructed linking it with Leningrad, but the increase of cost due to the long railway journey from Leningrad or the Central Productive Area is serious. When the railway line, now under construction, linking Kotlas with Murmansk via Soroka on the Gulf of Onega, is completed, trade from the Urals may go through Murmansk, though freightage costs for the long railway journey will raise the price of goods. Leningrad, Russia's chief outlet to Western Europe, is frozen from late November or early December to April. Vladivostok, at the extreme south of Russia's Pacific coast can be kept open by the use of ice-breakers, but it is, of course, far too remote to serve as an outlet for European Russia, which must

thus depend to a great extent on trading agreements with the countries to the west for her export and import trade.

Recently an attempt has been made to revive trade with Northern Asiatic Russia via the mouths of the Ob and Yenisei and in 1928 a Kara Sea trading expedition, consisting of 3 British and 5 Norwegian vessels left Hamburg carrying agricultural machinery, metals, drugs and coal to exchange for timber, flax, cow-wool, hides and horsehair brought along the Ob and Yenisei. (See URALSK AREA for future plans.) Inland communications in Russia

A TRANSPORT TRAIN CROSSING THE STEPPES IN SOUTHERN RUSSIA

are very poorly developed. Professor Semenov-Tian-Shansky points out that through a third of its territory transport is still effected by means of dogs and reindeer, through about a sixth by camels, through about a half by horses and oxen and in some southern areas by mules, asses and buffaloes.

Railways.— West of long. 50° E. and south of lat. 60° N. a network of railways has developed, but to the east and north of this region railways are mere trunk lines with no radiating network. Even in the region mentioned the railway net leaves vast areas untouched, the best served areas being those in the immediate vicinity of Moscow and Leningrad. Moreover the services on these lines are inadequate for the growing needs of population, industry and agriculture and vast sums must be expended before adequate provision of rolling stock is made. The markedly seasonal climatic régime in an agricultural country results in congestion and choking of the railway net after the harvest, and much forethought is needed to prevent wastage. Ice wagons and cold storage facilities are very little developed and so the fishing and dairy industries suffer. Grain may be held up in Siberia by lack of transport at a time when famine in other districts makes it urgently needed. Road and railway construction in the past was mainly dominated by strategic considerations in an empire slowly pushing its way among hostile tribes. This period of eastern and southern expansion has ceased and the present government finds itself free to devote its resources to consolidating and developing communications from an economic and social standpoint, but is hampered by the general poverty of the country. Energetic measures have, however, been taken and many miles of new railway have been opened and are under construction.

The most important development contemplated is the linking of the grain producing area of western Siberia with the cotton growing Central Asiatic Republics by a branch of the trans-Siberian railway going southwards from Semipalatinsk, and a great part of this line is now under construction. Its effect will be to increase the area under cotton by reducing grain sowing for local needs. In view of this link, textile factories are being built in Uzbekistan so that cotton goods may be supplied to Siberia by this shorter route instead of the more expensive Moscow route, which involves transit costs for raw cotton to Moscow and for cotton goods back to Siberia. Pressure on railway freightage in European Russia will thus be relieved.

River Transport.— Though the network of rivers is great, river transport in Russia suffers from the long seasonal pause due to winter frost and also from the shallowness of many streams and rivers during late summer. The great rivers of Asiatic Russia, with the exception of the Amur, either flow into the Arctic or the Sea of Aral. The Volga, the most important channel of river traffic in European Russia flows into the closed Caspian Sea, though this disadvantage is somewhat compensated by its useful-

ness for export of naphtha from Baku. The canal now under construction to link the Volga and the Don is the first stage in a projected scheme for linking western European waterways with Asiatic Russia and Vladivostok. Increase of the canal links and deepening and improvement of the rivers is specially important economically in view of the heavy freightage costs of rail carriage in a country of such vast dimensions, but this development is in an initial stage only and it must be many years before it becomes effective.

Roads.— Road communication, so essential for cultural and social development, as well as for transport of goods, is peculiarly bad in Russia. Apart from the fact that the majority of roads are so badly constructed that they become impassable during spring and autumn, just when they are specially needed owing to the blocking of rivers by floating ice, so that neither sledge nor boat communication is possible, they are altogether absent in many districts. It is calculated that the loss to the state through the bad condition of roads is not less than 350 million rubles per year, while a further 200 millions is lost through spring and autumn closure. The number of motor vehicles in Russia in 1927 was estimated at 12,000; this should be compared with the fact that the United States, a smaller country with better railway transport, had more than 23 million motor vehicles in 1928. It is sometimes stated that road and railway construction in Russia is comparatively easy owing to the general low relief. Against this, however, must be set the difficulty for the railways of water supply in the hard winter frosts; in the Eaikal section of the trans-Siberian railway and in other regions the frozen subsoil adds to the difficulty. A kindred problem will arise in the marshy tundra regions of both Russia and Siberia, when the railways are extended farther to the north.

Road construction over vast areas labours under this difficulty of a permanently frozen subsoil, which hampers drainage, while deformation due to freezing and subsequent thawing of the surface ground is another problem, to which is added the disintegrating effect of the great summer heat. In the steppe, semi-steppe and desert areas drifting sand and dust are the enemies. The trans-Caspian and Orenburg-Tashkent railways need constant care in this respect and government experimental stations for selecting plants which will prevent sand movement near the lines have been established. The strain on steel lines of severe winter frost followed by intense summer heat is great. The road problem is being attacked with characteristic vigour by the present government and by the nation at large. A society of "Friends of the Road" has been established and posters illustrating the dangers of bad roads and the advantages of good ones are displayed everywhere in order to encourage local soviets to take action. A special branch of the Academy of Sciences studies the science of road construction in relation to soil and climatic difficulties, see N. I. Prokhorov, *Soil Science in the construction of highways in the U.S.S.R.* (Leningrad, 1927). Thousands of miles of new road have been laid and in Leningrad province especially and in some other districts, new surfaces have been constructed for old roads. In 1928 a special "road week" on American lines was begun, with wireless, poster and other propaganda throughout the country. The ultimate effects of this national effort may be very great and much volunteer, in addition to government, construction and repair goes on.

Air Transport.— A very important development since 1923 is the spread of civil aviation, of incalculable importance in a country of such huge land surfaces. Regular services are established between Moscow, Nijni-Novgorod and Kazan, Tashkent and Alma-Ata, Bukhara and Khiva, Sevastopol and Eupatoria, Moscow and Odessa, Odessa and Batum, etc., and experimental flights to Yakutsk and Vladivostok are being carried out with a view to a future regular service.

EDUCATION

In the last years of the 19th century, the Tsarist government made little effort itself to provide the necessary increased provision for education for the masses, and suppressed all private and public initiative in this direction. Secondary education re-

mained the privilege of the few. The Soviet government considers that the campaign against illiteracy is the most urgent task of the state. A certain section of writers on Russia under the old régime, some Russian, and some foreign, took up the attitude that the peasant was happier and wiser in his illiterate condition. These writers, however, ignored the heavy toll of life and especially child-life consequent on this illiteracy; the impossibility of coping with infectious and contagious diseases among the people themselves and among their live stock. In some rural districts the mortality of infants under one year was more than 50%. The lowering of agricultural efficiency consequent on illiteracy cannot be over-estimated; in the absence of scientific information the peasant merely relied on trial and error, and on tradition. The enthusiasm of the government for education is supported by the keen enthusiasm of the people themselves and great progress was made between 1920 and 1926, the number of literates per 1,000 in 1920 was 465 while in 1926 it had reached 567, and progress among women was specially marked. Education among the peasant population, however, lagged markedly, 758 men and 626 women per 1,000 of the urban population being literate in 1926 as against 524 men and 274 women among the rural population.

The Commissariat for Education.— The Commissariat for Education has charge of education for children and adults, of science and art, of literature and publications, including the State Publishing Department, of museums, theatres and cinemas. The national minorities also have their own local departments, and education is in the vernacular; this fact has been of enormous importance in spreading literacy. The difficulties of learning to read and write in adult life are serious even if the language used is the mother tongue, and they become insurmountable for most people if a foreign tongue is the instrument of instruction. Initial progress among some nationalities was slow in the absence of a written language and of printed books. But rapid progress in this respect has been made and most minorities are now supplied. The Turkic tribes have adopted the Latin script in place of the Arabic, thereby much reducing the difficulty of learning to read. In some districts, notably the Ukraine, a literature in the mother tongue existed, but had been suppressed by order of the Tsar; in these cases progress has been very rapid; the provision of educational facilities for children of school age in the Ukrainian republic now takes third place in the six republics of the U.S.S.R., though the Ukraine was formerly noted for its illiteracy. In this respect the Transcaucasian Federation occupies first and the White Russian republic second place.

Within the R.S.F.S.R., which comes fourth on the list, are included many areas where education is peculiarly difficult and these offset the good school provision in such places as the Crimea, Moscow and Leningrad. The increasing pressure of financial burdens resulted in the closing of some schools opened in the first enthusiasm of the new ideals, and so, side by side with the attempts to liquidate illiteracy, the production of illiterates through lack of educational opportunities still goes on, though in a diminishing ratio. Lunacharsky, the Minister of Education, in a stirring appeal for further effort, quoted a peasant's speech. "Here am I 45 years of age being taught, and there is no one to teach my little son of 10 years," and he also quoted the many appeals for further educational opportunities addressed to him by women on their own behalf and for their children.

Child Education.— The Soviet scheme divides education of young children into three groups. (1) Kindergartens and crèches for children of pre-school age (3 to 8 years), (2) unified labour schools for children of 8 to 12 years, (3) institutions for orphans, neglected children and mentally or physically defective children. In pre-1914 times there were 300 kindergartens, mainly in towns, supported by private persons or liberal zemstvos. In 1925 there were 1,146 kindergartens and children's homes providing for 60,000 children. "Children's squares" had been established in rural districts for the harvest period, where the children of peasant mothers working on the fields are taken care of by a teacher or a nurse. The number of unified labour schools in 1925 was 87,000 providing for 6,817,000 children as against 94,000 primary schools providing for 5,900,000 children in pre-war times. In this

connection it must be borne in mind that Finland and some parts of the west now lost to Russia had better school provision, so that the figures are not really comparable. In 192; there were 46 schools for mentally defective children with 3,230 pupils and 56 schools for blind, deaf and dumb, and crippled children; these are mainly residential. In 1926-7 the number of elementary and secondary schools had increased markedly. The disproportion between the provision of education for the peasant and for the towns comes out sharply in the following figures when it is remembered that more than 80% of the population is rural.

School Statistics. — The towns in 1926-7 had 6,960 elementary and secondary schools attended by 1,893,386 pupils, while the villages had 92,937 schools with 7,498,322 pupils; the towns had 1,218 schools with a nine-year course attended by 395,552 pupils and the villages 470 attended by 173,350 pupils. The difficulty of providing for village education even in countries where the railway net is good and distances are small is great, but in a country like Russia where the railway net is poor, and the railways so overcrowded that it may be two or three days before a passenger can secure a seat, and where distances are so great that a child may be 200 or 300 m. from the nearest secondary school, they are at present an insuperable problem and many rural children attend school for two years only (from 8 to 10 years). Other villages have no schools at present; the replacement of school buildings destroyed during the war and the building of new schools at present absorb much of the education budget. Moreover there were no teachers trained to meet the new demand for them and much money has gone in provision of training colleges.

As time goes on these two items must diminish and money will be available for equipment, which is in a deplorable condition in many schools. The minister of education hopes, in spite of all these difficulties, that school places will be available for all children by 1934. Incidentally it should be noted that the first ideal of free education has had to be replaced by fee-paying rules in view of the general impoverishment of local budgets. A gradual change is coming over the spirit of education and instead of the earlier attempt to insist on uniformity, attempts are made to discover individual inclinations and abilities, and there is less attempt to introduce politics to children too young to understand them.

A distinctive feature of Soviet education is its attempt to link the school with life outside the school at every possible point. Sport and physical culture are increasingly encouraged with the following proviso, "Soviet sport is particularly anxious to do away with the disease of 'record-breaking,' for it considers physical culture as a means of preserving and improving health, not as an end in itself."

The complicated problem of the homeless orphans of the war and famine is still a cause for anxiety; many homes have been provided, but the children have often become so wild and detached from normal life by their terrible experiences that they prefer the freedom of the streets and the open road, often travelling incredible distances. Recently attempts to attract them have been made by establishing colonies where they are allowed to pursue arts and crafts or to cultivate their own gardens and fields. Some have been adopted by peasants; many have died; thousands are in homes and colonies and yet numbers remain, sleeping on the pavements, in cellars, even in cemeteries, and growing up to be a menace to the state.

Technical Education. — Technical education is available at trade schools, factory workshops, and training workshops for juveniles. There are also numerous technical and agricultural institutes for adults, some providing whole-time and others evening or part-time instruction. The loss of skilled workers during the war has created a shortage and much attention is devoted to this branch of the work. An interesting change of attitude to peasant industries, at first considered an unnecessary part of the ideal state, which was to be divided between large scale production and agriculture, has set in and training schools for peasant crafts are springing up rapidly. Provision for adults desiring to educate themselves is widespread and includes guidance in

home studies, evening and holiday classes, political schools, cottage reading classes, clubs, travelling libraries, special itinerant bookstalls with cheap rates for peasants, etc. An interesting feature is the "wall" newspaper, consisting of handwritten matter and drawings, which is pasted in prominent positions in factories and clubs. Special peasant newspapers are now issued containing simple matter expressed in a way likely to be understood by semi-literates; these peasant newspapers publish letters from peasant contributors. A special development for illiterates is the teaching poster, consisting of pictures designed to illustrate simple rules of health.

Universities. — Institutes of university standing are divided into two groups: (1) Workers' faculties, (2) Universities. The organisation of workers' faculties began in 1920 with the co-operation of the trade unions; most of them are in Moscow and Leningrad. Those attached to the science side usually send on their students to technical institutes, those on the agricultural side train agronomic instructors. In 1926-7 there were 109 workers' faculties with 45,702 students and 124 universities with 160,000 students. Thus the total number of students receiving education of a university standing is small. The universities suffered severely from the changed conditions after 1917 and from the low standard of preparation achieved by the students during the disastrous years up to 1923. Even now many students have had much interrupted pre-university preparation, and it will be some time before a generation which has had uninterrupted school preparation reaches the universities.

Scientific work in Russia was of a very high standard in pre-war times and in spite of all difficulties the famous Academy of Sciences has maintained its reputation. Regional research has developed rapidly and a series of monographs on the new republics and on the economic division of the country according to the State plan has been published. These all suffer from inadequate maps, but contain much new and useful material. A new geological map of the Asiatic part of Russia has been issued, incorporating recent traverses and Obruchev has worked out on the spot the relations of mountains in the Verkhojansk arc, previously unknown. (See S. Obruchev, "Discovery of a Great Range in North East Siberia," *Geographical Journal*, November 1927.) A remarkable soil map of Asiatic Russia has been published in several sheets by the Dokuchaiev Institute under the direction of Glinka and Prasolov. The work of the Physiological Laboratories under the direction of I. P. Pavlov (*q.v.*) is world famous. (See Pavlov, *Conditioned Reflexes*, 1927.) Numerous State Research Institutes have been established and have achieved striking results, e.g., the utilisation of peat, shale and brown coal for the production of electricity. All visitors to Russia note the great interest which the Soviet government takes in the artistic and archaeological treasures of the nation and the importance attached to their display in museums open to the public. Museum visits play a large part in education. Meyerhold's experiments in theatrical presentation and the work of the Moscow Art Theatre are well known. An interesting development in Russia is the theatre for the national minorities where encouragement is given to production in the mother tongue and to the development of native culture. The national minorities also have their own press. Rigid press censorship, as in the old régime, is still the order of the day, but there has been a widening of the scope of publication and the limitation of publication merely to communist literature is giving place to wide publication of scientific and other educational works. The press, the newspapers, wireless and education are, however, all used by the dictatorship as instruments of propaganda. (See GOVERNMENT and ADMINISTRATION, *infra*.)

RELIGION

Religion. — In 1917 the former Orthodox Greek State Church was disestablished, and many of its treasures were subsequently confiscated and arranged in museums. Many monasteries and churches were taken over as state property. The former more or less open persecution of non-conformists, who numbered many millions and the repeated massacres of Jews have therefore ceased. This persecution was a curious feature, since it existed alongside

of great tolerance for the Islamic faith. At first active campaigns against every form of religion, including the Islamic, were carried out by the Soviets, but milder measures have supervened and, in some cases, Islamic schools are permitted. The general law, however, is that class instruction for children and young people in religion is forbidden. Religious services, including those of the Islamic faith may be openly held and churches may be leased from the state by not less than 20 citizens constituting part of the congregation. Priests and clergy have no electoral rights and are liable to the death penalty if they attempt to use religion as a political instrument. In view of their former terrible persecution, the Jews "are regarded as an oppressed nationality by the Soviets; grants of land in the Crimea and the North Caucasian Area have been made to them and they are encouraged to take up communal farming.

(R. M. F.)

GOVERNMENT AND ADMINISTRATION

The essential feature of the present government of Russia may best be realized from the following quotation from the Guide-book to *the Soviet Union*, 1928. "The undisguised and deliberate use of the State Institutions as an instrument in the class struggle is fully in accord with the Marxian doctrine of the State, namely, that it is a class organisation; in this case it is the organisation of the ruling proletarian class. This conception of the State permeates all forms of social and economic life in the Union." In accordance with this theory no attempt is made to encourage popular representation, but every attempt is made to preserve the present Communist oligarchy. At present the Russian Communist party is the only authorized and organized party in the U.S.S.R. and controls the whole governmental machinery for the exercise of its dictatorship. The Communist party is controlled by a Central Committee of 71 members. This committee chooses an executive body, known as the Political Bureau (Politburo), of nine members who largely determine party policy. Joseph Stalin, as the General Secretary, has, since the death of Lenin, been in effect in general control of Soviet policy. While the Russian Communist party stands alone, within the party in 1926 and 1927 there arose an important radical opposition group led by Trotsky, Zinoviev, and other leaders. In November and December, 1927, the Central Committee of the party, dominated by Stalin, succeeded in expelling them from the party and later about 30 of these opposition leaders were banished. The Communist party thus retains control even though its membership in January, 1927, was only 774,571 out of the whole 146,000,000 of the people in the U.S.S.R.

The United State Political Department (O.G.P.U.), the successor to the former secret police department of the Tsarist régime, is entrusted with a political mandate "to suppress political and economic counter-revolution, espionage and banditism." It works for the stability of the Communist régime. "The O.G.P.U. directs the work of the local organs of the State Political Department through its agents attached to the Council of People's Commissaries of the United Republics acting in accordance with a special statute to be confirmed by legislative act. Supervision of the legality of the actions of the O.G.P.U. is carried out by the procurator of the Supreme Court of the U.S.S.R. on the basis of a special resolution of the Central Executive Committee of the U.S.S.R." (Chapter IX. of the Constitution of the U.S.S.R., 1923.) This procurator is appointed by the praesidium of the Central Executive Committee.

The permanent governing body of the U.S.S.R. is the *praesidium* of the Central Executive Committee (Tz.I.K.). The Tz.I.K. derives from the Congress of Soviets (see below). The Praesidium naturally includes some of the leaders of the Communist Party, and is therefore in close touch with the Party executive. It consists of 21 members, seven representing the Praesidium of the Federal Council, seven representing the Praesidium of the Council of Nationalities and seven elected by the two Councils in joint session. The Central Executive Committee is divided into two chambers, the Federal Council (414 members) and the Council of Nationalities (100 members). There are six chairmen of the Central Executive Committee, one representing each of the six

constituent republics. The praesidium of the Tz.I.K. transacts all current legislative work and part of the administrative work, and is responsible to the Central Executive Committee, while during the intervals between the meetings of the Central Executive Committee (which meets three times per annum upon notice from the praesidium) it is the legislative, executive and administrative organ of authority of the U.S.S.R. The following extracts from chapter V. of the 1923 Constitution explain its powers:—

1. The praesidium of the Central Executive Committee supervises the carrying into effect of the Constitution of the U.S.S.R., and the execution of all resolutions of the Congress of Soviets and the Central Executive Committee of the U.S.S.R. by all organs of authority.

2. It has the right to suspend and repeal the resolutions of the Council of People's Commissaries and individual Commissariats of the U.S.S.R. and also of the Central Executive Committees and Council of People's Commissaries of Union Republics.

3. It has the right to suspend resolutions of the Congresses of Soviets of Union Republics and subsequently to present such resolutions for examination and confirmation by the Central Executive Committee of the U.S.S.R.

4. It issues decrees, resolutions and ordinances and examines and confirms draft decrees and resolutions submitted by other organs *e.g.*, the Central Executive Committees of the separate republics.

5. It settles questions of the mutual relations between the Council of People's Commissaries of the U.S.S.R. on the one hand, and the Central Executive Committee of the united republics and their praesidiums on the other.

Congress of Soviets.—The Congress of Soviets (1,500 members) meets once a year, and the Central Executive Committee is granted the right to postpone the summoning of the Congress under extraordinary circumstances. During the interim between its meetings the supreme organ is the Central Executive Committee of the U.S.S.R., consisting of the Federal Council and the Council of Nationalities. The Congress of Soviets is composed of representatives of town Soviets on the basis of one delegate to 25,000 electors and representatives of provincial Soviets on the basis of one delegate to 125,000 of the population. The town population is thus given a marked advantage in representation in comparison with the peasant population. Delegates to the Congress of Soviets are elected at the provincial congresses of Soviets. The Council of Nationalities is formed of representatives of allied and autonomous socialist, soviet republics, five delegates from each, and of representatives of autonomous regions, one delegate from each. The composition of the Council of Nationalities is confirmed as a whole by the Congress of Soviets of the U.S.S.R. As a rule the Congress of Soviets does not frame laws, it merely lays down the basic principles of policy in the various domains of national life.

The Sovnarkom.—The Council of People's Commissaries (Russian abbreviation *Sovnarkom*) is composed of the Chairman and his deputy and ten people's commissaries responsible, by the terms of the constitution to the Central Executive Committee for the following branches of administration:—Foreign Affairs, Army and Navy, Foreign Trade, Transport, Posts and Telegraphs, Labour, Finance, Workers' and Peasants' Internal Trade and Public Economy. The five latter commissariats discharge functions which are within the competence of the separate republics and they also exist therefore in all the allied and autonomous republics, discharging their functions independently in their respective spheres, but in accordance with the guiding principles and instructions of the United Commissariats of the Union. This Council, within the limits of the rights granted it by the Central Executive Committee, issues decrees and resolutions which must be executed throughout the territory of the U.S.S.R., though these decrees and resolutions may be suspended by the Central Executive Committee. The Central Executive Committees of the respective republics may appeal against such decrees and resolutions to the Central Executive Committee, but may not suspend them, except in cases where they are in opposition to the constitution or to the legislation of a Union republic.

The government of each of the republics is arranged on the same lines, with a praesidium, a central executive committee and a council of people's commissars. The right of amnesty and also the right of pardon and rehabilitation in regard to citizens condemned by the legal and administrative organs of the U.S.S.R. is retained by the Central Executive Committees of each of the six republics.

The various republics, autonomous republics, areas and autonomous areas draw up their own budgets, and these are embodied in a single State budget of the U.S.S.R. But the Central Executive Committee determines taxes and revenues applying to the whole union and authorises the additional taxes and dues forming part of the budgets of the united republics. No electoral rights are enjoyed by persons who exploit other people's labour or who trade and live on rents, otherwise electoral rights are granted to all members of the community over 18 years of age, except to monks, clergy or those employed in religious establishments. Members of the Central Executive Committee of the U.S.S.R. may take part in a consultative capacity in the proceedings of all local councils or executive committees.

THE PEASANT QUESTION

The Civil and Criminal Codes.—The Civil and Criminal Codes and the organisation of the juridical system underwent a profound change at the time of the revolution, and during the period of military communism. A reconstructed code was issued in 1923 and later amended, and new codes were again drawn up in 1927. It is evident that a process of long adjustment between theoretical new codes and their interpretation and the method of enforcing them must take place in any country, but in a country so vast as Russia, containing so many illiterate people the process must be very complicated, especially as the constituent republics have, within certain limits, a right to amplify and alter the code of laws. The difficulty of finding judges capable of interpreting new codes, especially in the villages and rural towns, must be almost insuperable and it is probable that traditional methods and old interpretations will persist for some time and that the ultimate legislative code will be profoundly modified. The high ideal of early days "Here in the camp of Socialism are mutual confidence and peace, national freedom and equality, a dwelling together in peace" (First Section of the 1923 *Constitution*) has faded and freedom of thought and speech are still, as in the days of Tsarism, suppressed by the death penalty and temporary or permanent exile. The number of convicts in the prisons of the U.S.S.R. shows a progressive and marked increase between 1923 and 1927, but this, of course, may be due to the greater possibility of enforcing law and order since the cessation of civil fighting, which persisted in some more remote regions until 1925, and which was followed in many places by general lawlessness and banditism. War and revolution and famine have created throughout the chief constituent republics of the Union a vast army of homeless beggars who have become entirely dependent on charity or crime for food. (X.)

Theoretical control by the Communist Party has some practical limitations. The peasant, though limited severely in voicing his opinions, not only by the disproportionate representation given to town workers, but also by the general illiteracy of the peasantry and the frequent remoteness of the villages from centres of political activity, yet has at his control the weapon of refusing to produce more grain or raw material than will suffice for his own needs. Partly to prevent the peasants from uniting to take such action and partly for other political reasons every effort is made to stir up strife between the *kulaks*, as the wealthier peasants are called and the middle class and poorer peasants. Yet even in this respect a certain amount of caution is perpetually called for, since it is obvious that the two latter classes can produce enough for their own needs only and it is on the former class that surplus for the towns and for export depends, and legislation shows a tendency to oscillate between attacks on the wealthier peasants and withdrawals when lessened sowing results from the attacks. Much lessened sowing since 1921 has, however, been involuntary and has been due to the diminution in the

number of horses and working cattle and to the lack of agricultural implements. The increasing discord between the factory worker and the peasant is also unfortunate in its effects. The lot of the peasant cultivator is hard and, while legislation brings repeated lessening of hours and amelioration of conditions to the factory worker, the peasant must put in such long hours of arduous toil during his season of work that the Russian word for harvest has become synonymous with that for suffering. It is natural, therefore, that resentment is springing up on his side against the present dominance of the industrialised population in the framing of legislation. Thus the tradition of class hatred bequeathed from the old régime has taken another form which promises to be equally disastrous. A peasantry divided against itself with an industrial population divided against the peasantry may prevent union for political purposes, but it also prevents union for progress. In another direction Communism is limited by human nature. The primeval instinct for barter maintains retail, and even some wholesale, private trade, in spite of heavy taxes and other disabilities. It must be borne in mind, however, that so large a population could not be dominated by so small a minority unless deep-seated needs were being satisfied. Under the tsarist régime political freedom did not exist, and moreover, there was not even freedom to meet to discuss problems of social improvement. The Zemstvo law of 1890 reduced peasant representation on the Zemstvo to a powerless minority. There was a distinct attempt to keep the poorer classes illiterate while at present, though educational facilities are all too limited, the government makes strenuous efforts to combat illiteracy. For the first time the peasant finds himself free from the burden of debt imposed by the onerous terms of settlement which accompanied the measures for the emancipation of the serfs. Any national minority is now free to use its own language and to develop its own culture; congresses to discuss problems of local administration are encouraged; representatives from all parts of the U.S.S.R. meet to discuss their problems and to exchange ideas. The psychological effect on the nation of the new opportunities of sharing in social legislation and of meeting other workers from such varied regions, must ultimately profoundly alter social and cultural conditions in Russia.

DEFENSE

One of the first appearances of Russian warriors in history was the arrival of a Russian fleet off Constantinople in A.D. 860. The Varangians, or Norsemen, who had become leaders of the Russian Kiev principality, were instinctive sea marauders and their ships ranged widely over the Black sea. This was the first, but not the only early Russian attempt to capture Constantinople, the capital of the Byzantine empire. Constantinople resisted these raids successfully and peaceful as well as warlike relations were established between the Russians and the Byzantine Greeks. It was from Constantinople that Russia was converted to Christianity, and the majority of the Russian people have always professed the Greek Orthodox faith.

Russian political progress was severely interrupted when the Tatars swept over the country and subjugated it in the 13th century. The Tatar control was not very strict and the Russian princes enjoyed a good deal of autonomy, so long as they paid tribute and acknowledged the authority of the Tatar khan. Prince Alexander of Novgorod won a victory over the Swedes on the river Neva (he was subsequently known as Alexander Nevsky) and was victorious in a still more celebrated battle with the Teutonic knights on the frozen Lake Peipus in 1252. The Russian weapons at this time were not unlike those of mediaeval Europe: spears, swords and battle-axes. In contrast to the Tatars, who were famous for their horsemanship, the Russians usually fought most effectively on foot. A kind of feudal system prevailed in Russia at that time and the prince and his immediate retainers constituted the nucleus of the armed force, which was filled up with free and serf peasants.

The grand duchy of Moscow emerged as the leading Russian principality and an important date in the destruction of the Tatar sovereignty was 1380, when the grand duke Demetrius defeated the Tatar khan Mamai in a great battle at Kulikovo, on the upper Don. While there were vicissitudes of fortune and Moscow was raided and burned by the Tatars more than once after that time, the general trend was for Russian strength to increase, while the Tatars became weaker because of internal division.

Ivan III (reigned 1462-1505) introduced firearms and cannon into the use of his armed forces. There were decisive victories over the Tatars under his successor, Ivan IV (the Terrible) (1533-84), who captured Kazan, a Tatar stronghold, in 1552 and Astrakhan, at the mouth of the Volga, in 1556. Ivan, by the most ruthless methods, broke the power of the boyars or hereditary aristocrats, and replaced them with men of inferior birth who were directly dependent on the tsar for their power and estates. This marked the triumph of personal absolutism over the Russian type of feudalism and made it possible to appoint officers for merit or because they enjoyed the tsar's confidence, regardless of their birth.

Ivan IV endeavoured to push the Russian frontier to the Baltic sea (Russian military history is largely one of struggle for sea outlets) and won some initial successes in the regions that are Latvia and Estonia. But this expansion provoked wars with Sweden, Lithuania and Poland and strained to the utmost the resources of the Muscovite state. After the reigns of Ivan's weak son Theodore and his successor, Boris Godunov, a period of polit-

ical disorganization, foreign invasion and social chaos, which is known as the Troubled Times, commenced. This ended with the election of the first Romanov tsar, Michael, in 1613. The Poles, who had tried to take advantage of Russian weakness, were driven out of Russia. The Russian army of the 17th century was semi-Asiatic in character, numerous, but poorly trained, equipped and disciplined. Military instructors were engaged from Germany, Scotland and other foreign countries. An important element in the armed forces consisted of the Strelitz, the tsar's personal body-guard. This force became unruly and unmanageable and took part in palace revolutions. It was wiped out by Peter the Great.

Russian military development was slow during the 17th century, but experienced a considerable impetus under the reign of Peter the Great (1682-1725). The policy of engaging foreign experts, not only for military affairs, but for industry and shipbuilding was extensively applied. Peter was convinced that Russia possessed a future on the seas; built a new capital, which he called St. Petersburg, on the Gulf of Finland, and constructed an impressive building to house the admiralty. Russian mastery of the Baltic was established during the reign of Peter, partly as a result of his decisive victory over the adventurous Swedish king, Charles XII, at Poltava in 1709. Peter also introduced a system of compulsory military and civilian service for the members of the aristocracy, but this was later abandoned.

In the reign of the Empress Elizabeth (1741-62) Russia took part in the Seven Years' War against Frederick the Great of Prussia. The Russian army inflicted a crushing defeat upon Frederick's forces at Kunersdorf in 1759 and temporarily occupied Berlin in 1760. Russia's frontiers were pushed far to the south and the west under the reign of Catherine II (1762-96). Ukraine, which had been falling increasingly under Russian influence, was annexed and Russia was the principal territorial beneficiary of the three partitions of Poland. Russia was drawn into the wars of the French Revolution and of the Napoleonic period, and the Russian General Suvórov acquired the reputation of a brilliant strategist by means of his campaigns in Italy and Switzerland.

Napoleon invaded Russia in 1812 and occupied Moscow after the sanguinary battle of Borodino (Sept. 7). But the failure to break the Russian military resistance, the severity of the Russian winter and the disintegration of his army in an unfamiliar country, turned this campaign into the greatest disaster of Napoleon's career. Russian armies took part in the battle of Leipzig and in the campaigns which led to Napoleon's downfall. Russia had now developed a distinctive and excellent cavalry arm, largely recruited among the Cossacks, or hardy frontier settlers who lived on the outer marches of the empire and were accustomed to horsemanship.

Russia experienced its share of wars during the 19th century, its principal theatres of expansion being the Balkans, central Asia and the far east. The native peoples of central Asia and the Caucasus were subdued and the Russian frontier was brought to the northern boundary of Afghanistan. The outstanding commander in these central Asiatic operations was General Skobelev, who captured the Turkoman stronghold of Geok-Tepé in 1881. Russia acquired the province of Bessarabia from its subordinate ally, Rumania, as part of the settlement after the Russo-Turkish War of 1877-78. But its wider aspirations for control of Constantinople and the straits were blocked by the opposition of other powers, especially of Great Britain. Russia sustained a setback in the Crimean War (1853-56), when the British and French came to the assistance of Turkey and captured the Russian stronghold of Sevastopol on the Crimean peninsula.

Tsar Nicholas I (1825-55) enforced a drill-sergeant type of discipline, with many cruel punishments, in the armed forces. His successor, Alexander II (1855-81), as part of a general scheme of reforms, introduced some humanizing and modernizing changes, largely through the instrumentality of an enlightened war minister named Milyutin. In general, the Russian peasant soldier was a sturdy type physically, capable of great tenacity and stoical courage, but somewhat lacking in initiative. There were individual talented generals and officers, but the general

organization of the Russian army reflected some of the weaknesses of the Russian political, social and economic order. The quality of the recruits was lowered by the widespread illiteracy. Corruption was prevalent in letting war contracts. Despite substantial progress at the end of the 19th and the beginning of the 20th centuries, Russia remained backward in industry and transportation, by comparison with the leading world powers.

War With Japan.—These weaknesses were evident when Russia, to the surprise of the world, was defeated in its war with Japan (1904-05). The principal land battle in this war was at Mukden (Feb. 19-March 10, 1905), the decisive naval battle, which ended with the virtual destruction of Admiral Rozhdestvenski's fleet, which had sailed halfway around the world, was in the strait of Tsushima on May 27, 1905.

War With Germany.—Russia's participation in World War I against Germany led to appalling losses and finally to the complete collapse of the old Russian army and its reorganization as the Red army of the soviet republic. Russia entered the war with vast man power but with grave deficiencies in all technical branches of the service. In the beginning Russia had 60 batteries of artillery against Germany's 381. The proportion of railway mileage to territory in Russia was less than one-tenth of the German figure. The mobilization schedule called for 6,600,000 rifles over a three-year period; the need was for 17,700,000. Only 12% of the required 133,000 machine guns was available on Jan. 1, 1917. The Black sea approach to Russia was closed because Turkey was on the German side, and the flow of British and U.S. supplies through Archangel, Murmansk and Vladivostok was inadequate. Russia's losses in the war exceeded those of any other belligerent. They were estimated at from 6,000,000 to 8,000,000, killed, wounded and prisoners.

Revolution and Collapse.—The tsarist government was overthrown on March 12, 1917, as a result of workers' strikes and demonstrations in the capital, renamed Petrograd after the beginning of the war, which the soldiers refused to suppress, joining in with the demonstrators. The traditional discipline in the army was shaken to its foundations by the revolution, coming after almost three years of sanguinary and mostly unsuccessful fighting. Throughout the summer and autumn of 1917 the army turned into an armed mob, eager only to go home.

The bolshevik revolution, which overthrew the provisional government headed by Alexander Kerensky, on Nov. 7, 1917, was partly the result of war-weariness, since the bolsheviks alone were unequivocally against the continuance of the war. This won them at least the passive sympathy of the overwhelming majority of the soldiers, and Kerensky found no forces, except a few Cossacks, willing to fight against the new regime.

In the beginning the Russian soldiers were no more willing to fight for the bolsheviks than for the provisional government. The conclusion of the oppressive treaty of Brest-Litovsk with Germany, on which Lenin insisted, was a practical necessity because the appeals of the more extreme communists and Left Socialist revolutionaries for "revolutionary war" fell on deaf ears. The disorderly demobilization of the old army proceeded; its last commander in chief, General Dukhonin, who had refused to acknowledge the authority of the soviets, was lynched at the army headquarters in Mogilev.

During the next few months there was no compulsory military service in Russia. The armed forces at the disposal of the new regime consisted of workers' Red Guards and volunteer units of former soldiers and sailors. Small groups of so-called White Guards, Russians opposed to the bolshevik regime, began to form in the southeast. Civil war on a small scale was under way.

The Red Army: First Stages.—By April 22, 1918, the soviet government felt strong enough to decree compulsory military training for workers and peasants who did not employ hired labour. This was the beginning of the organized Red army that fought through the civil war and numbered more than 5,000,000 men in its ranks before the struggle was over in 1921. The new army was avowedly based on the class principle. People who belonged to the so-called bourgeoisie, aristocrats, businessmen, priests, etc., with their children, were ineligible for combatant

service, but were compulsorily mobilized for labour service.

One of the greatest problems that confronted the Red army in the beginning was the creation of a staff of officers that would be at once competent and reliable. Very few of the officers of the old army were in sympathy with bolshevism; the more daring and embittered of them were in the ranks of the Whites. Professional revolutionaries, workers and peasants seldom possessed the qualifications of officers.

This problem was met by mobilizing former officers in soviet territory, giving them tolerably favourable material conditions and warning them that their families would be held as hostages in the event of treason or desertion. Altogether about 50,000 prewar officers served in the Red army before the end of the civil war. There were some cases of passing over to the Whites, but the majority remained loyal to the soviet regime.

With a view to insuring the reliability of the officers, political commissars were attached to the various military and naval units. The commissars were communists and they were supposed to watch the officers as discreetly as possible and also to carry on political propaganda among the soldiers and stimulate morale.

As the war went on, a more politically reliable type of young officer began to emerge from the short-term officers' training schools that were set up. Just as was the case during the French Revolution, capable military leaders began to appear in the course of the struggle. M. N. Tukhachevsky, a staff captain in the tsarist army, became one of the most talented field commanders of the Red army. He was shot with a number of associates on a charge of treason in June 1937, after he had made a considerable contribution to the building up of the Red army. Another civil war general, Bluecher, a Russian despite his name, was subsequently commander of the soviet far eastern army, but disappeared from the public eye during the period of the purge.

The three men who were appointed commanders of the three main fronts at the beginning of the soviet-German war in 1941, Semyon Timoshenko, K. E. Voroshilov and Simeon Budenny, were all veterans of the civil war. Budenny, a moustached cavalry sergeant of the tsarist army, rose to national fame as commander of the soviet 1st cavalry army, which distinguished itself in action against the White leader, General A. I. Denikin, and against Poland. Timoshenko commanded a unit of this army and during the years after the end of the civil war, developed into a more capable military executive than the picturesque and temperamental Budenny, holding the post of war commissar for a time and becoming one of the most successful field commanders in the war against Germany. Voroshilov, a former worker and veteran communist, was attached to the cavalry army as a political commissar. He was commissar for war from 1925 until 1939.

Russia was a negligible sea power at the time of World War I and a number of units of its Black sea fleet was sunk in the harbour of Novorossiysk in 1918 to prevent their falling into the hands of the Germans. All details of soviet military preparation have been kept strictly secret; but there is reason to believe that soviet sea power developed much more slowly than soviet land and air power. Apart from submarines, of which the soviet union is credited with about 150, the soviet navy is a minor force. It was unable to dispute the mastery of the Baltic successfully with the Germans, although it retained control of the Black sea during 1941 and the early part of 1942 because of German inability to transfer axis units into that body of water. The principal soviet naval bases are at Kronstadt, near Leningrad, and at Sevastopol, on the southern coast of the Crimea; both were successfully held against axis attacks, although new bases which had been established in the vicinity of Riga and Tallinn and on Dago (Hiiu Maa) and Oesel (Saare Maa) islands, were lost during the German offensive in 1941. There is a secondary naval base at Novorossiysk, on the eastern coast of the Black sea. A considerable part of the soviet submarine strength is believed to be in the Pacific ocean, based on Vladivostok.

Soviet Armed Forces After the Civil War.—The huge Red army of 1920, which numbered about 5,500,000 men, of whom many were badly trained and equipped, was demobilized and reduced to a more efficient and manageable force. The strength of

the soviet regular army until 1935 was officially stated at 562,000. It was never made altogether clear whether this included the picked units of all arms of service which were under the control of the O.G.P.U. (state political police), reorganized into the N.K.V.D. (commissariat for internal affairs) in 1934. These units were estimated at about 100,000 and included some of the best trained soldiers, equipped with the most modern weapons.

There was also a militia, organized on a territorial basis and designed to function as a second military line of defense. Figures and details, as is usual in matters relating to soviet military affairs, are scarce. But it has been stated that 842,000 men were undergoing militia training at 4,500 training centres in 1928. The regime of service in the militia is a period of three months with the colours during the first year, to be followed by five to eight months' service, depending on the character of the unit, spread over the next four years.

Besides the regular army and the militia the soviet union possessed other agencies for imparting military training to a very large proportion of its male citizens. The Osaviakhim (Society for the Promotion of Aviation and Chemical Defense) grew rapidly in membership during the late '20s and early '30s. It registered 13,000,000 members in 1933. Of these 3,000,000 were women. The kind of training which the Osaviakhim gave varied in extent and thoroughness. It was first of all designed to make the Russian people conscious of the dangers of air and chemical warfare and of how these dangers should be met. Members were instructed in the use of gas masks and in air-raid precautions.

The younger and more active members, especially students and workers, took much more fundamental training. Hundreds of thousands of them passed the difficult all-around test of marksmanship and physical accomplishment in swimming, jumping, etc., which entitled them to wear the badge of the "Voroshilov Sharpshooter." Units of civilians who took Osaviakhim military courses, marching with rifles but without uniforms, were increasingly prominent in the big parades on the Red square in Moscow on the two great soviet holidays, May 1 and Nov. 7. All students in middle and higher schools and all members of the Union of Communist Youth have been required to take military training, regardless of whether they are called up for regular military service or not. The Red army thus possessed a huge reservoir of at least partially trained man power on which to draw in the event of war.

Increases in the Military Establishment. — The permanent strength of the Red army was increased from 562,000 to 940,000 in 1935 and 1,300,000 in 1936. A decree of Aug. 11, 1936, lowered the conscription age and ordered the recruits of one and a half classes to enlist every year between 1936 and 1939. The motivation of this last provision was the desire to compensate for the comparatively small numbers of the classes which came of age during these years, as their members had been born in the period of World War I and the civil war, when the birth rate was abnormally low. The growing menace of the international situation, both in Europe and in the far east, doubtless inspired the desire to keep a maximum number of troops under arms.

After the civil war, the soviet government endeavoured to make service in the Red army popular and esteemed. Discipline was put on a more humane and progressive basis and corporal punishment was abolished. A good deal of attention was devoted to political propaganda among the soldiers and there was a liberal organization of plays, concerts and other entertainments for soldiers and sailors. The Red army was a valuable link with the peasants and returned soldiers, converted to communism, were often used as organizers of collective farms. A number of soldiers were settled as farm colonists along the potentially dangerous frontier between Siberia and Manchoukuo.

Distribution and Quality of the Red Army. — The main forces of the Red army have always been deployed along the west European frontier of Russia, with Leningrad, Smolensk, Kiev, Odessa and Moscow among the principal military centres. A special far eastern army was organized in 1929, at a time when the Chinese seizure of the Chinese Eastern railway, in which the soviet government possessed an operating interest, led to armed clashes between Russian and Chinese forces, in which the former easily

emerged victorious. This army was considerably reinforced as political tension grew after the Japanese occupation of Manchuria. There were probably about 500,000 soviet troops in the far east at the time of the outbreak of the soviet-German war in 1941, and some crack mechanized units were stationed in this region. There is strong reason to believe that some mechanized and air units were transferred from the far east to European Russia to meet the crisis of the German advance late in 1941, although the soviet government maintained complete official silence on this question. The centre of the far eastern army administration is at Khabarovsk, on the Amur river.

During the period when political relations between the soviet government and the peasants were most strained because of the forcible collectivization of agriculture and the shortage of manufactured goods, in the late '20s and the early '30s, there were two noteworthy shifts in the composition of the Red army. The percentage of Communist party members in its ranks became greater and the proportion of workers to peasants increased very substantially. Marshal M. N. Tukhachevsky submitted the following figures in this connection to the 7th congress of soviets on Jan. 30, 1935:

Year	Workers %	Employees %	Peasants %	Percentage of Communists
1925 . .	11.0	4.3	84.7	19.0
1930 . .	31.2	10.9	57.9	34.3
1935 . .	45.5	10.8	44.5	49.3

The percentage of communists among the officers is much higher than among the soldiers. By this time the great majority of the prewar officers, who helped to lead the Red army during the civil war, had retired from active service. Their places were taken by graduates of the soviet military training schools, young men who experienced the normal indoctrination with communist ideas.

Some doubts as to the quality of the Red army higher command were raised by the drastic purge of the army and navy which took place in 1937. The most spectacular episode in this purge was the execution, after a secret court-martial, of Marshal Tukhachevsky and seven prominent generals of the Red army. A large number of officers of lesser rank were cashiered or disappeared and almost all the admirals of the Red navy were eliminated at the same time. Full details of the charges against the victims of this military purge were not published. The official explanation of their execution was that they had engaged in espionage work for a foreign power, presumably Germany, and had committed various treasonable acts.

How far the Red army would have suffered if Russia had become involved in war immediately after this purge is conjectural. By 1941 adequate replacements had apparently been found for the men who had been executed, although some observers of the course of the soviet-German war believe that the higher command has been weaker than the leadership of officers in the junior and middle grades.

Accurate information about the strength and quality of the Red army has always been very difficult to obtain, because of the soviet government policy of maintaining the strictest secrecy. So the door was left open to guesswork, which was sometimes dictated by prejudice or wishful thinking. The Germans, who probably possessed the best knowledge of the Red army, at least until relations between the two countries became strained after Hitler's rise to power, were generally inclined to take a favourable view of the Red army's equipment and potentialities.

It was evident from the exhibitions that were put on during the two great annual military parades on the Red square, on May 1 and Nov. 7, that the Red army leadership was thinking in terms of a mechanized war and was attaching considerable importance to aircraft. Every year, as a general rule, more aeroplanes, both of fighting and bombing types, could be seen overhead, while more varied types and greater numbers of tanks, from small whippets to huge land fortresses of 50 tons and more, rumbled through the Red square, the regular scene of military demonstrations.

It was only in 1941, however, that an adequate combat test was furnished. The civil war had been a struggle of Russians against Russians, except for minor clashes with indifferent and war-weary small interventionist forces and the episode of the war with Poland in 1920. It was fought under conditions of extreme physical and psychological exhaustion and economic disorganization on both sides and offered little indication as to the new army's prospects in a conflict with a foreign enemy, although some talented leaders emerged in the course of the struggle, in which cavalry raids and revolts in the rear of the opponent's lines played a much greater role than would be normal in a war between two states.

The soviet far eastern army smashed the Chinese Manchurian forces in the autumn of 1929; but this was a victory over a poorly equipped and poorly trained opponent. The soviet troops in the far east faced harder tests with a very fair measure of success in the prolonged border fighting with the Japanese around the heights of Changkufeng in 1938 and at Nomonhan, in Outer Mongolia, in 1939.

The occupation of eastern Poland in Sept. 1939, was carried out without much fighting and the seizure of Estonia, Latvia, Lithuania, Bessarabia and Bukovina was a bloodless affair. The soviet military showing against Finland was not impressive until the last weeks of the war. The effectiveness of the Finnish resistance had apparently been seriously underestimated and troops of inferior quality were sent into action, poorly equipped for fighting in the northern snows. It was only toward the end of the campaign that General Gregory Stern, shifted from the far east to the Finnish front, made effective use of massed artillery fire and smashed the Finnish defense line on the isthmus of Karelia.

The final issue of the war between the soviet union and Germany hung in the balance in Feb. 1942. But, whatever this issue might be, the Red army proved itself much the strongest land opponent that Hitler had encountered. For the first time, the Germans were obliged to fight an enemy almost as well furnished with tanks and aeroplanes as they were themselves. The soviet artillery also demonstrated its effectiveness. The morale of the Red army proved capable of sustaining severe defeats and long retreats until the end of November without cracking. There was sufficient resilience in the soviet military organism to hit back hard and effectively as soon as the German drive had spent its force and to take advantage of the bitterly cold Russian winter, for which the Germans were both less acclimatized and less well prepared with warm clothing than were the Russians.

ECONOMIC AND FINANCIAL CONDITIONS

Russia's Economy.— In its economy, as in many other aspects of its life, Russia before World War I was a land of contrasts. It was predominantly agricultural, with a comparatively small class of wealthy and well-to-do landowners and a majority of peasants, who lived, with few exceptions, in poor and primitive circumstances. The industrial revolution had come late to Russia; but the country was rich in mineral and agricultural resources, in coal, iron, oil, manganese, cereals, cotton, flax, sugar beets among other products. And, although industry played a less important part in the national economy than was the case in Germany and Great Britain, about half of its industrial workers were employed in large plants with more than 1,000 workers.

This was largely attributable to the fact that foreign capital, French, British, German, Belgian and U.S., in this order of importance, had been flowing into Russia rapidly since the last quarter of the 19th century. The foreign capitalist often found it profitable to put up a big factory, equipped with the latest machinery. So Russian industry was only partially the result of the slow accumulation of capital by pioneer Russian companies. It was the hothouse fruit of foreign investment. About one-third of the capital invested in Russian stock companies in 1914 was of foreign origin.

After the conclusion of the Franco-Russian alliance in 1891, Russian loans, state and municipal, found a ready market in France. French capital was strongly interested in the Russian mining and metallurgical industries. French money was heavily invested in the coal and iron industries of the Donetz basin.

British capitalists specialized in the Caucasian oil fields and in the textile industries which grew up in the neighbourhood of Moscow. Germans were active in the electrical industry; a number of Russian streetcar lines were built with Belgian capital. There was some British and U.S. mining and engineering development in the Ural mountains and in Siberia.

This important role of foreign capital in Russia helps to explain the extreme course of the revolution. It was easier to carry out sweeping measures of expropriation and confiscation because foreigners were often the victims of dispossession.

Partly because of the stimulus of an inflow of foreign capital that averaged 200,000,000 gold roubles (about \$100,000,000) annually during the years before World War I, partly because Russia was a new country, from the industrial standpoint, with great possibilities of development, the pace of industrial advance during the last decades of the 19th century and especially during the decade which preceded the beginning of World War I, was very swift, as may be seen from the following figures.

The foreign trade turnover in 1901-05 (average) was 1,573,500,000 roubles; in 1906-10 (average), 2,114,900,000 roubles; in 1913, 2,894,100,000 roubles. In 1890 there were 18,031 mi. of railways; in 1905, 36,808 mi.; in 1914, 43,378 mi. The volume of industrial production in 1870 amounted to 500,000,000 roubles; in 1890, 1,502,000,000 roubles; in 1912, 5,738,000,000 roubles. The output of pig iron in 1889 was 726,633 tons; in 1906, 2,692,233 tons; in 1913, 4,634,884 tons. The output of coal in 1900 was 16,155,594 tons; in 1906, 21,728,070 tons; in 1913, 36,268,044 tons.

Like the United States of America, which it resembles in its vast size and variety of natural resources. Russia, both under the old regime and under the soviets, showed a marked capacity for rapid economic expansion. The ascending curve of its progress, however, was arrested by World War I and turned down catastrophically during the civil war, to rise again gradually under the new economic policy and more steeply after the soviet government went over to a policy of forced industrialization at maximum speed.

Russian industry before World War I was located mainly in five areas, Moscow, St. Petersburg, the Donetz basin, the Urals and the Dombrova region of Poland. St. Petersburg and Moscow, the two largest cities in Russia, were natural markets for industrial goods. St. Petersburg developed, in the main, heavy industries, of which the Putilov metal works was one of the largest. Moscow rather specialized in textiles and consumers' goods. It was able to draw on the coal field southeast of Moscow for fuel. The Donetz basin, with its coal deposits, and the adjacent iron ore of Krivoi Rog, was the natural basis for an iron and steel industry. The Urals possess iron, coal, copper, asbestos and other valuable minerals, while neighbouring coal fields stimulated the growth of the Dombrova factories. These were further developed under the soviet regime, and this was especially true of the Ural region, which was selected for the location of some of the largest of the new plants, partly because of its distance from frontiers and consequent inaccessibility to air bombing. A considerable new industrial region was built up on the middle Dnieper, with the aid of the power which was generated by the Dnieprostroi hydroelectric power plant. There was also a substantial industrial expansion in Siberia, in the neighbourhood of the great Kuznetsk coal field, around Novo-Sibirsk and in some parts of eastern Siberia.

The outbreak of war in 1914 interrupted Russia's industrial progress and placed a heavy strain on its growing but inadequate economy. Russia was very largely isolated from its allies, France and Great Britain, and its industries and its transportation system could not measure up to the needs of the huge army that was mobilized. Production for civilian use declined and inflation began to make itself felt in the later years of the struggle. While Russia was normally self-sufficient in staple foodstuffs and exported large quantities of cereals to western Europe, the overloading of the railway system and the tendency of the peasants to hold back their products from the market as they found they could not buy a normal equivalent in manufactured

goods led to food shortage in the towns, where the population had swelled because of the growth of the munitions industry. Food riots in Petrograd were the beginning of the overthrow of the tsarist regime, which was consummated on March 12, 1917.

The national economy deteriorated rapidly during the eight months which elapsed between the March revolution and the bolshevik revolution of Nov. 7. All bases of social and economic order were shaken to their foundations. The peasants commenced to seize the land of the larger owners. There were continual workers' strikes and demonstrations, partly for political reasons, partly because the provisional government proved unable to check the inflationary trend, and there was a continual rise in the cost of living. A good deal of class hatred entered into the strikes and in some cases unpopular employers and engineers were driven away from the factories, which the workers undertook to operate themselves.

The bolshevik revolution brought into power the most extreme group of Russian Socialists. It was immediately followed by a decree nationalizing the land and expropriating all large holders. A decree of Nov. 27 subjected industry to a system of workers' control. The banks were nationalized on Dec. 27.

War Communism. — It was not the immediate purpose of the bolsheviks to nationalize all industry and trade. Their leader, Lenin, recognized Russia's technical backwardness and the difficulties of abruptly instituting full-fledged socialism in a land where the peasants constituted the great majority of the population. During the brief period between the conclusion of the treaty of Brest-Litovsk with the Germans in March and the outbreak of fighting with the Czechoslovak legions in May 1918, Lenin was inclined to emphasize the necessity for labour discipline and skilled management; he asserted that it would be profitable for the new regime to hire "bourgeois" specialists, even at very high rates of pay, in order to obtain a smooth flow of production.

But as the civil war became more intense, the soviet government found itself driven from one measure to another in the direction of establishing complete control over the industrial plant, the man power and the labour of the country. The factory owners, as a class, were naturally hostile to the soviets; many of them fled, abandoning their enterprises. The sugar industry was nationalized on May 2 and the petroleum industry on June 17, 1918. A decree of June 28 clearly pointed the way to the expropriation of the private industrialist; it provided for the nationalization of the largest undertakings in the mining, metallurgical, metal-working, textile, electrotechnical, pottery, tanning and cement industries. A decree of Nov. 29, 1920, completed the process by declaring nationalized all enterprises that employed more than ten persons, or more than five, if motor power were employed.

Foreign trade was nationalized (it practically ceased to exist during the years of civil war and blockade) and on Nov. 21, 1918, private trade within the country was forbidden. In theory, Russia was supposed to live under a gigantic rationing system, with city dwellers receiving food products and manufactured goods on ration cards and the peasants delivering up their surplus produce in exchange for manufactured goods from the towns.

In practice, this system could not and did not work out effectively, because the government lacked both the goods and the technical organization to make it function with even passable efficiency. There was a good deal of surreptitious barter between city and village and town dwellers obtained about as much food from those theoretically illegal operations as they received on their ration cards.

New organizations came into existence to administer this new system. One of the most important of these was the Supreme Economic Council, established on Dec. 15, 1917. Originally, it had been conceived as a body which would supervise the whole economic life of Russia, but its functions were gradually restricted to the management of industry. Under the Supreme Economic Council were some 40 *glavki*, or head departments, each designed to oversee a single industry. The *glavki* became a byword for cumbersome bureaucracy. They were organized on a vertical principle, lacked organic communication with each other and were

smothered in red tape.

The STO, an abbreviation for Council of Labour and Defense, assumed considerable powers; it may be described as a kind of war economic cabinet. And the food commissariat, which took charge of the distribution not only of food, but also of manufactured goods, occupied a strategic position in the scheme of war communism. The commissariat for transportation operated the railways and waterways on semimilitary lines; the commissariat for agriculture, especially in the later phases of the war communism period, tried to direct the peasants as to their selection of crops and their sowing.

Money tended to lose all value under this system. The rouble had declined considerably in buying power at the time when the bolsheviks came into power. Unchecked use of the printing press and the fact that the distribution both of food and of manufactured goods was supposed to be on a rationed basis soon led to an inflation as sweepingly destructive as that of Germany. A new currency had to be built up when a new policy was adopted. Toward the end of the war communism period, such things as housing, transportation and public services were supposed to be supplied free to all citizens.

Another feature of the war communism period was the attempt, in 1920, to use armies, under military discipline, for labour tasks. This was a pet idea of Trotsky, who believed that the terrific jam in production could be broken by the same methods that had led to the defeat of the Whites in the civil war: mobilization of labour under conditions of stern discipline, accompanied by fiery, emotional appeals. The labour armies, however, proved a fiasco and were soon discarded.

Considered as an economic experiment, war communism was a disastrous failure. There are few parallels in history for the collapse that overtook Russia's productive forces. By 1920 the big industries were producing 18%, the small industries, 43% of their prewar output. The prostration was most complete in the heavy industries. Pig iron was down to 2.4%, iron ore to 1.7% of the prewar figure. The output of copper ceased entirely. The railways, which suffered from the depredations of both sides during the civil war, crawled along with an ever-increasing percentage of damaged and disused locomotives and freight cars. In Jan. 1917, there were 537,328 freight cars in the country, of which 4.2% were out of use; by the end of 1919 the number of freight cars had diminished to 244,443, of which 16.6% were damaged. There were 20,394 locomotives (16.5% out of commission) in Jan. 1917, and 8,955 (47.8% unfit for use) at the end of 1918.

Wages and productivity of labour declined tremendously, while a large part of the city workers dispersed to the villages in search of food. The average wage of the Russian worker during these bleak years was little more than one-third of what it was under the tsars, according to the estimate of a prominent soviet statistician. Productivity of labour was 44% of the 1913 average in 1918, 21.6% in 1919 and 26% in 1920.

Agriculture was also hard hit by the crisis, although the peasants, until actual famine devastated a great area of the Volga valley and of Ukraine in 1921-22, suffered less from hunger than the city dwellers. The Russian harvest of cereals, which had averaged about 80,000,000 tons in the prewar years, declined to 50,000,000 tons in 1920. The tendency of the peasants was to concentrate on food crops and to cease planting other market crops, or at least to cut down the acreage substantially. By 1920 the area under flax had declined by 50%, compared with the prewar average, the area under sugar beets by 74%, the cotton acreage by 87%, the area under tobacco by 90%.

The cities of northern and central Russia lost more than one-third of their population between 1916 and 1920. Many Russian town dwellers, especially among the labouring classes, had friends and relatives in the country; and there was a widespread impulse to go back to the villages where, in spite of the requisitions, there was more chance of getting food.

The effect of war communism was temporarily to frustrate the realization of almost every communist economic ideal. Lenin and his associates believed in a state order based on the industrial proletariat as the ruling class and were eager to see

Russia overtake and surpass the leading "capitalist" countries in quantity and efficiency of production. They were also convinced, as Marxists, that large industrial units would supplant small and medium ones. The actual circumstances of life under war communism tended to contradict all these ideals. The working class was dispersing and a good many of the workers who remained in the factories turned into small speculators, making little objects of daily use, which could be sold or exchanged for food. The big factories in many cases stood idle or worked at a fraction of their normal capacity for lack of machinery and raw material. The communists in theory were worshippers of modern efficiency, of the machine. But the storm of social revolution and civil war had destroyed most of what little efficiency and mechanization had formerly existed in Russia and threatened to throw the country back into extremely primitive forms of economic life.

It would be incorrect to regard war communism as an experiment undertaken entirely for its own sake. Many of its features were almost inseparably associated with the hard exigencies of civil war. It was impossible, for instance, for the soviet government to give the peasants any adequate supply of manufactured goods when the factories, often cut off from sources of raw material, were unable to work at normal capacity and when war needs took precedence over everything else. Requisitioning evoked much bitterness in the villages and was accompanied by many abuses. But the army and the cities could not have been given even a minimum food ration without requisitioning.

The fluctuating course of the civil war contributed a good deal to the paralysis of production. For long periods of time, the metal plants around Petrograd could not obtain the iron ore of Ukraine or the Urals; the textile factories of the Moscow region were cut off from the cotton of Turkestan. Yet, when all due allowance is made for these factors, war communism must be considered an unworkable system. The stimulus of individual incentive, the sense of individual responsibility were deadened and almost lost.

From War Communism to **NEP**.—An uprising of sailors in the important naval base of Kronstadt in March 1921, sounded the doom of war communism. There had already been sporadic peasant revolts in Ukraine, in Tambov province, in Siberia. But the revolt in a fortress so close to Petrograd, a fortress which had always been considered a stronghold of communism, was interpreted by Lenin as a definite warning that other economic methods must be tried. The 10th congress of the Communist party, which met in Moscow in March 1921, and was strongly affected by the news of the Kronstadt rebellion, adopted without opposition Lenin's proposal that a tax in kind, of about one-tenth of the peasant's produce, should be substituted for the former arbitrary requisitioning of all the peasants' surplus. This was the cornerstone of the New Economic Policy, or NEP, as it was generally called; a number of other changes inevitably followed.

NEP.—Since the peasant was given the right to sell his produce, private trade within the country automatically became legal. A whole new class of so-called Nepmen, shrewd and cunning speculators, who had survived all the rigours and repressions of war communism, emerged from hiding and commenced to play a conspicuous part in soviet life. Small private business was again permitted. The slack accounting and financial methods of war communism were revised and the trusts which had replaced the unwieldy *glavki* as organs of management for the state industries, were required to balance their budgets and, if possible, show a profit. Payment of rent and taxes and charges for newspapers and public services were restored.

The rouble was stabilized at its old value of 51.2 cents (U.S.) and for a short time this new soviet currency was freely interchangeable for foreign currencies. This situation soon came to an end, however; both the exportation and the importation of roubles into Russia were forbidden and the soviet currency remained strictly reserved for internal use. There was a vast discrepancy between the official value of the rouble and its quotation on the "black bourse" which existed in Russia during the early '30s. The nominal value of the rouble was quoted at almost \$1

(in view of the devaluation of the dollar), while 40 or 50 roubles could be privately obtained for \$1 during the most difficult years of the first Five Year Plan. Later the rouble was written down to an official valuation of five to the dollar.

Many foreign observers interpreted the NEP as a complete abandonment of socialism. But this interpretation overlooked the strong control which the government retained over many key points of the national economy. The large industries, the railways, the mines, the banks remained nationalized. Foreign trade continued to be a state monopoly. Politically, moreover, the soviet state retained virtual power of life and death over the classes that benefited most from the relaxations of the NEP, the Nepmen in the towns and the *kulaks*, or more thrifty and well-to-do peasants, in the villages. These classes were treated as political and social pariahs. They were excluded from the franchise and from any part in national and local administration; they were denied any benefit of social legislation; their children could not be admitted into universities and higher schools.

The adoption of the New Economic Policy, coinciding as it did with the end of the civil war, broke the many vicious circles in which soviet economy had become entangled. The curve of industrial production, of agricultural output, of wages and productivity turned upward. Houses were repaired and made habitable. The cities again filled up. The light industries which produced goods for everyday use were first to recover; but in time the coal and iron mines of the Donetz basin and Rrivoi Rog, the oil wells of Baku, the metal and machine factories of Leningrad and Kharkov and other industrial centres were again able to set their wheels in motion and to work up to normal productivity.

The chief economic organizations of this period were the trusts and the syndicates. A trust, which was entirely state-owned, administered an industry or part of an industry; and in some cases a number of trusts combined and vested selling functions in a syndicate. The Supreme Economic council continued to function as a general state board of direction for industry. A body that began to acquire more importance in the late '20s was the *gosplan*, or State Planning commission. Originating as a commission attached to the STO, it assumed the function of endeavouring to plot the graph of the national economic development by publishing so-called control figures, in which the output of the coming year in every branch of national economy was laid down. There were distinct limits to this planning under the NEP, because the peasants, the private traders and small businessmen were outside its scope. But it acquired increased significance in the third phase of soviet economic life, that of planned economy.

It had been a part of the New Economic Policy to grant concessions to foreign capitalists and businessmen. While the soviet government refused either to restore integrally the properties of foreign business firms which it had seized or to pay compensation for the seizures, it professed willingness to lease various mines and factories, which it lacked resources to operate itself, to foreign concessionaires. The two largest concessions which were granted were for the exploitation of gold fields in the Lena river region of Siberia and for the development of manganese mines in the region of Chiatouri, in Georgia. An Anglo-American group obtained the first concession; the Averill Harriman interests, the second. Two distinctly political concessions, for the exploitation of oil wells and coal mines in the northern part of Sakhalin, were assigned to Japanese firms in 1925. This was unofficially part of the arrangement under which Japan consented to hand back northern Sakhalin, which had been occupied during the period of intervention in Russia, to soviet sovereignty. Diplomatic relations between the two countries were restored at the same time.

Concessions enjoyed their most flourishing period during the years of the New Economic Policy. They never, however, played an important role in soviet economic development. The big capitalist interests, alienated by the wholesale expropriation of foreign property after the revolution, remained suspicious and aloof. It was difficult for private business enterprises to function within the framework of a socialist economy; and this difficulty was greatly enhanced when the New Economic Policy

was scrapped in favour of an all-out planned economy. The concessions were practically all wound up and liquidated during the first Five Year Plan. Russia's industrialization was financed entirely by the sacrifices which were imposed on the Russian people, without any easing of the burden through foreign loans or foreign investments.

Although the New Economic Policy was a period of industrial and agricultural progress and of a rising standard of living after the appalling depression of war communism, it contained some features that were disquieting to the ruling Communist party. There was a feeling that capitalism, as represented by the Nepmen in the towns and the kulaks in the villages, was undermining the bases of socialist economy. Elbowed out in the struggle for power that went on behind the scenes after Lenin's death, Leon Trotsky directed oppositionist criticism against the alleged compromising of socialist principles by Stalin, who emerged more and more as the outstanding leader of the Communist party and, consequently, of the soviet regime. Trotsky was joined in his oppositionist stand by Gregory Zinoviev and Leo Kamenev, two of Lenin's old associates who had originally sided with Stalin against Trotsky but who later found themselves thrust into political obscurity by the potent Stalin.

While the New Economic Policy was an immense improvement, from the peasants' standpoint, over war communism, it did not prove able to adjust satisfactorily the relations between city and village. The theoretical buying power of the peasant was considerably increased, for two reasons. With the recent memory of inflation and worthless paper money, he had little incentive or desire to save. He could not use his money, as the thrifty peasant of prewar times would have done, to buy land and enlarge his farm, for the purchase and sale of land remained forbidden under soviet law. Every peasant family was given an allotment of land that was determined by the land at the disposal of his village community, and by the number of members in his family. The normal peasant holding under this system was in the neighbourhood of 12 ac.

Consequently, the peasant's instinct was to spend his surplus money for consumers' goods and the soviet light industries were never able to satisfy his needs, especially as a considerable number of textile mills and other factories, which had worked for the prewar Russian market, were located outside the frontiers of the soviet union, in Poland and in Latvia. Shortage of manufactured goods, high prices and poor quality became constant peasant complaints; and by 1928 there was already a tendency of the peasants to carry out a kind of slowdown strike, to raise less for the city market, which did not seem able to give them a fair equivalent in exchange.

Perhaps the basic cause of the liquidation of the NEP was the fundamental incompatibility between socialist industry for the towns and small peasant proprietorship in the villages. One system or the other had to be greatly modified; and Stalin decided that it would be possible both to cut the ground from under the feet of his critics within the party and to find a way out of the economic crisis by driving toward the double goal of a highly industrialized state and an agriculture that would be mechanized and placed under strong state control.

First Five Year Plan.—Industrialization and collectivization of agriculture dominated soviet life during the first Five Year Plan, which was shortened to four and a quarter years and ran from Oct. 1928 until the end of 1932. The task which the soviet government had set was a formidable one and could probably only have been realized by a regime which possessed absolute political power and the will to use that power with utter ruthlessness. It was also fortunate for the soviet government that this first and most difficult stage of internal reconstruction was not complicated by any foreign conflicts, except for the minor clash with China in 1929.

Many of the guiding principles of the NEP were set aside and there was a return, in some respects, to the methods and psychology of war communism. Labour under the New Economic Policy had been free and there were between 1,000,000 and 2,000,000 unemployed, who received state and local relief. The effect

of the Five Year Plan, with its many new factories and tremendous demand for labour, was to wipe out unemployment and to create a labour shortage. This led to a growing tendency to attach the worker or the engineer to his job, to forbid him to leave under threat of legal penalties. Forced labour on a large scale was introduced for the classes which were doomed to economic extinction under the new policy, the *kulaks* and the Nepmen. The O.G.P.U., or political police, was constantly carrying out round-ups of suspected elements in the cities, a familiar penalty being an administrative sentence to work on one of the new enterprises, and there were mass deportations of kulaks and their families from their native villages to timber camps and new industrial plants, where they were set to work at unskilled labour for bare subsistence rations.

Money had possessed much the same functions in Russia as in other countries during the period of the NEP. Russia lacked some of the luxuries and comforts that could have been obtained in more highly industrialized countries, but the soviet citizen spent his money in state or co-operative or private shops just as anywhere else.

A marked characteristic of Russia throughout the first Five Year Plan was the acute shortage of foodstuffs and of manufactured goods. There were several reasons. Agriculture was in a state of turmoil and upheaval. The dispossessed *kulaks*, being the better farmers, had produced a larger than normal share of food and other crops. Their elimination left a vacuum that was not immediately filled. Moreover, everything was subordinated to the needs of the heavy industries. Foodstuffs that were very short in Russia were shipped abroad to obtain foreign exchange to finance the purchases of machinery and equipment for the new industrial plants. Transportation was under a heavy strain, and food products were often not brought from places where there was a surplus to places where there was a lack. There was a vast influx of peasants into the cities and new industrial towns; and this meant an increased demand on all sources of supply.

Rationing, unknown since the end of the civil war, was reintroduced. Money to a very considerable extent became devalued. The insufficient supplies in the state and co-operative shops were distributed on a rationed basis and a system grew up under which every institution or factory had its own shop or its own restaurant, exclusively for the use of its own employees. Private trade again became illegal, in fact if not in law, the supply of goods in the private markets diminished and prices soared. The purchasing power of the rouble in free trade shrank by 90% or more. How much money a man earned became less important for his well-being than what type of shop or restaurant he was permitted to patronize.

Some observers, both in Russia and abroad, foresaw disaster in this reversion to some practices of war communism. But this third phase of the soviet economy developed under much more favourable auspices than the primitive experimental war communism of 1918-21. There was no distraction of war and all the mobilized energy of the country could find expression in new industrial construction. A younger generation had grown up under the influence of the soviet schools and Young Communist organization, indoctrinated with the ideas of the new regime and willing to endure hardship and to smash pitilessly any opposition. The soviet union was no longer blockaded and cut off from the outside world. It was possible to engage the services of thousands of foreign engineers and technicians, mostly Americans and Germans, to direct the building and the first stages of operation of the factories, mines and electrical power plants which were part of the scheme of industrial development.

So, although the human and material costs of this experiment in planned economy were prodigious (there were millions of deaths from famine and related diseases in Ukraine and in the north Caucasus in 1932-33 and the casualties among the deported kulaks and other "class enemies" of the soviet regime were considerable) the political structure successfully withstood the strain. By the time the plan was completed a considerable stride had been taken toward the goal of making Russia industrially self-suffi-

cient. The following table shows the progress which was made during the plan and also the falling short of the still more ambitious goals which had been set.

	1927-28	Estimated Output for Last Year of Plan	1932
Coal, tons	35,400,000	75,000,000	64,200,000
Copper, tons	28,300	84,700	47,200
Cotton thread, metres	2,871,000,000	4,700,000,000	2,540,000,000
Oil, tons	11,600,000	22,000,000	21,400,000
Pig iron, tons	3,300,000	10,000,000	6,160,000
Steel, tons	3,900,000	10,000,000	5,890,000
Superphosphates, tons	151,400	3,400,000	612,800

Some industries that had been nonexistent or negligible before the Five Year Plan, the manufacture of tractors, automobiles and motor trucks, were put on a mass production basis. Indeed the advance of the tractor and agricultural machinery industries was intimately bound up with the soviet scheme for the complete reorganization of the country's agriculture. Beginning in 1929, a mass drive was launched to induce the peasants to give up their individual holdings and organize themselves into collective farms (*kolkhozi*). It was made inconvenient not to join these collective farms; anyone who opposed the change was likely to be denounced and sometimes arrested and deported as a *kulak* or a *kulak* agent.

Co-operative farming had not been unknown in Russia before this great change in the national agricultural system. While the overwhelming majority of the peasants farmed their allotments on an individual basis, only restricted by the prohibition against buying or selling land, there were a few communes and a somewhat larger number of *artels*. The members of a commune usually lived together in a common dwelling and shared equally the produce of their labour. The *artel* was a looser form of association, in which land and working animals were pooled, the members retained their own homes and the output was shared in proportion to the amount of labour and equipment which each member contributed.

It was the *artel* that furnished the approved model for the collective farm. A typical collective farm includes about 100 peasant families as members, with between 1,000 and 1,500 ac. of land. A small village would often be transformed into a single collective farm, while a larger village would be divided into several collective farms.

The collective farms went through several changes of organization. The type of organization that prevailed in 1942 was as follows: the collective farm is an inalienable unit; its boundaries cannot be changed. The members possess the right to cultivate individual gardens and to possess cows and keep pigs, fowl, sheep and goats. Their main work, however, is supposed to be for the collective farm and they are paid, partly in kind, partly in cash, on the basis of the quantity and quality of the work performed. The president of the collective farm is elected by the members; but, as in all soviet elections, the local communist cell, or group, exercises a good deal of influence in the selection. The larger machines, tractors, harvesting combines, threshing machines, are not sold directly to the collective farms. They are placed in machine-tractor stations, state-controlled organizations which undertake to cultivate the land of the collective farms within a given radius of territory. Payment for this service is made in kind. Receipts from the machine-tractor stations and from the fixed quantities of grain, cotton, sugar beets and other products, which the collective farms are required to sell to the state at a price so low as to be practically nominal, assure the food supply of the cities and of the army.

After deductions of the payments in kind for tax and debt obligations, the peasant may sell his share of the crop, so far as this is not required for his own needs, either individually or through a co-operative to which he may belong. He is also free to sell his vegetables, poultry, eggs and small animals.

The unfamiliarity of this system, together with the lack of trained organizers and the excesses of zeal on the part of some local officials, made its first years very difficult and led to a tremendous destruction of livestock that depleted the country's normal output of meat and dairy products for some years to come. The severity of this livestock crisis is reflected in the following figures (computed in millions of head):

Livestock	1916	1929	1933
Horses	35.1	34.0	16.6
Large cattle	58.9	68.1	38.6
Sheep, goats	115.2	147.2	50.6
Pigs	20.3	20.9	12.2

In other words, the ravages of civil war had been generally more than made good by 1929, but were repeated on an even larger scale during the stormy first years of collectivization. As the peasants became resigned to the inevitability of the new system, as the supply of machinery increased and managerial capacity improved, collective farming struck firmer roots in the Russian soil. Toward the end of the '30s it was claimed in soviet official statements that the incomes of peasants in some collective farms compared favourably with what the average peasant received as an individual farmer. That some traces of the old individualistic spirit survived among the peasants as late as 1939 was evident from the fact that a severe decree was published in the spring of 1939, forbidding the peasants to increase the size of their gardens and individually farmed land at the expense of the common land of the collective farm.

The degree of realization of the first Five Year Plan was mixed and spotty. Heavy industry certainly received a powerful impetus and the ground had been prepared for further progress by the erection of such large factories and hydroelectric power installations as the Magnitogorsk iron and steel works, the Kuznetsk iron and steel plant, the tractor factories at Stalingrad, Kharkov and Chelyabinsk, the agricultural machinery works at Sverdlovsk, the chemical plants at Berezniki and Bobriki and the Dnieprostroi dam and power plants, which were designed to supply power to several newly built factories. Agriculture had been made over in the collectivist mould. The potential military strength of Russia had been notably increased and the soviet state had become much more completely master of the human and material resources of the country than it could have been during the NEP, with its concessions to private enterprise.

On the other hand, the desired figures of agricultural production were not realized and the parts of the plan which had provided for an increased standard of living, even specifying the increased amounts of meat, eggs and butter which should be available, were entirely unfulfilled. General living conditions during the Five Year Plan were bleak and hard, more suggestive of war than of peace; and the militant character of the period was often emphasized by using phrases and analogies drawn from war. Production levels were something to be stormed; every harvest was a campaign, first to get in the grain, then to see that a sufficient amount reached the cities.

A feature of life under the Five Year Plan was the enormous focusing of public attention upon productive processes that in other countries would usually be left to the financial and technical journals. One of the main functions of the soviet journalist was to tour the country and report on new factories and collective farms, pointing out both their successes and their failures. There was a flood of novels and plays which centred about the new industrial revolution which Russia was experiencing. There was almost a standardized plot for these works: an enterprise that was being built in the face of great obstacles; a communist hero, one or more villains recruited from the ranks of the *kulaks*, the priests or the sabotaging counterrevolutionary engineers. The effort to make the people industrially conscious went to the point of encouraging the writing of symphonies and ballets devoted to the industrial process. In the effort to give the workers a psychological incentive, the title Hero of Labour was bestowed on men who distinguished themselves by the amount and quality of their

work. Pictures of these heroes of labour were often displayed in soviet newspapers and busts of some of them were put up in the Park of Culture and Rest, Moscow's chief amusement centre.

Such a tremendous straining of the national energy for the achievement of industrial and agricultural objectives left an impression in every field of social life. There was a strong trend toward communal care of children and communal eating, because there was an effort to bring women into industry, so far as possible, and food supplies for the individual family mere scanty. Another factor that tended to disrupt family life was the institution of the so-called *nyepererivka*, or unbroken working week, with one day's rest in five. It often happened that the holiday of the husband and the wife did not fall on the same day.

Religion was under strong pressure; there was a revival of a militant antireligious crusading spirit. Many churches were closed and converted to secular uses; permission to build new churches was systematically refused; and the soviet constitution was amended in 1929 in a sense unfavourable to religious groups. The original soviet constitution had recognized freedom both for religious and for antireligious propaganda and had asserted the right of every soviet citizen "to profess any religion or none." This was amended so as to provide that freedom of religious worship and of antireligious propaganda should be recognized. As interpreted by the soviet administrative authorities and elaborated in supplementary legislation, this meant that religious activity had to be confined to the holding of services in houses of worship. All charitable, cultural and social activity was forbidden to ecclesiastical bodies. Religious propaganda was also, by implication, forbidden. There could be no presentation of the religious viewpoint through speech, press or radio, and there could be no reply to the constant attacks on religion in the magazine *Godless* and other atheistic publications.

Soviet Economy: The Fourth Phase.—Between 1918 and 1933 soviet economy had passed through three distinct phases, each with strongly marked characteristics. There had been the hungry years of war communism, when the new regime was fighting for its very existence, when the price of military success had been an unprecedented decline of production, both in industry and in agriculture. The NEP, with its relaxation of the extreme rigours of state control of national economic life, had provided a recuperative breathing space. People had more to eat and wear; public services functioned; the extreme chaotic destitution of war communism was overcome. Then came the third phase of Planned Economy, with its twin goals of building up a powerful industry and reorganizing agriculture on the new bases of mechanization and collectivization. Again, just as during the phase of war communism, the national energies were strained to the utmost and heavy sacrifices were required.

The period from 1933 until the outbreak of war with Germany in 1941, which opened up a new formidable ordeal for the Russian people, possessed its own distinctive qualities. For the masses of the people there was again some recuperation from the severe hardships of the first stages of industrialization. There was nothing that could have been accurately called a new NEP. Private trading and private farming were both virtually eliminated from the soviet economic scheme. On the other hand, certain equalitarian tendencies that had appeared during the first Five Year Plan were vigorously denounced and repudiated. The tendency was toward more, rather than less, inequality in wages and salaries, all, of course, within the framework of the state socialist system. No one in Russia may operate even a small business for personal profit. Practically everyone, in some form or other, is working for the gigantic state economic machine. But several developments illustrate a tendency to encourage differential remuneration for work of differing quality and importance.

It was a rule in the first years of the revolution that no communist, however high his position, could earn more than the so-called party maximum. This sum varied from time to time; but it was not much above what a highly skilled worker might earn. Any earnings above this figure had to be paid into the general party fund. There were various ways of evading the rigours of the party maximum. Perquisites of office were generous and

communists who wrote books and articles were exempted from the demand that all their earnings above the fixed sum should be turned over to the party. Still it imposed a certain material handicap; it was designed to keep out of the party individuals who thought of money more than of public service. The party maximum was abolished. A communist is paid on the same basis as any other soviet citizen.

Bonuses to directors and engineers who exceed production programs are increasingly common. Among the workers themselves there are more substantial variations in wage rates because of the development of the Stakhanovite movement, named after a Donetsk coal miner, Aleksei Stakhanov, who discovered that, by concentrating on one particular job and rationalizing the distribution of work, he could substantially increase his daily output of coal. The Stakhanovites are usually the more skilled, younger and stronger workers; and their earnings sometimes run as high as 1,000 to 2,000 roubles a month, although the average wage of the soviet worker is about 300 roubles a month.

It is difficult to convey accurately what the value of this wage is, because, although the rouble possesses a nominal exchange value of five to the U.S. dollar, it is really a currency for purely internal use and its buying power is not affected by its nominal exchange value. In terms of food and clothing and manufactured goods, the rouble buys much less than the equivalent of 20 cents in the United States. Sir Walter Citrine, British trade-union leader, who visited Russia in 1935 and made a detailed study of wages and prices, estimated that the rouble would buy about as much as 3d. in Great Britain, or six U.S. cents.

On the other hand, rents for workers and employees are kept relatively low, medical treatment is free and some workers and employees are given free treatment in rest homes and sanatoria. Higher and middle education was also free until 1940, when fees were charged for admission to universities and middle schools.

The abolition of rationing and the return to a system of free sale of foodstuffs and other goods, which took place in 1935, reflected an alleviation in general conditions of supply. But it also favoured the more highly paid, as against the poorer workers, because the prices which prevailed were a compromise between the comparatively moderate former charges for rationed products and the fantastically high prices which were charged on the private market and in the so-called state commercial stores which began to appear in the latter part of the first Five Year Plan.

All in all, it would seem that variations in compensation under the soviet system are not appreciably different from those which prevail under the so-called capitalistic system. The difference between the two economic regimes is that the function of ownership of means of production, factories, mines, railways, etc., in the soviet union is exclusively vested in the state. Income is therefore practically restricted to wages and salaries, although interest is paid on state bonds and every soviet citizen is practically required to invest three of four weeks' salary every year in new issues of these bonds, the proceeds of which are designed mainly to finance further measures of industrialization and public improvement.

Another sign of a changing mood was the restoration in 1935 of epaulets, which had disappeared from the uniforms of army officers since the revolution. At the same time, the simple "Comrade Commander" which had been the form of address for a Red army officer was replaced by regular military titles. Roughness and neglect in dress had been fashionable both for men and women in the tempestuous years of the first Five Year Plan. Later, neatness in dress and regular shaving were recommended both for military and civilian officials; Red army officers were supposed to learn to dance; and no stigma was attached to the woman who tried to make herself attractive. A kind of ascetic puritanism had been characteristic of the grimmer periods of the revolution; this was now frowned on. Stalin himself gave out the slogan: "Life has become gay and more joyous."

Changes in Education, Culture, Family Relations.—There were noteworthy shifts in the soviet attitude toward such questions as education, the family and culture. The soviet school during the first years of the revolution was experimental to the

last degree. Discipline was almost nonexistent. Marks and examinations were abolished. Teachers enjoyed only the authority that their personality could create. Various educational innovations, project methods, Dalton plans, etc., were introduced, regardless of the technical means for implementing these new ideas.

Even before the end of the first Five Year Plan there was a strong reaction against this educational modernism. It was found that pupils in soviet schools, while precocious in some fields, were gravely deficient in the elements of reading, writing and arithmetic and in elementary basic knowledge of history, geography and other subjects. Sweeping changes were introduced. Instruction was again given according to subjects. The prerevolutionary practice of putting students in uniforms was revived. Marks and examinations were restored and the teachers were given wide powers of disciplining and, in extreme cases, of expelling unruly pupils.

There was also a fundamental shake-up in the method of interpreting Russian history. During the first years of the revolution, a purely economic interpretation had been stressed. The role of individual personality had been almost ignored. Uncritical and undiscriminating condemnation of the Russian past had been the rule. Tsars were referred to, if at all, in terms of violent abuse. The impression was conveyed that Russia's past was one of almost unmitigated darkness.

This approach to Russian history was completely altered. Tsars like Peter the Great and Ivan the Terrible are held up for praise as men who, within the limitations of their time, contributed to the building up of the Russian state. Great Russian generals like Suvorov and Kutusov are recalled with pride and admiration. The sense of historical continuity, of a link with the Russian past, has been restored. The narrowly economic interpretation of history has been broadened to make room for an appreciation of distinguished individuals. This tendency was extended and strengthened after the outbreak of the war with Germany. Soviet war propaganda was carried on almost entirely in terms of nationalism, not of international revolutionary theory.

All this fits in with a marked growth of Russian nationalism, which had been visible for years and which probably found its culminating expression when Germany attacked Russia in 1941. The Russian Revolution had originally been conceived by Lenin and his associates as the prelude to, as part of, a world revolution. Russian nationalism was deprecated. The Red army was supposed to be fighting for the world revolution. The anthem that replaced "God Save the Tsar" was the traditional song of the Socialist parties of the world, the "Internationale." During the '30s, however, a soviet patriotism with a strong tinge of Russian nationalism was making visible progress. Russia's classical poets, Pushkin and Lermontov, were frequently quoted. The natural beauties of the Russian land, its high mountains, vast forests, wide steppes were emphasized. A nationalist note made itself felt in new books, in the press, in the schools.

Another significant change affected the attitude toward the family. The first years of the revolution witnessed a tremendous breakdown of settled family relations. The general chaos and excitement, the breakup of many families by the accidents of war and revolution, the tendency to condemn marriage as a "bourgeois" institution led to unprecedented freedom in sex relations. Divorce was made available at the desire of either partner in a marriage and without any necessity for stating reasons.

While soviet vital statistics were confused and contradictory, there seems little doubt that there was a considerable lapse in the normal growth of the soviet population during the early '30s. Famine conditions prevailed over considerable regions in 1932-33 and the inflow of population into the towns, combined with the difficult housing conditions, did not make for large families. Probably because of a realization of this state of affairs, the soviet government launched a drive for greater stability in family relations and for larger families. Divorce was made more difficult. Abortions were made liable to severe punishment.

Continuation of Industrial Progress.—While there was some relaxation of the frantic tempo of industrial advance and there was an attempt, especially during the second Five Year Plan, to devote more attention to the output of consumers' goods, which had been largely neglected during the first Five Year Plan, soviet industrial progress continued. Between 1932 and 1940 the output of iron and steel virtually trebled, rising from about 6,000,000 tons for each, to about 18,000,000 tons. The oil industry, which had developed rapidly during the first Five Year Plan, when there was a virtual doubling of output, from about 11,000,000 tons to about 22,000,000 tons, seemed to strike a snag when it reached a figure a little short of 30,000,000 tons. Apparently some of the richer deposits in the Baku field, which is much the largest, were showing signs of depletion, while production in other discovered fields in the southern Ural region did not seem in 1942 to have reached any considerable figure.

Figures were not available in 1942; but Russia had apparently pushed up its annual output of motor trucks and of tractors to a figure of 200,000 or 300,000 for each type of vehicle. Passenger cars were also flowing off the assembly lines of the large new plant at Gorki (formerly Nijni Novgorod). But these are apparently numbered in tens, rather than in hundreds of thousands annually. Russia's system of internal waterways was enlarged by the completion of two

large canals, linking the Baltic and White seas and joining the Volga with the Moscow river.

Especially after the outbreak of war in Europe in 1939, soviet industrial production was canalized more and more into military lines. It would be interesting to compare German and Russian industrial potential output; but there are many gaps, both in the German and in the soviet statistics, because of considerations of military secrecy. It would seem that the soviet union possessed a greater capacity for the output of tractors and agricultural machines, as German farms could not use more than a small fraction of the tractors, combines and other large machines which found employment on the vast farmlands of Russia. So long as the Caucasus remained in soviet possession, Russia could count on more oil than Germany was able to obtain from all the countries in Europe which fell under its domination.

On the other hand, Germany (counting in the resources of the conquered countries) possessed a much larger output of coal, iron and steel, the backbone of any munitions industry. The German-dominated Europe also most probably contained greater plant capacity and a larger reserve of skilled workers.

Railways.—The development of soviet railway transportation did not keep pace with the intensive industrial development of the country. During the period 1917-36, the length of the soviet railway lines increased only from 39,500 mi. to 52,500 mi., although the output of large-scale industry rose by almost five times during the same period. L. M. Kaganovitch, one of the most capable soviet administrators, was placed in charge of the railway system in 1935 and achieved some improvement in expediting freight shipments, although at the price of drastically curtailing passenger traffic. Two of the most important soviet railways are the Turksib, completed in 1930, which links up the Trans-Siberian railway with the Turkestan railway system, and a new railway across eastern Siberia, which branches off from the main Trans-Siberian line at Taishet and follows a route north of Lake Baikal. How far this second railway had advanced by 1942 was uncertain, since its construction was treated as a military secret. It would presumably be extended to the Pacific ocean, with a terminus, perhaps, at Nikolaevsk. The Trans-Siberian railway had been double-tracked with a view to making communication with the far east swifter and easier.

Finances.—The soviet budget displayed a steady tendency to increase; it was 14 times larger in 1937 than in 1927-28, as the following table shows:

Year	Budget (roubles)	Year	Budget (roubles)
1927-28	6,800,000,000	1933	35,000,000,000
1928-29	8,100,000,000	1934	49,700,000,000
1930	12,800,000,000	1935	65,900,000,000
1931	20,400,000,000	1936	78,700,000,000
1932	27,500,000,000	1937	98,100,000,000

Because of the completely different economic organization of the soviet union the national budget is entirely different in character and much larger in scope than the budget of a country where individual enterprise prevails. The financing of industry, transportation, agriculture and commerce, which takes place through private channels in other countries, is an item in the budget. Another reason for the vast rise in the budget is the depreciation in the value of the rouble during the first Five Year Plan.

The character both of revenue and of income in the soviet budget is distinctive and unusual. Much the biggest item of revenue (it accounted for about 77% of the 1937 budget) is a turnover tax, which is a levy on the proceeds of retail trade in grain, alcohol, oil, sugar, meat, cotton tissues, petroleum, gasoline and other commodities. This levy in 1937 worked out at about 58 kopeks on every rouble spent in the retail trade of the country.

There are no wealthy individuals in the soviet union, and the yield from income tax and taxes on enterprises and organizations in the 1937 budget was only 972,000,000 roubles, less than 1% of the total budget. The other principal sources of income were as follows:

Principal sources of income	Roubles
Deductions from profits of state industries	6,304,200,000
State loans	4,375,000,000
Agricultural and housing taxes	2,645,000,000

On the expenditure side, 39,585,600,000 roubles, or more than 40% of the budget, went for the financing of the various branches of national economy, industry, agriculture, transportation, communications, commerce, etc. The next largest item, 20,102,200,000 roubles, was assigned for national defense needs, which were thus already claiming more than 20% of the national expenditure. The other largest items of expenditure were 15,933,500,000 roubles paid out in allocations to the budgets of the various national republics of the soviet union and 10,870,100,000 roubles for such social and cultural services as health and education.

So the soviet national bookkeeping is relatively simple. It consists of siphoning a large part of the earnings and salaries of the population

back into enterprises of national economic development through a sales tax which is much heavier than any known in any other country. After about 1930, military preparedness took a large share of the soviet national expenditure, and no doubt some of the sums invested in economic development were used to promote military objectives.

Developments Before World War II.—Despite the conclusion of a nonaggression pact with Germany in Aug. 1939, the soviet government did not relax its vigilance or its measures of preparedness during the two years which elapsed between Hitler's attack on Poland and his onslaught against the soviet union. There was a steady tightening of discipline; the country was more and more placed on a war basis. Penalties for absence from work, for tardiness, for quitting a job without permission were made sharper. The seven-day working week, with Sunday as the day of rest, was substituted for the six-day week which had already replaced the former five-day week. The length of the working day was extended from seven hours to eight. There was also a marked increase in the prices of foodstuffs, which probably reflected a certain amount of storing for war emergencies.

HISTORY

I. PREHISTORY

The great East-European plain which was in the process of history united, together with Siberia, under the sway of Russian tsars, presents in spite of its general uniformity two contrasting geographic aspects which profoundly influenced the trend of its historical development: the northern and the southern. A primitive forest extending over the northern part of Russia reminds one of that described by Tacitus in his *Germania*. It was indeed its continuation and connected Russia with the western part of the European plain. It was comparatively late that this part of Europe was set free from its prehistoric ice-cover. It is still full of seas and great rivers which for long remained the only ways of communication for a scanty population scattered in distant glades. The primitive settlers added a few patches of cultivated land to their habitual means of livelihood—fish in the rivers, wild bee-hives and fur-bearing animals in the forests.

Quite different is the southern Russian landscape. It is the steppe, the prehistoric seat of nomad hordes which inhabited it from time immemorial until quite recently. These lived on horseback and in tents, used mare's milk as their food and threw on the booty taken in regular incursions against northern sedentary tribes. Here the most ancient traces of aborigines are found, of the palaeolithic stage, followed by the neolithic, also traces of Aegean culture in its primitive form. Here also we learn, by the intermediary of ancient Greek colonies on the northern Elack sea shore, the names of ancient peoples of Southern Russia; we are unable, however, to identify their nationality. The most ancient of them, the Cimmericians, are said to have been replaced by the Scythians (see SCYTHIA) and these by Sarmatians (*q.v.*). Some patriotic Russian historians (Zacelin, Ilovaisky, Samokvasov) tried to prove that these populations were Slavs but later research points to an Iranian origin (*e.g.*, the present representatives of the Sarmatae-Alani are found to be the Ossetes, who are not Slavs but a Caucasian people).

The original home of all Slavs is not to be sought in the steppe, but in the forest. Prof. Niederle states that, originating in the marshy land between the Vistula and Dnieper, the southern Slavs (Serbs and Bulgarians) descended to the Danube as early as the first century A.D. The first federation of eastern Slav tribes (Russians) appears in the 3rd-4th centuries A.D. as a powerful and numerous people called Antae, living between the Dnieper and

Dniester. They were involved in the wars of the Goths and Huns and were defeated by the Avars in the 6th-7th centuries. In the 7th century appears a new conquering nomad nationality in the steppe, the Khazars (*q.v.*) possessing a certain degree of civilization. They brought under their subjection some eastern Slav tribes whose names are given in the ancient Russian annals (Severiane, Radimichi, Viaticchi, Poliane). Khazar domination lasted until the beginning of the 10th century, when other nomads of Turkish descent and wilder habits—Hungarians (middle 9th century) and Petchenegs (end of 9th century) overran the steppe and broke for long the connection between Slav settlements and the Black Sea shore.

Origin of the "Russ."—The Slav forest tribes were now obliged to adapt themselves to the new situation. As a reply to the invasion of the steppe by the Turk hordes there appears a new organization of defence from the north. The defenders are the "Russ"—a "Varangian" tribe, in ancient annals considered as related to the Swedes, Angles and Northmen. Both "Russ" and "Varangians" are also known to Byzantine chroniclers ('Ρῶς, Βαρύγγου) first as Northern pirates, then as warriors serving in the imperial guard and finally (10th century) as chiefs of the caravans of traders coming yearly to Constantinople by the "Great Waterway," the Austrvegr of northern sagas, through the waterfalls of Dnieper, whose names are given by the emperor Constantine Porphyrogenetus both in "Russian" (Scandinavian) and in "Slavish" ('Ρωσσισι and Σκλαβνισι). Arabian writers represent the original seat of the "Russ" as an island covered with woods and marshes: this brings us to the source of the waterway mentioned: the sea of Ilmen near the ancient town Novgorod and Ladoga sea, where the river Neva has its origin. Excavations of 9th-10th century tumuli confirm the presence of northern warriors buried (or burnt) with their horses and arms, in that very tableland where four chief waterways of Russia, the Neva basin, Volga, Dnieper and Dvina converge and form outlets to the Baltic, the Caspian and the Black seas and thus determine the direction of ancient trade-routes. Numerous finds of Arabian, Byzantine and Anglo-Saxon coins (9th-11th centuries) along all these routes testify to a flourishing trade which corresponds exactly to the period of foundation of new states by northern Vikings at the one end and the florescence of Arabian and Persian Caliphates before the Mongol invasion at the other end of these trade-routes.

The First Russian Princes.—Russian legend says that the "Russ" were first asked to come to Novgorod by the local population which wanted them to put an end to their internal feuds. Rurik (Hrorekr) was the first (semi-legendary) "kniaz" (koning, prince) of Novgorod, but his companions wished to descend the Austrvegr, nearer to Byzantium, and Oleg (Helgi) settled in Kiev. The Russian Annals date the arrival of Rurik in Novgorod A.D. 862. But the first reliable datum is that of Oleg's commercial treaty with the Byzantines (911). A subsequent treaty was concluded in A.D. 945 by Oleg's successor Igor (Ingvar) together with his companions, whose signatures contain only three Slav names among 50 Norse. Constantine Porphyrogenetus gives a very picturesque description of this trade which still remained the chief business of the "Russ" dynasty. During winter the princes and their gesiths who distributed among themselves the towns in the basin of the Dnieper were busy making circuits among neighbouring tribes in order to force them to pay annual tribute. Their booty consisted of furs, money and slaves. As spring came they loaded their small boats "made of one single tree" (μονόξυλος) and conveyed their caravans down the Dnieper ready to ward off attacks of nomad steppe tribes. In the treaties mentioned their rights of trading in the capital were strictly defined. The "konings" extended their power over local tribes and to defend the land from nomad incursions, they constructed earthen walls on the frontiers of the steppe. The local aristocracy joined the ranks of their "drushina" (gesith, *comitatus*) and the process of assimilation began. The term "Russ" was now used to designate the southern outpost of the whole system of defence, *i.e.*, Kiev with the surrounding country. The son of Igor and his wife Olga (Helga) had already a Slav name, Sviatoslav. However, he still remained a northern Viking combined with a southern nomad

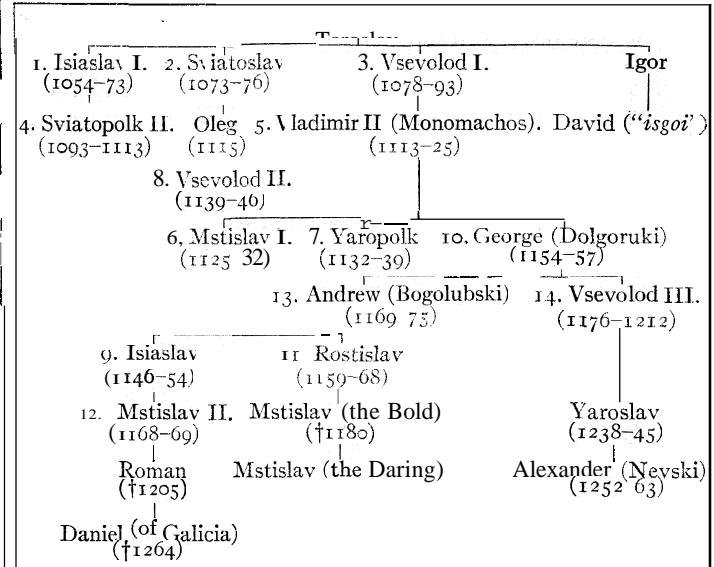

Sviatoslav did not yet feel at home in Kiev. He wanted to come still nearer to Byzantium and chose Pereyaslavets on the Danube in the Bulgarian land, because, he said "there was the centre where all goods gather from all parts: gold, clothes, wine, fruits from the Greeks, silver and horses from the Czechs and Hungarians, furs, wax, honey and slaves from the Russ." Sviatoslav also defeated the Khazars and the Volga Bulgars, but he was defeated by the emperor Zimisce and slain on his way back home by the Petchenegs (972). With him died the Scandinavian tradition of the Kiev dynasty.

II. THE CHRISTIANIZED RUSSIA UNDER THE GRAND DUKES OF KIEV

From the reign of Sviatoslav's youngest son Vladimir the Norman dynasty was definitely settled in Kiev. It still preserved its connections with other parts of Europe, attempted distant military expeditions against its Slav neighbours and ruled the large territory from the northern lakes to the nomads of the steppe and from the then uncertain Polish frontier to the river Volga and the Caucasus. This was the most brilliant period of southern Russian history; but its brilliancy rested on an extremely unsafe base, as the connection between the newly built State and the country inhabitants remained very loose. The only link which unified the subdued tribes was the power of the grand duke of Kiev. The population paid their tribute to the prince's tax-collectors; but otherwise they were left to themselves and preserved their ancient tribal organisation and habits.

Christianity Accepted.—Another element of union of enormous importance was added by the acceptance of Christian faith in 988 by Vladimir "the Saint." He took his religion from Byzantine Greeks, but the service was in vernacular as the prayer books and Bible had already been translated in Slavonic by the "Slav apostles" Cyril and Methodius in the 9th century. From 1037 the Russian Church was subject to the Constantinopolitan patriarchate; for two centuries nearly all "metropolitans" and most of the "bishops" were Greeks. Eventually the Slav and Russian element prevailed. After Vladimir's death (1015) his son Sviatopolk "the Damned" assassinated his brothers (Boris and Gleb, canonised as Saints), but was defeated by another brother Yaroslav, elective prince of Novgorod, who reunited all territory under the grand duchy of Kiev and embellished his capital with a cathedral in Byzantine style. He also founded the Bechersk monastery which became a famous seat of faith and learning; he collected books and had them translated. Under Yaroslav the earliest document of Russian law was revised under the name of *Russkaya pravda* (Russian right). He gave refuge to two sons of Eadmund who fled from Cnut; to king Olaf, banished from Norway, also to Harald Hardrada (III.) who married his daughter; he gave his other daughter to Andrew, the king of Hungary; his third daughter married Henry I. of France. His sons married Polish, Greek and German wives. He died in 1054. In order to prevent feuds among his numerous descendants he introduced an order of succession to the grand duchy of Kiev which was based on the principle that all territory as a whole belonged to the family, and different parts of it were distributed among them in temporary possession according to seniority and to the profitableness of the seat of administration. The most profitable towns on the main trade-route were Kiev, Pereyaslav (on the steppe frontier), Novgorod (the first Norman residence), then Smolensk (on the upper Dnieper) and Chernigov (on its confluent—Desna). All brothers of the first generation were considered as senior to the following generation. As soon as Kiev passed to another brother all the members of the family changed their seats and approached one step nearer to Kiev. If one died before reaching Kiev, his descendants were mere called *isgoi* and excluded from "mounting the scale." In the next column is a numbered table of successive reigns in Kiev during seven generations after Yaroslav.

The order of succession from brother to brother was kept only in the two first generations (1 to 5). Numbers 9 and 12 show preference given to nephews over uncles. And indeed, as early as 1097, at a conference held by the dukes at Liubech it was decided that the sons should keep their fathers' heritages. The direct suc-

cession from father to son prevailed in all dukedoms. Kiev was seen to be losing its former significance. Its great importance was based on trade; but southern trade was destroyed by the appearance in the steppe (1054) of the Polovtsi, nomads far more dangerous than the Petchenegs. It will also be seen that of all Yaroslav's sons only one line survived: that of Vsevolod and his brilliant son Vladimir Monomachos. Monomachos' line was then divided into two: the elder one (6, 9, 12) remained in Kiev and in its turn it was subdivided in two—Roman and Daniel preferred to move west from the then unsafe Kiev to Galicia, while two Mstislavs, the Brave and the Daring, as their nicknames show, remained to the end the knights errant of the chivalrous South. The cadet branch of Vladimir Monomachos (10, 13, 14) opened a new period of Russian history. The centre of influence changed then to northern woodland, far from the steppe. It was a far poorer but safer and, in the long run, more profitable settlement. In 1169 Andrew's troops stormed Kiev. This was the end of southern brilliance though Kiev was not definitely destroyed till 1240, by a last and most terrible invader, the Mongol Batu, Genghis-khan's nephew.

The Decay of Kiev.—The title of grand duke of Kiev thus lost its importance and with it broke down the unity of Russia. Ducal appanages became independent dukedoms; Russian territory was split in a dozen separate units which waged endless wars against each other. This was the darkest period of Russian history. The old Kiev centre suffered the most from these internal dissensions and from incursions from the steppe. The frontier population was nearly exterminated and mixed with Turk ethnic elements. However the ancient tribes remained untouched to the west and north of the river Dnieper. In their midst, about the 14th century appeared new branches of Russian people speaking their separate dialects: the "Little-Russians" and the "White-Russians" (the old "Krivichi").

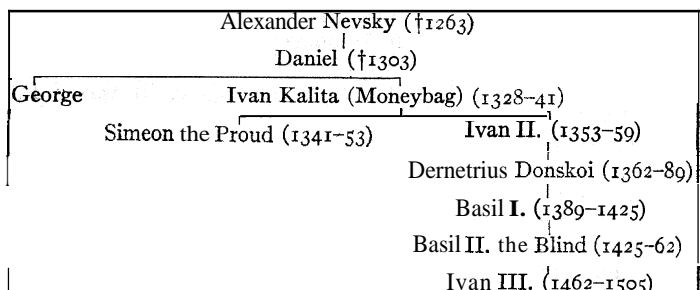

The New Political Centres.—By and by three distinct centres emerged from the chaos: Galicia, Novgorod and Moscow. Each was characterized by the prevalence of one of three main features of the political life of Russia during the Kiev period. These three features are (1) the *popular assembly* ("veche") which represented the ancient tribal organisation and which met in towns thus consisting chiefly of townfolk; (2) the princes; (3) the *boyars* and the "drushin" (*comitatus*), a landed aristocracy, partly of ancient tribal descent, partly the military companions of the prince at the conquest. This aristocracy developed especially in Galicia where the social structure approximated to western feudalism. On the north-western frontier it was, on the contrary, the democratic element that prevailed. The chief city, Novgorod, became a republic. "Lord Novgorod the Great" was ruled by a popular assembly (*veche*) which elected its mayor (*posadnik*) and its commandant (*tysiatski*) and concluded treaties with the

dukes who were invited only to watch over the defence. Novgorod had a largely developed trade and enormous dominions extending from its gates and from the mouth of the Neva over the whole Russian north up to the White sea and the Urals. That country was rich in furs, the chief export. The higher class of citizens was here formed of capitalists and rich merchants who at a later date gave an aristocratic tint to the republican rule of Novgorod.

Another element existed in the political structure of central Russia: the backwoods of the Oka and upper Volga. This country was cut off from all European connections. Its population consisted exclusively of agricultural colonists settled on ducal land. Thus the duke appeared here as a proprietor and organiser of social life. Towns were scarce and the population scattered in clearings. The few *veches* in the chief towns had no influence; noble landed proprietors were completely absent. Thus the power of the duke was here practically unlimited. Ducal psychology was framed accordingly. Unlike the valiant knights of the south, they formed a dynasty of great appropriators, stingy and acquisitive, ruling their dukedoms as private estates. They thus accumulated elements of strength which as time went on aided them to become masters of the whole of Russia.

III. THE RISE OF MOSCOW

After the conquest of Kiev by Andrew Bogolubsky the title of grand duke passed from Kiev to a northern town, Suzdal, and from there to Vladimir on the Kliazma. But as early as 1147 Moscow is mentioned in the annals. Its situation was exactly at the centre of Russia between the Oka and the upper Volga. It had long been a great centre of continental river trade, far from the southern area of Tatar devastation. The line of dukes of Moscow starts from Alexander Nevsky's younger son Daniel. The following is their genealogy during the domination of the Golden Horde (1240-1480).

All these princes had to ingratiate themselves with the Khans of the Golden Horde to receive from them the *yarlyk* (investiture) as grand dukes. They regularly journeyed to Sarai, the capital of the Khans at the mouth of the Volga and underwent every kind of humiliation. But they returned as chief collectors of the Tatar tribute, which gave them power over neighbouring dukedoms. Only the dukedom of Tver competed with them very stubbornly.

The dukes themselves involved the Tatars in their feuds and brought punitive expeditions on Russia. The khan's protection gave the Muscovite dukes the upper hand over their enemies. They very soon succeeded in increasing their possessions. Ivan I. extended his domains, by purchase and by violence, over the whole province of Moscow. Demetrius added to it the upper Volga region (excepting Tver and Yaroslavl), Tula and Kasinov; Basil I. — the remaining part of Oka and Susdal, Vladimir, Murom and Nijni-Novogorod; Basil II. — Elets in the south, Vologda and Ustyug in the north. A religious sanction was given to Muscovite unionist tendencies by the metropolitans of the Russian church who in the persons of Peter, Theognost and Alexis settled in Moscow. Accordingly, the grand dukes of Moscow added to their title: "of all Russia." Demetrius won a great name by his brilliant victory over the Tatars of the Golden Horde led by Mamai in a bloody battle on Kulikovo plain (1380). He thus appeared as a leader of all the national forces (excepting the grand duke of Ryazan) against the oppressors, and he received the blessings of

the church at the hand of St. Sergius of Radonesh, the prior of the convent of the Holy Trinity. However two years later Moscow was sacked and burnt by another conqueror, Tokhtamish, who in his turn was defeated by Timur, his former protector. The Mongolian yoke lasted for another hundred years, although in milder forms. While Moscow was steadily growing in importance in comparison with the rival grand dukedoms of Tver and Ryazan, the boyars and other "men of service" came in crowds to serve "the grand duke of all Russia." The institutions of Moscow which up to then resembled very much those of a large private estate, began to evolve into a system of State administration.

"All Russia" United.—Ivan III.'s acquisitions of Novgorod and Tver (1471, 1485) enlarged Russian territory up to the limits of settlements of the Great Russian branch of the nation and brought Russia into direct contact with other countries, Livonia, Lithuania and the Tatar khanate of Crimea. The title of "All Russia" became a reality, and systematic foreign relations were started. The "all Russian" potentate proffered historical claims against Lithuania which possessed a part of formerly Russian territories. The successful wars which followed extended the western frontier to Chernigov, and Novgorod Seversk, while leaving further claims for Smolensk, Kiev "and all Russian patrimony" to Ivan's successors. Ivan also built the fortress Ivangorod close to the gulf of Finland, thus opening the chapter of Russian pretensions on the Baltic. The Crimean khan Mengli-Gherai accepted his friendship and helped him to put an end to the Golden Horde. As early as 1480 Ivan refused the Tatar tribute and threw off the yoke. The title of "grand duke" seemed inadequate after all these successes; more pretentious claims were based on a new theory suggested by southern Slav and Greek divines.

Moscow—"Third Rome."—According to this the Muscovite duke was a successor of the Byzantine emperors and the only representative of the Orthodox Church in the world. Indeed, the Greek Orthodox Church had accepted the "Union" with the Catholics as early as 1439, at the Florence council, while Constantinople, "the second Rome," had been taken by the Turks in 1453. Obviously, the Greeks had been punished by God for their apostasy and their succession had to pass to the "third Rome," which was Moscow, and to the Russian grand duke, who remained the only faithful and really Christian prince in the world.

The realisation of this new scheme began by the marriage of Ivan III with Zoe (in Russian: Sofia) the only niece of the last Byzantine emperor Constantine Paleologus (1472). With her arrival new habits appeared at the Muscovite court intended to magnify the new "autocrat" (a title used by Ivan in foreign relations). The church that gave its sanction to that change claimed a reward: the prince had to help it against all "heresies" and internal dissensions. The prior of Volokolamsk convent, Joseph, insisted on burning some rationalistic heretics in Novgorod. He also defended the principle that "wealth gives power" to the Church, and he mercilessly crushed monastic and ascetic tendencies of the reformer, Nil Sorsky, the "abstainer from property." Thus the official theory on Russian Church and State was formed as early as the end of the 15th century. Under Basil III, the unification of Russian territory was consummated by the acquisition of another republic, Pskov (1510); by the final annexation of Ryazan, the last independent grand dukedom, and by a new extension at the expense of Lithuania—the acquisition of the frontier city of Smolensk (1514). The minority of Basil's son Ivan, who was three years old when his father died (1533), and subsequent disputes over the regency between rival factions, lasting 14 years, did not interrupt the growth of the Muscovite State. The reign of Ivan the Terrible marks the beginning of a new period of Russian history.

IV. THE MUSCOVITE TSARDOM

The reign of Ivan IV. (the Terrible) was an epoch of great and systematic reform. It gave its final shape to the Muscovite Tsardom which it preserved until the epoch of Peter the Great. At the age of 17 Ivan demanded to be crowned as tsar (shortened from Latin Caesar) and he connected this official assumption of title with a legend according to which the imperial regalia had been handed over to his predecessor Vladimir Monomachos by a Byzan-

tine *basileus*. The Constantinopolitan patriarch was induced to confirm that legend but he substituted Vladimir the Saint for Vladimir Monomachos in order to make good a chronological error. Popular songs preserved the memory of Ivan IV, as a democratic tsar, who "ferreted out treason" (*i.e.*, the boyars) "from Russian land." And indeed, he definitely deprived the "little dukes," who gathered at his court of their remaining sovereign rights and forced them to exchange their hereditary possessions for other landed estates, while their "service" to Moscow was made obligatory. To pass over to foreign countries was qualified as treason. The same measures were extended to boyars. Both dukes and boyars tried to recompense themselves by assuming political power in the *duma* of the Tsar, and the most powerful of them formed a "selected Rada" (a sort of privy council) through which they ruled the state. They summoned the first Russian *zemski sobor* (1550)—"men of all people" (*i.e.*, popular representatives), who revised the criminal code of Ivan III. They also took part in a Church council of 1551, where this code was signed and certain traditional rites in church and private life were sanctioned as specifically national. At two previous synods of 1547 and 1549 about 40 new Russian saints were canonised.

Autocratic Tendencies. — However the régime of the "selected Rada" did not last long. Ivan IV. resented it as an interference with his own power and he broke with the counsels of his youth. He grew nervous and suspicious and began systematically to extirpate ducal and boyars' families. To show his wrath against his enemies he left Moscow (1564) and settled in Alexandrovskaya Sloboda. He then divided the kingdom into two parts: his private *oprishnina* which he ruled personally, and the remaining "land" (*zemschina*) which he handed over to a christened Tatar, Prince Simeon Bekbulatovich. Far from suspending reconstruction, this curious division helped to reorganise the Russian ruling class—the "men of service"—on more democratic lines. Ivan IV. imitated for this purpose Byzantine patterns. He strictly regulated the connection between possession of landed estates and military obligations. His foreign policy—his long and successful war with Poland, Lithuania and Sweden in order to break through to the Baltic—also forced him to adopt reforms in the army and the financial system. Russian fusiliers (*streltsi*) and foreign mercenaries first appeared under Ivan IV. He also introduced new military taxation and ordered a first general description of taxable land (*pistsoviya knighi*) in order to make the levies proportionate to the record of lots of taxed land; here too he borrowed his system from Byzantium. At the same time he centralised the receipts of the State in a "great treasury" while separating them from his own income, which was concentrated in the "great palace." Through its four boards (the "fourths") the "great treasury" collected taxes chiefly from the north, while the peasants of the Muscovite centre had to work for "men of (military) service." The nobles received the honorary title of "courtiers" (*dvoriane*), to distinguish their upper section—the tsar's guard—from the "sons of boyars," who formed the lower section—the provincial gentry. Both "courtiers" and "sons of boyars" were yearly sent to defend the western and the southern frontiers—especially the latter, which was fortified by walls and hedge-rows (*zaseki*), to ward off the Tatar incursions. The posts of commandants for each "campaign" were distributed by the central board called *raziadni prikaz*.

The son and heir of Ivan IV., Theodore, was a weak man whom his father called more fit to be a bell-ringer in a convent than a tsar. The direction of affairs fell to the hands of his brother-in-law Boris Godunov, an able man who continued the policy of Ivan IV. The Church of Russia received its independence and equality with other orthodox churches by the granting to its head the metropolitan Job of the title of patriarch at the hands of Jeremiah, patriarch of Constantinople (1589). Another important measure was intended to strengthen economically the middle landlord class created by Ivan IV. as against the boyars. Peasant labourers were forbidden to leave their estates or migrate to other landowners. All such "fugitives" who fled from their masters after 1592 (the time of the completion of government registers) were ordered back in 1597. This was the origin of legal serfdom.

Extinction of the Dynasty. — In 1598 Theodore died; after

some hesitation Boris had himself elected tsar by a *zemsky sobor*. He pursued Ivan IV.'s policy of weakening the boyars. But he met with opposition on their part. The only legal heir of Theodore, Demetrius, had been killed in Uglich, the place of his exile, in 1591. But the boyars with the help of the Poles opposed to Boris a "Pseudo-Demetrius," a young and well educated man of obscure origin. Boris died (April, 1605) soon after the appearance of this pretender (Autumn, 1604), who was accompanied by Polish volunteers and aided by the Cossacks. On June 19, 1605, the impostor entered Moscow. On May 17, 1606, he was killed in a popular outbreak caused by the boyars who took advantage of the popular dislike of Pseudo-Demetrius' free habits of life and the Catholic tendencies of his Polish protectors. The old dynasty was completely extinguished. The throne of the Tsar passed to an influential boyar, Basil Shuisky (1606–1610). He gave a formal promise to the boyars "not to repeat the policy of Ivan IV." against them, *i.e.*, not to exterminate them by capital punishment, by exile and confiscation of estates, without resorting to the boyars' Court. However, the power of the boyars could not be restored; much more influential now was the rising class of small landlords, "men of service." Still more dangerous, for Basil were the Cossacks and the fugitive serfs in the newly colonised south of Russia. A real social uprising was started in the south by a former serf, Bolotnikov. The ferment was rife over the south and the east. A second false Demetrius appeared and in the spring of 1608 marched on Moscow. He established his camp at Tushino, near Moscow. The boyars wavered between the Tsar Basil and the "thief of Tushino": there were many "flittings." Basil turned to Sweden for help but as soon as he received aid from Charles IX, of Sweden Charles's rival, Sigismund, king of Poland, also entered Russia as Basil's adversary and a new pretender to the Russian throne. In Sept. 1609 Sigismund appeared before Smolensk. In July 1610 Basil was dethroned by the boyars and the "men of service." The throne remained empty through internal dissensions and a real "time of troubles" set in, which lasted for three more years (1610–13).

The "Time of Troubles." — The boyars preferred a Polish candidate and together with the "men of service" they offered the throne to Sigismund's son Vladyslav. A delegation was sent to Smolensk, and Moscow voluntarily received Polish troops under Zolkievsky. A treaty was concluded with Vladyslav which secured the rights of the *duma* and the privileges of the landed gentry. A Polish dynasty might have settled in Moscow but for Sigismund's desire to keep the throne for himself. Sigismund's pretension woke up the spirit of national opposition. The second Pseudo-Demetrius at once won popularity—especially among the Cossacks and the lower classes. But in December 1610 the impostor was killed by a Tatar of his suite. The middle landlord class then took action on the urging of the Patriarch Hermogene. The "men of service" under Lyapunov and the Cossacks under Prince Trubetskoy and ataman Zarutsky blockaded Moscow; inside the town a popular uprising forced the Poles to retreat to the Kremlin. But here again dissensions arose among the besiegers. Lyapunov was killed by the Cossacks, and the men of service returned to their homes. The south of Russia was in complete disorder; crowds of Cossacks and Polish marauders dispersed all over the north. This finally decided the gentry to make a new effort and to gather a new national army which would "exclude the Cossacks and stand firm until a new sovereign is elected by all the land." Prince Posharsky was made commander-in-chief of the army and Cosmo Minin, a butcher from Nishni-Novgorod, the treasurer. All northern towns and districts sent their detachments and their representatives to the army as it advanced up the Volga. In April 1612 it stopped at Yaroslavl. As Novgorod had been taken by the Swedes, Posharsky offered the throne to Charles Philip, brother of Gustavus Adolphus. In August Posharsky's army moved southwards to Moscow. On Nov. 27 the Poles capitulated in the Kremlin, and a national candidate was set free: the young Michael Romanov, whose father, the metropolitan Philarete, a nephew of the first wife of Ivan IV., was at that moment a prisoner in Poland. All votes were at the disposal of a national tsar, more acceptable to the gentry as he did not belong to an old princely family, and young enough (he was 17) to secure the boyars against over-

bearing conduct. Michael was unanimously elected by a regular *zemsky sobor* on Feb. 21, 1613.

V. THE FIRST ROMANOVS

The *zemsky sobor* which elected Michael (1613-1645) continued its session for three years, helping the new Tsar to restore the disorganized and ravaged country. A second *zemsky sobor* was then summoned which pursued for three more years the work of pacification. The co-operation of the tsar with the representatives of different social groups was becoming a regular system. But as the third year's session began (1619) the father of Michael, now patriarch, Philarete came back from Polish captivity, and until his death in 1633 he ruled Russia as the "second lord" at the side of his weak son. The peace with Sweden and Poland was concluded at Stolbova (1617) and Deulino (1618), with the loss of the Finnish seashore and Smolensk. But the struggle on the western, as well as on the southern frontier was far from being finished. Anticipating new conflicts the Government reconstructed entirely the army: they invited foreign commanders and hired whole regiments of mercenary infantry. To cover the increased expenses they had to introduce new heavy taxation. New registers of lots of cultivated land which had survived the devastation of the "Troubled times" were established. However, an attempt to take back Smolensk from the Poles (1632-34) proved unsuccessful and the Government did not feel strong enough to wage war with the Turks to retain Azov, a fortress on the sea of Azov which had been taken by a Cossack raid in 1642. The Russian colonization at that time went no further than the lines of Belgorod and those of Simbirsk and Zakamsk, which were fortified in 1636-56. To the south of the "Belgorod line" there developed at that very time a cross current of Little-Russian (Ukrainian) colonization from the western bank of the Dnieper. The new Cossack settlers (Poltava, Kharkov) felt the more independent from the Poles the further they went east, and in 1654 their hetman Bogdan Chmielnicki voluntarily surrendered the Ukraine to the protectorate of the "eastern orthodox tsar." A large autonomy of the Ukraine was acknowledged by Tsar Alexis. A war with the Poles ensued, in which the Russians finally took Smolensk, occupied Vilna and Kovno and forced Lublin to surrender. But before finishing with the Poles Moscow was implicated in a war with Sweden. By the resulting peace of Kardis (1661) Russia gave Livonia to Sweden; by the peace of Andrussovo, she resigned Lithuania, but kept for herself Smolensk, the eastern Dnieper bank and Kiev (1667).

European Influence: The **Raskol**.—The reigns of the first two Romanovs are closely connected in home as well as foreign policy. Moral and intellectual development was steadily influenced by the increasing intercourse with Western Europe. Since the "time of troubles" foreigners had come in crowds to Moscow. The clergy objected to too close relations with these foreigners which began to have their reflection in a change of habits and even religion. Consequently, about 1652, foreigners were relegated to a suburb called "the German suburb." However, this proved still worse for the Old Russian tradition, as the European culture now formed a single and undiluted unit which strongly influenced the court and the upper social classes. Russian boyars—such as Ordyn-Naschokin, Rtischev, Matveyev, Golitsyn—began to learn foreign languages, to acquire foreign books, to wear foreign clothes, to furnish their apartments with foreign household goods. Translations of foreign books increased in number from 24 in the first half of the 17th century to 94 in the second half. Tsar Alexis was especially accessible to the allurements of foreign comfort and pastime, going so far as to enjoy in private "English comedy" in German adaptations.

The national religious tradition of the 16th century appeared antiquated. The patriarch Nikon found that certain rites of the national Church which distinguished it from Greek orthodoxy, far from proving Russian superiority in faith, were based on ignorant distortion of ancient Greek originals of the books of Service. He asked some scholars of the theological academy of Kiev (founded by Peter Moghila about 1625) to prepare a revised edition. The majority of the clergy declared this attempt sacrilegious, as the

Old Russian saints had saved their souls according to the old books and rites. Nikon insisted on his "corrections." He invited two patriarchs (cf. Alexandria and Antioch) to come to Moscow and at a council of 1667 the "schismatics" were excommunicated. A long struggle began between the "old faith" and the "Nikonianism," as the official Church was now generally called. Popular masses followed the "schism" (*Raskol*) and as hopes for reconciliation passed they began to believe that the end of the world was approaching.

VI. PETER THE GREAT'S REFORM

The reign of Alexis' invalid son Theodore (1676-1682) was a sort of prologue to Peter the Great's reform. The leading part fell, under Theodore, as well as during the minority of Peter (1682-1689), to a well educated boyar, Prince Basil Golitsyn. He was the favourite of Theodore's energetic sister Sophia who broke the tradition of seclusion of Russian women. After Theodore's death Sophia, with the help of the streltsi, made her brother Ivan a second Tsar at the side of Peter and assumed the regency. Peter (ten years old) was left to himself and amused himself in the neighbouring village of Preobrajenskoye with technical and mechanical arts as applied to military games. He surrounded himself with lads of his age who soon became his first regular soldiers. The ill success of Golitsyn's much vaunted expeditions to Crimea (1687 and 89) gave Peter the chance to overthrow Sophia, to send her to a convent and exile Golitsyn. However, as Tsar, Peter continued his free life of sport. He now became a habitu  of the "German suburb," where he made acquaintance with many foreign specialists. A Swiss adventurer, Fran ois Lefort, initiated him into the pleasures of debauchery and became his best friend. He also encouraged Peter to extend his playing at soldiers to a real campaign against Azov. During two difficult campaigns (1695-96) Peter learnt chiefly the insufficiency of his knowledge, and Lefort urged him to complete his military and naval education abroad. Peter followed the advice: he joined his embassy in the capacity of a private working man and visited Germany, Holland and England (1697-98). He was forced to return speedily to Russia to stifle the new rebellion of the streltsi fostered by Sophia's agents.

Russia in Europe.—He then made peace with the Porte (1699), and on the following day declared war on Sweden and invaded Livonia. This "Northern War" lasted until 1721, and it proved to be the chief factor in Peter's military, financial and administrative reforms. Independently from these reforms made necessary by the war, Peter directly after his return from western Europe forced his subjects to shave their beards (which was felt as an unbearable religious offence) and to dress as foreigners. The Old-Believers ("schismatics") especially saw in it a proof that Peter was the expected Antichrist.

Peter's army was crushed by Charles XII. at Narva (1700). But while Charles was engaged in defeating Peter's allies, Denmark and Poland, Peter called up the yearly levies, created a new standing infantry, cavalry and artillery, occupied Livonia, Estonia and the mouth of the Neva, where he founded his new capital, St. Petersburg, on May 1, 1703. The "window to Europe" was thus opened. To cover his new and enormous expenses, he acquired the habit of taking money wherever he found it. He thus completely destroyed the old system of central administration, the "prikazes," and he distributed instead the financial resources of Russia directly among his generals by dividing Russian territory in eight "governments." Each "government" (gubernia) had to pay for the upkeep of a certain number of regiments. Russia thus received in 1708-12 its first regular division into provinces.

Charles XII. made the mistake of advancing from Poland to the south of Russia, instead of proceeding straight against Moscow. The Cossack hetman Mazeppa promised to help him, but was unable to raise the Ukraine. He joined Charles with an insignificant force. At Poltava (June 27, 1709) Charles was defeated by Peter and fled to Turkey. The Poltava battle produced a strong impression abroad: Russia was becoming a European state. Russian soldiers restored (August 11) the Polish throne, drove the Swedes from Pomerania and appeared in the middle of

opposite behaviour. After half a year of the reign of Peter III., Catherine was raised by the guards officers to the throne. The brother of her favourite Grigori Orlov, Alexis, assassinated Peter as soon as he was banished to Ropsha by Catherine.

The long reign of Catherine II. (1762-1796) was a turning point in Russian history. She received the fruit of half a century's evolution since Peter the Great's reforms. A prolific writer herself, in regular correspondence with the foremost men of her age, with Voltaire, Diderot, d'Alembert, Grimm, etc., not to speak of fellow potentates, such as Frederick II., Maria-Theresa, Joseph II., she wished to make her reign brilliant and herself an ideal enlightened monarch. She began her reforms by compiling from Montesquieu and Beccaria an "instruction" (Nakaz) on the basis of which a new code of laws was to be composed. In order to discuss it she gathered an elective assembly of 564 deputies chosen from all classes except the clergy and the serfs, and from all parts of the empire. However, she met with opposition on the part of the gentry to her schemes to fix within definite limits their power over the serfs. Far from engaging in a struggle with the ruling class she yielded to their desires; their power was increased and a number of crown estates were distributed among the ranks of her favourites, thus turning their peasant population into serfs.

Foreign Policy.—Catherine then began to search for "glory" in foreign politics. She conceived a bold scheme: (1) to recover from Poland the western provinces with an Orthodox White-Russian and Little-Russian population and (2) to take possession of the Elack sea shore, drive out the Turks from Europe and found in their place a series of new states in Moldavia and Walachia, in the Balkans and in Greece. She wished to take Constantinople and to place there her second grandson Constantine as the emperor of a new Greek empire. His very name was chosen to symbolize this project. Catherine was favoured in accomplishing at least a part of these designs by discords between two German states, Prussia (under Frederick II. and Frederick William II.) and Austria (under Joseph II., Leopold and Francis II.). In her first Turkish war (1768-1774) she had Prussia on her side and Austria against her; after Rumiantsev's victories she concluded a peace at Kuchuk-Kainardji, the beginning of the "eastern question" (*q.v.*), as by it Russia received the right to protect Turkish Christians. At the same time (1772) she took part in the first partition of Poland, proposed by Frederick in order to consolidate his territory and to compensate Russia for her war expenditure. In the second Turkish war (1787-1791) Catherine had Austria on her side and Prussia against her. She had to content herself, after the victories of Suvarov and Repnin, with the acquisition of Ochakov and the steppe between the Dniester and the Bug. But she consoled herself with new annexations from Poland (the second partition 1793 and the third partition 1795; *see* POLAND), while Prussia and Austria were busy fighting against the French Revolution. Catherine also annexed Courland (1795). Her numerous lovers flattered her imperial ambitions: the bold Gregory Orlov in her early years (1762-1775), the ingenious Potemkin in the midst of her reign (1776-1791) and the young Platon Zubov, handsome but insignificant, in her declining years (1791-1796).

Administrative Changes.—Between her two Turkish wars (1775-1785) Catherine returned to the legislative mania of her early years. Made wise by her experience with the "commission of the code" of 1767, she turned from Montesquieu to Blackstone and profited by the administrative knowledge of J. Sievers, a skilful adviser of German Baltic origin. She then published in 1775 her "statute of provinces," a good piece of organic legislation. Here for the first time in Russian history a local unit of administration, judiciary and self-government, was created. The Statute introduced a regular system of courts of justice, separate financial and administrative offices and—last but not least—corporations of local gentry meeting every three years to discuss their affairs and to elect their "marshals." This system lasted until the reforms of Alexander II. The reform of 1775 was completed by two "charters" granted in 1785 to "nobility" and to "burgesses." The charter of nobility served to perpetuate the

power of the ruling class until the liberation of the serfs in 1861, while the burgesses' charter laid the basis for real municipal self-government.

The protection extended to the gentry inevitably created a growing disaffection on the part of the serfs, who impatiently awaited their turn for emancipation. In 1773 the Yaik (Ural) cossacks revolted under Pugachev, who called himself Peter III. He roused the Bashkirs and the serfs allotted to the factories in the Urals, assailed Kazan on the Volga and sacked it. Through the whole empire the peasants only awaited his coming to rise, but he did not feel equal to the task, nor could his bands stand against regular troops. He therefore suddenly returned to Cossack country, lost his army, was extradited by his associates, tried and beheaded in Moscow.

Catherine definitely turned her back on the liberal ideas of her youth after the beginning of the French Revolution. She began to persecute representatives of the advanced opinion which she herself had helped to create. Radischev, the author of a spirited book, *A Journey from Petersburg to Moscow*, was sentenced to death as a Jacobin in 1790, but the sentence was commuted to ten years' exile in Siberia. Novikov, a freemason who accomplished admirable educational and editorial work, was sent to Schluselburg prison in 1792.

Paul I.—Catherine's son and successor Paul mounted the throne when he was 44, with a bitter feeling of having been deprived by his mother of his right to succeed his assassinated father, Peter III. He hated Catherine's favourites and her policy, both internal and external. His ill-balanced mind and tyrannical proclivities inspired fear in his associates, and in the sixth year of his reign (1796-1801) he was the victim of a court conspiracy. He stabilized the succession of the Russian throne by his "imperial family statute" (1797, in force until 1917). He sent Suvarov to Italy to fight against the French revolution; and he ended his reign while preparing with Napoleon an expedition to India against England. In social questions Paul's policy was also inconsistent. He alleviated the serf's obligatory work for his landlord by reducing it to three days in a week; but he gave away the peasants of the crown to noble proprietors as serfs, in an even larger number than Catherine (120,000 yearly). This did not make him, however, popular among the nobility, as his exalted idea of the divine right of the tsars caused him to treat them in a purely oriental way. He used to say that a person could be reputed of importance only as long as he was permitted to converse with his majesty.

IX. ALEXANDER I

Alexander I.'s reign (1801-1825), like that of Catherine whom he professed to imitate, opened with attempts at a very liberal legislation (1801-5), which were interrupted by active foreign policy and wars (1806-9). There followed a new attempt at a constitutional reform (1809), hampered by the nationalist opposition, which urged and approved the annexation of Finland (1809) and of Bessarabia (1812). The invasion of Napoleon (1812) brought the national feeling to extreme tension. The following years (1813-1818) were devoted to the assertion of Russia's influence in Europe. The last years of the reign (1819-1825) were marked by a reactionary policy, which provoked the first revolutionary movement in Russia.

Alexander received a careful education at the hand of his grandmother, who wished him to inherit the throne instead of Paul, his father. The Swiss republican Laharpe had a very strong influence on him in his early years (1784-95). But this education was interrupted by an early marriage (at 16) and it did not go beyond imparting to Alexander some general ideas unsustained by exact knowledge. His sentimental feelings were cooled by the court intrigues, the hidden enmity between his grandmother and father and finally by the harsh system of Paul's reign which Alexander was expected to approve and obliged to share in. The consequence was that he grew up a past master in dissimulation and self-restraint. His evasiveness in face of other people's strong opinions was often taken for weakness. But he knew how to promote his own views and if impeded in his designs he was capable of violent explosions of wrath.

Initial Liberalism.—In the first year of his reign Alexander surrounded himself with a few friends of his youth—Novosiltsev, Stroganov, Prince Adam Czartorisky, Prince Kochucey,—a "private committee," whom he wished to help him in drafting large schemes of reforms. He at once cancelled a series of reactionary measures of Paul and declared his desire to abolish arbitrariness and to inaugurate a reign of law. Public opinion received him with enthusiasm. But the "private committee," which met regularly for about a year, found dangerous and untimely a formal declaration limiting the power of the autocrat, and abolition of serfdom. The most important fruit of these good intentions was the introduction of "ministries" instead of the colleges of Peter the Great, which had been practically abolished by Catherine. A new senate statute was intended to make this institution the highest legal authority (1802). A very cautious ukase of 1803 permitted noble landowners to liberate their serfs, granting them at the same time lots of land. Only 47,000 serfs were thus liberated and became "free agriculturists." Somewhat larger measures limited the power of landowners over the serfs in Livonia and Estonia (1804-5). A new and important impulse was given to public education which was considered to be a preliminary condition to all substantial reforms. Three new universities were created.

Since 1801 Alexander had feared the consequences of Napoleon's ambition and he took upon himself, although it had no relation to Russian national interest, to organize a new coalition against France. In 1805 and 1806 he was involved in wars which ended in crushing defeats at Austerlitz and Friedland. He then changed his policy and concluded an accord with Napoleon directed against England, whose commerce with the continent had to be forbidden in all countries which adhered to this "continental system." At his personal meeting with Napoleon at Tilsit (1807) Alexander played a part which made Napoleon call him a "northern Talma" (a renowned actor) and a "Byzantine Greek." But he was in part genuinely under Napoleon's influence, and was entangled into new wars, with Sweden—which finished with the annexation of Finland (1809), and with Turkey—which lasted for six full years (1806-12) and ended with the annexation of Bessarabia. A year later (1808) Alexander again met Napoleon at Erfurt, but Napoleon's intention to raise the Polish question did not please Alexander, while Napoleon was offended by the refusal of the tsar to give him his sister in marriage. Relations were very strained by the end of 1810.

Conservative opinion was very much incensed against Alexander's alliance with the "Corsican usurper," especially as at that very time another and more serious attempt was made to introduce in Russia a constitutional government. Speransky, a prominent statesman, whose views were favoured by the emperor at that time, prepared a scheme, based on the introduction of self-government in four stages, beginning with electoral assemblies (*dumas*) in the cantons and ending at the top with the *duma* of the State. Each lower *duma* elected deputies to the upper one: cantonal *dumas* to district *dumas*, district *dumas* to provincial ones; these latter sent all their members to the State *duma*, a legislative assembly, deprived of legislative initiative but enjoying the right to make motions concerning the interest of the State, responsibility of functionaries and violation of fundamental laws. The Senate retained only judicial power, while the newly reformed ministries remained organs of the executive. The council of State, composed of high dignitaries and presided over by the emperor, was to prepare drafts of laws. In fact nothing except the council of State and the reformed ministries was realised (1810). Conservative opinion, as represented by nobility and bureaucracy, was furious with Speransky, and the tsar did not choose to defend him. On a futile pretext Speransky was dismissed from his office of imperial secretary and sent to exile (1812). His successor was an extreme nationalist and conservative, Admiral Shishkov.

Nationalism and Reaction.—When the war of 1812 began, the nationalist feeling reached its pitch. It was to be a "Scythian" war—a war of retreat. "Time" and "space" were to be the chief allies of Russia, whose military forces were two or three times

weaker than those of Napoleon. And indeed, the deeper Napoleon penetrated into Russia's endless plain the more equal the chances became. Alexander named another conservative, Kutusov, instead of Barclay, commander-in-chief, and a third conservative, Count Rostopchin, general governor of Moscow, which was the final aim of Napoleon's strategy. After the bloody but undecided battle at Borodino (Sept. 7, 1812) Moscow surrendered to Napoleon. For five weeks of his stay in Moscow he waited in vain for a peace proposal. Moscow was burnt by the inhabitants. His army was in process of dissolution, and winter was approaching. Then followed the famous retreat, during which the "Grand Army" was nearly annihilated, and the "wars of liberation" of 1813 and 1814, which brought Alexander and his army to the walls of Paris. At the Congress of Vienna (1815) he figured as a saviour of Europe, and he continued to play a leading part at Aix-la-Chapelle (1818), Troppau-Laibach (1820) and Verona (1822). All these events produced an enormous impression on the sensitive temperament of Alexander. "The fire of Moscow," he said later to the German pastor Eilert, "lit up my soul, I then got to know God and became another man." Alexander now found in the Bible the proofs of his mission and he proposed to his allies to establish a "Holy Alliance"—a monarchs' League of Nations based on the precepts of the scriptures. His intention was liberal, but Metternich made use of the idea for his policy of repression of all liberal movements in Europe.

The Revolutionary Movement.—Quite different were the impressions which the younger generation of officers who took part in the Napoleonic wars brought with them back to Russia. Many of them while abroad read political newspapers, and were present at the debates of representative assemblies. They learnt to quote the books of Delolme, Destutt-de-Tracy, Benjamin Constant, Filangieri, Bignon, etc. After their return to Russia they were shocked by the contrast of arbitrary rule, the abuses of bureaucracy, the venality and secrecy of the courts, the sufferings of the serfs and the indifference to popular education. Two secret political societies were formed by the most active of these officers in 1816-18: by Pestel in the southern army and by a group of guard officers in Petersburg—the Muravievs, Nicholas Turgenev. The former society—more radical—imitated the organisation of Carbonari; the latter borrowed their principles from the Tugendbund. Later on Pestel drafted a republican and strongly centralised constitution, while Nikita Muraviev composed a monarchical and federal constitution on the basis of those of Spain of 1812 and of the United States. Pestel's tactics were revolutionary, while the Petersburg group intended to help the government openly in questions of education, philanthropy, economics and improvement of justice, thus preparing Russia for a constitutional régime. They expected Alexander to sympathise with them, as in 1815 Alexander gave a constitution to Poland, and at the opening of the diet he mentioned that he was preparing one for Russia. He also acknowledged the old institutions of Finland. However, Alexander soon ceased to distinguish between "the holy principles of liberal institutions" and "destructive teaching which threatens a calamitous attack on the social order" (his expressions in the speech mentioned). He entirely agreed with Metternich (in 1820) that the liberal principles themselves were destructive. A period of reaction began in Russia. The transition to it was marked by an attempt to impart to Russia Alexander's religious enlightenment. The ministry of public education was united, for that purpose, with a new ministry of spiritual affairs, where all religions including the Russian Orthodox were treated equally (1817). Prince Alexander Golitsyn, the procurator of the holy synod and the president of the Russian branch of the Bible Society founded in 1812, was made the chief of the United ministries. The consequence was that in 1819-21 the young universities recently opened were entirely destroyed—especially by the curators of Kazan and Petersburg circuits, Magnitsky and Runich. They removed the best professors and prohibited good textbooks on natural law, morals and logic, on the ground that the teaching must be based exclusively on holy scripture. For Russian church dignitaries even their mystical pietism was heresy. Golitsyn was forced to leave his

office, after he had been anathematized by the archimandrite Photius, a fanatic protected by Alexander's favourite and true servant Arakcheev. During the last part of the reign Arakcheev, an ignorant and brutal man, enjoyed the power of prime minister.

Under these conditions secret societies changed their character. The measures of Alexander convinced them that monarchs' promises are not to be relied upon. They were also strongly impressed by military pronunciamientos in Spain and Naples (1820). Quiroga, Riego and Pepe now became their heroes. Nicholas Turgenev recorded in his diary in 1820: "we formerly asked, every time we met the readers of newspapers in the club, whether there was a new constitution. Now we ask whether there is a new revolution." One may judge of the impression produced on the officers of the guard when they learnt that they had to stifle the Neapolitan uprising, by orders of the Laibach Congress.

The former secret "society of welfare," imitating the Tugendbund, was officially closed in 1821, as being too moderate. Two societies appeared instead: the "northern" and the "southern" constitutionalists and republicans. The constitutionalists were losing ground; radical elements even among them (like the poet Ryleev) began to prevail. Proposals of regicide were heard from Kakhovsky and Yakubovich, but they were rejected or indefinitely postponed. In any case, revolutionary tactics were considered inevitable. But no definite scheme was in preparation. Suggestions were made for forcing the tsar, at some favourable opportunity, to nominate a liberal ministry of Speransky and Mordvinov, who would convoke a "Great Council" (later on Russian revolutionaries called it a Constituent Assembly) which should decide on the form of the Government.

A favourable occasion presented itself quite unexpectedly. Alexander died in Taganrog on Nov. 20 (Dec. 1) 1825. The order of succession happened to be undecided. Constantine, the elder of two surviving brothers, had renounced the throne in 1823; but Nicholas did not wish to acknowledge this, and he swore allegiance to his brother. Constantine would not accept the throne. Nicholas threatened to leave Russia. The correspondence between Warsaw and Petersburg was thus protracted for about two weeks. The "Decembrists," as they were called later, decided finally to raise the Guard regiments for Constantine against Nicholas and to force Nicholas—in case he survived that day—to appoint a liberal ministry which would do the rest. The rising was a failure (see NICHOLAS). The last of Russian palace revolutions was spoilt by too much idealism; but it served as an ominous prognostication of the coming democratic revolutionary movement.

X. NICHOLAS I. AND NATIONALIST REACTION

Nicholas was quite another type of man from his brother. A rough nature of limited understanding, he was conscious of his inferiority and sincerely disliked the idea of becoming tsar. But once he was tsar, he was sure he would be enlightened from above for the accomplishment of his Divine mission and he conceived an exalted idea of his personal dignity and infallibility. But he was no mystic. Cold and reserved, he inspired fear and hatred and he consciously made use of these feelings as the instrument of his power. His aim was to freeze every germ of free thought and independent moral feeling, as disturbing agents of the order of things entrusted by God to his personal care.

Nicholas' reign can be divided in three parts by two European sets of revolutions: those of 1830 and those of 1848. During the first five years (1825-30) he did not feel quite sure of himself and he appealed for help to advisers of Alexander's liberal period, such as Kochubey, Speransky and Kankrin. He even instructed a special committee of Dec. 6 (18), 1826, to collect for him all useful hints about necessary reforms. While punishing severely the decembrists (five of them were hanged; others sent to Siberia) he wished to make use of all their good ideas. But he reserved for himself the control over public opinion, and he confided to Count Benckendorf the organization of a new secret police of gendarmes controlled by the "third section" of his personal chancery. He adopted Alexander's policy of protecting the kings from their peoples; but he made an exception for Turkish

Christians (in the first place it was the Greeks). He thus carried on a war against Turkey (1827-9). By the treaty of Adrianople Greece was liberated; the "hospodars" of the Danubian Principalities were to be appointed for life and free from Turkish interference in internal affairs. The Straits and the Black sea were to be open.

Nicholas especially attended to education; he wished to clear it of everything politically dangerous and confine it to the upper class. He abolished the liberal University statutes of Alexander (1804); by the new statutes of 1835 he detached primary education which was intended for the lower classes from the "gymnasiums" and universities where only children of gentry and of officials were to be admitted.

The expulsion of Charles X. of France and the Polish insurrection of 1830-31 determined the "legitimist" tendency of Nicholas' foreign policy: he wished to become a real "policeman" of Europe and at Miinchengratz he renewed relations with Metternich. But his excessive interest in the "sick man" in Constantinople finished by rousing Europe against him. In 1833 Nicholas saved the sultan from the Egyptian rebel Mohammed Ali and by the Treaty of Unkiar-Skelessi received for that service free passage for Russian ships to the Mediterranean, while to all other powers the Dardanelles were to be closed during war-time. This concession drew the attention of the European powers and in 1841 all the five great powers agreed that the Dardanelles should be closed to warships of all nations.

"Slavophiles" and "Westerners."—In sharp contrast with Nicholas' educational policy, a new generation grew up, which was bred by Russian universities, especially Moscow university, between 1830 and 1848. They were not politicians or liberals of a Franco-English type. They were idealists and students of the philosophy of Schelling, Fichte and Hegel. In Moscow literary salons they did not discuss the form of the government, but dug deep into the very foundations of Russian history and the Russian national mind. Most of them declared that Russia was unlike Europe, and its type of civilization potentially far higher than the European one. They thought to discover Russia's peculiarity in her old peasants' commune (*mir*), which, they said, revealed the socialistic soul of Russia as unlike the individualist western soul. They execrated Peter the Great's europeanisation of Russia as a fatal deviation from the genuine course of Russian history, and they wanted Russia to come back to the forsaken principles of the Eastern Church and State—to orthodoxy and autocracy. The majority of public opinion, led by Herzen, Belinsky, Bakunin, Granovsky and others, revolted against this "slavophil" doctrine. They opposed to it their own doctrine of the "western" origin of Russian civilization. Herzen and Bakunin emigrated from Russia on the approach of the revolutions of 1848. They became the originators of Russian socialism, which however did not frighten Nicholas so much as Russian liberalism—an applied doctrine whose dangers he had experienced at the hands of the "Decembrists," whose movement in December 1825 has already been described.

Nicholas was not insensible to the chief social question in Russia—that of serfdom. How could he be when peasants' uprisings were steadily growing in frequency? They numbered about 41 in the first part of his reign, while in the second there were 378, and 137 during the last seven years. Nicholas formed a series of secret committees which, after many failures, prepared the law of 1842 on "voluntary accords" which abolished personal serfdom and fixed the amount of peasant lots and payments. Owing to Kiselev's energy, the same changes were obligatorily introduced in Poland (1846) and in some western provinces (1847). A real persecution of intellectuals began after the revolutions of 1848. A secret committee, presided over by Buturlin, was founded to punish press offences. Uvarov himself was found too liberal and resigned. His successor prince Shirinsky-Shikhmatov wished to "base all teaching on religious truth"; the chairs of history and philosophy were closed, the number of students limited; many writers arrested, exiled or otherwise punished. The private circle of followers of Petrashevsky, a young socialist, was sent to forced labour in Siberia (including Dostoyevsky) for having read and discussed prohibited literature.

The **Crimean War**.—Nicholas also wished to dictate his will to Europe. "Submit yourselves, ye peoples, for God is with us": thus ended his manifesto published on March 27, 1848. Nicholas sent his army to subdue Hungary which had revolted against the Kabsburgs. A few years later he inadvertently provoked a conflict with Turkey, because of a special question on the distribution of holy places in Jerusalem between Catholic and Orthodox priests which he confounded with the question of the general protectorate of Russia over Christian subjects of the sultan. European powers would not admit this protectorate, and Nicholas found against himself not only Napoleon III. and England, but also "thankless Austria." Turkey attacked the advanced Russian troops on Nov. 4, 1853; France and England declared war on Russia on March 8, 1854. The courage displayed in the defence of Sebastopol proved useless, as the whole fabric of Russian bureaucratic and autocratic government appeared incapable of competing with European technique. Corruption and lack of communication, feeble development of industry and financial deficiency deprived the valiant soldiers of the most necessary means of defence. Nicholas died, from sorrow, on March 2, 1855, feeling that all his system was doomed to destruction. A wholesale change of régime was indicated to his son and successor Alexander II.

XI. ALEXANDER II. AND THE "ERA OF GREAT REFORMS"

The reign of the "liberator" of serfs and Bulgarians ended with his assassination by terrorists (1855-1881). His personality partly accounts for this tragic contradiction. Alexander was a man of weak character, but good-natured and well-intentioned. He possessed no steadfast views on politics and during the reign of his father he sometimes surpassed Nicholas in reactionary intentions. But the Crimean War proved too clearly the danger of Nicholas' martinet system and public opinion was too impetuous for Alexander to resist. He swam with the current, and this period coincides with the "great reforms" which made his reign a turning point in Russian history. But Alexander was always conscious of his power as unlimited monarch, and his liberalism ended as soon as his reforms brought with them a revival of political or autonomous tendencies. He then began to waver; the reforms were left unachieved or curtailed. Public opinion grew impatient; extremist tendencies won the ground, and the gap between the Government and advanced opinion finally became insuperable. As a consequence, the original impulse for reform was exhausted as early as 1862. There followed a period of faltering which turned into a sheer reaction as the revolutionary movement grew.

Relief of the Serfs.—The greatest achievement of the era of reforms was the liberation of peasants. It paved the way for all other reforms and made them necessary. It also determined the line of future development of Russia. The chief motive which decided Alexander is clearly expressed in his words to the Moscow gentry: "The present position cannot last, and it is better to abolish serfdom from above than to wait till it begins to be abolished from below." However, Alexander met with passive opposition from the majority of the gentry; their very existence as a class was menaced. The preparatory discussion lasted from 1857 to March 1859 when the "drafting commissions" of the "main committee" were formed, composed of young officials enthusiastically devoted to the work of liberation—such as Milyutin and Soloviev and their Slavophil friends Samarin and Prince Cherkasski. Rostovtsev, an honest but unskilled negotiator, enjoying the full confidence of the emperor, was mediator. The programme of emancipation was very moderate at the beginning, but was gradually extended under the influence of the radical Press and especially Herzen's *Bell*. But Alexander wished that the initiative should belong to the gentry and he exerted his personal influence to persuade reluctant landowners to open committees in all the provinces, while promising to admit their delegates to discussion of the draft law in Petersburg. Not less than 46 provincial committees containing 1,366 representatives of noble proprietors were at work during 18 months preparing their own drafts for emancipation. But they held to the initial programme, which was in contradiction with the more developed one. The delegates from the provincial committees were only permitted—each separately—to

offer their opinion before the "drafting committees." Unfortunately, Rostovtsev died in Feb. 1860. Alexander who already feared that he had gone too far in his concessions appointed as his successor Count Panin, a reactionary. Under his influence the proposed allotments of land to peasants were diminished and the rents were increased. However it was impossible to change the main lines of the draft. By the law of Feb. 9 (March 3) 1861 the peasant became personally free at once, without any payment, and his landlord was obliged to grant him his plot for a fixed rent with the possibility of redeeming it at a price to be mutually agreed upon. In that case the Government paid at once to the landowner the whole price (in 5% bonds) and the peasant had to redeem his plot by payments to the exchequer during 49 years. Although the Government bonds fell to 77% and purchase was made voluntary, the great majority of landowners—very often in debt—preferred to get the money at once and to end relations which had become insupportable. By 1880 only 15% of the peasants had not made use of the redemption scheme, and in 1881 it was declared obligatory. The landowners tried, but in vain, to keep their power in local administration. The liberated peasants were organised in "village communities" governed by elected Elders.

Administrative Reform.—After the emancipation of the peasants, the complete reform of local government was necessary. It was accomplished by the law of Jan. 1 (13) 1864, which introduced the district and provincial "zemstvos" (county councils). Land proprietors had a relative majority in these assemblies. They were given (in all Russia) 6,204 seats (48%) while the peasants were entitled to choose only 5,171 delegates and the town inhabitants 1,649 (12%). The competence of zemstvos included roads, hospitals, food, education, medical and veterinary service and public welfare in general. How much was achieved before the end of the century in provinces enjoying zemstvo government as compared with others, can be seen from the following figures:

A third capital reform touched the Law courts. The law of Nov. 20 (Dec. 2), 1864, put an end to secret procedure, venality, dependence on the Government, etc. Russia received an independent court and trial by jury. The judges were irremovable; trials were held in public with oral procedure and trained advocates. Appeals to the senate could take place only in case of irregularities in procedure.

A little later came the reforms of municipal self-government (1870) and of the army (1874). General Dmitri Milyutin (the brother of the other Milyutin) reduced the years of active service from 25 to 16 and made military service obligatory for all classes. The only exemptions admitted were for reasons of education. Military courts and military schools were humanised.

The Revolutionary Wave.—The only branch of public life exempted from reform was the press. The press profited indeed by the new spirit of Alexander's reign. While in the last ten years of Nicholas' reign only six newspapers and 19 (mostly specialist) monthlies, were permitted, during the first ten years of Alexander's there were 66 newspapers and 136 monthlies. The general tendency of the press, very moderate at the beginning, soon became very radical. The leading spirits were the "nihilists"—Chernyshevsky, Dobrolubov, Pisarev; they preached extreme individualism. As early as 1862 "temporary measures" were applied against radical periodicals. Instead of a law on the liberty of the press there appeared in 1865 new "temporary rules" (which however remained in force for fully forty years) compiled from Napoleon

III.'s law of 1852. They set free from "previous censure" books of more than ten sheets, but the censors continued to seize printed books before their issue.

A new wave of revolutionary movement set in. It proceeded from the young generation of university students. They expected an agrarian revolution directly after the liberation of peasants. They were busy preparing for it working men, soldiers and peasants through popular education. Secret circles were formed, proclamations issued and even a revolutionary movement was attempted in connection with the Polish uprising of 1863. Finally, an attempt was made by a student, Karakozov, to assassinate the tsar in April 1866. All these attempts were extremely naive; a few young revolutionaries were executed or sent to Siberia and the whole movement was stifled in its primary stage. But Alexander was frightened. Gradually he dismissed his liberal advisers, and conservatives took their place. The Home Office was given (1861) to Valuyev, who tried to paralyse the introduction of the Emancipation Law and formally prosecuted its faithful adherents. University troubles brought about the removal of the liberal minister of public instruction, Golovnin, the author of a model university statute of 1863. His successor was a reactionary, Count Dinitri Tolstoy, who found the means of salvation in the classics. The old chief of gendarmes, Prince Dolgoruki, had to give place, after Karakozov's attack, to Peter Shuvalov who became the soul of reaction. General Trepov a police martinet was appointed general governor of Petersburg instead of the humane Suvarov. Zamiatin, the minister of justice, under whom the reform of tribunals was carried through, fell a victim to his defence of this reform against an imperial whim. He had to yield to an ignorant reactionary, Count Pahlen (1867), who nearly annihilated the reform. The same was done for the press by Timashev who superseded Valuev in 1868. Two radical monthlies *The Contemporary* and *The Russian Word* were closed (1866). Katkov, a European Liberal who now inclined to extreme nationalism and reaction, became the most influential journalist.

All this contributed to uphold and to increase the disaffection of educated public opinion. About 1869 a new young generation appeared which gave expression to that state of mind. Russian emigrants in Switzerland discussed at that time a new revolutionary doctrine which later on received the name of "Populism." Lavrov was giving it a scientific basis, but Bakunin found this too learned and plainly invited the youth to give up the study and go straight to the people with the aim of inducing disorder. He found this very easy, since Russian peasants with their "commune" were born socialists. The youth of Russia, chiefly the young girls who went to study abroad as there were no female institutes of learning in Russia, listened to these discussions in Zinich and, of course, mostly preferred Bakunin's active optimism to Lavrov's learning. In 1873 they were all ordered back to Russia by the Government and they met, when at home, with many student circles which were busy distributing books and revolutionary pamphlets among their provincial branches and working men. Nicholas Tchaikovsky, Prince Peter Kropotkin and Sergius Stepniak were among the leaders of that educational and (later on) revolutionary work. They decided, in the spring of 1874, to "go to the people"—a naïve crusade by inexperienced youth, hardly out of their teens, in order both to teach the people and to learn from them their socialistic wisdom. Of course they were not acknowledged by the people, in spite of their peasant attire, and were easily ferreted out by the police: 770 were arrested and 21 sent to prison. They then decided to change their tactics. A regular secret society was founded in 1876 under the name of "Land and Liberty" (or "Will"). They still hoped to provoke a mass uprising according to the "ideals of the people"; but their village settlements proved useless for revolution while in the towns they soon got engaged in a lively conflict with the police. As a result the terrorist side of their activity came to the forefront. In the autumn of 1879 the terrorist group formed their separate party "the People's Will," while the remaining members led by Plekhanov—under the name of "Black Partition" (*i.e.*, agrarian revolution)—remained inactive. A series of terrorist acts now followed, beginning with that of Vera Zasulich, who fired on Trepov for his having flogged a prisoner—

and was acquitted by the jury (1878). In 1879 Solovyevev fired five shots at the tsar. On Feb. 17, 1880 a young workman, Khalturin, blew up the imperial dining room at the winter palace. The police seemed powerless against the famous "executive committee" which directed the blows. And the government asked the loyal elements of public opinion for support. The answer was given, in the name of the Tchernigov zemstvo, by Ivan Petrunkevich: he said that no co-operation was possible with the government as long as public opinion was stifled. The Tver zemstvo, led by Rodichev, asked the tsar to "give us what he gave to Bulgaria" (*i.e.* constitution and political freedom). After the winter palace explosion a supreme commission was appointed under the chairmanship of General Loris-Melikov, who was given a sort of dictatorial power. Loris-Melikov's design was to isolate revolutionary elements by concessions to the Liberals, and after exterminating the revolutionaries to summon a sort of consultative assembly, thus renewing certain projects of aristocratic landowners in 1861-3. He submitted to the tsar, on Feb. 6, 1881, a proposal to appoint two "drafting committees" for administrative and financial reforms and to submit their drafts to a "general commission," where "experts" chosen by the zemstvos and municipalities should also be heard (two from each of them). The respective laws would be issued in the ordinary way by the council of State, but 15 delegates should be admitted to its session. It did not at all look like a constitution; but it might have served as an introduction to it. Fate decided otherwise: on the very day when Alexander signed Melikov's project, on March 1 (13), 1881, he was blown up by revolutionaries led by Sophie Perovskaya, on his way back home.

Foreign Policy.—Alexander II. was more successful in his foreign policy. He ascended the throne at a moment of great exhaustion and humiliation for Russia. The Paris treaty (1856) substituted European control for a Russian protectorate over Turkish Christians; the Russian fleet in the Black sea ceased to exist; the portion of Bessarabia nearest to the Black sea was given to the Danubian principalities. However, Russia did not permit Napoleon III. to make an international question of the Polish uprising of 1863; Alexander then approached his relative William of Prussia, and helped him against France in the foundation of the German empire. Russia made use of the Franco-Prussian war to repudiate the provisions of the Paris treaty forbidding her to construct naval arsenals and to keep a fleet in the Black Sea (1870). In 1872 the German, Austrian and Russian emperors met at Berlin and concluded a "three emperors' league" (without any formal treaty being signed. See EUROPE). However, Russia did not wish to strengthen Germany too much at the expense of France. In 1875 owing to Russia's insistence a Franco-German conflict was averted, to the great dissatisfaction of Bismarck who threatened Gorchakov with revenge. In the same year the Eastern question was reopened by a rising of Christian Slavs in Bosnia and Hercegovina (see EUROPE and TURKEY). In 1876 (summer) began the Bulgarian uprising. Russia proposed co-operative action to the powers, but meeting with hidden aid to Turkey from Disraeli, Alexander decided to act alone. When Serbia and Montenegro declared war on Turkey he met Francis Joseph at Reichstadt and on July 8, 1876 concluded an agreement in which all possibilities of defeat, victory or the collapse of Turkey were foreseen. Austria was to receive Bosnia and Hercegovina for "occupation and administration"; Russia was permitted to take back the lost portion of Bessarabia. A last attempt to formulate a European programme of pacification of the Balkans was made by the Powers at the Constantinople conference (Dec. 1876). After its failure Count Ignatiev visited the European capitals to discuss the possibility of war. Austria and England put as conditions of their neutrality: no attack on Constantinople, no Russian territorial acquisitions, no thrusting Serbia into war, Bulgaria, in case of its liberation, not to be under direct Russian control. Thus Russia was in advance deprived of possible gains in case of victory; as a matter of fact Disraeli looked for her defeat. Nevertheless Alexander went to war (see RUSSO-TURKISH WARS). Close to the walls of Constantinople the Russian army was stopped by the British fleet, and the Peace of San Stefano (March 3, 1878), favourable to the Bul-

garians, was emasculated at the Berlin conference. Russian public opinion, ignorant of the agreements concluded before the war, was much incensed against Bismarck, "the honest broker." Russia received the lost part of Bessarabia, and Kars, Ardahan and Batum in Transcaucasia. Far more important were the acquisitions of Alexander in Central Asia. From 1864 his generals were active against Kirghiz and Turkoman tribesmen who raided the unprotected frontier of Siberia. Russian soldiers marched up the Syr-Darya, subjugated Bokhara, and from there, through the desert of Khiva reached the Caspian shore. In 1867 the territory between Issyk-Kul and the Aral sea was constituted into a province called Turkestan, and in 1874 another province under the title of Transcaspia was formed of territories between the Amu-Darya and the Caspian sea. Russia reached the frontiers of Afghanistan and Chinese Turkestan, while in the Far East by the Treaty of Aigun (1858) she obtained from China territory running east from the rivers Amur and Usuri to the Pacific seaboard, and the naval base of Vladivostok was founded. Japan ceded Sakhalin in 1875 in exchange for two Kurile islands. In 1867 Alaska was sold to the United States, for the ridiculous price of \$7,200,000.

Industrial Progress.—Under Alexander II. Russia made decisive steps towards industrialisation. The length of railway increased from 671 versts (1857) to 3,408 (1867) and 16,700 (1876). Factory production grew from 352 (1863) to 909 millions of rubles (1879); number of workmen from 419,000 to 769,000, export of grain—from 3,859 chetverts (1860-62) to 21,080 (1872-74). In 1850 and 1857 Russia (for the second time since 1819) tried the experiment of free trade; but as it brought with it an excess of imports—a thing unusual in Russia—Reutern, the minister of finance in 1862-1878, returned to the protectionist system of Kankrin (1822-1859). He also favoured the organisation, for the first time in Russia, of private credit institutions. The ten Land Banks which were in existence at the end of the 19th century were all founded in 1871-73; there were also 28 commercial banks (founded 1864-1873), 222 municipal banks (1862-1873) and 71 societies of mutual credit (1877).

XII. ALEXANDER III.'S REACTIONARY REIGN

The thirteen years of the reign of Alexander III. (1881-94) are symbolized by a monument, the work of Paul Trubetskoi, in the square of the old Nicholas railway station in Leningrad. It shows a huge, heavy figure of a man mounting a horse which looks like a hippopotamus and yet is almost crushed by the weight of the rider. Russia overwhelmed by Alexander at the moment of its strength: such is the meaning of the symbol. At first it looked as if Alexander would continue the tradition of his father. The quasi-constitutional scheme of Loris-Melikov was discussed on March 8 in the winter palace but it met with the opposition of Constantine Pobiedonostsev, the former tutor of Alexander and his most trusted adviser. On April 29, 1881, appeared a manifesto written by Pobiedonostsev without the ministers' knowledge, in which the tsar described himself as "chosen to defend" autocratic power. At the same time a promise was made to continue Alexander II.'s reforms. Loris-Melikov with D. Milyutin at once resigned. His place was taken by Nicholas Ignatiev, a friend of the Slavophiles, who promised to leave untouched the powers of the zemstvos and municipalities and to alleviate the burdens of the peasants. And indeed, in June and Sept. 1881, Ignatiev summoned the "experts" selected by the Government among liberal zemstvo men. With their help he drafted a scheme for lowering the redemption prices, abolishing the poll-tax, regulating internal colonization and land rents. The new minister of finance Bunge assisted by opening a peasants' bank. He also enacted the first factory acts (1882) and appointed special factory inspectors to enforce their application. A special commission under Kakhkhanov (1881-84) prepared a reform of peasant self-government based on the principle of the equality of peasants with other social classes. In May 1882 Ignatiev proposed to Alexander to summon a *zemski sobor* in Moscow of about 3,000 representatives from all classes, on the day of the coronation.

Triumph of the Gentry: Religious Persecution.—But here Katkov and Pobiedonostsev won their victory. Ignatiev

resigned; Count Dmitri Tolstoy, the reactionary, took his place as home minister. His tool Delyanov enacted in his former ministry a new reactionary statute for the universities (1884). He now became the mouthpiece of the nobility and gentry, a decaying class that tried to preserve as much as possible of their vanishing power and property. In 1885 a special Bank for the Nobility was opened with the aim of preserving the landed property of the gentry from final liquidation (for debt). Then Tolstoy proposed to Pazukhin,—a sworn defender of noble privileges—to revise the zemstvo institution with the avowed aim of making the nobles' influence paramount in the country side. As a result two important laws were published. on July 12, 1889, on "land captains" and on July 12, 1890, on zemstvos. The composition of district assemblies was changed from the figures given above to 5,433 representatives of landed owners (57%), 1,273 municipal representatives (13%) and 2,817 representatives of village communities. However, the chief aim of the government was, rather than favour the gentry, to incorporate both the land captains and the executive boards of the zemstvos in its civil service by making them subordinate to the provincial governors, and destroying their representative character.

A particular feature of Alexander III.'s reign, was an increased persecution of everything dissimilar to the officially accepted national type, Dissenting sects, the Uniate Church and the Lutherans in the western provinces, Lamaist Kalmucks, Buriatts and especially Jews—suffered a systematic persecution. The press was definitely muzzled, revolutionary organizations destroyed and revolutionary movement stifled. Public opinion was silent until the great famine of 1891: from that year symptoms of a revival appeared. The new movement was entirely different from the Populism of the '60's and '70's. The Russian socialists became Marxists, Russia, they argued, was becoming an industrial country and the numbers of the industrial proletariat were speedily increasing. In fact Vyshnegradsky, minister of finance since 1887, not only continued Reutern's policy in developing the railway (22½ thousand versts at the beginning, 36½ at the end of Alexander's reign) and in protecting industry (prohibitive tariff, 1891), but tried to influence the foreign market and to stabilize the rate of exchange of the Russian ruble. He also resorted to foreign capital. In 1889-94 its influx was 5,300,000 rubles, as compared with 1,500,000 of 37 years before (1851-88). However, the position of the Russian consumer who had to pay about 34% *ad valorem* for imported goods, instead of 13% as before the tariff of 1891, was much worsened. The peasants especially suffered, as the price of grain, their only article for sale, fell from 1.19 ruble per pood (1881) to 0.59 in 1894, while their allotments which had been insufficient at the moment of liberation, further diminished (1861-1900) to 54.2%. As a result their arrears of taxes increased more than five times compared with 1871-80. Vyshnegradsky tried to relieve the Treasury by increasing enormously the customs and excise. In the decade 1883-92 taxation increased 29% while the population increased only 16%. Thus elements of an agrarian crisis were increasing as the 19th century was nearing its end.

Relations with Germany and France.—Alexander III.'s foreign policy was peaceful. He wished to be himself his foreign minister: the old and haughty Gorchakov gave place to a submissive Germanophile Giers. Bismarck profited by this, and in spite of his alliance with Austria (1879) which was avowedly concluded against Russia, contrived to renew, as early as 1881, the "Three Emperors' League" of 1872. In 1884 it was renewed for three following years, and in 1887, as Austria seceded, Bismarck concluded his famous "re-insurance" treaty with Russia. All these treaties fettered Russia in her Balkan policy, but secured her against the opening of the Straits to England and even permitted to her, by a secret protocol, the military occupation of the Straits in case of necessity. As at the same time the Triple Alliance with Italy was concluded (1882), Bismarck's policy proved too complicated for his successor, and in 1890 a Russian proposal to prolong the treaty for the next six years was rejected by Caprivi. Thus the way was opened to a Franco-Russian rapprochement, while Germany was courting England, Russia's competitor in Asia, where Alexander in 1885 took Merv,

thus definitely reaching the frontiers of Afghanistan and India. In 1889 France opened to Russia her market for loans and her factories for armaments; in 1891 a French squadron was enthusiastically received in Kronstadt and the "entente cordiale" was concluded which was followed by a military convention worked out in Aug. 1892 and definitely ratified by the tsar in March 1894.

Alexander III. died on Nov. 1, 1894, in Livadia, 50 years old. His robust constitution had been sapped by constant fear of the revolutionaries, which made him live at Gatchina like a prisoner, surrounded by a cordon of police agents. A new revolutionary movement was indeed in sight which, 23 years later, was to extinguish the dynasty.

XIII. NICHOLAS II.

There can hardly be imagined a more tragic contrast than that of the extremely complicated situation inherited by Nicholas II. and the complete nullity of the man who had to solve the problem. Like his father, Nicholas was not prepared to reign; like Alexander III. he would have preferred to live as a private man in his family circle and he hated his exalted avocation which clashed with his modesty and bashfulness. However, like Alexander III., he felt it a duty to bear the burden of autocratic power and, moreover, to preserve autocracy untouched for his successor. He had to wait long for this heir, as his marriage with princess Alix of Hesse (1894) brought him first four daughters, and when finally a son (Alexis) was born (1904), the parents had constantly to tremble for his life, as he inherited from his mother's side the dangerous disease of haemophilia. In their wish to save him at any cost they put their confidence in every kind of quack, beginning with M. Philippe, the spiritist from Lyons, and ending with the famous Rasputin. Intercourse with them finally reduced the nervous Alix to a state of religious exaltation and mystic faith in her predestined mission to save the tsar and her son from evil by obeying the precepts of God's elect.

The Struggle Begins.—Initial hopes that the "leadon coffin lid" of Alexander III.'s reign would be raised by the new tsar were very soon dispelled. When messages of congratulation were brought to the tsar by innumerable deputations on the occasion of his marriage (Jan. 17 [29], 1895) the delegates asked the tsar "that the voice of the people should be heard" and "that the law should henceforth be respected and obeyed not only by the nation but also by the ruling authorities." The tsar, instructed by Pobiedonostsev, answered: "I am aware that in certain zemstvo meetings voices have been lately raised by persons carried away by senseless dreams of the participation of zemstvo representatives in internal Government. Let all know that I intend to defend the principle of autocracy as unswervingly as did my father". The Liberals answered next day in an open letter: "Senseless dreams concerning yourself are no longer possible. If autocracy proclaims itself identical with the omnipotence of bureaucracy, its cause is lost. . . . It digs its own grave. . . . You first began the struggle, and the struggle will come."

The struggle had come. In June 1896 St. Petersburg saw the first strike of 30,000 workmen. The evolutionary wing of the Marxist socialists triumphed: here at last the "masses" had come forward with purely economic demands. In 1898 the Russian Social Democratic Labour party was formed. However, the old leaders did not approve of this peaceful and legal "economism" of the young generation. In their "orthodox" organ, the Spark, published abroad, they defended the political and revolutionary side of Marxism. In 1903, at a conference in London, their tendency, represented by Lenin, obtained the "majority" and "Bolshevism" (Bolsheviki=majoritarians) was created. On the other hand, the "People's Will" party was revived under the name of Social Revolutionaries with a new programme in 1898. They remained true to their two leading ideas; agrarian revolution and terrorism. Agrarian riots began two years later in southern Russia. In 1899 began also student disorders which were answered by the minister of public instruction Bogolepov, by the menace of military service for delinquents. On Feb. 27, 1901, Bogolepov was killed by the student, Karpovich. On April 15 the home

minister Sipyagin was killed by Balmashov. Pobiedonostsev recommended Plehve for his successor. Plehve had to struggle not only against the agrarian uprisings, but also against moderate elements—the zemstvo Liberals and the radicals of the liberal professions (professors, lawyers, journalists, engineers, the so-called "third element," officials of the zemstvos, etc.). They formed a secret "Union for Liberation" and from July 1902 published their weekly, *Liberation*, abroad. The number of persons accused of political crime rose from 919 (1894) to 1,884 (1899) and 5,590 (1903). The minister of finance, Witte, tried to oppose Plehve's policy, but was dismissed in Aug. 1903.

The Russo-Japanese War.—Witte's removal proved especially fatal for Russian policy in the Far East. William II. suggested to Nicholas the idea that Russia's true mission was in Asia, not in Europe. The trans-Siberian railway (begun 1891) presented new facilities for penetration, especially when a treaty with Li Hung-Chang (May 1896) secured its extension by the East China railway and in May 1898 a new lease was received to construct a branch through Mukden to Port Arthur which six months before had been occupied by the Russian fleet. A chauvinistic guard officer, Besobrasov, profited by Nicholas' confidence to cover with the tsar's protection his concession for cutting wood on the Yalu river. Many "patriotic" courtiers, grand dukes and the tsar himself acquired the bonds of the "Eastern Asiatic Industrial Society." Japan objected to the occupation of the left bank of the Yalu. As Count Ito received no satisfaction in Petersburg, he went to London and concluded (1902) a five years' alliance with England. Russia was then obliged to withdraw her troops from Manchuria and promised to do so before Oct. 8, 1903. The promise was not fulfilled. The war party, led by Besobrasov and Plehve decided against Witte for war. They knew nothing of Japan's readiness for war and were stupefied by the famous night attack of Feb. 5, 1904, on the Russian fleet in Port Arthur (see RUSSO-JAPANESE WAR).

The First Revolution.—The revolutionary movement found new substance in Russian military defeats. Patriotic feeling began to turn against the government. The war grew extremely unpopular. Plehve, who had wished to divert public attention from the internal situation by war, was blown up with his carriage in July 1904. After much wavering Nicholas appointed on Sept. 8, 1904, Prince Sviatopolk-Mirsky as successor to Plehve. Public opinion was delighted. The liberal zemstvo men met in Petersburg, on Nov. 19 (22), 1904, in private and worked out a petition to Nicholas asking for inviolability of the person, freedom of conscience, of speech, of meeting, of press, of association and equal civil rights. The majority also asked for "a regular popular representation in a separate elective body which should participate in legislation, in working out the budget and in controlling the administration. The professional groups (*see above*) organized banquets to support the zemstvo programme. Nicholas still wavered. His ukase of Dec. 12 (25), did not go beyond general promises and kept silence over the representative assembly. The chance of peaceful compromise with moderate constitutionalists was passing by. The revolution began.

On Sunday, Jan. 9 (22), 1905, many thousand working men, led by the priest Gapon, marched with ikons, singing religious songs, to the winter palace to speak to "their tsar." But the tsar was absent; the troops fired on the defenceless crowd and killed about a thousand people. Sviatopolk-Mirsky resigned. Bulighin, a bureaucrat, was appointed his successor. As a reply, Grand Duke Sergius was blown up in the Kremlin of Moscow by the Social Revolutionary Kaliaev. The tsar still wavered. He issued a promise merely to summon "the worthiest persons" to share in the drafting and discussing of laws.

Meanwhile, public excitement was growing, fanned by the news of Tsushima (May 27–28). The constitutional and the revolutionary movements began to separate. Constitutionalists (zemstvo men and "Liberation Union") held their congresses and prepared drafts of constitutional Laws. After Tsushima they sent to Nicholas a deputation which repeated the demands of the November petition of 1904, and received (June 6–19) the answer, that the "tsar's will was unshakable." Two weeks later Nicholas

promised to another delegation of the nobility that he would keep the tradition of the past. On Aug. 6 (19) a law conceded a "*duma* of the empire." But it was to be a consultative chamber, composed of class delegates, representing peasants (43%), landed proprietors (34%) and burgesses (23%). This *duma* was only entitled to prepare drafts of laws for the council of State. This, "Bulghin's constitution," provoked general indignation. Its only result was to give the upper hand to revolutionary elements (the Socialist Parties). There was now no end to meetings, workmen's and students' strikes, agrarian uprisings, which finally, on Oct. 10-14, united in one general strike all over Russia. From railway employees it spread to post and telegraph personnel, factories, shops, business offices and even children in primary schools. Communication with the provinces was interrupted; Nicholas was isolated in his summer residence at Peterhof. On Oct. 14 (27) a soviet (council) of workmen's delegates was formed whose vice-chairman was Trotsky. On Oct. 15 (28) the Constitutional-Democratic ("Cadet") party was founded, which included the radical wing of the zemstvo men and the moderate elements from the "Liberation Union" and other professional unions. The common aim of the left wing of public opinion was a constituent assembly elected on universal suffrage and leading to parliamentary government.

Nicholas thought of abdication. But he was saved by Witte who had just concluded (Sept. 5) the peace with Japan at Portsmouth and was generally expected to become a peacemaker inside Russia. On Oct. 17 (30) Nicholas signed the famous Manifesto prepared by Witte (now a count) and published it together with Witte's report, in which the necessity of concession was laid down. The Manifesto promised a "real" inviolability of person, freedom of thought, speech, meetings and associations. "No law was to be enacted without consent of the *duma*." But the word "constitution" was not used: the tsar retained his title of "autocrat" (samoderjets). He openly favoured the newly formed reactionary organization of "the Union of the Russian People." Then a wave of absolutist demonstrations and Jewish pogroms organized by the police followed, in a few days, the short-lived outbreak of enthusiasm elicited by the tsar's concessions.

The Decisive Counter Blow.—Witte was made prime minister of a unified cabinet. But he could not persuade liberal leaders to enter his cabinet as the situation remained extremely uncertain. His minister of interior, Durnovo, was a reactionary. Pobiedonostsev resigned (Nov. 1), but General Trepov was retained in near proximity to the tsar. Agrarian troubles reached their height in November, and Count Witte proposed to his minister of agriculture Kutler to prepare a draft of law on the basis of the expropriation of the landowners. It roused against Witte the nobility, who also founded their "Union." On the other hand Witte had to fight against the revolutionary movement which found its headquarters in the Petersburg soviet of workmen's delegates. The soviet published decrees and tried to play the part of a second government. Trotsky, backed by Lenin, preached a "permanent revolution." However the policy of the Socialist Parties definitely alienated the sympathy of the possessing class. On Dec. 3 (16) the Soviet with all its members present was arrested. Its substitutes replied by an armed uprising in Moscow (Dec. 7 [20]). Until the 13th (26th) there was disorderly shooting in the streets; then the guard regiments came down from Petersburg and the rebels were dispersed. There followed the so-called "punitive expeditions" led by Generals Min, Rennenkampf, Möller-Zakomelsky which exterminated with ruthless cruelty what remained of the revolutionary movement in Russia and Siberia.

This decisive blow at the revolution weakened also the constitutional movement. Witte was losing ground. A certain extension of electoral right, especially in the towns (Dec. 11 [24]) was his last success. The predominance of peasant deputies remained untouched as the peasantry was considered more conservative and reliable than the nobility. Witte promised to the tsar a pliant *duma*. He dismissed Kutler, but he refused to promise to dissolve the *duma* if it raised the agrarian question, a measure proposed by his competitor, the former home minister Gor-

emykin. Nicholas was encouraged to resistance by the repression of the revolutionary movement. He assured the deputations of the "Union of Russian People" that "the sun of Truth will shine bright over the Russian land" (Jan. 1906) and that his "autocracy will remain unchanged as it had been of old" (March).

The fate of Witte was sealed when the elections, which he left comparatively free, gave the majority to the Constitutional Democrats (the "Cadets") together with peasants who wanted a radical agrarian reform. The Socialists, who still hoped for a revolution resulting in a real "constituent assembly," decided to boycott the elections. Witte resigned after having rendered the tsar his last service: he concluded a loan in France, which made the tsar free to deal with the *duma* as he liked. Just before the *duma* met (April 27, 1906) new "Fundamental laws" were published which curtailed its power (see DUMA) while leaving to the tsar an extensive prerogative and to the council of empire, equal rights in legislation and the budget. The Government preserved the right of extraordinary legislation, without the *duma*, in emergency.

The Dumas.—Under these conditions the struggle was unequal. The dissolution of the *duma* was assured when in its address to the Throne it proposed its own programme of embodying into laws and enlarging the liberal promises of the October manifesto. After much delay Goremykin declared the programme "inadmissible." He received a vote of censure, which was, however, of no consequence. There was an avalanche of questions and interpellations in order to expose and to restrain the arbitrary rule of the bureaucracy—but all in vain. The Government answered by practically boycotting the *duma*. Then, a long debate began on the agrarian project introduced by the Cadets, on the basis of partial expropriation of big landed estates. The Government published a sort of counter project and warned the country not to believe in the *duma's* promises. The *duma* replied by a declaration which was interpreted by the Government as an illegal appeal to the country and served as a pretext for dissolution. On July 9 (22) the delegates found the Taurida palace locked and surrounded by army detachments and artillery. About 200 of them moved to Viborg in Finland in order to protest and to invite the people to passive resistance in case no new *duma* were convoked. On the other hand, the congress of the "United Nobility" demanded the changing for their benefit of the electoral law by the mere will of the tsar, in violation of the "fundamental laws." Stolypin, who had dissolved the first *duma* and took the succession of Goremykin, did not dare to do so. But he tried instead to solve the agrarian question by means of emergency legislation. His scheme was to increase the lots of the well-to-do peasants at the expense of the poorer ones by dividing the communal land at the first request of the former, and thus to avert the danger of expropriating the estates of the nobles (edicts of Oct. 2 and Nov. 22). He also set up field court martials to pronounce death sentences against the remaining revolutionaries (Sept. 1).

The second *duma* was convoked for March, 1907. In spite of all pressure on electors, it turned out much more radical than the first. The Cadets' representation sank from 187 to 123, while the Socialists, who this time took part in the elections, rose from 26 to 83, and the "Labour Group" (mostly peasants) rose from 8; to 97. Both extremist groups of urban and agrarian socialism thus nearly formed the majority, while there were, on the right wing, only 34 Octobrists (a party of landlords and rich merchants, formed soon after the "Cadets" with the Government's connivance—they professed to be constitutionalists) and 63 nationalists and avowed autocratists. However, the new majority was not so confident as had been the first *duma*, and shared the cautious tactics of the Cadets. The "United Nobility" was afraid of that moderation. They now induced Stolypin to prepare a new electoral law and only sought for a pretext to dissolve the *duma*. They found it in the lack of desire of the *duma* to denounce revolutionary terrorism and in the propaganda of the Socialist Democratic Party. On June 3 (16) the *duma* was dissolved and at the same time a new electoral law was published which partly disfranchised the nationalities (especially the Poles) and gave pre-

dominance to the representatives of the gentry.

Extreme pressure was used during the elections to the third *duma* (1907-12), as well as to the fourth one (1912-17). However, the government did not succeed entirely in stifling the opposition groups. The party composition of the two last *dumas* was as follows:

	3rd	4th
<i>Right wing:</i>		
Extreme right	52	65
Nationalists	93	88
	145	153
<i>Centre.</i>		
New (Nationalist) center	32
Octobrists	133	98
	133	130
<i>Left wing (opposition):</i>		
Poles and Mussulmans	26	21
Progressives	39	48
Constitutional Democrats (Cadets)	53	59
Labour Group	14	9
Social Democrats	14	15
	146	152

At the beginning of the decade of *duma* activity Stolypin worked with the leading group of Octobrists and their leader Guchkov. By that co-operation Stolypin was able to pass his agrarian laws and the nationalist bills depriving Finland of the last remains of her autonomy. It was the consummation of Nicholas' policy against Finland which had cost the life of his general governor Bobrikov in 1904. Poland was deprived of a part of Kholm territory. Measures were taken against the Ukrainian national movement and against the Jews, with the acquiescence of the *duma*. However, on the questions of the reconstruction of the army and navy Guchkov took a sharp line against the Government and the grand dukes, which incensed the tsar and seemed an attack on his prerogative. It made Stolypin go to the side of the Nationalists—a party newly created with the pecuniary aid of the Government and thus very submissive, led by Count Vladimir Bobrinsky and Paul Krupensky. On the other hand the Octobrists approached somewhat the Cadets and worked together on questions of foreign policy and the budget. An open conflict with Stolypin took place in 1911 over his reckless use of emergency legislation in order to break the opposition of the legislative institutions, including the upper house. As soon as Stolypin lost his credit with the *duma* he was no more needed by the tsar, who still cherished the hope of complete freedom from the *duma*. The assassination of Stolypin (Sept. 14, 1911) by a revolutionary, Bogrov, did not elicit any expression of regret from the tsar and was ascribed by rumour to a police plot.

The elections to the fourth *duma* were so arranged by the Government as to give an overwhelming majority of Nationalists who would then ask for the transformation of the *duma* into a consultative chamber. At the court Rasputin enjoyed already a paramount influence, and the tsarina began to meddle in politics with the aim of strengthening the weak tsar against all risk of concessions to constitutionalism, and also preserving autocracy unimpaired for her son. However, the results of the elections were a disappointment: the opposition increased in number and authority; the right wing of autocratists was merely equal to it; and there was no strong centre to lead the *duma*.

War and Opposition.—The beginning of World War brought nearly all parties together in a patriotic cry for a "sacred union." But the government did not know how to make use of this disposition of mind. It continued its exasperating internal policy and tried to do without the *duma*. Their situation was so much the worse when the Russian retreat began and the army proved unprepared. The war minister, Sukhomlinov, and other reactionary ministers were then dismissed and the *duma* was summoned for Aug. 1, 1915. The *duma* was empowered to control the supply of munitions through their members in a special committee together

with the "Union of the Zemstvos" led by Prince Lvov. The *duma* found finally its majority: but it was the majority of a "progressive block" which proposed to the tsar a national coalition government "possessing the confidence of the country" and a programme of reforms necessary to appease the country (Aug.-Sept. 1915). Unhappily there was no Witte to advise the tsar. Goremykin was only a courtier and he made the tsar answer by a prorogation of the *duma* and by the expulsion of all liberal ministers who favoured the idea of a national cabinet (Sept. 16).

Thus the last chance of a peaceful solution was lost. The *duma* could no more lead public opinion, which turned to revolution. The chiefs of the army were this time on the side of the *duma* and public opinion, as they did not believe in the possibility of victory as long as this régime lasted. The universally hated Goremykin had to resign when the *duma* met (Feb. 2, 1916); but his successor—the old master of ceremonies of the court Stiirmer, an ignorant and a comic figure, especially when he was made successor of Sazonov in foreign affairs (July), only contributed to discredit the whole system and to demonstrate its weakness. As the tsar had made himself commander-in-chief instead of Grand Duke Nicholas and was absent at headquarters, the tsarina took the lead in Petrograd (the new wartime name of the capital). She surrounded herself with an adventurous crowd of irresponsible advisers, the friends of her great "friend," Rasputin. The *duma* was at last summoned on Nov. 14. She poured her wrath on Sturmer, who had to go, and on Protopopov, her former vice-president who passed through the antechamber of Rasputin to get the post of home minister. Sturmer's successor A. Trepov was hissed by the *duma*. Warning on warning came to the tsar even from grand dukes and foreign diplomatists, insisting on serious concessions to the people in order to prevent revolution. But the tsar, hypnotised by the tsarina, would not listen. On Dec. 17 (30) Rasputin was assassinated by Prince Yussupov, husband of the emperor's niece, and Purishkevich, the leader of the extreme absolutists in the *duma*. Not even that blow could change the obstinacy of Alexandra Feodorovna. Protopopov seemed to wish to provoke an outbreak. In certain circles a scheme for the tsarina's arrest and the tsar's abdication were being discussed. The meeting of the *duma* had been postponed until Feb. 14 (27), 1917. Disorders in Petrograd began during its session, and on Feb. 26 (March 11) the *duma* was prorogued. The following day was the first day of the revolution.

BIBLIOGRAPHY.—*General works.* Good general reviews of Russian history have appeared recently in the chief European languages. Very useful and full of information (extensive bibl.) is Sir Bernard Pares' *A history of Russia* (1926). Karl Stahlin's *Geschichte Russlands von den Anfängen bis zur Gegenwart* is based on thorough special study; the exposé is embedded in learned criticism. Vol. 1 (Stuttgart) goes up to Peter's birth. In French there is *Histoire de Russie*, by Paul Miliukov, with Ch. Seignobos and L. Eisenmann (collaborators, Kizeveter, Miakotine and others. 3 vols. 1932-33). In Italian: *Storia della Russia* by Prof. Eugenio Šmurlo (vol. 1, *Dalle origini a Pietro il Grande* 1928). Earlier productions on Russian history which still preserve their interest are A. Rambaud, *Histoire de la Russie, revue et complétée jusqu'à 1917 par E. Haumant* (1918, good bibl.); V. O. Klyuchevsky, the renowned Moscow historian, *Lectures* (5 vols., in Russian, abridged Eng. tr. by C. J. Hogarth, 1911-13); R. Nisbet Bain's series of well informed books: *Slavonic Europe; a political history of Poland and Russia from 1447 to 1796* (1908 Cambridge historical series); *The First Romanovs, 1613-1725* (1905); *The Pupils of Peter the Great 1697-1740* (1897); *The daughter of Peter the Great 1741-1762* (1899). K. Waliszewski has issued a similar series (brilliant, but sometimes superficial) *Ivan le Terrible; La crise révolutionnaire 1584-1614* (1906); *Le berceau d'une dynastie, les premiers Romanovs 1613-1682* (1909); *Pierre le Grand* (1897); *L'Héritage de Pierre le Grand; La Dernière des Romanovs, Le Roman d'une Impératrice and Autour d'un trône* (Catherine II.). *Le fils de la Grande Catherine, Paul I; Alexandre I.* (2 vols.). See also the works of Alexander Brückner: *Geschichte Russlands bis zum Ende des 18 Jahrhunderts* (Gotha, 2 vols, 1896-1913; continued by C. Mettig); *Peter der Grosse; Katharine die Zweite* (both in Oncken's *Allgemeine Geschichte*); *Schiemann Russland, Polen und Liefland bis ins XVII. Jahrhunderts* (Oncken's *Allg. Gesch.*) and his *Geschichte Russlands unter Nikolaus I.* (3 vols, 1904-13).

For the history of the 19th and 20th centuries see Kornilov, *Modern History of Russia* (good and reliable, New York, 1916); B. THE RUSSIAN REVOLUTION: MARCH-NOVEMBER 1917

In the case of every great revolution the accretion of legend is bound to precede the work of historical investigation. And the bigger, more fundamental and more dramatic the revolution, the more difficult it is for the historian to brush aside the legend. Finally and definitely to get rid of it is almost impossible. Some elements of it become indeed so popular, so endeared to the imagination that they are almost ineradicable.

Up to quite recent times legend had taken complete control of the Russian Revolution and it is only lately that critical investigation has begun to substitute for it a solid basis of historical facts. Although it is safe to say that every phase of the Revolution has been distorted by passion and prejudice it was the beginning of the great event which suffered most from the mythopoeic principle. Two diametrically contradictory versions of what happened were current. According to one the Revolution was introduced by the enemy (Germany) with the obvious aim of bringing down the already undermined imperial régime and in this way of destroying the war-aims of the Triple Entente. According to the other the Revolution was provoked by the Russian Government itself in order that it might be crushed before it could fully muster its forces. It is sufficient to oppose these two versions; to reject them both as absurdities. To believe in the possibility of importing a revolution even in normal circumstances would be childish enough; but to credit it in time of war, when even to receive a foreign newspaper is almost impossible, would be the very height of absurdity. And yet in the case of the Russian Revolution people for want of a better explanation were ready to accept the theory that the upheaval which in five days swept away the monarchy and secured the allegiance of the entire nation had been organized and staged in Germany. The rival theory, which attributed the outbreak of the Revolution to deliberate provocation on the part of the Government, is equally preposterous, even if all allowances are made for the sinister influence of the hysterical empress and her circle and for the possible madness of the chief minister Protopopov.

The Russian Government at this time was guilty doubtless of the maddest and most unaccountable actions and this criminal incompetence necessarily contributed impetus to the revolutionary movement. The deplorable handling of the food question or the sudden arrest of the Worker representatives on the All-Russian Munition Committees are notorious cases in point. But such blunders as these can hardly be construed as deliberate provocation of Revolution. That the Government had prepared a plan for fighting the Revolution has never been denied. But whatever plan Protopopov had prepared was obviously designed to fight a post-War Revolution; and, madman though he may have been, he scarcely deserves to go down in history as the agent *provocateur* of the Russian Revolution.

The stark historical truth is that nobody either organized or provoked the Revolution. Even when the Revolution was in full swing few persons suspected that it had actually begun. All eyewitnesses of the events of the few days prior to March 11, 1917, when the Petrograd garrison suddenly went over to the side of the people, are unanimous in declaring that its previous movements lacked any semblance of organization or leadership. The strike of the Petrograd workers and the manifestations in the streets were purely elemental in character and merely voiced an aimless expression of dissatisfaction. The same testimony to the unexpectedness of the Revolution is borne by the mass of new documents which have recently been released from the State and Party archives. That the Revolution was neither organized nor expected by any of the existing parties or political groups is now established beyond question. This is the more surprising as not only was the possibility of a Revolution breaking out freely admitted, but it was almost taken for granted that it must break out if the War were lost or if radical constitutional reforms were delayed.

The Duma.—The attack made by the Progressive bloc of the Duma on the autocracy was in fact animated by their conviction of the double danger in which the country stood from defeat in the field and from revolution following on such defeat. They demanded the establishment of a constitutional government, a government "invested with the people's confidence" and their underlying aim was to forestall the Revolution. They were indeed so opposed to any semblance of revolutionary activity on the part of the masses that again and again they refused to countenance strikes or demonstrations which had been organized with the very intention of supporting the Duma's demands. Even a fortnight before the Revolution broke out they seriously quarrelled with their "friends from the left," the leaders of moderate labour opinion, for calling upon the workers to celebrate the re-opening of the Duma on Feb. 27 by making a sympathetic demonstration in front of the Taurida Palace. This aversion to exploiting the collective activities of the workers was not due to any *prima facie* objection to using revolutionary methods but solely to fear lest the masses should get out of hand, it being an axiom among the Russian intelligentsia that the working classes once aroused would make the full plunge to anarchy.

It was this fear of invoking popular support that throughout the War paralysed the efforts of the bourgeois parties in their struggle for power. This was what made the Duma's fight against tsarism so wasteful and ineffective. Reluctant to rely on the support of the masses the bourgeoisie was not strong enough in itself to challenge the Government; while to call in the masses was dangerous as likely to rouse the spirit of mob violence. This was the Duma's dilemma, to steer successfully between the Scylla of autocracy and the Charybdis of anarchy. Ministers accordingly were quick to realise the difficulty in which the Progressive bloc found itself and became less and less afraid of its attacks.

Schemes for a Court Revolution.—By the end of 1916 the attempt to bring down the Government by constitutional means had obviously failed. This failure compelled the more active and impetuous of the Liberal patriots to consider whether it was possible to realise their aims by a military *coup d'état* and a Court revolution. The initiative in this matter was notoriously taken by prominent officers at the front who were in close touch with the headquarters staff. The propaganda in favour of a Court revolution was started by General Krymov, the officer who subsequently commanded the army sent by General Kornilov in Aug. 1917 to suppress the government of Kerensky and to establish a military dictatorship. Only a few of the Liberal leaders seem to have been personally associated with Krymov's scheme; but sufficient documentary evidence exists to prove that the Progressives in the Duma were at least taken into confidence by the conspirators and were considering the formation of a cabinet in case the plot succeeded. Such members of the higher command as Generals Brusilov and Russky were favourably inclined to it and there are indications that even General Alexeyev the chief of the tsar's staff was aware of it. The complete scheme of the Krymov conspiracy was revealed by Alexander Guchkov, the war minister in the Provisional Government, in the evidence which

he gave before the tribunal set up for investigating the criminal record of the ministers of the old régime. The idea according to Guchkov was to seize the tsar as his train was proceeding from headquarters to Tsarskoe-selo, to compel him to abdicate in favour of the tsarevich with the Grand Duke Michael as Regent, to arrest the tsar's ministers with the help of the Preobrazhensky Guards, and then to proclaim the abdication simultaneously with the names of the new Duma ministers. This Court Revolution which was planned to take place in the early months of 1917 was first postponed by the strikes and unrest which prevailed at that time in the capital and was finally rendered abortive by the success of the March Revolution. The Krymov episode shows conclusively indeed that, however impatient moderate parties may have been at the Government's resistance to constitutional reform, they were entirely innocent of any intention to organize the masses for revolutionary action.

The Bolshevik Party.—The only party, in fact, which was and is persistent in claiming credit for a share in the organization of the 1917 Revolution is the Bolshevik party. They are now producing a mass of literature in support of this contention; but in all this mass it is difficult to find the slightest proof of their claim. True, Lenin and other leaders, who were at that time abroad, were formulating views as to the possibilities of revolution which were subsequently acclaimed as prophetic. But these views and the manifestos issued by the Zimmerwald Conferences¹ organized by Lenin could not be propagated in Russia owing to the fact that the Bolshevik members of the Duma and almost all the minor leaders had been arrested and banished to Siberia. Indeed what these writings prove is that the few Bolshevik agitators remaining in Petrograd including Shliapnikov, the representative of the Central Committee of the Party, were as little aware as the Mensheviks or the Liberals that the strikes, started early in March 1917, were likely to bring about the Revolution. On the contrary, as far as they could, they discouraged the idea of a strike as premature and likely to lead to disaster and only gave it their official support when it had actually broken out.

The Strikes.—Of the actual development of the Revolution there is very little to say. Strikes for higher wages at some of the factories had been occurring sporadically for some time; and on March 8 no fewer than 130,000 men are said to have been out. To this number must be added a considerable figure to account for the women workers who were demonstrating on that day (The Women's Day). But though the number of the strikers and of their sympathizers was large and though several bakers' shops were demolished by the mob neither the leaders of the Duma on the one hand nor the Government and the Police on the other gave the matter any particular attention. The only precaution taken by the authorities was to prevent the demonstrators reaching the centre of the city. The next day the strikers were still more numerous and probably amounted to 30% of all the workers in Petrograd. Some sections of the crowd succeeded in reaching the centre of the city and their mood soon became sinister and threatening. On that day too the university students joined the movement, and though the watchword of the strikers remained

¹The Zimmerwald Manifesto of 1915 is full of momentous declarations. The following are some of them:—

"The war that has produced this chaos is the outcome of Imperialism, of the endeavours of capitalist classes of every nation to satisfy their greed for profit by the exploitation of human labour and the treasures of Nature. . . .

"To raise welfare to a high level was the aim announced at the beginning of the war: misery and privation, unemployment and death, underfeeding and disease are the real outcome. For decades and decades to come the cost of the war will devour the strength of the peoples, imperil the achievements of social reform, and hamper every step on the path of progress. Intellectual and moral desolation, economic disaster, political reaction—such are the blessings of this horrible struggle of nations. . . .

"In this intolerable situation we have met together, we representatives of Socialist parties, of trade unions, or of minorities of them, we Germans, French, Italians, Russians, Poles, Letts, Rumanians, Bulgarians, Swedes, Norwegians, Dutch and Swiss, we who are standing on the basis, not of national solidarity, with the exploiting class, but of the international solidarity of the workers and the class struggle. . . ."

"bread," it is asserted that a few cries were raised denouncing the autocracy and the war.

The third day (March 10) proved the critical day. The strike became general and the strikers assumed an aggressive demeanour, raiding the police stations in the Viborg (factory) districts and disarming the police. In this quarter the police practically disappeared and the political demonstration began to assume the character of an armed rising. On the same day occurred the decisive factor in the Revolution: the Cossacks who had in the traditional way been patrolling the streets as the bulwark of the autocracy suddenly manifested their neutrality and even their friendliness to the strikers. Next day Khabalov, the military governor of the capital, received a telegram from the tsar, then at the front, ordering him to suppress the strike movement, and Golitsyn the prime minister received another empowering him to prorogue the Duma. Acting on the instructions he had received Khabalov tried to disperse the demonstrators by military force, employing in addition to the police cadet formations from the Guard regiments. The crowds in the centre of the city were thus dispersed and about 150 men were shot down. This resort to force on the part of the authorities, though it was not strong enough to crush the strikers, may well have intensified their revolutionary mood and must also have compelled every soldier in the city to consider very seriously what his duty would be were he called out next day (March 12) to shoot them down.

Attitude of the Army.—From this point the sequence of events is very difficult to trace. One thing is certain—that the shooting did not break the strike. And when the news came that the Volynski, Preobrazhenski and other regiments had revolted and joined the demonstrators no one felt any doubt that the Revolution had taken place at last and that the autocracy was doomed. True, Khabalov tried to carry matters with a high hand by sending a force of 1,000 picked men under the command of Col. Kutepov to arrest the mutinous soldiers; but, as he subsequently related, this force, though it was led by a very brave officer, melted, as it were, away. The fate of the Kutepov force is typical of the transformed mentality of the soldier class. Whole regiments, marching obviously with the avowed intention of obeying orders, no sooner came into contact with the demonstrators than they suddenly fraternized and shared their arms with them. The Government then made no more efforts to deal directly with the situation in Petrograd but concentrated on holding out until such time as the troops which the tsar had promised to send from the front could arrive to crush the Petrograd garrison and the revolutionists. But though ministers tried to entrench themselves first at the Winter Palace and then at the Admiralty they could hold neither place and the same evening (March 12) abandoned by the army they went into hiding and were eventually arrested and imprisoned.

The victory of the Revolution in the capital was seemingly complete. But the autocracy still survived and was in possession of sufficient forces to crush the revolt; moreover the revolutionists were so intoxicated by victory and the disorganization at Petrograd was so complete that the dispatch of a small but disciplined body of troops should easily have reinvigorated the authority of the tsar. But there remained unsolved the great enigma what was the actual mental attitude to the Revolution of the soldiers at the front and their officers. Unable to read this the Duma leaders hesitated to take over the power which the revolted populace urged them to assume. Instead of resorting to bold and still bolder measures, the only safe action in times of revolution, they made frantic efforts to induce the tsar and his generals to compromise with the Revolution and to accept at the eleventh hour their old demand for responsible government. Even after the Duma had allowed itself to be prorogued and the garrison had revolted Rodzianko, the Speaker, not only sent urgent telegrams to the tsar and the leading generals pointing out the necessity of saving the monarchy and the country by conceding the necessary reforms but even held consultations with the very ministers whom he had denounced as treasonable. The vision of the tsar was equally myopic. So blind was he to the real facts of the situation that even at this hour he flatly rejected the appeals of the Duma

and refused to believe that the strike had culminated in a revolution. When he and his advisers at last learned that the revolt of the Petrograd troops had endangered the existence of the monarchy they immediately ordered a number of regiments from various parts of the front to proceed to the capital.

But the loyalty and discipline of these troops had never been put to the test. The first detachments under General Ivanov were prevented by the railwaymen from approaching Petrograd while the picked regiments were never sent because before they could actually be moved the Revolution had developed such impetus and had gained such support even at the front that the attempt to crush it by military force was recognized as hopeless. The army indeed could no longer be relied on; and it may plausibly be assumed that even if the troops had been despatched they would probably have mutinied and fraternised with the revolutionists. The regiments sent by Kornilov at a later stage to deal with Kerensky and the Soviet never fired a shot and were won over by speeches made by the very people they were commanded to crush.

The Duma Committee. — While the spokesmen of the Duma were marking time and hesitating to take the leadership of the Revolution the representatives of the workers, many of whom had been just released from prison, were taking immediate steps to organize the revolutionary forces and to put themselves at their head. At a later stage a considerable effort was made to prove that the Duma Committee was established prior to the Soviet Committee. Even were this claim well-founded it would not invalidate the fact that while the Soviet Committee was conceived from the first as the organ and general staff of the Revolution the Duma Committee was appointed with the idea of restoring order and establishing relations with existing public administrations and organizations. That this creation of the Duma Committee was not a revolutionary act and was not tantamount to claiming the leadership of the Revolution is seen from the fact that Rodzianko the chairman of this Committee still continued his negotiations with the old régime. It was indeed only late in the early morning of March 13, after prolonged discussions and with considerable reluctance that the members of the Duma Committee made up their minds to constitute a government. Three considerations were obviously instrumental in leading them to this decision, first a clear consciousness of the elemental force of the Revolution, second the apprehension that the Petrograd Soviet might be tempted to assume power, and third the hope that by constituting themselves the ruling authority they might be able to cope with the increasing anarchy and to save the monarchy and even the dynasty.

The Soviet Committee. — Meantime the Soviet and Socialist Committee was developing remarkable energy in organizing its forces. Founded late on the afternoon of March 12 it had succeeded in opening its first plenary sitting the same evening with an attendance of approximately 250 members consisting of Socialist deputies of the Duma, the Worker Group of the Munition Committee, a number of prominent worker leaders representing the various shades of revolutionary opinion, and members of strike committees who had been active during the few previous days. Although this meeting of the Petrograd Soviet was chaotic and interrupted by delegates from more and more revolting regiments, who came to offer greetings and proffer allegiance, it managed to appoint a strong executive committee which immediately took over the business of food supplies and the strategical defence of Petrograd against any possible attack from the autocracy. It also came to the decision to change its constitution by including along with worker deputies army deputies. In this way the Soviet made a palpable bid for real power.

From this very moment, enlisting as it did the support of the workers and of the Petrograd garrison the Soviet Executive Committee was the depository of real power. Its members had been conscious of this fact and probably overestimated rather than underestimated their authority. But they made no overt or covert attempt to constitute a Revolutionary Government; and when the Duma Committee decided at last to assume the responsibility of forming the new Government their decision was unanimously

welcomed by the leaders of the Soviet. The attitude which these aspiring politicians took up with regard to the question of government is so surprising as to constitute one of the most intriguing problems of the Russian Revolution. Why the Petrograd Soviet refused immediately to proclaim itself the Government of Revolutionary Russia can only be a matter of surmise. Speaking in the first All-Russian Conference of Soviets, which was held early in April 1917, Steklov, one of the prominent members of its first executive committee, ascribed the refusal to the uncertainty as to the attitude of the army which prevailed at that time. "We were still doubtful," he said, "whether the revolutionary outbreak would succeed in establishing even a bourgeois régime. We were in the dark not only as to the feelings of the troops at the front but even as to that of the regiments stationed at Tsarskoe-selo. . . ."

But this explanation scarcely covers the whole of the ground. An orderly government, representing a compromise between the insurgent masses and the bourgeois classes, was obviously the sole bulwark against counter-revolution; and the desire for the establishment of such a government must undoubtedly have constituted the main factor in the unopposed assumption of power by the Duma. Still fear of the outbreak of a counter-revolution cannot be regarded as an adequate explanation of the willingness of the Soviet's leaders to delegate power to the Duma. On the contrary fear of counter-revolution should have induced them to keep the power in their own hands. Their decision to step aside and to leave the formation of a government to the bourgeoisie, the class determined to arrest the onrush of the Revolution, would be unintelligible unless the fact is recalled that most of them were deeply convinced that the aim of the Revolution was solely to establish a democratic régime and that any attempt to associate the movement with Socialistic experiments or the dictatorship of the proletariat would ruin it and so repeat the disastrous failure of 1905.

Among the members of the Soviet's first executive committee were a few Bolsheviki who accepted Lenin's dictum that the Russian Revolution was the vanguard of the World Socialist Revolution. But even they failed at the time to declare that the moment had come for establishing a Socialist and proletarian government in Russia. So unprepared indeed were they for taking action that when Lenin arrived in Petrograd three weeks later he found that his most difficult task was to inspire his own party with the necessary enthusiasm for "deepening the Revolution." But whatever may have been the views held by the Bolsheviki at this time they were in such an insignificant minority both in the Petrograd Soviet and outside that their views could not possibly carry any weight. Moreover their influence in the Soviet, whatever it may have been, was counterbalanced by that of an equally insignificant minority on the Right which denied that the Revolution had any aims other than the establishment of a democratic State and bourgeois liberties.

In fact most members of the executive committee of the Soviet expected and welcomed the advent of the World Revolution and believed in the missionary character of their own. They refused to accept the national victory over the autocracy as the sole aim of the Revolution; and they may have regarded it as merely "the first step." What they never denied was that the bourgeoisie had a part to play in the Revolution and a rightful claim to form the first national government. The assumption of power by the bourgeoisie seemed to them indeed in the natural course of events. Moreover considerations of their own safety operated to induce the leaders of the Soviet to stand aside and to leave the formation of the new Government to the Duma committee. But, while they were prepared to stand aside and to delegate the power to the bourgeoisie they reserved to themselves the right to keep a steady watch on the activities of the new government; for they made no secret of their suspicion that, left to their own devices, these bourgeois ministers might be tempted to abuse their authority by favouring the interests of their own class.

The Provisional Government. — But members of the Duma committee on the other hand, though they had few illusions as to the quarter in which the real power was vested, were not only

willing to form a government with the consent of the Soviet leaders but insisted on the latter issuing an open proclamation of their support. The published programme of the Provisional Government was indeed dictated by the Soviet leaders and was accepted in full by the members of the Duma committee. The status of the government created as a result of this compromise was necessarily precarious in the extreme. Nominally invested with full powers and sovereign authority the Provisional Government was in reality powerless and the mere creature of the Soviet. Its position was bound to be unstable because the basis of the compromise which established it was vague and uncertain. But the revolutionary impetus of the masses and the constant changes in the constitution of the Soviet and in the mentality of its leaders soon combined to render this basis even more unstable. Every day fresh groups joined the Soviet and new leaders replaced old ones with the consequence that new adjustments had constantly to be made and even relative stability became difficult to maintain.

The Royal Family Arrested.—While negotiations between the Soviet and the Duma were still proceeding and before the Provisional Government formally took over the administration (March 14), the extremely delicate question of the position of the tsar and of the dynasty came up for settlement. That the tsar Nicholas could no longer remain autocrat was a foregone conclusion; but the leaders of the Duma dreading the idea of Russia becoming a republic were determined to save the monarchy and even the dynasty. They accordingly dispatched Guchkov and Shulgín, two Conservative members of the Duma, to the tsar's headquarters at Pskov with the mission of obtaining the tsar's abdication in favour of the tsarevich and the appointment of the Grand Duke Michael as Regent. A few days previously such a solution of the national difficulties would have been regarded as a fantastically successful triumph for the Revolution. But in those few days the revolutionary movement had developed such an impetus that any attempt to save the dynasty was recognized as utterly impossible. The tsar therefore refused to risk the safety of his son and, abdicating both for himself and the tsarevich, proclaimed his brother Michael his successor. But when the terms of abdication became known on the following day even this solution had to be promptly abandoned and the very same members of the Duma committee who had pinned their faith to the dynasty proceeded to the palace of the Grand Duke and strongly urged him to refuse the throne till the Constituent Assembly had definitely drawn up a constitution.

A few days later the question of the dynasty came up again in a dramatic fashion which incidentally demonstrated both the strength of the Soviet and its determination when necessary to use it in defiance of the government. The tsar had requested the new ministers to arrange for the departure of himself and his family to Great Britain, a request which the leaders of the Soviet heard of by mere accident. At once they decided to prevent this departure and called on the Government to put the tsar and his family under arrest. But even before their protest could be dealt with they gave orders to the railwaymen to stop the imperial train and authorized one of their members, supported by a strong detachment of armed workmen, to arrest the tsar. The actual usurpation of power in this instance however proved unnecessary; for the new ministers themselves proceeded to put the Emperor Nicholas and his family under arrest.

The Army and the World War.—Yet, while this and other incidents demonstrated plainly that the Provisional Government was a mere government of caretakers, it was felt that the Soviet could rely only on the workers of the capital and had still to receive the all-important support of the army. The struggle for this support that took place between the Duma and the Soviet was the paramount business of the next few weeks. The battle was fought out in the main on two planes, one the question of the new status of the army, the other the question of continuing or terminating the war. The leaders of the Soviet championed the civil rights now claimed by the soldiers; while the Duma appealed to them in the name of national safety. That the semi-feudal conditions which had hitherto prevailed in the barracks had now to

be modified was obvious enough, and Guchkov, the minister of war, himself was preparing an official declaration to this effect. But, while he was for confining the liberties of the soldiers within the strict limits of discipline, the leaders of the Soviet declared that these liberties must be vindicated unconditionally. This resolve to gain the adherence of the soldiers by supporting their claims at all costs was responsible for the issue of the notorious Prikaz (Order) No. 1¹, which has generally been regarded as the origin of the disintegration of the Russian army.

Now that all the relative facts are known many of the interpretations given at the time to this order are discovered to be misleading. Nevertheless the main fact remains that it could only have been issued in an atmosphere of unscrupulous political intrigue. This practice of paying court to the army remained indeed the settled policy of the leaders of the Soviet right down to the outbreak of the Bolshevik revolt in Nov. 1917, when Trotsky gained the unconditional allegiance of the Petrograd garrison by championing its claim to remain idle in the capital.

But despite all the privileges which the Petrograd Soviet had granted to the soldiers the devotion of the army at the front and even at the capital had to be conquered. At first the Provisional Government seemed to be the body which had won the support of the army. When the ministers proclaimed the necessity of a more vigorous prosecution of the war, the army rallied enthusiastically to their support. For about a fortnight regiments stationed at Petrograd as well as delegations sent by those in the provinces and at the front marched to the Duma commanded by their officers, proclaimed their readiness to serve the Revolution, and offered the Government their allegiance and joyful support. The political significance of these demonstrations was very considerable; for the soldiers never failed to warn the Soviet against encroaching on the authority of the Government and against creating a dyarchy in the country. But the army's enthusiasm for prosecuting the war soon began to cool; while the propaganda made by the Soviet for the clarification of the Russian war-aims as a sure promise of terminating hostilities became increasingly popular.

On March 27 the Soviet issued a manifesto to the world declaring that Russia sought no gains from the war and was ready to conclude peace on the basis of "no annexations" and "no indemnities." From this time onward the question of peace terms became the main bone of contention between the Government and the Soviet, the Government adhering to the secret treaties made by the Allies, and the Soviet insisting on the denunciation of these treaties and agreeing to continue the War only for purposes of self defence. The pressure put on the Government to identify itself with the principles laid down in the Soviet's manifesto became at last so strong that ministers felt compelled to make a public declaration (April 9) in which Russia's war-aims were formulated as the establishment of a permanent peace on the basis of the self-determination of the peoples. This declaration was hailed as a great victory by the Soviet, which thereupon demanded that the Provisional Government take "the next step" and should communicate this declaration to the Allied Powers, with a view to their adopting its principles. After some hesitation Milyukov, the foreign minister, made official communication of the declaration: but in the covering letter which he dispatched to the Russian ambassadors he asked them to reassure the Governments to which they were accredited by informing them that Russia's position with regard to the War remained unchanged.

¹Prikaz No. 1 was composed by a commission of the Petrograd Soviet headed by N. D. Sokolov. In the name of the "Soviet of Workers' and Soldiers' Deputies," it ordered that committees of soldiers were to be formed in all military and naval units in Petrograd, and to send one representative each to the Taurida Palace next morning. In their political actions units were to be subject to their committees and to the Soviet. Orders of the military commission of the Duma were to be obeyed only when they did not contradict those of the Soviet. Arms were to be under the control of the committees and on no account to be given up if demanded by the officers. Strict discipline was to be preserved when on duty. Salutes, etc., when off duty were abolished. Special titles used in addressing officers, "Your excellency" and references to the officer's noble birth, were abolished. Officers were forbidden to use the second person singular in addressing soldiers.

Milyukov's note became known in Russia on May 2, the day succeeding that on which great demonstrations in celebration of Labour Day had been held all over Russia under the official recognition of the Government and with the participation of the garrisons in the towns and of the regiments at the front. The manifestations of national unity which were the striking feature of that great day were now exchanged at the moment for the ugly mood of division and party passion. For two days Russia seemed to be on the brink of civil war, the outbreak of which was finally only prevented by the action of the Soviet, which prohibited all meetings and demonstrations for three days and ordered the garrisons to remain in the barracks. The strength and discipline shown by the masses at this time finally convinced the Soviet leaders that the real power was in their hands.

The Soviet Enters the Government. — Discredited and disheartened by this proof of ministerial impotence Prince Lvov, the prime minister, issued a proclamation in which he expressed his conviction that a reconstruction of the Government on a wider basis, that is with the inclusion of Soviet representatives, was essential to the safety of the State. The Soviet at first (May 10) refused to entertain the idea of making a coalition with the bourgeois parties; but, when Guchkov, the war minister, actually resigned (May 12) and the danger of a complete break-up of the Government seemed imminent, it reconsidered its decision and agreed to enter the Government (May 18). In the letter of resignation which he forwarded to the prime minister Guchkov reviewed the political situation as follows. "Our illness," he declared, "consists in an odd divorce of power and responsibility. Some are in full possession of power without a shadow of responsibility; while those who are visibly in full possession of responsibility possess not a shadow of power."

Resolved now to assume its share of responsibility and having solemnly engaged to give the Government its complete support the Soviet was allotted five portfolios in the reconstructed cabinet, those of Justice, Agriculture, Labour, Food Supplies and Post and Telegraphs. The last-mentioned ministry was created specially to make room for Tseretelli a Menshevik member of the second Duma who had been banished to Siberia and was now the most popular and powerful member of the Soviet. To this list of Soviet and Socialist ministers must be added the name of Kerensky, who, though nominally a member of the executive committee of the Soviet, had previously joined the Provisional Government on his own responsibility. He was now promoted from the Ministry of Justice to the all-important Ministry of War; while that wealthy ex-director of the imperial theatres, Tereshchenko, minister of finance in the first Provisional Government, replaced Milyukov as minister for foreign affairs.

The fall of the first Provisional Government was due to two main reasons. The first was its assumption of responsibility without the backing of power. The second was its equivocal foreign policy of balancing between the imperialist war-aims of the Allies, which involved an indefinite prolongation of the War, and the Soviet's policy of limiting the war to a "revolutionary defence" ("No annexations. No indemnities.") which was based on the idea that an honourable peace might at once be concluded. The new Government occupied a more favourable position, for it represented both the bourgeoisie and the masses and thus possessed not only responsibility but actual power. It was confronted however by formidable difficulties; for not only had the crucial question of peace or war to be settled but the growing unrest in the villages and the dissolution of the Empire into separate national units called urgently for solutions which the Government was totally unable to furnish. The consequence was that the coalition lasted only two months and was finally brought down by the resignation of the three Liberal (Kadet) ministers, who adopted this method of protesting against the concessions made to the Ukrainian and Finnish autonomist movement. The new Government crisis coincided with the greatest crisis which the Revolution had so far had to face, the disastrous failure of the offensive in Galicia and the first Bolshevik rising in the capital.

The Russian Offensive. — The origin of the decision to renew the offensive is still obscure. There is reason however to believe

that pressure exerted by the Allies was responsible for the adoption of this policy. Many experts were totally opposed to it as likely to fail and thereby to accelerate the disintegration of the army. They pointed out that an offensive, if not strong and decisive enough, would give the Germans who had been inactive since the fight for the Stokhod (April 3) a much-wanted excuse for taking the counter-offensive on a much wider front than the Russians could hold. Sound strategy therefore demanded that while a most determined effort should be made to increase the fighting morale of the army, it should not be submitted too early to the test of challenging the enemy. But the offensive which the Kerensky Government so blindly and so enthusiastically adopted was obviously undertaken more for political than for military reasons. The effect of renewing the offensive, it was believed, would be either to prove in case of victory that Russia had still to be taken into account and so to compel the Germans to come forward with the offer of a democratic (that is non-annexation) peace, or, in the event of defeat, to compel the German Socialists definitely to take their stand either in defence of the Russian Revolution or in support of German militarism.

This fateful offensive, the failure of which destroyed the Russian army's last vestige of fighting strength, was undertaken then with a frivolity almost unparalleled. The preparation of it was equally frivolous and fantastic, based as it was on the naïve belief that the army's will to fight could be resuscitated by melodramatic speeches made by the war minister and a group of military and civil idealists. In the speeches which he made to the troops on his theatrical tour of the front Kerensky was fatuous enough to declare that the country expected them to work a miracle. But the effect which his rodomontade had on them was purely transient. They listened to it, applauded it, and even swore to fight and to die for the Revolution. But the moment the war minister left they went back to their barracks and refused to go to the trenches and thereby to relieve the first-line men. Several regiments indeed had to be disbanded for refusal to obey orders. In this atmosphere then the offensive was launched on July 1st. At first it proved remarkably successful: the Austrian lines were broken and many prisoners and guns were taken. But in less than a fortnight after operations opened not only were the Russian armies destroyed but Russia had ceased to exist as a great Power.

The Bolsheviks. — Meantime the Bolsheviks were making their first bid for power in the capital. Ever since his arrival from Zürich and his unsuccessful début at the Petrograd Soviet Lenin had been biding his time and maturing his plans. At first he was disposed to despise the Soviet as a petit bourgeois assembly and was determined to organize the proletariat for a single-handed revolt against the bourgeois state. But in April, as a result of witnessing the anti-Milyukov demonstrations, he perceived that this assembly could easily be used as a recruiting ground and rallying point for such a revolt. Accordingly he invented the watchword "All power to the Soviets" and disseminated it widely among the masses. But when the leaders of the Soviet compromised their principles and made a coalition with the representatives of the bourgeoisie he began to fear that the former were very unlikely to show either the courage or the zeal which would enable them to bring about the second or Socialist Revolution. In June therefore, during the sittings of the first all-Russian Congress of Soviets, he obviously returned to his original plan of staging a purely Bolshevik revolt.

A plot was actually formed at this time to call out the Bolshevik adherents among the factory workers and the garrison and a strong detachment of Kronstadt sailors; but news of it leaked out and Lenin, not yet prepared to break with the Soviet, postponed the venture. In three weeks' time, however, he revived it. The July rising was a very strange demonstration, the most marked characteristic of which was its lack of leadership. The members of the Central Committee of the Bolshevik party hesitated to identify themselves with it beforehand for fear it might prove unsuccessful. Ostensibly a demonstration in favour of the transference of power to the Soviet it was in essence an attempt to stampede ¹Battles of Brzezany (July 1-6) and Zborow (July 19-26).

that assembly, a fact which its leaders were prompt to recognize. For nearly two days the gunmen were in occupation of the capital; but their lack of objective and of leadership perplexed them and paralyzed their efforts. The obvious failure of the rising prevented Lenin and the Central Committee of the Bolshevik party from showing their hands, and they strongly protested their non-complicity in the *émeute*—in which over 400 persons lost their lives.

But these protests were not taken seriously; and it can now be definitely asserted that the whole scheme was inspired by the Bolsheviks, who hoped that they might reap some advantage by fishing in troubled waters. During the two days the rising lasted the Coalition Government was absolutely quiescent. But Kerensky on the very first day proceeded to the front, where he procured picked troops, which arrived in the capital on the day after the movement had fizzled out. Meantime any attempt to renew disturbances was rendered hopeless by the publication of documents which purported to prove that Lenin was a spy and a paid agent of the German General Staff. The result of this publication was the practical suppression of the Bolshevik Party. Lenin and Zinoviev went into hiding, to the considerable dismay of their friends. Trotsky, Kamenev and Lunacharsky were thrown into prison. The "Pravda," the organ of the Party, was suppressed and its machines destroyed by the mob.

Kerensky.—Emboldened by the success of this coup Kerensky now put himself forward as a candidate for the premiership. Prince Lvov was accordingly presented by the Soviet members of the Government with an ultimatum which required him, in accordance with the decisions of the recently held Congress of Soviets, to declare Russia a republic without waiting for the convocation of the Constituent Assembly, to suppress finally the Duma and the Council of State, and to accept the Congress's policy of forbidding any sale of land before the meeting of the Constituent Assembly. The Prince refused to comply with these demands, regarding them as a usurpation of the rights of the Constituent Assembly, and promptly sent in his resignation. The ministry was then reconstructed, Kerensky becoming prime minister as well as minister of war and Tseretelli succeeding Prince Lvov as minister of the interior. With the formation of the new ministry the Russian Revolution entered on a new phase—a phase of inaction. The record of Kerensky is indeed singularly barren. He failed to put new vigour into the prosecution of the war. He left the question of concluding peace just as he found it. He made no attempt to settle the various difficulties involved in the labour question. And he was so indifferent to the agrarian problem that he allowed the peasants to settle it as best they could.

In fact the only achievements of Kerensky's administration were the declaration of Russia as a republic and the convocation at Moscow of a spectacular State Assembly representing all classes in the country and all political groups. The actual purpose which this Assembly was meant to serve is obscure; but its composition and the choice of Moscow for its sittings seem to show that it was convoked with some vague hope of investing Kerensky's Government with that moral authority and sanction which it had hitherto so conspicuously lacked. Nothing remarkable however resulted from its three meetings save a series of hysterical speeches in which the prime minister announced his determination strenuously to support the Revolution and ruthlessly to suppress its enemies, whether they came from the Right or from the Left.

Kornilov.—Meantime the generals at the front and the members of the General Staff in the capital began to think that their time had come. Taking stock of the anarchy prevailing in the country and of the disorganization of the army they began to be more and more inclined to favour the creation of a military dictatorship. By temperament and by position Kerensky was in favour of such an idea and he actually supported General Kornilov the commander-in-chief in the preliminary steps for establishing the dictatorship. He only quarrelled with him when he realised that the general himself was aspiring to become dictator. Suspecting Kornilov's designs he promptly declared him a traitor and an enemy to the Revolution; to which the general

replied by sending picked Cossack regiments under the command of General Krymov against Petrograd with the object of intimidating Kerensky, and, forcibly suppressing the Soviet. Thereupon, Kerensky, turning his back on the Right, appealed to the Left for support; and the Executive Committee of the Soviet appealed in its turn to the workers to fight the threatened counter-Revolution. The Bolshevik leaders, now released from prison, took up the challenge with enthusiasm, and, recognizing that their opportunity had arisen, proceeded to arm the workers, in anticipation of the arrival of Krymov's troops. But no battle for the capital took place; for deputies from the Petrograd workers and soldiers went to meet the Cossacks and persuaded them that they had been sent on a false errand. And so the plan for setting up a military dictatorship failed, with the result that Kornilov, Denikin his close colleague at the front and three other generals, were arrested and imprisoned and that Krymov shot himself after being interrogated by the prime minister.

Rapid Rise of the Bolsheviks.—Just as the failure of the Bolshevik rising in July proved to be the opportunity of the Right, so now the collapse of Kornilov's raid gave their chance to the extreme Left. Soviet Russia was in a state of feverish activity. It was arming itself physically and morally for a fight against the counter-Revolutionary movement. The first result of this revival of revolutionary fervour was a renewal of the hatred to the officer class; and a new wave of massacre swept over the country, taking peculiarly ugly form in Finland where sailors killed their admirals and officers by throwing them overboard and beating them to death in the water. The All Russian Executive Committee of Soviets was reduced to sending emissaries to stop these outrages; while another sign of the times was that these emissaries had to be chosen from the Bolshevik ranks. The moderates were speedily losing their hold on the masses. Lenin's supporters indeed were now rapidly increasing their forces, so much so that by the middle of September both the Petrograd and the Moscow Soviets passed for the first time Bolshevik resolutions; while the moderate leaders, who had presided over them since their creation, were now replaced by Trotsky at the new and by Nogin at the old capital.

It thus became increasingly evident that the next Congress of Soviets, which was summoned for the end of October, was likely to elect an All Russian Executive Committee on which the Bolsheviks would have a majority, and that this majority would declare in favour of assuming the supreme power in the State. In the circumstances Lenin displayed considerable moderation and political shrewdness when he addressed a letter to the existing Executive Committee in which he called upon them to break away from Kerensky, now autocratic head of a directory, and the bourgeoisie and to declare themselves the Government of the country. The Committee rejected this overture; but, though they still continued unofficially to support Kerensky they withdrew their representatives from his Government. The united front of Soviet Democracy, which had seemingly been re-established by the challenge thrown out by Kornilov, was now finally broken. The Bolsheviks proceeded to declare the Executive Committee traitors to the Revolution and at last worked openly for their overthrow and for that of the bourgeois Government.

THE BOLSHEVIK REVOLUTION

Six months from the beginning of the Revolution the new republic was in a state of rapid disintegration. The Provisional Government was formally invested with full and sovereign power and was responsible neither to the Petrograd Soviet nor to the recently convoked Pre-Parliament. But actually it possessed no power at all and was a government of marionettes. The actual authority, then more than at another time in the Revolution, was held by the Soviets in the capitals and in numerous provincial towns, which openly defied the Government and exercised, each in its area, legislative as well as executive powers. In many of the provincial Soviets as well as in those of Petrograd and Moscow the Bolsheviks now counted on solid majorities; and in most cases the Bolshevik provincial Soviets constituted themselves quasi-independent republics. And not only were Soviet Republics

set up but the various nationalities, which had long been clamouring for autonomy, now began openly to secede from the State and to organize their own armies by withdrawing their nationals from the army under the plea of defending their newly created frontiers and their national flags. The whole country, town and villages alike, was in a state of feverish unrest, which soon developed into riots and anarchy. In the towns bread-riots broke out; and in the villages the demand was for land. To enumerate all the places where bread-riots, arbitrary division of land, expropriation of property and incendiarism took place would be impossible: they ranged practically from Finland to the Caucasus.

The most destructive of these revolts were those of the peasants, who began to solve the land problem in their own way by expropriating the land, driving off the cattle, burning down the landowners' dwellings and barns, demolishing agricultural machinery, felling wood in the forests and wantonly destroying trees in the orchards. In places in which the landowners delayed their flight they were captured, tortured and murdered. Yet the ministers were inactive and helpless. To put down these all-Russian pogroms by force, they lacked the necessary military backing: even the Cossacks refused to obey orders, remembering how they had been repudiated by Kerensky in the Kornilov episode. Reprisals would in any case have proved ineffective: the only measure which might have tranquillized the countryside would have been the speedy convocation of the constituent assembly with a guarantee that it would be invested with full power to solve the land question. But the Government, composed as it was of landlords and capitalists, could not and would not take this step. Closely connected with the peasants' revolt and with the general anarchy prevailing everywhere were the crimes committed by bands of armed soldiers who spread over the whole country robbing and killing, and almost destroying transport.

At the front the army still preserved on the surface a certain degree of discipline; but the mutual distrust and hatred of soldiers and officers was so profound that at any time an open clash might be expected, especially as a shortage of food and supplies, and in some cases actually famine, made the preservation of military subordination increasingly difficult. It became obvious that the army was likely to withdraw from the field either in the autumn or at any rate before the winter had passed. The soldiers discussed this possibility openly, declaring that they cared neither for freedom nor for land but only for peace. Even leading generals like Cheremisov (who held the Northern Command) advised the Government that the army was unreliable and might of its own volition, irrespective of every command to the contrary, withdraw from the field at any time.

Trotsky.— Meantime the Germans had been penetrating further and further into the Baltic provinces. On Oct. 12, with the support of their fleet, they occupied the island of Esel and so secured the command of the Baltic. Petrograd was now obviously menaced and ministers declared their intention of transferring the seat of government to Moscow. This attempt to abandon the capital strengthened enormously the Bolshevik scheme for overthrowing the Government. To dream of continuing the War after abandoning Petrograd, the biggest arsenal in the country, was denounced as sheer treason; and the Bolsheviks had accordingly an easy task in exciting the opposition of the workers to the policy of evacuation. Ministers, realizing their mistake, speedily gave up their intention, but not before the Bolsheviks had denounced them as usurpers and traitors. While their proposal to evacuate Petrograd thus furnished the Bolsheviks with an admirable lever for stirring up the masses, another mistake which ministers made, an attempt to replace the Petrograd garrison by more reliable troops from the front, was used by their enemies as a pretext for openly organizing military forces for an attack on them. Kerensky's declaration that these measures were dictated by the menacing situation in the Baltic was glaringly absurd; for the moral of the Petrograd garrison was notoriously low and the withdrawal from the front of troops with a higher moral was in sheer contradiction to ministers' declared purpose. The Petrograd Soviet accordingly under Trotsky's command, promptly came forward and countermanded the movement

of troops. On Oct. 26, the leaders of the Soviet constituted a military revolutionary committee which declared itself the highest military authority in the capital and province of Petrograd. This step was ostensibly taken for the defence of the capital against the enemy; but actually it was a movement for the creation of a general staff for the Bolshevik Revolution. Regarded from this point of view Oct. 26 should be considered the actual date on which this Revolution occurred. In the 14 days which intervened before Lenin was actually established as the head of the State, a very strange tragi-comedy was enacted, in which Trotsky, figuring as the General Monk of that Revolution, openly organized his forces without meeting with the slightest interference from the Government.

The Bolshevik Revolution was inseparably connected with the convocation of the second Congress of Soviets. The first, which took place in June, elected a Central Executive Committee, which was empowered to convene a second congress not later than the end of September. But, since the majority in most of the Soviets had become Bolshevik, this committee, which consisted entirely of Menshevik and social Revolutionaries, supporters of Kerensky, was reluctant to convene a second congress and postponed doing so from day to day. But when finally the Petrograd Soviet threatened to convene the congress itself the committee fixed Nov. 7 as the date of convocation. It was obvious to everybody that the congress would have a Bolshevik majority and would promptly declare against a Coalition Government and would form one composed exclusively of Soviet representatives. This expectation that the final trial of strength between the parties of the coalition and the adherents of the Soviets would take place at and in connection with the congress made it very easy for Trotsky to pretend that all his preparations were being made with the view of supporting a Soviet Government, which would be established in a constitutional way by the congress. Why, however, the Government should have been so naïve as to accept this explanation remains a mystery. The convocation of the All Russian Congress of Soviets was preceded by the holding of a number of regional congresses, all of which declared for a termination of the Coalition and for the establishment of a Soviet Government, the aim of which would be immediately to propose terms of peace, to give the land to the peasants, to establish a complete workers' control of the factories and to deal with the famine by expropriating the hoards of foodstuffs supposed to have been accumulated by the capitalists and landlords. These resolutions were broadcast all over Russia and Government wireless stations thus being used for the purpose of disseminating Bolshevik propaganda.

Nov. 3-6.— Meantime ministers waited patiently on events, believing that nothing could happen till Nov. 7. But Trotsky, with the instinct of a born strategist, gave battle two or three days before the appointed date. On Nov. 3 he confronted the general staff with a demand that all its orders should be counter-signed by the Military Revolutionary Committee. When the general staff refused this demand he ordered the Petrograd garrison to stand at arms in defence of the committee. On Nov. 4 a meeting attended by delegates from all the troops passed a resolution refusing obedience to commands of the general staff and recognizing the committee as the sole organ of power. This resolution was immediately circulated over the Government telephones to all the regiments in the capital.

To these proceedings Kerensky replied on the following day by issuing an ultimatum to the committee requiring them to withdraw the resolution. The ultimatum was ignored by the committee, which promptly called out parts of the garrison and organized worker detachments ("Red Guards") for the defence of the Smolny Palace, the headquarters of the Soviet and of the committee. Kerensky tried to counteract these measures by adopting that traditional method of defence, the raising of the bridges, to prevent communication between the left and right banks of Neva. He then proceeded to the Marian Palace where the Pre-Parliament was holding its sessions, and demanded that it should invest him with dictatorial powers to cope with the Bolshevik revolt. But while he was awaiting their decision, which, after

deliberating all night, they gave against him, preferring to set up a Committee of Public Defence, the Bolsheviks quietly and systematically took over, without firing a shot, the telegraph, the telephone and all other Government offices, with the exception of the Winter Palace and the offices of the general staff. The same night Lenin, who had been in hiding since July, appeared at the meeting of the Petrograd Soviet and in glowing language congratulated the delegates on inaugurating a new era. The new régime, which established the Soviet as the embodiment of supreme power in the State, was thus established one day in advance of the meeting of that Soviet Congress which had been proclaimed by the Bolsheviks as the sole authority competent to make such a decision. This was obviously an irregularity. But nobody present at the meeting of the Soviet seemed to care; for Lenin announced that the first step taken by the new Government would be the offer to all belligerents of a just peace.

Defeat of Krasnov and Flight of Kerensky.—Early in the morning of Nov. 7, Kerensky left for the front, in order to bring back troops to crush the revolt. The other members of the Government decided to await his return at the Winter Palace. But when they were informed that the guns, both of the cruiser "Aurora" and of the Peter and Paul fortress were trained on the Palace, they decided to surrender and told their defenders, a detachment of Cadets and a Woman's battalion, that they might disperse. When next day the Congress of Soviets formally opened, the non-Bolshevik members and the old executive committee registered a vigorous protest against the unconstitutional methods of the Bolsheviks and withdrew from the congress to join the Committee of Public Defence which had its headquarters at the municipal buildings. Kerensky meantime made frantic efforts to move the troops from the front to the capital; but the response he met with both from officers and men was thoroughly discouraging. He succeeded only in persuading the Cossack general Krasnov to move against Petrograd. On Nov. 11 Krasnov's troops were reported outside Gatchina, about 10 in from the capital.

Encouraged by this news and definitely expecting a crushing defeat of Trotsky's "Red Guards" the Committee of Public Defence gave orders to the cadets of the military schools to arrest the Revolutionary Military Committee and to make a general attack on all the Soviet strongholds. The attack was made in the morning; but by three o'clock in the afternoon the Bolsheviks, supported by some of the cruisers of the Kronstadt fleet, decisively repelled it and occupied the military schools. In the report of the events of the day which he sent to the Petrograd Soviet Trotsky made the following declaration, "We hoped to establish a compromise without bloodshed. But now when blood has been shed there is only one way left, a ruthless fight. It would be childish to expect that victory can be achieved by other means. Now is the actual moment. We have shown that we can take the power. We must show that we are able to keep it. I summon you to a ruthless fight." With these words Trotsky proclaimed the approaching Civil War. The same night he proceeded to the Gatchina front. Next day he reported the repulse of Krasnov's advanced detachments; and a day later he announced that the Cossack forces had been completely defeated. Krasnov subsequently surrendered on parole, Kerensky fled, and the Bolshevik régime was now for a time immune from military menace.

(M. FA)

THE STRUGGLE FOR EXISTENCE, 1917-1920

The Petrograd Revolution of Nov. 7 swept Russia. There were a few days of street fighting in Moscow and sporadic resistance elsewhere, but by the end of the month the Soviets held power throughout the country. In the urban centres the victory was won under the red flag of class warfare, with the watchword "All Power to the Workers' Soviets." The words "land," "bread" and "peace" gave the Bolsheviks the support of the soviets of peasants and soldiers.

The soviets were the only strong political force in a social structure whose disintegration was nearly complete. They were the organs of the proletariat, upon which the Bolsheviks, taught

by the Marxist doctrine of revolution, were resolved to build their State. They challenged not only the weakened capitalism of Russia but the capitalist system throughout the world. In the first days of success they exaggerated the effect of war-weariness upon the masses of western Europe and underestimated the effect of war-hatred. Their dream of a new proletarian Utopia and their appeals to fellow-workers of the world to throw off the burdens of Capital and War prepared the way for the conflict that was soon to plunge the new State into a three-year fight for life.

The Soviet Government at Work.—In an all-night session on Nov. 7-8 the Congress of Soviets in Petrograd declared the power of government to be vested in the Council of People's Commissars appointed mainly from the ranks of the Bolshevik Central Committee, with Lenin as premier and Trotsky as commissar of foreign affairs. The new rulers set out immediately to fulfill the promises which had won them popular support. The first act of the Soviet Government on Nov. 8 was to decree that all land belonged to those who worked it, without rent or other payment. This satisfied the peasants, who had been expropriating landlords' estates for several months, and their chief political organization, the Left Social Revolutionary Party, decided to collaborate with the Bolsheviks. Vigorous measures were taken to ensure a supply of food for Petrograd and other urban and industrial centres. To reinforce the victory of the industrial proletariat a universal eight-hour day was instituted on Nov. 11, and the control of the factory soviets over industry was established by successive decrees in the next two months.

The peace campaign began on Nov. 9, when Trotsky sent out a wireless invitation to all the belligerent powers to conclude an immediate armistice. The Allied Governments at once protested, and their representatives in Russia tried to enlist the commander-in-chief of the army, General Dukhonin, against the Council of Commissars. Dukhonin was replaced by Krylenko, a member of the Bolshevik Central Committee, by a Soviet decree of Nov. 22. Soon afterwards the late commander was torn to pieces by a mob of soldiers. That deed showed that Lenin had gauged the temper of the army and that the Allied insistence that Russia should go on fighting would be fruitless. In addition to their natural class hostility to a "Red" government, the Allied Powers seemed convinced that Lenin and his associates were acting in the interests and possibly in the pay of Germany. Washington was at first more friendly, but the American ambassador in Petrograd, Mr. Francis, soon indicated that he shared the view of his Allied colleagues.

The attitude of the German Government was equivocal. It accepted the armistice proposal, but it does not seem to have contemplated such severe conditions as were afterwards embodied in the Treaty of Brest-Litovsk. After brief negotiations within the German lines a ten-day truce was signed on Dec. 5, 1917. The Central Powers agreed not to transfer troops from the Eastern Front to the Western, but they moved several divisions to France before the end of the year.

Sabotage and Nationalization.—Meanwhile the Soviet Government was facing serious internal difficulties. The bourgeois classes, at first stunned by the success of the Revolution, began to rally. Instead of armed resistance they used the more dangerous weapon of sabotage, hoping to paralyze the Bolshevik régime. With no civil service, no personnel trained in finance, transport and the management of industry, the new government was suddenly called upon to undertake the administration.

Lenin met the bourgeois offensive with characteristic energy. When the financial powers of Petrograd refused to co-operate, he replied with a decree nationalizing the banks. When representatives of industry tried to sabotage production, a decree nationalized their factories and created a Supreme Economic Council to manage them. Other decrees followed in rapid succession, as one branch after another of the old economic system declared passive war. At first, probably, these were measures of immediate necessity rather than a part of the Bolsheviks' deliberate programme. In a sense they were the beginnings of the later "militant communism," but all of the responsibility for their adoption cannot be laid upon Bolshevik shoulders. Some

form of centralization was necessary to prevent economic collapse, and Lenin had previously published a pamphlet demanding State control over transport and the means of production, such as had been adopted by the western belligerents, not as a form of Socialist expropriation, but to save the country from chaos.

The nationalization of industries was legalized in Dec. 1917. At first it was applied haphazard, to meet sabotage by individual enterprises or groups. No entire industry was nationalized until May 1918, when a department of the Supreme Economic Council was organized to supervise the monopoly production of sugar. The following month oil production was centralized in the same way, and various commodities, such as yarn, matches, tobacco, tea, coffee, spices, were declared State monopolies. It was not until June 28, 1918, that all industrial and commercial enterprises of more than 1,000,000 rubles' capital were declared the property of the State.

The **Treaty of Brest-Litovsk.**—While the Soviet Government was trying to cope with sabotage and weld local soviets into an administrative machine, relations with Germany were still unsettled. Peace negotiations began on Dec. 22, 1917. On behalf of the Soviet, Trotsky put forward the principles of no annexation or indemnity and self-determination of subject races. At first the Germans seemed willing to accept, with certain reservations. On Dec. 28 they demanded the independence from Russia of Poland, Finland and the Baltic States, and on Jan. 8 the independence of the Ukraine. On Feb. 10 Trotsky announced the Soviet refusal to sign a "peace of annexation," but declared the war between Russia and the Central Powers at an end. A week later the German General Staff ordered an immediate advance. Narva, in northern Estonia, was occupied in order to threaten Petrograd, and German troops drove towards Moscow from the Polish border.

Lenin at once decided for peace, but acceptance of the German terms was not reached without a struggle in the Communist Central Committee. Lenin still believed that a general European revolution, as the result of war exhaustion, was not far distant. His prime object, therefore, was to gain time; a breathing-space, as he called it. His associates argued that to yield was to betray the Revolution. Trotsky remained neutral. He produced an epigrammatic phrase, "Neither Peace nor War!" and proposed to allow the Germans to advance without resistance.

Verbatim reports of this discussion published in Moscow showed that it was only by a threat of resignation that Lenin beat down the adverse majority in the Central Committee. Trotsky was replaced as commissar of foreign affairs by Chicherin, ex-diplomat and noble but a Communist of long standing, who renewed the Brest-Litovsk (*q.v.*) negotiations on Feb. 28, 1918. Chicherin's instructions gave him little scope for the diplomatic subtleties he afterwards displayed. On March 3 he accepted the German terms on behalf of the Soviet Government. The so-called Independent Government of the Ukraine had already signed a separate treaty admitting German suzerainty, and this Chicherin was forced to confirm. The Soviet Government further agreed to pay a large indemnity or its equivalent in raw materials. Poland and the Baltic States were left in the hands of the Germans, and the armies of General von der Goltz and General Mannerheim soon crushed the revolutionaries in Finland.

Lenin had won his breathing-space, but the agricultural and mineral resources of the Ukraine and the oil of the Caucasus were at the disposal of the Germans, and the German General Staff was now free to concentrate its forces against the Allied front in France. On March 5, however, two days after the signature of the treaty, Trotsky proposed to Bruce Lockhart, the British high commissioner, and to Raymond Robins of the American Red Cross, who was acting as liaison between the Soviet Government and the American ambassador, that ratification by the Congress of Soviets in Moscow might be prevented on condition that the Allies and the United States promised aid against Germany and restrained the Japanese from occupying Vladivostok. The British and American representatives appear to have regarded Trotsky's proposal favourably and to have advocated its acceptance in despatches to their respective Governments, but they

received evasive replies. The Congress of Soviets ratified the treaty on March 16 by a majority of 523.

Lenin used his breathing-space to patch up the administrative and economic machine and to drill an army to defend the Revolution. The fight against sabotage was not yet won, and the adversaries of the new régime were growing bolder. Trouble was brewing in the Cossack provinces and in Manchuria, where a reactionary army was assembling on Chinese soil. The German threat against Petrograd had driven the Soviet Government in flight to Moscow. The fact that the Allied ambassadors, instead of accompanying the Government, had preferred residence at Vologda, junction of the trunk lines of escape eastward to Siberia and northwest to the coast, was no good omen for future relations with the Powers they represented.

Relations with the Allies.—In the field of foreign affairs the Soviet Government had two severe handicaps. From the first the Allies suspected complicity with Germany, and were inclined to regard the Peace of Brest-Litovsk as a betrayal of the Allied cause. Secondly, neither they nor the Central Powers believed that a Soviet Government in Russia could endure. For many years opportunities for a friendly settlement were lost owing to the conviction that the régime was about to fall. The Allies declined to recognize the Treaty of Brest-Litovsk, which they held responsible for Ludendorff's victory in March. Their missions in Russia reported that trainloads of war supplies, leather, copper, oil and food, were being shipped into Germany. Although the Bolsheviks claimed that this was part of the indemnity imposed by the treaty, the Allies saw it as "aid to the enemy," to be prevented if possible. It was suspected that some of their representatives in Russia co-operated with anti-Bolshevik elements to hamper the transfer of supplies.

The Social Revolutionary Revolt.—The breach between the other political parties in Russia and the Bolsheviks had been widened by the suppression of the Constituent Assembly, which met in Moscow on Jan. 18, 1918. Its membership represented a large majority of Left and Right Social Revolutionaries, with a smaller proportion of "Cadets" or bourgeois representatives. The Bolsheviks had only 40 per cent of the delegates. The election of a Right Social Revolutionary, Chernov, as president, convinced them that they had nothing to gain from the Assembly and it was closed by Red soldiers on Jan. 19.

The Left Social Revolutionaries continued for a time to collaborate with the Soviet Government, but broke away completely after unsuccessful opposition to the ratification of the Brest-Litovsk Treaty. The strength of the Social Revolutionary Party was mainly drawn from the villages, which were growing increasingly restive as the Bolsheviks developed their basic programme of a workers' government, class warfare and socialism. The peasants had thought that the Revolution gave the land to them. They now found it was the property of the State, and that its surplus produce over their needs was required for State purposes. The bourgeois groups had become more hostile still, as they realized that their very existence was menaced by the new régime.

Differences between the Right and Left Social Revolutionary sections and the bourgeois groups tended to disappear in their common belief that the Bolsheviks had betrayed their country to Germany. Led by Boris Savinkov, Kerensky's former war minister, the Right Social Revolutionaries became the pivot of patriotic and anti-Bolshevik sentiment, eager to co-operate with military representatives of the Allies to nullify the effects of the Treaty of Brest-Litovsk. From attempts to blow up depots of stores, railway bridges and trains carrying supplies westwards, the Social Revolutionaries proceeded to the desperate *coup* of assassinating the German ambassador in Moscow, Count Mirbach on July 6, 1918, in the hope of provoking Germany to break with the Soviets. The Germans were otherwise occupied and no break occurred. The Social Revolutionaries then tried to incite the country to rebellion.

Savinkov captured the town of Yaroslavl, 180 m. north of Moscow on the railway to Vologda and Archangel, with a disciplined force which he had hoped to make the nucleus of an army

of insurrection. The Red troops from Moscow and Petrograd converged on Yaroslav too swiftly, and retook the town after two weeks. Savinkov escaped, but all possibility of overt resistance by the Social Revolutionaries vanished.

The Czechoslovaks.—Meanwhile alarmist rumours agitated London and Paris. It was stated that the Bolsheviks were arming German and Austrian prisoners in Siberia by tens of thousands, to combat the Czechoslovak Legion. Forty-five thousand Czechoslovak deserters from the Austrian forces had been formed into an army to fight for their country's freedom beside the Russians on the Austrian front. When the Russians collapsed they remained a fighting force, and plans were made in Paris to move them round the world to the western front. In early March, 1918, the Soviet Government agreed to provide transport across Russia, but the Czech legionnaires had continual trouble with local soviets over food supplies and right of way for their trains.

By the middle of May the entire force, moving eastward to the Pacific, was strung out in detachments across 5,000 miles of railway from Kazan to Vladivostok, a natural prey to anxiety and rumour. In point of fact, the story of a new German "mobilization" was found by Anglo-American military investigators to have no justification, but the Czechs were in no position to judge. On May 14 one of their detachments met a train-load of Austro-German prisoners being repatriated in accordance with the Treaty of Brest-Litovsk. A *fracas* ensued, with bloodshed which involved the local Red forces.

Moscow at once demanded that the Czechs fulfil their pledge to surrender their arms. They refused, and on May 29 forcibly resisted attempts to carry out the disarmament order. In June they fought the Bolsheviks openly throughout Siberia, and the local soviets were powerless against their disciplined troops. At the end of the month their Vladivostok contingent overthrew the soviet there and set up an anti-Bolshevik Government with the approval of the Allies. By July 31 almost all Siberia was changed from "Red" to "White" and the Czech forces were moving westward to attack the Soviet State.

Death of the Tsar.—The advance of the Czechoslovak and White Russian armies brought death to the ex-Tsar Nicholas II, who with his family had been held for some months at Ekaterinburg. The local soviet professed to believe that the imperial family planned to escape to Omsk, where the "White" Admiral Kolchak had established a counter-revolutionary government. Without a trial the soviet voted to execute "Citizen and Citizeness Romanov" and their family and did so on the night of July 16-17, 1918. When the White forces occupied the city a few weeks later no trace of the victims was found and it was assumed that the entire family had perished, although in 1928 Mrs. Anastasia Tschaikovsky claimed that she was the Grand Duchess Anastasia, youngest daughter of Nicholas II, and that she had escaped from the massacre. In burnt patches in the woods jewels belonging to the tsaritsa were said to have been identified. According to the story current in Russia the bodies were stripped and buried in peat-bogs and their clothing, into which the jewels may have been sewn, burned separately (see NICHOLAS II).

Intervention.—The month of August saw intervention in full swing. On the 2nd the British, who had already landed forces at Murmansk to prevent war supplies from falling into German hands, disembarked 2,000 men at Archangel, who overthrew the local soviet and set up a Provisional Government of the North. A few days later British and French contingents landed at Vladivostok, followed by a Japanese division on Aug. 12 and by two American regiments from the Philippines on the 15th and 16th. Western Siberia was already in the hands of the Czechs and a number of anti-Soviet Governments. On Aug. 24, Anglo-Japanese troops crushed Red resistance in the maritime provinces in a battle on the Ussuri River. Chita was captured on Sept. 6, and organized Soviet government beyond the Urals disappeared. The Czechs had seized the chief cities of the northern Volga and an anti-Soviet army was marching from the Cossack provinces of the Don. The British in the north were preparing to move southwards to join the Czechs and the Siberian Whites.

At the beginning of the autumn the tide turned. The Bolsheviks threw back the Czechs at the end of Sept. 1918, and halted the White advance from the Don. As Germany weakened on the western front, the Baltic provinces, Finland and the Ukraine lost her support. Turkey was on the verge of capitulation, and Turkish and German control over the Caucasus was vanishing. Lenin's prediction was coming true; the Central Powers and the Treaty of Brest-Litovsk were crumbling together, and the European Revolution appeared to be at hand. When the German sailors in Kiel raised the red flag on Kov. 9, 1918, the Soviet Government saluted the event with triumph.

The Bolsheviks had still to reckon with the Allies. The autumn of 1918 saw the reinforcement of foreign forces on Russian soil. By the end of the year there were approximately 15,000 British and American troops occupying a fan-shaped area in northern Russia, not less than 70,000 Japanese holding the important strategic points of eastern Siberia and the maritime provinces, 7,000 Americans protecting the Trans-Siberian and Chinese Eastern Railways, and about the same number of British supporting and instructing the armies of Admiral Kolchak, who had become dictator of the so-called "All-Russian Government" of Siberia by a coup *d'état* at Omsk on Nov. 18. The Czechoslovak commander, General Gaida, upheld Kolchak, but the Czechs were disillusioned and soon ceased to be a factor in Russian affairs. The French had occupied Odessa with a powerful fleet and a mixed force from Salonika.

The abandonment of the campaign by the Czechs counter-balanced the accession of foreign anti-Soviet forces, and the Whites were not yet in a position to strike an effective blow. When the new year began neither side could show much gain over November, except that the Revolution had reached the Baltic by the establishment of a Soviet Government at Riga on Dec. 26.

Red Terror.—During these months of pressure the Bolsheviks had hardened. Troops were called up, grain and cattle requisitioned, property confiscated. In the face of danger no compromise was possible and the country was conscripted ruthlessly to war. In the summer of 1918, to external dangers was added a deadlier enemy in their midst. After his defeat at Yaroslav, Boris Savinkov revived against the Soviet the Social Revolutionary terrorist centre which he had formed years before to combat tsardom by assassination. On Aug. 30, 1918, one of his agents, a girl named Kaplan, shot Lenin as he left a workers' meeting in Moscow. He did not die, but the Bolsheviks met Savinkov's terrorism with their own "Red Terror."

The following day Uritsky, chief of the Petrograd Cheka, was shot dead by Social Revolutionaries. The word *Che-ka* was formed from the initials of the Russian words "Extraordinary Commission." The department was organized in Dec., 1917, to deal with sabotage and other "Counter-Revolutionary" manifestations. As internal difficulties increased its activities were extended to cover speculation, smuggling, and political and military counter-espionage. Its power grew, accordingly, to include summary arrest, judgment and execution. It was thus ready to conduct the Terror. In revenge for the wounding of Lenin 500 of the most prominent figures of the old régime were shot that night in Moscow. The killing of Uritsky led to similar reprisals in Petrograd.

Latsis, a high official of the Cheka, defined the principles of the Red Terror, which could be summed up in two phrases: "Strike Quick!" and "Strike Hard!" A third, "Strike Secretly!" might have been added, for arrests were carried out at night, and families of prisoners were rarely given news of them until they were condemned or freed. The very name "Cheka" became a word of terror, and rumour fantastically exaggerated the number of its agents and its victims.

Militant Communism.—The effects of this tragic period are incalculable. On the one hand it stamped deep into the minds of western countries the belief that Russia had relapsed into Mongol savagery. On the other it confirmed the Soviet leaders in their hatred of the non-Bolshevik world.

Intervention gave impetus and coherence to the work of

nationalization, which had been proceeding sporadically. In some cases factories had been nationalized in order to fight sabotage by their owners or managers, in others to "legalize" confiscation already accomplished by the workers. Under the pressure of war the important industries were given control boards, which were not at first radically different from the war-time mechanisms under similar names in England, France and Germany. The attempt to fix prices in a period of acute currency inflation had produced the inevitable "flight" of commodities from the market. As the situation grew more difficult it became necessary to control not only industry and transport but the supply and distribution of food. From that stage the step to the control of all production and distribution was not a long one for a government of Marxian Socialists.

At first, in the early summer of 1918, restrictions were not so harsh as to prevent much private trade and speculation. It happened that the beginning of the Red Terror coincided with the period of greatest food shortage, before the harvest. The extraordinary powers given to the Cheka to suppress internal enemies were quickly directed against speculators seeking for profits.

From the outset an influential section of the Central Committee of the Bolshevik Party had been advocating a full Communist programme rather than Lenin's more cautious policy. Circumstances were now on their side, and by Aug., 1918, the period of "Militant Communism" which lasted nearly three years may be said to have begun. Private buying and selling were prohibited by law and offenders were severely punished. Cash wages were no longer paid. Workers and other employees were given cards for food, clothing and other necessities, free lodging and free transport on trams and railways. All "non-working" elements of the population were disfranchised. The peasants were subjected to requisitions of all their crops save what was needed for their households. They obtained commodity cards in exchange, but the breakdown of distribution and the difficulties of transport in a country ravaged by war progressively diminished their return from their labour. Extreme Communists declared that money would soon be wholly abolished. This hope was perhaps a screen for the conventional motives for inflation and the unavoidable fall in the value of the currency.

Money did not become wholly worthless, and a host of bagmen and hucksters, too numerous and unimportant to be imprisoned, continued private trade. The Government tried to eliminate them by entrusting distribution to the co-operatives, which had had an extensive network in Russia for many years. In spite of these efforts much of the lesser retail trade remained in private hands.

Attempts at Peace.—Representatives of every section of anti-Bolshevik Russians, from the Social Revolutionaries Kerensky and Savinkov to the Grand Duke Nicolai Nicolaievich, ex-commander-in-chief and uncle of the late tsar, went to Paris to enlist the support of the Peace Conference. But the Allies were chiefly concerned with Germany. They feared that circumstances might induce Germany and Russia to make common cause, and their first impulse was to neutralize the Bolshevik danger.

On Jan. 12, 1919, commissar for foreign affairs Chicherin asked the American State Department to open peace negotiations. On Jan. 16, the representatives in Paris of Great Britain, France, Italy and the United States discussed a general truce plan for Russia put forward by Lloyd George. President Wilson suggested that representatives of all Russian groups including the Bolsheviks should hold a meeting on the island of Prinkipo in the Sea of Marmora under the auspices of the Allies. The anti-Bolshevik governments in Russia refused to participate and the project was dropped.

In spite of continued hostility on the part of the French another attempt was made to reach a peaceful settlement. William C. Bullitt, attached to the American delegation in Paris, was sent to Petrograd in March, 1919. After a week's discussion he brought back peace terms which the Soviet Government pledged itself to accept, if the Allies agreed not later than April 10. The most important features of this document were a plan for the

pacification of Russia on the basis of the *status quo* of its many Governments, a willingness by the said Governments, including the Soviet, to recognize responsibility for the financial obligations of the former Russian empire, an exchange of official representatives between the Soviet Government and the foreign Powers, and an immediate withdrawal of foreign troops. In spite of warm support by Colonel House and the approval of Lloyd George and Orlando this project also was shelved. Bullitt later expressed the opinion that the chief cause of failure was the rapid advance of Kolchak's army, which once more strengthened the belief that the Soviet Government was doomed to extinction.

Renewed Intervention.—The White armies of Admiral Kolchak in Siberia, General Denikin in southwestern Russia, and General Yudenich in Estonia had been amply supplied by the Allies with money, equipment and instructors. Kolchak threatened Kazan and Samara, on the Volga, in May and planned to reach Moscow before the end of June, but strategic co-ordination was lacking; neither Denikin nor Yudenich was ready. Kolchak could not withstand the full weight of the Red Army, which had now been welded into a competent fighting force. An attempt at diversion by the British in the north came too late to help him.

The next stage of the White campaign was more dangerous. Denikin made rapid progress northwards in the summer, and in mid-October had taken Orel, within 200 m. of Moscow, and was threatening the capital. Simultaneously Yudenich drove at Petrograd. His English tanks broke the weak resistance of the Reds, whose main forces were concentrated against Denikin. Yudenich's advance guard was within 10 miles of Petrograd before the Soviet troops rallied. Then the tide ebbed. Yudenich was thrown back, and Denikin's offensive, heavily repulsed at Orel, fell to pieces. In December he was making a last stand at Novorossiysk in the Kuban and by April he had fled to Constantinople. Kolchak lost his capital, Omsk, in November and he finally resigned command a month later. The Czechs betrayed him to the Red Army at Irkutsk. He was put on trial as a traitor, condemned to death, and shot on Feb. 7, 1920. The bewildering collapse of the White armies was due to the hostility of the masses in the territory they controlled no less than to military defeat.

Kolchak's execution marked the end of the intervention period, although Japanese troops were still in occupation of Vladivostok and the maritime provinces and General Wrangel was re-forming the shattered army of Denikin in the Crimea. Later, during the war with Poland, Wrangel had some successes on the mainland, but the armistice released overwhelming forces against him, and in Nov., 1920, the remnants of his army were transported by the Allied fleet to Constantinople.

The Soviet army had been progressively demobilized as the enemy weakened, but the internal economy of the country was in a chaotic state. The peasants, irritated by requisitions, had reduced the production of grain, and industry, which had been harnessed everywhere to war, must be reconstructed on a peace basis. Trotsky, the commissar for war, proposed that the army should be utilized directly for production. This "labour conscription" or "labour army," as he called it, was opposed by the trade unions. Lenin admitted the scheme had advantages, but questioned its practical working. It was nevertheless adopted. The labour army helped to reorganize transport and some sections of heavy industry but discontent was generated among the workers.

War with Poland.—Before the situation became critical an emergency, war with Poland, settled the problem. The outer world seemed to believe the labour army a device to avoid demobilization and to prepare for an attack on Poland, the bastion of Europe against Bolshevism. Hungary, Austria, Bavaria and Saxony were still influenced by Communism, and the fear of a Russian-German coalition had not ceased to haunt European statesmen.

The Soviet Government proposed peace to Poland in Jan., 1920, on terms similar to those offered Finland and Estonia. The Poles at first seemed willing to agree, but their ambition grew as supplies of war material from France and a food loan of \$50,000,000 from the United States strengthened their country. At the end of March they demanded all the territory west of

the Polish frontier of 1772, a large cash indemnity, and the occupation of the Russian town of Smolensk as guarantee. The Bolsheviks refused, and the Polish army occupied Kiev early in May. Within a month the Bolsheviks struck back. The Soviet cavalry retook Kiev in June, while the main force advanced from Smolensk through Vilna and along the German border. The Red armies, marching forward almost without combat, converged upon Warsaw. The Polish retreat became a rout, and by the middle of August the Russians had reached the outskirts of the city.

France and England were appalled. A Sovietized Poland would mean Bolshevism in the heart of Europe. The French sent General Weygand, Foch's brilliant chief of staff, with a small group of officers, to Warsaw. It was impossible to move troops in large numbers across Germany and every moment counted. With the help of Weygand and his staff the service of supply was restored. A full account of the subsequent operations will be found in the article *RUSO-POLISH CAMPAIGN* to which reference should be made. It is sufficient to say here that the counter attacks beginning on August 14 were completely successful and that almost over-night, with little fighting, the Red armies were in retreat. A great part of the troops on the German border gave up their arms. On Oct. 11, after Polish territory had been entirely cleared, an armistice agreement was concluded at Riga. On March 18, 1921, peace was signed on terms favourable to Poland, with a new frontier which placed some 4,000,000 Russians under the Polish flag. Again the Soviet Government had paid a heavy price for peace.

The Peasants.— War Communism pressed heavily upon the peasants. Difficulties of transport and distribution prevented them from receiving manufactured goods in exchange for their requisitioned food products, and although their contribution to the national budget proportionately decreased as the currency emission to cover deficits grew greater, their position showed no corresponding improvement. Administrative confusion, red tape and contradictory instructions made the requisitions more onerous. Gradually the peasants reduced the area sown and concealed the harvested grain.

The following statistics show the agricultural decline under Militant Communism. (League of Nations, *Report on Economic Conditions in Russia*, Geneva, 1922.)

	1909-13 Average	1916	1920	1921
Harvest (millions of poods)	4,078	3,955	1,738	1,617
Area sown (millions of dessiatines)	81.1	82.5	56.8	49.1
Yield per dessiatine (poods)	50	48	30.6	32.6

The total harvest in 1921 was only about 40% of the average yearly harvest in 1909-13, while the area sown had decreased by almost one-half and the yield per dessiatine had decreased by more than one-third. The figures show that the decline was progressive from 1916 to 1921, except that the yield per dessiatine improved slightly in 1921.

The Bolsheviks tried to counter this passive resistance by an extension of class warfare to the villages. They divided the rural population into three categories: Rich Peasants (*kulaks* or exploiters); Middle Peasants, and Poor Peasants. The Poor were their protégés, they said; the Middle their friends, and the Rich their enemies. "Committees of Village Poor" were organized to supervise the grain requisitions and to take the part in village management which had hitherto belonged to the prosperous peasants. It was hoped that by this means kulak opposition would be overcome without antagonizing the Middle Peasants.

Events showed that the rural communities were no favourable *terrain* for class warfare. The ties of family and religion, a common dislike of tax-collectors, towns and townsmen, and a sullen distrust of any central authority which took their young men as soldiers and requisitioned their grain and cattle, proved stronger

than categorical distinctions. These distinctions tended to be more arbitrary than real; many of the Middle Peasants were the young relatives of kulaks, whose chief aim was to become kulaks themselves; many of the Poor were dependent, ignorant and shiftless. Bolshevik orators and newspapers spoke only of kulak opposition, but the attempts to apply class warfare and Communism to the villages were resented by the Middle Peasants also.

Peasant delegates to the Eighth and Ninth Congresses of the Communist Party in 1919 and 1920 had expressed the murmurs of the villages, and there were signs that the army, largely recruited from the Middle Peasant class, was growing restive. The Polish War brought a new *elan* of patriotic ardour in which this sentiment was for a time forgotten, but early in 1921 it burst forth. In February the garrison of the naval fortress of Kronstadt, near Leningrad¹, demanded the abolition of the grain monopoly. The flame was fanned by Social Revolutionary agitators, and a mutiny followed, which was suppressed only after heavy fighting. Almost simultaneously the peasants of Tambov, one of the central provinces of Russia, refused to yield their grain to requisition. Troops sent to enforce obedience made common cause with the peasants. Resentment had become revolt.

Lenin realized the danger, and induced the Tenth Communist Congress in March, 1921, to sanction a decree substituting a graduated food tax for the system of requisitions. Commodities demanded by the peasants, kerosene, salt, tools and leather, were rushed to Tambov, to be sold or bartered on a free trading basis. Those measures quickly ended the revolt. The source of trouble had been economic discontent rather than political unrest or counter-revolutionary agitation.

The Famine.— It is significant that both of these mutinies occurred at the end of winter, when climatic conditions had caused a failure of the autumn-sown grain, and the peasants, whose reserves were depleted by requisitions, were beginning to fear one of the famines that have devastated Russia periodically. Their anxiety was well founded. A prolonged drought in the early summer ruined the spring-sown grain throughout the "black earth" districts of the Volga, North Caucasus and Ukraine. By the middle of July a million peasants were in flight from their parched fields towards the centres of urban and river transport, where they were huddled in refugee camps infested with cholera and the epidemics of malnutrition. The crop failure was reckoned to have affected an area inhabited by 20 to 30 million people. Unless help was forthcoming, not less than 10 million seemed doomed to perish from starvation before spring.

In July the Soviet Government permitted an appeal by the writer Maxim Gorki to Herbert Hoover, then chairman of the American Relief Administration (A.R.A.), which had kept alive millions of hungry children in Belgium and northern France during the War, and had been at work later in Central and Eastern Europe. Hoover agreed to help, and a *modus operandi* was soon arranged between the A.R.A. and the Soviet authorities. This example was followed by a number of European charitable organizations, but the brunt of the work was done by the A.R.A., which at the peak of its activity, in March 1922, was giving daily rations to 10 million children and adults. Altogether foreign aid fed probably 12 million persons, and the Soviet Relief Administration maintained at least an equal number.

It was difficult to estimate the famine death roll, owing to the confusion between disease and starvation in the vital statistics. Deaths from actual hunger probably did not exceed half a million. Foreign relief for the famine rendered two other important services. It allayed much of the xenophobia provoked by intervention, and thus paved the way for a renewal of normal relations between Russia and the outer world. It also helped the Soviet to cope with the problem of disease, especially cholera and typhus, which had been epidemic in Russia for centuries. After 1922 there was no widespread recurrence of either pest.

The New Economic Policy.— It is customary to regard the New Economic Policy instituted by Lenin in the spring of 1921 as a more or less temporary abandonment of Communism to mollify the peasants. There is no question that an influential

¹The name Petrograd was changed to Leningrad on April 22, 1920.

section of the Communist Party saw it in that light. Lenin himself may not have shared this view. He was above all a realist, alive to the practical necessities of the moment. He had shown that he was well aware of the anomaly of an industrial proletarian revolution in a country 85% of whose population were backward peasants. By force of circumstance and the exigencies of war he had been compelled to adopt a programme of Socialist centralization which many of his followers welcomed as the correct and natural policy of a Socialist State. Lenin, himself born and bred in a Russian province, knew better than many of his colleagues the well-worn channels of life on the Russian plains.

Before the Communist Party reached a decision in its protracted discussion of agrarian policy in 1920 and 1921, Lenin found himself advocating not merely a change with regard to requisitions and the grain monopoly, but a general readjustment of the economic framework. Instinctively he felt that Socialist centralization had been pushed too far, that they were stifling the individual initiative without which the country could not recover from the effects of foreign and civil war. The reform of industry for peace purposes would require effort and expenditure which the State was unable to provide, and finance and transport were also in a desperate position.

Lenin's influence and insistence won. His critics had no valid alternative to offer. The New Economic Policy (called "NEP") was confirmed by a decree published Aug. 9, 1921. It permitted freedom of trading within the country, sanctioned overtime and piece work payment for workers, offered encouragement to foreign capitalists and concessionaires, and recognized by implication the rights of private property which had been abolished under Militant Communism. NEP not only made private business legal and possible in Russia, but also opened the door for commercial intercourse with the outer world. To many orthodox Communists this new freedom was a backward step.

New Financial Policies.—During the period of Civil War and Militant Communism the financial tools of capitalist states had been laid aside. Private banks, cheques, securities—all had gone. Money had depreciated rapidly as more and more of the national budget was covered by inflation. Frumkin, vice-commissar of finance, stated that 85% of the 1920 budget was provided by the emission of notes. The remaining 15% came from food requisitions and other sources.

If the New Economic Policy was to succeed it must clearly have banking facilities and a more convenient medium of exchange than commodity cards. The shift of policy was quickly made. The State bank was established in the autumn of 1921 and given the authority to issue banknotes as well as to serve as a credit institution. On Nov. 16, 1921, it began credit operations. By a year from that time the essentials of currency reform had been prepared, and the Bank began to issue notes. The monetary unit chosen for the new banknotes was the *chervonetz*, with a gold value of 10 pre-war roubles, that is, 119.4826 grains of fine gold or \$5.146 in United States currency. The rouble was thus given its pre-war gold equivalent. The law provided that the new banknotes should be secured to 25% by precious metals and foreign currencies.

For a time the *chervontsy* (State bank notes) circulated side by side with the earlier *sovznaky* (Government or "Soviet" notes), whose value was adjusted to the *chervonetz* from day to day. The State bank notes were strictly controlled, but the *sovznaky* were printed in great quantities in the succeeding months. The public, especially the peasants, grew to distrust them, and the remaining steps in currency reform were pushed through as quickly as possible. In March 1924, the emission of *sovznaky* was stopped and in May they passed out of circulation. Small denomination Treasury notes were issued for purposes of convenience, and silver and copper coins were minted. Henceforth the currency system of the Soviet Government was on the same general basis as that of western countries.

The reform of the currency required in turn the establishment of the State budget on a solid foundation, since the Government could no longer print notes to meet the deficits. Agricultural taxation, which had been substituted for requisitions early in 1921,

was again revised. In May 1922, a single tax in kind was established by decree, and the peasants were permitted to pay in specified commodities the graduated taxes imposed. In May 1923, a more extensive reform was made. Cumbersome miscellaneous taxes were swept aside, a "Single Agricultural Tax" was provided, and money payments were gradually substituted for commodity payments. Meanwhile urban taxation had been developed by indirect taxes and income and property taxes, so that the peasants, instead of forming the principal tax-paying body of the State, came to furnish only a small fraction of the national tax income.

Changes in Organization.—The most radical change involved in the New Economic Policy was the restoration of the whole internal economy of the country, industry, commerce, transport, housing and employment, to a straight money basis. Instead of the vague system of accounting prevalent under Militant Communism, every state enterprise was compelled to issue a regular balance-sheet and to show profit and loss in the old-fashioned way. Instead of commodity cards, employees received a regular wage paid in cash. Housing committees were entitled to charge rent on a graduated scale in accordance with the social position and earnings of the tenant, and were expected to maintain the premises under their charge in a reasonable state of repair and comfort. The railways and tram companies were allowed to charge fares for passengers and freight to cover expenditure and enable them to maintain an adequate service.

Communist critics of the New Economic Policy were perhaps justified in declaring it a reversion to capitalist methods. In later years there was acrid discussion upon this point, and an attempt was made to resolve ideological doubts by the adoption of the self-contradictory phrase "Socialist Capitalism" to define the precise significance of the policy. The commoner and less anomalous expression "State Capitalism" was probably more accurate. In any case, the Soviet Government could not avoid the process of decentralization which was a phase of post-war reconstruction in all of the belligerent countries. For them, no doubt, war-time centralization and "control boards" were matters of necessity rather than choice. For the Bolsheviks, choice and necessity coincided. But if centralization proved unwieldy in the advanced industrial countries of the west, it was a yet heavier burden upon the backward economy of Russia. Under the New Economic Policy a great many nationalized enterprises were "released," not to former proprietors or private owners, but to face competition in the open market. The financing of such corporations was carried out by the Industrial and Commercial Bank and by other new banking establishments.

As the New Economic Policy developed, industry was divided into "trusts," as they were called, such as the Oil Trust, the Coal Trust and the Flax Trust, at first horizontal in character, but gradually becoming vertical also. With the trusts, which were organs of production, were associated syndicates, organs of sale and purchase, handling both foreign and internal trade. The trusts were later divided into sections; for example, the Oil Trust subdivided into Azneft (Azerbaijan Oil), Grozneft (Grozny Oil) and Embaneft (Emba Oil). United action and governmental control were secured by an expansion of the Supreme Economic Council to include representatives of the trust sections, so as to form a kind of Industrial General Staff.

The Union of Soviet Socialist Republics.—Since 1917 the vast territory under the Soviet authority had been an inchoate mass whose constituent parts and political character were changing almost from month to month. The time had come to organize a framework of government.

At the end of 1922 the territory governed from Moscow consisted of the Russian Soviet Federated Socialist Republic (the R.S.F.S.R.), White Russia, the Ukraine, the Caucasus and Central Asia. Early in that year Stalin, the general secretary of the Communist Party, was instructed as commissar of nationalities to draw up a plan of federation. In Dec. 1922, the First Congress of Soviet Republics met at Moscow and confirmed the pact for the formation of a Union. Delegations were present from four federations, the Russian, Ukrainian, Caucasian and White Russian. The Far Eastern Republic, a semi-independent buffer state

closely affiliated to the R.S.F.S.R., had been merged with the latter in the preceding November, and a part of Central Asia was also included in the Russian Federation.

The constitution of the new state, the Union of Soviet Socialist Republics, was accepted by the Central Executive Committee on July 6, 1923, and became effective from that date. To the four allied republics two others were added at the end of 1924 by the inclusion of the federations of Uzbekistan and Turkmenistan, which superseded former geographical divisions of Central Asia.

The constitution was framed to express the new Soviet policy of decentralization and freedom for the constituent governments, a plan which might have prevented the breach between the nationalistic Baltic States and Moscow, had it been developed earlier. Under the constitution of 1924 (C. 2, Para. 4) each united republic retained the right of withdrawal from the Union. The sovereignty of the individual republics was carefully guarded, and many of the functions of government were left with them. Each republic had its own Council of Commissars, but the Union reserved for itself the Commissariats of Foreign Affairs, War and Marine, Trade, Transport and Posts and Telegraphs.

Paradoxically, the most important unifying force of the new state, which contained so many races, creeds and languages, was not mentioned in the constitution. The Communist Party, with its rigid discipline and centralized authority, was destined to control each of the constituent states and to cement them more firmly together.

The Changed Position Abroad.—in improvement of relations with the Baltic States followed the collapse of Denikin and Yudenich. In the autumn of 1919 Litvinov was sent by the Soviet to Dorpat in Estonia to negotiate peace with Estonia and Finland. Peace treaties with both States were signed early in the following year on reasonable terms. A settlement with Latvia, whose Soviet Government had been overthrown in May 1919, was delayed by the Lettish claim to the province of Lettgallen. The Letts refused to negotiate and in a three-weeks campaign, Jan. 3–24, 1920, drove the Red troops from the province. It was the only successful campaign against the Red Army in the whole intervention period. Peace with Latvia was signed on Aug. 11, 1920. In the previous January the Allied blockade had been lifted. Anglo-Russian negotiations began in the winter of 1919–20, but were interrupted by the Polish War, and it was not until March 16, 1921, that a trade agreement according de *facto* recognition to the Soviet was signed in London. In the same year similar agreements were made with Germany (May 6), Norway (Sept. 2), Austria (Dec. 7), and Italy (Dec. 26).

The Genoa Conference.—The New Economic Policy stimulated the foreign trend towards commercial rapprochement with the Soviet, and in the spring of 1922 an international conference was held at Genoa, where the Soviet envoys for the first time met foreign statesmen on equal terms. The atmosphere was at first cordial and a proposal was made to provide financial assistance to the Soviet on condition that the debts of the Tsarist Government were recognized. A period of haggling followed, but on April 16, 1922, Germany and the Soviet privately signed an agreement at Rapallo shelving the debt question, affirming mutual friendship, and re-establishing full diplomatic relations. This unexpected event revived fears of a Russo-German combination to upset the Treaty of Versailles, and the Genoa Conference ended without reaching a solution. Although a meeting of experts to discuss financial matters was held in the summer at The Hague, prospects of a settlement were never bright and little was accomplished.

The Soviet Government took the position that the western Powers had tried to enforce a humiliating abandonment of the principle of the repudiation of Tsarist debts and of the monopoly of foreign trade, which it had now come to regard as one of the main pillars of its economic system. If the stability of the new currency was to be maintained, rigid control over exports and imports was imperative. But in the first years of the New Economic Policy foreign trade was somewhat hampered by the attempt to force it all through the bottle-neck of an untrained bureaucratic department. With growing experience there was a

tendency to transfer the placing of orders and sales abroad to the State organizations directly concerned, while the Foreign Trade Department continued to act as control. Soviet trading corporations were established in London, Berlin, New York and other centres. French and American business men hesitated to allow long-term credits, but the English and Germans found them possible and the volume of trade steadily increased.

Effects of the New Economic Policy.—The policy of "concessions" to foreign enterprise on Russian soil, though less successful than the Soviet had hoped, brought money into the country and helped to increase the turnover. Important service was rendered by the Russian Union of Co-operatives, whose offices abroad did much to secure the first credits given to the Soviet and conducted a steadily increasing business which was principally in foodstuffs.

The following table shows the development of foreign trade during this period¹:

Year	(Millions of pre-war gold roubles)		
	Total	Imports	Exports
1921	228	208	20
1922	251	270	81
1923	350	144	206
1923–24	603	234	369

The growth of exports was the most striking change after the introduction of the New Economic Policy. Total trade expanded, and imports, following the Soviet policy of rigid control, fluctuated widely; but exports were multiplied two and a half times between 1922 and 1923, and in the newly established fiscal year ending Sept. 30, 1924, they were nearly doubled again.

The first years of NEP showed a corresponding improvement in internal trade and production. The figures below show the increase in turnover of all taxable concerns, State, co-operative and private, in the R.S.F.S.R., White Russia and the Ukraine. Accurate results for internal trade are impossible in any country, even a highly organized industrial one, but the indication that turnover was multiplied by four between the summer of 1922 and the spring of 1924 is probably not far wrong.

	Volume of turnover (Millions of roubles)
July–September, 1922	970
October, 1922–March, 1923	1,342
April–September, 1923	2,902
October, 1923–March, 1924	3,939

The period brought a great change in the outward appearance of the cities. Instead of grass-grown streets, dilapidated houses and closed shops, there was movement of traffic, fresh paint and plaster, and the hum of business. In the villages, discontent and famine gave way before plentiful harvests.

In the autumn of 1923 prices of agricultural products fell to 60% of the pre-war level. Meanwhile, stimulated by the necessity for showing profits which the New Economic Policy required, the trusts and other industrial enterprises had raised the prices of manufactured goods to 80% above that level. The disproportion was so great that the peasants refused to sell grain or buy goods. Warehouses were glutted and industrial stagnation was threatened. Trotsky coined the term "Scissors" to describe the crisis which followed, because the graph illustrating the ratio of industrial and agricultural prices to the pre-war average had the form of opened scissors, with industrial prices forming the upper blade.

To close the scissors was imperative. It was done in six months, by the sale of goods below cost price, which swept away most of the paper profits of the trusts but removed the danger of industrial stagnation, and by the progressive increase in the price of food products. Although this very serious crisis was past, the

¹The tables showing the development of foreign and domestic trade are summarized from those given in *Ten Years of Soviet Power in Figures*, U.S.S.R. Central Statistical Board (Moscow, 1927), pp. 368, 394–395.

task of keeping the scissors closed remained one of the major problems of the Soviet State.

The comparative liberty given to private trade under the New Economic Policy had produced a host of prosperous "Nepmen," as they were called. They spent money lavishly in the newly revived restaurants, cabarets and gambling rooms, and were no more popular with the mass of their fellow-citizens than the war or "valuta" profiteers in western Europe. They were largely middlemen, retail traders and small manufacturers, for the State continued to hold the principal sources of production and wholesale business in its own hands. They doubtless served their purpose in getting the commercial machine back into running order and furnishing the accumulations of capital; but they were peculiarly repugnant to the extreme Communists and to the organized workers, who saw them as a "new bourgeoisie." Nevertheless their luxuries and greed and gambling were not without value to the community. In the year 1923 gambling rooms, cabarets and restaurants yielded some ten million roubles' revenue to the municipality of Moscow, to be used for the repair of streets, water mains and sewers, and for other public works which greatly improved the condition of the city.

THE STRUGGLE FOR CONTROL

By the beginning of 1924 the New Economic Policy may be said to have justified itself as a practical measure. Currency had been restored to a gold basis, production was approaching pre-war standards, and agriculture had recovered from the effects of the famine and civil war. Much of the improvement had been due to the "Nepmen," or private traders, in the towns, and their counterpart, the "kulaks," or richer peasants, in the villages. They formed a new bourgeoisie, whose wealth and influence were steadily increasing.

The outer world seemed ready to believe that Russia had now entered upon an evolutionary process similar to that which followed the French Revolution under the Directory, and was eager to share in the development of the country's vast resources. It failed to reckon, however, with the fanaticism of the Communist Party and the tenacity of their Marxist faith. The Party had accepted the New Economic Policy, not as a volte-face but as an expedient. It refused to abandon its ideal of a universal Revolution and a world Socialist State. To that ideal it was determined to hold the Soviet Union, whatever difficulties might result at home or abroad.

Thus began a struggle for control between "Left" and "Right"; that is, between Marxist internationalism and the process of evolution, which raged with growing intensity through the coming years. Had Lenin lived, the struggle might have been less acute or avoided altogether. His authority and sense of realities were so great that it is probable that he could have maintained the New Economic Policy as the delicate adjustment between two opposing forces which he originally conceived it to be. His sudden death on Jan. 21, 1924, destroyed the balance which was gradually being reached.

The Period of Recognition.—The effect of Lenin's death had been discounted abroad because of his long illness and absence from public affairs. The growing prosperity of the Soviet State had stimulated the interest of foreign business men, who were beginning to feel that trade would be improved by the establishment of regular diplomatic and consular relations with Russia. Germany had taken this step two years before. The new Labour Government in England had promised to do the same as one of the means of diminishing unemployment, and the energetic Fascist autocracy of Italy was seeking fresh fields for commercial expansion. France was still preoccupied with the memory of her lost loans to the Tsarist Government and with her own reconstruction problems, but her hostility to the Soviet had to some extent diminished.

On Feb. 1, 1924, the British Government recognized the Soviet *de jure*. Other countries followed in rapid succession, and by the beginning of 1925 all of the Great Powers except the United States and Latin America had established diplomatic relations with the Soviet Union. The order was as follows:

Great Britain . . .	Feb. 1, 1924	Sweden . . .	March 15, 1924
Italy . . .	" 7, "	Denmark . . .	June 18, "
Norway . . .	" 13, "	Mexico . . .	Aug. 4, "
Austria . . .	" 20, "	Hungary . . .	Sept. 18, "
Greece . . .	March 8, "	France . . .	Oct. 28, "
Danzig . . .	" 13, "	Japan . . .	Jan. 1, 1925

Japanese recognition had been delayed by their claim to compensation for a massacre of Japanese soldiers by Red "partisans" in the Siberian town of Novy Nikolayevsk in May 1920. Although they had evacuated Vladivostok and the mainland in Nov. 1922, they retained northern Sakhalin until their claim should be satisfied. After two failures negotiations were resumed in Aug. 1924, and recognition was granted on Jan. 1, 1925. A supplementary agreement on Jan. 20 pledged the Japanese to withdraw from Sakhalin before the end of May and gave them important oil and coal concessions in the Russian half of the island.

The establishment of normal diplomatic relations led to an increase of foreign trade, but the absence of a settlement of tsarist debts, war debts and private claims prevented any extension of loans to the Soviet. Nevertheless short-term credits were soon arranged in many countries, and the regularity with which Soviet bills were met gradually overcame distrust. A number of important English firms gave terms of credit running from three to five years. In 1925 Germany provided a State-assisted credit of 300,000,000 marks for a period of three years. The French and Americans were more cautious, but heavy annual purchases of cotton in the United States on a short-term credit basis were made possible by longer credits elsewhere and by the general improvement of Russia's economic situation.

The Communist International.—Another factor, however, hampered not only financial but political relations between the Soviet and the rest of the world. It was interference in the internal affairs of foreign countries by the Third or Communist International, known as the "Comintern." The Third International was founded by Lenin in March 1919 as a successor to the First International of Marx. It was pledged to the cause of World Revolution which had, Lenin declared, been betrayed by the Second International of Amsterdam.

The Soviet Government maintained that the choice of Moscow as the headquarters of the Comintern involved no closer connection between it and the Third International than Amsterdam made between the Second International and the Government of the Netherlands. The Comintern was an aggregation of Communist Parties, and in theory, at least, the successful Communist Party of Russia was no more than *primus inter pares*. The avowed purposes of the Comintern to overthrow their régimes and institutions by violence caused foreign Powers to take a different point of view. Declining to regard casuistic distinctions, they considered the Comintern and the Soviet Government as vassals of one lord, the Russian Communist Party. While power in Russia remained in Communist hands, it was impossible for foreigners to reconcile the action of the Comintern in any country with friendly relations between that country and the Soviet Union.

Moreover, the Comintern extended its activities to the colonies of foreign Powers and to semi-colonial countries or spheres of influence, such as China. This caused ill-feeling between Russia and the foremost colonial Power, Great Britain, and in May 1923, Lord Curzon, as foreign secretary of a Conservative Government, addressed to Moscow a note on the subject, so sharply worded as to be the equivalent of an ultimatum. There were a number of points at issue, but the question of Communist "propaganda" in Britain and her colonies was the principal grievance. The Soviet Government acceded to the British demands, under protest; but the propaganda ghost was not laid, and it continued to trouble Anglo-Russian relations.

The British Labour Government of 1924 took steps towards a friendly settlement with the Soviet Union. An agreement was reached in the autumn of 1924 whereby the Soviet promised to repay old debts over a long term of years in return for immediate financial aid. Before the accord could be signed there was a general election in England, in which no small rôle was played by a letter said to have been written by Zinoviev, president of the

Communist International, to a member of the English Communist Party, giving instructions about Communist propaganda in the British Isles. The Labour Party was decisively beaten and the Conservatives returned to power. The agreement with the Soviet was shelved and the new Government accepted the Zinoviev letter, whose authenticity was denied by Moscow, as proof of the "nefarious interference" of the Bolsheviks in British affairs. The stir caused by this incident might have been forgotten but for events in Asia and other colonial regions, where the distinction between Soviet Government policy and Comintern activities at times became a subtle one.

Soviet Policy in Asia.—In 1919 Russia's influence was a negligible factor in Turkey and the Near East, Persia, Afghanistan and China. England, on the contrary, had never held so strong a position, and seemed on the verge of obtaining permanent control over what had formerly been the buffer States between her Empire and the tsar's.

Three years later, however, the Soviet had signed treaties of friendship with Turkey, Persia and Afghanistan as States independent of external influence, and established a virtual protectorate over outer Mongolia. The central Asian principalities of Khiva and Bokhara were firmly under Soviet rule, and the new Russian republic was now ready to challenge Britain in China.

The Soviet Government and the Comintern achieved this result jointly, under Lenin's guidance. The former disavowed unequal treaties, capitulations, treaty ports, protected areas and unilateral tariffs; while the latter devoted its energies to fostering not Communism but nationalism, by virtue of the Leninist doctrine of colonial slaves. This doctrine was Lenin's answer to the question which had long perplexed orthodox Marxists, namely, why the working masses of western Europe had failed to revolt, as Marx had predicted, against their capitalist masters. Lenin argued that the surplus profits from the exploitation of colonies and semi-colonial countries such as China had enabled the European capitalists to maintain their "wage slaves" above the starvation level which would make revolution inevitable. To free such countries from capitalist exploitation would therefore be a long step towards the proletarian world revolution. Lenin thus reconciled three apparently contradictory forces, the nationalist aspirations of colonial and semi-colonial countries, the spirit of Marxist Communism, and the reborn desire of new Russia for expansion, a desire which was expressed in the absorption of Khiva, Bokhara and Outer Mongolia.

The Soviet Government cemented its disavowal of "imperialist" colonial policy by the conclusion of equal treaties and pacts of friendship with the Asiatic countries, as follows:

Persia	Feb., 1921	Turkey	March, 1921
Afghanistan	" "	Outer Mongolia	Nov. "

The Soviet and China.—The Mongolian treaty caused irritation in Peking and had the effect of delaying a full accord between the Soviet and Chinese Governments until May 31, 1924. In a manifesto issued in July 1919, and formally repeated in Sept. 1920, the Soviet had affirmed in the most categorical manner its abstention from previous pacts infringing Chinese sovereignty in any way, its abandonment of all claim to the Boxer indemnity, and its willingness to treat with China on terms of full equality.

The treaty of 1924 put a Soviet ambassador, Karakhan, in the old tsarist embassy in the Legation Quarter of Peking, despite the objection of the foreign diplomatic corps to the presence of a potentially hostile element within the fortress that the Legation Quarter had become after the Boxer Rebellion of 1900. Meanwhile the Communist International was at work in South China, where both Russian and Chinese Communists supported the Nationalist slogan, "China for the Chinese!" As the Nationalists advanced northwards from Canton, the influence of their Russian advisers, Borodin in political affairs and Galen in the army, grew stronger. Neither had an official connection with the Soviet Government, but the foreign Powers, especially England, were convinced that both were acting under Moscow's orders. By March 1927 the Nationalists were masters of South China, including the Yangtse valley, and the native section of the greatest treaty port,

Shanghai.

At this moment Chang-Tso-Lin, the anti-Nationalist dictator of Peking, raided the premises of the military attaché in the Soviet embassy there, with the knowledge and permission of the foreign diplomatic corps. A mass of documents were seized and a number of arrests were made, including subordinate members of the Russian staff and Chinese Communists who had sought refuge in the embassy compound.

The documents published immediately showed a financial connection between the Soviet embassy in Peking and the Comintern or unofficial activities of Borodin and Galen in South China. A rupture of relations between Moscow and Peking followed. The foreign Powers, especially England, began to realize the full danger to them of the Leninist doctrine of colonial slaves. Strong military and naval forces enabled the foreigners to retain the treaty ports and the Legation Quarter of Peking, but they were compelled to abandon their privileges at Hankow on the Middle Yangtse, which for a time became the Nationalist headquarters.

Then, in the moment of victory, Russian influence began to wane. Nationalist leaders may have been alarmed by the revelations of the Peking embassy documents, or attracted by the material advantages of friendly relations with foreign Powers. It is also conceivable that Moscow at this time overestimated the revolutionary character of the Chinese Nationalist movement. At any rate, there occurred a split between the "Left" or Russophile section of the Nationalist Party and the "Right," which ended with the victory of the latter, the flight to Russia of Borodin, Galen and their staffs, and a harsh repression of Communism in the territory controlled by the Nationalists.

The Anglo-Soviet Rupture.—Events in China had increased anti-Soviet feeling in England, already aggravated by Russian financial contributions to the British coal-miners on strike in the previous year, and in May 1927 the premises of the Soviet Trading Corporation in London, Arcos, were raided by the police. In this case no seized documents were made public, but the result was similar to that in Peking. Diplomatic relations between England and the Soviet were severed on May 24, 1927. This was the first serious setback the Soviet had met since 1921. It caused a reduction of English credits and imports, and thus affected the internal economic situation, which had now come to depend in no small measure upon smooth relations with foreign capital and business.

Communist Policy at Home.—Lenin's death occurred at a time when the growing prosperity of the "Nepmen" and the new bourgeoisie had begun to raise fears in the minds of many Communists that the New Economic Policy might become a surrender to capitalism. The tremendous demonstration of popular sympathy which accompanied his funeral ceremonies, when three quarters of a million people waited an average of five hours in the arctic cold of 30 degrees below zero, night and day alike, before passing through the hall where Lenin's body lay in state, encouraged his successors to resist the bourgeois trend.

Deprived of Lenin's guidance, the Communist leaders dared take no risks with the internal enemy. The Nepmen had helped to renew commercial activity, but they must not be allowed to gain the upper hand. It was felt, moreover, that the State business organizations were now sufficiently strong to take the place of private enterprise, and the restoration of the currency to a sound basis would permit their being financed by the newly created State banking organizations. In the first half of 1924, therefore, private trade was loaded with heavy taxes and other restrictions. The Nepmen were unpopular with the masses and the measures taken against them were not unwelcome, but the reduction of private enterprise in the towns led the extremist section of the Communist party to demand a similar suppression of "Capitalist elements" in the villages. The struggle between the forces of Capitalism and Socialism thus provoked a sharper struggle within the Communist Party itself.

The Intra-Party Controversy.—There was a tendency abroad to exaggerate the importance of personal rivalries in the long and bitter controversy which followed, and to regard it primarily as a struggle for Lenin's mantle. It is probable that there was a clash

of temperament between Stalin, general secretary of the Communist Party, the Majority leader, and Trotsky, who conducted the Opposition, but the real issues went deeper. In the first part of the controversy, 1925-26, the Opposition tried to force the socializing process, which was the avowed aim of the Communist Party, at too swift a pace.

In the cities the State might now hope to supplant the Nepman without economic disorganization, but in the villages it was still dependent upon the "kulaks" or rich peasants, who produced the grain surplus needed for export and to feed the urban centres. When Trotsky demanded their repression the Majority did not yet see how they could be replaced, and the Communist Party Congress of Dec. 1925, confirmed the rights of "individual peasant producers," despite a screen of anti-kulak phrases to cover this compromise with Marxist principles.

A good crop in the summer of 1926, however, strengthened national food resources and brought forward a demand that the village capitalist be curbed. He was becoming dangerously strong, and the State had begun to feel, as it had about the Nepman two years before, that it could do without him. The Opposition platform, therefore, was in accord with prevailing Communist sentiment, and by 1927 it had attracted such prominent figures of the Bolshevik régime as Zinoviev, the president of the Third International, and Ramenev, one of Lenin's closest associates. But Trotsky's adherents declared that their arguments were perverted in the official press and that they were not given proper opportunity to state their case. They had recourse to underground methods, which the Majority denounced as an attempt to split the Party. The adherents of Trotsky refused to abandon their tactics and after hot discussion at the Communist Party Congress in Dec. 1927, were expelled from the Party. Trotsky and other Opposition leaders were sent into exile. Within a month of their departure from Moscow the victorious Majority had adopted their programme of repression of the "capitalist elements in the villages."

The Peasant Problem.— The immediate reason for this step was the failure in the summer of 1927 of the State grain collections. This was the name given to the system of state purchases of grain to provide for the needs of the urban population and the army, and for export. In the previous year the State had collected approximately 10,000,000 tons of cereals, of which more than 2,000,000 were exported, and it was planned to collect an equal amount in 1927-28. A renewal of the "scissors" disproportion between the prices of grain and manufactured goods caused difficulty. The peasants preferred to keep the grain for themselves and their stock, rather than sell it. Communist sentiment was already prepared for a drive against "anti-Socialist forces" in the villages. During the spring and summer of 1928 vigorous measures, reminiscent of the Militant Communism period, were employed to extract surplus grain from the richer peasants, who were described as "class enemies."

The quota was attained, but the growing needs of the towns left only a small margin for export, which fell to less than half a million tons. This reacted unfavourably upon the foreign trade balance, which had now become most important, because in 1927 the State had embarked upon an ambitious five-year programme of industrialization; that is, an attempt to build up a self-sufficient industrial production which required heavy purchases of machines and raw materials abroad. The enforced collections of grain caused much discontent in the villages, and in July 1928 the Central Committee of the Communist Party announced their abolition and promised they should not be repeated. Once again Communist insistence upon class warfare in the villages had over-emphasized the distinction between kulaks and the rest of the peasants.

The Electoral System.— Although the electoral system under the Soviet Constitution of 1923 had been carefully devised to redress the numerical disproportion between the rural and urban populations and to maintain the control of the Communist Party and organized labour over the principal organs of government, the power of self-expression which universal suffrage gave to the tillages could not be ignored. However great might be the author-

ity of the Communist Party, it hesitated to pursue any policy counter to the clearly defined will of the rural masses. The Party regarded itself as the guardian of the infant proletarian State, not yet fitted by experience and political development for full adult freedom. The electoral system was a valuable guide to public opinion, but as far as the real exercise of power was concerned, it was little more than a form of education in self-government.

This educational process was reinforced in a number of ways, the first of which was the Communist Party itself, which on Nov. 1, 1928, had 1,500,000 members. The Communist Youth organization had over 2,000,000 members, young persons of both sexes between the ages of 14 and 22. After them came 1,500,000 Young Pioneers (Communist Boy and Girl Scouts), aged 7 to 14. Some 12,000,000 urban workers were enrolled in trade unions, controlled by Communists and sympathetic with their aims. The Soviet Air League (Osaviakhim), a patriotic organization similar to the German Navy League before World War I, had thousands of branches and a membership of 13,000,000 by 1933. The Army and Navy, approximately 600,000 strong on a peace footing, was another forcing-ground for Communism. Only 10% of the recruits were members of the Communist Party or the Communist League of Youth, but at the expiration of service the proportion had increased to 50 per cent. Finally, the whole system of primary and secondary education had been revised to accord with Marxist ideals. On Nov. 1, 1928, there were in the Union 118,000 primary schools and 3,000 secondary schools and universities, all rigorously secular, with an obligatory course in the elementary principles of Socialism.

Foreign Relations.— The rupture with England did not prevent the Soviet from taking part in international disarmament conferences at Geneva in the autumn of 1927 and the spring of 1928. Disarmament had long been advocated by the Soviet Government, which in the winter of 1922-23 had attempted to arrange a scheme of armament limitation in a conference with its neighbours, Poland, Finland and the Baltic States. At Geneva the Soviet Government proposed to begin immediately the progressive reduction of land, sea and air forces. The other European Powers were distrustful and unprepared for such sweeping action, and the conferences ended without result.

Although the Geneva Conferences did little to improve the relations of the Soviet with the leading Powers of western Europe, and although the Soviet was excluded from the number of original signatories to the Kellogg World Pact of Non-Aggression signed at Versailles in the summer of 1928, there were signs in the following autumn that the United States, which had become a reservoir of capital for European post-war reconstruction, was beginning to modify its aloof or even hostile attitude towards the Soviet. For several years the two great international oil groups, the American Standard Oil and the British Royal Dutch Shell, had been laying claim to a large part of the nationalized oil-fields of the Caucasus; Standard as purchaser of the former Nobel interests, and Royal Dutch Shell by virtue of concessions they had formerly controlled. At the Genoa Conference in the spring of 1922 the Soviet seemed willing to discuss the oil question, and at one moment it was reported that it had arranged a *modus operandi* with the British group. This, however, fell through. Subsequent attempts to obtain sales contracts were unsuccessful until the Soviet Oil Syndicate concluded a series of sales contracts with two of the Standard subsidiaries in the winter of 1926-27, on terms advantageous to the Standard.

The hostility of the English group, already aroused by direct Soviet competition in England, France and elsewhere, was increased by this *coup*, which for a time threatened to precipitate a rate war between the English and American oil interests throughout the world. The parent Standard Company, however, had not renounced its claims to the Nobel properties, and in this respect its interests coincided with those of the English group. The rate war was checked, but whereas the British oil interests remained actively hostile to the Soviet, the Americans were passively friendly.

In the autumn of 1928 a contract between the Soviet Trading Corporation in New York and the General Electric Company in

the United States, giving the former five years' credit on purchases, was the first real breach in the "credit blockade," as it was called, which had hampered business relations between Russia and the United States. Hopes were roused in Moscow that the economic tension caused by the rupture with Britain and the absence of grain exports might be eased by financial aid from America.

BIBLIOGRAPHY.—Historical accounts of Soviet Russia cover the period only imperfectly. The works selected below should be supplemented from the files of the Russian newspapers *Isvestia*, *Pravda*, and *Economic Life*, and from the *New York Times*, contemporary journals, and Soviet official documents.

THE YEARS 1928-42

Industrialization.—The entire course of soviet life after 1928 was greatly influenced by the introduction of a system of planned economy which was expressed in a series of Five Year plans of national economic development. These plans undertook to prescribe every detail of economic life, how many factories should be built, how much coal should be mined, how much currency should be in circulation, how much food should be available. For successful execution, such a system required a degree of state control over all the elements in production unparalleled in human history; and it was no accident that the first Five Year Plan, which was shortened to four and a quarter years in practice, lasting from Oct. 1, 1928, until Dec. 31, 1932, involved the virtually complete destruction of the individualist classes that had survived in Russia under the New Economic Policy—the private traders and small businessmen in the towns and the peasants who farmed their own land in the villages. The traders were wiped out by confiscatory taxation, often accompanied by administrative banishment; the peasants were put under the strongest pressure to pool their individual holdings in collective farms (*kolkhozi*).

The purposes and effects of the first Five Year Plan were military as well as industrial. The objective in which it was most successful was the building up in Russia of a powerful, independent, self-sufficient heavy industry, which is, of course, the indispensable prerequisite for the conduct of modern war. Foreign specialists, mostly Americans and Germans, were engaged by the government and given important consultant posts in the construction of many large new plants, such as the Magnitogorsk iron and steel works, the tractor plants at Kharkov, Stalingrad and Chelyabinsk, the automobile factory at Gorki (formerly Nijni Novgorod), the machine-building works at Sverdlovsk (formerly Ekaterinburg) and the chemical plants at Berezniki and Bobriki.

The obstacles to the realization of this plan were formidable. There was no reserve of trained and skilled labour; food and hous-

ing conditions in the new industrial centres were usually very difficult; the suspicion of sabotage tended to paralyse the work of the older engineers. But the concentrated drive of the ruling Communist party, the imposition of sacrifices in the daily standard of living and the mobilization of national resources on a scale suggestive of a wartime emergency, realized impressive quantitative results in the output of heavy industry and minerals, as is shown by the following table:

	1913	1928	1934
Capacity of power stations, tons	1,098,000	1,905,000	6,197,000
Cement, tons	1,438,000	1,850,000	3,592,000
Coal, tons	29,100,000	35,400,000	93,600,000
Copper, tons	31,100	30,000	53,300
Crude oil, tons	9,200,000	11,600,000	25,500,000
Locomotives	644	479	1,326
Motor vehicles	100	671	82,500
Output of electricity, kw.-hr.	1,945,000,000	5,007,000,000	20,220,000,000
Pig iron, tons	4,200,000	3,300,000	10,400,000
Railway trucks (two-axle type units)	11,832	10,612	32,400
Rolled metal, tons	3,500,000	3,400,000	6,700,000
Steel, tons	4,200,000	4,200,000	9,500,000
Sulphuric acid, tons	121,000	211,000	782,000
Tractors (15-h p. type units)		1,300	114,800

Figures for the output of consumers' goods, such as textiles, soap, shoes, clothing, etc., were very much less favourable, and these years of rapid growth of heavy industries were years of extreme deprivation for the majority of the Russian people. Not only was there an acute shortage of manufactured articles of everyday use, but there was a serious lack of food. A rationing system was introduced which functioned regularly only as regards bread and a very limited allotment of sugar. Such foodstuffs as ham, sausage, cheese and butter became almost unobtainable luxuries, unavailable in government stores, fantastically expensive on the dwindling free markets. With a view to extracting hidden reserves of foreign currency from the population, a system of so-called Torgsin shops was instituted. There foodstuffs and manufactured articles were sold only for gold or for foreign currency, which the soviet government needed in order to pay for the large imports of foreign machinery and equipment.

There were several causes of this food shortage, which began to show signs of alleviation in 1934 and was relieved in 1935 to the point where the rationing and Torgsin shop system could be abolished.¹ There was an immense increase in the city and town population as a result of the industrialization of the country. There were difficulties with transportation. There was, in some cases, a deliberate exportation of foodstuffs from Russia in order to procure the badly needed foreign exchange.

Collectivization.—But the principal cause of food stringency was the temporary dislocation of normal agricultural production by the drastic change of Russian agriculture from an individual to a collectivist basis. After the bolshevik revolution, Russia became a country of small peasant holdings. The land which had formerly belonged to big and medium estates was confiscated and parcelled out among the peasants. Purchase and sale of land were forbidden, and every peasant family was allotted land in proportion to the number of its members. *Artels* and communes, associations in which the peasants worked the land on a more or less completely co-operative basis, were favoured in principle by the soviet government, but made little progress until 1929.

Then extremely strenuous measures, amounting to political and economic compulsion, were applied to induce the peasants to adopt the methods of collective farming. The government desired this organization of the peasants in *kolkhozi*, collective farms, for two reasons. These larger agricultural units could be farmed more easily with tractors, combines and other modern machinery which was beginning to flow in increasing quantities from the assembly lines of the new factories. The peasants organized in a

¹Rationing was reintroduced after the beginning of the war with German, in 1941

collective farm were much more susceptible to regimentation, easier to fit into the pattern of a planned economy than if they possessed the status of small holders, each on his small farm.

The wrench involved for many peasants in giving up their sense of individual ownership was severe; and the difficulty of effecting a smooth and easy transition to collective farming was enhanced because the peasants throughout this period were not receiving a normal or adequate supply of manufactured products in exchange for their grain and other products. Methods scarcely distinguishable from requisitioning were used to extract as much as possible from the peasants, while the supply of products which the peasants expected from the towns—clothing, boots, tea, sugar, etc.—was both scanty and irregular. There was also a good deal of administrative incompetence; city communists who were sent out to manage the collective farms often lacked proper understanding of the technical problems of farming and of the peasant psychology.

As a result of all these causes a very bitter struggle, approaching miniature civil war in some regions, developed over the issue of collectivization. The so-called *kulaks*, the 4% or 5% of the peasants who were rather better off than their neighbours, were strongly opposed to collective farming, from which, they believed, they had much to lose and little to gain. A decree of 1930 provided that in regions of general collectivization the *kulaks* should be "liquidated as a class"; i.e., driven from their homes with confiscation of their property. In many cases they were shipped off to forced labour in timber camps and in the new industrial enterprises. Conditions of hardship and shortage developed into outright famine in many peasant regions, especially in the Ukraine and in the north Caucasus during the winter of 1932-33 and the spring of 1933. There were millions of deaths in this famine. The herds and flocks of the country were seriously reduced: horses from 34,000,000 in 1929 to 16,600,000 in 1933; cattle from 68,100,000 to 38,600,000; pigs from 20,900,000 to 12,200,000; sheep and goats from 147,200,000 to 50,600,000.

The new system, however, gradually established itself, despite the individual sufferings which accompanied it. The government, supported by the Communist party organization, was strong enough to overcome the unorganized resistance of the peasants. The number of collectivized peasant households, which was 416,700 in 1928, had risen to 15,867,700 in 1934, or 73% of the entire number of peasant families in that year. The destruction of individual farming had been even more complete in terms of cultivated area, as the following table shows.

Year	Individual Peasants	Collective Farms	State Farms
1928	97.3%	1.2%	1.5%
1929	94.6%	3.5%	1.9%
1930	67.0%	29.9%	3.1%
1931	34.0%	57.9%	8.1%
1932	21.9%	68.1%	10.0%
1933	16.9%	72.2%	10.9%
1934	13.5%	75.0%	11.5%

This tendency continued, so that the individual peasants in Russia by 1942 were a small and dwindling remnant. Some concessions were made in 1933, however, to the peasants in the collective farms which eased the working of the new system. The peasant was given the right to retain a garden and to breed domestic animals on a basis of individual ownership. The requirements of the state as regards deliveries of grain and other products were fixed on a more definite basis, with less arbitrariness.

So the basic organization of Russian agriculture became the collective farm, of which there were about 250,000 in 1942. Another very important unit in modern soviet agriculture is the machine-tractor station. These stations, which are state-owned, retain tractors and other large machines and cultivate the fields of the collective farms in their neighbourhood, receiving payment in kind for this service. The peasants on a collective farm are paid according to the quantity and quality of their labour. Comparisons with prerevolutionary and precollectivization conditions are difficult; but there was undoubtedly an improvement over the extremely bleak years between 1929 and 1933. A new type of peasant, much closer to the industrial worker in industrial function and working habits and probably in psychology, was being created. There seems reason to believe that the state-controlled mechanized farming appealed more to the younger generation, brought up under communist ideological influence, than to the older

peasants who might still cherish some regrets for the old individual farming.

Stalin's Leadership and the Purges.—Joseph Vissarionovich Stalin emerged as the outstanding leader of the soviet regime during this period. Although he held no state office until the spring of 1941, when he succeeded his faithful adherent, V. M. Molotov, as premier, remaining up to that time general secretary of the Central committee of the Communist party, his power in every field, political and economic, was absolute and unquestioned. It became almost a matter of course to ascribe every soviet achievement, political, military, economic or social, to his genius and initiative.

Stalin's personal power was further confirmed by the political elimination and, in many cases, by the physical execution of most of the leading "Old Bolsheviks," the men who, along with Lenin and Trotsky, had played prominent roles in the first years of the revolution. Trotsky himself had first been banished to Turkestan and then sent into exile, finally taking up residence in Mexico. There he was murdered in the summer of 1940, under circumstances which were never very definitely cleared up. Meanwhile, there had been three spectacular trials of prominent revolutionaries in Russia, in Aug. 1936, Jan. 1937 and March 1938. The defendants confessed various acts of treason and sabotage, and almost 50 persons were sentenced to death. Among the victims of these trials were some of the most famous names of the revolution and of the early phases of the soviet regime. They included a former premier, A. I. Rykov, two former presidents of the Communist International, Gregory Zinoviev and Nikolai Bukharin, the once dreaded chief of the O.G.P.U. (political police), G. Yagoda, and many former diplomats, cabinet ministers and prominent economic executives. Marshal M. N. Tukhachevsky, one of the most gifted leaders of the Red army in the civil war, and seven generals of the Red army were shot after an alleged secret trial in June 1937. Throughout these years there were many secret executions, some of which were and others were not subsequently reported, and a far greater number of administrative banishments. While no precise figures were available, it is probable that death sentences were numbered in thousands and banishments in tens of thousands.

The trials and the accompanying purge were a dark and debatable subject. Foreign opinion was sharply divided. There was some retrospective justification of this merciless decimation of the ranks of the old revolutionaries on the ground that these men were agents of Hitler and that their elimination was a necessary measure of security. Foreign critics of the trials emphasized the factual discrepancies in certain details of the trials which were subject to verification in foreign countries; they interpreted the whole purge as a method of insuring Stalin's personal power and the confessions as the false self-incriminations of exhausted and broken men, who were perhaps influenced by threats against their families. There was not enough evidence to permit the formation of an absolutely certain positive judgment, especially as the great majority both of the executions and of the banishments were secret administrative affairs. Stalin's power certainly remained unshaken, and the soviet regime stood up to the shock of war without the internal disintegration which had been predicted as a result of the purges. It is, of course, quite possible that the masses of the Russian people who were not involved in the purge viewed with relative indifference this ruthless destruction of one part of the ruling class by another.

The New Soviet Constitution and Internal Changes,

The All-Union Congress of Soviets adopted a new constitution for the soviet union on Dec. 5, 1936. This instrument provided for direct, instead of the formerly indirect, election procedure for the choice of delegates to the soviet congress, proclaimed various social benefits as the right of every soviet citizen, established a bicameral national legislature, with representation in one house based on population, in the other on nationality (there were 11 soviet republics in the federation), recognized "freedom of service of religious cults" and contained some assurances of civil liberties.

Politically, the new constitution brought little if any change in soviet practice. Stalin remained a dictator of unlimited powers. Only one political organization, the Communist party, remained legal. Nor was any opposition permitted to manifest itself in speech or writing after the promulgation of the constitution.

Socially, however, and in everyday life, there were considerable changes in Russia after the end of the first Five Year Plan. There was no reversion to private capitalism; every branch of soviet economy is state-owned and state-dominated. But there has been toleration and even encouragement of much more material inequality than would have been found during the bleak, austere period of the first Five Year Plan, when the acute shortage of food and consumers' goods almost enforced a kind of equality of privation. The spread in income between the higher members of the bureaucracy, army and O.G.P.U. officers, industrial executives, popular authors, engineers, etc., and the masses of workers and peasants became greater. And this difference was also true as regards the spread in wages between skilled and unskilled workers.

There were significant changes of emphasis in education, in literature, in cultural life. The state set the tone in all these fields; there was no tolerance for the dissenter. But the soviet school, experimental and loosely disciplined for more than a decade after the revolution, became much stricter in its methods, with marks and examinations,

uniforms for students and more authority for teachers. Middle and higher education, formerly free, was now paid for.

Up to the middle '30s it was fashionable and, indeed, almost compulsory to deprecate the Russian past extravagantly and uncritically. But this has entirely changed; the nationalist note was often struck in soviet newspapers and soviet literature. Tsars of outstanding personality like Peter the Great and Ivan the Terrible were referred to with respect, instead of being indiscriminately abused.

There was an important change of attitude toward family life. Early soviet legislation practically eliminated all restrictions on intercourse between the sexes. Divorce could be had immediately for the asking by either partner, and there was no distinction between legitimate and illegitimate children. Because of the lack of more effective means of birth control, abortions were frequent. In the middle '30s there was a severe tightening of restrictions on divorce; the performance of abortions was made illegal and women were urged and encouraged to hear many children.

During the period from 1929 to 1933 there was a good deal of persecution of children whose "class origin" was suspect. Sons and daughters of priests, of former aristocrats and well-to-do families were barred from universities and found it hard to get employment. After 1933 there was more social equality, more feeling that class lines within the soviet state had been ironed out. It is perhaps not accidental that these changes of a moderate and conservative character coincided with the decimation of the ranks of the veteran revolutionaries who were identified with the more active destructive period of the revolution.

Later Economic Developments.—Collective farming became more and more firmly established, and 93.5% of the peasant households in 1939 were included in collective farms. Industrial output continued to increase, although the curve of increase showed signs of flattening out in some industries, and the spectacular percentage gains achieved in some industries during the first Five Year Plan (often based on a low original figure of production) tended to diminish. Some comparisons between 1934 and 1939 were as follows:

	1934	1939
Coal, tons	93,600,000	132,888,000 (1938)
Copper, tons	53,300	107,000
Oil, tons	25,500,000	29,530,000
Pig iron, tons	10,400,000	15,600,000
Steel, tons	9,500,000	18,800,000
Sulphuric acid, tons	782,000	1,208,000 (1936)

There was a significant shift of soviet production eastward, to the Ural mountains and to Siberia. This was largely prompted by military considerations, although there was sufficient mineral wealth in the Urals and in certain parts of Siberia to support a substantial industrial development. A large aeroplane engine plant was set up in Perm. Aeroplane factories were also built in Voronezh, Gorki, Kazan, Tomsk, Irkutsk and Khabarovsk, thousands of miles away from the European frontier.

Living conditions in general improved, and rationing was abandoned between 1933 and 1936. The problem of providing an adequate supply of consumers' goods was not solved; the purge accounted for some backwardness in industrial production, and war stringency began to be felt in Russia even before the Germans launched their attack in June 1941. Food was becoming more expensive and labour discipline was more severe, imprisonment being the penalty for tardiness or absence from work.

Foreign Policy.—Between 1928 and 1942 the soviet union passed through four fairly well differentiated stages of foreign policy, as follows:

(1) Friendship with Germany, antagonism to Great Britain and France. This was the general course of soviet foreign policy after the revolution, and it continued until Hitler's rise to power in Germany in 1933. There were occasional variations in this policy, periods of coolness between Moscow and Berlin. But soviet policy in the main was to support the German demand for disarmament, as opposed to the French thesis of security, to abstain from co-operation with the League of Nations, to depict Great Britain and France as the chief potential enemies. Soviet support of the British general strike and of the nationalist revolutionary movement in China aggravated relations with Great Britain, and there was a suspension of British-soviet diplomatic relations from 1927 until 1929.

(2) Collective security, anti-fascism, "United Front," Hitler's rise to power on an outspokenly anti-communist program and the obviously militarist, aggressive character of the nazi regime caused a change of orientation. Karl Radek, well known publicist, who was often an unofficial spokesman for the government until his arrest in connection with the treason and sabotage trials, heralded this shift in the spring of 1933 when he wrote a series of articles about the undesirability of violent change in the status quo. The soviet union joined the League of Nations on Sept. 18, 1934, the year when Germany quit that organization. Military alliances were concluded with France and Czechoslovakia and pacts of nonaggression, elaborately worded so as to exclude every form of disguised aggression, were concluded with Russia's western neighbours—Poland, Rumania, Latvia, Lithuania, Estonia and Finland. The regular soviet representative at important sessions of the League of Nations, Maxim

Litvinov, repeatedly advocated the ideas that peace was indivisible and that security must be organized on a collective basis.

The Communist International, always responsive to any change in soviet policy, changed very strikingly the character of its propaganda. Extreme revolutionary demands were pushed into the background, and political alliances were sought not only with Socialists but with liberal and radical parties. One result of this policy was the formation in 1936 of left-wing "popular front" governments in France and Spain. During the Spanish Civil War which broke out in 1936, the soviet government in the beginning sent a considerable amount of aid in tanks, planes and military specialists to the Spanish Republicans.

(3) A tremendous change in soviet foreign policy occurred on Aug. 24, 1939, when Stalin and Hitler signed a pact of nonaggression. There had been signs earlier in the year that the soviet government, which had been rebuffed and cold-shouldered at the time of the Munich conference in Sept. 1938, was considering a change of policy. Stalin had spoken of unwillingness to pull foreign chestnuts out of the fire. Litvinov, apostle of collective security, had been summarily dropped from the soviet cabinet on May 3, 1939, and replaced by Premier V. M. Molotov.

During this third phase, the soviet government pursued a policy of independent aggression, endeavouring to strengthen its strategic position and to derive benefit from the war in which the other major European powers were involved. Soviet troops crossed the Polish frontier on Sept. 17, 1939, and a partition of that country with Germany was arranged. Finland was attacked on Nov. 30; the Finnish resistance was unexpectedly strong. But on March 12 a peace treaty was concluded which gave the soviet union the isthmus of Karelia, the naval base of Hango and other concessions. The Baltic republics, Latvia, Lithuania and Estonia, which had been obliged to accept "mutual aid" treaties with the soviet union, admitting soviet garrisons in their territory, in Oct. 1939, were annexed outright and organized as soviet republics in the summer of 1940. At the same time, Rumania was forced to cede Bessarabia, a former Russian province, and northern Bukovina.

(4) War With Germany.—This third phase of soviet foreign policy came to an abrupt and violent end on June 22, 1941, when Hitler threw the main weight of his armed forces against the soviet union in a gigantic offensive from the Arctic ocean to the Black sea. Finland, Rumania and Hungary joined in the attack as allies of Germany. Winston Churchill welcomed the soviet union as an ally in the struggle against Hitler, and the U.S. government began to send military aid to Russia; lend-lease credit of \$1,000,000,000 was announced in November. Litvinov came out of obscurity and retirement and was sent to the United States as soviet ambassador.

During the first five months of the war, until the beginning of December, Germany maintained the initiative and conquered about 500,000 sq. mi. of territory. The Germans enjoyed the advantage of surprise and quickly overran eastern Poland, Latvia and Lithuania, the soviet forces holding out longer in Estonia. There were episodes of stubborn resistance in the Smolensk area, on the approaches to Leningrad and around Kiev and Odessa. But during the latter part of August and September the German forces pushed on and occupied a large part of the Ukraine. A fierce offensive was launched against Moscow itself in October and such important key towns as Bryansk, Vyazma and Orel were taken, while Odessa fell on Oct. 16 and the Crimean peninsula was overrun, except for the important naval base of Sevastopol.

The high point of the German advance was reached late in November, when Rostov-on-Don, the gateway to the Caucasus region, with its valuable oil wells, was occupied, Leningrad was virtually encircled, and the German forces had almost surrounded Tula and were within 20 or 30 mi. of Moscow.

The first sign of a turn in the tide was the recapture of Rostov-on-Don by soviet troops on Nov. 29. About a week later there was a corresponding shift of initiative on the northern sectors of the front. The salients which the Germans had driven into the Russian lines were wiped out, and the military map by the end of February presented a reverse picture, with deep soviet infiltrations into the German lines north and south of Smolensk, although the Germans were clinging stubbornly to some of the advance towns which they had taken in the autumn, such as Vyazma, Bryansk and Orel. There was a soviet bulge in the German line south of Kharkov, although this important industrial and rail centre remained in German hands. The port of Kerch, take-off point for a move against the Caucasus, had been retaken by the Russians, who had improved their position in the Crimea, although they had not driven the Germans out of the peninsula. By mid-April, 1942, the spring thaw had compelled a suspension of major operations on the front, although both sides were apparently preparing for bigger campaigns after the hardening of the ground. RUSSIA, CAMPAIGN IN NORTH. The campaign in north Russia must not be regarded as an isolated incident of the

World War of 1914-18, but as a definite part of the Allies' plan for the defeat of the Central Powers

Allied Expeditionary Force.—The original force consisted of 150 British marines who landed at Murmansk in April 1918. They were followed by 370 more at the end of May, with a further reinforcement of infantry and machine-gunners to the number of 600 on June 23. The strength of the forces gradually grew till the maximum strengths reached were as follows. White Russians, 20,000; British, 18,400; United States, 5,100; French, 1,800; Italian, 1,200; Serbian, 1,000.

Maj.-Gen. F. C. Poole, the commander-in-chief of the Allied forces in north Russia, arrived at Murmansk on May 24, 1918, and found that the Allies were holding the Kola peninsula with detachments at Kandalaksha. He pushed southwards down the Petrograd railway, and by the end of June had secured Kem and Soroka, the point where the road to Archangel via Onega branches eastwards. The ice-free port of Murmansk was thus fully protected against any possible raid by the German forces in Finland.

On August 3 Poole occupied Archangel with a force of 1,500 men, supported by British and French warships, and a force of Serbs and Russians under Col. Thornhiii moving overland via Soroka and Onega. Early in Oct. 1918, Gen. Poole proceeded to England, and in November Maj.-Gen. W. E. Ironside, who had been chief general staff officer in north Russia, succeeded him. The commands of Archangel and Murmansk were then made independent of one another.

The question of the maintenance of the Allied forces in north Russia had been early considered by the authorities. Murmansk, being an ice-free port, could be used all the year round, and the troops based upon it could be withdrawn at any time. But with Archangel the case was different. The port becomes frozen up from early November till late April. It was of the utmost importance to prevent the resources of Russia becoming available to the Germans, should they be able to continue fighting throughout 1919. The decision was therefore made to remain at Archangel during the winter.

The expedition to north Russia in the summer and autumn of 1918 undoubtedly did much to complicate the plans of the Germans. There is definite evidence that the German military authorities were unable to continue the transference of troops from east to west in the final stages of the World War of 1914-18, despite the urgent demands of Hindenburg and Ludendorff. The original object of the expedition was therefore fully achieved.

Peculiar Difficulties of the Campaign.—The armistice in Europe came just at the closing of the White sea with ice. For the north Russian force a new campaign was beginning, and all knew that relief could not come for at least six months. The feeling that demobilization was being carried out on all other fronts had a demoralizing effect upon all ranks of the force. Furthermore, the object of the campaign was obviously no longer the same. Germany as an enemy had disappeared from the scene, and the Allied troops were never again quite clear as to the reasons for the continuance of the fighting. In their efforts to reconstruct the Eastern Front, the Allies had espoused the cause of the White Russians and had called upon the Czech ex-prisoner of war units in Siberia to march westwards to join them. It was thus that the Bolsheviks became the new adversaries of the Allies.

For the British authorities the campaign was a serious responsibility. Food, clothing and munitions had to be unified so far as possible for the simplifying of supply. The town of Archangel contained at least three times its normal population owing to the influx of refugees, and it was impossible to let the population starve. Large supplies had to be imported for this purpose.

Winter of 1918-19.—The transition stage from summer to winter proved a difficult period for the Allies. The freezing of the Dvina came unusually late in Nov. 1918 and the Allied gunboats were withdrawn too soon for wintering in Archangel. The Bolshevik gunboats were thus enabled to descend the river from their more closely situated winter quarters and bombarded the Allied positions with their long-range guns. The situation was at one time critical, British and Americans, supported by Canadian artillery, fighting desperately to maintain their positions.

At Archangel during the winter the attitude of the Allies was purely defensive, covering the mobilization and training of the new troops of the north Russian provisional government. In the Murmansk area their task was to maintain a perpetual threat towards Petrograd and to divert as much of the Bolshevik forces as possible from Archangel. Fighting continued throughout the winter in both areas at irregular intervals, the Bolsheviks growing more efficient and exerting greater and greater pressure on the Allied columns. Nevertheless all the main Archangel positions were maintained intact against the repeated attacks of a superior enemy. In the Murmansk area, Gen. Maynard's troops succeeded in seizing the northern end of Lake Onega, thus making their threat against Petrograd an effective one, and containing a considerable force of active Bolshevik forces.

Arrival of Relieving Force.—The general thaw commenced in the first week of May, and by the 12th the river was free of ice. Two relief brigades under Brig.-Gens. Grogan and Sadlier-Jackson arrived at Archangel on May 26 and June 10 respectively, and evacuation of all troops which had spent the winter in north Russia commenced at once. The old contingents were embarked in turn, the British being the last to leave. Then followed those elements of the population which had elected to leave the country. In all, some 17,000 persons were transported from north Russia in British ships. By the end of July nothing remained but the fighting troops of the relief force and a few necessary administrative services.

A gradual substitution of Russian for British troops and administration was commenced, the process being accompanied by several outbreaks of mutiny amongst the new troops. The fronts of the various columns were cleared by vigorous action on the part of Brig.-Gens. Graham and Sadlier-Jackson, ably supported by the naval flotilla under Capt. Altham. By August 10 the withdrawal of the British troops to the inner defences of Archangel commenced.

Gen. Lord Rawlinson arrived at Archangel on August 12 and approved of the plans already arranged. Withdrawal continued without a hitch, and on September 27 the last 5,000 men were embarked simultaneously from 13 different points and the evacuation of Archangel was complete. The long withdrawal in the Murmansk area was then completed under the direction of Brig.-Gen. H. C. Jackson, who had replaced Gen. Maynard on September 20 owing to the latter's illness, the last man leaving the port on October 12.

RUSSIAN ARCHITECTURE. Historically, Russian architecture may be divided into two principal periods: the first, from the 10th to the end of the 17th century; the second, from about 1700 to the present. This chronological division is a consequence of the revolutionary activities of Peter the Great (1689-1725), whose drastic political and social reforms, intended to bring Russia into close contact with western Europe and its civilization, broke with the traditional conservative tendencies of Russian life and in architecture caused a shift from a deeply national style to the forms of western Europe. The architecture of the pre-Christian period was almost exclusively wooden, and, mainly due to the unlimited supply of lumber, the majority of buildings remained of timber during the era immediately following Russia's conversion to Christianity in 988. Typical peculiarities of this early wooden architecture are a horizontal disposition of wall logs and steeply pitched roofs.

Christianity found a fertile soil among the tribes inhabiting the widespread territories of what was to become the Russian empire, and an intensive building of churches set in after the acceptance of the new faith. The rulers of the various feudal principalities into which Russia was divided became defender; and champions of the church, and the building of a church became the central event in the reign of each of the numerous princes who, apart from religious considerations, wished to demonstrate

their power and wealth with splendour eclipsing that of predecessors and neighbours. Russian life centred in these churches; there new leaders were installed; the most important public questions were decided there; the prince kept his treasury in the church; the church was the last haven of refuge from invaders. Until the 17th century religion dominated Russian architecture which, nevertheless, was also closely connected with the fates of rulers and the geographical locations of the centres of political power. During this first period the most important schools of architecture were those of Kiev, Novgorod-Pskov, Vladimir-Suzdal and Moscow.

Early Centres.—The beginning of organized political life found Russia somewhat unified under the rule of the princes of Kiev, a city on the Dnieper river, the first capital of Christianized Russia. The Christian missionaries from the Eastern Church had brought their Byzantine culture with them, and this transplanted Byzantine art (see *BYZANTINE AND ROMANESQUE ARCHITECTURE*; *BYZANTINE ART*) was the starting point for the development of the new national architecture. In the different parts of Russia, Byzantine art, interpreted in different ways, developed into distinct forms. Sometimes, as in the neighbourhood of Novgorod-Pskoff (in north-western Russia), Byzantine influence is scarcely perceptible; at others it flowered into exquisite forms representing a happy combination of the two cultures, as in the Vladimir district.

The oldest church in Kiev, still existing in part, is the Desiatinnaya church, begun in 991; it was the reproduction of a Byzantine church, rectangular in plan, with three altar-apses. The cathedral of St. Sophia in Kiev (1017), with five apses and crowned by 13 cupolas, is the next in age and the largest built during the first two centuries after conversion; the principal parts of this cathedral are still extant, but later additions have considerably changed its exterior.

The erection of churches in the Novgorod-Pskov district, which was to play an important part in the development of a national Russian architecture, began only a few decades later. An independent and distinctive school of architecture appeared there in the 12th century. Here Byzantine art lost its influence much quicker than in Kiev, where it was applied with only insignificant structural changes. The influence most responsible for the appearance of this deeply national art was that of the thoroughly original local wooden architecture which affected both design and construction. The two-storey cross-shaped church appeared with one-storey lateral additions. The church with only one apsis replaced the church with three apses. In conformity with climatic conditions, the arched roof became one that sloped. The spherical cupola gave way first to the helmet-shape; then it assumed the characteristic bulb-shape, a form similar to that which had developed centuries before and spread over Asia with the influence of Buddhism. The entrance took the form of a kind of porch; the belfry appeared, first as only an opening for bells on top of the wall, but later as an independent, high tower in which bells were hung in several tiers. The Byzantine cubic form of the church was broken up into a picturesque group of buildings, reflecting, like most of the innovations, national tastes that had been educated on wooden architecture. The rich Byzantine ornamentation either disappeared completely from the austere and simple walls of Novgorod churches, or else gave way to a plainly modelled geometric pattern, accentuating here and there the picturesque smoothness of the walls. The treatment of the stucco shows a characteristic feature. The lines and contours of the architectural forms were finished freehand, and are uneven, as is the surface of the walls, which lends the buildings a singular and effective charm.

In the principalities of Vladimir and Suzdal in the Central part of Russia we find, in the 13th century, not only Byzantine influences but partly Romanesque (see *BYZANTINE AND ROMANESQUE ARCHITECTURE*) brought there from Italy. The former manifests itself in the general form of the churches, the latter mainly in their decoration. The Romanesque arched gallery on the level of the second storey of the church was introduced as a decorative element in the form of an ornament of arches. In general the archi-

itecture of Vladimir is characterized by a love for ornamentation that accentuates architectural masses. The walls of St. George in Youryev, wholly covered with ornaments of Romanesque origin, but strongly influenced by motifs of the native wood-sculpture for which Vladimir was famous, are typical. In the native wooden architecture projecting beams were carved, and the whole length of the crest of a building was sometimes ornamented by such beams projecting through. When stone became common in buildings designers drew inspiration from these forms.

Moscow.—The dominance of Moscow's architecture increased gradually with its political ascendancy. Masters from Novgorod and Pskov worked there, and the Russian national architecture reached its highest development in Moscow during the 14th and 15th centuries. The application of the motifs of the wooden architecture to stone building found its best expression in the tented church. As in the wooden, the square plan of the stone church was transformed by a system of little arches of peculiar form (*kokoshniki*) into an octagon, the basis of the tent. This turret-shaped church was frequently used during the 16th and 17th centuries; the tent was also widely applied to the roofs of belfries and towers. The basic elements of the Moscow church architecture took final form in the 16th century, and thereafter attention centred on structural ornamentation, some of which is comparable in richness to the best examples of the Florentine Renaissance. A reaction followed, characterized by pettiness of form and excessive flourishes, and sometimes erroneously regarded as the typical Russian style. One typical feature, however, is evident even in this period of decadence: the grouping of buildings in ensembles in whose composition as well as that of the individual buildings picturesque effects were produced. Many of the old monasteries, which, being surrounded by towered and crenellated walls, frequently resemble little fortresses, are interesting specimens of such ensembles.

In the majority of Russian cities of the period their central part was surrounded by strong walls with towers and battlements and sometimes by embankments and water-filled moats. This was called the Kremlin. It contained the ducal palace, government buildings, houses for the dignitaries and ducal guard and the principal cathedrals and churches. The Kremlin was really a fortress and was usually located on an elevation dominating the surrounding territory. Beginning with the austere lines of the fortress wall and ending with a group of majestic cathedrals whose golden cupolas sparkled in the sun, it generally made an extremely picturesque composition. The Moscow Kremlin is probably the best preserved. Although rebuilt many times it nevertheless presents a true picture of an ancient Kremlin; at the same time having a considerable number of Italian details, it is a good example of the Russianizing of foreign architectural forms.

St. Petersburg.—At the beginning of the 18th century, while Moscow and the rest of Russia continued to live according to tradition, Peter the Great (1689-1725) undertook to build a new capital, St. Petersburg, in the far north of his empire—a move which at once involved extensive and imposing building and a radical change from an isolated political existence to closer contact with western Europe. A new epoch in Russian architecture began. Being an innovator in everything, Peter strove from the first to create a new architecture. Instead of employing Moscow masters, he enlisted an army of architects, engineers and craftsmen from all parts of Europe. Their work resulted in the erection of incongruous buildings in western European forms. A degree of order came into this architectural chaos only after Peter's death, when Russian architects became educated in western European art, and Russian architecture, although it could look back on nearly eight centuries of national traditions, turned toward classicism. Thereafter its evolution was divided into two currents, one characteristic of the new capital, St. Petersburg, the other of Moscow, the old. All subsequent architectural periods and fashions were perceived and developed differently in each. In St. Petersburg, the official capital, which grew rapidly, building progressed on a large scale. Architectural ensembles grew up along whole tracts of streets and quays and around vast squares. Most of the new buildings erected by the Government, its

officials and the aristocracy were palatial, solemn and somewhat haughty. In Moscow, which had then dropped out of political life but where the charm of the traditions of a great past still existed, the buildings were simple, noble and showed a certain intimate affability.

The influence of the Renaissance (see RENAISSANCE ARCHITECTURE) scarcely reached Russia, but an outgrowth of it, the Baroque (see BAROQUE ARCHITECTURE), made a strong and lasting impression on Russian architecture, leaving numerous examples, which were, however, sometimes considerably affected by peculiar local conditions. In Moscow a wonderful specimen in this style is the church of Our Lady in Fili, representing a further evolution of the tented church. Here the tent loses its continuity and consists of several tiers of octagonals diminishing in size and put one above the other. In St. Petersburg and in the provinces the Baroque was widely used by the court architect, Count V. V. Rastrelli, one of the greatest architects of the time, whose talent created an epoch for the development of the Baroque. One of the principal reasons for the great success of the Baroque in Russia was its picturesqueness, a quality after which Russian architecture had always striven.

Catherine the Great. — In all Europe, the middle of the 18th century was a period of reaction against the pretentious forms of the Baroque and of reawakening interest in the austere and noble forms of classic architecture. In Russia, the brilliant reign of Catherine the Great (1762–96) was favourable for the development of this movement and it found an immediate response. A multitude of architects, both Russian and foreign, invited by the court, carried on the beautifying of the new capital, surrounding its vast squares with rows of classic columns, with elegant porticoes and with majestic facades. Catherine's interest in architecture was exceptional. Peter influenced the direction of Russian architecture; she assisted the development of the new school itself. With an energy equal to Peter's, she continued to create the capital, not only personally examining the designs but also, according to contemporaries, giving instructions and even supplying sketches for proposed buildings. During her reign the classic style was so intimately mixed with the creative genius of Russia that it occupied almost the same position as the traditional Russian style prior to the 17th century. An inexhaustible supply of serf labour allowed ambitious building programmes to be carried out. The ruling class, the aristocracy and gentry, living on estates scattered throughout the vast country, kept in close touch with the capital and, anxious to keep abreast of its fashions, built many mansions in the fashionable classic style whose solemnity and austerity fitted the epoch to perfection. Considering the numerous and diverse structures built in the classic style, it would be no exaggeration to call Russia of the 18th and 19th centuries a country of classic architecture.

19th and 20th Centuries. — The beginning of the 19th century inclined to even more austere forms, the Corinthian column gave way to the Doric, Rome seemed not simple and severe enough and early Hellenic forms came into favour. The Temple of Paestum became an ideal for the artist and the so-called Russian Empire style, very different from the dry and formal designs of Persier and Fontaine, appeared. Its characteristic traits are a Paestum-like archaism combined with great flat planes, here and there accentuated by severe but pithy ornamentation. The architecture of this period may be regarded as the climax of the Russian classic style. Under Nicholas I. (1825–55) the character of the building activity in St. Petersburg changed and from the erection of grandiose palaces, turned to more practical and commonplace problems. Porticoes and great wall surfaces with few window-openings which did not respond to the practical requirements gradually lost favour. Petty, unnecessary details were frequently applied with the intention to conceal by their display the shortcomings of a weak composition. Russian architecture, with frequently changing artistic tastes, declined steadily during almost the whole second half of the 19th century. At one time designers turned to the old Russian national style, but inspiration was sought from its most decadent period, the end of the 17th century; fortunately this tendency was of short duration and

left no deep traces.

With the end of the 19th and the beginning of the present century the advent of industry introduced a new and rapidly growing factor. A period of active building began and symptoms of a renascence of the best of the old Russian architecture appeared. Aside from current buildings a number of large factories were constructed. Residences no less splendid than the old palaces of the dignitaries of Catherine were built for the new kings of industry. At this time when the modernistic style prevailed in Europe, two more architectural currents were evident— one purely national, traditionally Russian, founded on the early and best sources of Russian art; the other classical, suggested by the severe and elegant architectural forms of Palladio. These two logically reflected the main traditions and the historical development of Russian architecture as though representing its two main courses of development. The World War and the subsequent revolution interrupted building for a whole decade.

(W. OL.)

Post Revolutionary. — Since the World War, many attempts have been made to create a national architecture from existing European styles. But these have been found unsuitable to represent the revolutionary ideas of the nation. All modern fads have been tried— "cubism," "futurism," "new art," "the heroic," but these have gone their way. The form of architecture in favour in 1929 and employed in all the new government buildings is based entirely on what the Russians call "mechanical technical" facts. The aeroplane, motor car and modern battleship are their inspiration, and all decoration other than the "scythe and hammer" the Bolshevik coat of arms, is eliminated. As Ladovski, the professor of the department of "modern architecture" at the Moscow academy has stated, "The future belongs to those who have remarkably little talent for the Fine Arts." Their desire is to create a new form of architecture devoid of any traditional inspiration, one which is essentially practical and suitable for its purpose. In other words they design the plan according to the requirements of the building on a purely constructional basis, and consider the result will produce its own beauty.

Lack of capital is another determining factor in this new form of architecture. Reinforced concrete has replaced stone and granite and everything is being designed and carried out with the greatest economy and simplicity. Russia prides itself in being a nation of workers and considers that its factories and business buildings should look like "work shops" and not like the mansions and palaces of an aristocracy. While the need for economy is evident in all modern Russian buildings, it is commendable that the new Government has not allowed the ancient buildings to fall into decay. Domed palaces and minarets have been painted and regilded. Mansions, now the headquarters of Government departments or of bakeries and other commercial industries, have been redecorated as originally designed. Churches of artistic merit have been repaired, and theatres, the pride of the people, receive particular attention.

Construction is of reinforced concrete throughout, painted in revolutionary red and grey. Walls are reduced to a minimum sufficient only for constructional purposes, while enormous glass areas are introduced to give the maximum window space to the workers. Flat roofs and balconies for the recreation of the workers are also considered essential. These new conditions produce their own problems in a country where the temperature is often 30° F below zero and the snow-fall great. To overcome the cold in winter elaborate heating systems have to be introduced. The windows are covered with a network of heating pipes placed behind the glazing bars, while double glazing is provided for all windows to keep out the cold. The greatest problem is that of the flat roof, as during winter the roof with its parapet walls forms a tank for the snow, with the resultant danger from leakages and burst pipes when thaw sets in. There are various methods of roof construction but the best is that in which a double concrete slab is used with an air space between.

Russia is still in a state of transition. Lack of materials and skilled craftsmen makes it difficult for their advanced dreamers and architects to carry out their conceptions. Nitski, one of the

ablest Bolshevik art critics, has said that the dreams of Lenin could not be realized for at least 100 years. Some of the most recent buildings carried out in the modern manner are: the Centrosoyuz warehouse; the new Telephone building; the Telegraph building and the Gostorg State building. (T. S. T.)

RUSSIAN ART. A comprehensive essay on the art of Russia implies a survey of the art of many races, beginning from remote antiquity. This article, therefore, deals with those artistic activities that have been manifested in Russia proper since her appearance as an organised and independent state under St. Vladimir (972–1015).

Premongolian and Mongolian Period.—As with their religion, the Russians took their art from Byzantium and up to the 14th century they preserved in their icons all the austerity and simplicity of design and also the economy of colouring of the Byzantine frescoes of the 11th and 12th centuries. The centres of activity during this period were at Kiev, Novgorod and Suzdal, and in all probability a great number of artists were Greeks. A very fine example from this period is the Odigitry Madonna (12th century) in the Riabushinsky collection at Moscow.

Novgorod School.—The 14th century marks the beginning of a new style and icon-painting at that time flourished in Novgorod. The new elements may be due to a fresh influx of Greek and perhaps Serbian painters, for there are certain characteristics in the Russian icons and frescos of this period which are common to the 14th century frescos both at Mistra (Greece) and in Serbia. However, in such works as the "Ascension" (1363) at Volotovo there is a sense for line and a simplicity of rendering not present in the Greek and Serbian frescos. In this work and also in the St. Theodore Stratilatos (1370) and the "Nativity" in the same monastery, can be clearly discerned all the great qualities which distinguish the Novgorod school in the following century. At the end of the 14th century (1378–1405) a Greek painter referred to by Russian chroniclers as "Philosopher Theophanos the Greek" did works in various churches and monasteries in Moscow and Novgorod.

The golden age of Russian art, the 15th century, is marked by so much grace that some scholars attempt to ascribe it to Italian influence. The chief means by which this elegance is obtained is continuity of outline of the design and either rhythmical linear repetition or symmetrical linear opposition of the movement, imposed on the central figure by the artist's interpretation of the action in the subject. The colouring too shows improvement. Instead of slightly tinted drawings as were the earlier icons, we have icons with clear and harmonious colouring distributed in flat surfaces and emphasised by lines marking the light. The most accomplished master of this period—and indeed in the whole history of Russian art—is Andrea Rublyov (1370–1430), probably a pupil of "Philosopher Theophanos the Greek," one of whose very few preserved works is the Holy Trinity (1408) in the Troitza Cathedral of the Troitza-Sergios monastery near Moscow (even the authenticity of this example is doubted by Randakov). Another master whose name is frequently mentioned in old records together with Rublyov is Dionysios, who worked at the Theraponte monastery. Some fine examples of the icons from this period are in the collections of B. E. Chanenko at Kiev and E. S. Ostruchov and S. P. Riabushinsky at Moscow.

Moscow and Stroganovsky Schools.—After the inclusion by Ivan the Terrible of Novgorod province into the Russian Empire the centre of artistic activity shifts to the capital of the new Empire, Moscow. Design in icons loses simplicity and the figures lose their dignified proportions. Colouring becomes dull and practically identical in all icons, and even their sizes tend

towards standardisation. The Byzantine architectural motives in the backgrounds of icons are supplanted by Russian ones, and even the type of faces bears a strong national character. In short, the Moscow school abandoned the high standards of its predecessor and came into closer touch with national life. Gradually icon-painting turned into more a manufacture of devotional objects than art. Meanwhile between the end of the 16th and the beginning of the 17th century sprung up the Stroganovsky school which combined to some extent some of the elements of both its predecessors. The craftsmanship is certainly of a very high grade, but the harshness of design, the somewhat exotic brilliance of colour, the lack of relationship between the national architectural forms in the background and the semi-Byzantine figures, the insistence on detail and finally—especially so in the later stages—the presence of undigested Western influence makes this school very inferior to the Novgorod school. However, it found great favour among the upper classes and became the most appreciated school in Russia. A great number of icons from this school are preserved; an inferior example is hung at the National Gallery. The best known masters from this school are Istoma and Nikiphor Savin, Procopy Tchirin, Ivan Prokopiev and Spiridion Timoviev.

The efforts of Peter the Great to introduce Western civilisation into Russia gradually brought to an end an art which had flourished for over six centuries and Western influence became paramount. Among the first artists of the new era are S. Ushakov, Th. Abrosimov, Ivan Bezmin and Saltanov.

THE NEW ERA

The 18th and the first half of the 19th centuries form an epoch of foreigners in Russia. Just as in the beginnings of Russian religious art the Byzantine artists were predominant, so now Italian, French, Dutch and German artists were working for the Russian court and were laying the foundations of Russian secular painting. Among the great number of foreign painters were four English artists, Walker, Atkinson, Miles and Richard Brompton. While foreign artists were well treated, the conditions under which most of the native artists worked were lamentable. The land owners were closely imitating the Court and had their own architects and painters. These were conscripted from their serfs and remained serfs. It was not unusual for an artist to be flogged because his master was not satisfied with his work. The artist had also to perform other duties, such as valeting, kitchen work, farm work, etc. In spite of this, native artists quickly attained the standards of their European teachers, but strictly speaking, we must acknowledge that Russian art as such was dead and that since the beginning of the 18th century art in Russia was nothing more than a minor branch of European art. Thus we have the various European schools, e.g., Classical, Romantic, Realistic. The most prominent artists of the Classical school are Akimov, Ugrumov, Egorov and Shebuev. Among the Romantics are Kiprensky, Tropinin, Brullov, Prince Gagarin, Alexander Ivanov, Vasnetzov and Vrubel, and among the Realistics are Venetianov, Vereshchagin, and Repine. The best known landscape painters are Lebedev, Ayvazovsky, Levitan and Syerov. Naturally, as soon as modern art arose in Europe, Russia followed suit. The most important modern artists are V. Kandinsky, Roerich, Larionov, Gontsharova, Chagal, Ostrumova, Punin, Iacovlev and Anrep.

Sculpture.—Sculpture never flourished in Russia owing to the fact that the Orthodox Church does not allow sculpture in churches. There are very few examples of ancient carving extant. Probably the best that can be seen is at Yuryev Polsky on St. George's Cathedral. Among modern sculptors the best-known are Prince Troubetsky, Orlov, Archipenko, Lipshitz, and Zadkin.

Minor Arts.—Among the lesser arts silver-work was turned out for centuries at Novgorod and Tula. From the 18th century onwards there has been a flourishing porcelain industry in many places in Russia, the most important factories being the Imperial Factory, Garder and Popov. (See RUSSIAN ARCHITECTURE)

RUSSIAN CO-OPERATIVE ORGANIZATIONS.

Soviet Russian Co-operation is the largest co-operative movement in the world in the number of its members and in the scale and variety of its operations. The chief types of societies are consumers, agricultural, productive and housing. Each of these groups has its own special organisation, central and local, but all participate through their central organisations in the All-Russian Co-operative Bank (*Vsecobank*), which through its central office and its local branches serves the whole system. The Consumers is by far the largest in numbers and resources. Great progress has also been made recently in the development of specialised agricultural societies.

Consumers Societies.—These began to be formed about the 'sixties of the last century following English examples. Progress for a time was slow, but the traditions of the *mir* or village community helped the development. In 1898 there was formed the Moscow Union of Consumers Societies which later developed into the All-Russian Central Union of Consumers Societies known generally now as *Centrosoyus*. By 1914 there were about 11,000 Societies with 1,500,000 members, with a total capital of £3,000,000 sterling and a turnover of £30,000,000 sterling per annum, in the Russian Empire, including Poland, Lithuania, Latvia and Esthonia. The War assisted the movement to grow more rapidly. Later, during the Revolution and the Provisional Government, the co-operative system was the only trading organisation which continued to function. In the early days of the Soviet Government it was regarded with some suspicion for many of the co-operative leaders at that time were Mensheviks. But there was no other organisation capable of supplying the urban population, and for a time the authorities used the societies as the Government rationing agency. When the blockade ended and the new economic policy was introduced in 1921, the movement was relieved of its special functions and restored to its previous autonomy. During all this troubled period, however, the rules, constitution and trading organisation of *Centrosoyus* and of many leading societies had been retained intact and there had been no break in legal continuity.

Since that date the progress of the movement has been remarkable. There was at first a big drop in nominal membership when the voluntary basis was restored. But the figures below show the subsequent growth in membership and in the number of societies and capital:

Year	Societies Societies	Membership	Share (in
		Membership	mill. roubles)
1924			
1926	22,621	12,406,000	16.9
1928	28,686	19,906,000*	179.0
1928	28,616	20,005,000*	172.0

*Approximate.

The Soviet authorities regard the Consumers Co-operative Movement as the appropriate machinery for the distributive trade, both urban and rural. Private trade has played relatively a less important rôle each year as the Societies have become better organised. In 1923-24, it was officially estimated that the retail trade of the country was as to 11% in Government hands; 30% in Co-operative hands and 59% in private hands; in 1926-27 with a trading turnover which had increased three fold, the shares of Government, of Co-operative and of private trade were respectively 16%, 51%, 33%. In 1926-27 the whole trade in tea, both import and distribution; 71.8% of the whole distribution of textiles; 73.2% of sugar; 60.7% of salt; 61.5% of tobacco were in Co-operative hands. In the great cities 70% or over of the trade in bread is co-operative.

The Consumers Movement through the many village societies collects a considerable portion of grain, eggs, poultry, etc., and markets it on its own account or on commission for the peasant through the urban societies as well as abroad. *Centrosoyus* and the societies also possess a considerable number of flour mills, bread factories, food-canning and preserving plants; tea-packing factories, etc.

Organization of Consumers Societies.—The unit is the

local primary co-operative society, of which there are three types: (1) the village society; (2) the urban society with a chain of co-operative shops and in some cases central departmental stores; (3) special transport workers societies. The rules of all the societies follow the Rochdale principles. Business is managed by officials responsible to periodical meetings of members. Each member whatever his shareholding is entitled to one vote only. The trading surplus, after paying fixed interest obligations is used for building up capital reserves, for social and educational activities, and for distribution to members in proportion to their business with the society. In comparison with English societies, proportionately far larger sums are put to capital account and dividends are much smaller. About 15% of surpluses on the average are used for educational and social purposes. On the average there are 14 stores to every town and two to every village society. There are over 400,000 employees.

The societies are combined in regional and district Unions, each of which acts as a wholesale organisation for its area. The relation between the Unions and the Societies is in principle the same as that between societies and their members. The district and regional Unions in their turn are combined in the *Centrosoyus* for the R.S.F.S.R. and similar organisations for each of the other Republics, the most important being the *Vukopsilka* for the Ukraine and *Zaksoyus* for the Transcaucasian Republic. In 1928, in addition, a U.S.S.R. *Centrosoyus* was constituted for general co-ordination of the whole organisation and for dealing with special trade problems especially import and export, storage of agricultural products and raw materials, and general agreements with industry on behalf of the whole system.

Agricultural Co-operative Societies.—These unite peasants as producers for the joint sale of their produce and for the purchase of machinery, etc.

The most important of them are the *Klebocentre* for grain and oilseeds; *Maslocentre*, i.e., the All-Russian Union of Butter-making co-operatives; *Linocentre*, i.e., the All-Russian Central Union of Flax Growers; *Zhivotnovodsoyus*, i.e., the All-Russian Central Union of Agricultural Co-operatives for the manufacture and sale of animal products; *Soyuskartofel*, i.e., Central Union of Potato Growers Co-operatives. In addition, the *Selskosoyus*, i.e., the All-Russian Union of Agricultural Co-operatives, imports and supplies the various agricultural unions with machinery and implements, building materials, metals, insecticides, fertilisers, etc.

The Agricultural Union of Unions exists for the consideration of common aims and interests and for negotiation with the Government, and with the Consumers Co-operatives, and for general co-ordination of the various types of agricultural co-operatives.

From the foreign point of view, the most important at present of the Agricultural Co-operatives is the *Maslocentre* which handles the whole export of Siberian butter and has its agents, in London and other European capitals. The total number of co-operatives in 1927 was 64,573 and they had a total membership of 9,468,200. In 1926-27 the agricultural produce sold totalled 878,000,000 roubles in value.

The Industrial Co-operatives.—The Societies of handicraft workers and artisans, are linked together in the All-Russian Union of Industrial Co-operatives, known as *Vsekopromsoyus*. At the end of 1927 it consisted of 4,534 industrial artels and of 102 local unions of industrial credit co-operatives with about 600,000 members in all.

The members of the *Vsekopromsoyus* are peasants engaged in wood-working, textile, knitting, metal, lace-making, embroidery, etc.

The Housing Co-operatives.—These are of two types: (a) tenant co-operative societies, in which the tenants of a new apartment house or a new housing estate erected with money advanced by the State or Municipality undertake joint ownership and supervision of the whole estate and the repayment of loans; (b) Building Societies for the actual building of houses. By 1927, the former had under their control accommodation for about 3,500,000 persons, and the latter had built houses for 100,000 persons, (E. F. W.)

RUSSIAN LANGUAGE AND LITERATURE. The Russian language is the Slavonic language of Russia. Understood in the widest sense, *i.e.*, including also Little Russian or Ukrainian and White Russian, Russian forms the Eastern group of the Slavonic languages. In philological works the term Great Russian is generally used to designate the language which the world at large calls Russian, and, except where expressly stated, Russian in the course of this article stands for Great Russian—the language of Tolstoi and the other great writers so well known to Western Europe.

The main phonetic characteristics of Russian are:—I. Common Slav (C.S.) half vowels *ǔ* and *ǐ* have disappeared as such: *ǔ*, which was written at the end of words until the recent Bolshevik orthographical reform, was mute and served but to show that the foregoing consonant was not palatalized. Where a vowel was indispensable to facilitate the pronunciation of a group of consonants, *ǔ* and *ǐ* have been replaced by *o* or *e*, but these vowels sometimes appear without such justification (e.g., *ogoni*, Lat. *ignis*); *ǐ* when so needed becomes *e*, otherwise it disappears or else leaves a trace in the palatal quality of the preceding consonant, in which case it is still written: C.S. *sǔnǔ*, "sleep" and *dǐnǐ*, "day"; R. son, *denǐ* (d'en').

II. C.S. *y*—a sound not unlike the *y* in "rhythm,"—has survived, as also in Polish. After gutturals it has become *i*.

III. Treatment of liquids: retention of *r*' and of hard *l* (not unlike English *l* in "wall"); helping out of sonant *r* and *l* by a vowel put in before the *r* or *l*; especially the so-called full vocalism, by which, e.g., C.S. *gorǔŭ*, "town," and *melko*, "milk," became *gorod* and *moloko*.

IV. C.S. nasal vowels: *o* and *e* (like French *on* and *in*) became *u* and *a*: C.S. *poŭi*, "way"; *peŭi*, "five"; R. *puti*, *p'ati*.

V. Palatalization (or softening): C.S. *tj*, *dj* gave R. *č*, *ž*, C.S. *světja*, "candle"; *medja*, "boundary"; R. *svěča*, *m'eža*. C.S. *pj*, *bj*, *vj*, *mj* gave R. *pl'*, *bl'*, *vl'*, *ml'*, e.g., R. *z'eml'a* "land." Before C.S. soft vowels *e*, *e'*, *g*, *z*, *ž* consonants were affected, the tongue being raised in anticipation of the narrow vowel, and so not making so clean a contact with the palate. Then what amounted to a new *j* developed in R., as *ž* became practically *j*; *e* and *ě* came to sound as *je*, *g* as *ja* at the beginning of a syllable, and all together with *ž* began very much to soften the preceding consonant in literary R.; however, this new *j* never broke down the consonant into a palatalized sibilant or affricate, though it had this effect in White Russian (Wh.R.) and Polish.

The result is that almost every consonant in Russian can be pronounced "hard" or "soft," a distinction which is very difficult for a foreigner to make, as his tendency is to overdo the softness and pronounce a full *j* after the consonant, instead of the palatal element melting into it. A soft consonant in its turn narrows the vowel before it, e.g., the vowel in *jelǐ*, "fir," is like a in "Yale"; that in *jelǔ*, "ate," like *e* in "yell."

VI. Great Russian has kept *g* where Little Russian and Wh.R., like Czech and High Sorb, now have *h*.

VII. A specially Russian point is that *je* and *ju* beginning a word, appear in R. as *o* and *u*; C.S. *jezero*, "lake"; *jutro*, "morning"; R. *ozero*, *utro*.

VIII. Russian has lost the distinctions of quantity which survive in Czech and S. Slav., but its accent is free as in S. Slav. The accent is extremely capricious, often falling differently in different cases of the same noun, or persons of the same tense, also it is an expiratory accent, so strong that the unaccented syllables are much slurred over and their vowels dulled.

The above phonetic peculiarities mark Russian as far back as we can trace it. In the earliest documents it appears with an apparatus of grammatical forms practically identical with that ascribed to primitive Slavonic. The history of the language is not so much that of its phonetic decay as that of its morphological simplification and syntactic development. The tracing of this process is rendered difficult by the fact that Old Bulgarian was the ecclesiastical and literary language until the 17th century, and though in the end the O.B. texts suffer modifications, producing the Russian form of Church Slavonic, the Russian forms appear in them only by accident. Russian is better represented in additions made by

the scribe, as in the colophon of the Ostromir gospel (A.D. 1056–57), the oldest dated ecclesiastical ms. In a certain number of legal documents dating from the 12th century onwards Russian forms definitely predominate, but the subject-matter is too limited to offer much material.

Borrowings.—The effect of the Church language upon Russian has been very strong, comparable to that of Latin upon French or English: O.B. forms of words and suffixes, betrayed by their phonetic peculiarities though pronounced more or less *à la russe*, have in some cases ousted the native forms, in other cases the two exist side by side; the old Slav. form generally has the more dignified or metaphorical, the Russian the simpler and more direct sense: even some of the grammatical terminations (e.g., pres. part. act.; certain forms of the adj., etc.) are Slavonic; but speakers are quite unconscious of using anything that is not Russian, and not till the 18th century did even grammarians understand the difference. Less important elements have been the Tatar, which gave names for many Oriental things such as weapons, jewels, stuffs, garments and some terms concerned with government, and the Polish, which during the 17th century supplied many terms needed to express European things and ideas. In the 18th century such importations were made from Latin and all the Western European languages, in Peter's time mostly from German and Dutch (for nautical terms, English supplied some), in Catherine's rather from French, which had become the language of the aristocracy. During the first quarter of the 19th century modern Russian found itself and discarded superfluous Slavonic and European borrowings alike. Since then fresh loan-words have mostly belonged to the international quasi-Greek terminology, though like German R. sometimes prefers analogous compounds made from its own roots.

Literary Russian as spoken by educated people is the Moscow dialect (see p. 751) modified by these influences. It is still a highly inflected language, comparable in that respect rather to Latin and Greek than to the languages of western Europe, though during historic time it has lost many of the grammatical forms whose full development we can study in O.B., and whose presence we can assert in the scanty remains of Old R. This process has relieved it of the dual number, save for certain survivals; in the nouns, of the vocative case (save for certain ecclesiastical forms), and many of the distinctions between the declensions, especially in the plural, the oblique cases of the simple, and the more cumbersome forms of the compound, adjective; in the verbs, of the supine, the imperfect, the aorist and the conditional (now reduced to a participle); but this simplification leaves it with six cases, Nom., Acc., Gen., Dat., Instrumental and Locative, three genders, three substantial declensions, -a, -o, -i, and traces of -u and consonantal stems, a special pronominal declension with many tricky forms, an adjective which takes its place between them, and a system of numerals in which a compromise between grammar and logic has produced a kind of maze. The forms of the verb are easier, as only the present indic. has three persons, the imperat. has but the 2nd, and the past is a participle, which, having discarded the copula, distinguishes only gender and number. The infinitive and four participles offer no special difficulty, but the gerundives or verbal adverbs, from the old masc. nom. sing., are troublesome. The curious mechanism by which these few verbal forms are by means of the aspects made to express most of our tenses and other shades of meaning of which even English is incapable, is briefly explained under SLAVONIC LANGUAGES. On the whole the syntax is simple, the periods which imitation of Latin and German once brought into fashion having given place to the shorter sentences of French and English models.

Dialects.—The dialects of Great Russian fall into two main divisions, which do not greatly differ from each other, Russian being an amazingly uniform language when the vast extent over which it is spoken is considered. These dialect groups are the northern or *o* group and the southern or *u* group. The line between them runs roughly E.S.E. from Pskov to the Oka and then eastwards to the Urals. The northern group is the more conservative and pronounces very nearly according to the spelling, unaccented *o* remaining *o*, but *o* is in general rather like *u*, while *e*

before hard consonants is apt to be *jo* and before soft consonants *ž*. The southern part of this group, comprising most of the governments of Vladimir and Yaroslavl with adjoining parts of Tver and Kostromá, are alone free from a further peculiarity, a tendency to mix up *c* and *č* which can be traced in the ancient documents of Nóvgorod and has spread with the Nóvgorod colonists across the whole of N. Russia to the Urals and Siberia. These distant dialects have adopted many words from the Ugro-Finnish natives. The southern or a group of dialects pronounces unaccented *o*, *e* and even *ž* as *a* or *ja*; with this goes a tendency to pronounce *g* as *h*, and to mix up *u* and *v*.

The Moscow dialect, which is the foundation of the literary language, really covers a very small area, not even the whole of the government of Moscow, but political causes have made it the language of the governing classes and hence of literature. It is a border dialect, having the southern pronunciation of unaccented *o* as *a*, but in the *jo* for accented *e* before a hard consonant it is akin to the North and it has also kept the northern pronunciation of *g* instead of the southern *h*. So too unaccented *e* sounds like *ž* or *ji*.

White Russian.—The present literary language arose in the 14th century and is based on one of the central dialects. The tendency of some modern writers to break with the earlier tradition and make their language different from Great and Little Russian has introduced into the vocabulary many foreign elements which have no real existence in the popular dialects. The language presents certain features which occur also in Ukrainian but in general character it agrees more closely with South Great Russian (being an *a*, not an *o* dialect, and distinguishing *y* from *i*, etc.). It is spoken in the whole or parts of the governments of Grodno, Suvalki, Vilna, Minsk, Vitebsk, Mogilev, Smolensk and in the N.W. part of Chernigov.

Little Russian or Ukrainian.—The literary language arose towards the end of the 18th century and has no genetic connection either with the ecclesiastical language of the S. Russian writers of the previous period or with the attempts of the preceding three centuries to write in Lit.R. The language is founded on the western dialects and the earlier writers avoided the use of such words as did not there occur. During the last quarter of the 19th century Lit.R. was persecuted in Russia and the Austro-Hungarian government seized the opportunity to encourage it in Galicia. Lwów (Lemberg) became a recognized literary centre and the refuge of writers who were expelled from Russia. The character of the literary language soon changed considerably and a number of Polonisms were adopted. After 1906, when the oppressive measures against the language in Russia were removed, the tide turned and the foreign elements were held in check. As a result of these conflicting tendencies the literary language is not yet stabilized.

Phonetically, Little Russian is characterized by itacism; for original *y* and original *ž* have coincided in a sound between *ž* and *y* not unlike the Eng. short *i*, and original *č*, also *e* and even *o* after having been lengthened in compensation for lost semi-vowels are now represented by *i*.

Further, Little Russian has reduced the common Russian softening, only keeping it before *a* and *o* and *ž* for *č* and *o*, and hardening the consonant before *e* and original *i*. In common with Wh.R. it has *h* for *g*, a vocative case, gutturals made sibilant before *i* (for *č*) in oblique cases, 3rd sing. generally without the *t*, 3rd plur. in *-ti*, 1st plur. in *-mo* and *-me* instead of *-mŭ*, *nn* for *nj*, *ll* for *lj*, *tt* for *tj*, *w* for *u*, *v* and hard *l*, but all these occur more or less throughout S. Russian and only tend to a superficial resemblance.

These phonetic peculiarities are not universal, but the presence of the narrowed *č*, *e* and *o* is sufficient to mark a dialect as Little Russian. The Russian alphabet is modified for Little Russian use as *ř*=*h* and hence *ř*=*g*; *ě* is used for the *e* which does not soften the preceding vowel, *ѣ* for the thick and *і* for the pure *i*.

BIBLIOGRAPHY.—DICTIONARIES: *Dict. of the R. Language*, published by the Second Section of the Academy of Sciences (St. Petersburg, 1895, etc.; four vols. have so far appeared reaching to the letter L); V. I. Dal', *Explanatory Dict. of Living Great R. Language* (4 vols., St. Petersburg—Moscow, 1903-09); I. I. Sreznevski, *Materials for a*

Dict. of Old R. Language (3 vols. St. Petersburg, 1893-1912); A. Alexandrow, *R.-Eng. and Eng.-R. Dict.* (2 vols.); J. Pawlowsky, *R.-Deutsches Wörterbuch* (Riga, 1911). The standard, but not quite completed, etymological dictionary is that by A. Preobraženski (Moscow, 1910-1917).

LITTLE RUSSIAN DICTIONARIES: E. Zelechowski, *Ruthenisch-Deutsches Wörterbuch* (Lemberg); B. Hrinčenko, *Slovar' ukr. movy* etc. (Kiev, 1908-09).

GRAMMARS: Historical—N. Durnovo, *Sketch of the Hist. of R. Lang.* (in Russian, Moscow, 1924); A. Šachmatov, *Sketch of the earlier period of the Hist. of R. Lang.* (in R., St. Petersburg, 1915); A. Sobolevskij, *Lectures on the Hist. of R. Lang.* (in R., 4th edit., St. Petersburg, 1908); K. M. Meyer, *Hist. Gram. der russ. Sprache* (Bonn, 1923). Descriptive and Practical—the best in English is the *Russian Grammar* by N. Forbes. The *Russ. Grammatik* by E. Berneker and M. Vasmer (1927), though short, is excellent. For Little Russian consult S. Smal' Stockyj and F. Gartner (*Gram. d. ruth. Sprache*, Vienna, 1913) and Smal' Stockyj's *Ruth. Gram.* in the Sammlung Goschen. For miscellaneous information concerning the White Russians and their language the authoritative work is by E. Karskij—*Bělorussij* (3 vols., 1903 etc.), which also gives a map of the White Russian territory.

DIALECTS: *The Attempt at a Dial. Map of the Russ. Lang. in Europe* etc. (Moscow 1915) by Durnovo, Sokolov and Usakov is most complete.

RUSSIAN PRONUNCIATION: M. V. Trofimov and D. Jones, *The Pron. of Russian* (1923).

RECENT LINGUISTIC DEVELOPMENTS: A. M. Seliščev, *The Lang. of Revolutionary Russia* (Moscow, 1928) is useful. (N. B. J.)

LITERATURE

The literature begins in the 11th century, about 50 years after introduction of Christianity into Russia, as an offshoot of the "Church Slavonic" literature of the Balkans. The "Church Slavonic" language, created in the 9th century by St. Cyril and Methodius, became the literary language of Russia. Though based on a Bulgarian dialect it was from the first used almost exclusively for translations from the Greek and is thus permeated with Greek syntactic and lexical influence. The overwhelming majority of Russian-Slavonic writings consists of translations of Christian books from the Greek. The secular literature of the Greeks remained practically untranslated. There was no literary contact with the West till much later. Original writings form only a small minority of the Old Russian mss. preserved. Printing was introduced in Moscow in 1564, but did not come into general use till the 18th century.

The first cultural and literary centre was Kiev, which retained its leading rôle till about 1200. The most important of the ecclesiastical writers of the period were the sacred orators, Ilarion, metropolitan of Kiev (d. 1053) and Cyril, bishop of Turov (later 12th century), brilliant and imaginative disciples of the Byzantine school. Of secular writings the most extensive are the Chronicles (*Letopisi*). They are anonymous and have been preserved only in later compilations. The contemporary entries go back to about 1040. The account of the preceding period is based partly on oral tradition, but consists partly of the conjectures of a learned monk of about 1100. Besides its invaluable historical importance the chronicle possesses considerable literary merits. The story of the blinding of Vasilko (1096) and the account of the years 1146-54 are particularly noteworthy, as well as the Galician chronicle of the 13th century. Imaginative literature is represented by an isolated masterpiece, the *Discourse* (*Slovo*) of the Campaign of Igor, an anonymous political prose-poem on an unsuccessful campaign of one of the border kings against the Cumans (1185). It was discovered in 1795, and first published in 1800. Its poetical qualities, magnificent diction and rich imagery give it a unique place in Old Russian literature. Only insignificant fragments of works in a similar style have been preserved from the 12th and 13th centuries, but its influence is clearly apparent in later works such as the stories of the battle of Kulikovo (1380).

After the middle of the 13th century north-eastern Russia was politically and cultural@ separated from the south and west. From the end of the 14th century Moscow became the leading centre of the north. Literature became more exclusively ecclesiastical and more Byzantine in spirit. A new style of standardized and impersonal rhetoric becomes obligatory and is extensively cultivated in the numerous lives of saints and in the, now official,

chronicles. By the side of these we find also more personal writings, polemical and historical. Of the former we may mention the correspondence exchanged between the oligarchic politician Prince Andrew Kurbsky (1528-83) and the Tsar Ivan the Terrible (1530-84), who was a pamphleteer of genius. The greatest of all Muscovite writers was the Archpriest Avvakum (c. 1620-81), the leader of the schism of the Old Believers (see RUSSIA: History). He wrote several epistles denouncing religious and cultural innovations, and encouraging his followers to resistance, and a Life of *Himself* (1673, Eng. trans. by Jane Harrison and Hope Mirrlees, 1924), which reveal a powerful personality. He was the first writer to reject literary Slavonic, and to use the vernacular for literary purposes. He remains unsurpassed in the wonderful use he made of it.

The later Muscovite period saw the beginnings of Russian fiction which developed from several distinct roots,—legendary and didactic stories related to the lives of the saints; romances imported from East and West, but which received free fairy-tale treatment; and picaresque tales of Muscovite manners.

Folk Literature.—The "oral literature" of the Great Russian people is rich and varied. The so-called *byliny* are narrative poems in unrhymed, unstanzaed stress-verse, intoned (not sung) by specially trained reciters. Their subject-matter is either historical, referring to events that go back to the taking of Kazan (1552); or legendary, dealing with the exploits of heroes (*bogatyri*), who are usually represented as grouped round the figure of Prince Vladimir. Their exploits are partly of the fairy-tale, partly of the *fabliau* type. The oldest texts of *byliny* (all on historical subjects) were written down in 1620 for the Englishman, Richard James (ms. in the Bodleian library). Next in antiquity comes the large collection ascribed to Kirsha Danilov, made in the mid-18th century in Siberia, and first published in 1804 (later, and more critical editions 1818 and 1901). In the later 19th century the *byliny* were discovered to be still extensively preserved in northern Russia, especially among the fishing population of lake Onego and Pechora. Large collections of them were published by Rybnikov (1861-67), Hilferding (1873), Markov (1901), Onchukov (1904) and Grigoriev (1904-10). Other poems surviving in the north of Russia are the laments for the dead, recited by professional wailing-women (collection by Barsov, 1872). Related in style to the *byliny* are the so-called Spiritual Verses (*Dukhovnye Stikhi*) recited by wandering mendicants. Their subject-matter is strongly influenced by Byzantine apocryphal literature. Among the Old Believers and mystical dissenters there developed a very remarkable lyrical poetry, devotional and mystical, often of great beauty. The lyrical, elegiac and choric songs are numerous and varied (principal collection by Sobolevsky, 1895-1902). Within the last decades a new type of improvised song, the *chastushka* (usually consisting of four rhymed lines), has received an extraordinary development among the peasants and working class. Of the prose forms of folklore charms can probably claim the greatest antiquity. Folk-tales cover a great variety of subject-matter, and display marked originality of treatment (collections by Afanasiev 1870, Onchukov 1903). An interesting branch of folklore is the popular drama. It goes back to 17th and 18th century literary sources, but the treatment, based mainly on wordplay, is characteristic (collection by Onchukov, 1913).

Beginning of Western Influence.—About 1650 Ukrainian and White Russian scholars and clerics began to introduce their new latinized scholasticism to Muscovy (see UKRAINIAN LITERATURE). Symeon of Polotsk was the first to publish books of rhymed didactic verse in Moscow. In the reign of Peter the Great two prelates of Ukrainian extraction and education, St. Demetrius Tuptalo, metropolitan of Kostov (1651-1709), and Theophan Prokopovich, archbishop of Novgorod (1681-1736), were prominent men of letters. Both wrote plays and possessed real poetical talent; Prokopovich was famous as the greatest orator of his day. His oratory like that of his successors in the reign of Elizabeth is markedly italianate and baroque.

Parallel to the Latin-Ukrainian invasion, another current, coming from Germany, brought a new secular literature. Plays from

the repertory of the German strolling actors were performed before Tsar Alexis as early as 1672. From 1675 onwards numerous translations of Latin romances were made and circulated in ms. and by the end of the century the writing of amorous verses had become the fashion among the young Muscovites. The reforms of Peter the Great confirmed the conquest of the Russian upper classes by the West. Culture was secularized. "Church Slavonic" was replaced by a clumsy Russian, larded with indigested bits of every kind of European idiom. The romances, plays and songs of the first 30 years of the 18th century, however interesting as symptoms of a great cultural revolution, can hardly be described as literature. Modern Russian literature begins only with the birth of the direct influence of the metropolitan literature of Europe, that of France. Parallel to the French-influenced literature of the upper classes there existed, however, throughout the 18th century a curious popular literature. It includes, besides a variety of narrative chap-books, an interesting series of inscriptions in rhymed doggerel, on cheap woodcuts (collection by Rovinsky, 1881).

The Age of Classicism.—The first pioneers of French classicism were Prince Antioch Cantemir (1708-44) (*q.v.*), whose Horatian satires mark the advent of conscious artistic realism into Russian literature, and Vasili Trediakovsky (1703-69), whose reputation as the type of the poetaster should not overshadow his real services in the reformation and study of Russian prosody. The actual founder of modern Russian literature was Mikhail Lomonosov (c. 1711-65) (*q.v.*). He was a man of encyclopaedic genius; in letters, his influence as lawgiver of the literary language and founder of the new prosody cannot be exaggerated. A minor pioneering figure by his side was Alexander Sumarokov (1717-74) who created the Russian dramatic repertory, and was the first literary critic and the most gifted song-writer of the century. The hierarchy of literary genres, as established by Lomonosov, placed tragedy, the heroic poem, and the solemn ode uppermost. In the first two genres nothing was produced of lasting value, although Sumarokov pretended to the title of a "Russian Racine," and Michael Kheraskov's (1733-1807) epic *Rossiada* (1775) earned him, for a generation, that of the "Russian Homer." The ode proved a more vigorous growth. Lomonosov's odes are still almost unrivalled in the language for solemn majesty and mightiness of diction. Gavriila Derzhavin (1743-1816) equalled Lomonosov in the gift of lyrical oratory, but his originality and the visual splendour of his imagery make him an even greater poet. Often harsh and rugged, his poetry is full of untamed vitality, and his classicism is the classicism of a barbarian.

In the "lower" genres classicism was above all a school in which Russian literature could develop what later became its most characteristic virtue. The burlesque epics of Vasili Maykov (1728-78), the fables of Ivan Khemnitser (1744-84), the comic operas and comedies of Alexander Ablesimov (1742-1823), Yakov Knyazhnin (1742-93), and Vasili Kapnist (1757-1823) display a rough and unrefined, but vigorous and lively realism, and are more interesting than the clumsy rococo graces of the once enormously popular adaptation of La Fontaine's *Psyche*, by Ippolit Bogdanovich (1742-1803). The same realism, with a higher degree of talent, is seen in the famous comedies of Denis Fonvizin (1744-92). The *Minor* (1782), especially, a clever satire of the boorish provincial squires, contains the first great character creation in Russian literature. The classical-realist tradition culminated in the work of the great fabulist Ivan Krylov (1768-1844) (*q.v.*), whose first book of Fables appeared in 1809.

In prose, satirical journals started in 1769 in imitation of Steele and Addison present the same kind of realism. Those edited by Nicolas Novikov (1744-1816) were marked by a high degree of public-spiritedness and contain much courageous criticism of existing social conditions. They were suppressed in 1773 by Catherine II. Novikov, who was a freemason and a pietist, represents the right wing of Enlightenment. Its left wing is represented by Alexander Radishchev (1749-1802), a disciple of Rousseau. His *Journey from Petersburg to Moscow* (1790, burnt by the hangman) is a powerful, if over-rhetorical, vindication of freedom against both serfdom and autocracy.

The movement started about 1791 by Nikolai Karamzin (1765-1826) (*q.v.*) continued the secularizing and enlightening work of the 18th century. Karamzin's reform of the literary language consisted in an extensive elimination of such "Church-Slavonic" as had been preserved by Lomonosov, in the wholesale translation from French of new words to denote modern ideas and feelings, and in a general tendency to follow French syntactic and stylistic models. The Karamzinian movement was also a reaction against the roughness and ruder force of the age of Derzhavin in favour of the "middle" literary genres and of a softer and more fluent style. Finally Karamzin was the pioneer of the "new sensibility" of Rousseau, and of the early forms of the romantic revival. He was opposed by a group of literary conservatives, the enemies of French influence and of "soft" poetry. Their leader was Admiral Alexander Shishkov (1754-1841). His followers, Semen Bobrov (*c.* 1767-1810) and Prince Sergius Shirinsky-Shikhmatov (1783-1837), were devotional and metaphysical poets of talent, but their archaistic manner was against the grain of the time. Of the followers of Karamzin the most gifted were Vasili Zhukovsky (1783-1852) and Constantine Batyushkov (1787-1855). Batyushkov was a pupil of the French and Latin elegiac poets and of Tasso. His elegies are classical and sensuous with few traces of sentimentality. Zhukovsky was imbued with German and English influences. He wrote little original verse though some of his lyrics are among the purest gems of Russian poetry. As a translator he has few equals in any language. Up to about 1825 he translated modern, chiefly pre-romantic poets; in his old age he turned to the great epics, Indian, Persian and Greek. His complete version of the *Odyssey* appeared in 1847. A no less excellent version of the *Iliad*, by Nicolas Gnedich (1784-1833), had preceded it in 1830.

PUSHKIN AND HIS SUCCESSORS

Pushkin.—Zhukovsky and Batyushkov were the immediate forerunners of Pushkin (1799-1837) (*q.v.*), whose apprenticeship was passed in the French and anti-Slavonic school of the Karamzinists. Later he freed himself from French influence, but his style always remained lucid and classical. His greatest popularity lasted from the appearance of his first "Byronic" poem in 1822 to about 1830. The work of his later years in which, discarding his earlier fluency and softness, he aimed at a severer and more impersonal style, met with little contemporary recognition. Only his tragic death reinstated him in public opinion and made him a national classic. He has since become to Russia what Dante is to Italy and Goethe to the Germans. The cult rendered to him has not always been kept this side of idolatry, and has tended to obscure the fact that he is an end rather than a beginning. His work is the culminating achievement of the period of the cultural ascendancy of the serf-owning nobility, rather than the fountainhead of later Russian literature. Of all his work only the "novel in verse" Evgeni *Onegin* (1825-33) with its central characters of Onegin and Tatiana had a considerable influence on the writers of the following age.

Pushkin was surrounded by a whole galaxy of poets, usually referred to as "The Pushkin Pleiad." The most notable of them were Eugene Baratynski (1800-44), a philosophical poet of profound and noble originality, second only to Pushkin himself as a master of words, and Nicolas Yazykov (1803-46), whose verse his contemporaries liked to compare to champagne, and who possessed a poetical momentum of exceptional force. Other remarkable poets were Denis Davydov (1784-1839), a hero of the Napoleonic wars, and the author of some sincere and vigorous lyrics of war and love; Prince Peter Vyazemsky (1792-1878), a master of poetical wit, and one of the most influential critics of the '20s; Baron Antony Delvig (1798-1831), an exquisite artist in classical and antique forms; the revolutionary Kondrati Rylejev (1795-1826, hanged as the head of the Decembrist conspiracy), who in his civic verse continued the noble oratorical tradition of Lomonosov; Dmitri Venevitinov (1805-27), whose early death was a great loss to the generation; and Fedor Glinka (1788-1880), a devotional poet who combined striking and effective simplicity with elevated mysticism. The movement of which Pushkin

and Vyazemsky were the recognized heads began by calling itself romantic, but was in reality much rather classical in spirit. Though they rejected the authority of Boileau they remained entirely free from romantic vagueness, from all "intercourse with the infinite," and from all aspirations after the unknown. The most general characteristic of even the minor poets of this Golden Age is a complete mastery of technique and a perfect adequacy of form to content.

After 1830 poetry begins to lose the sense of words, and to degenerate into untransformed emotion or shrill rhetoric. This is already the case with Alexander Polezhaev (1805-38), a pupil of Hugo and Byron and the direct forerunner of Lermontov in the passionate rhetoric of revolt. Lermontov himself (1814-41) (*q.v.*) was often merely a gushing emotionalist, or a thundering rhetorician. But at his highest moments of inspiration he reached summits of romantic vision that stand isolated in Russian poetry, while towards the close of his tragically ended life he was well on the way towards forming a sober and realistic style of great distinction and force. The general decline of poetry is not reflected in the work of Theodore Tyutchev (1803-73) whose compact and concentrated lyrics, though most of the best appeared as early as 1836, were not fully appreciated till much later. His poetry combines a penetrating pantheistic vision of the universe with the severe discipline of 18th century classicism. He has come to be generally regarded as Russia's second greatest poet. An interesting by-current was the artificial folk-song. It was cultivated already in the 18th century, but reached its highest development in the work of Alexis Koltsov (1808-42), the most famous of the Russian "uneducated poets." For all their artificial and literary antecedents his songs breathe a genuinely popular spirit.

The Russian drama of the first third of the century, though often quite competent for production on the stage, possesses small literary significance. Quite apart from the common run of plays stands the one comedy of Alexander Griboyedov (1795-1829) (*q.v.*), *Gore ot Uma* (*Woe from Wit*, 1825), one of the major classics of Russian literature. Historically it forms a connecting link between the classical realistic tradition that culminated in Fonvizin and Krylov, and the social realism of the later 19th century.

Russian prose-fiction remained for a long time without much vigour or originality. The only early novelist worth mentioning except Karamzin is Vasili Narezhny (1780-1825), a robust realist in the tradition of Le Sage and Smollett. From the end of the '20s the writing of fiction became more intense, though remaining largely imitative. Romances of Russian history in the manner of Scott by Michael Zagoskin (1792-1853) and Ivan Lazhechnikov (1792-1869) were particularly popular. The "Byronic" romanticism and smartness of Alexander Bestuzhev (pseud. Marlinsky, 1797-1837) also had a great success. The more refined forms of German romanticism were cultivated by Prince Vladimir Odoevsky (1804-69) and by Alexis Weltmann (1800-69), a gifted disciple of Jean-Paul. Pushkin himself, after 1830, began to pay more attention to prose than to poetry, elaborating a prose style that avoided all unnecessary ornament, and a narrative technique that discarded all that was not strictly relevant to the story. Lermontov's one masterpiece, *A Hero of Our Times* (1840), links the Russian psychological novel to the French analytical novel, while one of the stories included in it contains, *in nuce*, all the short-story technique of Chekhov.

The years 1832-45 are swayed by the genius of Gogol (1809-52) (*q.v.*). Much of his best work is distinctly romantic, and in a certain sense Gogol even marks the high-water mark of romanticism in Russia. But he was also a realist by his extraordinary power of visual convincingness, and in the way he opened to literature large regions of the vulgar and the ugly that had been taboo. Psychologically, he was not a social satirist—the grotesquely lifelike creations of his imagination were exteriorizations of his own inner fauna. But the state of the nascent Russian intelligentsia in the later '30s was such that it could only accept Gogol's work as a satirical criticism of contemporary Russia. His comedy *The Government Inspector* (*Revizor*, 1836) and his comic "epic" *The Dead Souls* (1842) became the main landmarks in the awakening of

Russian society from the political torpor it had been plunged into after the suppression of the Decembrist rebellion (1825).

The Intellectual Revolution. — The great intellectual revolution that led to the formation of the "intelligentsia," as we now understand the term, began outside the political sphere in an awakened interest in general and philosophical ideas. The generation of 1825-40 was intoxicated with the metaphysics of Schelling and Hegel. At the same time, in spite of a savage censorship, journalism began to aspire to the leadership of opinion. The Moscow Telegraph, the organ of advanced romanticism edited from 1825 to 1834 by Nicolas Pevoy (1796-1846), is particularly noteworthy in this connection. Towards the end of the '30s the intellectual fermentation began to take on a political and social colouring and to express itself in a general disapproval of existing conditions. By 1840 the intellectuals had formed themselves into two camps: the Slavophiles who criticized contemporary Russia for abandoning those of their ideals they discovered in Old Russia and in the religious traditions of the people; and the Westernizers whose faith was in rational progress on European lines. The most notable of the former were Alexis Khomyakov (1804-60), a man of brilliant gifts, a devotional and religious poet of talent, and the greatest theologian ever produced by Russia; and the brothers Aksakov, Konstantin (1817-60) and Ivan (1823-86). The influence of the Westernizers was stronger. Their chief leaders were the literary critic Vissarion Belinsky (1811-48) and Alexander Herzen (or Gertsen, 1812-70, see HERZEN). The former started his career as a romantic and aesthetic idealist. After 1840 he began to place social problems foremost and to demand a social significance of all literary work. His critiques became enormously influential, and he may be considered as the spiritual father of Russian Radicalism. The activity of Herzen, who emigrated in 1847, was chiefly political. In literature he owes his high standing to such work as *From the Other Shore*, a series of dialogues and essays in which he gave expression to his disillusionment in the revolution of '48, and *My Past and Thoughts* which is a great autobiography.

After the general political awakening of the country that followed the Crimean War the tradition of Belinsky was carried on by Nikolay Chernyshevsky (1828-89), Nicolas Dobrolyubov (1836-61) and Dmitri Pisarev (1840-68). They still further identified literary criticism with social politics. They rejected all non-utilitarian values, while Pisarev even condemned all art that was not directly and simply useful. About 1870 Russian Radicalism entered on a new phase, less rationalistic and more ethical, which proclaimed service to the people in atonement for the sins of serfdom, the only way of virtue open to the educated classes. These Radicals are known as the *narodniks* (populists). Their chief spokesman was Nicolas Mikhaylovsky (1842-1904), whose influence over the Radical intelligentsia was for about 20 years almost unlimited. The other camp was less influential (except in the purely political sphere where the brilliant journalism of Ivan Aksakov was a great power) but richer in original and independent personalities. The critic Apollon Grigoriev (1822-64) was excessively prolific and hot-headed, but at his rare best he displayed an imaginative understanding of the highest order. He is also the author of a few songs of strange and poignant beauty. A no less striking personality was that of Constantine Leontiev (1831-91), whose political philosophy of extreme conservatism is a curious amalgam of religious, aesthetic and biological considerations, that presents certain affinities with Nietzsche. Nicolas Strakhov (1828-96), was a good critic but a personality of less significance.

Rise of the Realistic Novel. — The Russian realistic novel grew up under the presiding influences of Gogol and of the idealistic social realism of French writers, especially of George Sand. The note of social revolt, echoed from France, is first heard in the *Three Tales* (1835) of Nicolas Pavlov (1805-64), and in the naïve and sincere work of Elena Hahn (pseud. Zinaida R-va, 1814-43). The influence of Gogol dominates the work of Yakov Butkov (c. 1815-56) and of Count Vladimir Sollogub (1814-82). These first gropings were followed by the great creative outburst of 1846-47, when in the course of a few months Turgenev, Dostoievsky,

Goncharov and others gave the world their first works. The main characteristics of the new school were: the realistic rendering of contemporary Russian life; an interest concentrated on social problems; a critical attitude to existing social conditions; an avoidance of all extremes of the grotesque and the romantic; and an endeavour to write as simply and "transparently" as possible, so that words should be only a reflection of things. In these two latter points they distinctly broke away from Gogol, whose disciples they otherwise claimed to be. The most successful novelists during the first 15 years of the movement were Ivan Goncharov (1812-1891) (*q.v.*) and especially Ivan Turgenev (1818-1883) (*q.v.*). The former in his second novel, *Oblomov* (1858) achieved one of the greatest masterpieces of social realism; the figure of Oblomov is at once strictly realistic and immensely symbolical, the imaginative quintessence of a characteristic aspect of the serf-owning intelligentsia. Turgenev is, of all his contemporaries, most closely related to Pushkin: most of his characters are developments of Onegin and Tatiana, the weak man and the strong woman. His novels, from *Rudin* (1856) to *Fathers and Sons* (1862), realize the perfect type of the "social" novel that is at once relevant to the solution of social problems and full of human significance. His style, realistic without rudeness, and poetical without emphasis, answered to perfection to the aesthetic ideal of the age, and was proclaimed the exemplar of Russian prose.

A different literary type is presented by the "philanthropic" fiction that sought to awaken sympathy with the poor and oppressed. Some writers (including the young Dostoievsky) took their subject matter from the life of the poorer urban classes, the "poor clerk" being a particularly favourite character; others devoted themselves to the peasant. The unquestionable masterpiece of the latter group is Turgenev's *A Sportsman's Sketches* (1847-52). Other writers of peasant fiction were Dmitri Grigorievich (1822-1900), whose first novels were among the literary events of 1846-47; and Marko-Vovchok (pseud. of Mme. Markovich, née Velinsky, 1834-1907), whose best work was done in Ukrainian (see UKRAINIAN LITERATURE). Another group of novelists chose the uneducated classes for their heroes, not as objects of compassion, but as the depositories of characteristic Russian qualities and of a moral strength that had been forfeited by the gentry. The best stories of this kind were written by Alexey Pisemsky (1820-81), especially *The Petersburgers* (1853). His novels of "genteel" life (*e.g.*, *A Thousand Souls*, 1862) are full of a bitter contempt for the educated classes. His characters are powerfully drawn and there is more masculine vigour in his narrative art than in that of any of his contemporaries. The novels of Nicolas Melnikov (pseud. A. Pechersky, 1819-83) contain more valuable ethnographical information than literary merits. Sentimentality, tempered by humour, marks the stories of Mme. Sokhansky (pseud. Nadezhda Kokhanovsky, 1825-84) who took her material from the life of the provincial squirehood of the back-steps.

Sergei Aksakov, a much older man (1791-1859), realized his possibilities only under the influence of Gogol and of the new realism. After several books on sport and animal life he published *Chronicles of a Russian Family* (1836), describing with extraordinary objectivity and vividness the life of the East Russian squires in the 18th century. It was followed by *Years of Childhood of Bagrovgrandson* (1858) where he tells the story of his first eight years with a minuteness of convincing detail that has been rivalled only by Proust. Aksakov's Russian is remarkable for its purity and plasticity. His works have been admirably translated into English by J. C. Duff.

The two novelists now unquestionably classed as the greatest of their age, Tolstoy (*q.v.*) and Dostoievsky (*q.v.*), produced their chief work between 1864 and 1880. Both are somewhat unrepresentative of their time in that their interest was in the permanent entities of the soul rather than in current social problems. Dostoievsky was moreover unlike his contemporaries in the dramatic power and sense of tragedy revealed in his great novels. But Tolstoy's *War and Peace* may be regarded as the fulfilment of an ideal common to all the Russian realists: a form of fiction

| 1. Mikhail Lomonosov (c. 1711-65) | 5. Nikolai Gogol (1809-52) | 9. Leo Tolstoy (1828-1910) |
| 2. Ivan Krylov (1768-1844) | 6. Theodore Dostoevsky (1821-81) | 10. Anton Chekhov (1860-1904) |
| 3. Mikhail Lermontov (1814-41) | 7. Nikolai Nekrasov (1821-77) | 11. Maxim Gorki (Alexey Peshkov, 1868-1936) |
| 4. Alexander Pushkin (1799-1837) | 8. Ivan Turgenev (1818-83) | 12. Dmitri Merezhkovsky (1865-1941) |

freed from artificial trammels, and adequate to the vast movements of life itself.

The '60s and '70s.—Tolstoy and especially Dostoevsky were at first underestimated. The limelight between 1863 and 1880 was occupied by novelists of less genius, but greater conformity with definite parties. The bulk of this party-fiction is valueless. But Michael Saltykov (pseud. N. Stchedrin, 1826–89) stands out on the Radical side as a figure of greater importance. The humour of his satirical sketches, at one time immensely popular, has worn out, but his novel *Messieurs Golovoff* (1876) is a powerful picture of the brutishness of the provincial gentry, a social novel equal in significance to *Oblomov*. The Radical generation of the '60s produced a whole galaxy of young men of humble birth and great promise, who succumbed to adverse circumstances and failed to do all they might have done. They include the stern and unsentimental realists, Nicolas Pomyalovsky (1835–1863) and Theodore Reshetnikov (1841–1871); the lyrical humorist Alexander Levitov (1835–1877); Gleb Uspensky (1840–1902), a conscience-stricken intellectual obsessed by a complex of social guilt; the unsuccessful revolutionary Andrew Novodvorsky (1853–82); and the Siberian Nicolas Kushchevsky (1847–76), whose only novel Nicolas Negorev (1871) gives him a unique place among the minor novelists so great are its qualities of character-drawing, of humour and of pathos.

The only man of the generation who achieved what he was intended to achieve, and has ultimately been recognized as a classic is Nikolai Leskov (1831–95). He failed to fit into the party divisions of the time and in consequence remained an outcast till the end of his life. His best work includes *Cathedral Folk* (1872, Eng. trans.), a humorous chronicle of provincial life; stories from the lives of the saints (after 1890); and a great number of short stories of Russian life. His rapid and packed narrative; his Russian, full of Rabelaisian resource and inventiveness; and his sharply drawn characters of strong men, saints and cranks, with their inextricable mixture of the heroic and the comical, stand in striking contrast to the usual methods of his contemporaries.

The drama followed the lead of the novel. The leading dramatists sought to reduce the element of plot and "artificiality" and to break away from the French school of Scribe. This is already apparent in the dramatic work (1847–52) of Turgenev, which sometimes anticipates the manner of Chekhov. The greatest dramatist of the realistic age, Alexander Ostrovsky (1823–86) (*q.v.*), also avoided all the artificialities of plot and effect, but created a new type of stagecraft, based on characters, which provided admirable "parts" for more than one generation of actors. A more dynamic type of play was cultivated by Alexander Sukhovo-Kobylin (1817–1903) whose three comedies (1855 seq.) are masterpieces of dramatic construction and savage satire. Pisemsky was also a more "dramatic" dramatist; his "popular tragedy" *A Hard Lot* (1858) remains the greatest realistic tragedy of the Russian repertory. Another type of play cultivated in the '60s and '70s was the historical play in blank verse. It produced nothing of first rate importance, but Tsar Feodor *Ioannovich* (1868) by Count Alexei Tolstoy (1817–1875) possesses merits that have made it deservedly popular on the stage.

The poets of the period were obsessed by the necessity of finding a compromise between the rights of the imagination and the demands of modern life. The more notable of these eclectics were Apollon Maykov (1821–97); Yakov Polonsky (1819–98), who had a genuine gift of romantic song; and Count Alexis Tolstoy, who is perhaps best remembered under his own name as well as in the invented character of Kosma Prutkov, as the greatest Russian nonsense poet. Other poets, like Ivan Nikitin (1824–61), cultivated a more realistic type of poetry. The greatest of the poetic realists was Nikolai Nekrasov (1821–77). He was a Radical and for many years the editor of a leading review. His work includes biting satire, poignant personal elegies, poems on the sufferings of the peasant, and narrative poems (*The Pedlars*, 1863; *Who can be happy in Russia*, 1879, Eng. trans. 1901), in which alone of all Russian poets he created poetry, truly collective and popular in spirit. The poetry of Afanasi Fet (1820–92) stands

at the opposite extreme. His early lyrics are as incorporeal and ethereal as Verlaine's, while in those of his last years he attained a degree of concentration reminiscent of Chinese poetry. The generation born after 1830 was singularly poor in poetic talent. The only exceptions were Constantine Sluchevsky (1837–1904), a metaphysical poet of great originality and real profundity, badly handicapped by the low poetic culture of his age; and the philosopher Vladimir Soloviev (see p. 756) whose lyrics are a record of his mystical experience.

The '80s.—The '80s were a period of gloom and reaction in the political and social sphere. There was a feeble renaissance of aesthetic values and of poetry, but the verse of the favourite poets of those years, Semen Nadson (1862–87) and Alexey Apukhtin (1841–93), which well reflects the general atmosphere of depression, is of very mediocre quality. The novelists of the '80s had many estimable qualities but little creative originality. The most notable are Vladimir Korolenko (1853–1921), a clean, optimistic idealist with a sense of poetry and a gift of humour; Alexander Ertel (1856–1908), whose novel *The Gardeners* is an admirable piece of sober and vivid realism; and N. Garin (pseud. N. G. Mikhaylevsky, 1852–1906), the author of a deservedly popular trilogy recounting the childhood and youth of a typical intellectual. Vsevolod Garshin (1855–88) was a more disturbed and metaphysically inclined spirit strongly influenced by Tolstoy. As a writer of short stories he is the immediate forerunner of Anton Chekhov (1860–1904) (*q.v.*). The atmosphere of Chekhov's best work is eminently representative of the gloom and depression of the disillusioned and unemployed intelligentsia. His narrative technique has its roots in the older tradition, but he carried it to that flawless perfection which has made him the favourite of the English intelligentsia. His influence on literature was small. He has had imitators, but no creative followers. The tremendous figure of the old Tolstoy overshadows all the younger generation of the '80s. His new ethical Christianity, it is true, affected the following generation almost exclusively by its negative attitude to all cultural values. But the indirect influence of that great personality cannot be exaggerated. The works in which he embodied his religious experience, *The Confession* and *The Death of Ivan Ilyich*, have nothing to compare with them for essential religious quality in modern literature. While his new narrative style, which rejected all "superfluous detail" and concentrated on the most generally human problems meant the end of the rule of purely "social" realism.

The '90s.—Soon after 1890 the depression of the '80s was followed by a general reawakening of life. In politics a new spirit was introduced by the advent of Marxism, and a general rise of revolutionary optimism. In literature the meteoric appearance of Maxim Gorki (pseud. of Alexey Peshkov, 1868–1936, see GORKI), was the greatest event of the later '90s. Other writers by his side continued the old tradition, among whom we may mention Alexander Kuprin (1870–1938), author of *The Duel* (1905), a "social" novel of army life, and of a number of well-told short stories. Gorki's successor in the popular favour was Leonid Andreyev (1871–1919) (*q.v.*), whose work shows an obsession with the vanity and emptiness of all human values and pursuits. His best stories, problem-stories of death and sex, are modelled on Tolstoy's, but he early succumbed to a crude "modernism" and his style degenerated into a succession of insincere clichés. Andreyev's outlook was shared by many writers who came into prominence about the time of the failure of the first revolution (1906–07). The most famous of these was Mikhail Artsibashev (1878–1927), the author of the notorious *Savin* (1907, Eng. trans. 1915), a drearily didactic novel that preached the gospel of complete obedience to sexual impulses, in a style unintelligently aped from Tolstoy. S. Sergeev-Tsensky (b. 1876), another pessimist, is a much more genuine writer, and the master of an individual style. His novel *Movements* (1910) is one of the most powerful stories of dying and death written since *Ivan Ilyich*. Ivan Bunin (b. 1870) (*q.v.*) may also be classed with the pessimists. His most important works, *The Village* and especially *Suchodol* (1912), give an impressive picture of the spiritual decay and cultural poverty of the peasantry and provincial gentry of central Russia

before the Revolution. Numerous novelists practising a more or less "modernized" realism came up in the years preceding the World War of 1914-18. Two deserve mention: Ivan Shmelev (1875-), whose story *That which happened* (1921, Eng. trans. 1926) was perhaps the best Russian story inspired by the war; and Boris Savinkov (*q.v.*) (pseud. V. Ropshin, 1879-1925), author of *The White Horse* (1909, Eng. trans. 1915), a striking revelation of the terrorist mentality.

Chekhov's innovations in dramatic technique carried to its logical end the anti-artificial and "anti-theatrical" realism of Turgenev and Ostrovsky. Gorki and Andreyev attempted to imitate his plays, but failed to master their inner, "musical" construction which alone makes them what they are. Andreyev also wrote "modernist" plays which are nothing but a succession of rhetorical clichés, and crude symbolism.

The "religious-philosophic" movement had its roots in the Christianity of Dostoevsky and in the gnostic idealism of Vladimir Soloviev (1853-1900) (*q.v.*). Soloviev, a brilliant dialectician and polemist, was not a creative philosopher, but his influence was very great. As a writer he is best remembered, apart from his mystical poetry, for his last work, *Three Dialogues on War, Progress and the End of the History* (1900, Eng. trans. 1911), an apocalyptic treatise in the form of a brilliantly witty conversation. Of his numerous followers we need only mention Father Paul Florensky, a writer of extraordinary subtlety and sophistication, and Nicolas Berdyaev (1874-), an impulsive thinker, more stimulating than profound. A very different kind of philosopher was Vasili Rozanov (1856-1919), one of the greatest masters of modern Russian prose. By rejecting what he called the "Gutenberg" style he made his Russian as flexible and spontaneous as spoken language. He was a convinced enemy of Reason, in theory as well as in practice. His religion was mainly a religion of sex and procreation, but he had a deep emotional sympathy with the traditions of Russian Christianity. One of his most characteristic books, *Solitaria* (1912), was translated into English (1927). Leo Shestov (1866-1938) was also an irrationalist, but in his war on Reason he used the weapons of his enemy with consummate skill. He had an intimate affinity with Dostoevsky and Tolstoy (Eng. trans. *Anton Chekhov*, 1916; *All Things Are Possible*, 1920).

Symbolist Poetry.—The literary movement of the '90s, dubbed "modernism" by its opponents, had for its principal components aestheticism and individualism. Dmitri Merezhkovsky (1865-1941) (*q.v.*) was one of the earliest and most influential mouthpieces of "modernism." He did excellent work at first as the interpreter of foreign values. But his historical novels reveal no originality, and as a religious thinker he was a long-explored nonentity. The most important literary expression of the "modernist" movement was the poetry of the Symbolists. In the first stages their poetry was largely derivative from foreign sources. The work of Constantine Balmont (1867-) (*q.v.*) and Valery Bryusov (1873-1924) (*q.v.*) has a translated and un-Russian flavour. But they contributed a great deal to raising the standards of poetic workmanship and the general level of literary culture. Other poets more original and at the same time more organically rooted in the Russian tradition were Fedor Sologub (1863-1927) (*q.v.*); Zinaida Hippisus (1869-) (*q.v.*), an intellectual poet of great technical originality; Innocent Annensky (1856-1909), whose small posthumous book *The Cypress Chest* (1910) contains lyrics of the most quintessential beauty; and Vyacheslav Ivanov (1866-), a gnostical metaphysician, a classical scholar, saturated with culture, the master of a magnificently ornate, Alexandrine style (*Cor Ardens*, 1911), as well as a splendid writer of ornate prose. The younger generation of Symbolists produced the greatest poet of the movement in Alexander Blok (1880-1921) (*q.v.*). His early mystical lyrics were purely musical and immaterial. Later when he lost his mystical visions, his poetry became more full-blooded and realistic. It is romantic in substance, but instinct with a grim and hopeless irony. His last poem, *The Twelve*, written immediately after the October revolution, is a sublime symphony made out of realistic dirt. Blok's contemporary Andrei Byeluy (pseud. of Boris Bugaiev, 1880-

1934, see BYELUY) was the most original and "advanced" of the younger Symbolist poets. His poetry is mystical in content, experimental in form and often humorous. Of the minor and later Symbolists there are Maximilian Voloshin (1877-1932), and Vladimir Khodasevich (1886-). The exclusively metaphysical character of Symbolism produced a reaction towards more concrete and less sophisticated poetry. Michael Kuzmin (1875-) was its first herald. About 1912 it crystallized into a movement whose leader was Nicolas Gumilev (1886-1921). His poetry is a strange mixture of gaudy aestheticism and manly romanticism. The poetry of Anna Akhmatova (Eng. trans. *Twenty-Seven Love Poems*, 1927) is also an assertion of human and concrete emotion as against the mysticism and metaphysics of Symbolism. Osip Mandelstam (1891-) (*The Stone*, 1916) is more concerned with cultural than with sentimental values. His technique is a curious combination of classical eloquence with an illogical associationism akin to that of the *surréalistes*.

The Symbolist Novel.—Of the elder Symbolists who attempted prose fiction Sologub (*q.v.*) is easily first. The *Little Demon* (1907) is one of the greatest Russian novels since Dostoevsky. Superficially it is a story of Russian provincial life, in the realistic tradition, but its symbolism has a metaphysical rather than a social significance. Other poets like Bryusov and Kuzmin tried to renovate Russian prose by adopting old and foreign styles. Bryusov's romance of witchcraft, *The Fire Angel* (1907), for instance, imitates the manner of a 16th century German memoirist. Russian prose was revolutionized by Andrei Byeluy (see above) and Alexei Remizov (1877-) (*q.v.*). They aimed at the maximum of verbal expressiveness, thus reviving the true tradition of Gogol and continuing the work of Leskov. Byeluy achieved this by a variety of means, among which rhythm, bold metaphor and verbal creation are most prominent. His novels, from the first, *The Silver Dove* (1909), to *Moscow* (first parts 1926), reveal a creative genius of a very rare order. Remizov's Russian is more colloquial; he continues the work of Avvakum and Rozanov of "de-latinizing" the language. His writings present an enormous variety of kind and subject. But most important of all are his stories of provincial life (*The Story of Stratilatov*, 1909, and *The Fifth Pestilence*, Eng. trans. 1927) which introduced a new type of grotesque realism and a new technique. They had a considerable influence on the rise of a new realism which used Russian life not as a peg on which to hang social or metaphysical problems, but as purely aesthetic material. Alexei N. Tolstoy (1882-) was the most popular and lively of these writers, the master of an admirable narrative manner, free from any kind of sophistication. His masterpiece is *The Childhood of Nikita* (1922). Michael Prishvin (1873-) is the author of the best animal stories in the language (*The Beast of Krutoyarsk*, 1913). Eugene Zamyatin (1884-1937) began as a disciple of Remizov, but later developed a complicated expressionist manner of his own.

The War of 1914-18 and Revolution.—World War I. did not profoundly affect Russian literature. The intellectual classes kept aloof from it. The Revolution of March 1917 remained almost equally alien to the Russian imagination, but not the Bolshevik revolution of eight months later, or the ensuing civil wars. Their external result was the division of intellectual Russia into two hostile camps, which after 1920-21 became a geographical division between those who remained in U.S.S.R. and the *émigrés*. The older generation of writers was pretty equally divided between the two sides. But the young generation of *émigrés* produced no valuable work with the possible exception of the historical novelist, Mark Aldanov (1889-) (*q.v.*). In the literature of ideas the *émigrés*, however, gave birth to the vigorous movement of the "Eurasians," with Peter Suvchinsky and Prince Nicolas Trubetskoy as leaders. Of the Bolsheviks, Lenin was an orator and a political writer of genius. Trotsky was a brilliant pamphleteer and his book, *Literature and Revolution* (Eng. trans. 1921), discussing the literary policy of the Communist party, is of interest. But the strictly literary men of the party were very second-rate. Anatoly Lunacharsky (1875-1933) (*q.v.*) was a conspicuous mediocrity, and Demian Bedny (pseud. of E. A.

Pridvorov, b. 1883), the Communist poet laureate, is no more than an able and sometimes witty writer of rhymed propaganda.

During the years of civil war and blockade (1918-21) Russian prose writers almost ceased from production and poetry ruled supreme. Of the "advanced" poetical groups, the Futurists were the most prominent. The Futurist movement began about 1912 as a revolt against the hieratic mysticism of the Symbolists. It united several fundamentally different tendencies, and there is little in common between its two principal representatives, Victor Khlebnikov (1885-1922) and Vladimir Mayakovsky (1893-1930), besides the common desire to give poetry a more rugged and virile accent and to tear it away from the withering hold of traditional poetical associations. Khlebnikov was a recluse and a stammerer, a mole who lived, as it were, at the linguistic roots of poetry. His work is caviare to the general public, but highly appreciated by fellow poets. Mayakovsky was an open-air orator. Much of his verse is revolutionary propaganda. Though totally lacking in the "finer touch," it is intensely original and highly craftsmanlike. Boris Pasternak (b. 1890), unquestionably the greatest living Russian poet (principal book of lyrics, *My Sister, Life*, written 1917, published 1922) is externally connected with some aspects of Futurism, but in substance he is nearer to the traditions of Tyutchev and Fet. His poetry is marked by an absolute freshness of perception and diction combined with a tensivity of lyrical emotion that is to be found only in the greatest. His prose (*Tales*, 1925) is also of the highest order, and being concerned with the realities of the soul stands apart from that of his contemporaries. Next to Pasternak the most significant recent poet is Marina Tsvetayeva (an *émigrée* since 1922), whose poetry is marked by an exceptional variety and richness of rhythmical imagination, and an exuberant vitality. Sergey Esenin (1895-1925) (*q.v.*), the favourite poet of the post-revolutionary intelligentsia, was at one time connected with "advanced" movements, but in reality he is a poet of sentiment of an essentially "19th century" type. After 1921 poetry began to lose its ascendancy. None of the poets who have come forward since then are of any very great significance, though the "proletarian poet" Vasili Kazin has a genuine gift of song, and Nicolas Tikhonov (1896-) and Ilya Selvinsky (1899-) are consummate and original masters of technique.

Post-Revolutionary Prose.—The period of the "New Economic Policy" (inaugurated 1921) saw the rise of a whole host of prose-writers who, while remaining outside the pale of party Communism, sympathized with the Communist Revolution. They have been given the name of *poputchiki*, which means "fellow-travellers up to a certain point." The first of the *poputchiki* were strongly under the influence of the "ornamental" style of Bely and Remizov, and of the "formalist" school of criticism, which insisted on the complete reduction of all literary facts to form. The most prominent of the "formalists" was Victor Shklovsky (b. 1893), a vivacious and clever critic, and the author of a very remarkable book of reminiscences of the War and the Revolution (*A Sentimental Journey*, 1923). The young "ornamental" novelists laid all their emphasis on style and formal originality, almost abandoning all pretence of narrative. The spirit of the Revolution expressed itself in their work in their treatment of mass movements. In the early novels of Boris Pilnyak (b. 1893) (*q.v.*) and of Vsevolod Ivanov (b. 1895) there are no individual characters, only vast movements of masses, crowds or peoples. Ivanov has overcome the limitations of "dynamism" and his later stories show more grit. The tales of Isaac Babel (b. 1894) are "intensified anecdotes" with a maximum of artistic concentration. He is a supreme master in the imaginative treatment of slang and mongrel dialects, and the most perfect artist of the younger generation. His best stories are about the Polish War of 1920. Leonid Leonov (b. 1899) is a more old-fashioned writer, related in tone and subject-matter to earlier masters, and full of sympathy for the underdogs of the Revolution. Other novelists tried to remedy the lack of narrative interest inherent in "ornamental" and "dynamic" fiction. Ilya Erenburg (b. 1891), who had been made famous by *The Adventures of Julio Jurenito* (1922), a satire of Capitalist Europe, won

still greater fame by crude novels of melodrama and adventure. Constantine Fedin (b. 1892) is a more serious writer; his novel *Cities and Years* (1924), a powerful story of War and Revolution, restored to a place of honour the ethical conception of human conduct, as opposed to the elemental dynamics of the masses. Since about 1925 "Soviet workdays" have replaced the civil war as the chief subject of fiction. Most of this new fiction of "Soviet manners" is not above the level of good journalism. Among those who represent Soviet life in a satirical light the most popular is Michael Zoshchenko (1895-), but Sergey Zayaitzky is the only writer of this description to have shown real imaginative power. Other writers like Lydia Seyfullina (b. 1889), in a curious type of best-seller, try to answer the Soviet typist's demand for "uplift." Recently there has grown up a great interest in the historical novel. Those by Yuri Tymyanov and by Olga Forsch (b. 1879) are works of real and solid merit.

By the side of the *poputchiki*, the "proletarian" novelists at first cut a rather inferior figure. The work of Yuri Libedinsky (b. 1898; *The Week*, Eng. trans. 1923), of Theodore Gladkov (b. 1883; *Cement*, 1926) and of D. Furmanov (d. 1926) is hardly literature, but it is interesting as reflecting the optimistic energy of the men who won the civil war and shouldered the work of reconstruction after it. The younger proletarian generation has produced writers of real talent. Artem Vesely (b. 1898) carried the "dynamic" novel to its highest perfection (*My Native Land*, 1926), infusing into it a vitality and cheerfulness entirely alien to its *poputchiki* initiators. A. Fadeyev and Sergey Semenov, on the other hand, are more interested in individual and ethical man. Fadeyev's *The Defeat* (1927) and Semenov's *Nafalza Tarпова* (1927) are works of great merit and still greater promise.

The drama, in spite of the continued vitality of the theatre, has produced little of importance. The realistic tradition has been abandoned. The plays of Nicolas Evreinov (b. 1879), a leading theatrical producer, have many points in common with Pirandello's. The Futurists at one time attempted to create a high-standard, boldly Aristophanesque propaganda play; but the only successful venture was Mayakovsky's *A Mystery-Bouffe* (1918). The dominant type of drama is a kind of conventional puppet-play with characters stripped of all reality and humanity. Such are the crude and mediocre plays of Lunacharsky (Eng. trans. *Three Plays*, 1923). Only the plays of the regretted Leo Lunts (1901-24) are on a much higher level. They are simplified tragedies of pure action, full of a genuine heroic spirit.

Historians.—Modern Russian historiography begins with V. N. Tatishchev (1686-1750); his history of Russia is a laborious but uncritical compilation from the chronicles. Gerhard Friedrich Miiller (1705-83), a German member of the Petersburg academy and a pioneer in many fields, was the first to open up the jungle of official acts and records. A critical spirit was first introduced by another German, August Ludwig v. Schloezer, and by the amateur historian I. N. Boltin (1735-92). Karamzin's (*q.v.*) *History of the Russian State* (12 vol., 1818-26) summed up the work of the 18th century, to which it essentially belongs: it is moralizing and rhetorical, and devoid of all "sense of period." Its conception of autocracy as the only constructive and beneficent force in the Russian past made it the bible of official and conservative Russia. But before Karamzin was dead new ideas were abroad; and acquaintance with Niebuhr and Hegel demanded a new approach to Russian history. Nicolas Polevoy (*see p. 754*) in his *History of the Russian People* (1830-33) attempted to supply the demand, but being no more than a journalist, failed. Michael Pagodin (1800-75), who did much to advance a critical and detailed knowledge of Russia's past, was prevented from achieving a synthesis by the provincial conservatism of his outlook. The younger Slavophiles were more imaginative, and being convinced that the chief hero of history was the People and not the State, concentrated their attention on the history of the masses. Their best historian was I. D. Belyaev (1810-73). The same predilection for social history and for the masses marks the work of the Radical historians, N. I. Kostomarov (1817-85) the most "literary" and widely read historian of the time, and A. P. Shchapov (1830-76), who tried to apply to Russian history the

methods of Buckle. The moderate and Liberal Westernizers, on the contrary, devoted themselves to the history of the State, which appeared to them as the only civilizing force, and of its legislation. The most industrious of them, S. M. Soloviev (1820-79), compiled what is the most complete detailed history of Russia (29 vol., 1851-79). It is little more than a transcript of the sources, interspersed with a few historical discussions, reflecting the ideas of Hegel. Russian historiography was freed from philosophy and party bias by K. N. Bestuzhev-Ryumin (1829-97) and V. O. Klyuchevsky (1841-1911). Klyuchevsky, especially, introduced a more intimate study of the sources, resulting in a more general reconstruction of the past; and his monographs on the pre-Muscovite and Muscovite period have become classics. His *Course of Russian History* (4 vol., 1904) has charmed many readers by its literary form, but is handicapped by the absence of a sincerely considered point of view. Bestuzhev-Ryumin became the master of a whole school of historians, among whom S. Th. Platonov (1860-1932) was the most eminent. *The Time of Troubles* (1899) is a masterpiece of knowledge and presentation. Apart from the main schools stand V. I. Sergeevich (1838-1909), whose *Antiquities of Russian Law* is a brilliant work of criticism, written in a concise and trenchant style; and E. E. Golubinsky (1834-1912), whose *History of the Russian Church* presents a strange mixture of great critical acumen and quaint stolidity. The old Westernizing tendency survives in the work of P. N. Milyukov (1859-1943): *Studies in the History of Russian Civilization*, whose leading idea is to prove the poverty and inferiority of old Russian civilization. N. P. Pavlov-Silvansky (1869-1908) was a Westernizer of a different type, who tried to prove the essential similarity of the historical process in Russia and the West. The rise of Marxism has led to the rise of a school of Marxist historians, who aim at reducing Russian history to universally applicable methods of dialectic materialism. Their patriarch, M. N. Pokrovsky (1868-1932), was a historian of great gifts whose treatment of historical problems did much to renovate our ideas of the Russian past.

The Study of Literature.—The study of literature began in the 18th century in the form of biographical compilations and bibliographical indexes, Novikov being the principal pioneer. Towards 1830 literary studies came under the influence of German philosophical idealism. Stepan Shevyrev (1806-64), a highly cultured critic and a right-wing Slavophil, was the first to attempt, without much success, a scholarly presentation of Russian literature. The journalistic surveys of Belinsky were much more influential in establishing a generally accepted *vulgate* of literary history. In the second half of the 19th century Russian folklore attracted considerable learned attention, almost invariably influenced by the romantic theories of Grimm. An extreme form of such romanticism is apparent in the work of Orest Miller (1838-89). Theodore Buslayev (1818-97) was a more circumspect idealist, and the first to attempt to bring together the study of old Russian literature and old Russian art. In the following generation A. A. Potebnya (1835-91) tried to place the study of folklore on a broad basis of linguistic psychology. Alexander Veselovsky (1838-1906) directed his efforts towards a strictly scientific study of comparative literature. Old Russian literature remained in the hands of philologists and its study was conducted on somewhat narrowly academic lines. The foremost representatives of this line of study today are V. N. Peretts (1870-) and V. M. Istrin, whose history of Kiev literature (1922) is the most authoritative survey of the period. Less moderate is the work of A. M. Pypin (1833-1904) whose *History of Russian Literature* is a scholarly and industrious attempt to represent old Russian civilization in the poorest possible light. The work of most historians of modern Russian literature is marked by a strong party bias and an absence of literary understanding. *The History of Russian Literature after 1848*, by A. M. Skabichevsky (1838-1910), and the writings of S. A. Vengerov (1855-1920), literary editor of the Brockhaus-Efron Encyclopaedia (1890-1907) and of numerous other publications, are best known and most frequently utilized. The Marxists introduced a fresh note by subordinating the study of literature to that of economics. Of the

early Marxists, the gifted Eugene Soloviev (pseud. Andreyevich, 1863-1905) wrote a *Philosophy of Russian Literary History* (1905) which is certainly worth reading. The canons of Marxist literary history were established by G. V. Plekhanov (1856-1918). Since 1917 Marxism is the official doctrine in literary history. The opposition is provided by the "formalists," whose influence on literary development has already been alluded to. Their most notable workers in the field of literary history are Boris Eichenbaum and Yuri Tynyanov. On the whole, Russian literary history is in a far from satisfactory state, and there is no single adequate presentation of it. For the ancient period (including the 18th century) the student will be best guided by such collections of extracts as the *Chrestomathy* of Brodsky, Mendelson and Sidorov (3 parts, Moscow 1922-23). For the 19th century and later he will have to find his own way with the aid of existing bibliographies.

White-Russian Literature.—White-Russian was, by the side of Latin, the official language of the Grand Duchy of Lithuania from the 14th century to its absorption by Poland, but apart from a few chronicles and a few translated romances it produced no literature. In the 19th century White-Russian literature did not rise above the level of provincial amateurishness. But in the present century a literary movement of which the chief names are Yanko Kupalo (b. 1882) and Michael Bagdanovich (Bogdanovich, 1892-1917) has resulted in the formation of a national literature. White-Russian folklore is less varied than either great Russian or Ukrainian, and has no narrative poetry. Its lyrical song however is rich, and some of it presents archaic features. White-Russian studies are now centred in the White-Russian State university at Minsk (founded 1921).

See N. Karsky, *The White-Russians* (in Russian, Warsaw, 1903 etc.); M. Haretsky (Goretsky), *History of White-Russian Literature* (in White-Russian, Minsk, 1926). For Ukrainian (or Little-Russian, or Ruthenian) literature see UKRAINIAN LITERATURE. (D. S. M.)

RUSSKY, NIKOLAI (1854-1918), Russian general, was educated at the infantry military school in St. Petersburg, graduated from the academy of the general staff in 1881, and by 1896 had reached general's rank. During the war with Japan (1904-5) he was the head of the staff of the II. Army, and planned the offensive carried out by General Gripenberg which led to the prematurely abandoned offensive of Sandepu. In 1914 he commanded the III. Army which attacked in Galicia, and advanced to Lvov (Lemberg) through which it passed in the further advance to the San-Dniester line. The dramatic entry of the III. Army into Lvov created for General Russky a prestige out of proportion to the real importance of his success. In Oct. 1914 he was appointed commander-in-chief of the north-western and afterwards of the northern armies. He continued to hold the command in spite of ill-health, and it was at his headquarters that the final scenes of Nicholas II.'s reign and his abdication took place in March 1917.

Soon after the Revolution General Russky retired, and in 1918 he was reported killed by the Bolsheviks.

RUSSO-JAPANESE WAR (1904-5). The seizure by Russia of the Chinese fortress of Port Arthur, which she had a few years previously, in concert with other Powers, compelled Japan to relinquish, was from the Russian point of view the logical outcome of her eastward expansion and her need for an ice-free harbour on the Pacific. The extension of the Trans-Siberian railway through Manchuria to Port Arthur and a large measure of influence in Manchuria followed equally naturally. But the whole course of this expansion had been watched with suspicion by Japan, from the time of the Sakhalin incident of 1875—when the island power, then barely emerging from the feudal age, had to cede her half of the island to Russia—to the Shimonoseki treaty of 1895, when the Powers compelled her to forego the profits of her victory over China. The subsequent occupation of Port Arthur and other Chinese harbours by European Powers, and the evident intention of consolidating Russian influence in Manchuria, were again and again the subject of Japanese representations at St. Petersburg (Leningrad), and these representations became more vigorous when, in 1903, Russia seemed to be about to extend her Manchurian policy into Korea. No less than ten draft treaties were discussed in vain between Aug. 1903 and Feb. 1904, and finally negotiations were broken off on Feb. 5.¹ On the 4th Japan had already decided to use force, and her military and naval preparations, unlike those of Russia, kept pace with her diplomacy.

This was in fact an eventuality which had been foreseen and on which the naval and military policy of Japan had been based for ten years. She, too, had her projects of expansion and hegemony, and by the Chino-Japanese War she had gained a start over her rival. The reply of the Western Powers was first to compel the victor to maintain the territorial integrity of China, and then within two years to establish themselves in Chinese harbours. From that moment Japanese policy was directed towards establishing her own hegemony and meeting the advance of Russia with a *fait accompli*. But her armaments were not then adequate to give effect to a strong-handed policy, so that for some years thereafter the Government had both to impose heavy burdens on the people and to pursue a foreign policy of marking time, and endured the fiercest criticism on both counts, for the idea of war with Russia was as popular as the taxes necessary to that object were detested. But as the army and the navy grew year by year, the tone of Japanese policy became firmer. In 1902 her position was strengthened by the alliance with England; in 1903 her army, though in the event it proved almost too small, was considered by the military authorities as sufficiently numerous and well prepared, and the arguments of the Japanese diplomats stiffened with menaces. Russia, on the other hand, was divided in policy and consequently in military intentions and preparations. In some quarters the force of the new Japanese army was well understood, and the estimates of the balance of military power formed by the minister of war, Kuropatkin, coincided so remarkably with the facts that at the end of the summer of 1903 he saw that the moment had come when the preponderance was on the side of the Japanese. He therefore proposed to abandon Russian projects in southern Manchuria and the Port Arthur region and to restore Port Arthur to China in return for considerable concessions on the side of Vladivostok.

His plan was accepted, but "a lateral influence suddenly made itself felt, and the completely unexpected result was war." Large commercial interests were in fact involved in the forward policy, "the period of heavy capital expenditure was over, that of profits about to commence," and the power and intentions of Japan were ignored or misunderstood. Thus Russia entered upon the war unprepared in a military sense. To the guards and patrols of the Manchurian railway and the garrisons of Port Arthur and Vladivostok, 80,000 in all, Japan could, in consequence of her recruiting law of 1896, oppose a first-line army of some 270,000 trained men. Behind these, however, there were scarcely 200,000 trained men of the older classes, and at the other end of the long Trans-Siberian railway Russia had almost limitless resources.² The

¹Belated declarations of war appeared on Feb. 10.

²The total Russian army on a peace footing was almost 1,000,000 strong.

strategical problem for Japan was, how to strike a blow sufficiently decisive to secure her object before the at present insignificant forces of the East Siberian army were augmented to the point of being unassailable. It turned, therefore, principally upon the efficiency of the Trans-Siberian railway and in calculating this the Japanese made a serious under-estimate. In consequence, far from applying the "universal service" principle to its full extent, they trained only one-fifth of the annual contingent of men found fit for service. The quality of the army, thus composed of picked men (a point which is often forgotten), approximated to that of a professional force; but this policy had the result that, as there was no adequate second-line army, parts of the first-line had to be reserved, instead of being employed at the front. And when for want of these active troops the first great victory proved indecisive, half-trained elements had to be sent to the front in considerable numbers—indeed, the ration strength of the army was actually trebled.

Objects of Japanese Attack.—The aim of the war, "limited" in so far that the Japanese never deluded themselves with dreams of attacking Russia at home, was to win such victories as would establish the integrity of Japan herself and place her hegemony in the Far East beyond challenge. Now the integrity of Japan was worth little if the Russians could hope ultimately to invade her in superior force, and as Port Arthur was the station of the fleet that might convoy an invasion, as well as the symbol of the longed-for hegemony, the fortress was necessarily the army's first objective, a convincing Sedan was the next. For the navy, which had materially only a narrow margin of superiority over the Russian Pacific squadron, the object was to keep the two halves of that squadron at Port Arthur and Vladivostok respectively separate and to destroy them in detail. But in February weather these objects could not be pursued simultaneously. Prior to the break-up of the ice, the army could only disembark at Chemulpo, far from the objective, or at Dalny under the very eyes of its defenders. The army could therefore, for the moment, only occupy Korea and try to draw upon itself hostile forces that would otherwise be available to assist Port Arthur when the land attack opened. For the navy, instant action was imperative.

On Feb. 8, the main battle-fleet, commanded by Vice-Admiral Togo, was on the way to Port Arthur. During the night his torpedo-boats surprised the Russian squadron in harbour and inflicted serious losses, and later in the day the battleships engaged the coast batteries. Repulsed in this attempt, the Japanese established a stringent blockade, which tried the endurance of the ships and the men to the utmost. From time to time the torpedo-craft tried to run in past the batteries, several attempts were made to block the harbour entrance by sinking vessels in the fairway, and free and deadly use was made by both sides of submarine mines. But, though not destroyed, the Port Arthur squadron was paralysed by the instantaneous assertion of naval superiority.

Alexeiev and **Makárov.**—Admiral Alexeiev, the tsar's viceroy in the Far East and the evil genius of the war, was at Port Arthur and forbade the navy to take the risks of proceeding to sea.³ For a time, when, in place of Admiral Starck (who was held responsible for the surprise of February), Admiral Makárov, an officer of European reputation, commanded the fleet this lethargy was shaken off. The new commander took his ships to sea every day. But his energetic leadership was soon ended by a tragedy. A field of electro-mechanical mines was laid by the Japanese in the night of April 12-13, and on the following day the Japanese cruisers stood inshore to tempt the enemy on to the mine-field. Makárov, however, crossed it without accident, and pursued the cruisers until Togo's battle-fleet appeared, whereupon he went about and steamed for port. In doing so he recrossed the mine-field, and this time the mines were effectual. The flagship "Petropavlovsk" was struck and went down with the admiral and 600 men, and another battleship was seriously injured. Then the advocates of passivity regained the upper hand and kept the squadron in harbour, and henceforward for many months the Japanese navy lay unchallenged off Port Arthur, engaging in minor oper-

³A vivid picture of the state of affairs in the navy at this period is given in Semenov's *Rasplata* (Eng. trans.).

ations, covering the transport of troops to the mainland, and watching for the moment when the advance of the army should force the Russian fleet to come out. Meantime seven Japanese cruisers under Vice-Admiral Kaimamura went in search of the Russian Vladivostok squadron; this, however, evaded them for some months, and inflicted some damage on the Japanese mercantile marine and transports.

Landing of Japanese 1st Army.—The Japanese had not waited to gain command of the sea before beginning the sea transport of that part of their troops allotted to Korea. The roads of that country were so poor that the landing had to be made not on the straits of Tsushima, but as far north as possible. Chemulpho, nearer by 50m. to Port Arthur than to Japan, was selected. On the first day of hostilities Rear-Admiral Uriu disembarked troops at Chemulpho under the eyes of the Russian cruiser "Variag," and next day he attacked and destroyed the "Variag" and some smaller war-vessels in the harbour, and the rest of the 1st Army (Gen. Kuroki) was gradually brought over during February and March in spite of an unbeaten and, under Makárov's régime, an enterprising hostile navy. But owing to the thaw and the subsequent break-up of the miserable Korean roads, six weeks passed before the columns of the army (Guard, 2nd and 12th Divisions), strung out along the "Mandarin road" to a total depth of six days' march, closed upon the head at Wiju, the frontier town on the Yalu. Opposite to them they found a large Russian force of all arms.

The Russian commanders, at this stage at least, had not and could not have any definite objective. Both by sea and by land their policy was to mass their resources, repulsing meantime the attacks of the Japanese with as much damage to the enemy and as little to themselves as possible. Their strategy was to gain time without immobilizing themselves so far that the Japanese could impose a decisive action at the moment that suited them best. Both by sea and by land such strategy was an exceedingly difficult game to play. But afloat, had Makárov survived, it would have been played to the end, and Togo's fleet would have been steadily used up. One day, indeed (May 15), two of Japan's largest battleships, the "Hatsuse" and the "Yashima," came in contact with free mines and were sunk. One of them went to the bottom with 500 souls. But the admiral was not on board. The Russian sailors said, when Makárov's fate was made known, "It is not the loss of a battleship. The Japanese are welcome to two of them. It is *he*." Not only the skill, but the force of character required for playing with fire was wanting to Makbrov's successors.

Plans of Kuropatkin.—It was much the same on land. Kuropatkin, who had taken command of the army, saw from the first that he would have to gain three months, and disposed his forces as they came on the scene, unit by unit, in perfect accord with the necessities of the case. His expressed intention was to fight no battle until superiority in numbers was on his side. He could have gained his respite by concentrating at Harbin or even at Moukden or at Liao-Yang. But he had to reckon with the fleet¹ at Port Arthur. He knew that the defences of that place were defective, and that if the fleet were destroyed whilst that of Togo kept the sea there would be no Russian offensive. He therefore chose Liao-Yang as the point of concentration, and having thus to gain time by force instead of by distance he pushed out a strong covering detachment towards the Yalu. But little by little he succumbed to his *milieu*, the atmosphere of false confidence and passivity created around him by Alexeiev. After he had minutely arranged the eastern detachment in a series of rear-guard positions, so that each fraction of it could contribute a little to the game of delaying the enemy before retiring on the positions next in rear, the commander of the detachment, Zasuulich, told him that "it was not the custom of a knight of the Order of St. George to retreat," and Kuropatkin did not use his authority to recall the general, who, whether competent or not, obviously misunderstood his mission. Thus, whilst the detachment was still disposed as a series of rearguards, the foremost fractions of it stood to fight on the Yalu, against odds of four to one.

¹Not, as is often assumed, the fortress itself.

Battle of the Yalu.—The Japanese 1st Army was carefully concealed about Wiju until it was ready to strike. Determined that in this first battle against a white nation they would show their mettle, the Japanese lavished both time and forethought on the minutest preparations. Forethought was still busy when, in accordance with instructions from Tokio, Kuroki on April 30 ordered the attack to begin at daybreak on May 1. For several miles above Antung the rivers Yalu and Aiho are parallel and connected by numerous channels. The majority of the islands thus formed were held and had been bridged by the Japanese. The points of passage were commanded by high ground a little farther up where the valleys definitely diverge, and beyond the flank of the ill-concealed positions of the defence. The first task of the right division (12th) was to cross the upper Yalu and seize this. To the Guard and 2nd Divisions was assigned the frontal attack on the Chiuliencheng position, where the Russians had about one-half of their forces under Maj.-Gen. Kashtalinski. On April 30, Inouye's 12th Division accomplished its task of clearing the high ground up to the Aiho. The Russians, though well aware that the force in their front was an army, neither retired nor concentrated. Zasuulich's mediaeval generalship had been modified so far that he intended to retreat when he had taught the Japanese a lesson, and therefore Kuropatkin's original arrangements were not sensibly modified. So it came about that the combined attack of the 2nd and Guard Divisions against the front, and Inouye on the left flank and rear, found Kashtalinski without support. After a rather ineffective artillery bombardment the Japanese advanced in full force, without hesitation or finesse, and plunging into the river stormed forward under a heavy fire. A few moments afterwards Zasuulich ordered the retreat. But the pressure was far too close now. Broken up by superior numbers the Russian line parted into groups, each of which, after resisting bravely for a time, was driven back. Then the frontal attack stopped and both divisions abandoned themselves to the intoxication of victory. Meanwhile, the right attack (12th Division) encountering no very serious resistance, crossed the Aiho and began to move on the left rear of the Russians. On the side of the defence, each colonel had been left to retire as best he could, and thus certain fractions of the retreating Russians encountered Inouye's advancing troops and were destroyed after a most gallant resistance. The rearguard itself, at Hamatan, was almost entirely sacrificed, owing to the wrong direction taken in retreating by its left flankguard. Fresh attempts were made by subordinates to form rearguards, but Zasuulich made no stand even at Fêng-hwang-chêng, and the Japanese occupied that town unopposed on May 5. The Japanese losses were 1,100 out of over 40,000 present, the Russian (chiefly in the retreat) at least 2,500 out of some 7,000 engaged.

The Yalu, like Valmy, was a moment in the world's history. It mattered little that the Russians had escaped or that they had been in inferior numbers. The serious fact was that they had been beaten.

Distribution of Russian Forces.—The general distribution of the Russian forces was now as follows: The main army under Kuropatkin was forming, by successive brigades, in two groups—1st Siberian Corps (Stakelberg), Niu-chwang and Kaiping; 2nd Siberian Corps, Liao-Yang. Zasuulich (3rd Corps and various other units) had still 21,000. In the Port Arthur "fortified rayon," under Lieut.-Gen. Stossel (4th Corps), were 27,000 men, and Gen. Linievich around Vladivostok had 23,000. These are, however, paper strengths only, and the actual number for duty cannot have been higher than 110,000 in all. The Trans-Siberian railway was the only line of communication with Europe and western Siberia, and its calculated output of men was 40,000 a month in the summer. In October 1904, therefore, supposing the Japanese to have used part of their forces against Port Arthur, and setting this off against the absence of Linievich and Stossel, Kuropatkin could expect to have a sufficient superiority in numbers to take the offensive. His policy was still, "No battle before we are in superior force."

Landing of Japanese 2nd Army.—For the moment it was equally Japan's interest to mark time in Manchuria. Still intent upon the Russian Port Arthur squadron, she had embarked her

2nd Army (Gen. Oku, 1st, 3rd, 4th and 5th Divisions) during April, and sent it to Chinampo whence, as soon as the ice melted and Kuroki's victory cleared the air, it sailed to the selected landing-place near Pitszewo. Here, under the protection of a continuous chain of war-vessels between the Elliot islands and the mainland, Oku began to disembark on May 5. But the difficulties of the coast were such that it took three weeks to disembark the whole and to extend across the peninsula to Port Adams. Oku then, leaving the 5th Division behind, moved down with the rest towards Kinchow, and after storming that place found himself face to face with a position of enormous strength, Nanshan hill, at the narrowest part of the peninsula, where part of a Russian division (3,000 only out of 12,000 were actually engaged) had fortified itself with extreme care. On May 26 took place the battle of Nanshan. The Japanese attack was convergent, but there was no room for envelopment; the Russian position moreover was "all-round" and presented no flanks, and except for the enfilade fire of the Japanese and Russian gunboats in the shallow bays on either side the battle was locally at every point a frontal attack and defence. The first rush of the assailants carried them up to the wire and other obstacles, but they were for many hours unable to advance a step farther. But the resolute Oku attacked time after time, and at last the 4th Division, on his right, assisted by its gunboats, forced its way into the Russian position. The Russians had just begun to retreat, in accordance with orders from higher authorities. But it was a second undeniable victory. It was, moreover, a preface to those furious assaults on Port Arthur which, because they were the expression of a need that every soldier felt, and not merely of a tactical method, transcend all cool-blooded criticism. The Japanese losses were 4,500 out of 30,000 engaged, or 15%, that of the Russians fully half of the 3,000 engaged. The victors captured many guns, but were too exhausted to pursue the Russians, whose retirement was not made in the best order.

The transports were now conveying the 6th and 11th Divisions to Pitszewo; these were to form the 3rd Army (Nogi) for operations against Port Arthur. Oku exchanged his 1st Division for the 6th. The 2nd Army then turned northward (3rd, 4th, 5th and 6th Divisions). The 10th Division, forming the nucleus of the 4th Army, had begun to land at Takushan on May 19. The 2nd and 4th Armies were the left wing of a widespread converging movement on Liao-Yang. Oku had the greatest distance to march, Kuroki the smallest. The latter therefore had to stand fast in the face of the Russian eastern detachment, which was three days' march at most from Fêng-hwang-chêng and could be supported in three more days by Kuropatkin's main body, whereas the pressure of Oku's advance would not begin to be felt by the Russian southern detachment until the twelfth day at earliest. It was necessary therefore for the first objective to make a slight concession to the second. Oku had to start at the earliest possible moment, even though operations against Port Arthur were thereby delayed for a week or two. In fact, Oku's march began on June 13, Kuroki's on June 24; the moves of the intermediate forces at various dates within this time.

Meanwhile Kuropatkin, assembling the main army week by week, was in a difficult position. His policy of gaining time had received a severe blow in the failure of his executive officer to realize it, and that officer, though his unpursued troops quickly regained their moral, had himself completely lost confidence. On the news of the battle (coupled with that of a fresh army appearing on the Korean coast), Kuropatkin instantly sent off part of his embryo central mass to bar the mountain passes of Fenshuiling and Motienling against the imagined relentless pursuit of the victors, and prepared to shift his centre of concentration back to Moukden. The subsidiary protective forces on either flank of Zaslulich had promptly abandoned their look-out positions and fallen back to join him. But the commander-in-chief, soon realizing that the Japanese were not pursuing, reasserted himself, sent the protective troops back to their posts, and cancelled all orders for the evacuation of Liao-Yang. From this time forward Kuro-

¹This was the 2nd Army, waiting in the port of Chinampo for the moment to sail for Pitszewo,

patkin allowed his subordinates little or no initiative. A few days later, Zaslulich's persistent requests to be allowed to retreat and the still uncertain movements of the 2nd Army induced him once more to prepare a concentration on Moukden. But on May 6 he learned that the Japanese 1st Army had again halted at Fêng-hwang-chêng and that the 2nd Army was disembarking at Pitszewo, and he resumed (though less confidently) his original idea. The eastern protective detachment, now strengthened and placed under the orders of Count Keller, was disposed with a view to countering any advance on Liao-Yang from the east by a combination of manoeuvre and fighting.

Alexeiev and Kuropatkin.—It was at this moment of doubt that Alexeiev, leaving Port Arthur just in time and profoundly impressed with the precarious state of affairs in the fleet and the fortress, gave the order, as commander-in-chief by land and sea, for an "active" policy (May 19). Kuropatkin, thus required to abandon his own plan, had only to choose between attacking the 1st Army and turning upon Oku. He did not yield at once; a second letter from the viceroy, the news of Nanshan, and above all a signed order from the tsar himself, "Inform General Kuropatkin that I impose upon him all the responsibility for the fate of Port Arthur," were needed to induce him to execute a scheme which in his heart he knew to be perilous. The path of duty for a general saddled with a plan which he disapproves is not easily discoverable. Napoleon in like case refused, at the risk of enforced resignation, and so did Moreau; the generality of lesser men have obeyed.

Stakelberg's 1st Siberian Corps was therefore reinforced towards the end of May up to a strength of above 35,000. But it remained a detachment only. The Liao-Yang central mass was still held in hand, for the landing of the 4th Army—really only a division at present—at Takushan and the wrong placing of another Japanese division supposed to be with Kuroki (really intended for Nogi) had aroused Kuropatkin's fears for the holding capacity of Keller's detachment. Moreover, disliking the whole enterprise, he was most unwilling to use up his army in it. The Russians, then, at the beginning of June, were divided into three groups, the southern, or offensive group (35,000), in the triangle Neuchwang-Haicheng-Kaiping; the eastern or defensive group (30,000), the main body of it guarding the passes right and left of the Wiju-Liao-Yang road, the left (Cossacks) in the roadless hills of the upper Aiho and Yalu valleys; the right (Mishchenko's Cossacks and infantry supports) guarding Fenshuiling pass and the road from Takushan; the reserve (42,000) with Kuropatkin at Liao-Yang; the "Ussuri Army" about Vladivostok; and Stössel's two divisions in the Kwantung peninsula.

On the other side the 1st Army was at Fêng-hwang-chêng with one brigade detached on the roads on either hand, the left being therefore in front of the Takushan division and facing the Fenshuiling. Oku's 2nd Army (four divisions or 60,000 combatants) was about Port Adams. This last was the objective of the attack of Stakelberg's 35,000. Kuropatkin's orders to his subordinate were a compromise between his own plan and Alexeiev's. Stakelberg was to crush by a rapid and energetic advance the covering forces of the enemy met with, and his object was "the capture of the Nanshan position and thereafter an advance on Port Arthur." Yet another object was given him, to "relieve the pressure on Port Arthur by drawing upon himself the bulk of the enemy's forces," and he was not to allow himself to be drawn into a decisive action against superior numbers. Lastly, on June 7, while Stakelberg was proceeding southward on his ill-defined errand, Kuropatkin, imposed upon by the advance of the Takushan column to Siu-yen, forbade him to concentrate to the front, only removing the veto when he learned that the 4th Army had halted and entrenched at Siu-yen.

Battle of Telissu.—On the 14th, all his arrangements for supply and transport being at last complete, Oku moved north. Although he was still short of part of the 6th Division, he was in superior force. He had, moreover, the perfectly definite purpose of fighting his way north, and at Telissu or Wafangkou on June 14, as he expected, he came upon Stakelberg's detachment in an entrenched position. On the 14th and 15th, attacking sharply on

the Russian front and lapping round both its flanks, Oku won an important and handsome victory, at a cost of 1,200 men out of 35,000 engaged, while the Russians, with a loss of at least 3,600 out of about 25,000 engaged, retired in disorder. Thus swiftly and disastrously ended the southern expedition. Meantime, except for the movement on Siu-yen already mentioned¹, and various reconnaissances in force by Keller's main body and by Rennenkampf's Cossacks farther inland, all was quiet along the Motienling front. Kuroki entrenched himself carefully about Fêng-hwang-chêng, intending, if attacked by the Russian main army, to defend to the last extremity the ground and the prestige gained on May 1.

From this point to the culmination of the advance at Liao-Yang, the situation of the Japanese closely resembles that of the Prussians in 1866. Haicheng represents Miinchenggratz, Liao-Yang Gitschin, and the passes east of Liao-Yang Nachod and Trautenau. The concentration of the various Japanese armies on one battlefield was to be made, not along the circumference of the long arc they occupied, but towards the centre. Similarly, Kuropatkin was in the position of Benedek. He possessed the interior lines and the central reserve which enables interior lines to be utilized, and a stroke of good fortune prolonged the period in which he could command the situation, for on June 23 an unexpected sortie of the Russian Port Arthur squadron paralysed the Japanese land offensive. In the squadron were seen the battleships damaged in the February attacks, and the balance of force was now against Togo, who had lost the "Yashima" and the "Hatsuse." The squadron nevertheless, tamely returned to harbour, Togo resumed the blockade and Nogi began his advance from Nanshan, but the 2nd and 4th Armies came to a standstill at once (naval escort for their seaborne supplies being no longer available), and the 1st Army, whose turn to advance had just arrived, only pushed ahead a few miles to cover a larger supply area. On July 1 the Vladivostok squadron appeared in the Tushima straits, and then vanished to an unknown destination, and whether this intensified the anxiety of the Japanese or not, it is the fact that the 2nd Army halted for 11 days at Kaiping, bringing the next on its right, 4th Army, to a standstill likewise. Its next advance brought it to the fortified position of Tashichiao, where Kuropatkin had, by drawing heavily upon his central reserve and even on the eastern detachment, massed about two army corps.

Tashichiao.—On the 24th Oku attacked, but the Russian general, Zarubayev, handled his troops very skilfully, and the Japanese were repulsed with a loss of 1,200 men. Zarubayev, who had used only about half his forces in the battle, nevertheless retired in the night, fearing to be cut off by a descent of the approaching 4th Army on Haicheng, and well content to have broken the spell of defeat. Oku renewed the attack next day, but found only a rearguard in front of him, and without following up the retiring Russians he again halted for six days before proceeding to Haicheng to effect a junction with the 4th Army (Nozu), which meantime had won a number of minor actions and forced the passage of the mountains at Fenshuiling South².

The 1st Army, after its long halt at Fêng-hwang-chêng, which was employed in minutely organizing the supply service—a task of exceptional difficulty in these roadless mountains—reopened the campaign on June 24, but only tentatively on account of the discouraging news from Port Arthur. A tremendous rainstorm imposed further delays, for the coolies and the native transport that had been laboriously collected scattered in all directions. The Motienling pass, however, had been seized without difficulty, and Keller's power of counter-attack had been reduced to nothing by the dispatch of most of his forces to the concentration at Tashichiao. But Oku's 2nd Army was now at a standstill at Kaiping, and until he was further advanced the 1st Army could not press forward. The captured passes were therefore fortified (as Fêng-

¹The occupation of Siu-yen was chiefly the work of the brigade pushed out to his left by Kuroki. Only a portion of the 10th Division from Takushan helped to drive away Mishchenko's Cossacks.

²The 5th Division of the 2nd Army had been sent to join the 10th as the latter approached Hsimucheng. The Guard brigade of Kuroki's army which had served with Nozu in the advance had now returned to Fêng-hwang chêng.

hwang-chêng had been for passive resistance. This, and the movements of the 4th Army, which had set its face towards Haicheng and no longer seemed to be part of a threat on Liao-Yang, led to the idea being entertained at Kuropatkin's headquarters that the centre of gravity was shifting to the south. To clear up the situation Keller's force was augmented and ordered to attack Kuroki. It was repulsed with a loss of nearly 1,000 men in the action at the Motienling (July 17), but it was at least ascertained that considerable forces were still on the Japanese right, and upon the arrival of a fresh army corps from Europe, Kuropatkin announced his intention of attacking Kuroki. And in effect he succeeded in concentrating the equivalent of an army corps, in addition to Keller's force, opposite to Kuroki's right. But having secured this advantage he stood still for five days, and Kuroki had ample time to make his arrangements. The Japanese general occupied some 20m. of front in two halves, separated by 6m. of impassable mountain, and knowing well the danger of a "oordon" defensive, he met the crisis in another and a bolder fashion. Calling in the brigade detached to the assistance of Nozu as well as all other available fractions of his scattered army, he himself attacked on July 31 all along the line. It was little more than an assertion of his will to conquer, but it was effectual. On his left wing the attacks of the Guard and 2nd Divisions (action of Yangtzu-ling) on the Russian front and flank failed—the frontal attack because of the resolute defence, the flank attack from sheer fatigue of the troops. Count Keller was killed in the defence. Meantime on the Japanese right the 12th Division attacked the large bodies of troops that Kuropatkin had massed (Yu-shu-ling) equally in vain. But one marked success was achieved by the Japanese. The Russian 35th and 36th Regiments (10th European Corps) were caught between two advancing columns, and, thanks to the initiative of one of the column leaders, Okasaki, destroyed. At night, discouraged on each wing by the fall of Count Keller and the fate of the 35th and 36th, the whole Russian force retired on Anping, with a loss of 2,400 to the Japanese 1,000 men.

Russian Retirement on Liao-Yang.—This was the only manifestation of the offensive spirit on Kuropatkin's part during the six months of marking time. It was for defence, sometimes partial and elastic, sometimes rigid and "at-all-costs," that he had made his dispositions throughout. His policy now was to retire on Liao-Yang as slowly as possible and to defend himself in a series of concentric prepared positions. In his orders for the battle around his stronghold there is no word of counter-attack, and his central mass, the special weapon of the commander-in-chief, he gave over to Bilderling and to Zarubayev to strengthen the defence in their respective sections or posted for the protection of his line of retreat. Nevertheless he had every intention of delivering a heavy and decisive counterstroke when the right moment should come, and meantime his defensive tactics would certainly have full play on this prearranged battlefield with its elaborate redoubts, bomb-proofs and obstacles, and its garrison of a strength obviously equal (and in reality superior) to that of the assailants. The Japanese, too, had effected their object, and as they converged on their objective the inner flanks of the three armies had connected and the supreme commander Marshal Oyama had taken command of the whole. But instead of boldly pushing out the 1st Army to such a distance that it could manoeuvre, as Moltke did in 1866 and 1870, he attached it to the general line of battle. It was not in two or three powerful groups but in one long chain of seven deployed divisions that the advance was made.

Battle of Liao-Yang.—On Aug. 25 the 2nd and 4th Armies from Haicheng and the 1st Army from the Yin-tsu-ling and Yu-shu-ling began the last stage of their convergent advance. The Russian first position extended in a semicircle from Anshantien (on the Liao-Yang-Hai-cheng railway) into the hills at Anping, and thence to the Taitse river above Liao-Yang; both sides had mixed detachments farther out on the flanks. The first step in the Japanese plan was the advance of Kuroki's army to Anping. Throughout the 25th, night of the 25th-26th, and the 26th of August, Kuroki advanced, fighting heavily all along the line, until on the night of the 26th the defenders gave up the contested ground at Anping. Hitherto there had only been skirmishing on a

large scale on the side of Hai-cheng Kuropatkin having already drawn in his line of defence on the south side towards Liao-Yang, the 2nd and 4th Japanese Armies delivered what was practically a blow in the air. But on the 27th there was a marked change in the Japanese plan. The right of the 1st Army, when about to continue the advance west on Liao-Yang, was diverted northward by Oyama's orders and ordered to prepare to cross the Taitszeho. The retirement of the Russian southern force into its entrenchments emboldened the Japanese commander-in-chief to imitate Moltke's method to the full. On the 28th, however, the 1st Army made scarcely any progress. The right (12th) division reached the upper Taitszeho, but the divisions that were to come up on its left were held fast by their opponents. The 29th was an uneventful day, on which both sides prepared for the next phase.

The Russians' semicircle, now contracted, rested on the Taitszeho above and below the town, and their forces were massed most closely on either side of the "Mandarin" road that the 1st Army had followed. Opposite this portion of the line was the Guard and the 4th Army. Oku was astride the railway, Kuroki extending towards his proposed crossing-points just beyond Kuropatkin's extreme left (the latter was behind the river). On the 30th the attack was renewed. The Guard, the 4th Army and the 2nd Army were completely repulsed.

On the night of the 30th the first Japanese troops crossed the Taitszeho near Lien-Tao-Wun, and during the 31st three brigades were deployed north of Kwan-tun, facing west. The Russian left wing observed the movement all day, and within its limited local resources made dispositions to meet it. Kuropatkin's opportunity was now come. The remainder of the Japanese 2nd Division was following the 12th, leaving a nine-mile gap between Kuroki and Nozu, as well as the river. It was not into this gap, but upon the isolated divisions of the 1st Army that the Russian general proposed to launch his counterstroke. Reorganizing his southern defences on a shorter front, so as to regain possession of the reserves he had so liberally given away to his subordinates, he began to collect large bodies of troops opposite Kuroki, while Stakelberg and Zarubayev, before withdrawing silently into the lines or rather the fortress of Liao-Yang, again repulsed Oku's determined attacks on the south side. But it was not in confidence of victory that Kuropatkin began the execution of the new plan—rather as a desperate expedient to avoid being cut off by the 1st Army, whose strength he greatly overestimated.

On the morning of Sept. 1—the anniversary of Sedan, as the Japanese officers told their men—Oyama, whose intentions the active Kuroki had somewhat outrun, delivered a last attack with the 2nd and 4th Armies and the Guard on the south front, in the hope of keeping the main body of the Russians occupied and so assisting Kuroki, but the assailants encountered no resistance, Zarubayev having already retired into the fortress. North of the Taitszeho the crisis was approaching. Kuroki's left, near the river, vigorously attacked a hill called Manjuyama which formed part of the line of defence of the 17th Corps from Europe. But the right of the 1st Army (12th Division) was threatened by the gathering storm of the counterstroke from the side of Yentai mines, and had it not been that the resolute Okasaki continued the attack on Manjuyama alone the Japanese offensive would have come to a standstill. Manjuyama, thanks to the courage of the army commander and of a single brigadier, was at last carried after nightfall, and the dislodged Russians made two counter-attacks in the dark before they would acknowledge themselves beaten. Next morning, when Kuroki (who had conceived the mistaken idea of a general retreat of the Russians on Mukden) was preparing to pursue, the storm broke. Kuropatkin had drawn together seven divisions on the left rear of the 17th Corps, the strength of the whole being about 90,000. On the extreme left was Orlov's brigade of all arms at Yentai mines, then came the 1st Siberian Corps (Stakelberg), the 10th Corps, and finally the 17th. But Orlov, perplexed by conflicting instructions and caught in an unfavourable situation by a brigade of the 12th Division which was executing the proposed "pursuit," gave way—part of his force in actual rout—and the cavalry that was with him was driven back by the Kobi (reserve army) brigade of the Guard. The fugitives

of Orlov's command disordered the on-coming corps of Stakelberg, and the outer flank of the great counterstroke that was to have rolled up Kuroki's thin line came to an entire standstill. Meantime the 10th Corps furiously attacked Okasaki on the Manjuyama, and though its first assault drove in a portion of Okasaki's line, a second and a third, made in the night, failed to shake the constancy of the 15th Brigade. Misunderstandings and movements at cross-purposes multiplied on the Russian side, and at midnight Kuropatkin at last obtained information of events on the side of Yentai mines. This was to the effect that Orlov was routed, Stakelberg's command much shaken, and at the same time Zarubayev in Liao-Yang, upon whom Oku and Nozu had pressed a last furious attack, reported that he had only a handful of troops still in reserve. Then Kuropatkin's resolution collapsed, although about three divisions were still intact, and he gave the order to retreat on Mukden.

Russian Retreat on Mukden.—Thus the Japanese had won their great victory with inferior forces, thanks "in the first instance to the defeat of Gen. Orlov. But at least as large a share in the ruin of the Russian operations must be attributed to the steadfast gallantry of the 15th Brigade on Xklanjuyama." The losses of the Japanese totalled 23,000, those of the Russians 19,000. Coming, as it did, at a moment when the first attacks on Port Arthur had been repulsed with heavy losses, this successful climax of the four months' campaign more than restored the balance. But it was not the expected Sedan. Had the two divisions still kept in Japan been present Kuroki would have had the balance of force on his side, the Russian retreat would have been confused, if not actually a rout, and the war might have been ended on Japan's own terms. As it was, Kuropatkin drew off the whole of his forces in safety, sharply repulsing an attempt at pursuit made by part of the 12th Division on Sept. 4. The railway still delivered 30,000 men a month at Mukden, and Japan had for a time outrun her resources. At St. Petersburg the talk was not of peace but of victory, and after a period of reorganization the Russians advanced afresh to a new trial of strength. But the remainder of the Manchurian campaign proved little more than a series of violent and resultless encounters of huge armies—armies far larger than those which had fought out the real struggle for supremacy at Liao-Yang.

Naval Actions.—At this time the siege of Port Arthur had progressed only so far that the besiegers were able to realize the difficulties before them. Their exertions and sacrifices were not crowned with success until the year had run its full course, and meantime the repeated frustration of their hopes had a moral reaction on the main struggle in Manchuria, apart from keeping one of their armies away from the decisive theatre. At sea, however, the Japanese navy scored two important successes. After months of blockade and minor fighting, the Russian Port Arthur squadron had been brought to action on Aug. 10. Admiral Vitheft, Makárov's successor, had put to sea shortly after the appearance of the 3rd Army on the land front of Port Arthur. The battle opened about noon, 20m. south of the harbour; the forces engaged on each side varied somewhat, but Togo finally had a superiority. As the Russians became gradually weaker, the Japanese closed in to within 3m. range, and Prince Ukhtomsky (who succeeded to the command on Vitheft being killed) gave up the struggle at nightfall. The Russians scattered, some vessels heading southward, the majority with the admiral making for Port Arthur, whence they did not again emerge. All the rest were either forced into neutral ports (where they were interned) or destroyed, among the latter being the third-class cruiser "Novik," which had already earned a brilliant reputation for daring, and now steamed half round Japan before she was brought to action and run ashore. The victors blockaded Port Arthur, until near the close of the siege when, after going ashore and examining the remnant of the Russian fleet from 203-Metre hill, Togo concluded that it would be safe to return to Japan and give his ships a complete refit. Kaimura's squadrons, after various adventures, at last succeeded on Aug. 14 in engaging and defeating the Russian Vladivostok squadron (Admiral Jessen). Thus the Russian flag disappeared from the Pacific, and thenceforward only the Baltic

fleet could hope seriously to challenge the supremacy of the Japanese navy.

The remainder of the war on land, although it included two battles on a large scale and numerous minor operations, was principally a test of endurance. After Liao-Yang there were no widely extended operations, the area of conflict being confined to the plain of the coast side of the Hun-ho and the fringe of the mountains. Japan had partially accomplished her task, but had employed all her trained men in this partial accomplishment. It was questionable, even in Oct. 1904, whether she could endure the drain of men and money if it were prolonged much further. On the other hand, in Russia opposition to the war, which had never been popular, gradually became the central feature of a widespread movement against irresponsible government. Thus, while the armies in Manchuria faced one another with every appearance of confidence, behind them the situation was exceedingly grave for both parties. A state of equilibrium was established, only momentarily disturbed by Kuropatkin's offensive on the Sha-ho in October, and by the Sandepu incident in the winter, until at last Oyama fought a battle on a grand scale and won it. Even then, however, the results fell far short of anticipation, and the armies settled down into equilibrium again.

Battle of the Sha-ho.—After the battle of Liao-Yang Kuropatkin reverted for a moment to the plan of a concentration to the rear at Tieling. Politically, however, it was important to hold Mukden, the Manchurian capital, and as the Japanese, as on previous occasions, reorganized instead of pursuing, he decided to stand his ground, a resolution which had an excellent effect on his army. Moreover, growing in strength day by day, and aware that the Japanese had outrun their powers, he resolved, in spite of the despondency of many of his senior officers, to take the offensive. He disposed of about 200,000 men, the Japanese had about 170,000. The latter lay entrenched north of Liao-Yang, from a point gm. west of the railway, through Yentai station and Yentai mines, to the hills farther east. There had been a good deal of rain, and the ground was heavy. Kuropatkin's intention was to work round the Japanese right on the hills with his eastern wing (Stakelberg), to move his western wing (Bilderling) slowly southwards, entrenching each strip of ground gained, and finally with the centre—*i.e.*, Bilderling's left—and Stakelberg, to envelop and crush the 1st Army, which formed the Japanese right, keeping the 4th Army (Nozu) and the 2nd Army (Oku) fixed by means of Bilderling's main body. The manoeuvre began on Oct. 5, and by the evening of the 10th, after four days of advanced-guard fighting, Stakelberg was in his assigned position in the mountainous country, facing west towards Liao-Yang, with his left on the Taitszeho. The advance of Bilderling, however, necessarily methodical and slow in any case, had taken more time than was anticipated. Still, Bilderling crossed the Sha-ho and made some progress towards Yentai, and the demonstration was so far effectual that Kuroki's warnings were almost disregarded by the Japanese headquarters. The commander of the 1st Army, however, took his measures well, and Stakelberg found the greatest trouble in deploying his forces for action in this difficult country. Oyama became convinced of the truth on the 9th and 10th, and prepared a great counterattack. Kuroki, with only a portion of the 1st Army, was left to defend at least 15m. of front, and the entire and 4th Armies and the general reserves were to be thrown upon Bilderling. On the 11th the real battle opened. Kuroki displayed the greatest skill, but he was of course pressed back by the four-to-one superiority of the Russians. Still the result of Stakelberg's attack, for which he was unable to deploy his whole force, was disappointing, but the main Japanese attack on Bilderling was not much more satisfactory, for the Russians had entrenched every step of their previous advance and fought splendidly. The Russian commander-in-chief states in his work on the war that Bilderling became engaged *à fond* instead of gradually withdrawing as Kuropatkin intended, and at any rate it is unquestioned that in consequence of the serious position of affairs on the western wing, not only did Stakelberg use his reserves to support Bilderling, when the 12th Division of Kuroki's army was almost at its last gasp and must have yielded to fresh

pressure, but Kuropatkin himself suspended the general offensive on Oct. 13. In the fighting of Oct. 13–16 the Russians gradually gave back as far as the line of Sha-ho, the Japanese following until the armies faced roughly north and south on parallel fronts. The fighting, irregular but severe, continued. Kuropatkin was so far averse to retreat that he ordered a new offensive, which had fair success on the 16th–17th. Kuropatkin wished to continue the offensive, but his corps commanders offered so much opposition to a further offensive that he at last gave up the idea. The positions of the rival armies from Oct. 18, the close of the battle of the Sha-ho, to Jan. 26, 1905, the opening of the battle of Sandepu (Heikoutai)—a period almost entirely devoid of incident—may be described by the old-fashioned term "winter quarters."

In Jan. 1905 the Russians, 300,000 strong, were now organized in three armies, commanded by Generals Linievich, Grippenbergr and Kaulbars; the total strength of the Japanese 1st, 2nd and 4th Armies and reserve was estimated by the Russians at 220,000. Towards the end of January Kuropatkin took the offensive. He wished to inflict a severe blow before the enemy could be reinforced by the late besiegers of Port Arthur, and sent Grippenbergr with seven divisions against Oku's two on the Japanese left. The battle of Sandepu (Heikoutai), fought in a terrible snow-storm on Jan. 26 and 27, 1905, came near to being a great Russian victory. But after two days' severe fighting, although Grippenbergr had not been checked, Kuropatkin, in face of a counterattack by Oyama, decided to abandon the attempt.

Battle of Mukden.—Both sides stood fast in the old positions up to the verge of the last and greatest battle. Kuropatkin was reinforced, and appointed Kaulbars to succeed Grippenbergr and Bilderling to the command of the 3rd Army vacated by Kaulbars. On the other hand, Nogi's 3rd Army, released by the fall of Port Arthur, was brought up on the Japanese left, and a new army under Kawamura (5th), formed of one of the Port Arthur and two reserve divisions, was working from the upper Yalu through the mountains towards the Russian left rear. The Russian line covering Mukden was 47m. long, the armies from right to left being 2nd (Kaulbars), 3rd (Bilderling) and 1st (Linievich); a general reserve was at Mukden. On the other side from left to right, on a line 40m. long, were Oku (2nd Army), Nozu (4th), Kuroki (1st) and Kawamura (5th), the general reserve in rear of the centre at Yentai and the 3rd Army in rear of Oku. Each side had about 310,000 men present. The entire front of both armies was heavily entrenched. The Russians had another offensive in contemplation when the Japanese forestalled them by advancing on Feb. 21. The 5th Army gradually drove in Kuropatkin's small detachments in the mountains, and came up in line with Kuroki, threatening to envelop the Russian left. The events on this side and misleading information induced Kuropatkin to pay particular attention to his left. The Japanese 1st and 5th Armies were now engaged (Feb. 25), and elsewhere all was quiet. But on the 27th the fighting spread to the centre, and Nogi (originally behind Oku) was on the march to envelop the Russian right. He was held under observation throughout by Russian cavalry, but it seems that little attention was paid to their reports by Kuropatkin, who was still occupied with Kuroki and Kawamura, and even denuded his right of its reserves to reinforce his left. With a battle-front exceeding two days' marches the wrong distribution of reserves by both sides was a grave misfortune. Kuropatkin was at last convinced, on Feb. 28, of the danger from the west, and did all in his power to form a solid line of defence on the west side of Mukden. Nogi's first attack (March 1–2) had not much success, and a heavy counterstroke was delivered on the 2nd. Fighting for localities and alterations in the interior distribution of the opposing forces occupied much time, and by the 3rd, though the battle had become severe, Kuropatkin had merely drawn in his right and right centre (now facing west and south-west respectively) a little nearer Mukden. His centre on the Sha-ho held firm, Kuroki and Kawamura made but slight progress against his left in the mountains. Nogi and Oyama were equally impressed with the strength of the new (west) Russian front, and, like Grant at Petersburg in 1864,

extended farther and farther to the outer flank, the Russians following suit. The Japanese marshal now sent up his army reserve, which had been kept far to the rear at Yentai, to help Nogi. It was not before the evening of March 6 that it came up with the 3rd Army and was placed in position opposite the centre of the Russian west front. On the rest of the line severe local fighting had continued, but the Russian positions were quite unshaken and Kuropatkin's reserves—which would have been invaluable in backing up the counter-attack of March 2—had belatedly returned to face Nogi. He had organized another counterstroke for the 6th, to be led by Kaulbars, but this collapsed unexpectedly after a brief but severe fight.

Russian Retreat on Tieling.—Kuropatkin now decided to draw in his centre and left towards Mukden. On the 7th, the various columns executed their movement to the Hun-ho with complete success, thanks to good staff work. The Japanese followed up only slowly. Nogi and Kaulbars stood fast, facing each other on the west front; after the arrival of the general reserve, Nogi was able to prolong his line to the north and eventually to bend it inwards towards the Russian line of retreat. On the 8th the fighting between Nogi and Kaulbars was very severe, and Kuropatkin now made up his mind to retreat towards Tieling. On the 9th, by Oyama's orders, Nogi extended northward instead of further swinging in south-eastward, Oku now occupied all the original line of the 3rd Army, Nozu alone was left on the south front, and Kuroki and Kawamura began to engage Linievich seriously. But Nogi had not yet reached the Mukden-Tieling railway when, on the night of the 9th, every preparation having been made, Kuropatkin's retreat began. On the 10th, covered by Kaulbars, who held off Nogi, and by strong rearguards at and east of Mukden, the movement continued, and though confusion was prevalent and the rearguards suffered very heavily, the Russians managed to draw off in safety to the northward. On the evening of the 10th, after all their long and hardly contested enveloping marches, Nogi's left and Kawamura's right met north of Mukden. The circle was complete, but there were no Russians in the centre, and a map of the positions of the Japanese on the evening of the 10th shows the 17 divisions thoroughly mixed up and pointing in every direction but that of the enemy. Thus the further pursuit of the Russians could be undertaken only after an interval of reorganization by the northernmost troops of the 5th and 3rd Armies. But the material loss inflicted on the Russians was far heavier than it had ever been before. It is generally estimated that the Russian losses were no less than 97,000, and the Japanese between 40,000 and 50,000. Japan had had to put forth her supreme effort for the battle, while of Russia's whole strength not one-tenth had been used. But Russia's strength in Europe, with but one line whereby it could be brought to bear in the Far East, was immaterial, and on the theatre of war a quarter of the Russian field forces had been killed, wounded or taken.

Rozhstvenski's Voyage.—It remains to narrate briefly the tragic career of the Russian Baltic fleet. Leaving Libau on Oct. 13-15, 1904, the fleet steamed down the North sea, expecting every night to be attacked by torpedo-boats. On the 21st, in their excitement, they opened fire on a fleet of British trawlers on the Dogger Bank (*q.v.*), and several fishermen were killed. This incident provoked the wildest indignation, and threatened for some days to bring Russia into conflict with England. A British fleet "shadowed" Rozhstvenski for some time, but eventually the Russians were allowed to proceed. On reaching Madagascar, Rozhstvenski heard of the fall of Port Arthur, and the question of returning to Russia arose. But a reinforcement under Rear-Admiral Nebogatov was despatched from the Baltic via Suez early in March 1905, and the armada proceeded by the Straits of Malacca, Nebogatov joining at Kamranh bay in Cochinchina. The united fleet was formidable rather in number than in quality; the battleships were of very unequal value, and the faster vessels were tied to the movements of many "lame ducks." Rozhstvenski had, moreover, numerous store-ships, colliers, etc. Nevertheless, the Japanese viewed his approach with considerable anxiety, and braced themselves for a final struggle. Of the vari-

ous courses open to him, Togo prudently chose that of awaiting Rozhstvenski in home waters. The Russians left Kamranh on May 14, and for a time disappeared into the Pacific. It was assumed that they were making for Vladivostok either via Tsushima strait or by the Pacific. Rozhstvenski chose the former course, and on May 27 the fleets met near Tsushima. By superior speed and handling the Japanese gained an increasing advantage, and by the following day the whole Russian fleet, with few exceptions, had been captured or sunk. (See **TSUSHIMA** for battle.)

The Peace of Portsmouth.—After the disasters of Mukden and Tsushima, and being threatened with internal disorder in European Russia, the tsar, early in June, accepted the mediation of the president of the United States, and *pourparlers* were set on foot. The war, meanwhile, drifted on through May, June and July. Linievich, who succeeded Kuropatkin shortly after the battle of Mukden, retired slowly northward, reorganizing his forces and receiving fresh reinforcements from Europe. A Japanese expedition occupied Sakhalin (July 8-30), and another, under General Hasegawa, advanced through Korea towards Vladivostok. But the fighting was desultory. The peace negotiations were opened at Portsmouth (N.H.), on Aug. 9, and by the end of the month the belligerents had agreed as to the main points at issue—that Russia should cede the half of Sakhalin, annexed in 1875, surrender her lease of the Kwantung peninsula and Port Arthur, evacuate Manchuria, and recognize Japan's sphere of influence in Korea. The treaty of peace was signed on Aug. 23, 1905.

BIBLIOGRAPHY.—Among the first-hand narratives the most important are: Ian Hamilton, *A Staff Officer's Scrap Book*; and the *British Officers' Reports*, War Office, 1908. Also *Reports of Military Observers*, General Staff U.S.A.; Major v. Tettau's *18 Monate beim Heere Russlands*; von Schwarz, *Zehn Monate beim Heere Kuropatkins*, and Kuropatkin's own work (part of which has been translated into English). Of detailed military histories the principal are the semi-official series of narratives and monographs produced by the Austrian military journal "Streffleur" (*Einzelschriften über den russ.-japanischen Krieg*); the volumes of lectures delivered at the Russian staff college after the war, French translation (*Conférences sur la guerre russo-japonaise faites à l'Académie Nicolas*); British official *History of the Russo-Japanese War*; German official *Russisch-japanischer Krieg* (Eng. trans. by K. von Donat); Löffler, *Der russisch-japanische Krieg* (Leipzig, 1907; French trans.); L. Gianni Trapani, *La Guerra russo-japponese* (1908); E. Bujac, *La Guerre russo-japonaise* (1909). Of critical studies one of the most important is Culmann, *Étude sur les caractères généraux de la guerre en extrême-orient* (1909). One naval narrative of absorbing interest has appeared, Semenov's *Rasplata* (Eng. trans.).

RUSSO-POLISH CAMPAIGN. This campaign, of 1920, which resulted in the defeat and rout of the Soviet Army when it was within sight of the Polish capital, is full of dramatic incident. Organization of command, staff and administration was lacking on both sides, but above all it was the want of a proper system of supply which accounted for the sudden collapse of troops engaged in a victorious advance. The thinly populated territory lying between the Niemen in the north and the Dniester in the south was incapable of supporting large bodies of troops, and as both sides attempted to live on the country during their advances the failure of their operations followed quickly each success.

Cause of the War.—During the course of 1919 and early 1920, the Soviet Government had succeeded in clearing their territory of the White Russian armies under Kolchak, Denikin and Yudenich. They were thus at liberty to examine the situation on their frontiers. With such a mixture of races living side by side in the disputed regions no delimitation of frontier would have suited all parties, and in the absence of authority to enforce a decision, trouble quickly arose between the Soviet and the newly formed Polish State. Poland was determined to maintain her new liberty and had called up fresh levies to support the various legions which had been repatriated from the fronts upon which they had been fighting in the World War. The Soviet began to concentrate their troops towards the west. Inflammatory speeches in Moscow and a fierce propaganda amongst the Polish working people brought Polish public opinion to a fever heat. From seven divisions in January the Soviet had, by March, increased the number of their

troops facing the Poles to 20 divisions, with three cavalry divisions. Poland decided that she could not wait quietly for the inevitable Soviet attack by which she would certainly be destroyed, and that she must act at once.

Polish Offensive.—Strategically, the territory in dispute may be divided into two separate areas: White Russia in the north and Volhynia and Podolia in the south. The marshes of the Pripiet divide one area from the other. Acting in collusion with Petlura, the Hetman of the Ukraine, who had promised to raise his country against the Soviet, the Poles advanced in April as far as Kiev. By the beginning of May the Polish-Soviet front ran from Dvinsk in the north along the course of the Dnieper to Kiev and thence to the Dniester near Kamenets. No sooner were the Poles established in Kiev than the Soviet northern army began to advance. The Poles were able to transfer troops from the south and counter-attacked the Soviet forces which had already penetrated as far west as Lida and Baranowicz. By the end of May the line held at the beginning of the month had been restored. Operations had been most ably carried out by the Polish minister of war, Gen. Sosnkowski, but there were indications that the Soviet were transferring more and more troops to the west and that a renewal of their attacks might be expected.

At the beginning of June, in the southern area there appeared a new Soviet cavalry leader, Budenny, who completely altered the situation. Budenny had been a non-commissioned officer in the old Russian Army and soon proved himself a man of action. Within a month he had driven back the Poles a distance of 200m. until their line in the south ran just east of Pinsk and Równe (Rovno) to the junction of the Dniester and Siret (Sereth).

Russian Success.—Fighting in the northern area continued intermittently during the month of June, preventing the Poles from transferring troops to the hard-pressed south. Despite the operations in the south it was clear that the main Soviet attack was coming in the north. On July 4 the blow fell. The whole Polish line gave way. Wilno (Vilna) and Minsk were lost in the first week. Grodno fell on July 20 and Bialystok on July 25. By the end of July the Soviet advance guards had reached the Bug. In 25 days the Poles had lost 300m. of territory. The main cause of the collapse was their failure to constitute reserves. In their desire to protect their new territory they had been led into a linear defence on a front of nearly 800m., where they were strong nowhere.

Disposition of Troops.—The Polish situation was now critical. With the help of the French military mission, under Gen. Weygand, a plan for a great counter-attack was evolved on Aug. 6. The situation of the opposing sides on that date was as follows:—

Soviet: (1) Northern group. Four armies—4th, 15th, 3rd and 16th, with a cavalry corps on the extreme north aiming to outflank the Polish left.

(2) Southern group. Two armies—12th and 14th with Budenny's cavalry, along a line from Kowel through Brody to Tarnopol. The men of the Soviet army were unfed and worn out with a month's marching.

Poles: (1) A Northern group formed of units which had been retreating for over a month, strengthened by reinforcements thrown in hastily as they came up. Much material had been lost and the men were tired and hungry, but the approach to the line of the Vistula was beginning to simplify the supply of food and munitions.

(2) Southern group. Three armies—6th, 3rd and 4th—facing the Soviet southern group. Here pressure from the enemy had been by no means so severe as in the north and many of the divisions still retained their original fighting value.

Polish Plan of Attack.—The Polish plan was to withdraw all but a minimum of force from the southern area and to attack the Soviet northern group with the greatest possible strength. The operation bears a close resemblance to Ludendorff's manoeuvre at Tannenberg. In many respects the situation was similar. The Russians were advancing in two main groups divided by the Pripiet marshes instead of the Masurian lakes. Here the Soviet southern group was advancing slowly like *Rennenkampf's* army in 1914. The situation would become critical as

soon as the two Soviet groups converged upon the Polish Army. No time was to be lost. Would the commander of the Soviet armies in the south allow himself to be deceived in the same manner as *Rennenkampf*?

On August 6 orders for the following fresh groupings were issued from Polish headquarters:—

(1) Three armies—and, ~ 5th—under Gen. Joseph Haller, were to withdraw slowly to the line of the Vistula from Deblin to Modlin, with the 5th Army pushed well forward on the left to prevent any outflanking of the Polish left between Warsaw and the East Prussian frontier.

(2) Two armies, 3rd and 4th—were to concentrate behind the Wieprz between Chelm and Deblin, ready to strike due north; the advance of these two armies to commence on Aug. 16.

(3) One army, 6th—would withdraw as necessity arose in the direction of Lemberg, tempting the Soviet southern group away from the critical point in the north.

By Aug. 12 all the armies, with the exception of the two on each flank, had reached their assigned positions without incident. In the south the 3rd had found the 12th Soviet army advancing and had been forced to throw out a detachment on its right flank to cover its concentration. It had been delayed in consequence. In the north, the 5th had been driven back by overwhelming strength and had been unable to prevent the enemy outflanking movement.

Enthusiasm in the Polish army had risen surprisingly in the days since the momentous decision to attack had been taken. The chief of the Polish State, Marshal Pilsudski, had himself taken command of the 3rd and 4th Armies. With the help of Weygand and his staff the service of supply had been restored. New bodies of reinforcements were moved forward from the depôts in Western Poland and the depleted units began to raise their heads again. National optimism returned. The enemy in the south made no determined move and appeared to have no inkling of what was afoot. Every hour that he delayed meant more chance of success for the Polish plan.

Polish Advance.—Gen. Sikorski's 5th Army in the north was the first to move. The Soviet movement round his left had assumed alarming proportions and had to be stopped. On Aug. 14 he pressed forward from his defensive position at Modlin and at once encountered the Soviet 15th Army advancing to the attack. Sikorski persisted in his attacks all through Aug. 15 and 16, his men fighting with determination. Not even the appearance of elements of the Soviet 4th Army in his left rear turned him from his purpose. Throwing out covering detachments to watch his rear, he attacked again on Aug. 17. His determination reaped its reward, for the enemy gave way in front of him, their retreat rapidly developing into a rout.

In the south Pilsudski's armies made good progress. The blow against the left of the Soviet 16th Army came as a complete surprise and they offered little resistance. During Aug. 16 and 17 the Poles covered over 50 miles. By Aug. 18 the 3rd Soviet Army, which lay between the 17th destroyed by Sikorski, and the 16th broken by Pilsudski, turned also in hopeless confusion.

On the extreme Soviet right their 4th Army, containing some of the picked Communist regiments, together with the cavalry corps, had reached the Vistula between Torun and Plock in their great turning movement when Sikorski suddenly advanced. Had they advanced resolutely even then, all might have been well, but they hesitated and were lost. Their half-hearted attacks against Sikorski's left had little effect. It was not till Aug. 20 that the order for a general retreat reached them. On Aug. 22, at Mława, and Aug. 23 at Chorzele they were successful in cutting themselves a passage, but on Aug. 24 at Kovno they ran up against Pilsudski's 4th Army blocking the way. Almost without making an effort to attack they passed ignominiously over the East Prussian border to internment.

The pace of the Polish pursuit was remarkable. From Aug. 16 to Aug. 25 the advanced units of the 2nd army had covered 200m. as the crow flies. The 4th Army averaged 25m. a day in their advance. The service of supply was left far behind. The troops existed as they could upon the exhausted country. Luckily

the Soviet resistance was so completely broken that there was no further fear of counter-attack and the Polish units had ample time in which to reorganize.

Conclusion.—The results of the battle of Warsaw, as it has been named, are only exceeded by those of Tannenberg. The Poles captured 70,000 prisoners, 200 guns and 1,000 machine-guns. From 50,000 to 100,000 Soviet troops passed over into East Prussia. The victory of the Poles was due to the adoption of a determined offensive based upon a sound plan. The raising of the morale of the beaten troops by the Polish authorities, roused to enthusiasm themselves by the inspiring presence of Gen. Weygand, is little short of miraculous. The crisis of the battle was undoubtedly Aug. 15–16, when Sikorski's 5th army cleared its front. If it was Pilsudski's force which completed the Soviet defeat, it was undoubtedly the magnificent fighting of Sikorski and his men which made victory possible.

RUSSO-TURKISH WARS. The Greek insurrection in 1824 gave England, France and Russia occasion to press demands upon Turkey, which the Porte refused to accede to, rejecting besides the London Protocol of July 1827. Hostilities broke out in Oct. 1827, when the allied fleet under Admiral Codrington defeated the Turkish flotilla off Navarino. This victory greatly facilitated the eventual Russian operations against Turkey as the Russian army supported and provisioned by her own fleet could march along the coast by the shortest road to Adrianople and thence towards the Turkish capital.

Towards the end of April 1828 the Russian army consisting of three army corps stood between the Pruth-Dniester 69,000 strong, war having been formally declared on April 28. Turkey, whose army was being reorganized at the time, decided to resist the enemy in the quadrilateral, Ruschuk, Silistria, Varna and Shumla, for which purpose she assembled about 80,000 men. One corps of the invading army invested Braila, which was captured on June 17; another Russian corps crossed at the mouth of the Danube on June 11, while a third drove back the garrisons of Ruschuk and Widdin into these fortresses from which they had emerged. The first two Russian corps now advanced on Shumen but finding the Turks to be stronger than they supposed, they fell back on Yenibazar. A Russian force was thrown forward towards Varna but only on the arrival of the Russian guard corps could the idea be entertained of investing it. The siege began on Sept. 10 and a month later Varna surrendered. The Russians owing to numerical weakness retired into winter quarters in Moldavia and Wallachia, leaving two corps in the vicinity of Varna, Pravodi and Bazardjik. The fortress of Silistria was still in Turkish hands and it now became on the resumption of hostilities the principal Russian objective. Sizopol at the entrance to the harbour of Burgas was captured providing the Russians with a base for their operations south of the Danube. Silistria being invested fell on June 29. Meanwhile Reschid Pasha advanced from Shumla against Pravodi hoping to recapture Varna but was beaten off. General Diebitch, who had replaced Wittgenstein as Russian commander-in-chief, defeated Reschid Pasha at Tcherkovna on June 11. Diebitch now decided to advance south of the Balkans. Reschid attempted to hinder his march but was vanquished at Sliven on Aug. 12. Adrianople was entered Aug. 20, but as Diebitch had only 15,000 men and pestilence was ravaging his ranks he deemed it wiser to conclude a treaty in September before Turkey became aware of the state of his army. Success crowned the Russian arms in Asia, Paskevitch gaining two important victories on June 1 and 2 at Erivan, his advance coming to a close by terms of the treaty arranged in Europe. A conference held in London proclaimed the independence of Greece, Russia receiving the islands at the mouth of the Danube, while Moldavia and Wallachia were to be no longer provinces of Turkey, but only under her protectorate.

The War of 1877–78.—The oppression of the Christian subjects of the Sultan had made hostilities in 1877 between Turkey and Russia inevitable. After the Crimean War Turkey promised

to grant reforms, thereby bettering the treatment of the Christian population, but the following years brought no material change. In 1875 an insurrection broke out in Hercegovina and Montenegro, to be followed by Serbia openly taking up arms against Turkey. Russia, whose sympathies by reason of race and religion, were wholly on the side of the Slavs, could not remain a silent onlooker of the events in the Balkans. Russian volunteers flocked in great numbers to join the Serbians and General Chernyaeff was entrusted with their command. Disparity of numbers however, went against the Serbians, the Turks gaining several successes, which culminated in their victory at Djunis on Oct. 29, 1876. Alexander II. then stepped forward and insisted on hostilities ceasing, to which Turkey hurriedly assented. A conference now assembled at Constantinople, but after months of deliberation, it failed to come to an agreement, Turkey taking advantage of the divergent views of the Great Powers. She became as time progressed less willing to make concessions. To prepare for all eventualities and to bring greater weight to her influence at the conference Russia mobilized six army corps in Nov. They consisted of the VII., VIII., IX., X., XI. and XII., corps and were concentrated on the southern frontier, on the Rumanian borders. Mobilization arrangements were not worked effectively nor the deployment of the forces. It must be borne in mind that conscription had been only enforced in Jan. 1874 and there was consequently a lack of well trained officers and reserves. Another great obstacle that hindered Russia from dealing a quick blow at Turkey was the lack of a fleet in the Black sea, though this restriction was removed in 1871. Knowing the unprepared state of the forces several experts, among them General Todleben, the world famous defender of Sevastopol in the Crimean War (*q.v.*), were opposed to Russia undertaking an active campaign, but the Pan-Slav movement which was general in Russia, forced the Tsar to declare war April 24. Having underrated her foe Russia began hostilities with insufficient forces, sending 257,000 men into Rumania and 70,000 each to the Caucasus and to the Austrian frontier. The Grand Duke Nicholas, the Tsar's brother, was in command of the forces and orders were instantly given to cross the Rumanian frontier; this state having proclaimed her independence of Turkey afforded every facility to the Russians to move their army to the Danube. Early in June the Russian army was assembled around Bucharest; it consisted of the VIII., IX. and XII. corps, with detachments thrown forward to the Danube. The XI. corps was guarding the region from the river Argis to the river Yalomniza, further east towards the Pruth stood the XIV. corps while the XIII. was expected by the middle of June and the IV. a month later. The Russian army was armed indifferently and tactically was ill trained, which was due to the men being unused to handling their new weapons. The Russian forces in the middle of June which intended crossing the Danube numbered 257,000 men, but one must deduct those guarding the railway line through Rumania.

The Turks numbered 135,000 men north of the Balkans who were distributed in the following manner: 80,000 in the quadrilateral, 23,000 around Vidin, 10,000 in Nicopol, 8,000 in Dobrudja, 3,000 in Tirmovo, 4,000 in Sistovo, 2,000 at Lom Palanka and 5,000 at Rahoff. Forty thousand men were grouped around Adrianople and Constantinople and some 80,000 in Bosnia, Montenegro and Epirus. The Turks besides disposed of another 120,000 men in Asia Minor.

Political and military reasons forced Turkey to remain on the defensive while Russia was bent on the swiftest possible offensive—bordering on rashness. Rumania having allowed the Russians to traverse her territory greatly aided their initial concentration towards the Danube. She was even prepared in the middle of June to join the Russians against the Turks with her force of 32,000 infantry and 5,000 cavalry, but the Russians, feeling certain of an easy victory, declined her proffered help. Two months later they were only too glad to avail themselves of this assistance which would have been of inestimable value in their first operations south of the Danube. To cross this river was their primary object, but this was impeded by the Turkish flotilla which patrolled the Danube and prevented them bridging

it. The Russians by means of steam launches, batteries, mines and torpedoes drove the Turkish ironclads into Sulina harbour, one being destroyed, while the smaller vessels were obliged to seek refuge in Silistria and Ruschuk. Mines were laid across the Danube, bridging now being made possible. Hearing of the hostile approach, Abdul Kerim, the Turkish leader, decided not to make a resolute defence against the enemy crossing the Danube, but to attack him, when advancing to besiege Ruschuk and Shumla. The distribution of the Turkish troops remained little changed by the middle of June; the detachments guarding the Danube were generally too weak to offer any serious resistance to the invader.

The Russians began crossing the river in boats at Zimniza early on June 23 and the following day the VIII. corps was across, standing on the southern bank of the Danube. The same day a bridge 1,300 yards long was begun to be constructed at Nicopol, which was ready by July 1, a second one being ready by Aug. 1. The other Russian corps, the XII. and XIII., commanded by the Tsarevitch, having crossed the Danube moved to the Lom and Yantra facing Ruschuk with the object of laying siege to it while the IX. corps made for Nicopol. Gourko's advance guard entered Tirnova July 7, the VIII. corps following it five days later. The Grand Duke Nicholas wished to cross the Balkans with two corps while guarding his right flank with the IX. corps, and watching Ruschuk fortress with the XII. and XIII. corps, but Alexander II. would not sanction this, rightly considering this plan too risky. Gourko left Tirnova July 12 hearing the Shipka Pass was defended by only 3,000 men. He made for the Hainkioi Pass intending to turn the Shipka Pass (*q.v.*), while a Russian detachment attacked the Pass from the north. Gourko having been delayed 24 hours, was repulsed by the Turks when attacking the Pass; the same fate befell the Russians advancing north of Shipka. Nevertheless next day Gourko again pressed forward, when the Turks offered to negotiate terms of capitulation. While they were being drawn up the Turks evacuated all their positions and retreated to Philipopolis. Gourko's capture of Shipka gave the advantage to the Russians for a short time only, though he hastened to put it in a state of defence and it remained in their hands up to the end of the war. Alarmed by the incursion of the Russians, the Turks recalled Suleiman Pasha from Montenegro with his army 30,000 strong and having transported it by sea to the mouth of Maritza pushed it forward without delay on July 23 between Hermanli and Karabunar. After several engagements against greatly superior forces Gourko received orders Aug. 5 from the Headquarters to return north of the Balkans. The passes being deemed of great importance the Russians decided to defend them with the 9th Division, 4th Rifle Brigade and a Bulgarian contingent.

Meanwhile Nicopol fell July 17, the IX. corps capturing 8,000 men and it now received orders to advance to Plevna. General Krudener, its commander, detached one division under Schilder-Schuldner, which without any preliminary reconnaissance attacked the Turks July 20, only to be thrown back with heavy losses by Osman Pasha's much superior force, which had marched from Vidin unperceived by the Russians. Though the Rumanians had warned them of the hostile approach no serious attention was given by the Russian military authorities, for which they had to pay dearly. But even now the Russians thought this to be a momentary check and gave orders to make a fresh effort to capture Plevna, for which purpose they detailed 40,000 men. Osman Pasha had meanwhile entrenched himself round Plevna and had occupied Lovcha on the 26th, thereby securing the direct road to Sofia. The second attempt to capture the town, July 31, failed as the first and the Russians at last began to realize that their forces were inadequate to vanquish the enemy. The Tsar, by an Imperial Ukaze called up the Guard and Grenadier Corps, 24th and 26th Infantry Divisions, also the 2nd and 3rd Infantry Divisions with the 3rd Rifle Brigade which had already left Moscow for Bulgaria. Valuable assistance was also forthcoming from the Rumanian forces, which now joined the Russians. The Russian plan of campaign, which was faulty to a degree, now became absolutely impossible, there being no longer any question

of moving south of the Balkans, whilst Osman from Plevna might threaten not only their right flank, but the bridges across the Danube. Every effort was to be made to vanquish the Turkish force defending Plevna, now greatly strengthened by field works.

At the end of July, Abdul Kerim, the Turkish commander-in-chief was superseded by Mohammed Ali, who decided to attack the Russian forces under the Tsarevitch (XI., XII. and XIII. corps) on the river Lom. Mohammed Ali had two army corps for his offensive, not to mention five divisions at Shumla and two at Ruschuk, but he carried out his movement with little skill, sending his left wing against the Russians standing on the Yantra, which brought about two engagements at Ayazla on Aug. 22 and 23. The Russians retreated slightly, and a week later the XIII. corps was attacked at Karahassankioi, but no serious result was gained by this move. On Sept. 5, another engagement occurred, but though the Russians retired across the Lom the Turks were unable to march further west. The intended plan to unite the forces of Mohammed Ali with those of Suleiman at Trnova failed, his advance producing no effect on the Russian forces assembled around Plevna, which were by that time considerably reinforced (two Russian and three Rumanian infantry divisions, together with a Russian rifle brigade). On the Rumanians joining the Russians, it was agreed that Prince Charles of Rumania should be in nominal command of the forces grouped around Plevna, which were now known as the Western army. But the authority vested in Prince Charles was small, as the Commander-in-Chief, the Grand Duke Nicholas, was living in the vicinity, not to mention the Tsar himself and General Milutin, the War Minister. By this time the Russians had mobilized a huge army.

Meantime Suleiman Pasha was ordered to join Osman, but he was instructed firstly to capture the Shipka Pass which he attempted to do Aug. 21. Severe fighting took place for several days, but Radetsky, being reinforced, maintained his position, beating off every hostile attack. Suleiman in five days having lost 10,000 men, a quarter of his effective strength, decided to fall back on Kazanlik, leaving detachments by the pass. Hearing that Suleiman had been forced to give up momentarily the attempt to capture the Shipka Pass, the Russians began to fear that he might endeavour, by using the Rosalita and Trojan Passes, not only to turn the Shipka Pass, but by moving via Lovcha to get into communication with Osman Pasha, who might at any moment make for Tirnova. For this purpose Prince Imeretinsky was ordered to drive a Turkish detachment from Lovcha, which he forced to retire into Plevna. Leaving a brigade to guard the town, Imeretinsky fell back on Bogot. The Allies now decided to assault Plevna again, for which purpose they assembled about 100,000 men. Three Rumanian divisions were to advance from Grivitza, four Russian from Radishevo, and a division, having a brigade in reserve under Skobelev, facing the Green Hills. A long artillery preparation took place Sept. 7-11, but the allies failed to make any proper reconnaissance, for which they had to pay a severe penalty, thousands of lives being sacrificed in vain. They advanced on the 11th, but failed to break the Turkish circle of defence. The Rumanians captured a redoubt at Grivitza, but were held up at Radishevo; Skobelev on his part established himself on the Green Hills, but was thrown back the next day by Osman Pasha, who used his reserves for the counter attack. A serious crisis now arose among the Allies and a council of war was held. Many of the members, including Milutin, the War minister, urged that the army should recross the Danube and renew the advance the following spring with increased forces. This opinion was over-ruled, the Tsar showing great determination, and it was decided to invest Plevna, entrusting all operations to General Todleben, the heroic defender of Sevastopol during the Crimean War. With his arrival, the Russians gained confidence and renewed energy, one and all feeling they were at last being led by a masterly head, that chaos was replaced by order. The Guard Corps, on arriving from Russia, was sent to cut the Turkish communications and the enemy was driven out of Gorni Dubniak and Telish by General Gourko, Plevna being thus cut off from the outer world. In the middle of Nov. the Russians stood as follows: 12 divisions around Plevna, 6 on the Lom; 3 by the Shipka Pass;

$2\frac{1}{2}$ on the Plevna-Orhanie road.

Suleiman, now commanding the main Turkish army, took the offensive, crossed the Lom and attacked the Russians at Mechka and Tristenik Nov. 19 and 26, but both times sustained a repulse. Vessil Pasha, who now in place of Suleiman stood facing the Shipka Pass, had been considerably weakened through sending reinforcements to aid Mohammed Ali near Sofia, and he could only muster 20,000 men. Meanwhile Gourko, hearing of Mohammed's preparations to relieve Plevna, urged that the Russians should advance boldly on Sofia, thereby depriving the enemy of the initiative. This plan being agreed to, Gourko, at the head of 30,000 men, drove the Turks out of Entropol, forcing Mohammed to retreat to Araba Konak Nov. 23. Gourko disposed of too small a force to be able to pursue the enemy, and so took up a position near Orhanie. Meantime in Plevna Osman's provisions were getting shorter every day, and ultimately he attempted a sortie, hoping to cut his way through Berkovitza to Sofia. After several hours severe fighting, however, Osman was convinced of the impossibility of breaking through, and surrendered with his whole army, about 40,000 men, on Dec. 10.

The Russians now decided to move on Sofia, cross the Balkans, relieve Shipka from the south and attack Vessil Pasha, the Tsarevitch with his 70,000 men being left to guard the communications. Gourko on Dec. 25 advanced with $5\frac{1}{2}$ divisions against the Turks but on reaching Toshkessen he found that the Turks had already retreated. The Russians, after occupying Sofia, followed the enemy, who was making for Tatar Bazardjik. There Suleiman assumed command, having collected a force 50,000 strong, including reinforcements from Shumen. Radetsky began his attack on Jan. 5 at Shipka, being aided by two columns coming on his left and right; the western, Skobelev with 17,000; the eastern, Prince Imeretinsky with 19,000 men. The Prince's advance was held up, while Skobelev, delayed, came on the scene only the following day, when they together captured the Turkish entrenched camp two miles south of the Pass, forcing Vessil Pasha to capitulate with 36,000 men. Suleiman, on hearing of Vessil Pasha's surrender, made for Philipopolis, Gourko following in direct pursuit, while Radetsky cut off his retreat from Adrianople, entering the town with his advanced guard on Jan. 19. After several minor actions near the town Suleiman retreated to the south over the Rhodope Mountains direct to the coast reaching Enos on Jan. 28. His forces were then shipped to Constantinople. The Russians advanced rapidly towards the Turkish capital, reaching the Chataldja lines on Jan. 30. Next day an armistice was concluded, the terms being greatly modified at the Berlin conference which took place the following July, when Russia was deprived of many important concessions, which greatly irritated both the nation and the army. Bulgaria now became an independent principality, while Eastern Roumelia was to be under the protectorate of Turkey.

While these events were taking place in Europe military operations were simultaneously being carried on in the Caucasus. The Grand Duke Michael, the Tsar's brother, commanded the Russian forces which were 65,000 strong. The Turks numbered 70,000 men under Mukhtar Pasha. The same mistake was committed in the Caucasus as had been done in Europe—the Russian army finding itself too weak was obliged to await reinforcements, which arrived by the end of August when they began their advance. The first serious battle occurred on Oct. 15, at Aladja Dagh, when the Turks were defeated, a part of their forces hurriedly making for Kars, which was an important fortress, while the other portion fled to Erzerum. Kars was now invested. A month later on Nov. 18, the Russians stormed and captured it. This was a brilliant feat of arms, perhaps the finest Russian exploit throughout this war. Their communications now being assured, the Russians moved rapidly towards Erzerum, but the severe winter weather and the strength of the fortifications prevented them capturing it as quickly as they had hoped. When the armistice was concluded Erzerum was still holding out, but the Turks were now forced to evacuate it under the terms of the armistice. The Russo-Turkish War amply proved the truth of the military maxim that to wage war with insufficient forces is

highly risky. The Russians were many times on the brink of disaster, which would most certainly have occurred had they been faced by abler Turkish leaders and more efficiently trained troops. (A. SMI.)

RUST, a term usually applied to the reddish deposit formed on iron and having the approximate chemical composition $2\text{Fe}_2\text{O}_3, 3\text{H}_2\text{O}$. For the rusting of iron three things must be present, viz., water, oxygen and a so-called "impurity"; ordinarily this impurity is provided by the carbon dioxide present in air or by the numerous elements present in small quantities in commercial varieties of iron, such as carbon, sulphur, phosphorus, etc., but if iron, air (or oxygen) and water are all highly purified, no rusting takes place. The action of the impurity is presumably to provide a feebly conducting solution with the water and so set up an electrolytic effect whereby salts of iron (*e.g.*, the sulphate or carbonate) are first formed and then decomposed by the oxygen. (See also CORROSION AND RUSTING.)

RUSTICATION, in architecture, a form of masonry in which the stones have their edges cut back to a careful plane surface, but with the central portion of the stone face either left rough or projecting markedly. (See DRAFTED MASONRY.) Rusticated masonry is found in the platform of the tomb of Cyrus at Pasargadae in Persia (560 B.C.) and is common in certain types of Greek and Hellenistic work such as retaining walls and the like. It was similarly used for terrace and retaining walls by the Romans, who also realized its decorative value and employed it not only for such utilitarian works as the Pont du Gard at Nîmes, France (c. 150) and the aqueduct at Segovia, Spain (c. 109), but also decoratively as in the Porta Maggiore at Rome (time of Claudius), where the rustication is very rough, and the walls of the temple of Augustus at Vienne, France (c. 41), in which the rustication is carefully finished, the faces of the stone cut to a plane and the edges very delicately sunk.

The early Renaissance architects developed this tradition still further, and in the 15th century palaces in Florence used it with magnificent effect. Thus in the Pitti palace, by Brunelleschi (1458), the Riccardi, by Michelozzo (1444-52), and the Strozzi, by Benedetto da Maiano (1489), the carefully studied rustication forms the chief element in the design, and in the Rucellai, from designs by Alberti (1446-51), the wall surfaces between the pilasters are delicately rusticated. During the Baroque period rustication assumed great importance in garden and villa design and all sorts of fantastic surfaces were employed on the projecting portions of the stones, such as vermiculated work, in which the surface is covered with wavy and serpentine sinkages like worm-eaten wood, or treated with vertical dripping forms like lime deposits from dripping water. Sometimes the stones had sides bevelled and brought to a point or ridge in the centre.

The use of rustication was introduced into England by Inigo Jones, as in the gate of the Botanic Gardens at Oxford (1632), and became a dominant feature in much English Renaissance work. In American colonial work this influence is seen in the occasional shaping of outside sheathing boards to imitate rusticated masonry, as in portions of the Morris-Jumel house in New York (1765). Quoins (*q.v.*), or corner blocks are, in many styles, rusticated, where the face of the wall is left smooth.

RUSTLESS STEEL. The simplest and cheapest rustless steels are ordinary mild steels containing chromium. Resistance of the steel to rusting depends on the amount of chromium it contains. The addition of 10% of chromium to pure iron suppresses its solubility in water; the resulting pure chromium-iron might be regarded as a satisfactory rust-resisting metal. But such pure chromium irons cannot be produced commercially. Commercial rustless steels contain carbon, even when little, causing rustings. Between 1912-14, a series of steels containing between 9 and 16% of chromium was investigated by Brearley (see U.S.A. patent 1197256/16), who concluded that with the stipulated amounts of chromium and not more than .70% of carbon, rustless steel articles could be produced providing they were submitted to suitable hardening operations. From this series of rustless steels developed by Brearley the familiar "stainless" cutlery is made.

The resistance of chromium steels to rusting is increased by

adding chromium and decreased by adding carbon. Small amounts of carbon are always unavoidably present but definite amounts are also added with the object of producing required degrees of hardness, resistance to wear or ability to cut. The useful extent to which chromium alone can be added to iron is limited because such comparatively pure chromium irons are brittle.

Steels containing more than 9% chromium were made as early as 1892. Their rust-resisting properties were not realized because at that time the resistance of steel to general corrosion was estimated by its measured resistance to solubility in dilute sulphuric acid. Since the solubility of high chromium steels in dilute sulphuric acid is greater than that of ordinary steel, the quest was directed away from and not towards chromium.

Up to the year 1912 the least corrodible steels then in general use were nickel steels. The more nickel they contained the less they were supposed to corrode. Steels containing 25% nickel were held in high regard, as they were notably resistant to dilute sulphuric acid, an active corrosive agent in industrial towns or under special conditions as in chemical works or mines.

The addition of nickel to steels which already contain chromium produces useful results: (1) conferring a certain degree of resistance to the corroding effect of cold sulphuric acids, whether in the liquid or vapour form; (2) making those higher chromium alloys tough which, without the nickel, would be brittle, and (3) making homogeneity comparatively easy without submitting the alloy to special forms of heat treatment. Materials of this class were investigated by Strauss in Germany 1912-14 (English patents, 13414/13 and 13415/13). Strauss appears to regard the presence of nickel as an indispensable constituent of rustless steels, and Krupp, with whom he was associated, has devoted most attention to a steel containing about 20% chromium and 6% nickel. Steels of this composition cannot be hardened by the usual heat-treatment processes. They are hardened by cold-working, as are all metals and alloys (see METALLURGY).

If scaling at high temperatures be regarded as a form of corrosion, then the work of Marsh must be noticed. Looking for some substitute for platinum wire or strip to wind resistance coils, Marsh found what he required in an alloy of nickel and chromium. This material, alloyed with more or less iron, is familiar as the coiled filament of heated metal in office and bedroom radiators. Its value for that purpose, apart from its electrical properties, is that it does not scale when it becomes red hot, but neither Marsh nor anyone else appears to have connected its resistance to scaling at red heat with its possible value as a rustless alloy. Haynes, who is reputed to have made the first motor-car in America, worked with cobalt-chromium alloys. From his observations and experiments arose the well-known cutting tool material called "stellite" and a similar material in a malleable form from which Haynes made pocket-knife blades.

The rustless chromium steels were first used for table cutlery and aero-engine exhaust valves. When the valves were required to offer great resistance to scaling, silicon was added with good effect. When valves were required to be as hard at red heat as ordinary structural steel is at ordinary temperatures, 12 to 30% of nickel was added. To resist other specific conditions, molybdenum, tungsten, manganese and copper have been added.

The development of rustless steel is hampered by two difficulties. The first relates to its adaptability to existing manufacturing processes. This difficulty starts with the actual making of the steel and is met in every hot-working and cold-working process. The second difficulty relates to the smelting of the ore. The ferro-chromium alloy can be produced cheaply by smelting chrome-iron ore in the blast furnace but it is useless for making rustless steel because it contains too much carbon. For soft varieties of rustless steel the steel maker requires ferro-chromium alloys containing practically no carbon. It is still not known how to adapt cheap smelting operations to chromium ore without contaminating the product with carbon, though much progress in this respect has been made during the past few years.

With introduction of rustless steels special causes of corrosion have been more sharply separated and defined. The most notable causes of corrosion, apart from direct solubility, are due to dis-

ortion and contact. A piece of rustless steel used for stainless knives and containing, say, 13% chromium, will remain bright if exposed in a country garden providing it has been suitably heat-treated. If, however, a piece of the same material be machined in a lathe the machined surface and the turnings themselves will rust, for they are distorted and to some extent their adjacent parts are distorted unequally. If the surface be smoothly ground and polished it will not rust. The polished surface does not offer easy lodgment for casual dirt but otherwise polishing in itself does not appear to exert a great restraint upon rusting. A piece of the same 13% chromium steel, for example, in the form of cold-drawn wire which has simply been highly polished after cold drawing rusts with surprising readiness (see also CORROSION).

RUTABAGA: see TURNIP.

RUTACEAE, a family of dicotyledonous plants, mostly shrubs and trees, comprising about 144 genera and 1,600 species found in temperate and tropical regions, and especially abundant in Australia and South Africa. *Ruta graveolens* is rue (*q.v.*). *Citrus* includes the grapefruit, orange, lemon (*qq.v.*), etc. *Chloroxylon swietenia* is satin-wood (*q.v.*). *Ptelea trifoliata* is the shrubby trefoil or wafer-ash; *Zanthoxylum americanum* is the prickly ash (*q.v.*).

See A. Engler, "Rutaceae," in Engler and Prantl, *Die Natürlichen Pflanzenfamilien* 19a: 187-357, fig. 89-164 (1931).

RUTBA WELLS, a post and watering place in the Syrian desert, in 33° N. and 40° E. The post, which is the headquarters of part of the desert police is the most westerly occupied place in Iraq. Westwards from this point Buxton found considerable traces in the desert of palaeolithic remains.

See L. H. D. Buxton, *Antiquaries Journal* (1926).

RUTEBEUF or **RUSTEBUEF** (fl. 1245-1285), French trouvère, was born in the first half of the 13th century. His name is nowhere mentioned by his contemporaries. He frequently plays in his verse on the word Rutebeuf, which was probably a pseudonym. Some of his poems have autobiographical value. In *Le Mariage de Rutebeuf* he says that on Jan. 2, 1261, he married a woman old and ugly, with neither dowry nor amiability. In the *Complainte de Rutebeuf* he details a series of misfortunes which have reduced him to abject destitution. In these circumstances he addresses himself to Alphonse, comte de Poitiers, brother of Louis IX., for relief. His distress could not be due to lack of patrons, for his metrical life of Saint Elizabeth of Hungary was written by request of Erard de Valéry, who wished to present it to Isabel, queen of Navarre; and he wrote elegies on the deaths of Anceau de l'Isle Adam, the third of the name, who died about 1251, Eude, comte de Nevers (d. 1267), Thibaut V. of Navarre (d. 1270), and Alphonse, comte de Poitiers (d. 1271), which were probably paid for by the families of the personages celebrated. In the *Pauvreté de Rutebeuf* he addresses Louis IX. himself.

The piece which is most obviously intended for popular recitation is the *Dit de l'Herberie*, a dramatic monologue in prose and verse supposed to be delivered by a quack doctor. Rutebeuf was also a master in the verse *conte*, and the five of his *fabliaux* that have come down to us are gay and amusing. The adventures of *Frère Denyse le cordelier*, and of "la dame qui alla trois fois autour du moultier," find a place in the *Cent Nouvelles nouvelles*.

Rutebeuf's serious work as a satirist probably dates from about 1260. His chief topics are the iniquities of the friars, and the defence of the secular clergy of the university of Paris against their encroachments; and he delivered a series of eloquent and insistent poems (1262, 1263, 1268, 1274) exhorting princes and people to take part in the crusades. He was a redoubtable champion of the university of Paris in its quarrel with the religious orders, and he boldly defended Guillaume de Saint-Amour when he was

driven into exile. The libels, indecent songs and rhymes condemned by the pope to be burnt together with the *Périls des derniers temps* attributed to Saint-Amour, were probably the work of Rutebeuf. The satire of *Renart le Bestourné*, which borrows from the Reynard cycle little but the names under which the characters are disguised, was directed, according to Paulin Paris, against Philip the Bold. To his later years belong his religious poems, and also the *Voie de Paradis*, the description of a dream, in the manner of the *Roman de la Rose*.

The best work of Rutebeuf is to be found in his satires and verse *contes*. A miracle play of his, *Le Miracle de Théophile*, is one of the earliest dramatic pieces extant in French.

The *Oeuvres* of Rutebeuf were edited by Achille Jubinal in 1839 (new edition, 1874); a more critical edition is by Dr. Adolf Kressner (*Rustebuef's Gedichte*; Wolfenbuttel, 1883). See also the article by Paulin Paris in *Hist. litt. de la France* (1842), vol. xx, pp. 719-783, and *Rutebeuf* (1891), by M. Léon Clédat, in the *Grands Écrivains français* Series.

RUTH, BOOK OF, in the Old Testament. The story of Ruth, the Moabitess, great-grandmother of David, is one of the Old Testament Hagiographa (see BIBLE, *Old Testament, Canon*). On the other hand, it follows Judges in the Septuagint, the Vulgate and the English version. But although a late rearrangement might transfer Ruth from the Hagiographa to the historical books, and place it between Judges and Samuel, no motive can be suggested for the opposite change, unless it had been placed in the last part of the Jewish canon after the second (with the historical books) had been definitely closed. Moreover, the book is untouched by the "prophetic" or "Deuteronomic" editing, which helped to give the "Former Prophets" (Joshua-Kings) their present shape after the fall of the kingdom of Judah. Nor has the narrative any affinity with the view that the history of Israel was a series of examples of divine justice and mercy in the successive rebellions and repentances of the people of God. Finally, if the book had been known when Joshua-Kings was edited it could hardly have been excluded, since David's ancestry (iv. 17, 18-22) was of greater interest than that of Saul (given in 1 Sam. ix. 1), whereas the old history names no ancestor of David beyond his father Jesse.

Date. — The book of Ruth deals with a distant past (Ruth i. 1), and delights in depicting details of antique life and obsolete usages (iv. 7). It views the stormy period before the kingship through the softening atmosphere of time, in contrast to the harsher colours of the old narratives of the book of Judges. It has been argued that, as the author seems to take no offence at the marriage of Israelites with Moabite women, he must have lived before the time of Ezra and Nehemiah (Ezra ix.; Neh. xiii.); but the same argument would prove that the book of Esther was written before Ezra. The very designation of a period of Hebrew history as "the days of the judges" is based on the exilic "Deuteronomic" parts of the book of Judges (ii. 16 *seq.*), and although the language sometimes recalls the narratives in Samuel and Kings, it can be assumed, either that the book is the work of a late author acquainted with the earlier literature, or that an old narrative was rewritten. The fact that the language is in contrast to that of Chronicles, Ezra, Nehemiah, etc., has no force since writings evidently more or less contemporary did not necessarily share the same characteristics (observe, for example, the prose parts of Job).

Purpose. — Like the stories appended to Judges, the book of Ruth connects itself with Bethlehem, the birthplace of David. Some connection between Bethlehem and Moab has been found in 1 Chron. iv. 22 (where the Targum and rabbinical exegesis discover references to the story of Ruth), and is explicitly suggested by the isolated 1 Sam. xxii. 3 *seq.*, which knows of some relationship between Moab and David. Next, the writer claims the sympathy of his readers for Ruth, upon whose Moabite origin he insists, and this is noteworthy in view of the aversion with which intermarriage was regarded at a certain period (Deut. xxiii. 3; Neh. xiii.; Ezra ix. *seq.*). The independent evidence for the present late form of the book has led many scholars to the conclusion that it was directed against the drastic steps associated with the reforms of Ezra and Nehemiah, which, as is known,

were not everywhere acceptable. Thus, not only have we a beautiful portrait of a woman of Moabite origin, but she becomes the ancestress of David himself; and in the days of these measures the simple story would raise the question whether the exclusiveness of Judaism was being carried too far.

RUTHENIA or **CARPATHIAN RUTHENIA**, an autonomous part of Hungary, from 1918-39 an autonomous part of Czechoslovakia. Its northern frontier follows the ridge of the Carpathian mountains between Hungary and Poland. Much of the province is mountainous, deeply dissected by incised valleys which often open into broad, fertile basins in their upper courses. The southern edge of the highland is heavily forested with beech on its lower levels and conifers on the higher. But the plain, largely the drainage basin of the upper Tisa and its tributaries, is the important region. Sheltered from the cold winds of the north and north-east it receives the full benefit of the moist south-westerly currents and the climate is ideal for cereal and vine cultivation. Maize, oats, wheat, and potatoes, named in the order of importance, occupy the greatest acreage followed by rye, tobacco, and barley, while the lower slopes are devoted to vineyards and orchards of plum and apple trees.

Ruthenia had been a much neglected district of Upper Hungary, inhabited by a backward population, where agricultural methods were most primitive and therefore insufficient to assure a decent standard of living to the population which in its large majority was Ruthenian, a Slav people closely related to the Ukrainians who lived on the north-eastern slopes of the Carpathian mountains. Industrial activity was therefore very small, illiteracy widespread, and the Ruthenian peasants without any initiative as a result of centuries of servitude. The Peace Treaty of Trianon brought the country under Czechoslovak administration, guaranteeing its autonomous status. This autonomy was during the first years very much restricted in view of the fact that the Ruthenians first had to be educated to self-government. The Czech administration founded a large number of schools with Ruthenian as the language of instruction, combated illiteracy and the low state of public health, and helped to modernize the economic life. Gradually the autonomous rights of the province were extended.

The area of the province was 4,886 sq.mi., the population in 1930, 725,357, of whom 450,925 were Ruthenians, 115,805 Magyars, 95,008 Jews, 34,511 Czechoslovaks, 13,804 Germans, and 12,777 Rumanians. The Ruthenians therefore formed 62.17%, the Magyars 15.96% of the population. With regard to religion 49.52% belonged to the Greek Catholic Church, 15.44% to the Greek Orthodox Church, and 14.14% to the Jewish faith. In 1930, 30.88% above the age of ten were illiterate. There were only two towns of over 20,000, Užhorod (26,669), capital, and Mukačevo (26,123), both in the southern plain.

As a result of the German-Italian award of Nov. 2, 1938, at Vienna, Czechoslovakia lost the southern and more fertile part of Ruthenia to Hungary. The remaining part was constituted as one of the three autonomous governments within the new Czechoslovakia. Its name was changed to Carpatho-Ukraine and it was regarded as the nucleus of a Pan-Ukrainian national movement the purpose of which was to create a great Ukraine embracing the Ukrainian parts of Poland and of the Soviet Union. The capital was moved to Hust, the area of the new State amounted to 4,283 sq.mi., with a population of 552,124, of whom 512,289 were Ruthenians. On March 14, 1939, Hungary, with Germany's action against Czecho-Slovakia, annexed Ruthenia. (H. Ko.)

RUTHENIANS, a name also applied to those Ukrainians, or Little Russians, who were formerly Austrian subjects. The name is simply a Latinized form of "Russian," the terms "Red Russian," etc., being due to false derivations. When, however, the early Ruthene states lost their independence, the term "Russia" was monopolized by the Muscovite state which, anxious to deny to the Ruthenes a national individuality, gave them the name of

"Little Russians." The Ruthenes themselves adopted the distinguishing title of "Ukrainians," *i.e.*, inhabitants of the Turkotatar frontier in S. Russia. The name Ruthene survived among the subjects of Poland and Lithuania, and later, Austria. The Ruthenians are thus neither more nor less than Ukrainians, and their linguistic and ethnographical features are described under that head. Yet they can be distinguished from the Ukrainians of Russia, both by their separate history (see POLAND, GALICIA) and by their religion. After Galicia and Volhynia came under Polish and Lithuanian rule in the 14th century, their upper classes were soon assimilated into the conquering nations, whose language and Catholic faith they adopted. The peasants sank into a state of great degeneracy, which was largely due to the decadence of their own Orthodox priests; recognizing which, they themselves proposed union with Rome. This was proclaimed by the Pope and accepted by the Ruthenes at the Union of Brest-Litovsk, Oct. 6-10, 1596. Under this new "Uniate Church," the Ruthenes retained their Slavonic liturgy and most of the outward forms of the Greek Orthodox Church, while acknowledging the spiritual supremacy of the Pope. Although the two liturgies were nominally entitled to equal treatment in Poland, actually the Uniate was always treated as inferior, and its adherents sank into a lamentable state of ignorance and poverty, due partly to the exactions of their feudal masters, partly to national oppression, partly to their portentous capacity for consuming fiery liquor, their habit of keeping the holidays of both Julian and Gregorian calendars (in 1860 16 districts in Galicia kept 160-200 days annually as holidays) and their superstitions (in 1807 a current method of exorcising cattle plague was to place the carcasses of the stricken animals in the wells, pastures and stables of uninfected districts).

On the partition of Poland, a number of Ruthenes passed back under Russian rule. Many of them were quickly reconverted to the orthodox faith, and every effort was made to Russify them. The orthodox propaganda was extended to Galicia (see PAN-SLAVISM) but the results were more sensational than practical. The Russian Government systematically discouraged Ruthenian nationalism until after the revolution of 1905, when some relaxation was made in the oppressive regulations. Similar efforts were made by the Poles of Galicia, and winked at by the Austrian Government, but here something was done for the Ruthenes. A metropolitan bishopric was founded at Lemberg in 1806, and suffragates added at Przemysl and Stanislaw. In 1877 a Ruthenian chair was established at Lemberg University, but Austria never granted a separate Ruthenian university, in spite of agitation.

After the war the largest body of Ruthenes, those in East Galicia, claimed the right of self-determination, but their short-lived state was soon absorbed in Poland (see GALICIA). The Ruthenes in the N.E. Carpathians were attributed to Czechoslovakia, special guarantees being laid down for their national autonomy. They were formed into the province of Sub-Carpathian Russia (see Czechoslovakia). The Ruthenes of Bessarabia and the Bukovina came under Rumanian rule (where the State religion was orthodox), with the protection of the Rumanian Minorities Treaty. In 1928 the estimated number of Ruthenes (excluding the Ukrainians of the U.S.S.R.) was: in Poland 3,883,000; in Czechoslovakia, 461,849; in Rumania, 792,000; in the U.S.A., 750,000; in Canada, 500,000 (where they formed the largest national group, after English and French); and small groups in Hungary and Yugoslavia. These figures are conservative estimates; the real numbers were probably much greater. None of these groups enjoyed complete independence. See UKRAINE, POLAND, RUSSIA, etc. Also the publications of the League for Ukrainian national independence (Geneva 1919-22).

(C. A. M.)

RUTHENIUM, the last of the six platinum metals to be identified, occurs in small amount only in ores from South America, and was hence overlooked by Wollaston and Tennant in 1803-04 (symbol Ru, atomic number 45, atomic weight, 101.7). The first indication of the existence of ruthenium was due to Osann (1828) who was working on platinum ore from the Ural mountains. He first announced the discovery of three new platinum

metals, one of which he called ruthenium after Ruthenia, a name for Russia, but subsequently withdrew his claim to discovery as regards one of them. The matter was not fully investigated till 1845 when Claus confirmed the existence of a new metal and retained for it the name suggested by Osann. The metal is best obtained from osmiridium by the method of Deville and Debray. After a preliminary separation of osmium and iridium (see OSMIUM), a residue is left containing most of the ruthenium which is washed with aqueous ammonium chloride to remove the remainder of the osmium. The final residue containing iridium and ruthenium is fused with caustic potash and nitre in a silver basin; the melt is extracted with water yielding an orange solution of potassium ruthenate, K_2RuO_4 , which is decolorized by addition of nitric acid, when an oxide of ruthenium gradually separates. This oxide dried and fused in a graphite crucible gives a button of impure ruthenium. Alternately, the aqueous solution of potassium ruthenate is saturated with chlorine and the solution distilled on a water-bath in a stream of chlorine when pure ruthenium tetroxide, RuO_4 , distils over. This tetroxide is dissolved in caustic potash, reduced by alcohol to Ru_2O_3 , which on ignition with reducing agents gives pure ruthenium (Gutbier and Trenkner, 1905).

Ruthenium in the massive state is a greyish-white metal similar in appearance to platinum, but as no important use has been found for it or any of its compounds, its properties are at present of purely scientific interest. Its specific gravity is 12.063 and its melting point is about 1,950° C. It is not readily attacked by acids but is comparatively easily oxidized, as simply heating in air causes it to be covered with a film of oxide. If strongly heated in a current of air, or preferably oxygen, it undergoes complete oxidation, the oxide RuO_2 being deposited some distance from the metal; this oxide, per se, is not volatile, however, but results from the decomposition of the volatile oxide, RuO_4 . Ruthenium is practically insoluble in all acids, but is readily attacked by chlorine, and in a finely divided state it dissolves easily in solutions of alkaline hypochlorites.

Ruthenium has at various times been credited with forming at least 7 different oxides, but as the existence of some of these is doubtful and as others are known only in combination, those of undoubted authenticity will alone be mentioned here. *Ruthenium sesquioxide*, Ru_2O_3 , is produced when finely divided ruthenium is heated in air or, together with potassium ruthenate, K_2RuO_4 , when the oxide RuO_2 is fused with caustic potash; it is a dark blue powder insoluble in acids. *Ruthenium dioxide*, RuO_2 , prepared either by igniting the sulphate in air or by burning the metal in a stream of air or oxygen, forms hard quadratic pyramids possessing a green metallic lustre. Ruthenium tetroxide, RuO_4 , obtained by distilling a solution of K_2RuO_4 in chlorine on the water-bath, forms golden-yellow crystals which melt at 40° and distil at about 100°. It possesses an odour resembling ozone and unless heated very carefully is liable to decompose with explosive violence. It blackens on exposure either to moisture or light, and is insoluble in water which slowly decomposes it with evolution of oxygen. The halogen salts of ruthenium are unimportant; chlorides such as $RuCl_2$, $RuCl_3$, and $RuCl_4$, are known either in the free state or in the form of double chlorides, such as potassium ruthenochloride, K_2RuCl_6 , and potassium ruthenichloride, K_2RuCl_5 ; an aqueous solution of the former gives a black precipitate of ruthenous iodide, RuI_3 , on addition of potassium iodide. *Ruthenium sesquisulphide*, Ru_2S_3 , occurs in the mineral laurite, generally associated with other platinum ores and can be prepared by precipitating solutions of soluble ruthenium salts with sulphuretted hydrogen. This compound on treatment with nitric acid is converted into ruthenium sulphate, $Ru(SO_4)_2$, obtained on evaporation to dryness as a yellow, deliquescent, amorphous mass. A double cyanide, *potassium ruthenocyanide*, $K_2Ru(CN)_6 \cdot 3H_2O$, is interesting as being isomorphous with yellow prussiate of potash, $K_4Fe(CN)_6$; the free acid $H_2Ru(CN)_6$ is also known in the solid state (see PRUSSIC ACID). The curious basic ammoniacal compound, $Ru(OH)_2Cl_4(NH_4)_7$, known as *ruthenium red*, is produced by the action of ammonia on a solution of $RuCl_4$ at 40° C; it dyes silk in a beautiful permanent yellow shade, but its use as a dye has been abandoned on account of cost.

Ruthenium in the tetrad condition gives a dark violet coloration in solution with potassium thiocyanate which distinguishes it from other metals of this group. Sulphuretted hydrogen gives first a blue coloration and then a brown precipitate insoluble in ammonium sulphide. Ruthenium or its compounds fused with caustic potash and nitre give a green mass which on extraction gives an orange solution of K_2RuO_4 , and this on acidification gives a dark brown or black precipitate. Except for ruthenium red, no practical use for ruthenium or any of its compounds has been found. If present in anything but the smallest quantity, it has a deleterious effect upon the properties of the other platinum metals, and hence these should be freed from ruthenium as far as possible. A practical use for ruthenium or some of its compounds is very desirable as large stocks of the metal have accumulated in the course of years and these are at present useless. (F. E. M.)

RUTHERFORD, ERNEST RUTHERFORD, 1ST BARON (1871–1937), British physicist, was born at Nelson, New Zealand, on Aug. 30, 1871, and studied at the University of New Zealand. After a period of research at Cambridge, he became in 1898 Macdonald professor of physics in McGill university, Montreal; in 1907, Langworthy professor of physics at Manchester university; and in 1919 Cavendish professor of experimental physics in the University of Cambridge, accepting, in addition, in 1920, the professorship of physics at the Royal Institution, London. His brilliant researches established the existence and nature of radioactive transformations, the electrical structure of matter, and the nuclear nature of the atom. He was elected F.R.S. in 1903, and was knighted in 1914. Many British and foreign degrees and honours were bestowed upon him. He was awarded the Nobel Prize for chemistry in 1908 and was president of the British Association, 1923, and of the Royal Society, 1925–30. He was created a baron in 1931 and died in Cambridge, England, Oct. 19, 1937.

His works include *Radio-activity* (1904), *Radioactive Transformations* (1906); *Radioactive Substances and their Radiations* (1912), and numerous papers in *The Transactions of the Royal Society*, *The Philosophical Magazine*, etc.

RUTHERFORD, MARK, the pen-name of William Hale White (1829–1913), English author, born at Bedford. His father, William White, a member of the Nonconformist community of the Bunyan Meeting, removed to London, where he was well known as a doorkeeper of the House of Commons; he wrote sketches of parliamentary life for the *Illustrated Times*, papers afterwards collected by his son as *The Inner Life of the House of Commons* (1897). The son was educated at Cheshunt and New College for the Congregational ministry, but the development of his views prevented his taking up that career, and he became a clerk in the admiralty. He had already served an apprenticeship to journalism before he made his name as a novelist by the three books "edited by Reuben Shapcott," *The Autobiography of Mark Rutherford* (1881), *Mark Rutherford's Deliverance* (1885), and *The Revolution in Tanner's Lane* (1887). Under his own name he translated Spinoza's *Ethics* (1883; new ed. 1894). Later books are *Miriam's Schooling, and other Papers* (1890), *Catherine Furze* (2 vols., 1893), *Clara Hopgood* (1896), *Pages from a Journal, with other Papers* (1900), *John Bunyan* (1905), *More Pages from a Journal* (1910), and *Last Pages* (1915), which was edited by his wife. Though for a long time little appreciated by the public, his novels—particularly the earlier ones—have a power and style which must always give his works a place of their own in the literary history of their time. He died at Groombridge, Sussex, on March 14, 1913.

See A. E. Taylor, "The Novels of Mark Rutherford" in *Essays and Studies* by members of the English Association (1913–14).

RUTHERFORD, a borough of Bergen county, New Jersey, U.S.A., on the Erie railroad, midway between Jersey City and Paterson. Pop. (1920) 9,497 (83% native white); in 1940, 15,466. The combined population of Rutherford and the adjoining borough of East Rutherford (7,080 in 1930 and 7,268 in 1940) was 22,734 in 1940. Both boroughs are primarily residential communities, with little manufacturing.

RUTHERFORD or **RUTHERFORD, SAMUEL** (c. 1600–1661), Scottish divine, was born at Nisbet, Roxburghshire,

and studied at Edinburgh, where he became professor of the humanities in 1623. He was dismissed in 1626 for an alleged indiscretion before his marriage, but in 1627 became minister of Anwoth, Kircudbrightshire. He was prosecuted by the bishop, Thomas Sydeserf, in 1636, on account of the severe Calvinism of his first book, *Exercitationes, Apologeticae pro Divina Gratia* (Amsterdam, 1636), and sentenced to confinement in Aberdeen. Most of his famous *Letters* belong to this period of banishment. At the Glasgow assembly of 1638 he was restored to his parish. In 1639 he became professor of divinity at St. Mary's college, St. Andrews, and in 1643 was sent to London as one of the eight Scottish commissioners to the Westminster assembly. His *Lex Rex, a Dispute for the Just Prerogative of King and People* (1644) gives him a recognized place among the early writers on constitutional law. In 1647 he became principal of the New college at St. Andrews. After the Restoration in 1660 his *Lex Rex* was ordered to be burnt. He was deprived of his office and charged with high treason. His health broke down, and after drawing up a *Testimony* (Feb. 26, 1661, posthumously published), he died on March 23, 1661.

Rutherford's *Letters*, first published in 1664, anonymously, by M. Ward, an amanuensis, as *Joshua Redivivus, or Mr. Rutherford's Letters*, have frequently been reprinted. The best edition (365 letters) is by Rev. A. A. Bonar (1848, with a sketch of his life).

See also a short *Life* by Rev. Dr. Andrew Thomson (1884); Dr. A. B. Grosart in *Representative Nonconformists*; Dr. Alexander Whyte, *Samuel Rutherford and some of his Correspondents* (1894); Rev. R. Gilmour, *Samuel Rutherford* (1904).

RUTHERGLEN (locally pronounced *Rüglen*), royal municipal and police burgh of Lanarkshire, Scotland. Pop. of royal burgh (est. 1938) 25,441. It is situated on left bank of the Clyde, 2½ m. by the L.M.S. railway S.E. of Glasgow, with the east of which it is connected by a bridge. The parish church stands near the spire of the ancient church where, according to tradition, the treaty was made in 1297 with Edward I., by which Sir John Menteith undertook to betray Wallace to the English. The industries include collieries, chemical works, dye-works, paper-mills, chair-making, tube-making, pottery, rope- and twine-works.

Rutherglen was erected into a royal burgh by David I. in 1126. It then included a portion of Glasgow, but in 1226 the boundaries were rectified so as to exclude the whole of the city, and Rutherglen has continued to resist incorporation with Glasgow. In early times it had a castle, which was taken by Robert Bruce from the English in 1313. It was kept in good repair till after the battle of Langside (1568), when it was burnt by order of the regent Moray. In 1679 the Covenanters published their "Declaration and Testimony" at Rutherglen prior to the battles of Drumclog and Bothwell Brig (1679).

RUTHIN, market town and municipal borough, Denbigh parliamentary division, Denbighshire, Wales, 215 m. N.W. of London by G.W.R. Pop. (1938) 3,188. Area 3.2 sq.mi. Ruthin (*Rhudd ddim*, "red fortress") stands on a hill above the river Clwyd. Apart from legends of Arthur, the first fact of note is its connection with the Grey de Ruthyn family (1282). Owen Glendower attacked the castle in 1400; it was later sold to Henry VII, and Elizabeth gave it to the earl of Warwick. In 1646 it was dismantled by the Parliamentarians but later a new castle was built on the site. The church of St. Peter has nearly 500 panels of carved oak. The incumbent is known as the warden.

RUTHVEN (rív'ən), name of a noble Scottish family tracing descent from a certain Thor, who settled in Scotland during the reign of David I. In 1488 one of its members, Sir William Ruthven (d. 1528), was created a lord of parliament as Lord Ruthven. Patrick, 3rd Lord Ruthven (c. 1520–1566), played an important part in the political intrigues of the 16th century as a strong Protestant and a supporter of the lords of the congregation. He favoured the marriage of Mary with Darnley, and was the leader of the band which murdered Rizzio. This event was followed by his flight into England, where he died. Ruthven wrote for Queen Elizabeth a *Relation* of the murder, which is preserved in mss. in the British Museum.

A descendant of the 1st Lord Ruthven in a collateral line, also named Patrick Ruthven (c. 1573-1651), distinguished himself in the service of Sweden, which he entered about 1606. After leaving the Swedish service he was employed by Charles I. in Scotland. He defended Edinburgh castle for the king in 1640, and when the Civil War broke out he joined Charles at Shrewsbury. He led the left wing at the battle of Edgehill, and after this engagement was appointed general-in-chief of the Royalist army. For his services he was created Lord Ruthven of Ettrick in 1639, earl of Forth in 1642 and earl of Brentford in 1644. The earl compelled Essex to surrender Lostwithiel, and was wounded at both battles of Newbury. In 1644 he was superseded in his command by Prince Rupert. After visiting Sweden on a mission for Charles II., Brentford died at Dundee on Feb. 2, 1651. He left no sons and his titles became extinct.

Patrick, 3rd Lord Ruthven, was succeeded as 4th lord by his son William (c. 1541-1584), who like his father was prominent in the political intrigues of the period and was also concerned in the Rizzio murder. In 1582 he devised the plot to seize King James VI., known as the raid of Ruthven, and he was the last-known custodian of the famous silver casket containing the letters alleged to have been written by Mary, queen of Scots, to Bothwell. In 1581 he was created earl of Gowrie, but all his honours were forfeited when he was attainted and executed in May 1584. (See GOWRIE, 3RD EARL OF.)

In 1853 the barony descended to Mary Elizabeth Thornton (c. 1784-1864), the wife of Walter Hore (d. 1878). She and her husband took the name of Hore-Ruthven, borne by later barons.

See the *Ruthven Correspondence*, edited with introduction by the Rev. W. D. Macray (1868); J. H. Round, "The Barony of Ruthven of Freeland" in Joseph Foster's *Collectanea Genealogica* (1881-85); and Sir R. Douglas, *The Peerage of Scotland* (new ed. by Sir J. B. Paul).

RUTILE, the most abundant of the three native forms of titanium dioxide, TiO_2 ; the others being anatase and brookite (*qq.v.*). Like anatase, it crystallizes in the tetragonal system, but with different angles and cleavages, it being crystallographically related to cassiterite, with which it is isomorphous. The crystals resemble cassiterite in their prismatic habit and terminal pyramidal planes and also in the twinning; the prism planes are striated vertically. Acicular crystals are sometimes twinned together to form reticulated skeletal plates to which the name "sagenite" (Gr. *σαγήνη* a net), is applied. At the same time, the colour is usually reddish-brown, though yellowish in the very fine needles, and black in the ferruginous varieties ("nigrine" and "ilmenorutile"); the streak is pale brown. The name rutile, given by A. G. Werner in 1803, refers to the colour (Lat. *rutilus*, red). Crystals are transparent to opaque, and have a brilliant metallic-adamantine lustre. The hardness is 6.5; specific gravity 4.2, ranging up to 5.2 in varieties containing 10% of ferric oxide.

Rutile occurs as a primary constituent in eruptive rocks, but more frequently in schistose rocks. As delicate acicular crystals it is often enclosed in mica and quartz; in mica (*q.v.*) it gives rise to the phenomenon of asterism; and clear transparent quartz (rock-crystal) enclosing rutile is often cut as a gem under the name of "Venus' hair stone" (Pliny's *Veneris crinis*). As a secondary mineral rutile in the form of minute needles is of wide distribution in various sedimentary rocks, especially clays and slates. As rounded grains it is often met with in auriferous sands and gravels. The mineral has little economic value; it has been used for imparting a yellow colour to glass and porcelain, and for this purpose is mined at Risør and other places in Norway.

(L. J. S.)

RUTILIUS CLAUDIUS NAMATIANSUS, Roman poet, flourished at the beginning of the 5th century A.D. He was the author of a Latin poem, *De Reditu Suro*, in elegiac metre, describing a coast voyage from Rome to Gaul in A.D. 416. The literary excellence of the work, and the flashes of light which it throws across a momentous but dark epoch of history, combine to give it exceptional importance among the relics of late Roman literature. The poem was in two books; the exordium of the first and the greater part of the second have been lost. What remains consists of about seven hundred lines.

The author is a native of S. Gaul (Toulouse or perhaps Poitiers), and belonged, like Sidonius, to one of the great governing families of the Gaulish provinces. His father was an imperial official with a distinguished career, and Rutilius himself was secretary of State and *praefectus urbi*. After reaching manhood, he passed through the tempestuous period between the death of Theodosius (395) and the fall of the usurper Attalus, which occurred near the date when his poem was written. Undoubtedly the sympathies of Rutilius were with those who during this period dissented from and, when they could, opposed the general tendencies of the imperial policy. We know from himself that he was the intimate of those who belonged to the circle of the great orator Symmachus—men who scouted Stilicho's compact with the Goths, and led the Roman senate to support the pretenders Eugenius and Attalus in the vain hope of reinstating the gods whom Julian had failed to save.

Perhaps the most interesting lines in the whole poem are those in which Rutilius assails the memory of "dire Stilicho," as he names him. Stilicho, "fearing to suffer all that had caused himself to be feared," planted the cruel Goths, his "skin-clad" minions in the very sanctuary of the empire. May Nero rest from all the torments of the damned, that they may seize on Stilicho; for Nero smote his own mother, but Stilicho the mother of the world!

We shall not err in supposing that we have here (what we find nowhere else) an authentic expression of the feeling entertained by a majority of the Roman senate concerning Stilicho. He had but imitated the policy of Theodosius with regard to the barbarians; but even that great emperor had met with passive opposition from the old Roman families. It is noteworthy that Rutilius speaks of the crime of Stilicho in terms far different from those used by Orosius and the historians of the lower empire. They believed that Stilicho was plotting to make his son emperor, and that he called in the Goths in order to climb higher. Rutilius holds that he used the barbarians merely to save himself from impending ruin. The Christian historians assert that Stilicho designed to restore paganism. To Rutilius he is the most uncompromising foe of paganism.

With regard to the form of the poem, Rutilius handles the elegiac couplet with great metrical purity and freedom, and betrays many signs of long study in the elegiac poetry of the Augustan era. The Latin is unusually clean for the times, and is generally fairly classical both in vocabulary and construction. The taste of Rutilius, too, is comparatively pure. It is common to call Claudian the last of the Roman poets. That title might fairly be claimed for Rutilius, unless it be reserved for Merobaudes. At any rate, in passing from Rutilius to Sidonius no reader can fail to feel that he has left the region of Latin poetry for the region of Latin verse.

BIBLIOGRAPHY.—All existing mss. of Rutilius are later than 1494, and are copies from a lost copy of an ancient ms. once at the monastery of Bobio, which disappeared about 1700. The *editio princeps* is that by J. B. Pius (Bologna, 1520), and the principal editions since have been those by Barth (1623), P. Burman (1731, in his edition of the minor Latin poets), Wernsdorf (1778, part of a similar collection), Zumpt (1840), and the critical edition by Lucian Miiller (Teubner, Leipzig, 1870), and another by Vessereau (1904); also an annotated edition by Keene, with a translation by G. F. Savage-Armstrong (1906). Miiller writes the poet's name as Claudius Rutilius Namatianus, instead of the usual Rutilius Claudius Namatianus; but if the identification of the poet's father with the Claudius mentioned in the Theodosian Code (2, 4, j) be correct, Miiller is probably wrong. Rutilius receives more or less attention from all writers on the history or literature of the times, but a lucid chapter in Beugnot, *Histoire de la destruction du Paganisme en Occident* (1835), may be especially mentioned, and one in Pichon's *Derniers écrivains profanes* (1906). See also O. Schissel von Fleschenberg, *Rutilius Namatianus* (Vienna and Leipzig, 1920). (J. S. R.)

RUTLAND, EARLS AND DUKES OF. The 1st earl of Rutland was Edward Plantagenet (1373-1411), son of Edmund, duke of York, and grandson of King Edward III. In 1390 he was created earl of Rutland, but was to hold the title only during the lifetime of his father, on whose death in 1402 the earldom accordingly became extinct, the earl then becoming duke of York. The title earl of Rutland seems to have been assumed subsequently by different members of the house of York, though it does not appear that any of them had a legal right to it. One of these

was the 1st earl's nephew, Richard Plantagenet, duke of York, father of King Edward IV. Richard's daughter Anne married for her second husband Sir Thomas St. Leger, and their daughter Anne married George Manners, 12th Baron Ros, or Roos (d. 1513). Their son, Thomas Manners (d. 1543), was therefore great-grandson of Richard Plantagenet, who had styled himself earl of Rutland among other titles. In 1525 Thomas Manners was created earl of Rutland, and his descendants have held this title to the present day.

Thomas was a favourite of Henry VIII., who conferred on him many offices and extensive grants of land, including Belvoir Castle, in Leicestershire, which became henceforth the chief residence of his family. He was succeeded in the earldom by his son Henry (c. 1516-1563); and his second son, Sir John Manners, acquired Haddon Hall, Derbyshire, by his marriage with Dorothy, daughter of Sir George Vernon, called "the king of the Peak." Henry, the 2nd earl, was an admiral of the fleet in the reign of Queen Mary, and later enjoyed the favour of Queen Elizabeth.

John, 9th earl (1638-1711), a partisan of the Revolution of 1688, received the Princess Anne at Belvoir Castle on her flight from London; after the accession of Anne to the throne she created him marquess of Granby and duke of Rutland in 1703. The 1st duke was three times married; the divorce in 1670, while he was still known as Lord Ros, of his first wife, Anne, daughter of the marquess of Dorchester, was a very celebrated legal case, being the first instance of divorce *a vinculo* by act of parliament, a divorce *a mensa et thoro* having previously been granted by the ecclesiastical courts. His grandson John, the 3rd duke (1696-1779), was the father of John Manners, marquess of Granby (q.v.), a distinguished soldier, whose son Charles, 4th duke of Rutland (1754-1787), succeeded his grandfather. When marquess of Granby he represented Cambridge university in the House of Commons, and hotly opposed the policy that led to war with the American colonies. He helped to procure the entrance of the younger Pitt to the House of Commons, and remained through life Pitt's intimate friend. After succeeding to the dukedom in 1779, he sat in the cabinets of Shelburne and of Pitt, and became lord lieutenant of Ireland in 1784.

He was one of the earliest to advocate a legislative union between Ireland and Great Britain, which he recommended in a letter to Pitt in June 1784. The poet Crabbe was for some time private chaplain to the duke at Belvoir. His wife, Mary Isabella (1756-1831), "the beautiful duchess," whose portrait was four times painted by Sir Joshua Reynolds, was a daughter of the 4th duke of Beaufort. His eldest son, John Henry, 5th duke (1778-1857), was "the duke" in Disraeli's *Coningsby*; the latter's two sons, who succeeded in turn to the dukedom, the marquess of Granby and Lord John Manners, figuring in the same novel as "the marquis of Beaumanoir" and "Lord Henry Sidney" respectively. The 7th duke is noticed separately.

RUTLAND, JOHN JAMES ROBERT MANNERS, 7TH DUKE OF (1818-1906), English statesman, was born at Belvoir Castle on Dec. 13, 1818, the younger son of the 5th duke of Rutland by Lady Elizabeth Howard, daughter of the 5th earl of Carlisle. Lord John Manners, as he then was, was educated at Eton and Trinity College, Cambridge. In 1841 he was returned for Newark in the Tory interest, along with W. E. Gladstone, and sat for that borough until 1847. Subsequently he sat for Colchester, 1850-57; for North Leicestershire, 1857-85; and for East Leicestershire from 1885 until in 1888 he took his seat in the House of Lords upon succeeding to the dukedom.

In 1841 Manners definitely associated himself with the "Young England" party, under the leadership of Disraeli. This party sought to extinguish the predominance of the middle-class *bourgeoisie*, and to re-create the political prestige of the aristocracy by resolutely proving its capacity to ameliorate the social, intellectual, and material condition of the peasantry and the labouring classes. Manners made an extensive tour of inspection in the industrial parts of N. England, in the course of which he and his friend Smythe expounded their views with a brilliancy which frequently extorted compliments from the leaders of the Manchester school. In 1843 he supported Lord Grey's motion for an

inquiry into the condition of England, the serious disaffection of the working classes of the north being a subject to which he was constantly drawing the attention of parliament. Among other measures that he urged were the disestablishment of the Irish Church, the modification of the Mortmain Acts, and the resumption of regular diplomatic relations with the Vatican. In the same year he issued in pamphlet form a strong *Plea for National Holydays*. In 1844 Lord John vigorously supported the Ten-hours Bill, which, though strongly opposed by Bright, Cobden, and other members of the Manchester school, was passed in May 1847.

Manners figured as "Lord Henry Sidney" in Disraeli's *Coningsby*, and not a few of his ideas are represented as those of Egremont in *Sybil* and Waldershare in *Endymion*. But the disruption of the Young England party was already impending. Lord John's support to Peel's decision to increase the Maynooth grant in 1845 led to a difference with Disraeli. Divergences of opinion with regard to Newman's secession from the English Church produced further defections in the ranks, and the rupture was completed by Smythe acquiescing in Peel's conversion to Free Trade. Lord John produced another volume of verse, known as *English Ballads*, chiefly patriotic and historical, in 1850. During the three short administrations of Lord Derby (1851, 1858 and 1866) he sat in the cabinet as first commissioner of the office of works. On the return of the Conservatives to power in 1874 he became postmaster-general in Disraeli's administration, and was made G.C.B. on his retirement in 1880. He was again postmaster-general in Lord Salisbury's administration, 1885-86, and was head of the department when sixpenny telegrams were introduced. Finally, in the Conservative government of 1886-92 he was chancellor of the duchy of Lancaster. He had succeeded to the dukedom of Rutland in March 1888, upon the death of his elder brother. He died on Aug. 4, 1906 at Belvoir Castle.

RUTLAND, a midland county of England, bounded north and east by Lincolnshire, north and west by Leicestershire, and south-east by Northamptonshire. It is the smallest county in England, having an area of 152 sq. miles. The western portion is formed of the Jurassic beds, including Lias, inferior Oolites and great Oolites, which form the high ground. They dip gently to the east and are interrupted in places by faults, as in the Welland valley between Ketton and Duddington. The lower Lias occupies but a very small part in the extreme north-west. The middle Lias includes marlstone and ferruginous limestone yielding iron in workable quantities and forming the productive soil of the Catmose valley. The upper Lias forms the steep slopes below the Oolitic scarps, and furnishes materials for bricks and tiles. The inferior Oolite limestones and sands form the highland of the west and the dip slope to the east, where, in the north-east, they are overlain by great Oolite. All these deposits are covered with glacial deposits.

Rutland is drained by the tributaries of the Welland, which flows along its eastern boundary.

History. — Ancient stone implements have been found in the Oakham district and along the river Wash, and small late Bronze age hoards. At the time of the Roman invasion, this region was inhabited by a scanty population of the Coritani tribe. This is inferred by the absence of finds, although Ermine street passes through its eastern portion. Rutland was forested in pre-Norman days and only a few early settlements occurred, which were found on the belt of Northampton sands at its junction with the Lias clays, where dry sites could be found near springs, with pastures on the clay beds. These sites were occupied by a tribe of the Middle Angles in the 6th and 7th centuries, and the whole region was absorbed subsequently in the kingdom of Mercia.

Although mentioned by name in the will of Edward the Confessor, who bequeathed it to his queen Edith for life, with remainder to Westminster abbey, Rutland did not rank as a county at the time of the Domesday survey in which the term Rutland is applied only to that portion assessed under Nottinghamshire, while the south-east portion of the modern county is surveyed under Northamptonshire, where it appears as the wapentake of Wiceslea. Rutland is first mentioned as a distinct county under the administration of a separate sheriff in the pipe roll

of 1159, but as late as the 14th century it is designated "Rutland Soke," and the connection with Nottinghamshire, a county which does not adjoin it at any point, was maintained up to the reign of Henry III., when the sheriff of Nottingham was by statute appointed also escheator in Rutland.

Rutland was included in the diocese of Lincoln, and in 1291 it became a new rural deanery, within the archdeaconry of Northampton; but on the elevation of Peterborough to an episcopal see by Henry VIII., in 1541, the archdeaconry of Northampton, with the deanery of Rutland, was transferred to that diocese. In 1876 the deanery of Rutland was placed within the newly-founded archdeaconry of Oakham.

The Norman Walkelin de Ferrers was connected with this county, and founded Oakham castle in the 12th century. The castle was subsequently bestowed by Richard II., together with the earldom of Rutland, on Edward, son of Edmond, duke of York. Essendine (Essenden, or Essingdon) was purchased in 1545 by Richard Cecil of Burleigh, and the title of baron of Essenden bestowed on his grandson is retained by the earls of Salisbury. Burley-on-the-hill was held by Henry Despenser, the warlike bishop of Norwich, in the reign of Richard II., and was purchased by George Villiers, duke of Buckingham, who there entertained James I. During the Civil War, Rutland was on the side of the parliament.

The county returned two members to parliament from 1295 until 1885, when the number was reduced to one. It is joined with part of the Kesteven division of Lincolnshire.

Agriculture and Trade.—Rutland has always been mainly an agricultural county. The Domesday survey mentions numerous mills in Rutland, and a fishery at Ayston rendered 325 eels. In the 14th century the county exported wool. Stilton cheese has long been made in Leyfield forest and the vale of Catmose, and limestone is dug in many parts of the county. The development of the economic resources of Rutland was helped in 1793 by the extension of the Melton Mowbray canal to Oakham.

In the east and south-east districts of Rutland the soil is light and shallow, whilst in other districts it is a fertile loam, and in the vale of Catmose the soil is either clay or loam or a mixture of the two. The east part of the county is chiefly under tillage and the west in grass. Over 88% of the whole area, or 85,590 ac., was under cultivation in 1939; of this 26,425 ac. was arable land. Clover and rotation grasses for hay occupied 3,486 acres. The chief crops in 1939 were, in order of acreage occupied: barley, wheat, oats, turnips and swedes, sugar beets and mangolds. Many sheep (Leicesters and Southdowns) and cattle, mainly Short-horns, were reared. Large quantities of cheese are manufactured and sold as Stilton. Agriculture is practically the only industry of importance, but there is some quarrying and bootmaking. The region producing iron is continued from Northampton into Rutland, and the working of the iron ore forms one of the industries of the county. The main line of the L.N.E. ry. intersects the northeastern corner of the county, and branches of that system, and of the L.M.S., serve the remainder. There were 300 miles of highways in 1941.

Population and Administration.—The area of the ancient and administrative county is 152 sq.mi., with a population of 17,860 (est. 1938). Between Sept. 1939 and Feb. 1940, however, war-time population movements, caused by evacuation and intensified industrial effort, caused an increase of 7%. The county contains five hundreds. Oakham (*q.v.*) is the county town and the only urban district. There are three rural districts. The county is in the Midland circuit, and assizes are held at Oakham. It has one court of quarter sessions, but is not divided for petty sessional purposes. The county is in the diocese of Peterborough.

See *Victoria County History, Rutland*; James Wright, *History and Antiquities of the County of Rutland* (London, 1684); T. Blore, *History and Antiquities of the County of Rutland*, vol. 1, pt. 2 (containing the East hundred and including the hundred of Casterton Parva; Stamford, 1811); C. G. Smith, *A Translation of that portion of Domesday Book which relates to Lincolnshire and Rutland* (London, 1870).

RUTLAND, a city of Vermont, U.S.A., the county seat of Rutland county; on Otter creek, 95 mi. N.E. of Albany (New York). It is served by the Delaware and Hudson and the Rutland

railways. Pop. (1920) 14,954 (90% native white); 1940 federal census 17,082. Rutland has a beautiful site, 600 ft. above sea level, encircled by the Green mountains. Twenty peaks can be seen from the city hall, and there are 20 lakes within 20 miles. It is a summer resort and touring centre. The famous Rutland marble (used for the memorial in Arlington National cemetery and for many public buildings throughout the country) is quarried in West Rutland and in Proctor (6 mi. N.W.) where there is the world's largest marble display. Some of the underground quarries are 300 ft below the surface. The manufacturing industries of the city (with an output in 1937 valued at \$9,054,189) include marble and monument works, and factories making stone-working machinery, maple-sugar products and utensils and scales. Its morning newspaper, the *Herald*, was established in 1794. Rutland was settled in 1770, and from 1784 to 1804 it was one of the capitals of Vermont. The capitol (1784) is the second oldest building in the State. The village was incorporated in 1847, and in 1892 a part of the town (including the village) was chartered as a city. Plymouth, a village 30 mi. S.E. of Rutland, was the birthplace of Calvin Coolidge.

RUTLEDGE, JOHN (1739–1800), American jurist and politician, was born in Charleston (S.C.) in 1739. He studied law in London, and began to practise in Charleston in 1761. He was a delegate to the stamp act Congress in 1765 and to the Continental Congress in 1774–77 and 1782–83; he was chairman of the committee which framed the State Constitution of 1776, and the first "president" (governor) of South Carolina in 1776–78. He resigned in 1778, but was elected governor in the following year, and served until 1782. In the Constitutional Convention of 1787 he urged that the president and the Federal judges be chosen by the national legislature. He was associate justice of the U.S. Supreme Court in 1789–91, and chief justice of the supreme court of South Carolina in 1791–95. Nominated chief justice of the Supreme Court of the U.S. in 1795, he presided during the August term, but the Senate refused to confirm the nomination, apparently because of his opposition to the Jay treaty. He died in Charleston July 23, 1800.

His brother, **EDWARD RUTLEDGE** (1749–1800), a signatory of the Declaration of Independence, was born in Charleston on Nov. 23, 1749. He studied law in his brother's office, and in London in 1769–73, and practised in Charleston. He served in the Continental Congress in 1774–77, and was sent with John Adams and Benjamin Franklin to confer on terms of peace with Lord Howe on Staten Island in Sept. 1776. As captain of artillery and as lieutenant colonel he served against the British in South Carolina. He was a member of the State legislature from 1782 to 1798, and in 1791 drafted the act which abolished primogeniture in South Carolina. From 1798 until his death Jan. 23, 1800, he was governor of South Carolina.

RUTULI, a people of ancient Italy inhabiting Ardea and the district round it on the coast of Latium, at no very great distance from Aricia, and just west of the territory of the Volsci. They are ranked by the form of their name with the Siculi and Appuli (Apuli), probably also with the Itali, whose real Italic name would probably have been *Vituli* (*see ITALY*). This suggests that they belong to a fairly early stratum of the Indo-European population of Italy.

RUVIGNY, HENRI DE MASSUE, MARQUIS DE, afterwards EARL OF GALWAY (1648–1720), was born in Paris on April 9, 1648, the son of the 1st Marquis de Ruvigny. He saw service under Turenne, who thought very highly of him. He had English connections, and was selected in 1678 by Louis XIV. to carry out the secret negotiations for a compact with Charles II., a mission which he executed with great skill. Succeeding his father as "general of the Huguenots," he refused Louis's offer, at the revocation of the Edict of Nantes, to retain him in that office, and in 1690, having gone into exile with his fellow Huguenots, he entered the service of William III. of England as a major-general, forfeiting thereby his French estates. In July 1691 he distinguished himself at the battle of Aughrim, and in 1692 he was for a time commander-in-chief in Ireland. He was created Viscount Galway and Baron Portarlington, and received a large grant of forfeited

estates in Ireland.

In 1693 Ruvigny fought at Neerwinden and was wounded, and in 1694, with the rank of lieutenant-general, he was sent to command a force in English pay which was to assist the duke of Savoy against the French, and at the same time to relieve the distressed Vaudois. But in 1695 the duke changed sides, the Italian peninsula was neutralized, and Galway's force was withdrawn to the Netherlands. From 1697 to 1701, a critical period of Irish history, the Earl of Galway (he was advanced to that rank in 1697) was practically in control of Irish affairs as lord justice of Ireland. After some years spent in retirement, he was appointed in 1704 to command the allied forces in Portugal, a post which he sustained with honour and success until the battle of Almanza in 1707, in which Galway, in spite of care and skill on his own part, was decisively defeated. But he scraped together a fresh army, and, although infirm, served in one more campaign. His last service was rendered in 1715, when he was sent as one of the lords justices to Ireland during the Jacobite insurrection. He died on Sept. 3, 1720.

RUVO DI PUGLIA, a town and episcopal see of Bari, Apulia, Italy, 21 mi. W. of the city of Bari by tramway, 853 ft. above sea-level. Pop. (1936) 24,748 (town), 25,452 (commune). The cathedral, a splendid basilica with a very lofty nave and two aisles, has three apses, a square campanile and a rich façade with three portals. It belongs to the early 13th century. The interior has a fine triforium. Ruvo occupies the site of the ancient Rubi.

RUWENZORI, also known as Runsono or Kokora, a mountain range of Central Africa, 65 m. long and with a maximum breadth of 30 m., trending a little east of north, lying just north of the equator between lakes Edward and Albert. The range falls steeply on the west to the central African rift-valley traversed by the Semliki, the western head-stream of the Nile, while on the east the fall is somewhat more gradual towards the western Uganda uplands. The upper parts are separated by fairly low passes into six groups of snowy summits, lying a little west of the central line, rising in each case above 15,000 ft. and reaching, in the culminating point of the western group (Mount Stanley), about 16,800 ft.

The origin of the range seems connected with that of the rift-valley on the west. Ruwenzori is a fault block of the Archaean floor of the continent, bounded east and west by lines of fracture, and having a general dip from west to east. A further upheaval produced an ellipsoidal anticline, causing the strata to dip outwards at a high angle. Traces of volcanic action are almost non-existent. Composed in its outer parts of Archaean gneisses and mica-schists offering no great resistance to denudation, in its centre the range consists of much more refractory rocks (amphibolites, diorites, diabases, etc.), to which fact, coupled with the existence of vertical fractures, the persistence and separation of the higher summits is probably due. The snow-clad area does not now extend more than ten miles in any direction; the snow-line is 13,450 ft. but there is evidence of a former extension to as low as 4,600 ft.

The upper region is almost entirely enveloped by day in thick cloud, which descends on the east to about 9,000 ft., and lower still on the west. As a result, the climate is excessively humid, the northern slopes having a rainfall of 200 inches a year giving extremely damp conditions on the mountain. The rivers are raging torrents and have cut deep valleys between the outer spurs. From the innermost recesses between Mounts Stanley, Speke and Baker, the main branches of the Mobuku descend to the east, while the four principal streams on the west unite to form the Butagu, the drainage on both sides ultimately finding its way to the Semliki, either directly or through lakes George and Edward.

The vegetation displays well-marked zones, varying with the altitude; but owing to the lower level to which the cloud descends on the west the limits of the several zones reach a lower level on the west than on the east. They have been defined as follows by Mr. R. B. Woosnam (1907), as follows, the figures in brackets being the upper limit on the east side:—grass (6,500 ft.), forest (8,500), bamboos (10,000), tree heaths (12,500) and lobelias and senecios (14,500), above which is the summit region of snow and

bare rock. The boundaries between the zones merely indicate the levels between which the respective forms are specially characteristic. The forest zone is the best marked, but on the west it merges in part with the low-lying forest of the Semliki valley. Mosses, hepaticae and lichens are prevalent in several of the zones, while bogs, vaccinium and other low-growing plants, are common above the forest zone. Helichrysums are abundant in the zone immediately below the snow. The larger mammals are found chiefly on the lower slopes, but bushbuck, pigs, leopards, monkeys, a hyrax and a serval cat occur at higher altitudes. The birds include kites, buzzards, ravens, sun-birds, touracos, a large swift, and various warblers and other small kinds. The upper limit of human settlement, with cultivation of colocasia and beans, has been placed at 6,700 ft.

In modern times the existence of a snowy range in this part of Africa was first made known by Sir Henry Stanley during the Emin Pasha relief expedition of 1887-89. Stanley named the main mass Ruwenzori, and outlying eastern peaks he called Mt. Gordon Bennett, Mt. Lawson, Mt. Edwin Arnold, etc.—the last named lying north-east of Lake George. Subsequently Stanley's own name was given to the chief summit. One of Stanley's officers, Lieut. Stairs, ascended the western slopes to over 10,000 ft. in 1889, and partial ascents were afterwards made by Dr. Stuhlmann, Mr. Scott-Elliot, Mr. J. E. S. Moore, Sir Harry Johnston, Mr. Douglas Freshfield, and others. Early in 1906 some of the secondary ridges above the snow-line were scaled by Messrs. Grauer, Tegart and Maddox, and by Dr. Wollaston and other members of the British Museum expedition, while later in the year the duke of Abruzzi led a well-equipped expedition to the upper parts of the range and ascended all the principal snow-clad peaks. The expedition produced for the first time a detailed map of the upper region, and threw much light on the geology and natural history of the range.

RUYSBROEK or **RUYSBROEGK, JAN VAN** (1293-1381), Dutch mystic, was born at Ruysbroek, near Brussels, in 1293. In 1317 he was ordained priest and became vicar of St. Gudule, Brussels. When 60 years of age he withdrew with a few companions to the monastery of Groenendael, near Waterloo, giving himself to meditation and mystical writing, and to a full share of the practical tasks of the society. He was known as the "Ecstatic Teacher," and formed a link between the Friends of God and the Brothers of the Common Life, sects which helped to bring about the Reformation. Ruysbroek insisted that "the soul finds God in its own depths," and noted three stages of progress in what he called "the spiritual ladder" of Christian attainment: (1) the active life, (2) the inward life, (3) the contemplative life. He did not teach the fusion of the self in God, but held that at the summit of the ascent the soul still preserves its identity. His works, of which the most important were *De vera contemplatione* and *De septem gradibus amoris*, were published in 1848 at Hanover; also *Reflections from the Mirror of a Mystic* (1906) and *Die Zierde der geistlichen Hochzeit* (1901).

BIBLIOGRAPHY.—A new edition of his works, *Alle de werken van J. van Ruysbroec de Wonderbare, etc.*, was published at Bussum in 1912 seq. A translation of his works into French was begun by the Benedictines of St. Paul de Wisques in 1920 seq. The following single works have been translated: *The Book of the Twelve Biguines* (1913); *The Adornment of the Spiritual Marriage*, etc., trans. by C. A. Wynschen, ed. with introd. and notes by E. Underhill (1916). See also R. M. Jones, *Studies in Mystical Religion*, pp. 308-14 (1909); M. Maeterlinck, *Ruysbroek and the Mystics, with selections from The Adornment of the Spiritual Marriage* (trans. by J. T. Stoddart, 1894); V. Scully, *A Mediaeval Mystic* (1910); E. Underhill, *Ruys-*

broeck (1915); Wautier d'Aygalliers, Ruysbroeck *l'admirable* (1923, Eng. trans. 1925).

RUYSDAEL (or **RUISDAEL**), **JACOB VAN** (c. 1628-1682), the most celebrated of the Dutch landscapists, was born at Haarlem. It is not known where he studied. His father, Isaak, was a framemaker, who also painted and it is suggested that Jacob studied first under him and that he was then under his uncle Solomon Ruisdael (c. 1600-1670) an able landscapist. The influence of Cornelis Vroom, another Haarlem landscapist, has also been traced in his early work; other authorities make him the pupil of Albert van Everdingen. The earliest date that appears on his paintings and etchings is 1646. Two years later he was admitted a member of the gild of St. Luke in Haarlem; in 1659 he obtained the freedom of the city of Amsterdam, and in 1668 his name appears there as a witness to the marriage of Hobbema. During his lifetime his works were little appreciated, and he seems to have suffered from poverty. In 1681 the sect of the Mennonites obtained his admission into the almshouse of the town, where he died on March 14, 1682.

The works of Ruysdael may be studied in the Louvre and the National Gallery, London, and in the collections at The Hague, Amsterdam, Berlin, and Dresden and Leningrad. His favourite subjects are simple woodland scenes, similar to those of Van Everdingen and Hobbema. He is especially noted as a painter of trees, and his rendering of foliage is characterized by the greatest spirit and precision. His views of distant cities, such as that of Haarlem in the possession of the marquess of Bute, and that of Katwijk in the Glasgow Corporation galleries, clearly indicate the influence of Rembrandt. He frequently paints coast-scenes and sea-pieces, but it is in his rendering of lonely forest glades (such as "The Pool in the Wood" at Leningrad) that we find him at his best. The subjects of certain of his mountain scenes seem to be taken from Norway, and have led to the supposition that he had travelled in that country. We have, however, no record of such a journey, and the works in question are probably merely adaptations from the landscapes of Van Everdingen, whose manner he copied at one period. Otto Beit owns a magnificent view of the "Castle of Bentheim" (1653) from which it may be concluded that his wanderings extended to Germany, where he may have made studies for the waterfalls and torrents which appear in many of his pictures. Only a single architectural subject from his brush is known—an admirable interior of the New Church, Amsterdam, in the possession of the marquess of Bute. The prevailing hue of his landscapes is a full rich green, which, however, has darkened with time, while a clear grey tone is characteristic of his sea-pieces. The art of Ruysdael, while it shows little of the scientific knowledge of later landscapists, is sensitive and poetic in sentiment, and direct and skilful in technique. Figures are sparingly introduced into his compositions, and are believed to be from the brush of Adrian Vanderveelde, Philip Wouwerman, Nikolaas Berchem, Eglog van der Neer, Ostade and Jan Lingelbach.

Unlike the other great Dutch landscape painters, Ruysdael did not aim at a pictorial record of particular scenes, but he carefully thought out and arranged his compositions. He particularly excels in the painting of cloudy skies which are spanned dome-like over the landscape. A romantic and sometimes deeply poetic sentiment is expressed in his work, as in "The Jewish Burial Ground" at Dresden which is regarded as one of the greatest landscapes ever painted. The "Cornfield" and the "Travellers," etchings, are also significant expressions of landscape art.

See Hofstede de Groot, *Catalogue of Dutch Painters* (1912).

RYAN, JOHN DENIS (1864-1933), American capitalist, was born at Hancock, Mich., on Oct. 10, 1864. In 1889 he went to Denver, where he was employed as a salesman of lubricating oils. In 1901 he secured an interest in a bank at Butte. In 1904 he was made manager of the Amalgamated Copper Company in Montana, becoming president in 1908. He had been elected president of the Anaconda Copper Mining Company in 1905, and after the merging of the Amalgamated interests in the Anaconda in 1910 he continued as president of the latter until 1918. He developed large water powers in Montana, and in 1913 electrified the rail-

way between Butte and Anaconda (100m.), the success of which led to a wide expansion of railway electrification. During 1917-18 Ryan was an executive of the American Red Cross. He was appointed, in April 1918, head of the aircraft board of the committee of national defence, and in August was appointed second assistant secretary of war and director of air service of the U.S. Army, which position he resigned in November. In 1919 he was elected chairman of the Anaconda Copper Mining Company.

RYAZAN, a province of the Russian S.F.S.R., surrounded by those of Moscow, Vladimir, Nizhegorod, Penza, Tambov and Tula, and not coinciding with the pre-1917 province of the same name. Area 39,967 sq km. Pop. (1926) 2,429,117, mainly Great Russians, with some Tatars, Poles and Jews in the towns. The province is drained by the Oka and its tributaries, the Pronya and Pra, and small lakes are numerous in the wide depression of the Oka. Forests cover about a fifth of the area, conifers, especially pines, prevailing in the more forested north, and deciduous forest with birch, ash and oak appearing in scattered patches in the south. North of the Oka is grey forest soil of little value for agriculture, but south of that river the fertile black earth of the steppe begins. The climate is extreme, average February temperature 3.2° F, July 67° F, rainfall 16 to 18 in. per annum.

Industries.—The province is essentially agricultural, except for a coal mining belt extending along the railway west from Ryazhsk. Dairying is not much developed, as the land is not suitable for pasture, but grain growing gives a good guarantee for the peasant and the villages are large, averaging 534 inhabitants. There are some collective agricultural artels. The chief crops are rye (50%), oats (19%), millet (11.2%) and potatoes (10%). Buckwheat, grass, hemp and sunflower seed are sown. Orchard fruits, especially apples, and cucumbers, cabbages, onions and other vegetables are cultivated in the valley of the Oka. Sheep, working and milch cattle, horses, pigs and a few goats are bred.

Koustar (peasant) textile industries are widespread, as is the making of leather and felt footwear, and the district was once famous for its lace making and leather embroidery. The northern region has small industries of this type, including the making of wooden vessels, sledges and boats, the preparation of pitch and tar and basketwork from the reeds in the marshy northern areas which occupy 6% of the province. The electric plant of Ryazan works on peat fuel from these bog areas, and also on the local coal. Marshy areas near the Oka river have been successfully drained and are now pasture lands.

There is a comparatively good railway net and 57% of the rivers are available for steam navigation; a good deal of transit trade goes on throughout the province.

RYAZAN, chief town of the above province, situated on the elevated right bank of the Trubezh, a mile above its confluence with the Oka in 54° 40' N., 39° 43' E. Pop. (1926) 49,044. A wide prairie dotted with large villages, the bottom of a former lake, spreads out from the base of the crag on which Ryazan stands, and actually has the aspect of an immense lake when it is inundated in the spring. The town manufactures agricultural machinery, boots, shoes and leather goods, and bricks, and has a distilling industry. It is an important trading centre, on a navigable river, with four railways radiating from it and a good main road linking it with Moscow. The Krestovozdvizhensk church contains tombs of the princes of the 15th and 16th centuries.

The capital of Ryazan principality was Ryazan—now Old Ryazan, a village close to Spask, also on the Oka. It is mentioned in annals as early as 1097, but continued to be the chief town of the principality only until the 14th century. In the 11th century one of the Kiev princes founded, on the banks of a small lake, a fort which received the name of Pereyaslav-Ryazanskiy. In 1294 (or in 1335) the bishop of Murom, compelled to leave his own town, settled in Pereyaslav-Ryazanskiy. The princes of Ryazan followed his example, and by and by completely abandoned the old republican town of Ryazan. In 1300 a congress of Russian princes was held there, and in the following year the town was taken by the Moscow prince. It continued, however, to be the residence of the Ryazan princes until 1517.

RYAZHSK, a town and railway junction of Russia, south of Ryazan, in 53° 42' N., 40° 3' E., on the Khupta river. Pop. (1926) 16,164. It is a grain collecting centre with an elevator, and manufactures *makhorka* tobacco and spirits.

RYBINSK, a town of Russia in the province of Yaroslavl, in 58° 3' N., 38° 47' E., on the navigable Volga, opposite to the mouth of the Sheksna, which connects the Volga system with Lake Ladoga. Pop. (1933) 86,700. Here goods are transhipped from the large Volga boats to the smaller ones of the Marii system linking with Leningrad. There are ship yards, wire-drawing mills, nail, metal and match factories, flourmills, leather works and a brewery.

(2) A small settlement of Asiatic Russia on a left bank tributary of the Irtysh in 56° 5' N., 72° 30' E.

(3) A small town of Asiatic Russia south of the trans-Siberian railway, lying between Krasnoyarsk and Kansk, in 55° 55' N., 94° 55' E.

RYDBERG, ABRAHAM VIKTOR (1828–1895), Swedish author and publicist, was born in Jonköping on Dec. 18, 1828. In 1855 he joined the staff of the *Goteborgs Handels-och sjöfartstidning*, in which his romances successively appeared; he was editorially connected with it until 1876. *The Freebooter on the Baltic* (1857) and *The Last of the Athenians* (1859) gave Rydberg a place in the front rank of contemporary novelists. It was a surprise to his admirers to see him presently turn to theology, but with *The Bible's Teaching about Christ* (1862), in which the aspects of modern Biblical criticism were first placed before Swedish readers, he enjoyed a vast success. He was not elected to the Swedish Academy until 1877, when he had long been the first living author of Sweden. Roman *Days* is a series of archaeological essays on Italy (1876). He collected his poems in 1882; his version of *Faust* dates from 1876. In 1884 he was appointed professor of ecclesiastical history at Stockholm. He died, after a short illness, on Sept. 22, 1895. Rydberg was an idealist of the Romantic type which Sweden had known for three-quarters of a century; he was the last of that race, and, as a writer, perhaps the greatest.

See C. Warburg, *Victor Rydberg, hans levnad och diktning* (1913); L. Lundh, *Victor Rydberg* (Stockholm, 1918); V. Svanberg, *Rydbergs Singoalla* (Uppsala, 1923).

RYDBERG, PER AXEL (1860–1931), American botanist, was born at Odh, Sweden, on July 6, 1860. He graduated at the gymnasium in Skara, in 1881, and soon after went to the United States, where he continued further study at the University of Nebraska (B.S., 1891; M.S., 1895) and at Columbia (Ph.D., 1898). In the period 1884–98 he also taught natural sciences in several Swedish-American institutions, and during summers in 1891–96 he was field agent for the divisions of botany and agrostology of the U.S. Department of Agriculture. In 1899 he was made curator at the New York Botanical Garden. He made extensive taxonomic studies of the seed-plants of the Great Plains and the Rocky Mountain region.

He published *Catalogue of the Flora of Montana and the Yellowstone National Park* (1900), *Flora of Colorado* (1906), *Flora of the Rocky Mountains and Adjacent Plains* (1917; 2nd ed., 1922). He also wrote monographs on Saxifragaceae, Rosaceae, Carduaceae and other plant groups, and various contributions to botanical journals.

RYDE, a municipal borough and watering place in the Isle of Wight, England, 5 mi. S.W. of Portsmouth. Pop. (1938) 17,740. Beautifully situated on rising ground on the northeast coast, overlooking Spithead, it is on the site of a village called La Rye or La Riche, which was destroyed by the French in the reign of Edward II. At the close of the 18th century it was a small fishing hamlet, but it rapidly grew as a watering-place. Ryde is connected by rail with the other towns in the island, and also by boat with Portsmouth, Southampton, Southsea, Portsea and Stoke's bay. The pier is half a mile in length. The principal buildings are All Saints church, the market house and town hall, the Royal Victoria Yacht club-house, the pavilion and the Royal Isle of Wight Infirmary. There are golf links near the town. The town was incorporated in 1868. Area, 12.3 sq. mi.

RYDER, ALBERT PINKHAM (1847–1917), American artist, was born at New Bedford, Mass., on March 19, 1847. He

was a pupil of William E. Marshall and of the schools of the National Academy of Design. Among his better known paintings are: "Temple of the Mind," "Jonah and the Whale," "Christ appearing unto Mary," "The Flying Dutchman," "Charity" and "The Little Maid of Arcadie." He became a member of the Society of American Artists in 1878, and a National Academician in 1906. He died at Elmhurst, Long Island, N.Y., on March 28, 1917. In 1918 the Metropolitan Museum held a memorial exhibit of his work.

RYE, a market town and municipal borough in the Rye parliamentary division of Sussex, England, 11 mi. E.N.E. from Hastings, on the S.R. Pop. (1938) 4,114. Area, 1.6 sq. mi. In early times Rye (La Rye, Rie) was a fishing village and, as part of the manor of "Rameslie," was granted by Cnut to the abbot and convent of Fécamp, by whom it was retained until Henry III resumed it in 1247, when that part outside the liberty of the town, and therefore known as Rye Foreign, was probably joined to the abbey's manor of Brede. The town had become attached to the Cinque Port of Hastings by the time of Henry II, but the fluctuations of the sea and attacks of the French caused its decline in the 13th and 14th centuries, and the walls were built during the reign of Edward III. The decay of Winchelsea contributed to the partial revival of Rye in the 15th and 16th centuries, when it was a chief port of passage. Towards the end of the 16th century the decay of the port began, and notwithstanding frequent attempts to improve the harbour it never recovered its ancient prosperity. By the end of the 13th century Rye seems to have become a borough, with mayor, barons and bailiffs but it possesses no charter distinct from the Cinque Ports. As a member of the Cinque Ports it sent representatives to the parliament of 1265, and two members were returned from 1366 until 1832, when, jointly with Winchelsea, it returned one member until 1885. In 1290 Rye was granted a three days' fair in September, altered in 1305 to March. Weekly markets on Wednesday and Friday were evidently held before 1405, as in that year the Friday market was changed to Saturday. Shipbuilding began here as early as the 13th century and is still carried on. The town is situated above the south of Romney marsh, which within historic times was an inlet of the English Channel. The sea began to recede in the 16th century, and now the river Rother forms a small estuary with its mouth 2 mi. from the town; this serves as a small harbour with a depth of 10 ft. at high tide. Fishing is the principal trade and there is a market for sheep, wool, grain and hops.

RYE, a village of Westchester county, New York, U.S.A., on Long Island sound, 24 mi. N.E. of New York city; served by the New York, New Haven and Hartford and electric railways. Pop. 1940, 9,865 federal census. It is a residential village, with several yacht and country clubs and a number of 18th century houses. The municipal hall is an old inn (Haviland) where Washington and Lafayette were entertained. "Kirby's tide-mill," built before the Revolution, still stands. Rye was the home of John Jay, and his grave is here, in the family burying-ground. At Rye Beach there is a seaside playground of 214 ac., owned and operated by the county. The village was incorporated in 1904.

RYE. This cereal, known botanically as *Secale cereale*, is of less importance than any of the grain crops. While generally distributed over the world, rye is of major importance only on the poorer soils of the northern hemisphere.

The spike of the rye plant consists of alternately ranked spikelets attached to a rachis forming a fairly dense head or "ear." The spikelets are composed of two thin and narrow glumes that enclose two or more florets. Each of the florets consists of a lemma and palea which enclose a pistil and three stamens. The number of fertile florets depends a great deal upon the soil fertility and growth conditions. The lemmas taper into awns of about two to four centimetres in length. The ovary develops after pollination into a long one-seeded fruit known botanically as a caryopsis. The outer colour of the caryopsis varies, but grayish-green and light brown grains predominate. Some of the grains are almost white. Upon threshing, kernels are freed from the enclos-

ing lemma and *palea*. Sterile florets occur to the extent of 25% to 30% in field grown rye and this is enough to reduce yields. Cross-pollination occurs nearly 100% because the flowers are largely self-sterile. The leaves are long, narrow and thin. The first foliage is reddish or purplish brown. The ligule is short and the auricles are only moderate in size. The growing culms have a bluish-green bloom, and the height and number of culms depend upon growth conditions. Rye has the tallest and strongest straw of all of the small grain crops. Because the straw may attain a height of 7 to 8 ft. on fertile soils, harvesting is accomplished with difficulty. There are numerous fibrous roots, and they penetrate downward more deeply than in other small grains.

Rye probably originated in southwestern Asia, like several other important genera such as *Triticum*, *Avena* and *Hordeum*. The exact progenitor is not known, though some think that the brittle rachis type, *Secale fragile*, may be the correct ancestor. Early cultivation was likely in western Asia.

Volunteer *Secale montanum*, a plant some authors think is the progenitor of common rye, has been seen growing thickly near Tashkent in Turkestan. No traces of cultivated rye have been found in early Egyptian monuments, and likewise ancient writings contain no reference to this crop. However, the name occurs in northern European languages and this suggests early cultivation in this area.

Only one species of cultivated rye is recognized, *Secale cereale*, although several other species have been found growing wild. This plant has seven chromosomes in the haploid stage, and there is no evidence of a polyploid series which is characteristic of wheat and other small-grained cereals. Most rye is grown as a fall-sown annual, though a small amount is spring-sown with spring instead of winter varieties.

Rye grows primarily in the temperate and cool regions of the world and up to altitudes of 14,000 ft. Possessing the greatest winterhardiness of all small grains, rye culture extends to the more northerly parts of North America, Europe and Asia as far north as the Arctic circle. This crop ripens earliest of all the small grains, usually about a week earlier than winter wheat. Even though it is grown in warmer parts of the United States and southern Europe the cooler areas have much greater production. The type of soil has an important influence on geographic distribution. Usually rye is grown on the poorer non-chernozem soils of Europe and Russia. Sandier and poorer soils are used in the United States.

Rye culture follows the conventional methods used for other small grains. The crop may be drilled or sown broadcast at the rate of about six pecks per acre.

Rye is not used to any great extent as a nurse crop in establishing forage crops. Soil requirements are modest—even more so than for oats. Rye will produce well on fertile soils, but these types of soils are reserved for growing other crops. In certain areas where other crops fail to produce satisfactory yields because of low soil fertility, rye is often grown. It is frequently rotated with other crops, although it is grown continuously in certain areas. Seeding time is usually in the early fall and harvesting is done mostly in June and July in the northern hemisphere.

As a grain crop rye has two main uses, for breadmaking and for livestock feed. In making rye bread, various proportions of wheat flour may be used because the gluten of rye is less elastic than that of wheat. Rye stands next to wheat in use for milling and baking loaf bread. This type of bread is darker in colour and usually heavier than wheat bread. It is frequently referred to as black bread in Russian and central European areas, where considerable quantities are consumed. In the United States it is of minor importance except where there are concentrations of racial stocks that consume large quantities of rye flour.

Livestock feed is one of the main uses of the rye crop. For most classes of livestock it is usually fed in mixtures of other feeds. It has less fats than has wheat, about the same protein content, and is about the highest in carbohydrates of all the cereal crops. Vitamin B₁ content is slightly lower than in barley and wheat, and much lower than in oats. Rye is used also in the making of alcoholic beverages.

Rye straw is fibrous and tough and, therefore, is of less use as a feed than as litter or bedding. The straw is used for thatching in certain areas of the world, and also in the manufacture of hats, paper, saddles and horse collars.

Rye has considerable use for fall and spring cattle grazing. As a spring pasture it is available before permanent pastures have made sufficient growth for grazing livestock. The leaves are high in vitamin A content. In warmer areas rye is used for fall grazing and cover cropping. It is also used as a green manure crop being plowed under in the spring and followed by a crop of greater economic value.

Ergot is one of the by-products of rye used in medicinal preparations. Ergot is caused from ovary infection by the fungus *Claviceps purpurea*. The developing young kernel is penetrated by the fungus and produces a large bluish-brown body called a sclerotium. Ergot sclerotia contain pharmaceutical compounds such as ergosterol, ergotoxin, ergotamin, ergostetrine, ergoclarin, etc. Ergot fed in large quantities may cause abortion.

Other diseases attack rye; but most of them cause only minor yield reduction. There are many leaf and stem diseases, such as leaf and stem rust, stalk and head smut, scald and blotch, and some root rots. On the whole, if ergot is omitted, disease losses in rye are less than in other small grains.

Improvement of the rye plant by breeding is difficult because of the high degree of self-sterility. Most improvement can be attributed to the mass selection method of breeding rather than the pure line method. Because of the necessity of cross-pollination, varieties are genetically impure. Inbred lines have been produced and their fertility raised to a point where they can be perpetuated without difficulty. Certain crosses between selected inbred lines are known to exhibit hybrid vigour and greater productivity than open-pollinated varieties. No method has been found to utilize this biologic principle. Since rye is thrifty and winter-hardy it has been hybridized with wheat; in some cases the more winter-hardy types of selections having wheat quality have been developed. However, the amount of wheat-rye hybrids in commercial production is rather small.

In the United States the following varieties of rye have been grown to a considerable extent: Schlanstedt, Petkus, Swedish, Dakold, Imperial, Raritan, Rosen and Abruzzes. Some exceptional characteristics are the winter-hardiness of Dakold, and the white kernels of Imperial. Most of these varieties have come from stocks of European and Russian origin.

In other countries some important varieties not already mentioned are Aland, Azov, Abyssinian, Erzemm, Hanna, Ivanov, Probsteyer and Russian Giant.

Production and Trade.—World production of rye averages about 1,500,000,000 to 1,800,000,000 bushels. Of the total, Russian and European production ordinarily account for perhaps more than 90%. Russian production alone is about half that of the world. Other important growers are Germany and Poland. The United States grew about 57,000,000 bushels in 1942. Countries of still lesser importance in planting rye are Hungary and France. The frequent low yield—about 12 bushels per acre—is partly due to the fact that rye is grown on poorer soils. The leading states for production in the United States are North Dakota, Minnesota, South Dakota and Nebraska.

Trade in rye has always been rather limited when compared with other grains.

International Trade in Rye, 1938

Country	Exports 1,000 bu.	Imports 1,000 bu.
Poland	17,603	3
Canada	1,121	14
Argentina	2,983	0
Germany	6	5,712
Denmark	463	3,760
Norway	0	4,951
Czechoslovakia	237	2,173
Netherlands	2,093	2,982
Belgium	55	12,282

From 1925 to 1930 the United States, U.S.S.R., Germany, Poland, Hungary and Argentina were the major exporters of rye, with German imports almost as much as exports.

From 1930 to 1935 the United States, Germany, Denmark and the Netherlands were the largest importers.

Belgium was the leading importer of rye in 1938.

(H. L. Ss.)

RYKOV, ALEXEI IVANOVICH (1881-1938), Russian politician, was born in Saratov, the son of a peasant. Saratov was a place of banishment for revolutionaries, and Rykov came under their influence. When he went to Kazan he was already taking part in social democratic organizations. He was imprisoned and sent back to Saratov to remain under police supervision. Continuing his revolutionary work, he was rearrested, but escaped abroad before his trial. He visited Lenin at Geneva, and returned to Russia as a propagandist in various industrial districts. In 1904 he was in Moscow, and in 1905 attended a congress of the Communist party which elected him a member of the party's central committee. On returning from the congress he was arrested in St. Petersburg (Leningrad). He was freed by the revolution of 1905, was a representative of the Bolsheviks in the St. Petersburg workmen's soviet and escaped from the capital when the soviet was arrested. He took part in the December revolt and the fighting on the barricades in Moscow, escaped to Odessa after the failure of that revolt, but presently was again working in Moscow, where he was arrested, but once more succeeded in escaping.

In 1907 he was arrested and banished to Samara, but went abroad to visit Lenin. He was arrested on returning and exiled to the province of Archangel for three years. He escaped shortly before the end of his term of exile, and went to Paris. He returned to Russia to organize a congress, was arrested in 1911 and remained in prison till 1913, when in October he was sentenced to exile to the Narym district for four years. In 1915 he escaped, went to Samara, was recaptured and sent back to the Narym district, where he remained until the revolution of 1917, after which he worked in the Moscow Bolshevik organization. He was active in the Koverber revolution, became president of the supreme economic council, and succeeded Lenin as president of the council of people's commissars. After 1929 his influence waned. Expelled in March 1937, he was shot following a trial in March 1938.

RYLANBS, JOHN (1801-1888), English manufacturer and merchant, was born at St. Helens, Lancashire, on Feb. 7, 1801, and was educated at the grammar school in that town. In 1819 he, his elder brothers and his father, a manufacturer of cotton goods, founded the firm of Rylands and Sons, cotton goods and linen manufacturers, at Wigan. The business rapidly increased, dye-works and bleach-works were added, and the discovery of coal under some of the firm's property added materially to its wealth. In 1825 the partners became merchants as well as manufacturers, and subsequently acquired spinning mills at Bolton and elsewhere. In 1847, his father being dead and his brothers having retired, John Rylands assumed entire control of the business, which in 1873 was turned into a limited liability company. John Rylands was a benefactor to various charities, and was one of the original financiers of the Manchester Ship canal. He died at Stretford on Dec. 11, 1888. A permanent memorial, the John Rylands Library, was erected by his widow in Manchester in 1899.

RYLANDS, SIR (WILLIAM) PETER (1868-), English industrialist, was born on Oct. 23, 1868, and educated at Charterhouse and at Trinity college, Cambridge. He studied law and was called to the bar in 1894, but four years later became managing director of Rylands Brothers. In 1900 he was made president of the Iron and Steel Wire Manufacturers' association. After the World War he became president of the Federation of British Industries (1919-21), and of the Iron and Steel institute (1926-27). He was knighted in 1921.

RYLE, HERBERT EDWARD (1856-1925), son of Bishop John Ryle of Liverpool and a distinguished Old Testament scholar, was made bishop of Exeter in 1901, and in 1903 bishop of Winchester. In 1911 he became dean of Westminster, which office he held until his death, Aug. 20, 1925.

RYMER, THOMAS (1641-1713), English historiographer royal, was the younger son of Ralph Rymer, lord of the manor of Brafferton in Yorkshire, executed for his share in the "Presbyterian rising" of 1663. Thomas was probably born at Yafforth Hall early in 1641, and was educated at a private school kept at Danby-Wiske by Thomas Smelt, a noted Royalist, and at Sidney Sussex college, Cambridge. He left the university without taking a degree. On May 2, 1666, he became a member of Gray's Inn, and was called to the bar on June 16, 1673. Rymer executed translations, wrote plays, prefaces and complimentary pieces. In 1692 Rymer became historiographer royal.

Within eight months of his official appointment Rymer was directed (Aug. 26, 1693) to carry out that great national undertaking with which his name will always be honourably connected, and of which there is reason to believe that Lords Somers and Halifax were the original promoters. The *Codex Juris Gentium Diplomaticus* (1693) of Leibniz was taken by the editor as the model of the *Foedera*. The plan was to publish all records of alliances and other transactions in which England was concerned with foreign powers from 1101 to the time of publication, limiting the collection to original documents in the royal archives and the great national libraries. Unfortunately, this was not uniformly carried out, and the work contains some extracts from printed chronicles. From 1694 Rymer corresponded with Leibniz, by whom he was greatly influenced with respect to the plan and formation of the *Foedera*. While collecting materials, Rymer unwisely engraved a spurious charter of King Malcolm, acknowledging that Scotland was held in homage from Edward the Confessor. When this came to be known the Scottish antiquaries were extremely indignant, and a controversy arose, the documents in which are now rare and valuable.

At last, on Nov. 20, 1704, was issued the first folio volume of the *Foedera, Conventiones, Litterae et cujuscumque generis Acta Publica inter reges Angliae et alios quosvis imperatores, reges, etc., ab A.D. 1101 ad nostra usque tempora habita aut tractata*. The publication proceeded with rapidity, and 15 volumes were brought out in nine years. Rymer died after the appearance of the last volume, but he had prepared materials for carrying the work down to the end of the reign of James I. These were placed in the hands of Robert Sanderson, his assistant, who produced the remaining five volumes (I 715-17 and 1726-35).

Rymer died at Arundel Street, Strand, on Dec. 14, 1713, and was buried in the church of St. Clement Danes. His will was dated July 10, 1713.

In 1810 the Record Commissioners authorized Dr. Adam Clarke to prepare a new and improved edition of the *Foedera*. Six parts, large folio, edited by Clarke, Caley and Holbrooke, were published between 1816 and 1830. Considerable additions were made, but the editing was performed in so unsatisfactory a manner that the publication was suspended in the middle of printing a seventh part. The latter portion, bringing the work down to 1383, was ultimately issued in 1869. A general introduction to the *Foedera* was issued by the Record Commission in 1817, 4to.

The best account of Rymer is to be found in the prefaces to Sir T. D. Hardy's *Syllabus* (1869-85, 3 vols. 8vo).

RYNCHOPIDAE: see SKIMMER.

RYOT or **RAYAT**, properly a subject, then a tenant of the soil (from the Arabic *ra'a*, "to pasture"). The word is used throughout India for the general body of cultivators; but it has a special meaning in different provinces. The *ryotwari* tenure is one of the two main revenue systems in India. Where the land revenue is imposed on an individual or community owning an estate, and occupying a position analogous to that of a landlord, the assessment is known as *zamindari*; and where the land revenue is imposed on individuals who are the actual occupants, the assessment is known as *ryotwari*. (See ZAMINDAR.)

RYSWICK, TREATY OF, the treaty of peace which in 1697 ended the war which had begun in 1689 between France on the one side and the Empire, England, Spain and Holland on the other (see GRAND ALLIANCE, WAR OF THE). The treaty was signed by all the Powers concerned except the Empire on Sept. 20, 1697, a treaty being concluded between France and the Emperor on Oct. 30.

The basis of the peace was that all towns and districts seized

since the treaty of Nijmegen in 1679 should be restored. Thus France surrendered Freiburg, Breisach and Philippsburg to Germany, although she kept Strasbourg. On the other hand, she regained Pondicherry and Nova Scotia, while Spain recovered Catalonia, and the barrier fortresses of Mons, Luxemburg and Courtrai. The duchy of Lorraine, which for many years had been in the possession of France, was restored to Leopold Joseph, a son of duke Charles V., and the Dutch were to be allowed to garrison some of the chief fortresses in the Netherlands, including Namur and Ypres. Louis undertook to recognize William as king of England, and promised to give no further assistance to James II.; he abandoned his interference in the electorate of Cologne and also the claim which he had put forward to some of the lands of the Rhenish palatinate.

See C. W. von Koch and F. Scholl, *Histoire abrégée des traités de paix* (1817-18); A. Moetjens, *Actes et mémoires de la paix de Ryswick* (The Hague, 1725); A. Legrelle, *Notes et documents sur la paix de Ryswick* (Lille, 1894); H. Vast, *Les Grands Traités du règne de Louis XIV.* (1893-99).

RYŪKYŪ ARCHIPELAGO (called also LUCHU), a long chain of islands belonging to Japan, stretching from a point 80 m. S. of Kyushu to a point 73 m. from the N.E. coast of Formosa, and lying between 24° and 30° N. and 123° and 130° E. Japanese cartographers reckon the Luchu islands as 55, having a total coastline of 768 m., an area of 935 sq.m., and a population of about 455,000. They divide them into three main groups, of which the northern is called Oshimashoto; the central, Okinawa-gunto; and the southern, Sakishima-retto. The terms *shoto*, *gunto* and *retto* signify "archipelago," "cluster of islands" and "string of islands" respectively. The last-named group is subdivided into Miyako-gunto and Yayeyama-gunto.

Almost at the extreme north of the chain are two islands with active volcanoes; Nakano-shima (3,485 ft.) and Suwanose-shima (2,697 ft.), but the remaining members of the group give no volcanic indications, and the only other mountain of any size is Yuwan-dake (2,299 ft.) in Amami-Oshima. The capital is Shuri in Okinawa, with a picturesque castle. The more modern town of Nafa, on the same island, possesses the principal harbour and has considerable trade.

Though so close to the tropics, the islands cannot be said to present tropical features: the bamboo is rare; there is no high grass or tangled undergrowth; open plains are numerous; the trees are not crowded together; lakes are wanting; the rivers are insignificant; and an unusual aspect is imparted to the scenery by numerous coral crags. The temperature in Nafa ranges from a mean of 82° F in July to 60° in January.

The fauna includes wild boars and deer, rats and bats. Excellent small ponies are kept, together with cattle, pigs and goats. The majority of the islands are infested with venomous snakes called *habu* (*Trimeresurus*), which attain a length of 6 to 7 ft. and a diameter of from 2½ to 3 in. Their bite generally causes speedy death, and in the island of Amami-Oshima they claim many victims every year. The most important cultivated plant is the sugar-cane, which provides the principal staple of trade.

Luchu is noted for the production of particularly durable vermilion-coloured lacquer, which is much esteemed for table utensils in Japan. The islands also manufacture fabrics.

People.—Although the upper classes in Luchu and Japan closely resemble each other, there are palpable differences between the lower classes, the Luchuans being shorter and better proportioned than the Japanese; having higher foreheads, eyes not so deeply set, faces less flattened, arched and thick eyebrows, better noses, less marked cheek-bones and much greater hairiness. The last characteristic has been attributed to the presence of Ainu blood, and has suggested a theory that when the Japanese race entered south-western Japan from Korea, they drove the Ainu northwards and southwards, one portion of the latter finding their way to Luchu, the other to Yezo. Women of the upper class never appear in public in Luchu, and are not even alluded to in conversation,

but women of the lower orders go about freely with uncovered faces. The Luchu costume resembles that of Japan. The chief staple of the people's diet is the sweet potato, and pork is the principal luxury. An ancient law, still in force, requires each family to keep four pigs. In times of scarcity a species of sago (obtained from the *Cycas revoluta*) is eaten.

History.—Tinsunshi, "Grandson of Heaven," is the mythical founder of the Luchu monarchy. Towards the close of the 12th century his descendants were driven from the throne, but the old national party soon found a victorious leader in Shunten, son of Tametomo, a member of the famous Minamoto family, who, having been expelled from Japan, had come to Luchu and married there. The introduction of the arts of reading and writing are assigned to Shunten's reign. Chinese invasions of Luchu may be traced back to A.D. 605, but they did not result in annexation; and it was in 1372 that China first obtained from the Luchuans recognition of supremacy. Luchuan relations with Japan had long been friendly, but at the end of the 16th century the king refused Japan assistance against Korea, and in 1609 the prince of Satsuma invaded the islands with 3,000 men, took the capital by storm, captured the king and carried him off to Kagoshima. A few years later he was restored to his throne on condition of acknowledging Japanese suzerainty and paying tribute. The Luchuans nevertheless continued to pay tribute to China also.

The Chinese government, however, though taking a benevolent interest in the welfare of the islanders, never attempted to bring them under military sway. The incongruity of this state of affairs did not force itself upon Japan's attention so long as her own empire was divided into a number of semi-independent principalities. But in 1879 the Japanese government, treating Luchu as an integral part of the mikado's dominions, dethroned its prince, pensioned him as the other feudal chiefs had been pensioned, and converted Luchu into a prefecture under the name of Okinawa. China remonstrating, a conference was held in Peking, when plenipotentiaries of the two empires signed an agreement to the effect that the archipelago should be divided equally between the claimants. The Chinese government, however, refused to ratify this compromise, and the Japanese continued their measures for the effective administration of all the islands. Ultimately (1895) Formosa also came into Japan's possession, and her title to the whole chain of islands ceased to be disputed.

RZESZŌW, a town of Poland, in the province of Lwow, situated on the river Wislok, half-way between Lwow and Cracow. Pop. (1931), 27,499. It was founded by Casimir the Great and became the seat of a great family, taking their name from the town and dying out in 1583. The old church shows traces of the original structure built by King Casimir in the 14th century. Ordinarily it is a prosperous town in an agricultural and pastoral district. It was captured by Germany in Sept. 1939.

RZHEV or RZHŌV, a town of Russia in the province of Tver, in 56° 20' N., 34° 19' E., lying on both sides of the Volga river, here 350 ft. wide, and navigable for steamers. It is a centre for four branch railway lines and a telegraph line, and has a radio-station. Pop. (1939) 54,081, mainly employed in saw-milling, leather work, oil pressing, silk spinning, distilling, brewing and the making of machinery. In the 12th century it was part of the principality of Smolensk, which from 1225 was a dependency of Novgorod. In the 15th century the parts of the town on the left and right banks of the river were governed separately under the rule of independent princes.

This letter corresponds to the Semitic **W** (sin). The Greek treatment of the sibilants that occur in the Semitic alphabet is somewhat complicated. Semitic **𐤎** (samech) appears in Greek as **Ξ** (ksi) with the value in early times of *ss*, later and more generally of *x* or *ks*. The name samech, however, which through its Aramaean form became in Greek sigma, was applied to the letter **Σ** which corresponded to Semitic **W** (sin) and stood for *s*. In certain Greek alphabets the letter was called by the name *san*. Semitic *ssade* appears in the early alphabets of Thera and Corinth in the form **M** representing *s*. These alphabets have no sigma, while those that have sigma do not have **M**.

Greek forms of the letter were **Σ**, **Ξ**, **Ϛ**, **ϛ**, **Ϝ**. The rounded form appears in the Chalcidic alphabet and from this it was taken

NAME OF FORM	APPROXIMATE DATE	FORM OF LETTER

FALISCAN		Ϛ ϛ
OSCAN		Ϛ ϛ
UMBRIAN		Ϛ
CLASSICAL LATIN AND ONWARDS		Ϛ

THE DEVELOPMENT OF THE LETTER "S" FROM THE PHOENICIAN, THROUGH THE CLASSICAL, DOWN TO MODERN TIMES

into Latin. Etruscan had no rounded form, but it appears in Umbrian and Faliscan. In Latin cursive writing of the 6th century the form was **Ϛ**, and from this descended the Irish and Saxon forms **ſ**. The Carolingian form on the other hand was extended above the line instead of below, e.g., **ſ**. In England in the 17th century the form was **ſ** and this is occasionally still seen in handwriting when followed by another *s*. The form **ſ** also

occurs, the left hand oblique stroke being really part of a ligature with a preceding letter.

The letter represents an unvoiced fricative. This has become voiced in English when intervocalic (e.g., houses, nose). In most other positions it remains unvoiced (e.g., sing, save, stamp, speak, *aspect*). When doubled the letter represents the unvoiced sound in all positions (e.g., grasses, miss, assess). (B. F. C. A.)

SAADIA, BEN JOSEPH (892-942): see **SEADIAH**.

SAALE, a river of Germany, a tributary of the Elbe, 226 m. long, rises between Bayreuth and Hof in the Fichtelgebirge. It joins the Elbe just above Barby. It is navigable from Naumburg, 100 m., with the help of sluices, and is connected with the Elster near Leipzig by a canal. Its chief affluents are the Elster, Regnitz and Orla (right), and the Ilm, Unstrut, Salza, Wipper and Bode (left). Its upper course is rapid. It is sometimes called the Thuringian or Saxon Saale, to distinguish it from another Saale (70 m. long), a right-bank tributary of the Main.

SAALFELD, a town of Germany, in the Land of Thuringia, situated on the left bank of the Saale, 24 m. S. of Weimar and 77 S.W. of Leipzig by rail. Pop. (1939) 23,325. Saalfeld grew up around the abbey founded in 1075 by Anno, archbishop of Cologne, and the palace built up by the emperor Frederick I. In 1389 it was purchased by the landgrave of Thuringia, and with this district it formed part of Saxony. In 1680 it became the capital of a separate duchy, but in 1699 it was united with Saxe-Coburg, passing to Saxe-Meiningen in 1826. One of the most ancient towns in Thuringia, Saalfeld is still partly surrounded by old walls and bastions, and contains some interesting mediaeval buildings, among them a palace, built in 1679 on the site of the Benedictine abbey of St. Peter, which was destroyed during the Peasants' War; the Gothic church of St. John, dating from the beginning of the 13th century; the Gothic town hall, completed in 1537; the Kitzerstein, a palace standing on an eminence above the river, probably first erected by the German king Henry I., although the present building is not older than the 16th century; and the ruin of the Hoher Schwarm, called later the Sorbenburg, said to have been erected in the 7th century. Saalfeld has a number of prosperous industries, and there are ochre and iron mines in the neighbourhood.

SAAR, a right-bank tributary of the Moselle. It rises in the Donon, an eminence of the Vosges, and flows generally northward through the Saar coalfield to its junction with the Moselle at Konz. The principal towns on the Saar are Saarguemines, Saarbriicken and St. Johann, Saarlouis and Saarburg. The river is navigable up to Saarguemines, a distance of 75 m., where there is connection with the Rhine-Marne canal.

SAARBRÜCKEN, a town in the Saar Territory (*q.v.*), on the Saar, 49 m. by rail N.E. of Metz. Pop. (1939) 135,080. Saarbriicken owes its name to a bridge which existed in Roman times. Its early lords were the bishops of Metz, the counts of

the lower Saargau, and the counts of the Ardennes. From 1381 to 1793 it belonged to the counts of Nassau-Saarbrücken, and then, after having been in the possession of France from 1801 to 1815, it passed to Prussia. St. Johann, Malstatt-Burbach and Saarbrücken were united in 1909. The trade of Saarbrücken is chiefly connected with coal, iron and glass. The coal fields extend over 70 sq.mi. Saarbrücken was heavily bombed during World War II.

SAARBURG, in Alsace-Lorraine: see SARREBOURG.

SAAREMAA (formerly OSEL), an island of Estonia, lying in the Baltic sea across the mouth of the Gulf of Riga. Pop. (1934) 55,851. It has a length of 45 mi., and an area of 1,010 sq.mi. The chief town, Arensburg, on the south coast, is a place of 4,339 inhabitants (1938), with summer sea-bathing and mud-baths. In 1227 Ösel was conquered by the Knights of the Sword, and was governed by its own bishops till 1561, when it passed into the hands of the Danes. By them it was surrendered to the Swedes in 1645. Along with Livonia, it was united to Russia in 1721, passing to Estonia in 1918. In 1940 soviet Russia took possession, and Germany conquered it in 1941.

SAARGEMUND: see SARREGUEMINES.

SAARLAUTERN (Fr. *Saarlouis*), a town in the Saar territory (*q.v.*), situated on the left bank of the Saar, and on the railway from Saarbrücken to Trier, 40 mi. S. of the latter. Pop. (1939) 33,356. Saarlouis was founded in 1681 by Louis XIV of France, and was fortified by Vauban in 1680-85. By the peace of Paris, in 1815, it was ceded to the allies and by them was made over to Prussia. Marshal Ney was born there. It contains a town hall in which are hung Gobelins, the gift of Louis XIV. There are coal mines in the vicinity, and the town has foundries and large manufactures. Saarlautern was heavily bombed in World War II.

SAAR (SARRE) TERRITORY, an industrial and mining region on the Franco-German frontier, north of Lorraine, near the iron-ore of Briey. Area, 743 sq.mi. Pop. (1939) 863,736. Chief town, Saarbrücken (pop. 135,080). The basic industry is coal, good for industrial purposes and gas production and moderate for coke.

The coal reserves of the Saar Territory, by the most conservative estimates, amount to 9,000,000,000 tons. Metallurgy, after coal, employs the greatest number of men. Next come ceramic, glass and chemical products industries.

The Saar is largely dependent on imports for certain commodities (including food supplies). The area was heavily bombed during World War II, with considerable damage to the industrial establishments and to the mines.

Treaty of Versailles and Administrations.—The treaty gave France absolute possession of the mines as compensation for destruction of her northern mines during World War I, and as part-payment towards German reparations. Districts containing these were detached from Germany and formed into the Saar Territory.

To assure the welfare of the Saarland inhabitants and enable France to exploit the mines, an international governing commission, responsible to the League of Nations as trustee, and exercising all powers of government formerly held by the German empire, Prussia and Bavaria, was instituted for 15 years. (Residence, Saarbrücken). It had five members, one French, one native inhabitant of Saar (non-French), one British, one Czechoslovak and one Finnish. The president was the British member, who acted as its executive. Decisions were taken by majority. Local German officials pledged fidelity to the commission. The eventual fate (return to Germany, union with France or continuation of League administration) of the whole territory (or part) was decided in 1935 by the League of Nations, according to plebiscite of the inhabitants. If the whole (or part) were united to Germany, the latter might repurchase ownership of the mines situated in such a part at a price, payable in gold, to be fixed by three experts. Both countries might, however, agree among themselves, before the time fixed for such repayment, to modify Paras. 36-38 of Annexe Saar of the treaty.

The powers of the governing commission were considerable, but the elected representatives of the people (consultative council)

had to be consulted before modification of laws or imposition of new taxes (except customs duties). This council had no power of initiative. The mines and customs were administered separately and independently of the commission by two local directors (the mines being the property of the French state, and the Saar having been incorporated within the French customs regime in Jan. 1925). The French franc became the only legal currency in June 1923. In many other respects, the status quo under German rule was maintained; the inhabitants retained their local assemblies, religious liberties, schools, language and nationality. A court of appeal of mainly neutral composition was instituted in 1920. A local gendarmerie (*Landjägerkorps*) of 1,000 men, recruited by the commission, and 700 local police, maintained order, French garrison troops having withdrawn in May 1927. A Saar railways defense force of 800 men (British, Belgian and French) was stationed in the territory to protect the railways.

The naturally somewhat unsympathetic attitude towards the imposed governing body did not prevent the latter caring for the inhabitants' welfare, or from coping successfully with periodical unrest, wages grievances and occasional strikes. The world coal situation did not leave the Saar unaffected. The most important strike occurred in spring 1923 (during Franco-German tension consequent upon Ruhr occupation), when 75,000 miners downed tools for 100 days. The treaty of Locarno and widening influence of the League of Nations created a more conciliatory atmosphere, both politically and industrially. The Saar had no foreign debt, and was exempt from participation in reparation payments; taxation was comparatively low. In anticipation of the plebiscite in 1935 H. Overbeck and G. W. Sante published a very detailed *Saar-Atlas* (Gotha, 1934), with coloured plates showing the coal seams, population density, railways, electric power lines, history, religion, language, architecture, etc., of the region.

In the plebiscite, which was duly held on Jan. 13, 1935, nearly 98% of all qualified voters appeared at the polls—an unprecedented showing—and of these 90.3% declared for reunion with Germany, 8.8% for continued autonomy under the League, and only 0.4% for French annexation. This nearly unanimous decision was carried into effect on March 1.

SAAVEDRA FAJARDO, DIEGO DE (1584-1648), Spanish diplomatist and man of letters, showed himself master of an excellent prose style in his *Idea de un príncipe político cristiano* (1640), of which there is an English translation by Astry (1700). His most interesting work is the *República literaria*, published in 165j as the *Juicio de Artes y Ciencias* under the name of Claudio Antonio de Cabrera.

SABAC, a town in Serbia, Yugoslavia. Pop. (1931) 12,563, many of whom are Jews. It is a busy river port on the Sava, exporting cereals, prunes, cattle and pigs, with a large weekly market for livestock, cheeses and grain. It is the seat of a bishop, a prefecture and a tribunal. The fortress was built by Mohammed II in 1470 to facilitate incursions into Slavonia. In the Austro-Turkish wars of 1788-91 the Serbs captured the town, and in the first Serbo-Turkish rising, Kara George, in 1806, defeated the Turks at Mishar, near Sabac. In World War I the Serbs took the town and drove the Austrians back across the Sava. Germans occupied the town in World War II.

SABADELL, a town of northeastern Spain, in the province of Barcelona; on the river Ripoll and on the Barcelona-Saragossa railway. Pop. (1930) 45,607. Cloth, linen, paper, flour and brandy are manufactured, and there are iron foundries and sawmills. About half the inhabitants are employed in the textile factories. Sabadell is said to be the Roman *Sebendurum*, but in Spanish annals it is not noticed until the 13th century.

SABAEANS. This name is used loosely for the ancient dwellers in southwest Arabia, in the parts now called Yemen, Hadramaut and Asir. Strictly it belongs to one tribe and one state only. The chief source of information about these peoples is their inscriptions, found in their own land and elsewhere; other sources are the Greek geographers, Babylonian and Ethiopic inscriptions, the Bible and the record of Aelius Gallus' expedition. The Arab tradition is not of much value and only for the latest period of the history.

History.—The land produced spices and incense and was a stage on the trade road from India, the Malay archipelago and Africa. At an early date men from Arabia migrated to Abyssinia. The oldest State in Yemen of which anything is known was Ma'in or Ma'an, the Minaeans of the Greeks. Its chief towns, Karnawu, Kaminahu and Yathil (the modern Barākiḥ) lay in the southern Jōf, about 120km. N.N.E. of Sanaa. Though the names of 20 kings are known the history of Ma'in cannot be written. Relations with Hadramaut were friendly, indeed they "almost suggest a personal union," and there was a colony or outpost at Ma'in Muṣ-rān (now El 'Ola) to guard the trade road to Egypt and Palestine. Later the State of Ḳatabān began to encroach on Minaean territory, and after fighting with and becoming a vassal or ally of Saba, it joined with that State in destroying Ma'in about 700 B.C. Taking all things into account, the extent of the State, the number of kings, the highly developed script and language, the beginning of the Minaean kingdom cannot be put later than about 1500 B.C. The Sabaeans are mentioned in a Minaean inscription as nomads who raided the caravan road to El 'Ola. This suggests that they may have migrated south to Yemen and founded the kingdom of Saba which bears their name. Perhaps the queen of Sheba lived in the north of Arabia though she has been decorated with the wealth of the kingdom in Yemen. Marib, 100km. east of Sanaa was its capital. An inscription of Sargon (c. 715 B.C.) refers to It'i-amara the Sabaeans, and one of Sennacherib (c. 685 B.C.) to Ka-ri-bi-lu, king of Saba'i. More than once the second successor of a Yt' 'Mr was a Krb'l. Most probably the pair referred to by the Assyrian kings was Yt' 'mr'Byn, who completed the Marib dam, so famous in Arab story, and defeated Ma'in, killing 45,000 of its inhabitants, and his grandson Krb'l Wtr, who finished the overthrow of Ma'in and pacified the country. Sennacherib speaks of receiving a present from Saba; even court flattery did not dare to call it tribute. About the same time Ausan, which had been a vassal of Ḳatabān, was crushed along with its ally and neighbour Datinat.

Krb'l Wtr was one of the last of a line of rulers who bore the title Mkrb. It was used also by the earlier lords of Ḳatabān. Not long after, the title of king was adopted by the ruler of Saba and used till 115 B.C. This period is marked by the rise of noble clans and ended with the incorporation of Ḳatabān after war both civil and foreign. At home the Hamdān clan tried for the throne and Himyar appears for the first time among the external enemies with Gedarot which had taken the place of the older Ausan. This year 115 is the first of an era by which some of the later monuments are dated. Now began a serious attack on the trade supremacy of the Sabaeans. The Nabataeans fixed themselves across the trade road to Syria and from Egypt as a base Rome tried to control the sea traffic, besides sending Gallus to attack by land. The royal title now became king of Saba and Du Raidān. About A.D. 300 Hadramaut was conquered and the style became king of Saba, Du Raidān, Hadramaut and Yamnat. This change coincided with a slackening of the Roman effort to control the eastern trade. In the middle of the century Abyssinia conquered the land but already in A.D. 375 there was a native king again. His immediate successor adopted the Jewish religion, a mark of an anti-Roman policy, and in A.D. 525 Du Nuwās, the last Jewish king, was killed and an Abyssinian governor ruled the land. The failure of the dam at Marib was at once an effect and a cause of the national decay. In A.D. 579 Persia conquered the country and in A.D. 628 the governor turned Muslim and submitted to the prophet. Ḳatabān was ruled at first by Mkrb and then by kings who may have been foreigners. The capital Tmna lay some 110km. S.E. of Marib. The capital of Hadramaut was Sabwat, the Sabota of the ancients.

Government and Social Conditions.—The States were built up of tribes mostly held together by local ties not by blood bonds. 4 tribe contained an aristocracy, tenant vassals, resident aliens and serfs. The name Ḳatabān stood for the kingdom and for the tribes composing it; all were children of the god 'Amm. In Saba the tribe of that name stood apart from the others and held a commanding position in the kingdom. The common phrase is "Saba and the tribes." Saba alone is the child of 'Imkh. Later it was put on a level with the other tribes, and was merged in the

militia. The king, tribal aristocrats and the temples were the great landholders. Under the form of government in Ḳatabān (probably much the same in the other States) the king was helped and to some extent controlled by a council of elders, though general policy was decided by the assembly of the tribes. In this the serfs had of course no place. At a later time in Saba the government became feudal; no longer did the tribal assembly decide the allocation of the land, the king granted fiefs. The change may have been helped by the example of the temples, where the retainers had to obey the orders of the god whose land they tilled. The offices of Mkrb and king were hereditary and the latter seems often to have associated his son with himself. The land paid three taxes which are never mentioned separately. The amount paid is not known but it was assessed while the crops were standing. Taxes were paid to the temples also; the tithe is named. Public works were done by forced labour. No list of customs, duties or tolls has been found. In early times the title Kbr is given to the chief of a tribe or clan, the governor of a town or district, the chief of the king's serfs and the head of a college of officials; thus there were many offices with one name. Down to the latest times a Kbr was the eponym after whom the year was named. Kyl is first heard of as the name of a leading section of a tribe in the territory of the god Ta'lab Riyam. The ancestors of a petty king are also called Kyl. So it is probable that he was part of the tribal organisation and took the place of the Kbr. The Kyn was an administrative officer to serve princes, temples or cities. One was a priest. The name suggests that he was not a part of the tribal organisation.

Trade and the Arts.—Monuments of the south Arabians have been found in Kuwait and Mesopotamia; a coffin of a dealer in spices was found in Egypt and an altar with a bi-lingual dedication to Wadd in Delos. Spices and incense were the chief exports and re-exports. The road from Hadramaut ran through the capitals of the other three States, so it is not surprising that one tried to make itself supreme. The returning caravans certainly brought back female slaves for the temple service; women from Gaza and Yathrib (Medina) are mentioned. The production of incense was in the hands of the nobles, 3,000 families Pliny says, and was surrounded with various tabus, besides a tithe paid to the temple at Sabwat. Great care was given to irrigation and the terracing of the hills into fields. The people were fine masons and stonecutters. The dam at Marib is now in much the same condition as when Hamdani (A.D. 848) saw it. The buildings were made of stone so carefully dressed that often the joints are scarcely visible; the stones are held together by leaden dowels and pillars are strengthened by mortise and tenon joints. Big buildings were often elaborately decorated and several forms of pillars and capitals were in use. The Arab tales of lofty houses with windows of translucent stone are not much exaggerated. The pointed arch was known. Many of the old cisterns are still in use. Many of the inscriptions are beautiful and testify to the skill of the stone-cutters, who were successful with the figures of animals and conventional foliage in low relief. Figures in the round were less good and in statues of men the body is usually a mere block while the face is wooden and expressionless and often out of proportion. Stone pots and jars for household use are simple but neat and well shaped. Most of the metal work that survives is figures of animals and tablets with inscriptions. The figures are generally crude. One can never be sure that the jewellery, pottery and similar small articles really belong to the land and the period. The best things suggest foreign influence or even origin. At first the coins followed Athenian models and the workmanship is very good in some. Later they degenerated till the owl looks like a jar with two round handles. Curiously the standard is Babylonian. The latest coins are weak imitations of Roman coins.

Inscriptions and Language.—The inscriptions are all on stone or metal. Words are separated by a divider and the letters are never joined. In early times the characters are angular but later the corners are rounded and curves appear. The alphabet is connected with the Phoenician; some of the letters are exactly alike, some look as if they had been purposely altered by

those who understood the art of carving in stone, and some not found in Phoenician are formed by differentiation from those that are. Short inscriptions have been found in Mesopotamia in which Sabaeen letters are combined with others resembling the Phoenician and Greek forms. It is not certain whether this is an early form of the alphabet or merely a freak. There are 29 letters, the 28 of Arabic and the second form of s which is found in Hebrew. The language is classified with Abyssinian as south Semitic and is split into several dialects which differ in grammatical forms and vocabulary. In Ma'in and Ḳatabān s is used in the pronoun of the third person and in the causative form of the verb where Sabaeen has h. Hadramaut has forms which are phonetically later than the other dialects. The vowels are not indicated so the pronunciation of all words is a matter of guesswork. The writing is usually from right to left but some of the oldest inscriptions read alternately from right to left and from left to right. This is occasionally found in later ones but then for special reasons. Presumably there was a literature but it has disappeared. Sabaeen inscriptions have been found in Abyssinia and the Ethiopic alphabet is derived from the south Arabian. Inscriptions in various alphabets derived from the Sabaeen are found in different parts of Arabia as far north as Damascus and testify to the widespread influence of the south Arabian kingdoms. Many of the south Arabian inscriptions are hard to interpret and the sense highly problematical.

Religion.--Over 100 gods and many temples are named but next to nothing is known about them. Certain deities are common to the whole land. Šams, the sun, is feminine and perhaps all goddesses are forms of it. 'Attar, the star Venus, is masculine but corresponds philologically with the Babylonian Ishtar and the Canaanite Ashtoreth. The moon, Waraḥ, Sahr or Sin, occurs occasionally and Il or Ilan is the name of a god as well as a common noun. Each country had its own god; Ma'in had Wadd, Ḳatabān had 'Amm, Saba had Ilmukah and the clan of Ḥamdān had Ta'lab Riyam. Perhaps these tribal gods are all forms of the moon. There are indications that the moon, sun and Venus formed a divine family. Others are Anbai, Du Samawi, the enigmatic Nakrah and Atirat (the Hebrew Ashera). Other divine names are clearly descriptive; Hawbas "the drier" is the moon according to Ḥamdāni, Kahil "the old," Sa'd "luck" the giver of good fortune and Hukm "judgment" the judge. At times kings seem to have been worshipped (after death?). Springs and water courses were inhabited by spirits. The bull, the bull's horns and the crescent were symbols of the moon and a disc stood for both the sun and Venus. Often one cannot decide which of the two is meant. The people were the offspring and the king the first-born of the god, so the formula runs "god, king and people." There were no images of the gods. To obtain success in one's undertakings it was the custom to dedicate to the god a statue of oneself in stone or figures of men or animals in gold (? gilt). Sacrifices and incense were offered to them. The names for altar and sacrifice are the common Semitic terms, and the altar of incense has among other names that of *miktār* as in Hebrew. A variety of spices (the wealth of the land) are named on these altars, as sand, ladanum, costus, tarum, frankincense and others not yet interpreted. Pilgrimages were made at certain seasons and the pilgrim month was named Du Hijjatan or Du Mahajjat. There are many names for the months, some of which refer to agriculture. The name for priest is r-s-w (which may mean giver) and in the El 'Ola texts comes the word I-w-, both masculine and feminine, which looks very like Levite. In later times the name Rahmān for God suggests Jewish influence. Christianity was introduced into South Arabia but it was not favoured because of its association with Abyssinia and the famous church in Sanaa was looked on as a sign of foreign domination. The massacre of Christians in Nejran had political causes as well as religious.

The ruins of the temple at Marib are an open space surrounded by an elliptical wall with the main door at one end of the shorter axis and a smaller at one end of the longer axis. Columns flanked the main door. Outside are several groups of pillars and a set of four may have held a canopy over a throne. The temple at

Sirwah is an oblong building with two sets of pillars inside it. One set held up the roof of the sanctuary and the other surrounded a light well. Another at Yeha in Abyssinia is an oblong building with the door at one end. It seems to have been of three storeys.

BIBLIOGRAPHY.—A full list of the older books is given in Fr. Hommel, *Südarabische Chrestomathie* (1893), and from 1892 to 1907 in O. Weber, *Studien zur altarabischen Alterthumskunde* iii. (1908). More recent works are: Hartmann, *Die arabische Frage*, (Leipzig, 1909); *Deutsche Aksum Expedition* (1913), Rhodokanakis, *Studien zur Lexicographie und Grammatik des altsüdarabischen* (1915 and 1917), *Katabanische Texte zur Bodenwirtschaft* (1919 and 1922) *Die Bodenwirtschaft im alten Südarabien* (1924), Nielsen, *Der Sabäische Gott Ilmukah* (1910), *Der Dreieinige Gott* (1922), Margoliouth, *Relations between Arabs and Israelites* (1924); *Handbuch der altarabischen Alterthumskunde*, ed. Nielsen (1927), in progress; O'Leary, *Arabia before Mohammed* (1927). (A. S. T.)

SABAKI, a river, 400 m. long, in Kenya colony, which enters the Indian ocean north of Malinda. As the Athi, it rises north of Nairobi, flows across the Kapoté and Athi plains, and turns south under the Yatta ridge. Navigation is interrupted by the Lugard falls, 100 m. from its mouth.

SABANG, a free port situated on the island of Pulu Weh, about 20 mi. N. of Kota Raja, the capital of Achin (Atjeh), in North Sumatra, Netherlands Indies, 308 mi. from Penang (from which it lies due west), 608 from Singapore and 1,100 from Batavia. Pop. 8,706. It is the first port of call in the Malay archipelago for vessels proceeding from Europe eastwards, being the westernmost point at the entrance to the Straits of Malacca. The harbour, built in 1887, principally as a coaling-station, is sheltered from the heavy swell of the Indian ocean and strong winds by mountains and high stretches of coast-line. Coal wharves extend 1,700 ft., the coal being conveyed to vessels by electric transporters, and vessels drawing 30 ft. can moor alongside; coal is also conveyed to vessels at anchor in Sabang bay (which is extensive) by lighters. There is a dry dock of 5,000 tons' capacity and slipways for the construction of small ships and lighters up to 1,000 tons. On the eastern side of the bay there is a petroleum wharf and two tanks, with a capacity of 4,000 tons. Goods destined for Northern Sumatra are landed at Sabang, a ferry service being maintained with Oleh Leh, the harbour for Kota Raja. There is a Dutch settlement at the head of the bay, with a post, telegraph and harbourmaster's office, and there is a cable to Oleh Leh and a wireless station. In 1939 the port was visited by 918 ships, measuring 7,182,000 cu.m. net. Sabang was occupied by the Japanese in 1942.

SABATIER, LOUIS AUGUSTE (1839-1901), French Protestant theologian, was born at Vallon (Ardèche), in the Cévennes, on Oct. 22, 1839, and was educated at the Protestant theological faculty of Montauban and the universities of Tiibingen and Heidelberg. After four years' work as a pastor he became professor of reformed dogmatics at Strasbourg. His markedly French sympathies during the war of 1870 led to his expulsion from Strasbourg in 1872. After five years' effort he established a Protestant theological faculty in Paris, and became professor and then dean. In 1886 he became a teacher in the newly founded religious science department of the *École des Hautes Etudes* of the Sorbonne. He died on April 12, 1901.

Among his chief works were *The Apostle Paul* (3rd ed., 1896); *Mémoire sur la notion hébraïque de l'Esprit* (1879); *Les Origines littéraires de l'Apocalypse* (1888); *The Vitality of Christian Dogmas and their Power of Evolution* (1890); *Religion and Modern Culture* (1897); *Historical Evolution of the Doctrine of the Atonement* (1903); *Outlines of a Philosophy of Religion* (1897); and his posthumous *Religions of Authority and the Religion of the Spirit* (1904), to which his colleague Jean Réville prefixed a short memoir. On his theology, see E. Ménégot in *Expository Times*, xv. 30, and G. B. Stevens in *Hibbert Journal* (April 1903).

SABATIER, PAUL (1858-1928), French historian, the younger brother of Louis Auguste Sabatier (*q.v.*), was born at Chabrillanoux, in the Cévennes, on Aug. 3, 1858. He studied at the Faculty of Theology in Paris, and in 1885 became vicar of St. Nicholas, Strasbourg, from which he was expelled on declining the German Government's offer of preferment which was conditional on his becoming a German subject. He was then appointed

pastor of St. Cierge, but being compelled by ill-health to give up his cure, he devoted himself to historical research. The appearance of his *Life of St. Francis*, in 1893, made his name, and his reputation was enhanced by the publication of *Collection d'études et de documents*, in 1898. In this work were incorporated the texts of the *Speculum Perfectionis seu Sancti Francisci Assisiensis legenda antiquissima*, an early life of St. Francis written by his disciple, Brother Leo, in 1227, the *Tractatus de Indulgentia Portiunculæ*, and the *Actus B. Francisci et sociorum eius*; but Sabatier's criticism and interpretation of the documents were widely challenged. In 1902 Sabatier founded the International Society of Franciscan Studies, and soon after he organized at Assisi La *Refezione Scolastica* for feeding necessitous children, in support of which he delivered a brilliant lecture on Modernism in France at London (1905). In 1914 he sent a striking letter to the president of the International Society of Franciscan Studies in reply to a resolution in favour of peace which had been passed by the council, in which he eloquently set forward the ideals of France in the World War. This was published in *The Times*, Jan. 22, 1915, and was later reprinted as a pamphlet. In 1919 Sabatier became professor of Protestant theology at Strasbourg, which post he held until his death in March 1928.

SABAZIUS, a Phrygian or Thracian deity, frequently identified with Dionysus, sometimes (but less frequently) with Zeus. His worship was closely connected with that of Cybele and Attis and was chthonian and mystic in character. It reached Greece in the 5th century B.C. A few passages state that the Jews worshipped him (confusion with Heb. *sabaōth*?) see Val. Max. I., 3, 2. The true etymology of the name is unknown. Whether he was the same as Sozon, a marine deity of Southern Asia Minor, is doubtful. His image and name are often found on "votive hands," a kind of talisman adorned with emblems, the nature of which is obscure. His ritual and mysteries (*Sacra Savadia*) gained a firm footing in Rome during the 2nd century A.D.

See Eisele in Roscher's *Lexikon*, s.v. (bibl.).

SABBATAI SEBI (1626–1676), Jewish mystic, who claimed to be the Messiah, was born in Smyrna, of Spanish descent. As a lad he was attracted by the mysticism of Luria (q.v.), which impelled him to adopt the ascetic life. He passed his days and nights in a condition of ecstasy. He began to dream of the fulfilment of Messianic hopes, being supported in his vision by the outbreak of English Millenarianism. Christian visionaries fixed the year 1666 for the millennium. Sabbatai's father (Mordecai) was the Smyrna agent for an English house, and often heard of the expectations of the English Fifth Monarchy men. In 1648 (the year which Kabbalists had calculated as the year of salvation) Sabbatai proclaimed himself Messiah, and in Constantinople came across a man, who pretended that he had been warned by a prophetic voice that Sabbatai was indeed the long-awaited Redeemer. At first his adherents were a small circle of devotees who kept their faith a secret. He charmed men by his sweet singing of Psalms, and children were always fascinated by him. He journeyed to Jerusalem, where a local pasha was opposing the Jews, and Sabbatai secured help for them from Cairo. At Cairo Sabbatai married, and secured the support of Raphael Halebi. With a retinue of believers, a charming wife and considerable funds, Sabbatai returned in triumph to the Holy Land. Nathan of Gaza assumed the rôle of Elijah, the Messiah's forerunner, proclaimed the coming restoration of Israel and the salvation of the world through the bloodless victory of Sabbatai "riding on a lion with a seven-headed dragon in his jaws" (Graetz). Again 1666 was given as the apocalyptic year.

Threatened with excommunication by the Rabbis of Jerusalem, Sabbatai returned to Smyrna (autumn of 1665). Here he was received with mild enthusiasm. From the Levant the Sabbataean movement spread to Venice, Amsterdam, Hamburg and London. Sabbatai no longer doubted the reality of his mission. Day by day he was hailed from all the world as king of the Jews. At the beginning of the fateful year 1666 Sabbatai went (or was summoned) to Constantinople. Here he was arrested, but reports of miracles continued, and many of the Turks were inclined to become converts. Soon he was transferred to Abydos. In September

Sabbatai was brought before the Sultan, and he had not the courage to refuse to accept Islam. The Messianic imposture ended in the apostasy of Sabbatai. In 1676 he died in obscurity in Albania. A sect of Sabbataeans—the Dormeh of Salonica—survived him and for many years the controversy for and against his claims left an echo in Jewish life.

See Graetz, *History of the Jews*, vol. v. ch. iv. 1. Zangwill has a brilliant sketch of Sabbatai's career in his *Dreamers of the Ghetto*.

SABBATH, the seventh and especially sacred day of the week among the Jews.

Observance.—How tenaciously the Jews held to the observance of the Sabbath may be seen from the fact that on this account the Romans found themselves compelled to exempt them from military service. The rules of the Scribes enumerated thirty-nine main kinds of work forbidden on the Sabbath, and each of these prohibitions gave rise to new subtleties. When the disciples of Jesus plucked ears of corn on the Sabbath they had, according to the Rabbinical views, violated the third of the thirty-nine rules, which forbade harvesting; and in healing the sick Jesus himself broke the rule that a sick man should not receive medical aid unless his life was in danger. In fact, as Jesus put it, the Rabbinical theory seemed to be that the Sabbath was not made for man but man for the Sabbath, the observance of which was so much an end in itself that the rules prescribed for it did not require to be justified by appeal to any larger principle of religion or humanity. The precepts of the law were valuable in the eyes of the Scribes because they were the seal of Jewish particularism, the barrier erected between the world at large and the exclusive community of Yahweh's grace. The ideal at which these rules aimed was absolute rest on the Sabbath from everything that could be called work; and even the exercise of those offices of humanity which the strictest Christian Sabbatarians regard as service to God, and therefore as specially appropriate to his day, was looked on as work. To save life was allowed; danger to life "superseded the Sabbath." The positive duties of its observance were to wear one's best clothes, eat, drink and be glad (justified from Isaiah Iviii. 13). A more directly religious element, it is true, was introduced by the practice of attending the synagogue service, but even this service was regarded as a meeting for instruction in the law rather than as an act of worship.

Attitude of Jesus and Early Christian Church.—The general position which Jesus takes up, that "the Sabbath is made for man and not man for the Sabbath," is only a special application of the wider principle that the law is not an end in itself but a help towards the realization in life of the great ideal of love to God and man, which is the sum of all true religion. But Jesus further maintains that this view of the law as a whole, and the interpretation of the Sabbath law which it involves, can be historically justified from the Old Testament. In this connection He introduces two of the main methods to which historical criticism of the Old Testament has recurred in modern times: He appeals to the oldest history rather than to the Pentateuchal code as proving that the later conception of the law was unknown in ancient times (Matthew xii. 3 seq.), and to the exceptions to the Sabbath law which the Scribes themselves allowed in the interests of worship (v. 5) or humanity (v. 11), as showing that the Sabbath must originally have been devoted to purposes of worship and humanity, and was not always the purposeless arbitrary thing which the Scribes made it to be. Modern criticism of the history of Sabbath observance among the Hebrews has done little more than follow out these arguments in detail, and show that the result is in agreement with what is known as to the dates of the several component parts of the Pentateuch.

In the early Christian church Jewish Christians continued to keep the Sabbath, like other points of the old law. Eusebius records that the Ebionites observed both the Sabbath and the Lord's day, the weekly celebration of the resurrection. This practice obtained to some extent in wider circles, for the *Apostolical Constitutions* recommend that the Sabbath shall be kept as a memorial feast of the creation, as well as the Lord's day as a memorial of the resurrection. The festal character of the Sabbath was long recognized in a modified form in the Eastern

church by a prohibition of fasting on that day, which was also a point in the Jewish Sabbath law. On the other hand Paul from the first days of Gentile Christianity, laid it down definitely that the Jewish Sabbath was not binding on Christians. Controversy with Judaizers led in process of time to direct condemnation of those who still kept the Jewish day (e.g., Co. of Laodicea, A.D. 363). For discussion of the difficult problem when and how the Christian Sunday superseded and took on some characteristics of the Jewish Sabbath see SUNDAY. (W. R. S.; S. A. C.)

Origin.—What was the origin of the Sabbath? What part did it play in the life of the Israelite nation before the exile? To these questions confident answers have been given, but the material upon which we can base our conclusions is not sufficiently extensive or clear to warrant dogmatism. It is a noteworthy fact that there is no evidence of Sabbath observance in the patriarchal period: there is, indeed, very little material that can be reckoned as pre-exilic.

There are four passages which seem to point to the conclusion that in the earlier times a close connection existed between the Sabbath and the new-moon festival. In 2 Kings iv. 23 the Shunammite's husband asks, when she proposes to visit the prophet, "Wherefore wilt thou go to him to-day? it is neither new moon nor sabbath." Among the religious observances which Isaiah names as offensive to Yahweh he links together (i. 13) "new moon and sabbath." In Hosea ii. 11 Yahweh says of Israel "I will cause all her mirth to cease, her feasts, her new moons, her sabbaths, and all her solemn assemblies." Amos (viii. 5) denounces the traders who say "When will the new moon be gone, that we may sell corn? and the sabbath, that we may set forth wheat?" The reference in Hosea would make it probable that the Sabbath was a season of festal joy, and that in Amos makes it clear that there was at any rate some cessation of ordinary business activities on that day. By inference this latter conclusion may be deduced from the passage in Kings. The question of the Shunammite's husband suggests that the ass for which she had asked in order to make her journey would have been available, even in harvest time, had the day been a new moon or a Sabbath: the inference surely is that on those days the work of harvesting stood still, so that the beasts would not be required for labour on the farm. This combination of new moon and Sabbath suggested to Meinhold (*Sabbat und Woche im Alten Testament*, 1905) that originally the Sabbath must have been the day of the full moon. This theory is very plausible, though Meinhold's endeavour to explain how the full moon feast came to be transformed into the regular seventh day Sabbath of abstinence is not convincing. Kittel has attacked the fundamental hypothesis on which the theory rests. He contends that the existence of a full moon feast in ancient Israel is nowhere demonstrable, and points out that while the new moon festival has maintained itself in later Judaism there is no survival of a full moon festival. This last argument, however, might easily be countered, for if it be a fact that the full moon festival was converted into the weekly Sabbath the disappearance of the former would be amply accounted for.

Meinhold regards the Decalogue as dating, at the earliest, from the exile, and rejects decidedly the idea that before the exile the Hebrews had a seven day week running throughout the year. Many critics, however, tend distinctly towards the belief that the Decalogue in some simple form may very well go back to the time of Moses. The story of the manna in Exodus xvi. in its original form may represent Moses as the discoverer of the Sabbath; and if so, this would be evidence that in certain streams of tradition Moses was regarded as the sponsor in Israel of the Sabbath. If the kernel of the commandments be accepted as Mosaic the institution of the Sabbath goes back to the very beginnings of the history of Israel. In the decalogue of Exodus xx. 3-17 the command "remember the sabbath day" follows immediately upon the commandments which are concerned with Yahweh and Yahweh's name. This shows how great must have been the importance of the Sabbath, and suggests that it was regarded as in an especial sense Yahweh's day, a fact for which the Old Testament offers abundant confirmation. The emphasis on the Sabbath in this form of the Decalogue is the more noteworthy

in view of the fact that it ignores all the other feasts and rites. It is highly probable, considering the close association between Yahweh and the Sabbath, that the celebration of the latter as a festival goes back to the time when Yahweh first became the national deity. This does not, of course, conflict with the theory that it was connected also with the changes of the moon, which, indeed, seems to be the most probable hypothesis. Whether originally it was the day of the full moon only, or whether the half-moon days were also Sabbaths, it is difficult to say.

It has been objected that a regular rest day like the Sabbath could be celebrated only by a settled agricultural people. Apart from the fact that the ancestors of the Israelite nation were not all nomads it may be urged that even the life of the desert was much more artificial than we have been accustomed to suppose. The wandering herdsmen have many trades. Some of them breed cattle. Slaves and artisans have always been known in the desert. At the oases corn and fruit are cultivated. And peoples in a comparatively primitive state of culture observe rest-days, though these are not as a rule periodic, and are not necessarily consecrated to a particular deity or employed for religious purposes. Hutton Webster (*Rest Days*, 1911), regards the restrictions which characterize them as being in the nature of tabus. Such days are observed at critical seasons, among which are the changes of the moon. He instances in particular the custom of Hawaii, according to which on a strict tabu day there must be no fire or light, and general gloom and silence prevail. No canoes may be launched, no one may bathe, or even be seen out of doors unless his presence is required at the temple. The old Hawaiian system included a remarkable approximation to the institution of a weekly Sabbath. In each lunar month four periods were tabu, the 3rd to the 6th nights, the time of the full moon, including the 14th and 15th nights, the 24th and 25th nights, and the 27th and 28th nights. On the other hand among some peoples such seasons of abstinence developed into joyous festivals and holidays. "Among many peoples in the lower culture," says Hutton Webster, "the time of the new moon and full moon, much less commonly each half moon, is a season of restriction and abstinence." Such days may be dedicated to a god, or may simply be regarded as unlucky days.

A theory that the Jewish Sabbath, name and institution alike, is derived from Babylonian sources was propounded by Friedrich Delitzsch (*Babel and Bible*) and has been widely accepted. To quote Delitzsch, "Since the Babylonians also had a Sabbath (*shabattu*) on which, for the purpose of conciliating the gods, there was a festival—that is to say, no work was to be done—and since the 7th, 14th, 21st and 28th days of the month are marked on a calendar of sacrifices and festivals dug up in Babylonia as days on which 'the shepherd of the great nations' (*i.e.*, the king) shall eat no roast flesh, shall not change his dress, shall not offer sacrifice, as days on which the king shall not mount the chariot, or pronounce judgment, the magus shall not prophesy, even the physician shall not lay his hand upon the sick, in short, as days which are not suitable for any affair, it is scarcely possible for us to doubt that we owe the blessings decreed in the Sabbath or Sunday day of rest in the last resort to that ancient and civilized race on the Euphrates and Tigris."

The evidence adduced by Delitzsch, plausible as it seems, is not however, conclusive. The inscription he quotes—which, though it comes from the "library" of Asurbanipal, is evidently of Babylonian origin—refers only to a particular month, the intercalary Elul, and it is not shown that these special days occurred in the other months. Further, the prohibitions apply only to particular persons such as the king and the physician. It should be noted, too, that the calendar specifies in addition to the 7th, 14th, 21st and 28th days also the 19th as an "evil day" on which the restrictions apply. It is explained that the 19th is the 49th day from the beginning of the preceding month, that is, the end of the seventh week from that starting-point. But even if this explanation is correct the fact would remain that the day of restriction occurs oftener than at the end of each week. In order to discover whether there is evidence of a general restriction of business in Babylonia on particular days C. H. W. Johns (*Ency. Brit.* 11th ed. vol. xxiii. 961 *seq.*) analyzed a great many business

contracts, classifying them according to the day of the week on which they were dated. The result showed that on all these "evil days" business was carried on, though, if the documents may be taken as fairly representative, there was a marked diminution of business on the 19th day of the month. During the First Dynasty of Babylon, and in the seventh century B.C., all these days show a falling off in the number of trading transactions. But, on the other hand, during the Kassite period trade went on much as usual on all days, including even the 19th day of the month. In any case these "evil days" seem different from the early Hebrew Sabbath; the latter was just the day when the Shunammite woman might actually have been expected to go on a journey, whereas the former were just the days when the king might not ride in his chariot.

It is true that the Babylonians had a day called *shabattum* or *shapattum*. This seems, however, to be distinct from the days of restriction dealt with in the calendar tablet. In a syllabary *shapattum* is equated to *um nuh libbi*, that is, "day of the rest of the heart." It has been urged that here is a proof that the Babylonians had a Sabbath which, like that of the Hebrews, was a rest day. But it is clear from the Babylonian penitential psalms that the real meaning of the words is "day when the heart (of the gods) is propitiated." A tablet discovered by Pinches shows that the *shapattum* was the 15th day of the month. A passage in the astronomical poem of the Babylonian epic *Enuma elish* quite clearly shows that the *shapattum* is the day of the full moon. The verb *shapatu* is elsewhere explained as equivalent to the verb *ganzaru*, meaning "to be complete, full." None of the attempted etymologies for Sabbath from the Hebrew is successful, probably for the reason that the word is older than the Hebrew language. It is not unreasonable to suppose that both *shapattum* and *sabbath* are descended from a word belonging to the older tongue from which both the Babylonian language and the Hebrew developed, and that its prime meaning is "full moon day." This would confirm Meinhold's theory that among the Hebrews the Sabbath was originally the full moon day. But the fact that the name is derived from a common source, and that the day itself among both peoples is originally the day of the full moon, must not blind us to the truth that the Babylonians had no real equivalent to the Jewish Sabbath at regular seven-day intervals. Had there been any great likeness between the ways in which the *shapattum* and the Sabbath were celebrated the latter could hardly have been insisted on as a distinctive mark of the Jews.

Sabbatical Year.—An ancient Hebrew law enjoined that in every seventh year the land should lie fallow ((Exodus xxiii. 11); vineyard and olive garden, too, are to remain uncultivated. Whatever may be produced under these conditions is to be for the poor and the wild beasts. It is extremely unlikely that this was meant to apply to all cultivated land in the same year. If any attempt were made to carry out this injunction the Sabbatical year must have varied from plot to plot. The later Law of Holiness does, however prescribe one definite year for all land. According to Josephus the Sabbatical year was a close time for warlike operations. From the same authority we learn that the Jews requested Alexander to remit tribute during the Sabbatical year, and that Tacitus complained that the Jews devoted every seventh year to idleness. Similar is the rule that there should be release of debtors from their debts in each seventh year.

The term has been adopted in universities for a period of freedom from academic duties every seventh year.

SABBATION or **SAMBATYON**, a river (1) natural and (2) supernatural. (1) The Targum pseudo-Jonathan to Exod. xxiv. 10 states that the Ten Tribes were exiled beyond the Sambatyon: this is repeated in Gen. Rabba lxxiii.: Num. Rab. xvi. and Yalqūt Genesis 984. This is therefore a river in Media, identified by Ramban (Deut. xxxii., 26) with the Gozan (II Kings xvii., 6) and a natural stream. Fuenn (Pirhe *Çafon* ii., 133) identifies this with the Zab in Adiabene which Xenophon calls *Sabatōs* and which

became corrupted to Sabbath. This river must be sharply distinguished from that mentioned by Josephus (War, vii., v., 1) who makes Titus on his return from the destruction of Jerusalem pass, near Beirut, a river which, flowing only on one day in seven, is called after the Sabbath. It will be noted that this river is in Palestine, not in Media and that it is periodic.

(2) With Pliny (*Hist. Nat.* xxxi., 2) two supernatural elements enter the story. First the river rests one day in seven instead of flowing on that day and secondly that day is the Sabbath. A variant of the miracle occurs in Gen. Rabba xi. In the 9th century the mysterious Eldad the Danite carried the wonder still further. In his chronicle the river is waterless but full of sand and stones which roll with a great noise during the week-days but rest on the Sabbath. Th. Noeldeke (*Beitrag zur Gesch. d. Alexanderromans*, 48) traces the Sambatyon in the Alexander legend. The river of sand (*Wadi ar-Raml*) is mentioned by Kazwini (*Cosmography* ed. Wiistenfeld, ii., 17) and by Mas'udi. Benjamin of Tudela mentions the ten tribes and the Gozan river but he ascribes no miraculous properties to it, save that David Alroy crossed it on his mantle. In the 17th century the miracles have increased. Travellers from India relate that the sand or water is curative of leprosy. Menasseh ben Israel states that the sand, if kept in a bottle moves about during the week but rests on Sabbath. It has been suggested that the sand element in the story is to be explained by a confusion of a Hebrew name *נַחַר הַחַל* (*Ne-har Hōl*) which could mean either "weekday river" or "river of sand."

See *Jew. Enc. s.v.* and A. Neubauer, *Jew. Quart. Rev. I.*, "Where are the Ten Tribes?"

SABELLIC (from Latin Sabellus, Samnite) has often been used of a minor group of the Italic dialects, namely the pre-Latin dialects of the Paeligni, Marrucini and Vestini (better called North Oscan), of the Volsci, and of the Marsi, Aequi, Sabini and other central Italian tribes (conveniently called Latinian); these dialects are all closely related to Oscan (*q.v.*). The same name, or sometimes Old Sabellic, is also used, but inaccurately, to describe two small but distinct groups of inscriptions from various sites near the east coast of central Italy (1) from Novilara and Fano (near Pesaro); (2) from Belmonte Piceno, Cupra Marittima, Castignano, Bellante, Grecchio and Superequo. These may be better designated, by "East Italic."

The second group, not more recent in date than the 6th century B.C., are doubtless the oldest written documents known from Italian soil. The lines of writing run alternately left to right and right to left, the positions of the letters being both reversed and inverted in the lines written right to left. Their alphabet is clearly of the same Chalcid-Etruscan origin as that of all the other alphabets of ancient Italy (except the Greek and Phoenician), but shows some peculiarities which suggest direct Greek influence; the language, still untranslated, will probably prove to be an Indo-European (two I.-E. stems, pater father, mater mother have been identified) and ancient Illyrian dialect (meitime is an Illyrian name). For it is known from the elder Pliny (N.H. 3, 110, cf. 113), from the Iguvine tables (*iapuzkum* Iapydian, *i.e.*, belonging to the Illyrian Iapydes), and from archaeological evidence, that there were Illyrian settlers in or near that district, the ancient Picenum, where these inscriptions were discovered.

But the documents of the Novilara group are later in date, distinct in alphabet—this is perhaps of Etruscan origin, but shows certain resemblances both to the Umbrian and to the Oscan alphabets—and probably also in dialect. The suggestion that the dialect, however, is allied to Etruscan itself, is quite unsupported by the evidence; the decorative motifs, for example the spiral, which appear on all three of the inscriptions of this group, point rather to the opposite coast of the Adriatic, where similar motifs occur, especially round Nesazio, on contemporary monuments; and there is nothing in the word-forms of these documents which may not be Indo-European, while the characteristic Etruscan syncope and elision (at least in the writing) are entirely lacking.

Linçei, ser. 5, vol. xvii (1908), pp. 681 *sqq.*, and *Notizie degli Scavi*, 1903, pp. 101 *sqq.* See also G. Herbig in M. Ebert's *Real-Lexikon der Vorgeschichte*, s.vv. Novilara, Vorsabeller (1927-; bibl.), and R. S. Conway in *Cambridge Ancient History* vol. iv. (1926) p. 445. The inscriptions have been edited anew by J. Whatmough, *Præ-Italic Dialects of Italy: Part II.* (in the press, bibl.), Nos. 342-355. (J. W.H.)

SABELLIUS (*fl.* 230), early Christian presbyter and theologian, was of Libyan origin, and came from the Pentapolis to Rome early in the 3rd century. He became the leader of the strict Modalists (who regarded the Father and the Son as two aspects of the same subject) whom Calixtus had excommunicated along with their most zealous opponent Hippolytus. His party continued to subsist in Rome for a considerable time, and withstood Calixtus as an unscrupulous apostate. In the West, however, the influence of Sabellius seems never to have been important; in the East, on the other hand, after the middle of the 3rd century his doctrine found much acceptance, first in the Pentapolis and afterwards in other provinces. It was violently controverted by the bishops, notably by Dionysius of Alexandria, and the development in the East of the philosophical doctrine of the Trinity after Origen (from 260 to 320) was very powerfully influenced by the opposition to Sabellianism.

Sabellian Doctrine.—The Sabellian doctrine itself, however, during the decades above mentioned underwent many changes in the East and received a philosophical dress. In the 4th century this and the allied doctrine of Marcellus of Ancyra were frequently confounded, so that it is exceedingly difficult to arrive at a clear account of it in its genuine form. Sabellianism, in fact, became a collective name for all those Unitarian doctrines in which the divine nature of Christ was acknowledged. The teaching of Sabellius himself was very closely allied to the older Modalism ("Patripassianism") of Noetus and Praxeas, but was distinguished from it by its more careful theological elaboration and by the account it took of the Holy Spirit. His central proposition was to the effect that Father, Son and Holy Spirit are the same person, three names thus being attached to one and the same being. What weighed most with Sabellius was the monotheistic interest.

Sabellius further maintained that God is not at one and the same time Father, Son and Spirit, but, on the contrary, has been active in three apparently consecutive manifestations or energies—first in the *πρόσωπον* of the Father as Creator and Lawgiver, then in the *πρόσωπον* of the Son as Redeemer, and lastly in the *πρόσωπον* of the Spirit as the Giver of Life. It is by this doctrine of the succession of the *πρόσωπα* that Sabellius is distinguished from the older Modalists. In particular it is significant, in conjunction with the reference to the Holy Spirit, that Sabellius regards the Father also as merely a form of manifestation of the one God—in other words, has formally put Him in a position of complete equality with the other Persons. This view prepares the way for Augustine's doctrine of the Trinity. Sabellius himself appears to have made use of Stoical formulas (*πλατύνεσθαι σοτελέσθαι*), but he chiefly relied upon Scripture, especially such passages as Deut. vi. 4; Exod. xx. 3; Isa. xlv. 6; John x. 38. Of his later history nothing is known; his followers died out in the course of the 4th century.

The sources of our knowledge of Sabellianism are Hippolytus (*Philos.*, bk. ix.), Epiphanius (*Hæc.* lxi.) and Dionys. Alex. (*Epp.*); also various passages in Athanasius and the other fathers of the 4th century. For modern discussions of the subject see Schleiermacher (*Theol. Ztschr.* 1822, Hft. 3); Lange (*Ztschr. f. hist. Theol.* 1832, ii. 2); Döllinger (*Hippolyt u. Kallist.* 1853); Zahn (*Marcell v. Ancyra*, 1867); R. L. Ötley, *The Doctrine of the Incarnation* (1896); various histories of Dogma, and Harnack (s.v. "Monarchianismus," in Herzog-Hauck, *Realencyk. fur prot. Theol. und Kirche*, xiii. 303). (A. H.A.)

ŠABIANS. The Šabians (*aš-Šabi'in*) who are first mentioned in the Koran (ii. 59, v. 73, xxii. 17) were a semi-Christian sect of Babylonia, the Elkesaites, closely resembling the Mandaeans or so-called "Christians of St. John the Baptist," but not identical with them. How Mohammed understood the term "Šabians" is uncertain, but he mentions them together with the Jews and Christians. The older Mohammedan theologians were agreed that they possessed a written revelation and were entitled accordingly

to enjoy a toleration not granted to mere heathen. Curiously enough, the name "Šabian" was used by the Meccan idolaters to denote Mohammed himself and his Muslim converts, apparently on account of the frequent ceremonial ablutions which formed a striking feature of the new religion.

From these true Šabians the pseudo-Šabians of Ḥarrān (*Carrhae*) in Mesopotamia must be carefully distinguished. In A.D. 830 the Caliph Ma'mūn, while marching against the Byzantines, received a deputation of the inhabitants of Ḥarrān. Astonished by the sight of their long hair and extraordinary costume, he inquired what religion they professed, and getting no satisfactory answer threatened to exterminate them, unless by the time of his return from the war they should have embraced either Islam or one of the creeds tolerated in the Koran. Consequently, acting on the advice of a Mohammedan jurist, the Ḥarrānians declared themselves to be "Šabians," a name which shielded them from persecution in virtue of its Koranic authority and was so vague that it enabled them to maintain their ancient beliefs undisturbed. There is no doubt as to the general nature of the religious beliefs and practices which they sought to mask. Since the epoch of Alexander the Great Ḥarrān had been a famous centre of pagan and Hellenistic culture; its people were Syrian heathens, star-worshippers versed in astrology and magic. In their temples the planetary powers were propitiated by blood-offerings, and it is probable that human victims were occasionally sacrificed even as late as the 9th century of our era. The more enlightened Harriinians, however, adopted a religious philosophy strongly tinged with Neoplatonic and Christian elements. They produced a brilliant succession of eminent scholars and scientists who transmitted to the Muslims the results of Babylonian civilization and Greek learning, and their influence at the court of Baghdad secured more or less toleration for Šabianism, although in the reign of Harūn al-Rashid the Ḥarrānians had already found it necessary to establish a fund by means of which the conscientious scruples of Muslim officials might be overcome. Accounts of these false Šabians reached the West through Maimonides, and then through Arabic sources, long before it was understood that the name in this application was only a disguise.

See also "Nouveaux documents pour l'étude de la religion des Harrianiens," by Dozy and De Goeje, in the *Actes of the sixth Oriental congress*, ii. 281 f. (1885); and Chwolsohn, *Sabier und der Sabismus* (1836).

SABICU WOOD is the produce of a large leguminous tree, *Lysiloma latifolia*, a native of Cuba, Haiti and the Bahamas. The wood has a rich mahogany colour; it is exceedingly heavy, hard and durable.

SABINE, SIR EDWARD (1788-1883), English astronomer and geodesist, was born in Dublin on Oct. 14, 1788, and was educated at the Royal Military Academy, Woolwich. He was appointed astronomer of the expeditions commanded by Ross and Parry in search of the North-West Passage in 1818 and 1819. Then he went to Spitzbergen and the tropical coasts of Africa and America, where he conducted pendulum experiments for determining the figure of the earth. In 1821 he conducted experiments on the length of the seconds pendulum in London and Paris, his results appearing in *Philosophical Transactions*, 1828. The greater part of his life was devoted to researches on terrestrial magnetism. The establishment of magnetic observatories in various parts of British territory all over the globe was accomplished mainly on his representations. He discovered (1852) a connection between the periodic variation of sunspots and magnetic disturbances on the earth.

Sabine was president of the Royal Society from 1861-1871; received the Copley medal of that society in 1821 and the Royal medal in 1849; and was made K.C.B. in 1869. He died at East Sheen, Surrey, on June 26, 1883.

SABINI. This was an ancient tribe of Italy which was more closely in touch with the Romans from the earliest recorded period than any other Italic people. They dwelt in the mountainous country east of the Tiber, and north of the districts inhabited by the Latins and the Aequians in the heart of the Central Apennines. Their boundary, between the southern portion of the Umbrians on the north-west, and of the Picentines on the north-east,

was probably not very closely determined. The traditions connect them closely with the beginning of Rome, and with a large number of its early institutions, such as the worship of Jupiter, Mars, and Quirinus, and the patrician form of marriage (*confarreatio*).

Of their language as distinct from that of the Latins no articulate memorial has survived, but we have a large number of single words attributed to them by Latin writers, among which such forms as (1) *firucus*, Lat. *hircus*; (2) *ausum*, Lat. *aurum*; (3) *novensiles*, Lat. *novensides* ("gods of the nine seats"); (4) the river name Farfarus, beside pure Lat. *Fabaris* (Servius, *ad Aen.* vii. 715); and (5) the traditional name of the Sabine king, *Numa Pompilius* (contrasted with Lat. *Quinctilius*), indicate clearly certain peculiarities in Sabine phonology: namely, (1) the representation of the Indo-European palatal aspirate *gh* by *f* instead of Lat. *h*; (2) the retention of *s* between vowels; (3) the change of medial and initial *d* to *l*; (4) the retention of medial *f* which became in Latin *b* or *d*; and (5) the change of Ind.-Eur. *q* to *p*. The tradition (e.g., Paul ex Fest. 327 M.) that the Sabines were the parent stock of the Samnites is directly confirmed by the name which the Samnites apparently used for themselves, which, with a Latinized ending, would be *Safini* (see SAMNITES and the other articles there cited, dealing with the minor Samnite tribes).

To determine the ethnological relation of these tribes, whom we may call "Safine," to the people of Rome on the one hand, and the earlier stratum or strata of population in Italy on the other, linguistic and archaeological material must be examined. Archaeological evidence connects the Sabines with the patricians of Rome, (see ROME, Ancient History). What language did the Sabines speak? Was it most nearly akin to Latin or to Oscan or again to Umbrian and Volscian? Festus, though he continually cites the *Lingua Osca*, never spoke of *Lingua Sabina*, but simply of Sabini, and the same is practically true of Varro, who never refers to the language of the Sabines as a living speech, though he does imply (v. 66 and 74) that the dialect used in the district differed somewhat from urban Latin. The speech therefore of the Sabines by Varro's time had become too Latinized to give us more than scanty indications of what it had once been. The language of the Samnites was that which is now known by the name of Oscan.

It appears that in, say, the 7th century, B.C., the Safines spoke a language not differing in any important particulars from that of the Samnites, generally known as Oscan; and that when this warlike tribe combined with the people of the Latian plain to found or fortify or enlarge the city of Rome, and at the end of the 6th century to drive out from it the Etruscans, who had in that century become its masters, they imposed upon the new community many of their own usages, especially within the sphere of politics, but in the end adopted the language of Latium henceforth known as *lingua Latina*.

See R. S. Conway, *Italic Dialects* p. 351 (Cambridge, 1897). For the history of the Sabine district see Mommsen, *C.I.L.* ix. p. 306; and Beloch, "Der italische Bund unter romischer Hegemonie" (Leipzig, 1880) and "La Conquista Romana della regione Sabina," in the *Rivista di storia antica* ix. p. 269 (1905).

SABINIANUS, pope from 604 to 606, the successor of St. Gregory the Great.

SABLE, the name of a small quadruped, closely akin to the martens, and known by the zoological name of *Mustela zibellina*. It is a native of Siberia and famous for its fur. The name appears to be Slavonic in origin, whence it has been adapted into various languages. The Eng. and Med. Lat. *sabellum* are from the O Fr. *sable* or *saible* (see MARTEN and FUR). "Sable" in English is a rhetorical or poetical synonym for "black." This comes from its usage in heraldry (first in French) for the colour equivalent to black.

SABLE ANTELOPE, a large and handsome South African antelope (*Hippotragus niger*), exhibiting the rare feature of blackness or dark colour in both sexes. The sable and the roan antelope (*H. equinus*) belong to a genus nearly related to the oryxes (*q.v.*), but distinguished by the stout, thickly ringed horns (present in both sexes) rising vertically from a ridge over the eyes at an obtuse angle to the plane of the lower part of the face, and then

sweeping backwards in a bold curve. The muzzle is hairy; there is no gland below the eye; the tail is long and tufted. Sable antelopes are among the handsomest of South African antelopes, and are endowed with great speed and staying power. They are commonly met with in herds including from 10 to 20 individuals. Forest-clad highlands are their favourite resorts. The roan antelope is a larger animal, with shorter horns, strawberry-roan in colour in both sexes.

SABLE ISLAND, an island of Nova Scotia, Canada, 110 m. S.E. of Cape Canso, in 43° 56' N. and 60° W. It is composed of shifting sand, and is about 20 m. in length by 1 m. in breadth, rising in places to a height of 85 feet. In the interior is a lake about 10 m. in length. At either end dangerous sandbars run out about 17 m. into the ocean. It has long been known as "the graveyard of the Atlantic"; over 200 known wrecks have been catalogued, and those unrecorded are believed greatly to exceed this number. The coast is without a harbour and liable to fogs and storms; irregular ocean currents of great strength sweep round it, and its colour makes it indistinguishable until close at hand. Since 1873 an efficient lighthouse system and life-saving station has been maintained by the Canadian Government, and the danger has been much lessened. Since 1904 it has been connected with the mainland by wireless telegraphy. Sable Island is the home of the Ipswich sparrow (*Passerculus princeps*).

Sable Island was known to the early navigators as Santa Cruz.

See George Patterson, "Sable Island," *Trans. Roy. Soc. Canada*, xii. (1894); Harold St. John, "Sable Island," with history, zoology and botany, *Boston Soc. Nat. Hist.*, vol. 36, no. 1 (1917).

SABORAIM: see GAON.

SABOTAGE, systematic working in such a manner as to delay production, or to injure the quality of the product, a policy sometimes advocated, especially by syndicalists, either to remedy a particular grievance or as part of a general revolutionary program. Sabotage of this kind may conveniently be discussed under two headings:

(1) Exceedingly slow work. This may be either *ca' canny* (*q.v.*), deliberately slow work, whose extreme form is the "stay-in strike" when the workers enter the factory but do no work at all, or it may take the form of elaborately careful work. Apart from the "stay-in strike," or "sit-down" in the U.S., the only generally effective use of this kind of sabotage has been "working to rule" by railwaymen. The procedure consists in following exactly the rule books, which, if rigorously applied, forthwith disorganize the service, as they generally contain items either obsolete or merely entered for formal purposes of record. An example of the former is the British regulation that every ticket must always be examined on both sides, the latter the Italian regulation that a driver must satisfy himself that he crosses all bridges at or about a certain speed, both of which items have been used for "working to rule" strikes. The first disorganizes the "City rush," the second the long-distance expresses.

(2) Injury to product or other obstruction. The anarchist "propaganda by deed" (*i.e.* assassination of oppressors: see ANARCHISM) is not strictly included in this, though in polemical writers the two types of action are often confused. The commonest form is destruction of machinery, but the doing of very bad work, deliberately designed to break down, is also frequent. Destruction of the tools of blacklegs is an allied form of sabotage (it was common in Sheffield in the '60s under the name of "rattening"); and, like sabotage in general, is only common when peaceful picketing is forbidden.

Sabotage as a policy has been advocated by the French trade unions and the (mainly American) Industrial Workers of the World. In both cases the reason given is that the workers are engaged in a class struggle in which the capitalist class shrinks from no methods however brutal, and that the workers cannot afford to abstain from any weapon for sentimental reasons. Its chief advocates, the French *syndicats* and the I.W.W., emerged from the war of 1914-18 and the ensuing crisis much weakened, and the Russian Revolution of Nov. 1917 had injured the general case for sabotage.

Sabotage is also, of course, a weapon commonly employed in

war time, or even in peace, against the essential industries of a hostile power. It may be the results of spy action (probably uncommon) or due to the action of nationally oppressed workers. It is commonly supposed that the Czech workers employed in the arsenals took effective and extensive sabotage action after the invasion by Germany in March 1939. But facts about such sabotage are naturally unobtainable, it being to the interest of both sides to conceal them.

See Georges Sorel, *Reflexions sur la Violence* (1910); E. Pataud and E. Pouget, *Comment nous ferons la Revolution* (Eng. tr. 1913); E. Pouget, *Le Sabotage* (1910); and SYNDICALISM, SOCIALISM, TRADE UNIONS, DIRECT ACTION and INDUSTRIAL WORKERS OF THE WORLD. (R. W. P.)

SABRATHA, an ancient city of Africa Proconsularis (Tripolis), founded in the 7th–6th century B.C. by Tyrian settlers as a factory on the shore of a flat and inhospitable coast, mod. Sabratha Vulpia, 48 m. W. of Tripoli by rail. Towards the end of the 2nd century A.D. its prosperity began to increase: Antoninus Pius built two temples; the tribunal before which Apuleius (*q.v.*) was tried met here, and under Commodus the Sabratenses had a statio (or office) at Ostia (*q.v.*). Towards the end of the 4th century there occurred fiscal exactions, religious disputes and attempts at invasion by the tribes of the interior (the most destructive being that of the Austuriani in A.D. 363), after which, as inscriptions show, the buildings of Sabratha, and notably the baths, were rebuilt. The Vandals themselves, who only occupied Tripolitania in A.D. 455, were defeated by a native rebellion, and after the destruction of their power by the Byzantines the very natives who had invited the aid of the latter rose against them also. During the years of peace following 548 new fortifications were made. Justinian's death, in 565, brought a renewal of the native risings. The Arabs took Tripoli in 643, and Sabratha was surprised in the night and sacked.

Excavations have revealed the east gate of the Roman walls, while Byzantine fortifications surround the western portion of the city, where are situated the forum, the curia or council hall, a temple of Jupiter (of whom a fine bust was found), and another temple (perhaps the Capitolium), both of the time of Antoninus Pius, two Christian basilicas (one, erected by Justinian, with fine mosaics), a baptistery. The theatre and the amphitheatre, fairly well preserved and recently carefully restored, lie farther away, near the quarries. The streets are wide and well laid, and the houses are numerous and closely built, without courtyards. There were no less than 12 fountains, supplied by an aqueduct. The Roman harbour was constructed by joining the rocks with masses of concrete, so as to form two moles with a narrow entrance between them; while along the shore were cisterns and storehouses.

See R. Bartocchini, *Guida di Sabratha* (Rome and Milan, 1927).

SABRE-FENCING, the art of attack and defence with the sabre, or broad-sword. About 1900 the light Italian sabre was introduced and became the recognized cut-and-thrust weapon. It was introduced in the United States about 1912; in Austria-Hungary it was popular as early as 1885; in Italy, the country of its origin, it has been in use since the middle of the 19th century. Its blade is about $\frac{7}{8}$ in. wide a little below the guard, tapering $\frac{5}{16}$ in., just under the point. For practice this is truncated and this edge blunt, but in scoring both edge and point are assumed to be sharp, while in countries on the continent of Europe (and also in Great Britain and the United States of America) the back-edge (false edge) is also supposed to be sharpened for some 8 in. from the point. The modern sabre is a descendant of the curved light cavalry sword of the late 18th century, which was introduced into Europe from the Orient by the Hungarians.

The sabre championship of Great Britain was instituted in 1898, side by side with the foil championship, through the agency of the Amateur Gymnastic and Fencing Association. In this connection there were no heartburnings, for the sabre is essentially a competitive weapon. One of the chief features of the competition in recent years was the victory in 1923 and 1924 of the veteran fencer E. Seligman, who thus became the first British fencer to gain a championship with all three weapons.

The winners since 1920 have been:

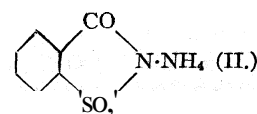

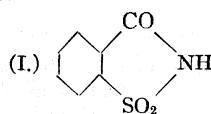

1920	Lieut. C. A. Kershaw, R.N.	1927	A. H. Corble
1921	W. Hammond	1928	G. L. G. Harry
1922	A. H. Corble	1929	Col. R. B. Campbell
1923	E. Seligman	1930	O. G. Trinder
1924	E. Seligman	1931	O. G. Trinder
1925	Lieut.-Commander C. A. Kershaw, R.N.	1932	A. G. Pilbrow
		1933–34	O. G. Trinder
1926	Lieut.-Commander C. A. Kershaw, R.N.	1935	A. G. Pilbrow
		1936	R. F. Brook

American Fencers League of America National champions:

1925–26	Leo Nunes	1931–32	J. R. Huffman (N.Y. A.C.)
1927	Nickolas Muray (N.Y.A.C.)		
1928	Nickolas Muray (N.Y.A.C.)	1933	N.Y.A.C. (Huffman, Denagy, Foy)
1929	Leo Nunes (N.Y.A.C.)		
1930	Norman C. Cohn (F.C.)	1934	Norman C. Armitage (F.C.)

SACCHARIC ACID exists in three forms. The ordinary or dextro (*d*)-saccharic acid is formed in the oxidation of cane sugar, grape sugar and many other carbohydrates with nitric acid. It forms a deliquescent mass, slowly yielding the crystalline lactonic acid, $C_6H_8O_7$. Sodium amalgam reduces it to glucuronic acid, $OHC[CH_2OH]_4CO_2H$, whilst hydriodic acid reduces it to adipic acid, $HO_2C[CH_2]_4CO_2H$. Laevo (*l*)-saccharic acid is formed by oxidizing *l*-gluconic acid with nitric acid, whilst the inactive (*df*l)-acid is obtained similarly from inactive gluconic acid. These three acids differ mainly in their action on polarized light. All three are tetrahydroxyadipic acids, with the formula $HO_2C \cdot (CH_2OH)_4 \cdot CO_2H$. Mucic acid (*q.v.*) is isomeric with them.

SACCHARIN, a name given to several totally different chemical substances of which the most noteworthy is the saccharin of commerce, a coal-tar product having an excessively sweet taste. This substance, which is the imide of *ortho*-sulphobenzoic acid and referred to scientifically as *ortho*-benzoic sulphinide, was discovered by Ira Remsen and C. Fahlberg in 1879 in the course of an investigation carried out at Johns Hopkins University, U.S.A., on the oxidation of *o*-toluenesulphonamide. The excessive sweetness of the substance was noticed accidentally by the latter observer who, after a day's work in the laboratory, washed his hands thoroughly and went home to supper, when he noticed that the bread tasted sweet, but closer examination showed that the taste came from his hands and even from his arms. He returned to the laboratory and tested the contents of each beaker and basin on the working bench until he came to the product possessing this remarkable property. This sweetening principle was the substance which subsequently attained world fame under its commercial name of saccharin. It is still manufactured substantially in the manner worked out by Fahlberg. Toluene (*q.v.*) is sulphinated with fuming sulphuric acid to its *ortho*- and *para*-sulphonic acids which are successively converted into calcium and sodium salts, and the latter treated with phosphorus pentachloride (or the trichloride plus chlorine). Phosphorus oxychloride is distilled off and the residue is thoroughly cooled and centrifuged to remove crystalline toluene-*p*-sulphonic chloride from the liquid toluene-*o*-sulphonic chloride, $CH_3 \cdot C_6H_4 \cdot SO_2Cl$. By a modification due to Heyden and to Monnet, this mixture of sulphonic chlorides is alternatively prepared by running toluene into excess of chlorosulphonic acid. The oily *ortho*-sulphonic chloride is converted by ammonium carbonate, or preferably by ammonia under pressure, into its amide, $CH_3 \cdot C_6H_4 \cdot SO_2 \cdot NH_2$, which on oxidation with alkaline permanganate yields the alkali salt of *ortho*-sulphaminobenzoic acid. This acid, $NH_2 \cdot SO_2 \cdot C_6H_4 \cdot CO_2H$, when liberated from its salts by mineral acid is converted spontaneously into saccharin (formula I.) which is its internal anhydride.

Saccharin is a white crystalline substance subliming at 100° and melting at $227-227.5^\circ$ C. When pure and concentrated, it is 550 times as sweet as cane sugar, the commercial product being of 300 times the sweetness of sugar. It is only sparingly soluble in

cold water, one part dissolving in 400 parts of boiling water. It is more soluble in alcohol, glycerol, ethyl acetate and acetone. From the last of these solvents it separates in large, colourless, transparent, monosymmetric crystals which when crushed or rubbed together display triboluminescence (W. J. Pope, 1895). The sweetness of saccharin is enhanced by mixing with *dulcin*, para-phenetolecarbamide, $C_2H_5O \cdot C_6H_4 \cdot NH \cdot CO \cdot NH_2$, which itself has some sweetening property,

Saccharin forms a sodium salt (with $2H_2O$) which dissolves readily in water and is known as *soluble saccharin* or *crystallose*.

The ammonium salt (formula II.), known as *sucramine* (melting point $150^\circ C$), is obtained in white crystals equally soluble in hot or cold water; it is sweeter than saccharin, being 700 times as sweet as cane sugar.

Saccharin and its soluble derivatives are used as sweetening agents, and medicinally they are employed as sugar substitutes in diabetes, in liver disease and for the reduction of corpulence or wherever the use of sugar is undesirable. The physiological action is not, however, negligible, for saccharin decreases appetite, gastric secretion, peptic digestion and intestinal absorption.

In the United Kingdom there is an import duty of 1s. 3d. per ounce on saccharin, and in the U.S.A. the import duty is \$1.50+45% *ad valorem* per pound. Importation is prohibited in certain countries and in others high customs duties are imposed.

The lactones of saccharic acids (*q.v.*) are also known as "saccharins." By boiling dextrin or laevulose with milk of lime, a lactone of the formula $CH_2OH \cdot CH \cdot CH(OH) \cdot C(OH) \cdot CH_3$ is

obtained. It crystallises in prisms soluble in hot water and with bitter taste. Isosaccharin and metasaccharin, melting at 95° and $142^\circ C$, are formed by the action of lime on milk sugar. (See H. Pringsheim, *Zucker-Chemie*, Leipzig, 1925.)

SACCHETTI, FRANCO (c. 1335–c. 1400), Italian poet and novelist, was a member of the noble and ancient Florentine family of the Sacchetti (comp. Dante, *Par.* c. xvi.). He held many important posts in the Florentine State. Sacchetti left a considerable number of *sonnetti*, *canzoni*, *ballate*, *madrigali*, etc. His *Novelle*, based on real incidents of Tuscan life, are written in pure and elegant Tuscan and are valuable for the light they throw on the manners of that age.

SACCHI, ANDREA (c. 1600–1661), Italian painter of the later Roman school, was born at Nettuno near Rome in 1600, or perhaps as early as 1598. His father, Benedetto, a painter, gave him his earliest instruction in the art; Andrea then passed into the studio of Albani, of whom he was the last and the most eminent pupil. Sacchi was one of the most learned designers and one of the soundest colourists of the Roman school. He went to Venice and to Parma to study Venetian colour and the style of Correggio. His principal painting—in the Vatican Gallery—is "St. Romuald relating his Vision to Five Monks of his Order." The Vatican Gallery contains also an early painting of the master—the "Miracle of St. Gregory," executed in 1624; a mosaic of it was made in 1771 and placed in St. Peter's. Other leading examples are the "Death of St. Anna," in S. Carlo di Catinari; also frescoes in the Palazzo Barberini—"Divine Wisdom." There are pictures by the master in the galleries of Perugia, Madrid and Dresden. He had a flourishing school: Nicholas Poussin and Carlo Maratta were his scholars.

See Hans Posse, *Der Römische Maler Andrea Sacchi* (Leipzig 1925).

SACCO-VANZETTI CASE, THE, a murder trial in Massachusetts, extending over seven years, 1920–27, and resulting in the execution of the defendants, Nicola Sacco and Bartolomeo Vanzetti. The trial resulted from the murder in South Braintree, Mass., on April 15, 1920, of F. A. Parmenter, paymaster of a shoe factory, and Alessandro Berardelli, the guard accompanying him, in order to secure the pay roll they were carrying. On May 5 Sacco and Vanzetti, two Italians who had immigrated to the

United States in 1908, one a shoe worker and the other a fish pedlar, were arrested for the crime. On May 31, 1921, they were brought to trial before Judge Webster Thayer of the Massachusetts superior court and, on July 14, were both found guilty by verdict of the jury. The verdict was disputed by Socialists and other Radicals on the ground that the men had not received a fair trial because of their Radical affiliations. Motion for a new trial, on grounds that the identification was not complete, failed. Further motions for a new trial were made from time to time but also failed on grounds that the evidence submitted did not justify it. On Nov. 18, 1925, the confession of Celestino Madeiros that he had participated in the crime, and that neither Sacco nor Vanzetti was present, added a new complication. Motion for a retrial on the basis of this confession was also denied by Judge Thayer who claimed that Madeiros, already sentenced to execution for another crime, was motivated in assuming the guilt in the hope that the giving of testimony would delay his own death. A motion of appeal to the State supreme court failed, the court taking the position that the trial judge had the final power to determine the matter of retrial on grounds of additional evidence. On April 9, 1927, Judge Thayer sentenced the two defendants to the electric chair.

It was at this point that the storm of protest broke loose. Newspapers in both Europe and America gave large amounts of space to the proceedings, mass meetings were held, and the officials connected with the case were flooded with petitions mingled with threats. The defence carried the case to Governor Fuller, holder of the power of clemency, who in addition to a personal investigation appointed President Lowell of Harvard university, President Stratton of the Massachusetts Institute of Technology and Robert Grant, a former judge, to investigate the case independently. On Aug. 3, Governor Fuller announced that he had found against the plea, and that his advisory committee had also come to the conclusion that a new trial was not warranted. Successive stays postponed the execution while further vain appeals were made to Judge Thayer, to the supreme judicial court, and finally to members of the U.S. Supreme Court, the attorney-general and the president. During the days following Governor Fuller's denial of clemency, demonstrations were made in many cities in America and abroad, bombs were set off in New York city and Philadelphia and guards were set up against other threats of violence. The two men were executed on Aug. 23, 1927, both maintaining their innocence.

See *The Sacco-Vanzetti Case: a Transcript of the Record of the Trial* (1928); F. Frankfurter, *The Case of Sacco and Vanzetti* (1927), and *The Outlook*, vol. cl., pp. 1,053 ff. (1928).

SACHAU, CARLEDUARD (1845–1930), German scholar, was born on July 20, 1845 at Neumiinster in Holstein. In 1869 he was appointed professor of Semitic languages at the University of Vienna, and in 1876 professor of oriental languages at Berlin, where he became director of the school of oriental languages. In 1879–80 he travelled extensively in Syria and Mesopotamia, and in 1897–98 in Babylonia and Assyria. He wrote *Syrisch-romisches Rechtsbuch aus dem 5. Jahrhundert* (1890); *Reise in Syrien und Mesopotamien* (1883); *Neuarabische Volkslieder aus Mesopotamien* (1889); *Katalog persischer Handschriften* (1889); *Muhammedanisches Erbrecht von Zansibar und Ost-Afrika* (1894); *Am Euphrat und Tigris* (1900); *Syrische Rechtsbücher* (1907–14).

For a complete bibliography of the works of Sachau, see S. Weil, *Die Festschrift zu Ehren Ed. Sachaus* (1915).

SACHEVERELL, HENRY (1674–1724), English ecclesiastic and politician, was the son of Joshua Sacheverell, rector of St. Peter's, Marlborough. He was adopted by his godfather, Edward Hearst, and his wife, and was sent to Magdalen college, Oxford, in 1689, was demy of his college from 1689 to 1701 and fellow from 1701 to 1713. Sacheverell took his degree of B.A. in 1693, and became M.A. in 1695 and D.D. in 1708. His first preferment was the small vicarage of Cannock in Staffordshire; and in 1705 he was elected to the chaplaincy of St. Saviour's, Southwark. In 1709 he leapt into notoriety by his famous sermons attacking the Whig ministry on the charge of

neglecting to watch over the interests of the church. These sermons were delivered, one in Derby on Aug. 15, the other in St. Paul's cathedral; and both, especially the latter, were delivered in excessively violent language. They were immediately printed, and made the preacher the idol of the Tory party.

The attention of the House of Commons was drawn to the two sermons by John Dolben in Dec. 1710, and were denounced as "malicious, scandalous and seditious libels." The Whig ministry, then slowly but surely losing the support of the country, were divided in opinion as to the propriety of prosecuting Sacheverell. Somers was against such a measure; but Godolphin urged the necessity of a prosecution, and gained the day. The trial lasted from Feb. 27 to March 23, 1710, and the verdict was that Sacheverell should be suspended for three years and that the two sermons should be burnt at the Royal Exchange. Popular resentment over the trial resulted in the downfall of the ministry, Godolphin being dismissed in August and the other ministers in November. Immediately on the expiration of his sentence (April 13, 1713) Sacheverell was instituted to the valuable rectory of St. Andrew's, Holborn, by the new Tory ministry. He died at the Grove, Highgate, on June 5, 1724 (See also ENGLISH HISTORY.)

See Hearne's *Diaries*, Bloxam's *Register of Magdalen* and Hill Burton's *Queen Anne*, vol. ii. There is an excellent bibliography by Falconer Madan (1887).

SACHEVERELL, WILLIAM (1638-1691), English statesman, son of Henry Sacheverell, a country gentleman, entered parliament in 1670 for Derbyshire. He was an opponent of the court policy, especially of the secret treaty with France. In 1678 he was one of the most active investigators of the "Popish Plot," and one of the managers of the impeachment of the five Catholic peers. He also served as a manager in the impeachment of Danby. He made the first suggestion of the Exclusion Bill on Nov. 4, 1678, in a debate raised by Lord Russell with the object of removing the duke from the King's Council. He vigorously promoted the bill in the House of Commons and opposed granting supplies till it should pass.

At the general election following the death of Charles II. in 1685 Sacheverell lost his seat, but he was an active member of the convention parliament. He died on Oct. 9, 1691. In the judgment of Speaker Onslow, Sacheverell was the "ablest parliament man" of the reign of Charles II. He was one of the earliest of English parliamentary orators; his speeches greatly impressed his contemporaries, and in a later generation, as Macaulay observes, they were "a favourite theme of old men who lived to see the conflicts of Walpole and Pulteney."

BIBLIOGRAPHY.—Many of Sacheverell's speeches are reported in Anchitell Grey's *Debates of the House of Commons, 1667-1694* (10 vols., London, 1769). See also Sir George Sitwell, *The First Whig* (Scarborough, 1894).

SACHS, HANS (1494-1576), German poet and dramatist, was born at Nuremberg on Nov. 5, 1494. His father was a tailor, and he himself was trained to the calling of a shoemaker. Before this, however, he received a good education at the Latin school of Nuremberg. In 1509 he began his apprenticeship, and was initiated into the art of the Meistersingers by a weaver, Leonhard Nunnenpeck. In 1511 he set out on his *Wanderjahre*, and worked at his craft in many towns, including Regensburg, Passau, Salzburg, Munich, Osnabrück, Lübeck and Leipzig. In 1516 he returned to Nuremberg, where he remained during the rest of his life, working steadily at his handiwork and devoting his leisure time to literature. In 1517 he became master of his guild and in 1519 married. Sachs became an ardent adherent of Luther, and in 1523 wrote in Luther's honour the poem beginning *Die wittenbergisch Nachtigall, Die man jetzt höret überall*, and four dialogues in prose, in which his warm sympathy with the reformer is tempered by counsels of moderation. The town council of Nuremberg then forbade him to publish any more *Büchlein oder Reimen*. Before long, however, the council itself declared for the Reformation. Sachs died on Jan. 19, 1576.

By the year 1567 Sachs had composed, according to his own account, 4,275 *Meisterlieder*, 1,700 tales and fables in verse, and

208 dramas, which filled no fewer than 34 large manuscript volumes; and this was not all, for he continued writing until 1573. The *Meisterlieder* were not printed, being intended solely for the use of the Nuremberg Meistersinger school, of which Sachs was the leading spirit. His fame rests mainly on the *Spruchgedichte*, which include his dramatic writings. His "tragedies" and "comedies" are, however, little more than stories told in dialogue, and divided at convenient pauses into a varying number of acts. The subjects are drawn from the Bible, the classics, the Italian novelists and elsewhere. He succeeds best in the short anecdotal *Fastnachtsspiel* or Shrovetide play, where characterization and humorous situation are of more importance than dramatic form or construction. Farces like *Der fahrende Schüler im Paradies* (1550), *Das Wildbad* (1550), *Das heiss Eisen* (1551), *Der Bauer im Fegefeuer* (1552), are inimitable in their way, and have even been played with success on the modern stage.

Hans Sachs himself made a beginning to an edition of his collected writings by publishing three large folio volumes (1558-61); after his death two other volumes appeared (1578, 1579). A critical edition has been published by the Stuttgart *Literarischer Verein*, edited by A. von Keller and E. Goetze (23 vols., 1870-96); *Sämtliche Fastnachtsspiele*, ed. by E. Goetze (7 vols., 1880-87); *Sämtliche Fabeln und Schwänke*, by the same (3 vols., 1893). There are also editions of selected writings by J. Tittmann (3 vols., 1870-71; new ed., 1883-85) and B. Arnold (2 vols., 1885). See E. K. J. Lützelberger, *Hans Sachs* (1876); C. Schweitzer, *Étude sur la vie et les oeuvres de Hans Sachs* (1887); K. Drescher, *Hans Sachs Studien* (1890, 1891); E. Goetze, *Hans Sachs* (1891); A. L. Stiefel, *Hans Sachs-Forschungen* (1894); R. Genée, *Hans Sachs und seine Zeit* (1894; 2nd ed. 1902); E. Geiger, *Hans Sachs als Dichter in seinen Fastnachtsspielen* (1904).

SACHS, JULIUS VON (1832-1897), German botanist, was born at Breslau on Oct. 2, 1832. On leaving school in 1851 he became assistant to the physiologist J. E. Purkinje at Prague. In 1856 he graduated as doctor of philosophy, and established himself as *Privatdozent* for plant physiology in the university of Prague. In 1859 he was appointed physiological assistant to the Agricultural Academy of Tharandt in Saxony; and in 1861 he went to the Agricultural Academy at Poppelsdorf, near Bonn, where he remained until 1867, when he was nominated professor of botany in the university of Freiburg-im-Breisgau. In 1868 he accepted the chair of botany in the university of Würzburg, which he continued to occupy until his death on May 29, 1897.

Sachs was especially associated with the development of plant physiology which marked the latter half of the 19th century, though he contributed to every branch of botany. His earlier papers, in botanical journals and publications of learned societies, are of interest. Prominent among them is the series of "Keimungsgeschichten," which laid the foundation of our knowledge of micro-chemical methods, and the morphological and physiological details of germination. Then there is his resuscitation of the method of "water-culture," and its application to problems of nutrition; and further, his discovery that the starch-grains to be found in chloroplastids are the first visible product of their assimilatory activity. His later papers were published in the three volumes of the *Arbeiten des botanischen Instituts in Würzburg* (1871-88). Among these are his investigation of the periodicity of growth in length; his researches on heliotropism and geotropism, in which he introduced the "clinostat"; his work on the structure and arrangement of cells in growing-points; the evidence upon which he based his "imbibition-theory" of the transpiration-current; his studies of the assimilatory activity of the green leaf; and other papers.

Sachs' works are: *Handbuch der Experimentalphysiologie der Pflanzen* (1865; French edition, 1868); *Lehrbuch der Botanik* (1868, Eng. ed. 1875 and 1882), a comprehensive work, giving a summary of the botanical science of the period, including the results of original investigations; *Vorlesungen über Pflanzenphysiologie* (1st ed., 1882; 2nd ed., 1887; Eng. ed., Oxford, 1887); *Geschichte der Botanik* (1875, Eng. ed. 1890).

A full account of Sachs' life and work was given by Professor Goebel, formerly his assistant, in *Flora* (1897), of which an English translation appeared in *Science Progress* for 1898. There is also an obituary notice of him in the *Proc. Roy. Soc.* vol. lxii.

SACHS, MICHAEL (1808-1864), German Rabbi, one of the first of Jewish graduates of the modern universities, was appointed Rabbi in Prague in 1836, and in Berlin in 1844. He took

the conservative side against the Reform agitation, and retired from the Rabbinate rather than acquiesce in the use of the organ in the synagogue. Sachs co-operated with Zunz in a new translation of the Bible. He is best remembered for his work on Hebrew poetry, *Religiose Poesie der Juden in Spanien* (1845).

SACKBUT, SHAKBUSSHE, SAGBUT, DRAW or DRAWING TRUMPET, the earliest form of slide trumpet, derived from the Roman buccina, which afterwards developed into the trombone. As soon as the effect of the slide in lengthening the main tube and therefore proportionally deepening the pitch of the instrument was understood, and its capabilities had been realized, the development of a family of powerful tenor and bass instruments followed as a matter of course. The transformation of the busine (*buccina*) into the sackbut involved two or three processes, the addition of the slide being accomplished in at least two stages, the extending portion of the tube being at first straight and later bent or folded to make the instrument less unwieldy. (See also TRUMBONE, TRUMPET and BUCCINA.)

SACKETS HARBOR, a village in Jefferson county, New York, U.S.A., at the eastern end of Lake Ontario, on the south shore of Black River bay, about 1 mi. from its mouth, and about 10 mi. W. by S. of Watertown. Pop. (1930) 1,680; (1940) 1,962. Sackets Harbor is served by the New York Central railway. It is built on low land, around a small, nearly enclosed harbour, the northern shore of which is formed by Navy Point, a narrow tongue of land extending about $\frac{1}{4}$ mi. nearly due eastward from the mainland. In the military cemetery is the grave of Gen. Zebulon M. Pike (*q.v.*), killed at York (Toronto) on April 27, 1813.

The first settlement was made in 1801 by Augustus Sacket and the village was incorporated in 1814. In the war of 1812 Sackets Harbor, important strategic point for the Americans, was the base for naval operations on the Great Lakes. In July 1812 it was attacked by a Canadian provincial squadron and again in May 1813, by a British squadron under Commander Yeo and troops under General Sir George Prevost, on both occasions unsuccessfully. For many years it boasted the world's smallest navy yard, under four acres. It continues to be occupied by Naval Reserves. For several years the property was in charge of the shipkeeper's widow and thus was commanded by a woman. The first steamship on the Great Lakes was launched at Sackets Harbor in 1817. Von Schultz and 700 men sailed from the port in Nov. 1838, to invade Canada, were captured near Prescott and Von Schultz was executed at Kingston after the trial.

See A. T. Mahan, *Sea-Power in its Relation to the War of 1812* (Boston, 1905); and W. Kingsford, *The History of Canada*, vol. viii. (Toronto, 1895).

SACKING AND SACK MANUFACTURE.

Sacking is a heavy closely-woven fabric, originally made of flax, but now almost exclusively made of jute or of hemp. The more expensive kinds, such as are used for coal sacks for government and other vessels, are made of hemp, but the jute fibre is extensively used for the same purpose, and almost entirely for coal sacks for local house supplies. The same type of fabric is used for wool sacks, cement bags, ore bags, pea sacks and for any heavy substance; it is also made up into a special form of bag for packing cops and rolls of jute and flax yarns for delivery from spinners to manufacturers. Proper sacking is essentially a twilled fabric, in which the number of warp threads per inch greatly exceeds the number per inch of weft. The illustration shows a typical kind of three-leaf twill, double warp sacking. All three-leaf twill sack-

ings are double in the warp, but four-leaf sackings are usually single; special kinds may be double in the warp. In all cases the warp is comparatively thin, say 6lb. to 8lb. per spynkle, whereas the weft is thick and single from 16lb. to 48lb. per spynkle. Cloths are usually 27in. wide, but other widths are made.

The lower part of the illustration shows four repeats of the three-leaf twill, while the lines drawn to the plan of the fabric show that each line of the design is reproduced in the cloth by two warp threads. Large quantities of cotton sacks are made for flour, sugar and similar produce; these sacks are usually plain cloth, some woven circular in the loom, others made from the piece.

Large quantities of seamless bags or sacks for light substances are woven in the loom, but these are almost invariably made with what is termed the double plain weave; *i.e.*, the cloth, although circular except at the end, is perfectly plain on both sides, and similar in structure to, but wider than hose-pipe (*q.v.*). Circular bags have been made both with three-leaf and four-leaf twills, but it is found much more convenient and economical to make the cloth for these kinds, and in most cases, for all other types, in the piece, and then to make it up into sacks by one or other of the many types of sewing machines. The pieces are first cut up into definite lengths by special machinery, which may be perfectly automatic or semi-automatic—usually the latter, as many thicknesses may be cut at the same time, each of the exact length. The lengths of cloth are then separately doubled up, the sides sewn by special sewing machines.

The chief centres for jute bags are Dundee and Calcutta, all varieties of sacks and bags being made in and around the former city. For paper sacks see PAPER and PAPER MANUFACTURE.

See T. Woodhouse, *The Finishing of Jute and Linen Fabrics* (1928).

SACKVILLE, GEORGE, 1ST VISCOUNT (1716–1785),

generally remembered as Lord George Sackville or Lord George Germain, third son of Lionel Cranfield Sackville, 1st duke of Dorset, was born on Jan. 26, 1716. Educated at Westminster School and Trinity College, Dublin, he was gazetted captain in 1737, and saw active service in the German campaign. Wounded in the charge of Cumberland's infantry column at Fontenoy, he was taken to the tent of King Louis XV. to have his wound dressed, and was soon released. He received rapid military promotion, and was gazetted major-general in 1755 and lieutenant-general in 1757. Meanwhile he filled the offices of first secretary to his father, the lord-lieutenant of Ireland, and Irish secretary of war, and sat in each of the two Houses of Commons at Westminster and Dublin. In 1758, under the duke of Marlborough, he shared in the ineffective raid on Cancale Bay, and the troops, after a short sojourn in the Isle of Wight, were sent to join the allied army of Duke Ferdinand of Brunswick in Germany. Marlborough died shortly after they landed, and Sackville succeeded him as commander-in-chief of the British contingent. His haughty and domineering temper estranged him both from his second-in-command, Lord Granby, and the commander-in-chief, Prince Ferdinand. This culminated on the day of Minden (August 1, 1758). The British infantry, aided by some of the Hanoverians, had won a brilliant success, and every man in the army looked to the British cavalry to charge and to make it a decisive victory. But Sackville, in spite of repeated orders from Prince Ferdinand, sullenly refused to allow Granby's squadrons to advance. The crisis passed, and the victory remained an indecisive success. A court-martial in 1760 pronounced him guilty of disobedience, and adjudged him "unfit to serve his Majesty in any military capacity whatsoever." In 1763 his name was restored to the list of the Privy Council. In 1769 he allied himself with Lord North. To this period belong the famous Junius Letters, with the authorship of which Sackville was erroneously credited. In 1770, under the terms of a will, he assumed the name of Germain. In 1775, having meantime taken an active part in politics, he became secretary of state for the colonies in the North cabinet, and he was practically the director of the war for the suppression of the revolt in the American colonies. Germain and the North cabinet misunderstood the situation and there was constant friction with the generals and the army in the theatre of war. Nevertheless he received a peerage. He died at Stoneland Lodge (Buckhurst Park) Sussex, on Aug. 26, 1785.

WEAVE AND CLOTH PLANS
Bottom; black squares show unit weave, black circles show three repeats of unit weave; top; plan of 9 units of the weave structure of cloth showing 12 double threads of warp and 6 picks of weft

SACKVILLE, THOMAS, 1ST EARL OF DORSET (c. 1530-1608), English statesman and poet, son of Sir Richard Sackville, was born at Buckhurst, Sussex, took his M.A. at Cambridge, and was called to the bar at the Inner Temple. He married Cicely, daughter of Sir John Baker of Sissinghurst, Kent; in 1558 he entered parliament as member for Westmorland, in 1559 he sat for East Grinstead, Sussex, and in 1563 for Aylesbury, Buckinghamshire. During a visit to the Continent in 1565 he was imprisoned for a rash declaration of Protestant opinions. The news of his father's death on April 21, 1566, recalled him to England. On his return he was knighted in the queen's presence, receiving at the same time the title of baron of Buckhurst. In 1571 he was sent to France to congratulate Charles IX. on his marriage with Elizabeth of Austria, and he took part in the negotiations for the projected marriage of Elizabeth to the duke of Anjou. In 1572 he was one of the peers who tried Thomas Howard, duke of Norfolk, and in 1586 he was selected to convey the sentence of death to Mary, queen of Scots. He was sent in 1587 as ambassador to The Hague and carried out under protest the foolish and often contradictory orders he received. His plain speaking on Leicester's action in the Netherlands displeased the queen. His return was followed by a short period of disgrace, but he was sent again to the Netherlands in 1589 and 1598. He was elected chancellor of the University of Oxford in 1591, and in 1599 succeeded Lord Burghley as lord high treasurer. In 1601 as high steward he pronounced sentence on Essex, his rival for the chancellorship and his opponent in politics. James I. confirmed him in the office of lord treasurer. He was created earl of Dorset in 1604, and died suddenly at the council table on April 19, 1608. His eldest son, Robert, the 2nd earl (1561-1609), was a member of parliament and a man of great learning. Two other sons were William (c. 1568-91), a soldier killed in the service of Henry IV. of France, and Thomas (1571-1646), also a soldier.

Sackville is remembered, not by his distinguished political career, but by his share in two works, each of which was, in its way, a new departure in English literature. To the second edition (1563) of the *Myrroure for Magistrates*, edited by William Baldwin, Sackville contributed the *Complaint* of Henry Stafford, duke of Buckingham, to which he prefixed an *Induction*. This induction was arbitrarily transposed (1610) to the beginning of the collection by a later editor, Richard Niccols, a proceeding which led to the attribution of the general design to Sackville, an error repeated by Thomas Warton. The originators were certainly Baldwin and his "printer" who designed the *Myrroure* as a continuation of Lydgate's *Fall of Princes* in the form of laments of the ghosts of great men written by various hands. Fragments of the earliest edition entitled *A Memoriall of such princes as . . . have been unfortunate . . .* are sometimes found bound up with Lydgate's book.

Sackville's *Induction* opens with a description of the oncoming of winter. The poet meets Sorrow, who offers to lead him to the infernal regions that he may see the sad estate of those ruined by their ambition, and thus learn the transient character of earthly joy. At the approaches of Hell he sees a group of terrible abstractions, Remorse of Conscience, Dread, Misery, Revenge, Care, etc., each vividly described. The last of these was War, on whose shield he saw depicted the great battles of antiquity. Finally, penetrating to the realm of Pluto, he is surrounded by the shades, of whom the duke of Buckingham is the first to advance, thus introducing the *Complaint*. Sackville's models were Gavin Douglas and Virgil. The dignity and artistic quality of the narrative of the fall of Buckingham make the work one of the most important between the *Canterbury Tales* and the *Faerie Queene*.

Sackville has also the credit of being part author with Thomas Norton of the first legitimate tragedy in English. This was *Gorboduc* or *Ferrex and Porrex*, performed at Christmas 1560 by the society of the Inner Temple, and on Jan. 18, 1561, before Elizabeth at Whitehall. The argument is as follows:

"Gorboduc, king of Brittain, devided his Realme in his lyfe time to his Sones, Ferrex and Porrex. The Sonnes fell to dyvision and discention. The yonger kylled the elder. The Mother, that more dearely loved thelder, fr revenge kylled the yonger. The

people, moved with the Crueltie of the fact, rose in Rebellion, and Slewe both father and mother. The Nobilitie assembled, and most terribly destroyed the Rebelles. And afterwards for want of Issue of the Prince, wherby the Succession of the Crowne became uncertayne, they fell to Ciuill warre, in whiche both they and many of their Issues were slayne, and the Lande for a longe tyme almoste desolate, and myserablye wasted."

The story is taken from book ii. chap. xvi. of Geoffrey of Monmouth's history. It was first printed (1565) in an unauthorized edition as *The Tragedie of Gorboduc* "whereof three Actes were wrytten by Thomas Nortone, and the two laste by Thomas Sackvyle." In 1570 appeared an authentic edition, *The Tragedie of Ferrex and Porrex*. The tragedies of Seneca were now being translated, and the play is conceived on Senecan lines. The paucity of action is eked out by a dumb show to precede each act, and the place of the Chorus is supplied by four "ancient and sage men of Britain." In the variety of incident, however, the authors departed from the classical model. The play is in blank verse, and is the first example of the application of Surrey's innovation to drama. Jasper Heywood in the poetical address prefixed to his translation of the Thyestes alludes to "Sackvylde's Sonnets sweetly sauste," but only one, prefixed to Sir T. Hoby's translation of Castiglione's *Courtier*, has survived.

The best edition of *A Mirror for Magistrates* is that of Joseph Haslewood (1815). *Gorboduc* was edited for the Shakespeare Society by W. D. Cooper in 1847; in 1883 by Miss L. Toulmin Smith for C. Vollmoller's *Englische Sprach und Litteraturdenkmale* (Heilbronn, 1883) and by J. Q. Adams *Chief pre-Shakespearean Dramas* (1925). The *Works* of Sackville were edited by C. Chapple (1820) and by R. Sackville-West (1859). See also *A Mirror for Magistrates* (1898) by W. F. Trench; and accounts in W. J. Courthope's *History of English Poetry*, vol. i. and in the *Cambridge History of English Literature*, vol. iii.

SACO, a city of York county, Maine, U.S.A., on the Saco river and the Atlantic ocean, opposite Biddeford and 14 m. S.W. of Portland. It is on federal highway 1 and is served by the Boston and Maine railroad. Pop. 7,233 in 1930 and 8,631 in 1940. There is abundant water power, and the city has cotton mills and various other factories. The adjoining town of Old Orchard, which has one of the finest beaches on the coast (a wide crescent 10 mi. long), has long been a popular summer resort and was a starting point for several early transatlantic air flights. Saco was settled as early as 1631, and was the seat of the Gorges government from 1636 to 1653. Until 1762 Saco and Biddeford were one town or plantation (under the name of Saco before, of Biddeford after 1718) as now they are practically one community in economic and social interests. In 1716 Sir William Pepperell acquired title to most of what is now Saco, and in 1762 this was incorporated as the town of Pepperellboro. The Pepperell property was confiscated in 1779. In 1805 the name of Saco was adopted, and in 1867 the town was chartered as a city.

SACRAMENT, the title given by Christians to an external rite or ceremony regarded as the instrument, or at least a symbol, of the reception by those who participate in it of a spiritual benefit whereof Christ is the author. As the conception of a spiritual benefit received through participation in an external rite is by no means peculiar to Christianity, the expression is often applied also to rites in other religions more or less analogous to those designated sacraments by Christians, and sometimes to any instance of the use of material objects as instruments whereby spiritual benefits may be conveyed or appropriated, even although no religious doctrine or ritual be associated with such conveyance or appropriation. The present article, however, will be mainly concerned with the Christian conception of a sacrament, and rather with the content and significance of that conception than with its history.

In the *Sentences* of Peter Lombard, Bishop of Paris 1159-1160, which served for centuries as the theological text-book of western Christendom, *sacramentum* in the most general use of the word is defined (5 *Sent.* dist. 1 B. following Augustine *Ep.* 138 § 8, *signa quae, cum ad res divinas pertinent, sacramenta appellantur*) as *sacrae rei signum*; and, more precisely, as *invisibilis gratiae visibilis forma*; but in its strictest acceptation, wherein it is applicable only to certain Christian rites, as *quod ita signum est*

gratiae Dei et invisibilis gratiae forma ut ipsius imaginem gerat et causa existat—an outward and visible sign of an inward divine grace, which it both aptly represents (as immersion in baptismal water represents cleansing from sin, or eating and drinking eucharistic bread and wine the maintenance and strengthening of spiritual life) and also actually imparts to the recipient.

The word *sacramentum* is used in classical Latin literature of the pledge deposited in a temple by the parties to a lawsuit, and also of the soldier's oath of allegiance to his commander; and neither of the senses has been without influence on its employment by Christian theologians. But the far less restricted sense given to it by the Latin-speaking Fathers and their choice of it to render the Greek *μυστήριον* point to its having had a more general signification, corresponding to its etymology, such as is suggested by St. Thomas Aquinas when he says that that may be called *sacramentum* whereby anything is made sacred (*sacratum*) as that whereby anything is adorned (*ornatur*) is called *ornamentum* (in 4 *Sent.* i. 1; cf. *Summ. Theol.* q.u. IX. art. 1: *Sacramentum dicitur a sacrando, sicut medicamentum a medicando*). Thus, behind the conception of a sacrament lies the notion, common to all peoples, of a "sacred" sphere or world, distinct from, but in close contact with, that of everyday life, so that particular persons, things, places and times can, by recognized methods of "consecration" or "desecration," be removed from one to the other.

The word *μυστήριον*, employed by the Greek-speaking Church, was associated with the same notion, being the regular designation of religious ceremonies of initiation. These ceremonies distinguished the initiated from those not counted worthy of such translation from the sphere of ordinary life to communion with denizens of a higher world, and suggested the *secrecy* with which "sacred" rites were invested, in order to secure their performance from the intrusion of profane or unconsecrated persons or things. In the New Testament *μυστήριον* is almost exclusively used of the divine secrets (e.g., of God's purpose to include all nations in the covenant made by him at first with Israel alone) which are described as now at length divulged to the world by the preaching of Christ's apostles. It is not applied to the solemn rites of initiation and communion which were nevertheless already regarded as "means of grace," and came, with the spread of Christianity in the Graeco-Roman world, to be treated as corresponding in the new faith to the ceremonies there denoted by the name, in which Christians from Justin onwards, were accustomed to see a diabolical travesty of the Christian "sacraments." Nor for a long time was the word *sacramentum*, by which the earliest Latin translators of the Scriptures rendered *μυστήριον* limited to those outward "means of grace" to which it came eventually to be appropriated; and, even after it had been thus appropriated, it was only gradually that among a host of ceremonies and things used in ceremonies, all supposed to convey divine grace in some manner or degree, a certain number were definitely acknowledged as properly entitled to the name of sacraments.

THE SEVEN SACRAMENTS

Seven rites were recognized in the west, from Peter Lombard onwards, as sacraments in the strict sense: Baptism, Confirmation, the Eucharist, Penance, Extreme Unction, Orders and Marriage; the Councils of Trent and of the Vatican endorsed this list which has also been adopted by the orthodox Church of the east. The Churches of the Reformation, on the other hand, acknowledged only baptism and the eucharist, to which indeed a certain pre-eminence was universally allowed, as entitled to be called sacraments in the proper sense; mainly on the ground that these alone could be proved from Scripture to have been instituted by Christ himself as external ceremonies effecting, or at least attesting and sealing, the conveyance of an inward spiritual grace to worshippers qualified to receive it by faith in the promise expressly associated with its performance by its divine Founder. In demanding that a sacrament in the proper sense must be able to claim institution by Christ the Reformers did not differ from the Roman Church. But they refused to accept inferences from the words of Scripture, though supported by ecclesiastical tra-

dition, as evidence of such institution equivalent to the direct commands to be found for baptism in Matt. xxviii. and for the eucharist especially in 1 Cor. xi.

The Scriptural texts alleged to suggest a like institution for the other rites recognized by the Roman Church as sacraments seemed to them either to be inapplicable to them or else to make no such provision for a particular outward symbol of the promised grace as was necessary to constitute a "sacrament," while the traditional rendering of *μυστήριον* by *sacramentum* in the application of the word to marriage in Eph. v. 32 could hardly be said to warrant the interpretation of the word there, as intended in a very specialized sense otherwise unknown to the New Testament. Where, however, there was, as with baptism and the eucharist, express scriptural authority for the institution by Christ of an outward and visible sign of an inward spiritual grace, of the bestowal whereof it was to be, to a believer in his promise, at least the assurance, if not the instrument, there the Protestant as well as the Catholic, recognized a genuine sacrament.

There was, however, an important point of difference between them, in respect of such ceremonies as they agreed in regarding as "sacraments." The former denied, and the latter affirmed that they confer grace *ex opere operato*. This phrase seems to have been originally intended to express the belief that sacraments do not depend for their efficacy on the moral character or even on the private beliefs of the individual minister; that where an otherwise qualified person, though wicked or unbelieving, yet intending "to do what the Church does," observes the appointed forms, the recipient need not be afraid that the promised grace is not received; the human minister being no more than an instrument in the hand of the true Giver, Christ Himself. This the Churches of the Reformation for the most part did not deny; the view of Wyclif that only one himself in a state of grace could administer a valid sacrament obtained little acceptance. But the Reformers objected to the phrase *ex opere operato*, which was solemnly reaffirmed against their objections by the Council of Trent. It seemed to them inconsistent with the supreme place assigned in their theology to faith as the sole means of justification. Catholics did not indeed deny that the absence of personal faith in a recipient in whom it could be present (as it could not be, for example, in infants brought to baptism) would present an impediment to this profiting by the grace offered in a sacrament, and on their side, Protestants, in allowing infant baptism, were constrained to admit that the requisite faith was not necessarily that of the individual recipient, but might be that of his parents or of the Church.

Nevertheless, the difference between Catholic and Protestant in that the one laid stress upon the necessity to salvation of sacraments where they could be had, and the other on the indispensableness of faith, which could justify without sacraments, while without it sacraments could not justify, profoundly affected their respective attitudes towards an institution which the Protestant as little intended to disparage as the Catholic. In respect of the eucharist, whereas Luther, Calvin, and the Reformers generally had hoped, by abolishing celebrations at which the priest alone communicated, to restore the primitive frequency of communions, the actual result of the changes introduced by them was to deprive that service in any form of the central place in the public worship of the Church which it had held from the very beginnings of Christianity. Catholics on the other hand were driven by the necessity of maintaining the efficacy of sacraments *ex opere operato* into placing and encouraging a reliance on sacraments which exposed them to the charge of allowing their religion to degenerate in practice into magic.

SYMBOLISM

It cannot be denied that the use of sacraments presents a certain resemblance to some kinds of magic. There is in both the employment of material objects and of bodily gestures in conjunction with a particular form of words to produce effects which, apart from such conjunction, they could not have accomplished. But sacraments resemble far more closely facts of human life which no one would think of describing as magical in any disparag-

ing sense; such as the operation of words, spoken or written, in creating states of feeling, inspiring action, or revealing personality. Here the necessity of intelligent acceptance by those affected of the conventional meaning of the sounds or words employed, the limitation of the effect produced to a certain social context, and the quality (not merely physical, but intellectual or spiritual) of the result obtained distinguish verbal communication (though, as certainly not fully explicable on the principles recognized in the natural sciences, it may fairly be called *mysterious*) from what is usually meant by *magic*. And in these respects, sacraments must be classed with verbal communication. No Christian theologian would allow that these are effective altogether outside of the context of that agreement as to the meaning of the signs and formulas used which exists among Christians, or for the production of merely physical effects according to any law which, like those called "natural," operates irrespectively of the consciousness of those in whose bodies they are produced.

Attempts to treat sacraments as thus effective for "magical" purposes have not been unknown; but they have always been denounced by ecclesiastical authority and regarded as wrong and profane. Without entering into details as to charges of the magical use of sacraments made by theological opponents against particular groups of Christians, it may be observed, in reference to one of special historical importance that, while it is quite arguable that to use the eucharist as a focus of adoring devotion apart from communion is an unwarrantable departure from its original intention, both parties to the controversy here indicated would agree in disapproving as illegitimate any use of it for purposes really other than that or those (whatever it or they may be) for the sake of which it was originally instituted.

Wherever sacraments are used at all (and few Christian denominations have, like the Society of Friends, abandoned the use even of the two which undoubtedly date back to New Testament times), although there may be no crude abuse of them for confessedly magical purposes, quite other than those which the Church holds them to be intended to secure, it is possible to assimilate them to magical performances, by losing sight of their function as vehicles for communicating to individuals a life essentially social and, like all social life, requiring a conventional or ceremonial mode of expression, and of the essentially ethical character of the life which they are thus designed to communicate. The use of material objects or of bodily gestures in the communication of spiritual grace is not alien to the religion of the New Testament, but it is never there taken out of the context of a moral and social life in the imparting and maintaining of which the whole purpose of such use of objects and gestures consists. It is in a firm grasp of the *social* character of sacraments and of the *moral* quality of the life which they are designed to serve as instruments in communicating that the true safeguard against the very real danger of a degeneration of sacramentalism into magic-mongering should be sought rather than in the elimination of sacramentalism from religion, with the whole history of which it is intimately bound up, and by which, as has been well said, "the higher gifts are made accessible to persons of all stages of culture."

"The principle that spiritual values and forces are mediated through material processes," the same writer observes, "runs through nature as a whole." The very production of a new personality is only possible through "a material process the most liable . . . to carnal misuse." "Truth, beauty, goodness . . . become effective only through material forms." There are "natural sacraments"—the kiss, the handshake, the flag—outside of religion. The admittedly important part which these and their like play in our common social life the sacraments play in religion; and in Christianity in particular, "we are bidden to act as sons of God and sharers in Christ, knowing by an outward sign that we are so. Our reliance is to be on the word and act of God, while the joy of responsive emotion copes and goes." (Gore, *The Holy Spirit and the Church*, pp. 24, 146, 148.)

To the value of sacramentalism to human life Goethe (*Wahrheit* 2*a*. *Dichtung*, Th. ii., B. 7) and Comte, who devised an elaborate system of symbolic rites for his new Religion of Humanity, may

be cited as witnesses. That in the early stages of civilization the magical and the sacramental are not easily discriminated is no more than may be said of the magical and the religious in general, or indeed of the magical and the scientific. Primitive magic owes its disappearance at a higher level of culture to its confusion (arising at first from lack of experience, afterwards from the persistence of uncriticized tradition) of different kinds of causation; the supposition, for instance, that the utterance of a name may affect an animal, thing, or unconscious person as it may a person who hears himself called; or that the moral healing of a soul may be effected by external actions without a change in the direction of the will. We still know too little about the interaction of mind and body to despise our ancestors or undeveloped contemporaries for making mistakes in this department, which it has taken centuries of progress, religious and scientific, to render us inexcusable in making. But neither need these ancient errors, even though they may, here as elsewhere, have left traces of themselves, interesting to the archaeologist in conventions and customs which have survived the false beliefs in which they originated, be supposed to render trivial or illusory the higher activities and experiences in connection with which these traces are retained.

THE ARGUMENT OF CONTINUITY

But while we may speak of "natural sacraments" the word is strictly appropriate only where a distinction is drawn between the everyday world and a "sacred" world transcending this, although not necessarily separated from it in space or time. Where the use of the term is extended to the communication of spiritual illumination or power through material symbols apart from religion, we have to do either with a metaphor or, more usually, with a conviction that what is experienced in religion may be employed as a key to the true or ultimate nature of the world as a whole, including those features of it which are revealed to us in that part of our experience which is not in itself specifically religious. For Christians the "sacred" sphere is that which is directly related to Christ, and accordingly nothing can be properly called a "sacrament" which cannot claim authorization by Christ as a vehicle of Divine grace. While a statement in the Bible was taken as, by its presence there, guaranteed to be, when rightly understood, free from error, the undoubted occurrence in Scripture of direct statements that Christ instituted baptism and the eucharist was sufficient to establish their claim. Critical study of the Bible has here, however, altered the situation. Few scholars would now be prepared to regard Matt. xxviii. 19, and 1 Cor. xi. 23 *sqq.* as putting it beyond doubt that the historical Jesus actually prescribed the permanent observance of these rites by his followers. Thus the old question as to the number of sacraments cannot be argued on the old grounds, but rather on that of the continuity between any rite now in use and a rite observed in the primitive Christian community from which the New Testament proceeded; and of the degree in which that community regarded it as intimately bound up with that fellowship with the crucified and risen Saviour which this community existed to offer to all who would join themselves with it.

That baptism and the eucharist were regarded as very intimately bound up with it is certain. Converts were always initiated by a ceremonial washing in Christ's name; such a washing, symbolical of cleansing from sin, being (whether or no actually practised or enjoined by Jesus) familiar to Jews as used in the admission of proselytes and specially associated with Christ's own baptism by John the Baptist, whose mission Christians believed to have been preparatory to their Master's. From the first the followers of Jesus continued the custom, which had plainly been characteristic of his daily intercourse with his disciples, of the solemn blessing and breaking of bread at their social meals; a custom invested with specially solemn associations by the circumstances of His last supper whereat he was believed to have used words identifying the bread and cup shared among his companions with his own body and blood, which were so soon after to be broken and shed upon the cross.

The credentials of the other rites acknowledged by many Christians as sacraments were more doubtful. A laying on of hands

symbolical of the gift of the Spirit seems usually from the beginning to have formed part of the initiatory rite, though sometimes detached from the baptism proper; but no tradition connected it with any injunction of Jesus; the gift imparted was associated in the New Testament with extraordinary manifestations not destined to be permanent; of the anointing which later became the chief feature of "confirmation" Scripture says nothing. Jesus had been wont to forgive sins and sins were believed to be washed away in baptism; but no ceremony or fixed formula is recorded to have been used by Jesus in this connection; only gradually was it realized that sin after baptism would be a normal feature of the Christian's life; nor can scriptural authority be claimed for the system of penitential discipline which was gradually developed in the Church. The unction of the sick mentioned in James was not, like the later rite which appealed to its precedent, intended to be "extreme"; its primary purpose was not the imparting of a spiritual gift, but bodily healing, which alone is mentioned as the object of unction in the only scriptural passage (Mark vi. 13) which appears to represent it as performed by Christ's direction. The setting apart of office bearers in the Christian community by laying on of hands is certainly apostolical; but this symbolic mode of appointment is nowhere stated in Scripture to have been used or enjoined by Jesus himself. Lastly, the only claim of the immemorial and universal institution of marriage to be a "sacrament of the new law" appears, as said above, to be the incidental observation of St. Paul (doubtless suggested by the prophetic use of it as a symbol of the bond between Yahweh and Israel) that it is a "great mystery" or "sacrament" as representing the union of Christ with his Church. But though only certain rites may be reckoned as sacraments in a prerogative sense, the whole system through which individual members of a religious group are placed, through symbols, conventionally recognized therein as instruments of its communication, in contact with the spiritual life which gives unity to the group may be regarded as sacramental. In Christianity—and the associations of the word "sacrament" are Christian—this is the divine life historically manifested in the person and work of Jesus Christ and believed to be continued in the community which, as inspired by His Spirit, may be called His "mystical body." Here those rites, the continuous experience of grace received through which throughout the history of the community attest the unbroken presence therein of the same source of spiritual life are entitled to the name of sacraments. It is clear that only where there exists faith in the reality of this divine life and in the organic relation of the community thereto, can any significance or efficacy be attributed to these; but also that such faith can only be other than an illusion if this life and this relation are in fact real.

SACRAMENTALS, in the Roman Catholic Church, sacred signs of ecclesiastical institution whereby the church grants to the faithful the fruits of her corporate impetration. They include blessings and prayers, and the use of blessed objects. Their institution is an extension of the sacramental principle that the material can be endowed with spiritual significance. Their special effect derives from the power of the church's prayer; it is conditioned in the concrete by the good dispositions of the user. (Cf. *Codex Iuris Canonici*, cc. 1144 ff.)

SACRAMENTARIANS, the name given to those who during the Reformation controversies not only denied the Roman Catholic doctrine of "transubstantiation," but also the Lutheran "consubstantiation." They admitted a spiritual presence of Christ which the devout soul can receive and enjoy, but denied any physical or corporeal presence. Finally accepting the Confession of Augsburg, they were merged in the general body of Lutherans; with the exception of the Swiss followers of Zwingli, whose position was incorporated in the Helvetic Confession. It is a curious inversion of terms that in recent years has led to the name Sacra-

mentarians being applied to those who hold a high or extreme view of the efficacy of the sacraments.

SACRAMENTO, the capital city of California, U.S.A., and the county-seat of Sacramento county, on the east bank of the Sacramento river, at the mouth of the American, midway between the Sierra Nevada and the Pacific ocean. It is on Federal highways 40, 50 and 99; has several airports, and is a station on the Chicago to San Francisco air-mail route; and is served by the Southern Pacific, the Western Pacific and two electric interurban railways, eleven auto-stage companies, and passenger and freight steamship lines on the river to San Francisco. Pop. 93,750 in 1930, of whom 3,347 were Japanese, 1,366 Chinese and 12,612 foreign-born white; 105,958 in 1940 by the federal census. The city occupies 13.7 sq.mi. and is about 30 ft. above sea-level. The mean annual temperature is 60° F, and the mean annual rainfall is 18.02 inches. The fine State capitol (built 1860-69) stands in a park of 40 ac. (owned by the State) in the heart of the city. A mile east of the capitol (in another State-owned park) is old Ft. Sutter, restored and maintained by the State as an historic museum. Within the city limits are the State fair grounds of 210 acres. The city park system covers 1,219 ac.; a municipal vacation camp is maintained in the mountains; the municipal auditorium (completed 1927) seats 5,000, and the athletic stadium (1928) 25,000. Zoning ordinances are in effect, and a city-planning board was created in 1926. The public-school system provides instruction from the kindergarten through two years of a college course. At Davis, 14 m. west, is a branch of the College of Agriculture of the State university. The State library (368,313 vols.) has a fine law department and the most complete collection in existence on the history of California, and the Crocker art gallery houses one of the largest and most valuable collections in the West. Since 1921 the city has operated under a council-manager form of government. The assessed valuation of property in 1940 was \$121,130,650.

Industries and Commerce.—Sacramento is the commercial and shipping centre for the Sacramento valley, a highly productive agricultural, mining and lumbering region. The immediate vicinity produces pears, peaches, plums, apricots, oranges, olives, cherries, strawberries, asparagus, celery, spinach, almonds and Tokay grapes. and harvests some fruit or vegetable every month in the year. Canning and preserving is the city's leading manufacturing industry, its product amounting to 6,200,587 cases (187,000,000 cans) a year. A can-manufacturing plant (erected 1927) has a daily output of 1,500,000 cans. The large railroad shops employ over 3,000 men.

Among the other major industries are meat-packing plants, rice and flour mills, olive pickling plants, bean and rice cleaners and polishers, brick and pottery works, box factories and an almond shelling plant.

The aggregate factory output in 1937 was valued at \$36,378,029. Bank debits in 1940 totalled over \$1,773,518,000.

History.—On Aug. 12, 1839, Capt. John Augustus Sutter (1803-80), a Swiss army officer, with three companions, landed at the confluence of the American and the Sacramento rivers, coming by row-boat from the port of San Francisco, then known as Yerba Buena. With the help of a few Indians they built an adobe house, roofed with tules, fortified it and surrounded it with a protecting adobe wall. Sutter had obtained from Governor Alvarado a grant of eleven square leagues of land. Settlers came, whom he welcomed, and his hospitality and prosperity made "Fort Sutter" famous. Situated as it was on the main line of overland travel, it soon became the greatest trading post in the West. Capt. Sutter employed several hundred men, had 13,000 head of stock on his ranges, a vast acreage of wheat and a large mercantile business. In 1847 he sent James W. Marshall to find a good site for a new saw-mill. A spot was selected on the south fork of the American river, 35 m. N.E. of the fort at Coloma, and work had begun on the mill when, on Jan. 24, 1848, Marshall picked up in the mill-race the first gold nugget found in California. The discovery of gold on his own land by his own man was, ironically, the cause of Sutter's ruin, for his men deserted him, the newcomers pillaged his property, and he died in the East a poor man; but it

was the foundation of the city's development and of the rapid settlement of the whole State. The site of the present city was surveyed in 1848 and the name Sacramento (already in common use) was adopted. The first sale of town lots was held in Jan. 1849. The Federal census reported a population of 6,820 in 1850, and the city was incorporated in that year. For some time conditions were chaotic, as in most new mining towns. Trouble with "squatters" almost led to local war in 1850. In 1849 the city offered \$1,000,000 for the honour of being the State capital. The legislature met here in 1852, and in 1854 it was chosen as the permanent seat of government. Three times between 1849 and 1853, and again in 1862, the city suffered from devastating floods, and in 1852 two-thirds of it was destroyed by fire. Further danger from flood has been averted by strong levees and by filling in the low land along the river. By 1856 the Sacramento Valley railroad (the first steam railway in California, built to accommodate the business developed in the gold mines) was completed to Folsom, 23 m. N.E. of Sacramento. Its chief engineer, Theodore D. Judah, took plans for a feasible route across the mountains to the capitalists in San Francisco and was laughed at as a dreamer. In Sacramento, however, he found four merchants (Stanford, Hopkins, Crocker and Huntington) who pledged their personal fortunes to secure the undertaking of the enterprise, and on Feb. 22, 1863, in Sacramento, the construction of the Central Pacific railroad across the Sierras was begun. On May 10, 1869, at Promontory Point, Utah, Senator Stanford drove the golden spike that united the section of road built from the West (in the face of tremendous physical obstacles) with the section built from the East, and later in the month the first through train from the Atlantic Coast reached the city. Through the rest of the 19th century the growth of Sacramento was steady and gradual, and in 1900 the population was 29,282. Since then, accompanying the increasing productivity of its tributary territory (due largely to irrigation and completion of the great levee system) there has been a rapid commercial and industrial expansion. Between 1900 and 1920 the population considerably more than doubled.

Between 1930 and 1940 the population increased 13%; postal receipts 63%; bank debts 205%; and building permits 180%, with an aggregate value for the ten-year period of \$49,448,69j.85.

SACRARIUM, a term used in Classical Latin for the place where sacred things were kept in a temple or private house. In mediaeval ecclesiology the term is used in various senses, e.g., choir or chancel of a church (usually called sanctuary or presbytery), tabernacle, sacristy, etc.

SACRED HEART. Devotion to the Sacred Heart of Jesus is a cult peculiar to the modern Roman Catholic Church. The principal object of this devotion is the Saviour Himself. Saint Marguerite Marie Alacoque (q.v.), assisted by her director, the Venerable Claude de la Colombière, S.J. (1641-1682), spread the devotion. This devotion was strongly opposed by the Jansenists, who claimed that the Heart of Christ was being adored as separate from the rest of His Being. Some of those within the Church, misled by the Jansenists, also opposed the devotion. The Jansenist synod of Pistoia, assembled by Scipio de Ricci, bishop of Pistoia (1780-1791), which formulated this objection against the devotion, was condemned by Pope Pius VII in the Bull *Auctorem Fidei* Aug. 28, 1794. In May 1805, De Ricci submitted to the papal condemnation of the synod. In 1856 Pius IX introduced the feast into the general calendar of the Roman Catholic Church, fixing the Friday after the Octave of Corpus Christi for its celebration. The Beatification of Blessed M.M. Alacoque in 1864 gave a new impetus to the devotion.

III, col. 271-351.

SACRIFICE, the ritual destruction of an object, or, more commonly, the slaughter of a victim by effusion of blood, suffo-

cation, fire or other means (from Lat. *sacrificium*; sacer, holy and *facere*, to make). While the Hebrew for sacrifice, *קרבן*, makes the killing of the victim the central feature, the Latin word brings out sacralization (see TABU) as an essential element in many cases. The sacrifice of desacralization is also found; hence MM. Hubert and Mauss describe a sacrifice as "a religious act, which, by the consecration of a victim, modifies the moral state of the sacrificer or of certain material objects which he has in view," i.e., it either confers sanctity or removes it and its analogue, impurity. It is, in fact, "a procedure whereby communication is established between the sacred and profane spheres by a victim, that is to say by an object destroyed in the course of the ceremony."

Principles of Classification.—It is possible to classify sacrifices according to (a) the occasion of the rite, (b) the end to be achieved, (c) the material object to be effected or (d) the form of the rite. (a) The division into periodical and occasional is important in Hindu and other higher religions: the former class is obligatory, the latter facultative. In less developed creeds the difference tends to remain in the background; but where sacrifices are found, solemn annual rites, communal, purificatory or expiatory, are celebrated, and are obligatory. (b) The end to be achieved is, sometimes sacralization, sometimes desacralization. In the former case the sacrificer is raised to a higher level; he enters into closer communion with the gods. In the latter either some material object, not necessarily animate, is deprived of a portion of its sanctity and made fit for human use, or the sacrificer himself loses a portion of his sanctity or impurity. In the sacrifice of sacralization the sanctity passes from the victim to the object; in that of desacralization, from the object to the victim. (c) Sacrifices may be classified into (i.) subjective or personal, where the sacrificer himself gains or loses sanctity or impurity; (ii.) objective, where the current of *mana* (see TABU) is directed upon some other person or object, and only a secondary effect is produced on the sacrificer himself.

Ritual.—The necessary elements of a Hindu sacrifice are:

(1) the *sacrificer*, who provides the victim, and is affected, directly or indirectly, by the sacrifice; he may or may not be identical with (2) the *officiant*, who performs the rite; we have further (3) the place, (4) the *instruments* of sacrifice and (5) the victim; where the sacrificer enjoys only the secondary results, the direct influence of the sacrifice is directed towards (6) the object; finally, we may distinguish (7) three moments of the rite—(a) the entry, (b) the slaughter, (c) the exit.

Sacralization and desacralization, sometimes performed by means of subsidiary sacrifices, were the essential elements of the preparation for sacrifice and the subsequent lustration. In developed forms, such as the offering of soma, they assumed a great importance; (1) the sacrificer had to pass from the world of man into a world of the gods; consequently he was separated from the common herd of mankind and purified; he underwent ceremonies emblematic of rebirth and was then subject to numberless taboos imposed for the purpose of maintaining his ceremonial purity. In like manner (2) the officiant prepared himself for his task; but in his case the natural sanctity of the priest relieved him of the necessity of undergoing all that the common man had to pass through; in fact, this was one of the causes which brought him into existence, the other being the need of a functionary familiar with the ritual, who would avoid disastrous errors of procedure, destructive of the efficacy of the sacrifice. (3) Where there was an appointed place of sacrifice there was no need of preparation of a place of sacrifice. (4) The necessary rites included (a) the establishment of the fires, friction being the only permitted method of kindling it, (b) the tracing on the ground of the vedi, or magical circle, to destroy impurities, (c) the digging of the hole which constituted the real altar, (d) the preparation of the post which represented the sacrificer and to which the victim was tied, and other minor details. (5) The victim might be naturally sacred or might have to undergo sanctification. In the former case (a) individual animals might be distinguished by certain marks, or, (b) the whole species might be allied to the god. In the latter case the victim had to be with-

out blemish; (c) the age, colour or sex of the victim might differ according to the purpose of the sacrifice. It reached a degree of sanctity when only the priest might touch it. Finally, the priest made three turns round it with a lighted torch in his hand, which finally separated it from the world and fitted it for its high purpose. The sacrificer had to remain in contact with the victim, either personally, or, to avoid ritual perils, by the intermediary of the priest. After excuses made to the animal or to the species in general, the victim was placed in position, and silence observed by all who were present. The cord was drawn tight and the victim ceased to breathe; its spirit passed into the world of the gods. It remained to dispose of the corpse. After a rite intended to secure its perfect ceremonial purity, a part of the victim was removed, held over the fire and finally cast into it. The remainder, divided into portions, was cooked; a certain number of these portions fell to the sacrificer, after an invocation, which made them sacred by calling the deity to descend into the offering and thus sanctify the sacrificer. (6) Then followed the rites of desacralization. Finally the priest, the sacrificer, and his wife performed a lustration and the ceremonies were at an end.

With present knowledge the problem of the original form of sacrifice, if there be a single primary form, is insoluble. It is impossible to give a general survey of the purposes of sacrifice; they are too numerous, and it is rare to find any but mixed forms.

Cathartic Sacrifice.—In primitive cults the distinction between sacred and unclean is not well defined (see **TABU**); consequently we find two types of cathartic sacrifice—(i.) one to cleanse of impurity and make fit for common use, (ii.) the other to rid of sanctity and in like manner render suitable for human use or intercourse.

(i.) The best example of the first class is the scapegoat, where a more concrete idea of expulsion of evil (see **DEMONOLOGY**, **EXORCISM**) is present among primitive peoples, such as the Australians.

(ii.) As an example of the second class may be taken the sacrifice of the bull to Rudra, which exemplifies the concentration of holiness in a single animal as representative of its species (see **ANIMAL WORSHIP**).

Communal Sacrifice.—The common meal is not a primitive rite of adoption. The custom of eating the body of the victim does not necessarily spring from any idea of communion with the god; it may also arise from a desire to incorporate the sanctity which has been imparted to it—an idea on a level with many other food customs (see **COUVADE**), and based on the idea that eating anything causes its qualities to pass into the eater. Where the victim is an animal specially associated with a god (the most conspicuous case is perhaps that of the corn spirit), it may be granted that the god is eaten; but precisely in these cases there is no custom of giving a portion of the victim to the god.

Deificatory Sacrifice.—The object of certain sacrifices is to provide a tutelary deity of a house, town or frontier. (a) In many countries, those who die a violent death are held to haunt the place where they met their fate; consequently, when a town is built living men are interred beneath the ramparts and the pillars of the gates. (b) In parts of North America the nagual or manitu animal, of which the Indian dreams during the initiation fast and which is to be his tutelary spirit, is killed with certain rites. (c) Human representatives of the corn or vegetation spirits are killed; in these, as in other cases of the sacrifice of the man-god, the killing of the old god is at the same time the making of a new god. (d) Suicide is treated as a means of raising a human being to the rank of a god. (e) Gods may be sacrificed (in theriomorphic form) to themselves as a means of renewing the life of the god. (f) The method of creating a fetish (see **FETISHISM**) on the Congo resembles deificatory sacrifice; but here there is no actual slaughter of a human being; magical means are alone relied upon.

Honorific Sacrifices.—Sacrifices tend to be interpreted as gifts to the god. Man seeks to influence his fellow men in various ways, and it is quite natural to find the same ideas in the sphere of religion. Food is often given to a god because he is be-

lieved to take pleasure in eating; the germ of this idea may have been to nourish the divine life. With the spiritualization of the god, comes a refinement of the tastes attributed to him, and the finer parts of the sacrifice, finally it may be only its savour, are alone regarded as acceptable offerings. Just as attendants are provided for the dead, so the god receives sacrifices intended to put slaves at his disposal. The gift theory of sacrifice is closely associated with that of the god as the ruler or king to whom man brings a tribute, just as he had to appear before his earthly king bearing gifts in his hands. The honorific sacrifice is essentially a propitiation but must be distinguished from the *piaculum* (see (below)).

Mortuary Sacrifice.—Sacrifices, especially of human beings, are offered immediately after a death or at a longer interval. Their object may be (a) to provide a guide to the other world; (b) to provide the dead with servants or a retinue suitable to his rank; (c) to send messengers to keep the dead informed of the things of this world; (d) to strengthen the dead by the blood or life of a living being, in the same way that food is offered to them or blood rituals enjoined on mourners.

Piacular Sacrifice.—Whereas the god receives a gift in the honorific sacrifice, he demands a life in the piacular. The essential feature of the *piaculum* is that it is an expiation for wrong-doing, and the victim is often human.

Human Sacrifice.—If tradition is any guide, human sacrifice seems in many important areas to be of secondary character; in spite of the great development of the rite among the Aztecs, tradition says that it was unknown till zoo years before the conquest; in Polynesia human sacrifices seem to be comparatively modern; and in India they appear to have been rare among the Vedic peoples. On the whole, human sacrifice is far commoner among the semi-civilized and barbarous races than in still lower stages of culture. In Australia, however, where sacrifice of the ordinary type is unknown, the ritual killing of a child is practised in connection with the initiation of a magician.

Among the forms of human sacrifice must be reckoned religious suicide, mainly found in India but not unknown in Africa and other parts of the world.

Sacrifice in Greece and Rome.—Both on the mainland of Greece and in the Greek colonies human sacrifice was practised, usually as a means towards expulsion of evil. (See **GREEK RELIGION**.)

At Rome the scapegoat did not suffer death; but in the *Saturnalia* a human victim seems to have been slain till the 4th century A.D. Many forms of animal sacrifice were found. (See **ROMAN RELIGION**.)

Sacrifice in Egypt.—Of Egyptian ritual little is known. (See **EGYPT: Religion**.)

Sacrifice in India.—Among human sacrifices may be mentioned the suttee, or custom of immolating a widow on the funeral pyre of the husband, and the Khond sacrifice of the Meriah, who was either purchased or the son of a victim father. Some days before the sacrifice, the victim, who was often kept in captivity for long periods, was devoted and his sanctity was increased; finally he was put to death by strangulation or pressure. The remains were dismembered and distributed among the fields, excepting the portion offered to the earth goddess, which was buried.

Sacrifice in Africa.—Especially in West Africa, many forms of sacrifice are found. Three main forms of human sacrifice existed: (1) the scapegoat; (2) the messenger; and (3) the expiation; but combinations were not infrequent. On the Congo, if a man committed a murder, the community voted whether he should die or be expelled; if the latter, a victim was killed, of which all partook; this is not a *piaculum* for re-establishment of the tribal bond, for the criminal is driven out of the community.

Sacrifice in America.—The Pawnees had an elaborate ritual, in which a human victim was sacrificed to the Morning Star; the blood of the victims was sprinkled on the fields, and the details of the rite are not unlike those of the Khond custom. The Iroquois sacrifice of the white dog bore in later times the character of a scapegoat festival. In Mexico human sacrifices were very

common, the number being estimated at 20,000 a year.

THE IDEA OF SACRIFICE IN THE CHRISTIAN CHURCH

There can be no doubt that the idea of sacrifice occupied an important place in early Christianity. It had been a fundamental element of both Jewish and Gentile religions, and Christianity tended rather to absorb and modify such elements than to abolish them. To a great extent the idea had been modified already. Among the Jews the preaching of the prophets had been a constant protest against the grosser forms of sacrifice, and there are indications that when Christianity arose bloody sacrifices were already beginning to fall into disuse; a saying which was attributed by the Ebionites to Christ repeats this protest in a strong form, "I have come to abolish the sacrifices; and if ye do not cease from sacrificing the wrath of God will not cease from you" (Epiph. xxx. 16). Among the Greeks the philosophers had come to use both argument and ridicule against the idea that the offering of material things could be needed by or acceptable to the Maker of them all. Among both Jews and Greeks the earlier forms of the idea had been rationalized into the belief that the most appropriate offering to God is that of a pure and penitent heart, and that the vocal expression of contrition in prayer or of gratitude in praise is also acceptable.

The best instances of these ideas in the Old Testament are in Psalms i. and li., and in Greek literature the striking words which Porphyry quotes from an earlier writer, "We ought, then, having been united and made like to God, to offer our own conduct as a holy sacrifice to Him, the same being also a hymn and our salvation in passionless excellence of soul" (Euseb. *Dem. Ev.*, 3). The ideas are also found both in the New Testament and in early Christian literature: "Let us offer up a sacrifice of praise to God continually, that is, the fruit of lips which make confession to His name" (Heb. xiii. 15); "That prayers and thanksgivings, made by worthy persons, are the only perfect and acceptable sacrifices I also admit" (Just. Mart. *Trypho*, c. 117); "We honour God in prayer, and offer this as the best and holiest sacrifice with righteousness to the righteous Word" (Clem. *Alex. Strom.*, vii. 6).

But among the Jews two other forms of the idea expressed themselves in usages which have been perpetuated in Christianity, and one of which has had a singular importance for the Christian world. The one form, which probably arose from the conception of Yahweh as in an especial sense the protector of the poor, was that gifts to God may properly be bestowed on the needy, and that consequently alms have the virtue of a sacrifice. Biblical instances of this idea are—"He who doeth alms is offering a sacrifice of praise" (Ecclus. xxxii. 2); "To do good and to communicate forget not, for with such sacrifices God is well pleased" (Heb. xiii. 16); so the offerings sent by the Philippians to Paul when a prisoner at Rome are "an odour of a sweet smell, a sacrifice acceptable, well pleasing to God" (Phil. iv. 18). The other form, which was probably a relic of the conception of Yahweh as the author of natural fertility, was that part of the fruits of the earth should be offered to God in acknowledgment of His bounty, and that what was so offered was especially blessed and brought a blessing upon both those who offered it and those who afterwards partook of it. The persistence of this form of the idea of sacrifice constitutes so marked a feature of the history of Christianity as to require a detailed account of it.

Meals as Thank-offerings. — In the first instance it is probable that among Christians, as among Jews, every meal, and especially every social meal, was regarded as being in some sense a thank-offering. Thanksgiving, blessing and offering were co-ordinate terms. Hence the Talmudic rule, "A man shall not taste anything before blessing it" (Tosephta Berachotz, c. 4), and hence St.

Paul's words, "He that eateth, eateth unto the Lord, for he giveth God thanks" (Rom. xiv. 6; cf. 1 Tim. iv. 4). But the most important offering was the solemn oblation in the assembly on the Lord's day.

The points in relation to this offering which are clearly demonstrable from the Christian writers of the first two centuries, but which subsequent theories have tended to confuse, are these. (1) It was regarded as a true offering or sacrifice; for in the Teaching of the Twelve Apostles, in Justin Martyr and in Irenaeus it is designated by each of the terms which are used to designate sacrifices in the Old Testament. (2) It was primarily an offering of the fruits of the earth to the Creator; this is clear from both Justin Martyr and Irenaeus, the latter of whom not only explicitly states that such oblations are continued among Christians, but also meets the current objection to them by arguing that they are offered to God not as though He needed anything but to show the gratitude of the offerer (Iren. iv. 17, 18). (3) It was offered as a thanksgiving partly for creation and preservation and partly for redemption: the latter is the special purpose mentioned (*e.g.*) in the Teaching of the Twelve Apostles; the former is that upon which Irenaeus chiefly dwells; both are mentioned together in Justin Martyr (*Trypho*, c. 41). (4) Those who offered it were required to be not only baptized Christians but also "in love and charity one with another"; there is an indication of this latter requirement in the Sermon on the Mount (Matt. v. 23, 24, where the word translated "gift" is the usual *lxx.* word for a sacrificial offering, and is so used elsewhere in the same Gospel, viz. Matt. viii. 4, xxiii. 19), and still more explicitly in the *Teaching*, c. 14, "Let not any one who has a dispute with his fellow come together with you (*i.e.* on the Lord's day) until they have been reconciled, that your sacrifice be not defiled." This brotherly unity was symbolized by the kiss of peace. (5) It was offered in the assembly by the hands of the president; this is stated by Justin Martyr (*Apol.* i. 65, 67), and implied by Clement of Rome (*Ep.* i. 44, 4).

Sacred Meals.—Combined with this sacrifice of the fruits of the earth to the Creator in memory of creation and redemption, and probably always immediately following it, was the sacred meal at which part of the offerings was eaten. Such a sacred meal had always, or almost always, formed part of the rites of sacrifice. There was the idea that what had been solemnly offered to God was especially hallowed by Him, and that the partaking of it united the partakers in a special bond both to Him, and to one another. In the case of the bread and wine of the Christian sacrifice, it was believed that, after having been offered and blessed, they became to those who partook of them the body and blood of Christ. This "communion of the body and blood of Christ," which in early writings is clearly distinguished from the thank-offering which preceded it, and which furnished the materials for it, gradually came to supersede the thank-offering in importance, and to exercise a reflex influence upon it. In the time of Cyprian, though not before, we begin to find the idea that the body and blood of Christ were not merely partaken of by the worshippers but also offered in sacrifice, and that the Eucharist was not so much a thank-offering for creation and redemption as a repetition or a showing forth anew of the self-sacrifice of Christ.

This idea is repeated in Ambrose and Augustine, and has since been a dominant idea of both Eastern and Western Christendom. But, though dominant, it has not been universal, nor did it become dominant until several centuries after its first promulgation. The history of it has yet to be written. For, in spite of the important controversies to which it has given birth, no one has taken the pains to distinguish between (i.) the theories which have been from time to time put forth by eminent writers, and which, though they have in some cases ultimately won a general acceptance, have for a long period remained as merely individual opinions, and (ii.) the current beliefs of the great body of Christians which are expressed in recognized formularies. A catena of opinions may be produced in favour of almost any theory; but formularies express the collective or average belief of any given period, and changes in them are a sure indication that there has

been a general change in ideas.

It is clear from the evidence of the early Western liturgies that, for at least six centuries, the primitive conception of the nature of the Christian sacrifice remained. There is a clear distinction between the sacrifice and the communion which followed it, and that which is offered consists of the fruits of the earth and not of the body and blood of Christ. Other ideas no doubt attached themselves to the primitive conception, of which there is no certain evidence in primitive times, e.g. the idea of the propitiatory character of the offering, but these ideas rather confirm than disprove the persistence of those primitive conceptions themselves. All Eastern liturgies, in their present form, are of later date than the surviving fragments of the earlier Western liturgies, and cannot form the basis of so sure an induction; but they entirely confirm the conclusions to which the Western liturgies lead.

In the course of the 8th and 9th centuries, by the operation of causes which have not yet been fully investigated, the theory which is first found in Cyprian became the dominant belief of Western Christendom. The central point of the sacrificial idea was shifted from the offering of the fruits of the earth to the offering of the body and blood of Christ. The change is marked in the rituals by the duplication of the liturgical forms. The prayers of intercession and oblation, which in earlier times are found only in connection with the former offering, are repeated in the course of the same service in connection with the latter. The designations and epithets which are in earlier times applied to the fruits of the earth are applied to the body and blood. From that time until the Reformation the Christian sacrifice was all but universally regarded as the offering of the body and blood of Christ. The innumerable theories which were framed as to the precise nature of the offering and as to the precise change in the elements all implied that conception of it. It still remains as the accepted doctrine of the Church of Rome. For, although the council of Trent recognized fully the distinction which has been mentioned above between the Eucharist and the sacrifice of the mass, and treated of them in separate sessions (the former in Session xiii., the latter in Session xxii.), it continued the mediaeval theory of the nature of the latter.

The reaction against the mediaeval theory at the time of the Reformation took the form of a return to what had no doubt been an early belief,—the idea that the Christian sacrifice consists in the offering of a pure heart and of vocal thanksgiving. Luther at one period (in his treatise *De captivitate Babylonica*) maintained, though not on historical grounds, that the offering of the oblations of the people was the real origin of the conception of the sacrifice of the Mass; but he directed all the force of his vehement polemic against the idea that any other sacrifice could be efficacious besides the sacrifice of Christ. In the majority of Protestant communities the idea of a sacrifice has almost lapsed. That which among Catholics is most commonly regarded in its aspect as an offering and spoken of as the "mass" is usually regarded in its aspect as a participation in the symbols of Christ's death and spoken of as the "communion." But it may be inferred from the considerable progress of the Anglo-Catholic revival in most English-speaking countries that the idea of sacrifice has not yet ceased to be an important element in the general conception of religion.

See J. H. Srawley and H. Watt, art. "Eucharist" in Hastings, *Encyclopaedia of Religion and Ethics*, vol. v.; R. A. S. Macalister, art. "Sacrifice (Semitic)," *ibid.*, vol. ix., p. 31; M. Gaster, art. "Sacrifice, Jewish," *ibid.* p. 24; G. F. Moore, art. "Sacrifice" in the *Encyclopaedia Biblica*; W. R. Smith, *Religion of the Semites (1889; reprint of 2nd ed., 1907)*; J. G. Frazer, *The Golden Bough*, pt. vi., "The Scapegoat," and *Folklore in the Old Testament*.

SACRILEGE, the violation or profanation of sacred things. The word comes from the Lat. *sacrilegium*, which originally meant merely the theft of sacred things, although already in Cicero's time it had grown to include in popular speech any insult or injury to them.

In primitive religions inclusive of almost every serious offence even in fields now regarded as merely social or political, its scope is gradually lessened to a single part of one section of ecclesiastical

criminology, following inversely the development of the idea of holiness from the concrete to the abstract, from fetishism to mysticism. The primitive defence against sacrilege lay directly in the nature of sacred things, those that held a curse for any violation or profanation (*see* TABU). Early criminal law brought a measure of physical sanction into consideration. The Levitical code exacted of the offender reparation for the damage with the addition of one-fifth of the amount, and an expiatory sacrifice (Lev. v. 15, 16). The tragic story of the stoning of Achan, who stole some of the spoils of Jericho which Joshua had consecrated to the treasury of Yahweh, is one of the most graphic details of Old Testament history (*cf.* Joshua vii. 20-25).

No religion was more prodigal in rules to safeguard that which was holy or consecrated than the Jewish, especially in its temple laws; violation of them often led to mob violence as well as divine chastisement. The temple rules do not apply to synagogues, however, and unseemly conduct in them is liable only to civil action.

While the Roman cults were amply protected by tabus, there was no comprehensive term in Roman law for religious violations and profanations in general. *Sacrilegium* was narrowly construed as the theft of sacred things from a sacred place. According to Ulpian the punishment for *sacrilegium* varied according to the position and standing of the culprit and the circumstances under which the crime was committed. For the lower classes it was crucifixion, burning or the wild beasts. The latter penalty was also attached to theft of sacred things by night, but stealing by day from a temple objects of little value brought only sentence to the mines. People of higher rank were deported. During classical times the law kept to the narrow meaning of *sacrilegium*, but in popular usage it had grown to mean about the same as the English word. Traces of this usage are frequent in Augustan writers. The early church Fathers use the word most frequently in the restricted sense, although an effort has been made to read the wider meaning in Tertullian. But by the middle of the 4th century the narrower meaning had disappeared. In Ambrose, Augustine and Leo I., *sacrilegium* means sacrilege. The wider meaning had invaded the law as well. Mommsen was of the opinion that *sacrilegium* had no settled meaning in the laws of the 4th century. But it was rather that an enlarged application of the idea of sacredness made the crime of sacrilege in the sense of *violatio sacri* a more general one. This was partly due to the influence of Christianity, which sought to include as objects of sacrilege all forms of church property, rather than merely those things consecrated in pagan cults, partly to the efforts of the later emperors to surround themselves and everything emanating from them with highest sanctions. In the Theodosian Code the various crimes which are accounted sacrilege include—apostasy, heresy, schism, Judaism, paganism, attempts against the immunity of churches and clergy or privileges of church courts, the desecration of sacraments, etc., and even Sunday. Along with these crimes against religion went treason to the emperor, offences against the laws, especially counterfeiting, defraudation in taxes, seizure of confiscated property, evil conduct of imperial officers, etc. There is no formal definition of sacrilege in the code of Justinian but the conception remains as wide.

The penitentials (*q.v.*), or early collections of disciplinary canons, gave much attention to sacrilege. The Frankish synods emphasize the crime of seizing church property of every kind, including the vast estates so envied by the lay nobility. The worst sacrilege of all, defiling the Host, is mentioned frequently and generally brought the death penalty accompanied by the cruellest and most ignominious tortures. The period of the Reformation naturally increased the commonness of the crime. Under the emperor Charles V. the penalty for stealing the Host was the stake; that for other crimes was graded accordingly. In France, in 1561, under Charles IX., it was forbidden under penalty of death to demolish crosses and images and to commit other acts of scandal and impious sedition. In the declaration of 1682, Louis XIV. decreed the same penalty for sacrilege joined to superstition and impiety, and in the somewhat belated religious persecution of the duke of Bourbon in 1724 those convicted of larceny in churches, together with their accomplices, were condemned, the men to the galleys for life or for a term of years, the

women to be branded with the letter V and imprisoned for life, or for a term. The trial of La Barre in 1766 at Abbeville is the most famous sacrilege case in modern times. Convicted of wearing his hat while a religious procession was passing—as well as of blasphemy—he was accused as well of having mutilated a crucifix standing on the town bridge. Declared guilty, after torture, he was sentenced to have his tongue cut out, to be beheaded and the body to be burned, a sentence which was confirmed by the parlement of Paris and the bigoted king Louis XV. In the midst of the French Revolution respect for *civic* festivals was sternly enacted, but sacrilege was an almost daily matter of state policy. In 1821 the reactionary parlement once more brought back the middle ages, by decreeing the death penalty for public profanation, the execution to be preceded by the *amende honorable* before the church doors. "Theft sacrilege" was treated in a separate series of equally savage clauses. This ferocious legislation was expressly and summarily abrogated in 1830.

English Law.—In English law, sacrilege is the breaking into a place of worship and stealing therefrom. At common law benefit of clergy was denied to robbers of churches. A statute of 1553 made the breaking or defacing of an altar, crucifix or cross in any church, chapel or churchyard punishable with three months' imprisonment on conviction before two justices, the imprisonment to be continued unless the offender entered into surety for good behaviour at quarter sessions. The tendency of the later law has been to put the offence of sacrilege in the same position as if the offence had not been committed in a sacred building. Thus breaking into a place of worship at night, says Coke, is burglary, for the church is the mansion house of Almighty God, The Larceny Act of 1861 punishes the breaking into, or out of, a place of divine worship in the same way as burglary, and the theft of things sacred in the same way as larceny. Now by the Malicious Damage Act 1861 the unlawful and malicious destroying or damaging any picture, statue, monument or other memorial of the dead, painted glass or other monument or work of art, in any church, chapel, meeting-place or other place of divine worship, is a misdemeanour punishable by imprisonment.

SACRISTY, in ecclesiastical architecture, the room or hall in a church wherein are kept the vestments and utensils (*sacra*) used in the services and celebrations.

SADDLE, a seat, usually of leather, fixed by girths to the back of a horse for riding; also a padded cushion for the back of a draught horse, fastened by girths and crupper; to it are attached the supports for the shafts, and rings for the reins. (*See SADDLERY*.) The word is also applied to many objects resembling a saddle in shape or function, such as a block to support a spar in a ship, or in machinery to support a rod.

In architecture, a saddle is a piece of wood, metal, marble, etc., at the bottom of a door opening. It is usually raised slightly above the floor on either side, and is used not only to cover the space or joint between the flooring of two adjacent rooms or spaces, but also to raise the bottom of the door sufficiently to clear carpets, rugs, etc. The word saddle is usually restricted to such a member in interior doorways; sill (*q.v.*) is used similarly in the case of exterior doorways. The term is also applied to a saddle-shaped stone used as a coping.

Saddle bars are small, horizontal bars of iron or bronze running across a stained glass window, and fastened to the stone or frame on each side, not only bracing the window structure, but forming a rigid basis to which the leading of the stained glass can be attached.

SADDLERY AND HARNESS. These two terms embrace the equipment for the horse when used for riding or driving. "Harness" was originally a general term for equipment, *e.g.*, the body armour of a soldier. It is now usually confined to the work and driving horse's equipment, "saddle and bridle" being applied to that of the riding horse.

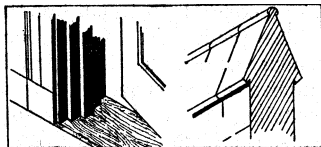

Saddlery is principally a leather trade, and the craft has been

established in England as a separate trade since the 13th century, when the London Saddlers' Company received its charter from Edward I. There is evidence also of its early prosperity at Birmingham; the principal seat of the British harness and saddlery trade is now at Walsall. Saddlers' ironmongery embraces the making of buckles, rings, chains, stirrups, spurs, bits, hames.

The "bridle" is the combination of straps, bits, rings, chains and buckles which fits on the horse's head. The headstall consists of the headpiece passing behind the ears and joining the head-band over the forehead; the cheek-straps run down the sides of the head to the bit to which they are fastened; in the "blind" type of driving bridle the "blinkers," rectangular or round leather flaps which prevent the horse from seeing anything except what lies in front, are attached to the cheek-straps; the nose-band passes round the front of the nose just above the nostrils; and the throat-latch extends from the top of the cheek-straps underneath the head. The "martingale," an attachment sometimes used on riding horses, passes between the horse's forelegs, with one end fastened to the saddle girth and the other to the bridle. It prevents the horse throwing up his head uncontrollably. The bit is the metal contrivance inserted in the mouth to which the reins are attached. There are innumerable patterns of bits, but they may be roughly divided into the straight bar, "snaffle" and "curb." The "snaffle" for the riding horse generally has a smooth, jointed steel mouthpiece, with straight cheek-bars, the rings for the reins and cheek-pieces of the headstall being fixed in the bars at the junction with the mouthpiece. A severer snaffle has the mouthpiece twisted and fluted. The bars prevent the horse pulling the bit through the mouth. The snaffle without bars is generally termed a "bridoon." The commonest form of bit used in driving is the double-ring snaffle, in which the rings work one within the other, the headstall straps fastening to one and the reins to the other, or, if the horse is driven on the double ring, the reins are buckled to both rings. The curb-bit (Fr. *courbe*, Lat. *curvus*, bent, crooked) is one to which a curb-chain or strap is generally attached, fastened to hooks on the upper ends of the cheek-bars of the bit and passing under the horse's lower jaw in the chin groove. The reins are attached to rings at the lower ends of the cheek-bars, the leverage thus pressing the curb-chain against the jaw. The mouthpiece of the curb-bit is unjointed and commonly has in the centre a "port," *i.e.* a raised curve allowing liberty for the tongue and bringing the pressure on the base of the horse's jaw. The curb-bit and the bridoon can be used together with separate headstalls and reins, and there are many combination bits.

Saddles.—The riding saddle is composed of the "tree," the framework, the parts of which are the pommel or head, the projection which fits over the withers, and the side bars which curve round into the cantle or hind-bow. The tree in the best saddles is made of beechwood split with the grain; thin canvas is glued over the wood to prevent splitting, and iron or steel plates then riveted on the head and on the cantle. Linen webs are fastened lengthwise and across, over which is nailed canvas and serge between which the padding is stuffed. To the tree are fastened the stirrup-bars. The leather covering of the tree should be of pig-skin; cheap saddles are made of sheep-skin stamped to imitate pig-skin. The various parts of the man's saddle are the seat, the skirt, *i.e.*, the fold or pad of leather on either side of the head, and the hanging flaps; knee-rolls are not used as much as they were, except where roughly broken-in horses are ridden. The saddle is cut straight over the withers with a square-ended cantle, as in the hunting saddle, or cut back over the withers with a round-ended cantle, as in the polo saddle. The saddles in use on the continent of Europe still retain the high pommel and cantle and heavy knee-rolls discarded by riders trained in the British school and the hunting-field. The saddles of the East and of the Arabs keep their primitive shape, and they are really seats *in* which rather than *on* which the rider sits. The Mexican saddle, with its silver adornments and embossed leather, is a characteristic type. It has a very high padded pommel and a round-headed projecting cantle.

Harness.—Space forbids the discussion of the varieties of harness for the pair-horse carriage, the four-horse coach, the farm wagon, etc., or the different kinds of ornamentation that are or

SADDLE IN ARCHITECTURE: (LEFT) IN DOOR OPENING. (RIGHT) STONE COPING

have been lavished upon it. The leather collar, heavily padded, passes over the head and rests firmly on the shoulders; the hames, linked pieces of metal, fit tightly round it and are fastened at the top and bottom by the hame-straps; they bear the traces, or straps which pass along the horse's sides and the shafts, and are attached to the whiffletree. Where the collar is dispensed with, the traces are attached to a breast-strap against which the horse works. This breast harness is much used for the lightly harnessed American trotting horses, and for military draught horses. The saddle pad is a narrow leather cushion resting on the back and girthed under the belly and held in position by the back-band and crupper, a loop strap passing under the tail. The saddle supports the shafts by straps fitted with shaft loop-holes. The reins pass from the bit through "terrets" or rings on the hames and pad. The harness on the horse's hind-quarters consists of the breeching, passing round behind the horse and helping in backing and stopping the vehicle and the hip-strap fastened to the breeching and passing over the hind-quarters. The bearing rein, or check-rein as it is often called, when used as a support to the head, or as a so-called aid to improvement of the paces, consists of a separate bridoon-bit with the reins passing through rings on the throat-band and thence slipped over a hook on the pad.

Historical Sketch. — Questions as to the epoch in the history of mankind when the horse was first trained for draught and riding are for archeologists and anthropologists to discuss (HORSE: History). With the domestication of the horse came the development of the bit; first a halter of hide bound the muzzle, then a thong slipped into the mouth, finally replaced by wood or bone. Stone age objects have been found in lake-dwellings, such as that at Robenhausen, near Zürich, which may have been bits; one is slightly curved, with two knobs grooved at either end for the reins. Bits from the bronze age and the iron age can be seen in most museums showing that the forms have changed little. In the late iron age burial of a Gaulish chief with his chariot at Somme-Bionne were two horses' bits of the jointed snaffle type.

In ancient Greece and Rome the bit and bridle were used during historic times, and allusions to riding without them refer to exhibitions of horsemanship. On Trajan's column the Numidians ride without bridles or bits, and various North African tribes trained their horses to obey their voice alone (cf. Claudian, *Epig.* i. 10, of the Gaulish *essedarii*, driving without bridle and reins). The *locus classicus* for the bridling and saddling of the Greek horse is Xenophon, *Περὶ ἵππικῆς*. The Greek name for the bridle bit and reins collectively is *χαλινός* (Lat. *frenum*), the bit proper *στόλισμιον*; in Lat. *frenum* is also used of the bit itself. The headstall (*κορυφαία*) and cheek-straps (*παρήϊα*) were richly decorated. In Homer (*Il.* iv. 142) the latter are ornamented with ivory plates stained with purple, and such have been found on the site of Troy (Schliemann, *Ilios*, 476, 631). The head-band also bore a crest (*λοφός*, *crista*), and in front the *ἄμπυξ* (*frontale*) might be extended down the face to serve as a defence, as in the mediaeval *chaufrein*. This frontal was a special subject of decoration. Of the two principal types of ancient bits, the unjointed and the jointed mouthpiece, the latter is the most common form. There are also other forms of bits; those with sharp points were called *lupata* (Virg. *Georg.* iii. 208). There is a Greek bit in the British Museum with revolving disks, a device which occurs in mediaeval bits, to give the horse something to keep turning in his mouth. The curb was also used; Xenophon distinguishes between the snaffle (*λείος χαλινός*) and the curb. The curb-strap or chain was termed *ὑποχαλινιδία* or *ψάλιον*, which, however, may mean a muzzle. A bronze bit found at Pompeii has a twisted and jointed metal mouthpiece and a plain curved bar acting as a curb-strap. The cheek-bars of the bit take a variety of forms: straight bars, circles with rays, square or oblong plaques, triangles and the swan-necked or S-shaped type are all found. In medieval times complicated and severe bits were used, and heavy bits with cruel mouthpieces and long elaborately curved cheek-bars are still used by Arabs and the riders of Central and South America.

The saddle was not used in Egypt; the Assyrian monuments show decorated saddle-cloths rather than the saddle. The harness of the chariots of Egypt and Assyria are also illustrated on the

monuments (see especially Sir J. G. Wilkinson, *Manners and Customs of the Ancient Egyptians* revised ed. 1878). The ancient Greeks rode bare-backed as in the Panathenaic frieze of the Parthenon or used a saddle-cloth (*ἐφίππιον*, Lat. *ephippium*; *sella* as applied to a saddle is quite late). Even the saddle-cloth does not appear to have been in use till the 5th century. A 6th-century vase, found at Daphnae, Lower Egypt (Flinders-Petrie and Murray, *Tanis*, 1888, ii. Pl. xxix.), shows a woman riding astride on a cloth, with fully developed headstall and powerful bit. A black-figured sarcophagus, now in the British Museum, from Clazomenae, shows a long pointed *ephippium* with a chest-strap. These indicate Asiatic influence, for Daphnae was an Ionian and Carian settlement of the 7th century B.C. In Xenophon (*l.c.*) we find that the saddle-cloth had been adopted by the Athenian cavalry, and from his advice as to the seat to be adopted pads or rolls seem to have been added. There were no stirrups (till the time of the emperor Maurice, A.D. 602), and the rider mounted at a vault or by blocks; mounting by the spear used as a vaulting pole was also practised as an athletic feat. On a funeral monument of the time of Nero in the museum at Mainz is the figure of a horseman on a saddle-cloth with something resembling the pommel and cantle of a saddle, but the first saddle proper is found in the so-called column of Theodosius at Constantinople (usually ascribed to the end of the 4th century A.D., though it may be more than 100 years earlier), where two figures are riding on high-peaked saddles resting on embroidered saddle-cloths. In mediaeval times the saddle was much like that of the Oriental saddle of to-day with high peaks before and behind. In the military saddle of the 14th and 15th century the high front parts of the saddle were armoured and extended to protect the legs of the rider. The jousting saddle (cf. the example in the Tower of London) becomes almost a box into which the rider is fixed; the high cantle fits round the rider's loins and when charging he lifted himself into practically a standing position in the stirrups. The saddle for use on the road or hunting was much like the Arab saddle of to-day, and similar forms are in use in Europe and elsewhere where the British saddle has not been adopted. Women rode astride or on a pillion behind a male rider. The side-saddle is said to date from the end of the 12th century. For the harness of the ancient draught horse see CHARIOT.

SADDUCEES, the name of a party which was opposed to the Pharisees down to the destruction of Jerusalem in A.D. 70. The Sadducees have been represented, not so much an organized party, as the lax and worldly-minded aristocrats, who were primarily interested in maintaining their own privileged position; who favoured Greco-Roman culture. Their attitude towards religious questions was purely negative; indeed, they were not a religious party at all. This view, championed by G. Hölscher, is not supported by the early sources. Both in Josephus and the N.T. Sadduceeism is represented as associated with certain definite religious positions; they represented the conservative tendency in matters of religion.

The most probable explanation of the name Sadducees is that proposed by A. Geiger, viz., that it is equivalent to "Zadokites," i.e., "the adherents of the Sons of Zadok." The latter were a priestly family who claimed descent from Zadok, who was head of the priesthood in the days of Solomon (cf. 1 Kings i. 34; and ii. 35); Ezekiel (xliv. 10-15) selected this family as worthy of being invested with the control of the Temple; and in fact members of this family formed the Temple hierarchy down to the time of Ben Sira (cf. *Sirach*. li. 12, Hebrew text). Later this priestly line became tainted with Hellenism, and ultimately the high priesthood was usurped by others. After the disappearance of the legitimate high priest of the house of Zadok the title "Zadokites" may well have been assumed by conservative elements in the priesthood, to preserve the earlier traditions of their order.

Unfortunately, we possess no statement from the Sadducean side of their beliefs and principles, unless the "Zadokite" work

discovered by Schechter represents, as is possible, the views of a section of the party. There are many controversial references in the Rabbinical literature to the Sadducees on points connected with the interpretation of the law. The main principle that divided the two parties was concerned with the written Torah (the Pentateuch). The supremacy of the law was common ground to both parties, but whereas the Pharisees assigned to the oral tradition a place of authority side by side with the written law, and determining its interpretation, the Sadducees refused to accept any ordinance as binding, unless it was based directly on the written word. The rest of Scripture (the Prophets and the Hagiographa) they regarded as mere Kabbalah "tradition." The Pharisaic device of harmonizing apparent contradictions between the Law and the Prophets by exegetical expedients was not accepted by the Sadducees, who refused to sanction doctrines and practices which could not be based on the written law. Thus the doctrine of a Davidic Messiah was rejected because it was considered that the prophetic teaching on this subject was in conflict with the *Torah*.

R. Leszynsky suggests that the Sadducees, or a section of them, accepted the hope of a priestly Messiah (cf. Ex. xix. 6), from which passage it might be inferred that a priestly line was destined to possess the Kingdom. There was also the example of the Priest King Melchizedek, which might easily suggest "Zadok King," or "Sadducean King." According to Acts xxiii. 8, the Sadducees denied the existence of angels and spirits, as well as the doctrine of the resurrection. This probably means that they did not accept the fully developed angelology of later times, while in the latter case the point of controversy was not whether the resurrection was true, but whether it could be proved from the Pentateuch. Another interesting point of difference is concerned with the date of Pentecost. The Sadducean hierarchy had its stronghold in the Temple, and it was only during the last 10 or 20 years of the Temple's existence that the Pharisees finally got control. With the destruction of the Temple in A.D. 70 their power as an organized party disappeared.

See R. Leszynsky, *Die Sadduzäer*, (1912); Art. "Sadducees," *E.R.E.* where further literature is cited. Cf. also Burkitt "Jesus and the 'Pharisees'" in *J. Th. S.* xxviii., 392-397. (G. H. B.)

SADE, DONATIEN ALPHONSE FRANÇOIS, COUNT [usually called the MARQUIS DE SADE] (1740-1814), French writer, was born in Paris on June 2, 1740. He entered the light horse at fourteen and saw considerable military service before returning to Paris in 1766. Here his vicious practices became notorious, and in 1772 he was condemned to death at Aix for an unnatural offence, and for poisoning. He fled to Italy, but in 1777 he was arrested in Paris, removed to Aix for trial, and there found guilty. In 1778 he escaped from prison, but was soon re-arrested and finally committed to the Bastille. Here he began to write plays and obscene novels. In 1789 he was removed to the Charenton Lunatic Asylum, but was discharged in 1790, only to be recommitted as incurable in 1803. He died there on Dec. 2, 1814. Among his works, all of the type indicated, were *Justine* (1791), *Juliette* (1792), *Philosophie dans le boudoir* (1793) and *Les Crimes de l'Amour* (1800). The word Sadism is derived from his name.

See C. R. Dawes, *The Marquis de Sade: his Life and Works* (1927).

SÁ DE MIRANDA, FRANCISCO DE (1485?-1558), Portuguese poet, was the son of a canon of Coimbra belonging to the ancient and noble family of Sá. He probably made his first studies of Greek, Latin and philosophy in one of the colleges of the Old City, and in 1505 went to Lisbon university. He seems to have resided for the most part in the capital down to 1521, dividing his time between the palace and the university, in the latter of which he had taken the degree of doctor of law by 1516.

In the middle of July 1520 he set out across Spain for Italy, and spent the years 1521 to 1525 abroad, visiting Milan, Venice, Florence, Rome, Naples and Sicily "with leisure and curiosity." He enjoyed intimacy with Giovanni Rucellai, Lattanzio Tolomei and Sannazaro; he saluted the illustrious Vittoria Colonna, a distant connection of his family, and in her house he probably talked with Bembo and Ariosto, and perhaps met Machiavelli and Guicciardini. He brought home with him (ca. 1525) the

sonnet and canzone of Petrarch, the tercet of Dante, the *ottava rima* of Ariosto, the eclogue in the manner of Sannazaro and Italian hendecasyllabic verse. He did not, however, abandon the short national metre, but carried it to perfection in his *Cartas*.

His *Os Estrangeiros*, produced in 1527-28, was the first Portuguese prose comedy, as his *Cleopatra* (c. 1550) is recognised to be the first Portuguese classical tragedy. In 1528 Miranda made his first real attempt to introduce the new forms of verse by writing in Spanish a canzone entitled *Fabula do Mondego*, and in 1530-32 he followed it up with the eclogue *Aleixo*.

The year 1532 had marked his passage from the active to the contemplative life, and the eclogue *Basto*, in the form of a pastoral dialogue written in *redondilhas*, opened his new manner. It has a pronounced personal note, and its episodes are described in a genuinely popular tone. The same epoch saw the composition of his *Cartas* or sententious letters in *quintilhas* which, with *Basto* and his satires, make up the most original, if not the most valuable, portion of his legacy. A more lyrical vein is apparent in the *quintilhas* of *A. Egipcíaca Santa Maria*.

In 1538 he wrote his second classical prose comedy *Os Vilhalpandos*, which was played before the Cardinal Infant Henry. He died on March 15, 1558.

Sá de Miranda led the way in a revolution in literature, and especially in poetry, which under his influence became higher in aim, purer in tone and broader in sympathy. He introduced the Renaissance into Portugal and at the same time made an austere stand against materialism. Some of his sonnets are admirable, and display a grave tenderness of feeling, a refinement of thought and a simplicity of expression which give them a high value. He wrote much and successfully in Castilian, several of his best eclogues being in that language.

Sá de Miranda's works were first published in 1595, but the admirable critical edition of Madame Michaelis de Vasconcellos (Halle, 1885) containing life, notes and glossary, supersedes all others. His plays can best be read in the 1784 edition of the collected works, *A. Egipcíaca Santa Maria* was edited by T. Braga (Oporto, 1913). See Sousa Viterbo, *Estudos sobre Sá de Miranda* (3 parts, Coimbra, 1895-96); Decio Carneiro, *Sá de Miranda e a sua obra* (Lisbon, 1895); Theophilo Braga, *Sá de Miranda* (Oporto, 1896); C. Michaelis de Vasconcellos, *Novos estudos sobre Sá de Miranda* in vol. v. (1912) of the *Boletim da Segunda Classe* of the Lisbon Academy of Sciences.

SADHU, a Sanskrit word meaning "straight," so "pure," a saint-like ascetic or devotee, who may belong to any order, such as the Sanyāsis, Bairāgis or Gosains.

SA'DĪ (c. 1184-1291), MUŠLIḤ-UDDĪN, or more correctly MUSHARRIF-UDDĪN B. MUŠLIḤ-UDDĪN, the greatest didactic poet and the most popular writer of Persia, was born about 1184 (A.H. 580) in Shiraz. His early youth was spent in study at the Nizāmiyya in Baghdiid and he returned to Isfahan just at the time of the inroads of the Mongols, when the atībeg Sa'd (in whose honour Sa'di took his pen-name) had been deposed by the victorious Khwarizm ruler of Ghiyāss-uddīn (1226). Distressed by the misfortune of his patron and disgusted with the miserable condition of Persia, Sa'di quitted Shirāz and entered upon the second period of his life—that of his wanderings (1226-1256). He proceeded via Balkh, Ghazni and the Punjab to Gujārat, on the western coast of which he visited the famous shrine of Siva in Somnath. After a prolonged stay in Delhi, where he learnt Hindūstānī, he sailed for Yemen. Overcome with grief at the loss of a beloved child (when he had married is not known), he undertook an expedition into Abyssinia and a pilgrimage to Mecca and Medina. Thence he directed his steps towards Syria and lived as a renowned sheikh for a considerable time in Damascus, which he had once already visited. There and in Baalbek he added to his literary renown that of a first-rate pulpit orator. Weary of Damascus, he withdrew into the desert near Jerusalem and led a solitary wandering life, till one day he was taken captive by a troop of Frankish soldiers, brought to Tripoli, and condemned to forced labour in the trenches of the fortress. After enduring countless hardships, he was eventually rescued by a rich friend in Aleppo, who paid his ransom, and gave him his daughter in marriage. But Sa'di, unable to live with his quarrelsome wife, set out on fresh travels, first to North Africa and then

through the length and breadth of Asia Minor and the adjoining countries. Not until he had passed his seventieth year did he return to Shiraz (about 1256; A.H. 653). Finding the place of his birth tranquil and prosperous under the wise rule of Abībākr b. Sa'd, the son of his old patron (1226-1260; A.H. 623-658), the aged poet took up his permanent abode, interrupted only by repeated pilgrimages to Mecca, and devoted the remainder of his life to Šūfīc contemplation and poetical composition. He died at Shiraz in 1292 (A.H. 691) according to Ḥamdallāh Mustaufī (who wrote only forty years later), or in December 1291 (A.H. 690), at the age of 110 lunar years.

His *Būstān* or "Fruit garden" (1257) and *Gulistān* or "Rose-garden" (1258), both dedicated to the reigning atābeg Abū Bekr, acquired great popularity in both the East and the West, owing to their easy, varied style and their happy *bons mots*. But Sa'dī's *Dīwān*, or collection of lyrical poetry, far surpasses the *Būstān* and *Gulistān*, at any rate in quantity, and perhaps in quality. Minor works are the Arabic *qašīdas*, the first of which laments the destruction of the Arabian caliphate by the Mongols in 1258 (A.H. 656); the Persian *qašīdas*, partly panegyric, partly didactic; the *marāthī*, or eiegies, beginning with one on the death of Abū Bekr and ending with one on the defeat and demise of the last caliph, Mosta'sim; the *mulammā'āt*, or poems with alternate Persian and Arabic verses of a rather artificial character; the *tarjī'āt*, or refrain-poems; the *ghazals*, or odes; the *šāhibīyyah* and *muḳattā'āt*, or moral aphorisms and epigrams; the *rubā'īyyāt*, or quatrains; and the *mufradāt*, or distichs. Sa'dī's lyrical poems possess neither the easy grace and melodious charm of Ḥāfīz's songs nor the overpowering grandeur of Jelālud-dīn Rūmī's divine hymns, but they are nevertheless full of deep pathos and show a fearless love of truth.

The first who collected and arranged his works was 'Alī b. Ahmad b. Bīsūtīn (1326-1334; A.H. 726-734). The most exact information about Sa'dī's life and works is found in the introduction to Dr. W. Bacher's *Sa'dī's Aḥorismen und Sinngedichte (Šāhibīyyah)* (Strassburg, 1879); a complete metrical translation of the epigrammatic poems, and in the same author's "Sa'dī Studien," in *Zeitschrift der morgenländischen Gesellschaft*, xxx. pp. 81-106; see also H. Ethé in W. Geiger's *Grundriss der iranischen Philologie*, ii. pp. 292-296, with full bibliography; and E. G. Browne, *Literary History of Persia*, pp. 525-539. Sa'dī's *Kullīyyāt* or complete works have been edited by Harrington (Calcutta, 1791-1795) with an English translation of some of the prose treatises and of Daulat Shah's notice on the poet, of which a German version is found in Graf's *Rosengarten* (Leipzig, 1846 p. 229 sq.); for the numerous lithographed editions, see Rieu's *Pers. Cat. of the Brit. Mus.* ii. p. 596. The *Būstān* has been printed in Calcutta (1810 and 1828), as well as in Lahore, Cawnpore, Tabriz, etc., a critical edition with Persian commentary was published by K. H. Graf at Vienna in 1850 (German metrical translations by the same, Jena 1850, and by Schlechta-Wssehrd, Vienna, 1852); English prose translations by H. W. Clarke (1879); and Ziauddin Gulam Moheiddin (Bombay, 1889); verse by G. S. Davie (1882); French translation by Barbier de Meynard (1880). The best editions of the *Gulistān* are by A. Sprenger (Calcutta, 1851) and by Platts (London, 1874); the best translations into English by Eastwick (1852) and by Platts (1873), the first four bibs in prose and verse by Sir Edwin Arnold (1899); into French by Defrémery (1858); into German by Graf (1846); see also S. Robinson's *Persian Poetry for English Readers* (1883), pp. 245-366.

SADIYA, the extreme north-east frontier station of British India, headquarters of the Sadiya Frontier Tract of Assam. Pop. (1931), 4,370. It stands high on a grassy plain, nearly surrounded by forest-clad mountains, on the right bank of what is locally (but erroneously) considered the main stream of the Brahmaputra. A railway on the opposite bank connects with the Assam-Bengal line. There is a bazaar, to which the hillmen beyond the frontier—Mishmis, Abors and Khamtis—bring down rubber, wax, ivory and musk, to barter for cotton-cloth and salt.

The Sadiya Frontier Tract covers an (estimated) area of 10,000 sq.m. extending to Tibet on the north and east and to Burma on the south and south-east, but only 4,200 sq.m. are under regular administration.

SADLER, MICHAEL THOMAS (1780-1835), English social reformer and economist was born at Snelston, Derbyshire, on Jan. 3, 1780. Entering business in Leeds in 1800, he took an active part in politics, devoting himself particularly to the administration of the poor law. In 1829 he was elected M.P. for

Newark and thenceforward, until he was deprived of his seat, he was the leader of factory reform in parliament. He was also chairman of the committee on this subject. His interest in agriculture is shown by his introduction of a bill in 1831 for the rebuilding of cottages, and the provision of allotments for the labourer. In 1832 he unsuccessfully contested Leeds, and after being rejected by Huddersfield in 1834, he settled in Belfast, where he died on July 29, 1835.

See R. B. Seeley, *Memoirs of M. T. Sadler* (1842).

SADLER (OR **SADLEIR**), **SIR RALPH** (1507-1587), English statesman, the son of Henry Sadler, steward of the manor of Cilney, near Great Hadham, Hertfordshire, was born at Hackney, Middlesex, in 1507. While a child he was placed in the family of Thomas Cromwell, afterwards earl of Essex, whose secretary he eventually became. Sadler held many positions under Henry VIII., but he is best known for his employment under Elizabeth in connection with the affair of Mary, Queen of Scots. Elizabeth sent him (1559) to Scotland, ostensibly to settle the border disputes, but in reality to secure a union with the Protestant party there, and he helped to arrange the treaty of Leith, July 6, 1560. In 1568 Sadler was appointed chancellor of the duchy of Lancaster, and in the same year was one of the English commissioners employed in treating on the matters arising from the flight of the Queen of Scots. From this time he seems to have been continually engaged as a discreet and trusty servant in connection with Mary's captivity, and was frequently sent with messages to her. On Aug. 25, 1584, when, owing to the imputations made by his countess, George 6th earl of Shrewsbury resigned his guardianship of the Queen, Sadler succeeded him. In September Mary was removed from Sheffield to Wingfield and thence early in 1585 to Tutbury. In April, Sadler, after numerous petitions on his part, was permitted to resign his distasteful charge. On March 30, 1587, Sadler died at Standon, and was buried there. His letters on Scottish affairs are most interesting.

BIBLIOGRAPHY.—*Letters and Negotiations of Sir Ralph Sadler* (Edinburgh, 1720); *The State Papers and Letters of Sir R. Sadler*, ed. Arthur Clifford, with a memoir by Sir Walter Scott (Edinburgh, 1809, 3 vols.).

SADO, an island belonging to Japan, lying 32 m. W. of Niigata (q.v.), in 38° N., 138° 30' E. It has a circumference of 130 m., an area of 336 sq.m. and a population of c. 106,000. The port is Ebisa, on the east coast; and at a distance of 16½ m., near the west coast is the town of Aikawa, having in its vicinity gold and silver mines, for which Sado is famous.

SADOWA, a village of Bohemia, 4 mi. N.W. of Königgrätz. Sadowa, with the small adjoining wood, was one of the principal and most hotly contested Prussian positions in the decisive battle of July 3, 1866, now usually called Königgrätz (see **SEVEN WEEKS' WAR**).

SAFED KOH, in many respects the most remarkable range of mountains on the north-west frontier of India, extending like a 14,000 ft. wall, straight and rigid, towering above all surrounding hills, from the mass of mountains which overlook Kabul on the south-east to the frontiers of India, and preserving a strike which—being more or less perpendicular to the border line—is in strange contrast to the usual frontier conformation. The highest peak, Sikaram, is 15,620 ft. above sea-level, and yet it is not a conspicuous point on this unusually straight-backed range. Geographically the Safed Koh is not an isolated range, for there is no break in the continuity of water divide which connects it with the great Shandur offshoot of the Hindu Kush except the narrow trough of the Kabul river, which cuts a deep waterway across where it makes its way from Dakka into the Peshawar plains.

The same name is often used for the mountain range north of the Hari Rud river in its upper course.

SAFEGUARDING OF INDUSTRY. This is a term which has come into use to designate a policy, entered upon by Great Britain after World War I, of tariff protection to particular industries under certain definitely prescribed conditions. The idea took shape at the Economic Conference of the Allies in Paris in 1916. The first of the resolutions concerning permanent measures, as distinct from war and reconstruction measures, was as follows:—

The Allies decide to take the necessary steps to render themselves independent of the enemy countries in so far as regards the raw materials and manufactured articles essential to the normal development of their economic activities.

The signatories—including, of course, Great Britain—retained complete freedom as to the nature of the measures to be adopted, and expressly added that, in deciding upon them, they would "have regard to the principles which govern their economic policy."

The Balfour Committee.—The further consideration of the matter was at once referred by H. H. Asquith, the prime minister, to the "committee on commercial and industrial policy after the war," presided over by Lord Balfour of Burleigh. In an interim report in March 1917 it drew a distinction between the great staple industries of the country and those producing "certain special commodities essential to national safety as being absolutely indispensable to important British industries, which were supplied before the war entirely or mainly from present enemy sources or from sources under present enemy control." The report also set forth the position with respect to synthetic dyes, spelter, tungsten, magnetos, optical and chemical glass, hosiery needles, thorium nitrate, gauges and drugs, as pivotal or "key" industries.

The committee presented its final report on Dec. 3, 1917, definitely recommending that "some Governmental action should be taken to promote and safeguard the development in the United Kingdom of industries of a special or pivotal character"; and also expressing the opinion that "the producers of this country are entitled to require from the Government that they should be protected in their home market against dumping." Dumping was defined as "the sale of goods at prices lower than those at which the goods are currently offered in the country of manufacture."

No action was taken on these recommendations until Aug. 1921, when the Coalition Government secured the passage of the Safeguarding of Industries Act, 1921. This dealt, in Part I., with the safeguarding of key industries, and in Part II. with the prevention of dumping, authorizing, in each case, a duty of one-third of the value.

Key industries were specified in a schedule to the Act; the Board of Trade was authorized to issue lists in accordance therewith; and complaints as to improper inclusion in, or exclusion from, the lists were to be considered by a referee appointed by the Lord Chancellor. The duration of this part of the Act was for five years. The enactment as to dumping in Part II. was restricted to goods other than articles of food or drink; and dumping was defined by implication as sale "at prices below the cost of production," which was itself defined as "95% of the wholesale price at the works." These provisions were unlimited in point of time. But under Part II. were now included conditions beyond those contemplated in 1917. The depreciation of the exchanges of continental countries, especially of Germany, had been accompanied by a "lag" between the internal and external value of their currencies, which, so long as it continued, gave their exports an advantage in foreign markets, thus exposing the home manufactures of those markets to an exceptional but, it might be, ruinous competition.

Accordingly the act added to the goods with respect to which action could be taken those sold "at prices which, by reason of depreciation in the value in relation to sterling of the currency of the country in which the goods are manufactured (not being a country within His Majesty's dominions) are below the prices at which similar goods can be profitably manufactured in the United Kingdom." On complaint being made to the Board of Trade, the Board must satisfy itself that the value of the currency of the country in question had fallen by at least one-third in relation to sterling. Whether it was alleged that the imports were being "dumped" in the usual sense, or sold cheaply on account of the rate of exchange, the Board was required to satisfy itself that there was a prima facie case for maintaining that such imports were seriously affecting employment. It might then refer the complaint to a special committee, selected from a permanent panel mainly of persons of commercial or industrial experience, which was directed to report as to whether the conditions were satisfied; into the effect which the imposition of a duty would exert on any

other industry using the goods as materials; and also as to whether the threatened industry in the United Kingdom was being carried on with reasonable economy and efficiency.

If the report was satisfactory, the Board of Trade was given power, but not required, to make an order applying the act, so long as it was not at variance with any engagement with any foreign state. The draft of the order must, however, be approved by the House of Commons before it became operative. Such an order, unless renewed, would not be valid for more than three years, and if made on the ground of depreciation of currency for more than three years after the passing of the act, after which period these provisions of the act were to lapse (*i.e.*, in Aug. 1924).

Four Classes of Goods Safeguarded.—Most of the applications received were adversely reported upon; but four having been adjudged to fulfil all the conditions, formed the subjects of a draft order laid before the House of Commons in June 1922, and approved by resolution of the House at the end of July. In each instance the complaint had been made on the ground of depreciated exchanges. The order applied to four descriptions of goods manufactured in Germany: fabric gloves and glove fabric, domestic glassware, illuminating glassware and domestic hollow-ware. The case of fabric gloves had previously been referred back to the committee that it might consider the assertion that the Lancashire cotton trade would be injured by the effect which the duty would have on the export of yarn from England, and it had reported, repeating its former recommendation. In the case of glassware, though the report of the committee had included imports from Czechoslovakia, that country had been so successful in stabilizing its currency before the order was actually prepared, that the president of the Board of Trade, in the exercise of his discretion under the act, determined to limit the imposition of duties to imports from Germany. In Oct. 1922 a further order was made with respect to gas mantles from Germany, the complainants having satisfied a committee that the conditions of the act were in fact satisfied.

The time required by so elaborate a procedure and the limited duration of the promised safeguarding prevented any further action being taken before the fall of the first Baldwin administration at the end of 1923. As to the effect of the orders it is difficult to form any confident opinion, in view of the continuance, outside the particular trades under the act, of the severe general depression of trade. But there is some evidence that in the case of domestic hollow-ware some improvement was discernible, and that in the other cases the trades were enabled to keep alive, and were saved from the still greater decline they would otherwise have experienced.

A Change in Procedure.—On the formation of the second Baldwin administration a new procedure was adopted. The general conditions on which safeguarding duties would be granted were announced on Feb. 3, 1925, in a White Paper (Cmd. 2327, 1925), together with the intention of the Government, when a prima facie case had been made out and reported on favourably by a special committee, and the imposition of a duty had been concurred in by the Board of Trade and the Treasury, to proceed by the ordinary methods of financial legislation, with all their customary safeguards. To the conditions imposed by the earlier act were now added (1) that the applicant industry should be "of substantial importance, on account of the volume of employment or the nature of the goods," and (2) that the competing imports should be "abnormal." And it was now made necessary to prove that the competition came "largely from countries where the conditions are so different . . . as to render it unfair." "Unfairness" was limited to one or more of the following causes:—

(a) Depreciation of currency, operating so as to create an export bounty.

(b) Subsidies, bounties and other artificial advantages.

(c) Inferior conditions of employment of labour.

The special committee in each case might "call attention to any special circumstances by reason of which the industry in the United Kingdom was placed at a serious relative disadvantage." Finally, the committee was called upon, in the event of the claim

to a duty being made out, to express its opinion as to the rate of duty which "would be reasonably sufficient to counteract the unfair competition."

The operation of the previous act had been restricted by existing treaty obligations, and a commercial treaty had recently been made with Germany extending to that country most favoured nation rights. The Government therefore now determined that any safeguarding duties imposed under the new act should be general in their application and not limited to imports from particular countries.

Further Applications Granted. — The following applications had been granted under the new procedure in 1928:

Subject of Application.

Date of Appointment of Committee.

Date and Command Number of Report.

Lace and embroidery.

March 9, 1925.

April 27, 1925.

Cmd. 2403.

Leather and fabric gloves and glove fabrics.

April 25, 1925.

July 6, 1925.

Cmd. 2531.

Gas mantles.

April 25, 1925.

July 29, 1925.

Cmd. 2533.

Cutlery.

Sept. 29, 1925.

Nov. 23, 1925.

Cmd. 2540.

Packing and wrapping paper.

Sept. 7, 1925.

Nov. 25, 1925.

Cmd. 2539.

Pottery. Translucent or vitrified articles of a description commonly used in connection with the serving of food or drink, or component parts of such articles.

Oct. 6, 1926.

March 23, 1927.

Cmd. 2838.

The lace, cutlery and glove trades were deemed important by reason of the volume of employment they provided. The gas mantle industry was considered important in view of its character. During the war it had been discovered that there was vital need in every branch of gunnery of the rare metals thorium and cerium for the manufacture of searchlights, and it was held that the only chance of maintaining the production of these metals was to give those engaged in their extraction the one commercial market furnished by the gas mantle trade.

The following were the subject of applications referred to but not recommended by the Committees: superphosphates, aluminium-hollow-ware, brooms and brushes, worsted and woollen fabrics, enamelled hollow-ware, hosiery and light leather goods and metal fittings.

An application was made in June 1925 for duties on pig-iron, wrought iron, heavy steel products and wire, but the Government

refused to submit this to a committee. It should be added that no applications under the "dumping" provisions of the Act of 1921 have been successful.

The report of the committee appointed by the Board of Trade upon:—

(a) The effect of Part I. of the Safeguarding of Industries Act 1921 on the development of the industries manufacturing the goods covered by the schedule to that Act.

(b) The question of the desirability or otherwise of an extension of Part I. of the Act after its expiry on Aug. 19, 1926.

(c) The question of the desirability of inclusion within the ambit of the schedule of any articles or substances not now covered.

was published on April 22, 1926 (Cmd. 2631 of 1926). The committee recommended the continuation, and in certain cases, the increase or extension of rates of duty, and the continuation of the safeguarding duties for ten years. These recommendations were carried into effect by the Finance Act, 1926.

See Reports of Board of Trade committees; *Final Report* of the committee on commercial and industrial policy after the war (Cd. 9035, 1918); *Official Reports* of parliamentary debates (Hansard's), especially those in the House of Commons (Aug. 11, 1921; July 31, 1922; and Dec. 9, 1925), and of the committee on industry and trade factors in industrial and commercial efficiency (1927).

(C. T.E.)

SAFES, STRONG-ROOMS AND VAULTS. The term "safe," whilst really including any receptacle for the secure custody of valuables provided with a lock, has come to be confined to such receptacles when fitted with a vertical door, as distinguished from a lid, and of such a size that they can be moved into position, by the use of proper appliances, in one piece. Such receptacles, when so large as to require that their parts should be assembled *in situ*, fall under the term "strong-rooms," or in the case of safe-deposit "vaults," and when constructed with hinged lids, as distinct from doors, under the terms "cash-box," "deed-box" and "coffer."

Although boxes provided with locks or coffers must have followed closely on the development of locks (*q.v.*) and been in use in ancient Egypt, yet no examples remain to us of earlier date than the middle ages. The earliest examples extant were constructed of hard wood banded with hammered iron, and subsequent development took place rather on artistic than on practical lines up to the time of the introduction of boxes entirely of iron. On the continent of Europe the iron box was developed to a very high standard of artistic beauty and craftsmanship, but with no real increase of security. Several specimens of these coffers supposed to be of 17th-century workmanship are preserved in the museum at Marlborough House.

Milner's Work.—Up to this time no attempt had been made to make coffers fireproof, for though a patent for fireproofing had been taken out in 1801 by Richard Scott, it does not appear to have been used. In 1834, however, a patent was obtained by William Marr for the application of non-conducting linings, followed about four years later by a similar patent in the name of Charles Chubb. The foundation, however, of the modern safe industry was laid by Thomas Milner, originally a tinsmith of Sheffield, who after a few years' business in Manchester established, in 1830, works at Liverpool for the manufacture of tinsplate and sheet iron boxes and who later made plate iron chests or coffers and, probably the earliest, safes about the year 1846.

For some years no marked improvements in safes were made, although the manufacture had been taken up in various places by different firms. Safes had, however, been constructed of thicker materials, and some attention had been paid to the more secure attachment of the various parts; also, with the advent of the wrought-iron safe, as distinct from the coffer, the practice had developed of securing the door by a number of bolts operated by a handle and fastening them in the locked position by the lock proper, in order that a small key might be used (Charles Chubb's patent, 1845).

Chatwood's Patent, 1860.—Concurrently with the increase of strength in safes and probably with the increased value of articles preserved in safes, the skill of the professional thief had also increased, and this went on for some years until the Cornhill burglary of 1861 called general attention to the question. In 1860

a patent was taken out by Samuel Chatwood for a safe constructed of an outer and inner body with the intervening space filled with ferro-manganese or spiegeleisen in a molten state, the total thickness being 2 in.

It is about this period (1860-1870), perhaps the most important in the history of safes, that the opening of safes by wedges seems to have become prominent. The effect of wedges was to bend out the side of the safe sufficiently to allow of the insertion of a crowbar between the body and the edge of the door, and various devices were adopted by different makers with the object of resisting this mode of attack.

To prevent safes from being opened by the drilling of one or two small holes in such positions as to destroy the security of the lock itself, advantage was taken of the improvements in the manufacture of high carbon steel, and even in what is to-day called the "fire-proof" safe a plate of steel which offers considerable resistance to drilling is placed between the outer door plate and the lock.

About 1888 the "solid" safe was introduced. In this the top, bottom and two sides of the safe, together with the flanges at the back only or at both back and front, are bent from a single steel plate. This construction, with solid corners, only became practicable in consequence of the great improvements which had been made in the quality of steel plates.

The Modern Safe.—The requirements of a modern safe may be briefly summarized as follows:

For fire resisting safes, the safe body must be constructed of steel plate of sufficient thickness, this varying with the dimensions of the safe, to withstand the effect of a fall from an upper floor in the event of a fire and to resist the crushing effect of falling masonry, displaced girders, etc., as safes are frequently buried by falling debris in the ruins of office buildings. The crucial test of the fire resisting capacity of a safe is fully applied under these conditions, *i.e.*, when buried under a red hot mass of ruins, often for a period of several days, before it can be dug out and removed from the collapsed building. The "proofing" of the safe must be of sufficient quantity, packed around the whole area of the body and door to preserve the heat resistance over a long period, otherwise when this reserve is exhausted the safe would become a slow oven and its contents charred and completely destroyed.

Safes which are intended to resist burglars, as well as fire, must be made with greater constructional strength successfully to resist brute force and destructive violence. In addition, they need to be formed from such a combination of metals and alloys as will withstand all forms of cutting and piercing tools and appliances, in addition to the oxy-acetylene cutting blow-pipe. This appliance, which is now in wide industrial use, will cut through practically all known steels, so that modern safe makers have had to resort to the metallurgist for the production of ferrous alloys which possess the power to resist the cutting effect of the gas flame, and are impervious to all drilling methods. The more successful of these alloys, although they can be heated by the gas flame to their melting point, cannot be cut, like steel, by the application of a stream of pure oxygen when their melting temperature has been reached.

It is essential that the walls and doors of such safes should be of considerable thickness, as mass is of great importance in providing resistance to the blow-pipe method of attack. The doors of such safes must be closely and accurately fitted to the opening in the safe body and secured in the closed position by a number of suitable moving bolts operated by an external handle. The actual shape of the bolts is not of vital importance, provided they are of sufficient strength and rigidity to resist all forces that can be brought to bear against them in an effort to force the door away from the safe body. The majority of safe manufacturers use bolts formed from either round or flat section steel bars, but others are of special shape and design.

In America, fire-resisting safes usually are not made burglar-proof; the highest standard of requirement being 20 minutes' protection against amateur attack through the door. Burglar-proof alloy steel chests are however frequently fitted into fire-

resisting safes. Most important are the locks used to control its operation. To provide the maximum amount of security and lengthen the period of resistance that a safe will offer to forcible entry, more than one lock should be employed and the locks need to be made as large as possible to increase the amount of material which has to be removed to expose the lock. It is also advisable to provide the lock with more than one moving bolt to engage with the bolting mechanism, as it is this moving lock bolt which prevents the bolt action being operated and the bolts retracted into the door.

When gunpowder was the only explosive available, it was possible to construct safe locks to resist its use, but with present day high power explosives other methods must be employed. In good quality safes these take the form of independent bolting actions which are brought into active operation only by the actual force of an explosive, when used to destroy the working lock; the effect of such an explosion being to substitute the dogging action of the special device for that of the lock which it was sought to destroy. To prevent the insertion of explosives in the keyholes it is the practice with work intended for bankers' use to provide a shutter, either in the form of a rotating disc or a sliding bar built into the door, to close the entrance to the locks after the keys have been used, the shutter action being in turn locked by a dial on the face of the door. In some instances, keyless combination locks only are used to control the bolting mechanism, but these locks are not in general use or favour in Great Britain, although their use is practically universal in the United States.

Time locks with two, three or four chronometer movements are frequently employed to control the hours for opening safes and vault doors. These locks are fitted in addition to either the key or dial operated locks, and are intended to prevent the door being opened at any other than the official times.

Strong-rooms and Vaults.—For the purpose of providing security for deeds, papers and books against the risk of fire, rooms are built either of brick or concrete, according to the conditions existing on the site and the amount to be expended on the construction, the thickness of the walls varying from 14 inches to 18 inches if built in brick, and from 8 to 14 inches in concrete. Bank vaults and strong-rooms for the custody of securities, cash, etc., are now mainly constructed of reinforced concrete or with a combination of brick and concrete, the thickness of the walls varying with their importance and the ground space available. Generally speaking, reinforced concrete walls can be built of less thickness than brickwork to provide equivalent security against penetration, but in all important vaults and strong-rooms it is advisable to reinforce the walls, roof and floor with linings of steel and flame resisting alloy, forming a self-contained safe inside the concrete shell.

The most effective method of employing steel to reinforce the concrete construction is to use it in the form of plates attached to the inner face of the walls by rag bolts or other suitable connections. The steel then has the protection of the full thickness of the concrete and itself prevents the breaking away of the inner face of the concrete in large sections into the void forming the strong-room, whereas if the steel reinforcement is distributed throughout the concrete walling in the form of bars or mesh work, it can be quickly and easily cut through with the blow-pipe.

In the design of strong-rooms and vaults, the formation of the roof and floor is frequently of more importance than that of the walls, the latter are usually subject to inspection (unless the room is built against an exterior or party wall, which should be avoided if possible), whereas the floor is liable to attack by means of tunnelling which can be carried out without any indication being given until the actual breaking through of the floor of the room. The highest degree of security is obtained when the vault is built as an island with an inspection or patrol passage entirely surrounding it, the floor of the vault being laid on sleeper walls providing for full visibility below the floor level, with suitable lamps and switches for illumination.

Electrical devices are frequently installed to give an alarm in the event of a burglarious attempt upon strong-rooms, either

VARIOUS TYPES OF SAFES, STRONG ROOMS AND VAULTS

1. Closed vault door, English type. Only one combination lock used in this type of door
2. A strong room with the cash or security vault door open, showing complicated mechanism that operates bolts
3. English type of strong room door standing open. Seven large bolts seen in front
4. A circular vault door used almost exclusively for safety deposit vaults. It has two combination locks and one four-movement time lock
5. English type door to vault or strong room. Equipped with four separate combination locks (each combination is known to but one man, thus four men are needed to open this type of door)
6. Safety deposit vault of a large bank, showing thousands of small safe deposit boxes that are rented by the year
7. Barred entrance to a safety deposit vault. Customer must first gain entrance through outer gate before entering vault
8. Steel filing safe equipped with safe-deposit boxes, an armoured steel chest with steel circular door, and filing units. Designed especially for hotels, clubs, lodges, etc.
9. A complete burglar's outfit for opening safes and strong rooms from a photograph taken by the British police after the set had been abandoned by the foiled owners. Acetylene gas containers, hose, torch, bits, drills, levers, chisels and other instruments are shown
10. Safe deposit boxes of the larger types in a vault. Such types are used largely by bond, brokerage and insurance companies

upon the main structure or the door. In no case should they be regarded as a primary means of defence, for they may be put out of action through failure of an essential feature or neglect of maintenance and inspection duties.

A new type of bank vault that is said to be virtually immune to burglar attack through the use of copper in construction has been recently announced by the Copper and Brass Research Association in America. It is said that a burglar would require about six hours of uninterrupted effort with the oxy-acetylene torch to penetrate a modern vault door 20 in. thick, containing a 12 in. plate of pure copper. The high resistance of copper to torch attack is explained by the fact that this metal is a rapid conductor of heat, in contrast with other metals of low heat conductivity heretofore used in vault construction. A torch capable of developing a heat between 5,000° and 6,000° F will penetrate the first few inches of a copper plate in a comparatively short time. However, the flame loses its efficiency as the copper conducts the heat rapidly away before the entire body of the metal can be raised to a fusing point, and the torch becomes ineffective. The ductility of the metal makes it unsuited for successful attack with explosives. The largest bank in Asia, Mitsui Bank building in Tokyo, is of this construction.

SAFETY GLASS: see GLASS, SAFETY.

SAFETY LAMP. On one occasion George Stephenson of locomotive fame observed that the flame of the candle did not pass through the small apertures of the latticed fender, and he gathered from this fact the rude idea of his safety lamp which he constructed and tried at Killingworth colliery, near Newcastle-upon-Tyne, before anyone else had tested one under similar conditions; and, in 1818, he was presented at Newcastle with a silver tankard containing one thousand guineas as the "discoverer of the safety lamp." In May 1818, however, Sir Humphry Davy gathered together and published his collected papers that he had written on the subject, from which it is evident that the ideas he had worked out were his own, so it would appear that Stephenson and Davy had been independent labourers in the same field, just as Daguerre and Talbot in the art of photography reached the same goal by somewhat different paths.

Sir H. Davy first turned his attention particularly to the subject of explosions of fire-damp in Aug. 1815, in consequence of a letter from the Rev. Dr. Gray. He arrived at the conclusion that a metallic tissue, however thin and fine, of which the apertures filled more space than the cooling surface, so as to be permeable to air and light, offered a perfect barrier to explosion. By surrounding the light entirely by wire gauze he established the principle which has governed the flame safety lamp since his day.

Dr. W. Reid Clanny (1776-1850) invented a safety lamp about the same time as Stephenson and Davy, but whereas Stephenson covered the light with a glass cylinder surrounded by an outer casing and top of wire gauze, the feed air being admitted through small holes in a copper ring below the level of the wick; and whereas Davy entirely enclosed the light by a cylinder of gauze, Clanny on the other hand substituted a glass cylinder for the lower portion of the wire gauze, the air entering at the bottom of the gauze and passing down the inner side of the glass.

In Great Britain, in any mine comprised within the Coal Mines Act of 1911, no lamp or light other than a locked safety lamp is allowed to be used in any seam the air current in the return airway of which is found normally to contain more than one half per cent of inflammable gas; and there are specified certain other conditions relative to safety lamps. Wherever safety lamps are required by the act, or regulations under that act, to be used the lamp must be of a type approved by the Secretary of State.

The safety lamps at present in use in the coal mines of Great Britain are divisible into two broad classes, viz., flame safety lamps and electric safety lamps. The official test of the lamps is in respect of general design, strength and general character of construction. Flame safety lamps must be provided with double gauzes or some other adequate arrangement serving the same purpose, the nature of the material forming the gauze being specified. The gauze to be composed of wire with 28 meshes to the linear inch (784 to the square inch) and the lamp must be so con-

structed that it is not possible to put together the component parts without the gauze; and it must be provided with an efficient locking device. Electric safety lamps must be so constructed that no liquid can escape from the battery when the lamp is turned upside down. The switch and other electrical contacts must be contained in flame-tight enclosures. For the United States, see COAL AND COAL MIXING, United States.

The number and type of safety lamps in use in Great Britain during the years 1907 and 1926 were:—

	1907	1926
Flame	677,688	493,325
Electric	2,684	380,123
Total	680,372	863,448

The flame safety lamp is put to another use besides that of illumination, namely, that of ascertaining the presence of inflammable gas, for when the lamp is placed in an atmosphere containing fire-damp, the flame elongates, and if the gas is present in considerable quantity the lamp is filled with blue flame. For testing the presence of gas the flame of the lamp is lowered until the yellow part is almost non-existent, when the gas will be discernible as a small blue cap to the flame; as the size of cap and the percentage of gas present in the air have been correlated, it is possible by this means to detect the presence of as low as one per cent of fire-damp in the air current. (R. R.)

SAFETY RAZOR: see RAZOR.

SAFETY-VALVE is a valve which lifts at a predetermined pressure and prevents the accumulation of a dangerous pressure in a steam boiler. The resistance to pressure is provided by a weight or by springs, the use of the latter being obligatory if the boiler is not a stationary one. The lever valve (see drawing) is loaded with a weight at the end, to keep the valve shut. A casing with

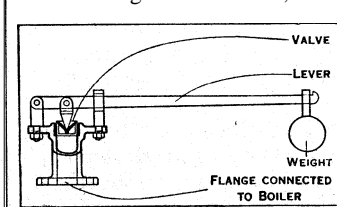

DIAGRAM SHOWING WORKING OF SAFETY-VALVE ON STEAM BOILER

lock may be fitted over to prevent tampering by an unauthorized person. Many boilers carry two safety-valves as a precaution, one being locked up. Marine boiler valves are of the direct spring-loaded type, the spring encircling the valve spindle. The pop valve blows off sharply with a pop, and is used for yacht and launch boilers. The valve closes again quickly when the pressure has been slightly reduced.

SAFFARIDS, a Persian dynasty of the 9th century, founded by Yakub (Yaqub) b. Laith b. Saffar ("coppersmith") about 866, who, originally a leader of bandits and outlaws, became governor of Sejistan. He soon added to his province Herat, Fars, Balkh and Tokharistan, overthrew the Tahirids in Khurasan, and, nominally still dependent on the caliphs of Baghdad, established a dynasty in Sejistan. (See CALIPHATE, section C, Abbasids, § 10, and PERSIA: History, section B.) Soon after 900 the dynasty became subordinate to the Sāmānids (*q.v.*) and few of its rulers had any real authority.

See S. Lane Poole, *Mohammedan Dynasties* (1894), p. 129.

SAFFI: see SAFFI.

SAFFLOWER or **BASTARD SAFFRON** (*Carthamus tinctorius*), a plant of the family Compositae; its flowers form the basis of the safflower dye of commerce. The plant is a native of the East Indies, but is cultivated in Egypt and to some extent in southern Europe. To obtain the dyeing principle (carthamin, C₁₄H₁₄O₇) the flowers are first washed to free them from a soluble yellow colouring matter they contain; they are then dried and powdered, and digested in an alkaline solution in which pieces of clean white cotton are immersed. The alkaline solution having been neutralized with weak acetic acid, the cotton is removed and washed in another alkaline solution. When this second solution is neutralized with acid, carthamin in a pure condition is precipitated as a dark red powder. It forms a brilliant but fugitive scarlet dye for silk, but its principal use is in the preparation of toilet

rouge, for which it is mixed with powdered talc.

SAFFRON, a product manufactured from the dried stigmas and part of the style of the saffron crocus, a cultivated form of *Crocus sativus*; some of the wild forms are also employed. The purple flower, which blooms late in autumn, is very similar to that of the common spring crocus, and the stigmas, which protrude from the perianth, are of a characteristic orange-red colour; the fruit is rarely formed. The Egyptians, though acquainted with the bastard safflower (*Carthamus tinctorius*), often used to adulterate saffron, do not seem to have possessed the true saffron; but it is named in Canticles iv. 14 among other sweet-smelling herbs. It is also mentioned by Homer and Hippocrates.

Saffron has long been cultivated in Persia and Kashmir, and is supposed to have been introduced into China by the Mongol invasion. It is mentioned in the Chinese materia medica (*Pun tsaou*, 1552-78). The chief seat of cultivation in early times, however, was the town of Corycus (modern Korghoz) in Cilicia. According to Hehn, the town derived its name from the crocus; Reymond, on the other hand, with more probability, holds that the name of the drug arose from that of the town. It was cultivated by the Arabs in Spain about 961, and is mentioned in an English leech-book of the 10th century, but seems to have disappeared from western Europe till reintroduced by the crusaders. According to Kakluyt, it was brought into England from Tripoli by a pilgrim, who hid a stolen corm in the hollow of his staff. It was especially cultivated near Histon in Cambridgeshire and in Essex at Saffron Walden, its cultivators being called "crokers."

Saffron was used as an ingredient in many of the complicated medicines of early times; that it was very largely used in cookery is evidenced by many writers; the Chinese used to employ it largely, and the Persians and Spaniards still mix it with their rice. As a perfume it was strewn in Greek halls, courts and theatres, and in the Roman baths. The streets of Rome were sprinkled with saffron when Nero made his entry into the city.

It was, however, mainly used as a dye. It was a royal colour in early Greek times, though afterwards, perhaps from its abundant use in the baths and as a scented salve, it was especially appropriated by the hetairai.

Saffron is chiefly cultivated in Spain, France, Sicily, on the lower spurs of the Apennines and in Persia and Kashmir. It occurs in the form of cake saffron, which consists of the stigmas and part of the style which have been "sweated" and pressed together into a cake, and also as hay *saffron*, which consists of the dried stigmas alone.

For further details, see M. Kronfeld, *Geschichte des Safrans* (Vienna, 1892).

SAFFRON WALDEN, a market-town and municipal borough in the Saffron Walden parliamentary division of Essex, England, 43½ mi. N.N.E. from London by the L.N.E.R. Pop. (est. 1938), 6,301. Area, 11.7 sq.mi. Of the old castle, dating probably from the 12th century, the keep and a few other portions still remain. Near it is a series of curious circular excavations in the chalk, called the Maze, of unknown date or purpose. The earthworks west and south of the town are of great extent; there was a large Saxon burial-ground here. The church of St. Mary the Virgin contains the tomb of Lord Audley, chancellor to Henry VIII. The town has a museum with good archaeological and natural history collections, an important school under the direction of the Society of Friends, and a literary institute. The grammar school dates from 1423. Benevolent institutions include the Edward VI almshouses. In the neighbourhood is the fine mansion of Audley End, built by Thomas, 1st earl of Suffolk, in 1603 on the ruins of the abbey, converted in 1190 from a Benedictine priory founded by Geoffrey de Mandeville in 1136.

Saffron Walden (Waledana) was almost certainly fortified by the Britons, and probably by some earlier people. The town corporation grew out of the Guild of the Holy Trinity, which was incorporated under Henry VIII, the lord of the town, in 1514. It was dissolved under Edward VI, and a charter was obtained appointing a treasurer and chamberlain and twenty-four assistants, who, with the commonalty, formed the corporation. In 1694 William and Mary made Walden a free borough. The culture of

saffron was the most characteristic industry at Walden from the reign of Edward III until its gradual extinction about 1768. Carnation growing is now important.

SAFFRON WOOD or **SAFFRONHOUT** (*Elaeodendron croceum*), a South African tree belonging to the staff-tree family (Celastraceae) and yielding valuable timber. The genus *Elaeodendron* contains about 30 species, confined to the tropics and subtropics.

SAFI or **ASFI**, a seaport on the west coast of Morocco, in 32° 20' N. 9° 12' W., 106 mi. W.N.W. of Marrakesh. The old town, built on the rapid slope of a plateau towards the sea, is surrounded by crenellated ramparts dominated by an old Portuguese citadel, the Kechla. A small harbour protected by a jetty projecting into 9 metres of water is being built. Safi is the chief town of the *contrôle* civil of Abda-Ahmar and the nearest port to Marrakesh. Trade reaches 55 millions (imports 34 millions, exports 21 millions). The share of France is 37 millions, that of Great Britain nine millions, that of Spain eight millions. The population (1936) was 25,159, of which 23,328 were natives and 1,831 were Europeans.

SAFRANINE, a red "basic" dyestuff belonging to the azine class. (See DYES, SYNTHETIC.)

SAGA, originally something related, Icelandic *segin* saga, a tale told, in English a saw. The early books speak of sagas which, apparently, were never written down and were in consequence lost; but, as soon as the art of writing was understood, the word saga began for the future to be used for written historical books. A volume made up of such histories was known as a sogubdk or book of sagas. They were not rigidly historical; any story which was constructed according to the literary formula was called a saga. The telling of tales was a recognized form of entertainment at Icelandic banquets; the person who repeated or read the tale being known as the *sögumaðr* or sagaman, and being held in high honour at the feast.

The saga, as has been often pointed out, is a prose epic, and in its various kinds it follows strict laws of composition. It was composed with great regularity, so as to proceed uniformly from the birth of the hero to his death, and indeed from before the one date until after the other. The style is brief, clear and conversational; the hero was often a distinguished poet, and in that case some of the best of his verses are interwoven into the narrative, being put in his mouth on striking occasions. Alliteration takes a great part in the ornament of the style. The skill with which the story is told, the quick turns of the dialogue, the brilliant evolution of the plot, all these give enduring charm to the more successful and ample of the sagas, and in the earlier examples these qualities are very rarely missing. The *sogu-old* or epoch celebrated in the sagas, lies between the years 890 and 1030, and opens with the original colonization of Iceland; before the end of the 11th century, the actual age of saga-composition has arrived; and lastly comes the age of writing when the sagas received their present literary form, the blossoming time of which was the 13th century. According to the definite statement of the great historian, Sturla, the first man who wrote down in the Norse tongue, in Iceland, "histories relating to times ancient and modern," was Ari Fróði (1067-1148), who was therefore the earliest of the saga-writers. He, as we know, was the author of *Islendingabdk*, an invaluable survey of the history of Iceland from the Settlement down to the year 1120. An earlier *Islendingabók* by Ari, now lost, contained lives of the kings of Norway (*Konungabdk* or book of kings) and pedigrees of early Icelandic settlers. These pedigrees with others supplied by Kolskeggr Fróði and Rrandr served later as a basis for the famous *Landnámabók*, which has come down to us and is of priceless value. The *Landnámabók* was gradually enlarged by the addition of new matter from the sagas and elsewhere till it reached its final form about the year 1220. It is believed that the admirable style in which the sagas are composed owed much to Ari, to whose individual genius the form of Icelandic classical prose is attributed. The works of Saemundr Sigfússon (1056-1133), who succeeded Ari as a writer of the lives of kings, are unfortunately lost.

We now pass to what are called the Greater or *Islendinga*

sagas, which are of a more romantic character than the historical biographies. Among these the greatest is *Njálssaga* (or *Njála*), the work of an unknown author. Extensive as is the work, it was evidently written by one hand, for the same idiosyncrasies of style recur throughout the whole saga. It must have been composed between 1230 and 1280. Vigfússon has described *Njála* as being, *par excellence*, the saga of law, and adds, "the very spirit indeed of early law seems to breathe through its pages." The scene in which *Njál*, the Lawman of judgment and peace, is burned in his homestead by his enemies is perhaps the most magnificent passage which has been preserved in the whole ancient literature of the North. The story of *Njála* is placed at the close of the 10th and the early years of the 11th century. *Eyrbyggiasaga* deals with politics as *Njálssaga* deals with law; it is a precious compendium of history and tradition handed down from heathen times. Extremely beautiful in its attitude to external nature, a matter often ignored in the sagas, is *Laxdaelasaga*, which is also the most romantic in sentiment. The aristocratic spirit of the great Icelandic families finds its most characteristic expression in *Egússaga*, a stirring tale of adventure, the central figure of which, Egill, is depicted with more psychological subtlety than is usual in the sagas; it probably belongs to about 1230. In *Grettissaga* biographical and mythical elements are curiously mingled; it is probably a recension, made about 1310, of two or more earlier sagas now lost. These are the five famous groups of anonymous narrative which are known as the Greater Sagas.

The Minor Sagas must be treated more briefly. *Gunnlaugs-saga Ormstungu* (The story of Gunnlaug Serpent's-Tongue) is a love-story of great charm. In *Gíslasaga* the gloom of the Icelandic outlaw-life is strikingly depicted in the adventures of Gísli. A very unusual specimen of the minor saga is *Bandamannasaga*, a comic story of manners in the north of Iceland in the 11th century, in which an intrigue of the old families banded against the pretensions of a wealthy parvenu, is handled in a spirit of broad humour. Among sagas which deal with the annals of Greenland and Vinland, a foremost place is taken by *Flóamannasaga*, which possesses peculiar interest from its description of the shipwreck of colonists on the coast of Greenland. We possess a late (13th century) recension of what must have been equally important as a record of the Greenland colony in the 11th century, *Fóstbræðrasaga*. Vigfússon formed a class of still shorter sagas than these, *thaettir* or "morsels" of narrative. At the close of the great period of the composition of all these anonymous sagas, a work of enormous length and value was composed or compiled by a poet and historian of great eminence, Sturla Thordsson (1214-84). About the year 1270 he began to compile the mass of sagas known as *Sturlungasaga*. The theory that Sturla was the author of the whole of this bulky literature is now abandoned; it is certain that *Hrafn's Saga Sveinbjarnarsonar*, for instance, belongs to an earlier generation, and the same is true of *Guðmundar Saga Góða*. Vigfússon distinguished these and other sagas, which Sturla evidently only edited, from those which it is certain that he composed, and gathered the latter together under the title of *Íslendingasaga*. To Sturla also are attributed two saga-biographies, the *Hdkonssaga* and the *Magnússaga*. It is a remarkable fact that while Icelandic saga-literature begins and ends with a definite figure of a writer, all that lies between is wholly anonymous. Ari was the earliest and Sturla the latest of the saga-writers of the classical period, but in the authors of *Njál* and *Laxdaela* we have nameless writers whose genius was still greater than that of the pioneer and of the last representative of old Icelandic literature. These unknown men deserve a place of honour among the best narrative-writers who have ever lived. In another class are the stories of bishops, *Biskupasögur*, which have considerable value as biographical material for reconstructing Icelandic social life in the 12th century. The admirable saga of Bishop Lárenzius (1266-1331) was composed by his private secretary, Einar Hafliðason (1307-93), who also wrote *Annals*, and is the latest Icelandic biographer. After his time a long silence fell on the literature of the country, a silence not broken until the revival of Icelandic learning in the 17th century.

It is evident that a vast number of sagas must have perished; when we consider how many are preserved, we can only express amazement at the fecundity of the art of saga-telling in the classical period. The mss. in which what we have were preserved, were all of vellum, and there were no sagas written on paper until the time of Bishop Oddr, who died in 1630; there was an enormous destruction of vellums during the dark ages. After 1640 it became the practice to make transcripts on paper from the perishing vellum mss.

For the history of the sagas see the copious *prolegomena* to Dr. Gudbrandr Vigfússon's edition of the text of *Sturlungasaga*, published in 2 vols. by the Clarendon Press at Oxford in 1878. See also the edition of *Biskupasögur*, issued by the same author, at Copenhagen, in 1858. Vigfússon and Möbius published the *Forisögur* or archaic sagas in 1860. In connection with the descents of Northmen on the shores of Britain particular interest attaches to the four volumes of sagas edited by Vigfússon for the "Rolls" series (1887-94). William Morris, who had done much to interpret the spirit of the sagas to English readers, and had published a translation of *Grettissaga* in 1869, started in 1891 the "Saga Library," in conjunction with E. Magnusson; of this a sixth volume appeared in 1905.

See also Jónsson, *Den oldnorske og oldislandske Litteraturs Historie* (Copenhagen, 1894-1901); F. W. Horn, *Geschichte der Literatur des Skandinavischen Nordens* (Leipzig, 1880). (E. G.; R. P. Co.)

SAGAING, a district and division of Burma, lying to the west of Mandalay on both sides of the Irrawaddy. The district has an area of 1,878 sq.m.; pop. (1931), 335,965, showing an increase of 8,957 in the decade. The chief crops are sesamum, millet, rice, peas, wheat and cotton. It lies in the heart of the dry belt, and the rainfall ranges from about 25 to 35 inches. In the hot season the maximum shade temperature rises to a little over 100° F. The lowest readings in the cold season average about 56° F.

Sagaing, the headquarters town, is opposite Ava, a few miles below Mandalay; pop. (1931), 14,127. It was formerly a capital of Burma. It is the terminus of the railway to Myitkyina. A steam ferry connects with the Rangoon-Mandalay line, and the steamers of the Irrawaddy Flotilla Company call daily.

The Sagaing division includes the districts of Upper and Lower Chindwin, Shwebo, Sagaing, Katha, Bhamo and Myitkyina.

SAGALLO, a small settlement on the north shore of the Gulf of Tajura, French Somaliland. In January 1889 Sagallo was occupied by a Cossack chief named Achinov, who was accompanied by some 200 people, and the archimandrite Pai'si who had been entrusted by the metropolitan of Novgorod with an evangelistic mission to the Abyssinian Church; while Achinov stated that he had a commission from the Negus for the purchase of arms and ammunition. The presence of Achinov at Sagallo was regarded by the French government as an invasion of French territorial rights. The Russian foreign office having disavowed (7th of February) any connection with Achinov, instructions were sent from Paris to secure the removal of the Cossacks. On the 17th of February French warships appeared off the port, and after an ultimatum which had no effect the fort was bombarded, and seven persons killed. The Cossacks then surrendered and were deported to Suez, whence they returned to Russia. Achinov was interned by the Russian government until October 1889. In 1891 he returned to Abyssinia. Pai'si was promoted by his ecclesiastical superiors. In Paris the incident caused great excitement amongst the Russophiles, and the consequent demonstrations led to the suppression of the League of Patriots and the prosecution of M. Paul Déroulède.

See *L'Archimandrite Païsi et l'Ataman Achinoff*, by vicomte de Constantin (1891).

SAGAN, a town in the Prussian province of Silesia, Germany, on the Bober, a tributary of the Oder, 60 mi. S.S.E. of Frankfort-on-Oder and 102 mi. S.E. of Berlin by the direct main line of railway to Breslau. Pop. (1939) 23,341. The mediate principality of Sagan, forming a portion of the Prussian governmental district of Liegnitz, was formed in 1397 out of a portion of the duchy of Glogau. One of its most famous possessors was Wallenstein. The town is still partly surrounded by its old fortifications and has numerous mediaeval houses. It contains the former palace of the dukes of Sagan and a mediaeval town-hall with old cloisters attached. The leading industries of the town are cloth-weaving and wool-spinning.

SAGASTA, PRÁXEDES MATEO (1827-1903), Spanish statesman, born July 21, 1827, at Torrecilla de Cameros, in the province of Logroño. From the first he displayed Liberal inclinations. He entered the Cortes in 1854 as a Progressist deputy for Zamora. Exiled after O'Donnell's *coup d'état* (1856), he returned to sit in the Cortes 1859-63. Exiled again after conspiring with Prim and the Progressists against Isabella, he took part in the rising at Cadiz which culminated in the revolution of Sept. 1868, was minister several times under Serrano and then under King Amadeo, 1868-72. Sagasta headed the most conservative groups of the revolutionary politicians against Ruiz Zorrilla and against the Federal republic in 1873; and in 1874 he vainly attempted to crush the Carlists and to check the Alphonist military conspiracy that overthrew Serrano (Dec. 1874). After the restoration of the Bourbons, Sagasta was premier in 1885-90 and again in 1892-95.

His attempt to conciliate both the Cubans and the United States by a tardy offer of colonial home rule, the recall of Weyler, and other concessions, did not avert the disastrous war with the United States, and his party was defeated (March, 1899). A trimmer par excellence, abler in opposition than in office, Sagasta returned with the Liberals to power in March 1901; in Dec. 1902 he was defeated on a vote of censure and resigned office, dying at Madrid on Jan. 15, 1903.

SAGE, MARGARET OLIVIA SLOCUM (1828-1918), American philanthropist, was born at Syracuse, N.Y., Sept. 8, 1828. She was educated at the Troy, N.Y., Female Seminary, afterwards known as the Emma Willard School. She married Russell Sage in 1869. Knowing her business ability and her interest in charity, her husband left her at his death over \$64,000,000 without restriction. In 1907 the Russell Sage Foundation was incorporated for the "improvement of social and living conditions of the United States of America." To it Mrs. Sage gave \$10,000,000. In 1912 Mrs. Sage bought Marsh island, off the coast of Louisiana, and later turned it over to the State as a permanent refuge for birds. She died in New York city Nov. 4, 1918. By her will she left \$36,000,000 to be divided into 52 parts and distributed to various public institutions. It is estimated that during her life she made public gifts to the amount of \$40,000,000.

SAGE, RUSSELL (1816-1906), American financier, was born in Oneida county (N.Y.), on Aug. 4, 1816. He had a part interest in 1837-39 in a retail grocery in Troy, and in a wholesale store there in 1839-57. He was an alderman of Troy in 1841-48 and treasurer of Rensselaer county in 1845-49. In 1853-57 he was a Whig representative in Congress. He became an associate of Jay Gould in the development and sale of railways; and in 1863 removed to New York city, where, besides speculating in railway stocks, he became a money-lender and a dealer in "puts" and "calls" and "privileges," and in 1874 bought a seat in the New York Stock Exchange. Sage died in New York on July 22, 1906. His wife, Margaret Olivia Slocum (*q.v.*), inherited his fortune, and gave liberal benefactions to different institutions. See **RUSSELL SAGE FOUNDATION**.

SAGE-BRUSH, the name given to various shrubby species of *Artemisia* (*q.v.*) native to plains and mountain slopes of western North America. The common sage-brush (*A. tridentata*) is a much-branched shrub, usually 3 ft. to 6 ft., but sometimes 12 ft. high, with silvery-grey, bitter-aromatic foliage, the small, wedge-shaped leaves mostly with three teeth at the outer end. This shrub is very abundant on semi-arid plains, mainly between 1,500 ft. and 6,000 ft. altitude, where it is often a conspicuous and characteristic feature of the vegetation. It occurs from Montana and western Nebraska to British Columbia and California, growing usually on fertile soil.

SAGE HEN or **SAGE-GROUSE** (*Centrocercus urophasianus*), a long-tailed North American grouse. The male is 26 to 30 in. long; breeds in the sage-brush plains from Saskatchewan to Utah and California, feeding on grasshoppers and the leaves and buds of the sage-brush.

SAGINAW (*säg'in-aw*), a city of Michigan, U.S.A., 85 m. N.W. of Detroit, on the Saginaw river, 15 m. from its entrance into Saginaw bay (Lake Huron); a port of entry and the county

seat of Saginaw county. It is on Federal highways 10 and 23, and is served by the Grand Trunk, the Michigan Central and the Pere Marquette railways. The population was 80,715 in 1930 (80% native white) and was 82,794 in 1940 by the federal census. The city lies on both banks of the river, on level ground, at an altitude of 581 ft. The area is 17 sq. mi. and the assessed valuation for 1940 was \$96,610,850. A council-manager form of government has been in operation since 1936. It is in the principal coal field of the state; there are 200 oil wells in the near vicinity, and immense brine wells, from which 1,000,000 barrels of salt are produced annually. The region raises large crops of sugar beets, grain, beans and other vegetables. Saginaw is the metropolis of a wide area, and has a large wholesale and distributing trade. Its manufacturing industries employed 20,535 workers with a total output in 1940 valued at \$100,398,729. Among the more important are railroad car and locomotive shops, foundries and machine shops and plants making auto parts, rules, sugar, furniture, graphite products and boilers. In 1822 Saginaw City was founded on the west bank of the river, and in 1849 East Saginaw was laid out and financed by eastern capitalists. The two cities were chartered separately in 1859, and were consolidated in 1890 to form the city of Saginaw. The lumber industry, to which the city owed its early development, was at its height about 1880-90.

SAGITTARIUS ("the Archer"), in astronomy, the 9th sign of the zodiac denoted by the symbol \nearrow an arrow or dart. The Greeks represented this constellation as a centaur in the act of shooting an arrow, and professed it to be Crotes, son of Eupheme, the nurse of the Muses. On account of its southern declination the constellation is not well seen in the latitude of Great Britain; but it is one of the most interesting regions of the sky. A very bright arm of the Milky Way passes through it, and another part of the constellation is occupied by remarkable dark obscuring patches of nebulae. It contains the Trifid nebula and the Omega nebula, both fine examples of bright diffuse nebulae. Cepheid variables and globular clusters seem to congregate in this region, and it is probable that the extension of the galactic stellar system is greatest in this direction.

SAGO, a food-starch prepared from a deposit in the trunk of several palms, the principal source being the sago palms (*Metroxylon rumphii* and *M. sagu*), a native of the East Indian archipelago, the sago forests being especially extensive in the island of Ceram. The trees flourish only in low marshy situations, seldom attaining a height of 30 ft., with a thick-set trunk. They attain maturity and produce an inflorescence (flower spike) at the age of 15 years, when the enormous pith of the stem is gorged with starch. If the fruit is allowed to form and ripen, the whole of this starchy core material passes into the developing fruits, leaving the stem a mere hollow shell; and the tree after ripening its fruit dies. Accordingly the palms are cut down directly the inflorescence appears, the stems divided into sections and split up, and the starchy pith extracted and grated to a powder. The powder is then kneaded with water over a strainer, through which the starch passes, leaving the woody fibre behind. The starch settles in the bottom of a trough, in which it is floated, and after one or two washings is fit for use by the natives for cakes and soups. That intended for exportation is mixed into a paste with water and rubbed through sieves into small grains, from the size of a coriander seed and larger, whence it is known according to size as pearl sago, bullet sago, etc. A large proportion of the sago imported into Europe comes from Borneo, and the increasing demand has led to a large extension of sago-palm planting. Sago is also obtained from various other East Indian palms such as the Gomuti palm (*Arenca pinnata*), the Kittul palm (*Caryota urens*), the cabbage palm (*Corypha umbraculifera*), besides *Corypha utan*, *Raphia flabelliformis* and *Phoenix farinifera*, also from *Mauritia flexuosa* and *Guilielma gasipaes*, two South American species. It is also obtained from the pith of species of *Cycas*.

SAGUARO: see **SUWARRO**.

SAGUENAY, a river of Quebec province, Canada, flowing into the St. Lawrence 120 m. north-east of Quebec. It drains Lake St. John, from which it issues by two channels, La Grande

and La Petite Décharge. It is a source of hydro-electric power, owing to its fall of 314 feet in its descent to sea-level, and the reduction of aluminium from its ores is carried on at the town of Arvida. From Chicoutimi the river is navigable by small steamers, and from Ha Ha Bay to the mouth by vessels of the largest size. It is indeed rather a fjord than a river, containing neither rock nor shoal, and having at its mouth a depth of some 600 ft. greater than that of the St. Lawrence. Its width varies from three-quarters of a mile to two miles, and the waters are blackened by the shadow of treeless cliffs, over 1,000 ft. in height, separated here and there by narrow wooded valleys, and culminating in Capes Trinity and Eternity, 1,600 and 1,800 ft. in height. Tadoussac, at its mouth: is the oldest European trading post in Canada.

Lake St. John is a shallow basin, 26 m. by 20, with an area of 365 sq.m. It receives the waters of the Ashuapmuchuan, often spoken of as the upper course of the Saguenay, the Mistassini, the Peribonka and various other important streams. In it is found the *ouananiche*, or land-locked salmon, which attains a weight of about 6 lb.

SAGUNTO, formerly Murviedro, a Spanish town 18 m. north of Valencia on the Valencia-Barcelona coast railway. Pop. (1930) 20,235. The well-preserved Roman theatre looks across the Huerta de Valencia to the Mediterranean. Sagunto is the ancient Saguntum, an ancient Greek or Greek-Iberian town, founded by colonists from Zacynthus (whence its name). About the year 228 B.C. the Romans, disquieted by the enormous growth of Carthaginian power in Spain, concluded an alliance with Saguntum and further required the Carthaginian general, Hasdrubal, not to pass the Ebro. These conditions were observed until 219 when Hannibal judged it safe to begin the war by attacking Saguntum. Confident in Roman protection, the town made a desperate resistance for eight months, at the end of which it was taken by storm. Rome complained to Carthage, requiring the surrender of Hannibal and the members of the Council present with him; the Council, though doubtful of the wisdom of Hannibal's action, naturally refused, and the second Punic War began. Saguntum never recovered its old importance, and in 138 B.C. was definitely eclipsed by the foundation of Valentia by D. Iunius Brutus, and its population by Lusitanian war-captives who were given the Latin franchise.

SAHAPTIN or **SHAHAPTIN**, originally the name of a tribe also called Nez Percé, has become the usual designation of a family of Indians on middle Columbia and lower Snake river, in Idaho, Oregon and Washington. The principal tribes are the Nez Percé, Palooos, Wallawalla, Umatilla, Tenino, Yakima, Klikitat. Subsistence was primarily on salmon and roots, residence likely to be shifting. The Sahaptin are now on Lapwai, Umatilla, Warm Springs and Yakima reservations, with remnants of other groups; the tribal lines are much blurred.

SAHARA, the great desert of North Africa. It forms the western part of a wide desert tract which extends from the Atlantic ocean through Egypt, across the Red sea and through Arabia to Mesopotamia. Its physical boundaries are in some directions clearly defined but in others vague, conventional and disputed. On the west the desert extends in many places to the Atlantic coast; on the north to the foot of the Atlas mountains and to the Mediterranean sea east of these ranges. The eastern part, the Libyan desert, is flanked by the Nile, but the Nubian desert beyond differs very little from it; whilst on the south the Sahara merges into the Sudan and the basin of the Niger and only in a few places does a natural boundary exist between them. The area of the desert is estimated at 3½ million square miles, about the area of Europe minus Scandinavia. Its greatest length along lat. 20° N. is 3,200 m. and its breadth from north to south varies from 800 to 1,400 miles.

In such a vast region as the Sahara desert a wide range of topographical forms must occur. Some small tracts lie below sea-level, but, on the other hand, approximately half the area stands above the 1,000 ft. contour line, the highest altitude (8,800 ft.) being reached in the volcanic cone of Tusidde (Tibesti massif). The horizontally bedded Cretaceous rocks form characteristic

plateaux and escarpments which are dissected by an ancient river system and form a sharp contrast with the volcanic cones.

The Sahara Proper.—This is the region which extends southward from the Atlas mountains as far as the highland tract of the central massif and down the western side of the latter to the basin of the Niger. For the most part it is a succession of low plateaux of Cretaceous rocks covered largely by dunes, locally called *erg* or *igidi*, although, in many parts of the west and south, Palaeozoic and Archaean rocks crop out. Along the Atlantic coast, in Mauritania, is a wide belt of dune country with recent deposits of salt and gypsum; inland the dunes give place to tracts of pebbles, the eastern continuation of which is the low plateau country of Adrar and El Juf again covered with dunes, which extend as far as the central massif. To the north are the districts of Rio de Oro, with a peneplained mass of Archaean and metamorphic rocks in the Wessat region; the plateaux of Dra'a and Tafilelt of Cretaceous and newer rocks, at the foot of the Anti Atlas and drained by the Wad Dra'a; the desert of Igidi, a large part of which is covered by dunes; and the plateau of Tademaït formed of flat Cretaceous rocks and formerly the watershed of this region. This plateau is continued eastward into the Hammada el Homra whilst to the north is the Great Erg, into which a spur of the hammada extends northward dividing it into the western and the eastern Erg.

The Central Tuareg Massif.—This comprises the Ahaggar plateau of Archaean and Palaeozoic rocks which occupies a central position in the desert and on which are several peaks of volcanic origin which do not rise above 8,000 ft. but are periodically snow-capped. The mass is flanked on the west, north-west and north-east by the lower plateaux of Ahenet, Muydir and the Tazili of the Asjer (5,000 ft.) respectively. The latter is continued south-eastward by a low range, the Tummo, into the Tibesti mass of Archaean rocks in which occurs the highest peak in the desert, Mt. Tusidde (8,800 ft.), an extinct volcano, and still farther south-eastward into the lower range of Ennedi.

The Libyan Desert.—This is triangular in shape, extending from the Mediterranean sea to the Sudan. In the north-west is the hammada country of the Fezzan (*q.v.*) in which are the mountains of Jebel es Soda (Black mts.) which are continued south-eastward towards Kufara by the Huruj es Soda. On the coast in the extreme north are the Jebel el Akhdar ranges, but the rest of the desert is a wide expanse of almost level country, over 500,000 sq.m. in extent, which consists of dunes and sandy wastes of unascertained limits, and across which there is only one known route, running from north to south through the oases of Kufara.

Geology and Structure.—Exact geological information about many parts of the Sahara is not known, but the main structure is now fairly well understood. In the central Tuareg massif we find Archaean gneisses, mica schists, granites, etc., which are flanked by folded Silurian rocks upon which rest Devonian and, in some places, Carboniferous strata. Permian, Trias, Jurassic and Lower Cretaceous rocks are apparently missing in the central Sahara, although the Jurassic crops out in south-west Algeria and along the Atlas borders, but a large area is covered by horizontally bedded Middle and Upper Cretaceous rocks, at the base of which is a variegated clay with gypsum. This latter, a typical lagoon formation, indicates the incoming of changed conditions which caused a widespread transgression in the Cenomanian epoch (lower chalk of Britain) and established an epi-continental sea on the stable mass of northern Africa. Miocene, Pliocene and Quaternary deposits occur locally, the Nummulitic limestone being important in the Libyan desert and Egypt. The Sahara is quite distinct from the folded Atlas mountains (*q.v.*), which tectonically belong to Europe and to which North Africa acted as hinterland during the period of Tertiary folding.

Water Supply.—The winds of the Sahara are very dry, and in consequence there is little or no precipitation, except in the highland region of the central massif, where there is a fall of a few inches per annum, and also along the coastal fringes. Nevertheless, the desert as a whole is not entirely without water, but possesses a skeleton of a regular river system. Inadequate streams radiate from the central massif, but they are soon lost in the sand

of the surrounding country. Similar streams flow down from the Atlas mountains, the Wad Dra'a finally reaching the ocean, whilst in the Atlantic and Mediterranean coastal regions similar streams occur, some reaching the sea, others losing themselves in the desert. Irrigation has been attempted in various parts, and it has been found that in many places, especially south of the Atlas and in Algeria, the geological structure is such that artesian water has been obtained. The water so obtained is remarkably fresh, and by means of it agriculture has been made possible in several districts, but the arid hammada country must be abandoned as hopeless. How far such irrigation works can be extended is very uncertain for the detailed geological structure of the area is not yet sufficiently known.

Origin of the Sand.—Several theories have been put forward to explain the enormous quantity of sand in the Sahara. The theory of marine origin is now no longer tenable, for the sand is Quaternary, or at the oldest Pleistocene, in age, and there is no evidence of a marine transgression since pre-Tertiary times. During the great Ice age, when the southern limit of the ice-sheet extended across Central Europe, meteorological conditions were such that much, if not all, of the desert belt lay in a warm, moist, temperate or sub-tropical zone. Under such conditions rock disintegration and soil formation would proceed in the way normal to such regions, the soil being held in position by vegetation, as is still the case in parts of Mauritania, the regions of north of Timbuktu and round Lake Chad and the several oases. A mature river system also assisted in the disintegration and transportation of sediments. Later the soil lost its moisture and the winds became dry, consequent upon the changed meteorological conditions brought about by the retreat of the ice, and vegetation disappeared, leaving the dry soil at the mercy of the wind.

Climate.—The summer heat (June, July and August) is very great and is measured by Augieras in terms of the number of days on which a thermometer not directly exposed to the sun's rays reached 50° C (122° F). In 1913 the number was 33, in 1914 it was 37, in 1915 it was 11 and in 1916 it was 42. During the hottest night in 1916 the temperature did not go below 104°, but the average summer night temperature is about 77°. These figures are for the western Sahara; the central highlands are cooler. The highest recorded temperature for the western Sahara is 56° C (132.8° F). In the cool season the monthly average maxima are about 68°–78°, the minima about 41°–50°. On one or two nights of the year the ground in the west may freeze; there is more frost in the central highlands. In summer the soil-temperature may occasionally reach 175°, the relative humidity may be as low as 5% even in the oases; in the cooler season the relative humidity may increase to 48%. The winds in many parts are chiefly the north-east trades, but there may be summer centres of low pressure, and in the western Sahara the wind often blows from the west.

Flora.—The three chief trees are the date palm, *Acacia tortilis* (on the rocky areas), and *Tamarix articulata* (in beds of wadis). The small plants belong mostly to the Compositae, Cruciferae, Leguminosae and Gramineae, usually with small, often hard, leaves, and sometimes fleshy stems. Some desert plants have leaves grey with hairs, which immediately suck in any drop of dew, while others have salt incrustation that attracts any moisture; some plants (colocynth) have very deep roots. Many desert plants retain vitality in spite of years of "resting" while they wait for water; the rose of Jericho is famous in this connection.

Fauna.—The antelope and gazelle occur in the Sahara, and were formerly hunted by the lion, which is now nearly extinct in the desert. Jackal, fox, fennec, badger, jerboa, rat, isabelline hare and, near water, bats also occur. The hyena wanders near the desert border, and the mouflon is found here and there on the higher land. Ostriches survive in the Mauretania Ergs, but must once have been abundant and widespread. Eagles are fairly numerous, and there are quails, with some ducks, flamingoes and herons near the wadis, where there is water occasionally. Horned vipers, several large lizards, scorpions, tarantulas, beetles, myriads of locusts and flies and many ticks are other members of the

fauna. A few crocodiles survive in some dwindling swamps of the west.

Peoples and Settlement.—It has been indicated above that what is now the desert of Sahara seems to have been open grass land or steppe land in the days of early man. Consequently, it is not surprising to find evidences of a more extensive human occupation of the region than its present climatic and physical conditions will allow.

Barth, in 1850, described drawings as representing a dense crowd of cattle all moving in one direction. Incised drawings are known in Tibesti, and in the region of North Tuareg (Adger), and north of this, through Algeria to Morocco from Constantine by Ain Sefra to Figig. The animals represented on these drawings no longer inhabit these regions. Neolithic implements have been found at the base of the rocks. Rock drawings are rarer in the western Sahara; some occur at Meherrah 60 km. W. of Menakeb.

Attempts have been made to trace in certain of the existing inhabitants the remnants of an early race of negro affinities, which inhabited the Sahara before the arrival of the Berbers and Arabs. Gautier thought that at a period as recent as the Roman conquest of North Africa the Sahara had still a Neolithic culture and people of negro affinities. Negro influence is undoubtedly seen in various parts of the Sahara, but it may date from a much more recent period than has been supposed. For example, the connection between many of the place-names in Fezzan and the language of Bornu is attributable to the northward extension of the influence of the Bornu-Kanem empire between the 11th and 14th centuries A.D. The allusions by classical writers to Ethiopians as inhabitants of the Sahara prove little, in view of the very vague and general meaning attached to the word. Caravans of negro slaves from time immemorial passed northwards along the main desert routes, and it is just in the oases on these routes that the dark element in the population is chiefly found. The oases are naturally the chief centres of population in the Sahara. They occupy positions where the underground water makes its way to the surface or is readily reached by boring; other centres of population are certain mountainous districts where the atmospheric moisture is condensed, and a moderate rainfall results.

The northern oases, such as Dra'a and Tafilelt, are poor. In the east is the Zufana group, near Tarhit. The Gurara oasis is probably an old lake floor watered by subterranean galleries made by man, and called *goggaras*, and is a rather rich settlement. Tuat is of the same type, but on a cliff top. Tinerkuk and Tarhuzg are Erg oases. Tidikelt is the only artesian oasis. Ugarta, Zerhama and Bon Mahud are small "spring" oases. The Tafilelt people meet in the Mai'der pass by the Daura, Bubut or Wahila, and move over the central plateau and pass Chech in the Tarhamant. The Dra'a meet at Tingut and go via Regbat and the edge of the Erg, and then across the central plateau to Tarhamant. Another raiding group are the Seguiet el Hamra. These people of the northern Sahara are nomads. The various confederations of the Tuareg, in the central Sahara, are grouped around hilly districts. The most important are the Awellimiden, on the left bank of the Middle Niger; and the Kel-Ui, grouped around the mountainous districts of Air or Asben, with Agades as centre; the two northern confederations, those of the Ahaggar and Asjer, being less powerful. North-west of Timbuktu, in the district or "kingdom" of Biru, is the oasis and town of Walata, a Tuareg settlement. The Tuareg are mostly a nomadic people of pre-Arab stock. All the men folk are veiled, and they have been known accordingly as the "People of the Veil." They were doubtless pushed into the fastnesses of the southern desert by Islamic invasions. Other mountainous districts in which a certain amount of rain falls regularly, and which contain a population above the average for the Sahara, are Tibesti and Borku, in the east centre, and Adrar in the west. Tibesti and Borku are peopled by Tibbus, once thought to be almost pure negroes. This has, however, been disproved. They are light or dark bronze in colour. Their language is related to that of the Kanuri in Bornu, but it appears that the language of the Tibbu is the older. The Tibbus are probably of Hamitic stock. The western Adrar is peopled

mainly by Moors (Berbers).

Commerce.—From the earliest times Saharan commerce has been the monopoly of the nomad peoples. Salt and ivory were carried across the desert in very early times. In the middle ages the Jews possessed great influence in this part of Africa as organizers of trade. In 1447 the Genoese merchant traveller, Antonio Malfaute, visited the Oasis of Tuat and pointed out its importance as a trade centre between the Muslim countries surrounding the desert. He mentions the large quantities of copper carried south to the negro kingdoms of the Sudan, and the vegetable butter there produced. There is evidence that the Venetians and Genoese both had considerable interests in African trade.

Salt and date palms are the chief products of the Sahara at the present time. The principal sources of the salt supply are the rock salt deposits of the Juf (especially Taudeni), the lakes of Kufara and the rock salt and brine of Bilma (*q.v.*).

Trade routes run (1) from Morocco to Cairo by Insalah and Ghadames, the route of West African pilgrims to Mecca, now largely superseded by the sea route from Tangier to Alexandria; (2) from Kuka (Lake Chad) to Murzuk and Tripoli; (3) from Kano and Zinder to Tripoli by Air and Ghat; (4) from Timbuktu to Insalah, Ghadames and Tripoli; (5) from Timbuktu to Insalah and thence to Algeria and Tunisia; (6) from Algeria—through Tuat and Timbuktu to the Niger. The Senussi movement brought into prominence the desert routes between Wadai in the south and Jalo and Benghazi in the north, which partially superseded some of the older routes. The long-established route from Darfur to the Kharga and Dakhla oases fell into disuse on the closing of the eastern Sudan by the Mahdist troubles. The great route leading from Tripoli via Ghadames and Ghat, to Zinder, Kano, and other great centres of the Hausa States maintains its importance, but the opening of trade from the side of the Niger by the British in the early years of the 20th century affected its value. The route across the western Sahara to Timbuktu is less used than formerly owing to the establishment by the French of a route from Senegal via Niore to the Upper Niger. The old route, however, retains some importance on account of the salt trade from the Sahara, which centres at Timbuktu.

Railway Schemes.—Two principal routes for a railway across the desert have been suggested, the one taking an easterly line from Biskra through Warqla to Air (Agades) and Zinder, the other starting from the terminus of the most westerly railway already existing, and reaching Timbuktu via Igli and the Tuat oases. A third suggested route is one from Igli to the Senegal, still farther west.

Political Divisions.—The western Sahara, in the main, is administered within French West Africa while the eastern regions of the desert fall into Italian Libya, Egypt and Anglo-Egyptian Sudan. The French first acquired an interest in the Sahara by their conquest of Algiers (1830-45). They gradually extended their influence southward with the purpose of forming a junction with their possessions on the Senegal. The acquisition of Tunisia (1881) largely increased the hold of the French on the Sahara, and the work of French pioneers to the south of Algeria was recognized by the Anglo-French agreement of 1890, which assigned to France the whole central Sahara from Algeria to a line from Say, on the Niger, to Lake Chad. The southern limit of the territory was, however, not strictly defined until 1898, when a new agreement gave to France a rectangular block south of the line mentioned, including the important frontier town of Zinder. A further agreement in 1904 again modified the frontier in favour of France. To the north-east and east the boundary of the French sphere was made to run south-east from the intersection of $23\frac{1}{2}^{\circ}$ N. with 16° E., following this south to the western frontier of Darfur and the Anglo-Egyptian Sudan. French Sahara is thus connected with the French possessions in West Africa and with the Congo-Shari territories of France on the south-east. The Spanish possessions are known as Rio de Oro. In the south the French influence extends beyond the Sahara, reaching the coast in Senegal, French Guinea, Ivory coast, Togo and Dahomey. The French Sahara proper may be very roughly estimated at about 1,500,000 sq. miles. Over the whole of French West Africa

there is a governor-general, who is assisted by a council. The seat of the General Government is at Dakar. Under the governor-general the various colonies are administered by lieutenant-governors.

Exploration.—The Egyptians penetrated the Libyan and Nubian deserts at points, and Carthaginians and Phoenicians were acquainted with the northern fringe of the desert in the west. Jews and Genoese in the middle ages learned much about the Sahara in the course of trade, and their knowledge was mapped by Jewish cartographers in Majorca in the 14th and 15th centuries. In 1819 Capt. G. F. Lyon and Joseph Ritchie penetrated from Tripoli to Murzuk. In 1822 came the journey of Oudney, Clapperton and Denham, from Tripoli to Lake Chad, and a year or two later Maj. A. G. Laing reached Timbuktu, also from Tripoli. In 1828 René Caillié crossed from Timbuktu to Morocco. Heinrich Barth, in the course of his great journey (1849-1856), commenced from Tripoli under the leadership of James Richardson, traversed a considerable portion of the Sahara. Between 1859 and 1861 Henri Duveyrier explored parts of the Tuareg domain. Knowledge of the northern Sahara, from Morocco to Tripoli, was largely increased by the journeys of Gerhard Rohlfs, begun in 1861; Rohlfs subsequently crossing (1865) from Tripoli to Lake Chad by nearly the same route as that previously taken by Barth. In 1873-74 Rohlfs visited the oases in the north of the Libyan desert, and in 1878-79 reached the oasis of Kufara. In 1876-77 Erwin von Bary, made his way to Ghat and Air. A French expedition under Col. Paul Flatters, after penetrating far south of Algeria, was massacred (1881) by Tuareg. Farther west, in 1880, Dr. Oskar Lenz started from Morocco, partly by a new route, to Timbuktu. In 1892 the Sahara was crossed from Lake Chad to Tripoli by the French Colonel Monteil.

In 1899 the central Sahara, from Algeria to Air, was traversed by Fernand Foureau. The great desideratum was the opening up of a route to the Niger countries, which might in time divert the trade from Tripoli to Algeria. In 1890 Foureau, who in 1883 had undertaken a first journey of exploration south of Warqla, reached the Tademait plateau in 28° N., fixing the position of many places, and in 1892-93 came the first of his long series of expeditions undertaken with a view of penetrating the country of the Azjer Tuareg, the powerful confederacy which lay on the route to Air and Lake Chad. Foureau finally reached Zinder, the important trade centre on the borders of Nigeria, in 1899.

In the central Sahara, French posts were gradually pushed farther south under a military organization. Subsequent travellers gathered much information respecting the mapping, geology, and other features of this part of the Sahara. Subsequent work in the Sahara is associated with the names of Laperrine, Arnaud, Cortier, Nieger, Villatte, Gautier and Chudeau, on the French side, while Vischer, Haywood, Hassanein Bey, Buchanan, Augiéras, Godefroy, Harding King, and F. R. Rodd have contributed much to our knowledge of the peoples and their environment.

SAHARANPUR, a city and district of British India, in the Meerut division of the United Provinces. The city is situated on a stream called the Damaula Nadi, 998 m. by rail from Calcutta. Pop. (1931) 78,655, of whom more than half are Mohammedans. It is an important railway junction. There are railway workshops, and a large wood-carving industry.

The DISTRICT OF SAHARANPUR has an area of 2,133 sq.m. It forms the most northerly portion of the Doab, or alluvial tableland between the Ganges and Jumna. The population is 937,471. The district contains the towns of Roorkee and Hardwar.

SAHOS or **SHOHOS**, Africans of Hamitic stock living to the west of Massawa. Probably akin to the Gallas and Afars. They are mostly Mohammedans, some few being Christians.

SAID HALIM, PRINCE (1863-1921), Turkish statesman, the son of Halim Pasha and the grandson of Mohammed Ali, the founder of the present Egyptian dynasty, was born in Cairo and was educated in Turkey, completing his studies in Geneva. Exiled because of his sympathy with the Young Turkish movement, he affiliated himself to the Committee of Union and Progress in Paris. After the revolution of July 1908 he returned to Constantinople and was nominated senator. At various times from 1908 to 1918 he was president of the council of state, minister for foreign affairs and general secretary to the Union and Progress party. On June 17, 1913, he became Grand Vizier, in which capacity he endeavoured to settle the questions of Armenian reforms, Mosul oil, and the participation of English, French and Russian capital in the Baghdad railway. He also endeavoured to establish close relations with Greece. Said Halim favoured a Turco-German alliance, but sought to keep Turkey neutral in the World War. On her entry into the war he tendered his resignation, which was refused, and he remained in office until Feb. 1917. After the Armistice of Mudros, Oct. 31, 1918, Said Halim was imprisoned by the British in Malta. Released in 1921, he was assassinated in Rome on Dec. 6, 1921.

SAID PASHA, MOHAMMED (d. 1928), Egyptian statesman, succeeded Boutros Pasha as prime minister of Egypt in 1910. He held office for four difficult years, in which he succeeded in carrying out various administrative reforms and an extension of provincial government. In May 1919 he formed a non-political ministry in the heat of the revolutionary movement. A bomb thrown at him in the street in September of that year exploded harmlessly in the roadway. In Nov. 1919, when he was informed of the coming of the Milner mission to Egypt, Said Pasha resigned with his cabinet. He was minister of education in Zaghul's cabinet (1924), and he was acting prime minister during Zaghul's absence in Europe. He resigned in Oct. 1924, and presently resigned his membership of the Wafd. He was returned to parliament as an independent member for Alexandria in Jan. 1925. Said Pasha died on July 20, 1928.

SAIGA (*Saiga tatarica*), a desert-dwelling antelope inhabiting the Khirghiz Steppe. A century ago it extended as far

west as Poland. During the later Tertiary period the saiga was widely distributed in Europe.

SAIGO TAKAMORI (1832-1877), Japanese patriot, was born in Satsuma in 1832. From early youth he took a prominent part in the politics of his clan, and owing to his extreme opinions with regard to the expediency of abolishing the Tokugawa administration, he was banished (1858) to the island of Oshima (Satsuma), where he attempted unsuccessfully to commit suicide. Ultimately he rose to high rank in the newly organized imperial government, but in 1873 he retired from the cabinet by way of protest against its decision not to take armed action against Korea. Thenceforth he became the rallying point of a large number of men dissatisfied with the new administration, and in 1877 he headed a rebellion which taxed all the resources of the central government. After several months of desperate fighting, Saigo and a small remnant of his followers made a swift retreat to Kagoshima, and fell fighting (September 14) within sight of their homes.

SAIGON, a town of French Indo-China, capital of colony of Cochin-China, on right bank of river Saigon, 34 mi. from sea. Pop. (1936) 111,000 of which 11,760 are French. The town is enclosed by the river Saigon on the east, the Chinese Arroyo on the south and the Arroyo of the Avalanche on the north, while on the west it extends towards the neighbouring town of Cholon. Double rows of trees which give shade in all the streets, and beautiful gardens, make Saigon one of the finest towns of the Far East. It is lighted chiefly by electricity and its water-supply is secured by a filtering reservoir. The chief public buildings are the government house, the law courts, the theatre, the cathedral, etc. The commercial port provided with new quays at the mouth of the Chinese Arroyo carries on a large rice trade. It is the only maritime entrance to Cochin-China and the principal port of the Messageries Maritimes line which links France with the Far East.

Saigon is the seat of two chambers of the court of appeal of French Indo-China, of tribunals of first instance and of commerce, and of the vicar apostolic of Cochin-China.

Before the French conquest, Saigon, then known as *Gai-dinh-thanh*, was the capital of Lower Cochin-China, which consisted of the "six southern provinces" of the Annamese empire, and constituted a vice-royalty under the government of a *kinhluoc*. The French captured it in 1859, and it was part of the territory ceded in 1862.

SAILCLOTH AND SAILMAKING. Sailcloth, now more commonly called canvas (*q.v.*) or, in the United States, duck, is usually a double warp, single weft fabric of the same structure as bagging (*q.v.*) and tarpaulin, although it is sometimes made with single threads of warp. Hemp and ramie are occasionally used in the manufacture of this cloth, but flax and cotton are the chief fibres employed. Many of the sails of fishing smacks and similar vessels are made entirely of cotton—the fabric sometimes retaining its natural colour, but more often dyed or stained tan. Since most of the larger vessels are now driven by steam or oil, the quantity of cloth used for sails is comparatively small. A large quantity of cloth, however, is used on steamships for covers, and for coal bags, sailcloth buckets, etc.

The very best kind of sailcloth is made from long flax, as this fibre possesses flexibility, lightness and strength combined. The number of threads per inch of warp varies from 14 double threads to 48 double threads, and from 12 to 36 shots per inch of weft, while the usual widths are 18, 24, 30 and 36 inches. Cotton canvas has for its limits about 26 to 54 threads of warp per inch, and 15 to 46 shots per inch; the warp yarn for cottons may be 2, 3 or several ply.

Sailmaking.—This is a very ancient industry, but is naturally much less important than it was before the introduction of steamships. The operations of the sailmaker may be stated as follows. The dimensions of mast and yards and sail plan being supplied, the master sailmaker is enabled to determine the dimensions of each sail—after due allowance for stretching—in terms of cloths and depth in yards—if a square sail, the number of cloths in the head, number in the foot and the depth in yards; if a fore-

and-aft sail (triangular), the number of cloths in the foot and the depth in yards of the luff or stay and of leech or after-leech; if a fore-and-aft sail (trapezium form), the number of cloths in the head, number in foot and the depth of mast or luff and of after-leech. These particulars obtained, there is got out what is technically termed a "casting," which simply means the shape, length, etc., of each individual cloth in the sail. These figures are given to the cutter, who proceeds to cut out the sail cloth by cloth in consecutive order, numbering them 1, 2, 3, 4, etc.; the series of cloths thus cut out are handed over to the workman, who joins them together by carefully made double flat seams, sewn with twine specially prepared for the purpose, with about 120 stitches in a yard. In the heavy sails the seam is about $1\frac{1}{2}$ in. in width, and in the British navy stuck or stitched in the middle of the seam to give additional strength; the seams in the lighter sails are about 1 in. wide. The whole of the cloths are then brought together, and spread out, and the tabling (or hemming, so to say) is turned in and finished off with about 72 stitches to a yard. Strengthening pieces or "linings" are affixed where considered necessary, in courses and top-sails such pieces as reef-bands, middle-bands, foot-bands, leech-linings, bunt-line cloths; in top-sails (only) a top-lining or brim; in other and lighter sails such pieces as mast-lining clew and head, tack and corner pieces; holes, such as head, reef, stay (luff), mast, cringle, bunt-line, etc., are also made where required, a grommet of line of suitable size being worked in them to prevent their being cut through. The next thing to be done is to secure the edges of the sail. Bolt-rope, a comparatively soft rope made from the finer hemp yarn (Italian) is used for this purpose; in the British navy it ranges from 1 in. (increasing in size by quarter inches) up to 8 in. inclusive; it is then neatly sewn on with roping twine specially prepared, the needle and twine passing between and clear of every two strands of the rope in roping.

Where slack sail has to be taken in, it is the practice to leave it to the judgment of the sail-maker; but where possible it is better to set up the rope by means of a tackle to a strain approximate to what it will have to bear when in use, and whilst on the stretch mark it off in yards, as also the edge of the sail in yards, so that by bringing the marks together in roping the sail will stand flat. In the British navy the largest size of rope sewn on to a sail is six inches; sizes above this are used for foot and clew ropes of top-sails and courses, being first wormed, parcelled (that is, wound round with strips of worn canvas), tarred and served over with spun yarn; the foot of the sail is then secured to it by being marled in. Where two sizes of bolt-rope used in roping a sail have to be connected, it is effected by a tapered splice. Cringles (similar to the handle of a maund) formed by a strand of bolt-rope, mostly having a galvanized iron thimble in them as a protection, are then stuck where necessary, as at the corners, sides or leeches, mast or luff; they are required either for making stationary or hauling "taut" by tackle or otherwise certain parts of the sail when in use. Fore-and-aft sails, such as spankers, gaff-sails and storm try-sails, are reduced in size by reef-points made of stout line (four to 20 lb.), crow-footed in the middle, a hole being pierced through every seam; one-half of the point is passed through and the crowfoot sewn firmly to the sail; the number of reefs depends upon the size of the sail, and the reefs are placed parallel to the foot. (T. W.)

UNITED STATES

Sailcloth or canvas is better known by the American trade as numbered duck. England manufactures a great deal from flax, while the U.S. mostly uses cotton. It is a plain woven fabric of heavy construction which varies with its use and is usually of plied warp and filling yarns (although in some cases the warp yarn may be single and drawn two ends per dent). Duck is used for many purposes including sails, tents, tarpaulin, bags, awnings, fire hose, wearing apparel such as overalls, hunting coats, belts, etc. The number of warp ends per inch vary from 26 to 48 and may be 2 to 5 ply and from 16 to 34 filling picks per inch 2 to 8 ply.

Specifications adopted by the Cotton Duck Association specify that duck shall be made of cotton, free from waste and thoroughly

cleaned, evenly woven, free from all sizing and free from an excessive number of avoidable imperfections in manufacture. Duck is numbered as follows: No. 1 duck is 22 in. wide and weighs 18 oz. per linear yard and is taken as the basis. For each ounce under 18 the number is increased by one which would make a 17 oz. duck #2, 16 oz. #3 and so on up to #12 which weighs 7 ounces. Duck heavier than 18 oz. per yard is numbered by ciphers, a cipher being added for each ounce increase in weight. Thus $1/0=19$ oz. duck; $2/0=20$ oz. duck. Duck is made as heavy as $20/0$ which would weigh 38 oz. per yard. However, duck above $2/0$ is very seldom used.

The numbering of duck conforms in England and the United States in number only. English specifications are based on a 24 in. fabric and on two ply yarn warp and filling for all numbers, while in the United States 22 in. is the standard width and designates that each number shall be more than two ply and varies with the number and the weight per running yard for specified widths in exact proportion. Thus a 24 in. duck would weigh $\frac{1}{4}$ more than the standard 22 in. goods, while 11 in. duck would weigh one-half as much as the standard width. Duck is made in widths from 14 to 120 in., but the most common widths are 22, 28 and 36 in., and are delivered in standard lengths of 110 to 120 yd. differing from the English requirements of 40 yd. lengths. Duck in the United States is known as hard, medium or soft texture. Hard duck is made from $2/0-#12$, and medium texture $2/0-#6$.

The English specifications for a #1 duck specifies it should weigh 18.8 oz. per yard, 24 in. wide, be delivered in a 39 yd. bolt, to weigh 46 lb. containing 26 lb. of warp, 660 double ends (approximately 28 ends per inch) and 20 lb. of filling, breaking 340 lb. in the warp and 480 lb. in the filling, using the Avery method of breaking a 24×1 in. test strip. Comparing this with the U.S. Government specification a #1 duck should weigh 18 oz. per linear yard, 22 in. wide, have as a minimum 26 ends and 19 picks per inch of 5 ply warp and filling, and specified widths should weigh in proportion to the 22 in. standard (that is, a #1 duck 24 in. wide should weigh 19.6 oz. per yard). The fabric when tested by the $1 \times 1 \times 3$ in. grab method, should break 440 lb. in the warp and 370 lb. in the filling. The difference in breaking strength is partially due to the method employed, therefore no comparison can be made.

(R. T. F.)

SAINFOIN (*Onobrychis viciaefolia*) is a low-growing perennial plant of the pea family (Leguminosae), with a woody rootstock, whence proceed the stems, which are covered with fine hairs and bear numerous long pinnate leaves, the segments of which are elliptic. The flowers are borne in close pyramidal or cylindrical clusters on the end of long stalks. Each flower is about half an inch in length with lanceolate calyx-teeth shorter than the corolla, which latter is pink, with darker stripes of the same colour. The pods or legumes are flattened, wrinkled, somewhat sickle-shaped and crested, and contain a single olive-brown seed. In Great Britain the plant is a native of the calcareous districts of the southern counties. It is native through central Europe and Siberia and is sparingly naturalized in the eastern United States.

SAINT. The articles on the different Saints are to be found in their proper alphabetical places, followed not preceded by the word saint, as Peter, Saint; Patrick, Saint, etc.

The term was originally applied, e.g. in the New Testament and also in the most ancient monuments of Christian thought, to all believers. In ancient inscriptions it often means those souls who are enjoying eternal happiness, or the martyrs. For a long time, too, sanctus was an official title, particularly reserved for bishops (v. *Analecta Bollandiana*, xviii. 410-411). It was not till almost the 6th century that the word became a title of honour specially given to the dead whose cult was publicly celebrated in the churches. It was to the martyrs that the Church first began to pay special honour. We find traces of this in the 2nd half of the 2nd century, in the *Martyrium Polycarpi* (xviii. 3) in connection with a meeting to celebrate the anniversary of the martyr's death. Another passage in the same document (xvii. 3) shows clearly that this was not an innovation, but a custom already established among the Christians. It does not follow that it was henceforth

universal. The Church of Rome does not seem to have inscribed in its calendar its martyrs of an earlier date than the 3rd century. The essential form of the cult of the martyrs was that of the honours paid to the illustrious dead; and these honours were officially paid by the community. Each church first confined itself to celebrating its own martyrs; but it was not long before it became customary to celebrate the anniversaries of martyrs of other churches. Finally the famous ascetics began to share in the honours paid to the martyrs.

The cult of the saints early met with opposition, in answer to which the Church Fathers had to defend its lawfulness and explain its nature. The Church of Smyrna had early to explain its position in this matter with regard to St. Polycarp: "We worship Christ, as the Son of God; as to the martyrs, we love them as the disciples and imitators of the Lord" (*Martyrium Polycarpi*, xvii. 3). St. Cyril of Alexandria defends the worship of the martyrs against Julian, St. Asterius and Theodoret against the pagans in general, "and they all lay emphasis on the fact that the saints are not looked upon as gods by the Christians, and that the honours paid to them are of quite a different kind from the adoration reserved to God alone. St. Jerome argued against Vigilantius with his accustomed vehemence, and especially meets the objection based on the resemblance between these rites and those of the pagans. But it is above all St. Augustine who in his refutation of Faustus, as well as in his sermons and elsewhere, clearly defined the true character of the honours paid to the saints: "Non eis templa, non eis altaria, non sacrificia exhibemus. Non eis sacerdotes offerunt, absit, Deo praestantur. Etiam apud memorias sanctorum martyrum cum offerimus, nonne Deo offerimus? . . . Quando audisti dici apud memoriam sancti Theogenis: offero tibi, sancte Theogenis, aut offero tibi Petre, aut offero tibi Paule?" (Sermo, 273, 7; cf. *Contra Faustum*, xx. 21). The undoubted abuses which grew up, especially during the middle ages, raised up, at the time of the Reformation, fresh adversaries of the cult of the saints. The council of Trent, while reproving all superstitious practices in the invocation of the saints, the veneration of relics and the use of images, expresses as follows the doctrine of the Roman Church: "That the saints who reign with Christ offer to God their prayers for men; that it is good and useful to invoke them by supplication and to have recourse to their aid and assistance in order to obtain from God His benefits through His Son our Saviour Jesus Christ, who alone is our Saviour and Redeemer."

BIBLIOGRAPHY.—See H. Thurston, art. "Saints and Martyrs, Christian" in Hastings, *Encyclopaedia of Religion and Ethics*, xi. 51 ff.; L. Duchesne, *Origines du culte chrétien*, 6th ed. (1925).

ST. AFFRIQUE, a town of France, in the department of Aveyron, on the Sorgues, 68 mi. N.N.W. of Beziers on the railway to Clermont Ferrand. Pop. (1936) 5,179. St. Affrique grew up in the 6th century around the tomb of St. African, bishop of Comminges. An old bridge over the Sorgues and some megaliths in the neighbourhood, especially the dolmen at Tiergues, are notable. There are iron forges; printing and manufacture of gloves are carried on; liqueurs and pâtés de foie gras are made.

ST. ALBANS, EARLS OF. The English title of earl of St. Albans was first borne by Richard Bourke, or de Burgh, 4th earl of Clanricarde (d. 1635), who was made earl of St. Albans in 1628. The second creation was in 1660, when Henry, Baron fermyn, was made an earl under this title. See below.

ST. ALBANS, CHARLES BEAUCLERK, 1ST DUKE OF. *cr.* 1684 (1670–1726), a natural son of Charles II. by Nell Gwynne. Born in London on May 8, 1670, Charles was made Baron Hedington and earl of Burford in Dec. 1676. He took service with the emperor Leopold I., being present at the siege of Belgrade in 1688. After the battle of Landen in 1693, William III. made him captain of the gentlemen pensioners, and four years later gentleman of the bedchamber. His Whig sentiments prevented his advancement under Anne, but he was restored to favour at the accession of George I. He died at Bath on May 10, 1726. His wife Diana, daughter and heiress of Aubrey de Vere, last earl of Oxford, was a well-known beauty, who became lady of the bedchamber to Caroline, princess of Wales, and survived until Jan. 15, 1742.

ST. ALBANS, HENRY JERMYN, EARL OF (*c.* 1604–1684), son of Sir Thomas Jermyn of Rushbroke, Suffolk, was vice chamberlain and then master of the horse to Queen Henrietta Maria. He accompanied Henrietta Maria in 1644 to France, where he continued to act as her secretary. In the same year he was made governor of Jersey, and conceived the idea of ceding the Channel Islands to France as the price of French aid to Charles against the parliament. When Charles II. went to Breda, Jermyn remained in Paris with Henrietta Maria, who persuaded her son to create him earl of St. Albans in 1660. Gossip even asserted a secret marriage between the queen and Jermyn. At the Restoration St. Albans received various appointments, and he contributed to the close secret understanding between Charles II. and Louis XIV., taking part in the preliminaries of the Treaty of Dover in 1669. In 1664 he obtained a grant of land in London near St. James's Palace, where Jermyn street preserves the memory of his name, and where he built the St. Albans' market on a site afterwards cleared for the construction of Regent street and Waterloo place. The earl, who was a friend and patron of Abraham Cowley, died in January 1684.

ST. ALBANS, a city, municipal borough, and market town in the St. Albans parliamentary division of Hertfordshire, England, on the L.M.S. and L.N.E. railways, 20 mi. northwest of London. Pop. (est. 1938) 36,200. Area 8 sq.mi. St. Albans became the seat of a bishop in 1877, the diocese covering most of Hertfordshire and Bedfordshire, with very small portions of Buckinghamshire, Cambridgeshire and Middlesex. The great cathedral, or abbey church, is finely situated on the steep hill above the small river Ver.

History.—Shortly after the martyrdom of St. Alban, probably in 303, a church was built on the spot, and in 793 Offa, king of Mercia, who professed to have discovered the relics of the martyr, founded in his honour a monastery for Benedictines, which became one of the richest and most important houses of that order in the kingdom. The abbots, Ealdred and Ealmer, at the close of the 10th century began to break up the ruins of the old Roman city of Verulamium for materials to construct a new abbey church; but its erection was delayed till the time of William the Conqueror, when Paul of Caen, a relative of Archbishop Lanfranc, was in 1077 appointed abbot. The church was built on the model of St. Stephen's, Caen, but on a larger scale. It was consecrated in 1115, but had been finished some years before. Of the original Norman church the principal portions now remaining are the eastern bays of the nave, the tower and the transepts, but the main outlines of the building are still those planned by Paul. It is thus one of the most important specimens of Norman architecture in England, with the special characteristic that, owing to the use of the flat broad Roman tile, the Norman portions are peculiarly bare and stern.

About 1155 Robert de Gorham repaired and beautified the early shrine and rebuilt the chapter-house and part of the cloister; but nothing of his work now remains except part of a very beautiful doorway discovered in recent times. About 1200 Abbot John de Cella pulled down the west front and portions of the north and south aisles. He began the erection of the west front in a new and enriched form, and his work was continued by his successor William de Trumpyngtone in a plainer manner. In 1257 the eastern portion was pulled down, and between the middle of the 13th and the beginning of the 14th century a sanctuary, ante-chapel and lady chapel were added, all remarkably fine specimens of the architecture of the period. In 1323 two great columns on the south side suddenly fell, and this necessitated the rebuilding of five bays of the south aisle and the Norman cloisters. Various incongruous additions were made during the Perpendicular period, and much damage was also done during the dissolution of the abbeys to the finer work in the interior. Structural dangers gave rise to an extensive restoration and partial rebuilding, begun under the direction of Sir Gilbert Scott, and completed in 1894 by Lord Grimthorpe, some of whose work was, and remains, the subject of much adverse criticism. The abbey's extreme length outside is 550 ft., which is exceeded by Winchester by 6 ft. The nave (292 ft.) is the longest Gothic

nave in the world and exceeds that of Winchester by about 20 ft. The length of the transepts is 175 ft. inside. The monastic buildings have all disappeared except the great gateway.

St. Michael's church (within the site of Verulamium) and St. Stephen's were originally constructed in the 10th century. Considerable portions of the Norman buildings remain. The former contains the tomb of Lord Chancellor Bacon. The restored clock-house in the market place was built by one of the abbots in the reign of Henry VIII.

To the southwest of St. Albans stood the ancient Verulamium (*q.v.*), one of the oldest towns in Britain, on Watling street. The corporation bought the site (104 ac.) in 1929 and a museum was built. The ruins served as a quarry not only to the builders of the abbey, but also for the other churches and the monastic buildings of St. Albans, and Roman bricks are found even in the fabric of the churches of neighbouring villages, as at Sandridge, 2½ mi. northeast. After being burned by Boadicea (A.D. 61), Verulamium revived, and its church was famous early in the 8th century. The Saxon royal residence of Kingsbury is variously assigned to the 6th and 8th centuries. In the 9th and 10th centuries the abbots enlarged the town, which was confirmed to them as a borough by Henry II. In 1253 a charter gave borough jurisdiction to the goodmen of St. Albans; and there were several succeeding charters. In 1877 St. Albans became a city. The famous "model" parliament of 1295 was held at St. Albans. Two burgesses were returned to the parliament of 1306-07, but after 1336 such right fell into abeyance until its resumption in 1553. Its abolition, because of bribery, took place in 1852.

During Wat Tyler's insurrection the monastery was besieged by the townspeople, many of whom were executed in consequence. At St. Albans the Lancastrians were defeated on May 21, 1455, their leader, the duke of Somerset, being killed and Henry VI taken prisoner; here, too, Queen Margaret defeated the earl of Warwick on Feb. 17, 1461. During the civil wars the town was garrisoned for the parliament. One of the earliest printing presses in the kingdom was set up in the abbey, and a number of books were printed there in the late 15th century.

Battle of St. Albans, May 22, 1455. The first battle in the Wars of the Roses wherein the smaller Lancastrian force was defeated by the Yorkists and King Henry VI taken prisoner. A subsequent battle at the same place on Feb. 17, 1461, ended in the Lancastrians defeating Warwick and regaining possession of King Henry VI's person. *See* ROSES, WARS OF THE.

See *Victoria County History, Herts*, vol. ii.; Peter Newcome, *The History of the Abbey of St. Albans* (London, 1793); and *Chronica monasterii S. Albani*, ed. by H. T. Riley for "Rolls" series (1863-76).

SAINT ALBANS, a city of northwestern Vermont, U.S.A.; a port of entry and county seat of Franklin county; 3 mi. from Lake Champlain (St. Albans bay) and 17 mi. from the Canadian border. It is on federal highway 7, and is served by the Central Vermont railway. Pop. (1940) 8,037. The city is 385 ft. above the level of the lake and is surrounded by hills with fine views of the Green mountains, Lake Champlain and the Adirondacks beyond. St. Albans bay is a famous fishing ground. The city is a summer resort and touring centre; headquarters of the railway, which employs some 500 persons in its offices and shops, and of various activities of the federal government (including the bureau of customs, the bureau of prohibition, the immigration service, and the Canadian border and lake patrol); and a shipping point for maple sugar and dairy products, variegated marble and other products of the region and its factories. It is the headquarters of the customs district of Vermont. The first settlement was made in 1774. The town was organized in 1788, incorporated in 1859 and chartered as a city in 1897. It has a mayor-city council form of government. On Oct. 19, 1864, it was raided from Canada by a party of Confederate soldiers (not in uniform), who looted three banks and wounded several citizens. They escaped to Canada, where the leader and 12 others were arrested, but not deprived of the \$208,000 they had taken. Later \$38,000 of this was refunded by the Canadian government. In 1866 and 1870 the Fenians made St. Albans a base for attacks on Canada, and U.S. troops were sent there to preserve neutrality.

ST. ALDWYN, MICHAEL EDWARD HICKS BEACH, 1ST EARL (1837-1916), English statesman, son of Sir Michael Hicks Beach, 8th Bart., whom he succeeded in 1854, was born in London on Oct. 23, 1837, and was educated at Eton and Christ Church, Oxford. He entered parliament as Conservative M.P. for East Gloucestershire in 1864, and held various offices between 1868 and 1880. In 1885 he was elected for West Bristol, and the Conservative party having returned to power, became chancellor of the exchequer and leader of the house of commons. After Gladstone's brief Home Rule ministry in 1886 he entered Lord Salisbury's next cabinet again as Irish secretary, making way for Lord Randolph Churchill as leader of the house; but his eyesight compelled him to resign in 1887 and meanwhile Goschen replaced Lord Randolph as chancellor of the exchequer. From 1888 to 1892 Sir Michael Hicks Beach returned to active work as president of the board of trade, and in 1895—Goschen being transferred to the admiralty—he again became chancellor of the exchequer. In 1899 he lowered the fixed charge for the national debt from 25 to 23 millions—a reduction imperatively required, apart from other reasons, by the difficulties found in redeeming consols at their then inflated price. When compelled to find means for financing the war in South Africa, he insisted on combining the raising of loans with the imposition of fresh taxation; and besides raising the income tax each year, up to 1s. 3d. in 1902, he introduced taxes on sugar and exported coal (1901), and in 1902 proposed the reimposition of the registration duty on corn and flour which had been abolished in 1869 by Lowe. On Lord Salisbury's retirement in 1902 Sir Michael Hicks Beach also left the government. He accepted the chairmanship of the Royal Commission on Ritualistic Practices in the Church, and he did valuable work as an arbitrator; he was a firm advocate of free trade and by his campaign against Joseph Chamberlain's protectionist programme did much to prevent Balfour from committing his party to that policy. When Balfour resigned in 1905 he was raised to the peerage as Viscount St. Aldwyn (1906), and was created an earl in 1915. He died in London on April 30, 1916.

ST. AMAND-LES-EAUX, a town of northern France, in the department of Nord, on the Scarpe, 22 mi. S.E. of Lille by rail. Pop. (1936) 11,013. St. Amand owes its name to St. Amand, bishop of Tongres, who founded a monastery here in the 7th century. The abbey was laid waste by the Normans in 882 and by the count of Hainaut in 1340. The town was captured by Mary of Burgundy in 1477, by the count of Ligne, Charles V's lieutenant, in 1521, and finally in 1667 by the French. The town has mineral waters and mud baths. The discovery of statues and coins in the mud shows that these must have been used during the Roman period. The town has forges and foundries.

ST. AMAND-MONT-ROND, a town of central France, capital of an arrondissement in the department of Cher, 39 mi. S.E. of Bourges by rail. Pop. (1936) 8,890. The town grew up round a monastery founded by St. Amand, a follower of St. Columban, in the 7th century. The château of Mont-Rond (10th century) was inhabited by Sully and Condé, but in 1652 it was taken by the royal troops and dismantled. The town has forges and foundries; furniture, jewellery and underwear are manufactured.

SAINT-AMANT, MARC ANTOINE DE GERARD, SIEUR DE (1594-1661), French poet, was born near Rouen in the year 1594, the son of a merchant. He obtained a patent of nobility, and attached himself to different great noblemen—the duc de Retz and the comte d'Harcourt among others. He saw military service and sojourned at different times in Italy, in England—a sojourn which provoked from him a violent poetical attack on the country, *Albion* (1643)—in Poland, where he held a court appointment for two years, and elsewhere. Saint-Amant's later years were spent in France; and he died at Paris on Dec. 29, 1661. Saint-Amant has left a not inconsiderable body of poetry. His *Albion* and *Rome ridicule* set the fashion of the burlesque poem, a form in which he was excelled by his follower Paul Scarron. In his later years he devoted himself to serious subjects and produced an epic, *Moïse sauvé* (1653). His best work consists of Bacchanalian songs, his *Débauche* being one of the most remarkable convivial poems of its kind.

The standard edition is that in the *Bibliothèque Elzévirienne*, by M. C. L. Livet (2 vols., 1855).

SAINT ANDRE, ANDRE JEANBON (1749–1813), French revolutionary, was born at Montauban (Tarn-et-Garonne) on Feb. 25, 1749. In July 1793 he became president of the Convention, entered the Committee of Public Safety and was sent on mission to the Armies of the East. On Sept. 20, 1793, he obtained a vote of one hundred million francs for constructing vessels, and reorganized the military harbours of Brest and Cherbourg. After a mission in the south (July 1794–March 1795) in which he showed great moderation, he was arrested on May 28, 1795, but was released by the amnesty of the year IV. He was then appointed consul at Algiers and Smyrna (1798), imprisoned by the Turks for three years, and subsequently became prefect of the department of Mont-Tonnerre (1801) and commissary-general of the three departments on the left bank of the Rhine. He died at Mainz on Dec. 10, 1813.

See Lévy-Schneider, *Le Conventionnel Jeanbon St. André* (1901).

ST. ANDREWS, city, royal burgh, university town and seaport of Fifeshire, Scotland. Pop. (1938) 8,383. It is situated on a bay of the North Sea, 123 m. S.E. of Dundee by the L.N.E. railway, *via* Leuchars junction. It occupies a plateau of sandstone rock about 50 ft. high, on the north breaking off in precipitous cliffs. The Eden enters St. Andrews bay N.W. of the golf links, which rank amongst the finest in the world. The Royal and Ancient Golf Club, founded in 1754, is the legislative authority of the game. There is a Marine Biological station. The city was never surrounded by walls, and of its ancient gates the West Port only remains. The Martyrs' memorial, erected to the honour of martyrs of the Reformation epoch, stands at the west end of the Scores on a cliff overlooking the sea.

The cathedral originated partly in the priory of Canons Regular founded by Bishop Robert (1122–1159). At the end of the 17th century some of the priory buildings were still entire and considerable remains of others existed, but nearly all traces have now disappeared except portions of the wall and the archways. The wall is about three-quarters of a mile long, and bears turrets at intervals. The cathedral was founded by Bishop Arnold (1159–1162), to supply more ample accommodation than was afforded by the church of St. Regulus. The principal portions extant, partly Norman and partly Early English, are the east and west gables and part of the nave and the south transept.

The castle, on a rocky promontory, is supposed to have been erected by Bishop Roger about the beginning of the 13th century as an episcopal residence, and was strongly fortified. It was destroyed, but rebuilt towards the close of the century. There remains a portion of the south wall enclosing a square tower, the "bottle dungeon" below the north-west tower, the kitchen tower and a subterranean passage. The grounds have been laid out as a public garden.

The town church, formerly the church of the Holy Trinity, was originally founded in 1112 by Bishop Turgot, but was rebuilt at the close of the 18th century with the exception of the square tower and spire, and again in recent years, the original lines being followed as closely as possible. In this church John Knox first preached in public, and in it, on June 4th, 1559, he delivered the famous sermon which led to the stripping of the cathedral and the destruction of the monastic buildings. The church contains a monument to James Sharp, archbishop of St. Andrews (assassinated 1679). In South Street is the ruin of the north transept of the chapel of the Blackfriars' monastery founded by Bishop Wishart in 1274; but the Observantine monastery founded about 1450 by Bishop Kennedy has disappeared, except the well.

The university of St. Andrews owed its origin to a society formed in 1410 by Lawrence of Lindores, abbot of Scone, and others. A charter was issued in 1411 by Bishop Henry Wardlaw (d. 1440), and six bulls were obtained from Benedict XIII. in 1413 confirming the charter and constituting the society a university. The lectures were delivered in various parts of the town until 1430, when Wardlaw allowed the lecturers the use of a building called the Paedagogium, or St. John's. St. Salvator's college was

founded and richly endowed by Bishop Kennedy in 1456; seven years later it was granted the power to confer degrees in theology and philosophy, and by the end of the century was regarded as a constituent part of the university. In 1512 St. Leonard's college was founded, and the original Paedagogium nominally changed into a college, with the parish church of St. Michael of Tarvet annexed to it; but its actual erection into a college did not take place until 1537, when it was dedicated to the Blessed Virgin Mary of the Assumption. The outline of the ancient structure is preserved, but its general character has been much altered by various restorations. It forms two sides of a quadrangle. The University library, which now includes the older college libraries, was founded about the middle of the 17th century and rebuilt in 1764. The lower hall in the older part of the building was used at times as a provincial meeting-place for the Scottish parliament. When the constitution of the colleges was remodelled in 1579 St. Mary's was set apart for theology; and in 1747 the colleges of St. Salvator and St. Leonard were formed into the United college. The buildings of St. Leonard's are now occupied as a school for girls. The college chapel is in ruins. The United college occupies the site of St. Salvator's college, but the old buildings have been removed, with the exception of the college chapel, now used as the university chapel and the parish church of St. Leonard's, a fine Gothic structure, containing an elaborate tomb of Bishop Kennedy and Knox's pulpit; the entrance gateway, with a square clock tower; and the janitor's house with some class-rooms above. University college, Dundee, was in 1897 affiliated to the university of St. Andrews. In 1892 provision was made within the university for the instruction of women; and for the board and residence of women students a permanent building was opened in 1896. Medical buildings were opened in 1899. Madras college, founded and endowed by Dr. Andrew Bell (1753–1832) is a famous school.

St. Andrews was probably the site of a Pictish stronghold, and tradition declares that Kenneth, the patron saint of Kennoway, established a Culdee monastery here in the 6th century. The foundations of the little church dedicated to the Virgin were discovered on the Kirkheugh in 1860. Another Culdee church of St. Mary on the Rock is supposed to have stood on the Lady's Craig, now covered by the sea. At that period the name of the place was Kilrymont (Gaelic, "The church of the king's mount") or Muckcross. St. Andrews is said to have been made a bishopric in the 9th century, and when the Pictish and Scottish churches were united in 908, the primacy was transferred to it from Dunkeld, its bishops being thereafter known as bishops of Alban. It became an archbishopric during the primacy of Patrick Graham (1466–1478). The town was created a royal burgh in 1124. In the 16th century St. Andrews was one of the most important ports north of the Forth, but it fell into decay after the Civil War.

SAINT ARNAUD, JACQUES LEROY DE (1801–1854), marshal of France, was born at Paris on Aug. 20, 1801. He entered the army in 1817, retired from the service in 1827, and re-entered it at thirty as a sub-lieutenant. He took part in the suppression of the Vendée émeute, and was for a time on General (Marshal) Bugeaud's staff. But his debts and the scandals of his private life compelled him to go to Algeria as a captain in the Foreign Legion. In 1848 he was placed at the head of a brigade during the revolution in Paris. On his return to Africa, it is said because Louis Napoleon considered him suitable to be the military head of a *coup d'état*, an expedition was made into Little Kabylia, in which St. Arnaud provided his superiors with the pretext for bringing him home as a general of division (July 1851). He succeeded Marshal Magnan as minister of war and superintended the military operations of the *coup d'état* of the 2nd of December (1851) which placed Napoleon III. on the throne. A year later he was made marshal of France and a senator, remaining at the head of the war office till 1854, when he set out to command the French in the Crimea, his British colleague being Lord Raglan. He died on board ship on Sept. 29, 1854, shortly after commanding at the battle of the Alma. His body was conveyed to France and buried in the Invalides.

See *Lettres du Maréchal de Saint Arnaud* (Paris, 1855; 2nd edition with memoir by Sainte-Beuve, 1858).

ST. ASAPH, a cathedral village-city of Flintshire, north Wales, on the Rhyl-Denbigh branch of the L.M.S. about 6 mi. from each of these towns. Pop. (1931) 1,845. Its Welsh name, Llanelyw, is derived from the Elwy, between which stream and the Clwyd it stands. Asaph, to whom the cathedral (the smallest in Great Britain, excluding converted parish churches) is dedicated, was bishop here in the 6th century. The small, irregularly built town has also a parish church, remains of a Perpendicular chapel near Ffynnon Fair (St. Mary's Well) and almshouses founded in 1678 by Bishop Barrow. The hill on which St. Asaph stands is Bryn Paulin, with early associations. The early cathedral, of wood, was burned by the English in 1247 and 1282, and that built by Bishop Anian in the 13th century (Decorated) was mostly destroyed during the raids of Owen Glendower (c. 1402). Bishop Redman's building (c. 1480) was completed by the erection of the choir about 1770. Further restoration took place in the 19th century. The church is plain, cruciform, chiefly Decorated but partly Early English, with a square tower; it has a library of nearly 2,000 volumes (some rare). In 1920 the then bishop of St. Asaph was enthroned in his cathedral as the first archbishop of the disestablished church in Wales.

SAINT AUGUSTINE, a city of northeastern Florida, U.S.A., on the coast, 38 mi. S.E. of Jacksonville; a port of entry and the county seat of St. Johns county. It is on federal highway 1 and the East Coast Inland waterway, and is served by the Florida East Coast railway. Pop. (1930) 12,111; 12,090 in 1940 by federal census, of whom 30% were Negroes. The white population is doubled during tourist seasons.

The city occupies a narrow peninsula formed by the Matanzas and San Sebastian rivers, and is separated from the ocean by the northern end of Anastasia island ($\frac{1}{2}$ mi. wide), where is located one of the world's best bathing beaches. It is the oldest city in the United States.

Many old houses remain, including the oldest house in the United States.

Ft. Marion (originally the Castle of San Marco), oldest standing fortification in the United States, is a well preserved specimen of Spanish architecture, built of coquina, begun about 1638 and finished in 1756. The old arsenal reconstructed in 1835 by the United States is state headquarters of the National Guard. A

BY COURTESY OF THE ST. AUGUSTINE CHAMBER OF COMMERCE

COURTYARD OF FORT MARION, ST. AUGUSTINE, SHOWING THE INCLINED ARCH BUILT BY THE SPANIARDS FOR THE TRANSPORTATION OF CANNON FROM THE PLAZA TO THE TERREPLEIN. THE STEPS ARE MODERN

wall and moat formerly ran across the peninsula at the northern edge of the city, and the city gate which was in this wall still stands, a picturesque ruin, at the end of St. George street. The Roman Catholic church was built in 1791. The post office was the Spanish Government building; the public library and the historical society both occupy buildings of historic interest. There is a beautiful modern church (Presbyterian) built in 1890 by Henry M. Flagler as a memorial to his daughter. St. Augustine is both a winter and a summer resort. The general offices and shops of the railway are here. Since 1915 the city has had a commission-

manager form of government.

On St. Augustine's day (Aug. 28), 1565, Pedro Menéndez de Avilés sighted this coast, and on Sept. 6 he landed with his band of colonists and began to fortify the peninsula. In 1586 Sir Francis Drake captured the fort and burned the town, and in 1665 it was pillaged by Capt. John Davis, an English freebooter. Conflicts with the English settlements in South Carolina and Georgia were frequent after 1681. When Florida was ceded to England in 1763 most of the Spanish population of St. Augustine went to Cuba; when in 1783 it came again under Spanish rule, most of the English left for the Carolinas, Georgia, or the West Indies; and when in 1821 it passed to the United States, the Spanish inhabitants remained. On Jan. 7, 1861, three days before Florida passed her Ordinance of Secession, a State force compelled the small garrison to evacuate the fort, but on March 11, 1862, it was retaken without bloodshed, and was then held by the Federals until the close of the war.

ST. AUSTELL, market town, urban district, Penryn and Falmouth parliamentary division, Cornwall, England, 14 mi. N.E. of Truro, on G.W. railway. Pop. (1938) 22,410. Area 28.6 sq.mi. To the north the high ground on which St. Austell stands culminates in Hensbarrow Downs (1,034 ft.). Holy Trinity church is Perpendicular, with Decorated chancel, richly ornamented. The town is the centre of the china clay (kaolin) district, and some 3,000 persons are ordinarily employed in the industry, exports being mainly to the Potteries and Lancashire. Nearby is Menacuddle Well, a good example of an Early English baptistry.

ST. BARTHOLOMEW or **ST. BARTHÉLEMY**, French West Indian island, 17° 55' N. and 63° 60' W., about 130 m. N.W. of Guadeloupe, of which it is a dependency. The horns of an irregular crescent enclose the bay of St. Jean, pointing north; the surface culminates in a central limestone hill 1,003 ft. high. It is 8 sq. m. in area, and timberless. Gustavia, on the south-west coast has a small but safe harbour. Lorient is the only other town. The inhabitants, mainly of French and negro descent, are English-speaking, and number about 2,520. St. Bartholomew was occupied by France in 1648 and ceded to Sweden in 1784. In 1877 it was again acquired by France at the cost of £11,000.

ST. BARTHOLOMEW, MASSACRE OF. This was the name given to the massacre of the Huguenots, which began in Paris on St. Bartholomew's Day, Aug. 24, 1572. The initiative for the crime rests with Catherine de' Medici. Disquieted by the growing influence of Admiral Coligny, who against her wishes was endeavouring to draw Charles IX. into a war with Spain, she resolved to have him assassinated. The attempt failed, however, and Catherine then determined to massacre all the Huguenot leaders.

After holding a council with the Catholic leaders, including the Duke of Anjou, Henry of Guise, the Marshal de Tavannes, the Duke of Nevers, and René de Birague, the keeper of the seals, she persuaded the king that the massacre was a measure of public safety, and on the evening of Aug. 23 succeeded in wringing authorization from him.

The massacre began on Sunday at daybreak, and continued in Paris till Sept. 17. Once let loose, it was impossible to restrain the populace. From Paris the massacre spread to the provinces till Oct. 3. The Duc de Longueville in Picardy, Chabot-Charny (son of Admiral Chabot) at Dijon, the Comte de Matignon (1525-97) in Normandy and other provincial governors refused to authorize the massacres. François Hotman estimates the number killed in the whole of France at 50,000. Catherine de' Medici received the congratulations of all the Catholic powers, and Pope Gregory XIII. commanded bonfires to be lighted and a medal to be struck.

See H. Mariéjol, "La Réforme et la Ligue" (1904), in vol. vi. of the *Histoire de France*, by E. Lavisse, which contains a complete bibliography of the subject.

ST. BENOÎT-SUR-LOIRE, a village of France, in the department of Loiret, on the Loire, 22 mi. E.S.E. of Orléans. Pop. (1936) 500. St. Benoît has a huge basilica, only survival of a 7th century monastery to which the relics of St. Benedict were brought from Monte Cassino. In the crypt is a modern shrine containing

the remains of St. Benedict, which still attract many pilgrims. The establishment was very important during the middle ages, owing partly to its school. In 1562 it was pillaged by the Protestants and, though the buildings were restored by Richelieu, the abbey declined. The basilica (1025-1218) has a narthex of two stories and two sets of transepts, surmounted by a square central tower.

SAINT BERNARD, a city of Hamilton county, Ohio, U.S.A., 15 mi. N.E. of Cincinnati; served by the Baltimore and Ohio and by others for freight. Pop. (1920) 6,312; (1930) 7,487; (1940) 7,387 by federal census. It is a residential suburb of Cincinnati, and has various manufacturing industries.

ST. BERNARD PASSES, two passes across the main chain of the Alps, both traversed by motor roads. The Great St. Bernard (8,111 ft.) leads (53 m.) from Martigny (anc. *Octodurus*) in the Rhone valley (Switzerland) to Aosta (anc. *Augusta Praetoria*) in Italy. It was known in Roman times. The hospice on the pass was founded (or perhaps refounded) by St. Bernard of Menthon (d. about 1081), and since the 12th or early 13th century has been in charge of a community of Austin canons, the mother-house being at Martigny. In former days the servants of the canons, and the famous dogs, saved many lives, especially of Italian workmen. In May 1800 Napoleon led his army over the pass, which was then traversed by a bridle road only. The Little St. Bernard (7,179 ft.) also was known in Roman times, and the hospice refounded by St. Bernard of Menthon, though it is now in charge of the military and religious order of SS. Maurice and Lazarus. The pass leads (39 m.) from Bourg St. Maurice in the Isère valley (Savoie) to Aosta, but is much less frequented by travellers than its neighbour opposite.

There is no certain mention of the road over the pass of the Great St. Bernard (*Alpis Poenina*, Poeninus Mons) before 57 B.C. when Julius Caesar sent Servius Galba over it. Even in Strabo's time it was impassable for wheeled traffic; we find that *Augusta Praetoria* originally had but two gates, one opening towards the Little St. Bernard (*Alpis Graia*), the other towards *Eporedia* (Ivrea), but none towards the *Alpis Poenina*. The military arrangement of the German provinces rendered the construction of the road necessary, and it is mentioned as existing in A.D. 69. Remains of it cut in the rock, some 12½ ft. in width, still exist near the lake at the top of the pass. On the plain at the top of the pass is the temple of Jupiter Poeninus (Peninus), remains of which were excavated in 1890-1893, though objects connected with it had long ago been found. The oldest of the votive-tablets which can be dated belongs to the time of Tiberius, and the temple may be attributed to the beginning of the empire; objects, however, of the first Iron age (4th or 5th century B.C.) were also found and many Gaulish coins. Other buildings, probably belonging to the post station at the top of the pass, were also discovered. Many of the objects found then and in previous years, including many votive-tablets, are in the museum at the hospice of the Great St. Bernard.

The Little St. Bernard was known to the Romans as *Alpis Graia*. It derived its name from the legend that Hercules, returning from Spain with the oxen of Geryon, crossed the Alps by this route, though the legend rather suits the route through the Maritime Alps. According to some modern scholars, Hannibal passed this way over the Alps (see HANNIBAL, and Partsch in Pauly-Wissowa, *Realencyklopädie* i., 1604). In any case it was the principal pass over the Alps into *Gallia Comata* until the pass of the *Alpis Cottia* (Mont Genève) was opened by Cn. Pompeius in 75 B.C., and became the principal route, though the road was only completed under Augustus by Cottius in 3 B.C. Various remains of the road are visible, and those of a building (possibly a temple of Jupiter) have been found on the summit of the pass.

See *Notizie degli scavi* (1883), 7 (1894), 46; and C. Promis, *Antichità di Aosta* (Turin, 1862), 115 sqq.

ST. BERTRAND-DE-COMMINGES, a village of S.W. France at the foot of the Pyrénées in the department of Haute-Garonne, 70 mi. S.W. of Toulouse by rail and road. St. Bertrand-de-Comminges (*Lugdunum Convenarum*) was founded in 72 B.C., and by the end of the 5th century became the seat of a bishopric suppressed at the Revolution. The town was destroyed towards

the end of the 6th century by Guntrum, king of Burgundy. It is about 1 mi. from the left bank of the Garonne on the slopes of an isolated hill crowned by its celebrated cathedral of Notre-Dame. The façade of the church with its square tower and the first bay with its aisles are Romanesque, and belong to an 11th century church begun by Bishop Bertrand, later canonized.

ST. BRIEUC, a town and watering place of western France, capital of the department of Côtes-du-Nord, 63 mi. N.W. of Rennes by the railway to Brest. Pop. (1936) 27,195. St. Brieuc owes its origin and its name to the missionary St. Briocus, who came from Wales in the 5th century, and whose tomb afterwards attracted crowds of pilgrims. The place was defended in 1375 by Olivier de Clisson against the duke of Brittany, and later attacked by the same Clisson in 1394, the cathedral suffering greatly in both sieges. In 1592 the town was pillaged by the Spaniards, in 1601 ravaged by the plague, and in 1628 surrounded by walls of which no traces remain. Between 1602 and 1768 the states of Brittany several times met at St. Brieuc. It stands 290 ft. above the sea, between 1 and 2 mi. from the English channel and less than a mile from the right bank of the Gouët, at the mouth of which is its seaport, Le Légué. St. Brieuc is the seat of a prefect and of a bishopric in the province of Rennes, and has a 13th-century cathedral, partially rebuilt in the 18th, and afterwards restored. There are granite quarries and metalworks. Agricultural machinery is built. In World War II the town was occupied by the Germans in June 1940.

ST. CATHARINES, a city of Ontario, Canada, and the capital of Lincoln county, on the Welland Canal and the Canadian National and Niagara, St. Catharines and Toronto electric railways, 35 mi S. of Toronto, with which it has steamer connection. Pop. (1941) 30,275. It is the centre of the Niagara fruit belt.

ST. CHAMOND, a manufacturing town of east-central France, in the department of Loire, 7½ mi. E.N.E. of St. Etienne, on the railway from St. Etienne to Lyons. Pop. (1936) 14,711. St. Chamond, founded in the 7th century by St. Ennemond or Chamond, archbishop of Lyons, became the chief town of the Jarret, a little principality formed by the valley of the Gier. There are remains of a Roman aqueduct. Silk-milling was introduced in the town in the middle of the 16th century by Gayotti, a native of Bologna. There are coal mines, forges and foundries.

SAINT CHARLES, a city of eastern Missouri, U.S.A., on the north bank of the Missouri river, 22 mi. N.W. of Saint Louis; county seat of St. Charles county. It is on federal highway 40, and is served by the Missouri-Kansas-Texas and the Wabash railways. Pop. (1940) 10,803. Saint Charles was settled in 1769 by Louis Blanchette, a Frenchman, and later came under Spanish rule. In 1849 it was incorporated as a city. In 1820 it became the first capital of the state and continued as such until 1826.

SAINT CLAIR, an anthracite-mining borough of Schuylkill county, Pennsylvania, U.S.A., on Mill creek, 3 mi. N. of Pottsville; served by the Pennsylvania and the Reading railways. Pop. (1940) 6,809. It was settled in 1825 and incorporated in 1850.

SAINT CLAIR RIVER, the outlet for Lake Huron, which in turn receives the waters from Lakes Superior and Michigan. Forming part of the boundary between the State of Michigan and the Province of Ontario, Canada, it flows in a southerly direction into Lake St. Clair with a fall of about 5.8 ft. in 40 miles. The river discharges through seven mouths, the one known as the South channel being used for deep-draught vessels, while several of the other channels are used for small craft. The South channel has been improved by the dredging of separate channels for up-bound and down-bound traffic, extending from deep water in the river into Lake St. Clair.

The project for the main improved channel through the river calls for a minimum depth of 20 ft. when the levels of Lakes Huron and St. Clair are at low water datum. The U.S. Congress in 1928 gave consideration to increasing the depth of this channel in connection with a programme for general deepening of all the main connecting channels of the Great Lakes, and some increase will probably be authorized in the near future. The water level of this river fluctuates with the levels of the lakes above and below. From about the year 1910 on, the difference

between the highest and lowest monthly mean levels during the navigation season has been about 4 feet. Occasional fluctuations due to winds of high velocity may be 3.5 ft. in six hours. Near the head of the river are the cities of Port Huron, Mich., and Sarnia, Ont., both of which handle some water-borne commerce but the great bulk of the traffic moves through the river without intermediate stop. This traffic is composed principally of iron ore, grain and limestone down-bound and coal up-bound.

ST. CLAUDE, a town of eastern France, capital of an arrondissement in the department of Jura, 42 mi. S.S.E. of Lons-le-Saunier by rail. Pop. (1936) 10,760. It is 1,300 ft. above sea level at the western base of Mont Bayard, among the heights of the eastern Jura at the confluence of the Bienne and the Tacon. The cathedral of St. Pierre, once the abbey-church, dates from the 14th to the 18th centuries. It is a bishopric and the seat of a sub-prefect. St. Claude is a tourist centre. Tobacco pipes and ivory, bone and horn articles are manufactured.

ST. CLOUD, a town of northern France, in the department of Seine-et-Oise, on the left bank of the Seine, 2 mi. W. of the fortifications of Paris by road. Pop. (1936) 16,597. The town is named after Clodoald or Cloud, grandson of Clovis, whose tomb was discovered in a crypt near the present church. He had granted the domain to the bishops of Paris, who possessed it as a fief till the 18th century. At St. Cloud Henry III and the king of Navarre (Henry IV) established their camp during the League for the siege of Wris and there the former was assassinated. The castle, at that time a plain country house belonging to Pierre de Gondí, archbishop of Paris, was acquired in 1658 by the duke of Orleans, who built the palace which perished in 1870. It was at St. Cloud that Bonaparte executed the coup d'état of the 18th Brumaire (1799); after he became emperor the palace was his favourite residence, and there he celebrated his marriage with Marie Louise. In 1815 it was the scene of the signing of the capitulation of Paris. Seized by the Prussians at the beginning of the investment of Paris in 1870, St. Cloud was sacked during the siege. Every year in September, at the time of the pilgrimage of St. Cloud, a fair lasting four weeks is held in the park, which is famous for its beauty. Within its precincts are the national Sèvres porcelain manufactory. There are metalworks and tool shops. During the season, horse races take place in the famous hippodrome of St. Cloud, attracting crowds of Parisians.

ST. CLOUD, a city in central Minnesota, U.S.A., on the Mississippi river, 65 mi. N.W. of Minneapolis, in the counties of Benton, Sherburne and Stearns, and county seat of the latter. It is on federal highways 10 and 52, is served by the Great Northern and Northern Pacific railways, and by motorbus. Pop. (1940) 24,173. The principal agricultural product is butter; small grain crops are also important. There are extensive quarrying and fabrication of granite, the 1940 valuation approximating \$5,000,000. The Great Northern carshops and paper mills are large industries in suburban communities. St. Cloud is the site of the largest of the Minnesota state teachers' colleges (est. 1869), the state reformatory (1887), and a U.S. veterans' hospital with 400 ac. of ground. Near by, at St. Joseph and Collegeville, are the College of St. Benedict and St. John's university. The assessed valuation of property in 1940 was about \$22,000,000. St. Cloud was settled in 1852, platted in 1854, incorporated as a village in 1868 and chartered as a city in 1889. Since 1912 it has had a commission-council form of government. Before the days of the railroads it was the terminus of the Hudson's Bay company for unloading the furs brought down from the Red river valley in wooden ox-carts.

ST. CROIX or SANTA CRUZ, the largest of the West Indian islands purchased from Denmark by the United States in 1917. It lies 65 mi. S.E. of Puerto Rico, in 17° 40' N. and 64° 14' W., is 22 mi. long, varies in breadth from 1 mi. to 6 mi. and has an area of 82 sq.mi. Pop. 12,902 (1940). Hills parallel with the west-

ern coast culminate in Mount Eagle (1,164 ft.). The narrower part is also hilly, but the S. shore has marshy tracts with brackish lagoons. The population was 12,902 in 1940, with 72.7% Negro, 3.4% white and 23.9% "mixed and others." Sugar is the staple product, but other crops are being encouraged. The capital, picturesque Christiansted (pop. 4,495) is situated at the head of an inlet on the north shore, but its harbour is largely choked with mud. The only other town, Frederiksted (pop. 2,698) stands on an open roadstead on the west coast. The climate is healthy, with a mean annual temperature of 74° F. and an average annual rainfall of 45.7 in.

St. Croix was discovered in 1493 by Columbus, and owned in turn by Dutch, English and Spanish. In 1651 it was taken by France, and was given to the Knights of Malta in 1653. Denmark purchased it in 1733. Slavery was abolished in 1848 after a violent insurrection. See ST. THOMAS; VIRGIN ISLANDS.

See annual *Reports of the governor of the Virgin islands.*

ST. CYR-L'ÉCOLE, a town of France in the department of Seine-et-Oise, 3 m. W. of Versailles at the end of the old park of Louis XIV. Pop. (1936) 8,694. Its importance is due to the famous military school (*école spéciale militaire*) in which officers for the cavalry and infantry are trained, established in 1808 in a convent where Racine's *Esther* and *Athalie* were first acted. The convent was suppressed at the Revolution. There is an airfield.

ST. DAVID'S (TYDDEWI), a cathedral village-city of Pembrokeshire, Wales, situated near the sea to the south-east of St. David's head, the most westerly promontory of south Wales. Pop. (1931) 1,580. St. David's is 10 mi. from Netterson G.W.R. station, and about 16 mi. S.W. from Fishguard. The little town, locally known as "the city," stands in a lofty position near the cathedral close, and consists of five streets focusing on the square, called Cross Keys, the ancient market place still possessing its market cross (restored 1873). The origin of the fine little cathedral and its village "city" in an area so remote under modern conditions is of special interest. North-west Pembrokeshire, like most western promontories of Britain, France and Spain, is remarkably rich in old stone monuments (menhirs, dolmens and stone circles), a fact pointing in all probability to its being on the coastwise and transpeninsular route frequented by prehistoric traders from the Mediterranean to Ireland. (See PEMBROKESHIRE.) The little boats of old were driven hither and thither at the mercy of wind and tide, so the coastland of St. David's head became dotted with alternative landing places, e.g., Porth y Rhaw, St. Non's Bay, Porth Clais, Porth Stinian, Whitesand Bay, which seem to have made the neighbourhood important in pre-Christian times, as one may judge from folk tradition, monuments on the headland, etc.

The pre-Christian tradition was continued by the Celtic saints moving between Ireland and Wales. In early mediaeval days the same route grew important, as pilgrims moved to and from the shrine of St. Iago da Compostella in north-west Spain. (See Hartwell Jones, "Celtic Britain and the Pilgrim Movement," *Y Cymmrodor* 1912.) The little landing places on the shore now had Christian chapels, where prayers were possibly said for safe voyages. The most important ruins at present are those of St. Justinian. At a focus behind a group of these small ports, in the quiet sheltered, well-watered valley of the Alun, the fine cathedral of SS. David and Andrew was built, and on the high ground around, as if sheltering it still further, the "village-city" grew. Throughout the middle ages the cathedral was the centre of pilgrimage and the mediaeval roads (often marked by sacred wells) may be traced across Pembrokeshire focusing on St. David's. Two pilgrimages to St. David's were popularly thought to equal one to Rome itself. The early holders of the see ventured, while the central government was weak, to exercise metropolitan rights over much of south Wales, but the increasing power of the Norman penetration reached St. David's and Anselm's forcible appointment of Bernard—a Norman monk—to be bishop in 1115 made St. David's a suffragan see of Canterbury. A conciliatory step, it would appear, was the canonization of David about 1120. Gerald de Barri (Giraldus Cambrensis) strove vainly to regain the ancient power of St. David's from 1199–1203.

The cathedral church is partly built of a beautiful purple-hued

sandstone, quarried locally. Its proportions are: length (exclusive of the Trinity and Lady chapels) 254½ ft.; breadth of nave and aisles, 51½ ft.; breadth of transepts, including tower, 116 ft.; and height of central tower, 116 feet. The earliest and main portion of the existing fabric was erected under Bishop Peter de Leia (1176-98) in the transitional Norman-English style. Bishop David Martin (1296-1328) built the Lady chapel; Bishop Henry de Gower (1328-47) made many additions in the Decorated style, including the stone rood screen and southern porch; and Bishop Edward Vaughan (1509-22) erected the Trinity chapel between the choir and Lady chapel. The cathedral suffered severely during the changes brought about by the Reformation and at the hands of Bishop William Barlow (1536-48) and again during the civil wars of the 17th century. Subsequent restorations took place. The interior of the nave, separated by six wide bays from the aisles, is imposing with its triforium and clerestory. It has an elaborate roof of Irish oak, the gift of Treasurer Owen Pole (c. 1500). The nave is divided from the choir by Bishop Gower's fine stone screen, while the choir contains the richly carved stalls erected by Bishop Tully (1460-81), the episcopal throne, and an oaken screen that serves to separate choir and presbytery. Bishop Vaughan's chapel contains fine Tudor fan-vaulting, and the Lady chapel decorated sedilia. To the north of the cathedral is the ruined shell of the beautiful chapel with an adjoining tower, forming part of the college of St. Mary, founded by John of Gaunt and Bishop Adam Houghton in 1377. On the west bank of the Alun stand the ruins of the episcopal palace erected by Bishop Gower (c. 1342). The palace was built for residential purposes rather than for defense and occupies three sides of a quadrangle 120 ft. square, and, though roofless and deserted for nearly three centuries, retains most of its principal features. The great hall, 96 ft. by 33 ft., possesses a traceried wheel window; the chief portal is still imposing; and the chapel retains its curious bell turret; while the peculiar but graceful arcaded parapet of the roof extends intact throughout the whole length of the building. Partially dismantled by Bishop Barlow (c. 1540) the half-ruined palace was occasionally occupied by succeeding bishops prior to the civil wars. The Close contains the deanery and other residences of the cathedral clergy, mostly occupying the sites of ancient buildings. It formerly owned four gateways, of which the South or Tower gate alone remains.

ST. DENIS, a suburb of Paris, capital of an arrondissement in the department of Seine. Pop. (1936) 78,401. St. Denis, an important junction on the northern railway, stands in a plain on the right bank of the Seine, the Crould and the Rouillon, which is here joined by the canal of St. Denis. It has numerous metallurgical works, where railway material, automobiles, naval engines and the like are constructed, distilleries of spirits, glassworks, potteries and manufactories of drugs, chemical products, oils, nickel plate and pianos. The name and fame of the town are derived from the abbey founded by Dagobert I on the spot where St. Denis, the apostle of Paris, was interred.

St. Denis, the ancient *Catulliacum*, was a town of no pretensions till the foundation of its abbey, which became one of the most powerful in France. The rebuilding of the church, begun in the 12th century by Suger, was completed in the 13th century. Among the many domains of the abbey was the French Vexin. It was held during the later middle ages by the French kings and vassals of the abbey, and to this fact is due their adoption of the oriflamme or red banner of St. Denis as the royal standard. Louis XIV reduced the abbey to the rank of a priory; and at the Revolution it was suppressed, the tombs being violated and the church sacked (1793). Louis XVIII caused all the articles belonging to St. Denis to be brought back to their original site, and added other monuments from the suppressed abbeys. But it was not until after 1848 that, under the direction of Viollet-le-Duc, the basilica recovered its original appearance. St. Denis was more than once pillaged in the Hundred Years' War, suffering especially in 1358 and 1406. A sanguinary battle, in which the Catholic leader Constable Anne de Montmorency found victory and death, was fought between Huguenots and Catholics in the neighbourhood on Nov. 10, 1567. The famous fair of Lendit,

which was important in the middle ages, is still held. St. Denis is the seat of a sub-prefect. In World War II the town was occupied by the Germans in June 1940.

The church exhibits the transition from the Romanesque to the Gothic style. The west front was built between 1137 and 1140. The right-hand tower is almost pure Romanesque; that on the left was Gothic, but its spire was struck by lightning in 1837. The porch formed by the first three bays contains some remains of the basilica of Pippin the Short and Charlemagne, by whom the church was rebuilt. The nave proper (235 ft. long and 57 wide) has seven bays, and dates, as well as most of the choir and transepts, from the reign of St. Louis. The secondary apse (rond-point) and its semicircular chapels (consecrated in 1144) are considered as the first perfected attempt at Gothic. The transepts have fine façades, the north of the 12th, the south of the 13th century, each with two unfinished towers. The church contains a series of tombs of the kings and princes of the royal houses of France. The most remarkable are those of Louis XII and Anne of Brittany, executed from 1516 to 1532; of Henry II and Catherine de' Medici, a masterpiece by Germain Pilon (1564-1583); of Louis of Orléans and Valentine of Milan, from the old church of the Célestines at Paris (1502-1515); of Francis I and Claude of France, one of the most splendid tombs of the Renaissance, executed under the direction of Philibert Delorme (1550-1560); and that of Dagobert, which, though considerably dilapidated, ranks as one of the most curious of mediaeval (13th-century) works of art. In the apse some stained glass of the time of Suger remains. The crypt dates partly from the 10th or 11th century. In the centre is the vault where the coffin of the king used to lie until, to make room for that of his successor, it was removed to its final resting place. It is at present occupied by the coffin of Louis XVIII, the last sovereign whose body was borne to St. Denis. Besides fine statues, the crypt contains the Bourbon vault, in which among other coffins are deposited the remains of Louis XVI and Marie Antoinette.

See F. de Guilhermy, *Monographie de l'église royale de St. Denis* (Paris, 1848).

ST. DIE, a town of eastern France, capital of an arrondissement in the department of Vosges, 38 mi. N.E. of Épinal by rail. Pop. (1936) 17,073. St. Dié (Deodatum, Theodata, S. Deodati Fanum) grew up round a monastery founded in the 7th century by St. Deodatus of Nevers, who retired to this place. In the 10th century the community became a chapter of canons. Among the privileges enjoyed by them was that of coining money. Though they co-operated in building the town walls, the canons and the dukes of Lorraine soon became rivals for the authority over St. Dié. The institution of a town council in 1628, and the establishment in 1777 of a bishopric which appropriated part of their spiritual jurisdiction, greatly diminished the influence of the canons: and with the Revolution they were swept away. During the wars of the 15th, 16th and 17th centuries the town was repeatedly sacked. It was also partially destroyed by fire in 1065, 1155, 1554 and 1757. St. Dié is on the Meurthe in a basin surrounded by well-wooded hills. The cathedral has a Romanesque nave (12th century) and a Gothic choir; the portal of red stone dates from the 18th century. A fine cloister (13th century), containing a stone pulpit, communicates with the Petite-Église or Notre-Dame, 12th-century Romanesque. St. Dié is the seat of a bishop and of a sub-prefect. There are iron and copper mines and quarries in the vicinity; furniture, casks, textiles are manufactured; trade is in chocolate and mineral water.

ST. DIZIER, a town of northeastern France, in the department of Haute-Marne, 45 mi. N.N.W. of Chaumont by rail, on the Marne and the Haute-Mame canal. Pop. (1936) 16,780. The town is an important centre of the iron trade. It dates from the 3rd century, when the relics of Bishop St. Didier were brought there. It has an airfield.

ST. DUNSTAN'S. St. Dunstan's is a charity for British soldiers, sailors and airmen blinded in or as a result of World War I, or in any subsequent military operations. The charity is registered under the Blind Persons act, 1920, and incorporated under the Companies acts 1908 to 1917. The charity is governed by

an executive council elected annually by the governors and members, who are in the main the principal supporters and subscribers to its funds. The charity was founded in 1915 by Sir Arthur Pearson, himself blind during the last ten years of his life. Since his death Lady (Arthur) Pearson has occupied the office of president of the organization, and the executive head has been Captain Ian Fraser, himself an officer who was blinded in the war.

With the exception of about one hundred Scotsmen, who are cared for by Newington House, Edinburgh, a war charity similar to St. Dunstan's in its inception and conduct, practically all blinded officers, non-commissioned officers and men (numbering one hundred and nineteen officers and two thousand two hundred and five other ranks) of the United Kingdom, Dominions and Colonial forces, have come under the care of St. Dunstan's and its branches or affiliated organizations. St. Dunstan's and Newington House, Edinburgh, are recognized by the government departments concerned as the official centres for training, re-education, settlement and after-care of the blinded men, but both charities rely entirely upon voluntary support and receive no State aid. St. Dunstan's organization started in 1915 in a house in Regent's Park, called "St. Dunstan's Lodge" lent for the duration of the war, by the American financier, Otto Kahn. Many large establishments, some existing, some built for the purpose, were acquired to house the men during training, and the administrative offices of St. Dunstan's are still in one of these buildings.

Large sums of money have been spent upon special pensions and allowances; housing and equipment; grants in aid of financial difficulties, sickness, etc.; maternity grants; trading subsidies; holidays; amusements, etc. A Children's Fund also provides weekly allowances for children born to blinded ex-service men after their discharge from the forces.

STE. ANNE DE BEAUPRÉ, pop. 1,783, a village of Montmorency county, Quebec, Canada, at the junction of the Ste. Anne river with the St. Lawrence, and on the Quebec Railway, Light and Power Co., 22 mi. below the city of Quebec. It stands in a rolling agricultural country, with hills in the background; and near by, on the Ste. Anne river, are beautiful falls and excellent fishing. For over two centuries Ste. Anne has been known as a Roman Catholic place of pilgrimage, and many miracles are still said to be performed through the intercession of the saint, the mother of the Virgin. The famous church and shrine were burnt down a few years ago but have been restored and pilgrimages are made from all over Canada and the United States. Among the sights of interest is a huge panoramic painting of the "Day of Crucifixion" on a canvas 45 ft. high and 360 ft. in circumference.

Ste. Anne is the headquarters of the French-Canadian Redemptorists and the seat of their college.

SAINTE-BEUVE, CHARLES AUGUSTIN (1804-1869), French critic, was born at Boulogne-sur-Mer on Dec. 23, 1804. He was a posthumous child. His father, a native of Picardy, and controller of town-dues at Boulogne, was a man of literary tastes; his mother was half English, her father, a mariner of Boulogne, having married an Englishwoman. Charles Augustin was sent to a boarding school in Paris to attend the classes of the Collège Charlemagne, and then of the Collège Bourbon. He then studied medicine, but after four years abandoned it to join the staff of the new Liberal newspaper, *The Globe*, in which he published the excellent articles on the French poetry of the 16th century afterwards separately published as *Tableau historique et critique de la poésie française au XVII^e siècle* (2nd ed., 1842). In 1829 he made his first venture as a poet with the *Vie, poésies, et pensées* de Joseph Delorme. His own name did not appear; but Joseph Delorme, that "Werther in the shape of Jacobin and medical student," as Guizot called him, was the Sainte-Beuve of those days himself. In 1830 came his second volume of poems, the *Consolations*. But the critic in him grew to prevail more and more and pushed out the poet. Sainte-Beuve was at this time a devoted Catholic and a little later for a very short period a disciple of Lamennais. But he gradually separated from his Catholic friends, and at the same time a coldness grew up between him and Victor Hugo, whose warm friendship he had won by an

early article on Odes et *Ballades*. He became the lover of Madame Hugo, and a definite separation between the former friends ensued in 1834. In 1831 the *Revue des deux mondes* was founded, and from the first Sainte-Beuve was one of the most active and important contributors. He brought out his novel of *Volupté* in 1834, his third and last volume of poetry, the *Pensées d'août*, in 1837. He had long meditated work on Port-Royal, which took shape in a series of lectures delivered at Lausanne in 1838. The book occupied him at intervals until 1848—Port Royal (5 vols. 1840-48; 5th ed., 1888-91).

In 1840 Victor Cousin, then minister of public instruction, appointed him one of the keepers of the Mazarin library, an appointment which gave him rooms at the library, and a competence, and leisure for study. With a Greek teacher, M. Pantasides, he read and re-read the Greek poets. Articles on Homer, Theocritus, Apollonius of Rhodes, and Meleager in the *Revue des deux mondes* were fruits of his new Greek studies. But in general his subjects were taken from the great literature of his own country. Seven volumes of Portraits, contributed to the *Revue de Paris* and the *Revue des deux mondes*, exhibit his work in the years from 1832 to 1848, a work constantly increasing in range and value. In 1844 he was elected to the French Academy as successor to Casimir Delavigne, and was received there at the beginning of 1845 by Victor Hugo.

In March 1848 was published an account of secret-service money distributed in the late reign, and Sainte-Beuve was put down as having received the sum of one hundred francs. The sum appears to have been in reality paid for alterations to a smoky chimney in the library, but Sainte-Beuve was annoyed at the imputation and resigned his chair. He lectured for a time at Liège, but returned to Paris within a year. Dr. Véron, the editor of the *Constitutionnel*, proposed to him that he should supply that newspaper with a literary article for every Monday; and thus the famous *Causeries du lundi* were started. Sainte-Beuve now lived in the small house in the Rue Montparnasse (No. 11), which he occupied for the remainder of his life, and where in 1850 his mother, from whom he seems to have inherited his good sense, tact and finesse, died at the age of eighty-six. For three years he continued writing every Monday for the *Constitutionnel*; then he passed, with a similar engagement, to the *Moniteur*. In 1857 his Monday articles began to be published in volumes, and by 1862 formed a collection in 15 volumes; they afterwards were resumed under the title of *Nouveaux lundis*, which now make a collection of 13 volumes more.

In 1854 he was nominated to the chair of Latin poetry at the college of France. He was rudely interrupted by the students, and resigned; he was then appointed lecturer on French literature at the École Normale Supérieure. Here he lectured for four years. During this period his contributions to the *Moniteur* were intermittent. He now returned to a regular Monday article for the *Constitutionnel*.

The Empire was tardy in acknowledging his merits, and it was not until 1865 that he received the senatorship with its income sufficient to make him independent, and his health was failing him. He could seldom attend the meetings of the senate; the part he took there, however, on two famous occasions—when the nomination of Ernest Renan to the college of France came under discussion in 1867, and the law on the press in the year following—offended the majority in that conservative assembly and delighted those who "belonged," to use his own phrase, "to the diocese of free thought." He gave further pleasure in this diocese by leaving the *Moniteur* at the beginning of 1869, and contributing to a Liberal journal, the *Temps*. This defection finally alienated him from the Bonapartists, and lost him the friendship of the Princess Mathilde. His literary activity suffered little abatement, but pain made him at last unable to sit to write; he could only stand or lie. He died in his house in the Rue Montparnasse on Oct. 13, 1869.

The root of Sainte-Beuve's criticism is his single-hearted devotion to truth. What he called "fictions" in literature, in politics, in religion, were not allowed to influence him. Some one had talked on his being tenacious of a certain set of literary opinions. "I hold very little," he answers, "to literary opinions; literary

opinions occupy very little place in my life and in my thoughts. What does occupy me seriously is life itself and the object of it." "I am accustomed incessantly to call my judgments in question anew, and to re-cast my opinions the moment I suspect them to be without validity." "What I have wished" (in *Port-Royal*) "is to say not a word more than I thought, to stop even a little short of what I believed in certain cases, in order that my words might acquire more weight as historical testimony." To all exaggeration and untruth, from whatever side it proceeded, he had an antipathy. "I turn my back upon the Michelets and Quinets, but I cannot hold out my hand to the Veuillots."

But Sainte-Beuve could not have been the great critic he was had he not had, at the service of this his love of truth and measure, the conscientious industry of a Benedictine. "I never have a holiday. On Monday towards noon I lift up my head, and breathe for about an hour; after that the wicket shuts again and I am in my prison cell for seven days." The *Causeries* were at this price. They came once a week, and to write one of them as he wrote it was indeed a week's work.

To mental independence, industry, measure, lucidity, his criticism adds the merit of happy temper and disposition. Sainte-Beuve has more, as a critic, than the external politeness which once at any rate distinguished his countrymen; he has a personal charm of manner due to a sweet and humane temper. He complained of *un peu de dureté*, "a certain dose of hardness," in the new generation of writers. The personality of an author had a peculiar importance for him; the poetical side of his subjects, however latent it might be, always attracted him and he always sought to extricate it. This was because he had the moderate, gracious, amiably human instincts of the true poetic nature. As a guide to bring us to a knowledge of the great personalities in French literature he is unrivalled.

BIBLIOGRAPHY.—See his "Ma Biographie" in *Nouveaux lundis*, xiii., *Lettres à la princesse* (1873); *Correspondance* (1877-78) and *Nouvelle Correspondance* (1880); the Vicomte d'Haussonville's *Sainte-Beuve* (1875); Scherer, *Études critiques sur la littérature contemporaine*, iv. (1863-95); G. Michaut, *Sainte-Beuve avant les Lundis* (1903); L. F. Choisy, *Sainte-Beuve, L'Homme et le poète* (1921); G. Michaut, *Sainte-Beuve* (1921); L. F. Mott, *Sainte-Beuve* (N.Y., 1925).

SAINTE-CLAIRE DEVILLE, ÉTIENNE HENRI (1818-1881), French chemist, was born on March 11, 1818, in the island of St. Thomas, West Indies, where his father was French consul. Together with his elder brother Charles he was educated in Paris at the Collège Rollin. In 1844, having graduated as doctor of medicine and doctor of science, he was appointed to organize the new faculty of science at Besançon, where he acted as dean and professor of chemistry from 1845 to 1851. He succeeded A. I. Balard at the *École Normale*, Paris, in 1851 and in 1859 became professor at the Sorbonne in place of J. B. A. Dumas (*q.v.*). He died at Boulogne-sur-Seine on July 1, 1881.

He began his experimental work in 1841 with investigations of oil of turpentine and tolu balsam, in the course of which he discovered toluene (*q.v.*). His most important work was in inorganic and thermal chemistry. In 1849 he discovered nitrogen pentoxide, the first of the so-called "anhydrides" of the monobasic acids to be isolated. In 1855 he devised a method by which aluminium (*q.v.*) could be prepared on a large scale by the aid of sodium, the manufacture of which he also developed. With H. J. Debray (1827-1888) he worked at the platinum metals, his object being on the one hand to prepare them pure, and on the other to find a suitable metal for the standard metre. With L. J. Troost he devised a method for determining vapour densities at temperatures up to 1,400° C, and, partly with F. Wohler, he investigated the halides of silicon and boron. His best known contribution to chemistry is his work on the phenomena of reversible reactions (*see* CHEMICAL ACTION), which he included under the term of "dissociation." He first took up the subject about 1857, and it was during his important investigations in this field that he devised the apparatus known as the "Deville hot-and-cold tube."

ST. ELMO'S FIRE, the glow accompanying the brush-like discharges of atmospheric electricity which usually appears as a tip of light on the extremities of pointed objects such as church

towers or the masts of ships during stormy weather. It is commonly accompanied by a crackling or fizzing noise.

The name St. Elmo is an Italian corruption, through *Santi Ermo*, of St. Erasmus, the patron saint of Mediterranean sailors, who regard St. Elmo's fire as the visible sign of his guardianship. *See* Hazlitt's edition of Brand's and Ellis's *Antiquities* (1905), s.v. "Castor and Pollux."

STE.-MARIE-AUX-MINES or MARKIRCH, a town of France in the department of Haut-Rhin intersected by the Liepvette, an affluent of the Rhine. Pop. (1936) 7,058. The once productive silver, copper and lead mines of the neighbourhood were worked from the 9th till the 19th century. The main industries of the place are weaving and dyeing. The river was at one time the boundary between the German and French languages; the German-speaking inhabitants on the right bank were Protestants and subject to the counts of Rappoltstein, while the French inhabitants were Roman Catholics and under the rule of the dukes of Lorraine. The town is a tourist centre.

ST. EMILION, a town of southwestern France, in the department of Gironde, 2½ mi. from the right bank of the Dordogne and 27 mi. E.N.E. of Bordeaux by rail. Pop. (1936) 883. The town derives its name from a hermit who lived here in the 7th and 8th centuries. It has remains of ramparts of the 12th and 13th centuries. The parish church, once collegiate, dates from the 12th and 13th centuries. A Gothic cloister adjoins the church. A belfry (12th, 13th and 17th centuries) commanding the town is built on the terrace, beneath which are hollowed in the rock the oratory and hermitage of St. Emilion, and adjoining them a large ancient monolithic church. Remains of a monastery of the Cordeliers (15th and 17th centuries) and of a building (13th century) known as the Palais Cardinal, are also to be seen. St. Emilion is celebrated for its wines.

SAINTE-PALAYE, JEAN BAPTISTE LA CURNE (or LACURNE) DE (1697-1781), French scholar, was born at Auxerre on June 6, 1697. His father, Edme, had been gentleman of the bed-chamber to the duke of Orleans, brother of Louis XIV, a position which descended to his son. In 1724 he had been elected an associate of the Académie des Inscriptions et Belles-Lettres, and from this time he devoted himself exclusively to the work of this society. He began a series of studies on the chroniclers of the middle ages for the *Historiens des Gaules et de la France* (edited by Dom Bouquet): Raoul Glaber, Helgaud, the *Gesta* of Louis VII, the chronicle of Morigny, Rigord and his continuator, William le Breton, the monk of St. Denis, Jean de Venette, Froissart and the Jouvencel. His *Glossaire de la langue française* was ready in 1756, but remained in manuscript for more than a century. He died on March 1, 1781.

See the biography of La Curne, with a list of his published works and those in manuscript, at the beginning of the tenth and last volume of the *Dictionnaire historique de l'ancien langage françois, ou glossaire de la langue française depuis son origine jusqu'au siècle de Louis XIV.*, published by Louis Favre (1875-82).

SAINTES, a town of western France, capital of an arrondissement in the department of Charente-Inférieure, 47 mi. S.E. of La Rochelle by the railway from Nantes to Bordeaux. Pop. (1936) 18,632. Saintes (*Mediolanum* or *Mediolanium*), the capital of the Santones, was a flourishing town before Caesar's conquest of Gaul; in the middle ages it was capital of the Saintonge. Christianity was introduced by St. Eutropius, its first bishop, in the middle of the 3rd century. Charlemagne rebuilt its cathedral. The Normans burned the town in 847 and 854. Richard Coeur de Lion was besieged and captured there by his father Henry II. In 1242 St. Louis defeated the English there, but the town was not permanently recovered from the English until the reign of Charles V. It has Roman remains, of which the best preserved is the arch of Germanicus, dating from the reign of Tiberius. This formerly stood on a Roman bridge destroyed in 1843, when it was removed and reconstructed on the right bank of the river. Ruins of baths and of an amphitheatre are also to be seen. The large amphitheatre was capable of holding 20,000 spectators. Saintes was a bishop's see till 1790; the cathedral of St. Peter, built in the early 12th century, was rebuilt in the 15th century and again after it had been almost destroyed by the Huguenots

in 1568. It has a 15th century tower. The church of St. Eutropius (6th century, rebuilt in the 11th) stands above a large, well-lighted crypt adorned with richly sculptured capitals and containing the tomb of St. Eutropius (4th or 5th century). The fine stone spire dates from the 15th century. Notre-Dame (11th and 12th centuries) has a noble clock tower and is now desecrated. The old *hôtel de ville* (16th and 18th centuries) contains a library. The town is the seat of a sub-prefect. The Mestreau museum has a fine collection of pottery, jewellery, furniture and embroideries. Small vessels ascend the river as far as Saintes, which carries on trade in grain, brandy and wine, has iron foundries and railway works and manufactures earthenware and tiles.

ST. ETIENNE, an industrial town of east-central France, capital of the department of Loire, 310 mi. S.S.E. of Paris and 36 mi. S.S.W. of Lyons by rail. Pop. (1936) 171,669. At the close of the 12th century St. Etienne was a parish of the Pays de Gier belonging to the abbey of Val-Benoite. By the middle of the 14th century the coal trade was developing, and in the early 15th century Charles VII allowed the town to build fortifications. The manufacture of firearms for the state was begun at St. Étienne under Francis I and was put under the surveillance of state inspectors early in the 18th century. The manufacture grew rapidly. The first railways opened in France were the line between St. Etienne and Andrézieux on the Loire in 1828 and that between St. Étienne and Lyons in 1831. In 1856 St. Étienne became the administrative centre of the department.

St. Etienne stands on the Furens, which flows through it, partly underground, and is important for the silk manufacture. It is the seat of a prefect, of tribunals of first instance and of commerce, of a chamber of commerce and of a board of trade-arbitrators and has schools of mining, chemistry and dyeing.

The town owes its importance chiefly to the coal-basin which extends between Firminy and Rive-de-Gier over an area 20 mi. long by 5 mi. wide and is second only to those of Nord and Pas-de-Calais in France. The mineral is of two kinds—smelting coal, said to be the best in France, and gas coal. There are manufactures of ribbons, trimmings and other goods made from silk and mixtures of cotton and silk. This industry dates from the early 17th century and is carried on chiefly in small factories (electricity supplying the motive power). The attendant industry of dyeing is carried on on a large scale. The manufacture of steel and iron and of heavy iron goods such as armour-plating is important and of ironmongery generally. Weaving machinery, cycles, automobiles and agricultural implements are also made. Before World War II manufacture of firearms was carried on at the national factory under the direction of artillery officers. Private firms made both military rifles and sporting-guns, revolvers, etc. Other industries are the manufacture of elastic fabrics, glass, cartridges, liqueurs, hemp-cables, etc. In World War II, the town was occupied by the Germans in November 1942.

ST. EUSTATIUS and **SABA**, two islands in the Dutch West Indies. St. Eustatius lies 12 mi. N.W. of St. Kitts in 17° 50' N. and 62° 40' W. It is 7 sq.mi. in area and is composed of several volcanic hills and intervening valleys. Orangetown, on an open roadstead on the W., has a small export trade in yams and sweet potatoes. Pop. 1,146 in 1941.

A few miles to the N.W. is the island volcanic cone of SABA, 5 sq.mi. in extent rising abruptly to nearly 2,800 feet. The town, Bottom, on an old crater floor, can be approached from the shore 800 ft. below only by steps in solid rock known as the "Ladder." The best boats in the Caribbees are built here; the wood is imported and the vessels, when complete, are lowered over the face of the cliffs. Pop. 1,213 (1941). The islands form part of the colony of Curacao (*q.v.*).

SAINT-EVREMOND, CHARLES DE MARGUETEL DE SAINT-DENPS, SEIGNEUR DE (1610-1703), was born at Saint-Denis-le-Guaist, near Coutances, on April 1, 1610. He served through a great part of the Thirty Years' War, distinguishing himself at the siege of Landrecies (1637), when he was made captain. During his campaigns he studied the works of Montaigne and the Spanish and Italian languages. In 1639 he met Gassendi in Paris, and became one of his disciples. He was present at Rocroy,

at Nordlingen and at Lerida. For a time he was personally attached to Condé, but offended him by a satirical remark and was deprived of his command in the prince's guards in 1648.

During the Fronde, Saint-Évremond was a steady royalist. The duke of Candale (of whom he has left a very severe portrait) gave him a command in Guienne, and Saint-Évremond, who had reached the grade of *maréchal* de camp, is said to have saved 50,000 livres in less than three years. He was one of the numerous victims involved in the fall of Fouquet. His letter to Marshal Créquì on the peace of the Pyrenees, which is said to have been discovered by Colbert's agents at the seizure of Fouquet's papers, seems a very inadequate cause for his disgrace. Saint-Évremond fled to Holland and to England, where he was kindly received by Charles II. and was pensioned. After James II.'s flight to France Saint-Évremond was invited to return, but he declined. Hortense Mancini, the most attractive of Mazarin's attractive group of nieces, came to England in 1670, and set up a salon for love-making, gambling and witty conversation, and here Saint-Évremond was for many years at home. He died on Sept. 29, 1703, and was buried in Westminster Abbey.

Saint-Évremond empowered Des Maizeaux to publish his works after his death, and they were published in London (2 vols., 1705), and often reprinted. His masterpiece in irony is the so-called Conversation du markchal d'*Hocquincourt avec le père Canaye* (the latter a Jesuit and Saint-Évremond's master at school).

His Oeuvres *mêlées*, edited from the MSS. by Silvestre and Des Maizeaux, were printed by Jacob Tonson (London, 1705, 2 vols.; 2nd ed., 3 vols., 1709), with a notice by Des Maizeaux. His correspondence with Ninon de Lenclos, whose fast friend he was, was published in 1752; La Comédie des académistes, written in 1643, was printed in 1650. Modern editions of his works are by Hippeau (Paris, 1852), C. Giraud (Paris, 1865), and a selection (1881) with a notice by M. de Lescure.

ST. GALL, a canton in north-east Switzerland, bordered by the principality of Liechtenstein and by Vorarlberg (Austria). It entirely surrounds the canton of Appenzell, which formerly belonged to the abbots of St. Gall. Five other cantons lie along its north, west and south borders.

Its area is 777.2 sq.mi., of which about 88% are reckoned "productive," forests covering about 165 sq.mi. and vineyards only about 1 sq.mi. The altitude above sea-level varies from 1,309 ft. (the Lake of Constance) to 10,667 ft. (the Ringelspitz) in the extreme south. There are nearly 3 sq.mi. of glaciers, but slightly over one-quarter of the unproductive area consists of lakes, including portions of the Lake of Constance, of the Wallensee, and of the Lake of Ziirich, together with several small lakes wholly within its limits. The canton is mountainous in the south near its borders with the Grisons and Glarus, but towards Thurgau the surface is characterized by hummocky hill country. Considerable low-lying alluvial plains occur along the courses of the Linth and Rhine, particularly in those sections of the rivers which form, in part, its frontiers on the east and south-west. Within the canton, the most important streams are the upper River Thur and the lower and middle portions of its principal tributary, the Sitter. It has ports on the Lake of Constance (Rorschach) and of Ziirich (Rapperswil), while Weesen is the chief town on the Wallensee. Probably the most fashionable watering-place is Ragatz, receiving the hot mineral waters (95° F) of Pfafers by means of a 3 m. conduit. The main railway lines from Ziirich past Sargans for Coire, and from Sargans past Rorschach for Constance skirt its borders, while the capital is on the direct railway line from Zurich past Wil to Rorschach, and communicates by rail with Appenzell and with towns in the Toggenburg (*q.v.*). In 1930 the population of the canton was 286,362 of whom 279,230 were German-speaking, 4,989 Italian-speaking and 993 French-speaking, while there were 170,445 Catholics, 114,545 Protestants and 704 Jews; in 1941 the population was 285,682. The capital of the canton is St. Gall, population (1941) 62,360; the other most populous places are Rorschach (pop. 10,536 in 1941), Altstätten (pop. about 8,900), Gossau (pop. 7,846) and Wattwil (6,330). In the southern and more Alpine portion of the canton the inhabitants mainly follow pas-

toral pursuits, while in the central and northern regions agriculture is frequently combined with manufactures.

The canton is one of the most industrial in Switzerland. Cotton spinning is widely spread, though the characteristic industry is the manufacture of muslin, embroidery and lace, chiefly at the capital and at Altstätten; the value of the embroidery and lace exported from the canton, though fluctuating, normally amounts to about one-seventh of the total export trade of Switzerland. Ores of iron and of manganese are raised in the Gonzen mine near Sargans. The canton is divided into 14 administrative districts, which comprise 91 communes.

The existing constitution dates from 1890. The legislature (Grossrat) of 174 deputies is elected on the principle of proportional representation. Each commune of 1,500 Swiss inhabitants or less has a right to one member, and as many more as the divisor 1,500 justifies. Members hold office for three years. The seven members of the executive (Regierungsrat) also hold office for three years and are elected by the combined communes. The two members of the federal Ständerat are named by the legislature, while the 13 members of the federal Nationalrat have, since 1911, been elected by a scheme of proportional representation, using the popular vote. The right of "facultative referendum" and of "initiative" as to legislative projects has, since 1875 and 1890 respectively, belonged to any 4,000 electors, but in case of "initiative" in constitutional matters (1861) 10,000 must sign the demand. The canton of St. Gall, a great part of which formerly belonged to the abbots of St. Gall, is one of the later political units, having been formed in 1803, from numerous districts, some of which, e.g., Gaster, Uznach and Gams, had been controlled by the adjacent and older cantons since the 15th century.

ST. GALLEN (Fr. **ST. GALL**), capital of the Swiss canton of that name, is situated in the upland valley of the Steinach, 2,195 ft. above sea-level. Its population is almost all German-speaking, while the Protestants and Catholics each comprise about half the population, with a small number of Jews. In 1920 the population was 70,437; in 1930 63,947, and in 1941 62,360, a decrease due partly to World Wars I and II.

St. Gallen owes its origin to St. Gall, an Irish hermit, who in 614, built his cell in the forest which then covered the site, and lived there till his death in 640. About the middle of the 8th century the collection of hermits' dwellings was transformed into a regularly organized Benedictine monastery. For the next three centuries this was one of the chief seats of learning and education in Europe. About 954 the monastery and its buildings were surrounded by walls as a protection against the Saracens, and this was the origin of the town.

In 1311 St. Gallen became a free imperial city, and about 1353 the guilds, headed by that of the cloth-weavers, obtained the control of the civic government, while in 1415 it bought its liberty from the German king Sigismund. This growing independence did not please the abbots, who had been made princes of the Empire in 1204, and there followed a long struggle between them and their rebellious subjects of St. Gallen and Appenzell. In 1411 the Appenzellers became "allies" of the Swiss confederation, as did the town of St. Gallen a few months later, this connection becoming an "everlasting" alliance in 1454, while in 1457 the town was finally freed from the abbot. After further conflicts, the abbot in 1490 concluded an alliance with the Swiss which reduced his position almost to that of a "subject district." The townsmen adopted the Reformation in 1524, and this new cause of difference further envenomed their relations with the abbots. Both abbot and town were admitted regularly to the Swiss diet, but neither succeeded in its attempts to be received a full member of the Confederation. In 1798 and finally in 1805 the abbey was secularized, while out of part of its dominions and those of the town the canton Sants (now St. Gall) was formed, with St. Gallen as capital.

St. Gallen is by rail 9 m. S.W. of Rorschach, its port on the lake of Constance, and 53 m. E. of Zürich. The older or central portion of the town retains the air of a small rural capital, but the newer quarters present the aspect of a modern commercial

centre. Its chief building is the abbey church of the celebrated old monastery (dating in its present form from 1756-1765). It has been a cathedral church (Catholic) since 1846. The famous library is housed in the former palace of the abbot, and is one of the most renowned in Europe by reason of its rich treasures of early mss. and printed books. Other portions of the monastic buildings are used as the offices of the cantonal authorities, and contain the extensive archives both of this monastery and of that of Pfäfers.

See *Dict. géogr. de la Suisse*, vol. iv. (1906).

SAINT-GAUDENS, AUGUSTUS (1848-1907), American sculptor, was born in Dublin, Ireland, on March 1, 1848, the son of a French father, a shoemaker by trade, and an Irish mother, and was taken to America in infancy. He was apprenticed to a cameo-cutter, studying in the schools of Cooper Union (1861) and the National Academy of Design, New York (1865-1866). His earliest work in sculpture, made upon the eve of his departure, in 1868, for Paris, was a bronze bust of his father, Bernard P. E. Saint-Gaudens. After some delay he was admitted as a pupil of Joffroy in l'École des Beaux-Arts, and two years later, with his fellow-student Mercié, he went to Italy, where he remained three years. While in Rome he executed his statues "Hiawatha" and "Silence." Returning in 1873 to New York he made, the following year, an admirable bust of the statesman, William M. Evarts, and was commissioned by John La Farge to execute a relief of adoring angels for St. Thomas' Episcopal Church, New York, a work which immediately won the esteem of his brother artists. The church was destroyed by fire a few years later. His statue of Admiral Farragut, Madison Square, New York, was ordered in 1876, exhibited at the Paris salon of 1880 and unveiled in 1881. It was received with enthusiasm and from its first appearance Saint-Gaudens was recognized as a new leader in his art. To this period also belong the "Randall" of the "Sailors' Snug Harbour," Staten Island, and the beautiful caryatides for the Vanderbilt fireplace, preserved in the Metropolitan Museum.

At all times throughout his life the sculptor found diversion from more serious tasks in modelling portraits of friends in low relief. Among these we may note the medallions and plaques of Bastien-Lepage and Dr. Henry Shiff (1880); Homer Saint-Gaudens and the children of Prescott Hall Butler (1881); Mrs. Stanford White (1884); Robert Louis Stevenson (1887); William M. Chase and the children of Jacob H. Schiff (1888); Kenyon Cox (1889), etc. Yet another form of sculpture was developed in his high-reliefs of Dr. Henry Bellows (1885) and Dr. McCosh (1889); and the lovely "Amor Caritas," which, with variations, long occupied his mind. His noble statue of Lincoln was unveiled in 1887 in Lincoln park, Chicago, and was at once accepted as the country's ideal. In Springfield, Mass., his unique "Deacon Chapin," known as "The Puritan," appeared also in 1887. The Adams memorial (1891) in Rock Creek cemetery, Washington, D.C., is considered by many to be Saint-Gaudens' greatest work; indeed not a few rate it as America's highest artistic achievement. The mysterious draped figure with shadowed face is often called "Grief," but the sculptor had no such intention; "Peace" or "Nirvana" better convey the meaning. The Garfield memorial in Fairmount park, Philadelphia, was completed in 1895. The Shaw memorial in Boston, a monument to Robert G. Shaw, colonel of a negro regiment in the Civil War, was begun in 1884 and occupied the master intermittently for more than 12 years, being dedicated in 1897. It is a large relief in bronze, measuring some 15 by 11 ft., and containing many marching soldiers, led by their young officer on horseback. The year 1897 saw likewise the completion of the "Logan" on a fiery steed, in Grant park, Chicago.

Another famous equestrian statue is the "General Sherman" which was begun in 1892 and dedicated in 1903. Standing at the entrance of Central park at 59th Street and Fifth Avenue, New York, this golden group of the mounted commander led by a beautiful winged "Victory" is one of the most impressive of the city's monuments. The "Sherman" was shown with other works of Saint-Gaudens at the Paris Exposition of 1900, receiving there the highest honours. The sculptor was made an officer of the Legion of Honour and corresponding member of the Institute of

France. A bronze copy of his "Amor Caritas" was purchased by the French Government. Other important works are the Peter Cooper memorial, New York; the "Parnell," in Dublin; the Phillips Brooks monument in Boston and a fine seated figure of Lincoln, recently erected on Chicago's lake front. Saint-Gaudens died at Cornish, N.H., on Aug. 3, 1907. He is rightly regarded as America's greatest sculptor and his work continues to exert a powerful and beneficent influence in the United States. In 1877 he married Augusta F. Homer and left a son, Homer Saint-Gaudens, now director of fine arts of the Carnegie Institute, Pittsburgh, Pa. His brother Louis (1854-1913) also a sculptor, assisted Augustus Saint-Gaudens in some of his creations.

Lewis Hind, *Augustus Saint-Gaudens* (1908); Homer Saint-Gaudens, *The Reminiscences of Augustus Saint-Gaudens* (1913). (L. T.)

ST. GAUDENS, a town of France, capital of an arrondissement in the department of Haute-Garonne, 1 m. from the river Garonne, 57 mi. S.S.W. of Toulouse. Pop. (1936) 4,684. St. Gaudens derives its name from a martyr of the 5th century, at whose tomb a college of canons was established. It was important as capital of the Nébouzan, as the residence of the bishops of Comminges and for its cloth industry. The church, once collegiate, dates chiefly from the 11th and 12th centuries, but the main entrance is flamboyant Gothic. It is the seat of a sub-prefect.

SAINT-GERMAIN, COMTE DE (c. 1710-c. 1780) called *der Wundermann*, a celebrated adventurer. Of his parentage and place of birth nothing is definitely known; the common version is that he was a Portuguese Jew. He knew nearly all the European languages, and spoke German, English, Italian, French (with a Piedmontese accent), Portuguese and Spanish. Grimm affirms him to have been the man of the best parts he had ever known. He was a musical composer and a capable violinist. His knowledge of history was comprehensive, and his accomplishments as a chemist, on which he based his reputation, were in many ways real and considerable. He pretended to have a secret for removing flaws from diamonds, and to be able to transmute metals. The most remarkable of his professed discoveries was of a liquid which could prolong life, and by which he asserted he had himself lived 2,000 years.

Saint-Germain is mentioned in a letter of Horace Walpole's as being in London about 1743, and as being arrested as a Jacobite spy and released. Walpole says: "He is called an Italian, a Spaniard, a Pole; a somebody that married a great fortune in Mexico and ran away with her jewels to Constantinople; a priest, a fiddler, a vast nobleman." At the French court, where he appeared about 1748, he exercised for a time extraordinary influence and was employed on secret missions by Louis XV.; but, having interfered in the dispute between Austria and France, he was compelled in June 1760, on account of the hostility of the duke of Choiseul, to remove to England. He appears to have resided in London for one or two years, but was at St. Petersburg in 1762, and is asserted to have played an important part in connexion with the conspiracy against the emperor Peter III. in July of that year, a plot which placed Catherine II. on the Russian throne. He then went to Germany, where, according to the *Mémoires authentiques* of Cagliostro, he was the founder of freemasonry, and initiated Cagliostro into that rite. He was again in Paris from 1770 to 1774, and after frequenting several of the German courts he took up his residence in Schleswig-Holstein, where he and the Landgrave Charles of Hesse pursued together the study of the "secret" sciences. He died at Schleswig in or about 1780-1785, although he is said to have been seen in Paris in 1789.

Andrew Lang in his *Historical Mysteries* (1904) discusses the career of Saint-Germain, and cites the various authorities for it. Saint-Germain figures prominently in the correspondence of Grimm and of Voltaire. See also Oettinger, *Graf Saint-German* (1846); F. Bülow, *Geheime Geschichten und rathselhafte Menschen*, Band 1. (1850-60); Lascelles Wrasall, *Remarkable Adventures* (1863); and U. Birch in the *Nineteenth Century* (January 1908).

SAINT-GERMAIN, CLAUDE LOUIS, COMTE DE (1707-1778), French general, was born on April 11, 1707, at the

Château de Vertamboz. He entered the army, but left France, apparently on account of a duel, and fought in the armies of the elector palatine and the elector of Bavaria. Then, after a brief service under Frederick the Great of Prussia, he joined Marshal Saxe in the Netherlands, and was created a field-marshal of the French army. On the outbreak of the Seven Years' War (1756) he was appointed lieutenant-general, but he fell a victim to court intrigues and professional jealousy. He resigned his commission in 1760 and accepted an appointment as field-marshal from Frederick V. of Denmark, being charged in 1762 with the reorganization of the Danish army. On the death of Frederick in 1766 he returned to France, bought a small estate in Alsace near Lauterbach, and devoted his time to religion and farming. In October 1775 he was appointed minister of war by Louis XVI., but his efforts to effect economies and to introduce Prussian discipline in the French army brought on such opposition that he resigned in September 1777. He died in his apartment at the arsenal on Jan. 15, 1778.

ST. GERMAIN, TREATY OF (see also VERSAILLES, TRIANON, and NEUILLY, TREATIES OF). Austria and Hungary had up to 1918 formed a diplomatic unit, but in Oct. 1918 they were virtually two separate states. The Armistice of Nov. 4 still recognized Austria-Hungary as a diplomatic unit, but Austria was proclaimed a Republic Nov. 12, as was Hungary Nov. 16. The Armistice concluded by the Powers direct with Hungary (Nov. 13) recognized that Power's *de facto* independence of Austria.

All the Powers, except the United States, early asserted that the "Fourteen Points," etc., did not apply to the settlements with Austria and Hungary. In Jan. 1919 it was known that even Wilson favoured including in Italy part of the Slovene population of Istria and Carniola, and would make Italy further concessions. On April 14 he agreed to grant Italy the Tirol south of the Brenner Pass, with about 250,000 Germans, as well as the Trentino, as already agreed by France and Great Britain. It was known also that the Czechoslovak State would include over 3,000,000 Germans. Austria was to be reduced to some two-thirds of her German-speaking territories. In mid-April the French Prime Minister Clemenceau obtained from the Allies the further important decision to prohibit union between Austria and Germany without the unanimous consent of the Council of the League. This was embodied in the draft treaty with Germany of May 6, and formed article 80 of the Treaty of Versailles of June 28, appearing as article 88 of the Treaty of St. Germain, and article 72 of the Treaty of Neuilly.

On May 2 the Austrian delegation was invited to Paris. On June 2 they were presented with a very imperfect draft treaty, followed by a more detailed one on July 20. Austria made great protests, turning mainly on two points. She asserted the applicability of the "Fourteen Points" to her case, and her right therefore to retain all her German subjects. President Wilson alone was willing to extend the application of the "Fourteen Points" to Austria; the treaty assigned 3,500,000 Germans to Czechoslovakia, about 250,000 to Italy. The other main point of dispute was how far Austria must accept the responsibilities of old Austria-Hungary. The Allies finally decided that the Austrian Republic was not a new State but an old one lopped off certain outlying provinces and endowed with a new government. The Allies recognized this government *de facto* by accepting their credentials on May 22 and *de jure* on Sept. 10, by signing the treaty with them at St. Germain-en-Laye. It came into force on July 16 1920.

Part I. The Covenant, and Part XIII. Labour, are as in the Treaty of Versailles.

Part II. of the Austrian Treaty details the borders of the new Austrian State.

Part III. Political Clauses for Europe.—This deals with technical details such as the financial obligations of the former Austrian empire affecting Italy, Yugoslavia, Czechoslovakia and Rumania. Articles 49-50 arranged for a plebiscite in two areas of the Klagenfurt basin. This plebiscite, taken in 1920, went in Austria's favour. West Hungary, with about 333,000

souls, was transferred from Hungary to Austria but ultimately, in 1921, without its chief town (see *BURGENLAND*). Further clauses in Part III, dealt with the protection of racial and religious minorities. Article No. 88 prohibits Austria from alienating her independence (*i.e.*, joining Germany) otherwise than with the consent of the Council of the League of Nations.

Part IV. Austrian Interests Outside Europe.—As in the Treaty of Versailles this part provides for a total renunciation of State properties immovable and movable outside Europe, and also of treaties, capitulations, concessions, etc., in the following countries: Morocco, Egypt, Siam and China.

Part V. Military, Naval and Air Clauses followed the general lines of the similar clauses in the Treaty of Versailles but showed somewhat more consideration to Austria. A long-service voluntary force not exceeding 30,000 was allowed. The manufacture of arms, etc., was confined to a single factory (article 132). The naval clauses were very drastic; the whole Austro-Hungarian Navy was broken up or distributed among the Allies, Austria only retaining four patrol boats on her inland waters. The air clauses were as in the German Treaty.

Part VI. Prisoners of War and Graves, Part XI. Aerial Navigation, were as in the German Treaty, with a few very small alterations.

Part VII. Penalties provided for the trial before Allied military tribunals of Austrian offenders against the laws and customs of war. This provision was not executed.

Part VIII. Reparations; Part IX. Financial Clauses; Part X. Economic Clauses.—By article 177 Austria accepted responsibility for herself and her Allies for causing loss and damage to the Allied (Entente) Governments by the War. The rest of the "Reparation Chapter" followed the corresponding section in the German Treaty. No lump sum was fixed, but discretion was, in effect, given to the Reparation Commission to fix it. Austria handed over her whole commercial fleet and much livestock to the Allies. Czechoslovakia, Yugoslavia, Poland and Rumania had, however, to contribute to expenses incurred by the Allies in liberating their territory from Austria. The financial clauses involved many complex questions as to the allocation of pre-war debt and the distribution of war debts. All these provisions were somewhat relaxed by the Supreme Council on March 17, 1921, and the process was completed by Austria placing her finances under control of the League in Sept. 1922 (see *AUSTRIA*).

Part XII. Ports, waterways and railways, merely stressed some points in the corresponding section of the German Treaty.

See *Treaty Series*, No. II (Cmd. 400 of 1919); also H. W. V. Temperley (ed.), *A History of the Peace Conference of Paris*; vol. iv. and v. (Institute of International Affairs, London, 1921).

ST. GERMAIN-EN-LAYE, a town of northern France, in the department of Seine-et-Oise, 13 m. W.N.W. of Paris by rail. Pop. (1936) 21,638. Built on a hill on the left bank of the Seine and on the edge of a forest 10,000 to 11,000 ac. in extent, St. Germain has a bracing climate, which makes it a summer residence for Parisians. A monastery in honour of St. Germain, bishop of Paris, was built in the forest of Laye by King Robert. Louis VI built a castle close by. Burned by the English, rebuilt by Louis IX, and again by Charles V, this castle was completed by Francis I. A new castle was begun by Henry II and completed by Henry IV; it was subsequently demolished, except the so-called Henry IV pavilion. The old castle has been restored. James II of England died at St. Germain. Several treaties were signed at St. Germain-en-Laye: in 1574 the peace with Charles of Lorraine; in 1612 the treaty of the restitution of Canada by the English; and, in 1919 the treaty with Austria. The town was occupied by the Germans in June 1940. Musical instruments are built there; frames, hosiery, confectionery are made.

ST. GERMANS, a village and parish of Cornwall, England, 93 mi. W. by N. of Plymouth by the G.W.R. Pop. of parish (1931) 1,964. It is supposed to have been the original seat of the Cornish bishopric. It was the see of Bishop Burghwald, who died in 1027. Under Leofric, who became bishop of Crediton and Cornwall in 1046, the see was removed to Exeter. Bishop Leofric founded a priory at St. Germans and bestowed upon it half the

lands which then constituted the bishops' manor of St. Germans. There was then a market on Sundays, but at the time of Domesday it had seriously declined. The bishop in 1311 obtained a grant of a market on Fridays and a fair at the feast of St. Peter ad Vincula. In 1343 the prior sustained his claim to a prescriptive market and fair at St. Germans. After the suppression the borough belonging to the priory remained with the crown until 1610. Meanwhile Queen Elizabeth created it a parliamentary borough and from 1563 to 1832 it returned two members. The 12th century church of St. Germanus has much Norman work, with Early English, Perpendicular and Decorated additions.

ST. GILLES, a town of southern France, in the department of Gard, on the canal from the Rhône to Sète, 12½ mi. S.S.E. of Nîmes by road. Pop. (1936) 4,399. In the middle ages St. Gilles, the ancient *Vallis Flaviania*, was the seat of an abbey founded in the 7th century by St. Aegidius (St. Gilles). It acquired wealth and power under the counts of Toulouse, who added to their title that of counts of St. Gilles. The church was founded 1116. The lower part of the Romanesque front (12th century) has three bays decorated with columns and bas-reliefs. There is a 12th century crypt. St. Gilles was the seat of the first grand priory of the Knights Hospitallers in Europe (12th century) and was their place of embarkation for the East. In 1226 it was united to the crown. In 1562 the Protestants ravaged the abbey, which they occupied till 1622; in 1774 it was suppressed. The town has an important trade in wines.

ST. GOTTHARD PASS, an important motor and railway route from northern Europe to Italy, takes its name from St Gotthard, bishop of Hildesheim (d. 1038), but does not seem to be mentioned before the early 13th century. The hospice on the summit is first mentioned in 1331, and from 1683 was in charge of two Capuchin friars. In 1775 the buildings near it were damaged by an avalanche, while in 1799–1800 everything was destroyed by the French soldiery. Rebuilt in 1834, the hospice was burnt in March 1905. The mule path (dating from about 1293) across the pass served for many centuries. The carriage-road was only constructed between 1820 and 1830. Beneath the pass is the St. Gotthard tunnel (pierced in 1872–1880, 9¼ m. in length, and attaining a height of 3,786 ft.), through which runs the railway (opened in 1882) from Lucerne to Milan (175½ m.). The railway runs first along the northern and eastern shores of Lake Lucerne, from Lucerne to Flielen (32½ m.), and then up the Reuss valley past Altdorf and Wassen, near which is the first of the famous spiral tunnels, to Goschenen (56 m. from Lucerne). Here the line enters the tunnel and gains,

A SECTION OF THE ST. GOTTHARD PASS IN THE FREMOLA VALLEY

at Airolo, the valley of the Ticino or the Val Leventina, which it descends, through several spiral tunnels, till at Biasca (38 m. from Goschenen) it reaches more level ground. Thence it runs past Bellinzona to Lugano (303 m. from Biasca) and reaches Italian territory at Chiasso, 3j m. from Milan. The railway is now the property of the Swiss Government.

ST. HELENA (hĕl-ĕn'ə), an island and British possession in the S. Atlantic, 15° 55' 26" S., 5° 42' 30" W. (Ladder Hill Observatory). Area 47 sq.m., extreme length, south-west to north-east 10¼ m., extreme breadth 8¼. The island is wholly of volcanic

origin, the activity being long extinct, whilst subaerial denudation has greatly modified it and marine erosion has formed perpendicular cliffs 450–2,000 ft. high on the east, north and west sides. Its principal feature, a semi-circular ridge of mountains, with the culminating summit of Diana's peak (2,704 ft.), is the northern rim of a great crater; the southern rim having been breached hypothetically forms the centre of the ring. From the crater wall outwards water-cut gorges stretch in all directions, widening as they approach the sea into valleys, some of which are 1,000 ft. deep. These valleys contain small streams. Springs of pure water are abundant. Along the enclosing hillsides caves have been formed by the washing out of the softer rocks. The lavas are basalts, andesites, trachytes and phonolites; there is much volcanic ash, tuff, scoriae, etc., and conspicuous features are formed by rocks, representing a late period of activity. Such features are Ass's Ears, Lot's Wife and the Chimney. There are several subsidiary craters. The only practicable landing-place is on the leeward side at St. James's bay. From the head of the bay a narrow valley extends for 1½ miles. The greatest extent of level ground is in the north-east of the island, where are the Deadwood and Longwood plains, over 1,700 ft. above the sea.

Although the island is within the tropics its climate is healthy and temperate. This is due to the south-east trade-wind, and to the effect of the cold waters of the South Atlantic current. The temperature varies on the sea level from 68° to 84° in summer and 57° to 70° in winter. The higher regions are about 10° cooler. The rainfall varies considerably.

Flora and Fauna.—St. Helena has three vegetation zones: (1) the coast zone, extending inland for 1 m to 1½ m., now "dry, barren, soilless, lichen-coated, and rocky," with little save prickly pears, wire grass and *Mesembryanthemum*; (2) the middle zone (400–1,800 ft.), extending about three-quarters of a mile inland, with shallower valleys and grassier slopes—the English broom and gorse, brambles, willows, poplars and Scotch pines, being the prevailing forms; and (3) the central zone, about 3 m. long and 2 m. wide, the home, for the most part, of the indigenous flora. Of 38 flowering plants all save *Scirpus nodosus* are peculiar to the island; several indigenous plants are dying out. The indigenous flora shows affinities with African flora, but in recent years many species have become extinct. The exotic flora gives the island almost the aspect of a botanic garden. The oak, thoroughly naturalized, grows alongside of the bamboo and banana. Among other trees and plants are the common English gorse; *Rubus pinnatus*, *Hypochoeris radicata*, the *Buddleia Madagascariensis*; *Physalis peruviana*; the common castor-oil plant; and the pride of India. The flax (*Phormium tenax*) has been introduced in recent years. The peepul is the principal shade tree in Jamestown, and in Jamestown valley the date-palm grows freely. Orange and lemon trees, once common, are scarce.

St. Helena has no indigenous vertebrate land fauna. The only land groups well represented are the beetles and the land shells. T. V. Wollaston, in *Coleoptera Sanctae Helenae* (1877), shows that out of a total list of 203 species of beetles 129 are probably aboriginal and 128 peculiar to the island—an individuality perhaps unequalled in the world. More than two-thirds are weevils and a vast majority wood-borers, a fact which bears out the tradition of forests having once covered the island. A South American white ant (*Termes tenuis*, Hagen.), introduced from a slave-ship in 1840, soon became a plague at Jamestown. Practically everything had to be rebuilt with teak or cypress. Fortunately it cannot live in the higher parts of the island. Besides domestic animals the only land mammals are rabbits, rats and mice, the rats being especially abundant. Probably the only endemic land bird is the wire bird, *Aegialitis sanctae Helenae*; the averdevat, Java sparrow, cardinal, ground-dove, partridge (possibly the Indian *chukar*), pheasant and guinea-fowl are all common. There are no freshwater fish, beetles or shells. Of 65 species of sea-fish caught 17 are peculiar to St. Helena; economically the more important kinds are gurnard, eel, cod, mackerel, tunny, bullseye, cavalley, flounder, hog-fish, mullet and skulpin.

Population.—When discovered the island was uninhabited. The majority of the population are of mixed European (British,

Dutch, Portuguese), East Indian and African descent—the Asiatic strain perhaps predominating, the majority of the early settlers having been previously members of the crews of ships returning to Europe from the East. From 1840 onward for a considerable period numbers of freed slaves of West African origin were settled here. Their descendants form a distinct element in the population. Since the substitution of steamships for sailing vessels and the introduction of new methods of preserving meat and vegetables the population has greatly diminished. The only town, in which live more than half the total population, is Jamestown. Longwood, where Napoleon died in 1821, is 3½ m. E. of Jamestown. The estimated population in 1930 was 3,905. A detachment of Royal Marine Artillery is stationed on the island.

Industries.—Less than a third of the area of the island is suitable for farming. The principal crop is potatoes. Cattle and sheep are raised but there is no outside market. The aloe (*Furcraea gigantea*) grows wild and the New Zealand flax (*Phormium tenax*), an introduced plant, is used in the manufacture of fibre. There are now seven mills engaged in the industry. In 1925, 1,500 ac. were under flax. Fish curing and lace making are also carried on. Trade is chiefly dependent upon the few ships that call at Jamestown—now mostly whalers. In 1925, the imports were valued at £57,805 and the exports at £47,476 of which £45,475 were from fibre and tow. St. Helena is in direct telegraphic communication with Europe and South Africa, and there is a regular monthly mail steamship service.

St. Helena is a crown colony. The governor (who also acts as chief justice) is aided by an executive council. He alone makes laws, called ordinances, but legislation can also be effected by the crown by order in council. The revenue in 1925 was £21,731 and the expenditure was £19,567. There is no public debt. Elementary education is provided in government and private schools. St. Helena is the seat of an Anglican bishopric established in 1859. Ascension and Tristan da Cunha are included in the diocese.

(J. I. P.; X.)

History.—The island was discovered on May 21, 1502, by the Portuguese João da Nova, on his voyage home from India, and by him named St. Helena. The Portuguese found it uninhabited, imported live stock, fruit-trees and vegetables, built a chapel and one or two houses, and left their sick there to be taken home, if recovered, by the next ship, but they formed no permanent settlement. Its first known permanent resident was Fernando Lopez, a Portuguese in India, who had turned traitor, and had been mutilated by order of Albuquerque. He preferred being marooned to returning to Portugal in his maimed condition, and was landed at St. Helena in 1513, with three or four negro slaves. By royal command he visited Portugal some time later, but returned to St. Helena, where he died in 1546. In 1584 two Japanese ambassadors to Rome landed at the island. The first Englishman known to have visited it was Thomas Cavendish, who touched there in June 1588 during his voyage round the world. Another English seaman, Captain Kendall, visited St. Helena in 1591, and in 1593 Sir James Lancaster stopped at the island on his way home from the East. In 1603 the same commander again visited St. Helena on his return from the first voyage equipped by the East India Company. The Portuguese had by this time given up calling at the island, which appears to have been occupied by the Dutch about 1645. The Dutch occupation was temporary and ceased in 1651, the year before they founded Cape Town. The British East India Company appropriated the island immediately after the departure of the Dutch, and they were confirmed in possession by a clause in their charter of 1661. The company built a fort (1658), named after the duke of York (James II.), and established a garrison in the island. In 1673 the Dutch succeeded in obtaining possession, but were ejected after a few months' occupation. Since that date St. Helena has been in the undisturbed possession of Great Britain, though in 1706 two ships anchored off Jamestown were carried off by the French. In 1673, the Dutch had been expelled by the forces of the Crown, but by a new charter granted in December of the same year the East India Company were declared "the true and absolute lords and proprietors" of the island. At this time, the inhabitants num-

bered about 1,000, of whom nearly half were negro slaves. In 1810 the company began the importation of Chinese from their factory at Canton. During the company's rule the island prospered: homeward-bound vessels, numbering hundreds in a year, anchored in the roadstead, and stayed for considerable periods refitting and revictualling. Large sums of money were thus expended in the island, where wealthy merchants and officials had their residence. The plantations were worked by slaves, who were subjected to very barbarous laws until 1792, when a new code of regulations ensured their humane treatment and prohibited the importation of any new slaves. Later it was enacted that all children of slaves born on or after Christmas Day 1818 should be free, and between 1826 and 1836 all slaves were set at liberty.

Among the governors appointed by the company to rule at St. Helena was one of the Huguenot refugees, Captain Stephen Poirier (1697-1707), who attempted unsuccessfully to introduce the cultivation of the vine. A later governor (1741-42) was Robert Jenkins (*q.v.*) of "Jenkins' ear" fame. **Dampier** visited the island twice in 1691 and 1701; Halley's Mount commemorates the visit paid by the astronomer Edmund Halley in 1676-78—the first of a number of scientific men who have studied on the island.

In 1815 the British Government selected St. Helena as the place of detention of Napoleon Bonaparte. He was brought to the island in October of that year and lodged at Longwood, where he died in May 1821. During this period the island was strongly garrisoned by regular troops, and the governor, Sir Hudson Lowe, was nominated by the Crown. After Napoleon's death the East India Company resumed full control of St. Helena until April 22, 1834, on which date it was in virtue of an act passed in 1833 vested in the Crown. As a port of call the island continued to enjoy a fair measure of prosperity until about 1870. Since that date the great decrease in the number of vessels visiting Jamestown has deprived the islanders of their principal means of subsistence. When steamers began to be substituted for sailing vessels and when the Suez Canal was opened (1869) fewer ships passed the island; of those that still pass the greater number are so well found that it is unnecessary for them to call. The withdrawal in 1906 of the small garrison, hitherto maintained by the imperial government, was another cause of depression, but during the World War (1914-18) a garrison was again sent to the island. During the Anglo-Boer war of 1899-1902 some thousands of Boer prisoners were detained at St. Helena, which has also served as the place of exile of several Zulu chiefs, an ex-sultan of Zanzibar and others. In 1922, Ascension Island, up to that time under the care of the Admiralty, was made a dependency of St. Helena.

Brooke, *History of the Island of St. Helena . . . to 1823* (and ed., 1824), containing many early accounts of the island; Charles Darwin, *Geological Observations on Volcanic Islands* (1844); J. C. Melliss, *St. Helena: a Physical, Historical and Topographical Description of the Island, including its Geology, Fauna, Flora and Meteorology* (1875); *Extracts from the St. Helena Records from 1673 to 1835* (compiled by H. R. Janisch, sometime governor, Jamestown, 1885); E. L. Jackson, *St. Helena* (1903). An annual report on the island is published by the Colonial Office, London. (R. L. A.; F. R. C.)

ST. HELENS, a municipal, county and parliamentary borough, Lancashire, England, 12 mi. N.E. of Liverpool, on the L.M.S. and L.N.E. railways. Pop. (est. 1938) 107,200. Area 12.4 sq.mi. A canal communicates with the Mersey. The town is wholly of modern development. Among buildings and institutions are the town hall, the Gamble institute, a technical school and library. This is the principal seat in England for the manufacture of crown, plate and sheet glass; there are also art glass works, copper smelting and refining works, chemical works, iron and brass foundries, potteries and patent medicine works. There are collieries in the neighbourhood. To the north are ruins of Windleshaw abbey and St. Thomas' well. The town was incorporated in 1868, became a parliamentary borough in 1885 (returning one member) and a county borough in 1888.

ST. HELIER, the chief town of Jersey, the largest of the Channel Islands. Pop. (1931) 24,986. Area 3.3 sq.mi. It lies on the eastern side of St. Aubin's bay. The harbour is flanked on the W. by a rocky ridge on which stands Elizabeth Castle,

and on the east by a promontory on which stands Fort Regent. The parish church is a cruciform building with embattled tower, partly 14th century. It contains a monument to Major Peirson, who lost his life in opposing the French attack on Jersey in 1781. The French leader, Baron de Rullecourt, is buried in the churchyard. A large canvas by John Singleton Copley depicting the scene is in the National Gallery, London, and a copy is in the court house of St. Helier. This building (lo Cohue), in Royal Square, is the meeting-place of the royal court and deliberative States of Jersey. Victoria College was opened in 1852 and commemorates a visit of Queen Victoria and the prince consort to the island in 1846. A house in Marine Terrace is distinguished as the residence of Victor Hugo (1811-1855). Elizabeth Castle dates from 1551-1590; and in 1646 and 1649 Prince Charles resided here. In 1649 he was proclaimed king, as Charles II., in Jersey by the royalist governor George Carteret. On coming to the throne he gave the island the mace which is still used at the meetings of the court and States. Close to the castle are remnants of a hermitage-chapel (9th or 10th century) traditionally connected with St. Helerius, which has given the name of the Hermitage to the rock on which it stands.

ST. HUBERT, a small town of Belgium in the province of Luxembourg and in the heart of the Ardennes. Population 3,220. Its abbey church contains the shrine of St. Hubert, and has an annual pilgrimage. According to tradition the church and a monastery attached to it were founded in the 7th century by Plectrude, wife of Pippin of Herstal. The second church was built in the 12th century, but burnt in the 16th century. The present building has been restored in modern times and presents no special feature. The spot where St. Hubert is supposed to have met the stag with the crucifix between its antlers is about 5 mi. from the town. St. Hubert is the patron saint of huntsmen.

ST. MYACINTHE, a city and port of entry of Quebec, Canada, and capital of St. Hyacinthe county, 32 mi. E.N.E. of Montreal, on the left bank of the river Yamaska and on the Canadian National, Canadian Pacific, and Quebec, Montreal and Southern railways. Pop. (1941) 17,798. It is the seat of a Roman Catholic bishop, and contains a classical college, a technical school, dairy school, two monasteries and several other educational and charitable institutions. It has manufactures of organs, leather, woollens and agricultural implements, and is an important distributing centre for the surrounding district.

ST. IMIER, a town in the west of the canton of Berne, Switzerland, and on the railway from Biel to La-Chaux-de-Fonds. It lies at the foot of Mont Soleil (4,230 ft.), which is ascended by a funicular railway. It is the centre of the watchmaking industry, a health resort, and a place for winter sports. The inhabitants, 6,505, are French-speaking and generally Protestant.

SAINTINE, JOSEPH XAVIER (1798-1865), French novelist and dramatist, whose real surname was BONIFACE, was born in Paris on July 10, 1798. In 1823 he produced a volume of poetry in the manner of the Romanticists, entitled *Poèmes, odes, épîtres*. In 1836 appeared *Picciola*, the story of the comte de Charney, a political prisoner in Piedmont, whose reason was saved by his cult of a tiny flower growing between the paving stones of his prison yard. This story is a masterpiece of the sentimental kind, and has been translated into many European languages. He produced many other novels and dramas, and died on Jan. 21, 1865.

ST. IVES, a market town, municipal borough and seaport of Cornwall, England, 10 mi. N.N.E. of Penzance, on the G.W.R. Pop. (1938) 7,877. Area 6.8 sq.mi. It lies near the west horn of St. Ives bay on the north coast. The site has associations with Celtic Christianity and is supposed to take its name from St. Hya, or Ia, an Irish martyr, accompanying St. Piran on his missionary journey to Cornwall in the 5th century. St. Ives was a mere chapelry of Lelant, an unimportant member of the distant manor of Ludgvan Leaze (which in *Domesday* appears as Luduam), and did not grow in the middle ages. In order to augment the influence of the Tudors in Parliament, Philip and Mary in 1558 invested it with the privilege of returning 2 members. Its affairs were at that time administered by a headwarden, who after 1598 appears under the name of portreeve. In 1639 a charter

of incorporation was granted under which the portreeve became mayor with aldermen and burgesses. Provision was made for four fairs and for markets on Wednesdays and Saturdays, also for a grammar school. A new charter was granted in 1685. In 1832 St. Ives lost one of its members, and since 1885 has formed the St. Ives division. The older streets near the harbour are narrow and irregular, but on the upper slopes a residential area has developed. The small harbour, built in 1767, has silted up and at the lowest tides is dry. The fisheries for pilchard, herring and mackerel are important. St. Ives is a thriving holiday resort (summer pop. 13,000), and has a town planning scheme.

ST. IVES, a market town and municipal borough in Huntingdonshire, England, mainly on the left bank of the Ouse, 5 mi. E. of Huntingdon, by the L.N.E.R. Pop. (1938), 2,620. Area, 3.3 sq.mi. The river is crossed by an old bridge said to have been built by the abbots of Ramsey early in the 15th century. A building over the centre pier was once used as a chapel. The church of All Saints is Perpendicular, with earlier portions. Oliver Cromwell was a resident in St. Ives in 1634–35. There is a considerable agricultural trade. St. Ives was noted for its eight-day fair beginning on Monday in Easter week, first granted to the abbot of Ramsey by Henry I. In the reign of Henry III merchants from Flanders came to the fair, which had become so important that the king granted it to be continued beyond the eight days if the abbot agreed to pay a fee of £50 yearly for the extra days. The fair, with a market on Monday granted to the abbot in 1286, survives, and was purchased by the town in 1874, the year of incorporation, from the duke of Manchester. The markets are extremely important to St. Ives and were substantially altered to give greater facilities for auction sales. The Norris library and museum, opened in 1933, is mainly devoted to books and collections relating to the county.

ST. JEAN-D'ANGELY, a town of western France, in the department of Charente-Inférieure, 33 mi. E. of Rochefort by rail. Pop. (1936) 6,082. St. Jean is named after the neighbouring forest of Angéry (*Angeriacum*). Pippin I of Aquitaine in the 9th century established there a Benedictine monastery, later reputed to possess the head of John the Baptist. This relic attracted hosts of pilgrims; a town grew up, took the name of St. Jean-d'Angély, was fortified in 1131, and in 1204 received a charter from Philip Augustus. The place was disputed between French and English in the Hundred Years' War, and later between Catholics and Protestants. Louis XIII took it from the Protestants in 1621 and changed its name to Bourg-Louis. St. Jean lies on the right bank of the Boutonne, navigable for small vessels. The town's chief industry is in wines and liquors.

ST. JEAN-DE-LUZ, a watering place and coast town of S.W. France, in the department of Basses-Pyrénées, at the mouth of the Nivelle, 14 mi. S.W. of Bayonne. Pop. (1936) 6,863. From the 14th to the 17th century St. Jean-de-Luz enjoyed a prosperity due to its mariners and fishermen. Its vessels were the first to set out for Newfoundland in 1520. In 1558, the Spaniards attacked and burned the town. In 1627, however, it was able to equip 80 vessels, which succeeded in saving the island of Ré from the duke of Buckingham. In 1660 the treaty of the Pyrénées was signed at St. Jean-de-Luz. At that time the population numbered 15,000. The cession of Newfoundland to England in 1713, the loss of Canada, and the silting-up of the harbour contributed to the decline of the town's maritime trade. St. Jean-de-Luz is in the Basque country on the bay of St. Jean-de-Luz, the entrance to which is protected by breakwaters and moles. It has a 13th-century church, the chief features of which are the galleries in the nave, which, by Basque custom, are reserved for men. Chief trade is in confectionery.

ST. JOHN, OLIVER (c. 1598–1673), English statesman and judge, was the son of Oliver St. John of Cayshoe, Bedfordshire, and great-grandson of the first Lord St. John of Bletso in 1559, and a distant cousin of the 4th baron who was created earl of Bolingbroke in 1624. Oliver was educated at Queens' college, Cambridge, and was called to the bar in 1626. He got into trouble with the court in connection with a seditious publication, and associated himself with the future popular leaders John Pym and

Lord Saye. In 1638, in a notable speech, he defended Hampden on his refusal to pay Ship Money. In the same year he married, as his second wife, Elizabeth Cromwell, a cousin of Oliver Cromwell, to whom his first wife also had been distantly related. The marriage led to an intimate friendship with Cromwell. St. John was member for Totnes in both the short and the long parliament, where he acted in close alliance with Hampden and Pym, especially in opposition to the impost of Ship Money (*q.v.*). In 1641, with a view of securing his support, the king appointed St. John solicitor general. None the less he took an active part in promoting the impeachment of Strafford and in preparing the bills brought forward by the popular party in the commons, and was dismissed from office in 1643. On the outbreak of the Civil War, he became recognized as one of the parliamentary leaders. In the quarrel between the parliament and the army in 1647 he sided with the latter, and throughout enjoyed Cromwell's confidence.

In 1648 St. John was appointed chief justice of the common pleas. He refused to act as one of the commissioners for the trial of Charles. In 1651 he went to The Hague on an unsuccessful mission to negotiate a union between England and Holland, but in the same year he successfully conducted a similar negotiation with Scotland. After the Restoration he published an account of his past conduct (*The Case of Oliver St. John*, 1660), which saved him from any more severe vengeance than exclusion from public office. He retired to his house in Northamptonshire till 1662, when he went to live abroad. He died on Dec. 31, 1673.

See the above-mentioned *Case of Oliver St. John* (1660), and St. John's *Speech to the Lords, Jan. 7th, 1640, concerning ship-money* (1640). See also Mark Noble, *Memoirs of the Protectoral House of Cromwell*, vol. ii (2 vols., 1787) and C. H. Firth's art. in *Dict. of Nat. Biog.*, vol. 1 (1897).

SAINT JOHN, the capital of St. John county, New Brunswick, Canada, in 45° 14' N., and 66° 3' W., 481 mi. from Montreal. Pop. (1941), 51,741. It is situated at the mouth of the St. John river on a rocky peninsula. With it are incorporated the neighbouring towns of Carleton and Portland.

Saint John was visited in 1604 by the Sieur de Monts (1560–c. 1630) and his lieutenant Champlain, but it was not until 1635 that Charles de la Tour (d. 1666) established a trading post, called Fort St. Jean (see Parkman, *The Old Régime in Canada*), which existed under French rule until 1758, when it passed into the hands of Britain. In 1783 a body of United Empire Loyalists landed at Saint John and established a city, called Parr Town until 1785, when it was incorporated with Conway (Carleton), under royal charter, as the city of Saint John. It soon became and has remained the largest town in the province, but for military reasons was not chosen as the capital. (See FREDERICTON.) Its growth has been checked by several destructive fires, especially that of June 1877. It has since been rebuilt of stone and brick.

The river enters the harbour through a rocky gorge, which is passable by ships during each ebb and flow of the tide. Saint John is the Atlantic terminus of the Canadian Pacific railway and one of the termini of the Canadian National railways, and joins with Halifax in being one of the chief winter ports of the dominion, the harbour being deep, sheltered, free from ice and always accessible, with 32 ft. of water at low tide and 58 to 60 ft. at high tide. It is the distributing centre for a large district, rich in agricultural produce and lumber. It has also an important fishery trade. There are textile works and engineering shops. Among the exports are timber, pulp, fish, cattle, apples, dairy produce, metal manufactures and motor cars. The industries include a structural steel plant with two dry docks, each 1,150 ft. long. Saint John has a municipal airport for both land and sea planes and air service connecting with Trans-Canada at Moncton.

ST. JOHN, one of the Virgin Islands of the United States, formerly the Danish West Indies. It lies 4 mi. E. of St. Thomas and is 10 mi. long and 2½ mi. wide; area, 19 square miles. It is a mass of rugged mountains, the highest of which is Camel mountain (1,270 ft.). Although one of the best watered and most fertile of the Virgin group, it has little commerce. It is a free port, and possesses in Coral bay the best harbour of refuge in the Antilles. The village of Cruz Bay lies on the northern coast. Pop. (1940) 722.

ST. JOHN, a river of New Brunswick, Canada, rising in two branches, one in the State of Maine, U.S.A., and the other in the province of Quebec. The American branch, known as the Wolloostook, flows N.E. to the New Brunswick frontier, where it turns S.E. and for 80 m forms the international boundary. A little above Grand Falls the St. John enters Canada and flows through New Brunswick into the Bay of Fundy at St. John. Its total length is about 450 miles. It is navigable for large steamers as far as Fredericton (86 m.), and in spring and early summer for smaller vessels to Grand Falls (220 m.), where a series of falls and rapids form a descent of 70 or 80 feet. Above the falls it is navigable for 65 miles. It drains an area of 26,000 sq.m., of which half is in New Brunswick, and receives numerous tributaries, of which the chief are the Aroostook, Allagash, Madawaska (draining Lake Terniscouata in Quebec), Tobique and Nashwaak.

ST. JOHN OF JERUSALEM, KNIGHTS OF THE ORDER OF THE HOSPITAL OF, known also later as the **KNIGHTS OF RHODES** and the **SOVEREIGN ORDER OF THE KNIGHTS OF MALTA**. The history of this order divides itself naturally into four periods: (1) From its foundation in Jerusalem during the First Crusade to its expulsion from the Holy Land after the fall of the Latin kingdom in 1291, (2) from 1309–1310, when the order was established in Rhodes, to its expulsion from the island in 1522; (3) from 1529 to 1798, during which its headquarters were in Malta; (4) its development, as reconstituted after its virtual destruction in 1798, to the present day.

Early Developments.—Ever since Jerusalem became a centre of Christian pilgrimage, a hospital or hospice for pilgrims had existed there; and early in the 11th century one of these was restored, served by Benedictines, and later dedicated to St. John the Baptist. When, in 1087, the crusaders surrounded the Holy City, the head of this hospital was a certain Gerard or Gerald, who earned their gratitude by assisting them in some way during the siege. After the capture of the city he used his popularity to enlarge and reconstitute the hospital, and adopted for his order the Augustinian rule. Donations and privileges were thereafter showered upon the new establishment. In 1113 Pope Paschal II. took the order and its possessions under his immediate protection (bull of Feb. 15th to Gerard), his act being confirmed in 1119 by Calixtus II. and subsequently by other popes. Gerard was indeed, as Pope Paschal called him, the "institutor" of the order, if not its founder. It retained, however, during his lifetime its purely eleemosynary character. The armed defence of pilgrims may have been part of its functions, but its organization as an aggressive military force was the outcome of special circumstances—the renewed activity of the Saracens—and was the work of Raymond du Puy, who succeeded as grand master on the death of Gerard (3rd of September 1120). The statesman-like qualities of Raymond du Puy rendered his long mastership epoch-making for the order; and from 1137 onwards they took a regular part in the wars of the Cross. During the Second Crusade Raymond was present at the council of the leaders held at Acre, in 1148, which resulted in the ill-fated expedition against Damascus. The failure before Damascus was repaired five years later by the capture of Ascalon (August 1153), in which the grand master and his knights had a conspicuous share.

Meanwhile, in addition to its ever-growing wealth, the order had received from successive popes privileges which rendered it, like the companion order of the Temple, increasingly independent of and obnoxious to the secular clergy. During the 30 years of Raymond's rule the Hospital, which Gerard had instituted to meet a local need, had become universal, and establishments were formed in East and West. After October 1158, when his presence is attested at Verona, this master builder of the order disappears from history; he died some time between this date and 1160, when the name of another grand master, Gilbert d'Assailly, appears.

Share in the Crusades.—The rule of the Hospital, as formulated by Raymond du Puy, was based upon that of the Augustinian Canons (*q.v.*). Its further developments, of which only the salient characteristics can be mentioned here, were closely analogous to those of the Templars (*q.v.*), whose statutes regu-

lating the life of the brethren, the terms of admission to the order, the maintenance of discipline, and the scale of punishments, culminating in expulsion are, *mutatis mutandis*, closely paralleled by those of the Hospitallers.

In two important respects the Knights of St. John differed from the Templars. The latter were a purely military organization; the Hospitallers, on the other hand, were at the outset preponderantly a nursing brotherhood, and, though this character was subordinated during their later period of military importance, it never disappeared. It continued to be a rule of the order that in its establishments it was for the sick to give orders, for the brethren to obey. The chapters were largely occupied with the building, furnishing, and improvement of hospitals, to which were attached learned physicians and surgeons, who had the privilege of messing with the knights. The revenues of particular properties were charged with providing luxuries (*e.g.*, white bread) for the patients, and the various provinces of the order with the duty of forwarding blankets, clothes, wine and food for their use. The Hospitallers, moreover, encouraged the affiliation of women to their order, which the monastic and purely military rule of the Templars sternly forbade. So early as the First Crusade a Roman lady named Alix or Agnes had founded at Jerusalem a hospice for women in connection with the order of St. John. Until 1187, when they fled to Europe, the sisters had devoted themselves to prayer and sick-nursing. In Europe, however, they developed into a purely contemplative order.

The grand-mastership of Gilbert d'Assailly was signalized by the participation of the Hospitallers in the abortive expeditions of Amalric of Jerusalem into Egypt in 1162, 1168 and 1169. The failure of the expedition to Egypt brought considerable odium on Gilbert d'Assailly, who resigned the grand mastership, probably in the autumn of 1170. Under the short rule of the grand master Jobert (d. 1177) the question of a renewed attack on Egypt was mooted; but the confusion reigning in the Latin kingdom and, not least, the scandalous quarrels between the Templars and Hospitallers, rendered all aggressive action impossible. In 1179 the growing power of the two military orders received its first set back when, at the instance of the bishops, the Lateran Council forbade them to receive gifts of churches and tithes at the hands of laymen without the consent of the bishops, ordered them to restore all "recent" gifts of this nature (*i.e.*, within ten years of the opening of the council), and passed a number of decrees in restraint of the abuse of their privileges.

A more potent discipline was to befall them, however, at the hands of Saladin, sultan of Egypt, who in 1186 began his systematic conquest of the kingdom. It was the Hospitallers who, with the other military orders, alone offered an organized resistance to his victorious advance. In May 1187 occurred the defeat of Tiberias, in which the grand master Gilbert des Moulins fell riddled with arrows; this was followed on July 4 by the still more disastrous battle of Hattin. The flower of the Christian chivalry was slain or captured; Hospitallers and Templars who fell into his hands Saladin massacred in cold blood. In October Jerusalem fell. The news of these disasters again roused the crusading spirit in Europe; the offensive against Saladin was resumed, the Christians concentrating their forces against Acre in the autumn of 1189. In the campaigns that followed, of which Richard I. of England was the most conspicuous hero, and which ended in the recovery of Acre and the sea-coast generally for the Latin kingdom, the Hospitallers played a prominent part; and during the following decade there was a steady restoration and development of the property and privileges of the order, notwithstanding renewed quarrels with the Templars, and the establishment—in face of the protests of the Hospitallers—of the Teutonic knights as a separate order. An increasing secularisation of their spirit can now be traced. In 1236 Pope Gregory IX. thought it necessary to threaten both them and the Templars with excommunication. To prevent their forming an alliance with the Assassins, and in 1238 issued a bull in which he inveighed against the scandalous lives and relaxed discipline of the Hospitallers.

Events were soon to expose the order to fresh tests. In the midst of the strife of parties, in which the fatal weakness of the

Christian cause lay, came the news of the invasion of the Chorasmians. In August the Tatar horde took and sacked Jerusalem. In October, it overwhelmed the Christian host at Gaza. Amid the general ruin that followed this defeat, the Hospitallers held out in the fortress of Ascalon, until forced to capitulate in October 1247. In 1249 they took part in the Egyptian expedition of St. Louis of France, only to share in the crushing defeat of Mansurah (February 1250). At the instance of St. Louis, after the conclusion of peace, 25 Hospitallers, together with the grand master, were released.

Upon the withdrawal of St. Louis from the Holy Land (April 1254), a war of aggression and reprisals broke out between Christians and Muslims; and no sooner was this ended by a precarious truce than the Christians fell to quarrelling among themselves, and the Hospitallers and Templars actually fought on opposite sides. In spite of so great a scandal and of the hopeless case of the Christian cause, the possessions of the order were largely increased, both in the Holy Land and in Europe.

The menace of a new Tatar invasion led to serious efforts to secure harmony in the kingdom. In 1258 the Templars, Hospitallers, and Teutonic knights decided to submit their disputes to arbitration, a decision which bore fruit in 1260 in the settlement of their differences in Tripoli and Margat. The concord was badly needed; for Bibars, having in 1260 driven back the Tatars and established himself in the sultanate of Egypt, began the series of campaigns which ended in the destruction of the Latin kingdom. Antioch fell in 1268 and the great fortress of Krak in 1271. The crusade of Prince Edward of England did little to avert the ultimate fate of the kingdom, and with it that of the Hospitallers in the Holy Land. This was merely delayed by the preoccupations of Bibars elsewhere, and by his death in 1277. In May 1285 Margat was lost, and Tripoli in April 1289. In May 1291 the Muslims captured Acre, the last hope of the Christians in the Holy Land. The headquarters of the Hospital were moved to Cyprus, and the problem of reorganization was taken in hand. Guillaume de Villaret, who became grand master in 1296, secured immense additions of property and privileges in Europe from the pope and many kings and princes, and effected a drastic reorganization of the order promulgated in a series of statutes between 1300 and 1304.

The Knights in Rhodes.—The history of the order for the next fifty years is very obscure. Certain changes, however, took place which profoundly modified its character. Hitherto the order had been a cosmopolitan society, in which the French element had tended to predominate; henceforth it became a federation of national societies united only for purposes of commerce and war. To the headship of each national organization was attached one of the great dignitaries of the order, which thus came to represent, not the order as a whole, but the interests of a section. The motive of this change was probably fear of the designs of Philip IV. of France and his successors to which point had been given by the fate of the Templars, and the consequent desire to destroy the preponderance of the French element.

The character and aims of the order were also profoundly affected by their newly acquired sovereignty. The Hospitallers ruled an island too narrow to monopolize their energies, but occupying a position of vast commercial and strategic importance. Close to the Anatolian mainland, commanding the outlet of the Archipelago, and lying in the direct trade route between Europe and the East, Rhodes had become the chief distributing point in the lively commerce which, in spite of papal thunders, Christian traders maintained with the Mohammedan states; the Hospitallers were thus divided between their duty as sovereign, which was to watch over the interests of their subjects, and their duty as Christian warriors, which was to combat the infidel. In view of the fact that the crusading spirit was everywhere declining, it is not surprising that their policy was henceforth directed less by religious than by political and commercial considerations. Not that they altogether neglected their duty as protectors of the Cross. Their galleys policed the narrow seas; their consuls in Egypt and Jerusalem watched over the interests of pilgrims; their hospitals were still maintained for the service of the sick

and the destitute. But, side by side with this, secularization proceeded apace. Even towards the infidel the attitude of the knights was necessarily influenced by the fact that their supplies of provisions were mainly drawn from the Muslim mainland. By the 15th century their crusading spirit had grown so weak that they even attempted to negotiate a commercial treaty with the Ottoman sultan; the project broke down on the refusal of the knights to accept the sultan's suzerainty.

Their history during the two centuries of the occupation of Rhodes, so far as its general interest for Europe is concerned, is that of a long series of naval attacks and counter-attacks; its chief outcome, for which the European states owed a debt of gratitude but ill acknowledged, the postponement for some two centuries of the appearance of the Ottomans as a first-rate naval power in the Mediterranean. The Ottoman peril, however, grew ever more imminent, and in 1395, under their grand master Philibert de Naillac, the Hospitallers shared in the disastrous defeat of Nicopolis; and this was followed in a few years by the loss of Smyrna. It was after this disaster that the knights built, on a narrow promontory jutting from the mainland opposite the island of Kos, the fortress of St. Peter the Liberator. The castle, which still stands, its name corrupted into Budrun (from Bedros, Peter), was long a place of refuge for Christians fleeing from slavery. Some years later the position of the order as a Mediterranean sea-power was strengthened by commercial treaties with Venice, Pisa, Genoa, and even with Egypt (1423). The zenith of its power was reached a few years later, when, under the grand master Jean Bonpar de Lastic, it twice defeated an Egyptian attack by sea (1440 and 1444). A new and more imminent peril, however, arose with the capture of Constantinople by the Turks in 1453, for Mohammed II. had announced his intention of making Rhodes his next objective. After a long series of naval battles had been carried on by the Hospitallers, the dreaded sultan Suleiman the Magnificent directed his attack on Rhodes. In 1522 he besieged the island, reinforcements failed, the European powers sent no assistance, and in 1523 the knights capitulated, and withdrew with all the honors of war to Candia (Crete). The emperor Charles V., when the news was brought to him, exclaimed, "Nothing in the world has been so well lost as Rhodes!" But he refused to assist the grand master in his plans for its recovery, and instead, five years later (1530), handed over to the Hospitallers the island of Malta and the fortress of Tripoli in Africa.

The Knights in Malta.—The settlement of the Hospitallers in Malta was contemporaneous with the Reformation, which profoundly affected the order. In England the refusal of the grand prior and knights to acknowledge the royal supremacy led to the confiscation of their estates by Henry VIII., and, though not formally suppressed, the English organization practically ceased to exist. The knights of Malta, as they came to be known, none the less continued their vigorous warfare. In 1550 they defeated the redoubtable corsair Dragut, but in 1551 their position in Tripoli, always precarious, became untenable and they capitulated to the Turks and concentrated their forces in Malta. On May 18, 1565, the Ottoman fleet appeared before the city, and one of the most famous sieges in history began. It was ultimately raised in September, on the appearance of a large relieving force despatched by the Spanish viceroy of Sicily, after 25,000 of the enemy had fallen. The memory of La Vallette, the hero of the siege, who died in 1568, is preserved in the city of Valletta, which was built on the site of the struggle.

In 1571 the knights shared in the victory of Lepanto; but this crowning success was followed during the 17th century by a long period of depression, due to internal dissensions and culminating during the Thirty Years' War, the position of the order being seriously affected by the terms of the peace of Westphalia (1648). The character of the order at this date became more exclusively aristocratic, and its wealth, partly acquired by commerce, partly derived from the contributions of the commanderies scattered throughout Europe, was enormous. The wonderful fortifications, planned by French architects and improved by every grand master in turn, the gorgeous churches, chapels and *auberges*, the great library founded in 1650, were the outward and visible

signs of the growth of a corresponding luxury in the private life of the order. Nevertheless, under Raymond Perellos (1697-1720) and Antonio Manoel (1722-1736), the knights restored their prestige in the Mediterranean by victories over the Turks. In 1741 Emmanuele Pinto, a man of strong character, became grand master. He expelled the Jesuits, resisted papal encroachments on his authority and, refusing to summon the general chapter, ruled as a despot. Emanuel, prince de Rohan, who was elected grand master in succession to Francesco Jimenes de Texada in 1775, made serious efforts to revive the old spirit of the order; and the last great expedition of the Maltese galleys was worthy of its noblest traditions; they were sent to carry supplies for the sufferers from the great earthquake in Sicily. They had long ceased to be effective fighting ships, and survived mainly as gorgeous state barges in which the knights sailed on ceremonial pleasure trips.

The French Revolution was fatal to the order. Rohan made no secret of his sympathy with the losing cause in France, and Malta became a refuge-place for the *émigrés*. In 1792 the vast possessions of the order in France were confiscated; six years later the Directory resolved on the forcible seizure of Malta itself. With this the history of the order of St. John practically ends. Efforts were, however, made to preserve it. Efforts to restore the order through Russian influence failed; and a chapter now granted the right of nomination to the pope, who appointed Giovanni di Tommasi grand master. From his death in 1805 until 1879, when Leo XIII. restored the title of grand master in favour of Fra Giovanni Ceschi a Santa Croce, the heads of the order received only the title of lieutenant master. In 1814 the French knights summoned a chapter general and elected a permanent commission for the government of the order, which was recognized by the Italian and Spanish knights, by the pope and by King Louis XVIII. In the Italian states much of the property of the order was restored at the instance of Austria, and in 1841 the emperor Ferdinand founded the grand priory of Lombardo-Venetia.

Present Constitution of the Order.—The "Sovereign Order of Malta" is now divided into the Italian and German "langues," the Knights of Malta, or national organizations, both under the Sacred Council (*Sacro consiglio*) at Rome. The Italian "langue" embraces the grand priories of Rome, Lombardy and Venice, and Sicily; the German "langue" consists of (1) the grand priory of Bohemia, (2) the association of the honorary knights (*Ehrenritter*) in Silesia, (3) the association of *Ehrenritter* in Westphalia and the Rhine country, (4) knights admitted individually under stated conditions.

In addition to the Sovereign Order of the Knights of Malta, there exist two Orders of St. John of Jerusalem of Protestant origin:—the Prussian *Johanniterorden* and the English Order of St. John of Jerusalem. Of these the Prussian order has the most interesting history. At the Reformation the master and knights of Brandenburg adopted the new religion. They continued, however, like other *Ritterstifter*, to enjoy their corporate rights; they even continued to acknowledge the jurisdiction of the grand preceptor of the German langue, in so far as the confirmation of official appointments was concerned, and to send their contributions to the common fund of the order. All members of the order must be of noble birth and belong to the Evangelical Church. The cross worn is of white enamelled gold with four black eagles between the arms; a white linen cross is also sewn on the left breast of the red tunic which forms part of the uniform. The order has founded, and supports, many hospitals.

The English "langue," though deprived of its lands, had never been formally suppressed. In 1826-1827 the commission instituted by the French knights in 1814, which was aiming at taking advantage of the Greek War of Independence to reconquer Rhodes or to secure some other island in the Levant, suggested the restoration of the English "langue," obviously with the idea of securing the help of Great Britain for their project. The negotiations resulted in articles of convention formally reviving the English "langue." For fifty years this was all the official recognition obtained by this curious and characteristic sham-Gothic restoration

of the Romantic period. The English "langue," however, though somewhat absurd, did good service in organizing hospital work, notably in the creation of the St. John's Ambulance Association, and this work was recognized in high quarters, the princess of Wales (afterwards Queen Alexandra) becoming a lady of justice in 1876 and the duke of Albany joining the order in 1883. In 1888 Queen Victoria granted a charter formally incorporating the order, the headquarters of which had been established in the ancient gateway of the priory at Clerkenwell. The sovereign is its supreme head and patron, the heir to the throne for the time being its grand prior.

BIBLIOGRAPHY.—For further study of the subject the work of J. D. Le Roulx is of fundamental importance. In 1883 he published *Les Archives de l'Ordre de Saint-Jean*, an analysis of the records preserved at Malta. This was followed in 1904 by his monumental *Cartulaire général des Hospitaliers de Saint-Jean de Jérusalem* (1100-1310), 4 vols. folio. This gives (1) all documents anterior to 1120, (2) all those emanating from the great dignitaries of the order, (3) all those emanating from popes, emperors, kings and great feudatories, (4) those which fix the date of the foundation of particular commanderies, (5) those regulating the relations of the Hospitallers with the lay and ecclesiastical authorities and with the other military orders, (6) the rules, statutes and customs of the order. Hitherto unpublished documents (from the archives of Malta and elsewhere) are published in full; those already published, and the place where they may be found, being indicated in proper sequence. Based on the *Cartulaire* is Le Roulx's *Les Hospitaliers en Terre Sainte et en Chypre* (Paris, 1904), an invaluable work in which many hitherto obscure problems have been solved. It contains a full list of published authorities. Of English works may be mentioned J. M. Kemble's Historical introduction to *The Knights Hospitallers in England* (Camden Soc., London, 1857); W. Porter, *Hist. of the Knights of Malta* (2 vols. 1858, new ed. 1883); Bedford and Holbeche, *The Order of the Hospital of St. John of Jerusalem* (1902), for the modern order.

ST. JOHN'S (SAINT JEAN), a city and port of entry of Quebec, Canada, and capital of St. John's county, 27 mi. S.E. of Montreal by rail, on the river Richelieu and at the head of the Chambly canal. Pop. (1941), 13,646. A large export trade in lumber, grain and farm produce is carried on, and its mills and factories produce flour, silk, pottery, hats, etc. Three railways, the Canadian National, Canadian Pacific and Central Vermont, enter St. John's. On the opposite bank of the river is the flourishing town of St. Jean d'Iberville (usually known simply as Iberville), connected with St. John's by several bridges.

ST. JOHN'S, the capital of Newfoundland, situated on the east coast of the island, in the peninsula of Avalon, in 47° 33' 54" N., and 52° 40' 18" W. It is the most easterly city of the American continent. Population, 41,500, mostly of Irish descent and Roman Catholics. It stands on rising ground on the north side of a land-locked harbour, which opens suddenly in the lofty coast. The entrance, known as The Narrows, guarded by Signal Hill (520 ft.) and South Side Hill (620 ft.), is about 1,400 ft. wide, narrowing to 600 ft. between Pancake and Chain Rocks. At the termination of The Narrows the harbour trends suddenly to the west, thus completely shutting out the ocean swell. The port has sufficient water for vessels of 30 ft. draught. There is good wharf accommodation, with a graving and a floating dock.

St. Johns was first settled by Devonshire fishermen early in the 16th century. It was twice sacked by the French, and captured by them in the Seven Years' War (1762), but recaptured in the same year, since when it has remained in British possession. Both in the War of American Independence and in that of 1812 it was the headquarters of the British fleet. The old city, built entirely of wood, was twice destroyed by fire (1816-1817 and 1846). Half of it was again swept away in 1892, but new and more substantial buildings have been erected, among which the Anglican and Roman Catholic Cathedrals stand out. Education is in the hands of the various religious bodies. St. Johns practically monopolizes the commerce of the island, being the centre of the cod, seal and whale fisheries. The chief industries are connected with the fitting out of the fishing vessels, or with the disposal and manufacture of their catch. Nearly all the commerce of the island is sea-borne. The town imports iron, coal, cattle and general produce and exports fish, oil, wood pulp and paper.

SAINT JOHNSBURY, a town of north-eastern Vermont, U.S.A., the county seat of Caledonia county, and a village of the

same name; 37 mi. E.N.E. of Montpelier, on the Passumpsic river and federal highways 2 and j. It is served by the Canadian Pacific, the Maine Central and the St. Johnsbury and Lake Champlain railways. Pop. (1930) 7,920; 1940 federal census 7,437. It is the home of the Fairbanks platform scale, invented there in 1830 by Thaddeus Fairbanks and manufactured there since 1837, and of the largest maple-sugar plant in the country. The town was settled in 1786 by Dr. Jonathan Arnold, and was named after Jean Hector St. John de Crèvecoeur, author of *Letters of an American Farmer* (1782). The village was incorporated in 1853. Since 1923 the town has had a city-manager form of government.

ST. JOHN'S WORT, the general name for species of *Hypericum* (family Hypericaceae), especially *H. perforatum*, small shrubby plants with slender stems, sessile opposite leaves which are often dotted with pellucid glands, and showy yellow flowers. *H. androsaemum* is tutsan (Fr. *tout saine*), so called from its healing properties. *H. calycinum* (Rose of Sharon), a creeping plant with large almost solitary flowers 3 to 4 in. across, is a plant of southeast Europe which has become naturalized in Great Britain in various places in hedges and thickets. The genus comprises about 250 species of herbs or under-shrubs, native mostly to temperate and subtropical regions. Some 30 species, chiefly herbaceous, are found in North America, widely distributed across the continent but most numerous in the eastern states and adjacent Canada. Many species are cultivated.

ST. JOSEPH, a city of southwestern Michigan, U.S.A., on Lake Michigan, at the mouth of the St. Joseph river and immediately west of Benton Harbor; a port of entry and the county seat of Berrien county. It is on federal highways 12, 31 and 33, and is served by the Michigan Central and the Pere Marquette railways, and motorbus lines and lake steamers.

The population was 8,349 in 1930 and was 8,963 in 1940 (10% foreign-born white) by the federal census. The two cities, connected by a wide thoroughfare and a ship canal, are practically one community, with a combined population estimated at 30,000, which is doubled in summer by visitors in search of health and recreation at the mineral springs and many resorts of the region. The surrounding country is the famous Michigan fruit belt. The traffic of the harbour in 1940 amounted to 279,361 tons.

St. Joseph has a variety of manufacturing industries, producing 83 different articles and employing 4,200 workers. The offices and central institution of the Michigan Children's Home society are there. In 1679 La Salle built Ft. Miami on or near the site of St. Joseph. The present city was settled in 1829, incorporated as a village in 1836 and chartered as a city in 1891.

ST. JOSEPH, a city of northwestern Missouri, U.S.A., on the east bank of the Missouri river, 55 mi. N.W. of Kansas City; a port of entry and the county seat of Buchanan county. It has a municipal airport (470 ac.) and is a station on the Chicago-Dallas airway; is on federal highways 36, 59, 71, 169 and 275; and is served by the Burlington Route, the Chicago Great Western, the Missouri Pacific, the Rock Island, the Santa Fe, the Union Pacific and six main trunk line railways. Pop. (1940) 75,711. The city covers 14.1 sq.mi., on bluffs above the river (graded down considerably in the business section), at an altitude of 814 ft. The parks (1,350 ac.) and boulevards contain much natural beauty and facilities for all the usual outdoor sports and recreations. There are 33 public and 11 parochial schools; 94 churches; hotels with 2,200 guest rooms; and hospitals with 391 beds. The assessed valuation of property for 1940 was \$86,685,630. Just east of the city is a state hospital for the insane (1874). Manufacturing is estimated as 109 outlets, with 5,700 wage earners and a pay roll of \$6,250,000; value of products, \$80,000,000. During 1939 structures replaced many obsolete buildings, among those, being a city market building, a modern telephone building, a federal court and post-office building, various fire stations of the bungalow type and a central police station, the latter being radio-equipped for contact with squad cars. Other buildings are the junior college, Benton and Lafayette high schools, Central high school building which is a structure of beauty and is located near the Noyes boulevard system, surrounded by beautiful trees and

homes, a municipal swimming pool, tennis courts and has a large stadium. Among the leading industries are meat packing and processing, milling and cereal products, clothing and other textiles, candy, dairy products, harness and saddlery, foundry and other important items. Bank debits for 1940 totalled \$326.517,000.

In 1826 Joseph Robidoux, a French Canadian, established an Indian trading post there, known as Blacksnake Hills. After the "Platte Purchase" in 1836 other settlers came in, and in 1843 Robidoux laid out a town, which he named in honour of his patron saint. It became the county seat in 1846 and in 1851 was chartered as a city. It developed early into an important trading centre, and was a busy outfitting point during the years of heavy travel by prospectors and other emigrants to the Rocky mountains and the Pacific coast. On April 3, 1860, the first rider of the "Pony Express" galloped out of St. Joseph (the eastern terminus of the service during the 17 months of its operation), and a year later Lincoln's inaugural address was carried through to Sacramento (nearly 2,000 mi.) in 7 days and 17 hours. During the Civil War St. Joseph was held continuously by the Unionists, but local sentiment was bitterly divided.

After the war a period of rapid development set in, which increased the population from 8,932 in 1860 to 19,565 in 1870, and so on to 77,403 in 1910.

SAINT-JUST, ANTOINE LOUIS LÉON DE RICHEBOURG DE (1767-1794), French revolutionary leader, was born at Decize in the Nivernais on Aug. 25, 1767. At the outbreak of the Revolution he was elected an officer in the National Guard of the Aisne. He assumed a stoical demeanour united to a tyrannical policy. He entered into correspondence with Robespierre, who, flattered by his worship, admitted him to his friendship. Thus supported, Saint-Just became deputy to the National Convention, where he made his first speech on the condemnation of Louis XVI—gloomy, fanatical, remorseless in tone—on Nov. 13, 1792. In the convention, in the Jacobin club, and among the populace he was dubbed the "St. John of the Messiah of the People." In the name of the Committee of Public Safety he drew up reports to the convention upon the absorbing themes of the overthrow of the party of the Gironde (report of July 8, 1793), of the Hébertists, and finally, of that denunciation of Danton which consigned him and his followers to the guillotine. In Saint-Just's hands these so-called reports furnished the occasion for a display of fanatical daring, of gloomy eloquence, and of undoubted genius. Camille Desmoulins said of Saint-Just—the youth with the beautiful countenance and the long fair locks—"He carries his head like a Holy Sacrament." "And I," savagely replied Saint-Just, "will make him carry his like a Saint Denis." The threat was not vain: Desmoulins accompanied Danton to the scaffold.

Saint-Just proposed that the National Convention should, through its committees, direct all military movements and all branches of the government (report of Oct. 10, 1793). This was agreed to, and Saint-Just was despatched to Strasbourg to superintend the military operations. It was suspected that the enemy without was being aided by treason within. Saint-Just "organized the Terror," and soon the heads of all suspects sent to Paris were falling under the guillotine. But there were no executions at Strasbourg, and Saint-Just repressed the excesses of J. G. Schneider, who, acting as public prosecutor to the revolutionary tribunal of the Lower Rhine, had ruthlessly applied the Terror in Alsace. Schneider was sent to Paris and guillotined. The conspiracy was defeated, the frontier was delivered and Germany invaded. On his return Saint-Just was made president of the convention. Later, with the army of the north, he placed before the generals the dilemma of victory over the enemies of France or trial by the dreaded Revolutionary tribunal; and before the eyes of the army itself he organized a force specially charged with the slaughter of those who should seek refuge by flight. Success again crowned his efforts, and Belgium was gained for France (May, 1794).

Meanwhile affairs in Paris looked gloomier than ever, and Robespierre recalled Saint-Just to the capital. Saint-Just proposed a dictatorship as the only remedy for the convulsions of society. At last, at the famous sitting of the 9th Thermidor, he

ventured to present as the report of the committees of General Security and Public Safety a document expressing his own views, a sight of which, however, had been refused to the other members of committee on the previous evening. Then the storm broke. He was vehemently interrupted, and the sitting ended with an order for Robespierre's arrest (see ROBESPIERRE), which entailed that of Saint-Just. On the following day, July 28, 1794, 22 men, nearly all young, were guillotined. Saint-Just maintained his proud self-possession to the last.

See *Oeuvres de Saint-Just, précédées d'une notice historique sur sa vie* (1833-34); E. Fleury, *Études révolutionnaires* (2 vols., 1851), with which cf. articles by Sainte-Beuve (*Causeries du lundi*, vol. v.), Cuvillier-Fleury (*Portraits politiques et révolutionnaires*); E. Hamel, *Histoire de Saint-Just* (1859), which brought a fine to the publishers for outrage on public decency; F. A. Aulard, *Les Orateurs de la Législative et de la Convention* (2nd ed., 1905); M. Lenéru, *Saint-Just* (1922). The *Oeuvres complètes de Saint-Just* were edited with notes by C. Vellay (1908).

ST. JUST (St. Just in Penwith), a market town of Cornwall, England, 7 mi. W. of Penzance. Pop. of urban district (1938) 4,090. Area 12 sq.mi. The town lies in a wild district 1 mi. inland from Cape Cornwall, which is 4 mi. N. of Land's End.

ST. KILDA (Gaelic *Hirta*, "the western land"), largest of a small group of about sixteen islets of the Outer Hebrides, Inverness-shire, Scotland. It is included in the civil parish of Harris, and is situated 40 m. W. of North Uist. It measures 3 m. from E. to W. and 2 m. from N. to S. Except at the landing-place on the south-east, the cliffs rise sheer out of deep water, and on the north-east side the highest eminence in the island, Conagher, forms a precipice 1,220 ft. high. The inhabitants, an industrious Gaelic-speaking community who numbered 36 in 1930, were that year evacuated at their own request and were settled mainly in Morvern parish, Co. Argyll. The island is practically cut off from the world for 8 months of the year. It has been in the possession of the Macleods for hundreds of years except for the period 1779-1871.

ST. KITTS or **ST. CHRISTOPHER**, an island in the British West Indies, forming, with Nevis and Anguilla, one of the presidencies in the colony of the Leeward islands. It is a long oval with a narrow neck of land projecting from the southeastern end; total length 23 mi., area 68 sq.mi. Mountains traverse the central part from N.W. to S.E., the highest being Mount Misery (3,771 feet). The island is well watered, fertile and healthy, and its climate is cool and dry (temperature between 78° and 85° F; average annual rainfall 38 in.). The rim of land formed by the skirts of the mountains, and the valley of Basseterre are cultivable. The higher slopes of the hills afford pasturage; the summits are crowned with dense woods. Sugar, molasses, cotton, salt, coffee and tobacco are the chief products; horses and cattle are bred. Primary education is compulsory. The principal towns are Old Road, Sandy Point and the capital Basseterre, which lies on the S.W. coast (pop. [1939] 8,000). A good macadamized road encircles the island. The local legislature consists of 6 official and 6 unofficial members nominated by the Crown. St. Kitts was discovered by Columbus in 1493 and first settled by Sir Thomas Warner in 1623. Five years later it was divided between the British and the French, but at the Peace of Utrecht in 1713 it was entirely ceded to the British Crown. Population, mostly negroes, 19,674.

SAINT-LAMBERT, JEAN FRANÇOIS DE (1716-1803), French poet, was born at Nancy on Dec. 26, 1716. He entered the army and, when Stanislaus Leszczyński was established in 1737 as duke of Lorraine, he became an official at his court at Lunéville. He left the army after the Hanoverian campaign of 1756-57, and devoted himself to literature, producing a volume of descriptive verse, *Les Saisons* (1769), now never read, many articles for the *Encyclopédie*, and some miscellaneous works. He was admitted to the Academy in 1770. His fame, however, comes chiefly from his amours. He was already high in the favour of the marquise de Boufflers, Stanislaus's mistress, whom he addressed in his verses as *Doris* and *Thémire*, when Voltaire in 1748 came to Lunéville with the marquise du Châtelet. Her infatuation for him and its fatal termination are known to all

readers of the life of Voltaire. His subsequent liaison with Madame d'Houdetot, Rousseau's Sophie, proved permanent. He published in 1798 the *Principe des moeurs chez toutes les nations ou catéchisme universel*, and published his *Oeuvres philosophiques* two years before his death on Feb. 9, 1803. Madame d'Houdetot survived until Jan. 28, 1813.

See G. Maugras, *La Cour de Lunéville* (1904) and *La Marquise de Boufflers* (1907); also the literature dealing with Rousseau and Voltaire.

ST. LAWRENCE. The river St. Lawrence, in North America, with the five fresh-water inland seas (see GREAT LAKES), Superior, Michigan, Huron, Erie and Ontario, forms one of the great river systems of the world, having a length of 2,100 m. from the source of the river St. Louis (which rises near the source of the Mississippi and falls into the head of Lake Superior) to Cape Gaspé, where it empties into the Gulf of St. Lawrence. The river is here considered as rising at the foot of Lake Ontario, where the name St. Lawrence is first applied to it.

The river, to the point where it crosses 45° N. in its north-easterly course, forms the boundary line between the State of New York and the province of Ontario; thence to the sea it is wholly within Canadian territory, running through the province of Quebec. At Point des Monts, 260 m. below Quebec, it is 26 m. wide, and where it finally merges into the Gulf of St. Lawrence, 150 m. farther on, it is 90 m. wide, this stretch being broken by the large island of Anticosti, lying in the mouth. The character of the river banks varies with the geological formations through which it runs. Passing over the Archaean rocks of the Laurentian from Kingston to Brockville the shores are very irregular, and the river is broken up by protrusions of granite and gneiss into a large number of picturesque islands, "The Thousand Islands," frequented as a summer resort. From Brockville to Montreal the river runs through flat-bedded Cambro-Silurian limestones, with rapids at several points, which are run by light-draught passenger boats. For the up trip the rapids are avoided by canalization. From Montreal to Three Rivers the course is through an alluvial plain over-lying the limestones, the river at one point expanding into Lake St. Peter, 20 m. long by 10 m. wide, with a practically uniform depth of 10 feet. Below Three Rivers the banks grow gradually higher until, after passing Quebec through a cleft in slate rocks of Cambrian age, the river widens, washing the feet of the Laurentian mountains on its north shore; while a more moderately hilly country, terminating in the Shick-shock mountains of the Gaspé Peninsula, skirts its south shore.

From Kingston, at the head of the river, to Montreal (170 m.), navigation is limited to vessels of 14 ft. draught. From Montreal to Quebec (160 m.), a ship channel has been dredged to a depth of 30 ft.; below Quebec the river is navigable by vessels of any draught. The locks of the present canals are 45 ft. wide, with an available depth of 14 ft. and a minimum length of 270 ft.; but plans are under consideration for a new ship canal allowing vessels of 25 or 30 ft. draught to enter Lake Ontario, from which the new Welland canal of the same depth leads to the Upper Lakes.

In the stretch between Montreal and Quebec the ship channel is a national work, and improvements have been undertaken to secure everywhere a minimum depth of 30 ft. and a width of 450 feet. The river from Kingston to the sea is well supplied with sids to navigation. In the dredged portions lights are arranged in pairs of leading lights on foundations sufficiently high and solid to resist the pressure of ice movement, and there is an elaborate system of fog alarms, lighted and other buoys, as well as telegraphic, wireless and telephonic communication, storm signal, weather and ice-reporting stations and a life-saving service.

Montreal, at the head of ocean navigation, the largest city in Canada, is an important distributing centre for all points in western Canada, and enjoys an extensive shipping trade with the United Kingdom. Quebec is the summer port used by the largest steamers in the Canadian trade. There are numerous flourishing towns on the river, from Kingston, a grain transferring port, to the sea. Large quantities of lumber are handled at mills along the river.

A natural highway between all points west of the Maritime Provinces and Europe, the St. Lawrence permits ocean traffic to penetrate 1,000 m. into the heart of the country. It is, moreover, the shortest freight route from the Great Lakes to Europe. From Buffalo to Liverpool via New York involves rail or barge canal transport of 496 m. and an ocean voyage of 3,034 nautical miles. Via Montreal there is a 14-ft. transport of 348 m. and river and ocean voyage of 2,772 nautical miles. From Quebec to Liverpool by Cape Race is 2,801 nautical miles, while the route by Belle Isle, more nearly a great circle course, usually taken between July and October, is only 2,633 nautical miles. On the other hand the St. Lawrence is not open in winter and the average time between the arrival of the first vessel at Montreal from sea and the departure of the last ocean vessel is seven months. From Kingston to Quebec the river freezes every winter, except at points where the current is rapid. Below Quebec, although there is border ice, the river never freezes. Efforts have been made to lengthen the season of navigation by using specially constructed steamers to break the ice; and it is claimed that the season of navigation could be materially lengthened, and winter floods prevented by keeping the river open to Montreal. Winter ferries are maintained at Quebec, between Prince Edward island and Nova Scotia, and between Newfoundland and Sydney, Cape Breton.

The river above tide water is not subject to excessive flooding, the maximum rise in the spring and early summer months, chiefly from northern tributaries from the Ottawa eastward, being 10 feet. The Great Lakes serve as impounding reservoirs for the gradual distribution of all overflows in the west. At Montreal, soon after the river freezes, there is a local rise of about 10 ft. in the level in the harbour, caused by restriction of the channel by anchor ice; and in the spring when the volume is augmented, this obstruction leads to a further rise. To prevent flooding of the lower parts of the city a dike was built in 1887 along the river front, which prevented a serious flooding in 1899.

Tides enter the Gulf of St. Lawrence from the Atlantic chiefly through Cabot strait (between Cape Breton and Newfoundland), which is 75 m. wide and 250 fathoms deep. The tide entering through Belle Isle strait, 10 m. wide and 30 fathoms deep, is comparatively little felt. The greatest range is attained in Northumberland strait and in Chaleur bay, where it amounts to 10 feet. At the entrance to the estuary at Anticosti it has again the oceanic range of about 6 ft., and proceeds up the estuary with an ever-increasing range, which attains its maximum of 19 ft. at the lower end of Orleans island, 650 m. from the ocean at Cabot strait. At Quebec, 30 m. farther up, the range is nearly as great; but at 40 m. above Quebec it is largely cut off by the Richelieu Rapids, and finally ceases to be felt at Three Rivers, at the lower end of Lake St. Peter, 760 m. from the ocean.

The St. Lawrence provides ample water-power, which is being increasingly used, and from Lake Superior to the gulf there are numerous points on its tributaries where power has been developed.

Nearly all the rivers flowing into the St. Lawrence below Quebec are stocked with salmon. In the salt water of the gulf and lower river, mackerel, cod, herring, smelt, sea-trout, striped bass and other fish are caught for market.

The St. Lawrence is spanned by the following railway bridges: (1) A truss bridge near Cornwall. (2) A truss bridge with a swing at Coteau Landing. (3) A cantilever bridge at Caughnawaga. (4) The Victoria Jubilee bridge, 6,592 ft. long by 67 ft. wide, with 25 spans, double railway and trolley tracks, driveways and sidewalks. (5) A cantilever bridge, having a central span of 1,800 ft., crosses the river at a point 7 m. above Quebec. The southern half of the superstructure, while in course of erection in August 1907, fell, killing 78 men, and necessitating a serious delay in the completion of the work.

Discovery of St. Lawrence.—The St. Lawrence was discovered by Jacques Cartier, commissioned by the king of France to explore and trade on the American coast. Cartier entered the strait of Belle Isle in 1534; but Breton fishermen had previously resorted there in summer and penetrated as far as Brest, 11 leagues west of Blanc Sablon, the dividing line between Quebec

and Labrador. Cartier circled the gulf, but missed the entrance to the river. On his second voyage in 1536 he named a bay on the north shore of the gulf, which he entered on Aug. 10, the feast of St. Lawrence, *Baye Saint Laurents*, and the name gradually extended over the whole river, though Cartier himself always wrote of the River of Canada. Early in September, he reached "Canada," now Quebec, and on Oct. 2 reached Hochelaga, now Montreal. No permanent settlement was then made. The first, Tadousac, at the mouth of the Saguenay, was established by Champlain in 1603, and Quebec was settled by him in 1608. Between that time and 1616 Champlain explored the whole river system as far west as Lake Huron, reaching it by way of the Ottawa river, and taking possession of the country in the name of the king of France. It became British by the treaty of Paris, in 1763.

Anderson, on improvements to navigation on St. Lawrence, 1904). (W. P. A.)

ST. LEGER, SIR ANTHONY (c. 1496-1559), lord deputy of Ireland, eldest son of Ralph St. Leger, a gentleman of Kent, was educated abroad and at Cambridge. He quickly gained the favour of Henry VIII., and was appointed in 1537 president of a commission for inquiring into the condition of Ireland. In 1540 he was appointed lord deputy of Ireland. His first task was to repress disorder, and he at once proceeded with severity against the Kavanaghs, permitting them, however, to retain their lands, on their accepting feudal tenure on the English model. By a similar policy he exacted obedience from the O'Mores, the O'Tooles and the O'Conors in Leix and Offaly; and having conciliated the O'Briens in the west and the earl of Desmond in the south, the lord deputy carried an act in the Irish parliament in Dublin conferring the title of king of Ireland on Henry VIII. and his heirs. Conn O'Neill, who in the north had remained sullenly hostile, was brought to submission by vigorous measures. For the most part, however, St. Leger's policy was one of moderation and conciliation—rather more so, indeed, than Henry VIII. approved. St. Leger's personal influence was proved by an outbreak of disturbance when he visited England in 1544, and the prompt restoration of order on his return some months later. St. Leger retained his office under Edward VI., and again effectually quelled attempts at rebellion by the O'Conors and O'Byrnes. From 1548 to 1550 he was in England. He was recalled from Ireland in 1551. Under Mary he was again lord deputy from 1553 to 1556, when he was recalled on a charge of falsifying accounts. He died (March 16, 1559) before the investigation was completed.

His great-grandson, SIR WILLIAM ST. LEGER, took part in "the flight of the earls" (see O'NEILL) in 1607, and spent several years abroad. Having received a pardon from James I. and large grants of land in Ireland, he was appointed president of Munster by Charles I. in 1627. He supported Strafford, actively assisting in raising and drilling the Irish levies destined for the royalist service. In the great rebellion of 1641 he executed martial law in his province with the greatest severity, hanging large numbers of rebels, often without much proof of guilt. He was still struggling with the insurrection when he died at Cork on July 2, 1642.

A biography of Sir Anthony St. Leger will be found in *Athenae Cantabrigienses*, by C. H. Cooper and T. Cooper (Cambridge, 1858); see also *Calendar of State Papers relating to Ireland, Hen. VIII.—Eliz.*; *Calendar of Letters and Papers of the Reign of Henry VIII.*; *Calendar of State Papers (Domestic Series), Edward VI.—James I.*; *Calendar of Carew MSS.*; J. O'Donovan's edition of *Annals of Ireland by the Four Masters* (7 vols., Dublin, 1851); Richard Bagwell, *Ireland under the Tudors* (3 vols., London, 1885-90); J. A. Froude, *History of England* (12 vols., London, 1856-70). For Sir William St. Leger, see *Strafford's Letters and Despatches* (2 vols., London, 1739); Thomas Carte, *History of the Life of James, Duke of Ormonde* (6 vols., Oxford, 1851); *History of the Irish Confederation and the War in Ireland*,

edited by Sir J. T. Gilbert (Dublin, 1882-91).

ST. LEONARDS, EDWARD BURTENSHAW SUGDEN, 1ST BARON (1781-1875), lord chancellor of Great Britain, was the son of a hairdresser of Duke street, Westminster, and was born on Feb. 12, 1781. After practising for some years as a conveyancer, he was called to the bar at Lincoln's Inn in 1807, having already published his well-known treatise on the *Law of Vendors and Purchasers* (14th ed., 1862). His parliamentary career was noticeable for his opposition to the Reform bill of 1832. He was appointed solicitor general in 1829, was lord chancellor of Ireland in 1834, and again from 1841 to 1846. Under Lord Derby's first administration in 1852 he became lord chancellor and was raised to the peerage as Lord St. Leonards. In this position he devoted himself with energy and vigour to the reform of the law; in 1855 he was offered the great seal again, but had to refuse. He died at Boyle farm, Thames Ditton, on Jan. 20, 1875.

Lord St. Leonards was the author of various important legal publications, many of which have passed through several editions. See J. R. Atlay, *Lives of the Victorian Chancellors*, vol. ii.

ST. LIZIER, a village of southwestern France in the department of Ariège on the right bank of the Salat, 1 mi. N.N.W. of St. Girons. Pop. (1936) 1,082. St. Lizier, in ancient times one of the 12 cities of Novempopulania under the name of *Lugdunum Consoratorum*, was later capital of the Couserans and seat of a bishopric (suppressed at the Revolution) to the holders of which the town belonged. It has a cathedral of the 12th and 14th centuries with a fine Romanesque cloister, and also remains of Roman ramparts.

The old episcopal palace (17th century) and the adjoining church (14th and 17th centuries), once the cathedral with its fine chapter hall (12th century), remain. The Salat is crossed by a bridge of the 12th or 13th century.

ST. LO, a town of northwestern France, capital of the department of Manche, 47½ mi. W. by S. of Caen by rail. Pop. (1936) 11,580. St. Lô, called *Briovera* in the Gallo-Roman period, owes its present name to St. Lô (Laudus), bishop of Coutances (d. 568). In the middle ages St. Lô became an important fortress and a centre for the weaving industry. In 1574, the town, which had embraced Calvinism, was stormed by the Catholics and many of its inhabitants massacred. In the *hôtel de ville* is the "Torigni marble," the pedestal of an ancient statue, the inscriptions on which relate chiefly to the annual assemblies of the Gallic deputies held at Lyons under the Romans. Agricultural implements are manufactured, and there is an important breeding stud.

ST. LOUIS, the chief city of Missouri, U.S.A., is situated in a central position in the Mississippi drainage system, on the west bank of the river, about 20 mi. below its confluence with the Missouri, 200 mi. above the influx of the Ohio and about 1,270 mi. above the Gulf of Mexico. Area, 61.37 sq. mi.; pop. (1890) 451,770; (1900) 575,238; (1910) 687,029; (1920) 772,897; (1930) 821,960; (1940) 816,048 by federal census. In 1940, 9.8% were foreign-born and 13.4% nonwhite.

Physical Features.—The city spreads along the river front for about 19 mi. and westward about 7 mi. Near the river the land rises rapidly for about ¼ mi. and then gradually, the uplands in the western part of the city being about 300 ft. above high-water mark.

The city is divided into sections by shallow valleys which furnish natural routes for railroads, of which 20 enter from the east and 8 from the west.

The river front and these transportation routes have been the principal determining factors in the situation of industrial areas. The intervening uplands and adjacent regions are occupied by business and residential districts.

City Zones.—From 1840 to 1880 the river front was the busiest part of the city. Along the central part for 3.7 mi. stretches the levee.

Wharves, warehouses, wholesale and jobbing houses, lumber yards and manufacturing plants are crowded together on the rapidly-rising ground between the river and 4th street.

When the railroads took the place of the river as the principal means of transportation, the importance of the levee declined; but it is an important wholesale and manufacturing district, for

several of the main railroad lines from the north and south enter along the river, and many long-established businesses have remained near the river.

The streets here are narrow and often poorly paved. Most of the buildings are old and ill adapted to modern commerce. River traffic has undergone somewhat of a revival, due to the establishment by the government of a line of steel barges between St. Louis and New Orleans; barge rates are somewhat lower than railroad rates. Municipal and government docks and warehouses have been built for the reviving river transportation.

Beginning at 4th street and extending west to 14th on high ground between Market street and Delmar boulevard, is the skyscraper business district. The largest retail establishments, several of them department stores, are on Olive street and Washington avenue. In this district are commercial hotels, theatres, clubs, office buildings, wholesale houses and factories. The downtown district is extending westward. In 1923 a bond issue of \$87,352,500 for public improvements was voted including \$6,000,000 for a memorial plaza and building, \$5,000,000 for a municipal auditorium and \$4,000,000 for a new courthouse. The plaza extends from Market street to Olive street and from 12th to 15th streets making a remarkable civic centre. At the south end are the city hall, municipal courts and auditorium; at the north the public library. Facing 12th between Market and Chestnut streets is the new courthouse.

Adjacent to the downtown retail district on every side are wholesale and jobbing houses, warehouses and factories. Here are most of the plants which produce shoes and shoe-making machinery, garments, drugs and medicines. To the west of the downtown district, spreading out like a fan and extending as far as Grand avenue, in the '70s was the finest residential district. This has become a shabby-looking region, densely inhabited by Negroes and foreigners, but factories, warehouses, automobile sales rooms and commercial hotels are becoming predominant. A \$2,600,000 plaza, with a \$60,000 Carl Milles fountain, has been built opposite Union station. Olive, Market, Delmar (once Mar@" street) and other thoroughfares have been widened. A depressed superhighway traverses the city from east to west.

Industrial Development.—St. Louis is the ninth American industrial area. Its advantageous position near the sources of supply of raw materials, the proximity of a vast thickly-populated area and of the soft-coal fields of Illinois, railroad and highway facilities and electric power make it a natural centre for large industrial plants, and for jobbing and wholesale houses. There were 1,989 factories employing 95,261 people in 1937. Leading industries are assembling and manufacturing automobiles, shoes, drugs, chemicals, beer, electric goods, tobacco, brick, terra-cotta and other clay products, railway and street cars, stoves, ranges and furnaces, steel and lead, hardware, various kinds of machinery, clothing, boxes and woodenware products. St. Louis is one of the largest centres of shoe manufacture in the United States. It is one of the largest of all markets for furs, hides, wool, horses and mules, grain, dry goods, millinery and men's hats. It is a centre for the manufacture of poultry and livestock feed and of meat packing. The total value of factory products in 1937 was \$1,202,718,632. New industrial areas on the outskirts have developed rapidly since 1915. The metropolitan area contains 1,368,000 people, and the outlying regions are growing more rapidly than the city proper. Metropolitan St. Louis is a rapidly-expanding industrial unit, but the outlying communities oppose enlarging the city boundary. The principal industrial areas followed naturally the lines of transportation. Hence industry and warehousing gravitated early to the river front where rail as well as water transport was convenient. (The decline of the river steamboat was to cause many old buildings of the levee district to lose value, become derelicts, spread blight over the city's "front yard," bring about the razing of 37 blocks.)

Other manufacturing areas grew up along the railroads branching through the city. St. Louis is strategically located with respect to transportation. Nineteen major railroads converge there, five major air lines use the municipal airport, 350 truck lines provide service and the navigable water system connects with all

of the principal mid-continent cities.

St. Louis is also a wholesale centre, with its preferential trade territory being 14 states in the middle west. The United States census of distribution credited it with \$1,164,000,000 of wholesale business of all types in 1939. Total retail sales of stores are estimated at \$350,000 annually. Adjacent to the industrial sections are densely-populated tenement districts where most of the unskilled foreign-born and Negro labourers live. The industrial area includes several cities on the Illinois side, such as East St. Louis, National City, Madison and Granite City. The population of the east side industrial area was (1940) 265,547 (75,609 in East St. Louis).

South of East St. Louis is the Cahokia power plant, which supplies power to many St. Louis industrial plants.

The Eads bridge, the first across the Mississippi at St. Louis, was completed in 1874, but was not successful until 1889, when the Terminal Railroad association was formed. In 1937 it controlled 397 mi. of track, the Eads and Merchant's bridges and the Union station, and had 132 locomotives. The McKinley bridge, built by the Illinois Traction company, is independent. In 1918 the St. Louis Municipal (or free) bridge was completed, but because of failure on the part of the city and the Terminal Railroad association to come to agreement, the "free bridge" was not used by the railroads until 1940.

Education.—The first permanent kindergarten and kindergarten training school in connection with public schools in the United States was established in St. Louis in 1873. The city maintains (1940) the Harris Teachers' college for white students, the Stowe Teachers' college for Negro students, 8 high schools for white and 2 for Negro children, 2 technical high schools, 11 evening schools, 113 elementary schools for white and 22 for Negro children, an educational museum, material from which is available for object lessons in various branches of study in all public schools, and a large stadium for high school athletics. The registration in the high schools for 1940-41 was 24,287; in the vocational and evening schools, 20,371; and in the elementary schools, 77,071. There were 4,079 in the department of instruction. The day schools cost the city \$11,392,574 (72.8% of this for supervisors' and teachers' salaries). The Roman Catholic Church maintains 29 high or college preparatory schools and 77 elementary schools. In or near St. Louis there are several excellent private schools.

Washington university (1853) is the leading institution of higher learning in St. Louis. The institution is made up of the college of liberal arts, the schools of engineering, architecture, business and public administration, graduate studies, law, medicine, dentistry and nursing, the Henry Shaw school of botany, the St. Louis school of fine arts, the extension division and the summer school. Most of the buildings are in the Tudor-Gothic style of architecture. The faculty numbers 676, and the students 3,186 exclusive of 2,744 in the adult study centre. The endowment in 1941 was \$17,446,699. The institution is nonsectarian. St. Louis university is a Jesuit institution founded (1818) as a Latin academy. It became a university in 1832. It is the parent school of six other prominent Jesuit colleges in the middle west. The university is composed of the college of arts and sciences, schools of divinity, medicine, law, philosophy and science, dentistry, commerce and finance, and education, the graduate school, and a normal school, the last being at Florissant, Missouri. In addition St. Louis university has merged with it five colleges, several of which are located in St. Louis county. The faculty numbers 777, and the students, exclusive of those in the merged colleges, 4,163.

Other institutions of higher learning in St. Louis or its suburbs are the Principia (Christian Scientist, 1898), Concordia Theological seminary (Evangelical Lutheran, 1839), Eden Evangelical college (German Evangelical Synod of North America, 1850), Kenrick Theological seminary (Roman Catholic, 1894), Benton College of Law (1896), Jefferson college (1940) and Lindenwood college (for women).

Libraries and Museums.—St. Louis is well supplied with libraries. In addition to the libraries of Washington and St. Louis universities, there are: the public library (917,639 volumes and

over 659,796 pamphlets) with a circulation of 3,167,069, 19 branches in its own or other buildings and a book-mobile; the Mercantile library (176,921 vols.); the Missouri Historical society, housed in the Jefferson memorial in Forest park, possesses a collection of nearly 50,000 vols. and about 500,000 mss. which pertain primarily to the history of the Mississippi valley. The society also maintains an archaeological and historical museum and houses the Lindbergh trophies and medals.

An association of music lovers maintains a symphony orchestra. In Forest park is the open-air municipal theatre, which seats 10,000. The City Art museum in Forest park houses a valuable collection of paintings, statuary, tapestries and other works of art.

The Artists' guild offers prizes to encourage artists and gives frequent art exhibits.

Hospitals.—The chief hospitals are the Barnard Free Skin and Cancer, Barnes, Jewish, St. Louis Children's, St. Luke's, St. Mary's, the Shriners (for crippled children), Deaconess, De Paul, Missouri Baptist and St. John's. The city maintains seven public institutions with a 7,500-patient capacity.

Newspapers; Water Supply.—The chief newspapers are the *Post-Dispatch*, the *Globe-Democrat* and the *Star Times*. Foreign language newspapers include weeklies in Jewish, Italian, German, Hungarian, Bohemian and Polish.

The waterworks are near Chain of Rocks park in the extreme northern part of the city, where large settling basins and a filtering plant are located. The Mississippi is the source of supply. Since 1923 additional waterworks have been built at Howard's Bend on the Missouri river about 30 mi. above its mouth, with a reservoir at Olivette.

Parks and Public Buildings.—The most notable park is Forest park (1,380 ac.), portions of which have been left wild. The western part was used for the Louisiana Purchase exposition of 1904. In the park are the City Art museum, Jefferson memorial, field house, municipal theatre, two public golf links, tennis courts, baseball and soccer fields and zoological gardens. Other large parks are Tower Grove (276 ac.), Carondelet (180 ac.), O'Fallon (166 ac.), Fairground (131.46 ac.) and Francis (69 ac.).

The Missouri Botanical garden (125 ac.), one of the finest in the United States, was a gift to the city from Henry Shaw (1800-89), who also endowed the botanical school of Washington university.

The city maintains over 50 small parks, gardens and playgrounds, and the Buder recreation camp (1939-05 a ~ .) at Valley park in St. Louis county. Of historical interest are the Old Cathedral (Catholic) and the old courthouse, the latter being the scene of the Dred Scott trial. In the settlement of estates in ante bellum days, slaves were often sold from the courthouse steps. The most imposing public buildings are the city hall, new courthouse, public library, municipal auditorium, Union station, federal building, art museum and Jefferson memorial. Of the business buildings, the most satisfying architecturally are the Mercantile Trust, the Bell Telephone and the Federal Reserve bank. The best churches architecturally are the new cathedral (Roman Catholic), the Westminster Presbyterian, Christ Church cathedral (Episcopalian), Second Baptist, St. John's Methodist Episcopal, First Church of Christ Scientist and Temple Israel.

Government.—In 1840 a police force composed of a captain, three lieutenants and 28 privates was organized. In 1841 the boundaries were enlarged and the city was divided into five wards. In 1842 voting by ballot was introduced, and an engineering department composed of the city engineer, street commissioner and superintendent of the waterworks was established. A health department was created in 1843. The following year the taxpaying qualification for voters was removed. In 1859 an amendment to the charter provided that the city council was to be a one-chamber body called the common council to be composed of 20 members, two from each of the wards. In 1861 the legislature established the metropolitan police of St. Louis, and placed it under the control of a board of police commissioners appointed by the governor. The mayor was an ex-officio member of the

board. The police department was then made independent of city Government. In 1866 the council was again made bi-cameral. In 1871 the number of wards was increased to at least 12.

Up to 1876 St. Louis and St. Louis county were a judicial unit, and jointly controlled the court house, jail, insane asylum and poor farm. By an act of the State legislature in 1875 provision was made for the separation of the city and county, for the city to extend its boundaries, and for a new charter. In 1876 the provisions were carried into effect. The court house, jail, insane asylum, and poor farm became the property of the city and the old county debt became a city obligation. Under the charter of 1876 the city was divided into 28 wards. The mayor was to hold office for four years and was given extensive power of appointment. The municipal assembly was bi-cameral, being composed of a council of 13 and a house of delegates composed of one member from each ward. The mayor appointed a board of public improvements composed of the street, sewer, water, harbour and wharf and park commissioners. Each commissioner was head of a department. The charter also provided for a health department, for an elective school board of 28, one from each ward, for a board of assessors, and a board of equalization.

In 1914 a new charter went into force. Under this charter the mayor holds office for four years and is given large powers of appointment and supervision. The board of aldermen is made up of a president and 28 aldermen, who hold office for four years. The board is a legislative body and has large powers, especially over money bills. The mayor appoints the members of the board of public service; this is composed of the president of the board and directors of public utilities, of streets and sewers, of public welfare and of public safety. Each is the head of a department. The department of finance is headed by a comptroller; the law department is headed by the city counsellor. The charter provides for two city courts, for a board of standardization, a board of estimate and apportionment, and a city plan commission. One of the reasons for the adoption of a new charter was the desire to safeguard the city against the machinations of politicians and political rings. To effect this, provisions were introduced for the recall of officials, for the initiation of legislation by petitions signed by 5% of the voters, and for the referendum upon ordinances if called for by 2% of the registered voters.

HISTORY

In 1762 Gilbert Antoine de St. Maxent and Pierre Laclède Liguest, merchants of New Orleans, organized a firm which obtained from the French governor of Louisiana a licence to trade with the Missouri river Indians. On Feb. 14, 1764, a party of workmen headed by Auguste Chouteau landed at the site selected by Laclède for his trading post and on the following day began work. In addition to Laclède's original party, settlers came from Cahokia; others who desired to escape from English rule in the Illinois country came, and at the end of the first year 40 families were living at St. Louis. The town was named in honour of Louis XV., whose patron saint was St. Louis, but for many years it was locally known as Laclède's village, and as Paincourt. Within its borders and in the general neighbourhood were several mounds erected by a prehistoric people.

Spanish Period.—In 1765, when the British military took possession of the Illinois country east of the Mississippi, St. Ange, the French commandant, retired with his soldiers to St. Louis, and continued to rule over that part which had been ceded to Spain in 1762, but over which Spain had not, in 1765, asserted her authority. St. Ange was left in control by the Spanish until Feb. 7, 1770, when he was superseded by Don Pedro Piernas, the first Spanish lieutenant governor of Upper Louisiana.

In 1772 the village had a population of 399 whites and 198 slaves. During the administration of St. Ange only one street had a name, the rue Royale, which now bears the prosaic name of Main street. Later the road which ran to the Bonhomme settlement (Walnut street) was known as the rue Bonhomme; Market street was the rue de la Tour; Second street, rue de l'Église. Modern Third street ran along rising ground in the rear of the village; there the barns were located and it was known as the rue

des Granges. West and north-west of the village lay the common fields, a fenced area in which each settler could, by permission, secure a lot for tillage. To the south and south-west the settlers enclosed a large tract for common pasturage and wood supply.

Excepting the Spanish officials, soldiers, and a few traders, the inhabitants were French, and all were Catholics. Families intermarried to such an extent that it is said that at the time of the transfer to the United States, two-thirds of the inhabitants were related. The traders carried on an extensive traffic with the Indian tribes along the Mississippi and Missouri rivers, and monopolized the trade with the Osage. Several large fortunes were made in furs and many families of St. Louis trace their ancestry back to the French fur traders of Spanish days. The great market was New Orleans; thither the inhabitants shipped their surplus flour and packs of furs. Of the early traders the most prominent were the Chouteaus, Auguste and Pierre, who for many years enjoyed a monopoly of the Osage trade and built up a substantial fortune.

In May 1780 a force of British regulars and Indians descended on the city, but the Spanish soldiery and the settlers beat off the invaders. In 1803 about half of the inhabitants of Upper Louisiana were Americans, but few became residents of St. Louis. Under Spanish rule the town grew very slowly and at the close of the regime contained only 180 houses, most of which were scattered along two streets which ran parallel with the river.

Under American Control.—On March 9, 1804, De Lassus, the Spanish lieutenant governor, formally delivered Upper Louisiana to Captain Amos Stoddard of the United States army, who had been authorized to act as agent and commissioner of the French Republic as well as agent of the United States. In 1804 Congress created the District of Louisiana and placed it under the jurisdiction of the officers of Indiana Territory. St. Louis became the governmental headquarters for the District. In 1805 the District of Louisiana was cut off from the jurisdiction of Indiana and made into the Territory of Louisiana. St. Louis was again chosen as the seat of government. In 1812 the Territory of Missouri was created, with St. Louis still the territorial capital.

From Town to City.—In 1808, on petition of two-thirds of the inhabitants, the territorial officers incorporated the town, and a board of trustees composed of two French inhabitants and three Americans was elected. The same year the *Louisiana Gazette* was established, this being the first newspaper west of the Mississippi river. The publication of the territorial laws in 1808 marked the appearance of the first book to be printed in what is now the State of Missouri. The total revenue of the town government in 1810 was only \$529.68; by 1815 the population probably did not exceed 2,600. Not until 1819 were primitive fire engines supplied by private subscription. The same year Market street from Main to the levee was paved. In 1821, at the time of the admission of Missouri to the Union, there were 621 buildings and a population of 5,600. In 1822 the State legislature incorporated St. Louis as a city. During the territorial period the composition of the population had undergone a distinct change. The French element, although still socially and financially prominent, was being engulfed by people from Virginia and Kentucky, but there was also a sprinkling of New Englanders, and the Irish were numerous enough in 1819 to form a Hibernian Benevolent society.

Fur Trade.—The fur trade continued to be a principal source of wealth. Up to 1809, with the exception of the original firm of Maxent, Laclède and Company, and the later Clamorgan company, the trade had been largely a matter of individual enterprise, aided occasionally by special concessions such as the Chouteau monopoly of the Osage trade.

But in 1807 Manual Lisa ascended the Missouri river and built a post at the mouth of the Big Horn and, in 1809, formed the Missouri Fur company. A rival organization headed by William H. Ashley in 1822 founded the Rocky Mountain Fur company; the American Fur company, of which John Jacob Astor was the principal figure established an office in St. Louis in 1822 and soon became the dominant factor in the fur trade. Astor retired in 1834 and the western department of the company was sold to Pratte, Chouteau and company. This organization continued to

3. Federal Reserve Bank building. Mauran, Russell, Crowell, and Mullgardt, architects
4. Municipal auditorium, facing the Memorial plaza. The building has an opera house with a seating capacity of 3,500 persons and an arena seating 12,500 persons. The Plaza Commission, consisting of members of seven firms of architects, designed the building

control most of the western fur trade until 1860. St. Louis was also the outfitting place for much of the trade with the North Mexican provinces.

Immigration and River Trade.—After 1812 St. Louis attracted many settlers including a large foreign element, which, in the '20s and '30s was predominantly German. The failure of the reform movement of 1848 brought another tide of German migration. In 1840 the population was 16,469; after that the growth was rapid, the population in 1850 being 77,860 and ten years later 160,773. In 1817 steamboats began to operate to St. Louis, in 1832, 80 steamboats arrived; in 1838, 154, and in 1845, 213. In 1854 St. Louis ranked third in enrolled tonnage among American cities. After that the river traffic increased tremendously; in 1860 5,178 vessels arrived at St. Louis and 5,218 departed, the total tonnage for the year being 844,039.

In the '30s St. Louis, like other towns in the West, became interested in the development of railroads. The Pacific Railroad Company, the parent of the Missouri Pacific, was organized in 1850; the line was begun in 1851, and the first 40 m. were opened to Franklin, Mo., two years later. In 1855 it reached Jefferson city, and Sedalia in 1861. A south-western branch of the Missouri Pacific was opened to Rolla in 1861. The St. Louis and Iron Mountain railway, incorporated in 1851, was opened from St. Louis to Pilot Knob, Mo., in 1858. The St. Louis, Kansas City and Northern railway was completed as far as Macon, Mo., in 1859. Thus before the Civil War St. Louis became the terminal for four western railroads. The Ohio and Mississippi railroad, to Cincinnati, was completed in 1857; it connected with the Baltimore and Ohio railroad, thus giving St. Louis rail access to the Atlantic coast.

By 1860 the city extended for about 6½ m. along the river front and reached westward between 3 and 4 miles. Most of the houses were built of brick, as were many of the sidewalks. Soft coal was used as fuel, frequently creating a pall of smoke. Missouri was a slave State, but only 1,500 slaves were owned in St. Louis and most of these were in domestic service. The Germans and the newcomers from the North were abolitionists. Many of the business men, regardless of their views on the slavery question, were opposed to secession. They feared that a break in the Union would be injurious to business, and felt that it was vital to St. Louis to have the Mississippi river under the control of the United States.

Civil War Period.—Soon after Lincoln's election it became evident that Governor Jackson was a secessionist and intended to take the State out of the Union. He was backed by a secessionist legislature. The State Government authorized the election of delegates to assemble in convention to consider the question of the secession of Missouri. The delegates concluded that there was no adequate cause for Missouri to dissolve her connection with the Union.

The next step of the Unionists was to prevent the St. Louis arsenal from falling into the hands of the secessionists. Capt. Nathaniel Lyon, with the assistance of the "Wide Awakes," who had been transformed into military companies known as "home guards," succeeded in protecting the arsenal and in shipping most of its guns to Illinois. The governor then authorized the assembly of militia near St. Louis. A camp, named after the governor, was laid out on the western outskirts of the city. Lyon and Blair believed that the purpose of the establishment of Camp Jackson was the seizure of the city. On May 10, 1861, Lyon sent three columns of home guards to capture the camp. The force was overwhelming and Frost, the commander, surrendered without a struggle. An unfortunate outbreak of violence occurred while the prisoners were under guard and about 25 people, several of them civilians, were killed or wounded. For 48 hours the citizens were in a state of panic, but when no other acts of violence occurred, the excitement subsided, and those who had fled returned to their homes.

After the Camp Jackson episode the wavering took a firm stand on one side or the other. But it soon became evident that the city was overwhelmingly Unionist in sentiment. Lynch's "slave pen," a place where adult slaves had been sold at auction, was

closed, and the slave pen where children were sold was soon transformed into a military prison. Eminent citizens hoped that the warring factions in the State might be brought into agreement by a conference of the leaders. On June 11 Gov. Jackson and Gen. Sterling Price met Blair and Lyon in a conference at the Planters' hotel, but no agreement was reached. The governor hastened to Jefferson City, issued a call for 50,000 troops, and then evacuated the capital.

Throughout the Civil War St. Louis remained a Unionist stronghold. There Gen. John C. Frémont, in command of the western department, established his headquarters, and from there Gen. Hallock directed movements in the Mississippi valley. Thousands of troops were encamped in and about the city. For many months St. Louis was under martial law; thousands of prisoners of war, and some 40,000 refugees were cared for during the war. St. Louis was the headquarters of the Western Sanitary commission which had charge of much of the war relief work.

Cultural Development.—For a quarter of a century after the Civil War the city was the centre of a remarkable philosophic and cultural movement. Its inspirer was Henry Conrad Brokmeyer (1826-1906), who later became prominent in State politics and was lieutenant governor of Missouri in 1876-1880. Brokmeyer, a Prussian from Minden, came to St. Louis in 1856. He made a translation of Hegel's *Logic*, but it was never published. Brokmeyer attracted William T. Harris, a brilliant graduate of Yale university, who taught in the St. Louis schools during 1858-67 and was superintendent of schools during 1867-80. Brokmeyer and Harris gathered about them a group of idealistic thinkers and formed a philosophical society which became the sponsor of *The Journal of Speculative Philosophy* (1867-93), the first periodical of the sort in English. For many years Harris, its editor, was the foremost exponent of Hegelian philosophy in the United States.

Economic Progress.—After the Civil War St. Louis grew with unusual rapidity; by 1870 the population was 310,864. In ten years it had almost doubled; St. Louis had become the principal distribution point for the Mississippi valley. But it soon found its supremacy challenged by Chicago, when the railroads made Chicago the terminal for lines to the Pacific coast. After 1870 the Mississippi and Ohio rivers gradually lost their importance as highways and the railroads became the great carriers of interstate commerce.

Since 1870 the history of St. Louis has been mainly economic. It has retained its prominence as a wholesale centre and has also become one of the greatest manufacturing cities in the world.

Louisiana Purchase Exposition.—In 1898 a site on the western outskirts of the city was selected for an exposition to celebrate the 100th anniversary of the purchase of Louisiana from France. The grounds covered 1,240 ac., of which 250 were under roof. The total cost, apart from individual exhibitions, was about \$42,500,000, of which the National Government contributed \$5,000,000 and the city and citizens of St. Louis \$10,000,000. The exposition was opened to the public in 1904. During the seven months of its existence, 12,804,616 paid admissions were collected, and total admissions were 19,694,855. When the exposition closed the company had a favourable balance of about \$1,000,000. Two permanent buildings remain from it, the Jefferson Memorial, the home of the Missouri Historical Society, and the Art building.

Recent Developments.—In 1933 the city determined to turn its central river front district into a national park, at a cost of \$30,000,000. The federal government agreed to put up three-fourths of the money and the city one-fourth. By 1941 the 37-block site had been cleared at a cost of \$7,560,000 and only \$1,000,000 remained available. The normal Republican city was ruled by a Democratic administration (for the first time in 24 years) from 1933 to 1941, when a Republican mayor was heavily victorious again.

ST. LOUIS, the capital of the French colony of Senegal, West Africa, with a population of 33,100 according to the 1936 census. St. Louis, known to the natives as N'dar, is 163 m. by rail N.N.E. of Dakar and is situated on an island 11½ m. above the mouth of the Senegal river, near the right bank, there separated from the sea by a narrow strip of sand called the Langue de Barbarie. This strip of sand is occupied by the villages of N'dar Toute and Guet N'dar. Three bridges connect the town with the villages; and the Pont Faidherbe, 2,132 ft. long, affords communication with Bouetville, a suburb on the left bank, and the terminus of the railway to Dakar. The mouth of the Senegal being obstructed by a shifting bar of sand, the steamships of the great European lines do not come up to St. Louis; passengers embark and land at Dakar, on the eastern side of Cape Verde. From July to the end of September—that is during flood-time—the water over the bar is, however, deep enough to enable smaller vessels to reach St. Louis without difficulty.

St. Louis was founded in 1659 by Dieppe merchants known as the *Compagnie normande*. It is the oldest colonial establishment in Africa belonging to France. (See SENEGAL.) Its modern development dates from 1854. The town, however, did not receive municipal government till 1872. All citizens, irrespective of colour, can vote. From 1895 to 1903 St. Louis was not only the capital of Senegal, but the residence of the governor-general of French West Africa. There is active trade with all the countries watered by the Senegal and the middle Niger. St. Louis is connected with Brest by a direct cable, and with Cadiz via Canary Islands.

See R. Rousseau, "Le site et les origines de Saint-Louis" (*La Géographie*, vol. xlv., 1925).

ST. LOUIS-SAN FRANCISCO RAILWAY COMPANY, popularly known as "The Frisco," was incorporated on Aug. 28, 1916, as successor to a company formed in 1876, having for its purpose the construction of a railroad from St. Louis, Mo., to the Pacific coast. This original plan, however, did not fully materialize. The present railroad comprises a total of 5,175 m. of road, extending from St. Louis and Kansas City, Mo., through Missouri, Kansas, Oklahoma, Arkansas into Texas, and crossing the Mississippi river at Memphis, Tenn., it passes through Tennessee, Mississippi, Alabama and Florida to the port of Pensacola on the Gulf of Mexico. The railway serves a rapidly developing section of the United States. The more important industries in the territory are iron and steel and other manufactures in St. Louis and Kansas City, Mo., Memphis, Tenn. and Birmingham, Ala.; the mid-continent oil fields; coal mining; lead and zinc mining; live stock raising; grain and cotton growing; and fruit and dairying in the great Ozark region.

The company's capital structure consisted (1939) of \$65,543,700 common stock, \$49,157,400 preferred stock, and \$273,967,767 bonds and equipment obligations, a total capital liability of \$388,668,367. Capitalizable assets amount to \$438,718,087. Gross revenues for the five years ending December 31, 1939, averaged \$47,330,113; surplus after all charges, except interest and dividends, averaged \$3,345,736; fixed interest charges averaged \$12,856,081. All principal issues are in default. (J. M. KU)

ST. LUCIA, the largest of the British Windward Islands, West Indies, in 14° N. 61° W., 24 m. S. of Martinique and 21 m. N.E. of St. Vincent. Area 233 sq.mi., length 42 mi., maximum breadth 12 m.; coast-line 150 m. long. It is considered one of the loveliest of the West Indian islands. It is a mass of mountains, rising steeply from the water, their summits bathed in perpetual mist.

The Pitons (2,720 and 2,680 ft.) are the chief natural feature—two immense pyramids of rock rising abruptly from the sea, their slopes, inclined at an angle of 60°, being clothed on three sides with densest verdure. In the south-west is Soufrière (about 4,000 ft.) a volcano with crater 3 ac. in area strewn with sulphur and cinders. The climate is humid, the rainfall varying from 70 to 120 in. per annum, with an average temperature of 80° F.

The soil is deep and rich; the main products exported are sugar, cocoa, logwood, nutmegs, mace, coconuts and copra, limejuice and lime oil. Bananas are an increasing cultivation. Snakes, including the deadly fer *de lance*, formerly prevalent, have been almost exterminated by the introduction of the mongoose. Only about a third of the island is cultivated, the rest being crown land under virgin forest, abounding in timber suitable for cabinet work. The total value of imports in 1925 was £277,013, of exports, £243,207, including bunker coal £77,399. Imports from British Empire £153,055, from United States £96,045, including coal £39,562. Exports to British empire £139,884.

Education is denominational, assisted by government grants. There are 49 schools, mostly Roman Catholic. Agriculture is taught. St. Lucia is controlled by an administrator (responsible to the governor of the Windward Islands), assisted by an executive council. The legislature consists of administrator and council of nominated members. Revenue, 1921, £75,555; expenditure £85,082. The law of the island preserves modified laws of the French monarchy.

Castries, the capital, on the north-west coast, has an excellent land-locked harbour, with a concrete wharf 650 ft. in length. It was for a time the principal coaling station of the British fleet in the West Indies, was strongly fortified, and has been the military headquarters. The troops were removed and the military works abandoned in 1905. The tonnage of steamships calling at the port in 1925 was 545,473. Pop. (1939) 9,000. Soufrière, a small town in the south, is the only other centre of any importance.

The bulk of the inhabitants are negroes, speaking a French patois, but English is gradually replacing it. There is a small colony of East Indian coolies, and the white inhabitants are mostly creoles of French descent. Total population (est. 1940) is 71,232.

History.—St. Lucia was probably discovered by Columbus in 1502, and named after the saint on whose day it was sighted. The Dutch are said to have built a fort there; but the first attempt to settle was made by Englishmen in 1605, when most of them were killed by the Carib inhabitants. From this time until the island became definitely a British possession in 1814 it was the scene of fiercely recurring struggles between England and France; and 13 British regiments gained the right to inscribe the name "St. Lucia" on their colours. In the first half of the 17th century it was included in royal grants made by the kings of England and France; but English settlers were long deterred by the unlucky reputation which St. Lucia gained after a second disastrous attempt at colonization in 1638, frustrated by sickness and native hostility. The French were more successful, sending settlers from Martinique in 1650, by whom a treaty was made with the Caribs ten years later. England defeated the French shortly afterwards, and regained the island, but it was restored by the Peace of Breda in 1667. Another British settlement under a grant of 1722 was frustrated by France. In 1748 the two nations agreed to regard St. Lucia as neutral. In 1762 it was captured by Rodney and Monckton, only to be given up once more at the Peace of Paris. In 1778 it again surrendered to the British who used its harbours as a naval base; and it was from Gros Islet bay that Rodney sailed before his famous victory over de Grasse in April 1782. Between 1782 and 1803 the possession of St. Lucia passed six times between England and France, England having to suppress a vigorous Revolutionist part, aided by insurgent slaves, before gaining possession in 1803, confirmed by a final cession in 1814. From this time the island was administered as a Crown colony—under Barbados from 1838-85; but after an unsuccessful petition by some of the inhabitants in 1920-21, for the substitution of representative Government, the revised constitution of 1924 introduced an elective element into the legislative council.

French influence on the development of St. Lucia has been very great, and is illustrated by the preponderance of the Roman Catholic Church and the survival of a French patois. In the years following 1763 French planters came from St. Vincent and Grenada and formed cotton and sugar plantations. In 1772 the population was said to number 15,000, mostly slaves. In 1834, when the

slaves were emancipated there were in St. Lucia over 13,000 negro slaves, 2,600 free Negroes and 2,300 whites. Prosperity was greatly retarded by the frequent wars, by epidemics of cholera and smallpox and by the decline of the sugar-cane industry. Improvement came with the increase of banana and cocoa cultivation and a wider range of agriculture.

See H. H. Breen, *St. Lucia: historical, statistical and descriptive* (1844); Sir C. P. Lucas, *Historical Geography of the British Colonies* (1905); and the annual reports issued by the Colonial Office. See also under WEST INDIES.

ST. MAIXENT (L'École), a town of western France, in the department of Deux-Sèvres, on the Sèvre Niortaise, 15 mi. N.E. of Niort by rail. Pop. (1936) 5,846. The abbey church, built from the 12th to the 15th century, was in part destroyed by the Protestants in the 16th century and rebuilt from 1670 to 1682 in flamboyant Gothic. There is a Romanesque nave and a lofty 15th century tower over the west front. The crypt contains the tomb of St. Maxentius, second abbot of the monastery, which was founded about 460. The prosperity of the town was at its height after the promulgation of the edict of Nantes, when it had 12,000 inhabitants. There is a military school for infantry officers. The chief industry is the manufacture of hosiery.

ST. MALO, a seaport of western France, capital of an arrondissement in the department of Ille-et-Vilaine, 51 mi. N.N.W. of Rennes by rail. Pop. (1936) 13,734. In the 6th century the island on which St. Malo stands was the retreat of Abbot Aaron, who gave asylum in his monastery to Malo (Maclovius or Malovius), a Cambrian priest, who afterwards became bishop of Aleth (now St. Servan); the see was transferred to St. Malo only in the 12th century. The town became prosperous in the 15th century owing to the discoveries of its seamen and the activities of its corsairs. In the 17th century the maritime power of St. Malo attained some importance. In Nov. 1693 and July 1694 the English vainly bombarded it. The St. Malo shipowners financed the Rio de Janeiro expedition of Duguay-Trouin in 1711 and also lent the king large sums for carrying on the war of the Spanish Succession. In June 1758 the English inflicted great loss on the royal shipping in the harbour of St. Servan, but another expedition in the following September received a complete check. In 1778 and during the wars of the Empire the St. Malo privateers resumed their activity. In 1789 St. Servan was separated from St. Malo, and in 1801 St. Malo lost its bishopric. The famous corsair, Robert Surcouf, was born there in 1773. It is also the birthplace of Chateaubriand (1768-1848), who was buried nearby in the islet of Grand-Bey. The Compagnie des Indes had its seat in the town.

St. Malo is on the English channel on the right bank of the estuary of the Rance at its mouth. It is a garrison town surrounded by ramparts which include portions dating from the 14th, 15th and 16th centuries but as a whole were rebuilt at the end of the 17th century and restored in the 19th century. The most important of the gates are that of St. Vincent and the Grande Porte, defended by two massive 15th-century towers. The granite island on which St. Malo stands communicates with the mainland on the northeast by a causeway known as the "Sillon" (furrow), commanded by the old 14th and 15th century castle, flanked with four towers, one of which, the great keep, is an older and loftier structure. In the sea round about lie other granite rocks which were turned to account in the defenses of the coast. The rocks and beach are continually changing their appearance, owing to the violence of the tides; spring tides sometimes rise 50 ft. above low-water level. The harbour of St. Malo lies south of the town in the creek separating it from the town of St. Servan. Including the basins belonging to St. Servan, it comprises an outer basin, a tidal harbour, two wet-docks and an inner reservoir, affording a total length of quays of over 2 mi. The wet-docks have a minimum depth of 13 to 15 ft. on sill, but the tidal harbour is dry at low water. The great bulk of trade is with England, the exports comprising large quantities of fruit, dairy produce, early potatoes and other vegetables and slate. The principal imports consist of coal and timber. The port carries on shipbuilding and equips a fleet for the Newfoundland cod-fisheries. Industries also include iron- and copper-founding and the manufacture of portable forges and other

iron goods and rope. The town is the seat of a sub-prefect and has a tribunal of commerce.

St. Malo is largely frequented for sea-bathing. The town is a maze of narrow streets and small squares lined with high and sometimes quaint buildings. Above all rises the stone spire (1859) of the cathedral, a building begun in the 12th century.

SAINT-MARC GIRARDIN (1801-1873), French politician and man of letters, whose real name was MARC GIRARDIN, was born in Paris on Feb. 22, 1801. After a brilliant university career in Paris he began in 1828 to contribute to the *Journal des Débats*, on the staff of which he remained for nearly half a century. At the accession of Louis Philippe he was appointed professor of history at the Sorbonne and master of requests in the Conseil d'État. Soon afterwards he exchanged his chair of history for one of poetry, continuing to contribute political articles to the *Débats* and sitting as deputy in the chamber from 1835 to 1848. He was charged in 1833 with a mission to study German methods of education and issued a report advocating the necessity of newer methods and of technical instruction. In 1844 he was elected a member of the academy. During the revolution of February 1848 Girardin was for a moment a minister, but after the establishment of the republic he was not re-elected deputy. After the war of 1870-71 he was returned to the Bordeaux assembly by his old department—the Haute Vienne. His Orleanist tendencies and his objections to the republic were strong, and though he at first supported Thiers, he afterwards became a leader of the opposition to the president. He died on April 1, 1873, at Morsang-sur-Seine, before Thiers was actually driven from power.

His chief work is his *Cours de littérature dramatique* (1843-63), a series of lectures better described by its second title, *De l'usage des passions dans le drame*.

See Hatzfield and Meunier, *Les Critiques littéraires du XIXe siècle* (1894).

SAINT-MARTIN, LOUIS CLAUDE DE (1743-1803), French philosopher, known as "le philosophe inconnu," the name under which his works were published, was born at Amboise on Jan. 18, 1743. While in garrison at Bordeaux he came under the influence of Martinez de Pasquales, who taught a species of mysticism drawn from cabalistic sources and endeavoured to found a secret cult with magical or theurgical rites. In 1771 Saint-Martin left the army to become a preacher of mysticism, first in Paris, and then in England, Italy, Switzerland and the French provinces. At Strasbourg in 1788 he met Charlotte de Boecklin, who introduced him to the writings of Jacob Boehme and inspired in him a semi-romantic attachment. He was brought up a strict Catholic and always remained attached to the church, although his first work, *Of Errors and Truth*, was placed upon the Index. He died at Aunay, near Paris, on Oct. 23, 1803.

His chief works are a translation of the works of Boehme; *Lettre à un anti sur la Révolution Française*; *Eclair sur l'association humaine*; *De l'esprit des choses*; *Ministère de l'homme-esprit*. Other treatises appeared in his *Oeuvres posthumes* (1807). Saint-Martin's ideal society was "a natural and spiritual theocracy," in which God would raise up men of mark, who would regard themselves strictly as "divine commissioners" to guide the people.

See A. J. Matter, *Saint-Martin, le philosophe inconnu* (1862); A. Franck, *La Philosophie mystique en France à la fin du dix-huitième siècle* (1866); A. E. Waite, *The Life of Louis Claude de Saint-Martin* (1901). There are English translations of *The Ministry of Man the Spirit* (1864) and of *Select Correspondence* (1863) by E. B. Manly.

ST. MARTIN, an island in the West Indies, about 5 mi. S. of the British island of Anguilla in 18° N. and 63° W. It is 37 sq.mi. in area and nearly triangular in form, composed of conical hills, culminating in Paradise peak (1,920 ft.). It is the only island in the Antilles owned by two European powers; 20 sq.mi. in the N., belonging to France, form a dependency of Guadeloupe, while the rest, belonging to Holland, is a dependency of Curaçao. Sugar, formerly its staple, has been succeeded by salt. The chief town of the French area is Marigot, a free port on the W. coast; of the Dutch, Philipsburg, on the S. St. Martin was first occupied by French freebooters in 1638, but 10 years later the division between France and Holland was peaceably made. The inhabitants, mostly English-speaking Negroes, numbered in 1938, 6,450 in the

French part, and in the Dutch (1941) 1,938.

ST. MARYLEBONE: see MARYLEBONE, ST.

SAINT MARYS, a city of Auglaize county, Ohio, U.S.A., on the Saint Marys river, 85 mi. W.N.W. of Columbus. It is served by the New York Central and the Nickel Plate railways and by a bus line. Pop. (1920) 5,679 (97% native white); 1930 federal census, 5,433; 1940, 5,532. It is in the gas and oil region of the state, and has various manufacturing industries. A mile west is Lake Saint Marys (17,600 ac.), constructed as a reservoir to supply the Miami and Erie canal (abandoned about 1900), and now developed as a pleasure resort.

Saint Marys is on the site of a Shawnee village, where James Girty (captured in Pennsylvania when a boy of 13 by a French and Indian force and adopted by the Shawnees) established a trading post in 1782. For this reason the place was for some years called Girty's Town. Ft. Saint Marys was built in 1784 or 1785 by Gen. Wayne; Ft. Barbee in 1812 by Col. Joshua Barbee at the instance of Gen. Harrison. The town was laid out in 1823 and became a city in 1903.

SAINT MARYS, a borough of Elk county, Pennsylvania, U.S.A., on Elk creek and federal highway 120, at an altitude of 1,700 ft.; served by the Pennsylvania and (for freight) the Pittsburgh, Shawmut and Northern railways. Pop. (1930) 7,433; (1940) 7,653. The borough was incorporated in 1848.

ST. MAWES, village in parish of St. Just-in-Roseland, Cornwall, England, on an arm of Falmouth harbour. Pop. of parish (1931) 970. There is a considerable fishing industry. The harbour is guarded by a large circular castle dating from the time of Henry VIII. St. Mawes was a borough, 1562-1835.

ST. MICHAEL'S (*São Miguel*), the largest island in the Portuguese archipelago of the Azores. Pop. (1930), 127,162; area, 297 sq.m. See AZORES.

ST. MICHAEL'S MOUNT, a lofty pyramidal island, exhibiting a curious combination of slate and granite, rising 400 yds. from the shore of Mount's bay, Cornwall, England. It is united with Marazion by a natural causeway passable only at low tide. If its questionable identity with the Mictis of Timaeus and the Ictis of Diodorus Siculus be allowed, St. Michael's Mount is one of the most historic spots in the west of England. It was possibly held by a religious body in the Confessor's time and given by Robert, count of Mortain, to Mount St. Michael, of which Norman abbey it continued to be a priory until the dissolution of the alien houses by Henry V., when it was given to the abbess and Convent of Syon. It was a resort of pilgrims, encouraged by Pope Gregory (11th century). The Mount was captured by Henry Pomeroy in the reign of Richard I. John de Vere, earl of Oxford, seized it and held it against the king's troops in 1473. Perkin Warbeck occupied it in 1497. Humphry Arundell, governor of St. Michael's Mount, led the rebellion of 1549. During the reign of Queen Elizabeth it was given to Robert, earl of Salisbury, by whose son it was sold to Sir Francis Basset, whose brother, Sir Arthur Basset, held it against the parliament until July 1646. It was sold in 1659 to Colonel John St. Aubyn and is now the property of his descendant Lord St. Levan, who has a residence in the castle. The chapel is extra-diocesan. Many relics are preserved in the castle. The chapel of St. Michael, a beautiful 15th-century building, has an embattled tower. The harbour, widened in 1823 to allow vessels of 500 tons to enter, has a pier dating from the 15th century. Pop. (1931) 71.

ST. MIHIEL, a town of northeastern France, in the department of Meuse, on the right bank of the Meuse and the Canal de l'Est, 23 mi. S. by E. of Verdun by rail. Pop. (1936) 4,854. St. Mihiel is famous for its Benedictine abbey of St. Michael, founded in 709. The abbey buildings (occupied by the municipal offices) date from the end of the 17th century and the beginning of the 18th century, and the church from the 17th century. The church of St. Étienne, chiefly in the flamboyant Gothic style, contains a magnificent Holy Sepulchre by Ligier Richier. St. Mihiel formerly possessed fortifications and two castles, destroyed in 1635. There are forges and foundries; optical instruments, furniture and embroidery are manufactured. During World War II, the town was occupied by the Germans in June 1940.

Battle of St. Mihiel, 1918.—In his first conference with the commander-in-chief of the French armies, Gen. Pershing visualized: the reduction of the St. Mihiel salient as the first U.S. operation in World War I. In accordance with studies made at his headquarters in Sept. 1917, he planned that the decisive U.S. effort would be against the German railroad system north and east of the Meuse river and the ore deposits in the vicinity of Metz and Longwy, with the elimination of the St. Mihiel salient as a necessary preliminary. Though early American control of the Woevre sector was agreed (May 19, 1918) the demands for American troops to assist the Allies in meeting the Germans elsewhere limited further steps along these lines to the creation of supply installations. At Bombon, on July 24, the commanders-in-chief, having determined to maintain the offensive, accepted Gen. Pershing's proposal that his army should undertake to reduce the St. Mihiel salient before the autumn rains began about the middle of September. This operation harmonized with the Château Thierry offensive and the British and French attacks against the Amiens and Ypres-Lys salients, made in order to free strategic railroads, preparatory to more extended operations. The counter-offensives against the Marne and Amiens salients in July and Aug. had gained such advantages that it was apparent the emergency which justified the dispersion of American divisions had passed. On Aug. 9 final orders were given for the American army to attack the St. Mihiel salient.

The American troops in France—at this time over 1,200,000—were sufficient for the offensive, but they were dispersed along the front from Switzerland to the Channel. While the I. Army Headquarters, two corps and corps troops and seven divisions were operating in the Marne offensive, other American divisions were holding sectors in the Vosges and Lorraine and several were training as reserves behind the British front. To assemble these combat and service troops into an army and undertake a major operation within the short period available and with the staffs so recently organized was an extremely difficult task. Deficiencies in artillery, aviation and special troops, caused by shipment of an undue proportion of infantry and machine guns to assist the Allies, were largely met by the French. While the I. American army was given a distinct and independent mission, Gen. Pershing suggested, as expedient, that it should function under the nominal direction of Gen. Pétain, the French commander-in-chief, in order to assure co-ordination on the part of the French armies adjacent to the I. army and to provide French units needed at the outset for supply services. To all intents and purposes the I. army was entirely independent of French command, as all plans were prepared and all movements and operations ordered by the commander of the I. army. The initial battle plan approved by Marshal Foch by Aug. 17, contemplated as an ultimate objective the general line: Marieulles (east of the Moselle), the heights south of Gorzé, Mars la Tour, Etain and the employment of 25 divisions under Gen. Pershing's personal direction. In furtherance of this plan, the scattered divisions, corps and service troops were first gathered in areas about Chaumont and Neufchâteau and then, beginning Aug. 28, the army advanced to its battle position.

The I. American army took command of the front from Port-Sur-Selle (east of the Moselle) to Watronville (north of Les Eparges) from the II. and VIII. French Armies on Aug. 30. On this day, at I. American Army headquarters (Ligny-en-Barrois), Marshal Foch discussed with Gen. Pershing a general plan for future operations and proposed employing American divisions under French command in the Champagne and Meuse-Argonne regions with a material reduction of the St. Mihiel forces in order to make available American troops for these new operations. Gen. Pershing could not accept such plans as they would require the immediate separation of the recently formed I. American army into several groups delaying further the formation of a distinct American army. Moreover, an enormous amount of preparations had already been made in supplies and munitions and in construction of roads, railroads, regulating stations and other installations for the supply of the army on a particular front. While willing to accept the employment of the American army as a unit where desired, Gen. Pershing would not entertain proposals for its dis-

ruption. At a later conference on Sept. 2, the employment of the American army as a unit was conceded and a decision reached to the effect that after reducing the St. Mihiel salient, the I American army would attack by Sept. 25 between the Meuse river and Argonne forest (see MEUSE-ARGONNE OPERATION). As a result of the decisions, the depth of the St. Mihiel operation was limited to the line Vigneulles, Thiaucourt, Regnkville.

There were 15 American divisions (each equal in size to 2 French divisions) and 4 French divisions available, 6 of which would be in reserve. Furthermore, 2 army corps headquarters and corps troops, practically all army artillery and aviation and the 1st, 2nd and 4th divisions, the first 2 destined for a leading part in the St. Mihiel attack, were all due to be withdrawn and started for the Meuse-Argonne by the fourth day of the battle.

The salient had been held by the Germans since Sept. 1914. It covered the most sensitive section of the enemy's position on the western front; *i.e.*, the Mézières-Sedan-Metz railroad and the Briey Iron Basin; it threatened the entire region between Verdun and Nancy and interrupted the main railroad line from Paris to the east. Its primary strength lay in the natural defensive features of the terrain itself. The western face of the salient extended along the rugged, heavily-wooded eastern heights of the Meuse; the southern face followed the heights of the Meuse for 5 mi. to the east and then crossed the plain of the Woivre, including within the German lines the detached heights of Louvumont and Mont Sec, which dominated the plain and afforded the enemy unusual facilities for observation. The enemy had reinforced the positions by every artificial means during a period of four years. Having concentrated by night movements over 600,000 men on the battlefield, the troops of the I army were deployed in attack positions on the night of Sept. 11. On the south face of the salient was the I corps (4 divisions in line) extending from the Moselle westward. On its left was the IV corps (3 divisions in line) with left facing Mont Sec. These 2 corps were to deliver the main attack, the advance pivoting on the centre of the I corps. The left of the IV corps was to advance toward the heart of the salient where contact would be made with the V corps from the west. On the western face of the salient lay the V corps (3 divisions in line) extended from Mouilly via Les Éparges to Watronville. While the centre division made a deep advance to gain contact with the IV corps on the south, the rest of the corps was to limit its advance while covering the flanks of the centre division. Between the IV and V corps around the apex of the salient, the II French corps (3 divisions in line) covering 24 mi., had the mission of attacking to hold the enemy in the salient. American artillery and aviation were greatly augmented by French artillery and aviation and assisted indirectly by the British independent air force located south of Nancy. The heavy artillery could reach the railroads entering Metz.

Gen. Foch's Army Detachment C held the salient on Sept. 12 with 8 divisions in line and 3 divisions in immediate reserve. While the Germans had an inkling of a possible American attack as early as Sept. 1, the magnitude and imminence were not suspected. An American ruse at Belfort, which comprised extensive preparation for an attack in that region, proved misleading to the enemy. A decision having been made to withdraw in face of a serious attack at St. Mihiel, preparations for a deliberate and methodical withdrawal were under way, some dismounted batteries having been displaced, when the Americans launched their attack at dawn on Sept. 12. After four hours' violent artillery preparation, accompanied by small tanks, the I and IV corps advanced. The infantry of the V corps attacked at 8 A.M. The operation was carried out with precision. Just after daylight of the 13th, elements of the IV and V corps joined at Vigneulles, 11 mi. N.E. of St. Mihiel. The enemy was overwhelmed, and all objectives were reached on the afternoon of Sept. 13. During the 14th and 15th, while the two German counterattacks were repulsed by the I corps, the Americans advanced along the Moselle to Pagny-sur-Moselle. On Sept. 14-16, local operations continued. American patrols advancing to Dampvitoux, eastern edge of Etang de Lachaussee, Jonville and Fresnes-en-Woivre. The swiftness with which the operation

was carried out enabled the Americans to smother the opposition to such an extent that they suffered less than 7,500 casualties during the actual period of the advance. During the battle the Germans engaged four new divisions and drew into local reserve several other divisions. The Americans captured nearly 16,000 prisoners (over 4,000 in the salient proper), 443 guns and large stores of material and supplies. The moral result of the victory was striking. An American army had suddenly appeared and crushed the enemy in one of his strongest positions. No form of propaganda could overcome the depressing effect on the enemy of this demonstration of ability to organize a large American force in so short a time and drive it successfully through its defenses. The strength of the I American army in the battle totalled over 500,000 Americans and 100,000 French, approximately 2,900 cannons, 400 tanks and 1,000 aeroplanes. (H. A. DR.; J. J. P.; X.)

ST. MORITZ, loftiest (6,037 ft.) and most populous village of the Upper Engadine in the Swiss canton of the Grisons. Pop. (1941) 2,305; about half were German-speaking, the rest chiefly Romansch and Italian. About half were Protestant and half Roman Catholic. It is built above the north shore of the lake of the same name, and is 56 mi. from Coire by the Albula railway. The village is about 1 mi. north of the baths, an electric tramway connecting the two. Both are ordinarily frequented by foreign visitors. The baths (chalybeate, sparkling with free carbonic acid) were already well-known in the 16th century.

ST. NAZAIRE-SUR-LOIRE, a town of France, capital of an arrondissement in the department of Loire-Inférieure, 40 mi. W.N.W. of Nantes by rail and 29 mi. by river. Pop. (1936) 38,627. According to remains discovered, St. Nazaire seems to occupy the site of the ancient *Corbilo*, placed by Strabo among the more important maritime towns of Gaul. At the close of the 4th century the site of Corbilo was occupied by Saxons, and, their conversion to Christianity being effected one or two hundred years later by St. Felix of Nantes, the place took the name of St. Nazaire. Under the Second Empire it was chosen as the site of the new harbour for Nantes, because the ascent of the Loire was becoming difficult. It has a granite dolmen 10 ft. by 5 ft. resting horizontally on two other stones. The harbour, accessible to largest ships, is separated from the estuary by a narrow strip of land and comprises an outer harbour and entrance, two floating docks, three graving docks and the extensive shipbuilding yards of the Loire Co. and of the General Transatlantic Co. whose steamers connect St. Nazaire with Mexico, the Antilles and the Isthmus of Panama. Ships for the navy and the mercantile marine are built, and there are important steelworks, blast furnaces, forges and steam sawmills. The town is the seat of a sub-prefect and has a board of trade-arbitrators, a chamber of commerce and a tribunal of commerce. Occupied in June 1940 by the Germans (who set up there a submarine base), it was raided by British commando forces in March 1942. By means of an old destroyer driven into the harbour and carrying explosives, the lock-gates and shipyards were blown up and the harbour was blocked.

ST. NEOTS (pronounced St. Neets), a market town in Huntingdonshire, England, on the right bank of the Ouse, 51½ mi. N. of London by the L.N.E.R. Pop. of urban district (1938) 4,087. Area 2.2 sq.mi. A stone bridge, built in 1589 from the ruins of a former priory, here crosses the river and connects the county with Bedfordshire. St. Mary's church is a fine Perpendicular building of the later 15th century, with original oak roof.

ST. NICOLAS, town, province of East Flanders, Belgium, 12 mi. southwest of Antwerp, a railway junction on the Antwerp-Ghent line, with linen manufactories of its own, and the central market of Waes; formerly barren and bleak downs, it is now highly productive. Pop. (est. 1938) 41,933.

ST. NICOLAS OR **ST. NICOLAS DU PORT**, a town of north-eastern France, in the department of Meurthe-et-Moselle, on the left bank of the Meurthe, 8 mi. S.E. of Nancy by rail. Pop. (1936) 5,078. The town has a fine Gothic church (15th and 16th century), possessing a finger joint of St. Nicolas, formerly the object of pilgrimages which were themselves the origin of well-known fairs. The fairs declined after 1635, when the Swedes sacked the town. Important saltworkings are nearby.

ST. OMER, a town and fortress of northern France, capital of an arrondissement in the department of Pas-de-Calais, 42 m. W.N.W. of Lille on the railway to Calais. Pop. (1936) 17,476.

Omer, bishop of Théroutan, in the 7th century established the monastery of St. Bertin, from which that of Notre-Dame was an offshoot. In the 9th century the village which grew up round the monasteries was named St. Omer. In 1559 St. Omer became a bishopric and Notre-Dame was raised to the rank of cathedral. The town and monastery were surrounded by walls by 980. In 1071 Philip I and Count Arnulf III of Flanders were defeated at St. Omer by Robert the Frisian. In 1127 the town received a communal charter from William Clito, count of Flanders. In 1493 it came to the Low Countries as part of the Spanish dominion. In 1677, after 17 days' siege, Louis XIV forced the town to capitulate; and the peace of Nijmegen permanently confirmed the conquest. In 1711 St. Omer, on the verge of surrendering to Prince Eugene and the duke of Marlborough owing to famine, was saved by the daring of Jacqueline Robin. St. Omer ceased to be a bishopric in 1801.

At St. Omer begins the canalized portion of the Aa, which reaches the sea at Gravelines, and under its walls connects with the Neuffossé canal, which ends at the Lys. There are two harbours outside and one within the city. The old cathedral belongs almost entirely to the 13th, 14th and 15th centuries. A heavy square tower finished in 1499 surmounts the west portal. The church contains interesting paintings, a colossal statue of Christ seated between the Virgin and St. John (13th century, originally belonging to the cathedral of Théroutan) and the cenotaph of St. Omer (13th century). The richly decorated chapel in the transept contains a wooden figure of the Virgin (12th century), the object of pilgrimages. Some arches and a lofty tower are all that remain of the abbey church of St. Bertin. St. Sepulchre (14th century) has a beautiful stone spire and stained-glass windows. There is a fine collection of records in the town hall, which was built of the materials of the abbey of St. Bertin. There are several houses of the 16th and 17th centuries; of the latter the finest is the Hôtel Colbert, once the royal lodging. St. Omer is the seat of a sub-prefect, of a court of assizes, of a tribunal of commerce, of a chamber of commerce, and of a board of trade arbitrators. It was the British headquarters during part of World War I. During World War II, the town was occupied by the Germans in June 1940 and, while under occupation, suffered severe raids from the Allied air forces. The industries include the manufacture of linen goods, sugar, soap, tobacco pipes and mustard, the distilling of oil and liqueurs, dyeing, salt-refining, malting and brewing.

The suburb of Haut Pont to the north of St. Omer is inhabited by a special stock, which has remained faithful to the Flemish tongue, its original costume and its peculiar customs, and is distinguished by honesty and industry. The ground which these people cultivate has been reclaimed from the marsh, and the *lègres* (*i.e.*, the square blocks of land) communicate with each other, only by boats floated on the ditches and canals that divide them. At the end of the marsh, on the borders of the forest of Clairmarais, are the ruins of the abbey founded in 1140 by Thierry d'Alsace, to which Thomas Becket betook himself in 1165.

SANTONGE, one of the old provinces of France, of which Saintes (*q.v.*) was the capital, was bounded on the north-west by Aunis, on the north-east by Poitou, on the east by Angoumois, on the south by Guyenne, and on the west by Guyenne and the Atlantic. It now forms a small portion of the department of Charente and the greater part of that of Charente Inférieure. Originally occupied by the Gaulish *Santonnes*, whose name it preserves, the district subsequently formed part of Aquitania Secunda. It formed the bishopric of Saintes and was divided into two *pagi*: *Santonicus* (whence Saintonge) and *Alienensis* (Aunis). Divided between the kings of England and France in 1259 it was wholly ceded to the king of England in 1360, but reconquered by Du Guesclin in 1371. Up to 1789 it was in the same *gouvernement* with Angoumois, but for judicial purposes Saintonge was under the parlement of Bordeaux and Angoumois under that of Paris.

See D. Massiou, *Histoire politique, civile et religieuse de la Saintonge*

et de l'Aunis (6 vols. 1836-39; 2nd ed., 1846); P. D. Ranguet, *Biographie saintongaise* (1852). See also the publications of the *Société des archives hist. de la Saintonge et de l'Aunis* (1874 seq.).

ST. PANCRAS, a northern metropolitan borough of London, England, bounded east by Islington, south-east by Finsbury, south by Holborn and west by St. Marylebone and Hampstead, and extending north to the boundary of the county of London. Population (1938) 179,400. In the centre of the borough are Camden Town and Kentish Town and the three great railway termini of Euston, St. Pancras and King's Cross, with their extensive goods depôts and adjacent hotels. To the south of this lies the residential district of Bloomsbury, one mainly of boarding houses and private hotels, and with several fine squares. Still further south is a shopping district adjoining the main shopping thoroughfares. North of the railway stations are the residential districts adjoining Hampstead Heath and Regent's Park, including Gospel Gate, part of Highgate and the Holly Lodge Estate (the property of the late Baroness Burdett-Coutts), which was bought in 1923 for a garden suburb. In the northern part also are considerable open spaces, the largest of which are Waterlow Park, part of Regent's Park, Parliament Hill and Fields (bought for the public in 1886) and Ken Wood, purchased in 1919. The last contains Ken Wood House, with a noted collection of pictures.

A thoroughfare, called successively Tottenham Court Road, Hampstead Road, High Street Camden Town, Kentish Town Road, and Highgate Road, runs from south to north; Euston Road crosses it in the south, and Camden Road and Chalk Farm Road branch from it at Camden Town. The parish church of St. Pancras in the Fields, near Pancras Road, has lost its ancient character owing to reconstruction, though retaining several early monuments. Among institutions, University College, Gower Street, was founded in 1826, and provides education in all branches common to universities excepting theology. With the department of medicine is connected the University College Hospital (1833) opposite the College. There are several other hospitals; among them the Royal Free Hospital (Gray's Inn Road); the North-west London hospital, Kentish Town; and, in Euston Road, the British (Forbes Winslow memorial) hospital for mental disorders, British hospital for skin diseases; and the Elizabeth Garrett Anderson Hospital for Women. The site of the Foundling Hospital (in the old Lamb's Conduit Fields) has been purchased for a playground for children, the hospital having moved to the country.

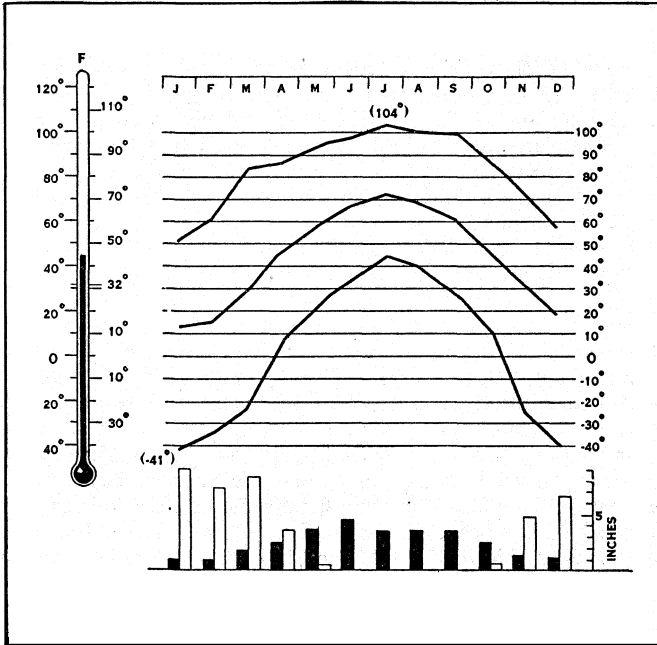

Other institutions are the London School of Medicine for Women, the Royal Veterinary College and the Aldenham Technical Institute. The Passmore Edwards Settlement, named for its principal benefactor, was founded largely through the instrumentality of Mrs. Humphrey Ward. Near Regent's Park is the site of Cumberland Market which has long been closed. The parliamentary borough of St. Pancras has north, south-east and west divisions, each returning one member. A large number of the inhabitants of the borough, particularly in the central part are employed in work connected with the railways. There are also furniture and piano-making industries which employ many people.

St. Pancras is mentioned in Domesday as belonging to the chapter of St. Paul's Cathedral, in which body the lordship of the manors of Cantelows (Kentish Town) and Totenhall (Tottenham Court) was invested. Camden Town takes its name from Baron Camden (d. 1794), lord chancellor under George III. King's Cross was so called from a statue of George IV., erected in 1830, greatly ridiculed and removed in 1845, but an earlier name, Battle Bridge, is traditionally derived from the stand of Queen Boadicea against the Romans, or from one of Alfred's contests with the Danes.

SAINT PAUL, the capital city of Minnesota, U.S.A., a port of entry, the judicial seat of Ramsey county, and federal headquarters for the state; near the head of navigation on the Mississippi river, 2,150 mi. from its mouth, just below and east of Minneapolis. It is on federal highways 10, 12, 52, 61 and 212; has direct air-mail service to Chicago, connecting there with the trans-continental airways; and is served by the Burlington Route, the Chicago Great Western, the Chicago, Milwaukee, St. Paul and Pacific, the Chicago, St. Paul, Minneapolis and Omaha, the Great

Northern, the Minneapolis and St. Louis, the Northern Pacific, the Rock Island, the Soo Line and electric interurban railways, a terminal switching and belt line, motor coach and truck lines in all directions and river barges. The population was 271,606 in 1930, of whom 44,143 were foreign-born white (largely from the Scandinavian countries, Germany and Canada); 1940 federal cen-

little more than a mile from the courthouse, the principal railway freight terminals and the bus depot, is the municipal airport (350 ac.), northern terminus of the air-mail service. Two of the transcontinental railways have their general offices in Saint Paul, as well as the Chicago, St. Paul, Minneapolis and Omaha, and it is the northwestern headquarters for the U.S. Railway Mail service.

WEATHER GRAPH OF SAINT PAUL. THE THERMOMETER INDICATES THE ANNUAL MEAN TEMPERATURE: THE MIDDLE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE: THE CURVES ABOVE AND BELOW THE HIGHEST AND LOWEST EVER RECORDED. THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION: (BLACK) TOTAL PRECIPITATION (INCLUDING MELTED SNOW): (WHITE) SNOWFALL

sus 287,736. The Twin Cities and their immediate suburbs constitute a great urban community of about 900,000.

Transportation Facilities.— Saint Paul is picturesquely located on a series of benches or terraces of irregular breadth and height, reaching a maximum of 266 ft. above the level of the river and merging in an elevated rolling plateau. It occupies 55 sq.mi., mostly on the north (or "east") bank of the Mississippi, but including an area in a bend of the river on the south side, opposite the heart of the business district. Six highway bridges and several used by railways cross the river within the city limits, connecting the main part of the city with the "west" side, and connecting Saint Paul with Minneapolis. Because of the irregular nature of the terrain and the numerous railways entering the city, there are 67 other bridges spanning railroad tracks and valleys. Saint Paul is indeed "the port of entry to the great northwest." The nine railway systems, with 23 lines originating or terminating there, have an aggregate mileage of 60,376 mi., one-fourth of the total railway mileage of the United States. They enter the city along the foot of the bluffs, or through a narrow valley giving access to the highlands back of the city. All use the fine Union depot, completed in 1926 at a cost of \$15,000,000. A switching and interchange railway, serving all the lines, handles 500,000 cars in a year.

After a long period during which the river, originally the principal artery of commerce, had scarcely been used, regular barge service on the upper Mississippi was again inaugurated (by the Inland Waterways corporation) in the summer of 1927. By 1928 biweekly sailings to and from Saint Louis (where connection is made with the lower river fleet) were provided by 60 steel barges and 4 towboats. There are three municipal terminals for handling general cargo, grain, coal and ore. Many motor truck lines and numerous bus lines operate in and out of the city in all directions.

On the south bank of the river, opposite the river terminal and

Buildings and Parks.— Dominating the view as the city is approached from the south and the east is the sky line of the loop section with the state capitol in the background. Prominent in this sky line is the new city hall and courthouse. Costing \$4,000,000, this structure departs from the typical monumental public building and places full emphasis upon the utilization of space, and it depends for beauty upon its simplicity of lines, mass and shadows, rather than upon columns and ornaments; and secondly, because of the works of art contained in it and the excellence of the interior finish.

The state capitol stands on high ground north of the business district, where it commands a view of the entire city. Designed by Cass Gilbert, Saint Paul architect, this structure of Minnesota granite and white Georgia marble, with massive central dome, was completed in 1905 at a cost of \$4,500,000. Included in the state building group are the state office building and the State Historical society building. Other prominent buildings are the federal building and the municipal auditorium, which seats more than 12,000 in the main arena and in addition has a theatre section, numerous smaller halls, conference rooms and exhibit areas. The residential sections of the city, mostly on high ground, are beautiful with trees, shrubbery and wide lawns. The most noted street, Summit avenue, 200 ft. wide, winds for part of its length along the edge of the bluff, commanding fine views of the river gorge and the lower terraces of the city. Adjoining the city on the southwest is the Ft. Snelling military reservation of 2,000 ac., an important modern army post. The picturesque original fort, built in 1822, still stands high on the bluff. The city's park system covers 2,359 ac. It includes 74 neighbourhood playgrounds and several large parks (up to 600 ac.) connected by drives and river boulevards. Harriet island, opposite the business section of the city, has been made a pleasure ground. Three of the parks contain large lakes and golf courses, and there are 53 lakes in the county. Indian Mounds park (named from the Sioux burial mounds which it encloses) on Dayton's bluff commands a magnificent view of the Mississippi. Next to it are the grounds of the state fish hatchery, one of the best equipped in the country. On the northern edge of the city, bounded by it on three sides, are the 260-ac. grounds and beautiful buildings (owned by the state) of the Minnesota Agricultural society, the scene of the annual state fair, the largest, one in the United States, with an attendance in 1939 of 706,619.

Schools and Churches.—In the northwestern corner of the city, adjoining the fair grounds, is the farm campus (419 ac.) of the state university, where the schools of agriculture and the main agricultural experiment station are located. Saint Paul is the seat also of Macalester college (Presbyterian; founded in 1853 as Baldwin institute); Hamline university (Methodist Episcopal; chartered 1854); the College of St. Thomas (Roman Catholic; 1885); the College of St. Catherine (Roman Catholic; 1909); Bethel Theological seminary (Baptist); Luther Theological seminary; Phalen Luther seminary; and St. Paul Theological seminary (Roman Catholic); the St. Paul College of Law; and a number of secondary and special training schools under various auspices, including one for the training of laboratory technicians. The public schools are housed in 76 buildings, most of them modern in construction. The public library occupies an entire block. In one wing is the valuable Hill reference library, maintained by the heirs of James J. Hill, and part of his famous gallery of paintings, which included the best collection of the Barbizon school in America. The law library of the state (75,000 volumes) is housed in the capitol, and the collection of the Minnesota Historical society (115,000 volumes) has a fine building of its own. Two daily newspapers are published.

The Pioneer-Press, established in 1853, is one of the oldest news-

papers in the northwest. Saint Paul is the see of a Roman Catholic archdiocese. The Cathedral of Saint Paul is one of the notable ecclesiastical structures of the country. There are 225 churches, representing all the principal faiths and denominations. The charitable agencies which depend for support on voluntary contributions are financed through a joint annual campaign, which raises about \$750,000. The Community Chest and several of the larger philanthropic agencies are housed in a central administration building provided by the Amherst H. Wilder charity, a trust fund of about \$3,800,000, established in 1910 for the benefit of the poor of the city.

Administration.— Saint Paul operates under a charter adopted in 1912 and effective Jan. 1, 1914, establishing a commission form of government. Elections are held biennially. The voters elect a mayor, a comptroller and six councilmen or commissioners; three justices of the peace, two municipal judges and four constables. The mayor assigns each commissioner to one of the six departments of government (public safety, public works, public utilities, parks and public buildings, finance and education) as its administrative head. The mayor is *ex officio* president of the council and has the veto power over its acts, but they may be passed over his veto by four votes. The comptroller is also the civil service commissioner. A city planning board was created in 1918. In 1922 it submitted a general city plan, and in 1924 a zoning ordinance was adopted. In comparison with other large American cities, Saint Paul, like its neighbour Minneapolis, has a low general death rate, a low infant mortality, little illiteracy, a small number of children employed for wages, a high percentage in school, a high percentage of home ownership and an index figure for cost of living which is below the average. The assessed valuation of property for 1940 was \$400,289,652.

Trade and Manufactures.— Saint Paul, near the head of navigation on the Mississippi river, became the railroad centre of the northwest in the days when the river was the principal artery of transportation. Because of these transportation advantages, it also became the distributing centre of the northwest. Today the wholesalers and jobbers distribute food, dry goods, clothing, general merchandise, hardware, petroleum products and farm implements to the surrounding territory. The South Saint Paul (adjacent to Saint Paul) livestock market has grown so that it is second only to Chicago in the receipt and slaughter of livestock.

Poultry, dairy and food products from the surrounding agricultural area are also processed in large quantities. Printing and publishing is one of the major industries of Saint Paul. Among the firms in this field are the world's largest publishers of law books and the largest producers of calendars and advertising specialties in the United States. Automobiles and accessories, wearing apparel and furs, foundries and machine shops are also important in the industrial life of the city. Saint Paul supplies the world with the familiar scotch and cellulose tapes and produces abrasives and other products. More than 600 manufacturers in the Saint Paul industrial area make over \$300,000,000 worth of products annually. The city has an important agricultural industry in the production of mushrooms, which are raised in large quantities in the caves in the sandstone bluffs on the west side of the river. More recently the caves are being used to age cheese, most of which is a Roquefort type developed at the University of Minnesota farm school and called "Minnesota Blue." Saint Paul has 19 banks, with total resources of \$249,082,457. Debits to individual accounts in 1940 amounted to \$2,072,149,470. The Federal Land bank and the Federal Intermediate Credit bank for the northwest are both located in Saint Paul.

History.— The site of Saint Paul was known to the Indians as *Znijniska*, the White Rock. It was occasionally used as a camping place, but it was not until about 1800 that an Indian village was established there. The first white visitor of record was the Jesuit missionary, Father Louis Hennepin, in 1680, but probably the traders Radisson and Groseilliers were there in 1658. La Salle mentions the locality in a letter written in 1682. In 1766 Jonathan Carver (*q.v.*) of Massachusetts made an adventurous journey by way of Mackinac across Wisconsin and into Minnesota, and his

heirs claimed the entire site of Saint Paul and much adjacent territory on the ground of an alleged grant made to him by the Indians. In 1805 Lieut. Zebulon M. Pike, sent by Jefferson to take possession of the region, bought most of the ground now occupied by the city, as well as the Ft. Snelling reservation, from the Sioux for 60 gal. of whiskey and a few presents, to which Congress later added \$2,000 in cash. In 1823 the first steamboat made its way up the river. In 1837 the site was opened to settlement. By 1840 there were about 200 settlers, mainly French, living by hunting, fishing and trading. To them came Father Lucien Gaultier, and under his guidance they built a church of logs in 1841 on the crest of the bluff and dedicated it to Saint Paul. The place came to be known as Saint Paul's Landing, later shortened to Saint Paul. On the organization of the Territory of Minnesota in 1849, the village of 32 houses was designated as the capital. It was incorporated as a city in 1854.

ST. PAUL, a volcanic island in the southern Indian ocean, in 38° 42' 50" S., 77° 32' 29" E., 60 m. S. of Amsterdam island, belonging to France. The island was attached to the general government of Madagascar by decree (1924) at the same time as other islands of the southern seas. The two islands belong to two separate eruptive areas characterized by quite different products; and the comparative bareness of St. Paul contrasts with the dense vegetation of Amsterdam. On the north-east of St. Paul, which has an area of 2½ sq.m., is a land-locked bay, representing the old crater, with its rim broken down on one side by an explosion, forming a natural harbour. The highest point is 862 ft. above the sea. Inaccessible cliffs occur on the south-west side. The oldest rocks are a trachyte which occurs at Nine Pin rock; this was followed by an extrusion of basalts, then by basic lavas, scoriae, palagonite tuffs, and basaltic ashes and finally basalt flows proceeded from the crater. The only remaining indications of volcanic activity are the warm springs and emanations of carbon dioxide. The island is uninhabited but the waters are well stocked with fish (*see* C. Vélain, "St. Paul et Amsterdam," *Annales de Géographie*, t. ii., p. 329).

ST. PAUL'S ROCKS, a number of islets in the Atlantic, nearly 1° N. of the equator and 540 m. from South America, in 29° 15' W. The whole space occupied does not exceed 1,400 ft. in length by about half as much in breadth. Besides sea-fowl the only land creatures are insects and spiders. Fish are abundant, seven species being collected by the "Challenger." Darwin considered the rocks not of volcanic origin; later investigators maintain that they probably are eruptive.

ST. PETER, a city of southern Minnesota, U.S.A., on the west bank of the Minnesota river, 75 m. S.W. of Minneapolis; the county seat of Nicollet county. It is served by the Chicago and North Western and the Chicago, St. Paul, Minneapolis and Omaha railways, and by motorbus lines. The population was 5,870 in 1940. St. Peter is an important grain and lumber market, and is the seat of a State hospital for the insane and of Gustavus Adolphus college (Swedish Evangelical Lutheran, 1862). The city was founded about 1852, incorporated as a village in 1865, and chartered as a city in 1891. In 1857 a bill making it the State capital passed the legislature, but was not signed by the governor.

ST. PETER PORT, the chief town of Guernsey, one of the Channel Islands. Pop. (1931) 16,318. It lies on a steep slope above its harbour, on the east coast of the island. The harbour is enclosed by breakwaters, the southernmost of which connects with the shore and continues beyond an islet on which stands Castle Cornet (12th century). A sea wall extends more than a mile towards the port of St. Sampson. To the south of the town is Fort George. The old boundaries of the town are marked by five stones. St. Peter's, the town church, standing low by the side of the quay, dates from various periods, with possible remnants of Norman walls, and has fine details of the 14th and 15th centuries. The Elizabeth college for boys was founded by Queen Elizabeth. Hauteville house, the residence of Victor Hugo from 1856 to 1870, is preserved as he left it, and the authorities of the city of Paris are now its trustees. Among other works which he produced in this island fastness was *Les Travailleurs de la Mer* (1863), unsurpassed even among the works of its author for

splendour of imagination and for pathos. The church of St. Sampson, consecrated 1111, is the oldest in the island.

The original harbour was built under King Edward I., if not earlier; it was added to under Queen Elizabeth, and outside this harbour lay a roadstead, landward of the islet of Castle Cornet. Most of this roadstead was enclosed by breakwaters in the mid 19th century, and the large harbour thus formed has had its quays increased by the completion in 1930 of a jetty projecting out into the pool. A large export trade in fruit, vegetables and flowers is carried on.

ST. PETERSBURG: see LENINGRAD.

SAINT PETERSBURG, a city of Pinellas county, Florida, U.S.A., on the west coast, 20 m. S.W. of Tampa; served by the Atlantic Coast Line and the Seaboard Air Line railways, National Air Lines and ocean steamship lines. The population was 60,812 in 1940 (federal census). The city covers 58.1 sq.mi. (52.2 sq.mi. of land) on the southern tip of the Pinellas peninsula, with the Gulf of Mexico on the west and Tampa bay on the south and east; it is connected with the mainland by the Gandy automobile bridge (7 m. long) and with the Gulf beaches by a great causeway. It has 33 m. of water front (6 m. owned by the city), a municipal landing field, 150 hotels, an assessed valuation of \$157,040,300, and a commission-manager form of government. The setting is sub-tropical, the climate mild and equable, with an average of only four or five days in the year on which there is no sunshine. The post-office is an "open-air" building, an unenclosed arcade around the outside forming the corridors for the public. The city is a summer and a winter resort, and a shipping point for fish, fruit and winter vegetables. The commerce of its harbour amounted in 1939 to 274,572 tons; and its manufacturing industries had an output in 1939 valued at \$3,835,000. There were fishermen and citrus-growers living on the peninsula long before the railroad reached it in 1885.

A town government was organized in 1887 and the city was chartered in 1903.

In 1900 the population was 1,575; in 1920, 14,237; in 1930 it was 40,422 (8% negroes).

SAINT-PIERRE, BERNARDIN DE (1737-1814), French man of letters, was born at Havre on Jan. 19, 1737. He was educated at Caen and at Rouen, and became an engineer. According to his own account he served in the army, taking part in the Hesse campaign of 1760, but was dismissed for insubordination, and, after quarrelling with his family, was in some difficulty. He appeared at Malta, St. Petersburg, Warsaw, Dresden, Berlin, holding brief commissions as an engineer and rejoicing in romantic adventures. He came back to Paris in 1765 poorer than he set out. He came into possession of a small sum at his father's death, and in 1768 he set out for the Isle of France (Mauritius) with a government commission, and remained there three years, returning home in 1771. On his return from Mauritius he was introduced to D'Alembert and his friends, but he was most attracted to J. J. Rousseau, of whom in his last years he saw much, and on whom he formed both his character and his style. His *Voyage à l'Île de France* (2 vols., 1773) gained him a reputation as a champion of innocence and religion, and in consequence, through the exertions of the bishop of Aix, a pension of 1,000 livres a year. The *Études de la nature* (3 vols., 1784) was an attempt to prove the existence of God from the wonders of nature.

His masterpiece, *Paul et Virginie*, appeared in 1789 in a supplementary volume of the *Études*, and his second great success, much less sentimental and showing not a little humour, the *Chaumière indienne*, not till 1790. In 1792 he married a very young girl, Félicité Didot, who brought him a considerable dowry. For a short time in 1792 he was superintendent of the Jardin des Plantes, and on the suppression of the office received a pension of 3,000 livres. In 1795 he became a member of the Institute. After his first wife's death he married in 1800, when he was sixty-three, another young girl, Désirée Pelleport, and is said to have been very happy with her. On Jan. 21, 1814 he died at his house at Eragny, near Pontoise.

Paul et Virginie has been pronounced gaudy in style and unhealthy in tone. Bernardin's merit lies in his breaking away from

the arid vocabulary which more than a century of classical writing had brought upon France, in his genuine preference for the beauties of nature, and in his attempt to describe them faithfully. After Rousseau, and even more than Rousseau, Bernardin was in French literature the apostle of the return to nature, though both in him and his immediate follower Châteaubriand there is still much mannerism and unreality.

Aimé Martin, disciple of Bernardin and the second husband of his second wife, published a complete edition of his works in 18 volumes (1818-20), afterwards increased by seven volumes of correspondence and memoirs (1826). *Paul et Virginie*, the *Chaumière indienne*, etc. have often been separately reprinted. See also Arède Barin's *Bernardin de Saint Pierre* (1891).

SAINT-PIERRE, CHARLES IRÉNÉE CASTEL, ABBÉ DE (1658-1743), French writer, was born at the Château de Saint-Pierre l'Église near Cherbourg on Feb. 18, 1658. His father was *bailli* of the Contentin, and Saint-Pierre was educated by the Jesuits. In Paris he frequented the salons of Madame de la Fayette and of the marquise de Lambert. He was presented to the abbacy of Tiron, and was elected to the Academy in 1695. In the same year he gained a footing at court as almoner to Madame. But in 1718, in consequence of the political offence given by his *Discours sur la polysynodie*, he was expelled from the Academy. He died in Paris on April 29, 1743.

Saint-Pierre's works are almost entirely occupied with an acute criticism of politics, law and social institutions. They had a great influence on Rousseau, who left elaborate examinations of some of them, and reproduced not a few of their ideas in his own work. His *Projet de paix perpétuelle*, which was destined to exercise considerable influence on the development of the various schemes for securing universal peace which culminated in the Holy Alliance, was published in 1713 at Utrecht, where he was acting as secretary to the French plenipotentiary, the Abbé de Polignac.

His works were published at Amsterdam in 1738-40 and his *Annales politiques* in London in 1757. A discussion of his principles, with a view to securing a just estimation of the high value of his political and economic ideas, is given by S. Siégler Pascal in *Un Contemporain égaré au XVIII^e siècle. Les Projets de l'abbé de Saint-Pierre, 1658-1743* (Paris, 1900).

ST. PIERRE and MIQUELON, the largest islands of two small groups 10 m. off the south coast of Newfoundland; united area about 93 sq.m. Both islands are rugged masses of granite, with a few small streams and lakes, a thin covering of soil and scanty vegetation. Area of St. Pierre group, 10 sq.mi.; pop. (1936), 3,655. Area of Miquelon group, 83 sq.mi.; pop. (1936), 520.

The islands were occupied by the French in 1660, and fortified in 1700. In 1702 they were captured by the British, and held till 1763, when they were given back to France as a fishing station. They are thus the sole remnant of the French colonies in North America. Taken by the English in 1778, restored to France in 1783, again captured and depopulated by the English in 1793, recovered by France in 1802 and lost in 1803, the islands have remained in undisputed French possession since 1814 (Treaty of Paris). Their importance is due to their proximity to the great Banks, which makes them the centre of the French Atlantic cod fisheries. Fishing lasts from May till October, when the population of the island is greatly increased. Two-thirds of the vessels are fitted out from St. Pierre, the chief town on the islands, the remainder coming from St. Malo, Cancale and other French coast towns. Primary education is free, with two schools for boys and three for girls, besides private schools. A Governor, after 1921, organized the public services, with the aid of a consultative council of administration and the municipal councils. In 1941-42 the islands were under Vichy control.

See Henrique, *Les Colonies françaises*, t. ii. (Paris, 1889); Levasseur, *La France*, t. ii. (Paris, 1893); *L'Année coloniale*, yearly since 1899, contains statistics and a complete bibliography; St. Pierre and Miquelon (Foreign Office Handbooks) 1920; *Annuaire des Îles de St. Pierre et Miquelon* (St. Pierre).

ST. POL, COUNTS OF. The countship of St. Pol-sur-Ternoise in France (department of Pas-de-Calais) belonged in the 11th and 12th centuries to a family surnamed Candavène. Elizabeth, heiress of this house, carried the countship to her husband, Gaucher de Châtillon, in 1205. By the marriage of Mahaut de Châtillon with Guy VI. of Luxembourg, St. Pol passed to the

house of Luxembourg. It was in possession of Louis of Luxembourg, constable of France, who was beheaded in 1475. The constable's property was confiscated by Louis XI., but was subsequently restored in 1488 to his granddaughters, Marie and Françoise of Luxembourg. Marie (d. 1542) was countess of St. Pol, and married François de Bourbon, count of Vendôme. Their son, François de Bourbon, count of St. Pol (1491-1545), was one of the most devoted and courageous generals of Francis I. Marie, daughter of the last-mentioned count, brought the countship of St. Pol to the house of Orleans-Longueville. In 1705 Marie of Orleans sold it to Elizabeth of Lorraine-Lillebonne, widow of Louis de Melun, prince of Épinoy, and their daughter married the prince of Rohan-Soubise, who thus became count of St. Pol.

(M. P.)

ST. POL-DE-LEON, a town of N.W. France, in the department of Finistère, about 1 mi. from the shore of the English channel, and 13½ mi. N. of Morlaix. Pop. (1936) 5,304. In the 6th century a Welsh monk, Paul, became bishop of the small town of Léon, and lord of the domain in its vicinity, which passed to his successors and was increased by them. It is a quaint town with several old houses. The cathedral (13th and 14th centuries) is largely in the Gothic style. The west front has a projecting portico and two towers with granite spires. Within the church there are beautifully carved stalls of the 16th century, a wooden shrine containing the bell of St. Pol-de-Léon, said to cure headache and diseases of the ear, and a huge baptismal font, popularly regarded as the stone coffin of Conan Meriadec, king of the Bretons. Notre-Dame du Kreisker is mainly late 14th century. Fishing is carried on. There is an important trade in early fruit and vegetables.

ST. PÖLTEN, an old town and bishopric in Lower Austria, annexed by Germany in 1938, on the left bank of the Traisen.

Inhabited since the Roman period, the modern town grew up around an abbey founded there in the 9th century and dedicated to St. Hippolytus, whose name in corrupted form was adopted for the town. St. Pölten is an important railway junction and has a considerable development of industries, notably cotton-spinning and the manufacture of iron and hardware. In addition, several religious institutions have grown up around the old abbey church. Pop. (1934), 36,619; (1939) 45,937.

SAINT PRIEST, EMMANUEL LOUIS MARIE GUIGNARD, VICOMTE DE (1789-1881), French politician, third son of the following, took part in the invasion of France in 1814. At the Restoration he was in the service of the duke of Angoulême, and during the Hundred Days tried to raise Dauphiné in the royal cause. He served in Spain in 1823, and after two years at Berlin became French ambassador at Madrid, where he negotiated in 1828 the settlement of the Spanish debt. After the July revolution Frederick VII. made him a grandee of Spain with the title of duke of Almazan. He arranged the escapade of the duchess of Berry in Provence in 1832, and was imprisoned for 10 months. He arranged an asylum in Austria for the duchess, and returned to Paris, where he was a leader of legitimist society until his death at Saint Priest, near Lyon on Feb. 26, 1881.

SAINT PRIEST, FRANÇOIS EMMANUEL GUIGNARD, CHEVALIER, then COMTE DE (1735-1821), French statesman, was born at Grenoble on March 12, 1735. He entered the army at the age of fifteen, leaving it in 1763 with the grade of colonel. After four years as representative of the court of France at Lisbon, he went to Constantinople, where he remained, with a short interval, until 1785, and married Wilhelmina von Ludolf, daughter of the Neapolitan ambassador. After a few months at the Hague, he joined Necker's ministry as minister without portfolio, and in Necker's second cabinet held office as minister of the interior until Dec. 1790. In 1795 he joined the comte de Provence at Verona as minister of the household. He followed the exiled court to Blankenburg and Mittau, retiring in 1808 to Switzerland.

He wrote *Mémoires sur l'ambassade de France en Turquie et le commerce des français dans le Levant* (ed. C. Schefer, 1877); and *Examen des assemblées provinciales* (1787).

ST. PRIVAT-LA-MONTAGNE, a village of Lorraine, 7 mi. N.W. of Metz. The village and the slopes to the west played

a great part in the battle of Gravelotte (Aug. 18, 1870). (See METZ and FRANCO-GERMAN WAR.)

At St. Privat occurred the famous repulse of the Prussian Guard by Marshal Canrobert's corps.

ST. QUENTIN, a manufacturing town of northern France, capital of an arrondissement in the department of Aisne, 32 mi. N.N.W. of Laon by rail. Pop. (1936) 48,538. St. Quentin (anc. *Augusta Veromanduorum*) stood at the meeting-place of five military roads. In the 3rd century it was the scene of the martyrdom of Gaius Quintinus. The bishopric was transferred to Noyon about 532. Towards the middle of the 7th century St. Éloi (Eli-gius), bishop of Noyon, established a collegiate chapter at St. Quentin's tomb, which became a famous place of pilgrimage. The importance of the town was increased during the middle ages by the rise of its cloth manufacture. The town was surrounded by walls in 883. It became under Pippin, grandson of Charlemagne, one of the principal domains of the counts of Vermandois, and in 1080 received from Count Herbert IV a charter which was extended in 1103. From 1420 to 1471 St. Quentin was occupied by the Burgundians. In 1557 it was taken by the Spaniards (see below). Two years later the town was restored to the French, and in 1560 it was assigned as the dowry of Mary Stuart. During the Franco-Prussian War St. Quentin repulsed the German attacks of Oct. 8, 1870; and in January 1871 it was the centre of the great battle fought by General Faidherbe. In World War I St. Quentin was held by the Germans from the end of Aug. 1914 to Oct. 1, 1918. During World War II fierce fighting took place in the area, and the town was occupied by the Germans in June 1940.

The town stands on the right bank of the Somme, at its junction with the St. Quentin canal (which unites the Somme with the Scheldt) and the Crozat canal (which unites it with the Oise). The collegiate church of St. Quentin, a fine Gothic building of the 12th, 13th, 14th and 15th centuries, damaged during World War I, was reopened in 1920. It has no west façade but terminates at that end in a tower and portal of Romanesque architecture; it has double transepts. The choir (13th century) has remains of a choir screen of the 14th century. Under the choir is a crypt of the 11th century, containing the tombs of St. Quentin and his fellow-martyrs Victorinus and Gervasianus. The hôtel-de-ville of St. Quentin is a Gothic building of the 14th, 15th and 16th centuries, with a flamboyant facade, adorned with curious sculptures. St. Quentin is the seat of a sub-prefect, of a tribunal of commerce, of a board of trade-arbitrators, and a chamber of commerce. The town is the centre of a district which manufactures cotton and woollen fabrics. St. Quentin produces chiefly window-curtains and carries on the spinning and preliminary processes and the bleaching and finishing. Other industries are the making of embroideries by machinery and by hand, and the manufacture of iron goods, machinery and chemical products. Trade is in grain, flax, cotton and wool.

1. **Battle of 1557.**—An army of Spaniards under Emmanuel Philibert of Savoy, invading France from the Meuse, joined an allied contingent of English troops under the walls of St. Quentin, which was then closely besieged. Admiral Coligny threw himself into the town, and the old Constable Montmorency prepared to relieve it. On St. Lawrence's Day, Aug. 10, the relieving column reached the town without difficulty, but time was wasted in drawing off the garrison, for the pontoons intended to bridge the canal had marched at the tail of the column, and when brought up were mismanaged. The besiegers, recovering from their surprise, formed the plan of cutting off the retreat of the relieving army. Montmorency had thrown out the necessary protective posts, but at the point which the besiegers chose for their passage the post was composed of poor troops, who fled at the first shot. Thus, while the constable was busy with his boats, the Spanish army filed across the Bridge of Rouvroy, some distance above the town, with impunity, and Montmorency, in the hope of executing his mission without fighting, refused to allow the cavalry under the duc de Nevers to charge them, and miscalculated his time of freedom. The Spaniards, enormously superior in force, cut off and destroyed the French gendarmerie who formed the vanguard of the column, and then headed off the slow-moving infantry south of Essigny-le-

Grand. Around the 10,000 French gathered some 40,000 assailants with forty-two guns. The cannon thinned their ranks, and at last the cavalry broke in and slaughtered them. Yet Coligny gallantly held St. Quentin for seventeen days longer, Nevers rallied the remnant of the army and, garrisoning Péronne, Ham and other strong places, entrenched himself in front of Compikgne, and the allies, disheartened by a war of sieges and skirmishes, came to a standstill. Soon afterwards Philip, jealous of the renown of his generals and unwilling to waste his highly trained soldados in ineffectual fighting, ordered the army to retreat (Oct. 17), disbanded the temporary regiments and dispersed the permanent corps in winter quarters.

2. The Battle of 1871.—This was fought between the German I. Army under General von Goeben and the French commanded by General Faidherbe. The latter concentrated about St. Quentin on Jan. 18, and took up a defensive position on both sides of the Somme Canal. The Germans, though inferior in numbers, were greatly superior in discipline and training, and Goeben boldly decided to attack both wings of the French together on the 19th. The attack took the customary enveloping form. After several hours' fighting it was brought to a standstill, but Goeben, using his reserves in masterly fashion, drove a wedge into the centre of the French line between the canal and the railway, and followed this up with another blow on the other bank of the canal, along the Ham road. This was the signal for a decisive attack by the whole of the left wing of the Germans, but the French offered strenuous resistance, and it was not until four o'clock that Faidherbe made up his mind to retreat. By skilful dispositions and orderly movement most of his infantry and all but six of his guns were brought off safely, but a portion of the army was cut off by the victorious left wing of the Germans, and the defeat, the last act in a long-drawn-out struggle, was sufficiently decisive to deny to the defenders any hope of taking the field again without an interval of rest and reorganization. Ten days later the general armistice was signed. (See further FRANCO-GERMAN WAR.)

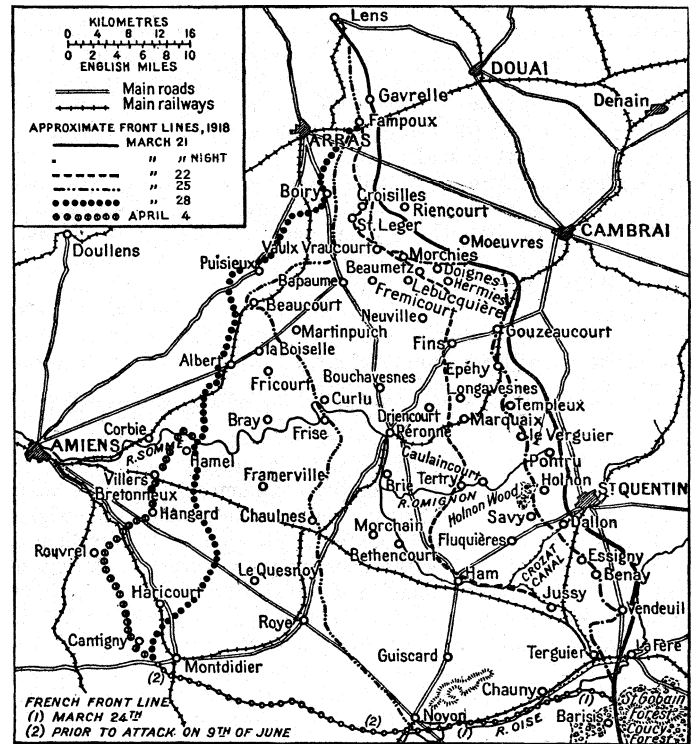

ST. QUENTIN, BATTLE OF, 1918. This is the name commonly given to the first phase of the great offensive of the Germans in 1918, by which they hoped to gain a military decision before the inflow of American reinforcements, the exhaustion of their food supplies under the stranglehold of the British Navy, and the obvious weakening of their allies could definitely turn the scales against them. The strategic conditions under which the offensive of March 21, 1918, was launched on the front north and south of St. Quentin are recounted under WORLD WAR, and the succeeding phases in the articles LYS, BATTLE OF THE; CHEMIN DES DAMES, BATTLE OF THE, and MARNE, SECOND BATTLE OF THE.

At 4.30 A.M. on March 21, 1918, the sudden crash of some 6,000 German guns heralded the breaking of a storm which, in grandeur of scale, of awe and of destruction, surpassed any other in the World War. By nightfall a German flood had inundated forty miles of the British front; a week later it had reached a depth of nearly forty miles, and was almost lapping the outskirts of Amiens, and in the ensuing weeks the Allied cause itself was almost submerged. These weeks rank with that of the Marne in 1914 as the two gravest crises of the World War. In them Germany came desperately near to regaining that lost chance, and best chance, of victory, which she had forfeited in early September, 1914. Why, when the Allies had made so little visible impression on the German front in two years of constant offensive, were the Germans able to tear a huge hole in the Allied front within a few days? Why, as this breach so far exceeded in size the dream-aims of its Allied forerunners, did it fail to obtain any decisive results? In seeking the answer to these "whys" lies the prime historical interest of the battle of St. Quentin, 1918.

The Opposing Forces.—Between Nov. 1, 1917 and March 21, 1918, the German divisions on the western front were increased from 146 to 192, troops being withdrawn from Russia, Galicia, Italy and the East. By these means the German armies in the West were reinforced by no less than 18,492 officers and 553,794 other ranks. Finally it was decided to make available 62 divisions for the main attack. These troops were systematically trained in new tactics of mobile warfare behind the front, while

every effort was made to conceal the actual area of attack, which extended from near Lens in the north to a little south of La Fkre.

The opposing line on this front was held, except for a few miles in the north, by the III. (Byng) and V. (Gough) British Armies respectively. The front of the III. Army extended from just south of the village of Gavrelle to half a mile north of Gouzeaucourt (26½ m.), and on March 21 was held by 10 divi-

PLAN OF THE BATTLE OF ST. QUENTIN

sions in line and seven in reserve. The V Army front (42 m), extended on a recent relief of the French (see WORLD WAR), ran from the right of the III. Army to the village of Barisis, a little south of the river Oise, between the forests of Coucy and St. Gobain. On this extended front there were 11 divisions in line and three in reserve.

German Plan.—The attack was to be carried out by four armies:— (a) XVII. Army (Below), comprising 17 divisions, was to attack on the frontage Gavrelle-Moeuvres. (b) II. Army (Marwitz), comprising 18 divisions, was to attack from Moeuvres to Pontru (north of St. Quentin). (c) XVIII. Army (Hutier), comprising 24 divisions was to attack from Pontru to Vendeuil (south of St. Quentin). (d) VII. Army (Gayl) was to demonstrate with three divisions against La Fkre.

The motive of this plan, devised by Ludendorff, now the directing brain of the German war-machine, was that the main strength of the German effort should be exerted north of the Somme—with the aim of driving the British Army back towards the coast and of cutting it off from the French— while the Somme and the XVIII. Army guarded the Germans' southern flank. This plan was radically changed in execution because Ludendorff gained rapid success where he desired it little and failed to gain success where he wanted it most.

To mystify the enemy as to the frontage selected for the main attack, subsidiary operations were prepared all along the Allied front, in Flanders, Champagne and the Argonne. From March 14 onwards the crown prince's army group was to bombard the enemy's headquarters on his front and make a show of bringing up reinforcements, and Gallwitz's army group was to carry out an attack on Verdun up to the point of engaging his infantry. The forming up for deployment of the attacking armies was begun on March 10, the divisions being organized in groups normally in a depth of three lines. The first or assault line was made the strongest, and was moved close up to the

front on March 20. The second line of divisions was some three to five km. in rear, and the third seven to ten km. behind the second line; the third line was to be held in reserve under the higher command, and was only to be used as the operations developed.

The **Prelude.**—On the British side, while the seriousness of the menace was appreciated, there was an apparently well-grounded belief in the power of the defence to stop a German attack. But these defensive calculations, like so many offensive actions throughout the previous three years, underrated the infinite value of surprise, which for three thousand years of recorded warfare has proved the master-key to victory. The real significance of the Cambrai attack on Nov. 20 previous had been that the British had revived the use of such a key, forging it from an amalgam of armour and the caterpillar tank. Unhappily, the effect of this tank key was largely lost because when inserted in the lock they had not the power to turn it fully, through exhausting their strength in the Passchendaele mud. (See *YPRES, BATTLES OF, 1917.*)

In the German counter-attack of Nov. 30 Ludendorff had used a key similar in principle if different in design—a short, sharp bombardment with gas and smoke shell, followed up by an inrush of infantry, specially trained in the new infiltration tactics. It would seem that by the following March the British had not sufficiently taken this lesson to heart. For, just as were the V. Army's subsequent excuses of weak numbers and a long line, the command had expressed ample confidence beforehand in its power to resist the onslaught. As a result, when the original front was forced, an inadequate preparation and co-ordination of the measures to block the enemy's path further back was revealed. The Army Command had failed to arrange for the blowing up of certain causeways and G.H.Q. had not given it a definite order. Worse still was the confusion caused by the fact that in the case of the more important railway bridges, this duty was entrusted to the railway authorities instead of the local commanders, and in this way the vital railway bridge at Peronne was allowed to fall undestroyed into German hands.

If this was good luck for the Germans, their thorough and skilful preparations for the initial assault had earned them success—although here again fortune favoured them. Ludendorff's solution for breaking the deadlock was a compound of wider frontages of attack, new infantry tactics, and, above all, for surprise, a lavish use of gas in a brief but intense artillery bombardment. For it, masses of artillery were brought up close to the front line in concealment, and against the V. Army front opened fire without preliminary ranging. This was to be followed by the infiltration of many dispersed little groups of automatic rifles and machine-guns. But the effect of the gas-gained surprise was immensely increased by nature, which in the early hours of March 21 provided a thick mist, which cloaked the infiltrating assailants as much as it masked the defending machine-guns. Without this aid it is questionable how far the German tactical surprise would have succeeded, and in this lay the essential inferiority of the German method of surprise, which still depended on unarmoured infantry, compared with the British surprise at Cambrai, and later, on Aug. 8, 1918, which was achieved by armoured machines.

The **Attack, March 21.**—While the bombardment, with a lavish mixture of gas and smoke shell, opened at 4.30 A.M. the German infantry attack did not begin until 9.40 A.M., when a general move forward was made under the cover of a creeping barrage, supplemented by low-flying aircraft. The British out-post zone was overrun almost everywhere by midday, but this was inevitable, and had been foreseen. But the northern attack met such stubborn resistance against the right of Byng's III. Army that it had not seriously penetrated the main battle zone even by the night of the 22nd, and, despite putting in successive reinforcements, the capture of Vaulx-Vraucourt was then the high-water mark of its progress. On most parts of Gough's V. Army front the battle-zone resistance was just as firm but the flood found a way through on the 21st near La Fère, on the extreme right, at Essigny and Ronsoy. The resistance of the

21st Division at Epéhy for a time checked this last breach from spreading northward, but it began to crumble so deeply that the neighbouring sectors were affected. Southward, near St. Quentin, the line sagged still more deeply, and on the night of the 22nd Gough felt compelled to order a general retirement to the line of the Somme.

On the 23rd Ludendorff gave the XVIII. Army, his left or southern wing, a limited permission to exploit this opportunity along the line of least resistance. But for several days he still pinned his faith and reserve strength to his right wing, despite the relatively small progress of his XVII. Army in the north and by the enforced postponement of its intended supplementary attack towards Arras, where Byng had anticipated the blow by a partial withdrawal. When the postponed blow was attempted on the 28th it collapsed under a storm of fire from the expectant defence. No fog came to the German aid. At last Ludendorff threw his weight into the push along the Somme westward, although he still held his left wing in a tight rein. But by that time the new surge towards Amiens was almost as stagnant, its impetus slackening far less because of the resistance than because of the exhaustion of the German troops and the difficulty of supply in so rapid and deep an advance. This was accentuated because their route had taken them across the desert formed by the old battlefields of 1916. On March 30 and April 4 they made fresh attempts, but the effect was and could only be local. For the resistance in the south had been given time, and relief from pressure, to harden into a crust which the belated intervention of fresh German reserves could not break.

On April 4 the great battle to all intents and purposes came to an end. The initial success had been great; since March 21 from a base of 74 m. a penetration of no less than 38 m. had been effected; the ground lost in 1916 and abandoned in 1917 had been more than made good, and vast quantities of stores as well as 90,000 prisoners and 1,200 guns had been captured. The British Armies had been seriously defeated, and 20 French divisions had been drawn into the battle; yet, in spite of the fact that 90 German divisions had been engaged, neither the transition to a war of movement nor the separation of the British and French forces had been achieved.

Conclusion.—The supreme features of this great offensive are, first, the immensity of its outward results compared with any previous offensive in the west; second, its ineffectiveness to attain decisive results. For the first it would be both unjust and untrue to blame the defending troops. They achieved miracles of heroic endurance, and the prolonged resistance in most of the battle zone is the proof. The real cause of the subsequently rapid flow-back lay in the frequent breakdown of control and communication. During three years of trench warfare the British had built up an elaborate and complex system, largely dependent on the telephone, and when the static suddenly became fluid they paid the inevitable penalty of violating those fundamental axioms of war—simplicity and flexibility.

On the German side, Arras was the actual rock on which their plan broke, and by which their advance was diverted into less profitable channels. It is possible that military conservatism cost them dear. For Colonel Bruchmüller, the famous artillery battle-piece "producer," brought from the eastern front for this offensive, has revealed that while Hutier's army carried out his surprise bombardment designs, Below's in the north clung to their old-fashioned methods, refusing to dispense with preliminary ranging. But if Hutier scored at the outset, his onrush slackened as his supplies and reinforcements failed with the distance covered, and when due tribute has been paid to the sturdy resistance, the German advance is seen really to have beaten itself. (B. H. L. H.)

ST. RÉMY, a town of southeastern France in the department of Bouches-du-Rhône, 15 mi. N.E. of Arles by road. Pop. (1936) 3,625. It lies to the north of the range of hills named the Alpines or Alpilles in a valley of olive trees. The church has a 14th-century spire. About a mile to the south are Gallo-Roman relics of the ancient Glanum, destroyed about 480, including a triumphal arch and a fine three-storied mausoleum. Near by is the old priory of St. Paul-de-Mausole with a Romanesque church and cloister.

There is trade in wines, oil and fruit.

ST. RIQUIER, a town of northern France, in the department of Somme, 8 mi. N.E. of Abbeville by rail. Pop. (1936) 1,313. St. Riquier (originally *Centula*) was famous for its abbey, founded about 625 by Riquier (*Rícharnis*), son of the governor of the town. It was enriched by King Dagobert and prospered under the abbacy of Angilbert, son-in-law of Charlemagne. The fine Flamboyant church of the 15th and 16th centuries has a richly sculptured west front. The treasury possesses a copper cross said to be the work of St. Éloi. In 1536 the women of the town helped their men defend it against the Germans. In 1544 the town was burned by the English, an event which marks the beginning of its decline.

SAINTS, BATTLE OF THE. This battle was fought between the fleets of England and France in the channel between the islands of Dominica and Guadeloupe on April 12, 1782. It takes its name from the Saints Is. in the channel. The French had 35 battleships under the Comte de Grasse based on Martinique, and their object was to give the British fleet the slip, and capture Jamaica. The British fleet of 36 ships was based on St. Lucia and was under Rodney.

The British Admiral kept close watch on the French movements. When, therefore, on April 8, the signal came that the French were out, the British were immediately after them on a northerly course. At dawn on April 9 the British van, under Hood, was close to de Grasse, who was forced to order his store-ships to make for Guadeloupe, sending two of his battleships to protect them. Hood was soon in action with the French rear, and his position was awkward in that he only, of the English, had made the Saints passage, the centre and rear being becalmed under the lee of Dominica. De Grasse was thus in a position to attack him with all his force, but he merely cannonaded his enemy from a distance. The British van suffered enough to make it necessary subsequently for it to change places with the rear, under Drake, but the arrival of Rodney caused de Grasse to withdraw, and the French battleship *Cato* was put out of action.

During the ensuing night and day the French gained somewhat and seemed likely to get clear away, but on the night of the 10th two battleships, the *Jason* and the *Zélé*, collided and the former was so seriously injured that de Grasse had to part with her. It would have been better for him had he dispensed with the *Zélé* also, for on the 11th she fell far behind the rest of the fleet, and it became clear that she would fall a victim to the British unless de Grasse turned to help her. This he did; and thus a general action was joined on April 12, the French by then having only 30 effective ships. The two fleets approached one another on opposite courses with the wind from the east; the British were sailing roughly north and the French south, the latter being the nearer to the wind. The fight began early, and by 10 o'clock the moment for the British to get on the same course as the French had arrived.

Rodney, however, never issued orders to this effect for, at this juncture, the wind shifted four points to the south. This meant that gaps appeared in the French line, and, more important, the English could turn to starboard and sail through them. Rodney and his flag-captain, Sir Charles Douglas, both grasped the possibilities of the situation, and the former decided to risk it. There were no signals for the movement so, relying on the force of example, Rodney took his flagship, the *Formidable*, stationed in the centre, through a convenient gap in the rear of the French centre. He was followed by the five ships immediately astern, all raking the French as they passed. A similar movement took place in the rear. Captain Affleck, in the *Bedford*, passing through the head of the same French squadron, was followed by Hood with the entire British rear. The French were thus broken into three bodies, de Grasse, in the *Ville de Paris*, with other ships of the centre being isolated between the two points of intersection, and, after a gallant defence, captured.

Rodney's officers blamed him for not putting up a more energetic pursuit, but he preferred to make sure of cutting the enemy off from their base. Actually the bad morale of the French, and the complete scattering of their fleet, rendered either alternative

nugatory.

SAINT-SAENS, CHARLES CAMILLE (1835-1921), French composer, was born in Paris on Oct. 3, 1835. For a short time he studied composition under Halévy, and in 1852, and again in 1864, competed without success for the Grand Prix de Rome. In 1853, when only eighteen, he was appointed organist at the Church of St. Merry, and from 1861 to 1877 was organist at the Madeleine, in succession to Lefébure-Wély. In 1867 his cantata "Les Noces de Prométhée" won a prize at the International Exhibition of that year but his first operas *La Princesse jaune* (1872) and *Le Timbre d'argent* (1877) had no great success. It was with his brilliantly effective "symphonic poems" *Le Rouet d'Omphale*, *La Danse Macabre*, *Phaëton* and *La Jeunesse d'Hercule* that he first attracted general-attention as a composer, though his powers as a pianist had been recognised from the first. His success as a dramatic composer was however not long delayed.

Through the influence of Liszt, his Biblical opera *Samson et Dalila* was brought out at Weimar in 1877 when its merits were immediately recognised, though it was not until 1890 that it was first heard in France, namely at Rouen. This work, generally accepted as his operatic masterpiece, had been begun as far back as 1869, and an act had been heard at one of Colonne's concerts in 1875. The following year it was given in Paris at the Eden Theatre, and finally in 1892 it was produced at the Grand Opera, where it has remained ever since, one of the most attractive works of the *répertoire*. Its Biblical subject prevented its performance in London until 1909, when it was given at Covent Garden with great success. None of his works is better calculated to exemplify the dual tendencies of his style. The first act, with its somewhat formal choruses, suggests the influence of Bach and Handel, and is treated rather in the manner of an oratorio. The more dramatic portions of the opera are not uninfluenced by Meyerbeer, while in the *Dalila* music there are occasional suggestions of Gounod. But though Saint-Saëns was an eclectic he put the stamp of his own individuality on every scene of the opera.

After the production of *Samson et Dalila* Saint-Saëns stood at the parting of the ways and compromised to some extent between the traditional style of the French school and the newer Wagnerian methods. As the result none of his later operas — *Etienne Marcel* (Lyons, 1879), *Henry VIII.* (Grand Opéra, 1883), *Proserpine* (Opéra-Comique, 1887), *Ascanio* (Grand Opéra, 1890), *Phryné* (Opéra-Comique, 1893), *Las Barbares* (Grand Opéra, 1901) achieved anything like the success of *Samson et Dalila*. But Saint-Saëns by no means confined his attentions to the stage, his compositions including examples in almost every department of the art. Among these may be mentioned the oratorios and cantatas *Oratorio de Noel*, *Les Noces de Prométhée*, *Le Déluge*, *La Lyre et la Harpe*; three symphonies; the four symphonic poems previously named; five pianoforte concertos; three violin concertos; the ballet *Zavotfe*; many chamber works; a Mass and a Requiem, besides a quantity of piano and organ music, and many songs. His literary works in turn include *Harmonie et mélodie*, *Portraits et souvenirs*, and *Problèmes et mystères*, besides a volume of poems, *Rimes familières*. He died in Algiers on Dec. 16, 1921.

SAINTSBURY, GEORGE EDWARD BATEMAN (1845-1933), English man of letters, was born at Southampton on Oct. 23, 1845. He was educated at Ring's college school, London, and at Merton college, Oxford (B. A. 1868), and spent six years in Guernsey as senior classical master of Elizabeth college (1868-74). From 1874 to 1876 he was headmaster of the Elgin educational institute. He began his literary career in 1875 as a critic for the *Academy*, and for ten years was actively engaged in journalism, becoming an important member of the staff of the *Saturday Review*. From 1895 to 1915 he was professor of rhetoric and English literature at Edinburgh university. Saintsbury's work bears the mark of his vast range of reading. Among the most important of his many works are his *Short History of French Literature* (1882; 6th ed., Oxford, 1901); *A Short History of*

English Literature (1898; 3rd ed., 1903); an edition of the *Mirror Caroline Poets* (3 vols., 1905-21); *A History of Criticism* (3 vols., 1900-04); *A History of English Prosody* (3 vols., 1906-21); *The History of English Criticism* (1911); and *A History of the French Novel* (1917-19).

ST. SERVAN-SUR-MER, a town and watering place of western France, in the department of Ille-et-Vilaine, on right bank of the Rance, south of St. Malo, from which it is separated by the Anse des Sablons, a creek 1 mi. wide. Pop. (1936) 10,986. The "Cité" occupies the site of the city of Aleth, which at the close of the Roman empire supplanted Corseul as the capital of the Curiosolites. Aleth was not Christianized till the 6th century, when St. Malo became its first bishop. At the Revolution St. Servan became a separate commune from St. Malo. North of the town is a wet dock, forming part of the harbour of St. Malo. The dock is used chiefly by coasting and fishing vessels, a fleet ordinarily starting each year for the Newfoundland codfisheries.

SAINT-SIMON, CLAUDE HENRI DE ROUVROY, COMTE DE (1760-1825), French socialist, was born in Paris on Oct. 17, 1760. He fought in the War of American Independence, was imprisoned in the Luxembourg during the Terror, and, on his release, amassed a small fortune by land speculation. He was also the originator of schemes to unite the Atlantic and Pacific by a canal, and to construct a waterway from Madrid to the sea. He continued his experiments throughout his life with the result that he was completely impoverished, and for some years before his death he was obliged to work nine hours a day to earn £40 a year. In 1823 he attempted suicide. He died two years later, on May 19, at Paris. Although a prolific writer his work attracted little attention while he lived and it was only after his death that his influence became considerable.

As a thinker Saint-Simon was deficient in system, clearness and consecutive strength; but his influence on modern thought is undeniable, both as the historic founder of French socialism and as suggesting much of what was afterwards elaborated into Comtism. Apart from the details of his socialistic teaching, his main ideas are simple, and are at once a reaction against the French Revolution and the militarism of Napoleon. So far was he from advocating fresh social revolt that he appealed to Louis XVIII. to inaugurate the new order of things. In opposition, however, to the feudal and military system, he advocated an arrangement by which the industrial chiefs should control society. In place of the mediæval church the spiritual direction of society should fall to the men of science. What Saint-Simon desired, therefore, was an industrialist state directed by modern science in which universal association should suppress war, and society should be organized for productive labour by the most capable men. The social aim is to produce things useful to life.

Although the contrast between labour and capital is not emphasised by Saint-Simon, the cause of the poor is discussed, and in his greatest work, *The New Christianity*, it takes the form of a religion. It was this development of his teaching that occasioned his final quarrel with Comte. Previous to the publication of the *Nouveau Christianisme*, Saint-Simon had not concerned himself with theology; but here, beginning with a belief in God he endeavours to resolve Christianity into its essential elements and finally propounds this precept—"The whole of society ought to strive towards the amelioration of the moral and physical existence of the poorest class; society ought to organize itself in the way best adapted for attaining this end." This principle became the watchword of the entire school of Saint-Simon.

Of the disciples who propagated his doctrines the most important were Olinde Rodrigues, and Barthélemy Prosper Enfantin (q.v.), who together had received Saint-Simon's last instructions. Their first step was to establish a journal, *Le Producteur*, but it was discontinued in 1826. The sect, however, had begun to grow, and before the end of 1828, had meetings not only in Paris but in many provincial towns. An important departure was made in 1828 by Amand Bazard, who gave a "complete exposition of the Saint-Simonian faith" in a long course of lectures at Paris, which were well attended. His *Exposition de la doctrine de St. Simon* (2 vols., 1828-1830), which is by far the best account of it, won

more adherents. The second volume was chiefly by Enfantin, who along with Bazard stood at the head of the society, but who was superior in metaphysical power, and was prone to push his deductions to extremities. The revolution of July (1830) brought a new freedom to the socialist reformers. A proclamation was issued demanding the community of goods, the abolition of the right of inheritance, and the enfranchisement of women. Early next year the school obtained possession of the Globe through Pierre Leroux (q.v.), who had joined the school, which now numbered some of the ablest and most promising young men of France.

The members formed themselves into an association arranged in three grades, and constituting a society or family, which lived out of a common purse in the Rue Monsigny. Before long, however, the sect was split by dissensions between Bazard, a man of logical and solid temperament, and Enfantin, who desired to establish a fantastic sacerdotalism with lax notions as to the relation of the sexes. After a time Bazard seceded, together with many of the strongest supporters of the school. A series of extravagant entertainments given by the society during the winter of 1832 reduced its financial resources and discredited it in character. They finally removed to Ménilmontant, to a property of Enfantin, where they lived in a communistic society, distinguished by a peculiar dress. Shortly after the chiefs were tried and condemned for proceedings prejudicial to the social order; and the sect was broken up (1832).

Saint-Simonism.—In the doctrine of the followers of Saint-Simon we find a great advance on the confused views of the master. In the philosophy of history they recognize epochs of two kinds, the critical or negative and the organic or constructive. The former, in which philosophy is the dominating force, is characterized by war, egotism and anarchy; the latter, which is controlled by religion, is marked by the spirit of obedience, devotion and association. The two spirits of antagonism and association are the social principles whose prevalence determines the character of an epoch. The spirit of association, which tends more and more to prevail over its opponent, is to be the keynote of the social development of the future. Under the present system the industrial chief exploits the proletariat, the members of which, though nominally free, must accept his terms under pain of starvation. The only remedy for this is the abolition of the law of inheritance, and the union of all the instruments of labour in a social fund, which shall be exploited by association. Society thus becomes sole proprietor, intrusting to social groups and social functionaries the management of the various properties. The right of succession is transferred from the family to the state.

The school of Saint-Simon insists strongly on the claims of merit; they advocate a social hierarchy in which each man shall be placed according to his capacity and rewarded according to his works. This is, indeed, a most special and pronounced feature of the Saint-Simon socialism, whose theory of government is a kind of spiritual or scientific autocracy, degenerating into the fantastic sacerdotalism of Enfantin. With regard to the family and the relation of the sexes the school of Saint-Simon advocated the complete emancipation of woman and her entire equality with man. The "social individual" is man and woman, who are associated in the exercise of the triple function of religion, the state and the family. In its official declarations the school maintained the sanctity of the Christian law of marriage. Connected with these doctrines was their famous theory of the "rehabilitation of the flesh," deduced from the philosophic theory of the school, which was a species of Pantheism, though they repudiated the name. On this theory they rejected the dualism so much emphasized by Catholic Christianity in its penances and mortifications, and held that the body should be restored to its due place of honour.

An excellent edition of the works of Saint-Simon and Enfantin was published by the survivors of the sect (47 vols., Paris, 1865-78). Of his other works the most important are, *Lettres d'un habitant de Genève* (1802); *Du Système Industriel* (1821); *Catéchisme des Industriels* (1823-24); *Nouveau Christianisme* (1825). See also Georges Weill, *Un Précurseur du socialisme, Saint-Simon et son oeuvre* (Paris, 1894), and a history of the *École Saint-Simonienne*, by the same author

(1896); G. Dumas, *Psychologie de deux messies positivistes St. Simon et Comte* (1905); G. Brunet, *Mysticisme social de Saint-Simon* (1925); E. N. Butler, *The St-Simonian Religion in Germany* (1926); and M. Leroy, *Vie véritable de Saint-Simon* (1925).

SAINT-SIMON, LOUIS DE ROUVROY, DUC DE (1675–1755), French soldier, diplomatist and writer of memoirs, was born at Versailles on Jan. 16, 1675. The peerage granted to his father, Claude de St. Simon, is the central fact in his history. The boy had for godfather and godmother Louis XIV. and the queen. After some tuition by the Jesuits (especially by Sanadon, the editor of Horace), he joined the *mousquetaires gris* in 1692. He was present at the siege of Namur, and the battle of Neerwinden. At this time he chose to begin the crusade of his life by instigating, if not bringing, an action on the part of the peers of France against Luxembourg, his victorious general, on a point of precedence. He fought, however, another campaign or two (not under Luxembourg), and in 1695 married Gabrielle de Durfort, daughter of the maréchal de Lorges, under whom he latterly served. He seems to have regarded her with respect and affection; and she sometimes succeeded in modifying his aristocratic ideas. But as he did not receive the promotion he desired he flung up his commission in 1702. Louis took a dislike to him, and it was with difficulty that he was able to keep a footing at court. He was, however, intensely interested in all the transactions of Versailles, and by dint of a most heterogeneous collection of instruments, ranging from dukes to servants, he managed to obtain the extraordinary secret information which he has handed down.

His own part appears to have been entirely subordinate. He was appointed ambassador to Rome in 1705, but the appointment was cancelled before he started. At last he attached himself to the duke of Orleans and, though this was hardly likely to conciliate Louis's goodwill to him, it gave him at least the status of belonging to a definite party, and it eventually placed him in the position of tried friend to the acting chief of the state. He was able, moreover, to combine attachment to the duke of Burgundy with that to the duke of Orleans. Both attachments were no doubt all the more sincere because of his undying hatred to "the bastards," that is to say, the illegitimate sons of Louis XIV. It does not appear that this hatred was founded on moral reasons or on any real fear that these bastards would be intruded into the succession. The true cause of his wrath was that they had precedence of the peers.

The death of Louis seemed to give Saint-Simon a chance of realizing his hopes. The duke of Orleans was at once acknowledged regent, and Saint-Simon was of the council of regency. But he had little real influence with the regent. In 1721 he was appointed ambassador to Spain to arrange for the marriage (not destined to take place) of Louis XV. and the infanta. His own account of the cessation of his intimacy with Orleans and Dubois, the latter of whom had never been his friend, is, like his own account of some other events of his life, obscure. But there can be little doubt that he was practically ousted by the favourite. He survived for more than thirty years; but little is known of his life. His wife died in 1743, his eldest son a little later; he had other family troubles, and he was loaded with debt. When he died, at Paris on March 2, 1755, he had almost entirely outlived his own generation, and the prosperity of his house.

Saint-Simon was an indefatigable writer, and he began very early to set down in black and white all the gossip he collected, all his interminable legal disputes of precedence, and a vast mass of unclassified and almost unclassifiable matter. Most of his manuscripts came into the possession of the government, and it was long before their contents were published in anything like fulness. Saint-Simon, though careless and sometimes even ungrammatical, ranks among the most striking memoir-writers of France, the country richest in memoirs of any in the world. He has been compared to Tacitus, and for once the comparison is just. In the midst of his enormous mass of writing, phrases scarcely inferior to the Roman's occur frequently, and here and there are passages of sustained description equal, for intense concentration of light and life, to those of Tacitus or of any other historian. As may be expected from the vast extent of his

work, it is in the highest degree unequal. But he is at the same time not a writer who can be "sampled" easily, inasmuch as his most characteristic phrases sometimes occur in the midst of long stretches of quite uninteresting matter. The interest of the *Memoirs*, independent of the large addition of positive knowledge which they make, is one of constant surprise at the novel and adroit use of word and phrase. Some of Macaulay's most brilliant portraits and sketches of incident are adapted and sometimes almost literally translated from Saint-Simon.

The first edition of Saint-Simon (some scattered pieces may have been printed before) appeared in 1788. It was a mere selection in three volumes and was much cut down before it was allowed to appear. Next year four more volumes made their appearance, and in 1791 a new edition, still further increased. The whole, or rather not the whole, was printed in 1829–1830 and reprinted some ten years later. The real creator of Saint-Simon, as far as a full and exact text is concerned, was M. Chéruel, whose edition in 20 volumes dates from 1856, and was reissued again revised in 1872. The standard edition is that edited by A. de Boislisle for the *Grands Ecrivains de la France* Series. For criticism on Saint-Simon there is nothing better than Sainte-Beuve's two sketches in the 3rd and 15th volumes of the *Causeries du lundi*. The latter was written to accompany M. Chéruel's first edition. In English by far the most accurate treatment is in a Lothian prize essay by E. Cannan (Oxford and London, 1885).

ST. THOMAS, a city and port of entry of Ontario, Canada, capital of Elgin county, on Kettle creek, 18 mi. S. of London and 8 mi. N. of Lake Erie. Pop. (1941) 17,132. It is an important station on the Canadian National, Michigan Central, London and Pt. Stanley, Pere Marquette, Wabash Railroad, and Canadian Pacific railways. It has numerous schools, a collegiate institute, and Alma Ladies' college. The Michigan Central railway shops, car-wheel foundry, flour, flax and planing mills are the principal industries.

ST. THOMAS (São Tomé), a volcanic island in the Gulf of Guinea immediately north of the equator (0° 23' N.) and in 6° 40' E. With the island of Príncipe (Prince's island, *see below*), and the small territory of Sarame around the fortress of São João Batista of Ajudá, on the coast of Dahomey, it forms the Portuguese province of S. Tomé and Príncipe. From the Gabun, the nearest point of the mainland of Africa, St. Thomas is distant 166 m., and from Cameroon 297 m. The length of the island is 32 m., the breadth W. to E. 21 m.; the area 400 sq. m.

From the coast the land rises towards lofty mountains (St. Thomas over 7,000 ft.). Malaria is common in the lower regions, but the unhealthiness of the island is largely due to the absence of hygienic precautions and to alcoholism. Conditions are now being improved. Manufacture of brandy ceased at the end of 1929. During the dry season (June to September) the temperature ranges in the lower parts between 66.2° and 80.6° F, and in the higher parts between 57.2° and 68°; in the rainy season it ranges between 69.8° and 89.6° in the lower parts, and between 64.4° and 80.6° in the higher parts. On Coffee mount (2,265 ft.) the mean of ten years was 68.9°, the maximum 90.5° and the minimum 47.3°. The heat is tempered by the equatorial ocean current. The rainfall is very heavy save on the north coast, but has steadily decreased of recent years, simultaneously with disafforestation.

Communications.—There are 200 kilometres of good motor roads, and 500 km. of Decauville line are in use. A State railway of 19 km. runs from S. Tomé to Vila da Trindade and the Milagrosa plantation; 45 km. more are being laid. S. Tomé and Príncipe are connected with Europe by cable. S. Tomé has a wireless station communicating directly with Cape Verde, Angola, etc. Telephone lines link the capital with the principal settlements and plantations. Two Portuguese and one German steamship line maintain a monthly service, and other ships call frequently.

Agriculture and Trade.—The soil is extremely fertile, and three-fifths of the island is covered with forest. Among the products are oranges, lemons, figs, mangroves, and, in the lower districts, the vine, pineapple, guava and banana. The first object of cultivation was sugar, and to this the island owed its prosperity in the 16th century. Sugar has been displaced by coffee, and, principally, cocoa, introduced in 1795 and 1822 respectively. The cocoa zone lies between 650 and 2,000 ft. above the sea. Four-fifths of the total production of the island is cocoa. In 1907 the export of cocoa (including that from Príncipe) was over 24,000

tons, about a sixth of the world's supply. In 1912 it had risen to 35,706 tons, the Province then ranking as the second producing country in the world. 125,000 acres are under cocoa. In 1906 and 1918 plant diseases gave much trouble. These are now controlled; but labour difficulties and, especially, the severe competition of the west coast of Africa, particularly Nigeria, have caused a great diminution, production being now 15,000 tons.

Vanilla and cinchona bark both succeed well, the latter at altitudes of from 1,800 to 3,300 ft. In 1905, 125 tons of bark were exported. Production has since diminished. Rubber, cinnamon, camphor and the kola-nut are grown. Coffee, of splendid quality, reached its maximum production in 1902, when S. Tomé produced 1,769,959 kg. and Príncipe 247 kg. Products of the oil-palm in 1921 were 2,808,664 kg.

The chief exports in 1925, in order of their importance, were (in kilos): cocoa 20,861,000; coconut 3,338,000; coffee 171,953; and cinchona 70,807. In the same year imports (in tons) were, in order of importance: maize 2,635; rice 2,069; dried fish 1,830; and beans 1,674. In 1927 the chief exports from S. Tomé were (in kilos): cocoa, 15,767,156, valued at \$76,755,155.00; and coconut, 2,997,316, valued at \$4,419,045.25. From Príncipe: cocoa 1,000,692, value \$5,355,171.53; and coconut, 395,480, value \$588,476.56. Imports in 1925 (both islands) were valued at \$31,195,326.00 (£1-\$97,382), and exports at \$68,513,874.00, a favourable balance of £383,218 (\$here means escudos, not dollars).

For 1926-27, the budget was balanced at revenue 10,213,658 escudos, and expenditure 9,173,658 escudos ordinary and 1,040,000 extraordinary. A new customs tariff protects Portuguese products, especially beer, cement (1,000 tons used annually), wines and distilled liquors.

Population.—At the last census, the inhabitants of S. Tomé were returned at 53,969, of whom 19,751 were natives, 32,817 imported labourers and 1,401 were classed as Europeans. The inhabitants, apart from the Europeans, consist (i.) of descendants of the original settlers, who were convicts from Portugal, slaves and others from Brazil, and negroes from the Gabun and other parts of the Guinea coast. They are known as "natives" and use a Negro-Portuguese "lingua de S. Tomé." (ii.) On the south-west coast are Angolares—some 3,000 in number—descendants of 200 Angola slaves wrecked at Sete Pedras in 1544. They retain their Bunda speech and customs, and are expert fishermen and canoemen. (iii.) Contract labourers from Cape Verde, Kabinda, etc., and Angola. These form the bulk of the population. In 1891, before the great development of the cocoa industry, the population was only 22,000. According to Aug. Chevalier (in *Occidente*, May 20, 1910), the population of St. Thomas and Príncipe combined in Dec. 1909 was 68,221, the "natives" being given at over 23,000.

St. Thomas, capital and chief port of the province, residence of the governor and of the Curador (the legal guardian of the serviaes, i.e., labourers), is situated on Chaves bay on the north-east coast. It is the starting point of a railway 9 m. long, which connects with the Decauville railways on the cocoa estates. Material has been acquired for the installation of a water supply, and plans are being made to supply the town and plantations with electricity produced by water power from the Contador river.

History.—St. Thomas was discovered in 1470 by the Portuguese navigators João de Santarem and Pedro de Escobar, who in the beginning of the following year discovered Annobon ("Good Year"). They found St. Thomas uninhabited. The first attempts at colonization were João de Paiva's in 1485; but nothing permanent was accomplished till 1493, when a body of criminals and of young Jews were sent to the island, and the present capital was founded by Alvaro de Carminha, in about 1500.

In the middle of the 16th century there were over 80 sugar mills on the island, which then had a population of 50,000; but in 1567 the settlement was attacked by the French, and in 1574 the Angolares began raids which only ended with their subjugation in 1693. In 1595 there was a slave revolt; and from 1641 to 1644 the Dutch, who had plundered the capital in 1600, held possession of the island. The French did great damage in 1709; the sugar trade had passed to Brazil and internal anarchy reduced St.

Thomas to a deplorable state. It was not until the later half of the 19th century that prosperity began to return.

The greatly increased demand for cocoa which arose in the last decade of the century led to the establishment of many additional plantations. Planters, however, were handicapped by the scarcity of labour. The difficulty was met by the recruitment of indentured natives from Angola, as many as 6,000 being brought over in one year. The mortality among these labourers was great, but they were well treated on the plantations. No provision was, however, made for their repatriation, while the great majority were brought by force from remote parts of central Africa and had no idea of the character of the agreement into which they were compelled to enter. The system was denounced in both Portugal and Great Britain as indistinguishable from slavery, though slavery had been abolished in Portuguese dominions in 1878. In March 1909 certain firms, British and German, as the result of investigations made in Angola and St. Thomas, refused any longer to import cocoa from St. Thomas or Príncipe islands unless the recruitment of labourers for the plantations was made voluntary. Representations to Portugal were made by the British government, and the Lisbon authorities stopped recruitment entirely from July 1909 to February 1910, when it was resumed under new regulations. British consular agents were stationed in Angola and St. Thomas to watch the working of these regulations. As one means of obviating the difficulties encountered in Angola the recruitment of labourers from Mozambique was begun in 1908, the men going out on a yearly contract.

The plantations are now well equipped and administered, with good houses and good labourers' quarters. There is an excellent medical service, government doctors visit all labour centres weekly, and there are special health regulations for the plantations. The labourers are well fed. In S. Tomé, mortality among negro labourers on plantations, in 1923-27, was 27.6 per 1,000, including infant mortality and accidents in work, as against a total mortality for the Province of 40 per 1,000. In 1927, 4,900 labourers, recruited in Angola, entered the colony. Many were repatriated to Angola, Mozambique and Cape Verde, after finishing their contracts. The number of labourers at the end of the year was 3,000 more than at the beginning. Recruiting is from Angola, Cape Verde and Mozambique. Labourers are contracted in their country of origin, in the presence of the authorities, for two or three years. On termination of their contracts, they are repatriated, unless they wish to re-engage. They are fed, lodged and clothed by the employers. Generally half of their earnings is treated as deferred pay, and paid on their return home, in the country of origin. Fulfilment of contracts is supervised by a State department, with a branch in Príncipe.

ST. THOMAS, an island in the West Indies and the most important, commercially, of the Virgin island group purchased by the United States from Denmark in 1917. Charlotte Amalie, the principal port and harbour of the Virgin islands, is situated near the middle of the southern coast of the island.

St. Thomas lies in 18° 20' N. and 64° 55' W., 40 mi east of Puerto Rico, 1,442 mi. south, 20° E. from New York city and 1,020 mi. from the Panama canal. It is 12 mi. long, varies in width from 1 mi. to 3 mi. and has an area of 32 sq.mi., or 20,480 acres. It is of volcanic origin. The main ridge, peaks of a submerged range, extends east and west the length of the island. Its hills are steep and rocky and sparsely covered with vegetation, the original timber having been cut away for lumber and charcoal. Two summits, Crown mountain and Signal hill, rise above 1,500 feet. Many of the spurs of the ridge slope down to the shore and form protected bays where the buccaneers of the 17th and 18th

centuries found refuge. The climate is salubrious, particularly during the first quarter of the year when the trade winds blow. The mean temperature is 78° F., the thermometer rarely falling below 64° and rarely rising above 91°. The average rainfall is 38.23 in.; the driest weather is in March and the rainy season in October and November. Drinking water is stored in cisterns owing to the dearth of wells.

After the abolition of slavery in 1848, agriculture became decadent. By 1917 the population was only 10,191 and it was 9,834 in 1930. By 1940, however, there were 11,265 inhabitants, of whom 64.3% were Negro, 15.8% white and the remainder "mixed and others." Destruction of the once profitable rum export trade as a result of United States prohibition of liquor contributed heavily to economic decline. From 1926 to 1933 the annual federal government contribution to the municipal treasury of St. Thomas and St. John averaged around \$100,000, but gradual improvement was made after 1931, with the inauguration of a policy of economic rehabilitation, and the federal contribution in 1940 was only \$34,900. Improved hotels and a stimulation of the tourist trade, along with governmental encouragement of small landholdings, were important among the economic developments. Most of the island's agricultural and dairy produce is for local consumption and ship supplies. Native handicraft work and rum distilleries provide the chief direct exports.

St. Thomas island was discovered and named by Columbus on his second voyage in 1493. The first colony was planted in 1657 by the Dutch who soon after abandoned it and migrated to New Amsterdam (New York). The Danes arrived and took formal possession in 1666, but their first colony also failed. The Danish West India company dispatched an expedition under Governor Jorgen Iversen which landed in St. Thomas harbour on May 25, 1672, and effected a permanent settlement. Later Huguenot refugees from St. Kitts were granted asylum. In 1755 the king of Denmark acquired the company's rights and made the harbour a free port. The island was temporarily seized by England in 1801-02, and again held by her in 1807-15, but was restored to and held by Denmark until 1917, when it was sold to the United States.

The chief value of the island is the harbour of Charlotte Amalie, one of the best in the Antilles, important as a United States naval base. It is perfectly landlocked, with a bottlenecked entrance, and has a deserved reputation for refuge. It commands the gateway to the Caribbean through the Virgin passage and is a port of call for passenger steamers from New York and European ports bound for the Panama canal and Central America via the Lesser Antilles. There are ample coaling facilities, oil reservoirs, shipyards and machine shops, floating docks and wharves with electric cranes.

Charlotte Amalie, pop. 9,801 (known as St. Thomas city from 1917 to 1932), the seat of government of the Virgin islands, lies on three low spurs of the island ridge, dubbed "Foretop, Maintop and Mizzen-top." A single level street parallel to the water front forms a common base for three cone-shaped clusters of white dwellings on the green background of the ridges. Government Hill is the most attractive residential section, the location affording constant enjoyment of the breezes and panorama. The official and commercial classes compose a small, exclusive and harmonious caste. English is the prevailing language, but Danish, Dutch, French and Spanish are also common. For general government, see VIRGIN ISLANDS.

See West Indies Yearbook (London and Montreal, annual), and Annual Reports of the governor of the Virgin islands.

ST. TROND, town, province of Limburg, Belgium, 18 m. north-west of Liège in an important strategic position near the frontier. Pop. (1930) 16,480.

ST. VINCENT, JOHN JERVIS, EARL OF (1735-1823), British admiral, was the second son of Swynfen Jervis, solicitor to the admiralty, and treasurer of Greenwich hospital. He was born at Meaford, Staffordshire, on Jan. 9, 1735, and entered the navy on Jan. 4, 1749. He became lieutenant on Feb. 19, 1755, and served in that rank till 1759, taking part in the conquest of Quebec. He was made commander of the "Scorpion" sloop in 1759, and post-captain in 1760. During the peace he commanded the "Alarm" (32) in the Mediterranean, and when he was put on half pay he travelled in Europe, taking professional notes everywhere. While the War of American Independence lasted, he commanded the "Fourroyant" (80) in

the Channel, taking part in the battle of Ushant (1778) (see KEPPEL, VISCOUNT) and in the various reliefs of Gibraltar. His most signal service was the capture (April 19, 1782) of the French "Pégase" (74) after a long chase. In 1783 he entered parliament as member for Launceston, and in the general election of 1784 as member for Yarmouth. In politics he was a strong Whig. On Sept. 24, 1787, he attained flag rank, and was promoted vice-admiral in 1793. From 1793 till 1795 he was in the West Indies co-operating with the army in the conquest of the French islands. On his return he was promoted admiral. In November 1795 he took command in the Mediterranean, where he maintained the blockade of Toulon, and aided the allies of Great Britain in Italy.

But in 1796 the occupation of Italy by the French armies closed all the ports to his ships, and Malta was not yet in the possession of Great Britain. Then the addition of the Spanish fleet to the French altered the balance of strength in the Mediterranean. The Spaniards were very inefficient, and Jervis would have held his ground, if one of his subordinates had not taken the extraordinary course of returning to England, because he thought that the dangerous state of the country required that all its forces should be concentrated at home. He was therefore obliged to act on the instructions sent to him and to retire to the Atlantic, withdrawing the garrisons from Corsica and other places. His headquarters were now on the coast of Portugal, and his chief duty was to watch the Spanish fleet at Cadiz. On Feb. 14, 1797, he gained a most complete victory against heavy odds. (See ST. VINCENT, BATTLE OF.) The determination to fight, and the admirable discipline of his squadron, which was very largely the fruit of his own care in preparation, supply the best proof that he was a commander of a high order. For this victory, which came at a very critical time, he was made an earl and was granted a pension of £3,000. His qualities as a disciplinarian were soon to be put to a severe test. In 1797 the grievances of the sailors, which were of old standing, and had led to many mutinies of single ships, came to a head in the great general mutinies at Spithead and the Nore. Similar movements took place on the coast of Ireland and at the Cape of Good Hope. (See NAVY AND NAVIES: History.) The spirit spread to the fleet under St. Vincent, and there was an undoubted danger that some outbreak would take place in his command. The peril was averted by his foresight and severity. He had always taken great care of the health of his men, and was as strict with the officers as with sailors. It must in justice be added that he was peculiarly fitted for the work. He carried his strictness with his officers to an extent which aroused the actual hatred of many among them, and exasperated Sir John Orde (1751-1824) into challenging him to fight a duel. Yet he cannot be denied the honour of having raised the discipline of the navy to a higher level than it had reached before; he was always ready to promote good officers, and the efficiency of the squadron with which Nelson won the battle of the Nile was largely due to him. His health broke down under the strain of long cruising, and in June 1799 he resigned his command.

When St. Vincent's health was restored in the following year he took the command of the Channel fleet, into which he introduced his own rigid system of discipline to the bitter anger of the captains. But his method was fully justified by the fact that he was able to maintain the blockade of Brest for 121 days with his fleet. In 1801 he became first lord and held the office till Pitt returned to power in 1803. His administration is famous in the history of the navy, for he now applied himself to the very necessary task of reforming the corruptions of the dockyards. Naturally he was fiercely attacked in and out of parliament. His peremptory character led him to do the right thing with the maximum of dictation at Whitehall as on the quarter-deck of his flagship. He also gave an opening to his critics by devoting himself so wholly to the reform of the dockyards that he neglected the preparation of the fleet for war. He would not recognize the possibility that the peace of Amiens would not last. Pitt made himself the mouthpiece of St. Vincent's enemies, mainly because he considered him as a dangerous member of the party which was weakening the position of England in the face of Napoleon. When Pitt's second ministry was formed in 1803, St. Vincent

refused to take the command of the Channel fleet at his request. After Pitt's death he resumed the duty with the temporary rank of admiral of the fleet in 1806, but held it only till the following year. After 1810 he retired to his house at Rochetts in Essex. The rank of admiral of the fleet was conferred on him in 1821 on the coronation of George IV., and he died on March 14, 1823. Lord St. Vincent married his cousin Martha Parker, who died childless in 1816. There is a monument to him in St. Paul's Cathedral, and portraits of him at different periods of his life are numerous. The earldom granted to Jervis became extinct on his death, but a viscounty, created for him in 1801, passed by special remainder to Edward Jervis Ricketts (1767-1857), the second son of his sister Mary who had married William Henry Ricketts, of Longwood, Hampshire. The 2nd viscount took the name of Jervis, and the title is still held by his descendants. (D. H.)

The *Life* by J. S. Tucker (2 vols.), whose father had been the admiral's secretary (married by excessive eulogy). See W. N. Anson, *Life of John Jervis, Admiral Lord St. Vincent* (1913); also W. L. Clowes, *The Royal Navy* . . . vol. iv. The life by Captain Brenton is rather inaccurate. The *Naval Career of Admiral John Markham* contains an account of the reforms in the navy. His administrations produced a swarm of pamphlets. Many mentions of him will be found in the correspondence of Nelson.

ST. VINCENT, one of the British Windward islands in the West Indies, lying about 13° 15' N., 61° 10' W., west of Barbados and south of St. Lucia. It is about 18 m. long by 11 in extreme width, and has an area of 150 sq.m. Beautifully wooded volcanic hills form the backbone of the island and have picturesque valleys. The highest summit is the volcano called the Soufrière (3,500 ft.) in the north, the disastrous eruption of which in May 1902 devastated the most fertile portion of the island, a gently sloping tract lying to the north, called the Carib Country. The climate of St. Vincent is fairly healthy and in winter very pleasant; the average annual rainfall exceeds 100 in., and the temperature ranges from 88° F in Aug. to 66° in Dec. and January. The capital of the island is Kingstown, beautifully situated on the south-west coast near the foot of Mount St. Andrew.

The population of the island in 1940 was 61,447; there are still a few Caribs of mixed blood, most of the aboriginal Caribs having been deported to British Honduras in 1797. Kingstown has a population of about 4,270. The present constitution dates from 1877, when the legislative council, consisting of four official and four nominated unofficial members, was formed. The principal products of the island are arrowroot, cassava starch, molasses, cotton, cacao, coconuts and copra, ground nuts and spices. The average annual value of exports from 1896 to 1906 was £63,177, in 1924 the value was £150,862. In 1899 a scheme was begun, with a grant of £15,000 from the Imperial treasury, for settling the labouring population, distressed by the failure of the sugar estate industry, as peasant proprietors.

St. Vincent is generally stated to have been discovered on St. Vincent's day, the 22nd of January 1498 by Columbus. Its Carib inhabitants remained undisturbed for many years. In 1627 Charles I. granted the island to the earl of Carlisle; in 1672 it was re-granted to Lord Willoughby, having been previously (1660) declared neutral. In 1722 a further grant of the island was made, to the duke of Montague, and then the first serious effort at colonization was checked by French insistence on neutrality confirmed by the treaty of Aix-la-Chapelle (1748). In 1762 General Monckton occupied the island; the treaty of Paris in 1763 confirmed the British possession, and settlement proceeded in spite of the refusal of the Caribs to admit British sovereignty. After some fighting in 1773 a treaty was concluded with them, when they were granted lands in the north of the island as a reserve. In 1779 the island was surrendered to the French, but it was restored to Britain by the treaty of Versailles (1783). In 1795 the Caribs rose, assisted by the French, and were only subdued by Sir Ralph Abercromby in 1796, after which the majority of them were deported. The emancipation of negro slaves in the island took place in 1838; in 1846 Portuguese labourers were introduced, and in 1861 East Indian coolies. St. Vincent suffered from a violent hurricane in 1780, and the Soufrière was in eruption in 1821. Severe distress was occasioned by the hurricane of the 11th of

September, 1898, from which the island had not recovered when it was visited by the eruption of the Soufrière in May 1902. This eruption was synchronous with that of Mont Pelé in Martinique (*q.v.*). There were earthquakes in the following July, and further eruptions on Sept. 3 and Oct. 15, and on March 22, 1903.

ST. VINCENT, BATTLE OF, fought on the 14th of February 1797, between the British and Spanish fleets, the most famous and important of many encounters which have taken place at the same spot. The battle first revealed the full capacity of Nelson, which was well known in the navy, to all his countrymen. In 1796 the Spanish government had made the disastrous alliance with the French republic, which reduced its country to the level of a pawn in the game against England. The Spanish fleet, which was in a complete state of neglect, was forced to sea. It consisted of 27 sail of the line under the command of Don José de Córdoba—fine ships, but manned in haste by drafts of soldiers, and of landsmen forced on board by the press. Even the flagships had only about eighty sailors each in their crews. Córdoba was drifting about with his unmanageable ships in two confused divisions separated from one another, in light winds from the west and west-south-west, at a distance of from 25 to 30 m. S.W. of the Cape. While in this position he was sighted by Sir John Jervis, of whose nearness to himself he was ignorant, and who had sailed from Lisbon to attack him with only 15 sail of the line. Jervis did not hesitate to give battle. Six Spanish ships were to the south of him, separated by a long interval from the others which were to the south-west. The British squadron was formed into a single line ahead, and was steered to pass between the two divisions of the Spaniards. The six vessels were thus cut off. A feeble attempt was made by them to molest the British, but being now to leeward as Jervis passed to the west of them, and being unable to face the rapid and well directed fire to which they were exposed, they sheered off. One only ran down the British line, and passing to the stern of the last ship succeeded in joining the bulk of her fleet to windward. As the British line passed through the gap between the Spanish divisions ships were tacked in succession to meet the windward portion of the enemy. If this movement had been carried out fully, all the British ships would have gone through the gap and the Spaniards to windward would have been able to steer unimpeded to the north, and perhaps to avoid being brought to a dose general action. Their chance of escape was baffled by the independence and promptitude of Nelson. His ship, the "Captain" (74), was the third from the end of the British line. Without waiting for orders he made a sweep to the west and threw himself across the bows of the Spaniards. His movement was seen and approved by Jervis, who then ordered the other ships in his rear to follow Nelson's example. The British force was thrown bodily on the enemy. As the Spanish crews were too utterly unpractised to handle their ships, and could not carry out the orders of their officers which they did not understand, their ships were soon driven into a herd, and fell on board of one another. Their incompetence as gunners enabled the "Captain" to assail their flagship, the huge "Santissima Trinidad" (130), with comparative impunity. The "San Josef" (112), and the "San Nicolas" (80), which fell aboard of one another, were both carried by boarding by the "Captain." Four Spanish ships, the "Salvador del Mundo" and "San Josef" (112), the "San Nicolas" (80), and the "San Isidro" (74), were taken. The "Santissima Trinidad" is said to have struck, but she was not taken possession of. By about half-past three the Spaniards were fairly beaten. More prizes might have been taken, but Sir John Jervis put a stop to the action to secure the four which had surrendered. The Spaniards were allowed to retreat to Cadiz. Sir John Jervis was made Earl St. Vincent (*q.v.*) for his victory. The battle, which revealed the worthlessness of the Spanish navy, relieved the British government from a load of anxiety, and may be said to have marked the complete predominance of its fleet on the sea. (D. H.)

AUTHORITIES.—A very interesting account of the battle of Cape St. Vincent, *A Narrative of the Proceedings of the British Fleet, etc.* (London, 1797), illustrated by plans, was published immediately afterwards by Colonel Drinkwater Bethune, author of the *History of the Siege of*

Gibraltar, who was an eyewitness from the "Lively" frigate. See also James's *Naval History* (London, 1837); Captain Mahan, *The Influence of Sea Power on the French Revolution and Empire* (London, 1892); Professor Geoffrey Callender, *The Naval Side of British History* (1924).

ST. VITUS'S DANCE or **CHOREA**, a disorder of the nervous system characterized mainly by involuntary jerking movements of the muscles throughout almost the entire body (see **NEUROPATHOLOGY**). This name was originally applied to epidemic outbursts of mental and physical excitement which occurred among the inhabitants of some parts of Germany in the middle ages. Sufferers from this dancing mania were wont to resort to the chapels of St. Vitus (more than one in Swabia), the saint being believed to possess the power of curing them.

Chorea occurs particularly between the ages of nine and twelve and is twice as frequent in girls as in boys. Fright, ill-usage, insufficient feeding, overwork or anxiety, are among the most common exciting causes especially when associated with family tendency to nervous disease; occasionally it complicates pregnancy. The connection of chorea with rheumatism is now universally recognized, and is shown by its frequent occurrence before, after or during attacks of rheumatic fever in young persons, and by the liability of the heart to suffer in a similar way in the two diseases.

The symptoms sometimes develop suddenly but are usually preceded by changes in disposition and general health. The first thing indicative of the disease is awkwardness or fidgetiness of manner together with restlessness. In walking, too, slight dragging of one limb may be noticed. The convulsive muscular movements usually first show themselves in an arm or a leg, and may remain localized; in all cases the disorderly symptoms are more marked on one side than on the other. The child with fully developed chorea, when awake, is never still, but is constantly twitching the body, limbs or face. These symptoms are aggravated when purposive movements are attempted or when the child is watched. When the tongue is protruded it comes out in a jerky manner and is immediately withdrawn, the jaws at the same time closing suddenly and sometimes with considerable force. Speech, swallowing and locomotion suffer from muscular inco-ordination. In short, the whole muscular system is deranged in its operations, and the term "insanity of the muscles" not inaptly expresses the condition. The involuntary muscles appear scarcely affected in this disease; the rhythmic movements of the heart, for example, are not as a rule impaired. But the heart may suffer from conditions similar to those in rheumatism.

This disease occasionally assumes a very acute and aggravated form; in which the disorderly movements are so violent as to render the patient liable to be injured, and to necessitate forcible control of the limbs, or the employment of anaesthetics. Such cases are very grave, if, as is common, they are accompanied with sleeplessness, and they may prove rapidly fatal by exhaustion.

It is doubtful whether any drug has much control over the disease, which under suitable hygienic conditions tends to recover of itself after one or two months or perhaps longer. Ruhrah, recognizing the importance of rest, recommends a modified Weir-Mitchell treatment. Of medicinal remedies the most serviceable appear to be zinc, arsenic and iron, especially the last two, which act as tonics to the system and improve the condition of the blood. In view of the connection of chorea with rheumatism, salicylate of soda in large doses has been recommended. In long-continued cases much benefit will be obtained by change of air and moderate gymnastic exercises. Massage and electricity may be beneficial.

In the acute form of chorea, where the convulsive movements are unceasing and violent, the only measures available are the use of chloral or chloroform inhalation to produce insensibility and muscular relaxation, but the effect is only palliative.

SAINT-WANDRILLE, a village of north-western France, in the department of Seine-Inférieure, 28 m. west-north-west of Rouen by rail. It is celebrated for the ruins of its Benedictine abbey. The abbey was founded in the 7th century by St. Wandrille. In the 13th century it was burnt down, and the rebuilding was not completed till the 16th century. Later it was practically destroyed by the Huguenots, and again restored. The demolition of the church was begun at the time of the Revolution. The

abbey church belongs to the 13th and 14th centuries; portions of the nave walls supported by flying buttresses are standing, and the windows and vaulting of the side aisles are in fair preservation. There is a cloister, from which a Renaissance door opens into the refectory, containing a richly ornamented lavabo. The refectory has graceful windows.

SAIONJI, KIMMOCHI, PRINCE (1849-1940), Japanese statesman, was born in October, 1849, at Kyoto. When less than 20 years of age, he took part in the councils which led to the Restoration, and at 19 was commander-in-chief of an imperial army. In 1881 he commenced his official career, and in the following year accompanied Ito to Europe and the United States to investigate the parliamentary system. In 1885 he was appointed minister to Austria; three years later he became vice-president of the house of peers and was raised to the privy council in 1894. In the same year he received the portfolio of education in the second Ito cabinet. In July 1903 he became the leader of the Seiyu-Kai and in 1906 prime minister; he was again premier from 1911 to 1912. In 1919 he represented Japan as chief envoy at the Peace Conference and in 1920 he was made prince. He was famous as Emperor Hirohito's chief adviser and as last of Emperor Meiji's Genro (Elder Statesmen). He died Nov. 24, 1940.

SAIS (Egyptian *Sai*), an ancient city of the Egyptian Delta, lying westward of the Thermuthiac or Sebennytic branch of the Nile. It was the capital of the 5th nome of Lower Egypt and must have been important from remote times. In the 8th century B.C. Sais held the hegemony of the Western Delta, while Bubastite families ruled in the east and the kings of Ethiopia in Upper Egypt. At the time when invasions by the Assyrians drove out the Ethiopian Taracus again and again, the chief of the twenty princes to whom Esarhaddon and Assur-bani-pal successively entrusted the government was Niku, king of Sais and Memphis. His son Psammetichus (*q.v.*) was the founder of the XXVIth Dynasty. Although the main seat of government was at Memphis, Sais remained the royal residence throughout this flourishing dynasty. Neit, the goddess of Sais, was identified with Athena, and Osiris was worshipped there in a great festival.

The brick enclosure wall of the temple is still plainly visible near the little village of Sa-el-hagar (Sa of stone) on the east bank of the Rosetta branch; otherwise only crude brick ruins and rubbish heaps remain on the site, but a few relics conveyed to Alexandria and Europe in the Roman age have come down to our day, notably the inscribed statue of a priest of Neit who was high in favour with Psammetichus III., Cambyses and Darius. Bronze figures of deities are now the most interesting objects to be found at Sa-el-hagar.

SAISSET, BERNARD (d. *c.* 1314), French bishop, was abbot of Saint Antonin de Pamiers in 1268. Boniface VIII., detaching the city of Pamiers from the diocese of Toulouse in 1295, made it the seat of a new bishopric and appointed Saisset to the see. Of a headstrong temperament, Saisset as abbot brought to an end (1297) the struggle with the counts of Foix, begun two centuries before, for the lordship of the city of Pamiers, which had been shared between the counts and abbots by the feudal contract of *pariage*. As an ardent Languedocian he hated the French, and opposed Philip IV. But when he tried to organize a general rising of the south, he was denounced to the king, perhaps by his old enemies the count of Foix and the bishop of Toulouse. Philip IV. charged Richard Leneveu, archdeacon of Auge in the diocese of Lisieux, and Jean de Picquigni, vidame of Amiens, to make an investigation, which lasted several months. Saisset was on the point of escaping to Rome when the vidame of Amiens surprised him by night in his episcopal palace. He was brought to Senlis, and on Oct. 24, 1301, appeared before Philip and his court. He was charged with high treason, and Philip tried to obtain from the pope the canonical degradation of Saisset. Boniface VIII., instead, ordered the king in December 1301 to free the bishop, in order that he might go to Rome to justify himself. At the same time, he sent the famous bulls *Salvator mundi*, a sort of repetition of *Clericis laicos*, and *Ausculta fili*, which opened a new stage of the quarrel between the pope and king. In the heat of the new struggle Saisset was forgotten. He

had been turned over in February 1302 into the keeping of Jacques des Normands, the papal legate, and was ordered to leave the kingdom at once. He lived at Rome until after the incident at Anagni. In 1308 the king pardoned him, and restored him to his see. He died, still bishop of Pamiers, about 1314.

See Dom Vaissete, *Histoire générale de Languedoc*, ed. Privat, t. ix, pp. 216-310; *Histoire littéraire de la France*, t. xxvi, pp. 540-547; E. de Rozière, *Le Passage de Pomiers*, in *Bibliothèque de l'École des Chartes* (1871); Ch. V. Langlois in Lavisse's *Histoire de France*, t. iii., pt. ii., pp. 142-146.

SAITO, MAKOTO, VISCOUNT (1858-1936), Japanese sailor and administrator, was born a commoner, at Iwate Ken. He joined the navy in 1873, and was rapidly promoted, being gazetted commander in 1897. The discipline of the Japanese navy, strict as it was, still left something to be desired, and when he became captain in 1898, Saito declared his intention of revising some of the existing regulations and enforcing a stricter observance of others. In the same year he was appointed vice-minister of the navy under Admiral Count Yamamoto. Two years later he was gazetted rear-admiral in recognition of his valuable services in the development of the navy along Western lines. He was promoted to vice-admiral in 1904 and became admiral in 1912. He received several decorations for his services in the Russo-Japanese war, where he profited by his experience as naval aide-de-camp to the Emperor in the Chino-Japanese conflict. He was minister for the navy in 1913 and 1914. After the upheaval of the Koreans in 1919 under the rule of Marshal Hasegawa, Baron Saito was appointed governor-general of Korea. His chief concern was education; there were only 250 schools in the peninsula at the time of his appointment, but by 1926, there were nearly five times that number. He was created baron in 1907, and was raised to the rank of viscount in 1925. He was appointed chief delegate to the naval disarmament conference at Geneva in 1927 and resigned his governor-generalship soon after. In Feb., 1936, he was assassinated.

SAJO or MOHI, BATTLE OF THE, 1241. This was the decisive battle in which the Mongols under Sabutai and Batu overthrew the Hungarian army under Bela, and thereby gained undisputed possession of Hungary, a conquest voluntarily abandoned next year (see MONGOL CAMPAIGNS). The date of the battle is usually reckoned as April 10, 1241, but other estimates place it on April 27, or even early in May. A week before the three wide-circling columns of the Mongol main army had converged and joined hands on the Danube near Gran, the Hungarian capital. Sabutai fell back slowly, luring Bela after him, away from the protection of the Danube. Meanwhile Sabutai had reconnoitred an ideal battle-ground in the plain of Mohi, a natural amphitheatre surrounded by the Sajo river and the famous hills of Tokay. After six days' pursuit the Hungarian army, including large contingents of Germans, Croats and French Knights Templar, camped here, while their apparently retreating foe crossed the river and disappeared out of sight. The Mongol plan was that while Batu fixed the Hungarians by a frontal attack across the river, Sabutai was to execute a wide manoeuvre back to the river, cross it lower down where he had reconnoitred a deep but fordable passage, and then fall upon the enemy's rear. During the night Batu turned on his track, and before dawn his advanced guard seized the bridge over the river to his front. The fire of catapults and archers covered the crossing of the main body. Then he moved forward to the attack and the battle was being hotly contested when, some hours later, Sabutai's surprise blow suddenly took the Hungarians in rear, dislocating both their formation and moral. The disruption of their host followed, and the fragments took flight, to shrink progressively under the Mongol pursuit, closely sustained for two days. Thousands were cut down on the field itself, the Knights Templar falling to the last man, but Bela, deserting his followers to their fate, made good his escape.

SAKA or SHĀKA, the name of various tribes which invaded India from Central Asia. More accurately, it denotes the tribe which invaded India 140-130 B.C. They are the Sacae of classical authors and the Se of the Chinese, representing an original Sek or Sok. The Chinese state that they were a pastoral people in the neighbourhood of the modern Kashgar. About

160 B.C. they were driven southward by the advance of the Yue-Chi (*q.v.*) from the east. One portion appears to have settled in western Afghanistan, hence called Sakasthāna, in modern Persian Seistan. The other section occupied the Punjab and possessed themselves of Sind, Gujarat, and Malwa. The rulers of these provinces bore the title of satrap (kshatrapa or chhatrapa) and were apparently subordinate to a king who ruled over the valley of Kabul and the Punjab. In 57 B.C. the Sakas were attacked simultaneously by Parthians from the west and by the Malava clans from the east and their power was destroyed.

Nothing is known of the language or race of the Sakas. Like many invaders of India at this period they adopted Buddhism.

See P. Gardner, *Coins of Greek and Scythian Kings in India* (1886); O. Franke, *Beiträge aus chinesischen Quellen zur Kenntnis der Turkvölker und Skythen* (1904); Vincent Smith, *Early History of India* revised by S. M. Edwardes (1924).

SAKAI, a pre-Dravidian people of the Malay peninsula (see RACES OF MANKIND; ASIA: *Further Asia*).

BY COURTESY OF THE FIELD MUSEUM OF NATURAL HISTORY
A SAKAI HUNTER WITH HIS BLOWGUN

The wilder tribes live on jungle fruits and game hunted with the blowgun (*q.v.*); the more civilized grow yams, maize, sugarcane, rice and sago.

See Skeat and Blagden, *Pagan Tribes of the Malay Peninsula* (1906). (J. H. H.)

SAKÉ, national beverage of Japan. In nature it stands midway between beer and wine. It is made chiefly from rice (see BREWING), by fermentation with the mould *Aspergillus oryzae*. Saké contains 12 to 15% of alcohol and about 3% of solid matter (extractives), 0.3% of lactic acid, a small quantity of volatile acid, 0.5% of sugar and 0.8% of glycerin. There are about 20,000 saké breweries in Japan, and the annual output is about 150 million gallons. Saké is a yellowish-white liquid, its flavour somewhat resembling that of Madeira or sherry. (See WINE.)

SAKHALIN, an island in the North Pacific, 600 m. long, 16 to 105 broad, area 24,560 sq.m., lying between 45° 57' N., and 54° 24' N., separated from the mainland by the narrow, shallow strait of Tartary or Mamiya strait, which often freezes in winter in its narrowest part. By the treaty of Portsmouth (U.S.A.) 1905, the part south of 50° N., became Japanese, and that to the north, Russian. During the Civil War and war of intervention following the 1917 revolution, the Japanese occupied the whole island and did not evacuate the northern part until 1925. This northern territory forms three fifths of the island and is part of the Far Eastern administrative area (*q.v.*). Structurally also it is linked with the mainland and not with the volcanic Japanese islands; native legends record it as a peninsula separated by a cataclysm. Sakhalin is imperfectly surveyed. Sokolov reports a western range in the Japanese part, dying down at 51° 45' N., and a second system starting from Cape Terpyeniya, in the Japanese part, containing the highest elevations, and reaching 51° N., where it is intersected by the valley of the Tym and passes to the western side, containing the Engiz-pal mass, closely related to Mount Tiara near the eastern sea. Estimates of the maximum heights in the eastern chain vary between 2,000 and 5,516 ft. The western hills (Mount Kitoisi 2,478 ft.) are less rounded than those on the east. The valleys of the Poronaya and Tym rivers stretch northward from the Gulf of Patience, and there are narrow sandy coastal plains. The lower course of the Tym lies in barren tundra land, and its upper course is impeded by rapids: the southward flowing Poronaya is navigable for about 30 m. There are other short rivers and numerous fresh-water lakes, as well as salt lagoons near the coast. Sometimes the bays at the river mouths are temporarily converted into fresh-water lakes by barriers thrown up by heavy seas, and later washed away again.

The whole island has a cold, foggy climate, with heavy rainfall in summer, and bitter cold and severe storms in winter. Snow falls

from October to May and may remain in places till July, while on the high land it re-commences in August; drifts may be 7 ft. deep. Drift ice is found along both coasts in the north and appears as late as July. The west coast conditions are somewhat moderated by a branch of the Kuro Siwo coming up the Gulf of Tartary, though cold, dense fogs are as prevalent here as in the east.

Fauna and Flora.—The north of the island, and the higher land is bleak tundra and much of the island is forested, coniferous trees prevailing on the mountains; amongst them is found the Kurilian bamboo. The coniferous passes into mixed deciduous in the river valleys, and there is a dense undergrowth of wild rose, berry-bearing plants and spiraea. The soil is unfavourable to agriculture and the vegetative period is at most 100 days, so that, with the exception of a few cereals, potatoes and vegetables grown on a patch of alluvial soil round Klyuch in the more sheltered central part, cultivation does not exist.

Bears, squirrels, pole-cat, ermine, sable, otter, glutton, marten, fox, elk and musk-deer are hunted and trapped. The bird life is varied and includes circumpolar and subtropical types, as well as those characteristic of the east of Asiatic Russia. Vipers, mosquitoes, horse- and sand-flies are pests. Fishing is the most common occupation and fish is almost the sole diet of many natives; vast quantities are exported to Japan for manure. Whales are numerous in the southern seas and the *bêche-de-mer* or trepang is caught for export.

Population.—The native tribes include Gilyaks, Oroke and Tungus, with Ainus in the Japanese part; for a description of the tribes of the Russian part see FAR EASTERN AREA. The Russians first settled on the island in 1857, and from 1875 to 1905 owned the whole of it. They established five penal settlements, to which convicts of the worst type were sent and afterwards liberated in the region, a policy from which much social disorder resulted; the penal settlement was abolished in 1907. The population in the Russian part in 1926 was about 12,000 and included many Japanese and Koreans. Malaria and scurvy are everywhere prevalent.

Industries.—During their occupation of the island up to 1925, the Japanese markedly developed the coal mining industry; this coal, which is of good quality and abundant, was first worked in 1859. In 1894 naphtha, long known to the natives, was investigated by the Russians and found to be practically free from benzene and most valuable. The naphtha and coal are being worked by a Japanese concession (1928). Iron and gold also exist and amber is cast up on the eastern shores. The Japanese also developed the timber industry of the district, which is, however, at present not prosperous (see FAR EASTERN AREA). There are railways in the Japanese part, but none in the Russian, except short lines linking the Alexandrovsk coal mines with the sea.

Steamers run from Vladivostok and Nikolaevsk-on-Amur to the chief town, Alexandrovsk (*q.v.*), from the end of April to October. Between October and December and from mid-March to April, there is no communication except by telegraph. Between these dates dog sledges cross the frozen sea from Nikolaevsk to Alexandrovsk. The island was under Chinese dominion till the 19th century. Martin Gerritz de Vries in the 17th century, La Pérouse (1787), Krusenstern (1805) visited it, but thought it a peninsula. A Japanese, Maimiya Rinzo, discovered the Strait of Tartary and the Russian navigator Nevelskoi in 1849 established it as possible for navigation.

See N. B. Arkhipov, *The Far Eastern Area* (1926); P. I. Polevoi, *Sakhalin* (1914).

SAKI, the name of a group of tropical American monkeys nearly allied to the uakaris (*q.v.*). The sakis, which form the genus *Pithecia*, are characterized by their long bushy and non-prehensile tails, distinct whiskers and beard, and the elongated hair on the crown of the head, which may either radiate from a point in the centre, or be divided by a median parting. They are very delicate animals and normally silent (see PRIMATES).

SAKTISM. The worship of Sakti, or female energy, is believed to be derived from lower cults prevalent in north-east Bengal and Assam. The principal Sakti shrine is situated at Kamakshya (? the fulfilment of lust) on the summit of a hill

two miles west of Gauhati. In Indian speculation the male principle is often regarded as quiescent, while the female principle is active and creative, a view which it may be noted is found in the physiological ideas of the Ba Ila, who hold that the male element is an inert creature but upon the female depend all the generative functions (Ila-speaking Peoples, 1920, vol. i. p. 227). A close connection exists with Tantrism, the ritual for which includes the *pancamakara*, the five elements, beginning with *m*, *madya*, *mâmsa*, *matsya*, *mudrâ*, *maithuna* (wine, meat, fish, parched grain, copulation). Apart from this, caste restrictions are minimized, girl widows may remarry, women are honoured.

The most popular Sakti worship relates to Durga and Kali and there is ample evidence that human sacrifice is in theory an essential element of the ritual.

See Sir C. Eliot, *Hinduism and Buddhism* (1922).

SAL (*Shorea robusta*), a valuable timber tree the wood of which resembles teak. Large forests of sal occur in India, where the tree is widely planted and officially protected. The genus *Shorea* (family Dipterocarpaceae) contains about 90 species found in India, Ceylon and thence eastward to the Philippines.

SALA, GEORGE AUGUSTUS HENRY (1828–1895), English journalist, was born in London, on Nov. 24, 1828. He was educated in Paris and London. In his earlier years he did odd jobs in scene-painting and book illustration. He wrote articles and stories for Charles Dickens in *Household Words* and *All the Year Round*, and in 1856 Dickens sent him to Russia as a special correspondent. Sala engaged in many journalistic enterprises, but he is best known for his journalism on the *Daily Telegraph*, with which he became connected in 1857. For that paper he did his most characteristic work, whether as a foreign correspondent in all parts of the world, or as a writer of leaders or special articles. In 1892, when his reputation was at its height, he started a weekly paper called *Sala's Journal*, but it was a disastrous failure; and in 1895 he had to sell his library of 13,000 volumes. Lord Rosebery gave him a civil list pension of £100 a year. He died at Brighton on Dec. 8, 1895.

See *The Life and Adventures of George Augustus Sala*, written by himself (4 vols., 1895).

SALAD, a preparation of fresh or cooked vegetables or other ingredients, eaten cold, and served with a dressing of which oil, vinegar and salt are essential ingredients. The word comes from Med. Lat. *salata*, salted, pickled, *salare*, to sprinkle with salt.

Salads are prepared from raw green leaves and stems such as lettuces, watercress and endive, but many varieties are also made from fresh fruits and cold cooked vegetables. Cold fish, poultry, game, meat and eggs, may likewise be included.

The preparation of lettuce, endive, watercress, small cress and corn salad needs care. For salad green leaves are best when young and should be gathered early before the sun is up and kept in a cool place until needed. Soaking in cold water for ½ hour before use makes them crisp. Each leaf should be separated and washed thoroughly. Watercress needs special care in cleansing, and small cress should have the black seed cases removed and should be kept in small bunches. After cleansing, the plants should be well drained in a salad basket, on a cloth on a sieve, or in a colander, or they can be shaken lightly in a cloth. The leaves may well be broken with the fingers or cut with a fruit knife; a steel knife must never be used or both colour and flavour will be spoilt. Chives, radishes, tomatoes and celery, cabbage, cucumbers and onion are in this class, as they are used raw. Chives may be chopped or whole; radishes cut in slices or whole; celery used in pieces or shredded, when it curls and makes a pretty garnish; tomatoes cut in slices or quarters; cucumbers in slices, cubes or shreds, cabbage shredded, green peppers shredded; chopped or sliced canned pimento is much used, as cubes or shredded.

Among fruits used for salads are bananas cut in slices, apples cut in cubes, oranges in slices or in natural divisions, pineapples and pears in cubes, cherries and plums, stoned, whole or in halves, grapefruit in sections, kumquats whole and shredded, grapes (seeded). Cold cooked vegetables useful in salads are also numerous, e.g., peas, beans, carrots, turnips, potatoes, artichokes, beet-

root and cauliflower buds, asparagus tips, brussels sprouts, spinach or other greens, okra, whole boiled onions. Care must be taken when cooking these, as if overcooked they will break up and become too soft; they may be cut in cubes, shreds or slices. Occasionally raw grated carrot is used.

Salad Dressings.—(1) The simple French dressing of oil and vinegar, seasoned with pepper, salt, mustard and sugar. This may be further flavoured with chopped tarragon, chervil, parsley, shallot, onion or chives. This dressing is used for green salads and for fruit and vegetable salads when served with poultry and cold meats. Cubes of apple with a French dressing are delicious with cold meat. Use at least twice as much oil as vinegar, seasoning to taste. Mix all in a basin and pour over the salad, mixing thoroughly; or mix from the oil and vinegar cruets directly on to the prepared salad, pouring the oil over the leaves first, for the vinegar is apt to make them flabby and it runs off them, whereas the oil coats them and then holds the vinegar; mix thoroughly.

(2) Mayonnaise (see also SAUCE). This dressing is used when a salad is to be served as a separate course, e.g., salmon mayonnaise, and for the more elaborate salads.

Garnishes.—Hard-boiled egg in slices or yolk of egg rubbed through a wire sieve and the white chopped, the two being placed in alternate groups; beetroot in fancy shapes, cucumber crimped and cut in slices, celery shredded and made to curl by keeping in cold water 30 minutes before use, the small heart of a lettuce, bunches of mustard and cress.

For fruit salad, a syrup flavoured with lemon, liqueurs or wine is made, and to this fruits of all descriptions are added.

(E. G. C.)

SALADE, SALLET or SALET, a head-piece introduced in the early 17th century replacing the heavy helmet. Its essential features were its smooth rounded surface, like an inverted bowl, and its long projecting neck guard. Usually there was no movable vizor, but the front fixed part covered most of the face, a slit being left for the eyes. (See HELMET.)

SALADIN (Arab. Sala-ud-din, "Honouring the Faith") (1138–1193), first Ayyubite sultan of Egypt, was born at Tekrit in 1138. The brilliance of his career was only made possible by the condition of the East in the 12th century. Such authority as remained to the orthodox caliph of Baghdad (see CALIPHATE) or the heretical Fatimites (*q.v.*) of Cairo was exercised by their viziers. The Seljukian empire had, after 1076, been divided and subdivided among Turkish atabegs. The Latin kingdom of Jerusalem had existed since 1089 only because it was a united force in the midst of disintegration. Gradually, however, Christian enthusiasm had aroused a counter enthusiasm among the Muslims. Zengi, atabeg of Mosul, had inaugurated the sacred war by his campaigns in Syria (1137–46). Nur-ed-din, his son, had continued his work by further conquests in Syria and Damascus, by the organization of his conquered lands, and, in 1157, by "publishing everywhere the Holy War." The opportunity of Saladin lay therefore in the fact that his lifetime covers the period when there was a conscious demand for political union in the defence of the Mohammedan faith. By race Saladin was a Kurd of Armenia. His father, Ayyub (Job), and his uncle Shirkuh, sons of a certain Shadhy of Ajdanakan near Dawin, were both generals in Zengi's army. In 1139 Ayyub received Baalbek from Zengi, in 1146 he moved, on Zengi's death, to the court of Damascus. In 1154 his influence secured Damascus to Nur-ed-din and he was made governor. Saladin was therefore educated in the most famous centre of Muslim learning, and represented the best traditions of Muslim culture.

His career falls into three parts, his conquests in Egypt 1164–74, the annexation of Syria 1174–87, and lastly the destruction of the Latin kingdom and subsequent campaigns against the Christians, 1187–92. The conquest of Egypt was essential to Nur-ed-din. It was a menace to his empire on the south, the occasional ally of the Franks and the home of the unorthodox caliphs. His pretext was the plea of an exiled vizier, and Shirkuh was ordered to Egypt in 1164, taking Saladin as his lieutenant. The Christians under Count Amalric immediately intervened and the four expeditions which ensued in 1164, 1167, 1168 and 1169

were duels between Christians and Saracens. They resulted in heavy Christian losses, the death of Shirkuh and the appointment of Saladin as vizier. His relations towards the unorthodox caliph Nur-ed-din were marked by extraordinary tact. In 1171 on the death of the Fatimite caliph he was powerful enough to substitute the name of the orthodox caliph in all Egyptian mosques. The Mohammedan religion was thus united against Christianity. To Nur-ed-din he was invariably submissive, but from the vigour which he employed in adding to the fortifications of Cairo and the haste with which he retreated from an attack on Montréal (1171) and Kerak (1173) it is clear that he feared his lord's jealousy.

In 1174 Nur-ed-din died, and the period of Saladin's conquests in Syria begins. Nur-ed-din's vassals rebelled against his youthful heir, es-Salih, and Saladin came north, nominally to his assistance. In 1174 he entered Damascus, Emesa and Hamah; in 1175 Baalbek and the towns round Aleppo. The next step was political independence. He suppressed the name of es-Salih in prayers and on the coinage, and was formally declared sultan by the caliph in 1175. In 1176 he conquered Saif-ud-din of Mosul beyond the Euphrates and was recognized as sovereign by the princes of north Syria. In 1177 he returned by Damascus to Cairo, which he enriched with colleges, a citadel and an aqueduct. From 1177 to 1180 he made war on the Christians from Egypt, and in 1180 reduced the sultan of Konia to submission. From 1181–83 he was chiefly occupied in Syria. In 1183 he induced the atabeg Imad-ud-din to exchange Aleppo for the insignificant Sinjar and in 1186 received the homage of the atabeg of Mosul. The last independent vassal was thus subdued and the Latin kingdom enclosed on every side by a hostile empire.

In 1187 a four years' truce was broken by the brilliant brigand Raynald of Châtillon, and thus began Saladin's third period of conquest. In May he cut to pieces a small body of Templars and Hospitallers at Tiberias, and, on July 4, inflicted a crushing defeat upon the united Christian army at Hittin. He then overran Palestine, on Sept. 20 besieged Jerusalem and on Oct. 2, after chivalrous clemency to the Christian inhabitants, crowned his victories by entering and purifying the Holy City. In the kingdom only Tyre was left to the Christians. Probably Saladin made his worst strategical error in neglecting to conquer it before winter. The Christians had thus a stronghold whence their remnant marched to attack Acre in June 1189. Saladin immediately surrounded the Christian army and began the famous siege.

Saladin's lack of a fleet enabled the Christians to receive reinforcements and thus recover from their defeats by land. On June 8, 1191, Richard of England arrived, and on July 12 Acre capitulated without Saladin's permission. Richard followed up his victory by an admirably ordered march down the coast to Jaffa and a great victory at Arsuf. During 1191 and 1192 there were four small campaigns in southern Palestine when Richard circled round Beitnuba and Ascalon with Jerusalem as objective. In January 1192 he acknowledged his impotence by renouncing Jerusalem to fortify Ascalon. Negotiations for peace accompanied these demonstrations, which showed that Saladin was master of the situation. Though in July Richard secured two brilliant victories at Jaffa, the treaty made on the 2nd of September was a triumph for Saladin. Only the coast line was left to the Latin kingdom, with a free passage to Jerusalem; and Ascalon was demolished. The union of the Mohammedan East had beyond question dealt the death-blow to the Latin kingdom. Richard returned to Europe, and Saladin returned to Damascus, where on March 4, 1193, after a few days' illness, he died. He was buried in Damascus and mourned by the whole East.

The character of Saladin and of his work is singularly vivid. In many ways he was a typical Mohammedan, fiercely hostile towards unbelievers—"Let us purge the air of the air they breathe" was his aim for the demons of the Cross,—intensely devout and regular in prayers and fasting. He showed the pride of race in the declaration that "God reserved this triumph for the Ayyubites before all others." His generosity and hospitality were proved in his gifts to Richard and his treatment of captives. He had the Oriental's power of endurance, alternating with violent and emotional courage. Other virtues were all his own, his extreme gentle-

ness, his love for children, his flawless honesty, his invariable kindness, his chivalry to women and the weak. Above all he typifies the Mohammedan's utter self-surrender to a sacred cause. His achievements were the inevitable expression of his character. He was not a statesman, for he left no constitution or code to the East; his empire was divided among his relatives on his death. As a strategist, though of great ability, he cannot be compared to Richard. As a general, he never organized an army. "My troops will do nothing," he confessed, "save when I ride at their head and review them." His fame lives in Eastern history as the conqueror who stemmed the tide of Western conquest on the East, and turned it definitely from East to West, as the hero who momentarily united the unruly East, and as the saint who realized in his personality the highest virtues and ideals of Mohammedanism.

AUTHORITIES—The contemporary Arabian authorities are to be found in Michaud's *Recueil des historiens des Croisades* (Paris, 1876). This contains the work of Baha-ud-din (1145-1234), diplomatist, and secretary of Saladin, the general history of Ibn-Athir (1160-1233), the eulogist of the atabegs of Mosul but the unwilling admirer of Saladin, and parts of the general history of Abulfeda. The biography of the poet Osema ibn Murkidh (1095-1188), edited by Derenbourg (Paris, 1886), gives an invaluable picture of Eastern life. Later Arabian authorities are Ibn Khallikan (1211-1282) and Abu-Shama (born 1267). Of Christian authorities the following are important, the history of William of Tyre (1137-1185), the *Itinerarium peregrinorum*, probably the Latin version of the *Carmen Ambrosii* (ed. by Stubbs, "Rolls" series, London, 1864), and the *Chronique d'outremer*, or the French translation of William of Tyre's history and its continuation by Ernoul, the squire of Balian, seigneur of Ibelin, 1228. The best modern authority is Stanley Lane-Poole's *Saladin* ("Heroes of the Nations" series, London, 1903). See also the bibliography to CRUSADES.

(W. F. K.)

SALAMANCA, a frontier province of western Spain, formed in 1833 out of the southern part of the ancient kingdom of León, and bounded N. by Zamora and Valladolid, E. by Avila, S. by Cáceres and W. by Portugal. Pop. (1930) 339,101; (est. 1939) 355,133; area, 4,829 square miles. Salamanca belongs almost entirely to the basin of the Duero (Portuguese *Douro*, *q.v.*), its principal rivers being the Tormes, which after a course of 135 mi. flows into the Duero; the Yeltes and the Agueda, also tributaries of the Duero; and the Alagon, an affluent of the **Tagus**. The southern border is partly defined along the crests of the Gredos and Gata ranges, but the highest point is La Alberca (5,692 ft.) in the Sierra de Peña de Francia, a little farther north. Forests of oak, pine, beech and chestnut cover a wide area in the south and southwest. Of the 49 Spanish provinces only Badajoz, Cáceres and Teruel have a larger number of livestock. Gold is found in the streams, and iron, lead, copper, zinc, coal and rock crystal in the hills, but the mines are only partially developed. The capital, Salamanca (*q.v.*) and Ciudad Rodrigo (*q.v.*) and Béjar (9,226) are the chief towns. The railways from Zamora, Medina, Plasencia and Peñaranda converge upon the capital, whence two lines go westward into Portugal—one via Barca d'Alva to Oporto, the other via Villar Formoso to Guarda. The province was occupied by Nationalist troops shortly after the outbreak of the civil war of 1936-39.

SALAMANCA, the capital of the Spanish province of Salamanca (anc. *Salmantica* or *Elmantica*), on the right bank of the river Tormes, 2,648 ft. above sea-level and 172 mi. by rail N.W. of Madrid. Pop. (1940) 64,922.

The town was of importance as early as 222 B.C., when it was captured by Hannibal from the Vettones; and it afterwards became under the Romans the ninth station on the Via Lata from Merida to Saragossa. It passed successively under the rule of the Goths and the Moors, till the latter were finally driven out about 1055. About 1100 many foreign settlers were induced by Alphonso VI. to establish themselves in the district, and the city was enlarged by Count Raymond of Burgundy. The Fuero de Salamanca, a celebrated code of civil law, probably dates from about 1200. Thenceforward, until the second half of the 16th century, the prosperity of the university rendered the city one of the most important in Spain.

Salamanca is the centre of a network of railways which radiate north to Zamora, north-east to Medina, east to Peñaranda,

south to Plasencia, west-south-west to Guarda in Portugal, and west to Oporto in Portugal. The river is here crossed by a bridge 500 ft. long built on twenty-six arches, fifteen of which are of Roman origin, while the remainder date from the 16th century. The city is still much the same in outward appearance as when its tortuous streets were thronged with students. The university was naturally the chief source of wealth to the town, the population of which in the 16th century numbered 50,000, nearly 8,000 of whom were students. Its decay of course reacted on the town-folk, but it fortunately also arrested the process of modernization. The ravages of war alone have wrought serious damage, for the French in their defensive operations in 1811-1812 almost destroyed the western quarter. Salamanca was again the scene of bitter fighting between Nationalist and Loyalist troops during the civil war of 1936-39. The magnificent Plaza Mayor, built by Andres Garcia de Quiñones at the beginning of the 18th century, and capable of holding 20,000 people to witness a bullfight, is one of the finest squares in Europe. It is surrounded by an arcade of ninety arches on Corinthian columns, one side of the square being occupied by the municipal buildings.

The **University**.—Salamanca is still rich in educational establishments. It still keeps up its university, with the separate faculties of letters, philosophy, sciences, law and medicine; its university and provincial public library, with many thousand volumes and mss.; its Irish college, provincial institute, superior normal school, ecclesiastical seminary (founded in 1778), economic and other learned societies, and very many charitable foundations. The city has still its 25 parishes, 25 colleges, and as many more or less ruined convents, and 10 yet flourishing religious houses. The university, the oldest in the Peninsula, was founded about 1230 by Alphonso IX of León, and refounded in 1242 by St. Ferdinand of Castile. Under the patronage of the learned Alphonso X its wealth and reputation greatly increased (1252-1282), and its schools of canon law and civil law attracted students even from Paris and Bologna. In the 15th and 16th centuries it was renowned throughout Europe. Here Columbus lectured on his discoveries, and here the Copernican system was taught long before it had won general acceptance. But soon after 1550 a period of decline set in.

Principal Buildings.—The old cathedral is a cruciform building of the 12th century, begun by Bishop Jerónimo, the confessor of the Cid (*q.v.*). Its style of architecture is that Late Romanesque which prevailed in the south of France, but the builder showed much originality in the construction of the dome, which covers the crossing of the nave and transepts. The inner dome is made to spring, not from immediately above the arches, but from a higher stage of a double arcade pierced with windows. The thrust of the vaulting is borne by four massive pinnacles, and over the inner dome is an outer pointed one covered with tiles. The Capilla de Talavera is used as a chapel for service according to the Mozarabic rite, which is celebrated there six times a year. On the north of and adjoining the old church stands the new cathedral, built from designs by Juan Gil de Ontañon. Though begun in 1509 the work of construction made little progress until 1513, when it was entrusted to Ontañon under Bishop Francisco de Bobadilla; though not finished till 1734, it is a notable example of the late Gothic and Plateresque styles. Its length is 340 ft. and its breadth 160 ft. The treasury is very rich, and amongst other articles possesses a custodia which is a masterpiece of goldsmith's work, and a bronze crucifix of undoubted authenticity, which was borne before the Cid in battle.

Of the university buildings the facade of the library is a peculiarly rich example of late 15th-century Gothic. The cloisters are light and elegant; the grand staircase ascending from them has a fine balustrade of foliage and figures. The Colegio de Nobles Irlandeses was built in 1521 from designs by Pedro de Ibarra. The double arcaded cloister is a fine piece of work of the best period of the Renaissance. The Jesuit College is an immense and ugly Renaissance building begun in 1614 by Juan Gomez de Mora. The Colegio Viejo, also called San Bartolomé, was rebuilt in the 18th century, and now serves as the governor's palace. The Dominican convent of San Esteban shows a mixture

of styles from the 13th century onwards. The church is Gothic with a Plateresque façade of great lightness and delicacy. The convent of the Agustinas Recoletas, begun by Fontana in 1616, is in better taste than any other Renaissance building in the city. The church is rich in marble fittings and contains several fine pictures of the Neapolitan school, especially the Conception by J. Ribera (1588-1656) over the altar. The convent of the Espiritu Santo has a good door by A. Berruguete (c. 1480-1561). Many of the private houses are untouched examples of the domestic architecture of the times in which they were built.

Rashdall, *Universities of Europe in the Middle Ages*, vol. ii, pt. 1, (London, 1895); E. Esperabé, *Historia pragmática e interna de la Universidad de Salamanca* (2 vols., Salamanca, 1914-17).

Battle of Salamanca, 1812. (For the operations which preceded this battle see PENINSULAR WAR.)—On July 22, 1812 the Allied army under Wellington (about 46,000 with 60 guns) was drawn up south of Salamanca, the left resting on the river Tormes, with a division under Pakenham on the north bank at Cabrerizos. Wellington's object was to cover Salamanca and guard his communications through Ciudad Rodrigo with Portugal. The French under Marshal Marmont (about 42,000 with 70 guns) were collecting towards Wellington's right, stretching southwards from Calvariza de Ariba. The country generally is undulating.

Until the morning of the battle it had been uncertain whether Marmont wished to reach Salamanca by the right or left bank of the Tormes, or to gain the Ciudad Rodrigo road, but Wellington now felt that the latter was his real objective. At daylight there was a rush by both armies for the two commanding hills of the Arapiles; the Allies gained the northern (since termed the "English"), and the French the southern (since termed the "French") Arapiles. While Marmont was closing up his forces, a complete change of position was carried out by Wellington. Pakenham was directed to march through Salamanca, crossing the Tormes, and move under cover to a wood near Aldea Tejada, while Wellington took up a line under cover of a ridge between Arapiles and Aldea Tejada. By noon his old right had become his left, and he was

instantly took advantage of this. Directing Pakenham to attack the head of the leading French division, and a Portuguese brigade (Pack) to occupy the enemy by assaulting the south (or French) Arapiles, he prepared to bear down in strength upon Maucune's right flank. The French attack upon Arapiles was after hard fighting repulsed; and, at about 5 P.M., Maucune's force, when in confusion from the fierce attack of Pakenham and Wellington in front and flank and suffering severely, was suddenly trampled down "with a terrible clamour and disturbance" (Napier) by an irresistible charge of cavalry under Sir Stapleton Cotton. This counterstroke decided the battle, Marmont's left wing being completely broken. The French made a gallant but fruitless effort to retrieve the day, and repulsed Pack's attack upon the French Arapiles; but, as the light waned, Clausel, Marmont being wounded, drew off the French army towards Alba de Tormes and retired to Valladolid. Both armies lost heavily, the Allies about 6,000, the French some 15,000 men, 12 guns 2 eagles and several standards. The rout would have been even more thorough had not the castle and ford at Alba de Tormes been evacuated by its Spanish garrison without Wellington's knowledge.

Salamanca was a brilliant victory, and followed as it was by the capture of Madrid, it severely shook the French domination in Spain. (C. W. Ro.)

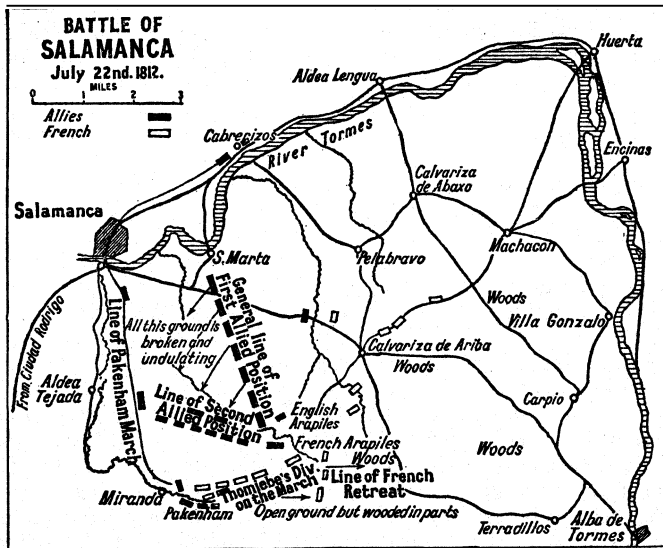

SALAMANCA, a city of Cattaraugus county, New York, U.S.A., 63 mi. S. by E. of Buffalo, on both sides of the Allegheny river. It is on federal highway 219 and state highways 17 and 18. It is served by the Erie, the Baltimore and Ohio and the Pennsylvania railways and by interurban trolleys and motorbus lines. Pop. 1940, 9,011 Salamanca is on both sides of the river, at an altitude of 1,390 ft., with wooded hills on the horizon.

It lies in the Allegheny Indian Reservation, and all land is held under a 99-year lease, authorized by Congress in 1892. It is within a few miles of the Allegheny State park of 65,000 ac.

Industries consist of railroad shops and terminals, furniture factories, tannery, plastic moulding, worsted yarns, print rolls, last blocks and milk-gathering plants. It was first settled in 1855 and called Hemlock. It was later named after a Spanish banker who was a large stockholder in the first railroad built in the county in 1862.

SALAMANDER. Salamanders in the restricted sense (genus *Salamandra*) are allies of the newts, but of exclusively terrestrial habits, indicated by the less compressed tail. The genus is restricted to the western parts of the Palaearctic region and represented by four species: the spotted salamander, *S. maculosa*, the well-known black and yellow creature inhabiting central and south Europe, north-west Africa, and south-west Asia; the black salamander, *S. atra*, restricted to the Alps; *S. caucasica* from the Caucasus, and *S. luschari* from Asia Minor. Salamanders, far from being able to withstand the action of fire, as was believed by the ancients, are only found in damp places. They often emerge in great numbers in misty weather or after thunderstorms. Although harmless to man, the large glands on their smooth, shiny bodies secrete a milky poison, which protects them from many enemies. The bright coloration of *S. maculosa* is therefore probably of warning function.

The two well-known European species pair on land, the male clasping the female at the arms, and the impregnation is internal. Long after pairing the female gives birth to living young. *S. maculosa*, which lives at low altitudes (up to 3,000ft.), deposits her young, 10 to 50 in number, in the water, in springs or cool rivulets, and these young at birth are similar to small newt larvae, and provided with external gills. *S. atra*, on the other hand, inhabits more hilly regions, up to 9,000ft. Such altitudes not being, as a rule, suitable for larval life in the water, the young are retained in the uterus until after metamorphosis. Only two young, rarely three or four, are born, and may measure as much as 50mm. at birth, the mother measuring only 120. The fertilized eggs are large and numerous, as in *S. maculosa*, but only one develops in each uterus, the embryo being nourished on the other eggs, the embryos of which break down into a soupy "vitelline mass." The embryo passes through three stages — (I) still enclosed within the

nearer to the Ciudad Rodrigo road, flanking Marmont should he move towards it.

It was not Wellington's wish (Despatches, July 21, 1812) to fight a battle "unless under very advantageous circumstances." He knew that large reinforcements were nearing the French, and, having determined to fall back towards Portugal, he began to pass his baggage along the Ciudad Rodrigo road. Marmont, about 2 P.M., seeing the dust of his baggage column, ignorant of his true position, and anxious to intercept his retreat, ordered two divisions under Maucune to push westward, while he himself attacked Arapiles. Maucune moved off, flanked by some cavalry and fifty guns, leaving a gap between him and the rest of the French. Wellington

egg membrane and living on its own yolk; (2) free, within the vitelline mass, which is swallowed by the mouth; (3) there is no more vitelline mass, but the embryo develops long external gills, which serve for a nutritive exchange through the maternal uterus, these gills functioning in the same way as the chorionic villi of the mammalian embryo's placenta. Embryos, in the second stage, if artificially released from the uterus, are able to live in water, but the uterine gills soon wither and are shed and are replaced by other gills similar to those in the larva of *S. maculosa*. Conversely, if *S. maculosa* is forced to breed without access to water, the development of the embryos becomes closely similar to that of *S. atra*. (See AMPHIBIA.)

SALAMIS, an island of Greece in the Saronic Gulf of the Aegean Sea, extending along the coasts of Attica and Megaris, and enclosing the Bay of Eleusis between two narrow straits on the W. and S. Its area is 36 sq.m., its greatest length in any direction 10 m.; its extremely irregular shape gives rise to the modern popular name *Κολλούρι*, i.e., baker's crescent. In Homer Salamis was the home of the Aeginetan prince Telamon and his sons Ajax and Teucer, and this tradition is confirmed by the position of the ancient capital of the island opposite Aegina. It subsequently passed into the hands of the Megarians, but was wrested from them about 600 B.C. by the Athenians under Solon (q.v.) and definitely awarded to Athens by Sparta's arbitration. Though Attic tradition claimed Salamis as an ancient possession the island was not strictly Athenian territory; a 6th-century inscription shows that it was treated either as a cleruchy or as a privileged foreign dependency. The town of Salamis was removed to an inlet of the east coast opposite Attica. In 480 Salamis became the base of the allied Greek fleet after the retreat from Artemisium, while the Persians took their station along the Attic coast off Phalerum. Through the stratagem of the Athenian Themistocles the Greeks were enclosed in the straits by the enemy, who had wheeled by night across the entrance of the east channel and detached a squadron to block the west outlet. The Greeks had thus no resource but to fight, while the Persians could not utilize their superior numbers, and as they advanced into the narrow neck of the east strait were thrown into confusion. The allies, among whom the Athenians and Aeginetans were conspicuous, seized this opportunity to make a vigorous attack which probably broke the enemy's line. After waging a losing fight for several hours the Persians retreated with a loss of 200 sail and of an entire corps landed on the islet of Psptaleia in the channel; the Greeks lost only 40 ships out of more than 300. During the Peloponnesian War Salamis served as a repository for the country stock of Attica. About 350 Salamis obtained the right of issuing copper coins. In 318 Cassander placed in it a Macedonian garrison which was finally withdrawn through the advocacy of the Achaean statesman Aratus (232). The Athenians thereupon supplanted the inhabitants by a cleruchy of their own citizens. By the end of the century A.D. the settlement had fallen into decay. In modern times Salamis, which is chiefly peopled by Albanians, has regained importance through the transference of the naval arsenal to Ambelaki near the site of the ancient capital. Excavations in this region have revealed large numbers of late Mycenaean tombs.

SALAMIS, the principal city of ancient Cyprus, situated on the east coast north of the river Pedias (Pediaeus). It had a good harbour, well situated for commerce with Phoenicia, Egypt and Cilicia, which was replaced in mediaeval times by Famagusta

(q.v.), and is wholly silted now. Its trade was mainly in corn, wine and oil from the midland plain, and in salt from the neighbouring lagoons. Traditionally, Salamis was founded after the Trojan War (c. 1180 B.C.) by Teucer from the island Salamis, off Attica, but there was a Mycenaean colony somewhat earlier.

A king Kisu of Silna (Salamis) is mentioned in a list of tributaries of Assur-bani-pal of Assyria in 668 B.C., and Assyrian influence is seen in terra-cotta figures from a shrine excavated in 1890–1891. Salamis seems to have been the principal Hellenic power in the island. The revolts against Persia in 500 B.C., 386–380 B.C. and 352 B.C. were led respectively by its kings Onesilas, Evagoras (q.v.) and Pnytagoras. In 306 B.C. Demetrius Poliorcetes won a great naval victory here over Ptolemy I. of Egypt. Under Egyptian and Roman administration Salamis flourished greatly, though the seat of government was at New Paphos (see PAPHOS). But it was greatly damaged in the Jewish revolt of A.D. 116–117; suffered repeatedly from earthquakes, and was wholly rebuilt by Constantius II. (AD. 337–361) under the name Constantia. There was a large Jewish colony, and a Christian community was founded by Paul and Barnabas in A.D. 45–46. Barnabas was himself a Cypriote, and his reputed tomb, discovered in A.D. 477, is still shown near the monastery of Ail Barnaba. St. Epiphanius was archbishop A.D. 367–402. The Greek city was destroyed by the Arabs under the Caliph Moawiya in 647; Christian survivors migrated to the neighbouring Ammochostos (see FAMAGUSTA).

Myres, *Archaeologia*, lxxi. 159–178 ("Prison of St. Catharine"); E. Oberhammer in *Poly-Wissowa* (s.v.). (J. L. My.)

SAL AMMOWIAC or **AMMONIUM CHLORIDE**, the earliest known salt of ammonia (q.v.), was formerly much used in dyeing and metallurgic operations.

The name *Hammoniaca* sal (from ἄμμος sand) occurs in Pliny, who relates that it was applied to a kind of fossil salt found below the sand, in a district of Cyrenaica. The general opinion is, that the sal ammoniac of the ancients was the same as that of the moderns; but the imperfect description of Pliny is far from being conclusive. The native sal ammoniac of Bucharia, described by Model and Karsten, and analysed by M. H. Klaproth, has no resemblance to the salt described by Pliny. The same remark applies to the sal ammoniac of volcanoes. Dioscorides, in mentioning sal ammoniac, makes use of a phrase quite irreconcilable with the description of Pliny, and applicable rather to rock-salt than to our sal ammoniac. Sal ammoniac, he says, is peculiarly prized if it can be easily split into rectangular fragments. Finally, we have no proof whatever that sal ammoniac occurs near the temple of Jupiter Ammon, or in any part of Cyrenaica, so it is improbable that the name is derived from Ammon, and it seems that the term sal ammoniac was applied as indefinitely by the ancients as most of their other chemical terms. In any case there can be no doubt that it was well known to the alchemists as early as the 13th century.

Egypt is the country where sal ammoniac was first manufactured, and thence Europe for many years was supplied with it. This commerce was first carried on by the Venetians, and afterwards by the Dutch. In 1716 C. J. Geoffroy read a paper to the French Academy, showing that sal ammoniac must be formed by sublimation; but his opinion was opposed so violently by W. Homberg and N. Lemery, that the paper was not printed. In 1719 D. Lemaire, the French consul at Cairo, sent the Academy an account of the mode of manufacturing sal ammoniac in Egypt. The salt, it appeared, was obtained by simple sublimation from soot. In the year 1760 Linnaeus communicated to the Royal Society a correct detail of the whole process, which he had received from Dr. F. Hasselquist, who had travelled in that country as a naturalist. The dung of black cattle, horses, sheep, goats, etc., which contains sal ammoniac ready formed, is collected during the first four months of the year, when the animals feed on the spring grass, a kind of clover. It is dried, and sold to the common

people as fuel. The soot from this fuel is carefully collected and sold to the sal ammoniac makers, who work only during the months of March and April, for it is only at that season of the year that the dung is fit for their purpose.

The composition of this salt (NH_4Cl) seems to have been first discovered by J. P. Tournefort in 1700. The experiments of C. J. Geoffroy in 1716 and 1723 were still more decisive, and those of H. L. Duhamel de Monceau, in 1735, left no doubt upon the subject. Thomson first deduced its composition synthetically from his observation that when hydrochloric acid gas and ammonia gas are brought in contact with each other, they always combine in equal volumes.

The first attempt to manufacture sal ammoniac in Europe was made, about the beginning of the 18th century, by Goodwin, a London chemist, who appears to have used the mother lye of common salt and putrid urine as ingredients. The first successful manufacture of sal ammoniac in Great Britain was established in Edinburgh about the year 1760. It was first manufactured in France about the same time by A. Baumé. It is now obtained from the ammoniacal liquor of gas works by distilling the liquor with milk of lime and passing the ammonia so obtained into hydrochloric acid. The solution of ammonium chloride so obtained is evaporated and the crude ammonium chloride purified by sublimation. The salt volatilizes (mostly in the form of a mixed vapour of the two components, which reunite on cooling), and condenses in the dome in the form of a characteristically fibrous and tough crust.

The pure salt has a sharp saline taste and is readily soluble in water. It readily volatilizes, and if moisture be rigorously excluded, it does not dissociate, but in the presence of mere traces of water it dissociates into ammonia and hydrochloric acid (H. B. Baker, 1895). (See also DRYNESS, CHEMICAL.)

Sal ammoniac (ammonium chloride, British and United States pharmacopoeiae) as used in medicine is a white crystalline odourless powder having a saline taste. It is soluble in 3 parts of cold water and in 50 parts of 90% alcohol. It is incompatible with carbonates of the alkalis. The dose is 5 to 20 gr. Ammonium chloride has a different action and therapeutic use from the rest of the ammonium salts. It possesses only slight influence over the heart and respiration, but it has a specific effect on mucous membranes as the elimination of the drug takes place largely through the lungs, where it aids in loosening bronchial secretions. This action renders it of the utmost value in bronchitis and pneumonia with associated bronchitis. The drug may be given in a mixture with glycerine or liquorice to cover the disagreeable taste or it may be used in a spray by means of an atomizer. Though ammonium chloride has irritant properties which may disorder the stomach, yet if its mucous membrane be depressed and atonic the drug may improve its condition, and it has been used with success in gastric and intestinal catarrhs of a subacute type and is given in doses of 10 grains half an hour before meals in painful dyspepsia due to hyperacidity. It is also an intestinal and hepatic stimulant and a feeble diuretic and diaphoretic, and has been considered a specific in some forms of neuralgia.

SALANDRA, ANTONIO (1853-1931), Italian statesman, was born at Troia, Puglia, in 1853. He first entered parliament as member for Lucera, and from the beginning of his political career was a Liberal of the right wing. When Sidney Sonnino became treasury minister in the Crispi cabinet of 1893, Salandra was chosen under-secretary in that department. He was minister of finance in the first Sonnino cabinet of 1906 and treasury minister in the second (1909-10). When, in March 1914, Giolitti resigned, Salandra was called upon to form the new cabinet, and in June he had to face a revolutionary outbreak in the Marches and Romagna. He was premier on the outbreak of World War I, and it was the Salandra cabinet which took the momentous decision of proclaiming Italy's neutrality, in spite of the existence of the Triple Alliance, because Austria-Hungary had violated art. 7 of the Triple Alliance by declaring war on Serbia without a previous agreement with Italy.

In May 1915 Salandra assumed the still greater responsibility of bringing Italy into the war on the side of the Allies. On re-

signing office in June 1916, in consequence of the Austrian offensive in the Trentino, he continued to support both the Boselli and the Orlando cabinets. During the disturbed period from 1919 to 1922 Salandra upheld the principles of orthodox Liberalism, and opposed the policy of the various cabinets who truckled to the extremists. He succeeded Tittoni as Italian delegate on the League of Nations Council and Assembly, and represented the Italian thesis in the Italo-Greek conflict arising from the massacre of the Tellini mission in Epirus in Aug. 1923. The Fascist movement was supported from the first by Salandra, but he did not join the Fascist party, and when he felt that Fascism was incompatible with the old Liberal tradition, especially after Mussolini's speech of Jan. 3, 1925, he withdrew his support, without, however, abandoning the Chamber. Subsequently his opposition became considerably attenuated, and in 1928 on the proposal of Mussolini, he was created a senator. Salandra died Dec. 19, 1931.

See on Salandra's war policy two books of his, written or compiled in the last nine years of his life: *I Discorsi della Guerra* (1922) and *La Neutralità italiana del 1914: ricordi e pensieri* (1928).

SALARIA, VIA, an ancient highroad of Italy, which ran from Rome by Reate and Asculum to Castrum Truentinum (Porto d'Ascoli) on the Adriatic coast, a distance of 151 mi. Its first portion was the route by which the Sabines came to fetch salt from the marshes at the mouth of the Tiber. Of its course through the Apennines considerable remains exist.

See T. Ashby in *Papers of the British School at Rome*, iii, 3-38.

SALAR JUNG, SIR (1829-1883), Indian statesman of Hyderabad, born in 1829, descendant of a family of officials under the Adil Shahi kings of Bijapur, then under the Delhi emperors and lastly under the Nizams. Sir Salar Jung's personal name was Mir Turab Ali; he was styled by native officials of Hyderabad the Mukhtar ul-Mulk, and commonly known as the Nawab Sahib. He succeeded his uncle Suraju ul-Mulk as prime minister of Hyderabad in 1853. Salar Jung disciplined Arab mercenaries, the more valuable part of the Nizam's army, and employed them against the rapacious nobles and bands of robbers who had annihilated the trade of the country. He then constituted courts of justice at Hyderabad, organized the police force, constructed and repaired irrigation works, and established schools. On the outbreak of the Mutiny he supported the British, and although unable to hinder an attack on the residency, he warned the British minister that it was in contemplation. The attack was repulsed; the Hyderabad contingent remained loyal, and their loyalty served to ensure the tranquillity of the Deccan. Salar Jung took advantage of the preoccupation of the British government with the Mutiny to push his reforms more boldly, and when the Calcutta authorities were again at liberty to consider the condition of affairs his work had been carried far towards completion. During the lifetime of the Nizam, Afzulu'd-dowla, Salar Jung was considerably hampered by his master's jealous supervision. When Mir Mahbub Ali, however, succeeded his father in 1869, Salar Jung, at the instance of the British government, was associated in the regency with the principal noble of the state, the Shamsu ul-Umara or Amir Kabir, and enjoyed an increased authority. In 1876 he visited England with the object of obtaining the restoration of Berar. Although he was unsuccessful, his personal merits met with full recognition. He died of cholera at Hyderabad on the 8th of February 1883.

See *Memoirs of Sir Salar Jung*, by his private secretary, Syed Hossain Bilgrami, 1883.

SALDANHA BAY, an inlet on the south-western coast of South Africa, 63 m. by sea N. by W. of Cape Town, forming a land-locked harbour. The northern part of the inlet is known as Hoetjes Bay. It has accommodation for a large fleet with deep water close inshore, but the arid nature of the country caused it to be neglected. From Kalabas Kraal on the Cape Town-Clanwilliam railway, a narrow gauge line runs via Hopefield to Hoetjes Bay—126 m. from Cape Town.

Saldanha Bay is so named after Antonio de Saldanha, captain in Albuquerque's fleet which visited South Africa in 1503.

SALDERN, FRIEDRICH CHRISTOPH VON (1719-1785), Prussian soldier and military writer, entered the army in

1735, and was transferred to the Guards in 1739. As one of Frederick's aides-de-camp he was the first to discover the approach of Neipperg's Austrians at Mollwitz. He commanded a guard battalion at Leuthen, again distinguished himself at Hochkirch and was promoted major-general. In 1760 at Liegnitz Frederick gave him four hours in which to collect, arrange and despatch the spoils of the battle, 6,000 prisoners, 100 wagons, 82 guns and 5,000 muskets. His complete success made him a marked man even in Frederick's army. At Torgau, Saldern and Mollendorf (*q.v.*) with their brigades converted a lost battle into a great victory by their desperate assault on the Siptitz heights. The manoeuvring skill, as well as the iron resolution, of the attack, has excited the wonder of modern critics, and after Torgau Saldern was accounted the "completest general of infantry alive" (Carlyle). In the following winter, however, being ordered by Frederick to sack Hubertusburg, Saldern refused on the ground of conscience. Nothing was left for him but to retire, but after the peace the general was at once made inspector of the troops at Magdeburg. In 1766 he became lieutenant-general. Saldern was a pedant of the most pronounced type. In one of his works he discussed at great length the question between 76 and 75 paces to the minute as the proper cadence of infantry. "Saldern-tactics" contributed powerfully to the disaster of Jena in 1806. His works included *Taktik der Infanterie* (Dresden, 1784) and *Taktische Grundsätze* (Dresden, 1786), and were the basis of the British "Dundas" drill-book.

See Küster, *Charakterzüge des Generalleutenants von Saldern* (1792).

SALE, GEORGE (c. 1697–1736), English Orientalist, was the son of a London merchant. In 1720 he was admitted a student of the Inner Temple, but subsequently practised as a solicitor. Having studied Arabic for some time in England, he became, in 1726, one of the correctors of the Arabic version of the New Testament, begun in 1720 by the Society for Promoting Christian Knowledge, and subsequently took the principal part in the work. He made an extremely paraphrastic, but, for his time, admirable English translation of the Koran (1734 and often reprinted), and had a European reputation as an Orientalist. He died on Nov. 13, 1736.

SALE, SIR ROBERT HENRY (1782–1845), British soldier, entered the 36th Foot in 1795, and went to India in 1798, as a lieutenant of the 12th Foot. He served in the operations against Tippoo Sahib, against the raja of Travancore (1808–09) and in the expedition to Mauritius (1810). After some years he became major in the 13th, with which regiment he was for the rest of his life associated. In the Burmese War he led the 13th in all the actions up to the capture of Rangoon, in one of which he killed the enemy's leader in single combat. In the concluding operations of the war, being now lieutenant-colonel, he commanded a brigade, and at Malown (1826) he was severely wounded. In 1838, on the outbreak of the Afghan War, Sale was assigned to the command of the 1st Bengal brigade of the army assembling on the Indus. His column arrived at Kandahar in April 1839, and in May it occupied the Herat plain. The Kandahar force next set out on its march to Kabul, and a month later Ghazni was stormed, Sale in person leading the storming column and distinguishing himself in single combat. The place was well provisioned, and on its supplies the army finished its march to Kabul easily. He was left, as second-in-command, with the army of occupation, and in the interval between the two wars conducted several small campaigns ending with the action of Parwan which led directly to the surrender of Dost Mohammed.

By this time the army had settled down to the quiet life of cantonments, and Lady Sale and her daughter came to Kabul. But the policy of the Indian Government in stopping the subsidy to the frontier tribes roused them into hostility, and Sale's brigade received orders to clear the line of communication to Peshawar. After severe fighting Sale entered Jalalabad on Nov. 12, 1841. Ten days previously he had received news of the murder of Sir Alexander Burnes, along with orders to return with all speed to Kabul. These orders he, for various reasons, decided to ignore; suppressing his personal desire to return to protect his wife and family, he gave orders to push on, and on occupying Jalalabad at once set about making the old and half-ruined fortress fit to stand

a siege. There followed a close and severe investment. At last Pollock and the relieving army appeared, only to find that the garrison had on April 7, 1842, relieved itself by a brilliant and completely successful attack on Akbar's lines. Pollock and Sale after a time took the offensive, and after the victory of Haft Kotal, Sale's division encamped at Kabul again.

At the end of the war Sale received the thanks of parliament. In 1845, as quartermaster-general to Sir H. Gough's army, Sale again took the field. At Moodkee (Mudki) he was mortally wounded, and he died on Dec. 21, 1845. His wife, who shared with him the dangers and hardships of the Afghan war, was amongst Akbar's captives. Amongst the few possessions she was able to keep from Afghan plunderers was her diary (*Journal of the Disasters in Afghanistan*, London, 1843).

See Gleig, *Sale's Brigade in Afghanistan* (London, 1846); Kaye, *Lives of Indian Officers* (London, 1867); W. Sale, *Defence of Jellalabad* (London, 1846); Regimental History of the 13th Light Infantry.

SALE, a town of Tanjil county, Victoria, Australia, the principal centre in the agricultural Gippsland district, on the river Thomson, 127½ mi. by rail E.S.E. of Melbourne. Pop. (1938), 4,372. It is the seat of the Anglican bishop of Gippsland, and contains the cathedral of the Roman Catholic bishop of Sale. Sale is the head of the Gippsland lakes navigation, the shipping being brought from the lakes to the town by canal.

SALE, a municipal borough in the Altrincham parliamentary division, Cheshire, England, 5 mi. S.W. of Manchester, on the L.M.S.R. and G.W.R. Pop. (1938) 37,480. Area, 5.67 sq.mi. The borough, created in 1935, is mainly residential. Several industries are carried on and provision has been made for further development. Market gardening to supply Manchester is extensive.

SALÉ (SĀ), a seaport on the Atlantic coast of Morocco, on the north side of the Bu Ragra, opposite Rabat (*q.v.*). Salé, inhabited by a native bourgeoisie, contains numerous Muslim sanctuaries, mosques, *zawiâs*, medersas and tombs of saints. Salé was, in the middle ages, the most important merchant port and entrepôt of the west coast. In the 17th century it became an independent republic, a great centre of corsairs. Various French and English expeditions tried, without much success, to put an end to it. The population (1936) was 31,823, of which 1,090 are Europeans and 30,733 natives.

SALEM, a city and district of British India, in the Madras presidency. The city is on both banks of the river Tirumani-muttar, 3 mi. from a station on the Madras railway, 206 mi. S.W. of Madras City. Pop. (1931) 102,179. There is a considerable weaving industry. Its situation in a green valley between the Shevaroy and Jarugumalai hills is picturesque.

The DISTRICT OF SALEM has an area of 7,058 sq.mi. Except towards the south it is hilly, with extensive plains lying between the several ranges. It consists of three distinct tracts, formerly known as the Talaghat, the Baramahal and the Balaghat. The Talaghat is situated below the Eastern Ghats on the level of the Carnatic generally; the Baramahal includes the whole face of the Ghats and a wide piece of country at their base; and the Balaghat is situated above the Ghats on the tableland of Mysore.

The western part of the district is mountainous. Amongst the chief ranges are the Shevaroy, the Kalrayans, the Melagiris, the Kollimalais, the Pachamalais and the Yelagiris.

The population in 1931 was 2,433,972. The principal crops are millets, rice, pulses, mangoes, and oil-seeds. Coffee is grown on the Shevaroy hills. The chief irrigation work is the Barur tank system. The Madras railway runs through the district, with two narrow-gauge branches. The chief industry is cotton-weaving, and magnesite and steatite are worked, and there are iron and steel works. The district was acquired partly by the treaty of peace with Tippoo Sultan in 1792 and partly by the partition treaty of Mysore in 1799.

SALEM, a city of Massachusetts, U.S.A., on the coast, 15 mi. N.E. of Boston; a port of entry, one of the county seats of Essex county and a city of great historic interest. It is served by the Boston and Maine railroad. Pop. 42,697 in 1920 (26% foreign-born white) and 41,213 in 1940 by the federal census. The city's area of 8.2 sq. mi. comprises a peninsula projecting toward the

northeast between Marblehead and Beverly, Winter island (connected with the neck of the peninsula by a causeway) and some territory on the mainland. The commerce of its harbour (almost entirely receipts of coal and oil) amounted in 1937 to 473,000 tons. Its manufactures (including cotton goods, boots and shoes, leather and incandescent lamps and radio tubes) were valued in 1937 at \$28,381,316. Salem is the seat of a state teachers college (1854).

The assessed valuation of property for 1940 was \$53,975,000.

Salem is one of the oldest cities in New England and has preserved an unusual number of historic and literary landmarks. In the centre of the city is the common (8 ac.). On a bluff projecting into South river is the old Burying point, set aside in 1637, with stones dating back to 1673; and in Broad street is another old burial ground, laid out in 1655. The famous India (or Crownshield's) wharf is now a coal pocket. The custom house (described by Hawthorne in the introduction to *The Scarlet Letter*) was built in 1818-19; the oldest of the three courthouses, which has great monolithic Corinthian columns, in 1839-41; the city hall, in 1837.

There are many old dwellings built by shipowners before the Revolution. Many are of the gambrel type, and they are rich in beautiful doorways, doorheads and other fine architectural details. The Salem Maritime national historic site comprises Derby wharf, the customhouse and three other buildings. Among the houses of special interest are the birthplace of Nathaniel Hawthorne (built before 1692); the "house of the seven gables," in use as a social settlement; the "witch house," where Jonathan Corwin is said to have held preliminary examinations in the witchcraft trials. The Essex institute (1848) and the Peabody museum (in the East Indian Marine hall, built in 1824) contain rich collections relating to colonial life.

Salem was founded in 1626 by Roger Conant (1593-1679) as a commercial venture, partly agricultural and partly to provide a wintering-place for the Banks fishermen. The name was probably chosen in allusion to Psalm lxxvi. 2. In 1628 a patent for the territory was granted by the New England council to the Dorchester Company, which promptly sent out a small colony under John Endecott as governor. This patent was superseded in 1629 by the charter for the Colony of Massachusetts Bay. Endecott continued as governor until the arrival (1630) of John Winthrop, who soon moved the seat of government to Charlestown and then to Boston. In 1629 the first Congregational Church in America was organized in Salem, and Roger Williams (*q.v.*) was one of its first pastors. In 1686 the people of Salem, guarding against the danger of being dispossessed by a new charter, secured a deed to their land from the Indians for £20. Salem village (then part of Salem, but now in Danvers) was the centre of the witchcraft delusion of 1692. Beginning with accusations by ten young girls that Tituba, the West Indian slave of the Rev. Samuel Parris, and two old women had bewitched them, the hysteria spread rapidly, and within four months hundreds were arrested and tried, 19 hanged, and one pressed to death for refusing to plead. The reaction came quickly, and in May 1693 Governor Phelps ordered the release of all prisoners held on the charge of witchcraft. Salem was an important port after 1670, especially in the India trade, and Salem privateers were conspicuous in the Seven Years' War, during the Revolution (when 158 of them took 445 prizes), and in the War of 1812. The first provincial assembly of Massachusetts met in Salem in 1774. On Feb. 20, 1775, at the North bridge, the first armed resistance of the Revolution was offered by the men of the town to royal troops sent to search for hidden cannon. Marblehead was set off from Salem in 1649, Beverly in 1668 and Danvers in 1752. Salem was chartered as a city in 1836. It was the birthplace of Nathaniel Hawthorne, William H. Prescott, Nathaniel Bowditch, Jones Very and William Wetmore Story.

SALEM, a city of southwestern New Jersey, U.S.A., the county seat of Salem county; 38 mi. S.W. of Philadelphia, on the Salem river, 2 mi. from its confluence with the Delaware. It is served by the Pennsylvania railroad and motorbus lines. The vicinity abounds in small river craft for pleasure. Pop. (1930) 8,047; (1940) 8,618. It is the trade centre for a rich agricultural

region and has important manufactures, including floor coverings, pickles, milk products and glass bottles, battery jars, carboys and large glassware. The public library was established in 1804; the county offices occupy the old Johnson house, built in 1804; and in the Friends' burial ground (set aside in 1676) is an oak tree 88 ft. high, with a spread of $\frac{1}{4}$ ac., a survivor of the original forest. In Finn's Point national cemetery, 4 mi. N. of Salem, are buried some 2,460 Confederate soldiers, who died while prisoners of war at Ft. Delaware, on an island in the Delaware river near the mouth of the Salem. Salem is the oldest permanent English settlement along the Delaware. It was founded in 1675 by John Fenwicke, an English Quaker, who bought from the Indians the land now embraced in Salem and Cumberland counties, and selected the site of the present city for his settlement, naming it Salem because of its peaceful aspect. In 1682 he submitted to the authority of the proprietors of West Jersey. Salem was incorporated as a town in 1695 and as a city in 1858.

SALEM, a city of Columbiana county, Ohio, U.S.A., 67 mi. S.W. of Cleveland; served by the Pennsylvania railway. Pop. (1920) 10,305 (84% native white); 1940 federal census 12,301. It is in a fine agricultural region, where coal and natural gas are plentiful, and has important manufactures (including pumps, furnaces, washtubs, mill machinery, miners' tools, enamelled ware, china, automobile tires and bodies and various other articles). Salem was settled by Friends in 1806, incorporated as a town in 1830, as a village in 1852 and as a city in 1887. It was a "station" on the underground railroad and the headquarters of the Western Anti-Slavery society, which published there *The Anti-Slavery Bugle*.

SALEM, the capital city of Oregon, U.S.A. and the county seat of Marion county; on the Willamette river, 51 mi. S.S.W. of Portland. It is on the Pacific highway and is served by the Southern Pacific and the Oregon Electric railways and by motor coach lines. Pop. (1920) 17,679 (88% native white); 1940 federal census 30,908. In the heart of the Willamette valley, Salem is surrounded by rich farm land, 35,000 ac. of fruits, berries and nuts, the only region in the United States where long-fibre flax is raised, and the principal hop-growing region. Its manufacturing industries include fruit, berry and vegetable canneries, a paper mill, large sawmills, also sash and door factories, woollen mills, ironworks and two linen mills. All but two of the state institutions are in or near the city, and at Chemawa, 5 mi. N., is a government school for Indians. On an 18-ac. campus in the heart of the city is Willamette university (Methodist Episcopal; 1842), an outgrowth of the mission work of the Methodist Episcopal church begun in the vicinity by Jason Lee in 1834. Around the mission and the school grew up a settlement which in 1853 was chartered as a city and in 1860 became the capital of the state.

SALEM, a town of southwestern Virginia, U.S.A., the county seat of Roanoke county; on the Roanoke river and federal highway 11, 6 mi. W. of Roanoke. It is served by the Norfolk and Western and the Virginian railways. Pop. 4,833 in 1930 and 5,737 in 1940 by the federal census. Salem lies about 1,000 ft. above sea level, in the beautiful region between the Blue Ridge and the Allegheny mountains. It is the seat of Roanoke college, coeducational (Lutheran; 1853), and of two orphanages (Baptist and Lutheran) and has a variety of manufacturing plants. The town was laid out in 1802, incorporated in 1806 and became the county seat in 1838. Since 1922 Salem has had a council-manager form of government.

SALE OF GOODS. The law of sale is usually treated as a branch of the law of contract, because sale is effected by contract. Thus Pothier entitles his classical treatise on the subject, *Traité du contrat de vente*. But a completed contract of sale is something more. It is a contract plus a transfer of property. By an agreement to sell a *ius in personam* is created; by a sale of *ius in rem* is transferred. The essence of sale is the transfer of property for a price. If there be no agreement for a price, express or implied, the transaction is of the nature of a gift. So, too, if commodity be exchanged for commodity, the transaction is called barter (*q.v.*) and not sale, and the rules relating to sales do not apply in their entirety. Again, a contract of sale **must**

contemplate an absolute transfer of the property in the thing sold or agreed to be sold. A mortgage may be in the form of a conditional sale, but English law regards the substance and not the form of the transaction. If in substance the object of the transaction is to secure the repayment of a debt, and not to transfer the absolute property in the thing sold, the law at once annexes to the transaction the complex consequences which attach to a mortgage. So, too, it is not always easy to distinguish a contract for the sale of an article from a contract for the supply of work and materials. If a man orders a set of false teeth from a dentist the contract is one of sale, but if he employs a dentist to stop one of his teeth with gold the contract is for the supply of work and materials. The distinction is of practical importance, because very different rules of law apply to the two classes of contract. The property which may be the subject of sale may be either movable or immovable, tangible or intangible. The present article relates only to the sale of goods—that is to say, tangible movable property.

The Code of 1893.—In 1847, when Justice Story wrote his work on the sale of personal property, the law of sale was still in process of development. Many rules were still unsettled, especially the rules relating to implied conditions and warranties. But for several years the main principles have been well settled. In 1891 the subject seemed ripe for codification, and Lord Herschell introduced a codifying bill which two years later passed into law as the Sale of Goods Act, 1893.

Sale is a consensual contract. The parties to the contract may supplement it with any stipulations or conditions they may see fit to agree to. The code in no wise seeks to fetter this discretion. It lays down a few positive rules—such, for instance, as that which reproduces the 17th section of the Statute of Frauds. But the main object of the act is to provide clear rules for those cases where the parties have either formed no intention or have failed to express it. When parties enter into a contract they contemplate its smooth performance, and they seldom provide for contingencies which may interrupt that performance—such as the insolvency of the buyer or the destruction of the thing sold before it is delivered. It is the province of the code to provide for these contingencies, leaving the parties free to modify by express stipulation the provisions imparted by law. When the code was in contemplation the case of Scotland gave rise to difficulty. Scottish law varies widely from English. To speak broadly, the Scottish law of sale differs from the English by adhering to the rules of Roman law, while the English common law has worked out rules of its own. The Codifying bill of 1891 applied only to England, but on the advice of Lord Watson it was extended to Scotland. As the English and Irish laws of sale were the same, the case of Ireland gave rise to no difficulty, and the act now applies to the whole of Great Britain. As regards England and Ireland, very little change in the law has been effected. As regards Scotland, the process of assimilation has been carried further, but this has not been completed. In a few cases the Scottish rule has been saved or re-enacted, in a few other cases it has been modified, while on other points, where the laws were dissimilar, the English rules have been adopted.

The act is divided into six parts, the first dealing with the formation of the contract. The 1st section, which may be regarded as the keystone of the act, is in the following terms: "A contract of sale of goods is a contract whereby the seller transfers or agrees to transfer the property in goods to the buyer for a money consideration called the price. A contract of sale may be absolute or conditional. When under a contract of sale the property in the goods is transferred from the seller to the buyer the contract is called a 'sale,' but when the transfer of the property in the goods is to take place at a future time or subject to some condition thereafter to be fulfilled the contract is called an 'agreement to sell.' An agreement to sell becomes a sale when the time elapses or the conditions are fulfilled subject to which the property in the goods is to be transferred." This section clearly enunciates the consensual nature of the contract, and this is confirmed by sec. 55, which provides that "where any right, duty or liability would arise under a contract of sale by impli-

cation of law," it may be negated or varied by express agreement, or by the course of dealing between the parties, or by usage, if the usage be such as to bind both parties to the contract. The next question is who can sell and buy. The act is framed on the plan that if the law of contract were codified, this act would form a chapter in the code. The question of capacity is therefore referred to the general law, but a special provision is inserted (sec. 2) relating to the supply of necessaries to infants and other persons who are incompetent to contract. Though an infant cannot contract he must live, and he can only get goods by paying for them. The law, therefore, provides that he is liable to pay a reasonable price for necessaries supplied to him, and it defines necessaries as "goods suitable to the condition in life of such minor or other person, and to his actual requirements at the time of the sale and delivery."

The 4th section of the act reproduces the famous 17th section of the Statute of Frauds, which was an act "for the prevention of frauds and perjuries." The object of that statute was to prevent people from setting up bogus contracts of sale by requiring material evidence of the contract. The section provides that "a contract for the sale of any goods of the value of £10 or upwards shall not be enforceable by action unless the buyer shall accept part of the goods so sold, and actually receive the same, or give something in earnest to bind the contract, or in part payment, or unless some note or memorandum in writing of the contract be made and signed by the party to be charged, or his agent in that behalf." It is a much-disputed question whether this enactment has brought about good or harm. It has defeated many an honest claim, though it may have prevented many a dishonest one from being put forward. When judges and juries have been satisfied of the bona fides of a contract which does not appear to satisfy the statute, they have done their best to get round it. Every expression in the section has been the subject of numerous judicial decisions, which run into almost impossible refinements, and illustrate the maxim that hard cases make bad law. It is to be noted that Scotland is excluded from the operation of sec. 4. The Statute of Frauds has never been applied to Scotland, and Scotsmen appear never to have felt the want of it.

As regards the subject-matter of the contract, the act provides that it may consist either of existing goods or "future goods"—that is to say, goods to be manufactured or acquired by the seller after the making of the contract (sec. 5). Suppose that a man goes into a gunsmith's shop and says, "This gun suits me, and if you will make or get me another like it I will buy the pair." This is a good contract, and no question as to its validity would be likely to occur to the lay mind. But lawyers have seriously raised the question, whether there could be a valid contract of sale when the subject-matter of the contract was not in existence at the time when the contract was made. The price is an essential element in a contract of sale. It may be either fixed by the contract itself, or left to be determined in some manner thereby agreed upon, e.g., by the award of a third party. But there are many cases in which the parties intend to effect a sale, and yet say nothing about the price. Suppose that a man goes into an hotel and orders dinner without asking the price. How is it to be fixed? The law steps in and says that, in the absence of any agreement, a reasonable price must be paid (sec. 8). This prevents extortion on the part of the seller, and unreasonableness or fraud on the part of the buyer.

Warranty.—The next question dealt with is the difficult one of conditions and warranties (secs. 10 and 11). The parties may insert what stipulations they like in a contract of sale, but the law has to interpret them. The term "warranty" has a peculiar and technical meaning in the law of sale. It denotes a stipulation which the law regards as collateral to the main purpose of the contract. A breach, therefore, does not entitle the buyer to reject the goods, but only to claim damages. Suppose that a man buys a particular horse, which is warranted quiet to ride and drive. If the horse turns out to be vicious, the buyer's only remedy is to claim damages, unless he has expressly reserved a right to return it. But if, instead of buying a particular horse, a

man applies to a dealer to supply him with a quiet horse, and the dealer supplies him with a vicious one, the stipulation is a condition. The buyer can either return the horse, or keep it and claim damages. Of course the right of rejection must be exercised within a reasonable time. In Scotland no distinction has been drawn between conditions and warranties, and the act preserves the Scottish rule by providing that, in Scotland, "failure by the seller to perform any material part of a contract of sale" entitles the buyer either to reject the goods within a reasonable time after delivery, or to retain them and claim compensation (sec. 11 [2]). In England it is a very common trick for the buyer to keep the goods, and then set up in reduction of the price that they are of inferior quality to what was ordered. To discourage this practice in Scotland the act provides that, in that country, the court may require the buyer who alleges a breach of contract to bring the agreed price into court pending a decision of the case (sec. 59). It seems a pity that this sensible rule was not extended to England.

In early English law caveat *emptor* was the general rule, and it was one well suited to primitive times. Men either bought their goods in the open market-place, or from their neighbours, and buyer and seller contracted on a footing of equality. Now the complexity of modern commerce, the division of labour and the increase of technical skill, have altogether altered the state of affairs. The buyer is more and more driven to rely on the honesty, skill and judgment of the seller or manufacturer. Modern law has recognized this, and protects the buyer by implying various conditions and warranties in contracts of sale, which may be summarized as follows: First, there is an implied undertaking on the part of the seller that he has a right to sell the goods (sec. 12). Secondly, if goods be ordered by description, they must correspond with that description (sec. 13). Thirdly, there is the case of manufacturers or sellers who deal in particular classes of goods. They naturally have better means of judging of their merchandise than the outside public, and the buyer is entitled within limits to rely on their skill or judgment. A tea merchant or grocer knows more about tea than his customers can, and so does a gunsmith about guns. In such cases, if the buyer makes known to the seller the particular purpose for which the goods are required, there is an implied condition that the goods are reasonably fit for it, and if no particular purpose be indicated there is an implied condition that the goods supplied are of merchantable quality (sec. 14). Fourthly, in the case of a sale by sample, there is "an implied condition that the bulk shall correspond with the sample in quality," and that the buyer shall have a reasonable opportunity of comparing the bulk with the sample (sec. 15).

Effects of Contract. — The main object of sale is the transfer of ownership from seller to buyer, and it is often both a difficult and an important matter to determine the precise moment at which the change of ownership is effected. According to Roman law, which is still the foundation of most European systems, the property in a thing sold did not pass until delivery to the buyer. English law has adopted the principle that the property passes at such time as the parties intend it to pass. Express stipulations as to the time when the property is to pass are very rare. The intention of the parties has to be gathered from their conduct. A long train of judicial decisions has worked out a series of rules for determining the presumed intention of the parties, and these rules are embodied in secs. 16 to 20 of the act. The first rule is a negative one. In the case of unascertained goods, *i.e.*, goods defined by description only, and not specifically identified, "no property in the goods is transferred to the buyer unless and until the goods are ascertained." If a man orders ten tons of scrap iron from a dealer, it is obvious that the dealer can fulfil his contract by delivering any ten tons of scrap that he may select, and that until the ten tons have been set apart, no question of change of ownership can arise. But when a specific article is bought, or when goods ordered by description are appropriated to the contract, the passing of the property is a question of intention. Delivery to the buyer is strong evidence of intention to change the ownership, but it is not conclusive. Goods may be

delivered to the buyer on approval, or for sale or return. Delivery to a carrier for the buyer operates in the main as a delivery to the buyer, but the seller may deliver to the carrier, and yet reserve to himself a right of disposal. On the other hand, when there is a sale of a specific article, which is in a fit state for delivery, the property in the article *prima facie* passes at once, even though delivery be delayed. When the contract is for the sale of unascertained goods, which are ordered by description, the property in the goods passes to the buyer, when, with the express or implied consent of the parties, goods of the required description are "unconditionally appropriated to the contract." It is perhaps to be regretted that the codifying act did not adopt the test of delivery, but it was thought better to adhere to the familiar phraseology of the cases. Section 20 deals with the transfer of risk from seller to buyer, and lays down the *prima facie* rule that "the goods remain at the seller's risk until the property therein is transferred to the buyer, but when the property therein is transferred to the buyer, the goods are at the buyer's risk whether delivery has been made or not." *Res perit domino* is therefore the maxim of English, as well as of Roman law.

Title. — In the vast majority of cases people only sell what they have a right to sell, but the law has to make provision for cases where a man sells goods which he is not entitled to sell. An agent may misconceive or exceed his authority. Stolen goods may be passed from buyer to buyer. Then comes the question, Which of two innocent parties is to suffer? Is the original owner to be permanently deprived of his property, or is the loss to fall on the innocent purchaser? Roman law threw the loss on the buyer, *Nemo plus iuris in alium transferre potest quam ipse habet*. French law, in deference to modern commerce, protects the innocent purchaser and throws the loss on the original owner. "En fait de meubles, possession vaut titre" (Code civil, art. 1,599). English law is a compromise between these opposing theories. It adopts the Roman rule as its guiding principle, but qualifies it with certain exceptions, which cover perhaps the majority of the actual cases which occur (secs. 21 to 26). In the first place, the provisions of the Factors Act, 1889 (extended to Scotland by 53 and 54 Vict. c. 40), are preserved. That act validates sales and other dispositions of goods by mercantile agents acting within the apparent scope of their authority, and also protects innocent purchasers who obtain goods from sellers left in possession, or from intending buyers who have got possession of the goods while negotiations are pending. In most cases a contract induced by fraud is voidable only, and not void, and the act provides, accordingly, that a voidable contract of sale shall not be voided to the prejudice of an innocent purchaser. The ancient privilege of market overt (*i.e.*, "open market") is preserved intact (sec. 22). The section does not apply to Scotland, nor to the law relating to the sale of horses which is contained in two old statutes, 2 and 3 Phil. and Mar. c. 7, and 31 Eliz. c. 12. The minute regulations of those statutes are never complied with, so their practical effect is to take horses out of the category of things which can be sold in market overt. The privilege of market overt applies only to markets by prescription, and does not attach to newly-created markets. The operation of the custom is therefore fitful and capricious. For example, every shop in the City of London is within the custom, but the custom does not extend to the greater London outside. If then a man buys a stolen watch in Fleet street, he may get a good title to it, but he cannot do so if he buys it a few doors off in the Strand. There is, however, a qualification of the rights acquired by purchase even in market overt. When goods have been stolen and the thief is prosecuted to conviction, the property in the goods thereupon reverts in the original owner, and he is entitled to get them back either by a summary order of the convicting court or by action. This rule dates back to the statute 21 Hen. VIII. c. 11. It was probably intended rather to encourage prosecutions in the interests of public justice than to protect people whose goods were stolen.

Having dealt with the effects of sale, first, as between seller and buyer, and, secondly, as between the buyer and third parties,

the act proceeds to determine what, in the absence of convention, are the reciprocal rights and duties of the parties in the performance of their contract (secs. 27 to 37). "It is the duty of the seller to deliver the goods and of the buyer to accept and pay for them in accordance with the terms of the contract of sale" (sec. 27). In ordinary cases the seller's duty to deliver the goods is satisfied if he puts them at the disposal of the buyer at the place of sale. The normal contract of sale is represented by a cash sale in a shop. The buyer pays the price and takes away the goods "Unless otherwise agreed, delivery of the goods and payment of the price are concurrent conditions" (sec. 27). But agreement, express or implied, may create infinite variations on the normal contract. It is to be noted that when goods are sent to the buyer which he is entitled to reject, and does reject, he is not bound to send them back to the seller. It is sufficient if he intimates to the seller his refusal to accept them (sec. 36).

Remedies of Buyer and Seller.—The ultimate sanction of a contract is the legal remedy for its breach. Seller and buyer have each their appropriate remedies. If the property in the goods has passed to the buyer, or if, under the contract, "the price is payable on a day certain irrespective of delivery," the seller's remedy for breach of the contract is an action for the price (sec. 49). In other cases his remedy is an action for damages for non-acceptance. In the case of ordinary goods of commerce the measure of damages is the difference between the contract price and the market or current price at the time when the goods ought to have been accepted. The convenient market-price rule is subordinate to the general principle that "the measure of damages is the estimated loss directly and naturally resulting in the ordinary course of events from the buyer's breach of contract" (sec. 56). Similar considerations apply to the buyer's right of action for non-delivery of the goods (sec. 51). In exceptional circumstances the remedy of specific performance is available to the buyer (sec. 52). Thus the court might order the specific delivery of an autograph letter of an otherwise unrecorded signatory of the Declaration of Independence. The seller's rights are further protected by the rules as to lien and stoppage in *transitu* (secs. 38 to 48).

The sixth and last part of the act is supplemental, and is mainly concerned with drafting explanations, but sec. 58 contains some rules for regulating sales by auction. The practice known as a "knock-out" has since been struck at by the Auctions (Bidding Agreements) Act, 1927, by which it is declared illegal and punishable.

The act of 1893 has been adopted in substance by very many of the colonial possessions, and has been followed in the main by the American Sales Act (U.S.A.). (M. D. C.)

C.I.F. Contracts.—These are in a class by themselves. The law governing them is mostly of recent growth and, nearly all of it, case law. They are contracts for the sale of sea-borne goods where the price quoted covers cost, insurance and freight. Hence the name. But the distinguishing characteristic of these sales is this: Performance is effected by tender of the documents in place of the delivery of the actual goods. Indeed, in the business world they are often referred to as sales of documents. By their means the goods are often sold many times over while still afloat; even though the ship be sunk or the goods perish no loss need fall upon the buyer, because he is protected under the policy of insurance effected on the goods or the bill of lading under which they are carried.

The documents are naturally the focus of attention. The seller must tender to the buyer the invoice, the bill of lading and the policy of insurance. On this point the requirements of the English courts are strict. By bill of lading is meant a bill or document attesting that the goods have been loaded on board, not that a shipping company is under contract to carry the goods on a named or subsequent ship. In the United States the practice may be different and the courts there may recognize "received for shipment" bills of lading and similar documents which circulate freely enough in the commercial world. Similarly with the policy of insurance. English law requires the tender of a policy. In the United States certificates of insurance and even more informal

records of the contract of insurance are in recognized use. In this respect perhaps English law lags a little behind commercial practice, for certainly these certificates are a great convenience and by special agreement can be regularly employed. But in criticizing the law as it stands it must not be forgotten that other interests besides those of buyer and seller are affected; the banker and underwriter have to be taken into account. The banker for his part has up till now resolutely set his face against the so-called "bill of lading" which gives no certain information as to the whereabouts of the goods.

When the documents are tendered the buyer must be ready and willing to pay the price. He is not entitled to withhold payment until he has had an opportunity of examining the goods. The term "net cash" in a c.i.f. contract means cash against documents. The property passes, if any one general rule can be laid down on the subject, when the documents are tendered. But on this as on other aspects of the sale there is a growing body of law to which it is very difficult to do justice in a general statement. Some of the topics are not altogether free from difficulty. Moreover, though it is a form of contract in use the world over, the law governing it is by no means as uniform as could be wished. Accordingly it has been suggested, though the suggestion has a greater measure of support on the Continent where it originated than in either England or the United States, that attempts should be made to secure uniformity along the lines of the York-Antwerp rules. More doubtless will be heard of the proposal as time goes on. (H. Got.)

UNITED STATES

The English law, as stated above, gives even in its details a picture of the American law. There is, to be sure, no market overt in the United States; and the American Factors' Acts are not only less broad in scope than the English, but, even with their narrower scope, are found only in a handful of States. Their policy should be compared with that of the statutes requiring filing or recording of chattel mortgages (*see* BILL OF SALE) and of conditional sales (*see* INSTALMENT PURCHASE). Where found, they commonly permit a consignee of goods, whose business also includes selling on his own account, to make an effective pledge of his principal's goods to secure his own debt; but the American law extends such powers to the "intending purchaser" who has secured possession only in a few specific cases, such as (in many States) instalment purchase. It should also be noted that the rule that risk follows title has an exception where title is withheld—as in the instalment purchase—only for securing payment of the price.

The chief divergence of American sales law from that described above has to do with warranties; *i.e.*, the nature of the seller's obligation with reference to the kind and quality of goods sold. The facts which will place some obligation on the seller with reference to quality are substantially the same in both countries. But in the United States, if the seller has undertaken any obligation in this respect, the buyer will, in the majority of States, be entitled not only to damages (the English "warranty") but also (at his election) to return the goods and recover the price (the English "condition"). This rule as indicated, is not universal. The American common law was in some conflict and confusion on the point, and the Uniform Sales Act, incorporating the view just stated, has not been adopted as yet (1928) in 20 of the States.

The long controversy over the buyer's power to return defective goods indicates the extent to which the law of warranty has been a creature of mercantile law, designated to settle disputes about goods between merchants. Of recent years, however, the law of warranty has been put to another striking social use: that of allocating the risks incident, in a highly industrialized society, to the unavoidable use of goods manufactured by persons with whom the user has no direct contact, who may be a "corporation" located in a distant place, whose methods the user has neither skill nor opportunity to know—but whose efficiency he is forced by the nature of the market to rely upon. Injury in those cases results from a tack or a piece of glass concealed in cake or a can of beans, from the explosion of an automatic water-heater, or from the breaking of an automobile wheel. In such cases return of the goods is not in

question, but only the allocation of the damage suffered. The device of an action for negligence has recently been extended for this purpose; but it seems to be limited to personal injury, as opposed to property damage; and it is obviously ineffective in the many States in which the burden rests on the injured plaintiff of proving the manufacturer negligent in regard to the particular defective article. There is some tendency to shift the burden to the manufacturer where the article is one, which, if negligently made, would be dangerous; *i.e.*, to make an injury due to defect raise a presumption of negligence in manufacture. Under this rule the remedy "for negligence" is effective—so effective indeed, as apparently to have given rise to a considerable volume of fraudulent claims. The remedy in negligence, too, may well be extended to any injured purchaser.

But the remedy for the same injury by way of the law of warranty seems in almost all States to be limited to the specific purchaser against his specific seller; it has been held to extend neither to his wife, his child, his employee nor his guest. Nor, under most decisions, will it run against the manufacturer if the plaintiff bought the article not directly from him, but from an intervening dealer. On the other hand, wherever remedy in warranty is available, it requires no proof of negligence at all: the seller is held to guarantee against dangerous defects in the article. It is clear the situation is one in which the courts are groping toward satisfying a definite social need, and yet one in which the traditional legal devices are only with delay and distortion capable of being made to fill the need.

Documents of Title.—One feature of American law in which wide changes have been worked in recent years requires mention. The old rule that no man might convey goods which he did not own imposes on buyers either a noticeable risk (of having any goods which have been improperly sold to them recovered by their true owners) or a degree of investigation incompatible with rapid turnover. Especially dangerous and impracticable is this in the case of bankers advancing money on the security of goods in warehouse or in transit; a banker's margin of profit is too low to make losses readily compensable, and enquiry into title is in general outside his competence. A practice therefore grew up, in the case of goods in warehouse, of accepting the warehouseman's receipt for the goods, if fair on its face, as full evidence of title to the goods, and of dealing with the receipt as with the goods themselves. The same practice has developed, even earlier, with reference to bills of lading, *i.e.*, carriers' receipts for goods entrusted to their care.

This mercantile custom has now received full warrant at law, in America, in all 28 States which have adopted the Uniform Sales Act (beginning in 1906); also, as to warehouse receipts, in the 48 States which have enacted the Uniform Warehouse Receipts Act (beginning in 1906); in more than half the States, as to bills of lading, and in all bills of lading arising out of interstate shipments, by the adoption of the Uniform Bills of Lading Act by Congress and many State legislatures (beginning in 1909). Sharp distinction is taken under these acts between straight or *non-negotiable* documents, which do not contain a promise to deliver to the order of named person, and which can transfer only such rights as the transferor possesses; and on the other hand, *order* or negotiable documents, which do carry a promise to deliver to the order of a named person, and which in general carry to a bona fide purchaser (or pledgee) for value all the rights apparent on their face, even though the transferor may have lacked such rights. The English law is to the same effect, and even expressly extends the same rules to policies of marine insurance drawn in proper form. All the American uniform acts named above are the work of Prof. Samuel Williston, whose credit in this connection is as great as that of Chalmers in England, and whose text on sales (see *The Law of Sales*, 2nd ed., 1924) promises to remain for a generation the authoritative work on the subject.

SALEP, a drug extensively used in oriental countries as a nerve restorative and fattener, and also much prescribed in paralytic affections. It is not used in European medicine. It consists of the tuberous roots of various species of *Orchis* and *Eulophia*, which are decorticated, washed, heated until horny in appearance, and then dried. Its most important constituent is a mucilaginous substance which it yields with cold water to the extent of 48%.

SALERNO (known in Roman and mediaeval times as Salernum), a small seaport, archiepiscopal see and capital of a province of the same name, about 30 mi. S.E. of Naples, Italy, finely situated at the foot of an amphitheatre of hills. Pop. (1936) 41,925 (town), 67,009 (commune). The modern town is of little commercial importance, but as a sea base and communications centre was bombed by the Allies in World War II.

The site was of some strategic significance under the Roman Republic and Empire, but the town was of only secondary importance until mediaeval times. It was dismantled by Charlemagne in the 9th century. Later it became the fortified capital of an independent principality and the rival of Benevento. During the 9th and 10th centuries it was frequently attacked by the Saracens. It was taken in 1076 by the Normans under Robert Guiscard. In 1194 it was sacked by Henry VI., and its development ceased. Salerno revived somewhat in the early 13th century, under Frederick II. (1194-1250), but soon fell into decay. The historic interest of Salerno centres round its medical school, the foundation of which is ascribed to the legendary "four masters"—a Latin, a Greek, a Jew and a Saracen. The legend represents the syncretic cultural influences under which the school arose. In the 10th and 11th centuries the place was a health resort. Under Norman rule the medical element became organized and was profoundly influenced by the work of Constantine the African (d. 1087, *q.v.*), secretary to Robert Guiscard who translated medical works from Arabic into Latin. A contemporary who translated medical works from Greek was Alfanus, archbishop of Salerno. A Jewish element was early in evidence. Under Frederick II. lectures in Hebrew were given at Naples, and one of the most important Latin translators from the Arabic, the Jew, Faraj ben Salim (d. c. 1290), worked at Salerno. The decline of the school dates from 1224, when Frederick II. instituted a university at Naples. The very well known doggerel Latin verses on the preservation of health, known as the *Regimen Sanitatis Salerni*, have been translated into almost every European language. They are addressed to an apocryphal "King of England," usually supposed to be Robert of Normandy, but there is no doubt that the verses are mostly of the 14th century. They are probably, in the main, the work of Arnald of Villanova (1235-1313).

The school is regarded as the earliest university in Europe. It became, in the later middle ages, a place of bogus degrees but survived till 1811, when it was closed by Napoleon.

BIBLIOGRAPHY.—F. Hartmann, *Die Literatur von Früh- und Hochsalerno* (Leipzig, 1919), and C. Singer, *Essays on the History of Medicine, presented to K. Sudhoff* (Oxford, 1924), contain bibliographies. The legends of Salerno are disposed of by C. Singer in *From Magic to Science* (1928), and the Arabic and Hebrew Salernitan relationships are discussed by him in *The Legacy of Israel* (Oxford, 1927). The work of Alphanus is printed by C. Burkhard, *Nemesii Episcopi Premnon Physcon . . . Alfano Salerni in Latinum translatum* (Leipzig, 1917). The records of the University of Salerno are collected by H. Rashdall, *The Universities of the Middle Ages*, 3 vols. (Oxford, 1895). An important document, recording the physicians at Salerno, is C. A. Garufi, *Necrologio del Liber Confratrum di S. Matteo di Salerno* (1922), discussed by P. Capparoni, *Magistri Salernitani nouidum cognitii* (London, 1921). The last edition of the *Scola Salernitana* is by F. R. Packard and F. H. Garrison, *The School of*

Salernum Regimen Sanitatis Salernitanum (1920). (C. Sl.; X.)

SALESBURY or **SALISBURY, WILLIAM** (c. 1520-c. 1600), Welsh scholar, was a native of Denbighshire, being the son of Foulke Salesbury, who belonged to a family said to be descended from a certain Adam of Salzburg, a member of the ducal house of Bavaria, who came to England in the 12th century. Salesbury was educated at Oxford, where he accepted the Protestant faith, but he passed most of his life at Llanrwst, working at his literary undertakings. The greatest Welsh scholar of his time, Salesbury was acquainted with nine languages, including Latin, Greek and Hebrew, and was learned in philology and botany. He died about 1600. About 1546 he edited a collection of Welsh proverbs (*Oll synwyr pen kembro*), probably the first book printed in Welsh, and in 1547 his *Dictionary in Englyshe and Welshe* was published (facsimile edition, 1877). In 1563 the English parliament ordered the Welsh bishops to arrange for the translation of the Scriptures and the book of common prayer into Welsh. The New Testament was assigned to Salesbury, who had previously translated parts of it. He received assistance from Richard Davies, bishop of St. Davids, and also from Thomas Huet, or Hewett (d. 1591), but he himself did the greater part of the work. The translation, printed in 1567, served as the basis for the new one made by Bishop William Morgan (c. 1547-1604).

SALESMANSHIP. No consideration of salesmanship as a serious factor in business science is possible without having simultaneous regard to the larger subject of sales organization and control. The function of selling may be divided under two heads, distributive selling and retail selling. Some special forms are both distributive, in that they are employed by manufacturers; and retail, in that it is direct to the "consumer" that the selling is done. Usually, however, distributive selling covers the wholesale distribution of merchandise in quantity; while retail selling covers the transference of the goods in small lots or single units to the actual consumers. There is a separate, and in many ways quite different, technique of salesmanship for each form of selling.

Briefly summarised, the duties of a distributive sales manager are constructive, investigative and administrative. These three parts are naturally much interrelated. They cover such specific duties as the creation of a sales organization, both internal and external, the formulation of a sales policy, the co-ordination of manufacturing, sales and advertising policies, the adjustment of sales policy to financial policy, the selection and training of salesmen, the allocation of territories, the fixing of sales quotas, the appointment of jobbers and agents, the analytic study of the needs, prejudices and pre-conceived ideas of the ultimate consumer, and so on.

Sales management is as yet very largely empirical, and unanimity in the choice and employment of terms to indicate its various functions is still to be obtained. There is evidenced, however, a tendency to adopt the terms "marketing" and "merchandising" to indicate the two parts of distributive selling. Marketing covers that part which is concerned with getting the goods on to the retailers' shelves; while merchandising has to do with getting the goods off the dealers' shelves into the hands of the actual consumers, the public. Many manufacturing concerns both market their goods by means of a highly efficient sales organization, and merchandise them by means of "consumer" advertising in the press and on the hoardings.

"Outdoor salesmen" fall into two groups, usually styled commercial travellers and speciality salesmen respectively. A commercial traveller is normally selling a line of goods to a body of regular customers, such goods being intended for re-sale. A speciality salesman, on the other hand, is usually selling a single article to a continually shifting body of customers, such article being for the purchaser's own use and not for re-sale. A patent scale is a typical example of a speciality. In their relationships with salesmen, few firms rely on verbal agreements merely, as these are certain sooner or later to cause friction. A long and involved agreement needlessly couched in legal (or pseudo-legal) phraseology is even more productive of misunderstanding and unpleasantness. The simpler the agreement, the better, provided it covers such things as salary, commission (if any), expenses,

territory, notice of termination required on each side, post-employment restriction, and so on. For a complete examination of the whole matter of salesmen's agreements, see the appropriate volume referred to in the bibliography. The same work contains useful data on the subject of methods of remunerating salesmen. Broadly speaking, some form of payment by results, with a basic living wage, is invariably preferred. Many firms have a system of sales quotas—the salesman receiving a salary, and drawing commission only on sales made above a specified figure per annum.

Psychology of Selling.—It is a truism that the sale takes place in the mind of the customer. For this reason the technique of salesmanship is very largely concerned with the thought processes of the customer, and might be referred to as a form of applied psychology. The mental "states" through which an individual's mind passes in the act of making a purchase have been propounded as (1) interest aroused, (2) knowledge increased, (3) adjustment to needs, (4) appreciation of suitability, (5) desire to possess, (6) consideration of cost, and (7) decision to buy. In the actual act of selling, the salesman is primarily concerned with inducing these mental states in turn in the mind of the prospective buyer.

There is, however, in salesmanship much that is extraneous to the actual act of selling. In certain forms of selling, for example, success or failure will in the main be governed by what the salesman does prior to "making contact" with the prospective buyer. In the higher realms of selling, pre-interview investigation plays a highly important part; and when at last the salesman comes face to face with his "prospect," it is with a most carefully prepared plan of action, known as a canvass. The preparation of a strong canvass, based on data gleaned from many sources, is part of the technique of salesmanship which is being successfully taught today. If the salesman is selling a speciality, such as a noiseless portable typewriter, the vital part of his canvass will be the demonstration. The four parts of the demonstration are (1) the production of the demonstration machine, (2) the explanation of its principal features, (3) the operation of the machine by the salesman, and (4) the operation of the machine by the prospect or his nominee. The complete interview may be divided into five parts. The first part is the courtesy opening; the second part begins the canvass proper, and consists of pre-demonstration sales arguments; the third part is the demonstration itself (which, as stated above, has its own four integral parts); the fourth part consists of post-demonstration sales arguments or "selling points," and ends with the salesman obtaining the order or desired action on the part of the prospect, or admitting temporary failure to do so; the fifth part is the courtesy close.

Of the various attributes and qualities essential to full success as a salesman, two may be cited as being of exceptional importance—adaptability and knowledge of merchandise. To some considerable extent, the measure of the salesman's success in getting orders will be the measure of his success in establishing the right relationships of mutual trust and regard between himself and his customers. The keenness of competition to-day has resulted in merchandise attaining a consistently high level of quality, and in certain circumstances whether or not a particular salesman obtains the business will be determined by whether or not he is liked by the buyer. The factor of sentiment weighs when other things are equal. It is the need for adaptability which leads the experienced salesman to become a shrewd judge of character. No one practically experienced pretends that character judgment, as the exigencies of selling permit it to be practised, is infallible. Nevertheless, a knowledge of physiognomy can be of the utmost value to the salesman who has learned to recognise the three ruling types—the phlegmatic or motive, the sanguinary or vital, and the nervous or mental. The salesman learns the physical characteristics of the various types, appreciates their corresponding mental attributes and qualities, and is thus able to obtain some valuable clues as to their probable behaviour. The wise salesman, however, regards his reading of the prospect's character as purely provisional, as providing a useful starting point merely. Of the other outstanding attribute, knowledge of merchandise, little need

be said beyond a most emphatic insistence upon its indispensability to full success. No amount of verbal plausibility or dialectic brilliance can compensate for lack of precise and complete knowledge of whatever one is selling. Other qualities and attributes desirable in a salesman are physical and mental fitness, a high standard of conduct ethically, a certain charm of manner, unflinching courtesy, persistence amounting to doggedness, a command of language above the average, some personal culture, an impressive bearing, marked powers of observation, a good memory, tact in large measure, and so on.

The Sales Field. — The equitable division of the sales field into territories for salesmen is a formidable task, the precise method of performing which must be governed by circumstances. A starting point may usually be obtained by considering the total absorption power of the sales field, the percentage of this total absorption power it is reasonable to expect to exploit, the estimated percentage of sales costs, and so on. For example, a sales manager might discover by market investigation (a highly important phase of distributive sales management) that the sales field is capable of producing £1,000,000 (or \$5,000,000) worth of sales per annum. In light of the nature and intensity of competition, the comparative merits of his merchandise, etc., the sales manager decides that it is reasonable to aim to secure 10% of this, or £100,000 (\$500,000) worth of sales per annum. He has gone very carefully into costs, and has fixed 7½% as a satisfactory percentage to cover salesmen's salaries and expenses, and £750 (\$3,750) per annum as a fair average total cost for each salesman. This means that the salesmen must average £10,000 per annum each in sales, and a sales force ten strong is indicated. The market investigation should have disclosed how the total absorption power of £1,000,000 (or \$5,000,000) is spread over the sales field; and the sales manager's task is now to divide that field into ten territories, each with a "sales potentiality" of £100,000 (\$500,000). This might not seem to present any great difficulty; but additional factors have still to be taken into consideration, such as method of travel (by road or rail), density of population, class of prospect, rate of turnover, desired frequency of visit, extent and strength of competition in the various areas, average length of interview, and so on.

The organization and control of a distributive sales force are aspects of sales management so prolific in peculiar problems that only the briefest and most general reference to them is possible. The keynote of the efficient sales organization is service to the customer, and the whole department must be planned and operated with this ever in mind. System and method are highly essential in a sales department; but vision and imagination are none the less important. There must be a departmental objective, clearly defined and positively expressed, towards the attainment of which all must strive. There must also be a clear-cut sales policy as a fundamental; and a sales department "procedure" to co-ordinate executive detail. When it comes to the control of the outdoor sales force, one finds two extreme schools of thought—one which believes in laying down minute procedure to which salesmen must rigidly adhere; the other which believes in letting the salesmen work in any way they choose, so long as orders in adequate volume are forthcoming. A course of action which is a happy mean between these two extremes is, however, found most generally satisfactory.

Retailing. — Retail selling, of course, presents its especial problems which are the more difficult of solution because of rapidly changing conditions. The growth of the "chain shop" idea, "supermarkets," the expansion of the co-operative store movement, the development of the departmental store—these are important factors in the tendency most clearly indicated in retailing today towards fewer, bigger and better shops. That shops are bigger and better cannot be denied; that they will be fewer by the inevitable process of elimination by intensified competition on one hand and amalgamation and absorption on the other seems incapable.

The business of retailing may be divided under two main heads—administration, which includes finance, and merchandising, which embraces both buying and selling. Our concern here is with

the selling part of merchandising. One of the most important things to realise is that all trade is either "created" or "diverted." It is created when we make a customer of an individual who has never previously purchased that class of merchandise; it is diverted when we merely secure the business from a competitor.

There are three classes of custom—casual, attracted and permanent—least desirable in this order. Casual custom is least desirable because least dependable. Attracted custom may be the fruits of advertising, novelty or interest of window display, exhibitions, demonstrations, etc. Stores which are situated in recognised and popular shopping centres, though appearing to depend largely on casual custom, are really exploiting attracted custom. In permanent custom we have the highest form, and the only form perhaps upon which real success may be built. Custom is made permanent by quality of merchandise (which embraces worth, value and desirability from the points of view of style and aesthetic appeal), quality of the service, the attentiveness, tact and courtesy of the assistants, and so on. The aim should be to convert the casual customer, first into an attracted customer, and then into a permanent customer.

All retail sales may be classified as "inevitable" or "worked for." The sale made to a customer who enters the store with her mind more or less made up to purchase that particular class of merchandise is an inevitable sale. Nothing but the absence of the article from stock, or gross discourtesy on the part of the assistant, will prevent the sale from being successfully completed. But if the assistant succeeds in interesting the customer in a second article, and in effecting the sale of that, then that second sale is "worked for," and its making is real salesmanship. The business which is able to show healthy expansion on inevitable sales only is the exception and not the rule. Most retail businesses are more or less dependent upon extra or "worked for" sales. Therefore, it is upon the making of extra sales that one concentrates in the teaching of retail salesmanship. The three sources of extra sales are (1) more customers, (2) more sales to the same customers, and (3) sales retrieved which would otherwise be lost. Admittedly, it is to advertising principally that we look to bring us the new customers to repair wastage and to provide the material of growth. None the less, it is part of salesmanship to give such complete satisfaction to those customers we have that they will return, and with them their friends. In making more sales to the same customers, the object is to tap the customer's "potential" purchasing power, as distinct from her (or his) "realised" purchasing power. Nothing savouring in the remotest degree of importunity is advocated; the forcing of goods upon customers is intolerable. The crux of the sale is the creation of desire to possess what is being offered sufficiently strong to overcome the natural reluctance to part with the price. It is absolutely wrong to sell a customer an article she does not desire, but perfectly right and proper to sell her a dozen articles which she has been made to desire, even though she had no intention of buying them when she entered the store.

The making of extra sales by retrieving sales which would otherwise be lost follows the eradication by training of such faults in the assistant as boredom, discourtesy, inattention, undue familiarity, lack of knowledge of goods, poor display, want of sales imagination, failure to overcome objections to suitability and price, and so on.

Training in retail salesmanship is being conducted with conspicuous success, and the following are the subjects it is desirable to cover by the instruction—the house policy, shop etiquette and deportment, sales routine, the layout of the store, personal hygiene and dress, general principles of salesmanship, the customer's mental states, personal attributes and qualities essential to success, how to handle the price factor, how to suggest other purchases, customers' buying motives, general knowledge of merchandise, how to handle difficult types of customers, effective display, typical sales difficulties, self-expression, commercial calculations, etc. This summary covers sufficient material for at least six months' instruction.

It can and should be much abbreviated for senior and experienced sales assistants.

SALES TAX.—The general sales tax is the latest fiscal measure which has found a place in the financial systems of western nations. Only during the last two decades has this device come into use. Now it occupies an important position in public finance. Some thirty nations have availed themselves of it; and in the United States twenty-four of the states have enacted such taxes by the autumn of 1938. The tax is called by various names, as a turnover tax, a transfer tax, a trading tax, a gross sales tax, a transactions tax, a producers' tax, etc. The common characteristic is that they are laid upon sales levied at uniform rates. Sometimes, as in Germany, they are imposed also upon sales of services.

This tax is primarily an emergency measure, and was first resorted to in order to meet the emergencies of war and of the financial difficulties which followed it. Such taxes were imposed in Germany and France during 1916. In 1914 France had introduced a stamp tax upon the sales of large retailers. It was not a general sales tax, although it probably suggested the sales tax which followed in 1916. In 1918 Germany enacted a general turnover tax, the most extensive sales tax ever introduced by any of the belligerent nations.

The financial crises which beset most of the European nations from 1921 to 1926 forced a general resort to the sales tax to balance budgets and stabilize currencies. The taxes imposed were still in effect, though much reduced, when the great depression of the 1930s came.

The financial difficulties of the 1930s brought a resort to some form of sales tax in practically all nations of the world, including the United States. The federal government has not resorted to a general sales tax, but has limited itself to a few items, the most important being gasoline and domestic electricity. The individual states have levied taxes which are much more general. These vary widely from state to state and from one year to another. All states have taxes on the sale of gasoline, and many have taxes on tobacco. Twenty-three states have general sales taxes.

These sales taxes have served their purpose of raising large sums of money at a time when many other sources of taxation were shrinking seriously. It is clear that they are ideally suited to meet public revenue problems in a period of prolonged business depression. The gasoline tax alone, which had been levied primarily for the support of highways, and which yielded \$304,000,000 in 1928, increased steadily during the depression, until it amounted to \$756,930,000 in 1937. In the latter year this was used for many purposes other than the support of highways. As a tax, it is practically impossible to evade. Aside from its use as an emergency measure, the sales tax should not be included in a permanent tax system. Once in effect, it can be increased too easily, and thus offers a continual temptation to increased expenditures. It has the further defect that it violates practically every principle of justice for it bears little or no relation to ability to pay, and rests with undue severity upon those least able to pay it. (D. F.)

SALEYER (Dutch, *Salajar*), a group of 73 islands belonging to the government of Celebes and its dependencies in the Netherlands Indies. They include Saleyer, Tambalongang, Pulasi and Bahuluwang; between 5° 36' and 7° 25' S. and 119° 50' and 121° 30' E. The main island, Saleyer, is more than 50 mi. long and eight mi. at its widest point; area, 248 sq.mi. The strata of the island are all sedimentary rocks; everywhere, except in the north and northwest, covered by a fertile soil. The watershed is a chain running throughout the island from north to south. The population, in 1930, mainly a mixture of Macassars, Buginese, and natives of Luvu and Buton, was 76,501, Saleyer being one of the most thickly populated parts of the division of Celebes. Trepang,

tortoise-shell, copra, coconut oil and salt are exported. The islands fell to the Japs in 1942.

SALFORD, city; municipal, county and parliamentary borough; Lancashire, England; 189 mi. N.W. of London. Pop. (1938) 199,400. Area, county borough, 8.1 sq.mi. Salford also gives its name to the hundred of southwest Lancashire in which Manchester is situated. The parliamentary and municipal boundaries of Salford are identical. The parliamentary borough returns three members. The borough, composed of three townships identical with the ancient manors of Salford, Pendleton and Broughton, is for the most part separated from Manchester by the river Irwell. The Irwell valley, largely occupied by factories, separates the higher ground of Broughton from that of Pendleton. The main railway station is Exchange station, on the L.M.S. railway, which is in Salford, but has its main approach in Manchester. Salford is well served with canals, chiefly the Manchester ship canal. Salford has been to some extent overshadowed by Manchester, and the two boroughs in spite of their separate government, are so closely connected as to be one great urban area. Broughton and Pendleton have each a separate town hall. Salford has 9 parks, 27 public playgrounds and recreation grounds, covering more than 400 ac., about one-twelfth of the city. The commercial and industrial history of Salford is closely bound up with that of Manchester. It is the seat of extensive cotton, iron, chemical and allied industries, large engineering and electrical instrument factories as well as works for the manufacture of furniture, rubber goods, mackintoshes, etc. Salford forms part of the port of Manchester and the largest docks on the Manchester ship canal are in Salford. It contains a number of valuable coal mines and the deepest workings in Britain are at Pendleton. Salford was made a free town in 1230-31 but was not incorporated until 1844, when it became a county borough. It was raised to the status of city in 1926.

SALICETI, ANTOINE CHRISTOPHE (1757-1809), French revolutionary, was born at Saliceto, Corsica, on Aug. 26, 1757. He was elected to the states-general in 1789, and later to the Convention. He was sent on a mission to repress counter-revolutionary plots in Corsica and Provence. His friendship with Robespierre led to his denunciation on the 9th Thermidor, but he was saved by the amnesty of the year IV. He organized the army of Italy and held various offices under the Consulate and the Empire. He died at Naples on Dec. 23, 1809.

SALICIN, SALICINUM, the bitter principle of willow-bark, $C_{13}H_{18}O_7$, found in most species of *Salix* and *Populus*.

Salicin is prepared from a decoction of the bark by first precipitating the tannin by milk of lime, then evaporating the filtrate to a soft extract, and dissolving out the salicin by alcohol. As met with in commerce it is usually in the form of glossy white scales or needles. It is neutral, bitter, odourless, unaltered by exposure to the air, soluble in about 30 parts of water and 80 parts of alcohol at the ordinary temperature, and in 0.7 of boiling water or in 2 parts of boiling alcohol, and more freely in alkaline liquids. It is also soluble in acetic acid without alteration, but is insoluble in chloroform and benzol. Salicin is used in medicine for the same purposes as salicylic acid (*q.v.*).

SALIC LAW and Other Frankish Laws. The Salic Law is one of those early mediaeval Frankish laws which, with other early Germanic laws are known collectively as *leges germanorum*. It originated with the Salian Franks.

The Salic Law has come down to us in numerous mss. and divers forms. The most ancient form, represented by Latin ms. No. 4404 in the Bibliothèque Nationale, consists of 65 chapters. The second form has the same 6j chapters, but contains interpolated provisions. The third text consists of 99 chapters. The fourth version, as amended by Charlemagne, consists of 70 chapters with the Latinity corrected and without the glosses. The last version, published by B. J. Herold at Basel in 1557 is founded on the second recension.

The law is a compilation, the various chapters were composed at different periods, and we do not possess the original form of the compilation. Even the most ancient text, that in 6j chapters, contains passages which a comparison with the later texts shows to

be interpolations, The scale of judicial fines is given in the *denarius* ("which makes so many *solidi*"), and it is known that the monetary system of the *solidus* did not appear until the Merovingian period. Even in its earliest form the law contains no trace of paganism—a significant fact when we consider how closely law and religion are related in their origins. The Romans are clearly indicated in the law as subjects, but as not yet forming part of the army, which consists solely of the *antrustions*, i.e., Frankish warriors of the king's bodyguard. As yet the law is not impregnated with the Christian spirit; this absence of both Christian and Pagan elements is due to the fact that many of the Franks were still heathens, although their king had been converted to Christianity. (For contrary opinion see Franz Beyerle in the *Zeitschrift der Savigny-Stiftung*, xlv. 216 seq.) Christian enactments were introduced gradually into the later versions. Finally, we find capitularies of the kings immediately following Clovis being gradually incorporated in the text of the law—e.g., the *Pactum pro tenore pacis* of Childebert I. and Clotaire I. (511–558), and the *Edictum Chilperici* (561–584), chapter iii. of which cites and emends the Salic Law.

The law as originally compiled underwent modifications of varying importance before it took the form known to us in Latin ms. No. 4404, to which the edict of Childebert I. and Clotaire I. is already appended. Finally, Charlemagne, who took a keen interest in the ancient documents, had the law emended, the operation consisting in eliminating the Malberg glosses, which were no longer intelligible, correcting the Latinity of the ancient text, omitting a certain number of interpolated chapters, and adding others which had obtained general sanction.

The Salic Law is not a political law; it is in no way concerned with the succession to the throne of France, and it is absolutely false to suppose that it was the Salic Law that was invoked in 1316 and 1322 to exclude the daughters of Louis X. and Philip V. from the succession to the throne. The Salic Law is pre-eminently a penal code, which shows the amount of fines for various offences and crimes, and contains, besides, some civil law enactments, such as the famous chapter on succession to private property (de alode), which declares that daughters cannot inherit land.

Of the numerous editions of the Salic Law only the principal ones can be mentioned: J. M. Pardessus, *Loi salique* (Paris, 1843), 8 texts; A. Holder, *Lex Salica* (1879 seq.), reproductions of all the mss. with all the abbreviations; H. Geffcken, *Lex Salica* (Leipzig, 1898), the text in 65 chapters, with commentary paragraph by paragraph, and appendix of *addimenta*; and the edition undertaken by Bruno Krusch for the *Mon. Germ. hist.* For further information see E. Mayer-Homburg, *Die fränkischen Volksrechte und das Reichsrecht* (1912); Cl. v. Schwerin, in the *Neues Archiv*, xl 581 seq.; Bruno Krusch, in the *Neues Archiv*, xl 497 seq., and in the *Nachrichten der Gesellschaft der Wissenschaften zu Göttingen* (1916), 683 seq.; E. Heymann and others, in the *Neues Archiv*, xli. 375 seq., 419 seq.; Franz Beyerle, in the *Zeitschrift der Savigny-Stiftung*, xlv. 216 seq.

The *Lex Ripuaria* was the law of the Ripuarian Franks, whose centre was Cologne. We have no ancient mss. of the law of the Ripuarians; the 35 mss. we possess, as well as those now lost which served as the basis of the old editions, do not go back beyond the time of Charlemagne.

On analysis, the law of the Ripuarians, which contains 89 chapters, falls into three heterogeneous divisions. Chapters i.–xxviii. consist of a scale of compositions; but, although the fines are calculated, not on the unit of 15 *solidi*, as in the Salic Law, but on that of 18 *solidi*, it is clear that this part is already influenced by the Salic Law. Chapters xxix.–lxiv. are taken directly from the Salic Law; the provisions follow the same arrangement; the unit of the compositions is 15 *solidi*; but capitularies are interpolated relating to the enfranchisement and sale of immovable property. Chapters lxxv.–lxxxix. consist of provisions of various kinds, some taken from lost capitularies and from the Salic Law, and others of unknown origin.

There is an edition of the text of the Ripuarian Law in *Mon. Germ. hist. Leges* (1883), v. 185 seq. by R. Sohm, who also brought out a separate edition in 1885 for the use of schools. For further information see the prefaces to Sohm's editions; H. Brunner, *Deutsche Rechtsgeschichte* (2nd ed., Leipzig, 1906), I. 442; Bruno Krusch, *Die Lex Bajuvariorum, mit zwei Anhängen: Lex Alamannorum und Lex Ribuarum* (1924) 333 seq. and *Neue Forschungen über die drei ober-*

deutschen Leges: Bajuvariorum, Alamannorum, Ribuariorum (1927) 142 seq.; Franz Beyerle, in the *Zeitschrift der Savigny-Stiftung*, xlviii., 264 seq.

Lastly, we possess a judicial text in 48 paragraphs, which bears the title of *Nofitia vel commemoratio de illa ewa (law), quae se ad Amorem habet*. This was in use in the district along the Yssel formerly called Hamalant. The name Hamalant is unquestionably derived from the Frankish tribe of the Cbamavi, and the document is often called *Lex Francorum Chamavorum*.

There is an edition of this text by R. Sohm in *Mon. Germ. hist. Leges*, v. 269, and another appended to the same writer's school edition of the *Lex Ribuarum*. See also Fustel de Coulanges, *Nouvelles Recherches sur quelques problèmes d'histoire* (1891).

(C. PF.; K. A. ECK.)

SALICYLIC ACID, employed in many medicinal preparations and in food preservation on account of its powerful antiseptic properties, is one of three hydroxybenzoic acids, HO·C₆H₄·CO₂H. It also finds considerable use in the manufacture of dyestuffs. (See DYES, SYNTHETIC.) It crystallises from hot water in prismatic needles melting at 156–159° C, and when carefully heated it sublimes without decomposition, this sublimation being sometimes applied as a method of purification. Salicylic acid and salicylaldehyde occur in the oils from various species of *Spiraea*, whereas methyl salicylate, a colourless oil boiling at 222° C, is the main constituent of oil of wintergreen from *Gaultheria procumbens* and *G. fragrantissima*. Salicylic acid was first obtained by R. Piria (1838) on treating salicylaldehyde with caustic potash, and until 1874 was mainly obtained by the action of potash on oil of wintergreen. It is now manufactured from phenol (see CARBOLIC ACID) by processes based on H. Kolbe's celebrated synthesis of the acid discovered in 1859 (Germ. Pat. 426), and on R. Schmidt's improvement whereby sodium phenoxide (or phenolate), C₆H₅·ONa, is converted into sodium phenylcarbonate, C₆H₅O·CO₂Na, and the latter salt heated under pressure until transformed completely into sodium salicylate, HO·C₆H₄·CO₂Na (American Patent 334290, English Patent 10167/1884).

Preparation.—Pure phenol is converted by concentrated aqueous caustic soda into sodium phenoxide and this salt is dried carefully and pulverised in a strong steel vessel (autoclave) capable of withstanding considerable pressure. The anhydrous sodium phenoxide powder is then saturated under pressure (100 lb. per sq.in.) with carbon dioxide and heated in the autoclave at 120–140° C. The resulting sodium salicylate is dissolved in water, decolorised with stannous salts or with zinc and charcoal and then acidified with mineral acid, when salicylic acid is precipitated, collected and washed with cold water. For colour making, the precipitated acid is sufficiently pure, but for preservative and medicinal purposes further purification is effected either by distillation in superheated steam or by sublimation. As salicylic acid is 35 times more soluble in hot than in cold water (100 parts of water at 15° C dissolve 0.225 part of salicylic acid), it may be readily crystallised from this solvent or from alcohol in which it dissolves more freely (1 part in 2.5 parts of 90% alcohol).

The following methods of preparing salicylic acid are of scientific interest: (1) from phenol, sodium carbonate and carbonyl chloride; (2) by the action of sodium on phenol and ethyl chloro-carbonate, Cl·CO₂C₂H₅; (3) by the process of F. Tiemann and K. Reimer who heated together at 100° C phenol, carbon tetrachloride and alcoholic potash.

Salicylic acid in aqueous solution develops a violet coloration with ferric chloride, and with bromine water it gives tribromophenol bromide, C₆H₂Br₃·OBr. Sodium in boiling amyl alcohol reduces it to n-pimelic acid, CO₂H·[CH₂]₅·CO₂H. When heated at 195–220° C, it decomposes, yielding phenol and carbon dioxide, but also giving phenyl salicylate, HO·C₆H₄·CO₂·C₆H₅ (salol). This drug, also prepared by the action at 125° C of phosphorus oxychloride or carbonyl chloride on a mixture of sodium phenoxide and salicylate, crystallises from alcohol in rhombic plates melting at 42° C and boiling at 172° C./12 mm. Acetylsalicylic acid (see ASPIRIN), prepared by the action of acetyl chloride on salicylic acid or its sodium salt, crystallises in colourless needles and melts at 132° C (with decomposition).

Applications of Salicylic Acid and **Salicylates**.—Salicylic acid has a strong inhibitory influence on the growth of micro-organisms, and retards the action of unorganised ferments and of the ferments of alcoholic and acetic fermentations. It has a widespread employment as a preservative of foods and beverages in concentrations of 0.5–6 parts per 1,000. It is thus used in jams and other fruit preparations, in glues and albuminoid substances, and also in milk, beer and wine. The use of salicylic acid as a food preservative was, however, condemned by a commission of the U.S.A. government in 1904.

Applied externally as an antiseptic and antipruritic to wounds and parasitic skin diseases, salicylic acid is less irritating than phenol, but may in strong solution have a destructive action on the horny layer of the epidermis. It is employed to remove corns and warts and in the treatment of lupus. It is a constituent of dental preparations and mouth washes.

For internal use, salicylic acid has been almost completely replaced by its sodium salt (sodii salicylas, official dose 0.6 to 2.09 grams) and its acetyl derivative (aspirin), which are less irritant to the mucous membrane of the stomach.

Salicylic acid is the basis of numerous drugs and therapeutic agents, and in addition to the above-mentioned there are also salipyrrin, salophen, diuretin and many others.

The greater proportion of salicylic acid is, however, employed in the manufacture of such azo-dyes as alizarin yellow (khaki yellow), chrysamine, anthracene brown, cloth brown, cotton yellow, diamine yellow N, anthracene yellow, etc. Large quantities serve for the preparation of 5-aminosalicylic acid which is an intermediate in the production of the important wool dye, diamond black.

SALIDA, a city of Chaffee county, Colorado, U.S.A., on the Arkansas river, federal highways 50 and 285, and the Rio Grande railroad, 140 mi. S.W. of Denver. The population was 4,689 in 1920 (88% native white) and was 4,969 in 1940 by federal census. The city lies at an altitude of 7,050 ft. in a basin almost surrounded by mountains rising to heights of over 14,000 feet. It is headquarters for the Cochetopa national forest. Chaffee county is 19th in the state in value of minerals produced. There is some granite quarried in this county, and a granite shed is in Salida, where there are also repair shops for the railroad, a creosoting plant, a coal-screening plant, large stockyards and a large rainbow trout commercial fish hatchery. Salida (so called because it stands at the "outlet" of the upper Arkansas basin) was settled and incorporated in 1880, when the Rio Grande railroad began service to this community.

SALIERI, ANTONIO (1750–1825), Italian composer, was born at Legnano, on Aug. 19, 1750. In 1766 he was taken to Vienna by F. L. Gassmann, who introduced him to the emperor Joseph. His first opera, *Le Donne letterate*, was produced at the Burg-Theater in 1770. Others followed in rapid succession, and his *Armida* (1771) was a triumphant success. On Gassmann's death in 1774, he became Kapellmeister and, on the death of Bonno in 1788, Hofkapellmeister. He held his offices for fifty years, though he made frequent visits to Italy and Paris, and composed music for many European theatres. His chef d'oeuvre was *Tarare*, later called *Axur, re d'Ormus* (1787), a work which was preferred by the Viennese public to Mozart's *Don Giovanni*. His last opera was *Die Neger*, produced in 1804. After this he devoted himself to the composition of church music, for which he had a very decided talent. Salieri lived on friendly terms with Haydn, but was a bitter enemy to Mozart, though the wild suggestion that he actually poisoned him (albeit made the basis of Rimsky-Korsakov's Mozart and Salieri) has long been scouted. He retired from office on his full salary in 1824, and died at Vienna on May 7, 1825. Salieri gave lessons in composition to Cherubini and to Beethoven, who dedicated to him his three sonatas for pianoforte and violin, op. 12.

See also Albert von Hermann, Antonio Salieri, *eine Studie* (1897);

J. F. Edler von Mosel, *Über das Leben und die Werke des Antonio Salieri* (Vienna, 1827).

SALII ("dancers"). An ancient priesthood at Rome, consisting of two colleges, each of 12 members, the Salii Palatini and the Salii Collini or Agonenses, connected respectively with the worship of Mars on the Palatine and the Quirinus on the *collis Quirinalis*. They wore armour of an ancient pattern, probably the old war-dress of the Italians, and in particular, carried shields called *ancilia*, shaped somewhat like the figure 8. These they carried in procession on certain days of the year, in March (Mars' month) and October (end of the campaigning season under early conditions), singing a very ancient hymn or hymns (axamenta, in honour of all the gods, and separate hymns to single deities, called by their names). They were assisted by women similarly dressed and called *saliae virgines*; these were hired for the occasion in historical times. The whole performance was accompanied with dancing.

All this suggests a war-dance, and can easily be paralleled from the customs of uncivilized peoples. But the matter is complicated by a statement of Johannes Lydus, a late and untrustworthy author, that on March 15 a man clad in goat-skins and called Mamurius was driven out with rods. This person Lydus identifies with Mamurius Veturius, said to have been the smith who made the *ancilia* after a pattern fallen from heaven. (See Lydus, *de mensibus*, p. 105, 19 Wiensch.) But the name may mean "old Mars," hence it has been plausibly conjectured that the ritual is at least in part connected with vegetation; the "old Mars" or worn-out spirit of fertility being yearly driven away. As, however, we have no proof that the Salii were connected with this ceremony, it is open to us to suppose, with Wissowa, that it is a mere coincidence of date, and that the name of the skin-clad figure was a popular one only, made up from the unintelligible words *mamuri veturi* in the Saliar hymn. The balance of evidence certainly is in favour of supposing the ritual of the Salii to have been purely war-magic, in its origin at least. There were also Salii at Tibur, of whom nothing is known (Servius on Aen. viii., 285).

BIBLIOGRAPHY.—W. Warde Fowler, *Roman Festivals* (1908); Wissowa, *Religion und Kultus* 2nd ed. (1912); Sir J. G. Frazer, *Golden Bough*, 3rd ed., ix., 229 ff. (bibl.).

SALINA, a city near the centre of Kansas, U.S.A., on the Smoky Hill river and federal highways 40S and 81; the county seat of Saline county. It is served by the Missouri Pacific, the Rock Island, the Santa Fe and the Union Pacific railways. Pop. (1920) 15,085 (90% native white); 21,073 in 1940 by the federal census. It is the seat of Kansas Wesleyan university (Methodist Episcopal; chartered 1885) and the see of a Protestant Episcopal bishop. The city operates under a commission-manager form of government. It has a city plan, zoning regulations, 185 ac. in parks, a municipal band and swimming pool, and an assessed valuation (1939) of \$23,271,888. Salina has a large wholesale and retail trade and varied manufactures. The annual volume of wholesale and retail trade is about \$37,500,000. Flour milling is the chief industry (10,000 bbl. a day). The city was founded in 1858 and chartered in 1870. The first railway (the Union Pacific) came through in 1867. The first flour mill (still in operation and using the original water turbines) was built in 1868.

SAEINA CRUZ, the southernmost seaport of Mexico on the Pacific coast, in the state of Oaxaca, at the southern terminus of the Tehuantepec National railway, with connections to Mexico City. Population 6000. It is situated near the mouth of the Tehuantepec river, on the open coast of the Isthmus of Tehuantepec. The new port was opened to traffic in 1907. A costly artificial harbour has been built by the Mexican Government to accommodate the traffic of the Tehuantepec railway. It is formed by the construction of two breakwaters, which curve toward each other at their outer extremities and leave an entrance 635 ft. wide. The enclosed space is divided into an outer and inner harbour by a double line of quays wide enough to carry six great warehouses with electric cranes on both sides and a number of railway tracks.

SALINAS, a city of western California, U.S.A., 10 m. from Monterey bay, in the Salinas River valley, between the Gabilan and the Santa Lucia mountains; the county seat of Monterey

county. It is on federal highway 101 and is served by the Southern Pacific railway. Pop 10,263 in 1930 and 11,586 in 1940 by federal census. The Salinas valley is one of the richest agricultural regions in the United States, producing especially lettuce, cauliflower, bulbs and seeds, sugar beets, artichokes, fruit and grain. Rubber also is produced. A beet-sugar factory near the city uses 5,000 tons of beets daily. The California rodeo is held there annually in July. Four miles from Salinas is Ft. Ord. Salinas was settled about 1858; became the county seat in 1872, in place of Monterey; and was incorporated as a city in 1874.

SALISBURY, JAMES EDWARD HUBERT GASCOYNE-CECIL, 4TH MARQUESS OF (1861—), British politician, eldest son of the 3rd marquis (*q.v.*), was educated at Eton and University College, Oxford. He entered parliament in 1885, and succeeded to the peerage in 1903. He served in the South African War, and on his return entered the ministry, joining the cabinet in 1903. In the crisis over the Parliament Bill he threw in his lot with the "Die-hards." He did not join either Coalition government during the World War, but was critical of both, taking an independent line. He gradually came to assume the informal leadership of the Conservative Opposition first in the House of Lords, and afterwards in the party generally. In a speech on Oct. 16, 1922, he categorically demanded the freedom of the party. Three days later the policy was accepted at the Carlton Club meeting. He was lord president in the council in Bonar Law's Cabinet and in Baldwin's first Cabinet. In Baldwin's second Cabinet he was lord privy seal, and from Curzon's death in 1925 until 1929 was leader of the House of Lords. He was created R.G. in 1917.

SALISBURY, ROBERT ARTHUR TALBOT GASCOYNE-CECIL, 3RD MARQUIS OF (1830-1903), British statesman, second son of James, 2nd marquis, by his first wife, Frances Mary Gascoyne, was born at Hatfield on Feb. 3, 1830. Lord Robert Cecil, as he then was, was educated at Eton and Christ Church, Oxford. His health was delicate and after leaving Oxford, he spent nearly two years at sea on a voyage round the world, visiting Cape Colony, Australia, Tasmania and New Zealand. On his return home he stood for parliament and on Aug. 22, 1853, was returned unopposed as member for the borough of Stamford in Lincolnshire. In the same year he was elected to a fellowship of All Souls.

He married in July 1857, the eldest daughter of Sir Edward Hall Alderson, Baron of the Court of Exchequer, a man of notable parts who at Cambridge had earned the rare distinction of being both Senior Wrangler, Senior Classic and Smith's Prizeman. His daughter inherited his abilities but there was very little money, and to add to his income Lord Robert joined the staff of the Saturday Review which had been lately founded by his brother-in-law, Mr. Alexander Beresford-Hope, this being, so far as is known, his only contribution to pure journalism. Most of his writing was done for the *Quarterly Review*, whose articles were then exclusively anonymous. The literary quality and vigorous lucidity of his style secured him a welcome in its pages, and of the 24 numbers which appeared between the years 1860 and 1866 there were only three which did not contain an article from his pen. Six of these have since been republished in volume form—three of them biographical essays on Pitt and Castlereagh and three dealing with foreign questions. These were uncompromisingly denunciatory of Lord John Russell's policy and to the study required for an effective presentation of his case may probably be traced his first knowledge of and interest in foreign affairs.

In the House of Commons.—Speeches on the same subjects, and notably one or two in 1864 on the abandonment of Denmark at the time of Germany's annexation of Schleswig-Holstein, placed him for the first time by general consent in the front rank of parliamentary debaters. When Lord Russell's Government was defeated over Mr. Gladstone's Reform bill in 1866, it was a foregone conclusion that he should be among those invited to join Lord Derby's cabinet. His eldest brother had died in 1865 and it was as Lord Cranborne that, in July 1866, he took office as secretary of State for India.

He only held it for seven months. The story of that ministry

is well known. In the summer of 1866 the Tory party, assisted by a secession of anti-democratic Liberals, defeated Mr. Gladstone's Reform bill as tending dangerously in the direction of household suffrage. In the summer of 1867, the same party passed a Reform bill which established household suffrage. Lord Cranborne, with two other members of the Cabinet, Lord Carnarvon and General Peel, resigned on Feb. 9, two days before the bill's introduction. The breach was embittered by the tactics which the two leaders employed towards their junior colleagues. They kept them in the dark till within a week or two of the bill's production; offered reassurance in the shape of counter-checks and limitations which were changed with every meeting of the cabinet—and were in fact all abandoned in the course of the bill's passage through parliament—and allowed them no opportunity for considered argument. Their belief that there had been a deliberate attempt to hustle them into a consent which it was known that they would not have given freely, estranged them personally from Disraeli for many years afterwards. When the parliamentary fight was over Lord Cranborne accepted the constitutional change as an accomplished fact which it behoved every good citizen to make the best of, and it was the offence against public morality of which he held his party and its leaders to have been guilty that became the theme of an article called "The Conservative Surrender" which appeared that October in the *Quarterly Review*. Its quality and its easily divined authorship procured it a sensational reception. Seven editions of the number which contained it had to be issued in order to meet the demand for it.

On April 12, 1868, his father died and his House of Commons career came to an end. During the six years which followed (1868-1874), Lord Salisbury joined actively from below the gangway in the warfare which his late colleagues waged against Mr. Gladstone's legislation. In 1870 he was chosen chancellor of Oxford university in succession to Lord Derby,—an indication of the reputation which his attitude in '67 had won for him among the more serious representatives of the party outside Parliament. It was a distinction which he always peculiarly prized. When, after the defeat of the Liberals in 1874, Disraeli undertook the formation of his second ministry, almost his first step was to invite the return of this alienated colleague. Under actual conditions there could be no risk of a repetition of his earlier experience, and after a few days of painful hesitation, he accepted. On Feb. 17 he resumed control of the Government of India where a disastrous famine claimed all his energies. By a curious chance a similar visitation had synchronised with his previous brief tenure of office, and he had left behind him a high reputation for success in dealing with it.

The first two years of this ministry were uneventful—except in connection with an ecclesiastical measure—the Public Worship Act, introduced in 1874 by Archbishop Tait. Lord Salisbury and his chief took opposite sides upon it, and the momentary clashing of their swords in debate excited some quite unfounded anticipations of ministerial rupture. But in 1876 a crisis arose in the south-east of Europe, one of whose incidental results was to fix permanently Lord Salisbury's destiny in public life.

The Eastern Question.—Two or three of the European provinces of the Turkish Empire had revolted against its misgovernment; there had been a voluminous interchange of notes and protocols among the signatory Powers of the Treaty of Paris; the already autonomous principality of Serbia had taken up arms in support of its co-religionists, and finally the Russian tsar had mobilised his army and declared that, if the rest of Europe did not act, he would. A conference of the Great Powers had thereupon been called to meet at Constantinople in December, to draw up a scheme of reforms and, by securing the Porte's acceptance of it, avert the threatened war.

The repercussion of these events in England had been peculiarly characterised. The insurrection in Bulgaria had been suppressed by Turkish irregular troops with incidents of great savagery. Misled by the optimism of the British embassy at Constantinople, the prime minister—now become Lord Beaconsfield—had poured scorn upon the first newspaper reports of these outrages, and in the impassioned agitation which Gladstone initiated on the

subject throughout the country, the Tory Government became an object for almost equal denunciation with the Turkish sultan. Salisbury resented the agitation, but was himself admittedly sympathetic with the cause of the insurgent Christians and had privately urged his colleagues to dissociate England once and for all from the incriminated cause of Turkish ineptitude. His views were known or divined and when Beaconsfield invited him to serve as plenipotentiary to the Constantinople Conference, the appointment helped to quiet the prevailing excitement and was received with general acclamation. At first all went smoothly at the Conference; there was no difficulty in obtaining unanimous agreement among the Christian Powers as to the reforms to be recommended. But there success stopped. The Turkish envoys rejected all proposals, and were deaf to every argument. Salisbury would have tried that of force, but his colleagues refused, and on Jan. 20, 1877, the conference broke up and Russia was left to carry out her originally proclaimed purpose.

She declared war on April 24. Throughout the remainder of that year counsels in the British cabinet were divided. The prime minister and Cairns advocated present intervention; Salisbury and Carnarvon opposed a resolute veto to any action which the Turks could construe into acquiescence in their defiance of Europe; and Derby, the foreign secretary, supported them with impartial loyalty. Agreement between the warring groups was obtained for a declaration of neutrality, balanced by a warning addressed to Russia that no attempt on Constantinople itself would be tolerated.

The change of issues foreshadowed in this document materialised in the new year and with it a change in cabinet grouping. The Turkish defence, at first resolute and successful, suddenly collapsed and when the Russian troops in rapid advance appeared upon the threshold of the forbidden city Lord Salisbury was foremost in urging that men-of-war should be sent up to the Bosphorus for its protection. On this decision being taken (Jan. 23), Derby and Carnarvon resigned, though the former was subsequently persuaded to withdraw his resignation.

An armistice was agreed upon and a treaty of peace, negotiated between the two belligerents, was signed at San Stefano on March 3. It provided for a huge Slav State under Russian protection stretching right across the Balkans and completely isolating Constantinople. Russia announced that at the approaching conference of the Signatory Powers required under treaty law to legalize the settlement she would admit discussion on those parts only of the new treaty which were "of European interest." The other Powers hesitated to enforce their rights but England declared that unless the treaty were submitted in its entirety she must decline to participate in the congress; Russia again refused, the summoning of the congress was indefinitely postponed, and when the British cabinet met on March 27 it was to face an imminent probability of war. They called out the Reserves and telegraphed orders for a contingent of Indian troops to be at once embarked for the Mediterranean. Lord Derby resigned the same evening and Lord Salisbury, who had taken a leading part in these decisions, was appointed foreign secretary the following day.

He signaled his accession to control by a despatch whose contents were telegraphed on April 1 to every capital and which became famous as the Salisbury Circular. Its object was to show that the Treaty of San Stefano; by reducing the Turkish Empire to vassalage, would constitute a greater menace to the interests of other Powers than would have arisen from its frank dismemberment in Russia's favour. It was by the treaty as a whole that this result would be achieved and it was as a whole therefore that it must be submitted to the judgment of Europe. This document, by the lucidity of its style and argument, the impression of resolution which it conveyed and the subtly indirect appeals which it contained to the interests or sentiments of the different neutral nations, effected an immediate revolution in the international position. Hesitation disappeared; the rest of Europe ranged itself on the side of the British contention and Russia could do no other than submit.

But danger was not over with the removal of obstacles to the

meeting of the Powers. In present conditions a failure of agreement at the Congress itself must precipitate a general war and Salisbury refused to risk that possibility. He entered into private communication with Russia and satisfied himself that the provisions which either side regarded as vital were capable of adjustment. On May 31st a secret agreement was signed between him and the Russian ambassador binding both Powers not to push dispute on these provisions to the point of rupture at the Congress. Russia's price for this adjustment was her retention of her Asiatic conquests, and to counteract the effect of these Salisbury co-incidentally arranged a convention with Turkey. Under this, in consideration of her ceding Cyprus to England and entering into an engagement of administrative reform in Asia Minor, England guaranteed her Asiatic frontier against further aggression.

These preparations having been effected, the Congress, summoned by Prince Bismarck, met at Berlin on June 13. Lord Beaconsfield and Lord Salisbury attended it, and a month later a treaty was signed there by the seven great Powers. It secured all the objects for which England had contended, and when the two plenipotentiaries returned to London Beaconsfield was able to announce that they had brought back "Peace with Honour."

In Opposition.—At the general election of 1880, the Conservative party was heavily defeated. Lord Beaconsfield died the following spring, and Lord Salisbury succeeded him as leader in the House of Lords, sharing with Sir Stafford Northcote in the leadership of the party as a whole. During this period of opposition and in the election campaign which closed it, he spoke continually on public platforms and developed gifts for attracting and holding mass meetings of working men which hitherto had had little opportunity for display.

In home affairs his attitude was distinguished alike from that of the Tory Democrats of that day and that of the more old-fashioned Toryism. He made no attempt, like the former, to clothe his views in radical or democratic phraseology, but on the other hand he was disdainful of privilege and frankly indifferent to tradition. That the confidence begotten of economic stability and respect for individual rights was of supreme importance to the class whose welfare depends on full and well-paid employment; that theorists and phrasemakers are the enemy, always and everywhere; above all, that unity and mutual trust are the indispensable foundation for all moral and all material welfare in a nation,—were the recurrent texts from which he spoke. But he demurred to the title of Conservative: "There is much . . . which it is highly undesirable to conserve." He identified himself strongly with the movement for housing reform and in speaking to a bill promoted by a Royal Commission of which he had been a member, he shocked the rigid individualists of his own and the opposite party by his warm advocacy of State expenditure in dealing with the evils of overcrowding.

In 1884 Gladstone introduced a bill for enfranchising two million agricultural voters and divorced it from the large rearrangement of seats which such an unequally distributed addition to the electorate would require. Salisbury saw in this procedure an intention of manipulating the constituencies in a party sense and invited the House of Lords to compel an appeal to the country on the question by refusing to pass one bill without the other. They did so and a tempestuous campaign of protest against their action followed. It was responded to by a similar campaign in their favour, in which Salisbury took a prominent part. The recurrent climax of his speeches was a challenge to the Government to dissolve parliament and so obtain the verdict of the electors on the issue. Through the Queen's mediation the controversy was closed by Gladstone's giving the required guarantee of impartiality in the Redistribution bill by inviting Salisbury and Sir Stafford Northcote to assist in drawing it up.

On June 8, 1885, the Liberals, disorganized by Sudanese disaster, allowed their Government to be defeated on a Budget vote and Mr. Gladstone resigned. The passage of the Franchise Act had made a dissolution impossible until the new registers were completed in November, and there were patent reasons why Salisbury, whom the Queen summoned, should refuse to take office. It would lose for his party all the advantage of attack in the

approaching elections, and it would place on it the invidious responsibility of governing Ireland without the Crimes act, whose necessity it had urged and which was due to expire that summer. But the state of affairs abroad which the Queen revealed to him decided Salisbury upon acceptance. England was at that moment without friends or authority in Europe; perennial antagonists—Russia and Austria—France and Germany—had been negotiating reconciliation at her expense; if present conditions were suffered to continue it seemed to him that any catastrophe was possible. He kissed hands as prime minister and foreign secretary on June 24.

First Ministry.—His tenure of office this time was too short for the testing of any policy, but he achieved one sensational success. That September, the southern Bulgarians, who had been left under Turkish rule by the Treaty of Berlin, revolted and proclaimed union with their northern brethren. These and their Prince, Alexander of Battenberg, had in the intervening seven years quarrelled hopelessly with their Russian patron and Russia was now foremost in vindication of the treaty and insistence upon an immediate reversal of the achieved union. A conference of the Powers was called and the rest of the Continent rallied to the Russian demand. Salisbury alone refused. Now that the union had become an accomplished fact, he declared, the Bulgarians would never willingly surrender it and to force surrender, as the Imperial Governments proposed, by means of a Turkish military "execution," was unthinkable. For weeks he was argued with, pressed, objugated for stultifying the united authority of Europe. He refused to give in and on Nov. 25 the conference broke up. Meanwhile Serbia, outraged at the accretion of territory illicitly secured by her neighbour, had invaded Bulgaria. Her unexpected and crushing defeat by Prince Alexander converted the great Powers to a depressed recognition of the facts upon which Salisbury had insisted. In December he was appealed to for help in discovering some face-saving compromise and the sultan was induced to come to a direct agreement with Prince Alexander, in which the union was recognized. The Treaty Powers had only to acquiesce, while the continental press turned round and congratulated the British minister upon the prescience and firmness which had saved Europe from a disastrous blunder.

Before this settlement was finally consummated Salisbury had left office. The general election in November had resulted in giving the Irish party the casting vote in the House of Commons. In December Gladstone had announced his adhesion to Home Rule and Salisbury's ministry was defeated on an amendment to the address on Jan. 26, 1886. Gladstone introduced his Home Rule bill which, with the assistance of 90 dissident Liberals, was rejected, on June 8. Parliament was dissolved; the Unionists gained a decisive victory though not one giving a majority to the Conservatives independently of their allies. On July 20, the Queen sent for Salisbury who, with her leave, pressed Hartington to take the premiership in his stead. But the Liberal-Unionist chief refused, promising independent support, and Lord Salisbury formed his second Government which remained in power for six years,—1886-92.

Government of 1886-92.—The worst difficulty which it had to encounter was at starting. Lord Randolph Churchill, who was the second man in the ministry and leader in the House of Commons, found himself unable to work with his colleagues, and resigned at the end of the year. The most popular platform speaker in the party, he was at that time without a rival on his own front bench, and the break up of the Government was anticipated. Salisbury again offered to widen its support by retiring in Hartington's favour, and Hartington again refused. But he advised his lieutenant, Goschen, to join the cabinet, which in the end suffered no permanent injury by Lord Randolph's defection. Salisbury, who at the outset had surrendered the foreign office to Lord Iddesleigh, now resumed its direction (Jan. 1887).

England was no longer in the position of dangerous isolation which she had occupied when he took office in 1885. The initiatory approaches which he had then made to the German chancellor had re-established friendly relations between them, and his successful obstinacy about Bulgaria had presented England to Europe as a power that had to be reckoned with. In '86, circum-

stances all combined to draw her towards the grouping of Central European Powers,—Germany, Austria and Italy as against the Russo-French combination. Russia had been alienated by her resistance to the coercion of Bulgaria, while across the Channel France's growing resentment at her continued presence in Egypt had operated in the same direction. But in 1887 there was an interval of hesitation. Salisbury was repelled by the German chancellor's methods. Throughout the preceding autumn and winter he had been ceaselessly resisting the chancellor's efforts to induce an Anglo-Russian war and so shift the Bulgarian quarrel from Austrian to English shoulders. The menacing pressure with which the chancellor visited any crossing of his wishes by a friendly Power had been a constant source of irritation. Salisbury's wish for a wider choice in friendships expressed itself that spring in a new departure in Egyptian policy. He offered to Turkey—as the suzerain power—an engagement to evacuate Egypt in three years if the conditions for her security permitted and with a right of re-entry reserved. After prolonged negotiation the sultan agreed to sign a convention to that effect (May 22, 1887). But France rejected the proffered compromise with indignation, and under threats of violence from her and Russia the sultan withdrew his consent, and refused ratification. The attempt, though it failed in its main object in a reconciliation with France, was not fruitless. It freed England from further solicitations and intrigues on the score of Egypt. She had made her offer and it had been rejected. Thenceforward, as Lord Salisbury soon made abundantly clear, she would consult only her own judgment as to the period of her occupation.

But France's inveteracy was decisive in determining England's continental friendships for the next ten years. Lord Salisbury declined to give them the character of alliances. In response to insistent requests from the Austrian and Italian Governments, backed by a private letter of strong appeal from the German chancellor (Nov. 22), he that autumn signed an engagement (the Tripartite Agreement, Dec. 10, 1887), to join with them in resisting any future coercion of Turkey on the part of Russia. The chancellor's letter hinted at a more general and binding adhesion to the Triple Alliance and it was followed by other suggestions to the same effect. These were ignored or evaded and more definite proposals met with more definite refusals. In the spring of 1887, Italy had asked for a defensive alliance specifically directed against France and in Jan. 1889 Germany invited a similar compact. Salisbury's answer on both occasions was that an undertaking to fight on an unarrived issue was contrary to the traditions of English policy and was impossible for a Constitutional Government.

To maintain this refusal of the only thing that constituted an alliance in Continental eyes without falling into the pit of national isolation was a difficult problem for diplomacy. Salisbury's large success in solving it during the period of his ministry was due in the main to his avoidance of exaggerated claims and his readiness not only to acquiesce in but actively to assist those of other countries wherever they were in any way admissible. Thus the detachment which must otherwise have become a source of jealousy and suspicion was, time and again, presented in a guise attractive to the needs of other nations. England never occupied a position of greater authority in Europe than during this time, and after Bismarck's retirement in 1890 Salisbury's became the dominating figure among European statesmen.

The white invasion of Africa which signalized that decade afforded opportunity for a marked display of his capacity for international co-operation. It was a movement unique in history for the rapidity, and, it may be added, the human benefit of its achievement. But behind the inrush of explorers, missionaries and traders of all nations, had now come their Governments, whose claims—undefined and illimitable—were, by the end of the eighties, advancing to inevitable conflict. England, whether by earlier occupation or the present activity of her adventurers, was a competitor in every region, north, south, east and west, and Lord Salisbury accepted the initiative to bring order out of chaos which was thus marked out for him. He engaged in negotiations, delimitations, arbitrations, and struck the best bargains he could

for his own clients compatible with an instructed sympathy with their rivals' requirements. With an eye for a future still eight years distant he averted encroachment upon the Nile valley up to the river's source, though no Englishman had as yet set foot south of Wady Halfa, and placated French enmity beforehand by a large complaisance in the west and north-west of the continent. He reasoned suavely with Italy's aspirations and sharply with Portugal's baseless obstruction to the northward advance of Cecil Rhodes' South Africans; and when England's and Germany's irreducible requirements proved incompatible, threw Heligoland into the scales in security of a peaceful settlement (June 1890). When he left office the main outlines of actual occupation and prospective "spheres of influence" had been drawn without the serious chilling of a single international relationship.

The elections of 1892 resulted in a victory for the Liberal party though with a small and unharmonious majority. Gladstone passed a bill for Home Rule and one for Welsh Disestablishment through the House of Commons in successive sessions, but the evident want of enthusiasm in the country for either measure encouraged Salisbury, in accordance with the principle on which he acted in this connection, to invite their rejection by the House of Lords. The place of the Lords in the Constitution was to secure an appeal to the electorate but they could only wisely assert it against the House of Commons when there were sound reasons to believe that the electorate agreed with them. On this occasion his judgment proved amply justified. Parliament was dissolved in '95 and the verdict of the constituencies ratified the Lords' action by a substantial majority. Lord Salisbury again became prime minister and foreign secretary while the Liberal Unionist leaders established the fusion of the two sections of the party by joining his cabinet.

Third Ministry.—This was in many ways the least satisfactory of Lord Salisbury's four tenures of the foreign office. Since he was last in office the German emperor had quarrelled with England over Far East politics, and never afterwards paid more than lip service to the old friendship. The breach with France was not yet healed, and, though Lord Salisbury's personal authority remained and the influence of his initiative, England was isolated in European sympathy throughout this period. He found diplomacy once more absorbed in the Near East problem as the result of a peculiarly atrocious outbreak of Turkish cruelty and misgovernment in Armenia. After failing in a private proposal to Germany to join in some drastic enterprise—its details are not known—for the dismemberment or subjugation of Turkey, he appealed in 1896 to the Christian Powers as a whole to take combined action for enforcing reform on the Porte. They agreed and accepted his initiative. The "Concert of Europe" succeeded both in this matter and in a subsequent crisis in Crete, in averting the ever-present danger of a breach in the "armed truce" on the continent. But as regarded the lot of the unhappy Armenians it proved a sore disappointment to its author—Russia, who, in the strange whirligig of time, had become the champion of Turkish independences, vetoing, with German support, any form of coercion at Constantinople.

In the summer of 1895 a long-drawn-out frontier dispute between British Guiana and Venezuela achieved sudden importance through the action of the American Government which, with a view to hastening a conclusion, addressed a singularly discourteous despatch to that of England, claiming rights of dictation rather than intervention. Lord Salisbury, after some delay, replied with a reasoned demurrer to such a development of the Monroe doctrine. President Cleveland responded in a fierce speech, foreshadowing ultimatums, and was applauded by his public in a wild outbreak of anglo-phobic jingoism. Lord Salisbury declined the quarrel and some months later, when feelings had cooled, tacitly conceded America's claim to intervene and agreed to defer the whole question to neutral arbitration, whose verdict substantially conceded the British case. (Oct. 1899.)

In the winter of '97-98 a stir of anger was roused in England by Russia's illegal seizure from China of two ports—Port Arthur and Talienwan—which were supposed to secure domination over Peking, and Lord Salisbury was much censured for passing the

aggression by with no more than a diplomatic protest. Events elsewhere called urgently for complaisance. The culminating crisis of the long quarrel with France over Egypt was imminent and Lord Salisbury held that its peaceful issue would depend on her finding no militant encouragement from sympathetic outsiders when the moment came. Colonel Marchand had been for more than three years making his way through the forests of Central Africa with instructions to assert a French claim upon the upper waters of the Nile before England had established an effective occupation there. He succeeded in fact in arriving that July at Fashoda a few weeks before General Kitchener reached it, steaming hurriedly up the river from the battle of Omdurman. But the news of the planting of the French flag and that of its removal reached Paris concurrently and with it a telegram from Lord Salisbury announcing the British occupation of the post and warning the French Government and people in the clearest terms that no compromise on England's claim upon the Nile valley was possible. Popular passion, dangerously excited for a few days, was thus compelled in the first moment of its ebullition to face the gravity of the decision to be taken and in the end it suffered its Government, discouragingly advised thereto by its Russian ally, to follow counsels of peace. The episode thus safely passed through proved, in spite of the resentment which it aroused at the time, the close of the quarrel that had so long kept the two nations apart. The resentment was artificially prolonged by the general unpopularity in which England was submerged through the South African war the following year, but when in 1901 that had passed by, the way was left open for the automatic operation of the forces which three years later resulted in the conclusion of the Entente.

The successful conduct of this crisis was Lord Salisbury's last diplomatic achievement of any note. He surrendered the foreign office in Nov. 1900, and the prime ministership in July 1902—only deferring this final retirement to avoid the embarrassment of a change before peace had been concluded in South Africa. He died a year later on Aug. 22, 1903, his wife having predeceased him in Nov. 1899.

He was singularly happy in his domestic life, taking little pleasure in society outside his home, though his wit, literary culture and gift of language made him a brilliant companion in conversation. Science was his main interest outside his profession and he was also widely read in history and theology. He was a strong Churchman and a convinced and devout Christian, his religious faith constituting the fundamental inspiration of his life.

Cecil, *Life of Robert, Marquis of Salisbury* (1921).

SALISBURY, ROBERT CECIL, 1ST EARL OF (c. 1565-1612), English lord treasurer, the exact year of whose birth is unrecorded, was the youngest son of William Cecil, 1st Lord Burghley, and of his second wife Mildred Cooke, of Gidea Hall in Essex. He was educated in his father's house and at Cambridge University. In 1584 he was sent to France, and was returned the same year to parliament, and again in 1586, as member for Restminster. In 1588 he accompanied Lord Derby in his mission to the Netherlands to negotiate peace with Spain, and sat in the parliament of 1588, and in the assemblies of 1593, 1597 and 1601 for Hertfordshire. About 1589 he appears to have entered upon the duties of secretary of state, though he did not receive the official appointment till 1596. In 1591 he was knighted, and sworn of the privy council. In 1597 he was made chancellor of the duchy of Lancaster, and in 1598 despatched on a mission to Henry IV. of France to prevent the impending alliance between that country and Spain. The next year he succeeded his father as master of the court of wards.

On Lord Burghley's death on Aug. 4, both Essex and Bacon desired to succeed him in the supreme direction of affairs, but the queen preferred the son of her last great minister. At this period began Cecil's secret correspondence with James in Scot-

land. Hitherto Cecil's enemies had persuaded James that the secretary was unfavourable to his claims to the English throne. An understanding was now effected by which Cecil was able to assure James of his succession, ensure his own power and pre-eminence in the new reign against Sir Walter Raleigh and other competitors, and secure the tranquillity of the last years of Elizabeth, the conditions demanded by him being that all attempts of James to obtain parliamentary recognition of his title should cease, that an absolute respect should be paid to the queen's feelings, and that the communications should remain secret.

Owing to Cecil's action, James took possession of the throne without opposition on the death of Elizabeth in 1603. Cecil was continued in his office, was created Baron Cecil of Essendine in Rutlandshire (1603), Viscount Cranborne (1604) and earl of Salisbury (1605). He was elected chancellor of the University of Cambridge in 1601, and obtained the Garter in 1606. Meanwhile Cecil's success had completed the discontent of Raleigh, who, exasperated at his dismissal from the captaincy of the guard, became involved—whether innocently or not is uncertain—in the treasonable conspiracy known as the "Bye Plot." Cecil took a leading part in his trial in July 1603, and, though probably convinced of his guilt, endeavoured to ensure him a fair trial and rebuked the attorney-general, Sir Edward Coke, for his harshness towards the prisoner. In 1608 the office of lord treasurer was added to Salisbury's other appointments, and the whole conduct of public affairs was placed solely in his hands. His real policy is not always easy to distinguish, for the king constantly interfered, and Cecil was often merely a follower, simulating approval of schemes opposed to his real judgment.

In foreign affairs Salisbury made it his aim to preserve the balance of power between France and Spain, and to secure the independence of the Netherlands from either state. He also hoped, like his father, to make England the head of the Protestant alliance abroad; and his last energies were expended in effecting the marriage in 1612 of the princess Elizabeth, James's daughter, with the Elector Palatine. He was in favour of peace, preoccupied with the state of the finances at home and the decreasing revenue, and, though sharing Raleigh's dislike of Spain, was instrumental in making the treaty with that power in 1604. In 1611 he disapproved of the proposed marriage between the prince of Wales and the Infanta. His bias against Spain and his fidelity to the national interests render, therefore, his acceptance of a pension from Spain a surprising incident in his career. At the conclusion of the peace in 1604 the sum Cecil received was £1,000, which was raised the following year to £1,500; while in 1609 he demanded an augmentation and to be paid for each piece of information separately.

As lord treasurer Salisbury showed considerable financial ability. In 1608 he imposed new duties on articles of luxury and those of foreign manufacture which competed with English goods, while lowering the dues on currants and tobacco. By this measure, and by a more careful collection, the ordinary income was raised to £460,000, while £700,000 was paid off the debt, leaving at the beginning of 1610 the sum of £300,000. But the minister's efforts were nullified by the extravagances of James, who continued to exceed his income. Salisbury erred, as the sequel was to show, in forcing the king's legal right to levy impositions against the remonstrances of the parliament. In the "great contract," the scheme now put forward by Salisbury for settling the finances, his lack of political wisdom was still more apparent. The Commons were to guarantee a fixed annual subsidy, on condition of the abandonment of impositions and of the redress of grievances by the king. An unworthy and undignified system of higgling and hagging was initiated between the crown and the parliament.

Salisbury had always been averse to prosecution for religion, and he made the offer in October 1607 that if the pope would excommunicate those that rebelled against the king and oblige them to defend him against invasion, the fines for recusancy would be remitted and they would be allowed to keep priests in their houses. This was a fair measure of toleration. But his attitude to the Nonconformists was identical with that after-

wards maintained by Laud; he maintained that "unity in belief cannot be preserved unless it is to be found in worship."

Elizabeth and James found security in Salisbury's calm good sense, safe, orderly official mind and practical experience of business, of which there was no guarantee in the restlessness of Essex, the enterprise of Raleigh or the speculation of Bacon. On the other hand, he was neither guided nor inspired by any great principle or ideal, he contributed nothing towards the settlement of the great national problems, and he precipitated by his ill-advised action the struggle between crown and parliament.

Lord Salisbury died on May 24, 1612, at the parsonage house at Marlborough. During his long political career he had amassed a large fortune, besides inheriting a considerable portion of Lord Burghley's landed estate. In 1607 he exchanged, at the king's request, his estate of Theobalds in Hertfordshire for Hatfield. Here he built the magnificent house of which he himself conceived the plans and the design, but which he did not live to inhabit, its completion almost coinciding with his death. In person and figure he was in strange contrast with his rivals at court, being diminutive in stature, ill-formed and weak in health. Elizabeth styled him her pygmy; his enemies delighted in vilifying his "wry neck," "crooked back" and "splay foot." He married Elizabeth, daughter of William Brooke, 5th Baron Cobham, by whom, besides one daughter, he had William (1591-1668), his successor as 2nd earl.

No complete life of Robert Cecil has been attempted, but the materials for it are very extensive, including *Hist. MSS. Comm. Series, Marquis of Salisbury's MSS.* (superseding former reports in the series), from which MSS. selections were published in 1740 by S. Haynes, by Wm. Murdin in 1759, by John Bruce, in *The Correspondence of King James VI. with Sir Robert Cecil*, in 1861 (Camden Society), and by Ed. Lodge, in *Illustrations of English History*, in 1838. Some of his writings are printed in the *Harleian Miscellanies* and the *Somers Tracts*.

SALISBURY, THOMAS DE MONTACUTE, 4TH EARL OF (1388-1428), was son of John, the third earl, who was executed in 1400 as a supporter of Richard II. Thomas was granted part of his father's estates and summoned to parliament in 1409, though not fully restored till 1421. He was present throughout the campaign of Agincourt in 1415, and at the naval engagement before Harfleur in 1416, and in 1417-18. During the spring of 1419 he held an independent command, capturing Fécamp, Honfleur and other towns, was appointed lieutenant-general of Normandy, and created earl of Perche. In 1420 he was in chief command in Maine, and defeated the Maréchal de Rieux near Le Mans. When Henry V. went home next year Salisbury remained in France as the chief lieutenant of Thomas, duke of Clarence. The duke, through his own rashness, was defeated at Baugé on March 21, 1421. Salisbury came up with the archers too late to retrieve the day, but recovered the bodies of the dead, and by a skilful retreat averted further disaster. He soon gathered a fresh force, and in June was able to report to the king "this part of your land stood in good plight never so well as now." (*Foedera*, x. 131.) Salisbury's success in Maine marked him out as John of Bedford's chief lieutenant in the war after Henry's death. In 1423 he was appointed governor of Champagne, and by his dash and vigour secured one of the chief victories of the war at Crevant on July 30. Subsequent operations completed the conquest of Champagne, and left Salisbury free to join Bedford at Verneuil. There his "judgment and valour" won the day. During the next three years Salisbury was employed on the Norman border and in Maine. After a year's visit to England he returned to the chief command in the field in July, 1428. Against the judgment of Bedford he determined to make Orleans his principal objective, and began the siege on Oct. 12; whilst surveying the city from a window in Tourelles he was wounded by a cannon-shot, and died on Nov. 3, 1428. Salisbury was the most skilful soldier on the English side after the death of Henry V. He was a patron of John Lydgate, who presented to him his book *The Pilgrim* (now Harley ms. 4826, with a miniature of Salisbury, engraved in Strutt's *Regal Antiquities*). By his first wife Eleanor Holand, daughter of Thomas, earl of Kent, Salisbury had an only daughter Alice, in her own right countess of Salisbury, who married Richard

Neville, and was mother of Warwick the King-maker. His second wife Alice was grand-daughter of Geoffrey Chaucer, and after his death married William de la Pole, duke of Suffolk.

The chief accounts of Salisbury's campaigns are to be found in the *Gesta Henrici Quinti*, edited by B. Williams for the Eng. Hist. Soc. (London, 1850) in the *Vita Henrici Quinti* (erroneously attributed to Thomas of Elmham), edited by T. Hearne (Oxford, 1727); the *Cronique of E. de Momtrelet*, edited by L. D. d'Arcq (Paris, 1857-1862); the *Chroniques of Jehan de Waurin*, edited by W. and E. L. C. P. Hardy (London, 1864-1891); and the *Chronique de la Pucelle of G. Cousinot*, edited by Vallet de Viriville (Paris, 1859). For modern accounts see Sir J. H. Ramsay, *Lancaster and York* (Oxford, 1892); and C. Oman, *Political History of England, 1377-1485* (London, 1906).

SALISBURY, WILLIAM LONGSWORD (or **LONGESPÉE**), 3RD EARL OF (d. 1226), was an illegitimate son of Henry II., who granted him the estates of Appleby, Lincolnshire (1188). In 1198 he received from Richard I. the hand of Isabella, or Ela (d. 1261), daughter and heiress of William, earl of Salisbury, and was granted this title with the lands of the earldom. He was received with favour by King John, who appointed him sheriff of Wiltshire in 1200, and subsequently gave him many important military and diplomatic posts, thus retaining his allegiance during the period of excommunication. In 1213 Salisbury was sent in command of a fleet to attack Philip of France, and, by his successful action at Damme, he foiled the projected invasion of England; but in the following year he was captured by the French and was only exchanged after prolonged negotiations. On his return to England he supported John in opposition to the baronial party, but feeling that the king's cause was hopeless, he surrendered to Louis on his arrival in England.

After the death of John, however, Salisbury deserted the French side in 1217, supported Herbert de Burgh and the young king, Henry III., and was appointed sheriff of Lincoln. It is asserted by Matthew Parker that he took part in the siege of Damietta (1219), but the evidence in support of this is scanty. It is known, however, that he supported the excommunication of William of Aumale in 1221; that he assisted in the war on the Welsh marches (1224); and that in 1225 he accompanied the expedition to Gascony. On the return voyage he was wrecked on the isle of Rhé, and the hardships which he suffered probably hastened his death, which occurred on March 7, 1226, at Salisbury.

SALISBURY, a city and municipal borough, and the county town of Wiltshire, England. 23 mi. W. of Winchester, with stations on the S.R. and G.W.R. Pop. (1931) 26,456; (est. 1938) 28,260. Area 4.4 sq.mi. The city lies in the valley at the junction of the rivers Avon, Wylve, Nadder and Bourne. The cathedral stands out above the city, which is partly laid out in squares called the "Chequers." To the north rises the bare upland of Salisbury Plain. The neighbourhood of Salisbury was one of the most important areas in prehistoric England. It seems to have been a meeting place of early cultures, e.g., of the people who made beakers and the people who built megaliths; 6 m N. is Stonehenge (q.v.). The Blackmore museum in the city has exhibits of almost every age from the neighbourhood. Most intimately associated, however, with the origins of Salisbury is the great prehistoric fortress of Old Sarum. It is about 2 m. N. of the present city. The great mound has a fosse and earthwork, while the summit is hollowed out like a crater and its rim surmounted by a rampart. It was certainly an important site in Romano-British times and especially in the period immediately preceding the arrival of the Romans. It was known to the Romans as *Sorbiodunum*. In 552 it was taken by Cenric, who named it *Searesbyrig* ("dry town") and it became the home of the kings of Wessex. Alfred strengthened the castle, and it was selected by Edgar as a place of national assembly to devise means of checking the Danes. About 1075 Old Sarum became the seat of a bishopric. Osmund, the second bishop, compiled a missal which forms the groundwork of the celebrated "Sarum Use." The "Sarum Breviary" was printed at Venice in 1483, and upon this, the most widely prevalent of English liturgies, the prayer-books of Edward VI. were mainly based. Osmund also built a cathedral, in the form of a plain cross. The garrison and priests, confined within a small space, were at perpetual feud; and after a licence

had been granted by Pope Honorius III., it was decided to move down into the fertile Avon valley. In 1102 Bishop Roger Poore obtained a comprehensive charter from Henry I. With the building of New Sarum in the 13th century and the transference to it of the see, Old Sarum lapsed to the crown. By the 16th century it was in ruins, and in 1608 it was ordered that the town walls should be demolished.

The new city, under the name of New Sarum (New Saresbury, Salisbury) immediately began to spring up round the cathedral close. A charter of Henry III. in 1227 creating it a free city recites the removal from Old Sarum, the king's ratification and his laying the foundation-stone of the church. In 1611 the city obtained a charter of incorporation from James I. under the title of "mayor and commonalty" of the city of New Sarum.

The cathedral church of St. Mary is a beautiful example of Early English architecture, begun and completed, save its spire and a few details, within one brief period (1220-1266). There is a tradition that Elias de Derham, canon of the cathedral (d. 1245), was the principal architect. The building is 473 ft. in extreme length, the length of the nave being 229 ft. 6 in., the choir 151 ft., and the lady chapel 68 ft. 6 in. The width of the nave is 82 ft., and the height 84 ft. The spire, the highest in England, measures 404 ft. (For plan, see *GOTHIC ARCHITECTURE: Gothic Architecture in England*.) The cathedral consists of a nave of ten bays, with aisles and a lofty north porch, main transepts with eastern aisles, choir with aisles, lesser transepts, presbytery and lady chapel. The two upper stories of the tower and the spire above are early Decorated. The west front, the last portion of the original building completed, bears in its rich ornamentation signs of the transition to the Decorated style. The perfect uniformity of the building is no less remarkable within than without. The frequent use of Purbeck marble for shafts contrasts with the delicate grey freestone which is the principal building material. An unhappy restoration of the cathedral (1782-1791) destroyed many magnificent stained-glass windows which had escaped the Reformation, and also removed two Perpendicular chapels and the detached belfry which stood to the north-west of the cathedral. The lady chapel is the earliest part of the original building. The cloisters, south of the church, were built directly after its completion. The fine octagonal chapter-house is of the time of Edward I. with a series of contemporary sculptures. The library contains many valuable mss. and ancient printed books. The diocese covers all Dorsetshire, excepting four parishes, the greater part of Wiltshire, and eight parishes in whole or in part in Southampton, two each in Berkshire and Devonshire and one in Somersetshire.

There are three ancient parish churches: St. Martin's, with square tower and spire, and possessing a Norman font and Early English portions in the choir; St. Thomas's (of Canterbury), founded in 1240 as a chapel to the cathedral, and rebuilt in the 15th century; and St. Edmund's, founded as the collegiate church of secular canons in 1268, but subsequently rebuilt in the Perpendicular period. The residence of the college of secular priests is occupied by the ecclesiastical college of St. Edmund's, founded in 1873. St. John's chapel, founded by Bishop Robert Bingham in the 13th century, is occupied by a dwelling-house. There is a beautiful chapel attached to the St. Nicholas hospital. The poultry cross, or high cross, an open hexagon with six arches and a central pillar, was erected by Lord Montacute before 1335. Among remaining specimens of ancient domestic architecture are the banqueting-hall of John Halle, wool merchant, built about 1470 and since 1930 used as a cinema; and Audley House (16th century), repaired in 1881 as a diocesan church house.

Salisbury returned two members to parliament until 1885 when the number was reduced to one. Since 1918 it has been in the Salisbury division of the county.

SALISBURY, capital of Southern Rhodesia. Population (1936) 32,846. Altitude 4,565 feet. It was founded in 1890, is well laid out, has good shops, and an excellent water supply. There are gold fields in the neighbourhood. The distance by rail to Cape Town is 1,661 mi., and to Beira 374 miles.

SALISBURY, a city of southeastern Maryland, U.S.A., at the head of navigation on the Wicomico river; the county seat

of Wicomico county. It is on federal highways 13 and 213, and is served by the Pennsylvania and (for freight) the Baltimore and Eastern railways. Pop. 7,553 in 1920 (21% Negroes); 10,997 in 1930 and 13,313 in 1940 by the federal census. It is the wholesale distributing centre for the "eastern shore" south of Delaware. Salisbury was founded in 1732, organized as a town in 1812, incorporated in 1854 and chartered as a city in 1880.

SALISBURY, a city of North Carolina, U.S.A., the county seat of Rowan county; 120 mi. W.S.W. of Raleigh, near the Yadkin river. It is on federal highways 29, 52 and 70, and is served by the Southern and the Yadkin railways. Pop. 13,884 in 1920 (26% Negroes); and 19,037 in 1940 by the federal census. It is a rapidly developing industrial and commercial centre in the rich and beautiful Piedmont section of the state, and is the seat of Catawba college (Reformed church; opened in 1851 at Newton and moved to Salisbury in 1923) and Livingstone college for Negroes (1882). The community has cotton mills operating 210,000 spindles (1938), car shops and various other manufacturing plants, with an annual pay roll of \$6,921,000.

There are granite quarries and iron deposits in the vicinity. The city operates under a council-manager form of government. Salisbury was incorporated as a town in 1755, and as a city in 1770. During the Civil War it was the seat of a Confederate military prison. On April 12, 1865, a cavalry engagement near by resulted in the capture of 1,364 Confederate soldiers. There is a national cemetery here, containing 12,186 graves.

SALISH. This tribe, popularly known as Flathead, has given name to the Salishan family of Indians, all speaking cognate dialects, in British Columbia and north-western United States. None of the Salishan tribes were agricultural or matrilineal; those on the coast practised potlatch festivals, accumulated wealth, held slaves and lived in plank houses like the other coastal tribes of the area. Inland, arts and customs were simpler. The principal groups or tribes are: 1, Interior Salish, comprising the Shuswap, Lillooet, Thompson or Ntlakyapamuk, Okanagan in British Columbia, and the Flathead or Salish proper, Kalispel, Coeur d'Alène, Spokane, Methow in the United States; 2, Coast Salish, in order from north to south: Bellacoola of Dean's inlet, Comox, Cowichan of Vancouver island, Nanaimo, Squawmish, Lummi, Snohomish, Snoqualmie (Seattle), Puyallup, Nisquallie, Cowlitz, Skokomish, Songish, Clallam of Strait of Juan de Fuca, Quinault, Chehalis, and, south of Columbia river, Tillamook called also Nehalem.

In 1909 the total population was 18,600, somewhat more than half being respectively in the interior and in Canada. The original number was perhaps three times as great.

SALITE (from Sala, Sweden, its original locality), a variety of monoclinic pyroxene (*q.v.*) characterized by a prominent parting parallel to the basal pinacoid (001), and owing this property to repeated twinning on this plane. Many salites correspond in composition to magnesium-diopside or enstatite-augite (see DIOPSIDE) and are particularly characteristic of the quartz-dolerite group of igneous intrusions. (C. E. T.)

SALIVAN, a group of tribes of South American Indians, usually regarded as constituting an independent linguistic stock. The Salivas, from whom the stock gets its name, lived originally along the western side of the Orinoco and for some distance west along its tributaries, from above the mouth of the Vichada to the Sinaruco.

They were a peaceful, docile folk, who, being attacked by the Caribs in the latter part of the 17th century, withdrew westward up the Meta and Vichada toward their heads. In the main a hunting and fishing people, they had no maize and but little manioc.

Like some of the neighbouring groups, they were accustomed to exhume the bones of the dead after a year or so, burn and reduce them to powder and then drink this, mixed with their fermented beer.

See J. Cassani, *Historia de la provincia de la compañía de Jesús del Nuevo Reino de Guanada* (Madrid, 1741).

SALLUST [GAIVS SALLUSTIVS CRISPVS] (86–34 B.C.), Roman historian, belonging to a well-known plebeian family, was

born at Amiternum in the country of the Sabines. After an ill-spent youth he entered public life, and was elected tribune of the people in 52. From the first he was a decided partisan of Caesar, to whom he owed such political advancement as he attained. In 50 he was removed from the senate by the censor Appius Claudius Pulcher, restored in 49 and became quaestor. In 46 he was praetor, and accompanied Caesar in his African campaign, which ended in the decisive defeat of the remains of the Pompeian party at Thapsus. He was then made governor of Numidia, where he was oppressive and extortionate. On his return to Rome he purchased and laid out in great splendour the famous gardens on the Quirinal known as the *Horti Sallustiani*. He now retired from public life.

His account of the Catiline conspiracy (*De coniuratione Catilinae* or *Bellum Catilinarium*) and of the Jugurthine War (*Bellum Jugurthinum*) have come down to us complete, together with fragments of his larger and most important work (*Historiae*), a history of Rome from 78–67, intended as a continuation of L. Cornelius Sisenna's work. In the *Catiline Conspiracy* Sallust adopts the usually accepted view of Catiline, and describes him as the deliberate foe of law, order and morality, without attempting to give any adequate explanation of his views and intentions. Catiline, it must be remembered, had supported the party of Sulla, to which Sallust was opposed. He is careful to clear Caesar of complicity and on the whole he is not unfair towards Cicero.

His *Jugurthine War*, again, though a valuable and interesting monograph, is not a satisfactory performance. Here, as in the *Catiline*, he dwells upon the feebleness of the senate and aristocracy, too often in a tiresome, moralizing vein, but as a military history the work is unsatisfactory in the matter of geographical and chronological details, though vivid in its depiction of character and scenery. The extant fragments of the *Historiae* (some discovered in 1886) are enough to show the political partisan, who took a keen pleasure in describing the reaction against the dictator's policy and legislation after his death. Two letters (*Duae epistolae de republica ordinanda*), and an attack upon Cicero (*Invectiva* or *Declamatio in Ciceronem*), frequently attributed to Sallust, are probably the work of a rhetorician of the first century A.D., also the author of a counter-invective by Cicero.

Editions and translations in various languages are numerous. Editio princeps (1470); (text and notes) F. Jacobs, H. Wirz (1894); G. Long, revised by J. G. Frazer, with chief fragments of *Historiae* (1884); English translation by A. W. Pollard (1882); (text and tr.) J. C. Rolfe (Loeb library, 1921). There are many separate editions of the *Catiline* and *Jugurtha*, chiefly for school use. The fragments have been edited by F. Kritz (1853) and B. Maurenbrecher (1891–93); and there is an Italian translation (with notes) of the supposititious letters by G. Vittori (1897).

SALMASIVS, CLAUDIVS, the Latinized name of CLAUDE SAUMAISE (1588–1653), French classical scholar, born at Semur-en-Auxois in Burgundy on April 15, 1588. He was educated at Paris and Heidelberg, where he went over to Protestantism. In 1609 he brought out an edition of Florus. He then returned to Burgundy, and qualified for the succession to his father's post, which he eventually lost on account of his religion. In 1620 he published Casaubon's notes on the *Augustan History*, with copious additions of his own. In 1623 he married Anne Mercier, a Protestant lady of a distinguished family. In 1629 Salmasius produced his *magnum opus* as a critic, his commentary on Solinus's *Polyhistor*, or rather on Pliny, to whom Solinus is indebted for the most important part of his work. Salmasius learned Arabic to qualify himself for the botanical part of his task. In 1631 he went as professor to Leiden, where he composed for Frederick of Nassau his *De Re Militari Romanorum*, not published till 1657. He was persistently attacked by a clique led by Daniel Heinsius. His *De primatu Papae* (1645) excited a warm controversy in France.

In November 1649 appeared his *Defensio regii pro Carolo I.* It does not appear who influenced him to write it but Charles II. defrayed the expense of printing, and presented the author with £100. The first edition was anonymous, but the author was universally known. This celebrated work, in our day principally famous for the reply it provoked from Milton (1651) even

in its own time added little to the reputation of the author. His reply to Milton, which he left unfinished at his death, and which was published by his son in 1660, is insipid as well as abusive. Salmasius died on Sept. 3, 1653.

As a commentator and critic, Salmasius is entitled to very high rank. His notes on the *Augustan History* and Solinus display not only massive erudition but massive good sense as well; his perception of the meaning of his author is commonly very acute, and his emendations are frequently felicitous.

The life of Salmasius was written by Philibert de la Mare, but never printed; it was used by Papillon, whose account of Salmasius in his *Bibliothèque des auteurs de Bourgogne* (Dijon, 1745) is by far the best extant, and contains an exhaustive list of his works, both printed and in ms. There is an *itoge* by A. Clement prefixed to his edition of Salmasius's *Letters* (Leiden, 1656), and another by C. B. Morisot, in his own *Letters* (Dijon, 1656). See also E. Haag, *La France protestante*, (ix, 149-173); and, for the *Defensio regia*, D. Masson's *Life of Milton*.

SALMERÓN, NICOLAS (1838-1908), Spanish statesman, born at Alhama la Seca, Almeria, April 10, 1838. Professor of literature and philosophy at Madrid, he co-operated with Castelar on *La Democracia* and in 1865 was a member of the directing committee of the Republican party. Imprisoned as a suspect in 1867, he was elected to the Cortes in 1871 and on the resignation of Amadeo (Feb. 11, 1873) was naturally marked out to be the leader of the party which sought to establish a republic in Spain. He succeeded Pi y Margall in the presidency of the republic on July 18, 1873, but resigned (Sept. 7), when he found that the generals insisted on executing rebels taken in arms. His successor, Castelar, was compelled to restore order by drastic means. Salmerón took part in the attack made on him in the Cortes on Jan. 3, 1874, and went into exile until recalled by Sagasta in 1881. In 1886 he was elected to the Cortes as Progressive deputy for Madrid. He died at Pau, Sept. 21, 1908.

SALMON AND SALMONIDAE. The salmonoids are soft-rayed fishes with abdominal pelvic fins, generally with an adipose fin, a pneumatic duct to the air-bladder with oviducts absent or incomplete, and with ribs attached to small separate bones wedged into pits in the centra of the vertebrae. The group includes three northern families, the Salmonidae, the Osmeridae (see SMELT) and the Salangidae, little white fishes of the seas of China and Japan. Three families, Argentinidae, Microstomidae and Ophisthoproctidae, are strictly marine, mostly oceanic. Three others, Retropinnatidae, Haplochitonidae and Galaxiidae, are southern, found on the coasts and in the rivers of Patagonia, Australia and New Zealand.

The Salmonidae are the most generalized family, distinguished by having the last two or three vertebrae turned upwards. They inhabit arctic and northern seas, and the fresh waters of Europe, northern Asia and North America; the marine species enter rivers to breed. There are eight genera, which may be distinguished as follows:—

I. Parietals not meeting. Scales small, 19 or more from origin of dorsal fin to lateral line. Dorsal fin short, of 10 to 16 rays.

A double or zig-zag series of teeth along vomer in middle of roof of mouth *Salmo*

A group of teeth on head of vomer *Salvelinus*

A curved series of teeth across head of vomer, connecting the palatine series; mouth large *Hucho*

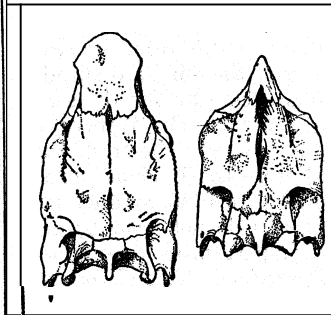

A straight series of teeth across head of vomer, connecting the palatine series: mouth smaller *Brachymystax*

II. Parietals meeting. Scales larger, 13 or less from origin of dorsal to lateral line.

A. Dorsal fin short, of 10 to 16 rays.
Teeth small, in bands. *Stenodus*
Teeth vestigial or absent. *Coregonus*

B. Dorsal fin longer, of 18 to 24 rays.
Mouth rather large; teeth strong. *Phylogephyra*
Mouth smaller; teeth moderate. *Thymallus*

Some of these genera are described in other articles, namely *Salvelinus* (CHAR), *Coregonus* (WHITEFISH) and *Thymallus* (GRAYLING). *Hucho* includes the huchen of the Danube, a large predacious fish with somewhat pike-like head, and two other species, respectively from Siberia, and from northern Saghalien and Yesso. *Brachymystax* has a single species from Siberia, and *Stenodus* one only, a large migratory fish, entering the Mackenzie river and arctic rivers of Siberia.

FROM REGAN IN THE "ANNALS AND MAGAZINES OF NATURAL HISTORY" (TAYLOR & FRANCIS)

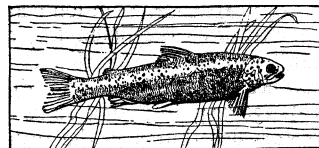

SKULLS OF (A) SALMON (SALMO SALAR), (B) QUINNAT (SALMO QUINNAT): JAWS, FACIAL BONES, ETC., HAVE BEEN REMOVED

The genus *Salmo* is by far the most important, and includes the black-spotted fish generally known as salmon and trout.

The Salmon (*S. salar*) is fusiform, with conical head; it is silvery, with scattered blackish spots; the mouth is moderately large with conical teeth in the jaws, and on the palate and tongue. It inhabits the north Atlantic, ranging from Hudson bay, Iceland and northern Europe to Cape Cod and the Bay of Biscay.

It feeds on herring, mackerel, sand-eels, etc., and enters rivers throughout the year, breeding on gravelly shallows from September to February. The fresh-run fish are silvery, with red flesh full of fat; they do not feed in the rivers and the sexual glands are developed at the expense of the other tissues, so that the flesh becomes pale and watery; in the breeding fish the silvery coloration is replaced by a dull grey or brown, and in the males especially large black spots edged with white and irregular red spots appear on the body; the skin is thick and spongy, with the scales imbedded in it; in the males the front teeth are enlarged, the jaws are prolonged, and the lower is hooked upwards. These peculiarities of the breeding fish are probably due to their abnormal physiological condition while fasting and transferring substance from the muscles to the genital glands. The female fish scoops out a trough in the gravel, and sinking into it deposits some eggs which are fertilized by the male; she then covers the eggs with gravel by strokes of the tail, burying them at a depth of about a foot. The eggs are about ¼ in. in diameter; they hatch out at the end of the winter. The fry, or *alevins*, have a large yolk-sac, which provides their nourishment for a month or two, during which they live in the gravel; then the young fish, a little more than an inch long, emerge and swim in shoals, feeding on crustaceans, insects, etc. Generally in about two years, but less in southern waters and more in the north, they attain a length of about six inches, and then migrate to the sea.

The young fish living in fresh-water, like other young Salmonidae, have a series of dark bars along the side and are known as parr (*q.v.*); when about to migrate they become silvery and are termed smolts. The smolts generally enter the sea about May; in the sea they grow rapidly, and after their first winter, when they are termed grilse, may weigh several pounds, and towards the end of their second summer 10 lb. or even more. Grilse may return to the river from which they came in order to spawn, but many salmon do not spawn as grilse, and may spend several years in the sea before spawning. After spawning the salmon is termed a kelt; these may return to the sea and recover, but in many rivers a large number die after spawning. Probably few salmon live more than ten years or spawn more than three or four times; large fish—a weight of more than 80 lb. may be obtained—are not necessarily very old; they are fish that have spent several years in the sea without spawning. The method of scale-reading has proved invaluable in elucidating the life-history of the salmon; the concentric lines of growth are close together on the central part of the scale formed during the life of the parr in fresh-water; the more rapid growth in the sea is marked by more rings farther apart, in which each winter is shown by a few rings, incomplete and closer together; if the fish enters fresh-water to breed the scale wears away and gets an irregular edge,

BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY
LAND-LOCKED SALMON (SALMO SALAR OUANANICHE)

and if it recovers and gets back to the sea, the line of this former edge is seen inside the rings formed later, and is termed a spawning mark.

Fresh-water Colonies.—Salmon may form permanent fresh-water colonies. The famous ouananiche of Quebec is a non-migratory salmon, a small but very active fish, rarely reaching 8 lb. The Sebago salmon inhabits the lakes of Maine. In Europe there are fresh-water salmon in Lakes Ladoga and Wenern. Lake Wenern is now cut off from the sea by inaccessible falls, but there can be no doubt that formerly salmon entered it from the sea to spawn in its tributaries, and that some of the smolts descending to the lake found it a sufficiently good substitute for the sea to stay there, and so founded a lacustrine race. In Wenern the salmon feed on fish and grow to a good size, but the fresh-water colony recently described by K. Dall from the Byglandsfiord in Norway (*Salmon and Trout Mag.* 1928) is of quite another kind, for the fish feed on minute crustacea and do not grow to more than a foot in length; they are overgrown parr, probably originally tempted to stay by the abundance of parr-food. This discovery is interesting, for a similar explanation has been given of the presence in the rivers of Dalmatia of *Salmo obtusirostris*, a fish reaching a foot in length, very like a salmon parr, but with a smaller mouth and more numerous gill-rakers, and feeding mainly on ephemeral larvae. This may be derived from a colony of salmon-parr formed in Glacial times, when salmon would have entered the Mediterranean.

The third Atlantic species of *Salmo* is the trout, *S. trutta*. (*See Trout*.) In the north Pacific there are about eight species of this genus, which form a natural group, distinguished from the salmon and trout of the Atlantic by the structure of the skull, the ethmoid bone in the Atlantic species being large and blunt, in the Pacific ones smaller and pointed. The steelhead (*S. gairdneri*) of the Pacific coast of North America forms numerous permanent fresh-water colonies, and there is a related species in the rivers of Formosa. The other five species are found on both coasts of the north Pacific; in them the breeding males have the jaws greatly prolonged and hooked, and it is believed that all the fish die after spawning. The largest and most valuable species is the quinnat (*S. quinnat*) which ascends rivers for long distances, and has parr that live in fresh-water. The blueback or redfish (*S. nerka*) also ascends streams, but the other species spawn at no great distance from the sea, to which the young fish soon make their way. The quinnat appears to have been successfully introduced into New Zealand, as has the trout (*S. trutta*), but attempts to introduce *S. salar* have been successful only in rivers in the extreme south, where the fish grow to be a fair size and breed, but feed in the lakes and do not go to sea.

The Salmonidae are to be regarded primarily as a group of northern marine fishes that breed in fresh-water, often forming colonies in lakes or rivers, and now including a number of species and even some genera that never go to the sea. An interesting feature of their distribution is the presence of species of certain genera, *Salmo*, *Salvelinus*, *Coregonus*, in lakes and rivers far to the south of their present range in the sea, which they must have reached from the sea in glacial times.

BIBLIOGRAPHY.—See *Salmon and Trout Magazine* (London) and papers by C. H. Gilbert and others in *Bull. U.S. Fisheries Bureau*; W. L. Calderwood, *The Life of the Salmon* (1907); J. A. Hutton, *Salmon Scales* (1909) and *Salmon Scale Examination* (1910); D. S. Jordan and B. W. Evermann, *Fishes of North America* (1897-1901) and *American Food and Game Fishes* (1904); D. S. SALMON-BERRY (*Rubus spectabilis*), a vigorous North American shrub of the raspberry genus, native from California to Alaska and eastward to Idaho, bearing rose-coloured flowers and large salmon-coloured edible berries. The name is applied also to the thimble-berry (*R. parviflorus*), of similar range but extending farther eastward, with white flowers and red scarcely edible fruit.

SALMONEUS, in Greek mythology, son of Aeolus (king of Magnesia, in Thessaly, looked upon as the mythic ancestor of

the Aeolian race), grandson of Hellen and brother of Sisyphus. He removed to Elis, where he built the town of Salmone, and became ruler of the country. His subjects were ordered to worship him under the name of Zeus; he built a bridge of bronze, over which he drove at full speed in his chariot to imitate thunder, the effect being heightened by dried skins and cauldrons trailing behind, while torches were thrown into the air to represent lightning. At last Zeus smote him with his thunderbolt, and destroyed the town (Apollodorus i. 89; Hyginus, *Fab.*, 60, 61; Strabo viii. p. 356; Manilius, *Astronom.*, 5, 91; Virgil, *Aen.*, vi. 585). There is small doubt that this is a confused recollection of some old rite of weather-magic. At Crannon in Thessaly there was a bronze chariot, which in time of drought was shaken and prayers offered for rain (Antigonus of Carystus, *Historiae mirabiles*, 15).

Frazer, *Golden Bough*, see index s.v.; another interpretation in S. Reinach, *Cultes, Mythes et Religions*, II. 160.

SALOME, the name of one of the women present at the crucifixion of Jesus (Mk. xv. 40) and at the sepulchre (xvi. 1). The name is derived from Heb. *shālôm*, "peace." Comparison with Matt. xxvii. 56 suggests that she was the wife of Zebedee. The name was borne by some of the Herod family also, notably by the daughter of Herodias by her first husband, the disinherited Herod Philip. She is probably the "damsel" (whose name is not given) mentioned in connection with the death of John the Baptist (Matt. xiv. 3-6; Mk. vi. 17-22). She afterwards married her uncle Herod Philip the Tetrarch. The reading in Mk. vi. 22 adopted by Hort, however, assumes that the girl dancer was Herod Antipas' own daughter, also called Herodias.

See Josephus, *Ant.* XVIII. v., 4; *Jewish War*, I., xxx., 7; Justin, *Dial.* 49; Schürer, *The Jewish People in the Time of Jesus Christ*.

SALON (-de-Provence), a town of S.W. France, in the department of Bouches-du-Rhône, 40 mi. N.N.W. of Marseilles by rail. Pop. (1936) 9,047. Salon is on the eastern border of the plain of Crau and on the irrigation canal of Crau. The church of St. Laurent is 14th century, and the church of St. Michel (12th century) has a fine Romanesque portal. The central part of the town preserves a gateway of the 15th century and the remains of fortifications. There are remains of Roman walls near Salon, and in the *hôtel de ville* (17th century) there is a milestone of the 4th century. There are quarries in the vicinity. The town carries on an active trade in olive oil and soap. Olives are grown in the district, and there is a trade in them.

SALONIKA (sah-lōn-ē'ka, popularly sā-lōn'ī-ka) or THESALONIKE, as the name was officially fixed in August 1937, the capital of Greek Macedonia, and one of the principal seaports of southeastern Europe. Pop. (1928, last census before World War II) 236,524, including some 50,000 Sephardic Jews, whose ancestors fled thither in the 16th century from Spain and Portugal: their language is a corrupt form of Spanish, called Ladinio (*i.e.*, Latin). Salonika lies on the west side of the Chalcidic peninsula, at the head of the Gulf of Salonika (*Simus Thermaicus*), on a fine bay whose southern edge is formed by the Kalamara heights, while its northern and western side is the broad alluvial plain produced by the Vardar and Vistritza rivers.

Antiquities.—The Via Egnatia of the Romans (Grand Rue du Vardar) traverses the city from east to west, between the Vardar gate and the Kalamara gate. Excavations there have revealed the Hellenistic *agora* near the present prefecture. Two Roman triumphal arches used to span the Via Egnatia. The arch near the Vardar Gate—a massive stone structure probably erected towards the end of the 1st century A.D., was destroyed in 1867 to furnish material for repairing the city walls; an imperfect inscription from it is preserved in the British Museum. The other arch, assigned to the reign of Galerius (A.D. 305-311), is built of brick and partly faced with sculptured marble.

The ecclesiastical architecture of Salonika was once remarkable for its specimens of early Christian (Byzantine) origin and style, with well-preserved mural decorations. St. Sophia (Aya Sofia), formerly the cathedral, probably erected in the 6th century by Justinian's architect Anthemius, was converted into a mosque in 1589. The nave, forming a Greek cross, is surmounted by a

hemispherical dome covered with a rich mosaic representing the Ascension. St. Demetrius, which was probably older than the time of Justinian, consisted of a long nave and two side aisles, each terminating eastward in an atrium the full height of the nave, in a style not known to occur in any other church. This church was destroyed by the great fire of 1917. It is partly repaired but mainly ruinous. St. George's, conjecturally assigned to the reign of Constantine (d. 337), is circular in plan, measuring internally 80 ft. in diameter. The external wall is 18 ft. thick, and at the angles of an inscribed octagon are chapels formed in the thickness of the wall, and roofed with wagon-headed vaults visible on the exterior; the eastern chapel, however, is enlarged and developed into a bema and apse projecting beyond the circle, and the western and southern chapels constitute the two entrances of the building. The dome is covered throughout its entire surface of 800 sq. yd. with what is the largest work in ancient mosaic still extant, representing a series of fourteen saints standing in the act of adoration in front of temples and colonnades. The Eski Juma, or Old Mosque, is another interesting basilica, evidently later than Constantine, with side aisles and an apse without side chapels.

Salonika is the see of an Orthodox Greek archbishop. Each religious community has its own schools and places of worship, among the most important being the Jewish high-school, the Jesuit college, a high-school founded in 1860 and supported by the Jewish Mission of the Established Church of Scotland, a German school, dating from 1887, and a college for boys and a secondary school for girls, both managed by the French *Mission Laïque* and subsidized after 1905 by the French government.

Railways, Harbour and Commerce.—Salonika is the principal Aegean seaport of the Balkan Peninsula, the centre of the import trade of all Macedonia, and the natural port of shipment for the products of an even larger area. It is the terminus of four railways. One line goes north to Nish in Serbia, where it meets the main line (Paris—Vienna—Constantinople) of the Oriental railways; another, after following the same route as far as Uskiib in Macedonia, branches off to Mitrovitza in Albania. A third line extends westward from Salonika to Monastir. A fourth, the Constantinople junction railway to Constantinople, was partly dismantled and put out of use in 1921, but re-organized later. It now runs via Séres and Kavalla and joins the main line at Kuleli Burgas.

The new harbour, which was opened to navigation in Dec. 1901, allows the direct transshipment of all merchandise whatever may be the direction of the wind, which was previously apt to render shipping operations difficult. The harbour works consist of a breakwater 1,835 ft. long, with 28 ft. of water on its landward side for a width of 492 ft. Opposite the breakwater is a quay 1,475 ft. long, which was widened in 1903–07 to a breadth of 306 ft.; at each end of the quay a pier 656 ft. long projects into the sea. Between the extremities of these two piers and those of the breakwater are the two entrances to the harbour. Salonika exports grain, flour, bran, silk cocoons, chrome, manganese, iron, hides and skins, cattle and sheep, wool, eggs, opium, tobacco and fennel. Other industries are cotton-spinning, brewing, tanning, iron-founding, and the manufacture of bricks, tiles, soap, flour, ironmongery and ice. The spirit called mastic or raki is largely produced.

Province of Macedonia, of which Salonika is the capital, is rich in minerals, including chrome, manganese, zinc, antimony, iron, argentiferous lead, arsenic and lignite, but some of these are unworked. The chief agricultural products are grain, rice, beans, cotton, opium and poppy seed, sesame, fennel, red pepper; there is also some trade in timber, live stock, skins, furs, wool and silk cocoons. Apart from the industries carried on in the capital, there are manufactures of wine, liqueurs, sesame oil, cloth, macaroni and soap. The principal towns, Séres, Vodena and Kavalla, are described in separate articles; Tikvesh is the centre of an agricultural region, Karaferia a manufacturing town, and Drama one of the centres of tobacco cultivation. The total population of Macedonia is in the neighbourhood of 1,500,000. This total includes the large number of refugees who were settled

here after 1922. The Greeks form about 90% of the population; there are no Muslims except those of Albanian origin. Bulgarians number about 77,000, being about 5% of the total.

History.—Thessalonica was built on the site of the older Greek city of Therma, so called in allusion to the hot-springs of the neighbourhood. It was founded in 315 B.C. by Cassander, who gave it the name of his wife, a sister of Alexander the Great. It was a military and commercial station on a main line of communication between Rome and the East, and had reached its zenith before the seat of empire was transferred to Constantinople. It became famous in connection with the early history of Christianity through the two epistles addressed by St. Paul to the community which he founded here; and in the later defence of the ancient civilization against the barbarian inroads it played a considerable part. In A.D. 390, 7,000 citizens who had been guilty of insurrection were massacred in the hippodrome by command of Theodosius. Constantine repaired the port, and probably enriched the town with some of its buildings. During the iconoclastic reigns of terror it stood on the defensive, and succeeded in saving the artistic treasures of its churches: in the 9th century Joseph, one of its bishops, died in chains for his defence of image-worship. In the 7th century the Macedonian Slavs strove, but failed, to capture the city. It was the attempt made to transfer the whole Bulgarian trade to Thessalonica that in the close of the 9th century caused the invasion of the empire by Simeon of Bulgaria. In 904 the Saracens from the Cyrenaica took the place by storm, and the inhabitants to the number of 22,000 were sold as slaves throughout the countries of the Mediterranean. In 1185 the Normans of Sicily took Thessalonica after a ten days' siege, and perpetrated endless barbarities, of which Eustathius, then bishop of the see, has left an account. In 1204 Baldwin, conqueror of Constantinople, conferred the kingdom of Thessalonica on Boniface, marquis of Montferrat; but in 1222 Theodore, despot of Epirus, one of the natural enemies of the new kingdom, took the city and had himself crowned there by the patriarch of Macedonian Bulgaria. On the death of Demetrius, who had been supported in his endeavour to recover his father's throne by Pope Honorius III., the empty title of king of Salonika was adopted by several claimants. In 1266 the house of Burgundy received a grant of the titular kingdom from Baldwin II. when he was titular emperor, and it was sold by Eudes IV to Philip of Tarentum, titular emperor of Romania, in 1320. The Venetians to whom the city was transferred by one of the Palaeologi, were in power when Murad II. appeared and on May 1st, 1430, in spite of the desperate resistance of the inhabitants, took the city, which had thrice previously been in the hands of the Turks. They cut to pieces the body of St. Demetrius, the patron saint of Salonika, who had been the Roman proconsul of Greece under Maximian and was martyred in A.D. 306. In 1876 the French and German consuls at Salonika were murdered by the Turkish populace. On Sept. 4, 1890, more than 2,000 houses were destroyed by fire in the south-eastern quarters of the city. During the early years of the 20th century Salonika was the headquarters of the Committee of Union and Progress, the central organization of the Young Turkey Party, which carried out the constitutional revolution of 1908. Before this event the weakness of Turkey had encouraged the belief that Salonika would ultimately pass under the control of Austria-Hungary or one of the Balkan States, and this belief gave rise to many political intrigues which helped to delay the solution of the Macedonian Question.

When the first Balkan War broke out in 1912, Salonika surrendered to the Greeks on the festival of its patron, St. Demetrius, Nov. 8, after 482 years of Turkish occupation. King George I. proceeded to what was now the second largest city of his kingdom, but was assassinated there on March 18, 1913, by a Greek, named Schinasi.

The Treaty of London of May 30, 1913, assigned Salonika to Greece, and the battle of Kilkis in the second Balkan War of that year prevented the Bulgarians from approaching it. Salonika was becoming more and more Hellenized when World War I brought it into prominence as the base of the Allied

operations in the Near East. (See SALONIKA CAMPAIGNS below.)

In 1916 a Venizelist revolution against King Constantine broke out there, and on Oct. 9 M. Venizelos arrived and formed a provisional government, which the Allies recognized, and to which Lord Granville was accredited as British representative. This government declared war on Nov. 23 against Bulgaria and Germany. On Aug. 18, 1917, a great fire destroyed a large part of the city, including the church of St. Demetrius. After the war an arrangement was made by which Yugoslavia should have a "Serbian Zone" in the harbour. After the proclamation of the Greek republic, Salonika often had a decisive voice in politics, and the large immigration of Greek refugees from Asia Minor further Hellenized the country round it. Salonika again figured prominently in World War II.

German forces driving southward from Bulgaria captured the city April 9, 1941, only three days after their initial assault on Greece. By so doing they cut off all Thrace from the rest of Greece and split Macedonia in two.

See General Sarrail, *Mon Commandement en Orient, 1916-18* (1920); P. Risal, *La Ville Convoitée, Salonique* (1914); *Greek Refugee Settlement* (League of Nations, Geneva, 1926).

SALONIKA CAMPAIGNS 1915-18. Under the heading SERBIAN CAMPAIGNS the collapse and subjugation of Serbia in 1915 is related in this work. The present article describes the campaigns in Salonika which formed the sequel to this Allied disaster.

I. OBJECTS OF THE EXPEDITION

Although undertaken for political objects—to bring relief to a hard-pressed ally and to check the influence of Germany in the Balkans—the Salonika campaigns were ultimately crowned by the first decisive military success of the World War. For on the Macedonian front the continent-wide trench barriers of the Central Powers were first breached beyond repair, and there too was knocked away the first national prop—Bulgaria—of the Germanic alliance. To disentangle cause from effect is difficult where moral, military and economic threads are so closely interwoven as in the years 1914-18, yet the fact at least stands out that the overthrow of Bulgaria began the series of national capitulations which ended with that of Germany on Nov. 11, 1918.

If Salonika was for several years an unproductive field of military effort, an infringement of the law of economy of force, which in some measure justified the German gibe that it was their largest concentration camp—"an enemy army, prisoner of itself"—the historian, when weighing his verdict, must throw the counterpoise of 1918 into the scales. And not this only, for it must be remembered that the Allied occupation of the Salonika front made possible the rebuilding of the Serbian army—from the ragged and disorganized survivors of the 1915 winter retreat through Albania to the well-equipped and irresistible force which broke through the Vardar front in Sept. 1918. On the credit side also must be set the fact that the Salonika expedition prevented the danger that Greece might become a submarine base for the Central Powers, one which would have lain in deadly proximity to the British artery of communication with the East via the Suez Canal. And again, that the Allied force contained the bulk of the Bulgarian army—although it is perhaps doubtful whether these would have placed their services at Germany's disposal for any front more remote from their homeland.

Although the Salonika expedition was the immediate outcome of the Serbian débâcle of Sept.-Oct. 1915, the idea had an earlier origin. For Salonika was not only the one feasible channel of Allied communication with and supply to Serbia, but that front offered a possible strategic flank for attack once the trench line on the western front had been welded into a seemingly impenetrable barrier. As far back as 1914, British and French naval missions, with guns, had been sent to support the Serbians, and they had also been supplied with munitions by the Salonika route. The question, too, had been mooted of a larger employment of military force in that theatre, but British commitments at Gallipoli led to this project being shelved—until the Bulgarian mobilization for war on the side of the Central Powers.

Throughout the summer of 1915 the two warring coalitions had been bidding for intervention on the part of the Bulgarians, and in this diplomatic bargaining the Entente suffered a moral and a material handicap—the first, their obvious failure at the Dardanelles; the second, Serbia's reluctance to concede any part of Bulgarian Macedonia, which she had seized as her share of the spoils of the second Balkan war of 1913. As this was the one prize on which the Bulgarians had set their heart, and as Austria had nothing to deter her from offering territory that belonged to her enemy—Serbia—the Entente offers failed to attract Bulgaria. Her intervention on the opposite side meant that free communication could be easily established between Germany and Turkey, and as a consequence that the Entente forces on the Gallipoli peninsula were imminently menaced.

II. THE RETREAT TO SALONIKA

Faced with this critical situation, the French and British Governments decided, albeit tardily, to succour Serbia with an expeditionary force.

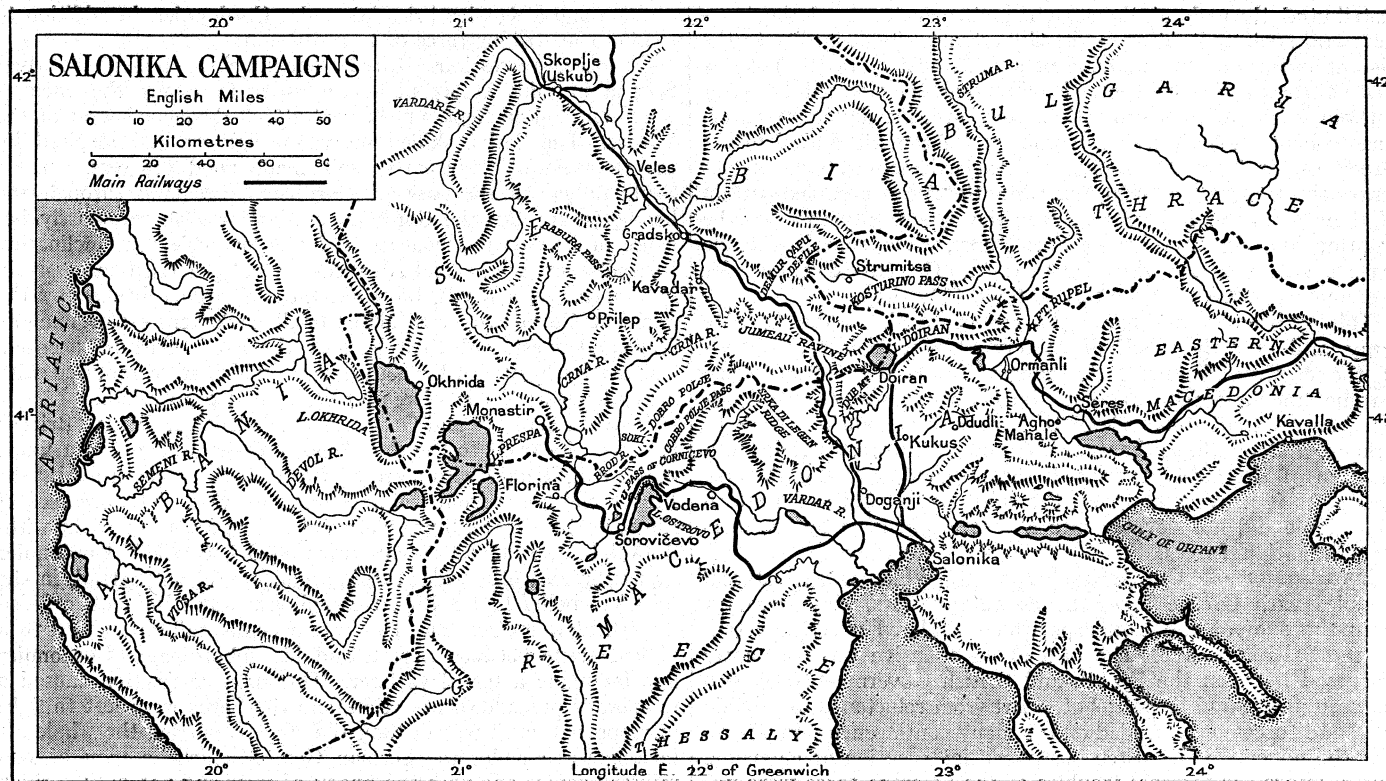

In this the French Government took the lead and nominated as commander Gen. Sarrail, the former chief of the III. Army in the Verdun sector. Sarrail's political activities had earned him the distrust of the military authorities; but the same factor, through his influence with the parties of the Left, made it difficult to ignore him completely. His removal by Joffre from the III. Army command placed the Government in a temporary dilemma, and they eagerly seized the opportunity of placating Sarrail and his political supporters by appointing him to a conveniently distant theatre of war.

While the constitution of Sarrail's force was still under discussion, the Bulgarian mobilization on Sept. 22 forced the hands of the Entente Governments. A hurried order was sent for the dispatch to Salonika of contingents from Gallipoli, preliminary to the arrival of reinforcements from France. Preceded by staff officers, the British 10th and French 156th Divs. began to disembark at Salonika on Oct. 5, and they were followed by the French 57th Division. On the same day, however, the Greek promise of aid to Serbia, made by M. Venizelos, was repudiated by King Constantine, and the Venizelist Government fell—to be replaced by that of M. Zaimis, which took neutrality as its keynote. This reacted at once not only on the Franco-British plan but on their operations. The Greek officials, civil and military, at Salonika did their best, or worst, to obstruct the disembarkation of the Allied contingents.

To increase the confusion, the intended concentration point was several times changed by successive orders from Paris until, on Sarrail's arrival on Oct. 12, he decided, in view of his slender resources and the doubtful attitude of the Greek army in his rear, to concentrate no further forward than the Demir Qapu (Demir Kapija) defile. The limited object was to protect the railway and to ease the pressure on the Serbian forces to the north by repelling a Bulgarian advance from Strumitsa (Strumica)—which would sever that line and so the Serbian line of retreat. Meanwhile, the British troops under Gen. Mahon began moving up to Doiran, in echelon behind the right of the French.

On Oct. 14 the vanguard of the French troops came into action at Strumitsa station (in Serbia), driving back a Bulgarian reconnaissance, and on Oct. 17, in response to Serbian urgings, a brigade was sent forward beyond the Demir Qapu defile as far as Krivolak. Reinforced by the arrival of the French 122nd Div. Sarrail began, on Nov. 3, an offensive northward to facilitate the Serbian retreat. But the seizure of the Babuna pass by the Bulgarians closed the channel of southward retreat for the main Serbian army, and finally shattered the hope that the Serbians might fall back on the relieving force, as was the advice of their allies.

Sarrail was thus faced with a difficult problem. On the one hand the gallant French efforts to break through towards the Babuna had failed and they were forced on the defensive, and, on the other, he received news of the Serbian decision to retreat westward through Albania towards the Adriatic. With his small force thus isolated he took the only possible decision—to fall

MAP SHOWING THE TERRAIN OF THE SALONIKA CAMPAIGNS IN 1915-1918. NATIONAL BOUNDARIES ARE INDICATED BY THE BROKEN LINE

back towards Salonika. This decision raised further problems. Were they to hold on there, or evacuate Greek soil altogether? With the disappearance of Serbia beneath the enemy flood, the Entente Powers could no longer claim that they were at Salonika merely to use a line of communication to which Serbia was by treaty entitled. The other justification, that they had come at the request of the Greek Government was now nullified by the downfall of Venizelos. Considerations of prestige and their desire to use Salonika as a base for diplomatic operations in the Balkans led the Entente Governments to remain, but without any clear policy as to the future.

Even with the decision to retreat taken, the Franco-British forces were not "out of the wood." The withdrawal had to be made down a single-track railway, through a country without roads—converted by the autumn rains into a swamp—and in face of a pursuing enemy. The retreat was made by echelons, in four stages, and only by a narrow margin did the French frustrate Bulgarian efforts to outflank and cut their retreat, first at the Demir Qapu defile, and again at Strumitsa station. The British, too, on the right were heavily attacked, and any weakening of their line at this critical juncture might have been fatal to the extrication of the Allied forces from the noose into which they had been pushed.

Fortunately, once the Greek frontier was regained the pursuit halted—mainly because the Germans were reluctant to undertake further commitments in the Balkans to the detriment of their strength in other theatres. Falkenhayn held that the Macedonian operations should be left to the Bulgarians, but this policy overlooked the fact that the Greeks, however friendly to the Germans, would have resented any invasion of their territory by the Bulgarians. Thus by Dec. 12 the retreating forces were safely out of reach of their pursuers, facing them across the frontier. After pausing for a few days on a line stretching roughly from Sorovičevo to Lake Doiran, the withdrawal was resumed, and by Dec. 18 the forces of Sarrail and Mahon were back in the vicinity of Salonika. Covering this base an entrenched line was constructed, on an 80m. arc stretching from the mouth of the Vardar through Doganji to the Gulf of Orfano, and occupied early in the new year

Allied Reinforcements.—The delay in the expected en-

emy offensive enabled the Entente force to receive reinforcements, not only French and British but Serbian, for the remnant of their army, after resting and being re-equipped at Corfu, was brought round to Salonika. From April onwards the stream steadily swelled until by July their strength on the Salonika front reached a total of 152,000, divided into three armies of two divisions each. The French had four divisions. The British had been raised to five divisions (10th, 22nd, 26th, 27th, 28th), and later a sixth (60th), organized in two army corps; in May Lieut.-Gen. G. F. (later Sir George) Milne took over command as general officer commanding the British Salonika Force. The total allied force was thus a little over 300,000 men. Opposing it early in 1916 were the Bulgarian I. and II. Armies and the German XI. Army—a total of some 280,000 men—aligned on a front from Lake Okhrida on the west to the point where the Struma enters Bulgaria on the east. But from March onwards the drain on the German forces at Verdun led Falkenhayn to withdraw the German troops, all but one division; by 1918 the XI. Army, though German in name and in staff, contained only one complete German battalion.

On the Entente side the reaction of Verdun took the form of orders from Joffre to Sarrail to pin down the enemy on his front, in order if possible to prevent Falkenhayn drawing upon the forces there. Accordingly the French moved out west of the Vardar towards Vodena and the British advanced north to Kukus. This advance, although it lengthened the front to be defended and the lines of communication, was of essential value for the security of the Allied force, for the entrenched position at Salonika itself was dominated from the mountains east of the town, and might become untenable if these heights were occupied by the enemy. But in how small degree the Allied advance fixed the Germans can be gauged from the previous paragraph, and Sarrail, who had been placed under Joffre's supreme command in Dec., received instructions not only to operate with greatly increased vigor on the Salonika front but also to prepare and organize a definite offensive to be launched simultaneously with the anticipated entry of Rumania into the war.

Meantime the situation was complicated by a Greek incident; until 1918 politics were to play a larger part in the Salonika theatre than war. The neutral Greek forces, five corps, were

distributed throughout the region, in theory to guard the frontier; and such a situation, while Gilbertian in its absurdity to the distant observer, was a source of serious anxiety to the Franco-British forces on the spot. Feeling that they would be safer without such dubious protection, they brought diplomatic pressure to bear on the Greek Government for the withdrawal of the Greek forces from Macedonia and their demobilization. Reluctantly the Greeks complied, but while the Allies occupied certain of their forts the Bulgarians seized the opportunity to cross the frontier, and appeared before Fort Rupel, which commanded the Struma gate into the Macedonian plain. The Greek commander thereupon handed over the fort to them (May 26).

This unfriendly act bared the eastern flank of the Entente army, and gave the whole of Eastern Macedonia into the hands of the enemy. To meet the danger the British occupied the Struma line in force. Further, the Entente Governments instituted an economic blockade of the Greek coast, sent a brigade to Athens, and by the ultimatum of June 21 enforced the demobilization of the Greek army and the resignation of the Government. As it proved, however, the seizure of Rupel and Eastern Macedonia did not develop into a general offensive by the German-Bulgarian forces.

Handicaps of **the Allies' Army.**—While these external troubles with Greece beset the Entente Powers, they were far from the sum of the handicaps which hindered effective action by the Salonika force. The idea of an offensive was constantly discussed between the French and British Governments, as also between Joffre and Sarrail; but, apart from reluctance to provide adequate forces, it depended on too many contingencies, in particular the uncertain and often postponed intervention of Rumania. Furthermore the internal troubles of the Salonika force were notorious. Sarrail had the title of "Commander-in-chief of the Allied Armies in the Orient," and with him Cordonnier commanded the French forces; but his status was a nebulous one. Not only was the British commander to all intents independent, but also the Italian—a detachment arrived from Italy in Aug. 1916.

Apart from the defect that Sarrail's orders were issued from French headquarters without consultation with the other Allied Powers, Sarrail's own personality was not such as to weld this loose understanding into an effective co-operation. In a heterogeneous force, composed of French, British, Italians, Serbians and Russians, it was hardly a recommendation that the chief commander should be known not to have the confidence of his own supreme command, and that even the suspicion should exist that he was conducting operations with one eye on the political game at home. The British, by polite but firm insistence on their independence, maintained tranquil relations; wrangles and disputes between the other Allied commands were continual, and the majority were unfortunately attributable to the policy or tactlessness of Sarrail.

While the Allied leaders were debating ways and means, the opposing armies moved, on Aug. 17, to forestall and dislocate the Allied offensive, which they judged would synchronize with Rumania's intervention. The Bulgarians made their effort on the two wings. The eastern wing from Rupel drove back the French cavalry on the east of the Struma and pressed down towards its mouth. But they dissipated their force by detaching part to seize the coastal strip of Kavalla, and the stout resistance of the British prevented them forcing the river line. On the western wing the position was more critical, for the Bulgarian advance from the Monastir area drove the Serbs out of Florina and reached Lake Ostrovo before they were ultimately held.

III. THE FIRST AND SECOND ALLIED OFFENSIVES

These reverses caused a further change in Sarrail's plan for the Allied offensive; the forces east of the Vardar were merely to contain the enemy, while those west of the Vardar carried out the offensive. Thus to all intents it became no more than a counter-offensive to restore the impaired situation in this sector. To release additional French troops the British extended their line west from Doiran to the Vardar; Sarrail was thus enabled to form an offensive group (of 2½ French divisions, one Serbian

division and a Russian brigade) under Cordonnier, in addition to the Serbian striking force of four divisions.

On Sept. 10 various British detachments crossed the river Struma in raids at six points in order to divert the enemy's attention, and on Sept. 11 the real attack developed west of the Vardar. The Serbs, skilled mountain fighters and inspired by the closeness of their native soil, made good progress, and on Sept. 14 gained the pass of Gorničeyo, breaking through the hostile front. But the Cordonnier group was slower, partly because of transport difficulties and Cordonnier's own inclination for the secure methodical advances he had practised successively in France. As a result, however, the Bulgarians, broken by the Serbs at Gorničeyo, were able to fall back across Cordonnier's front and re-establish their lines on the Brod. Sarrail, incensed, ordered fresh attacks by both groups, which were repulsed with heavy loss—as Cordonnier, protesting, had prophesied.

Between Sept. 30 and Oct. 8 the British XVI. Corps (Briggs) advanced its front to the line Agho Mahale-Ormanli, as a fixing move, coincidentally with a fresh attack on the main front by the French and Serbs from Kaimakčalan westward. The pressure of the Serbs turned the Bulgar left and forced a further slight withdrawal, but a Franco-Russian attack on Oct. 6 failed. Cordonnier urged the idea of a wider turning manoeuvre, but Sarrail, in the mistaken belief that a Bulgarian collapse was imminent, ordered a fresh blow on Oct. 14. This was a costly failure and led to a violent scene between Sarrail and his subordinate. Cordonnier left for home a few days later. This internal friction caused a temporary breakdown of action, and the Serbs were left to fight unsupported, until Sarrail took the step of putting the whole attacking force under the Serbian Gen. Michich—a man of real military genius and with the knack of inspiring not only Serbian but other national forces.

Michich attacked in the Crna bend on Nov. 12 while, to aid this offensive, Milne's troops made local attacks and raids as a diversion on the Struma. Despite rain and snow the Serbs pressed on, turning successive positions, with the French, Russians and an Italian brigade on their left. Monastir was outflanked and on Nov. 19 was found evacuated—the first important Serbian town to be regained. For a moment there was a real opportunity of exploitation, as the Bulgarians were in full retreat towards Prilep; but the immediate attacking forces were tired and hungry, and Sarrail suspended the advance—to the annoyance of the Serbs, who, in default of receiving fresh reserves, tried to press on unsupported until exhaustion stopped them.

By this time the Rumanian collapse, under pressure of the convergent German and Bulgarian attacks, was clear, and on Dec. 11 Sarrail received instructions to consolidate a defensive line embracing as much of the regained territory as possible. This line stretched from Lake Prespa—just north of Monastir—north slopes of Kaimakčalan—to the Vardar, and thence by Doiran to the Struma and down to the sea. Its worst feature was that the commanding heights were held almost everywhere by the enemy. This front was to remain practically unchanged until Sept. 1918.

Reorganization.—Apart from the incident of a threatening Greek concentration in Thessaly—settled by a fresh ultimatum—the winter months of 1916-17 passed quickly, and the opportunity was taken to reorganize and regroup the forces. From the Gulf of Orfani to the Vardar the front was held solidly by the British, owing to Milne's insistence, but on the rest of the front Sarrail followed his usual plan of interspersing detachments of the various nationalities—presumably on the principle "*divide et impera.*" Whatever its personal advantages it was hardly conducive to prompt and effective action. Reinforcements had now brought the French up to a strength of eight divisions, while there were six Serbian and 1½ Italian divisions—making with the British 213 divisions, plus two Russian brigades. The total Allied strength was approximately 600,000, while the Greek National Defence, or Venizelist army, was in process of formation. This concentration afforded adequate reserves for a resolute offensive in the spring.

Confronting the Allies were still the nominal German XI

Army, and Bulgarian I. and II. Armies, comprising the equivalent of one German and 13 Bulgarian divisions,' of which practically half faced the British. Apart from the II. Army, these forces were under a German Commander-in-chief, Gen. Von Scholtz. On their side no large move was considered, partly because the Bulgarians had already achieved their principal territorial aims, and merely desired to hold tight, while the Germans were satisfied with immobilizing so large an Allied force at no expenditure to themselves.

For the 1917 campaign Sarrail's scheme was for a preliminary flanking move on the extreme west, between Lakes Okhrida and Prespa, to shake the enemy's hold in the Monastir area; following this was to be the main fixing attack by the British on the Doiran front; then the French, Russians and Italians in the south-west of the Crna bend were to advance; and finally the Serbs were to strike the decisive blow to the west again.

The preliminary move began on March 12 and was soon suspended, achieving little apart from a creditable French local success on a spur west of Monastir. Then came the British turn—to attack the key position formed by the Dub and lesser ridges which commanded the passage between Lake Doiran and the Vardar. Milne had rejected an alternative proposal of Sarrail's that he should attack to gain Seres, which while attractive as a political advertisement had no military value, and being dominated by the hills behind would have been difficult to hold. After a two days' artillery preparation, in vile weather, the British infantry advanced to the assault, on a two-division front (22nd and 26th), at 9.45 P.M. on April 24, the late hour being to gain surprise and protection. On the left the enemy's first position was gained and held, but in the centre and right the difficulties of the Jumeaux ravine and the strength of the resistance foiled the attackers.

Worst of all, their sacrifice was in vain and their "fixing" rôle rendered abortive because the attack west of the Vardar was postponed by Sarrail, ostensibly for climatic reasons. Not until May 6 did the other attacks develop. Sarrail had rejected the Italian proposal for a flanking manoeuvre, in preference for a frontal blow, and this, made by the French and Italians, was a costly failure. The Serbian attack was even less effectual, in fact hardly developed, partly owing to internal political troubles then rife and partly to their want of confidence in the higher direction and in the genuineness of its intention to support their efforts. Once more the British, on the night of May 8, had delivered a fixing attack, and once more their heavy sacrifice had been purposeless. The offensive was definitely closed down by Sarrail on May 24.

The Bulgarians, content with the prestige of this successful repulse, attempted no counter-stroke, and as the Allied forces were neither in the mood nor the condition for further efforts, the front relapsed into stagnation for the rest of the year. The only minor incidents were a successful local advance in Sept. by the French on the extreme left, west of Lake Okhrida, and Milne's withdrawal of his right from the marshy valley to the foot-hills west of the Struma, a precaution to lessen the danger of malaria and dysentery. The focus of interest again became political—common action was taken to settle the simmering menace and intrigues of Greece. In June, Allied troops invaded Thessaly, but the abdication of King Constantine was forced without fighting, and the Venizelist Government returned to power. The consequent reinforcement of the Allies by the Greek army came as a prospective counterpoise to the contemplated withdrawal of two British divisions in Sept. for the projected offensive in Palestine.

Sarrail Superseded.—At the end of 1917 the new Clemenceau ministry recalled Sarrail, in response to the renewed requests of the British and Italian Governments, which were supported by Foch. His successor was Gen. Guillaumat, who had distinguished himself as an army commander on the Verdun front. His first aim was to restore confidence and cohesion in the Allied forces at Salonika, while hastening the reorganization

¹A Bulgarian division had almost twice the infantry strength of a French or German division.

and training of the Greek army. His second, to think out and prepare the plan for a fresh offensive, adopting in its main outlines one which Gen. Michich had suggested in 1916. But to obtain the sanction of the Allied Governments was more difficult, obsessed as they were with the threatened German offensive in France, and in any case dubious of the effectiveness of any major operation in Macedonia. While biding his time, however, Guillaumat seized the opportunity to "blood" his new Greek troops in an ably planned coup de *main* against the Srka di Legen ridge. Supported by a powerful concentration of French artillery it was completely successful, and Guillaumat withdrew the attackers into reserve before any possible counterstroke might dilute the moral tonic. On the main front there were no other incidents of note between Jan. and Sept. 1918; but away on the Adriatic coast, in Albania, Ferrero's Italian XVI. Corps, aided by a French division, advanced in July from the Viosa to the line of the Semeni and Devol rivers; an Austrian counter-offensive late in Aug. regained most of the lost ground.

In July also, Gen. Guillaumat, his task of reorganization completed, was summoned back to France, to be entrusted with the defence of the capital in view of the critical situation caused by the German offensives. A man who put first not his own interests, nor even those of France, but his duty to the Allied forces as a whole, his military ability had won the respect, as his character had won the esteem, of the multifarious contingents. He was succeeded by Gen. Franchet d'Esperey, who, if perhaps not possessing the exceptional tact and supra-national outlook of Guillaumat, was yet an able strategist, and well able to maintain allied co-operation. He adopted and put the finishing touches to Guillaumat's offensive plan, while the latter utilized his position at the centre of policy to gain sanction for its execution. Winning over M. Clemenceau, he then went to London and Rome on the same mission, and at last on Sept. 11 Franchet d'Esperey was authorized to attack—if there was still little confidence in its success.

IV. THE DEFEAT OF BULGARIA

The military situation on the eve of the offensive was numerically little changed. The Bulgarians had a ration strength of some 700,000 and a rifle strength of 200,000—divided into the same three armies. The Allies had a ration strength of about 574,000 and a rifle strength of 157,000, although against the inferiority of numbers they could put a slight preponderance in artillery and a heavy one in aircraft. But the real defect on the enemy's side was the first underlying war-weariness of the Bulgarians and their dissatisfaction with their German directors; and secondly the divided command by which the so-called German XI. Army and the Bulgarian I. Army—from Doiran westwards—were under Von Scholtz, while the Bulgarian II. Army and the coastal detachments were under the Bulgarian commander-in-chief, Gen. Gekoff.

For the new offensive Franchet d'Esperey's plan was first to strike a concentrated blow with a Franco-Serb group under Michich on a narrow front of seven miles along the Sokol-Dobro Polje range, aiming at a tactical break-through and a subsequent expansion of the breach to gain and clear the triangle formed by the Crna and the Vardar. This would menace the enemy's communications on both flanks, and the offensive would then be taken up in turn by the other forces along the front. The initial objectives were relatively modest, for the possibility of a strategic break-through, ending in the overthrow of the enemy armies, was no more than an idea in the commander's mind.

The immense difficulties of the terrain and the scantiness of reserves made even this limited aim far from certain of success. But Franchet d'Esperey's plan, made possible by the whole-hearted co-operation of the other Allied commanders, was an admirable fulfilment of the principle of concentration. On the vital sector six Serbian and two French divisions with 600 guns—more than a third of the total artillery strength in Macedonia—were concentrated against one Bulgarian division, and to do this the other sectors were almost stripped of their artillery.

The offensive began on Sept. 1, as the British 27th Div. made

a feint attack in the Vardar valley to divert the enemy's attention, and on the night of Sept. 14 a heavy bombardment was begun on the real front of attack. Next morning at 5.30 A.M. the French divisions assaulted and after hard fighting gained the Dobro Polje ridge, the Sokol also falling by the evening—opening a path for the Serbian divisions of the I. Army, hitherto in reserve, to be pushed through. At the same time the Serbian II. Army advanced to the attack. By nightfall on Sept. 16 a penetration of 5m. had been made.

The Serbian troops now wonderfully inspired by success and the sight of their homeland, swept forward with such *élan* that by the night of Sept. 17 they were 20m. forward, and the breach had been expanded to 25m. by Greek and French divisions on the flank. After the initial clash resistance was feeble, partly because the mountains hampered the lateral movement of reserves. By Sept. 19 the left wing of the attackers had reached across the Crna, while the right wing was rolling up the front eastwards towards the Vardar, and between the two wings the Serbian cavalry had penetrated to Kavadarci in the apex of the Crna-Vardar triangle. Meanwhile on Sept. 18 Milne's troops attacked on the whole front from the Vardar to Lake Doiran in order to prevent the Bulgarians withdrawing troops to dam the breach west of the Vardar. Facing the British were the pick of the Bulgarian troops and also the strongest fortified positions, so that although they penetrated the enemy's lines along most of the front, it was little wonder that lack of reserves and artillery compelled them to yield up the larger part of their gains. But they had fulfilled their mission of pinning down the enemy including the reserves during these critical days, Sept. 18 and 19, and by Sept. 21 the whole of the enemy's front west of the Vardar had collapsed under the convergent pressure of the exploiting Serbs and of the French on their flanks.

By the afternoon of the same day the collapse had extended to the Doiran-Vardar front, and the British aeroplanes spread considerable havoc among the troops of the Bulgarian VI. Army falling back through the narrow Kosturino pass. Similarly, on the extreme west, facing Prilep, the Italians joined in the advance. From now on the advance became a strategic pursuit, now fast, now slow, in which successive rearguard resistances of the enemy were outflanked. On Sept. 23 the Serbian spearhead reached Gradsko, and Veles three days later. Seizing their opportunity, a French cavalry brigade under Gen. Jouinot-Gambetta made a dash for Skoplje (Üsküb), and seized this vital centre of communications, the key to the whole front, on Sept. 29. This definitely separated the XI. Army from the remainder of the Bulgarian forces, forcing them on divergent lines of retreat. To the south-east the British had already invaded Bulgaria itself, taking Strumica on Sept. 26. That night a Bulgarian staff officer arrived at British headquarters to ask for an armistice, and three days later the Bulgarians capitulated, accepting the Allied terms unreservedly. The first national prop of the Central Alliance had fallen. While the reoccupation of Serbia proceeded rapidly, a mixed striking force was rapidly organized under Milne's command to advance through Thrace on Constantinople, and had pressed as far as the Maritsa, seizing the bridgeheads, when Turkey—her force in Syria already annihilated by Allenby—surrendered on Oct. 30. (*See* WORLD WAR I: *Bibliography*.)

SALSETTE ("sixty-six villages"), a large island in British India, N. of Bombay city, forming a part of Thana district. Area 246 sq.mi. It is connected with Bombay Island and also with the mainland by bridge and causeway. In various parts of the island are ruins of Portuguese churches, convents and villas, while the cave temples of Kanheri form a subject of interest. There are 109 Buddhist caves, which date from the end of the 2nd century A.D. Salsette is crossed by two lines of railway and is being opened up as a residential suburb of Bombay. The island was taken from the Portuguese by the Mahrattas in 1739 and from

them by the British in 1774; it was formally annexed to the East India company's dominions in 1782. There is another Salsette in the Portuguese settlement of Goa.

SALSIFY or **SALSAFY**, *Tragopogon porrifolius*, sometimes called oyster plant or vegetable oyster, a hardy biennial with long, cylindrical, fleshy, esculent roots, which, when properly cooked, are extremely delicate and wholesome; it occurs in meadows and pastures in the Mediterranean region and in Britain is confined to the south of England, but is not native. The leaves are linear-lanceolate. The second season a handsome purplish flower is borne atop a stalk 2-4 ft. high; the mature seed head appears much like that of an enlarged dandelion. Salsify requires a free, rich, deep soil, which should be trenched in autumn, the manure used being placed at two spades' depth from the surface. The first crop should be sown in March and the main crop in April. In rows a foot from each other, the plants being afterwards thinned to 8 in. apart. In November the whitish roots should be taken up and stored in sand for immediate use, others being secured in a similar way during intervals of mild weather. Salsify is widely naturalized as a wayside weed in the United States and Canada. In the United States, salsify is widely grown in home gardens but is of little importance as a market vegetable. It is sown about the average date of last frost in the spring, in rows about 1½ ft. apart and thinned to 3-4 in. apart. It requires the entire growing season to develop. Roots may be harvested and stored in a moist cellar or dug as needed through the winter. The roots are not damaged by freezing of the soil but must not be allowed to freeze after harvest.
(V. R. B.)

SALSOMAGGIORE, a town of Emilia, Italy, in the province of Parma, 6 mi. S.W. of Fidentia by steam tramway. Pop. (1936) 7,751, village; 15,259, commune. It is a popular watering-place. The water is strongly saline and is also used for inhalation. The wells are, some of them, over 2,000 ft. deep and yield illuminating gas and oil as well as water.

SALT, SIR TITUS, BART., 1869 (1803-1876), English manufacturer, was born on Sept. 20, 1803, at Morley, Yorkshire. His success in introducing the coarse Russian wool (*donskoi*) into English worsted manufacture, due to special machinery of his own devising, gave his firm a great impetus. In 1836 he solved the difficulties of working alpaca (*q.v.*) wool, created an enormous industry in the production of the staple goods for which that name was retained and became one of the richest manufacturers in Bradford. In 1853 he opened a few miles out of the city on the Aire, the extensive works and model manufacturing town of Saltaire. He died on Sept. 20, 1876.

SALT. In chemistry the term salt is applied generically to any compound formed by substituting the hydrogen of an acid by a metal or a group of elements acting as a metal. (*See* ACID.) Common salt, or, simply, salt, is the name given to the varied natural and industrial forms of sodium chloride, NaCl. Pure sodium chloride is made by passing dry hydrogen chloride gas into a saturated solution of commercial salt, when the purified substance is deposited in the form of a colourless crystalline powder. It crystallizes in cubes (*see* below, under Rock Salt) which melt at about 800° C, that is, at bright red heat, and begins to volatilize at a slightly higher temperature. It dissolves readily in cold water and a little more readily in hot water; 100 parts of water dissolve 35.52 parts of salt at 0° C, 39.16 parts at 100° C, and 40.35 parts at 109.7° C, the boiling point of the saturated solution. If a saturated solution in water be cooled to -10° C, a crystalline hydrate, NaCl·2H₂O, separates. (*See* HYDRATE.) Solution of salt in water is accompanied by reduction of temperature: 36 parts of salt in dissolving in 100 parts of water at 12.6° C lower the temperature to 10.1° C. If the same proportion of salt and snow be intimately mixed the temperature falls to -21.3° C.

Salt occurs in the sea, in natural brines and in the crystalline form, as rock salt. Its most abundant source is the ocean. Assuming that each gallon of sea water contains 0.2547 lb. of salt, and allowing an average density of 2.24 for rock salt, it has been computed that if dried up the entire ocean would yield no less than 4½ million cubic miles of rock salt or about 14½ times the bulk of the entire continent of Europe above high-water mark, Natural

brines having commercial importance are those of Austria, France, Germany, of Kharaghoda and Kuda in India, of Michigan, New York State, Ohio, Pennsylvania, West Virginia, and the salt lake of Utah in the United States, and the Dead sea. In Great Britain salt brines are met with in Cheshire, Worcestershire, Lancashire and Yorkshire, and have been found by deep boring in Derbyshire, Staffordshire and Midlothian. Salt in solution is accompanied by the chlorides and sulphates of potassium, calcium and magnesium; in many cases the valuable element bromine occurs, probably in the form of magnesium bromide.

Sea water contains on the average about 3.33% of solids, but the concentration of salts varies from about 2.9% in the polar seas to 3.55% and upwards at the equator. Enclosed seas such as the Mediterranean and Red seas contain a higher proportion of salt than the open ocean at the same latitude. (See OCEAN.) From Dittmar's analyses of sea water taken during the "Challenger" expedition, the average composition of the solids in sea water may be considered to be: sodium chloride 2.60%, magnesium chloride 0.31%, magnesium sulphate 0.22%, calcium sulphate 0.12%, potassium chloride 0.07% and magnesium bromide 0.007%. The mixed salt obtained by evaporation of sea water has, however, the following composition irrespective of the source of the sea water: sodium chloride 77.82%, magnesium chloride 9.44%, magnesium sulphate 6.57%, calcium sulphate 3.44%, potassium chloride 2.11%, magnesium bromide 0.22%, and some calcium carbonate.

Natural Brines.—The Dead sea, which covers an area of about 340 square miles, contains approximately 11,600 million tons of salt, and the River Jordan, which contains only 35 parts of salt per 100,000 of water, adds each year 850,000 tons of salt to this total. The composition of Dead sea water is given in the following table:

DEAD SEA WATERS	Surface water	Deep water (250 ft.)
	Specific gravity	1.1651
Sodium chloride	6.11%	7.20%
Potassium chloride	0.85	1.25
Magnesium bromide	0.38	0.61
Magnesium chloride	9.46	13.73
Calcium chloride	2.63	3.82
Calcium sulphate	0.11	0.05
Totalsolids	19.54	26.66

The concentration of salts in the Dead sea increases to a depth of about 250 feet, after which it remains practically constant. At this depth and below it is a concentrated solution, which, indeed, is supersaturated when pumped up, for a slight deposition of salt takes place owing to diminished pressure. Noteworthy features of Dead sea water are its relative freedom from sulphates and the high proportions of potash and bromide. These factors, coupled with the circumstance that atmospheric conditions in Palestine are favourable to solar evaporation for about 8 months of the year, indicate that the production of salt, potash, and even bromine is feasible in the Dead sea area, the process as regards salt and potash being similar to that described below under Manufacture. The brines at Kharaghoda resemble sea water in the character of their dissolved salts, but are much more concentrated, and in some cases practically saturated as shown by analysis No. 2.

KHARAGHODA BRINES	1	2
	Specific gravity	1.134
Sodium chloride	13.15%	14.52%
Potassium chloride	0.29	0.78
Magnesium bromide	0.01	0.15
Magnesium chloride	2.05	9.48
Magnesium sulphate	1.19	0.85
Calcium sulphate	0.33	0.33
Calcium carbonatt	0.01	0.02
Totalsolids	17.07	26.13

The following table gives the composition of some concentrated natural brines used for the production of salt in various countries.

CONCENTRATED NATURAL BRINE	Droitwich	Winsford	Syracuse, N.Y.	St. Charles, Mich.	Artern, Saxony	Friedrichshall, Württemberg
	%	%	%	%	%	%
Sodium chloride	24.97	25.46	21.71	22.84	25.27	25.49
Sodium sulphate	0.26
Potassium chloride	0.12	..
Potassium sulphate	0.29	..
Magnesium bromide	0.26
Magnesium chloride	0.05	0.21	0.14	4.03	0.42	0.01
Calcium sulphate	0.37	0.45	0.50	0.20	0.40	0.44
Calcium chloride	0.19	0.77
Total solids	25.65	26.11	22.54	28.10	26.50	25.54

Certain natural brines occurring in England and the United States are of interest, not only from the economic point of view, but also because they contain salts not usually found in brines, such as the chlorides of barium and strontium; when salt is produced from such brines special methods of manufacture are adopted. In Great Britain these brines were found at great depth in boreholes in Derbyshire, Staffordshire and Midlothian during the search for petroleum wells. In America they occur in the Ohio valley district of West Virginia and in Ohio, at depths ranging from 1,100 to 1,600 feet.

	Renishaw, Derbyshire	West Calder, Scotland	Pomeroy, Ohio	Malden, W. Virginia
Depth (feet)	3,198	3,910
Specific gravity	1.127	1.063	1.075	1.063
Sodium chloride	10.28%	6.26%	7.92%	6.01%
Potassium chloride	0.03	0.04	0.04	0.06
Magnesium bromide	0.11	0.07
Magnesium chloride	0.84	0.55	0.57	0.50
Calcium chloride	4.23	1.34	1.36	1.49
Strontium chloride	0.12	0.16	0.03	0.02
Barium chloride	0.14	0.07	0.04	0.07
Total solids	15.75	8.49	9.96	8.15

It has been suggested that the foreign brines, characterized by the absence of sulphates and carbonates, have been produced by a natural process akin to the "Permutit" process for softening water.

Rock Salt, mineralogically termed halite, crystallizes in the cubic system, the more usual form being a cube, but octahedral, dodecahedral, tetrahedral and hexoctahedral faces sometimes occur. The word halite is sometimes used as a group name to include a series of haloid minerals, of which rock salt is the type. Rock salt commonly occurs in cleavable masses, sometimes in laminar, granular or fibrous form, the last being known as "hair salt." The crystals, which occasionally have distorted or cavernous faces, possess a perfect cubic cleavage, exhibit conchoidal fracture and are rather brittle; the specific gravity varies from 2.1 to 2.6 and the hardness is 2.5 on the scale of Mohs.

Rock salt is colourless and transparent when pure, but is frequently red, yellow or brown, and more or less opaque owing to the presence of impurities such as lime and magnesium salts, with marl and iron oxide as insoluble impurities. The proportion of sodium chloride varies from 94.5% upwards, depending on the proportion of the foregoing impurities.

Rock salt occasionally exhibits double refraction, due perhaps to natural pressure. In some crystals small cavities are present, and these may contain saline solutions or gases such as carbon dioxide, CO₂, and volatile hydrocarbons. Some crystals (Knistersalz) decrepitate on being dissolved owing to the escape of condensed gases. Pure rock salt is essentially sodium chloride, but it generally contains magnesium salts, and these impurities cause it to be deliquescent. Rock salt is highly diathermanous, or capable of transmitting heat rays and the shorter infra-red rays. This property is utilized in investigations of infra-red radiation up to

about 16μ , and large rock salt prisms have been used for this purpose with faces up to 6". The refractive index of rock salt varies from 1.54431 at wave-length 0.5893μ (yellow light) to 1.44102 at 15.9116μ (infra-red).

Rock salt is occasionally found as a sublimate on lava, as at Vesuvius, where it is associated with potassium chloride, but it occurs mostly in bedded deposits, often lenticular in shape and sometimes of great thickness. These deposits are generally associated with other minerals such as gypsum, anhydrite, sylvine, carnallite and kieserite. The associated minerals are compounds of calcium, magnesium, and potassium, and it is inferred therefrom that rock salt has been formed by the evaporation of inland seas such as the Dead Sea and the Great Salt Lake of Utah, or perhaps in some cases by the extreme desiccation of an arm of the sea, such as the Kara Bughaz, which forms a natural salt-pan on the east side of the Caspian sea. Such beds of salt are found in strata of very varied geological age; the Salt Range of the Punjab, for instance, is probably of Cambrian age, while the famous salt deposits of Wieliczka near Cracow have been referred to the Pliocene period. In many parts of the world, including the British area, the Triassic age offered conditions especially favourable for the formation of large salt-deposits. In England all the known deposits of rock salt occur in the New Red Sandstone, and with one doubtful exception are of Triassic age. The great salt deposits of Prussian Saxony are of Permian age (Zechstein), whilst those of Bavaria and of Tirol are Triassic. In the United States of America salt is found in strata of very different ages: the Silurian in New York, Michigan and north Ohio; the Carboniferous in Pennsylvania; the Permian in Kansas, Texas and New Mexico; the Jurassic in Utah; the Tertiary in Louisiana, Idaho and Wyoming; and the Recent deposits of Oklahoma, Nevada and other western-states.

Manufacture.—At one time almost the whole of the salt in commerce was produced from the evaporation of sea water, and sea salt still forms a staple commodity in many maritime countries, especially where the climate is dry and the summer of long duration. Commercial salt is mainly manufactured from two sources, (1) natural brine and (2) rock salt.

(1) *From Natural Brine.*—When an aqueous solution of several salts is evaporated, the salts separate in the order of their solubility, the least soluble salt being deposited first and the most soluble last. Hence in the case of sea water and brines the order of deposition is calcium carbonate, calcium sulphate, sodium chloride, magnesium sulphate, carnallite (potassium magnesium chloride) and finally magnesium chloride. These salts are not, however, deposited completely within sharply defined limits of concentration; there is some overlapping and each salt is contaminated to a greater or less extent with others. Further, when solar evaporation is employed the difference of temperature between day and night will affect the character of the salt deposited. The art of the salt-maker is to produce grades of salt suitable for the particular use to which it is to be put; e.g., table salt, industrial salt, fish salt.

Salt is produced by solar evaporation from sea water in France, Portugal, Spain, Italy, India, California and China, and from natural brine or salt lakes in India, Russia and the United States. The process generally adopted is similar in principle, although details of evaporating pans and of manufacturing plant vary with local conditions. A preliminary concentration is usually carried out by allowing the brine to flow through a series of channels to concentrating ponds constructed of wood, puddled clay or concrete. The areas of the ponds vary from 280 to 20,000 sq. feet in different countries. The solution is concentrated first to specific gravity of about 1.21. At this stage suspended impurities (sand and clay) and the less soluble salts (calcium carbonate or chalk and calcium sulphate, gypsum and anhydrite) are removed. The clear brine is now run successively into crystallizing pans, usually three, of similar construction to the evaporating pans, where the salt is deposited. The total area of crystallizing pans is approximately one tenth of that of the evaporating pans. In the first crystallizing pan the brine is concentrated to a specific gravity of 1.25 and here the finest grade of salt is produced. The mother

liquor reaches a specific gravity 1.26 in the second pan, where the second grade of salt separates. In the third pan a specific gravity 1.275 is attained when the coarsest salt is deposited. The final mother liquor, termed bitters, is used in some countries, e.g., France, India and America, for the manufacture of potash, bromine, Epsom salts and magnesium chloride.

The salt from each crystallizing pan is raked into rows and allowed to drain for some days, then collected into heaps, drained again, lifted from the pans, washed and finally dried. As in most European countries a tax is levied on salt, it is obviously of advantage to trade in the dried material. The salt from the first pan is frequently utilized locally as table salt, that from the second pan goes as a rule into chemical industry, and that from the third pan is used for pickling fish, refrigerating, and as bath salt. Typical compositions of the salts thus produced are given in the following table:

	Grade I.	Grade II.	Grade III.
	%	%	%
Sodium chloride	96.0	95.0	91.0
Calcium sulphate	1.0	0.9	0.4
Magnesium sulphate	0.2	0.5	1.0
Magnesium chloride	0.2	0.5	1.2
Insoluble matter		trace	0.2
Water (moisture)	2.6	3.1	6.2

In England, Germany, most of the eastern states of the United States and elsewhere where it is impracticable to manufacture salt by means of solar heat, the brines are concentrated by artificial heat. Formerly the brine was concentrated in open pans over a fire until crystallization of the salt occurred. More recently steam jacketed vessels were used, but now much of the salt produced in colder countries is manufactured in triple-effect vacuum pans. In the older method the brine, natural or artificial, is first pumped into settling tanks, where lime and magnesium salts may be precipitated by the addition of milk of lime. The excess of lime is then removed by soda ash and, after settling, the brine is delivered into the steam-heated evaporating pan (grainer) at approximately the same rate as that at which evaporation is taking place, and at a temperature only slightly below that of the brine in the grainer. To obtain a high-grade salt the bitters are removed every day, but at less frequent intervals for coarser salt. The bitters may be further concentrated by waste steam in a separate or "dividend" grainer, when salt suitable for refrigerating is deposited. Where multiple-effect vacuum evaporators are employed, the vacuum in each vessel is so adjusted that the steam from the first vessel is sufficiently hot to boil the brine in the second vessel, and so on. In a triple-effect system, vacua of 15, 24 and 27 inches of mercury have been found efficient, the vacuum of the third vessel representing a high degree of evacuation. With ordinary open pans, one ton of coal will produce about 2 to $2\frac{1}{2}$ tons of salt, whereas it will yield 5 to 6 tons of salt with an efficient triple effect plant.

In France and Germany weak brines which could not profitably be used for salt making with the aid of artificial heat are first concentrated by a natural process. The brine is pumped to the top of a tower-like structure of scaffolding enclosing brushwood and is distributed by means of a spray over the top of the brushwood. Exposure to air and wind during the trickling down rapidly concentrates the brine which is collected in a trough and sprayed again over the brushwood until the liquor is sufficiently strong to be used in the ordinary concentrating pans. The brines at Pomeroy, Ohio, containing notable quantities of barium chloride were formerly concentrated in steam jacketed vessels without treatment to remove this salt, but it is now customary to separate barium by a preliminary addition of "salt cake" (sodium sulphate) when the precipitated barium sulphate is removed by sedimentation or filtration. By this procedure the barium chloride content of the first-grade salt has been reduced from 0.2% to negligible traces.

(2) *Manufacture from Rock Salt.*—In the Middlesborough

district of England and similar localities, fresh water is allowed to run down boreholes to the underground salt beds, remaining there until it is saturated with salt. This artificial brine is then pumped up and the salt crystallized from heated pans in the manner already described. White salt made from rock-salt is usually classified into boiled or fine, table, lump, stoved lump, superfine, basket, butter and cheese salt, unboiled and common, chemical, fishery, Scotch fishery, extra fishery, double extra fishery and bay salt. These names are derived from the size and appearance of the crystals, from their modes of production and their uses. The small crystals of boiled salts are formed in a medium constantly agitated by boiling. The fine or stoved table salts constitute the familiar white masses. Basket salt takes its name from the conical baskets in which it is allowed to drain when first drawn from the pan. Butter and cheese salts are not stove-dried, but left in moist condition, being thus more easily applied to their respective uses. Of the unboiled salts, the first two show by their names the use to which they are applied, and the others merely depend for their quality on the length of time which elapses between successive "drawings," and on the temperature of evaporation, which varies from 55° to 180° F (13° to 82° C). The time for unboiled salts varies from 12 hours to 3 or 4 weeks, the larger crystals requiring the longer time.

Where the rock-salt is of high degree of purity, as in the United States and in Galicia, the salt is ground and sieved, and comes on to the market without further treatment. A great drawback to this kind of salt is its tendency to revert to hard masses when kept in sacks. The mined salt in lumps of about 1 ft. diameter is first coarsely crushed and riddled. The coarser material is ground between rollers and the whole of the ground salt screened to four sizes, namely, oversize, no. 2, no. 3 and C.F. (common fine). The last may be further screened into three sizes including "packers fine" while the oversize is frequently sent back to the mill. In Germany a similar process is adopted, but coarser fragments of impurities such as anhydrite and gypsum are picked out by hand as the coarsely crushed rock-salt is carried past the workers on a travelling band or belt. The less pure forms of German rock-salt are purified by fusion, either alone or with soda ash and silica, or with chalk and saltpetre. In some cases the fused mass is subjected to a blast of compressed air to burn away carbonaceous matter, leaving a clear, white melt, which crystallizes on cooling. After separation from the slag by concussion, the salt is ground and sieved. Alternatively, an impure salt is digested with a saturated solution of pure salt in dilute hydrochloric acid, whereby impurities such as gypsum, magnesium salts and iron oxide are dissolved. The treated salt is filtered, washed with a saturated solution of pure salt, dried, ground and graded for market.

The salt workings in Great Britain represent the annual abstraction of a mass of rock rather more than a foot in thickness spread over a square mile. This displacement leads to grave subsidences so that in certain places—Northwich and Winsford—the damage to property is so great that the houses have to be keyed up with "shaps," "face-plates" and "bolts." Saltmaking is not an unhealthy trade, an occasional slight soreness of the eyes being the only ailment, whereas the atmosphere of steam saturated with salt seems specially preservative against colds, rheumatism, neuralgia and similar troubles.

Uses and Statistics.—Table salt of fine grain and high quality will remain dry and powdery when exposed to the atmosphere, owing to the addition of just sufficient sodium carbonate or trisodium phosphate to combine with such hygroscopic impurities as calcium and magnesium chlorides. Common salt used for various manufacturing purposes is a little coarser in grain than table salt. Fishing salt, a coarse-grained quality used in fish curing, may contain up to about 5% of saline impurities. Bay salt, the coarsest grained variety, contains about 10% of impurities and is used for refrigerating. Salt is used universally as a condiment and preservative. It is employed in the meat packing, fish curing, dairy and pickle industries; for salting cattle, curing hides and refrigerating. It is indispensable to the manufacture of sodium carbonate (washing soda), caustic soda, hydro-

chloric acid, chlorine, bleaching powder, and many heavy and fine chemicals; the glass and soap industries are dependent upon it and it is used also in the glaze and enamel trades. As a flux it enters into metallurgical processes and has been used in the manufacture of cement to aid in the recovery of potash as a by-product. Moreover, it finds a use in farming as an insecticide and a fertilizer, and as a lick stick for cattle.

The table on p. 900 gives (in long tons) the world's production of salt for the years 1923-25. (J. J. F.; A. G. F.)

Ancient History and Religious Symbolism.—Salt must have been quite unattainable to primitive man in many parts of the world. Thus the *Odyssey* (xi. 122 seq.) speaks of inlanders who did not know the sea and used no salt with their food. In some parts of America, and even of India (among the Todas), salt was first introduced by Europeans; and there are still parts of central Africa where its use is a luxury confined to the rich. Indeed, where men live mainly on milk and flesh, consuming the latter raw or roasted, so that its salts are not lost, it is not necessary to add sodium chloride, and thus we understand how the Numidian nomads in the time of Sallust and the Bedouins of Hadramut at the present day never eat salt with their food. On the other hand, cereal or vegetable diet calls for a supplement of salt, and so does boiled meat.

The habitual use of salt is intimately connected with the advance from nomadic to agricultural life, *i.e.*, with precisely that step in civilization which had most influence on the cults of almost all ancient nations. The gods were worshipped as the givers of the kindly fruits of the earth, and, as all over the world "bread and salt" go together in common use and common phrase, salt was habitually associated with offerings, at least with all offerings which consisted in whole or in part of cereal elements. This practice obtained among the Greeks and Romans and among the Semitic peoples (Lev. ii. 13). As covenants were ordinarily made over a sacrificial meal, in which salt was a necessary element, the expression "a covenant of salt" (Numb. xviii. 19) is easily understood; it is probable, moreover, that the preservative qualities of salt made it a peculiarly fitting symbol of an enduring compact, and influenced the choice of this particular element of the covenant meal as that which sealed an obligation to fidelity. Hence the Greek phrase *ἄλας καὶ τράπεζαν παραβαίνειν*, the Arab phrase "there is salt between us," the expression "to eat the salt of the palace" (Ezra iv. 14, R.V.) and the modern Persian phrase *namak harām*, "untrue to salt," *i.e.*, disloyal or ungrateful and many others.

Salt and incense, the chief economic and religious necessities of the ancient world, play a great part in all that we know of the ancient highways of commerce. Thus one of the oldest roads in Italy is the *Via Salaria*, by which the produce of the salt pans of Ostia was carried into the Sabine country. Herodotus's account of the caravan route uniting the salt-oases of the Libyan desert (iv. 181 seq.) makes it plain that this was mainly a salt-road, and to the present day the caravan trade of the Sahara is largely in salt. The salt of Palmyra was an important element in the vast trade between the Syrian ports and the Persian Gulf (see PALMYRA), and long after the glory of the great merchant city was past "the salt of Tadmor" retained its reputation (Mas'ūdī viii. 398). In like manner the ancient trade between the Aegean and the coasts of southern Russia was largely dependent on the salt pans at the mouth of the Dnieper and on the salt fish brought from this district (Herod. iv. 53; Dio Chrys. p. 437). The vast salt mines of northern India were worked before the time of Alexander (Strabo v. 2, 6, xv. 1, 30). The economic importance of salt is further indicated by the prevalence down to the present day of salt taxes or of government monopolies. In Oriental systems of taxation high imposts on salt are seldom lacking and are often carried out oppressively with the result that the article is apt to reach the consumer in an impure state largely mixed with earth. "The salt which has lost its savour" (Matt. v. 13) is simply the earthy residuum of such an impure salt after the sodium chloride has been washed out.

Cakes of salt have been used as money—for example, in Abyssinia and elsewhere in Africa, and in Tibet and adjoining parts.

^Exports for year ending March 31st of year following that stated.

(Excluding production from salt beds,

+Revised figures.

(See the testimony of Marco Polo and Colonel Yule's note on analogous customs down to our own time, in his translation of Polo ii., 48 seq. The same work gives interesting details as to the importance of salt in the financial system of the Mongol emperors: ii. 200 seq.)

In the Roman army an allowance of salt was made to officers and men, from which in imperial times this *salarium* was converted into an allowance of money for salt.

SALTA, a northwestern province of Argentina. Area, 48,872 sq.mi.; pop. (1914) 140,927; 1940 (estimate) 217,565. The western part of the province is mountainous, being traversed from north to south by the eastern chains of the Andes. Indenting these, however, are large valleys or basins, of highly fertile and comparatively level land, like that in which the city of Salta is situated. The eastern part of the province is chiefly composed of extensive areas of alluvial plains belonging to the Chaco formation, whose deep, fertile soils are among the best in Argentina. This part of the province is well wooded with valuable construction timbers and furniture woods. The drainage to the

Paraguay is through the Bermejo, whose tributaries cover the northern part of the province; and through the Pasage or Juramento, called Salado on its lower course, whose tributaries cover the southern part of the province and whose waters are discharged into the Paraná. The climate is hot in summer but mild in winter, and the year is divided into a wet and a dry season. Irrigation is necessary in a great part of the province, though the rainfall is abundant in the wet season, about 21 inches. Fever and ague, locally called *chicho*, is prevalent on the lowlands, but in the mountain districts the climate is healthy. There is considerable undeveloped mineral wealth, but its inhabitants are almost exclusively agriculturists. Its principal products are sugar, rum (aguardiente), wine, wheat, Indian corn, barley, tobacco, various tropical fruits, alfalfa and coffee. Stock-raising is carried on to a limited extent for the home and Bolivian markets. The province is traversed by a Government railway (the Central Northern) running northward from Tucumán to the Bolivian frontier, with a branch from General Guemes westward to the city of Salta (*q.v.*), the provincial capital.

The principal towns are Orán (pop. about 3,000) in the northern part of the province; Rosario de Lerma (pop. 2,500), 30 m. N.W. of Salta; and Rosario de la Frontera (pop. 1,200) near the Tucumán frontier.

Salta was at one time a part of the great Inca empire, which extended southward into Tucumán and Rioja. The first Spanish settlement was made by Hernando de Lerma in 1582.

SALTA, a city of Argentina, capital of a province of the same name, and see of a bishopric, on a small tributary (the Arias) of the Pasage, or Juramento, 976 m. by rail N.N.W. of Buenos Aires. Population 38,574. Salta is built on an open plain 3,560 ft. above the sea, nearly enclosed with mountains. The climate is warm and malarial in summer, but mild and pleasant in winter. Near by is the battle-field where Gen. Belgrano won the first victory from the Spanish forces (1812) in the War of Independence. There is a large mestizo element in the population, and the Spanish element still retains many of the characteristics of its colonial ancestors. Salta was founded in 1582 by Governor Abreu under the title of San Clemente de Nueva Sevilla, but the site was changed two years later and the new settlement was called San Felipe de Lerma. In the 17th century the name Salta came into vogue.

SALTASH, municipal borough, Bodmin parliamentary division, Cornwall, England, 5 mi. N.W. of Plymouth, on the G.W. railway. Pop. (1938) 6,736. Area 9.8 sq.mi. It is on the wooded shore of the Tamar estuary, on the lower part of which lies the port and naval station of Plymouth. Local communications are maintained by river steamers. At Saltash the Royal Albert bridge (1857-59) carries the railway across the estuary. The church of St. Nicholas and St. Faith has an early Norman tower. The church of St. Stephen retains its ornate Norman font.

Saltash (Esse, 1297; Ash, 1302; Assheburgh, 1392) belonged to the manor of Trematon and at the Domesday survey was held by Reginald de Valletort. Reginald's descendant and namesake granted a charter to Saltash about 1190. This charter was confirmed in the fifth year of Richard II. Roger de Valletort gave the borough of Saltash to the earl of Cornwall. Thenceforth the earls and subsequently the dukes of Cornwall were the lords of Saltash. The privilege of parliamentary representation was conferred by Edward VI. In 1584 Queen Elizabeth granted a charter of incorporation to Saltash. This was superseded by another in 1683 but the modern charter was adopted in 1886. In 1832 Saltash was deprived of its two members.

SALT-BUSH, the name given especially in Australia to plants of the genus *Atriplex* (family Chenopodiaceae), which inhabit arid saline soils, notably to *A. halimoides* and *A. nummularia*, which are cultivated for forage. *A. semibaccata*, also native to Australia, is grown as a forage plant in California, where it is known as Australian salt-bush. (See GREASEWOOD.)

SALTILLO, a city and the capital of the state of Coahuila, Mexico, about 615 mi. by rail N. by W. of Mexico City. Pop. (1940) 49,658. Saltillo is on the Mexican National railway and another railway connects it with the important mining and industrial town of Torreón, on the Mexican Central. The city is on the great central plateau of Mexico, about 5,200 ft. above sea level. It has a cool and healthy climate. Saltillo is an active commercial and manufacturing town, railway centre and the seat of a yearly fair of importance. Its manufactures include cotton and woollen fabrics, knitted goods and flour. The woollen *zarapes* or *ponchos* of Saltillo are among the finest produced in Mexico. There are undeveloped coal deposits in the vicinity.

Saltillo was founded in 1586 as an outpost against the Apache Indians. It became an incorporated city in 1827. In 1824 the capital of the state of Coahuila and Texas was at Saltillo. A partisan controversy removed the seat of government to Monclova in 1833, but it was returned to Saltillo in 1835. The battle of Buena Vista was fought near there on Feb. 22-23, 1847.

SALT LAKE CITY, the capital city of Utah, U.S.A., and the county seat of Salt Lake county, on the Jordan river, 11 mi. E. of Great Salt lake, at the foot of the Wasatch mountains, about equally distant from Denver, Los Angeles, San Francisco and Spokane. It is on federal highways 30 (the Lincoln), 40 and 91; has a modern municipal airport and is the concentration and distribution point for air mail between the Pacific coast and the east; and is served by the Denver and Rio Grande Western, the Union Pacific, the Western Pacific and several electric railways, and by aeroplane lines to Chicago, San Francisco, Los Angeles, Seattle and Great Falls. The population was 118,110 in 1920 (82% native white), 140,267 in 1930 and 149,934 in 1940.

Physical Aspect and Buildings.—Salt Lake City is the largest city between the Rockies and the coast, and is the headquarters of the Church of Jesus Christ of Latter-Day Saints (Mormons), by whom it was founded and who are still the largest single element in the population. It has an area of 52.5 sq.mi., an altitude of 4,255 ft., and is almost surrounded by mountain peaks, some of which reach a height of 12,000 ft. The site was chosen by Brigham Young (q.v.), and the basic plan of the city was determined by the original survey under his direction, which laid it out in ten-acre blocks, separated by streets 132 ft. wide. In one of these blocks (Temple square, originally the centre of the community) stand the great Mormon temple which no "gentile" may enter, built of gray granite (1853-93) with walls six feet thick and six spires, the highest (220 ft.) surmounted by a copper statue of the angel Moroni; the tabernacle (a low building seating 10,000

with a turtle-shaped roof unsupported by pillars or beams) where recitals are given daily on the magnificent organ (5,500 pipes); the assembly hall, also of granite, seating 2,500; a bureau of information and a museum of pioneer relics; the first house built in Utah (enclosed in a protecting shelter); monuments to Joseph Smith and his brother Hyrum; and a monument to the sea gulls which at a critical hour of the early colony's history saved the crops and all the vegetation from destruction by grasshoppers. In the adjoining block are the administration building of the church; Eagle gate, formerly the entrance to Brigham Young's estate; the Beehive house and the Lion house, two of his residences. The state capitol (a fine colonnaded building of marble and Utah granite, completed in 1916) stands half a mile N.E. of Temple square, at the head of State street (a long, straight thoroughfare) on an eminence commanding the entire valley and backed by the mountains.

East of it is Memory grove, a park created in honour of the veterans of the war of 1914-18, at the entrance to City Creek canyon. On the east edge of the city is the 92-ac. campus of the University of Utah (established by the provisional government of the state of Deseret, 1850) with an attendance of over 4,500.

Beyond the university is Ft. Douglas, an air base. At the entrance to Emigration canyon, east of the military reservation, is a point (marked by Pioneer monument) where Brigham Young looked down over the valley and said he recognized the site that had been shown him in a vision.

The state prison stands in the southern part of the city. Public parks and playgrounds cover 3,848 ac. Saltair, 15 mi. west of the city, is a popular pleasure resort on the lake (in which it is impossible to sink, on account of the large amount [about 27%] of salt in the water).

Churches and Schools.—Of the 144 churches, about half are Mormon chapels, and the rest (including a Roman Catholic cathedral) represent most of the faiths and denominations commonly found in American cities. The public-school system comprises 31 elementary, nine junior-high and three senior-high schools, and a part-time school for boys and girls who go to work before the age of 18. There are several private schools; a junior college under Presbyterian auspices (Westminster; established 1897); and various hospitals and charitable institutions. Interest in music, the dance and the drama was fostered from the beginning by Brigham Young. The Tabernacle choir (500 voices) is one of the best choruses in the United States, and the Salt Lake theatre (one of the foremost in design and appointments when it was built in 1862) had a brilliant history. Salt Lake City ranked second among the large cities of the country in the proportion of children and young people attending school and in literacy.

The general death rate and the infant mortality are among the lowest in the country. Since 1911 the city has had a commission form of government. The assessed valuation of Salt Lake county property for 1940 was \$147,383,655.

Commerce and Industry.—Salt Lake City is the commercial, financial and industrial centre of the state of Utah and of a large additional part of the intermountain territory. It is the seat of the fourth branch (established 1918) of the Federal Reserve Bank of San Francisco, serving 31 counties in Idaho and four in Nevada besides the entire state of Utah. Debits to individual accounts in the local banking institutions amounted in 1940 to \$870,831,052. Manufacturing has expanded rapidly since the war of 1914-18. More than 100 national firms have established branch factories or distributing offices there, to supply the natural trade territory of the city (500,000 sq.mi.), and many local industries have extended their markets to cover the country. Among the leading industries are slaughtering and meat-packing, printing and publishing, the refining of oil, the smelting of silver, lead and copper, and the manufacture of beet sugar, candy, flour and radio equipment.

Receipts at the stockyards totalled 1,528,130 head in 1940, of which the local packing plants used 155,000 head. There is an oil refinery covering 120 ac. The suburb of Murray, 7 mi. S. (population in 1940, 5,740), is a great smelting centre.

History. — The history of the city is bound up with that of the Mormons (*q.v.*) and of the State (*see* UTAH). On July 22, 1847, an advance party of Mormons, led by Orson Pratt and Erastus Snow, in search of a place where they might "colonize in peace and safety," entered the Salt Lake valley. On July 24, Brigham Young arrived and approved the site, and on July 28 he chose the spot for the temple. Ploughing and planting were begun forthwith; the hard sun-baked earth was flooded by building a dam in City Creek canyon; and an irrigation system was devised. The city was named the City of the Great Salt Lake, and was so called until 1868. Before the end of 1847 the main body of the people arrived. A theocratic government was set up, with a bishop in charge of each of the 19 wards into which the community was divided. The settlers were American citizens squatting on foreign soil, for the region at that time belonged to Mexico, and they were practically beyond the reach of any civil government, as their leaders had desired. This isolation was of brief duration. The Treaty of Guadalupe-Hidalgo, at the close of the Mexican War, transferred the region to the United States, and after the discovery of gold in California, the city was overrun with caravans of treasure-seekers. Many of the colonists deserted to join the stream of prospectors, notwithstanding the attitude of their leader, who opposed the exploitation of mineral wealth (even in Utah) and whose ideal was a community of farmers, merchants and manufacturers. Those who stayed at home grew rich as outfitters.

There was a considerable immigration from Europe in the early years, especially from England, where the Mormon missions were very successful. By 1850 the city had a population of 6,000.

It was chartered in 1851 by the territorial legislature of Utah. After the Civil War the non-Mormon population steadily increased, and there was a long period of conflict between the opposing elements, as well as officially between the Mormon church and the U.S. government over the practice of polygamy and other matters of dispute (*see* MORMONS), all of which happily is now long past.

SALTO, third city of Uruguay and capital of a department of the same name. Pop. about 35,000. It lies on the Uruguay river opposite the Argentine town of Concordia, 365 mi. by rail from Montevideo and 221 mi. by water from Buenos Aires.

The province of Salto covers 4,865 sq.mi., with a pop. of 96,088 or 19.7 per sq.mi., slightly less than the average for the country, which is 29.0. It is a rolling prairie land, devoted very largely to the raising of high grade cattle with some farms and vineyards about the principal towns. A large proportion of the population are Brazilians as the province borders on Brazil.

SALTON SEA or **SALTON SINK**, a depression in the Imperial Valley, California, whose water surface is 248.7 feet below sea level. Its drainage area of about 7500 sq.m. is mainly desert land and consequently the sink used normally to be dry, though at times the rate of inflow exceeded that of evaporation sufficiently to form a temporary lake. In 1905 during the construction of irrigation works in the valley, the Colorado river left its channel and flooded the sink to a maximum depth of 79 ft. with a surface area of about 330,000 acres. When the river was finally brought back to its proper course the water in the sink began to subside. But after 1920 this tendency ceased, and, fed chiefly by the irrigation ditches of the region, the sea became fairly constant at a level of about 37 feet at its deepest point.

SALTPETRE, the commercial name given to three naturally occurring nitrates, distinguished as (1) ordinary saltpetre, nitre or potassium nitrate, (2) Chile saltpetre, cubic nitre or sodium nitrate (3) wall saltpetre or calcium nitrate. These nitrates generally occur as efflorescences caused by the oxidation of nitrogenous matter in the presence of the alkalis and alkaline earths.

1. Ordinary **Saltpetre** or Potassium Nitrate, KNO_3 , occurs, mingled with other nitrates, on the surface and in the superficial layers of the soil in many countries, especially in certain parts of India, Persia, Arabia and Spain. The deposits in the great limestone caves of Kentucky, Virginia and Indiana have been probably derived from the overlying soil and accumulated by percolating water; they are of no commercial value. The actual

formation of this salt is not quite clear; but it is certainly conditioned by the simultaneous contact of decaying nitrogenous matter, alkalis, air and moisture. The demand for saltpetre as an ingredient of gunpowder led to the formation of saltpetre plantations or nitrieries, which at one time were common in France, Germany and other countries; the natural conditions were simulated by exposing heaps of decaying organic matter mixed with alkalis (lime, etc.) to atmospheric action. The salt is obtained from the soil in which it occurs naturally, or from the heaps in which it is formed artificially, by extracting with water, and adding to the solution wood-ashes or potassium carbonate. The liquid is filtered and then crystallized. Since potassium nitrate is generally more serviceable than the sodium salt, whose deliquescent properties inhibit its use for gunpowder manufacture, the latter salt, of which immense natural deposits occur (*see* below), is converted into ordinary saltpetre in immense quantities. This is generally effected by adding the calculated amount of potassium chloride (of which immense quantities are obtained as a by-product in the Stassfurt salt industry) dissolved in hot water to a saturated boiling solution of sodium nitrate; the common salt, which separates on evaporating the solution, is removed from the hot solution, and on cooling, the potassium nitrate crystallizes out and is separated and dried.

As found in nature, saltpetre generally forms aggregates of delicate acicular crystals, and sometimes silky tufts, but not as distinctly developed crystals. When crystallized from water, crystals belonging to the orthorhombic system, and having a prism angle of $61^\circ 10'$, are obtained; by the evaporation of hot solutions, unstable rhombohedra may be obtained, but these rapidly revert to the more stable form on cooling. The hardness is 2, and the specific gravity 2.1. It is fairly soluble in water; 100 parts at 0°C dissolving 13.3 parts of the salt, and about 30 parts at 20° ; the most saturated solution contains 327.4 parts of the salt in 100 of water; this solution boils at 114.1° . It fuses at 339° to a colourless liquid, which solidifies on cooling to a white fibrous mass, known in pharmacy as *sal prunella*. It is an energetic oxidizing agent, and on this property its most important applications depend. At a red heat it evolves oxygen with the formation of potassium nitrite, which, in turn, decomposes at a higher temperature. Heated with many metals it converts them into oxides, and with combustible substances, such as charcoal, sulphur, etc., a most intense conflagration occurs. Its chief uses are in glass-making to promote fluidity, in metallurgy to oxidize impurities, as a constituent of gunpowder and in pyrotechny; it is also largely used in the manufacture of nitric acid.

Potassium nitrate was used at one time in many different disused conditions, but it is now never administered internally, as its extremely depressant action upon the heart is not compensated for by any useful properties which are not possessed by many other drugs. One most valuable use it has, however, is the treatment of asthma. All nitrites (*e.g.*, sodium nitrite, ethyl nitrite, amyl nitrite) cause relaxation of involuntary muscular fibre and therefore relieve the asthmatic attacks, which depend upon spasm of the involuntary muscles in the bronchial tubes. Saltpetre may be made to act as a nitrite by dissolving it in water in the strength of about fifty grains to the ounce, soaking blotting-paper in the solution and letting the paper dry. Pieces about 2 in. square are then successively put into a jar and lighted. The patient inhales the fumes, which contain a considerable proportion of nitrogen oxides. This treatment is frequently very successful indeed in relaxing the bronchial spasm upon which the most obvious features of an attack depend.

2. Chile Saltpetre, Cubic **Nitre** or sodium nitrate, NaNO_3 , occurs under the same conditions as ordinary saltpetre in deposits covering immense areas in South America, which are known locally as *caliche* or *terra salitrosa*, and abound especially in the provinces of Tarapaca and Antofagasta in Chile, the fields being confined to a narrow strip of country $2\frac{1}{2}$ miles in width and 260 miles in length. The nitrate forms beds, varying in thickness from 6 in. to 12 ft., under a covering of conglomerate locally known as *lostra*, which is itself overlaid by a loose sandy soil. The conglomerate consists of rock fragments, sodium chloride and

various sulphates, cemented together by gypsum to form a hard compact mass 6 to 10 ft. in thickness. The caliche has often a granular structure, and is yellowish-white, bright lemon-yellow, brownish or violet in colour. It contains from 48 to 75% of sodium nitrate and from 20 to 40% of common salt, which are associated with various minor saline components, including sodium carbonate and more or less insoluble mineral, and also some organic matter, e.g., guano, which suggests the idea that the nitrate was formed by the nitrification of this kind of excremental matter. The caliche is worked up in *loco* for crude nitrate by extracting the salts with hot water, allowing the suspended earth to settle, and then transferring the clarified liquor, first to a cistern where it deposits part of its sodium chloride at a high temperature, and then to another where, on cooling, it yields a crop of crystals of purified nitrate. The nitre thus refined is exported chiefly from Valparaiso, whence the name of "Chile Saltpetre." The mother liquors used to be thrown away, but are now utilized for the extraction of their iodine (*q.v.*).

Chemically pure sodium nitrate can be obtained by repeated recrystallization of Chile saltpetre or by synthesis. It forms colourless, transparent rhombohedra, like those of Iceland spar; the crystals are almost cubic: hence the name of "cubic saltpetre." One hundred parts of water at 0° and at 100° dissolve 72.9 and 180 parts of the salt; at 120°, the boiling-point of the saturated solution, 216 parts. The salt fuses at 316°; at higher temperatures it loses oxygen (more readily than the corresponding potassium salt) with the formation of nitrite, which, at very high temperatures, is reduced ultimately to a mixture of peroxide, Na₂O₂, and oxide, Na₂O. The chief applications of Chile saltpetre are in the nitric acid industry, in the manufacture of ordinary saltpetre, and particularly as a fertilizer. When quite pure, it is only very slightly hygroscopic.

3. Wall-saltpetre or Lime Saltpetre, calcium nitrate, Ca(NO₃)₂, is found as an efflorescence on the walls of stables; it is now manufactured in large quantities from atmospheric nitrogen. (See NITROGEN, FIXATION OF.) Its chief applications are as a manure and in the nitric acid industry.

SALT RANGE, a hill system in the Punjab and North-West Frontier Provinces of India, deriving its name from its extensive deposits of rock salt. The range commences in Jhelum district, in the lofty hill of Chel (3,701 ft.), on the right bank of the river Jhelum, traverses Shahpur district, crosses the Indus in Mianwali district, thence a southern branch forms the boundary between Bannu and Dera Ismail Khan until it finally merges in the Waziristan system of mountains. The salt range contains the great mines of Mayo, Warcha and Kalabagh, which supply the wants of all Northern India. Coal of an inferior quality is also found.

SALTYKOV, MICHAEL EVGRAFOVICH (1826–1889), Russian satirist who wrote under the pseudonym of Nicolay Evgrafovich Stchedrin, was born in the province of Tula. Jan. 15 (2 j), 1826. In 1848 he published *Zaputennoye Dyelo* ("A Complicated Affair"), which led to his banishment to Vyatka, where he spent eight years as a minor government official. The clever picture of Russian provincial officials in his *Gubernskie Otcherki* ("Provincial Sketches") resulted from this experience. After an interval given to writing he was appointed deputy governor, first of Ryazan and then of Tver. On his return to St Petersburg in 1864 he was appointed president of the local boards of taxation successively at Penza, Tula and Ryazan. In 1868 he finally quitted the civil service. His principal works are: *Poshekhonskaya Starina* ("The Old Times of Poshekhona"), *Istoria odnava Goroda* ("The History of a Town"); A Satirical History of Russia; *Messieurs et Mesdames Pompadours*; and *Messieurs Golovloff*. He died in St. Petersburg on April 30 (May 12), 1889.

SALUS, an ancient Roman goddess of safety (from defeat, etc.). In 302 B.C. a temple on the Quirinal was dedicated to Salus (Livy x. 1), Salus being identified with Hygieia (*q.v.*). See Wissowa, *Relig. u. Kultus*, p. 131.

SALUTATIONS or *GREETINGS*, the customary forms of kindly or respectful address, especially on meeting or parting or on occasions of ceremonious approach. Etymologically *salutation* (Lat. *salutatio*, "wishing health") refers only to words spoken.

Embraces.—Forms of salutation frequent among savages and barbarians may persist almost unchanged in civilized custom. The habit of affectionate clasping or embracing is seen at the meetings of the Andaman islanders and Australian blacks, or where the Fuegians in friendly salute hug "like the grip of a bear." This natural gesture appears in old Semitic and Aryan custom.

Rubbing Noses.—The salute by smelling or sniffing (often called by travellers "rubbing noses") belongs to Polynesians, Malays, Burmese and other Indo-Chinese, Mongols, etc., extending thence eastward to the Eskimo and westward to Lapland.

Kissing.—The kiss, the salute by tasting, appears constantly in Semitic and Aryan antiquity. Herodotus describes the Persians of his time as kissing one another—if equals on the mouth, if one was somewhat inferior on the cheek (Herod. i. 134). In Greece, in the classic period, it became customary to kiss the hand, breast or knee of a superior. In Rome the kisses of inferiors became a burdensome civility (Martial xii. 59). The early Christians made it the sign of fellowship: "greet all the brethren with an holy kiss." Of more ceremonial form is the kiss of peace given to the newly baptized and in the celebration of the Eucharist, which is retained by the Greek church. After a time, by ecclesiastical regulations, men were only allowed to kiss men, and women women, and eventually in the Roman Catholic Church the ceremonial kiss at the communion was only exchanged by the ministers, a relic or cross called an *osculatorium* or *pax* being carried to the people to be kissed. While the kiss has thus been adopted as a religious rite, its original social use has continued. Among men, however, it has become less effusive. Court ceremonial keeps up the kiss on the cheek between sovereigns and the kissing of the hand by subjects. When these osculations cease to be performed they are still talked of by way of politeness: Austrians say, "*Küss d' Hand!*" and Spaniards, "*Beso a Vd. las manos!*" ("I kiss your hand!"). Stroking, pattings and other caresses have been turned to use as salutations.

Weeping.—Weeping for joy is sometimes affected as a salutation. Highly ceremonious weeping is performed by several rude races when, meeting after absence, they renew the lamentations over those friends who have died in the meantime. Among the Australian natives, the male nearest of kin presses his breast to the newcomer's, and the nearest female relative, with piteous lamentations, embraces his knees with one arm, while with the other she scratches her face till the blood drops. Obviously this is mourning. So, too, the New Zealand *tangi* is performed at the reception of a distinguished visitor, whether he has really dead friends to mourn or not. Weeping, as A. R. Brown has shown, is for the Andamanese a rite for the revival of sentiments that have lain dormant, the renewal of interrupted social relations and for the recognition of a change in personal relations.

Cowering.—Cowering or crouching is a natural gesture of fear or inability to resist. Its extreme form is lying prostrate, face to the ground. In barbaric society, as soon as distinctions are marked between master and slave, chief and commoner, these tokens of submission become salutations. The sculptures of Egypt and Assyria show the lowly prostrations of the ancient East, while in Dahomey or Siam subjects crawl before the king. A later stage is to suggest, but not actually perform, the prostration, as the Arab bends his hand to the ground and puts it to his lips or forehead, or the Tongan would touch the sole of a chief's foot, thus symbolically placing himself under his feet.

Kneeling.—Kneeling prevails in the middle stages of culture, as in the ceremonial of China; Hebrew custom sets it rather apart as an act of homage to a deity; mediaeval Europe distinguishes between kneeling in worship on both knees and on one knee only in homage.

Bowing.—Bowing, as a salute of reverence, appears in its extreme in oriental custom, as among the ancient Israelites: "bowed himself to the ground seven times." The Chinese according to the degree of respect implied bow kneeling or standing. The bowing salutation, varying in Europe from something less than the Eastern salaam down to the slightest inclination of the head,

is given mutually. Uncovering is a common mode of salutation, originally a sign of disarming or defencelessness or destitution, in the presence of a superior. Taking off the hat by men has for ages been the accepted mode in the Western world. Some Eastern nations are apt to see disrespect in baring the head, but insist on the feet being uncovered. Europeans have been called on to conform to a native custom by taking off their shoes to enter the royal presence. In Burma it is respectful to squat in the presence of a superior; elsewhere the inferior should stand.

Handshaking.—Grasping hands appears in antiquity as a legal act symbolic of the parties joining in compact, peace or friendship. In marriage, the hand grasp was part of the ancient Hindu ceremony, as was the "dextrarum iunctio" in Rome, which passed on into the Christian rite and became a mere salutation.

Words of Greeting.—As to words of salutation, even among the lower races certain ordinary phrases have passed into formal greetings. Many formulas express difference of rank and consequent respect, as where the Basuto salute their chiefs with "Tama sevata!" *i.e.*, "Greeting, wild beast!" Congo negroes returning from a journey salute their wives with an affectionate "Okowe!" but they, meekly kneeling round him, may not repeat the word, but must say "Ka! ka!" Among cultured nations, salutations are apt to be expressions of peace and goodwill. Such formulas run on from age to age, and the latter may be traced on to the Muslim greeting, "*Salām* 'alaikum!" ("The peace be on you"), to which the reply is "*Wa-'alaikum as-salām*!" ("And on you be the peace," *sc.* "of God!"). This greeting is a password among fellow believers, for it may not be used by or to an infidel. The Babylonian form, "O king, live for ever!" (Dan. iii. 9), represents a series of phrases, which continue still in the "*Vivat rex!*" ("Long live the king!"). The Greeks said "Be joyful!" both at meeting and parting. The Romans applied "Salve!" ("Be in health!") especially at meeting, and "Vale!" ("Be well!") at parting. In the modern civilized world, everywhere, the old inquiry after health appears, the "How do you do?" becoming so formal as often to be said on both sides, without either waiting for an answer. Hardly less wide in range is the set of phrases "Good day!" "Good night!" etc., varying according to the hour and translated into every language of Christendom. Among other European phrases, some correspond to our "Welcome!" and "Farewell!" while the religious element is exemplified by our "Good-bye!" ("God be with you!") and French "Adieu!"

Such half-meaningless forms of salutation serve the purpose of keeping up social intercourse.

SALUZZO, a city and episcopal see of Piedmont, Italy, in the province of Cuneo, 42 mi. S. of Turin by rail, 1,296 ft. above sea level. Pop. (1936) 10,443, town; 15,938, commune. The upper town preserves some part of the fortifications which protected it when, previous to the plague of 1630, the city had upwards of 30,000 inhabitants. The old castle of the marquises of Saluzzo (the line runs 1142-1548) now serves as a prison. Besides the Gothic cathedral (1480-1511), with the tombs of the marquises, the churches of San Giovanni (formerly San Domenico), San Bernardo and the Casa Cavazza, now the municipal museum, are noteworthy.

Railways run to Cuneo and Airasca (the latter on the Turin-Pinerolo line).

Henry IV restored the marquisate to Charles Emmanuel I of Savoy at the peace of Lyons in 1601.

SALVADOR or **EL SALVADOR** (sometimes incorrectly called San Salvador from its capital city), the smallest and most densely populated republic of Central America and probably the most intensively cultivated country in Latin America.

It is bounded on the north and east by Honduras, on the south by the Pacific ocean and on the west and north-west by Guatemala.

It is the only republic of Central America which has no Atlantic seaboard. The republic is 140 mi. long from east to west, and 60 mi. wide; its greatest length is about 160 miles. Its area is 13,176 sq.mi. (34,126 sq.km.).

Physical Features.—The chief physical features of Salvador are the two mountain chains, largely independent of the central Cordillera of Central America, which cross the country and the rich river valleys (chiefly that of the Rio Lempa). The mountains are accented by a series of volcanic cones, some of ancient and some of recent origin, which cross the country from east to west. Most of the area of the country is comprised in the plateau, some 2,000 ft. high, between the mountain chains, the region in which the coffee of Salvador is cultivated, and in which are situated the volcanoes. The Rio Lempa rises in Guatemala, crosses a corner of Honduras, and entering Salvador near Citala, flows east, forming its famously rich and beautiful valley, turns south at the base of the volcano Siguatepeque, and enters the Pacific at 80° 40' W. The Lempa is the only river of importance, and although it can be navigated for portions of its course, is little used. The Rio San Miguel drains the country between the Bay of Fonseca and the Lempa valley. The volcanoes are clustered into more or less well defined groups, and in some of these beautiful crater lakes are found; the largest of these, Lake Ilopango, has been used as a landing place for seaplanes. The most important volcanic groups are, from west to east: the Izalco group, including Izalco (thrown up in 1770), Marcelino, Santa Ana (8,300 ft.), Naranjos, Águila, San Juan de Dios, Apaneca, Tamajaso and Lagunita; the San Salvador group, 30 mi. east, the chief cone of which is San Salvador; Cojutepaque to the north-east; the San Vicente group farther east, marked by San Vicente volcano and Lake Ilopango; and the San Miguel group, to the south-east, including notable landmarks like San Miguel (7,120 ft.), Chinameca, Buenapa, Usulatan, Tecapa and Taburete. Two other volcanoes, Cacaguatque and Sociedad, in the north-eastern portion of the country, lie in the Cordillera and are not to be taken as part of the Salvador groups proper. Many of these volcanoes are in eruption, and San Miguel has had violent outbursts in recent years. In 1923 Mount San Salvador suffered an eruption which destroyed the coffee crop and damaged the city. But plants whose crops are destroyed by eruptions of volcanic dust invariably come up again with renewed vigour.

Climate—Salvador has, in general, a climate similar to that described under Central America, but locked in as it is by the Cordillera which marks its boundaries with Guatemala and Honduras, it has an almost temperate climate, on the table-land and along the mountain slopes, which are intensively cultivated for coffee, often to the very summits of the hills or volcanoes. The lowland is often hot and sultry when the winds are not blowing. The recognized seasons are the wet and the dry, the wet season, from May to October, being confusingly called "winter" in Salvador, the dry season, from November to April, "summer." Winds and thunderstorms mark the middle of the wet season, in July and August, and in September and October the rains are almost continuous, but moderate. Following the August storms, there is a brief dry spell, the "dog days," *veranillo* or "little summer," when crops are planted and preparations made for obtaining the greatest productivity from the soil. In the earlier days, when Salvador suffered from revolutions, there was a tradition that no revolution could be fought during the *veranillo*, as both armies insisted on returning home to attend to their planting. The geology, flora and fauna of Salvador are described in the article CENTRAL AMERICA.

Inhabitants.—The population was 1,459,578 by the census of 1930, and officially estimated in 1940 as 1,787,930 (a density of 135.7 per sq.mi.), more than double the 1887 population of 664,513. A large proportion of the people live on farms, and the number of landowners includes a very large number of small landholders; these small farmers raise coffee and sugar which is milled in larger properties or *centrals*, which buy the crop or prepare it for the market on a percentage basis. In 1938, 60.5% of the population was rural, 39.5% urban. The chief cities are San Salvador, the capital, 100,796; Santa Ana, 44,981; Nueva San Salvador (Santa Tecla), 23,276; San Miguel, 18,854; Sonsonate, 16,851; Cojutepaque, 14,579; Ahuachapán, 13,170; San Vicente, 12,759. The principal ports are: Acajutla (pop. 1,448) and La Unión (pop. 5,756).

The people of Salvador are made up of white, chiefly Spanish, stock (about 10%); mixed blood, Spanish and Indian (about 50%) and Indian (40%). There are very few Negroes. The rulers are chiefly of the white group, and this strain is jealously guarded; the large coffee planters are whites of Spanish colonial origin, there being some foreigners. The Indians of Salvador constitute an important element of the population, being industrious, efficient and commanding, as a class, higher wages on the plantations than the mixed bloods of similar social groups; Indian villages are still largely segregated by their own choice, but they have their own little coffee farms and work at

wages, with their families, for the white owners of the larger estates.

Government.— The present constitution was adopted Jan 20, 1939, and provides for division of the government into executive, legislative and judicial branches. The legislative body is a unicameral congress which meets in regular session twice a year. Voting is obligatory for every male citizen of 18 years or over. Since 15.3% of the total population voted in 1931 and 21.3% in 1935, it would appear that this provision is not enforced. The president is elected by popular vote for a term of six years, and is ineligible to succeed himself. The Constitution of 1939 specifically waived this provision in the case of the incumbent, General Maximiliano Hernández Martínez. In the event of death, disability or removal of the president, an *interim* president is elected by the cabinet, chief justice and congress. A new election must then be held within six months, and the new president's six-year term begins the following January 1. The president has four cabinet officers, who may attend sessions of congress and answer questions submitted them there. The judiciary is composed of a supreme court, two courts of third instance and several of first and second instance. The supreme court is made up of a chief justice and six judges from the court of third instance.

Defense.— The defensive forces consist of the permanent army, limited to 3,000 men, a militia and a national guard. The 1938-39 budget allotted 3,584,000 colones for national defense.

Education and Religion.— In 1938 there were 1,160 public schools with 2,086 teachers and 89,839 enrolled pupils, 97 private schools and 99 municipal schools. In secondary education there were, in 1937, 51 establishments, including two normal schools. The National university had 598 students and 89 faculty members in 1937. The Roman Catholic religion prevails, although there is freedom of worship. The church is headed by an archbishop at San Salvador and bishops in Santa Ana and San Miguel.

Industry and Agriculture.— Salvador aspires to become an industrial country, and the dense population, the character of the people and the geographical location tend to make this a likelihood of the future, when indeed electric power may possibly be developed in industrial quantity from such sources as Lake Ilopango, although the danger of earthquakes which would destroy reservoirs makes capital timorous in this direction. Meanwhile, although there are local manufacturing industries, Salvador is an agricultural state chiefly and produces coffee, sugar and specialties in quantities which make it an important factor, in proportion to its size, in world markets. Coffee is the chief crop, the exports amounting to 59,309 short tons (1938), providing more than 87% of the export value. Sugar is second, with production of 33,069 short tons. Maize, which is shipped to neighboring Central American countries, including Costa Rica and Nicaragua, is third. Beans are a similar food crop, and some wheat is also exported. Of the specialties, balsam of Peru and indigo are the chief, and both are important. Balsam (*q.v.*), a healing drug, is produced solely in Salvador, the misnomer coming down from early Spanish days, when Peru was best known. There is some mining, about 200 mining establishments being listed as in operation, but the total exports, chiefly gold, reach only about 9,000 oz. annually.

Commerce and Trade.— With 80% to 90% of all exports made up by coffee, Salvador's prosperity is dependent upon the size of her coffee crop and the world price. Before World War II the heavy overproduction of this commodity had affected the country's economy. Nevertheless, in terms of U.S. dollars, the value of foreign trade has increased. The following data show the tendencies:

Country	Imports (in 000's of dollars)		Exports (in 000's of dollars)	
	1937	1938	1937	1938
United Kingdom	1,134	833	172	151
France				
Germany	3,109	1,926	1,731	1,079
Italy	205	480	412	86
Japan	14	3	3	4
United States	4,034	4,275	9,413	6,759
Total	9,982	9,147	15,514	10,946

Communications.— The interior is well supplied with railways and with highways. The Salvador railway was opened in 1882, and the International railways finished their Salvador line to La Unión in 1922 and connected up with the Guatemala line in 1929. There is a short railway to Santa Tecla, near San Salvador, a line which is projected to be continued to La Libertad at some future date. The highways have been well developed, the older, dirt roads having been built and kept up for many years, and in recent years, paved city streets and properly graded and surfaced highways having opened up the interior. The highway to La Libertad from San Salvador has been built and improved twice since it was first projected.

Salvador has been the most active of all Central American countries in constructing its portion of the Inter American highway. By 1939, 72 mi. were paved, 48 mi. open for all weather, 53 mi. in dry weather only and only 8 mi. unimproved. On July 31, 1939, the total length of all national highways was 2,203 mi., of which 1,537 mi., including 134 mi. of pavement, was open in all weather. Local roads aggregated an additional 1,269 mi.

Finance.— The monetary unit is the *colón*, stabilized at 40 cents U.S. The public debt comprises (1939): internal, 5,886,000 colones; external, \$12,112,485 (U.S.) and ₡853,140. Most of the external dollar debt has been in default since 1933.

Over half of the national revenues normally come from customs receipts. Revenues have exceeded expenditures since 1936. The 1938-39 budget, however, took cognizance of accumulated surpluses (1,509,000 colones), and estimated 15,845,000 colones revenues, and 17,325,000 colones expenditures. The 1940 budget estimated: receipts, 21,321,650 colones; expenditures, 21,117,073 colones.

History.— Salvador was conquered by Pedro de Alvarado, Cortés' doughty lieutenant, who invaded the present republic in 1524 and early the next year met and defeated the Indians and captured their capital, Cuscatlán, placing the rule of the new region under the captain-generalcy of Guatemala. Salvador declared her independence from Spain with the other countries of Central America (*q.v.*), on Sept. 15, 1821, and her history was that of Central America during the early period. Her independent career has been marked by numerous revolutions and wars against other Central American countries. Through World War I, apparently following Mexico's example, she remained neutral, and later requested the United States to explain a reifference in the Versailles treaty to the Monroe Doctrine.

What was hailed as her first free election in almost 20 years was held in Jan. 1931 when Arturo Araujo was chosen president. Economic distress, however, combined with the general surge of reform spirit throughout Latin America led in December to the government's overthrow and the elevation of Gen. Maximiliano Hernández Martínez to the presidency. For several years this administration was embarrassed by a refusal of its neighbours and the United States (pursuant of a treaty of 1923) to recognize it. Martínez, nevertheless, managed to stay in office until 1934, when recognition was accorded. Since that time he has dominated the political life of the country. In 1935 he was re-elected without serious opposition, and in Jan. 1939 a constituent assembly which met to draft a new constitution specifically elected him for a further six-year term. A feature of President Martínez's first administration was the signing of a treaty with Guatemala (April 9, 1938), under which the long-standing boundary controversy between the two countries was settled. In the year 1939 the country formally withdrew from the League of Nations.

Martin, Salvador of the *Twentieth Century* (1911). (See also CENTRAL AMERICA: Bibliography.) (L. W. BE.)

SALVADOR or **BAÍA**, the oldest city of Brazil, for 250 yrs. the capital of the country and now the capital of the state of Baía, was founded by Thomé de Souza in 1549. Lat. 13° S. and long. 30° 31' W. Pop. (1940) 294,253. A picturesque and bluff-formed peninsula extending southward, ranging from slightly above sea level to 250 ft., separates Todos Santos bay, a deep body of water 25 mi. long and 20 mi. wide, from the Atlantic ocean. Salvador is situated on the inner side of the peninsula, facing west. Mean temperature 78° F. Annual rainfall 52 in. Having outgrown its original bay-level site, the city today extends well over higher levels. Lower and upper sections are connected by elevators and by graded and winding roads. Narrow streets, principally old business structures and some residences, warehouses, commercial activity, new docks and shipping services typify the lower city. On upper levels there are new parks, modern streets and boulevards, fine residences, flower gardens, modern shops, hotels, schools, theatres, churches. Electric car lines radiate to suburbs, and motor vehicles are increasing in number. Recent years have been marked by the construction of modern homes of the better class, miles of underground sewerage, a water system, suburban highways. Sanitary and health conditions are greatly improved; smallpox and other diseases are eliminated or under control. A railway to Joazeiro, 350 mi., connects with steamer service on the São Francisco river; also there is rail connection to Lençóis, Toca da Onca and the state of Sergipe, all of which provide outlets for agricultural products via Salvador. During the period 1900 to 1920 the population of Salvador showed a substantial increase of nearly 30%. Since that time (1920-40) the population has virtually remained static, the increase being less than 5%. Most marked advances of recent years are the extension of paved streets, modern business houses, further extension of electricity for domestic purposes and numerous civic improvements. Mule carts and other horse-drawn vehicles are being replaced by automobiles and trucks. Cia Brasileira de Energia operates street cars, telephones and power services. Port improvements, begun in 1909, have made fair progress and when completed will represent an outlay

of \$20,000,000. Ships now dock (instead of anchoring in bay) and cargo is efficiently transferred to and from ships. There are numerous extensive warehouses and mechanical energy is replacing physical labour in handling cargo. During recent years exports from the port have included cacao, hides, tobacco, coffee, sugar, rubber, diamonds, castor oil beans and hard woods. The total of exports for the years 1937 to 1939 amounted to an average of 175,000 tons annually. Manufactured goods imported during the same period of years ranged from 63,000 to 94,000 tons per year. A hundred industrial plants are engaged in manufacture of less complicated commodities. The Brazilian government maintains a dockyard at Salvador; a second one is operated by a British corporation. There is a coaling station with Welsh and other fuels on hand. Smaller vessels are built here and ship repairing occupies the attention of skilled mechanics and many labourers. The financial condition of the state of Baia is good and this reacts favourably on the city's progress.

SALVAGE, includes a service rendered voluntarily by a person by saving life or property from peril, and also the reward for such service and in certain cases the thing saved, as from fire on land. Usually the word is employed in reference to salvage at sea, which has two divisions: (1) civil salvage, (2) military salvage.

Civil Salvage.—This is defined in English law as such a service as may become the ground of a reward in an admiralty court, and arises from the preservation of life or property from dangers of the sea. The jurisdiction to give it is an admiralty jurisdiction. But the right to reward was recognized in the courts of common law before the admiralty court became, as it now is, a part of the High Court of Justice, *e.g.*, by enforcing a possessory lien of the salvor over the salvaged property. The origin of the rule has been traced to the doctrine of Roman law that "spontaneous services" in the protection of lives and property should be rewarded. But that doctrine has not found a place in English law, except as part of the maritime law administered in the court of admiralty. Thus services on land, as in rescuing lives or houses or goods from fire, do not entitle the person rendering those services to reward, unless he has acted under some contract or employment. But at sea or in a harbour or dock the right to reward springs from the service itself if it has been rendered to a ship, or her passengers, crew or cargo, or to property which has been thrown or washed out of her.

The right to salvage for saving lives from ships is the creation of modern statutes. Formerly the admiralty court treated the fact that lives had been saved as enhancing the merit of a salvage of property by the same salvors, where the two could be connected; and so indirectly gave life salvage. And this is still the position in cases where the Merchant Shipping Act of 1894 does not apply. This act (s. 544) applies to all cases in which the "services are rendered wholly or in part within British waters in saving life from any British or foreign vessel, or elsewhere in saving life from any British vessel." Also (s. 545) it can be applied, by Order in Council, to life salvage from ships of any foreign country whose Government "is willing that salvage should be awarded by British courts for services rendered in saving life from ships belonging to that country where the ship is beyond the limits of British jurisdiction." By s. 544 life salvage is made payable "by the owner of the vessel, cargo or apparel saved"; and is to be paid in priority to all other claims for salvage. Where the value of the vessel, cargo and apparel saved is insufficient to pay the life salvage, the Board of Trade may in their discretion make up the deficiency, in whole or in part, out of the Mercantile Marine Fund. The effect of the act is to impose a common responsibility upon the owners of ship and cargo to the extent of their property saved. Whatever is saved becomes a fund out of which life salvors may be rewarded, and to which they are entitled in priority to other salvors. By the Maritime Convention Act 1911 a master who does not render assistance to any person in danger of being lost at sea is guilty of a misdemeanour.

This limitation of the reward to the amount of the property salvaged also applies in the case of salvage of property. The ordi-

nary remedy of the salvor is against the property itself by proceedings in rem, to enforce the maritime lien given him by the law upon that property. This enables him to arrest the property, if within the jurisdiction, into whose hands soever it may have come; and, if necessary, the court will order a sale, and payment of his claim out of the proceeds. The salvor has also a remedy in *personam* against the owners or others interested in the property saved; but it seems that this right depends upon property having been saved, and having come to the owner's hands. The amount which can be awarded is limited by the value of that property.

In order to create a right to salvage lives or property saved must have been in danger—either in immediate peril, or in a position of "difficulty and reasonable apprehension." Danger to the salvor is not essential, though it enhances his claim to reward. Again, the service must have helped towards saving the lives or property. Ineffectual efforts, however strenuous and meritorious, do not give rise to a claim. But the service need not be completely successful. If it has contributed to an ultimate rescue it will be rewarded, though that may have been accomplished by others. And as we have seen, there must have been ultimate success. Some of the property involved in the adventure must have been saved. And its value, or the fund realized by its sale, limits the total of the awards to all the salvors. Cases, of course, occur in which services at sea are employed by ships in danger: as where a steamer with a broken propeller shaft employs another steamer to tow her; or where a vessel which has lost her anchors employs another to procure anchors for her from shore. In such cases the conditions of reward above set out may not apply. Reward may be payable, notwithstanding entire failure or success, by the express or implied terms of the employment. But such a reward is not truly "salvage."

Services that are rendered in the performance of a duty do not bestow a claim to salvage. Thus the crew cannot (while still the crew) be salvors of the ship or cargo; nor can the passengers, unless they have voluntarily stayed on the ship for the purpose of saving her. Nor can a pilot employed as such be salvor, unless he has boarded a vessel in such exceptional circumstances that his doing so for pilotage fees could not reasonably be expected; or unless the circumstances of the service, entered upon as pilotage, have so changed as to alter its character. Again, the owners and crew of a tug employed to tow a ship cannot claim salvage for rescuing her from danger which may arise during towage, unless circumstances have supervened which were not contemplated, and are such as to require extraordinary aid from the tug, or to expose her to extraordinary risk. Officers and crew of a ship of the royal navy may, with consent of the Admiralty, recover salvage when they have rendered services outside the protection which their ship ought to afford. No claim, however, can be made in respect of the ship herself, except she be specially equipped with salvage plant.

The reward depends first, on the degree of the danger to the property salvaged, on its value, and on the effect of the services rendered; next, on the risks run by the salvors, the length and severity of their efforts, the enterprise and skill displayed, and on the value and efficiency of the vessel or apparatus they have used, and the risks to which they have exposed her. Negligent or improper conduct of the salvors will cause a diminution or total disallowance of the award.

In apportioning the award given for a salvage service among the owners, master and crew of the vessel by means of which it has been rendered, the special circumstances of each case have to be considered. In nearly all cases a large portion goes to the owners and as in recent times the value and efficiency of ships (especially of steamships) have increased, so the proportion of the whole usually awarded to the owners has also increased. In an ordinary case of salvage by a steamship towing a distressed ship into safety, the share of the owners has often been about three-fourths; of the remainder the master usually gets about one-third, and the officers and crew divide the rest in proportion to their ratings. But where the salvaging ship has sustained special damage in the service, or her owners have been put to loss by it, that is taken into considera-

ion. On the other hand, where special personal services have been rendered by members of the crew they are specially rewarded.

An agreement as to the salvage to be paid is sometimes made at the time the assistance is given. When made fairly the court will act upon it, though it may turn out to be a bad bargain for one or other of the parties. But if the facts were not correctly apprehended by one or both, or if the position was one of such difficulty that those salvaged had no real option as to accepting the salvor's terms, the court will set the agreement aside.

The award of salvage is generally made in one sum against ship, freight and cargo; and those interests contribute to the amount in proportion to the value saved. Each is liable to the salvors for his own share, and for no more. If, however, the shipowner pays the cargo's share, he has a lien upon it for the amount. (T. G. C.)

Military Salvage.—This is such a service as may become ground for a reward in a prize court for the rescue of property from the enemy in time of war. It involves the determination of two questions: first, whether the property is to be restored to its original owner or condemned as prize to the recaptor; and second, what amount of salvage, if any, is to accompany restitution. The first question depends upon the law of nations, which may be taken to be that where a ship has been carried by an enemy *infra praesidia*, and especially after a sentence of condemnation, the title of the original owner is divested, and does not revest upon recapture by third parties. In such a case, therefore, *iure gentium* restitution cannot be claimed. The municipal law of civilized countries, however, does not encourage subjects to "make reprisals upon one another," and laws are generally found, as in England, which as between subjects of that particular State provide for restitution irrespective of any change in the title to the subject matter which may have occurred. But (speaking henceforth of England) in cases which do not fall strictly within these acts, the old maritime law, which was in unison with the general law of nations, is applied by the courts. Moreover, the English Prize Acts do not apply to foreign owners of recaptured prizes, and therefore no award can be made against them unless in accordance with the law of nations. In practice the courts have acted upon the "rule of reciprocity" where recaptures have been made of the property of formal allies, dealing with them as the allied State would have dealt with English property. If a neutral vessel is recaptured restitution is always ordered, unless the vessel is in peril of condemnation or destruction. An exception to the rule of restitution as between British subjects is made in the case of a British ship which has been "set forth as a ship of war" by the captor, and subsequently retaken by a British ship. Such a ship is not liable to restoration, but is the prize of the recaptor. This exception, the object of which is to encourage the capture of armed ships, dates from 1793, previous acts having provided for restitution upon payment of a moiety as salvage. The condition of setting forth as a ship of war is satisfied, where under a fair semblance of authority, which is not disproved, the ship "has been used in the operations of war, and constituted a part of the naval force of the enemy."

The right to salvage and the amount which will be allowed are also questions of the *iure gentium*, though usually governed by municipal law. In England the first statutory recognition of the right occurs in 1648, when an act of the Commonwealth provided that British vessels captured by an enemy and retaken by British ships shall be restored upon payment of one-eighth of the value of the property in lieu of salvage, or one-half in the case of a prize "set forth as a ship of war." Since the first act, and down to the act of 1805 inclusive, a distinction has always been drawn between a recapture effected by one of the royal ships of war and a recapture by a privateer or other vessel. In the former case the allowance has always been one-eighth, in the latter it varied, but was usually one-sixth. In the act of 1692 a clause gave salvage to a privateer, rising in amount from one-eighth to one-half according to the number of hours the prize had been in the enemy's possession, but this clause has disappeared since 1756. There is no provision in the present act for the payment of salvage, except in case of recapture by one of His Majesty's ships, but it seems beyond question that recaptors are entitled at law to salvage, although they may hold no commission

from the Crown. Similarly, salvage is awarded in the case of recapture from pirates or from a mutinous crew. In the case of royal ships the act of 1864 allows one-eighth salvage, which in cases of "special difficulty or danger" the court may increase to an amount not exceeding a quarter. (M. B.T.)

UNITED STATES

Mariners are not under any legal obligation to render salvage services to property in peril at sea. Salvage awards are granted by the maritime law in order to encourage them to undertake the peril and responsibility of performing such services. However, the duty of master mariners to render assistance to every *person* in peril at sea has been laid down by statute in the leading maritime countries (see Salvage Act of Aug. 1, 1912, c. 268, s. 2; Comp. Stat. s. 7,991). Under American law, failure of a master of a vessel to fulfil this duty renders him liable to a penalty not exceeding \$1,000, or imprisonment not exceeding two years, or both. The reward for life salvage is not so definitely provided for in American law as in England. By the Act of Aug. 1, 1912 (c. 268, s. 3; Comp. Stat. s. 7,992), salvors of human life may recover an award for such service only where a salvage award is made with respect to a salvaged vessel, her cargo and accessories. Salvors of life receive no award unless property is saved. A private vessel may take off the crew and passengers of a sinking liner, but unless some property is saved, no claim for salvage award will lie. But the property saved need not be saved by the salvors of human life. And if any property is saved, it matters not by whom, the salvage award on that property which, as will be hereafter remarked, usually does not exceed half of its salvaged value, is the fund from which the award for life salvage must be drawn (*The Admiral Evans*, 286 Fed. Rep. 442). It is provided by statute that with the exception of ships of war, or vessels appropriated exclusively to public service, salvors of human life who have taken part in the services are entitled to a fair share of the remuneration awarded to the salvors of the vessel, her cargo and accessories (Salvage Act of Aug. 1, 1912, c. 268, s. 3; Comp. Stat. s. 7,992).

The Government may claim salvage for services rendered by its public vessels. By the Act of July 1, 1918 (Stat. L. 40, p. 705, c. 114), the secretary of the navy is authorized to cause vessels under his control, adapted to the purpose, to afford salvage service to private or public vessels in distress, and to determine and collect reasonable compensation therefor when such salvage service is rendered by a vessel especially equipped for the purpose, or by a tug. The implication which might be drawn from the statute that, where the service is rendered by a public vessel not specially equipped for salvage service, such as a man-of-war or a transport, the Government may not demand and collect a salvage award, has been rejected by the courts. The Government has sued for and been allowed salvage award for salvage services rendered to a British merchant vessel by a merchant vessel owned by the U.S. Shipping Board and operated as a munitions ship for Government account (*The Impoco*, 287 Fed. 400). In the case of salvage services rendered by any merchant vessel owned or operated by the United States or the U.S. Emergency Fleet Corporation (now U.S. Merchant Fleet Corporation), it is provided by s. 10 of the Act of March 9, 1920 (Suits in Admiralty Act c. 95; Comp. Stat. s. 1,251), that the United States and the crew of any such vessel shall have the right to collect and sue for salvage services rendered, and any moneys recovered therefrom by the United States for its own benefit, shall be paid into the U.S. Treasury, to the credit of the department of the Government, or of the U.S. Shipping Board, or of the Emergency (Merchant) Fleet Corporation having control of the possession or operation of the vessel.

Salvage Award.—By statute, the master and crew of the salvaging vessel, in rendering services to another vessel of common ownership, are entitled to salvage award (Salvage Act of Aug. 1, 1912, c. 268, s. 1; Comp. Stat. s. 7,990). In the absence of request by the distressed vessel, salvage services, to merit an award, must be rendered directly to the salvaged property. It has been held that where a dry-dock is a fire and tugs extinguish

the flames, if a vessel in the dry-dock does not request such services and has other means of protecting itself, no salvage award may be claimed from it. The services were rendered directly to the dry-dock and perhaps incidentally benefited the vessel lying in it, but no salvage award may be claimed from the vessel (*Merritt and Chapman D. & W. Co. v. United States [The Leviathan]*, 274 U.S. 611). So, also, where vessels are moored alongside a river quay, services rendered by tugs in extinguishing a fire on one of the vessels do not give rise to a salvage claim against the vessels near by, unless the vessels against which the claim is made requested the salvors to perform the services (*The City of Atlanta*, 56 Fed. 252). In the same circumstances, however, if the salvors devote their attention to the other vessels and tow them away from the burning vessel, then salvage award may be claimed from them. It is not essential that there should be direct contact between the structure, gear or personnel of the salving vessel and the vessel saved. A word of warning to a vessel heading for a shoal, which enables her to avoid destruction, is a salvage service (*South American S.S. Co. v. Atlantic Towing Co.*, 22 F. [2d] 16). Likewise, a vessel which stands by another in distress, even though she does nothing else, is entitled to salvage award (*The Sapinero*, 5 F. [2d] 56; *Tlze Manchester Brigade*, 276 Fed. 410).

It often happens that while the services are rendered under the apprehension of grave peril, the result shows that the vessel was not in danger at all or at least not to the extent anticipated. In such case it has been held that it is the apprehended danger which fixes the value of the services and controls the amount of the award. The owner of the salved property will not be heard to argue that subsequent developments showed that the salvage was unnecessary or that the risks taken by the salvors were less in fact than they appeared at the time the services were rendered (*The Lowther Castle*, 195 Fed. 604). But see *The Sapinero*, 5 F. (2d) 56, holding that the master of the distressed ship exaggerated the plight of his vessel. Apparently it is the peril reasonably apprehended which controls.

Success is of the essence of a salvage service. But if a salvor undertakes a salvage service and is ready and able to carry it to completion, he cannot be summarily dismissed on the arrival of other assistance and thus deprived of salvage award. If a salvor is dismissed after he has contributed to the ultimate success of the operation and is ready and able to continue, he is entitled to share in the salvage award. Cases frequently arise where salvors are relieved by other vessels belonging to the same ownership as that of the distressed vessel. It has been held that the first salvors are entitled to share in the salvage award (*The Annie Lord*, 251 Fed. 157; *The Manchester Brigade*, 276 Fed. 410). However, a salved vessel need not retain incompetent salvors and is free to obtain whatever assistance is available. Whether or not the first set of salvors are entitled to share in the award depends on what they did and what they were able to do (*The Santa Rosa*, 295 Fed. 350).

Claims for Salvage.—In making demands for salvage, and in exacting security under process *in rem* against the salved property, salvors must be careful not to be exorbitant in their demands. The amount of salvage award is entirely discretionary with the court. A grasping attitude on the part of salvors will often work against their claim for salvage. Indeed it may cause the court to dismiss their claim entirely where their conduct is of such character as to destroy whatever merit there may have been in the service (*The Gypsy Queen*, 284 Fed. 607). The salved interests must also show the proper attitude. Owners of salved ships should make reasonable offers of award, or else the court may penalize them for putting the salvors to the expense of litigation (*The Western Star*, 157 Fed. 489). Interest on the amount of the award may be allowed, in the discretion of the court (*Tlze Naiwa*, 3 F. [2d] 381).

Where salvors are negligent in the performance of the service, or in care of the property after deliverance from the peril, the owner of the salved property may urge the fact against them in reduction of salvage award or as a complete defence to the claim (*The Henry Steers, Jr.*, 110 Fed. 578; *Tlze Bremen*, 111 Fed.

228; *The Ragnarok*, 158 Fed. 694; *Albury v. Cargo Ex. Lugano*, 215 Fed. 963; *The F. Q. Barstow*, 257 Fed. 395).

Salvage awards, in the view of the United States maritime law, while having as their purpose the encouragement of salvage service, must be fixed in such amounts as not to deprive the owner of the property saved of all benefit of the service.

Amount of Award.—This depends, in each case, on the facts. The courts frequently advert to awards made in similar cases, but precedents serve only as a guide. They have no controlling force (*The Buckhamon*, 284 Fed. 917). The appellate courts will not disturb the award made by the trial judge unless there appears to be such a clear abuse of discretion as to amount to an error of law (*The Bay of Naples*, 48 Fed. 737; *The Kia Ora*, 352 Fed. 507; *The Naiwa*, 3 F. [2d] 381; *The Santa Rosa*, 5 F. [2d] 478; *The Zaca*, 7 F. [ad] 69). A classic definition of the elements to be considered by a court in fixing salvage award was given by the U.S. Supreme Court in *The Blackwall*, 10 Wall. 1, 14:—

"(1.) The labour expended by the salvors in rendering the salvage service. (2.) The promptitude, skill, and energy displayed in rendering the service and saving the property. (3.) The value of the property employed by the salvors in rendering the service, and the danger to which such property was exposed. (4.) The risk incurred by the salvors in securing the property from the impending peril. (5.) The value of the property saved. (6.) The degree of danger from which the property was rescued."

It is, therefore, apparent that the amount of award in the various classes of salvage can not be readily classified because of the highly variable factors which enter into them. The following cases, grouped according to the nature of the service, will give some idea of the amounts of salvage awards. Towage on high seas: *The Varzin*, 180 Fed. 892; *The Melderskin*, 249 Fed. 776; *The Western Pride*, 274 Fed. 920; *The Katrina Luckenbach*, 61 Ct. Cls. 632. Releasing stranded vessels: *The St. Paul*, 82 Fed. 104; *The Kia Om*, 352 Fed. 507; *The Santa Rosa*, 295 Fed. 350. Extinguishing fire on vessels: *The F. Q. Barstow*, 257 Fed. 793; *Tlze Huttonwood*, 262 Fed. 452; *Tlze Zaca*, 7 F. (2d) 69; *The Florence Luckenbach*, 9 F. (2d) 1,008. Towing vessels away from burning vessels or pier: *The Geo. W. Elzey*, 250 Fed. 602; *The West Mount*, 277 Fed. 168; *The Thorwald Halvorsen*, 281 Fed. 506; *The Magnetic*, 293 Fed. 94; *The Santa Barbara*, 299 Fed. 152.

Where the salved vessel has been abandoned by her master and crew and is therefore derelict, the salvage awards run much higher than otherwise. The ancient rule was that the salvage award amounted to a moiety of the salved value. While this rule is no longer regarded as controlling, there are a few cases of derelict salvage awards which even exceed 50% (*Tlze Edwards*, 12 Fed. 508; *The Flower City*, 16 Fed. 866; *Tlze Bay of Naples*, 48 Fed. 737; *Tlze Myrtle Tunnel*, 146 Fed. 324; *The Flora Rodgers*, 152 Fed. 286).

Division of Award.—The division of salvage award between the owner of the salving vessel and the master, officers and crew is subject to the circumstances of each case. Where a vessel is towed from her position of distress at sea to a port of refuge, or where a stranded vessel is released, the salvage award is often divided four-fifths to the shipowner and one-fifth to the crew. In cases of towage on the high seas, where the salving crew has incurred considerable peril, the crew's share may run higher. An exceptional case arose when the "Katrina Luckenbach," steaming in convoy from Gibraltar to Hampton Roads in Aug. 1918, broke down at sea. The "Gaelic Prince," of the same convoy, took the "Katrina Luckenbach" in tow and brought her 1,356 m. to Hampton Roads, through an area in which German submarines were operating. Great risk was incurred by the master and crew of the "Gaelic Prince," because by taking the "Katrina Luckenbach" in tow their vessel became vulnerable to attack by a submarine. The court, in rendering a salvage award to the "Gaelic Prince" of \$93,000 in addition to the salvor's expenses, allowed two-thirds of it to the master, officers and crew (*Prince Line Ltd. v. The United States*, 61 Ct. Cls. 632). In cases of salvage services rendered to burning vessels, whether at sea or in port, the crew's share is usually from about one-quarter to one-

third, because of the personal risk involved. It may be more in cases of specific heroism. It should be borne in mind, however, that the facts of each case control the amount of salvage award and the share of it to be given to the officers and crew of the salving vessel. The services rendered by the personnel are considered by the court in fixing their share of the salvage award. Following this principle, if the facts show that the crew did nothing more than attend to their ordinary routine duties at sea, as in the case of towage of a vessel on a calm sea, the court may exclude the crew entirely from the award, particularly where both vessels are owned by the same interests (*The Lewis Bros.*, 287 Fed. 143; *The Lake Elmont*, 1924 A.M.C. 711). The crew's fund is usually pro-rated according to the monthly wages, the master's share figured on double his monthly wages.

Settlement Agreement.— The seaman is specially protected by law from those who would deprive him by agreement of his right to salvage award. He is the ward of the admiralty, and in order to protect him from those who would cause him to discount his rights in salvage, it has been provided by statute that every stipulation by which any seaman consents to abandon any right which he may have or obtain in the nature of salvage shall be wholly inoperative (*U.S. Rev. Stat.* 4,535; *Comp. Stat.* s. 8,324). However, it has been intimated in an *obiter dictum* that a settlement made with the seaman after the performance of the salvage service would be valid where the shipowner has acted in good faith (*Rivers v. Lockwood*, 239 Fed. 380).

Salvage awards are frequently agreed on by the parties without the need of litigation, and the shipowner commonly conducts the negotiations. If a suit proves necessary to collect the award, the shipowner has the right to sue on behalf of the crew (*Castner, Curran and Bullitt v. United States*, 5 F. [2nd] 214). The shipowner, however, has not any authority to bind the crew by any arrangement which he may make with the salvaged interests. Indeed, if the settlement which the shipowner agrees to accept is not commensurate with the services rendered, the crew may maintain direct action against the salvaged interests for their proper share of salvage award. The arrangements made by their shipowner are not a bar to their recovery (*Bergher v. General Petroleum Co.*, 242 Fed. 967). The common practice in salvage settlements without litigation is that the salvaged interests, in paying the entire award to the owner of the salving ship, demand and receive an agreement of indemnity by which the owner of the salving vessel agrees to hold harmless the salvaged interests from any future claims which may be made by the crew in respect of the salvage services. Thus the owner of the salving vessel takes upon himself the responsibility for the salvage settlement and assumes the obligation of making good to his own crew any deficiency of salvage award which any court in the future may allow to the seamen in addition to their share of the award fixed by the settlement. It is generally considered that any payment which the seaman receives, whether in consideration of the surrender of his salvage rights, or in the distribution of a settlement fund received by his shipowner, is deemed a payment *pro tanto* on account of any salvage award to which the seaman may be entitled (*The Edward Lee*, Fed. Cas. No. 4,292; *The Adirondack*, 5 Fed. 214; *Baker Salvage Co. v. The Taylor Dickson*, 40 Fed. 261; *Rivers v. Lockwood*, 239 Fed. 380). See also SALVAGING. (E. S. M.)

Roscoe, *On the Admiralty Jurisdiction and Practice* (4th ed., 1920); T. G. Carver, *Treatise on the Law relating to Carriage of Goods by Sea* (7th ed., 1925).

SALVAGE CORPS. The London Salvage Corps is maintained by the fire offices of London. The corps was first formed in 1865 and began operations in March 1866. The staff of the corps when first formed consisted of 64. Since that time, owing to the many improvements that have taken place in the system of dealing with salvage, and the increase in the work to be done, the corps has necessarily been strengthened, and the staff now numbers above 80. The headquarters are situated at Watling street, which is called the No. 1 station, and this station protects the City of London enclosed by the Euston road, Tottenham

Court road, City road and the river Thames; this is known as the "B" district. No. 2 station is at Commercial road, and attends to the whole of the east and north-east portion of London to the north of the Thames, and is known as the "C" district. No. 3 station, opposite the headquarters of the Metropolitan Fire Brigade Station in the Southwark Bridge road, protects the whole of south London, and is known as the "D" district. No. 4 station at Poplar covers the East End of London. Finally, No. 5 station, in Upper street, Islington, guards the parish of Islington. The working staff, which is mainly recruited from the royal navy, consists of the chief officer, superintendents, firemen and crews. The stations of the corps are connected by telephone with the fire-brigade stations from whence the "calls" are received.

Generally speaking, the work of the corps may be divided into two distinct classes: (1) services at fires; (2) watching and working salvage

Practical Work.— (1) *Services at Fires* form the most important feature of the work. Much depends upon the method of dealing with the salvage. If, for instance, a large Manchester goods warehouse was on fire in the top part, it would be very little advantage to the offices interested in the risk if the men were set to work removing the stock off the ground floor. The best method is to cover up with tarpaulin all goods there, and prevent the water from collecting on the lower floors. It will be gathered that the most important work of the corps is to prevent damage to goods, and that water is mostly looked after. The tenders which immediately on receipt of an alarm proceed to the scene of the fire with their crew of men, carry every kind of appliance for the saving of goods from destruction by fire or damage by water, as well as lime-light apparatus for use in working after the fire has been extinguished, thus enabling the men to note the position of dangerous walls, etc.

(3) **Working Salvage.**— When a fire has taken place, a man is left behind in charge of the salvage if the property is insured; or if that fact cannot be ascertained, but it appears probable that it is, a man is left until the information is obtained later. The duty, if an important one, is divided into a day and night duty. This enables an experienced man to be sent on day duty to meet the assessor and to carry out his instructions regarding the working out of the salvage; and a junior man at night. The day man, if working out salvage, sometimes finds it requisite to employ outside men as helpers over whom he acts as a kind of foreman. The "working out" may take the form of dividing up damaged goods into lots ready for a sale to be held by the assessor or of sifting over the debris to find remains of certain articles claimed for. If, for instance, a large fire occurred at a pianoforte manufacturer's, and the debris was all in one common heap, the London Salvage Corps might have to arrange certain quantities of pegs and wires in order to give an idea of the number of pianos before the fire. The watching continues until the loss is settled, when the charge of the premises is given over to the assured.

There are also salvage corps on similar lines, but on a smaller scale, in Liverpool and Glasgow. (C. J. F.)

UNITED STATES SALVAGE CORPS

The earliest effort in America at putting salvage work on an organized basis was made in New York city in May, 1835, when the Association of Fire Insurance Companies laid the foundation of the New York Fire Patrol by appointing four men "to attend all fires and protect property exposed to fire and damage thereto by water." This force was enlarged in 1839 and again in 1855. In May, 1867, the New York Board of Fire Underwriters was chartered and this date marks the inception of the New York Fire Patrol as it was in 1939, with eight companies operating in Greater New York, having a total force of 244 men. Salvage corps, sometimes called fire patrols, are maintained by the underwriting interests in 17 of the larger cities in the United States; the latest of these to be established was in Indianapolis in 1914. It is the policy of the insurance companies, as expressed through the National Board of Fire Underwriters, that no additional salvage corps will be organized by them and that every effort will be

made to reduce the fire insurance patrol service so far as is consistent, for the reason that fire departments are organized and maintained for the broad purpose of saving property and life, and that the first duty of fire extinguishment and life saving is followed closely by the obligation to curtail the property loss. This principle that organized salvage work is a legitimate function of the municipal fire department has been recognized in a number of cities of which Los Angeles is the best example; in that city eight fully equipped salvage companies are in operation. In more than 20 cities, the fire departments have organized companies which perform salvage work as a chief duty. About 72% of all fire departments, in cities of the United States having populations of at least 20,000, are equipped with salvage appliances which are used to reduce the loss due to fire or other causes. The salvage corps apparatus carries a great variety of equipment, including waterproof covers, brooms, shovels, scoops, sponges, etc.

The usual first move of the patrol on arrival at a fire in a mercantile building is to spread covers to protect goods located on floors beneath the fire, commencing where the water is likely to descend first, and then widening out as far as the number of covers available will permit. In manufacturing buildings the procedure is about the same as in mercantile property; where the number of covers is not sufficient to protect both stock and machinery the former should be given the preference, since machinery can be dried, cleaned and oiled after a fire. In dwellings a somewhat different procedure is followed; the men roll up the carpet or rug, placing it on top of some piece of furniture, and then moving all the furniture to the centre of the room. Clothing is removed from closets and wardrobes and placed on top of the pile, over which one cover is usually sufficient for protection. The type of cover most commonly used is 12 ft. by 18 ft. in size, and is made of tightly woven, waterproofed canvas or rubber coated fabric. These rubber coated covers have the advantage of drying more quickly after service and are more certainly water-proof than other types; disadvantages are the higher costs, added weight and tendency to become soft when used in temperatures not unusual at fires or to become brittle and crack. Some of the corps make their covers, using linseed oil as a water-proofing to the fabric. In addition to spreading covers, the salvage corps, and many fire departments, proceed after the fire is extinguished to sweep and shovel out water and rubbish, cover holes in roofs with spare tarpaulins or tar paper, and perform other services tending to minimize damage to the building and the goods it contains.

Progressive salvage corps officers may also accomplish a great deal in the way of educating merchants and the general public in methods of storing stock on skids to raise it slightly above the floor level, and in constructing shelving and wall-cases in such a way as to allow space for covering and to prevent stock from being wet.

The progressive officer will also find a large field for activity in promoting fire prevention activities and observing and reporting evidence of fires of incendiary or suspicious origin; it is usual practice to leave a man on watch to preserve such evidence, as well as to act in any emergency to prevent further damage or theft of the contents of a building. (W. E. MA.)

SALVAGING. Salvage work, or the raising and recovery of sunken ships and cargoes, has always had a fascination; first, for the reason that very little is known of the subject by the outside public; and secondly, because the spirit of adventure appeals to us still, although possibly in a modified degree compared with that which sent our forefathers out to search for hidden treasures in far-off lands.

Salvage engineering has always been confined to a small number of the engineering profession, although it is a highly technical business, where skill, experience and determination are pitted against wind and sea. It necessitates trained men and special appliances and is a work that must be carried on night and day whenever the elements permit.

Marine salvage may be divided up under a few principal headings:—

(1) The raising of vessels sunk in deep water by means of pontoons, etc.

(2) Raising by the application of compressed air to expel the water.

(3) Refloating of ships stranded on rocks or sand where the bottom is damaged and temporary repairs have to be made by divers, and where pumping plant of different descriptions is used to free the vessel of water.

(4) Uprighting of capsized vessels, etc.

Salvage Plant.—The salvage ship is one of the most important factors in salvage operations, and, although generally a small vessel, carries a very complicated equipment of appliances for use in the work with a view to rendering her as independent as possible of assistance from ashore, and enabling her to make repairs, etc., in out-of-the-way places where it would be difficult to obtain other assistance.

As an example, one of the most modern type is composite built (170ft. long by 60ft. wide), fitted with triple expansion engines, and has a speed of 14 knots. She accommodates about 80 officers and men, consisting of engineers, artisans, divers, motor engineers, electrical engineers and others. Her equipment consists of portable pumping plant of 5,000 tons per hour, which can be transferred to the wrecked vessel, portable oil-driven air compressors, portable electric lighting plant and electric submersible pumps which work under water.

At the mastheads the vessel has powerful electric arc lamps of 5,000 c.p., with sufficient length of water-tight cables to allow of them being placed on the wrecked ship and operated by the salvage ship's dynamos; also searchlights, submarine arc and incandescent lamps for the divers, submarine oxyacetylene burning plant for cutting plates under water, also a complete equipment of submarine pneumatic drilling machines up to gin. in diameter, pneumatic hammers, rock-boring drills and submarine photographic apparatus. She is fitted with long-range wireless telegraphy. Being constructed of wood she is able to remain alongside a damaged ship in rough weather.

At one time steam pumps were entirely used in salvage operations, and were supplied with portable boilers so that they might be placed on board a wreck. They performed very excellent service, generally under most difficult conditions. To place such heavy gear on board a wrecked ship from a salvage craft rolling alongside on a winter night required a large amount of skill and care. When placed in position they had to be connected up to the portable boilers, and steam had to be raised before they were available for pumping. It was also necessary to place a supply of coal on board if the ship's bunkers were not available, and

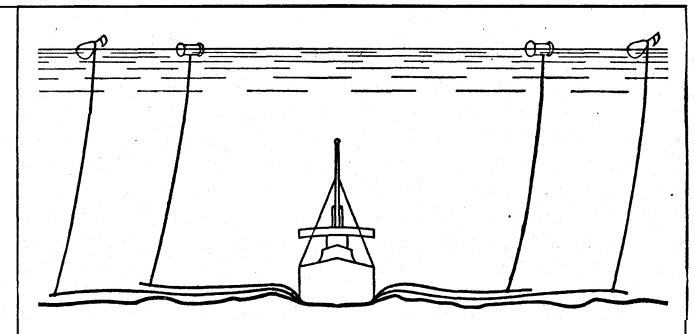

FIG. 1.—DIAGRAM OF 9 IN. STEEL LIFTING WIRES IN POSITION UNDER A WRECK WITH THEIR FREE ENDS BUOYED
The wires are made fast to lifting ships at low tide so that when the tide rises, the wreck is lifted off the bottom

this supply was often washed away. Steam pumps are still retained on board the salvage ship, as they are able to perform work that the present type of pumping plant cannot do; for instance, sand, coal, grain and even copper and iron ore can be discharged by them from under water.

The internal combustion engine (*q.v.*) went a great way to revolutionize salvage pumping plant. It was much lighter than the steam pump, required no boiler, and the fuel could be carried to the wreck in barrels or drums in an ordinary ship's life-boat. Further, when not required for work it can be stopped and

started again in a few minutes, while steam has always to be kept on the portable boilers of the steam pumps. The advantages of the oil motor-driven centrifugal pump will be obvious; it is just as efficient for pumping water as the steam pump, saves in cost of running, takes up less stowage space and uses paraffin or gasolene as fuel, which can generally be obtained without difficulty. The sizes in general use are 12 in. and 6 inch.

The latest type of pumping machinery is the electrically driven submersible. It has been tried under all conditions and found

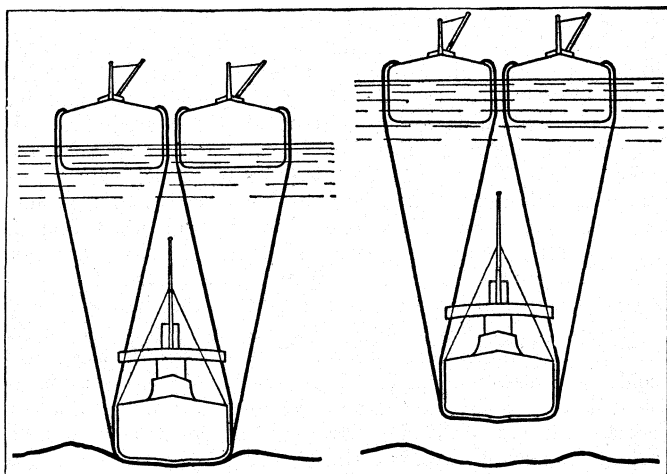

FIG. 2.— ON THE LEFT, THE LIFTING WIRES HAVE BEEN MADE FAST TO LIFTING LIGHTERS: ON THE RIGHT, THE WRECK IS CLEAR OF THE BOTTOM. AT HIGH WATER. IT IS THEN TOWED TO SHALLOWER DEPTHS AND THE OPERATION REPEATED

more efficient than any of the older types. It can be placed aboard in boats and driven from the dynamos of the salvage ship lying off the wreck. There is no necessity to secure it, as it works practically without vibration and can be used from the derricks and lowered down into the water. Its great advantage is that while the ordinary salvage pump has only a lifting capacity of 30ft., the submersible is able to raise the water to a height of 80ft.; no priming is necessary, and no particular attention need be paid to the discharge hose as far as making it air and watertight. Former electric salvage pumps that were tried were fitted with watertight cases, and proved entirely unsuccessful for this particular kind of work. In the submersible pump, water is allowed free access to the electrical parts.

Lifting Operations.—With this somewhat brief description of salvage plant used the particulars of actual salvage operations will be explained, commencing with the raising of sunken vessels from deep water by means of lifting barges dependent on the rise and fall of tide.

The method of procedure is to place lifting vessels of sufficient buoyancy over the wreck and pass a number of gin. steel wire ropes under the vessel, bringing the ends of the wires up and making them fast to the lifting ships at low water; then as the tide rises, if the calculations have been correct, the vessel is raised from the bottom the height of the rise of tide, and carried into shallower water where the wreck is grounded, and the operations are continued each tide until her decks are above water (*see* figs. 1 and 2). The fractures are then patched by the divers, salvage pumps installed and the vessel pumped out and floated. The dimensions of lifting vessels that have been employed in a large number of cases are: length 165ft.; breadth 36ft., and each with a lifting capacity of 1,500 tons maximum.

One of the principal difficulties with this method is the placing of the heavy wire cables under the bottom of the wreck, especially if she has sunk in sand, mud or clay. If not too deeply embedded this is generally accomplished by towing them under with two vessels, one on each side, and the ends of the cables attached to them. Where this is not found to be possible, owing to the wreck having become too deeply embedded, a system of hydraulic boring at high pressure is used.

In cases where there is little or no rise of tide submersible

pontoons are used. These are really steel cylinders with a lifting capacity ranging from 50 tons each to 250 tons or more. They are divided into three water-tight compartments and fitted with low pressure air connections for expelling the water, and with high pressure air for opening the valves. The ends of the cylinders used at the lifting of H.M.S. "Gladiator" were dome-shaped, and covered with collision mats to protect them against chafing. Strong channel bars were rivetted around the pontoons at intervals to carry the wire cables, and the whole of the cylinders between the channel bars were covered with 3 in. fir planking for protection against obstructions when lifting. Double 6 in. special extra flexible wire ropes were fitted in the required position around the pontoons, and to these were attached plate shackles to which the gin. lifting wires were fastened. In this case the pontoons were used to make the vessel upright, as she lay over on her beam ends at an angle of 113 degrees.

The gin. wire cables were swept under the wreck and the outside ends attached to the pontoons. These were filled with water and sunk alongside the ship; the other ends of the wires were then hove in as tightly as possible and made fast to massive steel bollards fastened to the upper side of the ship. The cylinders or pontoons were then emptied of water by means of compressed air and the vessel uprighted, assistance being also given by compressed air and pumping from some of the sound compartments. In this case pontoons were only used on one side, but in order to raise a vessel that is sunk and lying upright on the bottom two sets of cylinders are necessary, and the plan of lifting is as follows:—

A sufficient number of gin. wire cables are placed under the ship, the pontoons are attached to the ends of the wires on one side of the ship and filled with water, and by heaving in on the opposite cables they are hauled down into the required positions alongside the wreck. A special form of hydraulic gripping machines are attached to the pontoons on the other side of the wreck and the wire cables rove through these hydraulic grips. When everything is ready the pontoons are filled and allowed to slide down the wire cables to the bottom. The grips are then closed from the surface vessel and compressed air pumped down to all the pontoons, which expels the water, and if sufficient buoyancy has been given by the pontoons the vessel is brought to the surface.

In the method of lifting by compressed air all openings are closed by the divers, and compressed air pumped down to connections made to all the different compartments from air compressors of the salvage ships. The water is then expelled through the fractures and the vessel rises to the surface. This method entails a very large amount of diving work, as funnels, etc., have to be cut away and the openings closed and made air-tight. Decks have to be strongly shored up and supported.

The conditions of stranding are very varied. Assuming a large vessel stranded on a rocky bottom on an exposed coast and sustaining such damage that all compartments are filled with water and the vessel appears at first sight to be a hopeless wreck, a diver's survey of the position is made as soon as possible, and at the same time a careful survey is made of all compartments to ascertain whether the water falls in each at the same rate as the tide. Some compartments will generally be found to be holding water, that is to say the tide does not ebb and flow in them as it does outside. The amount of pumping plant required can thus be easily gauged for compartments under these conditions. When the tide ebbs and flows as it does outside it shows considerable damage to the outer bottom, which necessitates extra pumping plant and the patching of the fractures by divers.

(F. Y.)

SALVARSAN or "606," is the trade name of dihydrochloride of dioxy-diamino-arsenobenzene, a powerful remedy for syphilis, invented by Ehrlich and introduced to the public in 1910. It is a yellow powder which is prepared for injection into a vein by a rather complicated process. A little later Ehrlich invented a modification, "914" or Neo-salvarsan, which is much easier to use, and preparations of this type are now by far the most commonly employed. Of rather another order are Silver-salvar-

san and Neo-silver-salvarsan in which the action of arsenic is assisted by that of silver. There is now a fairly large variety of arsenobenzene preparations made by different firms. They are sold in Great Britain only after satisfaction of Government tests of toxicity and therapeutic activity which are applied to each batch. In America the arsenobenzene preparations are known as arsphenamines. A moderate dose of an arsenobenzene preparation usually causes the germs of syphilis to disappear from the secretions of open sores within a day and a rapid amelioration of symptoms follows, but it is necessary to treat for $1\frac{1}{2}$ to 2 years or more and to use also either the older remedy, Mercury, or the newer one, Bismuth. The best chance of success lies in commencement when the infection is very recent.

The arsenobenzene preparations are not tolerated equally well by all patients. In a minute percentage of cases they may cause death by damaging the small vessels of the brain or the kidneys. Other toxic effects are jaundice, and an inflammation of the skin (either of which may be fatal) and a variety of minor troubles. Serious effects from arsenobenzene injections are, however, far too rare to counteract their very great advantages. One of the most important of these is the rapidity with which patients are rendered non-infectious, an effect to which is probably due the very substantial decrease in syphilis in most countries which has taken place in recent years.

(L. W. H.)

SALVATION ARMY, a religious philanthropic organization founded by William Booth (*q.v.*), who in 1865 began to hold meetings for preaching in the streets in London and in tents, music halls, theatres and elsewhere. In 1878 the Mission, which had spread beyond London, was reorganized on a quasi-military basis, and the title of "The Salvation Army" was definitely adopted in June 1880, with Booth as "General" of the whole body. The spiritual operations of the Army at once rapidly expanded in spite of much disorderly opposition in some places. In doctrine, the Army is in harmony with the main principles of the evangelical bodies, "as embodied in the three creeds of the Church." Its preaching is practical and direct, asseverating the reality of Sin and Redemption, and the supreme duty of self-sacrifice for the sake of the salvation of others.

Great Britain.—The Army is under the General for the time being, who issues all orders and regulations. Large powers devolve upon other officers, such as the "Chief of the Staff," the "Foreign Secretary," and the "Chancellor," who direct affairs from the "International Headquarters" in London. The system of government is autocratic, "unquestioning obedience" being required throughout all ranks. The Army is divided, usually in harmony with national boundaries, into "territories," each under a "Commissioner," with headquarters in the capital of the country. The Territories are generally divided into "Provinces" and these again into "Divisions," which include a number of corps, each supporting its own "Captain" and "Lieutenant." The "soldiers" or members are drawn from all classes of the community. The property of the Army in the United Kingdom is held by the General for the time being, for the benefit of the Army exclusively, he being constituted the sole trustee of the property, in the disposal of which and in the appointment of his successor he is placed under the government of a deed poll, executed by Booth while the body was still known as "The Christian Mission," and enrolled in the Court of Chancery in August 1878. In other countries various modifications have been necessary, but the General's ultimate control has been practically assured.

The announcement of the founder's death was accompanied by the intimation that his eldest son, William Bramwell Booth (*q.v.*), formerly his chief of staff, had become the new general. Under the deed poll of 1878, each general appoints his successor under seal, but the name of the person so chosen is not divulged until the proper time. At an International Staff Council in 1904 a supplementary deed poll was adopted, the principal object of which was to set up machinery for removing from the position any general who proved to be unworthy of confidence, and also for the selection of a general by a high council of the Army called into being for this purpose, in the event of the position becoming vacant through failure to appoint or other cause. In Jan., 1929

the high council voted to remove General Booth on the ground of incapacity but Booth carried the issue to the courts. The court decided that the removal was illegal because no hearing had been given the general or his representatives before the vote was taken. On Feb. 13 after such a hearing a second vote resulted as the first, and the council proceeded to elect Edward J. Higgins, formerly chief of staff, as the new general. Booth intended to continue the fight, but he died in June. In Sept. 1934 Commander Evangeline Booth, the founder's daughter, and leader of the Army in the U.S.A., was elected to succeed General Higgins, and assumed command in November.

Extension.—In many quarters it was feared that after the withdrawal of the forceful and picturesque personality who had dominated Salvation Army affairs for a generation, and had raised up a worldwide following from what was originally a despised and derided local effort in the slums of London, the Army would decline. The World War also was a menace to all international organisations. These fears, however, proved to be groundless. The number of adherents has steadily increased, and the "field" occupied has grown greatly in extent. The Army has more than 14,000 corps or societies, each of which serves not only for the establishment of its own members in the faith, but as a centre of aggressive evangelistic effort. It has also 1,400 social institutions for the friendless, unfortunate and wayward. In the British Islands the centres number 1,500, and reach a similar figure in the United States; in Canada there are between 600 and 700, and in Australia and New Zealand nearly 1,900. India, with Ceylon, has nearly 5,000 such centres, and the Far East 450. The number of officers and cadets engaged in field and social work is about 22,360. The Army's mission field has greatly extended, and many of its officers who work devotedly in their own dark lands were, but a few years previously, themselves in the bondage of superstition. The right method of evangelising the people is found in the employment of converted officers of their own race and speech. In Japan, for instance, 98% of the officers are Japanese.

New Organisations.—The progress which continued under the second general is not to be measured merely by an extended front. New organisations have been called into existence, especially for influencing and instructing the young of both sexes. Careful provision has been made to insure a constant replenishment of officers by means of institutes for the training of cadets. In each year upwards of 1,800 young men and women are trained for Army work, to which they have to devote the whole of their time. Congresses on national and international lines are held frequently for the instruction and encouragement of officers; and constantly increasing use is made of the printing-press.

Social Work.—The social work, which received its first great impetus in 1890 with the publication of *In Darkest England and the Way Out*, by William Booth, has become not only more extensive but more varied in character. This work from the first has been regarded by the Army leaders as an organised warfare against social evils in order to clear the way for evangelisation.

It was realised that the physical and environmental condition of many of the people, especially in great cities, made it extremely difficult for them to apprehend the spiritual message which the Army had to deliver. Therefore various social activities arose, diverse in character but all actuated by the same purpose, from the provision of free breakfasts and night shelters to the settlement of people in overseas dominions. This last is a department of work characterised by careful selection of the emigrants, and is coupled, particularly in the case of the young, with training beforehand and effective provision for future care, while work is assured upon arrival. The efforts of the Army in getting men to work on the land, both in England and overseas, have called forth many commendations from statesmen and others.

Rescue work among women was one of the earliest social tasks to which the Army set its hand. In this work Mrs. Florence Booth, wife of Gen. Bramwell Booth, was the responsible leader from its inception until 1912. Maternity work has been carried out by the Army's ministering women, and for this in 1918 the Army received a grant from the British Government—the first state subsidy made to the Army in the country of its origin. In other lands

also social work has proceeded, adapted to the different national conditions and needs, and often commended and assisted by the governments concerned. This is true also of eastern lands: thus settlements for criminals have been established in India, and leper colonies in the Dutch Indies; and these are but instances of many such works.

Spiritual Character of the Work.—With this development of organisation the Army has maintained its original character as a body of spiritual witness and aggressive evangelism. In theory and creed it is at one in almost every respect with orthodox evangelical belief, but its methods—its realistic presentation of religion, and its use of various constraining means to bring people to salvation—distinguish it from other religious bodies. It continues to lay the greatest emphasis upon the need for conversion, preceded by penitence, and followed by growth in holiness. The people gathered into its ranks are cared for by its officers and trained in a real separation from the world and devotion to Christ. They are set to work immediately with a definite objective, their zeal is employed in the winning of others, and public testimony is required from them, however unlearned or backward in religious experience they may be.

A large place in the Army's endeavours is given to music and song. In every country the band—usually a brass band—is a feature of Army work. The strains of such a band, reaching farther than the human voice, draw numbers within earshot of the Army's message who would otherwise not be attracted. The Army has also made use of improvisations of various kinds, not only because in this way public attention is more likely to be caught, but because these methods prevent the officers from falling into the conventional and the ordinary.

The Army exacts a high standard of behaviour from its adherents. In the series of *Orders and Regulations* for officers and for the rank and file definite guidance is given even in the smaller matters of everyday conduct. Officers accept a relative poverty, being content to receive sufficient for their simple needs. There are contributory funds from which they receive allowances on retirement, and from which provision is made for widows and orphans. Marriages are solemnised "under the flag," and children of members are dedicated to become soldiers or officers in the "war." Officers wear a regulation uniform, which it is not permissible for the individual to vary. The uniform is regarded as a means of confessing to the world the fact of separation and consecration, as opening the way to many opportunities of usefulness which would not otherwise appear, and as making possible instant recognition and fellowship amongst Salvationists themselves. One of the great principles of the Army, firmly adhered to, is that women have absolute parity of privilege, position and dignity.

Salvation Army funds are raised from the voluntary offerings of the corps, from open-air and other collections, from the profits on publications and general trading, and from friends interested in evangelical and charitable work. The financial statements of the various funds are annually published, certified by public accountants. Reports and statistics of the spiritual and social operations of the army are given in the annual *Salvation Army Year Book* and in the *War Cry* and other publications issued at Headquarters (Queen Victoria Street, London, E. C. 4). Under the head of social operations are included Shelters and Food Depots, Labour Bureaus, Labour Homes and Factories, Rescue and Maternity Homes, Children's Homes, and Farm Colonies.

Gladstone, *In Darkest England and the Way Out* (1890); Bramwell Booth, *Servants of All* (1899) and *Echoes and Memories* (1926); Booth-Tucker, *The Life of Catherine Booth* (1892); Railton, *Heathen England; Twenty-one Years in the Salvation Army*; A. White, *Truth about the Salvation Army* (1892, 1900 and 1906); *The Great Idea* (1909; 2nd ed., 1910); T. F. G. Coates, *The Life Story of General Booth* (2nd ed., 1906); Harold Begbie, *Broken Earthenware* (1909), and *Life of William Booth* (1920); Mrs. B. Booth, *Powers of Salvation Army Officers* (1923); H. L. Taylor, *General Booth's Journal* (1925). The criticisms by J. Manson in *The Salvation Army and the Public* (1906; 3rd ed. 1908) caused some public discussion, but is now mainly of historic interest. An important biography is St. John Ervine's *God's Soldier: General William Booth* (2 vols., 1935).

THE UNITED STATES

In the United States the Salvation Army began its operations officially in March 1880, America being the first country to which evangelists were sent from England. A family of converts had gone to Philadelphia in 1879 and started evangelical services. At their request Gen. William Booth sent Commissioner RAILTON and seven women assistants as pioneer officers. The early years of the Salvation Army in America were strenuous ones; but the work prospered. The original staff soon found it impossible to cope with the success attending their efforts, and more help was sent from England. But America soon began to produce its own officers, a development which grew through the years until there were several training colleges devoted exclusively to maintaining the requisite supply of officers. These send out annually into the field some 500 young men and women as officer reinforcements, in addition to providing help for the missionary countries of the world.

The national leader in the United States, Commander Evangeline Booth, daughter of the founder and first general, William Booth, assumed her high command in 1904 after serving for nine years in a similar capacity in Canada. The years of her leadership witnessed great advances in every phase of Salvation Army activity. Commander Booth showed herself a leader possessed of many outstanding qualities. She endeared herself to all sections of the nation by her simplicity of purpose and her devotion to the ideals she set forth so vividly in her public addresses. Faced at the onset with overwhelming problems of money and personnel, she revolutionized the financial system of the organization, and strengthened its resources.

The work of the Salvation Army during the World War of 1914-18 endeared the organization to the nation in general. Commander Booth realized that extensive welfare work among the American troops would be required. With a rare courage, she placed the whole resources of the Salvation Army at the disposal of the government. The resultant work at home and in France, where the army women ministered day and night to the soldiers' comfort right up to the front-line trenches, was known and appreciated throughout the union. The president bestowed upon the commander the distinguished service medal as a mark of his appreciation in this connection.

Again during the war which started in 1939, the Salvation Army was in the field with welfare work made possible by U. S. contributions. Aid to the fighting forces and to refugees was administered in Norway, Finland, Belgium, the Netherlands, France, Germany, England, Italy and other countries.

Activities of the Salvation Army in the U.S.A. include sheltering, evangelistic meetings, rehabilitation centres, care for the unmarried mother and her child, children's homes, clinics, family welfare, aid to prisoners and their families, free employment bureaus, search for missing relatives, summer outings for women and children and social and religious instruction. In 1938 churches numbered 1,646 and membership 240,258. In 1940 approximately 4,800 officers directed the work of the Salvation Army in some 2,000 centres in the United States.

SALVEMINI, GAETANO (1873–), Italian historian, was born in Molfetta in Sept. 1873. In 1902 he became professor of mediaeval and modern history at Messina university. He then went to Pisa university, and in 1917 was appointed to the chair of history at Florence university. His best known historical works are *Magnati e Popolani in Firenze dal 1280 al 1295* (1899); *La Rivoluzione francese 1789-92* (1905); *Mazzini* (1915) and *L'Italia e gli Imperi Centrali dal 1871 al 1915*. He edited the Liberal newspaper *L'Unità* (1911-21). Before the World War he vigorously criticised the Socialists for their half-hearted social work, and attacked Giolitti's electoral methods. During the War he was a leading advocate of Italian diplomatic moderation. He was a member of the Italian parliament from 1919-21. After the Fascists captured power, however, his political activity was made impossible, and, being suspect, he was in constant personal danger. In June 1925 he was arrested in Rome and taken to Florence, where he was charged on the hearsay evidence of a printer with complicity in the production of an anti-Fascist newspaper *Non-*

Mollare. He was imprisoned for 35 days before being tried. No evidence but that of the printer was cited, and his case was postponed till July 1925 when he was provisionally released. Prof. Salvemini was compelled to leave Florence, and was kept under police surveillance until Oct. 1925, when he took the occasion of the Government amnesty, proclaimed for the Matteotti murderers, to leave the country. He went to London, and later took up university appointments in the United States. Among the works published in exile was *The Fascist Dictatorship* (1928).

SALVIA, a large genus belonging to the family Labiatae (*q.v.*), containing about 550 species in the temperate and warmer regions of both hemispheres. The name is derived from the Lat. *salvo*, from the healing properties of sage, *S. officinalis*. *S. verbenaca* is found in Great Britain in dry pastures and waste places as is also *S. pratensis*.

Many native species of *Salvia* occur in western North America, especially in California, where 15 species are found. Among these are *S. carduacea* (thistle sage), cultivated for its thistle-like, white-woolly foliage and blue flowers; *S. columbariae* and related, mostly Mexican, species are the source of chia.

Some Californian sages are important bee plants, among them the black sage (*S. mellifera*) and the bigflower sage (*S. grandiflora*).

Some of the salvias are among the most showy of soft-wooded plants, the blossoms being of a bright glowing scarlet. A useful species is *S. splendens*, a Brazilian shrub, commonly called scarlet sage. Treated as a tender annual, it is one of the most popular bedding plants in American gardens.

There are other very ornamental species of easy growth, increased by cuttings in spring, and succeeding well in ordinary rich loamy soil.

SALVIAN, a Christian writer of the 5th century, was born probably at Cologne (*De gub. Dei*, vi. 8, 13), some time between 400 and 405. He was educated at the school of Treves and seems to have been brought up as a Christian. His writings show legal knowledge. He married Palladia, the daughter of heathen parents, Hypatius and Quieta, whose displeasure he incurred by persuading his wife to retire with him to a distant monastery, which is almost certainly that founded by St. Honoratus at Lerins.

It was presumably at Lerins that Salvian made the acquaintance of Honoratus (d. 429), Hilary of Arles (d. 449) and Eucherius of Lyons (d. 449). That he was a friend of the former and wrote an account of his life we learn from Hilary (*Vita Hon.*, ap. Migne, I. 1260). To Eucherius's two sons, Salonus and Veranus, he acted as tutor in consort with Vincent of Lerins. Salvian continued his friendly intercourse with both father and sons long after the latter had left his care; it was to Salonus (then a bishop) that he wrote his explanatory letter just after the publication of his treatise *Ad ecclesiam*; and to the same prelate a few years later he dedicated his great work, the *De gubernatione Dei*. Salvian spent the last years of his life at Marseilles (Gennadius, ap. Migne, lviii. 1099). It has been conjectured that Salvian paid a visit to Carthage; but this is a mere inference based on the minute details he gives of the state of this city just before its fall (*De gub. vii.*, viii.). He seems to have been still living at Marseilles when Gennadius wrote under the papacy of Gelasius (492–496).

Of Salvian's writings there are extant *De gubernatione Dei* (more correctly *De praesenti iudicio*) and *Ad ecclesiam*, and a series of nine letters. The *De gubernatione*, Salvian's greatest work, was written between 439 and 450; it furnishes a valuable if prejudiced description of life in 5th-century Gaul. Salvian deals with the same problem that had moved the eloquence of Augustine and Orosius. Why were these miseries falling on the empire? Could it be, as the pagans said, because the age had forsaken its old gods? or as the semi-pagan creed of some Christians taught, that God did not constantly overrule the world he had created (i. 1)? He concludes that the misery of the Roman world is all due to the neglect of God's commandments and the terrible sins of every class of society. It is difficult to credit the universal wickedness adduced by Salvian, especially in face of the contemporary testimony of Symmachus, Ausonius and Sidonius. Salvian was a 5th-century socialist of the most extreme type, and a zealous ascetic

who exaggerated, albeit unconsciously, the faults that he desired to eradicate.

The *Ad ecclesiam* was first printed in Richard's *Antidotum* (Basel, 1528); the *De gubernatione* by Brassican (Basel, 1530). Salvian's works are reprinted (after Baluze) in Migne's *Cursus patrologiae*, ser. lat. vol. liii. For bibliography, see T. G. Schoenemann's *Bibliotheca patrum* (ii. 823), and the prefaces to the editions of C. Halm (*Monum. Germ.*, 1877) and F. Pauly (Vienna, *Corp. scr. eccl. Lat.*, 1883). See also S. Dill, *Roman Society in the Last Century of the Western Empire*, pp. 115–120.

SALVINI, TOMMASO (1829–1915), Italian actor, was born at Milan on Jan. 1, 1829. His father and mother were both actors, and Tommaso first appeared when he was barely fourteen as Pasquino in Goldoni's *Donne curiose*. In 1847 he joined the company of Adelaide Ristori, and with her he played the title rôle in Alfieri's *Oreste* at the Teatro Valle in Rome. He fought in the cause of Italian independence in 1849; otherwise his life was an unbroken series of successes in his art. He acted frequently in England, and made five visits to America, his first in 1873 and his last in 1889. In 1886 he played there Othello to the Iago of Edwin Booth. Apart from Othello, which he played for the first time at Vicenza in June 1856, his most famous impersonations included Conrad in Paolo Giacometti's *La Morte civile*, Egisto in Alfieri's *Merope*, Saul in Alfieri's *Saul*, Paolo in Silvio Pellico's *Francesca da Rimini*, Oedipus in Nicolini's play of that name, Macbeth and King Lear. Salvini retired from the stage in 1890, but in Jan. 1902 took part in the celebration in Rome of Ristori's eightieth birthday.

See his *Ricordi, anedotti ed impressioni* (Milan, 1895); *Leaves from the Autobiography of Tommaso Salvini* (London, 1893); G. Piccini, *Vita aneddotica di Tommaso Salvini* (Florence, 1908).

SALWEEN, a district in the Tenasserim division of Burma. Area, 2,582 square miles. Pop. (1931) 53,186, of whom 50,068 were aboriginal tribesmen (mostly Karens and some Shans). Nearly the whole district is a maze of mountains intersected by deep ravines, the only level land of any considerable extent being found in the valley of the Yonzalín, while the country is covered with dense forest, of which portions are reserved. The district is drained by three principal rivers, the Salween, Yonzalín and Bilin, fed by mountain-torrents. The Yonzalín, which rises in the extreme north, is navigable with some difficulty in the dry season as far as Papun; the Bilin is not navigable within the limits of the district except by small boats and rafts. The district headquarters are at Papun. The rainfall is heavy. A considerable trade is carried on with Siam by bridle paths across the mountains.

SALWEEN, a river of Tibet, China (Yunnan) and Burma. This river, called Nam Kōng by the Shans, Thanlwin by the Burmese, Lu Kiang, or Nu Kiang, or Lu Tzu Kiang by the Chinese, is the longest river in Burma, and one of the wildest and most picturesque streams in the world. It rises in Tibet south of the Kun Lun, and is thus a much longer river than the Irrawaddy. From the time it leaves Tibet it has a very narrow basin, and for long stretches has no other affluents than the mountain torrents from the hills, which rise from 3,000 to 5,000 or 6,000 ft. above the level of the river-bed. In the dry season the banks are alternate stretches of blinding white, fine sand, and a chaos of huge boulders, masses and slabs of rock, with here and there, usually where a tributary enters, long stretches of shingle. In the rains all these disappear, and the water laps against forest trees and the abrupt slope of the hills. The average difference between high and low water level of the Salween throughout the Shan States is between 50 and 60 ft., and in some places it is as much as 90. There are many rapids, caused by reefs of rock running across the bed, or by a sudden fall of from one to several feet, which produce very rough water below the swift glide; but the most dangerous places for navigation are where a point juts out into the stream, and the current, thrown back, causes a violent double backwater. Nevertheless, long stretches of the river, extending to scores of miles, are habitually navigated by native boats. The current is extremely variable, from $\frac{1}{2}$ m. an hour to ten knots. Launches ply regularly from Moulmein to the mouth of the Yonzalín, in Lower Burma. The worst part of the whole Salween.

so far as is known, is the gorge between the mouth of the Yōnzalin and Kyaukhnyat. It is quite certain that steam launches could ply over very long sections of the river above that, perhaps as far as the Kaw ferry, or even the Kunlong ferry. In British territory, however, there are very few settlements on the river itself, and frequently the ferry villages are built 1,000 ft. above the river.

The Chinese believe the Salween valley to be deadly to all strangers, but it is in Chinese territory—particularly in the Lu Kiang, or Mong Hko state—that there is the largest population on the river until Lower Burma is reached. A description of the Salween resolves itself into a list of the ferries at which it can be crossed, for no one marches up the river. The river is bridged by the Chinese on the main route from Tēng Yüeh (Momien) and Bhamo to Tali-fu. Native boats can ply from Kyodan S., and light draught steamers ascend as far as Shwegūn, 63 m. from Moulmein.

The Salween enters the sea in the Gulf of Martaban by two mouths, one to the north and one to the south of Bilugyun island. The southern mouth is the more important, and is the one by which ocean-going craft approach the port of Moulmein. The Salween cuts the British Shan States nearly in half, and is a very formidable natural obstacle. It seems probable, however, that long stretches of it can be opened to trade. It is certainly no less navigable than the Middle Mekong or the Yangtze-kiang above I-chang.

SALYES (Gr. Σάλυες; also SALLYES, SALYI, SALLUVII), a people occupying the plain south of the Druentia (Durance) between the Rhone and the Alps. According to Strabo (iv. p. 203) the older Greeks called them Ligyes, and their territory *Ligustikē*. In 154 B.C. the inhabitants of Massalia, who had been connected with the Romans by ties of friendship since the second Punic war, appealed for aid against the Oxybii and Decietes (or Deciates). These people, called by Livy (*Epit.* 47) "transalpine Ligurians," were perhaps two smaller tribes included under the general name of Salyes. They were defeated by Quintus Opimius. In 125-124 B.C. hostilities broke out between the Romans and the Salyes from the same cause. Gaius Sextius Calvinus (123-122 B.C.), subdued the Salyes, destroyed their chief town, and founded near its ruins the colony of Aquae Sextiae (Aix). Part of their territory was handed over to Massaliots. From this time the Salyes practically disappear from history.

For ancient authorities see A. Holder, *Alteltischer Sprachschatz*, ii. (1904).

SALZA, HERMANN VON (c. 1170-1239), master of the Teutonic Order, and councillor of the emperor Frederick II., entered the Teutonic Order in early life, became very intimate with Frederick II., took part in the expedition to Damieta in 1221, and accompanied the emperor on the crusade of 1228. About 1210 he was appointed master of the Teutonic Order, and in 1226 received the province of Kulm from Conrad I., duke of Masovia, in return for help against the Prussians. In 1230 the conquest of Prussia was begun by the Order, although not under his immediate leadership. In 1225 he reconciled Valdemar II., king of Denmark, with Henry I., count of Schwerin, and thus won again the land on the right bank of the Elbe for the Empire, and the recognition of imperial superiority over Denmark. Trusted by Pope Gregory IX. and the emperor alike, he brought about the treaty of San Germano between them in 1230, was the only witness when they met in conference at Anagni in the same year, and it was he who, in 1235, induced Frederick's son, Henry, to submit to his father. He died on March 19, 1239 at Barletta in Apulia, and was buried there in the chapel of his Order.

See A. Koch, *Hermann von Salza, Meister des deutschen Ordens* (Leipzig, 1885).

SALZBRUNN, a watering-place in the Prussian province of Silesia, Germany, at the foot of the Riesengebirge, 30 mi. S.W. of Breslau, by rail to Waldenburg. Pop. (1933) 13,761. It consists of Ober-, Neu- and Nieder-Salzbrunn, and manufactures glass, wire goods and yarn. Its alkali-saline springs were known as early as 1316. Gerhart Hauptmann was born there in 1862.

SALZBURG, a province of Austria, seized by Germany in March 1938, covers an area of 2,762 sq.mi. It

includes from south to north parts of the following lithological belts of the Alps, the crystalline, the slate and schist, the limestone High Alps, and the *flysch* zones. The first named extends from the glacier-capped Hohe Tauern and southern slopes of the Nedere Tauern to the line of the Pinzgau eastward to the Mandling pass. This is a region much dissected by tributaries of the Salzach and characterised by forestry and pastoral pursuits. The most important valley is that of the Gastein leading to a col between the Hohe and Nedere Tauern ranges and followed by a railway to Carinthia. North of this belt is a wedge-shaped mass of slates and schist, with softer outlines and lower forested heights, which is in turn replaced by the lake-strewn plateau of Dachstein limestone, split into several detached blocks, e.g., the eastern end of the Kitzbühl Alps, the Salzburg Alps (Birnhorn, 8,637 ft.), the Reiteralpe and the glacier-capped Schonfeldspitze mass (8,708 ft.). Part of the Dachstein group also belongs to Salzburg. Drainage is effected mainly by the Salzach which in its upper course follows a west-east marshy valley (Pinzgau) along the foot of the Hohe Tauern, at the junction of crystallines and slates, to Schwarzach St. Veit, where it takes a transverse course through a wider and more fertile valley (Ponzgau), breaking through a narrow pass between the Hagengebirge and the Tennegebirge and reaching the foreland at Salzburg; the upper waters of the Enns and Mur take the drainage of the eastern half of the Nedere Tauern. Salzburg is noted for its numerous beautiful lakes and the many magnificent falls on its rivers, e.g., the four Krimmler falls, together 2,085 ft. high, the most important falls in the Eastern Alps and the Tauern fall (660 ft.).

The enclosed basins of the higher mountain districts experience very hard winters and settlement in them is thin and confined to the sunny slopes and alluvial fans. About 16% of the total area is unproductive and of the remainder some 11% is given over to crops and 10% to meadows. Forestry and pastoral activities, aided by a wealth of Alpine pasture (some 30% of the area) are most important. Mineral resources include: salt at Hallein, copper near Bischofshofen, iron-ore at Werfen, marble (Adnet) and small quantities of gold, silver and arsenic. The absence of coal is compensated by the rich stores of water, from which electrical power is developed at Lend Gastein, Barenwerk, etc., yet industry is only moderately progressive. Catering for visitors to the spas, scenic resorts and centres for winter-sports is the most remunerative industry. Apart from Salzburg (*q.v.*), the capital, the population of 267,440 (1939) is rurally distributed, mainly along the valleys and chief lines of traffic, and no other town reaches 10,000 inhabitants. The people are of German stock and mainly Roman Catholic in religion, with a high standard of education. In 1938 Salzburg was made a German *gau*.

See F. Martin, *Kunstgeschichte von Salzburg* (Vienna, 1924) and E. Spengler, *Geologischer Führer durch die Salzburger Alpen und das Salzkammergut* (Berlin, 1924); E. Kriechbaum, *Salzburg und das Oberdonauland* (Berlin, 1938).

SALZBURG, the capital of the province of Salzburg, Austria, seized by Germany in March 1938, lies on both banks of the Salzach where this river leaves its narrow valley through the limestone Alps and enters the Alpine foreland.

The situation is important economically and strategically, for here several types of physical region, with differing agricultural possibilities, meet and the Orient route from Germany through Munich joins the Orient route from France through Switzerland and branches along the Salzach valley and through the Hohe Tauern to Carinthia and Italy. The site has been occupied since pre-Roman time, the original settlement being replaced by a Roman trading town (*Juvavum*) which was sacked by the barbarians (477). The modern city grew up around the monastery and bishopric founded here about 700 by St. Rupert of Worms, who preached Christianity in the district at the invitation of its ruler Duke Theodo of Bavaria, and its history from that time is closely bound up with that of the see. The present name, due to the local abundance of salt, appears first in 816 by which time it had been raised to an archbishopric. Its archbishops gained in temporal power and dignity and were made imperial princes by Rudolf of Hapsburg in 1278.

Relations between the ecclesiastical rulers on the one hand and

the nobles and people on the other were always difficult, e.g., during the Peasants' War of 1525-26, quelled with the aid of the Swabian League, and contributing to a reaction against the church when Salzburg became a stronghold of resistance to the Reformation. Persecution was rife and Protestant citizens were driven from the town. Nevertheless, the movement grew and in 1731-32, aided by the intervention of Frederick William I. of Prussia, 30,000 people sold their possessions and left the see, 6,000 of them leaving the capital. By the peace of Lunéville (1802) the see was secularized and given to the archduke of Austria. Following the peace of Pressburg (1805) it fell to Austria but four years later passed to Bavaria, returning to Austria in 1816 with the exception of a small portion on the left bank of the Salzach. In 1849 it became a crownland, several of its districts being transferred to Tirol, and remained so until 1918, when it became part of the Austrian republic. With the rest of Austria it was annexed to Germany by Hitler in March 1938.

Its ecclesiastical buildings include 8 convents and 25 churches, the majority interesting from their antiquity, architecture or associations. Of these, the 17th century cathedral, one of the largest and most perfect specimens of the Renaissance style in the Germanic countries, is on the model of St. Peter's at Rome. Though situated in the old town it is bounded on three sides by open squares, which permit its beauties to be appreciated. Other buildings of note are the old and new residences of the archbishops, the latter occupied by government offices, the present palace, the 15th century town-hall and the Mozart house and museum. The only relic of the university (1623-1810) is a theological seminary. By the suppression of its university Salzburg has been prevented from making that contribution to Austrian culture that its importance as an administrative and spiritual centre leads one to expect.

Salzburg has had a heavy seasonal tourist traffic, favoured by a healthy climate, delightful scenic surroundings and excellent music.

Its manufactures include brewing, book-binding, musical instruments and marble wares and light iron goods.

Pop. (1939) of the Reichsgau of Salzburg was 267,440; and of the town, 79,264.

SALZKAMMERGUT is a mountainous district of Austria forming the drainage area of the Traun and its tributaries above Gmunden. Originally its name (literally "salt-exchequer property") and its economic importance were derived from the valuable salt deposits, worked from prehistoric times at Hallstatt and Aussee, but although these are still valuable the region is rapidly developing as a health and tourist resort. Belonging to the eastern Alps it contains the Dachstein group (Dachstein, 9,830 ft.) with the most easterly glaciers of the Alps, the Totes Gebirge (Grosser Priel, 8,246 ft.), the Hollengebirge (Hollenkogel, 6,106 ft.), the Ischler and Sensen groups. Among its lakes are Traun, Hallstatt, St. Wolfgang and Atter, largest in Austria (18 sq.mi., 1,527 ft. above sea-level, 560 ft. deep), each over-shadowed by forested heights. The district embraced parts of the Austrian provinces of Styria, Salzburg and Upper Austria, and the occupations of its population, apart from those suggested above, are cattle-rearing, forestry and the development of electricity. The towns are small, along the valleys and lake shores. Among them Gmunden (*q.v.*) is the chief, while Hallstatt is famous for its museum of local finds illustrative of the cultural period to which it gave its name. Germany annexed the district in 1938.

SAMAIN, ALBERT VICTOR (1858-1900), French poet, was born at Lille on April 4, 1858. He was educated at the lycée of that town, and on leaving it entered a bank as a clerk. He enjoyed no literary associations, and his talent developed slowly in solitude. About 1884 Samain went to Paris, having obtained a clerkship in the Préfecture de la Seine, which he held for most of his life. His earliest volume of poems, *Au Jardin de l'enfant*, led to the sudden recognition of his talent, and to applause from critics of widely different schools. In 1897 this book was reprinted in a more popular form, with the addition of a section entitled *L'Urne penchée*. Samain's second volume, *Aux flancs du vase*, appeared in 1898. His health began to fail and he with-

drew to the country, where he died, in the neighbourhood of the village of Magny-les-Hameaux, on Aug. 18, 1900. A third volume of his poems, *Le Chariot d'or*, appeared after his death, with a lyrical drama, *Polyphème* (1901), which was produced at the Théâtre de l'Œuvre in 1904. Samain's natural life was patiently spent in squalid conditions; he escaped from them into an imaginative world of the most exquisite refinement.

See also R. Doumic, "Trois Poètes," in the *Revue des deux mondes* (Oct. 1900); L. Bocquet, *Albert Samain, sa vie, son oeuvre* (1905); and E. W. Gosse, *French Profiles* (1905); F. Gohin, *L'Œuvre poétique d'Albert Samain, 1858-1900* (1919); G. Bonneau, *A. Samain, poète Symboliste* (1925).

SAMANA RANGE, mountain ridge in the Kohat district of the North-West Frontier Province of India, commanding the south boundary of Tirah. The ridge lies between the Khanki valley on the north and the Miranzai valley on the south, and extends for some 30 m. W. from Hangu to the Samana Suk. It is some 6,000 to 7,000 ft. high. Beyond the Samana Suk lies the pass, known as the Chagru Kotal, across which the Tirah Expedition marched in 1897. On the opposite hill on the other side of this road is the famous position of Dargai (see TIRAH: Campaign). After the Miranzai Expedition of 1891 this range was occupied by British troops and eleven posts were established along its crest, the two chief posts being Fort Lockhart and Fort Gulistan. In 1897 all the forts on the Samana were attacked by the Orakzais, and this and the Afridi attack on the Rhyber pass were the two chief causes of the Tirah Expedition. When Lord Curzon reorganized the frontier in 1900, British garrisons were withdrawn from most of the Samana forts, which are now held by a corps of tribal police 450 strong, called the Samana Rifles.

SĀMĀNIDS, the first great native dynasty which sprang up in the 9th century in E. Persia, and, though nominally provincial governors under the suzerainty of the caliphs of Baghdad, succeeded in a very short time in establishing an almost independent rule over Transoxiana and the greater part of Persia. Under the caliphate of Mamun, Sāmān, a Persian noble of Balkh, who was a close friend of the Arab governor of Khorasan, Asad b. Abdallah, was converted from Zoroastrianism to Islam. His son Asad, named after Asad b. Abdallah, had four sons who rendered distinguished services to Mamun. In return they all received provinces: Niih obtained Samarkand; Aḥmad, Ferghana; Yahyā, Shash; Ilyās, Herat. Of these Aḥmad and his second son Ismā'īl overthrew the Saffārids (*q.v.*) and the Zaidites of Tabaristan, and thus the Sāmānids established themselves with the sanction of the caliph Motamid in their capital Bokhara.

The first ruler (874) was Naṣr I. (Naṣr or Naṣir b. Aḥmad b. Asad. b. Sāmān). He was succeeded by his brother Ismā'īl b. Aḥmad (892). His descendants and successors, all renowned for the high impulse they gave both to the patriotic feelings and the national poetry of modern Persia (see PERSIAN LITERATURE), were Aḥmad b. Isma'īl (907-913); Naṣr II. b. Aḥmad, the patron and friend of the great poet Rūdāgī (913-942); Nūḥ I. b. Naṣr (942-954); Abdalmalik I. b. Nūḥ (954-961); Maṣṣūr I. b. Niih, whose vizier Bal'ami translated Tabarī's universal history into Persian (961-976); Niih II. b. Maṣṣūr, whose court-poet Daqīqī (Daqīkī) began the *Shāhnāma* (976-997); Maṣṣūr II. b. Nūḥ (997-999); and Abdalmalik II. b. Nūḥ (999), under whom the Sāmānid dynasty was conquered by the Ghaznevīds. The rulers of this powerful house, whose silver dirhems had an extensive currency during the 10th century all over the N. of Asia, and were brought, through Russian caravans, even so far as to Pomerania, Sweden and Norway, where Sāmānid coins have been found in great number, were in their turn overthrown by a more youthful and vigorous race, that of Sabuktāgin, which founded the illustrious Ghaznevīd dynasty and the Mohammedan empire of India.

Under Abdalmalik I. a Turkish slave, Alptāgin, had been entrusted with the government of Bokhara, but, showing himself hostile to Maṣṣūr I., he was compelled to fly and to take refuge in the mountainous regions of Ghazni, where he established a semi-independent rule, to which, after his death in 977 (A.H. 367), his son-in-law Sabuktāgin, likewise a former Turkish slave, succeeded. Niih II., in order to retain at least a nominal sway over those Afghan territories, confirmed him in his high position and

invested Sabuktāgin's son Mahmiid with the governorship of Khorasan, in reward for the help they had given him in his struggles with a confederation of disaffected nobles of Bokhara under the leadership of Fā'iq and the troops of the Dailamites, a dynasty that had arisen on the shores of the Caspian Sea and wrested already from the hands of the Siminids all their western provinces. Unfortunately, Sabuktāgin died in the same year as Nūh II. (A.H. 997, 387), and Mahmiid (*q.v.*) confronted with an internal contest against his own brother Isma'il, had to withdraw his attention for a short time from the affairs in Khorasan and Transoxiana. This interval sufficed for the old rebel Fa'iq, supported by a strong Tatar army under the Ilek Khin Abu'l Hosain Naṣr I., to turn Nih's successor Mansiir II. into a mere puppet, to concentrate all the power in his own hand, and to induce even his nominal master to reject Mahmiid's application for a continuance of his governorship in Khorasan. Maḥmūd refrained for the moment from vindicating his right; but, as soon as, through court intrigues, Maṣṣūr II. had been dethroned, he took possession of Khorasan, deposed Maṣṣūr's successor Abdmalik II., and assumed as an independent monarch for the first time in Asiatic history the title of "sultān."

The last prince of the house of Sāmān, Montaṣir, a bold warrior and a poet of no mean talent, carried on for some years a kind of guerilla warfare against both Mahmiid and the Ilek Khan, who had occupied Transoxiana, till he was assassinated in 1005 (A.H. 395). Transoxiana itself was annexed to the Ghaznevid realm eleven years later, 1016 (A.H. 407).

See S. Lane Poole, *Mahommedan Dynasties* (1894), pp. 131-133; Stockvis, *Manuel d'histoire* (Leyden, 1888), vol. i. p. 113; also articles CALIPHATE and PERSIA: *History*, section B, and for the later period MAḤMŪD, SELJUKS, MONGOLS.

SAMANIEGO, FELIX MARIA DE (1745-1801), Spanish fabulist. His *Fábulas en verso castellano* (1781-84), imitations or translations for the most part of Phaedrus, La Fontaine and Gay, are excellent of their kind.

SAMARA, a province of Russia, lying east of the Volga river, except for the territory enclosed in the great Volga loop, and south of the Tatar A.S.S.R. Its southern boundary lies between the Great Irgiz and the railway from Saratov to Uralsk, and runs parallel to the latter till it reaches the boundary of the Kazakstan S.S.R., on the Obschiy Syrt plateau. Orenburg province and the Bashkir A.S.S.R., lie to the east.

South of the Volga loop (Samarskaya Luka) is a low flat steppe recently emerged from the post-Pliocene Aral-Caspian basin, while from the Samara river to the Sok are Permian formations. The province is a transition region between the black-earth and the salt steppe types of soil. The most fertile black earth with a humus content of 18% lies to the north-east of the province in the lyesso-steppe area—*i.e.*, steppe with patches of forest, here mainly oak. Between the Samara river and the Mocha, except for a patch north and south along the eastern part of the latter stream, the black-earth is of poorer humus content, of a sandy type, and patches of salted soil appear, especially near the Volga. South of the Great Irgiz river the soil is salt steppe, and there are salt marshes. South of the Samara river there is no forest, but the land in the loop and to the north of it is forested, and there is a patch of forest on the north bank, west of Buzuluk.

The region is undergoing a process of rapid desiccation. It has an arid climate, the rainfall varying from 8 to 16 in., per annum, mostly falling in spring and summer in heavy showers, so that the run-off is excessive and only the surface becomes saturated. The prevailing winds are from the north-east, dry and strong, and blowing with great violence in winter, so that snow does not lie and the ground is exposed to the severe winter frost. The average July temperature at Samara is 70.4° F and January 9.3° F. An added disadvantage is the liability to years of excessive drought such as 1911 and 1921. Winter lasts for five months and rain falls on an average of 95 days per annum, 34 of which are in June-August. Thunderstorms are frequent in June and July and if accompanied by dry hail may ruin the crops.

Diminution in the spring rainfall causes the disastrous famines to which the region is subject. Of the inhabitants, 90% are occu-

pled in agriculture, depending on the crops for sustenance and for purchase of necessities. Bad harvests, therefore, such as those of 1911 and 1921, bring disaster. In 1921 great numbers died of starvation and starvation diseases and others fled from the region, many to perish on the road. Bands of starving children, whose parents had succumbed first in their efforts to feed the children, penetrated even as far as the Caucasus. Livestock diminished and when the weakened survivors of the terrible period faced the next year there was a shortage of everything, from seeds and instruments to working cattle.

The area has revived to an extraordinary degree, an evidence of the fertility of its famous black soil. Attention had been concentrated on the drought problem and the need for more intensive agriculture in Samara as early as 1864, and some efforts were made to improve the type of cultivation. Further evidence of the crisis of extensive agriculture in the region is the great variation in the harvest, in 1911 not enough to satisfy local needs; in 1913, a surplus of 110,000,000 poods. Six experimental stations have been established to study local problems, Besenchuk, Buguruslan, Alekseyev, Bugulma, Buzuluk and one connected with the Samara agricultural school at Kinel.

The main lines along which attempts are being made to improve agriculture and lessen the chances of famine in the district are the increasing practice of irrigation; a wider range of variety in crops, and especially the sowing of grasses and lucerne, in this respect Samara stands first in the provinces of the famine area; the preservation of what forest is left, and the planting of more trees, in view of their protective value in a windswept region, and their influence on moisture conditions in the soil; the greater extension of stock raising, in view of the increasing importance of meat, dairy products, fats and wool for the growing industrial regions. Though many experiments have been made, no kind of winter corn able to withstand the severe conditions has yet been discovered, but more drought resisting varieties of hard wheat, which commands a better market than soft wheat, have been introduced. Efforts are also directed towards co-operative farming, though as yet not very successfully.

About 90% of Samara province is favourable for vegetation, and of this about two-thirds is ploughed land, about one-tenth is forest and scrub, and the rest is pasture, meadowland or garden. In the stock-raising areas, cattle, sheep and pigs are at pre-1914 level, but horses are still much below that level. Cattle plague often devastates the herds. A few dairy artels have been established. Bee-keeping and poultry raising are subsidiary occupations. The manufactures in the region are entirely dependent on local products and include flour-milling, distilling, starch manufacture, tobacco making, confectionery, woollen goods, leather and matches. Most of them are of the small scale, peasant type. Two sugar factories were working before 1914, and there is one factory producing agricultural machinery.

The population in 1926 was 2,409,773, consisting mainly of Great Russians, with Mordvas, Chuvashes, Tatars and Bashkirs. The ethnographic variety is very great and the colonies of Poles, Mennonites from Danzig, and Circassians settled here in 1847-59 by the government added to it. Difficulties of overcoming illiteracy and raising the cultural standard under these conditions are great. The Volga is the great artery of commerce, its tributaries are shallow and not suitable for navigation, with the exception of the Great Irgiz up to Kushum. Samara is linked by rail with Moscow on the west, and with Ufa, and Orenburg on the east, while a branch line reaches the Sok river. Roads are poor, there are few bridges, and transport difficulties hamper development. The chief towns are Samara, Pugachevsk, Buzuluk (*qq.v.*), and Buguruslan.

See P. A. Preobrazhenskiy *The Restoration of Agriculture in the Famine Area of Russia* (1922, in English); *Colonisation of the Samara Region* (1923, in Russian); M. M. Dubenskiy, *The Central Volga Region* (1927, in Russian).

SAMARA, a town of Russia in the province of Samara, in 53° 11' N., 50° 9' E., on the left bank of the Volga loop, at the junction of the Samara river. Pop. (1933) 259,100. It is a fine river port, and acts as an entrepôt for goods brought by rail and

transhipped, or vice versa. Its industries include the making of machinery, distilling, brewing, match-making, saw-milling, leather-work and flour-milling. There are municipal electricity, water and canal and tram services. Near the town is a *kumiss* or fermented mare's milk sanatorium. Samara was built in 1586 to secure communication between the recently conquered principalities of Kazan and Astrakhan. Later discontent among the serfs led to a rising in the district in 1775 and the town was the centre for its leader, Pugachev. Nearly a century earlier, in 1670, it was captured by the rebel Stenka Razin. Its importance as a trading centre dates from the end of the 18th century, when colonisation spread eastwards. In 1918 the Russian State gold treasure was transferred from Kazan to Samara, under the charge of employees of the Tsarist government, but when the military situation became critical, it was removed under an escort of Czech soldiers. In spite of the difficulties of this period and of the terrible famine conditions of 1921, the town's population has increased rapidly. It is now re-named Kuibishev.

SAMARIA, an ancient city of Palestine in the tribe of Ephraim, 6 m. N. of Shechem (Nāblus). The site, an isolated steep hill in the very centre of Palestine, is one of great natural strength. Sebastiyeh, a mean village of 600 inhabitants, occupies part of the area of the royal city; its houses are mostly built with ancient materials.

History.—Omri, king of Israel, bought the hill from its owner, Shemer, for two talents of silver, and erected a city which he made his capital (1 Ki. xvi. 24). The evidence of the excavations establishes that the site was unoccupied prior to the time of Omri (10th century B.C.). Ahab occupied the city, built a temple and remodelled Omri's palace, which was further extended later and probably by Jeroboam II. Ben-hadad II. of Syria in the days of Elijah and Elisha, after having been repulsed from its walls (1 Ki. xx. 34) returned to besiege it and bring it to dire straits through famine (2 Ki. vi. vii.). Shalmaneser IV. laid siege to it for three years (724–22 B.C.), but died during its progress. The operation was completed by Sargon, who deported its inhabitants and substituted for them a new body of settlers from Cutha, the ancestors of the Samaritans. Alexander the Great conquered it in 331 B.C., as did also later Ptolemy Lagi and Antiochus Poliorcetes. It offered a lively resistance to the fanatical John Hyrcanus. Pompey rebuilt it; Gabinius restored it; but Herod the Great was its chief benefactor. A temple, hippodrome and colonnaded streets were amongst his endowments; their remains still arrest attention. He made it his capital and it took the name Sebaste (commemorating Augustus). The rise of Nāblus (Neapolis), restored by Vespasian, involved the gradual decay of Sebaste. The Crusaders built a church on the hill and established a bishopric. The church, like so many others, was later converted into a mosque. Here were shown the tombs of Elisha, Obadiah, and John the Baptist.

Archaeology.—From 1908 to 1910 excavations, under the auspices of Harvard University were carried out on the site, the results of which were published in 1924. The oldest edifice found on the hill was the palace of Omri, added to and enlarged by Ahab and Jeroboam II. An interesting discovery was that of a number of Hebrew texts traced in ink on tiles in Hebrew writing of a beautiful type belonging to the 9th century B.C. The foundations of a forum, senate-house, palace, city-gate flanked by two round towers, etc., have been laid bare. The low ground to the north-east was the site of the stadium.

See G. A. Reisner, C. S. Fisher, D. G. Lyon, *Harvard Excavations at Samaria (1908–10)* (1924); R. Dussaud, "Samarie au temps d'Achab," *Syria* 6 (1925), 314 seq. (E. Ro.)

SAMARITANS, primarily meaning "inhabitants of Samaria, or the region of Samaria," is specially used, in the New Testament and by Josephus, as the name of a peculiar religious community which had its headquarters in the Samaritan country, and is still represented by a few families at Nāblus, the ancient Shechem. They claim to be descendants of the ten tribes, and to possess the orthodox religion of Moses, accepting the Pentateuch only and transmitting it in a Hebrew text which for the most part has but slight variations from that of the Jews. But

they regard the Jewish temple and priesthood as schismatical, and declare that the true sanctuary chosen by God is not Zion but Mount Gerizim, over against Shechem (St. John iv. 20). The sanctity of this site they prove from the Pentateuch, reading Gerizim for Ebal in Deut. xxvii. 4. With this change the chapter is interpreted as a command to select Gerizim as the legitimate sanctuary (cf. verse 7). Moreover, in Exod. xx. 17 and Deut. v. 21 a commandment (taken from Deut. xxvii.) is found in the Samaritan text, at the close of the decalogue, giving directions to build an altar and do sacrifice on Gerizim, from which of course it follows that not only the temple of Zion but the earlier shrine at Shiloh and the priesthood of Eli were schismatical.

The Samaritans must have derived their Pentateuch from the Jews after Ezra's reforms of 444 B.C., no doubt at the time of the expulsion from Jerusalem in 432 B.C. of a man of high-priestly family (Neh. xiii. 28), who had married a daughter of Sanballat. Cf. Josephus Ant, xi. 8. The story that they possess a copy of the Law written by Abisha, the great-grandson of Aaron, seems to have aroused a strangely wide-spread interest, so that, tourists invariably ask to see it and usually claim to have succeeded in doing so. Considering the extreme reverence with which it is regarded, it may safely be said that this manuscript is never shown to them.

In spite of the differences which separated the two communities, their internal development and external history ran parallel courses till the Jewish state took a new departure under the Maccabees. The religious resemblance between the two bodies was increased by the institution of the synagogue, from which there grew up a Samaritan theology and an exegetical tradition. The latter is embodied in the Samaritan Targum, or Aramaic version of the Pentateuch, which in its present form is probably not much earlier than the 4th century A.D., but in general is said to agree with the readings of Origen's *τὸ Σαμαρειτικόν*. Whether the latter represents a complete translation of the Law into Greek may be doubted, but at any rate the Samaritans began already in the time of Alexander to be influenced by Hellenism. They as well as Jews were carried to Egypt by Ptolemy Lagi, and the rivalry of the two parties was continued in Alexandria (Jos. Ant. xii. 1. 1), where such a translation may have been produced. Of the Samaritan contributions to Hellenistic literature some fragments have been preserved in the remains of Alexander Polyhistor.

The troubles that fell upon the Jews under Antiochus Epiphanes were not escaped by the Samaritans (2 Macc. v. 23; vi. 2), for the account in Josephus (Ant. xii. 5. 5), which makes them voluntarily exchange their religion for the worship of Zeus, is evidently coloured to suit the author's hostility. Under the Maccabees their relations with Judaea became very bitter. They suffered severely at the hands of Hyrcanus, and the temple on Mt. Gerizim was destroyed. Although this treatment established an unalterable enmity to the Jews, as we see in the New Testament, in Josephus and in Jewish tradition, the two sects had too much in common not to unite occasionally against a common enemy, and in the struggles of the Jews with Vespasian the Samaritans took part against the Romans. They were not, however, consistent, for under Hadrian they helped the Romans against the Jews and were allowed to rebuild their temple on Mt. Gerizim. They seem to have shared in the Jewish dispersion, since in later times we hear of Samaritans and their synagogues in Egypt, in Rome and in other parts of the empire. In the 4th century they enjoyed a certain degree of prosperity, according to their own chronicles, under Baba the Great, who (re-)established their religious and social organization. In 484, in consequence of attacks on the Christians, the Gerizim temple was finally destroyed by the Romans, and an insurrection in 529 was suppressed by Justinian so effectively that, while retaining their distinctive religion, they became henceforth politically merged in the surrounding population, with a merely domestic history. They are mentioned in later times by the Jewish travellers Benjamin of Tudela (1173) and Obadiah Bertinoro (1488 in Egypt), by Sir John Maundeville and others, but little was known of them in Europe till Scaliger opened communications

with them in 1583. In consequence of the interest thus aroused, the traveller Pietro della Valle visited them in 1616 and succeeded in obtaining a copy of their Pentateuch and of their Targum. At the present day they live only at Nāblus (Shechem), about 150 in number, the congregations formerly existing in Gaza, Cairo, Damascus and elsewhere having long since died out. Their ecclesiastical head is the "Priest-levite," who claims descent from Uzziel the younger son of Kohath (Exod. vi. 18). The line of the high-priests, so called as being descended from Aaron, became extinct in 1623.

In religion, since they recognize no sacred book but the Pentateuch, they agree with the Jews in such doctrines and observances only as are enjoined in the law of Moses. They do not therefore observe the feast of Purim, nor the fast of the 9th of Ab, nor any of the later rabbinical extensions or modifications of the law. Briefly summarized, their creed is as follows: (a) God is one, and in speaking of Him all anthropomorphic expressions are to be avoided: creation was effected by his word: divine appearances in the Pentateuch are to be explained as vicarious, by means of angels (so as early as the 4th century A.D.); (b) Moses is the only prophet: all who have since claimed to be so are deceivers; (c) the Law, which was created with the world, is the only divine revelation; (d) Mt. Gerizim is the house of God, the only centre of worship; (e) there will be a day of judgment. Closely connected with this are the doctrines (also found in the 4th century) of a future life and of a messiah (Ta'eb), who shall end the period of God's displeasure (Fanuta) under which his people have suffered since the schism of Eli and the disappearance of the Ark, and shall restore Israel to favour (Re'uta, Ridwān).

The Samaritan language properly so called is a dialect of Palestinian Aramaic, of which the best examples are found in the literature of the 4th century A.D. An archaic alphabet, derived from the old Hebrew, was retained, and is still used by them for writing Aramaic, Hebrew and sometimes even Arabic. After the Muslim conquest of Syria in 632 the native dialect of Aramaic gradually died out, and by the 11th century Arabic had become the literary as well as the popular language. In the Liturgy Hebrew was no doubt used from the earliest times side by side with Aramaic, and after the 11th century it became, in a debased form, the only language for new liturgical compositions.

Literature.— Their literature is, like that of the Jews, chiefly of a religious character. (For an account of it see Montgomery, *The Samaritans*.) Reference has been made above to Samaritan Hellenistic works which have perished except for a few fragments. According to Samaritan tradition, their books were destroyed under Hadrian and Commodus, but of the language and contents of them nothing is recorded. There can be no doubt that some, perhaps much, of the literature has been lost, for nothing is extant which can be dated before the 4th century A.D. The Targum, or Samaritan-Aramaic version of the Pentateuch was most probably written down about that time, though it was clearly based on a much older tradition and must have undergone various recensions. To the same period belong the liturgical compositions of Amram Darah and Marqah, and the latter's midrashic commentary (called the Book of *Wonders*) on parts of the Pentateuch, all in Aramaic. With the possible exception of one or two hymns there is nothing further till the 11th century when there appears the Arabic version of the Pentateuch, usually ascribed to Abu Sa'id, but perhaps really by Abu'l-ḥasan of Tyre, who also wrote three Arabic treatises, still extant, on theological subjects, besides some hymns. Of the same date (1053) is an anonymous commentary on Genesis, preserved in the Bodleian Library at Oxford (MS. Opp, add. 4°, 99), interesting because it quotes from books of the Bible other than the Pentateuch. In the 12th century, Munajja and his son Sadaqah wrote on theology; the earlier part of the chronicle called *al-Taulidah* was compiled in Hebrew (1149); and about the same time treatises on Grammar by Abu Sa'id and Abu Ishaq Ibrahim ibn Faraj, Ghazal ibn-al-Duwaik, who wrote on the story of Balak and on the restoration of the kingdom to Israel, is said to have lived in the 13th century, and another chronicle (in Arabic), called

the book of Joshua, is dated about the same time by T. W. J. Juynboll. In the second half of the 14th century lived three important liturgical writers, Abisha b. Phinehas (ob. 1376), Abdallah b. Solomon and Sa'd-allah (or Sa'd-ed-din) b. Sadaqah: Abu'l-fath, who composed his chronicle in 1355: a high priest Phinehas, author of a lexicon: and the anonymous writer of the commentary on the *Kitab al-asatir*, a work, ascribed to Moses, containing legends of the Patriarchs. Another famous liturgist was Abraham Qabazi, whose pupil Isma'il Rumaihi in 1337 wrote a work on the praise of Moses. Several members of the Danfi family were prominent in the 18th century as liturgists, among them Abraham b. Jacob, who also wrote a commentary on *Gen.-Num.*; and of the levitical family Ghazal ibn Abi Sarur, who commented on *Gen.-Exod.* Another Ghazal (=Tabiah b. Isaac), priest-levite, who died in 1786, was a considerable writer of liturgy. Of subsequent authors mention need only be made of the Hebrew chronicle by Ab Sakhwah (=Murjan) b. As'ad, of the Danfi family, in 1900, chiefly on the basis of *al-Taulidah* and Abu'l-fath; an Arabic chronicle by Phinehas b. Isaac (ob. 1898) of the levitical family; and an Arabic theological work, by the late priest-levite, Jacob b. Aaron.

BIBLIOGRAPHY.—See Montgomery, *The Samaritans* (Philadelphia, 1907). Since then the Pentateuch has been edited with critical apparatus by August von Gall (Giessen, 1914-18), *The Samaritan Liturgy*, text and introduction, by A. Cowley (Oxford, 1909), *The Asater*, with introduction, translation and notes by M. Gaster (London, 1927). (A. Cr.)

SAMARIUM, a metallic element (symbol Sm, atomic number 62, atomic weight 150.4), belonging to the rare-earth group, was discovered in 1879 by Lecoq de Boisbaudran and obtained in the form of pure compounds by Demarçay about 1901. Samarium occurs in many minerals such as monazite, gadolinite, samarskite, etc. It is best separated from the other members by the fractional crystallization of the double magnesium nitrates from 50% nitric acid. The oxide, Sm₂O₃, forms a pale yellow powder rapidly soluble in most acids giving topaz-yellow salts such as Sm₂(SO₄)₃·8H₂O. The solutions show characteristic absorption and spark spectra. The metal has been prepared by the electrolysis of the fused anhydrous chloride. It slowly oxidizes in the air and melts at 1,300°–1,400° C. Samarium, like europium, gives a lower chloride, SmCl₂, which is produced by heating SmCl₃ in hydrogen. (See RARE EARTHS.) (C. J.)

SAMARKAND, a city of Asiatic Russia, in 39° 39' N., 66° 56' E., situated in the Uzbek S.S.R. Pop. (1933) 154,600. The city is the ancient Maracanda, the capital of Sogdiana, then the residence of the Muslim Samanid dynasty, and subsequently the capital of the Mongol prince Tamerlane. It was captured by the Russians under General Kaufmann, after a fierce struggle, in 1868 and for a time declined. In 1900 its population was 58,194, but since the foundation of the Uzbek republic in 1924 with Samarkand as its administrative centre, the town has grown rapidly, an electric power station has been constructed and it has leather factories, cotton cleaning mills, flour-mills, distilleries, and pencil and brick factories. It is linked by rail with Orenburg and with the Caspian, and when these lines are joined up via Semipalatinsk with the trans-Siberian line, it is hoped that cotton cultivation will develop markedly and the population will depend on Siberian grain. It is situated at a height of 2,358 ft. in the fertile loess valley of the Zarafshan, at the point where the river issues from the western spurs of the Tian Shan, on a high plain, with the snow clad Hissar range rising to the south, from which bracing winds blow and make the city more healthy than others in Central Asia. Within a journey of a couple of days lie the glacier snouts of the Archa-Maidan, "Place of Junipers."

The Russian part of the town has wide streets lined with poplar, acacia, willow and elm trees, but the Muslim part is an intricate labyrinth of narrow, winding streets. Gardening, the making of pottery and metal goods, and trade in cotton, silk, wheat, rice, horses, asses, fruit and cutlery are among the occupations of the people. The native city, with its maze of yellow houses nestling among the trees, and from which rises the turquoise cupola of the Bibi-Khanum (a college erected in 1388 by a Chinese wife of Timur), centres on the Rigistan, a square around which are three

madrasahs (Muslim colleges), Ulug-beg, Shir-dar and Tilla-kari, of great architectural symmetry and beauty, decorated with enamelled tiles of various colours. Outside the walls of Samarkand are the Hazret Shah-Zindeh, the summer palace of Timur, on a terrace reached by 40 marble steps, and the grave of Shah-Zindeh (Kasim ibn Abbas), a companion of Timur. The latter was a famous shrine in the 14th century (Ibn Batuta's *Travels*, iii. 52). The Gur Amir, the tomb of Timur, a dome-crowned chapel, has suffered much from time and earthquakes; on its interior walls are turquoise arabesques and inscriptions in gold.

Maracanda was destroyed by Alexander the Great in 329 B.C. and was the scene of the murder of Cleitus. Ruins of its buildings, amongst which are plain and enamelled tiles and Graeco-Bactrian coins, lie outside Samarkand and are now called Aphrosiab. The city reappears as Samarkand at the time of the Arab conquest, when it was finally reduced by Kotaiba ibn Muslim in A.D. 711-712. Under the Samanids it became a brilliant seat of Arabic civilization and is reported to have been defended by 110,000 men when besieged by Jenghiz Khan in 1221, by whom it was destroyed and pillaged. When Timur (Tamerlane) made it his residence in 1369, its inhabitants numbered 150,000. The magnificent buildings of Timur's successors, which still remain, testify to its former wealth. But by the beginning of the 18th century it was almost uninhabited. It fell under Chinese dominion and subsequently under that of the Amir of Bukhara, and finally under that of Russia.

SAMAWA, a town on the Euphrates in 31° N., 45° E., at the junction of the Hindieh and Hilla branches of the Euphrates. The town is on the Baghdad-Basra railway and there is a good clear stretch of river as far as Nasiriyeh 71 m. down stream (up stream the river is practically impassable). It is also situated on the caravan routes to Hilla, Nejef and Basra, in a fertile area and is a centre of trade in local agricultural products, including vegetables, rice and wheat and barley. Like most of the Euphrates towns it is a market for such imported goods as sugar, indigo and coffee and also Manchester goods. A good deal of wool is raised locally and woollen carpets are manufactured in the town. Pop. (estimated) 10,000.

SAMBALPUR, a town and district of British India, in the Orissa division of Bihar and Orissa. The town is on the left bank of the river Mahanadi, and the terminus of a branch of the Bengal-Nagpur railway. Pop. (1931) 15,017. It contains a ruined fort with old temples.

The DISTRICT OF SAMBALPUR has an area of 3,824 sq.m. and a population (1921) of 880,945. The Mahanadi, which is the only important river, divides it into unequal parts. The greater portion is an undulating plain, with ranges of rugged hills, the largest of which is the Bara Pahar, covering an area of 300 sq.m., and attaining at Debrigarh a height of 2,267 ft. The Mahanadi affords means of water communication for 99 m.; its principal tributaries in Sambalpur are the Ib, Kelo and Jhira. To the west of the Mahanadi the district is under close cultivation; to the east the country is broken by hills and a considerable area is under forest. Gold dust and diamonds have been found near Hirakud, at the junction of the Ib and Mahanadi.

Sambalpur lapsed to the British in 1849, and was attached to Bengal until 1862, when it was transferred to the Central Provinces. In 1905 Sambalpur was transferred back again to Bengal, without the subdivisions of Phuljhar and Chandarpur-Padampur. On the outbreak of the Mutiny in 1857 a general rising took place, and it was not until 1864 that tranquillity was restored.

SAMBOURNE, EDWARD LINLEY (1844-1910), English draughtsman, illustrator and designer, was born in London, on Jan. 4, 1844. He was educated at the City of London school, and also received a few months' education at the South Kensington school of art. After a six years' "gentleman apprenticeship" with John Penn and Son, marine engineers, Greenwich, his humorous and fanciful sketches made surreptitiously in the drawing-office of that firm were shown to Mark Lemon, editor of *Punch*, and at once secured him an invitation to draw for that journal. In April 1867 appeared his first sketch, "Pros and Cons," and from that time his work was regularly seen, with rare excep-

tions, in the weekly pages of *Punch*. In 1871 he was called to the *Punch* "table." He drew his first political cartoon, properly so-called, in 1884, and ten years later began regularly to design the weekly second cartoon, following Sir John Tenniel as chief cartoonist in 1901. He died on Aug. 3, 1910.

See M. H. Spielmann, *The History of Punch* (1895).

SAMBUCA, SAMBUTE, SAMBIUT, SAMBUE, SAMBUQUE, an ancient stringed instrument of Asiatic origin generally supposed to be a small triangular harp of shrill tone (Arist. Quint. Meib. ii. p. 101). But there is no certainty on the point and the most widely different characters have been ascribed to the instrument from time to time in the older records. Thus it has been described as a kind of tambourine, as a sort of flute, as a cithara, as another form of the sackbut, and so on.

SAMLAND, a peninsula of Germany, in the province of East Prussia, on the Baltic. It separates the Frisches Haff on the west from the Kurisches Haff on the north-east, and is bounded on the south by the river Pregel and on the east by the Deime. Its shape is oblong; it is 43 m. long, and 18 broad, and has an area of 900 sq.m. The surface is mostly flat, but on the west sand-hills rise to a height of 300 ft. The chief product is amber. The former episcopal see of Samland was founded by Pope Innocent IV. in 1249 and subordinated to the archbishop of Riga. Bishop Georg von Polentz embraced the Reformation in 1523, and in 1525 the district was incorporated with the duchy of Prussia.

SAMNAN: see SEMNAN.

SAMNITES, the name given by the Romans to the warlike tribes inhabiting the mountainous centre of the southern half of Italy. The word *Samnites* was not the name, so far as we know, used by the Samnites themselves, which would seem rather to have been (the Oscan form of) the word which in Latin appears as *Sabini* (see below). The ending of *Samnites* seems to be connected with the name by which they were known to the Greeks of the Campanian coast. Both from tradition and from surviving inscriptions (see OSCAN and R. S. Conway, *Italic Dialects*, pp. 169-206) it is clear that they spoke Oscan; and tradition records that the Samnites were an offshoot of the Sabines (see e.g., Festus, p. 326 Muller). On two inscriptions, of which one is unfortunately incomplete, and the other is the legend on a coin of the Social War, we have the form *Safnim*, which would be in Latin *Sabinium*, and is best regarded as the nominative or accusative singular, neuter or masculine, agreeing with some substantive understood, such as *nummum* (see Conway, *ibid.*, pp. 188, 216).

The abundance of the group names ending in the suffix *-no* in all the Samnite districts classes them unmistakably with the great Saffine stock (see SABINI). The Samnites are thus intimately related to the patrician class at Rome (see ROME: History).

The longest and most important monument of the Oscan language, as it was spoken by the Samnites (in, probably, the 3rd century B.C.) is the small bronze tablet, engraved on both sides, known as the *Tabula Agnonensis*, found in 1848 at the modern village Agnone, not very far from the site of Bovianum, which was the centre of the northern group of Samnites called *Pentri*. This inscription, now preserved in the British Museum, is carefully engraved in full Oscan alphabet.

The text and commentary will be found in Conway, *op. cit.*, p. 191: it contains a list of deities to whom statues were erected in the precinct sacred to Ceres, or some allied divinity, and on the back a list of deities to whom altars were erected.

See R. S. Conway, *Dialectorum Italicarum exempla selecta*, and C. D. Buck, *Oscan and Umbrian Grammar*.

SAMO, a tall, robust-looking people inhabiting the borders of Upper Volta and the French Sudan. They speak a language, still little known, apparently related to Sia, and live in independent villages, distributed in quarters consisting of flat-roofed houses of mud. Marriage is restricted within the village but must be outside the extended family group. In the case of a divorce the children remain with the father. The family property passes to the brother of the deceased, and personal goods, or individual property, is inherited by the eldest son. The Samo are skilled cultivators, and raise cattle. They are animists and perform seasonal sacrifices and worship sacred animals protecting the

villages. The dead are exposed and then buried in special places set apart for (a) old men, (b) young men, (c) old women and (d) young women.

See Tauxier, *Le Noir du Yatenga* (1917).

SAMOA, an archipelago in the South Pacific, consists of 14 islands, forming a slightly curved chain, running in a northwestern, southeastern direction, between 13° 26' and 14° 22' S. and 169° 29' and 172° 48' W. The islands are administratively divided between American Samoa, a possession of the United States, and Western Samoa, which formerly belonged to Germany but in 1920 became a mandate of New Zealand. Tutuila is the main island of the American group, which also includes Aunuu, Ofu, Olosega, Tau and Rose, the last named a coral islet. Western Samoa is composed of eight islands: Savaii, Manono, Apolima, Upolu, Fanuatapu, Manua, Nuutele and Nuulua. The population of American Samoa in 1940 was 12,908, of whom 11,919 were natives and 989 were foreign-born. The white population, exclusive of the personnel of the local naval station, was 300. The population of Western Samoa in 1940 was 61,251, of whom 3,465 were of European origin, mostly British.

Climate, Flora, Fauna.—The climate of the archipelago is moist and sometimes oppressively hot, although there is a good deal of mild equable weather. There is a clear season from April until October and a rainy season from November to March. Southeast trade winds are prevalent during most of the year and temper the heat; but there are west winds from January until March. The annual temperature ranges from 60° to 90° F. The average annual rainfall in American Samoa for 26 years was 197 in.

The islands of the Samoan archipelago are of volcanic origin, and the larger ones, such as Tutuila in American Samoa, and Upolu and Savaii in Western Samoa, are mountainous, with little level land except along the coast. The soil is partly sand, partly clay. It is fertile in the alluvial valleys, but is thin, without subsoil, on the slopes.

The chief commercial product of Samoa is copra, the dried meat of the coco-nut, which is exported largely for the extraction of oil. The coco palm grows readily in the islands and is a source of food, drink and shelter to the natives. The Samoan forests are remarkable for the size and variety of their trees and the general luxuriance of their vegetation. A number of tropical fruits and nuts are indigenous in Samoa, including the nutmeg, the breadfruit, the papaya, the Samoan chestnut and the Malay apple.

The Samoan fauna are very limited, including a native rat, four species of snakes, several kinds of lizards and a few birds. The most interesting of the latter is perhaps the *Didunculus strigirostris*, a ground pigeon of iridescent greenish-black and bright chestnut plumage, which forms a link between the extinct dodo and the African *Treroninae*. Imported hogs and cattle have adapted themselves well to the Samoan climate and such imported vegetables and fruits as sweet potatoes, radishes, beans, turnips, cucumbers, avocados and citrus fruits have been raised.

Native Population.—The Samoans are pure Polynesians and have escaped the tendency to die out that has been observed among some of the natives of the South seas. It is a tradition that Savaii, in Western Samoa, was the centre of dispersal of the Polynesian race over the Pacific from Hawaii to New Zealand.

Physically the Samoans are of excellent stock. They are light brown in colour, with handsome, regular features. Their average height is 5 ft., 10 in. Their original idolatry was not accompanied by human sacrifices. Many have become converts to Christianity; but they retain some of the rites and superstitions that were associated with their old religion. The main items in their diet are vegetables, coco-nut in various forms, breadfruit, bananas, fish and pork, the latter being especially in demand for native feasts.

History.—The Manua group was probably discovered by the Dutch navigator, Jacob Roggeveen, in 1722. He gave them the name Baumann islands, after one of his captains. The French explorer, Louis de Bougainville, visited the islands in 1768 and called them the Iles des Navigateurs, a name which is still sometimes used. La Pérouse followed in 1787, Edwards of the "Pandora" in 1791 and Otto von Kotzebue in 1824. Two members of

the London Missionary society came to Samoa in 1830 and the American explorer, Charles Wilkes, surveyed the archipelago in 1839. Further commercial penetration followed, and Great Britain, the United States and Germany, respectively, appointed representatives in 1847, 1853 and 1861.

Native wars and foreign commercial interests led to demands for annexation. The United States took over Pago Pago, the best harbour in the archipelago, as a coaling station in 1878 and concluded a trading agreement with the natives. Germany and Great Britain obtained similar privileges in the following year. The three powers held a conference on the Samoan question in Berlin in 1889 and what amounted to a tripartite protectorate was established.

There was a new outbreak of native wars in 1898, and England and Germany reached an agreement on the Samoan question in 1900 which was subsequently ratified by the United States. Under this agreement Great Britain withdrew from Samoa altogether, in consideration of compensation elsewhere. Germany received title to Western Samoa and the United States took over Tutuila and the other eastern islands.

A New Zealand expeditionary force occupied Western Samoa on Aug. 30, 1914, and the League of Nations granted New Zealand a mandate for this part of the archipelago in 1920. German land holdings of more than 8,000 ac. were expropriated. At the end of 1941 and in 1942 these normally placid and isolated islands acquired important strategic significance in the Pacific war.

Administration and Commerce.—American Samoa.—American Samoa was acquired by the United States after the conclusion of a convention signed by the United States, Great Britain and Germany, Dec. 2, 1899, ratified Feb. 16, 1900, and proclaimed by the president of the United States on the latter date. Under an executive order of Feb. 19, 1900, the islands were placed under the authority of the secretary of the navy for use as a naval station. Area of American Samoa is 76 sq.mi.

Pago Pago, on the southern coast of Tutuila, was selected as the site of the naval station and later was developed as an air base, although variable winds from the neighbouring heights are a handicap in flying. The harbour, which is formed by the crater of an extinct volcano and is located in a deep protected bay, is excellent.

The high chiefs of Tutuila ceded this island and Aunuu to the United States April 17, 1900, and a similar cession of the islands of the Manua group (Tau, Olosega and Ofu) was executed July 16, 1904. Swains, or Rose island was annexed to Samoa by a joint resolution of congress, approved March 4, 1925.

Like Guam, American Samoa is administered by a naval officer, usually with the rank of captain, who is appointed governor by the president. The principal civil divisions of American Samoa are as follows: Manua district (Tau, Ofu and Olosega Islands), eastern district of Tutuila (including Aunuu island); western district of Tutuila; and Swains island. The islands constituting the Manua district and Tutuila districts are subdivided into counties. There are native governors, under the authority of the American governor, for Manua and for eastern and western Tutuila.

Pago Pago is the seat of government. The American governor has the right to promulgate laws and these are usually ratified at an annual meeting of native delegates. The laws of American Samoa, codified in 1921, are printed in the English and Samoan languages. It has been an aim of government policy to retain native ownership of the land. Small farming, rather than the system of large plantations, is the rule. There are public schools with more than 2,000 pupils and several private schools.

The principal export is copra, of which 2,640,500 lb. were shipped in 1939. The budget for 1939 called for an expenditure of \$127,317; the estimated income was \$106,231. There is a United States naval radio station at Pago Pago; it is also used for commercial service. Transportation is maintained by the Oceanic Steamship company. Pago Pago has been a port of call for ships plying between the United States and New Zealand, and American Samoa is on the air route from America to New Zealand.

Western Samoa.—New Zealand received a mandate to administer this former German possession on Dec. 17, 1920. The con-

stitution was settled by the Samoan act of 1921 and an amending act of 1923. The administrator, appointed by the New Zealand government, has the assistance of a legislative council and a consultative native council. Some friction developed in connection with a movement, led by an influential well-to-do halfcaste named Nelson, to give the halfcastes and natives more voice in the administration.

Western Samoa is more extensive in area than American Samoa and has a larger population. Its two largest and most populous islands are Savaii (703 sq. mi.) and Upolu (about 430 sq. mi.). Upolu is the most important island of the group and contains the principal port, Apia. It is a long, narrow island, with a backbone of mountains, well watered and intersected by lovely valleys, at the foot of which are level tracts suitable for cultivation.

The principal exports of Western Samoa are copra, cocoa and rubber. Exports in 1938 were valued at £444,877, imports at £196,272.

The name of Robert Louis Stevenson is connected with Western Samoa. The author's home during the last years of his life was at Vailima, in Upolu. He is buried on Mount Vala, which overlooks Apia and Vailima. There is a monument to him on Mount Vala.

H. CH.)

SAMOS, an island in the Aegean sea, separated from the mainland of Asia Minor by a strait of only about a mile in width; about 27m. in length, by 14 in greatest breadth; occupied by mountains, of which the highest, Mt. Kerkis, near its western end, is 4,725ft. high. This range continues from Mt. Mycale on the mainland. Samos was annexed to Greece in 1912. The capital is at Vathy, in a deep bay on the north coast, a quite modern town, well paved and connected by carriage roads with villages round both sides of the bay, and with Tigani on the south coast, the site of the ancient city. A third port, Carlovasi, further west on the northern coast, serves a separate lowland district. The island is remarkably fertile, and a great portion of it is covered with vineyards. Oil, raisins, silk, cotton and tobacco are also grown, and barges and sailing vessels are built at Tigani, almost wholly from native timber. Cigarette making employs many women and girls, the tobacco coming chiefly from Thrace. The population in 1938 was 70,497. The predominant religion is the Orthodox Greek; the metropolitan district is Samos and Icaria.

History.—At the time of the great migrations, in the 11th century B.C., Samos received an Ionian population mainly from Epidaurus in Argolis. By the 7th century B.C. it had become one of the leading commercial centres of Greece through its position near the Maeander and Caÿster trade-routes from inner Asia Minor. The Samians also traded with the Black sea and with Egypt, and claimed to be the first Greeks to reach the Straits of Gibraltar. Their commerce brought them into close relations with Cyrene, Corinth and Chalcis, but made them bitter rivals of their neighbour, Miletus. The feud involved both cities in the Levantine war (7th century B.C.) when Corinth built triremes for the Samians. The result favoured Miletus, but in the 6th century the insular position of Samos preserved it from mainland aggressions to which Miletus was exposed. About 535 B.C., when its oligarchy was overturned by the tyrant Polycrates (*q.v.*), Samos reached the height of its prosperity. Its navy "ruled the waves" from its new deep-sea harbour, and blockaded the mainland subjects of Persia; the tunnelled aqueduct (still open) secured copious water, and the great Temple of Hera was built. Polycrates first intrigued, and then quarrelled, with the Persian governor of Lydia,

and after his death by treachery, Darius conquered Samos and partly depopulated it. It had regained much when, in 499, it joined the general revolt of the Ionians against Persia; but owing to jealousy of Miletus, part of its contingent, at the decisive battle of Lade (494), deserted. In 479, however, following Xerxes' defeats in Greece, Samos betrayed the Persian fleet to the Greeks at Mycale. In the Delian League the Samians held special privilege and remained loyal to Athens until 440, when a dispute with Miletus, which the Athenians had decided against them, provoked them to secede. With a fleet of 60 ships they held their own for some time against a large Athenian fleet led by Pericles himself, but after a siege, capitulated and were degraded to a tributary rank. Towards the end of the Peloponnesian war, when Miletus became a Spartan naval base, Samos appears as one of the most loyal dependencies of Athens; and a temporary home of the Athenian democracy during the revolution of the Four Hundred at Athens (411 B.C.), and in the last stage of the war, it was rewarded with the Athenian franchise. This friendly attitude towards Athens was accompanied by the establishment of democracy. After the downfall of Athens, Samos was besieged by Lysander and again placed under an oligarchy. In 394, when the Spartan navy withdrew, the island declared its independence and re-established a democracy, but by the Peace of Antalcidas (387) it fell under Persian dominion. Recovered by the Athenians in 366, after a siege, it received a body of military settlers. After 322, when Athens was again deprived of Samos, its fate is obscure. For some time (about 275-270 B.C.) it served as a base for the Egyptian fleet, at other periods it recognized the overlordship of Syria; in 189 B.C. it was transferred by the Romans to the kings of Pergamum. Enrolled from 133 in the Roman province of Asia, it revolted to Aristonicus (132) and Mithridates (88), and forfeited its autonomy, but recovered it between the reigns of Augustus and Vespasian, and remained prosperous. Under Byzantine rule Samos became the head of the Aegean *theme* (military district). After the 13th century it passed through much the same changes as Chios (*q.v.*), and became the property of the Genoese firm of Giustiniani (1346-1566). At the Turkish conquest it was severely depopulated, and provided with new settlers, partly Albanians.

During the Greek War of Independence Samos bore a conspicuous part, and it was in the strait between the island and Mt. Mycale that Canaris blew up a Turkish frigate, in the presence of the army assembled for invasion. The enterprise was abandoned and Samos held its own to the end of the war. On the conclusion of peace the island was, indeed, again handed over to the Turks, but since 1835 held an exceptionally advantageous position, being in fact self-governed, though tributary to the Turkish empire, and ruled by a Greek governor nominated by the Porte, who had the title of "Prince of Samos," and was supported and controlled by a Greek council and assembly. The prosperity of the island bore witness to the wisdom of this arrangement, but did not prevent annexation to Greece when the political situation allowed it.

The ancient capital was on the south coast, at the modern Tigani, directly opposite to the promontory of Mycale. A natural cove, dominated by a low hill, has been converted by ancient and modern breakwaters into a safe port for small vessels. Behind the modern town rises a steep enclosing ridge, Astypalaea, crowned by Polycrates' wall, and perforated by his aqueduct. From this city a road led about 4m. W. to the Temple of Hera, whose site, close to the shore, is still marked by a single column, which has given to the neighbouring headland the name of Capo Colonna. Though so little remains standing, German excavators have revealed its massive foundations.

The modern capital of the island was, until recently, at Khora, about 2m. from the sea and from Tigani, but in the 19th century the capital was transferred to Vathy, on the north coast.

Samos was the birthplace of Pythagoras, the philosopher (*q.v.*) whose name and figure are found on coins of the city in imperial times. It also produced a school of sculptors beginning with Rhoecus and Theodorus, who are said to have invented the art of casting statues in bronze. Rhoecus was also the architect of

the Temple of Hera. Another famous Samian sculptor was Pythagoras, who migrated to Rhegium. The vases of Samos are among the most characteristic Ionian pottery in the 6th century. The name Samian ware, often given to a kind of red pottery found in Roman settlements, has no scientific value; it is derived from a passage in Pliny, N.H. xxxv. 160 *sqq.*

SAMOSATA (Sumeisat., modern Samsat), a city on the right bank of the upper Euphrates on the borders of Mesopotamia and Armenia in 37° 30' N., 38° 30' E. Samosata is an important crossing place of the river close to the point where it enters the plain. It forms one of the series of border forts, of which Edessa (*q.v.*) was the most important, which had a stormy history in relation to the frontier defence of Upper Mesopotamia. It had an additional importance as forming a point at which the crossing of the river could be made. Although it is uncertain whether it was ever on the Persian royal road, there was a bridge at this point in Strabo's time, when the city is described as being strongly fortified and the centre of a small but very fertile district. From this point caravan routes diverge to Diarbekr in the north, and downstream to Urfah (Edessa) but it lies off the main route.

The fortunes of Samosata followed those of the great empires at whose boundaries it stood. It appears originally to have been a Hittite city, and it was incorporated in the Assyrian empire in 708 B.C. Later it passed into the hands of the successors of Alexander, and became the capital of Commagene. In A.D. 72 it became a Roman province. In later times it passed through a series of changes, losing its status as the capital city of a district under Constantine, and in the tenth century becoming temporarily a *theme*, or administrative military district of the Byzantine Empire. It is said in the thirteenth century to have been an Armenian settlement, but today it is mainly occupied by Kurds.

SAMOTHRACE (mod. Gr. *Samothraki*, Turk. *Semadrek*), an island in the north of the Aegean Sea, nearly opposite the mouth of the Hebrus (Maritza) north of Imbros and north-east of Lemnos. It has a population of 3,866, nearly all Greek. Though of small extent it is, next to Mount Athos, by far the most conspicuous natural feature in this part of the Aegean (5,240 ft.). In *Iliad* xiii. 12, the poet represents Poseidon using its summit to survey the plain of Troy. This mountainous character and the absence of harbours precluded political importance, while permitting the survival of the archaic worship of the CABEIRI (*q.v.*) which Herodotus (ii. 51) and others attributed to "Pelasgian" aborigines. Probably on account of its sacred character the island always enjoyed autonomy, even in the time of Pliny.

The "Victory of Samothrace," set up by Demetrius Poliorcetes c. 305 B.C., was discovered in the island in 1863, and is now in the Louvre. The ancient city was situated at Palaepoli below the modern village on the N. side of the island close to the sea; with considerable remains of ancient walls, in Cyclopean style, of the sanctuary of the Cabeiri, and of other edifices of Ptolemaic and later date. A considerable sponge fishery is carried on. On the N. coast are much-frequented hot sulphur springs.

Samothrace was occupied by Germany in World War II.

SAMOVAR [Russ. *samovarū*], an urn for making tea after the Russian fashion; it is usually of copper, and is kept boiling by a tube filled with live charcoal passing through the centre. The word is usually taken in Russia to mean "self-boiler" (*samū*, self, and *baritī*, boil), but it is more probably an adaptation of a Tatar word *sanabar*, a tea-urn.

SAMOYEDES, a Neo-Siberian tribe, spread in small groups from the Altai mountains down the basins of the Ob and Yenisei, and along the shores of the Arctic ocean from the mouth of the latter river to the White sea, subdivided into three main groups: (a) The Yuraks in the coast-region from the Yenisei to the White sea; (b) the Tavghi Samoyedes, between the Yenisei and the Khatanga; (c) the Ostiak Samoyedes, intermingled with Os-

tiaks, in the forest regions of Tobolsk and Yeniseisk.

The Samoyedes, who now maintain themselves by hunting and fishing on the lower Ob, are partly mixed in the S. with Ostiaks. Clothed in skins, they make use of implements in bone and stone, eat carnivorous animals—the wolf included—and cherish superstitions regarding the teeth of the bear. Their huts are erected with stone; their graves are mere boxes left in the tundra. Death is ascribed to an evil female spirit. Personal belongings are buried with the dead. The religion is fetishism mixed with Shamanism, the shaman (tadji-bei) being a representative of the great divinity, Nim. Women become Shamans.

Of the S. Samoyedes, who are completely Tatarized, the Beltirs live by agriculture and cattle-breeding in the Abakan steppe. They profess Christianity, and speak a language closely resembling that of the Sagai Tatars. The Kaibals, or Koibals, can hardly be distinguished from the Minusinsk Tatars and support themselves by rearing cattle. Castrén considers that three of their stems are of Ostiak origin, the remainder being Samoyedic. The Kamasins, in the Kansk district of Yeniseisk, are either herdsmen or agriculturists. They speak a language with an admixture of Tatar words, and some of their stems contain a large Tatar element. The interesting nomadic tribe of Karagasses, in the Sayan mountains, is disappearing; the few representatives are rapidly losing their anthropological features, their Turkish language and their distinctive dress. The Motors are now little more than a memory. One portion of the tribe emigrated to China and was there exterminated; the remainder have disappeared among the Tuba Tatars and the Soyotes. The Samoyedes on the Ob in Tomsk may number about 7,000.

See M. A. Castrén *Grammatik der samoyedischen Sprachen* (1854); *Dictionary* (1855); *Ethnologische Vorlesungen über die altaischen Völker* (1857); *Versuch einer koibalischen und karagassischen Sprachlehre* (1857); also A. Middendorf, *Reise in den äussersten Norden und Osten Sibiriens* (1875) and M. A. Czaplicka, *Aboriginal Siberia* (1914).

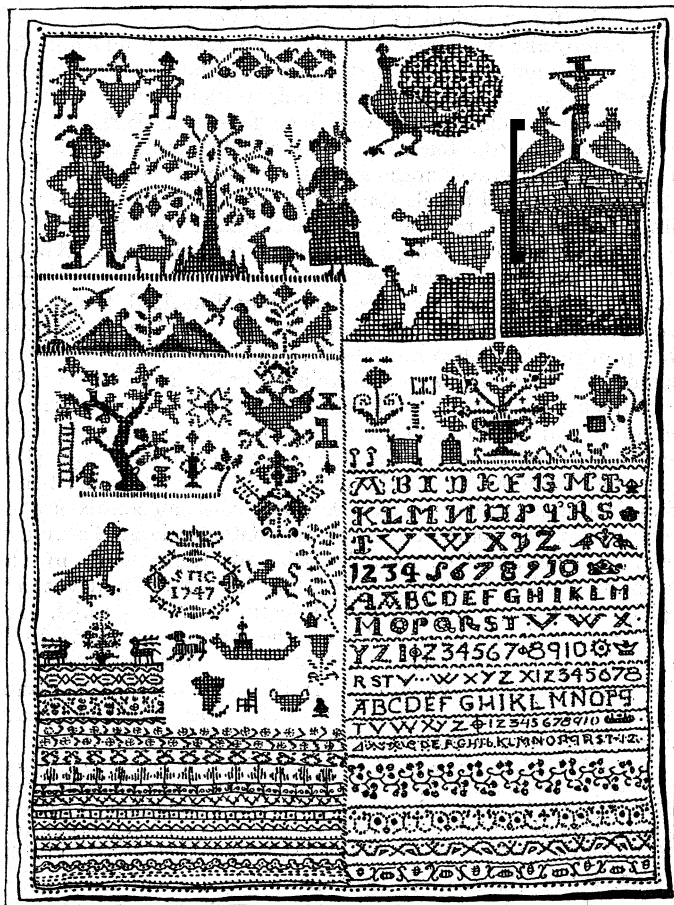

SAMPAN, the name of the typical light boat of far Eastern rivers and coastal waters; it is usually propelled by a single scull over the stern, and the centre and after part is covered by an awning or screen of matting. The word is said to be Chinese, *san*, thin, and *pan*, board. Others take it to be of Malay origin.

SAMPLE, a small portion of merchandise taken from the whole to serve as a specimen or evidence of the whole; hence a pattern or model. (See SALE OF GOODS.)

SAMPLER, a model or pattern to be copied, particularly a small rectangular piece of embroidery worked on canvas or other material as a pattern or example of a beginner's skill in needlework, as a means of teaching the stitches. Down to comparatively recent times every little girl worked her "sampler," and examples of 17th century work are still found and have become the object of the collector's search. See ill. on p. 924. They usually contained the alphabet, the worker's name, the date and Bible texts, verses, mottoes, the whole surrounded with some conventional design. The earliest sampler in existence is dated 1643 and is in the Victoria and Albert museum, South Kensington.

See M. B. Huish, *Samplers and Tapestry Embroideries* (1900).

SAMPSON, WILLIAM THOMAS (1840-1902), American naval commander, was born at Palmyra, N.Y., on Feb. 9, 1840, and graduated at the head of his class from the U.S. Naval academy in 1861. In this year he was promoted to master, and in the following year was made lieutenant. He was executive officer in the "Patapsco" when she was blown up in Charleston harbour in Jan. 1865. He served on distant stations and (1868-71 and 1876-78) at the Naval academy, and became lieutenant-commander in 1866 and commander in 1874. He was a member of the International Prime Meridian and Time Conference in 1884, and of the board of fortifications in 1885-1886; was superintendent of the Naval academy from 1886 to 1890; and was promoted to captain and served as delegate at the International Maritime Conference at Washington in 1889. He was chief of the Bureau of Ordnance in 1893-97. About 95% of the guns employed in the Spanish-American War were made under his superintendence. His influence was felt decisively in the distribution of guns and armour, and in the training of the personnel of the navy. He

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART
A SAMPLER OF 1747, FROM THE FISHBACK COLLECTION

superintended the gunnery training and prepared a new drill-book for the fleet. In Feb. 1898, Sampson, then a captain, was president of the board of inquiry as to the cause of destruction of the "Maine." At the outbreak of the war with Spain he was placed in charge of the North Atlantic Squadron, and conducted the blockade of Cuba. When it was known that Admiral Cervera, with a Spanish fleet, had left the Cape Verde islands, Sampson withdrew a force from the blockade to cruise in the Windward Passage, and made an attack upon the forts at San Juan, Porto Rico. After his return to the coast of Cuba he conducted the blockade of Santiago, and the ships under his command destroyed the Spanish vessels when they issued from the harbour of Santiago and attempted to escape. (See SPANISH-AMERICAN WAR.) Sampson himself was not actually present at the battle, having started for Siboney just before it began to confer with Gen. Shafter, commanding the land forces. He reached the scene of battle as the last Spanish vessel surrendered, and the engagement was fought in accordance with his instructions. He was promoted to commodore in 1898, to rear-admiral on March 3, 1899, and was made commandant of the Boston (Charlestown) navy yard in October of the same year. He died in Washington, D.C., on May 6, 1902.

See W. A. M. Goode, *With Sampson Through the War* (1899); A. T. Mahan, "Sampson's Naval Career," *McClure's Magazine*, vol. xix. (1902); James Parker, *Rear Admirals Schley, Sampson and Cervera* (1910).

SAMSHUI ("Three Waters"), a treaty port in the province of Kwangtung, South China, in latitude 23° 5' N. and longitude 112° 49' E., about 25 miles due west of Canton. It commands an important position at the junction of the Si-kiang (West River) and Pei-kiang (North River) and lies at the apex of the deltaic network of river-channels which lead to the Canton River or directly to the sea by the Si-kiang. It is thus favourably situated for the collection and distribution of trade commodities, but since the port was opened to foreign trade in 1897 it has

not grown to any considerable extent, largely owing to the proximity of Canton. Its trade is based on the large junk and launch traffic of the delta region. The export trade through the port is largely from Wuchow and Nanning higher up the Si-kiang. Owing to the Cantonese boycott of Hongkong in 1925-26 the foreign trade (especially in imports) of Samshui was seriously affected, as the following figures show:—

1924: Net Foreign Imports	. 8,175,492	1926: 1,417,997
Net Chinese Imports	. 1,095,562	350,032

The town has had railway connection with Canton since 1904; its estimated Chinese population in 1931 was 9,160.

SAMSON, whose deeds are recorded in Judges xiv.-xvi., was a hero of early Hebrew folk-tales. He belonged to the tribe of Dan, and was renowned for his exploits against the Philistines. The narratives are marked by a grim and boisterous humour, and are so little concerned with religion that they may almost be called pagan. But, though they contribute little towards the understanding of Hebrew religion, they add much to our knowledge of early customs, and throw light on Philistine civilization. Their account of the relationships between Hebrews and Philistines, too, is of some historical worth. (See PHILISTINES.)

It has often been noted that there are points of resemblance between the story of Samson and the myths of Gilgamesh, Melkart, and Hercules; but, while the kinship must be admitted, Samson is much more human than his counterparts in pagan myth and legend, and is probably to be regarded as a historical person. The story contains many features drawn from solar mythology. The name Samson is a derivative, of uncertain meaning, from the Hebrew word Sun—shemesh. It is noteworthy that a shrine of the Sun, Beth-Shemesh, stood in the neighbourhood of Samson's home. Long hair, in which according to the story lay the secret of his strength, is a familiar feature of solar heroes, as a symbol of the sun's rays. His exploit with the gates of Gaza may be connected with the myth which represents the sun as passing through a double-gated door on the eastern horizon. It has, indeed, been argued that the entire Samson story is a solar myth; but it is apparently much more highly probable that in this case the story of a popular hero has been expanded and decorated by mythological motifs.

Why does a story so lacking in religious interest appear in the book, and why is an almost pagan character like Samson reckoned among the saviours of Israel, when the story itself does not record any deliverance of the people from Philistine oppression? There is some evidence that the story was not included in an earlier form of Judges, and that a later editor was constrained by its popularity to insert it. The account of Samson's birth—suspiciously reminiscent of an incident in the history of Gideon—and dedication as a Nazirite, Judges xiii., is an editorial attempt to fit for more respectable company the boisterous, sensual Samson of the folk-tales, who wears his Nazirite costume with some obvious difficulty, and is moved far more by his own erratic impulses than by the spirit of Yahweh. S. A. Cook, comparing Judges xiii. with vi. 11-24, suggests that Samson may have been regarded as the founder of a local Manahathite cult.

See Burney, *Judges*, pp. 335-408; A. S. Palmer, *The Samson-saga, and its place in comparative Religion*; S. A. Cook, *Journ. of Theol. Stud.* 1927, pp. 372 sqq. (W. L. W.)

SAMSONOV, ALEXANDER (1859-1914), Russian general, passed through the cavalry school in St. Petersburg, and served in the war with Turkey in 1877-78. On passing out of the academy of the general staff in 1884 he was appointed on the general staff. He was commandant of the cavalry school at Elisavetgrad (1896-1904), and in 1902 was promoted to the rank of general. In the war with Japan (1904-05) he commanded the Ussuri mounted brigade and the Siberian Cossack division. In 1909 he was made ataman of the Don Cossacks, and became governor-general and commander of troops in Turkestan. In Aug.

1914 he was appointed commander of the II. Army, concentrated on the Narev. The desire to take pressure off France at the earliest possible moment led the Russian supreme command to give an order for an advance into eastern Prussia in spite of Samsonov's report that his army was not ready for an advance. As a result of the absence of support from Rennenkampf's I. Army Samsonov's army was destroyed in the Battle of Tannenberg (Aug. 26-29). Convinced that the battle was hopelessly lost, he ordered his staff to extricate themselves from the German ring, and shot himself in a wood.

SAMSUN (anc. *Amisus*), the chief town of the Samsun vilayet in Asiatic Turkey, situated on the south coast of the Black Sea between the deltas of the Kizil and Yeshil Irmaks. Pop. (1940) 36,917. It is connected by metalled roads with Sivas and Kaisarieh, and by sea with Istanbul. Samsun is a thriving town, and the outlet for the trade of the Sivas vilayet. Steamers lie about 1 m. from the shore in an open roadstead, and in winter landing is sometimes impossible. Its district is one of the principal sources of Turkish tobacco, a whole variety of which is known as "Samsun." Samsun exports cereals, tobacco and wool. Amisus, which stood on a promontory about 1½ m. N.W. of Samsun, was, next to Sinope, the most flourishing of the Greek settlements on the Euxine, and under the kings of Pontus it was a rich trading town. By the 1st century A.D. it had displaced Sinope as the north port of the great trade route from Central Asia, and later it was one of the chief towns of the Commeni of Trebizond.

SAMUCAN, a group of tribes of South American Indians, constituting an independent linguistic stock, so called from the Samucos, one of its best known tribes. The area occupied by this stock lies on the borders of the Bolivian Chaco, roughly between 19° 30' and 21° S. Lat. and from slightly west of the Paraguay river, westward to near the Parapiti. Living in a sub-desert area, the Samucan tribes were mainly a semi-nomadic hunting folk of peaceful and friendly character and simple culture. They wear little or no clothing, and construct flimsy and temporary huts of mats. They have no canoes, but are excellent swimmers. The spear, club and a very long bow are their weapons. Their social organization was of the simplest. Their religious ceremonies were marked by elaborate masked dances.

SAMUEL, a prophet who played an important part in the establishment of the Hebrew kingdom under Saul, and became naturally the hero of numerous legends, some of which are found interspersed among narratives of greater historical value in the early part of 1 Samuel. This mixture of legend with history tends to obscure the facts, and the difficulties of recovering the true story are aggravated because we find two absolutely contradictory representations of his attitude towards the idea of monarchy. According to one of these, after a severe defeat inflicted upon Israel by the Philistines, involving the temporary loss of the ark (1 Samuel, iv.), Samuel, acting in the tradition of the judges, summons "all Israel" to Mizpah (vii.), performs rites of purification, and offers sacrifice to Yahweh. The Philistines are subdued by the miraculous intervention of Yahweh, and Israel recovers its lost territory. Samuel thereafter rules as a theocratic judge. His sons, whom he would make his successors, are corrupt, and the people demand a king, like those of the surrounding nations, to rule them. Despite the solemn warnings of Samuel as to the arrogant oppression of kings the people are insistent, and, by Yahweh's instruction, Samuel concedes their demand, choosing, by sacred lot, Saul (x. 17-24). The same adverse attitude towards the institution of monarchy is even more emphatically expressed in the long farewell address of abdication made by Samuel (xii.). Quite different is the view we find in 1 Sam. ix.-x. 16. Here Samuel is a local seer of so little renown that his fame is unknown to Saul, who, seeking some lost asses, is advised by a servant to consult him. Samuel receives the divine command to anoint Saul as king, which, seemingly, he does with unqualified enthusiasm. It is obvious that of the two representations the latter will be nearer the truth; had Samuel been really a theocratic judge tra-

dition would hardly have dwarfed him to the grade of a local seer, whereas the contrary proceeding is quite natural. Further, the strong anti-monarchical ideas are surely the product of a later age, when the nation had experienced the exactions and follies of subsequent kings, whom they came to look upon as responsible for the national misfortunes (viii. 7, x. 19, xii. 12).

What, then, is the nucleus of important fact in these traditions? It is probable that the birthplace of Samuel was Ramah, and that—though the story of his dedication to the service of the sanctuary at Shiloh is idyll rather than history—he was a priestly seer who came into prominence during the dark days of Philistine oppression. The strong tradition as to his being the "king-maker" must rest on some historic basis; and, though later tradition has exalted Samuel at the expense of Saul, we may believe that he played an important part in the installation of Israel's first king. Though Samuel's denunciations of the monarchical idea are but the reflections of the views of a later age, they seem to have a point of contact with the history, for it is probable that the breach between Samuel and Saul in connection with Agag, 1 Samuel xv., was only the culmination of earlier divergences. Late tradition emphasizes this by its representation of Samuel as anointing David to replace Saul. (See SAMUEL, BOOKS OF.) (W. L. W.)

SAMUEL, HERBERT SAMUEL, 1ST VISCOUNT (1870-), British politician, was born at Liverpool on Nov. 6, 1870. He was educated at University College school, London, and at Balliol college, Oxford. In 1895 and 1900 he unsuccessfully contested South Oxfordshire as a Liberal, and in 1902 was elected for the Cleveland division of Yorkshire. He entered Campbell-Bannerman's Government in 1905 as parliamentary under-secretary to the Home Office. In 1908 he was sworn into the privy council. From 1909 to 1910 he was chancellor of the Duchy of Lancaster, with a seat in the cabinet, and in 1910 became postmaster-general. He held this office until 1914, and then became for a year president of the Local Government Board. From 1915 to 1916 he was again postmaster-general and chancellor of the Duchy of Lancaster, and in 1916 became home secretary. He acted as chairman of the select committee on national expenditure (1917-18), and in 1919 was special commissioner to Belgium. He was high commissioner to Palestine 1920 until August 1925, when he returned to England and was made chairman of the royal commission appointed to enquire into conditions in the coal industry, as a result of the dispute between the coal-owners and the miners in the summer of that year. In 1926 he was created G.C.B. He was chairman, Liberal party organization, 1927-29; home secretary, National Government, 1931; resigned in 1932; went into opposition in 1933. In 1937 he was created a Viscount.

SAMUEL, BOOKS OF, two books of the Old Testament, which in the Jewish canon are ranked among the Former Prophets (Joshua-Kings) in contrast to the Latter Prophets (Isaiah-Malachi).

Contents.—The books of Judges, Samuel and Kings are made up of a series of extracts from various sources, and freely handled by copyists down to a late date, as is shown by the numerous and often important variations between the Hebrew text and the Greek version (Septuagint). The main redaction of Judges and Kings was made under the influence of the ideas which characterize Deuteronomy, that is, after the reforms ascribed to Josiah (2 Ki. xxiii.); but in Samuel the "Deuteronomic" hand is much less prominent and the chronological system which runs through Judges and Kings occurs only occasionally.

The book of Samuel completes the history of the "Judges" of Israel (11th century B.C.), and begins by relating the events which led to the institution of the monarchy under Saul, the part played by Samuel being especially prominent (1 Sam. i.-xiv.). The interest is then transferred to David, the founder of the Judæan dynasty, and his early life is narrated with great wealth of detail. As Saul loses the divine favour, David's position advances, until, after the death of Saul and the overthrow of Israel, he gains the allegiance of a disorganized people (1 Sam. xv.-2 Sam. iv.), and Jerusalem becomes the centre of his empire (v.-viii.).—c. 1000 B.C. A more connected narrative is now given of the history of David (ix.-xx.), which is separated from the

account of his death and Solomon's accession (1 Ki. i., ii.) by an appendix of miscellaneous contents (xxi.-xxiv.).

Samuel and Saul.—The introductory account (i.-iv. 1a) of the birth, dedication and calling of the young prophet Samuel is a valuable picture of religious life at the sanctuary at Shiloh. It is connected by the prophecy of the punishment of the house of Eli (iii. 11 sqq.) with the defeat of the Israelites by the Philistines at Ebenezer near Aphek, the loss of the ark (iv. 1b-22), and its subsequent fortunes (v.-vii. 1). A Philistine oppression of 20 years ends when Samuel, here the recognized "judge" of Israel, gains a great victory at Ebenezer near Mizpah (vii.). But the deliverance of Israel from the Philistines is also ascribed to Saul (xiv.); there is no room for both in the history of the prophet (see vii. 14), and it is now generally recognized that two conflicting representations have been combined: (a) vii., viii., x. 17-24, xii., (b) ix. 1-x. 16, xiii., xiv. (See further SAMUEL, SAUL.) The account of Eli, Shiloh and the ark (i.-iii.) is a natural prelude to iv.-vii., where, however, we lose sight of Samuel and the prophecy. The punishment of Eli and his sons (iv.) becomes a passing interest. The sequel of the defeat in iv. is not stated, although other allusions to the fall of Shiloh (Jer. vii. 12-15, xxvi. 6, 9, Ps. lxxviii. 60 sqq.), and the subsequent reappearance of the priestly family at Nob (xxi. seq.) suggest that a fuller account of the events must have been extant. A narrative of Eli and the priesthood of Shiloh has probably been used to form an introduction to Samuel's victory (vii.), and it has been supplemented partly by the account of the early life of the future prophet and judge (note the present abrupt introduction of Eli in i. 3) and partly by narratives of the history of the ark (v. seq.). The section was handled at a relatively late period. This is clear from the presence of the Deuteronomic prophecy in ii. 27-36, which hints at the rise of the Zadokite priests of Jerusalem. Also, Hannah's psalm (ii. 1-10)—the prototype of the "Magnificat"—is a post-exilic passage, "probably composed in celebration of some national success" (Driver); its present suitability rests upon the interpretation of verse 5.

Saul.—Saul's reign is introduced in xiii. 1, where a blank has been left for his age at accession (some mss. insert "30"); the duration of his reign is also textually uncertain. The formula is parallel to that in 2 Sam. ii. 10 seq., v. 4 seq., and frequently in the Book of Kings, with the additional feature that the age at accession, there usually confined to the Judaeen kings, is here given for the Israelite Saul and his son Ishbosheth (*i.e.*, Ishbaal). The summary in xiv. 47 sqq. is immediately followed by a reference to the continuous Philistine warfare (v. 52, contrast vii. 13) which forms an introduction to the life of David. But the summary gives a picture of Saul's ability and position which differs so markedly from the subsequent more extensive narratives of David's history that its genuineness has sometimes been questioned; nevertheless, it is substantiated by the old poem quoted from the Book of Jashar in 2 Sam. i. 17-27, and a fundamental divergence in the traditions may be assumed. Similarly in 2 Sam. ii. 8-10, the length of Ishbaal's reign conflicts with the history of David (ii. 11 and iv. 1-v. 3), and the reorganization of (north) Israel with the aid of Abner does not accord with other traditions, which represent David as the deliverer of (all?) Israel from the Philistine yoke (iii. 18, xix. 9). But ii. 8-10a, in common with 1 Sam. xiii. 1, xiv. 47-51 (*cf.*, also the introduction in 1 Sam. vii. 2 and the conclusion vii. 15-17), are of a literary character different from the detailed narratives; the redactional or annalistic style is noticeable, and they contain features characteristic of the annals which form the framework of Kings. In Kings the Israelite and Judaeen records are kept carefully separate and the independent standpoint of each is at once obvious. Here, however, much complication arises from the combination of traditions of distinct origin, independent records of Saul having been revised or supplemented by writers whose interest lay in David.

David.—The stories of the relations between the founders of the respective monarchies of Israel and of Judah reflect the popular interest in DAVID (*q.v.*). Apart from the more detailed and continuous history, there are miscellaneous passages in 2

Sam. v.-viii., with an introduction (v. 1-3), and a concluding chapter rounding off David's reign (viii.). A similar collection in xxi.-xxiv. severs the closely-knit sequence of narratives in ix.-xx. (the "Court history of David") from David's death in 1 Ki. i.-ii. Their contents range over all periods, from the Amalekite war (viii. 12, *cf.* 1 Sam. xxx.) to David's "last words" (xxiii. 1; but see 1 Kings i. 1 and ii. 1). In particular they narrate the capture of Jerusalem from the Jebusites (v. 6-10) and other fights in that district as far as Gezer (vv. 17-2j), the purchase of land from a Jebusite for the erection of an altar (xxiv.; see 1 Chron. xxi.-xxii. 1, 2 Chron. iii. 1), and the pacification of the Gibeonites (xxi. 1-14). The last two inter-related narratives are severed by the no less inter-related material in xxi. 1j sqq., xxiii. 8 sqq. (connected with the conflicts in ch. v.); and these in turn are now separated by the psalm in xxii. (Ps. xviii.) and by David's "last words." The repetition of the list of officials in viii. 15-18 and xx. 23-26 is attributed by several authorities (after Budde) to the later insertion of ix.-xx. 22. On this view, the two groups v.-viii., xxi.-xxiv. were once contiguous—though not necessarily in their present form or order.

The compiler of 2 Sam. v.-viii. has placed after the capture of Jerusalem (v. 6 sqq.) the conflict with the Philistines (v. 17 sqq.), where the "hold" is not Zion but some place of retreat, perhaps Adullam (*cf.* xxiii. 14). Similarly, the conflicts in xxi. 15 sqq., xxiii. 8 sqq., which are located around Gath, Lehi (so read xxiii. 11), Pas-dammim (so v. g; see 1 Chron. xi. 13), Bethlehem, and the valley of Rephaim, should also precede the occupation of Jerusalem and the subsequent partition of territory among David's sons and others (*e.g.*, xiii. 23, near Bethel). These passages combine to furnish a representation of the events leading to the capture of the capital which is distinct from and now superseded by the detailed narratives in ii. 12-iv. Here, Ishbaal is east of the Jordan, David's men are engaged in fighting Benjamin and Israel—even at Gibeon (about 6 m. N.W. of Jerusalem), the interest of the history is in David's former relations with Israel at Saul's court, and he is regarded as the future deliverer of the oppressed people. The fragments preserved in 2 Sam. v.-viii., xxi.-xxiv. throw another light upon David's relations to Saul's family (xxi. 1-14, contrast ix.); and the stories of heroic conflicts with giant-like figures of Gath, etc. (xxiii. 9 seq., 18, *cf.* 1 Chron. xi. 11, 20) find no place by the side of the more detailed records of his sojourn under the protection of a king of Gath, one of a confederation of Philistine cities (1 Sam. xxvii., xxix.). It is possible that popular stories of the conquest of the earlier inhabitants have been applied to the PHILISTINES (*q.v.*); their general character associates them with the legends of the "sons of Anak," who enter into Judaeen (perhaps originally Calebite) tradition elsewhere (Num. xiii. 22, 28), and who according to one group of traditions occupied all the hill-country from Hebron northwards (Josh. xi. 21 sqq., xv. 14).

Saul and David.—The accounts of David's conflicts with giant heroes and of the conquest of Jerusalem and its district belong to Judaeen traditions which have been almost superseded by other traditions of the rise of the Hebrew monarchy and by popular narratives of early relations between the Judaeen David and the (north) Israelite king and people. The emphasis (in 1 Sam.) upon the rejection of Saul, his enmity towards David, the latter's chivalry, and his friendship for Jonathan, partly account for the present literary intricacies. On quite general grounds, divine traditions of distinct origin (Calebite or Jerahmeelite; indigenous Judaeen; North Israelite or Benjamite) are to be expected in a work now in post-exilic form. Moreover, the late genealogy of Saul in 1 Chron. viii. 29 sqq., ix. 35 sqq., is evidence of a keen interest in the Saulidae in post-exilic times. David's history is handled independently of Saul in 1 Sam. xxv.; and the narrative, now editorially connected with the context (v. 1, see xxviii. 3; and v. 44, see 2 Sam. iii. 1j), gives a valuable picture of his life in the south of Palestine, with which we may compare his relations with south Judaeen cities in xxx. 26-31. (The chapter with the prophecy of Abigail may be of Calebite origin.) His flight northwards to the Philistine king of Gath (xxvii.) is hardly connected with the preceding situations in xxiv. 17-22,

xxv., or xxvi. 21–25, or with his previous slaughter of Philistines at Keilah (xxiii. 1–15). His earlier successes over them are ignored in xxix. 5, although the couplet there quoted now finds its only explanation in xviii. 7 after the death of Goliath and the defeat of the Philistines. These traditions of the relations between Judah and the Philistines (cf. xxvii. 5 seq.) are distinct from the popular stories of giants of Gath, and now form part of the joint history of David and Saul.

The independent narrative of Saul's fate represents one of the disastrous attacks which recur in earlier and later history of the north (xxviii.–4, xxix.). The geographical data are confused by the stories of David (see 1 Sam. xxviii. 4, xxix. 1), and while the "Philistines" march north to Jezreel to deliver their attack, David's presence is not discovered until Aphek is reached (xxix.). His journey is the opportunity for an Amalekite raid (xxx. cf. xxvii. 8 seq.), and a defeat of Amalek by David proves more successful than that which led to Saul's rejection (xv. 20 seq. 26–28). Similarly, Saul's disaster leaves Israel again in the hands of the "Philistines" (xxxi. 7, cf. xiii. 6 seq.), and it is for David to save the people of Israel out of their hands (2 Sam. iii. 18, cf. 1 Sam. ix. 16); so, also, David's wars (2 Sam. viii.) bear a certain resemblance to those of Saul (1 Sam. xiv. 47). The sequel to the joint history has another version of Saul's death (2 Sam. i. 6–10, 13–16), and an Amalekite is the offender; contrast his death in i. 15 seq. with iv. 10 seq. The chapter explains the transference of the royal insignia from Israel to Judah. Here is quoted (from the "Book of Jashar") the old poetical lament over the death of the valiant friends Saul and Jonathan, describing their successful warlike career, the wealth they brought the people, and the vivid sense of national misfortune (i. 19–27). It is utilized for the history of David, to whom it is attributed.

In general, it appears that those narratives wherein the histories of Saul and David are combined—very much in favour of the latter—were originally distinct from those where (a) Saul's figure is more in accord with the old poem from the Book of Jashar, and (b) where David's victories over prehistoric giants and his warlike movements to Jerusalem pave the way for the foundation—from a particular Judæan standpoint—of his remarkably long dynasty, for the literary problem of 1 and 2 Samuel is that of the writing of the history of the early monarchy and how it came to be formed.

SAMUEL OF NEHARDEA, usually called **MAR SAMUEL** or **YARḤINAI** (c. 165–c. 257), Babylonian Rabbi, was born in Nehardea in Babylonia and died there c. 257. He is associated with the fame of his great contemporary Rab (Abba Araka *q.v.*). Besides his mastery in the traditional Law, Samuel was famed for his scientific attainments. He was one of the first to compile a Calendar of the Jewish year, thus preparing the way for the fixation of the festivals by means of scientific calculations. But Samuel's fame rests on the service which he rendered in adapting the life of the Jews of the diaspora to the law of the land. "The law of the State is binding law," was the principle which Samuel enunciated. When the king of Persia, Shapur, captured Mazaca-Cæsarea, the Cappadocian capital, Samuel refused to mourn for the 12,000 Jews who lost their lives in its defence.

SAN, BATTLES OF THE: see DUNAJEC-SAN, BATTLES OF THE; VISTULA-SAN, BATTLES OF THE.

SANA (SENĀ'A), a town of Yemen, south-western Arabia, situated in 15° 22' N. and 44° 10' E. It is placed in a broad depression, running locally nearly north and south, on the lofty uptilted western edge of the great Arabian land-block. It is 7,250 ft. above sea-level, and is connected with its chief port,

Hodeida (*q.v.*), on the Red sea, by a road which crosses the Karn al Wa'l pass (over 9,000 ft.), 25 m. W. of the city, and then follows the plateau steps down to the coast. The population of Sana is estimated at between 20,000 and 25,000.

Early traditions of ancient Sana connect it with the old kingdom of Himyar. Its early name was Azāl, possibly associated with Uzal of Gen. x. 27. A Syriac writer of the 6th century mentions a Himyarite nation of Auzalites. Its later name, signifying "fortified," is associated with the Abyssinian conquerors of Yemen. Sana was the capital of the Abyssinian, Abraha (c. A.D. 530), who built here the famous church (*Kalis*) which was destroyed two centuries later by order of the caliph Mansur (Azraki, p. 91). Its later history has been a record of desert raids interspersed with periods of prosperity. After the withdrawal of the Turks (1918) Sana became the capital of the imam of Yemen Proper.

The town consists of three parts: (1) The Medina, the old city, now the Arab quarter, on the east, containing the principal mosques. Here also, at its south-east corner, is the citadel el Kasr. On the crest of Jebel Nukum (2,000 ft. above the valley) are the ruins of the old fort of el Birash, and the Mutawakkil, formerly containing the palace of the imams, covering its western face; (2) the Bir Al Azab, west of the city, the residential area; and (3), on the extreme west, the Ka'el Yahud, or Jewish quarter. The city, with the Kasr and Mutawakkil, is surrounded by a lofty and thick wall. The Bir Al Azab and Ka'el Yahud are enclosed in a similar wall, but of more recent construction, connected with that of the city by the Mutawakkil, the whole forming a rough figure eight, some 2½ m. long from east to west and ¾ m. in breadth. The walls are pierced by eight gates. The city itself has narrow, paved streets, with massive flat-roofed houses of several storeys. The Jami 'Masjid, or principal mosque, with a model of the Ka'ba at Mecca in the centre, stands on the site of the Christian church built by Abraha (see above). Among the other mosques, of which there are 48 in all, that of Salah ed din is one of the finest. Ruins alone remain of the Kasr Ghumdan and other ancient buildings, whose splendours were sung by the poets of the early days of Islam.

The neighbourhood of Sana suffers from a lack of water, but, in places where this is brought from the hill streams on the west, fields of barley and lucerne and market gardens are seen, particularly at Randa, a suburb 6 m. N. of the town, and in the deep gorges of the Wadi Dhahr and Wadi Hadda, the terraced orchards of which are celebrated for their fine fruit trees. The water supply of the town is derived from numerous wells and from the Ghail Aswad, a small canal.

SANĀ'Ī, the common name of **ABULMAJD MAJDŪD B. ADAM**, the earliest among the great *Ṣūfī* poets of Persia, was a native of Ghazni (in Afghanistan). He flourished in the reigns of the Ghaznevid sultāns Ibrāhīm (1059–1099, 451–492 A.H.), his son Mas'ūd (1099–1114) and his grandson Bahrām (1118–1152). He composed chiefly *gasidas* in honour of his sovereign Ibrāhīm and the great men of the realm, but the ridicule of a half-mad jester is said to have caused him to abandon the career of a court panegyrist and to devote his poetical abilities to higher subjects.

For forty years he led a life of retirement and poverty, in which he wrote his great double-rhymed poem on ethics, which served as model to the masterpieces of Farīd-uddīn 'Attār and Jelāl ud-din Rūmī, the *Hadiqat ul-haqiqat*, or "Garden of Truth" (also called *Alkitāb alfakhrī*). Sana'ī wrote, besides the *Hadiqat* and the *Tariq-i-tahqiq*, several other *Ṣūfī* mathnawis of similar purport: for instance, the *Sair ul-'ibād ilā ma'ād*, or "Man's Journey towards the Other World" (also called *Kunūz-urrumūz*, "The Treasures of Mysteries"); the *Ishq-nāma*, or "Book of Love"; the *'Aql-nāma* or "Book of Intellect"; the *Kār-nāma*, or "Record of Stirring Deeds," etc.; and an extensive *dīwān* or collection of lyrical poetry. He died in 1150.

See Abdullatif al-'Abbāsī's commentary (completed 1632 and preserved in a somewhat abridged form in several copies of the India Office Library); on the poet's life and works, Ouseley, *Biogr. Notices*, 184–187; Rieu's and Flügel's Catalogues, etc.; E. G. Browne, *Literary History of Persia* (1906), ii. 317–322; H. Ethé in W. Geiger's *Grundriss der iranischen Philologie*, ii. 282–284.

SAN ANGELO, a city of western Texas, U.S.A., 217 mi. N.W. of San Antonio, on federal highway 87, at an altitude of 1,847 ft.; county seat of Tom Green county. It is served by the Gulf, Colorado and Santa Fe and the Panhandle and Santa Fe railways. Pop. (1930) 25,308 (88% native white), in 1940, 25,802 by the federal census. It is an important wool and mohair market; has a large jobbing business and various manufacturing industries; and is the trade centre for a wide stock-raising and farming territory. Tom Green county has 200 mi. of spring-fed running streams and a large state and a large federal fish hatchery. San Angelo has an army basic flying field with some 2,000 enlisted men, cadets and officers. Since 1915 the city has had a commission-manager form of government.

Old Fort Concho, a post on the transcontinental mail-stage route, is still standing.

SAN ANTONIO, third largest city (1940) of Texas, U.S.A., and county seat of Bexar county; 80 mi. S.S.W. of Austin, on the San Antonio river at the mouth of the San Pedro. It is on federal highways 81, 87, 90, 181 and 281; has a municipal airport and is an air-mail station; and is served by the Missouri-Kansas-Texas, the Missouri Pacific and the Southern Pacific railways (with two direct lines to the new deepwater port of Corpus Christi, 150 mi. S.S.E.) and by motorbus lines in all directions. Pop. (1920) 161,379, of whom 14,341 were Negroes and 36,346 foreign-born white (including 28,477 Mexicans); in 1940 it was 253,854 by the federal census.

San Antonio is surrounded by rich agricultural regions and there are still largely undeveloped, producing oil fields. It is the financial and commercial centre of a wide area; headquarters of the principal customs district on the Mexican border; the seat of the largest military establishment of the United States government; one of the most picturesque and historically interesting of American cities; and a winter resort. The San Antonio, San Pedro and Acequia rivers together provide 30 mi. of winding waterways within the city limits, spanned by hundreds of bridges. The city is a square of 36 sq.mi., laid out, according to the requirements of the original charter, with the cupola of the cathedral of San Fernando (originally built in 1734) exactly in the centre. Near the cathedral is the historic Alamo, the chapel of the Franciscan mission San Antonio de Valero (founded 1718), which since 1883 has been maintained by the state as a public monument and museum. Facing the Military plaza, where executions took place under Spanish and Mexican rule, is the former Governor's palace (1749), and south and west of the plaza lies the picturesque Mexican quarter. The Veramendi palace, where Col. B. R. Milam was killed (Dec. 5, 1835) by a sharpshooter, is near by. Above and around the quaint old buildings rise the tall hotels and business structures of the modern city. South of the city are four Franciscan missions: La Purisima Concepcion de Acuna (founded in eastern Texas in 1716, and moved here in 1731); San José de Aguayo (1720-31), one of the largest and most beautiful of the missions in America, with an exquisitely carved stone window; San Juan de Capistrano (1731); and San Francisco de la Espada (founded in eastern Texas in 1690 and moved here in 1731). The city's drives are shaded by palms, live oaks, and pecan trees. Its 56 public parks and plazas cover over 2,000 ac. and provide facilities for polo, golf, rifle practice, swimming, tennis and other sports. The water supply (purchased by the city from a private corporation in 1924 for \$7,000,000) comes from 32 artesian wells, with a daily capacity of over 120,000,000 gallons. In the southern suburbs are two artesian wells, with a daily flow of 800,000 gal. of hot sulphur water, used for the treatment of rheumatism and skin diseases. Near one of these wells is the Southwestern state hospital for the insane (1892). As a measure for the eradication of malaria, the city has built bat houses, from which the bats fly out at dusk to devour mosquitoes, returning to their roosts at dawn. The establishment of the United States army at San Antonio includes Ft. Sam Houston on Government hill, a cavalry post and headquarters of the eighth corps area; three aviation fields and two flying schools, one of which is Randolph field, "the West Point of the air"; a great motor transport camp, an

artillery camp, an arsenal, an artillery and rifle range and four polo fields. About 12,000 troops are usually stationed there, and the army expenditures amount to \$36,000,000 annually. The anniversary of the battle of San Jacinto (April 21) is celebrated regularly by a week-long fiesta; and in February each year the Texas open golf tourney and a polo tourney are held. San Antonio has 62 public and 50 private schools, including the College of Our Lady of the Lake (1896) conducted by the Sisters of Divine Providence; 250 churches; and a number of charitable institutions. It is the see of Protestant Episcopal and Roman Catholic bishops. The city operates under a commission form of government, adopted in 1914. The assessed valuation of property for 1940 was \$215,486,470.

The area of the trade territory of San Antonio is greater than the combined area of several eastern states. The customs district of San Antonio has considerable commerce (largely exports) with Mexico. The city has some 450 wholesale houses, and its manufacturing establishments had an output in 1939 valued at \$55,000,000. The principal manufactures are iron and steel, textiles, cigars, leather goods, clothing and soap. The oil fields in the vicinity have developed rapidly since the first one at Somerset (18 mi. S.) was opened in 1919. Bank clearings were \$906,477,705 in 1940.

San Antonio was important as the capital of Texas under Spanish and Mexican rule, and its history is closely bound up with that of the state (see TEXAS).

SAN ANTONIO DE LOS BAÑOS, a small town in Havana province, Cuba, about 23 mi. (by rail) S.W. of Havana. Pop. (1931), 24,799. San Antonio de los Baños is served by the western branch of the United Railways of Havana. It is on the banks of the Ariguanabo river, which drains a lake of the same name, and is itself one of the many "disappearing rivers" of the island; it becomes lost in a cave near San Antonio. The town has mineral springs and baths and is a summer resort of the people of Havana. The tobacco of the Vuelta Abajo lands immediately around the city is famous. The *pueblo* arose in the middle of the 18th century as a camp for convicts from Mexico. It became a *villa* in 1794. Early in the 19th century refugees from Santo Domingo settled there and founded coffee estates that gave the place great prosperity until the expulsion of the French in 1809; subsequently the cultivation of tobacco renewed its prosperity.

SANATRUCES (Sinatruces, Pers. *Sanatruk*), Parthian king. In the troublous times after the death of Mithradates II (c. 88 B.C.) he was made king by the Sacaraucae, a Mongolian tribe who had invaded Iran in 76 B.C. He was eighty years old and reigned seven years; his successor was his son Phraates III. (Lucian, *Macrob.* 15; Phlegon, fr. 12 *ap.* Phot, cod. 97; Appian, *Mithr.* 104; Dio Cass. xxxvi. 45).

SANAVIRONAN, a small group of tribes of South American Indians, supposed, on meagre evidence, to constitute an independent linguistic stock. The Sanavironas from whom the stock is named, and their relatives the Comechingones, lived in the Sierra de Cordoba, in the province of that name in Argentina. Only brief references to them are made by the early writers, and they are now extinct. They were said to have worn long tunics and mantles of wool and to have had some copper ornaments. They were remarkable in that they lived in semisubterranean houses, each containing several families. They were agricultural and used irrigation.

See E. Boman, *Antiquités de la Région Andine de la République Argentine*, etc. (Paris, 1908).

SAN BENITO, a city of Cameron county, Texas, U.S.A., in the rich valley of the lower Rio Grande, 20 mi. N.W. of Brownsville; on federal highway 96 and served by the Missouri Pacific railway lines.

Pop. (1920) 5,070, 38% foreign-born white; in 1940, 9,501 by the federal census. It is the trade centre of an irrigated region, which produces fruit, vegetables and cotton to the value of \$9,000,000 annually. The city was founded in 1908, incorporated in 1910.

SAN BERNARDINO, a city of southern California, U.S.A., 60 mi. E. of Los Angeles, at the entrance to the Cajon pass from

the north and the San Gorgonio Pass from the east, 1,050 ft. above sea-level; the county seat of San Bernardino county. It is on Federal highways 66 and 99, and is served by the Santa Fe, the Southern Pacific, the Union Pacific and electric railways, and by motor coach and truck lines in every direction. Pop. 18,721 in 1920 (79% native white); 43,646 in 1940 by the federal census. The city is surrounded by the orange groves, vineyards, orchards and fields of the fertile San Bernardino valley, and has for background the San Bernardino mountain range, with Mt. San Bernardino (11,600 ft.) only 20 m. E. It is a division terminal of the Santa Fe railroad, which maintains extensive repair shops here and employs altogether over 2,500 persons in the city. Other leading industries are the manufacture of iron and steel castings, aeroplanes, lumber and meat products, ice and refrigerators.

In 1810, on the feast day of San Bernardino of Siena, a party of missionaries, soldiers and Indians from the San Gabriel Mission, under the leadership of Father Dumetz, came into the San Bernardino valley to establish a station for travellers between the Mission and the Sierras to the north, and built a chapel on a site now within the southern boundary of the city. In 1851 a colony of Mormons (about 500) came from Salt Lake, laid out a city, and did much to develop the agricultural possibilities of the valley. The county was organized in 1853, with its seat at San Bernardino, which was incorporated as a town in 1854. It was chartered as a city in 1864 and again in 1905. The Southern Pacific in 1876, and the Santa Fe in 1885, connected it first with the ocean and then with the east, and by 1900 the population had grown to 6,150.

SAN BLAS, a tribe of Indians, also known as the Cuna-Cuna or Tule, who live on the north coast of Panama between San Blas point and Port Obaldia. Although in contact with Europeans since the 16th century they have maintained racial purity and independence by vigorous opposition to foreign settlement. Their language is a Chibchan dialect, and their culture also shows South American origin. Reports of white Indians among this tribe have arisen from pronounced cases of hereditary albinism.

See H. W. Krieger, "Material culture of . . . South-eastern Panama" *U.S. National Museum, Bulletin 134* (1926).

SAN CARLOS, a municipality (with administrative centre and 17 barrios or districts) and port of the province of Negros Occidental, of the island of Negros, Philippine Islands. Pop. (1939), 69,990; 60 were white. San Carlos is a point of export for sugar, which is extensively produced in the surrounding region. The vernacular is a dialect of Bisayan. Of the inhabitants aged 6 to 19 inclusive, 13.5% attended school in 1939, and 22.2% of the population 10 years old and over was literate. The number of parcels of land declared for taxation in 1938 was 1,840.

SAN CARLOS, a municipality (with administrative centre and 51 barrios or districts) of the province of Pangasinan, Luzon, Philippine Islands, on the railway running from Manila to Dagupan. Pop. (1939) 47,334, of whom 23,093 were males and there were no whites. It is in the midst of a fertile agricultural region. The buri palm fibre is used for making the native helmet (salacot). The town has brickyards, pottery factories and trade of importance. The Pangasinan language is the vernacular. Of the inhabitants aged 6 to 19 inclusive, 33.5% attended school in 1939, while 50.1% of the population 10 years old and over was literate. (C. S. L.)

SANCERRE, a town of central France, in the department of Cher, 34 mi. N.E. of Bourges by rail. Pop. (1936) 1,674. Sancerre, which gives its name to the small wine-growing district of Sancerrois, stands on an isolated vine-clad hill (1,000 ft.) about 1 mi. from the left bank of the Loire. A cylindrical keep, la tour des Fiefs, of the 13th century is the only relic of an ancient stronghold of the counts of Sancerre. From 1037 to 1152 the title of count of Sancerre was held by the counts of Champagne; from the latter year till 1640 it had its own counts, descended from Theobald IV of Champagne.

SÁNCHI, a small village in Central India, famous as the site of what are almost certainly the oldest buildings in India now standing. They are Buddhist topes (Pali. *thūpa*; Sanskrit, *stūpa*), that is, memorial mounds, standing on the level top of a small sandstone hill about 300 ft. high on the left bank of the river Betwa. The number of topes on this and the adjoining hills is

considerable. On the Sanchi hill itself are only ten, but one of these is by far the most important and imposing of all. It is a solid dome of stone, about 103 ft. in diameter, and now about 42 ft. high. It must formerly have been much higher, the top having

originally formed a terrace, 34 ft. in diameter, on which stood lofty columns. Round the base is a flagged pathway surrounded by a stone railing and entered at the four points of the compass by gateways some 18 ft. high. Both gateways and railing are elaborately covered with bas-reliefs and inscriptions. The latter give the names of the donors of particular portions of the architectural ornamentation, and most of them are written in the

This Buddhist shrine is an example of Indian "Renaissance" architecture

characters used before and after the time of Asoka in the middle of the 3rd century B.C. The monuments are Buddhist, the bas-reliefs illustrate passages in the Buddhist writings, and the inscriptions make use of Buddhist technical terms.

SANCHUNIATHON, an ancient Phoenician sage, who belongs more to legend than to history. He is said to have flourished "even before the Trojan times." Philo Herennius of Byblus claimed to have translated his writings from the Phoenician originals. According to Philo, Sanchuniathon derived the sacred lore from the mystic inscriptions on the Ἀμμωνεῖς (probably *ham-mānim*, "sun pillars," cf. Is. xxvii. 9, etc.) which stood in the Phoenician temples. That any writings of Sanchuniathon ever existed it is impossible to say. Philo conjured with a venerable name to gain credit for his narrative.

See Eusebius, *Praep. Ev.* i. g (Miiller, *Fragm. hist. Graec.* iii. pp. 563 seq.).

SAN CRISTÓBAL (formerly called SAN CRISTÓBAL DE LOS LLANOS, CIUDAD DE LAS CASAS and CIUDAD REAL), a town of Mexico, in the State of Chiapas, on a level tableland about 6,700 ft. above sea-level and 48 m. E.N.E. of Tuxtla Gutiérrez. Population 16,713. The surrounding country is fertile and healthful and is populated chiefly with Indians. San Cristóbal was founded

in 1528 on the site of an Indian village, and afterwards was famous as the residence of Las Casas, bishop of Chiapas. It was the capital of Chiapas until near the end of the 19th century.

SANCROFT, WILLIAM (1616–1693), archbishop of Canterbury, was born at Fressingfield, Suffolk, on Jan. 30, 1616, and entered Emmanuel college, Cambridge, in July 1634. He became fellow in 1642, but was ejected in 1649 for refusing to accept the "Engagement." He remained abroad till the Restoration, after which he was chosen one of the university preachers, and in 1663 was nominated to the deanery of York. In 1664 he was installed dean of St. Paul's, to the rebuilding of which, after the fire of 1666, he gave £1,400. He also rebuilt the deanery, and improved its revenue. In 1668 he was admitted archdeacon of Canterbury upon the king's presentation, but he resigned the post in 1670. In 1677, being now prolocutor of the Convocation, he was unexpectedly advanced to the archbishopric of Canterbury. He attended Charles II. upon his deathbed. He wrote with his own hand the petition presented in 1687 against the reading of the Declaration of Indulgence, which was signed by himself and six of his suffragans. For this they were all committed to the Tower, but were acquitted. Upon the withdrawal of James II. he concurred with the Lords in a declaration to the prince of Orange for a free parliament, and due indulgence to the Protestant dissenters. But, when that prince and his consort were declared king and queen, he refused to take the oath to them, and was accordingly suspended and deprived. From Aug. 5, 1691, till his death on Nov. 24, 1693, he retired to his native place.

He published *Fur predestinatus* (1651), *Modern Politics* (1652), and *Three Sermons* (1694). *Nineteen Familiar Letters to Mr. North* (afterwards Sir Henry North) appeared in 1757. See G. O'Oly, *Life of Sancroft* (2 vols., 1821); A. Strickland, *Lives of the Seven Bishops* (1866).

SANCTIONS AND GUARANTEES in international law correspond to the means adopted in national law to enforce legal decisions. During the years which followed the World War it became increasingly apparent that the most important and the most enduring of European political problems was that known as the problem of "security" (*q.v.*).

As a deduction from the new conception of security the word "sanctions" began to replace in the language of diplomacy the word "alliance." Security was now to be sought not in limited agreements between small groups of states to fight together whenever any of them should, for whatever cause, be involved in international conflict, but in common agreements among a greater or smaller number of states to act together when—and only when—the established rights of one of them had been violated by force. Security, therefore, must be found in "sanctions" against the wrongdoer. For some time indeed, the word "guarantees" was used instead of, or on an equal footing with, the word "sanctions," but gradually the use of the word "guarantee" disappeared and the word "sanctions" took its place.

The discussions which occurred after the war soon showed that there were two ways by which Governments believed the result in view could be achieved; first, by creating a general system embracing all the States throughout the world; and second, by creating limited arrangements applying to a certain number of States situated in geographical proximity to each other and bound together by common bonds of material interest.

Article 16 of the Covenant. — It was by the general method that the first step was made towards the organization of a true system of international sanctions. This first step consisted in the adoption of the Covenant of the League of Nations, Article 16 of which imposes obligations upon every member of the League to adopt common coercive measures, including especially a financial and economic boycott, against states which, in violation of the undertakings of the Covenant, resort to war. But unfortunately Article 16 contained ambiguities which seriously diminished the confidence of Governments in its efficiency. It was not, therefore, generally regarded as by itself creating a sufficiently sound system of sanctions to solve the problem of security. For that reason the Temporary Mixed Commission set up by the Council of the League of Nations prepared in 1923 the draft treaty of mutual guarantee (or assistance), on the basis of which was prepared the

Geneva Protocol of 1924. Both instruments were founded on the clear acceptance by all signatory states of obligations to co-operate by military or other necessary means against an aggressor.

Regional Guarantees. — The second method received its first application in the Anglo-American-French guarantee treaties drawn up in 1919 at Paris. These treaties failed to secure ratification, and were replaced by the Franco-Belgian, Franco-Polish and other similar treaties of alliance. The Little Entente was another example of the same method. But it was recognized even by the authors of these treaties that although they were subject to the Covenant of the League they were, nevertheless, liable to degenerate into alliances of the old sort, and that therefore they would be dangerous unless they were effectively controlled by the League. The Temporary Mixed Commission above mentioned in its draft treaty of mutual assistance for the first time combined the two methods into one coherent system. The Protocol similarly recognized the utility of special treaties in support of general sanctions, but on condition that such special treaties could only be applied after it had been recognized by some impartial arbitrator that aggression had taken place.

After the failure of the combination method of the Geneva Protocol, a return was made in the Locarno Agreements to the method of partial treaties. These agreements, however, in no way resembled an old-time alliance; the concern of their authors was plainly to create one more stable element in a new system of general international sanctions against aggression. (See LEAGUE OF NATIONS and bibliography thereto and INTERNATIONAL LAW.)

(P. J. N. B.)

On October 9, 1935, the League Assembly, with Austria and Hungary dissenting, declared that Italy had resorted to war contrary to Article XII of the Covenant. Fifty member states pledged themselves to apply collective sanctions against Italy and, in due course, these countries adopted an arms embargo. A financial embargo was added by 48 states, a boycott of imports from Italy by 47 states, a ban on certain exports to Italy by 47 states, and there was a pact of mutual support by 34 states. The United States, acting independently, applied an embargo to both belligerents. League sanctions did not include oil and, as limited, they failed to arrest Italy's invasion of Ethiopia. In June, 1936, sanctions were abandoned and an endeavour by France to apply sanctions to Germany when she marched troops into the Rhineland did not materialize.

SANCTI SPIRITUS, an old Cuban city in Santa Clara Province, situated on a sandy plain in an angle of the Yayabo river, which winds through the city. Pop. (1931), 85,583. It is connected by railway with Zaza del Medio, on the main railway line of the island, and with its port, Tunas de Zaza, 30 m. (by rail) to the south. The surrounding country is devoted principally to grazing. Sancti Spiritus was one of the seven cities founded by Diego Velásquez. Its settlement was ordered in 1514 and accomplished in 1516, and it is the fifth town of the island in age. The present city is about two leagues from the original site (Pueblo Viejo). In 1518, as a result of the war of the Comunidades of Castille, a mimic war broke out in Sancti Spiritus among its two score villagers. The place was sacked by French and English corsairs in 1719. Illicit trade with Jamaica was the basis of local prosperity in the 18th century.

SANCTORIUS (the Latin form of **SANTORIO SANTORIO**) (1561–1636), professor at Padua and colleague of Galileo, owes his medical fame to his demonstration that loss by "insensible perspiration" exceeds all other bodily excretions combined. Being inspired by the devices of Galileo, he invented a thermometer and an apparatus for measuring the pulse, and also a trocar and a cannula.

His chief works are the *De Medicina Statica* (1614) and a commentary on the *Canon* of Avicenna.

SANCTUARY, a sacred or consecrated place, particularly one affording refuge, protection or right of asylum. The word is also applied to the privilege itself, the right of safe refuge, and even to places of refuge for animals, such as a "bird sanctuary." In Egyptian, Greek or Roman temples it was applied to the *cella* in which stood the statue of the god, and the Latin word for

altar, *ara*, was used for protection as well. In Roman Catholic usage sanctuary is sometimes applied to the whole church, as a consecrated building, but is generally limited to the choir. The idea that such places afforded refuge to criminals or refugees is founded upon the primitive and universal belief in the contagion of holiness. Hence it was sacrilege to remove the man who had gained the holy precincts; he was henceforth invested with a part of the sacredness of the place, and was inviolable so long as he remained there. The story of the death of Demosthenes (*q.v.*) is a famous instance. Not all Greek and Roman temples, however, had the right of sanctuary. But where it existed, the action of the Roman civil law was suspended, and in imperial times the statues and pictures of the emperors were a protection against pursuit. Roman law did not recognize the use of Christian sanctuaries until toward the end of the 4th century, but the growing recognition of the office of bishop as intercessor helped much to develop it. In 399 the right of Christian sanctuary was finally and definitely recognized, and in 419 the privilege was extended in the western empire to 50 paces from the church door. In 431, by an edict of Theodosius and Valentinian it was extended to include the church court-yard and whatever stood therein, in order to provide some other place than the church for the fugitives to eat and sleep. Justinian in a Novel of the year 535 limited the privilege to those not guilty of the grosser crimes. In the new Germanic kingdoms, while violent molestation of the right of sanctuary was forbidden, the fugitive was given up after an oath had been taken not to put him to death. This legislation was copied by the Church at the council of Orleans in 511; the penalty of penance was added, and the whole decree backed by the threat of excommunication. Thus it passed into Gratian's Decretum, but historians like Gregory of Tours have many tales to tell showing how frequently it was violated.

The earliest extant mention of the right of sanctuary in England is contained in the code of laws issued by the Anglo-Saxon king Aethelberht in A.D. 600. By these he who infringed the church's privilege was to pay twice the fine attaching to an ordinary breach of the peace. Crosses inscribed with the word "Sanctuarium," were common on the highways, serving probably as sign-posts to guide fugitives to neighbouring sanctuaries. The canon law allowed the protection of sanctuary to those guilty of crimes of violence for a limited time only, in order that some compensation (*wergild*) should be made, or to check blood-vengeance. The procedure, upon seeking sanctuary, was regulated in the minutest detail. The fugitive had to make confession of his crime to one of the clergy, to surrender his arms, swear to observe the rules and regulations of the religious houses, pay an admission fee, give, under oath, fullest details of his crime (the instrument used, the name of the victim, etc.), and at Durham he had to toll a special bell as a formal signal that he prayed sanctuary, and put on a gown of black cloth on the left shoulder of which was embroidered a St. Cuthbert's cross. The protection afforded by a sanctuary at common law was this: a person accused of felony might fly for safeguard of his life to sanctuary, and there, within 40 days, go, clothed in sack-cloth, before the coroner, confess the felony and take an oath of *abjuration of the realm*, whereby he undertook to quit the kingdom, and not return without the king's leave. Upon confession he was, *ipso facto*, convicted of the felony, suffered attainder of blood and forfeited all his goods, but had time allowed him to fulfil his oath. The abjurer started forth on his journey, armed only with a wooden cross, bareheaded and clothed in a long white robe, which made him conspicuous among mediaeval wayfarers. He had to keep to the king's highway, was not allowed to remain more than two nights in any one place, and must make his way to the coast quickly. The time allowed for his journey was not long. In Edward III.'s reign only nine days were given an abjurer to walk from Yorkshire to Dover.

Under the Norman kings there appear to have been two kinds of sanctuary; one *general*, which belonged to every church, and another *peculiar*, which had its force in a grant by charter from the king. This latter type could not be claimed by prescription, and had to be supported by usage within legal memory. General sanctuaries protected only those guilty of felonies, while those

by special grant gave immunity even to those accused of high or petty treason, not for a time only but apparently for life. Of chartered sanctuaries there were at least 22: Abingdon, Armathwaite, Beaulieu, Battle Abbey, Beverley, Colchester, Derby, Durham, Dover, Hexham, Lancaster, St. Mary le Bow (London), St. Martin's le Grand (London), Merton Priory, Northampton, Norwich, Ripon, Ramsey, Wells, Westminster, Winchester, York. At the Reformation general and peculiar sanctuaries both suffered drastic curtailment of their privileges, but the great chartered ones suffered most. By the reforming act of 1540 Henry VIII. established seven cities as peculiar sanctuaries. These were Wells, Westminster, Northampton, Manchester (afterwards transferred to Chester), York, Derby and Launceston. By an act of James I. (1623), sanctuary, as far as crime was concerned, was abolished throughout the kingdom. The privilege lingered on for civil processes in certain districts which had been the site of former sanctuaries and which became the haunts of criminals who there resisted arrest—a notable example being that known as Whitefriars between Fleet Street and the Thames, east of the Temple. This locality was nicknamed *Alsatia* (the name first occurs in Shadwell's plays in Charles II.'s reign), and there criminals were able to a large extent to defy the law, arrests only being possible under writs of the lord chief justice. So flagrant became the abuses that in 1697 the "Escape from Prison Act," finally abolished all such alleged privileges. A further amending act of 1723 completed the work of destruction. The privileged places named in the two acts were the Minories, Salisbury Court, Whitefriars, Fulwood's Rents, Mitre Court, Baldwin's Gardens, The Savoy, The Clink, Deadman's Place, Montague Close, The Mint and Stepney.

In Scotland the most famous sanctuaries were those attaching to the Church of Wedale, now Stow, near Galashiels, and that of Lesmahagow, Lanark. All religious sanctuaries were abolished in the northern kingdom at the Reformation. But the debtor found sanctuary from "diligence" in Holyrood House and its precincts until late in the 17th century. This sanctuary did not protect criminals, or even all debtors, *e.g.*, not crown debtors or fraudulent bankrupts; and it was possible to execute a *meditatio fugae* warrant within the sanctuary. The abolition of imprisonment for debt in 1881 practically abolished this privilege of sanctuary.

A presumptive right of sanctuary attached to the royal palaces, and arrests could not be made there. In Anglo-Saxon times the king's peace extended to the palace and 3,000 paces around it: it extended to the king himself beyond the precincts. At the Present day members of parliament cannot be served with writs or arrested within the precincts of the houses of parliament, which extend to the railings of Palace yard. During the Irish agitation of the 'eighties Parnell and others of the Irish members avoided arrest for some little while by living in the house and never passing outside the gates of the yard. The houses of ambassadors were in the past quasi-sanctuaries. This was a natural corollary of their diplomatic immunities (*see* DIPLOMACY).

In Europe, generally, the right of sanctuary survived under restrictions down to the end of the 18th century. In Germany the more serious crimes of violence were always excepted. Highwaymen, robbers, traitors and habitual criminals could not claim church protection. In 1418 sanctuary was further regulated by a bull of Martin V. and in 1504 by another of Julius II. In a modified form the German *Asylrecht* lasted to modern times, not being finally abolished till about 1780. In France *le droit d'asile* existed throughout the middle ages, but was much limited by an edict of Francis I. in 1539. It was entirely abolished at the Revolution.

SAND, GEORGE (1804-1876), the pseudonym of Madame Amandine Lucile Aurore Dudevant, *née* Dupin.

George Sand was the daughter of Maurice Dupin, a retired lieutenant, and of Sophie Delaborde, the daughter of a Paris bird-fancier. Their ill-assorted marriage took place only a month

before the birth of the child (July 1, 1804; at Paris). Her paternal grandfather was M. Dupin de Francueil, a farmer-general of the revenue, who married the widow of Count Horn, a natural son of Louis XV., she in her turn being the natural daughter of Maurice of Saxe, the most famous of the many illegitimate children of Augustus the Strong, by Marie Rinteau ("Mlle. de Verrières"). George Sand, who was a firm believer in the doctrine of heredity, devotes a whole volume of her autobiography (*Histoire de ma vie*, 1857 seq.) to the elaboration of this strange pedigree. She boasts of the royal blood which ran through her veins, but she is no less frank in declaring that she is *vilaine et très vilaine*, a daughter of the people who shares by birth their instincts and sympathies. Her birth itself was romantic. Her father died when she was a small child, and her mother, after a struggle, abandoned Aurore to the care of her grandmother, Madame Dupin de Francueil, who was a survival of the ancien régime.

Her childhood was spent at Nohant, near La Chbtre in Berry, Madame Dupin's country house. Here she imbibed the passionate love of country scenes and country life which neither absence, politics nor dissipation could uproot; here she learnt to understand the ways and thoughts of the peasants, and laid up that rich store of scenes and characters which a marvellously retentive memory enabled her to draw upon at will. Next to the grandmother, the most important person in the household at Nohant was Deschates. He was an ex-abbé who had shown his devotion to his mistress when her life was threatened during the Revolution, and henceforward was installed at Nohant as factotum. He was maire of the village, tutor to Aurore's half-brother, and undertook the education of the girl. At odd hours of lessons she picked up a smattering of Latin, music and natural science, but most days were holidays and spent in country rambles and games with village children.

From the free out-door life at Nohant she passed at thirteen to the convent of the English Augustinians at Paris, where for the first two years she never went outside the walls. Nothing better shows the plasticity of her character than the ease with which she adapted herself to this sudden change. One day in the convent chapel she underwent conversion in the mystical sense. There is no doubt of the sincerity of her narrative, or even the permanence of her religious feelings under all her many phases of faith and aberrations of conduct.

Again in 1820 Aurore exchanged the restraint of a convent for freedom, being recalled to Nohant by Mme. de Francueil, who had no intention of letting her granddaughter grow up a *dévoté*. She rode across country with her brother, she went out shooting with Deschates, she sat by the cottage doors on the long summer evenings and heard the flax-dressers tell their tales of witches and warlocks. She was a considerable linguist and knew English, Italian and some Latin, though she never tackled Greek. She read widely though unsystematically, studying philosophy in Aristotle, Leibnitz, Locke and Condillac, and feeding her imagination with *René* and *Childe Harold*. Her confessor lent her the *Génie du Christianisme*, and to this book she ascribes the first change in her religious views.

On her grandmother's death she married on Dec. 11, 1822, Casimir Dudevant, natural son of Baron Dudevant. He seems then to have been neither better nor worse than the Berrichon squires around him, and the first years of her married life, during which her son Maurice and her daughter Solange were born, except for lovers' quarrels, were passed in peace and quietness, though signs were not wanting of the coming storm. Among these must be mentioned her friendship with Aurélien de Sèze, advocate-general at Bourdeau, which her husband resented. So long as the conventions were preserved she endured her life, but when her husband took to drinking and made love to the maids under her eyes she resolved to break a yoke that had grown intolerable. She then discovered a paper docketed "Not to be opened till after my death," which was nothing but a railing accusation against herself. She at once quitted Nohant, taking with her Solange, and in 1831 an amicable separation was agreed upon, by which her whole estate was surrendered to the husband with the stipulation that she should receive, in return for this

relinquishment on her part, an allowance of £120 a year.

Aurore Dudevant had regained her liberty, and made no secret of her intention to use it to the full. She endeavoured unsuccessfully to eke out her irregularly paid allowance by various expedients, and lived in a garret. She found a friend in Delatouche, the editor of *Figaro*. He was a native of Berry, like herself, a stern but kindly taskmaster who taught her the trade of journalism. On the staff of *Figaro* was another compatriot, Jules Sandeau, a clever and attractive young lawyer. Articles written in common soon led to a complete literary partnership, and in 1831 there appeared in the *Revue de Paris* a joint novel entitled *Prima Donna* and signed Jules Sand. Shortly after this was published in book form with the same signature a second novel, *Rose et Blanche*. The sequel to this literary alliance is best recounted in George Sand's own words: "I resisted him for three months but then yielded; I lived in my own apartment in an unconventional style." Her first independent novel, *Indiana* (1832), was written at the instigation of Delatouche, and the world-famous pseudonym George (originally Georges) Sand was adopted as a compromise between herself and her partner. The one wished to throw *Indiana* into the common stock, the other refused to lend his name, or even part of his name, to a work in which he had had no share. The novel was received with instant acclamation. *Indiana* is a direct transcript of the author's personal experiences (the disagreeable husband is M. Dudevant to the life), and an exposition of her theory of sexual relations which is founded thereon. To many critics it seemed that she had said her whole say and that nothing but replicas could follow. *Valentine*, which was published in the same year, indicated that it was but the first chapter in a life of endless adventures, and that the imagination which turned the crude facts into poetry, and the fancy which played about them like a rainbow, were inexhaustible.

Her liaison with Jules Sandeau, which lasted more than a year, was abruptly terminated by the discovery in their apartment on an unexpected return from Nohant of *une blanchisseuse quelconque*. For a short while she was broken hearted:—"My heart is a cemetery!" she wrote to Sainte-Beuve. "A necropolis," was the comment of her discarded lover when years later the remark was repeated to him.

Her third novel, *Lélia* (1833), is in the same vein, a stronger and more outspoken diatribe against society and the marriage law. *Lélia* is a female Manfred, and Dumas had some reason to complain that George Sand was giving them "du lord Byron au kilo." But a new chapter in her life was now to open. In her despair she turned for comfort and counsel to Sainte-Beuve, now constituted her regular father confessor. He recommended new friendships, but she found Dumas "trop commis-voyageur," Jouffroy too serenely virtuous and Musset "trop dandy." Mérimée was tried for a week, but the cool cynic and the perfervid apostle of women's rights proved mutually repulsive. Alfred de Musset was introduced, and the two natures leapt together.

The Musset Episode.—Towards the end of 1833 George Sand, after winning the reluctant consent of Musset's mother, set out in the poet's company for Italy, and in January 1834 the pair reached Venice, staying first at the Hôtel Danieli and then in lodgings. At first it was a veritable honeymoon, conversation never flagged and either found in the other his soul's complement. But there is a limit to love-making, and George Sand, always practical, set to work to provide the means of living. Musset, though he depended on her exertions, was first bored and then irritated at the sight of this *terrible vache à écrire*, whose pen was going for eight hours a day, and sought diversion in the cafés and other less reputable resorts of pleasure. The consequence was a nervous illness, through which George Sand nursed him with tenderness and care. But she made love at the same time to a young Venetian doctor whom she had called in, by name Pagello. The two found their way eventually to Paris, leaving Musset in Italy, deeply wounded in his affections, but, to do him justice, taking all the blame for the rupture on himself. George Sand soon tired of her new love, and even before she had given him his congé was dying to be on again with the old. She cut off her hair and sent it to Musset as a token of penitence, but Musset, though he still

flirted with her, never quite forgave her infidelity and refused to admit her to his deathbed. Among the mass of *romans à clef* and pamphlets which the adventure produced, two only have any literary importance, Musset's *Confessions d'un enfant du siècle* and George Sand's *Elle et lui*. In the former woman appears as the serpent whose trail is over all; in the latter, written twenty-five years after the event, she is the guardian angel abused and maltreated by men. *Lui et elle*, the rejoinder of the poet's brother Paul de Musset, was even more a travesty of the facts with no redeeming graces of style.

It remains to trace the influence, direct or indirect, of the poet on the novelist. *Jacques* was the first outcome of the journey to Italy, and in precision and splendour of style it marks a distinct progress. In *Les Lettres d'un voyageur*, which ran in the *Revue des deux mondes* between 1834 and 1836, we have not only impressions of travel, but the direct impressions of men and things not distorted by the exigencies of a novel. The Everard of the *Lettres* introduces us to a new and for the time a dominant influence on the life and writings. Michel de Bourges was the counsel whose eloquent pleadings brought the suit for a judicial separation to a successful issue in 1836. Unlike her former lovers, he was a man of masterful will, a philosopher who carried her intellect by storm before he laid siege to her heart. He preached republicanism to her by the hour, and even locked her up in her bedroom to reflect on his sermons. She was but half converted, and fled before long from a republic in which art and poetry had no place. Other celebrities who figure in the *Lettres* under a transparent disguise are Liszt and Mme. d'Agoult (known to literature as Daniel Stern), whom she met in Switzerland and entertained for some months at Nohant. Liszt, in after years when they had drifted apart, wrote of her: "George Sand catches her butterfly and tames it in her cage by feeding it on flowers and nectar—this is the love period. Then she sticks her pin into it when it struggles—that is the *congé* and it always comes from her. Afterwards she vivisects it, stuffs it, and adds it to her collection of heroes for novels." There is some truth in the satire, but it wholly misrepresents her rupture with Chopin.

Liaison with Chopin.—It was doubtless a revulsion of feeling against the doctrinaires, especially the strong influence of Lamennais and P. Leroux, and in particular against the puritanic reign of Michel that made her turn to Chopin. She found the *nzaestro* towards the end of 1837 dispirited by a temporary eclipse of popularity and in the first stage of his fatal malady, and carried him off to winter with her, in the south. How she roughed it on an island unknown to tourists is told in *Un hiver à Majorque* (1842), a book of travel that may take rank with Heine's *Reisebilder*. In nearly all George Sand's loves there was a strong strain of motherly feeling. Chopin was first petted by her like a spoil darling and then nursed for years like a sick child. In the end Chopin remonstrated with her for refusing to receive her ne'er do well son-in-law, Clésinger, at Nohant, and when she resented his interference, he left her in anger.

Meanwhile, during this, her second period, George Sand allowed herself to be the mouthpiece of others—"un écho qui embellissait la voix," as Delatouche expressed it. *Spiridion* (1838) and *Les Sept cordes de la lyre* (1840) are mystic echoes of Lamennais. *Le Compagnon du tour de France* (1841), *Les Maîtres mosaïstes* and *Le Meunier d'Angibault* (1845), *Le Pêché de M. Antoine* (1847) are all socialistic novels. George Sand had adopted her socialism from Pierre Leroux, and many works of this period are inspired by his humanitarianism. *Consuelo* (1842-1844) and its sequel *La Comtesse de Rudolstadt* (1843-1845) are *fantaisies à la Chopin*, though the stage on which they are played is the Venice of Musset. Chopin is the Prince Karol of *Lucrezia Floriani* (1847), a self-portrait unashamed as the *Tagebuch einer Verlorenen* and innocent as *Paul et Virginie*.

George Sand wrote with the rapidity of Walter Scott and the regularity of Anthony Trollope. For years her custom was to retire to her desk at 10 P.M. and not to rise from it till 5 A.M. She wrote *à la diable*, starting with some central thesis to set forth or some problem to investigate, but with no predetermined plot or plan of action. Round this nucleus her characters (too

often mere puppets) grouped themselves, and the story gradually crystallized. This unmethodical method produces in her longer and more ambitious novels, in *Consuelo* for instance and its continuation, a tangled wilderness, the clue to which is lost or forgotten; but in her novelettes, when there is no change of scenery and the characters are few and simple, it results in the perfection of artistic writing, "an art that nature makes."

The Pastoral Novels.—From novels of revolt and tendency novels George Sand turned at last to simple stories of rustic life, the genuine pastoral. It is here that she shows her true originality and by these she will chiefly live. George Sand by her birth and bringing-up was half a peasant herself, in M. Faguet's phrase, "un paysan qui savait parler." She had got to know the heart of the peasant—his superstitions, his suspiciousness and low cunning, no less than his shrewdness, his sturdy independence and his strong domestic attachments. *Jeanne* (1844) begins the series which has been happily called the Bucolics of France. To paint a Joan of Arc who lives and dies inglorious is the theme she sets herself, and through most of the novel it is perfectly executed. The last chapters when Jeanne appears as the Velida of Mont Barbot and the Grande Pastoure are a failing off and a survival of the romanticism of her second manner. *La Mare au diable* (1846) is a clear-cut gem, perfect as a work of Greek art. *François le champi* and *La Petite Fadette* are of no less exquisite workmanship. *Les Maîtres sonneurs* (1853) brings the series of village novels to a close, but as closely akin to them must be mentioned the *Contes d'une grande-mère*, delightful fairy tales of the Talking Oak, Wings of Courage and Queen Coax, told to her grandchildren in the last years of her life.

The revolution of 1848 arrested for a while her novelistic activities. She composed manifestos for her friends, addressed letters to the people, and even started a newspaper. But her political ardour was short-lived; she cared little about forms of government, and, when the days of June dashed to the ground her hopes of social regeneration, she returned to her quiet country ways and her true vocation as an interpreter of nature, a spiritualizer of the commonest sights of earth and the homeliest household affections. In 1849 she writes from Berry to a political friend: "You thought that I was drinking blood from the skulls of aristocrats. No, I am studying Virgil and learning Latin!" In her latest works she went back to her earlier themes of romantic and unchartered love, but the scene is shifted from Berry, which she felt she had exhausted, to other provinces of France, and instead of passionate manifestos we have a gallery of *genre pictures* treated in the spirit of *François le champi*. "Vous faites," she said to her friend Honoré de Balzac, "la comédie humaine; et moi, c'est l'églologie humaine que j'ai voulu faire."

George Sand was as fond of acting as Goethe, and like him began with a puppet stage, succeeded by amateur theatricals, the chief entertainment provided for her guests at Nohant. Undaunted by many failures, she dramatized several of her novels with moderate success—*François le champi*, played at the Odéon in 1849, and *Les Beaux Messieurs de Bois-Doré* (1862) were the best; *Claudie*, produced in 1851, is a charming pastoral play, and *Le Marquis de Villemer* (1864) (in which she was helped by Dumas fils) was a genuine triumph. Her statue by Clésinger was placed in the foyer of the Théâtre Français in 1877.

George Sand died at Nohant on the 8th of June 1876. To a youth and womanhood of storm and stress had succeeded an old age of serene activity and then of calm decay. Her nights were spent in writing, which seemed in her case a relaxation from the real business of the day, playing with her grandchildren, gardening, conversing with her visitors—it might be Balzac or Dumas, or Octave Feuillet or Matthew Arnold—or writing long letters to Sainte-Beuve and Flaubert. "Calme, toujours plus de calme," was her last prayer, and her dying words, "Ne détruisez pas la verdure."

BIBLIOGRAPHY.—The collected edition of George Sand's works was published in Paris (1862-83) in 96 volumes, with supplement 109 volumes; the *Histoire de ma vie* appeared in 20 volumes in 1854-55. The *Étude bibliographique sur les œuvres de George Sand* by the vicomte de Spoelberch de Lovenjoul (Brussels, 1868) gives the most complete bibliography. Of Vladimir Karenin's (pseudonym of

Mme. Komarova) *George Sand*, the most complete life, the first two volumes (1899-1901) carry the life down to 1839. There is much new material in *George Sand et sa fille*, by S. Rocheblave (1905), *Correspondance de G. Sand et d'Alfred de Musset* (Brussels, 1904), *Correspondance entre George Sand et Gustave Flaubert* (1904), and *Lettres à Alfred de Musset et à Sainte-Beuve* (1897). E. M. Caro's *George Sand* (1887) is rather a critique than a life. See studies by Sainte-Beuve in the *Causeries du lundi* and in *Portraits contemporains*; Jules Lemaitre in *Les Contemporains*, vol. iv.; E. Faguet, *XIX^e Siècle*; F. W. H. Myers, *Essays Ancient and Modern* (1883); Henry James in *North American Review* (April 1902); Matthew Arnold, *Mixed Essays* (1879). See also René Doumic's *George Sand* (1909), which has been translated into English by Alys Hallard as *George Sand: Some Aspects of her Life and Writings* (1910); C. Maurras, *Les Amants de Venise; George Sand et Musset* (1916); L. Vincent, *George Sand et le Berry* (2 vols. 1919); E. A. A. L. Seillière, *George Sand* (1920); E. W. Schermerhorn, *The Seven Strings of the Lyre. The Life of George Sand (1804-76)* (1928); and Eng. trans., by M. J. Howe, of her *Journal Intime* as *The Intimate Journal of George Sand* (1929).

SAND. If rocks and minerals are broken down by either natural or artificial agencies, the products may be classified as gravels, sands, silts and clays. The term sand is usually applied to the material of diameter ranging from about $\frac{1}{16}$ to 2 mm. Although most of the rock-making minerals occurring on the earth's crust are found in sands, only a limited number are met with at all frequently. For several reasons quartz is by far the commonest ingredient; it is abundant in rocks, is comparatively hard and has practically no cleavage so that it is not readily worn down to a fine state. Moreover it is nearly insoluble in water and does not decompose. In certain localities felspar, calcareous material, iron ores and volcanic glass, among other substances, have been found to be dominant constituents of sand. Most quartzose sands contain a small quantity of felspar. Small plates of white mica, which, though soft and very fissile, decompose very slowly, are often present. In addition all sands contain small quantities of "heavy" rock-forming minerals among which may be garnet, tourmaline, zircon, rutile, topaz, pyroxenes, amphiboles, iron ores, etc.

In certain shore and river sands these heavier constituents become concentrated as a result of current action and the removal of the lighter constituents. Economically valuable deposits may then be yielded. Such are the sands worked for diamonds and other gem-stones, those bearing gold, platinum, tin, monazite and other ores. The greensands, widely distributed over the floor of the ocean and found in ancient strata on the continents, owe their colour to the presence of glauconite, a potash-bearing mineral. These sands are used for water-softening and for land-dressing, and attempts have been made to extract potash from them.

In the pottery, glass-making and silicate (water glass) industries very pure quartzose sands are used in large quantities as a source of silica. Similar sands are required for lining the hearths of acid-steel furnaces and for foundry mixtures. Moulding-sands, that is, the sands utilized in foundries for making the moulds in which metal is cast, usually have a clayey bond uniting the grains of quartz. On account of the hardness and poor cleavage of quartz, sands are used extensively as abrasives. Garnet-sands, although of more restricted occurrence, are similarly used. Ordinary sands find a multitude of other uses, among which may be mentioned the preparation of mortar, cement and concrete. They are frequently sources of water-supply. (P. G. H. B.)

SANDALWOOD, a fragrant wood obtained from various trees of the natural order Santalaceae, and principally from *Santalum album*, a native of India. The use of sandalwood dates as far back at least as the 5th century B.C. It is still extensively used in India and China, wherever Buddhism prevails, being employed in funeral rites and religious ceremonies. In India it is used in the manufacture of boxes, fans and other ornamental articles of inlaid work. The oil, obtained by distilling the wood in chips, is used as a perfume, few native Indian attars or essential oils being free from admixture with it. As a powder or paste the wood is employed in the pigments used by the Brahmans for their distinguishing caste-marks.

Red sandalwood is the product of a small leguminous tree, *Pterocarpus santalinus*, native of S. India, Ceylon and the Philippine Islands. A fresh surface of the wood has a rich deep red

colour, which on exposure, however, assumes a dark brownish tint; its principal application is in wool-dyeing. Several other species of *Pterocarpus*, notably *P. indicus*, contain the same dyeing principle and can be used as substitutes for red sandalwood. The barwood and camwood of the Guinea Coast of Africa, from *Baphia nitida* or an allied species, called *santal rouge d'Afrique* by the French, are also closely allied to the red sandalwood of Oriental countries.

As a substitute for copaiba (*q.v.*), sandalwood oil, distilled from the wood of *Santalum album*, is pleasanter to take, but it is less efficient and more expensive.

SANDARACH, in mineralogy realgar or native arsenic disulphide, but generally a resinous body obtained from the small coniferous tree *Callitris quadrivalvis*, native of the north-west regions of Africa, and especially the Atlas mountains. The resin, a natural exudation on the stems, comes into commerce as small round balls or elongated tears, transparent, and having a delicate yellow tinge. It is a little harder than mastic, for which it is sometimes substituted. It is also used as incense, and by the Arabs medicinally as a remedy for diarrhoea. An analogous resin is procured in China from *Callitris sinensis*, and in S. Australia, under the name of pine gum, from *C. Reissii*.

SANDAWE, less correctly Sandawi, a small tribe of about 15,000 persons living in the Kondoa-Irangi district of Tanganyika Territory, Africa, between the rivers Bubu and Mponde. Attention was drawn to their language by the late Dr. Oskar Baumann, who visited their country in 1892, and was able to collect some specimens, being especially struck by the remarkable fact of its containing clicks (*q.v.*), which had up to that time only been observed in the Hottentot and Bushman languages of South Africa, and in those adjacent Bantu languages which had borrowed them. It was investigated at a later date by E. Nigmann (1909) and, more scientifically, by Dr. Otto Dempwolff (1916). The only English writer who has treated the subject in any detail is F. J. Bagshawe, Political Officer at Mbulu, who was in close contact with these people from 1917 to 1923.

It has been assumed, though without sufficient reason, that all languages containing clicks must be related to each other, and that there can be no possible relationship between a click-language and one where clicks are absent. That this position, however, is by no means generally accepted, appears from the disputes which have arisen over the question whether the Hottentot and the Bushman groups (neither consisting of a single language) have a common origin, or are entirely distinct. (See AFRICA, Ethnology.)

The three clicks found in Sandawe seem to be identical with three of the Nama clicks—those which have been adopted into Zulu and are represented in the current orthography by *c* (dental), *q* (cerebral or "retroflex") and *ǀ* (lateral). The last-named is not produced in quite the same way as by the Nama, but, as observed by Dr. Dempwolff, the sound is exactly the same. Both Nigmann and Bagshawe have noticed the fact that the Sandawe clicks form a distinct syllable, at any rate in some cases (it is not clear from the latter's account whether the rule is invariable), whereas in Zulu they form an integral part of a syllable, the pronunciation of which constitutes one of the greatest difficulties to a European learner.

The word-stress appears to be extremely variable and is often the only distinction between words of similar form, but different meaning (*e.g.*, *nda* "elephant" and *noá* "claw"). *Intonation* ("tone") is also, as in the Hottentot and Bushman languages, a very important feature: *tsa* with a high tone means "pot," with a low tone "tear." Both these points await fuller investigation.

A large proportion of the Sandawe vocabulary can be correlated with Nama words, and a less amount with other Hamitic languages, such as Tatoga, Iraku and even Somali. But this is an unsatisfactory basis for deducing relationship, otherwise Sandawe might be claimed as a Bantu language, since Dr. Dempwolff gives a longer list of words which can be identified as Bantu (obviously borrowed from Swahili, Gogo, Hehe, Irangi, etc.), than of those which he has traced to Nama. A far more trust-

vorthy criterion is to be found in the grammatical framework of the language and here there is little room for doubt. Sandawe possesses grammatical gender, suffixes to denote the plural, case-endings for nouns (an "instrumental case" is almost identical, both in form and meaning with that found in Nama), and other features in common with Nama and also, to a less extent, with other Hamitic languages. One peculiarity, the use of a different form for a verb in singular and plural (e.g., *tha* "he runs," *giribe* "they run"), is neither Hamitic, Bantu nor Sudanic. The order of words in a simple sentence (subject, object, verb: "the cattle herds," instead of "he herds cattle") and the position of the genitive (possessor preceding the thing possessed: *Humbu tse*, "ox's head," not, as in Bantu, "head of ox") are the same as in Nama, but differ from the normal Hamitic type. In both cases here would appear to be sufficient reasons for the difference.

Professor Alfredo Trombetti is inclined to think that the Sandawe are, of all existing peoples, those most nearly related to the Hottentots.

SANDAY, WILLIAM (1843-1920), English theological scholar, was born at Holme Pierrepont, Notts., on Aug. 1, 1843, the son of William Sanday, sheep and cattle breeder. Educated at Repton and Balliol College, Oxford, he became a scholar of Corpus Christi in 1863. He was a fellow and lecturer at Trinity in 1866, and was ordained in 1867. In 1876 after holding various college livings, he was appointed principal of Hatfield Hall, Durham. In 1882 he was appointed Ireland professor of exegesis at Oxford, and in 1895 Lady Margaret professor of divinity and canon of Christ Church, positions which he held until 1919. He died at Oxford on Sept. 16, 1920. Sanday was one of the pioneers in introducing to English students the mass of work done by Continental scholars in biblical criticism. An example of the admirable work he accomplished in this direction is his *Life of Christ in Recent Research* (1907).

His chief works are *The Authorship and Historical Character of the Fourth Gospel* (1872); *The Gospels in the Second Century* (1876); *The Oracles of God* (1891); *The Early History and Origin of the Doctrine of Biblical Inspiration* (1893); *Commentary on the Epistle to the Romans* (with Dr. Headlam, 1895); *Outlines of the Life of Christ* (1905, a republication of an article in *Hastings' Dictionary of the Bible*); *Christologies, Ancient and Modern* (1910) and *Personality in Christ and in Ourselves* (1911); *Bishop Gore's Challenge to Criticism* (1914); *The New Testament Background* (1918).

SAND-BLAST is a method of cleaning or marking surfaces by the discharge of sand, steel shot or grit through a nozzle at high velocity by means of compressed air. The abrasive action can be effected on internal parts without difficulty. Concisely, the applications of the process may be summarized as follows:—Cleaning sand from castings, with or without a view to painting or enameling, or annealing; cleaning scale from stampings for similar reasons; cleaning partly-finished products, as sheets, tubes, strips, sometimes for subsequent electric or gas welding, or motor-car and cycle parts, etc., and numerous fittings, prior to tinning, galvanizing or plating; cleaning tyre moulds, printers' lithographic sheets, pottery ware after firing, iron and stone buildings and painted or rusty ironwork, hardened tools to enable cracks to be detected; sharpening and dressing files; matting ebonite articles to improve insulation and appearance; frosting, badging and marking glassware of all kinds.

Small apparatus for marking and engraving glass is worked with a hand bellows, but in larger outfits a power-driven compressor is employed. Pressures range from about 15 lb. to 80 lb. per square inch. Fine sand is selected for glass decoration and coarse sand or flint for uses where much is lost through no collecting apparatus being installed. For most metal work chilled round or crushed iron shot is best, as it lasts a much longer time

than sand or flint before going into useless dust. The outfits are constructed in many ways, some having a flexible hose carrying the blast nozzle, and the operator wears a safety breathing helmet and plays the nozzle on the work. Another way is to have a metal cabinet with window through which the operator looks while he turns the object about under the fixed sand jet nozzle; rubber gauntlets are worn, passed through arm holes in the

BY COURTESY OF TILIGHMAN'S PATENT STEAM SAND BLAST CO.

SAND BLAST SHOWING JET DRIVING A STREAM OF SAND AND WATER AGAINST THE TEETH OF A NEWLY-CUT FILE

door. Castings are dealt with on machines, including the tumbling barrel, which constantly turns the castings over to expose all

the surfaces to the action of the jet led through one or both ends. The rotary table cleaner carries the castings past a rubber curtain into a chamber containing one or more jets, and then out again. The reciprocating table design conveys large or long castings through the blast chamber, out to the other side, on which they are turned over and returned through by the table.

In the Mathewson file-sharpening system a stream of fine sand and water (in effect a liquid grindstone) is driven against the teeth by a steam jet. The backs of the teeth are thus ground off; newly-cut files have the burr driven away, much improving the cutting power, and worn files are freshened up practically as new. The sketch shows the apparatus, on which the file is laid and moved to and fro by hand until found to be quite sharp.

SANDBURG, CARL (1878-), American poet, newspaper man, and interpreter of folk-songs, was born at Galesburg (Ill.), Jan. 6, 1878. The son of a poor Scandinavian immigrant, he had a wandering, hard-working youth, with little schooling.

During the Spanish-American War he saw active service in Porto Rico, and there got the inspiration for study at Lombard college, Galesburg. As magazine and newspaper writer, and editor of varied experience, and as secretary to the mayor of Milwaukee

(1910-12), Sandburg had ample opportunity to acquire the sympathy with the underlings of modern civilization and the knowledge of its ironic contrasts that distinguish his verse. His bludgeon-like phrases alternating with lovely, singing lines, his vivid etchings of the unbroken prairie and the fretted sky-lines of the industrial cities, together with his unaffected humanitarianism, won him several prizes for his verse, which includes *Chicago Poems* (1915), *Corn Huskers* (1918), *Smoke and Steel* (1920), *Slabs of the Sunburnt West* (1922), and *Good Morning, America* (1928). *Rootabaga Stories* (1922) was a favourite with children, but it was *Abraham Lincoln—the Prairie Years* (1926), *Abe Lincoln Grows Up* (1928)—that revealed Sandburg as a prose writer.

See Harry Hansen, *Carl Sandburg, the Man and His Poetry* (Girard, Kan. 1925: "Little Blue Books," No. 814) with bibl.

SAND-EEL, or SAND-LANCE. The fishes known under these names form a small family (*Ammodytidae*). Their body is of an elongate-cylindrical shape, with the head terminating in a long conical snout, the projecting lower jaw forming the pointed end. A low dorsal fin occupies nearly the whole length of the back, and a long anal commences immediately behind the vent, which is placed about midway between the head and caudal fin. The tail is forked and the pectorals are short. The absence of ventral fins indicates the burrowing habits of these fishes. In the Japanese *Bleekeria* small jugular ventral fins are present. The scales, when present, are small; but generally the development of scales has only proceeded to the formation of oblique folds of the integu-

ment. The dentition is quite rudimentary.

Sand-eels are small littoral marine fishes, only one species attaining a length of 18 in. (*Ammodytes lanceolatus*). They live in shoals at various depths on a sandy bottom, and bury themselves in the sand on the slightest alarm. Sand-eels destroy a great quantity of fry and other small creatures, such as the lancelet (*Amphioxus*), which lives in similar localities. They are excellent eating, and are much sought after for bait. The eggs of sand-eels are small, heavier than sea-water and slightly adhesive; they are scattered among the grains of sand in which the fishes live.

Sand-eels are common in the north Atlantic; a species scarcely distinct from the European common sand-lance occurs on the Pacific side of North America, another on the east coast of South Africa. On the British coast three species are found.

SANDEFJORD, the oldest and most famous spa in Norway, on the coast, 86 mi. S.S.W. of Oslo by the Skien railway. Pop. (1930) 5,930. The springs are sulphurous, saline and chalybeate. Specimens of *jaettegryder* or giant's cauldrons may be seen at Gaardaasen and Vindalsbugt, some upwards of 23 ft. in depth.

SANDEMAM, SIR ROBERT GROVES (1835-1892), Indian officer and administrator, was the son of General Robert Turnbull Sandeman, and was born on Feb. 25, 1835. He was educated at Perth and St. Andrews University, and joined the 33rd Bengal Infantry in 1856. In 1857, he took part in the final capture of Lucknow as adjutant of the 11th Bengal Lancers. After the suppression of the Mutiny he was appointed to the Punjab Commission by Sir John Lawrence. In 1866 he was appointed district officer of Dera Ghazi Khan, and there first showed his capacity in dealing with the Baluch tribes. He was the first to break through the close-border system of Lord Lawrence, by extending British influence to the independent tribes beyond the border. In his hands this policy worked admirably, owing to his tact in managing the tribesmen and his genius for control. In 1876 he negotiated the treaty with the khan of Kalat, which subsequently governed the relations between Kalat and the Indian government; and in 1877 he was made agent to the governor-general in Baluchistan, an office with he held till his death. During the second Afghan War in 1878 his influence over the tribesmen was of the utmost importance, since it enabled him to keep intact the line of communications with Kandahar, and to control the tribes after the British disaster at Maiwand. For these services he was made K.C.S.I. in 1879. In 1889 he occupied the Zhob valley, a strategic advantage which opened the Gomal Pass through the Waziri country to caravan traffic. He died at Bela, the capital of Las Bela state, on Jan. 29, 1892.

See T. H. Thornton, *Sir Robert Sandeman* (1895); and R. I. Bruce, *The Forward Policy* (1900).

SANDERS, NICHOLAS (c. 1530-1581), Roman Catholic agent and historian, born about 1530 at Charlwood, Surrey, was a son of William Sanders, once sheriff of Surrey, who was descended from the Sanders of Sanderstead. Educated at Winchester and New College, Oxford, he was elected fellow in 1548 and graduated B.C.L. in 1551. Soon after Elizabeth's accession he went to Rome where he was befriended by Pole's confidant, Cardinal Morone; he also owed much to the generosity of Sir Francis Englefield (*q.v.*). He was ordained priest at Rome, and was, even before the end of 1550, mentioned as a likely candidate for the cardinal's hat. For the next few years he was employed by Cardinal Hosius, the learned Polish prelate, in his efforts to check the spread of heresy in Poland, Lithuania and Prussia. In 1565, like many other English exiles, he made his headquarters at Louvain, and after a visit to the Imperial Diet at Augsburg in 1566, he threw himself into the literary controversy between Bishop Jewel (*q.v.*) and Harding.

His expectations of the cardinalate were disappointed by Pius V.'s death in 1572, and Sanders spent the next few years at Madrid trying to embroil Philip II., who gave him a pension of 300 ducats, in open war with Elizabeth. Sanders found his opportunity in 1579, when a force of Spaniards and Italians was despatched to Smerwick to assist James Fitzmaurice and his Geraldines in stirring up an Irish rebellion. The Spaniards were, however, annihilated by Lord Grey in 1580, and after nearly two

years of wandering in Irish woods and bogs Sanders died of cold and starvation in the spring of 1581.

The writings of Sanders have been the basis of all Roman Catholic histories of the English Reformation. The most important was his *De Origine ac Progressu schismatis Anglicani*, which was continued after 1558 by Edward Rishton, and printed at Cologne in 1585; it has been often re-edited and translated, the best English edition being that by David Lewis (London, 1877).

See Lewis's *Introduction* (1877); *Calendars of Irish, Foreign and Spanish State Papers, and of the Carew MSS*; Knox's *Letters of Cardinal Allen*; T. F. Kirby's *Winchester Scholars*; R. Bagwell's *Ireland under the Tudors*; A. O. Meyer's *England und die katholische Kirche unter Königin Elisabeth* (1910); the *Catholic Encyclopaedia*; and T. G. Law in *Dict. Nat. Biogr.* i. 259-261 with bibl.

SANDFLY FEVER. "Sandfly" or "phlebotomous fever" is an acute specific fever, common in tropical and sub-tropical countries. It is caused by a virus, possibly a leptospira, conveyed to man by the bite of a small midge of the dipterous family, Psychodidae. The incubation period is about five days.

Symptoms and Treatment.—The fever is sudden in onset, and of short duration, accompanied by severe headache and pains in the limbs. The attack starts with a general feeling of depression and loss of appetite, soon followed by weakness of the legs, and pains and tenderness in the muscles, especially those of calves and back of neck. The temperature rises rapidly to 102 to 104° Fahrenheit. There is flushing and fulness of face and eyes as though some constriction were being applied around the neck. The bloodshot eye is typical and in some countries has led to the disease being called "dog disease" (Hundfieber). Frontal headache and pains in the eyes and leg muscles are usually severe. The pulse is relatively slow throughout. There may be vomiting and diarrhoea. Rashes are uncommon and are not to be confused with insect bites. A blood examination shows a marked decrease in the number of white blood corpuscles. The temperature usually falls to the normal level within four days, although one- to seven-day types of fever are to be seen. Recovery is slow, depression and other nervous symptoms may persist for weeks or months.

As regards treatment, the sooner the patient takes to bed the less severe are the pains likely to be. The bowels should be moved by means of calomel, followed by salts. Then the aches and pains may be relieved by the administration of 10 grains of aspirin every four hours, or by half a teaspoonful of liquid extract of opium. Quinine is useless. Hot tea is very soothing for the pains, especially during the night. It is advisable to surround fever cases with a sandfly net to lessen the chance of the infection spreading. Tonics and a change of climate may be necessary during convalescence.

Etiology.—While the nature of the causal organism is uncertain, *Phlebotomus papatasi* is the proven carrier of the disease.

Sandfly fever is liable to occur wherever the *P. papatasi* can breed, *i.e.*, where for eight consecutive weeks the mean daily temperature lies between 65° and 90° Fahrenheit.

Epidemics of the fever depend on the number of infected *Phlebotomus*, and the number of susceptible people. Other conditions, such as temperature, humidity, winds and reaction of soil, may modify the prime factors.

Doerr in 1909 and Birt in 1910 showed that, in sandfly fever, the blood of man is infective by direct transmission to other men only in the first day of disease. Kilroy in 1909 infected himself by *Phlebotomus* bites, and, by inoculation of his blood transmitted the disease to a non-immune subject. Birt in 1910 showed that the virus could pass through a very fine filter. In 1921 Couvy reported that spirochaetes had been seen in cases of dengue in Beirut. In the same year the Royal Air Force Sandfly Commission isolated a leptospira in six cases of so-called sandfly fever in Malta, while in 1922, Vervoort and Van de Velde, working in the Dutch East Indies, found leptospira in cases of fever resembling phlebotomous fever. However, the correct diagnosis of some of these cases was doubtful, and until further transmission experiments have been carried out this organism cannot be accepted as the causal virus.

Doerr and Birt in 1910 claimed that *P. papatasi* which had fed on cases of sandfly fever were capable of transmitting the disease,

but only seven to ten days after sucking virulent blood.

During the years 1907 to 1922, parts of the bionomics of the sandfly had been worked out, but its life history was not fully elucidated.

The R.A.F. Sandfly Commission, working in Malta and London during 1921, 1922 and 1923, bred the sandfly in captivity and extensively studied the bionomics of this insect. The fever was transmitted to man by the bites of *Phlebotomus* bred in captivity in London, showing that these flies were the true carriers of the disease. Further experiments showed that the infection was handed on from generation to generation of sandflies in its breeding grounds, by the grub feeding on the excreta and dead remains of the parent flies.

Phlebotomus papatasi is a small midge measuring about 3mm. in length, of a very delicate build and thickly covered with fine, long hairs. The body is of a pale lemon tint and shows the morphological characters common to its genus. Eyes are relatively large, black and conspicuous. The antennae are long and filamentous. The proboscis is long and prominent. The fine wings are lancet-shaped, covered with hairs and held erect, except when newly hatched and shortly before death. The female fly has a spindle-shaped abdomen.

The life-history of this fly covers a period of about eight weeks, the exact time depending on food supply, temperature and humidity. The egg stage occupies about 9 days; the grub stage about 28 days; and the chrysalis stage about 10 days, ending in the emergence of the adult fly. The wings of the newly hatched fly are crumpled and moist. Until these are dry the young fly can only crawl. The recognition of this stage is most helpful in detecting breeding spots of the insect. During the night, when the atmospheric humidity is usually great, the wings cannot dry. The process of drying is usually completed within three hours after dawn, and the mouth parts are sufficiently hardened to allow of the sucking of blood during the first 24 hours of adult life. Copulation can take place within the next 24 hours, and eggs to the number of 40 are laid 6 to 10 days later. The length of life of the adult female fly in nature is about two weeks, though in the laboratory life may be prolonged for 30 days.

Only the female *Phlebotomus* bites. A feed of blood is essential for the eggs to become fertilised. The insect usually bites after sunset. Man is bitten wherever the skin is exposed. The sandfly progresses by a short hopping flight usually to one side. The distance of a single flight is never more than four yd., and it does not travel more than 50yd. from its breeding haunts. It is attracted by the odours of man and other animals, and enters buildings by apertures in the walls, windows, doorways, ventilators or cracks. The flight of the *Phlebotomus* is so feeble that it avoids all currents of air, natural or artificial. Upstairs rooms, which are more exposed to air currents, are less infected than those on the ground-floor. In nature the grub and chrysalis forms are found in the cracks in embankments, in the loose earth at the base of walls and buildings, in cultivated soil and in other places where suitable conditions of food, moisture and temperature exist. The grubs are found even to a depth of a foot or more in loose soil, and can migrate to the level of optimum environment. Hibernation takes place in the last grub stage, a very resistant stage. When ready to pass into the chrysalis form, they seek a drier spot, usually within a few inches of the surface of the ground. Excess of moisture is injurious to all stages of the life of this insect.

About 80% of newcomers to sandfly regions suffer from the fever during their first summer of residence, and about 15% develop a second attack within three years. Such factors as atmospheric temperature and humidity affect the development of the virus in man.

Prevention.—It is necessary to eliminate the hiding and breeding places of the fly. Cracks in the ground or in masonry must be got rid of by levelling, pointing, etc. Premises must be thoroughly cleansed, and dust and cobwebs removed. Good refuse disposal is essential. The sandfly must be kept away by sandfly proof nets (45 meshes to the square inch), electric fans or repellants, such as paraffin or camphor; whilst insects living

in corners of rooms must be destroyed by swatting with a damp cloth or spraying with 1% cresol. There must be a daily war against this pest. All the necessary repairs, tarring, painting and lime-washing must be carried out immediately before the warm weather sets in. Each year the interior of all rooms should be washed down and painted or lime-washed.

SANDFORD, JOHN DE (d. 1294), archbishop of Dublin, was probably an illegitimate son of the baronial leader, Gilbert Basset (d. 1241), or of his brother Fulk Basset, bishop of London from 1241 until his death in 1259. John first appears as an official of Henry III. in Ireland and of Edward I. in both England and Ireland; he was appointed dean of St. Patrick's, Dublin, in 1275. In 1284 he was chosen archbishop of Dublin in succession to John of Darlington; some, however, objected to this choice and Sandford resigned his claim; but was elected a second time while he was in Rome, and returning to Ireland was allowed to take up the office. In 1288, during a time of great confusion, the archbishop acted as governor of Ireland. In 1290 he resigned and returned to England. Sandford served Edward I. in the great case over the succession to the Scottish throne in 1292 and also as an envoy to the German king, Adolph of Nassau, and the princes of the Empire. On his return from Germany he died at Yarmouth on Oct. 2, 1294.

Sandford's elder brother, Fulk (d. 1271), was also archbishop of Dublin (1256-71). He is called Fulk de Sandford and also Fulk Basset owing to his relationship to the Bassets.

SANDGATE, a watering-place of Kent, England, on the S.E. coast, 1½ mi. W. of Folkestone. on the S. railway. In 1894 it was created an urban district, but this was abolished in 1934, and the town was transferred to Folkestone and Hythe. The population of the parish was 3,039 in 1931. Sandgate castle was built by Henry VIII in 1539 but on the formation of a camp here in 1806 it was so changed as to be more like a Martello tower. The camp of Shorncliffe lies on the heights north of the town.

SAND-GROUSE, the name applied to birds resembling grouse (*q.v.*) in certain features and inhabiting sandy tracts. They comprise the family *Pteroclididae* of the plover order. The commonest form is Pallas's sand-grouse (*Syrhaptes paradoxus*), inhabiting central Asia and occasionally invading Europe in large flocks. The nest is on the ground and contains four inconspicuous eggs. The wings are very long. The birds' plumage is adapted to the colour of the desert. Sand-grouse supply their young with water by soaking the breast feathers in water, which the little birds drink (see P. A. Buxton, *Animal Life in Deserts*). Fossil species occur in the Miocene formation.

SANDHURST, a town in the Wolringham parliamentary division of Berkshire, England, 9m. N. of Aldershot. Pop. 3,799 (1921). Two miles south-east of the town, near the villages of Camberley Town and York Town, and the railway stations of Blackwater and Camberley on the Southern Railway, is the Sandhurst Royal Military College. The college, now at Sandhurst, was established by Royal warrant in March 1802 in a house at Great Marlow. Near Sandhurst is Wellington college, one of the principal modern public schools of England, founded in memory of the great duke of Wellington, and incorporated in 1853.

Since 1877 the course at Sandhurst has varied from one year to two, except during the World War, when it was reduced for a short while to 4 months in order to increase the output. During the war 4,000 cadets were passed through the R.M.C. and at one time the numbers rose to 1,000. After the war subjects of general educational value were re-introduced into the curriculum and the length of the course became eighteen months. The college stands in beautiful grounds, with a large lake and ample space for games. The college is within 10 miles of Aldershot and is thus suitably placed for keeping in touch with military training. The roll of cadets includes Lord Roberts (1847), Lord Allenby (1881)

and Lord Haig (1884). At the R.M.C. cadets are trained for commissions in the cavalry, infantry, royal tank corps, royal army service corps of the British service and for the Indian army. Occasionally, when vacancies are available, special candidates are admitted to the royal corps of signals. Since 1922 a number of vacancies at the college have been specially reserved for selected N.C.Os. of the regular army recommended to be trained for commissions.

A few New Zealand cadets are trained for service in their own army. A limited number of Indians also undergo training for service in the Indian army and from time to time a few specially selected Egyptian, Siamese and Iraqi cadets are permitted to attend the course of instruction. The course consists of three terms, of which there are two a year (Feb. 1 to mid-July, and from Sept. 1 to Christmas). Cadets enter each half-year in batches of 150 to 200, at the age of 18-19 and after passing a competitive entrance examination. The army entrance examination is conducted by the Civil Service commission. With the exception of certain candidates nominated by the army council, candidates are required to possess a school certificate before being permitted to sit for the army entrance examination. The cadets are organized in four companies on the lines of an infantry battalion. The staff of the college includes a commandant, a company commander for each company, company officers for each platoon and officers of the army educational corps. These latter are especially responsible for instruction in non-military subjects, viz. constitutional history, European history, geography (obligatory), chemistry, mechanics, political and economic history, languages, electricity (alternative, 1 subject to be chosen by each cadet). The military and obligatory part of the course includes conduct of war, strategy, tactics and organization—illustrated from military history—map reading, military law, drill, riding and physical training.

At the end of the course commissions are allotted in various branches of the service according to existing vacancies, choice of promotion usually being given to those high up in the order of passing out. The normal fee is £100 a term and in addition certain charges are made for uniform, books, etc. The sons of officers of H.M. forces are, subject to certain conditions, admitted at a reduced normal rate of £60 a term. A limited number of cadets are admitted at reduced rates on account of pecuniary need at the discretion of the army council. A certain number of scholarships are available for cadets on entering the college (awarded on results of army entrance examination), and other scholarships are available for cadets during their course, and for young officers during the first five years of their service. The conditions of admission and fees, etc., vary from time to time, and information with regard to possible changes should be sought from the war office. (See also OFFICERS.) In the vicinity of Wellington college is Broadmoor prison for criminal lunatics.

SAN DIEGO, a city of California, U.S.A., on the Pacific ocean, 10 mi. from the Mexican border; a port of entry, the county seat of San Diego county, and the site of extensive activities of the United States army and navy. It is the terminus of the Pacific Coast highway and of the several transcontinental highways from the Atlantic coast which proceed westward from El Paso over practically the same route, and is served by the San Diego and Arizona Eastern (of the Southern Pacific lines) and Santa Fe railways, motorbus lines, and many coastal, intercoastal and foreign steamship lines. A municipal airport (Lindbergh field) of 413 ac., to accommodate both sea and land planes, is on the bay, within five minutes' drive of the business section of the city; and there are several commercial and governmental aviation fields. Pop. (1930) 147,995; (1940) 203,341, 95% native white; estimated (1941) 300,000 due to national defence expansion.

The city has a land area of 95.3 sq.mi. around the bay, and extending back 10.5 mi. at the extreme width. The climate is equable, with an average annual mean temperature of 61° F and an average annual precipitation (nearly all falling in the winter) of 10 inches. San Diego bay is a crescent-shaped basin 14 mi. long, separated from the ocean by a low, narrow sandspit extending west from the mainland below the city and expanding at its western end into two peninsulas, one of which is occupied by the city

of Coronado, directly opposite San Diego, the other (North Island) by U.S. navy aviation bases. The business district of the city has, in recent years, assumed a metropolitan appearance, with many tall and massive stores, office buildings and hotels. The residential section is built around Balboa park (1,400 ac.), the site of the Panama-California exposition of 1915-16, and of the 1935-36 California Pacific International exposition. It contains an archaeological institute with valuable exhibits of ancient American art, architecture and anthropology; a replica of a Pueblo Indian village, constructed for the exposition and now used by the Boy Scouts; zoological and botanical gardens; a natural history museum; a pavilion with a great outdoor organ on which recitals are given throughout the year; and a stadium seating 30,000, occupying a natural amphitheatre. At La Jolla, on the ocean 15 mi. N.N.W., is the Scripps Institution of Oceanography (affiliated with the University of California), the only institution of its kind in the west. Since 1931 the city has operated under a city-manager form of government. The assessed valuation of property in 1940 was \$150,000,000.

Long recognized as one of the country's finest vacation centres, San Diego boasts a wealth of recreational opportunities. Water sports, including speedboating, aquaplaning, yachting, swimming and rowing, may be enjoyed on its bays, harbour and beaches, while on land the entire gamut of sporting activities are available to resident and tourist alike. In near-by mountain ranges, winter sports including skiing and sledding are available in season, and desert expanses close by are popular for their scenic beauty. Two famous race tracks, the Del Mar Turf club and the Agua Caliente track, provide horse-racing fans enjoyment the year around. The city is the home of many flying and gliding clubs, and deep-sea fishermen find San Diego waters unsurpassed anywhere on the Pacific coast for game fishing. Lakes in the back country provide ample fresh-water fishing opportunities.

The roomy natural harbour (landlocked, free from currents and accessible at all seasons) is the first U.S. port of call for vessels operating through the Panama Canal. It has an area of 21 sq.mi. A channel 2,000 ft. wide, with a controlling depth of 40 ft. at mean low water, has been provided by government and municipal improvements begun in 1875. Terminal facilities include 41 wharves, two of which are large municipal piers, and 21,510 ft. of berthing space, excluding government-owned wharves. Since 1911, when the tidelands were ceded to the city by the state, about \$15,000,000 has been spent in improvements. The cargo handled in 1940 amounted to 658,978 tons, valued at \$30,037,396, and represented largely domestic commerce. Aviation is San Diego's largest, most important industry, employing approximately 35,000 workers (1941). Consolidated Aircraft, manufacturing flying boats and huge land bombers, is the largest integrated aircraft plant in the world (1941); Ryan, Solar and Rohr Aircraft are other important factories. The weekly aircraft pay roll is estimated at \$62 5,000 (1941). Fisheries are also important industries, employing about 1,500 fishermen and 1,900 cannery workers. About 107,587,893 lb. of fish entered the port in 1939, and value of the pack was \$10,759,689. More than 500 industrial and manufacturing plants produced products valued at about \$156,000,000 (1940). Total pay roll in San Diego, including civilian, military and governmental workers, approximated \$155,000,000 (1940). The manufactured products are diversified, the most important being aircraft, canned fish, kelp products, boats, parachutes, building materials and canned fruits and vegetables.

San Diego is the headquarters for the Eleventh Naval district, with a personnel of about 32,000 officers and men, and the site of the largest naval operating base on the Pacific coast, embracing a naval air station, marine base, fuel depot, supply depot, destroyer base, radio stations, submarine base, hospital and training station. Ft. Rosecrans is an important military post; Camp Callan at Torrey Pines, is an army cantonment for training selectees, capacity approximately 10,000 (1941); Camp Morcna, at Campo, is the site of a cavalry-training base, personnel capacity 2,000 (1941). In addition to the aviation activities of the army and navy (in progress there since 1917), there are 16 commercial aviation firms of importance, manufacturing planes, motors and parachutes; conducting training schools; and operating passenger and freight services. Many world

records in aviation have been established by the army and navy at an Diego; and it has been the scene of such feats as the taking of the first photographs from the air (1911), the first night flying, the first refueling in flight, and the first seaplane flight in the world.

San Diego bay was discovered in 1542 by the Portuguese navigator Cabrillo, in the service of Spain, and was named in 1602 by the Spanish explorer Viscaïno. At Old Town, in North San Diego, the first European settlement in Upper California was made in 1769. On July 6 Father Junipero Serra founded the mission of San Diego de Alcalá (the first of the 21 Franciscan missions in the state) and a little later a military presidio was established. The mission was moved in 1774 to a site 8 mi. from the centre of the present city, where it still stands in fair preservation. San Diego began the revolt against Governor Victoria in 1831, but in 1836 was intensely loyal to Mexican authority. In opposition to Governor Alvarado and the northern towns. It was made a port of entry in 1828, and in 1840 had a population of 140. On July, 1846, it was occupied by American forces under Gen. Frémont, who raised the first American flag to fly in California. In 1850 it was incorporated as a city, but as it did not grow it lost its charter in 1852. In 1867 there were only a dozen inhabitants. Then the pioneer builder, A. E. Horton (d. 1909), laid out a new city 3 mi. below the old site. By 1870 it had a population of 2,300, and in that year the military reservation was established on Point Loma. In 1871 work started on the Santa Fe railroad; in 1872 the new city was incorporated; in 1874 it was made a port of entry. The boom was ended by the depression of 1873-76, but development was resumed when the railroad reached the city in 1884. By 1890 the population had grown to 16,159. In the following decade the increase again was light, but between 1900 and 1910 it amounted to 124%, between 1910 and 1920 to 89%, from 1920 to 1930, 99%, and 1930 to 1940, 7.4%.

In the decade 1930-40 new buildings for which permits were issued represented an aggregate value of \$72,849,444. Bank debits totalled \$688,713,706 (1940). During the first quarter of 1941 building permits exceeded \$27,000,000.

SAND LILY (*Leucocrinum montanum*), a North American plant of the lily family (Liliaceae, *q.v.*), native to plains and mountain valleys from South Dakota and Nebraska west to the Pacific coast. It is a small stemless perennial with long, narrow, grass-like leaves tufted on a short rootstock from which rise also the nearly stalkless, pure white, fragrant, slender-tubed, lily-like flowers, about 2 in. long and ½ in. across. The sand lily, often called star lily, is a conspicuous early spring flower in many parts of its range. See SOAP PLANTS.

SANDOMIERZ, a small town of Poland in the province of Kielce, 140 m. S.S.E. of Warsaw by river and on the left bank of the Vistula, opposite the confluence of the San. It is one of the oldest towns of Poland, being mentioned as early as 1079; from 1139 to 1332 it was the chief town of the principality of the same name. In 1240, and in 1259, it was burned by the Mongols. In 1429 it was the seat of a congress for the establishment of peace with Lithuania, and in 1570 the "Consensus Sandomiriensis" was held here for uniting the Lutherans, Calvinists and Moravian Brethren. Subsequent wars, and especially the Swedish (*e.g.*, in 1655) ruined the town. Here in 1702 the Polish supporters of Augustus of Saxony banded together against Charles XII. of Sweden. The beautiful cathedral was built between 1120 and 1191; it was rebuilt in stone in 1360, and is one of the oldest monuments of Polish architecture. Two of the churches are fine relics of the 13th century. The castle, built by Casimir III. (14th century), still exists. The city gives title to an episcopal see (Roman Catholic). It was occupied by Germany in 1939.

SANDOWAY, a town and district in the Arakan division of Burma. The town (pop. 1931, 4,070) is a very ancient one and is said to have been at one time the capital of Arakan. The district has an area of 4,157 sq.m.; pop. (1931) 129,245, showing an increase of 17,216 in the decade. The country is mountainous, the Arakan range sending out spurs which reach the coast. Some of the peaks in the north attain 4,000 and more ft. The chief pass is the Taungup pass crossed by a bullock cart track leading from the village of Taungup to Prome on the Irrawaddy. The streams are only mountain torrents to within a few miles of the coast; the mouth of the Khwa forms a good anchorage for vessels of from 9 to 10 ft. draught. The hills are clad with evergreen forest or useless bamboo brake on their lower slopes; by evergreen oak forests on the higher parts. Only small areas of the district are available for cultivation and except for a few acres of tobacco nearly all the cultivation is rice. Sandoway was ceded to the British,

with the rest of Arakan (*q.v.*) by the treaty of Yandabo in 1826.

SANDOWN, watering-place, forming with Shanklin, an urban district, Isle of Wight, England, 6½ mi. S. of Ryde by rail. Pop. (1931) 6,302. It is on the S.-E. coast of the island, with a wide sandy shore. Pop., urban district (est. 1938) 10,930. Area 5.5 sq.mi.

SAND-PAPER, an abrasive material prepared by coating stout paper with glue and sifting Ene sand over its surface before the glue sets. Sand-cloth is prepared in the same way. It is widely used for smoothing the surface of wood, for rubbing down paint, and other purposes. (See also EMERY; GLASS-PAPER.)

SANDPIPER, the name given to all of the smaller limicoline birds which are not plovers (*q.v.*), snipe (*q.v.*), or phalaropes (*q.v.*). The greenshank (*q.v.*) and the redshank (*q.v.*) are also related to the common sandpiper or summer-snipe (*Tringa hypoleucis*). This little bird is a summer visitor to northern Europe and Asia. In the British Isles it arrives in May. It frequents clear streams, beside which it nests, on the ground. There are four eggs, protectively coloured, as is also the case with the young. It winters in India, Australia, and the Cape. In America it is replaced by *Actitis macularia*, the peewee or spotted sandpiper having similar habits. The green sandpiper (*T. ochropus*) is unique among the group, except for the North American solitary sandpiper (*Calidris solitarius*), in using the old nests of other birds wherein to lay her eggs. Another European species is the wood sandpiper (*T. glareola*), like the last, very dark in colour.

Other forms include the knot (*q.v.*), the dunlin (*q.v.*), the sanderling (*Calidris arenaria*), which lacks the hind toe, the purple sandpiper (*C. striata*) and the little, Temminck's, and American stints (*T. minuta*, *T. temmincki* and *Pisobia minutilla*). The American stint, often called the least sandpiper, is darker and ranges from the Arctic to Brazil. Bonaparte's sandpiper (*P. fuscicollis*) distinguished by its white tail-coverts, is a common American form. It is called the white-rumped sandpiper.

The semipalmated sandpiper (*Ereunetes pusillus*) has partially webbed feet; it is a small form, breeding in arctic America. The buff-breasted sandpiper (*Tryzvgites subruficollis*) is common in the Mississippi valley in autumn and breeds in Alaska and Keewatin, wintering in Argentine and Uruguay.

SANDRINGHAM, a village in Norfolk, England, 3 mi. from the Wash, and 24 from Wolferton on the L.N.E.R. Pop. (1931) 648. Sandringham House, a country seat of the king, was acquired by King Edward VII by purchase in 1863. The estate, of 15,578 ac., includes a park of 200 acres. The church of St. Mary Magdalene contains many memorials of the royal family.

SAND SPRINGS, a city of Tulsa county, Oklahoma, U.S.A., on the Arkansas river and federal highway 64, 8 mi. west of Tulsa; served by the Missouri-Kansas-Texas and the Sand Springs railways. The population was 4,076 in 1920 (89% native white) and was 6,137 in 1940 by the federal census. It has important manufacturing industries, especially glass works, cotton mills, chemical plants, smelters and oil refineries. The town was founded in 1911 and in 1918 it was chartered as a city.

SANDSTONE is a consolidated rock built up dominantly of grains of sand (*q.v.*) held together by a cementing substance. Sandstones are composed mainly of quartz, but may vary in composition in the same manner as sands. By increase in the size of their constituents they pass into conglomerates (*q.v.*) and by decrease into arenaceous shales and clay rocks. When the grains of sand are angular, the rock is termed a grit.

The minerals of sandstones are the same as those of sands. Quartz is the commonest; with it often occurs a certain amount of felspar (as in the rock arkose) and frequently white mica. The flakes of mica may often be seen lying on the bedding-planes and may give the sandstone a fissile character (*e.g.*, paving-stone) of much value in quarrying. The cementing material is often fine chalcedonic silica, or it may be secondary quartz, when a quartzite-like rock is produced. Calcareous material (calcite), glauconite, iron oxides, carbonaceous matter and other substances also act as cements and give the sandstones characteristic colours. Glauconitic sandstones are greenish, ferruginous sandstones, red, brown and yellow or grey. When the cementing substance is clay, the rock is often of white or grey colour and firmly compacted.

Pure sandstones may contain as much as 99% of silica. If relatively soft they are crushed to sand for commercial purposes. If firmly cemented they are utilized, on account of the resistance of silica to heat, for the manufacture of silica-bricks, furnace-linings; hearths, etc. Of this character is the well-known rock "ganister" worked in the districts of Sheffield, South Wales, etc. Less pure, but firmly-cemented siliceous sandstones are used for the making of grindstones and millstones. Similar rocks, as well as calcareous, dolomitic (see DOLOMITE) and ferruginous sandstones are extensively worked as building-stones, mostly by quarries but sometimes by mines. As sandstones are always porous, they do not take a good polish, and are not used as ornamental stones, but this property makes them valuable storage-basins and sources of water (e.g., the Trias of the Midlands). (P. G. H. B.)

SANDUSKY, a city of northern Ohio, U.S.A., a port of entry and the county seat of Erie county; on Sandusky bay (an arm of Lake Erie), 56 m. W. by S. of Cleveland. It is served by the Baltimore and Ohio, the Big Four, the New York Central, the Nickel Plate and the Pennsylvania railways and by lake steamers. Pop. 1940 by federal census. 24 874 (96% native white). It has an extensive lake trade, the largest fresh-water fishing industry in the country and many diversified manufacturing industries. The traffic of the harbour in 1940 was 10,168,452 tons, valued at \$40,-852,927, of which \$6,287,964 was foreign commerce (largely exports of coal). The aggregate factory output in 1940 was valued at \$22,654,861. Among the leading industries are the manufacture of crayons, radios, steel foundry products, paper-shipping cases and packing material. The city is built on a fine limestone ledge, and there are extensive deposits of marl, sand, gravel and clay in the vicinity. Just south of Sandusky is the Ohio Soldiers and Sailors Home. From Put-in-Bay (an island about 12 m. N.W. of Sandusky) Commodore Perry and his fleet sailed out on the morning of Sept. 10, 1813, for the Battle of Lake Erie. English traders visited the site of Sandusky as early as 1749, and by 1763 a fort had been erected, which was burned by the Wyandot Indians on May 16 of that year, during the P'ontiac rising. Permanent settlement began in 1817, and in 1845 Sandusky was chartered as a city. Since 1916 it has had a commission-manager form of government.

SAND VERBENA (*Abronia*), a large genus of plants of the four-o'clock family (Nyctaginaceae), allied to the *Mirabilis* of the gardens, comprising about 50 species, native chiefly to dry sandy soils in western North America. They are low, often prostrate annuals or biennials, with opposite, entire, thick, sometimes viscid leaves; showy, red, yellow or white, usually fragrant flowers, clustered in stalked heads encircled at the base by bracts, and a broadly-winged fruiting achene enclosing a single shining seed. The white sand-verbena (*A. fragrans*), with very numerous fragrant flowers, occurs from Iowa to Idaho and south to Texas and Mexico. The yellow sand-verbena (*A. latifolia*) and the pink sand-verbena (*A. umbellata*), found along the seashore from southern California to British Columbia, are grown as ornamentals in borders and rockeries. Various species bloom in immense profusion in deserts during the short rainy season.

SANDWICH, EDWARD MONTAGU or **MONTAGU**, 1ST EARL OF (1625-1672), English admiral, born on July 27, 1625, was a son of Sir Sidney Montagu (d. 1644) of Hinchinbrook, who was a brother of Henry Montagu, 1st earl of Manchester, and of Edward Montagu, 1st Lord Montagu of Boughton. He joined the parliamentary party at the outbreak of the Civil War. In 1643 he raised a regiment, with which he fought at Marston Moor, Naseby and at the siege of Bristol. Though one of Cromwell's intimate friends, he took little part in public affairs until 1653, when he was appointed a member of the council of state. In 1656 he was made a general-at-sea, his colleague being Robert Blake. Having taken some part in the operations against Dunkirk in 1657, he was chosen a member of Cromwell's House of Lords, and in 1659 he was sent by Richard Cromwell with a fleet to arrange a peace between Sweden and Denmark. After the fall of Richard he resigned his command and assisted in the restoration of Charles II. Again general-at-sea early in 1660, Montagu carried the fleet over to the side of the

exiled king, and was entrusted with the duty of fetching Charles from Holland. He was then made a knight of the Garter, and in July 1660 was created earl of Sandwich.

During the war with the Dutch in 1664-1665 Sandwich commanded a squadron under the duke of York and distinguished himself in the battle off Lowestoft on the 3rd of June 1665. When the duke retired later in the same year he became commander-in-chief. Trouble arose over certain valuable Dutch prizes which he had taken, and Sandwich was dismissed from his command, but as a solatium was sent to Madrid as ambassador extraordinary. He arranged a treaty with Spain, and in 1670 was appointed president of the council of trade and plantations. When the war with the Dutch was renewed in 1672 Sandwich again commanded a squadron under the duke of York, and during the fight in Southwold Bay on May 28, 1672, his ship, the "Royal George," after having taken a conspicuous part in the action, was set on fire and was blown up. The earl's body was found some days later and was buried in Westminster Abbey.

Lord Sandwich claimed to have a certain knowledge of science, and his translation of a Spanish work on the *Art of Metals* appeared in 1674. Many of his letters and papers are in the British Museum, the Bodleian Library at Oxford, and in the possession of the present earl of Sandwich. He is mentioned very frequently in the *Diary* of his kinsman, Samuel Pepys. See also J. Charnock, *Biographia Navalis*, vol. i. (1794); John Campbell, *Lives of the British Admirals*, vol. ii. (1779); and R. Southey, *Lives of the British Admirals*, vol. v. (1840).

SANDWICH, JOHN MONTAGU, 4TH EARL OF. (1718-1792), was born on Nov. 3, 1718, and succeeded his grandfather, Edward, the 3rd earl, in the earldom in 1729. Educated at Eton and at Trinity College, Cambridge, he spent some time in travelling, and on his return to England in 1739 he took his seat in the House of Lords as a follower of the duke of Bedford. He was a commissioner of the admiralty, plenipotentiary to the congress at Breda (1746), first lord of the admiralty (1748), and in 1753 a principal secretary of State. He took a leading part in the prosecution of John Wilkes. He had been associated with Wilkes in the notorious fraternity of Medmenham, and his attitude now in turning against the former companion of his pleasures made him very unpopular, and, from a line in the Beggar's Opera, he was known henceforward as "Jemmy Twitchee." He was postmaster-general in 1768, secretary of State in 1770, and again first lord of the admiralty from 1771 to 1782. For corruption and incapacity Sandwich's administration is unique in the history of the British navy. He died on April 30, 1792.

The Sandwich Islands (see HAWAII) were named after him by Captain Cook. His *Voyage round the Mediterranean in the Years 1738 and 1739*, was published posthumously in 1799, with a very flattering memoir by the Rev. J. Cooke; the *Life, Adventures, Intrigues and Amours of the celebrated Jemmy Twitchee* (1770), which is extremely rare, tells a very different tale. See also the various collections of letters, memoirs and papers of the time, including Horace Walpole's *Letters* and *Memoirs* and the *Bedford Correspondence*.

SANDWICH, a market town, municipal borough, and one of the Cinque Ports, in the Isle of Thanet and Dover parliamentary divisions of Kent, England, 12 mi. east of Canterbury, on the S.E. section of the S.R. Pop. (est. 1938) 3,913. Area, 3.3 sq.mi. It is 2 mi. from the sea, on the river Stour, which is navigable up to the bridge for vessels of 200 tons. The old line of the walls on the land side is marked by a public walk. The Fisher gate and a gateway called the Barbican are interesting; but the four principal gates were pulled down in the 18th century. St. Clement's church has a fine Norman central tower, and St. Peter's (restored), said to date from the reign of King John, has interesting mediaeval monuments. The curfew is still rung at 8 P.M. at St. Peter's. There are three ancient hospitals; St. Bartholomew's has a fine Early English chapel of the 12th century. The establishment of the railway and of the St. George's golf links (1886) rescued Sandwich from the decay into which it had fallen in the earlier part of the 19th century. The links are among the finest in England.

Richborough Castle, 1¼ mi. north of Sandwich, is one of the finest relics of Roman Britain. In the 4th century it was a fort of the coast defense along the Saxon shore.

The situation of Sandwich on the Wantsum, once a navigable

channel for ships bound for London, made it a famous port in the time of the Saxons, who probably settled here when the sea receded from the Roman port of Richborough. In 973 Edgar granted the harbour and town to the monastery of Christ Church, Canterbury, and at the time of the Domesday Survey Sandwich supplied 40,000 herrings each year to the monks. A charter of John in 1205 confirmed privileges enjoyed by the town in the time of William I. As one of the Cinque Ports, Sandwich owed a service of five ships to the king, and shared the privileges granted to the Cinque Ports from the reign of Edward I onwards. At the end of the 13th century the monks granted the borough, with certain reservations, to Queen Eleanor; a further grant of their rights was made to Edward III in 1364, the crown being thenceforward lord of the borough. The governing charter until 183j was that granted by Charles II in 1684.

During the middle ages Sandwich was one of the chief ports for the continent, but as the sea gradually receded and the passage of the Wantsum became choked with sand the port began to decay, and by the time of Elizabeth the harbour was nearly useless. In her reign Walloons settled here and introduced the manufacture of woollen goods and the cultivation of vegetables; this saved the borough from sinking into unimportance. Representatives from the Cinque Ports were first summoned to parliament in 1265; the first returns for Sandwich are for 1366, after which with Deal and Walmer it returned two members until disfranchised in 1885.

See W. Boys, *Collections for History of Sandwich* (1792); E. Hasted, *History of Kent* (1778-99); *Victoria County History* (Kent).

SANDYS (Sändz), **SIR EDWIN** (1561-1629), British statesman and a founder of the colony of Virginia, was the second son of Edwin Sandys, archbishop of York, and his wife Cecily Wilford. He was born in Worcestershire on Dec. 9, 1561. He was educated at Merchant Taylors' school and at Corpus Christi College, Oxford, and, though he never took orders, became a prebendary of York. He retained his prebend until 1599. He was entered in the Middle Temple in 1589. From the year 1593 till 1599 he travelled abroad. When in Venice he became closely connected with Fra Paolo Sarpi, who helped him in the composition of the treatise on the religious state of Europe, known as the *Europae speculum*. In 1605 this treatise was printed from a stolen copy under the title, *A Relation of the State of Religion in Europe*. Sandys procured the suppression of this edition, but the book was reprinted at the Hague in 1629. He was member for Andover in 1586 and for Plympton in 1589. On James I.'s accession Sandys was knighted. He sat in the king's first parliament as member for Stockbridge. He assailed the great monopolies, and he endeavoured to secure to all prisoners the right of employing counsel. He had been connected with the East India Company before 1614, and took an active part in its affairs till 1629. His most memorable services were, however, rendered to the (London) Virginia Company, to which he became treasurer in 1619. He sat in later parliaments as member for Sandwich in 1621, for Kent in 1624, and for Penrhyn in 162j. He died in Oct. 1629.

See Alex. Brown's *Genesis of the United States* (London, 1890).

SANDYS, GEORGE (1578-1644), English traveller, colonist and poet, the seventh and youngest son of Edwin Sandys archbishop of York, was born on March 2, 1578. He studied at St. Mary Hall, Oxford, but took no degree. On his travels, which began in 1610, he first visited France; from North Italy he passed by way of Venice to Constantinople, and thence to Egypt, Mt. Sinai, Palestine, Cyprus, Sicily, Naples and Rome. His narrative, dedicated, like all his other works, to Charles (either as prince or king), was published in 1615, and formed a substantial contribution to geography and ethnology. He also took great interest in the earliest English colonization in America. In April 1621 he became colonial treasurer of the Virginia Company and sailed to Virginia with his niece's husband, Sir Francis Wyatt, the new governor. When Virginia became a crown colony, Sandys was created a member of council in August 1624; he was reappointed to this post in 1626 and 1628. In 1631 he returned to England.

In 1621 he had already published an English translation of part 3f Ovid's *Metamorphoses*; this he completed in 1626; on this mainly his poetic reputation rested in the 17th and 18th centuries.

He also began a version of Virgil's *Aeneid*, but never produced more than the first book. In 1636 he issued his famous *Paraphrase upon the Psalms and Hymns dispersed throughout the Old and New Testaments*; in 1640 he translated *Christ's Passion* from the Latin of Grotius; and in 1641 he brought out his last work, a *Paraphrase of the Song of Songs*. He died, unmarried, at Boxley, near Maidstone, Kent, in 1644.

See Sandys' works as quoted above; the travels appeared as *The Relation of a Journey begun an. Dom. 1610, in four books* (1615); also the Rev. Richard Hooper's edition, with memoir, of *The Poetical Works of George Sandys*; and Alexander Brown's *Genesis of the United States*, pp. 546, 989, 992, 994-995, 1032, 1063; article, "Sandys, George," in *Dictionary of National Biography*.

SAN FERNANDO, a seaport of southern Spain, in the province of Cadiz, on the Isla de León, a rocky island among the salt marshes which line the southern shore of Cadiz bay. Pop. (1930), 29,232. San Fernando was probably a Carthaginian settlement. On a hill to the south stood a temple dedicated to the Tyrian Hercules; to the east is a Roman bridge, rebuilt in the 15th century after partial demolition by the Moors. The arsenal was founded in 1790. During the Peninsular War the cortes met at San Fernando (1810), but the present name of the town dates only from 1813; it was previously known as Isla de León. San Fernando is one of the three principal naval ports of Spain. The town is connected with Cadiz (4½ mi. N.W.) by a railway, and there is an electric tramway from the arsenal (in the suburb of La Carraca) to Cadiz. In the neighbourhood salt is largely produced and stone is quarried; the manufactures include spirits, beer, leather, esparto fabrics, soap, hats, sails and ropes; and there is a large iron-foundry. Nationalists occupied San Fernando early in the civil war of 1936-39.

SAN FERNANDO (DE LA UNION), a municipality, capital and port of the mountainous province of La Union, Luzon, Philippine Islands, on the west coast, 208 mi. from Manila. Pop. (1939) 23,366; 26 were whites. A good road connects it with Bauang, whence there is railway connection with Manila. Tobacco is produced in the surrounding region and is shipped from the port in considerable quantities. Other agricultural products are palay (rice), abacá (Manila hemp), maize (corn), sugar and coco-nuts. Ilocano is the vernacular. Of the inhabitants aged 6 to 19 inclusive, 46.4% in 1939 attended school, and 60.2% of the population 10 years old and over was literate. (C. S. L.)

SAN FERNANDO (DE PAMPANGA), a municipality (with 32 *barrios* or districts) and capital of the province of Pampanga, Luzon, Philippine Islands, on the Manila-Dagupan railway, in the southeast part of the province. Pop. (1939) 35,662. It is the centre of a fertile agricultural region and has a trade of considerable importance. The vernacular is Pampango. Of the inhabitants aged 6 to 19 inclusive, 40.3% were reported in 1939 as attending school, while 64% of the population 10 years old and over was reported as literate.

SANFORD, a city in the interior of Florida, U.S.A., the county seat of Seminole county; on Lake Monroe (the head of navigation on the St. Johns river) about midway (by rail) between Jacksonville and Tampa. It is on federal highway 92, and is served by the Atlantic Coast Line railroad and river steamers. The population was 7,262 in 1925, of whom 3,117 were Negroes; and 10,217 in 1940 by the federal census. The city lies around a wide curve in the lake shore and has several small lakes within its limits. Sanford is a winter resort, with several hotels and provision for all the sports and pleasures compatible with the climate. Since 1920 it has had a commission-manager form of government, and development is under the supervision of a city-planning and zoning commission established in 1923. It is the centre of a subirrigated region devoted chiefly to the growing of celery and other truck crops. Sanford is a division point on the railroad, which maintains shops there employing 350 men; and has pre-cooling plants, a large icing station and several manufacturing industries. The city was founded about 1871 by Gen. Henry S. Sanford and was incorporated in 1877. In 1887 it suffered from a disastrous fire. The first citrus nurseries in Florida were planted there and Sanford became the chief centre of the production and shipping of oranges. The "great freeze" of 1895

wiped out this industry. Later the cultivation of citrus fruits was revived.

SAN FRANCISCO, premier port and financial centre of the Pacific coast, is centrally located on the coast of California in 37° 47' 22.55" N. lat. and 122° 25' 40.76" W. long. It is situated on a peninsula bounded on the west by the Pacific ocean, north and east by San Francisco bay and south by wooded hills and fertile valleys of San Mateo county. The highest elevation is 938 feet. San Francisco bay is one of the finest and safest landlocked harbours in the world, which partially accounts for the city's importance as a port. Entrance from the Pacific to the bay is through the Golden Gate, a channel having a depth of 63 fathoms and a width of 1 1/8 miles. The city covers 44.6 sq.mi. and is built on hills, the principal ones being Telegraph, Russian, Nob, Rincon, Bernal heights, Potrero, Larsen peak, Twin peaks, Mt. Davidson (938 ft.), Mt. Olympus, Buena Vista, Lone mountain and Lincoln park. Romantic and cosmopolitan in character, San Francisco holds a lure peculiar to few cities of the world. Its population was 416,912 in 1910 and 506,676 in 1920. In 1930 it was 634,394 and 634,536 in 1940. There were 153,386 foreign-born whites in 1930 or 24.2%.

San Francisco bay contains several picturesque islands, while a number of large cities line the lateral side of the bay. Yerba Buena and Treasure islands are about half way between San Francisco and Oakland. Yerba Buena is used as a naval station and training school. Treasure island was the site of the exposition in 1939-40. Alcatraz island stands high above the water and is surmounted by a great military prison, topped by a lighthouse 214 ft. high. Angel island lies to the north of Alcatraz. Upon it is located Ft. McDowell, the United States quarantine and immigrant station. During the war of 1914-18 the island was used as a training and internment camp. Belvedere island is an exclusive residential and yachting territory and lies to the northwest of Angel island. San Francisco's suburbs consist of well-built cities ranging in population from 10,000 to 302,000. The islands and bayshore cities for many years were reached only by ferries. The construction of two mammoth bridges has expedited travel over the bay remarkably. The first, the San Francisco-Oakland bay bridge extending 8 1/2 miles across the bay, was opened on November 12, 1936. It is the longest bridge in the world over navigable

recorded. Long records show heaviest rainfall from November through March, ranging from two to five inches for a single month. Between April and October the rainfall averages less than 0.3 in. per month, with only a trace in July and August. Long records of the U.S. weather bureau show: temperature, mean maximum 62.6°, mean minimum 50.2° and monthly mean 56.1°; relative humidity 69%; total precipitation 22.02 in.; average hourly wind velocity 9.2 m.p.h., prevailing direction, west; sunshine 65% of possible, with 167 all-clear days. Hours of fog over San Francisco bay average 153 per year.

Government.—San Francisco has a combined city and county government, with legislative powers vested in a board of supervisors of 11 members, five and then six being elected every two years. The mayor, auditor, treasurer, assessor, tax collector, coroner, recorder, county clerk, sheriff, superior and police court judges are elected by the people and serve for a term of four years. The mayor receives \$10,000. The chief administrative officer appointed by the mayor receives \$12,000 per annum. The mayor appoints and may remove, at his pleasure, members of the police, fire, civil service, school, park, playground, health and public works boards. The mayor also has a power of veto over all legislation passed by the supervisors. San Francisco has operated under five charters, granted in 1850, 1856, 1861, 1898, 1932.

The "initiative and referendum" clauses, by which the taxpayers can have the final voice in any act passed by the board of supervisors was first embraced in the 1898 charter.

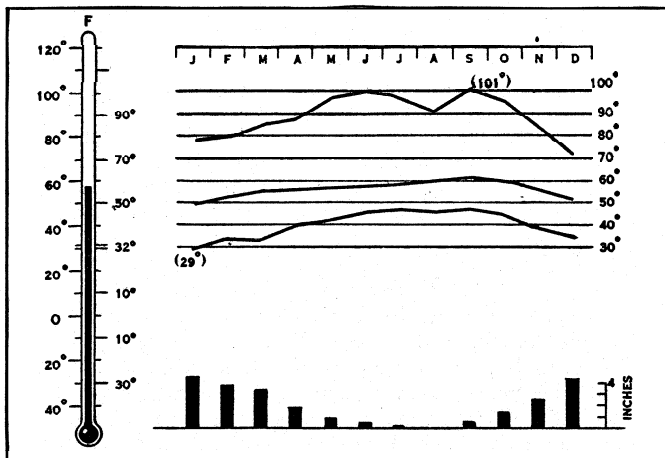

The city experienced periods of "boss rule" with more or less grafting until 1911, when a reform mayor, James Rolph, Jr., took office. Rolph served five successive terms, and when he became governor of the state in 1931 was succeeded by Angelo J. Rossi, the present mayor (1941).

The city has advanced rapidly. Outstanding are the many public buildings, street improvements, parks and other achievements. The fire and police departments had been established on a sound base. The police department employs over 1,350, and the fire department nearly 1,300. The water system is municipally operated. The average water demand on the system is 70,000,000 gal.

The city also possesses extensively developed power resources.

Industries and Commerce.—The federal census of manufacturing in 1939 showed the following conditions to exist in San Francisco and the San Francisco-Oakland industrial area: San Francisco—number of establishments, 2,172; wage earners, 31,789; wages, \$44,723,211; value of products, \$313,252,639; metropolitan area (five counties)—number of establishments, 3,441; wage earners, 76,374; wages, \$110,964,281; value of products, \$960,636,411.

The ten manufacturing classifications reported with the highest value of products in the San Francisco industrial area in the 1939 U.S. census amounted to \$326,089,967, or 34% of the area total. They were:

WEATHER GRAPH OF SAN FRANCISCO. THE THERMOMETER INDICATES THE ANNUAL MEAN TEMPERATURE. THE MIDDLE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE. THE CURVES ABOVE AND BELOW, THE HIGHEST AND LOWEST EVER RECORDED. THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION

water and was erected at a cost of \$77,200,000, which it is expected will be liquidated by tolls within twenty years. The second bridge spans the famous Golden Gate with a central suspension section of 4,200 feet. It was erected at a cost of \$35,000,000 and was opened to the public on May 28, 1937.

The climate is practically free from extremes, with a uniform relative humidity and an abundance of sunshine. Rainfall constituted the entire precipitation over a period of 50 years, with one or two extreme exceptions when a very light snowfall was

Petroleum Refining	\$112,043,874
Canned and Dried Fruits and Vegetables	40,408,393
Meat Packing	39,179,995
Bread and Bakery Products	23,207,553
Tin Cans and Other Tinware	22,637,907
Steel Works	21,318,750
Paints and Varnishes	21,214,450
Printing and Publishing, Newspapers	19,600,313
Malt Liquors	13,938,049
Ship and Boat Building	12,540,793

The sales of San Francisco firms selling at wholesale, in 1939 federal census, amounted to \$1,377,614,000 or \$2 70,000,000 above the 1935 total. Trade at retail in San Francisco of 11,339 stores in 1939, federal census, amounted to \$383,554,000. The annual pay roll amounted to \$58,135,000. In addition to the retail trade in San Francisco there were 6,576 service establishments reported by the 1939 federal census, with annual receipts of \$61,893,000. These establishments reported 19,239 employees and an annual pay roll of \$24,467,000.

San Francisco's business extends to all parts of the world; in the confines of the immediate trade area are a number of cities and towns, the greater number of which border on the bay. In the west bay section, on the San Francisco peninsula, the outstanding communities are San Francisco, Burlingame, San Mateo,

Redwood City, Palo Alto and San Jose. North of San Francisco on the Marin peninsula are the towns of San Rafael, Sausalito, Mill Valley and San Anselmo. In the east bay region are Oakland, Alameda, Berkeley, Richmond and San Leandro. These sections form a central unit and comprise the immediate all-year market.

Transportation and Distribution.—Converging in San Francisco are seven major transcontinental rail routes, 177 steamship lines, more than 30 truck lines, 4 transcontinental bus services, 3 transcontinental air transport routes and the famous trans-pacific Clipper fleet. San Francisco ranked third in tonnage of water-borne commerce of all ports in the United States, with an 11,000,000 ton lead over any other Pacific coast port. San Francisco is the focal point of two bridges, the San Francisco-Oakland bay bridge, a link in both federal highways 40 and 50, and the Golden Gate bridge, a link in federal highway 101.

Three modern air terminals in the San Francisco bay area are within 30 minutes of the heart of San Francisco. The enlarged municipal airport is the focal point of transcontinental and north-south services by transport planes. San Francisco is the eastern terminus for the Clippers providing service to and from the Hawaiian islands, Philippine islands and the orient. Service to and from Australia and New Zealand was in 1941 under development.

The bay area is 450 sq.mi. The harbour has 17.2 mi. of berthing space, including 43 modern piers equipped with complete facilities. The harbour is controlled by a board of state harbour commissioners appointed by the governor.

In 1940 4,193 ships with a registered tonnage of 14,418,170 arrived, and 4,167 ships with a tonnage of 13,799,194 departed. San Francisco's exports in 1939 were valued at \$119,518,716; imports, \$59,578,157. The principal exports are barley, canned fruits, raw cotton, machinery and parts, lead, canned salmon, fresh and dried fruit, lumber, oil and gasoline, scrap iron and automobiles. The principal imports are raw silk, coffee, sugar, copra, coconut oil, burlap, newsprint and tea. The 1940 report of the army chief engineer shows the relative tonnages of the water-borne commerce of San Francisco bay as follows: total (long tons), 30,863,957; foreign, 4,687,463; coastwise, 18,499,923; internal and intraport, 7,676,571.

Rail traffic in San Francisco totalled 204,136 cars in 1940. San Francisco airport traffic in 1940 totalled 21,650 planes, 109,245 passengers, 1,441,342 lb. air mail, 230,197 lb. air express.

Finance.—The Federal Reserve bank of San Francisco is the headquarters of the twelfth federal reserve district, which ranked third among the 12 districts with the volume of business during 1940, measured by bank debits totalling \$35,886,288,000. The San Francisco stock exchange, one of the major regional stock exchanges in the United States, is maintained in San Francisco. There is also the San Francisco mining exchange. San Francisco stock exchange transactions during 1940 totalled 6,009,597 shares, with market value of \$83,864,070.

Six of the 21 banks in San Francisco are among the first 50 banks of the nation. Four banks are branch systems operating a total of 594 branches throughout the state. Of the 21 banks in San Francisco, 16 are under state supervision. Of these 16, three are commercial and savings, one strictly savings, one savings and trust and two title insurance companies operating trust departments. There are five national banks, all of which operate trust departments. The trust departments are under state supervision.

San Francisco bank clearings in 1940 totalled \$7,773,877,000 and ranked fifth in the nation, and bank debits totalled \$10,995,001,000. San Francisco's 21 banks reported as of Dec. 31, 1940: total deposits of \$3,109,525,000, of which \$1,584,043,000 were time and \$1,525,482,000 demand. Total resources amounted to \$3,434,606,000.

Since there is no state property tax, the only levy in San Francisco is the combined city and county tax. This amounted to \$35,152,460 for 1939-1940 and resulted in a levy of \$42.95 on each \$1,000 of assessed valuation, which amounted to \$977,191,455 on the basis of 50% of the true value. Per capita city expenses were divided as follows during 1940: total, \$59.46; education, \$15.69; police and fire protection, \$11.03; charities, hospitals, and corrections, \$18.3 j; general government, \$4.99; recreation,

\$3.64; highways, \$1.91; sanitation, \$1.61; conservation of health, \$1.21; miscellaneous, \$1.04.

Education.—San Francisco's institutions of learning include the affiliated colleges of the University of California, San Francisco state teachers college, the University of San Francisco and numerous law and medical schools. Eight miles across the bay from San Francisco, at Berkeley, is the University of California, one of the largest in the United States; while at Palo Alto is Stanford university (*q.v.*). Near Oakland is St. Mary's university, and in the hills of Oakland is Mills college, an institution for women.

During the school year ended June 1939 San Francisco public day schools had an enrolment of 75,542—4,854 in kindergartens; 38,268 in elementary schools; 12,980 in junior and junior-senior high schools; and 19,440 in high schools. At the same time there were 10,953 in special schools, 24,893 in evening high schools and 22,000 in private and parochial schools. There were 3,128 teachers. The average daily attendance was 67,069 in public schools. The operating cost per average daily attendance was \$149.54. The value of the school property was \$42,428,683. Public schools were listed as follows: 72 kindergartens, 82 elementary and grammar; 70 junior high schools; 9 senior high schools; 6 evening high schools; 1 continuation school; 1 part-time and 1 ungraded school.

Public Buildings and Parks.—The group of buildings in the civic centre consists of (1) city hall; (2) Exposition auditorium, which has a seating capacity of 12,000 in the main auditorium; (3) San Francisco public library; (4) state building; (5) an opera house and other buildings; (6) a federal office building. A mint building was finished early in 1937. California palace of the Legion of Honor, in Lincoln park overlooking the Golden Gate, is a replica of the palace of the Legion of Honor in Paris. In Golden Gate park are the De Young Memorial museum, Academy of Sciences, Steinhart aquarium and the Museum of Anthropology. Near the Presidio is the San Francisco museum of art. At Kearny and Washington streets is the Hall of Justice, containing police courts and the criminal department of the superior court. Other buildings are the old United States mint, built in 1874; the post office; the customs house and the United States appraiser's buildings; and the Ferry building, built by the state in 1896, which is 659 ft. long and 156 ft. wide, containing many state offices.

San Francisco is noted for its parks. There are 54 parks and 94 recreational units, with a total acreage of 4,635.37. In addition to the municipal parks, the several government reservations, the largest of which is the Presidio, comprising 1,542 ac., all go toward augmenting the aggregate area of the city parks. All of San Francisco's parks are "man-made." The Golden Gate park, a well-known playground, comprises 1,017 ac. and is about 3 mi. long and $\frac{1}{2}$ mi. wide, extending from Stanyan street on the east to the Pacific ocean on the west, and lies in the midst of San Francisco residential districts. In the park are many museums and monuments, an aviary, aquarium, music temple, stadium, tennis courts, baseball and football grounds, bridle paths, an athletic field and running track, paddocks and children's playgrounds. Improved driveways in the park exceed 25 mi. in length. At the western end of the park is to be seen the sloop "Gjoa," the only vessel that ever navigated the northwest passage; it was given to San Francisco by its owner, Captain Roald Amundsen.

Streets and Boulevards.—San Francisco's street system was begun in 1835, when Calle de la Fundación or Foundation street was laid out. The first survey, made in 1839, covered what is now the financial and retail sections of the city. Other streets and avenues were gradually added until 1845 when Jasper O'Farrell made a second survey. This system applied the "checker-board lay-out," with Market street the main artery and division point. The streets north of Market run north and south and east and west; the streets south run parallel to Market street and at right angles. The Market street slant is about southwest and northeast. Among the scenic boulevards are the Marina, Twin Peaks, Market street extension, Lincoln, Embarcadero and Great Highway paralleling the ocean.

San Francisco's Chinatown comprises an area paralleling Grant ave. between Bush st. and Columbus ave. The "town" is hedged in by the financial, hotel and apartment house districts and a part of North Beach or "Latin Quarter." A chamber of commerce study indicated that in 1927 there were 7,744 foreign-born and more than 3,500 native-born Chinese in the district, while several hundred were scattered in other sections of the city. According to the federal census three years later, there were 16,303 Chinese residents.

Fires, Earthquake and Reconstruction. — Seven times San Francisco has been swept by disastrous fires. The first fire of note occurred on Dec. 24, 1849, and was followed in quick succession by others on May 4, 1850; June 14, 1850; Sept. 17, 1850; May 4, 1851 and June 22, 1851. In 1906 came the greatest conflagration experienced on the western coast. Following the earthquake which occurred early on the morning of April 18, 1906, flames swept through the city creating havoc, especially in the central business and residential sections. Thousands of buildings, hundreds of lives and approximately \$500,000,000 were the losses sustained. An area of 497 city blocks, or 4 sq.m., was devastated.

According to official records 28,188 buildings valued at \$105,000,000 were destroyed. The value of the contents of the structures wiped out was impossible to estimate. Insurance companies and San Francisco financial houses estimate the insurance paid at \$300,000,000, though many companies failed in the attempt to meet their obligations, while others repudiated them. Aid in the form of money to the sum of \$10,000,000 was contributed by American, European and Asiatic communities, while additional millions in food and clothing were rushed to the stricken city, whose inhabitants slept in the remaining houses, parks and the streets for weeks. The flames were subdued by the generous use of dynamite, with the result that many expensive buildings were sacrificed by "back-fire" to save other sections of the city. While San Francisco had experienced earthquake disturbances in 1868, 1898 and 1900, that of 1906 was the most violent.

Within a remarkably short time San Francisco began the struggle to rehabilitate itself. Owing to the courage and energy of the people, within a year following the catastrophe the city was taking on a somewhat normal appearance. The new structures were planned along more costly and substantial lines. With the aid of San Francisco banks and the money received from insurance companies, the city went forward step by step and a beautiful San Francisco once more arose from the débris and ashes.

History. — In his search for Monterey, Don Gaspar de Portola, governor of Lower California, left San Diego in July 1769 and some months later members of his little band discovered San Francisco bay and the tip of the peninsula whereon the city is situated. From that time until California became a part of the United States, San Francisco became an objective of international strategy. In 1775, Don Manuel Ayala sailed through the Golden Gate in the "San Carlos," a packet of the Spanish royal navy. It was the first ship to gain entrance to the bay from the Pacific ocean. While the Spaniards won the credit of the discovery, the English, years before, narrowly missed gaining possession of the bay and the surrounding territory as well, for in 1579 Sir Francis Drake, the English explorer, sailed within a few miles of the "Golden Gate" and came to anchor in a little cove a few miles north, in what is known to-day as Drake's bay.

In 1776 a land expedition commanded by Col. Juan Bautista de Anza arrived on the peninsula and established the Presidio and the Misión Dolores. The following year (1777) Padre Juni-

pero Serra, father of the California missions, arrived. With the establishment of the Presidio, and the subsequent establishment of the *pueblo* of Yerba Buena, began the San Francisco of to-day. From 1776 until 1806 the inhabitants, soldiers and missionaries led a quiet, happy existence, occupying themselves with building the mission and the presidio, and doing only work enough to get the necessities of life. For excitement, they had their Spanish *fiestas*, cock-fights and rodeos, while from time to time sailors, adventurers and visiting ranchers added a novelty. Trading in hides and tallow constituted the principal business of the period, though wines and brandies made by the missionaries were exchanged for ship's goods of varied assortment. Fur trading was also beginning to take on a commercial aspect. Eventually, this proved to be the principal business of the community.

In 1806, Russia made a faint attempt through Count Rezanov to establish a settlement and lay claim to the territory in the name of the tsar. Rezanov eventually planted a colony at Ft. Ross, near Santa Rosa, some miles north of San Francisco, which was intended to serve as a supply station and vegetable farm for the Russian possessions in Alaska. The outpost was established in March 1811. A stockade was built on Bodega bay. When completed, it became the headquarters of those Russians who had made Yerba Buena (San Francisco) their base since landing in 1806. Except for occasional visits by Rezanov and his men, the community soon forgot the Russian enterprise.

With the exception of a few quarrels between Mexicans and foreign colonists, as the Americans and other nationalities were called, all was tranquil until war was declared by the United States on Mexico on May 13, 1846. There was great excitement in San Francisco some weeks later when the news arrived. On July 9, 1848, Capt. John B. Montgomery of the U.S. navy, arrived with the sloop-of-war "Portsmouth" and raised the American flag on the plaza, known to-day as Portsmouth plaza, claiming the territory for the United States. The community continued under the name of Yerba Buena until 1847 when it was changed to San Francisco. At this time there were some 200 buildings and 800 inhabitants in the village.

The discovery of gold at Coloma in Jan. 1848 was not taken seriously in San Francisco, and it was not until April of that year that the settlement became infected with the "gold bug." Then every one with an outfit stampeded for the mountains in search of gold. Then a city of tents and shanties arose; gambling was rife and prices extraordinary.

During the early '50s San Francisco experienced her darkest days. Crime was rampant, while the city government was too inefficient or too indifferent to suppress it. Bancroft, in his *History of California*, states that up to 1854 there were 4,200 homicides and 1,200 suicides, while the records of the next few years following show many deaths by violence, the high mark being reached in 1855 with 585. In 1851 the Vigilance Committee was formed and freed the city of most of the lawless element, either by hanging or driving them from the town. It was necessary for the committee to come together again in 1856, when for a second time it succeeded in restoring order in the community. Altogether more than 8,000 reputable citizens served on the two committees.

With the decline of gold production between 1855 and 1860, San Francisco came into her own as the Pacific coast's main port, and through world trade the city grew substantially and conservatively. This reign of conservatism, however, was interrupted by the unparalleled development of the Nevada silver mines and the city again experienced the days of '49. There was a long period of frenzied speculation during which huge fortunes were won and lost within a few minutes. Panic gripped the people and only the financially strong survived. Many descendants of the successful financial giants of the silver period reside in San Francisco and have so handled their heritage that they are numbered among California's wealthiest and most influential citizens of to-day. At the outbreak of the Civil War San Francisco showed evidence of being strongly pro-Union although thousands of arms were shipped in, to Southern sympathizers, for the purpose of winning Californians over to their cause or to encourage them to launch an independent republic. Nothing came of this

ORIENTAL WOMAN SHOPPING IN
SAN FRANCISCO'S CHINATOWN

venture and San Francisco remained, with California, a Union stronghold. The famed "pony express," established in 1860, for a short time gave San Francisco quick mail and express communication with the interior of the country. The city's isolation, however, was not permanently removed until the first transcontinental railway was opened in 1869. The railway to Los Angeles was completed in 1876, thereby giving San Francisco connections with the east and south.

(R. B. KR)

SANGER, JOHN (1816–1889), English circus proprietor, was born at Chew Magna, Somerset, in 1816, the son of an old sailor who had turned showman. In 1845 he started with his brother George a conjuring exhibition at Birmingham. The venture was successful, and the brothers, who had been interested spectators of the equestrian performances at Astley's amphitheatre, London, then started touring the country with a circus entertainment consisting of a horse and pony and three or four human performers. Eventually John and George Sanger became lessees of the Agricultural hall, London, and there produced a large number of elaborate spectacles. In 1871 the Sangers leased Astley's where they gave an equestrian pantomime every winter, touring in the summer with a large circus. Subsequently the partnership was dissolved, each brother producing his own show. John Sanger died while touring, at Ipswich on Aug. 22, 1889, the business being continued by his son.

SANGERHAUSEN, a town in the Prussian province of Saxony, Germany, near the south base of the Harz mountains, 30 mi. W. of Halle. Pop. (1939) 12,653. Sangerhausen is mentioned in a document of 991 as appertaining to the estates of the emperor. By marriage it passed to the landgrave of Thuringia, it fell in 1249 to Meissen, and in 1291 to Brandenburg. In 1372 it passed to Saxony and formed a portion of that territory until 1815, when it was united with Prussia.

SAN GERMAN, a town in the southwestern part of Puerto Rico, about five miles from the Mona channel on the west and the Caribbean sea in the south. The population of the town by the census of 1940 was 6,446, and of the municipal district, 26,473. The original settlement was founded in 1512 by Diego, a son of Columbus. Its early history was marked by many vicissitudes. It was at different times attacked by the Carib Indians, by pirates, by the French in 1528, and as late as 1748 by the English. As a consequence the town was moved for safety from one place to another until it was finally established in its present position. For many years, when there existed only two municipal districts in the island, San Germán was the seat of government of the western, and San Juan of the eastern district. In 1538 a church was built by the Dominican friars which still stands, one of the oldest buildings of the Spanish settlement in the West Indies.

SANGIHE (SANGIR) and TALAUT ISLANDS, a group of islands off the northeast coast of Celebes, Dutch East Indies. Area, 808 sq.mi.; population (1930) 158,729, including 93 Europeans and 2,814 Chinese. The Sangihe Islands continue the northeastern extension of Celebes toward Mindanao, in the Philippines, and are set upon a long, narrow ridge, along a volcanic band, with very deep water on either side. Although fringed with recent coral formation, they are distinctly volcanic, with active volcanoes, Mount Awu, on Sangihe Island, having experienced recent severe eruptions, while earthquakes also have occurred. Sangihe, Siau and Tagulanda are the chief islands, and Talisse and Banka (Banka lies off the east coast of Sumatra) are between Tagulanda and the mainland of Celebes.

Banka gives its name to Banka passage, the channel by which entry is obtained from Celebes sea to the Molucca passage. Sangihe is 27 mi. long, and from g to 17 in width, is mountainous in the north, elevation decreasing considerably in the south, and has a coast which is generally steep. It has an average rainfall of 195 in., and, with Siau, has an exceptionally fertile volcanic soil with extensive cultivation of nutmegs, coco-nuts and Manila hemp. Taruna, on the west coast, is the capital, where a *contrôleur* resides who is in charge of all of the islands. It, and Peta, on the east coast, are regular ports of call; also Hulu, the capital and port of Siau, and Tagulandang, and Talisse, on the islands of that name. Tagulandang has two mountains of 2,500

ft., sloping from east to west, and Ruang, a small island west of Tagulandang, has an active volcano.

The people of Sangihe and Siau are closely related to the people of Minahasa and of portions of the Philippine Islands, with fair complexion, high nose and stiff, short black hair. They were formerly terrorized by the dreaded pirates of Sulu (islands off the S.E. coast of Mindanao, in the Philippines). But later, under direct Dutch rule, the Sangihe and Siau islanders progressed wonderfully, under the peaceful regime of Dutch rule, like their near relatives the Minahasese, and like these also, they became mostly Christians. Society is based on the matriarchal system, and the people, who speak a language of their own, live by agriculture and fishing and trading in wood, copra and nutmegs. The very fine and white Manila hemp they grow is practically only for domestic consumption, and its weaving is the most important industry. The Talaut, or Talaud, Islands consist of a group lying northeast of Sangihe, the chief of which is Karakelang, 39 mi. long and 15 wide, in the north. Heights of 2,300 ft. are said to exist in the southern part. The coast is steep, except on the south shore, which is fringed by a wide reef. Some tiny islands known as the Nanusa Islands lie northeast of Karakelang, and vessels run regularly to these, and to Beo, the capital of Karakelang, and of the group, where a *gezaghebber* resides, also to Lirung, the port and capital of a long island lying close to and southeast of Karakelang. The Sangihe and Talaut Islands were incorporated under the direct rule of the Dutch governor of Ternate as far back as 1677. Later they were attached to the residency of Manado; in 1942, during World War II, they passed under Japanese military control.

(E. E. L. ;X.)

SAN GIMIGNANO, a town of Tuscany, Italy, in the province of Siena, 24 mi. N.W. of Siena, at an elevation of 1,089 ft. Pop. (1936) 3,426 (town); 11,270 (commune). Being surrounded by its ancient walls, and retaining 13 out of its original 72 towers, it is, with its predominantly Gothic architecture, a thoroughly mediaeval town in appearance. In the Palazzo Comunale (1288–1323) is a fresco by Lippo Memmi of the Madonna enthroned (1317), copied from the "Majestas" at Siena. The Collegiata (the former cathedral) of the 12th century was enlarged after 1466 by Giuliano da Maiano, whose brother Benedetto carved the altar and ciborium in the chapel of S. Fina. The beautiful frescoes with scenes from her life (she was a local saint who died at the age of 15 in 1253) are the earliest work of Domenico Ghirlandajo (1475). The cathedral contains other 14th-century and early Renaissance paintings, including New Testament scenes by Barna da Siena (1380) and some fine choir stalls. S. Agostino (1280–1298) contains a famous series of frescoes by Benozzo Gozzoli, with scenes from the life of St. Augustine (1463–1467). The town was independent in the 13th century, but in 1353, owing to the dissensions of the Salvucci (Ghibellines) and Ardinghelli (Guelphs), it fell into the hands of Florence.

See R. Pantini, *San Gimignano e Certaldo* (Bergamo, 1905).

SAN GIULIANO, ANTONINO PATERNO-CASTELL, MARQUIS DI (1852–1914), Italian statesman, was born at Catania on Dec. 10, 1852, a member of a noble Sicilian family. After graduating in law at the University of Catania he became, in 1879, mayor of his native city, and in 1882 was elected to parliament. When in 1892 Signor Giolitti became premier, San Giuliano was selected as undersecretary for agriculture, while in the second Pelloux ministry (1899–1900) he held the portfolio of posts and telegraphs. Having been defeated at the election of 1904, he was nominated senator. When in Dec. 1905 Signor Fortis became prime minister he was appointed minister for foreign affairs, and on the fall of the cabinet early in 1906 he was appointed ambassador in London, where he remained until 1910. From London he was transferred to Paris, but he soon returned to the Consulta as foreign minister in the Luzzatti cabinet (1910–1911), and continued at the same post in Signor Giolitti's administration. San Giuliano was an ardent believer in the Triple Alliance but having retained his portfolio under Salandra, after Giolitti's resignation in March 1914, he carried out with complete loyalty the policy of neutrality adopted by Italy on the outbreak of World War I. He died in Rome on Oct. 16, 1914.

SANGLI, a native state of India, in Bombay, ranking as one of the Southern Mahratta Jagirs. The territory is widely scattered among other native states and British districts. Area, 1,111 square miles. Pop. (1931) 258,442. The town of Sangli has a station on the Madras and Southern Mahratta railway, 11 m. from Miraj Junction. Pop. (1931) 29,818.

SANHEDRIN: see SYNEDRIUM.

SANITATION: see HYGIENE.

SANITATION OF BUILDINGS. To preserve the health of the occupiers of any building, it is imperative that all polluted water and solid organic refuse should be removed from the premises at frequent intervals. Where the buildings are in a town it is usual for the local authority to remove the solid dry refuse by carting, but where a public water supply is available, liquid wastes are flushed away through a system of pipes. These latter comprise waste pipes to carry washing water, soil pipes to carry human excreta and rainwater pipes. If such pipes pass under the grounds of the premises they are termed drains and usually discharge eventually into the sewers in the public highway or into cesspools or septic tanks.

Drains.--Outside drains are usually composed of glazed stoneware or vitrified earthenware pipes, 2 ft long, not often larger than 4 in. diameter for branches and 6 in. diameter for the main drain. All drains inside a building, whether under or above ground, are usually of iron pipe. If the pipes are cast iron the joints are caulked with oakum and molten lead. If of wrought iron or steel they are screw joints.

All drains that carry solids should be provided with accessible clean-out caps, which can be readily unscrewed for the admission of cleaning rods, to remove obstructions which may choke the drains. It is good practice to have a clean-out cap or plug at each change in direction of a drain pipe. The drains must be run straight between these clean-out points.

Soil Pipes.--In British plumbing practice these are not disconnected where they are jointed to the drains, but waste pipes and rainwater pipes discharge into or onto gully traps at the base of the wall. Each house should have its own system of drains, separated from the sewer by a disconnecting chamber or manhole. The chamber is usually placed near the boundary of the property so as to prevent, as far as possible, the entry of sewer gas into the house drainage system. The intercepting trap is shaped so as to allow of removing obstructions on the outer side of the trap, and it is preferable for the manhole cover to be sealed. If the chamber is in an isolated position, the cover, which should be of cast iron, may be provided with a grating to afford means of ventilation, otherwise the chamber is fitted with a ventilating pipe to form a fresh-air inlet, and this is carried up well above ground level to some position where an accidental emission of drain gas would not cause a nuisance. Any such chamber should be built of the best bricks or cement concrete, suitably provided with curved channels for the branch connections. Such channels may be formed in the concrete or composed of half-round glazed pipes. Where inspection at bends is required, or where branches meet, but where it is considered to be too expensive or unnecessary to build a chamber, a shaft of 6 inch pipes is sometimes substituted, the whole being carefully jointed and supported by concrete. Since complete access to the drain is then impossible, the inspection will be confined to locating the position of a blockage or leakage to any particular length of pipes. When there is any possibility of the drains being flooded by the sewer, special interception traps are used in which a floating ball seals the inlet, and so prevents the reversal of the flow. No traps in which hinged valves or other mechanical contrivances are made use of, should be allowed.

In American plumbing practice all soil and waste stacks are usually installed within the buildings to prevent them from becoming frozen. These stacks generally are connected at their base to a system of iron main drain and branch drains in the basement, either at the basement ceiling or under the basement floor. In some cities, it is compulsory to have a main drain-trap with a fresh air inlet pipe located at the point where the main house-drain leaves the building to disconnect the house from street sewer gas,

and to insure a proper ventilation of the house drainage system.

In other sections of the United States, however, the main drain-trap and fresh air inlet are not permitted. In such places the house-drain runs directly to the sewer, cesspool, or septic tanks, without the intervention of a main or intercepting trap.

The gradients of the drains are usually arranged as to not only ensure the system being self-cleansing, but also so that they do not discharge their contents at such a rate that the solids are left behind to putrify on the sides of the channels. It is usual to fix the velocity at about 3 feet per second for these purposes.

Advantage may be taken of an inspection chamber or shaft to provide ventilation to the drains. All connections between branches and the main drain are made by specially designed pipes provided with junctions.

Drain Tests.--Drain testing is undertaken for two reasons:—(a) to ensure that the system of a new house is satisfactory before the dwelling is inhabited, (b) to locate defects in systems already in use. The testing in each case differs somewhat as it is considered that new drains should be able to pass severer tests than those which have been in use some years. New drains are, therefore, usually subjected to the "water test" in which any length of the drain is first closed at the lower end by some form of plug or stopper, and the drain is then filled with water so as to give a maximum head of pressure of not more than about 6 feet. The stopper is fitted with an expanding rubber ring, and constructed in some cases so that the air can escape, and the required head may be obtained by adding vertical lengths of 1 inch diameter pipe to a similar plug at the upper end of the pipe line. A slight diminution in the head may be observed at the commencement of the test, due to absorption by the joints and possibly by the pipes, but this will soon cease, and no further drop should occur for a period of an hour. The pipe trenches should all be left open until the tests have been made, the inspector being thus able to locate any fault if indicated by a fall in water level. For drains already in use it is customary to use the "smoke test." For this machines are used which generate smoke and then, by means of fans or pistons, pump it into the branch or main drain. Compressed air tests are also used, any leakage being shown on the gauge attached to the pump. Smoke "rockets" have been advocated in the past, but the amount of smoke generated is small and the effect is local. Smell tests, using peppermint, calcium carbide, etc., have also been used, but the difficulty in locating the leakage of a smell, and the great difficulty in preventing the chemical getting on the hands or clothes, has made this test almost obsolete. If smoke is used it is generated in a receiver connected to the fan or pump on one side and to a hose on the other, and is formed by the burning of oily waste, or any substance which will give off a dense cloud.

Obstructions in drains are usually removed by rods which can be jointed together to form any length, and occasionally fitted with brushes or scrapers.

Traps.--In British plumbing practice all parts of the drainage system, when there is any possibility of drain air entering the house, are disconnected by traps, the only exception being

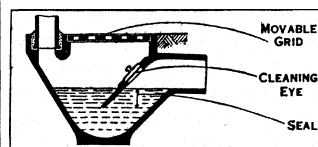

FIG. 1.—RAINWATER GULLEY

the soil pipe, which is connected to the drain by a bend. Such traps are placed either on the drainage system itself, or under each of the house plumbing fixtures and the "Seal" should always be about 2 in. to avoid the effect of evaporation. Gully-traps are installed to disconnect roof-leaders and sink waste-pipes from the drainage system. For sink wastes the liquid has to pass along an open channel outside the building for a length of at least 18 in. before entering the trap. It is intended to so prevent grease entering the drain by causing it to cool and solidify and remain either in the channel or the trap.

Grease traps are frequently specially provided where large quantities of grease may be expected, as from the cooking departments of hotels and clubs. The hot liquid enters near the base of the apparatus and leaves at the same level, and the grease rises

to the surface where it cools and solidifies. The water area is made as large as practicable and a wire basket or galvanized iron tray is provided to remove the grease, which operation should be frequently carried out.

Another type of grease trap operates by means of a syphon, the grease on the water surface being broken up by a flush, but it is generally found unsatisfactory. Traps are always placed under all sanitary fittings and are of the P or S type.

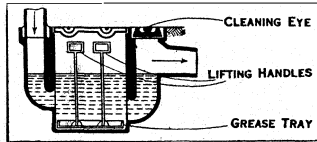

FIG. 2.—GREASE TRAP

In American plumbing practice every plumbing fixture including baths, shower receptors, water closets, urinals, lavatories, or wash basins, sinks, laundry tubs, floor-drains, area-drains, roof water-leaders and every fixture or fitting that discharges into a house drainage system must be properly and effectively trapped as close to the fixture or fitting as conditions will permit. These traps are of a variety of forms such as P. S. bottles, pot or drum, etc. All have water seals. Some are provided with check valves to prevent a back-flow of sewage through them. None, however, are permitted which depend upon mechanical contrivances as a substitute for a water seal. The water seal may, however, be augmented by a float, a check valve or other contrivance which will automatically close against back pressure. This protects the house against a backing-up of sewage as from a choked or flooded street sewer.

All fixture traps within a building must be protected against loss of seal by syphonage or air compression. The seal must remain intact to prevent sewer gas from entering the building through the traps. This trap protection is accomplished by the installation of special arrangements of vent piping which opens to the outer air and maintains the air pressure back of the trap seals practically at atmosphere.

Antisyphonage.—Since every sanitary fixture in a building must be trapped, possibilities might arise in which the seals of such traps would be broken by either increase or decrease of the air pressure unless provided against. Such cases would occur where a range of fixtures were connected to one soil or waste pipe and hence an antisyphonage or vent pipe is always provided. If no ventilating branches were provided it might be possible for a fitting on an upper floor to syphon out the water in the trap

of the fittings below by reducing the air pressure in the branch. Unsealing could also happen through the discharge of the upper fitting compressing the air in a branch below and so forcing the seal of a trap below. While such possibilities are not nowadays considered of such importance as formerly! the antisyphonage pipes are always fitted, as they form a convenient method of ventilating the branches. Each antisyphonage pipe connects the head of the trap to a ventilating stack which may be carried up above the eaves of the house, or may be connected into the soil pipe above the highest branch. Such soil pipe has, in any case, to be continued full bore either well above the eaves, or to such a position that the gases let free cannot cause a nuisance or enter the house by means of chimneys, skylights, windows or other openings. The open ends of soil pipes, and any other pipes used as ventilators, are best covered by a wire cage to prevent their being used by birds for nesting purposes.

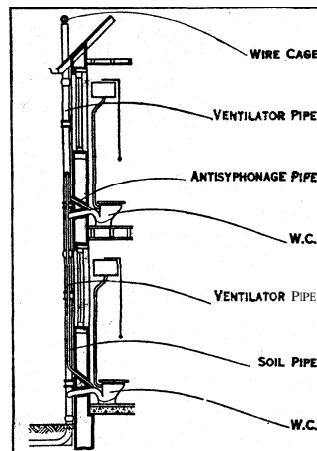

FIG. 3.—VENTILATION SYSTEM FROM LAVATORIES

Water Closets.—Of the sanitary fittings or fixtures usually found in buildings, the water closet is of the most importance. The "wash-down" and syphon closets are now practically the standard types, being simple, self-cleansing, reasonably quiet and

having no moving parts. They may either stand on the floor or be supported by brackets.

The "valve" closet is the most modern adaptation of the now obsolete "pan" closet. It has the disadvantage of possessing many moving parts, and requires careful setting and use. It can, however, be quite a successful and hygienic apparatus but is usually expensive.

All closet basins are now made of the plainest and simplest design possible and are usually of white glazed stoneware. All sharp bends or angles are carefully avoided, and no part of the apparatus is allowed to be concealed by woodwork or ornamental finish. The flushing is arranged to not only throw a strong rush of water into the trap, but a portion of the flush is passed round the hollow rim to cleanse the sides of the basin.

Flushing Cisterns.—In Great Britain these are always specified to be of the "waste-water-prevention" type as the Water

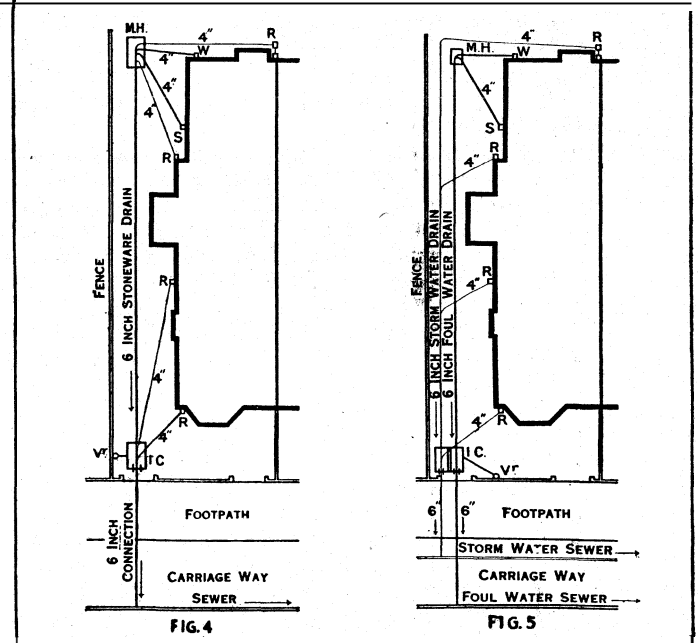

FIG. 4.—COMBINED SYSTEM OF HOUSE DRAINING
FIG. 5.—SEPARATE SYSTEM OF HOUSE DRAINAGE

Companies insist that their discharge shall be limited to a specified amount at each use. Two gallons is usually allowed, but three would be better, and unfortunately as little as one and a half gallons is often found. The cistern should be placed not less than five feet above the fitting flushed and connected to the latter by a 1½ inch diameter pipe, so as to give a good rush of water. An overflow must be placed below the inlet and should discharge direct into the open air, so as to give warning of irregular working of the valve. Similar cisterns are also made to discharge automatically at chosen intervals and so flush such fittings as ranges of urinals and closets. It is compulsory for such cisterns, whether automatic or otherwise, to be fitted to all apparatus receiving human excreta, so that there shall be no possibility of contamination of the rest of the water in the building. As regards the regulations in force for house drainage, reference should be made to the local by-laws, as these vary in detail in the different towns.

In the United States the water closets in general use in residences are flushed by "low-drain" tanks usually of vitreous china. The flush connection is generally about 2 in. diameter and short. The tank is supplied with water through a ball cash and a ½ in. supply pipe. The flushing appliance generally is either in the form of a syphon within the tank or a hollow flush valve usually of rubber. Each tank is provided with an overflow to the closet bowl, and a re-fill tube, which re-establishes the seal in the closet-trap after the flush has stopped and while the tank is being re-filled by the ball cock. Tank closets are generally installed in residences and other buildings where the water supply pipes are comparatively small in diameter.

Direct Flush Valves.—In large buildings such as hotels, office buildings, etc., where the water supply pipes are comparatively large, the water closets are flushed directly from the water supply pipes through slow-closing flush valves. These may be regulated to any length of flush desired. When the closet is properly flushed the valve shuts automatically. It is a mistake to install these valves when the supply pipes are too small or the pressure too low. The pipes should be larger than one inch and the pressure greater than 20 lb. per square inch behind the valve.

Baths—In Great Britain baths are now usually made of enamelled cast iron or glazed stoneware, but copper and zinc have occasionally been used. The two latter, however, require the support of framing, which is usually of wood, a material which is unsuitable for the hot, moist atmosphere of a bathroom. Cast iron baths may be provided with feet, but the stoneware type generally rest direct on the floor. The end at which the taps and outlet are fixed should be as close to the outer wall of the room as possible, so as to shorten the branch waste-pipe, and an overflow must be provided, which should not discharge into the trap as is sometimes permitted, but into the open air. The bath should be not less than six feet in length and should hold about 30 gallons of water when filled up to the overflow level.

In the United States baths are generally made of cast iron enamelled, both inside and out. Those standing on feet and detached from the wall are now seldom installed, except in cheap buildings. The most popular forms of baths are of the "built-in" type. Their sides are extended down to the floor and their rims are let into the wall, the floors and walls being tiled around the bath and made watertight.

As a sanitary precaution to prevent the bath contents from becoming syphoned back into the water supply pipes, when the water is shut off, and thereby contaminating them, it is advisable to have the bath supply-nozzle above the bath overflow level. Submerged supply-nozzles should not be installed.

Showers.—The shower is the most hygienic form of bath, as one bathes in running water. It is very popular in residences, hotels, schools, factories, gymnasiums, etc. Special care should be taken in designing shower supply piping that the temperature of the shower will not change suddenly while a bather is under it. Otherwise the bather may become scalded. Prevention lies in a proper piping arrangement, or a hot water supply temperature 120 degrees or lower, or by the installation of appliances to control automatically the shower temperature. A shower may be arranged over a bath, or over a floor receptor furnished with a floor drain. The control valves should be located so that they may be reached from outside the shower. Shower bathing has become so popular in America that many of the leading hotels are now equipped with one shower in each room, in addition to the regular plunge baths.

Urinals.—In Great Britain these fittings are not usually provided in private houses but are necessary in such places as hotels and clubs. They should be simple in design and provided with an automatic flushing cistern. They are usually about 4 feet high, are made of glazed porcelain and in as few parts as possible, and flushed by pipes or sprays at the back. The old types with straight sides and back and made of slate or cast iron cannot be kept clean and are to be considered obsolete. The liquids are removed by an open channel to a trapped gulley close to the outside wall. The liquid is then removed by a pipe similar to a soil pipe which is not trapped at ground level.

In the United States there is quite a variety of urinals in use in hotels, clubs and public buildings. Usually they are made of vitreous china and are attached to the wall or stand on the floor. Some are flushed from overhead tanks with chain-pull, or by timed automatic-flush. Others are equipped with direct flush valves which close slowly and automatically, being adjusted to a suitable time and volume of flush. Several makes are provided with local ventilation attachments to which vent pipes may be connected to remove offensive odors and prevent them from diffusing throughout the toilet rooms.

Lavatories.—In America the lavatories, or wash basins, are practically all made of vitreous china. Some are attached to the walls by brackets. Others are supported on legs or china pedestals.

To permit of washing in running water, if desired, the hot and cold supplies should connect into a nozzle arranged at a suitable height over the lavatory slab. The waste outlet is preferably of the "pop-up" type, the plug being operated by a knob or handle over the lavatory slab. Every lavatory should have an overflow connection and be separately trapped close to the bowl. The fixture should have no woodwork enclosing any part. It should all be open with access for keeping it clean.

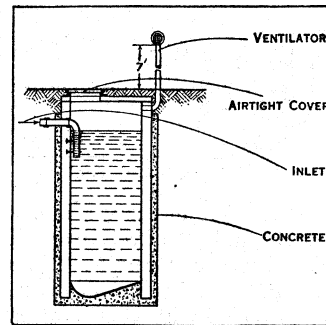

FIG. 6.—CESSPOOL

Kitchen Sinks.—These are made of enamelled cast iron, vitreous china or glazed porcelain and are set on legs, their backs being secured to the wall. There is a great variety of forms on the American market. The latest and best are one-piece fixtures with sink, drain boards, backs and apron all in one casting. The sink supply should be in the form of a combination faucet which permits the user to regulate the temperature of the water drawn. Sinks in some residences are provided with an electric dish washer compartment. Some are made in combination with a laundry tub. Some of the latest combinations comprise a sink in the middle, an electric dish washer at one end, and an electric clothes washer at the other end, all three compartments discharging their wastes through the trap under the sink.

Where much greasy dishwater will pass through a sink trap, the trap should be of a type especially designed to intercept the grease. This prevents the grease from getting into and clogging the house drains. The best type of grease trap for placing under a sink has its body in the form of a cold water jacket. Cold water to the plumbing fixtures passes through the grease trap jacket and so chills the grease in the sink waste water much more effectively than the air, or earth-cooled grease trap. (G. S. Co.; T. N. T.)

SAN JOSE (săn' hō-zā'), a city of California, U.S.A., 50 mi. S.E. of San Francisco and 7 mi. S.E. of the southern end of San Francisco bay; the county seat of Santa Clara county. It is served by the Southern Pacific, the Western Pacific and by numerous motor-coach and truck lines. Pop. 57,651 in 1930 (80% native white); in 1940, 68,457 by the federal census. It is a delightful residential city in the heart of the beautiful and fertile Santa Clara valley, and the largest fruit-canning and -packing centre of the U.S.A. The county has 130,000 ac. in orchards (including 61,000 ac. of prunes), 915 in berries and 14,835 in vegetables. In and near the city are 35 canneries with an annual volume of 9,000,000 cases; also evaporators and dehydrators; and 32 packing plants, which produce a total of more than 150,000 tons annually of dried fruit. The output of all the manufacturing establishments within the city limits in 1935 was valued at \$45,190,000. San Jose is the seat of a state college, the oldest in California (established 1862). The University of Santa Clara (1851) is in an adjoining suburb; the Leland Stanford Junior university is 18 mi. N.W.; and on top of Mt. Hamilton (4,209 ft.), 26 mi. E., is the Lick observatory. Besides several parks in the city, San Jose owns a tract of 716 ac. in the foothills 7 mi. E. (Alum Rock park), which contains many mineral springs and sulphur baths. The New Almaden quicksilver mine, which has been worked since 1824, is 14 mi. S. Since 1916 the city has had a council-manager form of government. The assessed valuation for 1940 was \$59,182,130. Bank clearings in 1940 were over \$148,000,000. Near San Jose is Moffett field, site of the United States army air corps training centre and the Ames Aeronautical Research laboratory of the national advisory committee on aeronautics. Also in this area are the world's largest cement plant and the largest magnesium plant in the U.S.A.

The Pueblo de San José de Guadalupe, the first Spanish pueblo in California, was founded on Nov. 29, 1777, primarily to promote agriculture, so that the country need not be dependent on Mexico for provisions. Father Junipero Serra had already (Jan. 18, 1777) established the Mission of Santa Clara de Asís in the vicinity.

Plants, seeds and cuttings were supplied to the mission and to the settlers. In March 1846, General Frémont, with a party of 62, visited the valley, and in July the town was occupied by Capt. Fallon and the American flag was raised over it. The first State legislature convened in San Jose on Dec. 15, 1849, and this was the seat of government until May 1, 1851. The city was incorporated in 1850 and reincorporated in 1865. By 1870 the population was 9,089. After the secularization of the church properties in 1834 the mission orchards and gardens were neglected, and the Santa Clara valley was given over largely to cattle and horse ranges. The foundation of the fruit industry on a commercial scale is credited to Louis Pellier, who in 1856 brought a number of prune cuttings from his home near Agen.

SAN JOSE or **SAN JOSÉ DE COSTA RICA**, the capital of the republic of Costa Rica, and of the department of San José; in the central plateau of the country, 3,868 ft. above sea-level, and on the transcontinental railway from the Pacific port of Puntarenas to the Atlantic port of Limón. Pop. (1941) 70,125. San José is an episcopal see, the most populous city in Costa Rica, and the centre of a rich agricultural region; its climate is temperate, its water-supply pure and abundant. The city was founded in 1738, and became the capital in 1823. (*See COSTA RICA: History.*) It is thoroughly modern in appearance, with well paved streets lighted by electricity; its houses one- or two-storied to minimize the danger from earthquake. The suburbs consist chiefly of cane huts, tenanted by Indians and mestizos. The larger of two public gardens, the Morazán park, contains a representative collection of the Costa Rican flora. The principal buildings are the cathedral, founded in the 18th century but restored after 1870, the hospital, Government offices, institutes of law and medicine and of physical geography, training school for teachers, national bank, museum, library and barracks. The staple trade of San José is in coffee.

SAN JUAN, an Andean province of Argentina, bounded north and east by La Rioja, south by San Luis and Mendoza and west by Chile, from which it is separated by the Andean Cordilleras. Area 34,432 sq.mi.; pop. (1940 estimate) 221,452. It is roughly mountainous, and belongs to the closed drainage basin of western Argentina, centring in the province of Mendoza. It is traversed by several rivers, fed by the melting snows of the Andes and discharging into the swamps and lagoons in the south-eastern part of the province, the largest of which are the Huanacache lagoons. The largest of these rivers are the Vermejo, Zanjón or Jachal and San Juan. They are all used for irrigation. The climate is extremely hot and dry in summer, but the winter temperature is mild and pleasant. Agriculture is the principal occupation of its inhabitants, though the soil is generally sterile and the rainfall uncertain and very light. Cereals are grown in some localities, and there are large vineyards where irrigation is possible, from which excellent wine is made. The province contains gold, silver, copper, iron, lead, coal and salt, but mining has never been developed to any extent. Pastoral interests are largely in feeding cattle for the Chilean markets, for which large areas of alfalfa are grown in the irrigated valleys of the Andes. The Argentine Great Western railway connects the capital of the province with Mendoza, and thus with the other principal cities of the republic.

The capital of the province is San Juan, once called San Juan de la Frontera (pop., 1914, 16,631), in a great bend of the San Juan river, 95 m. N. of Mendoza and 730 m. from Buenos Aires by rail. The great bend of the river affords easy irrigation, and the surrounding country is covered by a network of irrigating canals, even the paved streets of the town having streams of cool water running through them. The public buildings include a cathedral, three churches and several schools, including the "Escuela Sarmiento," a fine edifice with a Greek facade, named after President Domingo Faustino Sarmiento (1811-86), who was a native of this city. There is also a botanical garden.

San Juan was founded in 1561 by Juan Yufre, a companion of Captain Castillo, the founder of Mendoza. Both came from Chile, to which these outlying colonies were at first subject. From 1776 to 1820 it was governed from Mendoza, and then a popular uprising made the province independent and the town its capital. It

has suffered severely from political disorders, and in 1894 was nearly destroyed by an earthquake. The original settlement, now called Pueblo Viejo, 4 m. N., was abandoned on account of frequent inundations. The present town is situated about 2,165 ft. above sea-level and is defended from inundations by an embankment above the town, called the Murallón. San Juan exports wine, and has trade with Chile over the Patos and Uspallata passes.

SAN JUAN, the capital of Puerto Rico and its oldest, largest and most important city. Its population according to the census of 1930 was 114,715; and was in 1940, 169,247. The present and permanent location of the city is on an island near the north coast of Puerto Rico. In its growth it has crossed the San Antonio

BY COURTESY OF THE U.S. BUREAU OF INTERNATIONAL AFFAIRS

THE GOVERNOR'S PLACE, SAN JUAN

channel until its extensions—San-turce, Condado, Miramar and other suburban districts—have been absorbed and have become the residential portions of the city, leaving the principal business sections on the older site. Its harbour is a large and almost land-locked bay with a rather narrow entrance from the Atlantic.

The city owes its foundation to the noted explorer and colonizer, Juan Ponce de León. This romantic and gallant leader accompanied Columbus on his second voyage, when he discovered Puerto Rico, in 1493. Afterward, in 1508, Ponce de León was sent on an exploring expedition to the island, and then for the first time saw the bay on which San Juan is situated and called it "Puerto Rico," or Rich Port. After reporting his discoveries he was again sent to the island to effect a settlement, and did so near the present site of the city. The first settlement, known as "Caparra," was on the mainland, because of its greater safety from enemies approaching from the sea. Soon, however, that site was abandoned, and the present one was selected and has ever since been maintained. Substantial buildings, forts and fortifications were built during the following years. The city was completely surrounded by a massive wall, with moats and gates and bridges which made San Juan a typical walled city of the Spanish type. On a high bluff overlooking and commanding the entrance to the harbour Morro Castle was built for the protection of the harbour and city against the numerous fleets of the enemies of Spain. Along the harbour walls were other fortifications, and on the ocean front, besides Morro Castle, the great fortress of San Cristóbal, the Escambrón, the Princesa and other batteries were built.

Streets and Buildings.—The city is of the Spanish type, with narrow streets and numerous and rather low buildings, with balconies. Among the notable modern buildings are the marble capitol, of classic type, completed in 1928; the Condado-Vanderbilt hotel, one of the best in the tropics; the Federal building, housing the post office, the U.S. Court and other Federal offices; the U.S. customs house; the beautiful building of Spanish type, the School of Tropical Medicine; the Puerto Rico casino; the Atheneum, the Y.M.C.A. building; the Carnegie Library and the Central High School building. The city retains much of its ancient characteristics however.

There are many buildings of historic interest. Besides the old castles, El Morro and San Cristóbal, are the Casa Blanca, built for the son of Ponce de León, and the cathedral, which contains his tomb. The imposing and interesting building, La Fortaleza, now and for many years the governor's residence and offices, was commenced and partially built in 1533, only 40 years after Columbus's discovery of the island. It was also called in Spanish times, "The Palace of Santa Catalina."

Commerce.—The harbour is one of the best and most commodious in the West Indies. Several passenger steamers are in regular service between San Juan and New York. Steamers from France and Spain visit the island. Freight lines connect the city and nearly all Southern and Eastern ports of the States, and

regular service is maintained with other West Indian islands. Passenger and freight service is also maintained with South American ports. The number of vessels entering and clearing San Juan is nearly 3,000 annually, and is steadily increasing.

A large proportion of both exports and imports from and to the island pass through San Juan. Sugar, coffee, tobacco and fruits are the principal products exported, while the principal imports are lumber, iron and steel, machinery, automobiles and trucks, flour, rice and other food products. The city is a distributing point for the West Indies of many important manufactured products.

(H. M. T.; X)

SAN JUAN or HARO ISLANDS, an archipelago (San Juan, Orcas, Shaw, López, Blakely, Cypress, etc.) lying between Vancouver island and the mainland of North America. These islands were for many years the subject of dispute between the British and the U.S. Governments, and were finally assigned to the latter country by the arbitration of the emperor of Germany (on Oct. 21, 1872). Geographically, the cluster certainly belongs to the mainland, from which it is separated by Rosario Strait, generally much under 50 fathoms in depth, while Haro Strait, separating it from Vancouver island, has depths ranging from 100 to 190 fathoms. In 1873 the islands, formerly considered part of Whatcom county, Wash., were made the separate county of San Juan. Of the total area of 200 sq.m., about 60 are in San Juan, 60 in Orcas and 30 in López.

See Papers relating to the Treaty of Washington, vol. v. (1872), and the map in *Petermann's Mitteilungen* (1873).

SANKARAN NAIR, SIR CHETTUR (1857-1934), Indian jurist and politician, was born in the Malabar country on July 11, 1857, and educated for a legal career. Enrolled as a vakil of the Madras high court, he was appointed in 1899 government pleader and public prosecutor in Madras. In 1907 he was appointed advocate general, being the first Indian to hold the post in the province. In the following year he was made puisne judge of the Madras high court. He was by this time well known as a strong social reformer, a supporter of the Indian National Congress (being president of the 13th meeting, held at Amraoti in 1897), as a publicist and as founder and editor of the *Madras Review* and *The Madras Law Journal*. He was for many years a member of the Madras legislature. One of the first Indians and the first Madrasi to become a member of the Government of India he was selected for the education portfolio in 1915, but resigned in July 1919, on the ground that martial law was being continued in the Punjab too long after the disturbances had ceased. Taking a favourable view of the Montagu-Chelmsford reforms, he was appointed to the India Council in London in January 1920, but resigned to take office in the Indore State in November 1921. A vigorous condemnation of the non-cooperation movement entitled *Gandhi and Anarchy* (1922) contained references to the Punjab troubles, which led Sir Michael O'Dwyer, late lieutenant-governor of the Punjab, to bring a successful libel action against the author in London in the summer of 1924. Elected a member of the Council of State of India in 1925 Nair continued to pursue an independent line, and when that house decided in 1928 to co-operate with the Statutory Commission under Sir John Simon, the viceroy appointed him chairman of the all-India Committee to sit with the Commission, comprising members of both houses of the legislature.

(F. H. BR.)

SANKEY, JOHN SANKEY, 1ST VISCOUNT (1866-), British lawyer, was born on Oct. 26, 1866. Educated at Lancing and at Jesus College, Oxford, he was called to the bar at the Middle Temple in 1892. He took silk in 1909, and from that time advanced rapidly in his profession. He became a judge in the King's Bench division in 1914, and a lord justice of appeal in 1928. Sankey was chairman of the royal commission on the coal industry in 1919. In 1929 he was raised to the peerage and appointed lord chancellor. He was created a viscount in 1932, and retired in June 1935.

SANKEY COMMISSION: see COAL AND COAL MINING.

SĀNKHYA or SAMKHYA, the oldest system of Indian philosophy, its founder, Kapila, having been born at Kapilavastu, probably a century before Buddha's birth. For the system see

SANSKRIT LANGUAGE AND LITERATURE: Philosophical Systems.

SAN LEANDRO, a city of Alameda county, California, U.S.A., adjoining Oakland on the south. It is served by the Southern Pacific and the Western Pacific railways. Pop. (1920) was 5,703 (32% foreign-born white) and was 14,601 in 1940 by the federal census. Its manufactures include caterpillar tractors, motor parts, hosiery, and canned and evaporated fruit. A cherry festival is held annually. The city was settled in 1836 and incorporated in 1872. It has a city-manager form of government.

SAN LUCAR (SANLÚCAR DE BARRAMEDA), a fortified seaport of southern Spain, in the province of Cádiz; 27 mi. by sea from CQdiz, on the left bank of the Guadalquivir estuary, and on the Pherto de Santa Maria-San Lucar and Jerez de la Frontera-Bonanza railways. Pop. (1930), 26,887. Inscriptions and ruins prove that San Lucar and Bonanza were Roman settlements, though the original names are unknown. San Lucar was captured from the Moors in 1264, after an occupation lasting more than five and a half centuries. After 1492 it became an important centre of trade with America. From this port Columbus sailed across the Atlantic in 1498, and Magellan started in 1519 to circumnavigate the world. The 14th-century church and the palace of the dukes of Medina Sidonia contain many valuable pictures. The hospital of St. George was established by Henry VIII. of England. The Guadalquivir estuary is deep and sheltered. Bonanza, 2 mi. by rail up the river, and on the same bank, is the headquarters of the shipping and fishing trades. It is named after a chapel dedicated here by the South American Company of Seville to the Virgin of Fair Weather (Virgen de la Bonanza). The fisheries and agricultural trade of San Lucar are considerable; there are flour mills in the town.

SAN LUIS, a province of Argentina, bounded N. by Rioja, E. by Córdoba, S. by the La Pampa territory and W. by Mendoza. Area, 29,700 sq.mi. Pop. (1914) 116,266; 1940 estimate 200,135. San Luis belongs partly to the semi-arid pampa region, and partly to the mountainous region of the eastern Andes and Córdoba, whose ranges terminate between the 33rd and 34th parallels. It is one of the least important of the Argentine provinces because of its aridity and lack of available resources. Agriculture and grazing occupy some attention in the north, but are handicapped by lack of water. The mountains are rich in minerals, however, and a number of gold mines have been opened. The exports include cattle, hides, skins, wool and ostrich feathers. The capital is San Luis (pop. 1914, about 14,000) on the Arroyo Chorillos, a little S. of the *cerro* called Punta de los Venados, 161 mi. by rail from Mendoza, and magnificently situated on a plateau 2,490 ft. above sea-level. Next in importance is the town of Mercedes or Villa Mercedes (pop. 1914, about 18,250) on the Rio Quinto, an important railway junction where the railways from Buenos Aires, Rosario, Mendoza and San José unite.

San Luis was founded in 1697 by Martin de Loyola and was for nearly 200 years only a frontier outpost.

SAN LUIS OBISPO, a city of California, U.S.A., 8 mi. from the ocean and 190 mi. N.W. of Los Angeles; county seat of San Luis Obispo county. It is on federal highway 101 and is served by the Pacific Coast and the Southern Pacific railways. Pop. (1930) 8,276; (1940) 8,881. Its harbour (Port San Luis, on the bay 9 mi. S.W. of the city) is one of the important oil ports of California. The city was founded by Father Junipero Serra, who built there his fifth mission, now used as a parish church.

SAN LUIS POTOSÍ, a central State of Mexico, bounded north by Coahuila, east by Nuevo León, Tamaulipas and Veracruz, south by Hidalgo, Querétaro and Guanajuato, and west by Zacatecas. Area, 24,415 sq. miles. Pop. 579,831 in 1930. The State belongs wholly to the high plateau region, with the exception of a small area in the S.E. angle, where the tableland breaks down into the tropical valley of the Pánuco. The surface is comparatively level, with some low mountainous wooded ridges. The mean elevation is about 6,000 ft., ensuring a temperature climate. The rainfall is light and uncertain and the State is poorly provided with rivers. The soil is fertile and in favourable seasons large crops of wheat, Indian corn, beans and cotton are grown on the uplands. In the low tropical valleys, sugar, coffee,

THE TOWN OF SAN MARINO, CAPITAL OF THE REPUBLIC

San Marino, founded probably in the 4th century, is situated on the slopes of the mountain whose steep sides and crags constitute in great part the territory of the Republic. It has three citadels, all overlooking Rimini (Italy) and the Adriatic. The turreted building on the left is the Parliament house

tobacco, peppers and fruit are staple products. Stock-raising is an important industry and hides, tallow and wool are exported. Fine cabinet and construction woods are also exported to a limited extent. San Luis Potosi ranks among the leading mining states of Mexico. The Catorce district has some of the richest silver mines in the country. Other well-known silver mining districts are Peñón Blanco, Ramos and Guadalcizar. The development of Guadalcázar dates from 1620 and its ores yield gold, copper, zinc and bismuth, as well as silver. In the Ramos district, Cocinera lode is said to have had a total yield of over \$60,000,000. Railway facilities are provided by the Mexican Central and Mexican National lines. The capital is San Luis Potosi, and other towns, with populations as of 1930, are: Matehuala (13,795), a mining town 20 m. E. by W. of Catorce, with which it is connected by a branch railway; Catorce (7,000 in 1910 and only 611 in 1930), an important mining town 110 m. N. (direct) of San Luis Potosi (capital) and 8 m. from its railway station on the Mexican National; at an elevation of 8,780 ft., Santa Maria del Rio (2,759), 37 m. S.E. of the capital; Venado (1,756), 45 m. N. of the capital; Rio Verde (7,963), an agricultural centre with a national agriculture experiment station in its vicinity; Soledad Diez Gutiérrez (3,538) near the capital.

SAN LUIS POTOSÍ, a city of Mexico and capital of a State of the same name, near the head of the valley of the Rio Verde (a tributary of the Pánuco), 21½ m. N.W. of Mexico City. Pop. (1937) 92,000. The city is served by the Mexican Central and the Mexican National railways. The altitude of the city, 6,168 ft. above sea-level, gives it a cool temperate climate, though the sun temperatures are high. Notable buildings are the cathedral and Government palace fronting on the Plaza Mayor, the latter conspicuous for its façade of rose-coloured stone; the churches of El Carmen, San Francisco and Guadalupe; the La Paz theatre, mint, penitentiary and the Instituto Científico, in which law, medicine and science are taught. San Luis Potosi is an important railway and distributing centre, with a considerable trade in cattle, tallow, wool, hides and minerals. Its proximity to the port of Tampico, with which it was connected by a branch of the Mexican Central railway in 188 j, has greatly increased its commercial importance, though in earlier days it was also one of the principal centres of the diligence and pack-train traffic of this part of Mexico. The city has cotton and woollen factories using modern machinery, and large smelting works.

San Luis Potosi was founded in 1586. It was the centre of colonial administration and played a very important part in the civil wars and political disorders following Mexican independence. It was the seat of the Mexican Government of Benito Juárez in 1863, but was soon afterwards captured by the French under Bazaine. It was recovered by Juárez in 1867, after the French had retired.

SAN MARCOS, a city of south central Texas, U.S.A., on federal highway 81, 30 mi. S. of Austin; county seat of Hays county. It is served by the Missouri-Kansas-Texas and the Missouri Pacific railways. Pop. (1930) 5,134; 6,006 in 1940 by the federal census. It is the seat of the Southwest Texas teachers college and San Marcos academy. San Marcos has three pedigreed cotton-seed breeders. Livestock, sheep and goat ranching are sources of income. It is the wool trade centre of southwest Texas; site of a wool-scouring plant and a factory for virgin wool comforters and blankets. San Marcos was founded in 1848 and was chartered as a city in 1877.

SAN MARINO, a republic in northern Italy, 14m. S.W. of Rimini by road. It is the smallest republic in the world (32 sq.m. in area). According to tradition, the republic was founded by Marinus, a native of Arbe, probably after the middle of the 4th century. The *Castellum Sancti Marini* is mentioned in 755, the oldest document in the Republican archives mentions the abbot of San Marino in 88j. The republic, as a rule, avoided the faction fights of the middle ages, but joined the Ghibellines and was interdicted by the pope in 1247-49. After this it was protected by the Montefeltro family, later dukes of Urbino, and the papacy and successfully resisted the attempts of Sigismondo Malatesta against its liberty. In 1503 it fell into the hands of Caesar Borgia,

but soon regained its freedom. Other attacks failed, but civil discords in the meantime increased. Its independence was recognized in 1631 by the papacy. In 1739 Cardinal Alberoni attempted to deprive it of its independence, but this was restored in 1740 and was respected by Napoleon. The arms of the republic are three peaks, each crowned with a tower. There are traces of three different enceintes of the 14th, 15th, and 16th centuries. The principal church (Pieve), in classical style, dates from 1826-38 and contains the body of St. Marinus. The old church is first mentioned in 951. The available armed forces of the republic form a total of about 1,200 men, all citizens able to bear arms being technically obliged to do so from the age of 16 to 60 years. It issues its own copper coinage, which circulates in Italy also; but Italian money is current for the higher values. Most of the republic falls within the diocese of Montefeltro, a small portion within that of Rimini.

The peaceful revolution of March 25, 1906, restored the original system of election to the council (which had become a close corporation, renewed by co-option) by the *Arengo*, or assembly of heads of families, one-third of the council being henceforth renewable every three years. But in Sept. 1920 the council resigned in a body and enlarged the *Arengo* into a single constituency, electing the 60 councillors under practically universal suffrage and proportional representation.

San Marinese public life takes its colour from Italy; thus, the Catholic Popular Party there, as in Italy, became powerful, and Socialism, imported from abroad, was largely represented, at least until Fascism appeared. Pending the election of their successors after the vote of 1920, the two half-yearly presidents of the republic, for the first time since 1787, remained in office after their six months' legal tenure had expired, and, for the first time since 1740, the new *Capitani Reggenti* came into power on Dec. j instead of Oct. 1 or April 1, the time-honoured dates, a return to which was effected at the ensuing election of presidents.

In World War I the Germans accused the republic of espionage through the wireless station on Mt. Titano, which stands 2,437 ft. above the sea. When Italy entered the war, San Marino showed its sympathies by voting £1,500 for the Italian sufferers, and one of the regents publicly expressed his hope for an Italian victory. San Marino has been since 1862 in treaty relations with Italy. In 1921 the flight of socialists into the republic, and the "punitive expedition" of the Fascisti in search of them, led San Marino to invoke the aid of the Italian Carabinieri.

The republic no longer confers titles for a consideration, but finds a fruitful source of revenue in the frequent changes of its postage stamps (first issued in 1877 and divided into two series, one for foreign and the other for internal postage, in 1899). However, it has had to resort to a loan, and new taxes were imposed to provide higher salaries for officials, causing the peasant rising in 1910. But it steadily refused the offer of a gaming table. Newspapers were established in the republic. The only exports, besides postage stamps, are stone from Mt. Titano—the legendary founder of San Marino was a Dalmatian stone cutter—and the strong wine grown on this volcanic soil. The museum contains among other curiosities the banner of Garibaldi's "Italic Legion," which sought refuge at San Marino in 1849. The archives were re-arranged and described by Malagola. The population in 1939 was 14,547.

SAN MARTÍN, JOSÉ DE (1778-1850), South American soldier and statesman, was born at Yapeyú, on the river Uruguay, on Feb. 25, 1778. He was educated in Madrid for a military career and served against the Moors and in the struggle against Napoleon. In 1812 he offered his services to the Government of

Buenos Aires in its war for independence. Early in 1814 he was placed in command of the revolutionary army operating against the Spaniards in upper Peru, but soon resigned his command, realizing that the permanent success of the revolutionary movement depended upon the expulsion of the Spaniards from Chile, and also from their stronghold in Peru. To carry out this purpose, he enlisted the co-operation of the government of Buenos Aires, and, assisted by Bernardo O'Higgins, raised and equipped at Mendoza, a well-trained army of Argentines and Chileans for the invasion of Chile. In Jan. 1817, he suddenly carried his army (3,000 infantry, 1,000 cavalry and baggage) across the Andes through the Uspallata pass, outgeneraled the Spanish commanders and routed a large part of their forces at Chacabuco, on Feb. 12, 1817. Northern Chile, including Santiago, the capital of the country, being now freed of the Spanish, he turned the government over to O'Higgins, and set about the reconquest of the south, which he effected in the decisive victory of Maipú (April 5, 1818), thus completely establishing the independence of Chile.

With half of his program accomplished, he laid his plans for the attack upon Peru. He not only reorganized the army, but with the aid of Lord Cochrane constructed a fleet to operate simultaneously with it. In July 1821, the Spaniards evacuated Lima before the combined forces of the army and navy, and retired to the mountains. San Martín entered the city, proclaimed the independence of Peru, and assumed the reins of government under the title of protector. His position, however, was not yet secure. He was threatened by royalist operations in the interior, by jealousy among the patriots and by the rivalry of Bolívar, whose victories in Colombia and Ecuador had carried him southward to the northern borders of Peru. The great Colombian's ambition could brook no rival, and on Sept. 20, 1822, San Martín, having paved the way for the conclusive victories of Junín (1824) and Ayacucho (1824), resigned his authority and retired from the country. Finding it impossible to live a peaceful private life in South America, he withdrew as an exile to Europe. There he lived in poverty until his death at Boulogne on Aug. 17, 1850, from time to time vainly offering his services to the distracted nations he had helped to found.

San Martín did more than any other man for the cause of independence in the Argentine, Chile and Peru. He was an able soldier and a clear-sighted and vigorous statesman.

SAN MARTIN, a department of Peru, estimated to contain 17,450 sq. mi., created in 1906. It includes mountainous areas and the valley of the Huallaga river, a tributary of the Marañón, which flows into the Amazon. It is bounded north and east by the department of Loreto, from which it was formed, south by Huánuco and west by the departments of Libertad and Amazonas. Its population (1940) was 120,913. The capital is Moyobamba, situated on the Mayo river, a tributary of the Huallaga. The principal trade outlet is through Yurimaguas (Loreto), a river port on the Huallaga, down to Iquitos on the upper Amazon, about 500 mi. distant.

SAN MATEO, a city of San Mateo county, California, U.S.A., on the west side of San Francisco bay, 19 mi. S. of San Francisco. It has a commercial airport and is served by the Southern Pacific railway and by bus lines. Pop. (1940) 19,403 by federal census. The city operates under a city-manager form of government.

SANMICHELE, MICHELE (1484-1559), Italian architect, was born in San Michele near Verona. He was a pupil of his father Giovanni and his uncle Bartolommeo, both architects at Verona, and went at an early age to Rome to study classic sculpture and architecture. Among his first works are the duomo of Montefiascone, the church of San Domenico at Orvieto, several palaces and a fine tomb in S. Domenico. He was also employed by the signoria of Venice as a military architect. One of Sanmichele's most graceful designs is the Cappella de' Peregrini in the church of S. Bernardino at Verona. He built a number of

fine palaces at Verona, including those of Canossa, Bevilacqua and Pompei, as well as the graceful Ponte Nuovo. In 1527 Sanmichele began to transform the fortifications of Verona according to the newer system of corner bastions which he did much to advance. His last work (1559) was the round church of the Madonna di Campagna, 1½ mi. from Verona. He also wrote a work on classic architecture, *I Cinque Ordini dell' architettura*, printed at Verona in 1735.

See Ronzani and Luciolli, *Fabbriche . . . di M. Sanmichele* (Venice, 1832); and Selva, *Elogio di Sanmichele* (Rome, 1814).

SAN MIGUEL, the capital of the department of San Miguel, Salvador; 80 mi. E. by S. of San Salvador, near the right bank of the Rio Grande, and at the foot of the volcano of San Miguel or Jucuapa (7,120 ft.). Pop. (1940) 18,854. San Miguel is an important and attractive city, on the main line of the International railways of Central America. It possesses several handsome churches, municipal buildings, law courts and two well-equipped hospitals.

Near it are the ruins of an ancient Indian town. San Miguel has a flourishing trade in coffee, cotton, sisal, grain, cattle and indigo. Its port is La Unión (*q.v.*).

San Miguel was founded in 1530 by Spanish settlers and became a city in 1586.

SAN MIGUEL, a municipality (with administrative centre and 18 *barrios* or districts) of the province of Bulacan, Luzon, Philippine Islands, about 40 mi. N. of Manila on the Manila-Dagupan railway. Pop. (1939), 26,759 of whom 13,505 were males and 5 were white. The fertile surrounding region produces abundant crops of palay (rice). Maize (corn) and sugar are also produced. Cattle breeding and fish breeding are extensively carried on, and the municipality is noted for the manufacture of hats and silk textiles, furniture, and alcohol from the nipa palm. There is much weaving and tanning. Sibul springs, about 8 mi. N.E., is a health resort. Tagalog is the vernacular. Of the inhabitants of San Miguel aged 6 to 19 inclusive, 32.3% attended school in 1939, while 64.2% of the population 10 years old and over was literate.

SAN MINIATO, a town and episcopal see of Tuscany, Italy, in the province of Pisa, 26 mi. W. by S. of Florence by the railway to Pisa, 512 ft. above sea level, on a hill 2 mi. S. of the railway. Pop. (1936) 3,082 (town); 21,463 (commune). Its cathedral was remodelled in 1489 and has a façade decorated with disks of majolica. It has other churches of some interest. It manufactures glass, olive oil, leather and hats and has a castle of Frederick II, the residence of the imperial governors of Tuscany from 1226 to 1286, and from them bears the name of San Miniato al Tedesco.

SAN NICOLÁS DE LOS ARROYOS, a town and river port of Argentina, in the province of Buenos Aires, on the west bank of the Paraná, 150 mi. by rail N.W. of the city of Buenos Aires.

Population, about 30,000. It is a flourishing commercial town and a port of call both for river and ocean-going steamers of medium tonnage. It is a station on the main line of the Central Argentine railway and the terminus of a branch line from Pergamino.

It exports wheat, flour, wool and frozen mutton. The town is the judicial centre for the northern district of Buenos Aires. San Nicolás was founded in 1749 by José de Aguilar on lands given for that purpose by his wife (*née* Ugarte).

Its growth was very slow until near the end of the 19th century.

SANOCRY SIN. A gold compound used in the treatment of pulmonary tuberculosis. (See MEDICAL RESEARCH.)

SAN PABLO, a municipality of the province of Laguna, Luzon, Philippine islands, about 9 mi. S. of Laguna de Bay, and about 35 mi S.S.E. of Manila. Pop. (1939) 46,311 (a gain of 14,912 since 1918) of whom 22,952 were males and 32 were white. It has railway connections with Manila by way of Malvar, in the province of Batangas. Coconut palms grow in great abundance, and copra is the chief product. Abacá and rice are also grown.

The language spoken is Tagalog.

(C. S. L.)

SANQUHAR, a royal burgh and parish of Dumfriesshire, Scotland. Pop. (1938) 1,885. It is situated on the Nith, 26 m. N.W. of Dumfries by the L.M.S. railway. It became a burgh of barony in 1484 and a royal burgh in 1596, and was the scene of the exhibition of the Covenanters' Declaration, attached to the market cross in 1680 by Richard Cameron and in 1685 by James Renwick. The industries include coal-mining and the making of iron and steel, bricks and tiles, spades and shovels. The coal-field is very extensive. There are cattle and sheep fairs, and an agricultural show is held every May. Sanquhar castle, on a hill overlooking the Nith, once belonged to the Crichtons, ancestors of the marquess of Bute, but is now a ruin.

SAN RAFAEL, a beautiful residential city of California, U.S.A., 10 m. N. of San Francisco, on San Pablo Straits, at the foot of Mount Tamalpais; the county seat of Marin county. It is served by the Northwestern Pacific railroad and interurban bus lines. Pop., 1940, federal census, 8,573. There are private schools and the Dominican college (established in 1850, at Monterey). A Franciscan mission was established here in 1817 and around it a settlement grew up. Of the mission nothing remains but a group of pear trees planted by the Fathers and still bearing in 1941. The city was incorporated in 1874.

SAN REMO, a seaport of Liguria, Italy, in the province of Imperia, on the Riviera di Ponente, $9\frac{3}{4}$ m. E. of Ventimiglia by rail, and 84 mi. S.W. of Genoa. Pop. (1936) 23,963 (town); 31,769 (commune). Climbing the slope of a steep hill it looks south over a small bay, and, protected towards the north by hills rising gradually from 500 to 8,000 ft., it is in climate one of the most favoured places on the whole coast, which accounts for its reputation as a winter resort. The older town, with its narrow steep streets and lofty sombre houses protected against earthquakes by arches connecting them, contrasts with the new visitors' town, containing all the public buildings, which has grown up at the foot of the hill. The small harbour is sheltered by its sickle-shaped mole, 1,300 ft. long. Besides the Romanesque cathedral of San Siro, the white-domed church of the Madonna della Costa, at the top of the old town, may be mentioned. The Emperor Frederick's residence at San Remo in 1887-1888 greatly increased its repute as a winter resort. Flowers, especially roses and carnations, are extensively grown for export, and olives, lemons and palms are also cultivated.

SAN REMO, CONFERENCE OF (April 19-26, 1920). This conference was preceded by a meeting of the Supreme Allied Council (Mr. Lloyd George, M. Millerand, and Sig. Nitti) from Feb. 12 to 23 in London, where the main lines of the future Treaty of Sevres (see SEVRES, TREATY OF) with Turkey were laid down, and the draft treaty with Hungary and the Fiume question were discussed. At San Remo itself, where the three statesmen above mentioned were joined by representatives of Greece, Belgium and Japan, the Turkish Treaty was the first and principal business dealt with, and the framework of the Sevres Treaty was there constructed. The mandates for Syria, Palestine and Iraq were assigned to France and Great Britain respectively, and an Anglo-French oil agreement was negotiated which covered Rumania and the French and British non-self-governing colonies as well as the Middle East. The most controversial question dealt with, as between the Allies, was that of the maximum strength of the German army—both its total and the number of troops allowed in the neutral zone skirting the area under Allied occupation. On account of the Kapp Putsch and other internal disorder: the German Government asked the conference to permit the increase of the German army to twice the strength allowed by the Versailles Treaty. This request was refused and Germany charged with default in respect both of reparations and disarmament. At the same time the German Government was informed of the intention of the Allies to invite them to a direct conference. (See SPA, CONFERENCE OF.)

SAN SALVADOR, the capital of the republic of Salvador; situated in the valley of Las Hamacas, on the river Asalguate, at an altitude of 2,115 ft., and 30 m. inland from the Pacific. Pop. (1940) 100,796. San Salvador is connected by rail with La Unión on the Pacific and with all of the chief cities of Salvador,

and by the through line of the International Railways of Central America and the National Railways of Mexico with Guatemala, Mexico and the United States; also with the Pacific port of Acajutla by the older Salvador railway. It is connected with the port of La Libertad by a fine, hard-surfaced highway. In addition to the government offices, its buildings include a handsome university, a modest cathedral, a national theatre, an academy of science and literature, a chamber of commerce, an astronomical observatory and a number of hospitals and charitable institutions. There are two large parks and an excellent botanical garden. In the Plaza Morazán, the largest of many shaded squares, is a handsome bronze and marble monument to the last president of united Central America, from whom the plaza takes its name. San Salvador is the only city in the republic which has important manufactures; these include the production of soap, candles, ice, shawls and scarves of silk, cotton cloth, cigars, flour and spirits. The city is excellently paved with concrete, is admirably policed, has an abundant water supply, and can in many respects compare favourably with the smaller provincial capitals of Europe and America. It was founded by Don Jorge de Alvarado in 1528, at a spot near the present site, to which it was transferred in 1539. Except for the year 1839-40 it was the capital of the republic from 1834 on. It was temporarily ruined by earthquakes in 1854 and 1873.

SAN SALVADOR DO CONGO: see ANGOLA.

SANS-CULOTTES, the term originally given during the early years of the French Revolution to the ill-clad and ill-equipped volunteers of the Revolutionary army, and later applied generally to the ultra-democrats of the Revolution. They were for the most part men of the poorer classes, or leaders of the populace, but during the Terror public functionaries and persons of good education styled themselves *citoyens sans-culottes* ("citizens without knee-breeches"). The distinctive costume of the typical *sans-culotte* was the *pantalon* (long trousers)—in place of the culottes worn by the upper classes—the *carmagnole* (short-skirted coat), the red cap of liberty and *sabots* (wooden shoes). The influence of the *Sans-culottes* ceased with the reaction that followed the fall of Robespierre (July 1794), and the name itself was proscribed. In the Republican Calendar the complementary days at the end of the year were at first called *Sans-culottides*; this name was, however, suppressed by the Convention when the constitution of the year III. (1795) was adopted, that of *jours complémentaires* being substituted.

SAN SEBASTIAN (Basque *Iruñulo*, and officially Guipúzcoa), a seaport and capital of the Spanish province of Guipúzcoa, on the Bay of Biscay, and on the Northern railway from Madrid to France. Pop. (1940) 98,141. The city became the summer residence of the court in 1886. It occupies a narrow sandy peninsula, which terminates on the northern or seaward side in a lofty mass of sandstone, Monte Urgull; it is flanked on the east by the estuary of the river Urumea, on the west by the broad bay of La Concha. The old town, rebuilt after the fire of 1813, lies partly at the foot of Monte Urgull, partly on its lower slopes. Until 1863 it was enclosed by walls and ramparts, and a strong fort, the Castillo de la Mola, still crowns the heights of Urgull. The Alameda separates the old town from the new and gardens and villas now extend right up Monte Igueldo. The bay of La Concha has a broad sandy shore. There are saw and flour mills, and manufactures of preserves, soap, candles, glass and paper, especially in the busy suburb that has sprung up on the right bank of the Urumea. The fisheries are important. Vessels of 12 ft. draught can nearly always enter both dock and harbour. Larger vessels anchor south-east of Santa Clara Island. Nationalist forces captured San Sebastian during the civil war of 1936-39.

SAN SEVERINO (anc. *Septempeda*), a town and episcopal see of the Marches, Italy, in the province of Macerata, from which it is 18 mi. W. by S. by rail. Pop. (1936) 3,975 (town); 16,141 (commune). The lower town is situated 781 ft. above sea-level, and contains the new cathedral of S. Agostino, with a fine altar-piece by Pinturicchio (1489). S. Lorenzo in Doliolo and S. Domenico are both Romanesque churches. The Palazzo

Comunale has some interesting pictures by artists of the Marches. Lorenzo and Giacomo Salimbeni da San Severino, who painted an important series of frescoes in the oratory of S. Giovanni Battista at Urbino in 1416, were natives of the town. So was Lorenzo di Alessandro, of the end of the 15th century, whose pictures are mainly to be found in the Marches. The old cathedral of S. Severino is in the upper town (1,129 ft. above sea-level); it contains frescoes by the two Salimbeni, and very fine choir stalls (1483-1513). The ancient Septempeda lay 1 m. below the modern town, on the branch road which ran from Nuceria Camellaria, on the Via Flaminia.

SAN SEVERO, a city in Apulia, Italy, in the province of Foggia, from which it is 17 mi. N.N.W. by rail. Pop. (1936) 37,159 (town), 37,702 (commune). It lies at the foot of the spurs of Monte Gargano, 292 ft. above sea-level. It is the see of a bishop (since 1580), and has some remains of its old fortifications. San Severo dates from the middle ages. It was laid in ruins by Frederick II. In 1799 the town was almost entirely destroyed by the French. In 1627, 1828 and 1851 the town suffered from earthquakes. It is surrounded by fertile vineyards and oliveyards.

SANSKRIT LANGUAGE AND LITERATURE. The most important branch of the Indo-European family of languages in Asia is Aryan or Indo-Iranian, with two main divisions: Iranian and Indo-Aryan. Languages belonging to the latter are spoken to-day by 250 million people in India, where they are the dominant languages except in the south, in Ceylon and the Maldiv Islands, and throughout western Asia and Europe by colonies of Gypsies (see ROMANY LANGUAGE). As languages of administration they spread at one time far into central Asia, where now is Chinese Turkestan; and as vehicles of Buddhism they have influenced through translation the whole of central and eastern Asia; Hindu civilization carried their vocabulary into the East Indies and the Malay peninsula. The oldest documents of Indo-Aryan are composed in Sanskrit. These are the Vedic texts. Their exact date is unknown, but it is probable that the oldest of them belong to the latter half of the second millennium B.C. They were probably composed before the Aryans had learned the use of writing; but being religious texts which it was essential to preserve unchanged they were handed down by an oral tradition which by various controls was made exceedingly exact. Even at the time of entry into India there must have been some

dialectical differences in the language as spoken by the various invading tribes; with their further extension into India itself these differences became accentuated. The language of the Vedic texts shows a certain mixture, but is in the main founded upon the dialect of the north-west of India. With the advance of Aryan culture into the Punjab and the Gangetic plain the eastern dialects gained in importance; and this eastern influence, discernible in the earliest texts, constantly gains ground.

The most archaic of these texts is the *Rig-veda*, a collection of liturgical hymns; this is followed by the *Atharva-veda*, consisting chiefly of magical formulas, of prayers, curses and incantations. Considerably later come the first compositions in prose, commentaries on the Veda and philosophical treatises termed *Brāhmaṇas* and *Upanishads*. Although originally preserved as a religious language, Sanskrit was finally used for secular purposes. The earliest inscription in Sanskrit dates from 150 A.D., but it became the regular language of official inscriptions only in the 4th century A.D. But long before that the grammarians (of whom the most celebrated was Pāṇini in the 4th century B.C.) had fixed it as a learned language to which alone a strict interpretation confines the name Sanskrit, "the perfected," but which may conveniently be termed Classical Sanskrit as opposed to the Vedic or older form. As a literary language it is still cultivated; and a vast literature—philosophical, narrative, lyrical, dramatic, technical—has been written in it. Standing, in form at least, between the later Vedic and the Classical, but more nearly approaching the latter, is the language of the two great epics, the *Mahābhārata* and the *Rāmāyaṇa*, in which the influence of the spoken language can clearly be seen. For in the meantime the spoken dialects continued to develop. Some of these, such as Pali and the Prakrits (*qg.v.*), were in turn crystallized and used as religious languages

by new sects as well as for secular purposes before Sanskrit was so employed. From these vernaculars are eventually derived the modern Indo-Aryan languages. Sanskrit, the literary language, although preserving the sound-system of Vedic practically unchanged, did not escape the influence of its descendants. The grammar was considerably changed, chiefly in a simplifying and normalizing direction; meanings of words were altered and de-

FROM MACDONELL, "SANSKRIT GRAMMAR FOR STUDENTS" (CLARENDON PRESS)

veloped, and vast quantities of new words were gradually absorbed after being given a Sanskrit form. On the other hand Sanskrit has continued to influence the spoken languages.

Sounds.—The sound-system of Sanskrit consisted of: (a) Fourteen vowels, viz.: Twelve simple vowels: a, ā, ī, ī, u, ū, ṛ, Ṛ, ṛ, Ṛ, (ḷ), e, o. Two diphthongs: ai, au.

(b) Thirty-six consonants, viz.: Five series of stops and nasals: guttural: k, kh, g, gh, ṅ; palatal: c, ch, j, jh, ṅ; cerebral: t, th, ḍ, ḍh, ṇ; dental: t, th, d, dh, n; labial: p, ph, b, bh, m. Four semi-vowels: y, r, l, v. Three sibilants: palatal ś, cerebral ṣ, dental s. Two aspirates: voiced h, unvoiced ḥ (*visarga*). A nasal with loose closure of the lips ṁ (*anusvāra*), and another nasal ṁ (*anunāsika*) which probably was a simple nasalization of the vowel rather than a consonant proper.

Vowels.—The vowel-system was inherited practically unchanged from the common Indo-Iranian period, the only specific Sanskrit development being the change of the Indo-Iranian short diphthongs *ai, *au (=Avestic aē, ao) to ē, o (still classed as diphthongs by Indian grammarians) and of the long diphthongs *āi, *āu to ai, au. Thus to Avestic *daēvo haomo uxδāiš gāuš* Sanskrit corresponds with *dēvāḥ sōmāḥ ukthāiḥ gāuḥ*. The comparative simplicity of the vowel-system and the great predominance of the vowels a and ā were due to the fact that in the Indo-Iranian period four distinct Indo-European sounds—e, o, a, ṛ (ṛ, Ṛ, ṛ, Ṛ)—had coalesced in the one sound a (similarly ē, 6, ā had all become 6). The only trace left of the earlier differentiation was the fact that an original guttural before ā representing older ē had become a palatal: thus we have *sācatē*, "follows," from **sekwetai* (Greek *hēpetai*, Latin *sequitur*), but *sākṣat*, "he shall follow" beside Gk. *he'psetai*. Similarly the 12 I.E. diphthongs—ei, oi, ai, eu,

i, au, ēi, ōi, āi, ēu, ōu, āu—were merged in four Skt. sounds *ē, ō, i, au*. In this way the vowel-alternation (especially between *e* and *o*), a characteristic feature of Indo-European, was largely lost. nevertheless, where the word contained a sonant the alternation, though diminished in scope, was still discernible: *e.g.*, I.E. *ei*: *i* became Skt. *ē*: *i* (*e.g.*, Gk. *leipei*: *loipós*: *élipe* = Skt. *rēcati*: *ṛkah*: aricat), I.E. *e, o*: *ē, ō* became Skt. *a*: *ā*. The correspondences thus resulting—*a*: *ā*; *i*: *ē*: *ai*; *u*: *ō*: *au*; *ṛ*: *ar*: *iir*—being associated with particular grammatical formations were still further developed in Sanskrit into a system, which, early recognized by the Indian grammarians, was used by them in their description of the formation of the language.

Consonants.—The consonant-system has remained much truer to the original Indo-European. It is characterized by the rarity of spirants and by the opposition of unaspirated and aspirated stops both surd and voiced) in each series. In preserving the voiced spirate stops unchanged, Sanskrit and its descendants (for most of the modern Indo-Aryan languages still possess these sounds) are unique among the Indo-European languages, in which these sounds either became surd aspirates and later spirants (as in Greek and Latin) or lost their aspiration (as in Iranian, Balto-Slavonic, Armenian, Albanian, Germanic, Celtic). Thus to Greek *hērō*, Latin *fero*, Eng. *bear*, Sanskrit corresponds with *bhārāmi*, o Gk. *éthēke*, Lat. *fēcit*, Eng. *deed* with *ddhit*.

Some consonants were restricted in their use: *ñ* appeared only before or after palatals, *ṇ* only finally or before gutturals (and where a guttural had subsequently disappeared), *ṣ* only between vowels and semi-vowels or before cerebral stops, *h* only finally or before sibilants and surd gutturals or labials, *m* only finally or before consonants. Neither aspirate nor *h* nor *ś* ended a word. At the end of a sentence only the following consonants were used: *z, t, ṭ, ṣ, ṇ, n, m, h*.

Of the palatals *ch* appears as a single consonant only initially: elsewhere it is always doubled unless preceded by another consonant, for it corresponds to the Indo-European group *sk₁*: *e.g.*, *hindānti* "they cut" = Latin *scindunt*, *gacchāmi* "I go" = Greek *báskō*, *vāñchā* "wish" = Germ. *Wunsch*. *j* represents two I.E. sounds (1) palatal *g₁* (= Gk. *g*, Avestic *z*): *jānah* "birth" = Av. *zanō*, Gk. *génos*, Lat. *genus*; (2) velar *gʷ* before an original *ē* or *ī* (= Av. *j*): *jīvāh* "alive" = Av. *jīvō*, Lat. *vivos*, cf. Gk. *bíos*, Eng. *quick*. *jh* does not belong to the Indo-European part of the vocabulary, but appears only in onomatopoeic and borrowed words, or in words taken from the vernacular in which the frequent Sanskrit groups *dhy* and *hy* became (*j*)*jh*.

Of the sibilants *ś* corresponds to I.E. palatal *k₁*: in this Sanskrit agrees with the other eastern I.E. languages (Balto-Slavonic, Albanian, Armenian, Iranian) which have an *s* or *sh* sound as opposed to the *k* (*h* in Germanic) of the western languages: *e.g.*, *śatām* "100" = Av. *satem*, Lithuanian *šimtas*, but Gk. *he-katón*, Lat. *centum*, Eng. *hundred*. Before the surd dentals this *ś* became *s*: *viśāti* "enters," *viśtāh* "entered." But *ś* also corresponds to I.E. *s* when preceded by *i, u, r* or *k*, agreeing in this with Iranian and partly with Armenian and Balto-Slavonic.

The chief innovation in the consonant-system is the introduction of the third series, the cerebrals or linguals (better termed retroflex). The dentals were formed by the tip of the tongue striking the roots of the teeth, the cerebrals by the tip of the tongue, bent backwards, striking further back on the palate. In the oldest Sanskrit they are derived from the dentals when immediately preceded by *ṣ* or **z* (which subsequently disappeared): thus **diśtas* (= Lat. *dictus*) became **diśtas* and then *diśtāh*; **miṣḍham* (= Gk. *misthós*) became **miṣḍham* and then *miṣḍham*. Later also under the influence of a preceding *r* or *z* dentals became cerebrals: such words are really loans from the popular dialect, but they begin to appear in the literary language even as early as the Rigveda: thus *vikāṭah* "monstrous" is derived from *vikṛṭah* "strange." Some words, however, contain cerebrals which cannot be explained as derived from dentals in either of these ways. It is probable that these sounds were characteristic of both the families of languages, Muṇḍā and Dravidian, which the Aryan speakers of Sanskrit found in possession of India; and the appearance of them in Sanskrit and its descendants (and in a few of the adjoining Iranian

languages such as Baluchi and Pashto) can scarcely be unconnected with this fact.

The Indian grammarians emphasized the difference in the pronunciation of consonants according as they came at the beginning, in the middle or at the end of a word or before other consonants. These differences, though slight, have ended in transforming the whole Sanskrit consonant-system in its descendants, the modern Indo-Aryan languages. Final consonants were pronounced without being fully exploded: in the spoken languages these final consonants had disappeared before the middle of the 3rd century B.C. A similar pronunciation is assigned to consonants before stops: in the spoken languages these were early assimilated (*e.g.*, *suptāḥ* became *suttō*). *y* and *v* were pronounced more strongly initially than intervocalically: in the modern languages initial *y*—has remained or become *j*, but intervocalic *-y-* has been lost. [This contrast is observable even in the dialect of the Rigveda. For in the phonetically weak position of the termination and in certain accessory words intervocalic *-dh-* has lost its occlusion and become *-h-*: *ihi* "go" = Greek *íthi*, *śemahē* "we lie" = Gk. *keimetha*. Further in all words intervocalic *-d-* has become *-l-*, although other more easterly dialects still preserve it (through whose influence it was afterwards re-established in Classical Sanskrit): thus Classical *nidah* "nest" (from **niṣḍa-*) is *nīḷāh* in Vedic.]

Accent.—Our knowledge of the accent of Sanskrit words is derived from its marking in the more important Vedic texts and from the statements of grammarians. It was predominantly a musical or tonic, not a stress, accent. Three different types are generally distinguished, the *udātta* "raised," *anudātta* "unraised" and *svarita* the rising-falling accent following the *udātta*. Generally the position of the *udātta* agrees, as far as can be ascertained by comparison, with that of the chief word-accent of Indo-European. The rhythm of Sanskrit was purely quantitative; in verse metre depended only on the number and the length of the syllables composing a line, and was entirely independent of accent.

GRAMMAR

Nouns.—Sanskrit makes a perfect distinction between nouns (including adjectives, pronouns and indeclinables) and verbs. The declension of nouns comprises three numbers—singular dual and plural; and eight cases, viz. nominative, accusative, instrumental, dative, ablative, genitive, locative, vocative. In the majority of declensions ablative and genitive are not distinguished in the singular, nor dative and ablative in the plural, while the dual universally has only three separate forms,—(1) nom.-acc.-voc., (2) inst.-dat.-abl., (3) gen.-loc. These confusions were inherited from Indo-European, but the tendency to confuse still further the forms and functions of the cases continued within Sanskrit itself, the genitive especially enlarging its sphere at the expense of other cases. This process, continued in the spoken languages down to the present day, has resulted in a noun-declension, which for the most part consists of two cases only—(1) a direct case founded on the Sanskrit nominative and accusative; (2) an oblique case founded on the Sanskrit genitive or, perhaps, in some forms, the dative. Among the numbers the dual by itself was reserved to express natural pairs (such as *akṣī* "the eyes," *karnāu* "the ears"), or any two objects or persons already referred to or present in the mind of the speaker or hearer; otherwise the use of the word for "two" itself was required.

Although the idea of case was in the main expressed by the termination (as, *e.g.*, the nominative by *-s* in *dēvās* = Latin *deus*, the accusative by *-m* in *dēvām* = *deum*), it was sometimes accompanied by change in the pre-terminational element, and was connected with a shift of accent:

	Skt.	Greek	Skt.	Greek	Skt.	Greek
nom.	<i>pāt</i>	<i>pōs</i> (Doric)	<i>dýauḥ</i>	<i>Zeús</i>	<i>pita</i>	<i>patēr</i>
acc.	<i>pādām</i>	<i>pōda</i>	<i>dýdm</i>	Zkn-a	<i>pīṭāram</i>	<i>patēra</i>
gen.	<i>padāḥ</i>	<i>podós</i>	<i>dāvāḥ</i>	<i>Diós</i>	<i>pitūḥ</i>	<i>patrós</i>
dat.	<i>padē</i>	<i>ḗ podī</i>	<i>dīvē</i>	cf. <i>Dii</i>	<i>pitrē</i>	<i>ḗ patrī</i>
loc.	<i>padī</i>	<i>podī</i>	<i>dýāvī</i>	Lat. <i>Jove</i>	<i>pīṭāri</i>	
voc.			<i>dýauḥ</i>	<i>Zeū</i>	<i>pīṭar</i>	<i>patēr</i>

There was, however, one important class of stems, namely masc. and neut. in *-a* and fem. in *-ā* (corresponding to the *-o* and *-ā*

stems of Greek and Latin), in which the accent was fixed either on the stem or on the termination throughout the paradigm without any change in the form of the stem, of the type *ásvaḥ* = Gk. hippos, Lat. equos. There had, moreover, been a tendency in the pre-Sanskrit period to fix the form even of the variable stems, especially those consisting only of a root: thus the long vowel was generalized in *vāc-* "voice" (nom. *vāk*):

	Skt.	Latin	Avestic	Greek
acc.	<i>vācam</i>	<i>vōcem</i>	<i>vācim</i>	
gen.	<i>vācāḥ</i>	<i>vōcis</i>	<i>vacō</i>	<i>opós</i>

But in the process of normalization the vowel-declension (and especially with the stems in *-a -d*) was predominant, and even in Sanskrit itself there was a considerable transference of consonant-stems and root-stems to this declension: e.g., *pāda-* "foot," *dvāra-* "door," *dnata-* "tooth" replaced *pād-* *pad-*, *dant-* *dat-*, *dvār-* *dur-*. This proceeded apace in the spoken tongue, for the declension of the modern languages rests exclusively on vowel-stems and of these chiefly on the *-a -ā* stems.

As in Indo-European, the pronominal declension differed from the nominal, that of the personal pronouns radically, that of the demonstratives and others to a varying degree. In the personal pronoun each number had a different root (*t[u]vām* "thou," *yūyām* "you"), while that of the first person had different roots also for the nominative and the oblique cases (*ahām* "I," *mām* "me," *vaydm* "we," *asmdn* "us"). The tendency of the two declensions, the nominal and the pronominal, to influence each other is observable: e.g., the nominal ending of the neuter sing. nom. and acc. *-m* as in *kīm* "what?" (=Lat. quid) replaced the *-d* or *-t* still found in other pronouns (*tāt* "that"=Lat. is-tud). In the spoken language this mutual influence continued to react until practically all distinction between the two types of declension was lost.

Numerals.—The numeral-system, built upon a decimal basis, is that of Indo-European. There are separate names for the numbers up to 10; from 11 to 19 compounds of the units with the word for 10 partly correspond with those of Greek and Latin: e.g., *d(u)vādaśa* "12"=Gk. *dōdeka*, Lat. *duodecim*. Above that the tens (20, 30, etc.) were in origin probably compounds expressing a number of tens, and the intermediate numbers were formed by compounds of the units with these: e.g., *pāñca* "5" (Gk. *pēnte*, Lat. *quīnque*), *pāñcāśat* "50" (cf. Gk. *pentēkonta*, Lat. *quīnquāgīnta*), *pāñcapāñcāśat* "55." There are separate words for 100 and 1000. The special word for 100,000 (*lakṣaḥ*, whence modern *lākḥ*) is post-vedic. The numerals from 1 to 19 are adjectives; the rest are substantives.

Gender.—Traces of the distinction of gender between animate (=masculine and feminine) and inanimate (=neuter) are seen in the use of the neut. *udakdm* "water as a medium of floating, etc.," and the fem. *āpah* "water as personified as sentient beings." But for the most part in Sanskrit gender is grammatical and largely independent of nature. except that male and female living beings are usually (though not always) respectively masculine or feminine. There were three genders—masculine, feminine and neuter. The neuter was distinguished by its termination (or lack of termination) in the nominative and accusative, and by the fact that the form of the accusative was the same as that of the nominative. But the masculine and feminine substantives were primarily distinguished only by the form of an adjective, if there were one, in agreement with them (as often, e.g., in French or German). But there was a tendency to reserve certain types of stem for one or other gender. Thus the *-a* stems in Sanskrit are reserved only for masculine and neuter nouns (although in Greek they may still be feminine, e.g., *hē hippos* "the mare"); and the *-ā* stems are mostly feminine. In the older language the *-ī* stems might be masculine or feminine; in the later language they are almost all feminine. Similarly even in Classical Sanskrit *-i* stems are either masculine or feminine; but in the spoken language there was a growing tendency to confine them to feminine: thus words of this declension which are masculine in Sanskrit become feminines in the modern languages: *agnīḥ* m. "fire" (=Lat. *ignis*) becomes Hindi *āg* f.

Verbs.—In the Vedic language the verbal system is of considerable complexity. A verb might have various stems, viz. present (sometimes more than one), aorist (three in number, root e.g., *āsthām*=Gk. *éstēn*, strong, e.g., *aricam*=Gk. *élipon*, sigmatic, e.g., *araiḥṣam*=Gk. *éleipsa*); perfect (characterized by reduplication and peculiar terminations); future (rare in the old language). The significance of the stems lay in the mode of action they expressed. Very generally speaking, the present indicated continuous action, the aorist momentary action, the perfect a state resulting from past action. The various present stems indicated various types of present-stem action, such as intensive, repetitive, inchoative, causative, desiderative, etc. Each of the first three stems had five moods—indicative expressing fact, injunctive and subjunctive expressing will and futurity, optative expressing wish, imperative expressing command. In the indicative of the present, perfect and future stems there were two tenses, present and past; the aorist stem was in the indicative confined to the past tense. Each tense had three persons and three numbers—singular, dual and plural. Finally each tense could be conjugated in two voices with different terminations—active and middle. Among the parts of the infinite verb there was connected with each stem a participle which could be either active or middle, and independent of tense stems a past participle, one or more infinitives (for the most part case-forms of verbal nouns), a gerundive and an indeclinable participle or gerund. The total number of possible forms belonging to any one verb is thus very great.

The idea of time was expressed in the indicative primarily by the termination: the primary endings expressing present and future time, the secondary endings past (and also, to some extent, future) time. Past time was usually still further defined by the prefixing of a particle, *a* or *ā*, before the verb (corresponding to the Greek and Armenian augment), e.g., *dādhami* "I place," *ādadhām* "I placed"=Gk. *tithēmi*, *étithēn*. The active voice indicated that the action performed had reference to some person or thing other than the doer, the middle that the action had reference to the doer in some way or other: e.g., active *tanḍulān nēnēkti* "he washes the rice" (French *il lave*), middle *pāni nēnēktē* "he washes his hands" (*il se lave les mains*). As in Greek, the middle could also be used to express passive sense, but this use was later confined to the perfect and especially the aorist stems, while a special present stem (characterized by the suffix *-yā-* with middle terminations) was used for the present passive: e.g. *labhatē* "he takes," *labhyatē* "is taken." The expression of person was inherent in the verbal form, and pronouns were used only when emphasis was desired.

As with the nouns, there were two types of stems—the thematic with variable accent and variable stem form to which the terminations were directly attached (type *ds-ti* "he is"=Gk. *esti*, Lat. *est*), the thematic with invariable accent and stem between which and the termination the vowel *a* was inserted (type *vth-a-ti* =Lat. *veh-i-t*). There was a growing tendency for verbs to be brought into this class from the other, since its conjugation was the more normal; thus *yundk-ti* (3rd plur. *yūñj-ānti*) "joins," contrasted with the already thematic Lat. *jung-i-t*, became later *yuij-a-ti* (3rd plur. *yūñj-a-nti*). This type almost alone survives in the modern languages.

This verbal system was greatly simplified in Classical Sanskrit. The injunctive mood almost, and the subjunctive entirely, disappeared or were incorporated in the imperative. The aorist and perfect stems remained only in the indicative, and the aorist participle disappeared. The infinitive was reduced to one form only (the accusative of a noun in *-tu-*, corresponding in form to the Latin supine, e.g., *jñātum* "to know"=[*g*] *nōtum*), and the absolute to two, one for simple, one for compound verbs. This left the present stem predominant; and though the aorist and the perfect survived in the indicative, their meaning was scarcely, if at all, to be distinguished from that of the past tense of the present stem (*i.e.*, the imperfect). Finally even in Sanskrit itself the imperfect tended to be replaced by the past participle used as a finite verb. Among the spoken languages in some areas the aorist seems to have been developed further as a past tense, but as a whole the verb of the modern languages possesses a present

system based on the Sanskrit present stem and a past system based on the Sanskrit past participle.

Syntax.—In its main lines the syntax of Sanskrit is Indo-European, and the primary uses of its cases, moods and tenses can be paralleled from other Indo-European languages. Its most peculiar development was in the region of composition. Compounds, usually of not more than two members, are common in the Vedic texts. Even in the Epic their extension is considerable, and compounds consisting of three or four separate members are not rare. In the later, more artificial, language compounds may be met with which extend over a page or more.

Vocabulary.—Sanskrit shows a constant change and development of vocabulary. Part of this is in the natural evolution of already existing material. The main constituent of the vocabulary of Vedic Sanskrit is Indo-European, but even here there are some words which are not Indo-European. One source of such words is undoubtedly the languages which the Aryans found in India; and recently J. Przyluski has demonstrated that some (such as *bāṇāḥ* "arrow," *mayūraḥ* "peacock," *karṣāsam* "cotton") were received from *Mundā* or Austro-Asiatic languages. Another source for new words was found in the spoken Aryan languages: words taken from these were given a Sanskrit form. In this way even original Sanskrit words returned under a new form: we have already seen how *vikṛita-*, having in the spoken language become *vikāṭa-*, was readopted in that form in the literary tongue, and retained side by side with *vikṛita-*.

LITERATURE

The history of Sanskrit literature like the political history of ancient India suffers from the total want of anything like a fixed chronology. In its vast range there is scarcely a work of importance the date of which can be fixed with absolute certainty. The original composition of most Sanskrit works can indeed be confidently assigned to certain general periods but as to many of them, there is reason to doubt whether they have come down to us in their original shape.

The history of Sanskrit literature readily divides itself into two main periods—the Vedic and the classical. These periods partly overlap, and some of the later Vedic works are included in that period on account of their subject matter, and archaic style, rather than for any claim to a higher antiquity than some of the oldest works of classical Sanskrit. The first period may be put at 1500-200 B.C. and the second 500 B.C.-A.D. 1000.

THE VEDIC PERIOD

Samhitās.—The term *veda*, *i.e.* (sacred) "knowledge," "lore"—embraces a body of writings the origin of which is ascribed to divine revelation (*Śruti*, literally "hearing"), and which forms the foundation of the Brahmanical system of religious belief. This sacred canon is divided into three or (according to a later scheme) four co-ordinate collections, likewise called Veda: (1) the *Rig-veda*, or lore of praise (or hymns); (2) the *Sāma-veda*, or lore of tunes (or chants); (3) the *Yajur-veda*, or lore of prayer (or sacrificial formulas); and (4) the *Atharva-veda*, or lore of the Atharvans. Each of these four Vedas is a collection (*saṃhitā*) of sacred, mostly poetical, texts of a devotional nature, called *mantra*. This entire body of texts (and particularly the first three collections) is also known as the *trayi vidyā*, or threefold wisdom, of hymn (*rich*), tune or chant (*sāman*), and prayer (*yajus*)—the fourth Veda, when included, being classed together with the Rik.

Classes of Priests.—The Brahmanical religion finds its practical expression chiefly in sacrificial performances. The Vedic sac-

rifice requires for its proper performance the attendance of four officiating priests, each of whom is assisted by one or more (usually three) subordinate priests, *viz.*: (1) the *Hotar* (or *hotri*, *i.e.*, either "sacrificer," or "invoker"), whose chief business is to invoke the gods, in prayers or hymns; (2) the *Udgātar* (*udgātri*), or chorister, who has to perform chants (*stotra*) in connection with the hotar's invocations; (3) the *Adhvaryu*, or offering priest *par excellence*, who performs all the material duties of the sacrifice, such as the kindling of the fires; (4) the *Brahman*, or chief "priest," who superintends the performance and rectifies any mistakes that may be committed. The *Sāmaveda* and *Yajurveda* form special song and prayer books, arranged for the practical use of the *udgātar* and *adhvaryu* respectively; whilst the *Rik-saṃhitā*, though not arranged for any such practical purpose, contains the entire body of sacred lyrics whence the hotar draws the material for his recitations. The *brahman*, however, had no special text-book assigned to him, but was expected to be familiar with all the *Samhitās* as well as with the practical details of the sacrificial performance. (See BRAHMAN and BRĀHMAṆA.)

Brāhmaṇas.—The several *Samhitās* have attached to them certain theological prose works, called *Brāhmaṇa*, which also form part of the canon. Their object is to explain the relationship of the Vedic texts to the now very elaborate sacrificial ceremonial and to explain their mystic import. (See BRĀHMAṆA.)

Aranyakas and Upanishads.—Closely connected with the *Brāhmaṇas* are two classes of treatises called *Aranyaka* and *Upanishad*. The *Aranyakas*, *i.e.*, works "relating to the forest," intended to be read or expounded by anchorites in the quiet of the forest, resemble the *Brāhmaṇas*, which they supplement by dealing with special points of ritual. The *Upanishads* are of a more mystical nature, and form the first attempts at a systematic treatment of metaphysical questions. From their pantheistic views later developed the Vedānta philosophy. The *Upanishads* have to be assigned to very different periods of Sanskrit literature. The oldest treatises of this kind are doubtless those which form part of the *Samhitās*, *Brāhmaṇas* and *Aranyakas* of the three older Vedas.

Different Recensions.—As the sacred texts were not committed to writing till a much later period, but were handed down orally in the Brahmanical schools, it was inevitable that local differences of reading should spring up, which in course of time gave rise to a number of independent versions. Such different text-recensions, called *sākhā* (*i.e.*, branch), were at one time very numerous, but only a limited number have survived. As regards the *Samhitās*, the poetical form of the hymns, as well as the concise style of the sacrificial formulas, rendered these texts less liable to change.

Vedāṅgas.—Besides the purely ceremonial matter, the *Brāhmaṇas* also contained a considerable amount of matter bearing on the correct interpretation of the Vedic texts; and, indeed, the sacred obligation incumbent on the Brahmins of handing down correctly the letter and sense of those texts necessarily involved a good deal of serious grammatical and etymological study in the Brahmanical schools. These literary pursuits resulted in the accumulation of much learned material, which it became desirable to throw into a systematic form. These practical requirements were met by a class of treatises, grouped under six different heads or subjects, called *Vedāṅgas*, *i.e.*, members, or limbs, of the (body of the) Veda. In their present form these works represent a rather advanced stage of scientific development. Though a few of them are composed in metrical form—the majority belong to a class of writings called *sūtra*, *i.e.*, "string," consisting of strings of rules in the shape of tersely expressed aphorisms, intended to be committed to memory.

Sūtras.—The *Sūtras* form a connecting link between the Vedic and the classical periods of literature. These treatises are included among the Vedic writings, and in point of language may be considered as the latest products of the Vedic age, but they are no longer *śruti* or revelation. They are of human, not of divine, origin. The *Sūtras* are regarded nevertheless as works of great authority, second only to that of the revealed Scriptures;

in contrast to the latter they are called *smṛiti*, or tradition.

The six branches of Vedic science, included under the term *Vedāṅga*, are as follows:—

1. *Śikshā*, or Phonetics.—In addition to a small treatise ascribed to the great grammarian Pāṇini, the *Pāṇinīyā śikshā*, there are usually included under this head certain works, called *Prā-tiśākhya*, i.e., "belonging to a certain *śākhā* or recension," which deal minutely with the phonetic peculiarities of the several *Samhitās*, and are of great importance for Vedic textual criticism.

2. *Chhandas*, or Metre.—Tradition makes the *Chhandas-sūtra* of Piṅgala the starting-point of prosody. The Vedic metres, however, occupy but a small part of this treatise; they are particularly dealt with in the *Nidāna-sūtra* of the *Sāmaveda*, and in a chapter of the *Rik-prātiśākhya*. For later profane prosody, on the other hand, Piṅgala's treatise is valuable.

3. *Vyākaraṇa*, or Grammar.—Piṇini's famous grammar is said to be *the Vedāṅga*; but it marks the culminating point of grammatical research rather than the beginning, and treats chiefly of the post-Vedic language.

4. *Nirukta*, or Etymology.—Yāska's *Nirukta* deals entirely with Vedic etymology and exegesis. It consists, in the first place, of strings of words in three chapters: (1) synonymous words; (2) such as are purely or chiefly Vedic; and (3) names of deities. These lists are followed by Yāska's commentary, interspersed with numerous illustrations. Yāska quotes the works of several predecessors but his is by several centuries the oldest surviving work of its kind. The above four studies deal with the correct understanding of texts, the next two with rites and their proper seasons.

5. *Jyotisha*, or Astronomy.—The metrical treatise which has come down to us in two different recensions under the title of *Jyotisha*, ascribed to one Lagadha, or Lagata, seems to be the oldest existing systematic treatise on astronomical subjects.

6. *Kalpa*, or Ceremonial.—Sacrificial practice gave rise to a large number of systematic *sfitra*-manuals for the several classes of priests. The most important of these works have come down to us, and they occupy by far the most prominent place among the literary productions of the *sfitra*-period. The *Kalpa-sfstras*, or rules of ceremonial, are of two kinds: (1) the *Srauta-sūtras*, which are based on the *Śruti*, and teach the performance of the great sacrifices, requiring three sacrificial fires; and (2) the *Smārta-sūtras*, or rules based on the *smṛiti* or tradition. The latter class again includes two kinds of treatises: (1) the *Grihya-sūtras*, or domestic rules, treating of ordinary family rites, such as marriage, birth, name-giving, etc., connected with simple offerings in the domestic fire; and (2) the *Sāmayāchārīka*- (or *Dharma*-) *sūtras*, which treat of customs and temporal duties, and are supposed to have formed the chief sources of the later law-books.

THE FOUR VEDAS

After this brief characterization of the various branches of Vedic literature, we proceed to take a rapid survey of the several Vedic collections.

Rigveda.—The *Rigveda-saṃhitā* has come down to us in the recension of the *Śākala* school, which shows that it consists of 1,028 hymns, including eleven so-called *Vālakhilyas*, probably of later date. The hymns are composed in a great variety of metres, and consist, on an average, of rather more than 10 verses each, or about 10,600 verses altogether. This body of sacred lyrics has been subdivided by ancient authorities in a twofold way, viz. either from a purely artificial point of view, into eight *ashtakas* of about equal length, or, on a more natural principle, based on the origin of the hymns, and invariably adopted by European scholars, into ten books, or *mandalas*, of unequal length. Tradition has handed down the names of the reputed authors, or rather inspired "seers" (*rishi*), of most hymns. These indications have enabled scholars to form some idea as to the probable way in which the *Rik-saṃhitā* originated, though much still remains to be cleared up by future research.

Mandalas ii.–vii. are evidently arranged on a uniform plan. Each of them is ascribed to a different family of *rishis*, whence they are usually called the six "family-books": ii., the *Griṣa-*

madas; iii., the *Viśvāmītras* or *Kuśikas*; iv., the *Viimadevyas*; v., the *Atris*; vi., the *Bharadvājas*; and vii., the *Vasishṭhas*. Further, each of these books begins with the hymns addressed to *Agni*, the god of fire, which are followed by those to *Indra*, whereupon follow those addressed to minor deities—the *Viśve Devāh* ("all-gods"), the *Maruts* (storm-gods), etc. Again, the hymns addressed to each deity are arranged in a descending order, according to the number of verses of which they consist.

Mandala i., the longest in the whole *Samhitā*, contains 191 hymns, ascribed, with the exception of a few isolated ones, to sixteen poets of different families, and consisting of one larger (50 hymns) and nine shorter collections. Here again the hymns of each author are arranged on precisely the same principle as the "family-books." *Mandalas* viii. and ix., on the other hand, have a special character of their own. To the *Sāmaveda*, these two *mandalas* have contributed a much larger proportion of verses than any of the others. The hymns of the eighth book are ascribed to a number of different *rishis*, mostly belonging to the *Kāṇva* family. The chief peculiarity of this *mandala*, however, consists in the strophic character of its composition and the numerous repetitions throughout it. It is closely connected with the first half of the first *mandala* and they were evidently added as beginning and end to the collected ii.–vii. The ninth *mandala* consists entirely of hymns (114) addressed to *Soma*, the deified juice of the so-called "moon-plant" (*Sarcostemma viminale*, or *Asclepias acida*), and ascribed to poets of different families. They are called *ṣavamānī*, "purificational," because they were to be recited by the *hotar* while the juice expressed from the *soma* plants was clarifying. The hymns are by poets of the same families as ii.–vii. and it is evident that when these hymns were collected the *soma* hymns were taken out and put into a single collection. There are also a few *soma* hymns in the later books (i., viii., x.).

Mandala x. contains the same number of hymns (191) as the first, which it nearly equals in actual length. In the latter half of the book the hymns are clearly arranged according to the number of verses, in decreasing order—occasional exceptions to this rule being easily adjusted by the removal of a few apparently added verses. This *mandala* came into existence after the other nine were in their present form, a fact of which there is abundant evidence. It shows considerable uniformity and is all older than the latest insertions in other books of the former collectors.

It is usual to call the *Rik-saṃhitā* (as well as the *Atharvan*) an historical collection, as compared with the two *Samhitās* put together for purely ritualistic purposes. And indeed, although the *Rigveda* itself, in its oldest form, may have been intended as a common prayer-book, for the whole of the *Brihmanical* community, it is certain that in the stage in which it has been finally handed down it includes a certain portion of hymn material (and even some secular poetry) which could never have been used for purposes of religious service. It may, therefore, be assumed that the *Rik-saṃhitā* contains all of the nature of popular lyrics that was accessible to the collectors, or seemed to them worthy of being preserved. The question as to the exact period when the hymns were collected cannot be answered with any approach to accuracy. For many reasons, however, which cannot be detailed here, scholars have come to fix on the year 1000 B.C. as an approximate date for the collection of the Vedic hymns. From that time every means that human ingenuity could suggest was adopted to secure the sacred texts against the risks connected with oral transmission. But, as there is abundant evidence to show that even then not only had the text of the hymns suffered corruption, but their language had become antiquated to a considerable extent, and was only partly understood, the period during which the great mass of the hymns were actually composed must have lain considerably farther back, and may very likely have extended over the earlier half of the second millenary, or from about 2000 to 1500 B.C.

As regards the people which raised for itself this imposing monument, the hymns exhibit it as settled in the regions watered by the mighty *Sindhu* (*Indus*), with its eastern and western tributaries, the land of the five rivers (*Panj-āb*) thus forming the central home of the Vedic people. But, while its advanced guard

has already debouched upon the plains of the upper Gaṅgā and Yamunā, those who bring up the rear are still found loitering far behind in the narrow glens of the Kubhā (Cabul) and Gomati (Gomal). Scattered over this tract of land, in hamlets and villages, the Vedic Āryas are leading chiefly the life of herdsmen and husbandmen. The numerous clans and tribes, ruled over by chiefs and kings, have still constantly to vindicate their right to the land but lately wrung from an inferior race of darker hue. Not infrequently, too, the light-coloured Āryas wage internecine war with one another—as when the Bharatas, with allied tribes of the Panjāb, goaded on by the royal sage Viśvāmitra, invade the country of the Tritsu king Sudās, to be defeated in the "ten kings' battle," through the inspired power of the priestly singer Vasishṭha. The priestly office has already become one of high social importance by the side of the political rulers, and to a large extent an hereditary profession; though it does not yet present the baneful features of an exclusive caste.

The religious belief of the people consists in a system of natural symbolism, a worship of the elementary forces of nature, regarded as beings endowed with reason and power superior to those of man. In giving utterance to this simple belief, the priestly spokesman has, however, frequently worked into it his own speculative and mystic notions. Indra, the stout-hearted ruler of the cloud-region, receives by far the largest share of the devout attentions of the Vedic singer. His ever-renewed battle with the malicious demons of darkness and drought, for the recovery of the heavenly light and the rain-spending cows of the sky, forms an inexhaustible theme of spirited song. Next to him, in the affections of the people, stands Agni (*ignis*), the god of fire, invoked as the genial inmate of the Aryan household, and as the bearer of oblations, and mediator between gods and men. Indra and Agni are thus, as it were, the divine representatives of the king (or chief) and the priest of the Aryan community; and if, in the arrangement of the Saṃhitā, the Brāhmanical collectors gave precedence to Agni, it was but one of many avowals of their own hierarchical pretensions. Hence also the hymns to Indra are mostly followed, in the family collections, by those addressed to the Viśve Devāḥ (the "all-gods") or to the Maruts, the warlike storm-gods and faithful companions of Indra, as the divine impersonations of the Aryan freemen, the *viś* or clan. But, while Indra and Agni are undoubtedly the favourite figures of the Vedic pantheon, there is reason to believe that these gods had but lately supplanted another group of deities who play a less prominent part in the hymns, viz., Father Heaven (*Dyaus Pitar*, *Zēus πατήρ*, Jupiter); Varuna (probably *οὐρανός*), the all-embracing (esp. nocturnal) heavens; Mitra (*Zend. Mithra*), the genial light of day; and Savitar, the quickener, and *Sūrya* (*ἥλιος*), the vivifying sun.

Brāhmaṇas of Rigveda.—Of the *Brāhmaṇas* that were handed down in the schools of the *Bahvrīchas* (*i.e.*, "possessed of many verses"), as the followers of the Rigveda are called, two have come down to us, viz. those of the Aitareyins and the Kaushītakins. The *Aitareya-brāhmaṇa* and the *Kaushītaki-* (or *Sāṅkhāyana-*) *brāhmaṇa* evidently have for their groundwork the same stock of traditional exegetic matter. They differ, however, considerably in their arrangement of this matter. There is also a certain amount of material peculiar to each of them. The Kaushītaka is, upon the whole, far more concise in its style and more systematic in its arrangement—features which would lead one to infer that it is probably the more modern work of the two. While the Aitareya deals almost exclusively with the Soma sacrifice, the Kaushītaka first treats of the several kinds of *havīryajña*, or offerings of rice, milk and ghee, and then of the Soma sacrifice. Sāyana, in the introduction to his commentary on the work, ascribes the Aitareya to the sage Mahidiisa Aitareya (*i.e.*, son of Itarā), also mentioned elsewhere as a philosopher; and it seems likely enough that this person arranged the Briihmana and founded the school of the Aitareyins. Regarding the authorship of the sister work we have no definite statement. Probably it is what one of the manuscripts calls it—the *Brāhmaṇa* of *Sāṅkhāyana* (composed) in accordance with the views of Kaushītaki.

Each of these two Briihmanas is supplemented by a "forest-book," or Aranyaka. The *Aitareyāranyaka* is not a uniform production. It consists of five books (*ciranyaka*), three of which, the first and the last two, are of a liturgical nature, treating of the ceremony called *mahāvratā*, or great vow. The last of these books, composed in *siitra* form, is, however, doubtless of later origin. The second and third books are purely speculative, and are also styled the *Bahvrīcha-brāhmaṇa-upanishad*. Again, the last four chapters of the second book are usually singled out as the Aitareya-upanishad, ascribed, like its *Brāhmaṇa* (and the first book), to Mahidiisa Aitareya; and the third book is also referred to as the *Samhitā-upanishad*. As regards the *Kaushītaki-āranyaka*, this work consists of fifteen *adhyāyās*, the first two (treating of the mahāvratā ceremony) and the seventh and eighth of which correspond to the first, fifth, and third books of the Aitareyāranyaka respectively, whilst the four *adhyāyās* usually inserted between them constitute the highly interesting Kawhitaki- (*brāhmaṇa-*) *upanishad*, of which we possess two different recensions. The remaining portions (9-15) of the Aranyaka treat of the vital airs, the internal Agnihotra, ending with the *vaṃśā*, or succession of teachers. Of *Kalpa-sūtras*, or manuals of sacrificial ceremonial, composed for the use of the hotar priest, two different sets are in existence, the *Āśvalāyana-* and the *Sāṅkhāyana-sūtra*. Each of these works follows one of the two Briihmanas of the Rik as its chief authority: the Aitareya and Kaushītaka respectively. Both consist of a *Srauta-* and a *Grihya-sūtra*. *Āśvalāyana* seems to have lived about the same time as Pāṇini (? c. 400 B.C.)—his own teacher, Saunaka, who completed the Rik-*prātiśākhya*, being probably intermediate between the great grammarian and Yaska, the author of the Nirukta. Saunaka himself is said to have been the author of a *Srauta-sūtra* (which was, however, more of the nature of a Briihmana) and to have destroyed it on seeing his pupil's work. A *Grihya-sūtra* is still quoted under his name by later writers. The *Āśvalāyana Srauta-sūtra* consists of twelve, the *Grihya* of four, *adhyāyās*.

Regarding *Sāṅkhāyana* still less is known; but he, too, was doubtless a comparatively modern writer, who, like *Āśvalāyana*, founded a new school of ritualists. Hence the *Kaushītaki-brāhmaṇa*, adopted (and perhaps improved) by him, also goes under his name, just as the Aitareya is sometimes called *Āśvalāyana-Briihmana*. The *Sāṅkhāyana Srauta-sūtra* consists of eighteen *adhyāyās*. The last two chapters of the work are, however, a later addition, while the two preceding chapters, on the contrary, present a comparatively archaic, *brāhmaṇa-like* appearance. The *Grihya-sūtra* consists of six chapters, the last two of which are likewise later appendages. The *Sdmbavya Grihya-sūtra*, of which a single ms. is at present known, seems to be closely connected with the preceding work. Professor Biihler also refers to the Rigveda the *Vāsisṭha-dharmaśāstra*, composed of mixed *siitras* and couplets.

A few works remain to be noticed, bearing chiefly on the textual form and traditional records of the Rik-saṃhitā. The *Prātiśākhya*s have already been referred to as the chief repositories of *śikshā* or Vedic phonetics. Among these works the *Rik-prātiśākhya* occupies the first place. The original composition of this important work is ascribed to the same Śakalya from whom the vulgar recension of the (Śakala) Saṃhitā takes its name. He is also said to be the author of the existing *Paḍa-pāṭha* (*i.e.*, the text-form in which each word is given unconnected with those that precede and follow it).

Sāmaveda.—The term *sāman*, of uncertain derivation, denotes a solemn tune or melody to be sung or chanted to a rich or verse. The set chants (*stotra*) of the Soma sacrifice are as a rule performed in triplets, either actually consisting of three different verses, or of two verses which, by the repetition of certain parts, are made, as it were, to form three. The three verses are usually chanted to the same tune; but in certain cases two verses sung to the same tune had a different *sāman* enclosed between them. One and the same *sāman* or tune may thus be sung to many different verses; but, as in teaching and practising the tunes the same verse was invariably used for a certain tune, the term *sāman*, as well as the special technical names of *sāmans*, are

not infrequently applied to the verses themselves with which they were ordinarily connected.

In accordance with the distinction between *rich* or text and *sāman* or tune, the *sāman*-hymnal consists of two parts: the *Sāma-veda-saṃhitā*, or collection of texts (rich) used for making up *sāman*-hymns, and the *Gīta*, or tune-books, song-books. The textual matter of the *Samhitā* consists of somewhat under 1600 different verses, selected from the *Rik-samhitā*, with the exception of some seventy-five verses, some of which have been taken from Khila hymns, whilst others which also occur in the *Atharvan* or *Yajurveda*, as well as such not otherwise found, may perhaps have formed part of some other recension of the *Rik*. The *Sāma-veda-saṃhitā* is divided into two chief parts, the *pūrva-* (first) and the *uttara-* (second) *Zr̥chika*. The second part contains the texts of the *sāman*-hymns, arranged in the order in which they are actually required for the *stōtras* or chants of the various *Soma* sacrifices. The first part, on the other hand, contains the body of tune-verses, or verses used for practising the several *sāmans* or tunes upon—the tunes themselves being given in the *Grāma-geyagāna* (*i.e.*, songs to be sung in the village), the tune-book specially belonging to the *Pūrvārchika*.

Sāmaveda-brāhmaṇas.—The title of *Brāhmaṇa* is bestowed by the *Chhandogas*, or followers of the *Simaveda*, on a considerable number of treatises. The majority of the *Sāmaveda-brāhmaṇas* present, however, none of the characteristic features of other works of that class; but they are rather of the nature of *sūtras* and kindred treatises, with which they probably belong to the same period of literature. Moreover, the contents of these works—as might indeed be expected from the nature of the duties of the priests for whom they were intended—are of an extremely arid and technical character, though they all are doubtless of some importance, either for the textual criticism of the *Samhitā* or on account of the legendary and other information they supply.

If the *Sāmaveda* has thus its ample share of *Brāhmaṇa*-literature, though in part of a somewhat questionable character, it is not less richly supplied with *sūtra*-treatises, or works on exegesis, some of which probably belong to the oldest works of that class.

Yajurveda.—This, the sacrificial *Veda* of the *Adhvaryu* priests, divides itself into an older and a younger branch, or, as they are usually called, the Black (*krishṇa*) and the White (*śukla*) *Yajurveda*. Tradition ascribes the foundation of the *Yajurveda* to the sage *Vaiśampāyana*. Of his disciples three are specially named, *viz.*: *Kaṭha*, *Kālāpin* and *Yāska Paingī*, the last of whom again is stated to have communicated the sacrificial science to *Tittiri*. We have three old collections of *Yajus*-texts, *viz.* the *Kāthaka*, the *Kālāpaka* or *Maitrāyaṇī Samhitā*, and the *Taittirīya-saṃhitā*. The *Kāthaka* and *Kālāpaka* are frequently mentioned together; and the author of the "great commentary" on *Pāṇini* once remarks that these works were taught in every village. From the *Kāthas* and *Kālāpas* proper schools seem early to have branched off, each with their own recensions of the text. As regards the *Taittirīya-saṃhitā*, that collection, too, in course of time gave rise to a number of different schools, the text handed down being that of the *Āpastambas*.

The four collections of old *Yajus* texts, so far known to us, while differing more or less considerably in arrangement and verbal points, have the main mass of their textual matter in common. This common matter consists of both sacrificial prayers (*yajus*) in verse and prose, and exegetic or illustrative prose portions (*brāhmaṇa*). A prominent feature of the old *Yajus* texts, as compared with the other *Vedas*, is the constant intermixture of textual and exegetic portions. The *Charakas* and *Taittirīyas* thus do not recognize the distinction between *Samhitā* and *Brāhmaṇa* in the sense of two separate collections of texts, but they have only a *Samhitā*, or collection, which includes likewise the exegetic or *Brāhmaṇa* portions. The *Taittirīyas* seem at last to have been impressed with their want of a separate *Brāhmaṇa* and to have set about supplying the deficiency in rather an awkward fashion: instead of separating from each other the textual and exegetic portions of their *Samhitā*, they merely added to the latter a supplement (in three books), which shows the same mixed condition, and applied to it the title of *Taittirīya-brāhmaṇa*.

The *Maitrāyaṇī Samhitā*, the identity of which with the original *Kālāpaka* has been proved pretty conclusively by *Dr. L. v. Schröder*, who attributes the change of name of the *Kālāpa-Maitrāyaṇīyas* to Buddhist influences, consists of four books, attached to which is the *Maitri-* (or *Maitrāyaṇī*) *upanishad*. The *Kāthaka*, on the other hand, consists of five parts; the last two of which, however, are perhaps later additions, containing merely the prayers of the *hotar* priest, and those used at the horse-sacrifice. There is, moreover, the beautiful *Kātha-* or *Kāthaka-upanishad*, which is also, and more usually, ascribed to the *Atharvaveda*, and from which *Siinkhya-Yoga* ideas may have developed.

Samhitā of the White Yajurveda.—The defective arrangement of the *Yajus* texts was at last remedied by a different school of *Adhvaryus*, the *Vijjasaneyins*. The reputed originator of this school and its text-recension is *Yājñavalkya Vājasaneyā* (son of *Vājasani*). The result of the rearrangement of the texts was a collection of sacrificial mantras, the *Vājasaneyi-saṃhitā*, and a *Briihmana*, the *Satapatha*. On account of the greater lucidity of this arrangement, the *Vijjasaneyins* called their texts the *White* (or *clear*) *Yajurveda*—the name of *Black* (or *obscure*) *Yajus* being for opposite reasons applied to the *Charaka* texts. Both the *Samhiti* and *Briihmana* of the *Vijjasaneyins* have come down to us in two different recensions, *viz.*, those of the *Mādhyandina* and *Kāṇva* schools. In several points of difference the *Kāṇva* recension agrees with the practice of the *Rik-saṃhitā*, and there probably was some connection between the *Yajus* school of *Kāṇvas* and the famous family of *ṛshis* of that name to which the eighth *mandala* of the *Rik* is attributed.

The *Vājasaneyi-saṃhitā* consists of forty *adhyāyas*, the first eighteen of which contain the formulas of the ordinary sacrifices. The last fifteen (or even twenty-two) *adhyāyas* are doubtless a later addition. The last *adhyāya* is commonly known under the title of *Vājasaneyi-saṃhitā* (or *Isāvāsya-*) *upanishad*. Its object seems to be to point out the fruitlessness of mere works, and to insist on the necessity of man's acquiring a knowledge of the supreme spirit.

The last book is of the *Upanishad* order, and bears the special title of *Brihad-* (great) *āranyaka*; its last six chapters are the *Brihadāranyaka-upanishad*, the most important of all *Upanishads*. As regards the age of the *Satapatha*, the probability is that the main body of the work is considerably older than the time of *Pāṇini*, but that some of its latter parts were considered by *Pāṇini's* critic *Kātyāyana* to be of about the same age as, or not much older than, *Pāṇini*.

The consolidation of the *Brāhmanical* hierarchy and the institution of a common system of ritual worship, which called forth the liturgical *Vedic* collections, were doubtless consummated in the so-called *Madhya-deśa*, or "midland," lying between the *Sarasvatī* and the confluence of the *Yamunā* and *Gaṅgā*; and more especially in its western part, the *Kuru-kshetra*, or land of the *Kurus*, with the adjoining territory of the *Pañchālas*, between the *Yamunī* and *Gaṅgā*. From thence the original schools of *Vaidik* ritualism gradually extended their sphere over the adjacent parts. The *Charakas* seem for a long time to have held sway in the western and north-western regions; while the *Taittirīyas* in course of time spread over the whole of the peninsula south of the *Narmadā* (*Nerbudda*), where their ritual has remained pre-eminently the object of study till comparatively recent times. The *Vājasaneyins*, on the other hand, having first gained a footing in the lands on the lower *Ganges*, chiefly. it would seem, through the patronage of *King Janaka* of *Videha*, thence gradually worked their way westwards, and eventually succeeded in superseding the older schools north of the *Vindhya*.

Atharvaveda.—The *Artharvan* was the latest of *Vedic* collections to be recognized as part of the sacred canon. That it is also the youngest *Veda* is proved by its language, which in vocabulary and grammar marks an intermediate stage between the main body of the *Rik* and the *Briihmana* period. In regard also to the nature of its contents, and the spirit which pervades them, this *Vedic* collection occupies a position apart from the others. Whilst the older *Vedas* seem clearly to reflect the recognized religious

notions and practices of the upper, and so to speak, respectable classes of the Aryan tribes, as jealously watched over by a priesthood deeply interested in the undiminished maintenance of the traditional observances, the fourth Veda, on the other hand, deals mainly with all manner of superstitious practices such as have at all times found a fertile soil in the lower strata of primitive and less advanced peoples, and are even apt, below the surface, to maintain their tenacious hold on the popular mind in comparatively civilized communities. Although the constant intermingling with the aboriginal tribes may well be believed to have exercised a deteriorating influence on the Vedic people in this respect, it can scarcely be doubted that superstitious practices of the kind revealed by the Atharvan and the tenth book of the Rik must at all times have obtained amongst the Aryan people, and that they only came to the surface when they received the stamp of recognized forms of popular belief by the admission of these collections of spells and incantations into the sacred canon. If in this phase of superstitious belief the old gods still find a place, their character has visibly changed so as to be more in accordance with those mystic rites and magic performances and the part they are called upon to play in them, as the promoters of the votary's cabalistic practices and the averters of the malicious designs of mortal enemies and the demoniac influences to which he would ascribe his fears and failures as well as his bodily ailments. The fourth Veda may thus be said to supplement in a remarkable manner the picture of the domestic life of the Vedic Aryan as presented in the Grihya-sūtras or house-rules; for whilst these deal only with the orderly aspects of the daily duties and periodic observances in the life of the respectable householder, the Atharvaveda allows us a deep insight into "the obscurer relations and emotions of human life"; and, it may with truth be said that "the literary diligence of the Hindus has in this instance preserved a document of priceless value for the institutional history of early India as well as for the ethnological history of the human race" (M. Bloomfield). It is worthy of note that the Atharvaveda is practically unknown in the south of India.

This body of spells and hymns is traditionally associated with two old mythic priestly families, the Atharvans and Angiras, their names, in the plural, serving either singly or combined (Atharvāngirasas) as the oldest appellation of the collection. The two families or classes of priests are by tradition connected with the service of the sacred fire; but whilst the Atharvans seem to have devoted themselves to the auspicious aspects of the fire-cult and the performance of propitiatory rites, the Angiras, on the other hand, are represented as having been mainly engaged in the uncanny practices of sorcery and exorcism. The current text of the *Atharva-saṃhitā*—apparently the recension of the Saunaka school—consists of some 750 different pieces, about five-sixths of which is in various metres, the remaining portion being in prose. The whole mass is divided into twenty books. The principle of distribution is for the most part a merely formal one, in books i.-xiii. pieces of the same or about the same number of verses being placed together in the same book. The next five books, xiv.-xviii., have each its own special subject: xiv. treats of marriage and sexual union; xv., in prose, of the Vṛātya, or religious vagrant; xvi. consists chiefly of prose formulas of conjuration; xvii. of a lengthy mystic hymn; and xviii. contains all that relates to death and funeral rites. Of the last two books no account is taken in the Atharva-prāṭisākhya, and they indeed stand clearly in the relation of supplements to the original collection. The nineteenth book evidently was the result of a subsequent gleaning of pieces similar to those of the earlier books, which had probably escaped the collectors' attention; while the last book, consisting almost entirely of hymns to Indra taken from the Rik-saṃhitā, is nothing more than a liturgical manual of recitations and chants required at the Soma sacrifice; its only original portion being the ten so-called *kuntāpa* hymns (127-136), consisting partly of laudatory recitals of generous patrons of sacrificial priests and partly of riddles and didactic subjects.

The Atharvan has come down to us in a much less satisfactory state of preservation than any of the other Saṃhitās. The discovery in Kashmir of a second recension of the Atharva-saṃhitā,

contained in a single birch-bark ms., written in the Śārādā character, has provided further material for its study. This new recension, ascribed to the Paippalāda school, consists likewise of twenty books (*kāṇḍa*), but in textual matter and arrangement it differs very much from the current text. While lacking much of the latter the new version offers a good deal of fresh matter, amounting to about one-sixth of the whole. From the Mahābhṛshya and other works quoting as the beginning of the Atharva-saṃhitā a verse that coincides with the first verse of the sixth hymn of the current text, it has long been known that at least one other recension must have existed; but the first leaf of the Kashmir ms. having been lost, it cannot be determined whether the new recension (as seems all but certain) corresponds to the one referred to in those works.

Atharvaveda-brāhmaṇa.—The only Brāhmaṇa of the Atharvan, the *Gopatha-brāhmaṇa*, is one of the most modern and least important works of its class. It consists of two parts, the first of which contains cosmogonic speculations, interspersed with legends, mostly adapted from other Brāhmaṇas, and general instructions on religious duties and observances; while the second part treats, in a very desultory manner, of various points of the sacrificial ceremonial.

Atharvaveda-sūtras.—The Kalpa-sūtras belonging to this Veda comprise both a manual of Srauta rites, the *Vaitāna-sūtra*, and a manual of domestic rites, the *Kausika-sūtra*. The teacher Kausika is repeatedly referred to in the work on points of ceremonial doctrine. The last sūtra-work to be noticed in connection with this Veda is the *Saunakīyā Chaturādhyaikā*, being a Prāṭisākhya of the Atharva-saṃhitā, so called from its consisting of four lectures (*adhya*). Although Saunaka can hardly be credited with being the actual author of the work, considering that his opinion is rejected in the only rule where his name appears, there is no reason to doubt that it chiefly embodies the phonetic theories of that teacher, which were afterwards perfected by members of his school. Whether this Saunaka is identical with the writer of that name to whom the final redaction of the Sākalaprāṭisākhya of the Rik is ascribed is not known.

Upanishads.—Another class of writings traditionally connected with the Atharvaveda are the numerous Upanishads which do not specially attach themselves to one or other of the Saṃhitās or Brāhmaṇas of the other Vedas. The Atharva-*upanishads*, mostly composed in ślokas, may be roughly divided into two classes: those of a purely speculative or general pantheistic character, treating chiefly of the nature of the supreme spirit, and the means of attaining to union therewith, and those of a sectarian tendency. Of the former category, a limited number—such as the Praśna, Mundaka and Māṇḍūkya-*upanishads*—have probably to be assigned to the later period of Vedic literature; whilst the others presuppose more or less distinctly the existence of some fully developed system of philosophy, especially the Vedānta or the Yoga. The sectarian Upanishads, on the other hand—identifying the supreme spirit either with one of the forms of Vishnu (such as the Nārāyaṇa, Nṛisimha-tāpaniya, Rāma-tāpaniya, Gopāla-tāpaniya Upanishads), or with Śiva (*e.g.*, the Rudra-*upanishad*), or with some other deity—belong to post-Vedic times.

THE CLASSICAL PERIOD

The Classical Literature of India is almost entirely a product of artificial growth, in the sense that its vehicle was not the language of the general body of the people, but of a small and educated class. It would scarcely be possible, even approximately, to fix the time when the literary idiom ceased to be understood by the common people. We only know that in the 3rd century B.C. there existed several dialects in different parts of northern India which differed considerably from the Sanskrit; and Buddhist tradition states that Gautama Śākyamuni himself, in the 6th century B.C., used the local dialect of Magadha (Behar) in preaching his new doctrine. Not unlikely, indeed, popular dialects, differing perhaps but slightly from one another, may have existed as early as the time of the Vedic hymns, when the Indo-Aryans, divided into clans and tribes, occupied the Land of the Seven Rivers; but such dialects must have sprung up

after the extension of the Aryan sway and language over the whole breadth of northern India. But there is no reason why, even with the existence of local dialects, the literary language should not have kept in touch with the people in India, as elsewhere, save for the fact that from a certain time that language remained altogether stationary, allowing the vernacular dialects more and more to diverge from it. Although linguistic research had been successfully carried on in India for centuries, the actual grammatical fixation of Sanskrit seems to have taken place about contemporaneously with the first spread of Buddhism; and indeed that popular religious movement undoubtedly exercised a powerful influence on the linguistic development of India.

Epic Poems.—The Hindus, like the Greeks, possess two great national epics, the *Mahābhārata* and the *Rāmāyaṇa*. The *Mahābhārata*, i.e., "the great (poem or tale) of the Bhāratas," is not so much a uniform epic poem as a great collection of poetry, consisting of a mass of legendary and didactic matter, worked into and round a central heroic narrative. The authorship of this work is aptly attributed to Vyāsa, "the arranger," the personification of Indian recension. Only the bare outline of the leading story can here be given.

At Hastināpura (sixty miles from the modern Delhi) in the Bharata country Dhritarāshṭra, the elder of the princes, being blind, was passed over for his brother Pāṇḍu on the death of their father. On the death of Pāṇḍu, however, Dhritarāshṭra assumed the government, assisted by his uncle Bhishma, the Nestor of the poem. Pāṇḍu had five sons, Yudhishtira, Bhima and Arjuna, by his chief wife Kūntī, and the twins Nakula and Sahadeva by his wife Mādri. From their great-grandfather Kuru both families are called *Kauravas*; but for distinction that name is more usually applied to the sons of Dhritarāshṭra, while their cousins, as the younger line, are named, after their father, *Pāṇḍavas*. The Pāṇḍavas were brought up at their uncle's court like his own sons. The rivalry and varying fortunes of these two houses form the main plot of the great epic. The Pandu princes soon proved themselves greatly superior to their cousins; and Yudhishtira, the eldest of them all, was to be appointed heir-apparent. But they had to leave the country to escape the plots of their jealous cousins. In their exile Draupadi, daughter of King Drupada of Panchāla, won by Arjuna in open contest, and became the wife of the five brothers. At the contest they met their cousin, nephew of their mother Kunti, the famous Yādava prince Krishna of Dvārakā, who ever afterwards remained their faithful friend and confidential adviser. Dhritarāshṭra now divided the kingdom between the two houses; whereupon the Pāṇḍavas built for themselves the city of Indraprastha (on the site of the modern Delhi). After a time of great prosperity, Yudhishtira, in a game of dice, lost everything to Duryodhana, when it was settled that the Pāṇḍavas should retire to the forest for twelve years, but should afterwards be restored to their kingdom if they succeeded in passing an additional year in disguise. During their forest-life they met with many adventures, among which may be mentioned their encounter with King Jayadratha of Chedi, who had carried off Draupadi from their hermitage. After the twelfth year has expired they leave the forest, and, assuming various disguises, take service at the court of King Virāṭa of Matsya. Here all goes well for a time till the queen's brother Kichaka, a great warrior and commander of the royal forces, falls in love with Draupadi, and is slain by Bhima. The Kauravas, profiting by Kichaka's death, now invade the Matsya kingdom, when the Pāṇḍavas side with King Virāṭa, and there ensues, on the field of Kurukshetra, during eighteen days, a series of fierce battles, ending in the annihilation of the Kauravas; only the Pāṇḍavas, Arjuna and his charioteer Krishna survived on the victorious side. Yudhishtira now at last becomes *yuva-rāja*, and eventually king—Dhritarāshṭra having resigned and retired with his wife and Kunti to the forest, where they soon after perish in a conflagration. Learning also of the death of Krishna, Yudhishtira himself at last becomes tired of life and resigns his crown; and the five princes, with their faithful wife, and a dog that joins them, set out for Mount Meru, to seek admission to Indra's heaven. On the way one by one drops off, till

Yudhishtira alone, with the dog, reaches the gate of heaven; but, the dog being refused admittance, the king declines entering without it, when the dog turns out to be no other than the god of Justice himself, having assumed that form to test Yudhishtira's constancy. But, finding neither his wife nor his brothers in heaven, and being told that they are in the nether world to expiate their sins, the king insists on sharing their fate, when this, too, proves a trial, and they are all reunited to enjoy perpetual bliss.

The complete work consists of upwards of 100,000 couplets—its contents thus being nearly eight times the bulk of the *Iliad* and *Odyssey* combined. It is divided into eighteen books, with a supplement, entitled *Harivaṃśa*, or genealogy of the god Hari (Krishna-Vishnu). The portion relating to the feud of the rival houses constitutes somewhere between a fourth and a fifth of the work; and it is by no means improbable that this portion once formed a separate poem, called the *Bhārata*. While some of the episodes are so loosely connected with the story as to be readily severed from it, others are so closely interwoven with it that their removal would seriously injure the very texture of the work. This, however, only shows that the original poem must have undergone some kind of revision, or perhaps repeated revisions. That such has indeed taken place, at the hand of Brāhmins, for sectarian and caste purposes, cannot be doubted. According to Lassen's opinion, which has been very generally accepted by scholars, the main story of the poem would be based on historical events: on a destructive war waged between the two neighbouring peoples of the Kurus and Panchālas, who occupied the western and eastern parts of the Madhyadeśa (or "middle land" between the Ganges and Jumna) respectively, and ending in the overthrow of the Kuru dynasty. On the original accounts of these events—perhaps handed down in the form of lays or sagas—the Pāṇḍava element would subsequently have been grafted as calculated to promote the class interests of the Brāhminical revisers.

Date of the Epic.—The earliest direct information regarding the existence of epic poetry in India is in a passage of Dion Chrysostom (c. A.D. 80)—"even among the Indians, they say, Homer's poetry is sung, having been translated by them into their own dialect and tongue." It is generally agreed that this does not imply an Indian translation of Homer but means that the Indians had similar works. Whence Dion derived his information is not known; but as many leading names of the *Mahābhārata* and even the name of the poem itself are mentioned in Pāṇini's grammatical rules, not only must the *Bhārata* legend have been current in his time (? c. 400 B.C.), but most probably it was at the time of Patanjali, the author of the "great commentary" on Pāṇini (c. 150 B.C.). It cannot, however, be doubted that long before that time heroic song had been diligently cultivated in India at the courts of princes and among Kshatriyas, the knightly order, generally. In the *Mahābhārata* itself the transmission of epic legend is in some way connected with the Sūtas, a social class which, in the caste-system, is defined as resulting from the union of Kshatriya men with Brāhmaṇa women, and which supplied the office of charioteers and heralds, as well as (along with the Māgadhas) that of professional minstrels. Be this as it may, there is reason to believe that, as Hellas had her *αοιδοί* who sang the *κλέα ἀνδρῶν*, and Iceland her skalds who recited favourite sagas, so India had from olden times her professional bards, who delighted to sing the praises of kings and inspire the knights with warlike feelings. If in this way a stock of heroic poetry had gradually accumulated which reflected an earlier state of society and manners, we can well understand why, after the Brāhminical order of things had been definitely established, the priests should have deemed it desirable to subject these traditional memorials of Kshatriya chivalry and prestige to their own censorship, and adapt them to their own canons of religious and civil law. Such a revision would doubtless require considerable skill and tact; and if in the present version of the work much remains that seems contrary to the Brāhminical code and pretensions—e.g., the polyandric union of Draupadi and the Pāṇḍu princes—the reason probably is that such features were too firmly rooted in the popular tradition to be readily eliminated; and all the revisers could do was to explain them away as best

ey could. Thus Draupadi's abnormal position is actually accounted for in five different ways, one of these representing it as an act of duty and filial obedience on the part of Arjuna who, on returning home his fair prize and announcing it to his mother, is rebuked by her, before seeing what it is, to share it with his brothers. The epic in time became a great treatise on duty (dharma) indicating the divine origin of Brahman institutions, the caste system and the superiority of the priestly caste not only over the people but over kings. From inscriptions we know that by the end of the 5th century A.D. the Mahābhārata was appealed to as an authority on matters of law, and that its extent was practically what it now is, including its supplement, the Hari-śmṣā. Indeed, everything seems to point to the probability of the work having been complete by about A.D. 200. But, whilst the Mahābhārata and Kuru heroic lays may, and probably do, go back to a much earlier age, it seems hardly possible to assume that the āṇḍava epic in its present form can have been composed before the Greek invasion of India, or about 300 B.C. Moreover, it is by no means impossible that the epic narrative was originally composed—as some other portions of the works are—in prose, either continuous or mixed with snatches of verse. The leading position occupied in the existing epic by Krishna (whence it is actually called *kārshṇa-veda*, or the veda of Krishna), and the Vaiṣṇava spirit pervading it, make it very probable that it assumed its final form under the influence of the Bhāgavata sect with whom Vāsudeva (Krishṇa), originally apparently a venerated local hero, came to be regarded as a veritable god, and incarnation of Vishnu. Its culminating point this sectarian feature attains in the *Bhagavat-gītā* (i.e., the upanishad), "sung by the only one"—the famous theosophic episode, in which Krishna, in a lofty and highly poetic language, expounds the doctrine of *bhakti* (bhakti) and claims adoration as the incarnation of the supreme spirit. Of the purely legendary matter incorporated with the leading story of the poem, not a little, doubtless, is at least as old as the latter itself. Some of these episodes—especially the well-known story of Nala and Damayanti, and the touching legend of Sāvitrī—themselves form epic gems of high poetic value.

The **Rāmāyaṇa**, i.e., poem "relating to Rāma," is ascribed to the poet Vālmīki; and, allowance being made for some later additions, the poem indeed presents the appearance of being the work of an individual genius. In its present form it consists of some 24,000 ślokas, or 48,000 lines of sixteen syllables, divided into seven books.

(I.) King Daśaratha of Koiala, reigning at Ayodhyā (Oudh), has four sons borne him by three wives, viz., Rāma, Bharata and the twins Lakshmana and Satrugna. Rāma wins for a wife Sītā, daughter of Janaka, king of Videha. (II.) On his return to Ayodhyā he is to be appointed heir-apparent; but Bharata's mother persuades the king now to grant her a long promised boon and insists on his banishing his eldest son for fourteen years, and appointing her son instead. Separation from his favourite soon breaks the king's heart, whereupon the ministers call on Bharata to assume the reins of government. He refuses, however, and, betaking himself to Rāma's retreat on the Chitrakūṭa mountain (in Bundelkhand), implores him to return; but, unable to shake Rāma's resolve to complete his term of exile, he consents to take charge of the kingdom in the meantime. (III.) After a ten years' happy residence in the forest, Rāvaṇa, the demon-king of Ceylon, carries off Sītā to his capital Laṅkā while her two protectors are away in pursuit of a golden deer sent to mislead them. While she resolutely rejects the Rākshasa's addresses, Rāma sets out with his brother to her rescue. (IV.) After numerous adventures they enter into an alliance with Sugriva, king of the monkeys; and, with the assistance of the monkey-general Hanu-mān, and Rāvaṇa's own brother Vibhishana, they prepare to assault Laṅkā. (V.) The monkeys, tearing up rocks and trees, construct a passage across the straits—the so-called Adam's Bridge, still designated Rāma's Bridge in India. (VI.) Rāma crosses with his allies, slays the demon and captures the stronghold; Sītā successfully undergoes an ordeal by fire to clear herself of the suspicion of infidelity; they return to Ayodhyā, where, after a triumphal entry, Rāma is installed. (VII.) Rāma, how-

ever, seeing that the people are not yet satisfied of Sītā's purity, resolves to put her away; whereupon, in the forest, she falls in with Vālmīki himself, and at his hermitage gives birth to two sons. While growing up there, they are taught by the sage the use of the bow, as well as the Vedas, and the Rāmāyaṇa as far as the capture of Laṅkā and the royal entry into Ayodhyā. Ultimately Rāma discovers and recognizes them by their wonderful deeds and their likeness to himself, and takes his wife and sons back with him.

The first and last books are later additions by which the poem has been turned to the glory of Vishnu. In these two books Rāma has become deified and identified with the god Vishnu, whilst in the body of the poem his character is simply that of a perfect man and model hero. The background of the epic is a purely mythological one—Rāma representing the god Indra, and Sītā—in accordance with the meaning of the name—the personified "Furrow," as which she is already invoked in the Rigveda, and hence is a tutelary spirit of the tilled earth, wedded to Indra, the Jupiter Pluvius. Rāvaṇa would correspond to the demon Vritra of the Rigveda.

One version of the same story, with, however, many important variations of details, forms an episode of the *Mahābhārata*, the *Rāmopākhyāna*, the relation of which to Vālmīki's work is still a matter of uncertainty. In respect of both versification and diction the Rāmāyaṇa is of a distinctly more refined character than the larger poem; and, indeed, Vālmīki is seen already to cultivate some of that artistic style of poetry which was carried to excess in the later artificial poems (Kāvya), whence the title of *ādī-kavi*, or first poet, is commonly applied to him. The *Rāmāyaṇa* itself contains a prophecy like that of Horace's to the effect that it will always live on the lips of men, and it has been more than fulfilled. No story in India has attained such popularity. It has been translated into many vernaculars and through the version of Tulsi Das has exerted a tremendous influence on the spiritual life of India. To characterize the Indian epics in a single word: though often disfigured by fancies and exaggerations, they are yet noble works, abounding in passages of remarkable descriptive power, intense pathos, and high poetic grace and beauty; and while, as works of art, they are far inferior to the Greek epics, in some respects they appeal far more strongly to the romantic mind of Europe, namely, by their loving appreciation of natural beauty, their exquisite delineation of womanly love and devotion, and their tender sentiment of mercy and forgiveness.

Purāṇas and Tantras.—The *Purāṇas* are partly legendary, partly speculative histories of the universe, compiled for the purpose of promoting some special, locally prevalent form of Brāhmanical belief. They deal with cosmogony, stories of gods, sages and heroes, Vishnu's avatars, the solar and lunar lines of kings and other pseudo-historical matter. They are sometimes styled a fifth Veda, and may indeed in a certain sense be looked upon as the scriptures of Brāhmanical India. The term *purāṇa*, signifying "old," applied originally to prehistoric, especially cosmogonic, legends, and then to collections of ancient traditions generally. They are popular encyclopaedias of useful knowledge mostly with a Vaishnava tendency. They are connected in subject matter with the *Mahābhārata* and have some relationship to the law books and go back to a common source.

They are almost entirely composed in the epic couplet, and indeed in much the same easy flowing style as the epic poems, to which they are, however, as a rule greatly inferior in poetic value.

According to the traditional classification of these works, there are said to be eighteen (*Mahā-*, or great) *Purāṇas*, and as many *Upa-purāṇas*, or subordinate *Purāṇas*. The former are by some authorities divided into three groups of six, according as one or other of the three primary qualities of external existence—goodness, darkness (ignorance), and passion—is supposed to prevail in them, viz. the *Vishṇu*, *Nārādīya*, *Bhāgavata*, *Garuḍa*, *Padma*, *Varāha*—*Matsya*, *Kūrma*, *Liṅga*, *Śiva*, Skanda, *Agni*—*Brahmāṇḍa*, *Brahmavaivarta*, *Mārkaṇḍeya*, *Bhavishya*, *Vāmana* and *Brahma-Purāṇas*. The eighteen principal *Purāṇas* are said to consist of together 400,000 couplets. In northern India the Vaishnava *Purāṇas*, especially the *Bhāgavata* and *Vishṇu*, are by far the

most popular. The former is held in the highest estimation, and, especially through the vernacular versions of its tenth book, treating of the story of Kṛishṇa, has powerfully influenced the religious belief of India.

From the little we know regarding the Upa-purāṇas, their character does not seem to differ very much from that of the principal sectarian Purāṇas. Besides these two classes of works there is a large number of so-called Sthela-purines, or chronicles recounting the history and merits of some holy "place" or shrine, where their recitation usually forms an important part of the daily service.

The Tantras have to be considered as partly a collateral and partly a later development of the sectarian Puriinas; though, unlike these, they can hardly lay claim to any intrinsic poetic value. These works are looked upon as their sacred writings by the numerous *Sāktas*, or worshippers of the female energy (*śakti*) of some god, especially the wife of Siva, in one of her many forms (Pārvatī, Devi, Kālī, Bhavānī, Durgā). This worship of a female representation of the divine power appears already in some of the Purāṇas; but in the Tantras it assumes quite a peculiar character, being largely intermixed with magic performances and mystic rites, partly, indeed, of a grossly immoral nature. (See HINDUISM.) See the series of Tantric works edited by A. Avalon.

Artificial Epics and Romances.—About the beginning of the Christian era a new class of epic poems begins to make its appearance, differing widely in character from those that had preceded it. These later productions are of a decidedly artificial character, and must necessarily have been beyond the reach of any but the highly cultivated. They are, on the whole, singularly deficient in incident and invention, their subject matter being almost entirely derived from the old epics. Nevertheless, these works are by no means devoid of merit and interest; and a number of them display considerable descriptive power and a wealth of genuine poetic sentiment. The simple heroic couplet has been largely discarded for various more or less elaborate metres; and in accordance with this change of form the diction becomes gradually more complicated.

The generic appellation of such works is *kāvya*, which, meaning "poem," or the work of an individual poet (*kavi*), is, as we have seen, already applied to the *Rāmāyaṇa*. Six poems of this kind are singled out by native rhetoricians as standard works, under the title of *Mahākāvya*, or great poems. Two of these are ascribed to the famous dramatist Kālidāsa, the most prominent figure of this period of Indian literature and truly a master of the poetic art. In a comparatively modern couplet he is represented as having been one of nine literary "gems" at the court of a king Vikramāditya. Whether this name refers to Chandragupta II. Vikramāditya or not, Kālidāsa must have flourished about this time, c. A.D. 400. Of the principal poets of this class, whose works have come down to us, he appears to be one of the earliest; but there can be little doubt that he was preceded in this as in other departments of poetic composition by many lesser lights, eclipsed by the sun of his fame, and forgotten. Thus the *Buddhacharita*, a Sanskrit poem on the life of the reformer, which was translated into Chinese about A.D. 420, and the author of which, Aivaghosha, is placed by Buddhist tradition as early as the time of Kanishka (who began to reign in A.D. 78), calls itself, not without reason, a "mahākāvya"; and the panegyrics contained in some of the inscriptions of the 4th century likewise display, both in verse and ornate prose, many of the characteristic features of the *kāvya* style of composition.

Of the six universally recognized "great poems" here enumerated, the first two, and doubtless the two finest, are those attributed to Kālidāsa. (1) The *Raghuvamśa*, or "race of Raghu," celebrates the ancestry and deeds of Rāma. The work, consisting of nineteen cantos, is manifestly incomplete; but hitherto no copy has been discovered of the six additional cantos which are supposed to have completed it. (2) The *Kumira-sambhava*, or "the birth of (the war-god) Kumāra" (or Skanda), the son of Siva and Pārvatī, consists of seventeen cantos, the last ten of which are looked upon as spurious by some scholars, mainly on account of their erotic character, not a strong argument. There is no reason to doubt that the eighth canto is by Kālidāsa but he cannot have

written much of the other nine. (3) The *Kirātārjuniya*, or combat between the Prindava prince Arjuna and the god Siva, in the guise of a Kirāta or wild mountaineer, is a poem in eighteen cantos, by Bhāravi, who is mentioned together with Kālidāsa in an inscription dated A.D. 634. (4) The *Śiśupāla-badha*, or slaying of Śiśupāla, who, being a prince of Chedi, reviled Kṛishṇa, who had carried off his intended wife, and was killed by him at the inauguration sacrifice of Yudhishtira, is a poem consisting of twenty cantos, attributed to Māgha (ninth cent.), whence it is also called *Māghakāvya*. (5) The *Rāvanabaddha*, or "slaying of Rāvaṇa," more commonly called *Bhaṭṭikāvya*, was composed for the practical purpose of illustrating the less common grammatical forms and the figures of rhetoric and poetry. Bhaṭṭi, apparently the author's name, is usually identified with the well-known grammarian Bhartṛihari, whose death Professor M. Müller, from a Chinese statement, fixes at A.D. 650, while others make him Bhartṛihari's son. (6) The *Naishadhiya*, or *Naishadha-charita*, the life of Nala, king of Nishadha, is ascribed to Śrī-Harsha (son of Hira), who is supposed to have lived in the latter part of the 12th century. The *Nalodaya* deals with the same subject but the author's main object is to show his skill in tricks of style and metre. The long lost and recently discovered *Janakī-harana of Kumārādāsa* (eighth cent.) takes its subject (the rape of Sītā) from the *Rāmāyaṇa* strongly imitative of Kālidāsa; it is, however, the work of a poet of no mean ability. The stanzas of the *Rāghavapāṇḍavīya* are so ambiguously worded that the poem may be interpreted as relating to the leading story of either the *Rāmāyaṇa* or the *Mahābhārata*. Less ambitious in composition, though styling itself a mahākāvya, is the *Vikramāṅka-devacharita*, a panegyric written about A.D. 1085 by the Kashmir poet Bilhana, in honour of his patron the Chālukya king Vikramāditya of Kalyāṇa, regarding the history of whose dynasty it supplies some valuable information.

In this place may also be mentioned, as composed in accordance with the Hindu poetic canon, Kalhana's *Rājataranginī* (c. A.D. 1150) or "river of kings," being a chronicle of the kings of Kashmir, and the only important historical work in the Sanskrit language, although even here considerable allowance has to be made for poetic licence and fancy.

Under the general term "kāvya" Indian critics include, however, not only compositions in verse, but also certain kinds of prose works composed in choice diction richly embellished with flowers of rhetoric. The feature generally regarded by writers on poetics as the chief mark of excellence in this ornate prose style is the frequency and length of its compounds; whilst for metrical compositions the use of long compounds is expressly discouraged by some schools of rhetoric.

The Drama.—The Hindus ascribe the origin of dramatic representation to the sage Bharata (the word in Sanskrit means also "actor"). We know that treatises on the dramatic art existed at the time of Pāṇini, as he mentions two authors of *Naṭa-sūtras*, or "rules for actors," Śilālin and Kriśāśva. Now the words *naṭa* and *nāṭya*—as well as *nāṭaka*, the common term for "drama"—being derived (like the modern vernacular "Nautch"=*nritya*) from the root *naṭ* (nrit) "to dance," seem to point to a pantomimic or choral origin of the dramatic art. Fortunately, however, Patañjali, in his "great commentary," speaks of the actor as singing, and of people going "to hear the actor." Nay, he even mentions two subjects, taken from the cycle of Vishnu legends: the slaying of Kamsa (by Krishna) and the binding of Bali (by Viṣṇu)—which were represented on the stage both by mimic action and declamation. Judging from these allusions, theatrical entertainments in those days seem to have been very much on a level with the old religious spectacles or mysteries of Europe. It is not, however, till some centuries later that we meet with the first real dramas, which mark at the same time the very culminating point of Indian dramatic composition. Although we know the names of at least five predecessors of Kālidāsa, nothing but a few quotations from them have been preserved.

The long disputed possibility of Greek influence on the Sanskrit drama is not now maintained, although there are some superficial points of resemblance. The Hindu dramatist has little regard for

he "unities" of the classical stage, though he is hardly ever guilty of extravagance in his disregard of them. Unlike the Greek dramatic theory, it is an invariable rule of Indian dramaturgy, that every play, however much of the tragic element it may contain, must have a happy ending. A death never takes place on the stage, nor is anything indecorous allowed. The dialogue is invariably carried on in prose plentifully interspersed with those neatly turned lyrical stanzas in which the Indian poet delights to depict some aspect of nature, or some temporary physical or mental condition. The outstanding feature of the Hindu play, however, is the mixed nature of its language. While the heroic and leading male characters speak Sanskrit, women and inferior male characters use various Prākṛit dialects. As regards these dialectic varieties, it can hardly be doubted that at the time when they were first employed in this way they were local vernacular dialects; but in the course of the development of the scenic art they became permanently fixed for special dramatic purposes, just as the Sanskrit had, long before that time, become fixed for general literary purposes. Thus it would happen that these Prākṛit dialects, having once become stationary, were soon left behind by the spoken vernaculars, until the difference between them was as great as between the Sanskrit and the Prākṛits.

The *Mṛichchhakatikā*, or "little clay cart," has been considered earliest of the existing dramas because of a certain clumsiness of construction, but probably does not antedate the sixth century. According to several stanzas in the prologue, the play was composed by a king Śūdraka, but it is probably the work of a poet patronized by him. Chārudatta, a Brahman merchant, reduced to poverty, and Vasantasenā, an accomplished courtesan, meet and fall in love with each other. This forms the main plot, which is interwoven with a political underplot, resulting in a change of dynasty. The connection between the two plots is effected by means of the king's rascally brother-in-law, who pursues Vasantasenā with his addresses, as well as by the part of the rebel cowherd Aryaka, who, having escaped from prison, finds shelter in the hero's house. The wicked prince, on being rejected, strangles Vasantasenā, and accuses Chārudatta of having murdered her; but, just as the latter is about to be executed, his lady love appears again on the scene. Meanwhile Aryaka has succeeded in deposing the king, and, having himself mounted the throne of Ujjain, he raises Vasantasenā to the position of an honest woman, to enable her to become the wife of Chārudatta. The play is one of the longest, consisting of not less than ten acts, some of which, however, are very short. The interest of the action is, on the whole, well sustained; and, altogether, the piece presents a vivid picture of the social manners of the time, whilst the author shows himself imbued with a keen sense of humour, and a master in the delineation of character.

Kālidāsa.—In Kālidāsa the dramatic art attained its highest point of perfection. From this accomplished poet we have three well-constructed plays, abounding in stanzas of exquisite tenderness and fine descriptive passages: the two well-known mytho-pastoral dramas, *Sakuntalā* in seven and *Vikramorvaśī* in five acts, and a piece of court intrigue, distinctly inferior to the other two, entitled *Mālavikāgnimitra* in five acts. The plot of the last named is as follows: King Agnimitra, who has two wives, falls in love with Mālavikā, maid to the first queen. His wives endeavour to frustrate their affection for each other, but in the end Mālavikā turns out to be a princess by birth, and is accepted by the queens as their sister.

Śrī Harshadeva.—Śrī-Harshadeva—identical with the king (Śilāditya) Harshavardhana of Kānyakubja (Kanauj) mentioned above, who ruled in the first half of the 7th century—has three plays attributed to him; they are probably only dedicated to him by poets patronized by him. This at least commentators state to have been the case as regards the *Ratnāvalī*, the authorship of which they assign to Bāṇa. Indeed, had they been the king's own productions, one might have expected the Chinese pilgrims (especially I-tsing, who saw one of the plays performed) to mention the fact. The *Ratnāvalī*, "the pearl necklace," is a graceful comedy of domestic manners, with well-drawn characters. Ratnāvalī, a Ceylon princess, is sent by her father to the court of

King Udayana of Vatsa to become his second wife. She suffers shipwreck, but is rescued and received into Udayana's palace under the name of Sāgarikā, as one of Queen Vāsavadattā's attendants. The king falls in love with her, and the queen tries to keep them apart, but, on learning the maiden's origin, she becomes reconciled, and recognizes her as a "sister." Very similar in construction, but inferior, is the *Priyadarśikā*, in four acts, having for its plot another amour of the same king. The scene of the third play, the *Nāgānanda*, or "joy of the serpents" (in five acts), on the other hand, is laid in semi-divine regions. In spite of its shortcomings of construction the *Nāgānanda* is a play of considerable merit, the characters being drawn with a sure hand, and the humour is by no means despicable.

Bhavabhūti, a Brahman of Vidarbha, passed his literary life chiefly at the court of Yaśovarman of Kanauj (c. A.D. 700). Bhavabhūti was the author of three plays, two of which, the *Mahāvīracharita* ("life of the great hero") and the *Uttarardmacharita* with very little action ("later life of Rāma"), in seven acts each, form together a dramatized version of the story of the *Rāmāyaṇa*. The third, the *Mālatīmādhava*, is a domestic drama in ten acts, representing the fortunes of Mādhava and Mālatī, the son and daughter of two ministers of neighbouring kings, who from childhood have been destined for each other, but, by the resolution of the maiden's royal master to marry her to an old and ugly favourite of his, are for a while threatened with permanent separation. The action of the play is full of life and abounds in stirring, though sometimes improbable, incidents. The poet is considered by native critics to be not only not inferior to Kālidāsa, but even to have surpassed him in his *Uttararāmacharita*.

Minor Dramatists.—Bhaṭṭa Nārāyaṇa, the author of the *Veṇīsamhāra* ("the binding up of the braid of hair," based on an incident in the Mahābhārata), is known to have been alive in A.D. 840. The piece is composed in a style similar to that of Bhavabhūti's plays, but is inferior to them in dramatic construction and poetic merit, though valued by critics for its strict adherence to the rules of the dramatic theory, and popular in India, owing to its partiality for the cult of Krishna. The *Hanuman-nāṭaka* is a dramatized version of the story of Rāma, interspersed with numerous purely descriptive poetic passages. Contrary to the general practice, Sanskrit alone is employed in it. The play is attributed to Dāmodara Miśra (11th cent.), but gives the impression of being the production of different hands. Bhāsa is traditionally one of the great dramatists of India, a predecessor of Kālidāsa, but nothing of his has survived.

The *Mudrārākshasa*, or "Rākshasa (the minister) with the signet," is unique in being a drama of political intrigue, partly based on historical events, the plot turning on the reconciliation of Rākshasa, the minister of the murdered king Nanda, with the hostile party, consisting of Prince Chandragupta (the Greek Sandrocottus, 315-291 B.C.), who succeeded Nanda, and his minister Chāṇakya. The plot is developed with considerable dramatic skill, in vigorous, if not particularly elegant, language. The play was composed by Viśākhadatta, not much later than A.D. 860.

The *Prabodha-chandrodaya*, or "the moon-rise of intelligence," composed by Krishnamira about the 12th century, is an allegorical play, in six acts, the *dramatis personae* of which consist entirely of abstract ideas and symbolical figures divided into two conflicting hosts; it is full of vigour, however. It depicts the struggle between the wicked king Error and the good king Reason.

Lyrical, Descriptive and Didactic Poetry.—Allusion has already been made to the marked predilection of the mediaeval Indian poet for depicting in a single stanza some peculiar physical or mental situation. The profane lyrical poetry consists chiefly of such little poetic pictures, which form a prominent feature of dramatic compositions. Numerous poets and poetesses are only known to us through such detached stanzas, preserved in native anthologies or manuals of rhetoric, and enshrining a vast amount of descriptive and contemplative poetry. An excellent specimen of a longer poem, of a partly descriptive, partly erotic character, is Kālidāsa's *Meghadūta*, or "cloud messenger," in which a

banished yaksha (demi-god) sends a love-message across India to his wife in the Himālaya, and describes, in verse-pictures of the stately mandākrantā metre the various places over which the messenger, a cloud, will have to sail in his airy voyage. Another much-admired descriptive poem by Kālidāsa is the *Ritu-samhāra*, or "collection of the seasons," in which the attractive features of the six seasons are successively set forth.

As regards religious lyrics, the fruit of sectarian fervour, a large collection of hymns and detached stanzas, extolling some special deity, might be made from Purāṇas and other works. Of independent productions of this kind only a few of the more important can be mentioned here. Sankara Āchārya, the great Vedāntist, who seems to have flourished about A.D. 800, is credited with several devotional poems, especially the *Ānanda-lahari*, or "wave of joy," a hymn of 103 stanzas, in praise of the goddess Pārvatī. The *Sūrya-śataka*, or century of stanzas in praise of Sūrya, the sun, is ascribed to Mayiira, the contemporary (and, according to a tradition, the father-in-law) of Bāṇa (in the early part of the 7th century). The latter poet himself composed the *Chandīkāstotra*, a hymn of 102 stanzas, extolling Śiva's consort. The *Khaṇḍaprasasti*, a poem celebrating the ten avatāras of Vishnu, is ascribed to no other than Hanumān, the monkey general, himself. Jayadeva's beautiful poem *Gītāgovinda*, which, like most productions concerning Kṛishṇa, is of a very sensuous character, is a religious drama.

Didactic Poetry.—The particular branch of didactic poetry in which India is especially rich is that of moral maxims, expressed in single stanzas or couplets, and forming the chief vehicle of the *Nīti-śāstra* or ethic science. Excellent collections of such aphorisms have been published—in Sanskrit and German by Bohtlingk, and in English by John Muir. Probably the oldest original collection of this kind is that ascribed to Chāṇakya, but really much later.

Fables and Narratives.—For purposes of popular instruction stanzas of an ethical import were early worked up with existing prose fables and popular stories. A collection of this kind, a mirror for princes, was translated into Pahlavi in the reign of the Persian king Khusru Anushirvan, A.D. 531-579; but neither this translation nor the original is any longer extant. A Syriac translation, however, made from the Pahlavi in the same century, under the title of "Qualilag and Dimnag"—from the Sanskrit "Karataka and Damanaka," two jackals who play an important part as the lion's counsellors—has been discovered and published. The Sanskrit original, which probably consisted of fourteen chapters, was afterwards recast—the result being the *Panchatantra*, or "five books" (or headings), of which several recensions exist. A popular but late summary of this work, in four books, the *Hitopadeśa*, or "Salutary Counsel," has been shown by Peterson to have been composed by one Nārāyaṇa. Other highly popular collections of stories and fairy tales, interspersed with sententious verses, are: the *Vetālapanchaviṃśati*, or "twenty-five (stories) of the Vetāla" (the original of the Baitāl Pachisi), older than the 11th century, since both Kshemendra and Somadeva have used it; and the *Śuka-saptati*, or "seventy (stories related) by the parrot," the author and age of which are unknown.

SCIENTIFIC AND TECHNICAL LITERATURE

Law (*Dharma*).—Among the technical treatises of the later Vedic period, certain portions of the Kalpa-siitras, or manuals of ceremonial, peculiar to particular schools, are the earliest attempts at a systematic treatment of law subjects. These are the *Dharma-siitras*, or "rules of (religious) law." The Dharmasiitras consist chiefly of strings of terse rules, containing the essentials of the science, and intended to be committed to memory, and to be expounded orally by the teacher—thus forming, as it were, epitomes of class lectures. These rules are interspersed with stanzas or "gāthās," in various metres, either composed by the author himself or quoted from elsewhere, which generally give the substance of the preceding rules. One can well understand why such couplets should gradually have become more popular, and should ultimately have led to the appearance of works entirely composed in verse. Such metrical law-books did spring up

in large numbers, not all at once, but over a long period of time. These works are the metrical *Dharma-śāstras*, or, as they are usually called, the *Smṛiti*, "recollection, tradition,"—a term which, as we have seen, belonged to the whole body of Siitras (as opposed to the *Śruti*, or revelation), but which has become the almost exclusive title of the versified institutes of law (and the few Dharmasiitras still extant). Of metrical Smritis about forty are known to exist, but their total number probably amounted to at least double that figure.

Manu.—With the exception of a few of these works—such as the *Agnī*-, *Yama*- and *Vishnu-Smritis*—which are ascribed to the respective gods, the authorship of the Smritis is attributed to old rishis, such as Atri, Kāṇva, Vyāsa, Śāṇḍilya, Bharadvāja. It is, however, extremely doubtful whether, as a rule, there really existed a traditional connection between these works and their alleged authors or schools named after them. The idea, which early suggested itself to Sanskrit scholars, that Smritis which passed by the names of old Vedic teachers and their schools might simply be metrical recasts of the Dharma- (or Grihya-) siitras of these schools, was a very natural one, and, indeed, is still a very probable one, though the loss of the original Siitras makes it difficult to prove. One could, however, scarcely account for the disappearance of the Dharmasiitras of some of the most important schools except on the ground that they were given up in favour of other works; and it is not very likely that this should have been done, unless there was some guarantee that the new works, upon the whole, embodied the doctrines of the old authorities of the respective schools. Thus, as regards the most important of the Smritis, the *Mānava-Dharmaśāstra*, there exist both a Śrauta- and a Grihya-siitra of the Mānava school of the Black Yajus, but no such Dharmasūtra has hitherto been discovered, although the former existence of such a work has been made all but certain by Professor Buhler's discovery of quotations from a *Mānavam*, consisting partly of prose rules, and partly of couplets, some of which occur literally in the Manusmṛiti, whilst others have been slightly altered there to suit later doctrines, or have been changed from the original trishtubh into the epic metre. The idea of an old law-giver Manu Svāyambhuva—"sprung from the self-existent (svayam-bhū) god Brahman (m.)—reaches far back into Vedic antiquity: he is mentioned as such in early texts; and in Yāska's *Nirukta* a Sloka occurs, giving his opinion on a point of inheritance. But whether or not the Mānava-Dharmaśāstra embodied what were supposed to be the authoritative precepts of this sage on questions of sacred law we do not know; nor can it as yet be shown that the Manusmṛiti, which seems itself to have undergone considerable modifications, is the lineal descendant of that Dharmasiitra.

The Mānava Dharmaśāstra consists of twelve books, the first and last of which, treating of creation, transmigration and final beatitude, are, however, generally regarded as later additions. In them the legendary sage Bhṛigu, here called a Mānava, is introduced as Manu's disciple, through whom the great teacher has his work promulgated. Except in these two books the work shows no special relation to Manu, for, though he is occasionally referred to in it, the same is done in other Smritis. The oldest existing commentary on the *Mānava-Dharmaśāstra* is by Medhitithi, who is usually supposed to have lived in the 10th century. The most esteemed of the commentaries is that of Kullīka Bhaṭṭa, composed at Benares in the 15th century.

Yājñavalkya.—Next in importance among Smritis ranks the *Yājñavalkya Dharmaśāstra*. Based on the Manusmṛiti, it represents a more advanced stage of legal theory and definition than that work. Yājñavalkya, as we have seen, is looked upon as the founder of the Vājasaneyins or White Yajus, and the author of the Śatapatha-brāhmaṇa. The work bears some resemblance to the *Pāraskara-grihyasūtra* of the white Yajur Veda but a connection between it and the *Mānava-grihyasūtra* seems, however, likewise evident. As in the case of Manu, ślokas are quoted in various works from a *Bṛihat*- and a *Vṛiddha-Yājñavalkya*. The Yājñavalkya-smṛiti consists of three books, corresponding to the three great divisions of the Indian theory of law: *āchāra*, rule of conduct (social and caste duties); *vyavahāra*, civil and criminal law; and *prāyaścitta*, penance or expiation.

Nāradaśmṛiti.—The *Nāradiya-Dharmaśāstra*, or *Nāradaśmṛiti*, is a more practical work; indeed, it is probably the most systematic and businesslike of all the Smritis. It does not concern itself with religious and moral precepts, but is strictly con-
 ned to law.

Whether any of the Dharmaśāstras were ever used in India as actual "codes of law" for the practical administration of justice is doubtful. No doubt these works were held to be of the highest authority as laying down the principles of religious and civil duty; but it was not so much any single text as the whole body of the Smritis that was looked upon as the embodiment of the divine law. Hence, the moment the actual work of codification begins in the 17th century, we find the jurists engaged in practically showing how the Smritis confirm and supplement each other, and in reconciling seeming contradictions between them. This new phase of Indian jurisprudence begins with Vijñāneśvara's *Mitāksharā*, which, although primarily a commentary on Yājñavalkya, is so rich in original matter and illustrations from other Smritis that it is far more adapted to serve as a code of law than the work it professes to explain. This treatise is held in high esteem all over India, with the exception of the Bengal or Gauriya school of law, which recognizes as its chief authority the digest of its founder, Īmūtavāhana, especially the chapter on succession, entitled *Jāyabhāga*. Based on the *Mitāksharā* are the *Smṛitichandrikā*, a work of great common sense, written by Devāṇḍa Bhaṭṭa, in the 13th century, and highly esteemed in Southern India; and the *Vṛamitrodaya*, a compilation consisting of two chapters, on *chāra* and *vyavahāra*, made in the first half of the 17th century by Mitrāmīśra, for Rājā Virasimha, or Birsinh Deo of Orchhā, who murdered Abul Fazl, the minister of the emperor Akbar, and author of the *Āin-i Akbari*. There is no need here to enumerate any more of the vast number of treatises on special points of law, the more important of which will be found mentioned in English digests of Hindu law.

Philosophy.—The contemplative Indian mind shows at all times a strong disposition for metaphysical speculation. In the old religious lyrics this may be detected from the very first. Not to speak of the abstract nature of some even of the oldest Vedic poetries, this propensity betrays itself in a certain mystic symbolism, tending to refine and spiritualize the original purely physical character and activity of some of the more prominent gods, and to impart a deep and subtle import to the rites of the sacrifice. The primitive worship of more or less isolated elemental forces and phenomena had evidently ceased to satisfy the religious wants of the more thoughtful minds. Various syncretist tendencies show the drift of religious thought towards some kind of unity and of the divine powers, be it in the direction of the pantheistic idea, or in that of an organized polytheism, or even towards monotheism. In the latter age of the hymns the pantheistic idea is rapidly gaining ground, and finds vent in various cosmogonic speculations; and in the Brāhmaṇa period we see it fully developed. The fundamental conception of this doctrine finds its expression in the two synonymous terms *brāhman* (neutr.), probably originally "mystic effusion, devotional utterance," then "holy impulse," and *ātman* (masc.), "breath, self, soul."

The recognition of the essential sameness of the individual souls, emanating all alike (whether really or imaginarily) from the ultimate spiritual essence (*parama-brāhman*) "as sparks issue from the fire," and destined to return thither, involved some important problems. Considering the infinite diversity of individual souls of the animal and vegetable world, exhibiting various degrees of perfection, is it conceivable that each of them is the immediate efflux of the Supreme Being, the All-perfect, and that each, from the lowest to the highest, could re-unite therewith directly at the close of its mundane existence? The difficulty implied in the latter question was at first met by the assumption of an intermediate state of expiation and purification, a kind of purgatory; but the whole problem found at last a more comprehensive solution in the doctrine of transmigration (*samsāra*). This doctrine not found in the *Rigveda* was probably aboriginal and adopted by the Aryan invaders. The notion of *samsāra* has become an axiom, a universally conceded principle of Indian philo-

sophy. Thus the latter has never quite risen to the heights of pure thought; its object is indeed *jijñāsā*, the search for saving knowledge; but it is an inquiry (*mīmāṃsā*) into the nature of things undertaken not solely for the attainment of the truth, but with a view to a specific object—the discontinuance of *samsāra*, the cessation of mundane existence after the present life. The task of the philosopher is to discover the means of attaining *moksha*, "release" from the bondage of material existence, and union with the Supreme Self—in fact, salvation. Desire is due to ignorance or wrong knowledge of the true nature of things and is the cause of transmigration. The purpose of each philosophical school is to attain true and saving knowledge. Intense self-contemplation being the only way of attaining the all-important knowledge, this doctrine left little or no room for those mediatorial offices of the priest, so indispensable in ceremonial worship; and indeed we actually read of Brahman sages resorting to Kshatriya princes to hear them expound the true doctrine of salvation. But, in spite of their anti-hierarchical tendency, these speculations continued to gain ground; and in the end the body of treatises propounding the pantheistic doctrine, the Upanishads, were admitted into the sacred canon, as appendages to the ceremonial writings, the Brāhmaṇas. The Upanishads thus form literally "the end of the Veda," the *Vedānta*; but their adherents claim this title for their doctrines in a metaphorical rather than in a material sense, as "the ultimate aim and consummation of the Veda."

In later times the radical distinction between these speculative appendages and the bulk of the Vedic writings was strongly accentuated in a new classification of the sacred scriptures. According to this scheme they were supposed to consist of two great divisions—the *Karma-kāṇḍa*, "the work-section," or practical ceremonial (exoteric) part, consisting of the Saṃhitās and Brāhmaṇas (including the ritual portions of the Aranyakas), and the *Jñānakāṇḍa*, "the knowledge-section," or speculative (esoteric) part. These two divisions are also called respectively the *Pūrva-* ("former") and *Uttara-* ("latter," or higher) *kāṇḍa*; and when the speculative tenets of the Upanishads came to be formulated into a regular system it was deemed desirable that there should also be a special system corresponding to the older and larger portion of the Vedic writings. Thus arose the two systems—the *Pūrva-* (or Karma-) *mīmāṃsā*, or "prior (practical) speculation," and the *Uttara-* (or *Brāhma-*) *mīmāṃsā*, or higher inquiry (into the nature of the godhead), usually called the Vedānta philosophy.

Philosophical Systems.—It is not yet possible to determine, even approximately, the time when the so-called *Darśanas* (literally "demonstrations"), or systems of philosophy which subsequently arose, were first formulated. And, though they have certainly developed from the tenets enunciated in the Upanishads, there is some doubt as to the exact order in which these systems succeeded each other. Of all the systems the Vedānta has indeed remained most closely in touch with the speculations of the Upanishads, which it has further developed and systematized. The authoritative expositions of the systems have, however, apparently passed through several redactions; and, in their present form, these *śiṭra*-works evidently belong to a comparatively recent period, none of them being probably older than the early centuries of our era. By far the ablest general review of the philosophical systems (except the Vedānta) produced by a native scholar is the *Sarva-darśana-saṅgraha* ("summary of all the Darśanas"), composed in the 14th century, from a Vedāntist point of view, by the great exegete Mādhava Āchārya.

Among the different systems, six are generally recognized as orthodox, as being (either wholly or for the most part) consistent with the Vedic religion—two and two of which are again more closely related to each other than to the rest, viz.:

- (1) *Pūrva-mīmāṃsā* (*Mīmāṃsā*), and (2) *Uttara-mīmāṃsā* (*Vedānta*);
- (3) *Sāṅkhya*, and (4) *Yoga*;
- (5) *Nyāya*, and (6) *Vaiśeṣika*.

Mīmāṃsā.—1. The (*Pūrva-*) *Mīmāṃsā* (First Inquiry) is not a System of philosophy in the proper sense of the word, but rather a system of dogmatic criticism and scriptural interpretation. It maintains the eternal existence of the Veda, the different parts of

which are minutely classified. Its principal object, however, is to ascertain the religious (chiefly ceremonial) duties enjoined in the Veda, and to show how these duties must be performed, and what are the special merits and rewards attaching to them. Hence arises the necessity of determining the principles for rightly interpreting the Vedic texts, as also of what forms its only claim to being classed among speculative systems, namely, a philosophical examination of the means of, and the proper method for, arriving at accurate knowledge. The foundation of this school, as well as the composition of the Siitras or aphorisms, the *Mīmāṃsā-darśana*, which constitute its chief doctrinal authority, is ascribed to Jaimini. The Siitras were commented on by Śabara Svāmīn in his *Bhāṣya*; and further annotations (*Tantra-vārttika* and *Śloka-vārttika*) thereon were supplied by the great theologian Kumārila Bhaṭṭa (about A.D. 700). The most approved general introduction to the study of the *Mīmāṃsā* is the metrical *Jaiminīya-Nyāya mālāvīstara*, with a prose commentary, both by Mādhava Āchārya.

Vedānta.—2. The Vedānta philosophy or *Uttara-mīmāṃsā* (Second Inquiry) in the comparatively primitive form in which it presents itself in most of the older Upanishads, constitutes the earliest phase of sustained metaphysical speculation. In its essential features it remains to this day the prevalent belief of Indian thinkers, and enters largely into the religious life and convictions of the people. It is an idealistic monism, which derives the universe from an ultimate conscious spiritual principle, the one and only existent from eternity—the *Ātman*, the Self, or the *Puruṣa*, the Person, the Brahman. It is this primordial essence or Self that pervades all things, and gives life and light to them, "without being sullied by the visible outward impurities or the miseries of the world, being itself apart"—and into which all things will, through knowledge, ultimately resolve themselves. "The wise who perceive him as being within their own Self, to them belongs eternal peace, not to others." But, while the commentators never hesitate to interpret the Upanishads as being in perfect agreement with the Vedāntic system, as elaborated in later times, there is often considerable difficulty in accepting their explanations. In these treatises only the leading features of the pantheistic theory find utterance, generally in vague and mystic, though often in singularly powerful and poetical language, from which it is not always possible to extract the author's real idea on fundamental points, such as the relation between the Supreme Spirit and the phenomenal world—whether the latter was actually evolved from the former by a power inherent in him, or whether the process is altogether a fiction, an illusion of the individual self.

The foundation of the Vedānta system, as "the completion of the Veda," is naturally ascribed to Vyāsa, the mythic arranger of the Vedas, who is said to be identical with Bādarāyaṇa the reputed author of the *Brahmā-* (or *Sārīraka-*) *sūtra*, the authoritative, though highly obscure, summary of the system. The most distinguished interpreter of these aphorisms is the famous Malabar theologian Sankara Āchārya, who also commented on the principal Upanishads and the *Bhagavadgītā*, and is said to have spent the greater part of his life in wandering all over India, as far as Kashmir, and engaging in disputations with teachers—whether of the Śaiva, or Vaishnava, or less orthodox persuasions—with the view of rooting out heresy and re-establishing the doctrine of the Upanishads. In Sankara's philosophy the theory that the material world has no real existence, but is a mere illusion of the individual soul wrapt in ignorance,—that, therefore, it has only a practical or conventional (*vyāvahārika*) but not a transcendental or true (*pāramārthika*) reality,—is strictly enforced. In accordance with this distinction, a higher (*parā*) and a lower (*aparā*) form of knowledge is recognized; the former being concerned with the Brahman (n.), whilst the latter deals with the personal Brahman, the *Īśvara*, or lord and creator, who, however, is a mere illusory form of the divine spirit, resulting from ignorance of the human soul. To the question why the Supreme Self (or rather his fictitious development, the Highest Lord) should have sent forth this phantasmagory this great thinker (with the author of the Siitras) can return no better answer than that it must have been done for sport (*līlā*), without any special motive—since to ascribe such a motive to the

Supreme Lord would be limiting his self-sufficiency—and that the process of creation has been going on from all eternity. Sankara's *Sārīraka-mīmāṃsā-bhāṣya* has given rise to a large number of exegetic treatises, of which Vāchaspati-miśra's exposition, entitled *Bhāmātī*, is the most esteemed. Of numerous other commentaries on the *Brahma-sūtras*, the *Srī-bhāṣya*, by Rāmānuja, the founder of the Sri-Vaishnava sect, is the most noteworthy. This religious teacher, who flourished in the first half of the 12th century, caused a schism in the Vedānta school. Instead of adhering to Sankara's orthodox advaita, or non-duality, doctrine, he interpreted the obscure Siitras in accordance with his theory of *viśiṣṭādvaita*, i.e., non-duality of the (two) distinct (principles), or, as it is more commonly explained, non-duality of that which is qualified (by attributes). According to this theory the Brahman is neither devoid of form and quality, nor is it all things; but it is endowed with all good qualities, and matter is distinct from it; whilst bodies consist of souls (*chit*) and matter (*achit*); and God is the soul. On the religious side, Rāmānuja adopts the tenets of the ancient Vishnuite Pāñcharātra sect, and, identifying the Brahman with Vishnu, combines with his theory the ordinary Vaishnava doctrine of periodical descents (*avatāra*) of the deity, in various forms, for the benefit of creatures; and allowing considerable play to the doctrine that faith (*bhakti*), not knowledge (*vidyā*), is the means of final emancipation. This phase of Indian religious belief, which has attached itself to the Vedānta theory more closely than to any other, makes its appearance very prominently in the *Bhagavadgītā*, the episode of the *Mahābhārata*, already referred to—where, however, it attaches itself to Sāṅkhya-yoga rather than to Vedānta tenets—and is even more fully developed in some of the Purāṇas, especially the *Bhīṣmavata*. Its highest phase of development this doctrine probably reached in the Vaishnava sect founded, towards the end of the 15th century, by Chaitanya, whose followers subsequently grafted the Vedānta speculations on his doctrine. In opposition both to Sankara's theory of absolute unity, and to Rāmānuja's doctrine of qualified unity—though leaning more towards the latter—Mādhva Āchārya, or Pūrṇaprajña (A.D. 1197–1276), started his dvaita, or duality doctrine, according to which there is a difference between God and the human soul (*jīva*), as well as between God and nature; whilst the individual souls, which are innumerable, eternal, and indestructible, are likewise different from one another; but, though distinct, are yet united with God, like tree and sap, in an indissoluble union. This doctrine also identifies the Brahman with Vishnu, by the side of whom, likewise infinite, is the goddess Lakshmi, as *Prakṛiti* (nature), from whom inert matter (*jaḍa*) derives its energy. Here also *bhakti*, devotion to God, is the saving element. A popular summary of the Vedānta doctrine is the *Vedānta-sāra* by Sadānanda, which has been frequently printed and translated.

Sāṅkhya.—The *Sāṅkhya* system seems to derive its name from its systematic enumeration (*sankhyā*) of the twenty-five principles (*tattva*) it recognizes—consisting of twenty-four material and an independent immaterial principle. In opposition to the Vedānta school, which maintains the eternal coexistence of a spiritual principle of reality and an unspiritual principle of unreality, the *Sāṅkhya* assumes the eternal coexistence of a material first cause, which it calls either *mūla-Prakṛiti* (fem.), "prime Originant" (matter), or *Pradhāna*, "the principal" cause, and a plurality of individual souls, *Puruṣa*, which continually interact on one another. The system recognizes no intelligent creator (such as the *Īśvara*, or demiurgus, of the Vedānta)—whence it is called *nirīśvara*, godless; but it conceives the Material First Cause, itself unintelligent, to have become developed, by a gradual process of evolution, into all the actual forms of the phenomenal universe, excepting the souls. Its first emanation is *buddhi*, intelligence; whence springs *ahaṅkāra*, consciousness; thence the subtle elements of material forms, namely, five elementary particles (*tanmātra*) and eleven organs of sense; and finally, from the elementary particles, five elements. The souls have from all eternity been connected with matter,—having in the first place become invested with a subtle frame (*linga*), or

sūkshma-, *śarīra*), consisting of seventeen principles, namely, intelligence, consciousness, elementary particles, and organs of sense and action, including mind. To account for the spontaneous development of matter, the system assumes the latter to consist of three constituents (*guna*) which are possessed of different qualities, viz. *satva*, of pleasing qualities, such as "goodness," lightness, luminosity; *rajas*, of pain-giving qualities, such as "force," passion, activity; and *tamas*, of deadening qualities, such as "darkness," rigidity, dullness, and which, if not in a state of equipoise, cause unrest and development. Through all this course of development, the soul itself remains perfectly detached, its sole properties being those of purity and intelligence, and the functions usually regarded as "psychic" being due to the mechanical processes of the internal organs themselves evolved out of inanimate matter. Invested with its subtle frame, which accompanies it through the cycle of transmigration, the soul, for the sake of fruition, connects itself ever anew with matter, thus, as it were, creating for itself ever new forms of material existence; and it is only on attaining perfect knowledge, which reveals the absolute distinction between soul and matter, that the Purusha is liberated from the miseries of *saṃsāra*, and continues to exist in a state of absolute consciousness and detachment from matter. The existence of God, on the other hand, is denied by this theory, or rather considered as incapable of proof; the existence of evil and misery, for one thing, being thought incompatible with the notion of a divine creator and ruler of the world.

The reputed originator of this school is the sage Kapila, to whom tradition ascribes the composition of the fundamental text-book, the *Sāṅkhya-sūtra*, or *Sāṅkhya-pravachana*, as well as the *Tattva-samāsa*, a mere catalogue of the principles but these are comparatively modern. Probably the oldest existing work is *Īśvarakrishṇa's* excellent *Sāṅkhya-kārikā*, which gives, in the narrow compass of sixty-nine ślokas, a lucid and complete sketch of the system.

Yoga.—The Yoga system is a branch of the preceding school, holding the same opinions on most points treated in common in their Sūtras, with the exception of one important point, the existence of God. To the twenty-five principles (*tattva*) of the Niriivara Sāṅkhya, the last of which was the *Purusha*, the Yoga adds, as the twenty-sixth, the *Nirguṇa* Purusha, or Self devoid of qualities, the Supreme God of the system. Hence the Yoga is called the *Seśvara* (theistic) *Sāṅkhya*. But over and above the purely speculative part of its doctrine, which it has adopted from the sister school, the theistic Sāṅkhya has developed a complete system of mortification of the senses—by means of prolonged apathy and abstraction, protracted rigidity of posture, and similar practices—many of which are already alluded to in the Upanishads—with the view of attaining complete concentration (*yoga*) on, and an ecstatic vision of, the Deity, and the acquisition of miraculous powers. It is from this portion of the system that the school derives the name by which it is more generally known.

Nyaya and Vaiśeshika.—The *Nyāya* and *Vaiśeshika* (the latter the older) are separate branches of one and the same school, which supplement each other and the doctrines of which have virtually become amalgamated into a single system of philosophy. The term *Nyāya* (*ni-āya*, "in-going," entering), though properly meaning "analytical investigation," as applied to philosophical inquiry generally, has come to be taken more commonly in the narrower sense of "logic," because this school has entered more thoroughly than any other into the laws and processes of thought, and has worked out a formal system of reasoning which forms the Hindu standard of logic.

The followers of these schools generally recognize six categories (*padārtha*): substance (*dravya*), quality (*guṇa*), action (*karma*), generality (*sāmānya*), particularity (*viśeṣa*), intimate relation (*samavāya*) to which was added a seventh, non-existence (*abhāva*). Substances forming the substrata of qualities and actions are of two kinds: eternal (without a cause), namely, space, time, ether, soul and the atoms of mind, earth, water, fire and air; and non-eternal, comprising all compounds, or the things we perceive, and which must have a cause of their existence.

Causality is of three kinds: that of intimate relation (material cause); that of non-intimate relation (between parts of a compound); and instrumental causality (effecting the union of component parts). Material things are thus composed of atoms (*anu*), i.e., ultimate simple substances, or units of space, eternal, unchangeable and without dimension, characterized only by "particularity (*viśeṣa*)." It is from this predication of ultimate "particulars" that the Vaiśeshikas, the originators of the atomistic doctrine, derive their name. The Nyāya draws a clear line between matter and spirit, and has worked out a careful and ingenious system of psychology. It distinguishes between individual or living souls (*jīvātman*), which are numerous, infinite and eternal, and the Supreme Soul (*Paramātman*), which is one only, the seat of eternal knowledge, and the maker and ruler (*Īśvara*) of all things. It is by his will and agency that the unconscious living souls (soul-atoms, in fact) enter into union with the (material) atoms of mind, etc., and thus partake of the pleasures and sufferings of mundane existence.

The original collection of *Nyāya-sūtras* is ascribed to Gautama, and that of the *Vaiśeshika-sūtras* to Kaṇāda. The etymological meaning of the latter name seems to be "atom eater." whence in works of hostile critics the synonymous terms *Kana-bhuj* or *Kana-bhaksha* are sometimes derisively applied to him, doubtless in allusion to his theory of atoms.

Heretical Systems.—As regards the different heretical systems of Hindu philosophy, there is no occasion, in a sketch of Sanskrit literature, to enter into the tenets of the two great anti-Brāhmanical sects, the Jainas and Buddhists. Among the minor systems may be mentioned the following:

The *Chārvākas* are an ancient sect of undisguised materialists, who deny the existence of the soul, and consider the human person (*purusha*) to be an organic body endowed with sensibility and with thought, resulting from a modification of the component material elements, but their authoritative text-book, the *Bārhaspatya-sūtra*, is only known so far from a few quotations in polemics against the school. The sect was anti-Brāhmanical and such moral teaching as it taught was pure hedonism.

The *Pāñcharātras*, or *Bhāgavatas*, are an early Vaishnava sect, in which the doctrine of faith, already alluded to, is strongly developed. Hence their tenets are defended by Rāmānuja, though they are partly condemned as heretical in the *Brahma-sūtras*.

The *Pāśupatas*, one of several *Saiva* (Māheśvara) sects, hold the Supreme Being (*Īśvara*), whom they identify with Śiva (as *paśu-pati*, or "lord of beasts"), to be the creator and ruler of the world, but not its material cause. With the Sāṅkhyas they admit the notion of a plastic material cause, the *Pradhāna*; while they follow Patañjali in maintaining the existence of a Supreme God.

Grammar (Vyākaraṇa).—*Pāṇini*. Linguistic inquiry, phonetic as well as grammatical, was early resorted to both for the purpose of elucidating the meaning of the Veda and with the view of settling its textual form. The particular work which came ultimately to be looked upon as the "vedāṅga" representative of grammatical science, and has ever since remained the standard authority on Sanskrit grammar in India, is Pāṇini's *Aṣṭādhyāyī*, so called from its "consisting of eight lectures (*adhyāya*)," of four *pādas* each. For a comprehensive grasp of linguistic facts, and a penetrating insight into the structure of the vernacular language, this work stands probably unrivalled in the literature of any nation—though few other languages, it is true, affords such facilities as the Sanskrit for a scientific analysis. Pāṇini's system of arrangement differs entirely from that usually adopted in our grammars, namely, according to the parts of speech. As the work is composed in aphorisms intended to be learnt by heart, economy of memory-matter was the author's paramount consideration. His object was chiefly attained by the grouping together of all cases exhibiting the same phonetic or formative feature, no matter whether or not they belonged to the same part of speech. For this purpose he also makes use of a highly artificial and ingenious system of algebraic symbols, consisting of technical letters (*anubandha*), used chiefly with suffixes and indicative of the changes which the roots or stems have to undergo in word-formation. The date of

Pāṇini has been the subject of much discussion but may be safely put at about 400 B.C.

Pāṇini mentions some sixty-four predecessors which shows that this study had undergone a long process of development. Perhaps the most important of his predecessors was Śākāṭyana, also mentioned by Yāska—the author of the Nirukta, who is likewise supposed to have preceded Pāṇini—as the only grammarian (*vaiyākaraṇa*) who held with the etymologists (*nairukta*) that all nouns are derived from verbal roots.

Pāṇini's Siitras continued for ages after to form the centre of grammatical activity. But, as his own work had superseded those of his predecessors, so many of the scholars who devoted themselves to the task of perfecting his system have sunk into oblivion.

Kātyāyana.—The earliest of his successors whose work has come down to us (though perhaps not in a separate form) is Kātyāyana, the author of a large collection of concise critical notes, called *Vārttika*, intended to supplement and correct the Siitras, or give them greater precision.

Patañjali.—Kātyāyana was followed by Patañjali, the author of the (*Vyākaraṇa*-) *Mahā-bhāṣya*, or Great Commentary, who flourished about 150 B.C. For the great variety of information it incidentally supplies regarding the literature and manners of the period, this is, from an historical and antiquarian point of view, one of the most important works of the classical Sanskrit literature. The *Mahābhāṣya* is not a continuous commentary on Pāṇini's grammar, but a collection of the critical comments or *kārikās* on 1,713 of the 4,000 rules of Pāṇini. Patañjali is also called Gonardiya perhaps meaning "a native of Gonarda," a place, probably identical with Gonda, a town some 20 m. north-west of Oudh—and Goṇikāputra, or son of Goṇikā.

Lexicography.—Sanskrit dictionaries (*kośa*), invariably composed in verse, are either homonymous or synonymous, or partly the one and partly the other. There are occasional attempts at alphabetical order in the former but not in the latter. There are many intended for the use of poets and are collections of rare words and synonyms, rather than lexicons of the language. The great dictionary is the famous *Amara-kośa* ("immortal treasury") by Amarasimha, who probably lived early in the 6th century. This dictionary consists of a synonymous and a short homonymous part; whilst in the former the words are distributed in sections according to subjects, such as heaven and the gods, time and seasons, etc.; in the latter they are arranged according to their final letter, without regard to the number of syllables.

Prosody (Chhandas).—The oldest treatises on prosody have already been referred to in the account of the technical branches of the later Vedic literature. Among more modern treatises the most important is the *Mṛita-sanjīvanī*, a commentary on Pingala's Siitra, by Halāyudha (perhaps identical with the author of the glossary above referred to). Sanskrit prosody, which is probably not surpassed by any other either in variety of metre or in harmoniousness of rhythm, recognizes two classes of metres, namely, such as consist of a certain number of syllables of fixed quantity, and such as are regulated by groups of breves or metrical instants, this latter class being again of two kinds, according as it is or is not bound by a fixed order of feet.

Music (Sāṅgīta).—The musical art has been practised in India from early times. The theoretic treatises on profane music now extant are, however, quite modern productions. The two most highly esteemed works are the *Sāṅgīta-ratnākara* ("jewelmine of music"), by Śārngadeva, and the *Sāṅgīta-darpaṇa* ("mirror of music"), by Dāmodara. Each of these works consists of seven chapters, treating respectively of—(1) sound and musical notes (*svara*); (2) melodies (*raga*); (3) music in connection with the human voice (*prakīrṇaka*); (4) musical compositions (*prabandha*); (5) time and measure (*tāla*); (6) musical instruments and instrumental music (*vādya*); (7) dancing and acting (*nṛtta* or *nyitya*).

Rhetoric (Alaṅkāra-śāstra).—Treatises on the theory of literary composition are very numerous. Indeed, a subject of this description—involving such nice distinctions as regards the various kinds of poetic composition, the particular subjects and

characters adapted for them, and the different sentiments or mental conditions capable of being both depicted and called forth by them—could not but be congenial to the Indian mind. The *Nāṭya Śāstra* of Bharata is possibly as early as the sixth century. Not much later is the *Kāvya-darśa*, or "mirror of poetry," by Dandin, the author of the novel *Daśakumāracharita*. The work consists of three chapters, treating—(1) of two different local styles (*riti*) of poetry, the Gaudi or eastern and the Vaidarbhi or southern (to which later critics add four others, the Pāñchālī, Māgadhī, Lāṭī, and Āvantikā); (2) of the graces and ornaments of style, as tropes, figures, similes; (3) of alliteration, literary puzzles and twelve kinds of faults to be avoided in composing poems. Other important works are the *Kāvya-lāṅkāra*, by the Kashmirian Rudraṭa (9th century), the *Daśarūpa*, or "ten kinds of drama," by Dhanamjaya (10th century), the *Sarasvatī-kanthābharaṇa*, "the neck-ornament of Sarasvatī (the goddess of eloquence)," a treatise, in five chapters, on poetics generally (11th century), the *Kāvya-prakāśa*, "the lustre of poetry," (12th century) by Mammaṭa, a Kashmirian, and the late but important *Sāhitya-darpaṇa* (c. A.D. 1450).

Medicine (Āyur-veda, Vaidya-śāstra).—Though the early cultivation of the healing art is amply attested by frequent allusions in the Vedic writings, it was doubtless not till a much later period that the medical practice advanced beyond a certain degree of empirical skill and pharmaceutical routine. From the simultaneous mention of the three humours (wind, bile, phlegm) in a *vārttika* to Pāṇini (v. 1, 38), some kind of humoral pathology would, however, seem to have been prevalent among Indian physicians several centuries before our era. The oldest existing work is supposed to be the *Charaka-saṃhitā*, a bulky cyclopaedia in Slokas, mixed with prose sections, which consists of eight chapters, and was probably composed for the most part in the early centuries of our era. Whether the Chinese tradition which makes Charaka the court physician of King Kanishka (c. A.D. 100) rests on fact is uncertain. Of equal authority, but doubtless somewhat more modern, is the *Suśruta* (-*saṃhitā*), which Suśruta is said to have received from Dhanvantari, the Indian Aesculapius, whose name, however, appears also among the "nine gems." It consists of six chapters, and is likewise composed in mixed verse and prose—the greater simplicity of arrangement, as well as some slight attention paid in it to surgery, betokening an advance upon Charaka. Both works are, however, characterized by great prolixity, and contain much matter which has little connection with medicine.

Astronomy and Mathematics.—Early Indian astronomical knowledge is summed up in the *Jyotiṣha Vedāṅga* (ed. Weber. 1862). A more scientific era is marked by the appearance of the five original Siddhāntas (partly extant in revised redactions and in quotations), the very names of two of which suggest Western influence, namely, the *Paitāmaha*-, Szlrya-, *Vasishtha*-, *Romaka*-(i.e., Roman) and *Paulīśa-siddhāntas*. Based on these are the works of the most distinguished Indian astronomers, namely, Aryabhata, probably born in 476; Varāha-mihira, probably 505-587; Brahmagupta, who completed his *Brahma-sphuta-siddhānta* in 628; Bhaṭṭa Utpala (10th century), distinguished especially as commentator of Varāha-mihira; and Bhāscara Achārya, who, born in 1114, finished his great course of astronomy, the *Siddhānta-siromaṇi*, in 1150. In the works of several of these writers, from Aryabhata onwards, special attention is paid to mathematical (especially arithmetical and algebraic) computations. The question whether Aryabhata was acquainted with the researches of the Greek algebraist Diophantus (c. A.D. 360) remains still unsettled, but, even if this was the case, algebraic science seems to have been carried by him beyond the point attained by the Greeks.

SANSON, CHARLES HENRI (b. 1739), public executioner of Paris from 1788 to 1795, was great-grandson of Charles Sanson, who had received in 1688 the office of *exécuteur des hautes oeuvres de Paris*, which became hereditary in his family. Sanson's brothers exercised the same trade in other towns. In the last days of 1789 Gorsas in the *Courrier de Paris* accused Sanson of harbouring a Royalist press in his house. Sanson was brought to trial, but acquitted, and Gorsas withdrew the accusation. After the execution of Louis XVI., a statement by Sanson was inserted in the *Thermomètre politique* (13th February 1793) in contradiction of the false statements made in respect of the king's behaviour when confronted with death. He surrendered his office in 1795 to his son Henri, who had been his deputy for some time, and held his father's office till his death in 1840. There is no record of the elder Sanson's death. Henri's son Clement Henri was the last of the family to hold the office.

The romantic tales told of C. H. Sanson have their origin in the apocryphal *Mmoires pour servir à l'histoire de la Révolution Française par Sanson* (2 vols., 1829). Other *Mmoires of Sanson*, edited by A. Grégoire (ps. for V. Lombard) in 1830, and by M. d'Olbreuzé (6 vols., 1862-63) are equally fictitious. The few facts definitely ascertainable are collected by G. Lenôtre in *La Guillotine pendant la Révolution* (1893).

SANSOVINO, ANDREA CONTUCCI DEL MONTE (1460-1529), Florentine sculptor and architect, was the son of a shepherd, Niccolò di Domenico Contucci, and was born at Monte Sansovino near Arezzo, whence he took his name. He was a pupil of Antonio Pollaiuolo, and at first worked in the style of 15th-century Florence. Early works are: the terra-cotta altarpiece in Santa Chiara at Monte Sansovino, and the marble reliefs of the "Annunciation," the "Coronation of the Virgin," a "Pietà," the "Last Supper," and various statuettes in the Corbinelli chapel of S. Spirito at Florence. In 1490 he was invited to Portugal by King John II. and some pieces of sculpture by him still exist in the monastic church of Coimbra. These early reliefs show strongly the influence of Donatello. The beginning of a more pagan style is shown in the statues of "St. John baptizing Christ" over the east door of the Florentine baptistery. This group was, however, finished by the weaker hand of Vincenzo Danti. In 1502 he executed the marble font at Volterra, with good reliefs of the "Four Virtues" and the "Baptism of Christ." The statues of the Virgin and John the Baptist in the cathedral of Genoa were completed in 1503. His earliest work in Rome is probably the monument of Pietro da Vicenza (1504), in the church of Ara Coeli. The monuments of Cardinal Ascanio Maria Sforza and of the bishop Hieronimus Bassus for the church of S. Maria del Popolo are among his most important works. In 1512, Sansovino executed a group of the "Madonna and Child with St. Anne," now over one of the side altars in the church of S. Agostino. From 1513 to 1528 he was at Loreto, where he cased the outside of the Santa Casa in white marble, covered with reliefs and statuettes in niches between engaged columns; the greater part of his sculpture was executed by his assistants, and though the general effect is rich and magnificent, the individual pieces are both dull and feeble, the greater part of the work being executed by his assistants. The earlier reliefs, executed by Sansovino himself, are interesting. Jacopo Sansovino was his best pupil.

SANSOVINO, JACOPO (1486-1570), Italian sculptor and architect, was born at Caprese near Florence, his family name being Tatti. He became a pupil of Andrea Sansovino, from whom he received his name. In 1503 he accompanied Giuliano di Sangallo to Rome, devoting himself there to the study of the antique. Julius II. employed him to restore damaged statues, and he made a copy of the Laocoön group, which was afterwards cast in bronze. In 1511 he returned to Florence, and began the statue of St. James the Elder, which is now in a niche in one of the great piers of the Duomo. He carved a nude figure of "Bacchus and Pan," now in the Bargello. Soon afterwards Jacopo returned to Rome, and designed for his fellow-citizens the church of S. Giovanni dei Fiorentini, carried out by Antonio Sangallo the younger. A marble group of the "Madonna and Child," now in S. Agostino, was his next important work. In 1527 Jacopo fled from the sack of Rome to Venice, where he remained the rest of his life. He had charge of the public buildings adjacent to the Piazza di S. Marco, with the exception of the Doge's Palace. His most important works of sculpture at Venice are the colossal statues of "Neptune" and "Mars" on the grand staircase of the ducal palace; the bronze doors of the sacristy of St. Mark, cast in 1556 and the series of six bronze reliefs round the choir of the same church. In 1565 he completed a small bronze gate with a graceful relief of "Christ surrounded by Angels"; this gate shuts off the altar of the Reserved Host in the choir of St. Mark's. He made the monument of the Doge Francesco Venier, who died in 1556.

Jacopo's chief claim to distinction rests upon the numerous fine Venetian buildings which he designed, such as the public library, the mint and the Palazzo Corner della Ca Grande and the Palazzo Manin on the grand canal; also the graceful Loggetta of the Campanile di San Marco with the bronze statues of Peace, Mercury, Apollo and Pallas. Among his ecclesiastical works the chief were the choir of S. Fantino, the church of S. Martino and the facades of S. Maria Mater Domini and of the Scuola di S. Giorgio dei Schiavoni.

In 1545 the roof of the public library, which he was then constructing, fell in; on this account he was imprisoned and fined. However, he was soon set at liberty, and in 1548 he was restored to his post. He died on Nov. 27, 1570. Sansovino's architectural works have much beauty of proportion and grace of ornament, a little marred in some cases by an excess of sculptured decoration, though the carving itself is always beautiful, both in design and execution. He used the classic orders with great freedom and tasteful invention, and was instrumental in introducing the High Renaissance into Venice. He was much assisted by Alessandro Vittoria (1524-1608).

SAN STEFANO, TREATY OF, a treaty signed between Russia and Turkey on March 3, 1878, concluding the Russo-Turkish War. It created a very great vassal principality of Bulgaria, enlarged Serbia, and increased Montenegro to three times its size. The independence of all three States was recognized by the Porte. Russia obtained the Dobrudja, Ardahan, Kars, Bayazid and Batum, and the demolition of all the Danube fortresses. Improved conditions were promised the Armenian Christians; the autonomy of Bosnia-Hercegovina was to be admitted. But the treaty was viewed with concern by other countries.

In effect this treaty would have disintegrated the Turkish empire. The additional power falling to Russia directly and indirectly would have been tremendous. In the Balkans themselves there were protests from the Armenians and Greeks who, especially, would be sufferers in the rearrangement of territories, and from all the inhabitants of the different ceded provinces. Great Britain was especially opposed to the treaty because of the almost certainty that the Big Bulgaria would prove to be entirely under Russian influence. Austria also saw her Balkan interests threatened, and it was Austria who first demanded that the whole matter should be discussed by a European congress. The consequence was the meeting of the Congress of Berlin (q.v.), June 13-July 13, 1878, which entirely redrafted the Treaty of San

Stefano. (See also EASTERN QUESTION.)

SANTA ANA, the capital of the department of Santa Ana, Salvador, 50 mi. by rail N.W. of San Salvador. Population (1940), 44,981. It is situated about 2,100 ft. above sea-level, in a valley surrounded by high mountains, which are covered by coffee and sugar plantations and woods.

Cigars, pottery, starch, spirits, sugar and various textiles are manufactured, and the export trade in coffee and sugar has developed rapidly since the opening in 1900 of a railway to San Salvador and the Pacific port of Acajutla.

SANTA ANA, a city of southern California, U.S.A., 30 mi. S.E. of Los Angeles and 10 mi. from the ocean on the west and the Santa Ana mountains on the east; the county seat of Orange county. It is served by the Pacific Electric, the Santa Fe, and the Southern Pacific railways, and by motor-coach lines. Pop. (1930) was 30,322; 1940 federal census 31,921. It is the commercial centre of the rich Santa Ana valley (producing especially oranges, walnuts, celery and beans) and the neighbouring oil fields; and has numerous factories making a variety of products, including aeroplanes, glass, beet sugar, farm machinery, woollen goods, tiles, pumps, perfumes, preserved fruits, tools and citrus products. There are many fruit-packing plants and canneries in and about the city. Santa Ana was platted in 1869 and incorporated in 1888. In 1900 the population was 4,933, and it increased more than sixfold in the next 30 years.

SANTA ANNA, ANTONIO LOPEZ DE (1795–1876), Mexican revolutionist, dictator, president and soldier, was born in Jalapa, Vera Cruz, on Feb. 21, 1795. Entering the Spanish colonial army as cadet in 1810, he served against the revolutionists in Tamaulipas, Tex., and Vera Cruz until March 29, 1821, when he declared in favour of the Plan de *Iguala*. This revolution resulted in Mexican independence and the empire of Iturbide. Santa Anna advanced rapidly under the empire until Iturbide attempted to remove him from Vera Cruz. He pronounced opportunely for a republic and the subsequent revolution led to the downfall of Iturbide. Santa Anna was sent to San Luis Potosí, where he failed in another attempt at revolution, was recalled, and next sent to Yucatán, where he spent about a year as governor and military commander, returning to Mexico in 1825 and in 1827 to civil and military command in Vera Cruz. He subverted the election of 1828 by a revolution in favour of Guerrero, who became president. He defeated an ill-advised attempt of the Spaniards to recapture Mexico in 1829 and, resigning his commands, retired to his hacienda, Manga de Clavo, where, except for a futile effort to sustain Guerrero, he was quiescent until 1832, when he headed a revolution which made Pedraza president. In 1833, Santa Anna became president, an office that alternating with various substitutes, he occupied until his defeat and capture by the Texans at San Jacinto, April 21, 1836. He returned to Mexico in 1837, retiring to his hacienda until called to command forces against the French. He lost a leg in action against them at Vera Cruz. Santa Anna was president ad interim for a few weeks in 1839 and in 1841 again seized the office by revolution. He was captured by the counter-revolutionists in 1845 and was exiled. He retired to Havana but returned to Mexico the following year upon the outbreak of war with the United States. He was offered the presidency but, preferring to lead in the field, commanded the Mexicans in the battles of Angostura and Cerro Gordo and minor engagements. Early in 1847 he also assumed the presidency but, after his final defeats in the siege of Mexico City, retired to exile in Jamaica, from which, in 1850, he removed to New Granada. Recalled by the conservatives, he resumed the presidency for the fifth and last time on April 29, 1853. He became supreme Dictator but was again exiled August 11, 1855. He twice attempted to return to Mexico, but was turned back by the French in 1864 and by American naval forces in 1867. As a result of amnesty, he returned to Mexico in 1874 and, poor, broken and blind, died June 20, 1876. Santa Anna was unscrupulous, immoral and of no fixed principles, but he was energetic and of a magnetic personality. He fancied himself a western Napoleon and was the chief contributor to the disturbed condition of Mexico for 30 years. He fostered a tradition of success not entirely justified by facts

and in time of national crisis his turbulent countrymen again and again turned to him as the one possible leader.

SANTA BARBARA, a municipality (with administrative centre and 70 barrios or districts) of the province of Iloilo, island of Panay, Philippine Islands, on the Jalaur river, a few miles north of Iloilo (the provincial capital), on the Iloilo-Capiz railway. Pop. (1939) 35,406 (a gain of 6,939 since 1918) of whom 17,415 were males and none was white. The chief agricultural products are sugar, maize (corn), palay (rice), cacao, coco-nuts and tobacco. Cattle raising and textile weaving are also carried on. The vernacular is Panay-Bisayan. Of the inhabitants aged 6 to 19 inclusive, 42.2% were reported in 1939 as attending school, while 57.6% of the population 10 years old and over was reported as literate.

SANTA BARBARA, a city of southwestern California, U.S.A., on the Pacific ocean, 90 mi. above Los Angeles; the county seat of Santa Barbara county. It has airport facilities, and is served by the Southern Pacific railway and motor-bus lines. Pop. (1930) 33,613 (88% native white); 1940 federal census 34,958. The city lies around a crescent beach, on the southern slope of the Santa Ynez mountains. The beauty of the situation, the ideal climate throughout the year, the luxuriant semitropical vegetation, the historic interest, and the picturesque modern architecture, combine to make it one of the most delightful resorts of the state. A modified Spanish type of architecture generally prevails. The Mission of Santa Barbara, established by Father Junipero Serra in 1786, is the largest and best preserved of the California missions, and is now the Franciscan headquarters for the Pacific coast. The Santa Barbara state college (established 1909) has a fine location overlooking the ocean. A fiesta, "Old Spanish Days," is held in August every year. In the Painted Cave, 13 mi. distant, are fine rock paintings generally attributed to prehistoric Indians. This region produces a great variety of fruits, nuts and vegetables, including about half the entire commercial crop of lima beans grown in the United States. There are oil fields northwest of the city. A Spanish presidio was established there in 1782, four years before the mission. Santa Barbara took part in the revolution of 1829, and in the following sectional struggles inclined to the side of Monterey and the north. It was occupied by the Americans in Aug. 1846; then by the Californians in Oct.; again by the American forces on Nov. 27, 1846. In 1850 it was incorporated as a city. The railroad reached it in 1887. On June 29, 1925, a disastrous earthquake visited it, but the city was rapidly rebuilt.

SANTA CATALINA, an island in the Pacific ocean, one of the Santa Barbara group, about 20 mi. south of Los Angeles harbour, from which it is separated by San Pedro channel. It is a pleasure resort and fishing centre.

SANTA CATARINA, a maritime state of southern Brazil, bounded north by Paraná, east by the Atlantic, south by Rio Grande do Sul, and west by the territory of Iguassú (*q.v.*). Areal losses sustained through the creation of the territory of Iguassú in September 1943 reduced the size of the state to 30,967 sq.mi.; population (derived from the census of 1940), 1,140,178.

The Serra do Mar rises not far from the coast and leaves only a narrow coast zone; the plateau above is much broken with irregular ranges of mountains.

The coast region, which is interrupted by swamps and lagoons, is hot, humid and densely forested; the plateau is less densely wooded, temperate, and its fertile plains or open campos are devoted in large part to stock raising.

The drainage of the western and southern parts of the state is westward to the Uruguay, the rivers being tributaries of the Uruguay, which forms the southern boundary. A number of prosperous German colonies—the largest and best known of which are Blumenau, Dona Francisca, Joinville, Itajaí, Brusque, Dom Pedro and São Bento—are devoted chiefly to agriculture. There is not so much cultivation on a large scale as in São Paulo and the northern provinces. Coffee is produced to a limited extent, as are also Indian corn, beans, onions, fruit and mandioca. A prominent industry is the gathering and preparation of mate or Paraguayan tea (*Ilex paraguayensis*), which is an article of

export. The mineral resources include coal, iron, silver, gold and petroleum; the first alone is mined. A railway, the Dona Teresa Cristina, runs from Laguna, at the mouth of a lagoon of that name on the southern coast, northward to the port of Imbituba, as also westward up the valley of the Rio Tubarão to the coal-fields of that name (69 mi.) and southward to Araranguá. Another, a branch of the São Paulo-Rio Grande, runs from São Francisco do Sul inland to União da Vitória, on the main line which crosses the western part of this state. Another short line connects Blumenau with Trombudo.

The capital of the state is Florianópolis (*q.v.*), also called Santa Catarina; other towns (the population given being that of the municipal district in 1940) are Blumenau (41,528), Lages (54,089), Laguna (33,449), Joinville (45,932), Itajaí (44,394), Brusque (23,604), São José (28,480), opposite Florianópolis, Araranguá (59,404), Tubarão (54,366), and São Francisco (19,227), a good port in the northern part of the state in direct communication with a majority of the German colonies.

SANTA CLARA or **VILLA-CLARA**, the capital of Santa Clara province, Cuba, about 185 mi. (by rail) E.S.E. of Havana. Pop. (1938) 99,509. It is situated near the centre of the island, on a plateau, between two small streams, and is served by the United Railways of Havana and by the Cuba and the Cuba Central railways, the last connecting the east and west lines with the north and south coasts. The streets are straight and wide, and there are many fine buildings. The oldest church is of the latter part of the 18th century. The city is surrounded by fertile plains, which are cultivated in cane or devoted to grazing. Santa Clara was founded in 1689 by a band of schismatics from Remedios.

SANTA CLARA, a town of Santa Clara county, California, U.S.A., adjoining San Jose on the northwest. It is served by the Southern Pacific railway and by electric interurban, motor coach and truck lines. Pop. (1930) 6,302; in 1940, 6,650. It has immense fruit canneries and green-fruit and dried-fruit packing plants and other manufacturing industries. It is the seat of the Mission of Santa Clara de Ásis, founded by Father Junipero Serra in 1777, and of the University of Santa Clara (Roman Catholic), established in 1851.

SANTA CRUZ, ÁLVARO DE BAZAN, 1ST MARQUIS OF (1526–1588), Spanish admiral, born at Granada on Dec. 12, 1526, of an ancient family. In 1564 he aided in the capture of Velez de Gomera, was appointed in 1568 to command the galleys of Naples and was thus brought into close relations with Don John of Austria during the formation of the Holy League (1570). In the operations at Lepanto (Oct. 7, 1571) Bazan was always in favour of the more energetic course: his prompt action averted disaster when the allied line was broken. He accompanied Don John at the taking of Tunis (1572). When Philip II of Spain enforced his claim as heir to the crown of Portugal (1580–81), Santa Cruz held a naval command. In 1583 he was sent against the prior of Crato, an illegitimate representative of the Portuguese royal family, who with his friends held the island possessions of Portugal in the Atlantic. His victory off Terceira decided the struggle in favour of Spain. A zealous advocate of war against England, he made to Philip, on Aug. 9, 1583, the first definite suggestion of the Armada. The King's political and financial embarrassments caused many delays, and Santa Cruz, who was to have commanded, was hindered from acting with effect. He was at Lisbon without the means of fitting out his fleet, when Drake burned the Spanish ships at Cadiz (1587). Santa Cruz's independence of judgment finally offended the king and he was held responsible for failures and delays. He died on Feb. 9, 1588, at Lisbon. He was the designer of the great galleons which were employed to carry the trade between Cadiz and Vera Cruz in Mexico.

See C. Fernández Duro, *La Armada Invencible* (1884–85, 2 vols.); A. Altolaguirre y Duvale, *Don Alvaro de Bazán . . . estudio histórico-biográfico* (1888); W. Stirling Maxwell, *Don John of Austria . . .* (1883, 2 vols.).

SANTA CRUZ, an eastern department of Bolivia, bounded N. by El Beni, E. by Brazil. S. by Paraguay and Chuquisaca and W. by Chuquisaca and Cochabamba, Area 143,918 sq.mi. Pop.

(1940 est.) 417,000. It is only partly explored. It consists of a great plain extending east from the base of the Andes to the frontiers of Brazil and Paraguay, broken by occasional isolated hills, and in the northeast by a detached group of low sierras known collectively as the Chiquitos, which belong to the Brazilian highlands rather than to the Andes. On the western side of the department is an upland zone belonging to the eastern slope of the Andes, and here the Bolivian settlements are chiefly concentrated. The great plains, whose general elevation is about 900 ft. above the sea, are so level that the drainage does not carry off the water in the rainy season, and immense areas are flooded for months at a time. Extensive areas are permanently swampy. There are forests in the north and west, but the larger part of the department consists of open grassy plains, suitable for grazing. There are two river systems, one belonging to the Amazon and the other to the Plata basins. The first includes the Guapay or Rio Grande, Piray or Sara, Yapacani and Maracó, upper tributaries of the Mamoré, and the San Miguel, Blanco, Baures and Paragua tributaries of the Guaporé—both draining the western and northern parts of the department. In the extreme east a few streams flow eastward into the Paraguay, the largest of which is the Otuquis; their channels are partly hidden in swamps and lagoons. The climate of the plains is hot; nevertheless, on the Andean slopes the temperature is more agreeable. Products of the western districts are sugar, rum, cacao, rice, cotton, coffee and maize. Rubber and medicinal products are also exported. The Guapay is navigable for small boats in high water, and also the lower courses of the other rivers named.

The principal markets for Santa Cruz products are in the Bolivian cities of the Andes. There is a poor road across the plains from Santa Cruz de la Sierra to Puerto Suárez, on the Paraguay, and one to Cochabamba, but no railway leads to Santa Cruz as yet, and it requires 10 to 12 days to reach it by mule from Cochabamba or twice that time from Puerto Suárez. An air-mail line, however, has been established between Cochabamba and Santa Cruz, which carries passengers also, and makes the trip in 2½ to 3 hours.

The capital and only large town of the department is Santa Cruz de la Sierra (pop., 1942 census, 25,697), on the Piray, a tributary of the Mamoré, 1,450 ft. above sea level. It is situated on a lower terrace of the Andean slope in a highly fertile district, devoted to sugar-cane and stock-raising. It is a dusty, straggling, frontier town with a population consisting chiefly of whites. There are flour mills, sugar mills, distilleries, tanneries and leather manufactories. The original site of Santa Cruz de la Sierra was in the uplands, but it was removed to its present site about 1590, the phrase "de la Sierra" being kept.

SANTA CRUZ, a municipality (with administrative centre and 21 *barrios* or districts), capital of the province of Laguna, Luzon, Philippine Islands, on the southeast shore of Laguna de Bay, about 35 mi. southeast of Manila, with which it has railway connection. Pop. (1939) 17,649 (a gain of 3,493 since 1918), of whom 8,912 were males and five were white. Santa Cruz is a sugar centre and has a number of sugar mills and other manufactures. Other important products are palay (rice) and maize (corn). Tagalog is the vernacular. Of the inhabitants aged 6 to 19 inclusive, 40.4% were reported in 1939 as attending school, while 73% of the population 10 years old and over was reported as literate. The number of parcels of private land declared for taxation in 1938 was 3,936, and the number of owners was 2,974. (C. S. L.)

SANTA CRUZ, a city of California, U.S.A., on the northern headland of Monterey bay, 80 mi. S. of San Francisco; the county seat of Santa Cruz county. It is served by the Southern Pacific railway. Pop. (1920) 10,917 (82% native white); (1930) 14,395; (1940) 16,896 by the federal census.

From a curving beach the city slopes up to the foothills of the Santa Cruz mountains, in surroundings of great natural beauty. The mountains are covered with one of the noblest redwood forests of the state. Among the Santa Cruz bigtrees, 6 mi. from the heart of the city, are some 65 ft. in circumference and 300 ft. high. The State Redwood park is 23 mi. north. Poultry, bulbs (especially narcissus, freesia and gladiolus), berries, cherries,

grapes, other fruits and vegetables, are the principal products of the region. Loganberries were originated there; strawberries are picked nine months of the year; and the strip of land along the coast from Santa Cruz to San Francisco produces most of the artichokes grown in the United States. The city has a large fruit and vegetable cannery and a considerable fishing industry. The commerce of the city's harbour consists principally of receipts of lumber and general merchandise for local consumption and shipments of fish, glue stock, canned vegetables, cement and other local products. The city owns the long wharf, which extends out 2,600 ft. into deep water. A Franciscan mission (no longer in existence) was established here in 1791, and the Pueblo of Branciforte (never very important) was founded near by in 1797. In July, 1846, the American flag was raised over the town, and in 1876 it was chartered as a city.

SANTA CRUZ DE TENERIFE or **DE SANTIAGO**, a seaport and the capital of Tenerife and of the Canary Islands; in 28° 28' N. and 16° 15' W., on the east coast. Pop. (1940) 117,429. Santa Cruz occupies a small plain which is bounded by rugged volcanic rocks, and seamed by watercourses which are dry almost throughout the year. Scarcely any vegetation, except cactuses and euphorbias, is to be seen in the neighbourhood. Almost the entire town was rebuilt in the 19th century, when its population more than trebled. There are many good public buildings, including a school of navigation, technical institute, library, natural history museum and hospital. An aqueduct 5 mi. long brings pure water from the mountains of the interior. Dromedaries from the adjacent islands of Lanzarote and Fuerteventura are used to convey merchandise and in agriculture. The town was bombarded by the British fleet under Blake in 1657, and by Nelson, who lost his arm during the attack, in 1797. Some British flags lost on that occasion hang in one of the churches. Santa Cruz is an important coaling station and commercial centre. (See CANARY ISLANDS.)

SANTA FÉ, a central province of Argentina, bounded north by the Chaco territory, east by Entre Ríos and Corrientes, south by Buenos Aires, and west by Córdoba and Santiago del Estero. Area, 52,056 sq. miles. Pop. (1914) 899,640 (1940 estimate) 1,559,542. Santa Fé belongs to the great pampa region of Argentina, and has no wooded districts in the south except on the river courses. In the north, which is borderland to the Gran Chaco region, there are extensive forests, intermingled with grassy *campes*. The surface is a level alluvial plain, with a saline substratum at no great depth. Salt is found on the surface over large areas, and throughout the province the water is brackish 15 to 20 ft. below the surface. The soil, however, produces wheat, corn, alfalfa, linseed and other crops in abundance. Stock-raising (cattle, horses, sheep and swine) is also an important industry, with the related industries of butter and cheese-making, meat-curing and lard-refining. Many colonies have been made, especially near the provincial capital. It is one of the most productive provinces in the republic, in spite of notorious mis-government. The Paraná forms its eastern boundary for about 435 m., and provides unflinching transport facilities. The great river, however, is broken into many channels, forming islands and sand bars which are constantly changing their outlines. It receives two large tributaries flowing across the province—the Salado, the upper course of which is called the Pasaje and Juramento (the last given to commemorate the circumstance that the oath to wrest their independence from Spain was sworn on its banks in 1816), and which enters the Santa Fé channel of the Paraná near the capital; and the Carcarañá, or Carcarañal, whose sources are in the Córdoba sierras. The northern districts are well drained by numerous tributaries of the Salado. The railway communications of the province are good, comprising the trunk lines of the Buenos Aires and Rosario railway with its extension to Tucumán, which crosses the province from south-east to north-west; the Central Argentine from Rosario to Córdoba, and to Buenos Aires; the Córdoba Central; Santa Fé to Tucumán; and Provincia de Santa Fé, and the Buenos Aires and Pacific which crosses near its southern boundary. Small railway lines connect the important towns.

SANTA FÉ, a city of Argentina and capital of the province of that name, on the Santa Fé channel of the Paraná near the mouth of the Salado, about 299 mi. N.W. of Buenos Aires. Pop. (1940) 147,583. It is built on a sandy plain a little above the river level. It is regularly laid out and contains a cathedral, bishop's palace, Jesuits' college and church dating from 1654, a university, the cabildo or town hall facing on the principal square and provincial government buildings. It serves as headquarters of the Santa Fé railway. The town is less modern in appearance than Rosario, and has a number of old residences and educational and charitable institutions. It is a port of call for small river steamers and is in ferry communication with Paraná on the opposite bank of the river. Its shipping port for larger steamers was at Colastiné, until 1911, when the modern port of Santa Fé was opened, with two large docks capable of accommodating some 25 ocean-going vessels. Santa Fé has railway communications with Rosario, Córdoba, Tucumán and the frontier of the Chaco.

Santa Fé was founded by Juan de Garay in 1573.

SANTA FE (săn'tə fā'), capital of New Mexico, U.S.A., in the northern part of the state, on the Rio Santa Fe, 20 mi. E. of the Rio Grande; county seat of Santa Fe county and the oldest seat of government in the United States. It is on federal highways 66, 84, 85 and 285, and is served by the Denver and Rio Grande Western and the Santa Fe railways. Pop. (1940) 20,325 by federal census. It lies 7,000 ft. high, at the foot of the Sangre de Cristo Range. The climate is dry, sunny and invigorating, with an average annual rainfall of 14.49 in. and an average monthly mean temperature ranging from 28.8° F in Jan. to 69° in July. The original Spanish plaza is still the heart of the city. On the north side of the plaza is the old Governor's Palace, built in 1610; occupied continuously until 1909 by the Spanish, Indian, Mexican and American governors of New Mexico; and now housing the collections of the Historical Society of New Mexico and the archaeological exhibits of the State Museum.

The new State Museum (an art gallery) is an example of the "Santa Fe" architecture (reproducing in a blended unity the façades of six early New Mexico missions), where the members of the Santa Fe and Taos "art colonies" exhibit their work before sending it east. Near the plaza is the chapel of San Miguel (built in 1621), and close by is "the old house" of Indian construction, possibly antedating the Spanish occupation. St. Francis cathedral dates from 1869 and occupies the site of a church built in 1622. In the northeastern part of the city are the ruins of Fort Marcy, built by General Kearny in 1846. A stone in the plaza marks the end of the old Santa Fe Trail. The modern structures are mainly in the distinctive "Santa Fe" type of architecture, developed (largely since 1910, through the efforts of a small group of persons connected with the School of American Research and the State Museum) by combining features from the terraced dwellings of the Pueblo Indians, the crumbling Franciscan missions, and the *haciendas* of Spaniard and Mexican. The Pecos Division of the Santa Fe National Forest lies 5 mi. east of the city. Farther away, at distances ranging from 9 to 75 mi., are the Indian pueblos of Tesuque, San Juan, Santa Clara, San Ildefonso (home of Maria, the pottery maker), and Taos (one of the few remaining pueblos where the Indians still live in terraced houses); Chimayo, a Spanish plaza, where pilgrims come to be healed at the Santuario, and where blankets are woven on looms 100 years old; the Puyé cliff dwellings and those of Rito de los Frijoles; the Pecos River canyon, the hot springs of Ojo Caliente, the petrified forest near Cerrillos, and the turquoise mines near Bonanza.

Santa Fe was the site of prehistoric Indian pueblos, of which few remains above ground were left when the Spaniards came. The Villa Real de la Santa Fe de San Francisco was founded in 1610, during the administration of Don Pedro de Peralta, and the building of the presidio was begun at the same time. By 1630 there was a population of 250 Spaniards, 700 Indians and 50 half-breeds. In 1680, the Pueblo Indians drove out their conquerors (see NEW MEXICO) and enjoyed independence until Diego de Vargas quietly secured their submission again in 1692. Minor revolts took place in 1694 and 1696. Since 1712 an annual fiesta has been held in commemoration of the reconquest of 1692. During the 18th

century a considerable trade in sheep, wool, pelts and wines developed, chiefly with Chihuahua and the Indians of the Plains. Later, Santa Fe became the centre of an extensive commerce with the United States, carried on at first by pack animals, and from 1822 by wagon trains over the old Santa Fe Trail from Independence and Kansas City. In the later years of Spanish rule a number of American citizens were imprisoned in the dungeons of the Governor's Palace, charged with entering the province for trade and commerce, among whom were Major Zebulon M. Pike (1807), Auguste Pierre Chouteau and Joseph de Mun (1817) and David Meriwether (later a governor of New Mexico) in 1819. On Aug. 18, 1846, the city was occupied by an American force under General S. W. Kearny. A few months later the Mexicans assassinated the new governor, Charles Bent, and other Americans, but the revolt was quickly suppressed. In 1847 an English newspaper was established (the first in New Mexico) and in 1848 an English school was opened. At the outbreak of the Civil War the officers at Fort Marcy sympathized with the Southern cause. In 1862 the city was taken by General H. H. Sibley, and for two weeks the flag of the Confederacy floated over the Governor's Palace. The first railway reached the city in 1880.

SANTAL, an aboriginal tribe of Bengal, which gives its name to the Santāl Parganas. Immigrants from Hazārībāgh, they occupied the Parganas about 100 years ago. They are short, dark skinned, with broad noses, thick and everted lips, coarse and occasionally curly hair, but not woolly, and prominent cheekbones. They are good cultivators and cattle-breeders in the plains, and skilful hunters. They have an elaborate tribal structure, with 12 exogamous clans; their villages are well-built and clean, and each has its cadre of village officials and each *pargana* or group of villages its chiefs, who are assisted or controlled by a council. The Santals worship the sun and have totemistic beliefs. See H. A. Risley. *Tribes and Castes of Bengal* (1891).

SANTALACEAE, the sandalwood family, dicotyledonous, semi-parasitic shrubs, trees and herbs of tropical and temperate regions. There are 30 genera and about 400 species. *Santalum album* is the true sandalwood (*q.v.*). The bastard toad-flax (*Thesium humifusum*), an herbaceous root-parasite with green leaves, native to Great Britain, belongs to this family. To it belong the North American species of *Comandra*, likewise called bastard toad-flax and sometimes parasitic, and also the oil-nut or buffalo-nut (*Pyrrularia pubera*), of the Appalachian region.

See R. Pilger, "Santalaceae," Engler and Prantl, *Die Natürlichen Pflanzenfamilien* 16b: 52-97, fig. 27-47. (1935).

SANTAL PARGANAS, THE, a district of British India, in the Bhagalpur division of Behar and Orissa. Area 5,458 sq.mi. Pop. (1931) 2,051,472. In the east a sharply defined belt of hills stretches for about 100 mi.; west of this a rolling tract of long ridges with intervening depressions covers about 2,500 sq.mi., while there is a narrow strip of alluvial country about 120 mi. long lying for the most part along the loop line of the East Indian railway. The principal range is that of the Rajmahal hills, which cover about 2,000 sq.mi.; they nowhere exceed 2,000 ft. The alluvial tract has the damp heat and moist soil characteristic of Bengal, while the undulating and hilly portions are swept by the hot westerly winds of Behar and are very cool in the winter months. Coal is worked in the small Jaintia field. Shellac is manufactured; Pakaur is the chief centre of the industry.

The early history of British administration is a record of the measures taken to pacify and civilize the Paharias of the Rajmahal hills, who under Mohammedan rule had been turbulent robbers and marauders. The Santals, who give their name to the district and now number 754,804, began to migrate there from Chota Nagpur and the adjoining districts towards the close of the 18th century. Permission to settle in the valleys and on the lower slopes stimulated immigration to an enormous extent. The oppression of landlords, the exactions of Hindu money-lenders and the consequent loss of land caused a rebellion (the Santal War) in 1855-56. The insurrection led to the establishment of a form of administration congenial to the immigrants; and a land settlement has since been carried out on conditions favourable to the occupants of the soil. The Daman-i-Koh, meaning "the skirts

of the hills," which is a Government estate of 1,356 sq.mi., is treated as a reserve for them and other aboriginals, such as the Paharias. The district is traversed by both the chord and loop lines of the East Indian railway. It contains the old Mohammedan city of Rajmahal and the modern commercial mart of Sahibganj (pop. 15,883), both on the Ganges; and also the Hindu place of pilgrimage of Deoghar (pop. 14,217). The administrative headquarters are at Dumka, or Naya Dumka: pop. (1931) 9,471.

SANTA MARIA (DA BOCCA DO MONTE), an inland town of Brazil, in Rio Grande do Sul. 162 mi. by rail west of Margem do Taquari, the railway terminus for Pôrto Alegre, about 80 mi. by water northwest of that city. The population, including the municipal district, in 1940 was 76,280. Santa Maria, which lies 382 ft. above the sea, is the commercial centre of a rich district on the slopes of short mountain ranges, one of which, the Serra do Pinhal, forms the water parting between the eastern and western river systems of the state. The town derives its chief importance from its becoming the junction of the railway from Pôrto Alegre and the Brazilian railway running from São Paulo to the Uruguay border.

SANTA MARTA, a city and port of Colombia and the capital of the department of Magdalena, on a small bay 40 mi. E.N.E. of the mouth of the Magdalena river. Pop. (1938) 33,247. It is built partly on the beach and partly on the slopes of the Sierra Nevada de Santa Marta towards the south-east. Though small, the harbour is one of the best and safest on the coast, as no river flows into it to fill its anchorage with silt. The depth ranges from 18 to 19 fathoms at the entrance to 4½ fathoms along the inner shore line. The city is an episcopal see and has a cathedral. A 176 mi. railway runs southward to Fundación. Ciénaga (on the large lagoon of Ciénaga) connects with steamers running to Baranquilla (50 mi. farther).

Santa Marta was founded by Rodrigo de Bástidas in 1525, and became an important port and centre of trade during the Spanish colonial era. It was also a base of operations in the exploration and conquest of the interior.

SANTA MAURA (LEUCADIA, LEUCAS, LEVKAS) (*Λευκάδα*, ancient *Λευκάς*), one of the Ionian Islands (20 mi. N. to S., 5-8 mi. E. to W.; area 110 sq.mi.; population about 30,000), off the coast of Acarnania (Greece), S. of the entrance to the Gulf of Arta. It is a rugged mass of limestone and bituminous shales (partly Tertiary), rising to 2,000 and 3,000 ft. with limited areas of level ground. The grain crop suffices only for a few months' local consumption; but much olive oil of good quality is produced. The vineyards (in the west especially) yield red wine (bought mainly by Rouen, Cete, Trieste and Venice); the currant, introduced about 1859, has come to be the principal source of wealth (averaging 2,500,000 lb.); and cotton, flax, tobacco and valonia are grown. The salt trade, formerly of importance, has suffered from customs regulations. The chief town, Amaxichi (more usually Santa Maura, after the neighbouring fort), is at the north-east end opposite the lagoon. In the south-west is the village of Vasiliki, whence the currant crop is exported.

Cyclopean and polygonal walls at Kaligoni (south of Amaxichi) probably mark the ancient acropolis of Neritus (or Nericus), and the later Corinthian settlement of Leucas. From this point a Roman bridge seems to have crossed to the mainland. Between the town and Fort Santa Maura extends a Turkish aqueduct partly destroyed with the town by the earthquake of 1825. Forts Alexander and Constantine commanding the bridge are relics of the Russian occupation; the other forts are of Turko-Venetian origin. The magnificent cliff, 2,000 ft. high, at Cape Ducato at the S. end of the island, still bears the ruined temple of Apollo Leucatas (hence the modern name). At the annual festival of Apollo a criminal was obliged to plunge from the summit into the sea, where, however, an effort was made to pick him up; and it was by the same leap that Sappho and Artemisia, daughter of Lygdamis, are said to have ended their lives.

A theory has been proposed by Professor Dorpfeld that Leucas is the island described in the Odyssey under the name of Ithaca; arguing that the Homeric description of the island and its position, and also the identification of such sites as the palace of

Odysseus, the harbour of Phorcys, the grotto of the Nymphs and the island Asteris, where the suitors lay in wait for Telemachus, suit Leucas better than does the island called Ithaca (*q.v.*).

The strait separating it from the mainland is liable to silt. In 1903, however, a canal was completed 50 ft. broad and 17 ft. deep. The island was occupied by axis troops in 1941.

See CORFU; also P. Goessler, *Leukas-Ithaka* (Stuttgart, 1904); W. Dorpfeld, *Alt-Ithaka*, 2 vols. (Stuttgart, 1927).

SANTA MONICA, a city of Los Angeles county, California, U.S.A., on the Pacific ocean, 16 mi. W. of Los Angeles. It is on federal highways 66 and 101A and is served by the Union Pacific, the Santa Fe and the Southern Pacific railways and by bus lines. Population in 1930 was 37,146, and in 1940 it was 53,500 by the federal census. It is primarily a year-round seaside resort, beautifully situated on the Palisades, facing broad Santa Monica bay, and protected by mountains on the north. The elaborate and varied recreation facilities include a municipal fishing pier. Santa Monica was incorporated in 1886 and chartered as a city in 1907. It has the great Douglas Aircraft plant, Cloverfield airport and numerous beach and aquatic attractions. Since 1915 the city has been under a commission form of government.

SANTANDER, a maritime province of northern Spain, bounded north by the Bay of Biscay, east by the province of Biscay, south by Burgos and Palencia, and west by Leon and Oviedo. Pop. (1939) 398,283, area 2,108 square miles. Santander was part of the Roman province of Cantabria, which, after passing under the empire of the Goths, became the principality of Asturias (*q.v.*). The portion called Asturia de Santa Juliana, or Santillana, was included in the kingdom of Old Castile, and, on the subdivision of the old provinces of Spain in 1833, became the province of Santander. The province is traversed from east to west by the Cantabrian Mountains (*q.v.*), which in the Picos de Europa reach a height of over 8,600 ft., and send off numerous branches to the sea. The province is traversed from north to south by the railway and high road from Santander by Palencia to Madrid; the highest point on the railway (Venta de Pazoal) is 3,229 ft. above the sea. Other railways connect Santander with Bilbao on the east and with Cabezona de la Sal on the west. The province saw some of the heaviest fighting of the civil war of 1936-39; it was occupied by nationalists in 1937.

SANTANDER, the capital of the Spanish province of Santander, the seat of a bishop and one of the chief seaports of Spain; 316 mi. by rail N. of Madrid, on the Bay of Santander, an inlet of the Bay of Biscay. Pop. (1940) 99,485. It is on the inside of a rocky peninsula, Cabo Mayor, which shelters a harbour from 2 to 3 mi. wide and 4 mi. long. Santander is divided into an upper and a lower town. The Muelle is officially named Paseo de Pereda, in honour of the great novelist. The harbour was improved after 1850. In the civil war of 1936-39 Santander was attacked by Nationalist columns from Biscay, Soncillo and Navarre, well-supplied with tanks. It fell Aug. 16, 1937.

SANTAREM, a city of Brazil in the state of Pará, on the right bank of the Tapajóz, near its entrance into the Amazon. Population of the town and *município* (1940) 47,927. It is one of the most important towns and distributing centres of the Amazon between Belém and Manaus and is a port of call for all river steamers and a station on the Amazon cable line. Santarém is 435 mi. from Belém (by air) and is served regularly by Panair do Brasil. Seen from the river the town is attractive in appearance and consists of a European (white) and an Indian quarter, the latter of palm-thatched huts. Ruins remain of a fort built in colonial times to protect the population against hostile Indians. Its principal public buildings are a municipal hall and tribunal, a large municipal warehouse, a market, theatre and two churches. The productions of the neighbourhood are cacao, Brazil nuts, rubber, tobacco, sugar cane and cattle; and the rivers furnish an abundance of fish, which are cured here at the season of low water, when turtle eggs are also gathered upstream for the manufacture of oil and "butter." The Tapajóz is navigable for steamers to the rapids, 170 mi. above Santarém, and for small boats nearly to Diamantino, Mato Grosso, and a considerable trade comes from

Mato Grosso and the settlements along its banks. Santarém was founded by a Jesuit missionary in 1661 as an Indian *aldeia*, and became a city in 1848.

SANTAREM, a city on the right bank of the river Tagus, 51 mi. by rail N.E. of Lisbon, Portugal. Pop. (1930) 12,106. The older part contains the ruined castle of Alcaçova, famous in the middle ages as a royal residence. Below is Ribeira de Santarem, a comparatively modern river-port, and on the opposite bank is Almeirim, a village which was also a royal residence until 1755, when it was almost entirely destroyed by earthquake. Santarem has some trade in fish and agricultural produce, including wine and olive oil. Its chief buildings are an ecclesiastical seminary; the late Gothic church of the Convento da Graça, which contains the tomb of Pedro Alvares Cabral, the first Portuguese to visit South America (1502); the Igreja do Milagro, an early Renaissance church; and the church of Santa Iria (St. Irene), from which the name of the city is derived. There is a fine bridge.

Santarém is the Roman *Scallabis*, renamed *Praesidium Iulium* by Julius Caesar. From its position in the Tagus valley it became an important fortress during the wars between the Moors, Portuguese and Spaniards. Alphonso VI. of Castile first took it from the Moors in 1093, but it was recaptured and occupied by them until 1147, when Alphonso I. of Portugal recovered it. The Almohades endeavoured to win it back in 1184, but were defeated. The Miguelites were defeated here in 1834 (see PORTUGAL: History).

The administrative district of Santarem coincides with the eastern part of the ancient province of Estremadura (*q.v.*); population 401,767; area 2,555 sq. miles.

SANTAROSA, ANNIBALE SANTORRE DI ROSSI DE POMAROLO, COUNT OF (1783-1825), Piedmontese insurgent, and leader in the revival (Risorgimento) of Italy, was born at Savigliano, near Coni, on Nov. 18, 1783. He was the son of a general officer in the Sardinian army who was killed at the battle of Mondovi in 1796. Santarosa entered the service of Napoleon during the annexation of Piedmont to France, and was sub-prefect of Spezia from 1812 to 1814. After the restoration of the king of Sardinia in 1814, he continued in the public service. When in 1821 the Austrian army was moved south to coerce the Neapolitans, Santarosa conspired to obtain the intervention of the Piedmontese in favour of the Neapolitans by an attack on the Austrian lines of communication. The conspirators sought the co-operation of the prince of Carignano, afterwards King Charles Albert. On March 6, 1821, Santarosa and three associates had an interview with the prince, and on the 10th they carried out the military "pronunciamiento" which proclaimed the Spanish Constitution. The movement had no real popular support, and very soon collapsed. Santarosa was arrested, but escaped, and fled to France, living for a time in Paris under the name of Conti. Here he wrote in French and published in 1822 his *La révolution piémontaise*, which attracted the notice of Victor Cousin, by whom he was finally concealed. He was imprisoned and expelled from Paris. He passed over to England, where he found refuge in London with Ugo Poscolo. He accompanied his countryman Giacinto Collegno to Greece in Nov. 1824. He was killed when the Egyptian troops attacked the island of Sphacteria, near Navarino, on May 8, 1825.

See Atto Vannucci, *I Martiri della libertà italiana* (Milan, 1877), and vol. ix. of the series called *I Contemporanez italiani* (Turin), in which there is a life by Angelo de Gubernatis. Santarosa's correspondence was edited by Bianchi, *Lettere di Santorre Santarosa* (Turin, 1877). A personal description by Victor Cousin will be found in the *Revue des deux mondes* for March 1, 1840.

SANTA ROSA, a city of California, U.S.A., 52 mi. N. by W. of San Francisco, in a broad valley of the Coast ranges, at an altitude of 150 ft.; the county seat of Sonoma county. It is served by the Northwestern Pacific, the Southern Pacific, and electric railways, and by motor-stage and truck lines. Pop. (1920) 8,758 (82% native white); 1940 federal census 12,605. It is the trading centre and shipping point for a wide area, producing large quantities of poultry, eggs, cheese, butter, prunes, grapes, berries, hops, wool and other agricultural products. Because of the favourable conditions of climate and soil which it presented for horticultural experiments, Luther Burbank in 1875 chose Santa

Rosa for his home.

The city has varied manufacturing industries, supplying local needs and utilizing local products. Santa Rosa was settled about 1838 and incorporated in 1853.

In 1854 it replaced Sonoma as the county seat and in 1867 it was chartered as a city. It suffered severely in the earthquake of April 18, 1906. Since 1920 it has had a council-manager form of government.

SANTA TECLA, Salvador: see **NUEVA SAN SALVADOR**.

SANTAYANA, GEORGE (1863–), American philosopher and poet, was born at Madrid. At the age of nine he was taken to America.

He received the degree of B.A. from Harvard university in 1886, and served there, first as instructor, and then as professor of philosophy, from 1889 to 1912. For a long time his attachment to literature competed with "the love of wisdom."

In 1894 he published *Sonnets and Other Poems*; and at intervals ever since he has issued small volumes of classically compact and severely beautiful poetry, warmed with the restrained emotionalism of a Spaniard and an aristocrat, and coloured with the peculiar melancholy of an ex-Catholic who envies the consolations of "that splendid error which conforms better to the impulses of the soul" than life itself can do.

His first essay in philosophy was *The Sense of Beauty* (1896), which even the matter-of-fact Münsterberg rated as the best American contribution to aesthetics; five years later appeared *Interpretations of Poetry and Religion*; then for seven years he worked on his *magnum opus*, *The Life of Reason*.

These five volumes, *Reason in Common Sense*, *Reason in Society*, *Reason in Religion*, *Reason in Art*, and *Reason in Science*, at once lifted Santayana to fame.

In 1912 he abandoned his position at Harvard, and went to live in Europe. Since then he has wandered from country to country, from Oxford and London to Paris and Rome, adding industriously to his philosophical product and repute. In 1923 he issued *Scepticism and Animal Faith*, as an introduction to "one more system of philosophy"; and in 1927 he published *The Realm of Essence*, first of four volumes on *Realms of Being*. These later works have given form and completeness to a world-view which, in the *Life of Reason*, modestly announced itself as merely a contemporary application of Aristotle's thought. Epistemologically, Santayana's position is that idealism is true, but irrelevant and useless. Certainly the only reality is experience; and the "realm of essence" means the colours, forms, tastes, odours, pressures and temperatures which sensation gives, and the ideas, words, images and other interpretative representations which thought weaves around these essential experiences of the flesh. Our belief that these perceptions, by and large, fairly report the "external world" (the "realm of matter") is a form of "animal faith," a rough hypothesis which has the sufficient sanction of pragmatic use, and embodies the concordant element in the experience of all normal men.

Consequently we may accept as real what the senses report, and in every case this is matter. "In natural philosophy I am a decided materialist—apparently the only one living." Matter is far more complex in its structure, and far subtler in its possibilities, than we supposed; and to Santayana there is nothing strained in viewing thought as a function quite as natural and corporeal as digestion, and as transitory. "I believe there is nothing immortal. . . . No doubt the spirit and energy of the world is what is acting in us, as the sea is what rises in every little wave; but it passes through us; and cry out as we may, it will move on. Our privilege is to have perceived it as it moved." Mechanism is universal, and prevails even in the inmost recesses of the soul. Consciousness has no causal efficacy; it may see, and enjoy or deplore, the operations of life, but it cannot further or impede them in any way. Despite this materialism and scepticism, Santayana has discussed the problems and ideals of religion with the sympathy of a poet and the tolerance of a sage. "Religion is human experience interpreted by human imagination. . . . Matters of religion should never be matters of controversy. . . . We seek rather to honour the piety and understand the poetry

embodied in these fables."

In ethics Santayana cleaves to Aristotle: "In Aristotle the conception of human nature is perfectly sound: everything ideal has a natural basis, and everything natural an ideal fulfilment. His ethics, when thoroughly digested and weighed, will seem perfectly final." A rational morality, based upon secular education and intelligence, would serve for a society of philosophers; but for the majority of mankind morality will have to retain its emotional basis in natural affection and the social training of the home. So too with government: we must put up with the second best, which so admirably accords with our own quality. Democracy has many faults, but it has the great virtue of providing a more equal opportunity than other forms of government to talent and genius of whatever origin and rank. Perhaps in the distant future men will be sufficiently intelligent to combine aristocracy with democracy, giving the franchise to all, but limiting office to the fit. Till then we must suffer fools gladly.

WRITINGS.—*Sonnets and Other Poems* (1894); *The Sense of Beauty* (1896); *Lucifer, a Theological Tragedy* (1899); *Interpretations of Poetry and Religion* (1900); *The Hermit of Carmel, and Other Poems* (1901); *The Life of Reason, or the Phases of Human Progress* (1905–06); *Three Philosophical Poets* (Lucretius, Dante and Goethe) (1910); *Winds of Doctrine* (1913); *Character and Opinion in the United States* (1920); *Egotism in German Philosophy* (1916); *Poems* (1923); *Scepticism and Animal Faith* (1923); *Soliloquies in England* (1925); *Dialogues in Limbo* (1925); *Platonism and the Spiritual Life* (1927); *Realms of Being* (4 vols., 1927–40); L. P. Smith, *Little Essays drawn from the writings of George Santayana* (1921); *The Last Puritan*, a novel (1936).
(W. D. S.)

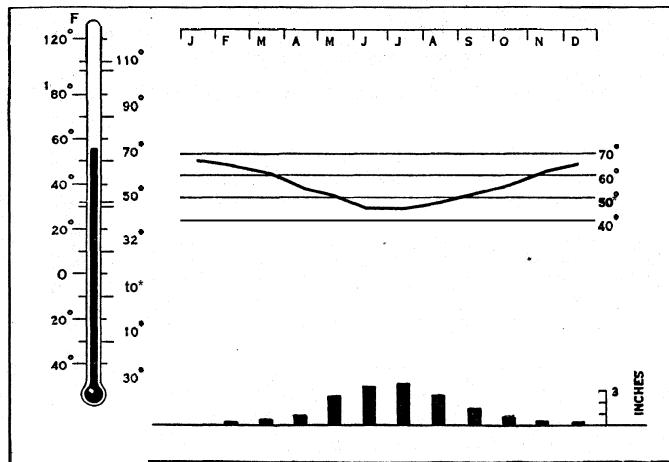

SANTIAGO or **SANTIAGO DE CHILE**, a city of Chile, capital of the republic and of a province of the same name, on the Mapocho river, a small tributary of the Maipú or Maipó, 115 mi. southeast of Valparaíso by rail, in 33° 26' 42" S., 70° 40' 36" W. Pop. (1895) 256,413; (1940) 943,669. The city is built on a wide, beautiful plain about 1,860 ft. above sea-level, between the main range of the Andes and the less elevated heights of Cuesta del Prado. In the centre of the city rises the rocky hill of Santa Lucia, once forming its citadel, but now converted into a pleasure-ground, with winding walks, picturesque views, theatres, restaurants and monuments. Immediately north-northwest and northeast are other hills, known as Colina, Renca and San Cristóbal, and overshadowing all are the snow-clad Andean peaks of La Chapa and Los Amarillos, visible from all parts of the city. The Mapocho, once the cause of destructive inundations (especially in 1609 and 1783), was enclosed with solid embankments during the administration of Ambrosio O'Higgins, and is now crossed by several handsome bridges; the oldest (1767–79) of these has 11 arches.

Santiago is laid out with great regularity, and its comparatively broad straight streets form parallelograms and enclose several handsome public squares, the Plaza de Armas, Plaza Constitución and others. It has all the characteristics of a modern capital: fine public buildings and private residences, broad avenues, well-paved and well-lighted streets and modern conveniences of every sort. Among the more recently constructed buildings are the Palacio de Bellas Artes, in the Parque Forestal; the national library; the agronomical institute and the school of engineering; and many modern skyscrapers and apartment houses. The electric tramway and lighting company, which before World War I had been in German hands, was reorganized as a Chilean enterprise. It constructed hydro-electric projects at Santiago in 1921, and secured the contract for supplying power to the railway from Santiago to Valparaíso after its electrification, as well as for lighting the city and running its tram-cars. In 1924 the government granted a concession to a local firm for the construction of an underground way through the centre of the city (5½ mi. long, 33 ft. below the surface). Water is brought in through two aqueducts, one 5 mi. long (1865), and the other from Laguna Negra 33 mi. away. There is a railway communicating with Valparaíso, with Los Andes and the international tunnel, and with the provincial capitals of the south and the north.

Manufacturing industries play an important role in Santiago, constituting more than 50% of the country's total. Among the leading industries are breweries, flour-mills, foundries, machine.

shops, woodworking plants, tanneries, knitting-mills, soap factories, factories for making shoes, hats, umbrellas and articles of clothing.

The cathedral, facing on the Plaza de Armas, was erected originally in 1619 by Pedro de Valdivia. It was rebuilt by Garcia Hurtado de Mendoza, destroyed by the earthquake of 1647, and was rebuilt on a new plan subsequent to 1748. It is 351 ft. long and 92 ft. wide, has only one tower and is not striking in appearance. Its interior decorations, however, are rich and in good taste. Among the other ecclesiastical buildings are the church of San Augustin, erected in 1595 by Cristóbal de Vera, and in modern times adorned with a pillared portico; the church of San Francisco (the oldest in Santiago); La Merced and Santo Domingo—dating from the 18th century; the church of the Reformed

Dominicans, rich in monolithic marble columns; the Carmen Alto, or church of the Carmelite nunnery, a small Gothic structure; the Augustine nunnery, founded by Bishop Medellin in 1576; the episcopal palace; and the chapel erected in 1852 to the memory of Pedro de Valdivia, next to the house in which he is reputed to have lived. There are two cemeteries—one exclusively Roman Catholic and the other secularized. Mural interment is the custom in Santiago.

Among the secular buildings the more noteworthy are the capitol with its rows of massive columns and its beautiful gardens; the Moneda, or executive residence, which contains the offices of the cabinet ministers also; the civic centre; the courts, or palace of justice; the post office and telegraph department; the exposition palace in the Quinta Normal, which houses the national museum; the University of Chile, dating from 1842; the national library with 500,000 volumes; the school of arts and trades (Escuela de Artes e Oficios); the national conservatory of music; the medical school; the astronomical observatory; the national institute; the mint; and a municipal theatre. There are also a military school, a school of agriculture, mining school, normal schools and a number of charitable institutions. The old Universidad de San Felipe, founded in 1747, was closed in 1839, and was succeeded three years later by the present national university. Facing the capitol, which includes the two halls of congress, is a small park and commemorative shaft, marking the spot where stood the Jesuits' church, burned down on the night of Dec. 8, 1868, and with it "2,000 victims, more or less," chiefly women.

Santiago was founded in 1541 by Pedro de Valdivia, who was engaged in the conquest of Chile, and it received the title of Santiago del Nuevo Estremo. It has suffered from earthquakes and from political disorder. After the defeat of the royalists at Chacabuco (Feb. 12, 1817), it was occupied by the revolutionary forces under Gen. José de San Martín. Though the scene of many revolutionary outbreaks, it has never been subjected to a regular siege. The fifth international conference of American states was held in Santiago in 1923, and the third Pan American Highway

congress convened there in 1939.

The province of Santiago, bounded N. by Aconcagua, E. by Argentina, S. by O'Higgins and Colchagua and W. by the Pacific and Valparaiso, has an area of 6,559 sq.mi. and a population (1940 census) of 1,261,717. It embraces part of the "Valle de Chile," celebrated for its fertility and fine climate.

SANTIAGO DE COMPOSTELA or **SANTIAGO**, a city of northwest Spain, in the province of Corunna; at the northern terminus of a railway from Tuy, near the confluence of the Sar and Sarela rivers, and 32 mi. S.W. of the city of Corunna. Pop. (1930) 38,270. The Galician region, of which the city is the centre, is composed of hills which have been strongly folded and faulted and where in consequence metal veins occur. In the ages when metal began to be known in the west people from the Mediterranean moved along the coasts of western Europe, and with these movements was associated the cult of the megaliths.

In those days navigation was precarious and sailors made for one of a number of small ports which had a common focus inland. Santiago was probably a focus for the numerous ports on the Galician rias. (Cf. Canterbury and St. David's.) At Padron, one of the ports of Santiago, there are two great stones called Barca and Patron (the ship and the skipper). The tradition of the sanctity of the old stone monuments lingered for centuries and the legend arose that St. James the Apostle had, after his martyrdom in Palestine, been borne hither for burial and that the body was brought ashore at Padron.

After the Moorish conquest the northwest corner was the only part of Spain that retained its independence and it was the region from which the reconquest of Spain for Christendom was begun. This produced a great enthusiasm for the Christian religion, an enthusiasm fanned by the reputed discovery of the bones of St. James at Compostela. A church was built over the relics and a bishopric transferred thither. The city thus became a centre for pilgrims and when the royal family of Castile became connected by marriage with that of Burgundy, which was associated with the Cluniac monks, the site gained an international significance. The road (route de S. Jacques) of the pilgrims became famous and many of the great romances of the middle ages developed from the tales told by the pilgrims to while away the tedium of the long journey to this remote corner of Spain. (Cf. the Canterbury Tales.) There were also many pilgrims from those western fringes of Europe, which had been connected with Galicia ages before in the early days of metal. The city was formerly the capital of Galicia, and is still the seat of a university and of an archbishopric, which long disputed the claim of Toledo to the primacy of all Spain. Its chief industries, apart from agriculture, are brewing, distillation of spirits, and the manufacture of linen, paper, soap, chocolate and matches. The city has also been long celebrated for its silversmiths' work.

In 1078 the erection of the present cathedral was begun and was consecrated in 1211. It is a cruciform Romanesque building. The Puerta Santa is kept closed, except in jubilee-years, when it is opened by the archbishop. Perhaps the chief beauty of the cathedral is the Portico de la Gloria, behind the western classic portal. It is a work of the 12th century, and probably the utmost development of which round-arched Gothic is capable. The shafts, tympana, and archivolts of the three doorways which open on to the nave and aisles are a mass of strong sculpture.

The Hospicio de los Reyes, on the north of the Plaza Mayor, for the reception of pilgrims, was begun in 1504 by Enrique de Egas under Ferdinand and Isabella.

SANTIAGO DE CUBA, a city and seaport of Cuba, on the southern coast of the eastern end of the island, capital of the province of Oriente, and next to Havana the most important city of the republic. Pop. (1931 census), 103,525, of whom about 50% were coloured. It is connected by the Cuba railway with Havana, 540 mi. to the W.N.W.; short rail ays extend into the interior through gaps in the mountains northward; and there are steamer connections with other Cuban ports and with New York and Europe.

Santiago is situated about 6 mi. inland on a magnificent landlocked bay (6 mi. long and 3 mi. wide), connected with the Carib-

bean sea by a long, narrow, winding channel with rocky escarpment walls, in places less than 200 yd. apart. The largest vessels have ready entrance to the harbour but direct access to the wharves is impossible for those of more than moderate draught (about 14 ft.). Smith key, an island used as a watering place, divides it into an outer and an inner basin. To the east of the sea portal stand the Morro, a picturesque fort (built 1633 seq.), on a jutting point 200 ft. above the water, and the Estrella; and to the west the Socapa. West of the harbour are low hills, to the east precipitous cliffs, and north and northeast, below the superb background of the Sierra Maestra, is an amphitheatre of hills, over which the city straggles in tortuous streets. The houses are mostly of one story. In the cathedral, Diego Velázquez (c. 1460–1524), conqueror of Cuba, was buried. It has suffered much from earthquakes and has been extensively repaired. Probably the oldest building in Cuba is the convent of San Francisco (a church since the secularization of the religious orders in 1841), which dates in part from the first half of the 16th century. Great improvements have been made in the city since the end of colonial rule, especially as regards the streets, the water supply and other public works and sanitation. On a hill overlooking the city is a beautiful schoolhouse of native limestone, erected by the American military government as a model for the rest of the island. Santiago is the hottest city of Cuba (mean temperature in winter about 82° F, in summer about 88°), owing mainly to the mountains that shut off the breezes from the east. There is superb mountain scenery on the roads to El Caney and San Luis in the thickly populated valley of the Cauto. In the barren mountainous country surrounding the city are valuable mines of iron, copper and manganese. On these the prosperity of the province largely depends. There are also foundries, soapworks, tanyards and cigar factories. The city has an important trade with the interior, with other Cuban ports, and to a less extent with New York and European ports. Mineral ores, tobacco and cigars, coffee, cacao, sugar, rum and cabinetwoods are the main articles of export.

History.—Santiago is less important politically under the republic than it was when Cuba was a Spanish dependency. The place was founded in 1514 by Diego Velázquez, and the capital of the island was removed thither from Baracoa. Its splendid bay, and easy communication with the capital of Santo Domingo, then the seat of government of the Indies, determined its original importance. From Santiago in 1518–19 departed the historic expeditions of Juan de Grijalva, Hernan Cortés and Pánfilo de Narváez—the last of 18 vessels and 1,100 men-at-arms, excluding sailors. So important already was the city that its *ayuntamiento* had the powers of a Spanish city of the second class. In 1522 it received the arms and title of *ciudad*, and its church was made the cathedral of the island. But before 1550 the drain of military expeditions to the continent, the quarrels of civil, military and ecclesiastical powers, and of citizens, and the emigration of colonists to the Main produced a fatal decadence. In 1589 Havana became the capital. Santiago was occupied and plundered by French corsairs in 1553, and again by a British military force from Jamaica in 1662. The capture of that island had caused an immigration of Spanish refugees to Santiago that greatly increased its importance; and the illicit trade to the same island—mainly in hides and cattle—that flourished from this time onward was a main prop of prosperity. From 1607 to 1826 the island was divided into two departments, with Santiago as the capital of the eastern department. After 1826 Santiago was simply the capital of a province. In July 1741 a British squadron from Jamaica under Admiral Edward Vernon and Gen. Thomas Wentworth landed at Guantánamo and during four months operated unsuccessfully against Santiago. The climate made great ravages among the British, who lost perhaps 2,000 out of 5,000 men. The bishopric became an archbishopric in 1785, when a suffragan bishopric was established at Havana. J. B. Vaillant (governor in 1788–96) and J. N. Quintana (governor in 1796–99) did much to improve the city and encourage literature. After the cession of Santo Domingo to France, and after the French evacuation of that island, thousands of refugees settled in and about Santiago. They founded coffee and sugar plantations and

gave a great impulse to trade. There were destructive earthquakes in 1675, 1679, 1766 and 1852. In the 19th century some striking historical events are associated with Santiago including the “Virginus” affair of 1873. The most notable military and naval events (in Cuba) of the Spanish-American War (*q.v.*) of 1898 took place at and near Santiago. Monuments commemorate the actions at El Caney and San Juan Hill.

SANTIAGO DE LAS VEGAS, an inland city of Havana province, Cuba, about 12 mi. S. of Havana. Pop. (1931), 21,265. Tobacco is the principal industry. An agricultural experiment station is maintained there by the Cuban government. The town dates from 1688, when a church was built for a colony of tobacco cultivators of the neighbourhood.

SANTIAGO DEL ESTERO, a province of Argentina, bounded north by Salta and the Chaco territory, east by the Chaco and Santa FC, south by Córdoba, and west by Catamarca, Tucumán and Salta. Area 53,451 sq.mi.; pop. (1914) 261,678; (1940, estimate) 496,530, chiefly Christianized Indians. The surface of the province is flat and low, chiefly open plains thinly covered with grass. There are forests in the west and north, extensive swamps along the river courses and large saline areas, especially in the southwest. The Salado (called Pasaje, and Juramento in Salta) crosses the province from northwest to southeast and empties into the Paraná, and the Dulce, or Saladillo, which has its sources in the Sierra de Aconquija, crosses the province in the same general direction, and is lost in the great saline swamps of Porongos, on the Córdoba frontier. The climate is extremely hot in the summer, the maximum temperature being 111° F (Mulhall); a minimum of 32° is occasionally experienced in the winter. There is an annual rainfall of 25 inches. Sugar, wheat, alfalfa, Indian corn, tobacco and hides are the principal products, and cotton, which was grown there under the Incas, is still produced. The province is traversed by the Tucumán extension of the Buenos Aires and Rosario railway, by a line from Santa FC to Tucumán, and by a branch of the Central Northern (Córdoba section) railway.

The provincial capital, SANTIAGO DEL ESTERO, is on the left bank of the Rio Dulce, 745 mi. N.W. of Buenos Aires, with which it is connected by rail. Pop. (1940) 56,740, chiefly of Indian descent. The city stands on a level open plain, 520 ft. above sea level, and in the vicinity of large swamps (esteros) bordering the Rio Dulce, from which its name is derived. There are a number of interesting old buildings in the city—a government house, several churches, a Jesuit college, a Franciscan convent and a girls' orphanage. The city was founded in 1553 by Francisco de Aguirre and was the first capital of the province of Tucumán, the earliest settled of the La Plata provinces.

SANTI QUARANTA, a seaport of Albania, on the Bay of Butrinto, and opposite the island of Corfu (Corcyra). Pop. before the Italian occupation of 1939, about 5,000, of whom 75% were Orthodox and the remainder Muslims.

In the neighbourhood are the ruins of the ancient Buthrotum, traditionally founded by Helenus, son of Priam (see Virgil, *Aen.* iii. 291 seq.). In the 1st century B.C. Buthrotum became a Roman colony on the main highway between Dyrrachium (Durazzo) and Apollonia. The modern city belonged to the Venetians from the 14th century till 1797 when it was captured by Ali Pasha of Janina. In 1939 the Italians renamed the town Porto Edda, after Mussolini's daughter. It was captured by the Greeks Dec. 6, 1940, and held until Germany's Balkan invasion in April 1941.

SANTLEY, SIR CHARLES (1834–1922), English vocalist, son of an organist at Liverpool, was born on Feb. 28, 1834. He studied at Milan under Gaetano Nava. He had a fine baritone voice, and while in Italy he began singing small parts in opera. In 1857 he returned to London and on Nov. 16 made his first appearance in the part of Adam in *The Creation* at St. Martin's hall. In 1859 he sang at Covent Garden as Hoel in the opera *Dinorah*, and in 1862 he appeared in Italian opera in *Il Trovatore*. He was then engaged by Mapleson for Her Majesty's, and continued to appear regularly in opera until 1870, when he sang as Vanderdecken in *The Flying Dutchman*. His last appearance in opera was in the same part with the Carl Rosa company at the

Lyceum Theatre in 1876. Santley died on Sept. 22, 1922. He had been knighted in 1907.

See his *Reminiscences of my Life* (1909).

SANTO DOMINGO (officially known as the Dominican Republic) occupies the eastern two-thirds of the island of Haiti and has an area of about 19,300 square miles. Its population was estimated to be 1,656,219 in 1940. There are several hundred Spanish and a few other European families living in the country

THE OLD FORTRESS AT THE MOUTH OF THE OZAMA RIVER, CIUDAD TRUJILLO

but the mass of the population is mulatto and negro. In general, the people average a shade lighter than in the neighbouring Republic of Haiti. Spanish is the universal language and the cultural heritage is that of Spain.

The Dominican Republic is very mountainous (*see* HAITI). Extending north-west to south-east and almost in the centre of the country is the great Cordillera Central whose highest elevation exceeds 10,000 feet and whose maximum width is eighty miles. This great mountain mass is largely unoccupied and is heavily forested. It receives an abundant rainfall and is the chief drainage divide of the country. The mountains and valleys north of this central core are well watered as a rule and support nearly two-thirds of the population. Sugar, cacao, tobacco and coffee are the chief money crops, but as elsewhere in the republic, most of the land is held by small farmers and utilized for sustenance crops. This section contains the famous Vega Real of early Spanish days. South of the Cordillera Central much of the land is arid and has poor soils. However, a thriving sugar industry is found east and west of Ciudad Trujillo. It is the general opinion that the country as a whole is capable of supporting several times its present population. There are a number of good harbours in the republic. Docks are in operation at Ciudad Trujillo, Puerto Plata, La Romana, San Pedro de Macoris and Barahona. At the other ports lighters must be used.

A representative government is established under the Constitution. All males over 18 years of age are qualified to vote. The administration is in the hands of three co-ordinate powers: the executive, the legislative and the judicial. The chief executive is the president. Prior to the Constitution of June 13, 1924, he was elected by indirect vote for six years and was not eligible for re-election to a second successive term. At that time, the term was reduced to four years and election was made by direct vote. The office of vice president was created for the first time. The president cannot be re-elected to the presidency nor elected to the vice presidency for the constitutional period following. He is assisted by a cabinet consisting of the secretaries of the seven departments: interior and police, foreign affairs, treasury and commerce, war and navy, justice and public instruction, agriculture and immigration, promotion and communications. There are 12 provinces, each of which elects by direct popular vote, for four periods, one senator and two members to the chamber of deputies. Each province has an appointed governor and is divided into communes, with necessary local officials. The supreme

court is composed of a chief justice and six justices. Courts of appeal are located in two or three of the larger centres. A court of first instance is located in each province and in each commune there is at least one local court. The Policia Nacional Dominicana (Guardia) has the double function of police and army. This organization was trained by and largely modelled after the U.S. Marine Corps. Primary education is free and, in theory, compulsory and is largely supported by the local authorities. The efficiency of the system, however, may be judged by the fact that 90% of the population is illiterate. The higher schools are supported by the Government, including a university. Roman Catholicism is the state religion; all others are tolerated under restriction. The gold standard was adopted in 1897 and the United States gold dollar became standard currency in 1905. The collection of customs is supervised by an American official appointed by the president of the United States. This latter situation is to last until the retirement of the bond issue necessitated by the refunding scheme entered into between the United States and the Dominican Republic.

History. — The area now occupied by the Dominican Republic along with the portion now included in the Republic of Haiti was held by Spain as the colony of Hispaniola until the Treaty of Ryswick in 1697. After that date the Haitian portion was ceded to France and the Dominican portion remained under Spanish dominion and became known as Santo Domingo, after the patron saint of Columbus's father. At the end of the 18th century the Spanish control was lost and the entire island came under the French. When the French lost control of the colony in the early part of the 19th century, the empires of Toussaint L'Ouverture and Jean Jacques Dessalines for a time united the entire island under one government, independent of all European powers. During the second decade of the 19th century, Spain again asserted her dominion over the eastern end of the island but was forced out by a revolution in 1821. A republic was proclaimed under the guidance of Colombia. The following year, President Boyer of Haiti invaded the country and again united the island under one flag. In 1844, the year following Boyer's downfall, the Dominican Republic was founded and since that date two political entities have been maintained. The presidency of the new republic alternated, with one exception, between Buenaventura Báez and Pedro Santana until in 1861 when Spain, on the invitation of Santana, again annexed the country. Dissatisfaction with Spanish rule brought revolution and the Spanish withdrew for the last time in 1865. Four years later, when Báez was again president a treaty was negotiated by Gen. O. E. Babcock, U.S.A. for the annexation of the Dominican Republic to the United States. This treaty was ratified by the Dominican senate but was rejected by the United States. With the exception of the rule of Ulises Heureaux, 1882-99, presidents followed each other in rapid succession and an unstable condition prevailed. An unusually violent revolution broke out following the election of Victoria in Feb. 1912 and the United States sent a mediatory commission which helped to effect a temporary agreement. Victoria resigned and the popular Archbishop, Adolfo A. Nouel, was elected president. He proved a poor executive and Bordas Valdes became provisional president. Revolution again became active and a second commission was sent from the United States. Bordas resigned and Báez became provisional president on Aug. 27, 1914. Jimenez took office as president in December of the same year. He was deposed in April 1916 by Arias, the secretary of war, who assumed power. On May 5, American forces were landed. Dr. Henriquez y Carvajal was then appointed as provisional president. More trouble followed and the United States felt compelled to intervene formally. On Nov. 29, 1916, "The Military Government of the United States in Santo Domingo" was created. Peace was soon established and improvements in finances, transportation, education and government machinery were carried out.

As the occupation was not undertaken with the object of destroying the sovereignty of the Dominican Republic, arrangements were made for the withdrawal of American forces as soon as conditions warranted. The military governor sailed on Oct. 24, 1922, when a satisfactory provisional government had been

set up. On June 26, 1924, the Dominican Republic ratified the treaty proposed by the United States and on July 12 the last of the U.S. forces were withdrawn, leaving only an American receiver of customs. Horacio Vásquez was at the same time inaugurated as president for four years, a term which was subsequently extended by Constitutional amendment to six years. In the last year of his administration, (Feb. 1930) Vásquez was suddenly expelled from office by a revolution and after a brief period under Provisional Pres. Ureña, Gen. Leonidas Trujillo became president and virtual dictator in the state.

CIUDAD TRUJILLO AS SEEN FROM A VESSEL IN THE HARBOUR

Production and Trade.—The Dominican Republic derives its income almost exclusively from agriculture, raising sugar cane and manufacturing raw sugar on a large scale. From 1923-27 inclusive 62% of its exports were sugar. The production of this commodity is largely controlled by foreign capital. Cacao, tobacco and coffee, on the other hand, are produced on a small scale by many peasants and the wealth earned by them means a direct addition to the purchasing power. Consequently, the successful production and sale of these secondary crops is usually a truer index to local prosperity than is the sugar crop. In the larger towns small factories produce such articles as cigars, cigarettes, rum, matches, shoes, soap, straw hats, furniture and brick. These commodities are produced entirely for local consumption and in most cases the demand is only satisfied by imports of the same goods. Mineral resources are limited and their production is practically negligible. The more readily accessible timber stands have been quite thoroughly exploited. Lumbering is still carried on upon a small scale and the export of mahogany and lignum-vitae is of some importance. The fishing industries are carried on in a primitive way and supply but part of the local demand.

The export trade of the republic is indicated by the following data which are average figures for the five year period 1923-27 inclusive: Total value of exports, \$27,830,200; exports to the United States, \$7,839,800 Sugar exported, \$17,438,200; cacao, \$4,178,800; tobacco, \$2,146,400; coffee, \$1,245,200. It will be noted that the combined value of the four chief exports account for 90% of the total value of exports and that sugar alone makes up 62% of the total value of exports. The United States receives about 28% of the exports, including practically all of the cacao and about one-third of the tobacco export. Much of the sugar is shipped to the United States ports but is almost all re-exported to Canada and European countries. Considerable quantities of cane are sold to Porto Rican mills. Honey, hides and skins, lignum-vitae and mahogany are secondary exports of importance. San Pedro de Macoris, Ciudad Trujillo and La Romana are the chief exporting ports of the republic. The total value of imports for the period indicated above was \$23,325,400. The United States furnished \$15,261,800 or 65%. Germany, the United Kingdom and France each furnished about 5%. Cotton cloth, iron and steel products, grain and flour, lard, mineral oils and automobiles constitute the chief imports. The public railroad mileage of the republic is 149 m. and in addition there are over 200 m. of unconnected narrow gauge lines owned by the sugar companies. There are about 550 m. of improved highway connecting Ciudad

Trujillo with northern points and with the Republic of Haiti. Miserable trails are the only lines of transport in the greater part of the country and are serious handicaps to further development. The total external debt was \$15,000,000 in 1927 or about \$15 per caput. The average annual gross customs collections (1923-27) was \$4,687,000. The entire banking business of the republic is carried on by branches of one American and two Canadian banks. (R. B. H.)

SANTO DOMINGO, the capital of the Dominican Republic in the island of Haiti, West Indies. Pop. (1921), 30,957. It is situated on the south coast, at the mouth of the river Ozama. Founded in 1496, it is the oldest existing settlement of white men in the New World, and perhaps the most perfect example of a Spanish colonial town of the 16th century. It is surrounded by ancient walls with bastions. The streets are straight, narrow and intersect at right angles. The massive houses are built of stone with coloured walls pierced with huge doors and windows. The cathedral, in the Spanish Renaissance style, dates from 1512, and contains the reputed tomb of Columbus (*q.v.*). The cell in which he and his brother were confined by order of Bobadilla is still shown in the old fortress. The city is the seat of an archbishop. It has a small harbour, but the river is navigable for 4 m. from its mouth. The city is now called Ciudad Trujillo.

SANTONIN, a drug used in the United States Pharmacopoeia and the British Pharmacopoeia, consisting of colourless flat prisms, turning slightly yellow from the action of light and soluble in alcohol, chloroform and boiling water. It is derived from santonica which is the unexpanded flower-heads of *Artemisia maritima*. The dose is 2 to 5 grs. The only B.P. preparation is the *trochiscus santonini*, but the preparation *sodii santoninas* is official in the U.S.P. Santonin is an anthelmintic used to poison the round worm *Ascaris lumbricoides*. It has no influence on tape-worms. It must be administered fasting and be followed by a purgative in order to expel the worm. The most convenient mode of administration is in capsules. For thread worms which infest the anus of young children, a suppository containing 2 to 3 grs. of santonin and used on alternate nights for three nights is effective. The U.S. preparation sodii santoninas is useless as a vermifuge and is used in diseased conditions of the optic nerve. Even small doses of santonin cause disturbances of vision, usually yellow vision or perhaps green (xanthopsia or chromatopsia). The urine also turns yellow and finally purple or red. These effects usually pass off in a few days. Large doses, however, produce toxic effects, aphasia, muscular tremors and epileptiform convulsions, and the disturbances of vision may go on to total blindness.

SANTORIN (corruption of St. Irene; anc. THERA), a volcanic island in the Aegean Sea, the southernmost of the Sporades. Officially it is a province in the Greek department of the CYCLADES (*q.v.*), divided into 9 communes.

In shape Santorin forms a crescent and encloses a bay on the north, east and south; on the western side lies the smaller island of Therasia. The encircling wall thus formed, elliptical, and 18 m. round its inner rim, is broken in two places—towards the N.W. by a strait a mile in breadth, where the water is not less than 1,100 ft. deep, and S.W. by an aperture about 3 m. wide, shallow, with Aspronisi (White Island) in the middle. From the bay cliffs rise perpendicularly to as much as 1,000 ft.; but towards the open sea, both in Santorin and Therasia, the ground slopes and has been converted into broad level terraces of tufaceous agglomerate, which though bare and ashen, produce the famous Santorin wine. The tufa itself is exported as cement especially for house-roofs. Towards the south-east, the limestone peak of Mount Elias (1,910 ft.) existed before the volcano was formed. In the middle of the bay lie three small volcanic islands, Palaea-, Mikra- and Nea-Kaümene (Old, Little and New Burnt Island). The highest, Nea-Kaümene, was thrown up in 1707 and 1866 to 351 ft. above the sea. Owing to the depth at the foot of the cliff there is no anchorage, and vessels have to be moored to the shore, except at one point in the neighbourhood of the modern town, where there is a patch of shallow bottom. The cliffs show horizontal bands of black lava, white and yellow tufa, and other

volcanic strata, red, purple, brown and green, with but little herbage. The modern town of Thera (or Phera, as it is commonly pronounced) is built at the edge of these cliffs, overlooking the bay at a height of 900 ft. The foundations of the houses and in some cases their sides, are excavated in the tufa, so that they are hardly traceable except by their chimneys. Owing to the absence of timber—for, except the fig, cactus and palm, there are hardly any trees in the island—they are roofed with barrel vaults. Both wood and occasionally water are imported from neighboring islands, for there are no wells, and the rain water, collected in cisterns, sometimes fails. The next largest village, Apanomeria ("Upper Part"), near the N. entrance, is crowded together in a whitewashed mass above the reddest rocks in the island.

Geology.—Most geologists agree that the whole of the bay was once covered by a single volcanic cone, represented by the outward slope of Santorin and Therasia, with its crater at the Kaiimene Islands; and that the bay results from explosion and subsidence. The Kaiimene Islands arose subsequently, and Palaea-Kaiimene is considered to be prehistoric. Principal eruptions in historic times are those of 196 B.C. (Strabo 57), when flames arose from the water between Thera and Therasia for four days and an island appeared; of A.D. 726, when again an island was thrown up; of 1570, when Mikra-Kaumene arose; of 1650, which destroyed many lives by noxious exhalations, and ended in the upheaval of an island in the sea to the north-east of Santorin, which is now a reef below sea-level; that of 1707, when Nea-Kaiimene arose; and that of 1866, when Nea-Kaiimene was extended towards the south and enlarged threefold.

In the southern parts both of Santorin and Therasia prehistoric dwellings have been found underneath the layer of tufa and between the stones branches of wild olive, a mode of building that still prevails in the island, to resist earthquake. Vases of imported Cretan ware date this settlement to the middle Minoan period, and connect the volcanic explosion with the earthquake which wrecked the first Palace at Cnossus.

In Greek legend the island of Thera originated from a clod of earth presented to the Argonauts by Triton (Apoll. Rhod., Argonaut, iv., 1551 seq. 1731 seq.). A colony was left there by Cadmus (Herod. iv. 147.). Subsequently a colony from Sparta, including Minyan refugees from Lemnos, was brought by Theras, who gave the island his own name, in place of Calliste. But the chief event in Thera's history was the planting of its famous colony of Cyrene on the north coast of Africa by Battus in 631 B.C., in accordance with a command of the Delphic oracle. Thera, as a member of the League of the Cyclades, was from 308 to 145 B.C. under the protectorate of the Ptolemies.

The ancient capital occupied a site on the eastern coast now called Mesavouno, between Mount Elias and the sea. It has been excavated since 1895 by Baron Hiller von Gartringen. There are extensive cemeteries; a Heroum of Artemidorus; an Agora; a Royal Portico; a temple of Dionysus and the Ptolemies, later dedicated to the Caesars; the Ptolemaic barracks and a gymnasium. The main street has narrow lanes to right and left; one leads to the sanctuary of the Egyptian gods. Near the street there is a small theatre, beneath the seats of which is a cistern into which rain-water drains from the auditorium: water was evidently scarce then as now. Farther south-east are the temples of Ptolemy Euergetes III., and of Apollo Carneius; finally, where the rocks fall precipitously, a gymnasium of the Ephebi. Numerous rock-carvings and inscriptions have been discovered, as well as statues and vases. Near the W. foot of Mount Elias is the temple of Thea Basileia, perfect even to the roof, now dedicated to St. Nicolas Marmorites.

Tournefort mentions that in his time nine or ten chapels were dedicated to St. Irene, the patron saint of the place; the name Santorin was given after the fourth crusade, when the island formed a portion of the duchy of the Archipelago.

SANTOS, a city and seaport of Brazil, in the State of São Paulo, about 200 mi. S.W. of Rio de Janeiro, and 49 mi. by rail S.E. of São Paulo city. Pop. of *município* (1940) 169,889. Santos covers an alluvial plain on the inner side of an island (São Vicente) formed by an inland tidal channel sometimes called the Santos river. The commercial part of the city is some miles from the mouth of the channel, but the residential sections extend across the plain and line the beach facing the sea. The city is only a few feet above sea level, the island is swampy and deep, cement-lined channels drain the city. The Santos river is free from obstructions and in front of the city widens into a bay deep enough for the largest vessels. The water front, formerly beds of mud and slime, the source of many epidemics of fever, is now faced by a wall of stone and cement. The quay is nearly 3 mi. long and can accommodate 50 steamers at one time; belt conveyors operated by steam load several thousand bags of coffee per hour. Many warehouses are splendidly equipped with machinery which replaces manual labour. The British-built railway to São Paulo ("heart of coffee land"), 49 mi. distant, transports the bulk of coffee of that region to Santos, making the line the best paying railway in South America. A paved highway from São Paulo to Santos was completed by the state government in 1919.

Santos has passed Rio de Janeiro in the amount of its exports and is now the world's greatest coffee port, shipping annually from 8,000,000 to 13,000,000 bags. The annual imports have increased in 20 years from 1,653,450 to 2,469,152 short tons. About 3,000 ships visit the port yearly, the busiest season being from August to January. The other exports include cotton, sugar, rice, rum, fruit, hides and manufactured goods. Bananas are grown in the vicinity for the River Plate markets.

An annual rainfall of about 77 in. and a mean temperature of 69°, combined formerly to create unhealthful conditions, but the building of a series of drainage canals, extension of modern sanitation, paving of streets, construction of better houses and port improvements are largely responsible for the change to a healthful city. A suburban seaside resort, Guarujá, with good hotels, draws many visitors from inland parts of Brazil.

The first settlement on the São Paulo coast was that of São Vicente in 1532, about 6m. S. of Santos on the same island. Other settlements soon followed, among them that of Santos in 1543-46, and later on the small fort at the entrance to its harbour, which was used for protection against Indian raids from the north. São Vicente did not prosper, and was succeeded (1681) by São Paulo as the capital and by Santos as the seaport of the colony. It was captured by the English privateer, Thomas Cavendish, in 1591, when São Vicente was burned.

SANTOS-DUMONT, ALBERTO (1873-1932), Brazilian aeronaut, was born at São Paulo, Brazil, on July 20, 1873. In 1897 he made his first balloon ascent from Paris. In 1898 he began to construct dirigible airships, and after many failures built one which, on Oct. 19, 1901, won the Deutsch prize and a prize from the Brazilian Government for the first flight in a given time from Saint Cloud to the Eiffel tower. In 1903 he erected at Neuilly the first airship station. Here he kept his fleet of dirigibles and travelled in them about the streets of Paris between the houses. The whole fleet was offered to France in the event of war with any country but America.

In 1905 Santos-Dumont turned his attention to heavier-than-air machines, and after experiment with a vertical-propeller model, he built in 1906 a machine on the principle of the box-kite, and with it won the Deutsch-Archdeacon prize in October, while in November he flew 220 metres in 21 seconds. In 1909 he produced his famous "demoiselle" or "grasshopper" monoplane, the forerunner of the modern light plane. On Dec. 3, 1928, after many years of residence in France, he returned to Brazil. On his arrival the government declared a half-holiday in his honour.

Santos-Dumont wrote *My Airships: A Story of My Life* (1904).

SANUTO or **SANUDO, MARINO**, the younger (1466-1533), Venetian historian, son of the senator, Leonardo Sanuto, was born on May 22, 1466. Marino Sanuto was elected a member of the Maggior Consiglio when only twenty years old, and

became a senator in 1498. He collected a fine library, which was rich in mss. and chronicles both Venetian and foreign, including the famous Altino chronicle, the basis of early Venetian history.

His chief works are: *Itinerario in terra ferma* (ed. Rawdon Brown, 1847); *I commentarii della guerra di Ferrara*, an account of the war between the Venetians and Ercole d'Este (pr. Venice, 1829); *La Spedizione di Carlo VIII.* (MS. in the Louvre); *Le Vite dei Dogi*, vol. xxii. of Muratori's *Rerum Italicarum Scriptores* (1733). The *Diarii*, his most important work, which cover the period from Jan. 1, 1496 to Sept. 1533, were edited by various scholars and published at Venice (58 vols., 1879-1903). Owing to the relations of the Venetian republic with the whole of Europe and the East it is practically a universal chronicle.

BIBLIOGRAPHY.—M. Rawdon Brown, *Ragguagli sulla vita e sulle opere di Marino Sanuto* (3 vols., Venice, 1837-38); G. Tiraboschi, *Storia della Letteratura Italiana*, vol. vi.; R. Fulin, *Marin Sanudo* (Turin, 1880); Ricotti, *I Diarii di Marin Sanudo* (Turin, 1880); and G. de Leva, *Marin Sanudo* (Venice, 1888).

SAN VICENTE, the capital of the department of San Vicente, Salvador; 30 m. E. of San Salvador, on the river Acahuapa, a left-hand tributary of the Lempa. Pop. (1940) 12,759. San Vicente is situated in a volcanic region abounding in hot springs and geysers. The volcano of San Vicente, the highest in the department, reaches an altitude of more than 7,000 feet. There are indigo and tobacco plantations. Shoes, hats, cloth, silk, spirits and cigars are manufactured. San Vicente was founded in 1634 on the site of Tehuacan, an ancient Indian city. For one year (1839-40) it was the capital of the republic.

SÃO FRANCISCO, a river of eastern Brazil rising in the southwest part of the state of Minas Gerais, about 20° 30' S., 46° 40' W., near the narrow valley of the Rio Grande, a tributary of the Paraná, and within 240 mi. of the coast west of Rio de Janeiro. It flows in a general north-northeast direction across the great central plateau of Brazil to about lat. 9° 30' S., long. 42° W., where it turns northeast and then southeast in a great bend, entering the Atlantic in lat. 10° 29' S. It has a total length of about 2,500 mi. and a fall of 2,700-2,800 ft. It is navigable from the Atlantic to Piranhas (148 mi.) and is nearly 1 mi. wide at Penedo. 22 mi. from the sea. Above Piranhas, about 193 mi. from its mouth, are the falls of Paulo Afonso, where the river plunges through a narrow gorge—in one place only 51 ft. wide—and over three successive falls, altogether 265 ft. The obstructed part of the river is about 190 mi. long, and consists of a series of rapids above the falls and a deep cañon with whirlpools for some distance below. The Brazilian Government has built a railway around these falls from Piranhas (151 ft. elevation) to Jatobá (978 ft.) with an extension of 71 mi.

Above Jatobá there is another series of rapids, called the Sobradinho, nearly 90 mi. above the lower rapids, which are navigable at high water, and above these an unobstructed channel for light-draught river boats up to Pirapora, a little above the mouth of the Rio das Velhas, a distance of 984 mi. Here the river runs through a barren, semi-arid region, sparsely settled. The rapids of Pirapora are 17 mi. above the mouth of the Rio das Velhas, and this point, the head of navigation on the river, and 1,742 ft. above sea level, is the objective-point of the central do Brasil railway, the purpose being to create by rail and river a central route from Rio de Janeiro to the northern ports of Baía and Recife.

The principal tributaries of the São Francisco are: on the right, the Pará, Paraopeba, Velhas and Verde-Grande; on the left, the Indayá, Abaeté, Paracatú, Urucuya, Carinhanha, Corrente and Grande. Several of these tributaries are navigable for long distances by small boats—the aggregate being a little over 1,000 mi. Some authorities give the aggregate navigable channels of the São Francisco as 4,350 mi. The upper valley of the São Francisco is partly forested, has a temperate climate, with a mean annual temperature of 85° F. and a rainfall of 1,637 millimetres. The rainy season is from December to March, but on the lower river there are sometimes droughts covering several years.

An admirable description of this great river is given by Richard Burton in *The Highlands of Brazil* (1869), and a more technical description by E. Liáis in *Hydrographie du Haut San-Francisco et du Rio das Velhas* (Rio de Janeiro, 1865).

SÃO LEOPOLDO, a city of the State of Rio Grande do Sul, Brazil, on the left bank of the Rio dos Sinos, 20½ mi. by rail north of Porto Alegre. It is the chief town of a *município* (commune) of the same name, having an area of 340 sq. mi. and inhabited chiefly by German colonists. Population (1940) of the *município*, 52,225. São Leopoldo has river and railway communication with Porto Alegre and railway connection with Santa Maria. It is a prosperous industrial town, with broad straight streets, substantial buildings and good schools. Among the articles which it manufactures are matches, hats, boots and shoes, soap, liqueurs and artificial drinks, leather and leather-work and earthenware. In the surrounding districts cattle and hogs are raised, and jerked beef, hides, pork, lard, potatoes, beans, *farinha de mandioca* (cassava flour), Indian corn, tobacco and a great variety of vegetables and fruits are produced.

The city was originally a German colony founded by the emperor Pedro I in 1824 and established at a place known as the *Féitoria Real de Cánhamo* (Royal flax factory).

SÃO LUIZ or in full, **SÃO LUIZ DE MARANHÃO**, a seaport of northern Brazil, capital of the State of Maranhão, on the W. side of an island of the same name, in lat. 2° 30' S., long. 44° 17' W. of Greenwich, about 300 mi. E.S.E. of Belém (Pará). Population of the *município* (1940) 86,546. An important part of the population is made up of the planters of the State, who live in town and leave their estates to the care of overseers. The island of Maranhão lies off the mouths of the rivers Mearim and Itapecuru, between the Bay of São Marcos on the W. and the Bay of São José on the E., and is separated from the mainland by a small channel called the *Canal do Mosquito*. It is irregular in outline, its greatest length from N.E. to S.W. being 34 mi., and its greatest breadth 19 miles. Its surface is broken by a number of low hills and short valleys. The city is built upon a tongue of land between two small estuaries, Anil and Bacanga, which unite and open upon the Bay of São Marcos. It covers two low hills and the intervening valley, the transverse streets sloping sharply to the estuary on either side. These slopes make it difficult to use vehicles in the streets, but they afford a natural surface drainage which makes São Luiz cleaner and more healthful than are usually the coast towns of tropical Brazil. The buildings are of the old Portuguese type, with massive walls of broken stone and mortar, having an outside finish of plaster or glazed tiles and roofs of red tiles. The principal public buildings are the cathedral, a large and severely plain structure, the Episcopal palace, the Carmelite church, the Government palace, town hall, custom-house, hospital and a number of asylums, convents and charitable schools. There are schools of law, pharmacy, agriculture and arts. Exports are mainly babassu nuts and cotton. Communication with the mainland is carried on by means of small steamers, and by a railway which crosses the eastern part of the state to Senador Furtado on the Parnaíba river opposite Teresina.

São Luiz was founded in 1612 by La Rivardière, a French officer commissioned by Henri IV. to establish a colony in this vicinity.

The French colony was expelled in 1615 by the Portuguese, who, in turn, surrendered to the Dutch in 1641. In 1644 the Dutch abandoned the island, when the Portuguese resumed possession and held the city to the end of their colonial rule in Brazil. The city became the seat of a bishopric in 1679.

SAONE (sôn), a river of E. France, 301 m. long, rising in the Faucilles mountains (Vosges), 15 m. S.W. of Épinal at a height of 1,300 ft. and uniting with the Rhône at Lyons. The name is derived from *Sauconna*, a 4th century name. Rising in the Vosges Hercynian massif, it meanders in the wide depression on Jurassic and Tertiary rocks between the Plateau of Langres, the Côte d'Or and the mountains of Charolais and Beaujolais on the west, and the western slopes of the Vosges and Jura and the plain of Bresse and the plateau of Dombes on the east. Near Allerey the Saône unites with the Doubs (left), which rivals it in volume and exceeds it in length at this point. At Chalon-sur-Saône it turns south, and passes Mâcon. Below Trévoux its valley narrows, winds past the Mont d'Or group and joins the Rhone at Lyons. The Saône is canalized from Corre to Lyons, a distance of 233 m.,

the normal depth of water being $6\frac{1}{2}$ feet. At Corre (confluence with the Coney) it connects with the Eastern canal, at Heuilly (below Gray) with the Saône-Marne canal, at St. Symphorien (above St. Jean-de-Losne) with the Rhône-Rhine canal, and at St. Jean-de-Losne with the canal de Bourgogne and at Chalon with the Canal du Centre. (See RHÔNE.)

SAÔNE-ET-LOIRE, a department of east-central France formed from the districts of Autunois, Brionnais, Chalonnais, Charollais and Mbonnais, previously belonging to Burgundy. It is bounded north by the department of Côte d'Or, east by that of Jura, south-east by Ain, south by Rhône and Loire, west by Allier and Nièvre. Pop. (1936) 525,676. Area, 3,331 sq.mi. The department extends down into the valley of the Loire on the west and into that of the Saône on the east, both with Pliocene deposits, from a high, but discontinuous, central north-to-south axis, stretching from the Côte d'Or (Jurassic) to the Beaujolais (largely granitic). The chief break in the highlands is used by the railway through the Charollais from Dijon through Beaune to Digoin on the Loire, and by the canal from Chalon-sur-Saône to Dijon. On the east the department extends beyond the Saône to include a large part of the region of Bresse which focuses chiefly on Chalon. The heights of the Morvan (2,959 ft. in the department) rise on the north-western border.

The average temperature at Mbcon (52° or 53° F), the most temperate spot in the department, is slightly higher than at Paris, the winter being colder and the summer hotter. At the same town the yearly rainfall is about 33 in., but both the rigour of the climate and the amount of rain increases in the hilly districts.

Agriculture prospers in Saône-et-Loire. Wheat, oats and maize are the chief cereals; potatoes, clover and other fodder, and mangold-wurzels are important, and beetroot, hemp, colza and rape are also grown. Excellent pasture is found in the valleys of the Saône and other rivers. The vine, one of the principal resources of the department, is cultivated chiefly in the neighbourhood of Chalon and Mâcon. Of the wines of Mbonnais, the vintage of Thorins is in high repute. The white Charollais oxen are one of the finest French breeds; horses, pigs and sheep are reared, and poultry farming is a thriving occupation in the Bresse. The industrial importance of the department is great, chiefly owing to its coal and iron mines; the chief coal mines are those near Creusot, Autun and Chapelle-sous-Dun. A pit at Epinac is over 2,600 ft. in depth. Iron is mined at Mazenay and Change, and manganese is found at Romanèche and there are quarries of various kinds. There are well-known warm mineral springs containing chloride of sodium and iron at Bourbon-Lancy. The iron and engineering works of Schneider and company at Le Creusot are the largest in France. The department also has many distilleries, potteries, porcelain-works (Digoin and Charolles), tile-works, oil-works and glass factories, and manufactures leather goods, esparto goods, sugar and fecula. Its commerce between the north and the midi is facilitated by navigable streams—the Loire, Saône, Doubs and Seille—the Canal du Centre, which joins Chalon-sur-Saône with Digoin on the Loire, and the canal from Roanne to Digoin and the lateral Loire canal, both following the main river valley. The chief railway of the department is the P.L.M.

Saône-et-Loire forms the diocese of Autun; it is part of the district of the VIII. army corps (Dijon); its educational centre is Lyons and its court of appeal that of Dijon. It is divided into 4 arrondissements—Mbcon, Chalon-sur-Saône, Autun, Charolles—51 cantons, and 590 communes. Mbcon, Chalon, Autun, Le Creusot, Cluny, Munteau-Les-Mines, Louhans, Charolles (*qqv.*) Tournus and l'aray-le-Monial, are the chief towns in the department.

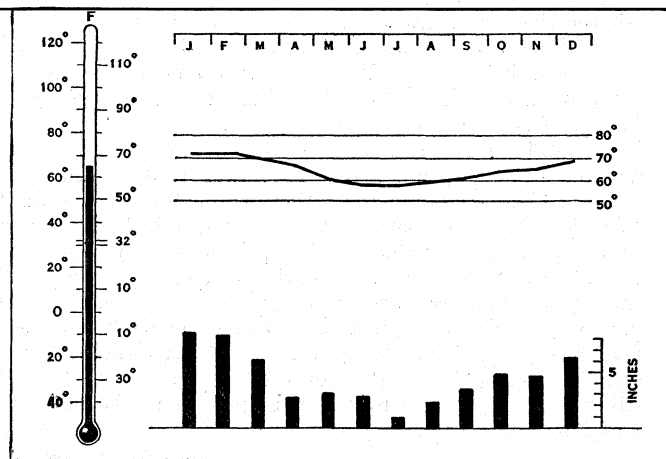

St. Marcel has a Romanesque church, once attached to an abbey where Abélard died; Anzy has a Romanesque church and other remains of an important monastery; Sully has a château of the 16th century; and Semur-en-Brionnais and Varennes-l'Arconce fine Romanesque churches. Prehistoric remains of the Old Stone Age have been found at Solutré near Mâcon, and have given the name *Solutrian* to a period of prehistoric time.

SÃO PAULO, a state of Brazil extending from $19^{\circ} 54'$ to $25^{\circ} 15'$ S. lat. and bounded north by Mato Grosso and Minas

Gerais, east by Minas Gerais, Rio de Janeiro and the Atlantic, south by the Atlantic and Paraná and west by Paraná and Mato Grosso. Pop. (1940) 7,239,711; area 95,459 sq.mi. The state has a coastline 373 mi. long, skirted closely by the Serra do Mar, below which is a narrow coastal zone broken by lagoons tidal channels and mountain spurs. Above is an extensive plateau, 1,500 to 3,000 ft. above sea level. Isolated ranges of low elevation break the surface in places, but in general the state may be described as a tableland with an undulating surface sloping westward to the Paraná. The extreme eastern part, however, has an eastward slope and belongs to the Paraiha basin. The state is traversed by a number of large rivers, tributaries of the Paraná, the largest of which are the Rio Grande, Peixe, Tieté, Agua-peí, Tigre and Paranapanema. The eastern slopes of the Serra do Mar are well wooded but there are wide grassy plains (*campos*) on the plateau. A large part of western São Paulo is still unsettled. The coastal zone has a hot climate, and it also has a heavy rainfall. On the plateau the rainfall is sufficiently abundant, but the air is drier and more bracing, the sun temperature being high and the nights cool. The open country is singularly healthful, but the river lowlands are generally not so.

The great industries are agricultural, and the most conspicuous is coffee production. São Paulo produces more than one-half the total Brazilian crop and its one great port, Santos, is the largest coffee-shipping port in the world. The *terra roxa* (red earth) lands of the central and northern parts of the state are peculiarly favourable. This soil is ferruginous, pasty and free from stone, and it covers the higher surface of the plateau with a thick layer. The best plantations are on the high divides between the river courses, and not in their eroded valleys. The disastrous effects of Brazilian coffee valorization during the '20s have been overcome to a large extent by adopting a "competition policy" and developing foreign markets through the activities of the Departamento Nacional do Café.

The other agricultural products of the State include sugar, cotton, rice, tobacco, Indian corn, beans, mandioca, bananas and other fruits, and many of the vegetables of the temperate zone. Cereals can be grown, but climatic conditions have been considered unfavourable. Sugar-cane was the first exotic to be cultivated

WEATHER GRAPH OF SÃO PAULO, BRAZIL. THE MERCURY IN THE THERMOMETER INDICATES THE NORMAL ANNUAL MEAN TEMPERATURE, THE CURVE SHOWS THE NORMAL MONTHLY MEAN TEMPERATURE, AND THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION

in São Paulo, and was its principal product in colonial times. Cotton was largely produced, especially during the American Civil War. The industry nearly disappeared, but now is again improving because of the demand for fibre by the national cotton factories. The cultivation of rice also is increasing, under the stimulus of protective duties. Although São Paulo is not classed as a pastoral region, the State possesses large herds of cattle, which are being improved by the importation of pure-bred stock from Europe. Butter and cheese are produced to a limited extent, and the supply of fresh milk to the cities is attracting some attention.

Attention is also given, to a limited extent, to the breeding of horses and mules. The most general and profitable of the animal industries is the breeding of swine, which thrive remarkably on the plateau. The state has an excellent agricultural school and experiment station at Piracicaba, and there is also a zootechnic station near the capital.

The principal manufactures are cotton and woollen textiles, jute bagging, *aramina* fabrics, furniture, iron and bronze, coffee machinery and agricultural implements, artificial liquors and food products. Steam power is generally used, though both electric and hydraulic power are employed. The iron mines and works at Ipanema, near Sorocaba, a government enterprise, are one of the oldest industries of the state, dating back to the first quarter of the 19th century.

São Paulo is well provided with railways, which include the pioneer line from Santos to Jundiá (an English enterprise) which has a double track from Santos to the city of São Paulo, the Paulista lines which are a continuation of the English line into the interior, the Mogiana lines running northward from Campinas through rich coffee districts to Uberaba in Minas Gerais and into Goiás, the São Paulo branch of the Central do Brasil line which passes through the eastern part of the state and provides communication with the national capital, the São Paulo and Rio Grande which crosses the states of Paraná, Santa Catarina and Rio Grande and connects with the railways of Uruguay, and the line from São Paulo to Puerto Esperança. The ports of the state are Santos, which is visited by large steamers in the foreign trade, and Cananéia, Iguape, São Sebastião and Ubatuba which are engaged in the coasting trade only. Cananéia and Iguape are chiefly known for the rice grown in their vicinity.

The capital of the state is São Paulo (*q.v.*) and its principal port and second city in importance is Santos (*q.v.*). The chief cities and towns, with populations in 1940 are as follows, the enumeration being for municipalities or parishes, including large rural areas and sometimes including separate villages: Campinas (*q.v.*); Guaratinguetá (29,660), on the Paraíba, 120 mi. E.N.E. of São Paulo; Piracicaba (77,576), 85 mi. N.W. of São Paulo; Limeira (45,257), in a fertile thickly-settled district; Rio Claro (47,718), 135 mi. N.W. of Santos, on a branch of the Paulista railway, in a fertile coffee-producing region, 2,030 ft. above the sea; Taubaté (41,179), one of the oldest cities of the state, on the Paraíba 80 mi. E.N.E. of the capital, in a rich agricultural district, with works for refining oil from the petroleum-bearing shales which are in the vicinity; Bragança (53,066), 50 mi. N. of São Paulo in a fertile country partly devoted to sugar production and stock; São José dos Campos (37,540); Tieté (26,205), on the Tieté river northwest of São Paulo; Pindamonhangaba (23,290), on the Paraíba river and Central do Brasil railway 105 mi. N.E. of São Paulo in a long settled district, 1,770 ft. above the sea, producing coffee, sugar, rice, Indian corn, beans, rum and cattle; Sorocaba (70,833), a prosperous manufacturing and commercial town on the Rio Sorocaba and Sorocabana railway, 50 mi. W. of São Paulo; Itú, or Ytú (26,909), about 70 mi. W.N.W. of São Paulo on the Tieté river and Ituana railway, with water power derived from the Salto (falls) do Itú, and with important manufactures; São Carlos (49,140); Casa Branca (22,288), in the northern coffee region; Paraíbauna (15,602); Pirassununga (23,093); Batatais (20,401); Franca (56,542); Jacareí (24,032); Botucatu (39,499); Jundiá (58,807), 86 mi. N. of Santos, an important manufacturing town and railway junction, 2,320 ft. above sea level; Ribeirão Preto (80,591), 197 mi. N. of Campinas on the Mogiana railway in a fertile coffee-producing region; Iguape (21,115), a port on the southern coast of the state, on a tide-water channel of sufficient depth for coastwise steamers, with exports of rice and timber; Lorena (15,569), 130 mi. N.E. of São Paulo, beautifully situated, 1,760 ft. above the sea, a station on the Central do Brasil railway, and the junction of a branch railway to the Campos do Jordão where the national government has established a military sanatorium because of its dry, bracing climate.

São Paulo was settled in 1532 by the Portuguese under Martim Afonso de Souza, who established a colony near Santos, at São Vicente, now an unimportant village. It was originally called the

capitania of São Vicente (organized 1534) and covered the whole of southern Brazil from Rio de Janeiro south. After the suppression of the captaincy grants, parts of this enormous territory were cut off from time to time to form other captaincies, from which developed the present states of Rio de Janeiro, Minas Gerais, Mato Grosso, Paraná, Santa Catarina and Rio Grande do Sul. In 1681 São Paulo succeeded São Vicente as the capital of the captaincy.

SÃO PAULO, a city of Brazil, capital of a state of the same name and seat of a bishopric, on the Tieté river 49 mi. by rail N.W. of the port of Santos and 308 mi. by rail W. of Rio de Janeiro. Pop. of the *município* (1940) 1,318,539. São Paulo is connected by rail with Santos, its port, with Rio de Janeiro and with other inland cities. In great part the city occupies an elevated open stretch of tableland commanding extensive views of the surrounding country; and a small part of it is in the low alluvial land bordering the Tieté. The upper part has several slight elevations forming healthful residential districts. The city is just within the tropics, but its elevation (2,500 ft. above the sea) gives it a temperate climate, bracing in the cool season and yet with high sun temperatures in summer. The city is singularly healthful. The streets are well paved and lighted with gas and electricity and have a good system of electric tramways. Excellent motor roads have been built out into the neighbourhood. The water supply is derived from the Cantareira hills, and there is a modern sewerage system. There are several excellent educational and scientific institutions among which are the Mackenzie college (an American school), a school of law, a Pasteur institute and a bacteriological institute. The city has a large Italian population and many Italian shops and industries. São Paulo was founded by the Jesuits under Manuel de Nobrega in 1554 and at first bore the name of Piratininga. In 1681 it succeeded São Vicente as the capital of the captaincy. The declaration of Brazilian independence occurred on Sept. 7, 1822, on the plain of Ipiranga, near the city, where a monument commemorates the event.

SÃO SALVADOR, Brazil: see SALVADOR.

SAPAJOU, an alternative name for the American capuchin monkeys (*q.v.*), comprising the genus *Cebus*. (See also PRIMATES.)

SAPAN or **SAPPAN WOOD**, a soluble red dyewood (Malay *sapang*), from a tree belonging to the leguminous genus *Caesalpinia* (*C. sappan*), a native of tropical Asia and the Indian archipelago. The wood is somewhat lighter in colour than Brazil wood and its other allies, but the same tinctorial principle, braziliin, appears to be common to all.

SAPARUA, the name of the chief island, and capital, of the Uliassers, a group of islands lying east of the island of Amboina, in the Moluccas. Japan occupied Saparuia in 1942.

SAPINDACEAE, a large family of dicotyledonous plants, with about 150 genera and 2,000 species, chiefly tropical, consisting of trees, shrubs and vines. The leaves are mostly alternate and compound, occasionally simple, while the flowers, mostly small, are irregular or unsymmetrical, mostly polygamo-dioecious, the fruits various. Important fruit trees include the litchi (*q.v.*) (*Litchi chinensis*), of China, longan (*Euphoria longana*) of China and India, the rambutan (*Nephelium lappaceum*) and palusan (*Nephelium mutabile*) of the Indo-Malayan region, the akee (*q.v.*) (*Blighia sapida*) of Africa, and others. The seeds of *Scheuchzeria oleosa* yield macassar oil, while the aril surrounding the seeds is edible. Other species yield important timbers, and the bark of still others is rich in saponin. The varnish tree (*Koeleruteria*) is widely cultivated in Europe and North America as an ornamental. See L. Radlkofer, "Sapindaceae," *Pflanzenreich* 98 (iv 165): 1-1539, fig. 1-45 (1931-33).

SAPOTACEAE, a family of tropical dicotyledonous plants, most of which are trees with leathery leaves. There are 35 genera and about 600 species, many of which are of economic importance as sources of gutta percha (*q.v.*), balata, shea butter, ironwood, etc. *Chrysophyllum cainito* is the West Indian star-apple. *Mimusops huberi* is the Brazilian milk-tree. *Achras zapota* of tropical America, cultivated in all tropical countries, yields the excellent fruit known as the sapodilla or naseberry, and the im-

portant chicle (*q.v.*), the basis of much chewing gum. *Lucuma nervosa* is the egg-fruit or canistel, of South America, now naturalized in Florida and the West Indies. The important commercial product gutta percha is chiefly derived from various species of *Palaquium* and *Payena* growing in the Malay peninsula and archipelago.

SAPPHIC METRE, certain forms of quantitative verse, named after their supposed originator, the Aeolic poetess Sappho (cf. **ALCAICS**). For two of her famous metres see **CHORIAMBIG VERSE**. Characteristic of all these metres is the emergence of a choriambus (- ~ ~ -), or perhaps a dactyl (- ~ ~), in the midst of what appears to be a series of feet of other lengths, especially trochees (- ~) (*q.v.*). The best-known employment of lines of this sort is in the Sapphic stanza, three Sapphic hendecasyllables followed by an Adonic, thus:

iām sātīs tērrīs nīvīs atq̄e dīraē
grāndīnīs mīsit̄ pāter̄ et̄ rubentī
dēxterā sācrās iaculātus arcēs
terrūit̄ urbem.

This is used occasionally in Latin by Catullus, frequently by Horace, who introduced some small modifications (fourth syllable always long, fifth syllable almost always the end of a word), and by later writers; in the Middle Ages it was much used for hymns, notably by Gregory the Great.

In modern languages, the Sapphic stanza has been imitated, sometimes with fair success, as by Swinburne:

Heard the flying feet of the Loves behind her
Make a sudden thunder upon the waters,
As the thunder flung from the strong unclosing
Wings of a great wind.

But it remains an exotic, not well suited to our methods of versification.

SAPPHIRE, a blue transparent variety of corundum (*q.v.*), or native alumina, much valued as a gem-stone. It is essentially the same mineral as ruby, from which it differs chiefly in colour which, normally, varies from palest blue to deep indigo, the most esteemed tint being that of the blue cornflower. Many crystals are parti-coloured, but by skilful cutting, the deep-coloured portion may be caused to colour the entire gem. As the sapphire crystallizes in the rhombohedral system it is dichroic, but in pale stones this character may not be well marked. In a deep-coloured stone the colour may be resolved, by the dichroscope, into an ultramarine blue and a bluish or yellowish green. In blue tourmaline and in iolite—stones sometimes mistaken for sapphire—the dichroism is much more distinct. The blue of sapphire has been referred to the presence of oxides of chromium, iron or titanium, whilst an organic origin has also been suggested. On exposure to high temperature, sapphires usually lose colour, but, unlike rubies, do not regain it on cooling. A. Verneuil succeeded in imparting a sapphire-blue colour to artificial alumina by addition of 1.5% of magnetic oxide of iron and 0.5% of titanous acid (*Comptes rendus*, Jan. 17, 1910). According to F. Bordas, sapphire exposed to the action of radium changes to green and then to yellow.

Under artificial illumination many sapphires appear dark and inky, and in some cases the blue changes to a violet. In spite of its hardness, which slightly exceeds that of ruby, it has been sometimes engraved as a gem.

Sapphires occur, with many other gem-stones, as pebbles or rolled crystals in the alluvial deposits of sand and gravel of Ceylon, the gem-gravel being known locally as *illam*. The principal localities are Ratnapura, Rakwana and Matara. Some of the slightly-cloudy Ceylon sapphires, usually greyish-blue, display when cut with a convex face a chatoyant luminosity, sometimes forming a luminous star of six rays, or "star-sapphires" (see **ASTERIA**). The asterism seems due to the presence of microscopic tubular cavities, or to enclosure of crystalline minerals, arranged in a definite system. In 1875 sapphires were discovered in deposits of clay and sand in Battambang (Siam), where they have been worked on a considerable scale; they occur also with rubies in the provinces of Chantabun and Krat. Many of the Siamese

sapphires are very dark, some being so deeply tinted as to appear almost black by reflected light. In Upper Burma sapphires occur in association with rubies, but are much less important (see **RUBY**), and they are also found in the Zanskar range, Kashmir, especially near the village of Soomjam, associated with tourmaline. Madagascar yields sapphires as rolled crystals generally of very deep colour. They are widely distributed through the gold-bearing drifts of Victoria, New South Wales and Queensland, but the blue of the Australian stones is usually dark, and it is notable that green tints are not infrequent. The Anakie sapphire-fields of Queensland are situated to the west of Emerald and east of the Drummond Range. Coarse sapphire is found in many parts of the United States, and the mineral occurs of gem quality in North Carolina and Montana. The great corundum deposits of Corundum Hill, Macon county, N.C., have yielded good sapphires, and they are found also at Cowee Creek in the same county. In Montana, sapphires were found in washing for gold in 1865, and have been worked on a large scale. The rolled crystals of sapphire occur, with garnet and other minerals, in glacial deposits, and have probably been derived from dikes of igneous rocks, like andesite and lamprophyre. They display much variety of colour, and exhibit peculiar brilliancy when cut, but are often of pale tints. The principal localities are at Missouri Bar, Ruby Bar and other places near Helena, where they were first worked, and also at Yogo Gulch, near Utica. The Helena crystals are of tabular habit, being composed of the basal pinacoid with a very short hexagonal prism, whilst at Yogo Gulch many of the crystals affect a rhombohedral habit. The Montana sapphires and the matrix have been described by Dr. G. F. Kunz, Professor L. V. Pirsson and Dr. J. H. Pratt (*Amer. Jour. Sc.*, ser. 4 vol. iv., 1897). The sapphire occurs also in Europe, being found in the Iserwise of Bohemia and in the basalt of the Rhine valley, Le-Puy-en-Velay in France, and in tholeiite intrusions in the island of Mull, but the European stones have no interest as gems.

SAPPHO (or as she calls herself **PSAPPHO**), the greatest poetess of Greece, was a native of Lesbos. In spite of her fame almost every detail in her history is doubtful. Only a few of the many and often conflicting statements made about her by ancient authors can be checked by her own writings. It would seem probable that she came of an aristocratic Mytilenean family (another account connects her with Eresus) and was born round about 600 B.C., so that she was contemporary with Pittacus and with the poet Alcaeus, with whom she may have exchanged verses. No less than eight versions of her father's name are recorded by Suidas, of which Scamandronymus, the form given by Herodotus (ii. 135), may be taken as the most acceptable. Her mother is said to have been named Cleis, and if the fragment *inc. lib.*, 17 is rightly ascribed, the statement is supported by the fact that her daughter also was a Cleis. There is more certainty about her brothers, or at any rate about two of the three, Charaxus and Larichus. She speaks of Larichus as being cupbearer, a position filled by youths of good family, and Charaxus (though not mentioned by name in the extant remains) is evidently the "brother" referred to in α 3. We learn from Herodotus and others that he sailed to Egypt and bought out a courtesan, Rhodopis or Doricha, for which Sappho attacked him. α 3 seems to be a prayer for his safe return from overseas and a reconciliation with his sister and α 4b perhaps contained a prayer that Doricha may not entangle him again. The poetess's family is of less interest than the pupils, friends and rivals with whom we meet repeatedly in the fragments of the poems, with their references on the one hand to Atthis, once loved but now estranged, Anactoria, gone far away, Dica, "lovelier than soft Gyriuno," on the other to Andromeda, who stole Atthis away, Gorgo and others. In α 11 there seems to be a hint of some enmity towards the house of Penthilus, with which Pittacus was connected by marriage, but it happens most frequently that where we have names the thought cannot be followed far, and that in the longer pieces, where affection is most touchingly, or distaste most cuttingly expressed, no names have survived. Apart from the relations just referred to we know next to nothing of the life of Sappho. She is said to have been banished, like other aristocrats, and to have gone to Sicily, but this flight has left no trace in the

remains unless the reference to Aphrodite of Panormus in *ἀ7 App.* be such. As for the story of her passion for Phaon and her leap from the Leucadian rock, it bears every sign of being pure fiction. There are two references to the advance of old age; we cannot tell whether her own or another's. Of the end of her life we know nothing at all.

Sappho's poems are said by Tullius Laurea to have been arranged in nine books. Suidas says there were nine books of lyrical poems, but epigrams, elegeia, etc., besides. The author of *P. Oxy.* 1300, also counts a separate book of elegeia, but his figure for the books of lyrical poems is lost. From the fragments we know of only eight books of lyrical poems. It appears that these books were, as far as possible, arranged according to metre (Bk. 1, for instance, containing only pieces in the so-called Sapphic stanza, and so on), but in the case of one book (the *Epithalamia*, perhaps *Rk. 8*) according to subject. The language seems to be no literary dialect, but the ordinary speech used by the contemporaries of the poetess, and so to differ in a greater or less degree from almost all the other Greek poetry that has come down to us. The conjunction of extreme simplicity of language with intensity of emotion, from which the poetry derives its peculiar effect, as well as the perfection of the form, has hitherto completely baffled translators, Swinburne among the rest.

Until comparatively recent times the poetry of Sappho survived only in the quotations made by ancient authors. The number of the fragments thus preserved was not inconsiderable, but their text was often seriously depraved, and, with two exceptions—the complete or nearly complete poems cited by Dionysius of Halicarnassus "Longinus"—their extent was insignificant. Within the last 50 years, however, there have been recovered from the soil of Egypt papyrus rolls and vellum codices, written at dates ranging from the 2nd to the 6th or 7th centuries A.D., which contain authentic texts of Sappho, terribly mutilated indeed, but remarkable for the integrity of their tradition. These remains are now preserved in Oxford, Berlin, London, Florence, Halle and Graz, and photographic facsimiles of parts of them may be seen in the publications of the Egyptian Exploration Society, the Berlin academy, the Società Italiana and the Graeca Halensis. Of the older editors, who were concerned only with the quotations, none but Bergk need be mentioned (*Poetae Lyricae Graecae*, 4th ed., Leipzig, 1882). Those who have done most for the editing and interpretation of the book texts are Professors W. Schubart and U. von Wilamowitz Moellendorff in Germany and A. S. Hunt in England. The only complete collection of all the known material is in *Σαπφούς μέλη* (Oxford, 1925), by E. Lobel, but a reference may be made to Diehl's *Anthologia Lyrica*, iv. (Leipzig, 1923), though the text is uncritical and much of the illustrative material irrelevant. In the introductions to *Σαπφούς μέλη* and its companion volume *Ἀλκαίου μέλη* (Oxford, 1927), will be found an attempt to establish the proper method of constituting the text. There is an article on Sappho by W. Aly in Pauly-Wissowa, *Realencyklopädie*, which collects the material for the life work of the poetess, but its conclusions should be treated with caution.

SAPPORO, the official capital of the island of Yezo, Japan, situated in 43° 4' N. and 141° 21' E. Pop. (1940) 206,103. It was chosen in 1870, and owed its prosperity at the outset chiefly to the public institutions established by the Japanese government in connection with the colonization bureau, which had for its object the development of the resources of Yezo. It is now a garrison town and has an agricultural college, a museum, saw-mills, flour-mills, breweries and hemp and flax factories.

SAPROPHYTES, the name given in botany to plants which

grow upon decaying organic matter, the products of the decay of which they absorb. Many fungi (*q.v.*) are saprophytic, as are some orchids (*q.v.*) and other flowering plants.

SAPRU, SIR TEJ BAHADUR (1875–), Indian jurist and politician, was a Kashmiri Brahmin born on Dec. 8, 1875. He was a successful advocate of the high court of Allahabad from 1896; a member of the United Provinces legislative council (1913–16); and a member of the Imperial legislative council (1916–20). When the Montagu-Chelmsford reforms were under consideration he served on Lord Southborough's committee to define the functions of the central, and the two sides of the provincial governments under the dyarchical scheme, and he was a member of the Moderate deputation which supported the reforms before the joint committee of both houses of parliament in 1919. He had long been connected with the Indian national congress, and when the Liberal wing broke away in 1919–20 he became president of the United Provinces Liberal League. In Dec. 1920 he was appointed law member of the governor general's executive council, but resigned to resume his practice in February 1923. Later in the year he was a representative of India at the Imperial conference in London. A member of the Reforms Inquiry committee set up on a vote of the legislative assembly in 1924, he encouraged a large portion of the Liberal wing to join hands with the Congress party in active promotion of the boycott of the statutory commission under Sir John Simon. A man of great gifts of expression, he had a leading share in the drafting of the "Nehru Report" of the so-called All-Parties Conference formulating a scheme of Dominion self-government for India approved at a conference held at Lucknow in August 1928. He was active in the promotion of education and was a member of the Benares Hindu university court, senate and syndicate. (F. H. BR.)

SAPSUCKER, the name given to American woodpeckers of the genus *Sphyrapicus*; there are three North American species—*S. varius*, the yellow-bellied sapsucker of eastern U.S.A.; *S. ruber*, the red-breasted sapsucker, and *S. thyroideus*, the Williamson sapsucker, the two latter inhabiting the western mountain ranges of Canada and U.S.A. All species have a habit of girdling trees with rows of holes. *S. ruber* has head and breast a dull red; this tint is confined to the head and (in the males) throat in *S. varius*, and to the throat alone in the male *S. thyroideus*, which has the belly bright yellow.

SÁPULPA, a city of north-eastern Oklahoma, U.S.A., on Federal highways 66 and 7j; the county seat of Creek county. It is served by the Frisco and the Oklahoma Union railways. The population was 11,634 in 1920 (85% native white and 11% negroes) and was 12,249 in 1940 by the federal census. It is in one of the principal oil and gas producing areas of the Mid-Continent Field. The city was founded in 1888 and incorporated in 1898. Since 1922 it has had a commission-manager form of government.

SARABAND, a slow dance, generally believed to have originated in Spain in the earlier half of the 16th century. The most probable account of the word is that the dance was named after Zarabanda, a celebrated dancer of Seville. Its music is in triple time, generally with three minims in the bar. Many examples occur in the Suites and Partitas of Handel and J. S. Bach.

SARACENS, the current designation among the Christians in the middle ages for their Muslim enemies, especially for the Muslims in Europe. In earlier times the name *Saraceni* was applied by Greeks and Romans to the nomad Arabs of the Syro-Arabian desert who harassed the frontier of the empire. *Σαρακηνή*, being a district in the Sinaitic peninsula (Ptolemy v. 16).

SARAGOSSA (*Zaragoza*), an inland province of northern Spain, one of the three into which Aragon was divided in 1833; bounded on the north by Logroño and Navarre, north-east and east by Huesca, south-east by Lérida and Tarragona, south by Teruel and Guadalajara and west by Soria. Pop. (1939) 573,561; area, 6,726 sq.m. Saragossa belongs wholly to the basin of the Ebro (*q.v.*). The main valley is bounded on the south-west by the Sierra de Moncayo (with the highest elevation 7,707 ft.).

Saragossa is traversed by the Ebro Valley Railway, which connects Miranda with Lérida, Barcelona and Tarragona, and has a branch to Huesca; it also communicates via Calatayud with

Madrid and Sagunto; and there are local lines to Cariñena (south-west from Saragossa) and to Tarazona and Borja (near the right bank of the Ebro). The only towns with over 5,000 inhabitants are Saragossa (1940: 202,160) (*q.v.*); Calatayud (1930: 15,168) (*q.v.*); Tarazona (9,605), an episcopal see, with a curious 13th-century cathedral; Caspe (9,924); Egea (7,800); Tauste (6,182); Épila (5,680); Alagón (5,213); and Borja (5,013). (On the inhabitants and history of this region, see ARAGON.)

SARAGOSSA (*Zaragoza*), the capital of the Spanish province of Saragossa and formerly of the kingdom of Aragon, seat of an archbishop, of a court of appeal, and of the captain-general of Aragon; on the right bank of the river Ebro, 212 mi. by rail N.E. of Madrid. Pop. (1940) 202,160. Saragossa (Celtiberian, *Salduba*) was made a colony by Augustus at the close of the Celtiberian War (25 B.C.), and renamed Caesarea Augusta or *Caesaraugusta*, from which "Saragossa" is derived. Under the Romans it was the chief commercial and military station in the Ebro valley, and the seat of one of the four conventus *juridici* (assizes) of Hither Spain. It was captured in 452 by the Suebi, and in 476 by the Visigoths, whose rule lasted until the Moorish conquest in 712, and under whom Saragossa was the first city to abandon the Arian heresy. In 777 its Moorish ruler, the viceroy of Barcelona, appealed to Charlemagne for aid against the powerful caliph of Cordova, Abd-ar-Rahman I. Charlemagne besieged the Cordovan army in Sarkosta, as the city was then called; but a rebellion of his Saxon subjects compelled him to withdraw his army. The Moors were finally expelled by Alphonso I. of Aragon in 1118, after a siege lasting nine months. As the capital of Aragon, Saragossa prospered greatly until the second half of the 15th century, when the court was transferred to Castile.

In 1710 the allied British and Austrian armies defeated the forces of Philip V. at Saragossa in the war of the Spanish Succession; but it was in the Peninsular War (*q.v.*) that the city reached the zenith of its fame. An ill-armed body of citizens, led by José de Palafox y Melzi (see PALAFOX), held the hastily-entrenched city against Marshal Lefebvre from June 15 to Aug. 15, 1808. The siege was then raised in consequence of the reverse suffered by the French at Bailén (*q.v.*), but it was renewed on Dec. 20 and on the 27th of January the invaders entered the city. Even then they encountered a desperate resistance, and it was not until Feb. 20 that the defenders were compelled to capitulate. Thousands of people perished in the city, largely through famine and disease. Among the defenders was the famous "Maid of Saragossa," Maria Agustin, whose exploits were described by Byron in *Childe Harold* (1, 55 sqq.). During the civil war of 1936-39, Saragossa was captured by the Nationalists.

Saragossa is an important railway junction; it is connected by main lines with Valladolid, Madrid and Valencia in the west and south, and by the Ebro Valley railway with Catalonia and the Basque provinces; also with France, via the Somport tunnel and with the northern districts of Aragon and Cariñena on the southwest. The city is built in highly cultivated land, irrigated by a multitude of streams which distribute the waters of the Imperial canal, and surrounded by an arid plain exposed to the sweep of violent gales which blow down, hot in summer and icy in winter.

One of its two stone bridges, the seven-arched Puente de Piedra, dates from 1447; there is also an iron bridge for the railway to Pamplona. The two most important buildings of Saragossa are its cathedrals, to each of which the chapter is attached for six months in the year. La Seo ("The See") is the older of the two, dating chiefly from the 14th century; its prevailing style is Gothic, but the oldest portion, the lower walls of the apse, is Byzantine. The Iglesia Metropolitana del Pilar is the larger building, dating only from the latter half of the 17th century; it was built after designs by Herrera el Mozo, and owes its name to one of the most venerated objects in Spain, the "pillar" of jasper on which the Virgin is said to have alighted when she manifested herself to St. James as he passed through Saragossa. The university was founded in 1474.

SARAJEVO (*sah-rah'yā-vō*), capital of Bosnia, Yugoslavia. Pop. (1931) 78,182, chiefly Serbo-Croatians. It lies in a fine situation in a valley 1,800 ft. above sea-level.

Though it is still half Oriental, and wholly beautiful with its hundred mosques, its ancient Turkish bazaar, picturesque wooden houses, and cypress groves, it was largely rebuilt after western fashion in 1878. Sarajevo is the seat of a Roman Catholic bishop, an Orthodox metropolitan, the highest Moslem ecclesiastical authority, and the supreme court. Notable in the town are the Begava *Djami* (Džamija), or mosque of Husref Bey, founded in 1465, and among the three most beautiful mosques in Europe, the Roman Catholic and Orthodox cathedrals, the hospitals, the town hall, the museum, the State-maintained Scheriat school for Moslem law students; a gymnasium; secondary schools; a technical institute and a teachers' training college. Near the picturesque bazaar is the oldest church in Bosnia, containing a 14th century picture of the Virgin, venerated throughout the kingdom. The industries include potteries, silk, and flour mills, a sugar beet factory, timber, and, under State control, a brewery, tobacco, embroidery and carpet factories, a model farm, a bee-keepers' association, a stud farm and a race course. Weaving on hand looms is an important industry.

Founded in 1262 by the Hungarian general Cotroman, under the name of Bosnavar or Vrhbosna, Sarajevo was enlarged two centuries later, and takes its name from the palace (Turkish, *serai*) which he founded. During the wars between Turkey and Austria, its ownership was often contested; and it fell before King Matthias I. of Hungary in 1480, and before Prince Eugene of Savoy in 1697. Destructive fires laid it waste in 1480, 1644, 1656, 1687 and 1789. It was chosen as the seat of Turkish government in 1850 instead of Travnik. In 1878 it became the seat of the Austro-Hungarian administration of Bosnia-Hercegovina and subsequently of the Bosnian Diet. Under Austrian rule it was largely modernized, but the schools now established also served as a focus of Serb nationalist feeling. Students at Sarajevo perpetrated the murder of the Archduke Francis Ferdinand (*q.v.*) which led to World War I. As the Archduke motored from manoeuvres to a gala lunch in the city a bomb was thrown unsuccessfully in the suburbs. The fatal shots were fired as the Archduke's car reversed out of a narrow street leading off the quays, opposite the chief bridge. In Nov. 1918 the diet at Sarajevo proclaimed union with Yugoslavia.

Sarajevo became for a few days in April 1941 the seat of the Yugoslav government in retreat and was then incorporated into the Italian "protectorate" of Croatia.

SARAKOLLE. A tall, long-headed, dark-skinned, prognathous people with coarse features and broad noses, in Sénégal, Mauritania and the French Sudan, who speak a much-debased Mandinga dialect, and claim a white ancestry, their forbears having once ruled over the Gana empire. Their villages are grouped in confederations under a paramount chief (Tunka). Formerly the extended family group was everywhere the social unit and marriage was endogamous and restricted to the village and the same caste; it is still restricted to the same caste but may be contracted outside the village. Betrothal, dowry and dower are all customary, and the first wife has authority over the rest and may own personal property and freely dispose of it. Descent is patrilineal, and inheritance is according to the Malekite code. The caste system consists of three distinct castes: (a) free-men; (b) artisans (smiths, shoemakers, fiddlers and grzots); (c) descendants of slaves.

See Saint-Père, *Les Sarakolle du Guidimaka* (1925).

SARAN, a district of British India, in the Tirhut division of Behar and Orissa. Area, 2,683 sq.m. Pop. (1931) 2,486,468. It is a vast alluvial plain with a general inclination towards the south-east, as indicated by the flow of the rivers in that direction. The principal rivers, besides the Ganges, are the Gandak and Gogra, which are navigable throughout the year. The district has long been noted for its high state of cultivation and dense population. It yields large crops of rice, besides other cereals, pulses, oil seeds, poppy and sugar-cane.

The indigo industry, formerly of the first importance, has declined, and sugar refining has in great part taken its place. The production of saltpetre is an industry of some importance. Saran is exposed to drought and flood. It suffered from famines in 1874

and 1897, and from floods in 1921, when 20 inches of rain fell in a single night. A scheme for irrigation from the river Gandak, started in 1878, proved a failure, after a capital expenditure of Rs. 7,000,000 and the canals have long been closed to irrigation. At Manjhi there are the remains of a fort, with ramparts still 30 ft. high, which date back to about the 6th century A.D. The administrative headquarters are at Chapra (pop. 42,415).

SARANAC LAKE, a village of north-eastern New York, U.S.A., in the Adirondack mountains, near Lower Saranac lake, on the boundary line between Essex and Franklin counties; served by the Delaware and Hudson and the New York Central railways. Pop. (1940) 7,138 by federal census. It is a summer and a winter resort, for both health and pleasure. Near the village, at an altitude of 1,650 ft., is the Trudeau sanatorium, founded in 1884 as the Xdirondack Cottage sanatorium by Dr. Edward L. Trudeau (1848-1915), the first semi-charitable institution in America for the open-air treatment of early tuberculosis. Dr. Trudeau, attacked by tuberculosis soon after beginning practice in New York city in 1872, had gone to the Adirondacks to die in a place he loved, but before the first winter was over was surprised to find his health greatly improved. He stayed on, making Saranac Lake his home for the remaining 40 years of his busy life, and out of his personal experience developed a method of treatment which has had a wide influence. The sanatorium has grown to a small village in itself, and Saranac Lake has become a resort for private patients. Within ten years not one in 20 of the applicants could be received. Robert Louis Stevenson spent the winter of 1887-88 at Saranac Lake, under Dr. Trudeau's care, writing some of his finest essays while there. In 1894 Dr. Trudeau established the Saranac laboratory for research in tuberculosis (the first of its kind in America) and after his death an endowment was raised for it (under the name of the Trudeau Foundation) as a memorial to him. In 1916 the Trudeau School of Tuberculosis was opened (also the first institution of its kind) to give specialized instruction in the diagnosis and treatment of the disease to practising physicians. The village of Saranac lake was incorporated in 1892, and now has accommodations for an average of 1,500 patients. Other institutions in the vicinity are the New York State sanatorium (1904), the Stony Wold sanatorium (1903), Sanatorium Gabriels (1897) and the National Vaudeville Artists' sanatorium, which together have a capacity of 675 beds.

SARAPUL, a town of North Russia, in the Uralsk Area on the river Kama, in 56° 32' N., 53° 45' E. Pop. (1926) 24,959. It is the centre for an agricultural district, and has oil-pressing, rope-making, brewing and leather industries. Like other towns in the Uralsk Area, it depends on Asiatic Russia for a market for its manufactured products.

SARASATE Y NAVASCUES, PABLO MARTIN MELITON DE (1844-1908), Spanish violinist, was born at Pamplona on March 10, 1844. At the age of 12 he began to study under Alard at the Paris conservatoire. His first public appearance as a concert violinist, was in 1860. He paid the first of many visits to London, where he enjoyed great popularity, in 1861, and in the course of his career he visited all other parts of Europe and also both North and South America. He was one of the first and most fascinating violinists of modern times, his playing being remarkable equally for purity and sweetness of tone, and for facility of execution. He died at Biarritz on Sept. 20, 1908.

SARASIN or **SARRAZIN, JEAN FRANÇOIS** (1611?-1654), French author, son of Roger Sarasin, treasurer-general at Caen, was born at Hermanville near Caen. He was on terms of intimate friendship with Scarron, with whom he exchanged verses, with Ménage, and with Pellisson. In 1639 he supported Georges de Scudéry in his attack on Corneille with a *Discours de la tragédie*. He accompanied Léon Bouthillier, comte de Chavigny, secretary of state for foreign affairs, on various diplomatic errands until 1643-44. He joined in the pamphlet war against Pierre de Montmaur, against whom he directed his satire, *Bellum parasiticum* (1644). He was accused of writing satires on Mazarin, and for a short time gave up the practice of verse. In 1648 he entered the household of Armand de Bourbon, prince de Conti, whose marriage with Mazarin's niece he helped to negotiate. He died at

Pézénas, on Dec. 5, 1654. The most considerable of his poems were the epic fragments of *Rollon conquérant, la guerre espagnole*, with *Dulot vaincu* and the *Pompe funèbre* in honour of Voiture. As a poet he was overrated, but he was the author of two excellent pieces of prose narration, the *Histoire du siège de Dunkerque* (1649) and the unfinished *Conspiration de Walstein* (1651).

His *Oeuvres* appeared in 1656, *Nouvelles Oeuvres* (2 vols.) in 1674. His *Poésies* were edited in 1877 by Octave Uzanne with an introductory note. Much of his correspondence is preserved in the library of the Arsenal, Paris. See Albert Menning's *Jean François Sarasins Leben und Werke* (2 vols., Halle, 1902-04).

SARASOTA, a city on the west coast of Florida, U.S.A., 53 m. S. of Tampa; the county seat of Sarasota county and one of the most charming resorts of the state. It is on federal highway 41 and the Tamiami trail; has a municipal airport, a deep-water harbour and municipal docks; and is served by the Atlantic Coast Line and the Seaboard Air Line railways. Pop. 8,398 in 1930; in 1940, 11,141 by the federal census. The city lies on the east shore of Sarasota bay, connected by causeways with long palm-studded keys to the west (St. Armand, Longboat and Lido). The assessed valuation in 1940-41 was \$14,832,678. Sarasota was founded in the early '80s by a Scotch syndicate of which Sir John Gillespie was president. In 1885 his son, J. Hamilton Gillespie, laid out there the first golf course in America.

SARASWATI, a river in the Punjab frequently mentioned in the *Rig-Veda*. Its meaning "abounding in pools" suggests that it was even at that early period a larger river than now. It is lost in the desert sands towards Rājputāna. Corresponding phonetically to the Iranian *Harāqaiti* (the modern Helmand), the name may have been applied to the Indus by the invading Aryans before they reached the eastern Punjab, but it soon ceased to refer to that river. As the Sarsūti, its present name, it joins the Ghaggar, the dry bed of the Hakra, the lost river of the Indian desert which can still be traced to its junction with the Indus. With the Drishadwati the Saraswati formed the west boundary of Brahmarvarta, and was the holy stream of Vedic India. As "fluent" it became the personified goddess of eloquence, learning and wisdom, wife of Manu, mother of the *Vedas*, and a daughter of Brahma. From her the Sarsūt Brahmans (*q.v.*) claim their name. Another Saraswati, in Guzerāt, also loses itself in the sand.

See A. A. Macdonell and A. B. Keith, *Vedic Index* (1912); A. A. Macdonell, *Vedic Mythology*, and E. W. Hopkins, *Epic Mythology*, Strassburg (1897 and 1915).

SARATOGA, BATTLES OF. The plan of campaign for the British in America in 1777 sought to isolate New England by occupying the Hudson valley. Burgoyne, the author of the plan, coming down from Canada via Lakes Champlain and George, was to meet Howe, marching up from New York, at Albany. A third, but much smaller force, under St. Leger, was to advance from Oswego down the Mohawk valley and join the other two columns. The plan failed because Howe, the British commander-in-chief, marched on Philadelphia—Germaine, the secretary of State, having failed to give him definite instructions. Burgoyne, with about 8,000 men, including seven regiments of British regulars and 3,000 Germans, reached Ticonderoga (July 1), which was evacuated by its weak garrison (July 6). He reassembled his army after the pursuit at Skenesborough and marched through the woods and swamps to Fort Edward, which was evacuated by the American commander, Schuyler, who retreated across the Hudson to Stillwater, 30 m. above Albany (July 31). The march was most laborious, involving the construction of 40 bridges, and necessitated a long halt at Fort Edward. Burgoyne should have taken his army back to Ticonderoga, and transferred it to Fort George, where a direct road led to Fort Edward. Had he taken this route, it is reckoned that he might have reached Albany by the 16th.

A German detachment, on the advice of "Colonel" Skene, who was also responsible for the recent march, was sent to Eenington to seize horses and supplies, but was surrounded and almost annihilated by the Green Mountain Militia, under John Stark (Aug. 16). Burgoyne now became uneasy; he had left nearly 1,000 men to garrison Ticonderoga; he had heard from Howe of his intention to invade Pennsylvania; and St. Leger was held up

before Fort Stanwix (actually St. Leger retreated Aug. 22). But he considered himself bound by his orders to press on to Albany. Having collected 30 days' rations, he crossed the Hudson (Sept. 13) and encamped near Saratoga. The Englishman, Gates, who had displaced Schuyler in command (Aug. 19), was encamped 4 m. away, on Bemis's Heights, with 12,000 men and was daily receiving reinforcements. Burgoyne advanced to the attack (Sept. 19). But Arnold came out with 3,000 men to meet him at Freeman's Farm. After 4 hours' fierce fighting Arnold retired, and Burgoyne encamped on the battlefield, but he had lost over 500 men, including a large number of officers, victims of Morgan's sharpshooters. Burgoyne heard (Sept. 21) from Clinton, who had been left in command at New York, that he was about to make a diversion up the Hudson. He sent a despatch to Clinton (Sept. 27) asking for orders. The answer was never received. Clinton started with a small force (Oct. 3) and captured two forts on the west bank, but he never had any intention of penetrating to Albany.

Burgoyne had now under 5,000 "effectives" left, and his supplies were running short. He reckoned that they might last till the 20th. He led out 1,500 men on reconnaissance (Oct. 7), but the Americans made a fierce counter-attack, and led by Arnold, inflicted a severe defeat upon the British army. Next day Burgoyne began his retreat, but Gates, with 20,000 men, surrounded him at Saratoga. Burgoyne opened negotiations on the 14th and the Convention of Saratoga was signed (Oct. 17), Burgoyne insisting that it was not a capitulation, and finding a precedent in the Seven Years' War.

See F. J. Hudleston, *Gentleman Johnny Burgoyne* (1928).

SARATOGA SPRINGS, a city of Saratoga county, New York, U.S.A., 30 m. N. of Albany and 12 m. W. of the Hudson river; served by the Boston and Maine and the Delaware and Hudson railways. Pop. 1940, 13,705 federal census. The city is in a region of great historic interest, and has been famous for its medicinal mineral springs since colonial days. It is a pleasure resort in summer, a health resort at all seasons, and is the seat of Skidmore college for women (1911). Adjoining the city is "Yaddo," the beautiful estate of Katrina Trask (Mrs. George Foster Peabody), which since her death in 1922 has been made a summer retreat for a limited number of painters, writers and other creative artists. Saratoga lake (6 m. long) is 3 m. S.E. of the city. The August races of the Saratoga Association for the Improvement of the Breed of Horses (organized 1863) draw a brilliant attendance. Among the long established hotels are the United States (800 rooms) and the Grand Union (900 rooms). The Convention hall seats 5,000. The 122 springs (heavily charged with carbonic acid gas and containing in varying proportions bicarbonates of lime, sodium, magnesium, chloride of sodium and other minerals) are in a reservation of 1,100 ac., owned and controlled by the State. The State bath houses have a capacity of about 5,000 treatments daily, and the bottling plant can fill 6,000,000 pint bottles in a year. The therapeutic value of the springs was known to the Indians, and the Saratoga country was a favourite summer camping ground of the Iroquois. It became a theatre of hostilities between the French and English colonists and their Indian allies. In 1693 a French expedition was checked in a sharp conflict near Mt. McGregor by an English and colonial force. In 1745 the settlement on the Hudson directly east of the present city of Saratoga Springs (called Saratoga at first, later Old Saratoga and now Schuylerville) was attacked by French and Indians, who massacred many of its inhabitants. The battles of Saratoga (*q.v.*) in the Revolutionary War were fought at Bemis Heights, 12 m. S.E. of Saratoga Springs. Most of the battlefield has been acquired by the State of New York, and Congress in 1926 authorized making it a national military park. The first white man known to have benefited from the Saratoga waters was Sir William Johnson, whose Indian friends carried him to the springs in 1767. A log house for the lodging of visitors was built in 1771; in 1783 Gen. Philip Schuyler and his family camped at the springs through the summer; in 1791 Gideon Putnam bought a large tract of land and put up the first inn; and in 1793 Dr. Valentine Seaman published a book about the waters which spread the knowledge of their curative properties.

Other hotels (large barn-like wooden structures) were built early in the 19th century, and by 1820 the Springs had become a popular resort. The Civil War brought depression, and cut off the patronage from the South; but soon afterwards, with the establishment of the races and the rebuilding of the United States hotel, it again became popular, and in the 1870's and '80s was one of the most fashionable watering-places of America ("the Queen of Spas"). Commercial exploitation of the springs (bottling the water and liquefying the carbonic acid gas) diminished their flow until they almost disappeared, and the resort was again depressed until the State intervened, first prohibiting the pumping and later acquiring the property (1909) and placing it in charge of the conservation commission (1916). Under State management the flow and mineral strength of the springs have been restored, and the patronage has increased tenfold in a decade. Saratoga Springs was incorporated as a village in 1826 and as a city in 1915.

SARATOV, a province of Russia, much smaller than the former Saratov province, lying on the right bank of the Volga river, with Ulianovsk and Penza on the north, Tambov on the west, Stalingrad on the south, and the German Volga republic and Samara on the east. Its area is 90,863 sq.km. and its population 2,891,404, almost entirely agricultural. A small portion of it, the Novo-Uzensk district, lies east of the German Volga republic. The province occupies the eastern part of the great central plateau of Russia, which slopes gently to the south until it merges imperceptibly into the steppe region; its eastern slope, deeply cut into by ravines, falls abruptly to the Volga. The higher parts range from 700 to 900 ft. above the sea, while the Volga flows at an elevation of 20 ft. only at Khvalynsk in the north, and thus the river banks have a hilly appearance.

Every geological formation from the Carboniferous to the Miocene is represented, though the older formations are concealed under Cretaceous deposits of fossiliferous marls, flint-bearing clays and iron-bearing sandstones. The boulder clay of the Finland and Olonets ice sheets penetrates into the east of the province, and loess and other post-glacial deposits are found in the south-east. Iron-ore is abundant and chalk, lime and white pottery clay are obtained in some parts.

The province is comparatively well drained, the upper course of the Sura, a tributary of the Volga, lies in the north and the upper Medvedyitsa and Khover flow south and drain into the Don. They are navigable in spite of their shallows, and ready-made boats are brought in pieces from the Volga, and put together on their shores. The forest has almost disappeared; houses are made of clay and dung is used for fuel.

The climate is severe and continental, with a recorded range of temperature of 119° F in some parts; at Saratov the average January temperature is 12.4° F, the average July temperature 71.5° F. The Volga at Saratov is frozen for 162 days in the year. Rainfall is scanty and irregular, varying between 8 and 16 in. in normal years and much less in drought years, the rain falling mainly in spring and early summer. The region is arid and rapid desiccation is progressing. In the north and west are sandy black-earth soils, interspersed with dark grey forest lands and grey wooded clays (Vol'sk, Khvalynsk, the northern part of Petrovsk). In Petrovsk, Serdobsk, Atkarsk and Balashov counties are clayey black-earths, while Balashov contains a strip of rich black-earth with a high humus content, but even here there are patches of salt land and salt marshes.

The yield of the soil in Saratov province has become stabilized at a low level because although the soil contains about 6-10% of humus, its friability disappears after a few years of persistent planting with cereals. The great variability of crop yield, sometimes so low as to reduce the district to starvation (*e.g.*, in 1921), and the appearance of salting indicate the need for more intensive methods of agriculture. Attempts are being made to increase the friability of the soil, to put large areas under grass for several years, and to introduce plough culture and better types of crop rotation, with less fallow, and to introduce the sowing of the more drought resisting types of grain. Marmots, mice and insects are great pests to agriculture. Experimental stations have been

established at eight points and the agronomical faculty of the University of Saratov has an experimental institute. In the Novo-Uzensk district east of the German Volga republic the soil and drought problem is even more acute; here are light brown and brown clayey soils, with some chestnut brown soil and sands and salty areas. In good years crops are successful, in drought years famine is severe. For 50 years the peasants here have been practising a form of irrigation and plans are now in hand foragoon irrigation of an extensive area above the town of Novo-Uzensk and near the settlement of Alexandrov-Gai, utilizing the waters of the Great Uzen.

Winter rye is the main crop, summer wheat, millet, oats and sunflower seed come next and potatoes are increasingly grown. Barley forms a very small percentage of the harvest. The province has not yet recovered from the terrible 1917-21 years, though conditions have improved rapidly in the last two or three years. There is a fair amount of stock raising in the district, sheep and working cattle occupy the first place and horses and pigs are also bred, but on the whole this is a diminishing industry. Cucumbers, melons, water-melons, and vegetables are grown around Saratov, Volsk, Atkarsk and Kamyshin, and in the Novo-Uzensk district. Beetroot cultivation is increasing.

Poultry raising of an export character is carried on, but dairy produce is not much developed. Fishing and the preparation of caviare are important at Kamyshin. A more intensive development of cattle breeding for meat and dairy purposes would lead to greater development of local production of bran and cattle foods, with a probable development of the bacon industry in dependence on by-products from the dairying industry. Flour-milling is the main industry, oil-pressing from oleaginous seeds is an export industry and there is some tobacco manufacture. There are metal works dependent on the local iron, and the State electrification scheme includes the development of a shale using electric plant at Saratov to supplement the small station now working. The shale is to be obtained from the Kashpir beds near Syzran and can be brought cheaply by water.

The railway net includes the line from Tambov to Kamyshin, with a branch linking with Penza, a line from Tambov to Saratov, one from Volsk on the Volga going through Petrovsk and Atkarsk to Balanda, part of the Penza-Syzran line, and the branch from the Volga through Novo-Uzensk to Alexandrov-Gai. The region is thus better supplied than the Samara province and has a good deal of transit trade between shipping and railway lines.

The rate of literacy is considerably higher than in the Samara province, though it is low amongst women. Saratov university helps to spread a higher standard of culture in the district. The chief towns are Saratov, Kuznetsk (qq.v.), Balachov and Volsk, the remaining centres having less than 20,000 inhabitants.

The district of Saratov has been inhabited since at least the Neolithic period. The inhabitants of a later epoch have left numerous bronze remains in their *kurkans* (burial-mounds) but their ethnological position is still uncertain. In the 8th and 9th centuries the semi-nomad Burtases peopled the territory and recognized the authority of the Khazar princes.

SARATOV, a town of Russia in the province of Saratov in 51° 35' N., 46° 1' E., on the Volga river, and on the plateau slopes near that river. Landslips from the Sokolova hill (560 ft.) often occur. Two ravines divide the town into three parts. The streets are wide and regular, with broad squares and there are some fine buildings. There is a university, an art gallery and a museum. Pop. (1933) 327,500. Its industries include iron-smelting, the making of nails and bolts, saw-milling, using timber floated down the river, flour-milling and railway repair shops. An electric plant using shale fuel from the Syzran beds is under construction. The shallowness of the Volga opposite the town, and the immense shoals along its right bank are drawbacks, but it has some importance as a river port. It is linked by rail with Tambov, and through Pokrovsk, on the opposite side of the river in the German Volga Republic, with Uralsk and the Central Asiatic Republics. It has an extensive collecting and entrepôt trade.

The town of Saratov was founded at the end of the 16th century, 7 m. above the present site, to which it was removed about

1605. Sary-tau or Yellow Mountain on which it stands has been inhabited from remote antiquity.

SARAWAK (sah-rah'wa), an independent State in north-west Borneo (q.v.), with an area of some 50,000 sq.m. (about the size of England and Wales), a coast line of about 500 miles and a population estimated at half a million. It is bounded on the northwest by the China sea, on the northeast by British North Borneo and on the southeast by Dutch Borneo. Sarawak was originally part of the dominion of the sultan of Brunei. A relatively small and ill-defined area before 1840, it was in rebellion against the sultan's officials. In 1840 Rajah Muda Hassim, the uncle and heir-presumptive of the sultan, prevailed upon James Brooke (q.v.), to help him against insurgents entrenched at Blidah fort. Brooke put down the insurrection, and on Sept. 24, 1841, Muda Hassim having resigned, he became rajah. In 1842 the sultan of Brunei confirmed Brooke as rajah of a district in Sarawak extending from Tanjong Datu to the entrance of the Samarahan river, an area of about 7,000 sq mi. Rajah Brooke and Captain (later Admiral Sir Henry) Keppel expelled Malay and Dayak pirates from the Saribas and Batang Lupar rivers during 1843-44. In 1857 there was a Chinese rising in which Rajah Brooke all but lost his life. From time to time additional territory was added to the state. The sultan of Brunei granted Brooke in 1861 all the rivers and lands from the Samarahan river to Kedurong point, and in 1882 100 mi. of coastline and all the country and rivers that lay between Kedurong point and the Baram river, including about three miles of coast on the northeast side of the latter. The Trusan river area was added to Sarawak in 1884, and the Limbang river and Lawas river districts in 1890 and 1905 respectively.

In 1863 Sarawak was recognized by the British government as an independent state, and in 1888 a treaty was concluded by which, in return for British protection, the United Kingdom took control of the relations of Sarawak with foreign states. While internal administration was left entirely in the hands of the rajah, the British government could determine questions that should arise as to the succession and might establish consular officers in the territory. British subjects were to have most-favoured-nation treatment, and no part of the territory could be alienated without the consent of the British government.

Sir James Brooke, who was created K.C.B. in 1863, died in 1868 and was succeeded as rajah by his nephew, Sir Charles Johnson Brooke (1829-1917). The latter was created G.C.M.G. in 1888, when Sarawak was made a British protectorate, and in 1904 King Edward VII formally recognized the title of his highness the rajah of Sarawak. H. H. Sir Charles Johnson Brooke was succeeded in 1917 by his son, H. H. Sir Charles Vyner Brooke, G.C.M.G. (1874-). The heir presumptive was Bertam Brooke (H.H. the Tuan Muda).

Three generations of Brookes thus administered the country with the aid of a civil service of British officials, Sarawak being a notable instance of a native state developed under an enlightened policy into a highly organized community. In the "centenary year" (1941), the rajah proclaimed termination of the era of absolute rule and proposed giving the country a new constitution with provision for a representative legislature. These measures were halted when Japanese forces seized Sarawak in 1942 in the course of World War II.

The principal sources of revenue were customs, government monopolies, rents and mineral royalties. The economic and financial position of the country was sound, and there was no public debt. Considerable progress was made in surveying the country by land and air. Churches and missions of different denominations were established, and the Anglican Bishop of Labuan and Sarawak had his headquarters at Kuching, capital of the country.

Climate, **Physical Features and Fauna.**—The climate of Sarawak, though tropical, is healthy for Europeans and the heat is never extreme. The thermometer rarely rises above 90° F. and falls to 70° F. at night, and the heat is often tempered by a cool breeze. The average annual rainfall at Kuching is 160 in. There is no marked division into wet and dry seasons, but there is more rain from October to March. The country is mountainous and very well watered. The chief rivers are the Rejang, Baram, Limbang

and Batang Lupar, all of which are navigable. The fauna is varied and includes anthropoid apes, monkeys, lemurs, wild cattle, deer, pigs and rhinoceros. Snakes and crocodiles are numerous.

Ethnology.—The native population of Sarawak is composed of different races comprising Mohammedan Malays and various pagan tribes including Ibans (Sea Dayaks), Land Dayaks, Kayans, Kenyahs, Milanos, Punans and Klemantans. There are also large numbers of Chinese and a few other immigrants. It was the policy of the rajah's government to encourage the settlement of Chinese families. The practice of head hunting, which was once prevalent, is practically extinct. Slavery also was abolished.

Population and Chief Towns.—The population of Sarawak was estimated in 1941 to amount to 490,585 persons. Kuching, the capital (1° 33' 10" N., 110° 20' 13" E.), is situated on the Sarawak river about 23 mi. inland. There are government offices and a courthouse and a museum with a fine collection of Bornean exhibits. The European population of Kuching consisted of government officers and their families and teachers at the Anglican and Roman Catholic schools, besides a few traders. Sibü, 60 mi. up the Rejang river, had a large Chinese population engaged in bartering imported manufactured goods for jungle produce. Mukah, near the mouth of the Mukah river, is the centre of the sago palm industry, the extracted pith being shipped in schooners to Kuching for cleaning. Miri, a few miles south of Baram point, is the centre of the Sarawak oilfields, which were extended to Bakong.

Communications.—Inland communication is chiefly by water, practically all parts of the country being accessible either by launches or small boats on the numerous rivers. In 1942 there were some 400 mi. of roads, of which about 84 mi. were in the vicinity of Kuching; bridle paths link the villages with administrative centres. About 13 mi. of railway line was abandoned with introduction of motor transport. Kuching was linked with Singapore with a weekly service of steamers (40 hr.), and there were also services from Singapore to Sibü and to Miri and a coastal steamer service. A government telephone service extended over Kuching and upper Sarawak, and there were both interior and exterior wireless services, with stations at Kuching, Baram, Bellingian, Bintulu, Kanowit, Kapit, Lawas, Limbang, Lundu, Matu, Meluan, Miri, Mukah, Saratok, Sarikei, Selalang, Sibü, Simanggang and Tatau.

Industry.—Plantation rubber, sago flour and pepper are exported in large quantities, as well as cutch, jelutong (sap of a jungle tree used in the manufacture of chewing gum, paint and insulating material), copra and damar. There are more than 20 varieties of rattans, some of which are of high quality. Camphor and various other medicinal products are extracted from trees and plants. Coalfields which had been worked out were abandoned in 1932. A second proved coalfield, at Silantik, contains a mineral analogous to high grade Welsh coal, but it had not been developed at the time of the Japanese invasion because of inaccessibility. The principal mineral wealth is petroleum, which was discovered at Miri in 1909 and was subsequently worked by Sarawak Oilfields, Limited. Gold is also mined in considerable quantities. Other exports from Sarawak include tuba, ilipe nuts and timber.

The dollar currency had the same value as that of the Straits settlements. In 1940, the revenue amounted to \$7,463,341 and the excess of assets over liabilities was \$10,398,476.

SARCOPHAGUS, the name given to a coffin in stone, which

on account of its caustic qualities, according to Pliny (H.N. xxxvi 27), consumed the body in 40 days (Gr. *σαρκοφάγος*, literally "flesh-eating," from *σάρξ*, flesh, *φαγέιν*, to eat); also by the Greeks to a sepulchral chest, in stone or other material, which was more or less enriched with ornament and sculpture. One of the finest examples known is the sarcophagus of Tutankhamun (c.

BY COURTESY OF THE
OF ART

AN ETRUSCAN TERRA COTTA URN OF THE THIRD CENTURY B.C. IN THE FORM OF A SARCOPHAGUS

1550 B.C.) made of granite and ornamented with angels with outspread wings. Of later date are the green porphyry sarcophagus and the terra-cotta sarcophagus from Clazomenae; both of these date from the early 6th century B.C., and are in the British Museum. The finest Greek examples are those found at Sidon in 1887 by Hamdy Bey, which are now in the Imperial Museum at Constantinople. (See GREEK ART.) Of Etruscan sarcophagi there are numerous examples in terra-cotta; occasionally they are miniature representations of temples, and are sometimes in the form of a couch on which rest figures of the deceased; one of these is in the British Museum. The earliest Roman sarcophagus is that of Scipio in the Vatican (3rd century B.C.), carved in peperino stone.

Of later Roman sarcophagi, there is an immense series enriched with figures in high relief, of which the chief are the Niobid example in the Lateran, the Lycomedes sarcophagus in the Capitol, the Pentesilea sarcophagus in the Vatican, and the immense sarcophagus representing a battle between the Romans and the barbarians, in the Museo delle Terme. In later Roman work there was a great decadence in the sculpture, so that in the following centuries recourse was had to the red Egyptian porphyry, of which the sarcophagi of Constantia (A.D. 355) and of the empress Helena (A.D. 589), both in the Vatican, are fine examples. Later, during the Byzantine period, there is a large series, either in museums or in the cloisters of the Italian churches. They are generally decorated with a series of niches with figures in them, divided by small attached shafts with semicircular or sloping covers carved with religious emblems, one of the best examples

being the sarcophagus of Sta. Barbara, dating from the beginning of the 6th century, at Ravenna, where there are many others.

SARDANAPALUS or SARDANAPALLUS, according to Greek fable, the last king of Assyria, the thirtieth in succession from Ninyas. The name is derived from that of Assur-danin-pal, the rebel son of Shalmaneser II., whose reign ended with the fall of Nineveh in 823 B.C. (or perhaps from that of Assur-dan III., the last king but one of the older Assyrian dynasty); his character is that ascribed to Assur-bani-pal. He was the most effeminate and corrupt of a line of effeminate princes; hence Arbaces, satrap of Media, rebelled and, with the help of Belesys, the Babylonian priest, besieged Nineveh. Sardanapalus now threw off his sloth and for two years the issue was doubtful. Then, the Tigris having undermined part of the city wall, he collected his wives and treasures and burned them with himself in his palace (880 B.C.).

His fate is an echo of that of Samassum-yukin, the brother of Assur-bani-pal (*q.v.*).

See J. Gilmore, *Fragments of the Persika of Ktesias* (1888). (A. H. S.)

SARD AND SARDONYX. These semi-precious stones are colour-varieties of chalcedony (*q.v.*). Sard is a variety of carnelian; its colour is brown by reflected and red by transmitted light. (See **CARNELIAN**.) Sardonyx is a variety of onyx (*q.v.*) having white layers alternating with strata of sard. Both sard and sardonyx were esteemed by the ancients and by the craftsmen of the Renaissance for use in gem-cutting.

SARDICA, COUNCIL OF, an ecclesiastical council convened in 343 by the emperors Constantius and Constans, to attempt a settlement of the Arian controversies, which were then at their height. Of the hundred and seventy bishops assembled, about ninety (principally from the West) were Athanasians, while on the other side were eighty Eusebians from the East. The anticipated agreement, however, was not attained; and the result of the council was simply to embitter the relations between the two great religious parties, and those between the Western and Eastern halves of the Empire. For as Athanasius and Marcellus of Ancyra appeared on the scene, and the Western bishops declined to exclude them, the Eusebian bishops of the East absolutely refused to take part, and contented themselves with formulating a written protest addressed to numerous foreign prelates.

Especial importance attaches to this council through the fact that Canons 3-5 invest the Roman bishop with a prerogative which became of great historical importance, as the first legal recognition of his jurisdiction over other sees and the basis for the further development of his primacy.

The canons are printed in C. Mirbt, *Quellen zur Geschichte des Papsttums* (1901), p. 46 f.; Hefele, *Conciliengeschichte*, ed. 2, i. 533 sqq.

SARDINE: see **PILCHARD**.

SARDINIA, an island of the Mediterranean sea, belonging to Italy. It lies 73 mi. S. of Corsica, from which it is separated by the Strait of Bonifacio, some 50 fathoms deep. The harbour of Terranova, in the north-eastern portion of the island, is 125 mi. south-west of Civitavecchia, the nearest point on the mainland of Italy. Sardinia lies between 8° 7' and 9° 49' E., and extends from 38° 52' to 41° 15' N. The length from south-west to north is about 160 mi., the breadth about 68 mi. The area of the island is 9,187 sq.mi., or including the small islands adjacent, 9,294 sq.mi. and it has 1,034,206 inhabitants (1936). It is divided into three provinces, Cagliari, Nuoro and Sassari. The density of population is lower than that of any other part of Italy, coming below that of Venezia Tridentina in 1936.

The island is mountainous, almost continuously so along the coast, and largely granitic with lofty upland plains in the east, and volcanic in the west. The highest point in the north-east group of the island (called Gallura) is Monte Limbara (4,468 ft.) south-east of Tempio. The valleys on the south-east and south-west are followed by the railway from Golfo degli Aranci to Chilivani and Sassari. The north-western portion of the island, called the Nurra, is entirely volcanic; so are the mountains to the south of it, near the west coast; the highest point is the Monte Ferru (3,448 feet). East of the railway from Chilivani to Oristano, on the other hand, the granitic mountains continue. The highest points are Monte Rasu (4,127 ft.), south of Ozieri, in the district called Logudoro, and, farther south, in the region called Barbagia, the Punta Bianca Spina, the highest summit of the chain of Gennargentu (6,016 feet). These two groups are divided by the deep valley of the Tirso, the only real river in Sardinia, which has a course of 94 miles, South of Gennargentu, in the district of the Sarcidano, is the Monte S. Vittoria (3,980 feet). Still farther west is the volcanic upland plain of the Giara (1,988 ft.) and south of the Sarcidano are the districts known as the Trexenta, with lower, fertile hills, and the Sarrabus, which culminates in the Punta Serpeddi (3,507 ft.), and the Monte dei Sette Fratelli (3,333 ft.), from the latter of which a ridge descends to the Capo Carbonara, at the south-east extremity of the island. South of Oristano, traversed by the railway to Cagliari, is the Campidano (divided into the Campidano of Oristano

and the Campidano of Cagliari), a low plain, the watershed of which is only about 100 ft. above sea-level. It is 60 mi. long by 7-14 mi. broad, and is the most fertile part of the island. South-west of it are the fine mountain groups around Iglèsias (4,055 feet). In this south-western portion of the island the mining industry of Sardinia is carried on.

Coast.—The coast of Sardinia contains few seaports, but a good proportion of these are excellent natural harbours. At the north-eastern extremity is a group of islands, upon one of which is the naval station of La Maddalena; farther south-east is the well-protected Gulf of Terranova, the port of arrival for the mail steamers from Civitavecchia. To the south of Terranova there is no harbour on the east coast until Tortoli is reached, nor on the south coast before Cagliari, the most important harbour on the island. In the south-western portion of Sardinia the island of S. Antioco, joined by a narrow isthmus and a group of bridges to the mainland, forms a good natural harbour to the south of the isthmus, the Golfo di Palmas; while the north section of the peninsula, with the island of S. Pietro, forms a more or less protected basin, upon the shores of which are several small harbours (the most important being Carloforte), which are centres of the export of minerals and of the tunny fishery. Not far from the middle of the west coast is the Gulf of Oristano, into which, besides the Tirso, several streams fall, forming considerable lagoons. Bosa has only an open roadstead; and at the southern extremity of the Nurra come the Gulf of Alghero and the Porto Conte to the west. Porto Torres is the chief port on the north-west coast of Sardinia.

Geology.—Geologically Sardinia consists of two hilly regions of pre-Tertiary rock, separated by a broad depression filled with Tertiary deposits. This depression runs nearly from north to south, from the Gulf of Asinara to the Gulf of Cagliari. Physically its continuity is broken by Monte Urticu and smaller hills, remains of Tertiary volcanoes. In the south the depression is known as the Campidano. In the north it forms the plain of Sassari. Both east and west of this depression the Archaean and Palaeozoic rocks are strongly folded, except the Permian beds. In the eastern region this was the last folding which has affected the country, and the Mesozoic and Tertiary beds are almost undisturbed. In the western region, on the other hand, all the Mesozoic beds are involved in a later system of folds; but here also the Tertiary beds lie nearly horizontal. In the western region all the Mesozoic systems, including the Trias, are well developed. The Trias does not belong, as might have been expected, to the Alpine or Mediterranean type; but resembles that of Germany and northern Europe. In the eastern region the Trias is absent; the Mesozoic series begins with the Upper Jurassic.

Granite and Archaean schists form nearly the whole of the eastern hills from the Strait of Bonifacio southwards to the Flumendosa river, culminating in the Monti del Gennargentu. The Palaeozoic rocks form two extensive masses, one in the south-east, the other in the south-west. They occur also on the extreme north-western coast, in the Nurra. Cambrian, Ordovician and Silurian beds have been recognized, the Upper Cambrian consisting of a limestone which is very rich in metalliferous ores (especially galena and calamine). The Permian, which contains workable coal seams, lies unconformably upon the older beds and seems to have been deposited in isolated basins (*e.g.*, at Fondu Corrongiu and San Sebastiano), like those of the Central Plateau of France. The Mesozoic beds are limited in extent, the most extensive areas lying around the Gulf of Orosei on the east and west of Sassari in the north. The Tertiary deposits cover the central depression.

Climate.—The climate of Sardinia is more extreme than that of Italy, but varies considerably in different districts. The mean annual temperature is 62° F at Cagliari and 61° F at Sassari, the respective maxima and minima (for a period of 30 years) being 98.5° F and 97° F and 36.5° F and 38.5° F. The island is subject to strong winds, which are especially felt at Cagliari owing to its position at the south-east end of the Campidano, and the autumn rains are sometimes of almost tropical violence. There are comparatively few streams and no inland lakes. Snow hardly ever

falls near the coast but is abundant in the higher parts of the island, though none remains throughout the summer. The rainfall in the southwest portion of the island is considerably greater than in other districts, in which it is extremely low, about 19 in. at Cagliari and 24 in. at Sassari.

The scourge of malaria has considerably diminished, but the undrained coast swamps still provide breeding-places for the malaria-carrying mosquito.

Customs and Dress.—The population of Sardinia appears to have belonged since ancient times to the so-called Mediterranean race. (See G. Sergi, *La Sardegna*, Turin, 1907.) The race has probably suffered less here than in most parts of the Mediterranean basin from foreign intermixture, except for a few Catalan and Genoese settlements on the coast (Alghero and Carloforte are respectively the most important of these); and the population in general seems to have deteriorated slightly since prehistoric times. The average cranial capacity of the prehistoric skulls from Anghelu Ruju being 1,490 c.c. for males and 1,308 c.c. for females, while among the modern population 60% of males and females together fall below 1,250 c.c. and the stature is generally lower than in other parts of Italy. In the province of Cagliari 29.99% of the recruits born in 1862 were under 5 ft. 1 in. and in that of Sassari 21.99%, the percentage for ten provinces of south Italy being 24.35.

These small individuals present apparently no other differences. and Sergi maintains that the difference is racial, these being descendants of a race of pygmies who had emigrated from central Africa.

But the lowness of stature extends to the lower animals—cattle, horses, donkeys, etc.—and this may indicate that climatic causes have some part in the matter also.

The dialects differ very much in different parts of the island, so that those who speak one often cannot understand those who speak another and use Italian as the medium of communication. They contain a considerable number of Latin words, which have remained unchanged. The two main dialects are that of the Logudoro in the north and that of Cagliari in the south.

The native costumes also vary considerably. In the southeast they have largely gone out of use, but elsewhere, especially in the mountainous districts, they are still habitually worn.

In the Barbagia the men have a white shirt, a black or red waistcoat and black or red coat, often with open sleeves; the cut and decorations of these vary considerably in the different districts. They have a kind of short kilt, stiff, made of black wool, with a band from back to front between the legs; under this they wear short linen trousers, which come a little below the knee. and black woollen leggings with boots. They wear a black cap, about 1½ ft. long, the end of which falls down over one side of the head.

In other districts the costume varies considerably, but the long cap is almost universal. Thus at Ozieri the men wear ordinary jackets and trousers with a velvet waistcoat; the shepherds of the Sulcis wear short black trousers without kilt and heavy black sheepskin coats, and the two rows of waistcoat buttons are generally silver or copper coins.

The costume of the women is different (often entirely so) in each village or district. Bright colours (especially red) are frequent. and the white chemise is an integral part of the dress. The skirts are usually of the native wool (called *orbacia*) and two are often worn, one over the other.

For widows or deep mourning the peculiar cut of the local costume is preserved but carried out entirely in black. The native costume is passing out of use in many places (especially among the women, whose costume is more elaborate than that of the men), partly owing to the spread of modern ideas, partly owing to its cost; and in the Campidano and in the mining districts, it is now rarely seen.

The curious customs, too, of which older writers tell us, are gradually dying out. But the festivals, especially those of mountain villages or of pilgrimage churches, attract in the summer a great concourse of people, all in their local costumes. There may be seen the native dances and bareback horseraces through the main street of the village.

Agriculture.—The greater part of the island is devoted to agriculture; according to the statistics of 1930, 126,744 individuals were occupied in it. Of these, 76,303 cultivated their own land.

Much of the island is stony and unproductive; but cultivation has not been extended nearly so much as would be possible. Where rational cultivation has been introduced, it has been often by non-Sardinian capitalists.

Two-fifths of the land belong to the state and two-fifths more to the various communes; the remaining fifth is minutely subdivided among a large number of small proprietors. Comparatively little grain is now produced, whereas under the republic, Sardinia was one of the chief granaries of Rome; and most of the soil, except the rugged mountain regions, is adapted to corn growing.

The Campidano and other fertile spots, such as the so-called Ogliastra on the east side of the island, inland of Tortoli, the neighbourhood of Oliena, Bosa, etc., produce a considerable quantity of wine, the sweet, strong, white variety called Vernaccia, produced near Oristano, being especially noteworthy.

The cultivation of olives is widespread in the districts of Sassari, Bosa, Iglesias, Alghero and the Gallura. Tobacco, vegetables and other garden produce are much cultivated.

The following list gives the acreage under cultivation and the various products (in tons) for 1938:

Products	Acres	Tons
Wheat	597,493	326,832
Barley	68,419	32,297
Oats	39,767	21,826
Maize	17,784	12,566
Beans	121,524	43,431
Garden produce	232,180	79,797
Potatoes	93,860	35,103
Forage	318,630	1,157,084
Grapes	83,980	...
Wine	17,831,989 (gallons)
Olives	112,879	...
Olive oil	1,875,661 (gallons)
Citrous fruits	14,573	69,000

Livestock.—A considerable portion of Sardinia, especially in the higher regions, is devoted to pasture. The native Sardinian cattle are small but make good draught oxen. A considerable amount of cheese is manufactured but largely by Italian capitalists. Sheep's milk cheese (pecorino) is largely made but sold as the Roman product. Horses are bred to some extent, while the native race of donkeys is remarkably small in size. Pigs, sheep and goats are also kept in considerable numbers. In 1930 there were 101,400 horses and donkeys, 240,000 cattle, 102,000 pigs, 2,054,000 sheep and 436,000 goats.

Of wild animals may be noted the moufflon (*Ovis* Ammon), the stag and the wild boar, and among birds various species of the vulture and eagle in the mountains and the pelican and flamingo (the latter coming in August in large flocks from Africa) in the lagoons.

Fisheries.—The tunny fishery is considerable, and it is centred principally in the southwest. A special fishing harbour and market are to be built here. The sardine fishery at present serves mainly for local consumption. Lobsters are exported, especially to Paris.

The coral fishery—mainly on the west coast—has lost its former importance. Neither the tunny nor the coral fishery is carried on by the Sardinians themselves, who are not sailors by nature; the former is in the hands of Genoese and the latter of Neapolitans.

The unhealthy lagoons contain abundance of fish. The mountain streams often contain small but good trout.

Hydro-electric Power.—This is at present derived from two artificial lakes—that which collects the waters of the Tirso, in the centre of the island (capacity 588,577,500 cu.yd., generating up to 25,000 h.p.), and that of Coghinas, in the north (capacity 447,318,900 cu.yd., generating 24,000 horse power).

Minerals.—The mining industry in Sardinia is confined in the main to the south-western portion of the island. The mines were known to the Carthaginians, as discoveries of lamps, coins, etc. (now in the museum at Cagliari), testify. The Roman workings too, to judge from similar finds, seem to have been considerable. The centre of the mining district (*Metalla* of the itineraries) was probably about 5 m. south of Fluminimaggiore, in a locality known as Antas, where are the remains of a Roman temple dedicated to an emperor, probably Commodus. After the fall of the Roman empire the workings remained abandoned until the days of the Pisan supremacy, and were again given up under the Spanish government, especially after the discovery of America. When the island passed to Savoy in 1720 the mines passed to the state; but in the period up to 1840 only 14,620 tons of galena were extracted and 2,772 of lead. In 1840 the freedom of mining was introduced, the state giving perpetual concessions in return for 3% of the gross production.

The following tonnage of minerals was extracted in 1926:

Minerals	Tons
Iron	8,124
Manganiferous iron	500
Manganese	540
Copper	620
Lead	49,802
Zinc:	
Calamine	100,943
Blende	28,312
Antimony	2,613
Arsenic	200
Iron pyrites	257
Anthracite	10,508
Lignite	56,940

The most important minerals are lead and zinc, obtained in lodes in the forms of galena and calamine respectively. In most cases, owing to the mountainous character of the country, horizontal galleries are possible. The Monteponi company smelts its own zinc, but the lead is almost all smelted at the furnaces of Pertusola near Spezia. Lignite is mined at Bacu Abis, near Gonnesa, and anthracite near Seui.

The salt-pans at Cagliari and of Carloforte are of considerable importance; they are let by the Government to contractors, who have the sole right of manufacture, but are bound to sell the salt necessary for Sardinian consumption at a low rate; the Government does not exercise the salt monopoly in Sardinia any more than in Sicily, but in the latter island the right of manufacture is unrestricted. The salt-pans of Cagliari produce 300,000 tons of salt annually, potash (for manure), magnesium sulphate and other kindred salts.

Communications.—The railway system of Sardinia is in the hands partly of the State and partly of two private companies. The State lines of the ordinary gauge run from Cagliari, past Macomer, to Chilivani (with a branch at Decimomannu for Iglesias). From Chilivani the line to Sassari and Porto Torres diverges to the north-west and that to Golfo degli Aranci to the north-east. The Terranova and narrow-gauge lines run from Cagliari to Mandas (whence lines diverge north to Sorgono and east to Tortoli, the former having a branch south-south-west to Villamar, and thence to Ales or Sanluri, on the main line from Cagliari to Macomer and the latter a short branch from Gairo to Ierzu), from Macomer east to Nuoro and west to Bosa, from Sassari south-west to Alghero, from Chilivani south to Tirso (on the line between Macomer and Nuoro), and from Monti (on the line from Chilivani to Golfo degli Aranci) north-west to Tempio. From Iglesias there is a line to Palmas-Suergiu with branches to Siliqua and Calasetta. There is a steam tramway from Cagliari to Quartu S. Elena. The trains are few and the speed on all these lines is moderate, but the gradients are often very heavy. The main road system, which dates from 1828, previous to which there were only tracks, is good, and the roads well engineered; many of them are traversed by road motor services. There is a daily steam communication with Civitavecchia from Terranova (the mail route), and weekly steamers run from Cagliari to

Naples, Genoa (via the east coast of the island), Palermo and Tunis, and from Porto Torres to Genoa (calling at Bastia in Corsica and Leghorn) and Leghorn direct. A line also runs along the west coast of the island from Cagliari to Porto Torres. There is also a service between Porto Torres and Ajaccio in Corsica. There is an air service between Rome and Cagliari via Terranova and twice direct.

The archiepiscopal sees of the island are: Cagliari (under which are the suffragan sees of Galtelli-Nuoro, Iglesias and Ogliastra). Oristano (with the suffragan see of Ales and Terralba) and Sassari (under which are the suffragan sees of Alghero, Ampurias and Tempio, Bisarchio and Bosa).

Education.—In 1931, 31% of the males and 41% of the females (or 36% of the total population over 6 years) were able to read.

The University of Cagliari had 945 students in 1938–39 and that of Sassari 366. There is a mining school at Iglesias. (T. A.; X.)

HISTORY

Archaeology.—No trace of palaeolithic man is recorded in Sardinia, and the earliest evidence of human occupation dates from the time when metal was first coming into use in the Western Mediterranean. There are, it is true, a few coastal stations in the south of the island that have yielded purely lithic industries, but in the greater number of the simple cave-dwellings wherein the earliest civilization is to be recognized, there are abundant copper implements together with the usual stone and obsidian tools. Indeed, it was probably the natural richness of the island in copper and lead that was responsible for the first settlements therein. This first civilization is, in a sense, the only prehistoric civilization of the island, for it continued without any remarkable alteration not only until the advent of the Greeks and the Carthaginians, but even until the coming of the Romans. In character it betrays a somewhat different aspect from the contemporary culture of its nearest neighbour, for whereas the affinities in Corsica pointed to a Ligurian source, here the ties are closer with central Italy and Sicily, and also, it has been argued, with North Africa.

The first habitations were perhaps cave-dwellings, but it was not long before stone-built huts were erected. Many villages of such huts are known, one of the best examples being that at Gonnesa in the south-west of the island. The little houses themselves were mostly round, and about 20ft. in diameter; inside they were furnished with benches, stalls for animals, and an altar near the entrance. In a strategic position near the huts were dwellings of grander character, perhaps the residences of chieftains, but fortified so that they might serve as watch-tower, refuge and defence for the whole village in times of danger. These are the *nuraghi*, double-storeyed towers in the shape of a truncated cone and built of large stones laid in regular horizontal courses, sometimes with the aid of a clay mortar. They are generally about 25 to 35ft. in diameter and about 40ft. in height, and in their usual form they contain an upper and lower chamber with tall and pointed corbelled roofs connected by a winding staircase; but sometimes they have several communicating chambers built bastion-wise against the tower on the ground level; or, again, the *nuraghi* proper may form part of a completely fortified enclosure that is protected by an additional tower. The *nuraghi* are sometimes furnished with embrasures or loop-holes, as at Losa, Giara and Santa Vittoria, and there is no doubt that they were primarily forts, all the constructional details being arranged with a view to tactical advantage in defence. The *nuraghi*, however, were not exclusively used in times of war, for many show abundant evidence of ordinary domestic occupation, and of use as bronze foundries; e.g., Ortu Commidu near Sardara. The intimate connection between village-life and the *nuraghi* is best illustrated on the plateau Giara di Gesturi, for this has no less than seventeen *nuraghi* set round its edge to defend the big cluster of huts on the top of the plateau. Here there is evidence of occupation extending from the copper age until the Roman period.

Though the earliest settlers lived in caves, and it is in caves that their burials are found, the tombs of the nuraghi-civilization are artificially constructed, and of three different kinds. The best-known are the *Domus de Gianas* (witches' houses), complicated artificial grottoes of which there are famous examples at Anghelu Ruju and S. Andrea Priu. In plan they show a nest of burial-cells communicating by means of narrow passages with an antechamber. This last was seemingly used for devotional and religious purposes, for it is sometimes painted red and decorated with carvings; while inside are pillars, also carved with cult-symbols, and stone troughs and hearths. The dead were buried in the cells in a crouched position and accompanied by rich grave-goods including stone axes, mace-heads, arrowheads, copper daggers, axes and awls, personal ornaments and amulets of many varieties, and pottery that included (at Anghelu Ruju) bell-beakers, a supposed link with the Spanish beaker-culture. The second and contemporary type of grave is a polygonal or rectangular megalithic structure, at first little better than a stone-lined pit, but passing into regular cist-forms. These rectangular chambers, however, are not numerous, and much more common is the third type, an obvious derivative of the cist, known as *Tombe dei Giganti* (giants' graves). In these a rectangular chamber with a corbelled roof is encased in a stone-edged mound with crescentic horns, and in the centre of this curved façade, and at the head of the chamber, is a gabled and panelled portal slab with a small hole at its foot, or, alternatively, a door of two up-rights and a lintel. The chambers vary from 24ft. in length to as much as 50ft., and doubtless served as graves for whole families, or even whole villages. In addition to these villages and graves, it remains to note the existence of a number of menhirs.

There was no Greek colonization in the formal sense although Greek historians have recorded that such colonization was projected (Herodotus, I., 170) and was achieved (Pausanias, X., 17, 5). Nevertheless, Olbia and Neapolis, as their names imply, were doubtless founded by Greeks, and there must have been more than one short-lived Greek settlement in the island. But the first serious interruption of the nuraghi-civilization was an occupation by Carthage about 500 to 480 B.C. that resulted in the exploitation of Sardinia as an important grain-growing land, and in the foundation of such towns as Cornus, Tharro and Sulci. The island remained a Carthaginian colony until 238 B.C. when it was ceded to Rome, and a struggle began between the natives and their new masters. Roman conquest was, however, inevitable, and in a short while the island was organized as a province that ultimately became one of the main corn-supplies for Rome.

Italien B, Domus de Gianas, Nuraghe, etc.* For the nuraghi see A. Taramelli in *Bollettino di Paleontologia Italiana*, S. 5 I (1916), 123, and other papers of this author, most of which are cited by Von Duhn in *Italische Gräberkunde*, Heidelberg, 1924, pp. 94 ff. For the megaliths see Duncan Mackenzie, *Papers of the British School in Rome*, V (1910), p. 89, VI. (1913), p. 127.

Roman Period.—In 238 B.C. the Carthaginian mercenaries revolted, and the Romans took advantage of the fact to demand the surrender of the island. The native tribes opposed the Romans, but were conquered after several campaigns; the island became a province under the government of a *praetor* or *propraetor*, to whose jurisdiction Corsica was added soon afterwards. A rebellion in 215 B.C., fostered by the Carthaginians, was quelled by T. Manlius Torquatus (*Livy* xxiii. 40). After this the island began to furnish considerable supplies of corn; it was treated as a conquered country, not containing a single free city, and the inhabitants were obliged to pay a tithe in corn and a further money contribution. It was classed with Sicily and Africa as one of the main sources of the corn-supply of Rome. There were salt-works as early as about 150 B.C., as is attested by an inscription assigned

FROM TINDALE, "THE ISLAND OF SARDINIA" (MACMILLAN)
"GIANTS' GRAVE" SHOWING FAÇADE WITH GABLED SLAB; SARDINIA

to this date in Latin, Greek and Punic. There were two insurrections of the mountain tribes, in 181 and in 114 B.C., but even in the time of Strabo there was considerable brigandage.

In the division of provinces made by Augustus, Sardinia and Corsica fell to the share of the senate, but in A.D. 6, Augustus, owing to the frequent disturbances, took them over and placed them under a *praefectus*. In A.D. 67 Nero restored Sardinia to the senate (but not Corsica) in exchange for Achaëa, and the former was then governed by a *legatus pro praetore*; but Ves-pasian took it over again before A.D. 78, and placed it under an imperial *procurator* as *praefectus*. It returned to the senate, not before A.D. 83 but certainly before the reign of M. Aurelius, when we find it governed by a proconsul, as it was under Commodus; the latter, or perhaps Septimius Severus, took it over again and placed it under a *procurator* as *praefectus* once more (*D. Vaglieri in Notizie degli scavi*, 1897, 280). A bronze tablet discovered in 1866 near the village of Esterzili is inscribed with a decree of the time of Otho with regard to the boundaries of three tribes, the Gallieneses, Patulienses and Campani, who inhabited the eastern portion of the island. Carales was the only city with Roman civic rights in Sardinia in Pliny's time (when it received the privilege is unknown). A Roman colony had been founded at Turrus Libisonis (Porto Torres) and others, later on, at Usellis and Cornus. We hear little of the island under the empire, except as a granary and as remarkable for its unhealthiness and the audacity of its brigands. It was not infrequently used as a place of exile.

Byzantine Period.—After the time of Constantine, the administration of Sardinia was separated from that of Corsica, each island being governed by a *praeses* dependent on the *vicarius urbis Romae*. In 456 it was seized by Genseric. It was retaken for a short time by Marcellianus, but was not finally recovered until the fall of the Vandal kingdom in Africa in 534, by Cyril. In 551 it was taken by Totila, but reconquered after his death by Narses for the Byzantine Empire. Under Byzantium it remained nominally until the 10th century, when we find the chief magistrate still bearing the title of *ἄρχων*.

Saracens.—In the 8th century (720) the period of Saracen invasion began; but the Saracens never secured a firm footing in the island. In 725 Liutprand purchased and removed to Pavia the body of St. Augustine of Hippo from Cagliari, whither it had been brought in the 6th century by the exiled bishop of Hippo. In 815 Sardinia submitted to Louis the Pious, begging for his protection; but the Saracens were not entirely driven out, and about A.D. 1000 the Saracen chief Musat established himself in Cagliari. Pope John XVIII. preached a crusade in 1004, promising to bestow the island (when or whether it had ever definitely passed into the power of the papacy is not absolutely clear) upon who ever should drive out the Saracens. The Pisans took up the challenge, and Musat was driven out of Cagliari with the help of the Genoese in 1022 for the third time. The Pisans and Genoese now disputed about the ownership of Sardinia, but the pope and the emperor decided in favour of Pisa. Musat returned to the island once more and made himself master of it, but was defeated and taken prisoner under the walls of Cagliari in 1050, when the dominion of Pisa was established.

Pisan Period.—The island had (probably since the end of the 9th century) been divided into four districts—Cagliari, Arborea, Torres (or Logudoro) and Gallura—each under a *giudice* or judge, in whom the dignity became hereditary. *Judices* are already mentioned as existing in the account of the mission sent by Nicholas I. in 864, as though the single authority of the Byzantine *ἄρχων* was already weakened. The three *ἄρχωντες* who appear in 10th-century inscriptions bear alternately the names Torcotorius and Salusius; and, inasmuch as this is the case with the *judices* of Cagliari from the 11th to the 13th century, there seems no doubt that they were the successors of these Byzantine *ἄρχωντες*, who were perhaps the actual founders of the dynasty. These names, indeed, continue even after the Pisan family of Lacon-Massa had by marriage succeeded to the judicature. The Greek language occurs in their official seals down to the 13th century. Intermarriage (sometimes illicit) was apparently freely used by the dominant

families for the concentration of their power. Thus we find that after the failure of Musat members of the family of Lacon-Unali filled all the four judicatures of the island. In the continual struggles between Pisa and Genoa some of these princes took the side of the latter. In 1164 Barisone, *giudice* of Arborea, was given the title of king of the whole island by Frederick Barbarossa, but his supremacy was never effective. In 1241 Adelasia, heiress of Gallura and Logudoro, was married as her third husband to Enzo, the natural son of Frederick II., who received the title of king of Sardinia from his father, but fell into the hands of the Bolognese in 1249, and remained a prisoner at Bologna until his death. After this the Pisan supremacy of the island seems to have become more of a reality, but Arborea remained independent, and after the defeat of the Pisans by the Genoese at the naval battle of Meloria in 1284 they were obliged to surrender Sassari and Logudoro to Genoa. In 1297 Boniface VIII. invested James XI. the king of Aragon, with Sardinia; but it was not until 1323 that he attempted its conquest, nor until 1326 that the Pisans were finally driven out of Cagliari, which they had fortified in 1305-1307 by the construction of the Torre di S. Pancrazio and the Torre dell' Elefante, and which became the seat of the Aragonese government. To the Pisan period belong a number of fine Romanesque churches, among which may be specially mentioned those of Ardara, S. Giusta near Oristano, La Trinità di Saccargia and Tratalias.

Aragonese Period.—The Aragonese enjoyed at first the assistance of the *giudici* of Arborea, who had remained in power; but in 1352 war broke out between Mariano IV. and the Aragonese, and was carried on by his daughter Eleonora, wife of Brancalione Doria of Genoa, until her death in 1403. Peter IV. had meanwhile in 1355 called together the *cortes* (parliament) of the three estates (the nobles, the clergy and the representatives of the towns) for the first time after the model of Aragon. After 1403 the Aragonese became masters of Arborea also. The title of *giudice* was abolished and a feudal marquise substituted. The code of laws issued by Eleonora was in 1421 extended to the whole island by the *cortes* under the presidency of Alphonso V., who visited Sardinia in that year. In 1478 the marquise of Oristano was suppressed, and henceforth the island was governed by Spanish viceroys with the feudal régime of the great nobles under them, the *cortes* being convoked once every ten years. Many of the churches show characteristic Spanish Late Gothic architecture which survived until a comparatively recent period. The Renaissance had little or no influence on Sardinian architecture and culture.

Modern History.—The island remained a Spanish province until the War of the Spanish Succession, when in 1708 Cagliari capitulated to an English fleet, and the island became Austrian; the *status quo* was confirmed by the peace of Utrecht in 1713. In 1717, however, Cardinal Alberoni retook Cagliari for Spain; but this state of things was short-lived, for in 1720, by the Treaty of London, Sardinia passed in exchange for Sicily to the dukes of Savoy, to whom it brought the royal title. The population was at that time a little over 300,000; public security and education were alike lacking, and there were considerable animosities between different parts of the island. Matters improved considerably under Charles Emmanuel III., in whose reign of 43 years (1730-73) the prosperity of the island was much increased. The French attacks of 1792-93 were repelled by the inhabitants, Cagliari being unsuccessfully bombarded by the French fleet. But the refusal by Victor Amadeus III. to grant the Sardinians privileges promised in consideration of their bravery led to the revolution of 1794-96. In 1799 Charles Emmanuel IV. of Savoy took refuge in Cagliari after his expulsion by the French, but soon returned to Italy. In 1802 he abdicated in favour of his brother Victor Emmanuel I., who in 1806 returned to Cagliari and remained there until 1814, when he retired, leaving his brother, Carlo Felice, as viceroy. Carlo was successful in repressing brigands, but had to deal with much distress from famine. In 1821 he became king of Savoy by the abdication of his brother, and the construction of the highroad from Cagliari to Porto Torres was begun (not without opposition on the part of the

inhabitants) in 1822. Feudalism was abolished in 1836, and in 1848 complete political union with Piedmont was granted. The later history of Sardinia is bound up with that of Piedmont and Italy. Victor Emmanuel II. (*q.v.*), king of Sardinia, became the king of a united Italy in 1861. During World War II, after the Allied victory in Tunisia (May 1943) Sardinia was bombed almost continuously. Few of the larger towns were spared; in the late summer of 1943 Sardinia was occupied by British and U.S. forces and the fascist regime ended without struggle.

SARDIS, more correctly SARDES (*αἰΣάρδεις*), the capital of the ancient kingdom of Lydia, the seat of a *conventus* under the Roman Empire, and the metropolis of the province Lydia in later Roman and Byzantine times, was situated in the middle Hermus valley, at the foot of Mt. Tmolus, a steep and lofty spur of which formed the citadel. It was about 2½ m. S. of the Hermus. The earliest reference to Sardis is in Alcman (Bergk, *Fr.* 24, c. 650 B.C.); in the *Iliad* the name Hydē seems to be given to the city of the Maeonian (*i.e.*, Lydian) chiefs, and in later times, Hydē was said to be the older name of Sardis, or the name of its citadel. It is, however, more probable that Sardis was not the original capital of the Maeonians, but that it became so amid the changes which produced the powerful Lydian empire of the 8th century B.C. The city was captured by the Cimmerians in the 7th century, by the Persians and by the Athenians in the 6th, and by Antiochus the Great at the end of the 3rd century. Once at least, under the emperor Tiberius, in A.D. 17, it was destroyed by an earthquake; but it was always rebuilt, and was one of the great cities of Asia Minor till the later Byzantine period. As one of the Seven Churches of Asia, it was addressed by the author of the Apocalypse in terms which seem to imply that its population was notoriously soft and faint-hearted. Its importance was due, first to its military strength, secondly to its situation on an important highway leading from the interior to the Aegean coast, and thirdly to its commanding the wide and fertile plain of the Hermus.

The early Lydian kingdom was far advanced in the industrial arts (*see* LYDIA), and Sardis was the chief seat of its manufactures. The most important of these trades was the manufacture and dyeing of delicate woollen stuffs and carpets.

In the Hellenistic and Roman periods Sardis was eclipsed by Pergamum (the Attalid capital), by Ephesus (the capital of the province of Asia) and probably also by Smyrna. After Constantinople became the capital of the East a new road system grew up connecting the provinces with the capital. Sardis then lay rather apart from the great lines of communication and lost some of its importance. It still, however, retained its titular supremacy and continued to be the seat of the metropolitan bishop of the province of Lydia, formed in A.D. 295. It is enumerated as third, after Ephesus and Smyrna, in the list of cities of the Thracasian *them* given by Constantine Porphyrogenitus in the 10th century; but in the actual history of the next four centuries it plays a part very inferior to Magnesia ad Sipylum and Philadelphia (*see* ALA-SHEHR), which have retained their pre-eminence in the district. The Hermus valley began to suffer from the inroads of the Seljuk Turks about the end of the 11th century; but the successes of the Greek general Philocalas in 1118 relieved the district for the time, and the ability of the Comneni, together with the gradual decay of the Seljuk power, retained it in the Byzantine dominions. The country round Sardis was frequently ravaged both by Christians and by Turks during the 13th century. Soon after 1301 the Seljuk amirs overran the whole of the Hermus and Cayster valleys, and a fort on the citadel of Sardis

was handed over to them by treaty in 1306. Finally in 1390 Philadelphia, which had for some time been an independent Christian city, surrendered to Sultan Bayezid's mixed army of Ottoman Turks and Byzantine Christians, and the Seljuk power in the Hermus valley was merged in the Ottoman empire. The latest reference to the city of Sardis relates its capture (and probable destruction) by Timur in 1402. Its site is now practically deserted.

The ruins of Sardis, so far as they are now visible, are chiefly of the Roman time; but though few ancient sites offered better hope of results, the necessity for heavy initial expenditure was a deterrent (*e.g.*, to H. Schliemann). On the banks of the Pactolus two columns of a great Ionic temple, now known to be that of Cybele-Artemis were still standing. More than one attempt to excavate this temple, the last by G. Dennis in 1882, was made and prematurely brought to an end by lack of funds. In 1910-1914 and also in 1922, the temple site and part of the necropolis were studied by H. C. Butler and others, of the American Society for the Excavation of Sardis.

See reports in *Am. Journal of Archaeology*, 1911-27, and the volumes of *Sardis*, especially I. and II. (H. C. Butler) on the history of the excavations down to 1914, and VI. pts. 1-2 (E. Littmann-W. H. Buckler) on the Lydian inscriptions; results and bibliography in Pauly-Wissowa *R. Enc.* XIII. 2123 f. (Biirchner-Deeters-J. Kéil); for the city's history in early Christian times, W. M. Ramsay, *Letters to the Seven Churches* (1904), V. Schultze, *Altchristliche Stadte* II. 2,145 f. (1926).

SARDOU, VICTORIEN (1831-1908), French dramatist, was born in Paris on Sept. 5, 1831. The Sardous were settled at Le Cannet, a village near Cannes, where they owned an estate, planted with olive trees. A night's frost killed all the trees and the family was ruined. Victorien's father, Antoine Léandre Sardou, came to Paris, and earned his living in a succession of employments. Victorien had to make his way as best he could. A play of his, *La Taverne des étudiants*, produced at the Odéon on April 1, 1854, was withdrawn after five nights. Many disappointments followed; some plays were rejected, others were accepted and not performed.

Sardou was now in actual want, and his misfortunes culminated in an attack of typhoid fever. He was dying in his garret, surrounded with his rejected manuscripts. A lady named Mlle. de Brécourt nursed him back to health, and introduced him to Mlle. Déjazet. Then fortune began to smile on the author. It is true that *Candide*, the first play he wrote for Mlle. Déjazet, was stopped by the censor, but *Les Premières Armes de Figaro*, *Monsieur Garat*, and *Les Prés Saint Gervais*, produced almost in succession, had a splendid run, and *Les Pattes de mouche* (1860: afterwards anglicized as *A Scrap of Paper*) obtained a similar success at the Gymnase. *Fe'dora* (1882) was written expressly for Sarah Bernhardt, as were many of his later plays. He soon ranked with Augier and Dumas. He ridiculed the vulgar and selfish middle-class person in *Nos Intimes* (1861: anglicized as *Peril*), the gay old bachelors in *Les Vieux Garçons* (1865), the modem Tartufes in *Séraphine* (1868), the rural element in *Nos Bons Villageois* (1866), old-fashioned customs and antiquated political beliefs in *Les Ganaches* (1862), the revolutionary spirit and those who thrive on it in *Rabagas* (1872) and *Le Roi Carotte* (1872), and the then threatened divorce laws in *Divorçons* (1880).

He struck a new vein by introducing a strong historic element in some of his dramatic romances. Thus he borrowed *Théodora* (1884) from Byzantine annals, *La Haine* (1874) from Italian chronicles, *La Duchesse d' Athènes* from the forgotten records of mediaeval Greece. *Patrie* (1869) is founded on the rising of the Dutch *gueux* at the end of the 16th century. The scene of *La Sorcibre* (1904) was laid in Spain in the 16th century. The French Revolution furnished him with three plays, *Les Merveilleuses*, *Thermidor* (1891) and *Robespierre* (1902). The last named was written expressly for Sir Henry Irving, and produced at the Lyceum theatre, as was *Danfe* (1903). The imperial epoch was revived in *La Tosca* (1887) and *Madame Sans Gêne* (1893). Later plays were *La Piste* (1905) and *Le Drame des boissons* (1907).

Sardou married his benefactress, Mlle. de Brécourt, but eight

years later he became a widower, and soon after the revolution of 1870 was married again, to Mlle. Soulié. He was elected to the French Academy in 1878. He died at Paris on Nov. 8, 1908.

SARGASSO SEA, a tract of the North Atlantic ocean covered with floating seaweed (Sargassum, originally named sargago by the Portuguese). This tract is bounded approximately by 25° and 31° N. and by 40° and 70° W., but its extent and density are influenced by winds and ocean currents. The weed, known as Gulf Weed (*Sargassum Bacciferum*), belongs to the brown algae (*q.v.*), and is easily recognized by small berry-like bladders. The floating masses are believed to be replenished by additional supplies torn from the coasts to the south-west and carried by currents to the great whirl of the Sargasso sea. The weed supports a considerable amount of somewhat low forms of animal life of a type always more characteristic of the littoral zone than of the open ocean. The Sargasso sea was first reported by Columbus, who on his initial "West Indies" voyage was involved in it for several days. The widely credited story of ships becoming embedded in the weed beyond possibility of escape was disproved by the "Michael Sars" expedition (1910).

SARGENT, JOHN SINGER (1856-1921), Anglo-American painter. For 40 years before his death John Singer Sargent was too towering a personality for his contemporaries to judge either him or his work in true perspective. A tall commanding presence, with a small head well set on broad shoulders, with large, somewhat prominent grey eyes, kindly in expression though nothing escaped them, with a close-cut beard at a time when nine men out of 10 were clean-shaven, he made an instant impression upon those who came into contact with him. During the last years of his life, with his great size, his dark hair and beard turned silver-white, his florid complexion, and an air about him of singular freshness and calm, he had a look as of some serene and beneficent Jove.

That he was a great artist is universally acknowledged, but that he was a great man his life attested—in its austerity, its generous highmindedness, its breadth of vision, and above all in its independence of praise, fame or wealth.

Essentially a cosmopolitan, he was of American descent. His father, Dr. Fitzwilliam Sargent, was born in Gloucester, Massachusetts, where his ancestors, emigrating from Gloucester, England, settled before 1650. For his medical training Fitzwilliam Sargent went to Philadelphia, and married Miss Mary Newbold Singer, a member of an old Philadelphia family. In 1854 the young couple went for change of air and scene to Europe, with no premonition that this journey would result in their permanent establishment abroad. Two years later, on Jan. 12, 1856, in Florence, at the Casa Arretini, on the Lungarno Guicciardini, their son, John Singer Sargent, was born. He showed his special aptitudes from his earliest childhood, which was spent at Nice, in Rome, in Dresden, with periodical returns to Florence. Whenever possible he took drawing lessons of a desultory kind, interrupted by the exigencies of schooling and a life of constant travel. His mother, who all her life loved to sketch in water-colours, recognised and encouraged his unusual gifts.

His own awakening to the enchantment of being able to express his delight in the visual world came to him, he once mentioned, at Miirren, in the summers of 1868 to 1870. His early drawings were carefully painstaking efforts to show every variation in rock forms, or in the verdure that sprang from their crevices. In 1873 he won a prize for drawing at the Accademia in Florence.

In 1876 he paid the first of many visits to America, but before the short interruption of this trip he had begun his artistic education in earnest, having entered the studio of **Carolus-Duran**, in Paris, in 1874, at the age of eighteen.

A fellow student described him as a tall, slenderly built, rather silent youth, with a friendly, somewhat shy manner, who could, on occasions, in spite of his diffidence, express himself with startling decision. His industry was no less remarkable than his youthful strength which was not unduly taxed by the strain of

attending the classes not only at Duran's studio, but the Beaux Arts and evening life classes as well.

Contrary to many published recollections, Sargent himself declared, perhaps with characteristic modesty, that he was by no means a brilliant pupil, and that he only acquired his amazing technical skill by continued concentrated effort. What he did recognise, with instant appreciation and lifelong acknowledgment, was the scientific precision of the method taught by Carolus Duran, who had based his theories on a close study of Franz Hals and Velasquez. John Sargent, not without struggle, made this technique his own, and it gave him, at the start, the assured mastery of his materials.

His first picture, exhibited in the Salon of 1878, won an honourable mention. It was called "En route pour la Pêche," and is now in the Corcoran Gallery at Washington. In the next year's Salon he showed the portrait of his master, which he had painted in 1877, at the age of 21, and which was instantly acclaimed as of extraordinary promise. Shortly after, emancipated from schools, he made a pilgrimage to Spain, which he had already visited as a boy, and the studies done in the Prado Gallery, which, after his death, were sold at Christie's at such phenomenal prices, were painted on this occasion.

Immediately after his return to Paris he painted the beautiful canvases "El Jaleo" (Salon 1882), now at Fenway Court, Boston, and "The Children of E. D. Boit" (Salon 1883), now in the Boston Fine Arts Museum. Of "The Lady of the Rose" (Miss Burkhardt), which was shown in 1881 and gained a second class medal, Henry James wrote that it was the work of "a talent which on the very threshold of its career has nothing more to learn." This was a phrase, for to the end of his days Sargent remained the student, making even briefer the span between brain and hand, between conception and achievement; yet these early canvases are remarkably mature, with a beauty of surface texture he rarely excelled, and with the atmospheric "quality" he had learned from Velasquez. He had the special readiness of genius to absorb great traditions, to take valuable hints from every source, and incorporate them into his own work with the freshness and vigour of a deeply original mind.

From the outset commissions came to him unsought. He had to knock at no doors; but it was not till the Salon of 1884, when he showed the portrait of Madame Gautreau (Metropolitan Museum of New York), that the painter awoke to find himself famous—or infamous. Madame Gautreau was the friend of Gambetta, acclaimed by the Republican party, and Sargent was accused of having purposely done a caricature. The journalists outdid each other in senseless abuse.

This experience, with its astounding unreason, probably laid the foundation for his almost incredible independence of critical comment. Irritated by adulation, detesting every form of publicity, he could never be induced, unless it was forced upon him, to read any criticism of his own work, appreciative or the reverse.

So furious and so prolonged was the outcry in the French Press that finally, in a fit of disgust, Sargent left Paris and moved to London. His first studio was in Kensington, but in 1885 he had already settled at 33 Tite Street, Chelsea. In 1901 he bought the adjacent house (No. 31), and a door was cut through between the two studios. Here he lived and worked till his death on April 15, 1925.

Into these 40 years of his London domicile was crowded the experience of a dozen ordinary lifetimes. His first exhibited study of childhood: "Carnation, Lily, Lily, Rose," was bought in 1887, by the Chantrey bequest, for the Tate Gallery. A few years later the Luxembourg acquired the picture of the Spanish dancer "Carmencita," painted 1890, shown at the Royal Academy 1891. In spite of adverse criticism, it was not long before he was in great demand as a portrait painter, and the unflagging zeal of his industry kept pace with every triumph of public recognition. He numbered among his sitters princes and princesses, musicians, actors, teachers, writers, statesmen and diplomats. Many of his distinguished models he painted in their habit as they lived. The great groups of "The Duke of Marlborough and his Family" (1905), the "Ladies Acheson," (1902), the "Daughters of the

Hon. Percy Wyndham" (1900), the "Misses Hunter" (1902), etc., and a noble series of single portraits, notably those of the Duke and Duchess of Connaught (1908), the Duke (1901) and Duchess of Portland (1902), Lord Russell of Killowen (1900); of Francis Penrose, Esq. (1898), and of innumerable beautiful women: The Duchess of Sutherland (1904), the Countess of Warwick (1904), Lady Agnew (1893), Lady (Ian) Hamilton (1896), Mrs. Hammersley (1893), increased his every-growing prestige.

In 1894 he was elected an associate, in 1897 to full membership of the Royal Academy, and at the exhibitions at Burlington House his portraits were the centre of interest and of controversy. It became a high distinction to be painted by him, and hundreds clamored for the honour in vain. Universities offered him degrees, he had as many medals as a war veteran. Quite unmoved by all this acclamation, he retained the serene simplicity of manner that made him so exceptional and so distinguished a figure.

In the sense of being generally understood John Sargent was never a popular painter. Painting is the most outspoken of the arts, but its language is not easy to read. Its apparent simplicity and the directness of its appeal to the eyes are misleading, and in the case of pictures so incisive and brilliant, so uncompromising in their truth, so unerring and authoritative in their presentation of character, it was no wonder that they awakened as much resentment as admiration. There are mysteries of light, as well as of darkness, and the secrets of this accomplishment were no less inscrutable, became actually more tantalising, because the method of expression was so frank, and looked so amazingly easy to imitate. And he was imitated, inevitably, but in no single instance with any distinction. Referred to as a psychologist or a satirist, he was frequently accused of deliberately accentuating the less pleasing qualities in his sitters—a foolish legend he dismissed with a shrug of his shoulders. "I chronicle," he once said, "I do not judge." Though his outlook on life was essentially indulgent, his sense of humour was irrepressible, and the unerring rectitude of his realism struck at a deep-rooted human weakness—a preference to be seen not as we are but as we should like to be.

In that its conclusions are so little deliberate painting differs from literature. John Sargent did not sum up his characters, he painted what he saw; but he caught, subconsciously perhaps, each fugitive betrayal of a passing thought, a restless movement, a smile or a glance. This subtle power of definition has been, in all ages, the peculiar gift of great portrait painters.

In recalling the astonishing variety and scope of his work, it may be assumed that he was almost indifferent to the form in which he was called upon to portray the modern spirit. His only prayer must have been that that spirit should not be utterly commonplace. For dullness he had no talent, even his magic touch failed to enliven it. Before the strange, the unexpected, the bizarre, his resource and his freshness were unailing. No happy invention was permitted to degenerate into a formula. He never repeated himself. For the extremes of youth and of age he had undeniable tenderness; with incredible delicacy he portrayed the flower-like freshness of one, and if he did not disguise in the other the hint of decrepitude it was generally illumined by more than a suggestion of wisdom and dignity.

At the very height of his fame, in 1910, he decided to give up the painting of portraits. He had grown tired of the tyranny of sitters, and had begun to lose interest in his work. This decision, so typical of his artistic integrity, he lived up to. Only in exceptional instances was he afterwards induced to break his rule, and then never for considerations of money. Though he lived on a generous scale, he was never a wealthy man. Always ready to give a helping hand to a student, or to a brother artist, he was at once too busy and too impatient of all forms of implied superiority ever to want to teach. Deliberately then, perhaps, he set his face against the scattering of his energies over too wide a field. An omnivorous reader and a passionate musician, an excellent host and a most entertaining guest, his rare leisure was all too adequately filled.

In a holiday spirit he began to play with water-colour (in which medium he had made his earliest efforts at painting) and the result of his first summer of freedom may be seen in the sparkling

brilliance, the irresistible gaiety of the 80 sketches bought en bloc by the Brooklyn Fine Arts Museum. His disciplined hand had acquired an almost miraculous lightness and certainty of touch.

But a heavier task had already for years been engaging his energies, and the last 20 years of his life were given more and more to the magnificent series of decorations which illustrate the range of his great gifts. It was said of his "History of Religion," begun in 1890 and not completed till 1916 (the subject for the great Hall in the Boston Public Library known as Sargent Hall), that his work here was not only a monument to the picturesque possibilities of his colossal subject, but to the sheer erudition of the painter. This task took him on several journeys to Egypt, Palestine, etc., as well as for a few months almost every year to America, where he had a studio in Boston, in the Columbus Avenue Building; and he had also another studio in London, for these huge decorations, at The Avenue Studios, 75 Fulham Road.

In 1914, at the outset of the War, he was on holiday in Austria, and he witnessed with horror the disintegration of the Europe he had known. He gave without stint; and when the opportunity offered went to the front to record his impressions at first hand. In his famous war picture "Gassed" (London War Museum) he testified to his deep admiration for the invincible pluck of the British soldier. In the background, through the waning light of the late afternoon, we see the ground carpeted by writhing figures; while a tragic procession of wounded men, blinded by gas, staggers towards the dressing station.

The quieter life in London suited Sargent's temperament better than the more lavish social exactions of Boston. In London finally he was to know an honour no living painter had hitherto experienced. The magnificent series of portraits, bequeathed to the nation by Asher Wertheimer, were hung in the National Gallery. A wing in the Tate Gallery, the gift of Sir Joseph Duveen, now houses these, and such other works by Sargent as are already in national possession—the portraits of Lord Ribblesdale (1902), of Coventry Patmore (1895), of Henry James (1914), Octavia Hill (1899), of Ellen Terry as Lady Macbeth (1899), and many others. Sargent is represented in the principal galleries of the world, but the Metropolitan in New York, and the Boston Fine Arts Museum, are particularly rich in fine examples. The decorations for the Boston Library, for the Boston Fine Arts Museum, for the Harvard Memorial Chapel, absorbed him till, fortunate to the end, death overtook him in his sleep, in his 70th year, with no evident diminution of his forces, no weakening of his physical or mental energy.

In looking back over his immense achievement, his extraordinary vitality strikes one first. His slightest sketch pulsates with life. The beautiful suavity of his style, acquired through the iron discipline of years, never sacrificed its spontaneity. He shirked no labour, and knew no greater joy in life than this concentration on work provided him. He would paint a head twenty times over in order to establish an appearance of fluency and ease. His insight into character went far beyond ordinary perception either of artists or of laymen; at its best it became a miracle of intuition as of skill in its rendition.

What he lacked entirely may be called, for lack of a better term, the feminine touch. Beauty or charm that were not in direct relation with his subject he could not entertain. This severity was his strength in contradistinction to the weakness of much of the art of the period which perpetuated the worship of purely irrelevant sweetness.

Taken as a whole his portraits, drawn from every class of society, in their great number and variety, in the boldness, the wit, the keen incisiveness and the distinction of their presentation, must come to be considered an epitome of the age he lived in—of its stateliness and splendour, of its elegance and grace, of its pretentiousness and its vulgarity. The human panorama, in its every manifestation, he found endlessly diverting and delineating it as he did with uncompromising directness, his work, in its unflinching yet happy realism, bears the very stamp of truth.

Mr. Sargent had never married. He had been a devoted son

and brother, and was survived by his two sisters, Miss Emily Sargent and Mrs. Francis Ormond. His body was interred at Brookwood Cemetery. Memorial services were held at Westminster Abbey, at the request of the Royal Academy, and a replica in bronze of the Crucifixion in the Boston Library, with a memorial tablet, has been placed in the Crypt of St. Paul's Cathedral. (J. H.N.)

SARGON, more correctly **SARRU-KINU** ("the legitimate king"), an Assyrian general who, on the death of Shalmaneser IV., during the siege of Samaria, seized the crown on the 12th of Tebet 722 B.C. He claimed to be the descendant of the early kings, and accordingly assumed the name of a famous king of Babylonia who had reigned about 2,000 years before him. His first achievement was the capture of Samaria, 27,200 of its inhabitants being carried into captivity. Meanwhile Babylon had revolted under a Chaldaean prince, Merodach-baladan, who maintained his power there for twelve years. In 720 B.C. Yahu-bihdi of Hamath led Arpad, Damascus and Palestine into revolt: this was suppressed, and the Philistines and Egyptians were defeated at Raphia (mod. er-Rafa). In 719 B.C. Sargon defeated the Minni to the east of Armenia, and in 717 overthrew the combined forces of the Hittites and Moschi (Old Testament Meshech). The Hittite city of Carchemish was placed under an Assyrian governor, and its trade passed into Assyrian hands.

The following year Sargon was attacked by a great confederacy of the northern nations—Ararat, the Moschi, Tibareni, etc.—and in the course of the campaign he marched into the land of the Medes in the direction of the Caspian. In 713 B.C. the Minni were defeated, and one of their chiefs, Däyuku or Daiukku (Deioces), transported to Hamath. In 714 B.C. the army of Rusas of Ararat was annihilated, and a year later five Median chiefs, including Arbaku (Arbaces) became tributary. Cilicia and the Tibareni also submitted as well as the city of Malatia, eastern Cappadocia being annexed to the Assyrian Empire. A league was now formed between Merodach-baladan and the princes of the west, but before the confederates could move, an Assyrian army was sent against Ashdod, and Edom, Moab and Judah submitted to Sargon, who was thus free to turn his attention to Babylonia, and Merodach-baladan was accordingly driven from Babylon, where Sargon was crowned king. Shortly after this Sargon sent a statue of himself to Cyprus and annexed the kingdom of Comagene. He was murdered in 705 B.C., probably in the palace he had built at Dur-Sargina, now Khorsabad, which was excavated by P. E. Botta.

(1925), 43–60. For Sargon the Ancient, founder of the Accadian Empire, see S. Langdon, *Cambridge Ancient History*, vol. i. (1923), 402–408.

SARI BAIR, BATTLE OF, 1915: see **DARDANELLES CAMPAIGN.**

SARIPUL or **SIRIPUL**, a town and khanate of Afghan Turkistan. The town lies 100 m. S.W. of Balkh; estimated pop. 18,000. Two-thirds of the people are Uzbegs and the rest Hazaras. The khanate, which lies between Balkh and Maimana, was allotted to the Afghans by the Anglo-Russian boundary agreement of 1873.

SARI QAMISH, BATTLE OF, 1914. This battle in Dec. 1914, between the Russians and the Turks in the Caucasus, is described under **CAUCASUS, CAMPAIGN IN THE, 1914–1918**. It arose out of Enver's (*q.v.*) rash project for a wide enveloping manoeuvre in mid-winter, and although almost carried to success by the astonishing fortitude of the Turkish troops, ended in a disaster which almost annihilated the Turkish III. Army.

SARK, one of the smaller Channel Islands, lying 7 mi. E. of Guernsey. It is 3 mi. long and $1\frac{1}{2}$ mi. in extreme breadth. Area, 2 sq.mi.; pop. (1931) 541, excluding visitors. It is divided into Great Sark (the more northern) and Little Sark, connected by the Coupée, an isthmus, more than 100 yd. long and six ft. wide, with precipices on each side going down 300 ft. to the sea. The coastal scenery, commemorated in art by the painter Toplis, is of surpassing beauty, with fretted crystalline rocks, rocky islets, natural arches, caverns, etc. Creux, the harbour of Sark, on the east side, has its only communication with the interior by two tunnels, one

dating from 1588, the other 1868. The fauna of the surrounding seas is rich. The island is highest (375 ft) about the centre of Great Sark, where stand the church, a few dwellings and a mill. Groups of houses at La Ville, Valette, Collinette, Discart and in Little Sark, suggest much earlier settlements. About the 6th century the Celtic saint, St. Magloire, founded a monastery here. There is little record of permanent settlement until the 16th century, when Elizabeth granted the lordship to Helier de Cartaret who re-peopled the island, dividing the land among 40 farmers in strips from east to west. De Cartaret set up a scheme of government—partly manorial, partly parochial, which still holds. The island is included in the bailiwick of Guernsey, but has a court of justice of its own, the officers being appointed by the court of Guernsey under recommendation of the seigneur. There is also a court of chief pleas, whose members are the holders of the 40 original properties. Farming and fishing are the chief occupations.

SARMATAE or **SAUROMATAE** (the second form is mostly used by the earlier Greek writers, the other by the later Greeks and the Romans), a people whom Herodotus (iv. 21, 117) puts on the eastern boundary of Scythia (*q.v.*) beyond the Tanais (*Don*). He says expressly that they were not pure Scythians, but, being descended from young Scythian men and Amazons (iv. 110-117), spoke an impure dialect and allowed their women to take part in war and to enjoy much freedom. Hippocrates classes them as Scythian. From this we may infer that they spoke a language cognate with the Scythic. The greater part of the barbarian names occurring in the inscriptions of Olbia, Tanais, and Panticapaeum are supposed to be Sarmatian, and as they have been well explained from the Iranian language now spoken by the Ossetes of the Caucasus, these are supposed to be the representatives of the Sarmatae and can be shown to have a direct connection with the Alani (*q.v.*), one of their tribes. By the 3rd century B.C. the Sarmatae appear to have supplanted the Scyths proper in the plains of south Russia, where they remained dominant until the Gothic and Hunnish invasions. Their chief divisions were the Rhoxolani (*q.v.*), the Iazyges (*q.v.*), with whom the Romans had to deal on the Danube and Theiss, and the Alani. M. I. Rostovtzev has put serious difficulties in the way of the assumption that *Sauromatae* and *Sarmatae* were actually the same people; see his *Iranians* attd Greeks in *S. Russia* (1922), and *Skifya i Bospor* (1925).

SARMIENTO, DOMINGO FAUSTINO (1811-1888), Argentine educator, author, journalist and president of the republic, was born in San Juan de la Frontera on Feb. 14, 1811. He had little formal education and at an early age, because of his political opinions, took refuge in Chile, where he earned a precarious livelihood. In 1836 he returned to San Juan and was imprisoned for propaganda, but escaped to Chile in 1839 and engaged in journalism, editing *El Mercurio* of Valparaiso and founding *El Nacional* in Santiago. In 1841 he went back to Argentina to join the resistance to the dictator Rosas, but perceiving it to be useless, returned to Chile, where he added politics to journalism, founded the first Chilean normal school, was a member of the faculty of the university and waged violent polemics in behalf of liberal government and public instruction. His interest in public education was intense and in 1846 led him to make a several years' visit to Europe, Africa and the United States to study educational methods. In 1852 Gen. Urquiza's rebellion against Rosas drew him once more to Argentina and on Feb. 3, 1852, he assisted in overthrowing the dictator at the battle of Monte Caseros. Unwilling, however, to acknowledge Urquiza's political domination, he withdrew to Chile, but in 1856 reappeared in Buenos Aires, thrust himself into the journalistic arena and commenced a far-sighted campaign for public education. Elected governor of San Juan in 1862, while representing Buenos Aires in the national senate, he surrendered this position in 1864 to become minister to Chile and Peru and, in 1865, to the United States. While there he was elected president of Argentina for the term Oct. 12, 1868, to Oct. 12, 1874. As president he maintained political, economic and social stability, successfully terminated the War of the Triple Alliance against Paraguay (1865-70) and completely reorganized and amplified the national system of public instruction. Soon after

he retired from the presidency he was re-elected to the senate and then appointed director of education in the province of Buenos Aires. He continued to maintain an aggressive journalistic stand on all debatable questions. In 1878 he became editor of *El Nacional*; was appointed minister of the interior in President Avellaneda's government in 1879 and in 1881 was made national superintendent of schools, in which capacity he was able to carry to its logical conclusion much of his long campaign for universal education. He died in Asunción, Paraguay, on Sept. 11, 1888. In the first instance an educator, Sarmiento achieved fame also as an author. His complete works fill 52 volumes, and *Facundo ó la civilización y la barbarie* (1845), a portrait of Argentina in the epoch of Rosas, is the best known work in Argentina's literature and has been frequently translated. Notable also are: *Recuerdos de provincias* (Santiago de Chile, 1850), *Viajes* (Santiago, 1849), *Vida de Lincoln* (New York, 1866), *Las escuelas: base de la prosperidad y de la república en los Estados Unidos* (New York, 1866). (W. B. P.)

Coester, *The Literary History of Spanish America* (New York, 1916); R. Blanco-Fombona, *Grandes escritores de América* (Madrid, 1917); *Enciclopedia Universal Ilustrada* (Madrid, 1927).

SARNATH, 4 mi. from Benares city, in India, is the scene of the richest of the recent archaeological discoveries in the United Provinces. It was known to occupy the place of the Deer Park, where Gautama Buddha first launched his reforming faith and preached the "eight-fold path"; but except for a vast dismantled stupa, there was, at the beginning of this century, little indication of its buried treasures. The Chinese pilgrim, Hiuen Tsang, in the 7th century, had visited the Deer Park, and describes a monastery for 1,500 monks, a stupa, and in front of it a memorial pillar which Asoka had built, 70 feet high and polished like a mirror. In 1904, with Lord Curzon's active encouragement, the shapeless ruins of Sarnath were opened up by skilled hands, and the work of excavation went on for years. To-day the visitor can walk about the courts of the monastery. Asoka's monumental column unfortunately is broken and fallen, though its surface still retains its wonderful polish. A museum houses the finds of diggers.

SARNEN, the capital of the western half (or Obwalden) of the Swiss canton of Unterwalden. It stands 1,558 ft. above sea-level, at the north end of the lake of Sarnen (3 sq.mi. in extent), and is 4½ mi. by rail from Alpnachstad, its port on the lake of Lucerne. Pop. (1930), 5,324. In the archives is preserved the famous ms. the White Book of Sarnen, which contains one of the earliest known versions of the Tell legend. (See TELL.)

SARNIA, a city and port of entry, Ontario, Canada, capital of Lambton county, 55 mi. N.E. of Detroit, on the left bank of the river St. Clair. Pop. (1941) 18,734. It is on the Canadian National and Pere Marquette railways, and is a port of call for steamers plying on the Great Lakes. It contains a large oil-refinery which handles the greater part of the product of the Ontario oil region. The Canadian National railway crosses the river at this point by the St. Clair tunnel, 6,025 ft. long or, including the approaches, 2¼ mi., which connects the town with the American city of Port Huron (Michigan). The town at its foundation was named after the Channel island Guernsey (Lat. *Sarnia*) as a compliment to Governor Sir John Colborne who had been in command there.

SARNO (anc. *Sarnus*), a town of Campania, Italy, in the province of Salerno, 11 mi. N.E. from that city and 30 mi. E. of Naples by the main railway. Pop. (1936) 14,811 (town), 21,998 (commune). It lies at the foot of the Apennines, 92 ft. above sea-level, near the sources of the Sarno (anc. *Sarnus*), a stream connected by canal with Pompeii and the sea. Teias was defeated here by Narses in A.D. 552. Sarno has the ruins of a mediaeval castle, which belonged to Count Francesco Coppola, who took an important part in the conspiracy of the barons against Ferdinand of Aragon in 1485. Walter of Brienne is buried in the ancient church of S. Maria della Foce rebuilt in 1701. The travertine which forms round the springs of the Sarno was used even at Pompeii as building material.

SARONNO, a town of Lombardy, Italy, in the province of Milan, from which city it is distant 13 m. N.N.W. by rail. Pop.

(1936), 15,782 (town); 29,017 (commune). The pilgrimage church of the Madonna dei Miracoli, begun in 1498 by Vincenzo dell'Orto, has a dome of rich architecture; the campanile dates from 1516. Internally it is decorated with fine frescoes by Gaudenzio Ferrari, representing a concert of angels, while those in the choir are by Bernardino Luini and are among his finest works. The place is well known for its gingerbread (amaretti) and is also a manufacturing town.

SARPEDON, in Greek legend, son of Zeus and Laodameia, Lycian prince and hero of the Trojan war. He fought on the side of the Trojans and was slain by Patroclus. Apollo rescued his body and, by the command of Zeus, handed it over to Sleep and Death, by whom it was conveyed for burial to Lycia, where a sanctuary (Sarpedoneum) was erected in his honour. In later tradition, Sarpedon was the son of Zeus and Europa and the brother of Minos. Having been expelled from Crete by the latter, he and his comrades sailed for Asia, where he finally became king of Lycia.

See Homer, *Iliad*, v. 479, xu. 292, 419-683; Apollodorus iii. 3 ff.

SARPI, PAOLO (1552-1623), Venetian patriot, scholar and church reformer, was born at Venice, on Aug. 14, 1552. Against the wish of his relatives, he entered the order of the Servi di Maria, a minor Augustinian congregation of Florentine origin, at the age of thirteen. He assumed the name of Paolo, by which, with the epithet Servifa, he was always known to his contemporaries. In 1570 he sustained no fewer than three hundred and eighteen theses at a disputation in Mantua, with such applause that the duke made him court theologian. Sarpi spent four years at Mantua, applying himself to mathematics and the Oriental languages. After leaving Mantua, he repaired to Milan, where he enjoyed the protection of Cardinal Borromeo, but was soon transferred by his superiors to Venice, as professor of philosophy at the Servite convent. In 1579 he was sent to Rome on business connected with the reform of his order, which occupied him several years, and brought him into intimate relations with three successive popes, as well as the grand inquisitor and other persons of influence. He returned to Venice in 1588, and passed the next seventeen years in study, occasionally interrupted by the part he was compelled to take in the internal disputes of his community. He was twice recommended for preferment to a bishopric, but the pope refused his sanction in each case. Sarpi, therefore, continued to occupy himself with mathematics, metaphysics and anatomy. The only certain physiological discovery which can be safely attributed to him is that of the contractility of the iris. It must be remembered, however, that his treatises on scientific subjects are lost, and only known from imperfect abstracts.

In the dispute which arose between Paul V. (*q.v.*) and Venice on the extent of the papal jurisdiction in the Venetian State, Sarpi prepared on behalf of the republic a memoir, pointing out that the threatened censures might be met in two ways—de facto, by prohibiting their publication, and de jure, by an appeal to a general council. The document was received with universal applause, and Sarpi was immediately made canonist and theological counsellor to the republic. In the following April Paul excommunicated the Venetians and sought to lay their dominions under an interdict. Sarpi now republished the anti-papal opinions of the famous canonist Gerson. In an anonymous tract published shortly afterwards (*Risposta di un Dottore in Teologia*) he laid down principles which struck at the very root of the pope's authority in secular things. This book was promptly put upon the Index, and the republication of Gerson was attacked by Bellarmine with a severity which obliged Sarpi to reply in an Apologia. The *Considerazioni sulle censure* and the *Trattato dell' interdetto*, the latter partly prepared under his direction by other theologians, speedily followed. Numerous other pamphlets appeared, inspired or controlled by Sarpi, who had received the further appointment of censor over all that should be written at Venice in defence of the republic. The Venetian clergy, a few religious orders excepted, disregarded the interdict, and discharged their functions as usual. The Catholic powers refused to be drawn into the quarrel. At length (April 1607) a compromise was arranged through the mediation of the king of France, which, while salving over the

pope's dignity, conceded the points at issue.

The republic rewarded Sarpi by making him state counsellor in jurisprudence, and giving him access to the state archives. On Oct. 5 he was attacked by a band of assassins and left for dead, but the wounds were not mortal. The bravos found a refuge in the papal territories. "Agnosco stylum Curiae Romanae," Sarpi himself pleasantly said, when his surgeon commented upon the ragged and inartistic character of the wounds.

The remainder of Sarpi's life was spent peacefully in his cloister, though plots against him continued to be formed, and he occasionally spoke of taking refuge in England. In 1615 a dispute between the Venetian government, and the Inquisition respecting the prohibition of a book led him to write on the history and procedure of the Venetian Inquisition; and in 1619 his chief literary work, the History of the Council of Trent, was printed at London under the name of Pietro Soave Polano, an anagram of Paolo Sarpi Veneto. Sarpi never acknowledged his authorship. He survived the publication four years, dying on Jan. 15, 1623. His posthumous History of the Interdict was printed at Venice the year after his death, with the disguised imprint of Lyons.

Great light has been thrown upon Sarpi's real belief and the motives of his conduct by the letters of Christoph von Dohna, envoy of Christian, prince of Anhalt, to Venice, published by Moritz Ritter in the *Briefe und Acten zur Geschichte des dreissigjährigen Krieges*, vol. ii. (Munich, 1874). These letters seem to show that Sarpi was a patriot first and a religious reformer afterwards. His scientific attainments must have been great; and, though Sarpi did not, as has been asserted, invent the telescope, he immediately turned it to practical account by constructing a map of the moon.

Sarpi's life was written by his enthusiastic disciple, Father Fulgenzio Micanzio, whose work is meagre and uncritical. Bianchi-Giovini's biography (1836) is greatly marred by digressions, and is inferior in some respects to that by Arabella Georgina Campbell (1869), which is enriched by numerous references to MSS. unknown to Bianchi-Giovini. T. A. Trollope's *Paul the Pope and Paul the Friar* (1861) is in the main a mere abstract of Bianchi-Giovini, but adds a spirited account of the conclave of Paul V. The incidents of the Venetian dispute from day to day are related in the contemporary diaries published by Enrico Cornet (Vienna, 1859). Giusto Fontanini's *Storia arcana della vita di Pietro Sarpi* (1863), a bitter libel, is nevertheless important for the letters of Sarpi it contains, as Grisellini's *Memorie e aneddoti* (1760) is from the author's access to Sarpi's unpublished writings, afterwards unfortunately destroyed by fire. Foscarini's *History of Venetian Literature* is important on the same account. Sarpi's memoirs on state affairs remain in the Venetian archives. Portions of his correspondence have been printed at various times, and inedited letters from him are of frequent occurrence in public libraries. The King's library in the British Museum has a valuable collection of tracts in the Interdict controversy, formed by Consul Smith.

[In addition to the above works see Balan, *Fra Paolo Sarpi* (Venice, 1887) and Pascolato, *Fra Paolo Sarpi* (Milan, 1893). Some hitherto unpublished letters of Sarpi were edited by Karl Benrath and published, under the title *Paolo Sarpi. Neue Briefe, 1608-16* (at Leipzig in 1909).]

SARPSBORG, a seaport and manufacturing town of Norway, in Smaalenene amt (county), 68 m. S.S.E. of Oslo on the Gothenburg railway. Pop. (1930) 12,401. It became important through the utilization of the falls in the river Glommen for driving saw-mills and generating electric power. The Sarpsfos is a majestic fall, descending 74 ft. with a width of 120 ft., and providing 50,000 h.p. for factories for calcium carbide (used for manufacturing acetylene gas), paper, cellulose, zinc, wood pulp and aluminium; and spinning and weaving mills. The port is at Sannesund; its quays can be reached by vessels drawing 20 feet. The town was founded in the 11th century, and destroyed by the Swedes in 1567. The existing town dates from 1839.

SARRACENIA or **SIDE-SADDLE FLOWER**: see PITCHER PLANTS.

SARRAIL, MAURICE PAUL EMMANUEL (1856-1929), French soldier, was born at Carcassonne (Aude) on April 6, 1856. He graduated from the St. Cyr Military academy in 1877, and after a series of promotions was appointed in 1907 director of infantry at the war office. In 1911 he was promoted general of division and on Nov. 1, 1913, was given command of the 8th army corps, being later (April 24, 1914) transferred to the 6th corps which he commanded on the outbreak of World

Nar I. On Sept. 2, 1914, after leading the 6th corps with credit in the battle of the Frontiers, he succeeded Ruffey as commander of the 3rd army which played a brilliant part during the retreat to the Marne. During the trench warfare operations of 1914-15 he was less successful, however, and he was transferred to the chief command of the French army of the east. He became commander in chief of the Allied forces on that front (see *BALONIKA CAMPAIGNS 1915-18*).

After the war of 1914-18 he devoted himself to politics and food, unsuccessfully, as radical deputy for Paris. He was in Jan. 1925, appointed high commissioner in Syria. His administration was severely criticized; during the rebellion which broke out among the Jebel Druses he bombarded the native quarter of Damascus. In Oct. 1925, as a result of the report by General Dupont, he was relieved of his post. He died on March 23, 1929.

SARRAUT, ALBERT PIERRE (1872-), French politician, was born at Bordeaux, graduated in law, and became *conseiller-général* of the canton of Lezignan. He attached himself to the radical-socialist group, and worked on the *Dépêche de Toulouse*, of which his brother, Maurice Sarraut, was one of the editors. He was poet and author as well as journalist. In 1906 he was included in the Clemenceau administration as under secretary of state for the interior, but resigned in consequence of difficulties in his constituency of Narbonne. He returned to politics in 1909 as under secretary at the marine ministry in the first Briand cabinet. In 1911 he was appointed to succeed Klobukowski as governor-general of Indo-China. On the outbreak of war in 1914 he returned to France, and became minister of public instruction; later he served in the 30th infantry regiment, and then became again governor-general of Indo-China. He was wounded at Hanoi (Tongking) by a shot fired by a discharged official. In 1922 he became minister for the colonies in the Poincaré government, and in that capacity drew up an important scheme for the development of each of the units of the French colonial empire. He was sent in 1925 to Angora as French ambassador for a short time. In 1926 he was elected senator. He

held office under Poincaré, 1927-28, and Herriot, 1932; and was prime minister from Oct. to Nov. 1933. In 1934 he was minister of the interior in the Doumergue government, and in 1936 he became prime minister again. Under Chautemps, in 1937-38, he served first as minister of state and later as minister of the interior.

From 1938-40, he was minister of the interior in the Daladier cabinet, and later in 1940 he served for a short time as minister of national education under Reynaud.

SARRAZIN, JACQUES (1588-1660), French painter, born at Noyon in 1588. He went to Rome where he obtained employment from Cardinal Aldobrandini at Frascati, where he won the friendship of Domenichino, with whom he afterwards worked on the high altar of St. Andrea della Valle. He decorated the great portal and the dome of the western façade of the interior court of the Louvre. He died on Dec. 3, 1660.

SARREBOURG, a town of France, capital of an arrondissement in the department of Moselle, 44 mi. northwest from Sarrebourg. Pop. (1936) 9,516. It has been identified with the Pons Saravi of the Romans; it belonged to the bishops of Metz and the dukes of Lorraine, and was annexed by France in 1661. During the Franco-German War (1870), World War I in August 1914, and World War II in June 1940, fierce fighting took place in the area. Sarrebourg is the seat of a sub-prefect and there is a military aerodrome. The industries include the manufacture of building material, clocks and mineral water.

SARREGUEMINES (SAARGEMÜND), a town of France, capital of an arrondissement in the department of Moselle at the confluence of the Blies and the Saar, 40 mi. E. of Metz, 60 mi. N.W. of Strasbourg by rail. Pop. (1936) 16,001. Sarreguemines originally a Roman settlement, obtained civic rights early in the 13th century. In 1297 it was ceded by the count of Saarbrücken to the duke of Lorraine, and passed with Lorraine in 1766 to France, being transferred to Germany in 1871 and to France in 1919, but reoccupied by Germany in 1940. It is the seat of a sub-prefect, and has a military airfield. It makes faience, plush, velvet, porcelain and earthenware, and has metalworks.
